SUPPLEMENT

TO THE

CYCLOPÆDIA,

OR,

UNIVERSAL DICTIONARY

OF

ARTS AND SCIENCES.

M.

MABBY, a kind of wine made from potatoes. It is ſaid to be uſed in Barbadoes. *Boyle*'s Works abridg. vol. 1. p. 71.

MABOUJAS, the *devil lizard*, a ſpecies of American lizard, ſo called from its uglineſs and diſagreeable aſpect. It grows to ſix or ſeven inches long, and to the thickneſs of a thumb, and is found in the trunks of rotten trees, and in marſhy places, where the ſun beams ſeldom reach. It is all over of a gloſſy black colour, and looks as if ſmeared over with oil. *Rochefort*'s Hiſt. Antill.

MACAM, *Indian apple*, in natural hiſtory, the name of a common Eaſt-Indian fruit; it is of a round ſhape, and about the ſize of our common wild crabs which grow in the hedges. Inſtead of the ſeveral ſmall ſeeds which our crabs and apples contain, this fruit has only one hard kernel. It is of an acid taſte, and of a raw and not very agreeable ſmell. The tree which produces this fruit, does not grow to any great height. It reſembles the quince tree in its leaves, except that they have a yelloviſh caſt. Mem. Acad. Par. 1699.

MACAQUO, in zoology, the name of a large ſpecies of monkey, called by Mr. Ray *cercopithecus angolenſis major*, the great Angola monkey. Its hair is all of the colour of that of a wolf, its noſtrils are elate, its head like a bear's, and its buttocks are bald, on theſe he frequently ſits upright. He always carries his tail bent into a ſort of arch, his length from the head to the inſertion of the tail is more than a foot; his tail equals his body in length, his legs are conſiderably long, and his body remarkably fat and bulky; his teeth are extremely white, and his penis very much reſembles that of a man. It is an extremely lively animal, and continually plays a number of antic tricks; its voice is ſhrill, and its only note hah! hah! *Ray*'s Syn. Quad. p. 155. See CERCOPITHECUS.

They have another ſpecies of this kind alſo about Angola, which may be called the black *Macaquo*. Its only colour is black, but on many parts of the back and ſides, there is a greyiſh caſt among it. This has a tail of remarkable length, being more than two foot long.

MACARON, the name of a ſort of vermicelli, a paſte made of flour and water, and formed into the ſhape of the barrel of a large quill, or the guts of ſmall fowls.

MACAW, or MACAO, in zoology, the name of a large ſpecies of parrot, diſtinguiſhed alſo by the length of its tail. There are three different ſpecies of this bird brought over into Europe, which not only differ in ſize and other particulars, but alſo in colour. The firſt is the largeſt, and is finely variegated with blue and yellow. The ſecond is ſomewhat ſmaller than this, and is principally red and yellow, and the third is red and blue. It is not uncommon alſo to ſee the *Macaw* perfectly white, and it is to that particular colour we give the name of *cockatoon*; though with ſome it is made the ſynonymous name of all the *Macaw* tribe.

MACERONE, in botany, a name given by ſome authors to the great *hippoſelinum*, or herb Alexanders. *J. Bauhine*, vol. 3. p. 126.

MACHÆRION, a word uſed by chirurgical writers as the name of an inſtrument of the nature of the inciſion knife. It is alſo ſometimes uſed to expreſs an inciſion, and by the aruſpices of old it was applied to ſome peculiar part of the liver of animals, from which they preſaged events.

MACHERA *Lapis*, in natural hiſtory, the name of a ſtone of a ferrugineous colour, frequent on mount Berecynthus in Phrygia. Plutarch, and many other grave writers, relate, that if any perſon found this ſtone, and took it up at the time of the celebration of the feaſts of Cybele, he inſtantly was ſeized with madneſs.

MACHLIS, in natural hiſtory, a name uſed by Pliny and ſome of the old authors, for the rein-deer. See the article RANGIFER.

MACKREL, the Engliſh name for the ſcombrus, or ſcomber. See the article SCOMBER.

Horſe MACKREL. See the article HORSE-*Mackrel*.

MACROCELE. See the article FULICA.

MACROCEPHALUS (*Cycl.*)—*Macroſephali*, or *Long heads*, is a name given to a certain people who, according to the accounts of authors, were famous for the unſeemly length of their heads; yet cuſtom ſo far habituated them to it, that inſtead of looking on it as a deformity, they eſteemed it a beauty, and as ſoon as the child was born, moulded and faſhioned its head in their hands to as great a length as poſſible, and afterwards uſed all ſuch rollers and bandages as might ſeem moſt likely to determine its growing long.

MACROCERCOS *Ovis*, in natural hiſtory, the name of a ſpecies of ſheep ſomewhat allied to the *ovis laticauda*, or *platycercos* in the largeneſs of its tail; but as that extends ſo wonderfully in breadth, this does ſo no leſs in length, being deſcribed to be three cubits long.

Authors who have treated of this animal obſerve, that it is wholly unable to manage this load of tail, ſo that in the

natural ſtate it trails upon the ground, and ſoon becomes ſore and ulcerated; for this reaſon the ſhepherds are obliged to contrive a ſort of ſupport for it, by which the animal is made eaſy.

MACROCOLUM, or MACROCOLLUM, among the Romans, the largeſt kind of paper then in uſe. It meaſured ſixteen inches, and frequently two feet.

MACROLOGY, Μακρολογία, in rhetoric, a redundant, or too copious ſtile; an example of which we have in Livy, lib. viii. *Legati non impetratâ pace, retro domum, unde venerant abierunt.*

The too copious is equally ſubject to obſcurity with the two conciſe ſtile, and conſequently ought to be avoided. *Voſſ.* Rhet. l. 4. c. 1. §. 12. p. 35. See the articles BRACHYLOGY and DICTION.

MACROPEDIUM, the *Long-legs*, a name given by ſome writers in natural hiſtory, to the common tipula. See the article TIPULA.

MACROPIPER, a name given by authors to the *piper longum*, or long pepper.

MACROPNUS, a word uſed by Hippocrates and other old writers in medicine, to ſignify a perſon who fetches his breath at long intervals. It is uſed in oppoſition to *brachypnus*, or ſhort-breathed. See the article BRACHYPNÆA.

MACROPTERA, in zoology, the name of a genus of birds of the hawk kind, remarkable for the length of their wings. The word is derived from the Greek μακρὸς, long, and πτερὸν, a wing.

The hawks of this genus have their wings ſo long, that when cloſed they reach to the end of the tail, or nearly ſo. Of this genus are the bald buzzard, the kite, the hen harrier, the honey buzzard, and common buzzard, the ſacre, the jerfalcon, &c. *Willughby*'s Ornitholog. p. 40.

MACRORYNCHÆ, *long-beaked*, in the Linnæan ſyſtem of zoology, the character of a large order of the bird kind.

The word is derived from the Greek μακρὸς, long, and ῥύγχος, a beak.

The birds of this order have all of them beaks many times longer than their head, with oblong noſtrils, and a furrow running from them towards the apex of the beak. *Linnæi* Syſtem. Nat. p. 45.

MACROTELOSTYLA, in natural hiſtory, the name of a genus of cryſtals, which are compoſed of two pyramids joined to the end of a column, both the pyramids, as alſo the column, being hexangular, and the whole body conſequently compoſed of eighteen planes.

The word is derived from the Greek μακρὸς, long, τέλειος, perfect, and στύλος, a column; expreſſing a perfect cryſtal with a long column. See Tab. of Foſſils, Claſs 3.

There are only three known ſpecies of this genus: 1. A very bright and colourleſs one, found in ſome few places in England, and very common in the mountains of Germany. 2. A blackiſh very bright kind, with ſhort pyramids, found ſometimes in Cornwall, but more frequent in Italy. And, 3. A dull whitiſh one, with irregular pyramids; this is ſometimes found in Yorkſhire and in Cornwall, and is very common in Germany. Either of the ſorts found with us, are called by the common name of *Corniſh diamonds*. *Hill's* Hiſt. of Foſſ.

MACROULE, in zoology, the name given by many to the largeſt ſpecies of coot. It is of a deeper black than the common kind, and has a larger bald ſpot on its head. It is alſo called by ſome *diable de mer*. *Ray*'s Ornithol. p. 289. See the article FULICA.

MACUCAQUA, in zoology, the name of a Braſilian bird of the gallinaceous kind, called alſo by ſome the *gallina ſylveſtris*, or wild hen. It is larger than our common hen, and has a black ſtrong beak ſomewhat hooked at the end; its body is thick and bulky, and it has no tail; its head and neck are variegated with black and yellow ſpots, its throat is white, its breaſt, belly, and back, are of a duſky aſh-colour; its wings are of an olive colour, and are variegated with black; the long feathers of them are all black. It is a very well-taſted fowl, and has twice as much fleſh as the European hen; its eggs are ſomewhat larger than the common hen egg, and of a bluiſh-green colour; it feeds on fruits that fall off the trees, &c. and runs well, but cannot fly high or far, and never is ſeen in the trees. *Marggrave*'s Hiſt. Braſil.

MACULA, (*Cycl.*) in the writers of medicine, is uſed to expreſs all kinds of ſpots and efflorescences on the ſkin with different epithets. Thus *Maculæ peſtilentiales* are the ſpots or efflorescences which appear upon the ſkin in peſtilential diſeaſes. *Maculæ hepaticæ* are ſpots of a browniſh red colour appearing on the ſkin in many places, from an *ichoreſcence* of the blood, attended with a ſort of coagulation. *Maculæ volaticæ*, or vaniſhing ſpots, are very common to children, appearing in ſeveral parts of their bodies, and very ſoon diſappearing again. *Maculæ maternæ* are the ſpots or blemiſhes on children called *nævi*, and marks from the mother's longing; and *maculæ albæ* are white ſpots which appear in the cornea of the eye, called by other names, albugo, leucoma, nebula, and nubecula.

MACULA *Oculi*, a word uſed by many authors to ſignify a cataract or ſuffuſion.

MAD-*Dog*. See the article MADNESS.

MAD-*Apple*. See the article MELONGENA.

MADAROSIS, a word appropriated by the Greek phyſicians to the falling off of the hair of the eye-lids. This was uſually occaſioned among them by ſmall but foul ulcers on the verge of the eyelid, and this falling off of the hair about their edges, is ſaid by Hippocrates to have been a very bad ſymptom.

MADDER (*Cycl.*)—For the botanical characters of *Madder*, See the article RUBIA.

The culture of *Madder* is an article of conſiderable advantage to the Dutch, and might be proſecuted here with equal ſucceſs. The method of cultivating it in Holland is this: In autumn they plough the land where the *Madder* is to be planted, laying it up in high ridges, that it may be mellowed by the winter's froſts. In March they plough it again, working it very deep, and laying it in ridges at eighteen inches aſunder, and about a foot deep. Then, in the beginning of April, when the *Madder* begins to ſhoot out of the ground, they open the earth about the old roots, and take off all the ſide ſhoots, which extend themſelves horizontally juſt under the ſurface of the ground, preſerving as much of the root as may be with them. Theſe they plant immediately on the tops of the new ridges, at about a foot diſtance from each other; and this they uſually do in ſhowery weather, when the plants immediately take root, and require no more water. In theſe ridges they let the plants remain two ſeaſons, keeping them clear of weeds; and at Michaelmas time, when the leaves are fallen off, they take up the roots, and dry them for the market.

In England it would not be neceſſary to lay the ground up in ridges, as our lands are not ſo ſubject to over-flowings; the plants alſo will thrive better, if at greater diſtances, and if the horizontal roots were to be deſtroyed at times, the downright root would ſucceed much the better. *Miller*'s Gardener's Dict.

MADDER-*Root*. Mr. John Belchier ſhewed to the Royal Society the bones of hogs which were become red, by their feeding on bran that had been boiled with printed calicoes, which had been ſtained with preparations of iron, alum, ſugar of lead, and had had an infuſion of *Madder-root*, to fix the colours. By feeding a cock ſixteen days on fig-duſt, with a little *Madder-root*, all his bones became alſo red. Phil. Tranſ. N° 457.

Mr. Hamel du Monceau verified Mr. Belchier's experiments, and obſerved, that except the villous coat of the ſtomach and inteſtines, the capſula of the cryſtalline and vitreous humours of the eyes, and ſome very hard bony tendons, and the bones, no other part had any tincture of the *Madder*. The moſt ſolid bones were moſt tinged, and all the red ones were larger, more ſpongy, and eaſily broken; nor did they unite ſo well, when broken, as white bones. Some young animals had their bones tinged in three days. The red colour went gradually off, when the creatures forbore to take the *Madder* for food, which proved unhealthy, for they began to languiſh ſoon, and died with it.—Vegetables did not take the red colour when they were planted in *Madder*; and none of the other dyes, with which he fed animals, had any ſuch effect of tinging their bones, as the *Madder* had. Mr. du Hamel, having mixed *Madder* with the food of a pig for ſome time, and then kept away the *madder* an equal time, found, upon ſawing the bones through, that their interior laminæ were red, while the exterior were white: And having fed another pig ſix weeks with *Madder*, then kept it out of its food as long, and then mixed it other ſix weeks; upon ſawing the bones, they were compoſed of three layers, the external and internal were red, the middle one was white. Mem. de L'Acad. des Scienc. 1739. & Phil. Tranſ. N°. 457, §. 4. Med. Eſſ. Edinb. Abr. Vol. 2. p. 477.

MADELION, in the materia medica, a word uſed by Dioſcorides for *bdellium*.

MADERAM-*Pulli*, in botany, a name uſed by ſome authors for the tree whoſe fruit is the tamarind of the ſhops. Hort. Malab. vol. 1. p. 39.

MADIC, a word uſed by ſome medical writers for buttermilk.

MADISTERIUM, a name given by the Greeks to an inſtrument intended to keep the ſkin ſmooth, by eradicating the hairs.

MADNESS, *Mania*, in medicine. See the article MANIA, *Cycl.* and *Suppl.*

MADNESS *from the bite of enraged animals*, *Rabies canina*.—The bites of enraged animals, tho' they were not *mad* at the time they inflicted them, are uſually attended with very grievous conſequences. If the wound is ſlight, the diſcharge of blood from the part is to be encouraged by preſſing it with the fingers, ſucking it in the mouth, or by the application of cupping-glaſſes, or enlarging it with a lancet. It is afterwards to be waſhed with warm ſpirit of wine, and bolſters dipped in the ſame liquor, are to be applied to it, repeating the application every three or four hours, till all danger of inflammation is gone off. If the wound be conſiderably deep, it is always neceſſary to enlarge it with the knife, unleſs it have already a very large opening; and, after applying ſpirit of wine for the firſt days, to prevent the bad ſymptoms, it may be eaſily healed with honey, or ſome digeſtive ointment, and afterwards with a vulnerary balſam, as uſual in other wounds. *Heiſter*'s Surg. 97.

To know whether the dog which has bitten a perſon be or be not *mad*, it is neceſſary to know the marks by which a dog, in that condition, is to be diſtinguiſhed from others; theſe are, that he foams at the mouth, lolls out his tongue, claps his tail between his legs, and runs up and down, without ceaſing, as if he was purſued; he makes a hoarſe noiſe when he barks, and is afraid of all animals that come in his way, ſnapping at every thing he meets, even his maſter whom he uſed to fawn upon; and other dogs are afraid of him, and avoid him.

Perſons bit by a *mad* dog are uſually afflicted with very violent diſorders, ſometimes ſooner, ſometimes later, according to the malignity of the poiſon imbibed by the wound, and other accidents. The moſt proper thing the ſurgeon can do on this occaſion, is to enlarge the wound with the knife, and promote the flowing out of the blood; then to waſh it with ſalt water, or with Venice-treacle diſſolved in vinegar; and when the texture of the part will permit, that is, when only the common integuments, or fleſhy parts are wounded, to apply the actual cautery to the wound, and afterwards dreſs it as other burns. Another method much practiſed, is to make a tight ligature above the wound, to prevent, as much as may be, the return of the blood by the veins from that part; then to enlarge the wound with a knife, and waſh it as before directed; then cauterize it if the part will admit that operation, if not, cleanſe the wound, if deep, by means of a ſyringe, and apply over it a plaſter of the mercurial kind; and if the perſon be plethoric, to open a vein. After the Venice-treacle has been uſed for a day or two in theſe caſes, the wound is to be dreſſed with honey, or with the common digeſtive ointment, mixed with the Ægyptian ointment, or with red precipitate, and be kept open by means of theſe dreſſings for ſome weeks; for wounds of this kind muſt never be healed too ſoon, eſpecially when they have not been cauterized. *Heiſter*'s Surg. 99.

Dr. de Sault argues for the *rabies canina*, depending on ſmall worms, of which, he ſays, there are a great number found in the heads of thoſe who die of this diſeaſe. From the analogy of this terrible diſeaſe with others; ſuch as the itch, lues venerea, &c. which, in his opinion, are alſo contagious, by worms communicated from one perſon to another, he was led to think that the cure of the *rabies* was only to be performed by mercury, and the ſucceſs confirmed his theory; for of four men who had all been bit at the ſame time by the ſame wolf, two were treated by the common ſpecifics of plunging in the ſea, &c. and died ſome days after of the *rabies*. The other two, having all the ſigns of an approaching *rabies*, were cured by Mr. de Sault's method, which is this: If he is conſulted immediately after the perſon is bit, he orders him to be bathed in the ſea, that the common confidence in this method may calm his mind. As ſoon as the patient returns, he puts him on the uſe of Palmarius's powder, compoſed of Fol. Rut. Verben. Salv. Plantag. Polypod. Abſinth. Vulg. Menth. Artemiſ. Meliſſ. Betonic. Hyperic. Centaur. Min. ana partes æquales, with ſome coralline. A dram of this powder is to be taken every morning, in a glaſs of white wine or warm water. This he gives for twenty or thirty days, as there is more or leſs preſumption of the poiſon having entered the blood. From the firſt day of taking the powder, he rubs a dram or two of ung. Neapolit. upon the wound, and ſkin round it, every other day. After doing this thrice, he applies the ointment every third day; and afterwards every fourth day, till he has made uſe of two or three ounces of the ointment. If the patient has delayed ſeveral days to take his advice, he uſes the mercurial friction three or four times a day, for four days, and encreaſes the doſe of Palmarius's powder; then forbears the inunction two days, leſt a ſalivation ſhould be brought on. Our author likewiſe recommends muſic as of uſe to calm the mind, and divert the fear which people, in danger of this diſeaſe, generally have. Medic. Eſſ. Edinb.

Dr. James relates the cure he made of dogs that were *mad*, and how he preſerved others from the rabies, who had been bit by *mad* dogs, by giving doſes of turbith mineral every day, or every other day. The other dogs of the pack that had been bit, died, notwithſtanding the famous pewter medicine, dipping in the ſea, and the other common ſpecifics. The Doctor likewiſe mentions three people who were bit by *mad* dogs, and eſcaped the *rabies* by the uſe of the turbith. Phil. Tranſ. N°. 441. §. 8.

Mr. Fuller relates the good effects of the pulvis antyliſſus, compoſed of lichen. ciner. terreſt. and piper. nigr. aa. in preventing the *rabies*. Phil. Tranſ. N°. 448. §. 5.

A perſon who had been bit by a *mad* dog, and began to have ſymptoms of the *rabies*, was ſaved by having one hundred and twenty ounces of blood taken in a week, and being bathed in cold water. Phil. Tranſ. ibid. §. 6.

Mr. Nourſe relates the hiſtory of a lad bit in the thumb by a *mad* dog; he took morning and evening a dram of the *pulvis antyliſſus* forty days, and bathed in the ſea ten days; he was cut for the ſtone ſoon after, and recovered very well; nineteen months after which he died, with all the ſymptoms of the hydrophobia. Phil. Tranſ. N°. 445. See the article HYDROPHOBIA.

We have an account of a man bit by one of theſe animals, who was cured by bleeding, nitre, and mithridate. See Phil. Tranſ. N°. 475. Sect. 4. The *pulvis antyliſſus*, and cold bathing, far from alleviating the ſymptoms in this patient, rather increaſed them. The cold bath was obſerved to augment the head-ach. Dr. Mortimer, the editor of the tranſactions, propoſes warm bathing.

The Tonquineſe pretend to an infallible remedy for the bite of the *mad* dog. Their method is to take about ſixteen grains of the beſt muſk; of the pureſt native cinnabar, and fineſt vermillion, each about twenty four grains; and having reduced them ſeparately to impalpable powders, they mix and adminiſter them in about a gill of arrack. This, in two or three hours, generally throws the patient into a ſound ſleep, and perſpiration: If not, they repeat the doſe, and think the cure certain. See Phil. Tranſ. N°. 474. p. 225. ſeq. Where Mr. Reid, to whom we are obliged for this receipt, obſerves, as to the vermillion, that though it be a preparation of cinnabar, yet, as the Tonquineſe ſeem to think its virtue different, it were to be wiſhed, that we knew their method of preparing it, in which they certainly excel.

This compoſition of muſk and cinnabar has been applied with ſucceſs to other diſtempers, only as Tonquin vermillion is not eaſy to be had, Mr. Reid ſubſtituted an equal quantity of factitious cinnabar in its ſtead, and ſometimes adminiſtered it in rum or brandy inſtead of arrack. See the article MUSK.

MADNING-*Money*, old Roman coins, found about Dunſtable, are ſo called by the country-people; and have their name from *magintum*, uſed by the emperor Antoninus in his Dunſtable itinerary. *Camb. Blount.*

MADON, in botany, a name by which Pliny, and ſome other authors, have called the white bryony. *Ger.* Emac. Ind. 2.

MADOR, a word uſed by ſome authors to expreſs the ſweat which ariſes under a ſyncope or fainting, whether it be cold or hot, or in larger or ſmaller quantities.

MADREPORA, in botany, the name of a genus of ſea plants, the characters of which are, that they are almoſt of a ſtony hardneſs, reſembling the corals, and are uſually divided into branches, and pervious by many holes or cavities, which are frequently of a ſtellar figure.

The ſpecies of *Madrepora*, enumerated by Mr. Tournefort, are theſe: 1. The ſtarry *Madrepora*. 2. The branched *Madrepora*. 3. The *Madrepora*, commonly called *Millepora*. 4. The common white oculated *Madrepora*, called the oculated white coral. 5. The ſmall white ſtellated and verrucoſe *Madrepora*, called the coralloide porus, and the aſtroites. 6. The much branched, and elegantly ſtellated white *Madrepora*. 7. The punctated verrucoſe *Madrepora*. 8. The abrotanum-like *Madrepora*. 9. The branched erect *Madrepora*, with numerous tubercles bending upwards. 10. The white compreſſed *Madrepora*, of a foliaceous ſtructure, and ſieve-like texture. 11. The white cypreſs-like *Madrepora*, or white porus, with hollow tubercles. 12. The great tree *Madrepora*. *Tourn.* Inſt. p. 573.

MAEL *Coronde*, in the language of the Ceyloneſe, the flowering cinnamon tree. This is a name given to a peculiar ſpecies of the cinnamon tree, which is all the year round found full of flowers. The flowers are not eaſily to be diſtinguiſhed from the very fineſt cinnamon flowers, but they produce no fruit, which the flowers of the fine cinnamon always do. The bark is much like that of the beſt cinnamon, in external appearance; but it has very little taſte or ſmell. The tree grows very large, and the inhabitants ſometimes tap it, by boring a hole into the trunk, at which it bleeds a thin watery juice, in the manner of our birch tree.

MÆMACTERION, Μαιμακτηριων, in chronology, the fourth month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our September and beginning of October. The Bœotions called it *Alalcomenius*.

It took its name from the feſtival *Mæmacterica*, ſacred to Jupiter, kept at this time. See *Pott.* Archæol. Græc. l. 2. c. 20. Tom. I. p. 413.

MÆMACYLON, in the materia medica, a name given by Dioſcorides, and the antients in general, to the fruit of the Arbutus, or ſtrawberry-tree.

MÆNA, in zoology, the name of a ſmall fiſh, caught in vaſt abundance about the ſhores of the Mediterranean, and common in the markets of Italy, where they are accounted but a poor ſort of fiſh, and ſold at a very cheap rate. It is ſomewhat of the figure of the pearch, but broader and thinner, and is ſeldom above four or five inches in length. Its colour is a duſky pale green, and pale yellow, variegated with tranſverſe black lines, and ſome longitudinal ones of a fine blue; and on each ſide, near the middle of the body, and juſt below the line which runs from the gills to the tail, it has a large black ſpot. This fiſh changes its colour in the different ſeaſons of the year, being white in winter, and greeniſh, or yellowiſh, and ſtreaked and ſpotted in the ſummer. The eyes are large, and the tail not much forked. Its back fin has the anterior rays prickly, the reſt ſmooth. *Rondelet.* de Piſc.. l. 5. c. 13. p. 138. *Aldrovand.* de Piſc. l. 2. c. 39. p. 223. *Geſner.* de Piſc. p. 612.

MÆNA *Candida*, in ichthyology, a name given by many authors to the ſmaris. It is not very improper, for they are

both

both of the ſame genus of the ſparus, and are very nearly allied to one another; the principal difference conſiſting in the tail and belly fins of the ſmaris being red. See the articles MÆNA and SPARUS.

MAESTOSO, or MAESTUOSO, in the Italian muſic, ſignifies to play with grandeur, and conſequently ſlow, but yet with ſtrength and firmneſs.

MAFORTIUM, among the Romans, a veil, or head-dreſs, worn by the married women. *Pitiſc.* in voc.

MAGAS, in the antient muſic, is uſed to denote the bridge of any inſtrument.

MAGAURI, in zoology, the name of a Braſilian bird, a ſpecies of ſtork. It is of the ſize of the common white ſtork. Its neck is a foot long, and its beak ſtrait and pointed, and nine fingers breadth in length; its legs long and naked. Its tail is ſhort. Its head, neck, and body, are covered with ſnow-white feathers. On the throat theſe are very long, very white and valuable. Its wing and tail have their long feathers black. Its legs are red; and its fleſh eatable. *Marggrave*'s Hiſt. Braſil.

MAGBOTE, or MÆGBOTE, in our old writers, a compenſation for the ſlaying or murder of one's kinſman, in antient times, when corporal puniſhments for murder, *&c.* were ſometimes commuted into pecuniary fines, if the friends and relations of the party killed were ſo ſatisfied. Leg. Canuti, cap. 2. *Blount*, Terms of Law.

The word comes from the Saxon *Mæg*, i. e. *Cognatus*, and *Bote*, *Compenſatio*.

MAGDALEO, a word uſed by diſpenſatory writers, to expreſs any thing made up into a cylindric form. The common rolls of plaſters which the apothecaries make up, to be ready for ſpreading upon occaſion, are thus called, as alſo the rolls of ſulphur, or common brimſtone.

MAGDALIÆ, or MAGDALIDES, the ſame as *Magdaleones*, rolls of ſulphur, plaſters, *&c.* Vid. ſupra.

MAGELLANIC *Clouds*, whitiſh appearances like clouds, ſeen in the heavens towards the ſouth pole, and having the ſame apparent motion as the ſtars.

They are three in number, two of them near each other. The largeſt lies far from the ſouth pole; but the other two are not many degrees more remote from it than the neareſt conſpicuous ſtar, that is, about eleven degrees.

Mr. Boyle conjectures, that if theſe clouds were ſeen thro' a good teleſcope, they would appear to be multitudes of ſmall ſtars, like the milky way. *Boyle*'s Works abr. vol. 1. p. 295.

MAGELLANIC *Gooſe*, *Anſer Magellanicus*, in zoology. See the article GOOSE.

MAGGOT, the common name of the fly-worm, bred in fleſh, from the egg of the great blue fleſh-fly Notwithſtanding the diſtaſte for this animal, its figure, and ſtructure of parts is greatly worth attending to, and may ſerve as a general hiſtory of the claſs of worms produced from the eggs of flies.

This animal is white and fleſhy; its body is compoſed of a number of rings, like the bodies of caterpillars, and other the like inſects, and is capable, at the pleaſure of the animal, of aſſuming different figures, being, at times, more or leſs extended in length, and conſequently more or leſs thick.

Notwithſtanding that this creature has no legs, it is able to move itſelf very ſwiftly, and, in its firſt attempt to move its body, is extended to its greateſt length, and aſſumes ſomething of the figure of a pointed cone. The pointed part of this cone is the head of the animal, and is not ſeparated from the next ring by any deeper furrow than the reſt of the rings are from one another. In ſome ſtates of the animal, one may ſee two ſhort horns thruſt out from the head; but what are more conſtantly obſervable are two brown ſcaly hooks; theſe are, however, ſometimes hid, and have each of them a ſheath, or caſe, into which the animal can retract them at pleaſure. Theſe hooks are bent into an arch, the concavity of which is toward the plane on which the creature is placed, and they are thickeſt at their inſertion in the head, and thence diminiſh gradually, till they terminate in a fine ſharp point.

Theſe two hooks are placed in a parallel direction, and can never come together, and therefore cannot ſerve in the place of teeth to grind the food between, but merely to pull and ſever it to pieces, that it may be of a proper ſize for the mouth of the creature.

The creature has beſide theſe two hooks a kind of dart, which is of about a third part of their length, and is placed at an equal diſtance between them. This alſo is brown like them, and ſcaly; it is quite ſtrait, and terminates in a fine point. The hooks have, as it were, two ſcaly thorns at their points, and this dart ſeems intended, by reiterated ſtrokes, to divide and break the pieces of fleſh theſe have ſeparated from the reſt into ſmaller parts.

Immediately below the apertures for the egreſs of the hooks, is placed the mouth of the animal; the creature does not ſhew this little opening unleſs preſſed, but if the preſſure be properly managed, it will ſufficiently open it, and there may be diſcovered within it a ſmall protuberance, which may very naturally be ſuppoſed either the tongue, or the ſucker of the animal.

The hooks in theſe creatures not only ſupply the place of teeth, but alſo of legs, ſince it is by faſtening theſe hooks into the ſubſtance it is placed on, and then drawing up its body to it, that it pulls itſelf along.

The back of this creature lowers itſelf by degrees as it approaches the extremity of the belly, and near the place where the back begins to lower itſelf, are placed the creature's two principal organs of reſpiration. One may perceive there two ſmall roundiſh brown ſpots; theſe are very eaſily diſtinguiſhable by the naked eye, becauſe the reſt of the body of the creature is white; but if we take in the aſſiſtance of glaſſes, each of theſe ſpots appears to be a brown circular eminence raiſed a little above the reſt of the body. On each of theſe ſpots one may alſo diſcover three oblong oval cavities, ſomething of the ſhape of button-holes; theſe are ſituated in a parallel direction to one another, and their length nearly in a perpendicular direction to that of the body of the animal.

Theſe apertures are ſo many ſtigmata or air-holes, openings deſtined to admit the air neceſſary to the life of the animal. The creature has ſix of theſe ſtigmata, three in each ſide of its body.

The great tranſparence of the body of this inſect, gives us an opportunity alſo to diſtinguiſh that it has on each ſide a large white veſſel running the whole length of the body. It is eaſy to follow the courſe of theſe veſſels through their whole length, but they are moſt diſtinct of all toward its hinder part, and they are always ſeen to terminate each in the brown ſpot before deſcribed; this leaves us no room to doubt but that they are the two principal tracheæ.

Theſe poſterior tracheæ have been well known to the later naturaliſts; but there are two others beſides theſe which they ſeem not to have diſtinguiſhed. Theſe are ſituated in the anterior part of the animal, and are eaſily diſcovered by following the courſe of the tracheæ on each ſide; for though theſe all the way diminiſh in their diameters as they approach the head of the animal, yet it may be eaſily enough ſeen where they terminate, which is (taking the head for one ring) in the junction of the ſecond and third ring. In this place the naked eye eaſily diſcovers a ſmall ſpot at the extremity of each, which viewed with a good microſcope appears to be a plain ſtigma, of the figure of a funnel with half of it cut off, and very elegantly indented, and as it were fringed at the edges.

Theſe ſtigmata in the anterior part of the body, are as conſtant in this creature as the poſterior ones, but it ſeems to have none of thoſe which the caterpillar claſs are furniſhed with along their ſides; though it ſeems from the ſtructure of the fly it afterwards transforms itſelf into, that it ought to have them, ſince that has ſtigmata in their places.

The ramifications of the two great tracheæ are very beautifully ſeen in this creature, eſpecially on its belly; and it is remarkable, that no veſſel analogous to the great artery in the caterpillar claſs can be diſcovered in theſe; though, if there were any ſuch, their great tranſparence muſt needs make them very eaſily diſtinguiſhable; nor could its dilatations and contractions, if ſo conſiderable as in that claſs of animals, be leſs ſo. See ERUCA.

Malpighi imagined that artery, in the caterpillar claſs, a ſeries of hearts; in its place, however, there may be ſeen in theſe animals a true heart. It is eaſy to obſerve in theſe creatures, about the fourth ring of their body, a ſmall fleſhy part, which has alternate contractions and dilatations, and is not only diſcoverable in the body by means of the creature's tranſparence; but on making a proper ſection of them in the ſecond, third, and fourth rings, will be thrown out of the body of the creature, and will afterwards continue its beats for ſome minutes. *Reaumur*'s Hiſt. Inſect. vol. 4. p. 166, ſeq.

MAGIC (*Cycl.*)—The moſt ignorant and barbarous people have been generally moſt ſuſpected of *Magic*. Among ourſelves, the moſt miſerably ignorant perſons have been accuſed of it; and among foreign nations the Laplanders and Iſlanders have been ſuppoſed moſt converſant of all others in it. Theſe people themſelves place an abſolute confidence in the effects of certain idle words and actions, and the reſt of the world is deceived in the ſame manner. The famous *magical drum* of the Laplanders is ſtill in conſtant uſe in that nation, and Scheffer, in his hiſtory of Lapland, has given us an account of its ſtructure.

This inſtrument is made of beech, pine, or fir, ſplit in the middle, and hollowed on the flat ſide where the drum is to be made. The hollow is of an oval figure, and is covered with a ſkin clean dreſſed, and painted with figures of various kinds, ſuch as ſtars, ſuns, and moons, animals, and plants, and even countries, lakes, and rivers; and of later days, ſince the preaching chriſtianity among them, the acts and ſufferings of our Saviour and his apoſtles, are often added to the reſt. All theſe fignres are ſeparated by lines into three regions or cluſters.

There is beſide theſe parts of the drum an index and a hammer. The index is a bundle of braſs or iron rings, the biggeſt of which has a hole in its middle, and the ſmaller ones are hung to it. The hammer or drum-ſtick is made of the horn of a rein deer, and with this they beat the drum ſo as to make theſe rings move, they being laid on the top for that purpoſe. In the motion of theſe rings about the pictures figured

gured on the drum, they fancy to themſelves ſome prediction in regard to the things they are to enquire about.

What they principally enquire into by this inſtrument, are three things: 1. What ſacrifices they ſhall offer as moſt acceptable to their gods. 2. What ſucceſs they ſhall have in their buſineſſes or undertakings, ſuch as hunting, fiſhing, curing of diſeaſes, and the like. And, 3. What is done in places remote from them. On theſe ſeveral occaſions they uſe ſeveral peculiar ceremonies, and place themſelves in ſeveral odd poſtures as they beat the drum, which influences the rings to one or the other ſide, and to come nearer to one or the other ſet of figures. And when they have done this, they have a method of calculating a diſcovery, which they keep as a great ſecret, but which ſeems merely the buſineſs of imagination in the diviner or magician.

MAGICAL (*Cycl.*) — MAGICAL *arrows*, a ſort of weapon very common among the barbarous inhabitants of Lapland, and many other of the northern climates, and ſuppoſed to poſſeſs great and very ſtrange virtues. The people who are poſſeſſed of them, pretend that they can, by their means, cauſe diſeaſes even to people at a great diſtance from them; and not only diſeaſes, but any other kind of miſchiefs they deſire; and they pretend to practiſe this not only againſt ſtrangers, but one another. There is a ſtory recorded in Scheffer's hiſtory of this country, as a legend univerſally believed among them, of a magician who, by means of one of theſe arrows, tore up a rock, near which another magician, with whom he was at enmity, was ſleeping, and buried him under it.

MAGIOTAN, a name given by the people of Provence, and ſome other places, to the ſtony matter, as they eſteem it, which choaks up in time the mouths of ſome of their rivers. This is a ſoft ſpongy matter, reſembling a coarſe and very friable ſtone; and, according to the opinion of count Marſigli, it is no other than a congeries of the ſand from the bottoms of the rivers farther up the country, which is rolled downwards, and in theſe places is full of ſparry and bituminous matter, which, in the place where it meets the full body of ſea-water, is ſtopp'd and coagulated by it into this firm and ſolid ſtate.

MAGMA, a word uſed by medical writers on many occaſions, ſometimes in a very lax, and ſometimes in a more appropriated ſenſe. Some writers uſe it to expreſs a maſs of any thing; others for a thick ointment made up with very little fluid matter, to prevent its running; and others for the remains of an ointment after expreſſion from its ingredients. Galen reſtrains the word *Magma* to expreſs only the fæces of mirobalans.

MAGNA (*Cycl.*)—MAGNA *Aſſiza eligenda*, a writ directed to the ſheriff to ſummon four lawful knights before the juſtices of aſſize, there, upon their oaths, to chuſe twelve knights of the vicinage, *&c.* to paſs upon the *great aſſize* between A. B. plaintiff, and C. D. defendant, *&c.* Reg. Orig. 8. *Cowel.*

MAGNALE, a word uſed by Van Helmont, and other enthuſiaſtical chemiſts, to expreſs what he calls a kind of ſpirit, which adminiſters to ſympathy and antipathy, and is the prompter and promoter of actions, and by virtue of which magnetiſm is conveyed, as by a vehicle, to a diſtant object. In other places he ſays *Magnale*, in mixed ſubſtances, is the æther, which is thinner than the air; and, as he expreſſes it, of an ambiguous nature between body and no body. In other places he ſays, that as the *Magnale* has nothing like itſelf in created beings, ſo it will admit of no manifeſtation by reſemblance. The *Magnale*, he ſays, is not light, as many ſuppoſe, but is a ſort of conjugal form aſſiſting the air.

MAGNANINE, in zoology, the name of a ſmall bird deſcribed by Aldrovand, Geſner, and ſome other authors, and ſeeming to be the ſame with our hedge-ſparrow, commonly known among authors by the name *curruca*. *Ray*'s Ornitholog. p. 158.

MAGNES *Carneus*, in natural hiſtory, a name given by Cardan, and ſome other authors, to a white earth dug in Italy and ſome other places, and called alſo by many *calamita alba*. It is an indurated earthy ſubſtance of the hardneſs of oſteocolla, and is of a white colour variegated with black lines. It adheres very firmly to the tongue, and is hence ſaid to attract fleſh in the ſame manner as the magnet does iron. It is even pretended, that if an iron ſtylus be rubed over with this ſtony earth, and then plunged into the fleſh, the virtue of the earth will heal the wound as ſoon as made, and when the weapon is taken forth, there will remain no appearance of hurt. Cardan affirms that he ſaw this tried with ſucceſs, but ſuſpects witchcraft in the caſe! *De Boet.* de Gem. p. 474.

MAGNET (*Cycl.*)—MAGNET, in medicine. Some writers of the middle ages have, from a miſtaken tranſlation of Theophraſtus, been induced to account the *loadſtone* poiſonous, which the antients were ſo far from doing, that they gave it inwardly. Galen aſcribes a purgative quality to it, and recommends it in dropſies; and Dioſcorides preſcribes it as a good medicine to evacuate groſs melancholic humors.

It is doubtleſs poſſeſſed of the ſame virtues with the other ores of iron, though of late never uſed inwardly, being only made an ingredient in ſome plaſters.

Arſenical MAGNET, a cauſtic made of equal quantities of antimony, common ſulphur, and white cryſtalline arſenic; which are to be kept in a ſand heat, till the whole melts into one uniform maſs. It ſucceeds very well in taking down fungous fleſh in wounds.

MAGNETIC *Needle*, in navigation, *&c.* See the article NEEDLE, *Cycl.*

MAGNETICAL *Meridian*, in navigation. See the article MERIDIAN, *Cycl.*

MAGNETIS *Lapis*, in the natural hiſtory of the antients, the name given in different ages to two very different ſubſtances. The earlieſt Greek authors expreſſed by it the loadſtone, which became afterwards called *heraclius lapis*; and then the word *Magnetis* was applied to a very different ſtone brought from the ſame place, the neighbourhood of Magneſia in Lydia.

This was a fine beautiful and bright ſubſtance, of a pure white, and ſo very bright and gloſſy, as to carry a reſemblance of poliſhed ſilver. It was dug in large maſſes, and was of a texture eaſy to be wrought into any figure; this made it in great eſteem among the antients, who had it in conſtant uſe turned into veſſels of different kinds for the uſe of the table. It ſeems to be wholly unknown at preſent among the nations we have commerce with. *Hill's* Theophraſt. p. 79.

MAGNISSA, in mineralogy, a name given by ſome of the antients to the white pyrites, called by others *leucolithos* and *argyrolithos*. Many have ſuppoſed the *Magniſſa* to be the ſame with the magneſia, that is, manganeſe, but this is an error; nor is there the leaſt ſimilitude between the two ſtones. It is plain, indeed, that the antients called a white and ſilvery looking ſtone alſo by the name *Magneſia*; but neither does this appear to have been the *Magniſſa* here deſcribed, for Theophraſtus deſcribes it as a ſtone that artificers uſed for turning things out of, which is utterly impoſſible to be done with the pyrites; the ſhattery texture of which would make it fall to pieces on the ſlighteſt attempt to cut it into ſhape by the wheel. The chemiſts of the preceding ages have plainly underſtood this word *Magniſſa* of the pyrites, and have made theſe two words and the *ſory* ſynonymous. Pliny mentions a gold-coloured and ſilver-coloured pyrites; theſe therefore were diſtinctions ſufficient for the white and yellow pyrites; but Dioſcorides has only mentioned one kind of the marcaſite or pyrites, which is the yellow or braſſy one, the moſt common of all the ſpecies. When the word pyrites, therefore, was only the name of this yellow ſtone, it is not wonderful that the white one ſhould be called by another name, as *Magniſſa*. See the article MARCASITE.

MAGNITUDE (*Cycl.*)—*Geometrical magnitudes* may be uſefully conſidered as generated or produced by motion. Thus, lines may be conceived as generated by the motion of points; ſurfaces, by the motion of lines; ſolids, by the motion of ſurfaces; angles may be ſuppoſed to be generated by the rotation of their ſides.

Geometrical magnitude is always underſtood to conſiſt of parts; and to have no parts, or to have no *Magnitude*, are conſidered as equivalent in this ſcience. There is, however, no neceſſity for conſidering *Magnitude* as made up of an infinite number of ſmall parts; it is ſufficient that no quantity can be ſuppoſed to be ſo ſmall, but it may be conceived to be farther diminiſhed; and it is obvious, that we are not to eſtimate the number of parts that may be conceived in a given *Magnitude*, by thoſe which in particular determinate circumſtances may be actually perceived in it by ſenſe, ſince a greater number of parts become ſenſible, by varying the circumſtances in which it is perceived. See *Mac Laurin*'s Fluxions, Art. 290, 291.

Many of late have ſuppoſed geometrical *Magnitude* to be compoſed of infinitely ſmall parts, and infinite in number; and hence have raiſed many paradoxes and myſteries in a ſcience wherein there ought to be none. Nay, infinitely ſmall parts of infinitely ſmall parts, *&c. ad infinitum*, have been introduced without the leaſt neceſſity. See *Mac Laurin*'s Fluxions in the Introduction, where he makes ſeveral remarks on Monſieur de Fontenelle's *Geometrie de L'infini*. See the article EXTENSION.

MAGNOLIA, in botany, the name of a very beautiful genus of plants, the characters of which are theſe: The perianthium is compoſed of three oval and hollow leaves, which look like petals, and fall with the flower. The flower conſiſts of nine petals of an oblong form, hollowed, narrow at the baſe, and broader at the apex, and terminating in an obtuſe point. The ſtamina are very numerous, ſhort, and pointed filaments; they grow to the common receptacle of the piſtil, which is placed beneath the germen, and are of a compreſſed figure. The antheræ are oblong and ſlender, and grow on every ſide to the filaments; the germina are numerous, of an oval oblong figure, and are placed about a clavated receptacle; the ſtyles are crooked and contorted; the ſtigmata are placed longitudinally on the ſtyles, and are hairy; the fruit is a ſtrobilus of an oval form, with compreſſed, roundiſh, and ſcarce imbricated capſules; theſe are compoſed of two valves, and contain one cell; they ſtand cloſe to one another without pedicles, and open in their outer part. The ſeeds are ſingle, and

hang by a thread from every ſcale or capſule of the fruit when that is ſo ripe as to burſt thoſe ſcales. *Linnæi* Gen. Plan. p. 254. *Dillen.* Hort. Elth. p. 168.

MAGNUM *Os Carpi*. This is the third bone of the ſecond row in the carpus, and is the largeſt of all the bones of that part. It is of a conſiderable length, and has a kind of articular round head, which is received into the cotyloide cavity formed by the two firſt bones of the firſt row; and this articulation is capable of a ſmall degree of flexion and extenſion. The digital ſide is a cartilaginous baſis unequally and obliquely triangular, the apex being turned inward. It is articulated with the ſecond metacarpal bone, and is alſo a little notched on the radial edge for its articulation with the ſmall edge of the metacarpal bone. The radial ſide is very ſmall, and near the baſis, being articulated with the os pyramidale; the reſt of this ſurface is without cartilage; the cubital ſide is double, anſwering to a like ſide in the os uniforme with which it is articulated. The outer ſurface, which forms a part of the outer ſurface of the carpus, is broad, rough, and uneven, for the inſertion of ligaments; the inner ſurface is likewiſe rough, but narrower; and round both ſurfaces are ſeveral depreſſions, which, while the bone is in the body, are filled with ſmall glands, ligaments, &c. *Winſlow*'s Anatomy, p. 84.

MAGODUS, among the Romans, a name given to thoſe players who ſometimes acted the part of men, and ſometimes of women. *Pitiſc.* Lex. Ant. in voc.

MAGOSTANS, in botany, the name by which Garcias calls the genus of plants, afterwards named by Linnæus *garcinia*. See the article GARCINIA.

MAGRA, a word uſed by ſome writers for a ſort of red earth, and by others for the cornelian, the red jaſper, or any other ſtone of a red colour.

MAGUDARIS, a name by which Dioſcorides calls the ſilphium. See SILPHIUM.

MAGYDARIS, in botany, a name uſed by Theophraſtus, and other of the old authors, for the laſerpitium or laſerwort. *Ger.* Emac. Ind. 2. See LASERPITIUM.

MAHALEB, in the materia medica, the name of the fruit of a ſort of wild cherry called *ceraſus ſylveſtris amara*, or the wild bitter cherry, by Bauhine. The wood of the tree is of a greyiſh caſt and fine grain, with a mixture of red in the veins, and is very firm, and of a ſweet ſmell; the leaves and flower carry a rude reſemblance of thoſe of the common cherry; the fruit is round, black, and reſembles a cherry, having the ſame ſort of ſtone in it, the kernel of which is like the bitter almond in taſte. It is commended in external applications, and the perfumers of France uſe it in their waſhballs. It is to be choſen freſh and ſweet, for it very often has an intolerable ſtinking ſmell, like that of bugs. *Lemery*'s Dict. of Drugs.

MAHOMET *Pigeon*, the common Engliſh name of a ſpecies of pigeon, called by Moore the *columba numidica alba*. It is of the ſame ſhape and ſize with the Barbary pigeon, and has all the characters of that ſpecies, but is always perfectly white, which gives the red circle about the eyes a more lively look. *Moore's* Columbarium, p. 51.

MAJA, in zoology, the name of a bird deſcribed by Nieremberg as very common in the iſland of Cuba, and frequenting the fields of rice in large flocks. It is deſcribed to be a ſmall bird of a yelloviſh colour, very delicate, and well taſted, and remarkable for having a ſtomach on the back or outſide of the neck. *Ray*'s Ornithol. p. 297.

MAIAGUE, in zoology, the name of a Braſilian bird of the web-footed kind, but having its hinder toe looſe. It is of the ſize of the common gooſe; its head is large and round; its neck long, and it always carries it crooked like the ſwan; its beak is ſtrong and hooked at the end; it is all over of a browniſh black in colour, except that its throat is yellow. It is found about the mouths of rivers, and feeds on fiſh; it builds on the ground; it is very nimble both in running, flying, and diving, and is not eaſily taken, but is a very well-taſted fowl. *Marggrave*'s Hiſt. Braſil.

MAIDEN (*Cycl.*)—MAIDEN *Aſſizes*, aſſizes where no perſon is condemned to die, are thus called.

MAIDEN-*hair*, *Adiantum*, in medicine. See the article ADIANTUM.

MAIDEN-*rents*, in our old writers, a noble paid by the tenants of ſome manors on their marriage. This was ſaid to be given to the lord, for his omitting the cuſtom of marcheta, whereby he was to have the firſt night's lodging with his tenant's wife, but it ſeems more probably to have been a fine for a licence to marry a daughter. *Blount*.

MAILE, in our old writers, a ſmall kind of money. Silver half-pence were likewiſe termed *Mailes*, 9 Hen. 5. By indenture in the mint, a pound weight of old ſterling ſilver was to be coined into three hundred and ſixty ſterlings, or pennies, or ſeven hundred and twenty *Mailes*, or half-pennies, or one thouſand four hundred and forty farthings. *Lownd*'s Eſſ. on Coins, p. 38. *Blount*.

MAIN, (*Cycl.*) a term applied to ſeveral parts of a ſhip, as the *Main-capſtan*, *Main-maſt*, *Main-top-maſt*, *Main-ſail*, &c. and ſignifying the chief or largeſt of the kind. See the articles CAPSTAN, MAST, SAIL, &c.

MAIN-*body of an army*, is the body of troops that marches between the advance and the rear guard. In a camp it is that part of an army which is encamped betwixt the right and left wing.

MAINIS, in ichthyology, a name uſed by Ariſtotle, Athæneus, and others of the old Greek writers, for the fiſh now called the *mena menerela*, and *menola*. It is a ſpecies of the ſparus, and is diſtinguiſhed from all the other ſpecies of that genus, by having four large teeth, and a variegated body, ornamented with a black ſpot in the middle of the ſides. This is the fiſh the Narbons call *jaſcele*. See the article SPARUS.

MAINPERNABLE, in law, is applied to one that is bailable, or who may be let to bail. *Terms of law*, *Blount*. See the article BAIL, *Cycl.*

MAINTAINERS, are thoſe that maintain or ſecond a cauſe depending between others, by diſburſing money, or making friends for either party, &c. not being intereſted in the ſuit; or attornies employed therein. Stat. 19 Hen. 7. c. 14. *Blount*. See the article MAINTENANCE, *Cycl.*

MAJOR (*Cycl.*)—MAJOR *Helicis*, in anatomy, a name given by Albinus to one of the muſcles of the eye, called by Santorini and others, *helicis muſculus*. This author diſtinguiſhes it under the name *Major*, from another muſcle which he calls the *minor helicis*, and which Santorini calls only *fibræ muſculares in plana helicis facie*, tho' it be a true and proper muſcle.

MAJORANA, *Marjoram*, in botany, the name of a genus of plants, the characters of which are theſe: The flowers and ſeeds are wholly like thoſe of origanum, but the heads are rounder, more denſe, compact, and ſhort, and compoſed of four orders of leaves, placed regularly in the manner of ſcales. *Tourn.* Inſt. p. 199.

The ſpecies of *Marjoram*, enumerated by Mr. Tournefort, are theſe: 1. The common ſweet *Marjoram*. 2. The broad-leaved golden *Marjoram*. 3. The round-leaved hairy *Marjoram*, with the ſmell of ſavory. 4. The round-leaved ſentellated *Marjoram*. And 5. The narrow-leaved woody *Marjoram*.

Marjoram is an attenuant, diſſolvent, and detergent. It is good in nervous caſes, and diſorders of the breaſt and lungs. Its flowery tops, dried and powdered, and given a ſcruple for a doſe, are greatly recommended in epileptic caſes. The dried plant is only kept in the ſhops.

The common ſweet *Marjoram*, though a plant ſo commonly cultivated with us, never ripens its ſeeds in England: And, as it is an annual plant, we are obliged yearly to have a ſupply of its ſeeds from Marſeilles, and other places in the ſouth of France, where it grows wild in great abundance.

It is to be ſown in the latter end of March, or beginning of April, on a dry warm ſpot; and when they are come up, they muſt be carefully watered and cleared from weeds. In June the plants will be grown pretty ſtrong, at which time ſome beds of rich light earth ſhould be prepared, to tranſplant ſuch into as ſtand too thick. Theſe muſt be planted at four inches diſtance, and the others left in the ſame manner. Theſe are to be watered till they have taken root; and it is always found that thoſe which have been tranſplanted produce finer and larger knots of heads, than thoſe which remain where they were ſown. They flower toward the latter end of July, at which time they are to be pulled up, and dried in a ſhady place for uſe. *Miller*'s Gardener's Dict.

MAIZ. The Indians in New England, and many of our other ſettlements in America, had no other vegetable but *Maiz*, or Indian corn, for the making their bread of. They call it *weachin*; and where our colonies are at this time numerous, there is yet much of the bread of the country made of this grain, not of the European corn.

The ear of the *Maiz* yields a much greater quantity of grain than any of our corn ears. There are commonly about eight rows of grains in the ear, often more if the ground be good. Each of theſe rows contains at leaſt thirty grains, and each of theſe gives much more flour than a grain of any of our corn. The grains are uſually either white or yelloviſh, but ſometimes they are red, bluiſh, greeniſh, or olive-colour'd, and ſometimes ſtriped and variegated.

This ſort of grain, though ſo eſſentially neceſſary to the natives of the place, is yet liable to many accidents. It does not ripen till the end of September; ſo that the rains often fall heavy upon it while on the ſtalk, and the birds, in general, peck it, while it is ſoft and unripe. Nature has, to defend it from theſe accidents, covered it with a thick huſk, which keeps off ſlight rains very well; but the birds, if not frighted away, often eat thro' it, and devour great quantity of the grain.

There ſeem to be three or four diſtinct ſpecies of *Maiz*, in different parts of America. That of Virginia is very tall and robuſt, growing to ſeven or eight foot high; that of New England is ſhorter and lower. And the Indians, further up in the country, have a yet ſmaller kind in common uſe. The ſtalk of the *Maiz* is jointed like the ſugar cane; it is very ſoft and juicy, and the juice is ſo ſweet and ſaccharine, that a ſyrup, as ſweet as that of ſugar, has been often made of it; and things ſweetened with it have been found not diſtinguiſhable from thoſe done with ſugar. It has not been tried yet whether it will cryſtallize into ſugar; but in all probability it will.

The Americans plant this corn any time from the beginning of March to the beginning of June; but the beſt ſeaſon is the middle of April. The ſavage Indians, who knew nothing of our account of months, uſed to guide themſelves in the ſeed-time of this uſeful plant, by the budding of ſome particular trees of that country, and by the coming up of a fort of fiſh into their rivers, which they call the *aloofe*. Theſe things were both ſo regular, that they were in no danger of miſtaking the time. Phil. Tranſ. N°. 142.

The manner of planting *Maiz* is in rows, at equal diſtances, every way abont five or ſix feet. They open the earth with a hoe, taking away the ſurface to five or ſix inches deep, and of the breadth of the hoe; they then throw in a little of the finer earth, ſo as to leave the hole four inches deep, or thereabouts, and in each of theſe holes they place four or five grains at a little diſtance from one another. If two or three of theſe grow up, it is very well; ſome of them are uſually deſtroyed either by the birds or other animals.

When the young plants appear, they hoe up the weeds from time to time; and when the ſtalk gathers ſome ſtrength, they raiſe the earth a little about it, and continue this at every hoeing, till it begins to put forth the ears; then they enlarge the hill of earth, round the root, to the ſize of a hop-hill, and after this they leave it till the time of harveſt without any farther care.

When they gather the ears, they either immediately ſtrip off the corn, or elſe hang up the ears, tied in traces at diſtances from one another; for if they are laid near together, they will heat and rot, or elſe ſprout and grow; but kept cool and ſeparate, they will remain good all the winter. The beſt method of all others, is to threſh out the corn as ſoon as the harveſt is over, and then lay it up in holes of the ground, well lined with mats, graſs, or the like, and afterwards covered at top with more earth. The moſt careful among the Indians uſe this method, and this ſort of ſubterranean granary always proves good. Id. Ibid. See the article TRACING.

The uſes of this plant among the Indians are very many. The great article is the making their bread of it; but beſides this, the ſtalks, when cut up before they are too much dried, are an excellent winter food for cattle; but they uſually leave them on the ground for the cattle to feed on. The huſks about the ear are uſually ſeparated from the reſt, and make a particular ſort of fodder, not inferior to our hay. The Indian women have a way of ſlitting them into narrow parts, and they then weave them artificially into baſkets and many other toys.

The original way of eating the grain, among the Indians, was this: They boiled it whole in water till it ſwelled and became tender, and then they fed on it either alone, or eat it with their fiſh and veniſon, inſtead of bread. After this, they found the way of boiling it into a ſort of pudding, after bruiſing it in a mortar; but the way of reducing it to flour is the beſt of all. They do this by parching it carefully in the fire, without burning, and then beating it in mortars, and ſifting it. This flour they lay up in bags, as their conſtant proviſion, and take it out with them when they go to war, eating it either dry or with water. Id. Ibid.

MAKINBOY, a name given by the people of Ireland to a kind of ſpurge, or tithymale, common there: This is a very violent purge, as all the other ſpurges are; but the Iriſh have an opinion, that it will produce this effect only by being carried in the pocket. This opinion, which had been univerſally believed for many ages, was proved to be falſe by Dr. Mullen, who carried a large quantity of it about him many days together, on purpoſe to give a fair trial; but it had not any the leaſt effect on him.

MAKING *Up*, a term uſed by the diſtillers to expreſs the bringing ſpirits to a certain ſtandard of ſtrength by the addition of water. See LOWERING.

It is uſed principally in the diſtilling ſpirits, after their firſt drawing, either by way of rectifying them, or of giving them the virtues of aromatic ingredients, in order to make the compound waters; ſuch as cinnamon, anniſeed, and the like. See DISTILLERY.

In the making theſe compounds, ſome uſe an alcohol, or totally inflammable ſpirit, which is much the beſt method; others uſe ordinary proof ſpirit of malt, or melaſſes. If the latter be uſed, it is beſt not to put any water with it into the ſtill; but if the former, ſo much water is to be added as will reduce it to the proof ſtrength, which is juſt an equal quantity. When this is done, there ſhould be drawn off three fifths of the whole by diſtillation; and the far better way would be to keep this liquor in this very ſtate, which is juſt the ſtrength of the trois cinques brandy of the French: But as people require theſe waters to be kept for drinking, in ſuch a ſtate as not to exceed, at the utmoſt, the ſtrength of proof ſpirit, generally to fall much ſhort of it, it is neceſſary to reduce this three fifths, to the whole, or more than the whole quantity of the proof ſpirit put into the ſtill. The apothecaries, to this end, uſually let the ſtill continue to work without changing the receiver, till an equal quantity is produced to the ſpirit put in, or one fourth more; it being the uſual ſtandard in theſe waters, to have five quarts made from a gallon of the ſpirit. By the method of doing this, by letting the ſtill run, the faints are taken into the water, and give it a vapid and diſagreeable taſte. Inſtead of this the diſtiller, when he has drawn off his three fifths of the quantity of proof, makes up the whole to the deſtined quantity, by adding the two other fifths, or more than that, if requir'd, of common water, in which it is alſo cuſtomary to diſſolve ſome fine ſugar; and this gives a fullneſs in the mouth to the water, and makes it mellow, or looſe the fiery taſte of the ſtill much ſooner. If it be only made up to the ſtrength of proof, it will mellow much ſooner than if reduced one fifth below that ſtandard, as the oil is much more perfectly diſſolved in ſpirit of a ſtandard proof ſtrength, than in ſuch as is weaker. The water employed in the *making up*, ſhould be either ſoft and clear river water, or elſe ſpring water rendered ſoft by diſtillation, otherwiſe it is apt to turn the water thick, and precipitate a ſediment, eſpecially if the water be drawn lower than proof, or if the ſpirit, originally employed, partake of an alkaline nature from the ſalts uſed in its rectification, as is uſually the caſe in the malt ſpirits, the groſs oil of which requires to be ſeparated, by mixing ſalt of tartar or pot-aſh with it in the ſtill in the rectification.

When it is neceſſary to *make up* waters lower than proof, they are generally cloudy; but this may be remedied, and they may be fined down in a day or two with a ſmall quantity of alum, or with whites of eggs, or the jelly of iſinglaſs beat up to a froth, and mixed in the ſame manner as is uſually done in the refining of wines.

The ſugar, added to theſe cordial waters, has not only the advantages of mellowing and filling the mouth, but it unites the oil to the ſpirit in a manner that it could never be united in without it. *Shaw*'s Eſſay on Diſtillery.

MALA *Aurea*, in botany, a name by which ſome authors have called the *poma amoris*, or fruit of the lycoperſicon. *J. Bauhin.* vol. 3. p. 620.

MALABATHRUM, among the antients, an excellent ſweet-ſcented ointment. *Hofm.* Lex. in voc.

MALABATHRUM, *Indian Leaf*, in botany. See the article TAMALAPATRI.

MALACCA *Stones*, a name given by many authors to the pedro del porco, or hog bezoar. A ſtone found in the gall-bladder of the Indian boars, and ſuppoſed as a remedy for the plague, and many other diſeaſes. It is uſually kept in a gold box, and infuſed for a few minutes in any liquor, till it communicates a bitterneſs to it.

MALACHE, a term uſed by authors in a different ſenſe; ſometimes expreſſing ſuch medicines as gently looſen the belly, and ſometimes ſuch ointments as relax and mollify.

MALACHITES, or MOLOCHITES, in natural hiſtory, a ſpecies of jaſper, but of leſs beauty than moſt of thoſe of that claſs. It is naturally of a pure and deep green, but ſometimes variegated with whitiſh or blackiſh ſpots and clouds. It is found in the Eaſt and Weſt Indies; alſo in many parts of Europe. See JASPER.

Its amuletic virtues, formerly in great eſteem, are too ridiculous to be particularized. It is ſaid to be a violent purgative, operating both by vomit and ſtool, and as ſuch given in dropſies, in ſo ſmall a doſe as five or ſix grains. If, as is very probable, its green colour be owing to particles of copper, it is not wonderful that it ſhould have this effect; but there are ſo many better medicines for this purpoſe, as to ſuperſede its uſe. See COPPER.

MALACOCISSOS, in botany, a name uſed by ſome authors for the common ground ivy, or *hedera terreſtris*; and by ſome others for the marſh-marygold. *Ger.* Emac. Ind. 2.

MALACODERMATA, in natural hiſtory, a term uſed to expreſs ſuch animals as have only ſoft ſkins for their covering; in oppoſition to the oſtracodermata, which have hard ſhelly matters for their covering, ſuch as crabs, lobſters, *&c.*

MALACOIDES, in botany, the name of a genus of plants, the characters of which are, that they have the flower of the mallow-kind, but their fruit reſembles that of the common bramble, except that it is dry, not juicy. It conſiſts of a number of capſules, collected into a head, and fixed to a placenta, and containing ſeeds like thoſe of the mallow, or of a kidney-like form.

The ſpecies of *Malacoides* are only two. 1. The betony-leav'd kind. 2. The ſmall-flowered *Malacoides*, with an angular leaf. *Tourn.* Inſt. p. 98.

MALACOPTERYGII, in the Linæan ſyſtem of zoology, the name of a large order of fiſhes which have not prickly fins.

The term is derived from the Greek μαλάκος, ſoft, and πτερυγίον, a fin. The fiſh of this order, are thoſe which have bony fins, with all their extremities not pointed or ſharp, but ſoft and harmleſs. Of this order are the carp, *&c.* *Linnæi* Syſtema Naturæ, p. 55.

MALACOSTOMOUS, in ichthyography, the name of a large genus of fiſhes, called in Engliſh the leather-mouth'd kind. Theſe fiſhes are wholly deſtitute of teeth in their jaws, but have them placed in their throats, near the orifice of the ſtomach. *Ray*'s Ichthyography, p. 245.

The word is derived from the Greek μαλακὸς, ſoft, and στόμα, a mouth. All the fiſh of this genus have their ſwimming, or air-bladder, divided into two parts; and of this genus are the carp, tench, bream, chub, and the like. *Ray*, Ichthyogr. p. 245.

MALA-

MALACOSTRACA, in natural hiſtory, a term uſed by ſome, as Ariſtotle, to diſtinguiſh what we call cruſtaceous animals of the ſea, &c. from thoſe which he calls oſtracodermata, or teſtaceous, as we expreſs it. See table of teſtaceous and cruſtaceous animals.

Ariſtotle ſays, that cruſtaceous animals, or *Malacoſtraca*, are ſoft within, and hard without; but that though their covering is not apt to be parted by contuſions, yet the one part of it may eaſily be torn from the other; and the teſtaceous animals, or oſtracodermata, are ſoft within, and hard without; and their covering may be bruiſed or broken to pieces, though its parts are not liable to be torn from each other. Theſe definitions have been uſually acquieſced in, but being in reality inſufficient for the diſtinctions they are intended to make, they have been the origin of great confuſion and error. The conſequences which Ariſtotle puts into his definition or characteriſtics, neceſſarily ariſe from doctrines founded on facts; for when the ſhell is but one, as is the caſe in all the teſtaceous kind, it may be bruiſed, or it may be broken, according as it is more or leſs brittle, but it cannot be torn aſunder; whereas in the whole cruſtaceous kind, the coverings which are over every ſeveral part, as the legs, back, belly, and tail in lobſters, are joined to each other only by membranes, which though tough may be torn aſunder, though the body of the cruſt in any part is too firm to be ſo torn. The naturaliſts of late ages have been much diſtreſſed about a place for the *echini marini*, or ſea urchins, in their cabinets and books, ſome calling them teſtaceous, and others cruſtaceous animals.

It is very evident, however, according to Ariſtotle's diſtinctions, that the echini are of the claſs of theſe malacoſtraca, or cruſtaceous animals, for they move upon their ſpines, which demonſtrates that their covering is moved by parts, and ſo put together, that it may be torn aſunder, as the legs of a lobſter may from the body; and indeed every ſpine is riveted into its proper cruſt, which alſo by conſequence muſt have its peculiar muſcle which guides the motion of the ſpine, by means of which the animal moves itſelf about any way that it pleaſes; it being peculiar to theſe animals, that they move by rolling about upon their ſpines, not by walking upon them, as the other animals do on their legs, the purpoſes of which theſe ſpines ſeem formed by nature to anſwer. Phil. Tranſ. N° 219. p. 195.

It is evident alſo, even to ocular inſpection, that all the cruſts of the echini are united by membranes, as they are in the crabs and lobſters. Aguſtino Scilla has accurately figured the internal parts of ſeveral ſpecies of theſe animals in his book of petrifactions, and theſe draughts of his put the matter out of all doubt, as they exactly agree with nature, and are of the nature of the joinings of the lobſter kind. The fiſh of the echinus kind are by theſe proved to be cruſtaceous animals in the ſtricteſt ſenſe of the term.

MALAGMA, a word uſed by ſome authors to expreſs a cataplaſm in general, of whatever nature, or made of whatever ingredients; but ſome have uſed it only for the emollient cataplaſms.

Galen never uſes it in any ſenſe but the laſt; it was a form of medicine meant only for external uſe, and was not very different in its conſiſtence from a plaſter. It ſeems to have conſiſted only of emollient ingredients at firſt, but afterwards to have been compoſed of aſtringents, or of medicines of any other kind, whoſe virtues could be conveyed under that form; gums, aromatics, ſalts, and other ſtimulating ingredients, often made a part of the compoſition; and ſometimes a ſmall quantity of oil, lard, or wax, entered the maſs; very often the malagma's conſiſted only of gums diſſolved in wine or vinegar, and ſometimes only of reſins, which naturally hardened of themſelves after being reduced to powder, and mixed with wine and vinegar to a proper conſiſtence for applying to the part.

MALANKUA, in the materia medica, the name by which ſome authors have called the plant whoſe root is the round zedoary.

Many indeed eſteem the long and round zedoary the roots of different plants, but they ſeem rather to be only the different parts of the roots of the ſame ſpecies. Hort. Mal. 11, 17. *Dale*'s Pharmac. p. 251.

MALARMAT, in ichthyology, a name given by authors to the fiſh called by ſome *lyra atera* and *cornuta*. It is a ſpecies of the trigla, and is diſtinguiſhed by Artedi by the name of the trigla, with many cirri, and with an octogonal body.

MALARUM *Oſſa*, in anatomy, are the cheek bones; they make the prominent upper part of the cheeks moſt remarkable in lean perſons: They form likewiſe a portion of the orbit, and compleat the zygomatic arches. They have their name from the Latin *mala*, the cheek; they are two in number, and are ſituated in the lateral and middle parts of the face. They are, in ſome meaſure, triangular or irregularly ſquare, and are divided into two ſides, the external gently convex, the internal unequally concave.

The eminences in each bone are the ſuperior or angular orbitary apophyſis, which joins by ſuture with the external angular apophyſis of the os frontis, and aſſiſts in forming the external angle of the orbit: from this apophyſis another ſubaltern proceſs runs inward on the inſide of the bone, one ſide of which forms a portion of the orbit, the other a portion of the zygomatic foſſa: The inferior or maxillary orbitary apophyſis, which with the angular apophyſis forms the inferior external portion of the orbit: The apophyſis malaris, which is in ſome meaſure the baſis of the reſt, and together with the apophyſis maxillaris, joins the orbitary apophyſis of the os maxillare, and the zygomatic apophyſis, which makes a part of the zygoma, and alſo of the zygomatic foſſa.

The cavities are the great orbitary ſlope, which makes the inferior external portion of the edge of the orbit; the zygomatic notch above the zygoma, and one or more little holes on the outſide, and in the orbitary apophyſis. Each bone is compoſed of two pretty compact tables, with a ſmall quantity of diploe between them, except in the anterior part of the apophyſis malaris. The os malæ on each ſide is joined to the os frontis by the angular apophyſis; to the os ſphœnoides by the ſubaltern apophyſis; to the os temporis by the zygomatic apophyſis; and to the os maxillare by its baſis. *Winſlow*'s Anatomy, p. 34.

MALKARABÆLA, in zoology, the name of an Eaſt Indian ſpecies of ſerpent found in the iſland of Ceylon. It is remarkably variegated with white and duſky-brown, in various figures. *Ray*'s Syn. Anim. p. 332.

MALL, or *Sea*-MALL, in zoology, the Engliſh name of a bird of the gull or larus kind, and diſtinguiſhed by authors by the name of *larus cinereus minor*. It is very like the *larus cinereus major*, or herring gull, but much ſmaller, not weighing above a pound. Its head and neck are grey, with ſome brown ſpots; the lower part of the neck is white, the back is grey, and the breaſt and belly white as ſnow; the tail is alſo perfectly white, and is not forked. *Ray*'s Ornitholog. p. 263.

MALLEOLUS, in ichthyology, a name given by Gaza and ſome others, to the fiſh called by Ariſtotle and the other old writers, *ſphyræna*, and by the Italians *luzzo marino*.

It is a beautiful fiſh, and ſeems to belong to the ſcombri, or mackrel kind. Salvian has figured it under the name of *ſudis*, a name by which it is alſo called by Varro and ſome other old authors, but Salvian's figure is very imperfect; he has omitted the back fin.

MALLEOLI, among the Romans, bundles of any combuſtible matter beſmeared with pitch, and uſed by the Roman ſoldiers either for giving light in the night-time, or for ſetting fire to ſome of the enemies works.

The *Malleoli* were ſometimes fixed to a dart or javelin, that they might be ſure to catch firm hold, and communicate the fire wherever they happened to light. *Pitiſc.* in voc.

MALLEUM *Movens*, in anatomy, a name given by Fabricius to one of the muſcles of the ear, called by Cowper the *internus auris*, and by Albinus, who had conſidered its proper uſe, *tenſor tympani*. See TENSOR.

MALLEUS (*Cycl.*)—The *malleus*, or hammer of the ear, is a long bone with a large head, a ſmall neck, a handle, and two apophyſes, the one in the neck, the other in the handle. The top of the head is conſiderably rounded, and from thence it contracts all the way to the neck; both head and neck are in an inclined ſituation, and the eminences and cavities in it anſwer to thoſe in the body of the incus. The handle is looked on by ſome as one of the apophyſes of the *Malleus*, and in that caſe it is the greateſt of the three. It forms an angle with the neck and head, near which it is ſomething broad and flat, and decreaſes gradually toward its extremity. The apophyſis of the handle, termed by others the ſmall or ſhort apophyſis of the *Malleus*, terminates the angle already mentioned, being extended toward the neck, and lying in a ſtrait line with that ſide or border of the handle which lies next it. The apophyſis of the neck, called alſo the apophyſis gracilis, is in a natural ſtate very long, but ſo ſlender withal, that it is very eaſily broken, eſpecially when dry, which is the reaſon why the true length of it was for a long time unknown. It ariſes from the neck, and ſometimes appears much longer than it really is, by the addition of a ſmall dried tendon ſticking to it. When the *Malleus* is in its true ſituation, the head and neck are turned upwards and inwards, the handle downwards, parallel to the long leg of the incus, but more forward; the apophyſis of the handle upwards and outward, near the ſuperior portion of the edge of the tympanum, near the center of which is the extremity of the handle; and the apophyſis gracilis forward, reaching all the way to the articular fiſſure in the os temporis. By the knowledge of this, the *Malleus* of the right ear may be known from that of the left when out of their places. *Winſlow*'s Anat. p. 49.

MALLOW, in botany. See the article MALVA.

MALMIGNATTO, in natural hiſtory, a name given by the inhabitants of the iſland of Corſica to a ſpecies of animal, or large inſect, called by ſome *tarantula*, and ignorantly ſuppoſed to be the ſame with the tarantula of Apulia. This iſland produces neither wolves, ſerpents, nor many other of the miſchievous and deſtructive animals which infeſt the neighbouring countries, but it produces two ſpecies of this venomous inſect, called the *Malmignatto*; the one of theſe has a round body, and the other an oblong one, reſembling that of our large kind of ant; it has alſo ſix legs, not eight, and never makes any web. From all which it appears not to be a ſpider, but

but truly of the ant kind, though a monſtrous ſized one, and very venomous. The round bodied kind, by its bite, occaſions violent pains, a ſenſation of coldneſs, and cramps all over the body; and the long-bodied one is yet more venomous. Its ſting occaſions an immediate lividneſs of the fleſh, with intolerable cramps and convulſions over the whole body; ſometimes the natural evacuations by ſtool and urine are alſo wholly ſtopped by it. The cure in both caſes, is to be attempted by cutting and cauterizing the wound, and dreſſing it with Venice treacle, as alſo by giving the ſame in large doſes diſſolved in wine. *Boccone*, Muſ. de Fiſ.

MALOGRANATUM, the *Pomgranate*, in botany. See the article POMGRANATE.

MALPIGHIA, in botany, the name of a genus of plants deſcribed by Plumier and Linnæus, the characters of which are theſe: The perianthium is ſmall, hollow, and permanent, and is compoſed of one leaf divided into five ſegments, in the ſinus of each of which there is placed a melliferous glandule. The flower is compoſed of five very large petals, which ſtand hollow, and are of a kidney-like ſhape, with long and ſtrait ungues. The ſtamina are ten broad and erect filaments which grow into a ſort of cylinder. The antheræ are ſimple, the germen of the piſtil is roundiſh and ſmall, the ſtyles are three, they are erect, ſhort, and crowned with obtuſe ſtigmata; the fruit is a large globoſe berry, having one cell, in which are contained three oblong, obtuſe, and hard ſtones, each of which contains an oblong and obtuſe kernel. *Plumier*, Rar. Plant. Hiſt. p. 36. *Linnæi* Gen. Plant. p. 194.

MALPOLON, in zoology, the name of a ſpecies of ſerpent found in the iſland of Ceylon, and very beautifully variegated with red marks in the form of ſtars. *Ray*'s Syn. Anim. p. 332.

MALT (*Cycl.*)—Almoſt every malſter has his ſecret in the making *Malt*, but there are ſome neceſſary cautions to be obſerved by all, which will enſure ſucceſs in the work; theſe are, 1. That the barley be newly thraſhed, or at leaſt newly winnowed. 2. That the whole be of one kind, not mixed up of ſeveral ſorts. 3. That it be not over-ſteeped in the ciſtern, or ſo long as to make it ſoft. 4. That it be well drained. 5. That it be carefully looked after in the wet couch, ſo as to ſtop the firſt tendency of the blade to ſhooting. 6. To turn the wet couch inſide outermoſt, if the barley comes, that is, ſhoots more in the middle than on the ſides. 7. To keep it duly turning after it is out of the wet couch. 8. To give it the proper heating in the dry heap. 9. To dry and criſp it thoroughly on the kiln, but without a fierce fire, ſo as to be ſeveral days in drying a kiln of pale *Malt*. *Shaw*'s lectures, p. 187.

Good *Malt* may be made of the grain of the maiz or Indian corn, but then a particular method muſt be taken for the doing it. Our barley *Malt*-makers have tried all their ſkill to make good *Malt* of it in the ordinary way, but to no purpoſe; that is, the whole grain will not this way be malted or rendered tender or floury, as in other *Malt*; for it is found, by experience, that this corn, before it be fully malted, muſt ſprout out both ways, that is both root and blade, to a conſiderable length, that of a finger at leaſt, and if more the better. For this purpoſe it muſt be laid in a heap a convenient time; and in this proceſs, if it be of a ſufficient thickneſs for coming, it will quickly heat and grow mouldy, and the tender ſprouts will be ſo entangled, that the leaſt moving of the heap will break them off; and the farther maturation of the grain into *Malt*, will be hindered by this means; and on the other hand, if it be laid thin, and often ſtirred and opened to prevent too much heating, thoſe ſprouts which have begun to ſhoot ceaſe growing, and conſequently the corn again ceaſes to be promoted to the mellowneſs of *Malt*. Phil. Tranſ. N° 142.

To avoid all theſe difficulties, the following method is to be uſed: Take away the top of the earth in a garden or field, two or three inches, throwing it up half one way, and half the other; then lay the corn for *Malt* all over the ground ſo as to cover it; the earth that was pared off is now to be laid on again, and nothing more is to be done till the field is all over covered with the green ſhoots of the plant. The earth is then to be taken off, and the roots of the grain will be found ſo entangled together, that they will come up in large cakes or parcels; it muſt be gently waſhed in order to take off all the dirt, and then dried on a kiln, or on a clean floor expoſed to the ſun. Every grain of the maiz will be thus tranſmuted into good *Malt*, and the beer brewed with it will be very pleaſant and very wholeſome, and of an agreeable brown colour, but very clear.

It may be worth trying whether the ſame proceſs is not with due care applicable to the malting of turneps, potatoes, carrots, parſneps, and the like. It might poſſibly be of ſervice alſo to attempt this leſs laborious way of making *Malt* of barley and other ſmall grains; the diſadvantages would be the not ſo eaſily ſeparating the dirt from the grain as in that larger kind; and as barley requires the root only, not the ear, to ſhoot in order to the making of *Malt*, it would be ſome difficulty to know the exact time of taking it up; but with all theſe diſadvantages the method is worth a trial.

MALT *Diſtillery*. This is an extenſive article of trade, and by which very large fortunes are made. The art is to convert fermented *Malt* liquors into a clear inflammable ſpirit, which may either be ſold for uſe in the common ſtate of a proof ſtrength, that is, the ſame ſtrength with French brandy; or is rectified into that purer ſpirit uſually ſold under the name of ſpirit of wine; or made into compound cordial waters, by being diſtilled again from herbs and other ingredients. See the articles BREWING and WASH.

To brew with *Malt* in the moſt advantageous manner, it is neceſſary, 1. That the ſubject be well prepared. 2. That the water be ſuitable and duly applied; and, 3. That ſome certain additions be uſed, or alterations made, according to the ſeaſon of the year, and the intention of the operator; and by a proper regulation in theſe reſpects, all the fermentable parts of the ſubject will thus be brought into the tincture, and become fit for fermentation.

The due preparation of the ſubject conſiſts in its being juſtly *malted* and well ground. When the grain is not ſufficiently *malted* it is apt to prove hard, ſo that the water can have but very little power to diſſolve its ſubſtance; and if it be too much *malted*, a part of the fermentable matter is loſt in that operation. The harder and more flinty the *Malt* is, the finer it ought to be ground; and in all caſes, when intended for diſtillation, it is adviſeable to reduce it to a kind of finer or coarſer meal. When the *Malt* is thus ground, it is found by experience, that great part of the time, trouble, and expence of the brewing is ſaved by it, and yet as large a quantity of ſpirit will be produced; for thus the whole ſubſtance of the *Malt* may remain mixed among the tincture, and be fermented and diſtilled among it. This is a particular that very well deſerves the attention of the *Malt* diſtiller, as that trade is at preſent carried on; for the diſpatch of the buſineſs, and the quantity of ſpirit procured, is more attended to, than the purity or perfection of it.

The ſecret of this matter depends upon the thoroughly mixing, or briſkly agitating and throwing the *Meal* about, firſt in cold, and then in hot water; and repeating this agitation after the fermentation is over, when the thick turbid waſh being immediately committed to the ſtill, already hot and dewy with working, there is no danger of burning, unleſs by accident, even without the farther trouble of ſtirring, which in this caſe is found needleſs, though the quantity be ever ſo large, provided that requiſite care and cleanlineſs be uſed: And thus the buſineſs of brewing and fermenting may very commodiouſly be performed together, or reduced to one ſingle operation. *Shaw*'s Eſſay on Diſtillery.

Whatever water is made choice of, it muſt ſtand in a hot ſtate upon the prepared *Malt*, eſpecially if a clear tincture be deſired, but a known and very conſiderable inconvenience attends its being applied too hot, or too near to a ſtate of boiling, or even ſcalding with regard to the hand. To ſave time in this caſe, and to prevent the *Malt* running into lumps and clods, the beſt way is to put a certain meaſured quantity of cold water to the *Malt* firſt; the *Malt* is then to be ſtirred very well with this, ſo as to form a ſort of thin uniform paſte or pudding; after which the remaining quantity of water required may be added in a ſtate of boiling, without the leaſt danger of making what, in the diſtillers language, is called a pudden.

In this manner the due and neceſſary degree of heat in the water, for the extracting all the virtues of the *Malt*, may be hit upon very expeditiouſly, and with a great deal of exactneſs, as the heat of boiling water is a fixed ſtandard which may be let down to any degree by a proportionate mixture of cold water, due allowances being made for the ſeaſon of the year, and for the temperature of the air.

This little obvious improvement, added to the method juſt above hinted for the reducing brewing and fermentation to one operation, will render it practicable to very conſiderable advantage, and the ſpirit improved in quality as well as quantity.

A much more profitable method than that uſually practiſed for the fermenting *Malt* for diſtillation, in order to get its ſpirit, is the following: Take ten pound of *Malt* reduced to a fine meal, and three pounds of common wheat meal: Add to theſe two gallons of cold water, and ſtir them well together, then add five gallons of water boiling hot, and ſtir all together again. Let the whole ſtand two hours, and then ſtir it again, and when grown cold, add to it two ounces of ſolid yeaſt, and ſet it by looſely covered in a warmiſh place to ferment.

This is the Dutch method of preparing what they call the waſh for *Malt* ſpirit, whereby they ſave much trouble and procure a large quantity of ſpirit. Thus commodiouſly reducing the two buſineſſes of brewing and fermenting to one ſingle operation. In England the method is to draw and maſh for ſpirit as they ordinarily do for beer, only inſtead of boiling the wort, they pump it into large coolers, and afterwards run it into their fermenting backs, to be there fermented with yeaſt. Thus they beſtow twice as much labour as is neceſſary, and loſe a large quantity of their ſpirit by leaving the groſs bottoms out of the ſtill for fear of burning. *Shaw*'s Lectures, p. 216.

All ſimple ſpirits may be conſidered in the three different ſtates of low-wines, proof ſpirit, and alcohol, the intermediate degrees of ſtrength being of leſs general uſe; and they are to be judged of only according as they approach to, or recede from theſe. Low-wines, at a medium, contain a ſixth part of pure inflammable ſpirit, five times as much water as ſpirit neceſſarily ariſing in the operation with a boiling heat. Proof goods contain about one half of the ſame totally inflammable ſpirit; and alkohol entirely conſiſts of it.

Malt low-wines, prepared in the common way, are exceeding nauſeous; they have, however, a natural vinoſity, or pungent agreeable acidity, which would render the ſpirit agreeable to the palate, were it not for the large quantity of the groſs oil of the *Malt* that abounds in it. When this oil is detained in ſome meaſure from mixing itſelf among the low-wines, by the ſtretching a coarſe flannel over the neck of the ſtill, or at the orifice of the worm, the ſpirit becomes much purer in all reſpects; it is leſs fulſome to the taſte, leſs offenſive to the ſmell, and leſs milky to the eye. *Shaw*'s Eſſay on Diſtillery.

When theſe low-wines, in the rectification into proof ſpirits, are diſtilled gently, they leave a conſiderable quantity of this groſs fetid oil behind them in the ſtill along with the phlegm; but if the fire be made fierce, this oil is again raiſed and brought over with the ſpirit; and being now broken ſomewhat more fine, it impregnates it in a more nauſeous manner than at firſt. This is the common fault of the *Malt* diſtiller and of the rectifier both; the latter, inſtead of ſeparating the ſpirit from this naſty oil, which is the principal intent of his proceſs, attends only to the leaving the phlegm in ſuch quantity behind, that the ſpirit may be of a due ſtrength as proof or marketable goods, and brings over the oil in a worſe ſtate than before. To this inattention to the proper buſineſs of the proceſs, it is owing, that the ſpirit, after its ſeveral rectifications, as they are miſcalled, often is found more ſtinking than when delivered out of the hands of the *Malt* diſtiller. All this may be prevented by the taking more time in the ſubſequent diſtillations, and keeping the fire low and regular, the ſudden ſtirring of the fire, and the haſty way of throwing on freſh fuel, being the general occaſions of throwing up the oil by ſpurts, where the fire in general, during the proceſs, has not been ſo large as to do that miſchief.

The uſe of a balneum mariæ, inſtead of the common ſtill, would effectually prevent all this miſchief, and give a purer ſpirit in one rectification, than can otherwiſe be procured in ten, or indeed according to the common methods at all.

Malt low-wine, when brought to the ſtandard of proof ſpirit, loſes its milky colour, and is perfectly clear and bright, no more oil being contained in it than is perfectly diſſolved by the alcohol, and rendered miſcible with that proportion of phlegm, which is about one half the liquor; its taſte alſo is cleaner, though not more pleaſant; there being leſs of the thick oil to hang on the tongue in its own form, which is not the caſe in the low-wines, where the oil being undiſſolved, adheres to the mouth in its own form, and does not paſs lightly over it.

When proof ſpirit of *Malt* is diſtilled over again, in order to be rectified into alcohol, or as we uſually call it, ſpirits of wine, if the fire be raiſed at the time when the faints begin to come off, a very conſiderable quantity of oil will be raiſed by it, and will run in the viſible form of oil from the noſe of the worm. This is not peculiar to *Malt* ſpirit, but the French brandy ſhews the ſame phænomenon, and that in ſo great a degree, that half an ounce of this oil may be obtained from a ſingle piece of brandy.

Malt ſpirit, more than any other kind, requires to be brought into the form of alcohol, before it can be uſed internally, eſpecially as it is now commonly made up in the proof ſtate, with as much of this nauſeous and viſcous oil as will give it a good crown of bubbles. For this reaſon it ought to be reduced to an alcohol, or totally inflammable ſpirit, before it is admitted into any of the medicinal compoſitions. If it be uſed without this previous caution, the odious taſte of the *Malt* oil will be diſtinguiſhed among all the other flavours of the ingredients.

Malt ſpirit, when it has once been reduced to the true form of an alcohol, is afterwards more fit for all the curious internal uſes than even French brandy, it being after this purification a more uniform, hungry, taſteleſs, and impregnable ſpirit, than any of the other ſpirits which we eſteem ſo much finer. *Shaw*'s Eſſay on Diſtillery.

A pure ſpirit being thus procured, ſhould be kept carefully in veſſels of glaſs or ſtone, well ſtopped to prevent the evaporation of any of its volatile part. If preſerved in caſks, it is apt to impregnate itſelf very ſtrongly with the wood. The quantity of pure alcohol obtainable from a certain quantity of *Malt*, differs according to the goodneſs of the ſubject, the manner of the operation, the ſeaſon of the year, and the ſkilfulneſs of the workman; according to which variations, a quarter of *Malt* will afford from eight or nine, to thirteen or fourteen gallons of alcohol. This ſhould encourage the *Malt* diſtiller to be careful and diligent in his buſineſs, as ſo very large a part of his profits depends wholly on the well conducting his proceſſes.

After every operation in this buſineſs, there remain a quantity of faints, which in their own coarſe ſtate ought never to be admitted into the pure ſpirit; theſe are to be ſaved together, and large quantities of them at once wrought into alcohol. It is eaſy to reduce theſe to ſuch a ſtate, that they will ſerve for lamp ſpirits. Their diſagreeable flavour being corrected by the adding of aromatics during the diſtillations, the reducing them into a perfect and pure alcohol is practicable, but not without ſuch difficulties as render it ſcarce worth the trader's while. One way of doing it is by diſtilling them from water into water, and that with a very ſlow fire. By this means a pure alcohol may be made out of the fouleſt faints.

The *Malt* diſtiller always gives his ſpirit a ſingle rectification *per ſe*, in order to purify it a little, and make it up proof, but in this ſtate it is not reckoned fit for internal uſes, but ſerves to be diſtilled into geneva and other ordinary compound ſtrong waters for the vulgar.

The Dutch, who carry on a great trade with *Malt ſpirit*, never give it any farther rectification than this, and it is therefore that the *Malt ſpirit* of England is in general ſo much more in eſteem. The Dutch method is only to diſtil the waſh into low-wines, and then to full proof ſpirit; they then directly make it into Geneva, or elſe ſend it as it is to Germany, Guinea, and the Eaſt-Indies, for the Dutch have little notion of our rectification. Their ſpirit is by this means rendered very foul and coarſe, and is rendered yet more nauſeous by the immoderate uſe they make of rye meal. *Malt* ſpirit, in its unrectified ſtate, is uſually found to have the common bubble proof, as the *Malt* diſtiller knows that it will not be marketable without it.

The whole matter requiſite to this is, that it have a conſiderable portion of the groſs oil of the *Malt* well broke and mixed along with it; this gives the rectifier a great deal of trouble if he will have the ſpirit fine; but in the general run of the buſineſs, the rectifier does not take out this oil, but breaks it finer, and mixes it faſter in by alkaline ſalts, and diſguiſes its taſte by the addition of certain flavouring ingredients. The ſpirit loſes in theſe proceſſes the vinoſity it had when it came out of the hands of the *Malt* diſtiller, and is in all reſpects worſe, except in the diſguiſe of a mixed flavour. *Shaw*'s Eſſay on Diſtillery.

The alkaline ſalts uſed by the rectifier, deſtroying the natural vinoſity of the ſpirit, it is neceſſary to add an extraneous acid in order to give it a new one. The acid they generally uſe is the *ſpiritus nitri dulcis*; and the common way of uſing it is the mixing it to the taſte with the rectified ſpirit: this gives our *Malt* ſpirit, when well rectified, a flavour ſomewhat like that of French brandy, but this ſoon flies off; and the better method is to add a proper quantity of Glauber's ſtrong ſpirit of nitre to the ſpirit in the ſtill. The liquor in this caſe comes over impregnated with it, and the acid being more intimately mixed, the flavour is retained. See the article SPIRITUS *nitri dulcis*.

MALT-*worm*, in the manege. See the article CREPANCE.

MALTA *Earth*. See the article MELITENSIS *terra*.

MALTHA, the name of a voracious fiſh of the ſhark kind, called the *ſorrat*, and the *lamiola* by ſome authors, a diminutive of *lamia*, ſignifying a ſmall ſhark. Its teeth are broad and pointed as thoſe of the ſhark; the fiſh has alſo many rows of theſe; the noſe is ſhort, and its fleſh lax and ſoft. *Willughby*'s Hiſt. Piſc. p. 50.

MALTHOCODE, a term by which the Greek writers expreſs'd the emollient topical remedies prepared with oil. Hippocrates expreſsly forbids the uſe of theſe in old ulcers.

MALVA, *mallow*, the name of a very large genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is very open at the mouth, and divided into ſeveral ſegments; from the bottom of the flower there ariſes a pyramidal tube, which is uſually loaded with ſtamina; and from the cup there ariſes a piſtil, which is fixed like a nail to the lower part of the flower, and alſo to the tube. This ripens into a flat orbicular fruit, though ſometimes pointed, uſually ſurrounded by the cup, and compoſed of a number of capſules, ſo placed round an axis, as that each of its ſtriæ receive their capſule as if in a kind of articulation. The ſeed contained in theſe is uſually of the ſhape of a kidney. This genus is alſo diſtinguiſhed from the alcea, or vervain *mallow*, by having its leaves leſs divided and cut in, and from the althæa, by having them leſs hoary. *Tourn.* Inſt. p. 94.

The ſpecies of *Mallow* enumerated by Mr. Tournefort, are theſe: 1. The roſe *Mallow*, or, as we call it, the hollyoak, with round leaves and pale-red flowers. 2. The white flowered roundiſh leaved roſe *Mallow*. 3. The deep red flowered round leaved roſe *Mallow*. 4. The ſhining purple flowered round leaved roſe *Mallow*. 5. The blackiſh red flowered round leaved roſe *Mallow*. 6. The violet coloured round leaved roſe *Mallow*. 7. The ſingle yellow flowered round leaved roſe *Mallow*. 8. The double flowered red round leaved roſe *Mallow*. 9. The double white flowered round leaved roſe *Mallow*. 10. The double fleſh-coloured round leaved roſe *Mallow*. 11. The double purple-flowered round leaved roſe *Mallow*. 12. The double black-flowered round leaved roſe *Mallow*. 13. The double yellow-flowered

round leaved roſe *Mallow*. And, 14. The pale yellow-flowered round leaved roſe *Mallow*, without ſtalk. Theſe are the ſpecies of what we call hollyoaks, and moſt of which we have in our gardens. The others are, 15. The Virginian maple-leaved *Mallow*, with ſmooth leaves. 16. The hairy Virginian maple-leaved *Mallow*. 17. The American *Mallow* of Caſpar Bauhine. 18. The hairy ſhrubby American *Mallow*, with cluſtered yellow flowers. 19. The curled-leaved *Mallow*. 20. The cut-leaved large flowered *Mallow*. 21. The white-flowered wild *Mallow*, with ſinuated leaves. 22. The blue-flowered wild *Mallow*, with ſinuated leaves. 23. The purpliſh flowered wild *Mallow*, with ſinuated leaves. 24. The wild *Mallow*, with ſinuated leaves, and blue flowers ſtreaked with white. 25. The wild *Mallow*, with ſinuated leaves, and a very ſmall purple flower. 26. The large flowered wild *Mallow*, with a deep green leaf, rounded and much ſinuated. 27. The erect wild *Mallow*, with gloſſy leaves and large flowers. 28. The ſmall flowered rounder leaved wild *Mallow*. 29. The round leaved variegated wild *Mallow*. 30. The ſtellated *Mallow*, with various leaves. 31. The purple bottomed early *Mallow*, called by authors *malva trimeſtris*. 32. The ivy leaved *Mallow*. 33. The round leaved ſmooth Spaniſh *Mallow*, with large red flowers. 34. The round leaved Italian *Mallow*, with a large purple flower. 35. The annual white-flowered *Mallow*, with the flowers ſtanding in rundles. 36. The hairy *Mallow*, with a heart-faſhioned leaf. 37. The hairy annual *Mallow*, with angular leaves, reſembling thoſe of ivy. 38. The currant-leaved Portugal *Mallow*. 39. The Indian *Mallow*, with the heart-faſhioned leaf. 40. The elm-leaved *Mallow*, with the roſtrated ſeed. 41. The elm-leaved *Mallow*, with the double-beaked ſeed. 42. The elm-leaved *Mallow*, with the double-beaked ſeed, and with flowers ſtanding in long cluſters. 43. The roundiſh-leaved Indian *Mallow*. 44. The mulberry-leaved Canada *Mallow* with double-beaked ſeeds. 45. The elm-leaved American *Mallow*, with flowers cluſtered together in the alæ of the leaves. 46. The vine-leaved American *Mallow*, with a roundiſh echinated fruit. 47. The purple-flowered ivy-leaved American *Mallow*. 48. The low American *Mallow*, with the leaf and the whole appearance of ground-ivy, and with bifurcated capſules. 49. The melon-leaved hairy American *Mallow*. *Tournefort*'s Inſt. p. 95, 96.

The freſh roots of *Mallow* are uſed as a diuretic and emolient, and the dried leaves as an ingredient in clyſters, and in emolient fomentations and cataplaſms. The antients gave the juice of the *Mallow*, in large doſes, for inflammations and obſtructions of the viſcera. A ſtrong decoction of *Mallow* root is apt to be mucilaginous, and to ſit ill on the ſtomach. It is a good common drink in pleuriſies, peripneumonies, and peculiarly in caſes of gravel, or inflammations of the kidneys; alſo in ſtranguries and ſuppreſſions of urine of all kinds.

MALVA *Marina*, the *Sea Mallow*, in botany, a name not very judiciouſly given by ſome writers to a ſpecies of ſubmarine plant, ſuppoſed in ſome degree to reſemble the leaves of the common *Mallow*. It is very common in the places where they fiſh for coral, and grows to the rocks without any regular root; it is found at different depths, but moſt uſually far from the ſurface, and its height is uſually about two inches. It is of a duſky greeniſh colour, with an admixture of a faint yellow; it is compoſed of ſeveral leaves of about half an inch broad, and a little more than that in length. Each of theſe is faſtened to a pedicle of about an inch and half long; the leaves are of a fine thin membranaceous ſubſtance, but their ſtalks or pedicles are thick and tough like horn. When examined by the microſcope many glandules diſcover themſelves upon the ſurfaces of the leaves, but the ſtalks or pedicles are entirely covered with glandules in form of ſmall protuberances, which make it as rough in thoſe parts as the common chagrin. The ſtalks when cut tranſverely ſhew an infinite number of pipes or veſſels running up to every part of the leaves. Count Marſigli has given an elegant figure of this, both as it appears to the naked eye, and by the microſcope. *Marſigli*, Hiſt. de la Mer.

MALUS, the *apple tree*, in botany, the name of a genus of trees, the characters of which are theſe: The flowers are of the roſaceous kind, each being compoſed of ſeveral petals arranged in a circular form; the cup finally becomes a fleſhy fruit of a roundiſh figure, umbilicated and divided within into ſeveral cells, containing oblong callous ſeeds. See the article APPLE.

MALUS *Aſſyria*, in botany, one of the many names given by the antients to the citron: They alſo called it *malus medica*, and by ſeveral other names, as theſe were expreſſive of the country whence they had the fruit. See the articles CITRON and CITREÆ *menſæ*.

MAMIRA, in the materia medica of the Arabians, a root frequently mentioned by Aviſenna, Serapion, and other of the Arabian writers. It ſeems mentioned as a poiſonous drug, and is ſo deſcribed, that it ſeems to be the ſame with one ſpecies of the durunegi, or doronicum of the ſame authors, and the common doronicum of the ſhops, diſtinguiſhed from the antithora, or other ſort of durunegi, by the yellowneſs of the inſide of the root. Aviſenna ſays that it is hard and woody, and formed of knots or joints. This is the very deſcription the ſame author gives of the durunegi of the firſt or poiſonous kind. Paulus Ægineta ſays its root is compoſed of ſeveral joints alſo; and Alphagus calls it a *nodoſe* or jointed root. Some have ſuppoſed that the *Mamira* was the ſame plant which we call ſmall celandine, but this has no title to be placed among the plants ſuſpected as poiſonous, nor any other plea to be gueſſed at as the *Mamira*, but only its roots conſiſting of many tubercles. Many things beſide have been conjectured to be the *Mamira* of the Greeks and Arabians, but the doronicum ſeems to be the plant.

MAMMEA, in botany, the name of a genus of plants called *mammei* by Plumier. The characters are theſe: The perianthium is compoſed of two ſmall deciduous and oval leaves; the flower conſiſts of four roundiſh concave expanded petals larger than the cup; the ſtamina are numerous ſimple filaments, of about half the length of the flower; the antheræ are roundiſh; the germen of the piſtil is roundiſh; the ſtyle is conic, and of the length of the ſtamina; the ſtigma is ſimple and permanent; the fruit is a very large and fleſhy berry, of a ſpherical figure, but acuminated with the ſtyle; the ſeeds are of an oval figure and callous texture, and there are ſometimes found four of them, ſometimes only one in the ſingle cell of the fruit. *Linnæi* Gen. Plant. p. 234. *Plumier* Gen. p. 4.

MAMMOTH's *Teeth*, or MAMMOUT *Bones*, in natural hiſtory, a name given by travellers and other writers to certain foſſile teeth, and other bones, found in Ruſſia and ſome other parts of the world, and that uſually at great depths in the earth. The Ruſſians and other people give them this name, ſuppoſing them to have belonged to an animal which they deſcribe as being of a monſtrous ſize, and living in caverns under ground. But the true account of them is, that they are in reality the teeth and other bones of elephants, there being no ſuch beaſt as theſe people deſcribe.

Breynius has given a very good account of theſe bones to the Royal Society, which is printed in the Philoſ. Tranſactions. He obſerves, that they are principally found in the northern parts of Siberia about the borders of rivers, toward the icy ſea; they are originally buried in the mountains; but when the froſts have cracked the higher banks of thoſe rivers, as they run under the ſides of the mountains, the earth falls in, and they are diſcovered among it. Sometimes compleat ſkeletons are found in theſe places, but more frequently the bones of ſome particular parts of the body, and nothing ſo frequently as the teeth. The teeth and bones are not always found of the ſame ſize, but often ſmall, and appearing to have belonged to young animals, often ſo large, that the grinders weigh from twenty to forty pounds; and often the ivory tuſks or dentes exerti weigh more than two hundred pounds each. It is very evident that theſe laſt are the tuſks of elephants, and the reſt of the bones, when ſtrictly examined, will all be found to have the ſame origin, all being reducible to ſome part of the ſkeleton of that creature. The tuſks are actually uſed as ivory, and the Czar of Muſcovy carries on a very large trade with them; they are wrought both there and abroad into combs and other works; and, according to the obſervation of captain Muller, perfectly reſemble the common ivory, except that they are more brittle, and are apt to turn yellow ſooner in the uſing. See Philoſ. Tranſ. N° 446. p. 129.

The compariſon of the deſcriptions and figures of the Siberian *Mammoth*'s teeth with the foſſile elephant's teeth of Ireland, and ſome parts of England, proves very clearly that the bodies are the ſame.

The foſſile bones of elephants are found in many other places beſide Siberia, but not in ſuch plenty as in this country; Italy, Germany, Poland, England, France, and Ireland, all afford them; but they are more altered by lying in the earth in theſe places. The greater warmth of theſe climates may be naturally enough ſuppoſed to have brought on this change in them, and the ſevere cold of Siberia to have been the principal agent in the preſerving them intire in the manner in which we ſee them.

The bones and teeth of elephants found under ground in other places, and called *ebur foſſile*, are of the ſame origin with theſe, as are alſo thoſe dignified in the German ſhops with the pompous title of *unicornu foſſile*, the difference in the preſervation being all that diſtinguiſhes them. Phil. Tranſ. N° 447. p. 149. and Mem. Acad. Par. 1727.

MAN, in the materia medica of the antients, a name by which manna has been called by the oldeſt writers. There has been, however, ſome confuſion in the hiſtory of manna, owing to the too general uſe of this word, the ſame authors uſing it as the name of ſeveral other ſubſtances of very different kinds, which came to their hands in form of ſmall granules or flakes like the manna. The fragments of frankincenſe in particular were called by this name, with the addition of the word *thuris*, and ſometimes without, *Man* or *Men* ſtanding ſingly for that drug.

MAN *the Capſtan*, on board a ſhip. See the article CAPSTAN, *Cycl.* and *Suppl.*

MAN *the Side, or Ladder*, on board a ſhip, is when an officer, or any perſon of diſtinction is at the ſhip's ſide ready to come aboard, the men are commanded to wait, and help him up the ſide.

MAN *the Top, or Yard*, on board a ſhip, a word of command for the men to go up to the top, or yard, for ſome particular ſervice.

MAN *of War*, the ſame with a ſhip of war. See the articles SHIP and RATE, *Cycl.*

MAN-*Eaters*. See the article ANTHROPOPHAGI.

MAN-*Bird*. See the article BIRD.

MANAA, in the Jewiſh cuſtoms, a kind of offerings made in the temple, otherwiſe called *Mincha*. The word *Manaa* is uſed in the ſeptuagint. See the article *Mincha*.

MANANAOG, in the materia medica, a name by which ſome call the fruit known with us by the name of St. Ignatius's bean. *Pluk.* Mantiſſ. p. 60.

MANATI, the *ſea cow*, a marine animal, the head of which is like that of a calf, but ſomewhat narrower; its eyes are like thoſe of a dog, its ſkin very thick and tough, and covered with a few greyiſh brown hairs. Its uſual length is about ſixteen foot, and it meaſures ſeven or eight foot round the body. At the fore part of the body it has two ſhort legs, with very broad feet, armed with claws; on the hinder part of the body it has no legs, but has a broad tail, with which it ſwims very ſwiftly. From the navel to the tail the body gradually leſſens, but juſt at the tail it becomes very broad again. *Cluſius. Ray*, Syn. Quad. p. 193.

Its eyes are very ſmall in proportion to its ſize, and it has, in the place of ears, two apertures like thoſe of the ſea calf, and the female has two teats on the breaſt, for they bring forth two young ones, and nouriſh them by ſuck. It feeds on vegetables, uſually living in large rivers, and riſing near the ſhore to feed on the herbs and roots that are found there.

MANATI *Lapis*, a name given to a bone, of which there are two found in the head of the *Manati*, or ſea cow; they are roundiſh and are uſually of the ſize of a hand-bell. They are ſaid to have great virtues againſt the ſtone and gravel, when burnt to aſhes, and given in white wine. The world need not, however, regret the ſcarcity of this remedy, for probably any animal bone, when burnt to aſhes, is poſſeſſed of all its virtues.

MANBALLA, in zoology, the Ceyloneſe name of a ſpecies of ſerpent, called alſo the *canine*, or *dog-ſerpent*, from its manner of flying at every thing that comes in its way, as our dogs do. It is of a deep brown colour, beautifully variegated with white. *Ray*, Syn. An. p. 332.

MANBOTE, in our old writers, a compenſation or recompenſe for *homicide*, particularly due to the lord for killing his man or vaſſal. *Terms of Law.*

MANCANILLA, in botany, a name given by Plumier to a genus of plants, ſince characterized by Linnæus in the name of Hippomane. See the article HIPPOMANE.

MANCORON, a word uſed by the antients to expreſs what they call a ſort of honey, which ſeems to have been evidently our modern ſugar. They ſay that it was a ſort of dry honey found concreted in canes or reeds, and was of the conſiſtence of ſalt, and that it was found in India and Arabia Felix, and that when taken into the mouth, it broke under the teeth like ſalt. See the article SUGAR.

MANDATARY, *Mandatarius*, he to whom a command or charge is given: Alſo he that comes to a benefice by a *mandamus* is called by this name. *Blount.*

MANDRAGORA, the *Mandrake*, (*Cycl.*) the name of a genus of plants, the characters of which are theſe: The flower is compoſed of one leaf, faſhioned like a bell, and divided into many ſegments at the end. This is encloſed in a cup, from the bottom of which riſes a piſtil, which perforates the baſe of the flower, and grows finally into a roundiſh ſoft fruit, in which are contained a number of ſeeds, which are uſually of the figure of a kidney.

The ſpecies of *Mandrake* are, 1. That with a round fruit, called the male *Mandrake*. 2. The bluiſh or purpliſh-flower'd kind, called the female. 3. The blue flower'd one, with ſmall leaves, and a round fruit. Moſt of the *Mandrakes* may be known even when not in flower, by their having large roundiſh leaves of an ill ſmell, and very large roots. *Tournefort*, Inſt. p. 76.

Mandrake has been recommended in caſe of barrenneſs, but without foundation. Its freſh root is a violent purge, the doſe being from ten grains to twenty in ſubſtance, and from half a dram to a dram in infuſion. It has been found to do ſervice in hyſteric complaints, but muſt be uſed with great caution, otherwiſe it will bring on convulſions, and many other very miſchievous ſymptoms. It has alſo a narcotic quality. At preſent we only uſe the freſh leaves in anodyne and emollient cataplaſms and fomentations.

MANDRAGORITES *Vinum*, *Mandrake Wine*, a ſort of medicinal impregnation of wine with the virtues of *Mandrake* root. It is prepared by cutting into thin ſlices half a pound of the bark of *Mandrake* roots, and ſtringing them on a thread, and letting them down into a veſſel containing nine galllons of white wine, ſo that they may hang looſely in it, and by that means fully impregnate it with their virtues. It was uſed in ſmall doſes as an anodyne and ſoporific. It had the ſame effects alſo, if only ſmelled to, and was ſometimes injected in clyſters to the ſame purpoſe. They ſay that half a pint of this liquor mixed with twelve times its quantity of wine, brings on a carus; and that even a ſmaller doſe than this, leſs diluted, is mortal.

MANDRAKE, *Mandragora*, in botany and medicine. See the article MANDRAGORA.

MANE-*Sheet*, in the manege, is a ſort of covering for the upper part of a horſe's head, and all round his neck, which at one end has two holes for the ears to paſs through, and then joins to the halter upon the fore part of the head, and likewiſe to the ſurcingle, or long girth, upon the horſe's back.

MANEGE. A horſe is ſaid to *manege* when he works upon volts and airs, which ſuppoſes him broke and bred. See the article MANEGE, *Cycl.*

MANEGE *for a Soldier's Horſe*, is a gallop of unequal ſwiftneſs, but ſo that the horſe changes hands readily.

High MANEGE, is the high or raiſed airs, which are proper for leaping horſes. See the article AIRS, *Cycl.*

MANEGED. A horſe is ſaid to be thoroughly *maneged*, or a finiſhed horſe, that is well broken, bred, and confirmed in a particular air or manege, ſo as to bear well upon the hand, know the heels, and ſit well upon the hips.

MANGANESE, *Magneſia*, in natural hiſtory, a very poor kind of iron ore. See the article IRON.

It is a denſe, ponderous, and heavy ſubſtance, in its fineſt and pureſt pieces, approaching greatly to the texture of the *lapis hæmatites*, being compoſed of regular parallel ſtria, diverging from a center to the circumference. This kind, however, is rare; beſide which there is another ſomewhat leſs pure kind of an iron grey colour, and irregularly ſtreaked like the ſteel-grained lead ores. But the common *Manganeſe* is of a perfectly irregular ſtructure. It is very heavy, moderately hard, and of a deep duſky grey, approaching to black, though ſometimes of a ferrugineous brown. It is found in large maſſes of no determinate ſhape, and of a rude, rugged, and unequal ſurface.

Manganeſe gives fire but difficultly with ſteel, and makes no effervescence with aqua fortis. It is found in many parts of England and Germany.

This ſubſtance is of vaſt uſe in the glaſs trade, but neither the induſtrious Neri, nor any others who have written of the art, can ever deliver the true proportions in which it is to be mixed with the glaſs metal on the ſeveral occaſions. The ſame thing is alſo to be obſerved in regard to zaffer, another ſubſtance in continual uſe with them. And the reaſon of this is, that there is vaſt difference in the quality of theſe bodies, ſome which are ſold being very pure and rich, others good for almoſt nothing, and much of middle degrees of purity between theſe. For this reaſon there is no determining how much of each is to be added to the glaſs, but the conciator adds them at ſeveral times and in ſmall quantities, and takes frequent proofs by his eye, till he knows that they are properly proportioned. *Merret's* Notes on Neri, p. 274.

MANGANUM, Μαγγανον, among the Greeks, a general name for inſtruments to throw large ſtones with. *Potter*, Arch. Græc. T. 2. p. 95.

MANGARATIA, in botany, a name given by ſome authors to the plant of which the common ginger of the ſhops is the root. *Piſo*, p. 227.

MANGER, in a ſhip, a circular place made with planks faſtened on the deck, right under the hawſes, being about a foot and half in height; the uſe of which is to catch and receive the ſea-water, beating in at the hawſes in a ſtreſs of weather.

MANGOUSTAN, in natural hiſtory, the name of a fruit of the Eaſt Indies. The tree which produces it is large, and uſually much branched. The leaves are ſix inches long, and two inches wide, of a lively green, and ornamented with a double ſeries of ribs, one part of which makes a border that ſurrounds the whole verge of the leaves. The flower is ſmall, and of a pale green colour; it is compoſed of four petals, which, when they open, ſhew the rudiments of the fruit forming itſelf within. Theſe leaves do not fall off at all, but remain faſtened to the bottom of the fruit till it is ripe, ſerving as a ſort of ſupport to it. The fruit grows to the bigneſs of an apple. It is perfectly round, and is covered with a hard and tough ſkin, which is of the twelfth of an inch thick, and is of a lively red, ſtreaked with ſeveral yellow lines, which are ſo many filaments running along it: At the extremity there are placed ſeveral rays, which running to the length of a tenth of an inch, meet together, and terminate in a point. The ſubſtance of the fruit is white, ſoft, and of a very agreeable taſte, approaching to that of raſpberries. The body of the fruit is compoſed of ſeveral lobes or quarters, as we call them, which will ſeparate from one another like thoſe of an orange; but they are not encloſed each in a ſeparate ſkin as thoſe are. Theſe are in number the ſame with the rays at the end of the fruit, that is, there are ſeven of them. When the fruit is eaten before it is perfectly ripe, the whole is eaten together; but when it is thoroughly ripened, there is found a ſingle kernel in the middle; this is greeniſh without and white within, and

is of an inſipid taſte, and therefore uſually thrown away. Mem. Acad. Scienc. Par. 1699.

This is an extremely agreeable fruit, and the eating it is never attended with any bad conſequences, even though it be eaten in ever ſo large quantities. People who are not uſed to the Indies are apt to give this the preference to all the fruits of the place; but the natives, and others who have accuſtomed themſelves to the ſmell of the *durion*, give that infinitely the preference. This is a large prickly fruit of the ſize of a melon, of an intoxicating quality, and of a taſte like that of ſugar and cream, but with a ſmell like that of rotten onions. The ſmell is intolerable to ſtrangers, but cuſtom has made it familiar to the Indians, and they diſregard it. The peel or rind of the *Mangouſtan* is a more powerful aſtringent than the pomegranate bark, and is given in decoction in diarrhœas and dyſenteries with great ſucceſs, as alſo in all other hæmorrhages. There is a ſort of wild *Mangouſtan*, called by the Portugueſe, *mato*, which grows in the woods both in the Eaſt Indies and in America. The fruit of this perfectly reſembles the true *Mangouſtan*, but is not eatable.

MANHEB, a word uſed by ſome chemical writers to expreſs ſcoriæ of any kind.

MANIA, (*Cycl.*) *Madneſs*, the moſt violent and acute ſpecies of a delirium, ariſing from a perturbation of the imagination and judgment.

Signs of it. Theſe are a bold and reſolute aſpect, and eyes ſuffuſed with blood; only it is to be obſerved, as to the firſt-mentioned ſymptom, that thoſe perſons who have gone *mad* through fear, have always in their aſpect a mixture of that terror the object firſt gave, and of that natural boldneſs which ariſes from *Madneſs*. The patient often lays traps and ſnares for the getting other people into his power, with intent to hurt them, though they never have in jured him. Sometimes mad people have been known to murther others; and they always have ſo much ſtrength as to overpower almoſt any one perſon; and though they have no actual fever, yet they are inſenſible of the external cold, and in general of other pains or injuries; nay, they are ſo loſt in ſpeculation, as often ſcarce to feel the blows and laſhes they receive in the courſe of their cure. They often do not even hear the people who ſpeak to them, and are naturally of a very jocund and chearful imagination, fancying themſelves kings and princes, and are delighted with muſic. They have a violent propenſity to venery, and ſuch an abſence of ſhame, that they will go to ſtool, or do any thing of a like kind, before any body. This is the uſual caſe in the height of the diſorder; and in its decline ſome are dull and ſtupid, others very ſorrowful and melancholy, and ſenſible of their unhappy diſorder. *Junker*, Conſp. Med. p. 689.

Perſons ſubject to it. Theſe are principally men of a choleric habit of body, and of violently paſſionate diſpoſitions. Thoſe who have continual domeſtic quarrels, are alſo frequently thrown into *Madneſs* by it; and women frequently incur this diſeaſe from long ſuppreſſions of the menſes, and a habit of giving looſe to laſcivious thoughts. Suppreſſions of the hæmorrhoids, and of the evacuation of the ſemen, have ſometimes alſo driven men into *Madneſs*; worms have alſo ſometimes occaſioned it, and ſometimes drunkenneſs.

Prognoſticks. *Madneſs* ariſing from immaterial cauſes, is much more difficult of cure than when it ariſes from diſorders of the bodily organs; hence when it ariſes from violent perturbations of the mind, or from intenſe ſtudy, it is almoſt incurable. When it ariſes from ſuppreſſions of the ſemen, or of the uterine, or hæmorrhoidal diſcharges, there is great hope of a cure by proper means. But *mad* perſons in general, when they ſleep ſound, and always awake in outrageous fits, are to be eſteemed incurable, or at leaſt greatly more difficult of cure than others.

Method of Cure. A briſk purge is firſt to be given; after this the patient is to be blooded pretty freely, ten ounces at the leaſt ſhould be taken away; after this the ſenſes are to be attempted to be rouſed by ſtrong vomits. White hellebore was famous on this occaſion among the antients; and there are ſome caſes in which it may be given with ſafety, and with great good effect. After this the violent emotion of the blood is to be attemperated by nitrous and abſorbent medicines; and, after theſe, the ſeveral remedies uſually eſteemed ſpecifics take place. Of this number are decoctions of the red anagallis or pimpernel, the ruta muraria, or white maidenhair, the ſeveral preparations of ſilver, the berries of the *Herba Paris*, aſſes blood, and the like; and great care is to be taken to bring the hæmorrhoidal and menſtrual diſcharges as far as poſſible to regularity. In caſes of retention of the ſemen, purified nitre is to be given in great quantities, and may be alſo externally uſed, applying it to the teſtes in a cataplaſm. The uſe of opiates is ſcarce to be ſuffered in any delirium, but of all things is never to be given in *Madneſs*, for it never gives them any ſleep, but enrages and adds to the complaint, having the ſame effect that ſtrong liquors would have upon them. The uſe of white hellebore, as a vomit, may be of great ſervice in ſome caſes; but in all hypocondriac complaints, and conſequently in *Madneſs*, in the cauſes of which theſe complaints have a ſhare, it is certain to encreaſe the diſeaſe. Id. Ibid. p. 691. We read of a *Mania* ariſing from a callous pia-mater. See Med. Eſſ. Edinb. vol. 4. art. 26. See alſo the article MADNESS.

MANICUM *Strychnum*, in botany, a term uſed by the old Greek writers to expreſs a kind of nightſhade, which, when taken internally, cauſed madneſs. Pliny, deſcribing this ſpecies, ſays that it has leaves like the ocymum or baſil; and Theophraſtus and Dioſcorides ſay it had leaves like the eruca or rockett. Where Pliny had his information is not eaſy to gueſs, for he commonly copies from theſe authors. They are, however, much more to be depended on; and as the leaves of the ocymum or baſil are not at all like thoſe of the rockett, Pliny is certainly wrong in his account; and the moſt probable reaſon for his error is, that he miſtook the Greek name of the plant, to which theſe authors compared the leaves of the *Manicum Strychnum*, and tranſlated *euzomon*, which is the name of the rockett into ocymum, baſil; a name ſomewhat like the Greek one in ſound, but wholly different in ſignification; the two plants baſil and rockett not only having leaves very unlike one another, but being alſo of different genera. A yet greater error of Pliny, in regard to this plant, is his placing it among the eſculent garden herbs, and ſaying that it was in uſe as a food, immediately after he had told us of its cauſing madneſs in thoſe who eat it. This is an evident confuſion of the maniac ſolanum with the pomum amoris or love-apple, the fruit of which is eaten in ſoups at this time.

MANIFESTUS *Clitoridis*, in anatomy, a name given by Veſalius and others to one of the muſcles of the female pudenda, called by Verheyen ſimply the *muſculus clitoridis*, but by Albinus and Cowper, *erector clitoridis*. Verheyen is not to be cenſured for calling it only the *muſculus clitoridis*, for it is properly the only muſcle of that part, the other generally attributed to the clitoris, and called by Riolan and others, *clitoridis inferior* and *latus*, not properly belonging to that part, but being truly a ſphincter vaginæ, or as Albinus by a more coarſe name calls it, the *conſtrictor cunni*. See the article SPHINCTER.

MANIHOT, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the one-leav'd kind, and is ſhaped like a bell, and is wide open, and divided into many ſegments at the edge. The piſtil finally becomes a roundiſh fruit, containing three capſules joined cloſely together, each of an oblong figure, and containing a ſeed of the ſame figure.

The ſpecies of *Manihot*, enumerated by Mr. Tournefort, are theſe: 1. The common *Manihot* of Thevet, called *jucca*, and *caſſada*. 2. The prickly American *Manihot*, with vine-like leaves. 3. The American *Manihot*, with broad elm-like leaves. 4. The American *Manihot*, with narrow elm-like leaves. 5. The climbing American *Manihot*, with leaves like betony. And 6. The ſmalleſt germander-leav'd American *Manihot*. *Tourn.* Inſt. p. 658.

This plant is alſo called *Manioc*; its juice is poiſonous; but the bread made of the plant, after the expreſſion of the juice, is innocent, and in frequent uſe in the Braſils, and other parts of the Weſt Indies. Mem. Acad. Par. 1700.

MANIQUE, in the materica medica, the name given by authors to an American root, commended greatly for curing tertian and quartan agues, and as an infallible remedy againſt venomous bites. Redi procured ſome of this famous root, and gave it many very fair trials, but could never diſcover any of theſe virtues in it. *Redi*, Eſperien.

MANNA (*Cycl.*)—This is a ſubſtance in many things very nearly related to ſugar and to honey; it is inflammable in the ſame manner, and it melts in water as eaſily as ſugar, and in the ſame manner is indiſſoluble in ſpirit of wine, except in regard to a very ſmall quantity of ſome ſeemingly extraneous particles: This is a very ſufficient proof that ſalts abound in it more than ſulphurs. M. Lemery, in his analyſis, drew from *Manna* a vinous liquor, of the ſame kind with that obtained from honey. Mead may alſo be made of *Manna*, in the ſame way that it is made from honey; but it is neither ſo ſtrong, nor ſo agreeable to the taſte, as that of honey. From as much mead as was made from two pounds of *Manna*, M. Lemery drew off by diſtillation eight ounces of a ſort of brandy, and on rectifying this, procured an ounce and half of a pure burning ſpirit, like in all reſpects to rectified ſpirit of wine. This ſpirit of *Manna* is accounted by ſome a ſudorific, and is given from half a dram to a dram and a half. M. Lemery having left the remaining liquor, after the diſtillation of the ſpirituous part of the *Manna*-mead, in a warm place for two years, found that it depoſited to the bottoms of the bottles ſeven drams of an eſſential ſalt of *Manna*, which was white, hard, brittle, and formed into fine needles, and was of an acid taſte, with an admixture of ſweet. This ſalt is purgative, and its doſe is a dram. All the remaining acid liquor being diſtilled, there remained at the bottom of the retort a quantity of matter of the conſiſtence of honey, which weigh'd twenty ounces; ſo that out of two pounds of *Manna*, there had been twelve ounces conſumed, to make the ſpirit, and to give the acidity to the remaining liquor. This honey-like reſiduum, being finally diſtilled with a ſtrong fire, there aroſe a reddiſh liquor of an acrid taſte, and with a ſtrong empyreumatic ſmell, and with this a few drops of a blackiſh oil; after this operation, the remainder in the retort was four ounces of a very light black coal. The coal, it is to be obſerved, is here only one eighth

of the weight of the *Manna*, which is ſomewhat ſingular, ſince in the pureſt honey, treated in the ſame manner, it always weighs one fourth of the original whole quantity. It is plain from hence, that *Manna* is a much purer ſubſtance than honey: It is alſo remarkable, that in farther treatment of this coal, there is a ſmall quantity of iron always diſcovered in it. *Manna*, honey, and all the other ſweet ſubſtances, we ſee, alſo loſe all their ſweetneſs, as ſoon as ever their acid is ſeparated from their oil. Hiſt. Acad. Par. 1708. p. 56.

Manna is far from being peculiar to the aſh tree of Calabria, on which it is uſually found. It is no other than the matter of the ſenſible tranſpiration of trees and plants in general, and is found on many different kinds in different quantities. The lime and ſycamore uſually have a great deal of it on their leaves in the heats of ſummer, and if ſteeped in water, render it ſweet and purgative. The ſweet matter found in the bottom of the trefoil, or jaſmine flowers, is alſo *Manna* in a certain ſtate. The bees are well acquainted with the ſameneſs of this extravaſated juice in different plants, and collect it for their honey, as well from the leaves of the lime and ſycamore, and many other trees, as from the flowers of plants. The elaboration it ſuffers under their management afterward is all that makes the difference between that and what men collect in Calabria; and honey is *Manna* in a certain ſtate.

At Briançon in France they collect *Manna* from all ſorts of trees that grow there; and the inhabitants obſerve, that ſuch ſummers as produce them the greateſt quantities of *Manna*, are very fatal to their trees. Their walnut-trees produce annually a conſiderable quantity; but if there happen a year in which they produce more than ordinary, they uſually find many of them periſh in the following winter.

It ſeems very plain from the whole, that *Manna* is only the extravaſated juice of the tree, which cannot ſurvive ſo great a loſs of it: And what not a little confirms this is, that the very hot ſummers are always thoſe which are the moſt abundantly productive of *Manna*. The antients were ſenſible of this ſpontaneous production of *Manna*, of ſeveral ſpecies of trees, ſo very different from one another, and from thence fell into the error of ſuppoſing it ſomething wholly foreign to the tree; an error very natural to thoſe who did not know that the nutritive juices of very many trees are nearly, if not wholly, the ſame. It was from this opinion of its origin, that they called it aerial honey.

My Boyle tells us, that in Apulia and Calabria, between the months of March and November, they obtain, by inciſion, from the common aſh-tree, a ſweet juice ſo like *Manna*, in that ſeaſon adhering to the leaves of the ſame kind of trees, that they call it *Manna del Corpo*, trunk-*Manna*; and uſe it ſucceſsfully. Works abr. vol. 1. p. 51.

MANNA *Alhagina*, a word uſed by ſome authors to expreſs that kind of *Manna* called by others *Manna maſtichina*, from its drops reſembling maſtic in ſmall tears. It is called *alhagina* from the plant which produces it, it being collected from the *alhagi maurorum*, in the ſame manner as the common *Manna* from the Calabrian aſh. See the article MANNA *Perſicum*, infra.

MANNA *Libanotis*, in the materia medica, a name given by the old Greek writers to the ſmall flakes and fragments of the frankinſenſe which flew off the larger pieces in the gathering and putting them up. See the article LEPTOS *Libanotis*.

MANNA *Maſtichina*, in the materia medica, a name given by ſome authors to a kind of *Manna* which they deſcribe as reſembling maſtic in its colour, and the ſize of the lumps it is collected in. This is what we uſually know at this time under the name of *Manna Perſicum*, or Perſian *Manna*, which is at this time in uſe in medicine in the Eaſt, as a common purge. See the next Section.

MANNA *Perſicum*, *Perſian Manna*. It does not appear in the writings of the antient Greek phyſicians, that they were acquainted with any ſpecies of *Manna*, though that medicine be now ſo common in the ſhops. They had the word indeed, but they applied it to a very different ſenſe; what they called *Manna* being what ſome authors ſtill call the *Manna* of frankincenſe, that is, ſuch pieces of the common olibanum as broke off in the carriage from the larger pieces. Philoſ. Tranſ. N°. 472. p. 86.

The Arabians are by ſome ſuppoſed to have firſt brought what we call *Manna* into uſe in medicine; but if they were not the abſolute inventors of this uſe of it, it is certain they were the firſt who made it general and common as a purge. Their country afforded ſeveral diſtinct ſpecies of *Manna*, all which ſeem to have been ſo common among them, that they thought deſcriptions of them needleſs; and for that reaſon have not left us ſufficient accounts of them, from which to determine what were their characters and differences. They diſtinguiſhed three kinds of this purging medicine, under three abſolutely different names, which were *Mamma*, *tereniabin*, and *ſiracoſt*; but it is not eaſily proved whether theſe are all now known, or by what appellations they are at this time diſtinguiſhed.

Rawwolf, in his itinerary publiſhed by Mr. Ray, and Tournefort in his voyage to the Levant, have given the cleareſt intimations, in regard to this ſubject, of any of the known writers; and if to theſe we add Cluſius, we have among the three all that is to be expected of any certainty upon the ſubject; yet the deſcriptions of theſe, though eye-witneſſes of all they write, have not prevented ſo eminent and late a writer as Geoffroy from falling into an error concerning the *Manna* of the Arabians. It is very evident, however, that we have ſtill one ſpecies of the *Manna Arabum*, that is, the *tereniabin*, produced in ſome parts of the world, there having been ſpecimens of it ſent over into England from Peterſburgh, near which place it is collected from a plant, known among botanical writers under the name of *alhagi maurorum*.

This is uſually called *Manna Perſicum*; it appears at firſt ſight a mixed maſs of a dirty reddiſh brown colour, but, upon a nearer view, it is ſeen to conſiſt of ſeveral ſorts of particles. Firſt, a great number of globular cryſtalline and almoſt tranſparent bodies of different ſizes, and of a yellowiſh white colour. The largeſt of theſe do not much exceed a large coriander-ſeed in ſize, and they have ſomewhat of the appearance of ſmall lumps of maſtic, but are of a ſomewhat reddiſh caſt. Secondly, there are among theſe a large quantity of ſmall prickles, and other little woody bodies, which ſeem to have been the pedicles of leaves. Thirdly, there are a few ſmall leaves, which are of a firm texture, and terminate in narrow points. Fourthly, there are a large number of ſmall long reddiſh-colour'd pods, of a ſweetiſh gelatinous taſte, containing from one to ſix or ſeven hard irregular and kidney-ſhap'd ſeeds, which to the taſte are very acerb. And fifthly, there is uſually ſome ſand and earth among it. Four ounces of this *Manna* diſſolved in water uſually leaves about one ounce of theſe ſubſtances in the filtre.

The globules firſt deſcribed are ſomewhat hard, they break between the teeth like ſugar-candy, and are of a pleaſant ſweet taſte, but have much leſs of the *Manna* flavour than the Calabrian, but enough of it to diſcover to what family the ſubſtance belongs. The ſeeds, ſticks, leaves, and pods, ſeem to be all of them parts of the plant which produces the *Manna*; and the ſeeds having been ſown with us, have raiſed plants of the alhagi. About the year 1537, when Rawwolf wrote his itinerary, it appears that large quantities of this kind of *Manna* were brought from Perſia to Aleppo, where it was then known by the name of *trunſchibil*, or *trunſchibin*, a corruption doubtleſs of the word *terenjabin*, or, as it ought to be written, according to Denſingius, *tereng jabin*.

Rawwolf alſo expreſsly informs us, that this ſpecies of *Manna* was gathered from a plant called *alhagi*. This plant is minutely deſcribed by Tournefort, who confirms the account of the *Manna* being gathered from it, which Rawwolf had given ſo long before.

Tournefort ſays, that it is chiefly gathered about Tauris a city of Perſia, under the name of *trunjibin*, or *terenjabin*, mentioned by Aviſenna and Serapion; he adds, that thoſe authors thought it fell upon certain prickly ſhrubs, whereas it is really the nutritious juice of the plant; and that, during the great heats in that part of the world, there are perceived ſmall round drops, as it were, of honey ſtanding upon the leaves of this plant; and that theſe harden into globules about the ſize of coriander-ſeeds, and are then gathered by the inhabitants, together with leaves, ſtalks, dirt, and the like foreign matter, which greatly take off from their virtue. Mr. Tournefort obſerves, that this *Manna* is greatly inferior to the Calabrian in virtue; and that twenty or thirty drams of it are given for a doſe. Philoſ. Tranſ. N°. 472. p. 90.

Cluſius tells us, that the *terenjabin* of the Arabians is gathered from a prickly ſhrub, ſuch as the alhagi is deſcribed to be; and Aviſenna declares, that it was found upon a thorny plant; though his tranſlators have been miſled from the near reſemblance of two Arabic words, to make it ſtones, not a plant, that it was gathered from.

It appears very plainly from the whole, that this ſubſtance now known in Ruſſia, and ſome other parts of the world, under the name of *Manna Perſicum*, is truly the *terenjabin* of the Arabians and of Cluſius, Rawwolf, and Tournefort; only that the word is differently ſpelt by the latter authors, and it is probably alſo that *Manna* called by Bauhine, and ſome other writers, *Manna Maſtichina Orientalis*, from the round globules it is compoſed of, reſembling the drops of maſtic. See the article TERENJABIN.

MANNA *Thuris*, the *Manna of Frankincenſe*, a term uſed by the antient phyſicians to expreſs ſuch ſmall pieces of frankincenſe, or olibanum, as broke off from the larger in the carriage. See the articles MANNA *Perſicum*, ſupra, and LEPTOS *Libanotis*.

MANNIFERA *Arbor*, in the materia medica, the name by which the round-leav'd aſh, on which the manna is found, is often called. *Dale*, Pharm. p. 332.

MANNING, in the navy. To *man* a ſhip or fleet, is to provide them with a ſufficient number of men for an expedition.

In *manning* the navy, it is uſual to promiſe, by proclamation, a bounty to all ſeamen and able-bodied land-men, who come into the ſervice by a certain time, which is commonly two months pay, and but ſeldom any more. This does indeed prevail on a good many, yet great numbers conceal themſelves till the fleet is at ſea, and others lurk about till the time limited for ſuch bounty is expired, which does not a little prevent the fleet's being in a readineſs for an early expedition.

And as ſeamen are thus encouraged to enter themſelves voluntarily, ſo there is another method uſed to compel them to it, and that is *preſſing*, by warrants from the lord high admiral to the captains, which are by them aſſigned to their lieutenants: And to render this the more effectual, veſſels are purpoſely hired into the ſervice, to proceed from place to place, with thoſe officers and their preſs-gangs, not only to receive volunteers, but alſo to impreſs what men they can light on. But their ſucceſs has been very uncertain, and always very expenſive; therefore it were much to be wiſhed, in a matter of ſo great conſequence to the nation, that more ſpeedy and effectual methods could be taken for *manning* the fleet.

MANONOETOC, in natural hiſtory, a name given by the people of the Philippine Iſlands to a ſpecies of horned owl common in thoſe parts.

MANSORIUS *Muſculus*, in anatomy, a name given by ſome writers to that muſcle of the face more generally known under the name of the *Maſſeter*. See the article MANSORII, *Cycl.*

MANTECU, a ſort of preparation of butter uſed by the Turks when they travel with their caravans. This is firſt oiled over the fire, and then ſalted and kept in veſſels made of a tough leather, worked round a wooden frame, of the ſame ſhape with the veſſels in which they bring their balſam from Mecca. *Pocock*'s Egypt, p. 186.

MANTICA, in zoology, the name by which Piſo and ſome other writers have expreſſed the pouch or bag of ſkin under the belly of the opoſſum, into which the young are received in time of danger. See the article OPOSSUM.

MANTICHORA, in natural hiſtory, a name given by the Roman authors to a fierce and terrible creature, which they deſcribe from the Greeks, who call it ſometimes alſo *Mantichora*; but when they write more correctly *Marticora* and *Martiora*. We have formed the name *man-tiger* on the ſound of the Roman name, though expreſſing a very different ſenſe; and our authors of the hiſtories of animals, figure to us under this name a terrible creature, partly from the accounts of Pliny exaggerated, and partly from their own imagination, with three rows of teeth, and with ſuch a ſhape as no animal ever poſſeſſed. Pliny tells us, that this creature had three rows of teeth which cloſed in with one another in a ſurpriſing manner; and Pauſanias, Ariſtotle, and Cteſias, all agree in the account of its having three rows in the under, and as many in the upper jaw. They alſo add, that the teeth, when they cloſe, fall in one with another in the manner of the teeth of a comb; and this they have alſo told us of the crocodile; and that therefore no bite is ſo terrible as that of theſe animals. Pliny and Ariſtotle both add to this, that the *Mantichora* had the face and ears perfectly reſembling thoſe of a man; and Ariſtotle adds, that its eyes were grey or bluiſh, and perfectly like the eyes of a man alſo. The voice of this animal is as oddly repreſented as its body; Cteſias and Ariſtotle, and many other of the Greek authors, ſay it had the ſound of a muſical inſtrument of the pipe kind; and Pliny ſays, that it was a ſort of mixed ſound, like that of the pipe and trumpet together; and Ælian gives it a power of imitating either the one or the other, as it pleaſed, by the different modulations of its throat. The Greek authors alſo give it a very great ſwiftneſs; but the Latins, not contented with any thing that does not look miraculous in ſuch an animal, give it a power of leaping in its running, which is little leſs than flying.

The whole ſtory of this animal ſeems founded on the love of the wonderful; and very probably the *Mantichora*, properly ſpeaking, was no other than ſome of the large hyænas which was at firſt ill deſcribed, and afterwards more and more wonders were added to the ſtory, till all ſhadow of truth was loſt.

MANTIS, the preying locuſt. See Tab. of Inſects, N°. 4. and the article LOCUST.

MANUAL, *manualis*, ſignifies what is employed, or uſed by the hand, and whereof a preſent profit may be made. Thus ſuch a thing is ſaid to be in the *manual* occupation of one, where it is actually uſed or employed by him. *Staundf.* Prærog. p. 54. *Cowel*, *Blount*.

MANUALIS *Lapis*, in natural hiſtory, the name of a ſtone found in America, of which Monardes relates that it has great virtues in curing chaps and cracks in the hands and feet; but he does not deſcribe it.

MANUBIÆ, among the Romans, the ſpoils of the enemy, or rather the money made of the booty, when ſold by the quæſtor. *Pitiſc.*

MANUCMANUC, in natural hiſtory, a name given by the people of the Philippine Iſlands to a very beautiful ſpecies of parrot, which is found very frequently wild in the woods there. It is of the ſame bigneſs with the common parrot, and is variegated with a great many different colours.

MANUCODIATA, in zoology, the name of the bird of paradiſe, as it is uſually called in Engliſh; a bird of which many fabulous accounts have been propagated, as that it had no legs, that it took in no food, and lived only on the dews; that it was always on the wing, and had no other way of reſting than as it hung in the air; that it was never taken alive, and that the male had a cavity in his back, which ſerved for the female to lay her eggs, and hatch her young in; all which are wholly fabulous. The bird is a bird of prey, but of a peculiar kind, the uſe of whoſe long feathers is not well known. See Tab. of Birds, N°. 6. *Ray*'s Ornithol. p. 55.

There are ſeveral ſpecies of this beautiful bird; Mr. Ray has reckoned eleven, and others have mentioned more, which were unknown to that author; but it is much to be queſtioned whether many of theſe are not rather the varieties of age and ſex in the ſame ſpecies. The diſtinguiſhing character of theſe birds is their extremely long feathers which they carry behind. It is well known now that they feed on ſmall birds, and build in the woods, perching upon trees like other birds, moſt of thoſe now brought into Europe being killed while ſitting. *Ray*'s Ornitholog. p. 62.

MANULCA, in antiquity, that part of the *catapulta* to which the cord uſed in working it was fixed. *Pitiſc.* See the article CATAPULTA, *Cycl.*

MANURE. See the article MANURING, *infra.*

MANURING (*Cycl.*)—Sea ſand is often made uſe of by way of *manure*, in ſome parts of Cornwall, near the ſea-ſhore. When the ſand is notably ſhelly, that is, much mixed with the broken pieces of ſea-ſhells, it is reckoned beſt. It is ſpread upon ſuch land as is intended for wheat, or uſually in the firſt crop of four, whatever be the grain; for after four crops it is the cuſtom in Cornwall to leave the land ſix or ſeven years for paſture before it is tilled again; and the graſs will be ſo good the firſt year, where this *manure* is uſed, as to be fit for mowing: This is called *mowing of gratton* by the people there. The Corniſh acre is eight ſcore yards, at eighteen foot to the yard. In one of theſe acres, the farmers beſtow, according to the diſtance from the ſea-ſhore, from three hundred ſacks to one hundred, each ſack containing thirteen gallons, which is called a horſe load, the roads in many parts of this country being ſo bad, that they are forced to carry the ſand on horſeback from the water-ſide to the land, though eight or ten miles diſtant. In this caſe the ſand coſts them in the whole about eight pence a load. Where the lands lie very diſtant from the ſhore, and from all water-carriage, they beſtow very little of this *manure*, but they do not care to be any where wholly without it. In ſome of theſe places they lay twenty load on an acre, and find a proportionable advantage from it. Where much ſand is uſed, the corn is large and plentiful, and the ſtraw little. Hence has grown the old Corniſh phraſe of *a buſhel of corn to a peck of ſtraw*; which is not miraculous in a place where the ears of barley are frequently found as long or longer than the ſtalks they grow on.

Where little of this ſand is uſed, there is generally a great deal of ſtraw, and but little and hungry ears of ſmall grain. After the corn is taken off, the graſs that naturally comes up is a white clover; and where the land is any thing deep, a red kind comes up among it. This is uſually but ſhort the firſt year, but it grows thick, and affords good feeding for the cattle; and they are found to thrive better, and give better milk than when they are fed on the high graſs, which generally ſucceeds where there has been leſs ſand uſed.

Another great advantage of the lands where much ſand is uſed, is, that no ſnow lies upon them; there is a continual winter-ſpring, and an early harveſt, uſually ſix weeks before the neighbouring lands that do not uſe it in proper quantities; ſo that all the expence of procuring it in quantities, is many ways amply repaid to the farmers.

We have about Erith, and in many other places, the ſame ſort of ſand in great abundance in the Thames, that is uſed with this great advantage in Cornwall; and if it ſhould be found on trial to anſwer as well, probably there would be found few places where this river would not afford it at ſome depth, or in ſome part of its bed. The coral ſand of Falmouth is dredged up from under about a foot thickneſs of the Ouze; and perhaps in the Thames, where the bottom ſeems of another nature, the ſame ſand, or ſome of equal efficacy, may be found underneath. The ſand taken up out of the Thames at Erith, is uſed by the brick-makers, and they obſerve that the graſs always grows particularly freſh and ſtrong about the edges of their heaps of it, and that clover naturally grows there among the other graſs. Phil. Tranſ. N° 113.

In ſome counties of England, particularly in Oxfordſhire, they uſe, by way of *Manure* for ſome of their lands, the cuttings and chippings of ſtone in the quarries, which is ſuppoſed to enrich the land by means of a ſalt that the ſtone contains, which being diſſolved by the weather is imbibed by the earth. *Plot*'s Oxfordſhire, p. 249.

MANUS *Martis*, in botany, a name given by ſome authors to the common cinquefoil, or *quinque folium vulgare*. *Ger.* Emac. Ind. 2.

MAO, or *Mau*, in botany, a name by which ſome authors have called the *magna Indica*, or Indian mango tree. *Hort.* Mal. vol. 4. p. 1.

MAPLE, *Acer*, in botany, the name of a genus of trees, the characters of which are theſe: The flower is of the roſaceous kind, and is compoſed of ſeveral petals arranged in a circular form. The piſtil ariſes from the cup, and finally becomes

comes a fruit compoſed uſually of two, ſometimes of three capſules, which are terminated by a foliaceous wing, and contain roundiſh ſeeds.

The ſpecies of *Maple* enumerated by Mr. Tournefort, are theſe: 1. The greater *Maple*, called the white mountain *Maple*, and by ſome the plane tree. 2. The common great *Maple*, with variegated leaves. 3. The mountain great *Maple*, with deep green leaves, reſembling thoſe of the platanus. 4. The great *Maple*, with rounder and leſs jagged leaves, ſuppoſed to be the Italian opulus of ſome authors. 5. The common or ſmall *Maple*. 6. The trifoliate *Maple*. 7. The bindweed leaved climbing American *Maple*, with flowers of a ſcarlet and gold colour. 8. The citron-leaved climbing American *Maple*, with blue ſpiked flowers. 9. The purple-flowered climbing American *Maple*, with pſeudo-acacia leaves. *Tourn.* Inſt. p. 615.

The ſeveral ſorts of this tree are eaſily propagated by ſowing the ſeeds, ſoon after they are ripe, in an open bed of common earth, covering them about half an inch thick with light ſandy earth. The ſpring following they will appear above ground, and will grow to a foot high the firſt ſummer. About the Michaelmas following they are to be removed, and planted at three feet diſtance, in which place they may remain four years; and at that time they will be large enough to plant out into the places they are to ſtand in.

The great *Maple* commonly, though very improperly called the *ſycamore-tree*, is raiſed very eaſily in this manner, and is a very valuable tree for gentlemen who have plantations near the ſea, as it bears the ſpray of the ſalt water very well, and will defend all the reſt if planted behind them.

The Virginian kinds may be propagated, either thus by ſowing, or by laying down the young branches early in the ſpring, giving them a little ſlit at a joint, by which means they will take ſufficient root in a twelve-month to be tranſplanted out. *Miller*'s Gard. Dict.

MAPLE *Sugar*, a kind of ſugar made from a ſpecies of the *Maple* called by Monſieur Sarazin, *Acer canadenſe ſacchariferum fructu minori*. Mr. Sarazin, a phyſician at Quebeck, intending to enquire at large into the nature of this ſort of ſugar, obſerved that there were four ſpecies of *Maple* common in the places where it was made, all which he ſent over to the garden at Paris. One of theſe ſpecies, diſtinguiſhed from the reſt by the ſmallneſs of its fruit, is called the ſugar *Maple*; this grows to ſixty or eighty foot high, and its juice, which is very redundant in the months of April and May, is eaſily made into a very good ſugar. They procure this juice from the tree by piercing a hole into the trunk, and placing veſſels to receive it: This juice, being evaporated, yields about one twentieth part of its own weight in pure ſugar. A middle-ſized tree, of this ſpecies, will yield ſixty or eighty pints of this juice, without receiving any damage as to its growth; and much more than this may be drawn, but then the tree manifeſtly ſuffers for it.

Mr. Sarazin obſerved ſome very remarkable particulars in regard to the ſaccharine quality of this juice, without which it never had it in the proper perfection. 1. The tree at the time that the juice is drawn out, muſt have its bottom covered with ſnow; and if it is not naturally ſo, the Indians know ſo well the neceſſity of it, that they always bring ſnow from elſewhere, and heap it up round it. 2. This ſnow muſt afterwards be melted away by the ſun-ſhine, not gradually thawed by a warm air. 3. There muſt have been a froſty night before the opening the hole in the trunk. It is remarkable that theſe circumſtances are ſuch as cuſtom and experience alone could have pointed out, ſince they ſeem contrary to reaſon; and ſo it is in many of the operations in chemiſtry, where the moſt ſeemingly rational means fail, while thoſe which ſhould ſeem quite contradictory to reaſon ſucceed. It is obſerved, that if the juice of the *Maple* be not in a condition to become ſaccharine while the ſnow lies at its root unthawed, that it almoſt immediately becomes ſo on the melting of the ſnow, and its penetrating into the earth. Mem. Acad. Par. 1730.

MARACANA, in zoology, the name of a bird of the parrot kind, but larger than the common ſpecies, and covered all over with bluiſh-grey feathers. It is very common in the Braſils.

The natives alſo call another bird of the parrot kind by the ſame name, which is of a fine green on the head, neck, and back, but the crown of the head looks a little bluiſh; the tail is mixed of red and a bluiſh-green; the under part being red, as is alſo the under part of the wings; at the origin of each wing, it has alſo a red ſpot; and on each ſide of the head a brown one. The noiſe this bird makes, is oe, oe, oe. *Marggrave*'s Hiſt. Braſil.

MARANA, in botany, a name by which ſome authors have called the ſtramonium, or thorn apple, a plant kept in ſome gardens. *Ger.* Emac. Ind. 2.

MARATHRUM, in botany, a name by which ſome authors have called the common fœniculum or fennel. Id. ibid.

MARBASIS, in botany, a name given by ſome to a kind of plant which they ſay climbed up trees, and there hung down from their branches in form of long jointed and naked filaments.

The word ſeems to be only a corruption of the word *anabaſis* of Pliny, which he calls alſo *ephedra*, and gives the ſame characters to. It ſhould ſeem that this is all an error, that no plant, ſuch as they deſcribe, ever exiſted, but that the whole was founded on this: The hippuris, or horſetail, was diſtinguiſhed by having naked and ſlender ſtalks full of joints; it thence became natural for the Greeks to call by the ſame name any thing that was in like manner compoſed of ſuch long and naked filaments; and the common *uſnea*, or hairy tree moſs, which hangs down from the branches of large foreſt trees, is more like a horſe's tail by far than the plant commonly ſo called is: it is not wonderful, therefore, that it ſhould be called by the ſame name.

The Greeks, from the watery places in which the common horſetail uſually grows, called it *ephydron*; and this word miſ-ſpelt ſeems to have made the *ephedra* of Pliny in this place. If this was found hanging from the branches of trees, and no body had ever mentioned its growing on the trees themſelves, it is no wonder that ſo careleſs a writer as Pliny ſhould deſcribe it as growing on the ground near the roots of trees, and climbing up their trunks, and then hanging down from their branches in form of horſes tails.

This ſeems to account for the whole that Pliny has left us concerning this plant; and it is very evident, that the common *uſnea*, or hairy tree moſs, very well agrees with his deſcription of the *ephedra* and *anabaſis*, though no other plant does. He ſays it hangs down from the large branches in form of numerous hairy threads, which are naked or wholly without leaves. The *Marbaſis* of the antients ſeems, therefore, to mean our *uſnea*. See the article USNEA.

MARBLE, *Marmor*, (*Cycl.*) in natural hiſtory. *Marbles* make a peculiar genus of foſſils, the characters of which are theſe: They are bright and beautiful ſtones, compoſed of ſmall ſeparate concretions, moderately hard, not giving fire with ſteel, and fermenting with and ſoluble in acid menſtrua, and calcining in a ſlight fire.

By theſe characters the *Marbles*, properly ſo called, are diſtinguiſhed from the porphiries and granites, which are properly ſtones of a very different kind, being compoſed of very different particles, and exhibiting contrary properties. See the article PORPHIRITIS, &c.

The *Marbles* are a genus of bodies ſuppoſed to be very well known, becauſe ſeen every day, and in common uſe; but they are in reality, notwithſtanding that, perhaps one of the moſt confuſed, and leaſt underſtood of all the bodies of this kind. The people who work upon them, know nothing more of them than that this will, and that will not receive a poliſh in a high degree; and that this may be worked, and another refuſes the tools; and the men of ſcience have conſidered them even leſs than theſe.

The *Marbles* were one of thoſe ſets of bodies that the antients were well acquainted with, and it may give no ſmall light into their true hiſtory, to pay a ſtrict attention to what they have left us concerning them, and enquire which of thoſe in uſe among them are known to us, and which loſt, and by what names we now call their *Auguſteum*, *Tiberianum*, *Luculleum*, and the reſt. This may ſerve to give a certain account of what they knew, and perhaps may point out to the builder, ſtatuary, and phyſician, ſome new uſes, at leaſt new to us, of many of them. *Hill*'s Hiſt. of Foſſ. p. 461. See the article LUCULLEUM, AUGUSTEUM, &c.

Ægyptian MARBLE, a name given by our artificers to a very beautiful green-and-white *Marble*, greatly in uſe among us, and brought in great quantities from Egypt and other places. It was alſo in frequent uſe, and in great eſteem among the Romans, who received it alſo from Egypt, and diſtinguiſhed too lightly two kinds of it, from the different diſpoſition and order of its variegations, and honoured them with the names of two of their emperors in whoſe reign they were firſt brought into uſe. Theſe were the *marmor Auguſteum* and *Tiberianum*. Thoſe pieces in which the variegations were waved and thrown into arches and circular figures, they called the *Auguſtan*, and thoſe which were marked with more diffuſed and ſcattered veins, they called the *Tiberian*. Theſe were the whole differences between the two; and if we were to acknowledge different ſpecies from ſuch differences as theſe, we muſt allow almoſt as many different ſpecies as we ſee blocks of *Marble*. *Hill*'s Hiſt. Foſſ. p. 482. This kind of *Marble*, in all its appearances, is, tho' a very beautiful yet a very rude, irregular, and various maſs. It is of a firm compact texture, and moderately heavy, and may be properly called a green *Marble* variegated with white, for thoſe are its two conſpicuous colours; but it has theſe mixed in ſo great a variety as to afford lights and ſhades of a vaſt number of degrees of colours. It has beſides theſe, alſo many other variegations of a duſky colour approaching to black. It is very bright and glittering when freſh broken, and variouſly ſo in its various parts. In the white parts it is brighteſt of all, and the other colours are more lucid as they are paler, or nearer approach to the white. It has, however, among its other particles, ſome of a very beautiful green foliaceous talc. The whole is capable of a good poliſh, and is common

mon in tables, &c. in the houſes of the polite part of the world. *Hill*'s Hiſt. Foſſ. p. 481.

Coralloide MARBLE, in natural hiſtory, the name given by authors to ſuch *Marbles* as have ſpecimens of the marine corals or bodies of that kind immerſed in them, as the ſea ſhells are buried in, and make a part of the body of others.

There are ſeveral ſpecies of *Marble* ſubject to hold theſe bodies, but we have in England principally two in uſe, the one of a greyiſh black, the other of a fine deep jetty black.

The firſt is found in many parts of Derbyſhire, and the corals it contains are of the porus kind, and of one of the moſt elegant ſpecies in the world; they are lodged in it at all angles, and in all directions, and are in general about an inch and half long, and three quarters of an inch broad, though ſome are much larger, and others ſmaller. They are compoſed of longitudinal plates, very fine and thin, and of a ſnow white, ranged in diſtinct orders, and finely interſperſed at ſmall diſtances, with thin tranſverſe plates; the whole internal part of the coral being thus divided into a ſort of ſquare cells. This net-like diviſion runs through about three-fourths of the body, but the top has only the longitudinal plates without the tranſverſe ones. It is plain that theſe before they were received into the bed of marble, had been ſuſtained in a fluid containing a very beautiful greyiſh white ſpar, for the net-like plexus of the bed is full of this matter; but the open part at top having no plates for the retaining this matter, has remained empty till received into the *Marble*, and is there found filled up with the common blackiſh matter of the reſt of the ſtratum. It is an extremely beautiful ſubſtance when poliſhed, and is uſed in many ornamental works. It is found in many parts of Derbyſhire and in Wales.

The other, or black *coralloide Marble*, is alſo a very beautiful ſpecies; it is a very cloſe compact ſubſtance, and of a fine even texture, very hard, of a deep jetty black, and capable of a high poliſh. It is elegantly variegated with fair and perfect ſpecimens of a coralloide porus, approaching to the nature of the former, but ſmaller and of a leſs elegant texture; and among theſe has uſually a great number of ſea ſhells, both of the turbinated and bivalve kinds. Theſe are lodged in various directions, and all of them, the corals as well as the ſhells, are of a pure ſnow white; and as the matter and texture of the others plainly ſhewed that they had been filled with ſpar before they were immerſed into the bed of *Marble*; theſe, on the other hand, retaining now no part of their original texture, though exactly their external figure, but being all made up of the ſame plain white ſpar, plainly ſhew that they were lodged in the *Marble* empty, and in their own native ſtate; for the cavities both of the corals and ſhells are all nicely filled with the matter of the *Marble*; but they have now no coralline nor teſtaceous matter about them, but in tract of time have plainly periſhed, and the cavities they left in the hard and ſmooth maſs of the *Marble* have been nicely and finely filled up with this ſpar, which therefore now as perfectly repreſents their figures, as if themſelves were there. *Hill's* Hiſt. Foſſ. p. 473.

It is found in great plenty in many parts of Ireland, particularly about Kilkenny, and is brought in great quantities to London, and uſed about chimney-pieces, and other ornamental works, and is commonly known among the artificers by the name of Kilkenny *Marble*.

Alabandium MARMOR, a name given by the antients to a very remarkably gloſſy ſpecies of black marble, dug near a city of that name in Caria, and much uſed in building among the Romans.

Caryſtium MARMOR, a name given by the antients to a ſpecies of marble, dug in the iſland of that name, and much uſed in ornamenting the public buildings; it was of a beautiful green, deeper than the Tiberian and Auguſtan marble, and without the white variegations. We meet with it ſometimes among antient remains; and the Italian antiquaries particularly mean this, by a name alſo in uſe among us, and proſtituted to every other ſpecies of green marble, the *verde antiquo*.

Chium MARMOR. See the article CHIUM *Marmor*.

Fuſile MARBLE. See the article FUSILE *Marble*.

MARMOR *Hymettium*. See the article HYMETTIUM *Marmor*.

Imitation of MARBLE in brimſtone. See the article BRIMSTONE.

Jaſſenſe MARMOR. See the article JASSENSE *Marmor*.

Lychnitis MARMOR. See the article LYCHNITIS *Marmor*.

Lydium MARMOR. See the article LYDIUM *Marmor*.

Lygdinum MARMOR. See the article LYGDINUM *Marmor*.

Lunenſe MARMOR. See the article LUNENSE *Marmor*.

Melium MARMOR. See the article MELIUM *Marmor*.

Numidicum MARMOR. See the article NUMIDICUM *Marmor*.

Parium MARMOR. See the article PARIUM *Marmor*.

Thaſium MARMOR. See the article THASIUM.

Tiberianum MARMOR. See the article TIBERIANUM *Marmor*.

Derby MARBLE, among our artificers, a name given to a very beautiful ſpecies of *Marble*, found in many parts of Derbyſhire, and frequently worked into chimney-pieces in London.

It is a very ſingular and beautiful ſpecies; its conſtituent matter is a pale, fine, whitiſh brown *Marble*, of a fine cloſe texture, and very bright and glittering hue: This is ſo full of entrochi, that they make more than half the ſubſtance of the maſs; and theſe cutting in different directions, and taking a fine poliſh, add greatly to the beauty of the whole, when wrought. *Hill*'s Hiſt. of Foſſ. p. 479.

The various forms in which theſe bodies appear in the ſtone, when cut, might give a ſuſpicion that many of them were ſome other foſſile; but this is only owing to their lying in all directions in the maſs; but when nicely examined, the oddeſt of them will be found to be no other than what a ſingle common entrochus may be cut into. They are of all ſizes, from the thickneſs of a large pin, to half an inch or more.

Italian MARBLE. See the article ITALIAN *Marble*.

Kilkenny MARBLE. See the article *Coralloide* MARBLE, *ſupra*.

Namur MARBLE. See the article NAMUR.

Colouring of MARBLE. The colouring of *Marbles* is a nice art, and in order to ſucceed in it, the pieces of *Marble*, on which the experiments are tried, muſt be well poliſhed, and clear from the leaſt ſpot or vein. The harder the *Marble* is, the better it will bear the heat neceſſary in the operation; therefore alabaſter, and the common ſoft white *Marble*, are very improper to perform theſe operations upon.

Heat is always neceſſary for the opening the pores of the *Marble*, ſo as to render it fit to receive the colours; but the *Marble* muſt never be made red hot, for then the texture of the *Marble* itſelf is injured, and the colours are burnt, and loſe their beauty. Too ſmall a degree of heat is as bad as too great; for, in this caſe, though the *Marble* receive the colour, it will not be fixed in it, nor ſtrike deep enough. Some colours will ſtrike, even cold, but they are never ſo well ſunk in as when a juſt degree of heat is uſed. The proper degree is that which, without making the *Marble* red, will make the liquor boil upon its ſurface. The menſtruums uſed to ſtrike in the colours, muſt be varied according to the nature of the colour to be uſed. A lixivium made with horſe's or dog's urine, with four parts quick-lime, and one part pot-aſhes, is excellent for ſome colours; common lye of wood-aſhes does very well for others: For ſome, ſpirit of wine is beſt; and finally, for others, oily liquors, or common white wine.

The colours which have been found to ſucceed beſt with the peculiar menſtruums, are theſe: Stone blue diſſolved in ſix times the quantity of ſpirit of wine, or of the urinous lixivium; and that colour which the painters call litmouſe, diſſolved in common lye of wood-aſhes. An extract of ſaffron, and that colour made of buckthorn berries, and called by the painters, ſap green, both ſucceed well diſſolved in urine and quick-lime, and tolerably well in ſpirit of wine. Vermillion, and a fine powder of cochineal, ſucceed alſo very well in the ſame liquors. Dragons blood ſucceeds very well in ſpirit of wine, as does alſo a tincture of logwood in the ſame ſpirit. Alkanet root gives a fine colour, but the only menſtruum to be uſed for this is oil of turpentine; for neither ſpirit of wine, nor any lixivium, will do with it. There is another kind of *ſanguis draconis*, called dragon's blood in tears, which, mixed with urine alone, gives a very elegant colour. Phil. Tranſ. N°. 268. Beſide theſe mixtures of colours and menſtruums, there are ſome colours which are to be laid on dry and unmixed. Theſe are dragons blood, of the pureſt kind, for a red; gamboge for a yellow, green wax for a green, common brimſtone, pitch and turpentine for a brown colour. The *Marble*, for theſe experiments, muſt be made conſiderably hot, and then the colours are to be rubbed on dry in the lump. Some of theſe colours, when once given, remain immutable, others are eaſily changed or deſtroyed. Thus the red colour given by dragons blood, or by a decoction of logwood, will be wholly taken away by oil of tartar, and the poliſh of the *Marble* not hurt by it.

A fine gold colour is given in the following manner: Take crude ſal armoniac, vitriol and verdegreaſe, of each equal quantities; white vitriol ſucceeds beſt, and all muſt be thoroughly mixed in fine powder.

The ſtaining of *Marble* to all the degrees of red, or yellow, by ſolutions of dragons blood or gamboge, may be done by reducing theſe gums to powder, and grinding them, with the ſpirit of wine, in a glaſs mortar; but for ſmaller attempts, no method is ſo good as the mixing a little of either of theſe powders with ſpirit of wine in a ſilver ſpoon, and holding it over burning charcoal. By this means a fine tincture will be extracted, and with a pencil dipped in this, the fineſt traces may be made on the *Marble*, while cold, which, on the heating it afterwards, either on ſand, or in a baker's oven, will all ſink very deep, and remain perfectly diſtinct in the ſtone. It is very eaſy to make the ground colour of the *Marble* red or yellow by this means, and leave white veins in it. This is to be done by covering the places where the whiteneſs is to remain with ſome white paint, or even with two or three doubles only of paper, either of which will prevent the colour from penetrating in that part. All the degrees of red are to be given to *Marble* by means of this gum alone; a ſlight tincture of it, without the aſſiſtance of heat to the *Marble*, gives only a pale fleſh colour, but the ſtronger tinctures give it yet deeper; to this the aſſiſtance of heat adds yet greatly; and finally the addition of a little pitch to the

tincture gives it a tendency to blackneſs, or any degree of deep red that is deſired.

A blue colour may be given alſo to *Marble* by diſſolving turnſol in a lixivium of lime and urine, or in the volatile ſpirit of urine; but this has always a tendency to purple, whether made by the one or the other of theſe ways. A better blue, and uſed in an eaſier manner, is furniſhed by the canary turnſol, a ſubſtance well known among the dyers: This needs only to be diſſolved in water, and drawn on the place with a pencil; this penetrates very deep into the *Marble*, and the colour may be encreaſed by drawing the pencil wetted afreſh ſeveral times over the ſame lines. This colour is ſubject to ſpread and diffuſe itſelf irregularly; but it may be kept in regular bounds, by circumſcribing its lines with beds of wax, or any other ſuch ſubſtance. It is to be obſerved, that this colour ſhould always be laid on cold, and no heat given even afterwards to the *Marble*; and one great advantage of this colour is, that it is therefore eaſily added to *Marbles* already ſtained with any other colours, and it is a very beautiful tinge, and laſts a long time. Mem. Acad. Par. 1732.

MARBLE *Colour*. To give this variegated colour to glaſs is a very eaſy operation: There needs no more than to put cryſtal frit into a pot in the furnace, and to work it before it has ſtood the uſual time to purify in the fire. *Neri*'s Art of Glaſs, p. 99.

MARBLE *Wood*, a name given by the people of ſome parts of America to the *lignum rhodium*, or roſe-wood, from the heart of the tree being ſometimes variegated like *Marble*.

MARBLED (*Cycl.*)—MARBLED *China Ware*, a name given by many to a ſpecies of porcelain, or China-ware which ſeems to be full of cemented flaws. It is called by the Chineſe, who are very fond of it, *tſou tchi*.

It is generally plain white, ſometimes blue, and has exactly the appearance of a piece of China which had been firſt broken, and then had all the pieces cemented in their places again, and covered with the original varniſh. The manner of preparing it is eaſy, and might be imitated with us. Inſtead of the common varniſh of the China-ware, which is made of what they call oil of ſtone and oil of fern mixed together. They cover this with a ſimple thing made only of a ſort of coarſe agates, calcined to a white powder, and ſeparated from the groſſer parts by means of water, after long grinding in mortars. When the powder has been thus prepared, it is left moiſt, or in form of a ſort of cream, with the laſt water that is ſuffered to remain in it, and this is uſed as the varniſh. Our cryſtal would ſerve fully as well as theſe coarſe agates, and the method of preparation is perfectly eaſy. Obſ. ſur les Cout. de l'Aſie.

The occaſion of the ſingular appearance of this ſort of Porcelain is, that the varniſh never ſpreads evenly, but runs into ridges and veins. Theſe often run naturally into a ſort of moſaic work, which can ſcarce be taken for the effect of chance. If the *marbled* China be deſired blue, they firſt give it a general coat of this colour, by dipping the veſſel into a blue varniſh; and when this is thoroughly dry, they add another coat of this agate oil.

MARCASITE, (*Cycl.*) in natural hiſtory, a name uſed in a very vague ſenſe by many writers upon foſſils, but reſtrain'd by Dr. Hill to be the name of a peculiar genus of foſſils, the characters of which are, that they are compound inflammable metallic bodies, naturally conſtituting whole ſtrata; of a ſolid and firm ſubſtance, of an obſcurely and irregularly foliaceous ſtructure, and of a bright glittering appearance, very freely and readily giving fire with ſteel, not fermenting with acid menſtruums, and when put into the fire, yielding a deep blue flame, and finally calcining into a purple powder.

Though the natural diſpoſition of theſe bodies be to form whole ſtrata, and that they are moſt uſually found in this ſtate, yet they are at times found in looſe maſſes, as many, even of the ſtones of ſtrata, at times are. They are ſubject alſo, by their frequent admixture with adventitious matter, the ores of metals, and other foſſile bodies, to ſuch various external appearances, that their varieties are almoſt innumerable, and moſt of them are very beautiful: But tho' theſe accidental differences are ſo very numerous, the genuine ſpecies are very few, the naturaliſt allowing only three. Theſe are, 1. The bright ſilver-colour'd *Marcaſite*. 2. The bright gold-colour'd *Marcaſite*. And 3. The pale heavy dead white *Marcaſite*.

The firſt ſpecies uſually conſtitutes ſtrata of great extent, and of about a foot in thickneſs; very often much leſs, but ſcarce ever much more: It is compoſed of a number of foliaceous flakes, not regularly diſpoſed, but oddly contorted and waved, and often folding round one another; though ſometimes this ſtructure is leſs diſtinct, and the whole ſeems run into one ſolid maſs. Its colour is extremely bright, very like ſilver, but more glittering. This is its common and its more pure ſtate; but it is liable to a vaſt number of varieties. Sometimes it contains a large quantity of the ore of lead or tin, and very often a duſky brown ferrugineous matter is intimately mixed with it; at other times many of the angular and regularly figured phlogoniæ are immerſed in it, and ſeem to make a part of its very ſtructure; and ſometimes where it has room, its conſtituent flakes riſe on its ſurface in ſeveral conjunct ſeries, and form a very elegant foliaceous top to it. Nor is this all the difference of appearance it puts on; for very often, where there has not been a ſufficient quantity of it to form itſelf into any figure alone, it is found depoſited in ſpecks, or flat cakes, of a more or leſs complex, but always of a flaky ſtructure, on ſtones or ores of various kinds; and frequently, beſide its native ſilvery white, it has all the rainbow-colours on its different parts, as differently turned to the light. *Hill*'s Hiſt. of Foſſ. p. 609.

The *golden Marcaſite* is a more beautiful ſubſtance than the former: It is of a leſs firm or compact ſtructure than the others, and is uſually found in very long but very thin ſtrata, and is of an extremely bright and glittering appearance, and is ſometimes found in large and miſ-ſhapen nodules, or looſe maſſes. It is liable to all the accidental varieties that the former is, and in many of them makes a very elegant appearance. The third, or dead white kind, is the hardeſt and heavieſt of all. It is, in its more uſual and natural appearance, of much leſs beauty than the former kinds, but it is, like them, ſubject to various accidents, under ſome of which its makes a very gay and ſplendid appearance. It, like the reſt, ſometimes forms compleat ſtrata, ſometimes detach'd nodules; but its moſt uſual appearance is in the horizontal cavities of other ſtrata; in theſe it often forms a ſort of baſtard ſtratum of many yards continuance, and frequently of very conſiderable thickneſs, for it almoſt always fills up the whole vacuity, and that ſo cloſely as ſeldom to leave room for any foliaceous ſhoots at its ſurface, or protuberances at its edges, but forms a plain maſs like that of a metal melted and poured into the place. It is of the ſmoothеſt ſurface of all the *Marcaſites*, and is ſomewhat ſoft to the touch, and in colour reſembles tarniſhed pewter.

This is its common appearance, but it ſometimes ſhews itſelf like the reſt in ſmall patches on the ſurfaces of ſtones, and is there often very beautifully foliated; it is liable alſo to all the accidents of the other kinds.

The *Marcaſites* are all found in great plenty in the Engliſh and German mines. Devonſhire and Cornwall afford vaſt quantities of them; and very beautiful ones are found in Derbyſhire. They often contain the ſeveral metals, but the quantity of ſulphur has yet baffled all the attempts that have been made to work them to advantage. *Hill*, Hiſt. of Foſſ. p. 610.

Aviſenna mentions four kinds of *Marcaſite*; the golden, the ſilvery, the braſſy, and the iron *Marcaſite*. He does not pretend that the two firſt contain really the metals whoſe names they bear, but ſays they are ſo called from their likeneſs in colour, and that they are thought by ſome to poſſeſs, in part, their virtues. Dioſcorides mentions only one kind, that is, the braſſy pyrites or *Marcaſite*. This is, of all others, the moſt common; and the preference is given by this author to ſuch of it as is of a bright braſs colour, and ſuch as, when ſtruck againſt ſteel, yields the largeſt ſparks. This is the kind called by Aviſenna and Serapio, *Marcaſita nuhaſi*, and it is called by the Perſians, *hagiar alruxenani*, that is, the ſtone of light or brightneſs, there being a very vivid and ſparkling luſtre in this ſtone when newly broken. The antients uſed to calcine it, and then made it an ingredient in their ſeveral compoſitions for diſeaſes of the eyes. The calcining it renders it a ſort of colcothar of vitriol, for the ſulphureous parts burn away in the operation, and leave only the *caput mortuum* of the vitriol behind; ſome have ſuppoſed it called *lapis lucis*, from its reſtoring light to the eyes; but this is a very far fetch'd etymology.

The firſt opinion of the world, in regard to this glittering ſubſtance, was, that it was almoſt all gold or ſilver, according to the colour: But the error of this opinion being ſoon diſcovered by trials, there grew another contrary one, that *Marcaſite* never contained any metal at all. This is, in general, true of our *Marcaſites*, but it is not to be extended into a general rule for thoſe of all the world. The ſearchers after royal mines are not to throw away all theſe ſubſtances as uſeleſs, wherever they find them. For Alonſo Barba, a very great judge of theſe things, and himſelf very converſant in mines, aſſures us, that the *Marcaſites* of the mines of Montſerrat *en los chicas* contain uſually one half ſilver: And in the mines of Potoſi there is great plenty of a *Marcaſite*, in which there is embodied a large quantity of the black ſilver ore, well known there, and eſteemed one of the richeſt kinds, except the native ſilver. They always are glad to find this *Marcaſite* vein, it being eſteemed a proof, that the black ore is very rich in ſilver. They make the ſame ſort of obſervation in regard to orpiment and gold, that they do in regard to *Marcaſite* and ſilver; that the orpiment uſually contains itſelf ſome gold, and is a certain ſign that there is gold in the neighbourhood wherever it is found. *Alonſo Barba* de Met.

MARCH, (*Cycl.*) in military affairs, is in general the ſteps made in marching, or the moving of a body of men from one place to another.

But the beat of the drum, when the ſoldiers are upon *March*, or beginning to march, is likewiſe called the *March*. It is likewiſe a word of command, when a battalion is to alter its diſpoſition.

To *march* is to move from one place to another. The orders being given the evening before a *March*, that the drums beat at a certain hour, the ſoldiers are then ready drawn up at their ſtandards and colours, in ſquadrons or battalions, ready to begin their *march*.

As many accidents may happen in the *March* of an army, as defiles, marſhes, woods, and the like, it is the prudence of a general to order his *March* accordingly, and to take care that the columns of his army have a free communication one with the other. The *March* of an army is compoſed of an advance guard, the main body, and the rear guard, and is ſometimes in two, four, ſix, or eight columns, according as the ground will allow.

MARCH, *Marchia*, in our old writers, is uſed for a limit or border. Thus we read of the *Marches*, between England and Wales; or England and Scotland; which laſt are divided into *Weſt* and *Middle Marches*. And the word is uſed generally for the precincts of the king's dominions, in 24 Hen. 8. c. 12. Terms of Law.

The word comes from the German *Marck*, i. e. *Limes*; or from the French *Marque*, i. e. *Signum*, uſed for the marks or ſigns to diſtinguiſh between two countries or territories. *Blount*, *Cowel*.

MARCHANTIA, *Liverwort*, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: It is of the nature of what we generally call the *lichens* or *liverworts*, and produces male and female flowers on the different parts of the ſame plants.

The male flower ſtands on a long erect peduncle, which ariſes from a ſort of cup or caſe on the plant. The cup is a common perianthium, of the peltated kind, and divided into four, five, or ten parts, every ſegment having its edges depreſſed, and all being of the ſame ſize. This perianthium is large, and contains under it as many flowers as there are ſegments of it. Each flower is monopetalous, of a turbinated form, ſtanding erect, and ſomewhat ſhorter than the cup. The ſtamen in each flower is ſingle, and is a ſlender filament, longer than the flower. The apex or anthera, ſuſtained on this ſtamen, is of an oval figure, and is commonly found burſt at the top into as many parts as there are ſegments in the perianthium, be that four, five, or ten. The farina within it is affixed to a ſort of hairyneſs.

The female flower has no pedicle; the cup is a one-leav'd perianthium, erect, open at the top, and undivided, conſiſting of a ſort of membranaceous ring, which does not fall off till the ſeeds are ripened. There is no other flower but this cup, which contains ſeveral naked ſeeds in the bottom; they are of a roundiſh compreſſed figure. Dillenius has compriſed this genus under the general term *lichen*; and Micheli has called different ſpecies of it by the different names of *lunularia* and *hepatica*; and, according to theſe diſtinctions, the *Marchantia* is the name of thoſe ſpecies which have the cup of the male flower divided into eight or ten ſegments, which are flat, and do not encloſe the flowers. The *hepatica* is the name of thoſe ſpecies which have the male cup, of a conic figure, divided into five ſegments, and thoſe bending inwards, and the *lunularia* of thoſe ſpecies which have the male cup, of a cruciform figure, with curled ſegments, encloſing the flowers. *Linnæi* Gen. Plan. p. 506. *Micheli* Nov. Gen. Plant. *Liverwort* is ſaid to be aperient, attenuant, and reſolvent, and therefore good in obſtructions of the liver, and other viſcera; but at preſent is only uſed as an ingredient in ſome compoſitions.

MARCHERS, or *Lords* MARCHERS, in our old writers, noblemen that lived on the marches of Wales, or Scotland. Theſe, in times paſt, according to Cambden, had their laws, and power of life and death, *&c.* like petty kings. But ſuch powers were aboliſhed by the ſtat. 27 Hen. 8. c. 26. and 1 Edw. 6. c. 10. Terms of Law, *Blount*.

MARCHIONIS *Pulvis*, a term uſed for a certain compound powder, preſcribed in the Leyden Diſpenſatory, and greatly recommended by many as an anti-epileptic and abſorbent.

The ingredients are male piony root, half an ounce, wood of miſſetoe of the oak, raſpings of ivory, elks hoof, ſpodium, the tooth of the unicorn fiſh, or, in its ſtead, the antlers of the ſtag's horn, red and white coral, and pearls, of each a dram. Theſe are all to be rubbed into a powder, with twenty leaves of pure gold, and given half a dram twice a day.

MARCULUS, among the Romans, a knocker, or inſtrument of iron to knock at the doors with. *Pitiſc.* Lex. Ant.

MARDAC, in the materia medica of the antients, a name given by ſome to litharge. The Arabian writers have ſometimes called it by this name, and ſometimes by that of *merdeſengi*. Many of their commentators have thought that they meant two different ſubſtances by theſe two names; but it does not appear to be truly the caſe, the two words ſtanding, in different writers, for the ſame thing. Aviſenna has given us a chapter on *Mardac*, in which he has tranſlated the chapter of Dioſcorides on litharge: And Serapio has given us a chapter on the *merdeſengi*, in which he has given us an account of the ſame ſubſtance, under the terms that Galen uſes for the deſcription of litharge, and even quotes him for the account.

MARES, *Equa*, in zoology, the female of the horſe kind. See the articles EQUUS and HORSE.

No *Mares* in the world are better for breeding out of of than the Engliſh, provided they are properly choſen for the ſort of horſe intended to be bred. The *Mare*, whatever ſort of horſe is intended to be raiſed from her, ſhould be perfectly ſound, and as free from all defects as the ſtallion. They ſhould have no ſplaint, ſpavin nor curb about them; for the colt will certainly take after them if they have. The higheſt ſpirited *Mares* are beſt, and, in general, if there be any natural defect in the *Mare*, it ſhould be remedied in the ſtallion; and if any in the ſtallion, it ſhould be remedied in the *Mare*, as much as poſſible, in order to the having good colts.

The particular directions regarding the kinds of horſes to be bred, are theſe: If for the manege, or pads, the *Mares* ſhould have their heads well ſet on, and their breaſts broad; their legs not too long, their eyes bright and ſparkling, and the bodies large enough, that the foal may have room to lie in their belly. They ſhould be of a good and gentle diſpoſition, and their motions eaſy and graceful: The more good qualities the *Mares* have, the better, in general, the colts will prove.

If the owner would breed for racing, or for hunting, the *Mares* muſt be choſen lighter, with ſhort backs and long ſides; their legs muſt be longer, and the breaſt not ſo broad; and ſuch ſhould always be choſen as have good blood in their veins. If the ſpeed and wind of any particular *Mare* have been tried, and found good, there is the more certainty of a good colt from her: But ſhe ſhould be in full health and vigour at the time, and not above ſeven years old, or eight at the utmoſt. The younger the breeders are, the better, in general, the colts will be.

A *Mare* may be covered any time after ſhe is two years old; but the beſt time is after ſhe is four; at this age, or between this and ſeven, ſhe will nouriſh a colt beſt of all; and though ſhe will breed till ſhe is thirteen, yet it is generally obſerved, that when ſhe is paſt ten, the colts bred from her are dull and heavy. People who regard the moon, in theſe caſes, will have their *Mares* covered only between the end of the firſt quarter and the full; they pretend that theſe colts will be the moſt ſtrong and vigorous, but that thoſe begot in the waning of the moon, will always be weakly and tender. A much more eſſential caution, however, is, that before the *Mare* is to be covered, ſhe ſhould be taken into the houſe for ſix weeks, at leaſt, and fed well with good hay and oats, well ſifted, to give her ſtrength to go through the operation. If there is any reaſon to ſuſpect that the *Mare* will not conceive, the beſt method to inſure it is to let her blood in the neck, about ſix days before ſhe is cover'd: The quantity of blood taken away ſhould be about two quarts, or ſomewhat leſs. It is a general cuſtom to open the veins on both ſides the neck for this, taking half the quantity from each, but this is trifling.

The method of covering, ſo as to make it moſt ſure to ſucceed, is this: The *Mare* is to be brought into ſome open place, and tied to a poſt; and the ſtallion is to leap her in the morning faſting, and as ſoon as he diſmounts, a pail of cold water is to be thrown upon her, to make her ſhrink in and retain the ſeed. She is then to be taken away out of hearing of the horſe, and is neither to eat or drink for four or five hours after.

It may be known if ſhe ſtands to her covering, by her keeping a good ſtomach, and not neighing at the ſight of a horſe. Some, to make it quite ſecure, put the *Mare* and horſe together in an empty houſe every night, for four or five nights, taking away the horſe in the morning, and feeding him very liberally, and the *Mare* very ſparingly, and particularly giving her very little water.

There muſt be proper care taken of her after covering. The ſame method of feeding her with good hay, and ſifted oats, muſt be continued three weeks, or a month, and ſhe muſt be kept within doors, and without any exerciſe; her ſtable muſt be kept very clean, and her feet pared, and with thin ſhoes on. After this ſhe may be turned out for the ſummer ſeaſon, and only taken up in September, in order to be kept well fed till ſhe foals. If there be great difficulty in her foaling, or the ſecundine be retained, the method is to hold her noſtrils, ſo that ſhe cannot breathe; and if this does not do, a decoction of madder-root, or of fennel, in water, with a mixture of ale or wine, is found very effectual.

When the whole is over, the *Mare* is very apt to eat up her ſecundine; but this ſhould be prevented, for it is an unnatural food for her, and will injure her health. When ſhe has licked her foal, ſome perſons ſhould ſtroak and milk her before the foal ſucks. This will make the milk come down in greater plenty, and will prevent it from clotting into lumps, or from diſagreeing with the young creature's ſtomach. It often happens, that the milk clods in the udder, and the foal, being able to get none out, the *Mare* is ſuppoſed to be dry; and in conſequence of this ſuppoſition, ſhe actually becomes ſo. But the remedy is eaſy. Let as much milk as can be got from her be boiled with ſome lavender flowers, and the udder bathed thoroughly with it warm, ſeveral times a day: If no milk, or not enough can be obtained from her, other milk or common water will do; for the principal effect is from the heat of the liquor, and the virtue of the lavender, which breaks the clods and lumps, and then the foal's ſucking more as it grows ſtronger, will prevent the like accident for the future.

The water given the *Mare* for the firſt month after foaling, muſt be what the dealers in horſes call the white maſh, that is,

is, bran and water, ſtirred together till the liquor is white: A month after foaling a decoction of brimſtone and ſavin will be very proper, and will give ſtrength to the colt.

After this the *Mare* may be put to any moderate exerciſe, as harrowing, or the like, and both ſhe and the colt will be the better for it; only care is to be taken that ſhe do not let the colt ſuck while ſhe is hot.

Many are of opinion, that the winter is a very bad time for a *Mare* to be foaling; but though there is ſcarcity of graſs, the *Mare* may be houſed at this time, and well fed with hard meat, and, in this caſe, it will prove better both for her and the colt; he will be better limbed and ſtronger than if bred at graſs. See the article FOAL.

MARECA, in zoology, the name of a Braſilian ſpecies of duck, much valued there at table. It is of the ſhape of our duck. Its head is grey, but has a beautiful red ſpot on each ſide, at the inſertion of the beak, and a whiteneſs in the lower part under the eyes. Its breaſt and belly are of the colour of freſh cut oak, variegated with black ſpots. Its legs and feet are black. Its tail grey; and its wings elegantly variegated with grey and brown; but they have in the middle a large mixture of that gloſſy green which we ſee in the necks of our drakes. There is, beſide this, another ſpecies of the *Mareca*, which is of a duſky olive-colour'd brown on the back, white on the throat, and grey on the breaſt and belly, and very remarkable for the fine bright red colour of its feet. *Marggrave*, Hiſt. Braſil.

MARENA, in zoology, the name of a fiſh of the harengiform kind, much approaching to the nature of the common pilchard; but differing from it in that it has not the ſerrated longitudinal line under the belly, and lives in lakes, not in the ocean. It ſeldom arrives to more than five inches in length; its back is blackiſh, and its ſides white and ſilvery, and its ſcales are very looſe, and eaſily rubbed off. It is a better taſted fiſh than the pilchard, and its fleſh is firmer. *Willughby*, Hiſt. Piſc. p. 229.

MARGA, *Marle*. See the article MARLE.

MARGEN, in the materia medica, a name uſed by ſome of the later Greek writers to expreſs red coral. It is founded on an error, however, the word *Margen* being made from the Arabian *margian*, which does not ſignify coral, but a purple ſea wrack, or fucus, uſed in dying. See the article MARGIAN.

MARGENSTEIN, in natural hiſtory, a name given by the German writers to a ſort of indurated marle, which while in the ſtrata is nearly of the hardneſs of ſtone; but when laid on the ſurface of the earth, and expoſed to the wind and rain, ſoon diſſolves, and enters the pores of the ground, enriching the ſoil to a very great degree. We have the ſame ſort of ſtony marle in ſome parts of England, only that ours is leſs hard, and yet takes more time to break and diſſolve in the air. They are both moſt proper for lands of a looſe loamy nature, and keep them in heart a long time. *Swedenborg*, de Rebus Natural.

MARGGRAVIA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium is compoſed of ſix ſcales, diſpoſed in oppoſite pairs, and the ſmaller placed below the others. The flower is very ſingular, it conſiſts of one petal, and is of a conic oval form, every where whole and perfectly cloſed at the mouth; this never opens, but, when it has ſtood a ſmall time, is thruſt off at the baſe by the other parts of the fructification. The ſtamina are numerous, ſhort, and expanded filaments; the antheræ are large, erect, and of an oval figure; the germen of the piſtil is oval; there is no ſtyle, and the ſtigma is obſolete. The fruit is a globoſe berry, having only one cell, in which there are numerous very ſmall ſeeds. Beſide the flowers there is ſomething very ſingular in the umbels of this plant: In the middle of theſe there ſtand a number of oblong ſeſſile bodies of a wonderful figure; they are compoſed of one leaf with an open mouth, and are bent downwards, and open at the baſe. Theſe are not flowers, but mere excretory glands for the plant, thus oddly ſituated. *Linnæi* Gen. Plant. p. 282. *Plumier* Gen. p. 29.

MARGIAN, in botany, a name given by ſome of the antient writers, particularly the Arabian phyſicians, to the plant called by others *argina* or *arginem*. This is deſcribed to be a purple ſea plant. Some have ſuppoſed that cochineal was meant by this word, but that is an error. Others have come ſomewhat nearer, in ſuppoſing it to be the name of coral; but as the antients have ſaid that it was uſed in dying, it could not be coral; and indeed there is no other plant that it can mean, but that fucus uſed by the Greeks in dying, and called *fucus porphyrizon*, or the purple dying ſea plant. See the articles ARGINA and FUCUS.

MARIGOLD, in botany. See the article MARYGOLD.

MARQUES *de Ladre*, in the manege. See the article DULL.

MARINE-*Barometer*. See the article BAROMETER, *Cycl.*

MARINE *Remains*, a term uſed by many authors to expreſs the ſhells of ſea fiſhes, and parts of cruſtaceous and other ſea animals, found in digging at great depths in the earth, or on the tops of high mountains. Their being lodged in theſe places, is an evident and unqueſtionable proof of the ſeas having once been there, ſince it muſt have covered thoſe places where it has left its productions.

It has been a favourite ſyſtem with many, and particularly with the late Dr. Woodward, that all theſe marine bodies were brought to the places where they now lie, by the waters of the univerſal deluge; which, as we are informed by holy writ, covered the whole ſurface of the globe, and even the higheſt mountains. But though this is a very ready expedient to account for many of the natural phænomena, yet there are evident proofs that it cannot have been the cauſe of all that is attributed to it; and there muſt neceſſarily have been ſome other cauſe of many of theſe remains having been placed where we now find them. Neither does the opinion of ſome particular authors, that partial inundations of different places have left theſe *marine* bodies behind them at the receſs of the waters, ſeem ſufficient to account for the multitudes of theſe remains, many of which we find thrown upon places inacceſſible to ſuch floods. *Moro* de Cruſtaceis in Montib. deprehenſ.

Signior Moro has attempted to account for theſe phænomena on a new plan of reaſoning. He obſerves, that it is the beſt baſis of argument to begin from facts; and that if we can certainly find how ſome part of theſe animal remains come to be depoſited at ſuch great diſtances from their natural reſidence, we may very rationally conclude, that by the ſame means, be they what they will, all the reſt were alſo brought thither. He adds, that the earth, once the bottom of the ſea, or the level ſurface of a plain, may be, and frequently has been, in the memory of man, raiſed up into a mountain by ſubterranean fires, earthquakes, and volcanos. He mentions the famous inſtance of the new iſland raiſed out of the bottom of the ſea near Santorini in the year 1707, which became of a circumference not leſs than ſix miles, and of the new mountain raiſed near Puzzoli in 1538.

Theſe and many other like facts, prove that the origin of mountains and iſlands may have been ſuch, and that the matter they conſiſt of may have been the ſame with what was once the bottom of the ſea; and that the *marine* bodies found in theſe mountains, were ſuch as were living, or remaining of living fiſh at the time when the iſlands or mountains were ſo raiſed above the ſurface of the water which before covered it.

This is no new opinion; but this author has ſet it in a new and much ſtronger light than it ever had appeared in before, by the inſtances and examples he has brought in proof of it.

Some have been fond of believing that the bodies we call *marine remains*, were never indeed any parts of living animals, but that they are mere *luſus naturæ* formed in the places where they are found; but Fabius Columna proved this to be an error, ſhewing that the ſhark's teeth, or gloſſopetræ of the iſland of Malta, when calcined by a ſtrong fire, yielded aſhes, the ſame with thoſe from animal bodies, and by no means of the ſame nature with thoſe produced from calcined ſtones.

That changes of parts of the bottom of the ſea into dry land, have often been made, is proved not only from the late known inſtances, but from the teſtimonies of Strabo, Pliny, and other writers of credit: And nothing is more obvious to reaſon, than that in the ſudden riſe of ſuch parts of the bottom of the ſea, all its contents, all the ſhells, and other hard parts of fiſhes lying there, would be carried up with it.

As ſome mountains and ſome iſlands muſt have certainly been produced in this manner, it is not impoſſible but that all of them may have been ſo; and there is no more than this required to account clearly and evidently for all the vaſt profuſion of *marine* bodies at land as we find them, without having recourſe to the improbable means of the univerſal deluge, which for many plain reaſons cannot have been the cauſe; or to the effects of particular inundations, which muſt have been wholly incapable of lodging many of them there. The lodgment of ſhells in the ſolid ſtrata of mountains, is better accounted for by this ſyſtem of Signior Moro than any other: And if it be aſked why ſome mountains afford them in great plenty, and others not at all, it will not be difficult to anſwer, by obſerving, that among the mountains of the more known parts of the world, ſome conſiſt of more ſolid rock, and others of various ſtrata of earthy and other matter; that the firſt of theſe may be ſuppoſed primary or natural mountains, and the others ſecondary or accidental ones; and that theſe *marine remains* are always wanting in the former, and uſually are found in the latter, which is a fact greatly favourable to this ſyſtem.

There are many difficulties attending the accounts of all authors of the formation of the earth, and the lodging theſe bodies in it; nor is this laſt ſyſtem without difficulty. The cauſes here aſſigned as to the origin of mountains and iſlands, doubtleſs have been ſo in regard to ſome, but ſcarce to all; and the bodies here treated of are ſo numerous, in ſome particular places, that ſcarce any account can ſolve the difficulty of their being collected together in ſo ſtrange a manner.

MARINE *Salt*. See the article SALT.

MARINELLA, in botany, a name by which ſome authors have called the great *plu*, or garden valerian. *Ger.* Emac. Ind. 2.

MARINER, the ſame with ſeaman or ſailor. See the article SAILOR, *Cycl.*

MARINERS-*Compaſs*. See the article COMPASS, *Cycl.*

MARIO, in ichthyology, a name given by Pliny, and other of the old Roman authors, to a large fiſh allied to the accipenſer or ſturgeon. There ſeems, from all that they have ſaid of it, great reaſon to believe that it was the fiſh we at preſent call *huſo*, or the ichthyocolla fiſh, from iſinglaſs made of it. Artedi makes this a ſpecies of the accipenſer or ſturgeon, and diſtinguiſhes it by the name of the accipenſer without tubercles. See the article ACCIPENSER.

MARJORAM, in botany. See the articles MAJORANA and ORIGANUM.

MARIS, in ichthyology, a name given by Charleton and ſome others, to a fiſh called, by the generality of both the antient and modern writers, *ſmaris*, and by ſome *leucomenides*, from its whitiſh colour, and its external reſemblance to the fiſh called *mænis* and *mæna*; it is, like that fiſh, a ſpecies of the ſparus; and is diſtinguiſhed by having a black ſpot on each ſide, and the tail and belly fins red.

MARISCA, a word uſed by chirurgical writers to expreſs an excreſcence about the anus.

MARITACACA, in zoology, the name of a very remarkable American animal, more uſually known by the name of the opoſſum. See the article OPOSSUM.

MARITUS, in the chemical jargon, a word uſed to expreſs the ſulphur of metals. The writers on the ſubject of the philoſophers ſtone uſually expreſs themſelves in this enigmatical manner, calling ſulphur the huſband, and mercury the wife in all metals; which, as they are more or leſs perfectly combined, make the metal more or leſs pure, and approaching to perfection.

MARK, (*Cycl.*) at ſea, the ſame with *land-mark*. See the article LAND-*Mark*.

MARK, in the manege. A horſe *marks*, that is, he ſhews his age by a black ſpot, called the bud or eye of a bean, which appears when he is five and an half, in the cavity of the corner teeth, and is gone when the horſe is eight years old. After that age he ceaſes to *mark*, and is ſaid to have razed. See the article EYE *of a Bean*.

Falſe-MARKED is the ſame with *counter-marked*.

MARK, among bowlers. See the article BOWLING.

MARLE (*Cycl.*)—The *Marles* in the northern parts of England contain ſand, and run into a ſort of loam: Thoſe in Suſſex are more like fullers earth, and therefore are by much the fatteſt and richeſt.

Marle, in general, is much of the nature of chalk, and the potters find, that when either chalk or *Marle* happen to be mixed with their clay, they will burn with the reſt of the ſubſtance, and the veſſels will ſeem very ſound; but as ſoon as any water is put in them, they will run, the chalk or *Marle* having been burnt into a ſort of lime, and ſlaking like common lime with the water.

The *Marles* that are ſo ſandy, that they can ſcarce hold together, are a very good manure for cold clay lands, and are an objection to the general rule, that *Marle* is not to be uſed to clay. *Marle*, in general, ſuits beſt with hot lands, for it is apt to bind and ſadden the tough clays; but as there are no rules without their exceptions, where *Marle* is not laid too thick, and is not of too binding a kind, it will often very much improve paſture grounds, though they are upon a clayey ſoil.

Cowſhut or ſtone *Marle* is, in moſt countries, found under clay, or low black land, eight or ten foot deep; clay and ſteel *Marle* ſometimes under ſandy land: In clayey ground it ſeldom lies more than three foot deep; but in ſandy ones it is often much deeper. The Suſſex *Marle* commonly ſhews itſelf pretty low among the broken ſtrata of hanging grounds.

For the digging of *Marle* they commonly uſe pick-axes, ſhovels, ſpades, and wheel-barrows; and where the pit is broad, that they can make an eaſy aſcent, ſmall carts of four foot ten inches long, and two foot three inches wide, and about fourteen inches deep, made ſo that a load is very eaſily ſhot out of them.

Marle is ſuppoſed to be fruitful from its ſalt and oily quality: The ſalt it is ſuppoſed to contract from the air, and therefore many are of opinion, that the longer it is expoſed to the air before it is uſed, the better. They lay it upon the graſs ground, in ſome places, three or four years before they plow it up; and when they cover the arable lands with *Marle*, they will not plow, in many places, to more than an inch deep, that they may not bury it. Markham, indeed, is of a contrary opinion, and would have it buried deep, that the ſun may not draw out its virtue. The *Marles* of different places are in themſelves ſo different, that both theſe opinions ſeem right in part; the *Marles* of Suſſex being found to ſucceed beſt where buried deep, as ſoon as taken from the pit; and thoſe of the north of England ſeldom doing much good to the lands, unleſs they are expoſed a long time firſt.

The experience of the farmers in different places has ſhewn alſo, that different times are to be obſerved for the laying it on, according to its nature and that of the land to be improved by it. In Suſſex they always lay on the *Marle* in the beginning of winter; and in Staffordſhire in May and June. Good *Marle* will ſlake like lime with the ſun's heat in a hot day, eſpecially if there has happened any rain. Some farmers harrow in the *Marle*, juſt before they plow the land, which is a very good way to mix it perfectly. Cole ſeed, clover, and all kinds of hay plants, grow well upon marled lands. Lands ſeated on *Marle* are uſually very rich, tho' in their own nature cold and heavy. The deeper theſe lands are turned up in plowing, the better crops they will always yield. *Mortimer*'s Huſbandry, p. 95.

It is a very material circumſtance in the marling of land, to find out how much the land requires of this manure; and till experience has thoroughly ſhewn this, it is better to err in laying on too little, than too much; becauſe the latter is a fault not to be remedied. It is to be obſerved alſo, that *Marle* never makes ſo great an improvement on land the firſt year, as it does afterwards.

In Staffordſhire they lay two hundred load of *Marle* upon an acre of land of the common kind; but where the ſoil is black, looſe, and ſandy, or full of worms, they will lay on three or four hundred load to an acre; it being a rule with them, that this ſort of ſoil cannot be marled too much. If the mould be thin, the leſs *Marle* does; if deep, it muſt have the more.

'Tis beſt ſowing of marled lands under furrow; becauſe if theſe lands are well huſbanded, they will be very mellow and hollow, which will occaſion the earth's ſinking from the roots of the corn, if it ſtand too high. If *Marle* ſaddens land, or makes it ſtiff or binding, it muſt be well dunged, and laid down for graſs. In Staffordſhire, after their land is marled, their way is to take the crops following. After the firſt crop of wheat is off, they plow in the wheat ſtubble in December, and if the weather proves froſty, to mellow it, they do not plow it again till April. They then ſow it with barley, allowing three buſhels of ſeed to an acre. The common produce of this is thirty buſhels. After this they ſow peaſe, for which they plow only once in the February following, allowing only three buſhels of ſeed to an acre, as in the barley. Next after this, if they intend ſix crops, they ſow wheat again upon the peaſe crop; the fifth crop is barley again; and the ſixth year's crop is red oats. Some ſow two or three crops more, when the ground has been well marled, but that is much better let alone.

In digging for the *Marle* they uſe in manuring their lands in Ireland, they meet with foſſile horns, and other curious foſſils. The *Marle* always lies in the bottoms of low bogs. It is never met with in any other places, and is found by boring with augurs made for that purpoſe. It uſually lies at five, ſeven, or nine foot depth. The obtaining it in many places is attended with very conſiderable expences, in draining off the water. The manner of digging it is this: They employ ſix able labourers, and a ſupernumerary; and theſe cut up a hole of twelve foot ſquare, which is ſuppoſed a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the ſupernumerary man ſupplies defects on all occaſions. For the firſt three foot they dig through a fuzzy earth, fit for making of turf or fuel. Under this lies a ſtratum of gravel, of about half a foot. Under this often, for three foot more, there is a more kindly moſs, which would make better fuel. This lower ſtratum of turf is always full of foſſile wood, which is uſually ſo ſoft, that the ſpade cuts as eaſily through it, as through the earth it lies in. Under this, for about three inches, is found a ſeries of leaves, principally of the oak; theſe appear very fair to the eye, but fall to pieces on touching; and this ſtratum is ſometimes interrupted with vaſt heaps of ſeed, which ſeem to be broom or furz-ſeed. In ſome places there appear berries of different kinds; and in others, ſeveral ſpecies of ſea plants, all lying in the ſame confuſed manner as the oak leaves. Under this vegetable ſtratum, there lies one of blue clay, half a foot thick, and uſually full of ſea ſhells. This blue clay is not ſo tough as common clay, but is thrown carefully up, and uſed as *Marle* in ſome places. Under this always appears the right *Marle*; the ſtratum of this is uſually from two to four foot thick, and ſometimes much more. Phil. Tranſ. N°. 394. p. 122.

This *Marle* looks like buried lime, and is full of ſhells; which are uſually of a ſmall ſize, and of the perwinckle kind; but there are ſeveral other ſorts, at times, found among them. Among this *Marle*, and often at the very bottom of it, are found great numbers of very large horns of the deer kind, which are vulgarly called elks horns. Theſe, where they join to the head, are thick and round; and at that joining there grows out a branch, which is about a foot long, and ſeems to have hung juſt over the creature's eyes; it grows ſtill round for about a foot above this, and then ſpreads broad, and terminates in branches long and round, turning with a ſmall bind. The labourers are obliged to work in a hurry in all theſe pits, ſo that they ſeldom bring them out whole. There are alſo, at times, found the leg bones, and other parts of the ſkeletons of the ſame beaſts; but this more rarely, only a few together, and but in few places.

MARLE, in medicine, is eſteemed an aſtringent, and given as ſuch in diarrhœas, dyſenteries, and hæmorrhages; the red kind is preferred for the laſt intention, though the difference is hardly worth regarding. The Germans give it alſo in fevers, in convulſions, and particularly in epileptic caſes; alſo in internal bruiſes.

Dice MARLE, in husbandry, a name given by the people of Staffordshire to a reddish *Marle*, that breaks into small square pieces like dice, or else into thin flakes, in the manner of lead ore, and looks smooth on the surface. This is a good manure, and the way of judging which of it is best, is to expose it to the air in rainy weather, or to put it in water. That which moulders soonest to powder in the air, and breaks quickest in the water, is sure to be the best, and proves very beneficial to land.

MARLINE, aboard a ship, is a small line made of hemp untwisted, that it may be the more gentle and pliable: Its use is to seize the ends of ropes from farcing out. They use it also to seize the straps at the arse (as they call it) or lower end of the block.

MARLING *a Sail*, is when being so ript out of the bolt rope, that it cannot be sewed in again, the sail is fastened by a *Marline*, put through the eye-let holes, made in it for that purpose, unto the bolt rope.

MARMARYGÆ, a word used by the old writers in medicine to express sparks of fire, or the appearance of such flashing before the eyes in some disorders.

MARMORA, *Marbles*, in natural history. See the article MARBLE.

MARMORARIA, in botany, a name given by some authors to the *brancha ursina*,

MARMORATA *Aurium*, a term used by some authors to express ear-wax.

MARMORELLA, in botany, a name by which some authors have called agrimony. *Ger.* Emac. Ind. 2.

MARMOREUS *Tartarus*, a word used by some authors to express the hardest kind of the calculus, or stone in the human bladder. See the article STONE.

MARMOTTE, *Marmotta*, the mountain rat, a creature very common in many parts of Europe, and frequently carried about as a shew by the poor Savoyards. It is of the size of a leveret, or between that of the hare and the rabbit; and is larger bodied than a cat, but much shorter legged. Its whole figure and appearance are like the common rat, whence it has its name. Its furr is much harder or harsher than that of the rabbit, and its colour a reddish tawney, sometimes lighter, sometimes darker; the end of its tail is back. Its eyes are large and prominent, and its ears short, and seeming as if cut off. It has two large teeth at the front of each jaw, as the squirrel, and other creatures of this kind, and these are not white, but yellow, as in the beaver. Its nose and mouth are adorned with a large number of black whiskers, making a sort of beard. The tail is about five inches long, and the legs are thick, and these and the belly are covered with long hair. Its toes are dispos'd as in the bear, and its claws are very long and strong, by means of which it digs the earth very readily. It makes great use of its hinder legs, and sometimes walks on them in an erect posture. Its back always appears very fleshy and fat, tho' the rest of the body be ever so lean; but this is not real fat, but a provision made by nature to guard the animal from cold. *Ray*, Syn. Quad. p. 221.

They will play with one another in the manner of kittens, and make a soft and not disagreeable noise on those occasions; but when they are provoked, or when they are affected, as they always are by a change of weather, they make a very shrill and disagreeable squeaking. They feed on vegetables, and are very fond of the roots of several plants; they are very fond also of milk, butter, and cheese. They sit on their buttocks to eat, and use their fore-feet as hands to reach their food to their mouths, in the manner of the squirrel. They lie hid in the winter in holes which they dig in the earth, and sleep away a great part of that season. They make their holes in a very nice and artful manner, and make themselves a bed of straw, and other soft matters, that they may lie the softer and the warmer. It is a creature easily bred up tame, and will be perfectly good-humour'd and familiar, but it hates dogs.

Its legs are very robust and strong, and it digs extremely quick. It runs but slowly on even ground, so that a man may overtake it; but if it once gets into the earth, it is said, it will burrow faster than a man with a spade can dig after it to take it.

This animal, in Poland, is said to herd in large communities, and be governed by a regular policy, making war with parties of its own species from other places, and taking spies and slaves, and keeping them for the most servile uses; particularly in the carrying in their provision for the winter, which they lay on the bellies of these slaves, first laying them on their backs, and then drawing them along with the load, in manner of a cart or waggon.

MAROGUS, a word used by Paracelsus to express a very powerful narcotic.

MARQUE (*Cycl.*)—*Letters of* MARQUE. See the article PRIZE.

MARRIAGE (*Cycl.*)—The people in Java *marry* and have children at nine or ten years old, and the women leave childbearing before they are thirty; and at Tunquin there are women common to any that will hire them, at eight or nine years of age.

Potter gives a large account of the several ceremonies observed by the Greeks in their *Marriages*. The Spartans were not permitted to *marry* till they arrived at their full strength. The reason assigned for this custom by Lycurgus, was, that the Spartan children might be strong and vigorous: And the Athenian laws are said to have once ordered, that men should not *marry* till thirty-five years of age. *Potter*, Archæol. Græc. l. 4. c. 11. T. 2. p. 263. seq.

Most of the Grecian states, especially such as made any figure, required their citizens should match with none but citizens. The usual ceremonies in promising fidelity was kissing each other, or giving their right hands, which was a general form of ratifying all agreements. Before the *Marriage* could be solemnized, the gods were to be consulted, and their assistance implored by prayers and sacrifices, which were offered to some of the deities that superintended these affairs, by the parents, or neareſt relations of the persons to be married. When the victim was opened, the gall was taken out and thrown behind the altar, as being the seat of anger and malice, and therefore the aversion of all the deities who had the care of love, as well as those who became their votaries. For the particularities relating to the bride and bridegroom, see the articles BRIDE and BRIDEGROOM.

The ceremonies of the Spartan *Marriages* being different from all others, deserve to be mentioned at length, as related by Plutarch. "When the Spartans had a mind to marry, "their courtship was a sort of rape upon the persons they had "a fancy for; and those they chose not tender and half-"children, but in the flower of their age, and full ripe for a "husband. Matters being agreed between them, the Νυμ-"φευτρία, or woman that contrived and managed the plot, "shaved off the bride's hair close to her skin, dressed her up "in man's cloaths, and left her upon a mattress: This "done, the bridegroom entered in his common cloaths, "sober and composed, as having supped at his ordinary in "the common hall, and stole as privately as he could into "the room where the bride lay, untied her virgin girdle, and "took her into his embraces. Having stayed a short time "with her, he returned to his comrades, with whom "he continued to spend his life, remaining with them "as well by night as by day, unless when he stole a short "visit to his bride; and that could not be done without a "great deal of circumspection, and fear of being discovered: "Nor was she wanting (as may be supposed) on her part, to "use her wit in watching the most favourable opportuni-"ties for their meeting, and making appointments when "company was out of the way. In this manner they lived "a long time, insomuch that they frequently had children by "their wives before they saw their faces by day-light. The "interview being thus difficult and rare, served not only for "a continual exercise of their temperance, and furthered "very much the ends and intentions of *Marriage*; but was "a means to keep their passion still alive, which flags and "decays, and dies at last by too easy access, and long conti-"nuance with the beloved object." *Potter*, Archæol. loc. cit. p. 295. seq.

According to Mr. Kersseboom's observations, there are about 325 children born from 100 *Marriages*. See Phil. Trans. N°. 468. Sect. 3.

Mr. Kersseboom, from his observations, estimates the duration of *Marriages*, one with another, as in the following table.

Those whose ages, taken together, make

40	live together between 24 and	25 years.
50	22	23
60	23	21
70	19	20
80	17	18
90	14	15
100	12	13

Phil. Trans. N°. 468. Sect. 3. p. 319.

MARROW (*Cycl.*)—The greatest part of the bones contain, in their large cavities or cells, this unctuous soft substance, which is more solid in some, and more soft in others. This, while it lies in the cavities of the large bones, is more particularly called *Marrow*; when dispersed in the small cellulous cavities, it is commonly called the medullary juice. The *Marrow* of the large hollow bones is a mass composed of an infinity of small vesicles, or membranous cells, joined together, and communicating with each other, furnished with blood-vessels and nerves, and filled with a fine sweet oily matter. All these cells are surrounded by a fine membrane, which, like an internal periosteum, sticks close to the inner surface of the bone, by means of an infinite number of capillary vessels, and of several other kinds of very small filaments. The reticular substance of the bones runs through this medullary mass, and, as it were, interlards it, and by this means sustains it in the middle of the great cavities. The *Marrow* of the cellulous or cavernous substance of the bones, is divided by small bony septa or plates, and by filaments of the reticular substance of the bones into a vast number of vesicles or membranous cells, which line the bony cells, and communicate with each other.

This cellular *Marrow* in the cavernous texture of some bones, differs from that in the great cavities of others both in colour and consistence. It is liquid, and of a red colour throughout; whereas

whereas the other is more ſolid, and is only red on its ſurface. This difference is owing to the blood-veſſels which run thro' each membranous cell, whereas the *Marrow* in the great cavities ſeems to be furniſhed with them in the common membrane only. Many of thoſe medullary cells are likewiſe divided by the bony filaments of the cavernous ſubſtance; and theſe ſmall filaments, as well as thoſe of the reticular texture, are covered by portions of the medullary membrane, as by a perioſteum.

The medullary membranes may be ſeparated from the liquor which they contain, by ſteeping the whole maſs in very hot water, and afterwards compreſſing it by gentle degrees. But it is to both theſe ſubſtances, taken together, that the anatomiſts give the common name of *Marrow*, not to either of them taken ſingly. The medullary membrane is very ſenſible, but not the juice, which is neceſſary to be obſerved, to underſtand properly what is meant by the ſenſibility of the *Marrow*. The *Marrow*, by its liquid and unctuous part, renders the bones in ſome meaſure pliable, and leſs brittle, as it continually pervades their ſubſtance in ſmall degrees: This continues to old age, and then the bones, being deprived of their *Marrow*, become very brittle.

In the bones of the oſſa innominata, there are no internal large cavities; but their ſubſtance being cellulous or cavernous, they contain no medullary maſs, but their cells are all moiſtened with a medullary juice, which diſtils inceſſantly through the membrane with which they are lined. In the os femoris the *marrow* lies in a large maſs, in the middle cavity of the bone, and in ſmall diſtinct cluſters in the cells of each extremity. The firſt is penetrated at different diſtances by the bony filaments, and is thereby ſuſtained in all violent motions and ſhocks, as running, leaping, and the like. In the bones of the leg the diſpoſition is exactly the ſame; and in the bones of the foot, the *Marrow* is ſuitable to their internal ſtructure, and is lodged in moleculæ, in the cavernous portions, and in maſſes in thoſe which have cavities to receive them. Thus the *Marrow* of all the tarſal bones is diſperſed in moleculæ, becauſe their internal ſtructure is ſpongy. In the metatarſal bones, and firſt phalanges of the toes, it is diſpoſed in the ſame manner as in the tibia and fibula, that is, it lies in moleculæ in the extremities, and in their middles in greater or leſſer maſſes, according to the ſizes of the cavities. In the other phalanges, which are entirely ſpongy, it is accordingly diſpoſed in moleculæ. In the vertebræ, ſternum, and ribs, the internal ſtructure of all which is cellular and ſpongy, the *Marrow* is contained only in ſmall ſeparate portions, and is no other than a red medullary juice. The bones of the head alſo being in like manner cellular in their internal ſtructure, contain alſo their *Marrow*, in like manner, in diſtinct portions, and lying in membranous cells in the diploe. *Winſlow*'s Anatomy, p. 118, 136, 150, 152.

The tranſpiration of the unctuous matter of the *Marrow* is not confined to the time of the animal's life, it is even carried on in the dead carcaſs, and is one great obſtacle to the whitening and cleaning the bones in a ſkeleton; for if there be not an opening made at one end of a bone, and the *Marrow* waſhed out of the whole bone at this aperture, by means of proper liquors injected with a ſyringe, the bone, though made ever ſo white at firſt, will certainly turn yellow afterwards, by this tranſpiration of the *Marrow* contained within it, which certainly happens on the leaſt heat of the weather, or otherwiſe. For this reaſon it is alſo, that the workmen who uſe bones always cut them longitudinally in two, and take out all the *Marrow*, and even all the ſpongy ſubſtance of the bone, which might be ſuppoſed to contain it, otherwiſe they know that the heat of any one's hand will turn their works yellow, tho' ever ſo white when firſt made. It is to be obſerved, that there are in the hollow bones ſeveral ſmall apertures thro' which there paſs blood-veſſels, which go from the membrane encloſing the *Marrow*; whence it appears that the bones are indeed nouriſhed from within as well as from without, though that be not by the *Marrow*, but by the blood-veſſels only: Thus the two tables of the ſkull are evidently nouriſhed; the external one by the veſſels of the pericranium, and the interior by the branches of thoſe veſſels which are ſpread along the *dura mater*.

It has been ſuppoſed that the quantity of *Marrow* increaſed in the bones according the increaſe of the moon; but this has been found a wholly erroneous opinion, the increaſe of the *Marrow* in all the bones depending on the quantity of nouriſhment, and the ſtate of reſt which the creature is allowed.

The ſenſation of the *Marrow* has been a point very variouſly ſpoken of. When a limb has been taken off, and the *Marrow* is left bare, if any thing touch it roughly, the patient feels an exquiſite pain. Some had ſuppoſed that this ſenſation might rather ariſe from the membranes, than from the ſubſtance of the *Marrow*: This, however, was put beyond all doubt by a curious, tho' very cruel operation, performed before the Paris academy. A living animal had its leg taken off before the academy, and the end of the bone left very bare, the membranes were all carefully removed, to the exquiſite pain and torture of the creature; and when the pain of this was over, the end of a ſtyle was plunged into the *Marrow*, without touching any other part whatever, and the creature, on this, expreſſed as violent a ſenſation of pain as from any of the former operations: This was repeated ſeveral times, and always with the ſame event; ſo that it is very evident that the *Marrow* is, in its natural ſtate, highly ſenſible of pain; and how much more may it be ſo in diſtempered bodies! Mem. Acad. Par. 1700.

The antients ſuppoſed that the *Marrow* ſerved for the nouriſhment of the bones; and their reaſons for believing it were, that they ſaw no blood-veſſels enter the ſubſtance of the bones, by which they could be nouriſhed, all the veſſels of that kind, which they could diſcover, going directly into their cavities, where the blood they contained ſeemed to undergo a ſort of concoction, which converted it into *Marrow*, and by that means rendered it fit nutriment for the bones; and they obſerved, in proof of this, that the longer any bone was, and the more violent uſes it was intended for, the larger was its cavity for the containing this nutritious matter.

Theſe reaſons, though they carry a great ſhew of probability, yet are eaſily refuted by accurate obſervation. We ſee, in young ſubjects, a vaſt number of blood-veſſels diſtributed thro' the ſubſtance of the bones, the texture of which, at that time, is lax and ſpongy. It is alſo to be obſerved, that there are many bones in the human body, as well as in brutes, which, according to this ſyſtem, could not be nouriſhed at all, ſince they contain no *Marrow*. Of this kind alſo are the horns of deer, and many other creatures, which, tho' they contain no *Marrow*, yet grow very vigorouſly. There are alſe other bones which are hollow, yet are only cloathed with a glandulous membrane; ſuch are the cavities between ſeveral parts of the two tables of the ſkull: And in the elephant, the foliaceous bones, which are in the place of the diploe, contain no *Marrow*, and are only covered with a membrane, which has ſeveral blood-veſſels ſcattered through it. The hollows of thoſe bony ſubſtances alſo which compoſe the claws of crabs, lobſters, and the like, contain no *Marrow*, but only the muſcles, whoſe office it is to move thoſe parts; and yet all theſe grow, and are nouriſhed, as well as thoſe bones which contain ever ſo much *Marrow* in their cavities. In fine, it may be well concluded, that it is not for the ſake of containing *Marrow*, that the bones are made hollow, but merely that they may be lighter, and more fit for motion. Mem. Acad. Par. 1700.

Obſervation gives abundant proofs, that a great quantity of the *Marrow* continually tranſpires through the ſolid ſubſtance of the bones, and in this action it is of great uſe, though not in the nouriſhing, yet in the preſerving the bones, its oily and unctuous matter ſoftening the rigid fibres of which the bone is compoſed, and rendering them more ſupple, ſoft, and flexile, and conſequently the whole bone much leſs liable to break.

MARRUBIASTRUM, baſtard *Horehound*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind. The upper lip is hollowed in the manner of a ſpoon, and the lower is lightly divided into three ſegments. The piſtil ariſes from the cup, and is fixed, in the manner of a nail, into the hinder part of the flower. It is ſurrounded alſo by four embryos, which afterwards become as many ſeeds of a roundiſh ſhape, ripening in a ſort of open caſe, which was the cup of the flower. There is, beſide theſe marks, alſo a peculiar face in the flower of this plant, by which it is, at ſight, diſtinguiſhed from the galeopſis.

The ſpecies of *Marrubiaſtrum*, enumerated by Mr. Tournefort, are theſe: 1. The common *Marrubiaſtrum*, called by ſome, the Germander-leav'd Ironwort, or Sideritis. 2. The marſh ſtinking *Marrubiaſtrum*. 3. The white-flowered ſideritis-leav'd *Marrubiaſtrum*, with prickly flower-cups. 4. The ſideritis-leav'd *Marrubiaſtrum*, with prickly cups, and yellow flowers, with edges of a blackiſh purple. 5. The motherwort-leav'd *Marrubiaſtrum*. 6. The American *Marrubiaſtrum*, with the flowers collected into heads, and with a ſweet ſmell like that of baum. *Tourn.* Inſt. p. 190.

MARRUBIUM, *Horehound*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind; the upper lip ſtands erect, and is divided into two horns; the lower is divided into three ſegments. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower. It is ſurrounded by four embryos, which afterwards become four oblong ſeeds, and are contained in a ſort of open capſule, which was before the cup of the flower. *Tourn.* Inſt. p. 192. The ſpecies of *Horehound*, enumerated by authors, are theſe: 1. The common white *Horehound*. 2. The hairy white *Horehound*. 3. The broad and roundiſh-leav'd exotic *Horehound*. 4. The ſhort-leav'd white *Horehound*. 5. The narrow-leav'd white *Horehound*. 6. The procumbent Spaniſh *Horehound*, with ſtellated and prickly flower-cups. 7. The procumbent Spaniſh *Horehound*, with ſilky and ſilvery leaves. 8. The ſtinking *Horehound*, as we call it, is the *ballote*, a different genus of plants; and the water *Horehound*, which is the *lycopus*, is alſo to be ſeen under its proper head.

Marrubium is ſaid to be an attenuant and reſolvent; it is famous for the relief it gives in moiſt aſthmas, and in all diſ-

eaſes

eaſes of the breaſt and lungs, in which a thick and viſcous matter is the cauſe. It is alſo capable of doing great good in many chronic complaints, where the cauſe is of the ſame kind. At preſent, however, it is very little uſed in the ſhops. There uſed to be a compound ſyrup of it, which is now out of uſe. See the article ASTHMA.

MARSHMALLOW, *Althæa*, in botany, the name of a genus of plants, the characters of which are the ſame with thoſe of the mallow, excepting that this has hairy or hoary leaves. See the article MALLOW.

The ſpecies of *Althæa* or *Marſhmallow*, enumerated by Mr. Tournefort, are theſe: 1. The common *Marſhmallow*, the *Althæa* of all the old medicinal writers. 2. The angular-leav'd *Marſhmallow*. 3. The rounder-leav'd *Marſhmallow*. 4. The ſhort blunt-leav'd *Marſhmallow*. 5. The round-leav'd hoary ſhrubby *Marſhmallow*. 6. The great-flowered *Marſhmallow*. 7. The ſharp-pointed-leav'd tree *Marſhmallow*, with ſmaller flowers. 8. The round-leav'd Spaniſh tree *Marſhmallow*. 9. The Portugal tree *Marſhmallow*, with round undulated leaves. 10. The larger-leav'd leſs hairy Portugal tree *Marſhmallow*. 11. The Venetian ſea tree *Marſhmallow*, the common *malva arborea* of authors. 12. The French tree ſea *Marſhmallow*. And 13. The Spaniſh *Marſhmallow*, with undulated leaves. *Tourn.* Inſt. p. 97.

The parts of *Althæa*, uſed in medicine, are the leaves and roots. The leaves, by decoction, afford a ſoft mucilaginous ſubſtance, good in all complaints ariſing from acrimony; of great ſervice in dyſenteries, &c. where the *mucus* of the inteſtines is raked off, and in many kinds of colics. It is alſo found of uſe in obſtructions of the urinary paſſages, ſtranguries, heat of urine, &c. and is, by ſome, held a great ſecret for the cure of a *gonorrhœa*. Ray and others alſo ſpeak of it as a pectoral; of uſe in coughs, and alſo pleuriſies.

Marſhmallow root is a very valuable medicine. It is emollient and diuretic, and gives great relief in diſorders of the kidneys and bladder, whether ariſing from acrimony of the urine or gravel. It is good alſo in all diſorders of the breaſt and lungs, ariſing from a thin acrimonious phlegm. In both which caſes, a decoction of the freſh root is the beſt way of giving it. In diarrhœas and dyſenteries, a ſtrong decoction of *Marſhmallow*-root, given clyſterwiſe, is alſo of great uſe. Externally, in form of a cataplaſm, it is excellent for ſoftening and maturating hard tumours.

The ſyrup of *Marſhmallows*, is leſs efficacious than the decoction; on account of the ſugar in the former, which makes an improper mixture with medicines of the mucilaginous kind.

Ointment of *Marſhmallows*, called *Unguentum Dialthææ*, is applied to tumours and inflammations, as an emollient and ſuppurative; which qualities it derives from the mucilage of the plant, being boiled a long time with the oil, before any of the other ingredients are mixed.

The *Emplaſtrum Diachylon* receives much of its virtue from the ſame plant.

The *Althæa* of the antients was plainly a different plant from that which we call by that name. Our *Althæa*, or *Marſhmallow*, is a very common plant, and grows in watery places, principally near the ſea; but the *Althæa* of the antients was a ſcarce herb, and grew in the barren deſarts of Arabia, Aſia, and the iſland of Sicily. Theophraſtus ſays it was found in no other place. The Arcadians called it, the *wild Mallow*; and only the people who uſed it in medicine called it *Althæa*. Theophraſtus gives us this account of it, and adds, that its flowers are yellow; a circumſtance in which it wholly differs from any of the accounts of later authors of the *Marſhmallow*. and from the plant itſelf, which we know by this name, its flowers being white. Dioſcorides gives the ſame account of the colour of the flower, and adds, that it was like a roſe in ſhape: And other authors ſay, that its flower was like a roſe, but do not mention whether that likeneſs conſiſted in the ſhape or colour. Others have recorded the likneſs of a roſe, and applied it to the colour of this flower, calling it a little flower, of the pale colour of a roſe. Theſe authors may, probably, have adapted the deſcriptions of the antients, in the caſe of the roſe-like flower, to the common *Marſhmallow* of our times; but the deſcriptions, as we find them in the antients, ſeem rather to refer us to the *Abutilon*, or yellow *Mallow* kind, than to our own *Althæa*. *Theophraſt.* l. 9. c. 15. See the article ABUTILON.

MARSHY *Lands*, a name given by our farmers to a ſort of paſture land, or grazing ground, which lies near the ſea, rivers, or fens.

As to lands lying near rivers, the great improvement of them is their being overflowed, which brings the ſoil of the uplands upon them, ſo that they need no other mending, though kept conſtantly mowed. The great inconveniency of theſe lands, is their being ſubject to floods, which high hills near the ſides of rivers, and the long courſe of them, beſpeak to be frequent. And though the richeſt land generally lies near ſuch rivers, yet there is the greateſt danger of the crops being ſpoiled, eſpecially when they are not encloſed; and therefore cannot be fed with cattle. This, when feeding bears any thing of a price, would be the very beſt way of managing theſe uncertain lands; and encloſing them would be highly beneficial, on this account. *Mortimer*'s Huſbandry.

The *Marſh*-lands in Lincolnſhire, and many other parts of England, produce a ſort of graſs, which feeds ſheep in a better manner than that of almoſt any other land, in regard to their ſize, and the quantity of wool. The ſheep about Grimſby, and ſome other places in this county, produce ſuch luſty wool, or, as they call it, wool of ſo large a ſtaple, that three or four fleeces uſually make a tod of twenty-eight pound weight. Several hundred loads of this wool are yearly carried from theſe places to Norfolk, Suffolk, and other parts of the kingdom, for the cloth manufacturers. They ſend this in large packs, which they call pockets, each containing about five and twenty hundred weight. Phil. Tranſ. N°. 223.

When *Marſh*-lands lie flat, it is neceſſary for the owner to keep all the water he can from them. The ſea water, in particular, is to be kept from them as much as poſſible; and this is uſually done at a very great expence, by high banks and walls.

Two things greatly wanting in theſe lands in general, are good ſhelter for the cattle, and freſh water. The careful farmer may, however, in a great meaſure, obviate theſe, by digging, in proper places, large ponds to receive the rain water, and by planting trees and hedges in certain places toward the ſea, where they may not only afford ſhelter to the cattle, but keep off the ſea breezes, which often will cut off the tops of all the graſs in theſe places, and make it look as if it had been mowed.

Theſe lands fatten cattle the ſooneſt of any, and they preſerve ſheep from the rot. It would be a great advantage to them, if there were raiſed, in the middle of every large *Marſh*, banks of earth in a croſs, or in the form of two ſemicircles, and theſe planted with trees; theſe would ſerve as a ſhelter for cattle, let the wind blow from what quarter it would, and would ſoon repay the expence of making. *Mortimer*'s Huſbandry.

There are, in different parts of England, very large quantities of land upon the ſea coaſts that would be worth taking in, though no one has yet thought of doing it. The coaſts about Boſton, Spalding, and many other parts of Lincolnſhire, give frequent inſtances of this, where the ſea falls from the land, ſo that on the outſide of the ſea walls, on the owſe, where every tide the ſalt water comes, there grows a great deal of good graſs, and the owſe is firm to ride upon when the water is upon it.

This owſe, when taken in, hardly ſinks any thing at all, and they dig the walls from the outſide of it, all the earth they are made of being taken from thence, and the ſea, in a few tides, filling it up again: And though the ſea, at high water, comes only to the foot of the bank, yet once in a year or two ſome extraordinary tides go over the banks, though they are ten foot high. Theſe banks are fifty foot broad at the bottom, and three foot at the top; and the common price of making them is twenty-ſix ſhillings a pole, the earth being all carried in wheel-barrows, and the face toward the ſea, where the greateſt ſlope is, being turfed. *Mortimer*'s Huſbandry.

MARSILÆA, in botany, the name by which Linnæus has called the pepper-graſs, called by the Engliſh botaniſts, *gramen piperinum*; by Vaillant and others, *pilularia*; and *ſalvinia* by Micheli. The characters are theſe: It is one of the *cryptogamia*, or thoſe plants which perform their fructification in ſecret. The male flowers are very numerous, and ſtand on the leaves without any pedicles. Theſe have no cup, but are each only a ſingle filament, or receptacle, of a hemiſpherico-convex form, with four pointed antheræ, which are long, erect, and ſpirally twiſted. The female part of the fructification has no cup or petals, but conſiſts of a round quadrilocular fruit, which contains a vaſt number of roundiſh ſeeds. *Linnæi* Gen. Plant. p. 508. *Micheli*, p. 58. *Vaill.* Bot. Par. 15. 6. See the article PILULARIA.

MARSUIN, in zoology, a name by which many have called the *phocæna* or *porpeſſe*, a fiſh too often confounded with the dolphin. *Willughby* Hiſt. Piſc. p. 31. See the articles DELPHINUS and PHOCÆNA.

MARSUPIALE, in natural hiſtory, a name given by Tyſon to the creature commonly called, the *poſſum*, or *opoſſum*. The peculiar diſtinction of this creature from all others, is its having a pouch, or *marſupium*, under its belly, into which it receives its young in time of danger. This has given occaſion to its name *Marſupiale*, but it is more generally called *opoſſum*. See the article OPOSSUM.

MARSUPIALIS *Muſculus*, in anatomy, a name given by Cowper, and ſome others, to a muſcle of the thigh, called alſo by ſome, *burſalis*. It is that muſcle, called by Albinus, Winſlow, and the generality of modern authors, *obturator internus*.

MARSUPIUM *Carneum*, in anatomy, a name given by Spigelius, Cowper, and ſome other authors, to certain muſcles of the thigh, called by the French writers, *les petits jumeaux*, and by Albinus, *gemini*. Veſalius does not eſteem them ſeparate muſcles, but calls them only *carneæ portiones decimo femur moventium muſculo attenſæ*, fleſhy portions affixed to the tenth muſcle of the thigh.

Riolan, who calls the *pyriformis*, or pyramidal muſcle of the thigh, the *quadrigeminus*, or *quadrigeminus prior*, calls theſe the *quadrigemini ſecundi & tertii*. They are ſometimes diſtinct, ſometimes they grow together.

MARTEAU, the name given by French naturaliſts to a peculiar ſpecies of oyſter, called alſo *malleum* by others. It is one of

of the moſt curious ſhells in the world. Its figure is that of a hammer, with a very long head, or rather of a pick-ax. It has a body of moderate thickneſs, and two long arms. It is of a browniſh colour, with a beautiful tinge of a violet blue. Notwithſtanding the ſtrange ſhape of theſe ſhells, they cloſe very exactly. See the article OSTREA.

MARTIALES *Flores*. See the article FLORES *Martiales*.

MARTES, the *Martin*, or *Martlet*, in the hiſtory of quadrupeds, the name of a creature of the weaſel kind, called alſo by ſome *Fogua*. There are two ſpecies of this creature, the one called the *Martes Abietum*, or fir *Martin*, the other the *Martes Fagorum*, or beech *Martin*. The beech *Martin* is diſtinguiſhed from the other by having a larger and blacker tail, and being all over of a darker colour, and by being white on the throat, whereas the others are yellow; but the ſpecies are ſcarce kept up diſtinct, the creatures mixing with one another in the breed. When diſtinct, the beech *Martin* is found to be a much tamer creature than the other, and may be kept about houſes like a cat; and often lives of its own accord about houſes, and among old walls. Their ſkins make a valuable furr; and that of the fir *Martin*, or yellow kind, is much the moſt valuable. *Ray*'s Syn. Quad.

The *Martin* is of the ſize of a cat, but longer bodied; its legs alſo are ſhorter, and its claws leſs ſharp, and ſhorter. Its whole body is covered with hair of a yellowiſh black, except only the throat, which, in the beech *Martin*, or tame kind, is white; and in the wild kind, or fir *Martin*, yellow. Its teeth are ſharp and ſtrong, and the dog-teeth, in particular, ſtand out a great way.

Geſner once kept one of the beech *Martins* tame like a dog, which would go out with him, and run about to the neighbours houſes, always returning carefully home again, and would play like a cat, lying on its back, and biting in jeſt, but never hurting any thing. *Geſner*, de Quad.

This creature leaves ſo ſtrong a ſcent, that the hounds, when out in a morning, will often take it, and make a noble cry. The chace, in this caſe, is very good while it laſts, but it is very perplexed; for the creature is not able to run long; and when ſhe is tired, ſhe gets up into a tree; the hounds often loſe her on this occaſion; but if ſhe is ſpied up in the tree, ſhe is to be hunted down with ſticks, *&c.* When killed, the hounds are not to be ſuffered to eat her fleſh, for it is unwholeſome. See Tab. of Quadrupeds, N°. 22.

MARTICHORA, in natural hiſtory, the name given by the antient Greeks to the animal which we call the *Mantichora* or *Man-tyger*. See the article MANTICHORA.

MARTIN, in zoology. See the article MARTES, ſupra.

MARTINAZZO, in zoology, the name of a ſpecies of water fowl, of the larus or gull kind, and called by the Dutch, the burgomaſter of Greenland; by the Corniſh people, the *waggell*, or the *great grey gull*. It is a large bird, uſually weighing a pound and half. It is all over of a mottled colour of brown, grey, and white; but is much darker on the back than on the belly. The back and wing feathers are all brown in the middle, and grey at the edges; but thoſe of the rump are moſtly white. They ſay that this gull will follow the ſmaller lari, and perſecute and terrify them till they void their food in excrements half digeſted, which he afterwards picks up, eſteeming it better than freſh food. *Ray*'s Ornithology, p. 266.

MARTINO *Peſcatore*, in ichthyology, a name given by Salvian, and ſome others, to the *Rana Piſcatrix* of authors; the *lophius* of Artedi. See the article LOPHIUS.

MARTIOBARBULI, among the Romans, a deſignation given to ſoldiers, who carried leaden balls to annoy the enemy with. *Pitiſc.* Lex. Ant. in voc.

MARTIORA, or MARTICORA, in natural hiſtory, the name which the antient Greeks gave to the animal which the Romans called *Mantichora*, and we, from a corruption of that word, the *man-tyger*. See the article MANTICHORA.

MARTIS *Arbor*. Beſide the common *Arbor Martis*, which is but a poor reſemblance of the *Arbor Dianæ*, Mr. Lemery has found a method of making a ſaline or vitriolic one, which is of greater beauty than any other metallic vegetation, and which differs from the generality of them, in that it is produced above the ſurface of the liquor, not under it, and buried in a fluid as they are. Mem. Acad. Par. 1707.

The method by which he firſt made this beautiful production was this: He diſſolved ſteel filings in ſpirit of nitre, and adding to the ſolution oil of tartar *per deliquium*, when the fermentation was over, there aroſe beautiful vegetations above the ſurface of the liquor, many of which expreſſed trees and plants, not only in their leaves and branches, but even in their roots, the ſmall fibres which repreſent them in this vegetation being truly hollow, and ſeeming to ſerve the office of roots in conveying up the fluid matter to the other parts, there to condenſe into leaves and branches.

In the making the ſolution of iron for this proceſs, there is always a great quantity of red vapours thrown up out of the mouth of the veſſel; if theſe are ſaved, by making the ſolution in a cucurbit, they are found to be a weak ſpirit of nitre, impregnated with the ſulphur of iron; and this ſpirit ſerves much better for the making this *Arbor Martis* than the plain ſpirit. Mr. Lemery obſerving this, diſtilled ſpirit of nitre on purpoſe for this uſe, from a ſolution of a large quantity of iron in the ſame ſpirit.

This new ſpirit evidently contained many of the ſulphureous particles of the iron, and produced infinitely more beautiful vegetations than the plain kind. Nor is it wonderful that it ſhould do ſo, ſince the ſucceſs of the proceſs ſeems wholly to depend on the quantity of the ſulphur of iron which is concerned in it. The ſolution of iron in ſpirit of nitre, whether the common kind, or this prepared on purpoſe for this vegetation, is of a reddiſh colour, and when the oil of tartar is mixed with it, the vegetation is more or leſs perfect according to the proportions, as will be learned by experiment, and very often the whole liquor, or nearly the whole, raiſes itſelf up to the top of the veſſel in form of beautiful branches. Mem. Acad. Par. 1707.

The oil of tartar, when firſt mixed with the ſolution, cauſes an effervеſcence, and when this is over, the liquor becomes quiet and clear again, but is of a deeper red colour than before. Soon after this the vegetations begin to form themſelves, by ſmall cryſtals, which appear upon the ſurface of the liquor. Theſe are extremely ſmall and ſlender, and they increaſe in length continually by the addition of others at their bottoms, thruſting them farther up, till at length they form threads or filaments, which ariſe out of the ſurface of the liliquor, and thence diverge and divaricate into all the beautiful variety of trees, buſhes, and herbs. Theſe nicely adhere to the internal ſurface of the glaſs, and, when they have riſen to its verge, fall over it, and run down the outſide in the ſame manner, ſo as beautifully to repreſent vines, ivy, or other creeping plants running along a wall. Many of the firſt formed filaments, in this caſe, encreaſe greatly in ſize, often becoming, at length, as thick as a writing quill; and theſe are always hollow within, and reſemble ſo many pipes. They are ſo arranged at the bottom of the glaſs, round the ſurface of the liquor, as to ſupport the reſt of the vegetations. The leaſt heat melts and deſtroys all theſe vegetations; barely touching them with the finger being ſufficient to reſolve them into the liquor from which they aroſe.

The eſſential ſubſtance of this beautiful vegetation is a mixture of iron with ſalt petre. The differences in the time and manner of the formation of the branches, does not depend wholly upon the different proportions of the liquors, but frequently on the temperature of the air; and ſometimes on the ſhape and ſize of the veſſels. When the vegetation is firſt formed, it is uſually leſs beautiful and diſtinct than afterwards. This is owing to its being too humid, the abundant moiſture ſwelling the parts, and injuring their figure. When it is dried to a certain degree, it appears in all its beauty; and after this it uſually ſoon changes for the worſe, the leaves appearing as if faded, and their red colour being changed to a faint orange colour.

The ſame vegetations which have been once raiſed, will not, on melting them in water, vegetate again; but only form a number of flat and thin cryſtals. This is the general event of the operation; yet ſometimes, when the ſolution has been ſuffered to ſtand till it acquires a deep red colour, a part of the ſalts will riſe up from the ſurface, in ſomething like their priſtine form; but this is only a ſmall portion of the whole that does it, the greater part remaining at the bottom of the veſſel, in form of rigid cryſtals.

The author of this curious diſcovery acknowledges that it was owing to accident; for that he had a very different thing in his thoughts, when he mixed the oil of tartar with the ſolution of iron; but as ſo beautiful an effect appeared, he was at the pains to vary all the ingredients, in different mixtures afterwards, to try what differences would be produced. He mixed the volatile alkalis inſtead of the fixed; other acids inſtead of ſpirit of nitre, and other metals inſtead of iron, in the ſeveral proceſſes, the events of which were as follow:

Spirit of ſal armoniac added to the ſolution inſtead of oil of tartar, precipitates a yellow powder to the bottom of the veſſel, but does not make the leaſt tendency towards vegetating. All the other acids were tried alſo in the place of ſpirit of nitre, and though all of them made the liquor begin to riſe ſooner than that, yet they only produced a ſaline cruſt over the ſurface, without any tendency to vegetation. Nay, ſpirit of nitre itſelf cannot form the vegetations, if impeded by a mixture of any of the other acids. Diſtilled vinegar, uſed inſtead of theſe acids of the mineral kingdom, produced only a a ſet of cryſtals which croſſed one another, without any appearance of vegetation. Copper ſeemed the metal moſt likely to ſucceed inſtead of iron, as being, of all the others, the moſt ſulphureous; but the event, on trial, by no means anſwered the expectation, and not the leaſt tendency to vegetation was found on treating it in this manner. Copper and iron, mixed together, produced only a low and very poor vegetation, evidently ſhewing that the copper did nothing but impede the iron from ſhewing itſelf in its natural beauty. Quickſilver ſucceeds no better than copper; there is only formed, by long ſtanding, a thin cruſt upon the ſurface of the glaſs, whence the liquor has evaporated, and the mercury is finally found precipitated to the bottom of the veſſel. Biſmuth was alſo tried

tried with the ſame circumſtances, but without ſucceſs. Mem. Acad. Par. 1707.

MARTIS *Lixivium.* See the article LIXIVIUM *Martis.*

MARTLETT, in zoology, a name uſed by ſome for the *Martin*, a creature of the weaſel kind. See the article MARTES.

MARTNETS, in a ſhip, ſmall lines faſtened to the leetch of a ſail, being reeved through a block on the top-maſt head, and coming down by the maſt to the deck. Thoſe *Martnets* which belong to the top-ſails are faſtened after the ſame way to the heads of the top-gallant maſts, but their fall comes down no farther than the top, when it is haled. The word is, *top the Martnets*; *i. e.* hale them up. Their deſign is, in furling the ſail, to bring that part of the leetch which is next the yard-arm cloſe up to the yard, that ſo the ſail may furl up the cloſer.

MARTYNIA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium is compoſed of one leaf, divided into five ſegments, which are pointed at the ends, and ſerrated at the ſides; three of theſe ſtand erect, the other two are reflex. The flower conſiſts of one petal, and is of the bell-faſhioned kind. The tube is large, inflated, and open, and contains a honey juice in its baſe. The limb is ſmall, and is ſlightly divided into five ſegments, the lower of which is larger than the reſt, and is more erect and crenated at the edges. The ſtamina are four capillary and and crooked filaments, one pair of them being bent between the other, and returning back again; and between the upper pair there appears the rudiment, as it were, of another filament, which terminates in a point. The antheræ are connected together, and bend toward each other at the points. The germen of the piſtil is oblong, and placed beneath the cup. The ſtyle is ſhort and ſimple. The ſtigma is flat. The fruit is an oblong, gibbous capſule, of a ſquare figure, each ſide having two furrows on it. It is pointed at each end, and, when fully ripe, opens at the top into two parts, and is found to encloſe four oblong ſeeds in a ſort of ſquare caſe or nucleus. The bending of the ſtamina is a very ſingular thing in this plant; but it does not happen till the apices have burſt, and diſcharged their farina. *Linnæi* Gen. Plant. p. 292. *Martin.* 1. 42. Hort. Malab. 9. 53.

The plant called by Houſton *martyniæ ſpecies*, is properly another genus, and has been ſince deſcribed by the accurate Linnæus under the name of *craniolaria*. *Houſton*, A. A. See the article CRANIOLARIA.

MARTZIAN, in the materia medica, a word formed by the modern Greek writers, to expreſs a ſort of ſea plant, uſed in painting, dying, *&c.*

The word is formed of the Arabian name *margian*, by changing the *g* into *tz*, a very common practice among theſe writers, and of which we have numerous other inſtances. It is generally ſuppoſed that the *Margian* of the Arabs, and conſequently the *Martzian* of the Greeks, is coral. But all accounts of the antients diſagree with this, and ſhew that the plant, meant by theſe names, is the *fucus thalaſſius* of the old Greeks, a red kind of ſea weed, growing upon the rocks, and uſed in painting and dying. The antient Arabs all uſed the word in this ſenſe. But the modern Greeks have been led away by the errors of the ſucceſſors to the Arabians; ſo that they uſe it as a name for coral.

MARU, in botany, a name by which Dodonæus and ſome others have called the *cerinthe*, or *honey-wort*. *Ger.* Emac. Ind. 2.

MARUBIUM, *Horehound*, in botany, *&c.* See the article MARRUBIUM.

MARVELL *of Peru*, a name given to the plant more uſually called *jalap*. See the article JALAP.

There are many ſpecies of this beautiful plant propagated in flower-gardens. They are all to be raiſed by ſowing their ſeeds in March, on a moderate hot bed. When they come up, they are to be tranſplanted to another hot bed, where they are to be ſet at ten inches diſtance; and when they are grown to about a foot high, they are to be tranſplanted into pots filled with light earth, and ſet in the ſhade till they have taken root, after which they may remain abroad till October. The ſtronger kinds ſhould be then removed into the greenhouſe, where they muſt be frequently watered during the winter, and in ſummer they muſt be often pruned to keep them in ſhape.

They flower in June, and continue flowering till the froſt prevents them. Some take up the roots when the ſtalks are dead, and lay them up in ſand till ſpring, when they are planted again in pots, and plunged into a moderate hot bed to facilitate their taking root. And the plants, from the roots of the former year, will always flower much ſtronger than the ſeedlings of the ſame year's growth. *Miller*'s Gardener's Dict.

MARUM, the herb *Maſtic*, in botany, a name given to one of the ſpecies of *thymbra*. See the article THYMBRA.

It is a plant very common with us in the gardens of the curious, and is propagated by planting cuttings in any of the ſummer months on a bed of freſh light rich earth, where they are to be carefully watered and ſhaded till they have taken root; after which they may be removed either into pots or borders. But the greateſt difficulty attending the keeping this plant, is the preſerving it from cats, which will come a great way, and tear them to pieces. It is obſerved, however, that though theſe animals never ſpare a plant that grows ſingle, they will not meddle with it when planted in large cluſters, which is indeed the only way to ſave it. *Miller's* Gardener's Dict.

The common herb *maſtic* is a cephalic, and is of ſervice in all diſorders of the nerves. It has alſo an aſtringency, by means of which it is of ſervice in hæmorrhages of all kinds, particularly in profluvia of the menſes.

MARYGOLD, *Caltha*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the radiated kind; its diſk is compoſed of ſeveral floſcules, and its outer circle of ſemi-floſcules; theſe are all placed upon the embryo ſeeds, and contained in a common cup. The The embrios finally become flat, crooked, and marginated capſules, containing a long ſhaped ſeed.

The ſpecies of *Marygold*, enumerated by Mr. Tournefort, are theſe: 1. The common *Marygold*, with pale yellow flowers. 2. The common *Marygold*, with deeper yellow flowers. 3. The common *Marygold*, with reddiſh yellow flowers. 4. The talleſt many-flower'd *Marygold.* 5. The common great many flower'd *Marygold.* 6. The great many flower'd *Marygold*, with bright yellow flowers. 7. The great many flower'd *Marygold*, with honey-colour'd flowers. 8. The *Marygold* with bending flowers. 9. The great flower'd proliferous *Marygold.* 10. The great proliferous *Marygold*, with honey-coloured flowers. 11. The proliferous *Marygold*, with ſmaller flowers. 12. The *Marygold* with variegated flowers. 13. The wild or field *Marygold.* 14. The ſmalleſt dwarf *Marygold.* 15. The African *Marygold*, with flowers white within, and of a violet blue on the outſide. 16. The wild Portugal *Marygold.* 17. The woolly ſea Portugal *Marygold.* *Tourn.* Inſt. p. 498.

The flowers of the common *Marygold* are cordial and alexipharmic; they promote ſweat, and are good to throw out the ſmall-pox, or any other eruption. They alſo promote the menſes, and are ſo far aperient, that they are found of ſervice in the jaundice, and in indurations of the ſpleen. The midwives burn them under women whoſe labour does not come on properly, and ſuppoſe they are of great virtue in promoting the pains. They alſo diſtil a water from them, as a remedy for ſore eyes; but theſe laſt virtues are not ſo well warranted.

African MARYGOLD. See the article TAGETES.

Corn MARYGOLD. See the article CHRYSANTHEMUM.

Marſh MARYGOLD. See the article POPULAGO.

Zoophyte MARYGOLD, in natural hiſtory, the name of a ſpecies of ſea animal, of a very beautiful kind, and of the nature of thoſe commonly called *Zoophytes*, or plant animals, by the old naturaliſts. In St. Lucy's pariſh, in Barbadoes, there is a cave in which is a baſon of very clear ſalt water; and in the midſt of this baſon lies a ſtone, which has been for many years found to be the habitation of a great number of animals of this ſpecies.

The ſtone is always covered with water; and from ſmall holes in its ſides, in ſeveral parts, there appear, at all times of the year, a number of creatures repreſenting the flowers of ſome of the radiated plants, and particularly of the common *Marygold*: They are yellow, and ſeem compoſed of a very great number of petals. Theſe, in their natural ſtate, are all regularly and beautifully expanded; but as ſoon as any thing diſturbs them, if it be only the motion of a ſtick that comes within three or four inches of them, they in an inſtant cloſe all the leaves up together, and the whole body, flower, ſtalk and all, is retracted back into the hole of the ſtone; but if the water be left a few minutes undiſturbed again, they will appear and expand themſelves in the former manner.

When they are nicely obſerved, there is a yet farther reſemblance of a flower in their ſtructure; for there ariſe from the center of the body certain oblong bodies, which very naturally reſemble the ſtamina ariſing from the center of a flower; but theſe have evidently the powers of animal limbs; for they no ſooner appear, but they dart themſelves about to the verge of the flower in ſeveral directions, and are plainly buſied in ſearch of prey. They are compoſed of ſeveral joints, and the creature often makes them meet in the manner of a forceps, to lay hold of any thing it pleaſes. Theſe parts, however, ſeldom appear thus exerted any long time together, but are, after a time, received back into the body.

Theſe arms may eaſily be conceived to be of uſe to draw in the prey within the compaſs of the body of the animal; and as ſoon as it is there, the ſame contraction of the ſeveral rays which ſerves them to eſcape danger, and bury themſelves in the cavity of the ſtone, will alſo ſerve to hold faſt the prey till the creature has fed on it.

Beſide theſe large yellow radiated *Zoophytes*, the top of the ſtone uſually affords a number of others of a blue colour, which ſtand among a ſort of veſicles of water bladders, diſpoſed like cluſters of grapes. Philoſ. Tranſ. N°. 470. p. 591.

MARYGOLD *Flower*, in zoology. See the article REGULUS *Criſtatus*.

MASARINO, in zoology, a name given by the Portugueſe, in the Braſils, to a large bird of the curlew kind, approaching to the gooſe in ſize; and more commonly known by its Braſilian name *curicaca*. See the article CURICACA.

MASCHARADA, in the Italian muſic, is applied to muſic compoſed for the geſtures of pantomimes, buffoons, mimics, and ſuch groteſque characters.

MASLACH, the name of a medicine greatly in uſe among the Turks, and called alſo *Anſion* or *Amphion*. It is prepared principally of opium. They take a dram of it at a time, and ſometimes two or three: They always uſe it when going to battle, and very often as a provocative to venery, as they do the crude opium.

MASLIN. See the article BULLIMONY.

MASORAH and MASORITES. See the article CABBALISTS.

MASSALIS, a word by which ſome of the chemical writers have expreſſed mercury.

MASSIMA, in the Italian muſic, is a note or character made in a long ſquare, with a tail to it; thus, . It contains eight ſemi-breves in common time. This character is diſuſed in the modern muſic, for they have found other ways to ſeparate the bars, and to mark the length of notes.

MASTED. A ſhip is ſaid to be *maſted*, when ſhe has all her maſts compleat.

Armed MAST, in a ſhip, one that is made of more than one tree.

Over-MASTED, or *Taut*-MASTED, is ſaid of a ſhip whoſe maſts are either too long or too big; which makes her lie too much down by the wind, and labour too much *a-hull*.

Spending a MAST, at ſea, is when it is broke by ſoul weather.

Springing a MAST, at ſea, is when it is cracked in any place.

Under-MASTED, or *Low*-MASTED *Ships*, ſuch whoſe *Maſts* are either too ſmall, or too ſhort: In which caſe ſhe cannot bear ſo great a ſail as ſhould give her true way.

MASTER (*Cycl.*)—MASTER *of a Ship of War*, the next officer to a lieutenant; he has under his care and direction every thing relating to the conducting and ſailing of the ſhip, as to determine the courſe ſhe is to ſail, command the ſailors, and give orders for ſteering, trimming and ſailing the ſhip. He is to keep the moſt accurate account of the ſhip's way, and be at all times able to give eſtimate, or prick off her place on the true ſea-chart; and is allowed mates to aſſiſt him in his office.

In merchantmen the *Maſter* is the chief officer.

MASTER *Load*, in mining, a term uſed to expreſs the larger vein of a metal, in places where there are ſeveral veins in the ſame hill. Thus it often happens, that there are ſeven, ſometimes five, but more uſually three veins or loads, parallel to each other, in the ſame hill. Of theſe the middle vein is always greatly the largeſt. This is called the *Maſter Load*; and the others which lie three, two, or one, on each ſide of this, are called the concomitants of the *Maſter Load*.

The general breadth of the *Maſter Loads*, in Cornwall, is from three to ſeven foot. They are ſeldom larger than this, except in certain peculiar places, as where all the veins meet together, as they ſometimes do, and form a knot, from which they ſeparate again, and each takes its peculiar courſe. The ſize of ſuch a knot is not eaſily determined, and it is uſually very rich in tin, or the other metal of the mine. The ſeveral parts, even of the *Maſter Load*, are not at all regular in breadth, but from ſix foot, it will, in ſome places, dwindle to one foot, or even to an inch broad, in a very ſmall ſpace; but the miners are not diſheartened at this, for they know it will ſoon grow wider again, unleſs really worked out. Phil. Tranſ. N°. 69.

The *Maſter Load* uſually lies in a hard rocky or ſhelfy ſtratum, made up of metalline matter, ſpars, mundic, and other unprofitable ſubſtances, or weeds, as the miners call them, and is, as it were, all along a continued rock; but has many veins and joints, as they are called. In ſome places the matter in which the ore lies is ſofter, and then it is much more eaſily worked. In Cornwall they uſually allow two ſhovel-men to three beele-men or pickers; but where the load runs in a ſofter ſubſtance, there muſt be a greater proportion of the ſhovellers or carriers away.

There is generally water found about the *Loads* of the metal. In moſt places it is met with at ſome feet deep from the *loady* ſurface; and it often runs through the heart of the *Load*, not in a direct channel, but windingly, in and out, inſenſibly through the veins and joints of the *Load*. When the miners have followed a *Load* to ſome depth, and the water begins to be troubleſome, as it generally ſoon is, if there be any in the work, they deſcend to the bottom of the hill, where they have that conveniency, and at the loweſt place begin as little a drift as the convenience of working or driving will permit, ſcarce half ſo big as that for a *Load*; they carry this on, on a level, till they come to the work itſelf. In this the uſe of the dial is needful, which they term *plumming* and *dialling*. See the article DIALLING, *Cycl.* and PLUMMING, *Suppl.*

By this means the exact place of the work is known, where to bring the adit, or where to ſink down to make an air ſhaft. Though the water is troubleſome in the *Loads*, yet there is always one great convenience attending it; which is, that where there is water, there is never want of air for the reſpiration of the miners, and the candles always burn well. But it is alſo to be obſerved, that in a ſoft, looſe, quagmire country, the earth ſometimes falls in after the workmen, in ſuch a manner as, though it does not choak up the whole ſhaft, yet it ſo far ſtops it, as to render the current of air leſs free, and the miners find the utmoſt neceſſity of opening a ſhaft for air to reſpire from the ſurface. If the ſoil be ſo ſoft as not to be able to ſupport itſelf in the working, as is ſometimes the caſe in theſe wet clayey hills, it is neceſſary to prop it up, as they go on, with boards, poſts, and the like. This adds greatly to the expence of mining; but in the working a *Maſter Load*, it is often worth while. When the miners are out of heart at the trouble of walling and propping, on this occaſion, it ſometimes happens, that a dipping of the *Load* carries them down into a firmer ſtratum, and they are at once reliev'd from all that trouble and danger.

MASTER-*Wort*, in botany, *&c.* See the article IMPERATORIA.

MASTER-*Yaw*, a large *Yaw* ſometines remaining after ſalivation. Se the article YAWS.

MASTICA *De ſoho*, in the materia medica, the name given by the Indians to the ſtone commonly known among authors by the name of *Pedro del Porco*, a ſort of bezoar taken out of the gall-bladder of an Indian boar. The Indians, and many of the European nations, eſteem this one of the greateſt medicines in the world in peſtilential diſeaſes, and the ſmall pox.

MASTIC (*Cycl.*)—The Arabian writers, Aviſenna and Serapio, in their chapters of the turpentine tree, often mention the lentiſk and its reſin, which they ſay was very much like the reſin of the common turpentine tree. But beſide this, Aviſenna has a peculiar chapter on *Maſtic*; whence it ſhould ſeem, that by the name lentiſk they do not mean the tree which produces *Maſtic*, as we do, but ſome peculiar ſpecies of the turpentine tree.

Aviſenna diſtinguiſhes two kinds of *Maſtic*, the one called *rumi*, and the other *cupti*: The *rumi* came from the iſland of Chios, and was white; the *cupti* was of a blackiſh colour, and was brought from Ægypt. See the article LENTISCUS.

MASTIC is alſo uſed as the name of an herb, otherwiſe called *Marum*. See the article MARUM.

MASTICHE *Terra*, *Maſtic Earth*, a name given by ſome of the old writers on the materia medica to the Chio earth, or *Terra Chia*. The reaſon of this ſtrange appellation ſeems to have been, that the fineſt *Maſtic* coming from the Iſland of Chios, had obtained the name of *Kie*, or *Chie*, and *Maſtic* and *Chia* being thus become, in one ſenſe, ſynonimous words, the uſe of them was, in this manner, carried much farther, and the earth of that iſland called by the name of the *gum*.

The Arabians ſeem to explain this very well, in their name of this earth; they not calling it *Maſtic earth*, but *thin beled Almaſtichi*, that is, *Terra Regionis Maſtichis*, the earth of the country where *Maſtic* is produced.

MASTICHINA, in botany, a name given by ſome authors to the herb maſtic, or garden *marum*. *Boer.* Ind. 156. See the article MARUM.

MASTIGADOUR, or SLABBERING-BIT, in the manege, is a ſnaffle of iron, all ſmooth, and of a piece, guarded with pater noſters, and compoſed of three halves of great rings, made into demi-ovals of unequal bigneſs, the leſſer being incloſed within the greateſt, which ought to be about half a foot high. A *Maſtigadour* is mounted with a head-ſtall and two reins. A horſe, by champing upon the *Maſtigadour*, keeps his mouth freſh and moiſt.

To put a horſe to the *Maſtigadour*, is to ſet his croupe to the manger, and his head between two pillars in the ſtable. Horſes that uſe to hang out their tongue, cannot do it when the *Maſtigadour* is on; for that keeps their tongue ſo much in ſubjection, that they cannot put it out.

MASTIGOPHORI, Μαστιγοφόροι, among the Greeks, certain officers appointed to preſerve the peace, and correct ſuch as were unruly at the olympic games. *Potter*, l. 2. c. 22. See alſo Mem. Acad. Inſcript. T. 1. p. 338, 339.

MASTON, in botany, a name by which Pliny and ſome other authors have called the *ſcabioſa*, or *ſcabious*, a blue-flowered plant, common among corn. *Ger.* Emac. Ind 2.

MATCHING, in the wine trade, the preparing veſſels to preſerve wines and other liquors, without their growing ſour or vapid. See the article WINE.

The method of doing it is this: Melt brimſtone in an iron ladle, and, when thoroughly melted, dip into it ſlips of coarſe linnen cloth; take theſe out, and let them cool. This is what the wine-coopers call *match*. Take one of theſe *matches*, ſet one end of it on fire, and put it into the bung-hole of a caſk; ſtop it looſely, and thus ſuffer the *Match* to burn nearly out; then drive in the bung tight, and ſet the caſk aſide for an hour or two. At the end of this time examine the caſk, and you will find that the ſulphur has communicated a violently pungent and ſuffocating ſcent to the caſk, with a conſiderable degree of acidity, which is the gas, and acid ſpirit of the ſulphur. The caſk may, after this, be filled with a ſmall wine, which has ſcarce done its fermentation, and bunging it down tight, it will be kept good, and

will ſoon clarify. This is a common and a very uſeful method; for poor wines could ſcarce be kept potable, even a few months, without it. Nor could ſtums be prepared in large quantities without this help. *Shaw*'s Lectures, p. 191.

MATER (*Cycl.*)—MATER *Metallorum*, in natural hiſtory, a name given by the Saxon mineraliſts, and thoſe of ſome other places, to a peculiar kind of marcaſite or mundic, which they ſuppoſe, according to the expreſſion, to be the mother, or parent of metals.

The marcaſite they call by this name is the common yellow kind, but in a foul ſtate, it being uſually mixed with ſome, poor ore of iron, or with ſome ſtony matter, which has made it concrete looſely and irregularly, and it is found ſometimes formed into thin undulated plates, and ſometimes into complex maſſes; but is always cavernous or ſpungy, or full of ſmaller or larger holes. Theſe are often empty; but in ſome pieces they contain parcels either of pure native metals, or of rich ores. Pieces of native copper are found in ſome, and ores of iron and tin in others. And it is ſaid in Saxony, that native ſilver, in thin plates, is found in ſome few.

MATERFILON, in botany, a name given by ſome authors to the *jacea nigra*, or common knapweed. Our Engliſh name *matfellon* ſeems a corruption of this. *Ger.* Emac. Ind. 2. See the article JACEA.

MATERIA (*Cycl.*)—MATERIA *Chemica*, a term uſed by authors to expreſs ſuch bodies as are the peculiar objects of chemical experiments.

The *Materia Chemica*, in a larger ſenſe, takes in all the bodies of the globe, all theſe being the ſubjects of chemiſtry in its extenſive ſenſe; but the curious, in chemical reſearches, may be deſirous of knowing in general, what bodies they ought to procure, and have in readineſs for them. Dr. Shaw has given a liſt of theſe for his portable laboratory, which will ſerve in general as well as on that particular occaſion.

This collection being diſtributed under proper claſſes, will come into a ſmall compaſs, and may be conveniently carried either by land or ſea, along with that uſeful furnace, and its neceſſary apparatus.

The natural arrangement of the *Materia Chemica* is into the general diviſion of animal, vegetable and mineral ſubſtances. But thoſe who are deſirous of a larger collection, may enlarge the number of general diviſions, according to Becher's method, by which all chemical ſubjects are arranged into eight general claſſes; metals, minerals, decompounds, ſalts, gums, earths, ſtones, ſpirits, and oils.

The claſs of metals contains gold, ſilver, copper, iron, tin, and lead; and all theſe are to be kept both in their natural and artificial ſtate; that is, in their ores, and as ſeparated from them for human uſes. To theſe natural metals are to be added the artificial or compound ones, *viz.* pewter, bell-metal, braſs, gun-metal, pin-metal, Bath-metal, wells-metal, princes-metal, London-metal, white copper, white gold, and yellow ſilver. Under minerals are included, antimony, biſmuth, zink, marcaſite, cobalt, zaffer, ſmalt, arſenic, manganeſe, orpiment, mercury, native cinnabar, and ſulphur. All theſe are to be kept both in their natural ſtate as dug out of the earth, and as purified. *Becher*'s Phyſ. Subter. p. 187.

The decompounds of minerals include aurum fulminans, luna cornea, the calxes of gold and ſilver, ultramarine, diſtilled verdegreaſe, burnt copper, putty, or calcin'd tin, ſugar of lead, cadmia, tutty, black lead, red lead, litharge, white lead, glaſs of lead, ſimple and martial regulus of antimony, glaſs and cinnabar of antimony, the preparations of quick-ſilver, as ſublimate, precipitate, and the reſt. The ſame ſort of arrangement may alſo take in the ſeveral kinds of decompounds of animal and vegetable ſubſtances. *Shaw*'s Port. Laborat.

The claſs of ſalts takes in ſea ſalt, nitre, alum, vitriol, borax, tartar, ſugar, potaſh, and the compound ſaline fluxes for ſtubborn ores. And to theſe are to be added the tribe of artificial ſalts, of which number are the tartarum vitriolatum, fixed nitre, ſoluble tartar, terra foliata tartari, nitrum nitratum, ſal ammoniac, Epſom ſalts, volatile ſalts, and ſeveral others of a ſimilar nature.

Under the gums are ranked pitch, reſin, turpentine, wax, camphor, amber, pit-coal, jet, and all bitumens, balſams, and inſpiſſated juices.

Among the earths are taken in ores, waſhed ores, fluds, calxes of metals, lime, plaſter, gypſum, chalk, boles, ſhells, ſand, and the foſſils commonly and properly called earths, whether they be of the calcarious or of the vitreſcible kinds; that is, whether in the fire they are converted into a ſort of lime, or run into a glaſs.

Stones include flints, pebbles, quarry ſtone, cryſtal, talc, the vulgar ſtones, and all the gems from the diamond down to the ſpars.

Laſtly, under ſpirits and oils come aqua regia, aqua fortis, oil of vitriol, ſpirit of ſalt, ſpirit of nitre, ſpirit of ſulphur, ſpirit of alum, ſpirit of vinegar, ſpirit of wine, ſpirit of urine, ſpirit of tartar, ſpirit of turpentine, oil of tartar per deliquium; the eſſential oils of nutmegs, cloves, and the like; the expreſſed oils of olives, almonds, linſeed, and the like; and the compound oils, as butter of antimony, artificial balſams, &c.

It is eaſy tn ſee that this ſort of claſſing is not fit for the naturaliſt, who ſtudies bodies for their natural qualities, nor indeed for the nice diſtinguiſher of any kind; but in this manner Becher adviſes the young operator in chemiſtry, to procure to himſelf a ſort of artificial alphabet of nature, and this will ſerve the purpoſe very well, where no more is meant than a mere *Materia Chemica*, to be put in ſuch order, that it may be readily had recourſe to in all its parts. With this the young operator is to proceed regularly, as he would do in learning a language. Forming firſt ſyllables out of the joining of two or more letters of this alphabet, and then words, by combining theſe firſt ſets together, and finally, whole diſcourſes; that is, forming theſe various ſimple bodies into mixts, compounds, and decompounds. *Becher*'s Phyſ. Subter. p. 179.

To avoid miſcarriages, and prevent being impoſed upon, it will be very proper to cultivate a knowledge of the productions of nature in their crude ſtate, and peculiar places of growth, where being firſt viewed and examined before they are gathered or dug up, an exact knowledge of them, as nature furniſhes them, may be procured. For want of this previous qualification, men, otherwiſe of great ſagacity, have erred in their operations, and perhaps blamed the original author of a proceſs, in which they miſcarry; while they are all the while uſing a wrong ſubject, or an adulterated or imperfect one, inſtead of the true. From this miſtake alone, numberleſs complaints have ariſen of the failure and uncertain ſucceſs in the proceſſes and experiments recorded even by the beſt authors.

The perſon who would work in chemiſtry with pleaſure and ſucceſs, ſhould make a ſufficiently copious collection of a *Materia Chemica* of this kind, all the particulars of which he is well aſſured of, as to their genuineneſs and perfection in in their kinds. Theſe being always ready, will prevent the neceſſity of ſending to the druggiſt at every turn, where the things ſent for are often either not to be had, or only in a ſophiſticated ſtate; when this alphabet of nature, compoſed of the ſeveral materials of chemical reſearches, is like the letter in a printing-houſe, diſtributed and lodged in proper cells, it may readily be drawn out for uſe as occaſion requires. It is impoſſible to expreſs with how little expence and trouble, yet with how great profit and pleaſure, numerous experiments, and thoſe of the moſt difficult kind, may be made, when the operator has, in this manner, all his materials about him.

Becher tells us, that he has, in this manner, gone through fifty experiments in a day; and, while writing on chemical ſubjects, if any difficulty or uncertainly occurred, he immediately got up from his deſk, made the neceſſary experiment, and ſat down again to write the certain fact: So that he affirms, there was very little more trouble in making the experiment at the fire, than in deſcribing the proceſs by the pen.

MATES, on board a ſhip, are aſſiſtants to the ſeveral officers; as *Maſter's Mates*, *Surgeon's Mates*, *Gunner's Mates*, *Carpenter's Mate*, *Boatſwain's Mate*, *Cook's Mate*, *Corporal's Mate*.

MATHEDORAM, a name by which ſome chemiſts have called *ſal gemm*.

MATITES, in natural hiſtory, the name of a ſtone deſcribed by ſeveral authors. The characters they give of it are, that it is of a pale greyiſh colour, and of the form of the nipples of a woman's breaſt, ſeveral of theſe nipples appearing upon one ſtone.

There have been many abſurd and idle conjectures, as to the origin of this ſtone; but it may be eaſy to account for its figure on very plain and natural principles. We find in the earth many ſtones, reſembling exactly the figures of ſhells of various kinds, and parts of other animals. Theſe have, in general, once been the things they thus repreſent petrified, or altered into the nature of ſtone, by the inſinuation of ſtony particles into their pores.

Among theſe none are ſo frequent as the remains of the *echini marini*, or ſea eggs, as we call them. Theſe we find in various forms; ſometimes ſingle ſpines, ſometimes whole ſhells, and ſometimes only parts of ſhells preſerved. It is well known, that all the *echini marini* have ſpines or ſpikes, whence they have their name; and in many of the ſpecies which we find recent on our ſhores, theſe ſpines are joined to the body of the ſhell by a ſmall protuberance, which, from its reſemblance to a nipple, we call *papilla*. Now we frequently find theſe papillæ delineated in creux, in pebbles, and other ſtones, ſometimes ſingly, and ſometimes in numbers together, in the form in which they adhered to the ſhell. We find, in other foſſils, that whatever ſhell, *&c.* is ſometimes delineated in creux on ſtone, is alſo ſometimes done in the elevated manner; and it is plain, that there needs no more to the formation of one of theſe *matitæ* than the petrifaction of a piece of the ſhell of one of thoſe *echini* which have large papillæ, ſuch as thoſe of the red ſea, with ſome of its papillæ upon it. As to the colour, it is not to be limited to grey alone, but may be as various as the colours of ſtones, ſince any ſpecies of ſtone may have gone to the formation of it; and whatever colour the ſtony matter was, of that will the *Matites* be.

MATKNELTZEL, in zoology, the name of a bird approaching to the ſnipe kind, and called by Geſner *gallinula erythra*;

and

and by the common people of Germany, *mattkern*. It is all over of a reddiſh or ruddy hue, except the belly, which is white; on the back the colour is more duſky, and is variegated with black ſpots. On the wings the colour is much fairer and clearer, ſome of the longer feathers of them approaching to the colour of the painters red earth, called reddle. It is common in watery places, in many parts of Germany and Italy. *Ray*'s Ornithology, p. 226.

MATO, in natural hiſtory, the name of a tree growing both in the Eaſt and Weſt Indies, and bearing a fruit of the ſize of an apple, and covered with a thick and tough red ſkin. This is called by ſome, the wild *mangouſtan*. Its fruit perfectly reſembles that of the mangouſtan in figure, but is not eatable. Mem. Acad. Par. 1699.

MATORIUM, a word uſed by ſome of the chemical writers to expreſs the *gum ammoniacum*, and by others *galbanum*.

MATRASS (*Cycl.*)—The *Matraſs*, uſed in aſſaying, is a veſſel of very pure and tranſparent glaſs, not too thick at the bottom, which would make it apt to burſt in the fire. It is, for this uſe, to be about eight or ten inches high, and to have an orifice ſcarce ſo much as half an inch wide, leſt the matters contained in it, being in a violent ſtate of ebullition, ſhould either riſe over the mouth of the veſſel, or at leaſt be partly thrown out in form of ſmall drops, like a thin rain, which drops always carry ſome of the metal with them. The bottom is capacious enough, when it will hold an ounce or two of aqua fortis, and the height of the veſſel is of farther uſe in making a greater repercuſſion of the fumes. The mouth ought alſo to be turned backwards, in form of a broad lip, that the ſolutions, when poured out, may not run down the ſides of the veſſel. *Cramer*, Art Aſſ. p. 68.

MATRICARIA, *Feverfew*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is naturally of the radiated kind. Its diſk is compoſed of floſcules, and its outer circle of ſemi-floſcules, all placed on the embryo ſeeds, and contained in one common cup, which is of a ſquammoſe ſtructure, and hemiſpheric figure. The embrios finally become ſeeds of an oblong figure, affixed to the thalamus of the flower. To this it is to be added, that the flowers always grow many together, in a ſort of cluſters, and the leaves are divided ino ſomewhat regular ſegments, ſtanding in pairs over againſt one another.

The ſpecies of *Feverfew*, enumerated by Mr. Tournefort, are theſe: 1. The common garden *Feverfew*. 2. The garden *Feverfew*, with red ſtalks. 3. The wild *Feverfew*, with flowers altogether yellow. 4. The ſweet-ſcented *Feverfew*. 5. The double-flowered *Feverfew*. 6. The white-flowered *Feverfew*, with three ſeries of ſemi-floſcules. 7. The *Feverfew*, with fiſtular petals. 8. The curled-leav'd *Feverfew*, with the petals of the flower all fiſtulous. 9. The *Feverfew*, with the marginal petals of the flower flat, the inner ones fiſtular. 10. The naked-flower'd *Feverfew*. 11. The tanzy-leav'd *Feverfew*, with large flowers, and umbilicated ſeeds. 12. The tanzy-leav'd *Feverfew*, with ſmaller flowers, and umbilicated ſeeds. 13. The buphthalmum-leav'd Pyrenean *Feverfew*. 12. The American *Feverfew*, with leaves like the *ambroſia*, and with ſmall white flowers. *Tourn.* Inſt. p. 493.

Feverfew has always been allowed one of the firſt places among the hyſteric and uterine plants. It is preſcribed in powder from a ſcruple to half a dram the doſe; but the much better way is in a ſlight infuſion made in the manner of tea. Taken in this eaſy manner for a continuance of time, it will bring the menſes, tho' ſubject to be interrupted and irregular, to their true period; and will remove a number of complaints, the natural conſequence of ſuch an irregularity.

It is alſo an agreeable carminative and bitter. It ſtrengthens the ſtomach, and diſperſes flatulences; and the expreſſed juice is ſaid to kill worms. Some likewiſe commend it in diſorders of the head, and in all nephritic complaints. Hoffman gives it great praiſes, uſed as a febrifuge. We uſed to keep a ſimple water and ſyrup of *Feverfew* in the ſhops; but at preſent they are wholly diſuſed, and the dried herb only kept ready for fomentations, and ſometimes as an ingredient in clyſters.

Many ſpecies of this plant are cultivated in gardens, for the beauty of their flowers. They are propagated by ſowing them in March, on a bed of light earth; when they are come up, they ſhould be tranſplanted out into nurſery beds, at about eight inches aſunder; and in the middle of May they ſhould be removed into the flower beds, where they are to ſtand. They flower in July and Auguſt; but they ſhould not be permitted to ſeed, which always weakens, and often deſtroys the roots: So that the ſtalks ſhould be cut down to the ground, when the flower decays. *Miller*'s Gardener's Dict.

MATRIMONY. See the articles ESPOUSALS and MARRIAGE.

MATRISYLVA, in botany, a name by which ſome authors call the common honey-ſuckle, or wood-bind, aud others the wood-ruffe.

MATRIX, (*Cycl.*) in anatomy. See the articles WOMB, UTERUS, FOETUS, *&c. Cycl.* and *Suppl.*

MATRIX *Succini*, in natural hiſtory, a name given by Hartman, and ſome other authors, to a ſort of ſubſtance reſembling foſſile wood, or the barks of trees, common in the cliffs of the ſhores of the Baltic, and found in digging all over Pruſſia. This is the bed in which the foſſile amber of that kingdom is lodged, and it is ſuppoſed to have no ſmall ſhare in the production or formation of that foſſile. The workmen who dig for amber always make this their guide, and follow the veins of it, never ſearching any where elſe for the amber. The very ſurface of this foſſile ſubſtance is often covered with a kind of amber; but this is poor, and of no value. Many authors have ſuppoſed this cortical or wood-like ſubſtance to be real foſſile wood; but this is an error. The maſſes of it are too large, ever to have been trees, and their fibres run often to twenty, thirty, or forty foot diameter, in the ſame unbroken compages. It differs from trees alſo in this, that as they have been form'd by ſucceſſive additions of matter by vegetation, their whole bulk is compoſed of circular ſtrata, if they may be ſo called, or additions of coats round a medulla or pith; but in this foſſile wood, as ſome have ſuppoſed it to be, there is no pith or medulla, no addition of circular coats, but the ſame vaſt maſs of it is continued to a vaſt length and breadth, in the manner of an earthy ſtratum, and is compoſed of thin laminæ, or plates laid flatwiſe one over another. Were this ſubſtance really formed of the bodies of trees, we ſhould alſo find in it that variety of fibres which the ſeveral parts of wood are known to conſiſt of; but nothing of this kind appears, we ſee the whole maſs, conſiſting of abſolutely the ſame ſhaped fibres; and there never was found, in any of this ſubſtance, the leaſt reſemblance of a knot or leaf, or the pedicle of a leaf, as might well be expected, had leaves ever grown from it. Phil. Tranſ. N°. 248. p. 14.

The foſſile wood, which is truly ſuch, and has been once vegetable matter, whatever part of the world it is found in, agrees in the ſame general marks of diſtinction and knots, and other evident proofs of its having been once vegetable are found in all of it; but this *Matrix* of amber, whether found in Pruſſia, Denmark, or elſewhere, is ſtill of the ſame kind, and ſhews none of theſe characteriſtic marks of wood. See the article SUCCINUM.

MATTS, on board a ſhip, a kind of broad, thick clouts, wove out of ſpun yarn, ſinnet, or thrums; and uſed to preſerve the main and fore-yards from galling againſt the maſts at the ties, and at the gunnel of the loof. They alſo ſerve to keep the clew of the ſail from galling there; as alſo to ſave the clews of the fore-ſail from doing ſo at the beak-head and boltſprit.

MATTAGESS, in zoology, the Engliſh name of the larger ſpecies of the *lanius* or *butcher bird*.

The word *Mattageſs* is borrowed from the Savoyards, and ſignifies the murdering pye; and has been given it from its ſavage diſpoſition, and its reſemblance to the magpye in the ſhape of its tail.

It is barely of the bigneſs of a thruſh; its beak is moderately long, black, and hooked at the end, but ſtrait all the way to that. Its tongue is bifid and hairy, and there are ſeveral black and ſhort briſtles at the top of the beak. Its head, back, and rump, are grey. Its chin and belly white, and its throat and breaſt variegated with duſky ſtreaks. Its feet and legs are black. It is very common in Germany, and is ſometimes ſeen in the northern parts of England, but with us is not very frequent. It lives among low buſhes, and builds in them. Its neſt is made of moſs, wool, and ſoft herbs, and the tender branches of heath. It has ſeven young ones at a brood, which are of a greeniſh colour, and very little reſemble their parent. It feeds on thruſhes, and ſmaller birds, and is a very terrible deſtroyer among them. *Ray*'s Ornithology, p. 53.

MATTHIOLA, in botany, the name of a genus of plants, the characters of which are theſe: The cup is a cylindric perianthium, is very ſhort, erect, and undivided, and remains after the flower is fallen; the flower is monopetalous, and conſiſts of a very long tube, which dilates, by degrees, into a large and wide mouth, with a ſmooth or undivided edge. The ſtamina are five pointed filaments, ſhorter than the flower. The apices are ſimple. The germen of the piſtil is globoſe, and is placed beneath the cup. The ſtyle is very ſlender, and of the length of the cup. The ſtigma is large and obtuſe. The fruit is a drupa of a globoſe figure, containing only one cell, and crowned with the cup. The ſeed is a globoſe nut or ſtone, containing a kernel of the ſame globoſe form. *Plumier*, 6. *Linnæi* Gen. Pl. p. 519. *Ponteder*. p. 39.

MATTKEM, in zoology, a common name in Germany for the *matkneltzel*. See the article MATKNELTZEL.

MATUITUI, in zoology, the name of a Braſilian bird, of the turdus or thruſh kind, and of the bigneſs of the common ſtarling. Its neck is ſhort; its breaſt large and ſtrong; its legs ſhort, and its beak a little hooked at the end, and of a fine high red. Its head, neck, back, wings and tail, are all of a fine deep brown, variegated with ſpots of a pale yellow. Its throat is yellow, and its breaſt and belly white, a little ſpotted with brown. Its thighs are grey. *Marggrave*'s

Hiſt. Braſil. See the article CURICACA, where *Matuitui* is corruptly printed *Matrictici*.

MATURAQUE, in natural hiſtory, the name of an American fiſh, of the harengiform kind, and having only one ſhort fin on the back. It ſeldom grows to more than four inches long, and is ſomewhat flattiſh, but not very broad. Its head is very broad, and covered with a ſhelly cruſt. Its lower jaw is ſomething longer than the upper, and has ſeveral very ſharp teeth, uſually ſix in number. The upper jaw has a larger number, but they are ſmall. Its gills are large, and its tail is made of a ſomewhat ſquare fin, a little rounded at the extremity. Its ſcales are large, and very regularly arranged. Its head, back, and the upper part of its ſides, are black, and its belly of a hoary white, and its fins are all black. It is caught in lakes, not in rivers, and is a well taſted fiſh. *Willughby*, Hiſt. Piſc. p. 235.

MAUDIHOCA, the *Caſſada*, or the poiſonous root of which bread is made in many parts of the Weſt Indies. See the article MANIHOT.

MAVIS, in zoology, the common name of the ſong-thruſh, or throſtle, called by authors the *turdus viſcivorus minor*, to diſtinguiſh it from the larger ſpecies, called in Engliſh the *miſſel bird*; and uſually known among us alſo by the ſimple name *thruſh*. It is called *viſcivorus* by authors, from its reſemblance in colour to the other *viſcivorus*, not from its feeding on the miſletoe-berries, as that does.

It is much ſmaller than the miſſel bird, and of a middle ſize between the fieldfare and redwing. Its back is of a greyiſh brown, ſomewhat like the colour of the Spaniſh olives; its belly white, and its breaſt yellowiſh, and ſpotted with brown and blackiſh ſpots, and it is ſpotted round about the eyes; its under ſmall feathers of the wings are of a yellowiſh or reddiſh brown, and thoſe under the tail whitiſh. Its legs are brown. It feeds on worms, ſnails, and ſmall inſects, and remains with us the whole year. It builds with moſs and ſtubble, and lines the neſt with mud. On this it lays five or ſix eggs, which are of a bluiſh green, variegated with a few black ſpots. It ſits on hedges and buſhes, and ſings very agreeably. *Ray*'s Ornithology, p. 138.

MAUMY *Soil*, in agriculture, an earth conſiſting of a white marly clay, chalk, and ſand, which cauſes it to work very ſhort, as the farmers call it, when any thing dry. This ſort of land is uſually ſowed with wheat, miſcellan, or barley, and requires the ſame tillage that the clay land does, and muſt be kept dry and warm.

Its moſt proper manure is the rotteneſt dung. As they frequently ſow beans next after wheat in clayey grounds, ſo in theſe they chooſe to ſow peas, chuſing a fair and ſettled ſeaſon for their ſeed-time; for if there happen a ſmart ſhower ſoon after their ſowing, the earth will bind ſo firmly together after it, that moſt of the ſeed will be loſt. *Plot*'s Oxfordſhire, p. 246.

MAUND, in our old writers, a kind of great baſket or hamper, containing eight bales, or two fats: It is commonly a quantity of eight bales of unbound books, each bale having one thouſand pounds weight. Book of Rates, p. 3. *Blount*.

MAUROUSE, the name of a creature of the deer kind, mentioned by Joſſelyn. It ſeems to be the ſame with the *Dama Virginiana* of Mr. Ray, one of which creatures was, in his time, kept alive in St. James's park. See the article DAMA. This is not certain, however; for Joſſelyn's deſcription is very imperfect; he only ſays it is like the mooſe-deer, but is ſmall, and has ſmall horns.

MAUZ, a name uſed by ſome authors for the *muſa*, or plantain-tree. *Alpin*. Egypt. p. 78.

MAXILLA (*Cycl.*)—MAXILLÆ *Quartus*, in anatomy, a name given by Veſalius, and ſome others, to one of the muſcles of the lower jaw, commonly known by the name of the *digaſtricus*, and called by Albinus, *biventer maxillæ inferioris*.

MAXILLAM *Atollens Tertius*, in anatomy, a name given by Riolanus, and ſome others, to a muſcle of the face, more generally known by the name of *maſſeter*.

MAXILLARY (*Cycl.*)—MAXILLARY *Bones*, *Maxillaria oſſa*. The *maxillary* bones, or great bones of the upper jaw are two in number, ſituated one on each ſide, in the anterior and middle part of the face; their conformation is very irregular, and they are of very conſiderable extent. Anatomiſts generally divide them into the external and internal ſides. By the external ſide they mean all that appears in an entire ſkull, without taking in the arch of the palate, and by the internal ſide, that which makes part of the arch of the palate, and all that is turned to the *ſeptum narium*. The ſeparation of this bone, by a ſmall tranſverſe ſuture behind the *foramen inciſorium*, is ſeldom found but in young ſubjects, before the oſſification is compleated. The *maxillary* bone is almoſt all compact, and without diploe, except in the alveolary arch, and at the point of the orbitary apophyſis.

The *Oſſa Maxillaria* are connected with the *os frontis*, *os ethmoides*, *os ſphenoides*, *oſſa unguis*, *oſſa malarum*, *oſſa naſi*, *oſſa palati*, *vomer*, *conchæ narium inferiores*, and with one another. They aſſiſt in forming the organ of maſtication, the arch of the palate, the cheeks, the orbits, the noſe, *&c.* *Winſlow*'s Anatomy, p. 33. ſeq.

MAXILLARY *Muſcles*, in fiſh, two large muſcles placed under the lower jaw, and ſerving to move it; theſe, with the two hypophthalmic muſcles, which are placed under the eyes, are the four cephalic muſcles of fiſhes, according to authors.

MAXIMIS ET MINIMIS. For the *method of Maximis & Minimis*, ſee the article MAXIMUM, *Cycl.* and *Suppl.*

MAXIMUM (*Cycl.*)—The fluxion of the baſe of a curve, or of its abſciſſa being given, when the fluxion of the ordinate vaniſhes, the tangent becomes parallel to the baſe, and the ordinate, moſt commonly, is a *Maximum* or *Minimum*, according to the rule given by authors on this ſubject, and mentioned in the Cyclopædia, under this head. But it is to be obſerved, that if the ſecond fluxion of the ordinate vaniſh at the ſame time, and the third fluxion be real, this rule does not hold; for the ordinate is, in that caſe, neither a *Maximum* nor a *Minimum*. If the firſt, ſecond, and third fluxions vaniſh, and the fourth fluxion be real, the ordinate is a *Maximum* or *Minimum*. The general rule given by Mr. Maclaurin, is, that when the firſt fluxion of the ordinate, with its fluxions of any ſubſequent ſucceſſive orders, vaniſh, and the number of all theſe fluxions that vaniſh is odd, then the ordinate is a *Maximum* or *Minimum*, according as the fluxion of the next order to theſe is negative or poſitive. But if the number of all the fluxions of the ordinate, of the firſt and ſubſequent ſucceſſive orders that vaniſh, be an even number, the ordinate is then neither a *Maximum* nor a *Minimum*. See Treat. of Fluxions, B. 1. c. 9. and B. 2. c. 5. art. 859. ſeq. The greateſt and leaſt ordinates are likewiſe diſcovered in ſome caſes, by ſuppoſing $\dot{y}$ to be infinite in reſpect of $\dot{x}$. But there are ſeveral exceptions to this rule. See *Maclaurin*, loc. cit. art. 262, 865.

A late author has formed ſome objections to the univerſality of Mr. Maclaurin's rule. See the Harmony of Antient and Modern Geometry, by Mr. *Paman*, Lond. 1745. 4°. in the Preface.

MAXY, in mineralogy, a name given by ſome to mundic, a ſulphureous mineral, common in the tin mines of Cornwall, and elſewhere. *Boerhaave*, Chem. p 99. n.

MAY *Dew*. See the article ROS *Mayalis*.

MAYA, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſmall ſpecies of ſparrow, much leſs than ours, and very common among them. It feeds on rice, and is very deſtructive of it.

MAZA, a name given by the antients to a ſort of food, in common uſe among the poorer ſort of people. It was made of the meal of parched barley, ſprinkled with ſome liquid, and was eaten with honey or with defrutum.

Hippocrates every where ſpeaks of this as of a coarſe kind of bread, and adviſes the changing the common finer bread, in the ſpring ſeaſon, for this coarſer kind, as a thing very conducive to health. He ſeems every where to conſider bread as the drier, and *Maza* as the moiſter diet.

MAZA, Μαζα, among the Athenians, a ſort of cake, which was the common fare of ſuch as were entertained at the public expence in the common hall, or *prytaneum*. *Potter*, Archæol. Græc. l. 1. c. 25. T. 1. p. 136.

Theſe cakes were made of flour boiled with water and oil. *Pitiſc*. Lex. Ant. in voc.

MAZONOMUS, among the antients, a very large diſh, commonly of wood, in which the *Maza* was ſerved. *Pitiſc*. Lex. Ant. in voc. See the article MAZA.

MAZORAH, among the Jews, denotes the ſcience of reading the ſcriptures. See the article CABBALA.

MAZUR, a ſpecies of birds, which the Arabian ſailors eſteem very lucky, becauſe it lays its eggs cloſe by the ſea ſhore before a tract of good weather; ſo that when theſe are obſerved, they promiſe themſelves a ſafe voyage. They alſo pretend that this bird gives notice to ſailors, when the ſhip approaches any danger, by flying and fluttering up and down. *Hofm*. Lex. in voc.

MEADOW *Land*. Too much water, and too little, are equally prejudicial to *Meadow* grounds. The beſt lands for *Meadow* paſture are either low lands, or hanging grounds, where there is a rich ſoil and a moiſt bottom; eſpecially where any little brook, or running ſpring, may be brought over it; and where there is ſome deſcent in the *Meadow*, that the water may not lodge on it. Theſe *Meadows* are much better for the farmer than thoſe near large rivers, where great crops are often loſt. *Mortim*. Huſb.

MEADOW-*Saffron*, *Colchicum*. See the article SAFFRON.

MEAL. The *Meal* or flour of England is the fineſt and whiteſt in the world. The French is uſually browner, and the German browner than that. Our flour keeps well with us, but in carrying abroad it often contracts damp, and becomes bad. All flour is ſubject to breed worms; theſe are white in the white flower, and brown in that which is brown; they are therefore not always diſtinguiſhable to the eye; but when the flour feels damp, and ſmells rank and muſty, it may be conjectured that they are there in great abundance.

The colour, and the weight, are the two things which denote the value of *Meal* or flour; the whiter and the heavier it is, other things being alike, the better it always is. Pliny mentions theſe two characters as the marks of good flour, and tells us, that Italy, in his time, produced the fineſt in

the world. This country, indeed, was famous before his time for this produce; and the Greeks have celebrated it; and Sophocles, in particular, ſays, that no flour is ſo white, or ſo good, as that of Italy. The corn of this country has, however, loſt much of its reputation ſince that time; and the reaſon of this ſeems to be, that the whole country being full of ſulphur, alum, vitriol, marcaſites, and bitumens, the air may have, in time, affected them ſo far, as to make them diffuſe themſelves through the earth, and render it leſs fit for vegetation; and the taking fire of ſome of theſe inflammable minerals, as has ſometimes happened, is alone ſufficient to alter the nature of all the land about the places where they are. *Deſland.* Trait. Phyſ.

The flour of England, though it pleaſes by its whiteneſs, yet it wants ſome of the other qualities valuable in flour; the bread that is made of it is brittle, and does not hold together, but after keeping a few days becomes hard and dry, as if made of chalk, and is full of cracks in all parts; and this muſt be a great diſadvantage in it when intended for the ſervice of an army, or the like occaſions, where there is no baking every day, but the bread of one making muſt neceſſarily be kept a long time.

The flour of Picardy is very like that of England, and after it has been kept ſome time, is found improper for making into paſte or dough. The French are forced either to uſe it immediately on the grinding, or elſe to mix it with an equal quantity of the flour of Bretany, which is coarſer but more unctuous and fatty; but neither of theſe kinds of flour keep well.

The flour of almoſt any country will do for the home conſumption of the place, as it may be always freſh ground; but the great care to be uſed in ſelecting it is in order to the ſending it abroad, or furniſhing ſhips for their own uſe. The ſaline humidity of the ſea air ruſts metals, and fouls every thing on board, if great care be not taken in the preſerving them. This alſo makes the flour damp and mouldy, and is often the occaſion of its breeding inſects, and being wholly ſpoiled.

The flour of ſome places is conſtantly found to keep better at ſea than that of others; and when that is once found out, the whole caution needs only be to carry the flour of thoſe places. Thus the French find that the flower of Poitou, Normandy, and Guienne, all bear the ſea carriage extremely well, and they make a conſiderable advantage by carrying them to their American colonies.

The choice of flour for exportation being thus made, the next care is to preſerve it in the ſhips; the keeping it dry is the grand conſideration in regard to this; the barrels in which it is put up ought to be made of dry and well-ſeaſoned oak, and not to be larger than to hold two hundred weight at the moſt. If the wood of the barrels have any ſap remaining in it, it will moiſten and ſpoil the flour; and no wood is ſo proper as oak for this purpoſe, or for making the bins and other veſſels for keeping flour in at home, ſince, when once well dried and ſeaſoned, it will not contract humidity afterwards. The beach wood, of which ſome make their bins for flour, is never thoroughly dry, but always retains ſome ſap. The fir will give the flour a taſte of turpentine; and the aſh is always ſubject to be eaten by worms. The oak is preferable becauſe of its being free from theſe faults; and when the ſeveral kinds of wood have been examined in a proper manner, there may be others found as fit, or poſſibly more ſo than this for the purpoſe. The great teſt is their having more or leſs ſap. See the articles FLOUR and WOOD.

MEAL *worm.* See the article WORM.

MEAN (*Cycl.*)—MEAN *Anomaly*, in aſtronomy. See the article ANOMALY, *Cycl.*

MEAN { *Conjunction*, / *Oppoſition*, } in aſtronomy, is when the *mean* place of the ſun is in { *Conjunction*, / *Oppoſition*, } with the *mean* place of the moon in the ecliptic. See the articles CONJUNCTION and OPPOSITION, *Cycl.*

MEAN *diſtance of a planet from the ſun*, in aſtronomy, is the right line drawn from the ſun, to the extremity of the conjugate axis of the ellipſis the planet moves in; and this is equal to the ſemitranſverſe axis, and is ſo called becauſe it is a *mean* between the planets greateſt and leaſt diſtance from the ſun.

MEAN *Motion*, in aſtronomy, that whereby a planet is ſuppoſed to move equally in its orbit, and is always proportional to the time.

MEASURE (*Cycl.*)—We have lately had ſome accurate compariſons between ſome of the French weights and meaſures, and thoſe of England, the reſult of which is, 1. The Paris half toiſe, as ſet off on the ſtandard kept in the Royal Society, contains of Engliſh inches, by the ſame ſtandard, 38.355. whence it appears, that the Engliſh yard and foot is, to the Paris half toiſe and foot, nearly as 107 to 114; for as 107 to 114, ſo is 36 to 38.35514.

2. The Paris two marc, or ſixteen ounce weight, weighs Engliſh Troy grains 7560; whence it appears, that the Engliſh Troy pound of twelve ounces, or 5760 grains, is to the Paris two marc, or ſixteen ounce weight, as 16 to 21; that the Paris ounce weighs Engliſh Troy grains 472.5; and that conſequently the Engliſh Troy ounce is to the Paris ounce, as 64 is to 63.

3. The Engliſh avoirdupois pound weighs Troy grains 7004; whence the avoirdupois ounce, whereof ſixteen make a pound, is found equal to 437.75 Troy grains. And it follows, that the Troy pound is to the avoirdupois pound, as 88 to 107 nearly; for as 88 to 107, ſo is 5760 to 7003.636; that the Troy ounce is to the avoirdupois ounce, as 80 to 73 nearly; for as 80 to 73, ſo is 480 to 438. And, laſtly, that the avoirdupois pound and ounce, is to the Paris two marc weight and ounce, as 63 to 68 nearly; for as 63 to 68, ſo is 7004 to 7559.873.

4°. The Paris foot, expreſſed in decimals, is equal to 1.0654 of the Engliſh foot, or contains 12.785 Engliſh inches. Phil. Tranſ. N°. 465. Sect. 5.

MEAT (*Cycl.*)—MEAT, in the manege. See the article DRY *Meat.*

MEB, or *Sea* MEB, in zoology, the name of a water bird of the larus or gull-kind, which is all over of a duſky grey on its upper part; its head is blackiſh at the top, and the beak is red. The legs are ſhort and black, and the wings very long, reaching beyond the tail when folded.

MECAXOCHITL, in the materia medica, the name of the *piper longum humilius*, or ſmall American long pepper. *Dale*, Pharm. p. 286.

MECHANICAL (*Cycl.*)—MECHANICAL *Force.* See the article FORCE, *Appendix.*

MECHANICAL *Operation of Medicines.* See the article MEDICINE.

MEDAL (*Cycl.*)—*Impreſſions of* MEDALS. A very eaſy and elegant way of taking impreſſions of *Medals* and coins, not generally known, is this: Melt a little iſinglaſs glue, made with brandy, and pour it thinly over the medal, ſo as to cover its whole ſurface; let it remain on for a day or two, till it is thoroughly dry and hardened, and then taking it off, it will be fine, clear, and hard as a piece of Muſcovy glaſs, and will have a very elegant impreſſion of the coin. *Shaw*'s Lectures, p. 430.

Sulphur is ſometimes uſed to take off impreſſions of *Medals*, coins, *&c.* The method is this: Having made a ledge of clay about the work, whoſe impreſſion is deſired, and carefully oiled the whole, gently pour brimſtone melted in a covered veſſel, to prevent its firing upon the metal. About the edge of this mould make a border of clay, as before, and lightly oil the internal ſurface of both; then gradually put into it, to the thickneſs of about a quarter of an inch, a mixture made up with calcined alabaſter and water, to the conſiſtence of ſtiff honey. This ſoon growing hard, may be taken out of the mould, and gives figures of the coin or *Medal. Boyle*'s Works abr. vol. 1. p. 151. A method ſomewhat different is deſcribed in the article BRIMSTONE.

We have an eaſy method of procuring the true impreſſion or figure of *Medals* and coins, by Mr. Baker in the Phil. Tranſ. N°. 472. Sect. 13.

Take a perfect and ſharp impreſſion in the fineſt black ſealing-wax, of the coin or *Medal* you deſire. Cut away the wax round the edges of the impreſſion; then with a preparation of gum-water, of the colour you would have the picture, ſpread the paint upon the wax impreſſion with a ſmall hair pencil, obſerving to work it into all the ſinking or hollow places, theſe being the riſing parts of the *Medal*; and the colouring muſt be carefully taken from the other parts with a wet finger. Then take a piece of very thin poſt paper, a little larger than the *Medal*, and moiſten it quite through. Place it on the wax impreſſion, and on the back of the paper lay three or four pieces of thick woollen cloth or flannel, of about the ſame ſize. The impreſſion, with its coverings, ſhould be placed between two ſmooth iron plates, about two inches ſquare, and one tenth of an inch thick. Theſe muſt be carefully put into a ſmall preſs, made of two plates of iron, about five inches and an half long, one inch and a half wide, and half an inch in thickneſs, having a couple of long male ſcrews running through them, with a turning female ſcrew on each, to force the plates together. Theſe being brought evenly together, by means of the ſcrews, will take off a true and fair picture of the *Medal*; which, if any deficiencies ſhould appear, may eaſily be repaired with a hair pencil, or pen, dipped in the colour made uſe of.

If a relievo only be deſired, nothing is neceſſary, but to take a piece of card, or white paſte-board, well ſoaked in water, then placing it on the wax mould, without any colouring, and letting it remain in the preſs for a few minutes, a good figure will be obtained.

This Method of taking off *Medals*, *&c.* is convenient, and ſeems much more ſo than the ſeveral inventions uſually practiſed in ſulphur, plaſter of Paris, paper, *&c.* wherein a mould muſt be formed, either of clay, horn, plaſter, or other materials, which require a good deal of time and trouble.

Some take impreſſions on paper from the *Medals* themſelves, by paſſing them through the rolling-preſs, and colouring them afterwards; but this is not only more difficult, but does great injury to the *Medals*, by impairing the ſharpneſs of their moſt delicate

delicate and expreſſive ſtrokes: Whereas wax does not hurt the fineſt *Medal* in the leaſt degree; and though a brittle ſubſtance, yet it effectually reſiſts the force of a downright preſſure.

Red ſeems the beſt colouring, and therefore black wax is directed to be uſed; but if the pictures are choſen in black and white, to reſemble copper plates, the wax ſhould be red; for the wax and paint ought to be of different colours, in order to diſtinguiſh when the colour is laid on properly, or rightly cleared away.

The ſubſtance of *Medals*, being metalline, is liable to be corroded; and the figures being raiſed, are alſo liable to be effaced by friction. Hence it is rare to find any perfectly preſerved. Gems are not ſubject to theſe inconveniencies. See the article GEM.

MEDEA, the name of a ſtone deſcribed by Pliny and the antients. They ſay it was black, and was variegated with gold-coloured veins, and that, when rubbed in water, it yielded a yellowiſh red juice, which had the flavour of wine. We know no ſtone at preſent anſwering theſe characters. Rulandus, indeed, mentions a kind of black hæmatites, or blood-ſtone, which tinges water to a ſaffron colour. This account he takes from Encelius; but this wants the much greater character, of giving it the taſte of wine.

MEDENA, a word uſed by Paracelſus to expreſs an inveterate kind of ulcer,

MEDEOLA, in botany, the name given by Linnæus to a genus of plants, called *ſalſa* by other authors. The characters are theſe: There is no cup, but ſome have erroneouſly taken the flower for a cup, and have deſcribed it under this name, and allowed no flower. The flower conſiſts of ſeveral petals, of an oblong oval figure, equal in ſize, and ſtanding expanded, with their ends often bent backwards. The ſtamina are ſix ſubulated filaments, of the length of the flower. The antheræ are incumbent. The piſtil has three corniculated germina. The ſtyles are of the ſame number, one terminating each germen. The ſtigmata are thick and crooked. The fruit is a roundiſh berry, dividing into three parts, and containing three cells. The ſeeds are ſingle, and of a cordated form. *Linnæi* Gen. Plant. p. 154.

MEDIALE, in botany, a name given by the antients to the central part of any tree. It is ſometimes uſed to ſignify the ſpungy pith that fils up the young branches of a tree, as in the elder, and the like. And ſometimes for the firm and hard ſubſtance, called the heart of the wood, and found to be much harder than any other part of it. Thus the name of *tree*, to which the word *Mediale* is annexed, muſt be the means of explaining what is meant by the word, whether a ſpongy pith, or a ſound and hard wood. The moſt accurate writers, however, make a diſtinction which ought to be kept up, that is, the calling the heart, or ſound internal part of wood, only *Mediale*, and the ſpungy part within the elder, *&c. Medulla.*

MEDIANTE, in muſic. *The Mediant of a mode* is that note which is a third higher than the final; or that which divides the fifth of every authentic mode into two thirds. See the articles MODE and THIRD.

This term is chiefly in uſe among the French. See *Broſſard*, Dict. Muſ.

MEDIATORS *of Queſtions*, in our old writers, were ſix perſons authorized by ſtatute, who, upon any queſtion ariſing among merchants, relating to any unmercable wool, or undue packing, *&c.* might, before the mayor, or officers of the ſtaple, upon their oath, certify and ſettle the ſame; to whoſe order and determination therein, the parties concerned were to give entire credence, and ſubmit. 27 Edw. 3. Stat. 2. c. 24. *Blount.*

MEDIATORS, Μεσαζονλες, under the emperors of Conſtantinople, officers of ſtate who had the direction of all affairs tranſacted at court. Their chief, or preſident, was called *megas meſazon*, Μεγας μεσαζων, and anſwered to the prime or grand viſier of the Turks. *Hofm.* Lex. in voc.

MEDICA, *Lucerne*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the papilionaceous kind, and its piſtil, which ariſes from its cup, becomes finally a ſeed-veſſel, of the ſhape of a ſnail, containing uſually kidney-ſhaped ſeeds.

The ſpecies of *Medica*, enumerated by Mr. Tournefort, are theſe: 1. The great upright *Medica*, with purple flowers. 2. The great upright *Medica*, with violet-coloured flowers. 3. The great upright *Medica*, with yellow flowers. 4. The great upright *Medica*, with variegated flowers of violet co-colour and yellow. 5. The wild *Medica*, with ſaffron-coloured flowers. 6. The wild *Medica*, with pale yellow flowers. 7. The wild *Medica*, with bluiſh green flowers. 8. The ſmall wild *Medica*, with blue and yellow flowers. 9. The ſea *Medica*. 10. The *Medica*, with broad ſcutellated fruit. 11. The *Medica* with orbiculated fruit. 12. The *Medica* with ſmooth leaves, marked with black ſpots, and with echinated fruit. 13. The echinated-fruited *Medica*, with ſmooth leaves, without the black ſpots. 14. The great *Medica*, with turbinated fruit. 15. The hairy *Medica*, with very rigidly echinated fruit. 16. The hairy echinated *Medica*. 17. The ſmalleſt echinated *Medica*. 18. The little coronated *Medica*. 19. The many fruited *Medica*, with obtuſe, and not crenated leaves. 20. The many-fruited *Medica*, with obtuſe crenated leaves. 21. The prickly two-fruited ſnail *Medica*, with elegantly divided leaves. 22. The perennial *Medica*, with the ciliary fruit. 23. The perennial ſhrub *Medica*, with orbiculated fruit. 24. The many-fruited orbicular-headed *Medica*, with a ſmaller fruit. 25. The orbiculated *Medica*, with a broad fruit, with a ſingle voluta. 26. The ſmaller orbiculated prickly *Medica*, with a ſingle large voluta. 27. The elegant orbiculated *Medica*, with the fruit rugoſe at the edges. 28. The barrel-fruited *Medica*, with the circles of the fruit wrinkled on each ſide, and turning black with age. 29. The larger and ſmaller ſmooth *Medica*, with the turned fruit. 30. The elegant *Medica* of Catalonia. 31. The prickly cochleated *Medica*, with large echinated fruit, turbinated at each end, and armed with ſpines turning backwards. 32. The *Medica* with the leaves and ſeeds of the heart-leav'd *Medica*, and with harder fruit. 33. The large double-fruited prickly barrel-headed *Medica*. 34. The two-fruited prickly *Medica*, with oval fruit, and ſhort rigid ſpines. 35. The many-fruited prickly barrel-headed *Medica*. 36. The leaſt, hairy and prickly barrel-fruited *Medica*. 37. The great prickly ſea *Medica*. 38. The *Medica* with lax fruit, of the ſmall echinated kind, but with prickles not ſtanding out. 39. The ſoft and hoary-leav'd hop *Medica*, with heart-faſhion'd ſeeds. 40. The great fruited *Medica*, with the prickles of the head turning both upward and downward. 41. The *Medica* with a large fruit, with the prickles turning all upwards. *Tourn.* Inſt. p. 413. See the article LUCERNE.

Malus MEDICA, in botany, a name given by ſome authors to the citron tree. *Ger.* Herb. 1287.

MEDICAL *Stones*. See the article STONE.

MEDICAGO, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the papilionaceous kind, and its piſtil, which ariſes from the cup, finally becomes a plain orbiculated fruit, of a ſort of falcated ſhape, and containing one kidney-ſhap'd ſeed.

The ſpecies of *Medicago*, enumerated by Mr. Tournefort, are theſe: 1. The annual trefoil-like *Medicago*. 2. The Spaniſh *Medicago*, with the appearance of the kidney vetch. 3. The cretic *Medicago*, with the appearance of the kidney-vetch. And 4. The hoary trifoliate ſhrubby *Medicago*, commonly called the Cytiſus with crooked pods. *Tourn.* Inſt. p. 412.

MEDICINES (*Cycl.*)—By *Medicines* is meant whatever corrects a depraved or vitiated conſtitution of body, and reſtores it to a heathful ſtate: So that they differ from aliments, which preſerve the body in a ſound ſtate, whereas *Medicines* reſtore it when impaired; and from poiſons, which tend to deſtroy the body. All the parts of diet may indeed be termed alimentary *Medicines*, in as much as they may ſerve to confirm health, againſt the firſt approaches of a diſeaſe; as poiſons, which are always detrimental to the body, have been called deleterious *Medicines*.

Medicines are either ſimple, or compound: Simple *Medicines* are thoſe which are formed ſpontaneouſly, or by the aſſiſtance of nature alone; and thoſe are called compound, which are owing to the art and induſtry of men; and to the mixtures of various ſimples put together.

The principal differences of ſimple *Medicines* are taken either from their form and texture, or from their virtues. In reſpect to their texture, they are divided into minerals, vegetables, and animals; each of which diviſions is termed a claſs, kingdom, or family.

In what the antients have left us concerning the *Medicines* they uſed, there is the utmoſt confuſion and obſcurity; the ſame ſubſtance is frequently called by many different names; ſome *Medicines* are barely mentioned by them, without any account of their nature or deſcription; and in regard to many others, the virtues aſcribed by them to one ſimple, have been, by later writers, attributed to others. To clear up, and ſet right all thoſe difficulties, at this time, would be a taſk as difficult as it would be uſeful. So great and ſo many virtues are aſcribed, by different authors, to particular *Medicines*, that, if they could be depended on, each ought to be looked on as an almoſt univerſal remedy; but as many of theſe virtues are merely imaginary, it requires even the greateſt caution to diſtinguiſh the fictitious from thoſe which truly belong to them; and though the knowledge of the virtues of *Medicines* be at this time carried to a very great length, there are nevertheleſs many things remaining yet to be diſcovered, and room enough ſtill to enrich the ſcience with new ſpecific remedies; nor will the judicious phyſician find leſs worthy employment for his thoughts, in endeavouring to determine the manner in which thoſe *Medicines* act, whoſe effects are already known, and to aſcertain the ſafeſt and beſt methods of adminiſtring them. *Geoffroy*, Tract. p. 2.

Such *Medicines* as are of a terreſtrial, or other the like nature, and will not diſſolve in water, the new Diſpenſatory of the college has ordered to be prepared in the following manner:

They are firſt to be pounded in a mortar, and then levigated with a little water, upon a hard and ſmooth marble, into an impalpable powder, and afterwards dried upon a chalk ſtone,

and then ſet by for a few days, in a warm, or at leaſt a very dry place. In this manner are to be prepared amber, antimony, bezoar, which ſhould be levigated with ſpirit of wine inſtead of water, blood-ſtone, calamy, firſt calcined for the uſe of the makers of braſs, chalk, coral, crabs claws, crabs eyes (ſo called); egg-ſhells cleanſed from the membrane adhering to them by boiling in water, oyſter-ſhells firſt cleanſed, pearls, verdegreaſe, tutty.

In antimony, calamy, and tutty, ſingular care ought to be taken to reduce them to the moſt ſubtle powder that can be. *Pemberton*'s College Diſp. p. 145.

Mechanical Operation of MEDICINES. To account for the operations of *Medicines* mechanically, ſeems to have been the favourite ſcheme of phyſicians and phyſiologers of the laſt and preſent century. Stahl and his diſciples reject theſe accounts, and think them ſufficiently refuted by the operation of opium, and of aſtringents. One grain of opium, properly taken, will, for a time, aſſwage pains all over the body. A very few grains of crocus martis aſtringens ſometimes ſtop an hæmoptyſis, before they can be ſuppoſed to have entered into the humours of the body. Is it not paſt all belief, ſay they, that ſo few grains mixed with ſo many pounds of fluids, ſhould retain any mechanical force, eſpecially as it is well known that aſtringents loſe their force by dilution. They farther urge, that the various effects of the ſame *Medicine* are a refutation of the mechanical hopotheſis; thus emetics ſometimes purge, and *vice verſa*; aſtringents encreaſe hæmorrhages; opium excites alacrity in ſome, inſtead of ſtupifying. Again, the ſight, or even bare imagination of ſome *Medicines*, will produce a ſenſible effect on the body, without any contact. Stahl and his followers therefore hold, that *Medicines* operate chiefly by exciting the vital ſenſe; and that this is the chief effect of *Medicines*, even where they ſeem moſt to act mechanically. See *Juncker*'s Conſp. Therap. p. 3. ſeq.

Hoffman, Heiſter, and others, have attacked the hypotheſis of Stahl. We ſhall not pretend to give any farther account of the controverſy. Perhaps in this, as in others, there may be a good deal of logomachy. Strictly ſpeaking, mechanical principles muſt be inſufficient to account for the operation of *Medicines*, as this ſometimes undoubtedly depends (in the *primæ viæ* at leaſt) on chemical principles; and no body has hitherto been able to account mechanically for the phænomena of chemiſtry. The laws of the *minima naturæ* have not hitherto been reduced to thoſe of the preſſure and impulſe of large ſenſible maſſes. And perhaps when the laws, that obtain in the minute parts of matter, have been found, we ſhall ſtill be at a loſs to account for all the phænomena of animated bodies, particularly the human.

Heiſter ſays, Stahl pretends that the rational ſoul and nature are ſynonimous terms; and that it is the rational ſoul which formed the fœtus in the womb, and which directs all vital, animal, and natural actions, to the preſervation of the body; hence ſometimes exciting evacuations, ſometimes ſpaſms, to get rid of diſorders. *Heiſter*, Diſſert. de Medicin. Mechan. præſtantia in Compend. Medicin. Practic. where he endeavours to refute the Stahlians.

Juncker, who wrote according to Stahl's principles, does not deny that there is ſomething mechanical in the operation of *Medicines* independantly of the will or ſpontaneity of nature; but he aſſerts that their chief operation is owing to nature, which makes uſe of the remedy to attain its end. His words are, *Operationem Medicamentorum ab ipſa natura gubernari innumeræ confirmant Obſervationes. Licet enim non negamus, ſubeſſe interdum actioni eorum aliquid mechanici, a naturæ arbitrio non pendentis, tanti tamen hoc non eſt habendum, ut operandi modus illi maxime adſcribi mereatur. A potiori enim ſit denominatio, & natura utitur remedio ad finem ſuum.* *Juncker*, Conſpect. Therap. p. 1, 2.

A late author obſerves, as to *Medicines*, that let what diſeaſe ſoever be named, and any *Medicine*, as univerſally uſeful in it, yet he can ſhew circumſtances of patients, or of the diſeaſe, where that *Medicine* would be very improper. He mentions ſeveral inſtances of this kind. See Medic. Eſſ. Edinb. vol. 1. p. 267. ſeq.

MEDICINES *from Metals*. See the article METALS.

Pocket MEDICINES, in ſurgery, are ſuch neceſſary remedies as the ſurgeon ought never to be without; but always to carry in a convenient caſe or box about him. Theſe are the common digeſtive ointment, and the brown or Ægyptian ointment, for cleanſing and digeſting foul ulcers, and ſome vulnerary balſams, as the *linimentum Arcæi*, or the balſam of Peru, of Gilead, or Capivi, or the Samaritan balſam: To theſe muſt alſo be added a plaſter or two, as the diachylon, or ſtypticum Crollii, ſince one or other of theſe is almoſt conſtantly wanted. Neither ſhould there be wanting a piece of blue vitriol for the taking down luxuriant fleſh, and to ſtop hæmorrhages; but if vitriol is wanting, burnt alum, red precipitate, the infernal ſtone, or any other corroſive *Medicine*, will ſupply its place in corroſive intentions, and the laſt will alſo ſerve to open abſceſſes, to make iſſues, and perform many other operations of that kind. With theſe there ſhould always be kept in readineſs alſo a quantity of ſcraped lint, that the ſurgeon may be able to give immediate aſſiſtance to wounded perſons, ſince, if he is unprepared for this, they may be eaſily taken off by an hæmorrhage, a circumſtance which ought alſo to prevail with the ſurgeon never to be wholly unprovided with bandages. *Heiſter*'s Surg. p. 11.

MEDIMNUM, Μεδιμνον, among the Greeks, a meaſure of capacity, holding ſix Roman *modii* or buſhels. *Danet*. in voc.

MEDINE, an Egyptian piece money, of iron ſilver'd over, and about the ſize of a ſilver three-pence. *Pocock*'s Egypt. p. 173.

MEDINUS, a name given by ſome to the *medus*, a ſtone celebrated by the writers of the middle ages for many imaginary virtues. See the article MEDUS.

MEDITRINALIA, among the Romans, feaſts inſtituted in honour of the goddeſs *Meditrina*, and celebrated on the 30th of September. They were ſo called from *medendo*, becauſe the Romans then began to drink new wine, which they mixed with old, and that ſerved them inſtead of phyſic.

MEDIUM, in botany, a name given by Dioſcorides to the violet, and by Lobel, to the ſea flag-flower, or *iris maritima narbonenſis*. *Ger*. Emac. Ind. 2.

MEDLAR, *Mepſilus*, in botany. See the article MEPSILUS.

We have two kinds of *Medlar* propagated very frequently in orchards, for the ſake of their fruit; the one is the common *Medlar*, or, as it is called by ſome, the Nottingham *Medlar*; the other the Dutch *Medlar*. The firſt of theſe was once almoſt the only kind known in England; but ſince the other has been introduced, it is found ſo much ſuperior in the ſize, and flavour of the fruit, that it is now almoſt the only kind thought worth the cultivating.

They are propagated by budding or grafting them upon the hawthorn, or the pear ſtock, upon either of which they take very well, and may be afterwards tranſplanted into the fruit-garden, either as ſtandards, or trained up againſt an eſpalier, in both which methods they will ſucceed very well. If the larger ſort are trained up in an eſpalier, the fruit will be much larger; but great care muſt be taken in the pruning, not to ſhorten the bearing branches, for the fruit is almoſt all produced at the extremities of theſe. The *Medlar* will grow on any ſoil; but on a moiſt and ſtrong ſoil, the fruit will grow larger, and on a dry one, it will, though ſmaller, be much better taſted. *Miller*'s Gardener's Dict.

The fruit ſhould be ſuffered to remain on the branches till October, at which time it will begin to fall of itſelf, and it ſhould then be gathered in the middle of a dry day, and laid up in a dry place till ſoft, and beginning to decay, which is uſually about a month after it is gathered; at this time they are fit for eating, for, till they begin to decay, they are too harſh for the palate.

MEDOKINA, in natural hiſtory, the name of a ſpecies of oyſter. See the article OSTREA.

MEDULLA (*Cycl.*)—MEDULLA *Spinali*. In fiſhes, the ſpinal marrow does not run through the middle of the vertebræ, as it does in other animals, but is carried through a whole ſeries of the apophyſes which ſtand on the upper part of the bone, and are therefore called the *apophyſes dorſales*, to diſtinguiſh them from the others, which their ſituation occaſions to be called the lateral and ventral. All theſe dorſal apophyſes of the vertebræ are hollow at their baſe, and by that means afford a continued channel for this marrow. The baſes of the lower apophyſes reaching from the anus to the tail, have alſo the ſame ſort of hollow at their baſe; but this ſerves only for the paſſage of the larger blood-veſſels.

MEDUS, or MEDINUS, a name given by the writers of the middle ages to a ſtone brought from Media, of which they ſay there were two kinds, the one black, and the other green. They attribute many ſtrange virtues to theſe ſtones; the black they ſay was a fatal poiſon when taken inwardly, but that if wetted with milk, and rubbed upon the ſkin of a woman with child, it cauſed her to bring forth a boy. This, and a number of other as probable virtues, did theſe ignorant and fanciful writers beſtow at pleaſure on ſtones never known to the world before, and of which themſelves gave no deſcriptions. This ſeems to be only a falſe hiſtory of the *Medea* of Pliny.

MEDUSÆ *Caput*, in natural hiſtory, a name given by authors to the *ſtella marina*, called by ſome, from its various branchings, *ſtella arboreſcens*. Rumphius, Geſner, and many other authors, have deſcribed this ſtrange fiſh in its recent ſtate, and in the acta eruditorum, we have an accurate figure, and a very remarkable account of one which was found foſſile, and preſerved in a remarkably perfect manner in ſtone.

The ſtone in which it was found was of the fiſſile or ſlaty kind, and it was ſo large as to extend over a piece of this ſtone of four foot in length, and between three and four in breadth. The body of the fiſh, from which all the reſt ſeemed originally to have ariſen, lay at one corner of the ſtone, and the arms extended themſelves lengthways in a very diſtinct and natural manner the whole length of the ſtone; and from theſe there parted, on every ſide, other ſmaller ones, and theſe were finally divided into others more minute, in ſuch a manner as to repreſent the niceſt painting. Act. Erudit. Ann. 1725. p. 377.

The ſtudy of foſſils is more improved by this ſingle ſpecimen, than by thouſands of others, and by the reaſonings of almoſt as many authors. The foſſils called *entrochi*, have always perplexed the writers on theſe ſubjects to account for; ſome having judged them a ſort of ſtony vegetables; ſome *luſus naturæ*; and others as different things; but in this

this table the whole fiſh is ſo perfectly preſerved, that there can remain not the leaſt doubt of its being really the *ſtella arboreſcens*; and in this both the figure and the author's words expreſs, in the plaineſt manner poſſible, that the long arms or branches reaching from one end to the other of the ſtone, are compoſed of a number of *entrochi* as it were, tied together in the ſame manner as the ſingle joints of thoſe *entrochi* which we meet with are to one another; or, in plain fact, that our *entrochi*, which have perplexed us ſo much to account for their origin, are in reality the fragments of the arms or branches of this fiſh. Theſe branches in this famous ſpecimen, were compoſed of what we call *trochitæ*, and had many rudiments of ſmaller branches, as well as perfect ones, growing from their ſides, and would have been ſo many common *entrochi*, if broken off.

What was moſt remarkable in this foſſil was, however, the ſeparating of ſmaller branches which ran entire to their ends, and there terminating in an infinite number of ſmall ramifications, all growing from one head; they formed cluſters of four or five inches in diameter, and of an inconceiveable beauty, reſembling the compound flower of ſome elegant plant. The matter of the larger branches, when examined, appeared to be the ſame with that of the common *entrochi*, that is, ſpar. The author calls it *ſelenites*, but that was a word indeterminately uſed by authors, till of late, for all plated and bright foſſils.

It is plain that this compleat fiſh could have no way come into this ſtone but at the time when it was yet moiſt and ſoft; and the author calls it *novum diluvii monumentum*, a new remembrancer of the deluge.

MEER, in mining, a ſpace containing twenty-nine yards in length in any vein. *Houghton*'s compl. Miner in the Explan. of the Terms.

MEER-*Stake*, in mining, is a pin of wood drove into the ſuperficies of the earth, to ſhew the extent or end of a *Meer* of ground. *Houghton*'s Compl. Miner in the Explan. of the Terms.

MEER-*Swiin*, in zoology, a name given by ſome to a ſea fiſh, more uſually known by the name of *capriſcus*. *Ray*'s Ichthyogr. Append. p. 1. See the article GOAT-*Fiſh*.

MEGALARTIA, Μεγαλαρτια, in antiquity, a feſtival in honour of Ceres, being the ſame with *Theſmophoria*. *Potter*. Arch. Græc. See the article THESMOPHORIA.

MEGALASCLEPIA, Μεγαλασκληπεια, in antiquity, a feſtival in honour of Æſculapius. See the article ASCLEPIA.

MEIDANS, in the eaſtern nations, are a ſort of country ſeats, where the greater people have open ſummer-houſes, to which they retire on the three days of the week in which they do not attend the paſhas divan, and where they divert themſelves with ſeeing their ſlaves ride, ſhoot, and throw the dart, while they are regaling with their pipe and coffee. *Pocock*'s Egypt, p. 184.

MEL, *Honey* (*Cycl.*)—See the article HONEY.

MEL *Cedrinum*, in the materia medica of the antients, a term uſed to expreſs a ſort of liquid manna, uſed rather as a pleaſant ſweet in foods, than as a medicine, and which ſeems to have been the ſame with the *Mel Roſcidum* of Galen, and with the liquid manna of mount Sinai; that mountain having been the place where it was annually collected in large quantities, even in Galen's time; and the account Bellonius gives of the manner of collecting it in his time, agreeing very well with what Galen has left about it. It is, however, an error in Bellonius, to ſuppoſe this to be the *terenjabin* of the Arabians, that being evidently a ſolid, not a liquid ſubſtance, and being, from all accounts the ſame with what is now called, *manna Perſicum*, or Perſian manna. See the article MANNA *Perſicum*.

The *Mel Cedrinum* is a term uſed only by Hippocrates for this ſubſtance, and ſeems ſo odd, that many are apt to believe there is an error in the text, and that the author never meant any ſuch thing. Foeſius is of opinion, that theſe ought to be read as two diſtinct names, with a comma between them, and that the author only meant by them two ſubſtances very well known in his time, which were common honey, and the liquid ſubſtance called *Cedrinum*, or *Cedria*. See the article CEDRIA.

MEL *Roſcidum*, in the materia medica of the antients, a name given to a kind of liquid manna collected in their time, as it is at preſent, in conſiderable quantities, on mount Sinai. The monks who collect it call it *terenjabin*, after the name of a kind of manna, common among the Arabians. But this is an error, the terenjabin of thoſe authors not being a liquid manna, but the ſmall round kind, collected from the *alhagi maurorum*, and now called *manna Perſicum*. It does not appear that the *Mel Roſcidum*, or any other ſpecies of manna, was uſed in medicine by the antients; this was eſteemed a curioſity, rather than a thing of any uſe, by Galen; and other authors ſay, it was ſweeter than honey itſelf, with no farther account; whence it ſeems rather to have been uſed as a delicacy than as a medicine. See the articles TERENJABIN and MANNA *Perſicum*.

MELAMPYRUM, *Cow-wheat*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the perſonated kind, conſiſting of one leaf, and divided into two lips, the upper of which is hooded, and the lower uſually whole, not divided into any ſegments. The piſtil ariſes from the cup of the flower, and is fixed to its hinder part in the manner of a nail, and finally ripening into a roundiſh capſule, divided into two cells, containing grains like thoſe of wheat. *Tourn.* Inſt. p. 173.

The ſpecies of *Melampyrum*, enumerated by Mr. Tournefort, are theſe: 1. The purple-flower'd *Melampyrum*. 2. The broad yellow-leav'd *Melampyrum*, 3. The purple and white flower'd creſted *Melampyrum*. The plant called the ſmalleſt yellow *Melampyrum* by Caſpar Bauhine, has no right to that name, being truly a ſpecies of the ranunculus.

MELAN *Pharmacon*, a word uſed by Hippocrates, and by ſome ſuppoſed to mean common writing ink: He orders this to be poured upon the cranium, in caſe of a fiſſure, in order to diſcover how far it has penetrated. Galen ſeems to refer to this, in ſome places, and mentions his having treated of it in his book of ulcers; but as no ſuch medicine is found preſcribed there, it is probably one of the loſt compoſitions of the antients. In the ſpurious editions of Hippocrates, his book treating of the diſeaſes of women, there is a black medicine ordered to be made of the ſquammæ and flos æris.

MELAENATOS, the *black eagle*, a ſpecies called alſo *aquila valeria* by ſome authors. It is a ſmall eagle, of twice the bigneſs of a crow. Its jaws and eyebrows are deſtitute of feathers, and look reddiſh; its head, neck, and breaſt, are black, and in the middle of its back he has a large triangular ſpot, of a pale browniſh red, with ſomething of whiteneſs intermixed. His rump is a reddiſh brown, and his wings variegated with black, white, and grey. His beak is not large, black at the end, the ſkin covering the noſtrils red, and the iris of his eye hazel-colour'd. His legs are feathered a little below the knee, and below that are red; and the claws very ſharp. *Willughby*'s Ornithology, p. 30.

MELANCHOLY, *Melancholia*, (*Cycl.*) in medicine, the name of a diſeaſe which conſiſts in the perturbation or injury of the imagination, which prevents it from forming a regular and determinate idea of things, as at other times; ſo that its due operations are interrupted, and often ſecond ideas, having no connection with the firſt, crowd in, and are ſucceeded by actions no way analogous to that firſt idea, and therefore appearing irrational.

Authors diſtinguiſh *Melancholy* into three kinds; the ſad, the merry, and the mixt, partaking of the nature of both; but in all theſe the cauſe is the ſame, and the difference is only owing to the temperament and habit of the patient.

This diſtemper has, however, its more eſſential differences, in regard to the cauſes from which it is produced. In ſome people, it ſeems wholly to depend upon a falſe prefiguration and judgment of things in the mind; and in this caſe it is uſually habitual and incurable. In others it ariſes from injuries of the body; and in theſe it always is obſerved to bear a proportion to the injury or debility of the parts. This peculiar ſpecies is called hypochondriac *Melancholy*; and finally, in others it ſeems of a mixt nature; as when it has taken its firſt origin from diſtemperatures in the body, but is afterwards ſo encreaſed by mental diſorders, that even after the total removal of the corporeal ones, it ſtill remains in all its force upon the mind. This is a too common, and very unhappy caſe.

Signs of it. Theſe are a perpetual anxiety of mind, without any rational cauſe; a diſtaſte and diſlike to every thing, even before it comes in ſight, and often a wearineſs even of life itſelf. A frequent weeping for imaginary cauſes, or for no cauſe at all. Many people, in this caſe, ſeem always to want room; they are for opening all the windows they can, and for running out into the ſtreets or fields, thinking themſelves every where impriſoned; others leave their houſes, and dread being taken up for capital offences, tho' never guilty of any; and, in others, theſe diſtemperatures of the mind are evidently joined with others of the body, ſuch as palpitations of the heart, ſighing very deeply, painful reſpiration, ſtrictures of the tonic motions of the parts, tremblings, paleneſs of the countenance, and extenuation of the body. Sometimes, inſtead of theſe reſtrictions, there are frequent remiſſions of the ſame tonic motions, whence ariſe ſudden fluſhings of the face, uncertain heats in the body, and a general laſſitude and loſs of ſtrength. In moſt caſes of this kind, there is an obſtinate coſtiveneſs of the bowels, and the affections of the mind are increaſed by terrible watchfulneſs, and if the perſons ſleep a little, they are terrified with troubleſome dreams all the while; if of ſanguine habits, they are continually dreaming of blood, of battles, and of fires; and, if of phlegmatic conſtitutions, of water and drowning. Dreadful apprehenſions happen alſo between ſleeping and waking, and they uſually awake in agonies, with violent tremblings, and difficulty of reſpiration. In the merry *Melancholy*, the alienations of the patient's mind are employed about chearful, and often obſcene ideas; and ſometimes their fancy exalts them to the ſtate of kings and princes.

Perſons ſubject to Melancholy. Theſe are principally men of great learning, and of ſedentary lives, hypochondriac people, and ſuch as are troubled with diſorders of the ſpleen; and to theſe are to be added women ſubject to hyſteric complaints.

Cauſes of it. Theſe are principally a ſpiſſitude of the blood, and a detenſion of it about the vena portæ; a bad diſpoſition of the internal parts, as a ſchirrous or ulcerous conſtitution in them, or an actually ulcerated ſtate. Perſons who are afflicted with

Melancholy

Melancholy from these causes, are usually subject to very unruly passions, and those of various kinds; love, fear, dejection of spirits, despair and anger, are often very predominant in them. A suppression of the hæmorrhoidal discharges in men, and of the menstrual ones in women, will also frequently throw them into this distemper; as will also an over great application to study, especially on abstruse subjects; a conscientious dread from past crimes; continual disappointment in the expectations; and sometimes a timorous disposition, brought on in infancy, by the folly of nurses.

Prognostics in it. That kind of *Melancholy* which is brought on by immaterial causes alone, such as that arising from too intense study, or other imaginations or effects of the mind, is always greatly more obstinate and difficult of cure than that which depends upon material causes, and has its origin in a distempered state of the body. The hypochondriac *Melancholy* is the most easy of all to be cured, especially if the hæmorrhoidal discharges can be brought on regularly again, yet even these cases must be taken in time, for when the *Melancholy*, even from such causes, is become habitual, it will remain after the cause is removed which gave them origin.

Method of Treatment. *Melancholy*, when it depends on immaterial causes, requires physic for the mind rather than for the body, and the frequent conversation with an ingenious friend, of a calm and quiet disposition, will go farther towards a cure than a thousand medicines. Persons in this state must be as little thwarted or contradicted as possible, and whips and chains are to be avoided, unless in cases of the most extreme necessity; this is also a method equally necessary in those cases where habit has confirmed upon the mind that disorder, which at first arose merely from material causes. But when the disease not only arises, but as yet depends entirely upon material causes, the cure is easy, and is to be performed in the following manner: The *primæ viæ* are to be cleansed by purges, particularly those made of black hellebore, and after this the patient is to be blooded in the foot, taking away about six ounces. Then the blood is to be attemperated by giving, three or four times a day, powders composed of purified nitre, and the common absorbents; and after a due use of these, the parts are to be restored to their pristine tone and vigour, by the milder chalybeates; the greatest care must also be taken to bring the hæmorrhoidal discharges in men, and the menstrual ones in women, to a natural and proper state, and then a sufficient quantity of weak liquors drank at meals, and a moderate degree of exercise, will bring the patient usually to an absolute state of health.

Hypochondriac *Melancholy* always is more relieved by bleeding than by any other practice; and indeed all attempts of a cure are vain, if this be not first done: Purified nitre dissolved in small quantities in all the patient's drink, will, in time, be found to do great things alone, as to a cure. It is the practice of some persons to give vomits in these cases; but they often turn *Melancholy* into a true *mania*. See the article MANIA.

MELANCORYPHUS, in natural history, the name of a bird, in the nests of which, the antients tell us, they found the callais or turquoise. This seems a very ridiculous story, and the whole to be only founded on the resemblance of colour between that stone and the eggs of this bird. It has been also disputed among authors, what was meant by the *melancoryphos* of the antients; the general opinion is, that it was that little bird which, from the blackness at the top of the head, we call the *black cap*. But the antients themselves seem to have meant a somewhat larger bird by it; for they tell us, that the ficedula, at a certain time of the year, changed colour, and became the *Melancoryphos*, or black crown. There is no great foundation for such an opinion as this, but it may, however, serve to shew, that these two birds were much of a size.

MELANOCERASUS, a name given by some botanical authors to the *solanum lethale*, or *bella donna*, a poisonous sort of nightshade, with a beautiful berry resembling a large black cherry. *Pluk.* Almag. p. 352.

MELANOPIPER, in the materia medica, a name given by some writers to the common black pepper. *Mont.* Exot. p. 9.

MELANTERIA, in natural history, the name of a fossile substance, much talked of by the antient writers in medicine, and supposed by most of the moderns to have been lost among the later ages. This, however, is an erroneous opinion, for it is really produced at this time in many parts of the world; though its resemblance to some of the other fossils, in its external appearance, has made it almost universally overlooked by the writers on these subjects. It is, in its most perfect state, a very beautiful substance, of a close, even, and regular texture, moderately heavy, and of a very beautiful yellow, like that of the finest gold. It is, in this state, found in loose irregular lumps, never very large, being usually only from an ounce to two ounces in weight, and of a smooth, even, and polished surface. This is the case when it is pure and solid, and it is then also of as bright and fine a colour on the outside as within. *Hill's* Hist. of Foss. p. 607.

This is a state, however, in which it is very rarely found; we usually meet with it either in the form of a downy efflorescence on various species of vitriolic minerals, particularly on the common marcasites and pyritæ; or else in loose, shattery, and friable masses, of rough surfaces, of a spongy texture, and of a coarse dusky yellow; in either of these states, however, it so much resembles a more or less pure native sulphur, that it is generally mistaken for that body. It makes no effervescence with acid menstruums, and when put into the fire, is found not to be inflammable, but calcines first to a whitish, and finally to a strong red colour.

Water dissolves a part of its substance, and this may again be procured separate from the liquor, by evaporation and crystallization, and then it appears in form of rhomboidal bluish green crystals.

It is found in the mines of some parts of the harts forest in Germany, and is often met with on the sides of hills in many parts of the East Indies, and in America; it is usually mistaken in all these places for a native sulphur. Id. ibid.

MELANTZANA, in botany, a name given by many authors to the mad apple, called more usually *Melongena*. See the article MELONGENA.

MELANURUS, in zoology, the name of a fish caught in the Mediterranean, and sometimes, though rarely, in the British seas; and called by some writers, *occulata* and *occhiata*.

It is of an oblong and rounded body, and its back very little prominent, and of a bluish black. Its sides are of a silvery white, but are variegated with dusky transverse streaks. Its eyes are remarkably large, and their iris of a fine shining yellow. Its mouth is moderately large, and its fore teeth broad, its hinder ones narrow, slender, and sharp. It has only one back fin, the anterior rays or nerves of which are prickly, but the hinder ones soft and inoffensive. Its scales are moderately large, and its tail is very remarkably forked. It seldom exceeds five or six inches in length: And its tail has a remarkable black spot in it, whence it has its name, as it has that of *occulata*, from the largeness of its eyes. *Gesner*, de Pisc. p. 638. *Aldrovand.* de Pisc. l. 1. p. 63.

MELAONES, a word used by certain authors for a black kind of worm found in meadows, in the month of May, which, when bruised, emit an agreeable smell. Some also have called a small species of beetle by the same name.

MELASMA, a sugillation, or black mark, from a bruise.

MELASSES. See the article MOLASSES, *Cycl.* and *Suppl.*

MELASTOMA, in botany, the name of a genus of plants, called by Burman, *acinodendron*. The characters are these: The perianthium consists of one leaf, and is obtuse and permanent; it is inflated in the middle, and scarce at all divided at the edge. The flower consists of five roundish petals, inserted near the rim of the cup. The stamina are ten filaments, short, and inserted into the cup. The antheræ are long and erect, but somewhat crooked. The germen of the pistil is roundish, and placed under the cup. The style is crooked and emarginated. The fruit is a berry containing five cells; it is of a roundish figure, but crowned with a cylindric rim, and surrounded by the cup. The seeds are numerous and small. *Linnæi* Gen. Pl. p. 190. *Burman.* Thesaur. Zeyl. p. 363. Hort. Malab. vol. 4. p. 42.

MELCHITES, a name of reproach given to the orthodox, who asserted and maintained the canons of the council of Chalcedon. It was given to the catholics by the heretics, and not by the catholics to the heretics, as mentioned in the Cyclopædia. See the article MELCHITES, *Cycl.*

The word is derived from the Hebrew *melech*, a king or prince, and signifies the same as royalists, or those who were of the emperor's religion. For the same reason the emperor Justinian had the epithet *Chalcedonensis* given him. *Hofm.* Lex. in voc.

MELDFEE, in our old writers, a recompence due and given to him that made the discovery of any breach of penal laws, committed by another person, called the promoters or informers fee. *Leg.* Inæ. c. 20. *Blount.*

The word is Saxon from *meldfeoh*.

MELEAGRIS, the *Turkey*. In the Linnæan system of zoology, this makes a distinct genus of birds, of the order of the gallinæ; the distinguishing characters are, that it has four toes on each foot, a fleshy papillose crest on its forehead, and long naked wattles. *Linnæi* System. Natur. p. 48.

MELECH, a word used by some of the chemical writers to express salt. See the article SALT.

MELECHIL, a word sometimes used as the name of the gum *bdellium*, and sometimes as that of the fruit of a tree of the palm kind, much used by the antients as a cordial and restorative. The word *mokel* has the same double sense, and both are, by the more accurate writers, determined in their meaning by the epithets annexed to them, the gum *bdellium* being called *Molechil*, or *mokel judaicum*, and the fruit *mokel mechense*; yet the consequence of even this has been more confusion; for the later writers supposed, that the fruit was not produced by a palm-tree, but by the same tree which produced the gum. See the articles MOKEL and BDELLIUM.

MELEGEION, a word used by some writers in medicine to express a fætid matter, of the consistence of honey, discharged from old ulcers.

MELES, the *Badger*, in the Linnæan system of zoology, makes a distinct genus of animals, among which the author includes the civet cat, as the creature which affords us the perfume

perfume of that name is uſually called. The characters of this genus are, that the animals of it have eight paps, two on the breaſt, and ſix on the belly, with feet with five toes on each, on the hinder as well as the fore ones. The author diſtinguiſhes the common *Badger* by his having the claws of his fore feet much longer than thoſe of the hinder ones; and the civet animal by its having all its claws of the ſame length. *Linnæi* Syſtem. Natur. p. 37. See the article TAXUS.

MELET, in zoology, a name uſed by ſome for a ſmall tranſparent ſea fiſh, called by authors, *hepſetus* and *anguilla*, and by ſome, *atherina*. *Willughby*'s Hiſt. Piſc. p. 210. See the article HEPSETUS.

MELIA, Μελία, of the Greek writers, the name of a vegetable that often occurs in the Greek naturaliſts, and which has ſo many ſignifications, that it is not eaſy to underſtand the authors, without being well acquainted with them. All late writers have perplexed the world by miſcalling things, and thence rendering names ſynonimous and confuſed, which were at firſt clear and diſtinct; but the confuſion of the ſenſes of the word *Melia* is as old as the earlieſt writers we are acquainted with: Theophraſtus complains of it in his time.

The moſt common uſe of the word is for the *fraxinus*, or aſh-tree. The antients uſed to make the handles of their ſpears and darts of this, and therefore they ſometimes called them *Melia*. This word was alſo uſed as the name of a ſeed, called alſo by ſome, *meline*. This was of the nature of panic, and by ſome confounded with the panic. Suidas mentions this as different from the panic; but Diocles ſeems to have made them the ſame ſeed. Pliny has tranſlated the paſſage from Diocles, and, by an unaccountable error, has called the plant *melfrugum*, and ſays, that it has the ſame virtues with millet.

MELIA, in botany, the name by which Linnæus calls the *azedarach*. See the article AZEDARACH.

MELIA *Terra*, in natural hiſtory, a name given by ſome authors to the *melinum*, or white earth of the iſland of Melos, uſed among the antients in painting; but in the works of Dioſcorides and Galen ſignifying a ſubſtance of a very different kind; the *melinum* of the painters having been a *Marle* (ſee the article MELINUM) and the *Melia Terra* of the phyſicians a tripela. The confuſion between theſe two ſubſtances, ariſes from the ſame ſource with that of a vaſt number of others in the materia medica, and natural hiſtory of the antients, things having, though ever ſo different in their nature and ſtructure, been at different times called by the ſame name, merely becauſe brought from the ſame place.

The *Terra Melia* of Dioſcorides, and the antient phyſicians, is a dry, looſe, and harſh earth, found in maſſes of different ſize, and lodged among the looſer ſtrata of other matter, never making a ſtratum of itſelf. It is very firm and hard, of a pale greyiſh white or light aſh colour, very heavy, of a looſe, open, and ſpungy texture, and of a rough, uneven, and duſty ſurface. It adheres ſlightly to the tongue, and does not ſtain the hands, but leaves a duſt after the handling, which is ſo harſh as to make a grating noiſe, when the fingers are afterwards rubbed together. It makes no efferveſcence with acids. It is found in all the iſlands of the Archipelago, and was uſed by the antients for the ſame purpoſes that the pumice was. *Hill*'s Hiſt. of Foſſ. p. 68.

MELIANTHUS, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the polypetalous anomalous kind, being compoſed of four leaves, ſometimes expanded into the ſhape of a fan, and ſometimes contracted into that of a cone. The cup is unequally divided into ſeveral ſegments, and from it ariſes a piſtil, which afterwards becomes a ſquare fruit, inflated in the manner of a bladder, and divided into four cells, which contain roundiſh ſeeds. *Tourn.* Inſt. p. 430.

The ſpecies of *Melianthus*, enumerated by Mr. Tournefort, are theſe: 1. The African *Melianthus*, called the great ſpiked African pimpernel. 2. The ſmaller procumbent African pimpernel-leav'd *Melianthus*. And 3. The leaſt American *Melianthus*. See Tab. 1. of Botany, Claſs 11.

MELICA, in botany, a name given by ſome authors to the plant which produces the *ſorghum*, or Indian millet. *Park.* Theatr. 1136.

MELICA, a word uſed by the antients as the name of a food of a refrigerating and moiſtening quality. It ſeems to have been a kind of *oxygala*; for Galen, where he directs perſons of a hot habit to uſe a refrigerating diet, among other aliments of that kind, directs the eating of *Melica*, which, he ſays, is prepared of milk. Conſtantine, in his book of Agriculture, mentions *Melica*, and ſays it was made by pouring milk into an earthen veſſel, firſt well impregnated with boiling hot vinegar, by means of which there was a ſeparation of the milk into whey and curd.

MELICERIOLA, a diminutive of the word *Meliceris*, a ſmall encyſted tumour. See the article MELICERIS, *Cycl.*

MELICHLORUM, in natural hiſtory, a name given by ſome of the antient writers to a ſpecies of jaſper, of a greeniſh yellow, uſually found variegated with other colours.

MELILOTUS, *Melilot*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of papilionaceous kind. The piſtil ariſes from the cup, and finally becomes a naked capſule or pod, not incloſed in the cup in the manner of thoſe of the trefoil, and containing one or two roundiſh ſeeds. The leaves grow three on every ſtalk. *Tourn.* Inſt. p. 406.

The ſpecies of *Melilot*, enumerated by Mr. Tournefort, are theſe: 1. The common or German *Melilot*. 2. The common *Melilot*, with white flowers. 3. The *Melilot* with long and ſharp pods. 4. The tall ſhrubby white-flower'd *Melilot*. 5. The tall ſhrubby yellow-flower'd *Melilot*. 6. The greater *Melilot*, with reflected pods. 7. The little creeping *Melilot*, with reflected pods. 8. The Italian *Melilot* with roundiſh ſeed-veſſels. 9. The narrow-leav'd creeping *Melilot*, with roundiſh ſeed-veſſels. 10. The little yellow *Melilot*, with ſmall flowers, and ſeed-veſſels arranged in thick ſpikes. 11. The little yellow-flower'd *Melilot*, with larger flowers and ſeed-veſſels, diſpoſed in longer and looſer ſpikes, and with narrower leaves, each having a black ſpot near the pedicle. 12. The procumbent *Melilot*, with longiſh rugged leaves, and ſhort ſpikes of flowers. 13. The *Melilot* with kidney-ſhaped ſeed-veſſels collected into heads, called the yellow-field trefoil, with numerous ſeeds. 14. The great ſweet-ſcented *Melilot*, with violet-colour'd flowers. 15. The cretic *Melilot*, with very large fruit. *Tourn.* Inſt. p. 408.

In the acts of the academy of Peterſburgh, we have a deſcription and draught of a new ſpecies of *Melilot* growing from ſeeds gathered in Siberia. It is there called *Melilotus ſeliqua membranacea compreſſa*. See Tom. 8. p. 229. ſeq.

Melilot is ſcarce ever given internally, but uſed externally; it is a great emollient, reſolvent, and digeſtive. It is a good ingredient in cataplaſms and fomentations of this intention. The flowers are recommended by ſome in infuſion, in the manner of thoſe of chamomile, as a remedy for the *fluor albus*.

MELINTZANIUM, in botany, a name given by the later Greek writers to the plant called *ſtrychnus* by the earlier writers of that nation. Theophraſtus, and all the old Greeks, uſe the word *ſtrychnus*, and ſay there are three kinds, two of which are poiſonous, and the other not. The firſt cauſing madneſs, the ſecond cauſing ſleep, and the third bearing an eſculent fruit. This laſt is the plant we call *pomum amoris*, the fruit of which is at this time eaten by many people.

It is not agreed by the late Greek writers whether this word *Melintzanion* ſhall ſtand for ſome one kind of the nightſhade, or for them all: If they borrowed it from the Italian *melanzana*, which ſeems probable enough, then it can only ſtand for that kind, not for the whole claſs of nightſhade; but we find ſome of them uſing it for the whole number of the nightſhades, poiſonous and not poiſonous, and making it only a ſynonym to *ſtrychnus*, others uſing it as the name of the fruit of the *pomum amoris*, or love-apple, and others for the fruit of the male mandrake, which is alſo eſculent, and which, Dioſcorides tells us, was eaten by the peaſants of his time, but that it made them ſleepy, if eaten in too large quantities.

The Arabian phyſicians uſe the word *bedengian* in the ſame ſenſe, ſometimes applying it to the love-apples alone, and ſometimes to the whole family of the nightſhades; and it is probable enough, that both the Italians and later Greeks copied their name *melanzana* and *melantzanion*, from *melongena*. Myrepſus has the words *melentzanon* and *agriomelentzanon*, that is, a wild kind of the *pomum amoris*, very frequent, and commends the ſeeds, and other parts of the plant, in fevers, and many other diſeaſes. Fuchſius confeſſes that he does not know what to make of the word; but it is wonderful that the ſimilitude of ſound between this and the *melanzana* and *melongena* did not lead him to the knowledge of what it was, as he was acquainted with thoſe words.

MELINUM, in natural hiſtory, the name of an earth, famous in the earlieſt ages of painting, being the only white of the great painters of antiquity; and, according to Pliny's account, one of the three colours with which alone they performed all their works.

It is a fine white marly earth, of a very compact texture, yet remarkably light; a ſort of texture which muſt render any earth fit for the painter's uſe, that is of a proper colour. It is frequently found forming a ſtratum in the earth, lying immediately under the vegetable mould. It is of a very ſmooth, but not gloſſy ſurface, is very ſoft to the touch, adheres firmly to the tongue, is eaſily broken between the fingers, and ſtains the ſkin in handling. It melts readily in the mouth, and is perfectly fine, leaving not the leaſt grittyneſs between the teeth. Thrown into water, it makes a great bubbling and loud hiſſing noiſe, and moulders away into a fine powder. It does not ferment with acids, and ſuffers no change in the fire. Theſe are the characters by which the *Melinum* of the antients is diſtinguiſhed from all the other white earths. It is ſtill found in the ſame place from whence the painters of old had it, which is that from whence it has its name, the iſland of Milo, called Melos by the Greeks, and is common in moſt of the adjacent iſlands. It has been of late tried here as a paint, and is found not to make ſo bright a white as the other ſubſtances now in uſe among the painters, but ſeems not liable, like them, to turn yellow; and if ſo, would be worth the conſideration of perſons in the colour trade, eſpecially as it may be had in any quantities for carriage. *Hill*'s Hiſt. of Foſſils, p. 43.

MELINUS *Color*, Μηλινον χρῶμα, in antiquity, a colour often mentioned in ſpeaking of the habits of players. It was a reddiſh yellow, or the colour of ripe apples, in Greek called μηλα, and their colour μηλοειδες χρῶμα. *Hofm.* Lex. in voc.

MELISSA, *Balm*, or *Baum*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is compoſed of one leaf, and is of the labiated kind. The upper lip is erect, and of a roundiſh figure, but bifid at the end. The lower lip is divided into three ſegments. The piſtil ariſes from the cup, and is fixed, in the manner of a nail, into the hinder part of the flower, and ſurrounded with four embryos, which afterwards become ſo many roundiſh ſeeds, ripening in an open capſule, which was the cup of the flower. The flowers of *Baum* always grow in the alæ of the leaves, but they do not always ſurround the ſtalks like thoſe of the ſideritis. *Tourn.* Inſt. p. 193.

The ſpecies of *Baum*, enumerated by Mr. Tournefort, are theſe: 1. The common garden *Baum*. 2. The hairy ſtrong ſmelling Roman *Baum*. 3. The low broad-leav'd *Baum*, with a large purple flower. 4. The low broad-leav'd *Baum*, with a very large white flower. 5. The low narrow-leav'd *Baum*, with a very large flower. 6. The ſhort-ſtalk'd, plantain-leav'd Pyrenean *Baum*.

Baum is greatly eſteemed among the common people, as good in diſorders of the head and ſtomach; but is leſs regarded in the ſhops. It is moſt conveniently taken by way of infuſion, like tea; and the green herb, contrary to the general rule in regard to other plants, is much better than the dry. See the article BALM.

Hoffman has contrived a proceſs for the obtaining the virtues of this plant, which affords its principles better than any other, and gives two medicines to the phyſician, unknown before, but of great value.

This method might be purſued with the ſame ſucceſs in other caſes, and many plants, not ſufficiently eſteemed at preſent, might thus afford uſeful preparations.

He took a large quantity of the leaves of *Baum*, freſh picked from the ſtalks, and filling a glaſs veſſel more than half full, with them, fixing the ſtopper carefully in, he put the veſſel into a dung-hill, where he let it remain three months: At the end of this time he took it out, and found the whole reduced to a kind of pultice. This being diſtilled in a retort, yielded firſt an empyreumatic liquor, but afterwards, when the fire was increaſed, a black and ſtinking oil came over, in form of thin laminæ, ſpreading itſelf over the ſurface of the liquor. There remained at the bottom of the retort a black and burnt maſs, reſembling a coal, which, being thrown on burning charcoal, had very much the ſmell of the common tobacco.

In this firſt diſtillation no volatile ſalt appeared, but the empyreumatic liquor being examined, was found very ſharp and acrid on the tongue, and of a ſharp and pungent ſmell. Spirit of vitriol being mixed with it, it afforded no efferveſcence; but on the mixing it with ſpirit of hartſhorn, ſpirit of urine, or the like, a ſmall ebullition always was produced, though it laſted but a few moments.

This liquor, rectified by a ſecond diſtillation, affords the volatile ſalt of *Baum*, which is a fine white and pellucid ſubſtance, adhering to the neck of the glaſs, in form of fine white and ſtriated cryſtal, and a yellow ætherial oil, of a very penetrating ſmell, and ſharp taſte, becomes ſeparated by the ſame rectification. Theſe are both found to be very great medicines, the ſalt as a ſudorific, and the oil as a high cordial, a carminative, and a deobſtruent. *Hoffman*, Act. Laborat. Chem.

MELITENSIS *Terra*, *Earth of Malta*, in the materia medica, an earth of which there are two very different kinds, the one of the genus of the boles, the other of the marles. The latter is that known by medicinal authors under this name; the former is the Malta earth now in uſe: But both being brought from the ſame place, are confuſedly called by the ſame name.

The Malteſe bole, which is what we uſe now, is a fine earth, of a cloſe compact texture, and very heavy; when dug, it is of a very pure white, but it is apt to contract a yellowneſs in drying, and become of a cream colour. It is of a very ſmooth and ſhining ſurface, ſcarce at all ſtains the ſkin in handling, adheres ſtrongly to the tongue, and melts into a butterlike ſubſtance in the mouth. It makes no efferveſcence with aqua fortis, or any other acid menſtruum, and ſuffers no change of colour in the fire. *Hill*'s Hiſt. of Foſſils, p. 4.

The Malteſe marle, which is the *Terra Melitenſis* of medicinal authors, is a looſe, crumbly, and very light earth, of an unequal and irregular texture, and when expoſed to the weather, ſoon falls into fine ſoft powder; but when preſerved and dried, it becomes a looſe light maſs, of a dirty white colour, with a greyiſh caſt; it is rough to the touch, adheres firmly to the tongue, is very eaſily crumbled to powder between the fingers, and ſtains the hands. Thrown into water it ſwells, and afterwards moulders away into a fine powder. It ferments very violently with acid menſtruums.

Both kinds are found in great abundance in the iſland of Malta, and the latter has been much eſteemed as a remedy againſt the bites of venomous animals, but with how much juſtice we cannot ſay. The other has ſupplied its place in the German ſhops, and is uſed there as a cordial, a ſudorific, and aſtringent. *Hill*'s Hiſt. of Foſſils, p. 37.

MELITITES, in natural hiſtory, an indurated clay, of a yelloviſh colour, but in many reſpects approaching to the nature of the morochthus or common French chalk.

It has its name from the Greek μελι, honey, according to Dioſcorides, from the ſweet taſte of the liquor it diſſolved into on rubbing with water; and probably it might be alſo ſo called from its colour, which does not ill reſemble that of honey.

The antients uſed it much in medicine; they applied it externally in ulcers, and gave it inwardly as a ſoporific to people who were to ſuffer pain, ſuppoſing it would make them leſs ſenſible of it. It is at preſent very common in Italy, and probably in many other places, but is not known or regarded. It is a very ſmooth ſubſtance, nearly as hard as the *morochthus*, of a very compact texture, and of great weight, of a fine even and gloſſy ſurface, very ſmooth and ſoft to the touch, and in colour of a greyiſh yellow. It does not at all adhere to the tongue, nor ſtain the fingers in handling; but drawn along a rough ſurface, leaves a fine ſlender white line; and ſhaved into very thin pieces, has ſome faint degree of tranſparence. It diſſolves, on rubbing in water, into a yellow thick liquor like cream, which has a luſcious or ſweetiſh taſte. It does not ferment with acids, and burns to a pure white. The ſweet taſte of this is common, in ſome degree, to the *ſteatites*, *morochthus*, and all the indurated clays, as are alſo their ſemi-tranſparence in thin pieces, and all their other properties. *Hill*'s Hiſt. of Foſſils, p. 24.

MELITITES *Lapis*, a name given by ſome authors to ſome of the rounder ſpecies of *echinitæ*, from their reſembling an apple in their ſhape.

MELITTOMA, a word uſed by the antients to expreſs a ſort of ſweet-meat, or confection, made with pleaſant ingredients mixed in honey.

MELLAGO, a word uſed by medicinal writers to expreſs any medicine that has the conſiſtence and ſweet taſte of honey. It is often applied to the rob, or inſpiſſated juice of fruits, mixed with ſugar in the making.

MELLE, or MULLI. The Peruvians, by gently rubbing the fruit of this tree between their hands in warm water, deprive it of all its ſweetneſs; after which they ſtrain the liquor, and leaving it a few days to ſubſide, it becomes a very tranſparent drink, and by boiling becomes an excellent kind of honey. Garcil. ap. *Boyle*'s Works abr. vol. 1. p. 53.

MELLEGUETTA, in the materia medica, a name uſed by ſome authors for the great cardamom, commonly called grain of paradiſe. *J. Bauhin.* vol. 2. p. 204. *Jonſ.* Dendr. p. 114.

MELLEUM *Marmor*; in natural hiſtory, the name of a plain yellow marble, reſembling honey or pure Venice turpentine in colour, and thence called by Cæſalpinus, *Marmor ſpecie Mellis aut Terebinthinæ*. It is a very beautiful marble, tho' but of one plain colour, and 'tis a wonder it is not more imported into England. It is of a very agreeable colour, and is conſiderably hard, and capable of a very elegant poliſh. It is dug in many parts of Italy, and is greatly eſteemed there. It never has any veins. *Hill*'s Hiſt. of Foſſils, p. 464.

MELLINE, in botany, a name given by many of the antient writers to the garden plant we call *Baum*. It had the name *Melline* from its yielding honey to the bees.

It has many other names, derived from the ſame ſource; ſuch as *apiaſtrum*, from *apis* the bee, *meliphyllum*, the honey-leaf, and from this, *meliſſophyllum*. Many alſo are of opinion, that the *amello* of Virgil is the ſame plant. He deſcribes it as having a gold-colour'd flower, and purple leaves at the bottom; this they explain by obſerving, that in *Baum* the ſtamina of the flowers which ſtand out, and are the moſt conſpicuous parts, are yellow, and the leaves of the calyx or flower-cup are purple: Theſe, they ſay, are what Virgil means by the leaves at the bottom, not the common leaves of the plant growing from the root, which are not to be ſuppoſed purple in any plant.

MELLISODIUM, a word uſed by ſome chemical writers to expreſs burnt lead.

MELLITA, in natural hiſtory, the name of a genus of the *echini marini*, of the general claſs of the placentæ. The characters of the *Mellita* are, that they are plain and flatted ſhells, with their edges arched and waved, and have on their ſuperficies two or more oblong apertures, which reach to the baſe. Of this genus, there are two known ſpecies; 1. A ſmooth one with a circular vertex. 2. A ſcutellated kind, reſembling the ſhell of the tortoiſe, and with a pentagonal vertex. *Klein*'s Echin. p. 30. See Tab. of Teſtaceous Animals, N°. 9.

MELO, the *Melon*, in botany. See the article MELON.

MELOCACTUS, the *Melon Thiſtle*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the monopetalous kind, and is tubulated at the bottom, and expanded into the form of a bell at the top, with ſerrated edges; this ſtands upon a cup, which finally becomes a ſoft fleſhy fruit, of the ſhape of an olive, which contains a ſmall ſeed. In many of the ſpecies, however, the fruit is collected into an elegeant head.

The ſpecies of *Melocactus*, enumerated by Mr. Tournefort, are theſe: 1. The common Eaſt Indian *Melocactus*. 2. The purple

purple *Melocactus*, with crooked ſpires. 3. The ſquare creeping American *Melocactus*, with white flowers and ſcarlet fruit. 4. The creeping trigonal American *Melocactus*, with white flowers. 5. The ſquare tree American *Melocactus*, with white flowers. 6. The arboreſcent American *Melocactus*, with ſtriated very prickly leaves, white flowers, and yellow tuberoſe fruit. 7. The very prickly American *Melocactus*, with ſeveral globules joined together in the manner of the opuntia. 8. The ſmall lanuginous tuberous American *Melocactus*. 9. The ſingle-ſtalked American *Melocactus*, with white flowers, and blackiſh purple fruit. 10. The tuberous purple American *Melocactus*, with very ſtrong and ſharp prickles. 11. The trigonal undulated American *Melocactus*, with very robuſt prickles, and white flowers and greeniſh fruit. 12. The trigonal American *Melocactus*, with ſhort prickles and white flowers, and ſcarlet fruit. 13. The creeping pentangular American *Melocactus*, with white flowers and red fruit. *Tourn.* Inſt. p. 653.

MELOCARPUS, a word uſed by ſome of the old authors to expreſs the fruit of the *ariſtolochia*, or *birthwort*, uſed in ſome external applications. See the article ARISTOLOCHIA.

MELOLANTHUS, the name of a peculiar ſort of beetle, which is found in all parts of England, and in many other countries among trees and hedges. The French call them *hanneton*, and we *cock-chafers*, *dorrs*, and by many other names. The name *melolanthus* is as old as Ariſtotle, and is given this creature from its feeding on the bloſſoms of the crab or wild apple. We have, of late years, had great damages done by the grubs of theſe beetles working under ground; but in Ireland they have been uſed to come in ſwarms, in certain years, in the beetle ſtate, and have been ſo terrible to this country, that the people have called them locuſts.

The firſt time they are remembered by authors to have appeared in this vaſt abundance, in this country, was in the year 1688. They then appeared in the ſouth-weſt part of the county of Galway; they appeared firſt upon the coaſt, and were brought by a ſouth-weſt wind, a wind ſo common there, that it may almoſt be called, the trade wind of Ireland; from the coaſt they ſoon ſpread over the inland parts of the county, and were ſeen every where in ſuch numbers, as were ſcarce to be conceived. They never ſtirred in the day-time, but were ſeen covering the leaves and branches of trees and hedges, and in many places hanging down in prodigious cluſters on one another's backs, in the manner of bees when they ſwarm. As ſoon as the ſun ſet, they uſed to leave the hedges, *&c.* and take wing, gathering into bodies, and making a humming confuſed noiſe like that of drums at a diſtance. They ſometimes formed bodies together, that darkened the air for three or more miles ſquare. They flew ſo low ſometimes, that it was ſcarce poſſible for a perſon, going along, to make his way through them; and by ſtriking againſt the faces and necks of women and children, they did much miſchief, every one leaving a mark behind it; and thoſe of this ſex or age, who had been among them, came home all over bruiſes.

This, however, was little to the miſchief they did the fields; for though the middle of the ſummer was the ſeaſon in which they came, they had, in a few days, eaten up all the leaves of the trees ſo compleatly, that they all looked as bare as in the depth of winter. The noiſe they made, while eating in vaſt numbers together, was like that of ſawing timber. The gardens fared no better than the hedges, for they eat up leaves, young ſtalks, and fruit, and every thing that was green and ſoft there, and left only a parcel of naked ſticks behind them. Many of the trees, thus ſtripped, wholly periſhed. Phil. Tranſ. N°. 234.

MELOMELI, a word uſed by the antients to expreſs honey impregnated with quinces.

MELON, *Melo*, in botany, makes a diſtinct genus of plants, the characters of which are theſe: The flowers conſiſt only of one leaf each, and are wide at the mouth, and divided into ſeveral ſegments, wholly reſembling the flowers of cucumbers. Of theſe alſo ſome are male or ſteril flowers, having no embryo fruit; others are fruitful or female flowers, having an embryo which ripens into a large fruit of an oval figure, ſometimes ſmooth, ſometimes rough, divided into three cells, and containing oblong ſeeds; each of theſe cells ſeems alſo divided into two.

The ſpecies of *Melon*, enumerated by Mr. Tournefort, are theſe: 1. The common *Melon*, with Dodonæus calls the *cucumis* of Galen. 2. The great ſmooth green *Melon*, with ſmaller ſeeds. 3. The Spaniſh *Melon*. 4. The ſmall round *Melon*, called the ſugar *Melon*, and round muſk *Melon*. 5. The turbinated *Melon*. 6. The reticular *Melon* of John Bauhine. 7. The little Egyptian *Melon*. *Tourn.* Inſt. p. 104.

Melon ſeed is cooling and diuretic, and has the ſame virtues with the other cold ſeeds, as they are called. See the article GOURD.

The proper management and culture of *Melons* is this: The ſeeds ſhould be procured from good *Melons*, produced in ſome diſtant garden; for if ſowed on the place where it was raiſedan ripened, it is very apt to degenerate. This ſeed ſhould be kept three years before it is ſowed, and it ſhould be ſowed at two ſeaſons. The firſt for the early crop, to be raiſed under frames, ſhould be ſown in January or the beginning of February; the ſecond, to be raiſed under bell or hand-glaſſes, is to be ſowed in *March*, and this is the ſowing which produces the general crop of *Melons*, which ripen in July and Auguſt. About a week before the time of ſowing the ſeed, ſome dung ſhould be prepared in a heap with the litter, or ſome coal-aſhes, and the ſame methods uſed as in the early cucumbers, for the firſt crop; but for the ſecond, which is of more general uſe, the ſowing may be on the upper ſides of the hot-beds that were for the early *Melons* or cucumbers, or on a freſh moderate hot-bed. When the young plants are come up, they muſt be removed to another hot-bed, and covered with hand-glaſſes, and watered and ſhaded till they have taken root; and after this they muſt have as much air and ſun as the ſeaſon will permit, and their ſtalks ſhould be earthed up as they grow, which will vaſtly ſtrengthen them.

In the beginning of April the plants will begin to ſhew their rough leaves, a parcel of dung is then to be prepared with the litter and coal-aſhes. The common quantity is a load to five holes; a trench muſt then be dug, which ſhould be ten inches deep, if the ſoil be dry, but only three if it be wet. The dung muſt be evenly laid in this, and heaped up to three foot high. Then the places intended for the holes muſt be marked out, at each of which muſt be laid a baſket-full of light rich earth, thruſting a ſtick of two foot long into the middle. Then cover the dung all over with the earth which was dug up out of the trench, laying it ſmooth, and about three inches thick; then the glaſſes are to be placed cloſe down over the place where each of the ſticks is, and in two days the earth will be warm enough to receive the ſeedling plants. The ſticks are now to be taken out, and the earth formed in the places into a hollow like a baſon, that it may retain the water which is given to the plants. The plants are then to be taken up, and two ſtrong and thriving ones put into each of theſe holes, which muſt be watered and ſhaded till they have taken root. The plants having taken root, and thruſt out a fourth leaf, the top of each of them ſhould be pulled off, in order to force out ſhoots from the bottom, and as the weather becomes warmer, the glaſſes muſt be raiſed with ſtones on the ſouth ſide, to give them air, and about twice a week they ſhould have a little water.

About the middle of May the ſtalks of the plants will begin to preſs upon the glaſſes on every ſide, and the glaſſes are then to be raiſed up on bricks, to give them room to run out; and they ſhould be pegged down with forked ſticks, and turned into a proper direction for their running, ſo that they may be out of the way of tangling one with another: They ſhould now, if the weather be ſevere, be ſheltered with mats in the night, and watered gently at times. When the ſtalks of the plants are grown to the edges of the bed, the earth muſt be raiſed with old dung buried under it, till it be upon a level with the beds, for two foot wide on each ſide. The branches are here to be trained in a proper courſe, and the glaſſes are to be left over the roots of the plants, and after this, what water is given them is to be ſprinkled all over the plants. When the fruit begins to appear, the waterings muſt be very gentle on the plants; but it will be proper to ſoak the earth well with large quantities of water about the beds, which will ſpread a moiſture even to the roots of the plants; from this time the plants ſhould be gently watered twice a week, and that always in the evening. When the *Melons* are grown of the ſize of a tennis ball, a piece of tile ſhould be laid under each to keep them from the ground. As they afterwards approach to ripeneſs, they ſhould be turned ſeveral times, that they may ripen equally on every ſide; and if the weather be not very favourable, they ſhould be covered with glaſſes. If the *Melon* is deſigned to be eaten as ſoon as cut, it ſhould be ſuffered to remain on the plant till it changes pretty yellow, and the ſtalk begins to ſeparate from the fruit; but if it be to be kept two or three days after cutting, it muſt always be cut proportionably ealier.

It is a practice with many to take off the leaves about the fruit, that it may have more ſun; but it is wrong, and the fruit is always the worſe taſted for it, and the ſkin is hard and tough. *Miller's* Gardener's Dict.

Whenever a *Melon* appears well knit on a branch, it is proper to cut off all the reſt of the branch beyond it, that the fruit may receive all the nouriſhment that would have been conveyed into the whole branch; only it muſt be obſerved, that a ſufficiency of leaves, of the neighbouring branches, be left or brought over it, to ſhade it from the exceſſive heat of the ſun in the drought and heat of the day.

There is uſually required the ſpace of forty days, from the time of a *Melon's* firſt knitting on the branch, to its being perfectly ripe: But in cold ſeaſons they are ſometimes longer. In order to ſave good ſeed for the next year, no other ſeeds are to be taken out than thoſe which have lain in that part of the fruit which is next the ſun, and theſe ſhould be taken out at the time of the eating the *Melon*, and immediately wiped dry with a cloth, and laid up in a dry place.

Melons ſhould not be eaten till they have been gathered twenty-four hours; they ſhould, in the mean time, be laid in a cool but dry place. The proper time of gathering them is a thing of great conſequence to the eating them in perfection; they generally diſcover the proper degree of ripeneſs

for gathering, by their ſmell, and by the ſplitting of their tail. The common kinds ſhew the approaching ripeneſs by a yellowneſs coming on in ſome part: This begins in one place, and ſpreads, by degrees, over a great part of the fruit. It is to be obſerved that twenty-four hours after the time of the firſt appearance of a yellowneſs in ſome part, is the exact ſeaſon for the gathering of theſe *Melons*. A *Melon* that ripens too faſt is never good; ſuch a ripeneſs is unnatural, and proceeds only from the poorneſs or ſickneſs of the root, which makes it turn thus ſuddenly. Phil. Tranſ. N°. 46.

When a *Melon* is perfectly fine, it is full, without any vacuity: This is known by knocking upon it, and when cut, the fleſh muſt be dry, no water running out, only a little dew, which is to be of a fine red colour. Large *Melons* are not to be coveted, but firm and well flavour'd ones. Our Gardeners, who raiſe *Melons* for ſale, ſow the ſeeds of the large rather than the good kinds, and they encreaſe the ſize of theſe by much watering the roots, but this ſpoils the taſte. Some of the French raiſe at this time particularly fine *Melons*, by a method kept as a ſecret, but which we find, on a ſtrict enquiry, is no other than the ingenious Mr. Quintiny's, of that nation, publiſhed near eighty years ago in our Philoſophical Tranſactions.

The *Melons*, particularly proper to be treated in this manner, are thoſe which have a thin and ſomewhat embroidered ſkin, not divided by ribs, and have a red pulp, dry and melting on the tongue, not mealy, and of a high flavour. Theſe are what ſucceed in the following method, and are greatly improved in ſize and flavour by it.

When the ſeeds of this *Melon* are placed in the ground, the firſt thing that appears is a pair of ſeminal leaves, or ears, as the Gardeners call them. Between theſe two leaves there ſhoots, ſome days after, a leaf, called the firſt leaf, or knot; and out of the ſame place, after ſome days more, there ſhoots another leaf, called the ſecond knot. Out of the midſt of this ſtalk of the ſecond knot, there ſhoots a third knot: This third knot muſt be cut off at its inſertion, without hurting the branch of the ſecond knot from whence it grows. Out of this place there will grow, after this cutting, a branch, which will be what the gardeners call the firſt arm, and this arm will, in the ſame manner as the firſt plant, ſhoot out, firſt one, then a ſecond, then a third knot; this third knot muſt be cut again as before, and thus the third knots are all along to be cut off, and arms or branches will grow up in the places of them, all the way in the ſame manner as the firſt; and it is at thoſe arms that the *Melons* will be produced; and they will be always good, if the foot or root be well nouriſhed in good earth, and cheriſhed by a good hot bed and the ſun. The foot of the *Melon* muſt never be ſuffered to paſs into the dung, nor the earth muſt not be watered but moderately, when it is ſeen to grow too dry; but in this caſe, it muſt be moderately moiſtened in time, leaſt the ſhoot ſuffer by it. Twice or three times a week is often enough to water in the drieſt weather, and this muſt always be done about ſunſet; and when the heat of the ſun is too violent, the *Melons* muſt be covered with ſtraw mats from eleven in the morning to about two in the afternoon. When it rains much, the *Melons* muſt alſo be covered, leſt it hurt them by too much moiſture. Phil. Tranſ. N°. 45.

If the root produce too many branches, the weakeſt are to be cut off, and only three or four left; and thoſe which are left are to be ſuch as have their knots cloſeſt to one another.

When the plants are removed from the ſeed-bed to the places where they are to ſtand, if they are very ſtrong, they ſhould be planted ſingle, but if otherwiſe, two are to be ſet in each hole.

When they are planted ſingle, the two branches which always grow on each ſide, from the baſe of the ſeed-leaves, are to be left on; but when two plants are ſet together, theſe branches are to be cut off, otherwiſe all the branches will be too numerous, and they will entangle and ſpoil one another.

When the *Melons* are knit, two of them only are to be left upon each foot, chuſing thoſe which are beſt placed, and next to the firſt and principal ſtalk that is to the heart of the foot. None but fair fruits are to be left, and ſuch as have a thick and ſhort tail; and the foot of the *Melon* muſt be ſhort, well truſſed, and not far diſtant from the ground. *Melons* of a long ſtem, and having the ſtalk of the leaf too long and ſlender, are never vigorous.

All the ſuperfluous branches muſt be cut off from time to time, as they ſhoot out.

There ſometimes ſhoots out a branch more than is here mentioned, between the two ſeed-leaves or ears. If this is ſtrong and vigorous, it is to be kept on, but if weakly, it is beſt to take it off, for it will never bear good fruit.

MELON *Seeds*. We read of *Melon* ſeeds thirty-three years old, vegetating and producing a fine number of plants. Phil. Tranſ. N°. 475. Sect. 6. and in N°. 464. we read of *Melon* ſeeds 43 years old, producing fruit.

Petrified MELONS, a name given by the people who have written books of travels, &c. to certain ſtones found on mount Carmel. The monks who inhabit that mountain at this time, and who pretend to be the followers of Elias the prophet, tell a legendary ſtory about theſe ſtones, which has given occaſion to the name. They ſay, that when Elias lived on that mount, a certain Gardener paſſing by his cave with *Melons*, the prophet aſked one of them; but the fellow replying, that they were not *Melons*, but ſtones that he carried, the prophet miraculouſly fulfilled the ſaying, and converted them into ſtones. Travellers who are fond of theſe ſtories, were uſually glad to pick up one of theſe ſacred ſtones as they went on; and the monks have been careful enough to gather all they could find for the better opportunity of obliging their viſiters; ſo that though they were once very common, they are now only to be had by the favour of theſe people.

Breynius is the only author who has given a good account of them; he ſays that they are ſpheric or ſpheroidal ſtones, of various ſizes, from that of a hen's egg to that of the largeſt *Melon*, or even more than that. They are generally found bedded in a very hard ſand ſtone, of a greyiſh or aſh colour; but they come out whole on breaking the ſtone, and are of a ſmooth ſurface; a greyiſh colour, or ſometimes a browniſh ferrugineous hue. When they are broken, there is always a cavity found in them, ſometimes regular and even, ſometimes very irregular, and generally proportioned to the bigneſs of the ſtone. This cavity is lined on all ſides with minute cryſtals, which are very bright and pellucid, and have their points ſtanding toward the center of the cavity. The ſubſtance of the ſtone itſelf approaches to the nature of marble, of a yellowiſh colour, and capable of a good poliſh; when wrought looking very like the Florentine marble. This is a cruſt of about half an inch or an inch in thickneſs, according to the bigneſs of the ſtone, and ſometimes this is covered with a paler-coloured cruſt, of the thickneſs of a ſtraw, which in ſome degree reſembles the bark or rind of the fruit. Theſe ſtones are truly a ſort of concave natural nodules, of the nature of our hollow flints. They have had no fruit for their matrix, nor have ever any of the ribs and furrows which the *Melon* has, nor any mark of the ſtalk; and within they have neither the natural diviſions of the *Melon*, nor any thing reſembling the ſeeds. It is not only the want of many parts abſolutely eſſential to the fruit ſuppoſed to be petrified, which ſhews that opinion to be erroneous; but the courſe of nature, in petrifactions in general, argues alſo greatly againſt it.

The things we meet with, in this ſtate, are all of them ſuch as are naturally hard, dry, and permanent, and none of the tender and ſucculent bodies, ſuch as the *Melon*, and the like fleſhy fruits, which muſt neceſſarily rot in the water that conveys the ſtony matter, before it could at all enter their pores. And the ſtones are certainly analogous to thoſe concave nodules of a ferrugineous colour, in the cavities of which amethyſts are produced; and to that genus of ſtones which Woodward calls concave cryſtalline balls, common in many parts of the world.

The fallacy of an extravagant opinion, in regard to foſſils of any particular form, is not peculiar to theſe ſtones, as witneſs the ſmall ſhells petrified and found in Ægypt, which from their flat and roundiſh ſhape, are ſaid to be the lentiles which the children of Iſrael eat when making the pyramids; the *cornua ammonis*, which is the remains of a ſea ſhell, and yet is ſuppoſed to be a petrified ſerpent; the *nummi minerales*, which are the operculums of ſhell-fiſh, but are generally ſuppoſed by the vulgar, about the places where they are found, to be medals and coins, petrified with lying in the earth, and many the like follies. *Breyn.* de Melon. Petr. Mont. Carm.

MELON *Thiſtle*. See the article MELOCACTUS.

MELONGENA, *Mad Apple*, in botany, the names of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of a rotated form, and divided into ſeveral ſegments at the edges. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the middle part of the flower. This afterwards changes to a fleſhy fruit, in which there are contained a number of kidney-ſhaped ſeeds.

The ſpecies of *Melongena*, enumerated by Mr. Tournefort, are theſe: 1. The long violet-fruited *Melongena*. 2. The *Melongena* with long white fruit. 3. The *Melongena* with long yellow fruit. 4. The *Melongena* with long bright red fruit. 5. The *Melongena* with cylindric violet-coloured fruit. 6. The round fruited *Melongena*. 7. The crooked-fruited *Melongena*. 8. The thorny *Melongena*, with round ſaffron-colour'd fruit. 9. The *Melongena* with round fruit, armed with violet-colour'd thorns. 10. The *Melongena* with round fruit, armed with greeniſh white thorns. 11. The *Melongena* with prickles, and with a round black fruit. 12. The prickly *Melongena*, with a long black fruit. *Tourn.* Inſt. p. 151.

This plant is propagated in the gardens of the curious with us; and in Spain, Italy, and Barbary, common in the kitchen gardens, the fruit of them being frequently eaten there boiled with fat fleſh, putting thereto ſome ſcraped cheeſe, and preſerving it through the winter with vinegar, honey, or ſalt pickle. This they eſteem of great efficacy to provoke venery. In ſummer alſo, when the fruit is juſt ripe, they eat it freſh dreſſed, with ſpices and other ingredients.

The manner of propagating them with us, is to ſow the ſeeds in March, upon a moderate hot bed, and when the plants are come up, they are to be thinned by planting them in another hot

hot bed at about four inches aſunder, watering and ſhading them till they have taken root. They muſt afterwards have as much air as the ſeaſon will allow, and in May they muſt be tranſplanted into a warm border, ſetting them at two foot diſtance every way. About the middle of June the fruit will appear, and if the weather be dry at this time, they muſt be often watered, which will make the fruit grow large. The fruit ripens in the end of July. *Miller*'s Gardener's Dict.

MELOPEPO, in botany, the name of a genus of plants, of a middle nature, as their name expreſſes, between the melon and the pompion. The characters which diſtinguiſh this genus from the others of the like kind, are, that the fruit is roundiſh, ſtriated, angular, and uſually deeply divided into five parts. The ſeeds are flat, and fixed to a ſpongy placenta.

The ſpecies of this genus, enumerated by Mr. Tournefort, are theſe: 1. The flatted or compreſſed *Melopepo*. 2. The great white-fruited *Melopepo*. 3. The yellow rough-fruited *Melopepo*. 4. The broad depreſſed *Melopepo*. 5. The citron-ſhaped *Melopepo*. 6. The conic *Melopepo*. 7. The *Melopepo* with a doubly turbinated fruit. 8. The yellow thin-ſkinned *Melopepo*. 9. The clypeated, or ſhield *Melopepo*. 10. The verrucoſe or warted *Melopepo*. 11. The tuberoſe warted *Melopepo*. 12. The lightly ſtriated yellow warty *Melopepo*, with rough leaves. 13. The white lightly ſtriated warty *Melopepo*, with rough leaves. 14. The warty *Melopepo*, with a white fruit and white ſeeds.

MELOTIS, a word uſed by the chirurgical writers to expreſs a ſmall probe, properly one intended to be uſed only to the ear.

MELT (*Cycl.*)—MELT *of Fiſhes*. In the *Melt* of a living cod-fiſh there are ſuch incredible numbers of thoſe ſmall animalcules found in the male ſeed of all animals, that in a drop of the juice of it, no more in quantity than a ſmall grain of ſand, there are contained more than ten thouſand of them; and, conſidering how many ſuch quantities there are in the whole *Melt* of one ſuch fiſh, it is not exceeding the bounds of truth to affirm, that there are more animals in one *Melt* of it, than there are living men at one time upon the whole face of the earth. However ſtrange and romantic ſuch a conjecture may appear at firſt ſight, a ſerious conſideration, and calculation, will make it appear very plain. An hundred ſuch grains of ſand as are here mentioned, will make about an inch in length; therefore in a cubic inch there will be a million of ſuch ſands.

The *Melt* of one of theſe fiſhes is frequently about the quantity of fifteen cubic inches, it muſt therefore contain fifteen millions of quantities as big as one of theſe ſands; and if there be ten thouſand animals in each of thoſe quantities, there muſt be, in the whole, a hundred and fifty thouſand millions: Which is a number vaſtly exceeding the number of mankind, even tho' we were to ſuppoſe the whole earth as populous as Holland. See Philoſophical Collections, p. 4.

MELTING (*Cycl.*)—MELTING *Cone*, in aſſaying, is a ſmall veſſel made of copper or braſs, of a conic figure, and of a nicely poliſhed ſurface within. Its uſe is to receive melted metals, and ſerve for their precipitation, which is effected, when two bodies melted together, and yet not mixing perfectly with one another in the fuſion, ſeparate in the cooling into two ſtrata, on account of their different ſpecific gravity. This precipitation might be made in the ſame veſſel in which the fuſion is performed; but then the melting-pot or crucible muſt be broken every time to get it out, whereas the conic ſhape, and poliſhed ſurface of this veſſel, makes it eaſily got out without violence. The ſhape of this veſſel is alſo of another uſe in the operation; for by means of it, the heavy matter ſubſiding to a point, is formed into a perfect and ſeparate regulus, even where the whole quantity, as is very frequently the caſe, has been but very ſmall.

When the quantity of the melted matter is great, it is common to uſe, inſtead of this cone, a large braſs or iron mortar, or any other conveniently ſhaped braſs or iron veſſel. It is neceſſary, when the cone is of braſs, to be cautious that it be not made too hot; for the brittleneſs of that metal, when hot, makes it eaſily break, on the ſtriking with any force on that occaſion, to make the melted maſs fall out.

Theſe, and all other moulds for the receiving melted metals, muſt always be well heated before the maſs is poured into them, leſt they ſhould have contracted a moiſture from the air, or have been wetted by accident; in which caſe the melted metal will be thrown out of them with great violence and danger. They ought alſo to be ſmeared over with tallow on their inſide, that the regulus may be the more eaſily taken out of them, and the ſurface of the mould not corroded by the melted maſs poured in.

If a very large quantity of a metal is, however, to be received into them, and eſpecially if any thing ſulphureous have place among it, this caution of tallowing the moulds does not prove ſufficient; for the large quantity of the maſs makes it continue hot ſo long, that this becomes but a ſlight defence to the ſurface of the mould. In this caſe the aſſayer has recourſe to a lute, reduced to a thin pap with water, which being applied in form of a very thin cruſt, all over the inſide of the cone, or mould, ſoon dries up indeed, but always preſerves the ſides of the veſſel from the corroſion of the maſs. And this caution is found neceſſary, even when pure copper is melted alone, without any mixture of ſulphur. See Tab. of Chemiſtry, N°. 31. *Cramer*, Art. Aſſ. p. 72.

MEMÆCYLUM, in botany, a name by which ſome authors have called the *arbutus*, or ſtrawberry-tree, a ſhrub preſerved in the gardens of the curious. *Ger.* Emac. Ind. 2.

MEMAICULA, in the materia medica of the antients, a name given to a fruit, ordered in ſome compoſitions as an aſtringent and a cooler. When the Greek writers uſe this word, their Latin tranſlators uſually render it by the word *unedo*. Pliny ſays, that *unedo* is the name of the fruit of the *arbutus*, or ſtrawberry-tree; but we find the earlieſt Latin writers do not countenance this. Varro calls the fruit of the *arbutus* by the name *arbutus*, as he does the fruit of the mulberry or morus, by the name *morus*. And it ſeems to have been contrary to the general cuſtom of the times to have impoſed a name upon a fruit, different from that of the tree which bore it. Some of the commentators ſay that the *Memaicula*, or *Unedo* was no other than the common wood-ſtrawberry. And Ægineta in one place ſays, that the fruit of the *camarus*, that is, of the *arbutus*, was called *Memaicula*; but in another place he gives a much better explication of the word, ſaying, that ſome of the Greeks uſed it as the name of the fruit of the *cornus mas*, or male cornel-tree. See the article CORNUS.

MEMBRANE (*Cycl.*)—Mr. Lewenhoek has been at the pains of examining, with great nicety, the fine *Membranes* which encloſe the faſciculi or ſmall bundles of fibres of which a muſcle is compoſed. Between theſe faſculi the *Membrane* is of a conſiderable thickneſs; but it divides itſelf every way into very fine and ſmall branches. This *Membrane* is evidently compoſed of a number of ſmall veſſels, and theſe may be diſtinguiſhed not only in its thick parts, but even where it is ever ſo ſmall and fine, ſo far as the microſcope can trace it; but this is not ſo far as might be wiſhed; for the *Membrane* ſtill divides itſelf in its progreſs into more and more ramifications, and where it envelopes only a ſingle fibre, is not to be diſtinguiſhed with any degree of preciſion, even with the beſt microſcopes. The ſmall veſſels extended through this *Membrane*, are doubtleſs intended to convey nouriſhment to it; but it is very certain, that the globules of blood can never paſs into ſuch ſmall canals. Phil. Tranſ. N°. 122. p. 140.

Adipoſe MEMBRANE, *Membrana Adipoſa*. It was the opinion of Boerhaave that the ſeat of the *lues venerea*, or pox, was in the *Membrana Adipoſa*. There are many ſeeming difficulties which have prevented the generality of the learned world from giving into this; but there have been ſeveral particular caſes, the ſymptoms of which ſeem to prove it really to be ſo.

Of theſe Dr. Huxam gives one, which alone may ſeem ſufficient to prove the reality of it. This is of a gentleman of about 27 years of age, and of a hot bilious conſtitution, who ſome years before his death had got a gonorrhœa, and before that was well cured, a ſecond, and after that a third; and after all theſe, had frequent impure converſations with the negro women in the Weſt Indies, who probably had that worſt ſpecies of pox, the yaws. He had, after this, a terrible itching under his ſkin, and a terrible ſtinking breath, and ſpit corrupt matter, but had no running ulcer, bubo, node, or other of the common ſymptoms of a confirmed pox; but after repeating his raſh conduct with ſome women in England, he had a Gonorrhœa of which he could not get cured; but a bubo appeared in the groin, and verrucoſe ſwellings about the anus.

One of theſe breaking diſcharged a great quantity of matter, and after that others appeared, the bubo would not ſuppurate, and ſcabs appeared in ſeveral parts of his body. He was fumigated with cinnabar, and a ſalivation propoſed; but after taking, at times, five drams of calomel, he had not the leaſt ſoreneſs of the gums, though that medicine had not purged nor vomited him. At length turbith vomits, and large doſes of mercurials, to which he had been much accuſtomed before, brought on a ſoreneſs of the mouth; but the ſpitting was tough, and did not amount to a pint a day. During this courſe the ſcaly eruptions encreaſed, and he was at length covered with them all over, and his limbs ſwelled, and even burſt in many places, the fiſſures diſcharging a ſtinking ichorous matter.

Hot baths and mercurial ointments were uſed on this, but the diſeaſe ſtill encreaſed under theſe means; the ſcales grew ſo ſtiff, that he could not move his limbs, and ulcers appeared in many parts, particularly a large tumour on each breaſt, which diſcharged vaſt quantities of an oily ſtinking matter. It was obſervable, that where theſe tumours and ulcers appeared, they only ran under the ſkin, being entirely ſeated in and feeding on the *Membrana Adipoſa*, ſo that the muſcles and tendons underneath appeared as fair and florid as in the moſt healthy conſtitution.

It was now plain, that mercury could do nothing toward a cure in any form, and the old method of ſweating was attempted with warm baths, to looſen the ſcales; by this means they came off apace in the manner of thoſe of the confluent ſmall pox, but larger, ſome of theſe being four or five inches over. In a week's time, the coat of mail was cleared off,

off, and his breath became ſweet; but the ulcers ſtill diſcharged great quantities, and notwithſtanding all that had been done, two large ſhankers appeared on the glans, and a bubo in each groin: He was alſo ſeized with a cough, and ſpit purulent and bloody matter. It was evident that the whole *Membrana Adipoſa* had been conſumed from the external part of the body, and the diſeaſe now began to ſeize on that part of it which inveſted the more vital parts; but nature could ſupport it no longer, and he died in the moſt extreme degree of a pocky conſumption. It is obſervable, that not one bone in the whole body appeared to be touched, though he died with more than forty ulcers upon him. Phil. Tranſ. N°. 460. p. 671.

MEMBRANACEOUS *Leaf*, among botaniſts. See the article LEAF.

MEMBRAS, in ichthyology, a name given by Rondeletius, Aldrovand, and ſeveral other writers, to the *halec* or herring. See the articles HALEC and CLUPEA.

MEMIREN, in the materia medica, the name by which Serapion and ſome other authors have called the pilewort, or ſmall celandine. *Ger.* Emac. Ind. 2.

MEMITHA, in the materia medica of the antients, the name of a plant which ſome have ſuppoſed to be our cerinthe, but others the glaucium, or yellow-horned poppy.

MEMORY (*Gycl.*)—Many have been the attempts, in all ages, to aſſiſt the *Memory*. Some have had recourſe to medicine, ſuch as Horſtius [a], Marſilius Ficinus [b], Johnſton [c], and others. That good health, a good digeſtion, and a mind free from care, are helps in this reſpect, is an old obſervation [d]. That attention, application, frequent recapitulation, are neceſſary, is known to every one. But whether, beſides natural health and parts, and the exerciſe of our faculties, art may not give a farther aſſiſtance to *Memory*, has been a queſtion. Simonides is ſaid to be the firſt who found out the art of *Memory* [e]. His method was by a choice of *places* and *images*, as a repoſitory of ideas; ſuch, for inſtance, as a large houſe divided into ſeveral apartments, rooms, cloſets, *&c.* All theſe, and their order, were to be rendered extremely familiar to the imagination and *Memory*. Then, whatever was to be remembered, was by ſome ſymbolical repreſentation or another, as an anchor for navigation, to be connected with ſome part of the houſe, or other artificial repoſitory, in a regular manner. Cicero [f] and Quinctilian [g] give us ſome account of this method, and ſpeak of it with reſpect. Several moderns have attempted improvements of artificial *Memory*. There was a collection of various treatiſes of this kind publiſhed at *Leipzig* [h]; this and Bruxius's Simonides Redivivus [i] are commended by Morhof [k]. Paſchius gives us ſome account alſo of ſeveral authors who have treated of this art [l]. It is certainly of uſe in hiſtory and chronology. The chief artifice, in this reſpect, is to form an artificial word, the letters of which ſhall ſignify numbers. Hence a date or æra may more eaſily be recapitulated and remembred than without ſuch a contrivance. This invention is mentioned as a ſecret known to few, by Paſchius [m]. It has been proſecuted lately in England [n], by Dr. Grey.—[[a] De Sanitat. Studioſor. lib. 2. c. 1. [b] De Vita, lib. 1. c. 25. [c] *Johnſton*, Idea Medicin. Practic. lib. 8. c. 4. Vid. *Paſch.* de Nov. Invent. p. 134. [d] *Quinctil.* Inſt. Orat. p. 992. [e] *Quinct.* lib. cit. p. 985. [f] Ad Herenn. lib. 3. [g] Lib. cit. [h] Variorum de Arte Memoriæ Tractatus, Lipſ. 1678. 8°. [i] Polyhiſtor. lib. 1. p. 374, 375. [k] *Adami Bruxii*, Simonides Redivivus, ſeu Ars Memoriæ & Oblivionis. Lipſ. 1640. in 4°. [l] Lib. cit. p. 133—140. [m] Lib. cit. p. 140. *Numerus per certas literas, verbo memoriali comprehenſas, exprimitur.* [n] Vid. *Memoria Technica*, or a New Method of Artificial Memory, *&c.* Lond. 1730. 8°. alſo *Lowe*'s Mnemonics.]

The method is this: To remember any thing in hiſtory, chronology, geography, *&c.* a word is formed, the beginning whereof being the firſt ſyllable or ſyllables of the thing to be remembred, does, by frequent repetition, of courſe draw after it the latter parts, which is ſo contrived as to give the anſwer. Thus in hiſtory, the deluge happened in the year before Chriſt 2348. This may be ſignified by the word Dél-*étok*; Del ſtanding for deluge, and *etok* for 2348. How theſe words come to ſignify theſe things, or contribute to the remembring them, is now to be ſhewn.

The firſt thing to be done, is to learn exactly the following ſeries of vowels and conſonants, which are to repreſent the numerical figures, ſo as to be able at pleaſure to form a technical word, which ſhall ſtand for any number, or to reſolve a word already formed into the number it ſtands for.

a	*e*	*i*	*o*	*u*	*au*	*oi*	*ei*	*ou*	*y*
1	2	3	4	5	6	7	8	9	0
b	*d*	*t*	*f*	*l*	*s*	*p*	*k*	*n*	*z*

Here *a* and *b* ſtand for 1, *e* and *d* for 2, *i* and *t* for 3, and ſo on. Theſe letters are aſſigned arbitrarily to the reſpective figures, and may very eaſily be remembred. The firſt five vowels in order naturally repreſent 1, 2, 3, 4, 5. The diphthong *au* being compoſed of *a*, 1, and *u*, 5, ſtands for 6; *oi* for 7, being compoſed of *o*, 4 and *i*, 3; *ou* for 9, being compoſed of *o*, 4 and *u*, 5: The diphthong *ei* will eaſily be remembered for 8, being the initials of the word. In like manner for the conſonants, where the initials could conveniently be retained, they are made uſe of to ſignify the number, as *t* for 3, *f* for 4, *s* for 6, and *n* for nine. The reſt were aſſigned without any particular reaſon, unleſs that poſſibly *p* may be more eaſily remembred for 7 or *ſeptem*, *k* for 8, or ὀκτω, *d* for 2, or *duo*; *b* for 1, as being the firſt conſonant, and *l* for 5, being the Roman letter for 50, than any others that could have been put in their places. Memor. Techn. p. 2, 3. 'Tis farther to be obſerved, that *z* and *y* being made uſe of to repreſent the cypher, where many cyphers meet together, as 1000, 1000000, *&c.* inſtead of a repetition of *azyzyzy*, *&c.* let *g* ſtand for 100, *th* for a thouſand, and *m* for a million. Thus *ag* will be 100, *ig* 300; *oug* 900, *&c.* *ath* 1000, *am* 1000000, *loum* 59000000, *&c.* Ib. p. 5.

Fractions may be ſet down in the following manner: Let *r* ſignify the line ſeparating the numerator and denominator, the firſt coming *before*, the other *after* it; as *iro* $\frac{3}{4}$, *urp* $\frac{5}{7}$, *pourag* $\frac{79}{100}$, *&c.* When the numerator is 1 or unit, it need not be expreſſed, but begin the fraction with *r*; as *re* $\frac{1}{2}$, *ri* $\frac{1}{3}$, *ro* $\frac{1}{4}$, *&c.* So in decimals, *rag* $\frac{1}{100}$, *rath* $\frac{1}{1000}$. Ibid.

This is the principal part of the method, which conſiſts in expreſſing numbers by artificial words. The application to hiſtory and chronology is alſo performed by artificial words. The art herein conſiſts in making ſuch a change in the ending of the name of a place, perſon, planet, coin, *&c.* without altering the beginning of it, as ſhall readily ſuggeſt the thing ſought, at the ſame time that the beginning of the word, being preſerved, ſhall be a leading or prompting ſyllable to the ending of it ſo changed. Thus, in order to remember the years in which Cyrus, Alexander, and Julius Cæſar, founded their reſpective monarchies, the following words may be formed; for Cyrus, Cyr*uts*; for Alexander, Alex*ita*; for Julius Cæſar, Juli*os*. *Uts* ſignifies, according to the powers aſſigned to the letters before mentioned, 536; *ita* is 331, and *os* is 46. Hence it will be eaſy to remember, that the empire of Cyrus was founded 536 years before Chriſt, that of Alexander 331, and that of Julius Cæſar 46. Mem. Techn. Introd. p. viii and ix.

For the farther application of this method, we refer to the ingenious author of the laſt cited book. We ſhall only add, that *technical verſes* contribute much to the aſſiſtance of the *Memory*, both as they generally contain a great deal in a little compaſs, and alſo becauſe, being once learned, they are ſeldom or never forgot. The author before quoted has given us ſeveral ſpecimens of ſuch verſes in hiſtory, chronology, geography, and aſtronomy, as alſo the Jewiſh, Grecian and Roman coins, weights and meaſures, *&c.* He adviſes his reader to form the words and verſes for his own uſe himſelf; as he perhaps will better remember them than thoſe formed by the author. Lib. citat. Introduct. p. xi.

It was a practice among the Jews not only to abbreviate ſentences and names of many words, by putting together the initial letters of thoſe words, and making out of them an artificial word to expreſs the whole, as *Rambam* for *Rabbi Moſes ben Maimon*; but they alſo made uſe of natural words to repreſent numbers, when they could meet with ſuch as happened to anſwer the number which they wanted to expreſs [a]. It is to obſervations of this kind the author laſt quoted ſeems to ſay he owed the firſt hints of his method [b].—[[a] Mem. Tech. Introd. p. xv, xvi. [b] Lib. cit. p. xvii.]

As to Simonides's method, Quinctilian ſays he will not deny it to be of ſome uſe; for inſtance, in repeating a multitude of words in the order they occur, and in things of this nature: But he thinks it of leſs uſe in getting by heart a continued oration, and in this reſpect rather an incumbrance [a]. He himſelf adviſes, if the ſpeech to be remembred be long, to get it by heart in parts, and thoſe not very ſmall. The partition ought chiefly to be made according to the different topics. He thinks it beſt to get things by heart tacitly, and if, the better to fix the attention, the words be pronounced, yet it ſhould be in a low voice. Apt diviſions help the *Memory* greatly. But after all, the great art of *Memory* is exerciſe: To get many things by heart, and daily, if poſſible. Nothing increaſes more by uſe, or ſuffers more by neglect, than the *Memory*. At whatever age a man aims at the improvement of this faculty, he ſhould patiently ſubmit to the uneaſy labour of repeating what he has read or written. Here, as in other caſes, where habits are to be acquired, exerciſe ſhould be increaſed by degrees [b].—[[a] *Nonne impediri eorum, quæ dicit, decurſum neceſſe eſt duplici memoriæ cura? Nam quomodo poterunt copulata fluere, ſi propter ſingula verba ad ſingulas formas reſpiciendum erit.* *Quinct.* Inſt. Orat. Lib. xi. c. 2. p. 989. [b] *Quinct.* loc. cit. p. 993. ſeq.]

Lord Bacon enumerates ſeveral helps to *Memory*, as order, artificial place, verſe, whatever brings an intellectual thing to ſtrike the ſenſes, and thoſe things which make an impreſſion by means of a ſtrong paſſion, as fear, ſurprize, *&c.* Thoſe things alſo ſink deepeſt, and dwell longeſt in the *Memory*, which are impreſſed upon a clear mind unprejudiced either before or after the impreſſion; as the things we learn in childhood, or think of juſt before going to ſleep; as likewiſe the firſt times things are taken notice of.

A multitude of circumſtances alſo, or, as it were, handles or holds to be taken, help the *Memory*; as the making many breaks in writing, reading or repeating aloud: But as to this laſt, ſee Quinctilian's opinion before mentioned. Thoſe things which are expected, and raiſe the attention, ſtick better than ſuch as paſs ſlightly over the mind; whence if a man reads any writing twenty times over, he will not remember it ſo well, as if he read it but ten times; with trying between whiles to repeat it, and conſulting the copy where his *Memory* failed. *Bacon*'s Works abrid. vol. 2. p. 475. See alſo vol. 1. p. 135, 136. vol. 3. p. 176. and the article MNEMONIC *Tables*.

Weakneſs of the MEMORY, in many caſes, is to be conſidered as a diſeaſe, and is looked on in that light by the medical writers, who have preſcribed various remedies for it. The principal cauſes of this debility, are a too frequent and conſtrained uſe, or rather abuſe of it, in the getting by rote numbers of words and ſyllables, particularly in the learning different languages; a paralytic affection in the head; violent external injuries in the ſame part; violent pains in the head, attended with deliriums, or attending a phrenitis. And to theſe are to be added drunkenneſs, and an abuſe of venery.

Prognoſtics. All debilities of *Memory* are cured with great difficulty by medicines alone; and indeed this complaint is ſeldom removed, unleſs the whole frame of mind and courſe of life be altered; all paſſions avoided, and exceſs of every kind left off. But of all other kinds, that debility of *Memory* which proceeds from a paralytic diſorder of the head, particularly when that diſorder affects the tongue, is found to be the moſt obſtinate and difficult of cure. Much ſleep, or exceſſive waking, are equally hurtful to the *Memory*, and frequently bring on an almoſt total loſs of it.

Method of treatment. All ſuch medicines as are of an agreeable taſte or odour, are generally ſuppoſed to be of ſervice in ſtrengthening the *Memory*; and lignum aloes, ambergriſe, and ſome other of the ſcented drugs, have been known to do great good. The aromatic, volatile, and ſpirituous medicines, alſo all help in this caſe, if taken in ſmall doſes, and continued for a long time together. The analeptics and nervine medicines are alſo greatly recommended, but they are ſeldom found of uſe; for among people afflicted with a debility of *Memory*, many are thoſe of robuſt conſtitutions and ſtrong appetites, who eat already more than nature requires, and have therefore very little uſe for analeptics or nutritive things.

Bleedings in ſmall quantities frequently repeated, in caſes where there is no contrary indication, frequently prove of great ſervice in this caſe; but the *primæ viæ* are firſt to be cleanſed before ſuch a courſe is entered upon. Many greatly recommend bags of aromatics to the head, to be conſtantly worn in caps; but it is much to be feared theſe can have but very little effect. *Junck*. Conſp. Med. p. 682.

MEN *allegro*, in the Italian muſic, is uſed to denote a movement not ſo briſk and lively as *allegro*. See the article ALLEGRO.

MEN *forte*, in the Italian muſic, intimates that the part to which it is added ought to be played or ſung not ſo ſtrong or ſo loud as the reſt.

MEN *preſto*, in the Italian muſic, ſignifies leſs quick. See the article PRESTO.

MENALD *deer*, a ſpecies of the common fallow deer, beautifully variegated. See the articles CERVUS and DEER.

MENENCHYTA, in medicine, certain compoſitions of medicinal ingredients made for injecting into the womb, in the cure of ſeveral diſeaſes of that part.

MENINGOPHYLAX, a word uſed by Celſus as the name of a chirurgical inſtrument, contrived for guarding the membranes of the brain while the bone of the cranium is raſped or cut, after the operation of the trepan.

MENING, in botany, a name given by the people of Guinea to a plant of the ricinus or palma Chriſti kind, which they uſe in medicine: They dry and powder the leaves, and then give them to be ſnuffed up the noſtrils to cure all ſorts of ſtuffings or ſtoppages in the head. Its leaves reſemble thoſe of the finch and ivy, and are hairy; whence Petiver has named it *ricinus Guineenſis hæderæ quinquefoliæ Virginianæ facie foliis hirſutis*. It is not known to grow any where in America. Phil. Tranſ. N° 232.

MENOGENIEN, in botany, a name by which ſome authors have called the pæonia, or common garden piony. *Ger*. Emac. Ind. 2.

MENSARII, among the Romans, officers appointed to manage the public treaſury, being ſometimes three, and ſometimes five in number. *Pitiſc*. in voc.

MENSORES, among the Romans, harbingers or officers, whoſe buſineſs it was to go and fix upon lodgings for the emperor, when he took a journey to any of the provinces. Their office was alſo to mark out encampments, and aſſign every regiment its poſt. *Danet*. in voc.

MENSORES alſo ſignified land-ſurveyors, architects, or appraiſers of houſes and public buildings. Thoſe likewiſe who diſtributed the proviſions in the army, were called *menſores frumentarii*; and ſervants who waited at table had the appellation of *Menſores*. *Pitiſc*.

MENSORES was likewiſe the title of officers among the Romans, appointed to receive the proviſions brought to the city by ſea, and to ſee them carefully laid up and preſerved in public granaries, of which there were great numbers. *Hoffm*. Lex. in voc.

MENSTRUUM (*Cycl*.) — As many more things might be done in chemiſtry than we now find practicable if we had more *Menſtruums* than are at preſent known, it muſt be a ſubject of infinite uſe in chemiſtry to diſcover new ones. To this purpoſe let it be conſidered, that in whatever way ſalts are united with other ſalts, new *Menſtruums* are produced by the mixture.

Thus if pure alkali be added to a ſolution of ſea ſalt, earthy matter is precipitated, and the ſalt afterwards obtained by criſtallization, from the clear liquor, will be a ſea ſalt much purer than before, and capable of acting on bodies in a different manner.

The ſame fixed alkali being added to the brine of nitre, makes the liquor thick and milky, and precipitates an earthy matter; after which the nitre, obtained by criſtallization, is much purer than before.

When fixed alkali is added to the brine of ſal armoniac, it lays hold of the acid of that ſalt, and ſets the volatile alkali of the compoſition free, and ſuffers it to fly off in the air, leaving only a very pure and fixed ſea ſalt at the bottom of the veſſel. If a pure volatile alkali be added to the brine of ſea ſalt, it makes the liquor thick, then purifies it, and flies off; and it does the ſame when added to a ſolution of nitre; and when added to a ſolution of ſal armoniac, it, in like manner, purifies the ſalt without altering its nature, and flys off as it was poured on. Vegetable acids produce but little alteration on being mixed with ſea ſalt, nitre, and ſal armoniac. Fermented vegetable acids, even after being purified by diſtillation, produce no great alteration when mixed with the ſame ſalts. If calcined vitriol, or alum, be mixed with nitre and diſtilled, they yield aqua fortis, which contains nothing of the acid of vitriol or alum, but is a mere ſpirit of nitre; and if mixed with ſea ſalt, and treated in the ſame manner, the produce is a ſpirit of ſalt; and if with nitre and ſea ſalt together, they make an aqua regia. So if nitre and calcined vitriol be melted together in an open fire, the acid of the nitre is diſcharged, and a kind of tartarum vitriolatum is left behind. Sea ſalt, treated in the ſame manner, leaves a ſort of Glauber's ſalt behind; and, in general, what way ſoever it be by which ſalts are joined with ſalts, new ſaline productions, and new *Menſtruums* will ariſe; whence the art of chemiſtry may be perpetually improved, and new *Menſtruums* will give new phænomena on different bodies. New *Memſtruums* of particular virtues, may alſo be made by variouſly combining the known *Menſtruums* together; and this may be done by an almoſt infinite variety of ways; much may be alſo done by reducing every known *Menſtruum* to its utmoſt degree of purity. And, laſtly, by reducing ſome of them into the minuteſt particles, they can be reduced to, whether by art or nature; for upon theſe three particulars the extraordinary ſkill of the chief chemiſts ſeems principally to depend. For inſtance, ſuppoſe an extremely pure, ſtrong, and ſubtle fermented vegetable acid was wanting: Take fine verdegreeſe prepared from copper corroded by the ſubtile vapour of a fermenting acid; add to it twenty times its weight of the ſtrongeſt diſtilled vinegar that can be made; digeſt them together till the verdigreeſe is thoroughly diſſolved, and the whole become a deep green liquor; purify this by filtration, and inſpiſſate it over a gentle fire to a pellicle; ſet it in a quiet place, where it will ſhoot into cryſtals like emeralds, conſiſting of an acid vinegar and diſſolved copper; pour off the liquor, collect the cryſtals, and evaporate as before; and by this means collect all the cryſtals that can be obtained; then dry theſe, and diſtil them in a retort, and the produce will be a moſt pure and ſtrong vegetable acid, not in the leaſt partaking of the nature of copper. But this experiment will not ſucceed with lead, tin, or any other of the metals ſoluble in vinegar; for the copper attracts the acid free of its water, and again reſtores it unaltered; but the others, though they equally attract and ſeparate it, yet always yield it altered and impure. Zwelfer imagined this acid to be the alkaheſt, or univerſal diſſolvent; but Tachenius ſoon proved that it was no other than diſtilled vinegar of a much greater purity than uſual.

To ſhew that by the compounding one *Menſtruum* with another, new, and often, excellent ſalts may be produced, let it be conſidered, that the regenerated tartar, properly prepared, may be intimately united to pure alcohol, and thus produce a vegetable *Menſtruum*, compoſed by the moſt cloſe union of the moſt ſubtile vegetable particles, *viz*. alkali, acid, and ſulphur; whence the effect of ſuch a liquor cannot but be extremely great, both as a *Menſtruum* and a medicine. So again, if a pure ſtrong alkaline ſpirit be united with pure alcohol, it produces an admirable *Menſtruum* called the offa Helmontii, which intimately diſſolves diſtilled vegetable oils, and thus makes a *Menſtruum* compounded of the genuine vegetable ſulphur, and an alkali, and is perhaps one of the beſt medicines, as well as the beſt *Menſtruums* hitherto known.

In like manner pure ſpirit of nitre ſaturated with the alkaline ſpirit of ſal armoniac, makes a kind of volatile nitre, and thus affords an opportunity of examining, by experiments, whether the great things expected from a volatile nitre by the chemiſts, will be performed by it or not. Experiments of this kind are extremely worth proſecuting. It is not certain whether any *Menſtruum* will diſſolve any ſubſtance without the aſſiſtance of fire, as no experiment could ever be made in any place deſtitute of all fire; there being evidently fire in our utmoſt known degree of cold; and we all know that *Menſtruums*, of whatever kind, act greatly the better for being aſſiſted by heat.

Menſtruums can ſcarce act as ſuch, unleſs reduced to a fluid form, or at leaſt approaching thereto; this is chiefly given them by means of fire, air, water, and triture: Theſe are the four cauſes which uſually excite the latent powers of *Menſtruums*. Certain *Menſtruums* contain a cauſe within themſelves apparently capable of exciting motion, though in reality it depends upon the near approach of ſome other body. Thus if a good loadſtone be ſuſpended by a thread, and hang at reſt in a great degree of cold, it will ſeem to have no active virtue; but if iron come near it, a motion is produced in both theſe bodies, till they come together, and remain in contact; and this kind of power generates motion ſpontaneouſly, without the aſſiſtance of any fire ſenſible to us, and is not excited by motion. So likewiſe ſtrong ſpirit of nitre confined in a cloſe veſſel, yields an acid fume conſtantly playing about the ſurface of the liquor, and iſſuing out whenever the veſſel is unſtopped. So alſo the alkaline ſpirit of ſal armoniac yields a fume never obſerved to be at reſt; and the ſpirit of this ſalt, made with lime, yields a fume much more volatile and moveable: All the bodies of this kind therefore ſtrangely retain, and ſtrangely excite motion. We are always to remember alſo that air, even in the coldeſt places, has always a ſtrong vibratory motion, and therefore may often excite theſe motions in theſe bodies; as on the other hand ſolutions are often immediately performed by means of the motion peculiar to the *Menſtruum* ariſing from it; while another motion of a different kind, and proceeding from a different cauſe, would not produce the effect. Thus, for inſtance, if a fine piece of Engliſh chalk be calcined in a ſtrong fire, or even in the focus of a burning-glaſs, it will ſcarce alter its nature by this violent motion, nor again by being expoſed to a hot or cold air, either at reſt, or agitated by winds; and though if long boiled in water, or a brine of ſalt of tartar, it will not diſſolve; yet it immediately melts and diſappears when put into cold vinegar. Whence we ſee there is a very great difference between the motion excited by the reciprocal force of the ſolvent and ſolvend, and the motion excited by fire, air, water, and impulſe. The acrimony of a *Menſtruum*, with reſpect to a human body, ſo as to excite pain, corrode or conſume the parts thereof, is no ſign that ſuch a *Menſtruum* is ſuited to diſſolve other bodies, as appears from oil of vitriol, ſpirit of nitre, ſpirit of ſalt, and *aqua regia*, which though they readily conſume fleſh, yet do not conſume or diſſolve wax and ſulphur, though theſe two may be eaſily diſſolved in the body. Many bodies incapable of ſolution in certain *Menſtruums*, may be ſuited for diſſolving therein, by being previouſly diſſolved in other *Menſtruums*. Thus if common ſulphur be boiled ever ſo long in alcohol, it diſſolves no more than a ſtone in water; but if the ſulphur be firſt melted with ſalt of tartar into a duſky maſs, the alcohol will then diſſolve it; ſo alſo powdered antimony remains untouched after boiling in alcohol; but if firſt boiled to a dry maſs in an alkaline lixivium, this maſs preſently yields a golden tincture to alcohol. Some chemiſts have conceived ſo highly of this regular and ſucceſſive application of different *Menſtruums*, particularly Mr. Boyle and Mr. Homberg, that they ſay even metals may by this means be reſolved into their component running mercury and fixing ſulphur. Thus they aſſert, that if ſilver be firſt diſſolved in ſpirit of nitre, and then long digeſted with pure fixed alkali, and afterwards ſeveral times ſublimed with ſal armoniac, it will at length, by means of theſe reſuſcitating ſalts, afford a true running mercury; in which operation the acids procure an entrance for the alkalis into the ſubſtance of the metal, as the fixed alkalis procure admiſſion to the volatile ones, which elſe could not enter. Boerhaave waves diſputing upon the point, whether the metals can be thus reſolved into their running mercuries, and only affirms, that after many trials, he was never able to effect it. *Boerh.* Chem. part 1. p. 562. ſeq.

It is an error to think a *Menſtruum* cannot be too ſtrong. Oil of vitriol diluted with ſeveral times its weight of water, diſſolves iron beſt. So aqua fortis diluted works beſt in lead. And Mr. Boyle makes the like obſervation as to the ſolution of ſilver. Works Abr. vol. 1. p. 165.

Animal MENSTRUUM. There are of the animal *Menſtruums* very many both of the natural and artificial kind; the natural are blood, ſerum, gall, urine, ſaliva, rennet, whey, buttermilk, *&c.* moſt of which, being properly employed, will either produce or diſcharge colours, and might be made ſerviceable in the painting and dying trades. Thus recent urine diſcharges the common ink out of linnen, *&c.* Blood affords, by proper management, the noble Pruſſian blue; and gall is a natural yellow, well deſerving to be treated in the manner of blood in that preparation. Of the artificial kind are the ſpirit of urine produced by chemiſtry, which ſerves to produce, alter and deſtroy a vaſt number of colours. The liquors diſtilled from recent, or fermented whey, buttermilk, *&c.* might be alſo found of great value; and variouſly compounding theſe ſeveral animal ſubſtances, even by random trials, or chance experiments, new diſcoveries in colours might be made; though much more, probably, by a right reaſoning and analogy. As for inſtance, the common bones burnt to a blackneſs, being found to afford the bone black, the experiment was eaſily transferred to ivory, and ſo the ivory black was diſcovered: And ſo of the reſt. *Shaw*'s Lectures. p. 183.

MENSTRUUM *Peracutum*. Mr. Boyle gives the name of *Menſtruum peracutum* to a *Menſtruum* made by pouring on the rectified oil of butter of antimony as much ſtrong ſpirit of nitre as would ſerve to precipitate out of it all the bezoarticum minerale; and then with a ſmart fire diſtilling off the liquor which would come over, and cohobating it upon the antimonial powder. Works Abr. vol. 1. p. 260, 377.

He put ſome highly refined gold into a large proportion of this *Menſtruum peracutum*, where it diſſolved ſlowly and quietly; and he found at the bottom of the glaſs a conſiderable quantity of a white powder, which the *Menſtruum* would not touch, and which was alſo indiſſoluble in aqua regia. The ſolution of gold being abſtracted, and the gold again reduced into a body, yielded, upon a ſecond ſolution, more of the white powder. This powder he melted down into a metal, anſwering in colour, malleability, ſolubility in aqua fortis, and in bitterneſs to the taſte of that ſolution, to ſilver. Hence he infers, that notwithſtanding the ſuppoſed unchangeableneſs of gold, this experiment ſhews it to be really changeable into ſilver, or at leaſt into a new kind of metal very different from gold. And he therefore concludes, that there is no impoſſibility in the nature of the thing, that one metal ſhould be tranſmuted into another. Ibid. p. 260—262.

By diſſolving gold in this *Menſtruum peracutum*, Mr. Boyle alſo tells us, he made the gold riſe in the retort, in the top and neck of which it was found in the form of yellow and reddiſh ſublimate. Works abr. vol. 1. p. 263, 377.

We do not find that Mr. Boyle gave the name of *Menſtruum peracutum* to the *Menſtruum* he extracted from bread, as it is ſaid he did, in the Cyclopædia, under the head MENSTRUUM. See Boyle's Works Abr. vol. 1. p. 34, 49.

MENTHA, *Mint*, the name of a well known genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind; the upper lip is arched, and the lower is divided into three ſegments; and the whole is ſo diſpoſed, that at firſt ſight the flower appears a four-leav'd one, or at leaſt one regularly divided into four ſegments. The piſtil ariſes from the cup, and is fixed in the manner of a nail into the hinder part of the flower, and ſurrounded with four embryos which afterwards become ſo many ſeeds, and are contained in the cup of the flower.

The ſpecies of *Mint*, enumerated by Mr. Tournefort, are theſe: 1. The common round-leav'd wild *Mint*. 2. The purple-flower'd round-leav'd wild *Mint*. 3. The verticillated garden *Mint*, with the ſmell of baſil. 4. The common curled-leav'd verticillated *Mint*. 5. The round-leav'd ſpiked curled *Mint*. 6. The beautiful Daniſh or German curled *Mint*. 7. The round-leav'd ſpiked wild *Mint*. 8. The great roundiſh-leav'd marſh or Water *Mint*. 9. The great round-leav'd Marſh *Mint*, with variegated leaves. 10. The hairy verticillate field *Mint*. 11. The rounder-leav'd verticillate field *Mint*, with an aromatic ſmell. 12 The ſpiked *Mint*, with variegated leaves. 13. The narrow-leav'd ſpiked *Mint*. 14. The ſmooth narrow-leav'd wild *Mint*, with rugged leaves, and a ſtrong ſcent. 15. The long blackiſh-leav'd leſs hairy wild *Mint*. 16. The common thick ſpiked pepper *Mint*. 17. The long-leav'd horſe *Mint*. 18. The longer-leav'd water *Mint*. 19. The water *Mint*, commonly called *Pennyroyal*. 20. The common white-flowered *Pennyroyal*. 21. The water *Mint*, called by many authors *male Pennyroyal*. 22 The ſmalleſt woolly water *Mint*. 23. The ſavory-leav'd water *Mint*. *Tourn.* Inſt. p. 189. See the article MINT.

MENYANTHES, *Buckbean*, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, is funnel-ſhap'd, and divided into ſeveral ſegments at the edges. From the cup there ariſes a piſtil, which is fixed in the manner of a nail to the hinder part of the flower, and afterwards becomes a fruit or ſhelly caſe, uſually of an oblong figure, bivalve, and full of ſmall roundiſh ſeeds.

The ſpecies of this plant, enumerated by Mr. Tournefort, are theſe: 1. The broad-leav'd trifoliate marſh *Menyanthes*, called by many writers, *Trifolium paluſtre*, and by us, *Marſh Trefoil*, or *Buckbean*. 2. The narrow-leav'd trifoliate marſh *Menyanthes*. And 3. The American white-flower'd *Menyanthes*, with leaves like thoſe of the water lilly. *Tourn.* Inſt. p. 117.

The characters of *Menyanthes*, according to Linnæus, are theſe: The cup is a perianthium conſiſting of one leaf, divided into five ſegments at the end, and is placed erect, and

remains

remains after the flower is fallen. The flower conſiſts of a ſingle petal, in form of a ſhort cylindric and ſomewhat open-mouth'd tube. The rim beyond the middle is divided into five ſegments, the jags being open, obtuſe, bent backward, and covered with a woolly hairyneſs. The ſtamina are five ſhort and tapering filaments, and the antheræ are acute, bifid at the baſes, and erect. The germen of the piſtil is of a conic form; the ſtyle is cylindric, and nearly of the length of the flower; and the ſtigma is bifid and compreſſed. The fruit is an oval capſule, containing only one cell, and ſurrounded with the cup. The ſeeds are very numerous, ſmall, and of an oval figure. *Linnæi* Gen. Plant. p. 64.

MENTZELIA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium conſiſts of one leaf, divided into five expanded ſegments. Theſe are lanceolated and deciduous, and terminate in a very long germen. The flower conſiſts of five ovated petals, which ſtand expanded, and are ſomewhat longer than the ſegments of the cup. The ſtamina are numerous erect ſetaceous filaments; the antheræ are ſimple; the germen of the piſtil is of a cylindric figure, and is extremely long, and ſtands under the cup; the ſtyle is ſetaceous, and of the length of the flower; the ſtigma is ſimple; the fruit is a long capſule, of a cylindric clavated form, containing only one cell, in which there are lodged numerous ſmall and roundiſh ſeeds. *Linnæi* Gen. Plant. p. 236. *Plumier*, Gen. 6.

MERCATORUM *Feſtum*, among the Romans, a feſtival kept by the mercantile people on the ides or 15th of May, in honour of Mercury, to whom they ſacrificed a ſow; then ſprinkling themſelves with the water of a fountain called *aqua mercurii*, they prayed the god to proſper their trade. *Danet*, in voc.

MERCURIALIS, *Mercury*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the apetalous kind, conſiſting only of a number of ſtamina placed in a cup. Theſe flowers are barren, and the embryo ſeeds appear on other plants of the ſame ſpecies, which have no flowers. Theſe finally become a fruit compoſed of two capſules, containing a roundiſh ſeed.

The ſpecies of *Mercurialis* enumerated by Mr. Tournefort, are theſe: 1. The teſticulated *Mercury*, commonly called the male *Mercury*. 2. The ſpiked *Mercury*, commonly, but improperly called, the *female Mercury*; this being truly the male, and the teſticulate the female, thoſe teſticles containing the ſeeds. 3. The mountain teſticulate *Mercury*, called *Cynocrambe*, or *Dogs Mercury*. 4. The ſpiked cynocrambe, or dogs *Mercury*. 5. The ſhrubby hoary teſticulate *Mercury*, called *Phyllon*. 6. The ſpiked *Phyllon*, or ſhrub hoary *Mercury*. 7. The Portugal ſhrub almond-leav'd teſticulate *Mercury*. 8. The ſpiked almond-leav'd ſhrub ſpiked *Mercury*. 9. The round-leav'd three-mouths *Mercury*, the male and female kinds. *Tourn.* Inſt. p. 534.

Mercurialis is of an emollient nature, and eaten in the manner of ſpinach, which, when cultivated in a garden, it greatly excels. If eaten largely, it opens the bowels. A cataplaſm of the leaves is much recommended in pains of the limbs, in tumours, and even in ulcers, which it cleanſes and diſpoſes to heal. Poor people in country places uſe it as a cataplaſm for the rheumatiſm, and even for the gout, with ſucceſs. In the ſhops, it is chiefly kept as an ingredient in decoctions for glyſters.

MERCURIFICATION, in metallurgic chemiſtry, the obtaining the *Mercury* from metallic minerals in its fluid form. For the effecting this, thoſe who have been engaged in theſe reſearches have propoſed three methods. The firſt is by means of a certain mercury, ſo prepared as to have a diſſolving power, by which it could take up the mercuries of metals in the ſame manner as water diſſolves ſalt from aſhes. The ſecond is by means of certain regenerating ſalts, ſuch as ſal armoniac, which are to detain the more earthy parts of metals, and leave their mercuries ſeparate or ſeparable from them by ſublimation or otherwiſe; and the third method is by means of a large lens or burning-glaſs, in the focus whereof if any metal be applied, its mercurial part is ſaid to ſeparate and go off in fume, which when collected and condenſed, appears to be running mercury. *Shaw*'s Lectures, p. 160. The firſt of theſe methods would be very eaſy, if the proper mercury were to be readily produced; the ſecond is extremely laborious, and requires much patience and reiteration. But the third ſeems eaſy enough, and practicable to advantage, when a glaſs of three or four foot in diameter is at hand, the ſky ſerene, and the ſun ſhines ſtrong.

MERCURY (*Cycl.*) — The manner of ſeparating *Mercury* from its ore, when not ſulphureous, is this: Take a pound of the ore beat to powder; this with the aſſayer muſt ſtand for one centner; put this into a glaſs retort, coated half way to its neck, which muſt be long, and turned back with ſuch declivity, that a glaſs recipient may be applied perpendicularly to it. The retort muſt be of ſuch a ſize, that the belly of it may be filled nearly two thirds with the ore; and muſt be placed ſo that nothing of the fluid, adherent to the neck of it, may fall into the cavity of the belly, but that the whole may run forward into the recipient, which muſt be filled with cold water: This muſt be ſo placed as to receive the noſe of the retort about one half inch into the water. The joints need not be luted. *Cramer*'s Art of Aſſaying, p. 350.

Let the retort be ſurrounded with burning coals, placed at a diſtance, leſt it burſt; by degrees bring the coals nearer, and at length cloſe to the retort; add freſh charcoal, and make it ſlightly red hot. When this fire has been continued an hour, take off the recipient, firſt ſtriking the neck of the retort to throw off the looſe drops that may hang there; and in the bottom of the water you will find the *Mercury*. This proceſs may be alſo performed in a ſand heat; but the bottom of the retort muſt touch the bottom of the veſſel that contains the ſand, and that be made red hot. The *Mercury* is to be ſeparated from the water by filtration.

The ſuppoſition of a ſympathy between *Mercury* and gold has been the great baſis of the attempts of the alchemiſts of all times, toward the making gold of it. But if they mean that the common *Mercury* has this ſympathy with gold, the contrary is proved by that remarkable proceſs, in which it appears that *Mercury* will incaleſce with that metal. If they mean that *Mercury* which they call the ſeed of metals, it is hard to offer any thing in argument againſt it, this being a ſort of ideal ſubſtance which no body has yet ſeen. It is much diſputed by the alchemiſts, whether there be or be not any ſuch thing as *Mercury* that will heat or incaleſce with gold, or produce a ſenſible heat in the maſs, on being only ſimply mixed with that metal reduced to fine parts. It has been ſaid by ſome, that thoſe *Mercuries* which they call *Mercurii Corporum*; that is, ſuch as have been extracted from the compleat metals by certain proceſſes, which they keep as inviolable ſecrets, will incaleſce on the mixture with gold; and on this they build their proceſſes. But the negative part of the queſtion is more generally maintained, the famous *Mercuries* of metals being held as non-entities with them; and even the ſearchers after tranſmutation of metals have in general acknowledged, that they themſelves never ſaw any ſuch incaleſcence of *Mercury* with gold, though they had heard others ſpeak of it as a thing they had ſeen. A *Mercury*, however, was ſome years ago produced before the Royal Society, which in the hands of the preſident himſelf, on the faireſt trial, did incaleſce with that metal. Phil. Tranſ. N°. 122.

Among the ſeveral methods recommended for the fixing this fluid metal into ſolid ſilver, oil of talc, and oil of the human fæces, are the moſt ſtrongly affirmed to be the infallible mediums. The firſt of theſe which has been ſo much miſunderſtood, by reaſon of its name, as to be ſearched for in the ſtone talc, is truly an oil prepared from the flowers of zink. See the article *Oil of* TALC.

The other is required to be clear and colourleſs as water, and without any ill ſmell. Theſe were qualities ſo difficultly to be found in an oil of that fætid matter, that both the one and the other of theſe oils were looked upon by many as impracticable proceſſes. But after the firſt had been made by two or three chemiſts, Mr. Homberg at length hit upon the laſt, but without finding any the leaſt tendency to ſuch an effect in it, or any change at all produced by it on *Mercury*, after ever ſo long digeſtion, or ever ſo many proceſſes. Mem. Acad. Par. 1711.

If *Mercury* be diſſolved in aqua fortis, ſo that the ſolution be clear and total, and if whilſt it is yet warm ſome lead filings be poured in by degrees, the lead will be precipitated into a white powder, and the *Mercury* reduced to a maſs of running quick-ſilver. *Boyle*'s Works abr. vol. 1. p. 318.

Mercury may be diſſolved in vegetable acids. This is done by reducing it to a calx by a long digeſtion. A ſcruple of this calx may be diſſolved in an ounce of diſtilled vinegar, in a boiling heat. The ſolution being filtred and expoſed to the cold, will in part be changed into fine cryſtals. This calx diſſolves likewiſe in the juice of lemons, rheniſh wine, and other vegetable acids.

But a precipitate of *Mercury* made from its ſolution in aqua fortis, by means of oil of tartar *per deliquium*, and well edulcorated by boiling water, is more eaſily diſſolved in diſtilled vinegar. It may even be diſſolved cold without digeſtion. *Marggraf.* in Mem. de L'Acad. de Berlin, 1746.

Boerhaave has obſerved, 1. that quickſilver, however well purified, yields always a ſoft black powder, of a ſharp braſſy taſte, when long expoſed to violent conquaſſation, or to a degree of heat, twice as great as that of animals. 2. Heat, near as ſtrong as what is neceſſary for diſtilling quickſilver, changes the greater part of *Mercury*, if not all of it, into a heavy, ſhining, red, friable powder, of a ſharp nauſeous taſte, which long and violently diſorders the human body, and diſpoſes it to excretions. 3. The fluid quickſilver remaining after this red powder is ſeparated, is more fluid, and of leſs ſpecific weight than common *Mercury*. 4. All the black, and near the whole red powder, can be brought into the former fluid ſtate, by a more intenſe heat; and this revivified quickſilver enjoys all the properties of common *Mercury*.

The experiments on *Mercury* above-mentioned were ſent by Boerhaave to the Royal Society. He ſent an account of others to the Royal Academy of Sciences at Paris. The concluſions from theſe experiments are, that he could not change quickſilver into any other metal, and that no quickſilver was

to be got from lead or tin. See Mem. de l'Acad. Royal. des Scienc. 1734.

Mercury diſſolved by rubbing it ſtrongly with any chemical oil, or with Venice turpentine, has been given to the quantity of a ſcruple, half a dram, or two ſcruples in a day. Such pills keep ſome people's belly open, others they purge, and a gentle ptyaliſm has ſometimes been occaſioned, nay, a high ſalivation has been raiſed by them. See Medic. Eſſ. Edinb.

Dr. Dover, in his Phyſician's Legacy to his country, having recommended crude *Mercury* or quickſilver as a moſt beneficial medicine for ſeveral diſeaſes, it had for ſome time a great run at London, which occaſioned the writing a great many pamphlets for and againſt it. Dr. Cheyne alſo greatly recommends this medicine in his treatiſe, entituled, *The Rational Method of curing Diſeaſes.*

The authors of the medical eſſays of Edinburgh aſſure us, that though ſome they knew had taken an ounce or two of crude *Mercury* each morning for ſeveral weeks, yet they knew no inſtance of its encreaſing any of the ſenſible evacuations; but they have been told, that ſome who uſed it thus, had paſſed ſome of it with their urine, and that the hands of others, taking this medicine, had tinged their ſnuff-boxes, *&c.*

But we have an account of the effects of crude *Mercury* on a perſon who had the advice of his phyſician for the taking it, in a remarkable caſe recorded in the Philoſophical Tranſactions, about the time when Dr. Dover had brought it into ſuch general uſe; and as the effects of it, in this caſe, may ſerve to caution people as to the uſe of it, it may be proper to give the ſubſtance of it, which is this: A perſon had long been ſubject to great difficulty in going to ſtool, for which he at length took ſeveral ounces of crude *Mercury* at different times, but without relief. Upon the opening of the abdomen there iſſued out a great quantity of wind, before the ſtomach or guts were wounded. The ſtomach was empty, and its inner coat violently inflamed. The ſmall guts were, in many places, fouled with a black powder reſembling Æthiops mineral, and in ſeveral parts of them were found ſmall globules of quickſilver. The black powder was doubtleſs the quickſilver altered into a ſort of æthiops in the body. The colon was inflamed and diſtended, and contained ſix quarts of liquid excrement, among which was a great deal of crude *Mercury*, and of the ſame black powder. This gut alſo was inflamed on the outſide, and had formed an abſceſs where it adhered to the omentum; the other guts in contact with this part alſo ſhared this diſorder. In the lower part of the colon the coats became ſchirrous, and the paſſage was very ſmall. Some of the valves were alſo become ſchirrous, and obſtructed the paſſage, and a ſmall plumb-ſtone was found buried in the villoſe coat of this inteſtine. This had alſo formed a ſmall abſceſs, which diſcharged itſelf into the pelvis. What part of theſe ſymptoms was owing to the taking the quickſilver is eaſy ſeen, and ſuch effects may be guarded againſt for the future, by obſerving the ſtate of the patient before it is given. Philoſ. Tranſ. N°. 442. p. 295.

Chemiſts having obſerved that ſome ſimple preparations of antimony and *Mercury* had ſurprizing effects in the cure of obſtinate diſtempers, employed their art to change theſe Herculean medicines into various ſhapes, to ſeparate their noxious and uſeleſs parts, and to combine their active principles. To theſe labours are owing the butter and cinnabar of antimony, *Mercurius vitæ*, bezoard mineral, ſolar, lunar, jovial, and ſeveral other preparations, on which the moſt exorbitant encomiums have been laviſhed. But with all this care, many of theſe remained unactive, and others incorrigible, and unfit for uſe. However it is certain that theſe two minerals, properly combined, have wonderful effects. We have, in the medical eſſays of Edinburgh, a preparation of Dr. Plummers, which is much recommended from the experience of its effects. See PLUMMER's *Æthiops.*

Mercury is often uſed in anatomical preparations, eſpecially for ſuch parts that do not eaſily retain air, as the lungs, or ſpleen, and glans penis. See *Monro* in Med. Eſſ. Edinb. vol. 3. art. 10. But it is to be obſerved, that the quickſilver does conſiderable damage to the ſmall cells of the lungs and glans.

Beſide the numerous other phænomena attending this remarkable mineral, the light it gives when ſhaken in a glaſs tube, which proceeds from electricity, is not to be omitted.

If *Mercury* be encloſed in a glaſs tube, cloſe ſtopped, that tube is found, on being rubbed, to give greatly more light than when it had no *Mercury* in it. When this tube has been rubbed, after raiſing ſucceſſively its extremities, that the *Mercury* might flow from one end to the other, one ſees a light creeping in a ſerpentine manner all along the tube; that is to ſay, the *Mercury* is all luminous. The *Mercury* being made to run along the tube afterwards without rubbing it, was found to emit ſome light, though much leſs than before; this proves that the friction of the *Mercury* againſt the glaſs, in running along, does in ſome meaſure electrify the glaſs, as the rubbing it with the hand does, only it is in a much leſs degree. This is more plainly proved by laying ſome very light down near the tube, for this will be attracted by the electricity raiſed by the running of the *Mercury*, and will riſe to that part of the glaſs along which the *Mercury* runs; and it is very plain from this, that what has been long known in the world under the name of the *phoſphorus* of the barometer, is not a phoſphorus, but merely a light raiſed by electricity, the *Mercury* electrifying the tube. Phil. Tranſ. N°. 484.

If *Mercury* be put into large exhauſted tubes, and theſe afterwards rubbed to excite their electricity, it is obſerved that they give, on all ſides, rays of a very bright and very lively light.

Calcin'd MERCURY, *Mercurius Calcinatus*, a new and more expreſſive name for the preparation of *Mercury*, commonly called *precipitate per ſe.* It is made by ſetting purified quickſilver for ſeveral months in a ſand heat, in a glaſs veſſel with a broad bottom, and opening it to the air by a ſmall hole, till it is reduced to a red powder.

The quickſilver muſt have a communication with the external air, as is neceſſary to the calcining of all the metals. This opening is beſt made, not as in the common bolt-heads, but at the lower end of a ſtem, going into the body of the glaſs; that if the quickſilver riſe with the heat, it may not, by aſcending into the ſtem, be removed out of the heat that is to calcine it. *Pemberton*'s Lond. Diſp. p. 225.

Coralline MERCURY, *Mercurius Corallinus*, the name given in the London Diſpenſatory to a preparation of *Mercury*, commonly known by the name of *arcanum corallinum.* It is prepared in this manner: Pour upon the red corroſive *Mercury*, commonly called *red precipitate*, thrice its weight of rectified ſpirit of wine, digeſt them together in a gentle heat for two or three days, often ſhaking the phial, then ſet fire to the ſpirit, and continue ſtirring the powder till the ſpirit is burnt away. *Pemberton*'s Lond. Diſp. p. 227.

This operation proceeds upon the principle of ſpirit of wine dulcifying acid ſpirits.

Oil of MERCURY, the name given by the chemiſts to a preparation of *Mercury* in a fluid form, by means of a ſtrong acid. The preparation is this: Calcine *Mercury* with oil of vitriol to a dry ſnowy calx; ſuffer it to cool, then put it into a glaſs, and pour upon it an equal quantity of oil of vitriol; let this boil away almoſt to a dryneſs, carefully avoiding the poiſonous fumes; then increaſe the fire, and by degrees reduce it to a dryneſs again; which is, in this ſtate, a very difficult and tedious taſk. When the powder is dry, put the ſame quantity of oil of vitriol again to it, and proceed as before: At length it will ſcarce dry by means of ever ſo long or ſtrong a fire, but only ceaſe flowing freely, and become ſomewhat rigid like a fixed oil. It is then highly ſharp, cauſtic, and not to be touched, like the *ignis gehennæ* of Paracelſus. By this means the *Mercury* is ſo fixed with the oil of vitriol, as not to be evaporated, or fly off, by the action of a very violent fire. *Boerh.* Chem. p. 317.

By this proceſs we ſee the method of impregnating, ſaturating, and incerating metals by acids to any degree, and alſo of fixing, in a great degree, volatile *Mercury* by them; but no metal is hence to be expected, for in whatever manner *Mercury* is fixed with acids, it is always recoverable again in its priſtine ſtate, by grinding it with twice its weight of iron filings, and diſtilling in a glaſs retort, with the greateſt degree of a ſand heat. Ibid. p. 320.

Corroſive Sublimate of MERCURY. Mr. Boulduc deſcribes an eaſy manner of making corroſive ſublimate. He pours equal quantities of quickſilver and dephlegmated oil of vitriol into a retort, then draws off part of the acid, which does not incorporate with the quickſilver; the fire is continued till the white maſs of diſſolved *Mercury* is dry, when he ſpeedily mixes it with equal parts of dried ſea ſalt, and ſublimes it in the common way.

MERCURY, *Mercurialis*, in botany and medicine. See the article MERCURIALIS.

MERCURIUS *Dulcis.* *Mercurius Dulcis* in large doſes, with cinnabar of antimony, is recommended in nervous diſeaſes, palſy, hemiplegia, epilepſy, and apoplexy. Med. Eſſ. Edinb.

Mr. Dictericus gives us theſe rules for knowing whether ſublimate is ſufficiently edulcorated in making *Mercurius Dulcis.* If after rubbing the *Mercury* on gold, the gold becomes only pale, and not white, the *Mercury* is dulcified enough; or if ſweet *Mercury* becomes black when mixed with lime-water, it is fit for uſe; but if either the gold becomes white, or the *Mercury* is of a brown or yellow colour, after mixing with lime-water, it is not ſufficiently dulcified. Commerc. Norem. 1737. hebd. 29. §. 2.

MERCURIUS *Emeticus Flavus*, a name given in the late London Diſpenſatory to the mercurial preparation commonly known by the name of *turbith mineral.* *Pemberton*'s Lond. Diſp. p. 228.

MERCURIUS *Vitæ* may, according to Mr. Boyle, be moderated in its evacuating quality, by continually ſtirring it in a flat glazed earthen veſſel, over a fire, till it emits no fumes, and turns of a grey colour; and he thinks this is the *Mercurius Vitæ purgans* ſo often mentioned by Riverius. *Boyle*, Works Abr. vol. 1. p. 74.

Mr. Godfrey obſerves, that what is called *Mercurius Vitæ*, prepared of ſublimate mercury and antimony, has no *Mercury* in it, but is the reguline part of the antimony, with the acid of the ſublimate; and what remains is the *Mercury*

formed into cinnabar by the ſulphur of the antimony. Miſcel. vere Util. p. 58.

MERCY, in law, is uſed for the arbitrament of the king or judge, in puniſhing offences, not directly cenſured by law. *Blount*, *Cowel*.

MERDESENGI, in the materia medica of the Arabians, a name given by Serapio to litharge. Aviſenna calls this ſubſtance *mardac*, and it has been erroneouſly ſuppoſed from this, that *mardac* and *Merdeſengi* were not the ſame ſubſtance; but this is a falſe conjecture. See the article MARDAC.

MERDIVORÆ, the *Dung Eaters*, in natural hiſtory, the name given by authors to ſeveral flies which feed on excrements of different animals. Of theſe there are three kinds very common among us, the *coprophagos*, which is of a dun colour, with a reddiſh head, and a white ſtreak along the middle of it. The red *dung-fly*, which has ſilvery wings, a red body, and black ſhoulders. And 3. The green one, which is of a very glittering hue, and has ſilvery wings.

MERGANSER, in zoology, the name of a large water fowl, called in Engliſh, the *Gooſander*, and by ſome authors, the *Harle*. See MERGUS.

Its common weight is four pounds, its body is oblong, and its back broad and flat. Its head, and the upper part of its neck, is in the male of a fine bluiſh or greeniſh black, very bright and ſhining; the lower part of its neck is white, and the middle of the back, part of the neck and part of the wings are black, the reſt are grey; the tail is grey; all the under part of the body is of a faint aſh-colour. The beak is near four inches long, hooked and pointed at the end, and ſerrated, and is part black and part red. The feet and legs are red; the three fore toes are joined by a membrane, but the hinder one looſe, yet that is encreaſed in breadth by a ſmall membrane. Its head feathers ſtand looſe, and make the head look larger than it is; but it has not, properly ſpeaking, the creſt which many of the birds of the ſame genus have. *Ray*, Ornithol. p. 253.

This is the figure of the male *Merganſer*; the female differs ſo much from this, as to be not only eſteemed a different bird by the common people, but even deſcribed as ſuch by authors. It is called by our people the *Dundiver*, or *Sparling Fowl*, and by authors, *mergus cirratus longiroſter*, the long-beak'd creſted diver. The great difference, however, is, that the female is of a ſomewhat reddiſh brown on the head, and has a creſt. See the article DUNDIVER.

MERETRIX, among the Romans. The *Meretrices* were the better ſort of curtezans, and differed much from the *proſtibulæ*, or common proſtitutes, who had bills or inſcriptions, *tituli*, over their doors, and were ready at all times to entertain their cuſtomers; whereas the *Meretrices* entertained none but at night.

The *Meretrices* were diſtinguiſhed from the matrons by their dreſs, being obliged to wear the *toga* and ſhort tunics, like thoſe of the men; whereas the matrons wore the *ſtola*, which was a garment that reached down to their feet, as did likewiſe their *palla*, or outer robe. *Pitiſc.*

MERGEN, a word uſed by ſome of the chemical writers to expreſs coral.

MERGUS, in the Linnæan ſyſtem of zoology, the name of a diſtinct genus of birds, of the order of the anſeres. The diſtinguiſhing characteriſtic of this genus is, that the beak is ſomewhat cylindric, and has a crooked point. *Linnæi* Syſt. Natur. p. 46.

The characters of this genus, according to Mr. Ray, are theſe: The feet are webbed, the three fore toes being connected by a membrane, but the hinder toe is left looſe. The beak is narrow, hooked at the end, and ſerrated.

Of this genus are the *merganſer*, or gooſander, the female of which ſpecies is called the *dundiver*. 2. The *albellus* of Aldrovand. 3. The *ſerula* of the Venetians. Which ſee under their ſeveral heads. And laſtly, the *Mergus Rhein*; commonly called ſimply by the name *Mergus*. *Ray*'s Ornithol. p. 254.

This laſt is of the ſize of a duck, and ſomewhat reſembles that bird in ſhape. It is all over very beautifully variegated with black and white. Its beak is black; and its belly is variegated with grey, with the black inſtead of white. Its tail is black; its legs brown, and the membrane of its feet black. Notwithſtanding that this ſeems deſcribed as a different ſpecies by authors, there is much room to ſuſpect that it is the ſame with our *albellus*. *Aldrovand.* de Avib. T. 3. p. 275. *Ray*'s Ornithol. p. 254.

MERGUS *Albellus Dictus*, in zoology, the name of the common *Mergus*, called *Mergus cirratus major*, the greater creſted diver, and *Mergus Rhein*, the diver of the Rhine, and commonly known in England by the name of the *ſmew*.

Its common weight is a pound and a half, and its beak is an inch and half in length. Its head and neck are white, except that it has a large black ſpot ending in a point, and ſurrounding the bottom of that tuft of feathers which hang from the back part of the head, and are what authors call the *cirrus* or *creſt*; and another oblong black ſtreak which runs from the angles of the beak to the eyes. Its throat, breaſt, and belly, are all ſnow white, and its back all over of a fine deep black; but its ſhoulder feathers, which are long and hang over the back, in part on each ſide, are white. Near the joining of the wings to the back, there are two or three arched black lines; and on the lower part of the neck there is another line, making a ſort of ring of the ſame colour. The wing feathers are partly black, partly white. Its beak is of a lead-colour'd grey, large at the baſe, and tapering to a ſharp hooked point. In the female the head is reddiſh, the throat is white; but there is a ſort of circle of a browniſh colour on the breaſt. Its upper part alſo is almoſt all grey, and it has no creſt. It feeds on fiſh, and is very common on our coaſts. *Ray*'s Ornithol. p. 254.

MERGUS *Cirratus Minor*, in zoology, a name by which Geſner calls the *capo negro*, a ſpecies of duck, called in Engliſh, the tufted duck, from its having a tuft of feathers, of an inch and half in length, hanging from the back of its head. *Geſner*, de Avib.

MERIDIONAL (*Cycl.*)—MERIDIONAL *Parts*. To find the *Meridional Parts* to any ſpheroid, with the ſame exactneſs as in a ſphere.

Let the ſemi-diameter of the equator be to the diſtance of the focus of the generating ellipſe from the center as m to 1. Let A repreſent the latitude for which the *meridional* parts are required, s the ſine of this latitude, the radius being unit; find the ark B, whoſe ſine is $\frac{s}{m}$; take the logarithmic tangent of half the complement of B from the common tables; ſubtract this logarithmic tangent from 10.0000000, or the logarithmic tangent of 45°; multiply the remainder by $\frac{7915.7044678978}{m}$, &c. and the product ſubtracted from the *meridional* parts in the ſphere, computed in the uſual manner for the latitude A, will give the *meridional* parts expreſſed in minutes for the ſame latitude in the ſpheroid, provided it be oblate.

Example: If $mm : 1 :: 1000 : 22$, then the greateſt difference of the *meridional* parts in the ſphere and ſpheroid is 76.0929 minutes: In other caſes it is found by multiplying the remainder above-mentioned by 1174.078.

When the ſpheroid is oblong, the difference of the *meridional* parts in the ſphere and ſpheroid, for the ſame latitude, is then determined by a circular ark. Phil. Tranſ. N. 461. Sect. 14. See alſo *Maclaurin*'s Fluxions, art. 895—899.

Mr. Murdoch has ſolved this problem by infinite ſeries, and has computed a table of *meridional* parts for an oblate ſpheroid, ſuch as is mentioned in the foregoing example. See his Treat. intituled, *Mercator*'s *Sailing applied to the true Figure of the Earth*, Lond. 1741. 4°.

MERIS, in muſic, an appellation given by Mr. Sauveur to the forty third part of an octave. See Mem. Acad. Scienc. 1701. The word is Greek, μερις, a part.

MERLANGUS, in ichthyography, a name given by Bellonius, and ſome other authors, to a ſmall ſpecies of whiting or *aſellus mollis*, called by the Venetians, *mollo*, and by ſome other nations, the *capelon*. *Willughby*'s Hiſt. Piſc. p. 171. See the article MOLLO.

MERLANUS, a name given by ſome writers in ichthyography to the common whiting or *aſellus mollis ſive albus*. *Rondelet.* de Piſc. p. 97. See the article WHITING.

MERLUCIUS, in zoology, the name of a fiſh commonly called the *hake*, and by ſome authors the *aſellus alter*.

It is a moderately large fiſh, growing to two foot or more in in length, and reſembling the common pike in figure, from whence it has its name, *Merlucius*, *quaſi maris lucius*, the ſea pike. It in ſome meaſure reſembles the common whiting in colour, the back being of a pale greyiſh hue, and the belly white. It is covered with ſmall ſcales. Its head is broad and flat, and its mouth very wide, as in the freſh water pike. The jaws are both, but eſpecially the lower, armed with long ſharp teeth, with others ſmaller and ſhorter between them. The eyes are large, and their iris of a fine yellow. It has two fins on the back, the firſt near the head, the other not far diſtant from it, and ſo long as to reach nearly to the tail. Its gill-fins are narrow, and its belly-fins are placed very high. Its tail is not forked. It is caught in the Engliſh and other ſeas, and is a valuable fiſh for the table. *Ray*'s Ichthyogr. p. 174.

MEROPS, in zoology, the name of a bird called alſo *apiaſter*, and in Engliſh the *bee-eater*.

It reſembles the king-fiſher in ſhape, and is of the ſize of a black-bird. Its beak is long, black, and a little crooked, and the iriſes of its eyes of a fine red. Its head is long and large. The feathers growing at the inſertion of the upper chap are of a bluiſh green; but thoſe on the middle of the head are white; the crown, however, a little backwarder is of a reddiſh brown, ſometimes with a ſlight admixture of green; and there runs on each ſide a black line from the angle of the beak through the orbit of the eyes; its neck and ſhoulders are green, but with a caſt of redneſs; and its belly and breaſt are blue. The tips of the long wing feathers are blackiſh, and the reſt are variegated with a bright green and a fine orange colour. Its tail is of a fine blue, and the two middle feathers of it are longer than any of the others. Its legs are very ſhort and thick, and are of the ſame form with the

the kingfiſher's. It is very common in Italy, and extremely ſo in the iſland of Crete; but is not known in England. It feeds on bees and other inſects, and ſometimes on ſeeds. See Tab. of Bird, N°. 17. *Ray*'s Ornithol. p. 102.

MEROS, in zoology, the name of a very large American fiſh, growing to five or ſix feet long, and called by the Braſilians, *cugupu-guacu*. Its head is very large, and its mouth wide and toothleſs. Its eyes have a black pupil and a yellow iris. It has five fins, one running the whole length of the back, and reaching nearly to the tail; the anterior part of this is narrow, and armed with ſmall but ſharp ſpines; the other part is broader, and ſuſtained by ſofter rays. Behind the anus is one like the hinder part of that on the back, and two others behind the gills, which are large and broad. The tail fin is very large and broad, and much more ſo at its extremity than at its origin. Its ſcales are ſmall. Its head, back, and ſides, are of a browniſh grey, and its belly white. It is accounted a well taſted fiſh. See Tab. of Fiſhes, N°. 53. *Ray*'s Ichthyography, p. 303.

MERULA, in ornithology, the name of the black-bird, a bird of the turdus or thruſh kind, of which there are ſeveral ſpecies. 1. The common kind, well known in our hedges. 2. The kind called the *paſſer ſolitarius*, or ſolitary ſparrow. See PASSER. 3. The *Cæruleus*, of which there are two kinds. See CÆRULEUS. 5. The Braſilian *Black-bird*, remarkable for the ſhortneſs and crookedneſs of its beak, and for its remarkably beautiful colours. Its tail and wings are black, and the reſt of its body of a fine beautiful deep red. Its legs and feet are black, or of a browniſh grey. Its wing feathers alſo have ſome ſlight variegations of red. 6. The *Merula Roſea*, or roſe-coloured black bird; this is ſmaller than the common kind, and its back, breaſt and wings are of a pale red or damaſk roſe-colour. Its wings and tail black. 7. The red-breaſted Indian *Black-bird*, called by the Braſilians *jacapu*. See JACAPU. 8. The *Merula Torquata*, or ring amzell. See AMZELL. Beſide theſe there is the *Merula Montana*, or common amzell: And the *Merula Bicolor*: And two other birds, called *Merula Congeneres* deſcribed by Aldrovandus, but not now known. See Tab. of Birds, N°. 29, 30. and *Ray*'s Ornithol. p. 140.

MERULA, in ichthyology, the name of a ſea fiſh of the turdus or wraſſe kind, of a ſhort and flat figure, and all over of a dull and dead bluiſh black. The back, ſides, and belly, are all of this colour, as are alſo even the fins and tail. It is a fiſh not much eſteemed, being of an inſipid watery taſte, but is ſold among the poorer ſort in the Italian markets. *Rondelet*. de Piſc. L. 6. c. 5. p. 172.

MERULA *Aquatica*, the name of a bird, called the *water ouzel* in Engliſh.

It is about the ſize of the common black-bird, but has a ſhorter body, and a thicker neck. Its beak is ſtrait, ſharp, and black, and its head, and the upper part of its neck, are of a browniſh black. Its back and wings are variegated with black and grey; its throat and breaſt are of a ſnow white; but the belly toward the tail is black; its tail is ſhort, and it is very thick feathered, as are in general all the water birds. It frequents waters, and is very common in many parts of Germany, nor much leſs ſo in the northern counties of England. It feeds on fiſh, and ſometimes on inſects, and though not a web-footed fowl, will ſometimes dive under water after its prey. *Ray*'s Ornithol. p. 104.

MERULA *Fluviatilis*, in ichthyology, a name given by Schoneveldt, and ſome other writers, to the common tench. Theſe are whimſical and arbitrary names, and expreſs nothing. Artedi has much better diſtinguiſhed the fiſh, having taken away even its generical name, and reduced it to the *cyprini*, of which genus it is evidently a ſpecies: He has called it the *black mucous cyprinus*, with an even, not forked or invected tail. This is a name by which it can never be miſtaken. *Artedi* Gen. Piſ.

MERULA *Saxatilis*, a name given by ſome to the *tordo marino*. See the article TORDO *Marino*.

MERZENIUS, in botany, a name uſed by ſome authors for marjoram. *Ger*. Emac. Ind. 2.

MES-AIR, in the manege, is a manege half *terra a terra*, and half corvet. See the articles TERRA *a Terra*, and CORVET, *Cycl.*

MESANGIA, in natural hiſtory, the name of a bird common in France and Italy; it is of the ſize and ſhape of the ficedula, and differs from it in very little, except the having a black ſpot upon the head. This ſeems to be the *melancoryphos* of the antients, who ſuppoſed, as many do at this time, that the ficedula changed into this bird. The ficedula, or fig-eater, comes into the gardens in France only at the time when the figs, which are its proper food, are ripe: Theſe it devours in an inſatiable manner, and as ſoon as it has done with them, goes away again. Soon after this the *Meſangia* or black cap appears, and is ſuppoſed to be the ſame bird, with the addition of this beautiful ornament. The antients were very fond of this imaginary change of one bird into another; and Ariſtotle tells us that the upupa is the ſame bird with the cuckow, only changed in the colour and diſpoſition of its feathers. Æſchylus tells us in the ſame manner, according to the opinion of his times, that the cuckow ſings all the ſummer, and after that diſappears; and that ſoon afterwards it comes again in a new form, with a plume upon its head, and is called the *upupa*.

MESAZONTES, Μεσαζοντες, officers under the emperors of Conſtantinople. See the article MEDIATOR.

MESE, in the Greek muſic, was the ultimate note of the meſon tetrachord, and anſwers to Guido's *a la mi re*. *Wallis*, Append. *Ptolem*. Harm. p. 157. See the article DIAGRAM.

MESEMBRYANTHEMUM, in botany, the name by which Dillenius, Linnæus, and others, have called the plants uſually named *Ficoides*. *Linnæi* Gen. Pl. p. 250.

MESENTERICA *Febris*, a name given by ſome authors to a peculiar kind of acute fever, called by our Sydenham, *nova febris* in a peculiar treatiſe; and by Heiſter more properly the ſtomachic or inteſtinal fever. See the article INTESTINALIS *Febris*.

MESERA, a name given by ſome medicinal writers to the Alexandrian tutty.

MESENTERIC (*Cycl.*)—MESENTERIC or MESERAIC *Arteries*. Ruyſch [a] painted the *meſeraic* arteries and veins as having different courſes in the diſtribution of their branches in the inteſtines. Albinus [b] attributes this miſtake to Ruyſch's having injected the arteries at one part of the inteſtines, and the veins at another; and by a figure repreſenting the internal cellular membrane of the ilium, with both arteries and veins injected, ſhews their courſes to be the ſame.—[a Adv. Dec. 3. Tab. 1. fig. 4, 5, 6, 7. b Diſſert. de Arter. & Ven. Inteſtin. ap Med. Eſſ. Edinb.] See the article MESENTERIC, *Cycl.*

MESIRE, a name given by Aviſenna to a diſtemperature of the liver, attended with a ſenſe of heavineſs, tumour, inflammation, and pungent pain, and always with thirſt, a dry mouth, and a parched black tongue.

MESITICUM, among the Romans, a toll paid for a place to ſell goods in the forum. *Pitiſc*. in voc.

MESMARCHURES, in the manege. See the article PASTERN.

MESOCHORUS, Μεσοχορος, among the antients. The *meſochori* were muſicians who preſided in concerts, and by beating a deſk in a regular manner with their feet, directed the meaſure of the muſic. For this purpoſe in the theatre they wore wooden clogs on their feet, that they might be better heard, which were called by the Greeks, *Crupezia*. *Hofm*. Lex. in voc.

MESOCHORUS, among the Romans, was alſo uſed for a perſon in public aſſemblies, appointed to give the ſignal for acclamation at the proper time, that all might join in it at once. *Pitiſc*. in voc. See the article ACCLAMATION.

MESOCUROS, Μεσοκυρος, in antiquity, an actreſs in tragedies who had the middle part of her head ſhaven: But others think that *Meſocuros* ſignifies a girl, or very young woman. *Hofm*. in voc.

MESOGLOSSI, a name given by ſome writers to the muſcles of the tongue, more uſually called by anatomiſts, the *Genioglooſſi*.

MESOPYCNI, Μεσοπυκνοι, in the antient muſic, was an appellation given to ſuch chords as formed the middle notes of the ſpiſſa. There were five *Meſopycni* in the ſcale. See the articles PYCNI and SPISSUM.

MESORO, in ichthyology, a name given by Salvian to that fiſh which we call the butterfly-fiſh, the blennus or belennius of other authors. It is diſtinguiſhed by Artedi by the name of the *blennus*, with a furrow between the eyes, and a large ſpot in the back fin. Salvian has taken his name from the common appellation of this fiſh among the Italian fiſhermen. See the article BLENNUS.

MESORO is alſo uſed by the Italians for the fiſh commonly called the *uranoſcope* or *ſtar-gazer*. It is a ſpecies of the trachini, and is diſtinguiſhed by Artedi under the name of the *trachinus*, with many beards on the lower jaw. *Willughby*, Hiſt. Piſc. p. 132.

MESOTHENAR, a flat and nearly triangular muſcle, lying between the firſt phalanx of the thumb and the bottom of the palm of the hand. It is inſerted by a very broad baſis in the ligament which connects the os magnum to that which ſupports the thumb. It is likewiſe inſerted along the internal or angular part of that bone of the metacarpus which ſupports the middle finger, and in the ſmall extremity of that which anſwers to the index; from thence the fibres contracting to an angle, terminate in a flat tendon of different breadths, which is inſerted in that ſide of the head of the firſt phalanx of the thumb, which is turned to the hollow of the hand, and in the neighbouring part of the baſis of the ſecond phalanx, by means of the ſecond ſeſamoide bone belonging to that joint. *Winſlow*'s Anatomy, p. 197.

MESPILEUS *Lapis*, in natural hiſtory, a name given to ſome ſpecies of the echinitæ, from their reſemblance to the ripe fruit of a medlar. This was a name given them before they were much known, and they were ſome time afterwards called, from their five lines on the ſurface, *pentexoche*.

MESPILUS, the *Medlar*, in botany, the name of a genus of trees, the characters of which are theſe: The flower is of the roſaceous kind, being compoſed of ſeveral petals arranged in a circular form, the foliaceous cup of which becomes afterwards a fruit of a roundiſh figure, coronated at the end, fleſhy,

fleſhy, ſoft, and unicapſular, containing ſeveral ſtones, each having an oblong kernel. See Tab. of Botany, Claſs 21.

The ſpecies of *Meſpilus* enumerated by Mr. Tournefort, are theſe: 1. The common wild *Medlar*, or German *Medlar*, with bay-like, not ſerrated leaves. 2. The greater bay-leav'd *Medlar*. 3. The great bay-leav'd *Medlar*, with an early-ripe, oblong, ſoft, and ſweet-taſted fruit. 4. The great bay-leav'd *Maple*, with a ſoft ſweet-taſted ſmaller fruit. 5. The *Medlar* with a middle-ſized oblong auſtere and ill-taſted fruit, with the corona always cloſed. 6. The parſley-leav'd *Meſpilus*, called the *lazerole*. 7. The double-flowered jagged apium-leav'd *Meſpilus*. 8. The *Lazerole*, with a large deep red and well-taſted fruit. 9. the *Lazerole*, with a ſmaller yellowiſh fruit. 10. The wild ſmall-fruited yellowiſh white *Lazerole*, with a turbinated fruit. 11. The Canada ſervice-leav'd *Meſpilus*. 12. The prickly *Meſpilus*, with pear-like, ſhining, and denticulated leaves, and with very beautiful red fruit. 13. The common apium-leav'd prickly *Meſpilus*, called the white thorn. 14. The common *white Thorn*, with double flowers. 15. The almond-leav'd prickly *Meſpilus*. 16. The barren wild trifoliate apium-leav'd *Meſpilus*, with very ſtrong thorns. 17. The large-fruited wild *Meſpilus*, with ſtrong prickles, and with hairy palmated apium leaves. 18. The roundiſh-leav'd *Meſpilus*, with black ſweetiſh fruit. 19. The roundiſh-leav'd *Meſpilus*, with red fruit. And 20. The American *Meſpilus*, with red fruit, and with broad leaves prickly underneath. *Tourn.* Inſt. p. 644. See the article MEDLAR.

MESSE *da Capella*, in the Italian muſic, is uſed for maſſes ſung by the grand chorus. In theſe, various fugues, double counter-points, and other ornaments, are uſed *Broſſard.*

MESSE *Concertate*, in the Italian muſic, is a maſs wherein the parts reciting are intermixed with choruſſes. *Broſſard.*

MESUA, in botany, the name of a genus of plants, the characters of which are theſe: The perianthium is permanent, and conſiſts of four ſmall oval leaves. The flower conſiſts of four large hollow and rounded petals. The ſtamina are numerous filaments, of the length of the cup. The antheræ are ſimple. The germen of the piſtil is roundiſh. The ſtyle is ſimple; and the ſtigma indented in four places. The fruit is a roundiſh, pointed, coriaceous capſule, with four longitudinal ſutures. It is compoſed of four valves, and contains four large fleſhy, obtuſe, three-corner'd, and turbinated ſeeds bedded in it. *Linnæi* Gen. Plant. p. 235. *Hort.* Mal. vol. 3. p. 53.

METACAL, an Ægyptian weight, uſed in the weighing of pearls, and conſiſting either of a carrat and a half, or of two carrats. Sixteen of theſe carrats make a dram, each of the carrats weighing four grains, and twelve drams an ounce. *Pocock*'s Ægypt. p. 175.

METACARPIUS, a ſmall very fleſhy muſcle, ſituated obliquely between the large internal annular or tranſverſe ligament of the carpus, and the whole inſide of the fourth metacarpal bone.

It is fixed by a ſmall ſhort tendon to the os orbiculare, and to the neighbouring part of the large ligament of the carpus; from thence its fibres run more or leſs obliquely toward the inſide of the fourth metacarpal bone, in the outer edge of which they are inſerted. The fibres of this muſcle are of unequal lengths, and extend all the way to the articulation of the firſt phalanx of the little finger, with the fourth metacarpal bone; but they have no manner of relation to that finger. *Winſlow*'s Anatomy, p. 194.

METACARPUS (*Cycl.*)—The antient anatomiſts reckoned five bones in the *metacarpus*, including that bone which is now looked upon to be the firſt phalanx of the thumb, the rejecting which from among them, has reduced the number to the four we allow. Theſe bones are all long, thicker at their extremities than in the middle, and of unequal length and bigneſs: The two firſt are ſometimes, though very rarely, equal, and the others leſſen by degrees from them. Anatomiſts, in their deſcriptions, divide each of theſe bones into a middle and two extremities, or into a baſis, body, and head. The baſes of them all are angular, and turned toward the carpus, and their head rounded like condyles, and turned toward the fingers. Both extremities are covered with cartilages, and the heads remain for a long time very diſtinct epiphyſes.

The firſt bone of the metacarpus is longeſt and largeſt, and ſupports the fore finger; its baſis is a little hollow, anſwering to the digital ſide of the os pyramidale of the carpus. On the outer edge there is a ſmall angular notch, and on the cubital edge of the baſis is a ſmall lateral ſide, which is articulated with the baſis of the ſecond bone. The inner edge is terminated laterally by an oblique angle, which is articulated with the neighbouring angle in the baſis of the os magnum; round the baſis are inequalities and depreſſions for the ligaments and articular glands. The outſide of the body of the bone is broader toward the head than toward the baſis.

The ſecond bone of the *Metacarpus* ſupports the middle finger, and has this very peculiar in it, that its baſis is very oblique, terminating at the outer edge by an angular point toward the firſt bone. By the triangular ſide of its baſis it is articulated with the baſis of the os magnum, and by its lateral ſides with thoſe of the firſt and third bones of the *Metacarpus*. The third bone is that which ſupports the ring finger, being leſs than the firſt and ſecond. Its baſis is irregularly triangular, and proportionably leſs than the two former, and by the principal ſide thereof, it is articulated with the firſt half of the ſide of the os unciforme; the ſmall lateral ſides of the baſis join thoſe of the ſecond and fourth bone. The fourth bone ſupports the little finger; the principal ſide of the baſis of this, inſtead of being triangular, as in other bones, is all of an equal breadth, a little oblique, and ſome part of it gently convex, the reſt gently concave, and articulated with the ſecond half of the ſide of the os unciforme; by its lateral ſide it joins the correſponding ſide of the baſis of the third bone, but in a much looſer manner than in the other articulations of that kind. In the oppoſite ſide there is a ſmall tuberoſity. *Winſlow*'s Anatomy, p. 86.

Fractures of the METACARPUS. In fractures of the hand or *Metacarpus*, the beſt method of reducing and replacing the bones, is, to extend the hand upon a ſmooth table, and while an aſſiſtant holds the whole hand evenly in that poſture, the ſurgeon is to replace the bones; and when that is carefully and perfectly done, to ſecure them with a proper bandage. *Heiſter*, Surg. p. 129.

Luxation of the METACARPUS. The four ſmall bones in the palm of the hand are ſometimes luxated from the carpus to which their upper parts are connected; this happens from external violences, not unfrequently, notwithſtanding that theſe bones naturally muſt much reſiſt ſuch a luxation; for the two carpal bones, which are ſeated in the middle between the two external ones, cannot be diſlocated to either ſide, as the two external ones, which ſuſtain the firſt and little fingers, cannot be luxated inwardly, but are very eaſily driven outward; and each of them may be luxated on the fore or back part of the hand; but which ever of theſe happens, the particular diſorder may be diſcovered and examined by feeling and inſpecting, and the cure may be performed by extending the hand on a flat board or table, and replacing with the thumb whatever of the bones have ſtarted from their natural ſituation. *Heiſter*'s Surg. p. 166.

METACHORESIS, a word uſed by Galen to expreſs a receſs of a morbid humour from one part of the body to another, a thing very common in many diſtempers.

METACOE, in botany, a name given by the people of Guinea to a plant, of which they are very fond, becauſe of its virtues as a balſamic and vulnerary. Its leaves, being bruiſed and applied to a freſh wound, cure it. They have alſo another uſe for it, twiſting the dried leaves into a ſort of match for their muſkets. Phil. Tranſ. N°. 232.

METAGITNION, Μεταγειτνιων, in chronology, the ſecond month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our July and beginning of Auguſt. The Bœotians called it *Panemus*, and the people of Syracuſe, *Carnius*.

It was ſo called from *Metagitnia*, one of Apollo's feſtivals kept in it. Vid. *Potter*, Archæol. Græc. T. 1. p. 414.

METAL (*Cycl.*)—Experiments on *Metals*, made with the great burning-glaſs at Paris, have proved, that all the imperfect metals, copper, iron, tin, and lead, are compoſed only of two parts, a ſulphur or oily matter, and a more denſe ſubſtance, called their earth, capable of vitrification. That from this oil or ſulphur proceed the opacity, the glittering brightneſs, and the malleability of theſe metals; that this ſulphur or oil ſeems no way different from the oils of vegetables and animals, and that it is the ſame in all the four imperfect *Metals*, and in mercury: That theſe four metals have a different ſubſtance for their baſe, the earth of each vitrifying in a different manner; and that to this is owing their difference from one another. Mem. Acad. Par. 1709.

Specific Gravity of METALS. The ſpecific gravity of *Metals* can never be very exactly determin'd, for it varies a little from many cauſes; firſt, according to the different heat of the atmoſphere, which expands water, and other fluids, infinitely more than it does ſolid bodies; and by that unequal diminution of the weight, makes it impoſſible to aſſign them a conſtant proportion, unleſs the heat be determined with the greateſt exactneſs. Secondly, according to the ſeveral degrees of purity in the water, which difference is ſometimes found not inconſiderable. Thirdly, according to the different purity of the *Metals*; for there is hardly any *Metal* found ſo very pure, but that it may be eaſily demonſtrated to be mixed with ſome others. Fourthly, according to the different weight of the atmoſphere itſelf; though the effects of its variations be not ſo conſiderable as of the reſt. *Cramer*, Art. Aſſay. p. 4.

Hence it is that there are, in a manner, as many different accounts of the ſpecific gravities of *Metals* as there are authors who have given an account of their experiments on the ſubject. However, except the *Metals* be of a very great impurity, the ſum of all the variations reſulting from all theſe cauſes, is not ſufficient to hinder any *Metal* from being certainly diſtinguiſhed from any other *Metal*, by its ſpecific gravity.

Slight variations in hydroſtatical experiments are indeed neither new things, nor are they by any means avoidable, either

either in making these or other experiments of affinity to them. By way of proof to such as may distrust this, from their never having made such experiments themselves, two very eminent testimonies may be produced. That most industrious and diligent mathematician Mersennus candidly acknowledges, that when he has occasion to mention the experiments of the learned Ghetaldus, and of the accurate French engineer Monsieur Petit, with his own, there will be often a variety of weight of some few grains; but he says, it is only like the variety of astronomical observations, which do almost always differ also by a few minutes or seconds; and to this he afterwards adds, that he expected not an exact uniformity between the observations of Ghetaldus, *&c.* already made, and the trials of any new experimenter, who would go through the work again. And our famous experimenter the lord Verulam confesses, that it is not to be doubted but that many of the bodies which he has set down in the table he has given, of their dimensions and weights, differ in the same species or denomination, some being heavier than others, and that therefore there is some contingency in the affair; so that tis not necessary that the individuals he made his trials upon should be exact standards of the weight of their respective species, or should, which makes directly to our present purpose, agree altogether to a tittle with the experiments of other men. *Boyle*, Hydrost. Experim. in Pref.

But this scarce evitable imperfection of hydrostatical experiments does not hinder, but that by their help we may make good estimates of the weights and bulks of very many bodies; and these estimates will be found not only preferable to those that can be made of the same bodies by geometrical instruments, but accurate enough to be very useful on a great number and variety of occasions.

METALS *for Specula.* In the making reflecting telescopes, the greatest article of all is the hitting upon a proper *Metal* for the specula. The common search is for a white and hard *Metal*, that shall be bright and durable; but Sir Isaac Newton advises, that at the same time great care must be taken that the *Metal* be not full of holes or pores, which, though so small as to be only discoverable by the microscope, yet will greatly impede the office of the speculum. This *Metal* may seem to take a very fine polish, but, in reality, the edges of these small pores will wear away faster in the polishing, than any other part of the *Metal*, and then however polite the *Metal* may seem, yet it will not reflect with such an accurate regularity as it ought to do. Thus tin-glass, mixed with the common bell-*Metal*, renders it more white and capable of reflecting a greater quantity of light than it otherwise would do; but then the fumes of this semi-*Metal* raised in the fusion like so many aërial bubbles, fill the *Metal* with microscopic pores. White arsenic both blanches the *Metal*, and renders it rather more dense than before, giving it no microscopical pores, unless the fusion has been too violent. The stellate regulus of Mars is recommended by the same gentleman to farther trials.

When the proper mixture is hit upon for the making such a *Metal*, there requires yet great caution in the polishing it. Whatever this is done with ought to be of the most extreme fineness, for if otherwise, its particles will scratch the face of the *Metal*, and make such microscopical holes as the tin-glass gives in the other instance. The proportion of arsenic is to be judged by trials, but something between a sixth and an eighth part of the weight of the copper seems to be the just proportion; when there is much less than an eighth, the *Metal* wants of its whiteness and brightness; and when much more, it is rendered too brittle. The method of making the mixture is this: The copper is first to be melted alone, and then the arsenic is to be put in; but while this mixture is stirred, great care must be taken to avoid the poisonous fumes. When the copper and arsenic are mixed, the tin is to be put in; this soon melts, and then the whole is to be stirred together, and poured off. Some add silver; but it is found, on trial, that this does as much harm in rendering the *Metal* soft, as it does good in rendering it white and luminous. Six ounces of copper, two ounces of tin, and one ounce of arsenic, seems one of the best proportions. It is to be carefully managed in the fire, and not kept too long in fusion, lest it grow porous by that means. Phil. Trans. N°. 81.

Colours from METALS. As metals have a strong texture in their metalline form, so they preserve their natural colours durably, unless corroded or dissolved by particular menstruums, after which their solutions strike particular durable colours, or afford the strongest stains.

Iron dissolved in stale small beer gives the beautiful yellow used in callico printing; when sublimed with sal armoniac it also affords a yellow: And the common iron-moulds made by ink are owing to the iron dissolved in the copperas of which ink is made.

Copper melted with zink appears of a gold colour; dissolved in aqua fortis, it affords a beautiful green; and in any alkali, a beautiful blue. And these solutions may be reduced to dry colours by crystallization or evaporation; and the same *Metal*, precipitated out of aqua fortis with common salts, gives the turquoise colour to white glass.

Tin, a white or colourless *Metal*, affords a light blue colour, when fluxed with antimony and nitre. The same *Metal* is necessary in striking the scarlet dye, with aqua fortis and cochineal; and its calx, by strong infusion, turns to a glass of an opal colour.

Lead, corroded by the fumes of vinegar, gives the fine white cerus; burnt in a strong naked fire, it becomes the strong red lead or minium; and melted into a glass with sand, is of the hyacinth colour. *Shaw's* Lectures, p. 171.

Silver being dissolved in aqua fortis, if chalk be put to the solution, turns of a beautiful purple or amethyst colour; and its own solution, though pale as water, durably stains the nails, skin, or hair, brown or black.

Quicksilver mixed with brimstone makes a black mass, and this, by sublimation, affords the beautiful red pigment, called cinnabar, or vermillion; and the solution of quicksilver being precipitated with common salt, yields a snow-white powder, which also turns black by being mixed with sulphur.

Gold, dissolved in aqua regia, affords a fine yellow liquor, which stains animal substances beautifully purple; and if the solution be sufficiently weakened with water, and mixed with a solution of tin, a fine red or purple powder may be procured, very useful for staining of glass and pastes to a beautiful red.

Fluxes of METALS. See the article FLUXES.

Granulation of METALS. See the article GRANULATION.

Medicines from METALS. All medicines that have lead in their composition, are scarce to be trusted for internal use; for we have numerous instances of the poisonous nature of this *Metal*, in the workers at the white lead or cerus-houses, and indeed in all who work on that *Metal*: And it were enough to banish the internal use of *saccharum saturni*, and the *tinctura antiphthisica*, to read in the *Miscellanea Curiosa*, Decad. 3. Obs. 30. how many men were poisoned at a time by drinking of prick'd wine, which had been rendered sweet by litharge.

Metals, however, do not act in the body unless dissolved; whence large quantities of crude mercury being swallowed, prove harmless for want of a proper menstruum to dissolve it in the stomach: But when crude mercury is dissolved in its proper menstruum, as in the making corrosive sublimate, we see it becomes one of the strongest poisons. Lead, Iron, and copper, being much more easily dissolved than quicksilver, are seldom taken without some remarkable effect, which must always prove the greater, the more of an acid humour, or in case of copper, even an alkaline is lodged in the stomach or intestines. The internal use of the crystals of silver, though sometimes successfully given in dropsical cases, should hardly be trusted, on account of their corrosive acrimony, which has sometimes occasioned bloody stools, and extreme weakness. The common tinctures of copper and solutions of blue vitriol, can scarce be taken internally with safety; as being not only emetic, but in some degree corrosive and poisonous. Even the *aurum fulminans* cannot be safely given till thoroughly washed from its salts; and even then if it meet with an acid solvent in the stomach, it may do very great mischief. Iron and tin have not been found so pernicious in the body, but rather beneficial, especially iron, when properly prepared and used.

Metallic bodies corroded by acids, generally erode when applied to sores. Some of these, sublimate mercury, for instance, and particularly arsenic, have shaken the whole frame of the body, when applied externally; and mercurial preparations do sometimes enter the blood, and produce a salivation. Med. Ess. Edinb. vol. 5. art. 24.

Salts of METALS. The salts of the several *Metals* have been medicines long known in the world, and are of excellent use in the cure of many diseases: But they might be of yet infinitely more service to the world, if a happier way of extracting them could be found than the general one now in use, of doing it by acids, and such strong and corrosive menstruums. Beside the mischiefs these menstruums bring as corrosives, which is assuredly much less than is vulgarly supposed, because they lose the greater part of this in acting on the *Metal*, they produce a great number of bad effects, and render the salts unfit for a great number of uses, by making them all vitriols, that is, by converting them into salts, which, like the common native vitriols, have a septic and violently acrimonious quality. The crystals, or salt of silver, called by the chemists, lunar vitriol, are a plain instance of this.

Borrichius and Kunkell devised another method to be used for obtaining the salts of *Metals*. This was the use of fire instead of acids, as the menstruum that should prey upon the *Metal*, and seeking the salts of all *Metals* from the mere action of a reverberatory furnace; but this method, though a very laudable attempt, yet is by no means calculated to be of general use, because the quantity of salts thus obtained is very small, and that obtained with great pains and expence. Kunkell has given the world an account of the effects of another method of treating *Metals*, of which he relates wonders; but

but he conceals the method. The ſolemn manner in which he declares the fact, however, ſeems to imply, that what he relates is truth; and he every where ſpeaks from his own perſonal knowledge, and the work of his own hands. The menſtruum he uſed was known by himſelf and many others, at Hall in Saxony, under the name of *Eſſentia Dulcis*; he ſacredly affirms, that this was neither acid nor corroſive, even in the ſlighteſt degree; that it left behind it no fæces, no ſaline nor earthy matter on evaporation alone; and that it more approached to the nature of ſpirit of wine, than to any other known liquid. He ſays, that this liquor diſſolved even gold, and that ſo perfectly, that it would all riſe with the liquor in diſtillation. Mercury being diſſolved in it, and the ſolution diſtilled in a retort, he ſays, that only a ſmall quantity of earthy matter remained in the retort, which was white, of a ſpongy texture, and fixed in the fire; and that the reſt of the body of the quickſilver was converted into a thin colourleſs and pellucid ſpirit in the receiver: And that gold, treated in the ſame manner, and diſtilled with a very gentle heat, was left at the bottom of the retort in form of a reſin; and that this reſin was ſoluble in common rectified ſpirit of wine, as was alſo the earth of the mercury; and that ſome days after the ſolution of this laſt earth, the ſalt with which this ſubſtance abounded, would ſeparate itſelf from the menſtruum, and form regular cryſtals at the ſide of the glaſs. This, he ſays, is the true ſalt of mercury, containing all the virtues of that *Metal*, and not converted into a vitriol or corroſive ſubſtance, by means of the menſtruum uſed to extract it.

When the ſalt has thus formed as many ſhoots as it will yield by this proceſs, the remaining liquor is to be evaporated gently, and there will be found a like ſalt at the bottom of the veſſel, of a white colour, an agreeable ſmell, and inſipid to the taſte: This, he ſays, is ſo fixed in the fire, that it is no more to de deſtroyed or altered by it, like the *Metal* from which it is obtained. It readily melts into a maſs in the fire; but if it be not immediately after that taken off from the fire, it will run through whatever veſſel it is melted in.

The author attributes to this ſalt all the wonderful virtues that the metal it is made from is known to poſſeſs; and gives inſtances of cures performed by it, which are ſo well atteſted, as ſcarce to leave any doubt of his veracity. He ſays, it works mildly by ſtool, urine, and ſweat. The caſes he gives of cures performed by it, are theſe: Two women, who were very bad with the venereal diſeaſe, two men in the laſt ſtages of hectic fevers, ſeveral perſons in bad kinds of the ſmall pox, and ſome in peripneumonies. The reſin-like ſubſtance into which gold is converted by the ſame operation, he ſays alſo may be transformed in the ſame manner into a white and ſubtile ſalt, of a very penetrating taſte; and to this he attributes great virtues in the cure of hæmorrhages and epileptic caſes, and adds, that it is an ingredient of the black compound powder, ſo famed for epileptic caſes, prepared at the public orphan hoſpital at Hall. *Kunkel*'s Diſſert. de Sal Met.

That a diſcovery of a manner of extracting the ſalts of *Metals* thus without the help of acids would be of great uſe to the world, is very evident, and the ſolemn manner in which this author aſſerts the having done it, ſeems to infer a probability of its being arrived at by others. He is very blameworthy in not declaring the method; but perhaps ſome hints may be gathered from what he has been pleaſed to declare about it.

Prince's METAL. See the article PRINCE.

METALLIC (*Cycl.*)—The antients have uſed this word very frequently as an epithet in the diſtinctions of the ſeveral ſubſtances which they have treated of. But it is to be obſerved, that the various writers have taken the word in a very different ſenſe. The medical writers in general mean by it ſomething of the mineral kind, that more or leſs partakes of the nature of ſome one of the metals, and that is wholly different from earths, ſtones, &c. In this ſenſe they call the *Lapis Armenus*, which indeed is properly not a ſtone, though we call it ſo, but an ore of copper, *metallic*; and by this term alone they diſtinguiſh it from the laps lazuli, which they call a ſtone. The naturaliſts, on the other hand, make no ſuch diſtinction, but call every thing *metallic* that is obtained out of the bowels of the earth; and thus ſtones, earths, ſalts, and even the liquid bitumens, are by them called *metallic* ſubſtances. The terms *metallic* oil, and *metallic* pitch, are found in the Greek naturaliſts, as the names of the *Petroleum* and *Piſſaſphaltum*; but the medical writers of the ſame time diſtinguiſh theſe by the name *Oryctæ*, which is properly foſſil, a word of a very wide ſenſe, taking in every thing produced in the earth; but the particular ones, which contained the particles of metals in a more or leſs perfect form, they ſeparated from theſe, and treated diſtinctly of under the name of the *Metallics*; chalk, ſand, earth, and ſtones of all kinds, are called by the Greek naturaliſts *metalla*, and the Latins have ſometimes uſed the word *metallum* for *lapis* a ſtone.

METALLIC *Germination*. See the article GERMINATION.

METALLIC *Vegetation*. See the article VEGETATION.

METALLORUM *Mater*. See the article MATER *Metallorum*.

METAPEDIUM, in natural hiſtory, a name given by ſome authors to a kind of ſtone, called by others *metatarſum*, and ſuppoſed to imitate a human foot. It is only a luſus naturæ in the formation of a common pebble.

METAPTOSIS, a word uſed by many phyſical writers to expreſs a change of one diſtemper into another, whether it be by *diadoche* or *diadexis*, as it is called; when the change is for the better, and the morbid matter removes from a more noble to an ignoble part: Or by *metaſtaſis*, when the change is for the worſe, and the morbid matter removes from an ignoble to a more noble part.

METASTASIS, Μεταστασις, *Remotio*, in rhetoric, is uſed for the removing the blame from the perſon accuſed to another perſon, or laying it upon ſomething as a cauſe. Thus Adam's excuſing himſelf by blaming Eve, is an example of the former; and the laying the crime of drunkenneſs upon the wine, is an inſtance of the latter. *Voſſ.* Rhet. l. 1. p. 147.

METATARSUM, in natural hiſtory, a name given by authors to a ſort of ſtone, ſuppoſed to repreſent a human foot. See the article METAPEDIUM.

METATARSIUS, a fleſhy maſs lying under the ſole of the foot, fixed by one end in the fore-part of the great tuberoſity of the os calcis, and running forward from thence, terminates in a kind of ſhort tendon, which is fixed in the tuberoſity, and poſterior part of the lower ſide of the fifth bone of the *Metatarſus*. It may move this bone, much after the ſame manner as the metacarpus moves the fourth bone of the metacarpus. *Winſlow*'s Anatomy, p. 226.

METATHESIS, a word uſed by medical writers for a change of place in ſuch humours, or other diſeaſed parts, as cannot be abſolutely removed or ſent off. Thus a *Metatheſis* of a cataract is a depreſſion thereof, ſo that it no longer ſhuts out the light.

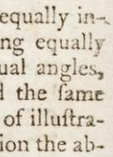
METATOR, among the Romans, a quarter-maſter. Out of every legion a tribune, and ſome centurions, were appointed to go before the army, in order to chuſe a place for a camp, and aſſign and mark out quarters to each legion. *Pitiſc.* Lex. Antiq. in voc.

METAXA, a word uſed by ſome medical writers to expreſs ſilk.

METEGAVEL, in our old writers, a tribute or rent paid in victuals; which was a thing uſual in this kingdom, as well with the king's tenants as others, till the reign of king Henry the firſt. *Blount.*

The word is Saxon, *metegavel*; i. e. *cibi gablum, ſeu vectigal.*

METEL, in natural hiſtory, the name of a ſort of *nux vomica*, of the ſame ſhape with the common kind, but ſomewhat larger.



METEMPSYCHI, in church hiſtory, heretics, who, in imitation of the Pythagoreans, maintained the tranſmigration of ſouls. *Hofm.* Lex. in voc. See the article METEMPSYCHOSIS, *Cycl.*

METESSIB, an officer of the eaſtern nations, who has the care and overſeeing of all the public weights and meaſures, and ſees that things are made juſtly according to them. *Pocock*'s Egypt, p. 166.

METHOD (*Cycl.*) —The ſupreme law of the philoſophical *Method* is, to premiſe that which is neceſſary towards the underſtanding or eſtabliſhing what follows. *Wolf.* Diſc. Prælim. Logic. c. 4.

The mathematical and philoſophical *Method* are the ſame, as may be ſeen by the practice of the geometers of antiquity, who conſtantly obſerve the law here mentioned. Id. ib.

Several authors, as Ramus, Meſſrs. de Port Royal, &c. have accuſed Euclid of want of *Method*. Had theſe gentlemen attended to the ſupreme law of all true *Method*, they would have been more cautious in their cenſures. The jeſuit Caſtel has renewed this groundleſs accuſation; and to convince his reader how much he excels the antients, he begins his geometry by a *petitio principii*. Thus to prove that the oppoſite angles *a*, *b*, as alſo *c*, *d* are equal. He aſſumes this principle, that the two lines whoſe interſection forms theſe angles, are equally inclined to each other above and below. Now, being equally inclined to each other, is the ſame as forming equal angles, which is the very thing to be proved [a]. We find the ſame confuſion of thought, which he introduces by way of illuſtration, in his doctrine of parallel lines; not to mention the abſurdity of *parallels being as it were one broad line* [b].—[a *Caſtel.* Math. Univerſ. p. 264. b Ib. p. 271.]

METHOD *of Maximis & Minimis*. See the article MAXIMUM, *Cycl.* and *Suppl.*

METHODISTS, in botany, perſons who have attempted that ſtudy upon certain principles, and have beſtowed their labours upn the diſpoſition and arrangement of plants, and allotting them proper and diſtinctive names. *Linnæi* Syſt. Nat. p. 1.

METOPIUM, in botany, a name given by Pliny to the plant which produces the gum ammoniacum. He ſays that the antient Greeks called it alſo by this name, but in that he errs. See the article AMMONIACUM.

METRENCHYTES, a name given by chirurgical writers to a ſort of ſyringe, contrived on purpoſe for injecting medicinal ſubſtances into the womb.

METRETES, the name of a meaſure uſed among the antients, containing ſomewhat more than nine gallons.

METROCELIDES, a word uſed by medical writers to expreſs a mark made by the imagination of the mother on the fœtus in utero.

METRONOMI, Μέτρονομοι, among the Athenians, officers that inſpected all ſorts of meaſures, except thoſe of corn; there were five of them in the city, and double that number in the *Pyræus*, in which the greateſt mart in Attica was kept. *Potter*, Archæol. l. 1. c. 15. T. 1. p. 83.

METROPTOSIS, a word uſed by ſome medical authors to expreſs a falling down of the womb, or prolapſus uteri. There is a plaſter calculated to be of ſervice againſt this caſe, and called hence, *emplaſtrum metroptoticum*.

METTESHEP, or METTENSCHEP, in our old writers, an acknowledgment paid in a certain meaſure of corn; or a fine or penalty impoſed on tenants, for their defaults in not doing their cuſtomary ſervices of cutting the lords corn. Paroch. Antiq. 495.

METUPORANGA, in zoology, the name of a Braſilian bird, called alſo by ſome *Tepetototl*, and by Aldrovand by the too general name *Gallus Indicus*.

It much approaches to the Gallinaceous fowls, called *Mitu* and *Pauxi*, of the ſame country, but differs from them in having no tail, if the deſcriptions of authors are accurate, and from the *mitu* in having a protuberance of the ſize of a cherry over the top of its beak. *Marggrave*'s Hiſt. Braſil. *Aldrov.* de Avib.

METYS, a word uſed by many of the antient writers to expreſs a ſubſtance collected by bees, in order to the ſtopping up cracks and crevices in their hives.

The old authors mention three kinds of ſubſtances uſed by the bees on this occaſion, the *Metys*, *Piſſoceros*, and *Propolis*. The moderns uſe only the latter term to expreſs every thing of this kind. The *Metys* and *Piſſoceros* ſeeming to have been only the ſame *Propolis*, more or leſs mixed with wax. This ſubſtance is a reſin, of a middle conſiſtence between the hard and the fluid ones. It is uſually of a reddiſh brown on the ſurface, and yellow within, and is collected from ſeveral trees, of which the poplar ſeems to be the principal, and the willow the next. *Reaumur*'s Hiſt. Inſ. vol. 10. p. 83. See the article PROPOLIS.

MEVIUM, a name mentioned by *Fallopius* and others, as given by ſome medical writers to the venereal diſeaſe.

MEUM, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe: The flower is of the roſaceous kind, conſiſting of ſeveral petals, arranged in a circular form, and ſtanding on a cup which afterwards becomes a fruit, compoſed of two oblong ſeeds, which are gibboſe and ſtriated on one ſide, and flat and plain on the other. To this it may be added, that the leaves are finely divided, and ſtand on branched ſtalks. There is only one known ſpecies of this genus. The plants uſually called by this name, and different from the common *Meum*, being all ſpecies of fennel; and Mr. Tournefort obſerves, that this anſwers ſo well to all the characters of fennel, that he ſhould have made it no more than a ſpecies of that genus, but in compliment to its having been ſo long received under a ſeparate name. *Tourn.* Inſt. p. 312.

The root of *Meum* is eſteemed by ſome a very great medicine in malignant diſeaſes.

It is alſo eſteemed an attenuant, and is preſcribed wherever there are thick humours to be evacuated. It is given in aſthma's, and all obſtructions of the lungs, and is by many recommended in flatulencies, colics, and ſuppreſſions of urine, and of the menſes. Dioſcorides and Galen tell us, that the too frequent uſe of this medicine, or the taking it in too large doſes, will occaſion violent pains in the head. It may be given in ſubſtance from half a dram to two ſcruples, or from a dram to two drams in infuſion. *Geoffroy*, Mat. Med. vol. 2. p. 105.

It ought to be choſen as long and large as can be had, round, not flatted, plump, and full, and of an aromatic ſmell, and a ſomewhat acrid taſte, and ſuch as is not duſty or worm-eaten. It is ſudorific and diuretic; but the principal uſe now made of it is only as an ingredient in the Venice treacle.

MEUTANG, in botany, the name of a flower much eſteemed by the Chineſe, which, on that account, they call the king of flowers. It is larger than our roſe, and imitates its figure, only its leaves are more expanded. As its ſmell comes ſhort of that of the roſe, ſo in beauty the roſe is outdone by it. It has no prickles, and its colour is a mixture of white with purple, but ſo as to incline moſt to white; yet ſometimes there are found reddiſh and yellow ones. The tree it grows on is not unlike our alder tree, and is cultivated throughout that large empire with great care, being covered in the ſummer time with a ſhade to defend it from the ſcorching heat of the ſun. *Hofm.* Lex. in voc.

MEZEREUM, the female *ſpurge laurel*, in botany, a ſpecies of thymelæa. See the article THYMELÆA.

The bark of the root of this ſhrub, or the inner bark of the trunk, are preſcribed by ſome in dropſies, and other caſes where ſtrong purges are neceſſary; but it is ſo violent, that it ought never to be uſed internally. Externally it is uſed as a ſeaton, to draw a copious diſcharge from the ear in inflammations of the eyes.

MEZUZOTH, in the Jewiſh cuſtoms, certain pieces of parchment which the Jews fix to the door-poſts of their houſes, taking that literally which Moſes commands them [a], ſaying, "Thou ſhalt never forget the laws of thy God, but thou "ſhalt write them upon the poſts of thy houſe, and on thy "gates." This expreſſion means nothing elſe, but that thou ſhalt always remember them, whether thou comeſt into thy houſe, or goeſt out. But the Hebrew doctors imagined, that the law-giver meant ſomething more than this. They pretended that, to avoid making themſelves ridiculous, by writing the commandments of God without their doors, or rather to avoid expoſing them to the profanation of the wicked, they ought at leaſt to write them on a parchment, and to encloſe it in ſomething. Therefore they wrote theſe words upon a ſquare piece of parchment, prepared on purpoſe, with a particular ink, and a ſquare kind of character, Deut. vi. 4, 5, 6, 7, 8, 9. "Hear O Iſrael, the Lord our "God is one Lord, *&c.*" Then they left a little ſpace, and afterwards went on, Deut. xi. 13. "And it ſhall come "to paſs, if thou ſhalt hearken diligently to my command-"ments, *&c.*" as far as, "Thou ſhalt write them upon "the door-poſts of thy houſe, *&c.*" After this they rolled up the parchment, and put it into a caſe of reeds, or other matter; they wrote on the end of the caſe the word *Shadai*, which is one of the names of God; they put it at the doors of their houſes, chambers, and all places moſt frequented; they fixed it to the knockers of the door, on the right ſide; and as often as they entered in, or went out, they touched it in this place with the end of their finger, which they afterwards kiſſed out of devotion. The Hebrew word *Mezuza* properly ſignifies the door-poſts of an houſe; but it is alſo given to this roll of parchment now mentioned. Leo of Modena may be here conſulted [b].—[[a] Deut. vi. 9. [b] Ceremon. of the Jews, part 1. c. 1. *Calmet.* Diction. Bibl.]

MEZZA *Pauſa*, in the Italian muſic, *half a pauſe*, intimates that the part wherein it is found muſt lie ſtill the time of a ſemi-breve in common time. See the article PAUSE.

MEZZA *Tirata*. See the article TIRATA.

MEZZO *Soprano*, in the Italian muſic, is the high tenor, which has the cleff C on the ſecond line.

MICA, in natural hiſtory, a name given by authors who have written of foſſils to many of the bractearia, or ſmall ſpangled talcs, whether in pure maſſes of themſelves, or immerſed in the matter of other foſſils.

The principal kinds of theſe are the white and the yellow, from their colour and ſplendid appearance, called the ſilver and gold glimmer, or *Mica aurea* and *Mica argentea*.

Of each of theſe there are ſeveral kinds, as many of the yellow and white bractearia, more or leſs, deſerve the name; but the moſt conſiderable ſpecies are thoſe called by Dr. Hill the *bractearium lucidum aureum bracteis parvis*, and the *bractearium argenteum lucidum bracteis variis*, the bright gold-colour'd bractearium with ſmall ſpangles, and the bright ſilvery bractearium with variouſly ſized ſpangles. Theſe have frequently led people of ſanguine imaginations, who have met with them in different places, to ſuppoſe they had found ores of gold and ſilver, but they, in reality, contain not the leaſt grain of either of thoſe metals, and are mere talc in ſmall flakes, accidentally colour'd. The yellow kind is found in many parts of the world, but no where ſo plentifully as in Arabia and Ægypt. In Germany and France there is alſo conſiderable plenty of it, and in our American plantations it is found in great abundance; nor is England without it even in various forms. We have ſome of it in pure homogene maſſes, ſome mixed among ſtony matter, ſome among ſand. The white is extremely plentiful in Sileſia and Bohemia, as alſo in France, Italy, and England. It is like the former, found either pure, or mixed among the matter of ſtone, and makes a very glittering and beautiful appearance. *Hill*'s Hiſt. of Foſſ. p. 77, ſeq.

MICARAGUÆ *Pomum*, a name given by ſome authors to the Spaniſh pear. *Chabræus*, p. 596.

MICHAH, a word uſed by ſome of the chemical writers to expreſs copper.

MICHALALATLI, in zoology, a name by which Nieremberg informs us, ſome of the Mexicans call the *achalalactli*. See the article ACHALALACTLI.

MICHELIA, in botany, the name of a genus of plants eſtabliſhed by Dr. Amman, the characters of which are theſe: The flower is monopetalous and of an anomalous kind, it is tubular, and opens into a kind of bilabiated mouth. The piſtil ariſes from the cup and finally becomes a fleſhy fruit, containing a kernel, or ſtone, divided into two cells, each of which contains one ſeed. This riſes to the ſize of a ſhrub, its branches are covered with a deep green bark, and do not grow ſtrait and even, but variouſly intorted; they ſend out many ſmall ſhoots, and are armed with very ſharp thorns of half an inch long; the leaves are about an inch and half long, and an inch broad; they ſtand on ſhort pedicles, and are of a pleaſant green on the upper ſide, and whitiſh underneath. The branches uſually terminate in long

and

and loose spikes of yellow flowers; these are each divided into four very uneven segments, the upper segment is very large and is arched; but the lower, and the side ones are much smaller and bend outwards. In the middle of the segments there stand two yellow stamina, sustaining each a round yellow head; the pistil arises between these, and is of the same colour, length, and thickness, with the stamina. The cup is very short, consisting only of one leaf; it is green and is divided in its upper part into two or three obtuse segments: The fruit is round and fleshy of the size of a walnut, green while young, but yellow when ripe, composed of a large quantity of a pale coloured pulp, surrounding a stone of an oval figure divided into two cells; in each of which is contained one kernel or seed. Act. Petropol. Vol. 8. p. 219.

MICROCOSMETER, a name given by Dolœus to an imaginary being, which he supposes to reside in the brain, and direct all the actions.

MICROCOUSTICS, the same with *microphones*. See the article MICROPHONES.

MICROPHONES, instruments contrived to magnify small sounds, as *microscopes* do small objects.

MICROSCOPE (*Cycl.*)—compound *Microscopes* sometimes exhibit a fallacious appearance, by representing convex objects, concave, and *vice versa*. See Philos. Transf. N°. 476. p. 387. See some accounts of the famous Leuwenhoek's *Microscopes* in the Philosophical Transactions, N°. 380. & 458.

The solar or *camera obscura Microscope*, and the *Microscope* for opaque objects, are the invention of Dr. Luberkhun; and have been executed by Mr. Cuff in England. Phil. Transf. N°. 458. p. 516, & 518.

Camera obscura MICROSCOPE. See *Solar* MICROSCOPE.

MICROSCOPE *for opaque objects*. The *Microscope* for opake objects remedies the inconvenience of having the dark side of an object next the eye: For by means of a concave speculum of silver, highly polished, in whose center a magnifying lens is placed, the object is so strongly illuminated, that it may be examined with ease. Phil. Transf. N°. 458. Sect. 9.

Solar MICROSCOPE. The *Solar Microscope* is composed of a tube, a looking-glass, a convex lens, and a *Microscope*. The tube is brass, near two inches in diameter, fixed in a circular collar of mahogany; which, turning round at pleasure, in a square frame, may be adjusted easily to a hole in the shutter of a window, in such a manner, that no light can pass into the room but through the aforesaid tube. Fastened to the frame by hinges, on the side that goes without the window, is a looking-glass, which, by means of a jointed brass wire coming through the frame, may be moved either vertically or horizontally, to throw the sun's rays through the brass tube into the darkened room. The end of the brass tube without the shutter has a convex lens, to collect the rays, and bring them to a focus; and on the end within the room, Wilson's pocket *Microscope* is screwed, with the object to be examined, applied to it in a slider. The sun's rays being directed by the looking-glass through the tube upon the object, the image or picture of the object is thrown distinctly and beautifully upon a screen of white paper; and may be magnified beyond the imagination of those who have not seen it. Phil. Transf. N°. 458. Sect. 9.

MICROSCOPIC *Objects*. All things too minute to be viewed distinctly by the naked eye, are proper objects for the *Microscope*. Mr. Hook has distinguished them to be exceeding small bodies, exceeding small pores, or exceeding small motions.

Exceeding small bodies must either be the parts of larger bodies, or things, the whole of which is exceedingly minute, such as small seeds, insects, sands, salts, &c.

Exceeding small pores are the interstices between the solid parts of bodies, as in stones, minerals, shells, &c. or the mouths of minute vessels in vegetables, or the pores in the skin, bones, and other parts of animals.

Exceeding small motions are the movements of the several parts or members of minute animals, or the motion of the fluids, contained either in animal or vegetable bodies. Under one or other of these three heads, almost every thing about us affords us matter of observation, and may conduce both to our amusement and instruction.

An examination of these objects, however, so as to discover truth, requires a great deal of attention, care, and patience, with some skill and dexterity, to be acquired chiefly by practice, in the preparing, managing, and applying them to the *Microscope*.

Whatever object offers itself as the subject of our examination, the size, contexture, and nature of it, are first to be considered, in order to apply it to such glasses, and in such a manner as may shew it best. The first step should always be to view the whole together, with such a magnifier as can take it in all at once, and after this the several parts of it may the more fitly be examined, whether remaining on the object or separated from it. The smaller the parts are which are to be examined, the more powerful should be the magnifiers employed; the transparency or opacity of the object must also be considered, and the glasses employed accordingly suited thereto, for a transparent object will bear a much greater magnifier than one which is opake, since the nearness that a glass must be placed at, unavoidably darkens an object if in its own nature opake, and renders it very difficult to be seen, unless by the help of the apparatus contrived for that purpose, which has a silver speculum. Most objects however become transparent by being divided into extremely thin parts. *Baker's* Microf. p. 52.

The nature of the object also, whether it be alive or dead, a solid, or a fluid, an animal, a vegetable, or a mineral substance, must likewise be considered, and all the circumstances of it attended to, that we may apply it in the most advantageous manner. If it be a living object, care must be taken not to squeeze or injure it, that we may see it in its natural state and full perfection. If it be a fluid, and that too thick, it must be diluted with water; and if too thin, we should let some of its watery parts evaporate. Some substances are fittest for observation when dry, others when moistened; some when fresh, and others after they have been kept some time.

Light is the next thing to be taken care of, for on this the truth of all our observations depends; and a very little observation will shew how very different objects appear in one degree of it to what they do in another; so that every new object should be viewed in all degrees of light, from the greatest glare of brightness to perfect obscurity, and that in all positions to each degree, till we hit upon the certain form and figure of it. In many objects it is very difficult to distinguish between a prominency and a depression, a black shadow and a black stain, and in colour between a bright reflection and whiteness. The eye of a fly in one kind of light appears like a lattice drilled full of holes, in the sun-shine like a solid substance covered with golden nails, in one position like a surface covered with pyramids, in another with cones, and in others with still different shapes.

The degree of light must always be suited to the object, if that be dark it must be seen in a full and strong light; but if transparent, the light should be proportionably weak; for which reason there is a contrivance both in the single and double *Microscope* to cut off abundance of the rays, when such transparent objects are to be examined by the largest magnifiers. The light of a candle for many objects, and especially for such as are very bright and transparent, and very minute, is preferable to day-light; for others a serene day-light is best; but sun shine is the worst light of all, for it is reflected from objects with so much glare, and exhibits such gaudy colours, that nothing can be determined from it with any certainty. This however, is not to be extended to the solar, or *camera obscura Microscope*; for in that nothing but sun-shine can do, and the brighter that is the better; but in that way we do not see the object itself on which the sun-shine is cast, but only the image or shadow of it exhibited on a screen; and therefore no confusion can arise from the glaring reflection of the sun's rays from the object to the eye, which is the case in other *Microscopes*. But then in that solar way we must rest contented with viewing the true form and shape of an object, without expecting to find its natural colour; since no shadow can possibly wear the colour of the body it represents,

Most objects require also some management in order to bring them properly before the glasses. If they are flat and transparent and such as will not be injured by pressure, the best way is to enclose them in sliders between two Muscovy tales or isinglasses. This way the feathers of butterflies, the scales of fishes, and the farinæ of flowers may be very conveniently preserved, as also the parts of insects, the whole bodies of minute ones, and a great number of other things. These are to be kept in sliders, each containing three, four, or more holes, and these must not be filled promiscuously; but all the things preserved in one slider should be such as require one and the same magnifying power to view them, that there may not be a necessity of changing the glasses for every object; and the sliders should be marked with the number of the magnifier it is proper to be viewed with. In placing the objects in the sliders, it is always proper to have a small magnifier, of about an inch focus, in your hand, to examine and adjust them by, before they are fixed down with the rings.

Small living objects, such as lice, fleas, bugs, mites, minute spiders, &c. may be placed between these tales without injuring them, if care be taken to lay on the brass rings without pressing them down, and they will remain alive many weeks in this manner; but if they are too large to be treated thus, they should be either preserved between two concave glasses, or else viewed immediately, by holding them in the pliers, or sticking them on the point at the other end of that instrument.

If fluids come under examination, to discover the animalcules in them, a small drop is to be taken with a hair pencil, or on the nib of a clean pen, and placed on a plate of glass; and if they are too numerous to be thus seen distinctly, some water warmed by holding it in the mouth must be added to the drop, and they will then separate and be seen distinctly. This is particularly necessary in viewing the animalcules in the *semen masculinum* of all creatures; which, tho' extremely minute, are always so numerous, that without this caution their true form can seldom be seen. But if we are to see the salts in a fluid, the contrary method must be observed, and

the plate of glaſs muſt be held gently over the fire, till part of the liquor is evaporated.

The diſſection of minute animals, as lice, fleas, &c. requires patience and care; but it may be done very accurately by means of a needle and a fine lancet, placing the creature in a drop of water, for then the parts will readily unfold themſelves, and the ſtomach, guts, &c. be very diſtinctly ſeen.

Theſe ſeem the beſt ways of preſerving tranſparent objects; but the opake ones, ſuch as ſeeds, woods, &c. require a very different treatment, and are beſt preſerved and viewed in the following manner.

Cut cards into ſmall ſlips about half an inch long, and a tenth of an inch broad; wet theſe half-way of their length in gum-water, and with that faſten on ſeveral parcels of the object, and as the ſpots of cards are of different colours, ſuch ſhould be choſen for every object as are the moſt different from its own colours. Theſe are very convenient for viewing by the *Microſcope* made for opake objects with the ſilvered ſpeculum; but they are proper for any *Microſcope*, that can view opake bodies.

A ſmall box ſhould be contrived for theſe ſlips, with little ſhallow holes for the reception of each; and this is conveniently done, by cutting pieces of paſte-board, ſuch as the covers of books are made of, to the ſize of the box, ſo that they will juſt go into it, and then cutting holes through them with a ſmall chiſſel, of the ſhape of the ſlips of card, theſe paſte-boards having then a paper paſted over their bottom, are cells very proper for the reception of theſe ſlips, which may be taken out by means of a pair of plyers, and will be always ready for uſe.

Great caution is to be uſed in forming a judgment on what is ſeen by the *Microſcope*, if the objects are extended, or contracted, by force or drineſs.

Nothing can be determined about them, without making the proper allowances; and different lights and poſitions will often ſhew the ſame object as very different from itſelf. There is no advantage in any greater magnifier than ſuch as is capable of ſhewing the object in view diſtinctly; and the leſs the glaſs magnifies, the more pleaſantly the object is always ſeen.

The colours of objects are very little to be depended on, as ſeen by the *Microſcope*; for their ſeveral component particles being by this means removed to great diſtances from one another, may give reflexions very different from what they would, if ſeen by the naked eye.

The motions of living creatures alſo, or of the fluids contained in their bodies, are by no means to be haſtily judged of, from what we ſee by the *Microſcope*, without due conſideration; for as the moving body, and the ſpace wherein it moves, are magnified, the motion muſt be ſo too; and therefore that rapidity with which the blood ſeems to paſs through the veſſels of ſmall animals muſt be judged of accordingly: Suppoſe, for inſtance, that a horſe and a mouſe move their limbs exactly at the ſame time, if the horſe runs a mile while the mouſe runs fifty yards; tho' the number of ſteps are the ſame in both, the motion of the horſe muſt notwithſtanding be allowed the ſwifteſt; and the motion of a mite, as viewed by the naked eye, or through the *Microſcope*, is perhaps not leſs different. *Baker*'s Microſcope, p. 62.

MICTUS *Cruentus*. See the article *Bloody* URINE.

MID-*Feather*, in the Engliſh ſalt-works, the name given to a ſort of partition placed in the middle of the furnace, over which the pan is ſet for boiling the ſea-water or brine into ſalt.

This partition divides the body of the furnace into two chambers. See the article SALT.

MID-*Ship Beam*. See the article BEAM, *Cycl.*

MIDA, in natural hiſtory, the name of a worm or maggot, of which is produced the purple fly, found on bean-flowers, and thence called the bean-fly.

MIDAD *Alhendi*, in the materia medica of the Arabians, a name given to the common indigo blue.

The expreſs meaning of the words is Indian ink; but this is an erroneous name, founded on Pliny's miſunderſtanding the words of Dioſcorides. The Greeks in general have called the common writing ink *Melan*; but they have alſo uſed this word *Melan* as an adjective, expreſſive not only of black, but of deep blue. Thus Theophraſtus has called both the violet flowers and the fine deep blue ſapphires, *Melanes*. Pliny, finding him call the indigo when of a very fine and deep colour, *Melan Indicon*, thought it to be different from the common indigo, and thence ſuppoſed it a ſort of Indian ink. Thus Indian ink has become a ſort of name for this blue.

MIDDLING-*Teeth*, in the manege, are the four teeth of a horſe that come out at three years and a half, in the room of other four foal-teeth, ſeated between the nippers and the corner-teeth; from which ſituation they derive the title of *Middling*. There's one of them above, and one below, on each ſide of the jaws. See the article TEETH.

MIDYON, a word uſed by Theophraſtus, as the name of a ſpecies of oak. It is preſcribed by ſome of the old phyſicians, in their compoſitions; but is uſually ſuppoſed to ſtand there, by an error of the copies; the word meant being miſy.

MIFRES, a name by which ſome writers have called alphaltum. See the article ASPHALTA.

MIGRATING-*Bog*.—Theſe ſoft maſſes of earth have been ſometimes known to move out of their place. An inſtance of this there was in Ireland, in the year 1697, about Charleville, in the county of Limerick. There was heard for ſome time a noiſe under ground like that of thunder at a great diſtance, or almoſt ſpent; and ſoon after this the earth of a large bog in the neighbourhood began to move, and a hill or riſing ſituated in the middle of it ſtood no longer above the level of the reſt, but ſunk flat.

The *bog* not only moved itſelf, but moved with the neighbouring paſture-lands, tho' ſeparated by a large and deep ditch; the motion continued a conſiderable time, and the ſurface of the moving earth roſe into a ſort of waves, but without breaking up or burſting any where. The paſture-land roſe very high, and was carried on in the ſame motion till it reſted upon a neighbouring meadow, the whole ſurface of which it covered, remaining ſixteen feet deep upon its ſurface. The whole quantity of the bog was torn from its former ſeat, and left great gaps in the earth where it had joined, which threw up foul water, and very ſtinking vapours. *Phil. Tranſ.* N° 233.

All the country came in to ſee ſo ſtrange a ſight as this, for it continued moving a long time; but few gueſſed the true cauſe of it, which was this: A more than ordinary wet ſpring occaſioned the riſing of the bog to a great height in one part, and thence propagated itſelf through the whole bog; ſo that the hill in the midſt was undermined, and naturally ſunk flat; this and the greater than ordinary weight of this large bog preſſing upon the adjoining paſture-land, forced up its foundations, which were only a looſe ſand. This was puſhed on ſideways where there was a deſcent from the bog, and at length having given the bog more room, all was quiet and remained in that ſtate. The bog was more than forty acres of ground.

MIGRATING-*Birds*. See the article *Birds of* PASSAGE.

MIHA, in the materia medica, a name uſed by ſome authors for ſtyrax. *Ger.* Emac. Ind. 2.

MILAX, a name by which *ſmilax* is often meant by the Greek writers. The adding or taking away the letter *s* from words beginning with an *m*, was a thing common and indifferent among them. This name is however one of the ſynonimous terms of the Greeks, ſometimes being uſed as the name of the yew-tree, and ſometimes as that of the creeping plant we call *ſmilax* at this time. Dioſcorides, and Galen, and moſt of the later Greek authors, call the tree *Milax*, and the herb ſmilax, as if there were a difference between the two names; but this is not regularly kept up by any of them, and in the antients is not regarded at all; there being no more difference between the words *Smilax* and *Milax*, than between ſmaragdus and maragdus, as that word, the name of the emerald, is at times variouſly written.

MILDEW (*Cycl.*)—Some have ſuppoſed the blight and *Mildew* to be both the ſame thing, but very erroneouſly. The *Mildew*, properly ſo called, ſometimes reſts upon the leaves of trees in form of a fatty juice, and ſometimes on the ears of corn; it is tough and viſcous to the touch, and the ſun's heat drying it up, it becomes yet more viſcous and hard, and ſo daubs over the young grains in the ear, that they can never after expand themſelves properly, nor grow to their due ſize or weight. Bearded wheat is leſs ſubject to the *Mildew*, than the common ſort; and it is obſerved, that newly dung'd lands are more ſubject to the *Mildew*, than others. The moſt happy remedy for this is out of the farmer's power, but often happens naturally; this is a ſmart ſhower of rain, and immediately afterwards a briſk wind. This wholly diſperſes it.

If the *Mildew* is ſeen before the ſun has any power, it has been recommended by many, to ſend two men into the field with a long cord, each holding one end, and drawing this along through the ears, the dew will be diſlodged from them before the ſun's heat is able to dry it to that viſcous ſtate in which it does the miſchief. Some alſo ſay, that lands which have for many years been ſubject to *Mildews*, have been cured of it by ſowing ſoot with the corn, or immediately after it. See the article BLIGHT.

MILE (*Cycl.*)—In Scotland the *Mile* is equal to 1184 paces, every pace being five feet; ſo that the Scotch *Mile* contains 5920 feet. Tr. Pract. Geom. p. 4. See the article MEASURE.

MILIARIUM, the name of a tall and narrow veſſel, uſed in the bathing of the antients, for heating water to any degree, to give warmth to the reſt. See Mem. Acad. Inſcript. Vol. I. p. 127.

MILIARY *Fever*. See the article PURPUREA *Febris*.

MILIOLUM, a word uſed by ſome medical writers, to expreſs a ſmall tumor in the eye-lid, of the ſize and ſhape of a ſeed of the common millet.

MILITARY *Rewards*. See the article REWARDS.

MILIUM, *Millet*, in the Linnæan ſyſtem of botany, makes a diſtinct genus of plants; the diſtinguiſhing characters of which are, that the calyx is a glume containing ſeveral flowers, and compoſed of three valves, which are of an oval figure and pointed;

pointed; the two inner ones are placed oppoſite to one another; the third is ſituated behind one of theſe. The flower is ſmaller than the cup, and is made up of two valves which are of an oval figure, and one of them much ſmaller than the other. The ſtamina are three very ſhort capillary filaments, the antheræ are oblong, the germen of the piſtil is roundiſh, the ſtyles are two in number and are very ſlender, the ſtigmata are like pencils. The flower incloſes the ſeed, and does not open to let it fall out. The ſeed is ſingle, and of a roundiſh figure. *Linnæi* Gen. Plant. p. 17. See Tab. 1. of Botany, Claſs 15.

Millet is reckoned by Pliny the moſt fertile of all grain; one grain of it producing three Roman ſextaries. *Hoffm.* Lex. in voc. See the article SEXTARIUS, *Cycl.*

MILIUM *Arundinaceum*, in botany, a name by which ſome authors call the lacrymæ Jobi, or Job's tears. *Herm.* Cat. p. 426.

MILIUM *Indicum*, in botany, a name by which ſome authors call the maize, or Indian wheat. *Park.* Theatr. 1138.

MILK (*Cycl.*)— *Milk* is evidently one of the beſt nouriſhments of the body; and it is not wonderful that it ſhould prove ſo, when we conſider that in all caſes of nouriſhment the proximate matter taken to nouriſh ought to be as like as may be to the body to be nouriſhed by it. We ſubſiſt by the ſame things by which we are generated, and even while in the ſtate of a fœtus in the womb, we are nouriſhed not by blood, as ſome ſuppoſe, but by a lacteous juice, which is ſeparated from the blood in the uterus by means of the placenta, as it is in the breaſts of women who give ſuck, by glandules and tubuli deſtined for that purpoſe. Meats which we daily feed upon paſs down into the ſtomach indeed in their own form, but they do not nouriſh us till they are changed into chyle, or a milky liquor.

Milk being analyſed is found to be compoſed of fatty, ſerous, and terreſtrial parts; and theſe its conſtituent principles being eaſily mixed and ſeparated again, are made of it matter for the nouriſhment of the different parts of the body. The ſerous part, which is alſo nitrous, being a proper vehicle to convey through the veſſels the fatty parts, which are as well adapted to all the offices of nutrition as any ſubſtance can be. It is eaſy to infer from this account of *Milk*, that it is not only a proper food for children, but for grown people alſo; but proper regulations are to be obſerved as to its uſe in particular caſes; no aliment any more than this being capable of ſuiting all conſtitutions and circumſtances. Meat in the ſtomach is converted into chyle, or a ſubſtance like *Milk*; this chyle paſſes into the heart through the blood-veſſels, and its fineſt and moſt ſpirituous parts are there tranſmuted into the red part of the blood; and after this the other groſſer parts of it are by different elaborations transformed into bile, and the ſeveral other humours in the body. It is evident that theſe humours, as well as the blood itſelf, muſt all have a ſupply; and that meat cannot give this ſupply, till it is converted into chyle or *Milk*; how much labour then is ſav'd the animal functions by giving at once into the ſtomach chyle ready form'd, that is *Milk*; and in caſes where the action or juices of that organ are ſo debilitated as not to be of power to convert the meat into chyle, what remains but that the perſon muſt die ſlowly, by a want of the ſupplies of the ſeveral fluids of the body, if ſomething be not given that is capable of paſſing into the blood with leſs preparation than meats are; and what is ſo proper on ſuch an occaſion as *Milk*, which is already ſo nearly allied to the nature of the fluid that ſhould have been there ſeparated from meat, that it will readily ſupply all its offices.

MILK-*Diet* is uſeful in the gout and ſtone. See the article STONE.

Dr. Cheyne recommends *Milk* and ſeed-diet with water for drink, as the ſureſt preſervative againſt diſeaſes, and cure of them. See the articles CANCER, PALSY, FITS, GOUT and STONE.

Upon opening a vein, eſpecially after meals, *Milk* is ſometimes found inſtead of blood. See Phil. Tranſ. N°. 6. pag. 100.

The ſalt of *Milk* may be prepared by boiling whey to one half, then filtrating it; the coction and filtration is to be continued, till the liquor becomes of the conſiſtence of a ſyrup. This being put into a cellar to chryſtallize, the ſalt will be formed into a cake of a ſaccharine taſte, reſembling manna.

This preparation is Dr. Gaubius's, and is ſomewhat different from that which Valentini, in his *Medicina Nov. Antiq.* alledges to be the famous ſaccharum lactis, ſo much cried up by Lodovicus Feſti, and recommended by others as an infallible cure for the gout. Med. Eſſ. Edinb.

MILK *of Sulphur*. See the article SULPHUR *Precipitatum*.

MILK, in the wine trade. The coopers know very well the uſe of ſkim'd *Milk*, which makes an innocent and efficacious forcing for the fining down of all white wines, arracks, and ſmall ſpirits; but is by no means to be uſed to red wines, becauſe it diſcharges their colour. Thus, if a few quarts of well-ſkim'd *Milk* be put to a hogſhead of red wine, it will ſoon precipitate the greater part of the colour, and leave the whole nearly white; and this is of known uſe in the turning red wines when prick'd into white; in which a ſmall degree of acidity is not ſo much perceived. *Shaw*'s Lect. p. 209.

Milk is, from this quality, of diſcharging colour from wines, of uſe alſo to the wine-coopers, for the whitening of wines that have acquired a brown colour from the caſk, or from having been haſtily boiled before fermenting; for the addition of a little ſkim'd *Milk* in theſe caſes, precipitates the brown colour, and leaves the wines almoſt limpid, or of what they call a water whiteneſs, which is much coveted abroad in wines, as well as in brandies.

Womens MILK.— The *Milk* is often a very troubleſome and dangerous thing to women in their lyings-in, and ſubjects them to many painful diſorders. About the third or fourth day after delivery they are uſually affected with chilneſſes and ſhiverings, which are well known to be owing to that cauſe, and are therefore not to be treated as a diſeaſe, nor any medicines to be given in them; only it is proper to keep the perſon warm, and promote perſpiration, eſpecially in the breaſts. Sometimes indeed this ſymptom is joined with a febrile heat, or a real inflammatory fever, which is then to be taken off by the proper means. See the article *Inflammatory* FEVER.

Very frequently there come on inflammations of the breaſts, of the erſypelous kind; theſe are uſually taken off by the external uſe of ſpirit of wine and camphor with a little ſaffron in it, and by carefully keeping the parts warm.

The *Milk* often proves very difficult to be drawn out; this is to be helped by the keeping the body carefully open by caminative and emollient clyſters, by keeping up a gentle diaphoreſis, and by attemperating medicines mixed with the milder alexipharmics. The breaſts are all the time to be kept carefully covered with flannel, and gently preſſed and rubbed at times; and finally they are to be drawn by means of a pipe, or by the mouth of an experienced perſon.

Deficiency of MILK, is alſo a very common complaint, and it is in ſome caſes abſolute, there being no *Milk* at all derived into the breaſts; in others, it is only a partial one, there being ſome *Milk*, though not enough to ſupply the child with nouriſhment. A total deficiency of *Milk* moſt frequently happens to perſons who have their firſt child when ſomewhat advanced in years, and to ſuch as are of a choleric diſpoſition; but a partial deficiency of it is often owing to a ſaltneſs of the ſerum, and ſometimes to the want of nouriſhments, and often is brought on by ſorrow.

When ſaline and bilious humours are in fault, then lac lunæ, calcin'd cryſtal, and other abſorbent powders, become of great uſe: Some alſo preſcribe the powder of earth-worms carefully dried, and the voiding the humours by ſtool, by means of gentle purges: When a want of nouriſhment is the only occaſion of it, the *Milk* may always be recovered in a proper quantity by means of good foods, with *Milk* and other nouriſhing fluids.

An over-abundance of MILK is as common a complaint, as a deficiency of it, and requires as much care in the treatment, otherwiſe the perſon is frequently ſubject to nodes and abſceſſes in the breaſt. The proper remedies are the eating and drinking more ſparingly, and the letting two children ſuck inſtead of one.

Many people do not ſuckle their children, and therefore find it neceſſary to drive away their *Milk* abſolutely. This is beſt done by taking internally the digeſtive ſalts, with diaphoretic and diuretic medicines. Externally, it is proper to apply to the breaſts bags of the dried leaves of parſley, mint, chervile, *&c.* with the ſeeds of coriander and parſley, and a little camphor; and ſpirit of wine with camphor, and a little ſaffron is to be rubbed in, or linnen rags wetted in it and applied. Cerates may alſo be made of white wax melted in oil of almonds, with a little camphor, and applied to the breaſts freſh every morning and evening, or oftner if neceſſary.

A too great thinneſs of the MILK, is another common complaint with nurſes; this is to be laid ſometimes to the diet, ſometimes to the concoction, and ſometimes to the unnatural tenuity of the humors; in this caſe the *Milk* is often perfectly watery, and the child is thrown into an atrophy by it. The remedies for this are, a change of diet, and a purging of the primæ viæ by ſome gentle cathartic, and afterwards a ſtrengthening of them by bitters, and ſtomachic medicines. Sometimes alſo, it is neceſſary to evacuate the ſerous humours by the common phlegmagogues, ſuch as jalap in proper doſes mixed with a little powder'd ginger, which is an excellent corrective for it.

The *Milk* is ſometimes ſalt to the taſte, and ſometimes of a bilious yellow colour; and theſe diſtemperatures of it uſually throw the child into colics, diarrhœa's, vomitings, cutaneous eruptions, with ſcabs, and ſometimes abſolute ulcerations, and ſometimes into fevers. In this caſe, the nurſe or parent is to take the abſorbents and nitrous medicines, with intermediate purges; thus, powders of crabs-eyes, oyſter-ſhells, and purified nitre, with ſmall doſes of rhubarb between whiles, often perfect a cure; but during the courſe of taking theſe remedies, and for ſome time afterwards, the diet muſt be under ſome regulations, particularly ſalt foods are to be avoided; and all acids, aromatics, and ſtrong liquors, either wholly let alone, or taken very ſparingly. The perſon muſt alſo carefully avoid all violent paſſions of the mind, as anger, fear,

fear, and the like; and from all violent emotions of the body.

A contrary extreme to the thinneſs and watery appearance of the *Milk* before deſcribed, is, *a mucous thickneſs of it*. This is principally troubleſome and dangerous to the parent, as it is apt to bring on tumors and nodes in the breaſt. The method of treatment in this caſe, is to give gentle alexipharmics for ſome days, then the gentle laxative medicines in ſmall doſes, and finally to allow a moderate uſe of wine.

Stagnations of the MILK. Theſe are very frequent in lyings-in, and are to be diſcuſſed by the ſame method as was before ordered for the ſending it back, in caſes where perſons do not chooſe to give ſuck; and, to the things there directed, may be added, the internal uſe of ſperma-ceti and of calcin'd mountain cryſtals, in powder; and externally, cataplaſms of ſperma-ceti with ſome volatile urinous ſalt, and the gentle compreſſion of the breaſts by wearing ſtrait cloths about that part.

Nodes of the Breaſts often ariſe from the abundance and the mucous nature of the *Milk*. They are to be diſcuſſed by plaſters of ſperma-ceti, with anniſe, parſley, and coriander ſeeds; and by gently rubbing with a ſoft fleſh-bruſh, as alſo by wearing ſome animal's ſkin that has a thick fur on it, which at once ſerves the double office of warmth and a gentle friction.

Abſceſſes of the Breaſts very often happen alſo from the ſame cauſes; and theſe when there appears no hopes of diſcuſſing them are always to be brought to ſuppuration as quick as poſſible. A maturating plaſter is to be laid on the parts that are to be broke, and the other parts are to be rubbed with ſpirit of wine and camphor, and ſaffron infuſed in it. When the matter in the abſceſs is ripe, if the ſkin do not burſt of itſelf it is to be immediately opened with a lancet; after this a plaſter of equal parts of diachylon ſimplex and that with the gums, with a little comphor mixed in it is to be applied; and afterwards digeſtives are to be wholly avoided, and no dreſſings but balſamics allowed. The liquor of myrrh, or a mixture of eſſence of myrrh and amber and ſpirit of turpentine, make an admirable dreſſing; and internally, gentle purges are to be given, and the milder dieuretics, with the nitrous and ſaline medicines.

Cracks and fiſſures of the Nipples, is another terribly troubleſome complaint with thoſe who give ſuck. The beſt applications to theſe, are the oil of eggs with the liquamen of the buds of the poplar, oil of wax, linſeed oil ſhook together with the whites and yelks of eggs, a liniment made of marygold-flowers and freſh butter, an ointment of liquorice, and the liquor produced from the flowers of mullein and marygolds, heated together in an oven. The ſucking out the *Milk*, by means of a glaſs pipe, is very neceſſary during the continuance of this complaint; but the beſt method of preventing it, is the applying white wax to the nipples for ſome time before, as well as after the time of the labour.

The Smallneſs of the Nipples is a trouble to many nurſes; theſe when the complaint is only owing to their lying-in, the breaſts are to be forced out by the ſucking of a robuſt child of ſix or more months old, by the application of the common glaſs-pipe firſt made warm, and by the ſucking of a grown perſon experienced in ſuch caſes: All natural accidents of this kind may be cured by this means; but often the nipples have been ſo forced in by ſtays, at the very time of their growth in young girls, and this force continued ſo long, that no art is able to recal them to their natural ſtate, or make them fit for an infant to ſuck from.

The miſchiefs that ſometimes attend perſons who have given ſuck, in the weaning of children, or on the death of a child, and the *Milk* being left undrawn out, are to be avoided, by letting ſome other child ſuck a little at a time, and that leſs and leſs every day, and by drawing afterwards a little every day with a pipe.

It is very common among nurſes to be extremely ſcrupulous about diet, and to require the niceſt foods for the creating good *Milk*; but it is evident, that though ſome care is neceſſary to this purpoſe, yet it is not this; for the poorer people, who live on the coarſeſt food, often have the richeſt *Milk*. The whole neceſſary caution ſeems to conſiſt in avoiding exceſs, and feeding as much as poſſible on ſimple foods, without too many vegetables, and not to lead too ſedentary a life.

Things hard of digeſtion are to be abſtained from, as alſo acids; too ſalt meats, and all flatulent things, and the acrid and aromatic things, are to be very carefully meddled with; ſince, tho' they do not affect the mother, they ſeldom fail to bring diſtempers upon the child. There is no better drink for thoſe who give ſuck than malt liquors, when they are well ſettled and clear. Stronger things, even wine in thoſe who are habituated to it, tho' it do not hurt them, is to be refrained from, ſince it ſubjects the child to convulſions and many other diſorders.

Over large draughts of cold liquors, and the expoſing the breaſts too much to the cold, are often the cauſes of very great diſorders both in the mother and the child. Gentle exerciſe, and motion of the body in general, is highly ſerviceable to nurſes, as is alſo that of the breaſts in particular. The gently ſhaking and preſſing them throwing off the aqueous part of the *Milk*, and filling the lactiferous ducts more freely and copiouſly, than would otherwiſe be done. The improper methods of dreſs in ſome places, and ſqueezing the girls into ſlenderneſs by ſtrait ſtays, often occaſions the lactiferous ducts to be ſo contracted, and the nipples ſo repreſſed, that no art can afterwards bring the perſon to be properly qualified for ſuckling a child. *Junker*'s Conſp. Med. p. 732, ſeq.

Violent paſſions of the mind are extremely injurious to thoſe who give ſuck. It is very common to ſee nodes and abſceſſes of the breaſts brought on by theſe alone, and eryſipelatous inflammations are as frequent in perſons of other habits, from the ſame cauſes. The child alſo is often thrown into diarrhœa's, by it; and in general, it is a very neceſſary rule to ſqueeze and ſhake the breaſts to diſcharge the *Milk* after a great fright, or a violent fit of paſſion, before the child is ſuffered to ſuck. If the menſes appear at the time of giving ſuck, the child is uſually greatly injured by the alteration the *Milk* ſuffers.

When women are newly lain in, if the breaſts become turgid, and there is danger of the *Milk*'s coagulating in them, the child if it be ſtrong ſhould be immediately put to ſuck; but if otherwiſe, the breaſts are to be gently ſhaken and preſſed to diſcharge the redundance, or another child, or grown perſon, put to ſuck them.

Extract of MILK, a ſweet dry extract of cows milk made by evaporation.

Fred. Hoffman recommends this extract boiled with pure water to the quantity of what is exhaled of the *Milk*, as an excellent drink in many diſorders, where *Milk* itſelf is not proper. See his Diſſert. *de ſaluberrima ſeri lact. virtut.* oper. Tom. VI. p. 13.

Milk is often thought improper with purgatives, and it certainly does render ſome perſons coſtive; but this does not hold generally, nor perhaps for a long time, even in thoſe whom it may ſo affect at firſt. Hoffman recommends an ounce of manna diſſolved in a pint of *Milk* as a good laxative.

Moon's MILK. See the article LAC *Lunæ*.

MILK-WORT. See the article LACTARIA.

MILK-*wort*, in botany. See the article GLAUX.

MILL (*Cycl.*)—MILL-*Dams*. A very firm way of making theſe in a quick or running ſand, which is uſually found a very troubleſome circumſtance in the making them, is by laying the foundation with unſlacked lime; which, by ſlacking among the ſand, runs together into a hard ſtone, which gives a very firm and ſure foundation. *Plot*'s Staffordſhire, p. 336.

MILL-*Stones*. The *Mill-ſtones* which we find preſerved from antient times, are all ſmall and very different from thoſe in uſe at preſent. Thoreſby mentions two or three ſuch found in England, among other Roman antiquities, which were but twenty inches broad; and there is great reaſon to believe that the Romans, as well as the Egyptians of old, and the antient Jews, did not employ horſes, or wind, or water, as we do, to turn their *Mills*, but made their ſlaves and captives of war do this laborious work; they were in this ſervice placed behind theſe *Mill-ſtones*, and puſhed them on with all their force. Sampſon, when a priſoner to the Philiſtines, was treated no better, but was condemned to the *Mill-ſtone* in his priſon. The runner or looſe *Mill-ſtone* in this ſort of grinding, was uſually very heavy for its ſize, being as thick as broad. This is the *Mill-ſtone* which it is expreſly prohibited in Scripture to take in pledge, as lying looſe it was more eaſily removed. The Talmudiſts have a ſtory, that the Chaldæans made the young men of the captivity carry *Mill-ſtones* with them to Babylon, where there ſeems to have been a ſcarcity at that time; and hence, probably, their paraphraſe renders the text "have borne the *Mills*, or *Mill-ſtones*;" which might thus be true, in a literal ſenſe. They have alſo a proverbial expreſſion of a man with a *Mill-ſtone* about his neck; which they uſe to expreſs, a man under the ſevereſt weight of affliction. This alſo plainly refers to theſe ſmall ſort of ſtones.

MILLAINS, according to Mr. Wingate, are the third ſubdiviſion of the primes in Gunter's line; and expreſs the thouſandth parts of ſuch primes.

MILLEFOLIUM, *Yarrow*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the radiated kind; its diſk is compoſed of floſcules, and its outer edge of ſemi-floſcules, which all ſtand up on the embryo-ſeeds, and are contained in one general ſquammoſe cup, of a ſort of cylindric figure. The embryo's finally ripen into ſlender ſeeds; to this it is to be added, that the leaves are always finely divided, and the flowers are collected into tufts.

The ſpecies of *Yarrow*, enumerated by Mr. Tournefort, are theſe: 1. The great white-flowered *Yarrow*, called Achillæa. 2. The common white-flowered *Yarrow*. 3. The great purple-flowered *Yarrow*. 4. The common *Yarrow*, with purple flowers. 5. The noble *Yarrow*, or ſcented *Yarrow*. 6. The Montpelier ſweet *Yarrow*. 7. The hoary alpine *Yarrow*, with fleſh-coloured flowers. 8. The hoary alpine *Yarrow*, with beautiful flowers. 9. The woolly yellow *Yarrow*. *Tourn.* Inſt. p. 495.

The

The common *Yarrow* which is in flower on our ditch-banks, and in dry paſtures the greateſt part of the ſummer, is a much nobler medicine than is ſuppoſed. The medical writers have ſaid much of it as a vulnerary, and recommended its external uſe in tumors and ulcers; and internally, as a remedy for hæmorrhages of all kinds; in which caſes experience ſhews us, that a ſtrong decoction of the whole plant, roots and leaves, does wonders. The flowers of this plant have the ſingular property of yielding a fine deep blue oil, by diſtillation. The flowers of Chamæmile do the ſame; but we do not know any other plant, except theſe two, that do it.

MILLEMORBIA, in botany, a name given by ſome authors to the ſcrophularia, or figwort, from its ſuppoſed virtues in many diſeaſes. *Ger.* Emac. Ind. 2.

MILLEPEDA, in conchyliology, the name given by authors to a ſpecies of murex of the ſpider ſhell-kind, ſo called from the great number of prominences in the ſhape of points called feet in this ſeries of ſhells, which ariſe from its lip which is greatly extended. The body of the ſhell is full of bumps and tubercles, and the tail is long and crooked. See the article MUREX.

MILLEPEDES (*Cycl.*)—Well-known inſects, uſed on many occaſions in medicine. This inſect is otherwiſe called *Aſellus*, or *Oneſcus*, in Engliſh the *Wood-louſe*. Mr. Ray deſcribes ſeven different ſpecies of this inſect, ſome of which we ſee every day, others are more rare. Theſe are, 1. The common *Millepes*, called the *Aſellus Aſininus*; this is thinner and flatter than the blue kind, and carries antennæ ſtrait forward, and its colour is a pale browniſh grey; the laſt ring of its body is acute, not annular, and the appendages of the ſides are forked, as is alſo the tail. This kind is common in old walls, and under the barks of old trees. 2. The greater blue or livid *Millepes*; this is conſiderably larger than the former, and is of a duſky bluiſh black colour; the laſt ring of its body is annular, not pointed, its tail is not forked; its body, like that of the former, is divided into fourteen rings, and it eaſily rolls itſelf up into a round ball. 3. The great ſea *Aſellus*; this is three times as large as the common kind, its body is divided into twelve rings, its eyes are large and round, the antennæ are long, and are compoſed only of three points, the tail is double, and has four horns; its colour is ſomewhat paler than the common kind. 4. The mountain *Aſellus*; this is of the ſize of the livid kind, and in the ſame manner rolls itſelf up when touched; its body is divided into eleven rings, and its colour is a mixture of black and red. 5. The great Cornwall *Aſellus*; this is about an inch in length, its antennæ are very long, it has fourteen feet, and is of a reddiſh brown colour; it is diſtinguiſhed from all the other kinds by the ſhape of its tail, which is a flat lamina, divided into three points at the end; the eyes are ſmall and black, and the body is compoſed only of ſeven rings beſide the head and tail; the feet have all a ſort of hooks at their end, and the hinder legs are longer than any of the others. 6. The *Aſellus aquaticus*, or water *Millepes*; this is ſomewhat ſmaller and ſlenderer than the common kind, its antennæ are very ſlender, and its colour is a pale browniſh grey, with a dark ſtreak running down the back; its body conſiſts of ſeven joints, each of which has a pair of legs; its hinder pair of legs are longer than the others, and it has another peculiar mark, which is, there are two very ſlender horns iſſuing from the tail, and making a kind of fork. The 7th kind is the ſhort ſea *Millepes*; this is broader as well as ſhorter than the common kind, and has two appendages on each ſide the tail, which it uſes in ſwimming; this is of the ſame colour with the common kind, but has a black liſt running down the back; the eyes are ſmall, the body conſiſts of ten joints, beſides the broad tail; it rolls itſelf up in the manner of the blue *Wood-louſe*, and has under each ring of the body, beſide a pair of legs, two fins that ſerve it in ſwimming. *Ray*'s Hiſt. Inſ. p. 41.

The firſt and ſecond kinds are uſed in common in medicine; but the ſecond or blue kind, which rolls itſelf up into a ball, is the proper medicinal kind.

Beſide theſe proper *Aſelli*, there are ſome other ſpecies commonly called *Pulices marini*, which ſeem greatly to approach to their nature. Theſe are, 1. The horned ſea *pulex*; its body is compoſed of twelve joints, it has ſeven pair of legs, and the hinder ones are longer than the others, the antennæ are a pair of very large horns, and at the baſe of theſe there ſtand two other very ſhort and ſlender ones: It has fins to ſwim with, and it is of a whitiſh colour, and very ſlender body. 2. The *pulex marinus* of Bellonius; this is of the ſhape of the common *aſelli*, but ſomewhat ſlenderer and rounder bodied, and its legs are much longer; its back is brown, its eyes are large and black, and the antennæ are articulated and have two ſmall ones growing from their roots; its body is pellucid, and it moves very ſwiftly in the water; the tail is compoſed of a large bundle of hairs. This is found in great plenty under ſtones by the ſides of rivers near the ſea. 3. The freſh-water *pulex*; this differs very little from the laſt ſpecies, but is ſingular in the places it inhabits, which are the banks and mud of hot ſprings, in which no other animal can live. *Ray*'s Hiſt. Inſect. p. 44.

MILLEPORA, in botany, a name by which Linnæus diſtinguiſhes that genus of ſea-plants, of a hard ſtructure and full of holes, which are not ſtellate or radiated, in which it differs from the madrepora.

MILLERS-*Thumb*, in ichthyology, an Engliſh name for the fiſh called alſo the bull-head, and by authors the cottus. See the article BULL-HEAD.

Some are ſo erroneous as to ſuppoſe this fiſh, and the loach to be the ſame. See the articles LOACH, and COBITIS.

MILLIARIA *Cohors*, in antiquity. See the article COHORS *Equitata*.

MILLMOTH, in natural hiſtory, the name of an inſect approaching to the nature of the beetle, but having no ſheath wings. It is common in the abodes of millers and bakers, and other perſons who deal in meal.

MILPHOSIS, a word uſed by the antient medical writers, as a name of the diſeaſe of the eye-lids, by which the hairs fall off from them, and the edges become red and tumid.

MILTOS, in the natural hiſtory of the antients, the name of what we call reddle, a red earth of the ochreous kind, uſed in painting. The Greeks uſed the word in a leſs determinate ſenſe, and called all the red earths by this name, with adjectives derived from the names of the places where they were found, *&c.* to denote their differences.

Many however have thought too boldly, that the cinnabar found native, and called by the Greeks *minium*, was alſo comprehended under this name; but for this there is no warrant, and the paſſage in Pliny which gave birth to the opinion, is merely an error in the copies from the falſe pointing; and all that Pliny ſeems really to have meant, was, that the Greeks called reddle by the name of *Miltos*, and minium by that of cinnabar. Reddle ſeems to have been of very antient uſe in painting; for we have plain teſtimony in Homer, that it was uſed by the Greeks in the time of the Trojan war, that poet calling their ſhips by an epithet which ſignifies their being painted with reddle; and the accounts of the earlieſt painters, which tell us that they uſed only four colours, make reddle to be one of theſe four. *Hill*'s Theophraſt. p. 124. See the articles REDDLE and RUBRICA.

MILVAGO, in ichthyology, a name given by Geſner and ſome others, to a fiſh called by authors in general *milvus* and *cuculus*, and by ſome *lucerna*, and the flying fiſh. It is a ſpecies of the trigla, and is called by Artedi the trigla, with a ſnout bifid at the extremity, and the ſide-lines forked near the tail. See the article TRIGLA.

MILUS, μιλος, a name given by the Greek writers to a plant uſed in garlands, and ſometimes to a tree. Theophraſtus evidently uſes it as the name of a tree, and Crato as that of a garland herb.

It ſhould ſeem by compariſon of what they ſay of this *Milus*, that it is no other than a corruption of the word *milax*, or *ſmilax*. This we know was uſed as the name of the yew-tree, and alſo as the name of that climbing plant which we at this time call ſmilax; and what ſtrengthens the opinion is, that this creeping ſmilax was one of the common herbs uſed in garlands, having got into eſteem on theſe occaſions by the length and toughneſs of its branches, which were eaſily twiſted into any form, and wound round about whatever they pleaſed.

Pliny tells us, that it was a melancholy herb, and not fit for garlands; becauſe it had been once a virgin, and was turned into this form in conſequence of an unhappy love for the inconſtant youth crocus; but if this were to have been an objection to the uſe of theſe plants among the antients, thoſe garlands muſt have been either very thin, or made of paltry weeds; for the fancy of their poets had ſcarce let any flower or herb worthy obſervation paſs without ſome ſuch hiſtory.

There ſeems to have been no plant uſed ſo frequently in the rites of Bacchus as the *ſmilax*, or this climbing herb; and this is by the earlieſt writers ſometimes called *Milax*, or *Milos*, and ſometimes *Smilax*; ſo that it ſhould ſeem that they were only the ſame word differently ſpelt.

Euripides frequently mentions it in his Bacchi, and ſometimes celebrates it in flower, ſometimes in fruit, calling it καλλικαρπος, and ανθεσφορος, the elegant fruited and the flowery ſmilax; and this laſt ſenſe of it Pliny has taken, calling it *anthophorus*, the flowery ſmilax. Athenæus, in his fifth book, mentions the bacchides as carrying ſpears covered with vines, ivy, and ſmilax, or *Milos*. In this ſenſe of ornamenting garlands, ſpears, *&c.* they meant only the herb ſmilax, not the yew-tree.

MILVUS, the *flying fiſh*, the name of a fiſh remarkable for the length and ſize of its gill-fins, which it ſometimes makes uſe of to fly with: It is of the cuculus or gurnard kind, and is called by ſome the rondine, and by others the falcone. See Tab. of fiſhes, N°. 41.

Its general ſize is about ſix inches in length; its head is broad and flatted, and its body long and rounded, and very ſlender toward the tail. The ſpace of the forehead between the eyes is large and hollow, and the whole head is covered with a ſtrong bony cruſt; this is rough and of ſeveral colours, as blue, yellow, and purple: This cruſt covers alſo ſome part of the back, and terminates in two very long and ſtrong ſpines, which lie down upon the back: It is covered with very hard ſcales, every one of which riſes into a ſharp tubercle in the middle. The back is of the ſame colours with the head, but ſomewhat

ſomewhat duſkier. Its eyes are large, and the coverings of the gills terminate on each ſide in a very long and ſharp thorn, which is ſerrated on the outſide. The mouth is ſmall, and is placed low in the head; and its jaws are granulated, rather than toothed. Its belly is white, and its tail forked. Its gill-fins, commonly called its wings, are ſo long as when laid cloſe to the body to reach to the tail, and they are as it were double, a ſmall fin compoſed of a ſeries of ſhort nerves or rays connected by a ſmall membrane ſtanding before each. Theſe wings are of an olive colour on their upper ſide, and are ſpotted with very beautiful blue ſpots near their edges. *Willughby*'s Hiſt. Piſc. p. 284.

This fiſh, when it pleaſes, is able to riſe out of the water and fly to a conſiderable diſtance in the air; but when its wings are dry, is obliged to plunge again into the water to moiſten them. It does this often, when purſued by an enemy; and whole ſhoals have been ſeen thus flying together. It is common in the Mediterranean, and ſome other ſeas; but is not known in ours, nor in any of the colder climates.

MILVUS, in ornithology, the name of the common kite: A bird diſtinguiſhed from all other birds of prey, by its forked tail. It remains with us the whole year; but in many other countries is a bird of paſſage. *Ray*'s Ornithol. p. 41.

MILVUS *Æruginoſus*, in zoology, the name of the moor-buzzard; a bird of the long-wing'd hawk kind, ſmaller than the common buzzard, and not ſo flat on the head. Its beak is large and crooked, covered with a greeniſh yellow ſkin near the top, and black in other places. Its mouth is bluiſh within. Its head is of a whitiſh orange colour, variegated with black ſtreaks; its throat is of the ſame colour; and all the reſt of its body, as well back as belly, is of a duſky ruſt colour, only that in each wing there is a yellowiſh white ſpot; and the feathers at the root of the tail are yellowiſh. Its legs are long and ſlender, and of a yellowiſh colour. The inſide of its wing-feathers are whitiſh. It is common with us about heaths and marſhes. *Ray*'s Ornithol. p. 42.

MIMOSA, the *ſenſitive plant*, in botany, the name of a genus of plants, the characters of which are theſe: The flowers are uſually collected into tufts or heads, and each conſiſt of one leaf of a fennel-like ſhape, containing a great number of ſtamina: The piſtil ariſes from the bottom of the flower, and finally becomes either a ſimple bivalve pod containing a number of oblong ſeeds, or elſe a compound one made up of ſeveral parts joined to one another by a ſort of tranſverſe articulation, each containing one roundiſh ſeed. To this it is to be added, that the leaves of all this genus of plants, when touched, become capable of a ſort of reciprocal motion. *Tourn.* Hiſt. p. 605.

The ſpecies of *Mimoſa*, enumerated by Mr. Tournefort, are theſe: 1. The common *ſenſitive ſhrub*. 2. The prickly and more *ſenſitive Mimoſa*. 3. The broad-leav'd *ſenſitive plant*, with pods collected in round cluſters. 4. The Jamaica *ſenſitive plant*. 5. The prickly Pernambuco *Mimoſa*. See the article SENSITIVE *Plant*.

MINA, or MNA, among the antient Greeks, a piece of money worth an hundred drachmas.

The *Mina* was ſomewhat more than three pounds Sterling; ſixty *Minæ* made the Attic talent. *Danet.* in voc. See the article COIN, *Cycl.*

MINCA, a name given by the antients to a very coarſe and bad kind of myrrh.

MINCHA, in the Jewiſh cuſtoms, offerings of meal, cakes, or biſcuits, made in the temple of the Lord [a]. The Seventy have ſometimes preſerved this word in their tranſlation [b]; but inſtead of *Mincha* they read *Manaa*, which doubtleſs was the received pronunciation in their time. We find *Manaa* in the ſame ſenſe, in Baruch i. 10 [c].—[[a] Levit. ii. 3, *&c.* [b] See the Greek of Jerem. xvii. 26. Dan. ii. 46. 2 Kings viii. 5, 9. xvii. 7. xx. 12. 2 Chron. vii. 7. Nehem. xiii. 5, 9, *&c.* [c] *Calmet.* Dict. Bibl.]

MINE (*Cycl.*)—The diſcovery of *Mines* is not always attended with a certainty of advantage. The firſt thing to be conſidered in regard to it, is whether it can be dug to profit; and to be able to determine in this reſpect, we are duly to weigh the nature and ſituation of the place, and compare the reſult of the whole with the profit from the richneſs of the ore, and the charges of digging, ſmelting, and working it.

A *Mine* is either found in a mountain, a hill, a valley, or a flat; of theſe, mountains and hills are dug with greateſt eaſe and conveniency, chiefly becauſe the drains and burrows, that is, the adits and avenues may be here readily cut both to drain off the water, and to form gangways for bringing out the ore. In whatever place the *Mine* lies we are to look for the veins, which rains or other accidents may have diſcovered; and where ſuch a vein is found, if it be tolerably large and rich, it is beſt to open the *Mine* there. Otherwiſe the moſt commodious place for ſituation is to be choſen, that is, neither on a flat, nor on the tops of mountains, but in their ſides. *Shaw*'s Lectures, p. 244.

The beſt ſituation for a *Mine*, is a mountainous, woody, wholeſome ſpot, of a ſafe eaſy aſcent, and bordering upon a navigable river. For wood is indiſpenſably neceſſary for making the engines and inſtruments, building the huts, fencing in the works, and working the ores. But tho' wood ſhould be wanting, if a navigable river be nigh, that may be ſupplied, as water-carriage is cheap. Water however muſt never be wanting. This is beſt ſupplied by a large river, and is neceſſary on a thouſand occaſions, to waſh the ores, turn the works, *&c.* Good convenience of carriage muſt alſo be regarded, both for the carrying the ore or metal to market, and the bringing neceſſaries to the workmen: For proviſions are ſeldom to be found where there are *Mines*. See the articles DIGGING, MINING, and TRACING.

MINE-*Dial*, is a box and needle with a braſs-ring divided into 360 degrees, with ſeveral dials graduated thereon; generally thus made for the uſe of *Miners*.

MINERAL (*Cycl.*)—*Engliſh*-MINERALS. Dr. Woodward has obſerv'd, that the Engliſh *Minerals* are much more valuable and numerous, than has been generally ſuppoſed. Fullers-earth, a thing ſo cheap as to be diſregarded by many, he obſerves, is of almoſt as much value to our commerce, as any article of foreign production. The property this earth has of imbibing oil and greaſe, is not confined to the trifling ſervice of taking out accidental ſtains in clothes, but it is of ſo much uſe in cleanſing the wool and the cloth made of it, that we could never have flouriſhed in the cloth-trade in the manner we have done, had we not this foſſil among us ſo very plentiful and cheap, and at the ſame time ſo excellently good. This earth is one inſtance of the pre-eminence of our ſoil above others. Another inſtance we have in our black-lead or wadd, a *Mineral* of great uſe and value in ſeveral branches of trade and arts; and which is found no where fine and good, except in England, and in our colonies; and that of the laſt place, tho' better than the black-lead of other nations, is greatly inferior to our own.

The amber and jet of England are found in conſiderable quantity, and are equal to thoſe of any other part of the world. Our cannal-coal comes very near the beauty of jet; and even our common coal for firing is greatly ſuperior in goodneſs, to that of any other part of the world, and is no where found in ſuch vaſt plenty as with us. The Engliſh earths and gravel are well known to be ſuperior to thoſe of other countries, in none of which ſuch graſs-plats or ſuch gravel-walks are to be ſeen, as in the Engliſh gardens. We have ſtones, ſlates, flags, and the other neceſſary foſſils for building, in ſufficient plenty.

Vitriol and alum are found in greater plenty in England, than in any other country; and are ſo eaſily worked or procured from their ores, that we can ſell them cheaper than any other people. *Woodw.* Cat. Foſ. Vol. I. p. 5.

Tin is another article in which England has always had a great pre-eminence; the county of Cornwall alone produces more tin than all the world beſide; and the tin of England is well known to excel that of other nations, as well in value as in quantity.

Lead ore is alſo richer in England than in any other country, and is found in greater quantity here than any where elſe; beſide this, it runs more kindly in the fire, and requires leſs trouble and expence in the working, than any other lead; and is, when wrought, much finer and more ductile, than any other lead.

This does not ariſe from any peculiarity in the metal, for lead is the ſame in all countries, when equally purified; but the ſpar which lies about, and is mixed with our lead-ore, is of ſuch a nature and diſpoſition, that it is eaſily wrought upon and readily parts from it, leaving the metal more pure than it can be procured by the common large operations in other countries; ſo that they are forced to ſend it away much leſs pure than ours is.

Copper and iron are alſo found in England in very great plenty, and ſeveral ores of theſe metals have of late been brought into uſe, which were not known before the modern improvements in chemiſtry.

MINERAL *Waters*. See the article *Mineral* WATERS.

Earth of MINERAL *Waters*. See the article EARTH.

MINERAL *Juices*. See the article JUICE.

MINERAL *Courts*, *Curiæ Minerales*, in law, courts for regulating the concerns of lead-mines; as *ſtannary courts* are for tin. *Blount*.

MINERVALIA, among the Romans, called alſo *Quinquatria*, were feaſts celebrated in honour of Minerva. They began March 19th, and laſted five days. The firſt day was ſpent in prayers to the goddeſs; the reſt in offering ſacrifice, ſeeing gladiators fight, acting tragedies upon mount Albanus, and reciting pieces of wit, wherein the conqueror had a prize given him. Scholars had then a vacation, and made a preſent to their maſters, which was called *Minerval*.

MINICULATOR, among the Romans, a ſervant who embelliſhed any writing with *Minium*. *Hoffm.* Lex. in voc. See the article MINIUM, *Cycl.* and *Suppl.*

MINING, the ſinking or digging into the earth in ſearch of metals, or other valuable foſſils.

The neceſſity of cleaving and opening rocks has been always accounted one of the moſt troubleſome articles in the buſineſs of *Mining*; they being often compoſed of ſuch ſtone as tools can work but very ſlowly upon in the common ways. Fire and gunpowder have been the two things principally had recourſe to on theſe occaſions; and both ſucceſsfully, but in dif-

ferent ways. The fire calcines ſtones, and they then eaſily become ſhattered to pieces, and give way to tools that would not touch them before; but in this caſe, beſide the expence of wood, the hindrance of the labourers is an article to be conſidered, for the rocks are made ſo hot all about the place where the fire has been, that the people cannot get to work again of a day or two, and then the effect of fire reaches but a little way in the rock.

Gunpowder makes its way much farther, and at the ſame time is much cheaper and does not delay the work, but the labourers may go on immediately afterwards. There have been many ways contrived of uſing this, but one of the ſimpleſt and beſt, ſeems that delivered by Mr. Beaumont, in the Philoſophical Tranſactions. For this there are only three ſimple inſtruments required, a borier, a gun, and the quinet or wedge. Theſe are the names the *Miners* on Mendip hills give the inſtruments. The borier is an iron inſtrument, ſteeled at the end; it is two foot two inches long, and is ſomewhat thicker at the ſteel'd end than in any other part: The uſe of this is to make the hole in the rock deep enough to receive the powder. The gun is about ſix inches long, and an inch and quarter in diameter; and has a hole drilled through it, to receive the priming. The quinet is a wedge of iron of about ſix inches long, and ſo ſhaped that its flat part on one ſide joins with a flat part in the gun made to receive it, and by that means the gun is faſtned very firmly in its place. Philoſoph. Tranſ. N°. 167. p. 854.

The manner of uſing theſe inſtruments, is this: One man holds the borier on the rock, turning it round while another forces its point in by blows of a large hammer on the other end. When the hole is made ſomewhat deeper than the length of the gun, they dry it with a rag, and then put into it two or three ounces of powder; over this they lay a paper, and then they put the gun into the hole, and faſten it in by driving in the quinet or wedge againſt its flat part. When the powder and gun are thus fixed, they paſs down a wire through the hole drilled in the gun, and with this they pierce a hole through the paper which covers the powder; they then prime the gun, and lay a train with a lighted match; but all go out of the *Mine* before the gunpowder takes fire, and as ſoon as it has gone off they go down to work again, finding the rock ſplit and the inſtruments unhurt. The paper in this caſe is put over the powder only that the tools may be ſafely employed in driving down the gun and the quinet, becauſe were not the powder covered it might do miſchief to the workmen by going off by ſome ſpark cauſed by ſtriking either againſt thoſe inſtruments or againſt the rock itſelf.

MINIUM, (*Cycl.*) in the natural hiſtory of the antients, a name given to what we now call *Cinnabar*. A native mineral of a ſhinining red colour, out of which quickſilver was extracted.

This native mineral becoming much in uſe, was ſoon adulterated, and that commonly with lead ore calcined to a redneſs; and hence, after the two words *Minium* and *Cinnabar* had been long uſed in common, the cinnabar became retained only to the native mineral, and the *Minium* to that adulterated with lead-ore, or to the red adulterating matter alone, which is the ſenſe in which it is ſtill uſed.

The word *Cinnabar* however, by which they at laſt diſtinguiſhed it, among the oldeſt writers on medicine, was uſed as the name of a very different ſubſtance, a vegetable juice of a ſtrong red colour, called by us dragon's blood, and among them long believed to be the dry'd blood of dragons; and when the antients called the mineral body here deſcribed by the ſame name, they always diſtinguiſhed the other cinnabar, where they had occaſion to name it, according to their uſual method by an adjective derived from the name of the place whence it was brought, calling it *cinnabari Indicum*, the Indian cinnabar.

The native *cinnabar* of the antients was the ſame with ours at this time, and was found in the ſame variety of forms. Theophraſtus tells us, that it was hard and ſtony, and that they had it from Spain and Colchis, where it was produced among the rocks. *Hill*'s Theophraſt. p. 140.

Many have ſuppoſed, from the name of a factitious *cinnabar* among the moſt antient writers, that they were acquainted with our method of making the artificial *cinnabar*; but this was by no means the caſe. What they called factitious *cinnabar*, was, according to the ſame Theophraſtus, no other than a fine arenaceous ſubſtance of a ſcarlet colour, and very bright and ſhining, which they had from one particular place only, which was in the country above Epheſus. This they carefully collected, and rubbed to a fine powder, in veſſels made of ſtone, and afterwards waſhed it in other veſſels of braſs or of wood; the coarſer matter they went to work upon again, rubbing and waſhing it as before, till by theſe repeated powderings and waſhings they ſeparated all the pure cinnabar, which always ſunk to the bottom of the veſſels, leaving the accidental foulneſſes at top.

The factitious *cinnabar* of the antients, was therefore no other than a preparation of a native mineral, which contained a quantity of true cinnabar mixed among a large quantity of other matter, and the operation conſiſted in nothing but the ſeparating it from its other matter. The invention of this is attributed to one Callias, an Athenian, who belonged to the ſilver mines; and was diſcovered, as moſt other things have been, by accident. This man had got together a vaſt quantity of this ſand, ſuppoſing from its colour and brightneſs that it contained gold; and tho' he found himſelf miſtaken in that, yet the working on it in hopes of diſcovering that precious metal diſcovered to him this excellent paint. See the article CINNABAR, *Cycl.* & *Suppl.*

The method in which *Minium* is made in large quantities with us, is this: They firſt burn lead in a furnace into a kind of litharge, by continually ſtirring it while melted with an iron rake; this they afterwards grind with two pair of ſtones, which deliver it from one to another, the firſt pair grinding it coarſer, the ſecond finer; theſe are worked by means of a mill which moves ſix pair of them at once. When thus reduced to a fine powder, it is waſhed and then put into a furnace, and is burnt with a reverberatory fire for two or three days, all the while they continue ſtirring it with a large iron rake, hung on a ſwivel or iron hook; and toward the end of the time they watch its being of the right colour. When this is doing, the fire muſt not be carried beyond a certain degree, leſt the matter clod and run together. *Ray*'s Engliſh Words, p. 138.

MINIUM, in medicine, is uſed externally; it obtunds the acrimony of the humors, allays inflammations, and is excellent in the cleanſing and healing of old ulcers: It is uſed, on theſe occaſions, in many of the plaſters and ointments of the ſhops.

MINORATIO, a word uſed by the antients to expreſs a ſlight or moderate evacuation, only ſerving to leſſen the humors, not to carry them off.

MINOW, or MINIM, in ichthyology, a name given by the Engliſh to the ſmall fiſh, called by authors the phoxinus. According to the new Artedian ſyſtem, this is a ſpecies of the cyprinus. See the articles CYPRINUS, and PHOXINUS.

MINT (*Cycl.*)—All the ſorts of *Mint* of which we have ſeveral propagated in gardens for medicinal uſe, are to be propagated by parting the roots in ſpring, or planting cuttings in any of the ſummer months, but they muſt have a moiſt ſoil; and if the weather proves dry, they will require very frequent waterings, after they are firſt planted. They ſhould be planted in beds of four foot width, with walks two foot wide between them, and ſhould be ſet at five inches diſtance. And they ſpread ſo faſt at the roots that the beds ſhould never ſtand above three years before they are taken up and tranſplanted; for the roots after this time will mat and clog together, ſo as to choak one anotber. *Miller*'s Gardener's Dict. See the article MENTHA.

Many people are fond of *Mint* ſallad early in the ſpring; the way to propagate this, is to take up ſome roots of *Mint* before Chriſtmas, and plant them pretty cloſe upon a moderate hot bed, covering them an inch deep with freſh earth; the beds muſt then be covered either with mats, or frames and glaſſes, and in a month's time the *Mint* will come up and will ſoon be fit for uſe.

When *Mint* is cut for drying, it ſhould be done juſt when it is in flower, and muſt always be done in a dry day; for if cut in wet weather, the leaves will change black. It ſhould then be ty'd in ſmall bunches, and hung in a ſhady place upon lines.

If the ſoil be good, *Mint* will afford three crops every ſpring; but after July, they ſeldom are ſo good, ſo that the ſhoots made after that time ſhould be ſuffered to remain till the end of September, to be cut for drying. After this cutting there ſhould be about an inch of freſh earth ſifted over them, which will make them ſhoot much better the following ſpring.

No plant grows ſo vigorouſly and readily in water as *Mint*; and therefore none is ſo proper to try experiments in vegetation upon.

It is generally ſuppoſed, that plants are the ſame in their taſte and virtues in whatever ſoil they grow; and this is true in regard to all of them, while they live and flouriſh; the greateſt difference being only in degree.

But plants removed into a ſoil in which they cannot thrive, but in which they will be killed in time, are often altered in their nature, before they periſh. This is inſtanced in nothing ſo clearly as in experiments made on *Mint*, growing in glaſſes of water. Let ſeveral ſhoots of the plant grow in this manner till very vigorous and ſtrong, and then place near one of them a glaſs of water in which ſea-ſalt is diſſolved, remove one of the roots from the freſh water into this, and the plant will be killed in a few days; and its leaves, ſtalk, and every part will taſte ſtrongly of ſea-ſalt, though none could be imbibed any other way than by this ſingle root. Let another plant of *Mint* be ſet near a bottle of ink, and one of its roots put into the ink, the whole plant will in a few days become black, and after that yellow, and will taſte of the copperas.

It is leſs wonderful that theſe unnatural ſalts ſhould affect the *Mint* in this manner, than that the infuſion of another plant ſhould do it; yet this is evidently the caſe. Let a quantity of the ſeeds of wild garlic be bruiſed and put into water, and let two or three of the roots of a vigorous plant of *Mint* growing in common water be put into this liquor, the whole plant will in a few days decay, and the whole plant being

chew'd

chew'd in the mouth will be found to have a very ſtrong flavour of garlic.

MINT, in medicine, is a famous ſtomachic and carminative; it is alſo eſteemed a great cephalic. There is a ſimple water, and an eſſential oil of it kept in the ſhops. The plant itſelf is taken by way of infuſion or decoction, and enters many compoſitions for the above intentions.

MINUET, or MENUET, in muſic, a compoſition anſwering to a kind of dance of the ſame name, ſaid to be invented in Poitou; the motion whereof is triple. It has commonly two ſtrains, each played twice over; the firſt has four or eight bars; the laſt note of which ſhould be either the *dominant*, or *mediant* of the mode, never the final; and the ſecond has eight bars, it uſually ends on the final of the mode, with a pointed minim or whole bar. *Broſſard.*

MINUTE *Tithes*, *Minores Decimæ*, ſmall tithes of wool, lambs, pigs, butter, cheeſe, *&c.* 2 Inſt. 649. *Blount.*

MIRALETUS, in ichthyology, a name given by Bellonius and ſome other writers, to the ſpecies of ray, commonly called by others *raja oculata*. This is accurately diſtinguiſhed by Artedi, by the name of the ray with a ſmooth back and belly, and with a row of ſpines round the eyes, and three other rows of them on the tail.

MIRROR (*Cycl.*)—*Burning*-MIRRORS. An experiment has of late been tried with a machine invented by Mr. De Buffon at Paris, conſtructed of a number of *Mirrors*, which ſeems the great ſecret of Archimedes revived, and vindicates the credit of antiquity in this point.

The machine conſiſts of 140 ſmall plane *Mirrors*, each about four inches long, and three broad; theſe are fixed at about a quarter of an inch diſtance from each other upon a large wooden frame about ſix foot ſquare, ſtrengthened with many croſs-bars of wood; for the mounting of theſe *Mirrors* each of them has three moveable ſkrews, which the operator commands from behind, and which are ſo contrived that the *Mirror* can be inclined to any angle, and in any direction that meets the ſun; and by this means the ſolar image of each *Mirror* is made to coincide with all the reſt.

They firſt tried the experiment with only 24 of the *Mirrors*, which readily ſet on fire a combuſtible matter which they had prepared of pitch and tow daubed upon a deal-board, at the diſtance of ſixty-ſix French feet. The only difficulty that was found, was the making the ſolar images exactly coincide; but this was the fault of the apparatus. Philoſ. Tranſ. N°. 483.

This trial, and ſo much ſucceſs from it, engaged the inventor to puſh the attempt much farther; he put together therefore a kind of polyhaedron conſiſting of 168 pieces of plane looking-glaſs of ſix inches ſquare each, and by means of this with the faint ray of the ſun in the month of March he ſet on fire ſome boards of beech-wood at an hundred and fifty foot diſtance; and by increaſing the number of the *Mirrors*, he is in hopes of doing the ſame at nine hundred feet off. This machine has, beſide other advantages, the convenience of being able to burn downwards or horizontally, as one pleaſes; and it burns either in its diſtant focus, or in any nearer interval, which our common burning-glaſſes cannot do, their focus being wholly fixed and determined. And perhaps this machine may afford a manner of meaſuring either light or the different degrees of heat of burning bodies. The difficulty is to find the method of marking the degrees and of fixing a point of compariſon, for the point of kindling will not determine it, becauſe that chiefly depends upon the greater or leſs degree of inflammability of different combuſtible bodies. Phil. Tranſ. N°. 483.

MIROUETTE, in the manege, is uſed for a dapple bay. See the article DAPPLE.

MISADIR, or MIXADIR, a name given by ſome authors to ſal armoniac.

MISEN, MISSON, or MIZEN, in a ſhip, denotes either the maſt, or ſail of that name; but at ſea, they always mean the ſail when the word *Miſen* is uſed.

The uſe of the *Miſen* is, to keep the ſhip cloſe to a wind: Wherefore if a ſhip is apt to gripe too much, they uſe no *Miſen*. But it is often uſed when a ſhip rides at anchor, to back her a-ſtern; ſo that ſhe may not foul her anchor, on the turning of the tide; and ſometimes a ſhip lies a-try with her *Miſen* only. See the article MAST, *Cycl.*

Set the MISEN, at ſea, the word of command to fit the *Miſen*-ſail right as it ſhould ſtand.

MISEN-*Stay*, in a ſhip. See the article STAY, *Cycl.*

MISEN-*Yard*, in a ſhip. See the article YARD, *Cycl.*

MISERERE-*Mei*, (*Cycl.*) a name by which many authors call the *Iliaca Paſſio*, or what is vulgarly termed a twiſting of the guts. Medical writers diſtinguiſh this into three kinds: 1. The convolutionary. 2. The hernioſe. And 3dly, the obſtructionary.

In the convolutionary kind, the ſituation of the inteſtines in regard to one another is altered, and very frequently has a remarkable duplicature. In the hernioſe kind, the inteſtines, diſtended with fæces and with flatulencies, are received into the ſcrotum, or ſome other part, ſo as not eaſily to be reduced into their natural places. And in the obſtructionary, there is no other cauſe but a violent coſtiveneſs.

The *Miſerere* differs from the ordinary kinds of colic, in degree, as all the ſymptoms are greatly more violent in this caſe; and in its ſituation, as the ilion and ſmall guts are affected in this, and in the other colics uſually the larger; and it is always a much more dangerous caſe than an ordinary colic.

Signs of it. Theſe are extremely ſharp and violent pains acroſs the navel, a remarkable anxiety of mind, with frequent eructations and heartburn, and great internal heat; a violent obſtruction in the bowels, in which glyſters have very little or no effect; and as the diſeaſe increaſes, a vomiting, which, as it continues, at length brings up the ſtools by the mouth, with violent pains, and frequent faintings; after this, unleſs the medicines take place, there comes on an inflammation of the ilion, and thence a ſuppuration and mortification, on which the pains inſtantly go off, and the patient falls into cold ſweats, and dies in a very little time after. It is a very rare caſe, and though many colics are called by this name, yet in reality it is rarely met with. People, however, of all ages and ſexes, are equally ſubject to it from the following cauſes.

Cauſes of it. Theſe are either a convolution of the inteſtines, with an immediate inflammation, or a tumour in the parts of the inteſtine contained in the hernial ſack, and the uſe of violent and powerful aſtringent medicines bringing on ſuch a coſtiveneſs as never happens naturally. Violent commotions of the body in leaping, riding, or running, have been known ſometimes to bring on the diſeaſe, as alſo violent ſneezing and coughing, and the carrying of too great weights; as alſo crude foods, and ſuch as have been indurated by ſmoak, and flatulent and fermenting liquors. Sometimes alſo it has been evidently owing to worms killed in the bowels, and not voided by ſtool.

Prognoſtics in it. This is a very terrible diſeaſe, both in regard to the danger that attends it, and to the pain. In caſes where its origin is from a diſtortion and convolution of the inteſtines, there is very little hope of recovery; and when it ariſes from a hernia, it is very often fatal alſo, eſpecially when attended with an inflammation and plethora. Its mildeſt ſtate is when it ariſes only from indurated ſtools, and an obſtinate coſtiveneſs; this is uſually cured, if proper aſſiſtance be given in time.

Method of Cure. When a convolution of the inteſtines is the cauſe, the whole effort is to be uſed to explicate them; but this is a thing more eaſily conceiv'd in the mind than effected; to this purpoſe ſome recommend the ſwallowing of a muſket-bullet, others a globule of antimony, and others a pound of quickſilver, taking before-hand a ſpoonful or two of oil of ſweet almonds, and ordering motion by walking or riding afterwards; others adviſe the introducing the noſe of a pair of bellows into the orifice of the rectum, and blowing up into the inteſtines; but as that gut is uſually ſo conſtricted in this caſe, as ſcarce to admit the pipe of a clyſter apparatus, there is no great hope of ſucceeding in the other attempt; and others finally adviſe the throwing in the fume of tobacco. The diſcuſſion of the inflammation is ſcarce leſs neceſſary than the other; this is to be done by powders of nitre, cinnabar, and crabs eyes, taken four times a day, and by rubbing the abdomen with camphorated ſpirit of wine, in which ſaffron has been infuſed; bags of carminative ingredients, with camphor, may alſo be applied to the abdomen with good effect: And finally, if there be a plethoric habit, bleeding is a very neceſſary operation.

In caſes where this is occaſioned by a hernia, the firſt thing to be done is the reducing the inteſtine into its proper place. To this purpoſe the patient muſt lie upon his back, and emollient and carminative fomentations muſt be applied to the part, made of decoctions of marſhmallows, camomile flowers, and the ſeeds of aniſe fennel, and fœnugreek, boiled in milk; and, when there is no inflammation, fomentations of this kind may be applied in the manner of cataplaſms, by wetting a ſponge with them, and applying it to the part. An inflammation is carefully to be guarded againſt, by nitrous medicines, and by gentle diaphoretics, and as ſoon as the gut is replaced, clyſters muſt be given to bring on again a laxity of the bowels.

When the caſe only ariſes from an induration of the fæces, there are firſt to be given internally nitrous and cinnabarine medicines, to prevent or take off an inflammation, and at the ſame time clyſters are to be given, with the emollient decoctions, and a little nitre and camphor, with ſome oil; and if it be neceſſary for a yet farther ſtimulus, ſome venice ſoap may be added; acrid ſuppoſitories are to be introduced into the rectum, and the ſoap plaſter to be applied to the abdomen, or elſe ſpirit of wine camphorated is to be rubbed in; bags with carminative ingredients may alſo be applied warm, and where the ſtate is plethoric, bleeding is neceſſary.

Theſe are the general methods, and uſually one or other of them takes effect in the milder caſes. But it is to be obſerved, that honey, though ordered by ſome, is never to be put into theſe clyſters, for where there is an inflammation, it promotes ſuppuration. Clyſters of common warm water, with ſalt, have ſometimes been found to have very great effect. The patient is to be kept warm during the courſe of the diſeaſe, and the diet is to be very ſparing, though the drinking warm liquors is to be indulged. *Junker*, Conſpect. Med. p. 574. ſeq.

MISERICORDIA,

MISERICORDIA *in Cibis & Potu*, in our old writers, is uſed for any gratuitous portion of meat and drink, given to the religious in convents beyond their ordinary allowance. *Matt. Paris.* And in ſome convents they had a ſtated allowance of theſe over-commons upon extraordinary days, which were called *Miſericordiæ Regulares.* Mon. Angl. T. 1. p. 149.

MISGUM, in zoology, the name of a fiſh of the anguilliform kind, but broader and flatter than the eel, and of much the ſame ſize from the head to the tail. It has five black lines, one on the back, two which are ſomewhat broader, in the middle of the ſides, and two others which are narrower lower down; theſe are all extended from the head to the tail. The intermediate ſpaces, and the belly, are of a ſomewhat bluiſh white, dotted with black ſpots. The fins are alſo ſpotted in the ſame manner. The mouth is ſmall and round, like that of the lamprey, and is ſurrounded with beards, ſix on the upper jaw, and four on the under. And there are two other very ſlender ones near the noſtrils. The eyes are ſmall; the gills four on a ſide; and beſide the back fin there are four, two near the gills, and two lower on the body. This is a common fiſh about the German ſhores, and is eſteemed a very delicate one at the table. It lays its ſpawn in March, and is in beſt ſeaſon for eating in January and February. It is caught principally in ſtanding and muddy waters; and it is ſaid, that when out of water, it makes a ſort of hiſſing noiſe. *Willughby*, Hiſt. Piſc. p. 119.

MISLETOE (*Cycl.*)—It has been formerly ſuppoſed that the *Miſletoe* was produced as a ſort of excreſcence from the tree it is found on; but time and experiments have ſhewn, that it is raiſed like other plants from ſeeds. Its berries are of a viſcous nature, and ſticking to the beaks of the birds that eat them, they may be rubbed off againſt the branches of other trees, and there take root and grow, but this is not neceſſary for their propagation, for the great numbers of plants of it uſually found on the ſame trees, ſeem to prove very plainly, that it is produced by the falling of its ſeeds, like all other plants, but that the matrix for theſe is not earth, but the branches of a living tree.

The trees on which *Miſletoe* is principally found, are the apple, the aſh, and other ſmooth-rind'd ones. It is very rarely found upon the oak; and though it may eaſily be propagated by its ſeeds on other trees, yet it has not been found to take readily upon the oak. *Miller*, Gardener's Dict.

Ariſtotle thought that *Miſletoe* was not a plant produced from ſeeds, but a mere excreſcence of the trees on which it was found, produced either by an extravaſation of the nutritive juices of the tree, or by a tranſpiration of it; and many authors who have written of it, have been of the ſame opinion. But Theophraſtus and Pliny were of opinion that it ow'd its origin to ſeeds, but that they muſt neceſſarily paſs through the bowels of a bird before they were in a condition to grow.

The ſeeds of *Miſletoe* are ſo ſoft, that one would imagine they would be digeſted by the ſtomach of a bird. Bonone, however, has obſerved, that they are voided entire; but there is no neceſſity of ſuppoſing their paſſing this ſtate, in order to their germinating. Malpighi has very perfectly deſcribed the ſeeds of *Miſletoe*; he ſays, that it germinates by puſhing out two horns from two of its angles; and Camerarius has made the very ſame obſervation. But the firſt account we have of *Miſletoe*'s being regularly raiſed by planting the ſeeds, is from Mr. Ray, who mentions its having been done by Mr. Doody.

The fruit of the *Miſletoe* are roundiſh ſoft berries, faſtened by a ſhort pedicle to the bottom of a fleſhy cup. That part of the berry which ſtands oppoſite to this pedicle, is ſomewhat flatted, and there may be ſeen there a ſmall ſhining brown body of an oval figure, which is that part of the piſtillum called by Linnæus, the *ſtigma*; and round about this ſtigma there are four longiſh marks, which ſhew the places where the leaves of the flower have been faſtened. The ſkin of the fruit, when ripe, is very ſmooth, tranſparent, and tough, and on examining it by the microſcope, it is ſeen very full of veſſels produced from the pedicle, and making frequent anaſtomoſes with one another. Within this is the ſeed wrapped up in a viſcous matter, and of a flatted ſhape, and greeniſh colour; they are beſt ſeparated from this viſcous matter by ſteeping in warm water, and are uſually found to be triangular, ſometimes oval.

When a berry of *Miſletoe* is cruſhed and broken againſt the bark of a tree, the viſcous matter which ſurrounds the ſeed ſoon dries away into a thick and tough ſkin, which ſurrounds the ſeed, and keeps it faſt down to the bark; but the rains frequently waſh theſe off afterwards, eſpecially when they have fallen upon the ſmoother part of the bark, or upon ſuch parts of a tree as are clean and free from moſs. And hence it is, that moſt of the *Miſletoe* we find, is either found upon the under part of the branch of a tree from whence the rain could not ſo eaſily diſlodge it, or on ſuch as have a rough bark, or are in part covered with the common tree-moſſes.

Mr. Du Hamel determined to inveſtigate the nature of this odd plant, put ſeveral of the ſeeds of it into ſmall ſlits, which he cut in the barks of different trees, by that means to defend them from being waſhed away by rains, and theſe all ſucceeded well and ſhot, except thoſe he planted on the fig, on which he made ſeveral unſucceſsful attempts; the miſchief done to the ſeeds by the milky juice of this tree, was probably the cauſe of this. It is no wonder that *Miſletoe* grows equally on all ſorts of trees, ſince there requires no more to make it grow than the effect of the rains and night dews; and this author found the ſeeds ſhooting on earthen pots and ſtones, which he kept ſhaded from the heat of the ſun; and from parallel experiments it ſhould ſeem alſo, that the tranſpiration of trees helps greatly the germination of theſe ſeeds.

The ſeeds of *Miſletoe* ſown, if we may ſo call it, on the bark of trees in February, begin to ſhoot in June, and at that time there are ſeen two little round bodies iſſuing out at the two angles of the triangular ſeeds; but as theſe ſeeds are ſubject to ſome irregularities in their figure, ſo they alſo are in their germination, for from the oval ſeeds there is only one ſhoot, and from thoſe which are irregularly angular, there are ſometimes four or five.

Each of theſe round bodies is faſtened to a pedicle, which has its inſertion in the fleſhy part of the ſeed, in which there are a ſort of grooves, which make it ſeem as if theſe pedicles came out of a ſort of caſe.

This ſort of germination is peculiar to *Miſletoe*, no other ſeed ſhooting out ſo many radicles. Theſe alſo are often found of very different lengths, tho' coming from the ſame ſeed, nor do they all appear at the ſame time, but ſeem to vegetate differently and diſtinctly.

The length of theſe radicles is in a great meaſure owing to the poſition of the ſeed on the branch of the tree, for they always grow in length till they reach the bark; ſo that if the ſeed be ſo placed that the germ iſſues out cloſe to the tree, it is proportionably ſhort; but if it happens to proceed from the upper part of the ſeed, it bends and grows in length till it reaches the bark to which it is to be fixed.

Mr. Du Hamel, willing to try how far this elongation of the radicle might be carried, placed two ſeeds of *Miſletoe*, which had already germinated, upon a ſmall ſupport, raiſing them from the branch of the tree. In the one of theſe the radicle was turned toward the branch, tho' at an unnatural diſtance, in the other it was directed a contrary way. The conſequence was, that the firſt grew to twice its natural length, and then the blackneſs of the round body at the end ſhewed it began to decay; after which it grew no more; the other turned its germ back to the ſupport, and fixing there, periſhed for want of nouriſhment. Another time, making a hole in the branch of a nut-tree, juſt when the radicle of a *Miſletoe* ſeed was ſtriking, he cauſed the radicle to grow to twice its natural length, and it finally reached the bottom of the hole, and ſtuck there, and produced a vigorous plant. It is to be obſerved alſo, in regard to the germination of theſe ſeeds, that they are the only ones in which the radicle takes indifferently any direction, in all other ſeeds it points ever downwards only.

The ſeeds of *Miſletoe* will ſhoot equally well on the upper and under ſides of a branch of a tree, and thoſe on the upper will bend their radicles downward, while thoſe on the under will ſtrike theirs directly upward with the ſame eaſe.

The radicles of *Miſletoe* are, as has been already obſerved, compoſed of a little round body, ſuſtained by a pedicle. When this pedicle has grown to ſuch a length that the round body touches the bark, it opens before into the ſhape of the trunks of flies, and other inſects, and by this means touching cloſely at all its edges, it becomes faſten'd extremely firm to the tree. From this reſemblance in ſhape to the trunks of ſmall animals, Dr. Du Hamel calls theſe radicles the trunks of the ſeed of *Miſletoe*. The ends of theſe trunks of the radicles are alſo faſtened to the bark of the tree by a viſcous matter, which, when the trunk is gently raiſed, draws out into ſtrings on all ſides to ſome length.

In the inner part of this trunk, or open button, there are two ſubſtances to be diſtinguiſhed; in the center there is a white granulated matter, and round that a greeniſh one; both theſe are juicy, but the outer leſs ſo than the central white part; the outer one is plainly the ſame with the outer rind of the root of the *Miſletoe*, or the ſecond bark of its trunk. Theſe both very quickly adhere to the tree, ſtriking their ſeveral granulæ into it, and theſe furniſh afterwards the roots of the *Miſletoe*.

The outer bark of *Miſletoe* is thin, of a deep green, and ſomewhat rough; it is ſtronger than that which it covers; and this is not extended to the roots of the plant, but ſpreads over the bark of the tree at the bottom of the ſtalk, juſt as the feet of the corals and other ſea plants do over ſtones. The viſcous matter, by which the trunk adheres to the tree, is furniſhed from all parts of the radicle, but principally from its outer bark, and is not at all owing to the juices of the tree, ſince it is found as abundantly on thoſe radicles which have been made to adhere to ſtones, as on thoſe which have been on trees. A little time fixes theſe trunks very firmly; but it is obſervable, that though the outer bark or edge of theſe open balls adheres equally all round to the bark of the tree, the granulæ of the inner ſubſtance always direct themſelves to and inſinuate in the little clefts or cracks of the rind of the tree. While the ſeeds of *Miſletoe* are in this ſtate, they may be tranſplanted to other places, and ſet on other trees, and ſeldom fail to thrive.

Seeds of this plant may be made to ſhoot on ſtones, and will fix their trunks to them, but here they naturally ſoon periſh; they may however be removed from theſe ſtones to the

branches of trees, as ſoon as they have affixed themſelves, and being then in a ſtate of drawing nouriſhment, they will affix themſelves to the tree, and from its juices begin to thrive immediately.

It has been very naturally ſuppoſed by thoſe who thought the *Miſletoe* no perfect plant, that it had no roots, nay even thoſe who allowed it to be a perfect plant, and produceable from ſeeds, yet have ſuppoſed it had no root. Malpighi, however, affirms that he plainly ſaw its roots. And Tournefort countenances the ſame opinion; but neither of theſe authors have perfectly deſcribed them.

In that part of the branch of a tree where the *Miſletoe* grows, there is always obſerved a thickneſs, and the bark is always chopped in ſeveral places; but the roots of the *Miſletoe* are by no means to be ſeen externally, being hid both by the bark of the tree, and by the expanſion of the bark of the plant itſelf at its bottom. It is neceſſary, therefore, for the diſcovery of the roots, to raiſe very nicely both the bark of the plant, and that of the tree; but the hardneſs of theſe barks, and their ſtrict attachments to the roots, makes this difficult; and there is indeed no way of ſucceeding well in the attempt, but by boiling the part in water, and making nice diſſections of it before it is cold. By this means the bark of the *Miſletoe*, and that of the tree, are both eaſily raiſed, and the roots of the *Miſletoe* are found partly inſerted into the bark, and partly into the wood of the branch.

The bark of trees is a ſubſtance compoſed of ſeveral beds or ſtrata, the upper or outer of which is an extremely thin one, and the others, which are thicker, are formed by the extenſion of the woody fibres, which run longitudinally into a ſort of network, the cells of which are filled with a parenchymatous ſubſtance. This is the ſtructure of all the barks of a tree, except the outer thin one; but of theſe, thoſe are always the moſt ſucculent and rich which lie innermoſt, or neareſt the wood of the tree.

It is obſervable, that when an inſect wounds the bark of a tree or plant, there is always a greater derivation of the juices to the wounded part than elſewhere, and hence galls and other protuberances are formed; this ſeems alſo the caſe here, and the application of the trunk of the *Miſletoe* ſeed, and the penetration of its roots ſeem alſo to wound the part ſo much, as to cauſe in the ſame manner a derivation of a great quantity of juices for the nouriſhment of the young plant: And as the roots ſtrike deeper in, there is made a greater extravaſation of the juices of the tree, and a ſort of tumour is neceſſarily formed.

Among the ſeveral roots of the *Miſletoe*, there are ſome which extend themſelves among the more ſucculent parts of the bark, and others which penetrate to the wood of the branch. Theſe ſpread themſelves every way with great eaſe, as they are principally formed at a time when the tree is full of ſap.

It has been ſuppoſed by many, that the roots of the *Miſletoe* penetrated the woody ſubſtance of the tree; but though appearances make greatly for this ſyſtem, it is by no means true in fact. The roots of the young plants, when they have penetrated through all the lamina of the bark, and reach the wood, turn off, as the roots of plants do which meet with ſtones, &c. in their paſſage, and ſpread horizontally between the inner bark and wood, or elſe re-aſcend the bark, the looſe and juicy nature of which is much fitter for affording them nouriſhment than the hard ſubſtance of the wood. It is true, that in making ſections of the branches where old plants of *Miſletoe* grow, there are often found roots, nay ſometimes even the woody ſtem of the plant plunged into the matter of the hard wood; but this is merely owing to the inner bark of the branch having become woody ſince the penetration of the roots, not to the roots finding their way into what was actual wood at the time.

There are alſo found always a multitude of woody excreſcences, like warts and wens, about the place where the *Miſletoe* grows; theſe are formed like the woody galls produced on trees by the punctures of inſects, by an extravaſation of the woody juices. Theſe make the ſwelling about that part of the branch where the *Miſletoe* grows, and theſe, as they become woody, and ſwell about the roots, ſerve to cover them with hard wood, which they never penetrated. Theſe make it probable enough that the roots of *Miſletoe* never penetrate hard wood; but what proves it much more evidently, is, that if the branches of trees full of *Miſletoe* plants be cut and ſplit in different directions, juſt at the place of the inſertion of the plant, the ſeveral annual circles of the wood within are found perfect, regular, and in their natural ſtate, ſo far as the branch was form'd at the time the *Miſletoe* took root upon it; theſe ſhew the age of the branch at that time, but above theſe there are always ſeveral other laminæ, which are what have been formed ſince the time of the *Miſletoe*'s growing there; and theſe which have been formed out of the inner laminæ of the bark, in which the roots of *Miſletoe* had made many wounds and great extravaſations of the juices, are found, tho' woody, full of the roots of the plant, and are very irregular, and full of the tubera which thoſe extravaſations occaſion, by by no means appearing like the annual circles of the wood formed before. The ligneous fibres in the outer, or ſince form'd wood, are laid in very irregular directions, and the roots of the *Miſletoe* may be eaſily diſtinguiſhed among them by their colour.

The *Miſletoe*, as the bark in which its roots were ſpread, hardened into wood, would be in the ſtate of a tree, planted in an earth which, by degrees, petrified about it, and muſt periſh; but nature has provided for it in this caſe; for as theſe roots are impriſon'd in wood, and a new bark is formed by the ſap of the tree, the trunk of the *Miſletoe* ſends out a new ſeries of roots, which ſpread thro' this in like manner; ſo that tho' a plant of *Miſletoe* has ever ſo many ſeries of its roots embodied in the hard wood, from which it can have no nouriſhment, it has alſo ſome, ſufficient for its ſupport, ſpread among its yet new-form'd bark.

The *Miſletoe* is frequently found in this ſtate; nor are we to ſuppoſe, indeed, that tho' the wood is not able to furniſh ſo much juice as the bark, that it furniſhes none at all; for the roots of the plant do not decay, when they have penetrated what afterwards becomes perfect wood; even in its hardeſt ſtate, they are ſtill found perfect in it, and in a living ſtate, and undoubtedly furniſh ſome, tho' not a great deal of nouriſhment to the plant. Another thing very remarkable in thoſe plants of *Miſletoe*, many of the roots of which are lodged in the hard wood, is, that the roots diffuſed through the bark have often a large tubercle at their ends, which probably is furniſhed with numerous openings for the receiving the juices the plant is to be nouriſhed by, and ſerves in the place of many roots.

There are ſometimes indeed found plants of *Miſletoe* which live wholly by the nouriſhment they receive from the wood; theſe are in the ſtate of grafts of common fruit-trees; but theſe are rare, and it very ſeldom ſucceeds when the *Miſletoe* is attempted to be propagated by the common method of grafting, though the plants of *Miſletoe* may very eaſily be grafted by approach into one another.

A farther circumſtance worthy obſervation, is, that tho' ſome plants of *Miſletoe* have been found growing very well with their roots only in the wood, yet this is generally fatal to them, and many plants of it are found dead and wither'd, by means of the woody part of the tree riſing into a ſort of wen or tubercle about them, and by its cloſely ſurrounding their ſtalk, preventing all intercourſe with the bark, by means of new roots. This is uſually the caſe when the plants of *Miſletoe* are weak, and the branch on which they grow very ſtrong and vigorous; and on the contrary, when the plants are very ſtrong, and the branch weak; in which caſe, the roots of a large *Miſletoe* plant will ſometimes penetrate the whole round of the bark, and taking in all the nouriſhment to itſelf, the end of the branch beyond it will periſh and rot off; but the *Miſletoe*, in this caſe, is not able to ſupply the place of the ſtarved part of the branch, but the remainder of the bough generally dies quite to the trunk of the tree, and the *Miſletoe* periſhes with it.

Though this plant is evidently propagated by its ſeeds, yet it alſo propagates itſelf very often by ſuckers, and it is not uncommon to find young ſhoots at a finger's breadth or two from the old one. The gardeners, who value their trees, are very careful to deſtroy the *Miſletoe* from them, and that very properly, ſince it is extremely obvious from what has been obſerved, that it robs the tree it grows on of a great deal of its nutritious juice. The common method of cutting off the plants to this purpoſe, is, however, by no means ſufficient; for the old ſtock frequently puſhes out new ſhoots, and the roots afford ſuckers, ſo that the caſe becomes worſe than before. There is indeed no way of deſtroying it, but the cutting away with it a part of the turbercle it forms on the branch where it grows.

The roots of *Miſletoe*, while young, are green, very tender, and granulated, as is alſo the bark of the older ones; but theſe have a woody filament within. They are not regularly round, but are often flat, and uſually adapted in their ſhape to the place where they are lodged; and about their inſertions it is not unfrequent to ſee a ſort of elongation of their bark, which blends itſelf with the bark of the tree on which they grow.

The progreſs of the branches of *Miſletoe* is much ſlower than that of the roots. The firſt year, and often the ſecond, is ſpent wholly on their part, in the raiſing themſelves into an erect poſture, and very often this operation proves fatal to them.

The ſeeds, as has been before obſerved, faſten themſelves to the branches of trees, by means of the viſcous juice contained in the berries. The radicles produced hence affix themſelves, by means of the hollow button at their extremity, to the bark of the tree; and the other end being yet held faſt in the ſeed, the whole proceſs forms a ſort of arch. When the button end of the radicle has got itſelf good root in the bark of the tree, and begins to ſend up ſap in abundance into its pedicle, which is to be the ſtalk of the plant, that by degrees begins to looſen itſelf from the ſeed; and this is often a work of great difficulty; for the ſeed being firmly attached by its viſcous matter now dried to the bark of the tree, holds down the end of the ſtalk, that very often the force of riſing in the young plant is not enough, and it remains in its arched form, and periſhes; and often

often the open end is forced away from its hold on the bark by the reſiſtance, and the young plant dies.

Thoſe ſhoots which are ſingle from ſingle ſeeds are oftenеſt deſtroy'd at this juncture, for they have ſingly the force of the whole ſeed to ſtruggle againſt, and when they ſucceed, uſually raiſe it up, and keep it on their extremity; but where the ſame ſeed ſends three or four radicles, theſe all ſtruggle ſo many different ways to riſe, and the huſk of the ſeed is uſually torn, by their efforts, into three or four pieces; and every radicle carrying its portion on the top, becomes a diſtinct plant. It might ſeem from this, that the ſeminal lobes were neceſſary to the growth of the young plant; but this is not the caſe, for if the ſtalks of the ſeveral radicles are cut off while they adhere to the ſeed, they thrive not at all the worſe for it.

It is a very ſingular circumſtance in this plant, that its ſeeds produce ſingly ſeveral young plants. No other vegetable has this property. 'Tis true, indeed, that two young hazels have been ſeen to riſe from the ſame nut; but then we know very well, that nuts have frequently double kernels in the ſame ſhell; but here the ſeed is contained ſingly in a berry, and, to all examination, appears of a ſimple uniform ſtructure, tho' it doubtleſs is compoſed according to the number of young plants it will produce, of three, four, or more perfect ſeeds.

When the young plant of the *Miſletoe* ſeed has freed itſelf from the huſk at its end, and raiſed itſelf upright, it is found terminated at the end by a ſort of button, like that of other young ſhoots, which contain the leaves. This button ſtands, however, unalter'd all the firſt year, and ſometimes all the ſecond; in the ſpring following there appear from the button two leaves, and in the alæ of theſe leaves there are ſeen two other buttons; and afterwards there iſſue from theſe buttons branches terminated uſually by two, but ſometimes by three leaves. Theſe are the produce of the third or fourth year; all the ſucceeding years there are new buttons formed in the alæ of the leaves, and the branches from theſe expand themſelves ſo regularly, that very frequently the whole ſhrub is of a regularly round figure.

The old leaves become yellow, and fall off, and there come no new ones in their places, ſo that the old ſtalks, and conſequently the whole inner part of the plant is naked, and the leaves are only found on the circumference growing on the young branches.

It is a remarkable obſervation, that every button of the *Miſletoe* contains the rudiments of three young branches, and hence every knot ought to be furniſhed with ſix branches; and this would ever be the caſe, but that ſeveral of the young branches die either before, or ſoon after their emerging from the button.

Among the other ſingularities of this plant, it is alſo worthy obſervation, that its ſtalks have not that tendency natural to thoſe of all other plants, of riſing directly upwards; for if it grow on the under part of a branch of a tree, it ſhoots as regularly downwards, as it does upwards when it grows from the other ſide, and this without ſeeming at all to ſuffer by it, or to have any inclination to turn upwards.

Some of the old authors have ſaid, that the *Miſletoe* kept its leaves all the winter, when it grew on an ever-green tree, but that when the leaves fell from the tree it grew on, its leaves fell alſo; but this is erroneous, *Miſletoe* holding its leaves all the year, on whatever tree it grows, and ſtanding unhurt in the ſevereſt winters.

Miſletoe will grow on all kinds of trees; but it does not grow on all with the ſame ſtrength and vigour. The pear, the apple, the white thorn, and the lime, are trees it grows on very ſucceſsfully. The oak, the hazel, and the juniper, are very ſtarving for it. Mr. Du Hamel could never make it ſucceed by ſowing on the laſt of theſe trees; but it has ſometimes been found naturally propagated on it, tho' in a ſtarving condition. It will alſo grow on annual plants, but on theſe it never can come to any height, as their ſtalks periſhing at the approach of winter, the *Miſletoe* periſhes with them. Mr. Du Hamel took great pains to ſow and try to raiſe it on the ground, and ſucceeded ſo well as to make the ſeeds ſhoot, and their radicles grow to ſome length; but finding no proper hold to fix themſelves upon, they all periſhed; whence it ſeems that this is abſolutely a paraſitical ſhrub, and can grow no where but on ſome other tree.

The *Miſletoe* is covered with two barks, an external thin one of a greeniſh colour, and ſomewhat wrinkled and granulated; and under this with a much thicker, of a paler green, and ſomewhat granulated, and interſperſed with woody fibres. Under this lies the wood, which, when dry, is very hard, but has no appearance of any grain, and cuts with equal eaſe in a longitudinal or tranſverſe direction. The ſtalk between every two knots is perfectly ſtrait, but at the knot it takes great inflections. Each of theſe pieces of the ſtalk in ſome meaſure repreſents the tibia of the human leg, being a little larger at one end than at the other, and always much ſmaller in the middle than at either extremity. It joins the ſucceeding ſtalk not in the common manner of vegetables, but by a ſort of articulation, and has a ſort of epiphyſes like the bones. The analogy is carried alſo yet farther, in that as in young animals the epiphyſes of the bones are all ſoft and tender, but harden in older ones; ſo in this plant the young branches ſeparate eaſily at their articulations, but in the old ones theſe are as hard as any other part of the ſtalk.

The leaves of *Miſletoe* are thick without being ſucculent, their pedicle is very ſhort, and there run from it four or ſix longitudinal ribs, which reach the outer end of the leaf without making any obſervable ramifications.

Miſletoe is a very vigorous and lively plant, and is one of thoſe to which nature has allotted males and females in diſtinct plants of the ſame ſpecies. Authors however are not perfectly agreed as to the manner of this. Pliny abſolutely affirms, that there are two ſorts of *Miſletoe*, the one which bears fruit, and the other which never does. And Mr. Edmund Barrell greatly confirms this opinion by his own obſervation, giving an account that he raiſed four plants of *Miſletoe* from ſeeds, two of which bore fruit, but the other two only flowers. Mr. Tournefort, Linnæus, and Boerhaave, however, affirm, that the flowers and fruit are not produced in different plants, but on the different branches of the ſame individual. The matter thus remained doubtful till Mr. Du Hamel determined to enquire thoroughly into the truth; and his obſervations wholly confirmed thoſe of the antients, and of Mr. Barrell. Nay, he adds, that the whole habit of the male and female plants of the *Miſletoe* is ſo different, that they are eaſily known aſunder, without having recourſe to their flowers, or fruit; and he never found, in all his obſervations, ſo much as a ſingle flower on a female plant, or a ſingle berry on a male one.

The buds which contain the male flowers of *Miſletoe* are rounder than thoſe which contain the female flowers, or the embryo fruit, and are three times as large. The buds ſhew themſelves diſtinctly on the branches in autumn, and in December they are of a conſiderable ſize, tho' not at all inclined to open; and the female plants are yet full of the berries of the former year. The male buds uſually grow three and three on the ſame pedicle, and they open in February or the beginning of March. Their flower is of one regular piece, forming a ſort of open bell; it is cut into four parts, the notches going down to the middle of the flower, and the ſegments being ſo many half ovals. There are four thick oval bodies, or four granulated ſhoots which are attached to the inner part of the bell, and which riſe over its lips; they are greeniſh at firſt, but they afterwards become yellow; theſe are full of an extremely fine powder: Theſe are truly the ſtamina of the *Miſletoe*, and that part of them which to the naked eye appears granulated, is by the microſcope found to be formed into a multitude of ſlight cavities, like thoſe of the morel. The flowers are placed in cluſters ſix or ſeven together, either in the alæ of the branches, or at their extremities; and having done their office, they fall off in May. The female plants have their flowers in the ſame places, but theſe have only three or four at a joint; they open at the ſame time that the male flowers do, on the other plants: When theſe flowers are perfectly opened, we ſee the embryo fruit crowned with four petals, which are planted in a ſort of cleft that runs all round the fruit, and which becomes more and more diſtinguiſhable as the fruit grows larger.

Theſe petals are at firſt united at their tops, and form a ſort of cone, but they ſoon after open and ſhew the figure of an antique crown; and there is then ſeen in the middle a ſort of rough eminence granulated like the peel of an orange, and of a browniſh colour. That part of the fruit which is below the inſertion of the petals grows much faſter than that which is above them, ſo that when theſe are grown to a conſiderable ſize, the petals ſeem placed merely upon them.

By the beginning of June almoſt all the petals are fallen, but the four inſertions remain however very diſtinguiſhable on the berry; and we may obſerve on their tops, as they are now about as big as a grain of hempſeed, a brown eminence which is the remains of the rough protuberance contained within the petals; and, on cutting them, the ſeed is found in the middle, of a greeniſh colour; the berries continue growing all July and Auguſt, and are ripe in September or October. Mem. Acad. Par. 1740.

MISOPTOCHOS, the *Beggar-hater*, an affected name given by ſome to the gout, a diſeaſe that ſeldom invades the poor or induſtrious.

MISSA, in the church of Rome. See the article MASS, *Cycl.*

MISSEL-*Bird*, in zoology, the common Engliſh name of the larger ſpecies of thruſh, called alſo the *ſhrite*, and by authors the *turdus viſcivorus major*. It is much larger than any other of the thruſh-kind. Its legs and feet are yellow; its head of a browniſh lead colour; and its back, tail, and rump, of the ſame colour, with an admixture of yellow; but in the ſummer months it a little changes its colour, and becomes more grey or of the colour of unripe pickled olives; its throat, breaſt and belly, are all variegated with black ſpots; the middle of its belly whitiſh, and the upper part of its breaſt and part of its ſides and the under feathers of its tail yellowiſh. *Ray*'s Ornithol. p. 138.

It uſually is ſeen on the top branches of tall oaks, elms, and other high trees, and ſings very ſweetly. It remains the whole year with us, and flies ſingly, except with its female. It is the beſt of all the kind for the table.

MISSILIA, among the Romans, a name given to largeſſes, thrown among the people on occaſion of games and ſhews, ſuch as ſmall gold or ſilver coins, ſweet-meats, and ſometimes animals, as ſheep, oxen, deer, &c. which were let looſe to be carried off by the people. *Hofm.* Lex. in voc.

The word comes from *mittere*, to throw, or let looſe.

MISSING *Wood*, a phraſe uſed among bowlers. See the article BOWLING.

MISSION, *Miſſio*, among the Romans, a term uſed to ſignify the emperor's ſending to reſcue a wounded gladiator from his antagoniſt. The *Munerarij* or perſons who exhibited the games, and likewiſe the people, uſed to reſcue a favourite gladiator. The manner of their ſignifying this favour, was *pollice preſſo*, or with the thumb hid in the palm of the hand. However the gladiator was only ſaved for that time; whereas by the *Rudis* he had a free diſcharge. *Hoffm.* Lex. in voc. See the article RUDIS.

MIST (*Cycl.*)—The bluiſh *Miſt* which we ſometimes ſee on our fields and paſtures in a morning, though often innocent, yet has been in ſome places found to be the actual cauſe of murrain, and other fatal diſeaſes among the horned cattle.

Dr. Winklar gives, in the Philoſophical Tranſactions, an account of a murrain affecting the cattle in Italy and other places, which was evidently ſeen to ſpread itſelf over the countries in form of a blue *Miſt*. Wherever this was perceived, the cattle were ſure to come home ſick; they appeared dull and heavy, and refuſed their food; and many of them would die in four and twenty hours. Upon diſſection there were found large and corrupted ſpleens, ſphacelous and corroded tongues; and in ſome places thoſe people who were not careful of themſelves in their management of their cattle, were infected and died as faſt themſelves. The principal cauſe of this diſeaſe ſeemed to be the exhalation of ſome unwholeſome ſteams from the earth; and it was obſervable, that there had been three earthquakes in Italy the year before it happened. The method of cure which ſucceeded beſt, was this: As ſoon as any beaſt appeared to be ſick, they examined the tongue, and if aphthæ or little bliſters were found on it, they ſcraped it with a ſilver inſtrument made with ſharp teeth at the ſides, till it bled in all thoſe parts where the aphthæ were; the blood was then wiped away with a cloth, and the whole tongue waſhed ſeveral times with vinegar and ſalt. After this the following medicine was given internally: Take of ſoot, brimſtone, gunpowder, and ſalt, of each equal parts; mix theſe in as much water as will make a mixture thin enough to be ſwallowed, and let a ſpoonful be given for a doſe three or four times a day. The cattle which were in health had this medicine given them, as well as the ſick; and the conſequence was, that very few died in Swiſſerland, while almoſt all died in other places.

It was very remarkable that the contagion, on this occaſion, ſeemed to travel ſlowly and regularly on: It came at the rate of about two German miles in twenty-four hours: This it kept regularly to during the whole time of its raging, and never appeared in very diſtant places at the ſame time.

The whole ſurface of the earth emitting theſe effluvia, no cattle eſcaped them in the courſe of their way, but thoſe which were kept within doors at rack and manger fell ill at the ſame time, and in the ſame manner with thoſe in the open fields. Dr. Slare was of opinion, that it was owing to certain inſects which could not fly faſter than at the rate of two German miles a day; and that they travelled regularly, and ſpread the miſchief where they paſſed; but there wanted ſome judicious perſons, verſed in theſe obſervations, to have examined both the ſtate of the air, and the beaſts, on this occaſion. Philoſ. Tranſ. No. 145.

MISURER, in our old writers, an abuſe of any liberty or benefit: As he ſhall make fine for his *Miſurer*. Old. Nat. Br. 149.

By *Miſurer*, a charter of a corporation may be forfeited; ſo alſo an office, &c. *Blount*, *Cowel*.

MISY, (*Cycl.*) in natural hiſtory, the name of a foſſile ſubſtance, uſed very frequently by the antients in medicine, and ſuppoſed to be one of their now loſt medicines, but erroneouſly; it being ſtill very common in the Turkiſh dominions, and not unfrequently found in the mines at Cremnitz in Hungary. It is a conſiderably firm ſubſtance, tho' of an irregular and ſeemingly not compact texture, and much reſembles ſome of our gaudy marcaſites; but that it wants their hardneſs and their weight, and is not inflammable.

It is commonly found in large looſe maſſes, which are uſually broad and flat, and uneven at their edges; but ſometimes it conſtitutes whole ſtrata, which are continued often for a conſiderable length, but are ſeldom of more than three inches in thickneſs, and uſually lie like horizontal veins among other metallic minerals. It is ſoft and ſmooth to the touch, and may be rubbed to pieces between the fingers; and is both on the outſide and within of a very elegant bright pale yellow, having much the appearance of braſs, when that metal is clean and well ſcoured. Its internal ſubſtance ſeems made up of numbers of very bright and ſmall moleculæ, moſtly of angular figures. It is never covered with any inveſtient coat or cruſt; but when it has lain ſome time expoſed to the air, it becomes of a duſkier colour than before on the ſurface. It will not raiſe any efferveſcence with acid menſtrua, and in the fire becomes of a deep purple. Water diſſolves a very conſiderable part of its ſubſtance, and this may afterwards be ſeparated from the liquor by evaporation and cryſtallization, and appears to be of the ſame nature with the common green vitriol: Its cryſtals being exactly of the ſame figure, and their effect upon a decoction of galls being the ſame, inſtantly turning it into ink. It has ſo much of the appearance of a ſulphureous body, that one is ſurpriſed not to find it inflammable. *Hill*'s Hiſt. of Foſ. p. 606.

It is at preſent no where put to any uſe. The antients eſteemed it of the ſame nature with the chalcitis, but that it poſſeſſed thoſe virtues in a more remiſs degree; they had it from Ægypt and Cyprus, and uſed it externally in hæmorrhages, and ſome cutaneous eruptions.

MISY, in botany, a name given by Theophraſtus, and all the old Greek writers, to a kind of truffle or ſubterranean muſhroom, of a very delicate flavour. The truffles of Numidia, and ſome other parts of Africa, were always eſteemed ſuperior to thoſe of any other part of the world. They are called *terfez*, *camaha* or *kema*, by ſome later writers, and were brought to Rome, and ſo greatly eſteemed, that no diſh was ranked above them. Theſe were called Libyan truffles by the Romans, and they ſeem to have been the ſame with the Cyrenian *Miſy* of the Greeks. It is to be obſerved, that the Greeks in general, in early times, were very little acquainted with the affairs of Africa; and all that they had from this part of the world, was ſaid to come from Cyrene, ſome old cities of their forefathers being there, and keeping up a friendſhip and traffic with them. The *thyon*, a tree growing plentifully in almoſt all parts of Africa, and which is the ſame with the citrus of the Romans, was in this manner attributed to Cyrene, by the ſame Theophraſtus. And thus, when ſpeaking of truffles, he adds, that the Cyrenean *Miſy* ſurpaſſed all the other kinds in flavour; his words ſtand at large in Athenæus; and thence Pliny has taken his account, which he cloſes in this manner: "The thing which they call *Miſy*, in "the province of Cyrene, is of this kind; but it is more fleſhy "and of a finer taſte and ſmell." This is the ſenſe of Pliny, as the text ſtands in our copies; but it is probable that he tranſlated Theophraſtus better than they, at leaſt as we know that what he ſays is not his own, but taken from that author, we have a right to underſtand it his way, and that is, that the roots of this Cyrenean *Miſy* have a delicate ſmell reſembling that of meat, or fleſh newly cut. *Pliny*, L. 19. c. 3.

It is very certain, that this Cyrenean *Miſy* of the old Greeks is the ſame thing with the delicate African truffle or terfez of LeoAfricanus, and the moderns; and Pliny had read ſome of the antients who were ſenſible of this, and has taken from them an account that the African truffles are the fineſt in the world; and yet did not perceive, that theſe African truffles were the ſame with the Cyrenean *Miſy*, which he immediately after mentions from Theophraſtus.

MITE, (*Cycl.*) in natural hiſtory, the name of a ſmall animal, very well known and found in old cheeſe, and in many other bodies both recent and periſhing.

To the naked eye the *Mites* in cheeſe appear like moving particles of duſt, but the microſcope diſcovers them to be perfect animals, having as regular a figure and performing all the functions of life as perfectly as creatures that exceed them many times in bulk. See Tab. of Microſcopical Objects, Claſs 1.

They are cruſtaceous animals, and are uſually tranſparent; the principal parts of them are the head, the neck, and the body. The head is ſmall in proportion to the body, and has a ſharp ſnout and a mouth that opens and ſhuts like a mole's. They have two ſmall eyes, and are extremely quick-ſighted; and when you have once touched them with a pin, you will eaſily perceive how cunningly they avoid a ſecond touch.

They are of different ſorts; for ſome of them have ſix legs, and others have eight. Each leg has ſix joints ſurrounded with hairs, and two little claws at the extremity, with which it very nicely takes hold of any thing. The hinder part of the body is plump and bulky, and ends in an oval form, from which there iſſue out a few exceeding long hairs. Other parts of the body and head are alſo beſet with thin and long hairs.

The males and females are eaſily diſtinguiſhed in theſe little animals. The females are oviparous as the louſe and ſpider, and from their eggs the young ones are hatched in their proper form, without having any change to undergo afterwards. They are however, when firſt hatched, extremely minute; and, in their growing to their full ſize, they caſt their ſkins ſeveral times.

Theſe little creatures may be kept alive many months between two concave glaſſes, and applied to the microſcope at pleaſure. They are thus often ſeen *in coitu*, conjoined tail to tail; and this is performed by an incredibly ſwift motion. Their eggs, in warm weather, hatch in twelve or fourteen days; but, in winter, they are much longer. Theſe eggs are ſo ſmall, that a regular computation ſhews, that ninety millions of them are not ſo large as a common pigeon's egg. *Baker*'s Microſcope, p. 187.

Mites are very voracious animals; they not only prey upon cheeſe, but on all ſorts of dry'd fleſh, fiſh, fruits, and ſeeds; and almoſt on all things which have ſome degree of moiſture, without

without ever being wet; and they have often been ſeen to eat one another. Their manner of eating is by thruſting alternately one jaw forward and the other backward; and in this manner grinding their food; and after they have done feeding, they ſeem to chew the cud.

There are ſeveral leſſer diſtinctions obſervable in the *Mites*, which are found among different ſubſtances. Thoſe in malt-duſt and oatmeal, are much nimbler than the cheeſe *Mites*, and have more and longer hairs. The *Mites* among figs reſemble beetles, and have two feelers at the ſnout, and two very long horns over them; theſe have only ſix legs, and are more ſluggiſh than thoſe in malt-duſt. Thoſe found among figs had alſo very long hairs, and thoſe beſet at certain diſtances with other ſmaller hairs; whence Mr. Lewenhoek conjectures, that theſe longer and larger hairs are jointed at thoſe places where the ſhort ones are found.

There are a ſort of wandering *Mites*, found wherever there is any thing they can feed on; theſe are often found in form of a white duſt, and are not ſuſpected to be living creatures.

The *Mite* is an animal very tenacious of life; it will live months without food; and Mr. Lewenhoek had one which lived eleven weeks on the point of a pin, on which he had fixed it for examining it by his microſcope. *Lewenhoek*'s Arcan. Nat. T. 4. p. 368.

MITELLA, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the roſaceous kind, conſiſting of many petals diſpoſed in a circular form. The piſtil ariſes from the cup of the flower, and finally becomes a roundiſh and pointed fruit, which when ripened ſplits into two parts, and in ſome degree reſembles a mitre, and contains uſually roundiſh ſeeds.

The ſpecies of *Mitella*, enumerated by Mr. Tournefort, are theſe: 1. The American *Mitella*, with fimbriated petals. 2. The American *Mitella*, with whole petals. 3. The great American dying *Mitella*, called *Orellana*, *Achiotl*, and *Wruow*. Tourn. Inſt. p. 241.

MITELLA, in ſurgery, a name given to the ſcarf for ſuſpending the arm when injured.

MITHRIDATES, in natural hiſtory, the name of a ſtone found in ſome parts of Perſia, ſeeming to be the ſame as the *mithridax* or *mithrax*. See the next article.

MITHRIDAX, in natural hiſtory, the name of a gem deſcribed by Solinus, and mentioned by ſome of the later writers, who have quoted him, or borrowed from him; but the name is not met with in any author earlier than his time. The qualities he beſtows upon it, are the ſame with thoſe given by Pliny to the *mithrax*; and as the word *mithrax* never occurs in Solinus, it is highly probable that he means this ſtone by it. He ſays, that when the ſun ſhines upon the *Mithridax*, it ſhews a great many various colours.

Iſidore ſays the ſame thing, evidently borrowing the account almoſt the words from him.

Pliny tells us, that the *mithrax* has the ſame quality, and that it is in itſelf whitiſh. Its name is taken from the Perſian word for the ſun, and is the ſame as *gemma ſolis*. Pliny indeed, in the latter end of his book, deſcribes a ſtone called *ſolis gemma*, without ſaying that it is the ſame with the *mithrax*; but his accounts in both places agree very well one with another; and the common cuſtom of that author of collecting at large from all the writers of his time, might eaſily lead him to deſcribe a thing twice, which he found in two authors called by two different names.

The *mithrax* both of Pliny, and all the other antients, is evidently the opal; and the *Mithridax* having no other qualities attributed to it, but thoſe the opal poſſeſſes, may be determined to be only a corruption of the ſame name.

MITHRAX, in natural hiſtory, the name given by Pliny and the antients, to a gem found in Perſia, which when held up to the ſun ſhewed many colours. It was probably no other than the opal. Hence the barbarous writers of the middle ages ſeem to have taken their account of the *Mithridates*. See the preceding article.

MITRE (*Cycl.*)—*Mitre* is uſed by the writers of the Iriſh hiſtory for a ſort of baſe money, which was very common there about the year 1270; and for thirty years before, and as many after. There were beſide the *Mitre*, ſeveral other pieces called according to the figures impreſſed upon them, roſaries, lionades, eagles, and by the like names. They were imported from France, and other countries, and were ſo much below the proper currency of the kingdom, that they were not worth ſo much as a half-penny each. They were at length decry'd in the year 1300, and good coins ſtruck in their place. Theſe were the firſt Iriſh coins in which the ſcepter was left out. They were ſtruck in the reign of Edward the ſon of our Henry the Third, and are ſtill found among the other antiquities of that country. They have the king's head in a triangle full-faced. The penny, when well preſerved, weighs twenty-two grains; the half-penny ten grains and a half. *Simon*'s Iriſh Coins.

MITTA, in our old writers, an antient Saxon meaſure. Its quantity is not certainly known; but it is ſaid to be *menſura decem modiorum*, a meaſure of ten buſhels. *Doomſday*.

Mitta, or *Mitcha*, beſides being a meaſure for ſalt and corn, is uſed for the place where the caldrons were put to boil ſalt. *Calderias quoque ad ſal conficiendum cum propriis ſedibus* Mitchæ *vocantur*. *Gale*'s Hiſt. Brit. 767. *Blount*.

MITTENDARII, among the Romans, commiſſioners ſent into the provinces by order of the *præfectus prætorio*, or captain of the guards, upon ſome public account, as to inſpect the behaviour and management of provincial governors, and obſerve whatever was amiſs; all which they were to lay before the præfect, who had authority to remedy ſuch abuſes. *Pitiſc.* in voc.

MITTENDO *Manuſcriptum pedis finis*, in law, a writ judicial, directed to the treaſurer and chamberlains of the exchequer, to ſearch for and tranſmit the foot of a fine, acknowledged before juſtices in eyre, into the common-pleas, *&c.* Reg. Orig. 14. *Blount. Cowel.*

MITU, or MITU-PORANGU; in zoology, the name of a Braſilian bird of the pheaſant-kind, according to Marggrave, and the generality of thoſe who ſpeak of it; but ſuppoſed by Mr. Ray, rather to approach to the nature of the peacock, or turkey-cock.

It is larger than the common Engliſh cock, and is all over the back, wings, *&c.* of a fine deep black; but on the belly of a partridge-brown; and has a ſeries of fine gloſſy black feathers on its head, which it occaſionally raiſes up into a ſort of creſt. Its beak is very beautiful, broad at the baſe and narrow at the point, and of a fine bright red. Its tail is very long, and it can at pleaſure raiſe and expand it like the turkey. It is very eaſily tamed, and loves to rooſt on trees. Its fleſh is very fine and delicate. See Tab. of Birds, N°. 24. *Marggrave*'s Hiſt. Braſil.

MIXT, in chemiſtry. See the article AGGREGATE.

MIXTURE (*Cycl.*)—MIXTURA *Simplex*, *ſimple* MIXTURE, in pharmacy, the name of a form of medicine uſed in the preſcriptions of ſome modern phyſicians. It is made by mixing ten ounces of the ſpiritus theriacalis camphoratus of Bates, ſix ounces of ſpirit of tartar, and two ounces of ſpirit of vitriol; theſe are to be ſet in a glaſs hermetically ſealed for three weeks that they may be perfectly mixed; the doſe is a dram or thereabouts. Its virtues are, that it reſiſts putrefaction, promotes ſweat, and is of great ſervice in malignant fevers. See the article MIXTURE, *Cycl.*

MIZNEPHETH, in the Jewiſh antiquities, a kind of mitre worn by the high-prieſt. See the article CIDARIS.

MIZQUITL, in botany, a name uſed by ſome authors for that ſpecies of the Acacia, or Egyptian thorn, whoſe unripe fruit affords the inſpiſſated juice, which is the true ſuccus acaciæ of the ſhops, and whoſe gum, naturally flowing from the trunk and branches, is the true gum arabic. *Hernand*, p. 59. *Dale* Pharm. p. 343.

MNEME-CEPHALICUM *Balſamum*, the name of a famous compound balſam, ſaid to have been purchaſed from a certain Engliſh phyſician by Charles Duke of Burgundy, at the price of ten thouſand florins. Some who have been very laviſh in its praiſes have affirmed, that it has a power of preſerving in the mind the remembrance of all things that are paſt; but this ſeems ſtretching the praiſe of it a little too far. It is prepared in the following manner: Take of the juices of the leaves of baum, and baſil juices, of the flowers of tamariſk lillies, primroſes, roſemary, lavender, borrage, and broom, of each two ounces; of lillies of the valley, roſes, and violets, each one ounce; of cubebs, cardamoms, grains of paradiſe, and yellow ſaunders, carpobalſamum, florentine iris, ſaffron, ſavory, piony-flowers, and thyme, of each half an ounce; of liquid ſtorax, ſtorax-calamita, oppoponax, bdellium, galbanum, gum ivy, and labdanum, of each ſix drams; roots of long birth-wort and piony, and oil of turpentine, ſpikenard, coſtus, juniper, bays, maſtich, ben, and ſpike, of each five drams. The dry ingredients are to be beaten to powder, then mixed with the reſt, and a ſufficient quantity of water being added the whole is to be diſtilled by an alembic, and the oil carefully ſeparated from the water. The method of uſing it is this: The firſt two months the paſſages of the ears and noſtrils are to be anointed with the bigneſs of a pea of it every day; then for two months longer, the ſame is to be repeated every third day; after this, it is to be uſed once a week, then once a fortnight, till a year is expired; and after this it is to be uſed once in two months for the ſucceeding years. This is the account of Sennertus. *Sennert*. Pract. L. 1. c. 5.

MNEMONIC *Tables*. Among the artifices to aſſiſt the memory, this is one of great uſe.

Mnemonic Tables exhibit in a regular manner, what is to be remembred of the ſame ſubject. And altho' the ſciences ought to be taught in a ſcientifical manner, as much as poſſible, and that every thing ſhould be ſo placed as to be intelligible and demonſtrable from what has preceded it; yet tables ought not to be rejected, as they are helps to retain the doctrines of which the mind has had ſufficient evidence [a]. In ſuch tables the properties of things are to be expreſſed conciſely; illuſtrations and demonſtrations ſhould be left out, as the propoſition ought to have been made ſufficiently clear and certain, before it is regiſtred in the table. Hence the contents of ſuch tables ought only to be the definitions, and the propoſitions relative to the ſubject. If a ſubject require a long table, this may be ſubdivided into ſmaller; by making firſt a table of the moſt general heads, and referring from

each

each of these heads to a separate table; by this means the order and connexion of the whole will be preserved. Such tables would produce a local and artificial memory, of great use to the retention and recollection of things. They would greatly facilitate a distinct view of the properties of their subjects, and facilitate recapitulation. Besides, as the expressions used in such tables ought to be very concise, so as just to be sufficient to excite the idea of the object to be remembered, soon after that idea has been acquired; after some time a certain obscurity will be found in perusing the tables, which will give us timely warning that our ideas begin to fade, and that they ought to be renewed. And this may be done without much trouble, if not too long delayed [b].—[[a] *Wolf.* Psycol. Empir. §. 200. not. p. 140. [b] Vid. Tabul. Mnem. Construct. & usus ap. *Wolf.* Horæ subseciv. Marburg. An. 1730. Trim. Æstiv. p. 468. seq.]

MNIUM, in natural history, the name of a genus of mosses, the characters of which are these: It has heads of two different kinds, the one sort naked and dusty, having no calyptra or other covering; the others are regular capsules, like those of the hypnum and bryum, containing a fine powder, and covered with a calyptra or hood. This diversity in the fructification distinguishes the *Mnia* from all the other mosses; but these diversly constructed heads are in some species found on the same plants; in others, on different ones of the same species, as the male and female flowers are in hemp, mercury, and many other of the larger plants. The stalks which support the membranaceous heads are long, and naked; those which support the naked heads, are in some naked, in others covered with leaves; but they are in all shorter than the others. See Tab. of Mosses, N°. 7. *Dillen.* Hist. Musc. p. 230.

It is the general opinion, that the fine powder included in the capsules of the hypnum and bryum, is of the nature of the farina fœcundans of the flowers of plants, and serves to impregnate the buds or young shoots in the alæ of the leaves, which are the female part of the fructification in this class of plants; and in this sense the membranaceous heads of the *Mnia* contain a like farina, which impregnates the globules in these naked heads, and qualifies them for acting as seeds or young plants; but all this is rather hypothesis and conjecture than observation; tho' Dillenius does suppose he has seen the germination from the globules of the dusty heads in one species of the *Mnium*. Haller says, that these dusty heads are only so many congeries of young plants when viewed with good glasses, and that therefore the *Mnium* is not properly a genus of plants, but should be referred to the bryums, to which it belongs. All this however is yet but lightly founded, and the more natural opinion seems to be that of supposing the powder in the capsules of all the mosses a true seed, not a farina. *Haller.* Helvet. p. 81. See the article Moss.

There are properly two orders of the *Mniums*. Those of the first order are erect; those of the latter procumbent, or creeping. Of the first order there are four known species: 1. The common narrow and short-leav'd *Mnium*: This is a very small moss, it grows in tufts, and produces stalks from a third of an inch to an inch in length; from these in March and April there are produced dusty or naked heads, of the size of poppy seeds. These soon ripen and shed their dust; but the membranaceous capsules arrive at their maturity more slowly, and retain their perfect state much longer: these are much less frequent than the dusty naked heads, but they usually grow upon the same stalks. 2. The transparent mother of thyme leaved *Mnium*: This seldom rises to more than an inch in height, and is very common about the bottoms of rocks and roots of trees. 3. The common large upright and forked bog *Mnium*: This is three inches high in a flourishing state, and has all its branches bifurcated: It is common in boggy places. 4. The greater bog *Mnium*, with many heads: This is less branched than the former, and has very numerous dusty heads.

Of the creeping or procumbent *Mniums*, there are only three known species: 1. The transparent trichomanes-leaved *Mnium*, with uncut leaves: This is a very elegant plant, and is common in boggy places. 2. The transparent trichomanes-like *Mnium*, with divided leaves: This is common about Hampstead and Highgate. And, 3. The lichen-leaved *Mnium*: This grows in shady places, and has the dusty heads at the extremities of the leaves.

MOAR-*Loore*, in husbandry, a term used to express a peculiar distemperature of corn, generally comprehended under the common term of a blight. In this case the earth sinks away from the roots of the corn, and leaves the plant standing in great part above ground with naked roots; these being too weak to support the stalks, the plants fall and the ears become light. This is a distemperature peculiar to corn growing on light and loose lands. *Tull's* Horsehoeing Husbandry.

The remedy is this: Turn a shallow furrow against the rows, when they are strong enough to bear it, and the mold is fine and dry, the motion of the stalks with the wind will draw in this loose powder, and it will spread itself equally among all the plants of the row, tho' it be triple or quadruple. It is easy to see that this remedy is only practicable in the method of the horsehoeing husbandry; for in the common way of sowing, there is no means of relief in this case. And in general, the horsehoeing husbandry prevents the falling of the wheat, the stalks never drooping so absolutely in the drill'd wheat as they do in that sown in the common way.

MOARING, at sea. See the article Mooring, *Cycl.*

MOBILES, in the antient music, was an appellation given to the two intermediate chords of a tetrachord; because their variations produced the different genera and species of music [a]. They were called by the Greeks κινητοι, or κινουμενοι [b].—[[a] Vid. Phil. Transf. N°. 481. p. 270, 271. [b] *Wallis's* Append. ad Ptol. Harm. p. 159.]

MOCHLICA, a term by which some authors call the violent or drastic purges.

MOEHRINGIA, in botany, the name of a genus of plants described by Linnæus; the characters of which are these: The perianthium stands expanded, and is composed of four leaves of a lanceolated figure. The flower is composed of four petals of an oval figure not indented at the ends, and smaller than the segments of the cup. The stamina are eight capillary filaments; the antheræ are simple; the germen of the pistil is globose; the styles are two, they are erect and of the length of the stamina; the stigmata are simple. The fruit is a globose capsule, composed of four valves, but having only one cell in which are several seeds, convex on one side and angular on the other. *Linnæi* Gen. Pl. p. 167.

MOCHUS, in botany, a name used by some authors for the orobus or bitter vetch. Dodonæus, among others, calls it by this name. *Ger.* Emac. Ind. 2.

MOCK-*Bird*, the name of an American bird of the merula kind, and very much approaching to the cæruleus or blauvogel. It is of the size of the common lark: Its beak is short, and strait; its tail very long; and its whole body of a very fine deep blue. *Ray's* Ornith. p. 142.

Mock-*Lead*, in mineralogy, a name given by the English writers to a sort of fossil, called also *blende* and *galena*. It has very much the appearance of an ore of lead, being bright and glossy, of a bluish black colour, and plated; but on trial it is found to yield very little or none at all of that metal.

MODERATA *Misericordia*, in law, a writ that lies for him who is amerced in a court-baron, or other court not of record, for any transgression, beyond the quality or quantity of the offence. It is directed to the lord of the court, or his bailiff, commanding them to take a *moderate amercement* of the party. This writ is founded upon *Magna Charta*.

If a man be amerced in a court-baron, on presentment by the jury, where he did not any trespass, he shall not have this writ, unless the amercement be excessive and outrageous: And if the steward of the court, of his own head, will amerce any tenant or other person without cause, the party ought not to sue for this writ of *Moderata Misericordia* if he be distrained for that amercement; but he shall have action of trespass. New. Nat. Br. 167.

When the amercement which is set on a person is affeered by his peers, this writ of *Moderatæ Misericordiæ* doth not lie; for then it is according to the statute 10 Edw. II.

MODERATOR (*Cycl.*)—Moderator-*Ring*, in anatomy, is used by Valsalva for that ring which the muscles of the eye make round the optic nerve, at the bottom of the orbit. He alledges, that the exterior fibres of these muscles which rise from the nerve, must shorten it when they contract, and when the interior fibres act they must compress it; so that these different fibres of the muscles affect the nervous fluid here very differently.

Valsalva also describes such another ring made round the motory nerves of the eye; but acknowledges, that it is neither so remarkable nor distinct as the former. Med. Ess. Edinb. abr. Vol. 2. p. 410, 411.

MODERN-*Music*, *Musica moderna*, may be divided into two parts: First, *Antiquo-Moderna*, which is generally a serious sort of music, consisting of many parts; and which has been in use from Guido's time, to the beginning of the last century. Secondly, the *Modern* which has been used in this and the last century: It is very different from the *Antiquo-Moderna*, being brisker, lighter, gayer, and more sprightly.

MODIOLI, in natural history, a name given by some authors to the trochitæ or single joints of the rays of the petrified magellanic star-fish, which when connected in numbers together form that fossil called *entrochus*. Others also have used this word *Modiolus* to express the compound body, or entrochus itself. Tho' the general form of the trochitæ be thin and flat, yet they are sometimes found considerably thick; and tho' the entrochi or compound *Modioli* are usually so many cylinders of equal diameter in all parts, yet there are sometimes found such as are thick in the middle, and thence gradually taper to each end; some also are composed of joints, each of this form; these differ very greatly from the common kind, and instead of consisting of a number of little wheels are made up of a series of little barrels, joined, as it were, end to end.

Among large quantities of these some are found ornamented with what naturalists call the summitates or fastigia, which are long and slender pieces, and have a little button at the top.

All entrochi have a central cavity, or hollow, running thro' the whole length; and they are of different ſpecies, according to authors, as this cavity differs in ſize and figure. It is ſometimes a mere point in the center of the ſtone, and ſometimes takes up a third part or more of its bulk. In ſome places there are indeed found entrochi which are perfectly hollow, being only a thin cruſt; of theſe, ſome are perfectly ſmooth and even on the ſurface, and others are in the common way, made up of rings, or marked with deep circular furrows. The hole in thoſe *Modioli* which are thicker, is ſometimes round, ſometimes formed like a cinquefoil-leaf; but this laſt is more rarely met with, and is called by ſome of the later writers on foſſils, *entrocho-aſteria*, the ſtarry entrochus, to diſtinguiſh it from the common kind. The roots, as they are called, of the entrochi have very often a configuration which leads to this; they have uſually five feet, and from each foot there paſſes inwardly a little furrow to the top of the ſtone. This may very well give birth to the five enlargements of the central hollow in the others, and make them *entrocho-aſteriæ*. There is a ſcarce ſpecies found ſometimes on Mendip-hills, which has ſix hollows inſtead of the five of the other, and theſe all terminate in angles, ſo that the whole is a ſexangular hollow, whereas the cinquefoil inlets are uſually round as the leaf whoſe name they bear, tho' ſome few of them have ſharp angles. Phil. Tranſ. N°. 129.

The joints and ſockets by which the entrochi are joined together are very various, for as ſeveral rays ſhooting from a center muſt of neceſſity have conſiderable wideneſſes between them, as they paſs toward the circumference, according to the bigneſs; ſo to fill up thoſe wide ſpaces in ſome, between two rays there iſſues from the center a third ray, which paſſes as the others to the circumference of the ſtone. Some have their rays gently widening from the center all the way to the circumference: In ſome, between two forks, made by a ray that parted ſingle from the center but divides afterwards, there riſes alſo a little ray which runs to the circumference: And ſome others are ramoſe, having a trunk riſing from the center, with three, four, or five branches, running to the circumference: Some alſo are ſmooth half way of the ſtone from the center, and have a circle of ſmall rays near the circumference; and ſome are perfectly ſmooth, and have no rays at all. Theſe are uſually very thick, and are joined together in the entrochus after this manner: One trochite, or ſimple *modiolus*, a little within the outer circle, in the upper and lower parts, where the rays uſe to be, has round inlets or ſockets conſiderably deep, ſo that only a thin tympanum hinders the trochite from being hollow at this width all through; and in the middle of this tympanum there is a hole as in the other trochitæ, which is ſometimes round, and ſometimes of a pentangular figure. The trochites that anſwer this, have ſmooth joints on both ſides, without any ſkrew-like ridges entering into theſe ſockets, thoſe joints being hollow alſo; and ſo other trochitæ with ſockets come on again upon theſe; and thus the entrochus is made up. Some of theſe *Modioli* have both ſockets and rays, and ſome have a ſocket alone on one ſide, and rays without a ſocket on the other. Finally, ſome are perfectly ſmooth, only that a ſmall ridge runs round them, a little within the outer circle, which enters into a ſmall furrow anſwering to it; and ſome are ſmooth and joined only *per harmoniam*. Some of the trochitæ hold of an equal thickneſs from the center to the circumference, and others are conſiderably thick at the circumference, and thence grow gradually thinner to the central cavity, at the verge of which, all round, they make a ſort of edge. Theſe have concavities on both ſides, to which convexities in the adjoining trochitæ anſwer: Some hold of an equal thickneſs half way from the circumference toward the center of the ſtone, but they then grow thin, and continue ſo to the very verge of the cavity.

Beſide the generality of theſe trochitæ which are round, there are others found which are of an oval figure, ſome rounded at the ends, and ſome pointed; theſe have their central cavity as well as the others, and ſome have it very ſmall, others very large. In theſe it is always oblong, according to the ſhape of the ſtone, not round, as in the round ones. Theſe uſually are not joined in the entrochus by means of rays, but have a ridge running all along the verge in one, which is received into a furrow in the other. Some of theſe joints are ſhaped with a double oval, the oval of the upper part of them ſtanding contrary to the oval in the lower: in others, the ovals do not ſtand ſo entirely oppoſite one to another, but only the oval in the upper part ſeems a little wreſted from the direct line of the oval of the lower part, ſo that they ſtand bendwiſe to each other, and make up a figure like a St. Andrew's croſs. There are entrochi made up in this manner, and it is in general obſerved, that moſt of the oval entrochi grow crooked and twiſting. Theſe oval ones are found leſs frequently in the entrochus ſtate, than in the ſingle trochites; but they are ſometimes met with, and are liable to all the accidents in figure and ſurface of the common round ones. The obſervations of the manner of joining of the ſeveral trochitæ into the entrochus, and of the rays and ſpaces, with the manner of filling up the latter, and the various divarications of the former, are a very pleaſing obſervation; but it is neceſſary, in many caſes, to have recourſe to the aſſiſtance of glaſſes for the perfectly underſtanding them, the naked eye loſing a great part of the ſtructure.

MODIRA *Kaniram*, in botany, a name given by ſome authors to the tree, whoſe wood is the *lignum colubrinum*, or ſnake-wood of the ſhops. Hort. Malab. vol. 8. p. 47.

MODULUS *of the logarithmic Syſtem*. See the article LOGARITHM.

MOFFAT *Waters*, mineral waters of conſiderable efficacy at *Moffat*, in the county of Annandale. They ariſe from two ſprings on the declivity of a hill, which yield about 1360 gallons of water daily. Theſe waters have a ſulphureous taſte, and ſmell of the waſhings of a gun-barrel; their colour is milky or bluiſh. The ſeaſon for uſing them is between the middle of April and the end of September; but they may be drank all winter, and if the rains be moderate, the ſtrength of the water is not found to be impaired. The water of the upper ſpring being too foul for drinking, is made uſe of for bathing, and is, for this purpoſe, made ſomewhat warmer than tepid. The quantities of water uſually drank are pretty large, exceeding ſometimes a gallon. It is uſual to join purgatives, and that in great doſes, frequently repeated with the uſe of the waters; but this is thought unjuſtifiable by ſome [a]. The water is alterant and diuretic. Its purging is owing to the large quantities drank, or to ſome ſingularity in the conſtitution, as a weak ſtate of the ſtomach and inteſtines. Few medicines are ſaid to be ſuperior to theſe waters in diſorders of the ſtomach and bowels. It has alſo proved uſeful in nephritic, nervous, and hyſteric colics, melancholy, barrenneſs, female weakneſſes and diſorders, as alſo in old gleets, either natural, or cauſed by venereal diſorders. In rheumatic and ſcorbutic complaints it is advantageous, and in cutaneous eruptions. It is ſaid ſeldom to fail in ſcrophulous diſorders [b]. This water gives no marks of a chalybeat nature with galls, nor of acidity with tincture of roſes, or ſyrup of violets, neither does it produce any efferveſcence with oil of tartar *per deliquium*, or ſpirit of ſal ammoniac. It ſeems to contain a ſubtil volatile ſulphur, but in ſmall quantity, ſince it ſoon loſes its remarkable ſmell and taſte, when expoſed to the air, and that acid liquors can neither ſeparate nor precipitate it. Upon evaporation there is found a dirty ſalt mixed with earth. This ſalt ſeems not to be nitre, nor ſal ammoniac, but common ſalt, and by a ſlow evaporation of a ſolution of ſea ſalt, cryſtals not unlike thoſe of the ſalt of *Moffat* water have been obtained [c].—[a] Medic. Eſſ. abr. vol. 1. p. 99. [b] Ibid. p. 101. [c] Ibid. p. 103. ſeq. where other experiments on theſe waters may be ſeen.]

MOGORIN, in botany, a name given by the Portugueſe to an Indian or Chineſe flower, growing on a ſmall ſhrub. It is of a wonderful white colour, and not unlike the *gin-ſeng*, only that it abounds more with leaves, and ſmells much ſweeter; one ſingle flower filling a whole houſe with its odoriferous effluvia. On this account the Chineſe put a high value upon it, and carefully defend the ſhrub it grows on from the inclemency of the winter, by covering it with vaſes provided on purpoſe. *Hofm.* Lex. in voc.

MOHAUKS *Corn*, in botany, a name given by the Indians to a peculiar ſort of the maiz, or Indian corn. It is moſt frequent in the more northerly parts of America. The general time of ſowing the maiz in Virginia and other places, is in the end of April; but this *Mohauk* kind need not be ſown before June, and yet will come well to maturity before the winter. The ſtalks of this kind are ſhorter than thoſe of the common ſort. The ears alſo are ſhorter, and grow nearer the ground, and the corn is generally of various colours. Phil. Tranſ. N°. 142.

MOIRE, in conchyliology, the mohair ſhell, a name given by the French virtuoſi to a peculiar ſpecies of voluta, which ſeems of a cloſely and finely reticulated texture, and reſembles on the ſurface a piece of mohair, or a very cloſe ſilk-worms web. See the article VOLUTA.

MOISTURE (*Cycl.*)—The *Moiſture* of the air has conſiderable effects on the human body. For the quantity and quality of the food, and the proportion of the meat to the drink, being given, the weight of a human body is leſs, and conſequently its diſcharges greater in dry weather than in wet weather; which may be thus accounted for: The *Moiſture* of the air moiſtens the fibres of the ſkin, and leſſens perſpiration, by leſſening their vibratory motion. When perſpiration is thus leſſened by the *Moiſture* of the air, urine, indeed, is by degrees increaſed, but not equally. See Dr. *Bryan Robinſon*'s Diſſ. on the Food and Diſcharges of human Bodies, p. 68. ſeq.

Hence we learn, that to keep a body of the ſame weight in wet weather as in dry, either the quantity of food muſt be leſſened, or the proportion of the meat to the drink increaſed; and both theſe may be done by leſſening the drink, without making any change in the meat.

MOLA, (*Cycl.*) a mole, or falſe conception, in medicine, is a membranaceous and fibrous concretion in the womb, containing uſually a large quantity of coagulated or thick blood. This is ſometimes produced alone in the uterus, ſometimes at the ſame time with a regular fœtus. There are many origins to be aſſigned to theſe concretions, but the moſt uſual ſeems to be the

the leaving behind of part of the ſecundines after abortion. In young people theſe are leſs dangerous, and ſeldom remain in the womb more than a year, but in older perſons they ſometimes remain many years, and at length often occaſion the death of the perſon. When they are produced in the womb at the ſame time with a regular fœtus, they uſually deprive it of part of its nutriment, and occaſion falſe pains, and many irregular complaints, during the time of geſtation; but theſe uſually are attended with fewer accidents at the time of delivery than when the ſame ſubſtances are produced alone in the womb. The German writers of wonders give accounts of theſe concretions being living animals, armed with claws and beaks, or wide mouths, and deſtroying the fœtus when they are in the womb at the ſame time with one; but theſe are idle reports, and are to be looked upon in the ſame light with the hiſtories of Sooterkins. *Junk.* Conſp. Med. p. 721.

The ſigns of a *Mole* in the uterus are very dubious, and during the firſt months of geſtation, it is ſcarce poſſible to diſtinguiſh it from a genuine fœtus; but after this, if the ſymptoms of pregnancy go on, and there is no motion perceived at a time when the fœtus ought to ſtir, it is ſhrewdly to be ſuſpected that this is the caſe; and this becomes the more evident, if after this time there come on irregular and uncertain diſcharges of blood from the uterus, at different times; in this caſe there is alſo uſually ſo great a flaccidity in the ligaments of the uterus, that it does not retain its place in the body; but when the perſon turns in bed, is plainly felt falling like a dead weight from one ſide of the abdomen to the other. It is alſo obſerved, that in theſe caſes, tho' the belly ſwells as much as when there is a genuine fœtus, yet it is not ſo regularly rounded before, but is flatter at the middle, and more turgid toward the ſides, ſo that the burthen ſeems carried on one or the other ſide, or partly in both, while the middle remains empty. There is always in this caſe alſo a ſenſation of a weight on the lower part of the abdomen, greater by much than in the caſe of their being really a child there. At the regular time of delivery, the caſe becomes much plainer than before; for there then come on either no pains at all, or thoſe which come are ſlight and inconſiderable, very irregular in their periods and returns, and by no means ſufficient for the exclusion of a fœtus. When the *Mole* happens at the ſame time with the fœtus, it is ſeldom to be diſcovered till the time of delivery, or if it be found out ſooner, there can be nothing done till both that and the fœtus are excluded; after this the womb is to be very carefully cleanſed, as in abortions. At other times, when the caſe is obvious, that there is a *Mole* without any fœtus, the common forcing medicines are to be given for ſeveral days every month, about the time of the periodic returns of the menſes; and if theſe do not bring it away, recourſe is to be had to the hand of the midwife. *Junker*'s Conſp. Med. p. 723.

We find a very ſingular inſtance in Kerkring, of a *Mole*, in which a child was encloſed. The whole was declared a falſe conception, and might have been ſacrificed as ſuch, had not ſome perſon preſent obſerved ſomething ſtir within it, and, on the opening it, taken out the living child. *Kerkring*, Specil. Anat.

MOLA, in zoology, the name of a fiſh commonly called in Engliſh, the *ſun fiſh*. It is of a very ſingular figure. Its body is broad and ſhort, and its hinder extremity is terminated by a circular fin, which ſerves it for a tail; ſo that it looks like the head of a large fiſh ſever'd from its body; it is frequently of two foot in length, and ſometimes very much exceeds that ſize, growing even to two hundred weight. It has no ſcales, but is cover'd with a hard, harſh, and rough ſkin. Its back is black, and its belly white; the ſides are of a middle colour between both. Its back and belly both terminate in a narrow edge. Its mouth is very ſmall for the ſize of the fiſh, and, when open, is round. Its jaws are hard, and edged like a knife within; externally they are rough, as if beſet with ſeveral rows of ſmall teeth. The head does not at all project from the reſt of the body. The eyes are very ſmall. It has only one pair of fins, which are ſituated near the gills, which are only two elliptic holes covered with their proper membranes. Its fleſh is very ſoft, and its bones are all griſly and tender. The ſkin ſticks very firmly to the fleſh, and is not eaſily taken off. It is caught in the Mediterranean, and ſometimes in the Britiſh ſeas. See Tab. of Fiſhes, N°. 27. *Willughby*'s Hiſt. Piſc. p. 151.

MOLAGO *Codi*, in botany, a name by which ſome authors have called the plant which produces the common black pepper. Hort. Mal. vol. 8. p. 23.

MOLANGA, in botany, a name given by ſome authors to the plant which produces the common black pepper. *Piſo.* Mant. Arom. p. 492.

MOLARES *Dentes* (*Cycl.*)— Theſe are twenty in number, five being placed on each ſide of both jaws, immediately after the canini. The two firſt in each row are ſmall, the two next larger, as is alſo the laſt, which appears very late, and is often wholly wanting. The *Molares* have been, according to this difference in their ſize, diſtinguiſhed into ſmall grinders, large grinders, and *dentes ſapientiæ*, or the teeth of wiſdom, ſo called, becauſe they ſeldom appear till people are arrived at years of diſcretion.

The bodies of the *Molares* in general are very thick, ſhort, and irregularly cylindrical, or rather with four ſides, a little rounded, and terminated by a broad end, more or leſs filled with obtuſe points, cut, in ſome meaſure, like ſo many diamonds. The name of *crown* is alſo frequently given to the bodies of theſe teeth, from ſome ſort of reſemblance they are ſuppoſed to have to it. In the two ſmall *Molares*, the crown is leſs than in the others, and often not ſo large as the bodies of the canini: they have uſually but two points. In the two large *Molares*, the crown has a much greater extent, and the points are three, four, or five in number. The fifth grinder, or *dens ſapientiæ*, has uſually a crown much like the two former, but commonly more rounded, and with fewer points. The roots of the *Molares* are long, and more or leſs flat; in ſome ſingle, in others two, three, or four, and ſometimes, but rarely, five in number; ſometimes all theſe roots are diſtinct, ſometimes they are wholly united, and ſometimes they are united only in part; they are generally ſtrait, and at a greater diſtance from one another at their extremities than at the crown of the tooth. The roots of the ſmall grinders appear often ſingle, without being ſo in reality; for in examining them narrowly, they are found to have two roots united, or ſoldered together; and ſometimes all the diſtinction that appears, is in their having two ſeparate points. The great *Molares* have commonly ſeveral roots, the firſt three, and the ſecond four; or ſometimes, the firſt four, and the ſecond five; but theſe numbers are variable. The roots are ſometimes all perfectly diſtinct, and ſometimes they are partly diſtinct, and partly united in the ſame tooth in different degrees; and in ſome ſubjects, one or more of their points are bent outward, inward, or in other directions; and it is not always that more roots are met with in the upper teeth than in the lower. The fifth grinder has often but one root, and that is ſometimes very ſhort, and ſometimes remarkably long. It is common to meet with this tooth in grown perſons almoſt wholly hid in its ſocket, and it has, in theſe caſes, but a very ſmall opening for it to appear at. In all the *Molares*, near the collar, the roots, be they ever ſo many, meet and unite into one body. *Winſlow*'s Anatomy, p. 43.

MOLARES, in the natural hiſtory of the antients, the name for the compound mineral bodies we now call *pyritæ* and *marcaſites*. See the articles PYRITÆ, and MARCASITE.

MOLDAVICA, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind. The upper lip is ſomewhat arched, bifid at the extremity, and turned upwards; the lower one is alſo bifid, and both of them terminate in marginated edges, reſembling the mouth of ſome animal. The cup is tubulated, and uſually divided into two unequal lips. The piſtil ariſes from this, and is fixed in the manner of a nail to the hinder part of the flower, and ſurrounded by four embryos, which ripen into oblong ſeeds, and are contained in the cup of the flower.

The ſpecies of *Moldavica*, enumerated by Mr. Tournefort, are theſe: 1. The blue-flowered betony-leaved *Moldavica*. 2. The white-flowered betony-leaved *Moldavica*. 3. The betony-leaved *Moldavica*, with fleſh-coloured flowers: And 4. The ſtrong-ſcented trefoil *Moldavica* of America, called by ſome, the balm of Gilead plant, from its ſmell. *Tourn.* Inſt. p. 184.

MOLE, *Talpa*, in zoology. See the article TALPA.

MOLE, *Mola*, in medicine. See the article MOLA.

MOLE-*Hills*. Theſe little hillocks of earth are a very great prejudice to the paſture lands, not only in waſting ſo much of the land as they cover, but in hindering the ſcythe in mowing. In the weſt of England they uſe a peculiar inſtrument for the breaking up of theſe; it is a flat board, very thick, and of about eight inches in diameter, into which there is faſtened a perpendicular handle of three or four foot long. It has four broad and ſharp iron teeth at the front, which readily cut through the hill, and ſpread the earth it conſiſts of; and behind there is a large knob, proper for breaking the clods with, if there are any. Some uſe a ſpade, or other common inſtrument, in the place of this, but not ſo well. There is, however, a much better inſtrument even than this, for deſtroying theſe hills, where they are in very great numbers. This is a kind of horſe machine; it has a ſharp iron about three foot over, and with a ſtrong back. It is about four or five inches broad, and has two long handles for a horſe to be harneſſed to, and a croſs bar of iron to ſtrengthen it at the bottom of the handles, reaching from the one handle to the other. The middle of this croſs bar is furniſhed with one, two, or more, ſharp pieces of iron, like ſmall plow-ſhares, to cut the *Mole-hills* into two, three, or more parts. The iron behind is of a ſemicircular figure. A ſingle horſe is harneſs'd to this machine, and a boy muſt be employed to drive it, and a man to hold and guide it; the ſharp irons or ſhares are the firſt things that meet the hill, they run through it, break its texture, and cut it into ſeveral parts, and the circular iron following immediately behind them, cuts up the whole by the roots, and leaves the land level. This inſtrument will deſtroy as many *Mole-hills* in one day as a common labourer can in eight, and would be of very great advantage to the kingdom, if brought into general uſe. *Mortimer*'s Huſbandry, p. 331.

It is to be obſerved, that this leaving a naked ſpace in the place of every hill, it will be neceſſary to go over the land, and ſow them with hay-ſeed, otherwiſe theſe ſpots will want

the produce of graſs the firſt years. The farmers in ſome parts of England are not willing to deſtroy the *Mole-hills*, but let them ſtand from year to year, ſuppoſing that they get ſome ground by them; but the advantage by this means is ſo little that it does not ballance the unſightlineſs and damage to the mowing.

MOLE-*Cricket*. See the article GRYLLOTALPA.

MOLES-*Carnea*, in anatomy, a name given by Veſalius, and others, to a muſcle, called by Winſlow, Albinus, and others, the *complexus*. Spigelius calls it the *Carnea Moles Trigemino adjuncta*. See the article COMPLEXUS.

MOLES *Carnea Labia formans*, in anatomy, a name given by Fallopius to the muſcle called by Albinus *orbicularis oris*, and by Cowper *conſtrictor labiorum*.

MOLLE, in botany, the name of a genus of plants: The characters of which are theſe: The flower is of the roſaceous kind, or compoſed of a number of petals arranged in a circular form; the piſtil finally becomes a fruit reſembling a grain of pepper. *Tourn.* Inſt. p. 661.

There is only one known ſpecies of this genus, which is the *Molle* of Cluſius, called by Caſpar Bauhine the Peruvian lentiſk.

MOLLE, in ichthyography the name of a ſmall ſpecies of whiting, common in the Mediterranean, and in the markets of Rome, Venice, &c. and called by authors the *Aſellus omnium minimus*, and the *merlangus*. It is the ſmalleſt of all the aſellus kind, ſeldom exceeding four inches in length; it has a beard like the cod, hanging from the angle of its lower jaw; and has on each ſide nine ſpots on its noſe and gills; the back is of a pale brown, the belly white, and it has extremely ſmall and ſoft ſcales. The fleſh is very delicate. *Ray*'s Ichthyogr. p. 171.

MOLLE, in the antient muſic, a name given to a ſpecies of the diatonic; and alſo to a ſpecies of the chromatic. See the articles DIATONIC, and CHROMATIC.

The Greeks called it μαλακον, and uſed the term in oppoſition to *intenſum*, συντονον. As the latter was formed by increaſing the tenſion of the chord, and thereby making it approach nearer to the higheſt extreme of the tetrachord, ſo the *Molle* was formed by remiſſion or relaxation. Hence the diviſion of the diatonic into *Molle*, μαλακον, and *intenſum*, συντονον. *Ariſtoxenus*, p. 50, 51. edit. Meibom. See the articles DIATONIC, and GENUS.

MOLMAN, in our old writers, a man ſubject to do ſervice. It is applied to the ſervants in a monaſtery. *Spelm.* Gloſſ. *Blount.*

MOLOCH, an effected term uſed by ſome chemical writers, to expreſs a leaden pot, through which mercury is made to paſs in the fire.

MOLOCH, in antiquity, the name of the Phœnician god. See the article DÆMON, *Cycl.*

MOLOCHITES, in natural hiſtory. See the article MALACHITES.

MOLOPS, a word uſed by ſome medical writers, to expreſs the purple ſpots which appear upon the ſkin in malignant fevers.

MOLOSSES (*Cycl.*)—*Artificial* MOLOSSES. There has been found a method of making *Moloſſes* from apples, without the addition of ſugar. The apple that ſucceeds beſt in this operation is a ſummer-ſweeting of a middle ſize, pleaſant to the taſte, and ſo full of juice, that ſeven buſhels will yield a barrel of cyder.

The manner of making it is this: The apples are to be ground and preſſed, then the juice is to be boiled in a large copper, till three quarters of it be evaporated: This will be done with a moderate fire in about ſix hours, with the quantity of juice above-mentioned; by this time it will be of the conſiſtence and taſte as well as of the colour of *Moloſſes*.

This new *Moloſſes* ſerves to all the purpoſes of the common kind, and is of great uſe in preſerving cyder. Two quarts of it put into a barrel of racked cyder, will preſerve it, and give it an agreeable colour.

The invention of this kind of *Moloſſes* was owing to Mr. Chandler of Woodſtock in New-England, who living at a diſtance from the ſea, and where the common *Moloſſes* was very dear and ſcarce, provided this for the ſupply of his own family, and ſoon made the practice general among the people of the neighbourhood. It is to be obſerved, that this ſort of apple the ſweeting, is of great uſe in making cyder, one of the very beſt kinds we know being made of it. The people in New-England alſo feed their hogs with the fallings of their orchards of theſe apples; and the conſequence of this is, that their pork is the fineſt in the world. Phil. Tranſ. N°. 374. p. 230.

MOLOSSES *Spirit*; a very clean and pure ſpirit, much uſed in England, and made from *Moloſſes* or common treacle diſſolved in water, and fermented in the ſame manner as malt for the common malt-ſpirit. If ſome particular art is not uſed in the making this, it will not prove ſo vinous as the malt-ſpirit, but more flat and leſs pungent and acid, tho' otherwiſe much cleaner taſted, as its eſſential oil is of a leſs nauſeous flavour. Whence if good freſh wine leys, abounding in tartar, be duly fermented in the ſolution made thin for that purpoſe, the ſpirit will by that means become much more vinous and briſk, and approach more to the nature of the foreign ſpirits.

After the firſt diſtilling of *Moloſſes* ſpirits from the waſh into low wines; it is to be rectified, and in the ſucceeding rectifications proper additions are to be made. Alkaline ſalts, ſo common in the rectifying the malt ſpirits, muſt be avoided in this caſe, as not at all ſuiting this ſpirit, and the neutral ones only muſt be uſed, ſuch as ſandiver, common decrepitated ſalt, ſal enixum Paracelſi, and the like; but upon the whole nothing ſo conſiderable is to be expected from theſe ſalts, as from a careful rectification in balneo mariæ, without any other admixture; by this alone repeated two or three times with freſh water each time, the ſpirit will at once be made fit for the niceſt uſes.

Where the *Moloſſes* ſpirit is brought to the common proof ſtrength, if it be found not to have enough of the vinoſity in it, it will be very proper to add to it ſome good ſpiritus nitri dulcis; and if the ſpirit be clean worked, it may by this addition alone be made to paſs on ordinary judgments for French brandy.

When newly diſtilled, this ſpirit like all others is colourleſs, and limpid as water; but our diſtillers always give it the ſame ſort of yellow tinge, which the foreign ſpirits are found to obtain from the caſks they are ſent over in. They have many ways of giving this colour extempore; but the two moſt in uſe are, either by an extract of oak-wood, or by burnt ſugar. *Moloſſes* ſpirit coming dearer than that of malt, it is frequently met with baſely adulterated with a mixture of that ſpirit, and indeed ſeldom is to be bought without ſome daſh of it. Many have a way of mixing malt in the fermenting liquor, by this the yield of the whole is greatly increaſed, and the maker may aſſure the buyer that the ſpirit is pure as it ran from the worm.

England is the principal place where this ſpirit is made at this time; it was at one time prepared in great quantities in France, eſpecially in the river Loire; but it is now forbid there, under a ſevere penalty. In Holland alſo they have it not, on account of the high duty laid upon treacle in favour of their own ſugar-bakers.

We meet with very little of *Moloſſes* ſpirit reduced to the ſtrength of alcohol or ſpirit of wine, tho', when rectified to this ſtate in a proper manner, it is very little inferior to the real alcohol of wine, the name of which is ſo well known among us, tho' the thing itſelf is perhaps never ſeen here. All that we call ſpirit of wine being no other than malt ſpirit reduced to an imperfect alcohol, or a ſpirit almoſt totally inflammable. Great quantities of *Moloſſes* ſpirit are uſed in the adulterating of brandy, rum, and arrack; and great quantities are uſed alone in the making cherry-brandy and other drams by infuſion, in all which many prefer it even to the foreign ſpirits.

In moſt of the nice caſes in our compound diſtillery the *Moloſſes* ſpirit ſupplys the place of a pure and clean malt ſpirit, which we have not yet the way of producing in the large way to advantage. Our cinnamon, citron, and other fine cordial-waters, are made with it; for the malt ſpirit would give theſe a very diſagreeable flavour.

There is alſo another uſe to which this ſpirit ſerves extremely well, and which even a foreign ſpirit that has any remarkable flavour will not do ſo well in; this is the making the extemporaneous wine, which ſome people are ſo fond of. See the article *Extemporaneous* WINE.

It gives a yellow ſtain to the hands, or other ſubſtances dipped into it; and may therefore be of uſe in dying. It is poſſible alſo, that the vinegar-makers may find uſe for it in their way; but the moſt advantageous of all its uſes, is to the diſtiller himſelf, a quantity of it added to new treacle intended for fermentation will be of great uſe in the proceſs, and increaſe very conſiderably the quantity of ſpirit; but the proportion in regard to the new matter muſt not be too great. *Shaw*'s Eſſay on Diſtillery.

MOLTEN-*Greaſe*, in the manege, is a fermentation or ebullition of pituitous and impure humours, which precipitate and diſembogue into the guts, and oftentimes kill a horſe. This diſeaſe does not commonly ſeize upon any but very fat horſes, when over-rid in very hot weather.

MOLVA, in zoology, a name by which ſome authors have called the common cod-fiſh, called the *morhua*, and *aſellus major* by other writers. *Geſner* de Piſc. p. 102. See the article COD-*Fiſh*.

MOLUCCA, in botany, the name of a genus of plants; the characters of which are theſe: The flower conſiſts of one leaf, and is of the labiated kind; the upper lip is hollowed in the manner of a ſpoon, and the lower is divided into three ſegments. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower, and ſurrounded by four embryos, which afterwards become four angular ſeeds, ripening in a bell-faſhioned open capſule, which was before the cup of the flower. See Tab. 1. of Botany, Claſſ. 4.

The ſpecies of *Molucca*, enumerated by Mr. Tournefort, are theſe: 1. The ſmooth *Molucca*. 2. The prickly *Molucca*. And, 3. The ſhrubby *Molucca* of Sicily, called by ſome authors ſhrubby balm. *Tourn.* Inſt. p. 187.

Theſe plants are otherwiſe denominated *Anacardiums*. See the article ANACARDIUM.

MOLUCCA-*Beans*, a name given by Sir Robert Sibbald, in his prodromus; and by Mr. Wallace, in his deſcription of the Orkney-iſlands, to a ſort of fruit frequently caſt on ſhore in the north-weſt iſlands of Scotland; eſpecially on the coaſts moſt expoſed to the waves of the great ocean.

They are called by ſome Orkney-beans, and are not the produce of that iſland, or indeed of any other part of Europe, but of America.

Sir Hans Sloane procured four ſpecies of them little injured by the ſea, and found on examination that three of them were the common produce of the iſland of Jamaica; where he had himſelf gathered them, and deſcribed them in his catalogue and hiſtory.

The firſt ſort was a kind of kidney-bean, and the plant which produces it is deſcribed by Sir Hans under the name of the great perennial kidney-bean with a great crooked lobe. It is alſo figured in the Hortus Malabaricus, by the name of *Perim Kakuvalli*, and Sir Robert Sibbald alſo calls it *Nux Indica ex qua Pyxides pro pulvere ſternutatorio parant.* This is a native of the Eaſt and Weſt-Indies, and is ſometimes found thrown on ſhore in the county of Kerry in Ireland; and in ſome other places.

A ſecond kind of fruit thrown on ſhore in the Orkneys, is a very common fruit in Jamaica, known there by the name of the horſe-eye bean; it has this name from its reſembling the eye of ſome large animal by reaſon of a hilus or welt which ſurrounds it. This is deſcribed by many authors, and among the reſt by Sir Hans Sloane, in his catalogue of the Jamaica plants; and is found in many other of the hotter parts, both of the Eaſt and Weſt-Indies.

A third kind of fruit found on theſe ſhores, is that called by the people of Jamaica the aſh-coloured nickar-nut; it has this name from its colour, and from its being perfectly round and of the ſhape of a nickar or marble, ſuch as boys play with: This alſo is common to the Eaſt and Weſt-Indies.

A fourth kind is alſo a Jamaica fruit, with the hiſtory of which we are not yet well acquainted; no body has ſeen it growing, but the fruit itſelf is preſerved in many of the collections of the curious, and has been figured and deſcribed by Cluſius, and others, under the name of a round exotic fruit ridged with four riſing nerves.

Theſe are the principal kinds of fruit thus toſſed on ſhore with us; but how the products of Jamaica, or other parts of America, ſhould be brought to the ſhores of Scotland and Ireland, ſeems not eaſy to determine on any certain foundation. It is eaſy to conceive, that when they grow by the ſides of rivers they may fall off from the trees into them, and be thence conveyed into the ſea. It is likewiſe eaſy to ſee, that when they are thus floating on the ſurface of the ſea they may be carried about by the winds and currents, and be carried a great way; but their journey this way muſt naturally be ſtopped by the main continent of America, and they muſt be forced through the gulf of Florida, or the canal of Bahama, going thence conſtantly eaſt, and into the North-American ſea. This is eaſily conceived by a ſimilar fact which happens every day: which is, that a kind of ſea-lentil, called *ſargaſſo*, which grows very plentifully on the rocks about Jamaica, is waſhed off from thence and carried by the winds and currents, which for the moſt part go impetuouſly the ſame way, toward the coaſt of Florida, and thence into the North-American ocean; and are there found floating on the ſurface. Thus far it is eaſy to trace our fruits from their native ſoil; but how after this they ſhould make the reſt of their voyage is a great myſtery, and not to be accounted for by us, unleſs we ſuppoſe, that as ſhips when they go ſouth expect a trade eaſterly wind, and when they come north expect and generally find a weſterly wind, for at leaſt two parts in three of the year; ſo we are to ſuppoſe theſe fruits being brought north by the current from the gulf of Florida, are put into theſe weſterly winds way, and by them conveyed to the coaſts of Scotland and Ireland. Philoſ. Tranſ. No. 222. p. 300.

By the ſame means that theſe beans came to Scotland, it is reaſonable to believe that the ſame winds and currents brought from America thoſe ſeveral things towards the Azores and Porto Santo, which are recorded by Ferdinand Columbus, in the life of his father; which gave this bold adventurer the firſt notions of there being ſuch a place as America. The things he mentions as waſhed aſhore in this manner, were a piece of wood very ingeniouſly wrought, but evidently without the help of iron tools. This was taken up by a Portugueſe pilot, four hundred and fifty leagues from ſhore, off cape St. Vincent, after a weſt wind, which had blown violently for many days: After this ſuch another piece of wood was taken up on the ſhores of Porto Santo, after ſuch another long and violent weſt wind. After this large canes, vaſtly ſuperior to any of the growth of the then known parts of the world, were found thrown on the ſame ſhores, and the fruits of pines which did not grow in any known part of the world; and finally the bodies of two men appearing to be of a different nation from any of the known people, and two of their canoes, were driven on ſhore on the iſland Flores, one of Azores. All theſe things having been found only after ſtrong and continued weſt winds, it appeared very evident, that there muſt be land ſomewhere to the weſt, where fruits and men were to be found; and that theſe men had no knowledge of our arts, by their want of iron. It was eaſy to ſee from this how uſeful we might be to them, if they could furniſh us with any thing of value. And on this plan was founded the greateſt diſcovery of the modern times.

MOLY. The name of this plant is rendered famous by Homer, and has been on this occaſion much enquired into as to its true ſenſe, by the botaniſts of almoſt all times. The old interpreters of Homer all explain this word by the wild rue; and the only reaſon for this is, that at ſome time, probably long after the days of Homer, the people of Cappadocia called the wild rue *Moly*. But this plant is wholly different from the *Moly* of Homer, which Theophraſtus affirms grew in his time in Arcadia, in great plenty, and had a round bulbous root like an onion, and long and graſſy leaves like the ſquill. The authority of this author, who wrote profeſſedly on the ſubject of plants, and wrote ſo early, is ſufficient to explode the abſurd opinion of the *Moly* of Homer, being wild rue; but tho' the commentators are thus eaſily ſet aſide, there is yet another author who will lead into no leſs errors. This is Pliny, who has blended together the accounts of all the writers before him on this ſubject; and as they have contradicted one another, he has preſerved all their contradictions. After telling us the fabulous ſtory of its being found out by the god Mercury, and being good againſt witchcraft and the like, he tranſlates the words of Theophraſtus, that it grows about Phineas and Cyllene, in Arcadia; and has a round and black root of the ſhape of an onion, and leaves like the ſquill. To this Theophraſtus has added, that it is not however difficult to be dug up, as Homer ſeems to think; but Pliny, to make Theophraſtus and Homer agree at any rate, leaves out the word *not* in his tranſlation, and ſays, that it is very difficult to be dug up. *Pliny*, L. 25. c. 4.

The phyſicians of Italy, in the time of Pliny, were fond of believing that they had the true *Moly* of Homer growing in the Campania of Rome; and Pliny ſeems to have been alſo wholly convinced of it; and mentions as a reaſon of his conviction, that they had brought to him a root of *Moly*, which was dug up with prodigious difficulty from among rocks and ſtones, and which, when he ſaw it, meaſured thirty foot long, yet was not compleat, but broken off at the end; ſo that it might poſſibly have been much longer. The author's ſkill in botany appears to have been very little, that could make him believe, becauſe of the ſingle obſervation of the difficulty of getting it up, that this was the true *Moly* which he had juſt before deſcribed from Theophraſtus, as having a round root like an onion.

It is probable that this was the root of the ſaint-foin or lucerne, both theſe plants growing wild in Italy, and both having roots of a prodigious length, probably not leſs than that here mentioned by Pliny; but that he could ſuppoſe theſe roots to be of the bulbous kind, ſhews an ignorance that but ill agrees with the veneration ſome people have for this author. This plant had nothing in common with the *Moly* of Homer and that of Theophraſtus, excepting the difficulty of getting it up, which Theophraſtus denys to be a truth; and in which probably Homer was miſinformed, as no bulbous root can be very difficult to get up; but Pliny, that the Roman root might agree with the true *Moly*, firſt compels Theophraſtus againſt the letter of his own account, to ſay *Moly* was hard to be dug up, and then makes this a reaſon for a plant's being the true *Moly*, which does not appear to have had any one character in common with it. Nature is uniform in her productions, and tho' a bulbous plant ſuch as the *Moly* of Theophraſtus, would naturally have graſſy leaves, as all bulbous plants have; yet this long-rooted plant, deſcribed by Pliny, in the common courſe of nature could not have ſuch, but probably had either pennated or trifoliate leaves.

Pliny adds, that the Greek authors have made the flowers of the *Moly* yellow, whereas Homer ſays that they were white; but it does not appear that this is a juſt accuſation, for neither any of the Greek writers extant at this time, nor any of the fragments of others which we find recorded, expreſs any ſuch thing: On the contrary, the whiteneſs of the flower ſeems to have been always looked upon as one of the great and eſſential characters of the *Moly*; and the wild rue ſeems to have been ſuppoſed the *Moly* of Homer, only becauſe it has white flowers, and roots black on the outſide. The error of Pliny in ſuppoſing the Greeks to have called the flowers of the *Moly* yellow, ſeems to have ariſen from a Greek writer having ſaid, that the flowers are like thoſe of the leucoium, but white as milk. He has probably taken this ſentence, but without the laſt word, and then accuſed the author of ſaying they were like the leucoium flowers in colour, when he only ſays they are ſo in ſhape.

The author of the Priapeian verſes ſeems to follow this, and ſays, that yellow or gold-coloured flowers ariſe from the *Moly*; but this is by no means conſonant to Homer's account, who ſays they are white like milk. And ſo ſay all that have written after him.

On the whole, the *Moly* of Homer ſeems to have been a ſpecies of allium or garlic. See the article GARLICK, ſp. 32.

MOLYBDÆNA, *Leadwort*, in botany, a name given by ſome authors to the great toothwort, or dentillaria of Rondeletius. *Ger.* Emac. Ind. 2. See the article PLUMBAGO.

MOLYBDÆNA is alſo a mineral ſubſtance, called *black lead*. See the article BLACK *Lead*.

MOLYBDIA, in natural hiſtory, the name of a genus of cryſtals. The word is derived from the Greek Μόλιβδος, lead; and expreſſes cryſtals altered in their figure by particles of that metal. The cryſtals of this genus are of a cubic form, or compoſed of ſix ſides, at right angles, like a die.

Of this genus there are three known ſpecies. 1. A colourleſs one, compoſed of extremely fine cruſts. This is found in many parts, both of this and other kingdoms, where there are lead mines; and tho' naturally colourleſs, is ſometimes tinged with a red, green, or blue. 2. A dull one with thicker cruſts, ſometimes whitiſh, and ſometimes coloured to a yellowiſh or other hue. This is found in the lead mines of Yorkſhire, and ſome other places. And 3. A dull bluiſh white one, with very thick cruſts. This is very frequent in the lead mines in Derbyſhire, and is generally found in large cluſters. *Hill*'s Hiſt. of Foſſ. p. 193.

MOLYBDOMANTIA, Μολυβδομαντεια, in antiquity, a ſpecies of divination, by obſerving the motions, figures, &c. of melted lead. *Potter*, Archæol. Græc. lib. 2. c. 18.

MOLYZA, μώλυζα, a word uſed by the Greek phyſicians to expreſs a head of garlick. Hippocrates has ſeveral times preſcribed this under the name of *Molyza*, and this having ſome ſort of reſemblance to the word *moly*, ſeveral of the interpreters of Hipprocrates have been very deſirous of making it the ſame thing with the *moly* of Homer. But the words of Hippocrates himſelf, in his book of the diſeaſes of women, ſet this in a clear light; for he there adds the name of garlick to the *Molyza*, and orders a *Molyza* of garlick to be ſcraped clean for uſe. Heſychius calls *Molyza* a head of garlick, and Pſellus, on the antiquated words of the Greek phyſicians, ſays the ſame thing.

MOMENT (*Cycl.*)—A *Moment* ought not to be conceived as the leaſt part of time, but as a termination or limit of time. *Maclaurin*'s Fluxions, vol. 1. p. 245.

MOMISCUS, a word uſed by ſome as a name of the *dentes molares*, and by others only as the name of that part of thoſe teeth which is near the gums.

MOMORDICA, in botany, the name of a genus of plants called by many authors, *balſamina* and *charantia*. The characters of the plants of this genus are theſe: The flower conſiſts of one leaf, ſhaped like a bell, wide open at the mouth, and deeply divided into five ſegments, ſo as to ſeem a five-leaved flower. Of theſe, ſome are male or ſteril flowers, having no embryo fruit, others are fruitful, and have each its embryo fruit at the bottom, which ripens into a capſule, more or leſs turbinated, fleſhy, hollow, and endued with an elaſtic power, by means of which it throws out the ſeeds on touching it, when ripe, to a conſiderable diſtance.

The ſpecies of this genus, enumerated by Mr. Tournefort, are theſe: 1. The common *Momordica*, called the round-leaved, male, or creeping *balſamina*. 2. The *Momordica* of Ceylon, with a ſhorter fruit, and a vine-like leaf. 3. The longer-fruited *Momordica* of Ceylon, with vine-like leaves.

The flower of this genus of plants is ſo very deeply cut into its ſegments, that there is ſome doubt whether it be not properly a five-leaved flower. The error of calling it *balſamina*, and confounding it with the ſpecies of that genus, is very great. See the article BALSAMINA.

MOMOT, the name of a bird deſcribed by Nieremberg, and ſaid to be an inhabitant of the hot countries. It is of the ſize of a pigeon; its beak is black and crooked, three fingers breadth long, and ſerrated at the edge. Its head is blue like the peacock's, and its feet brown. The reſt of the body is of a pleaſant green. But what is moſt ſingular in this bird, is, that it has in its tail one feather much longer than the reſt, which is naked for a great way, and is feather'd only at the end. This laſt circumſtance Mr. Ray judges wholly falſe, as no birds have ſingle feathers in their tails, but all that are there grow in pairs.

MONACANTHUS, in zoology, a name given by ſome to the alpheſtes, or cinedus, a fiſh approaching to the turdus kind; but differing, in that its back fin is prickly all along, whereas the forepart only is ſo in the turdus.

MONACHELLE, in ichthyology, a name given by ſome to the fiſh called, by the oldeſt Greek writers, the *chremps*, and by the later ones, as alſo by the Latin authors on theſe ſubjects, *chromis*. It is properly a ſpecies of the ſparus, and is diſtinguiſhed by Artedi from the others, by the length of the ſecond ray of the belly fins.

MONADELPHIA, in botany, a claſs of plants whoſe ſtamina or male parts, by reaſon of their filaments running in among one another, are all formed into one body.

The word is formed of the Greek μονος, ſingle, and ἀδελφὰ, brotherhood, or community. Theſe coalitions of the ſtamina in flowers being underſtood in botany by that term.

Of this claſs are the craneſbill, mallow, &c.

The general characters of this claſs of plants are theſe: There is always a perianthium to the flower, no ſpecies of the whole claſs being without it. This is always permanent, and ſurrounds the baſe of the ſeed-veſſel, after the flower is fallen. The flower always conſiſts of five petals, which are cordated at the top. The ſtamina are a great number of filaments, which grow together in one body at the baſe, and are looſe at the top. The external ones are ſhorter than the others; and the antheræ are always incumbent. In the piſtils there is found a receptacle of the fructification, which is placed in the center of the flower. The germina are erect, and ſurround in a rotary manner the apex of the receptacle. The ſtyles are all found growing together at the bottom, into one body with the receptacle, and in their upper part they are divided into as many filaments as there are germina. The ſtigmata are ſlender and expanded. The fruit is a capſule, divided into as many cells as there were piſtils in the flower. This is of very various figures in the various genera and ſpecies; but the ſeeds in all are reniform, or ſhaped like kidneys. See Tab. 1. of Botany, Claſs 1.

This is an extremely natural claſs, and there is not one plant uſually allowed to belong to the reſt of this kind, that this character ſeparates, nor one of any other kind that it brings in among them. Tournefort has been guilty of a very great error, in regard to the flowers of the plants of this claſs; he ſays that they are monopetalous, and only divided into five ſegments; but a ſtrict obſervation will ſhew, that they really conſiſt each of five ſeparate petals, which only are joined at the baſe by certain filaments, which together make one body. Hence it follows, that they are ſtrictly and truly pentapetalous, tho' they fall off together, not ſeparately, on ſhaking the plant. *Linnæi* Gen. Pl. p. 325.

It is obſerved, that all the plants of this claſs are mucilaginous and emollient, and have great virtues, as diuretics, &c. The common marſhmallow deſervedly ſtands at the head of theſe, and is common in the preſcriptions of phyſicians on theſe occaſions, as well as in many of the ſhop compoſitions, as the ſyrrup of marſhmallows, and the like.

Tho' authors in general have kept this claſs of plants together, they have been much divided in their opinions, as to the characters or parts of them, by which they ſhould divide them into genera. Some have had recourſe, on this occaſion, to the ſeed-veſſel; others finding that inſufficient, have conſulted the leaves. Linnæus uſes the cup of the flower on this occaſion, which is a very eſſential part in this claſs of plants, and ſufficiently different in the different genera.

MONANDRIA, in botany, a claſs of plants which have hermaphrodite flowers, with only one ſtamen in each.

The word is formed of the Greek μόνος, ſingle, and Ἀνηρ, male. Of this claſs of plants are the blite, turmeric, and the like. See Tab. 1. of Botany, Claſs 1.

MONARCHICI, in church hiſtory, heretics towards the end of the ſecond century, who allowed but one perſon in the godhead, and taught that the father was crucified. *Hofm.* Lex. in voc.

MONARDA, the name by which Linnæus calls the plant which is the *origanum ſpurium*, or baſtard wild marjoram of Rivinus. This, in the Linnæan ſyſtem of botany, makes alſo a diſtinct genus of plants, the characters of which are, that the cup is made of one leaf, and is cylindric and tubulated, with an even edge marked with five notches. The flower conſiſts of only one petal, which is a cylindric crooked tube, longer than the cup, and with a labiated opening. The upper lip is long, narrow, ſtrait, whole, and ſurrounded with rims; the lower lip is bent back, is broad, and ſlightly trifid, the middle ſegment being the longer, narrower, and rimmed round the edge. The ſtamina are two filaments, of the length of the upper lip of the flower, in which they are hid. The antheræ are of a compreſſed form, truncated above, and convex below. The piſtil is a quadrifid germen, with a thread-like ſtyle involved among the ſtamina, and a ſtigma bifid and pointed. It has properly no fruit, the cup encloſing in its bottom the ſeeds, which are roundiſh, and four in number. *Linnæi* Gen. Plant. p. 6.

MONEMERION, Μονημεριον, among the antient Romans, a ſhew, according to ſome, wherein none but tame beaſts were expoſed to view.

Others will have it to be a ſhew of one day's continuance. *Pitiſc.* in voc.

MONEY (*Cycl.*)—*Madning* MONEY. See the article MADNING.

MONGER, a little ſea-veſſel which fiſhermen uſe. Stat. 13 Eliz. c. 11. *Blount.*

MONK-*Fiſh*, the Engliſh name of a ſpecies of the ſqualus, according to the new Artedian ſyſtem; called *rhina* and *ſquatinus* by the old authors. It is diſtinguiſhed by Artedi from the other ſquali, by the name of the *ſqualus* with no *pinna ani*, and with the mouth on the top of the head. See Tab. of Fiſhes, N°. 7.

MONK's *Hood*, a name given to ſeveral ſpecies of aconite, or wolfs-bane. See the article ACONITE.

The flowers of this plant are in common uſe in the country, to garniſh diſhes, tho generally ſuſpected of being poiſonous; but the ſtalks have been found very violently ſo, according to an account given in the Philoſophical Tranſactions, of a perſon who eat them inſtead of celeri.

The firſt ſymptom this perſon felt, was a biting, and ſenſation of a tingling heat, not only affecting his tongue, but his jaws;

jaws; his teeth, after this, ſeemed looſe, and his cheeks were ſo much irritated, that he thought they were ſwelled to three times their natural ſize, and he could not be perſuaded of the contrary by the people who were about him, nor by his glaſs. This tingling ſenſation by degrees ſpread itſelf farther, till by degrees his whole body, but eſpecially the extremities, were affected by it; he then felt a weakneſs in his joints, eſpecially in his knees and ankles, and frequent twitchings of the tendons. At length, he felt a pain that gave him an idea of the circulation of the blood being wholly affected, and abſolutely ſtopped in his legs toward the feet, and from his wriſts to his fingers ends. He had all this time no ſickneſs, or diſpoſition to vomit. He took near a pint of oil, and ſwallowed after that great quantities of carduus tea; this made him vomit; but after this his head grew miſty, his eyes dim, and a humming noiſe was continually in his ears; after this he fell into abſolute faintings, and his eyes were cloſed, his limbs ſtiff, and his teeth fixed. He was, however, recovered at length by repeated draughts of carduus tea, and cordial draughts of wine, with tincture of ſaffron, caſtor, and the like, between the times of his reachings to vomit. Philoſ. Tranſ. N°. 432.

The young ſhoots of this plant have ſome reſemblance to ſalary, and were put into the ſalad as ſuch. The whole quantity put in, was but the top of one root; and one other perſon eat of the ſallad beſide the man. She eat more ſparingly, and had all the ſymptoms of which the man complain'd, only in a leſs degree.

MONOCEROS *Minor*, in ichthyography, the name of a fiſh caught in the American ſeas; its uſual length is a foot and half; its height about nine inches, very flat bodied, and high backed like a perch, and bow bellied. Its head has ſome reremblance to that of a baboon. Its mouth is ſituated low, and is not above an inch over. Its teeth are of the eighth of an inch long, and of the thickneſs of a midling needle; and the gills are ſubtended to the eyes and mouth, like the ſegment of a circle. The eyes ſtand near the top of the head, and are an inch over. From the top of the head is prolonged a ſmooth, round, tapered, ſtrait horn, two inches round about the root, and about three inches long. This ſeems to have no bone within it, nor is inſerted into any, but ſeems merely the cuticle hardened, as in corns, into a ſort of horny ſubſtance. The back fin reaches from the head to the tail. It is covered with a tough thick ſkin, feeling ſomewhat rough. *Grew*'s Muſ. Soc. Regal. p. 104.

MONOCEROS *Piſcis*, is alſo uſed as the name of a fiſh, common in the American ſeas, and called *pira-aca* by Marggrave, and ſome other authors; and by the Portugueſe, *piexe porco*.

It is a very ſmall fiſh, of about three fingers breadth long, and two broad where broadeſt; it is of a flatted or compreſſed ſhape; the mouth is very ſmall, but of the figure of that of a hog; and there are in the lower jaw only two broad teeth, and ſeveral ſmall ones in the upper. The eyes are very large and yellow, with black pupils. A little behind the eyes, on the ridge of the back, it has an upright horn, a little bending backwards, leſs than a finger's breadth long, of a rounded figure, and of the thickneſs of a large thread; this is ſerrated on each ſide by a row of ſmall teeth or prickles, their points bending downwards; and the whole horn ſeems ſupported by a ſmall membrane, which is laid tranſverſely on the back. It has a ſmall furrow under each eye, in the cavity of which is placed a little fin; under the belly it has another larger fin, at the inſertion of which there is alſo another horn like that on the back, but ſmaller. Its ſkin is very rough to the touch, and is of an obſcure yellowiſh colour. The fins and the ridge of the back are yellower than any other part of it. See Tab. of Fiſhes, N°. 36. *Cluſ.* Exot. lib. 6. c. 28.

MONOCOLI, Μονόκωλοι, a kind of fabulous men, who, as the Arabians give out, inhabit the country of Segir in Arabia Felix. They are furniſhed with only half the head, breaſt and belly; and have but one eye, one ear, one hand, and one foot; notwithſtanding which they can walk very ſwiftly, and even climb trees; talk with one another, and ſing verſes very elegantly compoſed. Their chief reſidence is ſaid to be by the ſides of lakes, or the ſea ſhore. *Hofm.* Lex. univ. in voc.

The word is Greek, compounded of μονος, one, and κωλον, a member.

MONODON, in the Linnæan ſyſtem of zoology, the name of the monoceros, or ſea unicorn, a fiſh of the whale kind, which makes a diſtinct genus of fiſhes; the characters of which are, that it has no fin on the back, and a very long tooth in its upper jaw. *Linnæi* Syſt. Nat. p. 51.

The word is Greek, compounded of Μονος, one, and οδους, a tooth, and expreſſes this fiſh's having only a ſingle tooth.

Artedi makes the *Monodon* a peculiar genus among the cetaceous fiſhes, or plagiuri. The *Narwal* is the only known ſpecies of this genus. See the article NARWAL.

MONOECIA, in botany, a claſs of plants which have not the male and female parts, that is, the ſtamina and piſtillum in the ſame, but in different flowers; and thoſe on the ſame individual, or on the different ſtalks, growing from the ſame root; thoſe which contain the ſtamina are called the male flowers, thoſe which contain the piſtillum, the female ones.

The word is derived from the Greek, μονος, the ſame, and οἶκος, habitation. The plants of this claſs are the alder, mulberry, amaranth, &c. See Tab. of Botany, Claſs 1.

MONOGASTRIC, in anatomy, a name given by Vieuſſens, and ſome of the French writers, to one of the muſcles of the ear, called by Cowper, the *internus auris*, and more properly by Albinus, the *tenſor tympani*.

MONOGRAPHI, in botany, authors who have written expreſs treatiſes on only one plant; as Douglaſs on the Guernſey lilly, &c. *Linnæi* Fund. Bot. p. 1.

MONOMACHON, a name given by ſome to the inteſtine, otherwiſe called *cæcum*.

MONOMERES, a word uſed by the antients alone, but more frequently joined with the word *phorbeia*, to expreſs one ſort of the bandage uſed to confine the breath, by thoſe who played on the antient pipe. This conſiſted only of one ſtrait, and one tranſverſe piece; and the latter came fully over the mouth, and cloſed it up, except that a hole was cut in it to receive the mouth-piece of the pipe. The *diemeres* conſiſted of ſeveral pieces, and only tied up the lower lip.

MONOPAGIA, a word uſed by ſome medical writers, for that ſpecies of headach which affects only one point, or ſmall part of the head.

MONOPETALOUS (*Cycl.*)—See theſe flowers repreſented in Tab. 1. of Botany, Claſs 1.

MONOPHAGI, Μονοφαγοι, in antiquity, a deſignation given to thoſe who celebrated the Æginean feſtival, becauſe they feaſted or eat together without the aſſiſtance of their ſervants; none but denizens of that iſland being allowed to be preſent. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 364.

MONOPODIA, among the antients, a ſort of tables uſed in their feaſts, and diſtinguiſhed by this name from their having but one foot; the name being derived from the Greek, μονος, one, and πους, foot. *Hardouin.* in Plin. vol. 2. p. 641.

MONOPS, in natural hiſtory, a name given by Ælian, and ſome other of the old Greek writers, to the *bonaſus*. It ſhould appear from this name, which expreſſes a ſingle eye, that the creature had but one eye; but this is not the caſe, and the word is rather formed upon the name *monopus*, which was originally written *monapus*, and the *a* only changed into an *o*, by the corruption of the copies of the authors who had treated of it. The name *monapus* was given this animal, according to Ariſtotle, by the people of the country where the creature was moſt frequent, and therefore is not to be attempted on any Greek etymology. Some of the Greeks have called the ſame creature *monepos*, and ſome *bolinthos*. See the article BONASUS.

MONOSCELI, Μονοσκελεις, a fabulous race of men, who are repreſented by Pliny to have only one leg. They were alſo called *ſicapodes*. See the articles SICAPODES and MONOCOLI.

The word is Greek, compounded of μονος, one, and σκελος, a leg.

MONOSPERMALTHÆA, in botany, a name given by Mr. Iſnard, in the *Acta Germanica*, to a genus of plants afterwards called *waltheria* by Linnæus. *Iſnard*, A. G. 1720. See the article WALTHERIA.

MONOTROPA, in botany, the name of a genus of plants, called by Tournefort, *orobanchoides*, and by Dillenius, *hypopitis*. See the article OROBANCHOIDES.

MONRINGION, in botany, a name given by ſome authors to the tree whoſe fruit is the ben nut, and whoſe wood the *lignum nephriticum* of the ſhops. Hort. Mal. vol. 6. p. 19.

MONSTER (*Cycl.*)—The French Academicians have of late diſputed whether *Monſters*, that is, creatures born with their organs preternaturally formed or ſituated, ſupernumerary or defective, were originally ſo formed in their firſt ſtamina; or whether this deformity has been owing to ſome accidental change upon them. The arguments for theſe opinions, are remarks on particular hiſtories of ſuch *Monſters*, which we cannot abridge, and therefore muſt refer to the Memoirs de l'Acad. des Sciences, 1733, 1734, 1731, 1739.

MONTENSES, a name given to the Donatiſts. See the articles CAMPITÆ, *Suppl.* and DONATISTS, *Cycl.*

MONTH (*Cycl.*)—Among the antient Greeks, the year was divided into twelve *Months*, which contained thirty and twenty-nine days alternately; but ſo as the *Months* of thirty days always went before thoſe of twenty-nine; the former were termed πληρεις, full, and δεκαφθινοι, as ending on the tenth day; the latter were called κοιλοι, *hollow*, and from their ending on the ninth day, ἐναφθινοι.

In order to underſtand their method of reckoning the days of the *Month*, it muſt be conſidered that every *Month* was divided into τρια δεχημερα, or three decads of days; the firſt decad they called μηνος ἀρχομενου or ἱσαμενου; the ſecond, μηνος μεσουντος; the third, μηνος φθινοντος, παυομενου or ληγοντος. Whence the firſt day of the *Month* was called νεομηνια, as falling upon the new moon, and πρωτη ἀρχομενου or ἱσαμενου, as being the firſt day of the firſt decad; the ſecond day was termed, δευτερα ἱσαμενου; the third, τριτη ἱσαμενου; and ſo on to the δεκατη ἱσαμενου.

The firſt day of the ſecond decad, which was the eleventh day of the *Month*, was called πρωτη μεσουντος or πρωτη ἐπιδεκα; the ſecond of this decad, δευτερα μεσουντος, or ἐπιδεκα, and ſo on to εικας, the twentieth, which was the laſt of the ſecond decad.

The

The first day of the third decad was termed πρωτη επ' εικαδι; the second, δευτερα επ' εικαδι, and so of the rest. Sometimes they inverted the numbers of this last decad, the first being called φθινοντος δεκαλη; the second, φθινοντος ενναλη; the third, φθινοντος ογδοη; and so on to the last day of the *Month*, which was called Δημητριας, *Demetrias*, from Demetrius Poliorcetes; before whose time, particularly in Solon's laws, it was called ενη και νεα, *the old and new*; because the new moon falling out on that day, part of it belonged to the old moon, and part to the new. It was also called τριακος, *the thirtieth*; and that not only in the *Months* which consisted of thirty days, but also in those of twenty-nine; for in these, according to some accounts, the twenty-second day was omitted; or, according to others, the twenty-ninth: But which day soever was omitted in computation, the thirtieth was constantly retained. Hence, according to Thales's first scheme, all the *Months* were called *Months* of thirty days; tho', by Solon's regulation, half of them contained only twenty-nine: And the lunar year of Athens was called a year of 360 days; tho' really, after Solon's time, it consisted of no more than 354. Vid. *Pott.* Archæol. Grec. l. 2. c. 26.

The names of the *Months* being various in different parts of Greece, it will be sufficient particularly to consider those of Athens, barely mentioning those of others that correspond with them. 1. *Hecatombæon*, this was the first *Month* of the Athenian year, beginning on the first new moon, after the summer solstice, and so answered to the latter part of our June, and the first part of July. It consisted of thirty days, and was by the Bœotians called *Hippodromus*, and by the Macedonians *Lous*; but its antient name was *Cronius*. 2. *Metagitnion*, the second *Month* of the Athenian year, answering to the latter part of our July, and first of August. It contained only twenty-nine days, and was called by the Bœotians *Panemus*; and by the people of Syracuse, *Carnius*. 3. *Boedromion*, the third *Month* of the Athenian year, which contained thirty days, and corresponded to the latter part of our August, and first of September. 4. *Mæmacterion*, the fourth *Month* of the Athenian year, consisting only of twenty-nine days. It answered to the latter part of our September, and first of October; and was called by the Bœotians *Alalcomenius*. 5. *Pyanepsion*, the fifth *Month* of the Athenian year: It contained thirty days, corresponded to the latter part of our October, and first of November; and was called by the Bœotians, *Damatrius*. 6. *Antheſterion*, the sixth *Month* of the Athenian year, answering to the latter part of our November, and first of December. It contained twenty-nine days, and was called by the Macedonians *Dæsion*, or *Desion*.. 7. *Posidion*, the seventh *Month* of the Athenian year, answering to the latter part of our December and first of January, and containing thirty days. 8. *Gamelion*, the eighth *Month* of the Athenian year; it answered to the latter part of our January and first of February, and consisted of twenty-nine days. 9. *Elaphebolion*, the ninth *Month* of the Athenian year, corresponding to the latter part of our February and first of March; it contained thirty days. 10. *Munychion*, the tenth *Month* of the Athenian year: It contained twenty-nine days, and answered to the latter part of our March and first of April. 11. *Thargelion*, the eleventh *Month* of the Athenian year: It contained thirty days, and answered to the latter part of our April and first of May. 12. *Scirrophorion*, the twelfth and last *Month* of the Athenian year: It contained twenty-nine days, and answered to the latter part of May and first of June. Vid. *Pott.* Archæol. Grec. L. 2. c. 26. & *Stephan.* Thes. Ling. Græc. T. 5. p. 223. seq.

As the Roman *Months* were the same with those now in use among the Europeans, we shall only refer to the article CALENDS, *Cycl.* and *Suppl.* where the manner of their computation is explained.

MONTIA, in the Linnæan system of botany, the name of a distinct genus of plants; the characters of which are these: The cup is a perianthium composed of two oval, hollow, obtuse and erect leaves, which remain when the flower is fallen. The flower is composed of three petals, joined together at their insertion; these are of an oblong oval figure, and the two side-ones are larger and placed lower than the others. The stamina are three capillary filaments, of the length of the flower: The antheræ are small: The germen of the pistillum is of a turbinated form; the styles are three, hairy and expanded, the stigmata are simple. The fruit is a capsule of a turbinated form, obtuse, of one cell, separated by three valves: The seeds are three in number, and roundish. *Linnæi* Gen. Plant. p. 21.

MONTIFRINGILLA, in zoology, the name of a bird known in English by the name of the *bramble*, *brambling*, or *mountain-finch*; and called by the antients *orospiza*. It is of the size and shape of the chaffinch; its beak is large, very strong, and strait, beginning with a large base, and ending in a point in form of a cone. Sometimes this is altogether black, sometimes it is partly black and partly yellow; from the head to the middle of the back it is of the blackish colour of the common starling, with a variegation of a greyish red from the edges of the feathers being of that colour; the hinder part of the back is white; the throat is of a reddish yellow, and the breast white. It is common in Italy, and is sometimes found in England. *Ray*'s Ornithol. p. 189.

There are beside this, two other species of the *Montifringilla*, or brambling; the one large, of the size of the common lark, and having the claw of its hinder toe longer than the rest, as in the lark; and the other a smaller, and seeming of a middle nature between the lark and brambling. It is reddish on the back, and white on the belly, and variegated with black and reddish brown on the wings. These are both common in Lincolnshire, and some other parts of England.

MONTROSE-*Waters*. Steel spaws are very numerous in the country about *Montrose* in Scotland: The principal of these are at Aberbrothoc, Kincardin, and Peterhead [a]. That of Aberbrothoc is in greatest esteem [b].—[[a] Medic. Ess. Abr. Vol. 1. p. 106, 107. [b] Ibid. p. 111.]

Beside these, there is a well near *Montrose*, the water of which is of a whitish colour, soft taste, and faintly discovering the mineral quality. This water is of a different nature from the steel-springs. The alcali prevails in its salt; it resembles the Scarborough-water, and no salts come up to any analogy with those of the *Montrose* water, and those of Scarborough, but nitre and sea-salt. See Med. Ess. Vol. 3. Art. 8. Abr. Vol. 1. p. 112. seq. where various experiments with those waters are enumerated, and a comparison instituted between them and the Scarborough waters.

The water of this *Montrose* well is universally diuretic; being drank from two to three pints, purges; and half the quantity succeeds with some. It has been found very useful in stranguries and stoppage of urine, scorbutic disorders, flatulencies, spasmodic colic, and spitting of blood. In rheums and strains it has been of good use by way of cold pump, where persons could not bear such use of ordinary cold water. Med. Ess. Vol. 3. Art. 9. Abr. Vol. 1. p. 122. seq.

MONYCHA, an epithet applied by naturalists to those animals whose hoofs are single and undivided; such are the horse, and the like.

MOON (*Cycl.*)—It is commonly agreed among philosophers and astronomers, that the *Moon* turns about the earth; but father Alexander supposes they may be all mistaken, and that the earth really turns about the *Moon*; and from this extraordinary hypothesis, he endeavours to account for the flux and reflux of the sea. See Journ. des Scav. Oct. 1727.

Mons. Grand-jean de Fouchy endeavours to prove, that there is no matter about the *Moon*, that can sensibly inflect the rays of light: And hence, that this secondary planet has no atmosphere whose refraction is observable. It might indeed have a circumambient fluid, the horizontal refraction of which might amount to 1″ or 2″, and some observations may seem to give ground for admitting something of this sort. But with respect to astronomers the *Moon* may be said to be destitute of an atmosphere. See Phil. Trans. N°. 455. sec. 3.

We have some observations and tables concerning the *Moon*'s motion, by Mr. Richard Dunthorn, in the Philosophical Transactions, N°. 482, sec. 13. where he gives an hundred observed longitudes of the *Moon* compared with the tables, *viz.* 25 eclipses of the *Moon*, taken (except the first) from Flamstead's Historia Cœlestis, the Philosophical Transactions, and the Memoirs of the Royal Academy of Sciences; the two great eclipses of the sun in 1706, and 1715; 25 select places of the *Moon*, from Flamstead's Historia Cœlestis; and 48 of those longitudes of the *Moon*, computed from Flamstead's Observations by Dr. Halley, and printed in the 1st edit. of the Historia Cœlestis.

In the Philosophical Transactions, N°. 473. we have a new method of computing the appulses of the *Moon* to the fixed stars and planets; as also of eclipses of the earth, commonly called eclipses of the sun, by Mr. Gersten, professor of the mathematics at Giessen.

The full *Moon* appears to the naked eye broader than a circular object subtending an equal angle seen by perfect vision. In a *Moon* of three or four days old the illuminated part appears too broad, in proportion to the obscure part, and likewise seems to extend more outwards, or to have a greater diameter than the obscure part. Also in an eclipse of the sun or *Moon*, the bright part appears too broad in proportion to the dark part, and the eclipse appears less than it really is.

This observation was made by Horrox, and is accounted for by Dr. Jurin, in his essay upon distinct and indistinct vision.

MOON-*Eyes*, in the manege. A horse is said to have *Moon-eyes* when the weakness of his eyes increases or decreases according to the course of the *Moon*; so that in the wane of the *Moon* his eyes are muddy and troubled, and at new *Moon* they clear up; but still he is in danger of losing his eye-sight quite.

MOON-*Fish*, a name given to the fish called by authors, *orbis*. See the article ORBIS.

MOP, in some counties of England, is the term for what is called the statute in other places; being the time that young people who intend themselves for servants, meet at some certain place, in order to be hired into services. *Plot*'s Oxfordshire, p. 207.

MOOR (*Cycl.*)—MOORS, in the isle of Man, those who summon the courts for the several *sheadings*; such are the lords bailiffs:

bailiffs: Every *Moor* has the like office with our bailiff of the hundred. *King*'s Descript. of the Isle of Man.

MOOR-*Cock*, an English name for the red-game, or our lagopus, more commonly called the gor-cock. It is a very delicate bird, larger than a partridge, and common on the hills in Derbyshire and Yorkshire. *Ray*'s Ornithol. p. 128. See the article GOR-*Cock*.

MOORS-*Head*, in the manege. See the article MORE's-*Head*.

MOOR-*Hen*, *Gallinula*, in zoology, the name of a genus of water-birds; the characters of which are these: The head is small, the body compressed, the beak short and moderately crooked, the wings small and hollowed like those of the common cock and hen kind, the tail very short, the legs long, and the toes remarkably so.

The common *Moor-hen*, called *Gallinula Chloropus* by authors, is a very well known bird, somewhat like the coot in shape, but smaller, and very much flatted in the body. Its feet are greenish, and its breast a lead-coloured blue; its belly greyish. It is common about our rivers, and is a very well tasted bird. *Ray*'s Ornithol. p. 233.

MOOR-*Land*, or MOORY-*Land*, in agriculture, is a black, light and soft earth, very loose, and without any admixture of stones; and with very little clay, or sand.

The uppermost stratum of the fen-lands is usually of this earth, and it usually constitutes a moderately thick or deep bed. Intermixed with water it cannot easily be worked up into a paste; and when with labour worked up into somewhat of a firm mass, its surface appears spongy and porous; and as soon as dry, it easily moulders away to powder.

It is usually soft to the touch, unless it be worked very closely between the fingers, then it shews a mixture of a small quantity of sand, both to the touch and to the eye.

It seems indeed to consist almost entirely of pure vegetable matter, and this lying in such plenty on the surface of the fen-lands, is the cause of their being so very fertile.

The great disadvantage of the places which have this soil, is their being liable to be glutted with wet; and to remedy the inconveniencies arising from thence, the farmers who rent these lands have a custom of burning the soil at proper seasons. It burns very freely and easily, the surface readily catching flame, and a substance somewhat bituminous, usually contained among the soil, helps the burning. *Moreton*'s Northamp. p. 36.

MOOR-*Stone*, the name of a very remarkable stone found in Cornwall, and some other parts of England, and used in the coarser works of the present builders.

This is truly a white granite, and is a very valuable stone. It is a very coarse and rude, but beautiful congeries of variously constructed and differently figured particles, not diffused among, or running into one another, but each pure and distinct, tho' firmly cohering with whatever it comes in contact with. Its colours are principally black and white; the white are of a sort of marbly texture, and opake, formed into large congeries, and emulating a sort of tabulated structure; among these there are many of a pure crystalline splendor and transparence, and among these are lodged in different directions many small flaky masses of pure talcs of several colours; some are wholly pellucid, others of an opake white, others of the colour of brown crystal, and a vast number perfectly black. *Hill*'s Hist. of Foss. p. 498.

It is found in immense strata in some parts of Ireland, but is disregarded there.

It is found with us in Devonshire, Cornwall, and some other counties; and brought thence in vast quantities to London. It never forms any whole strata there, but is found on the surface of the earth in immense and unmanageable masses; and to separate these into portable ones, they dig a hole with a wedge in some part of them, and surrounding it with a ridge of clay they fill it up with water; this by degrees soaks in, and finding its way into the imperceptible cracks so far loosens the cohesions of the particles there, that the day after they drive a larger wedge into the hole, and the stone breaks into two or more pieces. It is used in London for the steps of public buildings; and on other occasions, where great strength and hardness are required.

The people of Cornwall who have this stone in great plenty, use it in their tin-works, and particularly in their tin-kiln, on the good effect of which a great deal depends. This kiln is four-square, and at its top is placed a large block of *Moor-stone*; the usual size of this block is six foot in length and four in breadth; in the middle of this block there is made a hole of about six inches in diameter. This stone serves as a head to cover another like stone placed beneath it; but this under one is not so long as the upper by six inches. The reason of this is, that it must not reach the innermost or back part of the wall, which is the open place thro' which the flame ascends from another place below that, where a very strong fire of furze is constantly kept up; and there is another little hole also on the outside. The forepart is like a common oven, and has such a sort of chimney.

The tin ore is roasted in this kiln, to burn away the mundick, in this manner: The ore is brought in powder, and poured out in heaps on the surface of the top-stone, a man stands there and thrusts it down through the hole in this stone into the kiln, that is, to the surface of the under-stone; a person who stands below spreads this as it falls with an iron rake, and gives notice to the person above when there is enough down, that is when the surface of the lower stone is covered three or four inches thick. When this is done, the hole at the top is covered with green turfs, that the flame may reverberate the stronger; and the heat that the *Moor-stone* acquires helps to roast the ore; while the flame that comes up from the ore is blue, there yet remains mundic among it; but when this is burnt off, the flame is yellow. Philos. Trans. N°. 69.

The miners in some parts of Cornwall use the name *Moor-stone* for a sort of coarse free-stone, which lies very often over the tin ore; this is of a greyish colour, and is somewhat softer than that usually employed in building.

MOOR-*Titling*, a commong English name for the œnanthe, more frequently called the stone-chatter. See the article STONE-CHATTER.

MOORING (*Cycl.*)—MOORING *a fair Birth at Sea*, is *Mooring* in a place free from any annoyance.

MOORING *a Proviso*, at sea, is to have an anchor out, and a hawser a-shore; then the ship is *moored* with her head a-shore. And two cables is the least, and four the best to *moor* by. See the article ANCHOR.

MOORING *Water-shot*, is to *moor* neither alongst nor athwart the tide, but quartering between both.

MOOSE-*Deer*. The first mention we find of this remarkable animal, is in a tract of Mr. Josselyn's, entitled New-England Rarities. That author says, it is a very fine creature, growing to twelve foot high; the horns are extremely beautiful with broad palms, some of those full grown being two fathom from the tip of one horn to the tip of the other. The same author, in another work, entitled, Two Voyages to New-England, calls this creature a monster of supernuity; and says, that when full grown it is many times larger than an ox. What Neal says of this animal seems copied from Josselyn. But the best account we have of it, is from Mr. Paul Dudley; this gentleman says, that they are of two kinds: The common light-grey *Moose-deer*, called by the Indians *Wampoose*, and the larger black *Moose*. The grey *Moose* is the same animal which Mr. Clayton, in his account of the Virginian quadrupeds, published in the Philosophical Transactions, calls the elk: And this is the creature, described in the Anatomical Discoveries of the Paris Academy, under the name of the stag of Canada. Horns of this creature have been sent from Virginia, and called elks horns: They are wholly the same with those of our red-deer, except in size; weighing about twelve pounds, and measuring from the burr to the tip about six foot long. Phil. Trans. N°. 444. p. 386.

Mr. Dudley says, that the grey *Moose* is like the English deer; and that these creatures herd together thirty or more in a company. The black or large *Moose* has been taken, he says, measuring fourteen spans in height from the withers, which, allowing nine inches to the span, is ten foot and a half.

The stag or male of this kind has a palmed horn, not like that of our common or fallow deer, but the palm is much longer and more like to that of the German elk; but it differs from that in having a branched brow antler between the burr and the palm, which the German elk hath not.

The large horns found fossile in Ireland, have, from their vast dimensions, been supposed to have originally belonged to the black *Moose-deer*; but they, as likewise most other of the large horns found in this part of the world, appear to be the horns of the German elk, having no brow-antlers.

Mr. Ray mentions, in his Synopsis of animals, a pair of extremely large fossile horns, which he saw in a museum in Sussex; but he mentions no brow-antlers in these, and therefore probably they, as well as most others preserved in museums, were the horns of the German elk.

It is not agreed by authors what number of young the *Moose* brings forth at a time; Mr. Dudley says but two; but Josselyn, and from him Neal, say three; and these authors add, that they do not go so long with young as our does, by two months.

There is, beside the *Moose*, another animal of the deer-kind, very common in Virginia, and other of the Northern provinces of America. This creature has round horns, not spreading out as in the stag or red-deer, but meeting nearer together at the tips, and bending forwards over the creature's head; and the brow-antlers are not crooked and standing forward, but strait and upright. The skin of this deer is of a sandy colour with some black hairs, and is spotted all over while young with white spots as some of our fallow deer are, and it is about the bigness of our fallow deer when full grown. The *Dama Virginiana* of Mr. Ray was different from this, if the description be exact, and the horns of the palmated kind. This *Dama* of Mr. Ray seems to be what Josselyn, in his Voyages, calls the *Maurouse*; but his description is too short to form any regular judgment from, he only says that the *Maurouse* is like the *Moose*, but that its horns are small, and the creature about the bigness of a stag. Phil. Trans. N°. 444. p. 388.

Josselyn mentions also the buck, the stag, and the rain-deer; but it is very much to be doubted whether they are the same

animals that we mean by thoſe names. He mentions alſo another ſort of American deer, an animal called a *Macarib*, a *Caribo*, or a *Pohano*; but this ſeems a mere fiction; no ſuch animal exiſting in nature.

MORBUS-*Comitialis*, the epilepſy, one of the moſt terrible diſeaſes to which human nature is ſubject.

The ſymptoms of this diſorder vary greatly in different perſons; ſometimes it ſeizes them ſuddenly, and unexpectedly; at others, it is preceded in every paroxyſm by a train of concomitant ſymptoms, ſuch as a general laſſitude and wearineſs of the whole body, a pain in the head, great perturbation of the ſpirits, and an unuſual dread and terror; ſometimes alſo a ringing in the ears gives notice of its approach, or an inflation of the præcordia or palpitation of the heart and difficulty of breathing. It is common alſo to feel a cold air as it were aſcending from the extremities up to the heart and brain; ſometimes the joints feel cold, and often rumblings are felt in the abdomen, and fetid ſtools are diſcharged.

In the fit, the thumbs are uſually faſt clenched to the hands, the eyes diſtorted, ſo that only the white of them is ſeen, the patient is wholly ſenſeleſs, and a froth burſts out of the mouth with a ſort of hiſſing noiſe; the tongue is often lacerated by the teeth, and the joints uſually feel a violent ſuccuſſion. But ſometimes violent ſpaſms ſeize all the limbs, inſtead of theſe ſuccuſſions or tremblings; and they remain forcibly bent, ſo as to make the patient reſemble a ſtatue of wood. In infants the penis is erected; in more grown perſons the ſemen is often ejected, and the urine diſcharged to great diſtances. And theſe ſymptoms, ſometimes ſooner, ſometimes later, gradually go off.

The paroxyſms, according to the diverſity of cauſes, are longer or ſhorter, and fewer or more frequent; but they generally return at ſtated periods, as on certain days, hours, or months, or on the changes of the moon, eſpecially at the new and full moon.

Women are uſually ſeized with theſe paroxyſms at the time of the return of the menſes; and what is moſt obſervable is, that they are frequently occaſioned by ſeemingly ſlight cauſes, commotions of the mind, a colder ſeaſon than ordinary, the uſe of ſtrong liquors, cloſe application of the mind to any thing, and finally, the uſe of venery, often bring on theſe fits. Infancy and youth are the times of life moſt ſubject to this diſorder; and it more frequently attacks perſons of a nice and delicate conſtitution, than thoſe of a robuſt and hardy make.

The cauſe of this terrible diſorder appears to be a ſtricture of that membrane which ſurrounds the brain and the ſpinal marrow. The cauſes are very various, and thence alſo the diſeaſe varies in its ſpecies and appearance. The moſt terrible and mortal epilepſies have been brought on by external violence, by blows, wounds, fractures, and depreſſions of the cranium. Theſe are generally preceded by pains of the head, and a torpor of the ſenſes; and in theſe, after the patient's death, corrupted blood or ſerum is always found either between the *dura* and *pia mater*, or between the *dura mater* and *cranium*.

Chronical epilepſies, returning at ſtated periods, are alſo frequently occaſioned by certain acute bony protuberances ariſing internally in the baſis of the cranium, and ſometimes in the lateral ſinus. It is eaſy to ſee that this ſpecies of epilepſy is incurable; yet medicine can do great ſervice in it, by keeping the brain in ſuch a condition, that its preſſure on theſe protuberances may not be enough to produce a violent fit.

Polypoſe concretions in the jugular veins, and obſtructions of the ſinuſes of the *dura mater*, are alſo cauſes of incurable epilepſies. The paſſions of the mind alſo, as anger, fear, and the like, contribute greatly to bring on epilepſies, as they act immediately upon the nervous parts, and either conſtringe or dilate them preternaturally, which cannot be done very often without inducing a bad habit. Infants are often rendered epileptic either from ſucking the milk of a nurſe in a violent fit of paſſion, or from the violent commotions of mind the mother was ſubject to while pregnant. The terror of the ſight of one perſon in an epileptic fit, has frequently thrown another into the ſame diſorder; and it has been often known, that a ſtrong propenſity to venery, from a natural redundancy of ſemen, being ſuppreſſed by chaſtity, has brought on this diſeaſe. Women have fallen into it from violent love alſo, and have, in that caſe, found their cure in marriage.

In the cure of an epilepſy, the firſt intention muſt be to correct and expel from the body the remote material cauſes of the diſorder; ſecondly, to mitigate the ſpaſms of the *dura mater* and nervous parts by medicines of a ſedative and corroborating nature; the former, to check and allay the violent motion of the fluids, the other to reſtore the due tone and natural elaſticity to the parts, the weakneſs of which, occaſioned by a former fit, gives frequent occaſions for ſucceeding ones. Of the firſt kind are poppy-ſeeds or flowers, ſaffron, nutmeg, and the like; and among the chemical medicines, the *ſpiritus nitri dulcis*, when truly prepared. Of the corroboratives to be given in epileptic caſes, roſemary, rue, lavender, cardamom ſeeds, and ambergreaſe. Spirit of hartſhorn, and the oil of hartſhorn, made pure by frequent rectifications, is alſo greatly beneficial. The decoctions of the woods, as guaiacum, ſaſſafras, and the like, are alſo good remedies: And ſeveral epilepſies have been known to be perfectly cured, by taking half a pint of a ſtrong decoction of guaiacum twice a day, with a few drops of ſpirit of vitriol in each doſe, and making all the while a weaker decoction ſerve for the common drink. It is neceſſary, however, if there be a redundance of blood, to begin the cure with frequent bleedings. Cupping on the parts near the head is alſo of great ſervice, and ſometimes the opening the jugular vein is neceſſary, by which alone patients have ſometimes been cured.

But tho' theſe are the methods of cure, in ſome caſes, yet in others, where the diſeaſe has had a different origin, very different means are required. When an epilepſy ariſes from an impure ſerum, lodged in the veſſels and membranes of the head; which too often happens from the ſudden drying up of old ulcers, ſtopping of iſſues, or the like means; then the intention of cure conſiſts in the diſcuſſion, evacuation, and derivation of the ſerum to other parts. For this purpoſe cathartics are to be exhibited, and ſetons. Iſſues and bliſters are of ſingular ſervice. Nature has been known to cure epilepſies of this kind, by an eruption of pimples all over the body. And there is recorded in Willis a memorable inſtance of a girl, ſubject to frequent returns of epileptic fits; who, in one of them, happening to fall with her her head into the fire, and ſo accidentally cauteriſing it, remained well ſo long as the ulcers diſcharged any thing; but when they dried up, the former fits returned.

In epilepſies ariſing from violent emotions of the mind, in which acrid, bilious, and acrimonious humours are conveyed into the nervous ſyſtem, the uſe of whey, mineral waters, and a proper regimen added to the ſweetening powders, uſually produce a cure. Acidulated medicines are alſo highly proper, and ſpirit of vitriol, or *ſpiritus nitri dulcis*, are of very ſingular efficacy. When an epilepſy ariſes merely from pain, as that of the ſtone, the tooth-ach when violent, or ſpaſms of the ſtomach or inteſtines, then clyſters of oil are of very great uſe; and after theſe, bleeding is uſually very proper.

In the epilepſies of infants, ariſing from gripes, corrupted milk, or difficult dentition, great benefit is to be had from clyſters of milk with a little Venice ſoap diſſolved in it. A few grains of cinnabar, given internally, often prove alſo of ſingular benefit: And muſk is known to be a remedy ſecond to none in theſe caſes. When Epilepſies are cauſed by worms eroding the inner coats of the inteſtines, after the uſe of the common anti-epileptic remedies, the medicines for worms muſt be given, and their uſe continued, till, by the ſymptoms ceaſing, there is reaſon to think theſe pernicious animals are deſtroyed.

When an epilepſy returns at ſtated periods, or at the changes of the moon, the cauſe is uſually in the ſtomach or duodenum, or its adjacent parts, the biliary ducts and pancreas. In this caſe therefore there ſhould always be a clyſter given, and afterwards a vomit, before the expected fit.

In the time of the paroxyſms of epilepſies, people ought to abſtain from the uſe of ſubſtances that are too volatile, ſpirituous, fragrant, or fetid; for all theſe fill the head with vapours; nor ſhould ſuch things be exhibited as promote ſneezing or vomiting, ſince they derive the humours to the head, and often recall the paroxyſms. The moſt uſeful means, in the fit, are to keep the patient in an erect poſture, to rub his hands and feet. In all kinds of epilepſies it is proper to abſtain from wine and malt liquors, and to drink only water. Opiates, and too volatile medicines, muſt be very cautiouſly given to children, and to perſons of tender habits: And when epilepſies return on the ſlighteſt cauſes, it is proper to abſtain from a load of medicines, and truſt to nature and a proper regimen alone. In this regimen the patient muſt abſtain from all ſtrong liquors, from great heat, or exceſſive cold, from venery, from ſeeing any terrible ſight, from anxiety of mind, and from buſineſs. Young perſons are to abſtain from fruit; and all violent emotions of the mind are carefully to be avoided.

Many phyſicians have preſcribed the root of the wild valerian, as a remedy which is alone capable of curing this terrible diſeaſe.

MORDEHI, an Eaſt Indian name for a diſeaſe, to which the people of that country are ſubject. It conſiſts in a violent diſorder of the ſtomach. The great heats, copious ſweats, and ſupervening cold of that country, all naturally tend to weaken the ſtomach. Now if the inhabitants eat or drink immoderately at night, the concoction of their aliments can be but very unduly performed. Hence, beſide this diſtemperature of the ſtomach, they are ſubject to others of the bowels; and diarrhœas are very common among them, and with difficulty cured. *Hoffman*, de Morb. Endem.

MORDEXYN, or MORDOXI, a name given to a diſeaſe very frequent among the inhabitants of Goa, which conſiſts in a nauſea, and continued vomiting, and uſually ſeizes the patient ſuddenly and unexpectedly, and often proves fatal.

MORDILAPIS, a name given by ſome writers to loaches, a ſmall fiſh, often found under ſtones in ſhallow waters.

MORE'*s-Head*, in the manege, implies the colour of a *Roan horſe*, who beſides the mixture or blending of a grey and a bay, has a black head, and black extremities, as the main and tail. See the article ROAN.

MORELLA, in botany, a name uſed by ſome as a common term for all the nightſhades; others have appropriated it to the

lycopersicon, or love-apple only. Æmilius Macer tells us, that in his time all the plants called by the Greeks *strychna*, were called by the Latins *Morella*.

MORETUM, among the Romans, a kind of sallad, composed of the eight following Ingredients, *viz.* garlic, parsley, rue, coriander, onions, cheese, oil and vinegar. *Pitisc.* in voc.

MORGAY, an English name for the sea fish called also the *rough hound-fish*, one of the galeus kind; the *catulus minor* of Salvian, and *mustelus stellaris tertius* of Bellonius.

It is of a pale, and somewhat reddish grey, and is spotted with brown and whitish spots; the belly is silver white, and the body long and round; its skin is very rough, and its flesh very firm, and finely flavour'd. Some say it tastes of musk, or some such perfume. It is the smallest of all this genus of fishes, and seldom weighs above a pound and half. *Willughby*'s Hist Pisc. p. 64.

It is common in the Mediterranean, and is frequent in the markets in Italy.

MORGII, among the Mahometans, a sect who lay much stress upon belief, and stand opposed to the *Alwaidii*. See the article ALWAIDII.

MORHUA, in zoology, a name used by some authors for the common cod-fish. *Bellon.* de Pisc.

MORIAM, in our old writers, a head-piece called a pot, Stat. 4 & 5 P. & M. c. 2. The word comes from the French *Morion*, or Italian *Morione*, *i. e. Cassis*. *Cowel.*

MORILLON, in zoology, the name of a species of duck, seeming the same with the *capo rosso*, a small red-headed wild duck. See the article CAPO *Rosso*.

MORINA, in botany. This plant, in the Linnæan system, makes a distinct genus, the characters of which are, that the cup is double, and of two kinds, in the same plant; the one a perianthium of the fruit, which is monophyllous, cylindraceous, and remains after the flower is fallen off. The rim of this has ten notches in it, two of which have longer segments, which stand opposite to one another. The other cup is the perianthium of the flower, which is also composed of one leaf, and is of a tubular form, and slightly bifid, the segments being rimmed at their edges, pointed, and remaining also when the flower is fallen. The flower is a single petal, forming a very long tube, a little bent, and wider at top than the bottom. The rim is plain, obtuse, and divided into two lips; the upper of which is bifid, and the lower trifid. All the segments are of a roundish figure, and nearly equal in size. The stamina are too slender filaments, laid close against the style, shorter than the flower. The antheræ are erect, and applied closely to one another. The pistil has a roundish germen, placed under the receptacle of the flower; the style is of the same length with the stamina; and the stigma is formed into a small head. It has properly no fruit; the seed succeeding each flower being single, roundish, and surrounded with the cup of the flower. *Linnæi* Gen. Plant. p. 7.

MORINELLUS, in zoology, the name given by authors to the bird commonly called in English, the *dotterel*.

The usual weight of this bird is a quarter of a pound; but the male is smaller than the female, and weighs usually half an ounce less. Its Beak is a finger's breadth long. Its head is very beautifully variegated with small black and white spots; and has a line of white over the eyes. Its throat is of a greyish white, variegated with streaks of brown. Its breast and the under part of its wings are of a dusky yellow. The belly is white; and its back and wings are brown, with variegations of a whitish and yellowish colour. Its rump is grey; as is also its neck; and its tail is variegated with grey, black, and white. It is common in Lincolnshire, and some other counties of England; and is a very delicate bird. It is commonly caught in the Night. *Ray*'s Ornith. p. 230.

MORINELLUS *Marinus*, the *Sea Dotterel*, a name given by authors to the bird, commonly known in England by the name of the *turnstone*; and called by Turner, *cinclus*. *Ray*'s Ornithol. p. 231. See the article TURNSTONE.

MORINGA, in botany, the name by which some authors call the tree which produces the ben nut, or *glans unguentaria*, and whose wood is the *lignum nephriticum*, or nephritic wood of the shops.

MORION, in botany, a name given by the antients to a kind of nightshade. The antient Greeks, Theophrastus, and others, called all the nightshades in general by the name *strychnos*. Some of these they said were poisonous, and others esculent. The poisonous were of two kinds, some bringing on sleepy disorders, and others making the patient mad.

The esculent kind was the *pomum amoris*, or love-apple, eaten at this time by the Portuguese, and many other nations, and by some in England. Some after-writers used the word *Morion* as a distinctive name for those kinds of nightshade which caused sleepy disorders; and after these, some used it as the peculiar name of one species, and others as the name of the male mandrake of Dioscorides, whose fruit, according to that author, was commonly eaten by the shepherds; but when taken too largely, threw them into sleepy disorders. From this word *Morion* has come, in all probability, the Latin name *morella*, given at first to the *pomum amoris*, or love-apple; and afterwards, according to Æmilius Macer, to all the nightshades; for he expressly says, that those plants which the Greeks called *strychna*, the Latins called *morella*; and we find that the old Greeks called all the nightshades *strychna*.

MORION, in the natural history of the antients, a name given to one of the semi-pellucid gems, more commonly called *pramnion*. It is a stone appearing externally only of a fine deep black; but when held up against a candle, or against the sun-shine, giving a very beautiful red, in different degrees, from that of the hyacinth to that of the amethist or carbuncle. *Hill*'s Hist. of Foss. p. 471. See the article PRAMNION.

MORISONA, in botany, the name of a genus of plants, the characters of which are these: The perianthium is one-leaved, inflated, and divided at the top into two lips. These stand open; but the neck is contracted, and the whole soon withers. The flower consists of four oblong obtuse petals, which are expanded when they are out of the cup. The stamina are numerous filaments. The antheræ are simple. The style is capillary and erect, and is longer than the tube of the flower. The germen of the pistil is oval. The stigma is capitated, and of a plano-convex figure. The fruit is a globose berry, with a hard smooth rind. It has only one cell, and is supported by the style by way of pedicle. The seeds are numerous, and are of the shape of the common kidney-beans, but small. *Plumier*. Gen. 23. *Linnæi* Gen. Plant. p. 230.

MORLING, or MORTLING, in our old writers, the wool which is taken from the skin of dead sheep, whether killed, or dying of the rot, 4. Edw. 4. cap. 2. & 3. 27 Hen. 6. cap. 2. 3 Jac. 1. cap. 18. 14 Car. 2. c. 18. *Blount*, *Cowel.* See the article SHORLING.

MOROCHITES, in natural history, a name by which some of the old authors have called the *morochthus*, or French chalk. *Hill*'s Hist. of Foss. p. 22. See the next article.

MOROCHTHUS, in the history of fossils, a name of an indurated clay, commonly known among us by the name of French chalk, or marking-stone; and its principal use with us is the taking spots out of cloaths, and the serving taylors to mark with, as it makes a much more determinate and a neater line than chalk. The antients, however, had it much in esteem in medicine, and used it as an astringent, and in colics and hæmorrhages, and externally in disorders of the eyes.

It is distinguished from all other earths, by being the hardest of all, considerably heavy, very smooth to the touch, and in colour of a greyish white, with a considerable admixture of green. It is of a disagreeable brackish taste, and does not ferment with acids. It is dug in Germany, the island of Sardinia, and many other places; but no where so plentifully as about Brianson in France, whence it is there commonly called *Brianson chalk*. *Hill*'s Hist. of Foss. p. 22.

MOROCTES, one of the names by which Pliny, and some other of the older authors called the *Morochthus*, or French chalk. *Hill*'s Hist. of Foss. p. 22. See the foregoing article.

MORONA, a name used by some for the *huso*, or isinglass-fish. *Willughby*, Hist. Pisc. See the article HUSO.

MORPHASMUS, Μορφασμος, among the antients, a kind of dance, wherein, by a great many figures, they imitated the transformations of Proteus. *Hofm.* Lex. in voc.

MORRHA, in natural history, a name given by some to the substance more properly called *murra* or *myrrha*, of which the cups called *murrhina* and *myrrhina* were made. See the articles MURRHINA and MORRHINA.

MORRHINA *Vasa*, in the writings of the antients, a term very frequently met with, and used to express a sort of cup and vases used for drinking out of, and on some other occasions.

The word is generally written *myrrhina*, and various conjectures have been formed concerning it, some supposing it to be meant of vessels made of myrrh, some of the onyx, and some of a peculiar sort of spotted stone. See the article MYRRHINA.

The word, however, is written by all the most correct writers *Morrhina*. Pausanius and many others give us proofs of this. It is evident that there is no stone mentioned by the antients under the name *morrha*, nor is this word ever found used as a synonym for the onyx, or any other stone, but always as the name of the matter of which the vessels were made.

The antients had many things in use among them, the nature and origin of which were unknown to them; and this *morrha* seems to have been one of that number. Some of them say it was a stone, and others call it a fluid, condensed by being buried under ground. And if to this we add the beauty of the polish, the tender texture of the substance, which was easily broken by a fall, and the size of some of the vessels made of it; for we are told that Heliogabalus had his chamber-pot made of it; it will appear very probable that it was a factitious matter, and was of the nature of our China ware. The antients, not knowing that the *morra* was a factitious substance, which it does not appear indeed that they did, does not prove it not to be such; for they for many ages wore garments of silk, and had that substance in use on many other occasions, and all the time believed it to be the *lanugo* or down of a tree, dressed by combing, *&c.* and it was not till the

the days of Juſtinian that they knew it was ſpun by worms. Their ignorance of the origin of ſilk, however, no more altered its nature, than their ignorance of the fabric of their *morrhina vaſa* did that of the ſubſtance they were made of.

The antients had their moſt elegant and valuable *morrhina vaſa* from India and Carmania; but Arrian tells us, that there was a great quantity of them made at Dioſpolis in Ægypt. This he calls another ſort of *Morrhina* work; and it is evident, from all accounts, that the *morrha* of Dioſpolis was a ſort of glaſs ware, made in imitation of the porcelane or *morrha* of India.

There is ſome difference in the accounts given by Pliny and Martial, of the *Morrhina vaſa*. The firſt author ſays, that they would not bear hot liquors, but that only cold ones were drank out of them. The latter, on the other hand, tells us, that they bore hot liquors very well. It ſhould ſeem, that the moſt credit was to be given to Pliny; but if ſo, their porcelane was greatly inferior to ours in this particular.

MORSE; in zoology, the name of a monſtrous ſea animal, called by ſome the *roſmarus* and *walrus*, and by others, very improperly, the *hippopotamus* and *equus marinus*. See the article HIPPOPOTAMUS.

The *Morſe* is an ill-ſhaped amphibious animal, of the ſize of a large ox, covered with a ſkin like that of the ſeal, and ſomewhat reſembling an ox in the head; for which reaſon ſome have called it the ſea cow, or *vacca marina*, whence it has been erroneouſly confounded by ſome with the *manati*.

It has two large prominent and crooked teeth before, which are as fine as ivory, and are uſed by artificers for the ſame purpoſes. It brings forth uſually but one young one at a time, never more than two. It is a very ſtrong and vigorous animal, and difficultly taken; when it is caught, it is uſually at land, ſeldom at ſea.

Vorſtius, who met with a young one of this creature, has very accurately deſcribed it; whence we have the beſt deſcription extant of the nature of the animal. This young one was of the ſize of a large dog, and in ſhape much reſembled the phoca or ſea calf. Its head was round; its eyes large, and like thoſe of an ox; its noſtrils depreſſed and wide, and opening, and drawing together as the creature pleaſed. It had apertures on the ſides of the head for ears. Its mouth opened round and not very large; and on the upper lip it had a ſort of whiſkers, compoſed of thick cartilaginous briſtles. The lower jaw was of a trigonal form; the tongue ſhort and thick, and the mouth well furniſh'd with broad and flatted teeth. Its fore feet, as well as the hinder ones, were very broad; and the hinder extremity of its body very much reſembled that of the *phoca* or ſea calf. When it walked, the fore feet were directed forwards, the others turned backward. The toes were five on each foot, and theſe were joined by a membrane, which was remarkably thick. The hinder feet had claws, the fore ones had not; and the creature had no tail, and crept rather than walked on the hinder parts. Its ſkin was thick and tough, and covered with a few ſhort grey hairs. It made a noiſe like the grunting of a hog. *Ray*'s Syn. Quad. p. 191.

MORT (*Cycl.*)—MORT, among the fiſhermen of ſome parts of England, a name given to the ſalmon while in its third year's growth. *Willughby*'s Hiſt. Piſc. p. 189. See the article SALMON.

MORTALITY (*Cycl.*)—*Bills of* MORTALITY. Mr. Simpſon makes the proportion of the number of inhabitants of any place, to the number of births that happen there annually, as 26 to 1. Whereas Mr. Kerſſeboom [a] makes it 35 to 1; which Mr. Simpſon thinks owing to a want of obſervations. But Mr. Kerſſeboom has ſince ſhewn, in 29 tables, that the proportion of 26 to 1 cannot be admitted, and that his own, of 35 to 1, is right. He alſo proves, from Mr. Maitland's obſervations, that children in London, of two years old, continue to live, on a medium, above 37 years; and he obſerves, that by Dr. Halley's table [b], they live 38½.—[a Doctr. of Annuit. p. 127. b Phil. Tranſ. N°. 465. Sect. 3. p. 319.]

Mr. Kerſſeboom ſuppoſes, that out of every 100 children born, five come dead into the world; and that out of every 100 children born alive, near 20 die under a year old. Mr. Simpſon's calculation differs greatly from this, he ſuppoſing that full 32 out of 100 children, die under a year old. Phil. Tranſ. ibid.

There is a ſurprizing diſparity obſerved between the chriſtenings and burials of the city of London; which is chiefly owing to diſſenters of all ſorts baptizing their children without ſending in accounts of their chriſtenings to the pariſh clerk. See Mr. *Maitland* in Phil. Tranſ. N°. 450. Sect. 16.

From the account there given of the chriſtenings and burials in London for ten years, from 1626 to 1635 inclusive, it appears that the chriſtenings exceeded the burials; nor can it be doubted that they do ſo ſtill. This obſervation will ſhew the cauſe of ſome miſtakes of Mr. Kerſſeboom. See Phil. Tranſ. ibid.

Mr. Maitland, in his account of London, ſhews, that at a medium of nine years, there are annually buried in London 29542, and in Paris only 17804; ſo that the number of inhabitants in London exceed thoſe in Paris by nearly in the proportion of 5 to 3. Hiſt. of Lond. p. 540, 548.

MORTAR (*Cycl.*)—The ſalt-petre workers in France uſing the *Mortar* of old buildings for extracting that ſalt, Mr. Petit has thought it worthy a peculiar attention, and has made ſeveral trials, by way of analyſis, of *Mortar*, to determine whether it really and eſſentially contains nitre in it, or whether it be only ſerviceable in that mixture of ſalts from which nitre is produced.

The common managers of the ſaltpetre-works are of opinion, that *Mortar* contains in it all the ſaltpetre they procure from it, and that the wood-aſhes, and other ſubſtances they uſe with it, only ſerve to abſorb the fat or oily parts, and ſo ſet the ſaltpetre at liberty to ſhoot. This they pretend to affirm upon experience; but they do not conſider that tho' they can procure ſaltpetre from the rubbiſh or *Mortar* without the addition of wood-aſhes, yet it is not pure *Mortar* that they make their experiments upon, but ſuch as is taken from their own heaps, upon which they always throw all the reſiduum of their former works, and all that liquor which will ſhoot no more cryſtals, but which they call the mother-water of ſaltpetre.

This gentleman therefore very properly judged, that to make a regular trial of the *Mortar* or rubbiſh alone, he muſt not take it from their ſtores, uſed in the ſaltpetre-works, but pick it himſelf from the ruins of old buildings.

The mark the ſalt-petre workers have to know good *Mortar* for their purpoſe, is, that it taſtes acrid and ſalt when applied to the tongue; but to this it may be alſo added, that it ought to be of a greyiſh colour, and ſuch as when powdered and ſprinkled upon burning charcoal yields ſome ſparks of fire; and the more ſparks it gives, the better it is for the purpoſe. And another character of the goodneſs is, that theſe well impregnated *Mortars* have a certain unctuoſity or fattineſs to the touch, which other kinds have not.

The fineſt of all kinds of *Mortar* for ſalt-petre work, is ſuch as is had from the ruins of old buildings in a low ſituation, and out of the way of much ſunſhine; where there has been no great quantity of fire kept, and eſpecially ſuch as has ſerved for the cements of the walls of ſtables, or the like.

Mr. Petit choſe from ſuch a wall twelve pounds of old *Mortar*; this he had beat to powder, and poured upon it eighteen pints of water; the whole was then ſet over the fire, and ſtirred from time to time for three or four hours, that the water might be well tinctured from the *Mortar*; after this the water was filtred through paper, and was then found to be tinctured to a pale yellow, tranſparent, bitter, and ſomewhat acrid to the taſte.

The impregnation may be made without heat, by only ſtirring the *Mortar* about for nine or ten days in cold water, and the quantity of the ſalts taken up will be according to the goodneſs of the *Mortar* and the quantity of water employed. The common ſpecific gravity of this liquor to water, is as 32 to 31, or thereabouts. Mr. Petit having procured the tincture of fifty pounds of *Mortar* by ſeveral impregnations in ſeventy-two French pints of water, evaporated it ſo far till it appeared highly charged with ſaline particles, taſting very acrid and bitter, and being of a browniſh red colour; and its ſpecific gravity was in this ſtate to water, as 4 to 3, there being more in quantity than about four pints. This was ſtill limpid and of a duſky colour, and was afterwards evaporated over a gentle fire to the conſiſtence of an extract, which as it cooled became much thicker and firmer, reſembling butter. This being left open to the air ſoon relented into a liquor of the conſiſtence of a ſyrup: Its ſpecific gravity was now to water as 5 to 3; but in leaving it open to the air, it continually attracted freſh humidity, and became leſs ſpecifically heavy. Experiments made with this extract ſucceeded in the following manner.

1. It turned the common blue paper to a fine deep red. The impregnations in water uninſpiſſated do this alſo in different degrees according to their ſtrength.

2. Mixed in equal quantities with ſpirit of nitre and with ſpirit of ſea-ſalt, it made no effervescence or alteration in either.

3. A leaf gold being put into the mixture of this impregnation with ſpirit of nitre was immediately diſſolved, and in an hour or two afterwards the liquor was much clearer than before.

A leaf of gold being put into the mixture of this impregnation and ſpirit of ſea-ſalt, was in the ſame manner diſſolved in a few minutes. It is generally ſuppoſed indeed that ſpirit of ſalt alone will diſſolve gold, but there ſeems an error in this founded on the inaccuracy of the preparation of ſuch ſpirit of ſalt; for Meſſ. Geoffroy and Boulduc have at different times produced before the French Academy ſpirit of ſalt carefully prepared by themſelves, which would not at all diſſolve gold, not even with the aſſiſtance of heat; even ſuch ſpirit of ſalt would however be made to diſſolve gold by mixing this impregnation with it: So that it has the power of diſſolving gold in a great degree.

4. A leaf of ſilver being diſſolved in ſpirit of nitre, and this impregnation of *Mortar* added to the ſolution, the whole became turbid, and a precipitation happened, part of the matter

ter being thrown to the bottom, and part remaining ſuſpended in form of a white cloud, which kept its place without falling.

5. The impregnation being mixed in equal quantities with oil of vitriol formed a coagulum, and made a great effervescence, with copious red vapours, and a ſtrong ſmell of aqua fortis; and theſe vapours appeared at any time on ſtirring the mixture for ſeveral days together. If a larger quantity of oil of vitriol be added to this coagulum, it all becomes fluid, but ferments violently; and finally there will be a white matter precipitated to the bottom of the clear liquor; and if a leaf of gold be brought near this mixture it will be diſſolved even by the vapour which exhales from it. Spirit of nitre has no effect upon this mixture, either in its ſtate of a coagulum, or when reduced by more oil of vitriol into a clear liquor; but the volatile ſpirit of urine ferments violently without the leaſt heat with it.

6. Oil of tartar *per deliquium* being added to the impregnation, the liquors would not readily mix, but remained ſeparate, the impregnation ſinking to the bottom; but on ſtirring them thoroughly together, they finally were made to unite into a white ſubſtance like butter, with a ſtrong urinous ſmell. If a ſmall quantity of corroſive ſublimate be added to this mixture, the urinous ſmell ceaſes; and if oil of vitriol be added, there is a violent fermentation occaſioned; and, in fine, a large quantity of precipitate.

7. This impregnation of *Mortar* being mixed with an equal quantity of a ſolution of corroſive ſublimate, there is nothing remarkable produced, though the mixture be ever ſo much ſhaken; but if a little oil of tartar *per deliquium* be added to this, the mixture becomes turbid, and, on ſtirring all together for ſome time, it becomes white and thick like butter. If to this, more corroſive ſublimate be added in ſolution, it becomes orange-coloured; and, on more ſtirring, this becomes again white; and finally gives a white precipitate at the bottom, of a tranſparent liquor.

8. If inſtead of oil of tartar an equal quantity of lime-water be added, this in the ſame manner gives an urinous ſmell, and the whole difference is, that the mixture will not become thick with this, as it will with oil of tartar.

9. The impregnation of *Mortar* produced the ſame coagulum on mixing with ſpirit of urine, that it did with oil of tartar *per deliquium*; but it made no coagulation with ſpirit of ſal armoniac with lime; the occaſion of this difference is, that the ſpirit of urine contains a great deal of volatile ſalt, and the other but little. It is a common error to ſuppoſe that the ſpirit of ſal armoniac, which is moſt pungent, contains the greateſt quantity of ſalt; but this is not the caſe, for the ſpirit made with lime is much more pungent than that with ſalt of tartar, though the laſt is well known to contain a greatly larger portion of ſaline particles.

10. If a piece of paper or linnen be wetted in this impregnation, and afterwards dried, it takes fire very violently, and ſparkles with the ſame violence as if it was impregnated with ſalt-petre.

From theſe experiments it is abundantly proved, that the impregnation of *Mortar* contains a large quantity of a ſaline and nitrous ammoniac ſalt; for a diſſolution of ſal armoniac and ſpirit of nitre mixed together are found to produce all the changes in the different bodies before-named, that the impregnation does. On the whole, though it has been ſuppoſed by Mr. Tournefort, and others, that *Mortar* contained ſal-petre, ſea-ſalt, and a fixed alkali; yet there does not appear any proof of its containing any one of thoſe ſalts; no fixed alkali can ever be ſeparated from the impregnation of it; and tho' the linnen or paper wetted in the impregnation of it ſparkled when on fire, yet it is not nitre, but merely a nitrous ſal armoniac, which occaſions that phænomenon. The ſame effect is produced, if the linnen or paper be wetted with a mixture of ſpirit of urine and ſpirit of nitre. And the ſeveral experiments before recited prove, that there is in *Mortar* a ſpirit of nitre and a ſpirit of ſea-ſalt, which with the volatile urinous ſalts form a nitrous or a ſaline ſal ammoniac. Mem. Acad. Scienc. Par. 1734.

MORTARIOLUM, a word applied by different writers to different things, from their reſemblance to a mortar in ſhape. The chemiſts expreſs by this name a ſmall mould made for the faſhioning their cupells; and anatomiſts call the ſockets of the teeth the *Mortariola* of the jaws.

MORTIFICATION (*Cycl.*)— MORTIFICATION, in religion, any ſevere pennance obſerved on a religious account. How antient and how univerſal the practice of it has been, and for what reaſons obſerved. See the article FASTING.

MORUS, the *Mulberry*, in botany, the name of a genus of trees, the characters of which are theſe: The flower is of the amentaceous kind, conſiſting of a great number of ſtamina, with their apices which ariſe from a four-leaved cup; theſe are male-flowers, and the embryo-fruits appear on different parts of the tree, and finally become a ſort of compound berry, ſoft and full of juice, and compoſed of cluſters of ſucculent ſquammæ which contain roundiſh ſeeds. *Tourn.* Inſt. p. 589.

The ſpecies of *Mulberry*, enumerated by Mr. Tournefort, are theſe: 1. The common *Mulberry*, with black fruit. 2. The *Mulberry* with ſmall black fruit, and elegantly divided leaves. 3. The *Mulberry*, with white fruit. 4. The *Mulberry*, with ſmall purpliſh white fruit. And 5. The *Mulberry*, with ſmall inſipid white fruit.

The fruit of this tree, while unripe, is very aſtringent; but when thoroughly ripe, it is of a contrary quality, rather purgative, cooling, very pleaſant, and quenching thirſt. Its ſyrup, which is very pleaſant, is the only uſe made of it in the ſhops.

The more general cultivating *Mulberry* trees in England might be of greater uſe than is at preſent ſuppoſed in many reſpects. In Devonſhire they have a way of mixing *Mulberry* juice with their cyder in the making, and thus make the very beſt of all Engliſh vinous liquors. And as to the great article of breeding ſilk-worms, though a recommendation from the crown could not bring about the planting theſe trees in ſufficient number for it in James the Firſt's time, yet the trees have been found to flouriſh every where with us when properly planted, and the worms feed very kindly and work very well with us. When this manufacture was firſt attempted, the people of many parts of England, nay and in ſome parts of the dampeſt places in Ireland, tried it, and always with ſucceſs. The only thing that ſtopped the progreſs of ſo valuable a thing at that time, was the want of a ſufficient quantity of *Mulberry* trees, and the ſcheme has been neglected ever ſince. Phil. Tranſ. N°. 133.

The tree was always eſteemed by the antients for its delicious fruit, before the uſe of its leaves was ever found out. The Romans, in the height of their luxury, preferred it before all the foreign fruits; and Columella, and the other antients are very expreſs in the methods of propagating it.

MORXI, the Indian name of a peſtilential diſtemper, very common in Malabar, and in ſome other parts of the Eaſt-Indies, frequently carrying off great numbers of people.

MOSCH, a name of a ſort of roriferous veſſels, ſaid to have been diſcovered by Bilſius, in the kidneys.

MOSCHELÆUM, a name given by authors to a compound, fragrant and aromatic oil, in which muſk is a very predominating ingredient.

MOSCHATELLINA, in botany, the name of a little plant common under our hedges in ſpring, which conſtitutes a peculiar genus; the characters of which are theſe: The flower conſiſts of one leaf, and is rotated and divided into ſeveral ſegments at the edge. From the cup of this riſes a piſtil, which is fixed in the manner of a nail to the middle of the flower; and finally becomes a ſoft ſucculent berry, containiug flatted ſeeds. *Tourn.* Inſt. p. 156.

MOSCHELAPHUS, in natural hiſtory, a name given by ſome writers to a creature of a mixed nature, produced by the copulation of a ſtag and a cow. Wagner tells us, that theſe creatures are ſometimes ſeen in the mountainous parts of Swiſſerland; as are alſo the Hippotauri, generated between a bull and a mare; but neither of theſe ever propagate their ſpecies. *Wagner*'s Hiſt. Helvet.

MOSCHIFERUM *Animal*, in natural hiſtory, the name of the creature which affords us the perfume called muſk.

This creature ſeems to be neither of the goat nor deer-kind, and it is doubtful whether or not it chews the cud; it has however no *dentes inciſores* in the upper jaw, which ſeems a mark that it does; but it has, according to the obſervation of Ariſtotle, exerted teeth or tuſks there, in the manner of the boar. His noſe is ſharp, like that of a greyhound; his ears like a rabbit's, about three inches long, and erect; and his tail or ſcut, about two inches; his foot is deeply cloven. The hair on the body is about half an inch long, and very thick, and of a brown and white colour. *Ray*'s Syn. Quad. p. 140.

The *Muſk* bladder or bag is about three inches long and two over, ſwelling out an inch and half from the belly, and ſtanding as much before the groin. It has no horns, and its tuſks by their figure ſeem intended equally for feeding and fighting.

MOSCHOSITERON, a name given by Myrepſus, and other old writers, to Fœnugreek.

MOSS (*Cycl.*)—Theſe ſmall plants, tho' neglected of many ages, have, by the induſtry and application of the later botaniſts, been found a very numerous and very beautiful claſs of plants; and not without their uſes in medicine and mechanics, and to various purpoſes of human life. Dr. Dillenius, who has ſtudied them with an uncommon care, and given a very valuable hiſtory of them, has deſcribed more than ſix hundred ſpecies; the greater part of which are found in our own country, though ſome peculiar to others; and doubtleſs, there yet remain vaſt numbers unheeded and unknown in many countries. See Tab. of *Moſſes*.

The *Moſſes* of Virginia, Penſilvania, and other parts of North-America, are in part the ſame with ours, and in part different; about two thirds of the number of *Moſſes* of theſe countries hitherto obſerved being common to our own country alſo, the reſt peculiar to that part of the world. Thoſe of South-America, are almoſt all wholly different from ours. The *Moſſes* of Greenland and Lapland are moſtly of the ſame kind with thoſe of our Welch mountains. And in the mountainous

tainous parts of the world between the Tropics, there are many extremely beautiful fern-like *Moſſes*, unknown in all other places.

Ireland and Scotland yet remain to be ſearched in a great meaſure, and probably will afford great numbers hitherto wholly unknown. It cannot but be acknowledged, that the diſtinctions of theſe little vegetables are ſo minute, and their appearance ſo various in their different ſtates, that very probably ſucceeding obſervations will much retrench the number deſcribed by Dillenius; but as the ſame obſervers will probably add as many new and truly diſtinct ſpecies, as they find occaſion to ſtrike off from the old liſt, there is no doubt but that the number will be found at leaſt as great as it ſtands at preſent with that author.

Uſes of MOSSES. Were there no other uſe in theſe minute and beautiful objects than the admiring the wonderful works of the creator, this were enough to make the ſtudy of them worthy of attention; the almoſt endleſs variety of the figure and ſtructure of their leaves, the ſlenderneſs of the ſtalks that ſupport them, and the regularity and nice order in which they are arranged; the minuteneſs of their roots, and the ſlenderneſs of the pedicles which bear the heads, each of which is often ſmaller than the fineſt hair, and the extreme exility of the veſſels through which juices are conveyed along theſe for the nouriſhment of the plant and ſeeds, can never enough be admired; and the various ſtructure of the heads or ſeed-veſſels with their coverings, by means of which the tender ſeeds and farinæ are defended, afford to the microſcopic obſerver an endleſs fund of admiration.

But theſe are not all the uſes they were intended for, many may yet remain unknown; but we at preſent well know that ſeveral of the uſneas are great and valuable medicines, uſed as deſiccatives and aſtringents; that the common cup *Moſs* is one of the greateſt remedies in the convulſive coughs of children, called the chin-cough, is known to every one; and Dr. Mead has ennobled the grey ground-lichen, by publiſhing its virtues in one of the moſt terrible of all diſeaſes, the bite of a mad dog. The common green liverworts are known medicines in diſorders of the breaſt, as are alſo all the ſpecies of polytricha. The ſeeds of our lycopodium are given with ſucceſs in nephritic caſes; and the Indians give one of their ſpecies in many diſtempers, and as they ſay, with great benefit. The common white ground coralloides ſerves the rain-deer of Lapland for food, when all other herbage is loſt; and the confervæ ſerve for food to many of the fiſhes both of the ſea and rivers, and to ſeveral water-fowl. And theſe, as well as the land *Moſſes* afford ſhelter and habitation to many inſects, and their young. Many of the ſpecies of coralloides and lichenoides are found of great uſe in that profitable branch of commerce the art of dying; and doubtleſs many others have alſo the ſame qualities, though not yet diſcovered; and we may be guided in ſearches of this kind by obſerving that many of them tinge the papers between which they are dried, to very beautiful and laſting colours. The *Moſſes* which cover the trunks of trees, as they always are freſheſt and moſt vigorous on the ſide which points to the north, if not only produced on that, ſerve to preſerve the trunk of the tree from the ſeverity of the north-winds, and direct the traveller in his way, by always plainly pointing out that part of the compaſs.

The ſoft marſh and bog *Moſſes* ſerve the poor in many places for ſtuffing their beds, and in the buſineſs of tranſporting plants from other countries; nothing is of ſo great uſe as the ſtalks and leaves of theſe little vegetables: The ſucculent plants coming over in great beauty and vigour when rolled up in dry *Moſs*; and trees and ſhrubs, by having their roots covered with ſuch as is ſomewhat moiſt.

The great quality of the *Moſſes*, which makes them ſo ſerviceable in this caſe, is, that they do not heat and ferment on being moiſtened, as hay and ſtraw would.

Characters of MOSSES. What the botanical writers ſtrictly underſtand by the word *Moſs*, is a claſs of plants appearing of an inferior rank, to the common vegetables; the leſs perfect genera of which ſeem to be wholly deſtitute of flower or ſeed or any thing analogous to either, at leaſt as far as our obſervations have hitherto been able to carry us, and to conſiſt of ſimple, ſimilar, and uniform parts; the genera a little above theſe have ſome diverſity of parts, and carry ſomething that looks analogous to vegetation in the common way, having a reſemblance of thoſe parts which ſerve other plants for their fructification. The more perfect genera of the *Moſſes* not only conſiſt of different parts, but have alſo their appropriated organs containing a pulpy matter, which finally becomes dry, and aſſumes the form of a fine and ſubtle powder, compoſed of granules, each of which is either a ſeed or a granule of farina ſerving for the propagation of the ſpecies.

The more imperfect *Moſſes* are diſtinguiſhed from the others by their appearance to the naked eye; they are either in form of a fine lanugo, or down covering the ſurface of different bodies, or elſe they appear as ſlender filaments or foliacious bodies floating about in the water, or as filaments of a tougher texture hanging down from the branches of old trees, or as little ſhrubs or ſingle horns growing erect on the parched earth of mountains and heathy places; or finally, as broad and foliaceous bodies ſpreading themſelves over the dry barks of trees or rocks, without any pedicle or other ſupport.

The more perfect kinds of *Moſſes* are found in the ſhape of ſmall but regular plants, dividing into ſeveral branches, and clothed with leaves; theſe are of various forms and ſtructures, ſome being broad and thin, others ſlender as hairs; ſome pellucid, others opake; ſome ſmooth, others hairy. From the alæ of theſe leaves in ſome kinds, and from the ſummit of the ſtalks in others, there ariſe heads or capſules of a various figure and ſtructure, but all unicapſular; ſome of theſe are naked, others covered with a calyptra or hood; ſome ſtand on long pedicles, and others are placed cloſe to the ſtalks. Theſe heads are uſually called *capſulæ*, and their pedicles *ſetæ*, in the *mnia*, *hypna*, *brya*, and *polytricha*; but in the *lichenes* and *lichenaſtra* the pedicles are called *pediculi*, and the heads *capitella*.

The *byſſi*, *confervæ* and *tremellæ*, appear to be wholly deſtitute of ſeeds; the ſeveral parts of theſe genera have no difference from one another; and in the *tremellæ*, though there is often an appearance of leaves like thoſe of trees, yet when examined they will be found to differ in this, that the upper and under ſides are no way different.

The *uſneæ*, *corolloides*, and *lichenoides*, all have ſomething which ſeems analogous to a flower or fruit in the perfect plants; and all the other genera of *Moſſes* as the *ſphagna*, *hypna*, &c. have perfect fructifications, and produce the powder before-mentioned ſerving in the place of farinæ or ſeeds, and regularly propagating the plants. The mnia, lycopodioides, and above all others the lichens or liverworts, have perfect and regular fructifications obvious to the eye. The mnia have duſty heads, which appear plainly to be the female part of the fructification.

The lycopodioides has ſeveral capſules containing farinæ, and beſide theſe ſeveral female capſules containing ſeeds, and not farinæ, interſperſed along the ſame ſpikes.

The heads of the lichens or liverworts which contain the farinæ, differ from all the others in that they are polycoccous; in this alſo they differ from the ſeed, bearing heads of the ſame plants or ſcyphi, as they are called, which are ſingle, and contain the rudiments of ſeeds, obvious to the naked eye, which may be daily ſeen to encreaſe; and the propagation of the plant from them is eaſily obſerved through its ſeveral ſtages: This however is very ſingular, and extremely different from that of all other plants, in that the whole operation conſiſts only in the dilatation of the ſeeds, they having no heart or eye, as it is called, in the ſeeds of the larger plants, no place from whence the radicle is to ſhoot, nor any ſeminal leaves, but expanding ſimply into breadth, they become young plants like the parent.

The other genera of *Moſſes* have all capſules for the containing their ſeed or farinæ. Theſe, in ſome, are covered with a calyptra or hood, in others they are naked. Of the firſt kind are the *ſphagna*, *brya*, *fontinales*, *hypna*, and *polytricha*; and of the latter, the *ſelagines*, *lycopodia*, *poroniæ*, *anthocera*, and *lichenaſtra*.

The capſules of the *ſphagna* have no calyptra, becauſe the heads being placed on extremely ſhort pedicles, and the leaves of the plant long, they are covered and defended by them; and having beſide a very rigid and ſtiff operculum, they are in no neceſſity of any other covering; but the *fontinales*, *hypna*, *brya*, and *polytricha*, are all defended in their capſules by calyptræ, leſt the too abundant humidity ſhould deſtroy the ſeeds. The operculum ſlides off from all theſe in a tranſverſe direction; for when the included pulp in the capſule becomes ripened into ſeeds or farinæ, the notched parts of the rim ariſe from the ſurface, and expand themſelves outward, by means of which the operculum is at liberty to fall off, and the ſeeds have liberty to fall out, and propagate the plants.

The *ſelagines*, *lycopodia*, and *lycopodioides*, have neither capſule, operculum, nor calyptra; for the fruits of theſe genera lying immerſed in the alæ of the leaves, they need no ſuch coverings; but they ſtand naked cloſe to the ſtalk, and when mature, they open longitudinally, and throw out their ſeeds.

The fruits of the anthocera open in the ſame manner, but they are of a very different figure, reſembling pods, whereas the others are of a kidney-like ſhape.

The poroniæ are very ſingular, in that their capſules are perforated with many holes, thro' which the ſeeds or farinæ are diſcharged when ripe. The heads of the lichenaſtra, when they are ripe, become lucid, and opening into four parts, carry the appearance of a tetrapetalous, or four-leaved cruciform flower.

The ſubſtance with which the heads or capſules of all the *Moſſes* are filled, reſembles either ſeeds, or the ſmall globules of the farinæ of flowers, which all reſemble ſeeds of particular figures in miniature. The fructifications of theſe minute plants ſeem to be either from theſe, as ſeeds falling to the earth; or, according to the opinion of ſome, they ſeem to contain only farinæ in the capſules, which impregnating certain bulbs or nodules in the alæ of the leaves, cauſe them to grow and vegetate, as is ſeen in ſome of the larger plants, as in the bulbs produced in the alæ of the leaves of the dentaria, and of the lillies, and ſome others. The former opinion, of the powder in the heads or capſules, being actually

perfect

perfect ſeeds, is the more probable, as theſe bulbs in the alæ of the leaves are found only in ſome of the hypna, and others of a few other genera, whereas the propagation is as quick and certain in thoſe which have none of them, as in thoſe which have; and the want of female parts of fructification, which makes ſo many deſiderata in the Linnæan ſyſtem of botany, is eaſily made up, and the whole explained according to the uſual courſe of nature in other vegetables, by allowing the powder in the capſules to be real ſeeds, and the ſmall globules on the pointals ſurrounding the aperture of the capſule, the farina.

The opinion of the *Moſſes* growing only from theſe nodules in the alæ of the leaves, or from the impregnated ends of the branches which had received the powder from the capſules, was originally founded on the obſerving, that the trailing or branched hypnums annually grew out into length, from the extremities of all their branches, and annually loſt as much of the old ſtalk at the root, as they gained of the new at the ſummit; but it appears from further obſervations, that they are real ſeeds which are contained in form of powder in the capſules; ſince the bryums, and many others, are found growing from ſmall points or ſpots, which are aſſemblages of their minute leaves, propagated on the ground, under the old ones juſt where the powder of the capſules has fallen; and tho' it be allowed, that the hypnums and other trailing *Moſſes* do grow from the ends of the branches, yet they may alſo be produced in form of new plants, from regular and perfect ſeeds ſhed from the capſules. It is certain that the bryums are by this means propagated and ſpread into large tufts, and the other genera may alſo be ſo propagated, tho' they have beſide a property of encreaſing by growth of the ſtalk; which ſeems no other than the property of many of the larger plants to creep at the root, and ſhoot out in length greatly from the extremities of their horizontal branches, lying on or under the ground, as thoſe ſpreading parts may more properly be ſo called than roots, the fibres puſhed out from them perpendicularly into the earth, being properly the roots; and it is well known that theſe plants, tho' they propagate themſelves thus by the root, produce ſeeds alſo like the others, by which they may be equally propagated; and this analogy is to be carried yet farther; for as thoſe plants which creep by the roots, produce fewer ſeeds than thoſe which are propagated only by ſeeds, ſo the hypnums, which are the genus of *Moſſes* in which this growth by the ſtalk is principally obſerved, are very thinly beſet with capſules of ſeed, and many of them produce but very few in a ſeaſon; whereas the brya, and other *Moſſes*, which have not this advantage of growing from the ends of the ſtalks, are found every year profuſely covered with capſules from every tuft; nay, there is ſcarce any branch which does not produce its capſule. Now if theſe capſules contained only a farina capable of impregnating the nodules, or the ends of the branches, it is obvious there would be as much of it required for the hypna as for any other kinds of *Moſſes*; but if they are real and perfect ſeeds, it is no wonder that nature has given them profuſely, to ſuch kinds as are to be propagated only by ſeeds, and more ſparingly to thoſe which are propagated alſo by the increaſe of the branches.

To this it may finally be added, that the ferns and other epiphylloſpermous plants approach moſt of all others to the nature of the *Moſſes*; and tho' it has been ſuſpected by many, that the fine powder at the back of their leaves was not ſeeds, but only a farina; yet it is now well known that it is true and perfect ſeed, ſince, under many ſpecies of them, there are conſtantly found new and ſelf-ſown plants ariſing in their firſt rudiments of leaves and figure, which have plainly grown from the duſt or powder fallen from the old plants; and as this is now found to be the caſe in regard to the ferns, probably it will alſo appear the ſame in regard to the *Moſſes*, when they have been yet farther examined than at preſent. But whether theſe grains of powder have the lobes and radicle by which the ſeeds of larger plants propagate themſelves, or whether they grow into plants like the parent ones, in the manner of the lichens, by mere expanſion, is a thing that requires farther obſervations to determine.

Some of the *Moſſes*, it is evident, approach to the nature of the plants, which have their male and female parts in the ſame flower, and to thoſe which have them in different ones. The lichens have their leaves notched and jagged like thoſe of the perfect plants, and have, in the ſame manner, their under ſurface different from the upper. Theſe have their male flowers or heads on long pedicles; theſe heads contain only farina, and the ſeeds are lodged in little cups or diſhes on the ſurface of the leaves. The next in perfection to theſe are the lycopodioides, which have flowers with farina, and fruits with ſeeds, diſpoſed along the ſame ſpike. The mnia have heads of two kinds, the one membranaceous, like thoſe of the hypnums and other *Moſſes*, and the other duſty, and containing a powder viſible on their ſurface; the one of theſe plainly contains the farina, the other the ſeed. The lichenaſtra are very ſeldom found with ſeeds on them; but they creep greatly by the roots; whence a new propagation by ſeeds is leſs neceſſary. The polytricha are ſuppoſed to carry only a farina in their heads, and their branches ſtellated at the ends, to carry the ſeeds which are to be impregnated. This has been the common opinion; but it wants confirmation. Some of the bryums have the ſame appearance of a female part, and the young nodules in the alæ of the leaves of the hypnums are generally alſo referred to the ſame uſe. But theſe are conjectures; and the much more probable opinion is, that the powder in the heads of all the *Moſſes* is true ſeed, which in general is impregnated with farina from the pointals, over the mouth of the capſule; and in ſome inſtances, as in the mnia, *&c.* as in ſome of the more perfect plants, from different flowers in a different part of the plant. *Dillen.* Hiſt. Muſc. Introit.

The manner of ſeeding of *Moſſes* in general may be in ſome degree gueſſed at by that of one genus of them, which has been traced through all its ſtages, and to which moſt of the others, though every genus has its diſtinct fructification in ſome reſpects, yet bear a very great general analogy.

The genus already obſerved, is that called by Dr. Dillenius, the *hypnum*. The ſpecies of this are very numerous and common; but that particular one which was the ſubject of theſe obſervations, is the ſhort-branched ſilky kind, common on old walls; and called by that author in his hiſtory, *Hypnum vulgare, ſervicum, recurvum, capſulis erectis cuſpidatis*.

The head of this *Moſs* appears to the naked eye a ſmall ſmooth browniſh yellow oblong body, of about a ninth of an inch long; this is covered at its upper end with a membranaceous calyptra or hood, in ſhape reſembling an extinguiſher, or a funnel inverted. When this calyptra is taken off, and the head viewed with a microſcope, the ſurface of it is ſeen to be ridged with longitudinal ſtriæ. The baſis of the head is of a deep orange colour, and more opake than the reſt; and the top is bounded by an orange-coloured ring ſwelling out ſomething beyond the ſurface of the contiguous parts of the head. Good glaſſes ſhew that in this head there are not wanting the parts eſſential to the fructification of what are uſually called the more perfect plants. This ring is truly a monophyllous undulated calyx, within which ariſe ſixteen pyramidal fimbriated ſtamina; theſe are of a pale greeniſh colour, and are loaded with a whitiſh oval farina. The ſtamina all bend toward each other from their baſes, and almoſt meet in a point at their tops. This is their appearance when the head is nearly ripe; and immediately under the arch formed by theſe ſtamina, is a cylindric hollow piſtillum, through which the farina makes its way, and is diſperſed among the ſeeds in the head. The fruit is a large capſule, filling every part of the membrane which ſhews itſelf on the outſide of the head, and in moſt places is contiguous to it. This capſule is filled with perfect and very beautiful ſeeds; they are round, tranſparent when unripe, but afterwards opake, and of a very beautiful green, which colour they retain even when dried. Philoſ. Tranſ. N°. 478. Sect. 12.

When this head is firſt produced from the plant, the ſtamina are very ſlender, and ſtand erect; the head is ſcarce any thicker than the ſtalk, and the calyptra covers it all over, to ſhield the tender ſubſtance of the farina from external injuries. As the farina afterwards ſwells in the ſtamina, the ſeeds in the head increaſe alſo in bulk, and by their increaſe the head is more extended in thickneſs, and the ſtamina are by this means ſeparated farther and farther from each other at their baſes, but bend inwards toward their points, ſo as to form a kind of arched covering over the ſtigma of the piſtillum which is ſingle; and from hence the farina falls as it ripens into the head, and impregnates the ſeeds. Id. Ibid.

All the *Moſſes*, liverworts, and the other plants of the ſame character, poſſeſs the ſame general virtues of drying and aſtringency.

Moss *on Trees*, in gardening. The growth of large quantities of *Moſs* on any kind of tree is a diſtemper of very bad conſequence to its increaſe, and much damages the fruit of the trees of our orchards.

The preſent remedy is the ſcraping it off from the body and large branches, by means of a kind of wooden knife, that will not hurt the bark, or with a piece of rough hair cloth, which does very well after a ſoaking rain. But the moſt effectual cure, is the taking away the cauſe. This is to be done by draining off all the ſuperfluous moiſture from about the roots of the trees, and may greatly be guarded againſt in the firſt planting of the trees, by not ſetting them too deep.

If trees ſtand too thick in a cold ground, they will always be covered with *Moſs*; and the beſt way to remedy the fault, is to thin them. When the young branches of trees are covered with a long and ſhaggy *Moſs*, it will utterly ruin them; and there is no way to prevent it, but to cut off the branches near the trunk, and even to take off the head of the tree, if neceſſary; for it will ſprout again; and if the cauſe be in the mean time removed by thinning the plantation, or draining the land, the young ſhoots will continue clear after this.

If the trees are covered with *Moſs*, in conſequence of the grounds being too dry, as this will happen from either extreme in the ſoil, then the proper remedy is the laying mud from the bottom of a pond or river, pretty thick about the root, opening the ground to ſome diſtance and depth to let it in; this will not only cool it, and prevent its giving growth to any great quantity of *Moſs*, but it will alſo prevent the

other great miſchief which fruit-trees are liable to in dry grounds, which is the falling off of the fruit too early. *Mortimer*'s Huſbandry, vol. 2. p 78.

Heath-Moss. See the article HEATH.

Silk-Moss, in botany, a name given by Count Marſigli to a ſpecies of ſea *Moſs*, of a very remarkable fineneſs and ſoftneſs, much more reſembling ſilk than any other of the vegetable productions. It is wholly compoſed of a ſort of tuft of fine hairs or filaments, and is of a bluiſh green colour, and almoſt tranſparent. It grows on rocks, ſtones, ſhells, or any thing elſe that lies in its way, and is found uſually at ſmall depths; it is not ſo tough and flexible as many other of the ſea plants, but is eaſily rubbed to powder between the fingers. When examined by the microſcope, the ſingle filaments do not appear of the ſame equable ſurface and uniform texture; but they are ſeen to be jointed and made up as it were of a great number of pieces faſtened end by end to one another, in the manner of the beads of a lady's necklace. It is of a fine bluiſh green, and perfectly tranſparent before the microſcope, and reſembles a ſtring of gems, ſuch as the aqua marina, or ſome other like ſtone. *Marſigli* Hiſt. de la Mer. p. 79.

Sea-Mosses. Theſe ſmall plants are very beautiful when viewed by the naked eye; but when examined with the microſcope, they afford a very pleaſing variety of ſtructure and conformation.

The common kinds afford a great variety of colouring, the different parts of the ſame plant often appearing ſome brown, ſome yellow, ſome red, and ſome grey. On drying, theſe colours become leſs elegant; but on putting the dried plant again to ſoak in water, they are in ſome degree recovered, and the variations are uſually found to be owing to the joints and knots in the ſtalks, which interrupt the courſe of the general colour, and are often themſelves either black, or of a dark and deep brown.

The ſummits of their branches are frequently terminated by little tranſparent bubbles; theſe ſome have taken for fruit, but very erroneouſly; they are in reality only globules of clear water. Some of them are jointed at ſeveral diſtances, and every joint has its regular ſhape and ſtructure. This is the caſe in the two great claſſes of the corallines and the confervas. Others are elegantly variegated with brown, yellow, and green, and though leſs tranſparent, are not leſs beautiful than the former; theſe are in general of the fucus or fucoides claſs. Others are white and tranſparent, like *Moſſes* of cryſtal. Theſe are ſmall and elegant corallines, and their joints are uſually variegated with black ſpots: It is not unuſual alſo to ſee, at the extremities of the branches of theſe, certain ſmall black globules, which appear to be the fruit; but they are in reality no other than globules of water thus tinged by ſome juices from the plant.

It is poſſible, however, that theſe liquid globules may be ſo far of the nature of a fruit, as to contain the ſeed of the plant. We know that the ſeeds of the ſea fucus's in general are enveloped in a glutinous liquor, and kept at the ſummit of the branches of the plant; they are indeed in thoſe large plants ſurrounded with a viſible and ſenſible membrane, which is indeed thicker and longer than any other part of the plant; and it is not impoſſible that theſe fine and ſmall globules may have their covering membrane, too fine and thin to become the object of our ſenſes. *Marſigli* Hiſt. de la Mer, p. 80.

The generical characters of theſe plants are to be ſeen under their ſeveral heads of *fucus*, *coralline*, and the reſt; but theſe minute plants are often omitted by the writers on botany, though they make ſo elegant a figure on being viewed with the aſſiſtance of glaſſes.

Moss is alſo a name given by ſome to the boggy ground in many parts of England, more uſually called a *fen* and *bog*.

In many of theſe grounds, as well in England and Ireland as in other parts of the world, there are found vaſt numbers of trees ſtanding with their ſtumps erect, and their roots piercing the ground in a natural poſture, as when growing. Many of thoſe trees are broken or cut off near the roots, and lie along, and this uſually in a north-eaſt direction. People who have been willing to account for this, have uſually reſolved it into the effect of the deluge in the days of Noah; but this is a very wild conjecture, and is proved falſe by many unanſwerable arguments. The waters of this deluge might indeed have waſhed together a great number of trees, and buried them under loads of earth; but then they would have lain irregularly and at random; whereas they all lie lengthway from ſouth-weſt to north-eaſt, and the roots all ſtand in their natural perpendicular poſture, as cloſe as the roots of trees in a foreſt.

Beſide, theſe trees are not all in their natural ſtate, but many of them have the evident marks of human workmanſhip upon them, ſome being cut down with an ax, ſome ſplit, and the wedges ſtill remaining in them; ſome burnt in different parts, and ſome bored through with holes. Theſe things are alſo proved to be of a later date than the deluge, by other matters found among them, ſuch as utenſils of antient people, and coins of the Roman emperors.

It appears from the whole, that all the trees which we find in this foſſile ſtate, originally grew in the very places where we now find them, and have only been thrown down and buried there, not brought from elſewhere. It may appear indeed an objection to this opinion, that moſt of theſe foſſile trees are of the fir kind; and that Cæſar ſays expreſly, that no firs grew in Britain in his time; but this is eaſily anſwered by obſerving, that theſe trees, though of the fir kind, yet are not the ſpecies uſually called the fir, but pitch-tree; and Cæſar has no where ſaid that pitch-trees did not grow in England. Norway and Sweden yet abound with theſe trees, and there are at this time whole foreſts of them in many parts of Scotland, and a large number of them wild upon a hill at Wareton in Staffordſhire to this day.

In Hatfield marſh, where ſuch vaſt numbers of the foſſile trees are now found, there has evidently once been a whole foreſt of them growing. The laſt of theſe was found alive, and growing in that place within ſeventy years laſt paſt, and cut down for ſome common uſe.

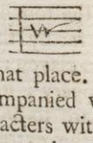
It is alſo objected by ſome to the ſyſtem of the firs growing where they are found foſſile, that theſe countries are all bogs and moors, whereas theſe ſorts of trees grow only in mountainous places: But this is founded on an error, for though in Norway and Sweden, and ſome other cold countries, the fir-kinds all grow upon barren and dry rocky mountains, yet in warmer places they are found to thrive as well on wet plains. Such are found plentifully in Pomerania, Livonia, and Courland, *&c.* and in the weſt parts of New England there are vaſt numbers of fine ſtately trees of them in low grounds. The whole truth ſeems, that theſe trees love a ſandy ſoil; and ſuch is found at the bottoms of all the *Moſſes* where theſe trees are found foſſile. The roots of the fir-kind are always found fixed in theſe, and thoſe of oaks, where they are found foſſile in this manner, are uſually found fixed in clay, ſo that each kind of tree is always found rooted in the places where they ſtand in their proper ſoil; and there is no doubt to be made, but that they originally grew there. When we have thus found that all the foſſile trees we meet with once grew in the places where they are now buried, it is plain that in theſe places there were once noble foreſts, which have been deſtroyed at ſome time; and the queſtion only remains how and by whom they were deſtroyed. This we have reaſon to believe, by the Roman coins found among them, was done by the people of that empire, and that at the time when they were eſtabliſhed, or eſtabliſhing themſelves here.

Their own Hiſtorians tell us, that when their armies purſued the wild Britons, theſe people always ſheltered themſelves in the miry woods, and low watery foreſts. Cæſar expreſly ſays this, and obſerves, that Caſſibelan and his Britons, after their defeat paſſed the Thames, and fled into ſuch low moraſſes and woods, that there was no purſuing them; and we find that the Silures ſecured themſelves in the ſame manner when attacked by Oſtorius and Agricola. The ſame thing is recorded of Venutius, king of the Brigantes, who fled to ſecure himſelf into the boggy foreſts of the midland part of this kingdom: And Herodian expreſsly ſays, that in the time of the Romans puſhing their conqueſts in theſe iſlands, it was the cuſtom of the Britons to ſecure themſelves in the thick foreſts which grew in their boggy and wet places, and when opportunity offered, to iſſue out thence and fall upon the Romans. The conſequence of all this, was the deſtroying all theſe foreſts, the Romans finding themſelves ſo plagued with parties of the natives iſſuing out upon them at times from theſe foreſts, that they gave orders for the cutting down and deſtroying all the foreſts in Britain which grew on boggy and wet grounds. Theſe orders were punctually executed; and to this it is owing that at this day we can hardly be brought to believe that ſuch foreſts ever grew with us as are now found buried.

The Roman hiſtories all join in telling us, that when Suetonius Paulinus conquered Angleſea, he ordered all the woods to be cut down there, in the manner of the Roman generals in England: And Galen tells us, that the Romans, after their Conqueſt in Britain, kept their ſoldiers conſtantly employed in cutting down foreſts, draining of marſhes, and paving of bogs. Not only the Roman ſoldiers were employed in this manner, but all the native Britons made captives in the wars, were obliged to aſſiſt in it: And Dion Caſſius tells us, that the emperor Severus loſt no leſs than fifty thouſand men in a few years time, in cutting down the woods, and draining the bogs of this iſland. It is not to be wondered at, that ſuch numbers executed the immenſe deſtruction which we find in theſe buried foreſts. One of the greateſt ſubterranean treaſures of wood is that near Hatfield; and it is eaſy to prove that theſe people to whom this havock is thus attributed, were upon the ſpot where theſe trees now lie buried. The common road of the Romans out of the ſouth into the north, was formerly from Lindum (Lincoln) to Segelochum (Little-Burrow upon Trent), and from thence to Danum (Doncaſter), where they kept a ſtanding garriſon of Criſpinian horſe. A little off on the eaſt, and north-eaſt of their road, between the two laſt named towns, lay the borders of the greateſt foreſt, which ſwarmed with wild Britons, who were continually making their ſallies out, and their retreats into it again, intercepting their proviſions, taking and deſtroying their carriages, killing their allies and paſſengers, and diſturbing their garriſons. This at length ſo exaſperated the Romans, that they were determined to deſtroy it; and to do this ſafely and effectual-

ly, they marched againſt it with a great army, and encamped on a great moor not far from Finningly: This is evident from their fortifications, yet remaining.

There is a ſmall town in the neighbourhood called *Oſterfield*, and as the termination field ſeems to have been given only in remembrance of battles fought near the towns whoſe names ended with it, it is not improbable that a battle was fought here, between all the Britons who inhabited this foreſt, and the Roman troops under Oſtorius. The Romans ſlew many of the Britons, and drove the reſt back into this foreſt, which at that time overſpread all this low country. On this the conquerors taking advantage of a ſtrong ſouth-weſt wind ſet fire to the pitch trees, of which this foreſt was principally compoſed; and when the greater part of the trees were thus deſtroyed, the Roman ſoldiers and captive Britons, cut down the remainder, except a few large ones which they left ſtanding, as remembrances of the deſtruction of the reſt. Theſe ſingle trees however could not ſtand long againſt the winds, and theſe falling into the rivers which ran through the country, interrupted their currents, and the water then overſpreading the level country made one great lake, and gave origin to the *Moſſes* or moory bogs, which were afterwards formed there, by the workings of the waters, the precipitation of earthy matter from them, and the putrefaction of rotten boughs and branches of trees, and the vaſt increaſe of water *Moſs*, and other ſuch plants which grow in prodigious abundance in all theſe ſort of places. Thus were theſe burnt and felled trees buried under a new-formed ſpungy and watery earth, and afterwards found on the draining and digging through this earth again.



Hence it is not ſtrange that Roman weapons and Roman coins are found among theſe buried trees; and hence it is that among the buried trees ſome are found burnt, ſome chopped and hewn; and hence it is that the bodies of the trees all lie by their proper roots, and with their tops lying north-eaſt, that is, in that direction in which a ſouth-weſt wind would have blown them down: Hence alſo it is, that ſome of the trees are found with their roots lying flat, theſe being not cut or burned down, but blown up by the roots afterwards when left ſingle; and it is not wonderful, that ſuch trees as theſe ſhould have continued to grow even after their fall, and ſhoot up branches from their ſides which might eaſily grow into high trees. Philoſ. Tranſ. N°. 275.

By this ſyſtem it is alſo eaſily explained why the moor ſoil in the country is in ſome places two or three yards thicker than in others, or higher than it was formerly, ſince the growing up of peat-earth or bog-ground is well known, and the ſoil added by overflowing of waters is not a little.

As the Romans were the deſtroyers of this great and noble foreſt, ſo they probably were alſo of the ſeveral other antient foreſts; the ruins of which furniſh us with the bog-wood of Staffordſhire, Lancaſhire, Yorkſhire, and other counties. But as the Romans were not much in Wales, in the iſle of Man, or in Ireland; it is not to be ſuppoſed, that foreſts cut down by theſe people gave origin to the foſſile wood found there; but though they did not cut down theſe foreſts, others did; and the origin of the bog-wood is the ſame with them and with us. Holingſhead informs us, that Edward the Firſt being not able to get at the Welch, becauſe of their hiding themſelves in boggy woods, gave orders at length that they ſhould all be deſtroyed by fire and by the ax; and doubtleſs the roots and bodies of trees found in Pembrokeſhire under ground, are the remains of the execution of this order. The foſſile wood in the bogs of the iſlands of Man and Angleſea, is doubtleſs of the ſame origin; though we have not any accounts extant of the time or occaſion of the foreſts there being deſtroyed; but as to the foſſile trees of the bogs of Ireland we are expreſsly told, that Henry the Second, when he conquered that country, ordered all the woods to be cut down that grew in the low parts of it, to ſecure his conqueſts by cutting away the places of reſort of rebels.

Moving-Moss. We have an account in the Philoſophical Tranſactions, of a moving-*Moſs* near Church-town in Lancaſhire, which greatly alarmed the neighbourhood as miraculous. The *Moſs* was obſerved to riſe to a ſurprizing height, and ſoon after ſunk as much below the level, and moved ſlowly towards the ſouth.

Wall-Moss. See the article Wall-*Moſs*.

MOSTRA, in the Italian muſic, a little mark ſet at the end of each line of a tune, thus  to ſhew that the firſt note of the next line is in that place.

If this firſt note be accompanied with a ♯ or flat *b*, it is right to place thoſe characters with the *Moſtra*. Alſo if in a thorough baſs this firſt note have any cyphers, it would be of uſe to put the ſame cyphers with the character, at the end of the preceding ſtaff. Again, if the part change its cleff with the firſt note, the cleff ought to be marked with the *Moſtra* in the ſame manner. The *Moſtra* is of great uſe, eſpecially in quick motions, as it prepares the player for what is to come. Vid. *Broſſ.* Muſ. Dict. in voc.

MOSYNÆCUM *Æs*, in metallurgy, a name given by the antients to a white metal made of copper, in great eſteem among them.

Ariſtotle tells us, that it was extremely bright and of a perfect fine white colour; and adds, that it was made of copper by melting it with an admixture of a peculiar kind of earth. Strabo alſo mentions this; and Theopompus tells us, that it was made of copper and an earth, and that it looked ſo like ſilver, that it was generally called *Pſeudoargyron*.

Virgil mentions it under the name of *Aurichalcum album*, and ſeems to give it great praiſes. We are not able at preſent to ſay what it was they uſed in making it. We know ſeveral things that will render copper white, as arſenic, and the like; but none of theſe can well be ſuppoſed to be the thing. For arſenic, and all the things we uſe to make our factitious metal, debaſe the copper, and render it brittle; whereas by the accounts of Strabo, and others, their white metal ſeems to have been better for all uſes than the copper itſelf. As to their telling us that it was a ſort of earth which they uſed on this occaſion, very little regard is to be paid to the terms; for they had an inaccuracy of ſpeaking that leaves us much in the dark, in many other things beſide this. They called the *calaminaris* ſtone, which is an ore of zink, by the name of *Cadmian* earth, in their deſcription of the manner of making braſs.

It has ſeemed abſurd to ſome to call this white metal *aurichalcum album*, becauſe they ſuppoſe the word *auricalchum* to ſignify gold-coloured copper; but this is an error. The *aurichalcum* is but a falſe ſpelling of *orichalcum*. See the article Orichalcum.

MOTACILLA, the *Waterwagtail*, in the Linnæan ſyſtem of zoology, the name of a large genus of birds, of the order of the paſſeres; the diſtinguiſhing characters of which are theſe: The tongue is jagged, and has a rim or margin round it; the beak is ſtrait, and pointed, and the hinder claw is of the ſame length with the reſt, by which alone it is ſufficiently diſtinguiſhed from the lark kind. Of this genus are the wagtail, the red-breaſt, wren, nightingale, &c. *Linnæi* Syſt. Nat. p. 49.

Mr. Ray enumerates three ſpecies of *Waterwagtail*, the white, the yellow, and the grey. The firſt is the moſt common, and well-known kind. The yellow one is of the ſame ſhape and ſize with that, but is beautifully variegated with yellow and green: this builds among the corn. The third or grey one is of the ſame ſize with the others, and is the moſt clamorous and noiſy of them all. It is principally variegated with black and grey, but has ſome yellowneſs, eſpecially about the rump. *Ray*'s Ornithol. p. 171, 172.

MOTETTO, in the Italian muſic, a kind of church-muſic, compoſed with much art and ingenuity from one to eight parts, with or without inſtruments, uſually accompanied with a thorough baſs. When the compoſer gives a looſe to his fancy, without confining himſelf to any rules, ſubjects, or paſſions, it is called *Fantaſia*, or *Ricercata*. See the articles Fantasia, and Ricercata.

The word is ſometimes uſed for pieces made to hymns to ſaints, &c. and whole pſalms are often thus called. Vid. *Broſſ.* Muſ. Dict. in voc.

Field-MOTH. See the article Tinea *Campeſtris*.

MOTHER-*Wort*, *Cardiaca*, in medicine, is only uſed in the ſhops as an ingredient in ſome of the compound waters, intended againſt hyſteric complaints; and the country people frequently make an infuſion of it in the manner of tea, for the ſame purpoſe. It is alſo ſaid to be good in flatulencies, and colics, to give great relief in epileptic caſes, and to deſtroy worms. It promotes urine, and the menſes; but its power this way is greatly inferior to that of penny-royal. See the article Penny-*Royal*.

The name *Cardiaca*, improperly given to this plant, has led many into an opinion of its being a cordial; but experience does not ſhew any ſuch thing. See the artiele Cardiaca.

Mother *of Vitriol*. See the article Vitriol.

MOTION (*Cycl.*)—*Laws of* Motion. Of three laws of *Motion*, which conſiſt in the preſervation of 1°. *The relative velocity* in the colliſion of elaſtic bodies, that is the difference of the velocities of thoſe bodies moving the ſame way, and the ſum when they move in contrary directions. 2°. The quantity of direction; ſee the article Direction. 3°. The ſum of the product of the maſſes by the ſquares of the velocities. Two of theſe laws being granted, the third follows neceſſarily. Thus, let A and B be two bodies, their velocities before the ſhock *a* and *b*, and after the ſhock *x* and *y*. Suppoſe firſt that before and after the ſhock the bodies move the ſame way, the firſt law of conſervation gives $a-b=y-x$; the ſecond $Aa+Bb=Ax+By$: Hence by tranſpoſition $a+x=y+b$ and $Aa-Ax=By-Bb$; and theſe two equations multiplied together give this new one, $Aaa-Axx=Byy-Bbb$, or by tranſpoſition, $Aaa+Bbb=Axx+Byy$. And it is plain, that if *a* or *b*, as well as *x* or *y*, be taken negatively to ſignify that the bodies A and B move in contrary directions before and after the ſhock, this ſuppoſition will not alter the ſigns of the equation $Aaa+Bbb=Axx+Byy$. *Bernoulli* Oper. Tom. 3. p. 57.

The preſervation of the ſame quantity of *motion* in the univerſe, was a principle laid down univerſally by Deſcartes; but has been found falſe, and holds true only in the ſame direction, which is thus expreſſed by Sir Iſaac Newton: "The "quantity

" quantity of *motion*, which is collected by taking the ſum " of the *motions* directed towards the ſame parts, and the " difference of thoſe that are directed to contrary parts, ſuf- " fers no change from the action of bodies among them- " ſelves." *Newt.* Princip. lib. 1.

Some philoſophers, after Deſcartes, have ſuppoſed the preſervation of the ſame force or *vis viva*. See the articles FORCE, and VIS *Viva*.

But this holds only in elaſtic bodies, when there is a ſhock; and hence thoſe philoſophers have been led to maintain, that all bodies were elaſtic, at leaſt in their elements, and that an inflexible body was impoſſible, being repugnant to the law of continuity. See the article CONTINUITY.

MOTION *of the Limbs*. See the article LIMB.

MOTION, in the antient muſic, was uſed to ſignify the tranſition of the voice, from an acute to a grave ſound; or the contrary. This they expreſſed by κατα τοπον κινεισθαι. *Wallis*'s Append. ad Ptolem. Harmonic. p. 153. See the article LOCUS.

Meibomius tranſlates it, *moveri in loco*.

MOTION, in the manege. A horſe is ſaid to have a pretty *Motion*, when he moves and bends his fore-legs with great eaſe and freedom upon the manege. But if a horſe trots right out, and keeps his body ſtraight, and his head high, and bends his fore-legs handſomely, then to ſay he has a pretty *Motion* with him, implies the liberty of action of the forehead.

Muſcular MOTION. Dr. Browne Langriſh endeavours to prove that the blood has no immediate effect in *muſcular Motion*, by experiments of tying the crural and carotid arteries of dogs, who did not thereby loſe the action of any muſcles. He grants however, that when all the blood is intercepted, *muſcular Motion* ceaſes in a few minutes. The chief uſe of the blood towards *muſcular Motion*, is to keep the fibres warm, ſupple, diſtended, and ready for the influx of animal ſpirits into them, and by its *Motion* to aſſiſt theirs.

The muſcular fibres are little hollow cylinders, not divided into cells; the animal ſpirits are near a-kin, or analogous to ſpirit of ſal ammoniac, &c. and therefore, whenever they fly from the nerves into the muſcular fibres, they will increaſe the attractive quality of their component particles towards each other, ſo as to make them run nearer together, which will occaſion the coats of the fibres to be both thicker and ſhorter, and the muſcle will be contracted in all its dimenſions. The animal ſpirits are too ſubtile to be fixed, and therefore immediately make their eſcape through the fibres, and leave them in the ſame ſtate they found them in, as ſoon as the ſupply by the nerves is diſcontinued. There is a difference in the mechaniſm of the nerves ſent to the muſcles, which act by the influence of the mind, from thoſe of the muſcles which are ſaid to perform involuntary motions, the latter having no hindrance to the courſe of the animal ſpirits, unleſs ſometimes the parts through which they paſs have influence on them; whereas the nerves, which ſerve the muſcles of voluntary motion, have ſome little conſtrictions at their extremities, or elſewhere, which hinders the courſe of their fluids, except when their reſiſtance is overcome by the momentum of the ſpirits being increaſed by the will. The uſe of the ganglions is to prevent any communication of *motion* from one nerve to another, whereby in a ſtate of health, ſenſation is always performed diſtinctly. Eſſ. on Muſc. Motion.

Dr. Stuart having cut off the head of a frog, obſerved, that upon thruſting a probe into the *medulla ſpinalis*, the muſcles of the body were brought into convulſive contractions. And that the ſame happened to the muſcles of the head, when the probe was thruſt into the brain. From which he concludes, that the brain and nerves contribute to *muſcular Motion* in a high degree. Next he laid bare the crural artery, vein, and nerve of a dog, and placing a thread parallel to them, made two ligatures on them, at four inches diſtance from each other; then cutting the veſſels through, beyond the ligatures, he took them out, and obſerved, that the nerve did not contract, though the blood-veſſels loſt three eighth parts of their length. From whence he infers, that what the nerves contribute in *muſcular Motion*, cannot ariſe from, or be owing to elaſticity, but to the fluid they contain, which can be no other than a pure elementary water. Phil. Tranſ. N°. 424. §. 5.

Rythmical MOTIONS, a phraſe uſed by Voſſius, and other writers on the antient rythm, to expreſs thoſe *motions* which were made uſe of in the Greek and Roman entertainments to convey the ideas of the poet, or to aſſiſt muſic in rouzing the paſſions. Theſe not only had great force when joined with ſounds, but even without any voice or ſound they could move the paſſions in the ſpectators, more than many of the beſt orators of the times could do with their moſt laboured diſcourſes.

Roſcius, the ſtage-player ſo famous in their pantomimes which were all dumb ſhew, was ſo excellent at expreſſion by theſe *rythmical Motions*, or geſtures, that Cicero and he being cotemporaries there were many diſputes between them, which could vary the ſame ſentence moſt; the one uſing all the power of words, the other being confined to geſtures alone.

MOTION, *Moto*, or *Movimento*, in the Italian muſic, has many ſignifications; ſometimes it means only a *Motion* or paſſage from one note to another, at whatſoever diſtance, as a ſecond, third, or any other interval; and is the ſame whether the intermediate degrees (if there are any) be ſounded or only the extremes of them, as the firſt and laſt ſound of any given interval. Sometimes it regards the quickneſs and ſlowneſs of ſuch *motions*, as a briſk, ſlow, lively, or languid *motion*; and in this ſenſe it is uſed with regard to minuets, gavots, ſarabands, &c. See each article in its proper place, and MOTION, *Cycl.*

But the moſt common, and indeed the moſt important acceptation of the word, is with reſpect to harmony; thoſe above deſcribed only regarding melody. See the articles MELODY, and HARMONY, *Cycl.*

With regard to harmony, it is the comparing the manner wherein an upper or treble part moves from one ſound to another, with that wherein a lower or baſs-part moves; this is to be done three ways. The firſt is when the upper and lower parts move both the ſame way, either upwards or downwards, and is called *Moto retto*. The ſecond is when in comparing the upper with the lower part, the one aſcends while the other deſcends, or *è contra*, and hence called *Moto contrario*. The laſt is when one of the parts holds out, or continues a ſound, while the other riſes or falls on any note whatſoever; and this is called *Moto obliquo*. Vid. *Braſſ.* Muſ. Dict. in voc.

MOTIVE is ſometimes applied to that faculty of the human mind, by which we purſue good and avoid evil. Thus Hobbes diſtinguiſhes the faculties of the mind into two ſorts, the *cognitive*, and *motive*. Human Nat. p. 4. edit. 1651. See the article COGNITIVE.

MOTOS, (*Cycl.*) in the materia medica of the antients, a name given by Galen and others to a kind of Caſſia bark, the beſt and fineſt that has been uſed at any time. The antients were very fond of this drug, and ranged it according to its different goodneſs into ſeveral ſorts.

MOUCHEROLLE, in zoology, the name of a ſmall bird of the ſize of the ſparrow, and of the ſame colour, but longer bodied; its wings are of a duſkier colour than the reſt of its body; and its head is variegated with very ſmall blackiſh ſpots. Its throat and belly are white, but the throat and the ſides of the breaſt and belly have a faint reddiſhneſs; the beak is black, ſtrait and ridged, ſo as to appear triangular. It feeds on flies and other inſects, and is common in gardens and orchards in many parts of England, though it has no Engliſh name. It is confounded by the common people with the common white throat, but differs from it in that its tail is all of one colour, whereas the white-throat's is variegated. It ſomewhat reſembles alſo the *beccifago*, or petty-chaps, but differs from it in having no greeniſh colour, and in its bill being ridged and triangular. *Ray*'s Ornithol. p. 159. See the article BECCIFAGO.

MOVING *Force*. See the articles FORCE, and VIS *Viva*.

MOULD (*Cycl.*)—MOULDS, in natural hiſtory, are defined to be foſſile bodies compoſed of diſſimilar particles of a looſe ſoft texture, ſomewhat ductile while moiſt, compoſed of argilaceous particles ſeparated by ſand or the gritt of ſtone, and uſually found mixed with the putrified remains of vegetable and animal ſubſtances.

Of this claſs of bodies there are two genera: 1. The thruptomichthes or *Moulds* of a lax friable texture. And, 2. The gloromichthes, which are of a more tough and viſcid texture. *Hill*'s Hiſt. of Foſſ. For the ſeveral ſpecies of vegetable *Moulds*, ſee the articles THRUPTOMICHTHES, and GLOROMICHTHES.

The goodneſs of *Mould*, for the gardeners purpoſes, is known by the ſight, ſmell, and touch.

Thoſe *Moulds* are accounted beſt which are of a bright brown or hazily colour. This is always the colour of the beſt loams, and other natural earths; and this is judged the better, if the earth cut tolerably eaſily, and does not ſtick and cling to the ſpade, but is light, friable, and falls in ſmall clods; and is ſuch as naturally neither chaps and cracks in dry weather, nor turns to mortar in wet. Next to theſe the dark grey and ruſſet *Moulds* are accounted beſt; and the worſt of all are the light and dark aſh-colour; theſe are uſually found on heaths and commons. The clear tawny *Mould* is neither by any means to be preferred; but that of a yellowiſh red is accounted the worſt of all; this is commonly found in wild and waſte places, and ſeldom produces any thing naturally but furz and fern. *Miller*'s Gardeners Dict.

All that lands give us to judge of them by from the ſmell, is, that the beſt after rain, and after digging up, emit a good and pleaſing ſcent: But by the touch they may be judged of with conſiderable accuracy; for by this may be known whether they are too ſandy or too clayey; and whether they be tender, fatty, deterſive, and ſlippery; or more harſh, gritty, porous and friable. What we are to judge beſt by the touch, is the middle nature between the extremes on either ſide, ſuch as will eaſily diſſolve and break, and being made of a juſt proportion of ſand and clay, will not ſtick to the ſpade or fingers after every light ſhower of rain.

To analize *Mould* by means of water, waſh it thoroughly in warm water in large quantities, and filtrate the liquor. Evaporate this to a conſiderable degree of concentration, and it is manifeſtly of a ſaline taſte, but making no alteration in ſyrup of violets; therefore the ſalt it contains is neither acid nor alkaline, but neutral. This analyſis purſued farther, the parti-

cles

cles may be diſunited and kept ſeparate, and will be found to be a large proportion of ſand, a quantity of a light mud, capable of remaining a long time ſuſpended in water, a heavier mud ſinking immediately in water. By an analyſis of any particular *Mould* by this means, we may find its true conſtituent particles, and be able to mix up and compound a ſimilar one for the growth of any peculiar plant it produces: But plants have the aſſiſtance of heat as well as moiſture, in the draining their juices from the earth; therefore it may not be improper to try the effect of fire on the ſame ſubject. The common garden *Mould* diſtilled in a retort in a naked fire, managed in its various degrees, affords a water, and oil and ſpirit like thoſe yielded by animal ſubjects, and poſſibly ariſing from ſome extraneous particles mixed with the earth, and a dry *caput mortuum*, or indolent earth remains in the retort.

The particles of animal, vegetable, and mineral ſubſtances, floating in the atmoſphere, and thence precipitated on the earth, may give ſome of the properties to garden *Mould*, and thoſe different in different places; as is evident about London, where the *mould* is ſo impregnated with ſmoak, precipitated on it from the atmoſphere, that it differs much from that of open countries. *Shaw*'s Lectures, p. 64.

MOULDS *of Coins*, a ſort of concave *Moulds* made of clay, having within them the figures and inſcriptions of antient Roman coins found in many parts of England, and ſuppoſed to have been uſed for the caſting of money.

Mr. Baker having been favoured with a ſight of ſome of theſe *Moulds* found in Shropſhire, bearing the ſame types and inſcriptions with ſome of the Roman coins, gave an account of them to the Royal Society.

They were found in digging of ſand, at a place called Ryton in Shropſhire, about a mile from the great Watling-ſtreet road. They are all of the ſize of the Roman denarius, and of little more than the thickneſs of our halfpenny. They are made of a ſmooth pot or brick clay, which ſeems to have been firſt well cleanſed from dirt and ſand, and well beat or kneaded, to render it fit for taking a fair impreſſion. There were a great many of them found together, and there are of them not unfrequently found in Yorkſhire; but they do not ſeem to have been met with in any other kingdom, except that ſome have been ſaid to be once found at Lyons. They have been ſometimes found in great numbers joined together ſide by ſide, on one flat piece of clay, as if intended for the caſting a great number of coins at once; and both theſe, and all the others that have been found, ſeem to have been of the emperor Severus. They are ſometimes found impreſſed on both ſides, and ſome have the head of Severus on one ſide, and ſome well known reverſe of his on the other. They ſeem plainly to have been intended for the coinage of money, though it is not eaſy to ſay in what manner they can have been employed to that purpoſe, eſpecially thoſe which have impreſſions on both ſides, unleſs it may be ſuppoſed that they coined two pieces at the ſame time by the help of three *Moulds*, of which this was to be the middle one.

If by diſpoſing theſe into ſome ſort of iron frame or caſe, as our letter-founders do the braſs *Moulds* for caſting their types, the melted metal could be eaſily poured into them, it would certainly be a very eaſy method of coining; as ſuch *Moulds* require little time or expence to make, and therefore might be ſupplied with new ones as often as they happen to break.

Theſe *Moulds* ſeem to have been burnt or baked ſufficiently to make them hard; but not ſo as to render them porous like our bricks, whereby they would have loſt their ſmooth and even ſurface, which in theſe is plainly ſo cloſe, that whatever metal ſhould be formed in them would have no appearance like the ſand holes by which counterfeit coins and medals are uſually detected.

MOULD-*Warp*, a name given by the people in many parts of England to the mole. See the article TALPA.

MOULDER, in brick-making. See the article BRICK-*Making*.

MOUNT (*Cycl.*)—MOUNT-*Egg*. In the tin-works, after that tin from the burnt ore is melted down, and re-melted, there will ſometimes remain a different ſlug in the bottom of the float; this they call *Mount-egg*; and though of a tin colour, yet is of an iron nature, as hath been found by applying a magnet to it.

MOUNTAIN (*Cycl.*)—The origin of *Mountains* ſeems to have been from exploſions by means of ſubterranean fires; and it is very probable that they have all vaſt hollows beneath them; that this might have been the means uſed at the creation, to make the dry land appear, is no way diſſonant to reaſon, ſince hiſtory proves, that fires have raged in ſubterranean caverns under the ſeas, and there is no natural impoſſibility in fire's ſubſiſting in ſuch caverns, even when the earth was all over covered with water, as at the firſt creation.

Mountains appear, to many, defects and blemiſhes in the earth; but they are truly of the utmoſt uſe and neceſſity to the well-being both of man and other animals. Many creatures cannot live but in particular ſituations, and even the tops of the higheſt and the coldeſt *Mountains* are the only places where ſome creatures as well birds as quadrupeds, will live; of this kind are the ibex and chamois among beaſts, and the lagopus among birds.

The *Mountains* alone are able to furniſh man with the ſeveral metals of ſo many uſes in life; for if theſe were produced in level ground, it ſeems very evident that no art could ever keep the mines dry, by which we ſhould get at them; nor could we have ſprings and fountains, but for the advantage of the height of hills. This ſeems indeed to be the great deſign of *mountains*, that their ridges being placed through the midſt of continents, might ſerve to diſtil freſh water for the uſe of man and beaſt; and their heights to give a deſcent to thoſe ſtreams to run gently down, and be of more benefit to the creation. Thus the more we conſider nature, the more we muſt admire its works; and what ſeems defect or blemiſh in them, on a ſlight view, often proves, on more juſt obſervation, a great benefit and beauty. *Ray*'s Phyſico-Theological Diſcourſe, c. 3.

The difficulty of breathing at the tops of high *Mountains* is a thing ſo plainly felt, that none who has ever been in the way of making the experiment, but is well convinced of the certainty of the fact. Acoſta deſcribes what he felt on the tops of the high *Mountains* of Pariacaca very judiciouſly.

The *Mountains* of Armenia, and particularly that on which Noah's ark is ſuppoſed to have reſted, have been alſo made famous by the like accounts; though the ſnows that lie on the tops of theſe *Mountains* make it impracticable to aſcend their tops; the people who climb as high as they can, always find that they breathe with more difficulty, and are compelled to fetch their breath oftener than when on the plains; and on travellers complaining of this, their guides always tell them, that it is a known thing, and is what every body ſuffers there.

The *Mountains* in Languedoc and the Pyreneans have the ſame effect. People of curioſity have ſometimes remained hours on the ſummit of theſe mountains, and always found the ſame ſort of difficulty in breathing; but it is poſſible that this may be owing to the exhalations of certain ſteams from the earth in theſe places, leſs loaded with a weight of air than below; and this appears the more probable, as in going up the mountain Teneriffe, if many people are in company, and aſcend different ways, ſome uſually bear it better than others; and the very complexions of ſome are turned yellow by the exhalations which are very plainly perceived by their ſmell and ſharpneſs, while others who aſcend to the ſame height by different tracts, eſcape.

The moſt remarkable *Mountain* in the world in ſhape, is that called the *needle Mountain*, or the *inacceſſible Mountain*, in Dauphiny.

This is a vaſt hill, placed as it were bottom upwards, or ſet on its ſummit on the earth with its broad baſe elevated in the air; it is but about a thouſand paces in circumference at the bottom, and is above two thouſand at the top. On the center of the plain at the top there ſtands another ſmall and very narrow, but very high hill.

It obtained the name of the *needle* as it got the other, by its being ſuppoſed impracticable to the aſcent of any one, by reaſon of its projecting ſo greatly outwards. Some hardy perſons however once ventured to climb it, and found at the top a number of the chamois, animals by no means qualified for climbing, and which doubtleſs had never either aſcended or deſcended the *Mountain*, and which muſt be ſuppoſed to have bred there for many ages, though it be very difficult to account for their firſt getting to the place. Hiſt. Acad. Par. 1700.

Chains of MOUNTAINS, a term uſed by geographers to expreſs thoſe continuations of *Mountains* which run in ſtrait ridges along whole countries, and appear diſpoſed in uninterrupted orders wherever they are found. Kircher labours to prove, that theſe chains are annular, and reach abſolutely round the globe of the earth, encompaſſing it from north to ſouth, and thence to the north again; and in the ſame manner from eaſt to weſt, and from thence to the eaſt again; their courſe only diſappearing, by the wiſe providence of nature, in the bottoms of the ſea, that the immenſe body of waters treaſured there might have its motion free and unimpeded in its channel, but appearing again in the ſame line in every the ſmalleſt iſland that ſhews itſelf in the way of their ſtrait courſe, from the country where the laſt link of the chain was ſeen, to that where their firſt link appears again. He ſays that theſe vaſt hills of earth and ſtone, ſerve not only to ſtrengthen and ſupport the fabric of this vaſt globe of earth, but they have another very great uſe, not only to man, but to all animals, and even vegetables; which is, that they are the ſtorehouſes where the grand reſervoirs of freſh water, ſo neceſſary to all life, are treaſured up, and from whence it is eaſily poured down upon the lower parts of the globe. In Europe, the great reſervoirs of water, that ſupply whole countries of immenſe extent, are placed in that vaſt chain of *Mountains* called the Alps, from which, as from an inexhauſtible ſtore, the vaſt tracts of fruitful land that lie below them are ſufficiently watered.

The *Mountains* which compoſe this part of the great annular chain running north and ſouth round the globe, are called by three different names; the *Cottiæ*, the *Rhætian hills* with the *Vogeſus*, and the *Appennines*; from theſe are poured out the immenſe rivers which water this fruitful part of the world, the Danube, the Rhine, the Rhone, the Moſelle, and an

almoſt

almoſt infinite number of others, every one of which, after it has ſupplied the inhabitants of a whole tract of vaſt extent, diſcharges ſo much water hourly into the ſea,, that the mind is aſtoniſhed at the account, and would wonder whence only one of them could be ſupplied. Theſe rivers, and a multitude of other ſmaller ones, and beſide theſe a great number of lakes of vaſt extent are all ſupplied by the hydrophylacia or reſervoirs of water treaſured up in the boſoms of theſe hills, and could not have performed their office of watering theſe extenſive countries, had thoſe reſervoirs been placed any where except in ſuch a lofty ſituation in theſe *Mountains*. *Kircher*'s Mund. Subter.

The Alps, though they all ſupply more or leſs of this profuſion of water, yet they are not all equally hollowed for the reception of it, and conſequently do not all contain ſupplies for an equal tract of land; this is provided for by nature by a vaſt number of other ſmaller *Mountains*, which in ſeveral parts of the countries through which this chain paſſes, run from its ſides like leſſer knots, and extend over ſome ſmaller or greater part of the country.

Theſe are a ſort of auxiliary ſupplies, and ſerve for many countries in the place of the original heads; but the rivers propagated from theſe, though ſufficient for the occaſions of the inhabitants of the lower country, yet do not diſcharge thoſe vaſt quantities of waſte water into the ſea that thoſe which derive their origin from the greater *Mountains* do. The Noric *Mountains* in Germany, the Vogeſus, many mountains in Dauphiny, and thoſe in Italy, which run from the ſides of that long chain, which reaches like a ſpine all along that country, are all of this kind, and all leave this benefit to the lower countries. The Pyrenean and Carpathian *Mountains* alſo yield a vaſt number of rivers from their ſides; and the rivers of Spain, of Poland, and of Hungary, all have evidently the ſame origin from theſe high-ſeated reſervoirs, in the chains of *Mountains* which paſs through them. The countries where extended plains are found for vaſt tracts uninterrupted by any of the links or knots of theſe vaſt chains of *Mountains*, are the only places where thirſt and drought are the deſtruction both of animals and plants; and, in general, that country which has moſt and higheſt *Mountains*, is the moſt plentifully, moſt regularly, and moſt conſtantly watered by ſmaller as well as larger ſtreams.

The diſpoſition of *Mountains* on the ſurface of the globe ſeems more regular than is generally ſuppoſed by thoſe who ſee but a few of them in particular countries at a time; they are diſpoſed in reality in ranges or chains, reaching to vaſt extents, and in ſome from pole to pole from north to ſouth.

One grand chain of *Mountains* reaches from Iceland through Scotland, England, and Germany, with a ſtrait courſe to the Alps, which are as it were a vaſt knot in this chain, more cloſely diſpoſed, and more eminent than the others.

Theſe are ſucceeded in the ſame ſeries by the Appennines, which run through the whole kingdom of Italy in the manner of the ſpine of the back in animals, and are continued on in the ſame ſeries by thoſe of Sicily; and from theſe the ſame chain is carried on to Africa, and continues in what are called the *Mountains of the Moon*. From hence another vaſt knot or link of this extenſive chain is carried on to the utmoſt part of Africa, and terminates, as to our view, at the Cape of Good Hope; and there is no reaſon to doubt but that the chain is continued in the oppoſite land, and ſo on to the utmoſt limits of the ſouthern pole. From hence the ſame ſeries makes its way again, and beginning anew as it were from the ſouth pole, is carried on through the little known ſouthern regions to the Magellanic Streights. Here the famous Andes *Mountains* of South America take it up, and along this vaſt tract it is carried through this part of the new world into North America, and thence to the northern pole again, terminating where it began, or joining the other part of the chain where we took up the beginning of our account; ſo that the whole ſeries making a vaſt belt or circle round the globe, has no beginning nor end, but in our imagination, or in our ignorance of the parts of the world through which it is carried in the ſame regularity as in thoſe countries whither commerce has led us, and where maps have ſheen them.

Another vaſt chain of *Mountains* running with the ſame regularity, and in the ſame manner forming a belt round the whole globe of the earth, cuts this at right angles, and is continued in its courſe. This goes through Tartary from a beginning far beyond our reſearches up behind that vaſt country, and continuing itſelf through the middle of Scythia, forms a ſeries that appears in the Eaſt Indies, running along the middle of that vaſt region to Cape Comorin; here the chain dips into the ſea; but if its courſe is exactly marked, it will be found to be continued in the ſame rout through the iſland of Ceylon; hence it is carried under water to its oppoſite point on the limits of the earth, and hence through ſeas and lands not yet known to us, is carried on to the place in the back of Tartary, and from which we have begun the account. We have but very ſmall proofs indeed of its continuation through a vaſt tract of this its courſe; but we are to accuſe for this defect not nature in her diſpoſal, but our own ignorance, whatever little we do know plainly pointing out, that the chain is continued in the ſame regular manner as the other, and placed exactly at right angles with it.

As the continual flux and reflux of that vaſt body of ſeas from the eaſt weſtward, might by its force do ſome miſchief to the compages of the earth, provident nature has contrived for the ſtrengthening the great frame of this globe, certain tranſverſe chains or belts of mountains, which are ſo diſpoſed as to ſtrengthen and keep together the whole machine in the moſt ſtrong and laſting manner. One ſeries of theſe runs directly from the eaſt weſtward from the utmoſt limits of the Chineſe empire, through that whole vaſt country, and where theſe are ſtopped by the boundaries of that country, they are continued through the weſt of Scythia, India, and the Caſpian Sea, America, Aſia Minor, Macedonia, and to the Rhætian *Mountains*, which carry on the chain to the *Mountains* of Narbon, Gaul, and theſe to the Pyreneans; and theſe are carried on weſtward in the ſame direct chain, ſo far as we are able to trace them, and apparently run on toward the point from which the account began, ſo as to form as regular a circle as the others, were every link of it expoſed to our ſight, by our knowledge of the regions through which it paſſes, and many of which are yet left to future diſcoveries.

The haſty judgers of this ſyſtem may ſuppoſe, that it wants due weight, becauſe the chains of *Mountains* here deſcribed do not appear to be regularly carried on through the bottom of the ſea from the laſt link on one land to the firſt on the oppoſite land to it; but the whole chain ſeems broken abruptly at either promontory, and only to be renewed, not continued, at the other; but it is very probable, that though not ſo evident to our eyes, theſe chains of *Mountains* are continued under the bottoms of the deepeſt ſeas in the ſame regular manner as on the openeſt land, though their heads do not appear above the ſurface of the water, but are only ſeen at thoſe places where the ſcattered iſlands happen in their courſe, till they arrive at the main land again. This diſpoſition is not to be ſuppoſed owing to chance or irregularity, but appears contrived by the wiſdom of the great Creator.

The vaſt body of ſeas that ſurrounds the globe with its neceſſary and perpetual flux, required a clear and free bed to roll its immenſe congeries of waters in; and the tops of the *Mountains* appear to have been diſcontinued in the courſe of this fluid, that it might have a free channel, and no ſtops or hindrances in its courſe, to ſpread its waters over the whole earth.

Cock of the MOUNTAIN, *Urogallus*, in zoology. See the article UROGALLUS.

MOURNING, (*Cycl.*) among the antients, was expreſſed various ways, as by tearing their clothes, by wearing ſackcloth, laying aſide crowns, and every other mark of joy. Plutarch, in his life of Cato, relates, that from the time of his leaving the city with Pompey, he neither ſhaved his head, nor, as uſual, wore the crown or garland. Sometimes public grief was teſtified by a general faſt. *Hofm.* Lex. in voc. *Moeſtitia*. See the article FASTING.

Among the Romans a year of *Mourning* was ordained by law for women who had loſt their huſbands.

In public *Mournings* at Rome the ſhops were ſhut up, the women laid aſide all their ornaments, the ſenators their laticlavian robes, and the conſuls ſat in a lower ſeat than uſual. See *Pitiſc.* in voc.

The antients had a remarkable way of *Mourning* for ſoldiers, ſlain in battle. The whole army attended the funeral ſolemnities with their arms turned upſide down, it being cuſtomary for *Mourners*, in moſt of their actions, to behave themſelves in a manner contrary to what was uſual at other times. In thoſe places where it was the faſhion to wear long hair, *Mourners* were ſhaved; and where others ſhaved, *Mourners* wore long hair. Their conjecture therefore is frivolous, who imagine that the ſoldiers turned the heads of their ſhields downwards, leſt the gods, whoſe images were engraven upon them, ſhould be polluted with the ſight of a corpſe; ſince not the gods only, but any other figures, were frequently repreſented on ſhields; nor did the few only near the corpſe, but the whole company held their ſhields in the ſame poſition: Not to mention that other arms were alſo pointed downwards. *Potter*, Archæol. Græc. T. 2. p. 103.

The *Mournings* of the Eaſtern nations of Indians are much more cloſely followed, though of much ſhorter duration than ours. After the death of a near relation they *mourn* fifteen days, during which time they eat nothing but rice and water. They are not to chew betle, or to uſe the common waſhings in this time; but they are to do acts of charity, ſuch as diſtributing food to the poor; and prayers are ſaid, intreating the Almighty to forgive the ſins of the dead perſon, and to aſſign him a good place in the other world. On the ſixteenth day, that is the day after the finiſhing of the time of *Mourning*, they make a ſolemn feaſt according to their abilities, and invite to it all their friends and neighbours. After this they annually, on this day, give food to the poor, and renew their prayers for the happineſs of the dead perſon. Phil. Tranſ. N°. 243.

Sable-MOUSE. See the article SABLE.

MOUSE-*Ear*, in botany. See the article MYOSOTIS.

MOUSE-*Deer*. See the article MOOSE-*Deer*.

MOUTH (*Cycl.*)—Whether the *Mouth* of a fœtus be neceſ-

ſary

ſary for its nutrition, has been controverted. The learned Mr. Monro is of opinion it is not: See his reaſons, and his anſwers to what has been advanced by many learned men in favour of the contrary opinion, in the Med. Eſſ. Edinb. Vol. 2. Art. 9. or the Abridgment, Vol. 1. p. 305.

Mr. Monro obſerves farther, that the opening of the *Mouth* does not only depend on the motion of the lower jaw downwards, but alſo on the ſuperior jaw being raiſed up by the muſcles, which extend the head back. He ſays any one may convince himſelf of the truth of this, by putting the blade of a knife oppoſite to the conjoined edges of the teeth, when the *Mouth* is ſhut; and the knife being held unmoved while the *Mouth* is opened, he may, by the help of a mirror, ſee the upper teeth raiſed remarkably at every aperture he performs. Medic. Eſſ. Edinb. vol. 1. art. 11.

In the fiſh kinds the *Mouth* is very different in the ſeveral genera and ſpecies in its ſituation, figure, and proportion, and is by the beſt naturaliſts made a mark of diſtinction among them. In regard to place or ſituation, it is, 1. in ſome placed in the front or tip of the head; and in this caſe both the jaws are ſometimes of the ſame length; ſometimes the one is conſiderably longer than the other. Examples of this ſituation occur in moſt fiſhes. 2. In ſome the *Mouth* is placed in the lower or under part of the head under the ſnout. Examples of this we have in the ray-fiſhes, the ſquatina, the petromyza, *&c.* 3. In ſome fiſhes it is placed tranſverſely to the body, that is, the opening of the *Mouth* cuts the ſite of the back and belly at right angles: But 4. In others it is oblique. The generality of fiſhes give us inſtances of the firſt ſituation; and the pleuronecti in general give us examples of the laſt.

As to figure, there are alſo very many differences. When the *Mouth* is opened, it is in ſome, 1. of an oblong, round, or roundiſh ſquare ſhape; this we ſee inſtances of in the cyprini, *&c.* 2. In others it is oblong and wide; of this we ſee inſtances in moſt fiſh. 3. It is ſpherical, as in the petromyzæ. Theſe are the general diſtinctions; but beſide theſe there are many leſſer diſtinctions, which are only degrees of theſe.

The proportion of the *Mouth* to the head is alſo very various; 1. In ſome it is much ſmaller than the breadth of the head; of this we ſee examples in the cyprini, cobites, pleuronecti, and many others. 2. In ſome it is equal to the width of the head, or very nearly ſo, as in the cotti, ſiluri, *&c.* *Artedi*, Ichthyol.

MOUTON *d'Or*, an old French coin. See the article AGNEL.

MOXA (*Cycl.*)—The antient phyſicians uſed flax, as the people of the eaſtern nations now do their *Moxa* for cauterizing in certain parts of the body. The method of uſing the *Moxa* is this: A ſmall cone of the down or *Moxa* is to be made up of about a thumb's breadth long, much after the manner they are for a ſuffitus. The baſis of this cone is to be ſtuck upon the part with a mucilage of gum arabic, and its top is then to be ſet on fire by a candle or burning coal. By this means the whole cone will be gradually conſumed, and the part by degrees cauterized. This is uſed in caſes of the gout; and if the pain does not ceaſe on the firſt operation, it is to be repeated till it does. *Heiſter*'s Surgery, p. 319.

MOYNAU, in fortification. See the article MOINEAU.

MUCILAGINOUS *Glands* (*Cycl.*)—The rough unequal depreſſion at the bottom of the cotyloide cavity of the oſſa innominata is filled by a broad flat *mucilaginous* gland, bordered with a fatty ſubſtance, and covered with a fine membrane. The *mucilaginous* glands of the bones of the leg lie in ſmall ſpaces, depreſſions, and ſuperficial notches, near the edges of the cartilages of each joint, and are all covered by the capſular ligaments. In the bones of the foot theſe glands anſwer in number and figure to the depreſſions between the *cartilaginous* edges and ligaments.

In the articulations of the ſternum, vertebræ, and ribs, the *mucilaginous* glands are very ſmall; but they are accompanied by many fatty moleculæ lying round each joint. The inner ſurface of the ligamentary tube which lines the bony canal of the ſpine, is lubricated alſo by an oily or adipoſe ſubſtance. And the true *mucilaginous* glands of the occipital and maxillary articulations in the bones of the head, are all proportioned to the joints to which they belong, and lie between the capſular ligaments and the circumferences of the cartilages. *Winſlow*'s Anatomy, p. 125, ſeq.

MUCILAGO, in botany, a name under which Micheli has comprized ſome ſpecies of that kind of fungus called *mucor*, conſiſting of ſmall bladders, or veſicles with ſeeds affixed to filaments on the inner part. See the article MUCOR.

MUCOCARNEOUS, an epithet uſed by authors for a ſort of abſceſſes, which are partly made up of fleſh and partly of a thick mucous matter.

MUCOR, in botany, a name given by Micheli, and continued by Linnæus, to a genus of muſhrooms, often comprized by authors among the moſſes, and called by the ſame Micheli under the ſmall varieties of ſome of the ſpecies, *mucilago* and *lycogala*. Their characters are theſe: They are funguſes conſiſting of roundiſh little bladders, in which are found numerous ſeeds affixed to hair-like receptacles, placed all over the inſide of the bladders.

MUCOSA, in ichthyology, a name given by the Italians to a ſpecies of the ray-fiſh, called by the old authors, *leioraia*, and *bos marinus*; and by the lather authors, *raja oxyrynchus* and *læviraia*. It is diſtinguiſhed by Artedi by the name of the variegated ray, with ten prickly tubercles on the middle of the back. See the article RAJA.

MUCOUS (*Cycl.*)—MUCOUS *Fevers*, a term uſed by medical writers to expreſs thoſe fevers in which nature is endeavouring to rid herſelf of an abundance of pituitous, mucous, and ſerous matter. The catarrhal fevers of all ſorts are expreſſed under this denomination. *Junker*'s Conſp. Med. p. 252. See the article FEVER.

MUCRONATED, whatever ends or terminates in a point, like that of a ſword, *&c.*

MUCU, in zoology, the name of a Braſilian fiſh of the lamprey kind. It is long and ſlender; its head is pointed; its eyes black and ſmall; and its mouth very ſmall; and it has no fins. It is brown all over, only of a duſkier colour on the back than on the belly, and has a number of obliquely tranſverſe lines on the ſides, which are black. It is an eatable fiſh, and is caught in lakes in Braſil. *Marggrave*, Hiſt. Braſ. p. 96.

MUCUS (*Cycl.*)—MUCUS *of Fiſhes*. The bodies of moſt of the fiſhes called *alepidotes* by authors, from their having either no ſcales at all, or only a few ſmall ones, are covered in the place of ſcales with this *Mucus*. It is a tough and thick viſcous liquor, and ſticks firmly to the body, defending the ſkin from injuries from ſtones, and the like. It is ſecreted from certain glands placed about the head, and on moſt parts of the body, but particularly in the linea lateralis. *Artedi* Ichthyology.

MUDD, in ichthyology, a name given by the Swedes to the fiſh called by Schonefeldt and others, *aphua* or *aphya*.

It is a ſpecies of the cyprinus, according to Artedi, and is diſtinguiſhed by that author by the name of the *red-eyed two-inch cyprinus*, with nine bones in the pinna ani. See the article CYPRINUS.

MUERDEM, among the Turks, an officer belonging to their moſques, who with his voice calls the people to prayers; thereby ſupplying the want of bells, which the Mahometans will not uſe. *Hofm.* Lex. in voc. See the articles BELL, and MOSQUE, *Cycl.*

MUFFLE, in metallurgy, is an arched cover, reſiſting the ſtrongeſt fire, and made to be placed over coppels and teſts in the operations of aſſaying, to preſerve them from the falling of coals or aſhes into them; though at the ſame time of ſuch a form, as not to hinder the action of the air and fire on the metal, nor prevent the inſpection of the aſſayer.

The *Muffles* may be made of any form, ſo they have theſe conditions; but thoſe uſed with coppels are commonly made ſemi-cylindrical, or when greater veſſels are employed, in form of a hollow hemiſphere.

The *Muffle* muſt have apertures, that the aſſayer may look in, and the fore part of it muſt be always quite open, that the air may act better in conjuction with the fire, and be inceſſantly renewed; for without this, ſcarce any fumes are to be produced, and without theſe, the vitrification of lead is ſcarce practicable; for when the air is once filled with a certain quantity of vapours, it ſcarce admits any more afterwards; and for this reaſon a conſtant ſucceſſion of freſh air is neceſſary.

The apertures in the *Muffle* ſerve alſo for the regimen of the fire; for the cold air ruſhing into the larger opening before, cools the bodies in the veſſel; but if ſome coals are put in it, and its aperture before be then ſhut with a door fitted to it, the fire will be increaſed to the higheſt degree, much more quickly than it can be by the breathing-holes of the furnace. Another uſe of theſe apertures is alſo, that the arſenical vapours of lead and antimony paſſing through the holes in the back part of the *Muffle*, may not be offenſive to the aſſayer, who ſtands before it.

As to the height, length, and depth of the *Muffles*, theſe muſt be proportioned to the ſize and number of the veſſels they are intended to cover; and care muſt be taken in this, that all parts of the inner ſurface of thoſe veſſels muſt be in the reach of the aſſayer's eye. The moſt frequent ſize of the *Muffle* however is four inches high, ſix or eight inches long, and four or ſix inches broad. The ſegments cut off at the baſes, for the leſſer holes muſt be of ſuch a proportioned height, that the leaſt veſſels put under it, may not be in the way of coals or aſhes falling into them, for that always hinders the vitrification of lead, and the deſtruction of the other metals and ſemi-metals, and will ſometimes entirely reduce them again when already deſtroyed; and the ſcoriæ, ſoftened by aſhes, ſoften and retard the operation.

Wooden moulds of a proper ſhape, are moſt convenient for the making theſe *Muffles* in, and the matter for making them of is the ſame with that of the German clay teſts; that is, either a pure native clay, of a condition to bear the fire, which will be known upon the trial; or ſuch clay, hardened by a mixture of the powder of ſtones: And in order to the forming of theſe, the maſs muſt be made tolerably ſoft and pliant. Knead a ſufficient quantity of this maſs with your hands upon a flat ſtone; ſpread it out evenly into a thin cake or plate, ſomewhat longer and broader than you intend the *Muffle* to be made; and ſo thick, that two or more thin plates or lamina, of about two lines thick each, may be cut off from it. This is eaſily done by rolling the maſs on the ſtone with

a rolling-pin, ſtrewed over lightly with aſhes, or powder of chalk.

When the cake is thus rolled out, with a thin, fine, and perfectly ſtrait braſs wire cut off from the cake one thin plate; this muſt be done with great caution, leſt it ſhould break; take this up, and rubbing it over with oil or fat, lay it over the mould; then cut out a ſemicircular piece from the maſs, of the ſame thickneſs with the former, and with this cover the back plane, or farther end of the mould, joining the edges of this plate to thoſe of the former, cloſely and perfectly, by wetting them well with water.

Next cut off from the cake another thin plate, to be the bottom of the *Muffle*; this may be either left looſe for the *Muffle* to be placed on it occaſionally, or the bottom edges of the already formed *Muffle* may be joined to it all round by means of water, as the back was before joined to the arched part of the *Muffle*. But whether it be intended that the bottom ſhall be thus fixed on, or left looſe, it muſt be half an inch broader every way than the bottom of the *Muffle*, that this may ſtand the more ſure and firm upon its baſis.

When the *Muffle* is thus made, wet your hand, and rub it carefully all over, that the ſmall and perhaps inviſible cracks and chinks in the plates may be cloſely joined, and the whole matter of it applied perfectly cloſe to the ſurface of the mould.

When the *Muffle* has been ſome time expoſed to the air, and is ſomewhat dried, and hardened on the mould, cut out two or three hemiſpherical pieces on each ſide, to make the holes before deſcribed, at the baſis and back, and then draw away the mould from within it; for if the *Muffle* is ſuffered to dry perfectly on the mould, it always cracks. When the whole is perfectly dry, let it be baked in a potter's kiln, or in the aſſayers oven; but without great care in the latter method, and lighting the fire at top firſt, it is apt to crack; ſo that the potters kiln, where at hand, is much the better way of baking it. See Tab. of Chemiſtry, N°. 1. 2.

If there be adapted to the formerly deſcribed convex mould, another concave one nearly fitting it, only leaving room for the thickneſs of the *Muffle* between, and the clay be placed between them, and formed by this means into its exact ſhape, by a ſtrong and every way equal preſſure, this will make *Muffles* not only with much leſs trouble, but they will be much ſtronger, leſs apt to crack, and more capable of reſiſting the fire, than thoſe made by the hand in the other way.

The only cautions neceſſary for the making theſe, are, that the clay be a little drier than when it is to be worked by the hand; that the ſides, both of the inner or convex mould, and of the outer concave one, be thoroughly oiled or greaſed, and the preſſure on the ſurface of the outer or concave mould, be as ſtrong and as equal as may be. There is no clay better for the making theſe *Muffles* than the *Windſor loam*, an earth well known among the chemiſts and glaſsmen, and always to be ſold in London; and the rubbing the inſides of the mould with black lead in fine powder, very well ſupplies the place of greaſing them, to prevent the matter from ſticking to them.

Theſe are the *Muffles* ordinarily uſed in aſſaying; but when very large teſts are to be covered, they uſe large ſpheroidal *Muffles*, made of caſt iron, or ſometimes of the ſame clay, and wrought in the ſame manner, only made upon proportionably larger moulds. The clay is uſually, for theſe large ones only, laid in a lump on the top of the mould, and with wet hands ſpread all over it to the bottom, and by this means a *Muffle* is made with little trouble. *Cramer's* Art Aſſ. p. 62.

MUGGENT, in zoology, the name of a ſpecies of freſh water wild duck, called by many authors the *muſcaria*, from its catching flies that play on the ſurface of the waters.

It is about the ſize of the common tame duck. The beak is ſhort and broad, and is of a ſaffron colour. It is all over of a mottled colour, like that of the partridge, made up of black, white, brown and grey, ſo oddly mixed together, as to ſhew neither ſeparate. The crown of the head is black, and the feet are yellow. *Geſner* de Avib.

Mr. Ray ſuſpects this not to be different from our common wild duck.

MUGWORT, *Artemiſia*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the floſculous kind, being compoſed of ſeveral floſcules, divided into many ſegments at their ends, ſtanding on the embryo ſeeds, and contained in a ſcaly cup. Among the flowers there alſo appear many naked embryos, which terminate in a fine ſmall filament, bifid at the end. Theſe, as well as the embryos of the flowers, finally become ſeeds, in ſhape reſembling thoſe of wormwood.

The ſpecies of *Artemiſia*, enumerated by Mr. Tournefort, are theſe: 1. The common *Artemiſia*, with a purple ſtalk, and purple flowers. 2. The larger *Artemiſia*, with greeniſh-white ſtalks. 3. The *Artemiſia* with leaves variegated with yellow. 4. The red ſea *Artemiſia*. *Tourn.* Inſt. p. 460.

Mugwort has long been famous as an uterine and antiſpaſmodic, and a medicine of great efficacy in all diſeaſes of the nerves. It is evidently aperient and abſtergent; it promotes the menſes, and cleanſes the womb. It is given in decoction, or much more agreeably in a light infuſion, in the manner of tea. The midwives uſe it alſo externally, boiling it, and applying it to the belly, to promote the menſtrual diſcharges, or the expulſion of the ſecundines. It is by ſome much recommended as a cure for the *ſciatica*; and it is to be taken for this purpoſe, either in powder, two drams for a doſe, or the expreſſed juice drank an ounce or two twice a day for ſome months. There uſed to be a diſtilled water, a ſyrup, a conſerve, and an extract of *Mugwort* in the ſhops, and the ſalt was made as that of wormwood; but at preſent theſe are diſuſed, and the dried herb only is kept there, as an ingredient in ſome of the compound waters. *Hill*, Hiſt. Mat. Med. p. 342, ſeq.

MUGIL, the *Mullet*, in ſome degree reſembles the dace or dare in ſhape. The noſe is ſharp; the belly a little bowed; the head plain and flatted. Its ſcales are very large, and cover not only the body, but the membranes of the gills, and a great part of the head. The back is of a duſky bluiſh or greeniſh brown; the belly white, and the ſides are variegated with longitudinal black and white lines running from the head to the tail. It has no teeth; but the tongue is ſomewhat rough. It is ſuppoſed to feed wholly on weeds, and the like; and ſeems indeed to eat no fiſh. It is moſt frequently caught at ſea; but at times comes up into rivers. *Willughby's* Hiſt. Piſc. p. 275.

The *Mullet* is a very well taſted fiſh; and of its ſpawn is made what we call *botargo*. See the article BOTARGO.

Rondeletius, and other authors, have deſcribed three or four different ſpecies of *Mugil*; but they ſeem rather varieties of the ſame fiſh, owing to age, place, and other accidents.

In the Artedian ſyſtem of ichthyology, the characters of the *Mugil* are theſe: The branchioſtege membrane on each ſide contains ſix crooked bones; the upper one being the broadeſt, and being hid under the covering of the gills, ſo that only five are diſcernible. The ſcales are large, and they cover the head; and the opercula of the gills, as well as the body of the fiſh. The head is of a depreſſed figure in its anterior part; and the body is oblong and compreſſed. According to theſe diſtinctions, there is only one known ſpecies of *Mugil*; this is the *Mugil* of Ovid and the antients. It reſembles the thymallus in its external figure. Its jaws are tender and thin, and have no teeth in them. The tail is forked. *Artedi* Gen. Piſc. p. 26.

MUGIL *Alatus*, the *winged Mullet*, a name given by ſome authors to the *hirundo piſcis*, or ſwallow-fiſh, as, excepting its wing-fins, it very much reſembles the *Mullet* in ſhape. *Geſner* de Piſc. See the article HIRUNDO *Piſcis*.

MUGIL *Niger*, the *black Mullet*, a name given by authors to a fiſh of the *Mullet* kind, but all over black, more uſually known by the name of the *portius piſcis*. *Ray's* Ichthyol. p. 276.

MULÆ, a word uſed by ſome medical writers to expreſs puſtules on the ſkin, which are owing to extreme heats, or to cold.

MULA *Herba*, in botany, a name uſed by ſome for the ceterach, or ſmooth ſpleenwort. *Ger.* Emac. Ind. 2.

MULBERRY, *Morus*, in botany, &c. See the article MORUS.

The common *Mulberry*-tree is to be propagated either by ſowing the ſeeds, or by laying down the tender branches, which in two years will be well rooted, and may be cut off from the tree, and tranſplanted into the places where they are to remain. But thoſe plants which are propagated from ſeeds, are uſually the moſt vigorous, and grow the moſt regularly, and with the ſtraiter ſtems; but then there is a great diſadvantage attending this propagation, which is, that the trees are frequently altogether male, producing only catkins, and no fruit; ſo that it is better to do it by layers from a tree, which is known to produce plenty of good fruit; the ſtraiteſt ſhoots ſhould be always choſen for layers; and when they are tranſplanted, they ſhould be tied up to ſtakes to keep them ſtrait. This tree ſhould not be often pruned; but only ſuch branches are to be cut off as croſs and bruiſe one another.

The *Mulberry*-tree thrives beſt in a light ſoil, which ſhould not be too wet, nor over dry; and it ſhould always have an open expoſure; for if planted too near trees or buildings, ſo as to be ſhaded thereby, the fruit ſeldoms ripens well; though it will be to great advantage to have them defended from the weſt and ſouth-weſt winds, by trees or buildings at a diſtance.

The ſoil under the *Mulberry*-tree ſhould always be well dug up every year, and manured, which proves of very great ſervice to the fruit.

The white *Mulberry* is cultivated in France and Italy for the ſake of its leaves, as there is an opinion, that the ſilk-worms ſhould be fed only with theſe; but it is affirmed by perſons who ſeem to know beſt, that the Perſians feed their worms only with the leaves of the black kind.

The trees intended for feeding ſilk-worms ſhould not be ſuffered to grow tall, but kept in a ſort of hedge; and inſtead of pulling off the leaves ſingly, they ſhould be cut off with ſheers together with the young branches; this is not only much ſooner and more eaſily done, but it is leſs injurious to the

the trees. The white ſort is propagated either by ſeeds or layers as the black, and is equally hardy. *Miller*'s Gardener's Dict.

MULBERRY-*Cyder*, a name given by the people of Devonſhire, and ſome other parts of England, to a ſort of cyder rendered very palatable by an admixture of *Mulberry* juice in the making: They chooſe for this purpoſe the ripeſt and blackeſt *Mulberries*, and preſſing out their juice and mixing it with a full-bodied cyder at the time of the grinding and preſſing, giving juſt ſo much of it as adds a perceptible flavour. It is very worthy the attention of people who live in other counties, where ſtrong and good cyder is made, that this renders it a ſort of wine much more agreeable than any other Engliſh liquor, and might be brought into general uſe, to the great advantage of the dealer. The colour of this liquor reſembles that of the brighteſt red wine, and the flavour of the *Mulberry* never goes off. Phil. Tranſ. N°. 133.

MULBERRY-*Shell*, a ſpecies of *Dolium*. See the article DOLIUM.

MULE (*Cycl.*)—*Mules* are chiefly uſed in countries where there are rocky and ſtony ways, as about the Alps and Pyrenees, *&c.* Great numbers of them are kept in theſe places; they are uſually black, and are ſtrong, well-limbed, and large, being moſtly bred out of the fine Spaniſh mares.

The *Mules* are ſometimes fifteen or ſixteen hands high, and the beſt of them are worth forty or fifty pounds a-piece. No creatures are ſo proper for large burdens, and none ſo ſure footed. They are much ſtronger for draught than our horſes, and are often as thick ſet as our dray-horſes, and will travel ſeveral months together, with ſix or eight hundred weight upon their backs. It is a wonder that theſe creatures are not more propagated in England, as they are ſo much hardier and ſtronger than horſes, and are leſs ſubject to diſeaſes, and will live and work to twice the age of a horſe.

Thoſe that are bred in cold countries, are more hardy and fit for labour than thoſe bred in hot; and thoſe which are light made are fitter for riding than horſes, as to the walk and trot; but they are apt to gallop rough, though theſe do it much leſs than the ſhort-made ones. *Mortimer*'s Huſbandry.

They take ſo much after the mare they are bred from, that they may be procured of any kind, light or ſtrong, as the owner pleaſes. The general complaint we make againſt them, is, that they kick, and are ſtubborn: But this is only owing to our neglect in the breeding them, for they are as gentle as our horſes in countries where they are bred with more care.

Mules are of two kinds; the one between the horſe and the ſhe-aſs, the other between the he-aſs and the mare. The firſt ſort are the leaſt valuable. They are commonly very dull, and take after the aſs, and are not large; the other breed is therefore what is propagated chiefly in all countries where mules are uſed. The largeſt and fineſt he-aſs muſt be procured for this breed; and in Spain, where *Mules* are greatly eſteemed, they will give fifty or ſixty pounds for a fine he-aſs, only to be kept as a ſtallion. They breed with this creature out of the fineſt and largeſt mares they have, giving the aſs an advantage of height of ground, and putting the mare into a narrow pit, railed on each ſide.

Some authors affirm, that in Syria there are a ſort of *Mules* which propagate their ſpecies; but this is a miſtake; for in all the countries where they are common of both kinds, no ſuch thing ever happens.

If the aſs deſigned to be bred on is ſuckled by a mare, or the mare ſuckled with an aſs, it makes them much more familiar than they would otherwiſe be; and this may always be done by taking away the colt that belongs to the dam, and putting the other in its place, keeping them in the dark ten days or a fortnight.

MULGRANOC, an Engliſh name for a ſmall ſea-fiſh caught in the Corniſh and other ſhores, the *alauda non criſtata* of Rondeletius, and the *galeetto* of other authors. *Willughby*'s Hiſt. Piſc. p. 133.

MULIERTY, the being or condition of a *Mulier*, or lawful iſſue. Co. Litt. 352. *Blount*.

MULLER, (*Cycl.*) in zoology, a name uſed by ſome for the fiſh called in Latin the *Cataphractus*, and in Engliſh the mailed fiſh, or pogge. *Willoughby*'s Hiſt. Piſc. p. 212. See the article CATAPHRACTUS.

MULLET, (*Cycl.*) in zoology, a name by which the people in ſome counties of England call the *Anas arctica Cluſii*. See the article DUCK.

MULLETT, in ichthyology, a name given in England indeterminately to ſeveral kinds of fiſh of different genera; but the proper ſenſe of the word is the ſame with that of the mugil or cephalus, of the generality of authors; the cephalus of Ariſtotle and the Greeks; and the ceſtreus or ceſtrea of Oppian and others. See the article MUGIL.

MULLUS, in zoology, the name of a fiſh properly of the cuculus kind, of which there are two ſpecies; the one called *Mullus imberbis*, the other *Mullus aſper*. The firſt is a very ſcarce ſea-fiſh, with a large head, ornamented with ſeveral ſmall figures of ſtars, large eyes, a ſmall mouth of a fine bright red within, and without teeth; the covering of the gills have ſeveral prickles pointing toward the tail; the whole body is of a reddiſh colour, and the gill-fins have near their end ſome filamentous-fingered appendages. Its belly is white, and there are two rows of pointed bones running from the head to the tail all along the back.

The other, or *Mullus aſper*, is a ſmall fiſh of about the length and thickneſs of a finger, and of a beautiful red or ſomewhat purpliſh colour; and is covered with ſcales ſerrated at their extremities, and placed obliquely. *Rondelet.* de Piſc. p. 640.

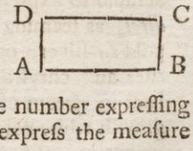
MULLUS *Barbatus*, in zoology, the name of a fiſh of the cuculus or the gurnard kind, caught in the Mediterranean, and reckoned an extremely delicate fiſh for the table. Its uſual ſize is about ſix or ſeven inches in length. Its head is flatted and its body conſiderably thick; and the back flat, not ridged. From the head all the way to the tail, it becomes gradually ſmaller, ſo as to reſemble an obeliſk in figure. Its ſcales are ſerrated at the edges, and are eaſily rubbed off; they are of a browniſh olive colour; but the ſides, when they are off, look as if tinged with red lead. The eyes ſtand very high in the head, and it has two very long beards under its chin. It has no teeth in the jaws, and its tail is very forked. *Geſner* de Piſc. p. 285.

MULLUS *Imberbis*, in zoology, the name of a ſmall fiſh caught in the Mediterranean and Archipelago, and called by many *rex mullorum* and *re de triglia*. Its uſual ſize is about four or five inches in length. It is all over of a reddiſh hue, and is covered with very large ſcales. Its belly is alſo ſomewhat prominent, by which it is diſtinguiſhed from all the other mullets. Its eyes are large, its mouth very wide, and its jaws rough like a file. Its tail is forked, and it has no beards. *Willughby*'s Hiſt. Piſc. p. 286.

MULTIBONA, in botany, a name given by ſome authors to parſley. *Ger.* Emac. Ind. 2.

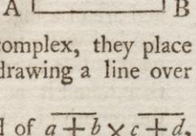
MULTIFIDUS *Spinæ*, in anatomy, a name given by Albinus to a muſcle, the ſeveral parts of which he ſays have been called by ſeveral different names by the generality af anatomical writers.

That part of it which is ſituated in the region of the loins, is called by Veſalius, the *decimus tertius* and *decimus quartus dorſum moventium*, and by ſome the *tertius dorſi muſculus*. That which is ſituated in the back is called by Veſalius, *decimus quintus* and *decimus ſextus dorſum moventium*, and by others, *quintus dorſi muſculus*.



That part which is in the neck is called by Veſalius, the *ſeptimus* and *octavus dorſum moventium*, and by many the *quartus cervicis muſculus*; and by Fallopius, *pars tertii paris muſculorum dorſi*. That part of it which is in the loins and back is called by Fallopius the *quartum par muſculorum dorſi*, and ſeems to be the *ſacer* of Riolanus.

That part which is in the neck is called by Riolanus alſo a part of the ſpinatus, and by ſome the *tranſverſalis colli*: And its diſtinct portions in the neck are called by Douglaſs the *intervertebrales*.



MULTIPLE (*Cycl.*)—MULTIPLE *ſuperparticular Proportion*, is when one number or quantity contains another more than once, and a certain aliquot part; as $3\frac{1}{3}$ to 1.

MULTIPLE *ſuperpartient Proportion*, is when one number or quantity contains another diverſe times, and ſome parts beſides; as $4\frac{5}{6}$ to 1.

MULTIPLICATION (*Cycl.*)—Accurately ſpeaking, in every *Multiplication*, the multiplicator muſt always be conſidered as a number; and it is eaſy to conceive a quantity of any kind multiplied by a number. But to talk of a pound multiplied by a pound, a debt by a debt, and a line by a line, *&c.* is unintelligible. However, by analogy, in the application of algebra to geometry, we meet with ſuch expreſſions, and nothing is more common than to find AB × BC, to denote the rectangle ABCD, the length of vhich is AB, and the breadth BC. But this is only to be underſtood by analogy; becauſe, if the number expreſſing the meaſure of the ſide AB was multiplied by the number expreſſing the meaſure of BC, the product would expreſs the meaſure of ABCD.

The ſign of *Multiplication* moſt commonly uſed among algebraiſts, is ×. But the Germans, after Leibnitz, only make uſe of a point placed between the quantities multiplying each other, thus: $a \cdot b$ is the ſame as $a \times b$ and AB . BC, the ſame as AB × BC, or the rectangle of AB into BC, that is the rectangle ABCD.

When the quantities to be multiplied are complex, they place them between a parentheſis, inſtead of drawing a line over them, as we commonly do.

Thus they write $(a+b) \cdot (c+d)$ inſtead of $\overline{a+b} \times \overline{c+d}$, for the product of $a+b$ into $c+d$. Sometimes the point is omitted, thus: $(a+b)\,(c+d) = \overline{a+b} \times \overline{c+d}$.

MULTIPLICATION, in algebra. To multiply algebraic quantities, we muſt attend not only to the quantities themſelves, but alſo to their ſigns.

The general rule for the ſigns is, that when the ſigns of the factors are like, (*i. e.* both + or both —) the ſign of the product

product is +; but when the signs of the factors are unlike, the sign of the product is —.

Then if the quantities to be multiplied be simple quantities, find the sign of the product by the last rule; after it place the product of the coefficients, and then set down all the letters after one another, as in one word.

If the factors be compound quantities, multiply every part of the multiplicand by all the parts of the multiplier, taken one after another, and then collect all the products into one sum; which will be the product required. See *Maclaurin*, *Saunderson*, or any other elementary writers.

The reason of the rule here given for the signs of the product, *viz.* That + by +, or — by — give +, and that + by —, or — by + give —, is apt to perplex beginners. But if it be considered, that in all *Multiplication* the multiplicator is, strictly speaking, a number, the difficulty soon vanishes; for, 1°. When any positive quantity $+a$ is multiplied by any positive number $+n$, the meaning is, that $+a$ is to be taken as many times as there are units in n, and therefore the product is evidently $+na$ or na, the positive sign being omitted.

2°. When $-a$ is multiplied by n, then $-a$ is taken as often as there are units in n, and the product must be $-na$.

3°. As *Multiplication* by a positive number implies a repeated addition, *Multiplication* by a negative implies repeated subtraction; so that when $+a$ is to be multiplid by $-n$, the meaning is, that $+a$ is to be subtracted as often as there are units in n; therefore the product must be negative, being $-na$.

4. When $-a$ is to be multipliied by $-n$, then $-a$ is to be subtracted as often as there are units in n; but by the rules of subtraction, to subtract $-a$ is equivalent to adding $+a$, and consequently the product is $+na$.

The 2*d* and 4*th* cases may be thus illustrated, by the import and meaning of the signs + and —, $+a-a$ must be $=o$. Therefore if we multiply $+a-a$ by n, the product must vanish, or be nothing; because the factor $a-a=o$. The first term of the product is $+na$ by case 1. therefore the second term of the product must be $-na$, which destroys $+na$; so that the whole product must be $+na-na=o$. Therefore $-a$ multiplied by $+n$ gives $-na$.

In like manner, if we multiply $+a-a$ by $-n$, the first term of the product being $-na$, the latter term of the product must $+na$, because the two together must destroy each other, or their amount be o, since one of the factor $a-a=o$. Therefore $-a$ multiplied by $-n$, must give $+na$. See *Maclaurin*'s Algebra, Part 1. chap 4. *Saunderson*'s Algebra, Vol. 1. p. 57. And *Barrow*'s Euclid, Schol. Prop. 1. Elem. 2.

MULTIPLIER, in arithmetic, the number multiplying. See the article MULTIPLICATOR, *Cycl.*

MULTIVALVES, in natural history, the name of a general class of shell-fish distinguished from the univalves, which consist of only one shell, and the bivalves, which consist of two, by their consisting of three or more shells.

Of these there are much fewer species than either of the univalve or bivalve class. A late accurate French author has ranked all the species under six genera, which are these: 1. The *echini* or sea-eggs. 2. The *vermiculi*, or sea-worms. 3. *Balani* or center-shells. 4. The *pollicipides* or thumb-shells. 5. The *conchæ anatiferæ* or goose-shells. And 6. The *pholades*. Hist. Nat. Eclairc. part 2. p. 235. All these see under their several heads.

MULTONES *Auri*, in our antient writers, an old coin of gold, having an *Agnus Dei*, sheep or lamb on the one side, and from that impression called *Multones*. This coin was most common in France, and sometimes current in England. Patent 33 Edw. 1. cited by the learned Spelman. *Blount.*

MULUD, in the materia medica, a word used by Avisenna and Serapio to express a sort of litharge, called by the Greeks *molybdites*, as seeming to partake of the nature of lead alone, not of gold or silver, or any other metal, as they thought the argyrites and chrysites did. This *Mulud* or molybdites was the least in esteem of all the kinds of litharge, and was of a dusky greyish white colour. It seems to be the same that Dioscorides means by *pelia* and *polia*, and sometimes by *lithargyrus Siculius*, from the place whence it was brought.

MUMMY (*Cycl.*)—There are found at this time in Poland a kind of natural *Mummies*, or human bodies, preserved without the assistance of art. These lie in considerable numbers in some of the vast caverns in that country. They are dried, with the flesh and skin shrunk up almost close to the bones, and are of a blackish colour. In the wars, which several ages ago laid waste that country, it was common for parties of the weaker side to retire into these caves, where their enemies, if they found it out, suffocated them by burning straw, &c. at the mouth of the cavern, and then left the bodies; which being out of the way of injuries from common accidents, have lain there ever since. *Rzaczinski* Hist. Pol.

MUMMY, among the gardeners, is the term used for a sort of waxey composition used in grafting. It is made of one pound of common black pitch, and a quarter of a pound of turpentine, put into an earthen pot with a cover fitted to it; this is to be set in the open air, and the cover being taken off, the matter is to be set on fire, and when it has burned a little while, it is to be quenched by putting on the cover. This is to be repeated till the mixture is of a proper consistence, which is known by pouring a little of it on a pewter plate, on which, when it is enough, it will coagulate immediately. When it is of this consistence, it is to be poured into another pot, and a little yellow wax is to be added to it, and then melting the whole together, it is to be kept for use. *Miller*'s Gardener's Dict.

MUNDUS *Patens*, among the Romans, a solemnity performed in a little temple of a round form; and dedicated to Dis, and the infernal gods.

It was opened only three times in a year, *viz.* on the day after the *Vulcanalia*, the 4*th* of October, and the 7*th* of the ides of November, during which days the Romans believed that hell was open; and therefore they never offered battle on those days, listed no soldiers, never put to sea, nor married. *Pitisc.* in voc. See the article VULCANALIA.

MUNDUYGUACU, in botany, a name of the *nux cathartica* of the West Indies, a kind of great ricinus, or palma Christi. *Piso*, 169.

MUNGATHIA, in zoology, the name given by some to a species of Indian ferret, of a reddish grey colour, called also *mungo*.

MUNGO, in zoology, the name of an American animal of the ferret kind, called by authors *viverra Indica ex griseo-rufescens*, or the reddish grey Indian ferret. Some call it also *mungathia*. *Mus.* Leyd. Cat.

MUNITION (*Cycl.*)—MUNITION-*Ships*, in the navy, those which have stores on board, to supply the necessaries to a fleet of men of war at sea.

In the time of an engagement, all the *Munition*-ships and victuallers attending the fleet are to take their places and proper stations in the rear of all the rest, and not engage in the fight, but attend such directions as shall be sent unto them, at all times, by the admiral.

MUNNY *Sheller*, in natural history, a name given by the natives of the East Indies to a species of red orpiment, which they have plentifully there. It is of a glowing colour, and has a great many shining spangles in it. They give this in fevers, after it has been calcined: It first melts in the fire, and then emits copious white fumes, smelling like those of arsenic. These are supppsed to contain the poisonous parts of it, and it then becomes a safe internal medicine, and is given with great success.

MUNTINGIA, in botany, the name of a genus of plants, the characters of which are these: The perianthium consists of one leaf, divided into large pointed segments. The flower consists of five roundish petals, of the length of the segments; of the cup. The stamina are numerous capillary filaments, they are very short; and the antheræ are simple. The germen of the pistil is globose, and is covered with hairs; there is nostyle, and the stigma is capitated and pentangular in figure. The fruit is a globose berry, with only one cell; it is umbilicated by the stigma. The seeds are very small and numerous, and are of a roundish figure. *Linnæi* Gen. Plant. p. 229. *Plumier*, Gen. 6.

MUNYCHIA, Μουνχια, in antiquity, an anniversary solemnity at Athens, upon the sixteenth of the month *munychion*, in honour of Diana, surnamed *Munychia*. For the origin and ceremonies observed in it, see *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 414. seq.

MUNYCHION, Μουνχιων, in chronology, the tenth month of the Athenian year. It contained twenty-nine days, and answered to the latter part of our March and beginning of April. See the article MONTH.

It had its name from the festival *munichia*, kept in it.

MURÆNA, in the Artedian system of ichthyology, the name of a genus of fishes, the characters of which are these: They are of the malacopterigious or soft-finned kind. The branchiostege membrane on each side contains ten slender and curved bones; but the skin is so thick, that these are not easily distinguished before that is pulled off. The foramina of the nostrils are two, and are placed in the very summit of the snout, one on each side. The body is long and cylindric; in some species there are three fins, in others two, in others only one.

The species of *Muræna* enumerated by Artedi, are these: 1. The simple-coloured *Muræna*, with the lower jaw longest. This is the common eel. 2. The *Muræna*, with the upper edge of the back fin black. This is the conger, or sea eel. The iris of this fish is white; that of the common eel is red. 3. The *Muræna* with a sharp snout, variegated with white spots, and with the edge of the back fin black. This is the myrus of the antients, and the flat-tailed sea serpent of the later writers. 4. The cylindric-bodied *Muræna*, with no fin at the tail. This is the common sea serpent of authors; it grows to five foot in length. 5. The cylindric, slender, and spotted *Muræna*, with a rounded cuspidated tail, with no fin to it, This is the spotted sea-serpent of authors. 6. The *Muræna* with no pectoral fins. This is the fish which all authors call the *Muræna*, Artedi only extending that word as a generical name to the other species. *Artedi*, Gen. Pisc. 19.

According to *Willughby*, the *Muræna* is a fish of the anguilliform or eel-like class. Its body is broad, and its snout pointed, and of a flatted figure. It is variegated in colour with a dusky

brown or tawny, a black, and a gold yellow. Its head is moderately large, and its mouth extremely wide, and has, in the rim of each jaw, a row of very ſmall teeth, and in the middle of its palate, two teeth much larger than the reſt, and moveable inwards. Sometimes there is only one of theſe. At the end of its ſnout there are two ſhort and hollow apophyſes, and over the eyes two more. The former of theſe ſeem to ſerve the creature for hearing, and the latter for ſmell; for the antients all agree, that this fiſh can hear. The eyes are very ſmall, and placed in the middle of the head. It has two round holes at the gills for throwing out the water. The gills are four, and it neither has any fins at the gills, nor on the belly. Near the back part of the head begins a fin, which runs downs the ridge of the back, and ſurrounding the tail, returns up to the anus, and there terminates. This, as in the eel, is covered with the common ſkin. It is caught on the ſhores of Italy, and in other parts of the Mediterranean. Its fleſh is white, tender, and of a fine flavour, and was highly valued by the antient Romans. But there is ſome danger in the eating them. Their bite alſo is very venomous, and often occaſions long pain, and many ill conſequences to people who ſuffer it. *Willughby*'s Hiſt. Piſc. p. 103.

It is to be obſerved, that the dictionaries uſually give us the word lamprey as the Engliſh of *Muræna*; but the *Muræna* and lamprey, called by the Latin authors, *lampetra*, are two very different fiſhes. See the article LAMPETRA.

Muræna is originally Greek, and is derived from the *verb*, μυρειν, to flow, or be ſlippery, and expreſſes the manner in which its ſlipperyneſs makes it roll about, and eſcape the catcher, by ſlipping through his fingers.

MURÆNA is uſed by Albertus for the common ſmall lampern, the *lampetra parva fluviatilis* of authors. This is one of the petromyza of Artedi, and is diſtinguiſhed by the having only one row of very ſmall teeth in the verge of the mouth, beſide the large lower ones.

MURELIA, in botany, a name by which Pliny, and ſome other authors, have called the *parietaria*, or pellitory of the wall. *Ger.* Emac. Ind. 2.

MUREX, in natural hiſtory, the name of a genus of ſhell-fiſh, the characters of which are theſe. It is an univalve ſhell, beſet with ſharp ſpines and tubercles, with a rough clavicle exerted near the ſummit in moſt ſpecies, but in ſome depreſſed. The mouth is always expanded, and ſometimes has teeth, ſometimes not; the lip is ſometimes digitated, ſometimes elated or folded, or jagged; and the columella is ſometimes rough, ſometimes ſmooth. See Tab. of Shells, N°. 13.

Notwithſtanding that this is the general character of the *Murex*, and that all the ſpecies have an oblong mouth, and the body covered with tubercles, there are, under this extenſive character, four ſpecific variations of figure, which are very obſervable. The firſt is ſeen in the alated *Murex*, which has no ſpines. The ſecond is in the ſpider ſhell, which has very remarkable ſeries of fingers or hooks. The third is the helmet-ſhell, which is a true triangular *Murex*. The laſt is a furrowed *Murex*, which has no wings, nor protuberances, nor ſpines; but has a flat head, and an oblong dentated mouth. Hiſt. Nat. Eclairc. p. 290. *Aldrovand. Rondelet. Rumphius.*

On the firſt examination of ſeveral of the ſpecies of helmet-ſhell, the outer coat of which is ſmooth, it would be natural to refuſe them any place among the *Murex* claſs; but when we ſee the oblong ſhape of the mouth, and find that it is furniſhed with teeth, and afterwards obſerve the rudiments of tubercles which are to be ſeen on the mouth ſide, we ſhall perceive that they are all true *Murices*, though leſs prickly than the others.

The antients were furniſhed with their fineſt purple dye from a fiſh of the *Murex* kind, and therefore expreſſed the purple colour by the word *Murex*. We find in Virgil, *Tyrio ardebat murice lana.* Plumier tells us, that in America the *Murex* is called *piſſeur*, from its readily ejecting the liquor, which gives the purple colour when it is taken from the rocks. And Fabius Columna diſtinguiſhes the *Murex* from the purpura and buccinum, but in a very injudicious manner. He ſays the purpura affords the fine purple colour: the *Murex* is covered wirh ſpines and tubercles; and the buccinum is known by its ſmooth and long wreath. But he ſhould have known that the affording the purple dye is common to the *Murex* and purpura, and even to ſome of the buccinum kind; and that there are *Murexes* with very few ſpines or tubercles, and buccina which are not ſmooth. The knowledge of the inſufficiency of theſe characters, would have engaged him in ſeeking others more eſſential; and a perſon of his great abilities would then perhaps have prevented half the confuſion that has happened ſince in the world, on occaſion of errors of this kind propagated from his writings, and thoſe of two or three others of his time. *Virg.* Æneid. L. 4. *Fabius Columna*, Aquat. & Terreſtr. Obſerv. p. 55.

The family of the *Murex* being very extenſive, it may be proper to divide them into ſome ſeparate ſeries from the general common marks of certain numbers of the ſpecies. 1. Some have remarkably eminent tubercles and ſpines. 2. Some are nearly ſmooth, but have a rough clavicle, and a crooked beak. 3. Some have digitated lips. And 4. Some have alated and laciniated lips. The ſpecies preſerved in the cabinets of the curious are theſe. Firſt, of the rough or prickly *Murices* we have the following:

1. The *Murex* with a compreſſed clavicle, and with obtuſe black ſpines. 2. The grey *Murex*, with an exerted clavicle, and rows of black ſpines. 3. The *Murex* with a compreſſed clavicle, ſurrounded with bluiſh ſpines. 4. The yellowiſh *Murex*, ſurrounded with four rows of obtuſe ſpines. 5. The whitiſh *Murex*, with two rows of ſpines. 6. The brown and blue *Murex*, with three rows of ſpines. 7. The yellowiſh *Murex*, every where regularly beſet with ſpines. 8. The whitiſh *Murex*, with a purple dentated mouth, and with yellow low tubercles or umbos. 9. The white hedgehog *Murex* with black ſpines, and with a dentated mouth. 10. The muſic *Murex*, with a rugoſe columella. 11. The ruſtic muſic *Murex*. 12. The lightening *Murex*, with a rugoſe columella. 13. The variegated *Murex* with a rough exerted clavicle. 14. The undulated, contabulated and tuberous *Murex*, with an exerted clavicle. 15. The whitiſh ſtriated *Murex*, with a clavicle furniſhed with long ſpines. 16. The yellow coſtated *Murex*, with furrows and tuberoſities on all parts of the ſhell. 17. The ſtriated umbilicated verrucoſe or warty *Murex*, with a reddiſh columella. Hiſt. Nat. Eclairc. p. 290.

Of the ſecond ſeries of the *Murex*, or thoſe which have a ſmooth body, a clavicle ſomewhat rough, and a crooked beak, we have the following ſpecies: 1. The triangular *Murex*, or helmet-ſhell of Rondeletius, with a dentated mouth and folded lip. 2. The red turban *Murex*, with ſeveral umbones, and with both lips folded back and expanded. 3. The helmet-ſhell of Bonani, or the agate helmet-ſhell, with a leſs dentated mouth. The laſt appearance is that under which we uſually ſee this ſhell, it having been commonly poliſhed, and its outer coat taken off, before it is admitted into a cabinet. 4. The yellow variegated helmet-ſhell. 5. The grey ſtriated helmet-ſhell, without umbos. 6. The whitiſh helmet-ſhell, variegated with yellow undulated lines. 7. The agate helmet-ſhell, with regular yellow ſpots. 8. The blue ſtriated helmet-ſhell, with yellow undulated lines. 9. The wavy helmet-ſhell.

Of the third kind, or thoſe which have digitated lips, we have the following: 1. The common ſpider-ſhell or *Murex*. 2. The ſpider-ſhell called by the French the *Murex lambis*. 3. The hooked-clawed or male ſpider-ſhell. 4. The female ſpider-ſhell. 5. The millipede ſpider-ſhell. 6. The cornuted ſpider ſhell of Rumphius. 7. The ſeven-fingered ſpider-ſhell. 8. The five-fingered ſpider-ſhell. 9. The four-fingered ſpider-ſhell. 10. The ſpider-ſhell, with ſix elegant furrows. 11. The ſcorpion-ſhell, with a radiated mouth. 12. The ſtrait-pointed red ſpider-ſhell. 13. The crow-billed ſpider-ſhell, or the blue, white and yellow ſpider-ſhell, with five appendages at the lip. This latter appearance is that under which we ſee the ſhell when it has been poliſhed.

Of the fourth ſeries of *Murexes*, or thoſe which have alated and laciniated lips, we have the following ſpecies: 1. The aſſes-ear *Murex*, with a crooked beak, and a lip red on the inſide. 2. The triangular *Murex* with large ſtriæ and tubercles, called the hogs-eared *Murex*. 3. The *Murex* with a red mouth and black columella. 4. The *Murex* with a ſtriated mouth, black on each ſide. 5. The white and brown-mouthed *Murex*. This, when poliſhed, is the ſpecies called the *turtle Murex* in cabinets. 6. The ear *Murex* of Rumphius. 7. The *Murex* with a reddiſh laciniated and very wide extended lip, and an aculeated clavicle. 8. The red *Murex*, with a laciniated lip and prickly clavicle. 9. The variegated and verrucoſe *Murex*, with a thick laciniated lip. 10. The variegated and verrucoſe *Murex*, with a jagged very thin lip. 11. The yellow *Murex*, with a laciniated lip and gibboſe clavicle. 12. The lead-coloured, bellied *Murex*, with a folded lip. 13. The ſmooth *Murex*, with a thick folded lip, and a dentated columella. 14. The yellow and tuberous *Murex*, with a folded lip, dentated on one part, and ſpotted on the other. 15. The yellow *Murex* with a regular rib, ſpotted, and running tranſverſely from the beak to the middle of the back. 16. The grey coſtated *Murex*, with a wide lip on the ſide of the columella. 17. The white coſtated and contabulated *Murex*. To theſe ſpecies is to be added one of a very ſingular kind, the mouth of which opens the contrary way to all the others. Hiſt. Nat. Eclairc. p. 288.

MUREX, among the antient Romans, a caltrap or iron inſtrument with ſharp points every way, uſed as a defence againſt the enemies horſe. *Pitiſc.* in voc.

MUREX *Mutiani*, a name given by ſome authors to the genus of ſhells, known at this time under the name of *porcelains* and *conchæ venereæ*. See the article PORCELLANA.

MURINA, or MURINES, μυρινης οινος, in antiquity, a delicious ſweet wine, medicated with ſpices. It was a kind of hippocras, and the uſual drink of the ladies. *Hofm.* Lex. in voc. See the article HIPPOCRAS, *Cycl.*

MURRA, among the antients, a foſſile ſubſtance found in Parthia and Carmania, of a fine ſmell, and beautiful variety of colours.

It was thought to be ſome humour condenſed in the earth by the heat of the ſun. *Pitiſc.* in voc. See the articles MURRINE and MORRHINA, *Cycl.* and *Suppl.*

MURRA was likewiſe a dry perfume, made of the *Murra* reduced to powder. *Pitiſc.* in voc.

MURRE, in zoology, a name given in ſome parts of England to the razor-bill. See the article ALKA.

MURRHINA, in antiquity, a kind of ſweet medicated wine. See the article MURINA.

MURRINE, in the writings of the antients, a name frequently given to cups uſed for drinking, and to veſſels of a ſmall ſize, uſed for the preſerving perfumes, *&c.* and called *Murrina* from *murrha* or *myrrha*, the name of the ſubſtance from which they were made.

There have been many errors among the critics and commentators about this *Murrha*; but the greateſt of all is that of Baronius, who ſuppoſes it to have been myrrh, the gum we now know under that name. The deſcriptions and uſe we hear theſe veſſels were put to, plainly proves the abſurdity of this opinion. Some have ſuppoſed theſe veſſels to be made of cryſtal, but this is contrary to the account of all the antients.

The Greeks had the words κρυσαλλος for cryſtal, and Σμυρνη for myrrh, very common among them, and therefore if theſe veſſels had been made of either of theſe ſubſtances, they would in ſome places have called them *Smyrnina* or *cryſtallina*. On the contrary, the moſt correct among them call them *murrhina* or *morrina*. The cups made of cryſtal, which were alſo in uſe at thoſe times, were called *cryſtallina*, and theſe *murrhina* or *murrhæa*, by way of keeping up the diſtinction: And Martial tells us, that the ſtone they were made of was ſpotted or variegated, calling them *pocula maculoſæ murræ*. And Statius mentions the cryſtalline and *murrhine* cups in the ſame ſentence, but as different things, not the ſame. Arrian mentions alſo the λιθος μορρια, which his interpreters cenſure as an error of the copies, and would alter into *myrrha*, the name of the gum *myrrh*. See the article MORRHINA.

MURROBATHRARII, among the Romans, a kind of perfumers. See the article MURRA.

MURUCUIA, in botany, the name of a genus of plants, the characters of which are theſe: The flower is roſaceous, or compoſed of ſeveral petals arranged in a circular form. The cup alſo is compoſed of many leaves or ſegments. The middle of the flower is occupied by a tube in the ſhape of a truncated cone; from this there ariſes a piſtil, which has a tender embryo fruit, ſurrounded by three club-faſhioned bodies, with numerous ſtamina underneath. The embryo finally becomes a fruit of an oval ſhape and fleſhy ſubſtance, unicapſular, and containing many ſeeds covered with a ſort of hoods. See Tab. 1. of botany, Claſs 6. *Tourn.* Inſt. p. 241.

The only known ſpecies of this plant is the *Murucuia*, with lunated leaves, called by others, the ſcarlet-flowered Indian climber, with lunated leaves.

MURZAROLT, in falconry. See the article FALCON.

MUS, the *Mouſe*, in the Linnæan ſyſtem of zoology, makes a diſtinct genus of animals, of the order of the glires, and taking in the whole family of the mouſe and rat kind. The generical characters are, the having four toes on the fore-feet, and five on the hinder, and their palms made and faſhioned for running. *Linnæi* Syſt. Nat. p. 39.

Of this genus there are ſeveral diſtinct kinds: 1. The *common Rat*. This is a too well known animal; its colour is a duſky browniſh grey; its tail is compoſed of a multitude of rings, not leſs than a hundred and ſixty.

2. The *water Rat*. This is much larger than the common *Rat*, and is of a ſomewhat reddiſh brown colour; its feet are webbed, or the toes connected by membranes like thoſe of a duck; it tail alſo is much ſhorter, and all the way of the ſame thickneſs, not tapering off, but ſeeming as if cut off in the middle; its teeth alſo are much longer, and of a pale yellowiſh colour.

3. The *muſk Rat*. This is about the ſize of our common *Rat*; its hair is long, and very thick ſet; its back black, and its ſides and belly grey. The head is ſmall, and the noſe long and ſharp, as if intended, like that of the hog, for digging up the earth. Its mouth does not open very wide; its eyes are extremely ſmall, and its jaws adorned with a number of long grey hairs all along the opening of the mouth. Its tail is as long as its body, and is flatted and beſet with a few ſcattered hairs. Its feet are divided into five toes, the larger ones connected by a membrane to aſſiſt the creature in ſwimming, and the hinder legs are ſomewhat longer than the fore ones. This creature is common in Ruſſia, and has a very ſtrongly perfumed ſmell like that of muſk. *Ray*'s Syn. Quad. p. 217.

4. The common *Mouſe*. This is too well known to need any deſcription; but it is diſtinguiſhed from the reſt of the genus by its ſmallneſs, and its prominent large eyes. Its colour is a duſky grey on the back, and a whiter grey on the belly.

5. The *larger Mouſe*. This is of twice the ſize of the common *Mouſe*, and is uſually found in caverns of the earth in the fields, though ſometimes alſo in houſes; its back is of a mixed colour of black and tawny; its belly very white; and there is an even line drawn along each ſide, which ſeparates the two colours; the head is longer than that of the common *Mouſe*, and the eyes larger and more prominent; the ears are rounder and wider; and the tail very long, and covered with ſhort hairs, black on the upper part, and white underneath. The legs alſo are longer than in the common *Mouſe*; and there are ſix tubercles in the bottom of the foot. *Ray*'s Syn. Quad. p. 218.

6. The *great-headed field Mouſe*. This is larger than the common *Mouſe*, and its head is remarkably large in proportion to its ſize. Its noſe is ſhort and blunt. Its eyes ſmall, and not prominent; and its ears, ſhort, broad, and roundiſh, and almoſt entirely hid in the furr, which is much deeper than that of the common *Mouſe*. This has alſo a much longer body, and its tail is remarkably ſhort, and is thinly covered with hairs; its legs alſo are very ſhort. Its back is of a very deep and duſky brown, with a mixture of yellow; and its belly is of a ſort of lead colour, the points of all the hairs being white, and their bottoms black. It is common in dry paſtures, and is abundantly diſtinguiſhed from all the other kinds by the the thickneſs of its neck and ſhoulders, and the ſhortneſs of its tail.

7. The *great long-tailed field Mouſe*. This is very nearly of the ſize of a rat; its tail is very long, and its ears ſhort and round; its head is thick, and the noſe not ſharp, as in moſt of theſe creatues, but ſhort and rounded, and is of a deep brown, with ſome mixture of red at the ſides; and it has a ſort of beard of long hairs between the mouth and the eyes.

8. The *Dormouſe*, or ſleeper, called *Mus avellanorum* by many authors, and *ſorex* by Pliny. Of this there are two diſtinct kinds, a greater and a ſmaller. See the article SOREX. The other kinds are, 9. *Citillus*. 10. The *Cricetus*. 11. The *Marmotta*. 12. The *Cavia Cobaya*. 13. The *Aguti*. 14. *Paca*. 15. The *Leming*. And 16. The *Glis*. All which ſee under their ſeveral heads. Beſide theſe there is alſo another variegated kind, known by the name of the *ſtriated indian-tree Mouſe*, which is very rare, but is ſometimes found in the cabinets of the curious. *Ray*'s Syn. Quad. p. 218.

MUS *Alpinus*, in zoology, a name given by many authors to the mountain rat, more commonly known by the name of the *marmott*. See the article MARMOTTA.

MUS *Araneus*, in zoology, the name of a creature called in Engliſh, the *ſhrew*, the *ſhrew-Mouſe*, or the *hardy-ſhrew*.

It is of mixt brown, and reddiſh tawny colour; the belly is white. Its tail is about two fingers breadth long, and covered with ſhort hairs. The whole body of the creature has a rank, offenſive, and poiſonous ſmell. It body is about three fingers breadth, and its eyes black and very ſmall; they are indeed little larger than thoſe of the mole, and do not exceed the ſize of the head of the ſmalleſt pin; it is no wonder therefore that the creature is almoſt blind. The teeth are very ſmall, and differ in their ſhape and ſituation from thoſe of all other creatures in the world; and ſeem as if nature had in one creature made a ſort of mixture of the teeth of the *Mouſe* and the ſnake kind.

It has two long fore teeth, as all the *Mouſe* kind have; but theſe are not ſingle, as in *Mice*, but have two or three other ſmall and ſharp teeth growing out of them: Theſe, to an inaccurate obſerver, might either be wholly unſeen, or taken for diſtinct teeth; and the anterior long teeth are not ſeparated from the reſt by any gap or ſpace, as in the *Mouſe* kind, but make one continued ſeries with the others. The upper jaw in this creature is longer than the under, and the teeth are ſharp and ſerrated, ſome with two, ſome with three points; and theſe ſo ſmall, that they might eaſily not be ſeen, but that the tips of them are reddiſh. *Ray*'s Syn. Quad. p. 240.

It is very common in many parts of the world, and is met with in almoſt all our dry grounds; the cats will kill it, but never attempt to eat it.

It is diſtinguiſhed at firſt ſight from the common *Mouſe*, in that it is ſmaller; its noſe longer, and like a hog's; it has five toes on the hinder as well as on the fore feet; its eyes are extremely ſmall; its ears very ſhort; its claws are long and whitiſh, and its feet ſhort.

MUS *Norwegicus*, in zoology, the name given by authors to the Norway rat, commonly called the *leming*. See the article LEMING.

MUS *Pharaonis*, *Pharaoh's Rat*, a name given by the people of Ægypt to the ichneumon, a creature of the weaſel kind, which they are very fond of for its deſtroying ſerpents, and keep tame about their houſes as we do cats. See the article ICHNEUMON.

MUS *Terræ*, in botany, a name given by ſome authors to the roots of the *bulbocaſtanum* or earth-nut; it was probably at firſt *muris terræ radix*, the earth mouſes root, and ſo called from the *earth-Mice* or *field-Mice* being very fond of them; but the word *radix* being left out, it ſtands only *Mus Terræ*.

MUSA, in botany, a large herbaceous plant, approaching to the growth of trees. Almoſt all the writers of botany have looked upon the *Muſa* as a tree, on account of its bigneſs; it is tender, ſucculent, and not at all woody; the ſtalk, though very thick, is ſo weak as to be unable to ſupport itſelf, were it not for a great number of dry caſes or huſks, which are membranous and thick, and defend it from bowing and from the weather. The *Muſa* alſo is an annual plant, which bears fruit only once, and then by degrees periſhes; whereas all trees are woody, perennial, and bear fruit a great many times. It has been by ſome writers enumerated among the palmaceous

ous claſs; but this ſeems very idle, as they are all trees, and have no reſemblance with the *Muſa*, except in their having naked ſtems. The leaves of the *Muſa* at firſt have no reſemblance to thoſe of the palms, but afterwards as they dry and wither they ſplit on each ſide into a vaſt number of fibres which have ſome ſort of reſemblance with the palm-leaves.

The Indians diſtinguiſh no leſs than twenty-five ſpecies of *Muſa*, which they know from one another principally by the fruit. Philoſ. Tranſ. N°. 410.

MUSADA, a name given by ſome chemical writers to ſal-armoniac. See the article SAL.

MUSCA, the *Fly*, in the hiſtory of inſects. See the article FLY.

MUSCA, in antiquity, a deſignation given to paraſites, buffoons, *&c.* who intruded themſelves into the company of thoſe that deſpiſed them, or found means to be admitted to entertainments where they were not welcome. *Hofm.* Lex. univ. in voc.

MUSCÆ is alſo uſed for officers of the popiſh inquiſition, who feign themſelves of the ſect of the priſoners, in order to draw a confeſſion of their opinion from them, and thereby betray them; there being perſons placed to overhear their converſation. *Hofm.* Lex. in voc.

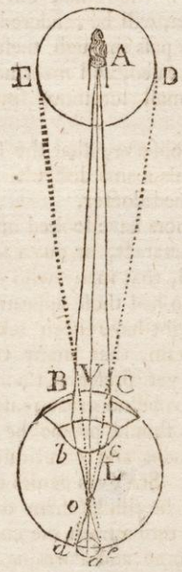
MUSCÆ *Volitantes*, dark irregular veins and ſpots, ſeeming to fly before the eyes of many people, eſpecially on looking at bright objects, ſuch as white paper, the ſky-light, the candle, *&c.* Theſe have often the appearance of flies, ſpiders, cob-webs, ſometimes that of ſmoke, duſt, *&c.* The reſemblance of many of theſe ſpots to flies have given them the name of *Muſcæ Volitantes*, q. d. flies flying about.

This phænomenon is not eaſy to account for. Some will have its cauſe to lie in the aqueous humor; others in the retina. Monſ. de la Hire's account of them is this: They are of two ſorts, ſome permanent, which, in fixing the eye upon a point of an object, appear always fixed in the ſame ſituation to that point; others ſeem to fly about, and to change their ſituation, though the eye be fixed. The ſhapes of both ſorts are changeable. The firſt ſort are commonly like a dark ſpot upon a white ground; the ſecond ſort appear like the knots of a deal board; ſome parts of them being very clear and ſurrounded with dark threads; they are alſo attended with long fillets of irregular ſhapes, which are bright in the middle, and terminated on each ſide by parallel black threads. On fixing the eye upon an object, they appear to deſcend gradually; eſpecially after ſhaking the head ſuddenly.

The ſpots that appear fixed in reſpect to the axis of the eye, muſt, for that reaſon, be cauſed by ſome diſorder in a correſponding part of the retina, or in ſome part of the vitreous humour lying pretty cloſe to the retina. For an opacity of the coats or humours in any part remoter from the retina, by intercepting ſome part of the rays of every pencil, could only cauſe an uniform obſcurity or faintneſs of light in every place of the retina, and not a total defect of it in any particular place. Hence M. de la Hire attributes the cauſe of theſe permanent ſpots to ſmall drops of extravaſated blood upon the retina.

But he finds it more difficult to account for the moving ſpots. When the rays of the ſun are tranſmitted through a piece of bad glaſs, and fall upon white paper, the ſhadows of the little ſands, veins, and irregularities in it, appear not unlike thoſe ſpots. He therefore imagines the aqueous humour is ſometimes troubled with ſome little mothery, ropy ſubſtance; ſome parts of which, by the figures of their little ſurfaces, or by refractive powers, different from the humor itſelf, may caſt their diſtinct images upon the retina. He ſuppoſes them in the aqueous humour, rather than in the vitreous; becauſe of its greater fluidity for a freedom of deſcent, and becauſe they will then appear to deſcend, as being ſituated before the pupil, or at leaſt before the place of the interſection of the pencils. But if this heterogeneous mother be in the vitreous humor, it muſt be lighter than this humor, ſo that after a ſudden ſhake of the head, it may firſt deſcend a little, and then aſcend gradually, to cauſe the gradual apparent deſcent above-mentioned. La Hire *Diſſert. ſur les differ. accidens de la vue.*

Theſe ſpots are obſerved to change their figures, ſometimes in two or three hours, at other times not in two or three days; and to appear more numerous at one time than another. Id. ibid. and Dr. *Smith*'s Optics in the Remarks, Art. 27. ſeq.



We have an inſtance in the Philoſophical Tranſactions, N°. 384. of thoſe fixed ſpots above-mentioned. A woman, who, in looking with the left eye only, at three ſhort words in print, could ſee the extremes, but not the middlemoſt; and, in looking with the right eye only, at the middle between four ſhort words, could ſee but three of them; one of the two middlemoſt being covered with a dark round ſpot; but in looking with both eyes ſhe could ſee them all.

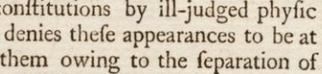
Pitcairn denies the cauſe of the *Muſæ volitantes* to lie in the aqueous humour, and ſays it is owing to, and a ſign of, an internal inflammation of the veſſels of the retina. Heiſter thinks them owing to ſome obſtruction of thoſe veſſels; and both theſe authors, and many others, think them forerunners of a gutta ſerena, or a cataract; and propoſe a cure by mercurials and decoctions of guaicum. See *Pitcairn*'s Elem. Medic. & *Heiſter*'s Compend. Medic. Practic. Plempius has given a deſcription of the *Muſcæ volitantes*, in his Ophthalmographia.

Dr. Porterfield, in the Medical Eſſays of Edinburgh, obſerves, that theſe ſpots may proceed from ſome little extravaſations, verrucoſe ſwellings, or other defects in the retina, which by intercepting the rays will occaſion a defect in the picture; and by conſequence a ſimilar and correſponding defect or ſpot in the object. He obſerves alſo, that theſe ſpots commonly vaniſh, or at leaſt become leſs ſenſible, when the object is brought nearer the eye, and within the limits of diſtinct viſion. For, the rays which are now exactly united upon the retina, by being more crowded have their force augmented; by which means a ſenſible impreſſion is made upon the retina through theſe extravaſations. Hence theſe ſpots are moſt ſenſible to thoſe who have a ſmall pupil, and eſpecially to thoſe who are ſhort, or long-ſighted. Hence alſo, in a preſbytical eye, the ſpots which were formerly very ſenſible, become faint, when the object is viewed through a convex glaſs; for by means of this glaſs more rays enter the eye, which being united exactly at its bottom, muſt ſtrike the retina ſtrongly enough to make a ſenſible impreſſion through theſe extravaſations, which will render the ſpots obſcure.

The learned doctor farther obſerves, that what has been ſaid with reſpect to theſe ſpots, when occaſioned by extravaſations or the defects in the retina, will alſo hold when they are occaſioned by a calloſity, or any degree of paralyſis or inſenſibility in ſome parts of the retina by which the impulſe received from the rays is made leſs ſenſible.

But, beſides theſe defects in the retina, there is another cauſe which may give occaſion to theſe ſpots, both in the *myopia* and *viſus ſenilis*; and that is, certain ſmall opaque marks in the cornea itſelf, or any where within the eye, which, by intercepting ſome of the rays, muſt occaſion a defect in the picture, from which defect a kind of dark ſpot will be ſeen in the object. Thus, in the eye of a myops, if there be any opacity in the cornea, or within the eye which intercepts the rays B*be*, C*cd*, and V L *a*, there will be a defect in the

picture at *e*, *d*, and *a*; from whence alſo the external appearance will be deficient at the correſponding points E, D, and A; where, by conſequence, dark ſpots will be ſeen. For it is to be obſerved, that there is not one point in the picture which is formed by a plurality of rays which meet at the point, but every ray goes to a different point of the picture, both in myopical and preſbytical eyes; and therefore, when any of the rays are intercepted, that part of the picture to which ſuch rays belong will not be illuminated, which muſt occaſion a correſponding defect in the appearance of the object. But in the perfect ſight, where the rays which come from the ſeveral points of the object, are ſo refracted as to meet again at ſo many correſponding points in the retina, every point of the picture is formed by a cone of rays, whoſe baſe is the pupil; and therefore, though ſome of thoſe rays be intercepted, yet no part of the picture will be darkened, and conſequently no defect will be ſeen in the object from any ſuch opacity in the cornea, or humors of the eye, unleſs this opacity be in the back part of the vitreous humor, where the pencil is narrow, and intercepts the whole pencil. This may be proved from the Camera Obſcura, by ſticking ſome ſmall patches on the glaſs. Theſe will not be perceived if the paper is placed at the due focal diſtance; but if the diſtance be greater or ſmaller, the ſpots will appear.



The doctor alſo obſerves, that theſe ſpots are not all of the ſame kind. He thinks that thoſe which change not their place with reſpect to the axis of viſion proceed from ſome defect either in the retina or cornea, or in the vitreous and cryſtalline humors. As for thoſe which are in conſtant motion, he ſuppoſes them to ariſe from ſome corpuſcles floating in the aqueous humor.

Beſides theſe dark ſpots, there is another kind often met with, more bright and luminous than the object itſelf before which they

they appear. These spots appear best by looking at distant bright objects, and are always of the same colour with the object. In the middle their colour is clear and strong, surrounded by a dark shady border. They are commonly accompanied with certain irregular veins, which proceed from each spot, and which as well as the spots themselves change their order and disposition. These veins are also of the same colour with the object, and being bright and luminous in the middle, are likewise terminated by a dark and obscure edge. These spots change their position with respect to the axes of vision, according as the eye is differently moved, being sometimes in the axis of vision itself, and at other times to the right or left of this same axis; but when the eye is kept fixed in the same direction, they, as well as the dark kind of spots first mentioned, commonly descend gradually.

As to the cause of these brighter spots and veins, it seems that, first, they must proceed from some corpuscles within the eye, which are at liberty to change their place, and which therefore must be supposed to float in the aqueous humor. Secondly, seeing these spots always descend when the eye is kept fixed, the corpuscles from which they arise must ascend; and are consequently lighter than the aqueous humor in which they swim. Thirdly, these spots being more bright and luminous than the object, they cannot be occasioned by any opaque corpuscles, which by intercepting the rays would cast a shade upon the retina. What therefore bids fairest for producing these brighter spots and veins, is some small, oily, diaphanous particles and filaments which swim in the aqueous humor before the crystalline; for such, by their lightness, will ascend, when left to themselves; and by their greater refractive power, produce these luminous spots terminated by dark lines. That oily and sulphureous substances, though less dense than water, have a stronger refractive power, is evident from the observations of Sir Isaac Newton. From which it follows, that the rays of light, which pass through these oily particles, will meet sooner behind the crystalline, than the other rays. Whence in a presbytical eye, the rays of light which come from the several points of the object will not converge to so many other points in the retina, but behind it, by which the picture in the retina, will be rendered more dark and obscure; but the rays which pass through these oily grains, by having their refraction increased, will meet nearly at the retina, where they will form small luminous spots, surrounded with dark borders.

But we must here observe, that the same appearances happen to myopes; and this seems difficult to account for from this theory of the learned doctor.

Many medical authors have looked on the *Muscæ volitantes* as forerunners of a cataract, or gutta serena. And we suppose it cannot be denied, that many who have fallen into those terrible disorders have had those appearances before their eyes; and hence they might have been taken for prognostics. But as it is no less certain, that many thousands have the same appearances, and yet preserve their sight very well to the last, there seems to be no great reason to be alarmed about them; and far less should people be running to quacks, and injuring their stomachs and constitutions by ill-judged physic on such occasions. St. Yves denies these appearances to be at all dangerous, and he thinks them owing to the separation of some parts of the retina from the choroid. However, as the disorder is troublesome and alarming to the patient, he advises purgatives from time to time, and millepedes. We can say, from experience, that neither mercurials, nor sea-water, nor other purgatives, nor millipedes, nor again Tunbridge or other chalybeate waters, have had any effect towards removing or diminishing these disorders. A greater dose of wine than usual has been known to increase it for a little time; and Plempius has made the like observation. We shall only add, that several of these flying appearances resemble little globules joined by threads, thus  and these globules appear in different numbers, and at different distances.

All authors agree, that these appearances change their figure; which is true, in some measure; but from our own observation we can say, that though they seem on a sudden looking to the sky, or other bright object, to vary in their figures; yet when they begin to descend, they return in one constant figure before we lose sight of them. On the whole it seems, this phænomenon is not yet fully accounted for. The vascular form of most of these appearances, their resemblances to small veins or arteries, makes it difficult to conceive them floating in the humors of the eye; and, on the other hand, their seeming contortions, and change of figure on suddenly looking up, or shaking the head, makes it no less difficult to conceive them fixed and obstructed capillaries, as many authors suppose.

MUSCARI, in botany, the name of a genus of plants; the characters of which are these: The flower is liliaceous, but consists only of one leaf, of a somewhat globular form, and divided into six segments at the edge; the pistil arises from the bottom of the flower, and finally becomes a fruit of a sort of triangular form, which is divided within into three cells, and usually contains a number of roundish seeds.

The species of *Muscari*, enumerated by Mr. Tournefort, are these: 1. The purple-flowered broad-leaved field *Muscari*, called by authors the great purple boytroide or fair-haired hyacinth. 2. The broad-leaved field *Muscari*, with white flowers. 3. The great blue-flowered *Muscari*. 4. The broad-leaved elegant *Muscari*. 5. The great white-flowered *Muscari*. 6. The *Muscari* with bluish green flowers. 7. The white-flowered byzantine *Muscari*. 8. The branched *Muscari*. 9. The smaller branched *Muscari*. 10. The smaller broad-leaved blue-flowered *Muscari*. 11. The lesser rushy-leaved blue field *Muscari*. 12. The lesser flesh-coloured flowered rush-leaved field *Muscari*. 13. The little rushy-leaved field *Muscari*, with white flowers. 14. The perfumed *Muscari*, with a dark greyish flower. 15. The sweet-scented *Muscari*, with a browniſh flower. 16. The blackish-flowered *Muscari*. 17. The yellow-flowered *Muscari*. 18. The early yellow-flowered *Muscari*. *Tourn.* Inst. p. 347. seq.

We have several species of this plant cultivated in gardens: Three or four for the beauty of their flowers, and one with a purplish green flower for the remarkable sweetness of its scent. In June, when the leaves of these plants are decayed, the roots should be taken up, and spread upon mats in a dry place for a fortnight, till the bulbs are dried; then they may be packed up, each sort by itself, till October, when they are to be planted in borders for flowering the following spring. They should never be suffered to remain in the ground more than two years unremoved; for they multiply so fast that the number of the off-sets greatly weakens the flowering roots, and the flowers are consequently small. They are easily propagated by these off-sets, which are so hardy as to grow even if buried a foot under ground; and the common kind propagates itself so fast this way, that when it has once got possession of a bed it is with great difficulty extirpated. *Miller*'s Gardener's Dict.

MUSCERDA, a name by which some authors have called mouse-dung, a thing recommended by many as a purge for infants; and said to be good in alopecias. Given in clysters it is said to be of service in many disorders of the bowels; and externally applied, to be of great use in condylomata of the anus.

MUSCICAPA, in zoology, a name by which Aldrovand and some others have called the *stone-chatter*, making that bird, which is properly an œnanthe, one of the species of that genus or the fly-catchers. *Aldrovand* de Avid. See the article STONE-CHATTER.

MUSCICAPA, the *Fly-Catcher*, is also the name of a small bird of the ficedula kind, and very nearly allied to the beccifago, or petty-chaps. It is called also in some places, *chivin* and *borin*. It is a little larger than the wren, and has a very sharp-pointed beak. Its head, neck, and back are of a pale grey, and its throat and belly of a yellowish white. Its rump is white; its wings grey; its tail, feet, and legs, are brown; and its claws very slender. *Ray*'s Ornithology, p. 158.

MUSCLE (*Cycl.*)—Mr. Winslow, in his treatise on the *Muscles* in his *Exposition anatomique de la Structure du Corps humain*, shews prodigious varieties in the actions of these organs of motion, which were never so much as hinted at before. Dr. Waltherus, after comparing the *Muscles* of the human body with the descriptions of them published by several authors, particularly by Mr. Winslow, has made several accurate remarks on them, which may serve as a supplement to his *Anatome teneriorum Musculorum repetita*. Nov. Act. Erud. June 1733.

The *Muscles* in fishes are not placed lancellatim, or one upon another in a longitudinal direction; but they are generally laid either transversely or somewhat obliquely one behind another, from the anterior part of the body to the origin of the tail. This structure is best seen in the spinose fishes.

These *Muscles* of the spinose fishes may be conveniently divided according to their situation into the dorsal, pectoral, and neutral. After these, the inferior ones of that part of the body near the tail, are to have their place; and finally, the cephalic, or those of the parts about the head.

The dorsal *Muscles* have an interstice in the middle of the length of the back, or are separated longitudinally from one another, and are terminated in the sides over-against the spina dorsalis. The pectoral and ventral *Muscles* take their origin from the basis of the ribs, and they meet in the middle of the breast and belly. The *Muscles* of the lower part of the body arise along the spina dorsi, and meet one another in the bottom of the belly. The cephalic *Muscles* serve to the moving the eyes and the jaws, and are principally four: one is placed on each side under the eyes, and one on each side in the lower jaw. The two former are called the hypophthalmic *Muscles*, and the two others the maxillary *Muscles*; they are most evident in the gadi, &c.

MUSCLES *of Vegetables*. The *Muscles* in animal bodies have been the subject of numerous dissertations; but those in vegetables have been less regarded. Mr. Tournefort, however, has plainly proved, that many of the vessels of plants become in the drying fibres capable of tension; that in many plants there are great numbers of these fibres which have all the same direction, and always act all together, and can only

ſhorten or contract themſelves in one particular direction; wherefore the parts compoſed of theſe fibres are very properly compared to the *Muſcles* of animals. By the word *Muſcle* we underſtand a part compoſed of fibres ſo determinately arranged, that by their contraction they can only move the part in ſome certain and determinate manner; and in this which ſeems the received ſenſe of the word, there are many inſtances in which it may be uſed to parts of plants, with the ſtricteſt juſtice.

All the pods of the leguminous plants, as peaſe, *&c.* are compoſed each of two valves, more or leſs convex on the outſide; theſe are placed evenly upon one another, and faſtened together by means of a great number of very fine veſſels; they are faſtned much more firmly together at the back, than at the fore-rim; and the large veſſels which carry nouriſhment both to the valves and ſeeds, are lodged there, and ſend many ramifications both to one and the other of the valves of the pod.

Each valve is formed of two ranges of fibres; the exterior arrangement is formed into a ſort of net-work, and the threads which compoſe it iſſue from the back of the pod, and are propagated longitudinally and ſomewhat obliquely through the ſurface of the valves, and finally terminate at the edge or fore-rim of the pod, after they have entered into the fleſhy part, with the net-like plexus of veſſels, of which they make frequent anaſtomoſes.

The interior plan or arrangement of fibres croſſes the exterior, in the ſame manner as the interior intercoſtal *Muſcles* in the human body croſs the exterior; and theſe form the inner membrane of the pod: Theſe fibres ariſe like the others from the back of the pod, and run obliquely to the edge. A neceſſary conſequence of this ſtructure is, that the arrangement of exterior fibres muſt become dry before the others, as muſt alſo the fleſhy ſubſtance in which they lie; and the conſequence of this is, that they muſt contract and draw the edge of the valve to which they belong at once upward and outward, and endeavour to ſeparate it from the edge of the other valve, drawing with it the interior arrangement of fibres; this therefore pulls open the pod, and the air which is very hot at the ſeaſon when the ſeeds of theſe plants ripen, inſinuating itſelf into the interſtices of the internal arrangement of fibres which are expoſed to it by the opening of the pod, ſoon acts upon them, and they begin to contract in their turn. Theſe fibres were once the veſſels which conveyed the nutritive juices to the pods and ſeeds; but when that uſe is no longer neceſſary for them, and when no more juices aſcend, after the ſeeds have arrived at their deſtined ſize, they then ſhrink up, and no more perform the office of veſſels, but become mere fibres. As theſe do not all dry up, and ſuffer this change together, but neceſſarily it happens firſt to thoſe which are ſituated at the greateſt diſtance from the pedicle, and conſequently thoſe are the firſt of the interior fibres which act by ſhortening themſelves; this therefore begins at the extremity of the pod, and is continued up to the pedicle, and the effect is that as theſe interior fibres are ſtronger and more numerous than the exterior, which are at this time as far ſhortned as they are capable of, they now draw backwards and inwards the lips of the edge of the pod toward the back. When the warm air acts upon theſe fibres to dry and contract them, it draws nearly equally at both their ends; and therefore if the two arrangements of fibres were regularly tranſverſe, each valve of the pod muſt be drawn by this action into a ſort of tube, or pipe; but as they are placed in an oblique direction, and parallel to one another, the natural effect of their contraction muſt be the drawing the valve into a ſpiral form, which we ſee is exactly the caſe. The lines which form the rim of each valve can make no reſiſtance to this contraction, becauſe they are ſo dried up by the warm air, and want of juices, that they may be crumbled to powder between the fingers, and eaſily break in any part with the ſmalleſt force. This claſs of plants gives numerous inſtances of this ſort of *Muſcles* in vegetables, and they are more obvious than moſt others, being not only common in the hedges but cultivated in gardens for the uſes of the kitchen, *&c.* The ingenious author of the ſyſtem gives many other inſtances in other plants. Mem. Acad. Par. 1693.

MUSCLE, in ichthyology, the Engliſh name of the *Mytulus*. See the article MYTULUS.

Horſe-MUSCLE. See the article HORSE-*Muſcle*.

MUSCULUS (*Cycl.*)—MUSCULI *capitis acceſſorii*. There is ſometimes found a ſmall *Muſcle* fixed by one end to the extremity of the firſt tranſverſe apophyſis of the neck near the inſertions of the two obliqui, from whence running up obliquely it is again inſerted behind the maſtoide apophyſis. This *Muſcle* is commonly thought to be a third ſmall tranſverſalis, on that ſide where it is found; but it ſeems rather to be an additional *Muſcle* to the obliquus ſuperior. The recti, and other obliqui are alſo found ſometimes double. *Winſlow*'s Anat. p. 238.

MUSCULUS *faſciæ latæ*, a ſmall and pretty long *Muſcle* ſituated a little obliquely upward, and downward on the forepart of the hip. It is fixed above to the outſide of the anterior ſuperior ſpine of the *os ilium*, between the inſertions of the *glutæus medius*, and *ſartorius*. From thence its fleſhy fibres run down a little obliquely backward, forming a very flat body four fingers breadth in length, and two in breadth. This body lies between two lamina of the *faſcia lata*, and is inſerted therein by ſhort tendinous fibres, which diſappear at that place where the *faſcia* adheres to the great trochanter, and tendon of the *glutæus maximus*. The *faſcia* is therefore by no means to be looked upon as a tendinous expanſion of this *Muſcle*. *Winſlow*'s Anatomy, p. 211.

MUSCULUS *Latus*. See the article LATUS *Muſculus*.

MUSCULUS, is alſo a name by which ſome call the common ſea *Muſcle*, more properly called *Mytulus*. See the article MYTULUS.

MUSCULUS *Myſticatus*, in ichthyology, a name given by Geſner and ſome other writers, to the common whale or *balæna edentula* of authors. This is diſtinguiſhed from all the other cetaceous fiſhes by Artedi, by the name of the whale with the fiſtule in the middle of the head, and with the back ſharp toward the tail. See the article BALÆNA.

MUSCULUS, among the Romans, a military machine, under cover of which the ſoldiers approached and undermined the walls of places beſieged, or filled the ditches. *Pitiſc.* Lex. Antiq. in voc.

MUSCUS *Arboreſcens Marinus*, in botany, a name given by Count Marſigli to a very elegant ſpecies of ſea-plant. It grows to the rocks at conſiderable depths under water, and is uſually of about three inches high; and is compoſed of ſeveral thick branches, furniſhed toward the tops with tranſparent leaves. The ſtalks are hollow, and it is all ſoft while in the ſea, but grows ſomewhat rigid when dried.

When examined by the microſcope, its ſurface appears to be granulated or covered with a ſort of ſmall glandules, which ſtand very near one another, and on cutting it tranſverſely the whole ſubſtance is ſeen to be hollow, and that general hollow to communicate with all theſe glandules, ſo that their office plainly is ſeverally to receive the ſea-water, and convey it into this general cavity, where it is diſtributed throughout the whole plant for its nouriſhment and ſupport. The leaves of this plant being rubbed on blue paper, give it a yellowiſh green colour.

Count Marſigli has gone through the analyſis of this plant, and as by it we may be informed of the principles and properties of many other ſea-plants of the ſame genus, it may not be improper to give an abſtract of his obſervations.

Four and twenty ounces of this plant being put into a retort, there came over five ounces of phlegm of a ſweetiſh taſte, and of the colour of oil of almonds. The ſpirit was of a duſky earth colour, of a fixed nature, of an unctuous yet ſomewhat acrid taſte, and leaving a bitterneſs behind it; of this there was twelve ounces, and the remainder in the retort was ſix ounces and three drams. So that the whole produce being twenty-three ounces and three drams, there was only five drams of the whole loſt in the operation. The water does not alter the colour of blue paper, on ſteeping in it; being mixed with the decoction of mallow flowers it turns it to an aſh-colour. The decoction of galls becomes of a bluiſh colour, and a ſolution of copperas of a greeniſh aſh-colour with it: The tincture of turnſol becomes of a bluiſh colour, tending to white. Spirit of nitre being added to it cauſes a ſlight fume, and the decoction of mallow flowers being after this added, a fine red colour is produced. Spirit of vinegar turns this green; and no change at all is produced by any of the following liquors, ſpirit of ſalt, ſpirit of ſal armoniac, lime-water, alum-water, oil of tartar: a ſolution of corroſive ſublimate collects a quantity of white and groſs particles, and precipitates them to the bottom. *Marſigli*, Hiſt. de la Mer. p. 73.

The ſpirit being examined with blue paper makes no change in its colour on being ſteeped in it; the decoction of mallow flowers mixed with it becomes of a pale yellowiſh green; the decoction of galls changes with it to a duſky red; a ſolution of copperas becomes of a dirty yellow, and thick; the tincture of turnſol changes to an aſh-colour. Spirit of nitre being mixed with it, cauſes a moderate fume without any ebullition, and the colour of the mixture is a reddiſh grey; on mixing the decoction of mallow flowers with this, it becomes of a yellowiſh red. Spirit of vinegar added, renders it more fluid and of a leſs duſky colour. Spirit of ſalt changes it to a reddiſh colour. Spirit of ſal armoniac, and oil of tartar, make no change at all; but lime-water renders it more clear and fluid. Alum-water collects a quantity of white matter, and precipitates it; and a ſolution of corroſive ſublimate, in like manner turns it white, and precipitates the groſs parts. The *caput mortuum* yielded one dram and ten grains of fixed lixivial ſalt; the taſte of this is but moderately acrid, and its colour a greyiſh white; being rubbed on blue paper it changes its colour to its own. The decoction of mallows on mixing this ſalt with it loſes its blue colour, and becomes grey; and on frequently ſhaking the veſſel, it finally becomes yellow. Spirit of nitre mixed with this ſalt does not ſo readily or violently efferveſce with it, as with moſt other lixivial ſalts; and if a little turnſol be added to this, it becomes of the colour of red wine. Spirit of vinegar diſſolves it very quickly, and becomes thick and turbid with it. Spirit of ſalt diſſolves it very readily, but makes no fume, though a very conſiderable ebullition.

ebullition. Lime-water diſſolves it ſlowly, and carries it to the ſurface; and alum-water, in like manner, on diſſolving it is covered with a thick ſcum at the top: Corroſive ſublimate added to this, precipitates the ſalt again, without altering its colour. Spirit of ſal armoniac, and oil of tartar, make no change upon it. It is remarkable, that this plant contains no volatile ſalt.

MUSCUS *Marinus latus*, the broad and flat ſea *Moſs*, a ſea-plant deſcribed by Count Marſigli. It is found in ſeveral places at different depths, growing to the rocks and ſtones. Its upper ſurface is compoſed of a ſeries of leaves of an auriculated figure, amaſſed together in an irregular manner; but its under-ſide is ſmooth and even, except that it is beſet with a number of ſoft points or eminences, which are not eaſily diſtinguiſhed by the naked eye. Theſe, when a microſcope is uſed, are found to be ſo many little white tubes of a cylindric figure; theſe are evidently the apertures by which the plant receives its nouriſhment; for in this, as in the other ſea-plants in general, when the root faſtens upon a rock or ſtone, it is not to extract nouriſhment from it, but only to fix itſelf firm in its place by it; for the whole ſurface of the plant takes in nouriſhment from the circumambient water, and every part acts as a root receiving ſupplies for the whole. *Marſigli*, Hiſt. Mer. p. 73. See the article Moss.

MUSEAU, in natural hiſtory, a term applied by Mr. de Reaumur to a ſort of bladder which the inſects of the fly claſs are provided with to make their way out of their ſhell, after their laſt transformation into the nymph ſtate.

The word is French, and literally ſignifies a ſnout or muzzle. The flies to whom nature has given this inſtrument, have it only during that ſhort ſtage of their lives which is between their being encloſed in the membrane which covers them in the nymph ſtate, and their firſt flying about at liberty. At this time, in order to their getting out of their ſhell, nature gives them a power of inflating and ſwelling out their head to a great ſize, and throwing out this ſort of bladder from its anterior part, by which means the cap of the caſe or ſhell is thrown off, and the end of it opened by the two longitudinal lines giving way. The creature, after this, as it has no uſe for this ſingular piece of mechaniſm, ſo it has no power to exert it during the remainder of its life. *Reaumur*, Hiſt. Inſ. vol. 4. p. 340. See the article Transformation.

MUSEBYTER, in zoology, a name given by ſome to the fiſh called by authors *Dobula*, a German fiſh, found in ſeveral parts of Germany; much approaching to our common dace. *Willughby*'s Hiſt. Piſc. p. 261.

MUSEIA, Μουσεια, in antiquity, feſtivals in honour of the muſes at ſeveral places of Greece, eſpecially among the Theſpians, where ſolemn games were celebrated every fifth year. *Potter* Archæol. Græc. l. 2. c. 20. T. 1. p. 415.

The Macedonians had alſo a feſtival in honour of Jupiter and the muſes, which was celebrated with ſtage-plays and games, and laſted nine days, according to the number of the muſes. *Potter*, ibid.

MUSHROOM, *Fungus*, in botany, the name of a genus of plants; the characters of which are theſe. It is a headed vegetable compoſed of a pedicle crowned with a broad head, which is convex and ſmooth at the top, and hollow, foliated, lamellated or fiſtulous on the other ſide. See Tab. 1. of Botany, Claſs 17.

The ſpecies of *Fungus*, enumerated by Mr. Tournefort, are theſe: 1. The common eſculent *Muſhroom*, with a broad round head. 2. The *Muſhroom* with broad and round livid heads. 3. The large ſweet-ſcented royal *Muſhroom*. 4. The white *Muſhroom*, with a broad orbiculated head. 5. The yellow *Fungus*, with a flat ſtalk, and rounded head. 6. The flatted round and hairy-headed *Fungus*. 7. The reddiſh brown ſmooth orbicular-headed *Fungus*. 8. The large flat orbiculated headed *Fungus*, with rough prominent veins. 9. The great *Fungus*, with a protuberant head variegated on the upper ſide, and hairy underneath. 10. The plain-headed brown *Fungus*, with lacerated edges. 11. The broad-headed *Fungus*, with a long variegated pedicle. 12. The round-headed ſpring *Muſhroom*. 13. The white-headed meadow *Muſhroom*. 14. The flat round-headed yellow *Muſhroom*. 15. The white and brown furrowed round-headed *Fungus*. 16. The brown bulboſe *Fungus*, with a double head. 17. The browniſh white *Fungus*, with pointed heads. 18. The ſmall umbilicated *Fungus*. 19. The variegated navel *Muſhroom*. 20. The orbicular *Fungus*, with the edges bent inwards. 21. The angular *Muſhroom*, with jagged edges. 22. The thick porous *Muſhroom*. 23. The white wood *Muſhroom*, with an acrid pepper-like milky juice. 24. The broad ſcarlet-headed *Muſhroom*, with a ſweet and well-taſted milky juice. 25. The little milk *Muſhroom*, with very long and ſlender pedicles. 26. The great all-white eſculent *Muſhroom*. 27. The white *Muſhroom*, called biſette. 28. The great-headed *Muſhroom*, with heads brown on the upper ſide, and white underneath, and with a ſpotted ſtalk. 29. The yellowiſh red *Fungus*, with greeniſh gills. 30. The great reddiſh *Muſhroom*, with a ſhort thick ſtalk, and white gills. 31. The lamellated *Muſhroom*, with a broad thin and membranaceous head. 32. The yellow and white ſmall viſcid meadow *Fungus*. 33. The red ſmall viſcid meadow *Muſhroom*. 34. The ſmall tender duſty *Muſhroom*, with heads grey on the upper ſide, and covered on the under ſide with thin black lamellæ. 35. The ſmall *Fungus*, with a long pedicle, and a half-round yellowiſh head. 36. The ſmall *Muſhroom*, with a long tough and firm ſtalk, and a head pointed at the top, and ſhewing the ſhell of the gills on the out-ſide. 37. The ſmall *Fungus*, with a long ſtalk, and a head ſtriated on both ſides. 38. The very ſmall *Fungus*, with a conic reddiſh brown head, and a few lamellæ. 39. The very ſmall whitiſh grey *Fungus*, with a long ſlender pedicle, and but few lamellæ. 40. The duſky brown *Muſhroom*, with heads pointed at the top. 41. The conic-headed orange-coloured *Fungus*. 42. The yellow *Fungus*, growing in cluſters about the roots of trees. 43. The browniſh *Fungus*, growing in cluſters on rotten wood. 44. The white ſhining *Fungus*, growing many together. 45. The larger ſhield-faſhioned *Fungus*. 46. The ſmaller ſhield-faſhioned *Fungus*. 47. The red orbiculated marſh *Muſhroom*. 48. The ſmall yellow funnel-faſhioned *Muſhroom*. 49. The white *Fungus*, with inverted heads. 50. The ſmall turbinated cluſter *Muſhroom*. 51. The velvety lamellated tree *Muſhroom*. 52. The ſmall lamellated *Muſhroom*, growing to alders in the ſhape of a comb. 53. The hard white tree-*Muſhroom*, with lamellæ reſembling the blood-ſtone. 54. The ſmall white lamellated *Muſhroom*, with a long ſlender pedicle. 55. The white hairy tree-*Muſhroom*, lamellated underneath. 56. The orbicular hazel *Muſhroom*. 57. The orbiculated *Muſhroom*, called the toad-ſtool. 58. The white inſipid *Muſhroom*, with conic heads. 59. The white orbiculated birch *Muſhroom*. 60. The reddiſh black orbiculated *Muſhroom*. 61. The flie *Muſhroom*, ſo called becauſe it is ſaid to kill flies. 62. The broad white orbicular *Fungus*. 63. The broad orbicular *Fungus*, with the edges turning inwards. 64. The bulbous-ſtalked *Fungus*. 65. The broad *Fungus*, with jagged edges. 66. The *Fungus*, with edges divided into five ſegments. 67. The orbiculated autumnal oak *Muſhroom*. 68. The truffle-like *Muſhroom*. 69. The *Muſhroom*, reſembling in colour and in ſmell the root of ſow-bread. 70. The thick conic-headed *Fungus*. 71. The red firr *Muſhroom*, with reflex edges. 72. The common greyiſh white cluſter *Muſhroom*. And, 73. The ſcaly and globoſe American ſcarlet *Muſhroom*. *Tourn.* Inſt. p. 556. ſeq.

Muſhrooms are plants more perfect than many people imagine; they have a regular root, a ſtalk conſiſting of ſeveral arrangements of fibres, the interſtices of which are filled up with a parenchymatous ſubſtance, leading from the root to the head or umbel; the under ſide of this umbel is full of lamellæ or chives, every one of which is a regular pod or ſeed-veſſel. If theſe lamellæ are examined in their ſeveral ſtates, the ſeeds in them may be eaſily diſcovered, and are always found to be of a ſize and degree of maturity proportioned to the ſtate of the plant at that time; they have each of them alſo a ſiliquaceous aperture lengthwiſe, the ſeeds lying in rows ready to fall through it. The plant is eaſily and regularly propagated through theſe, and not only may be raiſed from ſeed, but, like many other plants, may be propagated by roots. The ſeveral filaments at the root producing tubercles, in the manner of the potatoe; from each of which there will ariſe new roots, and a new plant. The periods of vegetation in this plant are alſo ſufficiently regular; and the common opinion of its ſpringing up in a night, and periſhing in a day, has no foundation in reality. For, in the common way of raiſing them on hot beds, it is eaſy to find, that they often ſtand a fortnight or longer from their firſt appearance, before they are fit for the table. Phil. Tranſ. N°. 472. p. 160.

Notwithſtanding that the ſeeds of ſome ſpecies of *Muſhrooms* have been diſcovered, the accurate Buxbaum is of opinion, that very many plants of this genus propagate themſelves greatly by root, and are truely perennial; and this he ſupports by many ſolid arguments, drawn from obſervations of the ſeveral ſpecies of *Muſhroom*, or *Fungus*, which are obvious and under the eye of every obſerver, at many times of the year.

1. There are ſome *Funguſes* which, while young, or when firſt appearing out of the earth, ſtand on a pedicle which is very lightly rooted, or does but penetrate a very little way into the earth; but after the head has expanded itſelf, and is withered, this bottom of the pedicle pierces deeper into the ground, and there acquires a greater thickneſs and becomes a ſort of bulb, remaining there in that ſtate till the next year, when it brings forth a new plant.

2. There are certain ſpecies of *Funguſes*, which grow on the old ſtumps of tree; theſe ſend their roots deep into the ſubſtance of the rotting wood, where they alſo remain many years, and annually produce new *Funguſes* at a proper ſeaſon. Of this ſort is the cluſter *Muſhroom* of old trees, deſcribed by Mr. Tournefort; the roots of this, as of the former kind, do not begin to deſcend or inlarge in length and thickneſs till the upper part of the plant withers; but they then begin to grow and often force themſelves into the crevices to a great length, and become ſtrangely divaricated: To this is owing the erroneous account of ſome authors of *Muſhrooms* or *Funguſes*, found ſpreading and branching between the bark and the wood of old trees, ſuch ſuppoſed *Funguſes* having been only

only the enlarged roots of ſome known ſpecies, whoſe upper part is decayed; but which, at a proper ſeaſon, will be received from theſe roots. The agarics always grow upon trees, and wherever they are fixed, there is always a callous tubercle in the wood under them, which denotes the paſſage of the root. Thus what Breynius calls the leather-like blood-red oak *Muſhroom*, is no other than the root of the common endive tree-*Muſhroom*; and the cylindric tree-*Fungus* or touchwood of Dillenius, is only the root of the common cluſter *Fungus* above deſcribed.

3. There is a ſpecies of *Fungus* which, while young, is round, and ſeems to have no fibres, or roots; but theſe at length decaying, become filled with a dry duſt or ſubtle powder, and then they puſh down very numerous roots into the earth; and among theſe roots there are placed ſeveral globules, which are no other than compleatly organized *Funguſes* of the ſame kind with the other, and ready to appear like it in a ſucceeding year. The common boletus, and ſeveral ſpecies of the lycoperdon, ſhew inſtances of this. Ray obſerves the ſame ſort of propagation by roots in that ſpecies called *fungus phalloides*, which, he ſays, creeps a long way under the ground, with white fibrous roots variouſly interwoven one with another; and to which there are affixed, at certain diſtances, little globules, which are ripened into more *Funguſes* of the ſame kind in a ſucceeding year. Acta *Petrop.* vol. 3. p. 265.

The violet-coloured *Fungus*, creeping on wood in manner of a herpes, deſcribed by Mr. Ray, is no other than the root of the violet-coloured meſenteric agaric, and the black compreſſed *Fungus* variouſly branching between the bark and the wood of trees, is the root of the black-fingered *Muſhroom* of Mentzelius, or the plant itſelf impeded in ſome accident in its growing.

4. There are *Funguſes* which creep with their pedicles, and ſhoot out roots from them; and now and then young plants, in the manner of the plants of the more perfect kind, which have creeping ſtalks; of this kind there are ſeveral ſpecies, which grow on the decayed fruits and leaves of trees, all of which plainly propagate themſelves by the root.

In ſeveral ſpecies of theſe plants there is placed round the ſtalk, at a ſmall diſtance from the head, a ſort of ring of a tough matter, reſembling the outer covering of the whole *fungus*; this uſually catches many of the ſeeds of the plant in their fall from the head when ripe, in order to the re-producing the ſpecies; and hence ſome have been of opinion, that it was placed there by the author of nature, in order to break the fall of the ſeeds, and preſerve them from the fury of the winds, in their falling from too great a height, in reſpect to their extreme lightneſs; but it rather appears, that the ſeeds often found on this ring, fall there only by accident, and are there detained by a viſcoſity with which that part of the plant abounds; and that the uſe of this ring is very different.

Linnæus has claſſed the *Funguſes* in general, together with the fig-tree, the ſeveral ſpecies of the ferns, the moſſes, and ſome others, under the character of *cryptogamia*; that is, ſuch plants as perform the great work of their fructification in ſecret, or at leaſt whoſe flowering and ſeeding are not obſerved ſo eaſily, as in thoſe plants which we uſually call the more perfect ones. In ſome of theſe the beſt microſcopes have not yet been able to inform us of the true manner in which this is performed, and many of the *Funguſes* or *Muſhrooms* are of this number.

Almoſt all the *Muſhrooms* which have thick and fleſhy umbels, and fleſhy ſtems, have this ſort of ring round their ſtalk, from which, when the plant is young, and not yet in a flowering ſtate, there ariſes a membrane which connects the rim of the umbel to the ſtem, and preſerves the under part while in this ſtate; but when this time is over, the umbel, which was before of an hemiſpherical figure, growing larger, and the membrane not giving way, it is torn off from the rim of the umbel, and adheres only to the ſtem. Soon after this the ſeeds ripen, and the umbel then loſing its former figure, commences almoſt a plane. This is the ſtate in which the plant is ſold in our markets under the name of *flaps*.

When the umbel is of this figure, the ſeeds being perfectly ripe, muſt fall upon the whole ſpace covered by the umbel, and as a part of this ſpace the ring muſt receive its ſhare of them; but there is no reaſon to believe that it receives more than are allotted to ſuch a part of the determinate ſpace on which they are to fall.

As to thoſe ſpecies of *Muſhrooms* whoſe ſtems are ſlender, and their umbels thin, ſoft, and ductile, they never have this ring at all, and yet their ſeeds have often farther to fall than thoſe of the other kinds which have it, as they are uſually taller plants. The rims of the tender umbels in theſe kinds clap themſelves quite cloſe to the ſtalks, in the form of a contracted umbrella, and expand as the others do when the ſeeds are ripe; and the ſpecies of *Funguſes* of this kind are much more numerous than thoſe of the former, and propagate themſelves full as regularly.

The poiſon of *Muſhrooms* has been much talked of by ſeveral perſons; but there ſeems to be no certain account of any body's ever having been injured by eating the common *Muſhroom*, unleſs by accident, as from the eating too many at once, and thereby over-loading the ſtomach; or by their being eaten by perſons who had a particular diſlike to them, as ſome perſons have to the moſt innocent aliments, particularly to cheſe. If theſe *Muſhrooms* had any poiſonous quality, it muſt have been often found out by the phyſicians in ſuch a place as London, where there are annually ſuch vaſt quantities of them conſumed, yet nothing of this kind is obſerved; and there ſeems, upon the whole, to be nothing hurtful in this ſpecies; though there may be many others which are truly poiſonous. Nor is it any more wonderful, that the different ſubjects of this claſs of vegetables ſhould differ in their virtues, than that thoſe of other kinds ſhould. The roots of carrots and parſnips are daily found a very wholeſome food, while thoſe of other plants of the ſame claſs, ſuch as the water-hemlock, the dropwort, and others of the umbelliferæ are known to be poiſonous.

The antients have taken great pains to diſtinguiſh the ſeveral kinds of *Muſhrooms*, that the world might know the hurtful from the ſafe. The boletus mentioned by Juvenal, on account of the death of the emperor Claudius, is ſufficiently deſcribed by Pliny. Cluſius, among the moderns, has deſcribed a vaſt number of different ſpecies, every where diſtinguiſhing the eſculent and wholeſome from the poiſonous or pernicious kinds. The ſeveral authors who have treated of them ſince the time of Cluſius, have all mentioned the effects of ſome or other of the poiſonous kinds; and there are numerous inſtances of the miſchief done by them at one time or other. Some have been willing to aſcribe this miſchief to animalcules inhabiting the plant; but this ſeems erroneous, and particularly from the following inſtance: We have one kind of *Muſhroom* growing in England, called the white acrid *Fungus*. This is ſo extremely ſharp, that it ſtimulates the tongue, as if it had been touched with ſpirit of nitre: And Tournefort obſerves, that if rubbed on blue paper, it turns it red in the ſame manner as that liquor, or any other of the violent acid ſpirits would; this cauſtic quality remains in the plant even after drying; and it is very evident, that we need look no farther than this for the origin of the poiſonous quality in this ſpecies. There is another kind which is obſerved to kill the very flies as they ſettle upon it. It is not probable that ſuch plants as theſe ſhould be inhabited by any kind of animalcules, nor is it neceſſary to have recourſe to ſuch cauſes of the miſchief which enſues from the eating them, when their own juices ſeem ſo very able to have occaſioned it. Philoſ. Tranſ. N°. 473. p. 54.

Mr. Miller ſays, that the true eatable *Muſhroom* is diſtinguiſhed from the poiſonous and unpleaſant kinds by theſe marks. When young it appears of a roundiſh form like a button, the ſtalk as well as the button being white, and the fleſhy part very white when broken, the gills within being livid. As they grow larger they expand their heads by degrees into a flat form, and the gills underneath are at firſt of a pale fleſh-colour; but as they ſtand long, become blackiſh.

In order to propagate *Muſhrooms*, the meadows and paſtures ſhould be ſearched for them in Auguſt and September; and wherever they are found, the ground ſhould be opened all about the roots, where there will be found abundance of ſmall white knobs. Theſe are to be taken up with lumps of earth about them. Then ſome new horſe-dung muſt be procured, and the litter being ſhaken out, the dung muſt be laid together on a heap to ferment for eight days. A trench muſt then be dug, and the dung laid in it a foot thick, and covered over ſix or eight inches thick with light rich earth; and into this, on each ſide, ſhould be put in the knobs of *Muſhroom* ſpawn, as it is called, at ſix inches diſtance. After this another layer of dung is to be made upon this earth, to ſix or eight inches thickneſs, or more, but obſerving to draw in the ſides, ſo as not to cover the knobs of *Muſhrooms* above half an inch; then another layer of earth is to be laid on this, and ſome more knobs of the *Muſhroom* ſpawn placed on this at the ſides, as in the former; then put on a third layer of dung, drawing it in ſtill narrower, that it may not cover the ſecond plantation; and cover this with another layer of earth, drawing this up into a ridge at the top, and planting more of the *Muſhroom* ſpawn in this; but ſtill laying it in ſideways as before. When all is thus finiſhed, the whole bed is to be covered half a foot thick with dry litter, to prevent the earth from drying too faſt. When the bed has been made a fortnight, it ſhould be carefully looked over, drawing away the litter with the hands, to ſee whether any young *Muſhrooms* appear; and they muſt be gathered as they grow large; for if ſuffered to remain, they will rot upon the bed, and deſtroy all the young ſpawn that is about them. And when they begin to produce, the bed muſt be ſearched every other day all the year round, and every day in Auguſt and September, which is the time of their principal increaſe, to gather ſuch as are fit for uſe. The manner of gathering them is, to pull them gently out of the ground, ſo that no part of their ſtalk may be left behind; but if any part of the ſpawn is pulled up with the ſtalk, that muſt be carefully returned into the bed. As the cold or wet weather comes on, the covering of dry litter over the whole bed muſt be increaſed. A bed thus managed, will remain good many months, and produce vaſt abundance of *Muſhrooms*; and the ſpawn may be at times taken out from it to ſupply other new beds.

beds. At whatever time of the year this is taken up, it ſhould be carefully laid up in a dry place till the month of July following, which is the proper time for planting it in new beds. *Miller*'s Gardener's Dict.

The vaſt variety of known *Funguſes* which are found regularly every ſeaſon in their proper ſoils, are not all that the naturaliſt has to enquire into the nature of; there are others whoſe productions are much more ſurprizing. Theſe are ſuch as are only ſeen once or twice in an age, and that in places where it is very difficult to account for the manner of their production. One of theſe we had ſome years ago, which appeared upon an old piece of wood in a blackſmith's cellar in the Hay-market, and grew to twelve inches or more in height; and, when cut down, appeared again at the ſame time the next year, and ſo on for ſeveral ſucceeding years, as if, contrary to the nature of the generality of theſe plants, it had a perennial root, and grew regularly from the old ſtock. This appeared to us a ſingular production, and a wholly new ſpecies; but ſo long ago as in the year 1692, Mr. Tournefort found ſuch a one growing on an old beam in the abbey at St. Germains. His deſcription of it is very accurate; and its reſemblance with ours as great as could be expected, in ſo looſe a growing plant as an irregular *Fungus*. It was compoſed of a cluſter of five large and thick leaves, and made ſomewhat of the appearance of the tympanum of the capital of a Corinthian pillar, but in a coarſe way; it was about ſix inches high, and nine inches wide; and each leaf or part was about half an inch in thickneſs. They were all very ſolid, and capable of continuing a long time without decay. They all aroſe from the ſame baſe, and forming pedicles ſeparately, they again united, and made a broad and beautiful aſſemblage of joined leaves to the top. They expanded a little above this joining, each into the figure of a deer's horn; and at the edges were ſo cut and ſinuated, that they not unaptly reſembled the leaves of certain cut and curled cabbages, common in our gardens; they were of a pale yellowiſh colour, like that of buff-leather, and had a border of a ſtronger yellow about their outer edge; the internal ſubſtance was white, and very hard and firm, though light, and was pierced in different places with a vaſt number of holes, many of which were large, and reſembled thoſe of a ſponge or pumice; theſe all had apertures on the ſurface of the leaves; and theſe apertures, when examined with a microſcope, were found to be ſurrounded with a wrinkled rim, covered with a very fine and ſubtil powder, the greater part of the grains of which hung to a fine filament, and might be taken for the ſeed of the plant. The back-ſide of the leaf was more ſmooth and gloſſy than the other. It had ſeveral ribs, which run out into ramifications, that might eaſily be traced by the eye to their extremities at the edges of the leaf; and this part of the leaf was in many places covered with a ſort of tartarous cruſt, which ſeemed to be a ſort of placenta or ovary; but on examination there appeared no rudiments of ſeeds in it. The beam on which this *Muſhroom* grew was very firm and ſound in all other places, but juſt where it was rooted there was a crack out of which moiſture ouzed; and probably the beam was in that part rotten, or worm-eaten within. The ſmell of the plant was like that of others of the ſame kind, and an infuſion of a piece of it turned an infuſion of turnſol to a bright red; ſo that it manifeſtly abounded in acids.

It is not eaſy to account for the appearance of theſe plants which are ſeen ſo rarely, and that in places where no plant could be expected to grow: the only probable ſolution of the point ſeems this, that as the ſeeds of the *Muſhroom* kind are all very minute, and generally in theſe ſpecies which have no lamellated heads, cover the whole ſurface of the leaves, the number of ſeeds produced by one ſuch plant muſt be numerous beyond all account, and at the ſame time light enough to float about in the air. Theſe muſt be at times thrown againſt a thouſand different bodies where there is no proper nouriſhment for them, and muſt therefore periſh; whereas if many accidents are required to concur, to make a ſoil proper for it to grow in, wherever ſuch ſoil happens to be produced, as the air has free acceſs every where, it is not impoſſible but that, at one time or other, one of theſe ſmall ſeeds may happen to be properly depoſited. Mem. Acad. Par. 1692.

The Laplanders have a way of uſing *Funguſes*, or common toadſtools, as we call them, as the Chineſe and Japoneſe do the moxa, to cure pains. They collect the large *Funguſes* which they find on the bark of beech and other large trees, and dry them for uſe. Whenever they have pains in their limbs, they bruiſe ſome of this dried matter, and pulling it to pieces with their fingers, they lay a ſmall heap of it on the part neareſt to where the pain is ſituated, and ſet it on fire. In burning away, it bliſters up the part, and the water, diſcharged by this means, generally carries off the pain. 'Tis a coarſe and rough method, but generally a very ſucceſsful one, eſpecially when the patient has prudence enough to apply it in time, and reſolution enough to bear the burning to a neceſſary degree.

MUSHROOMS *growing out of Flints*. Naturaliſts have of long time obſerved, that there are ſea *Funguſes* of a very different ſubſtance and ſtructure from any of the common kinds, growing on rocks, ſtones and corals, or other ſtrong ſea plants, which ſeem wholly incapable of ſupplying them with any vegetable nouriſhment. Theſe have been ſuppoſed to be as it were all root, and to take in their nouriſhment at every part of their ſurface from the circumambient water: But in the year 1739 Mr. Alefeld obſerved a like ſort of *Funguſes* growing in places where they had no ambient fluid to afford them nouriſhment, except the air, and yet were fixed upon as unpromiſing a baſis for the ſupplying them with any, as thoſe of the ſea. Theſe were found on common flints on the ſurface of the earth. This gentleman obſerved, that a great many various ſpecies of flints which lay in part buried in the earth, and in part lying above its ſurface, were on this open part covered with a ſort of white duſt. This was in July, and in hot dry weather. Having the curioſity to examine this duſt with a microſcope, every particle of it was found to be a compleat and perfect *Fungus*, all of the ſame determinate figure, and much reſembling the common earth *Muſhrooms*. They were white in colour, and had each a very ſhort pedicle, in many, ſcarce to be ſeen at all; their head was round and umbilicated, and very elegantly and evenly ſtriated on the upper part, the ſtriæ or furrows all running from the center to the circumference; and the rim of each head being a little elevated. Upon the whole, they not unaptly reſembled in miniature a common tea-cup inverted, and the ſaucer inverted alſo, and placed upon it. The ſubſtance of theſe *Funguſes* was of two kinds, the one furniſhed a cortical part or covering, and the other filled up the whole internal ſpace.

The internal part was ſoft and ſpongy, and much like what the inſide of the common *Muſhroom* is: this was white. The outer or cortical part was reddiſh, and rather repreſented a congeries of ſmall grains of ſand, collected into that form by ſome glutinous matter, than any ſolid or continuous body. The thin external coat of this being removed, there were ſeen within it a multitude of ſmall round globules of gloſſy ſurfaces, reflecting the light in manner of ſome of the ripe ſmooth ſummer fruits, ſuch as the cherry, and the like. This was their appearance when freſhly uncovered; but after they had been expoſed ſome time to the air, they became flaccid, fell almoſt flat together, and were umbilicated and marked with rays from a center like thoſe of a ſtar.

Theſe *Funguſes*, if not injured by accidents, remain in their perfect ſtate a long time upon the ſtones. Five months keeping produces no alteration in them; but at length they become flaccid and wither, and in this ſtate are not to be recovered by water, as many of the common land *Funguſes* will, which ſwell, and for a time appear plump on being wetted.

They grate harſhly like ſtony matter between the teeth, and reſiſt the force of acid menſtruums; they bear the great degrees of heat or cold without any injury; but if they are expoſed to a flame, the outer covering of the head burſts and flies off, and theſe red globules come in full ſight, while the reſt of the *Fungus* remains unaltered. The ſame effect is produced by plunging them into hot water; and if they be boiled in water, over a ſtrong fire, the globules are diſlodged and loſt in it. If the flints on which they are produced, are heated red hot, the *Funguſes* are deſtroyed, and wholly diſappear in the places where they were; only the fragments of the outer covering of the head remaining ſcattered, on different parts of the ſtone, like pieces of broken pots or glaſſes: theſe fragments loſe their red colour, and are found grey. On the whole, it appears from theſe experiments, that the cortical part of this *Fungus* is not of the nature of common vegetable matter, but is truly ſtony; ſo that the plant may be properly arranged among a ſet of *lythophyta*, or ſtone plants, properly ſo called. The author of this curious diſcovery obſerves, that he uſually found many ſmall red inſects running about upon theſe ſtones, and among the cluſters of *Funguſes*. Theſe afforded at leaſt a proper retreat or nidus for them, if not food; for it is poſſible the internal part of the *Funguſes* might be eaten by them. Act. Eruditor. Ann. 1739.

Baſtard MUSHROOM. See the article FUNGOIDES.

Pepper MUSHROOM. See the article PEPPER.

MUSHROOM *Galls*, in natural hiſtory, a name given by authors to a ſmall ſpecies of galls very common on the leaves of the oak in September and October, and reſembling the common eſculent *Muſhroom*. They are placed on the upper ſurface of the leaf, and are often in great numbers on the ſame leaf, ſome containing twenty or thirty, and others only three or four. The leaves which have conſiderable numbers upon them, make a very beautiful figure, and appear as if ornamented by art with a number of elegant figures. Theſe galls are uſually about a ſixteenth, though ſometimes a tenth of an inch in the diameter; they are compoſed of an orbicular head, which adheres to the leaf by a very ſhort pedicle, ſo that its edges, which droop a little in the manner of thoſe of the common *Muſhroom*, uſually touch the ſurface of the leaf all round. Theſe little galls are of various colours, according to their different degrees of maturity; they are of a greeniſh white at firſt, after that they become of a yellowiſh tinge, from which they paſs through all the ſhades of orange and flame colour, to a very beautiful red, which is always their colour when perfectly mature. When they are obſerved by the microſcope, their ſurface appears hairy, and the ſeveral

hairs all ſtand near one another at their baſes, and diverge at their points, as is the natural conſequence of their ſtanding on a convex body. *Reaumur*, Hiſt. Inſects. vol. 6. p. 194.

The uſe, as well as the figure of this gall is very ſingular. Malpighi and Mr. Reaumur have both deſcribed it, and the former of theſe authors deſcribes a cavity in the center of the head; but this ſeems to have been done at random, and rather ſuppoſed from analogy, than ſeen in fact; for the latter author, who is perhaps one of the moſt accurate obſervers that ever wrote, could never find any cavity in any one of the great numbers he diſſected; but he obſerved what was an uſe of the ſame kind with that of the other galls, in this, though performed in a different manner; they are plainly all deſtined for the lodgment and ſecurity of ſmall animals; and as, in the generality of them, theſe little creatures are contained in their ſubſtance, ſo in this they are ſheltered from injuries by it, though in another manner. For although there are not inſects lodged in the ſubſtance of it, there are always a great number found in the ſpace, encloſed within its circumference, as its edges every where touch the ſurface of the leaf, and the whole forms an arched dome with an upright pillar or pedicle in the middle. Theſe worms perfectly reſemble in figure thoſe of the lime galls, but they are of a yellow colour. There are uſually found a dozen or more of them under one gall, though ſometimes there are only two or three, or but a ſingle one. Theſe are ſo ſmall as not to be diſtinctly ſeen without the help of glaſſes; but they are of the nature of thoſe worms which turn into two-winged flies. Their manner of living is the ſame as that of thoſe contained in the ſubſtance of galls, for they continually ſuck and gnaw the inſide or under ſurface of the gall, and thence it increaſes in growth till they have done eating. *Reaumur*, Hiſt. Inſ. vol. 6. p. 19.

The flies into which theſe worms are finally transformed, have not yet been diſcovered; but this is no wonder, ſince the animals themſelves are ſo minute as to require glaſſes to view them. It is probable that they undergo their change into the chryſalis ſtate in ſome other place, for they are never found in it under the galls; but this is common alſo to many other ſpecies.

MUSHROOM *Worms*. The various ſpecies of *Muſhrooms* are ſubject to be eaten and deſtroyed by a great variety of inſects. There is however one ſpecies which is more frequent than all the reſt, and which has therefore obtained, among authors, the name of the *Muſhroom worm*. This is a white worm, with a hard ſcaly black head; it has ſome fleſhy tubercles, which it throws out at pleaſure from the under part of its ſeveral rings, and which ſerve it as legs. This is found indifferently in almoſt all the ſpecies of *Muſhrooms*; but in none ſo frequently as in the great wood-*Fungus*, which is porous and greeniſh underneath. Theſe worms have been watched in vain by ſeveral curious obſervers, to know what would be their laſt ſtate; but the difficulty was, that when the *Muſhrooms*, with the worms in them, were put into boxes for their transformation, they ſoon corrupted and ran into water, in which the worms were drowned. The putting earth in the box under the *Muſhrooms*, ſucceeded no better than this, the *Muſhroom* moiſtening all the earth about it too much by its decay, to ſuffer the worms to live in it: At length Mr. Reaumur found the proper method, which is, to put only ſmall fragments of the *Muſhroom* on large beds of earth in large boxes; and in this caſe the worm uſually lives to change into its nymph ſtate, and by this means at length acquires its perfect ſtate, and is found to be a tipula or long-legs of no great beauty, being of a duſky brown colour, and middling ſize.

The other ſpecies of *Funguſes* have alſo their worms; but there is one of a very ſingular nature, which is found frequently on the agaric which grows on the ſtumps of oak-trees, eſpecially near the roots. This is a long and ſlender worm, ſomewhat flatted, and reſembling a ſmall leech, but that it has a hard and ſcaly head of a blackiſh colour. The body is compoſed of many rings, in the manner of the earth worm, and looks very bright and gloſſy, being always covered with a viſcous liquor. This creature is eaſily found, for it never eats into the ſubſtance of the *Fungus* but only crawls about upon its ſurface; the traces, wherever it has been, are marked with a coat of a ſhining varniſh, and reſemble the places over which ſnails have crept. There is ſomething very ſingular however in this creature's uſe of the viſcous humour it is covered with, which is not obſervable in the ſnail kinds. It is an extremely tender creature; and nature ſeems to have given it this liquid covering as a defence againſt the injuries of the external air, which would otherwiſe ſoon dry it up and kill it. This it defends itſelf from in the following manner: It fixes upon a place where it deſigns to remain ſome time, and then begins to make itſelf an habitation, by extending this viſcous matter, by means of its mouth, over a ſpace of the ſurface of the *Fungus*, which is more than equal to the bigneſs of its body; it doubles the coat of matter ſeveral times, ſo as to form a ſoft bed, on which it lays itſelf down, and then, by drawing its head ſeveral times from the ſides upwards, it extends two other plates of this glutinous matter, which dries into a thin ſkin immediately on being expoſed to the air. Theſe meeting in an angle over the body, form a ſort of covering like the ridge of a houſe, under which the creature lies, and is by this means defended from the air, as much as neceſſary, and yet is at liberty to feed at pleaſure. This ſort of covering is perfectly tranſparent, and is yet ſtrong enough for all the purpoſes it is intended for. This worm has no legs, but its manner of marching forward is by applying its head to ſome diſtant part of the ſurface of the agaric; there it drops a large drop of this viſcous matter, which ſoon hardens, and retains the head ſo firmly, that it is able to draw all the body to it. This is a ſort of motion that anſwers all its purpoſes very well, as it has but a very ſmall ſurface to crawl upon, and needs make but very ſhort journeys even upon that. This creature ſeems never to corrode the ſubſtance, or even the outer ſkin of the *Fungus*, but to live entirely upon the clear and glutinous fluid that covers the ſurface of this kind of agaric.

This worm makes a very beautiful object for the microſcope. When young it is as tranſparent as glaſs, and the motion of its internal parts is very eaſily diſtinguiſhed. It has two brown ſpots near the head, which look very like eyes, and the aperture, out of which the glutinous matter with which it makes its habitation iſſues, is very large, and ſeems the mouth. When this little creature is taken out of its habitation, it very ſoon dies, the air drying up all its liquid covering. The ſpots which reſemble eyes are really the anterior ſtigmata, and there are two others behind. When this creature is to paſs into the chryſalis ſtate, it does not remove from the *Fungus*, but ſpins itſelf a web, and remains upon it. This web is compoſed of the ſame matter with the covering or habitation under which it uſually reſides, but it is thicker, more opake, and of a coarſer ſtructure. The creature begins it by drawing ſeveral longitudinal lines, and other tranſverſe ones, as thick and ſtrong as it can make them; theſe compoſe the beams and raftors, or the open ſhell of the edifice; over and under theſe its ſpreads ſeveral continued plates of this glutinous matter, and theſe all drying in a very little time upon one another, form a fine and ſtrong ſhell, which it makes rough and uneven by farther additions; and finally cloſing the orifice, it works within, and ſtrengthens it yet much more, ſo that it is liable to no injuries from the weather, or from the common deſtroyers of theſe things, which are a ſmall ſort of carnivorous worms, which never attempt to force this covering. The creature remains about a fortnight under this covering, and then comes forth in the form of a fly, which is evidently a ſpecies of tipula. It has very long legs, and a long and ſlender body; the body is brown, and the breaſt yelloviſh; the wings are long and ſlender, and the antennæ are of a very ſingular and remarkable figure; they are broad and flat, and yet terminate in a point. Theſe are compoſed of ſeveral articulations, and make a very beautiful figure when examined by the microſcope. Beſide theſe, this fly has, in the manner of the other tipulæ, a pair of beards placed on the anterior part of the head, which it at pleaſure bends down over the face, and compleatly covers with them the longitudinal fiſſure, which is the mouth, ſituated in this as in the other tipulæ. *Reaumur*, Hiſt. Inſ. vol. 9. p. 23. ſeq.

MUSIC (*Cycl.*)—*Muſic*, among the antients, was taken in a much more extenſive ſenſe than among the moderns. Meibomius [a] from Porphyry enumerates its parts by the names *harmonica*, *rythmica*, *metrica*, *organica*, *poëtica* and *hypocritica*. Alypius [b] alſo and Voſſius [c] make the *harmonica*, *rythmica* and *metrica* to be ſo many parts of *Muſic*. Ariſtoxenus [d] adds the *organica*. Voſſius alſo to the three ſpecies of practical *Muſic*, *harmonica*, *organica* and *hydraulica*, adds a fourth, *orcheſtria*, or dancing. Ariſtides Quinctilianus defines *Muſic*, the knowledge of what is graceful and becoming in ſounds and motions [d]. What we call the ſcience of *Muſic*, was by the antients rather called *harmonica*.—[[a] In. Not. ad *Euclid.* Introd. Muſic. p. 41. [b] Page 1. Edit. *Meibom.* [c] De Scient. Mathem. c. 22. [d] Γνῶσιν τε πρέπουσῶν ἐν φωναῖς καὶ κινήσεσι. V. *Wallis*'s Appendix ad Ptolem. Harm. p. 153.] See the article HARMONICA.

Chromatic MUSIC, *Muſica Chromatica*, among the Italians, is uſed to expreſs that kind of *Muſic* in which there are many chromatic ſigns, as flats or ſharps, and intervals, &c. See the article CHROMATIC.

Diatonic MUSIC. See the article DIATONIC.

Didactic MUSIC, *Muſica Didactica*, that part of ſpeculative *Muſic* which only conſiders the quantity, proportions, and different qualities of ſounds.

Dramatic MUSIC, *Muſica Dramatica*, *Scenica*, or *Theatrale*, among the Italians, is uſed to denote ſuch compoſitions of *Muſic* as are particularly made and fitted for theatres. See the article RECITATIVO.

Enharmonic MUSIC. See the article ENHARMONIC.

MUSICA *Ennunciativa*, or *Ennarrativa*, is uſed in much the ſame ſenſe as *Muſica ſignatoria*. See the article MUSICA *ſignatoria*, infra.

Figurate MUSIC, *Muſica Figuralis*, *Figurata*, or *Coloratu*. *Figurate Muſic*, that wherein the notes are of different values, and the motions various, now ſlow, then quick, &c.

Harmonic MUSIC, *Muſica Harmonica*, among the Italians, is uſed for pieces conſiſting of many parts, which, though very different, yet, when played together, make an agreeable whole. This we call *Muſic* in parts.

Hyporchematic, or *Choraic* MUSIC is uſed by ſome authors for a ſort of *Muſic* fit for ballads and dancing.

Inſtrumental MUSIC is uſed to denote muſical compoſitions made to be executed by inſtruments.

Meliſmatic, or *Melodic* MUSIC, is uſed to denote a ſong, or ſingle part, merely for a voice or for an inſtrument. *Broſſard.* See the article MELODY, *Cycl.*

Melopoëtic MUSIC is the ſcience or art of ranging and diſpoſing ſounds in ſucceſſion in an agreeable manner; or the art of making melody. See the articles MELODY and MELOPOEIA, *Cycl.*

Meaſured MUSIC, *Muſica Miſurata*, among the Italian authors, a kind of *Muſic* the notes of which are unequal. It is contrary to *Muſica Piena*, or *Chorale.*

Metabolic MUSIC, *Muſica Metabolica*, among the Italians, is properly *Muſic* tranſpoſed, as when the piece goes out of its natural mode into a tranſpoſed one, the better to expreſs the words, or to diſtinguiſh ſome change in the action, paſſion, motion, &c.

Metric MUSIC, *Muſica Metrica*, is uſed by Italian authors, to denote the harmonious cadence of the voice, heard when any one declaims, or repeats verſes; or it is an air compoſed to verſes.

Modern MUSIC. See the article MODERN.

Modulatory MUSIC, *Muſica Modulatoria*, among the Italians, that part of *Muſic* which teaches to compoſe or modulate, *i. e.* that fixes rules for the uſe of modes, and teaches either to ſing or play well. See the articles MODE, and MODULATION, *Cycl.*

Odic MUSIC, *Muſica Odica*, among the Italians, is the ſame with *hyporchematic*, or *choraic*. Vid. ſupra.

Organic MUSIC, *Muſica Organica*, among the Italians, is uſed to denote muſical compoſitions deſigned to be performed by inſtruments only.

Pathetic MUSIC, *Muſica Pathetica*, is a moving and affecting kind of *Muſic*, that cauſes emotions in the mind, either of love, grief, or pity.

Poetic MUSIC, *Muſica Poetica*, is ſometimes uſed for the art of inventing ſongs, of modulating concords and diſcords together agreeably, and making what we call compoſitions, &c.

Recitative MUSIC, *Muſica Recitativa*, *ſcenica* or *dramatica*, a ſort of *Muſic* uſed in operas, &c. irregular as to time, being a declamation in ſinging, to expreſs the paſſions: From its being thus irregular in its time, the Italians often place the phraſe *a tempo giuſto*, when the recitative ends, and an air, be it minuet, jigg, or any other, follows, to ſhew that the time is then ſtrictly to be obſerved.

Rhythmic MUSIC, *Muſica Rythmica*, is uſed for the harmony or cadence of the words in proſe; or a ſong compoſed to words in proſe. *Broſſard.*

Scenic MUSIC, the ſame with *Recitative.* See above.

Signatory MUSIC, *Muſica Signatoria*, is uſed for that part of *Muſic* which teaches the knowledge of the characters, notes, figures, pauſes, and all other ſigns and marks whatever, uſed in *Muſic.*

Vocal MUSIC, *Muſica Vocale*, or that compoſed for the voice, in oppoſition to organical or inſtrumental, which is intended to be played on inſtruments only.

MUSIC *Shell*, in natural hiſtory, the name of a ſpecies of ſhell-fiſh of the murex kind, remarkable for its variegations, which conſiſt of ſeveral ſeries of ſpots placed in rows of lines, like the notes of *Muſic.*

MUSICAL (*Cycl.*)—MUSICAL *Numbers* are 2, 3, and 5, together with their compoſites. They are ſo called becauſe all the intervals of muſic may be expreſſed by ſuch numbers. See the article INTERVAL.

This is now generally admitted by *muſical* theoriſts[a]. Mr. Euler ſeems to ſuppoſe, that 7 or other primes might be introduced; but he ſpeaks of this as a matter doubtful and difficult[b]. It is to be obſerved, that 2 correſponds to the octave, 3 to the fifth, or rather to the twelfth, and 5 to the third major, or rather the ſeventeenth[c]. From theſe three may all other intervals be found[d].—[[a] *Euler* Tentam. Nov. Theor. Muſ. p. 62, 163. Dr. *Pepuſch* in Phil. Tranſ. N°. 481. p. 267, ſeq. [b] *Euler*, ibid. p. 163. [c] Phil. Tranſ. ibid. [d] *Euler* & *Pepuſch.* loc. cit.]

MUSIMON, in natural hiſtory, the name of an animal eſteemed a ſpecies of ſheep, deſcribed by the antients as common in Corſica and Sardinia, and found in no other part of the world. It is much to be ſuſpected, whether the animal deſcribed under this name is now any where to be found in the world; not that it is to be ſuppoſed that any ſpecies of animal once created is become extinct, but that this probably was a ſpurious breed between two animals of different ſpecies, perhaps the ſheep and goat, which like the mule not being able to propagate its ſpecies, may have failed ever ſince. Theodore Beza, indeed, gives an account of an animal, which he received from an ignorant countryman of Sardinia; which, he ſaid, was peculiar to that place, and was called *muſlo*; that its hide and hair was like that of a deer, its horns wholly like thoſe of a ram, curling back to its ears, and its ſize that of a middling ſtag; and that it fed on vegetables, and lived among the rocks. The tragelaphus of Bellonius differs little from the *Muſimon*, according to the deſcriptions of both. *Ray's* Syn. Quad. p. 75.

MUSK (*Cycl.*)—*Muſk*, and other perfumes of the ſame tribe, have been long celebrated as antiſpaſmodics, but were formerly ordered in ſuch ſmall quantities as to have little effect. Practitioners thought four or five grains a large doſe. But the Chineſe have taught us to be more bold; the tenth part of an ounce is an uſual doſe among them. The remedy in the eaſt for the bite of the mad dog contains 16 grains of *Muſk*, and this they repeat frequently. See the article MADNESS.

The effects of *Muſk* are, eaſe from pain, quiet ſleep, and a copious diaphoreſis. Hence it has been found of great uſe in ſpaſmodic diſorders, petechial, malignant, putrid fevers, the goal diſtemper, hiccoughs, *ſubſultus tendinum*, &c. For the particular caſes we refer to the Philoſophical Tranſactions, N°. 474. §. 18.

It has alſo been found uſeful in ſpaſmodic diſorders, given by way of clyſter, as Dr. Wall obſerves, in that Tranſaction.

The operation of *Muſk*, in ſome reſpects, reſembles that of opium; but is in this much preferable, that it does not leave behind it any ſtupor or languidneſs, which the latter often does. *Muſk* therefore ſeems likely to anſwer in thoſe low caſes where ſleep is much wanted, and opiates are improper.

It is ſaid to be beſt given in a bolus, and that thoſe who are moſt averſe to perfumes, may take it in that form without inconvenience. For, as Etmuller and others, have long ago obſerved, the ſmell of the perfume is often found to be of diſſervice, where the ſubſtance inwardly taken produces good effects, Phil. Tranſ. ibid.

It is pity that a medicine of this conſequence ſhould be ſo liable to adulterations, and that the criteria of its genuineneſs are ill ſettled.

In a paper read before the Royal Society March 17, 174⅞, ſeveral cures performed by *Muſk* on diſtempered cows, were mentioned.

When *Muſk* begins to decay, it is a practice uſed in the Eaſt-Indies to put it into a bladder or bags, wherein many ſmall holes are made with a needle, and hang it in a neceſſary houſe, but not low enough to touch the filth. Others keep it wrapped up in linnen, well moiſtned with rank urine. *Boyle's* Works abr. Vol. 1. p. 146.

Mr. Boyle ſays of his own knowledge that *Muſk* has greatly contributed to the preſervation of fleſh. Works abr. Vol. 1. p. 30.

MUSK-*Ant*, the name given by Liſter and Ray, to a peculiar ſpecies of *ant*, which is of the number of the perfumed inſects. It is found on dry banks, and is ſo much ſmaller than the common ant, that it needs no other diſtinction. Thoſe of this ſpecies which are without wings are of a yellowiſh colour, and when bruiſed or cruſhed emit a ſharp and acid ſmell, as the common ant does; but thoſe which have wings are coal-black, and theſe, inſtead of the ſour ſmell of the others, emit a perfume not to be endured for its ſtrength. The ſmell of all the perfumed inſects goes off in keeping; and theſe little creatures, after they have been dead and dry ſome time, are found to ſmell leſs ſtrongly, but much more agreeably. Phil. Tranſ. N°. 76.

MUSK-*Inſect*, a term uſed by ſome to expreſs the capricorn, or *Muſk* beetle; but it is too looſe a phraſe for that animal, ſince there are other inſects which ſmell as ſtrongly of that perfume. There is a ſmall kind of bee very frequent in the paſtures of Lincolnſhire, and ſeveral other parts of England, in April. This frequents the ranunculus and dandelion flowers, and has a very ſtrong and fine ſcent of *Muſk*. There is alſo a hexapode worm, which feeds on the *gallium luteum*, or yellow ladies bedſtraw, which has the ſame perfumed ſcent in a no leſs degree. Both theſe inſects, and even the capricorn beetle, loſe their perfume when they have been ſome time dead. Phil. Tranſ. N°. 76. See the article CAPRICORN *Beetle.*

MUSK-*Rat*, an animal very common in ſeveral parts of America, and greatly reſembling the beaver in all reſpects, except ſize. A full grown *Muſk*-rat might very naturally be miſtaken for a beaver of about a month old. And Mr. Sarazin, of the Academy at Paris, obſerves, that the Indians call theſe the ſame animals, only diſtinguiſhing the beaver by the name of the elder, and the *Muſk*-rat of the younger brother. They live in ſummer on all ſorts of plants, and in winter on the great roots of the water-lilly. They live in communities, at leaſt they always do ſo in winter, and erect themſelves certain habitations of different ſizes, ſome ſuited for the reception of only one family, others for a great number of ſuch. Their great care is employed in the chuſing a proper place for theſe habitations; for it is neceſſary that they ſhould be not only defended from the injuries of weather, but freely open to the water, and that without fear of inundations; and they muſt alſo be in the neighbourhood of large plantations of the roots on which they are to feed. To have all theſe neceſſary conveniencies they always build in the ſteep banks of ſome river, which has a level bottom, and a wide bed without too much depth; and as ſuch rivers always abound with the roots they

want; they have thus always a dry home, plenty of provisions, and no danger of inundations; for they are prepared for little risings of the water, by having upper stories or rooms, into which they retire when the ground-floor is uninhabitable; and rivers of this great breadth and small current, are not subject to any very high floods. Mem. Acad. Par. 1732.

The size of the room is always well proportioned to the number of the intended family; if it be only for seven or eight, then a room of two foot square does, and it is made proportionably larger as the number is to be greater. When they have laid out the plan of their habitation, they plant a parcel of rushes all around it, which they surround in a very artful manner with clay, pressing it down with their feet, and working it even with their tail, which is like that of the beaver, and serves them for a trowel. They have a passage out of their house, which they go out at daily as long as the weather continues tolerably mild; but when it becomes very severe, they block up this passage, and the whole habitation afterwards often becomes covered many foot deep with snow; in this case they keep within doors, and have wells which supply them with water; other holes which serve to receive their excrements; and they burrow under ground to the river, and seek for the large roots they are to feed upon.

In this season, if they are at some difficulties to get food, they have the advantage however of being out of danger of the huntsmen, who know not where to seek them in the snow; but when the thaws come on, which is usually in March or April, they discover and take great numbers of them; if this season be slipped, however, they generally escape, for soon after this the melting of the snows cause inundations, which happen at no other times, and which drive them out of their habitations into the higher countries; in this time they single one another out for the propagation of the species, and even this is a scene of some danger to one sex, for the huntsmen find the way to imitate the courtship of the female, and will by that noise draw severally many males about them, which they shoot as they come in reach. After the time of copulation is over, and the waters are abated, the females return to their old lodgings, and there bring forth and nurse up their young; the males run about the country till winter, and then retire also to the waters for their winter life; but they usually make themselves new lodgings every season. Mem. Acad. Par. 1732.

MUSK-*Seed*, in the materia medica, the name of the seed of the *alcea Ægyptiaca villosa*, or hoary Egyptian vervain mallow. It is a small seed of about the bigness of a pin's-head, of a greyish brown in colour, and of the shape of a kidney, and when it is fresh has a perfumed smell. It is brought into Europe from Ægypt, and from Martinico. The Ægyptians use it internally as a cordial and provocative; but in Europe it is of very little use, we wholly neglect it in medicine; but the perfumers in France and Italy use it among their compositions. *Lemery*'s Dict. des Drog.

MUSKET (*Cycl.*)—MUSKET-*Baskets*, in fortification, baskets of about a foot and a half high, and eight or ten inches diameter at the bottom, and a full foot at the top. They are filled with earth, and set on low parapets or breast-works, or on such as are beaten down, that the musketeers may fire between them at the enemy, and yet be tolerably well secured against their fire.

MUSQUETEERS, *Mousquetaires*, in France, are troopers who fight sometimes on foot, sometimes on horseback; they are gentlemen of good families, and are divided into two troops, the one called the grey *Musqueteers*, because of the colour of their horses; the other the black *Musqueteers*, for the same reason.

MUSSAHIR, in ornithology, a bird mentioned by Arabian writers. It is said, that this creature after having employed the day in seeking its food, spends the whole night in singing; its notes are said to be so melodious, as to banish all thoughts of sleep from them that hear them. *Hofm.* Lex. Univ. in voc.

MUST (*Cycl.*)—MUST *of Rhenish wine*. This is a liquor that, though drank by some, is found extremely to affect the brain; for not having passed the natural effervescence which it would have been subject to, in the making of wine, its salts are locked up till the heat of the stomach setting them to work, they raise their effervescence there, and send up abundance of subtile vapours to the brain. The *Rhenish Must* is of two kinds, being made either with or without boiling. That made without boiling is only put up so close in the vessel, that it cannot work; this is called stumm-wine. That by boiling is thus prepared: they take strong vessels not quite filled, and putting them into a cellar they make a fire mild at first, but increased by degrees; and afterwards they gradually lessen it again, that the boiling may cease of itself. This operation is finished in thirty-six or forty hours, according to the size of the vessel; and the wine-boilers, instead of common candles which would melt by the heat, use thin pieces of split beach-wood. These also serve for a double purpose, not only lighting them, but giving them notice of the boiling being enough; before that time, the quantity of vapours thrown up make them burn dim; but as soon as it is finished, the vapours ascend in less quantity, and the lights burn brisk and clear. About seven or eight days after this boiling, the *Must* begins to work, and after this working it is called wine. They have also another kind of *Rhenish Must*, which is thus prepared: they boil the liquor to half the quantity, and put into it the medicinal ingredients they are most fond of; such as orange-peel, elecampane-root, and juniper-berries, or the like; being thus medicated, the whole works much more slowly, than it otherwise would. If the boiled *Must* by too violent an effervescence cast out its lees, it will on this become vapid and dead, unless this separation is stopped by some fatty substance, such as fresh butter, or the like: They put this in upon a vine-leaf, or else apply lard to the mouth of the vessel. *Portzius*, de Vin. Rhen.

MUSTACEUM, among the antient Romans, a kind of cheese-cake. It was composed of cheese, anniseed, cumin, and suet added to flour, moistened with *mustum*, or new wine. *Pitisc.* in voc. See the article MUST, *Cycl.* and *Suppl.*

MUSTARD, *Sinapi*, in botany. See the article SINAPI.

The common *Mustard* is cultivated in many places, both in gardens and fields, for its seeds. It is propagated by sowing the seeds in spring upon an open place, which has been well dug or ploughed. When the young plants are come up they must be cleared of weeds, and houghed up to about eight or ten inches asunder. They will then grow strong, and when the seeds ripen the whole plant is cut down, and the seeds thrashed out.

But besides this, there is another kind of *Mustard*, commonly known by the name of the white or garden *Mustard*, which is sown for a sallad-herb in spring: the seeds of this are to be sown very thick in drills on a warm border, or a moderate hot bed; they will be fit to cut for sallading in three weeks after the sowing. *Miller*'s Gardener's Dict.

Hedge-MUSTARD, *Erysimum*, in botany. See the article ERYSIMUM.

MUSTARD *Vomits*. The powder of *Mustard*-seed may be made into the consistence of a loch with warm water, in which a little sea-salt has been dissolved. Of this a common spoonful, sometimes two, diluted with tepid water, are given on an empty stomach; it operates well as an emetic, and proves an excellent remedy in most nervous disorders, according to Mr. Monro, in Med. Ess. Edinb. Vol. 2. Art. 19. p. 303. not.

MUSTELA, the *Weasel*, in the Linnæan system of zoology, is a distinct genus of quadrupeds, including the ferret, polecat, martin, ermin, *&c.* The characters of the genus are, that the creatures of it have a considerable number of paps situated on the belly, feet adapted to climbing, and four *dentes molares* or grinders, on each side of the mouth. See Tab. of Quadrupeds, N°. 24. and *Linnæi* Syst. Nat. p. 36.

The *Weasel*, in some parts of England, is called the *foumart*, or *fitchet*. It is a little creature, smaller than the *pole-cat*; its back and sides are reddish, and its throat and belly white, the whiteness reaching perfectly from the angle of the chin to the insertion of the tail: Its head is something like a dog's, the upper jaw reaches beyond the lower, and is ornamented with some bristles by way of whiskers. Its fore-teeth are six in number in each jaw, and are small and set very close together, like the teeth of a comb; those of the under jaw are much smaller than the others; the dog-teeth are long, large, and strong; the eyes are small and black, the ears short and broad, and covered with very thick-set hairs; and, which is a very remarkable circumstance, they are doubled in their lower part. The inner cavity of the ear is very large, and full of tubercles. The feet are small, but broad, and each divided into five toes; the legs are short. The heart and liver are, in dissecting this creature, found remarkably large. *Ray*'s Syn. Quad. p. 195.

MUSTELA *Africana*, in zoology, a name by which Clusius has called an animal, properly of the squirrel kind, and known among others by the name of the Barbary squirrel. *Ray*'s Syn. Quad. p. 218. See the article SCIURUS.

MUSTELA, in ichthyology, the name of a genus of fishes, of which there are several species; the most common of which is that called the *Sea-loche*, or whistle-fish. This resembles the common eel in figure, colour, and slipperyness to the touch; but it is not half so long, in proportion to its thickness; and is something flatter, and has a turgid belly. It is covered with extremely minute scales, and its mouth is large, and furnished with sharp teeth, and has several series of very small teeth in many parts of its mouth. At the angle of the lower jaw it has one beard, and at the upper part of the nostrils in the upper jaw it has two. It has two pair of fins under its belly, and on the back, beside the common fin reaching half the length and almost to the tail, it has at some small distance from the head a cavity in which is a membrane edged with filaments.

The different species of this fish are of three colours; one is not spotted, and of the colour of a tench; another is spotted with white; and the third with reddish black spots; and beside these there are the *Mustela vivipara* of Schonfeldt, commonly known by the name of *Aelquappe*, and the *Mustela fossilis*, called *Peisker*, and the *Eel-pout*. *Willughby*'s Hist. Pisc. p. 121. All which see under their several heads.

MUSTELA *Fluviatilis*, in ichthyology, a name by which ſeveral authors have called the common *lampetra* or *lamprey*. *Bellon.* de Piſc. 1. p. 91. *Geſner*, de Piſc. p. 696.

MUSTELA *Lumpen*, in ichthyology, a name given by Artedi, from Ray and others, to that ſpecies of blennus called ſimply *lumpen* at Antwerp; and by Geſner *galea*.

It is diſtinguiſhed by Artedi from the other blenni, by a ſpecific name expreſſing that it has four bifid cirri or beards growing under the throat, and tranſverſe areolæ or ſtreaks on the back. See the article BLENNUS.

MUSTELA *Marina*, in ichthyology, a name given by Bellonius and others to that fiſh which we call in Engliſh the *ſheat-fiſh*, the *glanus* and *glanis* of Pliny and the old authors.

It is diſtinguiſhed by Artedi by the name of the *ſilurus*, with four beards near the mouth. By this character it is evidently diſtinguiſhed from the fiſh called the *lake*, which, though a genuine ſpecies of ſilurus, has only one beard.

MUSTELINUM *Genus*, in zoology, the name of a claſs of animals, ſo called from their general likeneſs to the weaſel in ſhape; they are all carnivorous animals, and are diſtinguiſhed from the other quadrupeds of that ſort by their ſmallneſs, the length of their bodies, and the ſmallneſs and narrowneſs of their heads. Their feet are ſmall, and their legs ſhort, whence they are calculated for running into holes and crannies; their teeth are leſs numerous than in many quadrupeds; in the dog kind there are forty, and in theſe but thirty-two. Their inteſtines are ſhort and ſimple; they have no colon nor cæcum, nor any diſtinction of great and ſmall guts. *Ray*'s Syn. Quad. p. 195.

MUSTELUS, in ichthyology, a name given by Gaza and ſome other writers, to the fiſh called *galeus aſterias*, and *ſtellatus* by modern authors. This only accidentally differs from the common *galeus lævis*, the ſmooth or unprickly hound. Both are accounted the ſame ſpecies by Artedi, and are expreſſed by the ſame name, the *ſqualus* with obtuſe or granulous teeth. See the article SQUALUS.

MUSTELUS *Lævis*, a name by which Aldrovandus and ſome others have called the fiſh, diſtinguiſhed by others by the name of *galeus lævis*, the ſmooth hound-fiſh. *Aldrov.* de Piſc. p. 393. See the article GALEUS.

MUSTELUS *Lævis*, in zoology, the name of a kind of ſhark, called alſo the *canis galeus*, and *canoſa*. *Willughby*'s Hiſt. Piſc. p. 51. See the article CANIS *Galeus*.

MUSTUS *Fluviatilis*, in ichthyology, a name given by Bellonius to that ſpecies of cyprinus which we know by the name of the barbel. See the article CYPRINUS.

MUSTUS is alſo a word uſed by ſome authors to expreſs the white calx of urine.

MUTABILIS *Lapis*, in natural hiſtory, a name given by ſome to the ſemi-pellucid gem, more commonly called *oculus mundi*. See the article OCULUS *Mundi*.

MUTATIONES, among the Romans, poſt ſtages, or places where the public couriers were ſupplied with freſh horſes.

The *Mutationes* were wholly deſigned for the uſe of theſe couriers, or meſſengers of ſtate; in which reſpect they differed from *manſiones*. See the article MANSIONES.

MUTCHKIN, a liquid meaſure uſed in Scotland; it contains four gills, and is the fourth part of the Scotch pint. See the articles PINT, MEASURE, *&c.*

MUTEFERRIRA, a body of horſe kept up in Egypt, in the ſervice of the Grand Seignior; theſe, with the chaouſes, were originally the guards of the ſultans of Egypt. This is a body of the greateſt dignity, as is expreſſed by the word, which ſignifies a choſen people. *Pocock*'s Egypt, p. 166.

MUTILUS, in natural hiſtory, the name given by ſome to the common muſcle. See the article MYTULUS.

MUTU, in zoology, a name by which ſome call a large Braſilian bird, of the gallinaceous kind, more uſually called *mitu*. *Marggrave*'s Hiſt. Braſ. See the article MITU.

MUZZLE (*Cycl.*)—MUZZLE *of a Gun or Mortar*, the extremity of the cylinder, where the powder and ball is put in. The metal which ſurrounds the extremity of the cylinder, is likewiſe called the *Muzzle*.

MYAGRUM, in botany, the name of a genus of plants, the characters of which are theſe: The flower conſiſts of four leaves, and is of the cruciform kind; and the piſtil which ariſes from the cup, becomes finally a fruit of a turbinated form, unicapſular, and containing one oblong ſeed, and having two empty cells at the apex.

The ſpecies of *Myagrum*, enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved ſingle-ſeeded *Myagrum*. And 2. The leſſer ſingle-ſeeded *Myagrum*. *Tourn.* Inſt. p. 211.

MYAGRUS *Deus*, in the antient mythology, a name given to Jupiter on certain occaſions, as when they ſacrificed to him at the olympic games, to drive away the vaſt quantities of flies which uſually infeſted thoſe rites. The word, though it ſtands thus in Pliny, and many of the old authors, is yet falſely printed, for this *Myagrus* ſignifies the mouſe-deſtroyer, not the fly-deſtroyer, which is properly ſignified by *Myiagrus*. V. *Apomyos*, ſupr. and *Myiagrus*, inf.

MYCETITES, in natural hiſtory, the name of a ſpecies of ſea-coral, which is uſually of a conic ſhape and ſtriated texture; always ſmall, and uſually found adhering to ſea-ſhells, or large corals. See the article FUNGITÆ.

MYCETITES *Diſcoides*, in natural hiſtory, a name given by Dr. Woodward to thoſe kinds of foſſile coralloide bodies which the generality of writers had called, after Dr. Plot, *porpitæ*. Theſe are uſually ſmall, and of a roundiſh, but flatted figure. They are hollowed on one ſide with a ſort of umbilicus, and ſtriated on the other. They are found on the ploughed lands in Oxfordſhire, and ſome other of our midland counties, and in other places buried in the ſolid ſtrata of ſtone. They are ſometimes yelloviſh, ſometimes browniſh, and are from the breadth of an inch to a fourth part or leſs of that ſize. When broken, they are uſually found to conſiſt of a kind of ſpar, not unlike that of which the ſhelly coats of the echinitæ, or the lapides indici, and other ſpines of echini conſiſt in their foſſile ſtate. And in ſome of them the ridges and ſtriæ are thick ſet with little knobs and tubercles. The baſis in ſome of theſe is flat, as it is in others riſing in form of a circular elevation from the umbilicus, and others have a circular cavity in the ſame place. See Tab. of Foſſils, Claſſ. 7. *Woodward*, Cat. Foſſ. vol. 1. p. 114.

MYCONOIDE, an epithet uſed by ſome chirurgical writers for ſome ulcers which are found continually filled with a thick mucous matter.

MYDESIS, a word uſed by the antient phyſicians to expreſs a general corruption of any part, from a great redundance of moiſture. Galen has appropriated it to the eye-lids.

MYDRIASIS, a name uſed by authors to expreſs a diſeaſe of the eye, conſiſting in a dilatation of the pupil, and a conſequent dimneſs of ſight.

MYDROS, a word uſed by Hippocrates to expreſs a ball of iron or ſtone, which was uſed to be heated in the fire, and thrown into urine, intended as a fomentation.

MYGBAOTH, in the Jewiſh antiquities, a kind of mitre worn by the prieſts. See the article CIDARIS.

MYGDONIUM *Marmor*, a name given by the antients to a ſpecies of marble much uſed in their larger buildings. It was white, variegated with black; but that black rather diſpoſed in clouds and ſpots than veins. It is confounded with the *docimenum marmor* by ſome writers; but that was always of a pure white, without the leaſt variegation.

MYIAGRUS *Deus*, in the heathen mythology, a name given ſometimes to Jupiter, and ſometimes to Hercules, on occaſion of their being ſacrificed to for the driving away the vaſt numbers of flies which infeſted the ſacrifices on certain public occaſions. The word is generally ſpelt *Myagrus*; but this muſt be an error, as this word does not expreſs the fly-deſtroyer, but the mouſe-deſtroyer; and we have it ſufficiently teſtified by the antients, that flies were the only creatures againſt whom this deity was invoked. Pliny calls this deity alſo *Myiodes*, and tells us, that the flies which uſed to peſter the Olympic rites went away in whole clouds, on the ſacrificing a bull to this god. We find in Athenæus alſo, that this ſacrificing to the god of flies, at the Olympic games, was a conſtant cuſtom. Some diſtinguiſh theſe two deities, and tell us, that the latter, or *Myiodes*, uſed to viſit the nations in vengeance with a vaſt multitude of flies; and that, on paying him the due honours of a ſacrifice, they all went away again; and this ſeems to agree with what Pliny tells us in ſome places. See the article MYIODES.

At the time of the Olympic games, Jupiter was worſhipped under the name of the *Apomyos*, or *Myiagrus Deus*, to ſupplicate the deſtruction of thoſe troubleſome creatures. This happened only once in many years, when the ſacrifices were performed there; but the Elians worſhipped him continually under this name, to deprecate the vengeance of heaven, which uſually ſent, as they expreſſed it, an army of flies, and other inſects, toward the latter end of the ſummer, that infeſted the whole country with ſickneſs and peſtilence.

MYIODES *Deus*, in the heathen mythology, a name given ſometimes to Hercules, but more frequently to Jupiter, to whom a bull was ſacrificed, in order to make him propitious in driving away the flies that infeſted the Olympic games. See the article MYIAGRUS *Deus*, ſupra.

MYLASSENSE *Marmar*, in the works of the antients, a name uſed for a ſpecies of marble, dug near a city of that name in Caria. It was of a black colour, but with an admixture of purple; the purple not diſpoſed in veins, but diffuſed through the whole maſs. It was much uſed in building among the Romans.

MYLE, a word uſed by ſome authors as a name for the *patella* or *limpit*, and by others to expreſs what we call a mole, or falſe conception in the uterus.

MYLO-HYOIDÆUS, a broad thin penniform muſcle, ſituated tranſverſely between the internal lateral parts of the baſis of the lower jaw, and lying on the anterior portions of the two digaſtric muſcles. It is made up of two equal fleſhy portions, one lying on the right ſide, the other on the left, both on the ſame plane, and joined to a ſmall middle tendon, which is inſerted anteriorly in the middle of the baſis of the os hyoides, and from thence runs directly forward, diminiſhing gradually in its courſe. This is therefore a true digaſtric muſcle, and cannot be divided into two. Each portion is fixed by

by fleſhy fibres to the internal lateral part of the lower jaw, between the oblique prominent line and the baſis under the firſt four *dentes molares* and the *caninus*; the anterior and greateſt part of the other fibres of each portion run obliquely from before, backward to the middle tendon, in which they are regularly fixed, the anterior fibres being the ſhorteſt, and a ſmall triangular void ſpace being formed between them and the ſymphyſis of the chin. The poſterior fibres of each portion, which make about a fourth part of the whole, run likewiſe on each ſide of the os hyoides, and are inſerted along the lower edge of its anterior or convex ſide, and from thence a little upward. *Winſlow*'s Anatomy, p. 254.

It has its name from the os hyoides, and the Greek μύλη, the dentes molares.

MYLON, in ſurgery, is uſed for the largeſt tumours of the ſtaphylomatous kind in the cornea and uvea of the eyes. *Heiſter*'s Surgery, p. 423. See the article STAPHYLOMA.

MYOCEPHALUS, a name given by ſome authors to the diſtemperature of the eyes, commonly known by the name of a ſtaphyloma. *Heiſter*'s Surgery, p. 423.

MYODES *Platyſma*, a name given by ſome anatomical writers to what is called by others the quadratus genæ; it is a muſcular expanſion in the neck.

MYOPARO, among the Romans, a kind of ſhip, which partly reſembled a merchant-ſhip, and partly a ſhip of war, and was that which pirates moſtly uſed. *Pitiſc.* in voc.

MYOPIA. See the article SHORT-SIGHTEDNESS.

MYOPS, *Fly-eyed*, a word uſed to expreſs a perſon who is ſhort-ſighted or pore-blind.

MYOPS, in natural hiſtory, the *Ox Fly*, an inſect uſually confounded with the breeze fly, but really differing very much from it. This is common in woods and about path-ways, and never fixes on any other creatures except oxen. It has a long and ſomewhat flat body, and is of a blackiſh grey in colour.

MYOSOTIS, *Mouſe-Ear*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the roſaceous kind, conſiſting of ſeveral leaves ranged in a circular order. The piſtil, which ariſes from the cup, becomes at length a ſeed-veſſel, of the ſhape of a bull's horn, open at the end, and containing ſmall roundiſh ſeeds affixed to a placenta.

The ſpecies of *Myoſotis*, enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved Alpine *Myoſotis*. 2. The woolly *Myoſotis*, with broad leaves, reſembling thoſe of toad-flax. 3. The woolly *Myoſotis*, with narrower toad-flax leaves. 4. The hoary creeping *Myoſotis*. 5. The Spaniſh corn *Myoſotis*. 6. The hairy field *Myoſotis*, with large flowers. 7. The hairy field *Myoſotis* with ſmall flowers. 8. The clammy and hairy field *Myoſotis*. 9. The ſmaller hairy *Myoſotis*. 10. The knot-graſs-leaved field *Myoſotis*. 11. The narrow-leaved woolly and viſcous Alpine *Myoſotis*. 12. The low myrtle-leaved Alpine *Myoſotis*. 13. The *Myoſotis* with very fine ridged leaves. 14. The large-flowered Portugal *Myoſotis*, with toad-flax leaves. *Tourn.* Inſt. p. 244.

In the Linnæan ſyſtem of botany, the characters of the *Myoſotis* are theſe: The cup is an oblong erect perianthium, ſlightly divided into five ſegments at the extremity, and remaining when the flower is fallen. The flower is compoſed of only one petal, in form of a cylindric tube, ſhort, and ſlightly divided into five at the extremity; the jags being rimmed round, and obtuſe; and the opening of the flower cloſed by five convex prominent ſcales. The ſtamina are five very ſhort filaments, placed in the neck of the tube. The antheræ are ſmall, and covered. The piſtil has four germina. The ſtyle is ſlender, and of the length of the tube of the flower. The ſtigma is obtuſe. The cup remains, and holds four oval ſeeds. *Linnæi* Gen. Plant. p. 56.

MYRACOPON, a name uſed by ſome authors for an ointment intended to be uſed to the whole body to prevent laſſitude. It is deſcribed by Galen.

MYRICA, in botany, a name by which ſome authors call the plant tamariſk. *Chabræus*, p. 75.

MYRINX, a word uſed by ſome to expreſs the membrane of the tympanum in the ear.

MYRIOPHYLLUM, in botany, the name of a genus of plants, called by others, *pentapterophyllum*. The characters are theſe: It produces both male and female flowers diſtinct on the ſame plant. In the male flower the perianthium is compoſed of four oblong and erect leaves; the exterior one being large, the interior one much ſmaller. There is no corolla. The ſtamina are eight capillary filaments, which are longer than the cup. Theſe are of a looſe flaccid ſtructure. The antheræ are oblong. The female flowers always ſtand below the male. The perianthium is divided into a number of ſegments. The piſtil has four germina of an oblong figure. There are no ſtyles; but the ſtigmata are hoary. The ſeeds are placed four together, and are of an oblong figure. *Linnæi* Gen. Plant. p. 459. *Ponteder.* Anth. 18. *Vaillant*, Act. Germ. 1719. *Dillen.* Gen. 7.

MYRMECIAS *Lapis*, the *Wart Stone*, a name given by ſome authors to a ſtone covered on the ſurface with wart-like excreſcences. It is a name of a very vague ſignification, ſome of the ſtones called by it being mere flints, and others owing their protuberances to coralloide bodies, the wires of aſteriæ, or other of the extraneous foſſils contained in them, and ſo lodged, that their ends juſt ſtand out.

MYRMECITES, in natural hiſtory, a name given by ſome authors to a ſmall ſtone, with ſome imaginary reſemblance of an ant in its ſhape. Others have alſo made it the name of ſuch pieces of amber as contain an ant, or the legs, wings, or other fragment or remains of that little animal.

MYRMECOPHAGA, the *Ant-Eater*, the name given by Linnæus to the creature called by others, the *tamandua-guacu*, or ant-bear.

The name is derived from the Greek μυρμηξ, an ant, and φαγω, to eat. The creature is ſo called becauſe his food is ants, which he eats by thruſting his long tongue into their neſts, and drawing it back into his mouth when covered with them.

This, in the Linnæan ſyſtem of zoology, is a diſtinct genus of animals, the characters of which are, that they have no teeth; have feet formed not for climbing, but walking, and have eight abdominal paps, ſix on the belly, and two on the breaſt. *Linnæi* Syſt. Nat. p. 34.

MYRMILLO, among the Romans, a kind of gallic armour uſed in theatrical ſhews. But ſome will have it to be the ſame that Achilles's *myrmidones* wore; whence it had this name. *Pitiſc.* in voc.

MYROBALANS (*Cycl.*)—It is very evident from the writings of the antient Greeks, that what we at this time call the *Myrobalan* was not known to them under that name, and perhaps what they called ſo is not known to us at this time; our *Myrobalans* being a ſort of plums, and theirs being a dry fruit, rather of the nut-kind, and uſed in perfumed unguents, and other compoſitions of that kind, to give them a ſcent. This variation from the original ſenſe of the word is not new, however, and the authors who began it are ſo far back, that it ſeems to have been an error of as old a date as any of this kind.

MYROBATINDUM, in botany, a name given by Vaillant to a genus of plants, which, with the *camara* of Plumier, and and the *pſeudoviburnum* of Rivinus, is included by Linnæus under one general character, by the name *lantana*. *Vaillant*, Act. Germ. 1722. See the article LANTANA.

MYRRH (*Cycl.*)—It is an apophthegm of chemiſts, derived from Van Helmont, that whoever can make *Myrrh* ſoluble by the human body, has the ſecret of prolonging his days. And Boerhaave owns there ſeems to be truth in this from its reſiſting putrefaction. He himſelf, and other chemiſts before him, have given methods for making ſolutions of *Myrrh*, but only by means of alcohol. It ſeems not a little ſurprizing that ſuch great chemiſts ſhould never find out that *Myrrh* is ſoluble in common water. *Pemberton*, Lond. Diſp.

MYRRHINA *Vaſa*, in antiquity. See the articles MURRINE, and MORRHINA.

MYRRHIS, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe: The flower is of the roſaceous kind, compoſed of ſeveral unequal petals, which are arranged in a circular order, on a cup which afterwards becomes a fruit, compoſed of two long ſeeds, reſembling the beak of a bird, which are ſtriated and gibboſe on one ſide, and ſmooth and plain on the other.

The ſpecies of *Myrrhis*, enumerated by Mr. Tournefort, are theſe: 1. The greater *Myrrhis*, or ſweet cicutaria. 2. The annual *Myrrhis*, with ſmooth ſtriated ſeeds. 3. The little white-flowered perennial *Myrrhis*, with hairy leaves, and gold-coloured ſeeds. 4. The yellow perennial *Myrrhis* with daucus leaves. 5. The tuberous or knotty *Myrrhis*. 6. The hoary annual *Myrrhis*, with ſtriated hairy ſeeds. 7. The broad-leaved white flowered marſh *Myrrhis*. 8. The broad-leaved red-flowered marſh *Myrrhis*. 9. The long-ſeeded daucus-like mountain *Myrrhis*. 10. The hairy-ſeeded annual Portugal *Myrrhis*, with parſnep leaves. 11. The trifoliate Canada *Myrrhis*, looking like angelica, and called by ſome the trifoliate American angelica. *Tourn.* Inſt. p. 315.

The ſeeds of the common ſweet cicely, or wild chervil, are a very powerful diuretic and promoter of the menſes. They are good in jaundices, and beginning dropſies, and in the gravel and ſtone.

MYRRHITES *Lapis*, in natural hiſtory, a name uſed by many of the antient authors for a ſemi-pellucid ſtone of the nature of the agates; and ſeeming to have been the yellow cornelian of the moderns.

MYRTIDANON, a word uſed by the old Greek writers on medicine, but in a different ſenſe by different authors.

Hippocrates calls it a round fruit, which the Perſians in his time called pepper, and which probably had all the heating qualities of that fruit. Dioſcorides expreſſes it by an excreſcence common on the trunk of the myrtle, and which, as he obſerves, is more aſtringent than the myrtle itſelf. *Myrtidanum vinum* alſo ſignified wine impregnated with myrtle.

MYRTIFORMIS *Naſi*, (*Cycl.*) in anatomy, a name given by Santorini, and ſome others, to one of the muſcles of the face, called by Albinus, *depreſſor alæ naſi*, and by Cowper and others, *depreſſor labii ſuperioris*, *conſtrictor alæ naſi*.

MYRTITES, the name of a compoſition in the antient pharmacy, made of fine honey, and the depurated juice of myrtle berries boiled up together to a conſiſtence.

MYRTLE, *Myrtus*, in botany. See the articles MYRTUS, *infra*, and MYRTLE, *Cycl.*

There are ſeveral ſpecies of this plant preſerved in our gardens; they are all eaſily propagated from cuttings. The beſt ſeaſon for this is July; and the ſtraiteſt and youngeſt vigorous ſhoots are to be choſen. Theſe ſhould be cut off about eight inches long, and the leaves of the lower part ſtripped off to two inches high, and that part of the ſtalk twiſted which is to be placed in the ground; they are to be planted in pots of light rich earth, at about two inches diſtance from each other, obſerving to cloſe the earth very well about them, and give them a gentle watering. They are then to be removed into a moderate hot-bed, and ſhaded and watered once in two or three days till they have taken root. In about a month's time they will be rooted, and will begin to ſhoot, and muſt then be inured by degrees, to the air; and in Auguſt they ſhould be removed into the open air, but placed in a warm ſituation, and ſheltered from the winds; they ſhould ſtand here till October, and then be removed into a green-houſe, where they ſhould be placed ſo as to have as much air as poſſible. In the March following they ſhould be removed into ſeparate pots of rich earth, and in May ſet out to the open air in a warm and well defended place. They will require in the ſummer frequent waterings, and the dead leaves ſhould be carefully picked off. As they advance in growth, they are to be ſhifted at times into pots of a larger ſize; and this ſhould be done either in April or in Auguſt; and toward the end of October, they ſhould always be removed into the green-houſe.

MYRTILLUS, in botany, a name by which ſome authors have called the black whortle berries. The *vitis idæa anguloſa* of other authors. *Dale*, Pharm. p. 294.

MYRTOCHEILIDES, a name given by ſome authors to the nymphæ in the female pudenda.

MYRTUS, the *Myrtle*, in botany, the name of a genus of trees, the characters of which are theſe: The flower is of the roſaceous kind, and is compoſed of ſeveral petals arranged in a circular form. The cup finally becomes a fruit or berry of the ſhape of an olive, coronated at the end, divided into three cells, and containing kidney-ſhaped ſeeds.

The ſpecies of *Myrtle*, enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved Roman *Myrtle*. 2. The broad-leaved Bœtic *Myrtle*, or the bay-leaved *Myrtle*. 3. The bay-leaved *Myrtles*, with leaves growing in cluſters. 4. The broad-leaved Belgic *Myrtle*. 5. The common Italian *Myrtle*. 6. The common Italian *Myrtle* with white berries. 7. The narrow-leaved Bœtic *Myrtle*. 8. The wild *Myrtle* with very ſharp-pointed leaves. 9. The *Myrtle* with very ſmall ſharp-pointed leaves. 10. The common ſmall *Myrtle*. 11. The common ſmall *Myrtle*, with leaves variegated with yellow. 12. The broad-leaved white-berried Spaniſh *Myrtle*. *Tourn.* Inſt. p. 640.

Myrtle-berries are eſteemed cooling and aſtringent. They are recommended in gonorrhœas, diarrhœas, dyſenteries, and hæmorrhages of all kinds; but ſeldom uſed by the faculty.

MYRTUS *Sylveſtris*, the *wild Myrtle*, in botany, a name given by ſome authors to the *ruſcus*, or butcher's broom, from ſome faint reſemblance of its leaves to thoſe of the *Myrtle*. *Ger.* Emac. Ind. 2. See the article RUSCUS.

MYRUS, in zoology, a kind of ſea-ſerpent, a fiſh of the eel claſs, ſuppoſed by ſome to be the male muræna, but erroneouſly. Its ſnout is very long and ſharp-pointed; its body black, ſlender, and round, without ſcales, and free from ſpots. The cavity for the gills is only one on each ſide. Near the neck there are ſome ſmall yellow dots to be ſeen, while the creature is alive; but theſe are ſcarce viſible after it is dead. Its fleſh is tender and delicate. *Rondelet.* de Piſc. vol. 1. p. 340.

MYS, in ichthyology, a name given by Ælian, Appian, and many others, to the fiſh called *capriſcus* by the later writers; the *capros* and *chærus* of others of the antients. See the article GOAT-*Fiſh*.

MYSIA, Μυσια, in antiquity, a feſtival in honour of Ceres. For the origin and ceremonies obſerved in it, ſee *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 415.

MYSTERY (*Cycl.*)—Mathematicians have been accuſed of introducing *myſteries* into geometry, which ought to have none. See the Analiſt; and Mr. *Maclaurin*'s Fluxions in the Introduction, and in other places. See alſo the article PARADOX.

MYSTOCEROS, in ichthyology, a name given by Geſner and ſome others to that ſpecies of the ſilurus which we call the ſheat-fiſh. It is the glanus of Pliny, and the reſt of the old authors; the ſilurus of Rondeletius and others. It is diſtinguiſhed by Artedi by the name of the ſilurus with four beards under the chin. It is plainly to be known from the fiſh called the *lake*, by this character; that having only one beard, it is a genuine ſpecies of ſilurus. See the article SILURUS.

MYSTRUM, among the antients, a liquid meaſure, which was the fourth part of the cyathus.

It weighed about two drams and an half of oil; and of water or wine, two drams two ſcruples. It was much about our ſmall ſpoonful. *Danet.* and *Pitiſc.* in voc.

MYSTUS *Fluviatilis*, in zoology, a name by which ſome writers, particularly Bellonius, have called the common *barbel*. *Willughby*, Hiſt. Piſc. p. 259. See the article BARBUS.

MYSTUS *Marinus*, the *Sea Barbel*, the name of a fiſh caught in the Adriatic, and common in the markets of Venice.

It is of an oblong figure, and in colour of a ſilvery white, variegated on each ſide with ten obliquely tranſverſe black lines. Its belly is very white. Its tail is forked, and its head long. Its back fin has part of its rays prickly, part ſoft to the touch. Its eyes are not large, and their iriſes are yellow. Its lips are prominent, thick, and ſoft, and only ſerrated in the place of teeth; but in the hinder part of its mouth it has ſeveral rows of ſhort and large *molares* or grinders. Its ſcales are large, and adhere firmly to the fleſh. It is a very well taſted fiſh. *Geſner*, de Piſc. p. 144.

MYSTUS *Niloticus*, in zoology, a name given by Bellonius to a fiſh of the barbel kind, caught in the Nile. Its body is thick and ſhort, and its belly very broad. It grows to ſo large a ſize as to weigh twenty pounds. Probably this may be no other than the common barbel growing to a larger ſize, as we ſee many fiſh will in ſome places more than others. *Bellonius*, de Piſc.

MYTACISM, Μυταχισμος, in rhetoric, the too frequent repetition of the letter M, thus *mammam ipſam amo, quaſi meam animam*. *Voſſ.* Rhet. l. 4. p. 46.

MYTIS, a name uſed by ſome writers to expreſs the black juice found in the mouth of the ſepia or cuttle-fiſh, with which it colours the water when in danger of being taken, and by this means often makes its eſcape. It is alſo uſed by Hippocrates as the name of a ſea-fiſh different from the ſepia.

MYTTOTON, a word uſed by the antients to expreſs a mixt ſort of country food, made of garlic, onions, eggs, cheeſe, oil, and vinegar. It was much eaten by the labouring people among the antients, and accounted a very wholeſome diſh.

MYTULUS, the *Muſcle*, in natural hiſtory, the name of a genus of ſhell-fiſh, the characters of which are theſe: It is a bivalve ſhell, of an oblong form, ending in a point, and having its two extremities equal. It is ſometimes ſmooth, ſometimes rough. In ſome ſpecies flat; in others elate; and in ſome has the beak elate. The *Tellina* and *Pinna marina*, of each of which there are ſeveral ſpecies, are properly of this genus.

The three words of *Mytulus*, *Muſculus*, and *Tellina*, may however be made of great uſe in the ſubdiſtinctions of the genus into certain ſeries.

In this ſenſe the word *Mytulus* may expreſs all the large *Muſcles*, ſuch as the *pinna marina*, and other *Muſcles*, which are remarkably much elevated in their ſhape, and have pointed beaks. The word *Muſculus* may be uſed to ſignify ſuch *Muſcles* as are ſmaller and more flat; and *Tellina* to expreſs, as it uſually does with authors, a bivalve ſhell of the *Muſcle* kind, but thinner and tenderer, and of an oblong figure, but not pointed.

The hinge of theſe ſhells is not in the center of the ſhells, but toward one end, and they have uſually a kind of little beak at that part.

The *Tellinæ* are attached to the ſhell by two ligaments; the *Muſcles* only by one.

The largeſt kind of *Mytulus* we know, is the *Pinna marina*; of which ſhell we have three kinds, one larger than the reſt, which is red within; this often produces pearls, but they are nearly of the ſame reddiſh colour with the lining of the ſhell. There have been found ſhells of this ſpecies ſo large as that the pair have weighed fifteen pounds. The ſmall *Pinna*, and the rough echinated *Pinna*, have their ſhells thicker near the edge where they open, than at the cardo. Theſe *Pinnæ marinæ* have a ſort of filaments iſſuing from the body of the fiſh, and faſtening it to ſtones, or any other ſubſtances. This the antients called *byſſus*, and wrought it into gloves and other things of that kind; and in ſome places it is to this day put to the ſame uſe. The common *Muſcles* have the ſame property of forming theſe threads; and Liſter has thence called them *ſetiferæ*. The ſilk of theſe common *Muſcles* is greatly inferior to that of the *Pinna marina* in fineneſs and beauty. The *Muſcles* hold themſelves in the ſame place, by means of their threads. The *Pinna marina* ſticks its ſharp end into the mud or ſand, and all the reſt of the ſhell remains at liberty to open in the water. Its filaments, which are propagated from the middle of its body, ſerve to draw up the mud and ſand about it, on occaſion, to defend it againſt the motion of the water in tempeſts.

The ſpecies of *Muſcles*, known at preſent, are theſe: Of the flat kind, which terminate in a point at one end, we have the following: 1. The great ſtriated magellanic *Muſcle*. 2. The ſmaller ſtriated magellanic *Muſcle*. 3. The ſmaller variegated magellanic *Muſcle*. 4. The ſmooth *Muſcle*. 5. The mouſe-throat *Muſcle*. 6. The date *Muſcle*. 7. The large rough *Muſcle*; this is commonly found covered with balani or center-ſhells. 8. The ſmaller rough *Muſcle*; this is frequently found covered with ſea-worms. 9. The blue *Muſcle*, ſtriated near the bottom; this is a very rare ſhell. 10. The roſe-coloured

loured variegated *Muſcle*. 11. The grey ſtriated *Muſcle*. 12. The great Newfoundland *Muſcle*. 13. The great Canada *Muſcle*.

Of thoſe uſually known in cabinets, under the name of *Pinnæ marinæ*, we have the following: 1. The common great *pinna*, variegated with grey and red. 2. The ſmaller whitiſh aculeated *Pinna marina*. 3. The ſmall reddiſh aculeated *Pinna*. 4. The *Pinna* of the ſhape of a ham, commonly called the *ham Pinna*. 5. The larger ſpinning *Pinna*, called the *ſilk Pinna*, becauſe of the great quantity of ſilk which it ſpins. 6. The ſmaller *Pinna marina*, called *Pinna tridacna* by Rondeletius. 7. The *Pinnophylax*; this is a large ſpecies, ſo called by Rumphius, from its often affording a lodging to a ſmall crab. 8. The duck-bill *Pinna*.

Of thoſe *Mytuli*, which are of a more elate figure and equilateral, we have the following: 1. The white tender *Muſcle*; this, when poliſhed, is kept in cabinets under the name of the ſilver ſhell. 2. The black *Pholas Muſcle*. 3. The yellow *Pholas Muſcle*. 4. The light and thin *Muſcle*, open in every part with a trunk. 5. The leſs open *Muſcle*, with a trunk. 6. The duſky-coloured *Muſcle*, from the iſle of Papous; this, when its outer coat is poliſhed off, makes a very beautiful figure, and is found to be liniated within the ſhell with brown and bluiſh faſciæ, and in this ſtate is a remarkably elegant ſhell. See Tab. of Shells, N°. 19.

Of the *Tellinæ*, which are oblong and flat ſhells with equal extremities, we have the following ſpecies: 1. The violet-coloured *Tellina*. 2. The violet *Tellina*, with four white zones. 3. The ſmooth *Tellina*, elegantly variegated with pale red and white faſciæ. 4. The hairy *Tellina*, of the Mediterranean ſea. 5. The larger hairy *Tellina*, of the ocean. 6. The Canada *Tellina*. 7. The *Tellina* of the Azores iſlands. 8. The great Newfoundland *Tellina*. 9. The ſmall Canada *Tellina*. 10. The Saint Savinian *Tellina*. This laſt is often found poliſhed in our cabinets, and then is very elegantly variegated with roſe-colour and a ſilvery white. Theſe are all the known *Tellinæ*, with equal extremities.

But of thoſe which have the two ends unlike, we have the following ſpecies: 1. The reddiſh-beaked *Tellina*, reſembling a ſurgeon's forceps. 2. The yellowiſh forceps *Tellina*. 3. The *Tellina* of the ſhape of a knife. 4. The long-beaked *Tellina*. 5. The rough *Tellina*, called the cat's-tongue *Tellina*. 6. The faſciated and radiated roſe-coloured *Tellina*. 7. The orange-coloured *Tellina*, doubled on one ſide, and dentated at the edge. 8. The leaf *Tellina*; this greatly reſembles the leaf of a tree. 9. The white granulated *Tellina*. 10. The reddiſh tranſverſely ſtriated *Tellina*. 11. The flatted and truncated *Tellina*. 12. The violet *Tellina*, with a ſtriated apex. 13. The yellowiſh *Tellina*, with a ſtriated apex. 14. The reddiſh *Tellina*; this is an elegant ſhell, though little variegated. Hiſt. Nat. Eclair. p. 326.

The common ſea *Muſcle* has, from its being always found faſtened to the rocks, been ſuppoſed by many wholly incapable of progreſſive motion; but this is an erroneous opinion. It is a common practice in France at ſuch ſeaſons of the year as do not afford ſun enough to make ſalt, to throw the common ſea *Muſcles*, which the fiſhermen catch about the coaſts, into the brine-pits. They have an opinion that this renders their fleſh the more tender and delicate, as the rain which falls at theſe ſeaſons makes the water of the pits much leſs ſalt than the common ſea-water. The *Muſcles* are on this occaſion thrown careleſsly in, in ſeveral different parts of the pits; yet, at whatever diſtances they have been thrown in, the fiſhermen when they go to take them out, always find them in a cluſter together; and as there is no current of water in theſe places, nor any other power of motion which can have brought the *Muſcles* together, it ſeems very evident that they muſt voluntarily have marched from the places where they were at firſt, to have met thus together. This progreſſive motion is wholly performed by means of what we call the tongue of the *Muſcle*, from its ſhape; but, from its uſe in this caſe, appears rather to merit the name of a leg, or an arm, as by laying hold of any diſtant ſubſtance, and then forcibly contracting itſelf again, it draws along the whole body of the fiſh; the ſame part, when it has moved the animal to a proper place, ſerves alſo to fix it there, being the organ by which it ſpins the threads which we call its beard, by which it is held to a rock, or to another *Muſcle*. The motion of the *Muſcle*, by means of this part, is juſt the ſame with that of a man laid flat on his belly, who would draw himſelf along by laying hold of any thing with one hand, and then drawing himſelf to it. Mem. Acad. Par. 1710.

Muſcles are well known to have a power of faſtening themſelves very firmly either to ſtones, or to one another's ſhells, in a very ſtrong and firm manner; but the method of doing this was not well underſtood, till the obſervations of the accurate Mr. Reaumur explained it.

Every one who opens and examines a common *Muſcle* will find, that in the middle of the fiſh there is placed a little blackiſh or browniſh body reſembling a tongue; this in large *Muſcles* is near half an inch long, and a little more than a ſixth of an inch in breadth, and is narrower at the origin than at the extremity; from the root of this tongue, or that part of it which is faſtened to the body of the fiſh, there are produced a great number of threads, which when fixed to any ſolid ſubſtance hold the *Muſcle* firmly in its place: Theſe threads are uſually from an inch to two inches in length, and in thickneſs from that of a hair to that of a hog's briſtle. They iſſue out of the ſhell in that part where it naturally opens, and fix themſelves to any thing that lies in their way, to ſtones, to fragments of ſhells, or, which is the moſt common caſe, to the ſhells of other *Muſcles*; whence it happens that there are uſually ſuch large parcels of *Muſcles* found together. Theſe threads are expanded on every ſide, and are uſually very numerous, an hundred and fifty having been found iſſuing from one ſhell; they ſerve the office of ſo many cables, and each pulling in its proper direction, they keep the *Muſcle* fixed againſt any force that can be offered from whatever part it come. The filaments are well known to all who eat *Muſcles*, who ever carefully ſeparate them under the name of the beard; and Mr. Reaumur has found, that while the animal is living in the ſea, if they are all torn away by any accident the creature has a power of ſubſtituting others in their room: He found that if a quantity of *Muſcles* were detached from one another and put into a veſſel of any kind, and in that plunged into the ſea, they in a little time there faſtened themſelves both to the ſides of the veſſel and to one another's ſhells; the extremity of each thread ſeemed in this caſe to ſerve in the manner of a hand to ſeize upon any thing that it would fix to, and the other part which was ſlenderer and ſmaller to do the office of an arm in conducting it.

To know the manner of the *Muſcle*'s performing this operation, this diligent obſerver put ſome *Muſcles* into a veſſel in his chamber, and covered them with ſea-water; he there ſaw that they ſoon began to open their ſhells, and each put forth that little body before deſcribed by its reſemblance to a tongue, and at the root of which theſe threads grow; they extended and ſhortned this part ſeveral times, and thruſt it out every way, often giving it not leſs than two inches in length, and trying before, behind, and on every ſide with it, what were the proper places to fix their threads at: At the end of theſe trials they let it remain fixed for ſome time on the ſpot which they choſe for that purpoſe, and then drawing it back into the ſhell with great quickneſs, it was eaſy to ſee that they were then faſtened by one of theſe threads to the ſpot where it had before touched and remained fixed for a few minutes; and in repeating this workmanſhip the threads are increaſed in number one at every time, and being fixed in different places they ſuſtain the fiſh at reſt againſt any common force.

The ſeveral threads were found to be very different from one another, the new formed ones being ever whiter, more gloſſy, and more tranſparent than the others; and it appeared on a cloſe examination, that it was not as might have been moſt naturally ſuppoſed, the office of the tongue to convey the old threads one by one to the new places where they were now to be fixed, but that theſe in reality were now become uſeleſs; and that every thread we ſee now formed, is a new one made at this time; and in fine, that nature has given to ſome ſea-fiſhes, as well as to many land-inſects, a power of ſpinning theſe threads for their neceſſary uſes. And that *Muſcles* and the like fiſh are under water, what caterpillars and ſpiders are at land. To be well aſſured of this, however, Mr. Reaumur cut off all the beard or old threads of a *Muſcle* as cloſe as he could, without injuring the part, and the proof of the opinion of their ſpinning new ones at pleaſure was now brought to this eaſy trial, whether theſe *Muſcles* ſo deprived of their old ones could fix themſelves as ſoon as others which were poſſeſſed of theirs, and could throw out their threads to as conſiderable diſtances. The experiment proved the truth of the conjecture, for thoſe whoſe beards or old threads were cut off, fixed themſelves as ſoon as thoſe in which they were left, and ſpread their threads to as great a diſtance every way.

When the mechaniſm of this manufacture was thus far underſtood, it became a natural deſire to enquire into the nature of the part by which it was performed: This has hitherto been mentioned under the name of the tongue, from its ſhape; but it is truly the arm of the fiſh, and whenever it happens to be looſened from its company, or fixed in a wrong place, it ſerves the animal to drag its whole body ſhell and all along, and to perform its ſeveral motions. It fixes itſelf to ſome ſolid body, and then ſtrongly contracting its length, the whole fiſh muſt neceſſarily follow it, and be pulled toward the place where it is fixed. This is an uſe however that this part is ſo rarely put to, that it is not properly to be eſteemed a leg or an arm, for this; but, according to its more frequent employment, may much better be denominated the organ by which the threads are ſpun.

Though this body is flat in the manner of a tongue for the greater part of its length, it is however rounded or cylindric about the baſe or inſertion, and it is much ſmaller there than in any other part; there are ſeveral muſcular ligaments faſtned to it about the root or baſe, which hold it firmly againſt the middle of the back of the ſhell; of theſe ligaments there are four, which are particularly obſervable, and which ſerve to move the body in any direction. There runs all along this body a ſlit or crack, which pierces very deeply into its ſubſtance,

ſtance, and divides it as it were into two longitudinal ſections; this is properly a canal, and along this is thrown the liquor which ſerves to form the threads; and it is in this canal or ſlit that theſe threads are moulded into their form. Externally, this appears only a ſmall crack or ſlit, becauſe the two fleſhy ſections of the parts almoſt meet and cover it, but it is rounded and deep within, and is ſurrounded with circular fibres. This canal is carried regularly on from the tip of the tongue, as it is called, to its baſe, where it becomes cylindric; the cylinder in this part being no other than a cloſe tube or pipe, in which this open canal terminates. The cylindric tube contains a round oblong body, of the nature of the threads, except that it is much larger; and from the extremity of this all the threads are produced, this ſerving as a great cable to which all the other little cordages diſperſed towards different parts, are fixed. The tube or pipe in which this large thread is lodged, ſeems the reſervoir of the liquor of which the other threads are formed; all its internal ſurface being furniſhed with glands for its ſecretion. Mem. Acad. Par. 1711.

The *Muſcle*, like many other ſea-fiſhes, abounds in this liquor; and if at any time one touch with a finger the baſe of this ſpinning organ, one draws away with it a viſcous liquor in form of ſeveral threads, like thoſe of the caterpillar, ſpider, and the other ſpinning land-animals. The threads fix themſelves with equal eaſe to the moſt ſmooth and gloſſy, as to rougher bodies; if the *Muſcles* are kept in glaſs-jars of ſea-water, they as firmly faſten themſelves to the glaſs as to any other body.

Muſcles, be they ever ſo young, have this property of ſpinning; and by this means they faſten themſelves in vaſt numbers to any thing which they find in the ſea. Mr. Reaumur has ſeen them when as ſmall as millet-ſeeds, ſpin plentifully, though their threads proportioned to their own weight, are much finer and ſmaller than thoſe of larger *Muſcles*.

It is a queſtion yet undetermined whether the *Muſcle* has a power of breaking, or otherwiſe getting rid of its threads, in order to its removing from the place where it is once fixed; but it appears probable that they have not, and that they muſt remain where they have once faſtened themſelves, though their deſtruction be the conſequence of it. Mr. Reaumur tried this experiment in his jars, when they had well fixed themſelves to the ſides of them, he poured off part of the ſalt-water, ſo that it became the intereſt of the fiſh to leave their hold and go lower down, but they ſeemed to have no power to effect this. Mem. Acad. Par. 1711.

The common *Muſcle* affords the curious obſerver a very pleaſing object of examination by the microſcope. The tranſparent membrane, which immediately appears on opening the ſhell, ſhews the circulation of the blood for a long time together through an amazing number of veſſels. And Mr. Lewenhoek, in ſeveral which he diſſected, diſcovered numbers of eggs or embryo *Muſcles* in the ovarium, appearing as plainly as if he had ſeen them by the naked eye, and all lying with their ſharp ends faſtened to the ſtring of veſſels by which they received nouriſhment. The minute eggs, or embryos, are by the parent placed in due order, and in a very cloſe arrangement on the outſide of the ſhell, where by means of a gluey matter they adhere very faſt, and continually increaſe in ſize and ſtrength, till becoming perfect *Muſcles* they fall off and ſhift for themſelves, leaving the holes where they were placed behind them. *Baker*'s Microſcope, p. 242.

This abundance of *Muſcle* ſhells very plainly ſhew when examined by the microſcope, and ſometimes they are in the number of two or three thouſand on one ſhell; but it is not certain that theſe have been all fixed there by the *Muſcle* within; for theſe fiſh uſually lying in great numbers near one another the embryos of one are often affixed to the ſhell of another. The fringed edge of the *Muſcle*, which Mr. Lewenhoek calls the beard, has in every the minuteſt part of it ſuch variety of motions as is unconcievable; for being compoſed of longiſh fibres, each fibre has on both ſides a vaſt many moving particles. *Lewenhoek*'s Arcan. Nat.

MYUTES *Lapis*, in natural hiſtory, a name given by ſome authors to a foſſile body, part of an aſteropodium which they have thought in ſingle joints ſomewhat reſembled the ears of a mouſe. See the article ASTEROPODIUM.

MYXA, or MYXARIA, in the materia medica, a name uſed by ſome authors for the ſebeſtens, a ſort of plum of Ægypt and Aſia. *J. Bauhin*, V. 1. p. 198. See the article SEBESTEN, *Cycl.*

MYXOLYDIAN, in antient muſic, the firſt ſpecies of the diapaſon. See the article DIAPASON.

MYXON, in zoology, the name of a fiſh of the mullet kind, called by others, *Bacchus*.

It much reſembles the common mullet; but its head is leſs pointed, and its body is covered beſide the ſcales with a mucous matter. It has a remarkable irregularity in the manner of its ſwimming, and looks red about the lips and covering of the gills. *Rondelet*. de Piſc. p. 683. See the article MUGIL.

N.

N.

NABATHÆA *ſiliqua*, in the materia medica, a name given by the interpreters of Aviſenna, and other of the Arabian phyſicians, to the *jembut*, or *aljembut*, of thoſe authors.

It appears, from the accounts they have given us of this drug, that it was a long and ſlender pod, produced on a thorny tree. It has been generally ſuppoſed to be the ſame wirh the *carob*, or *ſiliqua dulcis*, but very erroneouſly. The ſame authors who mention this *aljembut*, or *Nabathæa ſiliqua*, mention that alſo under the name of the *alnabati*, or *Syrian ſiliqua*, as it is interpreted.

The *Syrian ſiliqua*, they ſay, purges, and is good in colics. The *Nabathæan* they recommend to us, as an aſtringent in hæmorrhages. It is plainly to be inferred from this, that the *Nabathæa ſiliqua* is different, in the greateſt degree, from the Syrian pod, or *carob* fruit; and by its virtues, and the deſcription they give us of the thorny tree which produces it, it ſeems very probable that it was the pod of ſome ſpecies of the *acacia*.

What gives the greateſt probability to this opinion is, that the ſame authors have plainly, in other places, called the *acacia* by the common name of *ſiliqua*. Iſidore, explaining ſome paſſages of the old Roman authors on this ſubject, ſays, that the ſhrub *ſilicon*, which the Latins had improperly called *ſiliqua*, yields a fruit, the expreſſed juice of which is the drug called *acacia* in the ſhops.

The Arabian authors who mention this *ſiliqua Nabathæa*, and call it alſo *ſeuchi*, and *charnub ſeuchi*, deſcribe the ſhrub which produces it, as being prickly, and riſing but a cubit high from the ground; and, they add, that it had crooked, or falcated pods, which contained ſeeds, and a pulp very much reſembling the other *ſiliqua*, which is the *carob*. Neophytus, and others, tell us, that the pods of the *acacia* were called by the Greeks *ceration*, as well as thoſe of the *carob*; and the Arabians call the *acacia*, *alcarad*, a name plainly derived from this *ceration* of the Greeks.

As therefore both the pods of the *carob*, or *ſiliqua edulis*, and thoſe of the *acacia* were called by the ſame names *ceratia*, &c. it is plain that when the authors before-mentioned deſcribe two kinds of *carob*, or as they expreſs it *ceratia*, differing from one another, and poſſeſſing, the one the virtues of the *carob* fruit, and the other of the *acacia*, they mean the *carob* by the purging fruit, and the *acacia* by the aſtringent.

NABCA, in botany, a name by which ſome authors have called the tree more uſually deſcribed under the name of *ænoplia*, or the great jujube tree. *Chabræus*, p. 51.

NABECH, in botany, the name given by the Arabian writers to the fruit of the tree *ſadar*, which is the *lotus* of Dioſcorides, and the *acanthus* of Virgil. The fruit of this, which is round, and like a cherry, only ſmaller, was firſt called by this name *nabech*, or *nabac*, but afterwards the tree was alſo called by it. See the article SADAR.

NABLUM, in Hebrew, *nebel*, an inſtrument of muſic among the Hebrews. The Seventy, and the Vulgate, tranſlate it ſometimes by *nablum*, and at other times by *pſalterion*, or *lyra*, or even *cithara*.

The *nablum* was a ſtringed inſtrument, very near of the form of a Δ, which was played upon by both hands, and with a kind of bow. See Calmet's diſſertation concerning the inſtruments of muſic of the antient Hebrews, prefixed to the ſecond volume of his commentary upon the pſalms. *Calmet*, Dict. Bibl.

NADIR-*il-kiſne*, in the Turkiſh offices, the ſuperintendant over the wardrobe. *Pocock*'s Egypt, p. 188.

NÆVI (*Cycl.*) are excreſcences of fleſh in various parts of the body, ſuppoſed to have been occaſioned by frights, diſappointments, &c. of the mother, while the infant was in the womb. Theſe tumors ariſe in all parts of the body; they are of all figures, and of all ſizes, and are ſometimes of the common colour of the ſkin, ſometimes black, red, &c. Many of them, both in ſhape and colour, reſemble fruits of ſeveral kinds, as mulberries, ſtrawberries, and the like; or animals, as mice, or ſpiders.

They are to be removed, as warts, by ligature, cautery, or extirpation with the knife. But if they have large veſſels near their roots, if they are ſtrongly fixed to the bone, or if they ſeem to have a cancerous diſpoſition, it is much beſt for the ſurgeon to let them wholly alone; and where they are ſeated in the neighbourhood of arteries, or large veins, if preſſed to extirpate them, he ſhould never be without cauteries, ſtyptics, bandages, and other neceſſary apparatus, in caſe of hæmorrhages. *Heiſter*'s Surgery. p. 323.

NAGEMULUS, in ichthyology, a name given by ſome of the German authors to the fiſh called by Willughby and others, the *lucioperca*, or *pike-pearch*. It is truly a ſpecies of pearch, and is diſtinguiſhed from the common pearch, principally by having two long teeth on each ſide of the mouth. See PERCA.

NAJAS, in botany, the name given by Linnæus to a genus of plants called by Vaillant and Micheli *fluvialis*. The characters are theſe: it produces male and female flowers diſtinct. In the male flowers, the perianthium is compoſed of one leaf of a cylindric figure, and truncated at the baſe, growing ſmaller at the top, and having at the mouth two oppoſite ſegments which bend backwards. The flower is compoſed of only one petal, and is a tube of the length of the cup; its verge is divided into four ſegments, which are rolled backwards. There are no ſtamina, but the middle of the flower produces one, oblong, erect anthera. In the female flower there is no cup, nor any petal, but a piſtil whoſe germen is of an oval figure, and terminates in a ſlender ſtyle; the ſtigmata are ſimple; the fruit is an oval capſule, containing one oblong oval ſeed. *Linnæi* Gen. Pl. 443. *Vaill.* A. G. 1719. T. 1. T. 2. *Michel.* 8.

NAIL, (*Cycl.*) in the manege. The different poſition of the *nails* of the bridle, or left hand of the horſeman, gives the horſe a facility of changing hands, and forming his departure, and ſtop; by reaſon that the motion of the bridle follows ſuch a poſition of the *nails*. To give a horſe head, you muſt turn the *nails* downwards. To turn the horſe to the right, you muſt turn them upwards, moving your hand to the right. To change to the left you muſt turn the *nails* down, and bear to the left. To ſtop the horſe you muſt turn them upwards, and lift up, or raiſe your hand.

NAILS *of the human body*. Dr. Pozzi endeavours to prove, that the *nails* grow out of the tendons, which are ſpread upon the laſt phalanx of the fingers and toes. See UNGUIS.

NAKED *ſtalk*, or *leaf*, among botaniſts. See the articles STALK, and LEAF.

NAKIB, in the Oriental dignities, the name of an officer who is a deputy to the cadiliſkier, or, as he may be called, the lord high chancellor of Egypt, appointed by the grand ſignior. *Pocock*'s Egypt, p. 170.

NAKIR, a word uſed by ſome medical writers to expreſs a violent flatulence which paſſes from one limb to another, and is always attended with pain.

NAKOUS, an Egyptian muſical inſtrument, made like two plates of braſs, and of all ſizes, from two inches to a foot in diameter; they hold them by ſtrings faſtened to their middles, and ſtrike them together ſo as to beat time. They are uſed in the Coptic churches, and in the Mahometan proceſſions. *Pocock*'s Egypt, p. 186.

NAL *la appella*, in botany, a name uſed in the Hortus Malabaricus to expreſs an Indian ſhrub, or tree, from the roots of which they obtain an oil of a gold yellow colour, and very agreeable ſmell, called *appel* oil. It is of a bitteriſh and ſharp taſte, and is in great eſteem among them in pains of the head. Hort. Malab.

NAMANTIA, in ichthyology, a name given by the French to the *manati*, or *ſea cow*.

NAME (*Cycl.*) — *Generical* NAME. See GENERICAL.

NAMUR *marble*, a name given by our artificers to a ſpecies of black marble, which is very hard, and capable of a good poliſh, but has no variegations of any other colour. It is common in Italy, France, and Germany, and is the ſpecies called the *Lucullean marble* by the Romans. *Hill*'s Hiſt. Foſſ. p. 466. See LUCULLEUM *marmor*.

NAPELLUS (*Cycl.*) — This plant is poiſonous in ſome places, and innocent in others. Its mortal quality increaſes with the heat of the climate, and goes off where that is ſmall. In the ſouth of France, it is a fatal poiſon; in Bretany, they find the roots inoffenſive to the moſt tender conſtitutions; and farther north, they eat the leaves among their ſallad herbs, to get them an appetite, and find them a ſafe and wholeſome food. *Deſlandes* Tr. Phyſ.

It is ſaid the *napellus* may be ſo corrected by volatile ſalt of tartar, as to become innocent. *Boyle*'s Works, Abr. Vol. 1. p. 60. Dr. Hill makes the *napellus* a ſpecies of aconite. *Hill*'s Nat. Hiſt. Vol. 2. p. 483.

NAPESCA, a name given by ſome to a ſpecies of *jujube*.

NAPHA, a name given by many of the writers in pharmacy to *orange-flower water*.

NAPHTHA, (*Cycl.*) in natural hiſtory, the name of a genus of fluid foſſils, the characters of which are, that they are of a thin conſiſtence, bright and pellucid, of a ſtrong ſmell, very readily inflammable, and, when pure, burning away, without leaving any reſiduum.

Of this genus there are only two ſpecies, the one commonly known by the name of *naphtha*, the other by that of *petroleum*. The firſt is a pure and clear mineral fluid, of a much thinner conſiſtence than any of the expreſſed oils of vegetables; and

ſomething thicker than the finer of the diſtilled ones; it is of a pale yellow, with a faint caſt of brown among it, and is, indeed, of the very colour of the common brown amber uſed by the apothecaries. It is of a briſk, penetrating ſmell, ſomething like that of the chemical oil of amber, but not ſo offenſive. It is extremely inflammable, and is found floating on the waters of certain ſprings which break out at the ſides of hills in Perſia, Tartary, China, and other parts of the eaſt. It ſeems very practicable, by means of this mineral fluid, and a proper acid, to make a ſort of artificial amber, this being only a ſort of fluid amber.

The ſecond kind, commonly known by the name of *petroleum*, is a thin, ſubtle, and penetrating fluid, much thinner than the yellow *naphtha*, and as fine as the cleareſt diſtilled oils of vegetables. It is of a very ſtrong and penetrating ſmell; and is of various colours. It is naturally of a clear, fine, and bright white, and nearly as pellucid as the pureſt ſpring water; but it is more frequently found brown, rediſh, or blackiſh. It is produced in almoſt all parts of the world: England, France, and Germany, afford it in many places, but it is moſt plentifully found in Italy. *Hill*'s Hiſt. of Foſſ. p. 419, ſeq.

Naphtha has much the ſame medical virtues with *petroleum*, only in a more remiſs degree. In Perſia, it is uſed externally on many occaſions, and alſo given inwardly in colics, a few drops being the doſe. See PETROLEUM.

NAPLES *yellow*, the common name in the colour ſhops of London, and among our painters, for the ochre called *giallolino*. See GIALLOLINO.

NAPUS, *navew*, in botany, the name of a genus of plants, the characters of which are the ſame with thoſe of the turnep, and which ſcarce deſerves to be made a different genus from it, differing only in its general figure.

The ſpecies of *navew* enumerated by Mr. Tournefort are theſe: 1. The white-rooted, manured *navew*. 2. The yellow-rooted, manured *navew*. 3. The black-rooted, manured *navew*. 4. The largeſt-rooted, manured *navew*. And, 5. The wild *navew*. *Tourn.* Inſt. p. 229.

The ſeeds of *napus* are roundiſh, of a blackiſh colour, and of an acrid and biting taſte. They are accounted deterſive, inciſive, aperitive, and digeſtive, and ſaid to be good in malignant fevers, and the ſmall pox, and are an ingredient in the Venice treacle. The root of the plant is ſaid to be alſo good in coughs, aſthmas, and conſumptions.

Nape oil is made from the ſeed of the *napus ſylveſtris Lobelii*, often called *navette*, and the oil *navetta oil*. *Lemery*'s Hiſt. of Drugs. See NAVETTE.

NAPUS, in natural hiſtory, a name given to a ſpecies of *voluta*, approaching to the nature of the famous admiral ſhell, and more commonly known by the name of the *falſe admiral*, or *baſtard admiral*. See ADMIRAL.

NAPUT, in botany, the name given by the Norwegians to a plant whoſe root is an excellent remedy for the colic. It grows plentifully in the northern parts of Norway, and is the conſtant remedy uſed by the miners for their colics, which are particularly ſevere. The taſte is ſaid to be agreeable, being at firſt chewing ſomewhat like a radiſh, but afterwards having the flavour of the garden angelica. Phil. Tranſ N° 114.

NARCAPHTHON, in the materia medica, the name given by many to the bark called *caſcarilla*.

NARCE, νάρκη, a torpor, ſtupor, or dullneſs of ſenſation; uſed either for a natural ſtupidity, or for that ſtupefaction of the ſenſes brought on by medicines, to alleviate the violence of pains.

NARCISSITES, in natural hiſtory, a name given by ſome authors to a ſpecies of *aſteropodium* from its ſuppoſed reſemblance to the flowers of the narciſſus; others have called ſome of the coralloide funguſes by that name, and others a ſpecies of echinites of the pileated kind.

It is, however, a name that none of them have any title to, ſince the reſemblance will appear very ſmall when nicely conſidered.

NARCISSOLEUCOIUM, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the liliaceous kind, and is compoſed of ſix petals, ſometimes equal, ſometimes irregular in ſize, and is pendulous, and of a ſomewhat bell-faſhioned form. The cup of the flower becomes finally a fruit of a roundiſh figure, divided into three cells, and containing roundiſh ſeeds; to this alſo it is to be added, that the root is bulbous.

The ſpecies of *narciſſoleucoium* enumerated by Mr. Tournefort, are theſe: 1. The common *narciſſoleucoium*. 2. The *narciſſoleucoium* with a white expanded flower. 3. The many-flowered, late, meadow *narciſſoleucoium*. 4. The double, many-flowered, meadow *narciſſoleucoium*. 5. The greater, trifoliate *narciſſoleucoium*. 6. The leſſer, trifoliate *narciſſoleucoium*. 7. The blue-flowered, trifoliate *narciſſoleucoium*. 8. The broad leaved, autumnal *narciſſoleucoium*. 9. The capillaceous-leaved, autumnal *narciſſoleucoium*. 10. The capillaceous-leaved, vernal *narciſſoleucoium*. *Tourn.* Inſt. p. 387.

NARCISSUS, in botany, the name of a genus of plants, the characters of which are theſe: the flower is liliaceous, conſiſting of one leaf made in a bell-like ſhape, and divided at the edge into ſix ſegments, ſurrounding its middle in manner of a crown. The cup grows out of a membranaceous huſk, and becomes at length a longiſh, or roundiſh fruit, ſomewhat approaching to a trigonal form; and opening, ſhews itſelf to be compoſed of three cells, which uſually contain roundiſh ſeeds. See Tab. 1. of Botany, Claſs 9.

The ſpecies of *narciſſus* enumerated by Mr. Tournefort are theſe: 1. The great, pale-flowered *narciſſus*, with hoary leaves. 2. The great, blueiſh, white-flowered *narciſſus*, with a deep, yellow, circle. 3. The white-flowered, ſcented *narciſſus*, with the circle of the flower yellow. 4. The ſnow white, ſweet-ſcented *narciſſus*, with a red circle. 5. The white *narciſſus*, with a yellow circle. 6. The great, white, ſweet-ſcented *narciſſus*. 7. The great, white, oriental *narciſſus*. 8. The middle, white, oriental *narciſſus*. 9. The white, oriental *narciſſus*, with a ſtarry cup. 10. The great, plain, white *narciſſus*. 11. The leſſer, plain, white *narciſſus*. 12. The ſnow-white *narciſſus*. 13. The ſmall-flowered, white *narciſſus*, with the ſmell of jaſmine. 14. The great, white, oriental *narciſſus*, with a yellow cup. 15. The middle, white, oriental *narciſſus*, with a yellow cup. 16. The leſſer, white, oriental *narciſſus*, with a yellow cup. 17. The white, oriental *narciſſus*, with a yellow, double cup. 18. The oriental *narciſſus*, with a round, gold, yellow cup. 19. The pale-flowered *narciſſus*, with a ſaffron-coloured middle. 20. The pale-flowered *narciſſus*, with a gold, yellow middle. 21. The many-flowered, white *narciſſus*, with a deep, yellow circle. 22. The *narciſſus*, with a purple middle. 23. The pale-flowered *narciſſus*, with a ſaffron-coloured middle. 24. The pale-flowered *narciſſus*, with a gold, yellow circle. 25. The white *narciſſus*, with reflex leaves, and a ſhort, gold yellow cup. 26. The elegant *narciſſus*, with double flowers, variegated with yellow, and ſaffron colour. 27. The ſtrong-ſcented, full-flowered *narciſſus*, with a yellow middle. 28. The very large flowered *narciſſus*, with a yellow middle. 29. The ſnow white, fine ſcented *narciſſus*, with a yellow cup. 30. The many-flowered, African, yellow *narciſſus*. 31. The many-flowered, Portugal, yellow *narciſſus*. 32. The great, many-flowered, Conſtantinople *narciſſus*, with double, greyiſh, white flowers. 33. The yellow, Conſtantinople *narciſſus*. 34. The narrow-leaved, all-yellow *narciſſus*. 35. The narrow-leaved, yellow *narciſſus*, with a large cup. 36. The great, white-flowered, narrow-leaved *narciſſus*. 37. The ſmaller, white-flowered, narrow-leaved *narciſſus*. 38. The pale-flowered, narrow-leaved *narciſſus*, with a deep, yellow cup. 39. The little, white *narciſſus*, with a beautiful, purple border. 40. The graſſy-leaved *narciſſus*, with a deep yellow middle. 41. The ruſh-leaved *narciſſus*, with yellow flowers, and long cups. 42. The ſmaller, yellow-flowered, ruſh-leaved *narciſſus*. 43. The ruſh-leaved *narciſſus*, with yellow, variegated flowers. 44. The ruſh-leaved *narciſſus*, with a pale flower, and a deep yellow cup. 45. The ruſh-leaved *narciſſus*, with a round, roſe-like flower. 46. The plain, white flowered, ruſh-leaved *narciſſus*. 47. The ruſh-leaved *narciſſus*, with twiſted leaves, and with white flowers, and yellow cups. 48. The white, autumnal *narciſſus*. 49. The ſmalleſt, white, autumnal *narciſſus*. 50. The great, white flowered, broad-leaved *narciſſus*, with a ſhort, yellow cup. 51. The broad-leaved, pale-flowered *narciſſus*, with a large, gold-coloured cup, and a ſtriated ſtalk. 52. The broad-leaved *narciſſus*, with large, pale-coloured flowers, and a yellow cup. 53. The middle, white *narciſſus*, with a ſhort, yellow cup. 54. The great, pale, yellow *narciſſus*. 55. The yellowiſh *narciſſus*, with an hexangular tube. 56. The yellow *narciſſus*, with a round tube. 57. The white *narciſſus*, with a yellow tube. 58. The white *narciſſus*, with a yellow cup, and with the ſmell of the muſcari. 59. The white *narciſſus*, with an oblong, yellow cup. 60. The wild, pale-flowered *narciſſus*, with a yellow cup. 61. The great, all-yellow *narciſſus*, with a very long cup. 62. The plain, yellow *narciſſus*, with the leaves of the flower bent back. 63. The ſmall, plain, yellow *narciſſus*. 64. The white *narciſſus*, with a yellow cup. 65. The white *narciſſus*, with a yellow fimbria. 66. The ſmall, creeping, yellow *narciſſus*. 67. The white, narrow-leaved *narciſſus*, with an oblong cup, and a depending flower. 68. The mountain, ruſh-leaved *narciſſus*, with a yellow cup. 69. The mountain *narciſſus*, with a fimbriated flower. 70. The ſmalleſt, white, mountain, ruſhy-leaved *narciſſus*. 71. The mountain, ruſhy-leaved *narciſſus*, with a gold, yellow cup. 72. The coronated, mountain *narciſſus*. 73. The double-flowered, oriental *narciſſus*, with yellowiſh, white flowers. 74. The broad-leaved, white *narciſſus*, with the yellow middle. 75. The white *narciſſus*, with a double yellow corona. 76. The double, plain, yellow *narciſſus*. 77. The double, purple-middled *narciſſus*. 78. The double, ſnow-white *narciſſus*. 79. The Virginian, double, white *narciſſus*. 80. The double, yellow, wild *narciſſus*, without a cup. 81. The double *narciſſus*, with variegated flowers. 82. The yellow, wild *narciſſus*, with a double, or triple, yellow tube. 83. The paler, yellow, wild *narciſſus*, with a triple tube. 84. The yellow *narciſſus*, with a divided tube. 85. The double, yellow, broad-leaved *narciſſus*. 86. The double, anemone-like, gold-yellow, ruſh-leaved *narciſſus*. 87. The gold-yellow, double *narciſſus*. 88. The ſea *narciſſus*, called by many the little, white *ſquill*. 89. The purple-flowered, ſea *narciſſus*, 90. The liliaceous *narciſſus*. 91. The white-flowered, ſpring, American *narciſſus*. 92. The American *narciſſus*,

narciſſus, with double white flowers, ſmelling like ba'ſam of Peru. 93. The white *narciſſus* of Ceylon, with a hexangular ſweet-ſcented flower. *Tourn.* Inſt. p. 353, ſeq.

NARCOS, in ichthyology, a name given by Joannes Cuba, and other writers, to the *torpedo* or cramp-fiſh; a ſpecies of raia, diſtinguiſhed by Artedi by the name of the *raia tota lævis*, the wholly ſmooth raia.

NARCOSIS, a ſtupefaction or inſenſible ſtate, whether brought on by medicines, or happening from natural cauſes.

NARDINUM *unguentum, ointment of ſpikenard*, an ointment greatly celebrated among the antient writers in medicine. It ſeems to have been variouſly prepared, but always with a great number of aromatic ingredients, and always with *ſpikenard* for the baſis.

Dioſcorides ſays, that the *malabathrum*, or Indian leaf, was ſometimes an ingredient in it, but that it was alſo ſometimes made without it. It was generally, however, mix'd with the *oleum balaninum*, or *amphacinum*, inſpiſſated with an addition of ſchænanth; and to increaſe its fragrancy there were added, coſtus, amomum, myrrh, and balm of Gilead.

The fineſt was accounted that which was of a thin conſiſtence, and very fragrant ſmell. It was ſaid to be attenuating and deterſive, but ſomewhat acrimonious; and was ſometimes, for particular uſes, reduced to a ſolid conſiſtence with reſin. *Dioſcorides*, l. 1. c. 35.

NARDUS, in the Linnæan ſyſtem of botany, the name of a diſtinct genus of plants of the graſs kind, the diſtinguiſhing characters of which are, that there is no calyx; that the flower is compoſed of two valves; the exterior is very ſlender, oblong, and ends in a beard or awn, and in ſome ſort receives the other into a cavity in its fore part: the interior is ſmall and ſtrait, and is terminated by a much ſhorter awn. The ſtamina are three capillary filaments, ſhorter than the flower: the antheræ are oblong: the germen of the piſtillum is oblong: the ſtyles are two in number, capillary, and reflex and downy: the ſtigmata are ſimple. The flower continues firmly attached to the ſeed. The ſeed is ſingle, long, ſtrait, pointed at both ends, and narrower in its upper than in its under part. *Linnæi* Gen. Plant. p. 19. See SPIKENARD, *Cycl.*

NARDUS *ruſtica*, in botany, a name attributed by ſome authors to the *aſarabacca*, and by others to the *baccharis monſpelienſium*. *Dale*, Pharm. p. 79.

NARES *piſcium*. The *noſtrils* in fiſh are placed ſo very variouſly, and have ſo many differences in number, figure, ſituation and proportion, that they make a very eſſential ſeries of characters, for the diſtinguiſhing the genera and ſpecies one from another. In regard to number; 1. Some fiſh have them not at all, as the petromyzum. 2. Many fiſh have one *noſtril* on each ſide, placed in the manner of thoſe of birds and quadrupeds, as the chonepterus, &c. 3. Many have them placed two on each ſide, as the cyprini, percæ, &c.

In regard to figure, they are, 1. In ſome round, as all four are in the gadi, and the two anterior ones in the conger, mackrell, &c. 2. Some are oval, as the poſterior pair in the conger, &c. and, 3. Many are oblong.

As to their ſituation, they alſo differ much: 1. Some are placed very near the ſnout or roſtrum, as the clupeæ; and the anterior tubuloſe foramina, in the conger or ſea eel, are alſo of this kind. 2. In many kinds of fiſh they are placed near the eyes, as in the pike, the pearch, and the like: and, 3. In ſome they are placed as it were at a middle diſtance between the eyes and the end of the ſnout, as in the ammodytæ or ſand eels, &c. The *nares* of fiſh differ alſo in proportion: in thoſe fiſhes which have two pairs of theſe holes, they are, 1. In ſome very near one another, ſo as almoſt to touch: they are thus placed in the cyprinus and clupeæ, &c. 2. They are placed at great diſtances, which is the caſe in the conger, the pearch, and many others. According to theſe variations, the *noſtrils*, tho' a part in general very little attended to, yet become of notable uſe in the diſtinguiſhing the ſpecies. *Artedi*'s Ichthyol.

NARIFUSORIA, a name given by authors to ſuch medicines as were meant to be inſtilled into the noſtrils, for diſorders of the head and eyes.

NARINARI, the Braſilian name of a fiſh of the *aquila marina* kind, called by the Dutch *piilſtert* and *ſcicle*.

It is very large and flat, and the figure of its body is nearly triangular, its ſides or wings being very broad, and larger. The head is very large, and has a furrow down its middle: the mouth is ſomewhat triangular, but rounded at the corners. It has no teeth; but in the place of them, has a bone in the under part of its mouth, in the ſhape of a tongue, of four fingers long, and a finger and half broad, and a ſmaller bone of the ſame ſhape in the upper part: between theſe it cruſhes its prey. The under bone conſiſts of ſeventeen ſmall pieces, of the figure of the letter V. Theſe are hard and firm, and are held together by cartilages, and under them are the ſame number of others, much more ſoft and ſpungy. The upper bone conſiſts of fourteen pieces, which are each in like manner double, and joined to one another by cartilages. The body is uſually a foot and a half long, and the tail four foot. Its fleſh is finely flavoured. *Marggrave* Hiſt. Braſ. p. 119.

The bones of this and the like fiſh's mouths, are the foſſile *ſiliqueſtra*.

NARIS *externus alius*, in anatomy, a name given by Riolanus to one of the muſcles of the noſe, the uſe of which, he ſays, is to dilate the ala of the noſe, without any elevation of the noſe itſelf. It is called by Albinus the *compreſſor naris*, and by Winſlow the *tranſverſalis*, or *inferior naſi*. Cowper calls it the *elevator alæ naſi*, and Santorini the *tranſverſus naſi*.

NARONICÆ *radix*, in the materia medica, a name given by ſome authors to the iris root. *Ger.* Emac Ind. 2. See IRIS.

NARROW, in the manege. A horſe is ſaid to *narrow*, when he does not take ground enough, or does not bear far enough out to the one hand or to the other. If your horſe *narrows*, you muſt aſſiſt him with the inſide rein, that is, you muſt carry your hand to the outſide, and preſs him forward upon ſtraight lines with the calves of your legs.

NARROW is alſo a term among bowlers. See BOWLING.

NARWAL, a name given to a fiſh of the whale kind, more frequently called the *ſea-unicorn*. See UNICORN.

NASAMMONITES, in natural hiſtory, a name given by the antients to a ſtone, which Pliny deſcribes to have been of a blood colour, variegated with veins of black. We know no ſtone which anſwers to this character at preſent, unleſs it be ſome of the agates, in a variegated ſtate.

NASCALE, a ſort of peſſary, made of woo', cotton, or the like, and introduced into the vagina, after being impregnated with proper ingredients.

NASDA, a word uſed by ſome medical writers for *naphtha*, and ſeemingly a corruption of that word.

NASITAS, a word uſed by ſome authors to expreſs a ſpeaking thro' the noſe.

NASTOS, in botany, a name by which Cluſius and ſome other authors have called the reed, of which the common walking canes are made, which is the *arundo ſarcta* of other writers. *Ger.* Herb. p. 34.

NASTURTIUM, *creſſes*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of four leaves, and is of the cruciform kind: the piſtil ariſes from the cup, and becomes a roundiſh flatted fruit, divided by an intermediate membrane into two cells, and containing uſually a number of flat ſeeds. To theſe marks it is to be added, that the leaves of the *naſturtiums* are divided and cut into ſegments, by which it is at ſight diſtinguiſhed from the thlaſpi. The ſpecies of *naſturtium* enumerated by Mr. Tournefort, are theſe: 1. The common garden *creſs*. 2. The curled-leav'd garden *creſs*. 3. The narrow-leav'd garden *creſs*, with more curled leaves. 4. The broad-leav'd garden *creſs*. 5. The wild *creſs*, called by ſome the umbellated *thlaſpi*. 6. The leſſer-podded wild *creſs*, with finely-divided leaves. 7. The wild *creſs*, with extremely fine divided leaves. 8. The oriental *naſturtium*, with the lower leaves like thoſe of yarrow, and the upper ones like thoſe of thorough wax. 9. The wild *creſs*, with criſtated pods. 10. The alpine *creſs*, with finely-divided leaves. 11. The little ſpring *creſs*, called by ſome the rock *cardamine*. 12. The little rock *creſs*, with leaves like thoſe of ſhepherd's purſe. 13. The ſmall procumbent ſpring *naſturtium*: and, 14. The little ſpring *naſturtium*, with leaves only at the root. *Tourn.* Inſt. p. 213.

Water-creſſes are frequently eaten in ſpring as a ſallad. The whole plant is of a very acrid taſte, and is a powerful attenuant and reſolvent. It is recommended as a kind of ſpecific in the ſcurvy, and is eaten in great quantities by many with that intent. It is good againſt all obſtructions of the viſcera, and conſequently in jaundices, and other chronic diſeaſes. It is alſo a powerful diuretic and promoter of the menſes. People have pretended to preſerve the virtues of this plant in waters, ſyrups, and conſerves; but the beſt way of taking it is either to eat it as a ſallad, or to drink its expreſſed juice ſingly, or mixed with that of the other antiſcorbutic plants, as brook-lime, &c. which is often done.

NASUS, in zoology, the name of a freſh-water fiſh, common in the Rhine, the Danube, and moſt of the large rivers in Germany, tho' unknown in England, and called by different authors the *ſimus*, *ſavetta*, and *platyrynchos*.

Its general ſize is between ſix and twelve inches in length. In ſhape and colour it much reſembles our chub. Its belly and ſides are of a ſilvery white, and the belly fins and the lower half of the tail are often a little reddiſh: its head is ſmall, and has a black ſpot on its hinder part; its belly is flat, and ſomewhat broad, and its ſcales large; and its ſnout or noſe ſtand out beyond the mouth, which is a ſingularity, and from which it had its name. Its mouth is very ſmall; it has no teeth, and its ſkull is pellucid. It is a looſe and inſipid-taſted fiſh, and very full of bones. They ſpawn in May, at which time the males are rougher than at any other ſeaſon, and have their heads ſpeckled with white ſpots, like the Engliſh rudd. At this time alſo they ſwim together in immenſe ſhoals, and the fiſhermen have ſometimes caught two or three thouſand of them in one night. *Willughby*'s Hiſt. Piſc. p. 254.

NATANT *leaf*, among botaniſts. See LEAF.

NATATIO, *ſwimming*, in ichthyology. The *ſwimming* of fiſhes in general is greatly aſſiſted by their air bladder. Thoſe kinds which have not this bladder, either have regular lungs, and contain air in them, as is the caſe in the cetaceous fiſhes; or they have remarkably thin and flat bodies, as the rays and thornbacks, and the pleuronecti; or remarkably long and flexous ones, as the petromyza; and by theſe means are capable of eaſy flexuous motions, which, with the help of the fins, thruſt them any way at pleaſure; tho' their bodies are not ſo nicely pois'd, as to the

weight

weight of the water, as thoſe of ſuch fiſh as have the aſſiſtance of theſe air-veſſels. It has been ſuppoſed by ſome, that the motion of fiſh in the water depended principally upon the pectoral fins, but this is eaſily proved falſe by experiment; for if the pectoral fins of a fiſh are cut off, and it be again put into the water, it will be found to move forward or ſideways, upward or downward, as well as it did when it had them on. If a fiſh be carefully obſerv'd, while *ſwimming* in a baſin of clear water, it will be found not to keep theſe pectoral fins conſtantly expanded, but only to open them at ſuch times as it would ſtop or change its courſe, this ſeeming to be their principal, if not their only uſe. The pectoral and ventral fins, in the common fiſhes of the cathetoplateous or compreſſed form, ſerve in the ſame manner in the keeping the fiſh ſtill, and ſerve in ſcarce any other motion than that toward the bottom: ſo that this motion of the fiſh, which has been generally attributed to their fins, is almoſt wholly owing to their muſcles, and to the equipoiſe of their air-bladder. That the uſe of the pectoral and ventral fins is to keep the fiſh ſteady and upright in the water, is evident from the conſequences of their loſs: if they are cut off, and the fiſh put again into the water, it cannot continue in its erect natural poſture, but ſtaggers about, and rolls from ſide to ſide. The fins of the back and anus are alſo of great uſe to the keeping the creature in its natural poſition, as is eaſily ſeen by cutting them off, and obſerving the motions of the fiſh afterwards.

Tho' a great deal depends on the motion of the muſcles of the ſeveral parts of the body in the *ſwimming* of the fiſh, yet the tail, and thoſe muſcles which move the lower part of the body, to which it is affixed, are the great inſtruments by which their ſwift motions in the water are performed. The moving the tail, and that part of the body to which it adheres, backward and forward, or ſideways any one way, throws the whole body of the fiſh ſtrongly the contrary way; and even in *ſwimming* ſtrait forward, the motion and direction are both greatly aſſiſted by the vibrations of this part, as may be experienced in the motion of a boat, which when impelled forward, may be firmly guided by means of an oar held out at its ſtern, and moved in the water as occaſion directs. The dorſal muſcles, and thoſe of the lower part of the body between the anus and tail, are the principal that are uſed in the motion of this part, and theſe are therefore the moſt uſeful to the fiſh in *ſwimming*. The muſcles of the belly ſeem to have their principal uſe in the contracting the belly and the air-bladder. They have been ſuppoſed of uſe to move the belly fins; but there are too many of them for ſuch a purpoſe, and theſe fins have each its peculiar muſcle fully ſufficient to the buſineſs. The uſe of the tail in *ſwimming* is eaſily ſeen, by cutting it off, and committing the fiſh to the water without it, in which caſe it is a moſt helpleſs creature. See AIR-*bladder*.

NATIVO *habendo*, in law, a writ directed to the ſheriff, for a lord who claimed inheritance in any villain, when his villain was run away from him, for the apprehending and reſtoring him to the lord. Terms of Law.

NATIX, in natural hiſtory, a name given by ſome old writers to the *nerita*.

NATRIX, in botany, the name given by Rivinus to a genus of plants, nearly allied to the anonis, and comprehended with it in one genus by Linnæus, under the name of *anonis*. *Rivin.* vol. 4. p. 82. See REST-*harrow*.

NATRIX, in zoology, the name of the common or water ſnake, called alſo *torquata*, from the ring about its neck. It is much longer and larger than the viper, and is no water animal, properly ſpeaking, but a land one, which being able to ſwim very well, often takes the water to hunt about for frogs, which are its principal food. It grows to be much longer and larger than the viper, and does not bring forth live young ones, but great numbers of eggs, which it lays in dunghills, to be hatched by the warmth of the place, or by the heat of the ſun.

It is very common in buſhy places, and near waters, and in winter finds holes in the banks of ditches, or about the roots of trees, where it lies torpid the whole winter. It has no poiſon, and may be ſafely taken up and played with, never ſo much as attempting to bite. It feeds on many ſmall inſects, ſometimes on vegetable ſubſtances, and oftener on frogs, mice, &c.

Its back is of a ſort of duſky earth colour, and its belly variegated with black and a bluiſh white, but near the head almoſt wholly white, having only a few ſmall ſpots of black at the ſides, the colour growing darker toward the end of the tail; and near the end, the middle part of all the ſcales are black, and their extremities only of a bluiſh white: the whole belly is covered with long parallel ſcales, placed tranſverſely. The back and ſides are covered with ſmall ſcales, and are variegated with ſeveral ſtreaks and ſpots of black: there are more than eighty tranſverſe black lines running from the back to the ſides; and beſide theſe, two other rows of ſmaller, in form of ſpots, near the middle of the back. The head is covered with large ſcales of a duſkier colour than thoſe of the reſt of the body, and the upper jaw is white on each ſide, with four or five ſlight lines of black running acroſs it. Its chain is yellow, and is compoſed of two large ſpots of that colour, placed one on each ſide of the neck, or at each angle of the jaws, between which is placed a large triangular ſpot of a deep black, with its top directed toward the tail. It has none of thoſe long canine teeth of the viper and other poiſonous ſerpents, by means of which the poiſon is conveyed into the wound, but only two rows of ſmall ſerrated teeth, deſtined by nature for no other uſe than eating its food.

It may not be judged improper to have been thus particular in the deſcription of this ſpecies, as it is well to know what of the ſnake kind are, and what are not to be feared; and as the apothecaries and others, for want of theſe characters, often buy this common ſnake under the name of the viper. *Ray's* Syn. Anim. p. 335, 336.

NATRUM, or NATRON, (*Cycl.*) in natural hiſtory, the name of the *nitre* of the antients.

There have been various opinions about the *natrum* of the antients, and ſome have been of opinion, that our ſalt petre or nitre was the ſame ſubſtance; but this has been always diſcountenanced by the more judicious. Dr Hill, who had met with a ſalt from the ſame part of the world whence the antients had their *natrum*, and which anſwered to all the characters they have given of it, defines it to be a ſalt found ſometimes pure, and ſometimes fouled with earth, fermenting with acids, and forming flat oblong cryſtallizations, with four unequal ſides, and two truncated ends. Theſe were the characters of that ſalt, and theſe perfectly agree with the accounts we have of *nitre* in the earlieſt ages, tho' we have none ſufficiently accurate to take them all in. And whatever may have been the opinion of ſome, that the *natrum* or *nitre* of the Hebrews was very early loſt, a careful examination of the antients proves the contrary, and that this very ſalt was the *nitre* both of the Greeks and Romans, the *nitrum* and *aphronitrum* of Dioſcorides, and the *nitrum* of Pliny. It is found in broad and flat maſſes of various ſizes, but uſually ſmall, and when broken, are found to be compoſed of faſciculi or bundles of ſmall fibres, of an oblong and flatted figure, and laid but looſely together.

It is naturally of a duſky white; but is ſometimes found of a brown colour, and ſometimes of a fine deep red. This is its pureſt ſtate; but beſide this, it is frequently found in form of powder mixed with dirt, and riſing in little hillocks on the ſurface of the ground. It is of an acrimonious pungent taſte, and is more like the alkaline ſalts produced by burning vegetables, than any of the native ſalts. It diſſolves in a very ſmall quantity of water, and ferments violently with aqua-fortis, or any other weaker acid menſtruum.

It is found in great plenty in Sindy, a province in the inner part of Aſia, and in many other parts of the eaſt, and might be had in any quantities. Perhaps it would be worth conſidering as a branch of commerce, as it would ſupply the place of pot-aſhes in the making ſoap and glaſs, as the ſame author has tried.

The characters recorded of the *nitre* of the antients are, 1. That it would ferment with vinegar; and, 2. That it had an abſterſive quality. Theſe we have from the ſcriptures: and the reſt were, that it was of an acid taſte; that it was found native in the eaſtern parts of the world; that it ſerved in the place of ſoap, and that with ſand it would make glaſs. All theſe properties this ſalt has; and it may be added, that no other native ſalt has them *Hill's* Hiſt. of Foſſ. p. 386 to 389.

It is a very remarkable property of this ſalt, that tho' in itſelf an alkali, and fermenting very violently with acids in its native dry ſtate, yet in ſolution it does not ferment with them at all. If indeed oil of vitriol, or ſome other acid, be added to the ſolution of *natrum* while turbid, that is, while ſome of the particles of the ſalt remain yet whole in it, the two liquors will ferment violently; but if the ſolution be ſet by till wholly clear, the ſame acid will cauſe no effervescence in it; but the ſame ſolution, evaporated to a third part, will again ferment with that or any other acid, the particles of the ſalt at that time being got together again, and meeting the acid as in their ſolid form.

This ſalt contains a volatile alkali, abſorbed from the air, and embodied in it. Its other principle ſeems a marine ſalt, which it may receive either from the earth, or from ſalt ſprings or ſea water, according to the different places where it is found.

Pliny tells us, that the *natrum* of Egypt was only found to be produced at thoſe times of the year when the dews fell. And M. de la Chambre affirms, that in Egypt, three or four days before the Nile begins to overflow, there always falls a certain dew, which has a fermenting quality, and will leaven dough expoſed to the air. At the time of the falling of this dew, the *natrum* pits grow full of that ſalt: and Vanſlebius, Sands, and many others, join in affirming, that at this time the air becomes greatly more healthy; and tho' before the falling of this dew, or the inundation of the Nile, people die of the plague to the number of five hundred in a day in Grand Cairo, after this not one dies of that diſeaſe. It is eaſily ſeen, that the overflowing of the Nile does not produce this effect, but the dews and air, which at that time are full of that volatile alkali, which is one of the principles of the *natrum*. People who have preſerved ſpecimens of the *natrum* have alſo obſerved, that they would grow much heavier on being expoſed to the air at the time of the overflowing of the Nile. Phil. Tranſ. N° 160.

NATURAL *(Cycl.)* — NATURAL *history.* The *natural history* only of any one particular place, is a ſubject very extenſive in its materials, and to be ſet about without great care and circumſpection. Mr. Boyle has favoured the world with a liſt of the heads under which to arrange things, and what to enquire after on ſuch an occaſion.

The general heads under which he comprehends the articles of this hiſtory, are four; the things which regard the heavens, the air, the waters, and the earth.

Of the firſt claſs are the longitude and latitude of the place; the length of the longeſt and ſhorteſt days and nights; the climates, parallels, &c. what fixed ſtars are ſeen, and what are not ſeen there.

About the air may be obſerv'd, its temperature, as to the firſt four qualities, and the meaſure of them; its weight, clearneſs, refractive power; its ſubtlety or coarſeneſs; its abounding with or wanting an eſurine ſalt: its variations according to the ſeaſons of the year, and the times of the day: what duration the ſeveral kinds of weather uſually have: what meteors it is moſt or leaſt apt to breed; and in what order they are generated, and how long they generally laſt: what winds it is moſt ſubject to; whether any of them be ſtated or ordinary: what diſeaſes are ſaid to be epidemical, or depending on the ſtate and condition of the air: what other diſeaſe it is ſubject to, wherein the air may be ſuppoſed to have ſome ſhare: what is the uſual ſalubrity and inſalubrity of it, and what ſorts of conſtitutions it agrees with, what it does not.

About the waters, it may be proper to obſerve the ſea, its depth, tides, currents, ſaltneſs, and other qualities: next, the rivers will come under conſideration, their depth, length, courſe, inundation, and the goodneſs or badneſs of their waters, with their gravity, and other peculiar qualities. After theſe, the lakes, ſprings, ponds, &c. are to be conſidered, eſpecially the mineral waters, their kinds, qualities and virtues, and the manner of trying them. The inhabitants of the waters may follow here; and the particular kinds of fiſh that are found there, whether of the ſea or rivers, are to be mentioned, with an account of their ſtores, bigneſs, goodneſs, ſeaſons of perfection, haunts, peculiarities of any kind relating to them, and the manner of taking them, eſpecially when there is any thing ſingular in it.

The things relating to the earth, are laſt to be examined: theſe are, firſt the earth itſelf, then its inhabitants, and its various productions, whether external or internal. In the earth itſelf may be obſerved, its dimenſions, ſituation eaſt, weſt, north and ſouth; its figure; its plains and valleys, their extent; its hills and mountains, and the height of the talleſt, both in reference to the neighbouring valleys and plains, and to the level of the ſea; as alſo whether the mountains lie ſcattered, or are diſpoſed in ridges; and if of the latter kind, whether they run eaſt, weſt, north, or ſouth. What promontories alſo, and what firey or ſmoaking hills it has, if any: whether the country be coherent, or much broken into iſlands: what the magnetical declination is in ſeveral places, and the variation of that declination in the ſame place, and if thoſe be conſiderable; what may be conjectured as the occaſions of them, whether the vicinity of iron-mines, of ſubterranean fires, or what elſe. What the nature of the ſoil is, whether clayey, ſandy, or of good mold; and what vegetables, plants and trees beſt agree with it and ſucceed in it, what worſt. By what particular contrivances the inhabitants improve the advantages, or remedy the diſadvantages of the ſoil; and what hidden qualities the ſoil may have. The inhabitants of the earth are then to be conſidered, both natives, and ſtrangers that have been long ſettled there; and in particular, their ſtature, colour, features, ſtrength, agility, or defects of theſe; and their complexions, hair, beauty, and the like; their diet, inclinations and cuſtoms, ſo far as they are not owing to education: the fruitfulneſs or barrenneſs of the women; their hard or eaſy labours: the diſeaſes they are moſt ſubject to, and any remarkable ſymptoms attending them.

As to the external productions of the earth, the enquiries are to be theſe: what graſſes, grains and fruit it beſt produces: the herbs, flowers, and timber trees; and the coppices, groves, foreſts and woods the country has or wants: what peculiarities are obſervable in any of them; what ſoils they moſt like or diſlike, and with what culture they thrive beſt. Then what animals the country has or wants, both as to wild beaſts and birds of prey, and as to poultry and cattle of all ſorts; and particularly, if they have any animals that are not common, or any thing particular in thoſe that have. After thoſe, the ſubterranean ſtores are to be examined; what minerals the earth affords, and what it wants: then what quarries of ſtone, and in what manner they lie: what clays and earths are found there; as, clays, marles, fuller's-earths, earths for tobacco-pipes, earth for potter's wares, medicinal earths: what other mineral productions it yields, whether coals, ſalt mines, or ſalt ſprings, alum, vitriol, ſulphur, &c. What metals the country yields, with a deſcription of the mines of them; their depths, numbers, ſituations, ſigns, waters, damps, quantities of ores, goodneſs of the ores, and the ways in uſe for the reducing them to metals.

To theſe general heads ſhould be added, inquiries into traditions in the country, of any thing relating to it, whether peculiar to it, or only more common there than elſewhere; and where theſe require learning or ſkill in the anſwerer; the utmoſt care is to be taken to put the people in a way to give their accounts in a ſatisfactory manner; for a falſe or bad account of any thing is always much worſe than no account at all. Phil. Tranſ. N° 11.

NATURAL, in muſic, is applied to a ſong, the notes whereof move eaſily and gracefully, giving the performer as little trouble as poſſible; as when it is not carried too high, or ſunk too low, whereby the voice or inſtrument is in no wiſe forced or ſtrained. Vid. *Broſſ.* Muſ. Dict. in voc.

NATURAL *harmony*, is that produced by the *natural* and eſſential chords of the mode. See MODE.

NATURAL *note*, is uſed in oppoſition to ſharp and flat notes, which are called artificial. See NOTE and SCALE.

The *natural note* ♮, is uſed to contradict thoſe flats and ſharps that are ſet at the beginning of a ſtaff; and, in ſuch caſe, you muſt take the *natural note* as it is in the gamut.

NATURAL *muſic*, *muſica naturale*, among the Italians, is uſed to ſignify muſic formed by the organs of the human voice, unaſſiſted by inſtruments or other artifices.

Natural muſic is more peculiarly uſed to denote a ſong that proceeds in the *natural* order of the notes, without flats or ſharps.

NATURALIZATION *(Cycl.)* — By our ſtatutes, foreign proteſtants are *naturalized* by reſiding ſeven years in the Britiſh colonies in America. 13 Geo. II. c. 7.

NAVAGIUM, in our old writers, a duty incumbent on tenants to carry their lord's goods in a ſhip. *Liberi ſint ab omni carriagio*, navagio, &c. *Blount.*

NAVALIA, among the Romans, were docks or ports where ſhips uſed to be laid up after building.

NAVALIA likewiſe ſignified the wharfs or keys at Rome, where the ſhips uſed to load and unload their goods, all which were near the Sublician bridge. *Pitiſc.* in voc.

NAUCRARI, Ναυκραροι, among the Athenians, a deſignation given to the chief magiſtrates of the δημοι, boroughs or townſhips, which were likewiſe called ναυκραριαι, becauſe each of them were obliged, beſides two horſemen, to furniſh out one ſhip for the public ſervice. *Pott.* Archæol. Græc. l. 1. c. 13. T. 1. p. 78.

NAVE *(Cycl.)* — NAVE *of a wheel* is that ſhort thick piece in the center of the wheel, which receives the end of the axle-tree, and in which the ends of the ſpokes are fixed; it is bound at each end with hoops of iron, called the *nave-bands*: it has likewiſe in each end of the hole, thro' which the end of the axletree goes, a ring of iron called the *wiſher*, which ſaves the hole of the *nave* from wearing too big.

NAVEL *(Cycl.)* — NAVEL-*ſtring.* It is a method univerſally received by prudent ſurgeons and midwives, to make an exact ligature upon the umbilical cord or *navel-ſtring* of the new-born infant, leſt it ſhould bleed to death thro' the veſſels which compoſe it. This ligature is to be made, as ſoon as the infant and after-burthen are delivered, with a ſtrong thread of about an ell long, folded together four times; and having made a knot at one end, it is then to be paſſed twice round the *navel-ſtring*, at about two or three fingers breadth from the abdomen, and afterwards tied with a double knot: this done, the cord leading to the placenta may be divided with a pair of ſciſſars below the ligature, and the wounded part belonging to the infant dreſſed with lint, after which it may be left to the nurſe till it becomes dry, and falls off of itſelf.

There have been inſtances of ſome children receiving no harm from the cutting the *navel-ſtring*, without the ceremony of the ligature; but as there have alſo been too many inſtances of their dying by the omiſſion, and as the operation is ſo eaſy, the midwife is unpardonable who omits it. *Heiſter's* Surgery, p. 22.

Dr. Schulze contradicts the common opinion concerning the umbilical veſſels: he endeavours to prove, that the *navel* is not formed by the ligature which the midwives make, or by animals gnawing the *navel-ſtring* of their young with their teeth, but by nature; and that the umbilical veſſels ſeparate ſpontaneouſly, or with very little force, from the interior ſurface of the ſkin; after which, the umbilical veſſels within the young creature's body contract and ſhrivel, their extremity by which they adhered to the *navel* becoming black and pointed, as if they had been burnt, and at laſt diſappear altogether: for, ſays he, what are commonly deſcribed as theſe veſſels changed into ligaments, are no other than the ſheaths in which they were formerly contained. From this doctrine he concludes, that it is unneceſſary to make any ligature upon the *navel-ſtring* after birth.

In confirmation of this, Dr. Eller relates ſeveral inſtances of the *navel ſtrings* of children being left untied after they were cut, without being attended with any hæmorrhage, or other bad conſequence. Commerc. Norimb. 1733. Hebd. 48. §. 2.

Mr. Monro is of opinion, that the fœtus in viviparous animals receives its nutrition from the umbilical veſſels alone. See FOETUS.

It has been obſerved, that in blowing into the placenta by the umbilical veſſels, the air and the blood were eaſily forced out of it, by that ſurface of the placenta which is affixed to the uterus; but that they could by no means be driven out at the other

other ſurface which is toward the fœtus. Hence it is to be obſerved, that the uterus appears not to be covered by any membrane within, and that the placenta alſo has none on that ſide where it adheres to the womb, ſo that there is nothing to prevent the blood from readily flowing from the uterus into the placenta, and thence to the child. What we uſually underſtand by the word membrane is a covering of ſo cloſe a texture, as to keep out air, or fluids; and it is very evident to reaſon, that the placenta ought to have none ſuch on that part where it is to communicate with the uterus; neither can the eye diſcover any ſuch there, though on the other ſide it is eaſy to diſtinguiſh one.

The *navel-ſtring*, beſide its vein, and its two arteries, is compoſed of a ſpongy ſubſtance, in which theſe blood veſſels are lodged; this ſpongy ſubſtance is compoſed of a number of cellules which communicate with one another, and contain a glutinous liquor, which is uſually found in them in great abundance: if we conſider the *navel-ſtring* as a cylinder, the blood veſſels run in a ſpiral round its axis, and are laid one over another, but that differently in different ſubjects; hence it is that the *navel-ſtring* is tortuous.

When the veſſels have run through the whole length of the *navel-ſtring* in the ſame diameter, they break into a number of branches, and enter the placenta, where they afterwards divide themſelves into capillary ramifications. The diameter of the vein is all the way double to that of both the arteries; ſo that it contains twice as much blood as the two arteries togegether. If the *navel-ſtring* were only compoſed of theſe three veſſels, the fœtus, in moving, might eaſily compreſs them in ſuch manner, as to ſtop the current of the blood, and its inevitable death muſt be the conſequence of this; but nature having provided this ſpongy, or cellular ſubſtance, for their lodgement, this is able to give way to them, when preſſed in any direction, and enables them, therefore, to bear a conſiderable force, without the current of the blood being ſtopped by them in it; nor is the glutinous liquor, of which thoſe cells are full, of little uſe in lubricating theſe veſſels. Mem. Acad. Par. 1714.

NAVEL-*wort*, *cotyledon*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is compoſed of one leaf, faſhioned into a bell-ſhape, with a long tube, and divided into ſeveral ſegments at the end: from the center of the cup there ariſes a piſtil, which perforates the bottom of the flower, and ripens afterwards into a fruit compoſed of ſeveral ſmall ſheaths of capſules, collected into a ſort of head, and all opening at their tops, and uſually containing an extremely minute ſeed.

The ſpecies of *cotyledon* enumerated by Mr. Tournefort are theſe: 1. The common kind called wall *navel-wort*, and *umbilicus veneris*. 2. The great Portugal kind. 3. The yellow-flowered kind, with a long, tuberoſe, and creeping root. 4. The middle-ſized *cotyledon*, with a yellow flower. 5. The ſhrub, African *cotyledon*, with round leaves, bordered with an edge of purple, uſually called the round-leaved, hoary, African *ſedum*, or *houſeleek*. 6. The thick, or cylindric-leaved, African *cotyledon*, with beautiful purple flowers, known alſo to many under the name of a *ſedum*, or *houſeleek*. 7. The long-leaved, African *cotyledon*, with fibroſe roots, and umbellated flowers. 8. The fibroſe-rooted, ſea *cotyledon*, with houſeleek leaves, and fleſh-coloured flowers. Theſe are the genuine ſpecies of *cotyledon*, but authors who have leſs accurately examined plants, have ranked under this name ſeveral which are ſpecies of houſeleek, of geum, and of ſaxifrage. *Tourn.* Inſt. p. 90.

The *cotyledons*, when not in flower, may uſually be known by having thick, tuberoſe roots, and thick or fatty roundiſh leaves. Theſe, however, are found to be no certain characters, as there are plants truly of this genus, which have long leaves, and fibroſe roots.

NAVETTE, the name by which moſt of the European nations call the *napus*, or *bunias ſylveſtris* of Lobel, the plant from the ſeeds of which the oil which we call rape oil, and the French and others *navette* oil, is expreſſed. The plant is cultivated in many parts of England, and in other countries, for the ſake of the ſeed; the oil drawn from this is uſed by many artificers, and is of a fine yellow colour, and the ſmell is not offenſive. *Lemery* Dict. of Drugs.

NAVICULA, in natural hiſtory, a name given by a late French author to the claſs of ſhells called by us the *nautili*. See NAUTILUS.

NAVIGATION (*Cycl.*) — *Sub marine* NAVIGATION, or the art of ſailing under water, is mentioned by Mr. Boyle as the deſideratum of the art of *navigation*. This was attempted, and ſucceſsfully, according to him, by Cornelius Drebbel; ſeveral perſons who were in the boat breathing freely all the time. *Boyle's* Works, abr. Vol. 1. p. 130.

NAVIGATOR, in the ſea language, uſually denotes a perſon capable of carrying, or guiding a ſhip to any place deſired.

NAULIUM, in antiquity, a muſical inſtrument otherwiſe called *nablum*. See NABLUM.

NAULUM, among the Romans, properly ſignified freight; whence it is uſed to denote a piece of money put into the mouth of a perſon deceaſed, to pay Charon the ferry-man for his paſſage: this piece was to be of the current coin of the emperor then reigning; ſo that from it the time of the perſon's death may be known. *Danet.* in voc.

NAUPLIUS, in natural hiſtory, a name by which ſome authors have called the *nautilus*, as well the papyraceous, as the chambered kind. See NAUTILUS.

NAUTICUS (*Cycl.*) — NAUTICUS, in natural hiſtory, a name given by ſome to the *nautilus*. See NAUTILUS.

NAUTILUS, (*Cycl.*) in natural hiſtory, the name of a genus of ſhell-fiſh, the characters of which are theſe: it expreſſes, in general, in every ſpecies, the figure of a boat, or veſſel, made for ſwimming on the water; but in the different ſpecies, it is of very different figures, roundiſh, or oblong, thin, or thick, furrowed, or ſmooth, and ſometimes is auriculated, ſometimes not. Bonani obſerves that this genus of ſhell-fiſh is very well named from the Greek ναυτίλος, which ſignifies both a fiſh, and a ſailor, for that the ſhells of all the *nautili* carry the appearance of a boat, or ſhip, with a very high poop.

Different authors, among the antients and moderns, have called the *nautilus* by the names of *pompilus*, *nauplius*, *nauticus*, *ovum polypi*, *polypus teſtaceus*, and the French call it *le voilier*. It is ſuppoſed that men firſt learned the method of ſailing in veſſels, from what they ſaw practiſed by this creature.

We at preſent know two diſtinct genera of *nautilus*, the thin and the thick-ſhelled *nautilus*. The firſt is called *nautilus papyraceus*, and its ſhell ſeems indeed no thicker, or ſtronger, than a piece of paper, when out of the water. This ſpecies is not at all faſtened to its ſhell, but there is an opinion as old as the days of Pliny, that this creature creeps out of its ſhell, and goes on ſhore to feed. When this ſpecies is to ſail, it extends two of its arms on high, and between theſe, ſupports a membrane, which it throws out on this occaſion; this ſerves for its ſail, and the two other arms it hangs out of the ſhell, to ſerve occaſionally either as oars, or as a ſteerage; but this laſt office is generally ſerved by the tail. When the ſea is calm, it is frequent to ſee numbers of theſe creatures diverting themſelves with ſailing about in this manner; but as ſoon as a ſtorm riſes, or any thing gives them diſturbance, they draw in their legs, and take in as much water as makes them ſomewhat heavier than the ſea water in which they ſwim, and they then ſink to the bottom. The manner of their voiding this abundant water when they would riſe again, is by a number of holes, of which their legs are full. Hiſtoir. Natur. Eclair. Part. 2. p. 248.

The other *nautilus*, whoſe ſhell is thick, never quits that habitation. This ſhell is divided into forty, or more partitions, which grow ſmaller and ſmaller as they approach the extremity, or center of the ſhell: between every one of theſe cells, and the adjoining ones, there is a communication, by means of a hole in the center of every one of the partitions. Through this hole there runs a pipe, which is of the whole length of the ſhell. It is ſuppoſed by many that the fiſh occaſionally changes the place of its reſidence, by removing from one to another of theſe cells, through this pipe in the little hole; but this is by no means probable, as the body of the fiſh muſt neceſſarily be cruſhed to death, if it were poſſible to make it paſs through ſuch a hole. It ſeems, therefore, much more probable, that the fiſh occupies always the largeſt chamber in its ſhell, that is, it lives in the cavity between the mouth and the firſt partition; and that it never removes out of this, but that all the apparatus of cells, and a pipe of communication which we ſo much admire, ſerves only to admit occaſionally air, or water, into the ſhell, in ſuch proportion as may ſerve the creature in its intentions of ſinking or ſwimming. *Rumphius*, p. 17. fig. b.

Ariſtotle has evidently deſcribed two ſpecies of *nautili*, and ſome authors have thought he deſcribed three; of this number is Bellonius, whom Rondeletius treats very ſeverely for the error of this opinion; but it is cuſtomary with Rondeletius to be ſevere upon Bellonius. *Bonani*, p. 89.

Some authors call this ſhell *concha margaritifera*; but this can be only on occaſion of the fine colour of its inſide, which is more beautiful than any other mother of pearl; for it has not been obſerved that this ſpecies of fiſh ever produced pearls.

It muſt be obſerved that the polypus is by no means to be confounded with the paper-ſhelled *nautilus*, notwithſtanding the great reſemblance in the arms and body of the encloſed fiſh; nor is the cornu ammonis, ſo frequently found foſſile, to be confounded with the thick-ſhelled *nautilus*, though the concamerations, and general ſtructure of the ſhell is alike in both, for there are great and eſſential differences between all theſe genera. See the article CORNU *Ammonis*, &c.

The three principal differences of the *nautilus* claſs are, that ſome are papyraceous, ſome are auriculated, and ſome are umbilicated. *Rondelet.* p. 98.

The ſeveral known ſpecies of *nautilus* are theſe: 1. The great, ſmooth, and thick *nautilus*. 2. The little *nautilus*, with a ſmooth and thick ſhell. 3. The ſmooth, and thick, umbilicated *nautilus*. 4. The common, concamerated *nautilus*. 5. The furrowed, and empty *nautilus*, with no diaphragms, or ſeparation within. 6. The thin, and flatted, papyraceous *nautilus*. 7. The auriculated *nautilus*, with a wider ſhell. 8. The undulated, and furrowed *nautilus*, with dents on each ſide the edge. 9. The *nautilus* with a ridged and ſerrated back. This laſt ſpecies is often found in the cabinets without

out its outer coat, and the ſhell then looks all over like the moſt beautiful mother of pearl. Hiſt. Natur. Eclair. Part. 2. p. 249. See Tab. of Foſſils, Claſs 9. and Tab. of Shells, N° 8.

NEALED, at ſea, is uſed when the ſounding is deep water cloſe to the ſhore: it is then ſaid to be *nealed to*; as alſo when the ſhore is ſandy, clayey, ooſy, or foul and rocky.

NEAPOLITAN *diſeaſe*, a name given by many authors to the venereal diſeaſe; and from hence came the name of the *Neapolitan* ointment, which is a mixture of quickſilver, and other things into an ointment, intended as a cure for it.

NEAR, or *No* NEAR, at ſea, a word of command from him that conds the ſhip, to the man at the helm, requiring him to let her fall to the leeward.

NEBEL, in the Jewiſh antiquities, a kind of muſical inſtrument See NABLUM.

NEBRITES, in natural hiſtory, a name given by the antients to a ſtone held ſacred to Bacchus. It was of the browniſh yellow colour of the ſkin of the young fawn, with ſome variegations, and was ſemi-pellucid: it ſeems to have been the ſame with ſome of our agates, with a yellow ground; the antients, however, do not appear to have been very determinate in their accounts of it, for Pliny mentions another kind of it, which was black.

NEBRUS, in natural hiſtory, a name given by the antients to the *hinnuleus*, a deer of one year old. In the next year it is called *pattalia*; in the third *dicrota*; and in the fourth *cladii*; the word *ceraſtæ* was uſed as the name of this animal when of a greater age than this.

NEBULGEN, a word uſed by ſome of the chemical writers to expreſs what they call a ſalt generated by the moiſture of the air falling upon ſtones in the fields, and there indurated by the heat of the ſun into the form of a dry ſalt.

NECESSARIO, in the Italian muſic. This word is prefixed to certain parts in muſic, as *a doi violini neceſſario*, i. e. that muſt be played by two violins; *canto neceſſario* is uſed to ſignify much the ſame as *concertante*. See CONCERTANTE.

Every mode has certain chords, which may be called its neceſſary, or eſſential chords. Vid. *Broſſ.* Dict. Muſ. in voc.

NECHIASECH, an obſcure word coined by Paracelſus, and very frequently uſed by him, and his followers; he ſeems to underſtand by it ſaline, corroſive, and corroding particles.

NECK (*Cycl.*) — There are ſeveral ſorts of wounds in the *neck*; ſometimes the ſeat of the wound is only in the common integuments, and muſcular fleſh; this is attended with very little danger: but the moſt dangerous, and, indeed, generally incurable wounds, are thoſe of the larger blood veſſels in theſe parts: ſuch are thoſe of the jugular veins, and carotid and vertebral arteries; or where the aſpera arteria is wounded, or the gula, the medulla ſpinalis, the nerves that deſcend by the *neck*, or when ſeveral of theſe parts are wounded at the ſame time.

Wounds of the arteries of the *neck* are ſcarce ever to be remedied. The patient uſually bleeds to death, before a ſurgeon can be had in theſe caſes; but even if the ſurgeon were preſent at the inſtant the wound was inflicted, the largeneſs of the arteries, their vicinity to the heart, and the impoſſibility of making a ſufficient preſſure upon the wounded veſſel in this part, give but little hope of relief.

Wounds in the external jugular veins are not of great danger, if a ſurgeon be applied to in time; but wounds in the internal jugulars are very dangerous, partly from their ſize, which is of the thickneſs of one's finger, and, partly from their ſituation, which is ſo deep that no proper application can reach them to any advantage. Wounds in this vein are uſually eſteemed mortal, but it is ſometimes poſſible to ſave life in this caſe.

Wounds of the aſpera arteria, or windpipe, are uſually deemed mortal, where the windpipe is entirely divided, or is wounded in its lower part, within the cavity of the thorax, or joined with a wound of the carotid arteries, or internal jugulars, which is frequently the caſe: but if the windpipe is only wounded in its fore-part, and the neighbouring veſſels remain unhurt, it is uſually found curable.

Wounds of the gula, or œſophagus, afford very little hopes of recovery, where it is much wounded, or entirely divided, becauſe, in this caſe, not only the office of deglutition is cut off; but the part is ſo ſituated that it is impoſſible almoſt to wound it, without injuring, at the ſame time, ſome of the neighbouring nerves, and blood veſſels. But when the gula only is wounded, and the wound ſmall, there is ſome hope of a recovery.

Wounds in the medulla ſpinalis, in one part, are very dangerous, but more particularly ſo when inflicted on that part of it which preſſes through the neck. It is no wonder, therefore, that ſcarce any recover after a conſiderable wound of this kind; which it is impoſſible ſhould happen without wounding the vertebral veins and arteries at the ſame time; and the ſituation of the part is ſuch that it is impoſſible to convey proper remedies to them. Nor are wounds of the large nerves of the neck leſs dangerous than theſe; for, if they are divided, the parts of the thorax and abdomen to which nature has determined them, immediately loſe their aſſiſtance, and of conſequence become unequal to the offices for which they were intended.

For the cure of wounds in the *neck*, the method is as different as the nature of thoſe wounds. Where the integuments, and muſcular fleſh alone are wounded, the common method of curing ſlight wounds takes place. Where the external jugular is hurt, the ſame methods uſed after bleeding in that vein prove ſufficient. When the internal jugular has received a ſmall wound, the hæmorrhage will be eaſily ſtopped by filling the wound well with dry lint; or with the puft ball, or duſty muſhroom; lodging, over theſe applications, ſquare bolſters, and ſecuring all with a bandage, drawn as tight as the nature of the part will admit. Where this method does not take place, the ſurgeon ſhould make a proper preſſure on the wounded part with his finger, till the hæmorrhage is entirely ſtopped. The ſame methods muſt be uſed to the wounds of the vertebral veins; and when the hæmorrhage is once ſtopped, the dreſſings applied are not to be removed for three days, and then a vulnerary balſam and plaiſter applied to heal the wound. In large wounds, or an entire diviſion of the internal jugular, the ſurgeon, if preſent in time, ſhould make a firm preſſure with his finger on the wounded part, and make inciſions, lengthways, above the wound, till he can get at the veſſel, and then make a firm ligature upon it, by the aſſiſtance of a crooked needle.

In caſe of a wound of the carotid artery, a ſurgeon, if preſent in time, ſhould uſe the ſame method as in thoſe of the internal jugular vein. This method is more likely to have ſucceſs in wounds of the upper and middle part of that veſſel, than in thoſe of the lower part of it; and where the wound is not in the trunk of the artery, but in one of its branches near the head, you ſhould fill up the wound with lint dipt in ſome ſtyptic liquor, and then cover it up with thick compreſſes, ſecuring all with a tight bandage, and ordering an aſſiſtant to make a preſſure upon the part with his hand, for ſome time after: and, in theſe caſes, the dreſſings are not to be removed till the third or fourth day.

In curing the wounds of the aſpera arteria, the ſurgeon ought to clean the wound, and then endeavour to unite the parts by the help of ſticking plaiſters; or where the wound is large, by making two ſtitches with a crooked needle, dreſſing up the wound afterwards in the uſual manner, and enjoining the patient to keep his head in a proper ſituation, that is, ſomewhat bending downwards. The wound, thus treated, if it has been made either by puncture, or by the cutting of a ſharp inſtrument, will eaſily heal; but if it has been made by a bullet, and any part of the aſpera arteria is carried away, the ſuture is to no purpoſe; wounds of this kind are only to be dreſſed with the vulnerary balſams. If the aſpera arteria is entirely divided, and the lower end of it has ſhrunk into the cavity of the thorax, ſo that it cannot be laid hold on, there can be no remedy.

When the œſophagus is wounded, what is taken in at the mouth comes out through the wound, and the patient is uſually affected with hiccoughs and vomitings. Where this is entirely divided, there is no remedy; but where it is only perforated or wounded in part, the cure may be attempted by dreſſing it with the vulnerary balſams, endeavouring to unite it by means of ſticking plaiſters, and enjoining the patient a ſtrict abſtinence for ſome days, and giving nouriſhing glyſters of broth, milk, &c. If nouriſhment muſt be taken at length by the mouth, the wound muſt be perfectly cleaned every time afterwards, and be dreſſed daily till it heals. Wounds of the medulla ſpinalis are beſt dreſſed with balſam of Peru, or medicines of a like nature, mixed with a ſmall quantity of honey of roſes, and ſpread upon pledgits, and applied moderately warm. Slight wounds of this kind are ſometimes healed by this means; but large ones in this part always bring on certain death. *Heiſter* Surg. p. 74.

In the Memoires de l' Acad. royale des Sciences, Ann. 1730. we have ſome curious obſervations by Mr. Winſlow on the motions of the *neck*, as alſo on thoſe of the head and ſpine.

NECK, in the manege. See CARRYING.

NECK *of the caſcabel*, in artillery, is that part betwixt the breech mouldings, and the *caſcabel*.

NECK *of a gun* is that part betwixt the muzzle mouldings, and the Corniſh ring.

NECOPHORON, in botany, a name uſed by Pliny, and other authors for the *ſmilax aſpera*, or *rough bindweed*. *Ger.* Emac. Ind. 2.

NECROLIUM, a word uſed by ſome of the alchemical writers to expreſs a remedy almoſt always capable of averting death, and continuing life to its utmoſt period.

NECROSIS is uſed by many of the medical writers for a mortification.

NECTAR (*Cycl.*) is uſed by ſome of the antients to expreſs honey. This ſignification of the word was owing to the ſuppoſition that honey was the drink of the bees, as they eſteemed the yellow matter collected on their thighs to be their food. They called the latter ambroſia. It ſeems that the antients have been more in the right as to their opinion of the ambroſia than other authors, who have uſually eſteemed that yellow ſubſtance to be true wax. But it appears from experiments that it is not really ſo; nor can wax be ſeparated from it by any of the known proceſſes of chemiſtry. It ſeems rather that the bees eat it, agreeably to the opinion of the antients, and that after having ſerved them as nouriſhmment, it is converted

in their bowels into the ſubſtance we call wax. *Reaumur*'s Hiſt. Inſ. Vol. 10. p. 50. See HONEY.

NECTARINE, a fruit greatly eſteemed for its delicious flavour, and ſuppoſed to have its name from the nectar of the Gods, in heathen ſtories.

It differs in nothing from the peach, but in having a ſmoother ſkin, and a firmer pulp. See PEACH.

We have ten kinds of *nectarine* cultivated by the curious in gardening.

1. *Fairchild's early nectarine*; this is a ſmall fruit of a red colour, and very well taſted, and ripens in July, the earlieſt of all this kind

2. The *Elruge nectarine*; this is a larger fruit, of a purple colour on that ſide which was toward the ſun, and of a greeniſh yellow on the other parts. This is a very well flavoured *nectarine*, of a ſoft, melting juice, and parts from the ſtone: it ripens toward the end of July.

3. The *Newington nectarine*; this is a fair large fruit, of a fine red toward the ſun, and of a yellowiſh green toward the wall. It has a very rich juice, but the pulp adheres to the ſtone: this ripens in Auguſt.

4. The *ſcarlet nectarine*; this is of a fine glowing red toward the ſun, and of a pale red toward the wall; it ripens in the end of July.

5. The *Brugnon*, or *Italian nectarine*; this is a fair, large fruit, of a deep red next the ſun, but of a ſoft yellow next the wall. The pulp is firm, and of a rich flavour, but cloſely adheres to the ſtone, and is red in that part: this ripens in the middle of Auguſt.

6. The *Roman red nectarine*; this is a very fair large fruit, of a deep purple toward the ſun, and of a greeniſh yellow next the wall. The pulp is very firm and well taſted, but it is red about the ſtone, and adheres firmly to it: this is ripe in the middle of Auguſt.

7. The *Murry nectarine*; this is a middle-ſized fruit, of a dirty red next the ſun, and of a greeniſh yellow next the wall. The pulp is tolerably well flavoured: this ripens in the middle of Auguſt.

8. The *golden nectarine*; this is a fair handſome fruit, of a ſoft red next the ſun, but of a gold yellow next the wall, and its pulp is very yellow, but of a faint red about the ſtone to which it adheres: it is a very well-flavoured kind, and ripens at the end of September.

9. *Temple's nectarine*; this is a very fine kind: it is of a ſoft red toward the ſun, and of a yellowiſh green next the wall. It parts from the ſtone, and is of a very rich flavour; the pulp is white in other parts, but yellowiſh about the ſtone: this ripens in the middle of September.

10. The *Peterborough nectarine*, called by ſome the late, green *nectarine*; this is a middle-ſized fruit, of a pale green colour toward the ſun, and of a whitiſh green toward the wall; the pulp is firm, and well-flavoured: it ripens toward the end of September.

The pruning, planting, and whole culture of this plant is the ſame with that of the peach. *Miller*'s Gard. Dict. See the article PEACH.

NECTARIUM, among botaniſts, expreſſes what is only a part of the corolla, ſometimes, though more rarely the whole. It is a part deſtined for the reception of the honey juice of the plant; and is very various in its figure. Sometimes, it is only a hollow in a petal; ſometimes, it is a little ſquamma; ſometimes a tubercle; and ſometimes a plain tube.

NECUIA, in botany, a name given by the antient Greeks to a ſpecies of *mullein*. See MULLEIN.

The Greeks and Romans both uſed the ſtalks of a peculiar kind of *mullein*, called *thryallis* by Nicander. For the making the wicks of lamps, we have a kind of *mullein* called *lychnites*, and candle-wick *mullein*, from the λυχνίτες of Dioſcorides; but it is not certain that ours is the ſame plant.

The antients uſed the ſtalks of many different plants for the wicks of their candles, and lamps. The ruſh ſtripped of its bark was as commonly in uſe with them, as with us, for this purpoſe; and they alſo uſed the nettle, this *mullein*, and many other plants, whoſe ſtalks were compoſed of tough filaments, for the ſame purpoſe; beating them out like hemp, and when dry, dipping them in melted reſin, and other ſuch inflammable ſubſtances. When thus prepared, they were readily inflammable, like our flambeaux, and this *mullein* having ſtalks more long, and large, and more firm than all the others, was uſed to make thoſe lights with which they ſet fire to the funeral pile for conſuming the aſhes of their dead friends.

NEEDLE (*Cycl.*) — NEEDLE, in ſurgery. It is to be obſerved, that *needles* of ſilver pierce more eaſily in ſtitching arteries after an amputation, than thoſe made of ſteel. *Monro*, in Med. Eſſ. Edinb. Vol. 5. Art. 41.

NEGATIVE (*Cycl.*) — NEGATIVE *power*, in algebra, is uſed for thoſe powers of a quantity which have a negative ſign. Thus a^{-m} is called a negative power. *Negative* powers ariſe from the diviſion of any power of a quantity, by a greater power of the ſame quantity. Thus, $\frac{a^4}{a^6} = a^{4-6} = a^{-2}$; and in general, $\frac{a^m}{a^{m+n}} = a^{-n} = \frac{1}{a^n}$ for $\frac{a^m}{a^{m+n}} = \frac{1}{a^n}$. See POWER, *Cycl.* and *Suppl.*

NEGATIVE *ſign*. The uſe of the *negative ſign*, in algebra, is attended with ſeveral conſequences that at firſt ſight are admitted with difficulty, and has ſometimes given occaſion to notions that ſeem to have no real foundation. This ſign implies that the real value of the quantity repreſented by the letter to which it is prefixed, is to be ſubſtracted; and it ſerves with the poſitive ſign, to keep in view what elements or parts enter into the compoſition of quantities, and in what manner, whether as increments, or decrements, (that is, whether by addition or ſubſtraction) which is of the greateſt uſe in this art.

In conſequence of this, it ſerves to expreſs a quantity of an oppoſite quality to the poſitive, as a line in a contrary poſition; a motion with an oppoſite direction; or a centrifugal force in oppoſition to gravity; and thus often ſaves the trouble of diſtinguiſhing, and demonſtrating ſeparately, the various caſes of proportions, and preſerves their analogy in view. But as the proportions of lines depends on their magnitude only, without regard to their poſition; and motions, and forces, are ſaid to be equal, or unequal, in any given ratio, without regard to their directions; and, in general, the proportion of quantities relates to their magnitude only, without determining whether they are to be conſidered as increments or decrements; ſo there is no ground to imagine any other proportion of $-b$ and $+a$, (or of -1 and 1) than that of the real magnitudes of the quantities repreſented by b and a, whether theſe quantities are, in any particular caſe, to be added, or ſubſtracted. It is the ſame thing to ſubſtract a decrement as to add an equal increment, or to ſubſtract $-b$ from $a-b$, as to add $+b$ to it: and becauſe multiplying a quantity by a *negative* number implies only a repeated ſubſtraction of it, the multiplying $-b$ by $-n$, is ſubſtracting $-b$ as often as there are units in n; and is therefore equivalent to adding $+b$ ſo many times, or the ſame as adding $+nb$. But if we infer from this, that 1 is to $-n$ as $-b$ to nb, according to the rule, that unit is to one of the factors as the other factor is to the product, there is no ground to imagine that there is any myſtery in this, or any other meaning than that the real magnitudes repreſented by 1, n, b, and nb are proportional. For that rule relates only to the magnitude of the factors and product, without determining whether any factor, or the product, is to be added, or ſubtracted. But this likewiſe muſt be determined in algebraic computations; and this is the proper uſe of the rules concerning the ſigns, without which the operation could not proceed. Becauſe a quantity to be ſubſtracted is never produced in compoſition, by any repeated addition of a poſitive, or repeated ſubſtraction of a *negative*, a *negative* ſquare number is never produced by compoſition from the root. Hence $\sqrt{-1}$, or the ſquare root of a *negative*, implies an imaginary quantity; and, in reſolution, is a mark or character of the impoſſible caſes of a problem, unleſs it is compenſated by another imaginary ſymbol, or ſuppoſition, when the whole expreſſion may have a real ſignification. Thus $1+\sqrt{-1}$, and $1-\sqrt{-1}$ taken ſeparately, are imaginary, but their ſum is 2; as the conditions that ſeparately would render the ſolution of a problem impoſſible, in ſome caſes deſtroy each other's effect, when conjoined. In the purſuit of general concluſions, and of ſimple forms for repreſenting them, expreſſions of this kind muſt ſometimes ariſe where the imaginary ſymbol is compenſated in a manner that is not always ſo obvious.

By proper ſubſtitutions, however, the expreſſion may be tranſformed into another, wherein each particular term may have a real ſignification, as well as the whole expreſſion. The theorems that are ſometimes briefly diſcovered by the uſe of this ſymbol, may be demonſtrated without it, by the inverſe operation, or ſome other way; and though ſuch ſymbols are of ſome uſe in the computations by the method of fluxions, its evidence cannot be ſaid to depend upon arts of this kind. See *MacLaurin*'s Fluxions, B. 2. ch. 1.

NEGRO (*Cycl.*) — Mr. Boyle has obſerved, that the heat of climates cannot be the true cauſe of the colour of *negroes*. For though the heat of the ſun may darken the colour of the ſkin, yet experience does not ſhew that heat is ſufficient to produce a true blackneſs, like that of *negroes*. In Africa itſelf many nations of Æthiopia are not *negroes*, nor were there any blacks originally in the Weſt Indies. In many parts of Aſia, under the ſame parallel with the African regions, inhabited by blacks, the people are but tawny. He adds, that there are *negroes* in Africa, beyond the ſouthern tropic, and that a river ſometimes parts nations, one of which is black, and the other but tawny. *Boyle*'s Works abr. Vol. 2. p. 42, 44.

Dr. Barrere alledges that the gall of *negroes* is black, and being mixed with their blood, is depoſited between their ſkin, and ſcarf ſkin. Diſſ. on the phyſ. cauſe of the colour of *negroes*.

We have a diſſertation on this head by Dr. John Mitchell of Virginia, in the Philoſophical Tranſactions, N° 476. Sect. 4. where he advances theſe propoſitions, and enters into a learned detail to ſupport them.

1°. The colour of white people proceeds from the colour which the epidermis tranſmits; that is, from the colour of the parts under the epidermis, rather than from any colour of its own.

2°. The ſkins of *negroes* are of a thicker ſubſtance, and denſer texture, than thoſe of white people, and tranſmit no colour through them.

3°. The part of the skin which appears black in *negroes*, is the *corpus reticulare cutis*, and external lamella of the epidermis: all other parts are of the same colour in them with those of other people, except the fibres which pass between those two parts.

4°. The colour of *negroes* does not proceed from any black humour, or fluid parts contained in their skins; there being none such in any part of their bodies, more than in white people.

5°. The epidermis, especially its external lamella, is divided into two parts by its pores and scales, two hundred times less than the particles of bodies on which their colours depend.

This is founded on Leuwenhoek's observation that a portion of the epidermis no bigger than what can be discerned by the naked eye, is divided into 125000 pores, and these pores must divide such a portion of the skin into as many particles. But the particles of bodies on which their colours depend, are, by Sir Isaac Newton's Optics, Lib. 2. P. 3. Prop. 7. 600 times less than these which can be discerned by the naked eye. Therefore the particles of the skin must be about 200 times less than these; since $\frac{125000}{600} = 208\frac{1}{3}$. It may also be observed that such a small portion of the epidermis is divisible into 250 scales, which must encrease the number of its parts.

6°. From these propositions, and from Sir Isaac Newton's theory of light and colours, the doctor thinks he may conclude, that the proximate cause of the colour of *negroes* is threefold; *viz.* The opacity of their skin, proceeding from the thickness and density of its texture, which obstructs the transmission of the rays of light, from the white and red parts under the skin, together with its greater refractive power, which absorbs these rays; and the smallness of the particles of this skin, which hinders it from reflecting any light.

7°. The influence of the sun, in hot countries, and the manner of life of their inhabitants, are the remote causes of the colour of *negroes*, Indians, &c. And the ways of living in use amongst most nations of white people, make their colours whiter than they were originally, or would be naturally.

In support of this proposition, the doctor observes, that the skin is deprived of its white colour, by the force and influence of the sun, four ways. 1st. By being rendered opaque, from a dissipation of its more aqueous, and pellucid juices. 2dly. By a concretion of its vessels and glandules, from this dissipation of their aqueous contents, which renders the skin both thicker and denser, or more callous and rigid. 3dly. By a new accretion of many new membranes, which render it thick and opaque. 4thly. By encreasing those parts or principles, in the composition of the epidermis, which have the greatest refractive power; as the terrestrial and fixed saline; but especially the tenaceous sulphureous, which refract and absorb light more strongly than any other substances; while the more transparent and pellucid principles, as the aqueous, spirituous, and volatile saline, are evaporated by the heat, which causes the other more fixed principles to be accumulated; and these particles being likewise more comminuted by the sun, will, on this account, be black; as happens to oil when well boiled. These causes, with those first-mentioned, may, the doctor thinks, by conspiring make the skin quite black; especially if we add another effect of the sun's power, a peculiar necrosis of the epidermis, occasioned by the forcible vibrations, contractions, and exsiccations of its fibres by the sun beams which cause it to turn black, as these, or other parts do, by the heat of an inflammation, or a fever, in gangrenes, black tongues, &c.

We cannot pretend to follow the author in all the detail of his observations on this subject, nor of his answer to a material objection already mentioned from Mr. Boyle, that the sun cannot be the cause of the colour of *negroes*, because several nations, in the same latitude with those *negroes*, are not made black by it. He seems to think the heat of Africa greater than that of other parts of the world. Whether it be so, or not, is we doubt, not easy to determine; but it would be a strong confirmation of his doctrine, if we could see any people, originally white, become black and woolly by transplantation, or vice versa.

NEGRO, in zoology, the name of a large bird approaching to the crane kind, and more usually known among authors by its Brasilian name *jabiru*. See JABIRU.

NELANJENUM, in natural history, the name of a curious and peculiar fossile substance found in the East-Indies.

It has much the appearance of some of our steel-grained lead ores, and is very ponderous, but it does not contain any lead; in this it approaches to the nature of that substance common in Europe, and called blende, or mock lead; but this last is foliated, and resembles the plated lead ores, whereas this resembles the close ground ores. It is found in the beds of rivers in many places; they calcine it, and, reducing it to powder, mix it with the juice of herbs, and use it in ulcers.

NELLA *corvindum*, in natural history, a name given by the people of the East-Indies to a very hard stone which they use as we do emery.

It is of a talcky nature, being composed of flaky spangles, and a coarser matter intermixed. They dig it at the foot of some mountains, and in some other places. It lies so near the surface that the rice-fields abound with it; and it is seen on stirring the ground. It is always found in nodules, or detached masses, and is usually of a sort of iron colour, though subject to some variations. It is used by the common people to scower arms, and other iron works; and by the lapidaries, among them, to polish rubies, and other stones. For this last purpose they grind it with stick lack, and make it into a sort of cement, with which they daub over the face of the polishing machine.

NELLON, in botany, a name given by some to rice. It is an Indian word, and properly signifies the grain of rice taken off from the stalks, but covered with its proper pellicle. The first operation to be performed upon this, is the beating it with large stones, or other more manageable tools, till this skin flies off. Then it is to be dried in the sun, and, after that beat a second time, to get off its thin, internal, redish coat: when this is done, it is in a state to be used, and it is then only that the Indians call it *arisi*, the word from which we formed our word rice. Observations sur les Coutumes de l'Asie.

NELUMBO, in botany, the name of a genus of plants, usually confounded with the nymphæa.

The characters of the *nelumbo* are these: The flower is like that of the nymphæa, but the fruit wholly different, not only in shape, but in structure, being not divided into several cells, but having the seeds placed irregularly, at distances from one another in it.

There is only one known species of this genus, which is the *nelumbo* of the Ceyloneſe, called by others the *Indian nymphæa*, and *faba Ægyptiaca*, the *Ægyptian bean*. *Tourn.* Inst. p. 261.

NENUPHAR. The antient writers on the materia medica, have all mentioned a peculiar species of this plant, under the name of *nenuphar indicum*. The roots of this they call *fel*, and Avisenna says, that they have the same virtues with the mandrake. *Fel* is also the name of another very different medicine used in those times; a fruit of a climbing plant, of the size and figure of a cucumber, as to stalks and leaves, but bearing for fruit this *fel*, which was a sort of nut of the size of a pistachea nut, and covered with a thick shell.

This *fel* was of the nature of the *bel* and *fel*, two other fruits of a like sort, all heating and drying. These were qualities altogether opposite to those of the mandrake; and the synonymous use of the word *fel* for these two things not having been observed, the author is accused of contradicting himself in different parts of his works, when, in reality, he is treating of contrary things, tho' unluckily called by the same name; the one a cold root, the other a hot fruit.

NENUPHAR, in botany, is also a name used by some authors for the *water-lilly*. *Ger.* Emac. Ind. 2.

NENUFARINI, a name given by the adepts to a kind of imaginary spirits which they suppose to inhabit the air, and to direct and govern many things on earth.

NEOCORI, Νεοκοροι, among the antients, persons whose business it was to take care of temples, and other consecrated places. They were otherwise called *æditui*. *Pitisc.* in voc. See the article ÆDITUUS.

NECŒNIA, Νεοινια, in antiquity, a festival celebrated in honour of Bacchus, when the new wine was first tasted. *Pott.* Archæol. T. 1. p. 416.

NEOMENIA, Νεομενια, in antiquity. See NUMENIA.

NEOPTOLEMIA, Νεοπτολεμεια, in antiquity, a festival celebrated by the Delphians with much pomp and splendor, in memory of Neoptolemus, the son of Achilles, who was slain in an attempt to sack Apollo's temple, which he undertook in revenge of his father's death, to which that god was accessary. *Pot.* Archæol. Græc. T. 1. p. 416.

NEOTTIA, in botany, the name given by Linnæus to the plant called by Tournefort and others *nidus avis*, and by Ruppius *corallorhiza*. *Linnæi* Gen. Pl. p. 434. See NIDUS *avis*.

NEPA, a word used by naturalists sometimes to express a *crab*, sometimes for a *scorpion*, and sometimes for a plant, called by the botanists *genista Spartium*.

NEPENTHES, in botany, the name of a genus of plants, the characters of which are these: the perianthium is divided into four roundish segments; there are no petals, and scarce any stamina; but four antheræ are affixed to the stylus near its top; the pistil has an extremely slender germen; the style is pointed, and of the length of the cup; and the stigma is obtuse; the fruit is an oblong, columnar, truncated capsule, faintly quadrangular, consisting of four cells, and made up of four valves. The seeds are numerous, pointed, and of a chaffy structure, and are shorter than the capsule. *Linnæi* Gen. Pl. p. 437.

NEPETA, *catmint*, in medicine. See CATMINT.

NEPHALIA, among the Greeks, a festival called the feast of sober men, at which the Athenians offered to the sun and moon, to Aurora and Venus, a drink made of water and honey. They burnt all sorts of wood on the occasion, except the vine and fig-tree. *Danet.* in voc.

NEPHRITICUM *lignum*, or NEPHRITIC *wood*. See TRANSMUTATION *of colours*.

NEPHRITIS, (*Cycl.*) in medicine, is used for an inflammatory affection of the kidneys, owing its origin to a stagnatory congestion of blood in them, which nature seems to have intended to direct to the internal, hæmorrhoidal vessels, thence to be discharged to ease her of the load of a plethora.

The simple *nephritis* is thus carefully to be distinguished from the

the calculoſe one; for the former may, for a long time, affect a patient without any thing of a ſtone being in the caſe; and, on the contrary, a ſtone may be long lodged in the kidneys, without its bringing on any ſuch complaint as the *nephritis*.

In the ſimple *nephritis* there is always a ſenſation of pain and heat about the loins, which is plainly perceived to lie deep within the fleſh, but is never very acute. On the contrary, in the calculoſe *nephritis*, the pain is violently ſharp.

In the ſimple *nephritis*, the urine, after it has ſtood ſome time, ſhoots to the ſides of the pot pellucid cryſtals of a rediſh colour. But, in the calculoſe, the heavy matter immediately precipitates itſelf to the bottom, and is ſabulous and gritty; and the ſimple *nephritis* is always greatly relieved by a gentle motion of the body, as walking, or the like; whereas all motion of the body exaſperates the calculoſe *nephritis*.

The *nephritis* is diſtinguiſhed alſo from the iſchiatic pains, which ſometimes run up to the ſame parts, by its being evidently perceived to lie deep within the fleſh, whereas thoſe pains affect the external muſcles; yet there is ſuch a connection and conſent of parts in theſe caſes, that not unfrequently the one is taken for the other.

Signs of it. Theſe are a pain in the region of the loins, which does not uſually affect both, but only, or, at leaſt, principally, one ſide, uſually the left. The pain is at firſt tenſive and dull, but afterwards becomes more acute; in the beginning it is often attended with a chillneſs, and general trembling, which is ſucceeded by a heat, and acrid gnawing, ſcarce to be ſupported; and this is uſually attended with a want of appetite, and loſs of ſtrength, and a continual, though not violent, thirſt. The ſleep is unſound, and there uſually is either a dull pain in the head, or a vertiginous complaint, more or leſs violent; and very frequently nauſeas, and reachings to vomit, attend the fits, or prognoſticate the acceſs of them.

The pain never extends itſelf down the whole thigh, nor is that ever wholly numb'd, or rendered torpid by it; and the diſorder does not ſeem continual, but attacks the patient at different times, and theſe after conſiderably long intervals, if he live regularly. The bowels are uſually coſtive at the time of the fits, and there is a frequent want of making water, though very little is voided at a time, and that thin, when the pain is violent; when it is more obtuſe, the urine is commonly thick, and has, as it were, threads in it, of a ſort of mucilaginous matter; and to this it is to be added, that ſometimes the ſpermatic veſſels which run to the teſtes become hard and tumid.

Men are more ſubject to this diſeaſe than women, and of thoſe, ſuch principally as are plethoric; and people in the middle and later periods of life, are, in general, more ſubject to it than thoſe who are younger. In general, young people are not ſubject to this diſeaſe, unleſs it be from an hereditary diſpoſition, or ſome very powerful, and violent, external cauſes. Men are much oftener tormented with the *nephritis* than women, and none ſo often fall into it as thoſe who have omitted the uſual evacuations, and afterwards fall into violent exerciſes; and finally, people who have the gout and the ſciatica, are uſually alſo *nephritic*.

Cauſes of it. Theſe are principally the ſuppreſſion of natural evacuations; or the omiſſion of habitual artificial ones; the abuſe of hot medicines of the diuretic kind, ſuch as the oils of turpentine, and juniper, and the balſam of ſulphur; as alſo the over frequent uſe of venery, and the taking medicines to provoke to it; violent paſſions, or great and fatiguing exerciſes; external injuries by blows, falls, or the like; and the uſe of a too hot diet, and too much of ſtrong liquors.

Prognoſtics. The ſimple *nephritis* may uſually be cured, if properly treated, but the calculous one ſcarce ever can; and tho' all inflammations of the internal parts are juſtly accounted very dangerous, yet this is the leaſt ſo of all others, becauſe the urine continually paſſing through the part, abſterges and cleanſes it, and prevents corruption, or gatherings of matter. The greateſt danger is in ſuch as have a diſpoſition to generate calculous matter, and to hectics. In theſe caſes the diſeaſe is apt ſoon to change from its ſimple nature.

It is very rare that both kidneys are ſeized with this diſtemper, but uſually the left alone ſuffers by it: the more inflammatory the ſtate of the body is, the worſe it is with perſons afflicted with this diſeaſe, and the more they are ſubject to it: thus young people who have often a turgeſcence of blood, are more frequently ſubject to this diſeaſe than old perſons, and are with more difficulty cured of it: and it is an obſervation as old as Hippocrates, that the coming on of hæmorrhages from the internal hæmorrhoids cures this diſeaſe.

Method of cure. In the time of the fit, the firſt thing to be done is the opening the belly by a clyſter of the emollient kind, prepared of milk or broth. Simon Pauli expreſly directs, from repeated experience of its good effects, a decoction of the herb veronica, or ſpeedwell, with ſome oil, and a little ſalt. After this, powders of nitre, cinnabar, and tartarum vitriolatum, ſhould be taken every three hours; and, towards the evening, there ſhould be mixed with one of theſe doſes, eight grains of diaphoretic antimony, and four of crab's eyes. Emulſions of the cold ſeeds in the cooling ſimple waters, are alſo of great uſe; and to the common ſeeds uſed on this occaſion, may be added thoſe of poppies, and of carduus mariæ. In the mean time external applications may alſo be uſed with ſome ſucceſs; ſuch as bags of chamomile, melilot, and fenugreek ſeed dry, and heated at the fire; as alſo the ſpirits of ſerpyllum, and the like, and the ſoap plaiſter: to all theſe may be added the uſe of leeches, which are, indeed, a great relief in all the diſtemperatures of the urinary parts; and, finally, during the whole courſe of the cure, refrigerating and diluting liquors are to be drank in large quantities, as barley water, tea, and the like.

After the fit, the neceſſary treatment to prevent a return, is to bleed regularly, ſpring and autumn; to take, at times, gentle purges of rhubarb, ſena, and the like; to keep the hæmorrhoidal diſcharges in their proper ſtate; and the habitual coſtiveneſs which uſually attends people in this diſeaſe is to be taken off by a moiſt aud lubricating diet; and wine, and ſtrong liquors, are to be avoided. *Junker's* Conſp. Med. p. 216, ſeq.

NEPHROMETRÆ, a name given by ſome authors to the muſcles of the loins, called by the generality of medical authors *pſoæ*.

NEPHROTOMY, in ſurgery, the cutting into the kidneys, in caſe of the ſtone being lodged there, and taking it out in the ſame way as from the bladder.

This is an operation which has been very little practiſed, and uſually ſuppoſed to be attended with very great danger: few authors who have treated of theſe diſeaſes have ſo much as mentioned this operation, and the few that have named it, have generally condemned it. Sinibaldus fancying that it was an operation antiently practiſed, ſtrove very earneſtly, indeed, to have it revived. He has called in the opinion of Hippocrates to ſupport his account of its having been done with ſafety, and adviſes the ſurgeons to try their hand on brutes firſt, and accuſtom themſelves to the operation, and then not to fear it in regard to men.

It is certain that a ſtone in the kidney is ſo terrible a diſeaſe, that it is very much to be wiſhed that ſome ſafe operation could be invented to cure it; but it is making too free with Hippocrates, to ſay that he countenances or directs ſuch an operation in general. His words ſeem to expreſs only the making an inciſion near the kidney; but even if they are to be underſtood as directing the cutting into it, it is under ſuch reſtrictions, that opportunities will very ſeldom offer; and, when they do, a common ſurgeon would not ſcruple performing all that is directed, without either conſulting Hippocrates, or trying his ſkill upon brutes. Hippocrates only adviſes it in caſe of a ſwelling and impoſthumation, where there is matter formed, and the tumor manifeſts itſelf upon the ſurface. In this caſe every ſurgeon would know it was his buſineſs to make an inciſion. Phil. Tranſ. N° 223. p. 334.

Caſes requiring this are frequent, and that even without a ſtone. An inflammation in a kidney degenerates into an abſceſs, and when matter is formed, the ſurgeon opens the tumor, and the matter is diſcharged. Sometimes ſtones bred in the kidneys cauſe impoſthumations; the ſurgeon opens theſe, and the ſtones are brought away together with the matter. Nay, nature herſelf has done the whole for ſome people, and the ſtones have made their way through the kidney, and through the integuments, &c.

Tulpius gives an account, from his own obſervation, of a man who had a ſtone in his kidney, which, after many years, diſcharged itſelf through the loins, and occaſioned a fiſtula in the part, through which the urine was long voided, together with the matter. The attempts of many ſurgeons to heal this fiſtula proved vain, and, at length, one ſucceeding ſo far as to ſtop up the mouth of the ulcer, the matter which uſed to be diſcharged from it was thrown into the abdomen, and the man died of a fever. Tulpius gives the death of this perſon as an objection againſt the operation of *nephrotomy* in general, as he ſuppoſes a ſimilar fate might attend the wounds made in theſe parts by the ſurgeon.

From an impartial examination of the works of Hippocrates, it does not appear that the cutting for the ſtone in the kidneys was regularly practiſed in his time, nor, indeed, for many ages after; for Celſus makes no mention of it, although he is very particular upon the operation of cutting for the ſtone in the bladder. Galen is ſo copious a writer, that he never miſſes any thing practiſed either in his own time, or before it, in his accounts of diſeaſes, yet he mentions nothing of this operation, though he is very long upon the article of the diſeaſes of the kidneys. Cardan, indeed, mentions this operation as one of thoſe of the antients which were practiſed in his time. His haſty reading the words of Hippocrates has led him into this error, and he lays the fault of its being now loſt, in a great meaſure, on Galen's omitting to mention it. It is wrong to accuſe Galen of this omiſſion, ſince neither Celſus, nor Ruffus, who preceded him, nor Aretæus who was his cotemporary, nor, indeed, any of the Greek or Latin phyſicians, have named it, though they, as well as the moderns, mention occaſionally an abſceſs in the kidneys, and the manner of curing it.

The Arabians, indeed, mention the operation as practiſed and countenanced by ſome perſons before their time; but they all join in condemning it as a bold and hazardous operation, from which very little good is to be expected, and which ſets the life of the patient in the moſt imminent danger. Aviſenna ſpeaks of it as the act of a madman, and, it ſeems, that it was ſometimes

ſometimes practiſed in his time, but by his manner of naming it, ſeems to have been only done by ſome mountebanks, who having no reputation to loſe, ventured boldly, and ſometimes had ſucceſs. The reſt of the Arabians are ſilent about the operation, and it ſeems to have been only practiſed by a few people in the days of this author, and wholly diſcountenanced afterwards, from its bad ſucceſs.

Among the moderns, the firſt who has named it is Rouſſet, in his treatiſe on the Cæſarian ſection. In order to invite men to countenance the Cæſarian operation, he recommends ſeveral other deſperate ones, and among the reſt, this of *nephrotomy*: but he is not able to produce one inſtance of its having been practiſed either in his own, or earlier times, but when there was an abſceſs and an external tumor. Cælius Rodeginus gives indeed a very remarkable inſtance of an operation of this kind being performed by chance, by a woman who, in the agony of her pain from the ſtone in the kidney, ſcratched with her own nails, till ſhe tore thro' the fleſh ſo deep, that eighteen ſtones were diſcharged at the wound.

The general opinion of authors is thus againſt the operation; and the moſt famed among thoſe who have treated of wounds of the kidneys ſay, that any wound which enters into the pelvis is mortal. Yet this opinion, tho' general, is not certain or determinate; and we have an account in the Philoſophical tranſactions of the operation of *nephrotomy* being performed with ſucceſs, by Marchetti of Padua, on Mr. Hobſon the Engliſh conſul at Venice. Phil. Tranſ. N° 223. p. 337.

NEPTA, a name uſed by ſome authors for the *aſphaltum*. It ſeems a corruption of *naphtha*.

NEPTUNE'S *cap*, a name given by naturaliſts to a remarkable ſpecies of marine fungus, which is never found affixed to any ſolid body, but always looſe, and rolling about at the bottom of the ſea. Its uſual ſize is about five inches in height, and ſix or ſeven in diameter at the baſe. It gradually becomes narrower from the baſe to the ſummit, where it terminates in a round end, ornamented with cluſters of a foliaceous ſort of ſubſtances, reſembling a cock's comb, but of the ſame matter with the reſt of the plant.

Its internal ſurface is very different from this: it is lightly furrowed down the ſides, and beſet with a number of ſmall protuberances, with obtuſe points. Some of theſe, when ſmall, are found with a pedicle growing to them. This is always of a very brittle ſubſtance, and it is probable that all thoſe found looſe had originally ſuch pedicles, by which they adhered to ſome ſolid body, in the manner of the corals, and other ſea plants; but that its extreme brittleneſs occaſions it to be ſoon broken off, by the motion of the water, after which the plant rolls looſe about, and takes in its nouriſhment at its ſeveral pores, by means of the water which every way ſurrounds it.

It is not probable that theſe and the like ſea plants are nouriſhed only by ſea water; but that there is in the ſea a ſort of mud continually formed out of the decayed particles of animals, and the ſofter vegetables, which may be ſuppoſed much to reſemble the common vegetable mold in its uſes, as it has much the ſame origin; and this, or at leaſt its finer and lighter parts, may be conveyed by water into the pores of theſe plants, and nouriſh them. Mem. Acad. Par. 1700.

NERANTZIUM, in botany, a name given by ſome of the Greek writers to the citron tree. The antient Greeks were not acquainted with the word, and it ſeems to have been formed in the barbarous ages from the word *narange*, the name by which the Arabian phyſicians called the ſame fruit.

NERFLING, in zoology, the name of a freſh water fiſh of the leather-mouth'd kind, common in ſome of the lakes in Germany, and there called alſo the *orff* or *oorve*, and ſeeming to be the ſame with the common Engliſh rudd. See RUBELLIO. There are two kinds of this fiſh, the fleſh of the one of which, when dreſſed, is white, and that of the other yelloviſh or redifh. The latter kind is moſt valued. *Willughby*'s Hiſt. Piſc. p. 252. *Geſner* de Piſc.

NERION, *oleander*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is compoſed of only one leaf, and is of the funnel-faſhion'd kind, and divided into many ſegments at the edge. The piſtil ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower: this finally becomes a fruit of a cylindric ſhape, compoſed of two pods, which contain ſeeds winged with down. See Tab. 1. of Botany, Claſs 20.

The ſpecies of *nerion* enumerated by Mr. Tournefort, are theſe: 1. The red-flowered *nerion*. 2. The white-flowered *nerion*. 3. The narrow-leav'd Indian *nerion*, with ſingle ſweet-ſcented flowers. 4. The broad-leaved Indian *nerion*, with ſweet-ſcented double flowers. 5. The broad-leaved Indian *nerion*, with ſweet-ſcented, double, variegated flowers: and, 6. The climbing American *nerion*, with tuberoſe briony-like roots. *Tourn.* Inſt. p. 654.

NERITA, a genus of ſhell fiſh, of the nature of the ſemicircular-mouth'd cochleæ, and comprehended under the general term *cochlea ſemilunaris*. See Tab. of Foſſils, Claſs 9. and SEMILUNARIS *cochlea*.

NEROPHIDION, in ichthyology, a name given by Schoneveldt, and ſome others, to that ſpecies of the *acus* or *ſyngnathus* of Artedi, which is called by that author the hexagonal-bodied *ſyngnathus* with the pinnated tail; and by others, the *acus Ariſtotelis*, and *acus ſecunda ſpecies*, and *typhle*; by ſome alſo, *blennus*.

NERVE (*Cycl.*) — The antients found, that by cutting, tying or compreſſing any *nerve*, or any other way intercepting its communication with the brain, the parts to which it belonged were immediately deprived of all ſenſe and motion. One remarkable inſtance of this is, the making an animal dumb by tying the *nerves* near the wind-pipe. We read in Galen, of a boy who became quite dumb by having both the recurrent *nerves* divided.

The experiment of cutting theſe *nerves* in brute animals, was repeated and confirmed by Veſalius; and Dr. Martin aſſures us, he tried it ſucceſsfully on a pig; nor did the animal recover its voice, as ſome have ſuſpected it might. As the voice depends on a proper aperture of the glottis, it ſeems likely that when the recurrent *nerves* are cut, the glottis will always ſtand open, and be incapacitated from being ſhut at the will of the animal. See Med. Eſſ. Edinb. Vol. 2. Art. 8.

An anonymous phyſician offers what he calls an *experimentum crucis*, in proof of the *nerves* being compoſed of cylindrical canals, containing a fluid: it is the demonſtration of the optic *nerve* inflated and dried, which appears canular to the naked eye. See Preſent State of Rep. Let. Vol. 12. Art. 16.

Wounds of the NERVES. Upon the diviſion of a *nerve*, the limb to which that *nerve* was extended becomes inſtantly rigid, void of ſenſation, and withers: ſo that it is no wonder that a man inſtantly expires, upon the diviſion of thoſe nerves which are ſent to the heart or diaphragm: a wound alſo is attended with great danger where the *nerve* is only partially wounded, and not entirely divided; for the wounded fibres contract themſelves, and thoſe which remain undivided ſuffer too great extenſion, which will bring on moſt violent pain, ſpaſms, convulſions, inflammations, and gangrenes, and ſometimes death itſelf. *Heiſter*'s Surg. p. 27.

NERVES *microſcopically examined*. Mr. Leuwenhoek endeavoured by his microſcope, to diſcover the ſtructure of the *nerves* in the ſpinal marrow of an ox: he ſaw there with great delight, minute hollow veſſels of an inconceivable firmneſs, inveſted with their proper membrane, and running out in length parallel to one another, and making up their compoſition: and tho' ſome hundreds of theſe veſſels go to the formation of the leaſt *nerve* that can be examined, he not only diſcerned the cavities in them, which he computed to be three times leſs than their diameters, but in ſome perceived the orifices as plainly as the holes in a pricked paper are to be ſeen when looked at againſt the ſun. It requires, however, great dexterity and expedition to make this examination with ſucceſs; for after a thin ſlice of the ſpinal marrow is placed before the microſcope, in leſs than a minute's time it becomes dry, and the whole appearance vaniſhes. *Baker*'s Microſcope, p. 145.

NERVOSE *leaf*, *nervoſum folium*, among botaniſts. See LEAF.

NESTLINGS, a name given to Canary birds brought up by hand. See CANARY and PASSERES *Canarienſes*.

NET (*Cycl.*) — The taking fowls by *nets* is the readieſt and moſt advantageous of all others, where numbers are to be taken.

The making the *nets* is very eaſy, and what every true ſportſman ought to be able to do for himſelf. All the tools neceſſary to it are wooden needles, of which there ſhould be ſeveral of different ſizes, ſome round, and others flat; a pair of round-pointed flat ſciſſars, and a wheel to wind off the thread. The packthread is to be of different ſtrength and thickneſs, according to the ſort of birds that are to be taken; and the general ſize of the meſhes, if not for very ſmall birds, is two inches from point to point.

The *nets* ſhould be made neither too deep nor too long, for they are then difficult to manage; and they muſt be verged on each ſide with twiſted thread. The natural colour of the thread is too bright and pale, and is therefore to be altered in many caſes, according to the occaſion.

The moſt uſual colour is the ruſſet: this is to be obtained by plunging the *net*, after it is made, into a tanner's pit, and letting it lie there till it be ſufficiently tinged; this is of a double ſervice to the *net*, preſerving the thread very greatly, as well as altering the colour. The green colour is given by chopping ſome green wheat, and boiling it in water, then ſoaking the net in this green tincture till it have ſufficient colour. The yellow colour is given in the ſame manner, with the decoction of celandine: this gives a pale and faint ſtraw colour, which is the colour of ſtubble in the harveſt time, and is juſt what is wanted. The brown *nets* are intended to be uſed on ploughed fields; the green on graſs grounds, and the yellow on ſtubble lands.

Great care is neceſſary in the preſerving of *nets*; and the principal thing to be conſidered in regard to this is, that all wet rots the threads: whenever they have been uſed in dew or rain, they muſt be hung up to dry in the ſun; and if there is any rent or breach made, it muſt be mended as ſoon as it is diſcovered. In the drying, they muſt be hung as far as may be from the walls, that they may be out of the way of mice and rats, which are very apt to deſtroy them. The utmoſt depth that ſhould be allowed to a *net* for fowl, is two fathom, and the utmoſt length ſix fathom.

The places for uſing fowling *nets* to moſt advantage, are the morning and evening haunts where the birds come to feed. The ſportſman is to be at the place at leaſt two hours before the time of their coming, and the *net* muſt immediately be

ſpread

ſpread flat and even upon the ground, and the two ends faſtened down with ſtakes. At the lower part there is to be a long cord fixed to the upper edge of the *net*, by means of which it may be immediately raiſed, and pulled over. The ſportſman is to hide himſelf behind ſome natural or artificial ſhelter, at the extremity of this line, and ſome cut graſs muſt be ſtrewed all over the *net* as it lies on the ground, to hide it from the fowl; and ſome live bird, that has been taken before, ſhould be ſtaked down before the *net*, by way of a ſtall, to draw in the others.

As ſoon as a ſufficient number of birds are within the compaſs of the *net*, it is to be pulled ſwiftly over them, and the fowler having taken thoſe that are under it, may ſtake down two or three more live ones, and ſpread the *net*, covering it with graſs as before. This ſort of ſport may be continued from as ſoon as it is light in the morning till an hour after ſun-riſe; but after that time, the birds have done feeding ravenouſly, and the ſport is over for that day.

Cinque-port NET, in fiſhery, a name given to a ſort of ſquare *net*, reſembling a cage, and having five entrances into it, from whence it has the name.

It is a very ſerviceable *net* in any pond or river, and is equally good in ſwift or ſtanding water. In order to make this *net*, there muſt be provided four large and ſtrait poles, anſwerable in length to the depth of the water. The ends of theſe muſt be ſharpened in the manner of ſtakes, and there muſt be notches within a foot of the ſharp part to faſten the *net* to, and at a convenient diſtance, on the poles, there muſt be another ſet of notches, for the faſtening the other ends of the *net*.

The bottom of this *net* is four-ſquare, without any entrance. A boat muſt be taken out with this *net*, to place it properly. The four poles muſt be fixed in the bottom in ſuch a manner, that each may anſwer to the other in a direct line; and they muſt ſtand at ſuch diſtances, that the *net* may be drawn out as ſtiff as poſſible between them. If the *net* is to be fixed in a ſtanding water, this method alone will do very well; but if it be a ſmooth ſtream, ſomething more is neceſſary, otherwiſe the motion of the water will keep the *net* playing about, and this will frighten away the fiſh. To prevent this, four ſtrong ſticks are in this caſe to be faſtened along the tops of the others, ſo as to make a ſort of frame, to ſtreighten and ſtrengthen the others, and keep all tight.

When the *net* is perfectly fixed, it repreſents a cage, and the ſides, top, and bottom are kept ſo firm, that the fiſh do not regard them, but ſeem to take them for weeds; but going in at the entrances, there is no returning, and in rich places great numbers are taken.

Crow NET, in birding, a name given to a ſort of *net* contrived for the catching of wild fowl in the winter ſeaſon.

This *net* may be uſed in the day-time, and is to be made of double thread, or of fine packthread, and the meſhes are to be two inches wide. The length of the whole ſhould be about ten yards, and the depth about three. It ſhould be verged on the ſides with a ſtrong cord, and ſtretched out in length very ſtiff upon long poles, prepared for that purpoſe. When this *net* is brought to the place where it is to be uſed, it muſt be opened, and ſpread at full length and breadth: then its lower end is to be faſtened all along the whole length to the ground, ſo that it only can be moved up and down. The upper end of the *net* muſt ſtand extended on the long cord, the farther end of it being firſt ſtaked to the earth by a ſtrong cord, about five yards diſtant from the *net*, and ſtanding in an even line with the bottom of the *net*. The other end of the cord muſt reach at leaſt five and twenty yards, to ſome natural or artificial ſhelter, by means of which the ſportſman is to lie concealed from his prey. The *net* muſt be placed in ſuch exact order, that it will play upon the leaſt jerk of the cord, and that muſt always be given ſuddenly, leſt the prey eſcape. This *net* is principally uſed for crows and pigeons, on new-ſown corn fields, and it may alſo be uſed in ſtubble fields, where the ſtubble will hide the *net* from the fowl. If the meſhes are made ſmaller, it may be uſed at barn-doors and the like for ſmall birds, and a bait of chaff will bring them together under it. But the great uſe of the *crow-net*, is to ſpread it in mornings and evenings where the haunts of wild fowl are, which in hard weather fly in great flocks to and from land, with and againſt the wind, and then fly cloſe to the ground, in open countries and low lands, where there are few hedges. When a whole covey of theſe are within the reach of the *net*, it is to be let go over them, and they will be taken in great numbers at one caſt.

Tunnel NET. See the article TUNNEL.

Wolf NET. See the article WOLF.

NETE, *(Cycl.)* in the antient muſic, was a general name for one of the extreme chords of a tetrachord. Some ſay it was the higheſt, and others the loweſt ſound. But perhaps the truth of the matter is, that it was the higheſt or loweſt ſound, according as the aſcending or deſcending ſcales were conſidered. Vid. Phil. Tranſ. N° 481. p. 269. See HYPATE.

When the *nete* is ſaid to be one of the extremes of a tetrachord, it is to be underſtood of a tetrachord conſidered by itſelf: for, when tetrachords were combined, the *nete* ſometimes took another name, as appears from the Greek ſcale inſerted under the article DIAGRAM. Vid. *Wallis* App. ad Ptol. Harm. p. 158.

NETHINIMS, among the Jews, the poſterity of the Gibeonites, who were condemned by Joſhua to be hewers of wood and drawers of water for the houſe of God. *Hoſm.* Lex. in voc. *nethinæi*. *Joſ.* ix. 22.

NETOPION, ΝΗΤΟΠΙΟΝ, a name given by the antients to a very fragrant and coſtly ointment, conſiſting of a great number of the fineſt ſpicy ingredients. Hippocrates, in his treatiſe of the diſeaſes of women, frequently preſcribes the *netopion* in diſeaſes of the uterus; and in other places he ſpeaks of its being poured into the ears as a remedy for deafneſs, theſe compoſitions, by their attenuating qualities, dividing the viſcous and thick humors. The word *netopion* is alſo ſometimes uſed to expreſs the *unguentum Ægyptiacum*, and ſometimes ſimply for oil of almonds.

NETTINGS, in a ſhip, are a ſort of grates made with ſmall ropes, and ſeized together with rope-yarn, and are laid in the waſte of a ſhip, ſometimes, to ſerve inſtead of gratings. See GRATINGS.

NETTING-*ſail*, in a ſhip. See the article SAIL.

NETTLE, in botany. See the article URTICA.

Dead NETTLE. See the article LAMIUM.

NETTLE-*tree*. See the article CELTIS.

NEURADE, in botany, a name given by Linnæus to a genus of plants, called by Juſſieu *tribulaſtrum*. The characters are theſe: the perianthium is very ſmall, and ſtands upon the germen of the piſtil: it is compoſed of one leaf, divided into five ſegments. The flower conſiſts of five equal petals, larger than the leaves of the cup: the ſtamina are ten filaments, of the length of the cup: the antheræ are ſimple: the germen of the piſtil ſtands under the cup, and is of a gibbous figure: the ſtiles are ten in number, and are of the length of the ſtigmata: the ſtigmata are ſimple. The fruit is an orbicular capſule, of a depreſſed figure on the ſurface, and convex underneath, and is every way ſurrounded with prickles. The inner part is divided into ten cells, in every one of which is lodged a ſingle ſeed. *Linnæi* Gen. Plant. p. 185.

NEURIS, in the writings of the antients, the name given to a ſpecies of marble, otherwiſe called *elaphoneſum*, and *proconneſium*. It was much uſed by the Roman ſtatuaries, and was dug in a ſmall iſland that lay between Paros and Cyzicus. It was of a duſky or blueiſh white, and was variegated with fine and ſlender veins of black, often beautifully diſpoſed, and in the bodies of the naked ſtatues reſembling the courſe of the veins.

NEUROBATES, in antiquity, a rope-dancer. See the article DANCE, *Cycl.*

NEUROPHYLLON, in natural hiſtory, a name given by Mr. Lhuyd to a ſpecies of foſſile plant, remarkable for the ridges on the leaf. See *foſſile* PLANT.

NEUTHA, a name given by authors to a pellicle covering the eyes or the ears of a child in the birth, and ſometimes the whole face.

NEVEW, in botany, &c. See NAPUS.

NEWT, or EFT, in zoology. See the article EFT.

The land *newt*, or as naturaliſts often call it, the land *ſalamander*, has ſomething very remarkable in its outer coat. Its ſkin often appears dry, like that of the lizard kind, but often alſo it appears wetted, and as if covered with a fine ſhining varniſh: the change from one to the other of theſe ſtates is uſually performed in an inſtant, and it frequently becomes immediately wet all over on the touching it. It alſo contains, under the ſkin, a ſort of milky liquor, which ſpurts out to a diſtance on preſſing the body of the animal.

The paſſages for this milk are a vaſt number of pores or holes, many of which are plainly viſible to the naked eye; and very probably the firſt-mentioned liquor, which covers the ſkin in manner of a varniſh, may be the ſame with this, its white colour not being diſtinguiſhable when it is ſpread ſo thin over the ſurface of the animal. This milk reſembles very much the milky juice which the tithymals, and many other of the ſucculent plants, afford on being cut or broken. It is of an inſupportably acrid and ſtyptic taſte; and tho' the tongue receives no injury from touching it, yet the ſenſation is ſo violent, that one is apt to imagine there muſt be a wound made in it. This animal, when bruiſed, yields alſo a very diſagreeable ſmell.

It has generally been ſuppoſed, that this animal is of a poiſonous nature; and the famous ſalamander of the old writers ſeems to be of the ſame genus, if not the ſame animal. Mr. Maupertuis, determined to inform the world of the truth in regard to theſe remarkable particulars, cauſed a large number of theſe animals to be brought to him, which the country people, who had caught them about the bottoms of old walls, brought to him with as much caution as if they had been vipers.

The firſt experiment he made, was that of the incombuſtible quality of this animal: to this purpoſe he threw ſeveral of them into a common fire; moſt of them periſhed immediately, but a few made ſhift to crawl out; but theſe could not get away on a ſecond trial, but periſhed like the reſt. It was obſerved, however, that the moment they were thrown into the

fire,

fire, the whole quantity of milky juice they contained was driven out at all the pores, and drying in an inſtant, ſtood in round globules, like ſo many pearls, till wholly conſumed by the heat.

It is poſſible that the obſerving this creature to have a power of throwing out theſe juices, and covering itſelf at pleaſure with wet, might give riſe to the imaginary property of its ſubſiſting by the ſame means unhurt in the fire.

This trial being made, the next was to be certainly determined whether the creature were poiſonous, or not. This Mr. Maupertuis propoſed to try two ways; the firſt by making the creature bite ſome animal; the other by making ſome other creature eat the *newt*. But theſe experiments were attended with more difficulties than might have been imagined, for it was neither eaſy to make it bite any thing, nor to make any creature eat it. No provocation could make the *newt* bite, and when its jaws were opened by force, its teeth were found ſo ſmall, and ſo placed, that they ſeemed rather intended to ſaw, or cut things to pieces, than to bite with; and when a chicken was brought to be bit, and the feathers removed from the part, the jaws had no force to make the teeth penetrate, and, when preſſed together, the teeth rather broke, or were put out of their places, than entered the animal, ſo that it was neceſſary to take off the ſkin, and the chicken then received ſeveral wounds, by forcibly preſſing the jaws of the *newt*, together with parts of the raw fleſh between: after this the lips, and tongue, of a dog, and the tongue of a turkey, were bitten in the ſame manner by other *newts*. The animals were let looſe, and not one of them received the leaſt injury from the bite.

The following trial was made, whether the fleſh of the creature, or its milky juice were poiſonous, when received into the ſtomach. Several animals were kept hungry a conſiderable time, on purpoſe to make them eat the animal, but none of them would touch it, ſo well has nature defended this little creature by the acrid juice under its ſkin, of which other animals are warned, as by inſtinct, and refuſe to ſwallow ſo diſagreeable a repaſt. A dog was at length compelled to ſwallow a *newt* cut into ſeveral pieces, while alive, and a turkey was forced to ſwallow, in like manner, a ſmall one. The dog's mouth was tied up for half an hour, and half an hour after they were untied, he vomited up the tail and the feet of the animal, and received no injury; nor did the turkey which ſwallowed the young one. After this, pieces of bread were ſoaked in the milky juice alone, and chickens were made to ſwallow them, and wounds inflicted with weapons dipt in the ſame juice, but no harm ever enſued to the creature from either.

From all theſe tryals, it appears very evident, that the ſtories of this creature's being poiſonous, are as idle, and groundleſs, as thoſe of its living in the fire.

One thing remarkable this gentleman obſerved in his diſſections of the animal, which was, that he found in ſeveral of the females, at once cluſters of eggs, and living young ones. The eggs formed cluſters reſembling thoſe of the ovaries of birds, and the young ones were contained in two tubes, or long pipes, the coats of which were perfectly tranſparent, and the young ones were eaſily diſtinguiſhed through them, and there were counted in one female fifty-four of theſe, all living and vigorous. Mem. Acad. Par. 1727.

NEXI, among the Romans, perſons free-born, who, for debt, were delivered bound to their creditor, and obliged to ſerve him, till they could pay the debt. *Hofm.* Lex. in voc.

NEXT *taker*, among miners, is he that hath the next meer in poſſeſſion. *Houghton's* compl. Miner in the Explan. of the Terms.

NHAMBUGUACU, in botany, a name of the great American *ricinus*, or *palma Chriſti*. *Marggr.* p. 77. *Piſo*, p. 180.

NHAMDIA, in zoology, the name of a fiſh caught in the rivers of many parts of America, and of a fine taſte. It is of the anguilliform kind, and has a long and fat body, becoming ſmaller toward the tail; its belly is ſoft; its head flat; and its mouth of a parabolic figure, and armed with ſmall teeth. It is uſually of about eight or ten inches long; its eyes are ſmall and prominent; and it has a beard compoſed of ſix filaments, four placed below, and two above; the laſt are much longer and thicker than the other four, and have a long furrow behind each. It has ſeven fins beſide the tail; one of the back fins is thorny; the reſt are covered with the common ſkin of the body, which is ſoft, and free from ſcales. Its tail is forked, and its head is covered with a ſtrong ſhelly coat; this is of a duſky brown. Its back and ſides are of a bluiſh grey; the larger back fin is of the ſame colour; all the reſt are black; and, on each ſide, there is a red line reaching lengthways from the gills to the tail. *Willughby's* Hiſt. Piſc. p. 140.

NHANDIROBA, in botany, a name given by Plumier to a genus of plants, the ſame with the *ſevillea* of Linnæus. *Plumier*, Nov. Gen. 27. See the article FEVILLEA.

NHANDUAPOA, the name of a Braſilian bird, called alſo *jabiruguacu*, but more frequently known by its Dutch name *ſcurvogel*. See SCURVOGEL.

NHANDUGUACU, in zoology, the name of a Braſilian bird of the emeu, or caſſowary kind, but ſmaller than the common, or African caſſowary. Its body is conſiderably large; its neck long and ſtrong; its legs very long and thick; its wings extremely ſhort, and unfit for flying, but aſſiſting it in running; its feathers are grey, and, on the back, are conſiderably long. It commonly carries its neck bent like a ſwan; its head is ſhaped like that of a gooſe; its back feathers cover the rump, and make a ſort of tail; it runs as ſwift as a greyhound, and feeds on fleſh and fruits. *Marggrave's* Hiſt. Braſ.

NHAQUUNDA, in zoology, the name of a ſmall fiſh caught in the American rivers. Its body is oblong, and every where nearly of the ſame thickneſs; its head and mouth are like thoſe of the pike; and its uſual length is about four inches. It can extend its upper lip, and round the opening of its mouth. It has no regular teeth, but its jaws are rough like a file. It has two fins at the gills, two on the belly, one long one on the back, but not reaching from head to tail, and one ſhort, and almoſt ſquare one, behind the anus. Its tail is covered with a hard ſhelly cruſt; its body is covered with moderately large ſcales; and its back and ſides are of a ſilvery grey; its belly white It has on each ſide a ſingle row of round black ſpots, of the bigneſs of a pea, and among theſe a number of ſmall blue ones. The fins alſo are all variegated with blue ſpots, and it has a long ſtreak reaching from the gills almoſt to the tail, and under the end of that another ſhort one which runs into the ſubſtance of the tail; theſe are both raiſed above the ſurface of the reſt of the body, and are of a fine gold colour. It is a very well taſted fiſh. *Marggrave's* Hiſt. Braſ.

NICETERIA *Athenas*, Νικητηρια Αθηνας, in antiquity, an Athenian ſolemnity in memory of Minerva's victory over Neptune, when they contended which of them ſhould have the honour of giving a name to the city afterwards called Athens. *Potter*, Archæol. T. 1. p. 416.

NICHILIANISTÆ, in church hiſtory, heretics who maintained that Chriſt had no being. *Hofm.* Lex. in voc.

NICOL, in natural hiſtory, a word uſed by the miners in Germany to expreſs a greeniſh cruſt, covering ſeveral of the ſpecies of marcaſites and cobalt; it emits fumes that ſmell of garlick in the calcination, and is very injurious to the workmen, cauſing contractions of their limbs, and other diſorders. It is ſometimes found in maſſes alone, but that more rarely.

NICOMIA, in natural hiſtory, a name given by ſome to a ſtone called by others *chert* and *ubern*. It is of a greyiſh, horny conſtitution, and has veins of red on it. It is very hard and ſemipellucid, much reſembling the common agates, and it gives fire readily with ſteel. It lies in ſtrata in Yorkſhire, and many other parts of England: theſe ſtrata are about three foot thick, and run a vaſt way among the rocks. It uſually lies among lime ſtone, and is not regular in colour, being ſometimes of a duſky or blackiſh hue, like the common flint. It is ſo hard that no common tool will touch it, and it breaks irregularly, and without any grain, in the manner of the common flint. *Woodw.* Cat. Foſſ. Vol. 1. p. 22. See CHERT.

NICOTIANA, *tobacco*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the infundibuli form kind, conſiſting of one leaf divided into ſeveral ſegments at the edges; the piſtill ariſes from the cup, and is fixed in the manner of a nail to the hinder part of the flower; this afterwards becomes a membranaceous fruit, of a roundiſh or oblong figure, divided by an intermediate membrane into two cells, which contain a large number of ſeeds fixed to a placenta. *Tourn.* Inſt. p. 117.

The ſpecies of *tobacco* enumerated by Mr. Tournefort are theſe: 1. The great, broad-leaved *tobacco*. 2. The great, narrow-leaved *tobacco*. 3. The great broad, and round-leaved *tobacco*. 4. The ſmall *tobacco*, called *priapeia* by ſome writers. 5. The white-flowered, thorny, tree *tobacco*.

NIDDUI, in the Jewiſh cuſtoms, is uſed to ſignify, ſeparated, or excommunicated. This, according to ſome, was to be underſtood of the leſſer ſort of excommunication in uſe among the Hebrews. He that had incurred it was to withdraw himſelf from his relations, at leaſt to the diſtance of four cubits: it commonly continued a month. If it was not taken off in that time, it might be prolonged for ſixty, or even ninety, days. But if, within this term, the excommunicated perſon did not give ſatisfaction, he fell into the *cherem*, which was a ſecond ſort of excommunication; and thence into the third ſort called *ſcammatha*, the moſt terrible of all. *Calmet* Dict. Bibl. in voc.

NIDUS *avis*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the polypetalous, anomalous kind, and is compoſed of ſix diſſimilar leaves, the five upper of which are ſo diſpoſed, as, in ſome meaſure to reſemble an helmet; the lower one is headed, and bifid at the end. The cup finally becomes a ſeed veſſel, containing ſeeds of a very remarkable ſmallneſs, and appearing only as duſt. The roots are fibrous, and ſo interwoven together as to reſemble a bird's neſt.

There is only one known ſpecies of this genus, which is the plant called by many *orchis abortiva fuſca*, the brown, abortive orchis. *Tourn.* Inſt. p. 137.

NIEKE *corondi*, in the language of the Ceyloneſe, the name of a ſpecies of cinnamon. The tree which produces it reſembles the *nieke*, another tree very common there. This is

a very bad kind of cinnamon, and has very little taſte or ſmell. It is very ſeldom ſold as cinnamon, but is much in eſteem among the natives for its medicinal virtues. They obtain a water, and an oil from it, by roaſting, which they anoint themſelves with, to preſerve them from noxious fumes, and infections of any kind; and uſe the expreſſed juice of the leaves to cool the head, and ſtrengthen the brain, rubbing it on externally. Phil. Tranſ. N° 409.

NIGELLA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, conſiſting of ſeveral petals arranged in a circular form, and ornamented with a ſort of corolla between theſe and the ſtamina, made up of a ſort of horn-like bodies. The piſtil ariſes from the center of the flower, and finally becomes a membranaceous fruit, of a roundiſh, or oblong, form, and often divided into ſeveral parts.

The ſpecies of *nigella* enumerated by Mr. Tournefort are theſe: 1. The horned, field *nigella*, called by many authors *melanthium*. 2. The horned, field *nigella*, with blue double flowers. 3. The horned, field *nigella*, with white flowers. 4. The broad-leaved *nigella*, with large, ſingle, blue flowers. 5. The narrow-leaved *nigella*, with large, ſingle, blue flowers. 6. The narrow-leaved *nigella*, with large, ſingle, white flowers. 7. The great, double, blue-flowered *nigella*. 8. The *nigella* with ſmall, ſingle, white flowers. 9. The *nigella* with ſmall, double, white flowers. 10. The Cretic *nigella*. 11. The broad-leaved, ſweet-ſcented, Cretic *nigella*. And, 12. The *nigella* with ſingle, pale, red flowers. *Tourn.* Inſt. p. 258.

We have ſeveral ſpecies of this plant propagated in the gardens about London: they are all raiſed by ſowing the ſeeds in the ſpring, on a bed of light earth, where they are to remain; and, when they come up, they are to be thinned to proper diſtances, and kept clear from weeds. *Miller*'s Gard. Dict.

NIGHT (*Cycl.*) — NIGHT *angling*, a method of catching large and ſhy fiſh in the night. Trout, and many other of the better ſorts of fiſh, are naturally ſhy, and fearful; they therefore prey in the night, as the ſecureſt time.

The method of taking them on this plan is thus: the tackle muſt be ſtrong, and need not be ſo fine as for day-fiſhing, when every thing is ſeen; the hook muſt be baited with a large earthworm, or a black ſnail, and thrown out into the river; there muſt be no lead to the line, ſo that the bait may not ſink, but be kept drawling along, upon, or near, the ſurface.

Whatever trout is near the place will be brought thither by the noiſe, and motion of the water, and will ſeize the worm, or ſnail. The angler will be alarmed by the noiſe which the fiſh makes in riſing, and is to give him line, and time to ſwallow the hook; then a ſlight twitch ſecures him. The beſt and largeſt trouts are found to bite thus in the night, and they riſe moſtly in the ſtill and clear deeps, not in the ſhallow ſwift currents. Sometimes though there are fiſh about the place, they will not riſe at the bait; in this caſe, the angler muſt put on ſome lead to his line, and ſink it to the bottom. Dict. Ruſt. in voc.

NIGHT-*ſhade*, in botany. See SOLANUM.

NIGHT-*walkers*. See NOCTAMBULATIO, and NOCTAMBULI.

NIGHTINGALE, *philomela*, in zoology. See PHILOMELA.

Virginian NIGHTINGALE, in zoology, the common, but improper, name of a bird of the groſs-beaked kind, called by authors the *coccothrauſtes Indica criſtata*.

It is a little ſmaller than our blackbird; it has a black ring ſurrounding the eyes, and noſtrils; the beak is very large and thick, but not altogether ſo large as in the common groſs-beak; and its head is ornamented with a very high, and beautiful creſt, which it moves about very frequently. It is all over of a very fine, and lively red, but paler on the head and tail than elſewhere. It is brought to us from Virginia, and is much valued in England, for its beauty, and delicate manner of ſinging. It is very fond of almonds, and the like fruits. *Ray*'s Ornithol. p. 179.

NIGRITIES *oſſium*, among the antients. See CARIES.

NIL, in botany, a name given by the Arabians to two very different ſeeds, which are often, by this means, miſtaken in their writings, one for the other. Aviſenna tells us firſt that *nil* is the ſeed of a creeping plant, of the bindweed kind, and that this plant had blue flowers, like the campanulas, or bell-flowers. But, in another place, he tells us that *nil* is the name of a plant uſed in dying, which ſeems to be the ſame with our *iſatis*, or woad. They ſometimes call this plant, and ſometimes the paint prepared from it, by the name *nil*. The old interpreters of Dioſcorides into the Arabic have every where tranſlated the word *iſatis*, or woad, by the word *nil*, or the vegetable of which *nil* was made. The interpreters of the Arabians have been all miſled into errors by the double ſenſe of the word *nil*, and have too often tranſlated what is ſaid of the *nil*, as a dye, or paint, to belong to the ſeed; and what is ſaid of the ſeed by authors, is, by them, interpreted ſo as to be expreſſed of the *iſatis*.

Aviſenna uſes the word *uſme*, as a name of the leaf of *nil*: this is to be always underſtood as meaning that *nil* which is uſed in dying; and, after this, he has a ſelect chapter on the *iſatis*, under this name *nil*. It is probable that the convolvulus, or bindweed, called *nil*, obtained this name only from its flowers being of the ſame colour with the fine blue pigment obtained from the other *nil*, or woad.

NILACUNDI, in natural hiſtory, a name given to a ſtone of the gem kind, which is half a ſapphire, and half a ruby. See SAPPHIRE, and RUBY.

The word *nilaa* is the Indian name for the ſapphire, derived from the word *nil*, the name of indigo, and given to this gem becauſe of its fine blue colour, which approached to the tinge of that pigment. The latter part of the word is not eaſily accounted for, without making a little variation in the ſpelling, but, with that, is very clear and eaſy. *Jacut*, or *jacuti*, and, as ſome ſpeak it, *jacuhti*, is the name given by the Indians to the ruby, and it is only ſuppoſing the word to be properly *nilajacuti*, and it expreſſes in their own language, exactly what we underſtand by it, a ſtone, part ſapphire, and part ruby.

NILAHUMATU, in botany, a name given by ſeveral authors to the ſmooth fruited *ſtramonium* of Malabar. See the article STRAMONIUM.

NILIACUM *mel*, a name by which the antients expreſſed the very fineſt honey.

NILICANARAM, in botany, the name by which ſome authors call the tree whoſe fruit is the myrabolan uſed in medicine. Hort. Mal. Vol. 1. p. 69.

NILUFAR, in botany, a name given by the antient writers to the common *water-lilly*. They diſtinguiſhed this plant by that name from the Indian *nymphæa*, whoſe root was of a cold and ſoporific virtue, like that of the mandrake. This they call always *nenufar*. The word *nilufar* afterwards gave riſe to another name *linufar*: this was only formed of the ſame letters a little tranſpoſed, and was uſed to expreſs all the kinds of the *water-lilly*. The Greeks borrowed the word *nilufar* of the Arabians, and, at firſt, wrote it *nilafaran*, but afterwards it became contracted into *noufaran*, and ſo it ſtands, at this time, in moſt of the works of the modern authors of that nation. Neophytus runs into great errors on this account, and confounds together the trifoliate lotus, with the lotus of Ægypt, the leaves of which are like thoſe of the *nymphæa*, or the *arum*.

Some writers have ſuppoſed the *and oſace* to be a kind of *nilufar*, and to have been deſcribed as ſuch by the antients, and others have thought the ſame of the *ſtratiotes*; but all this is without foundation. Theſe plants are wholly unlike both to the *nymphæa*, and to one another, and were never confounded, either together, or with that plant, except in the brain of ſuch authors.

NIMBUS, among the Romans, a ſcarf embroidered with gold, which women wore on their foreheads.

NIMBUS was likewiſe uſed for the money thrown among the people, upon any public occaſion. *Pitiſc.* Lex. Ant. in voc.

NINTIPOLONG, in zoology, the Ceylonneſe name of a ſpecies of ſerpent called alſo *ſerpens hypnoticus*. It is a very poiſonous ſpecies, and its bite brings on a ſleep upon the perſon, which terminates in death. It is of a deep, blackiſh brown, variegated with ſmall ſpecks of white. *Ray*'s Syn. Anim. p. 332.

NINZIN, in the materia medica, a name uſed by ſome authors for the famous Chineſe root, commonly called *ginſeng*. See GINSENG, *Cycl.*

NIPPERS, in the manege, are four teeth in the forepart of a horſe's mouth, two in the upper, and two in the lower jaw. A horſe puts them forth between the ſecond and third year. See TEETH.

NIPPERS is alſo an inſtrument in uſe among ſmiths, and farriers, being a kind of pincers, wherewith, in ſhoeing an horſe, they cut the nails before they rivet them. It is alſo uſed in taking off a ſhoe.

NIPPERS, in a ſhip, are ſmall ropes about a fathom, or two, long, with a little truck at one end, and ſometimes only a wale-knot. Their uſe is to help to hold off the cable from the main, or jeer capſtan, when the cable is ſo ſlimy, ſo wet, or ſo great, that they cannot ſtrain it to hold it off with their bare hands.

NIPPLES (*Cycl.*) — The *nipples* of women, in their firſt lying in, are frequently ſo ſmall, and ſunk into their breaſts, that the infant cannot get at them to ſuck its nouriſhment. The readieſt method in this caſe is to apply an infant ſomewhat older, and which can draw ſtronger; or, if this does not ſucceed, to let a woman who has been practiſed in the art, attempt to ſuck.

When theſe do not ſucceed, it is common to have recourſe to a glaſs pipe, and the poorer people in ſome places uſually make a tobacco pipe ſerve the turn. Others apply a ſmall cucurbite made of ivory in the form of a hat, which they ſuck ſtrongly in their mouth. The common ſucking-glaſs is alſo, when properly applied, of very ſignal ſervice. To do this, the ſmall hole at the ſide is to be ſtopped with wax, and the glaſs heated with warm water; or, by holding it before the fire, ſo as to rarify, and in part, expel the air. It is then to be applied to the *nipple*, which, in this caſe, will not only be pulled

out, but will discharge a large quantity of milk, so as to take down the inflammation and tumor in the breast. When the sucking power of the glass is grown weak, the hole at the side is to be opened, and the milk poured out; the glass is then to be heated again, and the hole being stopped again, is to be a second time applied, and so on, till the intention is fully answered. *Heister*'s Surgery, P. 2. p. 11.

NIPPLE-*wort*, in botany, &c. See LAMPSANA.

NIQUI, in zoology, the name of a fish of the cucullus kind, approaching to the figure of that species commonly called *draco*, and *araneus marinus*, and in English the *weever*. Its head is large and thick, and its mouth large and without teeth. The under jaw is longer than the upper, and the anterior part of the body is somewhat broad, and flatted; the hinder part, especially toward the tail, is rounded Its usual length is four or five inches; the eyes are small, but they are placed, like those of the crab, out of the head. It is covered with a mixt colour of brown, black, and yellow on the back and sides, and is white on the belly; it is spotted all over the head, back, and sides, with small black spots as big as poppy seeds. It is common about the American shores, and is eatable when the liver and gall are taken out, otherwise it is said to be poisonous. *Marggrave*'s Hist. Bras. See Tab. of Fishes, N° 49.

NIR, in the materia medica, a name given by the Arabian physicians to the pigment, or colour, made from the *isatis*, or woad. The word is derived from the Latin *nigrum*, black. The colour of this pigment is, indeed, not black, but a deep blue; but we find numerous instances of the Greeks and Latins, both using the proper appellatives of black for the same colour, a deep blue. We find Theophrastus calls the fine deep blue oriental sapphires black, μελανας, and Virgil expresses the deep blue of the violet by the word *nigra*. Many of the Arabians call this plant, and the pigment, or colour, made from it, by the name *nil*, but that is a less determinate name, as they call also the seed of a kind of bindweed with blue flowers by the same name. See NIL.

NISAN, a month of the Hebrews, answering to our March, and which sometimes takes from February, or April, according to the course of the moon. It was made the first month of the sacred year at the coming out of Egypt. *This month shall be unto you the beginning of months, it shall be the first month of the year to you.* Exod. xii. 2.

It was the seventh month of the civil year. Moses calls it *abib*. The name *nisan* is only since the time of Ezra, and the return from the captivity of Babylon. *Calmet* Dict. Bibl.

NISSOLIA, in botany, the name of a genus of plants, the characters of which are these: the flowers, and fruit, are the same with those of the lathyrus, but the leaves stand single, and the stalks have no claspers, or tendrils at their ends. There is only one known species of *nissolia*, which is the plant called by some the small, one-leaved *lathyrus*. *Tourn.* Inst. p. 656.

NISUS, in zoology, a name by which many authors call the *accipiter fringillarius*, or sparrow-hawk. *Ray*'s Ornithol p. 51. See the article FRINGILLARIUS *accipiter*.

NISUS is also a name used by some old naturalists for the *haliaëtus*, or *aquila marina*, called in English the *sea eagle*, or *osprey*. *Willughby*, Ornithol. p. 29.

NISUS is likewise a name given by the barbarous writers of the middle ages to *alabaster*.

NITEDULA, in zoology, the field mouse. See MUS.

NITIDUM *folium*, among botanists. See LEAF.

NITRE (*Chem.*) — NITRE is a salt found immersed in imperceptible particles, in earthy substances, as the particles of metals in their ores, and is discoverable in these bodies by an acrid and pungent taste, and a sensation of coldness with which it affects the tongue: sometimes also it is found native, and pure, in form of an efflorescence, or shapeless salt, either on its ore, or on old walls, and yields, after solution, hexaëdral prismatic crystals.

Many have been of opinion that *nitre* was, in part at least, an animal salt, and that where it was found on old walls, it was owing to the effluvia of animal bodies once inhabiting the place; but we find it now in vast quantities in several of the marly earths of the East-Indies, and some other places, which, however, though they abound with it, when they are in the naked cliffs, exposed to the air in a proper situation, yet when dug up from any depths in the earth, the same substances are not found to contain any of this salt.

This marly earth is frequent in China, Persia, and many parts of the east, and is chosen for working from places where it stands in barren cliffs, on hills facing the northern, or eastern winds. The manner of their separating *nitre* from this earth, is as follows; they dig large pits, which they coat over on the inside with a stiff and firm clay; this they fill half full of water, and into it throw the earth. When the water has stood some days to imbibe the salt, they draw it off into other pits, defended by slight walls on all but the north-east side. Here the sun exhaling the water, the salt which it had imbibed, affixes itself to the sides of the pit in small, brownish, white, hexaëdral, but very imperfect crystals, which are what we receive from the East-Indies, under the name of rough *nitre*.

This is the way the greatest quantity of this salt is made, but it is also procured from divers other materials, and by many other methods. In many of the eastern nations, the ruins of old buildings exposed to the north-east winds, and sheltered from rain, have their walls covered with efflorescences of a nitrous salt, which is usually thrown with the earth into the *nitre* pit. Earths moistened with the excrements of animals as the earths of pigeon-houses, and the like, all afford more or less *nitre*, and, in France, vast quantities are annually made from lime rubbish, and the ruins of old buildings.

By which ever of these methods *nitre* is procured, it is ever in all respects the same salt. Its crystals are of a hexaëdral prismatic form, terminated by hexaëdral pyramids. It dissolves in a moderate fire, and does not flame, unless a coal, or some other sulphureous body fall in. It requires near seven times its own weight of water to dissolve it perfectly. *Hill*'s Hist. of Foss. p. 393, 394, 395.

This salt gives the greatest of all proofs of the effects of synthetical, or recomposing chemistry. It is first separated, or analysed, in the following manner: take two pounds of refined saltpetre in fine powder; pour upon it one third of its weight of oil of vitriol, and distill it in a glass retort, in a strong sand heat, there will be produced a strong acid spirit of *nitre*, which cannot, by any experiment, be found to participate at all of the nature of the oil of vitriol used in its preparation. Then take a pound of fresh *nitre*, melt it in a crucible, and throw into it, at times, pieces of charcoal, till it will no longer keep in fusion with the same degree of fire; then encrease the fire, and melt it, and then pour it into a proper vessel; leave it to cool of itself. This is fixed *nitre*, and is an alkali: now dissolve this fixed *nitre* in water, and exactly saturate that water with the acid spirit of *nitre* before distilled, this compound liquor will, by standing, shoot into true and perfect crystals of *nitre*. And the experiment succeeds as well, if a solution of pot ashes, or any other fixed alkali, be used instead of that of fixed *nitre*. *Shaw*'s Lectures, p. 170.

Of all the salts which afford us those strong liquors commonly known by the name of the mineral dissolvents, salt petre, or *nitre*, is the only one which yields red vapours, or whose spirit rises in form of red vapours, as soon as it is separated by means of fire; but the reason of this fact has never been accounted for, till Mr. Hellot explained it to the Academy at Paris, in one of his memoirs.

Of the chemists who have before treated of it, some imagined that the redness of the vapours was owing to some part of the sulphureous substances which the salt had imbibed from the urine and dung of animals where it was formed; others that this colour was owing to particles of fire carried up with the vapours in their ascent. But these are weak conjectures, since, if the first were the case, the mixtures of sal armoniac with common salt of vitriol, ought to yield red vapours in distillation, which never is the case; and, if the latter be supposed, it is not easy to say, why oil of vitriol does not arise in the same coloured vapours; since it requires a more violent, and longer continued fire to raise it.

Vitriol is added to *nitre* in the distillations which yield these red vapours, and it is the first point to be determined in the investigating this phænomenon, whether the vapours owe their colour truly to the *nitre*, or whether they borrow it from the additional vitriol. Baldwin, Stahl, and many others are of opinion indeed, that the red vapours are owing to the vitriol, and essential to it, and call them the *anima nitri*; and they prove the assertion by the known observation that *nitre* melted with a tender white glass, turns it to purple, or some shade of red; whereas neither alum, common salt, nor the fixed alkalis give this colour; and it is probably some portion of an ammoniacal urinous salt, mixed in the *nitre* which gives the colour, since sal armoniac will give the same colour when fused with glass. What is it, however, in the sal armoniac which has this effect? not its volatile alkali, for that is dissipated in the mixture by the first efforts of the fire; neither can it be the acid spirit of sea salt, since experiment proves that it can have no such effect, when employed alone.

A little crocus martis, or any calx of iron, does the same thing to glass, and sometimes even the smoak of the furnace will do it, when woods of too resinous a kind are employed as fuel; many a large quantity of what was meant for pure crystalline glass having been tinged red, or purple, in this manner, and wholly spoiled; and all that we can judge on the whole, as to *nitre*, or sal armoniac tinging them, is, that it is a fatty, or unctuous matter in those salts which produces the colour: and, in all probability, *nitre* contains, beside a quantity of an urinous, or ammoniacal salt, a small quantity of a ferrugineous matter, in extremely minute and imperceptible particles.

Mr. Lemery has proved that all the salt petre made in Europe has been originally an ammoniacal salt; and, indeed, if *nitre* be rubbed for a considerable time in a glass mortar made warm, with a quantity of a fixed alkali salt, it will afford an urinous smell. It is not easy to prove that all sal armoniac contains ferrugineous matter; but when we consider

ſider that iron is always found in the aſhes of vegetables, and that it, therefore, evidently aſcends in extremely minute particles, with the juices of plants; and that ſal armoniac is prepared from a ſoot made of the excrements of thoſe animals which feed on plants, we ſhall find it no impoſſibility that iron ſhould be there; and we well know that iron, in any ſtate, cannot but give that colour to glaſs, which *nitre*, in a ſmaller quantity, and ſal armoniac, in a larger, are able alſo to give. Memoirs Acad. Scienc. Paris. 1736.

All obſervations and experiments would ſeem to prove that the red colour given to glaſs by *nitre*, can only be owing to ferrugineous, or ammoniacal matter contained in it; and it is no very raſh conjecture, to ſuppoſe that the ammoniacal matter contained in the ſalt-petre, rarifying, and extremely dividing the ferrugineous matter, during the time of the diſtillation, may diſtribute them in their diſjunct moleculæ, to all that matter, or thoſe particles, which form thoſe vapours, and tinge them red by its diſtribution of them.

It is to be obſerved, however, that the vapour of ſpirit of *nitre*, or of aqua fortis, are not always red, but only are ſo when the fire is great enough to raiſe with the vapours the matter which colours them; for if ſpirit of *nitre* be made with the addition of alum calcined, with dry ſalt-petre, and with filings of zink mixed together, there will be obtained with a ſmall degree of fire, a ſpirit of *nitre*, which does not come over in red fumes.

If the fire be raiſed to a greater degree of violence, there will afterwards be obtained a ſecond ſpirit of *nitre*, which will come over in red fumes; but the firſt of theſe will ſhew the great experiment of taking fire on mixture with oil of turpentine, or the European oils of vegetables, better and more readily than the other.

It is therefore no eſſential character of ſpirit of *nitre* to riſe in red vapours, ſince the firſt riſes without; and this is truly the pure ſpirit of *nitre*; while the ſecond, which riſes in red fumes, is impure, being coloured by ferrugineous, or other foreign matter raiſed in vapour with the reſt, by the great violence of the heat.

It is obſervable, that if vitriol calcined to a redneſs be uſed with the *nitre*, for drawing the ſpirit, the vapours riſe of a perfect blood red. In the common way of diſtilling what is called ſimply ſpirit of *nitre*, the cuſtom is to put into the retort with the ſalt-petre, a very large quantity of a vitriolic earth; and in the making that ſpirit called aqua fortis, green vitriol, or Engliſh copperas is mixed with the *nitre*. This is abundantly known to contain a great deal of iron. Here, therefore, is in each caſe a quantity of ferrugineous matter added; and we well know that this can give a red colour to the vapours, with which it is by violence of fire compelled to riſe. Repeated trials of ſpirit of *nitre*, with mercurial preparations alſo, prove beyond contradiction, that there is ferrugineous matter in that ſpirit. Many of the common mercurial precipitates, when made with aqua fortis, or with plain ſpirit of *nitre*, may have abſolute plain iron ſeparated from them; and the chemiſts know well that this is not to be ſuppoſed to have been lodged in the mercury, ſince it is very difficult to conceive how that metal ſhould become amalgamated with it; but there can be no difficulty of ſuppoſing it ſeparated from the menſtruum, ſince it is evident that there is iron contained in the matters uſed in the diſtillation of it, and even in the ſalt itſelf from which it is originally drawn.

It would be very natural to ſuppoſe that the ferrugineous matter was raiſed only from the additions of pure vitriol or a vitriolic earth; but it is evident from the experiment of *nitre* alone turning glaſs red, that there is certainly alſo ferrugineous matter in that ſalt itſelf; nor is it at all difficult to conceive how iron comes to enter the body of that ſalt; ſince, if we conſider it as made in Europe, from the rubbiſh of old buildings, and the cleanſings of ſtables, &c. it is eaſy to conceive that pieces of iron of ſeveral kinds may have been ruſted away, and conſumed there, and ſo mixed among the matter from which the ſalt was afterwards made. The addition of wood aſhes always uſed alſo in the making it, may have lodged ferrugineous matter among it, ſince it has been often proved that the aſhes of all vegetables contain true iron. Memoirs Acad. Scienc. Par. 1736.

It may ſeem a difficult thing to conceive, however, in what manner ſo ſmall a quantity of iron as there can be ſuppoſed to be in *nitre*, is able to colour ſo large a body of vapours as are ſeen to riſe in the diſtillation. But if we conſider the extreme diviſibility of the particles of metals into colouring matter, and the vaſt quantity of water that a ſingle grain of copper is capable of tinging blue, when diſſolved in an alkali, we ſhall be the leſs ſurpriſed at it; eſpecially if it be conſidered alſo that it has been proved already that there is true ſal armoniac in all *nitre*, and it is well known that this ſalt is capable of rarifying, and extremely dividing the particles of that, or any other metal; and if as much ſal armoniac as can be diſſolved in aqua fortis be added to that ſpirit, it is well known alſo that it will make it ſend up vapours much redder than before, which can only be owing to the ſal armoniac raiſing a larger quantity than ordinary of the ferrugineous matter contained in the aqua fortis than would naturally have been raiſed from it.

The moſt ready way of reducing *nitre* to powder, is to diſſolve a quantity of it in as little water as may be, and evaporate the water over a gentle fire, continually ſtirring it till dry, by which means the *nitre* will be found in form of a very dry white powder. This is the method uſed by the gunpowder-makers. *Shaw's* Lectures, p. 389.

The curious, in the hiſtory of *nitre*, and its preparation from vegetables, &c. and the purifying it for gunpowder, and other uſes, may conſult the works of Glauber, Stahl, and Clark, on the ſubject of this ſalt, and compare them with the diſcourſe of the younger Lemery on the origin of *nitre*.

Purified NITRE. See NITRUM *purificatum*.

Spirit of NITRE. See SPIRITUS *nitri*

NITRIUM *ſal*, in natural hiſtory, a name given by many writers to the ſalt ſeparated from the water of the lake Natron in Ægypt, which is the *natrum*, or *nitre* of the antients.

This lake is ſituated in the Nitrian deſart, ſo called from *Nitria*, a very large town there. It is ſix or ſeven acres in extent, and lies about thirty miles weſt and by ſouth from Terana, and about the ſame diſtance north from the pyramids: from the bottom of this lake the ſalt called *natrum* ariſes to the ſurface of the water, and is there condenſed, by the heat of the ſun, into the hard and dry form in which it is ſold.

Four ounces of the water of the Natron being examined by evaporation in a glaſs veſſel, placed in a ſand heat, there will ariſe, as ſoon as it becomes warm, a ſort of ſcum to the top; this being taken off, another inſtantly ſucceeds, and ſo on, ſo long as any water remains in the glaſs.

This ſalt, thus ſcummed off, is the ſame in all reſpects with the *natrum*, or the Smyrna ſoap earth; being a fixed alkali, fermenting with acids, and boiling into ſoap with oil. This icy ſcum is the ſame as that called by Pliny *flos ſalis*, and ſeems to be the ſame with that which Herodotus ſays the Ægyptians made uſe of in the preparation of their mummies. It is ſaid that the water of this lake, though it contains ever ſo large a quantity of this ſalt, will not ferment with any acids, tho' the leaſt particle of the ſalt ſeparated either by a natural, or artificial heat, will ferment violently with any acid. What the heat of the ſand furnace does in this experiment, the heat of the ſun does in the lake itſelf; and the ſingular circumſtance of the water of the lake not fermenting with acids, is confirmed by this, that a clear ſolution of the ſalt in common water will not ferment with them.

The antients have attributed great virtues to the ſalt of this lake; and this being called *nitrum*, as a ſhort name for *nitrium ſal*, we have had ſome who have ſuppoſed the ſalt which we call *nitre*, to be the ſame, and theſe people have wondered that they did not find the ſame virtues in our *nitre*.

The mineral waters of all parts of the world ſeem to contain more or leſs of this ſalt, and to owe their virtues in a great degree to it; and, probably, it might be no ſmall improvement to phyſic, to bring it more into the preſent practice. Molenbroch recommends it greatly in the ſtone; and it may be the more probably uſed, as all alkali ſalts are known to be good in that diſtemper. Some add to this, that it ſeems qualified to diſſolve ſtony ſubſtances, it being of ſo piercing and penetrating a ſpirit, that no rock, or ſtone is found about the lake from the waters of which it is procured. Phil. Tranſ. N° 160.

NITRO AERIAL *ſpirit*, a term invented by Mayow, and ſince uſed by many others, to expreſs a very active principle in the air, cauſing great changes in the bodies abſorbing it and expoſed to it.

The acid ſpirit of nitre is produced partly by the air, and partly by a terreſtrial matter making up the reſt of the body of that ſalt. Mr. Boyle, in his experiments on flame and air, has abundantly proved this; and that igneous particles of the air reſide in nitre, is as certain a concluſion from the ſame principles: theſe conſtitute its moſt active part, and by theſe the flame of kindled nitre is produced.

The aërial particles of nitre are truly no other than the igneo-aërial matter of it, and this aërial matter is evidently lodged in the acid ſpirit of it, not in the fixed ſalt. This acid ſpirit is, according to Mayow, compoſed of a terrene matter, which is flexile and humid, and of etherial particles, which are rigid and dry, active and igneous, and proceeding from the air.

Theſe igneous particles are common to nitre and to air, and are therefore called *nitro-aërial*; and the ſpirit of nitre derives, according to this ſyſtem, from theſe particles its active and corroſive quality, which makes it a ſort of potential fire; and on this the form of nitre chiefly, if not only depends.

Now as this *nitro-aërial* or igneous ſpirit reſides in the acid ſpirit of nitre, it is thence inferred, that the *nitro-aërial* ſpirit is of a nitro-ſaline nature, obtaining rather the nature of an acid than a fixed ſalt; conſidering alſo, that the effects of fire in general anſwer to thoſe of a very ſubtle and corroſive ſalt. Fire in general, on theſe principles, is eaſily proved to depend principally upon the ſaid *nitro-aërial* principle put into motion.

This *nitro aërial* ſpirit makes the moſt active, and, indeed, the principal part of the ſalt which we call *nitre*. Its terreſtrial and acid parts make up the reſt of the maſs; and theſe are rather of uſe

uſe to form the whole into a body, and give it form and conſiſtence, than to add to any of its fat.

NITRUM, is uſed by the poet Martial to expreſs that ſort of foulneſs in cryſtal, which Pliny, and other of the antient Roman authors, diſtinguiſh by the name of *ſal*. See the article SAL.

NITRUM *antimoniatum*, in chemiſtry, the name of a ſalt procured by evaporating the filtrated waters uſed in making the *antimonium diaphoreticum* to a dryneſs, continually ſtirring them towards the end of the operation. There, at length, remains from theſe a white ſaline matter, of a particular taſte, not ungrateful, nor nitrous, but perfectly mild.

Hence we ſee that *nitre* is changed into a new ſalt by detonation with antimony.

This ſalt is gently aperitive, and, in denſe, inflammatory blood, excellently reſolves without violence. It ſucceſsfully promotes perſpiration, ſweat, and urine; hence it cools, and becomes greatly ſerviceable in the ſmall pox, meaſles, pleuriſy, and peripneumony. We ſee how erroneous has been the opinion of this water being noxious, and how valuable a medicine that opinion had led people for a long time to throw away.

NITRUM *calcarium*, in natural hiſtory, a name given by Dr. Liſter to a peculiar ſpecies of neutral ſalt, which he firſt publickly deſcribed in his book on the medicinal waters of England. He very improperly calls it *nitre*; becauſe it has none of the properties or qualities of *nitre*, but only a ſort of general reſemblance in its external form. He obſerves that this ſalt, tho' very little known, was abundantly the moſt copious of all the ſorts afforded by the mineral waters in general; and ſays its cryſtals were long and ſlender, and conſiſted of four ſides, and were terminated by a point compoſed of two triangular planes. He adds, that this ſalt doubtleſs had its origin from a mixture of the acid of ſulphur, and a calcarious earth of an alkaline nature.

This ſalt is found *in* almoſt all the mineral waters of Germany, and is very juſtly obſerved by Hoffman to be of the nature of Glauber's ſalt: that it is not *nitre* is evident from this, that it is not inflammable, nor will yield aqua fortis by diſtillation. It ſeems, indeed, true Glauber's ſalt, compoſed of the acid of vitriol, or ſulphur, for this is in both the ſame, and of that alkaline earth which is the baſis of ſea ſalt: this is its origin, in the veſſels of the chemiſt, as well as in the bowels of the earth, and probably the figure of the cryſtals of that obſerved by Dr. Liſter, was the ſame in the point, as well as in the body, both being quadrilateral columns terminated by pyramids compoſed of a number of triangular planes. *Hoffman* Opera, T. 5. p. 139.

This number in Glauber's ſalt is four, though Dr. Liſter obſerved only two in the ſalt he examined; but it is frequently ſeen in the factitious, or common Glauber's ſalt, which naturally has four planes in the pyramid, that two of them are ſo ſmall, as ſcarce to appear more than flat ſparks at the verge of the point; in almoſt all the cryſtals, one of the four is thus ſmall, ſo that they ſeem to conſiſt only of three, while the whole four are truly there. The ſame is the caſe frequently in the common rock cryſtal, whoſe pyramid ought to conſiſt of ſix planes, and, in truth, always does ſo, but one or more of them are frequently ſo ſmall, that a haſty obſerver would ſay it conſiſted only of four or of five planes.

If this may be allowed to be the caſe, in regard to Dr. Liſter's obſervation of his cryſtals, there ſeems no doubt but that his *nitrum calcarium* is true and genuine Glauber's ſalt, as much as that of the chemiſt's laboratory; and, according to his own juſt obſervation, it is compoſed of the very ſame principles with that chemical ſalt. The mineral waters of Egra abound with this ſalt, which Hoffman alſo has called, for that reaſon, *ſal Egranum*, when ſeparated from them by evaporation; but none contains ſo great a proportion of it as the Sedelitz waters, a pint of which, on evaporation, leaves two drams of it.

The medicinal waters in the neighbourhood of Paris contain it alſo in a very conſiderable quantity, though leſs than this. It is the opinion of Hoffman, that when any water before impregnated with a vitriolic acid, in its current under ground, paſſes over this calcarious earth, it as readily joins a part of it with it, as the vitriolic acid does with the ſea ſalt, or its baſis, in the making the common Glauber's ſalt, and thence produces a bitter purging ſalt, of the ſame nature with that; and, indeed, if the acid of ſulphur be mixed with any alkaline ſubſtance, a bitter neutral ſalt is produced, ſomewhat analogous to this, and to the Glauber's ſalt.

NITRUM *nitratum*, in chemiſtry, the name of a preparation of *nitre*, made by adding a ſufficient quantity of ſpirit of *nitre* to a lixivium of pure *nitre*, and afterwards evaporating it to a pellicle, and ſetting it by to ſhoot. The cryſtals formed by this liquor are perfectly nitrous in their figure, but they will be of an acid taſte

We ſee, by this, that it is poſſible to alter a ſalt, and to reduce it into the appearance of a different body, by means of ſubſtances before ſeparated from itſelf; and, in this caſe, the alteration is made, in almoſt any degree, at pleaſure; the ſalt produced being more or leſs acid, as more or leſs of the acid ſpirit is uſed: but it is to be obſerved, that the more acid there is uſed, the more difficultly the ſalt dries, and the more difficultly it is kept dry, it being always ſubject to run in the air. This preparation of *nitre* is a good medicine in burning fevers. *Boerhaave*'s Chem. Part 2. p. 176.

NITRUM *purificatum*, *purified nitre*, is thus prepared: take *nitre*, or common ſalt-petre, one pound; pure water three quarts and a pint; ſet them on the fire together, and diſſolve the ſalt perfectly by boiling: then ſtrain the hot lixivium through a double flannel, and ſet it over the fire again in an earthern veſſel. Evaporate it gently, till on taking out a little of the liquor in a ſpoon as it cools, there are ſeen threads as it were ſhooting in it; in this ſtate the ſalt is ready to concrete. Set it in a cool place, putting clean ſticks acroſs the veſſel, and the ſalt will form itſelf into extremely pure and beautiful cryſtals on the ſide of the veſſel, but principally on the ſticks. Theſe dried in a colander are fit for uſe.

This is the beſt of all the preparations of *nitre*, for medicinal uſe, in its native form. It diſſolves immediately on entering the body, where it wonderfully cools, and thins the blood, giving it a fine florid colour. In all inflammatory diſeaſes attended with condenſations of the blood, this ſalt proves excellently cooling and attenuating. It is given from four or five grains to ten, twelve, or fifteen at a doſe. Some give more at a time, but it is more adviſeable to have the doſes ſmaller, and oftener repeated. It is alſo good in the ſmall-pox, and ſuppreſſions of urine. It is alſo ſaid to be given by many in hæmorrhages with ſucceſs. If there be any caſe in which caution is required, it is in a conſumption where the lungs are ulcerated.

NITRUM *vegetans*, a name given by the chemiſts to a preparation of *nitre*, which very readily ſhoots out into beautiful cryſtallizations. If, in the making Glauber's ſpirit of *nitre*, there are uſed four parts of *nitre*, and one of oil of vitriol, and the ſpirit be entirely driven off, the white ſalt remaining dry in the retort, on being expoſed to the open air, will ſoon be covered with a thick and long down, as if it grew; but if this ſalt be diſſolved in water, and there ſtrained, and evaporated to a dryneſs, in a cylindrical glaſs, and kept expoſed to the open air, its upper ſurface will often appear covered with beautiful branching little plants, all which will diſſolve away upon the application of heat, and leave the ſurface even; but upon expoſing the veſſel again to the open air, in a quiet place, they will grow again as before, thus ſeveral times exhibiting the reſuſcitation of plants, as it were, from their own aſhes.

Some chemiſts have formed ſeveral fables upon ſome ſuch baſis as this; and, very probably, the whole ſecret of their operations was no more than a concealed fraud of this kind, this having nothing to do with vegetation.

NITRUM *vitriolatum*, a preparation of *nitre* made as follows: Diſſolve the maſs left in the retort after diſtillation of a ſpirit of *nitre*, in about eight times its weight of water; filtrate the ſolution, and, when perfectly clear, evaporate the liquor to ſuch a ſtandard, that the ſalt will no longer be ſuſtained in it; then ſet it in a cool place, and collect the ſalt as it ſhoots, laying it in an earthen colander to dry. This is of much the ſame virtues with *tartarum vitriolatum*, and is frequently ſold under its name. See TARTARUM *vitriolatum*.

NIVALIS *avis*, the *ſnow-bird*, a name given by authors to a bird common in Poland in the ſevereſt months of the winter, and at no other time. The country people call it *ſniegu'ka*, which ſignifies *ſnow-bird* alſo: it is obſerved to come with the ſnows, and go away again with them. The country people uſe to preſage the mildneſs, or the ſeverity of the ſucceeding winter from their flights in greater or in ſmaller numbers, or earlier, or later, in the ſeaſon.

NIURI, in botany, the name of a genus of plants, called by Linnæus *phyllanthus*. Hort. Mal. 10. 27. See the article PHYLLANTHUS.

NOAH's *ark ſhell*, in natural hiſtory, the name of a kind of ſea ſhell, which authors were always puzzled about referring to any genus, till a late French author has referred it to a new genus he has made under the title *cordiformis*, taking in the bucardia, and triangular heart-ſhells. The cabinets of the curious afford us three ſpecies of this ſhell; the common kind, a yellow and white kind, with broad irregular lines, and a variegated kind. Hiſt. Nat. Eclair. p. 333.

Mathiolus and Rondeletius have called the *noah's ark ſhell*, *rhomboides*, and *muſculus ſtriatus*; and Liſter, who has followed theſe authors, has placed it among the muſcles. Rumphius has placed it among the pectens, and ſome have made it a ſpecies of oyſter. The impropriety of its arrangement under any of theſe genera is very obvious from the characters of each. It is indeed of a ſomewhat different figure from the generality of heart-ſhells, as it is from all the other ſhells in the world, but it agrees with them in its general character, for it is deeply ſtriated, as they all are; and it is of a figure, in ſome meaſure, reſembling that of a heart, though running out into an irregular length at the point.

We have another ſhell of this genus which no one ever doubted to belong to it, which yet is of an oblong figure, and ſo much reſembles the *Noah's ark*, as to plainly ſhew they ought both to be reckoned ſpecies of the ſame genus. This is the oblong bucardium, or ox heart ſhell, commonly called the *baſtard Noah's ark*.

NOCERIANA *terra*, *earth of Nocera*, in the materia medica, a white

white earth uſed in medicine in Germany, Italy, and ſome other parts of the world, but not known in the Engliſh ſhops. It is now dug principally about Macerata, a city in the marquiſate of Ancona, in the pope's territories, and is in great eſteem in malignant fevers, and againſt the bites of venomous animals.

It is a denſe earth, of a greyiſh white, very hard, and of an inſipid taſte, and does not effervеſce with acid menſtruums. *Hill*'s Hiſt. of Foſſ. p. 3.

NOCTAMBULATIO, *walking in the ſleep*. This is a very remarkable diſtemperature of the imagination, and, in different perſons, differs greatly in degree. Thoſe who are but moderately affected with it, only repeat their actions of the day, and getting out of the bed, go quietly to the places they frequent at other times; but thoſe who are afflicted with it in the moſt violent degree, go up to dangerous places, and do things that would terrify them to think of, when awake: theſe are by ſome called lunatic *night-walkers*, becauſe fits are obſerved to return with moſt frequency, and violence, at the changes of the moon.

Cauſes of it. The only material cauſe that can be aſſigned in this caſe, is a plethora, or over-fullneſs of blood, but this is influenced by an immaterial one, that is, by the fancy, which is buſily employed in dreams about particular objects.

Method of cure. The primæ viæ are firſt to be cleared of all their foulneſſes by a ſtrong purge; after this it is proper to bleed in the foot, taking away eight or ten ounces; then powders compoſed of nitre, cinnabar, and crab's eyes, ſhould be taken three or four times a day, and particular regard ſhould be had to the changes of the moon. It will be proper to ſet a veſſel of water by the bed-ſide, in ſuch a manner that the perſon will naturally ſtep into it on getting out, and be awaked by that means; and if theſe things fail, a perſon ſhould be ſet up to watch him, and beat him, every time it happens. *Junker*'s Conſp. Med. p. 698.

NOCTIBO, in zoology, the name given by the Portugueſe to a ſmall Braſilian bird, a ſpecies of the *goat-ſucker*, or *churn-owl*, more known among naturaliſts by its Braſilian name *ibijau*. *Marggr*. Hiſt. Braſil. See the article IBIJAU.

NOCTUA *aurita*, in zoology, a name by which ſome have called the ſmaller ſpecies of the *horn owl*, more uſually diſtinguiſhed by the name *otus*. *Ray*'s Ornithol. p. 63. See the article OTUS.

NOCTUA *canora*, in zoology, a name given by Nieremberg to a bird of the Spaniſh Weſt-Indies, called by the natives *chicantli*, and ſometimes kept by the Spaniards in cages. See CHICANTLI.

NOCTUA *minor*, in zoology, the name given by Mr. Ray to the *keutzlin*, or, as others call it, the *ſchaffilt*, a very beautiful little bird of the owl kind, and not exceeding the ſize of the common thruſh. *Ray*'s Ornithol. p. 69. See SCHAFFILT.

NOCTUINI *oculi*, a name given by ſome to grey eyes, from their reſembling thoſe of the *noctua*, or *owl*.

NOCTUOLENT, among botaniſts, a name given to ſuch plants as ſmell ſtrongeſt in the night time. See DOG-*roſe*.

NODULUS, a word uſed in pharmacy for a knot tied in a rag, and including ſome medicinal ingredients to be ſuſpended in any liquor. See NODULE, *Cycl*.

NOERA, a word uſed by ſome chemiſts for the head of an alembick, or the cover of a cucurbit, or any other veſſel uſed in diſtillation. *Caſtell*. Lex. in voc.

NOFESCH, in natural hiſtory, a word of Hebrew origin, uſed as the name of a precious ſtone. There has been much diſpute among the commentators on the old teſtament, what ſtone it was. It ſeems derived from the root *ſuch*, which ſignifies the ruby, or carbuncle, and, as a derivative of that word, it muſt be ſuppoſed to expreſs a red ſtone, not one of any other colour. As the ruby is ſignified by *ſuch*, this cannot mean the ſame ſtone, and therefore probably meant the garnet, they having no other name, that we known of, for that ſtone, and it being very like the ruby.

NOCHETZLINOPALLI, or NOCHEZNOPATLI, in botany, a name by which ſome authors have called the *opuntia*, on which the cochineal inſect loves to feed. *Jonſ*. Dend. p. 56. See OPUNTIA.

NOISETIER, in botany, the name by which the French call the ſeveral ſpecies of hazel, and filbert-trees. See HAZEL.

NOLA, in botany, a name uſed by ſome authors for the *anemone*. *Ger*. Emac. Ind. 2.

NOME (*Cycl*.) — NOME, Νομη, in medical writers, is uſed for an eating, or corroding ulcer, and is much the ſame with *phagedæna*. See PHAGEDÆNA, *Cycl*.

The word is Greek νομη: it occurs in Galen. Some later writers, as Foreſtus, call it *ulcus obambulans*, and *obambulativum*. *Caſtellus*.

NOME, among the antient Egyptians, a diviſion, or province, into which the whole kingdom was divided. The origin of the *nomes*, according to Diodorus Siculus, was this: the inhabitants being refractory, and much inclined to inſurrections, in order to prevent theſe, the kings divided the whole country into different provinces, or *nomes*, and eſtabliſhed the worſhip of ſome particular animal in each of them, prohibiting at the ſame time ſuch animal to be eaten within the bounds where it was worſhipped.

Hence, as every province was intoxicated with its own particular form, and object of worſhip; it entertained the higheſt contempt for that of its neighbours, and took a pleaſure in profaning the animal, which among them had divine honours paid it. This religious oppoſition had the deſired effect; for, all mutual confidence being thereby cut off, there were no more inſurrections againſt the government. Mem. Acad. Inſcrip. Vol. 13. p. 52.

NOME is alſo uſed for a kind of ſong, or hymn, in honour of the gods, ſaid to have been invented by Terpander. For a further deſcription of which, ſee Mem. Acad. Inſcrip. Vol. 14. p. 342, ſeq.

NOMENCLATORES, (*Cycl*.) among the botanical authors, are thoſe who have employed their labours about ſettling and adjuſting the right names, ſynonyms, and etymologies of names, in regard to the whole vegetable world. *Linnæi* Fund. Bot. p. 2.

NOMOPHYLACES, Νομοφυλακες, among the Athenians, magiſtrates who were to ſee the laws executed, being not unlike to our ſheriffs. They had the execution of criminals committed to their care, as alſo the charge of ſuch as were confined priſoners. They had alſo power to ſeize thieves, kidnappers, and highwaymen, upon ſuſpicion; and, if they confeſſed the fact, to put them to death; if not, they were obliged to proſecute them in a judicial way. *Potter*, Archæol. Græc. T. 1. p. 78.

NOMOPHYLACES were likewiſe officers belonging to the Olympic games, whoſe buſineſs it was to inſtruct thoſe who were to contend, in all the laws of the games. See HELLENODICÆ.

NOMOTHETÆ, Νομοθεται, among the Athenians, were a thouſand in number, and choſen by lot out of ſuch as had been judges in the court *Heliæa*. Their office was not (as their name ſeems to imply) to enact new laws by their own authority, for that could not be done without the approbation of the ſenate, and the people's ratification; but to inſpect the old, and, if they found any of them uſeleſs, or prejudicial, as the ſtate of affairs then ſtood, or contradictory to others, they cauſed them to be abrogated by an act of the people. Beſide this, they were to take care that no man ſhould plough, or dig deep ditches within the Pelaſgian wall; to apprehend the offenders, and ſend them to the archon. *Potter*, Archæol. Græc. l. 1. c. 13. T. 1. p. 79.

NON (*Cycl*.) — NON *aſſumpſit*, in law, a plea in perſonal actions, whereby a man denies any promiſe made, &c.

NON *diſtringendo*, a writ not to diſtrain, uſed in divers caſes. *Blount*, *Cowel*.

NON *implacitando aliquem de libero tenemento ſine brevi*, a writ to prohibit bailiffs, &c. from diſtraining any man touching his freedom, without the king's writ. Reg. Orig. 171. *Blount*, *Cowel*.

NON *intromittendo quando breve præcipe in capite ſubdole impetratur*, a writ directed to the juſtices of the bench, or in eyre, commanding them not to give one that had, under colour of intitling the king to land, &c. as holding of him *in capite*, deceitfully obtained the writ called *præcipe in capite*, any benefit thereof, but to put him to this writ of right. Reg. Orig. 4. This writ having dependance on the *court of wards*, ſince taken away, is now diſuſed. *Blount*, *Cowel*.

NON *merchandizando victualia*, a writ to juſtices of aſſize to enquire whether the magiſtrates of ſuch a town do ſell victuals in groſs, or by retail, during the time of their being in office, which is contrary to an antient ſtatute, and to puniſh them if they do. Reg. Orig. 184. *Blount*, *Cowel*.

NON-*ſi iſſum*, in the antient muſic. See APYCNON.

NON-*ſuch clay*, a particular ſort of earth, which, mixed with another clay brought from Worceſterſhire, makes a compoſition very uſeful for the making the melting-pots uſed in the green glaſs making. *Neri*'s Art of Glaſs, p. 246.

NONUPLA, in the Italian muſic, denotes a quick time, peculiar to jigs. This ſpecies of time is otherwiſe called *the meaſure of nine times*, which requires two falls of the hand, and one riſe. There are three ſorts of *nonupla*. 1. *Nonupla di ſemi-minime*, or *dupla ſeſqui quarta*, thus marked $\frac{9}{4}$, where nine crochets are to be in the bar, of which four make a ſemibreve in common time, i. e. in the down ſtroke, ſix, and but three up; it is uſually beat *adagio*. 2. *Nonupla di crome*, or *ſeſqui ottava*, marked thus $\frac{9}{8}$, wherein nine quavers make a bar, inſtead of eight in common time, i. e. ſix down, and three up: 'tis beat *preſto*. 3. *Nonupla di ſemi-crome*, or *ſuper ſetti partiente nona*, thus diſtinguiſhed $\frac{9}{16}$, in which nine ſemi-quavers are contained in a bar, whereof ſixteen are required in common time, ſix down, and three up: 'tis ordinarily beat *preſtiſſimo*. See ADAGIO, PRESTO, and PRESTISSIMO.

Beſide theſe, there are two other ſpecies of *nonupla*, for which ſee TRIPLE, *Cycl*.

NOOZE, a name given by ſportſmen to a ſort of horſe-hair ſpringe made to take woodcocks, and very ſucceſsful, when the proper precautions are taken. The *nooze* is made of ſeveral long and ſtrong hairs twiſted together, with a running *nooze*

at

at one end, and a large knot at the other, which is to be paſſed through the ſlit of a cleft ſtick, to prevent the *nooze* from being pulled away when the bird is caught in it.

The ſportſman, when he knows his buſineſs, does not ſtay to watch theſe ſnares, but ſets them in the morning, and returns again to them at four in the afternoon, when he ſeldom fails of meeting with a ſufficient number taken. The ſticks are to be about the bigneſs of a man's little finger, and are to be made ſharp at one end, that they may fix the better in the ground: to each of theſe is to be fixed one *nooze*. The ſportſman is to take out with him ſeveral dozens of theſe bundled up together, and going into the coppice woods where there lie many leaves upon the ground, he is to ſearch among theſe for the marks of woodcocks frequenting the place; if there come any there, it will be ſoon found out by the leaves, which are ſpread about from ſide to ſide by thoſe birds, in ſearching under them for worms. Their dung alſo, which is of a dark grey colour, being found about the place, is a proof of their frequenting it.

When the place is thus pitched upon, the ſportſman is to take a large circle at ſome diſtance from it, on each ſide, in the way where the woodcocks are ſuppoſed to come to the place; he is here to plant a ſmall hedge row of furze, or other buſhes, of a conſiderable extent, and pretty thick, leaving gaps in it here and there. The woodcocks, in making up to their place of feeding, when they come to this hedge, will run along by the ſide of it, till they come to one of the gaps, and then go through, for they hate to take wing, and will run, at any time, a long way under a hedge, rather than fly over it. On this depends the ſucceſs of the ſport.

The *noozes* are to be fixed one in each of theſe gaps thro' which it is known the woodcocks will paſs; the ſtick to which it is faſtened is to be ſtuck firmly in the ground, and the *nooze* to be ſpread wide open on the ground, leaving only ſome dry leaves to ſupport it. The whole gap being occupied by this *nooze*, the woodcock, when he comes, cannot eaſily eſcape being taken by the legs in it, and when once caught he will lie till the ſportſman comes. While a ſportſman is walking about a wood in this view, it is very common for him to find ſpringes, or *noozes*, of horſe-hair, fixed at ſix inches high, in ſeveral places. This may be looked on as a proof that there are partridges in the wood, and theſe are the means uſed by the country people to take them. The woodcocks, though in the day they lie in woods, yet, in the night, they go out, and frequent rivers and brooks, and, in the froſty nights, ſuch ſprings as do not freeze are particularly reſorted to by them.

The ſportſman, when he has ſet his *noozes* in the woods for the day-time, ſhould retire to the watery places near them, and ſearch for the marks of theſe birds coming to them by their dung, and other tokens. As ſoon as a place is found which they frequent, there muſt be a ſmall hedge row built there alſo in the ſame manner as in the woods; and in the gaps, which are to be made at the diſtance of about ſix foot one from another, there are to be placed either the ſame ſort of *noozes* as thoſe in the woods, or the ſpringes made with hazel boughs, and the horſe-hair tied to a packthread. In either caſe, there is no doubt of ſucceſs, for the birds which have once frequented a place, will come to it every night, as long as they remain any where near it; but particularly, if there be any ſpring near a wood, the water not freezing when other waters are iced over, will be ſure to bring the woodcocks together at it, and *noozes* planted properly about this place, will ſeldom fail of ſucceſs. If they have been left a night or two without ſucceſs, the ſportſman is not to deſpair; for though there ſhould happen to be no woodcocks there when they are firſt ſet, theſe birds change place ſo often, that it need not be doubted but ſo proper a rendezvous will be ſoon reſorted to by them.

NOPE, in zoology, an Engliſh name uſed by ſome for the *bull-finch*. See BULL-*finch*.

NORA, a word uſed by ſome of the chemical writers for *lime*, by others for *nitre*, and by others for all ſalts in general, as the word *ſal*.

NORTH (*Cycl.*) — NORTH-*weſt paſſage*. A *north-weſt paſſage* by Hudſon's bay, into the pacific ocean has been more than once attempted of late years, but, hitherto, without ſucceſs. Some greatly doubt of the practicableneſs of ſuch an enterprize, and think the obſervations made by the Ruſſians give us ſmall hopes. But, as they have not yet publiſhed the particulars of their diſcoveries, little can be ſaid about them. Some general things may be ſeen in the Phil. Tranſ. N° 482. Sect. 14. It appears from thence, that the Ruſſians have paſſed between the land of Nova Zembla, and the coaſt of Aſia, and, as the Dutch did formerly diſcover the northern coaſts of Nova Zembla, we may now be well aſſured, that that country is really an iſland.

NOSE (*Cycl.*) — *Bleeding at the* NOSE. An hæmorrhage of the *noſe* is an uſual remedy of nature to relieve herſelf, in caſes of a plethora, and a difficult circulation. It is often wholly ſalutary, and comes on, in ſuch caſes, leiſurely; proceeds without violence, and ſtops at a proper time. But it is ſometimes to be looked on as a diſeaſe coming on haſtily, continuing with violence, and bringing on very bad ſymptoms. Bleedings at the *noſe*, in acute diſeaſes, are ſometimes critical, happening on the days of the criſes, and theſe are uſually copious: ſometimes they are merely ſymptomatic, happening at indeterminate and uncertain times; ſuch are the bleedings from this part in the ſmall-pox, and in petechial fevers: the firſt are ſalutary, theſe rather of bad conſequence.

The lighter hæmorrhages of the *noſe* are often preceded by no ſymptoms, but break out placidly, and go off in the ſame manner. The more violent ones are uſually preceded by a congeſtion of blood about the head, a redneſs of the cheeks, an inflation of the face, a turgeſcence of the veſſels of the temples, and the neck, a noiſe and ringing in the ears, a heavineſs of the eyes, and often a ſparkling of light in them; a vertiginous diſorder of the head, a binding of the bowels, a thinneſs and diminution of quantity of urine, tenſions in the hypochondria, a ſuppreſſion of cuſtomary ſweats, and a coldneſs of the lower parts.

Perſons ſubject to it. Theſe are young people, principally thoſe between the age of fourteen, and one and twenty; and thoſe of plethoric habits. Women are leſs ſubject to them than men. Scorbutic habits uſually throw people into bleedings at the *noſe*; which is not wonderful, ſince the ſcurvy principally owes its riſe to a plethora. Theſe bleedings are brought on by violent emotions either of the mind, or body, by blows on the part, by a too copious uſe of wine, or hot foods, and ſpicey things; by great heat of the weather, or of the room where a perſon remains ſome time; and ſometimes by much lighter cauſes, as barely the waſhing the face, or bending the head too much toward the earth.

Prognoſtics. It is commonly known, that moderate bleedings at the *noſe* relieve people in heavineſſes of the head, and pains and numbneſs in the limbs, and occaſion a more chearful turn of mind. But when this diſcharge is injudiciouſly treated, or raſhly ſtopped by aſtringents, there often ſucceed violent fullneſs and inflations of the veſſels of the head, and dangerous inflammations of the eyes, and other parts. Too frequent bleedings at the *noſe* in young perſons ſometimes preſage conſumptions, for the congeſtions which occaſioned them turning upon the breaſt as the perſon grows up, occaſion ſpitting of blood, and finally a phthiſis. A critical bleeding at the *noſe*, if ſufficient in quantity, often happily carries off a fever. In petechial fevers, ſymptomatic hæmorrhages at the *noſe* are very bad ſymptoms; and, in the ſmall-pox dangerous, though leſs fatal than in this diſeaſe. An habitual hæmorrhage from the *noſe* in grown perſons, is often a ſymptom of ſome diſtemperature in the abdominal viſcera; and, in old people, they often preſage apoplexies, and vertigoes; for when there is a conſtant congeſtion of blood about the head, and this accuſtomed diſcharge is any way impeded, it is often ſeen that theſe diſeaſes are the effect.

Method of treatment. In all bleeding at the *noſe*, if the blood flows moderately, if it ſhews by its fluid ſtate, that it reſults from a plethora; if it is not too great for the age and ſtate of the patient, and if it be habitual, and uſe to be attended with good conſequences, nothing is to be done to impede or ſtop it. But if they be violent, and return often, or if the quantity of blood diſcharged be too great for the ſtrength of the patient to bear, and they are uſually attended with bad conſequences, then the aſſiſtance of medicine is neceſſary. Nitre, mother of pearl, cinnabar are to be given in powder, and decoctions of daiſy roots, comfrey, and poppy flowers in large draughts, with jellies of hartſhorn and ivory; and, if neceſſary, ſome gentle opiate, and a proper diet muſt be preſcribed; the abſtaining from ſpirituous liquors, and high-ſeaſoned foods being abſolutely neceſſary, and the keeping out of great heats, and avoiding violent paſſions, being equally neceſſary. Bleeding and purging are proper after the fit is over, to prevent a return; and to theſe may be added warm baths for the feet, and the common diaphoretics. *Junck.* Conſp. Med. p. 20.

Fracture of the NOSE. In the *noſe* both bone and cartilage are ſubject to fractures, which happen ſometimes on either ſide, and ſometimes in the middle from blows or falls; if either of the bones in the front of the *noſe* are fractured, it produces a flatneſs in the *noſe*, and the air meets with obſtructions in its paſſage through the noſtrils; and if the bone, on either ſide, is fractured, the part becomes hollow. When the cartilage is diſturbed, the *noſe* inclines too much on one ſide. Theſe fractures ſometimes happen without a wound, but more uſually they are attended with a wound of the common integuments. If the injury of the *noſe* is very great, the fracture can never be ſo perfectly cured, but that ſome deformity will remain. The vicinity of this part to the brain alſo, which is frequently injured at the ſame time, renders caſes of this kind often dangerous. A caries alſo, or an ozæna, or polypus, are no uncommon attendants on this diſorder. In order to reſtore the bones of the *noſe* to their proper ſituation, the patient is to be placed in a ſeat oppoſite to the light, and his head held back by an aſſiſtant. The ſurgeon is to raiſe the depreſſed parts with a ſpatula, a probe, or a quill, applying externally the thumb of one hand, and the fore finger of the other. If the bones of the *noſe* are fractured on both ſides,

they

they are to be raiſed on each in this manner, and the cavity of the noſtrils is to be filled up with long doſſils, to prevent the bones from collapſing; covering the part alſo for this end with ſome plaiſter, and applying firſt the dreſſings common in recent wounds. If the bone is fractured into ſeveral ſplinters, they are to be reduced into their proper places by the fingers; but if a ſplinter is ſo entirely ſeparated from the bone, that it will not eaſily unite with it again, it is to be taken out with the forceps. The bones will unite, when properly replaced, in about fourteen days, if no caries, or abſceſs intervene. If the bone ſhould require a ſtronger ſupport than what has been hitherto mentioned, one may be formed out of ſtrong paper, either ſingle, or double, and adapted to each ſide of the *noſe*, and ſupported by bolſters, and the whole muſt be kept in its place by a four headed bandage not tied too tight. *Heiſter*, Surg. p. 117.

Luxated NOSE. It ſometimes happens, though not often, that the bones of the *noſe* are ſeparated from each other, or diſtorted out of their natural places, without a fracture. When this caſe happens, the patient is to be ſpeedily placed in a high chair, and an aſſiſtant muſt ſtand behind, and hold his head firm in a proper poſture: the ſurgeon is then to introduce with one hand a thick probe, a gooſe quill, or a ſmall ſtick ſhaped for that purpoſe up the noſtril internally, by which means the depreſſed parts of the *noſe* may be thruſt out into their places: in the mean time he is to apply his other hand externally, to guide, and direct the parts which are thus moved from within. This being done, and the bones properly replaced, there is ſcarce any thing elſe to be done, but to let a piece of ſticking plaiſter lie upon the *noſe* for ſome time. *Heiſter*, Surg. p. 151.

Wounds of the NOSE. Wounds of the *noſe* are generally cured by the dry ſuture; but, where the wound divides the cartilage, and penetrates ſo deep that the lips of it cannot be kept in contact by the application of ſticking plaiſters, the true ſuture muſt be made through the ſkin, on each ſide of the wound; and Bleyny affirms that when a part of the *noſe* has been actually cut off, and ſeparated from the reſt, it has been afterwards united, by means of ſutures. When the naſal bones have been fractured, it is uſual to place ſmall tubes of lead, or ſilver, under them for ſome time, leſt the paſſage of the *noſe* ſhould be ſtopped up by the ſhooting of new fleſh. Externally ſome vulnerary balſam, or glutinous powder, is to be uſed, and covered with ſticking plaiſters, which muſt be kept on by the four-headed bandage. *Heiſter*, p. 81.

NOSE-*band*, in the manege, called in French *muſerolle*, is that part of the head-ſtall of a bridle that comes over a horſe's noſe.

NOSTOCH, the name of a vegetable ſubſtance which ſeems to differ from moſt of the other bodies of that kind, in ſeveral particulars.

It is a ſubſtance of an irregular figure, of a greeniſh brown colour, and ſomewhat tranſparent. It trembles at the touch, in the manner of a jelly, but it does not melt when held in the hand. It has therefore ſomewhat of the character of a vegetable leaf, but it has neither veins nor fibres.

It is found in all ſorts of ſoils, but moſt frequently in ſandy ones, ſometimes on the gravel of garden walks, and moſt uſually makes its appearance after rain. It is found only in the ſummer months, and retains its humidity and perfect figure ſo long as it is a moiſt ſeaſon, but immediately dries up, and withers away, on the ſun, or winds affecting it.

Many people have ſuppoſed this not to be a plant; it appears all on a ſudden, and, as it were, by a ſort of miracle, either from the earth or clouds, and ſome have called it *flower of earth*; others *flower of heaven*; and the obſcurity of its origin has occaſioned its being held in great eſteem among the chemiſts, who ſuppoſe that it contains an univerſal ſpirit capable of converting other metals into gold. Memoirs Acad. Par. 1722.

Mr. Magnol, and Mr. Tournefort, were the firſt authors who aſſerted its true origin, and ranged it among the plants. Its nature, however, was never perfectly diſcovered till Mr. Reaumur took it under conſideration. This accurate obſerver ſoon found that it was a leaf which naturally imbibed water in a very particular manner; that when it had enough of this liquor in it, it then appeared in its natural flouriſhing ſtate; and when it loſt this again, it became thin, and wrinkled, and was not to be known for the ſame ſubſtance, or, indeed, ſcarce to be ſeen at all. Hence appears the reaſon of its ſuppoſed ſudden production, and decay. If it has, ever ſo long, lain in the walks of a garden in its empty wrinkled ſtate, it is never taken notice of; but, on a ſhower of rain, it imbibes the water, and immediately ſwells out into this jelly-like ſtate, and, on the ſun's evaporating that moiſture, it falls into its undiſtinguiſhable ſtate again; and theſe changes may affect the ſame plant alternately for many days together.

Mr. Geoffroy imagined that he had found roots to the *noſtoch*; but Mr. Reaumur poſitively aſſerts that it has none. He obſerved, indeed, at certain times, on the ſurface of ſome ſpecimens of this, a vaſt number of round tubercles of different ſizes, which appeared to be the ſeeds of the plant: theſe he regularly ſowed in earthen pots of mould, and theſe produced young plants like the parent *noſtoch*, but even theſe were never diſcovered to have any appearance of roots; and, to try farther whether they had any, Mr. Reaumur turned all the plants bottom upwards, and they received no harm from it, but grew juſt as vigorouſly as before.

If the *noſtoch* has truly no roots, as appears to be very evidently the caſe, it follows that it imbibes its nouriſhment in the manner of the ſea plants, which imbibe the water by which they are nouriſhed at all their pores.

It ſhould ſeem that there are two ſpecies of this *noſtoch*, the one only a plain flat leaf; the other curled, wrinkled, and variouſly undulated: and it is on this laſt, that the fruits which produce the young plants are principally found. It may be, however, that the one of theſe may be the male, and the other the female of the ſame ſpecies, as in many larger plants; or poſſibly the being in the ſtate of fructification alone may make the difference.

NOSTRILS (*Cycl.*) — The *noſtrils* are ſometimes ſubject to be preternaturally cloſed; though this is a caſe that but rarely happens. It is ſometimes owing to a careleſs treatment in the ſmall pox, in the bad kinds of which the *noſtrils* have been known to cloſe, and adhere ſo ſtrongly to the upper lip, which is found turned back at the ſame time, as to leave no poſſibility of ſhutting the mouth. In this unhappy caſe, the only relief is by the knife, ſeparating the lip from the noſe, and then opening a paſſage through each of the *noſtrils*. Theſe are to be kept open, either with tents, or leaden pipes, and the lip preſſed downward into its natural poſition by a compreſs and bandage, and this continued till the wounds are ſiccatrized. *Heiſter*'s Surgery, p. 447.

NOSTRILS *of fiſh*. See NARES *piſcium*.

NOSUS, a name by which ſome of the barbarous writers of the middle ages have called *alabaſter*: others alſo have called it *niſus*.

NOTHING (*Cycl.*) — Some modern mathematicians have diſtinguiſhed *nothing* into two kinds. They talk of *abſolute nothing*, and of *relative nothing*; but all this jargon is the reſult of confuſed notions, and ought to be baniſhed out of geometry. See INFINITESIMAL.

NOTION (*Cycl.*) — This term, and the word *idea*, are often taken in the ſame ſenſe; but an ingenious author obſerves, that we cannot ſtrictly be ſaid to have an *idea* of an active being, or of an action, although we may be ſaid to have a *notion* of them. I have ſome knowledge, or *notion*, of my mind, and its acts about *ideas*, inaſmuch as I know, or underſtand what is meant by thoſe words. What I know, that I have ſome *notion* of.

However, if the world will have it ſo, the terms *idea* and *notion* may be uſed convertibly. But yet it conduces to clearneſs and propriety, that we diſtinguiſh things very different by different names. It is alſo to be remarked, that all relations including an act of the mind, we cannot ſo properly be ſaid to have an *idea*, but rather a *notion* of the relations or habitudes between things; but, if in the modern way, the word *idea* is extended to ſpirits, relations, and acts, this is, after all, an affair of verbal concern. *Berkeley*, Princip. of Hum. Knowl. Sect. 142. p. 160, 161. See IDEA.

NOTONECTA, in natural hiſtory, the name of a ſpecies of water-inſect, approaching to the nature of the cimex. It always ſwims upon its back, and is very ſwift in its motions. Its belly, which it ſhews while in the water, is of a yellowiſh white; its legs are long; when taken out of the water it hops. It is indeed a very beautiful, and very nimble little creature; and is common in the ponds of water in Hyde park, and in ſeveral other places about London. It has four wings, ſix legs, and no antennæ; it is eight inches long, three broad, and two and a half thick. The body is black, and of a very particular form, being flattiſh at the belly, and riſing to a ridge on the middle of the back; ſo that when it ſwims, which is almoſt always on the back, its body reſembles a boat in figure.

The belly is jointed, ſtriated, and hairy, and has a large opening at the tail, out of which, when hurt, it thruſts forth ſomething reſembling a ſting. The head and ſhoulders are large, hard, and yellow, without any ſpots; the eyes are large and red, and are of a ſomewhat triangular form. The noſe is a long, green, hollow proboſcis, terminating in a hard and ſharp brown point; this, in its natural poſture, is kept under the belly, and reaches to the middle pair of legs. The outer pair of wings are of a pale fleſh-colour, with ſpots of a dead white; theſe are long, narrow, and ſomewhat tranſparent: they terminate in a roundiſh point, and perfectly cover the whole body. The triangular piece which ſtands between the top of the wings, is hard and perfectly black; the inner wings are broader and ſhorter than the outer ones; they are thin, and perfectly tranſparent, and are of a pale pearl colour. The legs are green and hairy; the foremoſt pair are ſhorteſt; the middle ones longer than theſe; but the hinder pair are greatly longer than all the reſt, ſo that they ſerve as oars, and are tufted with hair at the end to that purpoſe. This creature moſtly lives in the water, where it preys on ſmall inſects, killing them, and ſucking their juices with its proboſcis, in the manner of the water ſcorpion, and many other aquatic inſects; and it ſeizes its prey violently, and darts with incredible ſwiftneſs to a conſiderable diſtance after it.

Though it generally lives in the water, it ſometimes, however crawls out in good weather, and drying its wings by expanding them in the ſun, takes flight, and becomes an inhabitant of the air not to be known for the ſame creature, unleſs to thoſe who had accurately obſerved it before; when tired of flying, or in danger of an enemy, it immediately plunges into the water. If taken into the hand, it ſtings, and gives an intolerable pain, but this goes off in a very few minutes. This is the ſpecies moſt frequently met with, but it is not the only *notonecta* we have, three or four other kinds, different in ſize, and colour, being found not unfrequently in large waters.

NOVACULA *piſcis*, the *raſor-fiſh*, in zoology, the name of a ſea-fiſh caught in the Mediterranean, and ſome other ſeas, and much eſteemed at the tables of the great.

It is of a very ſingular ſhape, having a large and flatted head with no ſnout, or noſe; but its mouth, which is very ſmall, is no more than a ſimple gap, or ſlit, in the lower part of the head; there are four long teeth in the fore-part of it, and all the reſt is furniſhed with very ſmall, but very ſharp ones. The eyes are ſmall, and ſituated in the upper part of the head. It has two large fins at the gills, and two ſmall ones on the belly. Its back is furniſhed with one long fin, not very high, but reaching from the beginning of the back to the tail. The anus is placed nearer the head than the tail; and, from this to the tail, there is another long fin: its tail is large and broad. It is altogether of a flatted form, and is covered with large ſcales of very beautiful colours; the head and gills have ſeveral ſtreaks of a fine blue; the belly-fins, and the tail, are of a cancellated work of green and yellow; the back fin is red ſpotted with black; and the body of the fiſh of a fine yellowiſh red.

It is a ſmall fiſh, ſeldom exceeding three or four inches in length, and, in its flat ſhape, ſomewhat reſembles the faber. It keeps about the ſhores, particularly ſuch as are ſtony, and ſeems never to go into deep water; and is caught on the ſhores of Majorca Minorca, the iſland of Malta, and elſewhere, and lives on ſmall fiſh. *Salvian.* de Aquat.

NOVACULARUM *lapis*, in natural hiſtory, the name given by De Laet to a ſtone which he deſcribes from Ximenes, who has it under the American name *iztli*.

It is the ſtone out of which the natives of America made their weapons of war, and tools for other uſes of life, before they knew the uſe of iron.

There are three ſpecies of this ſtone, the one blue, the other white, and the other black; they are all capable of a very high poliſh, and, when ſet in gold, or ſilver, are very highly eſteemed by the natives: they reflect the images of things, in the manner of all other highly poliſhed bodies, and the two firſt are conſiderably tranſparent.

There are ſeveral quarries of theſe ſtones in the neighbourhood of Mexico, whence the Indians uſed to get them; they naturally ſplit, in the getting out, into angular, and edged figures, and theſe they afterwards faſhioned to the purpoſes they wanted them for, and poliſhed with the powder of a harder ſtone.

They ſtill make knives of them, in a very expeditious, and very remarkable manner. They hold the maſs of ſtone between their feet, and, with an inſtrument prepared on purpoſe, they cut off pieces of four or five inches long, and about one inch broad, riſing to a prominence on each ſide in the middle, and growing very thin toward the edges: it is wonderful to ſee with what expedition they finiſh this odd workmanſhip. The knives, when made, are ſharper than any other inſtrument in the world; but they are very tender, eaſily broken, and more eaſily battered, and notched at the edges. They make alſo longer weapons of the ſame ſhape out of this ſtone, which they fix into wooden handles, with a ſort of gum, and theſe ſerve them as ſwords. They are very terrible weapons for one blow, but they ſeldom hold together ſo as to bear a ſecond. They make alſo the heads of their arrows of them, and when theſe were firſt found by our travellers they were not ſuppoſed to be of human workmanſhip, but to have fallen from heaven in thunder, and were called by many authors *ceraunia*. *Ximenes* Hiſt. Ind. Occid. l. 10. c. 13. See CERAUNIA.

NOVENSILES, among the Romans, heroes newly received into the number of the gods, or the gods of the provinces and kingdoms which the Romans had conquered, and to which they ſacrificed under the name of *dii novenſiles*. *Danet.* Dict. in voc.

NOUER *l' eguillette*, in the manege. See YERK.

NOURISHMENT (*Cycl.*) — NOURISHMENT *of plants*. The antients in general gave to the earth the power of producing plants and animals, and whatever elſe lives upon, or exiſts in it; and for this reaſon they gave it the general title of parent earth, and mother of all things. They ſuppoſed that into this common parent all returned again at laſt; and that after a time of diſſolution in its bowels, they returned back again into the formation of more bodies of the ſame kind. Even thoſe among them who aſſerted the doctrine of the four elements, yet allowed that the earth was the matter which conſtituted thoſe bodies, and that the other three, that is, fire, air, and water, ſerved only to convey, and diſtribute this, as there was occaſion; and Thales is only miſunderſtood, when he is ſuppoſed to think differently from this general ſyſtem of the antients.

But though the antients all gave earth the power of producing animals, and other bodies, the moderns have gone into an opinion that water is the origin of all. Lord Bacon was one of the firſt who argued on this principle: he ſays, that for the *nouriſhment* of plants water is almoſt all in all; and that the earth only ſerves to keep the ſtalk upright, and to defend the root from over-heat, and over-cold. Since the time of this great author many have been yet more expreſs in this opinion, and have aſſerted that water is the only principle of all natural things, ſuppoſing that by ſome ſecret proceſs of nature water is tranſmuted into ſtones, plants, and other things. Phil. Tranſ. N° 253. p. 193.

Helmont attempted to prove this doctrine by many experiments; and Mr. Boyle who followed him through the whole courſe of his experiments, ſeems to aſſent to his opinion, that water is tranſmuted by nature into wood and ſtone, though, in his uſual way, he delivers his thoughts with great modeſty, and candour. The two principal experiments they build their opinions upon, are, that of mint, and ſome other plants growing in water; and that of a tree being planted in a ſmall quantity of earth, which being baked to a dryneſs, and weighed before the tree was ſet in it, and again baked, and weighed afterwards, will be found to have loſt nothing of its own weight, though the tree has encreaſed to a very great degree, only from the water with which they have wetted this earth from time to time.

It might be objected to the laſt experiment, that it is not eaſy to bake earth to the ſame degrees of dryneſs twice over, ſo as to have any hopes of being exact in the weight; but allowing ever ſo great an exactneſs in that, the experiment brings no proof with it, unleſs they can prove that the water which was uſed in the wetting it was pure and homogeneous, and not charged with any tereſtrial matter; for, if it were, the plant may, after all, owe its encreaſe entirely to that earth alone, and the water may only ſerve, according to the doctrine of the antients, to convey and diſtribute this grand *nouriſhing* element, in a neceſſary and proper manner.

It is true that water often appears ſo clear and pellucid, that one would ſcarce ſuppoſe any portion of ſo opake a matter as earth could be contained in it; but we find by chemical experiments, that ſo opake a body as ſilver may be diſſolved in aqua fortis, ſo as to give it no colour, nor render it in the leaſt degree leſs pellucid than before. Our water, however, is not ſo pure in any caſe, as is vulgarly imagined. The naked eye will often diſcover particles of earthy matter, though very ſmall, floating in the very cleareſt we have: and experiment ſhews, that, when evaporated, all water leaves behind it a large quantity of opake, earthy matter, which we could not ſee in it by the naked eye.

This remainder of evaporated water, generally conſiſts of particles of two kinds: the one part are found to be earthy, and ſuch as are fit for the *nouriſhment* of plants, and theſe ſeem ſo different among themſelves, on a nice examination, that they ſeem fitted either for the *nouriſhment* of different plants, or for that of the different parts of the ſame plant; the other particles are of a ſparry and cryſtalline nature, and ſeem calculated for the production of ſtones, &c. In ſome ſprings, we alſo meet with many other principles ſuſpended, ſuch as alum, vitriol, nitre, ochre, and other things, and often many of them in the ſame ſpring; the water, as it paſſes through the ſtrata of ſtone, earth, &c. often waſhing off, and carrying away, in a ſtate of ſolution with it, the particles of thoſe bodies in conſiderably large quantities. Theſe are carried ſuſpended in the water to the mouths of the ſprings, but they are not ſo well ſuſpended afterwards. Phil. Tranſ. N° 253 p. 196.

Vegetable earth, or that kind of mould which is neceſſary for the *nouriſhment* of plants, is more light than ſpar and other minerals, and is both more readily diſſolved, and more eaſily ſuſpended in water than theſe. Hence the waters of all rivers contain a great quantity of this, though very little of the other particles, they being always found moſt plentifully in water near its ſource, and leſs and leſs ſo the farther it has run in the open air. River water contains alſo more of this terreſtrial matter than rain water, as is proved by eaſy experiments, though that contains ſome: and it is evident from the whole, that earth is contained in all water, and, therefore, that all water whatever is capable of conveying it into the bodies of plants, and diſtributing it through their ſeveral parts, for their *nouriſhment* and encreaſe.

If the cleareſt water be put into a clean vial, and ſtopped ſo as to keep out duſt, the earth in it will ſoon be diſcovered: the motion of the water, while in its natural ſtate, keeps this earth in ſmall particles, and, therefore, they are leſs diſcernible; but, on being ſet to reſt in this manner, theſe particles get together, and form larger combinations, which become more viſible, and finally ſo many of them will join together, that they will become apparent, in form of ſmall clouds of opake matter floating in the water; and theſe will become larger and larger, as they have yet more and more freſh matter added to them.

If this earthy matter be of a vegetable nature, it will remain ſuſpended in the water by means of its lightneſs, and will by degrees acquire a green colour, and this will become every day more and more green, as it acquires more and more matter to it. This colour is not to be wondered at, ſince we find how very great a ſhare of it is deſtined to appear of the ſame colour in plants.

When the water ſuſtains a large quantity of mineral, or ſparry matter, this forms its concretions in the ſame manner as the vegetable; and being heavier than this light vegetable earth, it ſubſides to the bottom, and ſometimes not alone, but entangling its particles among thoſe of the vegetable kind, it carries them down along with it. It is palpable from theſe, and from a great number of other the like obſervations, that water of whatever kind does ſuſtain in it the matter of earth, ſuch as is neceſſary for the encreaſe and *nouriſhment* of vegetables; and it appears very conſonant to reaſon, that, in paſſing through the ſeveral ſmall veſſels of the plants into which it is received, it depoſites, and leaves behind it, this earth arranged into a proper form. This the ingenious Dr. Woodward has proved by the experiments of plants growing in glaſſes of water; an accurate liſt of each of which is given at large in the tranſaction referred to in this article.

NOVUS *auris muſculus*, in anatomy, a name given by Fabricius to the muſcle called by Albinus *laxator tympani*, and by others *externus auris*, and *exterior*.

NUAYHAS, the *ague tree*, a name given by the Indians to a ſort of bamboe cane, the leaves of which falling into the water, are ſaid to impregnate it with ſuch virtue that the bathing in it afterwards will cure the ague.

They uſe alſo a decoction of the leaves to diſſolve coagulated blood, giving it internally, and, at the ſame time, rubbing the bruiſed part externally with it. It is ſaid that this plant bears its flowers only once in its life; that it lives ſixty years before theſe appear, but that when they begin to ſhew themſelves, it dies away in about a month afterwards, that is, as ſoon as it has ripened the ſeed.

There ſeems ſomething of fiction in the account of many other particulars of this tree, in the hortus Malabaricus, but it ſeems certain that the length of the ſtalks, or trunk, muſt be very great; for, in the gallery of Leyden, there is preſerved a cane of it of twenty-eight foot long, and another but little ſhorter in the Aſhmolæan muſæum at Oxford, which is more than eight inches in diameter; yet both theſe appear to be only parts of the whole trunk, they being nearly as large at one end as at the other.

NUBA, a word uſed by ſome writers to expreſs a peculiar ſort of manna, or honey-dew, of a roſe-colour. Some chemiſts alſo uſe it as a name for *copper*.

NUBECULA, a name uſed by ſome authors for the diſtemperature in the eye called *albugo*, and *leucoma*, by moſt writers, being ſpots in the cornea of the eye. *Heiſter*'s Surgery, p. 421. See ALBUGO.

NUBELOSA *linea*, a term uſed by the Latin writers on heraldry, to expreſs a ſort of clouded line in certain coats of arms. Our heralds call it *nebule*, and the French *nuance*. It is figured ſo as to repreſent clouds at the edge, and was given to the firſt of the families who bear it, as a token of their ſkill in aſtronomy and navigation.

NUBES, in natural hiſtory, a word uſed by the antients to expreſs that whitiſh foulneſs which we frequently ſee in the bottom of the fineſt columns of cryſtal; we expreſs this by the ſame word *cloud*.

The columnar emeralds are ſubject to the ſame ſort of foulneſs at their bottom, and this part was called the root of the emerald properly enough, as it was that end of the column where it grew to the ſtone; but the word root of emerald has been ſince applied to ſeveral very different ſubſtances of a green colour, and ſome degree of tranſparence.

NUBIGENUM *æs*, a term uſed by ſome hiſtorians to ſignify copper generated in the clouds, and falling from thence with rain, or in ſtorms. They talk alſo of iron, and of ſtones produced the ſame way, and call them *ferrum nubigenum*, and *lapides nubigeni*.

Many of the German hiſtorians mention the falling of iron in duſt, and in large pieces; and Aviſenna tells us ſuch things of Italy. Julius Scaliger ſays that he had by him a piece of iron which came down in rain in Savoy; and Cardan tells us of twelve hundred ſtones falling from heaven, one of which was of an hundred and twenty pound weight, and others thirty or forty pounds apiece; they were all, he ſays, of the colour of iron. Dr. Liſter is for ſuppoſing them to be genuine pyritæ, which, he ſays, is ſoluble into vapour, and thus raiſed into the air may there concrete again into its own form, or that copper and iron may concrete from it. Phil. Tranſ. N° 156. See *præternatural* RAINS.

NUCIFRAGA, in zoology, a name given by many to the *coccothrauſtes*, or *groſs beak*, from its breaking nuts, and the ſtones of fruits. See COCCOTHRAUSTES.

NUCULA *terreſtris*, in botany, a name given by ſome to the *bulbocaſtanum*. See BULBOCASTANUM.

NUDIPEDALIA, among the antients, a feſtival in which all were obliged to walk bare-footed.

This was done on account of ſome public calamity, as the plague, famine, an intenſe drought, and the like.

It was likewiſe uſual for the Roman matrons, when any ſupplication and vows were to be made to the goddeſs Veſta, to walk in proceſſion to her temple bare-footed. *Pitiſc.* Lex. Ant. in voc.

NUFAR, in botany, the name of the *water-lilly*. This was the original name, and was firſt uſed by the Arabians; from them the Greeks borrowed it, and variouſly changed it. The Arabians themſelves added the prefix *nil* to it, to expreſs one particular kind of *water-lilly* of Ægypt; this they called *nil nufar*, or, for a ſofter way of ſpeaking, *ninufar*, and *nenufar*.

The Greeks borrowed this word, and wrote it firſt *ninufarium*, and afterwards, for ſhortneſs, *nuphar*ium. The afterwriters tranſpoſed the letters, and made out of it, *nilufar*, *linufar*, a word wholly unintelligible, but by their tracing it back to its original. See NILUFAR.

NUHAR, a name uſed by ſome chemical writers for *copper*.

NUMERAL (*Cycl.*) — NUMERAL *figures*. The antiquity of theſe in England has been ſuppoſed as high as the eleventh century, from an antient date found at Colcheſter, at firſt thought to expreſs 1090; the figure in the place of hundreds being taken for a cypher, by not attending to the inſide ſtrokes, which were pretty near defaced; but upon a more accurate view that miſtake was diſcovered, and the date found to be 1400. See Phil. Tranſ. N° 439 and 475.

NUMELLA, among the Romans, an engine of wood uſed in puniſhing offenders, whoſe necks and feet were made faſt in it. *Pitiſc.* Lex. Ant. in voc.

NUMELLA was likewiſe uſed to denote a rope or cord made of raw ox-hides to bind beaſts with. *Pitiſc.* in voc.

NUMENIA, Νεμηνια, or Νεομηνια, in antiquity, a feſtival obſerved at the beginning of every lunar month, in honour of all the gods, but eſpecially Apollo, who was called Νεομηνιος, becauſe the ſun is the author of all lights; for whatever diſtinction of times and ſeaſons may be taken from other planets, yet they are all owing to him, as the original and fountain of all thoſe borrowed rays, which the reſt have only by participation from him. For the ceremonies of this ſolemnity, ſee *Potter*, Archæol. T. 1. p. 416.

NUMENIASTÆ, Νεμηνιαϛαι, among the antients, a deſignation given to thoſe who kept a feſtival on every new moon. See the article NUMENIA.

NUMENIUS, in the Linnæan ſyſtem of zoology, the name of a diſtinct genus of birds, of the order of the *ſcolopaces*. The diſtinguiſhing characters of this genus are, that the feet have each four toes, and the beak is longer than the toes. *Linnæi* Syſt. Nat. p. 47.

NUMENIUS is alſo a name uſed by many authors for the curlew, a bird more uſually known by the name of *arquata*. See the article ARQUATA.

NUMENIUS *Indicus*, the *Indian curlew*, the name given by Cluſius to the *guara* of the Braſilians, a very beautiful large bird, of the nature of the curlew, but of the ſize of the *platea* or ſpoonbill. *Ray's* Ornithol. p. 219. See GUARA.

NUMIDICA *avis*, in zoology, a name given by many to the common turkey.

NUMIDICUM *marmor*, in the natural hiſtory of the antients, the name of a peculiar ſpecies of marble, which was of no great beauty, but ſingular in its remarkable hardneſs, and capable of a very elegant poliſh.

It ſeems to have been one of the firſt marbles the Romans brought into uſe in pavements. It is a very firm, hard and ſtrong kind, of a cloſe texture, and in colour of a pale aſh-coloured blue. It is found in Italy, Spain, France and Germany, but no where ſo plentifully as in the laſt country. It is a very durable and ſtrong kind; but its want of variety in colour, makes it but little eſteemed. *Hill*'s Hiſt. of Foſſ. p. 465.

NUMMULARIUS, among the Romans, was uſed to ſignify a *banker*, or perſon who deals in money.

It likewiſe denoted an aſſayer, or one who eſtimated the goodneſs and value of money, as to its weight and fineneſs of metal. *Pitiſc.* Lex. Ant. in voc.

NUN (*Cycl.*) — NUN, in zoology, the common Engliſh name for the *parus cæruleus*, or blue titmouſe, diſtinguiſhed from the common titmouſe by its ſmallneſs, and by its having a blue head, ſurrounded by a white line. *Ray's* Ornithol. p. 176. See PARUS.

NUN is alſo the name of a peculiar ſpecies of pigeon, called by Moore the *columba veſtalis*. It is but a ſmall pigeon, but ſomething larger than the jacobine, and has a very particular plumage, from which it has taken its name, its head being as it were covered with a veil.

The body of this ſpecies is all white, the head, tail, and ſix of the flight feathers black, red or yellow; the eyes are pearl-coloured, and the hood white: this is a large tuft of feathers on the hinder part of the head, and the more numerous they are, the more the bird is eſteemed.

This is a very beautiful ſpecies of pigeon, and is very much eſteemed. Some of its feathers, however, will vary ſometimes

times from their true colour. These birds are called foul feathered. But it is a mere accidental variety, the young of such being often as perfect and beautiful as of any others. *Moore*'s Columbarium. p. 47.

NUNCIATION, *nunciatio*, among the Romans, was particularly used to signify the report which the augur made concerning what he had seen.

This he did to the chief magistrate present, and the magistrate communicated the same to the people, and so dismissed the assembly, which was called *obnunciation*. *Pitisc.* in voc.

NUSIADAT, a name given by some of the chemical writers to sal armoniac.

NUSTAM, a word used by Paracelsus and his followers to express the cream of milk, or the pellicle which in some cases swims upon the surface of wine.

NUT, among botanists, a pericarpium of an extraordinary hardness. See the article PERICARPIUM.

NUT-*hatch*, in zoology, the English name of a bird, known among authors by that of *sitta*; and from its climbing trees in the manner of the wood-pecker, called by some, tho' improperly, *picus cinereus*, the grey wood-pecker. *Ray*'s Ornithol. See SITTA.

NUT-*jobber*, in zoology, an English name for the *sitta*, more commonly known among us by the name of the *nut-hatch*. See the article SITTA.

NUTRITION (*Cycl.*) — *Defect of* NUTRITION, or ATROPHY. This takes its origin from the infarctions of the glands of the mesentery, and evidently manifests itself in the patient by a successive decay and attenuation of the parts.

An *atrophy* differs from a hectic in this, that there is in it only an infarction of the mensenteric glands, whereas in the other case they are generally ulcerated: and in degree the difference also is manifest, all the symptoms being more violent in the hectic than in the simple *atrophy*.

Signs of it. An *atrophy* is known by a general languor both of body and mind; a depraved and unhealthy look of the face; a light and unsettled sleep; an uncertain appetite, sometimes voracious, sometimes nauseating all things, but usually most desirous of cold foods; a straitness of the breast, and an uneasiness after eating; great internal heat, and dryness of the tongue. The bowels are usually lubricous and moist, and throw out the food half undigested: in some cases, however, they are observed to be dry and costive. The urine often appears to be a chylous matter: the abdomen is tumid and hard in the first stages of the disease, but afterwards it becomes more flaccid, and then on feeling it there may be several nodes and lumps perceived. The body by degrees wastes away, and there is a continual feverishness and thirst, and that especially in the night-time: and these symptoms often increase to that violence, as plainly to resemble a hectic, and bring on an equal loss of strength and spirits.

Sometimes the *atrophy* arises from worms, and then the whole face is always pale; the nostrils are full of a mucous matter, and sometimes become excoriated: the appetite is voracious, and the patient feels an insufferable restlessness when hungry, which goes off, and they generally become inclined to sleep after a full meal. When this is the case in young subjects, the rickets and swellings about the joints usually succeed the other symptoms, and crookedness of the legs, gibbosity of the back, and various distortions of the spine follow it: these often put an end to the *atrophy*; but as they continue, and become lasting deformities, they are a very unhappy remedy.

Persons subject to atrophies. Children, while very young, are most of all subject to this disease, and often fall into it from improper food: the use of heavy and fæculent malt liquors, and of acids, which coagulate the milk, that usually makes a large part of their nutriment. The suppression of their sweats is another frequent cause of *atrophies*, especially when occasioned by large draughts of cold liquors when they are hot in the night, and sometimes by an improper use of astringents to stop those diarrhœas to which they are frequently subject. Youths more grown up are often thrown into an *atrophy* by eating voraciously of crude, thick, heavy and obstruent diet, or from the drinking spirituous liquors: sometimes from their having been injudiciously treated in fevers, and sometimes from their being violently infested with worms in their bowels. Men grown up usually fall into it after being debilitated by other illnesses, and by the remains of the causes of those illnesses being left in the body; and by nothing oftener are reduced to this distempered state than by inordinate hæmorrhages. Persons who are scrophulous, or have infarctions of the external glands, usually also are at one time or other afflicted with this infarction of the internal ones, and few escape it that labour under any other violent concretions of the internal parts.

Prognostics. A recent *atrophy* is not difficult of cure; and even the most inveterate one, tho' stubborn enough, is always much less dangerous and difficult of cure than an hectic. The more complicated this disease is, the more difficult it always is in the cure; and it is hence that grown persons are not so easily or so often cured as children, because with them it is usually complicated with many other disorders; and, in general, that *atrophy* which is brought on by hæmorrhages, or by ill-treated illnesses, is much more difficult of cure than that which arises from a wrong diet. And, finally, in *atrophies* arising from worms, when they are destroyed, the disease usually ceases.

Method of cure. The first thing to be done in this case is, to thoroughly abstergе and cleanse the primæ viæ by gentle purges, among which nothing is so proper as calomel, assisted by syrup of rhubarb, or the like, and these purgatives are afterwards to be repeated at different intervals, during the course of the cure. After the first purges, resolvent and attenuating medicines are to be given; and finally, the preparations of steel, decoctions of arum and pimpernel root, with ground-ivy, are very beneficial, as is also the juice of ground-ivy given alone; and the resolvent salts, as tartar of vitriol, nitre, and the like, with some of the aperient tinctures of steel. *Junker*'s Consp. Med. p. 112, 214.

NUX (*Cycl.*) — NUX, the *wallnut-tree*, in botany, the name of a genus of trees, the characters of which are these: the flower is of the amentaceous or catkin kind, and is composed of a great number of leaves affixed to an axis, and disposed in a squammose manner: under each of these there is placed a large cluster of apices. These flowers, however, are barren, and the embryo fruit appear in other parts of the tree. These finally become a hard shell, covered by a soft or fleshy one, and easily dividing into two halves, having within it a kernel usually consisting of four lobes, divided by a sort of woody septa.

The species of *wall-nut* enumerated by Mr. Tournefort, are these: 1. The common *wall-nut*. 2. The great *wall-nut*, called the French and horse *wall-nut*. 3. The tender-fruited, or brittle-shell'd *wall-nut*. 4. The double-bearing *wall-nut*. 5. The harder fruited *wall-nut*. 6. The jagged-leav'd *wall-nut*. 7. The late ripening *wall-nut*. 8. The *wall-nut tree* with very small fruit. 9. The *wall-nut tree* with plain, not serrated leaves. *Tourn.* Inst. p. 581.

NUX *maris*, in natural history, a name given by many writers to a peculiar species of sea shell. It is one of the *dolium*, or *concha globosa* kind, and of that genus called *gondola*, and is the first species mentioned under that word. See GONDOLA.

NUX *regia*, the *royal nut*, a name given by some authors to the *wal'nut*. *C. Bauhin*, Pin. p. 417.

NYCTICORAX, in zoology, the name of a bird called in English the *night raven*. It is of the heron kind, and is called by Mr. Ray *ardea cinerea minor*, or the small grey heron. It is much smaller, and shorter-neck'd, than the common heron; its head and back are black; its neck grey, and its throat and belly yellowish; it has on each side of the head a white streak from the angle of the beak to the eyes; and on the hinder part of its head has a crest made of three feathers, or hairy substances of five fingers breadth long: its wings and tail are grey: it flies principally by night, and makes a very hoarse and disagreeable croaking. *Ray*'s Ornithol. p. 204.

NYCTOSTRATEGI, Νυκτοστρατεγοι, among the antients, officers appointed to prevent fires in the night time.

At Rome, they had the command of the watch, and, from their number, and office, were called *nocturni triumviri*. *Pitisc.* in voc.

NYGMA, a word used by some of the medical writers to express a wound by puncture.

NYMPHAGOGI, Νυμφαγογοι, among the antients, an appellation given to those who led the bride from her father's house, to that of the bridegroom. Vid. *Pitisc.* in voc. See BRIDE.

NYMPH (*Cycl.*) — NYMPHS *of flys*, in natural history, is that state of the fly class, which is between their living in the form of a worm, and their leaving that form for that of their parent fly. See Tab. of Insects, N° 29, seq.

In this state, in many genera of the flys, the worm, or maggot, makes a shell of its own skin, which hardens, and becomes brown, or reddish, while the whole of its body becomes detached from it; and, after having lain some time in form of an oblong ball, without any visible parts of the creature that is to be produced from it, acquires, by degrees, the form of the fly, and all its limbs, and appears an embryo fly wrapped up in an extremely thin, and fine membrane. This is properly the *nymph* state, and, in these flys, when the parts of this *nymph* are more confirmed, and hardened, it is, in reality, no other than the fly wrapped up in this bag, which is so very transparent that every lineament of the insect it contains may be clearly discerned through it. The wings, however, in this state, appear as if they were not yet perfectly formed, but the truth is, that they are only very nicely, and regularly folded together. The creature, however, in this state, though ever so perfect, seems quite inanimate. When all the parts, however, have acquired their due strength, the creature puts itself into motion, and gets loose from its covering, which is no small difficulty; for though the skin of this is very fine and thin, yet as it serves as a nice case to every part of the animal, the effects by which it is to get rid of it must be somewhat difficult to the creature. A much greater difficulty, however, it will necessarily be imagined to be for the embryo fly to get out of the outer shell, or case, which is usually firm, hard, and rigid; but nature has so ordered it, that no more force shall be required for this great work than the creature is able to exert.

Out of the two ſorts of ſhells of theſe inſects, the one in form of an egg, and the other of the worm itſelf, there are two ways for the fly's egreſs.

For the firſt of theſe, it is always from the ſame end of the ſhell, in form of an egg, that the embryo fly is ſeen to make its way out. This is always that end which is near the head of the fly, and which was, originally, the head of the worm.

The head of the fly, however, is provided with no inſtrument to make this great opening. The point of the trunk is yet very ſoft, and, even when at its utmoſt hardneſs, it could only make a very ſmall, and, in a manner, imperceptible hole. Nature has furniſhed the creature with another means of freeing itſelf from this ſhell. The cap at the top of this is made, as it were, of two halves, and they ſo looſely attached both to one another, and to the other part of the ſhell, that they very readily ſeparate with a ſmall force, and fall off from it. But this is not all; for in every one of theſe ſhells, toward the joining on of the cap to the head part, there are two ribs, or prominent lines, diametrically oppoſite to one another, and reaching to ſome diſtance in the ſhell. Theſe ſeem formed to ſtrengthen the ſhell, but they are, in reality, intended to weaken it, and are the places at which it not only eaſieſt breaks, but even ſplits, and opens, with a ſmall force. This, with the falling off of the cap gives ſufficient room of egreſs to the fly, and may be eaſily diſcovered to be intended ſo to ſeparate by nature itſelf; ſince in breaking any other part of the ſhell, it cracks irregularly, and indeterminately; but here it ſeparates only at theſe lines.

It is eaſy, indeed, for us by a ſlight force to ſeparate the two pieces of the cap of the ſhell in theſe caſes, and a ſmall force does it; but this, though ſmall to us, is great in proportion to the ſtrength and circumſtances of the *nymph*, encloſed as it is on all ſides.

The ſkull of the fly, it is to be conſidered, however, is ſolid and cruſtaceous, and of a conſtant and regular figure, as in other larger animals; yet the fly, in this ſtate, is able to inflate and contract its head alternately, and, by that means effects much of the great buſineſs of its liberty. This extending the bulk of the head, is aſſiſted by a ſort of bladder which the creature, at each of theſe inflations, puſhes out to ſome diſtance from its head, and which, ſometimes, even equals the head itſelf in ſize. The air is the only means by which the fly can, in this manner, inflate and ſwell its head; and, when neceſſary, it ſwells its whole body in the ſame manner. The inflation of the head, and the throwing out this ſort of bladder, which is an operation the fly is never able to do afterwards through its whole life, are evidently meant to diſlodge and throw off the cap, and open the ſide lines of the ſhell. *Reaumur*, Hiſt. Inſect. Vol. 4. p. 332, ſeq.

NYMPH-*animal*, in natural hiſtory, one of the terms uſed by Swammerdam, in his claſſing the inſects according to their ſtates and productions. It expreſſes thoſe creatures which are produced in their perfect form from the egg, and are ſubject to no changes of any kind afterwards. See TRANSFORMATION *of inſects*.

NYMPH-*chryſalis*, or NYMPH-*aurelia*, a name given by Swammerdam in his hiſtory of inſects, to one of the four general claſſes into which he has reduced all thoſe animals in regard to their changes.

The creatures of this claſs are not hatched from the egg in their proper form, but in that of a worm, or caterpillar, and, after hatching, they obtain their perfection by ſlow degrees, not as the *nymph* vermicles of the graſhopper do, in a manner obvious to the eye, but under the covert of their ſkin, and muſt appear chryſalis's before they are perfect flies. The common day and night butterflies, and many other inſects are of this claſs. *Swammerd.* Hiſt. Inſect.

NYMPHA *vermiculus*, in natural hiſtory, a term uſed by Swammerdam to expreſs one of the four general claſſes of the tranſmutations of inſects, or, as he more properly ſtiles them, their manner of growth.

The animals of this claſs are not produced from the egg in their perfect figure, nor yet in the worm ſhape, as the caterpillar of the butterfly, and maggot of the fly, but the parts of the inſect are imperfectly ſhaped in the egg, and, after hatching, it does not appear properly itſelf, but acquires its perfection viſibly by means of outward food. The locuſt, graſhopper, &c. are of this claſs. *Swammerd.* Hiſt. Inſect.

NYMPHA *vermiformis*, in natural hiſtory, a word deviſed by Swammerdam, and by him uſed to expreſs one of his four great claſſes on inſects, according to their production.

Thoſe of this claſs are not hatched from the egg in their own form, but in the ſhape of worms, and differ from the caterpillar kind in this, that they always remain ſhut up in the ſkin of the worm, till they throw off both ſkins at once, and appear in their winged ſtate. The common flies, &c. are of this claſs. *Swammerd.* Hiſt. Inſect

NYMPHÆA, the *water lilly*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the roſaceous kind, conſiſting of ſeveral petals arranged in a circular form; the ſeed veſſel ariſes from the cup of the flower, and is, when ripe, of a globoſe or conic figure, multicapſular, and filled with oblong ſeeds. See Tab. 1. of Botany, Claſs 6.

The ſpecies of *nymphæa* enumerated by authors are theſe: 1. The great white *nymphæa*, or *water lilly*. 2. The great American *water lilly*, with very large rounded leaves, beautifully crenated, and purple underneath, and with large white flowers. 3. The American *nymphæa*, with ſmaller rounded leaves, obtuſely crenated, green underneath, and with white flowers. 4. The ſame ſpecies of *water lilly* are known when not in flower, by their large leaves, which float upon the ſurface of the water. *Tourn.* Inſt. p. 260.

NYMPHARENA, in natural hiſtory, the name of a ſtone found in the beds of ſome rivers, and having the appearance of a ſea horſe's tooth. Doubtleſs it was a petrified tooth of that or ſome other ſuch animal, ſuch things being often found now, though in theſe early ages they were little known or regarded.

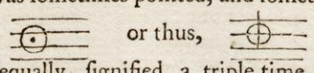
NYMPHARIUM, in botany, a name given by the Greek writers of the later ages to the *water lilly*.

The word is formed of *nymphæa*, and is of the ſame kind with many other names of plants deviſed about the ſame time, which ſeem a ſort of diminutives formed on the before received names of the ſame plants. Thus *ſcillarium* is a name given by Aëtius to the *ſquill*, when the roots were ſmall. Moſt of theſe words were formed of the Arabian names of the things thoſe new ones expreſſed.

NYMPHARUM *oculi*, in natural hiſtory, a name given by ſome of the antient writers to the ſtone we call *oculus Beli*, and ſometimes to the operculum of a ſhell-fiſh, common on the ſea ſhores in many places, and called *umbilicus veneris*. We are told of Caligula that he carried his ſoldiers armed to the ſea ſide, to pick up the *nympharum oculi*, and ſhells. It is certain in this place, the word only means the *umbilicus veneris*, for the other *oculi nympharum* are found only on the ſhores, and in the beds of ſome particular rivers, not on the ſea ſhores among ſhells.

NYMPHOIDES, in botany, the name of a genus of plants, approaching to the nature of the water lilly, or *nymphæa*, in external appearance, and thence uſually eſteemed ſpecies of that genus, but improperly.

The characters of this genus of plants are theſe: the flower conſiſts of one leaf, uſually of a rotated form, and divided into ſeveral ſegments at the edge. The piſtil ariſes from the cup, and perforates the bottom of the flower, and finally ripens into a ſoft fruit, or capſule, of an oblong, compreſſed figure, having only one cell, and containing many ſeeds wrapt up in a calyptra. See Tab. 1. of Botany, Claſs 2.



The ſpecies of *nymphoides* enumerated by Mr. Tournefort are theſe: 1. The common *nymphoides*, which ſwims on waters: this is called by moſt other authors the *yellow water lilly*, with fimbriated flowers. 2. The *nymphoides* with leaves beautifully ſtained with purple ſpots. 3. The Indian *nymphoides*, with white fimbriated flowers, called by authors *nadil ambel*. *Tourn.* Inſt. p. 153.

NYSSA, in botany, the name of a plant deſcribed by Gronovius, and made by Linnæus a diſtinct genus of plants, under the ſame name. The characters are theſe: it produces male and female flowers; in the male flower the cup is a five-leaved, expanded perianthium. The flower is monopetalous, but divided into five ſegments, of the ſhape and ſize of thoſe of the cup. The ſtamina are ten pointed filaments, longer than the flower. The antheræ are double.

In the female flower the cup is of the ſame figure as in the male, but it remains upon the fruit. The flower is the ſame as in the male; the piſtil has an oval germen under the cup; the ſtyle is ſingle, and ſlender, and is longer than the flower. The ſtigma is oblong, compreſſed, and bent. The fruit is a drupa of an oval figure, containing one cell, in which is contained an oval nut, ſharp pointed at the ends, and rib'd with longitudinal lines. *Linnæi* Gen. Pl. p. 482. *Gronov.* Virgin. p. 121.

O.

O *(Cycl.)* — It was not, ſtrictly ſpeaking, the letter O, but the figure of a circle O, or double CO, by which the modern antients, in muſic, uſed to expreſs what they called *tempo perfetto*, or triple time. Hence the Italians call it *circolo*. This circle was ſometimes pointed, and ſometimes barred, thus

 or thus,

But theſe equally ſignified a triple time. *Broſſard.*

The ſeven antiphones, or alternate hymns of ſeven verſes, &c. ſung by the choir in the time of Advent, was formerly called *O*, from their beginning with ſuch an exclamation.

OAK, *quercus*, in botany. See the article QUERCUS.

Holm-OAK. See the article ILEX.

OAK-*apples*, a name given to the common galls, uſed in dying. See the article GALL.

OAK-*leaf galls*. Theſe are of ſeveral kinds; the remarkable ſpecies called the muſhroom gall, is never found on any other vegetable ſubſtance but theſe leaves; and, beſide this, there are a great number of other kinds.

The double gall of theſe leaves is very ſingular in that, as the generality of productions of this kind affect only one ſide of a leaf, or branch, and grow all one way; this kind of gall extends itſelf both ways, and is ſeen on each ſide of the leaf, in form of two protuberances, oppoſite the one to the other. Theſe are of differently irregular ſhapes, but their natural figure ſeems that of two cones, with broad baſes, and very obtuſe points, though ſometimes they are round, or very nearly ſo. See Tab. of Inſects, N° 25.

Theſe make their firſt appearance on the leaf in April, and remain on it till June, or longer. They are at firſt green, but afterwards yelloviſh, and are ſofter to the touch than many other of the productions of this kind: they are uſually about the ſize of a large pea, but ſometimes they grow to the bigneſs of a nut. When opened, they are found to be of that kind, which are inhabited each by one inſect only, and each contain one cavity. The cavity in this is, however, larger than in any other gall of the ſize, or even in many others of three times the ſize; the ſides of it being very little thicker than the ſubſtance of the leaf.

It would be natural to expect, in this large lodgment, a large inſect, but what is uſually found is only a ſmall browniſh ſubſtance, of a kidney-like ſhape, looking like the ſeed of ſome plant. This is hard and motionleſs; but is, however, the chryſalis of an inſect which may be found living in the gall, when opened in an earlier ſeaſon, and is a ſmall white worm, owing its origin to the egg of a fly. This creature has a method of depoſiting its eggs within the ſubſtance of the leaf, and the young ones, when hatched, eating on each ſide, form the double tumor.

The life of the creature in this ſtate is but ſhort, and its duration in the chryſalis conſiderably long. The ſhell under which it paſſes this ſtate is not made in the manner of that of moſt other worms, of its own ſkin, but is formed of the woody fibres of the ribs of the leaf, which it gnaws into ſmall pieces, and forms into that ſhape by means of a viſcous humour, ſecreted from its own pores. At length the fly makes its way out of this caſe by breaking off one end of it, and then eats itſelf a paſſage through the gall, and flies at large. The flies hatched of theſe inſects are very ſmall, yet Mr. Reaumur has obſerved them ſo carefully, as to be able to diſtinguiſh three or four kinds of them.

The moſt common fly produced of theſe galls, is a very beautiful ſmall one, of the four-winged kind. Its body and breaſt are black; its wings gawſy, and colourleſs; and its antennæ conſiderably long, and of the conic, granulated kind. The body of this fly is very ſhort. A ſecond ſpecies is very different from this firſt; it is of a brown colour, much longer bodied, and has antennæ of the club kind. There is another which reſembles this in ſhape, but its body is of a fine ſhining green, with an admixture of a gold colour; the wings of this exhibit all the rainbow colours in the manner in which they are ſeen on a bubble of ſoap ſuds.

It is not eaſy to aſcertain the origin of the ſeveral ſpecies of flies, which are, at times, ſeen in this manner to come out of the ſame ſpecies of galls. It ſeems the common courſe of nature, that only one ſpecies of inſect forms one kind of *gall*; yet it may be, that two or three kinds may give origin to the ſame kind. There is, however, another occaſion of our ſeeing different ſpecies come out of different *galls* of the ſame kind; and this is the effect of the enemies of the proper inhabitants.

It might appear that the parent fly, when ſhe had formed a *gall* for the habitation of her worm offſpring, had placed it in an impregnable fortreſs: but this is not the caſe; for it frequently happens that a fly as ſmall, perhaps, as that which gave origin to the *gall*, produces a worm which is of the carnivorous kind, as the other feeds on vegetable juices. This little fly, well knowing that where there is one of theſe protuberances on a leaf, there is a tender and defenceleſs inſect within, pierces the ſides of the *gall*, and depoſits her egg within it. This, when it hatches into a worm, feeds upon the proper inhabitant, and, finally, after devouring it, paſſes into the chryſalis ſtate, and thence appears in the form of its parent fly, and is ſeen making its way out of the *gall*, in the place of the proper inhabitant.

On opening theſe *leaf galls*, which are properly the habitation only of one animal, it is common to find two, the ſtronger preying upon the body of the other, and ſucking its juices as it does thoſe of the leaf; often it is found wholly employed in devouring its unoffending neighbour at once: this is probably the caſe when its time of eating is nearly over; and, in fine, when we find the *gall* inhabited by only one inſect, or containing only one chryſalis, as it ought in its natural ſtate to do, we are never certain that this is the proper inhabitant, as it may be one of theſe deſtroyers who has eaten up the other, and ſupplied its place. *Reaumur*'s Hiſt. Inſ. Vol. 6. p. 197, ſeq.

OAK *puceron*, a name given by naturaliſts to a very remarkable ſpecies of animal of the *puceron* kind. The generality of ſuch animals live on the ſurface of the branches and leaves of trees, and plants; but theſe bury themſelves in the clefts of the *oak*, and ſome other trees, and getting into the crevices, where the bark is a little ſeparated from the wood, they there live at eaſe, and feed to their fill, without being expoſed to their common enemies.

Theſe are the largeſt of all the ſpecies of *pucerons*; the winged ones are nearly of the ſize of a common houſe fly, and the naked, or ſuch as have no wings, though leſs than theſe, are yet greatly larger than any other ſpecies of *pucerons*; the winged and naked kinds in theſe, as well as in the other ſpecies of *pucerons*, are all mothers, and great number of young ones may be preſſed out of the body of either kind, when gently ſqueezed. The winged ones are black, and the others of a deep brown, or coffee-colour; they have the moſt remarkable trunk of any animal in the world; it is more than twice the length of their bodies, and has not its origin at the extremity of the head, as in other inſects, but is fixed into the breaſt near the origin of the firſt pair of legs. When the creature is walking, it carries this ſtrait along the belly, and trailing a conſiderable length behind it, but with the point turned up, that it may be out of the way of accidents, and be ready to ſuck. When the creature has a mind to ſuck a part of the tree that is juſt before it, it draws up, and ſhortens the trunk, till it brings it to a proper length, and direction; but when it ſucks in the common way, it crawls upon the inner ſurface of the bark, and the turned up end of the trunk, which reſembles a tail, fixes itſelf againſt the wood that is behind it, or contiguous to its back, and ſucks there. The extremity of this trunk holds ſo faſt by the wood, that when it is pulled away, it frequently brings a ſmall piece of the wood away with it.

The ants are as fond of theſe as of the other ſpecies of *pucerons*, and that for the ſame reaſon, not feeding upon them, but on their dung, which is a liquid matter of a ſweet taſte, and is the natural juice of the tree, very little altered. Theſe creatures are the ſureſt guides where to find this ſpecies of *puceron*; for if we at any time ſee a number of theſe crawling up an *oak* to a certain part, and there creeping into the clefts of the bark, we may be aſſured that in that place there are quantities of theſe *oak pucerons*.

The mechaniſm by which this trunk of the *oak puceron* is ſhortened, is like that by which we alter at pleaſure the length of our teleſcopes which are compoſed of ſeveral parts running one into another. This trunk is, in the ſame manner, compoſed of three joints, which, at the pleaſure of the animal, are received more or leſs into one another's cavities, and, in all ſtates, are ſo flexile, that the animal can bend, and direct them to any part at pleaſure.

The laſt joint of the trunk, or that which is fartheſt from the body is terminated by a very hard and ſharp point; it is made only to pierce into the ſubſtance of the hard wood, and as, if this had been hollow, it muſt have been both weaker, and thicker, both which are great diſadvantages in regard to its uſe, nature has made it ſolid. In this it departs from the general nature of other trunks of inſects, which are always open at the end: but inſtead of that, this has an oblong ſlit on its upper part, a little above the end; by this means, it is able at once forcibly to enter the wood, and to imbibe its juices. This ſlit is not to be perceived without the largeſt magnifiers, but there is always to be ſeen a drop of tranſparent liquor on the place where it is, if the creature be a little ſqueezed when newly taken off from the wood. This whole trunk is beautifully tranſparent, and there are two long bodies like hairs ſeen within it. It is hard to gueſs at

the uſes of ſo minute parts, but, probably, theſe ſerve either to aſſiſt the motions of that trunk in lengthening, or ſhortening, or elſe as piſtons, in drawing up the juices for food.

Though the trunk already deſcribed appear very ſingular in this inſect, there is ſomething in the mechaniſm of the parts by which it receives its nouriſhment ſtill more wonderful, more out of the common method of nature than that: this is, that the creature has, properly ſpeaking, a double trunk, for it has, beſide this long one, another which is ſhorter, being about the lengthened diameter of thoſe of the other inſects of this kind, and placed, as they are, at the extremity of the head. The creature can elevate, and protend, this leſſer trunk at pleaſure, but, in its natural ſtate, it is lodged in a ſmall channel, in the long and large trunk before deſcribed, made to receive it. The uſe of this ſeems very plain, though very ſingular; as the creature was to feed upon the juices of a hard and ſolid wood, it required an organ of peculiar ſtrength to enter its ſubſtance; this nature has provided it with in its long trunk, but, as the uſes that was deſtined for required its being placed on the breaſt, this was a part too far diſtant from the head to be proper for the receiving the juices. This ſcheme of nature for the nouriſhment of the animal, ſeems therefore to have been this; the larger trunk is to receive, and convey to its upper part, the juices of the tree, and the ſmaller trunk is there to be inſerted at pleaſure into it, and to ſuck up from thence the juice into the body, as, in common caſes, its office is to do it immediately from the plant itſelf. *Reaumur*'s Hiſt. Inſ. Vol. 6. p. 64, 78.

The ants are ſo extremely fond of the juices of the tree, when prepared for them by paſſing through the body of this animal, that when the *puceron* has a drop not yet evacuated, but hanging only in part out at the paſſage, an ant will often ſeize on it there.

The diſtinguiſhing characters of the *pucerons* of all kinds, is their having two paſſages for the excrements on the hinder part of the body, beſide what reſembles the anus in larger animals; theſe paſſages, in moſt ſpecies, are formed into a ſort of horns, or ſhort hollow tubes, ſticking out from the body of the creature, and ſerving as a very obvious diſtinction of it from all other animals: in this, however, and in ſome other ſpecies, theſe paſſages are not formed into horns, but are only two round tubercles a little more elevated than the reſt of the ſurface of the body, and placed where the horns in others ſtand. *Reaumur*'s Hiſt. Inſ. Vol. 6. p. 78.

OAK *ſnake*, in zoology. See DRYINUS.

OAT, *avena*, in botany. See the article AVENA.

Some phyſicians have greatly recommended a diet drink made of *oats*, in various diſtempers. The method of preparing the drink is as follows: take of recent *oats* entire, and well waſhed, one pound and an half; of the freſh root of ſuccory, cut into ſlices, one handfull; ſpring water twelve pints; boil all together in a clean earthen veſſel to the conſumption of half, and then ſtrain the liquor through a linnen cloth, and add to it ſix ounces of coarſe ſugar, and half an ounce of ſal prunellæ; let it boil again, and afterwards be taken off the fire, and ſet by, for a day and a night, in a cool place; then pour off the clear liquor, and keep it in a cellar in veſſels cloſe ſtopped.

Two ordinary cup-fulls of this liquor given twice a day, three hours before, and as many after dinner, are ſaid to do wonders in the cure of all kinds of fevers, colic pains, pleuriſies, itches, cutaneous tumors, and hypocondriacal diſorders; as alſo in cleanſing the kidnies from ſand, and opening the obſtructed viſcera. The uſe of it is ordered to be continued thirteen days, and, if the patient be cacochymic, a gentle purge is to be given before it is taken. It is accounted a great preſervative againſt illneſs, if taken thrice a year, in ſpring, in autumn, and in the dog days; and the inventor of it, Joannes de St. Catharina, is ſaid to have kept himſelf alive by it to the age of an hundred and twenty years, without any diſeaſe.

Dr. Lower having tried it, and found its good effects, by repeated experience, made it public, and the celebrated Hoffman has written an expreſs treatiſe about it, in which he recommends it both in intermittent and continued fevers, but adviſes purified nitre to be uſed inſtead of the ſal prunellæ, and obſerves that the two boilings ordered by Dr. Lower are not neceſſary, but that the ſugar and nitre may be added at firſt. It muſt be kept carefully in ſummer, otherwiſe it ſoon becomes ſour, and unfit for uſe.

Thoſe who deſire to have it coloured may boil in it an ounce of alkanet root, and two ounces of red ſaunders, which will give it a fine red colour, without at all affecting its virtues.

It is, unqueſtionably, a very valuable medicine, affording ſingular relief wherever obſtructions of the veſſels are to be removed, or ſalts to be waſhed out of the habit; where the viſcid juices are to be diluted, or a due degree of moiſture, and humidity reſtored. It is alſo excellent for allaying thirſt in fevers, and for ſtopping hæmorrhages.

Black OATS. Theſe are commonly ſown upon an etch crop, or on a lay, which they plough up in January, when the earth is moiſt, taking care to turn the turf well, and to lay it even and flat. *Oats* are to be ſown earlier in the northern parts of England than in the ſouthern.

Oats are ſown with a broad caſt at twice as they do barley, harrowing it well in; but this muſt always be harrowed the ſame way that the furrows lie of a lay, or but very little croſs, for fear of raiſing the turf, but upon an etch, as ſoon as the land is ploughed on an edge, they ſow and harrow it in once; then ſow it a ſecond time, the full quantity, and harrow it five or ſix times over, obſerving to harrow once or twice acroſs, which breaks the clods, and covers the ſeed better than harrowing all one way. They commonly ſow them upon a broad ridge, which they give the land but one ploughing for.

The uſual time of ſowing black *oats* is in the beginning of February, or a very few weeks later, ſometimes not till the beginning of March: they are a hardy grain, and will bear any thing of wet or cold. Four buſhels of ſeed is the quantity for an acre; but they grow beſt on a moiſt land, though they will not miſs any where. The farmer knows that his *oats* are ripe when the ſtalk turns yellow, the grain feels hard and the huſk begins to open, and ſhew the ſeed. After they are cut, they ſhould lie for the dew and the rain to plump them, and make them thraſh well; and, if weedy, to kill the weeds: but, if there happen much rain, they muſt be got in again as ſoon as dry, otherwiſe the *oats* will ſoon fall out of the huſks, and great part of the crop be loſt.

Red OATS. The red *oat* is a kind of corn very common in Staffordſhire, and ſome of the northern counties; it is a ſort of naked *oat*, and is very proper for making oatmeal, becauſe the kernel thraſhes out of the hull, without carrying it to the mill, or drying of it. This *oat* is cultivated in the ſame manner as barley.

White OATS. This kind of *oat* is commonly ſown upon an etch, after wheat, rye, or barley: they only give the land one ploughing, and ſow them, and harrow them, as they do the black *oats*, except the land is ſubject to weeds; in that caſe it is good to plough up the wheat, or rye ſtubble, in November, which will make it rot the better, and be a kind of winter fallowing. Only if you have a very dry burning ground, which black *oats* will not delight in, in that caſe, they often ſow them upon a lay. March and April are the uſual time of ſowing white *oats*, and the drier the weather is when they are ſown, the better; they grow beſt upon a dry, gravelly, or ſandy land, and they are the beſt of all to be ſowed upon a land very ſubject to weeds, becauſe, being ſowed late, they allow a very late ploughing, and growing very quick after this, they over-top the weeds ſooner than any other plant. The reaping of white *oats* is the ſame with that of the black, and they generally yield about the ſame quantity, that is, twenty buſhels, or thereabouts, from an acre. *Mortimer*'s Huſbandry, p. 134.

Wild OAT, in huſbandry, a kind of *oat*, or *oat* graſs, which comes up of itſelf, without ſowing, and is much hated, and dreaded by the farmers. This, in many counties of England, is the greateſt of all hinderances of the good crops of barley, and often of other grain. It is a rough and hairy *oat*, and uſually black. In the wetter years, and after much froſt, this is found to be moſt troubleſome.

The beſt remedy the farmer has againſt this, is to ſow the land moſt apt to produce it with beans, and when they are come up to about three inches high, to turn in ſheep upon the ground, about twenty ſheep to an acre; theſe will eat up all the ſhoots of the wild *oat*, and not touch the beans ſo long as there is any of the *oat* ſhoots left. *Mereton*'s Northampt. p. 480.

OAT-*ſnail*. See the article SNAIL.

OBELISCUS *marmoreus*, in natural hiſtory, the name of a very remarkable ſpecies of ſhell-fiſh, unknown to us in its recent ſtate, but met with very frequently foſſile in the Swediſh ſtone uſed for pavements, and in ſome other kinds, and more accurately named by late authors *polythalamium*, and *orthoceratites*, and by Klein *tubulus marinus concameratus*. *Klein*. de tubul. p. 7. See TUBULUS *concameratus*.

OBELISK (*Cycl.*) — One of the uſes of *obeliſks* among the antients, was to find the meridian attitudes of the ſun, at different times of the year. Hence they ſerved inſtead of very large gnomons. One of the *obeliſks* now ſtanding at Rome, that of St. John's Lateran, is, in height, 108 Engliſh feet, without the pedeſtal; and the other *obeliſk*, buried under the *campo Marzo*, wants but little of the ſame height. Pliny gives us a deſcription of this gnomon, lib. 36. §. 15. From him it appears that there was laid down, from the foot of the *obeliſk* northward, a level pavement of ſtone, equal in breadth to the breadth of the *obeliſk* itſelf, and equal in length to its ſhadow at noon, upon the ſhorteſt day; that is to ſay, that its length was to the height of the *obeliſk*, almoſt as 22 to 10, and that, under this pavement, there were properly let in parallel rulers of braſs, whoſe diſtances from the point, directly under the apex of the *obeliſk*, were reſpectively equal to the lengths of the ſhadow thereof at noon, on the ſeveral days of the year, as the ſame lengths decreaſed from the ſhorteſt day to the longeſt, and again increaſed from the longeſt day to the ſhorteſt. Vid. Phil. Tranſ. N° 482. Lect. 5. where we alſo find ſome remarks by Mr. Folkes on Hardouin's amendment of a paſſage in Pliny's natural hiſtory, lib. 2. §. 74. Edit. Pariſ. 1723. fol. about the length of the ſhadows of gnomons in different latitudes.

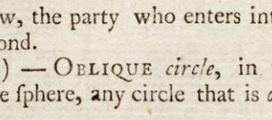
OBEY, in the manege. A horſe is ſaid to *obey* the hand and heels, to *obey* the aids, or helps, when he knows and anſwers them according to demand.

OBLADA, in ichthyology, a name given by ſome to the *melanurus* of authors, a fiſh of the *ſparus* kind, diſtinguiſhed by Artedi by the name of the *ſparus variegated with longitudinal lines, and with a large black ſpot on each ſide near the tail.*

OBLATÆ (*Cycl.*)—OBLATA is alſo a word uſed by ſome authors to expreſs a ſort of purging tablet, made of fine flower and ſugar, with ſome purging ingredients.

OBLATÆ is alſo uſed to ſignify the conſecrated wafers, or hoſts, diſtributed to the communicants in the maſs or ſacrament of the altar; and ſometimes the cuſtomary treats in religious houſes have been called by the name of *oblatæ*.

OBLIGATO, in the Italian muſic, ſignifies *for, on purpoſe for*, or *neceſſary*, as *doi violini obligato*, on purpoſe for two violins; and ſo of other things, as *conſagotto obligato*, that muſt be played with a baſſoon, &c.



Sometimes it ſignifies confined, or reſtrained, by certain rules, ſubjected to certain limits or laws, in order to perform ſome particular thing, to give ſome particular expreſſion of a paſſion, action, &c. In this ſenſe we ſay, *contrapunto obligato*, *fuga obligata*, &c. We alſo ſay, the baſs is *obligato*, when it is only a ground of a certain number of bars, which are to be repeated over and over; ſuch is the baſs to chacones, &c. and every baſs wherein one is obliged to keep a certain movement, and to perform only certain notes, &c.

OBLIGEE, in law, is the party to whom an obligation, or bond is made. *Blount.*

OBLIGOR, in law, the party who enters into, or executes, an obligation, or bond.

OBLIQUE (*Cycl.*) — OBLIQUE *circle*, in the ſtereographical projection of the ſphere, any circle that is *oblique* to the plane of projection.

OBLIQUO, in the Italian muſic, ſignifies two breves tied together, which make but one body, whence it is named in Italian *nota d' un corpo ſolo*; ſometimes there is a tail, or the right, or left ſide, either aſcending, or deſcending. (See NOTE, LIGATURE, and VIRGULA.) However it be, the two extremes mark the ſound, the middle ſerves only to tie them, thus:

OBLIQUUS *brevis*, in anatomy, a name given by ſome authors to the muſcle uſually called the *obliquus inferior occuli*, the *ſextus occuli* of Fallopius.

OBLIQUUS *externus*, in anatomy, the name of a muſcle of the abdomen, which is broad and thin, fleſhy on its upper and back part, and tendinous on the anterior, and greateſt portion of the lower part. It reaches from half the lateral and inferior part of the thorax, to almoſt half the lateral and ſuperior part of the pelvis: and from the back part of the regio lumbaris to the linea alba. It is fixed by its upper part to the ribs, by its lower to the os ilium, ligamentum Fallopii, and os pubis, and by the fore-part to the linea alba; the poſterior portion next the vertebræ of the loins has commonly no true muſcular inſertions. It is called alſo the *obliquus deſcendens*, *obliquus ſuperior*, and *obliquus major*.

It is fixed to eight ribs by the ſame number of angles, the inſertions in the bony extremities of the ribs are at different diſtances from the cartilages, and the name of digitations, or indentations, have been given to theſe angular inſertions, becauſe they join a like number of the ſame kind belonging to other muſcles, as the fingers of the hands may be locked between each other; theſe digitations appear to be entirely fleſhy, but they are almoſt all truly a little tendinous in their back part; they ſeem to encreaſe in breadth alſo as they deſcend, and often unite with the intercoſtal muſcles, as they paſs over them; there are in theſe muſcles other internal inſertions, covered and hid by thoſe which appear outwardly. The firſt digitation is longer than the reſt, and has about the breadth of two fingers; the ſecond is about an inch in breadth; the third is about three fingers broad; the fourth mixes, by ſome of its anterior fibres, with the ſerratus major, as the firſt does with the pectoralis major, and the ſecond with the ſerratus major; the fifth mixes both with the foregoing, and with the firſt digitation of the latiſſimus dorſi; the ſixth is about two fingers broad, and ſends off a faſciculus of fibres to the ſerratus major; and the ſeventh is of the ſame breadth with the former, and ſome of its fibres are ſent off to the ſerratus poſterius inferior. *Winſlow*'s Anatomy, p. 163.

OBLIQUUS *internus*. This is another name for the *obliquus aſcendens*. It is a broad thin muſcle like the former, with nearly the ſame extent and inſertions, that is in the lower ribs above, in the criſta of the os ilium, and ligamentum Fallopii below, and in the linea alba before; but it differs from it in this, that the lower part of it is more fleſhy than the upper. One portion of its lower extremity, which is intirely fleſhy, is fixed by very ſhort tendinous fibres in the middle ſpace between the two labia of the criſta of the os ilium, from the back part of the tuberoſity of that criſta, near the ſymphyſis of the os ſacrum, almoſt all the way to the ſuperior, and anterior ſpine of the os ilium; ſo that its inſertion reaches farther back than that of the obliquus externus. The fleſhy fibres thus fixed run up firſt from behind, obliquely forward, and then this obliquity encreaſes proportionably, as the fibres lie more anteriorly, and they croſs thoſe of the fleſhy portion of the external obliquus, being afterwards inſerted exteriorly in the lower edges of the cartilages of all the falſe ribs, and thoſe of the two loweſt true ribs, reaching to the extremity of the cartilago enſiformis. *Winſlow*'s Anatomy, p. 165.

OBLIQUUS *capitis ſuperior*, a muſcle ſituated laterally between the occiput, and firſt vertebra, and nearly of the ſame figure with the two recti. It is fixed to the end of the tranſverſe apophyſis of the firſt vertebra, from whence it runs upward, and very obliquely backward, and is inſerted in the tranſverſe line of the os occipitis, almoſt at an equal diſtance from the criſta, and the maſtoide apophyſis between the rectus major and the complexus minor, which it covers a little. *Winſlow*'s Anatomy, p. 237.

OBLIQUUS *capitis inferior*, a muſcle ſituated in a contrary direction to the obliquus ſuperior, between the firſt and ſecond vertebræ of the neck, and reſembles the ſuperior in every thing but ſize. It is fixed below to one branch of the bifurcated ſpinal apophyſis of the ſecond vertebra, near the inſertion of the rectus major, from whence it runs obliquely, upward and outward, and is inſerted in the end of the tranſverſe apophyſis of the firſt vertebra, under the lower inſertion of the obliquus ſuperior. *Winſlow*'s Anatomy, p. 237.

OBLIQUUS *capitis inferior* is alſo the name given by Albinus to a muſcle called by Winſlow *obliquus major*; and, by Veſalius, and the old authors, *ſextus capitis moventium*. Fallopius makes it the *ſeptimus capitis*, and Euſtachius, in his treatiſe, *De motu capitis*, calls it *parvus muſculus a ſecundæ vertebræ ſpina in proceſſum tranſverſum ſpinæ ejusque infixus*.

OBLIQUUS *ſuperior oculi*, in anatomy, a name given by Albinus, and others, to the muſcle called *obliquus major*, and *tertius palpebrarum*, by others.

OBLIQUUS *naris muſculus*, in anatomy, a name given by Winſlow to the muſcle ſince called by Albinus the *levator labii ſuperioris alæque naſi*.

OBLONG *leaf*, among botaniſts. See LEAF.

OBNUNCIATION, *obnunciatio*, in Roman antiquity. See NUNCIATION.

OBOE, or OBOI, in the Italian muſic, is uſed to ſignify an *hautboy* or *hoboy*, or that a part is to be played on that inſtrument.

OBRANG, in botany, the name given by the people of Guinea to a very ſingular and remarkable plant, the virtues of which they greatly praiſe. They boil it in water, and uſe the decoction by way of a fomentation to take down ſwellings of the teſticles. Its leaves have ſome faint reſemblance to thoſe of our liquorice, whence Petiver has called it *glycyrrhizæ folio ſingulari frutex Guineenſis ſpinis gemellis*. Phil. Tranſ. N° 232.

OBRIZUM, in antiquity, a kind of gold. Pliny ſays [a], that they call the gold that has been ſeveral times purified in the fire, *obrizum*. *Auri experimento ignis eſt ut ſimili colore rubeat quo ignis*; *atque ipſum* obrizum *vocant*. *Abriz* in Arabic, or Perſian, ſignifies fine gold without mixture, which the Greeks and Latins call *obrizum* [b]. — [a *Plin.* l. xxxiii. c. 23. b *Calmet*, Dict. Bibl.]

OBSIDIANUS *lapis*, in the natural hiſtory of the antients, the name of a ſtone which they have alſo deſcribed under the name of the *Chian marble*. It is a very ſmooth and hard marble, extremely difficult to cut, but capable of a fine poliſh, and was uſed among the antient Greeks for the making reflecting mirrors. See the article CHIUM *marmor*.

The later writers have ſuppoſed the name *obſidianus* derived from ſomebody of the name of *Obſidius*, who was the inventor of this uſe of it; but it ſeems only a falſe ſpelling of the word *obſianus*, απο της οψεως, from ſeeing the images of things in it. *Hill*'s Hiſt. of Foſſ. p. 460.

OBSTITA, among the Romans, a term uſed to ſignify places that had been thunder-ſtruck, which were otherwiſe called *bidentalia*. *Hofm* Lex. Univ. in voc. See BIDENTAL.

OBSTRUCTION *of the bowels*, *obſtructio alvi*, in medicine, the name by which authors expreſs what we call *coſtiveneſs*, that is, a retention of the ſtools a longer time in the bowels than they ſhould be kept there, from whatever cauſe that retention happens.

An *obſtructio alvi* is ſometimes idiopathic, where there is no other diſeaſe concurring to it; ſometimes it is ſymptomatic, and depends entirely on other diſeaſes, as on fevers, congeſtions, and the like.

Signs of COSTIVENESS. The firſt, and moſt obvious, of theſe is, the not going to ſtool in the ſpace of twenty-four hours; this is uſually ſucceeded by a dizzyneſs, and vertiginous diſorder of the head, painful congeſtions of blood about the head, flatulencies, oppreſſions of the ſtomach, and ſtraitneſs and anxiety about the præcordia. *Junker*'s Conſp. Med. p. 590.

Perſons ſubject to COSTIVENESS. Men of ſedentary, and idle lives, are more ſubject than others to this complaint, eſpecially when ſubject to commotions of the blood, and of a dry choleric temperament, and ſuch as are ſubject to hypo-

condriac affections, and to the gout, or to nephritic complaints, and to acute fevers.

Cauſes of COSTIVENESS. Theſe are obſerved by writers to be of two kinds, the active, and the paſſive. The active cauſe is a certain ſtricture which comes on in the rectum in many different diſorders; as in the ſtone, in nephritic complaints, and in general, in all the congeſtions of blood toward the upper parts of the body. What is called the paſſive cauſe of *coſtiveneſs*, is that occaſioned by a ſort of ſluggiſhneſs in nature, which leaves the periſtaltic motion of the guts too languid, on occaſion of which the fæces are eaſily indurated in the bowels. The occaſional and accidental cauſes which contribute to this induration of the fæces are the following: a neglecting the uſual time of going to ſtool; and checking the natural tendencies, and motions toward it; an extraordinary heat of the body, and copious ſweats; a larger quantity of ſolid food taken into the ſtomach than is proper for the quantity of fluids ſwallowed, and a common uſe of ſuch food as is dry and hard of digeſtion.

Prognoſtics in COSTIVENESS. It is the origin of a great many diſorders; and, in particular caſes, is often attended with imminent danger. In choleric habits, in which perſons are ſubject to large quantities of bilious matter being lodged in the primæ viæ, *coſtiveneſs* is uſually attended with colics, and violent heats. The indurated excrements alſo, when they preſs upon the veins in the guts, very often prevent the circulation, and, by that means, bring on dangerous inflammations in the parts; and, in general, whatever diſeaſe is attended with *coſtiveneſs* is rendered worſe and more violent by it.

Method of treatment in COSTIVENESS. An idiopathic *coſtiveneſs*, when grown into a habit by long ſufferance, is beſt cured by means of drinking more liquids than uſual, and giving the body a greater ſhare of motion; but this motion muſt, by no means, be violent, for that always encreaſes the diſeaſe, but when placid and eaſy, it tends greatly to the reſtoring the periſtaltic motion of the bowels to its proper ſtate. To this it is to be added, that many people have reſtored themſelves from this diſtemperature to a good ſtate, only by going to the cloſe-ſtool every day, at a certain hour, and only endeavouring for ſome time, but without great violence, to force a ſtool; the conſequence of a continual practice of this, for ſome weeks together, has brought nature to expect it, and, in fine, to be prepared for it, and always to have fæces at the time ready to be diſcharged The eating a ſmall piece of bread with a large quantity of butter ſpread over it every day before dinner and ſupper is alſo a good cuſtom; and purges taken every ſpring and autumn are a method of bringing nature into a proper courſe. When the caſe is violent, and calls for the aſſiſtance of medicine, there is always more benefit obtained from clyſters, than from purging medicines given internally. Theſe laſt, when given, muſt never be violent.

In a ſymptomatic *coſtiveneſs*, the primary diſeaſe is always to be firſt regarded, and this is, generally, not a little relieved by a proper removal of the *coſtiveneſs*. In chronic caſes, the ſame rules are to obſerved as in the cure of the idiopathic *coſtiveneſs*; but, in acute caſes, recourſe is to be had to clyſters, and large draughts of warm, and weak fluids, ſuch as barley water, and the like.

When *coſtiveneſs* is attended with no other complaint, but people enjoy their perfect health with it, there is no occaſion for medicines, nature being in ſome conſtitutions habituated to it, and doing well with it. There are many perſons who, in general, do not go to ſtool oftener than once in three days; ſome once in a week; and there have been inſtances of people, who, while they have enjoyed a perfect health, and eat very heartily, have not gone above once in three or four weeks. When habitual *coſtiveneſs* is to be cured by motion, and drinking more fluids, theſe muſt be always uſed together; for otherwiſe drink alone more relaxes the bowels, and motion alone diſſipates the already too little humidity. Thus either of them alone muſt add to the diſeaſe, which, when given together, they cure. The common method of attempting to cure *coſtiveneſs* by repeated doſes of purges, brings on a great many inconveniencies, particularly they always leave the bowels more bound than before, and by that means add to the complaint they were meant to relieve, and even the gentleſt purging medicines have this effect. *Junker*'s Conſp. Med. p. 391.

In caſes of this kind, Dr. Huxham recommends a medicine prepared with ſalt of hartſhorn, ſaturated with ſpirit of vinegar, which not only takes away the fœtid ſmell of the oil of the ſalt, but changes it into an agreeable aromatic. Obſ. de aere, et morb. epid.

OBTUNDENTIA, a word uſed by ſome authors to expreſs ſuch medicines as are given to obtund, or edulcorate the acrimony of the humors.

OBTURATOR (*Cycl.*) — OBTURATOR *externus*, a ſmall flat muſcle, which fills up the foramen ovale of the os innominatum exteriorly, and reaches from thence to the great trochanter of the os femoris behind the neck of that bone. It is fixed by fleſhy fibres to the outer, or anterior ſide of the os pubis, all the way to the foramen ovale, to the edge of that hole next the ſmall ramus of the iſchium, under the acetabulum, where a tendon is formed, which continues its courſe behind the neck of the os femoris toward the great trochanter, and is inſerted between the gemelli, and quadratus, in a ſmall foſſula, between the apex of the great trochanter, and the baſis of the collum femoris. *Winſlow*'s Anatomy, p. 211.

OBTURATOR *internus*, a flat muſcle, almoſt triangular, ſituated in the bottom of the pelvis; it covers the foramen ovale, and almoſt all the inſide of the os pubis and iſchium. It is fixed to the internal labium of all the anterior half of the foramen ovale, a little to the neighbouring part of the *obturator ligament*, and alſo both above and below the foramen. It is likewiſe fixed to the upper half of the inſide of the os iſchium, from the upper oblique notch in the foramen ovale, to the ſuperior part of the great poſterior ſinus of the os ilium.

From all this extent, the fleſhy fibres contracting in breadth, run down below the ſpine of the iſchium, where they go out of the pelvis through the poſterior notch in the iſchium. The inſide of the body of this muſcle, or that turned to the cavity of the pelvis, is pretty uniform; but the outſide, or that turned toward the foramen ovale, and which touches the bone, has four middle radiated tendons, which uniting at the poſterior notch of the iſchium, run over it from behind forward, as over a pulley, each tendon ſliding in a particular cartilaginous channel. Afterwards the four tendons having got out of the pelvis, are pretty ſtrictly united in one large flat tendon, which, croſſing over that of the pyriformis, unites with it, having firſt received on each ſide, ſome additional fleſhy fibres from the two gemelli. The great tendon ſlides freely, in a ſort of membranous vagina, formed by theſe muſcles, and is inſerted in the middle of the ſuperior part of the cavity of the great trochanter, adhering cloſely to the capſular ligament of the joint, and being united to the tendons of the glutæus minimus, and pyriformis. *Winſlow*'s Anatomy, p. 209.

OBTURATOR *ligament*. This is one of the proper ligaments of the oſſa innominata, and fills up all the great foramen ovale, except the oblique notch at its upper part. It is faſtened preciſely to the edge of the circumference of that hole, from the anterior part of the oblique notch, all the way to the ſymphyſis between the os pubis, and os iſchium. From thence to the poſterior part of the inferior notch, it is fixed to the internal labium of the edge of the circumference, forming a kind of ſmall channel with the external labium; and afterwards it is fixed to the common edge of the foramen ovale, and cotyloide notch. By this diſpoſition, an opening is left between this ligament, and the ſuperior oblique notch, and immediately below this common opening, there are two ſmall perforations in the ligament alone. *Winſlow*'s Anatomy, p. 124.

OBULARIA, in botany, the name given by Linnæus to a genus of plants, the characters of which are theſe: there is no cup to the flower, but, in the place of one, there ſtand two leaves of the plant. The flower is compoſed of only one leaf; the tube is of a bell ſhape, inflated, and pervious, and the edge is divided into four ſegments, which are ſhorter than the tube, and are of a bifid figure. The ſtamina are four ſubulated filaments, ariſing from the ſegments of the flower, and two of them are ſomewhat ſmaller than the others. The antheræ are ſmall. The germen of the piſtil is oval, and compreſſed. The ſtyle is cylindric, and of the length of the ſtamina; and the ſtigma is oblong, bifid, and remaining. The capſule is of an oval, compreſſed figure, and contains numerous ſeeds, in form of a fine powder. *Linnæi* Gen. Plant. p. 297.

OCCATION, a term in the antient huſbandry, by which they expreſſed what we do by harrowing, though they performed it with a different inſtrument, a kind of rake.

With the teeth of this inſtrument, they levelled the ground, and broke the clods, and, with the hand, ſtrewed the corn over this level ground. Then they brought on the plough, and ploughed it in; ſo that the grain was ſown in furrows, as we expreſs it, and uſually came up, as we ſee it does at this time with us, in the ſame caſe, in the lower parts only. After it had got a few leaves, they went over the ground again with the ſame inſtrument a ſecond time, to clear away the weeds, and move the earth about the roots of the young plants. If they did this lengthways of the furrows, the earth being ſomewhat hardened, there fell but little of it among the corn; but if they did it croſſways of the furrows, a great deal fell down upon, and among, the young plants, and, in a manner, buried them; they were uſually obſerved to grow the better for this croſs harrowing, except in cold places; and the huſbandmen thought the vigour of the plants was owing to the burying them with new earth; but this was really rather prejudicial to them, and the advantage they had aroſe from the more deep ſtirring of the ground. *Tull*'s Huſbandry.

OCCHIO, in glaſs-making, the hole in the floor of the tower of the leer. *Neri*'s Art. of Glaſs. p. 243.

OCCIDENS, an affected name given by ſome of the chemical writers to *vinegar*.

OCCIDENT, in geography, the weſtward quarter of the horizon, or that part of the horizon where the ecliptic, or the ſun therein, deſcends into the lower hemiſphere.

Equinoctial

Equinoctial OCCIDENT, that point of the horizon where the sun sets, when entering *aries*, or *libra*.

Estival OCCIDENT, that point of the horizon where the sun sets at his entrance into the sign *cancer*, when the days are longest.

Hybernal OCCIDENT, that point of the horizon where the sun sets, when entering the sign of *capricorn*; at which time, the days, with us, are shortest.

OCCIPITAL *(Cycl.)* — The *os occipitis*, or *occipital bone*, is situated in the posterior and lower part of the cranium; it represents a kind of lozenge, irregularly indented, and is convex without, and concave within. It sometimes, but very rarely, is found to consist of two pieces, being divided, in that case, by the continuation of the coronal suture. It consists of an external, and internal side, of the upper, lower, lateral, and middle parts; the first four of which may be looked upon as so many angles; and has four edges, the two superior of which are indented, the two inferior are more or less unequal in different subjects. Near the middle of the convex outside of this bone, the *occipital* protuberance, or rising, is observable; under this protuberance are two superficial transverse arches; these are more remarkable in some subjects, than in others, one superior, and larger, the other inferior, and less, and both reaching to the mastoide process on each side: the inferior arch is cut at right angles by a perpendicular line, called the external, *occipital* spine, or crista. Under the superior arch are two rough planes, one on each side of the spine; and between the extremities of the two arches are two other such planes, one on the right hand, and the other on the left. We see likewise two condyles, or condyloide apophyses, crusted over with cartilages, gently convex, of an oblong oval figure, and situated obliquely; their posterior extremities being at a greater distance from one another than their anterior. Also a large, cuneiform, production, which, from the condyles, is directed upwards, and, in adults, is often joined inseparably to the os sphenoides. This may be termed the apophysis basilaris, or the great apophysis of the *occipital* bone. Lastly, there are some unequal tubercles on the lower part of this apophysis, and two little angular productions in the edge of the bone, over against the condyles.

There are likewise in this bone two large notches under the lateral angles, which receive the posterior apophyses of the ossa temporum, two small notches, or portions of the jugular fossæ, and of the foramina lacera; each of these is often divided by a small bony production: also the great *occipital* hole, on the anterior edge of which there is an impression for the insertion of a ligament, two anterior, and two posterior condyloide fossulæ, two anterior condyloide holes for the ninth pair of nerves, which are sometimes double, and two posteior condyloide holes for small veins, which are sometimes wanting. The upper part of this bone is thick, as being much exposed to blows, and other injuries: the lower part is thinner, but is well guarded by muscles. It forms the back part of the head; serves for the articulation of the head with the trunk; contains a part of the brain, and almost all the cerebellum; and gives passage to the medulla oblongata, and a great many of the nerves, and vessels; and insertion to a great many of the muscles. *Winslow's* Anatomy, p. 25.

OCCUPIERS *of walling*, a term in the salt works for the persons who are the sworn officers, that allot, in particular places, what quantity of salt is to be made, that the markets may not be over-stocked, and see that all is carried fairly and equally between the lord and tenant. These persons always appoint how many houses shall work at a time; and, when, there is salt to be made, these appoint a cryer to proclaim it to all the workers, that they may put to their fires at the same time; and a like proclaiming of the time when they shall leave off; and those who continue to work after this prohibition, are to have their salt spoiled, or destroyed. *Ray's* English Words, p. 173.

OCELLATI *lapides*, in natural history, a name given by the antients sometimes to express certain stones, found on the shores, and in the beds of rivers, and naturally marked with the figure of an eye; and sometimes for small round stones of the shape of the grove of the eye, made by art for children to play with, and of the nature of what we call marbles. Suetonius tells us, that Augustus Cæsar used to divert himself sometimes with playing *nucibus et ocellatis*.

The word *lapidibus* is understood after the last word, and the meaning of the author plainly is, that he played, like a boy, with nuts and marbles. The word *ocellatus*, therefore, here, as in many other passages of the antients, plainly expresses those little round stones, formed by art, of little or no value, and intended only for boys to play with. But we have abundant testimony among the antient naturalists of the word having been used also as the name of the gem which we now call *oculus beli*, and all those other stones of the agate, or other semi-pellucid kinds, which had the figure of an eye naturally impressed upon them, that is, a round spot of a different colour, in the center of a small roundish stone. These were scarce among the antients, because they had none but the true *oculi beli*, or such stones as were of a particular species, and were found naturally of the shape and size of an eye; but we have them much more common, because our jewellers, whenever they find a natural spot in an agate, surrounded with a white circle, cut it out from the rest of the stone, and sell it as a natural *oculus beli*.

The name *ocellati lapides*, is not, by any means, a strange, or unnatural one for the genuine stones thus shaped, and marked with the resemblance of a pupil; for the antients used the name of the eye in a much larger sense, expressing by it any thing that appeared rounded and protuberant. Pliny, speaking of the Callais, or Turquoise stone, says, that it protuberated from the rocks in the form of an eye, and means no more by it, than that the masses of it were round, and prominent, as we see those of copper ore-turquoise at this day.

OCHNA, in botany, the name of a genus of plants, the characters of which are these: the cup is a perianthium, composed of five small leaves, of an oval, but pointed shape, standing expanded, and falling with the flower. The flower is composed of two roundish petals, with very obtuse ends, and with ungulæ of the length of the leaves of the cup. The stamina are a number of fine slender filaments, converging at the ends. The germen of the pistil is oval, and terminates in a pointed style, which is erect, and longer than the stamina. The fruit is a very large, and fleshy receptacle, of a roundish, truncated form, in either side of which there is lodged a single berry, of an oval figure. The seeds are single, and of an oval figure also. *Plumier*, 32. *Linnæi* Gen. Pl. p. 819.

OCHRA, or *gallinula* OCHRA, in zoology, the name of a species of moorhen. It is all over of a dusky, and obscure, yellowish green, and is browner on the breast, and belly, than on the back, yet with the same yellowish green predominant. The head, neck, breast, and wings, have several white spots; and the face is in part white; the beak is part black, and part red; and the legs are of a yellowish colour. *Aldrovand.* de Avib. l. 20. c. 48.

OCHRA *vitrioli*, in natural history, a name given to that yellow earth, or *ochre*, which is one of the principles, or constituent parts of all vitriol. This is separated from it by solution in water, and falls to the bottom of the vessel; and the yellow substance that tinges the sides of fountains, and springs of chalybeat waters, in many places, is the same substance, and shews that they are only solutions of vitriol, which, as such, must needs deposit that earth, which, though retained imperceptibly in the vitriol, yet cannot be sustained in water so well as while that salt was solid.

Basil Valentine tells us, that repeated solutions of the same quantity of vitriol, will, at length free it from all its earth; and that then it will be found a very different substance from what it was before, and fit for several wonderful experiments, which he describes. This separation of the earth of vitriol has been tried in vain, by twenty repeated solutions; but there is a much shorter way of effecting it, which is this: Powder a good quantity of Dantzick, or Hungarian vitriol; put it into a high and narrow cucurbit, and add to it a considerable quantity of water; keep a fire under it for four days, and the earth will, in a very great quantity, subside from it, when cold, in much greater quantity from this one operation, than from several repeated ones of the common kind.

Another method, which separates more than its earth from it, is this: Let the vessel containing the powdered vitriol, without any addition of water, be placed in a balneum Mariæ, and kept hot in the same manner for four days; the vitriol will, in this case, melt as if water were put to it. While it continues in this fluid state, the *ochre*, or earth, and not only that, but with it, the metalline parts, and the gross sulphur, will in a great measure subside, and become a hard cake, the vitriol continuing fluid about it. Let this be poured off, and when cold, it will crystallize, leaving only a small quantity of a liquamen behind. This operation may be repeated two or three times, and the vitriol then becomes a very different substance from what it was before, and is fitted for several operations, which it would not otherwise succeed in. Many have tried to effect this separation by liquation, by means of a dry heat, placing the vessel in sand, in filings of iron, or over the flame of a lamp, burning spirit of wine, or oil; but it never will succeed this way, though the vitriol be ever so long kept in a state of liquation. Phil. Trans. N° 103.

The *ochra vitrioli* may be obtained also in a great proportion, though in another form, if, after a long, and intense calcination, the vitriol is freed from its salt by an ablution of warm water often repeated. The far greater part of the remaining colcothar, thus dulcified, is earth, with an admixture only of a small quantity of some metalline parts.

Another way of obtaining it, is dissolving vitriol in common water, and adding to the solution filings of zink, or salts of tartar, or some other alkali. See the article VITRIOL.

A great proof of the earth called *ochra vitrioli* being contained in large quantity in that salt is, that it requires no earth beside to be mixed with it in distillation: whereas common salt, nitre, and the other salts, require a great quantity of common earth to be added to them, to prevent their fusion.

Alum, and vitriol alone, require no ſuch additions, the firſt of theſe containing a very large quantity of an alkalious, white earth, as the other does of an ochreous yellow one.

OCHRES, in natural hiſtory, the name of a large genus of earths, uſed principally by the painters. The moſt common kinds are either yellow, or red, though there are brown, blue, and green *ochres*, and a number of diſtinct ſpecies of all theſe colours. Of the yellow *ochres*, Dr. Hill, in his hiſtory of foſſils, deſcribes eleven ſpecies. Of the red, the ſame number. Of the brown two. Of the blue, and green, one ſpecies each; and of the black, two.

The greater number of theſe are, or have been, at one time, or other, in uſe in painting, in different parts of the world. Some, however, there are, eſpecially of the yellow and red kinds, which that author has, himſelf, diſcovered in different parts of our own, and other kingdoms, which are worthy the tryals of the perſons concerned in that branch of trade, as they have already been proved, at his requeſt, in ſmall quantities, and found to anſwer very well. *Hill*'s Hiſt. of Foſſ. p. 51.

The ſpecies of the yellow *ochres* are theſe: 1. The *ochra leviſſima, friabilis, pallidiſſime flaveſcens*; or very light friable pale yellow *ochre*. An earth found of late years in Penſylvania, Virginia, and ſome other of our American plantations, which has been tried both in water, and oil, and makes a very pale ſtraw colour in the former, and a fine yellow, though ſomewhat deeper, in the latter; but making no good colour, when burnt.

2. The *ochra ponderoſa, dura, pallide flaveſcens*; the hard, heavy, pale, yellow *ochre*. This is found in Germany, Saxony, France, and England, and is well known to the painters, and much uſed by them for a pale yellow. They call this French *ochre*; but it is dug in conſiderable quantities in Dorſetſhire. This makes but a dull colour, when burnt, and is, in its native ſtate, much inferior to the common kind.

3. The *ochra leviſſima, flava, friabilis*; the light, crumbly, yellow *ochre*. This is frequently thrown out at the mouths of chalybeate ſprings, and, ſometimes, from ſuch as are not manifeſtly impregnated with the particles of that metal; and is found in great abundance on Hampſtead heath. This is not uſed by the painters, but is a bright yellow, and very fine, and is, therefore, worth trying.

4. The *ochra levis, aurea, friabilis*; the light, friable, gold-coloured *ochre*. This was the *ochre* of Theophraſtus, and of the earlieſt ages we have accounts of. It is common in our gravel pits, in large looſe lumps. The painters of the preſent age are not acquainted with this; but it is a very valuable ſubſtance, making a fine ſtrong yellow in its native ſtate, and a very bright, and beautiful red, when burnt. *Hill*'s Hiſt. of Foſſ. p. 52.

5. The *ochra crocea, laminata, levis*; the light, plated, ſaffron-coloured *ochre*. This was alſo well known to the antient painters, though not ſo early as the former, and is the Attic, or Athenian, *ochre* of Dioſcorides. It is, like the former, common in ſmall plated maſſes, in our gravel pits, and, though not known to our preſent painters, has been tried, and proves a very fine yellow, both in water, and oil, in its native ſtate, but does not make a bright red, on burning. *Hill*'s Hiſt. of Foſſ. p. 53.

6. The *ochra ponderoſa, flava, friabilis*; the heavy, friable, yellow *ochre*. This is common in England, and is well known, and very much uſed in its native ſtate among the painters. It is dug in Buckinghamſhire, Somerſetſhire, and Oxfordſhire, but is greatly inferior to the two former kinds. *Hill*'s Hiſt. of Foſſ. p. 54.

7. The *ochra argillacea, ponderoſa, lutea, dura*; the hard, heavy, clayey, yellow *ochre*. This is dug in Buckinghamſhire, Yorkſhire, and ſome other counties, and is ſent up to London, and uſed by the painters, making a very lively yellow in its native ſtate, and a pleaſant, though not a ſtrong red, when burnt. *Hill*'s Hiſt. of Foſſ. p. 55.

8. The *ochra duriſſima, ponderoſa, flava*; the ſtony, hard, and heavy, yellow *ochre*. This is well known to the painters, and much valued by them. It is dug in Buckinghamſhire, Staffordſhire, and Yorkſhire, but moſt plentifully in Oxfordſhire, whence it is continually ſent up in great quantities to London. It makes, in its native ſtate, a fine yellow, and, when burnt, a very beautiful red, and is the ſort uſed for burning into red *ochre* in the colour-ſhops.

9. The *ochra argillacea, ſordide flaveſcens*; the dull, duſky, yellow, clayey *ochre*. This is dug in Buckinghamſhire, Staffordſhire, and Oxfordſhire, and is ſent up to London, and uſed in the coarſer mixtures at the colour-ſhops, in its native ſtate, but, when rightly managed, it burns to a very fine valuable red. This, and the former, and ſome other of the before-mentioned, contain in them a conſiderable quantity of a genuine clay, and thence are more compact and ſtiff than the more pure kinds.

10. The *ochra argillacea, luteo-fuſca levis*; the browniſh, yellow, light, clayey *ochre*. This is common in Buckinghamſhire, Northamptonſhire, and many other counties, and though not ſo florid in its colour as many other *ochres*, yet makes a very pleaſing paint, and has what the painters call a good body. This is not yet known among the painters, but is worth their being acquainted with. *Hill*'s Hiſt. of Foſſ. p. 56.

11. The laſt is the *ochra ponderoſa, friabilis, aureo-crocea*, commonly called *giallolino*, and by our painters *Naples yellow*. See the article GIALLOLINO.

The ſpecies of the red *ochres* are the following: 1. The *ochra rubra friabilis ponderoſa, quæ ſil Syricum antiquorum*; the red, heavy, friable *ochre*, the Syrian *ſil* of the antients. See the article SIL.

2. The *ochra purpurea friabilis alkalina, quæ almagra recentiorum, ſil Atticum antiquorum*; the friable, purple, alkaline *ochre*, the *almagra* of the moderns, and Attic *ſil* of the antients. See the artcles SIL, and ALMAGRA.

Theſe are both uſed at this time in painting, and the latter alſo in medicine. The firſt of them is common in many parts of England; the latter ſeems peculiar to Spain.

3. The *ochra purpurea ponderoſiſſima dura*; the hard, heavy, purple *ochre*. This is well known among the painters, and called by them *Indian red*, and by Lemery *terra perſica*. It is dug in the iſland of Ormuz, in the Perſian gulph, and thence is diſperſed over all the Eaſt-Indies. There is alſo ſome of it dug about Bombay. It is uſed both there, and with us, as a fine red in painting. *Hill*'s Hiſt. of Foſſ. p. 58.

4. *Ochra friabilis floride rubeſcens*; the bright red, friable *ochre*. This is much eſteemed in painting in many parts of the world, but is leſs known in England than in any other of the European nations. It is dug in vaſt quantities in the country above Bengall, and is uſed by the painters in France and Germany, as a fine red. It would be worthy our traders in theſe commodities better acquaintance. *Hill*'s Hiſt. of Foſſ. p. 59.

5. The *ochra friabilis pallide rubeſcens, quæ bolus Veneta vulgo*; the pale red friable *ochre*, commonly called *Venetian bole*. See the article VENETA *bolus*.

6. The *ochra friabilis levis, pallide rubeſcens, alkalina*; the light, friable, alkaline, pale, red *ochre*. This is a very fine, and valuable earth, at preſent unknown in painting, but very eaſy to be had, and worthy the bringing into uſe. It is thrown up in digging in our American plantations, and proves, on tryal, to be a bright and fine colour in oil. *Hill*'s Hiſt. of Foſſ. p. 60.

7. The *ochra argillacea palliditſime rubeſcens*; the pale red, clayey, *ochre*. This is a ſubſtance yet unknown to the world, but produced in great plenty in Penſylvania, and Virginia, and will, at leaſt, ſupply to thoſe countries all the purpoſes of the Engliſh reddle.

8. The *ochra puriſſima levis purpuraſcens*; the fine, light, purple *ochre*. This is a ſubſtance common in many parts of England, but not yet univerſally known among our painters. They often uſe it, indeed, without knowing what, or whence, it is; ſome conſiderable quantities of it having, at times, been ſent to London, from the foreſt of Dean in Glouceſterſhire, and one or two of the colour-men engroſſing it to themſelves, and ſelling it, when prepared, under the name of *Indian red*, the third ſpecies of red *ochre*, to which it is, at leaſt, equal in beauty of colour.

9. The *ochra purpurea ponderoſa puriſſima, quæ rubrica ſinopica antiquorum*; the fine, heavy, purple *ochre*, the *rubrica ſinopica* of the antients. See SINOPICA *rubrica*.

10. The *Ochra argillacea indurata rubra, quæ Creta rubra auctorum*; the indurated, clayey *ochre*, called *red chalk*. See the article CHALK.

And the 11th, and laſt, the *ochra ſaxea rubra, quæ ſil marmoroſum antiquorum*; the red, ſtony *ochre*, the marbly *ſil* of the antients. *Hill*'s Hiſt. of Foſſ. p. 62. See the article SIL.

The ſpecies of brown *ochres* are only two; the firſt is, what the painters call *umber*; and the ſecond what they call *Cologn earth*. See the articles UMBER, and COLOGN *earth*.

The blue, and green, are the ſubſtances called *lapis armenus*, and *bergruen*, which ſee under the articles ARMENUS *lapis*, and BERGRUEN.

Of the black *ochres* there are, laſtly, two ſpecies; the firſt of theſe is the *ochra friabilis, ponderoſa, nigreſcens*; the heavy, friable, black *ochre*. A very fine, and valuable earth, worthy to be brought into uſe among the painters, though, at preſent, unknown to them. It is found in perpendicular fiſſures of the ſtrata of ſtone in Leiceſterſhire, and ſome other counties of England, and would make a very fine black, either in water, or oil. *Hill*'s Hiſt. of Foſſ. p. 65.

The ſecond is the *pſeudo ochra levis, nigreſcens, quæ Creta nigra pictorum*; the light, black, baſtard *ochre*, called *black chalk*. See the article CHALK.

Theſe are the ſeveral ſpecies of *ochres* at preſent known; and it is very plain, from this ſhort account of them, that both our own country, and our plantations abroad, contain many treaſures of them, the value of which is yet unknown.

Dr. Liſter obſerves, that ochreous earths are ſeparated in greater or leſs quantities, from all the medicinal ſprings of England, and it is to theſe, and the nitrous and muriatic ſalts, that they all owe their virtues. The *ochre* they contain is uſually of the nature of that which our painters, to diſtinguiſh it from the yellower kind, call *brown ochre*. This is produced from the iron ores that are met with in the way of the current of

theſe

theſe waters; and, among the reſt, the pyrites affords a great deal of them. All kinds of the pyrites, and all the limeſtones of England, when they are ſubject to be much moiſtened under ground, will, in time ſhoot out their ſalts, and part with their earths. *Liſter* de Font Med. Angl.

The earth of the pyrites is *ochre*, and the ſalt of the limeſtone is the calcarious nitre, an alkaline ſalt of the nature of the natrum of Ægypt; and from theſe two ſubſtances, and a ſmall portion of common ſalt, which the waters take up in their paſſage through the earths that contain it, all the virtues of them are owing. The ſalt of the pyrites being green vitriol, it might be expected that this ſhould be found in the waters impregnated by that ſubſtance; but Dr. Liſter obſerves that though there are many ſprings in England which are well known to receive their virtues from this foſſile, yet there is no ſuch thing as vitriol to be obtained from any of them; and this is not wonderful, ſince we know that the pyrites will not yield its vitriol when newly taken out of the earth, but muſt be expoſed a conſiderable time firſt to the air; ſo that the *ochre* only is the ſenſible thing that it receives from this ſubſtance, and, perhaps, with it ſome ſaline matter which is the baſis of vitriol, and would be vitriol in time, on a due expoſition to the air.

OCHROPUS *gallinula*, in zoology, a name by which many authors have called a bird more uſually known by the name of *tringa*. *Geſner* de Avib. See the article TRINGA.

OCHROPUS, or *gallinula* OCHROPUS, the *yellow-legg'd moorhen*, a ſpecies of the *gallinula*, or *moorhen*. It is of the ſize of the common kind; its beak, as well as its legs, is yellow, or of a ſulphur colour; its back is of a rediſh brown; the tips of its wings of a very fine red; it has white variegations on its head, and in the middle of its wings, and on its belly; the longeſt feathers of its wings are black; and there are alſo ſpots of black on the back in ſeveral places. The edges of its eyebrows are of a deep ſaffron colour; and it has, beſide all theſe colours, a great deal of grey in the wings. It has no hinder toe. It builds in thickets, in watery places, among ruſhes and high graſs. *Aldrovand.* de Avibus, l. 20. c. 48. *Geſner* de Avib.

OCHRUS, in botany, the name of a genus of plants, the characters of which are theſe. The flower is of the papilionaceous kind. The piſtil ariſes from the cup, and finally becomes a pod, which is uſually of a rounded, or cylindric form, and contains a number of roundiſh ſeeds. To this it is to be added, that the leaves are ſometimes ſingle, ſometimes of the conjugated kind, and terminating in tendrils.

The ſpecies of *ochrus* enumerated by Mr. Tournefort, are theſe: 1. The *ochrus* with undivided leaves, ſending out tendrils from their ends, and with yellowiſh ſeeds, called *ervillia* by ſome authors. 2. The *ochrus* with undivided leaves, terminated by tendrils with brown ſeeds. 3. The *ochrus* with undivided leaves terminated by tendrils, with black ſeeds. And 4. The yellow-flowered, woolly, American *ochrus*. *Tourn.* Inſt. p. 396.

OCIMUM, in botany. See OCYMUM.

OCNUS, in zoology, a name by which Ariſtotle, and other of the antients have called the *bittern*, or *butter bump*. See the article BITTERN.

OCOB, a name given by ſome chemiſts to *ſal armoniac.*

OCREA, (*Cycl.*) among the antients, a kind of military ſhoe, or ſhort boot, which was made of white tin, and ornamented with gold, or ſilver, about the ankles. Its uſe was very antient, the Greeks were ſo well provided with them in Homer's time, that he thence gives them the appellation of ἐυκνήμιδες Ἀχαιοι. Among the Romans, none were allowed to wear the *ocreæ*, but the two upper claſſes of the people, or ſuch whoſe eſtate exceeded 7500 drachms. See *Hofm.* Lex. Univ. in voc.

OCTAETERIS, Ὀκταετηρις, in antiquity, a cycle, or term, of eight years, at the end of which three entire lunar months were added. This cycle was in uſe till Meton, the Athenian, reformed the calendar, by finding out the golden number, or cycle of nineteen years. *Potter*, Archæol. Græc. T. 1. p. 460. See CYCLE, and CALENDAR, *Cycl.*

OCTANDRIA, in botany, a claſs of plants with hermaphrodite flowers, and eight ſtamina, or male parts in each. See Tab. 1. of Botany, Claſs 1.

The word is formed of the Greek ὀκτω eight, and ἀνὴρ male. The plants of this claſs are the maple tree, heath, &c.

OCTAVE (*Cycl.*) — *Diminiſhed* OCTAVE, in muſic. See DIMINISHED *octave.*

OCTAVINA, in the Italian muſic, a kind of ſmall ſpinnet, eaſily moved, having only one row of keys, and thoſe not to the uſual number, perhaps not to above three octaves, the common ones going to four, or more. See SPINET, *Cycl.*

OCTOPHORUM, among the antients, a carriage with eight wheels.

It alſo ſignified a chair, or litter, *lectica*, carried by eight chair-men, which kind of chair was moſtly uſed by the women. *Piſc.* in voc.

OCTUNX, a word uſed by ſome diſpenſatory writers to ſignify eight ounces.

OCULATA, in zoology, a name given by many to the fiſh more uſually called *melanurus*. It has the name *oculata* from the remarkable largeneſs, and fine golden iris of its eyes. *Willughby's* Hiſt. Piſc. p. 310. See MELANURUS.

OCULATUS *lapis*, the *eyed ſtone*, a name given by Mercatus, in his Metallotheca Vaticana, and by many other writers, to what we call the *pudding ſtone*, a ſtone formed of a great number of pebbles, of a ſmall ſize, immerſed, and formerly bedded, in a flinty cement, little leſs hard than the ſtones themſelves, and in ſome ſpecies not at all ſo. The reſemblance of theſe round pebbles, when the maſs was cut, to the eyes of animals, probably gave origin to this name. It is eaſy to conceive that at the time when theſe ſtones were formed the matter of the cement was ſoft as mud, while the ſtones which are bedded in it were hard, and perfectly formed, otherwiſe they could never have had admiſſion into it. It is alſo natural to ſuppoſe, that as theſe ſtones are placed very irregularly in the maſs, the ends and ſides of many of them muſt be prominent above the reſt, and above the ſurface of the cement; and this we uſually find to be the caſe: but in ſome places we find large lumps of this ſtone, whoſe ſurfaces are naturally ſmooth, as if wrought by art; the external pebbles being thus cut off, as it were, down to the level of the ſurface, and their internal lineations appearing. We find ſeveral ſtones rounded and ſmoothed on the ſurface in this manner, by long lying on the ſhores of the ſea, and being there waſhed about among other hard bodies by the tides. But theſe maſſes are alſo found in gravel pits, and thoſe ſuch as have evidently been ſo ever ſince the formation of the cruſt of the earth after the deluge, and have never been diſturbed, or removed, ſince that time. As a hurry, and violent motion of the water, alone can have occaſioned the wearing down of theſe pebbles on the ſurface of the *pudding ſtone*, and as they have never been in the way of ſuch a motion of water ſince the time of their ſubſiding from among the waters of the deluge, it muſt have been at that time that they were thus rolled about, and rounded; and this is one great proof of the Woodwardian ſyſtem of things at that time; and that the waters, in departing from off the ſurface of the earth, ran with great violence, and carried ſtones, &c. a long way in their current, in which courſe they ſuffered all that the daſhing, and rolling about in the waters of the ſea, could do to ſuch ſtones in a long period of time. See Tab. of Foſſils, Claſs 5. *Mercati* Metall. Vat. p. 139. *Woodw.* Cat. Foſſ. Vol. 1. p. 46.

This *pudding ſtone* is not the only inſtance of this effect of the rapidity of the waters of the deluge in running off from the face of the earth, for there are found in many places great numbers of ſtones which have been parts of ſtrata, or larger maſſes, and which have been broken off, and rolled into the form of pebbles at that time. And among what we commonly underſtand by the name pebbles, we find many which have prominent ridges running round them, which have been veins harder in their matter than the reſt of the ſtone; and therefore, while the reſt has been worn away, theſe have remained leſs worn, and conſequently ſtanding higher than the other parts.

OCULIPETA, in zoology, a ſpecies of ſerpents. See the article TEXMINANI.

OCULUM *aperiens*, in anatomy, a name given by ſeveral authors to a muſcle of the face, called by the generality of writers *aperiens palpebram*, and *aperiens palpebram rectus*; by Albinus, *levator palpebræ ſuperioris.*

OCULUS *beli*, in natural hiſtory, the name of one of the ſemipellucid gems of the genus of the *hydrophanæ*, and called by Dr. Hill *hydrophanes albido-cinereus, flavo-variegatus, nucleo centrali nigerrimo*, or the greyiſh white *hydrophanes*, variegated with yellow, and with a black, central, nucleus. See Tab. of Foſſils, Claſs 5.

It is a very elegant, and beautiful gem. Its baſis, or ground, is a whitiſh grey, variegated with yellow, and ſometimes with red, and a little black, but that more rarely, and is found in ſmall maſſes from half an inch to an inch in diameter; of a rounded figure, and thickeſt in the middle, tapering away gradually to the ſides. The outer part of the ſtone, or that toward the edges all round, is ever of a whitiſh grey, more or leſs variegated with yellow, &c. and its central nucleus is always of a deep and fine black, ſurrounded by a broad circle, of a pale yellow, and repreſenting very beautifully the pupil and iris of the eye; theſe are incloſed in the matter of the ſtone, and are often ſurrounded by other very fine concentric circles, of a pale flame colour; but more frequently there is only the black pupil, ſurrounded by the yellow iris, and that placed in the body of the ſtone which repreſents the white of the eye: the ſhape of the ſtone alſo favours its reſemblance of an eye, and the whole is very elegant. It is of the hardneſs of the agate, and takes a tolerable poliſh; when thrown into water, it has, in a great meaſure, the property of the oculus mundi, the whole ſtone becomes greatly more bright, and lucid, and the grey part becomes of a plainly yellowiſh caſt.

There are many things improperly called *oculus beli* by our jewellers, but the genuine ſpecies is very rare. Nothing is more common than to find in the agates little circular veins of different colours round a central ſpot; theſe the lapidaries frequently cut out, with a proper quantity of the ſtone about them, and call them *oculus beli*. They are not peculiar to the agate, but are common alſo in the cornelian, and ſtand ſometimes,

times ſingle, ſometimes two or three together, and according to the colours of the circles, repreſent the eyes of various animals. *Hill*'s Hiſt. of Foſſ. p. 470.

OCULUS *cati*. See the article ASTERIA.

OCULUS *leporinus*, a diſtemperature of the eyes, called alſo *ectropium*. *Heiſter*'s Surgery, p. 432. See ECTROPIUM.

OCULUS *marinus*, the *ſea eye*, a name given by ſome authors to the *umbilicus marinus*, from its reſemblance to the ſhape of an eye. See UMBILICUS *marinus*.

OCULUS *mundi*, in natural hiſtory, the name of one of the ſemi-pellucid gems of the genus of the *hydrophanæ*. It is of one plain and uniform colour, which is a whitiſh grey, and has no veins, or other variegations. It is found in ſmall maſſes, of the ſhape of our common flints, and pebbles. It has but a very obſcure degree of tranſparence, and is not capable of a fine poliſh. This ſtone, however, though of little beauty, has this very ſingular property, that, when thrown into a baſon of water, in the ſpace of half a minute, it begins to change its appearance, and, very ſoon, inſtead of a pale grey, becomes of a very bright, and conſiderably pellucid, pale yellow, like that of amber, or the yellow cornelian; this it retains as long as it remains in the water, but as ſoon as taken out, and dried, it reſumes its grey colour, and becomes as opake as before, It is found ſo far as is yet known, only in China; but the ſhores of ſome of our own rivers afford us ſtones coming up to its qualities in ſome degree, though not ſo beautifully tranſparent in water as the oriental *Hill*'s Hiſt. of Foſſ. p. 468.

OCULUS *Veneris*, a name given by ſome to the *umbilicus marinus*.

OCYMOPHYLLON, in botany a name given by Buxbaum to a new genus of plants, the characters of which are theſe: the flower is of the ſtamineous kind, having no petals; this ſtands upon the embryo fruit, which afterwards becomes an oblong quadrangular ſeed veſſel, divided into four cells, and containing roundiſh, and very ſmall, ſeeds. Its leaves are like thoſe of the common ocymum, or baſil, whence its name; and its place of growth is in damp marſhes. Boccone has deſcribed it under the improper name of *glaux*, calling it the great, green-flowered, *marſh glaux*. Act. Petropol. Vol. 4. p. 421.

OCYMUM, *baſil*, in botany, the name of a genus of plants, the characters of which are theſe. The flower conſiſts of one leaf, and is of the labiated kind. The upper lip is erect, roundiſh, and crenated, and is larger than the under one, which is curled up, and lightly indented. The piſtil ariſes from the cup, and is fixed, in the manner of a nail, to the hinder part of the flower, and ſurrounded by four embryos, which afterwards become as many ſeeds, of an oblong figure, to which the cup of the flower ſerves as a capſule. This cup is divided into two lips, the upper of which is erect and bifid, and the other divided into ſeveral ſegments, by ſlight notches.

The ſpecies of *baſil* enumerated by Mr. Tournefort are theſe: 1. The clove *baſil*, or *acinos*, of Columna. 2. The great *baſil*, with fimbriated leaves, reſembling thoſe of endive. 3. The broad-leaved, ſpotted, and curled *baſil*. 4. The green *baſil*, with bullated leaves. 5. The green-leaved, fimbriated *baſil*. 6. The common large clove *baſil*. 7. The largeſt clove *baſil*. 8. The large black *baſil*, with a ſtrong ſmell of rue. 9. The citron-ſcented *baſil*. 10. The aniſe-ſcented *baſil*. 11. The common, or middle *baſil*. 12. The white-flowered, common *baſil*, with deep, blackiſh green, leaves. 13. The blue-flowered, common *baſil*, with deep, blackiſh-green leaves. 14. The middle-ſized, curled *baſil*, with a ſhort, conglomerated ſpike. 14. The ſmall, ſerrated, narrow-leaved *baſil*. 16. The ſmall, narrow-leaved *baſil*, with bullated leaves. 17. The three coloured *baſil*. 18. The ſmalleſt *baſil*. 19. The leaſt *baſil*, with purpliſh black leaves. *Tourn.* Inſt. p. 203.

OECOMENIUM, in botany, a name given by the antient Greeks to a plant called alſo *thapſia*, and *cymene*. See THAPSIA and CYMENE.

OECONOMICAL *chemiſtry*. See CHEMISTRY.

OEDEMA (*Cycl.*) — The perſons moſt ſubject to *œdematous* tumors, are people of a phlegmatic habit, and ſuch as have had ſuppreſſions of ſome natural evacuations. Men who have had the hæmorrhoidal diſcharges ſtopped upon them, and women labouring under ſuppreſſions of the menſes, are more than all others ſubject to them. Perſons ſomewhat advanced in age, are, in general, more ſubject than young ones, and women with child, particularly during the more advanced ſtate of their pregnancy, are often afflicted with them. The long holding the legs in cold water, will ſometimes alone occaſion them, and, among the poorer country people, the women who make a cuſtom of ſtanding in the water to waſh their cloaths are often affected with theſe ſwellings in one or both knees. People who have received large wounds, and have had them treated raſhly, with cold applications, are alſo ſometimes thrown into danger of theſe ſwellings. The repelling tumors of other kinds, and ſometimes the ſtriking in an eriſipelas, or other cutaneous eruption, will alſo occaſion them; and ſometimes people who have been treated with too hot a regimen in acute fevers are ſubject to ſwellings in their feet, which though they appear red, and are hot at times, yet, when ſtrictly examined, appear to be truly *œdematous*.

Prognoſtics in this caſe. *Oedematous* ſwellings are always very obſtinate, and tedious in their cure; but they are the more ſo when their cauſes are the more complicated, and more things than one conſpire to their origin. None of theſe ſwellings are ſo eaſily cured, as thoſe which ariſe from external injuries, or ſimple refrigeration; and thoſe which ariſe from cutaneous humors ſtruck in, are often found very eaſy of cure, provided that they are not of very long ſtanding: and, in general, ſuch as are very cold when out of bed, and always very hot when in it, are more difficult of cure than others. But this is to be obſerved, that there is great difference between a cure of theſe tumors, and the only ſtriking them in; the latter caſe being very often attended with much worſe complaints than the tumors themſelves, the too frequent conſequences of ſuch retropulſions being inflammations of the abdomen, and præcordia, and abſolute dropſies.

Method of cure. The firſt ſtep towards a cure muſt be the correcting the mucous and viſcid ſtate of the humors: this is beſt done by the neutral ſalts, as tartarum vitriolatum, and the like; and by gum ammoniacum, the roots of pimpernel, and woods of ſaſſafraſs, guaiacum, and the like, with the warm aromatics, as ginger, and the ſpices, and carminative ſeeds. The matter, when thus attenuated, is to be evacuated by purges of a ſtrength proportioned to the conſtitution of the patient, and, after this, the true tone of the parts is to be re-eſtabliſhed by chalybeates, and the part to be ſecured from a relapſe with a large bandage, and with warm and ſtrengthening fomentations. It rarely happens that theſe ſwellings ulcerate, but when they do, there is no application ſo proper as the liquor of myrrh. *Junker*'s Conſp. Med. p. 410.

The method of treating *œdematous* tumors is very different according to the different cauſes to which they owe their riſe. The external method of treating theſe tumors in the legs and feet is uſually to have recourſe to frequent frictions with warm cloths; theſe are to be repeated every night and morning, and the parts to be rubbed each time till they appear very red, and are hot; the limb is then carefully to be preſerved from the injuries of the cold air, and it is a very proper method to wear ſtockings made of ſome warm furr, and to lie with hot bricks, wrapped up in cloths, near the legs and feet, to divide, and attenuate the blood: a proper bandage is, after theſe methods, to be applied, which is to aſcend gradually from the feet up to the knees; this ſtrengthens the limb, and prevents a ſtagnation, and collection, of the blood in any part of it. Proper ſtrengthening internal medicines muſt be given during all this time; and, after the trying what has been already directed, ſtrengthening remedies are to be attempted externally alſo: to this end the limb may be placed over burning rectified ſpirit of wine, wrapping it up in cloths in ſuch manner that it may receive the ſteam; this will encline the ſtagnating fluids to eſcape through the ſkin, or elſe render them fit to return into the circulation, and at the ſame time will do much toward reſtoring the proper tone of the limb. In many families it is a ſecret to apply the herb great celandine, bruiſed in manner of a pultice, either alone, or mixed with the perſicaria acris or water pepper, and great benefit is ſometimes obtained by theſe herbs, for they are very active medicines, and powerful reſolvents. Others apply alſo for the ſame purpoſe, the lepidium, or pepper-wort, and horſe-radiſh root, ſcraped, and moiſtened with white wine; but the moſt excellent remedy of this kind is the cataplaſm made of pidgeon's dung, mixt with common ſalt and vinegar, and applied warm, and often removed. A fomentation of no ſmall uſe is made alſo of a lee made of oak aſhes, mixed with ſmith's forge water, adding a little ſpirit of wine, and a ſmall quantity of alum. This may be applied with ſtuphs or the legs may be bathed in the liquor, as warm as it can well be borne, twice a day. Spirit of wine alſo, either alone, or mixed with lime water and alum, or lime water alone, are good fomentations; and another from which great benefit has been received is this: take ſpirit of wine, and common vinegar, of each a pint; crude alum an ounce and half; vitriol an ounce; mix all together, and uſe it as the foregoing. Great care muſt always be taken after the uſing theſe, or the like fomentations, that the limb be well covered with bandages and ſtockings; the patient muſt alſo, during the time, drink ſparingly, and uſe moderate exerciſe frequently. The medicinal waters, eſpecially the ſulphureous, often do ſervice in theſe caſes, but they do not always ſucceed. Dr. Harris relates, that he has cured the moſt dangerous of theſe caſes, with a mixture of the aperient ſaffron of ſteel, and the bark. Others ſpeak of having performed cures with the bark alone; but there are not wanting ſome who declare this to be a very dangerous method. *Heiſter*'s Surgery. p. 232.

OEDICNEMUS, in zoology, the name of a bird called alſo *charadrius* by Geſner and Aldrovand, and in Engliſh the *ſtone curlew*. It is a conſiderably large bird, weighing eighteen ounces. Its beak is about two fingers breadth long, and is ſtrait, pointed at the end, and partly black, partly yellow. It has a naked, yellowiſh, green membrane under its eyes; its legs are long, and yellow; and it has only three toes, having no hinder one. Its thighs are naked half the way up, as

in other water birds. Its breaſt and thighs are white. Its throat, back, and neck, of a mixture of reddiſh brown and black, much like the colour of the curlew; whence the Engliſh have very improperly called it the *ſtone curlew*. The under part of its tail is reddiſh. It breeds very late, the young being often found callow at the latter end of October. It lives principally in watery places, and flies in the night, making at that time a very remarkable ſhrill noiſe. *Ray*'s Ornithol. p. 227.

OENANTHE, *water dropwort*, in botany, the name of a genus of umbelliferous plants, the characters of which are theſe: the flower is of the roſaceous kind, compoſed of ſeveral heart-ſhaped petals, which are irregular in ſize, and are diſpoſed in a circular form, on a cup, which afterwards becomes a fruit compoſed of two oblong gibboſe ſtriated ſeeds, which are flatted and ſmooth on their inner ſide, and end in a ſort of prickles, the middle one of which is longer and ſtronger than the others. The ſpecies of *œnanthe* enumerated by Mr. Tournefort, are theſe. 1. The parſley-leaved *œnanthe*. 2. The ſea *œnanthe*, with blackiſh-coloured, parſley-like leaves. 3. The Portugal *œnanthe*, with the leaf and the ſmell of parſley. 4. The chervill like *œnanthe*, or poiſonous, hemlock *dropwort*. 5. The ſtaphylinus-leaved *œnanthe*. 6. The common water *œnanthe*. 7. The rue-leaved, water *œnanthe*. 8. The proliferous, water *œnanthe*. 9. The *œnanthe* with black and long roots. And, 10. The Portugal *œnanthe*, with a thick globoſe ſeed. *Tourn.* Inſt p. 312.

One of the ſpecies of this plant, diſtinguiſhed by its yellow juice, and by its growing near waters, is a very terrible poiſon. Many accounts have been given of people dying by it, but none which ſets its terrible effects in ſo juſt a light, as one which happened very lately to ſome French priſoners with us, and which is recorded in the Philoſophical Tranſactions. Eleven French priſoners had the liberty of walking in, and about, the town of Pembroke; three of them being in the fields a little before noon, found, and dug up, a large quantity of this fatal plant, with its roots, taking it to be wild celeri, in order to eat it with their bread and butter, after dinner; and, when they had waſhed it, they all three taſted, or eat a ſmall quantity of it, in the fields.

As they were entering the town, one of them, without any previous notice of ſickneſs at the ſtomach, or diſorder in the head, was immediately ſeized with convulſions; the other two ran home, and ſent a ſurgeon to him, who attempted to relieve him by bleeding, but in vain, for he died in a very little time. The other two priſoners, wholly ignorant of the cauſe of their comrade's death, and of their own danger, gave the roots they had brought in to the other eight priſoners, who all eat more or leſs of them with their dinner. A little while after dinner, the two remaining perſons who had gathered the roots, were ſeized in the ſame manner as the firſt, and one of them died, but the other recovered, having been blooded, and a vomit having been, with great difficulty, forced down his throat, as his jaws were, in a manner locked together. The other eight were all immediataly bled, and vomited, and all recovered.

It is obſervable that none of theſe perſons had thoſe comatoſe ſymptoms which are well known to attend thoſe who have eaten the common cicuta, or hemlock.

This root is well known in all that part of England under the name of the *five-fingered root*, and is in frequent uſe externally with the common people, for the felon, or worſt ſort of whitloe. The Frenchmen eat only the root, and none of the leaves, or ſtalk.

It is extremely neceſſary that this dangerous plant ſhould be well known, as it grows very plentifully with us all about the banks of the Thames; and Mr. Watſon has cauſed a fine drawing, both of this, and of another poiſonous plant which it is often confounded with, the cicuta aquatica, or water hemlock of Wepfer, to be prefixed to that number of the tranſactions where this account is given: and this ſeems the more neceſſary, as the plant ſeems to have been miſtaken in a manner by all the world, not only the common people, but the more verſed in plants, having miſtaken it at times for ſeveral very different things. The ſame gentleman informs us from various authors, that eight lads in Ireland had been poiſoned by it, miſtaking it for the root of the water parſnip; two men died by miſtaking it for the Macedonian parſley; and Wepfer, who wrote an expreſs treatiſe on the poiſonous nature of the water hemlock, has confounded this plant with it, ſaying, that Lobel had deſcribed the water hemlock, under the name of this *œnanthe*, or *dropwort*; and the generally accurate Hoffman, when treating of the vegetable poiſons, makes no mention of the difference between theſe two plants.

Neither the roots of this *œnanthe*, or thoſe of the cicuta aquatica, or water hemlock of Wepfer, have any diſagreeable flavour to deter thoſe who taſte of them from eating, and they both occaſion violent convulſions, and death, if not timely prevented. The intention of cure ſeems in both the ſame; firſt by emptying the ſtomach and inteſtines as ſoon as poſſible, and then cauſing the patient to drink largely of oleaginous fluids; there is great difficulty, however, of getting the patient to ſwallow any thing, the jaws being faſtened together by the ſpaſm; after the ſtomach has been freed from this pernicious vegetable, the ſymptoms have generally abated by degrees, and the patient has recovered.

Threlkeld mentions this plant as growing in Cumberland, where the people call it *dead tongue*, and uſe it as a pultice to the galled backs of their horſes. The German botaniſts do not mention it as growing among them, nor Haller in his *Enumeratio ſtirpium Helvetiæ*, whence it ſeems to be ſeldom met with, except in England, Holland, and ſome parts of France. Phil. Tranſ. N° 481.

OENANTHE, or *dropwort*, in botany, is alſo a name originally given by the antient Greeks to the flowers of the wild vine. It was afterwards made to expreſs alſo the flowers of the common manured vine, and the young grapes while ſmall, and juſt appearing from the flowers. Theſe, with the tendrils, and ſmall leaves of the vines, were ſometimes uſed for the making garlands, and ornamenting other things; and after this, another plant of a very different nature became uſed on the ſame occaſions, and called by the ſame name.

Pliny ſuppoſes that the umbelliferous plant *œnanthe*, was ſo called from its flowers having the ſmell of grapes; but we find this to be a mere imaginary notion, for Meander, and many other of the Greek writers, declare the flowers of the *œnanthe* to have no ſmell at all; but ſuppoſe that they were called *œnanthe* from their growing in cluſters like thoſe of the vine.

The herb *œnanthe* became famous in the ointments of the Greeks, which were intended to rub the body with, to give ſtrength, and to take off laſſitude, or wearineſs. Many have doubted whether the *œnanthe* uſed in theſe compoſitions was the flower of the vine, or the plant *œnanthe*; but Theophraſtus clearly decides this in favour of the plant, and ſays, that not only the flowers, but the leaves of it, were uſed for this purpoſe; but then he diſtinguiſhes the plant into two kinds. His account is, that the Cyprian *œnanthe* was very ſweet-ſcented, and grew upon the mountains, and in other dry and barren places; and that the *œnanthine* ointment was made with its leaves and flowers, but that this could not be made with the Grecian *œnanthe*, becauſe that had no ſmell. Dioſcorides runs counter to this; and ſays, that the *œnanthine* ointment was made of the flowers of the wild vine, and that that was always eſteemed the beſt which ſmelt moſt ſtrongly of the flowers of that ſhrub. It appears therefore that there were two different ointments of this name in uſe among the Greeks.

Pliny, that he may loſe nothing in his deſcription of the *œnanthe*, copies both Theophraſtus and Dioſcorides in their accounts of this plant; and, in conſequence, has put together a wholly confuſed, and unintelligible relation of the nature and virtues of this plant.

OENANTHE, in zoology, the name of a genus of birds of the ſmaller ſize, of which there are four ſpecies: 1. The common *œnanthe*, called the *fallow-finch*, or *wheat ear*. 2. The *œnanthe* called *anthus*, and *ſterus*; and in Engliſh, the *whinchat*. 3. The *œnanthe* called *rubetra*, and in Engliſh the *ſtone-chatter*, or *moortitling*. 4. The American *œnanthe*, or *guirarhu nheengeta*. *Ray*'s Ornithol. p. 169, 170. See the articles WHEAT-*ear*, WHINCHAT, &c.

OENARIA, a name given by the antients to aſhes prepared from the leaves, tendrils, and young ſtalks of the vine. They were accounted highly diuretic.

OENOGALA, a word uſed by Hippocrates, and other of the Greek authors to expreſs a mixture of milk and wine for immediate drinking. Others have uſed it to expreſs wine alone heated, ſo as to be juſt as warm as new milk.

OENOMANTIA, Οινομαντια, in antiquity, a ſpecies of divination by wine, which is done by making conjectures from the colour, motion, noiſe, and other accidents of the wine of libations. *Potter*, Archæol. T. 1. p. 319.

OENOS, in zoology, the name uſed by authors for the *ſtock-dove*, or *wood pigeon*, called alſo by ſome *vinago*, ſomewhat larger than the common pigeon, but of the ſame ſhape and general colour. Its neck is of a fine changeable hue, as differently oppoſed to the light; and its breaſt, ſhoulders, and wings are of a fine purpliſh hue, or red wine colour, from whence it has its name *vinago*. Its legs are red, and feathered a little below the joint. *Ray*'s Ornithol. p. 136.

OENOSTAGMA, a name given by ſome of the chemical writers to *ſpirit of wine*.

OEPATA, in botany, a name by which ſome authors have called the tree which produces the fruit called *anacardium orientale*, or the Malacca bean. Hort. Mal. Vol. 4. p. 95.

OESTROMANIA, a name given by ſome authors to the uterine diſorders which ſometimes affect young women, and is commonly called *furor uterinus*.

OESTRUM (*Cycl.*) — OESTRUM, in zoology, the name of a ſpecies of fly, called alſo ſometimes the *gad-fly*, *breeze-fly*, and *aſylum*. It is a very troubleſome creature to oxen, but is not ſo common as ſome ſuppoſe. It is never found, except in the neighbourhood of waters: the head is green; the body yelloviſh; the eyes are very large; and the trunk long, and remarkably ſtrong. It flies very ſwiftly, and without noiſe. Mouffet mentions, beſide our Engliſh kind, two others, the one from Virginia, the other from Muſcovy; the firſt very large, having a great head, and a white ſtreak down the ſhoulders; the latter remarkable for having wings of a ſilvery colour, reaching beyond the body.

OESTUM *Veneris*, a name given by ſome anatomical authors to the *clitoris*.

OETHODES *ulcus*, a term uſed by the Greek writers for ſuch ulcers as had tumid, and callous lips; and as ſuch ulcers are uſually very difficult to heal, the word became afterwards appropriated to all ſorts of ulcers difficult to cure.

OFF-*ſet-ſtaff*, in ſurveying, a rod, or ſtaff, of any convenient length; for inſtance, of 10 links of the chain. This ſtaff is divided into 10 equal parts. Its uſe is for the ready meaſuring the diſtances from the ſtation line of things proper to be repreſented in a plan. See CHAIN.

OFF-*ward*, in the ſea language, the ſame with contrary to the ſhore; thus they ſay, *the ſhip heels off-ward*, when, being aground, ſhe heels towards the water ſide; *the ſhip lies with her ſtern to the off-ward, and head to the ſhore-ward*, when her ſtern is towards the ſea, and head to the ſhore.

OFFA *alba*, (*Cycl.*) in chemiſtry, a concretion produced by a due mixture of ſpirit of urine, or ſpirit of ſal armoniac with the ſpirit of wine. Some call it the *offa alba* of Paracelſus [a], others of Van Helmont, whence it is ſometimes called *offa Helmontiana*; but Van Helmont was not the inventor of it, but Raim. Lully, ſays [b] Boerhaave.

The manner of making the *offa alba* is deſcribed in this laſt author [c], who obſerves it to be difficult, as it requires both liquors to be perfect, and ſome nice circumſtances to be obſerved. — [a *Boyle*'s Works, abridg. Vol. 1. p. 32. b *Boerh.* Chem. Vol. 2. proc. 122. c Id. ibid.]

Van Helmont [a] endeavours to account for the formation of the ſtone in the bladder, from this experiment; but, as Boerhaave [b] obſerves, the *offa alba* has nothing in common with the ſtone. — [a *Boyle*, loc. cit. b Ibid.]

Boerhaave recommends this mixture as a good deobſtruent, taken in Canary faſting. Ibid.

OFFENCE, *delictum*, in law, an act committed againſt the law, or omitted where the law requires it. *Weſt*, Symbol.

Offences are diſtinguiſhed into two kinds, viz. ſuch as are capital, and ſuch as are not. Capital *offences* are thoſe for which the offender is to loſe his life. Thoſe not capital, where the offender may forfeit his lands, and goods; be fined, or ſuffer corporal puniſhment, or both, but not loſe his life. *Hale*, P. C. 2. 126, 134. Under capital offences are comprehended high treaſon, petit treaſon, and felony: and offences not capital include the remaining part of the pleas of the crown, and come under the title of miſdemeanours.

Some *offences* are puniſhable by the common law, but moſt of them by ſtatutes.

OFFICIARIIS *non faciendis, vel amovendis*, a writ directed to the magiſtrates of a corporation, requiring them not to make ſuch a man an *officer*, or to put one out of the *office* he hath, until enquiry is made of his manners, &c. Reg. Orig. 126. *Blount*, *Cowel*.

OFFION, a name uſed by ſome of the medical writers for *opium*.

OIL (*Cycl.*) — The uſe of *oil* in ſtopping the violent ebullition of various ſubſtances, may be very great in many occaſions of life. It is well known that if a mixture of ſugar, honey, or the like, be boiling on the fire, and in danger of riſing over the ſides of the veſſel, the pouring in a little *oil* immediately makes it ſubſide. In many caſes the marking a circle round the inſide of a veſſel, in which a liquor of this kind is to be boiled, with a piece of hard ſoap, ſhall, like a magic ring, confine the ebullition to that height, and not ſuffer it to ſtir any farther. This is wholly owing to the *oil*, or fat contained in the ſoap: but there is, beſide theſe, another very important uſe of *oil*, on a like occaſion, which is the pouring a little of it on any metallic ſolution, while making; this reſtrains the aſcent of the noxious vapours; preſerves the operator from danger; and, at the ſame time, by keeping down the evaporating matter, gives redoubled ſtrength to the menſtruum.

Animal OIL, *oleum animale*, in medicine, the name of an eſſential *oil* diſtilled by a retort from blood, and recommended as a powerful remedy in epilepſies, the gout, and other obſtinate diſeaſes.

It was originally uſed in Germany in theſe intentions, and has become of late much uſed in England, but ſhould not be given too freely as an internal. As an external, it may probably be of good ſervice in removing fixed pains, removing hard tumors, &c. for it is extremely penetrating. *Shaw's* Lectures, p. 147.

OIL *of camphor*, a name given by the chemiſts to a ſolution of camphor in ſpirit of nitre. It is uſed to exfoliate carious bones, and on other the like occaſions It is obſervable, that camphor, which is ſoluble in this acid, in the proportion of one half its quantity, is not at all ſoluble in ſpirit of vitriol, ſpirit of alum, or diſtilled vinegar; and that it is the only known vegetable reſin that is ſoluble in this menſtruum. See CAMPHOR

Chemical OILS, a name given by ſome to the eſſential *oils* of plants, and other ſubſtances ſeparated in diſtillation, and ſwimming on the ſurface of the water, where the alembic is employed. They are diſtinguiſhed by this title from the expreſſed *oils*, ſuch as thoſe of almonds, linſeed, olives, and the like, which are made by ſo ſimple a proceſs as mere ſqueezing. See *eſſential* OILS, infra.

To procure this chemical principle pure and unmixed from the matter diſtilled from a vegetable body, the unctuous matter obtained from the proceſs, may be waſhed from its adhering ſalts, and groſſer earth, in warm water, barely by ſhaking them in a glaſs together, then ſeparating the *oil* from the water by means of the common ſeparating glaſs; in which, if the *oil* be ſpecifically heavier than the water, it ſinks to the bottom, and may be ſuffered to run out firſt, by means of the pipe of that glaſs which has its inſertion at the bottom; if ſpecifically lighter than the water, it may be kept behind, as it floats on the top of the water, while all that is poured off, and has carried the groſs fæculent parts with it. *Shaw's* Lectures, p. 150.

Connecting OIL, in chemiſtry, a term uſed by Boerhaave, and his followers, to expreſs a certain *oil*, found in all vegetable ſubſtances, but wholly differing from, and independent of, their eſſential *oil*. This is not poſſeſſed of any of their virtues, or qualities, but ſeems the ſame in all plants, and is the means of their conſiſtence and ſolidity, giving tenacity to their earth, which, without it, falls to duſt, and the plant exiſts no more.

This *oil* is not ſeparable by boiling water, as the eſſential *oil* is, but only by fire: when a plant has been boiled, and diſtilled, its eſſential *oil*, ſalt, &c. are all carried off, and what remains is only the earth connected by this *oil*. This being expoſed to the fire, the *oil* diſcovers itſelf in a thick, black, ſtinking ſmoak, and finally, taking fire, it burns away, and leaves only the earth which was the baſis of the plant, retaining its form, indeed, if the proceſs have been carefully made, but falling into a ſhapeleſs powder only on being roughly breathed upon.

This great author, therefore, eſtabliſhes it as a rule, that there are three ſorts of *oils* in plants. 1. An *oily* froth. 2. The *eſſential oil*, diſſolved in decoction. And, 3. This *connecting*, or *conſolidating oil*, ſeparable only by a naked fire. *Boer.* Chem. Part 2. p. 20.

Eſſential OIL. There is found in every plant analyſed by diſtillation, an *eſſential oil*; but this is very different from the ſame plant, both in its quantity and in its qualities, as it is managed in the operation.

If a plant be thrown into a retort, and diſtilled with a violent fire, it is known to yield leſs *oil*, than if the fire were more moderate: if the plant be fermented, eſpecially if it be of the aromatic kind, it always yields much more *oil* after this operation, than it does without it.

It is plain from hence, that there are methods of obtaining more *oil* from the ſame plant, than would be yielded by it in the common way; and it is as certain, that according to all the methods in common uſe, there is ever left a large quantity of the *oil* behind; and therefore, that a way may poſſibly be invented of drawing yet more from the ſame plant than is yet known to be done. We all know, that when the reſiduum in the retort, after the diſtillation of the plant, is burnt in the open air, it loſes half, or often three fourths of its weight, and the matter evaporated in this burning to cauſe this great diminution can be only the remainder of the *oil* of the plant, which would not be ſeparated from its earth in a cloſe veſſel.

It may be obſerved alſo, that the *oil* of a plant, in the diſtillation by the retort, never comes over till toward the end of the proceſs, and drops from the neck of the veſſel at the ſame time with the acid ſpirit of the plant, and while the urinous volatile ſalt is alſo riſing; ſo that the three principles are, in a manner, all ſeparated from the plant together: when there is a large portion of acidity in the plant, and but a ſmall quantity of urinous ſalt, it is alſo conſtantly obſerved, that there is a larger quantity of *oil*, and that this *oil* is more fluid, and that the caput mortuum diminiſhes leſs in burning. This particular is remarkably obſervable in the analyſes of mallows, prunella, melilot, and ſouthernwood. On the contrary, ſuch plants as yield but a ſmall quantity of acid ſpirit, or volatile ſalt, always afford but little *oil*, and that *oil* is always thick, and the caput mortuum of theſe plants diminiſhes greatly in burning; that is, a great quantity of the *oil* was entangled in the earthy matter, and could not get looſe, otherwiſe than by burning the plant in the open air. Inſtances of this ſort are found in the analyſes of the *caltha paluſtris*, &c.

Hence it appears, that the acid and volatile ſalt in plants are greatly inſtrumental to the diſengaging their *oil*, and giving it ſeparate in diſtillation. Hence when a plant does not contain acid enough in itſelf to diſengage its *oil*, it appears no ill method to try to aſſiſt the ſeparation by the addition of another acid of the vegetable kind.

To try this, Mr. Homberg firſt diſtilled a certain quantity of fennel-ſeed in the common way, and afterwards diſtilled the ſame quantity of the ſame ſeed, in the ſame manner, except that he added for every pound of the ſeed four ounces of ſpirit of ſalt to the water in which it was put for diſtillation This laſt diſtillation yielded one third more *oil* than the firſt Both the *oils* were equally clear, and ſtrong-ſcented of the ſeeds, but the laſt ſeemed to ſmell leſs of the fire than that obtained by the ſimple diſtillation in the common way. There is no doubt but that the ſpi-

rit of ſalt in this proceſs not only encreaſed the natural ferment in the liquor, which is neceſſary to the ſeparation of the *oil*, but that it alſo attenuated the particles of the *oil* in the ſeed, and made them much more eaſily ſeparate themſelves, and riſe with the heat, than they would otherwiſe have done. What not a little confirms this opinion alſo, is the known experiment of rendering camphor liquid by means of acid ſpirits. Mem. Acad. Par. 1700.

The modern chemiſts have not looked upon the *oil* as one of the genuine principles of the plant it is drawn from, as has been the cuſtom among writers of earlier date. They know that theſe *oils* are themſelves mixed bodies, and capable of another analyſis, by which they are ſeparated into ſalt, phlegm, and earth. Theſe three principles conſtitute all *oils*; but theſe differ greatly in different plants, and that perhaps, more from their manner of admixture than from their different quantities. That bodies of the ſame kinds, variouſly mixed, may have theſe different appearances, is in nothing more evident, than in the mixture of quickſilver, and ſulphur; if this be done only by grinding, the reſult is a black powder; but, if they are ſublimed together, they form a red, bright, compact body, formed of ſeveral congeries of ſtriæ, called cinnabar. And, in the ſame manner, the ſame principles, phlegm, ſalt, and earth, may, according to the different manner of their mixture, form *oils* of very different natures one from another: nor is this all the ſource of their difference, for, by our own management of them, we make them appear in very different forms, in the ſame ſpecies. Thus the *oil* naturally contained in a ſeed is produced from it, according to our different management, in three different forms. To inſtance this: in the *oil* of aniſeed if we heat and preſs this ſeed, we draw what is called an *oil* by expreſſion, a fattiſh ſubſtance, of the nature of *oil* of olives, almonds, and the like, and with only a moderately acrid taſte; if we diſtil it with water in an alembic, we obtain the *eſſential oil*, or common *oil* of aniſeed; and if we diſtil it dry by the retort, we obtain a fetid, thick, and empyreumatic *oil*. The *oil* in the ſeed is evidently the ſame, but it puts on theſe forms according to our pleaſure. Mem. Acad. Par. 1707.

Expreſſed oils, as well as balſams, and reſins, when applied to the animal bodies, increaſe putrefaction, and are the moſt effectual ſuppurants and incarners. *Monro*, in Med. Eſſ. Ed. Vol. 5. Art. 24.

It may be eaſily ſeen from this, that little knowledge of the nature of the *oils* of plants is to be obtained from the common analyſes; the way to truly underſtand them, is to mix them with different ſubſtances, and to digeſt them alone, and, in mixture with thoſe ſubſtances, to try the different events.

Mr. Geoffroy made a multitude of experiments on the *oil* of thyme with this view, and, from the events of theſe, has made ſeveral very fair deductions as to the cauſes of the different colours of the flowers of plants.

A large quantity of dried thyme being diſtilled with water, in earthen cucurbits, yielded him a pure deep yellow *oil*; this he rectified by diſtilling it again, with a great quantity of water; and, by this means, obtained a pale yellow *oil*, which he uſed for all his experiments.

He divided the *oil* into ſeveral parcels, and with one he mixed diſtilled vinegar; with others the acid ſpirits of nitre, vitriol, and ſea ſalt, ſeverally reduced by a mixture of water to the ſtrength of common vinegar, which is about the ſtandard of the acidity found in the juices of plants. All theſe mixtures were ſet in digeſtion, and the *oil* became of a deep ſaffron colour. If the acid ſpirits had been uſed in their native ſtrength, they would have immediately burnt up the *oil*. Another parcel of the *oil* was digeſted with ſpirit of ſal armoniac made with lime. This paſſed all the degrees of yellow, of red, and of purple; and finally became of a true violet-blue. Spirit of urine, and that of ſal armoniac with ſalt of tartar, produced alſo the ſame changes, except that the degrees of colour differed.

On the contrary, the fixed alkali of *oil* of tartar digeſted with the ſame *oil*, only changed it to a deep brown. *Oil* of tartar added to the *oil* with ſpiris of ſal armoniac, when it is yet only of a fine purple, turns it to a deep blue; and diſtilled vinegar mixed with it in the ſame ſtate, turns it to a deep blackiſh colour; this mixed with ſpirit of wine, tinges it to a greyiſh colour; and a little *oil* of tartar being then added, it becomes green, and that colour does not go off. If diſtilled vinegar be added to this mixture, it deſtroys at once the alkali, and the green colour which was owing to it, and gives the *oil* its original yellowiſh hue.

Oil of thyme which has been made blue by means of *oil* of tartar, being mixed with ſpirit of wine, the whole appears grey, and, on adding more *oil* of tartar, it becomes blue; diſtilled vinegar takes off this blue colour, leaving the liquor rediſh; and more *oil* of tartar makes it blue again.

It appears from theſe laſt experiments, that *oil* of tartar acts differently on the *oil* of thyme, according to its different ſtate; turning it blue or green, according as it is rarified, or concentrated. It ſhould ſeem alſo, that the ſpirit of wine contained a latent acid, ſince all its effects on the *oil* of thyme are overpowered by a mixture of *oil* of tartar.

Mr. Geoffroy was at the pains of trying this whole courſe of experiments on ſeveral other *eſſential oils*, as thoſe of lavender, juniper, turpentine, and others, but they did not produce the ſame effect on all. Hence it appears that there is great difference between the *eſſential oils* of different plants, in regard to the effects of other bodies on them.

The ſame courſe of experiments he tried on other *oils*, not of the vegetable kingdom, and, among theſe, he found none, except that of yellow amber, which at all approached to the nature of *oil* of thyme.

This *oil*, mixed and digeſted with ſpirit of ſal armoniac, acquires a purple colour; *oil* of tartar mixed with this, does not change its colour, but when ſpirit of wine is added to this mixture, the *oil* of tartar becomes blue, while the *oil* of amber continues of its purple colour.

There ſeems to be a certain degree of denſity neceſſary in an *oil* to render it capable of all the changes of colours; this denſity ſeems perfectly hit in the *oils* of thyme and amber, and all the changes of the colours that are given to them, ſeem only the effect of rarifying, or condenſing them. If they are rarified to the utmoſt, by being mixed with ſpirit of wine, they become colourleſs and tranſparent; and, if condenſed in the higheſt degree, as in the experiment with the diſtilled vinegar, they become blackiſh. Theſe are the two extremes, and all the other colours are but degrees and ſhades approaching to, or receding from, one or the other of theſe. The *oils* naturally more rarified, ſuch as *oil* of turpentine, and the like, have naturally no colour, nor can receive any from theſe proceſſes; only if the mineral acids be mixed with them in their full ſtrength, they burn them up to a ſort of reſin, and, finally, to a black maſs, reſembling charcoal. But, perhaps, future attempts may teach us an art of ſo modifying the particles of theſe *oils* as to render them ſuſceptible of all the changes that *oil* of thyme is.

The colours of the leaves and flowers of plants are of the ſame nature with thoſe produced in the *oil* of thyme, in thoſe proceſſes; and, as chemiſts, in general, agree that all colours are the reſult of ſulphurs differently acted upon by ſalts, perhaps, great light may be given into their nature and origin from theſe experiments. Mem. Acad. Par. 1707. See the article *Colours of* FLOWERS.

The *eſſential oils* of vegetables may be divided into two claſſes, according to their different ſpecific gravities, ſome floating upon water, and others readily ſinking to the bottom thereof. Thus the *eſſential oils* of cloves, cinnamon, and ſaſſafras, readily ſink, but the *oils* of lavender, marjoram, mint, &c. ſwim upon the water. The lighteſt of all the *eſſential oils*, is, perhaps, that of citron peels, which even floats on ſpirit of wine; and the heavieſt of them ſeems the *oil* of ſaſſafras.

For the obtaining the full quantity of the more ponderous *oils* from cinnamon, cloves, ſaſſafras, &c. it is proper, 1. To reduce the ſubjects to fine powder. 2. To digeſt this powder for ſome days in a warm place, with thrice its quantity of ſoft river water made very ſaline with the addition of ſea ſalt, or ſharp with *oil* of vitriol. 3. To uſe the decoction left in the ſtill, inſtead of common water, for a freſh digeſtion. 4. To uſe alſo, for the ſame purpoſe, the water of the ſecond running, after it has been cleared of its *oil*. 5. Not to diſtil from too large a quantity of the ſubject at once. 6. To leave a conſiderable part of the ſtill empty. 7. To uſe a briſk fire, or a ſtrong boiling heat at firſt, but to ſlacken it a little afterwards. 8. To have a low ſtill-head, with a proper internal lodge, and current, leading to the noſe of the worm. And, 9. To cohobate the water, or pour it back upon the matter in the ſtill, after ſeparating its *oil*, and repeating this once or twice more. *Shaw*'s Lectures, p. 141.

Eſſential oils, when applied to the human body, ſtimulate, exode, reſiſt putrefaction; and, mixed with the blood, raiſe ſome degree of fever. Med. Eſſ. Edinb. Vol. 5. Art. 24.

The vegetable world affords vaſt variety of *eſſential oils*, moſt of them very odorous, and of great virtues.

The *eſſential oils* of many of the plants uſually diſtilled have their peculiar reſervoirs in the plant. Mr. Geoffroy perceiving this, determined to ſearch for them through the different parts of the plants, and enquire into the reaſon of ſeveral precautions which are always found neceſſary, in order to ſucceed in the diſtillation of them. See OIL-*bladders*, infra.

From what has been ſaid above, it appears, that the *oils* in common uſe are of three different kinds. The firſt are mere *oily*, or fatty bodies, extracted either by expreſſion, or by decoction: of the firſt kind are thoſe of almonds, linſeed, nuts, olives, and the like; and of the other, that of bay berries, and the like, which are procured by boiling the ſubſtance, on which the *oil* collects itſelf on the top of the water.

The ſecond kind of *oils* are thoſe extracted from vegetables, by common diſtillation by the alembic, with the help of water; theſe contain the *oily* and volatile part of the plant, and carry, by way of pre-eminence the name of *eſſential*, or *ætherial oil*

The third ſort of *oils* are the fetid ones, which are, in like manner, produced by diſtillation, but by means of a different diſtillation in a naked fire, and without the aſſiſtance of water.

It ſeems to follow from this account, that the *ethereal*, or *eſſential oils* are the volatile exalted ſulphurs of thoſe plants; and as ſulphurs are the baſis of all ſmells, it is eaſy to be preſumed, that all ſweet-ſcented plants have an *eſſential oil* in ſome of their parts. The balſams, and reſins, which we find in many vegetables, ſeem to have their origin from the *eſſential oils* of the trees or plants they belong to, and which are uſually found greatly to abound with them. Indeed, in the balſamiferous trees, the liquor which flows out on wounding the trunk, may very properly be eſteemed a ſort of *eſſential oil* of a harder conſiſtence than the common ones. Of this nature are the balſam of Capivi, of Gilead, and the reſt; and theſe very *oils*, farther indurated, furniſh us alſo with the ſcented reſins, ſuch as benjamin, myrrh, and the like.

All *eſſential oils* become thick and reſinous on being mixed with any foreign acid; they alſo acquire the ſame conſiſtence of themſelves in long keeping, and that partly from the ſame principle; their ſubtler parts evaporating give room for the acid ſalt, which they naturally contain, to diſplay its power; and being then in an over-proportion to the reſt, it does not fail to act upon the whole in the ſame manner that any other acid would. Thus the *oil* remains no longer what it was, but becomes a reſinous ſubſtance, of a ſmell reſembling turpentine.

Chemiſtry is not, however, without its reſource on this occaſion; for this thickened *oil* being mixed with a large quantity of water, and diſtilled in a balneum mariæ, a great part of it will come over with all its wonted fluidity, limpidity, and odour; but even this new diſtilled *oil* is not exempted from the ſame change again. This diſadvantage in the keeping the *eſſential oils* diſtilled in the common way, has occaſioned Mr. Geoffroy to contrive another method of making them. This renders them more limpid and fluid than in the common way, and they are never ſubject to grow thick; but the medium not being water, ſo much of the *oil* cannot be procured from the ſubject, becauſe ſome is abſorbed and ſtained in the medium. The inſtance this gentleman gives of his new method is in the eſſence of citron, and is this:

A common alembic is to be filled with the thin pared, external rinds of the fruit; a ſufficient quantity of ſpirit of wine is to be poured on theſe, and the veſſel being well cloſed, the whole is to ſtand ſome time in digeſtion; during this time, the ſpirit charges itſelf with a vaſt quantity of the *eſſential oil* of the bark, and being carefully diſtilled in balneo mariæ, it brings over with it a great deal incorporated in itſelf, but, beſide that, there is a large portion ſwimming on the ſurface of the ſpirit, and eaſily ſeparable from it in the common way: this is as clear, pellucid, and thin, as the ſpirit itſelf, and is, in all reſpects, ſuperior to the eſſence made by any other means. The ſpirit of wine may be ſaved for a ſecond operation of the ſame kind, and there will then be no loſs from it; for being already ſated with as much of the *oil* as it naturally abſorbs, it will take in no more by the ſame means, and therefore may ſerve for ever ſo many new diſtillations, without loſs. If all the *oil* be finally deſired to be ſeparated from the ſpirit, it may eaſily be obtained by mixing the ſpirit with a large quantity of water, as is done in making the *oil* of ſpike. The *oil* will then ſwim at top, and the ſpirit may be ſeparated again from the water by diſtillation.

Some of the *eſſential oils* are ſo abundantly charged with ſalts, that, in long keeping, they will actually depoſit plain concretions of the ſaline kind. This is frequently obſerved in *oil* of turpentine, which, though ever ſo well rectified, will yet affix long cryſtals like needles to the ſides of any veſſel in which it has been long kept; the *oils* of marjoram, and feverfew, do the ſame; as alſo ſeveral of the others. All the other *oils* alſo ſuffer great changes in keeping; that of juniper becomes thick like turpentine, in a ſhort time; and thoſe of ſage, and of roſemary, after ſome keeping, are not diſtinguiſhable from one another. The age and ſtate of the plant may alſo make great difference in the ſmell of the *oil*, and there have been many inſtances of the *oil* of ſage becoming wholly like camphor in keeping. The diſtilled *oils* of ſome plants vary alſo at times in their colour. The *oil* of rue, and that of wormwood, ſometimes come over green, and ſometimes brown; the *oil* of chamæmile in Italy is always blue, but Mr. Geoffroy ſays, that he could never get a blue *oil* from the chamæmile of France by a ſimple diſtillation; and as to thoſe *oils* which ſometimes are green, they all become of the common clear yellowiſh colour of the other *oils*, if rectified by diſtilling them over again in a balneum mariæ.

In dry ſeaſons wormwood affords but little *oil*, accompanied with a bituminous matter, or a genuine reſin; and, in theſe ſeaſons, if the young ſhoots only are diſtilled, the *oil* is almoſt conſtantly found to come over green; but in moiſt years the wormwood yields a much larger quantity of *oil*, and it is then always brown. Wormwood which has grown on dry ſandy ſoils is always more white, and woolly, on the leaves, and always affords an *oil* of ſome tendency to a greeniſh colour; while, on the contrary, ſuch as grows in rich moiſt ground, has larger, and leſs woolly leaves, and yields a brown *oil*. The ſeaſon, and degree of heat, added to this difference of ſoil, may alſo make greater changes than could be imagined in the *oils* of plants. Mr. Geoffroy aſſures us, that he once made, in a dry ſeaſon, from a quantity of thyme which had grown in a dry ſoil, an *oil* as pure, as limpid, and as ſweet and high-ſcented, as that of the hotter countries, whereas the *oil* of thyme made in France is uſually much poorer, and of an obſcure colour, and coarſe earthy ſcent.

The *oils* of plants have not always the ſame taſtes with the plant they are diſtilled from, or, at leaſt, not in the ſame degree. Nothing is more bitter than wormwood, yet the *oil* of wormwood has no remarkable bitterneſs. Aniſe, which is of a ſweet taſte, yields, on the contrary, an *oil* infinitely more ſweet than the ſeed; and pepper, which is ſo remarkably hot and acrid, affords an *oil* no way remarkable for its pungency. Thyme, which is in itſelf very acrid and pungent, conveys that property, in a yet greater degree, to its *oil*; there is, indeed, no *eſſential oil* ſo acrid and firey as that of this plant. The fetid *oils* drawn in dry diſtillation by the retort, in an open fire, no way differ from theſe but by the damage the fire has done them, and may always be converted into theſe by repeated diſtillations. Nay, the very fat *oils*, ſuch as that of almonds, may be attenuated ſo far as to become as fine, and as ſubtile, as the *eſſential oils*. This is to be done by means of quick lime; and ſeveral repeated diſtillations of this *oil*, or any other of a like kind, with freſh lime to every diſtillation, will reduce it to be volatile, penetrating, and capable of being raiſed, and diſtilled, by means of water, which is the great teſt of the *eſſential oils*. The bituminous, and fetid *oils*, may alſo, in the ſame manner, be reduced by repeated diſtillations, to the ſtate of the *eſſential* ones, and to be equally fluid, and limpid, and equally penetrating. Memoirs Acad. Par. 1721.

Adulterations of eſſential OILS. Many of the *eſſential oils* being dear, it is a very common practice to adulterate, or debaſe them, ſeveral ways, ſo as to render them cheaper both to the ſeller and the buyer. Theſe ſeveral ways ſeem reducible to three general kinds, each of which has its proper method of detection. Theſe three ways are, 1. To adulterate them with *expreſſed oils*. 2. With alcohol. And, 3. With cheaper *eſſential oils*.

If any *eſſential oil* be adulterated with an expreſſed *oil*, it is eaſy to diſcover the fraud by adding a little ſpirit of wine to a few drops of the ſuſpected *eſſential oil*, and ſhaking them together; for the ſpirit will diſſolve all the *oil* that is *eſſential*, or procured by diſtillation, and leave all the expreſſed *oil* that was mixed with it untouched.

If an *eſſential oil* be adulterated with alcohol, or rectified ſpirit of wine, it may be done in any proportion, up to that of an equal quantity, without being eaſily diſcoverable either by the ſmell, or taſte. The way to diſcover this fraud is to drop a few drops of the *oil* into a glaſs of fair water, and if the *oil* be adulterated with ſpirit, the water will immediately turn milky, and by continuing to ſhake the glaſs, the whole quantity of ſpirit will be abſorbed by the water, and leave the *oil* pure at top. *Shaw*'s Lectures, p. 145.

Finally if an *eſſential oil* be adulterated by a cheaper *eſſential oil*, this is commonly done very artfully: the method is to put fir-wood, turpentine, or *oil* of turpentine, into the ſtill, along with the herbs to be diſtilled for their *oil*, ſuch as roſemary, lavender, origanum, &c. and, by this means, the *oil* of turpentine diſtilled from theſe ingredients comes over in great quantity, and is intimately blended with the *oil* of the genuine ingredient. The *oils* thus adulterated always diſcover themſelves in time, by their own flavour being over-powered by the turpentine ſmell; but the ready way to detect the fraud, is to drench a piece of rag, or paper, in the *oil*, and hold it before the fire; for thus the grateful flavour of the plant will fly off, and leave the naked turpentine ſcent behind.

Fern OIL. See the article FERN.

Green OIL, *oleum viride*, a form of medicine preſcribed in the late London pharmacopœia, and made in the following manner. Take leaves of bay, rue, marjoram, ſea wormwood, and chamæmile, each three ounces; *oil* of olives a quart. Boil the herbs in the *oil* till they are criſp, and then ſtrain off the *oil*, and when it has ſtood for the fæces to ſubſide, put it up for uſe. *Pemberton*'s London Diſp. p 350.

Red OIL, in the porcelain manufacture, a name given to a peculiar colour uſed on the China ware, or to thoſe pieces of the ware which are coloured with it. It is a very elegant ornament, and would be worthy our attempting to imitate in England, on our better ſorts of wares. They do it in the following manner: they mix the red colour called *tam-lan-hum*, or the copperas red, before deſcribed under the article of COLOURING *of china*; this they mix with *oil* of ſtone, (ſee OIL *of ſtone*.) and with another *oil*, as they expreſs it, of the ſame kind, made of a whitiſh ſort of pebble, or agate, found on the ſhores of their rivers, and the place of which might probably be ſupplied with us by common chryſtal. The powder is to be thoroughly mixed with theſe liquors, and the veſſel dipt carefully into the mixture, or ſome parts of it only covered with it in figures: after this, it is to be ſet by to dry, and, when thoroughly dried, it is to be baked in the common way. The general method is that of covering the veſſel all over, both inſide and out with this red; and it comes out of the moſt bright and brilliant colour imaginable, but it will

not

not ring when ſtruck upon, as our common china ware does. We ſeldom ſee this in any degree of perfection, but it is very elegant when fine. Obſerv. de l' Aſie.

OIL *of the earth*, *oleum terræ*, in the materia medica, the name of a thick mineral fluid of a duſky browniſh black, with a faint caſt of purple, and of the conſiſtence of a thin ſyrup, very little tranſparent, and of a ſtrong penetrating ſmell, like that of common *oil* of amber. It ouzes out of the cracks of rocks, in ſeveral parts of the iſland of Sumatra, and ſome other parts of the Eaſt Indies, and is much eſteemed there in paralytic diſorders; but it is ſeldom imported into England, what our Eaſt India ſurgeons and captains uſually bring over under this name, being only a vegetable *oil* impregnated with the virtues of certain of their foſſils by boiling. *Hill*'s Hiſt. of Foſſ. 420.

OILS *inflammable with acids*. See INFLAMMABILITY.

OIL *of olives*. The *oil of olives* having been publickly declared in England to be a certain remedy for the bite of a viper, the perſon who made the diſcovery having ſuffered himſelf to be dangerouſly bitten, and recovered not only himſelf, but ſeveral animals bitten at the ſame time, by this remedy alone, and that before a number of perſons of the greateſt eminence in medicine, the royal academy at Paris were determined to give the *oil* a number of fair trials, and determine, beyond controverſy, a point of ſo great importance, as whether this *oil* was, or was not, a remedy for this terrible poiſon.

Theſe experiments they have related in their memoirs; to theſe they have added the ſtate of the bodies of animals, when opened, after they had died of theſe bites; and to theſe they have ſubjoined ſome very uſeful reflexions. They occaſioned ſeveral pigeons, ſome young chickens, two cocks, a gooſe, a turkey, two cats, and eight dogs, to be bitten by vipers; in examining the wounded part, there uſually appeared at firſt only two little red ſpots, though ſometimes a ſmall quantity of blood, and very ſoon afterwards there began to appear a tumor, which, by degrees, encreaſed and extended over the neighbouring parts. The creatures were bit in the thigh, or leg, and the whole limb ſoon after became livid, and the ſwelling, and colour, extended thence over the lower part of the belly; and this was commonly followed by vomiting, and convulſions. The birds often bent their necks forward as if to vomit, and threw up only a quantity of phlegm, and death uſually ſoon followed theſe ſymptoms.

Of four pigeons which were bitten by four different vipers at the ſame time, and to which nothing was done to prevent the effect of the poiſon, they all died in a quarter of an hour, half an hour, or at the utmoſt, a little more than an hour. Two other pigeons were bitten, and about three minutes afterwards the parts wounded were rubbed with *oil of olives* warmed; but notwithſtanding this, they both died, the one in twenty-five minutes, the other in an hour and half. Two other pigeons were bitten after this, and the wounded parts immediately rub'd with *oil of olives*, made very hot, without heating the part; the one of theſe died in fifteen minutes, and the other in an hour and half. Theſe had all been bitten on the thigh. They next cauſed a pigeon to be bitten on the wing, and applied the *oil* immediately, but the bird died in five minutes.

After this, eight pullets were bitten on the thigh. No application was made to any of theſe, they all ſhewed the marks of being bitten, yet two of them eſcaped alive. Of the others, one lived an hour; two that had been bitten, both by the ſame viper, periſhed; that which was firſt bitten, in an hour, the other in an hour and a quarter; and the other three, which were bitten by a viper which had, before that, bitten another animal, periſhed; the firſt in an hour, the ſecond in about ſeven hours, and the third in an hour and half.

Eight other pullets were afterwards bitten by vipers, and the hot *oil* was applied to the wounded part at different times afterwards, but none were ſuffered to remain longer than ten minutes without it. Of theſe animals, three were ſaved; the others died in a very little time: notwithſtanding the application of the *oil*, one of them only excepted, which lived to the day after, but then died.

Six other pullets were firſt rub'd over with *oil* on the part intended to be bitten; and, after the bite, the *oil* was carefully applied hot to the part ſeveral times; but notwithſtanding this, they all died. One of them lived ſix hours, but the others all periſhed in a very ſhort time after they received the poiſon.

Two large cocks were next bitten; to one of them the *oil* was applied ſoon after he received the wound; but he, notwithſtanding, died in three hours. The other cock had not the *oil* applied, but an actual cautery was brought near the wound, and held there about three minutes; this creature periſhed alſo in about two hours.

A gooſe was next bit by a viper, and the bite ſeeming doubtful whether it had penetrated farther than the ſkin, another viper was made to bite it a ſecond time; the *oil* was applied immediately afterwards to the wound, and the application continued a long time with frequent repetitions; but, notwithſtanding this, the uſual ſymptoms appeared, and the creature died in two hours and a quarter. A large turkey was next bitten, and the two firſt bites appearing dubious, he was wounded a third time; the *oil* was applied in time, and repeated many times; but, notwithſtanding this, the uſual ſymptoms appeared, but after about three hours they abated, and the creature continued out of order for three days, and finally recovered. Eleven days afterwards the ſame turkey was again bitten by a viper, and no application was made; he was ſick again for about two days, but at the end of that time he recovered.

A young kitten was bit on the noſe by a viper; the *oil* was applied, and the creature was well the next day. A grown cat was bitten by four vipers, and the *oil* was applied; the creature made her eſcape, but ſhe was ſeen alive afterwards. Eight dogs were bitten, ſome on the thigh, ſome on the noſe, and others under the belly. Three of theſe had no application made to them; a tumor, and lividneſs ſucceeded the bite, but they all recovered, as well as the other dogs who were rub'd with the *oil*; one of theſe was a young puppy. The laſt dog that was bitten was of the Daniſh breed, and was very large, though but two months old; he was bitten by ſeveral vipers, and that in ſeveral parts, and the application of the *oil* was not made till after an hour and half. The tumors on the bitten parts growing very large, there were ſcarifications made in them, and hot *oil* poured into them. The creature ſhewed many ſigns of convulſions; his breath grew hard, his limbs failed him, he vomited, and purged, and, in fine, he died about eight-and-forty hours after the biting, notwithſtanding this cloſe application of the *oil*.

From theſe experiments, there is little credit to be given to this boaſted remedy. The pigeons which were bitten by vipers all died, notwithſtanding all that could be done by it; the article of the pullets is not at all more favourable to it; ſome having eſcaped to which it was applied, and others died; and of thoſe which were bitten, and had no application made to them, ſome alſo lived; and the *oil* was found to produce no good effect in a great many others in the ſame circumſtances. The turkey which lived with the application of the *oil*, we find could live alſo without it; and though ſome dogs lived which were bathed with *oil* after the bite, ſome alſo lived to which nothing was applied, and the *oil*, with all favourable circumſtances, we ſee, could not cure the Daniſh dog: ſo that, upon the whole, if the *oil* be a remedy for the bite of a viper, it is, at leaſt, a doubtful one, and far from the infallible cure it was ſuppoſed to be.

The great inſtance of the man's being recovered who was bitten on purpoſe to try the experiment, is far from proving the *oil* an infallible remedy, ſince he had other remedies adminiſtered to him, and there have been ſeveral inſtances of men being cured by theſe without the application of the *oil*. And it is to be obſerved, that the bite of a viper is not always certain death to a man, if he uſe no remedies at all, but that many have recovered, notwithſtanding that the ſymptoms which affected that perſon have appeared upon them. We ſee very plainly by the before recited trials, that of ſeveral animals of the ſame kind, bitten at the ſame time by vipers, ſome have recovered, and others have died, and this equally when this ſuppoſed remedy was, or was not, applied to them. And, in the ſame manner, it may happen to men, that of numbers who have been bitten, ſome would recover, and others die, whether any means were uſed, or not. Memoires Acad. Scienc. Par. 1737. See the article POISON.

OIL *of ſaſſafras*. Many of the vegetable *oils* obtained by diſtillation, will be found, under certain circumſtances, to approach to camphor. The *oil* of thyme may be cryſtallized, according to a proceſs of Mr. Newman's, who calls it, in that, *camphora thymi*. Phil. Tranſ. N° 479. p. 379.

The *oil* of ſaſſafras is peculiarly liable to cryſtallization in certain circumſtances, and that into the moſt beautiful forms. Mr. Maud gives an account of a quantity of this *oil*, which having ſtood expoſed to the air in a very froſty night in an open veſſel, was in the morning found changed three parts in four of it into very beautiful and large cryſtals: they were of an hexagonal form, very tranſparent, and of three or four inches in length, and half an inch in thickneſs. Theſe cryſtals ſubſided in water, and were indiſſoluble in it; they were readily inflammable at the fire, and were reduced by heat to their priſtine fluid ſtate: hence it is evident that they ſtill retain the natural qualities of an *oil*, though they appear under ſo very different a modification of their parts. What is moſt remarkable in this change, is, the metamorphoſis of a fluid to a ſolid body, of ſo determinate and regular a figure, and that theſe cryſtals ſhould be perfectly clear and colourleſs, though the liquor from which they froze, was of a yellowiſh colour, not unlike that of Madeira wine.

This ſeems to afford a new inſtance of cryſtallization, which is generally accounted for by the particles of a fluid, or thoſe of any other body ſuſpended in a fluid, being brought nearer by cold, and, at length, coming within the ſphere of each other's attraction, unite together into an immediate contact. This *oil* being a very heavy fluid, much heavier than water, is the more likely thus to unite, as its parts are nearer together. This may be a hint to the curious to diſcover wherein conſiſts the difference of ſolidity and fluidity; and it likewiſe ſhews how

how much the colour of bodies depends upon the mechanical ſituation of their parts.

OIL *of ſtone.* In the manufacture of the Chineſe porcelain, they uſe a liquid matter of a white colour, which they call by this name, on which their great myſtery of finiſhing their work depends; yet this has been leſs enquired into by the imitators of that ware in Europe, than many other articles of leſs conſequence. The ſtone of which this *oil* is made, is of the ſame degree of hardneſs with that which the petunſe is prepared of. They procure it from quarries, and chuſe ſuch as is of a good white colour, and has many dark green ſpots in it.

Theſe ſpots are of the colour of the leaves of cypreſs. Sometimes a ſtone is choſen which has a brown ground, variegated with ſpots and blotches of a reddiſh colour. They firſt carefully waſh this ſtone; then laying it in a clean place, they break it to pieces with iron inſtruments, and afterwards grind theſe to a perfectly fine, and impalpable powder, by rubbing them in large mortars, with peſtles of ſtone faced with iron, and turned either by the labourers, or by water. When the whole is thus reduced to a fine powder, they throw it into a veſſel of water, and ſtirring it briſkly about, they let the coarſer part ſubſide to the bottom, and there ſwims a fine thick matter like cream, for two or three inches depth, on the ſurface. This they carefully ſcum off, and putting it into another veſſel of clear water, they let it throw down any coarſe matter it may yet contain; and, finally, taking off the thick ſurface again, they mix this with ſome freſh water in another veſſel, and leave it to ſubſide; then pouring off the clear water, they take out the remainder at the bottom of the veſſel, which is perfectly fine, and reſembles a thick cream. To every hundred pounds of this, they add one pound of a ſubſtance of the nature of which we are not yet perfectly informed. It is ſaid to be a mineral reſembling alum. They calcine this firſt, and then beat it to a fine powder, and this being added to the cream, or *oil*, as it is called, ſerves to keep it always in the ſame liquid ſtate. This ſubſtance, when finiſhed in this manner, has very little title to the name of an *oil*; it is rather a varniſh, and is always uſed in mixture with another varniſh, which is called at this time fern *oil*, and uſed to be called lime *oil*; it is prepared in the ſame manner with the other after burning. See FERN-*oil*.

OIL *of vitriol.* See the article VITRIOL.

OIL *of wax.* See the article WAX.

OIL *bladders*, in plants. — It is a diſcovery, partly of Mr. Tournefort, and partly of Mr. Geoffroy, that the eſſential *oils* of all plants are contained in their perfect and pure ſtate, in the plants themſelves, while growing; they have, in different vegetables, different parts aſſigned for their reception; in ſome the flower; in others, the flower cup only, as in roſemary, and the like; in others the bark; in ſome, the parenchyma of the root; and in others, the wood.

Wherever they are lodged, they are always contained in theſe veſicles, or capſules, which require only to be broken, or burſt open, in order to ſet them looſe; this is effected by the boiling water in the common diſtillations, and the natural ſubtilty and lightneſs of the *oil* then makes it eaſily riſe in vapour, and its oleaginous quality rendering it incapable of mixing with the water, it ſwims at the top, and is eaſily ſeparated.

Theſe veſicles are moſt uſually placed in, or about, the flower, and it is in many plants a very eaſy matter to trace them to their ſeveral places of principal reſidence. Mr. Tournefort has obſerved that theſe *oil bladders* in the fraxinella taking their origin at the root, thence aſcended to the fruit or covering of the ſeeds. This plant has a very remarkable variety in its *oil* in the different parts. The flower is ſweet-ſcented; the veſicles placed along the ſtalk contain a very ſharp and acrid *oil*, ſomewhat reſembling the eſſence of lemons, when kept a long time. The leaves have ſcarce any ſenſible odour, but the root has a ſcent peculiar to itſelf, and different from that of all the reſt of the plant. *Geoffroy*, ap. Memoires Acad. Paris 1721.

The eſſential *oil* of cinnamon has alſo a difference of the ſame kind, which is owing to the different fluid contained in the veſicles in different parts; the bark of the root yields an *oil*, which, after keeping ſome time, always yields a pure and genuine camphor; whereas the *oil* of the bark from other parts of the tree has nothing of this property.

It is alſo eaſy to obſerve, that the capſules of certain fruits have more odour than the fruits themſelves. The coat which covers the piſtachia nut, contains much more eſſential *oil* than its kernel; and the bark which ſurrounds the amomum, and cardamoms, has much more ſmell than the kernel of the ſeed. The firſt bark of the nutmeg is well known to have a more fragrant ſmell than the nutmeg itſelf, being the mace; yet there is, within this, another covering of that fruit, which has no ſcent at all.

Moſt of the ſeeds of the umbelliferous plants, which uſually paſs for aromatics of the firſt and moſt eminent kind, have, in reality, no ſmell at all in themſelves; the *oil bladders* which yield their virtues being placed in their outer covering, the kernel within the ſeed uſually containing a fat *oil* of the olive or almond kind, and wholly different from the eſſential. The *oil* of aniſeed made by expreſſion is fluid, of a green colour, and of a fatty nature, but is highly ſcented with the *oil* which it has taken with it from the covering; on the contrary, the eſſential *oil* procured from the ſame ſeed by diſtillation, is thin, not fatty, of a much more clear and penetrating ſcent, of a pale colour, with no admixture of greenneſs, and readily concretes into a maſs like butter on external cold. In coriander ſeed, the kernel carefully ſeparated from its membranes has no ſmell, and contains only a fatty *oil*, like that of the olive, while the veſicles are all ranged in the rind, and therefore in that alone is the aromatic ſmell. Theſe veſicles in the ſkin of fruits are the occaſion of the ſweet flavour of many; as of the ſtrawberry, raſpberry, and the like; in theſe they are too ſmall to be diſtinguiſhable, while, in the thicker rinds of the orange and lemon kind they are eaſily diſcerned, and, on the leaſt preſſure, burſt, and throw out their contents, which make what we call the *zeſt*, and which is ſeparated in this manner in greateſt quantity in hot countries, and where there are plenty of the fruit, is preſerved under the name of *bergamot*, and other eſſences of a like kind.

There is, however, no ſubject in the vegetable world in which theſe veſicles are more plainly perceived than in the berries of the juniper, a fruit very well known, and in conſtant uſe with us. Theſe berries are at firſt green, afterwards of a reddiſh brown, and finally black, and they are two years in coming to maturity. The berry is formed at the top, in the manner of a bud of the roſe, or piony, which is juſt ready to open; and it ſometimes does open into four or five parts, according to the number of ſeeds it contains. It contains, beſide theſe, an acrid, a ſweet, and an aromatic juice, which leaves a ſenſible bitterneſs behind it in the mouth.

In order to account for theſe ſo different taſtes in the ſame fruit, Mr. Geoffroy attributes its acrid quality to the ſkin, or huſk, and in ſome berries, indeed, to the unripeneſs of the whole, for want of a due heat of the weather; the ſweet taſte is from the juice of the fruits which is properly a ſaccharine or melleous liquor, and the aromatic flavour is wholly owing to the *oil* which is lodged in the veſicles expanded over the whole inner ſubſtance of the fruit. Theſe ſubſtances are indeed ſo determinately marked in the berry, that it is poſſible to ſeparate them; but theſe are not all the differences of taſte and matter in this little fruit, every kernel of which has in it five or ſix veſicles, lodged each in a peculiar, and appropriated cavity, in the external part of the ſeed. Theſe are eaſily ſeparated from the reſt of the fruit, and, when that is dry, are found to contain an abſolute reſin; they are of a duſky colour, and each drop of reſin in them is of an oval figure, and is very bitter to the taſte; hence therefore is the remarkable bitterneſs that affects the mouth, when the berry is thoroughly broken by the teeth.

The knowledge of this may be of great uſe to the apothecary in his medicinal preparations of juniper berries of ſeveral kinds. When he wants only the extract, which is the melleous juice of the berries alone, they ought not to be ſtamped or bruiſed, to diſlodge this reſin, which has no buſineſs there, but ſhould be only boiled, and the decoction inſpiſſated. But when the eſſential *oil* is required, the whole berry muſt be bruiſed, and that in a thorough manner, that all its kernels be broken. The cells, or veſicles of *oil*, now indurated into a reſin, burſt open, and the whole diſperſed in ſuch a manner that water may affect it. Memoires Acad. Par. 1721.

In order to diſcover what are the parts of a plant in which the *eſſential oil* moſt abounds, it will be proper to examine what part yields the moſt ſmell; and this will be found different in different plants. In ſome the ſeat of odour occupies the whole body of the flower; in others only ſome particular part of the flower has it, and in ſome; it is principally lodged in the covering; and in ſome it is diſperſed every way, thro' the body of the fruit. In ſome inſtances it is found lodged in other parts of the plant, and ſometimes it is equally ſtrong in every part of it.

This principle of the *eſſential oils* varies alſo not only in regard to the place where it reſides, but in the different ſcents it yields in different places; or in the ſame parts of the plant in different ſeaſons. Thus the leaves, ſtalks, and roots of the violet have no ſmell, while the flowers have a great deal. All parts of the jaſmine tree are without ſcent in like manner, except the flowers, which are very ſweet. And the caſe is the ſame in the tuberoſe, the jonquille, &c. in all theſe plants the *eſſential oil* is very volatile, and in very little quantity; their reſervoirs are ſo obſcure, that we cannot find the leaſt trace of them; and, inſtead of an *eſſential oil*, all that can be obtained from them by diſtillation, is a ſweet-ſcented water, and even this loſes its ſmell in a very little time. Of this ſort alſo are the flowers of the lime tree, the lilly, and the clove julyflower; in theſe there is no part ſcented but the extremities of the flowers, and then not till they are thoroughly opened; and, for this reaſon, if we would obtain a ſweet ſcented water from theſe, we are to uſe no part but the flower, and that not till perfectly expanded on the extremities

tremities of the petals; and, with all the caution that can be taken, the water diſtilled from theſe will have but very little ſmell, if the ſeaſon chance to prove rainy.

This is not the caſe in the wallnut tree flowers; theſe contain a large quantity of *eſſential oil*, and, conſequently give a very ſtrong-ſcented water; but this water very often varies from the ſmell of the flower, acquiring in the diſtillation the ſmell of the bitter almond: the reaſon of this is, that the embryo fruit is contained in the flowers, and it is that which is the principal ſource of the *oil*, and the *oil* it yields is wholly analogous to the fruit of the bitter almond.

Peach bloſſoms afford a very ſweet-ſcented water, and their young leaves have a ſmell like that of bitter almonds, and in general, the ſame obſervation may be extended to all thoſe plants which have bitter kernels in the fruit. It is obſervable, that among the radiated flowers, ſuch as that of colts foot, and the like, the flower itſelf has little or no ſmell, but whatever ſcent we perceive in it, ariſes from the cup, whoſe ſcales, or conſtituent leaves, have either a velvety down, or a ſeries of veſicles which contain all the *eſſential oil*, and, conſequently, all the odour. When flowers of this kind are to be diſtilled for their *oil*, they muſt, therefore, be uſed before they are blown open, as the veſicles are then in their fineſt ſtate. Theſe veſicles are ſo large and numerous in hot ſeaſons, in the cup of the marygold, the ſun-flower, and ſome other ſuch plants, that they are eaſily diſtinguiſhed by the naked eye.

Balm has very little *eſſential oil*, and if it be not choſen for diſtillation in a very favourable time, its water will have ſcarce any ſcent at all. The moſt favourable time is, when the plant is fulleſt of veſicles, and that uſually is when it is about ſix or eight inches high; its leaves appearing ſomewhat reddiſh, and being but of about half the bigneſs they are to grow to. This obſervation extends alſo to moſt of the plants of the ſame claſs, nay even to the woody ones, except that they are more aromatic; that is, that they contain a number of veſicles of an odorous reſin, which is wholly owing to the cloſer and firmer texture of the wood.

Sage, while young, when its ſtalks are not yet grown woody, is all over odorous, even its ſtalks, as well as every other part, being full of theſe veſicles of ſweet-ſcented matter, which may be expreſſed on preſſing them. When the *eſſential oil* of ſage is to be drawn, the plant is always to be choſen in this ſtate, and the more woody ones which have ſtood through a whole ſeaſon, are always found to have loſt the greateſt part of their odour in diſtillation. The woody part of this plant has no ſmell; the outer bark, indeed, has ſome ſcent, but that very little.

The flowers of roſemary, ſage, and lavender, and others of the ſame kind, though in the whole they yield a very ſweet ſcent, yet the aromatic eſſence is not lodged in them where it might moſt naturally be ſuppoſed; that is, in the petals, for if we pull theſe clean out of the cup, as in the violet and clove we ought to do, the ſeparated petals have very little ſmell, and that little is not eſſential to the petals, but is wholly owing to the breaking of ſome of the veſicles which are placed in the furrows of the cup, in which all the ſmell is contained, and which, being burſt in the violently drawing away the flower, leave a little of their contents on it. Indeed, if theſe cups are obſerved with a microſcope, or, but attentively, by the naked eye, they will all be found full of ſmall bladders, which contain a pure *eſſential oil*, of a very high and aromatic ſcent.

Thyme and lavender ſhould either have their tops cut off, and thoſe diſtilled immediately, or elſe they ſhould be gently dried, and both flowers, tops, and young leaves, be diſtilled, ſince thoſe are endued with a very aromatic ſcent at their firſt ſhooting.

Among the trees, very many have ſweet-ſcented leaves and flowers, while the wood has not the leaſt odour; to draw the *oil* from theſe the young ſhoots are to be taken, ſince the veſicles which contain the *eſſential oil* are all lodged in theſe, and are at this time in their beſt ſtate, the heat of the ſun exhaleing afterwards their moſt volatile parts. Even the young wood of theſe ſhoots is capable of affording ſome *oil*, ſince in it, theſe veſicles are placed between the outer and the inner bark, but theſe are all perfectly deſtroyed before the wood hardens: this is the caſe in the orange tree, the myrtle, the bay, ſavin, and the like.

It is to be obſerved in the ſweet-ſcented woods, that the place where the reſin is collected in greateſt quantities, is in the knots from which young branches are to riſe; this is very eaſily obſervable in the firs and juniper. This is not, however, the caſe in all the reſinous woods; for ſome of theſe abound ſo in reſin, that their ſeveral woody beds, or layers, are all connected to one another by beds of reſin; as is the caſe in guaiacum, in the calambac wood, and that of aloes. And this is more peculiarly remarkable in the laſt; for in the fineſt wood of this kind ſent from the Eaſt-Indies, the woody parts are ſtript away, and only theſe reſinous beds are left remaining; and, conſequently, while the coarſer and cheaper ſorts burn like our woods to a charcoal, this precious kind melts upon the fire like a true reſin, and is the fineſt-ſcented ſubſtance imaginable.

In all the reſinous woods, the young ſhoots of the tree are to be preferred for the extraction of the *eſſential oil*. This is well known to thoſe who traffick largely in this way: And even the liquid balſams, of which enough cannot be obtained by inciſion, may be thus procured: they boil the tops of the branches, and the young ſhoots, in water, and collect from the ſurface of that liquor, the fluid balſam which the boiling has ſeparated from the ſhoots, and which cannot mix with it.

Beſide the parts of trees, and plants, already mentioned, as containing their *eſſential oils*, it is to be obſerved that nature has enveloped the young eyes, or buds, with numerous coverings, thick ſpread with the ſame reſinous matter, the uſe of which is to defend them from the injuries of the air, and from the ſeverities in particular of the winter. Some of theſe are filled with a ſoft and fine cottony down which encloſes both the young leaves, and young flowers, as is the caſe in the horſe cheſnut; theſe are all externally covered with a number of thick and ſtrong ſcales, laid cloſely one over another, and cemented down, as it were, with this reſinous matter. Theſe make a covering which ſpirit of wine eaſily breaks open, by diſſolving the reſin, but which water cannot affect, and which, therefore, is impenetrable to rains. This reſin has its particular reſervoirs alſo in the bark of the tree into which it riſes with the ſap. The young buds, or eyes, in the black poplar are of the ſame kind; they have the ſame downy ſubſtance for their lodgment, and the ſame natural balſam, as it may well be called from its ſweet ſcent, for their defence. When the leaves of this tree grow larger, theſe ſcales fall off, and the leaves have then no more ſmell. The reſin, or balſam, mixing itſelf with the ſap which ſtill remains ſomewhat aromatic.

It is not only the ſtalks, the cups, and the ſcaly eyes of plants, which contain their *eſſential oils*; for even the aromatic roots are not without their ſhare of it. Rhubarb is no aromatic root, and yet the aſſiſtance of glaſſes will ſhew many lucid ſpecks in it, which are truly ſmall parcels of reſin; and the florentine iris, and calamus aromaticus, contain great numbers of ſuch lucid ſpecks, or parcels of pure reſin.

The ſtalk of angelica has a very aromatic ſmell, and the ſeeds have a very different one; the root alſo is very aromatic, its parenchyma being all filled with the veſicles which contain the balſamic eſſence. The plant of the elecampane has ſcarce any ſmell, while the root is very aromatic, almoſt all the veſicles of balſam being contained there. The ſeat of theſe reſinous, or oily particles, is uſually the whole parenchymatous ſubſtance of the root, eſpecially in thoſe roots which have no woody ſubſtance in the middle; ſuch as rhubarb, and the like; and thoſe which have woody matter in their middle, contain this aromatic ſubſtance in their bark; ſuch are the roots of fraxinella, and the like, of which we therefore uſe in medicine, only the outer bark.

Thus we have traced the ſeveral reſervoirs of the *eſſential oils* in plants, and, as for the manner of ſeparating them from the ſubjects, it has been delivered above. See *Eſſential* OIL.

OIL *dregs*. See the article DREGS.

OISEAU, in conchyliology, the name of a peculiar ſpecies of oiſter, of ſo remarkable a figure, that it repreſents a bird with its wings expanded, and has a ſmall protuberance at the hinge, repreſenting a head, and a long proceſs at the oppoſite end, which very well repreſents a tail. It is of a duſky reddiſh colour on the outſide, and of a fine pearly hue within. When the outſide of this ſhell is taken off, and it is nicely coloured, by cutting it down to a proper depth in every part, it is of a fine reddiſh yellow, and is the aurora ſhell of collectors.

OISTER, in zoology. See OYSTER.

OKE, an Egyptian weight, conſiſting of three rotolos, each of twelve ounces, at twelve drachms to the ounce, and ſixteen carrats to the drachm. *Pocock*'s Egypt, p. 178.

OKELA'S, in Ægypt, and ſome other of the Eaſtern countries, are a ſort of indifferent buildings round a court, and commonly appropriated to the merchants of ſome particular country with their goods; as at Cairo, there is one for the merchants of Nubia, and the black ſlaves, and other goods they bring with them; and another for white ſlaves from Georgia. *Pocock*'s Egypt, Vol. 1. p. 37.

OKER, in natural hiſtory. See OCHRE.

OLD (*Cycl.*) — OLD-*works*, in mining, are ſuch that are either fallen in, or ſtand unwrought. *Houghton*'s compleat Miner, in the Explanation of the Terms.

OLDENLANDIA, in the Linnæan ſyſtem of botany, the name of a genus of plants, the characters of which are theſe: The cup is a perianthium divided into four pointed ſegments, which are inſerted on the germen of the piſtil, and remain when the flower is fallen. The flower is compoſed of four petals of an oval figure, ſpread wide open, and twice as long as the ſegments of the cup. The ſtamina are four ſimple filaments. The antheræ are ſmall. The germen of the piſtil is roundiſh, and placed below the receptacle of the flower. The ſtyle is ſimple, and of the length of the ſtamina. The ſtigma has a rim round it. The fruit is a

globoſe

globoſe ſkinny capſule, compoſed of two cells, each containing a number of ſmall ſeeds. *Linnæi* Gen. Plant. p. 49.

OLEA, *oils.* See the article OIL.

OLEA, the *olive tree*, in the Linnæan ſyſtem of botany, makes a ſeparate genus of plants, the character of which is, that they have a perianthium compoſed of one ſingle leaf, ſmall, and tubular; indented at the extremity into four diviſions, placed erect, and falling with the flower. The flower is compoſed of one ſingle petal, which is a cylindraceous tube, of the ſame length with the perianthium; its margin equal, but divided into four ſegments, each of them ſomething indented in the middle. The ſtamina are two filaments, ſhort, pointed, placed oppoſite to one another, and terminated by erect antheræ. The piſtil is compoſed of a roundiſh germen, with a ſingle ſtylus, which is very ſhort, and terminated by a thick ſtigma, which is biſid, and has fringed edges. The fruit is ſmooth, and ſomewhat oval, having but one cell, and containing for its ſeed, one longiſh, oval, ſcabrous, and ſtriated nut. *Linnæi* Gen. Plant. p. 2.

The characters of this genus, according to Mr. Tournefort, are theſe: the flower is of one leaf, and of the funnel-faſhioned kind, and uſually divided into four ſegments at the edges. The piſtil ariſes from the cup, and is fixed, in the manner of a nail, into the hinder part of the flower. This finally becomes a ſoft and juicy fruit, of an oval figure, containing an oblong ſtone, in which there is a kernel of the ſame ſhape.

The ſpecies of *olive* enumerated by Mr. Tournefort are theſe: 1. The large-fruited *olive*. 2. The *olive* with ſmaller oblong fruit. 3. The *olive* with oblong, blackiſh-green fruit. 4. The white fruited *olive*. 5. The *olive* with ſmall, roundiſh fruit. 6. The *olive* with larger, oblong, fruit. 7. The large-fruited *olive*, with a very thick pulp. 8. The great *olive*, with oblong, and angular, almond-ſhaped fruit. 9. The *olive* with oblong fruit, of the ſhape of the cornel-berry. 10. The great, round-fruited *olive*. 11. The green, middle-ſized, round-fruited, *olive*. 12. The early, middle-ſized, round fruited *olive*. 13. The cluſtered, ſmall-fruited, round *olive*. 14. The ſmall-fruited, blackiſh-red, round *olive*. 15. The ſmall, round *olive*, with fruit variegated with black and red. 16. The ſmall, Lucca *olive*, with ſweet-ſcented fruit. 17. The wild *olive* tree, with hard leaves, hairy underneath. 18. The Spaniſh wild *olive*, with hard leaves, hairy underneath, and with obtuſe, pointed fruit. *Tourn.* Inſt. p. 599.

OLEA is alſo the name of a ſtone deſcribed by Ludovicus Dulcis, and ſome other ſuch authors, who attribute great virtues to it, and ſay it was variegated with ſeveral colours, as yellow, black, white, green, &c. It ſeems to have been ſome one of the common agates, to which their ignorance had prompted them to give a new name

OLEA *Bohemica*, in botany, a name by which ſome authors have called the *zizypha* or *zizyphus*, the wild *jujube* tree. *I. Bauhin*, Vol. 1. p. 27.

OLEANDER, in botany. See NERION.

OLEARIA, in natural hiſtory, the name of a genus of round-mouthed ſea ſnail, or *cochlea lunaris*. It is of a very large ſize, capable of holding two quarts, and had its name *olearia* from its being antiently uſed in families, as the veſſel in which they kept *oil*.

OLEASTER, in the materia medica, the name of the *ſallow thorn*, or *ſea buckthorn*, the *rhamnoides ſalicis folio* of botanical authors. *Dale*, Pharm. p. 282.

OLEUM, *oil.* See the article OIL.

OLEUM *medicum*, in the writings of the antients, a name given to a famous *oil* which had a quality of burning under water, in ſpite of all that could be done to quench it. It was called *Medicum*, becauſe of its being produced among the Medes, and ſome have called it *oleum Medeæ*, becauſe it was ſuppoſed to be that ſubſtance with which Medæa anointed the crown of her rival. Ammianus Marcellinus tells us, that if an arrow was anointed with this *oil*, and ſhot out of a bow againſt any inflammable ſubſtance, the whole immediately took fire, and, if any one attempted to quench the flames by water, they only burnt the more fiercely for it. The *venenum Pharicum* of Nicander is ſuppoſed to be the ſame thing with this *oil*, and to have been ſo called from Pharai, a town, not the name of a man, whom ſome imagine the inventor of it. Pharai is a town in Crete mentioned by Stephanus, and we find by the antients, that this poiſon was ſometimes had from Crete. Nicander and Procopius are of the number of thoſe who mention the violent and terrible effects of the *oleum Medeæ*, and all that they ſay is equally applicable to the *oleum Medicum* of others; ſo that they ſeem the ſame liquor. Some tell us of a plant that produces this *oil*, but Pliny ſays that it was a liquid mineral bitumen, of the nature of naphtha, which is very probable; for ſome of theſe mineral *oils* are the moſt inflammable of any ſubſtances that we are acquainted with. Babylon is celebrated by many authors as the country which produced this terrible liquor, and all agree that Babylon is a place where naphtha is more common than in any other part of the world. Strabo tells us, that there is a white kind common there, as well as the foul or black ſort. This white one may probably be the ſame with the *oleum Medicum*, and *oleum Medeæ*; but then it is to be obſerved, that the virtues attributed to it are too far exaggerated, as is very common with the antients in their accounts of ſtrange things.

OLEUM *Medeæ*, a name given by the antients to the mineral fluid, more generally known by that of *naphtha*. See OLEUM *Medicum*, ſupr. and NAPHTHA.

OLEUM *vitri antimonii*, in medicine, a name given by Baſil Valentine, and others, to a famous preparation of antimony, which they keep as a ſecret, or, at leaſt, declare in ſuch terms as are unintelligible, and boaſt of, as the univerſal medicine. The learned Kerkring has given the proceſs for making this red *oil* of the glaſs of antimony, but that in ſo enigmatical a manner, that he ſeems himſelf not to expect any body to underſtand him; and only ſays, in his own juſtification, that he has given it in plainer terms than any body had done before him. The author relates many wonderful things of this diaphoretic *oil*, on his own experience; particularly, the curing a confirmed dropſy, by throwing off the water by ſweat; ſo that the patient, in a manner, ſwam in it, and the drops run through the bed, in all parts, to the floor. It were well if we could underſtand the proceſs. *Kerkring* on Baſil. Valent.

OLIGACTIS, in natural hiſtory, a name given by Linkius, and others, to a genus of ſtar fiſh, conſiſting of thoſe which have fewer than five rays.

OLIGAEDRA, in natural hiſtory, the name of a genus of cryſtals. See CRYSTAL.

The word is derived from the Greek ὀλιγὸς, a few, and ἕδρα, a plane, or ſide; and expreſſes a cryſtal which is compoſed of only a few planes.

The bodies of this claſs are cryſtals of the imperfect kind, being compoſed of columns affixed irregularly to ſome ſolid body at one end, and, at the other, terminated by a pyramid; but the column and pyramid being both pentangular, the whole conſiſts only of ten planes, not, as the common kind, of twelve. See Tab. of Foſſils, Claſs 3.

Of this genus there are only three known ſpecies. 1. A whitiſh one, with a ſhort pyramid, found principally in Germany, and ſometimes brought over to us, among parcels of common cryſtal. 2. A bright and colourleſs one, with a longer pyramid. This is found in Germany, and in ſome parts of England, as in the tin mines of Cornwal, and on Mendip hills. And, 3. A brown one, with a ſcabrous cruſt. This is produced only in the Eaſt Indies, and is well known by our lapidaries by its rough coat, and is eſteemed the fineſt of all brown cryſtals. *Hill's* Hiſt. of Foſſ. p. 184.

OLIGOTROPHEROS, among the Greeks, a name given to the finer ſort of bread made of the fineſt flower. They called it by this name becauſe of the little ſhare of nouriſhment it conveyed; and, by way of diſtinction from it, called the brown bread *polytropheros*, or much nouriſhing.

OLIVARIA *corpora*, a name given by ſome anatomical writers to two oblong pro eſſes of the medulla oblongata, thus called from their reſembling an olive in ſhape.

OLIVE, *olea*, in botany. See OLEA.

OLIVE-*oil.* See OIL *of olives.*

OLIVE-*gum.* See the article GUM.

OLOC, in natural hiſtory, a name given by the people of the Philippine iſlands, to their *quail*. It is like ours in all reſpects, but much ſmaller.

OLOCENTROS, in natural hiſtory, a name given by the old Greeks to a ſmall animal of the ſpider kind, whoſe bite was accounted mortal. It is the ſame with the *ſolipuga*, ſo called from its ſtinging, or biting moſt violently, in places, or ſeaſons, where the ſun had the moſt power, as Africa, &c. The name *ſolifuga* was a corrupt way of writing that word, and this ſeems alſo a falſe way of writing the word *heliocentros*, which ſignifies the ſame as *ſolipuga*. See HELIOCENTROS.

OVALIDIA, in botany, a name given by ſome authors to *chamæmile*. *Ger.* Emac. Ind. 2.

OLY, a word uſed by ſome chemical writers to expreſs the oily part of metals, ſeen, in ſome circumſtances, ſwiming upon the ſurface of their ſolutions.

OLYRA, a name given by many botanical writers to the *ſprat corn*, the *zea*, and *triticum amylæum*, or *ſtarch corn* of other authors. This is a ſort of grain cultivated in many parts of Germany. It comes to a ripeneſs toward the latter end of autumn, and is uſed for the common food of the poorer ſort of people. It is like the ſpelt wheat, but is ſomewhat leſs nutritive. Vid. *Dale*, Pharmac.

OMAGRA, a name given by ſome medical writers to the *gout*, when ſeated in the articulation of the humerus with the ſcapula.

OMBRIA. See the articles BRONTIA, and CERAUNIA.

OMBROMETER, a machine to meaſure the quantity of rain that falls. We have the deſcription and figure of one in Phil. Tranſ. N° 473. p. 12. It conſiſts of a tin funnel, whoſe ſurface is an inch ſquare, a flat board, and a glaſs tube ſet into the middle of it in a groove. The riſe of the water in the tube, whoſe capacity, at different times, muſt be meaſured, and marked, ſhews the quantity of rain that has fallen.

OMELYSIS, a word uſed by Hippocrates, and others of the antients, to expreſs the meal of barley, crude, or not parched. It is recommended, when reduced to the form of a pultice, by boiling in wine and oil, for curing all tumors of the tonſils. It is alſo recommended, mixt in water, to be drank in hæmorrhages of the uterus. Authors of later date have made the word *omelyſis* ſtand for all ſorts of meal, or flower, and ſome for an equal mixture of the meal of barley, linſeed, and fænugreek ſeed, in equal quantities; a medicine uſed for horſes. And Cœlius Aurelianus uſes it frequently for a cataplaſm made either of meal, or bread and water.

OMENTA, a word uſed by ſome anatomical writers to expreſs the membranes of the brain.

OMENTUM (*Cycl.*) — *Falling down of the* OMENTUM. On large wounds of the abdomen, the *omentum* will frequently protrude itſelf through the wound, either alone, or with ſome portion of the inteſtines. When this is the caſe, the firſt buſineſs is to enquire whether the protruded part preſerves its heat, moiſture, and natural colour: if it is not found faulty in any of theſe circumſtances, it muſt be gently returned, but when the ſtraitneſs of the wound forbids this, the protruded part muſt be taken off cloſe to the wound, and the wound healed according to the common form. The *omentum* in this caſe will adhere to the internal part of the wound, without bringing on any diſorder, or inconvenience to the patient. But where the inteſtines fall out at the ſame time, the *omentum* is to be fomented by an aſſiſtant with warm milk and water, till the inteſtines are returned.

If any part of the protruded *omentum* be cold, dry, livid, putrid, or corrupted, the mortified part muſt be entirely cut off before the reſt is returned, leſt the neighbouring parts ſhould be brought into conſent, which would inevitaby prove fatal to the patient. The corrupted part is to be taken off in this manner: paſs a waxed thread two or three times round the ſound part of the *omentum*, near the place where it is injured, and faſten it with a knot, to prevent any hæmorrhage from enſuing after the reduction of it; when you have made a ſecure ligature, take off the corrupted part with the knife, or ſciſſars, and return what is ſound, leaving, at leaſt, the length of a foot of the ligature hanging out of the wound of the abdomen, till it ſlips off from the ſound part of the *omentum*. The wound muſt be dreſſed in the common way, the depending part of it being kept open by a large tent: and, at every dreſſing, the ligature muſt be pulled a little gently forward, till it has, at length, entirely ſlipped off from the ſound part of the *omentum*. *Heiſter*'s Surg. p. 66.

OMER, in the Jewiſh antiquity. See CORUS.

OMNES, in the Italian muſic, a Latin term which we ſometimes find uſed for *tutti*, all, or altogether. See TUTTI.

OMOPLATO-HYOIDÆUS, a muſcle called alſo *coracohyoidæus*, and *ornohyoidæus*. It is a very long and ſlender muſcle, much narrower than the ſterno-hyoidæus, and ſituated obliquely on the ſide of the neck, or throat, between the ſcapula, and the os hyoides; it is a digraſtic muſcle, being divided into two fleſhy portions, joined endwiſe to a ſhort, middle tendon. It is commonly fixed in the lower extremity to the ſuperior coſta of the ſcapula, between the ſmall notch, and the angle, and ſometimes very near the angle, and, from thence, ſome anatomiſts have called it the *coſtohyoidæus*; from thence it paſſes over the coracoide apophyſis, adhering ſometimes to it by a kind of aponeuroſis, or membranous ligament; and, from this adheſion, the name *coracohyoidæus* was given it before its main inſertion was diſcovered. It is alſo very often fixed to the clavicula by ligamentary, or fleſhy fibres, and ſometimes inſerted in the whole middle portion of that bone, being inſeparably united with the ſterno-hyoidæus: having paſt the clavicle, it is bent forward, and runs between the ſterno-maſtoidæus, and internal jugular vein, the ſmall middle tendon being ſituated in this place; from thence it runs up to its inſertion in the inferior lateral part of the baſis of the os hyoides near the corner, and inſertion of the ſterno-hyoidæus, which it covers a little. *Winſlow*'s Anatomy, p. 255.

OMPHACITIS, a name given by naturaliſts to a ſmall ſort of gall of the oak.

OMPHACIUM. See OMPHACION, *Cycl.*

OMPHACOMELI, a ſort of *oxymel* made of the juice of unripe grapes, and honey.

OMPHALODES, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is rotated, and divided into ſegments at the edge. The piſtil ariſes from the cup, and is fixed, in the manner of a nail, into the middle of the flower, and afterwards changes into a fruit compoſed of four capſules, containing flattiſh ſeeds affixed to a placenta, which forms a quadrilateral pyramid.

The ſpecies of *omphalodes*, enumerated by Mr. Tournefort, are theſe: 1. The Portugal *omphalodes*, with leaves like thoſe of flax. 2. The taller, Portugal *omphalodes*, with hound's-tongue leaves. 3. The little, ſpring, comfrey-leaved *omphalodes*, called by ſome *borrage-comfrey*, and *creeping*, *dwarf comfrey*. *Tourn.* Inſt. p. 140.

OMPHALOMANTIA, a word uſed by ſome authors to expreſs a ſort of divination pretended to by the midwives and old women, of telling how many more children a woman is to have, by examining the number of knots on the umbilical cord.

OMPHALOTOMY, Ὀμφαλοτομια, the operation of cutting the navel-ſtring of new-born infants. See UMBILICAL, *Cycl.*

OMPHALUS, (*Cycl.*) in natural hiſtory, a term uſed by the antients to expreſs what they at other times called *umbunculus* in ſtones; that is, a ſmall round and prominent ſpot, in the center of the ſtone.

The *zmilampis*, which was a kind of oculus beli found in the Euphrates, had uſually a blue prominent pupil, and this was called *omphalus*, and *umbunculus*, indifferently, and ſo in other ſtones. The words have both the ſame origin, and are uſed to expreſs its being like the button, or prominent piece, in the middle of a ſhield, called by the Greeks *omphalos*, and by the Latins *umbo*. See the articles ZMILAMPIS, and UMBUNCULUS.

OMPHAX, in the natural hiſtory of the antients, the name they gave to a gem of the pellucid kind, and of a diſagreeable greeniſh colour, with a mixture of yellow. Pliny and ſome other old writers, make this a kind of the aqua marine, calling it the *beryllus oleaginus*; but the earlier writers very juſtly determined it not to be of the beryll kind, but properly a diſtinct ſpecies of gem; and, therefore, very properly called it by a peculiar generical name. *Hill*'s Theophraſtus, p. 80.

OMOPLATÆ *octavus*, in anatomy, a name given by Spigelius, and others, to a muſcle called by Winſlow *the upper portion of the rhomboidalis*, but by Albinus, the *rhomboides minor*. What Winſlow calls the lower portion of the rhomboidalis, he calls the rhomboidæus major.

ONAGER, in natural hiſtory, the name given by authors to the *wild aſs*, a creature common in Syria, and ſome other places, and differing very little more from the common aſs, than as creatures in their native wildneſs do from thoſe of the ſame ſpecies kept in ſtables, and brought up to be domeſtic animals. The ſkin of this creature is very robuſt, and durable, and makes the common chagrin leather uſed by our caſe-makers, &c. its ſurface being rough with ſmall tubercles. *Ray*'s Synop Quad. p. 63.

ONAGRA, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, conſiſting of four leaves, diſpoſed into a circular form, and ſtanding on a cup; from the upper part alſo of this cup, which is hollow, there ariſes a piſtil which finally becomes a cylindric fruit, which, when ripe, ſplits open in four places, and is compoſed of four cells, each containing a number of angular ſeeds, which are affixed to a placenta.

The ſpecies of *onagra*, enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved, yellow-flowered, American *onagra*, called by authors the *yellow*, *podded willow-herb*. 2. The broad-leaved, American *onagra*, with paler, yellow flowers. 3. The large-flowered, broad-leaved, American *onagra*. 4. The ſmall, narrow-leaved, Canada *onagra*. 5. The red-ſtalked, ſmall-flowered, narrow-leaved *onagra*. 6. The betony-leaved, American *onagra*, with rough fruit. 7. The American *onagra*, with large leaves, like thoſe of arſmart, and with ſmall yellow flowers. 8. The American *onagra*, with narrower, arſmart leaves, and large yellow flowers. 9. The ſhrubby, American *onagra*, with large yellow flowers, and leaves like the oleander. *Tourn.* Inſt. p. 302.

ONAGRIUS *lapis*, a name by which ſome call the *aſinius lapis*. See ASINIUS *lapis*.

ONCOS, Ογκος, in antiquity, was uſed to ſignify an ornament for the head, peculiar to thoſe who offered ſacrifice. Mem. Acad. Inſcrip. Vol. 3. p. 134.

ONDEGGIARE, in the Italian muſic, ſignifies to return the hand beating time, not directly, but by degrees; as *ondeggiare la mano*, to keep it wavering in the air, or giving it two motions, before it is quite lifted up to end the bar, and thence to fall it to beat a firſt, ſecond, or third time, of that, or another meaſure.

ONEIROGMOS, a word uſed by the antients to expreſs *venereal dreams*.

ONEIROPOLI, Ονειροπολοι, in antiquity, perſons whoſe buſineſs it was to make predictions from *dreams*. *Potter*, Archæol. T. 1. p. 304.

ONEIROSCOPI, Ονειροσκοποι, in antiquity. See ONEIROPOLI.

ONION, *ceſa*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the liliaceous kind, and compoſed of ſix leaves; in the center of it there ſtands a piſtil which finally becomes a roundiſh fruit, divided into three cells, and containing roundiſh ſeeds. To this it is to be added, that the flowers are placed in ſpherical heads, and that the leaves, as well as ſtalks are tubular.

The ſpecies of *onion* enumerated by Mr. Tournefort, are theſe: 1. The common, red-flowered *onion*, with red coats to the root. 2. The common, white-flowered *onion*, with white coats to the roots. 3. The *onion* with a turbinated root. 4. The oblong-rooted *onion*. 5. The ſcallion *onion*. 6. The fiſſile *onion*, or *cibule*. 7. The great African ſweet-rooted *onion*. 8. The perennial, ruſh leaved, ſectile *onion*. 9. The fine-leaved, Alpine, marſh *onion*. 10. The ſmalleſt, Portugal *onion*, with capillaceous leaves, and purple flowers. 11. The

11. The fine-leav'd, bicomated *onion*, with duſky colour'd flowers. 12. The little ruſh-leav'd, purple flowered *onion* 13. The purple-flower'd, globular-headed, fine-leaved *onion*. *Tourn.* Inſt. p. 382.

Onions are much eaten, and it would be well if they were yet more ſo; they attenuate tough humours, cleanſe the ſtomach, and excite appetite, and in ſome degree promote the menſes. But they are apt to breed flatulencies, and, if eaten too largely, to affect the head and diſturb the ſleep afterwards. An *onion* boiled to a perfect ſoftneſs, is recommended by many as a cataplaſm for ripening peſtilential buboes. A freſh cut *onion* rubbed on the part till it become red, and itch, is ſaid to be a cure for baldneſs. A mixture of equal parts of juice of onions and ſpirit of wine, is eſteemed a cure for deafneſs, a few drops being put at times into the ears: An *onion* cut in two, and macerated an hour in the ſame ſpirit, is a good application for the head-ach. A cataplaſm of roaſted *onions* and butter is an excellent application for the piles.

The three ſorts of *onions* propagated for the ſake of their roots for winter uſe, are the Straſburg onion, the red Spaniſh *onion*, and the white. Theſe are to be propagated by ſowing their ſeeds in the latter end of February, in a dry, and ſomewhat ſandy ſoil, yet rich: in about a month's time the plants will appear, and, in a fortnight after that, they will be forward enough for hoeing, which muſt be done with a very ſmall hoe, cutting up all the weeds, and leaving the *onions* two inches aſunder; this ſhould be done in a dry ſeaſon, and the ground will then be clear of weeds for a month. At the end of this time, they muſt be hoed again, and cut to three inches apart; and a month after this, to four inches, at which diſtance they will thrive well, and grow very large. Toward the latter end of July, the *onions* will have arrived at their full growth, which is known by their leaves hanging down, and ſhriveling; and they muſt at this time be pulled up, and ſpread on a dry place, and turned every day, to prevent their ſtriking freſh roots; in a fortnight's time they will be dry enough to houſe, and ſhould be wiped clean, and ſpread thin in an upper loft, or garret.

The differences between theſe ſpecies are not eſſential, they often degenerating into one another; and even the large Portugal *onion*, after a few years, with us, will loſe itſelf ſo far that no one would imagine it came of that race. *Miller*'s Gardener's Dict.

Welch ONIONS, a ſort of *onions* propagated by gardeners, for the uſe of the table in ſpring; they never make any bulb, and are therefore only to be eaten green in ſallads. They are propagated by ſowing their ſeeds toward the end of July in beds of a dry, but rich ſoil; and in three weeks after ſowing, they will appear above ground: they muſt be kept carefully cleared from weeds. About October all their leaves die away, which has occaſioned ſome to think the whole plantation loſt, and to dig up the ground for ſome other uſe; but if they are ſuffered to ſtand, they will ſhoot up again very ſtrong in January, and from that time will grow very vigorouſly, and reſiſt all weathers, and will be fit to draw for young *onions* in March, and are extremely green and fine, and more valued at market at that ſeaſon than any other kind; but they are much ſtronger than any other *onions*, and have very much of the taſte of garlick. Id. ibid.

ONION-*ſhell*, in natural hiſtory, a name given by authors to a peculiar kind of *oyſter*, which is of a roundiſh figure, and very thin, and tranſparent, and repreſents very exactly a piece of the peel of an *onion*. See OSTREA.

ONISCUS, in ichthyology, a name given by Athæneus, and others of the Greek writers, to the *accipenſer*, or *ſturgeon*. See ACCIPENSER.

ONISCUS is alſo the officinal name of the *whiting*. *Dale*, Pharm. p. 372.

ONISCUS, in zoology, is alſo a name uſed by ſome to expreſs the common *millepedes*, called in Engliſh *wood lice*, and *ſows*. *Aldrov.* de Inſ. p. 632.

ONOBRYCHIS, *cock's-head*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the papilionaceous kind, and its piſtil finally becomes a ſhort pod, of a creſted form, and in ſome ſpecies echinated; this contains a kidney ſhaped ſeed. To this it is to be added, that the flowers grow in a denſe ſpike.

The ſpecies of *onobrychis* enumerated by Mr. Tournefort, are theſe: 1. The great, vetch-leaved *onobrychis*, with bright red flowers, and an echinated fruit. 2. The great, vetch-leaved *onobrychis*, with pale red flowers, and echinated fruit. 3. The great, vetch-leaved *onobrychis*, with echinated fruit, and with white flowers. 4. The ſtone *onobrychis*, with long, and narrow, vetch-like leaves. 5. The leſſer *onobrychis*, with echinated fruit. 6. The leſſer *onobrychis*, with a very large, and remarkably echinated fruit. *Tourn.* Inſt.

ONOCENTAURUS, a fabulous animal, ſuppoſed to be a compound of a man and an aſs. Ælian[a] ſpeaks of *onocentaurs*. It was half man, and half aſs, as the centaur was half man, and half horſe[b]. — [[a] Lib. 7. cap. 9. [b] *Calmet*, Dict. Bibl.]

ONOCROTALUS, in zoology, the name of a very remarkable bird, commonly known among us by the name of the *Pelican*. It is of the ſize of a gooſe, or larger; and is of a greyiſh white all over, except that the neck looks a little yellowiſh, and the middles of the back feathers are blackiſh. The bill is remarkably long, and hooked at the end, and has under it a lax membrane extended alſo to the throat, and makes a bag or ſack capable of holding a very large quantity. Its feet are web'd, as in the duck, and gooſe, all the toes being joined by the membrane. There is one very ſingular thing in this bird, which is, that its bones are ſolid, containing no marrow, and are all pellucid. *Ray*'s Ornithol. p. 246.

ONOS, in ichthyography, a name given by ſome authors to the *æglefinus*, or common *haddock*. *Willughby*'s Hiſt. Piſc. p. 170. See the article ÆGLEFINUS.

ONOS is uſed by Athæneus, and many other of the Greek writers, to the fiſh which we call the *hake*, the *aſellus minor* of authors; called by Bellonius, Geſner, and ſome others, the *merlucius*.

ONYX, *(Cycl.)* in natural hiſtory, the name of a genus of the ſemipellucid gems; the characters of which are, that they have variouſly coloured zones, but none of red, theſe making them ſardonyxes; and that they are formed of chryſtal debaſed, but by a very ſmall admixture of earth, and compoſed either of a number of flat plates, or of a ſeries of coats made by incruſtation round a central nucleus; the different coloured ones being covered with a coat of the baſis or common matter of the ſtone, and ſeparated from one another by, and alternately variegated with, thin veins of that matter, in form of other zones.

As there have been many diſputes about what were properly the gems of the antients, the *onyx* has not been leſs perplexed than the reſt. The characters here aſſigned them will diſtinguiſh them, however, from all other ſtones; and will not let the careful obſerver eaſily be deceived, when he ſees a ſtone in its rough and native ſtate; but they will not ſo well ſerve the leſs nice enquirer from being impoſed upon in purchaſing *onyxes* when cut and wrought. Our lapidaries ſeem to have had a deſign of baniſhing the diſtinctions of the agate and *onyx* out of the world; for as the zones are the moſt obvious character of the *onyx*, they have found an eaſy way to make pieces cut properly out of maſſes of agates reſemble them. Agates, though never plated or formed of regular zones, are frequently veined in ſtrait narrow lines, and a piece of one of theſe agates cut perpendicularly to the ſite of theſe veins, gives the very figure of the zones of an *onyx*. The white Gambay agate is what they uſually chooſe for this purpoſe; ſuch pieces of this ſtone as have the black dendritæ in them, when properly cut out from the reſt of the maſs, are their Mocoa ſtones; but other parts of the ſame ſtone, which have not theſe delineations, but have ſtrait cloſe veins are cut out in a proper direction, and ſold for *onyxes*. Theſe may always, however, be diſtinguiſhed by their wanting the proper degree, purity, and tranſparence; and by this, that the common pale auricular *onyxes*, which are the kind theſe moſt reſemble, have always a peculiar blueiſh caſt, which is not found in theſe counterfeits.

We have four ſpecies of the *onyx* now in uſe among our lapidaries. The firſt is a blueiſh white one, with broad white zones. This was the true *onyx* of the antients, and is compoſed of a blueiſh white *onyx*, variegated with white and brown zones. It is ſometimes found compoſed of flat and even plates of theſe, laid cloſely on one another, and ſometimes is in form of a pebble, compoſed of a central nucleus of pure chryſtal, or nearly pure, ſurrounded with thoſe cruſts which form the zones. It is very common in the Eaſt-Indies, and is found alſo in New Spain, and ſometimes in Germany and Italy, tho' of much ſmaller value, and leſs brightneſs, hardneſs, and tranſparence.

The ſecond is a very pure *onyx*, with ſnow white veins, which is exceeding bright and tranſparent, and tho' compoſed only of two colours, is inferior to very few of the *onyxes* in beauty. It is always found in the form of a roundiſh pebble, uſually about the ſize of an egg, and compoſed of ſeveral coats of a blueiſh white, and a fine and pure white, laid evenly round a central neuleus of pure, but ſhattery chryſtal; the whole is very bright, and the blueiſh part very little leſs tranſparent than pure chryſtal; the nucleus is generally of an angular form, and the coats or zones being all exactly of the ſame ſhape, make a very beautiful appearance. It is found only in the Eaſt-Indies, and is very much eſteemed in Italy, but with us is not ſo much regarded as it deſerves.

The third ſpecies is the *jaſponix*, which, ſee under its proper head.

The fourth is the brown *onyx*, with blueiſh white zones. This is a very clear and pure ſtone, but is ſo much leſs beautiful than the other kinds, that tho' very common in the Eaſt Indies, it is very ſeldom ſeen or regarded among us. *Hill*'s Hiſt. of Foſ. p. 490.

ONYX, in conchyliology, the name given by the curious to a ſpecies of voluta, found in cabinets, but never met with in that ſtate on the ſea-ſhores. The true account of this is, that the ſhell in this elegant form owes its appearance to art, having been poliſhed, and having had its outer coat taken off. With this outer coat which is of a duſky yellow, it is often kept in the ſame cabinet under another name, being then

then called by the French, the cierge, or wax-ſhell. See VOLUTA.

ONYX, in zoology, a name by which Pliny, and many other of the antient writers, have called the *ſolen*. See SOLEN.

ONYX *indicus*, in the materia medica of the antients, a term uſed by the Greek writers to expreſs what is uſually called *unguis odoratus*, or the ſweet hoof. Some call it *onychus indicus*, as particularly Myrepſus in his antidote of fifty ſpecies. The ſame author mentions the *blatta bizantia*, and tells us that it is not the ſame thing with the *onyx indicus*, but that the Italians called by this name the *os naſi* or bone of the noſe of the purple fiſh. What he means by this is probably the bony tongue of that animal, nature having given it ſuch a weapon to pierce the ſhells of thoſe fiſh on which it is to feed. We frequently find the chamæ, and other ſhell-fiſh, with holes bored through the upper ſhell as exact as if it were done with an inſtrument: this has been done by the purple fiſh, to get at the fleſh of the animal within for food; and the bony tongue with which this fiſh performs this, is called by the Italians of thoſe times *blatta Byzantia*. Actuarius tranſlates the blatta Byzantia of all the earlier writers by the phraſe *os naſi purpuræ*; and the interpreters of the Arabian writers give the ſame name to what they call *unguis odoratus*, or *onyx indicus*, for the Arabian name exactly expreſſes this.

The word *blatta* among the earlieſt Latin writers, means a bubble of mud. Paulus Ægineta quotes Feſtus for many inſtances of the word being uſed originally in this ſenſe: after this, it became uſed for the grumes, or clots, into which the red part of the blood concretes, after it is out of the veſſels; and, after this, it became a name for the ſanies, or foul matter, concreting in lumps, when the purpura, or purple-fiſh, was expoſed to the air. The purple colour was finally called by the ſame name, and from this, any thing dyed purple was ſaid to be dyed with blatta. The blattæ of the Turkiſh dominions were the purple fiſh of that part of the world: theſe were more excellent than thoſe of any other known part, and were therefore moſt employed. The word blatta Byzantia ſignifies no more than purpura Byzantina, and when the purple colour had been taken out, the tongues, or other parts of the ſhells of theſe fiſh, were uſed in medicine, under the ſame name of blatta Byzantia. Thus Myrepſus is found to be in the right. The *onyx indicus* of the Greeks was, however, very different. This, though it was alſo a ſhell, or part of a ſhell, was collected not at Conſtantinople, but in the lakes of the Eaſt-Indies. Dioſcorides plainly makes it different from the purpura, by comparing the ſhell to that; he ſays, it is part of a ſhell-fiſh, in many reſpects reſembling the purpura. Some have ſuppoſed that Dioſcorides underſtood the whole ſhell of the fiſh by the word *pama*, which he has uſed on this occaſion; but this is not the caſe, for the Greeks had many other words to expreſs a ſhell by, and no other author countenances the uſe of *pama* in that ſenſe. Beſides, Dioſcorides ſays afterwards, that the whole ſhell of the fiſh which produced the *onyx* being burnt, had the ſame virtues with the ſhell of the purpura, and other the like fiſh. The Arabians ſeeing by this, that Dioſcorides did not mean the whole ſhell by this word, have expreſſed his meaning by a phraſe which ſignifies not a whole ſhell, but a fragment, or part of one. The word *pama* properly ſignifies operculum, and, as all the ſhell-fiſh of the buccinum kind, to which this purpura belongs, have opercula, or thin ſhells, to cover the orifice when the fiſh is retracted in, it is plain enough that the antients meant this by the word *pama*; and this they might very well call *onyx*, or *unguis*, from its being thin, and flat, and not unaptly reſembling in ſize and ſhape, the human nail. This operculum, when taken from the purpura, as it ſeems to have been among the Romans, who had that fiſh from Conſtantinople, was properly called blatta Byzantia, being the only part of the fiſh uſed in medicine; but whether this, or the bony tongue, were ſo called, it is certain that this is no proper name for the true *onyx indicus* of the Greeks, which was not any part of the blatta, or purple fiſh; but, as Dioſcorides expreſly ſays, of another ſpecies of ſhell-fiſh, ſomewhat like it.

OOSCOPIA, Ωοσκοπια, in antiquity, a ſpecies of divination, wherein predictions were made from eggs. *Potter*, Archæol. Græc. l. 2. c. 14. T. 1. p. 319.

OOST, in huſbandry, a name given by the people who manure hops, for the kiln in which they dry them after they are picked from the ſtalks. This is a ſquare room, built up of brick, or ſtone, ten foot wide, more or leſs, and having a door on one ſide. In the midſt of this room is a fire-place, about thirteen inches wide, and as much high; and, in length, reaching from the mouth ſo nearly to the back part of the kiln, that a man has juſt room to go round it. This fire-place is called a *herſe*, and the fire is let out into the room by ſeveral holes in the ſides, in the ſame manner as in malt-kilns. Five feet above this, is laid the floor on which the hops are to be laid to dry, and this muſt have a wall round it of four feet high, to keep the hops from falling out. At one ſide of the upper bed muſt be made a window by which to puſh out the hops as they are dried into a room prepared for them. The beds muſt be made of laths an inch ſquare, placed at a quarter of an inch diſtance from one another, and ſupported by beams underneath. The hops are to be poured on this bed with a baſket, till the whole is covered half a yard thick with them; when this is done, lay them even with a rake, and let a fire be made in the fire-place below. Some recommend a wood-fire, but experience ſhews that nothing does ſo well as charcoal; let the fire be kept at the mouth of the furnace, for the air will be carried all the way through; and thus let the hops lie, never ſtirring them till they are thoroughly dry; when they rattle under the rake, and the inner ſtalks are brittle, they are ſufficiently dried, and are to be puſhed out, and a freſh parcel laid in the *ooſt* in their place.

Some people dry their hops in a common malt-kiln, ſpreading them on a hair-cloth about ſix inches thick, and now and then turning them till they are all thoroughly dried, then laying them in a heap, till they are to be put in the bags. But both theſe ways are liable to ſome inconveniencies; the *ooſt* generally over-drys the under ones, by the time that the per ones are dry enough; and the hair-cloth, and the turning in the other way breaks and ſhatters them, and ſpills many of the ſeeds. See TIN-*floor*.

OPAL (*Cycl.*) — The *opal* is a gem of a very peculiar kind, and has been eſteemed by many, in all ages, of very great value; though, at preſent, it is of leſs price, in proportion to its ſize, than any other of the finer gems. The Romans eſteemed it the fourth gem in value; and its ſingularity, as well as beauty, ſeem very well to entitle it to at leaſt that rank; it is ſofter than any other of the gems, and is with difficulty poliſhed to any degree of nicety. Its moſt frequent ſize is between that of a pea, and a horſe-bean, but it is found as ſmall as the head of a large pin, and up to the ſize of a wallnut. Its figure is very various, and uncertain, but it is never found in a columnar, or cryſtalliform ſtate. Its moſt uſual figure is an irregularly oblong, flatted at the bottom, and convex at the top, and dented with various ſinuoſities on the ſides. There have been found ſome of the regular ſhape of a kidney, and others almoſt perfectly round, and, not unfrequently, it is met with in thin flat pieces. It is often found looſe among the earth of mountains, ſometimes on the ſhores of rivers, and not unfrequently bedded in the coarſer kinds of jaſper, ten or twenty *opals*, of different ſizes and colours, being frequently found in one ſtone.

It is naturally of a ſmooth ſurface, and fine gloſs, and many of the fineſt *opals* that have been ſeen, have been worn with their native poliſh. Its colour, as it appears in a fine ſpecimen, is of ſo mixt a nature as not to be eaſily deſcribed, but is beſt expreſſed by comparing it to the fineſt ſort of mother of pearl. It differs, however, greatly from that in its ſuperior luſtre and brightneſs, and in being ſo pellucid that one may ſee deep into the ſtone. As it is variouſly turned about, it ſhews the colours of all the other gems, yellow, red, blue, green, purple, and a milky grey. The laſt of theſe colours is the native dye of the ſtone, and it has many of the others in a ſuperior beauty even to the gems to which they naturally belong, particularly the fire-colour of the carbuncle, which ſeems in the *opal* to lie deep in the body of the ſtone. It is the moſt difficult to counterfeit of all the gems; and this is done by a very fine, and well choſen piece of ſome pearly ſhell. It is ſometimes found wanting one or more of the colours, and ſometimes of a deep blueiſh black, with no other colour viſible on changing the light, but a deep red, which is very ſtrong and glowing, and makes it a very beautiful ſtone; ſometimes it has alſo a general yellowiſh caſt, and ſometimes a greyiſh one, which greatly impair the reflexions of the other colours, and injure the ſtone.

It is found in Ægypt, and Arabia, and in ſoms parts of the Eaſt-Indies, and in Europe. The oriental ones are the fineſt, but thoſe of Bohemia are often very beautiful. *Hill*'s Hiſt of Foſſ. p. 600.

Counterfeit OPAL. To imitate this gem in natural cryſtal, uſe the following method: take yellow orpiment, and white arſenic, of each two ounces, crude antimony, and ſal armoniac, of each one ounce; powder all theſe, and mix them well together; put this powder into a large crucible, and lay upon it ſmall fragments of cryſtal, and, upon theſe, other larger pieces of cryſtal; fill up the crucible with theſe, and lute on to it another crucible inverted, with a hole at the bottom as big as a ſmall pea; when the lute is dry, ſet the veſſels in a quantity of charcoal in a large chimney, covering them up with coals to the middle of the upper crucible; ſo long as the materials fume out at the hole, keep up a ſtrong fire; when that is over, let the fire go out of itſelf; and then unlute the crucibles; the greateſt part of the cryſtal will be found tinged to the colours of various gems; not only the *opal*, which will be very fair, and beautiful, but the topaz, and ruby colour will be ſeen in others. *Neri*'s Art of Glaſs, p. 119.

OPEN (*Cycl.*) — *Self*-OPENS. See SELF-*opens*.

OPERATION (*Cycl.*) — *Hermit*-OPERATION. See the article STONE.

OPHICARDELON, in natural hiſtory, the name of a gem mentioned by Pliny, which, he ſays, was a black ſtone covered at top and bottom with white: this ſeems, without all doubt, to have been the *camea* of our jewellers.

OPHIDION, in ichthyology, the name of a fiſh of the eel kind, and reſembling the common eel, and conger, in ſhape, but that it is ſhorter in proportion to its thickneſs, and more flatted, and of a paler colour. It ſeldom exceeds eight inches in length, and the back is grey, and the ſides of a bright ſilver colour. It is cloathed with ſmall ſcales, which are long and narrow, and are not placed like tiles hanging over one another, as in other fiſhes, but only ſcattered here and there, and laid in no order. The mouth is large, and the jaws are furniſhed with very ſmall teeth, and, beſide theſe, with three ſmall eminences ſet with the like teeth; the one on the roof of the palate, the others lower on each ſide. The eyes are large, and it has one pair of fins near the gills. It is a very delicate fiſh, and is caught in great plenty in the Mediterranean, and ſold at Venice, and other places. *Willughby*'s Hiſt. Piſc. p. 112. *Aldrov.* l. 3. c. 26. *Geſner*, p. 104.

The name *ophidion* is given by Artedi to a genus of fiſhes, the characters of which are theſe: they are of the malacopterygious, or ſoft-finned kind; the body is oblong, and of a cylindric figure, and has three fins. The ſpecies of this genus are properly only two, diſtinguiſhed by the cirri, or beards. The firſt is the *ophidion* with four cirri growing from the lower jaw: this is the *ophidion* of authors. The ſecond is the *ophidion* without cirri: this is found in the Baltic. *Artedi*, Gen. Piſc. 20.

OPHIOBORUS, in natural hiſtory, a name given by the antients to a ſpecies of carnivorous fly, which feeds on the bodies of beetles, or other flies, or on the fleſh of dead ſerpents. Its wings are of the colour of poliſhed braſs, whence it was alſo called by the Greeks *chalcomuca*, the *braſs fly*.

OPHIOGLOSSUM, *adder's tongue*, in botany, a genus of plants, no part of the fructification of which is viſible, except the fruit. This is an oblong, double, or diſtichous capſule, divided by a great number of tranſverſe articulations, into many cells, each of which, when mature, opens tranſverſely, and is found to contain a great number of ſmall ſeeds of a ſubovate figure.

Caſpar Bauhine deſcribes what he calls three ſpecies of this plant. 1. The common *ophioglo ſſum*, with a ſingle leaf, of an ovated figure, having no viſible nerves, or veins in it, very thick and fleſhy, and of a beautiful bright green. This ſpecies is a native of England, and common in deep paſtures. 2. The angular-leaved *ophioglo ſſum*. And, 3. The roundiſh-leaved *ophioglo ſſum*. Mentzal deſcribes three ſpecies alſo beſide the common one; but all theſe are only varieties of the common *ophioglo ſſum*, the capſule or ſpike of which is often bifid, and the leaves vary greatly in length and breadth.

All Europe, ſo far as yet known, affords only one ſpecies of *ophioglo ſſum*; but, in America, are found two diſtinct ſpecies, beſide the common European ſort. 1. The reticulated, heart-ſhaped-leaved, *ophioglo ſſum*. And, 2. The palmated *ophioglo ſſum*.

Tournefort makes eight ſpecies of *ophioglo ſſum*, which are only the varieties of the common European kind, mentioned above. Vid. *Hill*'s Hiſt. Plant. p. 134, ſeq.

This is a ſpring plant, and is only to be found in April, and May. It is not uncommon in wet meadows, and is eaſily diſtinguiſhed among the other ſpring plants by its ſpike, or tongue.

It is eſteemed one of the beſt vulnerary herbs this nation produces; but it is more in uſe among the common people than in the ſhops. They gives its juice internally, and uſe the herb bruiſed, or an ointment prepared from it, with lard, or May butter externally at the ſame time. *Dale*'s Pharmac.

OPHIOMANCY, Ὀφιομαντεία, in antiquity, the art of making predictions from ſerpents. Thus Calchas, on ſeeing a ſerpent devour eight ſparrows with their dam, foretold the duration of the ſiege of Troy. And the ſeven quoils of a ſerpent that was ſeen on Anchiſes's tomb, were interpeted to mean the ſeven years that Æneas wandered from place to place before he arrived in Latium. Thus, Virgil. Æn. l. 5. v. 85.

Septem enim gyros, ſeptena volumina traxit.

The word is Greek, compounded of ὄφις, a ſerpent, and μαντεία, divination. *Hofm.* Lex. in voc.

OPHIOMORPHITES, in natural hiſtory, the name given by ſome authors to the foſſils called more uſually *cornua ammonis*; which are compoſed of ſeveral wreaths, rolled in a ſpiral form over one another, and reſemble a ſnake when rolled up. Theſe are found of prodigious ſizes, ſome not leſs than the fore-wheel of a chariot. They are evidently formed from ſome ſea-ſhell, the ſhelly matter remaining on ſome of them, and all being compoſed of ſeveral cells, communicating with one another by means of a ſiphunculus, in the manner of thoſe of the nautilus. See CORNU *ammonis*.

OPHIOPHAGI, in natural hiſtory, a name given by ſome to the *eagle vulture*, and ſome other birds of prey which are ſometimes ſeen to feed on ſerpents.

Pliny gives the name *ophiophagi* to a certain people of Æthiopia, whom he deſcribes as very barbarous and ſavage, going always naked, and feeding on ſerpents, whence the appellation. Solinus, who generally copies Pliny, but imperfectly, has perverted his meaning ſtrangely in this paſſage, having placed the *ophiophagi* in Arabia Felix, inſtead of Æthiopia.

OPHITES, the *ſerpentine marble*, in the natural hiſtory of the antients, a name given to ſuch of the marbles as had their variegations not in form of veins, but of ſmall ſpots uſually of an oblong figure, and thence imitating in ſome degree, ſpots on the back of a ſerpent.

The antients knew three ſpecies of this kind, which they called the black, the white, and the grey *ophites*, and this laſt alſo frequently *tephria*; and allowing theſe ſpotted variegations to be the characters of an *ophites*, we have, beſide theſe, two others known at this time.

As to the *ophitæ* of the antients, the uncertain accounts they have given us of them have been the occaſion of many unlucky miſtakes, about what they meant by the names. Some have imagined that they meant a black, others a white marble. A more accurate ſurvey of their works together, will ſhew, however, that they, in reality, were very diſtinct in their meaning, though they ſeem obſcure, becauſe ſhort; but they ever diſtinguiſhed between their three *ophitæ*; and it is plain from them, that the black and white *ophitæ*, as they call them, were both marbles whoſe ground was green, and only were diſtinguiſhed by their variegations, and their different degrees of hardneſs; and what they mean by the black and white, was only the black ſpotted, and the white ſpotted *ophites*. *Hill*'s Hiſt. of Foſſ. p. 483.

Black OPHITES is a very beautiful, and conſiderably hard marble, of a very fine green, aad elegantly variegated with ſmall black ſpots and irregular lines, and ſometimes with an admixture alſo of white ones. Theſe are frequently ſeen together in the ſame block, and make a ſort of white ſpotted, and black ſpotted kinds; but the diſtinctions of the antients were not founded only on theſe, but on the eſſential character, the hardneſs of the ſtone, the white kind being greatly ſofter, as we find by all their accounts.

The antients found this ſpecies in Ægypt, and knew of it in no other place. We have it now in many parts of the world: the deſarts of Arabia abound with it; it is common in the iſlands of the Archipelago; and has often been found in Wales. *Hill*'s Hiſt. of Foſſ. p. 484.

White OPHITES is alſo a very beautifully variegated maſs, of a fine and even texture, moderately heavy, and, when pure, is of a very elegant pale green, not unlike that of the malachites, and elegantly variegated with ſpots, clouds, and lines, of a fine deep black, an extremely pale green, and often with very large variegations of pure white. It is very ſoft, and eaſily ſcratched, even with a pin, but is capable of a good poliſh, and looks very beautiful and bright, when wrought.

The antients had it in great repute; it cut eaſily, and without much trouble, was made into elegant veſſels for their tables; and in Germany, it is ſtill in common uſe on the ſame occaſions, and is by ſome recommended as a medicine againſt venemous bites. The antient writers have well diſtinguiſhed this from the black kind, not by its whiter ſpots, which were common to both, though more frequent and numerous in this, but by its ſoftneſs. They had it only from Ægypt, but we find it in France, Italy, Germany, and ſome other places.

Grey OPHITES, called alſo *tephria*, was not, like the other ſpecies, diſtinguiſhed by its ſpots, but by its ground colour, which is a very lively and beautiful aſh-colour, or pale grey. It is a very fine, even, and ſmooth marble, and is variegated with a multitude of black ſpots of irregular figures; but, in general, all much of the ſame ſize, and that not exceeding the ſixth part of an inch in length: it is conſiderably hard, and takes an elegant poliſh. The antients had this with their baſaltes from Æthiopia. Ægypt alſo afforded it, and does ſo to this day: in Germany alſo we find it in large quantities. It has been celebrated from the earlieſt times for its virtues againſt venomous bites, and is in many parts of the world worn as an amulet, to this day.

The other two *ophitæ*, which ſeem not to have been known to the antients, are 1. A greyiſh brown one, with green ſpots. The ground of this is of a duſky aſh-coloured brown, and the ſpots are of a lively and beautiful green, uſually ſmall, and of an oblong figure; and the whole is very hard, of an even ſtructure, and capable of a fine poliſh. It is frequent in Ægypt, and Arabia, and is ſaid to have been dug in England. The 2. is a pale grey one, with green ſpots and veins. This is a ſmooth and fine marble; its ground is a beautiful pale grey, in ſome places ſlightly tinged with red, and in others approaching to white. Its ground has all theſe varieties in colour, ſometimes in the ſame, ſometimes in different blacks, and it is variegated with a very beautiful pale green, diſpoſed with not much leſs variety, for it is ſometimes in ſmall ſpots, ſometimes in thin uneven veins, and ſometimes in thicker. It is very hard, and capable of an elegant poliſh. It is frequent in Germany, and tables are made of the larger pieces, and vaſes of the ſmaller ones. It is ſaid alſo to be found in England. *Hill*'s Hiſt. of Foſſ. p. 486, ſeq.

OPHRIS, or OPHRYS, in botany, the name of a genus of plants, called in Engliſh *twyblade*, the characters of which are theſe: the flower, which has no perianthium, conſiſts of five oblong petals. The nectarium is dependent, longer than the petals, biſid, and marked with a deticulation on each ſide of its baſe. The ſtamina are two very ſhort filaments. The antheræ are erect, and covered by the inner margin of the nectarium. The germen of the piſtil is oblong and contorted. The ſtyle adheres to the inner ſide of the nectarium. The fruit is an oval capſule, containing a multitude of duſt-like ſeeds. Vid. *Linnæi*, Gen. Plant. p 434.

The ſpecies of *ophris* are, 1. The ovated-leaved *ophris*, or the common *twyblade*. 2. The bulbous-rooted *ophris*. 3. The creeping-rooted marſh *ophris*. 4. The leaſt, or triangular-leaved *ophris*. Vid. *Hill*'s Hiſt. of Plants, p 592.

OPILIO, in natural hiſtory, the name given to a peculiar genus of ſpiders. The diſtinguiſhing character of which is, that they have but two eyes. Their legs are uſually very long, and their skin hard and firm. They do not ſpin webs like the common ſpiders, for the catching their prey. Their head ſeems to grow to the middle of their ſhoulders: their forceps is terminated by two claws like thoſe of the leg of a crab. They differ from the common ſpider alſo, in the nature of their excrements; thoſe of this kind being hard and ſolid, the others liquid.

Of theſe there are four principal kinds: 1. The grey creſted *opilio*. This is the largeſt ſpider of this kind. Its body is greyiſh or browniſh, and its legs very long and ſlender; and it has on the back part of the head, a ſort of creſt formed of a double row of ſpines, and there is a rhomboidal crown ſpot on the middle of the back. This ſpecies is common in the fields about Auguſt. 2. The rediſh brown not creſted *opilio*. This is of a middling ſize, and has the longeſt legs of any kind. 3. The ſmall wood *opilio*, variegated with black and white ſpots, with a very elegant creſt. This is very ſmall, and has a remarkably little head. Its legs are remarkably long. It is found in woods in April. 4. The ſmall ſcarlet ſpiders, commonly called the *tant*, or *taint*. This is ſuppoſed to be very poiſonous. *Ray*'s Hiſt. of Inſects, p. 29. See the article TANT.

OPIMATORES, among the Romans, military men, who had the direction and management of the proviſions, and were to take care that the army wanted nothing. *Pitiſc.* Lex. Ant. in voc.

OPISTHODOMUS, ὀπισθοδομος, among the Athenians, the public treaſury, ſo called from its being ſituated on the back-ſide of Minerva's temple. Here, beſides other public money, a thouſand talents were laid in ſtore, againſt any very urgent occaſion; but if any man expended them upon a trivial account, he was to put to death. Alſo the names of all that were indebted to the commonwealth, were entered in a regiſter in this place. The tutelar gods of this treaſury, were Jupiter Σωτηρ, or the Saviour, and Plutus, the god of riches, whom they repreſented with wings, and placed next to the ſtatue of Jupiter the Saviour; which was unuſual in other places. *Potter*, Archæol. Græc. l. 1. c. 8. T. 1. p 31.

OPISTHOGRAPHUM, οπισθογραφον, among the antients, a waſte book, or ſchedule, on which were writ, extemporary things that wanted to be reviſed and corrected afterwards. *Pitiſc.* in voc.

The word is compounded of οπισθεν, *i. e.* afterwards, or on the backſide, and γραφω, I write; becauſe it was writ over again on the backſide of every page, which was left blank for that purpoſe.

OPIUM *(Cycl.)* — Dr. Charles Alſton, profeſſor of botany and the materia medica, in the univerſity of Edinburgh, has given us a diſſertation on *opium* in the medical eſſays of that place, vol. 5. art. 12. This gentleman is of opinion, that notwithſtanding the authorities of Lemery, Savary, Monſieur de la Condamine, in the Mem. de L'Acad. des Sciences for 1732, mentioned in the Cyclopædia, all which would lead us to conclude we have nothing but the meconium, or the expreſſed juice or decoction of the plant, our *opium* is neither an extract, nor an inſpiſſated expreſſed juice of poppies, but the milky juice drawn by inciſion from poppy heads. To ſhew this, the doctor, according to the directions of Dioſcorides, on a dry day before noon, cut off the crown of white poppy heads, ſo as to avoid penetrating into the cavity of the fruit, and collected the milk with a ſilver ſpoon in a China cup. The juice being expoſed to the open air, in a few days thickened to the conſiſtence of *opium*, and was of a fiery, hot, bitter taſte, and ſoporiferous ſmell, and more ſo than the common *opium*, of a dark yelloviſh brown colour on the outſide, ſomewhat higher within, and appeared as if compoſed of drops: after ten years keeping, its colour and taſte remained. This agreed with the account Bellonius, lib. 3. obſ. 15. gives of the beſt *opium*. That which was gathered from the papaver vulgare, or wild poppy, was ſomewhat of a lighter colour; but Dr Alſton thinks this but accidental, as the milk ſoon turns black on the knife. He alſo ſlightly ſcarified ſome poppy heads after the Perſian manner. When the juice was thickened, he ſcraped off the *opium*, and obtained more of it than by the other method. To procure the tear in its utmoſt perfection, he cut off the ſtar from ſeveral heads, and bending them down, let the milk drop into a cup. It grew ſolid as *opium*, and being formed into a lump, appeared uniformly white; nor was there any difference in the juices of different poppies.

Secondly, the Doctor obſerves, that the extract and inſpiſſated juice ſcarce any way reſemble *opium*; nor is their taſte and ſmell like it. The extract appears black when dried, and ſo does the juice, but when diluted, the firſt is brown, and the latter green. The extract is tough and adheſive, the juice rough and friable, and grows mouldy a day or too after expreſſion. *Opium* may poſſibly be mixed with either of theſe; and the greeniſh brown *opium* may have ſome ſmall portion of the juice in it. Its penetrating ſmell is certainly owing to the mixture of ſome aromatic ſubſtance.

Thirdly, *opium* contains more roſin than either the inſpiſſated juice, or extract. One third of *opium* appears to be roſin, while the juice and extract ſcarce yield one tenth part.

Fourthly, if *opium* was not the tear of the poppy, there would be no occaſion for ſowing ſo many fields with poppies in Egypt, and other places. Nor would it be ſo powerful a medicine, for its anodyne virtues depend chiefly on the milky juice.

The objection drawn from the low price of *opium*, is of no force; for even in this climate, where the heads are ſmall, the Doctor obſerves he could, in an hour, collect a dram of *opium* without the Perſian knife, or that dexterity which is acquired by practice. From all theſe conſiderations he concludes, that the greateſt part of *opium* is the tear of the poppy.

It has been controverted whether *opium* be got from the white or black poppy. Dr. Alſton thinks it of no conſequence, with reſpect to the medicine, which be choſen; the juice of both having the ſame effects.

As to the ſophiſtication of *opium*, the Doctor is of opinion, that only an innocent liquid is mixed with it, or a milky juice of the ſame nature with that of poppies, otherwiſe it would not be ſo ſtrong as what is made here. As the wild lettice, or *lactreca ſilveſtris odore viroſo*, C. B. *Pin.* 123. abounds with a milk of the ſame taſte and ſmell with *opium*; it may poſſibly be mixed with it, and without detriment; ſince the milk of the common lettices is anodyne and ſomniferous.

Many learned men among the moderns, have been of opinion, that *opium* was the nepenthes of Homer. Dr. Alſton forms ſome objections againſt this, and thinks that ſome of the antient phyſicians, who were neither ſtrangers to Egypt nor Homer's works, would have made the diſcovery long before the ſixteenth century.

Opium is acrid, bitter, and ſtrongly odoriferous. On attentively taſting it, a naſeous bitterneſs is firſt perceived; then a pungent heat affects the tongue, next the palate, and laſt of all the lips. The heat continues ſome time, the bitterneſs longer, provoking a plentiful diſcharge of ſaliva. It alſo heats the noſe, and produces an inclination to ſneeze.

Opium is certainly diaphoretic, and has ſtimulating qualities, which ſtrongly refute the notion of its being refrigerating; it is certainly a hot medicine, tho' in many caſes it diminiſhes preternatural heat.

Opium conſiſts of five parts of gum, four of reſin, and three of earth, not diſſolvable either in watry or ſpiritous menſtruums. Suppoſing that the reſin of *opium* is as good, or as much wanted as the gum, or the mucilaginous part, brandy will be found the beſt menſtruum.

Frider. Hoffman thinks the narcotic virtue of *opium* depends on its volatile ſulphur, (*vaporoſum ſulphur.*) Geoffroy in his *Materia Medica*, will have this virtue owing to a thick rareſiable ſulphur, (*ſulphur craſſum ad modum rareſcibile*) a kin to that of ſaffron, caſtor, &c. But Dr. Alſton thinks both theſe opinions inſufficiently ſupported. *Opium* is rather alcaleſcent than aceſcent, yet it is not an alcali. From the abovementioned gentleman's experiments, it ſeems that the ſolution of *opium* gave more appearances of an alcali, than of an acid; contrary to the account given by Geoffroy, Mat. Med. Tom. 2. p. 697. From theſe experiments it alſo appears, Firſt, that the eſſential ſalt of *opium* is ammoniacal; Secondly, that *opium* contains a very ſmall proportion of an acid; Thirdly, that it is aſtringent, or makes the ſame change on Chalybeats which vegetable aſtringents do.

The moſt active principles of *opium* are very fixed; for it keeps well, and, when forty years old, remains hard, ſolid, and retains its taſte; and it ſeems that the practice of toaſting *opium*, in order to correct it, by diveſting it of its narcotic part, is of no ſervice; and *opium* affords little or nothing by diſtillation.

Upon a chemical analyſis *opium* yields phlegm, urinous ſpirit, oil, a volatile and a fixed ſalt, and ſome earth; but little of the virtues of *opium* can be inveſtigated, or explained, from its analyſis, ſince ſimples extremely different as to their effects on human bodies, afford the ſame principles on diſtillation, as Homberg has ſhewn by the analyſis of the deadly night-ſhade, and cabbage. See Mem. de l' Acad. des Sciences. An. 1701. The curious may find the analyſis of *opium* in the abovementioned diſſertation by Dr. Alſton.

The effects of *opium* on other animals are not much different from its effects on men. Dr. Alſton put a few drops of a ſo-

lution of *opium* into a frog's ſtomach, and the circulation of the blood of the animal being examined by a microſcope, no alteration was perceived in the blood, as to its conſiſtence, colour of the ſerum, magnitude, figure, or colour of the red globules, but its velocity was ſurprizingly diminiſhed. In about half an hour, the blood regained its common celerity, and the frog its vigour. On giving the creature a ſecond doſe, the blood moved ſlower than it did the firſt time, and its velocity gradually decreaſing, ſtagnated firſt in the ſmaller, then in the larger veſſels, and in a quarter of an hour the frog expired. It is remarkable, that, notwithſtanding the diminution of the velocity of the blood, the pulſe was not leſs frequent, and that even when the circulation ſtopt in the foot, the pulſe remained viſible by an undulatory motion. On opening the frog, its ſtomach was found full of a clear mucus, tinged with the *opium*, and every thing alſo ſeemed perfectly natural. This experiment was repeated ſeveral times, with the ſame appearances.

A dog being killed by an injection of a ſolution of *opium* into his crural vein, on opening his thorax, the lungs were found ſound, but very ſmall, and white, without any blood in them. The heart was big, and all its great veſſels diſtended with blood; but nothing preternatural was obſerved in the brain or abdomen.

Opium, externally applied, is diſcutient, anodyne, and ſoporiferous, and has almoſt the ſame effects as when taken inwardly; but, that it can make any part inſenſible of pain is not evident. Wedelius declares he never could obſerve any ſuch effects. One inconvenience following the immoderate application of *opium*, mandragora, and hyoſciamus for pains of the eyes, taken notice of by Galen, is the mydriaſis, or a preternatural dilatation of the pupils. Mr. Ray gives a notable inſtance of this kind, ariſing from the application of a leaf of the deadly night-ſhade to a cancerous ulcer a little below the eye. The uvea, in a night's time, entirely loſt its muſcular force, and was ſo relaxed, that the pupil, in the cleareſt light, remained four times bigger than that of the other eye.

Opium rather coagulates, than attenuates the blood. See Dr. Friend's Emmenolog. cap. 14. This favours what is affirmed by ſome authors, that the blood has been found congealed, or frozen, as they expreſs it, about the heart of thoſe who have been killed by *opium*. See Wedel. Opiolog. l. 1. §. 1. c. 5. Uſe makes the quantity of *opium* ſafe, and even beneficial, which would otherwiſe prove poiſonous. Daily experience confirms this; and they who habituate themſelves to *opium*, find it as neceſſary as ſpirituous liquors to tipplers. A few grains will deſtroy a perſon unaccuſtomed to it, but ſome diſorders, as madneſs, enervate its force. Among the Eaſtern nations, a dram of *opium* is but a moderate doſe. Garcias mentions one who took ten drams every day, and tho' ſhe appeared ſtupid and ſleepy, yet ſhe diſputed very readily and learnedly on any ſubject. It is remarkable that, notwithſtanding this exceſſive uſe of *opium*, the Turks are generally long liv'd, if we credit Bellonius, lib. 3. obſ. 14, 15.

The action of *opium* is very analogous to that of wine or vinous ſpirits; the good and ill effects of both differ little. See Wedelius in his *Opiologia*, and Geoffroy's materia medica. Platerus affirms that wine is narcotic, and Sydenham that *opium* is the moſt excellent cordial in nature.

The virtues of *opium*, internally taken, depend chiefly on its action on the ſtomach. There are many inſtances of terrible ſymptoms, and death itſelf cauſed by narcotics, before they went out of the ſtomach, and without inflaming it, or cauſing any viſible change in it, far leſs vitiating the maſs of blood; and alſo of the ſame ſymptoms being removed, and death prevented by vomiting. Dr. Alſton is alſo of opinion; 1mo. That the anodyne and hypnotic virtues of *opium* do not depend on its action on the brain or on the blood. 2do. That it affects firſt and principally the nerves to which it is applied; next ſuch as more immediately communicate with them; then thoſe which ſerve for ſenſation and voluntary motion; and laſt of all, by conſent the whole nervous ſyſtem. 3tio. That this impreſſion on the nerves differently affects the ſenſorium commune and the mind according to its degree, and the nature and function of the nerves primarily acted upon. 4to. That the primary or firſt obſervable effect of the mechanical impreſſion of the narcotic part of *opium* on the nerves, is the relaxation of their fibres. Now as this relaxation of the nerves, and conſequently of the moving fibres, demonſtrates *opium* to be more than a palliative remedy in a great many diſeaſes; ſo it is not difficult by it to account for its bad as well as good effects. For by relaxing to a certain degree, it may prove anodyne, cordial, diaphoretic, hypnotic, &c. or cauſe ſtagnations, deliriums, lethargies, apoplexies, and death.

It does not appear that *opium* rarefies the blood, or that the operation of this medicine depends on ſuch a rarefaction. If it were, it ſeems likely that bleeding might be a remedy for the ſymptoms occaſioned by the abuſe of *opium*; but ſome authors affirm that veneſection is mortal even the day after a narcotic has been taken. See Dr. *Alſton*, loc. cit.

We have an account in the Memoirs of the Academy of Sciences at Paris, of the death of a young man at Cairo, from his being decoyed into taking a very large doſe of this medicine. Among a number of young people in that city, who frequently drank together, there was one who always boaſted of his ſuperior power to bear a large quantity of liquor, and his companions, determined to get the better of him for once, diſſolved, without his knowing of it, a dram of liquor in the liquor he was to drink; the conſequence was, that, inſtead of falling aſleep, as they expected he would, he fell into violent deliriums, and afterwards into a profound and dead ſleep.

The next morning his comrades went to ſee him, and triumph in their victory, but found him dying, looking livid, without pulſe, and with his mouth cloſed. They ſent for aſſiſtance, but in vain. After the death of the perſon, the body, arms, and thighs, became covered with livid tumors as big as the head of a young child, and theſe emitted an intolerable ſtench, almoſt as ſoon as the corpſe was cold. There is one very ſingular accident in regard to this caſe, which is, that this ſtench allured all the cats from the neighbouring houſes, who came with great eagerneſs, and were hardly prevented from devouring the body.

Dr. Smyth, while at Smyrna, took pains to obſerve, what the doſes of *opium* taken by the Turks, in general, were. He found that three drams in a day was a common quantity among the larger takers of it, but that they could take ſix drams a day without miſchief. A Turk eat this quantity before him, three drams in the morning, and three in the evening, with no other effect than its giving him great cheerfulneſs. But the taking it thus habitually greatly impairs the conſtitution; the perſons who accuſtom themſelves to it, can by no means live without it, and are feeble and weak; their legs are uſually thin, and their gums eaten away, ſo that the teeth ſtand bare to the roots; they are often alſo of a yellow complexion, and look much older than they really are. The Turkiſh meſſengers, when ſent upon buſineſs of haſte, always carry *opium* with them, and take largely of it when tired; they ſay it immediately gives them ſtrength and ſpirits to proceed, taken with proper precaution. Phil. Tranſ. N°. 223.

When *opium* affects the head, or lungs, by its volatile æthereal oil, or ſpirit, acids, eſpecially foſſile acids, are the proper correctors. And, when it produces ſickneſs, nauſeas, vomitings, ſpaſms, flatulent colic pains, and ſuch like ſymptoms, by the action of its ponderous, ſtimulating, and adheſive oil, the warmeſt alexipharmics muſt be uſed. *Morgan*, Mecan. Prac. Phyſ. p. 271.

Opium given too ſoon, to ſtop the operation of emetics, has been known to produce dangerous effects. See Medic. Eſſ. Edinb. Vol. 4. Art. 6. or its Abridgment, Vol. 1. p. 160.

The reſinous part of *opium* being noxious in Mr. Godfrey's opinion, he propoſes to make liquid laudanum, by digeſting an ounce and a quarter of *opium*, in half a pint of diſtilled water twenty-four hours, ſhaking the veſſel frequently; then filtres it, and adds three ounces of ſpirit of wine; after which, the other ingredients may be added at pleaſure. Miſc. vere util. p. 59.

OPIUM *Cyreniacum*, in the materia medica, a name given by ſome of the writers of the middle ages to *aſſa fœtida*. This was the *ſcordolaſaron* of the Greek writers of thoſe times, and was called *Cyreniacum* from the place whence it was principally brought. Aviſenna tells us, that, in his time, it was brought principally from Kirvan, and that is Cyrene.

OPLITODROMI, Οπλιτοδρομοι, among the Greeks, a deſignation given to thoſe who run in armour, at the Olympic, and other games. *Potter*, Archæol. Græc l. 2. c. 21. T. 1. p. 442. The word comes from the Greek οπλον, *armour*, and δρομος, a *race*.

OPOBALSAMUM, (*Cycl.*) in the materia medica, a name given by ſome authors to the true *balſamum judaicum*, or *balm of Gilead*. *Dale*, Pharm. p. 282.

OPOPIA, a name given by ſome anatomical writers to the bones which form the receptacle of the eyes.

OPORICE, a name given by the antients to a medicine compoſed of the autumnal fruits, and extolled for its great virtues againſt weakneſſes of the ſtomach and dyſenteries.

It was compoſed of five quinces with their ſeeds, as many pomegranates, a pint of ſervices, a pint of Syrian ſumach, and half an ounce of ſaffron; all theſe were put together into a gallon of muſt, and boiled over a very gentle fire to the conſiſtence of honey, with great care to avoid burning. Vid. *James* Med. Dict. in voc. & *Pliny*, l. 24. c. 14.

OPOS, a word uſed by the old medical writers, to expreſs the juices of plants, whether flowing ſpontaneouſly, or by means of inciſions. It is uſed by Hippocrates to expreſs the juice of ſilphium, which was called ſimply the juice, by way of eminence, as we call the quinquina bark ſimply the bark. Others have made it ſignify the juice of the fig-tree, and the caprificus, which they had in frequent uſe to curdle their milk.

OPOSSUM, or POSSUM, in zoology, the name of a very remarkable American animal, deſcribed by various authors, under the names of *maritacaca*, *carigoi*, *ropoza*, *caregueya*, *jupatuma*, *tlaquatzin*, *ſarigoi*, and *ſemivulpa*.

It is a creature of the ſize of a large cat. Its head is ſhaped like that of the fox; its noſe ſharp, and its upper jaw longer than the under; its teeth are ſmall, but like thoſe of the fox and,

and it has two long ones, like the hare, in the front of the mouth; its eyes are very beautiful, ſmall, round, and vivid; its ears long, ſmooth, and very ſoft, placed erect, like thoſe of the fox, and very thin and tranſparent. It has black whiskers, like thoſe of a cat; and has other hairs of the ſame kind on the other parts of its face, and over its eyes; its tail is round, and a foot long, and is of great ſervice to it, as it uſes it to twiſt round the branches of trees, hanging itſelf to them by that means. The tail is hairy near the inſertion, but naked all the other part, and is partly black, partly of a brownish white; its hinder feet are conſiderably longer than the fore ones, and each has five toes; they much reſemble hands, and the nails are white and crooked, the hinder one being as in the monkey kind, the longeſt. Its head, and legs, as Hernandez obſerves, ſomething reſemble thoſe of the badger. It has a broad, longitudinal, black ſtreak, on the face; it is of a blackiſh colour with a mixture of a brown and grey on the back and ſides, and has ſomewhat of a faint yellowiſh caſt on the belly. *Ray*'s Syn. Quad. p. 183.

What diſtinguiſhes this creature, however, from all the other animals of the world, is, that it has a bag or pouch into which it receives its young as ſoon as deliver'd; this is a ſort of open uterus, and is placed under the belly near the hinder legs; in this the young are ſhelter'd till they are able to ſhift for themſelves, and when they begin to be ſtrong enough they frequently run out and return in again. The creature is of a ſtinking ſmell like our fox or martin. It feeds on ſugar canes, and ſome other vegetables; but not wholly on theſe, for it frequently preys on birds which it catches on the trees, and often plays the fox's trick of ſtealing poultry.

The *Opoſſum* has been called *Marſupiale* by ſome authors, from the *Marſupium* or pouch for the receiving its young. This pouch is a membranous body, not very thick, though conſiſting of ſeveral coats. It has four pair of muſcles, ſerving to contract and diſtend, as alſo to open and ſhut it at the mouth, and there are two bones in this part of the body peculiar to this animal, and ſerving only for the inſertion of theſe muſcles. The pouch itſelf is to be rang'd among the veſiculous parts of the body, which ſeem to be part muſcles, part glands, and to perform the office of both motion and ſecretion. The hollow part of this pouch is lightly colour'd with hairs, but theſe are not placed ſo thick but that the ſkin is ſeen between them. Theſe hairs are uſually matted together in ſeveral places with a tough, yellow, and glutinous matter ariſing out of ſeveral glands there. This ſubſtance is of a very nauſeous and offenſive ſmell. Mr. Ray, and others, have obſerved that this animal, while alive, ſtinks like a pole-cat, or even worſe than that animal. This ſtink is principally owing to the matter contain'd in this bag; and yet ſo nearly is this matter ally'd to that contain'd in the ſcent-bag of the civet-cat, and other animals, that when expoſed to the air for ſome days, it loſes its offenſive ſmell, and becomes a very grateful perfume like them. The ſame obſervation holds good of the ſcent bag of our weazel, and pole-cat, which (particularly in the laſt animal) are very offenſive while freſh, but when expoſed to the air and dry'd, become only a perfume reſembling that of civet.

John Faber relates out of Lerius, that the *opoſſum* or *ſerigni* ſtinks ſo that the barbarous Indians refuſe to eat it; but that if the kidneys be taken out, the ſtink goes off in a great meaſure, and the creature becomes eatable, and his fleſh very well taſted; but it is very probable that Lerius, who had ſeen the operation performed, but examined only in a curſory manner, miſtook the ſeat of the offenſive ſmell, and that the perſon who performed it, cut deeper than he was aware, and took out this bag or pouch as well as the kidneys. The kidneys, and the fat about them, have no ill ſmell at all.

The pouch of the *opoſſum* has, beſide its glandular coat, a muſcular one, which ſerv'd to contract or diſtend the whole ſubſtance of it together, as its muſcles did its particular parts; beſide this, alſo, it has a vaſcular coat, in which the blood veſſels are diſpoſed in very great abundance.

The male *opoſſum*, as well as the female, has this kind of pouch under its belly, and takes upon himſelf, at times, the care of carrying and preſerving the young in caſe of any impending danger. Phil. Tranſ. N°. 239. p. 123.

OPTIO, among the Romans, an aſſiſtant or lieutenant belonging to every centurion.

They were called *optiones* from *opto*, I chooſe; becauſe it was in the option of the centurion to chooſe whom he pleaſed for this employment; though at firſt it was otherwiſe, the *optio* being choſen by the tribune or chief commander of the legion. *Pitiſc.* in voc.

The *optiones* were not peculiar to the camp, but were uſed alſo in many other offices of life. id. ibid.

OPULUS, the *water-elder*, in botany, the name of a genus of trees, the characters of which are theſe: The flower conſiſts of only one leaf, but puts on a various form in the different ones. Some are rotated and pierced at the bottom by a piſtil; theſe are barren. Others are hollowed into the ſhape of a baſin, and pierced in the ſame manner at their bottom by the pointall of the cup: In theſe the cup finally becomes a ſoft juicy berry, containing a flatted and heart-faſhion'd ſeed. See Tab. 1. of Botany, Claſs 20.

The ſpecies of *opulus* enumerated by Mr. Tournefort, are theſe: 1. The common *opulus* or *water-elder*. 2. The *opulus* with globoſe flowers. *Tourn.* inſt. p. 607.

OPUNTIA, in botany, the name of a large genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, or conſiſts of ſeveral leaves diſpoſed in a circular form. The cup, after the flower is fallen, becomes a ſeed-veſſel of a fleſhy ſubſtance, umbilicated, and unicapſular, fill'd with ſeeds uſually of an annulated appearance.

The ſpecies of *opuntia* enumerated by Mr. Tournefort, are theſe: 1. The common *opuntia* or Indian fig. 2. The middle ſeed *opuntia*, with oblong leaves. 3. The *opuntia* with ſmall roundiſh and compreſſed leaves. 4. The largeſt *opuntia* with long, broad, and thick leaves. 5. The ſmalleſt, round-leaved, Indian *opuntia*. 6. The ſmall American *opuntia* with long and very ſlender ſpines. 7. The little, narrow-leaved, American *opuntia*. 8. The tall tree *opuntia* of America, with cereus leaves, and white flowers. 9. The tall tree *opuntia* of America, with articulated leaves and yellowiſh flowers. See Tab. 1. of Botany, Claſs 6.

We have ſeveral ſpecies of this plant, propagated in the gardens of the curious; they are all early raiſed by cutting off their branches at the joints during any of the ſummer months; theſe cuttings are to be laid by for a fortnight, in a dry, warm place, that the wound may heal up, otherwiſe they are very ſubject to rot, as are alſo all the other ſucculent plants. The proper place for planting theſe, is one third part common paſture land, one third ſea land, and one third more of an equal mixture of lime rubbiſh and rotten tanner's bark. This mixture ſhould be made three or four months before it is to be uſed, and the larger ſtones and clods ſeparated, and laid at the bottoms of the pots, and the reſt filled up with the finer part; the cuttings are to be planted in theſe pots, which are then to be plunged into a hot bed of tanner's bark, where they muſt be gently watered, and when they begin to ſhoot they muſt have as much air as poſſible; and, finally, removing them into the ſtove, they muſt be placed near the glaſſes, and have as much air as may be: they may be expoſed to the open air in the ſummer months, but they ſucceed much better when they are kept continually in the ſtove. *Miller*'s Gard. Dict.

ORACH, *atriplex*, in botany. See ATRIPLEX.

Stinking *orach* is a powerful medicine. The very ſmell of it will ſometimes recover patients out of hyſteric fits, when all the common means fail; and a decoction of the plant is an excellent medicine in the ſame caſes. A decoction of it, made very ſtrong, and given in a glyſter, in hyſteric caſes, is alſo excellent; and a conſerve of the leaves, one of the beſt forms it can be given in, has the ſame virtues in a very high degree, alone; and is a good medium to bring other medicines into the form of an electuary for the ſame purpoſes. A ſyrup of it is ſometimes kept in the ſhops, and is not without its merit, though a great deal of the virtue of the plant be loſt in ſuch a form.

ORANGE, *aurantium*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of ſeveral petals, arranged in a circular form; the piſtil ariſes from the cup, and is ſurrounded by a number of little leaves, which terminate in the ſtamina. This piſtil finally becomes a fruit of a roundiſh figure, covered with a thick and fleſhy rind, and divided within into ſeveral cells, which are full of juice and veſicules, and contain ſeveral callous ſeeds. To this is to be added, that the leaves are heart-faſhioned at the bottoms.

The ſpecies of *orange*, enumerated by Mr. Tournefort, are theſe: 1. The common ſweet *orange*. 2. The common-ſharp-taſted *orange*. 3. The winter *orange*, with a leſs juicy fruit. 4. The ſharp-taſted wild *orange*. 5. The *orange*-tree with curled leaves. 6. The ſtellated roſe-*orange*. 7. The variegated *orange*. 8. The variegated, narrow-leaved *orange*. 9. The corniculate *orange*. 10. The narrow-leaved corniculate *orange*, with ſmaller fruit. 11. The ſtriated *orange*. 12. The fœtiferous *orange*. 13. The manyfold fœtiferous *orange*, with one fruit, including two or three others. 14. The Lisbon *orange*. 15. The China *orange*. 16. The large-fruited *orange*. 17. The manyfruited *orange*. 18. The *orange* with very narrow ſpear-pointed leaves. *Tourn.* Inſt. p. 620.

ORANGE-*flowers*. Theſe flowers are very juſtly eſteemed one of the fineſt perfumes. The water diſtilled from them is accounted ſtomachic, cordial, and carminative. Some alſo ſpeak of it as a ſudorific.

There are a very great variety of *orange*-trees in the gardens of the curious. The manner of raiſing them from ſeeds is this: When you purpoſe to raiſe ſtocks for buding, they ſhould be raiſed from citron ſeeds, taken out of the rotten fruit in ſpring; for the ſtocks of this kind are preferable to any other, both for their quickneſs of growth, and their readily taking buds either of *oranges*, lemons, or citrons.

A good hot bed muſt be prepared, either of horſe dung or tanners bark. The laſt, where it can be had, is much the beſt;

beſt; the ſeeds muſt be ſown in pots of rich earth, and theſe, when the bed is of a due temper, muſt be plunged into it. The pots muſt be watered frequently, and the glaſſes of the hot-bed ſhaded with mats in the heat of the day, and at times raiſed to give air.

The ſeeds will come up in three weeks, and a month after this the plants will be fit to tranſplant into ſingle pots. The bed muſt be now renewed, and ſome pots of about five inches over at the top, muſt be filled half full with freſh earth, mixed with very rotten cow-dung. Place one plant in the middle of each of theſe pots, and then fill it up with the ſame earth; then place theſe pots in the new hot-bed, and water the plants every day. By July, the plants will be two foot high, and muſt then be hardened by degrees to the air, by raiſing more and more the glaſſes of the hot-bed. In September they muſt be taken into the greenhouſe; in the winter ſeaſon they muſt have frequent ſmall waterings, and in ſpring their heads muſt be waſhed, to cleanſe them from filth. In ſpring, they muſt have again a gentle hot-bed, but in June they muſt be hardened again; and in Auguſt they will be fit to bud.

At this time you are to make choice of cuttings from very thriving and fruitful trees; chuſing ſuch buds as are round. When the ſtocks are budded, they muſt be removed into the greenhouſe, to ſhelter them from wet, turning their buds from the ſun, but letting them have as free air as poſſible, and refreſhing them often with water. They muſt remain in the greenhouſe all winter, and in the ſpring muſt have another bark hot-bed; then cutting off the ſtocks about three inches above the buds, obſerve to give them as much water as they require.

The buds with this management will be by July three feet high, and they muſt then be hardened by degrees, that they may bear the greenhouſe in the winter; and as this will be a ſufficient height for the ſtems, it is proper at this time to ſtop the leading branch to force out lateral ſhoots. This firſt winter they will be tender, and muſt be taken great care of, and after this they require no more care than other full grown trees.

It is a regular and certain way of ſupplying a greenhouſe with *orange*-trees, but there is a much more expeditious one, which is the purchaſing ſuch trees as are brought over every year from Italy. Theſe are as large when we receive them, as thoſe of our own produce will be in ten or twenty years growth; and tho' they have but ſmall heads then, will be brought to have very good ones in three years, and to produce very fine fruit.

In the choice of theſe trees, thoſe which have two buds in ſtock are preferable to thoſe which have only one; and the ſtraitneſs of the ſtem, freſhneſs of the branches, and plumpneſs of the bark, are greatly to be regarded. When you have purchaſed a proper number of theſe trees, each of them is to be ſet in a tub of water, with its head and half its trunk above the ſurface; they are to ſtand in this three days, then they are to be taken out, their roots picked, and bruſhed clean, and the tops of the branches cut off, and they are to be planted ſingly, in pots juſt large enough to contain their roots, in a mixture of freſh earth and rotten cow-dung. Theſe are to be ſet in a moderate hot tanners bark-bed, and ſome potſhreds muſt be always put at the bottom of the pots, to keep their holes from being ſtoped, and give a free paſſage to the water. They are to be moderately watered at proper times, and by the month of June they will ſhoot out pretty long ſhoots, which muſt be ſtoped, in order to produce the lateral branches. They muſt now be hardened by degrees, and in the middle of July muſt be brought into the open air, in ſome warm ſituation, defended from winds and from the too great heat of the ſun. In September they muſt be removed into the greenhouſe, and watered gently during the winter. In the ſucceeding ſummer, the branches muſt be ſtopped from growing to their lengths, to furniſh a good head; and they muſt be frequently watered. And after this, they will require no farther management, but to be new potted every year; which ſhould be done in April, and the earth prepared for it a year beforehand, of cow-dung and freſh earth. The roots ſhould be ſoaked a quarter of an hour in water, and afterwards ſcrubed very clean, before they are put into the new pot.

If old *orange*-trees have bad heads, the way to mend them is to cut them moſtly off, and proceed with them in the ſame manner as with the trees brought from Italy.

All *orange*-trees require frequent waterings, but theſe ſhould not be large; there muſt always be a paſſage for the water to run off at the bottom of the pot or tub; they muſt have as much freſh air in winter, as the ſeaſon will allow, and they ſhould not be placed too near each other in the greenhouſe. In ſummer they ſhould be placed where they may have the morning and evening ſun, without too much wind; and they ſhould not be houſed till October. The ſhaddock and citron are much tenderer than the *orange*, and ſhould therefore be houſed ſooner.

In the Philoſophical Tranſactions, N° 114, there is a very remarkable account of a tree ſtanding in a grove near Florence, having an *orange* ſtock, which had been ſo grafted upon, that it became in its branches, leaves, flower, and fruit, three-formed; ſome emulating the *orange*, ſome the lemon, or citron, and ſome partaking of both forms in one; and what was very remarkable, was, that theſe mixed fruits never produced any perfect ſeeds; ſometimes there were no ſeeds at all in them, and ſometimes only a few empty ones.

The ſeeds of the *orange* kind ſeem different in their nature from thoſe of all other plants. In the generality of others, the ſeed is only a ſort of nidus, and bed of a nouriſhing matter, for the young plant contained in ſome one part of it, and called the plantula ſeminalis; and however minute the ſeed itſelf may be, this plantula is but a very ſmall part of it: but the ſeeds of the *orange*, though contained in the inſide of a pulpy fruit, and in all reſpects, ſeeming of the nature of the common ſeeds, yet, when examined nicely, are found to contain, not a ſimple plantula ſeminalis, but each of theſe ſeeds or kernels, contains within it another compleat ſeed. Both in the *orange*, and lemon kinds, on opening what we call the ſeeds, when the ſkin, or membrane, is ſtripp'd off, there are frequently found two ſeeds encloſed in that membrane, that is, under the ſkin, and without ſide of the kernel, there is a ſmall ſeed, the like of which does not appear in the ſeed of any other fruit.

It is true, indeed, that in hazel nuts, as alſo in almonds, and in peach and apricot kernels, we often find a double ſeed, or kernel, but then each of them is ſeparately encloſed in its own membrane, and has no communication with the other, but is only placed in ſimple contact with it; and each has its diſtinct ſtalk, or ſtring, by which it ſeverally receives its nouriſhment; and, in theſe, the containing of two kernels ſeems only an accident, a kind of ſuperfœtation, as in the twin births of animals, which, naturally, bear only one.

When one of the *orange* or lemon ſeeds is ſtripp'd of its outer membrane, there appears a little ſtring, which lying under it, cauſes a protuberance in the firſt ſkin; and from this ſtring not only the ſeed, but the plant within it receives its nouriſhment; and the firſt and hard ſkin, which is eaſily ſeparated, ſeems only given to it for the defence of the inward parts; whereas nuts, almonds, peach-ſtones, and the like, have a much harder and firmer coat given them for the ſame purpoſe. The ſtring which appears through the firſt membrane extends its ſmall veſſels alſo through the ſecond membrane near the ſeat of the plantule; but theſe are ſo extremely fine, that we loſe them before they enter it, no microſcope being able to ſhew them farther than where they grow extremely ſmall, and fine, near the entrance into this part. It is an amazing thought, but it is alſo an evident truth, that this ſmall ſtring, which runs in this manner under the coat of this ſeed, contains in it as many diſtinct veſſels as are to be found in a full grown *orange*-tree; for if all theſe veſſels were not in the young plant, while involved in its matrix, whence ſhould they come afterwards? When this ſtring is cut tranſverſely, and examined before a good microſcope, ſomething of this appears, for there are ſeen in it the ſections of ſeveral veſſels, and the ſmall quantity of pulpy matter between them is encloſed in a ſeemingly thick and tough membrane, together with them, in order to keep the whole together: if the ſeed, or kernel, be itſelf cut acroſs, it appears to be only a congeries of a great number of globules of a ſoft matter, preſſed together. Within this ſeed thus cut, and under all its membranes are ſeen the two regular, and perfect ſeeds, lodged together, and not ſeparated by any membrane, as the accidental double kernels of nuts, &c. always are; ſometimes, indeed, there is only one ſuch obſerved, and ſometimes there are three. Theſe are not always of the ſame ſize, but one is often larger than the others. Each of theſe is, however, a true perfect, and diſtinct ſeed, and is divided naturally into two lobes, and theſe ſeem only to have been united at firſt, juſt where the young plant lies, ſo that this whole kernel ſeems to have been deſtined by nature for no other end, but to foſter and cheriſh the young plant, till it become able to ſhoot up and live above ground. In the heart of this inner ſeed is found the plantula ſeminalis, which is not larger than a ſmall grain of ſand, to the naked eye. The wonderful conformation of this ſtructure, cannot but ſtrike any one who is uſed to examine ſeeds, with great amazement. It is plain that the ſeed contained within the other ſeed, can only receive its nouriſhment from the veſſels contained in the ſtring above deſcribed. But it is amazing, that theſe ſhould not be, as uſual, immediately diſtributed from that general cord, or congeries of them, to the ſeed itſelf, but to another that is the center ſeed, and can only come to the inner ſeed, after having paſſed thro' this, and been in it devaricated into other veſſels too fine for the eye to trace.

Signior Franciſco Lana, in his prodromus to ſome philoſophical diſcoveries, tells us, that there is a way of producing *oranges*, without ſowing or planting the trees, only by infuſing the flowers in oil of almonds; for that this oil will, every year afterwards, at the proper ſeaſon, produce both flowers, and ripe *oranges*. See the whole proceſs at large, under the article FRUITS, as atteſted by the author and his friends.

Sea ORANGE, in natural hiſtory, a name given by Count Marſigli to a very remarkable ſpecies of ſea plant. It is tough and firm in its ſtructure, and, in many things, reſembles the com-

common fucus; but, inſtead of growing into the branched form, the generality of thoſe plants have, it is round and hollow, and in all reſpects, reſembles the ſhape of an *orange*. It has, by way of root, certain very fine filaments, which faſten themſelves to the rocks, or to ſhells, ſtones, or any thing elſe that comes in the way. From theſe their grows no pedicle, but the body of the *orange*, as it is called, is faſtened by them to the rock, or other ſolid ſubſtance. The *orange* itſelf, is uſually of about three or four inches in diameter; and while in the ſea, is full of water, and retains this when taken up. In this ſtate, it frequently weighs a pound and an half, but when the water is let out, and it is dryed, it becomes a mere membrane, weighing ſcarce any thing. It is beſt preſerved, by ſtuffing it full of cotton, as ſoon as the water is let out of it, and hanging it up to dry in this form. Its ſurface is irregular and rough, and its colour a duſky green on the outſide, and a clearer, but ſomewhat bluiſh green within; and its thickneſs is about an eighth part of an inch. When viewed by the microſcope, it is ſeen to be all over covered with ſmall glandules, or indeed, compoſed of them; for they ſtand ſo thick, one by another, as to leave no ſpace between, and ſeem to make up the whole ſubſtance: ſo that it appears very like the rough chagrin skin uſed to cover toys. Theſe are all ſo many hollow ducts, thro' which the ſea-water finds a paſſage into the globe formed by this skin, and by this means it is kept always full and diſtended; on cutting it with a pair of ſciſſars, the water immediately runs out, and the skins collapſe: but there is ſomething farther remarkable, which is, that the whole ſubſtance, near the wounded place, is in motion, and ſeems as if alive, and ſenſible of the wound. The glandules are found full of water, and reſembling ſmall tranſparent bottles; and what goes to the ſtructure of the plant beſide theſe, is an aſſemblage of a vaſt number of filaments, all which are alſo hollow, and filled with a clear and tranſparent fluid.

There is another plant of this kind, deſcribed by Count Marſigli, Triumſetti, and others, and called the *ramoſe*, or branched *orange*. This is very much of the nature of the former plant, but inſtead of conſiſting of one round globule, it is formed of ſeveral oblong ones, all joined ſo together, that they repreſent the branches of ſome of the fucus's, but that they are ſhorter; and theſe are all hollow and full of water, in the ſame manner as the ſingle globes of the common kind. This has, by way of root, certain fine and ſlender filaments, which faſten it to the ſtones or ſhells near which it is produced; and it is of a duſky greeniſh colour on the ſurface, and of a fine bluiſh green within. The ſurface viewed by the microſcope, appears rough, as in the other, and the glandules are of the ſame kind, and are always found full of a clear water. *Marſigli*, Hiſt. de la Mer. p 81.

ORANGE-*dew*, a ſort of dew which falls in the ſpring-time, from the leaves of *orange* and lemon trees, and is extremely fine and ſubtile. Mr. De La Hire obſerving this, placed ſome flat pieces of glaſs under the leaves to receive it, and having thus procured ſome large drops of it, was deſirous of finding out what it was. He ſoon found that it was not a merely aqueous fluid, becauſe it did not evaporate in the air; and that it was not a reſin, becauſe it readily, and perfectly mixed with water: it was natural here to ſuppoſe it a liquid gum; but neither did this, on examination, prove to be the caſe; for being laid on paper, it did not dry as the other liquid gums do. Its anſwering to none of theſe characters, and its being of the conſiſtence of honey, and of a ſweet-ſugar-like-taſte, gave a ſuſpicion of its being a kind of manna; and whatever in the other tryals had proved it not a reſin, a gum, *&c.* all equally tends to prove that it is this ſubſtance.

ORARIUM, in eccleſiaſtical writers, the ſame with *brandeum*. See the article BRANDEUM.

ORATORIO, in the Italian muſic, a ſort of ſpiritual drama of dialogues, containing recitativos, duettos, trios, ritornellos, choruſſes, *&c.*

The ſubjects of theſe pieces are uſually taken from the Scriptures, or from the life of ſome ſaint, *&c.*

The muſic for the *oratorio* ſhould be in the fineſt taſte, and moſt choſen ſtrains. Theſe *oratorios* are greatly uſed at Rome in time of lent; and of late in England.

ORBICULAR *leaf*, among botaniſts. See LEAF.

ORBICULARE *os*. See the article OS.

ORBICULARIS, (*Cycl.*) in anatomy, a name given by Riolanus, and ſome others, to the muſcle called by Albinus *orbicularis oris*, and by Cowper and others, *conſtrictor labrorum*

ORBICULARIS, in botany, a name given by ſome authors to the *artanita*, or *cyclamen*, called in Engliſh *ſow bread*. *Ger.* Emac. Ind. 2. See CYCLAMEN.

ORBICULARIS *inteſtini*, in anatomy, a name given by Veſalius, and ſome others, to the muſcle now known by the name of the *ſphincter ani*.

ORBIS, in zoology, the name of a genus of fiſhes, of which there are a great many ſpecies: that, however, which is uſually meant by the word *orbis* above, is the ſpecies called *orbis primus*, by Rondeletius, and *orbis ægyptiacus* by Salvian, becauſe frequently caught in the oſtia of the Nile. Excepting the tail, this fiſh is of a round figure. It has no ſcales, but is covered with a firm and hard skin all over, full of ſmall prickles, which render it very rough. Its mouth is ſmall, and has four broad teeth. It has only one hole on each ſide for its gills, and a fin under each. It has another fin near the tail on its under part, and another anſwering to it in its upper. The tail is one broad and flat fin. It is not eatable, for the whole fiſh is head, or if you would rather call it ſo, belly. *Willughby*'s Hiſt. Piſc. p. 143. See Tab. of Fiſhes, N° 18, 63.

There is an opinion, that when this fiſh is dryed and hung up by the tail, it will always turn its mouth to that quarter from whence the wind blows.

The other ſpecies of this genus are, the *orbis lagocephalus*, *orbis ſcutatus*, *orbis muricatus*, *orbis ranæ rictu*, *orbis ſpinoſus Cluſii*, *orbis muricatus alter Cluſii*, and the *orbis oblongus teſtudinis capite*. *Rondelet*, *Geſner*, *Aldrovand.* and *Salv.an.*

ORBIS *magnus*, in aſtronomy, the *orbit* of the earth in its annual revolution round the ſun.

ORCHESOGRAPHY, the art of noting all the ſteps and motions uſed in dancing. See DANCE, *Cycl.*

ORCHIS, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the polypetalous anomalous kind, conſiſting of ſix leaves irregular in ſhape and ſize. The five upper of which are ſo diſpoſed, as in ſome degree, to reſemble a helmet. The lower leaf is of various ſhapes in the different ſpecies; it has uſually a head, and often a tail, and reſembles the body of a fly, a bee, a man, or other animal. The cup of the flower finally becomes a fruit, which is pervious by three feneſtræ, to each of which there adheres a valve. The ſeeds are extremly ſmall, and reſemble a fine duſt. To this it is to be added, that the roots are fleſhy, with fibres propagated from them, and are in ſome ſpecies roundiſh, and reſemble the teſticles of an animal, and in others divided into ſeveral ſegments, reſembling a hand and fingers. See Tab. 1. of Botany, claſs 11. *Tourn.* Inſt. p. 431.

The ſpecies of *orchis*, enumerated by Mr. Tournefort, are theſe: 1. The broad-leaved great *orchis*, with a gaping hood. 2. The ſmaller-flowered broad-leaved *orchis*, with a gaping hood. 3. The broad-leaved *orchis*, with a compact ſpike of flowers. 4. The narrower leaved *orchis*, with a gaping hood. 5. The great ſoldier *orchis*. 6. The middle ſoldier *orchis*. 7. The leſſer ſoldier *orchis*. 8. The mountain ſoldier *orchis*, with a red conglomerated ſpike. 9. The tall meadow ſoldier *orchis*, with variegated flowers. 10. The lower meadow ſoldier *orchis*. 11. The ſweet-ſcented purple mountain *orchis*. 12. The ſweet-ſcented dusky purple *orchis*. 13. The globular-flowered *orchis*. 14. The dwarf alpine moſſy-leaved *orchis*. 15. The common male *orchis*, with ſpotted leaves. 16. The common male *orchis*, with ſhorter ſpotted leaves. 17. The common *orchis*, with drooping leaves, not ſpotted. 18. The common *orchis*, with drooping plain leaves, and with ſmall white flowers. 19. The common female *orchis*. 20. The common female *orchis*, with roſe-coloured flowers. 21. The female *orchis*, with white and changeable-coloured flowers. 22. The common little male *orchis*, with ſpotted leaves. 23. The male man *orchis*. 24. The female man *orchis*. 25. The monkey *orchis*. 26. The male Portugal man *orchis*, with an aromatic ſmell. 27. The Portugal man *orchis*, with a ſmall green flower with a purple edge. 28. The bearded or goat *orchis*, with ſhort and broad leaves. 29. The goat *orchis*, with longer and narrower leaves. 30. The ſmaller goat *orchis*. 31. The ſmaller goat *orchis*, with a purple ſpike. 32. The common purple ſpiked ſtinking *orchis*. 33. The white ſweet-ſcented *orchis*, with ſpiral flowers. 34. The two-leaved *orchis*, with very broad leaves. 35. The narrower-leaved bifoliate *orchis*. 36. The ſmaller bifoliate *orchis*, with white flowers, with long ſpurs. 37. The greater trifoliate *orchis*. 38. The ſmaller trifoliate *orchis*. 39. The butterfly *orchis*, called by ſome the *frog orchis*. 40. The greater bee *orchis*, with the upper leaves white and purple. 41. The bee *orchis*, with greeniſh flowers. 42. The bee *orchis*, with ferrugineous flowers. 43. The bee *orchis* with blue flowers. 44. The bee *orchis*, with ſpotted flowers. 45. The bee *orchis*, with white flowers. 46. The bee *orchis*, with wholly purple flowers. 47. The bee *orchis*, with variegated flowers. 48. The greater fly *orchis*. 49. The leſſer fly *orchis*, with green wings and a green head. 50. The yellow fly *orchis*. 51. The narrow-leaved *orchis*. 52. The *orchis* reſembling an expanded butterfly, with green flowers. 53. The butterfly *orchis*, with ſpotted leaves. 54. The narrow-leaved white flowered butterfly *orchis*. 55. The ſpider *orchis*. 56. The Italian mountain *orchis*, with a ferrugineous flower with an oblong tongue. 57. The ſpotted-leaved Italian *orchis*, with long tongues. 58. The broad leaved handed meadow *orchis*, with long ſpurs. 59. The broad-leaved palmated meadow *orchis*, with freſh coloured flowers with long ſpurs. 60. The broad-leaved palmated meadow *orchis*, with ſnow-white flowers with long ſpurs. 61. The great narrow-leaved palmated meadow *orchis*. 62. The palmated meadow *orchis*, with ſpotted leaves. 63. The white-flowered ſpotted-leaved palmated meadow *orchis*. 64. The ſpotted leaved palmated meadow *orchis*, with variegated flowers. 65. The greate ſt

greateſt meadow-palmated *orchis*. 66. The leſſer palmated *orchis*, with long ſpurs to the flowers. 67. The ſmall narrow-leaved ſweet-ſcented palmated *orchis*. 68. The clove-ſcented palmated *orchis*. 69. The white-flowered palmated *orchis*, with the ſmell of elder. 70. The purple-flowered palmated *orchis*, with the ſmell of elder. 71. The palmated frog *orchis*. 72. The caſtrated *orchis*. 73. The broad-leaved marſh palmated *orchis*. 74. The narrower-leaved palmated marſh *orchis*. 75. The common palmated marſh *orchis*, with very narrow leaves. 76. The palmated marſh *orchis*, with ſpotted leaves. 77. The palmated marſh *orchis*, with red leaves and flowers. 78. The green-flowered palmated *orchis*. 79. The largeſt palmated *orchis*, with a bright-red ſweet-ſcented flower. 80. The greateſt palmated mountain *orchis*. 81. The narrower-leaved great palmated mountain *orchis*. 82. The white-flowered palmated mountain *orchis*, with ſpotted leaves. 83. The narrower-leaved palmated alpine *orchis*, with a black flower. 84. The narrow-leaved palmated mountain *orchis*, with roſe-coloured flowers. 85. The narrow-leaved palmated mountain *orchis*, with white flowers. *Tourn.* Inſt. p. 443.

ORCHIS-*root*, in the materia medica, is otherwiſe named *ſalep*, vulgarly called *ſaloop*. See the article SALEP.

ORCHIS, in ichthyology, a name given by Geſner, and ſome others, to the fiſh, commonly called *orbis*, and by Artedi the ſpherical *oſtracion*, with four teeth, and ſmall ſpines all over it. See the article OSTACION.

ORCHOTOMY, a word uſed by ſome chirugical writers for the operation of caſtration.

ORCYNUS, in zoology, a name by which ſome authors have called the fiſh commonly known by the name of the tunny or thynnus. *Willoughby*'s Hiſt. Piſc. p. 176. See THYNNUS.

ORDER, in rhetoric. See DISPOSITION, *Cycl.*

ORDINARY (*Cycl.*)—ORDINARY *Court of Chancery*. See PETTY *bag*.

ORDINATE (*Cycl.*)—To find the greateſt and leaſt *ordinates* to curves. See MAXIMUM, *Cycl. & Suppl.*

ORE (*Cycl.*)—Some *ores* are ſo kindly as to melt readily of themſelves, without any aſſiſtance from the common fluxes; theſe are of great value to the owners. Other are more intractable and require the aſſiſtance of various fluxes, and others ſo very obſtinate as not be work'd in the larger way, where there can be no very conſiderable expence allow'd for fluxes. On this account many mines remain at this time unwrought, as being untractable in the large way without great charges; hence the improving the buſineſs of fluxes ſerves to render them at once both cheap and effectual, and muſt be of great ſervice to metallurgy.

Some of the cheapeſt and moſt powerful fluxes now in uſe are dry'd wine lees, dry'd cow-dung and horſe-dung, dry'd river-mud, fuller's-earth, iron filings, common ſalt, potaſh, and ſandiver. Theſe may be uſed in the larger works, as nitre, tartar, borax, ſal armoniac, and mercury ſublimate in the leſs: as for compound fluxes they are very numerous, almoſt every operator having his particular noſtrum; and it is plain that ſome fluxes are better adapted to the *ores* of ſome metals than others; but certainly a few general ones might be fixed upon, one or other of which would anſwer all the operator's expectations.

The following three preparations are all very general, very powerful, and not expenſive. 1. Take of nitre, prepared by long boiling in lime water, of ſea-ſalt melted in the fire, of ſandiver, and of dry wine lees, each one part; glaſs of lead three parts, and powdered glaſs eight parts; mix them all well together, and uſe them in an equal weight with ſtubborn *ores*. 2. For a ſtill ſtronger flux take equal parts of white tartar, common ſalt, and nitre prepared as above; calcine all together to a white powder, and mix with it its own weight of glaſs of lead: of this flux add two parts to one part of the moſt ſtubborn ores. 3. For every powerful ſaline flux, take of the ſtrongeſt ſoap-boiler's lees four pounds, of white tartar and common ſalt, melted in the fire, each one pound, boil theſe together, with four gallons of human urine, to a dry ſalt. This flux is particularly ſerviceable where ſulphur and cobalt abound, and render the *ore* very refractory. *Shaw's* Lectures, p. 257.

The *ores* of the richer metals, as gold and ſilver, uſually contain a very conſiderable portion of ſulphur, and Alonſo Barba tells us, that the moſt expert mineraliſts in Peru, always eſteem abundance of ſulphur a ſign of a rich *ore* in the neighbourhood. Among the richeſt *ores* of the mountain of Potoſi, there are ſuch quantities of native brimſtone, that the cavities in the mines are often filled with a blue flame, on only bringing a lighted candle into them ſo as to touch their ſides. It has been wondered at, that where there is abundance of ſulphur in theſe mines, there ſhould be no vitriol found, that being only a metal diſſolved by means of ſulphur; but this objection ceaſes, when we conſider the denſe and compact nature of theſe two metals, which renders them not ſoluble by means of ſulphur, as the others are. Wherever there is ſtore of ſulphur, or of pyrites, or other ſtones which contain ſulphur in the mines of copper and iron, great ſtore of vitriols are always found there alſo, being formed by the corroſion of the *ores* of thoſe metals by ſulphur, which renders them ſoluble in water, from which they again concrete in form of ſalts. Chemiſtry is able to imitate the operations of nature on this occaſion ſeveral ways; for copper, or iron, being formed in thin plates, and either rubbed over with the acid ſpirit of ſulphur, or calcined with powder of common ſulphur, become ſoluble in water, and afford cryſtals of true vitriol wholly analogous to the natural ones, and either blue or green, as iron, or copper are the metals employed; but theſe proceſſes not being able to produce cryſtals of ſalt, or vitriol, from either ſilver, or gold, it is not wonderful that nature is not able to form them by the ſame means.

The general formation of ſulphur from the ores of metals yet lying in the bowels of the earth, is, probably, after this manner. An acid, ſaline, ſulphureous ſteam, or vapour, ſuch as common ſulphur is eaſily reduced to, by heat not greater than that within the bowels of the earth, inſinuating itſelf either through the pores of ſtones, or through their cracks, which are always frequent about the veins of metals, penetrates into the bed of *ore*; ſuppoſe of copper. The vapour is continually ſupplied with freſh quantities from below; and as it blends itſelf with the metal, corrodes it as the fume of brimſtone will the ſame copper in plates. The metal, thus corroded, being ſoluble in water; as we find by experience, it is neceſſary, that the *ore* muſt, under the ſame management, be ſo too; and, in this caſe, the water, which is continually pervading all the ſtrata of the earth, waſhes off the diſſolved metal; and wherever it happens to be ſtayed in ſmall quantities afterward, whether within the vein of the metal, or at a diſtance from it, it cryſtallizes the ſalt it contains, and common blue vitriol is produced, if the metal in the vein be iron. The ſame proceſs is obſerved, and the event is the ſame in all reſpects, when copper is the metal corroded, except that the vitriol, inſtead of blue, is green; this plainly accounts for the obſervation of the workers in copper-mines, that vitriol and brimſtone are uſually found together, the one being a natural conſequence of the other. Sulphur is, indeed, often found where there is no vitriol, but vitriol is very ſeldom found without ſulphur; it being not a diſtinct principle, but a genuine production of ſulphur. Phil. Tranſ. N° 104.

Dreſſing of ORES. See the article DRESSING.

Iron ORE. See IRON.

Gold ORE. See GOLD.

Firm, *Pottern*, and *Steel* ORE. See LEAD *ore*.

OREILLARD, in the manege. See WIDE-*eared*.

OREJUELAS, in botany, a name uſed by ſome authors for the *flos auriculæ*, a flower growing in New Spain, and uſed there in making chocolate. *Dale*, Pharm. p. 339.

OREON, a name given by the antients to a kind of *horſe-tail*, which they found growing on the mountains in wet and damp places. It is to this ſpecies that many authors have attributed the principal virtues of the genus; and this ſeems to have been the ſame with our great water *horſe-tail*. Neophytus ſays, that it roſe up with a ſingle ſtalk, reſembling a young reed, and that this was compoſed of ſeveral points, which, in the manner of cups, were inſerted one into another; and that from theſe joints the leaves grew, and that they reſembled thoſe of the pine-tree. The branches are what this author calls leaves, and they do pretty well reſemble the leaves of the pine-tree. They are long and ſlender, and of a bright green. Our great *horſe-tail* loves the heads of ſprings in hilly countries, and is always moſt plentiful in ſuch places.

OREOSELINUM, *mountain-parſley*, in botany, the name of a genus of plants of the umbelliferous kind, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of ſeveral petals, arranged in a circular order on a cup, which afterwards becomes a fruit compoſed of two large, oval, flattiſh, ſtriated, and marginated ſeeds, which ſometimes depoſit their covering. To this it may be added, that the leaves are like thoſe of parſley, or hemlock.

The ſpecies of *oreoſelinum* enumerated by Mr. Tournefort are theſe: 1. The great, parſley-leaved *oreoſelinum*. 2. The leſſer, parſley-leaved *oreoſelinum*. 3. The hemlock-leaved marſh *oreoſelinum*. 4. The ſhrubby, aniſe-leaved, African *oreoſelinum*, which produces the *galbanum* of the ſhops. This is called by many *ferula galbanifera*. *Tourn.* Inſt. p. 319.

OREXIS, *appetite*. The appetite, when exceſſive, or otherwiſe vitiated, is diſtinguiſhed by medical writers into ſeveral kinds, and deſcribed under ſeveral names, according to its difference in degree, and other particulars.

The firſt kind is the *addephagia*: this is the name given that ſpecies in which the food is not only eaten in too large a quantity, but is ſwallowed in a particularly ravenous manner.

The ſecond is the *orexis canina*: in this caſe the patient is continually eagerly longing for food, and if it is not ready ſo ſoon as he deſires, he is ſubject to fainting fits after the recovery, from which he does not feel the ſame craving appetite.

The third is the *pica*, or *ſitta*: this is the caſe when the patient has an eager appetite to things not fit for food, ſuch as chalk, cinders, tobacco-pipes, and the like.

The fourth is the *malacia*: this is diſtinctively made the name of that ſpecies of *exceſſive appetite* in which the pati-

ent has a great desire for some particular things, but those of the nature of common food, and usually of the nicer, and more delicate kind.

Signs attending it. An over-large eating is usually attended with cardialgias, anxieties, and straitness of the breast; after this, with nauseas, eructations, and not unfrequently with a vomiting, or a diarrhœa; often a dizziness of the head follows, and sometimes very violent pains in it, with a lassitude and pains in the limbs, and pains and rumblings in the abdomen; finally, sometimes fevers, sometimes suffocations, and sometimes convulsions, are the consequence.

Persons subject to it. The *excess of appetite*, in its different kind, affects different sets of people. The *addephagia* is usually the case with boys who are just come to distinguish good taste, and feed as their parents do; and sometimes with women who have more sensation than judgment. People in general of sanguine and sanguineo-phlegmatic habits, eat more food than others; and choleric persons often eat, and usually swallow their food, quicker than others. Persons of melancholic habits, are usually of all others, the least eaters. Finally, people, in general, eat heartily, and even excessively, when they come, from a coarse and homely diet, to a more elegant and agreeable one; and this *excessive appetite* becomes a symptomatic complaint with people who are troubled with worms, and with hypochondriac complaints, with quartans, and often with epilepsies.

The *malacia* seems particularly to affect women during the time of their being with child. The *pica* is common to women with child; to young women before the first eruption of the menses; with those who are emaciated by a too violent flux of that discharge; and, finally, sometimes, though more rarely, to persons in epilepsies, and in quartans.

Causes of it. *Excessive appetite* is generally occasioned by a too great love to agreeable tastes, which generally degenerates into a custom of devouring things of agreeable flavours greedily; and, finally, into an habitual and almost necessary desire of them. In infants who are over-much fed by their nurses, the fault is not in the will, but even this also, in fine, becomes habitual, and not to be overcome easily.

Prognostics in it. *Excessive appetite* does great mischief among men, and is a very common complaint, inasmuch that there are ten thousand who err in eating more than nature requires, for one who eats less. It is common for persons recovered from illnesses to have an *excessive appetite*; but, if this be indulged to the extent, it usually brings on either a return of the same disease, or, at least, one equally bad. People, after long hunger, have also the same sort of *excessive appetite* as after diseases, but there have been frequent instances, that those who indulged it freely have died upon the spot. In general, the consequences of *excessive appetite* indulged, is diseases of many kinds, particularly obstructions of the viscera, cachexies, and atrophies. When the *pica* attends a quartan, it very often happens, that all medicines are vain in the attempt of a cure, till that unnatural *appetite* has been perfectly sated. When young girls fall into a *pica* from a want of the menses at a due time, they are always relieved from it by the appearance of that evacuation; but in persons who fall into it from inordinate profluvia of that discharge, it is usually very difficult of cure, and the same difficulty always attends it when hereditary.

When people have eat to an immoderate degree by reason of any of these kinds of *excessive appetite*, the best method of relieving them, is by giving them large draughts of warm water, till they vomit; or, if the stomach will not be brought to discharge its contents by this means, a few grains of emetic tartar are to be given, or a small dose of ipecacuanha. After this the bowels are to be gently relaxed; but this is by no means to be done by any violent medicines, the stimulus of which would bring on violent and dangerous pains. After the mischief of a monstrous repletion is, by this means, got over, the best preservative for the future is abstinence, and gentle exercise. There have, however, been instances of people being cured of this disease, by palling the *appetite* by large draughts of oil, regularly taken, three times a day. The good women have a way of curing the *pica* in girls, by making the chalk, and other such things which they are to eat, bitter, or of some other disagreeable taste; when a girl has been once tricked in this manner, she will often have as violent a distaste to these unnatural eatables, as she before had an inclination for them; and, in like manner, grown persons who have violent *appetites* to certain particular foods, have been cured by conveying into them an infusion of tobacco, or some other such thing as will provoke vomiting, so disguised as not to be tasted, while eaten. When the stomach and bowels, over-loaded by these meals, are, of themselves, discharging their abundant contents, by vomit, or stool, it is a very rash and dangerous practice to give any thing to stop those emotions till the whole is thoroughly carried off. *Junker's* Consp. Med. p. 605, seq. See the articles CANINE, BULIMY, &c.

ORFUS, in zoology, the name of a fresh water fish, common in Germany, and called there the *orft*, the *oerve*, and the *nerfling*; seeming by the descriptions of Gesner, and other authors, to be the same with our *rudd*, or *rubellio fluviatilis*. See Tab. of Fishes, N°. 43. *Willughby's* Hist. Pisc. p. 252.

ORGANO, in the Italian music, is used to signify the thorough bass. It is usually scored with figures over the notes, for the harpsichord, bass-viol, and lute.

ORGUES, (*Cycl.*) are preferable to herses, or portcullises, because these may be either broke by a petard, or they may be stopped in their falling down; but a petard is useless against an *orgue*; for if it break one or two of the pieces, they immediately fall down again, and fill up the vacancy; or if they stop one or two of the pieces from falling, it is no hindrance to the rest; for being all separate, they have no dependance upon one another.

ORICHALCUM, or AURICHALCUM, *brass*. See the article BRASS, *Cycl.* and *Suppl.*

It is to be observed, that zink is the metal which has the power of giving a yellow colour to copper. We long supposed, from calamine's answering the same purpose, that two different substances could do this; but it has been since found that they are the same, and that calamine is no other than the ore of zink. See the article CALAMINE.

It is evident from all accounts, that the *orichalcum* of the antients was a fictitious substance, not a natural metal. They made it on the same basis that we make brass at present; but they had several ways of doing it, and distinguished it into several kinds. They had a white sort in frequent use and great esteem; and even the yellow they distinguished into two principal sorts, under different names. The *orichalcum* and *æs flavum*, brass and yellow copper, are with us synonymous terms; but with them they were used to express different combinations of the ingredients. Pliny tells us indeed of a natural mine of this metal found somewhere, and that the metal produced from it was in very great esteem. He says, that the making of brass was first found out in Cyprus, and that it was an artificial metal, but that this natural kind was greatly superior to it, and was the only kind in esteem, so long as the mine yielded any of it, but that at last it was exhausted. This account is unquestionably erroneous; but yet it has taken so much footing in the world from the authority of this author, that many suppose it truth, and think that we have not at present the metal called *orichalum* by the antients. They who suppose, according to Pliny, that there was once a vein or mine of this metal, which was afterwards lost again, certainly err, and there is sufficient proof of the truth of the contrary opinion by all the Greek writers, declaring the manner in which *oricalcum* was made, which was with copper and calaminaris-stone, as brass is made at this time. Some indeed have somewhat perplexed the matter, by adding the word pseudoargyron, as a part of the composition. Among these is Strabo, but by that author in other places we find, that all that he means by this name is, the calamine found in silver mines, which resembled, as the common calamine does, some kinds of silver ore; so that the two accounts come to the same thing.

ORICHALCUM, or AURICHALCUM *album*, *white brass*. This was a metal well known among the antients, and celebrated by Aristotle and by Strabo, and others, under the name of κραμα λευκον. It was made by mixing an earth with copper while in fusion; but what that earth was, we are not informed.

There have been many objections made to the name *aurichalcum album*, as a contradiction in terms. The epithet white being by no means allowable with a word which is generally supposed to express gold-coloured brass; but this is an error. The truth is, that *aurichalcum* is an error in orthography; the true word being *orichalchum*, ορειχαλκον, mountain copper. The Romans changing the *o*, in a Greek word into *au*, when they adopted it into their own language, is common; and we daily see so many instances of it, that this custom alone might justify it, were the word always written *aurichalchum* by the Romans; which, however, it is not, Virgil, and several others expressly calling it *orichalchum*, according to the original or proper orthography: there was, therefore, no idea of gold, nor any other denomination of colour intended in the word *aurichalchum*; all that was expressed by it was, mountain copper; and this term was made to express a mixed metal, made of copper and of some earth, stone, or other mineral. In this sense, the mixture of copper with that of earth, whatever it was that turned it white, was as properly called *orichalchum album*, as that with calamine was *orichalchum flavum*, or simply *orichalchum*. We know several ways of turning copper white, one of which was much practised some years ago, and spoons and other utensils made of it, had the name of *alchymy* things; but this was done by means of arsenic; a thing not known to the antients: this, therefore, could not be the same with their white brass, and indeed, none of our methods seem to be the same with theirs, since the metal is debased by all ours, and becomes brittle; whereas, in their management, according to their own accounts, it seems not to have lost any thing of its ductility, tho' it acquired a peculiar brightness.

ORIENTAL, (*Cycl.*) in astronomy. A planet is said to be *oriental* when it rises in the morning before the sun.

Hybernal

Hybernal ORIENT, that point of the horizon where the ſun riſes when in the firſt degree of Capricorn. See OCCIDENT.

ORIGANUM, *wild marjoram*, in botany, the name of a genus of plants, the characters of which are theſe: the flower conſiſts of one leaf, and is of the labiated kind, the upper lip is erect, of a roundiſh ſhape, and bifid, the lower is divided into three ſegments. The piſtil ariſes from the cup, and is fixed in the manner of a nail into the hinder part of the flower, and ſurrounded with four embryos, which afterwards become many ſeeds, and ripen in the cup of the flower. To theſe marks, it is to be added, that the *origanums* all bear their flowers in a ſort of ſcaly ears or ſpikes.

The ſpecies of *origanum* enumerated by Mr. Tournefort are theſe: 1. The common *origanum*. 2. The common *origanum* with variegated leaves. 3. The white wild *origanum*. 4. The low, woolly, procumbent *origanum*. 5. The heracleotic *origanum*, or *cunila gallinacea* of Pliny. 6. The *origanum* of Crete, called *pot-marjorum*, the genuine hyſſop of the antients, according to Lobel. 7. The round-leaved *origanum*. 8. The *origanum* with the ſmell of pennyroyal. 9. The broad-leaved, ſmooth, low *origanum*. 10. The Canada *origanum*, with umbellated flowers. 11. The broad-leaved woolly cretic *origanum*, uſually known by the name of *dittany of Crete*. 12. The *origanum* of mount Sipylus. 13. The ſlender-headed Canada *origanum*. 14. The woody *origanum* of Syracuſe, with large umbels of flowers. *Tourn.* Inſt. p. 199.

Origanum is a very pleaſant aromatic. An infuſion of the plant, drank in the manner of tea, is of great ſervice in diſorders of the ſtomach; it abſterges the viſcous matter apt to lodge there, and thereby promotes an appetite and aſſiſts digeſtion. It alſo diſpels flatus's, and is eſteemed good in jaundices, and all other chronic caſes occaſioned by obſtructions of the viſcera.

ORIGINARY, *originarii*, among the Romans, an appellation given to ſlaves born in their maſter's houſes, who were otherwiſe called *vernæ*. *Hofm.* Lex. in voc.

ORIOLUS, in zoology, a name by which ſeveral authors have called the *galbula*, a very beautiful yellow bird of the thruſh kind, remarkable for its manner of hanging its neſt. *Albertus*. See the article GALBULA.

ORITES, in natural hiſtory, the name of a ſtone deſcribed by the antients, and celebrated by the writers of the middle ages for its wonderful virtues. Pliny ſays, that it was round, and remained unhurt in the fire, and that ſome called it *Sideritis*. To this the later writers have added, that there are three kinds of it; the firſt round and black: this rubb'd over with oil of roſes was famous for the bites of venomous beaſts. The ſecond was green, variegated with veins and ſpots of white: this was to be carried about people, to preſerve them from many ſorts of injuries. And the third was compoſed of parallel plates, and ſaid to have the virtue of cauſing abortion, if only carried in the pocket.

ORITORIUS *lapis*, a name given by Ludovicus Dulcis, and ſome other authors, to the *ochreoferreous ætitæ*, or eagle ſtones; particularly to a ſpecies of them common in Germany, and uſed in the ſhops there, and in ſome other places, under the name of *eagle ſtones*. Theſe are of a browniſh colour and ſmooth ſurface, and are eaſily broken, being only compoſed of a thin cruſt of ferrugineous earth, encloſing ſeveral ſmall lumps of a greeniſh marle, which rattle in it when ſhaken.

ORIZEUS *color*, a term uſed by authors to expreſs the yellow colour in the eyes and urine of perſons afflicted with a jaundice. See JAUNDICE.

ORKNEY-*beans*, in natural hiſtory, a name given by authors to a ſort of fruit found on the ſhores of the *orkney* iſlands near Scotland. Theſe are of ſeveral diſtinct ſpecies, and are none of them the produce of thoſe iſlands, nor of any places thereabout, but are probably of American origin, many of them being plainly natives of Jamaica.

They are found principally on thoſe coaſts which are moſt expoſed to the waves of the great ocean, and are on theſe ſo plentiful, that they might be gathered in large quantities, if of any value; but the only uſe they are put to is the making ſnuff-boxes out of them. Sir Robert Sibbald, and Mr. Wallace, in their accounts of Scotland, have both named them under the title of *Molucca beans*. See MOLUCCA *beans*.

ORLEANA, in the materia medica, the name of the *arnotto*, or *uruca*. *Dale*, Pharm p. 388.

ORMENA, among the antient naturaliſts. See ASPARAGUS.

ORNICUS *lapis*, a name given by ſome anthors to the *ſapphire* of the antients, which is a peculiar ſpecies of our *lapis lazuli*, in which the gold-coloured matter is not diſpoſed in veins, but in ſeparate ſpots of the form of a ſtar. It was firſt called *o iniſcus*, and *orinus*, by corruption from *aurinus*, golden, and thence came, at length, the word *ornicus*.

ORNITHIÆ, a name given by the antients to certain winds, which uſually blew in ſpring, at the time when the birds of paſſage came over to them. Pliny ſays, that theſe winds blew from the Weſt, and that, by ſome, the Eteſian winds were called by this name. Others ſuppoſe that they blew from the North, or North-Weſt.

ORNITHOGALUM, *ſtar of Bethlehem*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is liliaceous, being compoſed of ſix petals, arranged in a circular form. The piſtil ſtands in the center of the flower, and finally becomes a roundiſh fruit, or ſeed-veſſel, divided into three cells, and containing a number of oblong ſeeds; to this it is to be added that it has a bulbous or tuberous root, in which it differs from the phalangium, which has a fibrous one.

The ſpecies of *ornithogalum* enumerated by Mr. Tournefort are theſe: 1. The great Syrian *ornithogalum*, with umbellated flowers. 2. The great, narrow-leaved, *ornithogalum*, with umbellated flowers. 3. The broad-leaved, middle-ſized, white *ornithogalum*, with umbellated flowers. 4. The narrow-leaved, middle-ſized, white *ornithogalum*, with umbellated flowers. 5. The leſſer white *ornithogalum*. 6. The umbellated *ornithogalum*, with bluiſh white flowers. 7. The greateſt, broad-leaved, Alexandrine *ornithogalum*. 8. The Indian, broad-leaved, *ornithogalum*. 9 The great, narrow-leaved, *ornithogalum*, with greeniſh white flowers. 10 The great, narrow-leaved, *ornithogalum*, with flowers in ſpikes. 11. The ſpiked *ornithogalum*, with ſnow-white flowers. 12. The great, white-ſpiked, French *ornithogalum*. 13. The great, white-ſpiked, Byzantine *ornithogalum*. 14. The ſpiked *ornithogalum*, with greeniſh-white flowers. 15. The Spaniſh white-flowered, ſpiked *ornithogalum*. 16. The pale, blue-flowered *ornithogalum*. 17. The *ornithogalum* with a large flower growing on a ſmaller. 18. The great, pale yellow *ornithogalum*. 19. The yellow *ornithogalum*, with larger flowers. 20. The tuberous-rooted, African, yellow *ornithogalum*, with onion-like leaves, and ſweet-ſcented flowers. 21. The common, wild *ornithogalum*. 22. The leſſer, wild, yellow *ornithogalum*. 23. The narrow-leaved, bulbiferous, *ornithogalum*. 24. The yellow-flowered, Portugal *ornithogalum*, with capillaceous leaves. 25. The Indian *ornithogalum*, with yellowiſh-green flowers. 26. The African *ornithogalum*, with green flowers, growing one out of another. 27. The one-leaved, ſpiked *ornithogalum*, with a ſnow-white, ſweet-ſcented flower. 28. The blue-flowered, two-leaved, German *ornithogalum*. 29. The trifoliate, German *ornithogalum*, with deep blue flowers. 30. The bifoliate, German *ornithogalum*, with fleſh-coloured flowers. 31. The bifoliate, German *ornithogalum*, with white flowers. 32. The narrow-leaved, white, late-flowering, *ornithogalum*. 33. The blue-flowering *ornithogalum*, with yellowiſh green ſtamina. 34. The purple-flowered *ornithogalum*. 35. The ſpiked *ornithogalum*, with grey flowers. 36. The blue-flowered, Conſtantinople *ornithogalum*. 37. The Conſtantinople *ornithogalum*, with bluiſh purple flowers. 38. The Conſtantinople *ornithogalum*, with a white flower. 39. The Conſtantinople *ornithogalum*, with duſky, bluiſh flowers. 40. The borrage-flowered, Conſtantinople *ornithogalum*. 41. The blue *ornithogalum*, with ſtriated flowers. 42. The Spaniſh, deep-blue, *ornithogalum*. 43. The great, purpliſh, blue *ornithogalum*. 44. The ſummer *ornithogalum*, with flowers ſtanding alternately on the ſtalks. 45. The great, autumnal *ornithogalum*, with pale, purple flowers. 46. The great, autumnal *ornithogalum*, with white flowers. 47. The leſſer, autumnal *ornithogalum*, with purple flowers. 48. The leſſer, autumnal *ornithogalum*, with blue flowers. 49. The little, ſpring *ornithogalum*. 50. The blue-flowered, Portugal *ornithogalum*. 51. The broad leaved, Portugal *ornithogalum*, with violet-coloured flowers. 52. The broad-leaved, Portugal *ornithogalum*, with fleſh-coloured flowers. 53. The broad-leaved, Portugal *ornithogalum*, with greviſh flowers. 54. The broad-leaved, Portugal *ornithogalum*, with white flowers. 55. The Peruvian, eriopherous *ornithogalum*. 56. The oriental, eriopherous *ornithogalum*. 57. The *ornithogalum* of the ſea ſhores, commonly called the *red-rooted ſquill*. 58. The white-rooted, maritime *ornithogalum*, commonly called the *white-rooted ſquill*. 59. The maritime *ornithogalum*, with an eſculent root, called the *eſculent ſquill*. *Tourn.* Inſt. p. 378.

The ſeveral ſpecies of this plant produced in our gardens are all propagated with great eaſe by the off-ſets which the roots produce in very great abundance. The beſt time to tranſplant the roots is in the beginning of July, when the leaves are decayed. They ſhould have a light, ſandy ſoil, which, if it be over-dunged, will decay, and rot the roots: they continue flowering a long time, and are a very great ornament in gardens, but they ought to be tranſplanted once in two or three years, otherwiſe the roots grow luxuriant in off-ſets, and the flowers are weak. *Miller's* Gard. Dict.

ORNITHOPODIUM, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the papilionaceous kind, and its piſtil which ariſes from the cup finally becomes a hooked, or falcated, jointed pod, of a flattiſh and undulated form, and containing, in each joint, one roundiſh ſeed. To this it is to be added, that the pods of this plant uſually grow four or five together; and by that means in their ſhape reſemble a bird's foot.

The ſpecies of *ornithopodium* enumerated by Mr. Tournefort are theſe: 1. The great *ornithopodium*. 2. The little *ornithopodium*. 3. The *ornithopodium* with roots compoſed of knotty tubercles. 4. The ſcorpioides *ornithopodium*, with flatted

pods.

pods. 5. The Portugal, ſcorpioide *ornithopodium*, with undulated pods. 6. The purſelain-leaved *ornithopodium*. *Tourn.* Inſt. p. 400.

ORNITHOSCOPI, ὀρνιθοσκοποι, in antiquity, diviners, or ſoothſayers, who made predictions, and drew omens, from birds. They were likewiſe called *ornithomantes*, and *orneoſcopi*, &c. *Potter*, Archæol. Græc. l. 2. c. 15. T. 1. p. 321.

OROBANCHE, *broom rape*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the perſonated kind, divided into two lips, the upper of which is galeated, and the lower divided into three ſegments. The piſtil ariſes from the lower part of the cup, and finally becomes an oblong fruit, conſiſting of only one cavity, which uſually contains extremely minute ſeeds.

The ſpecies of *orobanche*, enumerated by Mr. Tournefort, are theſe: 1. The great large flower'd *orobanche*, ſmelling like cloves. 2. The great ſtinking *orobanche*. 3. The great Portugal *orobanche*, with purpliſh flowers. 4. The ſmall flowered *orobanche*. 5. The bluiſh flowered *orobanche*. 6. The branched, purple-flowered *orobanche*. 7. The blue-flowered, branched *orobanche*. 8. The whitiſh-flowered, branched *orobanche*. *Tourn.* Inſt. p. 175.

OROBO, a name given by the chemiſts to any ſort of metallic glaſs.

OROBOIDES, a name given by Hippocrates, and other authors, to a furfuraceous ſediment in the urine of perſons who have the jaundice: it is uſually of a rediſh brown colour; and is not peculiar to that diſeaſe, but is found in ſome others.

OROBUS, *bitter vetch*, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the papilionaceous kind; from the cup there ariſes a piſtil, which is covered with a membrane, and finally becomes a membranaceous pod of a cylindric figure, uſually containing oval ſeeds. To this it is to be added, that the leaves grow in pairs on a middle rib, which terminates in a point.

The ſpecies of *orobus*, enumerated by Mr. Tournefort, are theſe: 1. The purple-flowered, ſpring *orobus* of the woods. 2. The vernal, wood *orobus*, with a pale red flower. 3. The broad-leaved *orobus*, with ſmall purple flowers. 4. The broad-leaved *orobus*, with ſmall pure white flowers. 5. The narrow-leaved, aſphodell-rooted, wild *orobus*. 6. The vetch-leaved, wood *orobus*. 7. The red-ſtalked, vetch-leaved, wood *orobus*. 8. The Italian, narrow-leaved *orobus*, with variegated flowers. 9. The wood *orobus*, with oblong ſmooth leaves. 10. The Engliſh, wild, wood *orobus*. 11. The Pyrenæan *orobus*, with nervous leaves. 12. The American *orobus*, with ſcarlet fruit, marked with a black ſpot, by ſome called the *phaſeolus* of America, and the *abrus*, and ſcarlet Indian pea *Tourn.* Inſt. p. 393.

OROCONITES, in the materia medica, a name given by Hippocrates, and others, to a bulbous root that is recommended as a rich food. It has the name from the Greek, ὄρος, a mountain, and κονιτες, of a conic figure. This ſhews that it was a root of ſuch a ſhape, found growing in mountainous places; but the learned have been puzzled in their attempts to find out what it was.

Guillandinus is of opinion, that the *oroconites* of Hippocrates is the *traſi*, or ſweet *cyperus* root, but there are many arguments againſt this opinion, though the two circumſtances expreſſed in its name, that is, the place of growth, and the ſhape of it, are ſufficient to throw this to the ground. The *traſi* grows in low marſhy grounds, near waters, and its roots are ſmall tubera of the ſhape of a hazel-nut, whence the Spaniards, who are very fond of them, have called them *avellanda*. The Arabians have a root which they call the bulb, by way of eminence. This ſeems, indeed, to be the ſame with the *oroconites* of Dioſcorides; and they give the ſame account of its virtues, and tell us, that it grew far from waters on the mountains of Syria, near Damaſcus, and elſewhere, and that it was of the ſize and ſhape of a pear; this may very well be called a conic ſhape in a root.

ORONTIUM, in botany, a name given by ſome authors to the *antirrhinum*, called in Engliſh *calf's ſnout*, or *ſnap-dragon*. *Ger.* Emac. Ind. 2.

OROSPIZA, in zoology, a name by which the antient naturaliſts called the *brambling*, or *mountain finch*.

The word is Greek, and expreſſes *mountain-chaffinch*. See the article MONTIFRINGILLA.

ORPELLO, a preparation of braſs uſed in the glaſs trade, and prepared in this manner: cut plates of braſs into ſmall pieces, and place them in a luted crucible, in a ſtrong fire, but not ſo violent as to melt it. Let it ſtand in this manner for four days, in which time it will be well calcined; when cold, powder, and ſift it, and finally grind it on a porphyry. This will be a black powder; ſpread this on tiles, which place on burning coals in the leer, near the hole, for four days; take off the aſhes that may fall into it, and finally powder and ſift it fine for uſe. It is known to be nicely prepared, when, on mixing with the melted metal in the glaſs furnace, it makes it ſwell and boil.

The colour it gives is a very elegant ſky-colour, and a ſea-green, or a mixt colour, between them, according to the quantity, and degree of calcination. *Neri*'s Art of Glaſs, p. 35.

ORPHAN (*Cycl.*) — Among the Athenians, the *orphans* whoſe fathers had loſt their lives in the ſervice of their country, were under the guardianſhip of the *polemarchus*, who was to provide them with a competent maintenance, out of the public treaſury. See POLEMARCHUS.

ORPHANUS, in natural hiſtory, a name given by ſome authors to a poor ſpecies of *opal*, called by ſome *pſeudo-opalus*: it has no other colours beſide a milky white, and purpliſh red. This ſtone is frequent in Germany, and Hungary.

ORPHEOTELISTÆ, ὀρφεοτελισται, in antiquity, perſons initiated in the Orphic myſteries. They aſſured all that were admitted into their ſociety of certain felicity after death; which when Philip, one of that order, boaſted of, Leotychidas, the Spartan, replied, Why do not you die then, you fool, and put an end to your misfortunes, together with your life? At their initiation, little elſe was required of them beſides an oath of ſecreſy. *Potter*, Archæol. Græc. T. 1. p. 497.

ORPHEUS, in zoology, the name of a fiſh caught in the Archipelago. It is of a broad and flat figure, and of a fine purple colour; its eyes are large and prominent, and its teeth ſerrated; it has only one fin on the back, and the anterior rays of that are prickly, the others ſoft to the touch. Its anus is ſmall, and it is ſaid to have no paſſage for the ſemen.

This was the fiſh called *orpheus* by the antients, but the modern Greeks call another fiſh by that name. This is of a flat figure, but very thick, has a ſmall mouth, and is covered with ſmall, but very rough ſcales, which adhere very firmly to the fleſh; the tail is not forked; it has fleſhy lips, and very ſmall teeth; its back and ſides are black; its belly white; it has a large black ſpot at the root of the tail. Its head is reddiſh, and its fins are very elegantly diverſifyed with various colours; it has only one back fin, and that has the anterior ray prickly, the hinder ones not at all ſo. It grows ſometimes to twenty pound weight, and is much eſteemed among the modern Greeks. *Geſner* de Piſc. p. 752.

ORPIMENT, (*Cycl.*) *auripigmentum* — *Orpiments* are inflammable foſſile ſubſtances compoſed of numbers of thin flakes, like the talcs, which eaſily ſplit, and are ſeparated from one another, and are flexile, and not elaſtic, ſoluble in oil, fuſible in a moderate fire, and yielding in burning an offenſive ſmell like that of garlic.

Theſe, like the talcs, are, in ſome of the ſpines, compoſed of large plates, or flakes, each making the whole ſurface of the maſs, and, in others of ſmall flakes lodged in extraneous matter, or cohering alone into a maſs in form of ſpangles.

Of this genus of foſſils, there are only three known ſpecies: 1. A broad-flaked, gold-coloured kind, well known among the antients, as is plain from the deſcription of it left us by Dioſcorides, and much eſteemed at preſent by our painters. This is found in ſeveral places, as in the iſlands of the Archipelago, in the mines of Goſſelaer, in Saxony, in ſome parts of Turky, and the Eaſt-Indies, and in its utmoſt purity about Smyrna; this makes the fineſt of all yellows in painting. 2. The ſmall-flaked, yellow kind, which is the common *orpiment* of the ſhops, and is a fine colour, though greatly inferior to the former. This is found in many parts of the Turkiſh dominions, and in Germany. And, 3. Red *orpiment*. This has been a name given by the more judicious to ſandarach, and, by the vulgar, to red arſenic, but is to be reſtrained only to this foſſile, which is of a fine bright red, and of the regular texture of the *orpiments*, and anſwering all their characters. This is a very beautiful ſubſtance of a fine bright red, very gloſſy, and a little tranſparent, and is found in the Turkiſh dominions, in the iſlands of the Archipelago, and even in our own country, Dr. Hill having lately received ſome of it from Cornwall, under the name of red mundic.

The Engliſh druggiſts are guilty of an unpardonable piece of ignorance, in that, in general, they know no difference between yellow *orpiment*, and the yellow factitious arſenic, which they regularly ſell under its name; the *orpiment* is known to be a ſafe internal medicine, and the thing they ſell under its name is a very terrible poiſon. The colour-men, however, who ſell both are well acquainted with the difference. *Hill*'s Hiſt. of Foſſ. p. 204.

ORRHAGOGA, a name given by the antients to ſuch medicines as operated violently, as purges, and evacuted ſerous and watery humours.

ORRHOPIGION, a word uſed by anatomical authors, ſometimes to expreſs the extremity of the ſpine, but more frequently the line or ſeam which runs from the penis along the middle of the ſcrotum to the anus.

ORRHOPISSA, a name given by the antients to the thinner or more fluid parts of tar.

ORRICE, a name given by the vulgar to the *iris-root*. See the article IRIS.

ORRUS, in botany, a name by which many of the antients called the cultivated pine tree, from its being remarkably full of juice.

The firſt perſon who has given us the name is Theophraſtus; but he is followed in it not only by the other Greeks, but alſo by the Latins, who have called the ſame tree for the ſame reaſon *ſapinus*, a contraction or abbreviation of the word *ſapapinus*, the juicy pine. Pliny tells us, that this laſt was the name of the manured pitch tree; but in this he errs, for Vitruvius, and others, tell us that the pine nuts, *nuces pineæ*, which were eaten

and used in medicine, were the fruit of the *ſapapinus*, or *ſapinus*; and it is evident, that theſe muſt be the produce of a pine tree, not of a pitch tree, or any thing of the fir kind.

ORTHOCERATITES, in natural hiſtory, a name by which ſome late authors have called a ſpecies of ſea ſhell, found frequently foſſile, but not known at preſent in its recent ſtate; called by others *polythalamium* and *tubulus marinus concameratus*. It is uſually ſtrait, but ſometimes its end is twiſted like the *cornu ammonis*. See TUBULIS *Concamerati*.

ORTHODOXI, in botany, ſuch ſyſtematic writers as have formed their methods on the true natural foundation, and divided the plants under their conſideration into claſſes and genera, according to the characters of their parts of fructification. Theſe are either the *univerſales*, or *particulares*; by the firſt are meant, thoſe who have thus ranged the whole vegetable world; and by the latter, thoſe who have undertaken only ſome one claſs of plants, as the umbelliferous, &c. *Linnæi*, Fund. Bot. p. 2.

ORTHODROMICS, that part of navigation which teaches the art of ſailing in the arch of ſome great circle.

The word is Greek, Ορθοδρομικα, derived from ορθος, *rectus*, ſtreight, and δρομος, curſus, run or diſtance; *q. d.* the ſtreight or ſhorteſt diſtance; and this can only be in the arch of a great circle.

ORTHRAGORISCUS, in zoology, the name uſed by Rondeletius, and ſome other authors, for the fiſh more commonly known by the name of the *mola*, and called in Engliſh the *ſun fiſh*. *Willughby*'s Hiſt. Piſc. p. 151. See the article MOLA.

ORTYGOMETRA, in zoology, the name of a bird called in Engliſh the *daker-hen*. It is ſomewhat larger than the quail. Its body, in ſhape, reſembles the common hen. It has two dusky lines on the head: its breaſt and belly are white: its throat of a dusky brown: its back feathers are black in the middle, and of a tawny colour at their edges: its thighs are variegated with transverſe-white ſtreaks. It is common in Ireland, and in ſome of the northern counties of England, particularly in Northumberland. The noiſe it makes is only *crex*, *crex*, whence the antients have called it by that name. The Italians call it *re edelle quaglie*, or the *king of the quails*. It is a very delicately taſted bird. *Ray*'s Ornithol. p. 122.

ORVALA, in botany, the name given by Linnæus to a genus of plants, called *papia* by Micheli. The characters are theſe: The perianthium is compoſed of one leaf, it is tubulated and dilated at the mouth, and is crooked and divided into five ſegments; the lower two being ſhorter than the reſt. The flower is compoſed of one petal, and is not of the labiated kind; the tube is of the length of the cup. The limb is erect, long, and divided into four ſegments. The upper of which is oblong, convex, and falcated and lunated at the point. The lower is oblong, and is alſo lunated at the point, and the ſide ones are oblong and pointed, and divided each into three ſegments. The ſtamina are four filaments of the length of the flower; they are placed under the upper ſegments of the flower; the antheræ are two in number. The germen of the piſtil is divided into four; the ſtyle is ſimple, and of the ſame length with the ſtamina; the ſtigma is bifid, and acute. The ſeeds are four, and of an oval kidney-like ſhape. *Linnæi*, Gen. Plant. p. 278.

ORVALA, in botany, is alſo a name uſed by ſome authors for the *horminum*, or *clary*. *Ger.* Emac. Ind. 2.

ORYCTOGRAPHY, is that part of natural hiſtory wherein foſſils are deſcribed. *Wolfm.* Diſc. Prælim. Logic. §. 81.

ORYCTOLOGY, is that part of phyſics which treats of foſſils, or it is the ſcience of foſſils. Under this head comes the doctrine of ſalts, ſulphurs, ſtones, gems and metals. *Wolfm.* Diſc. Prælim. Logic. §. 81.

ORYGMA, ὄρυγμα, among the Athenians, a name given to the pit, more uſually called *barathron*; (See BARATHRON) whence the public executioner received the appellation of ὁ επὶ τῳ ὀρυγματι. It was a dark noiſome hole, and had ſharp ſpikes at the top, that no man might eſcape out; and others at the bottom, to pierce and torment ſuch as were caſt in. From its depth and capaciouſneſs, it came to be uſed proverbially for a covetous miſer, or voracious glutton, that is always craving, and can never be ſatisfied; and ſuch a one the Latins called *barathro*. *Potter*, Archæol. Græc. l. 1. c. 25. T. 1. p. 134, ſeq.

ORYX, in zoology, an animal mentioned by Ariſtotle and Pliny, with only one horn. Pliny makes it a ſpecies of wild goat; but Columella thinks it was a kind of deer. It is ſaid, that this creature was of great uſe in Africa, to relieve the ſcorched inhabitants from thirſt, there being always found in its body veſicles full of a very wholeſome and pleaſant liquor. *Hofm.* Lex. in voc.

ORYZEUM, a name given by many of the chemical writers to gold.

OS *(Cycl.)* — Os *argenteum*, in natural hiſtory, the name of a ſpecies of ſhell fiſh, of the round mouthed ſnail, or *lunaris cochlea* kind. It has a very elegant ſilver colour in the round opening, or mouth of the ſhell. See LUNARIS *Cochlea*.

Os *aureum*, the golden mouth, in natural hiſtory, a name given to a ſpecies of cochleæ of the lunar kind, or of that genus which have a round mouth. This, in the *os aureum*, is of a fine yellow. See LUNARIS *Cochlea*.

Os *calcis* *(Cycl.)* — This is the largeſt bone of the foot, of which it makes the poſterior part, and in ſome meaſure the baſis. It is oblong and very irregular, and may be divided into a body and two apophyſes, one great and anterior, the other ſmaller, lateral and internal. The body of the *os calcis* has ſix ſides; one poſterior, one anterior, one ſuperior, one inferior, and two lateral. The poſterior ſide is broad, unequally convex, and as it were divided into two portions, one ſuperior, ſmall and poliſhed, the other inferior, much larger, unequal, and rough, which, in children, is an apophyſis, and may be termed the *tuberoſity* of the *os calcis*. The lower part of it is bent downward, and terminates in two tubercles or obtuſe points, which belong rather to the inferior than the poſterior ſides of the bone. The upper ſide may be divided into two parts, one poſterior and unequal, having a ſmall depreſſion; the other anterior, convex, and cartilaginous, proportioned to the great inferior cavity of the aſtragalus. This ſide is turned obliquely forward, and by this obliquity becomes part of the foreſide, the remaining part of which is loſt in the anterior apophyſis. The lower ſide is narrow, and behind it lies the two tubercles already mentioned, of which the internal is the biggeſt; they both ſerve for the inſertion of the aponeuroſis in the ſole of the foot, but chiefly the biggeſt. The two lateral ſides are continued over the anterior apophyſis, the external is gently convex and unequal, covered only with the common integuments and ligaments; the internal is hollow and depreſſed. The greater anterior apophyſis lies in the ſame direction with the body, being a continuation thereof. It has five ſides or remarkable parts, and were it not for the body would have a ſixth. The upper ſide has an irregular and unequal depreſſion, which, together with that in the apophyſis of the aſtragalus, forms a conſiderable foſſula. And its anterior extremity has a ſmall cartilaginous ſurface, anſwering to one of thoſe in the apophyſis of the aſtragalus. The anterior ſide of the apophyſis is broad, oblique, cartilaginous, partly convex and partly concave, and is articulated with a like ſurface of the os cuboides: this is the foreſide of the whole *os calcis*, when conſidered without any diviſion. The outſide of the apophyſis is very rough, being a continuation of the outſide of the body, with a tubercle or eminence of the place where the two ſides meet. This, however, is not found in all ſubjects. On the lower part of this tubercle is a cartilaginous ſurface for the paſſage of the tendon of the *peronæus longus*: ſometimes we ſee only ſome ſmall veſtiges of this eminence, and often none. We ſometimes alſo meet with a cartilaginous ſurface, ſmall, lower down, and more forward, near the anterior extremity of the apophyſis, for the paſſage of the ſame tendon. The lower ſide is a tuberoſity continued from the ſide of the body, and deſigned for the inſertion of muſcles. The lateral apophyſis is almoſt common to the body, and to the great anterior apophyſis, and increaſes the cavity on the inſide of the *os calcis*. On its upper part it has a very ſmooth cartilaginous ſurface, articulated with one of the inferior ſurfaces of the aſtragalus. This apophyſis is very low down, and its inferior part is ſmooth for the paſſage of tendons. *Winſlow*'s Anatomy, p. 97, ſeq.

Os *calcis luxated*. It ſometimes happens, that the *os calcis* above, and no other bone of the foot, is diſplaced or luxated by ſome external force; and this happens ſometimes toward the external, ſometimes toward the internal ſide of the foot. When this accident happens, it is eaſily diſcovered by the violent pain it occaſions; and by the inequality of the part, that is, there is a cavity plainly obſervable in one part, and a tumor in the other, on the place. The reduction of this diſlocation is very eaſy. The patient is to be placed on a bed, and while two aſſiſtants extend the limb in the oppoſite directions, the ſurgeon replaces the diſlocated bone with his fingers, and the preſſure of the palm of his hand, and then there is no more than a proper bandage and reſt required to the cure. *Heiſter*, Surg. p. 174.

Os *cuneiforme*. This in the carpus is the third bone of the firſt row. It has its name from the Latin *cuneus*, a wedge. Its figure much repreſenting that of a wedge ſticking between the two rows. It has a rough ſurface with a ſmall tubercle upon it, which forms the greateſt part of the cubital edge of the carpus; and four articular ſides of which one is convex, which compleats the articular convexity of the carpus, one orbicular and internal, or on the concave ſide of the carpus, on which the os piſiforme is ſet; and two others, which make an angle between them, one for the os ſemilunare, and the other for the os unciforme. *Winſlow*'s Anatomy, p. 83.

The *oſſa cuneiformia* of the tarſus are ſituated before the os ſcaphoides. The firſt of them is the largeſt, and the third the leaſt; with the os cuboides, theſe form a ſort of arch, which on the ſide next the other foot is high, and low on the oppoſite ſide. In each of theſe bones we may diſtinguiſh the baſis, the apex, and four ſides, one poſterior, one anterior, and two lateral; whereof one is internal, the other external. The firſt bone is like a wedge contorted and bent. Its baſis is low down, unequally rounded, like an oblong tuberoſity, ſerving for the inſertion of a tendon; the internal lateral ſide, or that which is turned towards the other foot, is unequally convex, and rough, for the inſertion

tion of ligaments. The external lateral side, or that next the second bone is unequally concave, and cartilaginous toward the superior and posterior edges. The largest portion of this side is articulated with the second bone. The rest toward the anterior edge is joined laterally to the second bone of the metatarsus. The backside is the least; it is cartilaginous and almost triangular, suited to the first of the three triangular surfaces of the os scaphoides. The anterior side is cartilaginous, large, and semilunar, the convex edge being turned toward the other foot, and by this the first *os cuneiforme* is articulated with the first bone of the metatarsus. The angle is turned upwards, and the obliquity of it occasions the anterior side to be the highest, and the posterior lowest. The second *os cuneiforme* has the basis upward, and the angle downward, and resembles a wedge more than the first: this basis is short and rough, for the insertions of ligaments. The backside is cartilaginous, and perfectly triangular, suited to its articulation, with the middle surface of the convex side of the os scaphoides The anterior side is also cartilaginous, a little more oblong and articulated with the basis of the second metatarsal bone. The two lateral sides have, toward their superior and posterior edges, oblong cartilaginous surfaces, by which they are articulated with the first and third *ossa cuneiformia*; the rest of these two sides is a little depressed, and there, by small interstices, void spaces are left between the bones: this is every way the straitest bone of the three, its angles hid between the two other bones of the same name, and does not reach so low as theirs, which makes this part of the foot a little hollow. The third *os cuneiforme* has likewise its basis upward, and its angle downward. The basis is longer than that of the second, almost flat or very little convex, and rough for the insertion of ligaments; the angle runs down lower than that of the second bone. The backside is cartilaginous and triangular, that is of the same figure with the third surface of the convex side of the os scaphoides: the anterior side is, likewise, cartilaginous and triangular, but a little oblong, being articulated with the basis of the third bone of the metatarsus. The internal lateral side is broad, with two cartilaginous surfaces, one toward the posterior edge, the other toward the anterior; the first is for its lateral articulation with the second *os cuneiforme*; the second for its lateral articulation with the basis of the second metatarsal bone. The external lateral side is likewise broad, and toward its posterior edge has a large cartilaginous surface for its articulation with the os cuboides towards its anterior edge. There is a sort of void space for the passage of vessels, and sometimes a little cartilaginous corner for its lateral articulation with the fourth bone of the metatarsas. *Winslow*'s Anatomy, p. 100.

Cartilages of the Os *femoris*. No part of the *os femoris* is covered, except the uniform convexity of the head, and the articular portion of the lower extremity. The trochanters have no true cartilage, what appears like it being only the remains of tendinous insertions; the cartilaginous substance, which to a certain age unites the apophyses to the body of the bone, does not belong to these, because it is only found in the time of youth, and in adults is converted into a bone. The cartilaginous matter, by which the head of the *os femoris* is cemented, deserves, however, to be observed here, because that apophysis has been separated by violent falls. The convexity of the head of the *os femoris*, all the way to its symphysis with the neck, is covered with a very smooth, shining cartilage. A little below the middle of this convexity, and something toward the back part, there is a depression in the shape of a crescent, the cartilage being here interrupted by the insertion of the internal articular ligament of the head of the *os femoris*. The cartilage which covers the lower extremity of this bone is exactly fitted to the semi-oval convexity of the inferior surface of each condyle, and to the pulley formed by their union. *Winslow*'s Anatomy, p. 126.

Ligaments of the Os *femoris*. The *os femoris* is connected by its upper extremity to the os innominatum, and by the lower to the bones of the leg, by means of several ligaments. The ligaments of the upper extremity are two in number, one which surrounds the whole articulation thereof, with the cotyloide cavity, and one contained in the articulation. The first is termed the orbicular ligament of the head of the *os femoris*; the other the internal ligament; and to these may be, though but improperly, added a third, which is of the nature of a capsular ligament. The orbicular ligament is the most considerable, the largest, and the strongest, of all the articular ligaments of the human body; it is fixed quite round the border of the cotyloide cavity, and is made up of several sorts of fibres, and is much stronger and thicker in some parts than in others; the other, or internal ligament of the head of the *os femoris*, resembles a flat cord, and is composed of a bundle of flat fibres, closely interwoven. The ligaments of the lower extremity of the *os femoris*, by which this bone is connected with the leg, are six in number, one posterior, two lateral, two middle, or crucial, and the capsular. The crucial ligaments lie within the joint, and are fixed by one end to the back part of the notch, or opening, which parts the two condyles: these are surrounded by the capsular ligament, but all the rest lie on the outside thereof, being closely joined to it. Of the two lateral ligaments, one is internal, and broad, being fixed to the tuberosity of the internal condyle; the other is external, and narrow, and is fixed to the tuberosity of the external condyle. The posterior ligament is broad and thin, and being fixed a little above the convexity of the external condyle, it thence descends obliquely behind the great notch, and internal condyle. The capsular ligament is, as it were, glued to the three former, and is fixed quite round the inferior extremity of the *os femoris*; at a small distance above the anterior, lateral, and posterior parts of the cartilage, and above the posterior part of the great notch; and from the cartilage and notch, through the small space upward already mentioned, it covers the bone, and afterwards is inverted downward, to form the capsula for the mucilaginous liquor of the joint. *Winslow*'s Anatomy, p. 126.

Os *frontis*. This is situated in the anterior part of the skull, and forms that part of the face which is called the forehead, from whence it has its name. Its figure is symmetrical, resembling a large shell almost round. Tho' this has always been looked upon as one bone, it is to be observed that it is sometimes found divided into two equal parts by a continuation of the sagittal suture; and this division is equally common to both sexes. Considered as one bone it may be divided into an upper part, which belongs to the crown of the head, a lower part which belongs to the basis of the skull, an anterior part which is the forehead, and two lateral parts at which the temples begin. Its two sides are the one external, which is in its greatest part convex, and forms the forehead; the other internal, which is concave in proportion. On the outside are observed the following eminences: Two superciliary arches, which form the upper edge of each orbit, or the supercilia; three risings not always equally apparent, one between the two arches, and the other two above them; which may be called the knobs of the forehead: five apophysis, one at the extremities of each arch, one between the orbits, which sustain the ossa nasi, and which in some subjects makes a part of the bony septum of the nose. This last may be called the nasal apophysis, the other four the angular apophyses. The external cavities are these two orbitary portions or vaults forming the upper portions of the orbits: a remarkable depression in each of these vaults above the external angle, which contains the lachrymal gland: a small depression above the internal angle, to which is fixed the cartilaginous pully of the great oblique muscle of the eye; two portions of the temporal fossæ; two little cristæ which form the anterior extremity of the great semicircular plane of the temples, on each side, at the edge of the superciliary arches, near the external angle; two superciliary foramina, which are sometimes double, and sometimes only notches; and, lastly, two holes or portions of holes, called the internal orbitary holes.

On the inside of this bone we see a sharp perpendicular eminence, called the frontal or coronal spine, directly opposite to the middle rising on the outside already mentioned; above this spine, a portion of the groove for the longitudinal sinus, which when the spine is wanting, runs down lower; below the spine a considerable opening, called the ethmoidal opening, because it contains the os ethmoides; the sides of this are always more or less cellular. Between this opening and the coronal spine, a blind opening, which in some subjects is wholly in the *os frontis*, in others, common to that bone and to the os ethmoides, and which seems to open into the frontal sinuses near the nose. The anterior fossæ of the basis of the skull, which receive the anterior lobes of the brain, and which, by juting out forwards, form the risings on the outside, before taken notice of: toward the lower part they are uneven, answering the inequalities of the lobes, and they are also a little raised, to make room for the orbits, sulci or furrows of the arteries of the dura mater, and sometimes other indeterminate depressions. Tho' this bone is in general composed of two tables, and a diploe, yet the orbitary vaults are very thin, and without any diploe. About the middle of the lower part of the bone, where the middle rising is commonly situated, the two tables are parted, to form two cavities called the frontal, or superciliary sinuses, and the separated portions are here each of them composed in some measure of two tables, or at least have two surfaces, which make in all four surfaces of each of the two tables.

The frontal sinuses are extended on the edge of the superciliary on each side, more or less, all the way to the superciliary perforations; below they are open, and communicate with the cells of the os cribrosum. They are commonly parted by a bony septum, which is often more or less uneven; sometimes also it is perforated, and sometimes part of it, sometimes the whole is wanting.

In different subjects these sinuses are observed to vary extremely both in extent and form; in some they are very small, and often very irregular, and their disposition cellulous; sometimes also they are entirely wanting, and in such subjects the cavity of the nose is larger than ordinary; one of them does not open into the nose but only communicates with the other.

The *os frontis* is articulated by suture with seven other bones, the ossa parietalia, os ethmoides, os sphenoides, ossa lacrymalia, ossa nasi, maxillaria, and the ossa malarum. It contains

tains the anterior lobes of the brain, and a portion of the longitudinal ſinus, and forms the forehead, the upper parts of the orbits, and a portion of the temples. *Winſlow*'s anatomy, p. 21.

Cartilages of the Os *humeri.* The cartilage by which the hemiſphere of the head of the *os humeri* is covered, is gradually thicker toward the middle, and thinner toward the edges. The four ſurfaces of the tuberoſities, which appear cartilaginous in dry bones, ſerve only for the inſertion of the tendons of four muſcles, which move the *os humeri* on the ſcapula. The channel, or ſinus, between the two tuberoſities is partly covered by a thin cruſt, which appears rather ligamentary than cartilaginous, and partly by a tendinous ſtratum. The trochlea and ſmall head of the lower extremity of the *os humeri*, are covered with a common cartilage, in which the ſame proportion of thickneſs is obſervable, as in that of the upper extremities; and this holds indeed pretty generally of the convex articular cartilages: and the foſſulæ near the pulley and ſmall head, are covered with a thin cartilaginous and ligamentary varniſh.

Ligaments of the Os *humeri.* The capſular, or mucilaginous ligament, looſely ſurrounds the whole articulation of the ſcapula with the head of the *os humeri*. The true ligament of this joint ſeems to be made up of two ſorts of ligaments cloſely united together, *viz.* of a capſular ligament, which ſurrounds the whole articulation, and of ſeveral true ligaments which run over, and cloſely adhere to the former at different diſtances. On the body of the *os humeri* there are two particular ligaments, which may be termed the intermuſcular, or lateral ones: they are long, flat, thin, but ſtrong and narrow, fixed by one edge along the two lower thirds of the bone, and reaching to both condyles; they are broad, pretty tight, and are very narrow at the upper part, but broader toward the condyles.

The lower extremity of the *os humeri* is joined to the bones of the fore arm, by two faſciculi of ligamentary fibres, one fixed to the internal condyle, the other to the external. Each faſciculus is compoſed of fibres cloſely joined together near the condyle, but afterwards parting in diſtinct bands like a gooſe's foot. The capſular ligament is fixed to the condyles, and then covers them, and is afterwards fixed round both ſides of this lower extremity above the foſſulæ. The foſſulæ are ſlightly varniſhed over alſo with a cartilaginous ſubſtance. This capſula ſeems to be ſtrengthened by a ligamentary wall, the fibres whereof croſs one another in different directions, and appears larger and looſer when the muſcles are ſeparated from it, than when cloſely united to them in its natural ſtate. *Winslow*'s Anatomy, p. 139.

Os *humeri fractured.* Fractures of the *os humeri* are leaſt dangerous when near its middle, and much worſe when near its upper or lower head. It ſometimes happens, that the fractured ends of this bone keep their places, but much more frequently they are found ſlipped one over another; by which means the fractured limb is made ſhorter than the ſound one: ſometimes alſo, tho' much more rarely, it happens, that the divided ends of the bone recede from one another, by reaſon of the weight of the arm, and by that means the fractured limb becomes longer than the ſound one. In fractures of this bone, where the ends of the divided bone have ſliped one over another, as is uſually the caſe, there is required both force and ſkill to reduce them, eſpecially if the patient has tenſe nerves and larger muſcles, as is uſually the caſe in ſtrong men. To extend the arm on this occaſion, the patient muſt be ſeated on a high ſtool, and an aſſiſtant muſt lay hold of his arm firmly above the fracture, keeping his elbow gently bent; then the lower part of the arm beneath the fracture, is in like manner to be taken hold of, and the arm is to be gently extended forward, by endeavouring to remove eaſily each part from the other, in a right line. The ſurgeon is then to take hold of the fractured part of the arm, and with both his hands reduce the fractured bones into their proper places, while the arm is kept in a proper ſtate of extenſion by the aſſiſtants; and when they are replaced, the limb is to be rolled up with the proper bandages. *Heiſter*'s Surg. p. 127.

Os *hyoides.* Mr. Du Vernoy obſerves, that the right ſide of the *os hyoides* is ſhorter than the left. Comment. Acad. Petrop. Tom. 7.

Cartilages of the Ossa *innominata.* Theſe are not ſo numerous as might be imagined, on examining the bones in a dried ſkeleton, where we are apt to think we ſee the dried remains of cartilages on the criſta of the os ilium, on the tuberoſity of the os iſchium, and on the grooves and notches which give paſſage to the tendons of muſcles; but none of theſe incruſtations are true cartilages, but for the moſt part tendinous, aponeurotic or ligamentary, which ſubſtances being dryed, look more like cartilages than the true cartilages themſelves in the ſame ſtate. The true cartilages of theſe bones in adults are properly five in number, three of which are common, and two proper. The firſt and principal common cartilage, is that which makes the ſymphyſis of the oſſa pubis. This forms a kind of arch, which is more conſiderable in men than in women; the two others join the oſſa ilium to the os ſacrum, but are thinner than that of the oſſa pubis. The proper cartilages are thoſe which line the cotyloide cavities, in the edge of each of which there is a notch or opening between the anterior or inferior parts, and in the cavity itſelf there is a broad and ſhallow depreſſion, reaching from the notch beyond the middle part of the cavity; all the reſt of the acetabulum is covered with a very white, ſhining, ſmooth cartilage, which terminates preciſely at the edge of the cavity. *Winſlow*'s Anatomy, p. 122. See Ilium.

Ligaments of the Ossa *innominata.* Theſe are of two kinds, common and proper: the common ligaments are thoſe which go between theſe and the neigbouring bones, of which there are a conſiderable number: One ſuperior, inſerted by one end in the internal labium of the poſterior part of the os ilium; one inferior and anterior, fixed by one end in the inner ſide of the criſta of the os ilium, and by the other in the ſuperior and anterior part of the firſt falſe tranſverſe apophyſis of the os ſacrum. Several inferior and poſterior, fixed by one end along the internal labium of the tuberoſity of the criſta of the os ilium, and by the other in the firſt three falſe tranſverſe apophyſes: and to this muſt be added the ligaments by which the os femoris is joined to the *os innominatum*. The principal proper ligaments are four: the two ſacro-ſciatic, the obturator, and the inguinal, which ſee under their proper heads; but beſide theſe, there is another ſmall, flat, and very ſtrong ligament, which runs tranſverſely between the two angles of the cotyloide notch, and may be termed the proper, or tranſverſe ligament thereof. The elaſtic border of the cotyloide cavity may likewiſe be reckoned among the ligaments: it is a ſort of additional piece, ſtrongly united to the edge of the cavity, but eaſily yielding any way, on preſſure. The two ligaments by which the os femoris is connected to the *os innominatum*, are alſo inſerted in this bone; one of theſe ligaments ſurrounds the whole articulation, and the other is contained in it: the firſt is called the orbicular ligaments, the other, tho' very improperly, the round ligament: the orbicular is very ſtrong, and unequally thick, and ſurrounds the whole convex circumference of the ſupercilium of the cotyloide cavity. The ligament which lies in the joint is not round, but is a flat cord, broad at one end, and narrow at the other, and is in ſome degree of a triangular ſhape. *Winſlow*'s Anatomy, p. 122.

Os *innominatum fractured.* A fracture of this bone very ſeldom happens; but when it does, it is readily diſcovered by the injury and ſymptoms in the neighbouring parts, and is the more particularly dangerous, when the patient diſcharges a brown bloody matter. In reſtoring this bone, the patient muſt lie down on his ſound ſide; the bone muſt be replaced with the hands, covered with compreſſes, dipt in ſpirit of wine, and kept on by the ſpica bandages. Afterwards bleeding, with cooling and relaxing medicines, muſt be uſed, and a thin diet obſerved. *Heiſter*'s Surg. p. 126.

Os *orbiculare.* This, in the carpus, is the fourth bone of the firſt row. It has its name from the roundneſs of its figure, and is, for the ſame reaſon, by ſome called *os piſiforme*, and *os lenticulare*; it is, however, not perfectly, or regularly round; it has but one cartilaginous ſide, which is irregularly orbicular, and the border, a circumference of which repreſents a kind of narrow collar. The reſt of the bone is rough, convex, and irregularly round, making one of the four eminences, on the concave ſide of the carpus. This bone, and the os cuneiforme, may be ſuppoſed to make a third row, diſtinct from the other two. *Winſlow*'s Anatomy, p. 83.

Naſi Ossa. See Nasi *oſſa.*

Palati Ossa. See Palati *oſſa.*

Parietalia Ossa. See Parietalia *oſſa.*

Pectoris Ossa. See Pectoris *oſſa.*

Os *ſacrum* (*Cycl.*) — As this bone is the baſis by which the whole ſpine is ſupported, it has by ſome been called *os baſilare*; its figure comes near that of a long triangle, with the baſis upward, and apex downward. Anatomiſts, in its deſcription, divide it into the upper part, or baſis, the lower, as it is ſituated, or apex; two ſides, the anterior, or concave, and the poſterior, or convex; and two lateral parts, or edges. The pieces of which it is compoſed in infants, called falſe vertebræ, are five in number, and are united together by cartilages, which in time almoſt diſappear, leaving only little ridges, or lines, more or leſs prominent in their places. The firſt of theſe is much larger than any of the true vertebræ, but their ſize diminiſhes by very great degrees as they deſcend; ſo that the loweſt which makes the point of the *os ſacrum*, has ſcarcely the appearance of a vertebra. At the baſis, or upper part, of the *os ſacrum*, are two articular apophyſes, anſwering to the inferior ones of the laſt vertebra of the loins. Below each of theſe apophyſes laterally is a large notch, and between them, we ſee diſtinctly enough the body of this firſt falſe vertebra, which is like that of the lumbar vertebræ, being very much inclined backward; ſo that the body of this firſt falſe vertebra, as well as that of the laſt true one, is longer before than behind; and from this obliquity it is that the *os ſacrum* and laſt lumbar vertebra, form at their connection, a very conſiderable angle. The lateral parts are broad at top, forming on each hand a large, irregular, cartilaginous ſurface, in the figure of a great S, and ſometimes of a bird's head.

head. By these two sides the *os sacrum* is connected to the ossa innominata, by a cartilaginous symphysis. Between each of these lateral sides and the nearest posterior holes, there is a large rough depression, and under that another not so large. These depressions are often pierced by several holes, which lose themselves in the substance of the bone. *Winslow*'s Anatomy, p. 60.

Os *sacrum fractured*. When this bone is found to be fractured, the fragments are to be reduced into their proper places with the fingers, and if any part of it be depressed inwards, a finger dipp'd in oil or butter, and with the nail close cut off, must be introduced up the anus in order to thrust the depressed fragment into its proper place, to which it is to be directed externally by the other hand. This being performed, a sticking plaister is to be applied, and compresses dipped in spirit of wine over it, to be kept on by the T bandage, or the plaisters may be let alone, and only the compress and bandage applied. The patient must keep his bed a fortnight, lying on his sides; or if he will needs sit up, it must be on a chair without a bottom, that the bones may not be displaced by touching the seat. *Heister*'s Surg.

Os *sepiæ*, the cuttle-fish bone. See SEPIUM, *Cycl.*

OSSA *temporum*. See TEMPORUM *Ossa*.

Os-*tincæ*. The sides of the os-tincæ have been known to open together in women with child, and have been divided by incision, in order to extract the child. See Med. Ess. Edinb. Vol. 3. Art. 19.

OSSÆI, or OSSENI, a name sometimes given to the Jewish sect of religion called *Essenians*. *Hofm.* Lex. Univ. in voc. See ESSENIANS, *Cycl.*

OSCHEALIS *hernia*, a term used by some writers for a hernia of the scrotum.

OSCILLA, in antiquity, small images of wax or clay, made in the shape of men or women; which were consecrated to Saturn in order to render him propitious. *Hofm.* Lex. Univ. in voc.

OSCINES, among the Romans, an appellation given to such birds, from whose chattering or notes, omens and predictions were drawn. *Hofm.* Lex. Univ. in voc.

OSLEOM *iron*, in the wire-works, a particular sort of bars of iron wrought on purpose for the manufacture of iron-wire. These are small and square, and the first thing done with these, toward the making them into wire, is, the straining, or drawing them at a furnace to small rods, of the thickness of one's little finger; these they bow round, and deliver them to the wire-drawers. *Ray*'s Engl. Words, p. 132. See WIRE.

OSMERUS, in ichthyography, the name of a genus of fishes, of the malacopterygious, or soft-finned kind, the characters of which are these: The branchiostege membrane contains seven or eight bones on each side. The back and belly fins are placed at the same distance from the top of the snout; by which it is distinguished from the coregoni and salmons. The teeth are large, and are placed on the tongue in the palate and in the jaws.

The species of *osmerus*, enumerated by Artedi, are these: 1. The *osmerus* with seventeen bones in the pinna ani: this is the smelt or eperlanus of authors. 2. The *osmerus* with eleven bones in the pinna ani.

This is the little fish called *saurus* by Salvian, and by the people of Rome, named *tarantola*. It is about a span long, and somewhat thicker than a man's thumb. The scales are moderately large, and the pinna dorsi has twelve rays. *Artedi*, Gen. Pisc. 8.

OSMONDS, in our old writers, a kind of iron antiently brought into England. It is mentioned in Stat. 32. Hen. VIII. c. 14. *Blount*, *Cowel.*

OSMUNDA, in the Linnæan system of botany, the name of a genus of plants, of the fern kind, the characters of which are: That the seeds are produced in globose capsules which stand distinct, but are collected in a cluster on the branch, and open horizontally when ripe. The seeds are small, oval in figure, and very numerous: according to this character, that species of the fern kind usually called the *sensible polypody* of Muntingius, and ranked among the polypodies is, an *osmund*; for it produces clusters of globose capsules so large, that they are scarce to be conceived to belong to any thing of the fern kind. These also stand on particular stalks, not on the back of the leaf, which is also the case in the other species of *osmund*, as our common English kind evidently shews.

The characters of *osmunda*, according to Mr. Tournefort, are these: The flowers are not discovered, but the seeds are collected into clusters. The capsules in which they are enclosed, are of a spherical figure; and when ripe, they burst by the contraction of the fibres. The leaves resemble those of the fern's.

The species of *osmund*, enumerated by Mr. Tournefort, are these: 1. The common, or marsh *osmund*. 2. The *osmund* with lunated leaves, commonly called *moonwort*. 3. The *osmund* with multifid leaves, called *branched moonwort*. 4. The larger branched *osmund*, with lunated leaves. 5. The feverfew-leaved *osmund*, or *moonwort*. 6. The *osmund* with adiantum leaves. 7. The hairy lonchites-leaved *osmund*. 8. The great fern leaved *osmund*. 9. The lesser fern-leaved *osmund*. 10. The hart's-tongue-leaved *osmund*. 11. The cut-leaved *osmund*, with broad dents. 12. The deeply jagged, and lightly hairy *osmund*. 13. The asphodel-rooted *osmund*. 14. The verticillated *osmund*. 15. The spear pointed lightly serrated *osmund*. *Tourn.* Inst. p. 547.

OSOSOR, a word used by some authors as a name for opium. See the article OPIUM.

OSPRION, a word used by some authors for a bean, which is its proper and determinate signification; but by some authors it is extended to all sorts of pulse.

OSSA. See the article Os.

OSSELET, in the manege, is a very hard excrescence, resembling a little bone, on the inside of the knee, (and never on the outside) appearing to be of the same substance with the rest of the knee, and only distinguishable from the knee by its descending a little lower.

OSSERVANZA, in the Italian music, is used for singing or playing with care; that is, executing a piece of music justly and exactly as it is marked, without adding or diminishing. *Bross.* Dict. Mus. p. 22.

OSSICULA *auditoria*, in anatomy, are four little bones contained in the cavity of the tympanum, or barrel of the ear, and assisting to the hearing; they are denominated from things they have been supposed to bear a resemblance to, the malleus, incus, stapes, and os lenticulare, called by others the *os orbiculare*; each of which see under their proper heads.

OSSICULA *musculorum*, in ichthyology, a name given by authors to those oblong and slender bones which are situated in the flesh of some kinds of fish between the muscles: these, in the anterior part, and especially near the head, are of a forked shape; but in the hinder part of the body, they are usually simple and slender. These sorts of bones are found in the following kinds of fish: 1. In all the cyprini. 2. In the esoces. 3. In the clupeæ. 4. In the eels. 5. In the coregones. 6. In the osmerus. 7. In the salmon kind. 8. In mackrell. And 9. In the ammodytes or sand eel. In the five last, these bones touch the spine at one end, but in the others they no where come near it.

The use of these loose bones seems to be, to strengthen and support the muscles, that by this means they may be able the more forcibly to move the body, and turn it about: they are peculiar to fish, no land animal having them. *Artedi*, Ichthyol.

OSSIFICATION *(Cycl.)* — Dr. Nisbet's opinion of *ossification* is, that in the blood, or a fluid secreted from it, there is an ossifying juice consisting of particles which are not apparent: that whenever nature designs an *ossification* between membranes, or within a cartilage, she occasions a more than usual afflux of this fluid; which so much distends the vessels which were before invisible, as to make them capable of receiving the red globules of blood, which is always to be seen near to the place where *ossification* is begun. In this blood, gritty bony particles are to be felt by the point of a knife; which have been formed by the attraction and cohesion of the particles of the ossifying juice obstructed, along with the other grosser fluids, in the beginning of the vessels prepared to receive refuent juices. The blood being capable of forming fine membranes, the membranous parts of a bone, which act as a gluten to keep these particles and fibres together, if there be any such, that do not arise from the coats of its vessels, are produced by a cohesion round the cretaceous particles of a part of the fluid, in which they were generated and contained. Thus the membranes of cartilages serve as a bed between, or within which the bony particles are deposited, or shoot; but without any intermixture of the particles of the bone and cartilage, or continuation of the fibres of the one substance to those of the other, as is evident in cartilages containing bones kept long enough in water, and then slit; for the bone will, as soon as the large vessels that enter its substance are divided, slip as easily, if not easier, from it, than an acorn does out of its cup: and there is a smoothness and polish of the parts of both cartilage and bone, which shew there is no conjunction of the fibres of the two substances. While the bones are encreasing within cartilages, the cartilages are extended and spread out; by which, with the pressure which they suffer, and the great influx of various fluids, and the nutricious matter being hindered to flow freely into them, they decrease continually; and at last may truly be said to be entirely destroyed. Med. Ess. Edinb.

Dr. Buddeus endeavours to prove, that the preternatural *ossifications*, which are commonly said to be formed in different parts of the body, do not deserve that name; for that these hard substances have scarce any other properties of bone, except whiteness and hardness. *Misc.* Berol. Tom. 5. pars 2. §. 1.

OSSIFRAGUM, in botany, a name given by Bartholine, and some other writers, to a peculiar kind of grass, growing in some parts of Norway. It comes up early in the spring, before any other grass, and the cattle are tempted to eat it; but it emaciates them, and makes them sickly; their back bones become protuberant if they feed any time on it, and their legs so weak that they can hardly go. The remedy among

among the country people is a very odd one. They collect the bones of different animals, and break them into ſmall pieces. The cattle greedily devour this ſort of food when offered them in this diſeaſe, and there follows a ſort of driveling at the mouth for a conſiderable time, after which they become well. It is poſſible there may be much error in this ſtory. The kingdom of Norway is full of mines, and the effluvia of theſe may be the occaſion of the cattles illneſs, and the ceaſing of theſe effluvia their cure; for it is not probable that either of theſe effects ſhould be owing to the graſs or the bones. *Barthol.* Act. Med.

OSSIPAGINA, in botany, a name given by Arnobius and ſome other of the old Greek writers to the conſolida-major, or greater comfry. It had this name from its ſuppoſed quality of agglutinating broken bones on being taken internally. The Greek writers have ſometimes called this plant *pecte*.

OSTEOCOLLA, (*Cycl.*) a ſubſtance uſed in Germany in caſes of fractures, giving it inwardly to bring on a callous; but ſo inaccurately deſcribed by authors, ſeveral different ſpecies of the cruſtaceous ſpars having been deſcribed under its name, that it is not eaſy to aſcertain what it truly and regularly is. Dr. Hill, from the inſpection of what is now univerſally received in Germany as ſuch, which anſwers very well to the accounts given of the ſubſtance by thoſe who have firſt recommended it in medicine, has aſcertained the name to a peculiar ſpecies of cruſtaceous ſpar of the terrene kind, which he has deſcribed under the name of *cibdeloplacium craſſius, exalbo pallide fuſcum, durum, ſuperficie ſcabra*, or hard, pale brown, thick cruſtaceous ſpar, with a rough ſurface.

This is found in long, thick, and irregularly-cylindric pieces, which are uſually hollow, but are ſometimes filled up with a marley earth, and ſometimes contain within them the remains of a ſtick, round which the *oſteocolla* had been formed: but tho' it is plain from hence, that many pieces of *oſteocolla* have been formed by incruſtation round ſticks, yet the greater number are not ſo; but are irregularly tubular, and ſeem formed of a flat cake, rolled up into a cylindric ſhape. The cruſts of which theſe are compoſed do not form regular concentric circles round the internal cavity, as muſt have been the caſe had they been formed by incruſtation, but ſhewing plainly that they were once ſo many thin ſtrata, compoſing a flat ſurface, which has afterwards been rolled up as one might do a paper three or four times doubled, into two, three, or more ſpiral lines; in which caſe, each ſingle edge of the paper would be every where a regular part of a continued ſpiral line drawn from a given point; but they would by no means be ſo many detached concentric circles.

The *oſteocolla* is found of various ſizes, from that of a crow-quill to the thickneſs of a man's arm. It is compoſed of ſpar and earth, and is found, both in digging and in ſeveral brooks, in many parts of Germany and elſewhere. *Hill's* Hiſt. of Foſſ. p. 359.

Oſteocolla is called *hammoſteus* in many parts of Germany. It has this name in theſe places from the obſervation of its always growing in ſand, never in clay, or any ſolid ſoil, nor even in gravel. Where a piece of it any where appears on the ſurface, they dig down for it and find the branches run ten or twelve feet deep. They uſually run ſtreight down, but ſometimes they are found ſpreading into many parts near the ſurface, as if it were a ſubterraneous tree, whoſe main ſtem began at twelve foot depth, and thence grew up in a branched manner, till met by the open air. The main trunk is uſually of the thickneſs of a man's leg, and the branches that grow out from it are thickeſt near the trunk, and thinner as they ſeparate from it. The thinneſt are about the ſize of a man's finger. The people employed to collect this *oſteocolla* when they cannot find any mark of it on the ſurface, ſearch after the ſpecks of white, or little lumps of whitiſh ſoft matter, which they find lying in different parts on the top of the ſand. Theſe always lead them either to a bed of perfect *oſteocolla*, or to ſome in the formation. If they miſs of the ſubſtance which they ſeek after, they ſtill find a ſubſtance like rotten wood; which, when traced in its courſe, is found to proceed from a main trunk, at the depth of that of the *oſteocolla*, and to ſpread itſelf into branches in the ſame manner. The diggers call this ſubſtance the flower of *oſteocolla*, or *hammoſteus*.

The *oſteocolla* found in the earth is at firſt ſoft and ductile, but in half an hour's time, if expoſed to the air, it becomes as hard as we find it in the ſhops. The method to take up a perfect piece for a ſpecimen, is to open the ground, clear away the ſand, and leave it ſo for an hour or thereabouts: in this time it will harden, and may be taken out whole. It is certain, that the *oſteocolla* is produced at this time; for, if a pit be cleared of it, there will more grow there in a year or two, but with this difference, that it will be ſofter and will not harden ſo eaſily in the air as the other. What the rotten ſubſtance reſembling the decayed branches of trees is, it is not eaſy to ſay, unleſs it really be ſuch: but the opinion of the common people, that it is the root of ſomething, is abſurd; becauſe its thickeſt part always lies at the greateſt depth, and the branches all run upwards. The *oſteocolla* is a marley ſpar, which concretes round this matter; but what it is that determines it to concrete no where in the ſame ground but about theſe branches, is not eaſy to ſay. The rottenneſs of this ſubſtance which forms the baſis of the *oſteocolla*, renders it very liable to moulder and fall away; and hence it is that we uſually ſee the *oſteocolla* hollow. Sometimes it is found ſolid, but in this caſe there will be found to have been a vegetable matter ſerving as its baſis, and inſtead of one branch, it will be found in this caſe to have concreted about a number of fibres, the remains of which will be found in it on a cloſe examination. *Phil.* Tranſ. N. 39.

OSTEOCOLLA-*flower*. See the article FLOWER.

OSTEOCOLLA-*roots*. See the article ROOT.

OSTEOCOLLON, in botany, a name given by ſome authors to the great comfry. *Ger.* Emec. Ind. 2.

This name was given by ſome of the old writers to the ſymphytum, or comfry, from an opinion that its agglutinating quality reached to the bone, and that it was of great ſervice taken internally in caſes of fractures.

OSTEOGONY. See the article OSSIFICATION.

OSTEOLOGY (*Cycl.*)—There are properly two kinds of *oſteology*, one of which is to be learned from bones dried and prepared by boiling, and the other from the bones of a dead ſubject, as they are naturally connected with each other. Both theſe methods are very neceſſary for the practice of phyſic, and for the exact knowledge of the human body. By examining dry bones, however, we can only learn their exterior forms, their ſituation, and the connection which they may have with one another; but when we conſider them as joined together in a dead body, we are in a condition to obſerve many other things in regard to them, very uſeful in phyſic: becauſe their connections with one another by cartilages and ligaments, and by the diverſity of articulation, are ſometimes very different in the dry from what we ſee them in the freſh bones; there are, for inſtance, in dry bones, certain cavities which appear to be cotyloide, becauſe they are diveſted of their cartilages; but in freſh bones, they are found to be glenoide, their cavities being filled with cartilages. And, on the other hand, ſome cavities appear to be glenoide in the ſkeleton, which are cotyloide in the body, their cavities being augmented by cartilaginous ſupercilia.

The exterior form and qualities of bones are much better demonſtrated alſo from freſh ſubjects, than from prepared bones; becauſe they looſe a great many things in boiling, ſuch as the cartilaginous bodies, the perioſteum, the mucilaginous ſubſtance found between them, and the marrow contained in their cavities; all which may be ſhewn in a freſh body, but cannot be ſeen in a ſkeleton. *Riolan.* Encheiridion Anatomicum.

OSTINATO, or *Contrapunto* OSTINATO, in the Italian muſic, is much the ſame with *Perfidia*. See PERFIDIA, *Cycl.*

OSTRACION, in the Linnæan ſyſtem of zoology, the name of a large genus of fiſhes of the general order of the branchioſtegi. The characters which diſtinguiſh the fiſh of this genus, are, that they have no belly-fins, and their ſkin is always hard and often prickly. Of this genus, beſides the *oſtracion*, commonly ſingly ſo called, are the orbis, hyſtrix, atinga, &c. *Linnæus's* Syſtem. Naturæ, p. 52.

The characters of the *oſtracion*, according to Artedi, are theſe: there is no branchioſtegi membrane; the figure of the body is particular, being globoſe, or ſpherical, or roundiſh, oval or oblong and ſquare, or finally conic; the ſkin is very hard, and uſually beſet with rigid and hard ſpikes, either on the whole body or on ſome part of it, but in ſome ſpecies it is wholly ſmooth; there are no belly-fins; the number of the others is five, there are two pectoral or lateral fins, two others are on the back, the other at the anus and the tail; the mouth is ſmall; the teeth are large; and the eyes are covered with the common ſkin of the head; there are on each ſide two foramina for the noſtrils, near the eyes; the lips may be drawn back, but in their natural ſtate they cover the greater part of the teeth. *Artedi*, Gen. Piſc. 39.

The ſpecies of this genus are theſe. 1. The oblong ſquare *oſtracion*, with four large tubercles on the back: this is the piſcis quadrangularis maximus of Ray. 2. The oblong ſquare *oſtracion*, with a gibbous back: this is covered all over the body with beautiful hexagonal figures. 3. The oblong ſquare *oſtracion*, with a ſharp ſnout, and with ſeveral ſpots on the back and head; there is a ſpecimen of this in the cabinet of Sir Hans Sloane. 4. The ſquare *oſtracion*, variegated with a great number of ſpots: the ſpots of this are rounded, and are of various colours. 5. The triangular *oſtracion*, with two ſpines on the head, and two more on the lower part of the belly: this is covered with hexangular and other radiated bodies inſtead of ſcales. 6. The triangular *oſtracion*, with two ſpines near the head, and one long one on the upper part of the body near the tail: this is very beautifully ſpotted. 7. The triangular *oſtracion*, with two ſpines in the lower part of the belly, and covered with hexagonal bodies, with prominent edges: this is the piſcis triangularis of Cluſius and other authors. 8. The triangular *oſtracion*, ſpotted all over and covered in many places with tubercles, having two ſpines in the lower part of the belly: the ſpots of this fiſh are of various colours, and they are larger than the tubercles. 9. The triangular *oſtracion*, with hexagonal and radiated tubercles, and

with two ſpines in the lower part of the belly. This is ſmaller than moſt of the others. 10 The triangular *oſtracion*, covered with innumerable ſmall tubercles, and having no ſpines.

The ſpecies hitherto enumerated, have all a conſiderable number of teeth, the following ſpecies have only four: 1. The round *oſtracion*, with four teeth, covered every where with ſmall ſpines. This is the orbis of ſome authors. 2. The ſpotted *oſtracion*, covered all over with ſmall and very thick-ſet ſpines. This is the orbis aſper of authors. 3. The oblong and compreſſed *oſtracion*, with a roundiſh belly, and with ſpines only on that part. This is the orbis lagocephalus of Grew. The following ſpecies of *oſtracion* have no teeth at all, but have bony jaws: 1. The ſphæric *oſtracion*, covered all over with thick-ſet three cornered ſpines. This is the atinga orbicularis of authors; and is about the ſize of a gooſe's egg. 2. The roundiſh *oſtracion*, covered every where with flat and ſhort ſpines, but with the belly ſmooth. This is the orbis ſpinoſus of Cluſius. 3. The roundiſh *oſtracion*, covered with ſhort three-cornered ſpines, ſet at diſtances from each other. This is the orbis reticulatus of Liſter. 4. The oblong roundiſh *oſtracion*, with tubercles on each ſide, and with a very long back fin. 5. The roundiſh *oſtracion*, with numerous thick-ſet ſpines of a three-cornered figure at the baſe. 6. The conic oblong *oſtracion*, with long cylindric ſpines on all parts of the body, but principally on the ſides. This is the hiſtrix piſcis, or porcupine fiſh of authors. 7. The oblong *oſtracion*, with long and cylindric ſpines covering all parts of it, but principally the head and neck. 8. The oblong ſmooth *oſtracion*, with a long head, and with a body adorned with various figures. This is the orbis teſtudinis capite of Ray. 9. The compreſſed roundiſh rough *oſtracion*, with horizontal pectoral fins, and with four foramina in the head. This is the fiſh called by authors the *mola*, or *ſun-fiſh*. *Artedi*, Gen. Piſc. p. 39.

Willughby uſes the word *oſtracion* for a fiſh caught ſometimes in the river Nile. It is very thick in proportion to its length, and of a ſomewhat pentangular form. It is uſually of about a foot long, and is covered with a ſhelly coat or skin, not leſs ſtrong and hard than many of the ſhell-fiſh kind. It has a ſtrait, not forked tail, two fins a little above it, and two more higher up the body. Its eyes are white; its mouth ſmall; and it is all over of a pale whitiſh hue. *Willughby*'s Hiſt. Piſc. p. 148.

OSTRACITES, (*Cycl.*) in natural hiſtory, a name given by authors to the foſſile *oiſters*, common in many parts of England. Theſe are of various ſhapes and kinds; and the name is by ſome authors made to ſignify, the ſhell itſelf, when preſerved in its native ſtate and condition; as is the caſe with thoſe found about Woolwich and Blackheath; and by others, the ſtones caſt or formed in thoſe ſhells, or in cavities from whence they have been waſhed away and diſſolved: in both theſe caſes, the ſtone carries the exact reſemblance of the ſhell, even in its niceſt lineaments; in the firſt caſe, carrying every mark of the inſide; in the other, of the outer ſurface. *Hill*'s Hiſt. of Foſſ.

We have this ſtone in great plenty in many parts of England; and it is very famous, in ſome places, for its virtues in caſes of the gravel, and the like complaints, as mentioned in the *Cyclopædia*. See Tab. of Foſſils, Claſs 9.

This virtue of a foſſile, not generally known, may make it neceſſary to add ſuch an account of it, that it may not be miſtaken by thoſe who are willing to try it. It is the *oſtracites maximus rugoſus aſper*, the greateſt rough and uneven *oſtracites*, excellently deſcribed by Liſter. It burns to lime as the ſpars and ſelenitæ do, and yields no volatile ſalt on a chemical analyſis. The common oiſter ſhells freſh taken and uſed, do not afford more than half a ſcruple of a liquor moderately urinous, from a quarter of a pound of the ſhells; and probably, on being long expoſed to the weather, they would looſe even that, and yield no more, on trial, than the *oſtracites*.

Theſe foſſile oiſter-ſhells are more beaked at the part where the hinge is, than the common oiſter; and in their ſpecific gravity, they are heavier than freſh oiſter ſhells, and approach to the nature of the ſelenites.

It is to be obſerved, that all the foſſile ſhells, and particularly the *lapides judaici*, or Jew's ſtones, which have been the ſpines of ſea echini, have been eſteemed diuretics, and good in the ſtone and gravel. Among the antients, Dioſcorides, Pliny, and all the reſt recommend them highly. Phil. Tranſ. N° 251.

OSTRACODERMATA, a term uſed by Ariſtotle, to expreſs that claſs of ſhells which we call *teſtaceous*, in oppoſition to the cruſtaceous animals, or malacoſtraca. The definition Ariſtotle gives of this claſs of animals is, that they are ſoft within, but hard without; that their ſhells may be bruiſed or broken; but their parts cannot be torn from one another, as they can in the cruſtaceous kind, ſuch as the lobſter; whoſe ſhells covering the legs, body, tail, &c. being ſo many diſtinct pieces of ſhell, and only joined by membranes, may be torn aſunder by pulling till thoſe membranes give way. The echini marini, or ſea urchins, have been generally allowed to be teſtaceous animals; and even Ariſtotle himſelf, the author of the diſtinctions, as well as later writers, have arranged them in this manner; but it is plainly erroneous; for they have all the characters of the cruſtaceous kinds, when ſtrictly examined; and their ſhells are, as in the lobſter, made up of ſeveral pieces connected by membranes, and diviſible one from another, by tearing or pulling without breaking; and every one of the ſpines is a ſort of leg, moveable every way upon its ſocket, and joined in the ſame manner only by a membrane: Geſner ranks them among the teſtaceous fiſhes, tho' he acknowledges that Rondeletius, whom he uſually follows, claſſes them among the cruſtaceous kinds; reckoning them after lobſters and crabs. Pliny alſo is of this opinion, and differs in it from moſt others of the antients: yet the place of theſe fiſhes has ſcarce yet been aſcertained. A ſhell is properly enough the name of the covering of theſe, as well as of the other, or teſtaceous fiſhes; and in the teſtaceous kinds, may be defined to be a hard ſubſtance, covering an entire animal, or at leaſt one whole ſide of one without joints or ligatures: and, on the other hand, a cruſt may be defined to be ſuch a hard ſubſtance as covers only one particular joint of the encloſed animal; ſo that in the whole cruſtaceous fiſh, there are as many ſhells, if we may be allowed to uſe that word in the general ſenſe, on every animal, as there are joints in that animal. The ſcalops, oyſters, wilks, &c. give us familiar inſtances of the firſt kind or ſhells, properly ſo called; and the crabs and lobſters, of the latter kind or cruſts. The firſt, therefore, are properly teſtaceous animals; and the latter cruſtaceous: and in this caſe, whoever examines the ſea echini in their exact and perfect ſtate, will find that they evidently belong to the cruſtaceous, not to the teſtaceous claſs.

The echini, lobſters, &c. may be called *multi teſtaceous*, or many-ſhelled; and the others *ſimply teſtaceous*, *biteſtaceous*, and by other terms, expreſſing the characters of thoſe few genera which have more ſhells than two: and as in the ſcaly fiſhes, every ſeparate ſcale has its ſeparate muſcle, to which it is anſwered by a particular tendon; ſo all the cruſtaceous animals have particular muſcles, which are ſeparately inſerted one into every cruſt; and all theſe cruſts are alſo connected to each other by common membranes, which are in a particular manner neceſſary, as they do not lie one upon another as the ſcales of fiſhes do, and by that means ſecure and ſtrengthen each other. Phil. Tranſ. N° 219. p. 199.

OSTREA, the *oiſter*, in natural hiſtory, the name of a very large genus of ſhells, the characters of which are theſe: It is a bivalve ſhell, of a coarſe external ſtructure, and dirty appearance; each ſhell being compoſed of a great number of laminæ not nicely cloſed down upon one another. It is in ſome ſpecies ſmooth, in others ſtriated, tuberous, or prickly; uſually flat, but ſometimes globoſe, plicated, and wrinkled into ſinuſes. The lower ſhell being always deeper than the other. Aldrovand ſuppoſes this genus of ſhell fiſh obtained the name *oſtreum*, from the Greek ὀστέον, a bone, as they are of a bony hardneſs. See Tab. of Shells, N° 17.

Moſt authors have confounded the two genera of *oiſters* and chamæ together, tho' there is an obvious and invariable diſtinction. The *oiſter* is rough, and has a ſort of beak; and notwithſtanding the roughneſs of both ſhells, it always ſhuts very evenly and firmly: add to this, that one of its ſhells is flat, the other convex; and is thus abſolutely diſtinguiſhed from the chamæ. Hiſt. Nat. Eclair. p. 313.

Oiſters in their growth become faſtened to every ſolid ſubſtance which they happen to come into contact with; and rocks, ſmall ſtones, wood, ſea-plants, and a thouſand other things are found at times with *oiſters* adhering to them, whoſe ſhells have fitted themſelves to the form of the thing itſelf, and left their natural ſhape. The people who fiſh for, and trade in *oiſters*, pretend to diſtinguiſh two kinds; one which is fecund and will breed; the other which is barren. They ſay, they diſtinguiſh theſe by a little black fringe, which always ſurrounds the good breeding *oiſters*.

The way to make *oiſters* green is, to put them into ſmall pits where the water is about three foot deep, and where the ſun has great power; in theſe they become green in three or four days.

The ſpecies of *oiſters* being very numerous, they may be better underſtood by being arranged under ſome general heads.

I. Some *oiſters* are plane and ſmooth.

Of theſe we have the following ſpecies: 1. The common *oiſter*. 2. The naturally green *oiſter*. 3. The oriental *oiſter*. 4. The pearl *oiſter*, or berberis; this is by many authors deſcribed as a peculiar genus, under the name of *concha margaritifera*; but it is a true ſpecies of *oiſter*. 5. The green-onion-rind *oiſter*. 6. The roſe-coloured-onion *oiſter*. 7. The yellow-onion *oiſter*. 8. The amber-coloured-onion *oiſter*. 9. The ſtriated-onion *oiſter*. 10. The ſaddle *oiſter*. 11. The violet-coloured ſaddle *oiſter*. 12. The pintado *oiſter*, whoſe ſpots reſemble thoſe of the pintado, or guinea hen. 13. The pond *oiſter*. 14. The red-ſtriated japan *oiſter*. 15. The ſwallow *oiſter*.

II. Some *oiſters* are ſmooth, yet foliated on the ſurface.

Of theſe we have, 1. The malleum, or brachiated *oiſter*; called *the mallet-headed oiſter*. 2. The ſmall plicated *oiſter*, called *the cocks comb*, or *the hog's ear oiſter*. 3. The hedge-

hog *oyſter*: this has its ſhells round, with tubular ſpines. 4. The leaf *oyſter*. 5. The tortuous *oiſter*, called by many the leg *oiſter*. 6. The thigh *oiſter*.

III. Some *oiſters* are of a globoſe form, and carry ſpines on their ſhells.

Of theſe we have the following ſpecies: 1. The round-ſpined *oiſter*. 2. The *oiſter* with flat ſpines. 3. The fire-coloured *oiſter*, with large ears. 4. The white-pointed rock *oiſter*: this is uſually found adhering to ſtones. 5. The bridge *oiſter*: this alſo is uſually found affixed to ſtones or pebbles, in ſuch a manner as to repreſent a bridge; the ſeveral ſmall ſtones its ſhell ſpreads over making the piers. 6. The furr and roſe-coloured *oiſter*, with flat white ſpines. 7. The coral *oiſter*. 8. The medal *oiſter*, ſo called from the place near Bourdeaux, where it is found. 9. The *oiſter* with red and blue ſpines. 10. The cluſter *oiſter*, with variegated ſhells.

IV. Some *oiſters* are of a globoſe figure, and jagged with high raiſed laminæ.

Of theſe we have the following ſpecies: 1. The great foliated *oiſter* of Rumphius, called by ſome the Placenta foliacea. 2. The ſtriated orange *oiſter*, from the Baltic. 3. The ſquammoſe or ſcaly *oiſter*, called Scandebec by Rondeletius. 4. The ſquammoſe *oiſter*, with tubular ſpines. 5. The yellow ſquammoſe foliaceous *oiſter*: this ſpecies is often found adhering to the ſeveral kinds of coral, and is not unfrequently itſelf covered with balani or center ſhells.

V. Some *oiſters* are oblong and umbonated.

Of theſe we have the following ſpecies: 1. The ſmooth ſpondylus or aſs-foot *oiſter*. 2. The rugoſe but not ſpinous *oiſter*. 3. The white-plated *oiſter*, with a digitated edge covered with roſe-coloured ſpines. 3. The yellow-plated *oiſter*, variegated with red and white. 5. The gaidaron *oiſter* of Rondeletius. See OYSTER.

OSTRICH, *ſtruthio*, in zoology. See STRUTHIO.

OSTRUCIUM, a name given by the Latin writers of late ages to the plant called ſmyrnium and oluſatrum. Macer calls this plant caulis ſylveſtris, and has given to it the virtues attributed by the antients to the ſtruthion, ſuppoſing theſe to be the two names of the ſame plant; but this is evinced to be an error by the writings of all the antient Greeks. Theophraſtus in particular ſays, that the ſtruthion is a prickle or thorny plant. This alone is ſufficient to prove it can have no relation to the *oſtrucium* of the later authors, or Alexanders, which is a ſmooth unbelliferous plant.

This inaccuracy of the writers who collect their accounts from the ancients, is ſometimes of bad conſequence; ſince thoſe who are unable to have recourſe to the original authors, are miſled ſo far as to ſuppoſe the virtues of one plant may be found in another. See the article SMYRNIUM.

OSYRIS, in botany, the name given by Linnæus to a genus of plants, including the caſia of Tournefort, and other authors. The characters are theſe: it produces both male and female flowers. In the male flowers the perianthium is one leaved and hollow, and is divided into three ſegments, which are all of the ſame ſize, and of an acute oval figure. There are no petals, and the ſtamina are three ſhort filaments. The antheræ are ſimple. In the female flowers the cup is of the ſame figure as in the male, but is very ſmall and ſtands upon the germen of the piſtill, and remains on it a long time. There are no petals. The germen of the piſtill is roundiſh, the ſtyle is very flat, and the ſtigma roundiſh. The fruit is a round berry, having one cell, in which is contained a ſingle bony ſeed. *Linnæi* Gen. Plant. p. 472. *Tourn.* 448.

OSYRIS is alſo uſed by ſome authors for the linaria or toad-flax. *Ger.* Emac. Ind. 2.

OTAPULLI, in botany, a name given by ſome authors to the tree which produces the *gamboge*, or *gutta gamba* of the ſhops. Hort. Malab. Vol. I. p. 41.

OTENCHYTES, a name given by ſome authors to a ſyringe made for injecting into the ears

OTHOMAN. See the article OTTOMAN.

OTHONE, οθων & οθονιον, among the antients, a kind of linnen garment worn by women. *Pitiſc.* in voc.

OTHONI, a word uſed by chemical writers for what they otherwiſe call the *mercury of the philoſophers*, or *philoſophic ops*.

OTHONNA, the name given by ſome authors to a ſtone found in Ægypt, and deſcribed to be always in ſmall pieces, and of the colour of poliſhed braſs: probably it is ſome ſpecies of the *pyrites*.

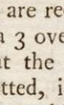
OTHONNA, in botany, a name given by ſome authors to the *african marygold*. *Ger.* Emac. Ind. 2.

OTIS, in zoology, the name of a large bird, called in Engliſh the *buſtard*. The *otis* is called *tarda* and *otardes* by ſeveral authors. See Tab. of Birds, N° 28.

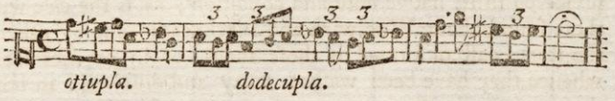
In the Linnæan ſyſtem of zoology, the *otis* makes a diſtinct genus of birds of the order of the Gallinæ; the diſtinguiſhing characters of which are, that the feet have only three toes each, and thoſe all placed before, and the head is not adorned with a creſt or any other ornament. *Linnæi* Syſtem. Nat. p. 47.

It is of the ſize of the common turkey, its beak is like that of the common gallinaceous fowls; its head and neck are grey; its belly white, and its back variegated with tranſverſe ſtreaks of red and black; it has no hinder toe, by which, and by its ſize, it is eaſily diſtinguiſhed from all the reſt of the gallinaceous kind. It feeds on herbs, and eats very greedily the leaves of dandelion, and particularly on the ſeeds of hemlock, which ſeems a very ſtrange food It is frequent in many parts of England, where there are large heaths and plains: they are very bad fliers, and very difficultly raiſe themſelves up from the ground; but they are extremely ſhy, and if they ſee a man at a very great diſtance, they immediately eſcape as faſt as they can. Their fleſh is eſteemed. *Ray*'s orinthology, p. 129.

OTITES-*digitus*, the *ear-finger*, a name given by authors to the finger next the little one.



OTOMO, in zoology, the name of a bird of the lagopus kind, called alſo *colmeſtre*, and by the Germans, *ſteinhun*, that is, *ſtonehen*. It is of the bigneſs of a tame pigeon; its belly and wings are white, with only a very few browniſh feathers; its head, neck, and breaſt are variegated with brown feathers, and the upper part of the neck with black and white; its beak is very ſhort and black, and it has fine red granulated membranes over its eyes; its tail is principally black, but is variegated with brown and white; and its legs and feet are feathered to the ends of the toes. *Geſner* de Avibus.



Mr. Ray is of opinion, that this is the ſame ſpecies of bird, with the common white *lagopus*, it being no way different but in colour, and thoſe birds being ſaid to change colour in the ſummer months. It is caught on the mountains of Germany, and is a very delicate bird for the table.

OTTER, in zoology. See the article LUTRA.

OTTERPIKE, in zoology, the name of a large ſpecies of the *draco-marinus*, or *ſea-dragon*, called in Engliſh the *weaver*: it is not greatly larger than the *weaver*, but is of a great variety of beautiful colours; and inſtead of the yellow ſide-lines which that fiſh has, this has rows of large black ſpots. *Willughby*'s Hiſt. Piſc. p. 288.

OTTOMAN, or OTHOMAN, an appellation given to the empire of the Turks, or rather to their emperors, from *Othomannus*, or *Oſmanhus*, the firſt prince of the preſent family. See *Hoffm.* Lex. in voc.

OTTUPLA, in the Italian muſic, ſignifies *octuple*, or the meaſure of four times; it is marked with a ſemi-circle, C; and ſometimes thus:  when it is to be played very quick. In this time, eight quavers are contained in a bar. But it often happens, that ſuddenly, inſtead of two quavers for every time of the bar, three are required; this is called *dodecupla*. 'Tis enough to place a 3 over three quavers, or notes of equal value, to ſhew that the meaſure muſt be changed; and when this three is omitted, it ſufficiently demonſtrates the meaſure to be *ottupla* again: this makes what is called by the Italians *ottupla è dodecupla*, thus:

ottupla. *dodecupla.*

Corelli, in the laſt movement of his tenth ſonata, opera terza, very often uſes an 8 after the *dodecupla*, to ſhew, that the triple there is changed to common time.

OTUS, in zoology, the name of the common *horn-owl* of the ſmaller kind, in many reſpects different from the great *horn-owl* or *eagle-owl*. It is a moderately large bird; its beak is black, and its face ſurrounded with a double circle of feathers, the outer of which is variegated with fine black, white and brown lines, and the place where both circles join is all the way black; its belly and the feathers on its legs are brown; its throat and breaſt are covered with feathers black in the middle, with white and brown edges; its long wing feathers are ſpotted with black; its horns, or feathers that riſe up from its ears, are black in the middle and variegated with brown and white at their edges; and its tail is grey above and yellow underneath, and is variegated with ſeveral tranſverſe black ſtreaks; its feet are hairy down to the toes. It is common in Italy, and is ſometimes caught in ſome parts of England, and generally fixes its abode in mountainous places. *Ray*'s Ornithol. p. 64.

OVA (*Cycl.*)—The ingenious Dr. Kerkring was the firſt who advanced the generation of all animals to be from *ova*, and that even man himſelf was produced out of an egg. The ſyſtem occaſioned great raillery at the time, and the author found himſelf under a neceſſity of publiſhing all his obſervations by way of juſtification. The *eggs* which he found in the teſticles of all females countenanced his opinion, and he gave figures of the parts in their natural ſituation, and of the eggs which he found in women from the age of eighteen to more than forty, in his different diſſections. Among the other creatures he examined, he found many ſmall eggs in the teſticles of cows, and other creatures of the viviparous kind. He gives an account of one *egg* which he had an opportunity of opening about four days after it had fallen into the matrix of a woman, and in this he could perceive the marks of the little embryo, the head of which was diſtinctly to be ſeen from the body. Another *egg*, which he had an opportunity of opening at about a fortnight after conception, afforded him a ſight of a little ſecundine. The membrane chorion divided in four places, and the amnion divided in the ſame manner the navel ſtring, by which the child was faſtened to the ſecundine;

cundine; and in the child itſelf, the face at this time began to be formed, and the features were diſtinguiſhable, and the principal parts of the body eaſily traced. At longer periods from the time of impregnation, the features and lineaments of all the parts appear more and more ſtrong; and the author has given accurate deſcriptions of the progreſs of the fœtus toward perfection, and figures of it at three, four, five, and ſix weeks after conception, at which laſt time all is very fair and plain.

The *ova* in which theſe lineaments of the fœtus are found after conception, are themſelves formed without ſuch lineaments, not only in married women, but in maids who have had no commerce with men at all; and it is the ſame in creatures naturally oviparous. The pullet will even lay her eggs without any intercourſe with the cock, but then they will have none of the lineaments of the young fowl, which are found in the eggs laid after treading, and enlarging every day after the beginning of the incubation.

The eggs found in the teſticles of unmarried women are generally of the ſize of a pea, round, and containing a glutinous liquor, which will harden, on boiling, in the ſame manner as the yolk and white of a common egg. The taſte is rather unpleaſant than inſipid, and they are inveloped in two ſkins, which after they are fallen into the womb become two membranes, called the amnion and chorion, which enlarge as the contents enlarge.

Fallopius obſerved theſe eggs in women before the time of Kerkring, but it was this author who carried on the conjectures of the other into a ſort of certainty, and added proofs to what he had firſt hinted from a number of experiments; and Wharton, in his account of human generation, is of opinion, that the ſemen penetrates into the teſtes of the female by means of the Fallopian tubes; in which caſe, the impregnation is in this inſtance performed exactly as in others of the oviparous creatures, and the whole difference amounts to no more than this, that in ſome the impregnated matter loſes its figure of the *egg* before it is excluded the parent; but in others, it retains it till it is not only put forth out of the body, but hatched by its genial heat afterwards.

The egg being impregnated by the ſemen admitted this way, deſcends into the womb, and there becomes, in a few days, of the biggneſs of a cherry; and afterwards increaſes, as we have already obſerved. This author having an opportunity of opening the body of a woman who had died ſuddenly about four days after the end of one of the menſtrual diſcharges, found in the womb an egg, of the biggneſs of a black cherry: he aſked the husband carefully, whether he had lain with his wife ſince the time of the menſes; and was informed that he had. This egg was evidently the produce of that impregnation; and tho', at the utmoſt, it could be no more than four days old, the fœtus was plainly diſtinguiſhable in it, on an accurate inſpection; and the head in ſome ſort found: the reſt of the body ſeemed an unformed maſs of fleſh. In ſuch another caſe, where there was reaſon to believe the embryo about fifteen days old, the eyes, noſe, ears, and mouth, were eaſily diſtinguiſhable in the head; and the body was ſo far faſhioned, as to be eaſily known by its ſhape, and the rudiments of legs and arms appeared very plainly from it. The bones, as they are afterwards to become, are at theſe young periods mere griſtles, and harden by degrees afterwards; but they ſoon acquire that degree of firmneſs, that the fleſh may be taken off and they preſerved as ſkeletons.

At about three weeks from the time of the conception, the fœtus has its cartilages for bones ſo perfect and ſo firm, that with due care in the management of ſo tender an object, the fleſh may be ſeparated, and a ſkeleton preſerved of this ſmall ſize. The head is very large at this period, in proportion to the body; but what is afterwards to become the ſkull, is only a membrane inflated with wind. The arms and hands are ſeen diſtinctly, and even all the fingers are formed. The number of the ribs may be eaſily counted, and the toes are as diſtinct as the fingers; but they are all ſo minute and tender, that a very nice hand, and very great art are neceſſary for the diſplaying them. After another week, that is, when the fœtus is a month old, the bones are ſo well formed, that the whole figure preſerves its form, and is able to ſupport itſelf. The jaw bones appear; the clavicles are formed; and all the ribs are very fair and diſtinct, except the firſt and laſt; and theſe two, even after another month, do not acquire the conſiſtence of bones. At this period of one month, the joints of the arms, and thoſe of the legs, are all very diſtinctly ſeen.

On examining a fœtus at two weeks beyond this period, that is, at ſix weeks from the time of conception, the inferior jaw bone has in it ſomewhat very remarkable; for it is plainly ſeen to be compoſed of ſix little bones; whereas, in the younger periods this is not obſervable; and when the child is born they are all joined together, and make but one bone.

Theſe are the proportions of growth in fœtus's, which have continued regularly growing to the time of the death of the parent, and have been taken out by diſſection afterwards: much leſs is to be judged from abortions, where the regular proceſs of nature in the growth and formation of the fœtus is perverted, and the child has, perhaps, been dead ſome months before it is excluded, or has been ſickly, and therefore not capable of taking nouriſhment, and growing as it ſhould have done. For theſe reaſons it not unfrequently happens, that an abortive fœtus of four months is not larger than one of theſe regular fœtus's of ſix or eight weeks; nor the parts any thing more advanced in their ſtate and ſolidity, or if at all, but very imperfectly and irregularly.

Mr. Dennys has added ſome obſervations on this ſyſtem of Kerkring; he agrees that theſe eggs, in which the rudiments of the fœtus are firſt to be diſcerned, are generated in the teſticles of the female, and made to deſcend thence by the ſpiritous effect of the male-ſemen, making its way thither thro' the tubes; and adds, that they are of very different forms and ſizes in different women The ſame woman often has, in her teſticles, eggs of very different ſizes; and as to the proportion in ſize, between different animals, no regard ſeems paid in it to their bulk, ſince not only thoſe of a cow, are much ſmaller than thoſe of a woman, but thoſe of a duck, or a hen, are vaſtly larger than either. The firſt beginnings of things do not always bear a proportion to their ſtate and increaſe, in the animal or vegetable world: beans are a much larger ſeed than that of the apple or pear, tho' the latter raiſes a large tree, while the former only furniſhes a ſmall plant. The reaſon why the eggs of fowls are proportionably larger than thoſe of the human ſpecies, or of quadrupeds, is, that they are to contain not only the young animal, but alſo the food for it to live on in the firſt part of its life. *Dennys*, in *Kerkring*, de Ovo.

Monſieur Gaulois obſerves, that the veſicles or eggs, in all ſorts of females, are to be obſerved in three ſorts of ſtate or condition: Firſt, while they are faſtened to the place where nature has lodged them, as in a repoſitory. Secondly, when they are looſened from the place. And Thirdly, when they incloſe the embryo

In the firſt of theſe ſtates, they are common to all females in the animal world; and authors of long ſtanding have obſerved, that there were in all the female animals, veſicles faſtened to certain parts of their bodies It is alſo certain, that after conception, that which incloſes the fœtus is very like an egg; but this is no new doctrine neither, for even Hippocrates and Ariſtotle have advanced it: Harvey alſo, of later times, has treated very much at large on this ſubject. The whole matter, in the doctrine of Kerkring that is new, and that deſerves a further enquiry is, whether theſe veſicles, which were always known to be faſtened to the bodies of females, are at all looſened from them; and whether that kind of egg, wherein the embryo is found, be, or be not one of theſe veſicles looſened?

The ſyſtem of Kerkring is founded on the anſwering this queſtion in the affirmative; but thoſe who are of the contrary opinion, who are not a few, think, that the bladder reſembling an egg, in which the fœtus is formed, comes not from elſewhere, but is formed in the place of the conception; and Harvey pretends to explain in what manner it is formed there; and they all agree, that the veſicles, called eggs in females, are ſo faſtened that they never can be removed; and even if they were, that there is no paſſage large enough for them to deſcend by from the place of their formation into the womb. Some pretend alſo, that if theſe are eggs then men have eggs alſo; for that the veſicles found in cluſters at the ſides of the *vaſa deferentia*, which anatomiſts from their figure compare to a cluſter of grapes, are truly and exactly of the ſame kind with thoſe veſicles called eggs in females. See EGGS.

OVA, among the antients, a kind of verſes, wherein the verſes were reduced to the form of an egg. *Hofm.* in voc.

OVAL-*leaf*, among botaniſts. See LEAF.

Foramen OVALE. See FORAMEN *Ovale*.

OVARY, *ovarium* (*Cycl.*)—OVARIUM of fiſhes. All fiſh have *ovaria*, but they, as well as the eggs they contain, differ greatly in the different kinds, in number, ſituation, figure, and ſtructure. In the cetaceous, the cartilaginous, and moſt of the other kinds of fiſh, the *ovarium* is double, or there are two *ovaria*; but in ſome fiſh, as in the *oſmarus*, the *perea fluviatilis* of Bellonius, and perhaps in ſome others it is ſingle. As to its ſituation, it generally occupies the whole length of the abdomen, as in moſt of the ſpinoſe fiſhes; and in the petromyzum and accipenſer. In many of the cartilaginous fiſhes it occupies only the upper part of the abdomen; and finally, in the cetaceous fiſhes it is placed at the corner of the uterus. As to its figure, it is generally oblong and compreſſed, as is ſeen in moſt of the ſpinoſe kinds: in thoſe fiſh which have it ſingle, it is oblong and cylindric, and in the cetaceous fiſhes it is round.

The eggs themſelves are alſo very different in number and ſtructure. In regard to number, they are in ſome fiſhes very few, as in the cetaceous kinds. In the cartilaginous kinds they are ſomewhat more numerous, amounting to fifty or a hundred; and in other kinds of fiſh they are ſo numerous, as to be beyond account.

In regard to their ſize and ſtructure, they alſo differ conſiderably: in ſome fiſh they are large, and reſemble a hen's egg in their contents; having a white, and yolk, and cica-

tricula, all distinct in them, as in the cartilaginous fishes of many kinds. In others, as in the cetaceous kinds, they are very small and simple, and have no distinct appearance either of white, yolk, or of the cicatricula. Hence it is evident, that the fœtus of cetaceous fishes, while included in the egg, receives its nourishment from the womb itself; but in the others, as the cartilaginous, and other fish, the white of the egg serves as nourishment to the fœtus while it remains in it. Finally, in the generality of other fishes, the eggs are very small, and probably do contain a white, and yolk, tho' their size makes it not easy to see their parts distinctly. All the spinose fishes have these small sorts of eggs, and among the cartilaginous ones, the accipenser and petromyzum. It has been supposed by some, that the eggs of these fishes were simple bodies, and only answered to what Harvey, and other authors on these subjects call the *cicatricula*; but this cannot be the case, for if so, the young fish must perish; for the semen of the male fish is only scattered over the eggs while they lie in the water, and serves only to the rendring them prolific. The figures of all the eggs of fishes, so far as is yet known, is round. *Artedi*, Ichthyology.

OVATED-*leaf*, among botanists. See LEAF.

OUCH, in our old writers, a collar of gold, or such like ornament, worn by women about their necks. Stat. 24 Hen. VIII. c. 13. *Blount*, *Cowel*.

OVEN, or *Assaying* OVEN, in metallurgy, is the particular sort of furnace, used by the assayers in their operations on metals.

It is most conveniently constructed in the following manner: Make with iron plates a hollow quadrangular prism, eleven inches broad, and nine inches high, ending at top in a hollow quadrangular pyramid of seven inches in height; this prism must be closed at bottom with such another iron plate, which serves as a bottom to it. Near the bottom make a door three inches high, and five inches broad, to lead to the ash-hole. Above this door, and at the height of six inches from the basis, make another door of the figure of the segment of a circle, four inches broad at its basis, and three inches and a half high in the middle; then fasten three iron plates on the forepart of this furnace; let the first of them, which must be eleven inches long, and half an inch high, be placed with its lower edge against the bottom of the furnace, and fastened there with three or four rivets in such a manner, that there may be, between the upper edge of the said plate, and the side of the furnace, a groove so wide, that the sliders of the lower door may be put into it, and freely move backward and forward therein: these must be made of a thicker iron plate.

The second iron plate eleven inches long, and three inches high, must be placed perfectly parallel to the foregoing plate; and in the space between the two doors in such a manner, that both the upper and lower edge of it may, with the side of the furnace, form a hollow groove: one of these grooves which looks downward, serves to receive the upper edges of the sliders that shut the lower door; and the other that looks upward, is to receive the inferior edges of the sliders of the door above.

The third plate, which is to be of the same dimensions with the first, must be riveted close above the upper door, in such a manner, that it may form a groove looking downward, and contiguous to the upper edge of the upper door. In order to shut both doors, you must adapt to each of them two sliders made of iron plates, that may move within the above-mentioned grooves; but the two sliders belonging to the upper door, must have each a hole near the top; that is, one a small hole a fifth of an inch broad, and an inch and a half long; and the other a semicircular aperture, one inch high, and two inches broad: besides this, let each slider have a handle, that it may be laid hold of when it is to be moved.

Beside these, let five round holes, each of an inch in diameter, be bored in the furnace; two of these must be made in the fore part of the furnace, two in the back part of it, but all at the height of five inches from the bottom, and three inches and a half distant from each side of the furnace: and, finally, a fifth hole must be made at the height of one inch above the upper edge of the upper door. The inside of the furnace must be lined throughout with iron hooks, standing out about half an inch, and placed at about three inches distance from one another, to hold on, and fasten the matter of the lute, with which the whole inner surface of the furnace is to be coated.

Let an iron moveable hollow quadrangular pyramid, of three inches in height, be next adapted to the upper aperture of the furnace; this must be seven inches broad at the basis, and end upwards in a hollow tube three inches in diameter, two inches high, and nearly cylindrical, but a little convergent at the top: this prominent tube serves to support a funnel, or flue, which must be nearly cylindrical, hollow, and two foot high, and made of iron plates. This, when a very strong fire is required, must be put perpendicularly upon the shorter tube, in such a manner, that it enters closely and evenly into it an inch and a half, or two inches deep; and may be taken off at pleasure when the fire is not required to be so very violent. This pyramidal cover must, however, have beside, two handles fitted to it, that it may conveniently also be taken off or put on at pleasure; and that this when put on the aperture of the furnace may not be subject to be easily thrown down, let an iron plate be riveted to the right and left upper edge of the furnace, and be turned down toward the inside, so as to make a furrow open before and behind, into which the lateral edges of this cover may enter, and be fastened, and at pleasure moved backward and forward when it is to be put on or removed.

Lastly, let a square ledge, made of a thick iron plate, be fastened on the top of the upper edge of the lower door, which will conveniently support the grate and the lute; but this must be made of two pieces, that it may easily be introduced into the cavity of the furnace; and thus will you have an *assay oven* compleat, and ready for a great variety of operations.

When this is to be used, that the fire may be the better confined, and the iron not be destroyed by growing red-hot, the whole inside of the furnace must be covered over with lute, a finger, or a finger and a half thick. The matter for the making the assaying metals, &c. or a mixture of clay with sand, powder of calcined flints, or broken crucibles, either mixed with water, or with blood diluted with water, will serve very well for this purpose: but the most ready of all lutes, and at the same time one of the best in the world, is the coarse earth called Windsor loam: this must be mixed up with water pretty stiff, and pressed on the inside of the furnace, first wetted also with water; and when this lute begins to dry, it must be beat down close to the sides with a wooden mallet; and then the unevennesses and cracks, filled up with clay somewhat moister, so as to be made smooth and even with a trowel, and then left to dry gently; and if any cracks happen, they must again be filled up. If any pieces of this lute are broken off by the fire, let it be quite cold, and wet it after the operation is over, and the edges of the old lute and fresh clay will unite very well, and fill up the holes. If the crack is but small you may use the furnace again immediately, even before the fresh clay is dry.

This is the method of coating the *assay furnace* or *oven*; but before this is done there must be put within the furnace small iron bars, equal in length to the diameter of the oven; these must be prismatical in shape, quadrangular, and half an inch thick: their extremities will be supported by the ledge before described within the oven; and they must be placed at three quarters of an inch distance from one another. These must also be so placed, that their flat sides may be oblique with regard to the transverse section of the furnace, and that the two opposite angles may look one upwards and the other downwards. The bars being thus not laid flat, but edgeways, you hinder the ashes of the fuel of the fire from being detained too long between the interstices of the bars, and from making any obstruction that would oppose the free draught of the air. After the placing these, the furnace being coated over with lute, and dried by a gentle heat, is fit for use.

When an operation is to be performed in this, two iron bars of an inch in thickness, and somewhat more than the diameter of the furnace in length, must be put thro' the four holes before described, standing opposite to one another; and the ends of the bars must jut out a little beyond the edges of the holes on each side; these serve to support the muffle with its bottom, in which the coppel or test, with the matter to be worked on is to be placed: these are then to be introduced thro' the upper aperture of the furnace, and set on these bars in such a manner, that the open foreside of the muffle be contiguous to the inward border of the upper door. The fuel is to be introduced thro' the top of the furnace, and the cover on this account must be moveable, and not too heavy. The best fuel is charcoal made of hard wood, and broken into pieces of an inch big, that the muffle may be covered regularly over some inches high; large pieces of coal are to be avoided at this time, because they cannot fall into the narrow interstices between the sides of the muffle and those of the furnace; and cannot of course surround every way this circumference of the muffle; for which reason if such were used, there must be some places void of fuel, and the fire, consequently, either not strong enough, or unequal: and if, on the other hand, the pieces of coal were too small, they would fall immediately thro' the interstices of the grate into the ash hole, and the tenderest particles of them turn too soon into ashes, and increase the heap of ashes, and obstruct the free draught of the air.

Scotch coal, or Kennel coal, but not Newcastle or sea coal, broken into small pieces, may be mixed with an equal quantity of charcoal; or if any ores require long roasting, the fire may be first kindled with Scotch coal alone, but the operation must be finished with charcoal alone. *Cramer's* Art of Ass. p. 75. seq.

OVER *(Cycl.)* — OVER-*blow*, in the sea language. They say it *over-blows* when the wind blows so very hard that the ship can bear no top sails.

OVER-

OVER-*done*, in the manege, in French, *outré*. A horſe is ſaid to be *over-done*, or *outré*, when his wind and ſtrength are broke and exhauſted with fatigue.

OVER-*flowing of lands*. The farmers of England having long obſerved how great an advantage it was to meadow and paſture land, to be ſometimes *over-flowed* by the ſudden riſe of brooks, rivers, or the like, which brings the ſoil of the uplands upon them, and makes them need no other mending or manuring, tho' conſtantly mowed, have found an artificial method of working the ſame effect, and by it producing the ſame good effect in many of their grounds without any ill one. The benefit of the natural *over-flowings* of meadow lands, which lie in the way of floods, is in ſome ſort taken off, by their being ſubject alſo to theſe inundations at improper times; and when a winter flood has cauſed a fine crop of graſs, a ſummer flood ſometimes comes and deſtroys it all before the hay-making ſeaſon.

There are ſome lands ſo advantageouſly ſituated, that with the aſſiſtance of art they may be laid under water or left dry, at the pleaſure of the farmer. Theſe are the moſt valuable of all graſs lands, and it is upon theſe that the farmer practiſes his artificial *over-flowings*; improving them in winter by letting in the floods to have their ſoil for manure upon them, and keeping them dry in ſummer when the graſs is long.

The artificial *over-flowing* of lands is commonly effected by directing the ſtreams of rivers, brooks, ſprings, or land floods, or ſome part of them, out of their proper channel; but where the ſtreams lie ſo low as to be incapable of *over-flowing* the lands, they are made uſe of to turn ſuch engines as may raiſe a quantity of water ſufficient to do it. The beſt and cheapeſt engine for effecting this, is that called the Perſian wheel; which may be made of any ſize, according to the height the water is to be raiſed to, and the ſtrength of the ſtream by which it is turned. This wheel is placed ſo, that its bottom only is immerſed in the ſtream; and there are open boxes at its cogs; theſe are all filled one after another with water, which is raiſed with them to the upper part of the wheel's circuit, and then naturally empties itſelf into a trough which carries it to the land.

Where there are not ſtreams to turn this wheel, the farmers have recourſe to pumps, and other engines, moved by wind. Lands that lie near brooks give more frequent opportunities for theſe practices, than thoſe which are near rivers; the brooks having greater falls, and the rivers running more ſlow and level: but when it can be effected by the water of large rivers, the land is yet more enriched by it, theſe waters being more fruitful than the others.

When the water is, by this engine, thrown into the trough, it is to be conducted by it to the higheſt part of the land; and when that is ſufficiently flooded, the water is to be let into a large but not deep trench, ſeveral ſmall ones running out of which to all parts of the land, may convey it every where, and every part may be enriched by it. It is always proper to contrive this matter ſo, that the *overflowing* may be often repeated, and the water quickly carried off; for when it is ſuffered to lie long upon the land in winter, it is apt to breed ruſhes and other coarſe plants in the ground.

Some farmers graze their lands till Chriſtmas, and ſome longer; but as ſoon as fed bare, from Allhallows till ſpring, that the graſs is not too high, is the propereſt time of *overflowing*, except that it prove a dry time in April or May. If this happen, *overflowing* the lands at this time will be of ſingular advantage; for the graſs will grow three times as faſt after it, in hot weather, as it would in cold. Land-floods are the beſt to *overflow* with in winter, and warm fattening ſprings in ſummer; only it muſt be obſerved, that the water of one operation is dried in before any more is let on. It is always beſt alſo to do it at night, that the moiſture may be ſoaked into the ground before the heat of the day; for otherwiſe the land is often burnt. The waſhings of towns and of public highways is of great improvement to lands, as is alſo the waſhings of lands where ſheep feed.

All waters are not proper for this purpoſe of *overflowing* of lands to enrich them, the waters of coal mines and other places where there is any ſulphureous mineral mixed among them, being apt to deſtroy and kill the graſs where-ever they come. Theſe waters are eaſily known from the healthful ſpring, by their leaving a reddiſh mud or ſediment behind them where-ever they have paſſed; but it is poſſible, that even theſe may have their uſe when properly applied. They ſeem to contain a vaſt quantity of ſalt of ſome kind, and we know that urine, dung, and many other things, that are moſt fit of all others to enrich land, will burn up and deſtroy plants, if improperly laid on in large quantities: the caſe may be the ſame in theſe, and very probably theſe waters abounding in ſalt would do great good if they were properly blended with common water, and let in upon the lands with floods of ſweet water. The farmers have gone ſo far towards the proving the truth of this, that they have found ſome of theſe ſprings, when more diſtant from their ſource, not only more innocent than before, but beneficial.

Cold clay lands, and other ſtrong lands that lie flat, will only be improved by *overflowing* them with land floods, and that only in ſummer, when the ſeaſon is very dry. Theſe lands will not bear water in ſuch quantity at any other time, becauſe it will not ſoak into them eaſily; and it is for the contrary reaſon, that the light and ſpungy lands are always moſt improved by *overflowing*. *Mortimer*'s Huſbandry.

OVER-*grown*, in the ſea language. When the waves of the ſea grow high, the ſailors call it *rough ſea*; but when the ſurges and billows grow vaſtly high, then it is an *over-grown ſea*.

OVER-*hale*, in the ſea language. A rope is ſaid to be *over-haled*, when drawn too ſtiff, or haled the contrary way.

OVER-*hale the runner*, in the ſea language. See RUNNER.

OVER-*hale the ſheet*, in the ſea language. See SHEET.

OVER-*ride*, in the manege, the ſame with *over-done*. See the article OVER-*done*, ſupra.

OVER-*ſet*, or *overthrow*, in the ſea language. A ſhip is ſaid to *over-ſet* when her keel turns upwards; which misfortune happens either by bearing too much ſail, or by grounding her, ſo that ſhe falls upon one ſide.

OVER-*worked*, in the manege, is the ſame with *over-done*. It is called in French, *eſtrapaſſer*. See OVER-*done* and ESTRAPASSER.

OVER-*laying of children* may be prevented by a machine called *arcuccio*. See ARCUCCIO.

OVIEDA, in botany, the name given by Linnæus to a genus of plants, called by Plumier *valdia*. The characters of which are theſe: the perianthium is a ſhort and broad one-leaved cup, lightly divided into five erect and pointed ſegments, and remaining after the flower is fallen. The flower conſiſts of one petal, and is of the labiated kind. The tube is extremely long and ſlender, and ſtands upon the germen of the piſtil. It is ſomewhat thicker at the top than at the baſe, and the upper lip is hollow and emarginated; the lower is divided into three ſegments. The ſtamina are four filaments longer than the flower. The antheræ are roundiſh. The germen of the piſtil is globoſe, and ſtands between the cup and the flower. The ſtyle is capillary, and of the length of the ſtamina; and the ſtigma is bifid and acute. The fruit is a globoſe berry, placed in the cup, which grows larger to receive it, and is of a campaniform ſhape. The ſeeds are oval, and are two in number. *Linnæi* Gen. Plant. p. 295. *Plumier*, Gen 24.

OVILE, among the Romans, a name given to the incloſures in which the comitia met to create magiſtrates. See the article COMITIA, *Cycl.*

OVIPAROUS (*Cycl.*)—The diſtinction between *oviparous* and viviparous creatures, ſeems, in the inſect world, to be much leſs fixed and determinate than is ſuppoſed. It is evident, that ſome flies, which are naturally *oviparous*, if they are kept from the finding a proper nidus for their eggs, be it meat, or any thing elſe, will retain them ſo long beyond their due time of excluſion, that they will hatch into worms in the body of the parent, and be afterwards depoſited alive on fleſh, or in the manner of the young of the viviparous inſects. Bartholine gives an account in his Medical obſervations, of a hen, which, inſtead of eggs, brought forth no leſs than five living chickens; but ſhe died of it.

This ſtory of Bartholine is countenanced in a great meaſure by a thing which happened in this kingdom; where, in the county of Norfolk, ſome years after his publiſhing this hiſtory, there was a hen, which, tho' big with eggs, could not lay, but after a time died; and people being curious to open her afterwards, there was found in the ovarium, a chicken diſcloſed from the ſhell, and perfectly formed in all its parts; and probably had this been excluded in this ſtate, more would have followed, after being hatched in the ſame unnatural manner. We have in ſome authors inſtances given of the ſame accident in the ſerpent kind, which puzzle the diſtinction between the *oviparous* and viviparous kinds.

OVIS, the *ſheep*. The character of this genus of animals, given by naturaliſts, is, that the covering is wool, not hair; the mouth proportionably ſmaller than in the ox kind; the horns crooked, wrinkled, and often ſpiral, and the papillæ only two.

The wool of theſe animals is only a congeries of very long and ſlender hairs, oddly twiſted and contorted, and variouſly interwoven with one another. This is a cloathing peculiar to the ſheep kind, ſo far as is yet known, no other animal having been ſeen to poſſeſs it: it is not, however, the cloathing of all the ſpecies of ſheep, ſome of the diſtant nations having ſhort hair, like that of the goat.

We at preſent know five ſpecies of this animal: 1. The common *ſheep* of our own paſtures. 2. The *ovis laticaudo*, famous for the enormous ſize and breadth of its tail, which often weighs thirty pounds. See the article PLATYCERCOS. 3. The *ovis ſtrepſichoros*. See STREPSICHOROS. 4. The *ovis Afri.ana*, or African *ſheep*, which inſtead of the wool of the *ovis*, has ſhort hair like that of the goat; we have theſe often brought into England, and they ſeem no way different from ours but in their covering. And 5. the *ovis Guinienſis*, commonly called the *Angola ſheep*. This is of the ſize of our *ſheep*, but the hinder part of its head is more prominent, and its ears hang down. Their ſcrotum is very large, and their penis placed in the middle of the belly; the horns ſmall, and bending down to the eyes; and the neck adorned with a large mane.

mane. The hair of the reſt of the body is ſhort, and they have a dewlap under the throat like our bulls. *Ray*'s Syn. Quad. p. 73.

To theſe are uſually added the *pacos* and *muſmon*; the firſt of which properly belong to the camel claſs, not the *ſheep*, and the latter an animal ſuſpected not to be found any where at this time.

In the Linnæan ſyſtem of zoology, the *ſheep* makes a diſtinct genus of animals, of the order of the *pecora*. The characters by which the creatures of this genus are diſtinguiſhed from the reſt of that order, are theſe: their horns are hollow, bent backward, wreathed and crooked, and ſcabrous, not ſmooth on their outſide. *Linnæi* Syſtem. Nat. p. 43.

OUMIEN, a name given by the Chineſe to a peculiar ſort of porcelain, of which they are very fond. It is black, ornamented with gold. They ſometimes alſo call the blue and gold, which is made in the ſame manner, by the ſame name. They colour it with three parts of the azure, and ſeven parts oil of ſtone, and lay on the gold afterwards. If they would have it bluiſh, they add leſs of the azure, and ſome ceruſs white. Obſerv. de l'Aſie.

OUNCE *(Cycl.)* — The *ounce averdupois* weight, is about 37½ grains *troy*. See POUND.

OUNCE is alſo the Engliſh name of the lynx, or *lupus cervarius*, a very fierce beaſt of prey. See LYNX.

OURISSIA, in zoology, a name by which Cluſius and ſome other authors have called the *humming-bird*, or *guainumbi*. *Cluſ* Exot. l. 5. c. 7. See the article GUAINUMBI.

OUROLOGY, in medicine, a name given by authors to a treatiſe or diſcourſe on the ſubject of urine. The chemiſts have given us treatiſes on the analyſis of urine, and the preparations of it, ſuch as the phoſphorus, &c. under the name of *ourologies*: and medical writers have, under the ſame name, given us treatiſes on the prognoſtics from the urine, and its various appearance in different diſeaſes.

The firſt ſtep towards judging by the urine, is to fix ſomething as its ſtandard in a healthy ſtate, all the deviations from which, in whatever reſpect, are to be judged ſignals of diſtempers or diſtempered habits. This ſtandard is beſt taken from the urine of a perſon in health, of between thirty and forty years old, and it is of a citron colour and moderate conſiſtence, of a due and ſomewhat ſtrong ſmell, and made in a conſiderable quantity. This, when it has ſtood a proper time, is alſo to depoſit a natural ſediment. By being well acquainted with all the ſtages and changes of this, the diſeaſed urine will be eaſily judged of by their ſeveral peculiarities in difference from it. Phil. Tranſ. N°. 100.

It is ſaid by ſome, that people often die with good and healthful urine; but this is only ſaid by thoſe who are not ſkilful in urine: for it is as impoſſible for the urine to be healthful at the approach of death in diſeaſes, as for the blood to be ſo.

The time of inſpecting the urine, and the time that the urine is made that is to be inſpected, are alſo circumſtances of great conſequence. The urine by which the beſt judgment is to be formed, is that made after the firſt ſleep in the night; and the time of judging of this is not immediately when it is made, but about two hours after, when it has had time to ſettle. It muſt in the mean time be ſet to ſettle in a moderate air, neither too cold nor too hot. The firſt hinders the ſettling, and the latter rarifies the colour; and if very great, it cauſes an ebullition, which deſtroys what ſhould ſwim upon the ſurface of the urine. The urine muſt not be judged of in the ſun, nor by candle-light; for either of theſe lights will give falſe colours: but the proper place is, when there is a moderate, not glaring light; and when it is firſt received, it muſt be held very ſtill and ſteady; afterwards it will be proper to ſhake it, to ſee the whole that ſwims in it, and will ſeparate from it. *Eygel.* de Urinis.

The colour of the urine is the moſt precarious of all its appearances, and to be judged of with the greateſt caution. What is taken to be the mark of a diſeaſe in this caſe, is often only the effect of medicines or the food: rhubarb or ſaffron will make the urine yellow, and a common ſallad will make it greeniſh; but theſe tinctures go off after a few hours from the time of taking the things which occaſion them. People who live in a hot air, and thoſe who uſe violent exerciſe, uſually make more high coloured urine than others. The ſubſtance, the quantity, the qualities, and the contents of the urine, will always diſcover to the attentive view the nature, cauſe, and ſymptoms of the perſon who made it. What is moſt to be obſerved as to the ſubſtance of the urine is, whether it be thick or thin, clear or turbid, oily or not oily. The copiouſneſs of it is only to be judged of by compariſon of the quantity voided within the twenty-four hours by the patient, with that he uſed to void in health, or that quantity which at a medium a man in health does uſually void. Among the qualities of the urine, the principal is the ſmell. This is affected not only by diſeaſes, but by medicines taken for them. The urine is on many occaſions rendered fœtid; and there are ſome things which communicate an agreeable ſmell to it, ſuch as turpentine and many of the diſtilled oils. Among the things which render the urine fœtid, the principal are ulcers and purulent matter. The taſte of the urine alſo declares its qualities. It is naturally of a ſaltiſh and ſulphurous taſte, but this goes off, and a ſweetneſs or inſipidity is obſerved in it. The principal colours of the urine in its various ſtates, as inflamed by diſeaſes, are white, yellow, reddiſh, and black; to one or two of theſe, differing in degree or to mixtures of two or more of them, in different proportions, may be referred the other leſs common colours of pale citron, high-red, green and blue, which laſt two, in any perfect degree, are very uncommon. The moſt dangerous of all urines are the blue and the black, particularly the laſt: the antients, however, judged too ſeverely of it. Galen ſays, he never knew any one recover who made black urine; but we meet with ſome inſtances of children eſcaping after this ſymptom.

The contents of the urine are of three kinds: the ſediment or matter ſubſiding to the bottom; the matter hanging in the middle; and the matter ſwimming at the top. Theſe differ according to their degrees of weight, and in all theſe the phyſician is to obſerve, the ſubſtance, colour, uniformity and likeneſs. For example: the beſt ſediment is that which is moderate in ſubſtance and quantity, white, uniform, and alike both for matter and time. We are not to expect a ſediment in the urine in all diſeaſes, and in ſome a thinner, in others a thicker ſediment, is the beſt ſymptom. Among all the appearances of the middle and top of the urine, the worſt is that of a ſort of clouds forming themſelves in the urine, and riſing to the top entirely. Theſe are the ſigns of light-headedneſs, and often of death itſelf.

Beſides theſe, which are the general contents of urine, there are particular ones; ſuch as mealy matter, ſcales, coagulated blood, purulent matter, aſhes, ſlime, pieces of ſeeming fleſhy matter, ſmall hairs, woolly filaments, flying duſt, tough ſtuff adhering to the ſides of the veſſel, and reſembling the webs of ſpiders, bladders, froth, fat or cream-like ſubſtances, and finally ſandy or ſtony matter. This laſt is the moſt frequent of all, and is of two kinds; the one found in the body, the other only ſeparated from the urine after it is diſcharged. It is of great conſequence to know theſe, as they give great light into the nature of nephritic complaints. The ſandy matter generated in the body always precipitates itſelf to the bottom in the urine, as ſoon as it is made, and remains looſe in it; but the other only ſeparates from it in the pot, and adheres to the ſides of it in form of a ſort of cruſt. It has been ſuppoſed by many, that preſages of the ſtone may be made from theſe ſeparations from the urine, but there is no certainty in it; only this, that thoſe who have been uſed to void grains of ſand, if they ſuddenly leave it off, and from that time begin to make a whitiſh and thin urine, they then may be ſuſpected to have a ſtone breeding within them.

The nature of the ſand voided at times by people afflicted with the ſtone, may ſerve as a guide to judge of the nature of the diſeaſe. When it is hard and red, the ſtone is likely to be ſituated in the bladder; if hard and white, the kidneys are likely to be the ſeat of the diſorder. We have inſtances of very particular matters voided by urine, beſide theſe: ſome wholly erroneous; others certain, tho' very ſtrange. Plempius gives an account of a woman who voided a yellow fatty matter with her urine for ſeveral months after the going off of a quartan ague, and tho' ſhe diſcharged great quantities of this, was not at all the better for it. Phil. Tranſ. N°. 100.

OUT, OUTSIDE, or WITHOUT, in the manege, is the contrary of *in*, *inſide*, *inner*, &c. See IN, INNER, &c.

OUTIN, in zoology, a name by which ſome call the fiſh known among authors by the name of *oxyrynchus*. *Willoughby*'s Hiſt. Piſc. p. 187. See the article OXYRYNCHUS.

OUTLICKER, or OUTLIGGER, in a ſhip, a ſmall piece of timber, three or four yards long, as occaſion ſerves, made faſt to the top of the poop, and ſtanding right out a-ſtern: at the outmoſt end of it is a hole, into which the ſtanding part of the ſheet is received, and made faſt through the block of the ſheet; and then again received through another block, which is ſeized to this *outlicker*, hard by the end of it. This is ſeldom uſed in men of war, or in great ſhips; and whenever it is made uſe of, it is becauſe the mizen maſt is placed ſo far aft, that there is not room enough within board to hale the ſheet flat.

Outligger ſeems the true orthography of the word, which appears to be derived from the Dutch *uitlegger*, q. d. *outlier*.

OUTNESS, is uſed by ſome for that relation of things by which one appears out of, or at a diſtance from another.

Dr. Berkeley, in his eſſay on viſion, makes uſe of the word *outneſs*; and obſerves, that we form no notion of *outneſs* from the ſenſe of ſeeing merely, but only from motion.

OVUM *(Cycl.)* — OVUM-*anguinum*, a name given by many authors to a foſſil, ſuppoſed by the vulgar to be the petrified egg of a ſerpent, but being really like the brontiæ and ombriæ, ſpecies of the *echinites*. See ECHINITES.

OVUM-*polypi*, in natural hiſtory, a name given by ſome of the earlier writers, to the papyraceous, or thin-ſhelled nautilus. The reſemblance of the body and arms of the fiſh which inhabits this ſhell, with thoſe of the ſea-polypus, gave occaſion to their ſuppoſing this creature the ſame animal, not yet got out of the egg. The ſhell of this ſpecies being very thin, and

and looking like an egg-shell, gave farther countenance to this error in less knowing ages.

OVUM *rumphii*, in natural history, the name of a species of *porcelane shell*, of the oblong kind, called an *egg*, from its shape, by that author. See PORCELLANA.

OUZELL, or *Brook* OUZELL, in zoology, an English name for the *rollus aquaticus*, more usually called the *water rail*. See the article ROLLUS.

OUZELL, or *Ring* OUZELL, an English name for a bird of the *merula* or *blackbird* kind, remarkable for a white ring about its neck, and thence called by authors *merula torquata*; it is more commonly called in English, the *ring amzell*. *Ray*'s Ornithology, p. 144. See AMZELL.

OUZEL, or *Water* OUZEL, the English name of the *merula aquatica*. See MERULA.

OWL, in zoology. See the article BUBO.

Churn OWL. See CAPRIMULGUS.

Horn OWL. See HORN.

OWL *fish*, or *sea* OWL, in ichthyography, an English name for the *lumpus*, more frequently called the *lump-fish*; and by the Scotch the *cock-paddle*. *Willughby*'s Hist. Pisc. p. 208. See the article LUMPUS.

OWL *pigeon*, the name of a particular species of *pigeon*, called by Moore the *columba bubo nominata*. It is a small and short-bodied *pigeon*. It has a short round head, and has a series of feathers that separate and open two ways upon the breast: but its most remarkable character is its beak, the upper chop of which is bent, and hooked over like an owl's: this is the occasion of its name. It is of various colours, as white, blue, or black, but is always of only one colour, never pied. *Moore*'s Columbarium, p. 54.

OX, *bos*, in zoology. See the article BOS.

The *ox* is a very serviceable animal, in many respects; but his nature depends wholly on that of the bull and cow, from which he is bred. Derbyshire and Lancashire are said to have the best *oxen* in England. Wales, and the island of Anglesea, afford a kind that are very valuable to the farmers, as they will fatten upon middling land; and the Scotch *oxen* are yet hardier than these. The long-legged short-horned cow, of the Dutch breed, is the best for milk; but then this kind needs to be very carefully kept. This sort of cow will often yield two gallons of milk at a time.

When these creatures are intended to breed, the better the land is the larger sort of beasts are to be chosen, and the greater will be the profit. But of whatever sort the breed is, the bull should always be of the same country with the cow, otherwise it never succeeds so well. The bull should be chosen of a sharp quick countenance, his forehead broad and curled, his eyes black and large, his horns long, his neck fleshy, his belly long and large, and his hair smooth and like velvet; his breast should be large, his back strait and flat, his buttocks square, his thighs round, his legs strait, and his joints short. This sort of bull is the best for breed, and makes the best *oxen* for draught as well as for fattening.

The cow ought to have a broad forehead, black eyes, great clean horns, the neck long and thin, the belly large and deep, the thighs thick, the legs round, and the joints short; a white large and deep udder with four teats, and large feet. The size must be proportioned to the goodness of the land. The largest cows, in general, give the greatest quantity of milk; and it is always a good rule to take the cattle from a worse ground than that on which they are to be kept; for if from a better they are apt to degenerate. The best time of a cow's life for breeding of calves, is from three years old till twelve: the black cows are usually chosen to breed out of.

The largest *oxen* are to be chosen for work, and for feeding, but then it must be where there is land rich enough to maintain them. When they are to draw, care must be taken to match them well, both for height and strength; for if one be stronger than the other, the weakest will soon be destroyed. They must never be driven beyond their natural pace, for the beating them throws them into surfeits, and many other diseases.

The time of putting *oxen* to work, is at three years old; they must be worked gently the first year, especially in hot weather, and fed with a large quantity of hay: this will enable them to bear their labour better than grass; and they should be always kept in a middle state, neither too fat nor too lean. They may be worked till they are ten or twelve year old, and then sold.

It is observed, that meat and fair treatment, succeed much better with this animal than blows. The best way to break a young one to the yoke, is to put him to it with an old tame *ox* of about his own height and strength. If he prove unruly after this, he must be kept hungry, and made to feed out of the driver's hand. *Oxen* are much more profitable to keep than horses, there being no loss in them; and an old wrought *ox* fattening as well as a young one, and being as good meat. Their keeping also is cheaper, for they eat no oats: their harness and their shoes also are considerably cheaper, and they are not so subject to diseases. They must always indeed have good grass and good hay, and they are not so serviceable as horses, when there is much working in carts, and where the ways are good; but for winter plowing, where the ground is heavy, an *ox* will do as much work as a horse. Every farmer who can keep two teams, would do wisely to have one of them of horses, and the other of *oxen*; it is much better to yoke them together by the necks and breasts, than by the horns as some do; and where a man keeps an *ox* team, he should raise two *oxen* and two cow calves every year to keep up his stock; for it is better for a farmer, in all necessary things, to be a seller than a buyer. Chalky land spoils the feet of *oxen* more than any other. *Mortimer*'s Husbandry, p. 233.

Stealing OXEN, or creatures of the *ox* kind, old or young, whether bull, cow, &c. strictly so called, steer, bullock, heifer, or calf, is now felony without benefit of clergy; as is likewise killing any of these, with an intent to steal any part of their carcases. Stat. 15 & 16. Geo. II. c. 34. & Stat. 14. Geo. II. c. 6. See CATTLE.

Diseases of OXEN. As scarce any creature is more useful to man than the *ox* kind, nothing is more worthy consideration than the nature and origin of their diseases, and the remedies for them. The same distemper that has of late years carried off such vast numbers of these cattle with us and elsewhere, has at other times raged in Italy. In the year 1710, and the succeeding one, there was a great mortality amongst the horned cattle there, and the occasion of it was evidently the unnatural season preceding. The whole autumn before had been wet, and at the time of the winter solstice there were continual cold winds, and small, but lasting rains. The spring that succeeded, was also cold and rainy, and the defect of heat and abundance of moisture, made a change in the whole face of nature: the medicinal springs had not their wonted effect; and the fruits of the earth could not appear at their proper seasons, nor in their due perfection. The grass was injured by this, and the ground rendered continually damp and unwholesome; and to this was evidently owing the malignant and contagious disease that raged among the cattle afterwards. It was supposed at that time with them, as of late with us and elsewhere, that the contagion was brought in among their *oxen* by strange cattle coming from infected places, but this proved to be an error; for if an *ox* was removed to ever so distant a pasture, he never escaped the better for it: the whole earth and its productions were vitiated throughout the country, and there was no safety in any part of it. *Michelotti* de Morbis Boum.

The use of this observation must be, the keeping the cattle in succeeding years out of the way of those things which occasion their sicknesses in such as these. If the autumn or winter be extremely cold and wet, remove the cattle out of the low grounds, and put them to feed in sandy dry soils on the high grounds; give them water from such places where the sun has most power, and it is less chilling cold than in others; and in cases of imminent danger, always mix some salt in it. If the bad weather continues, let them always have clean straw to lie on, and a dry covering; and in cases where the contagion is already begun, the fumigating the houses where they are kept with bay-leaves and eleutherian bark, is judged convenient. As to remedies, when they are once seized with the distemper, it is hard to understand what intention to prescribe in, and how to ascertain the doses; and as the late practice, in attempting to cure, has been of very little service, the cautions for the preserving and preventing the disease, ought to be redoubled, to prevent an almost incurable misfortune.

The diseases of *oxen* are much less frequent than those of the human species; but where-ever they appear, they usually become more violent after a time, and generally are very contagious. In Italy in the year 1711, there appeared a disease among the *oxen*, which carried off as great numbers as the late distemper among us has done. Some acrid and caustic salts in the blood, seem to have been one of the principal causes of this disease; as when the blood was let out at the ear of the dying cattle, and fell upon the ground, there were always found, as it dried up, certain concretions of salts sparkling like so many crystals.

In many of the creatures which were opened, after dying with this disease, the insides of the stomach and intestines were found covered with tubercles like the pustules of the small-pox: the common people supposed this the cause of the disease; but upon farther enquiry, it appeared only one of the effects of it; for such beasts as died very suddenly of this disease, when opened, had their intestines sound; so that these pustules on their surface appear to have been only a symptom of the disease in a very advanced stage. All medicines were found vain in this disease; and such of the creatures as recovered, had always pustules of this kind on their skin, which ouzed out a bloody ichor.

From the whole it appears, that this disease was an acute fever in these creatures, of a malignant kind; and that the texture of the blood was always broke in it; and that its cause was to be attributed to various salts taken in from the air, or in eating or drinking. Many had called it a plague among the cattle, but it appeared rather what we understand by the name of a contagious pestilential fever, than an absolute plague; and a peculiarly humid season, joined with exhalations of mineral substances out of the earth, for some reason which we cannot comprehend, more frequent than

uſual, brought it upon theſe creatures, whoſe noſes being continually near the ground, gave theſe exhalations immediate entrance.

The method of cure ſeems to conſiſt in two intentions; the firſt of abating the fever; the ſecond of reſtraining the acrimonious malignity of the ſalts.

Purges of all kinds are cautiouſly to be avoided; and bleeding in the beginning is always neceſſary, and muſt be more largely admitted in the more robuſt creatures. The common medicines given as febrifuges and cephalics, all do harm; the fumigations of diverſe kinds, all are idle or miſchievous; and moſt of theſe things intended as reliefs, tend plainly to the increaſing the diſeaſe, as they add to the accelerated motion of the blood, and break its texture more than before. The moſt rational method of treatment is this:

As ſoon as a beaſt is ſeen to be affected, let him be ſeparated from the reſt and kept warm. When his mouth begins to be ſore, let a clyſter be given; and if this does not work, then a gentle emollient may be given by the mouth, made of lenitive electuary and cream of tartar, diſſolved in a large quantity of water-gruel; this is the more neceſſary if the creature be fat: if a lean beaſt be ſeized, bleeding is the firſt thing to be done; after this, a ſeton muſt be made in the neck, and the parts about where the vein was opened ſhould be ſcarified. If the fever does not abate on theſe methods, the creature ſhould be blooded again: then, inſtead of the great quantities of watry liquors, which are uſually given, the creature ſhould have ſomething ſtrong, ſuch as a mixture of wine with its liquor, and that in conſiderable quantity. When the fever abates, he is to be allowed but little drink for the three firſt days, and that ſhould be a decoction of mallows with a mixture of lemon juice, or ſome other ſuch acid. In caſes where the ſeton does not diſcharge kindly, a bliſter muſt be applied over it. When by this means the creature begins to recover, elm leaves and olive leaves, are to be mixed with the hay it eats; the creature muſt be walked out a little, and its litter changed for freſh: this ſhould be done every day, in caſes where the creature is weak and poor.

For the preſervation of cattle from the diſeaſe, nothing is ſo proper as the taking great care that they drink only clean and pure water, and that they eat only dry food till ſome hours after ſun-riſe: they muſt be carefully kept out of infected places, and their ſtables fumigated, by burning in them frankinſence, juniper berries, and the like ingredients; or by firing off ſmall quantities of gunpowder at ſeveral times, or ſprinkling vinegar and camphor on a red-hot iron. The creatures mouths ſhould be waſhed at times with lemon juice, and their ears with vinegar or urine; and no hogs, ſheep, or other animals ſhould be ſuffered to feed among them. *Gazola* de Peſte Boum.

Theſe were the ſentiments of Gazola on this fatal diſeaſe, which he had carefully attended to in all its ſtages Lanciſi, however, diſſents from this author in ſome particulars. He ſays, that the diſtemper was a true plague among the cattle; and obſerves, that this very plague among the *oxen*, was well known among the antients. It was firſt brought into Italy from Hungary, and infected the cattle by the breath, by the pores of the skin, or by any other paſſage that it found open. He preſcribes for the preſervation, the taking great care that they have perfectly good food and drink; and adviſes the waſhing their mouth and noſtrils with a mixture of vinegar, garlick, ſulphur, ſalt, and juniper berries; and both he and Gazola agree in adviſing the rubbing the creatures over with ſweet oil. This author condemns all medicines, and even bleeding, but greatly recommends ſetons, cauteries, and bliſters. He adviſes theſe to be uſed as ſoon as ever the creature is perceived to be ſick, and that not only on the neck, but on the ſhoulders, the hips, and any other part. *Lanciſi*, ap. Acta Eruditor. Ann 1715. p. 463.

Franciſcus Fantaſti publiſhed a treatiſe on the ſame ſubject, about the ſame time; and by his writings it appears, that the *oxen* were ſeized differently, and affected with different ſymptoms in different places, tho' the cauſe of the diſtemper was evidently the ſame in all.

Some of the cattle, he obſerved, voided great quantities of blood by the urinary paſſages. Theſe uſually died, and on opening them the blood was always found fluid, and the brain was often decayed, or full of a fœtid matter; and the marrow in their bones was found dried up and waſted, and all the humors were found evidently tending to a ſtate of corruption.

This author rejects bleeding in all periods of the diſeaſe, as a practice that could be of no uſe in a caſe where the blood and humors had all loſt their due ſtate, and were tending to corruption. He commends ſcarification and cauteries; he alſo greatly recommends the trepaning the horns to the medullary part, and the making ſetons in the ears, on their necks, and in their breaſts; the only internal medicine he preſcribes, is a mixture of the theriaca diateſſaron, two ounces; dioſcordium, one ounce; powder of peruvian bark, two ounces. This doſe is to be given every day for three ſucceſſive days, diſſolved in three pints of the juice of brook lime, water creſs, and ſcurvy graſs, with the addition of a pint of ſtrong white wine. John Baptiſt Mazzini, wrote in another part of the world at the ſame time, on the ſame ſubject; with him we find, that the *oxen* which were ſeized with the diſeaſe, continually had a running of a mucous matter from their noſe, and a weeping at the eyes; and that when the corners of theſe creature's eyes were waſhed with wine, in which ſage leaves had been infuſed, there came out ſeveral cluſters of ſmall and ſlender worms twiſted one among another, and forming little bundles of twenty and more. He obſerves alſo, that theſe creatures, when affected, uſually carried their heads upward, not bending to the earth as uſual. This author adviſes every thing to be done to promote perſpiration: he preſcribes contrayerva and angelica root, in white wine, in large doſes once or twice a day warm, and recommends the fumigating their ſtalls with juniper and bay berries. The waſhing their mouths and noſtrils with wine and ſulphur, is alſo preſcribed in his treatiſe: a decoction of roſemary, fennell, and ſage, with white wine, vinegar, and ſalt, is alſo recommended as a drink to be often given; and he preſcribes the holding their heads forcibly in a depending poſture, that they may give opportunity to the ſaliva to run out, and the waſhing their mouth with vinegar and ſalt to cleanſe it of the foulneſs. *Mazzini*, Litter. ad Vallinier. de Peſte Boum.

Ox-*eye*, in the ſea language, a name given by the ſeamen to thoſe dreadful ſtorms that are ſometimes met with on the coaſt of Guinea; for at firſt it appears in the form of an *ox*'s eye, and not much bigger; but it deſcends with ſuch celerity, that in a very little ſpace of time, and often before they can prepare themſelves for it, it ſeems to them to overſpread the whole hemiſphere; and at the ſame time forces the air with ſo much violence, that the ſhips are ſometimes ſcattered ſeveral ways, ſome directly contrary, and ſometimes are ſunk down right.

Ox-*eye*, *certhia*, in ornithology. See CERTHIA.

Ox-*fly*, in natural hiſtory, a ſpecies of two-winged fly, bred from a fly-worm, hatched under the ſkin of oxen, from the egg of the parent fly lodged there.

The female of this fly makes a number of ſmall wounds in the backs of horned cattle, and in each of theſe depoſits an egg; which is afterwards hatched by the warmth of the creature's body. As ſoon as hatched, the young worm finds itſelf in a very convenient lodging, and in a way to be furniſhed with all the neceſſaries of life.

The places were they lie are eaſily diſcovered, as there is ever a tumor about them, like that on the foreheads of children from falls; within this, and under the thick skin of the creature, is the worm lodged. The country-people know very well that a worm is contained within each of theſe tumors, but they are ſomething miſtaken as to the fly it comes from; the gad-fly being the moſt buſy about theſe creatures, and giving them moſt vexation, they naturally enough have ſuppoſed this the produce of the egg of that fly; but this is an erroneous opinion: Mr. Valliſnieri ſeems the firſt who underſtood the true ſtate of the caſe, and he has given a very full and excellent account of it.

Every one of theſe tumors on the ox has within it a cavity proportioned to the ſize of the worm, and both the internal cavity, and the external tumor, always increaſe gradually as the incloſed worm grows larger. In the middle of May theſe tumors are ſeen of their full ſize, and are then an inch high, and an inch and a half broad at their baſe.

The greater number of theſe tumours are always found on cattle of about three years old. The number of tumors on the creature are uncertain, and are according to the number of eggs which have ſucceeded from the laying of the fly; ſometimes only three or four, ſometimes twenty or thirty, or more, are found on the ſame creature. They are not regularly placed, but are uſually on the back about the ſpine, tho' ſometimes on the legs and ſhoulders. Sometimes they ſtand very cloſe to one another; ſometimes they are more diſtinct and ſeparate. It is obſerved alſo, that the oxen which feed on open plains are much leſs ſubject to them than thoſe that are kept in the neighbourhood of woods.

At the time when the worm has obtained its full growth, and is about to leave the tumor, there is a perforation in it ſufficiently plain to eyes accuſtomed to obſervations of this kind; nor is it indeed only at this time that this hole may be obſerved; it is diſtinguiſhable at all times, if properly ſought after, and is evidently the hole made by the parent fly to introduce its egg, which has never cloſed, but, on the contrary, has opened more as the tumor increaſed, and the incloſed worm grew; but toward the end of the time that the worm is incloſed, it enlarges much more quickly than at any other period.

The hole is placed in various parts of the tumor, but very rarely on or near its top, more frequently near ſome part of its circumference. But theſe often, tho' near the circumference while the tumor is ſmall, become ſituated at its top, when it is grown to its utmoſt ſize, from the irregular growth of its ſeveral parts. This hole is of very ſignal ſervice, and indeed of abſolute neceſſity to the life of the animal incloſed; ſince it is by means of this that it holds a communication with the external air, and its poſterior ſtigmata are placed as thoſe of the reſt of the fly-worms, near the hinder extremity of the body, and that part were they are is always placed directly againſt this hole in the tumor. When the tumor is of a conſiderable ſize, theſe may be ſeen by the naked eye; and

when

when ſmaller, the help of glaſſes will always diſcover them; the place where they are ſituated being rendered the more conſpicuous and obſervable by two brown creſcents placed round them.

Theſe worms may be properly enough ſtiled the inhabitants of animal galls, ſince the tumors which contain them are truly analogous to the galls of the oak and other the like vegetable excreſcences.

The hole in theſe tumors is not only uſeful to the animal for a breathing place, but it has another not leſs neceſſary uſe; which is to let off a quantity of abundant matter formed in the tumor, which would, if confin'd there, occaſion a large abſceſs, and choak and deſtroy the animal.

If theſe worms were endued with the qualities of thoſe of the common fleſh-fly, and had hooks at their head-part, to tear and pull the fleſh in pieces, the creature who had thirty or forty of theſe gnawing devourers in its back, preying upon its fleſh at once, would be in a very miſerable ſtate: but this is by no means the caſe, the creatures have no organs to tear its fleſh with, they only live on the matter found in the abſceſs, and give the creature no great pain; being only like ſo many tents kept in a wound neceſſary to be preſerved open, or ſo many peas in iſſues.

The worms may at any time be diſlodged from theſe tumors by a moderate preſſure, and made to come out at the hole of the tumor. This, tho' it appear conſiderably too little, yet anſwers the purpoſe; as the body of the worm well enough bears preſſure, and it is only neceſſary, in order to get them out whole, to renew the force upon the tumor, for the puſhing out every ſeparate ring of its body.

While theſe worms are young, they are white, like thoſe of the common fleſh-fly; but when they grow towards their full ſize, they become ſomewhat brown They are of different ſizes, as is uſual with the worms of other flies; thoſe which are to give the female fly being always the larger, and thoſe which give the male the ſmaller. The larger of theſe are conſiderably more than an inch long, and more than half an inch thick in the fulleſt part of their bodies.

They have nothing very remarkable in their ſhape; their anterior part is ſomething ſmaller than their poſterior, and they have no legs. They are compoſed of eleven rings, counting that for one where the mouth is placed; and of theſe the eighth is the largeſt. Theſe rings are not quite circular, being ſomewhat flatted on one ſide; but what is moſt remarkable is, that the flatter ſide is the back, and hence the creature is, contrary to the uſual cuſtom of theſe inſects, hollow, as it were, on the back, and convex on the belly: and there is a good reaſon for this, ſince, as all the other worms which are deſtined to crawl upon a flat ſurface ought to have their bellies flat, that they may touch it in as many points as may be, and the creature be by that means kept ſteady, ſo this creature which inhabits the concave ſurface of a cavity, ought, in order to have its belly touch in as many points as may be, the ſurface it has to crawl upon, to have it, as it is found, tolerably convex.

The worm has ſix longitudinal furrows on its back and ſides, which interſecting the channellings of the rings, make its ſurface very rough and uneven: but beſides this, the whole intermediate ſpaces appear chagrined, and when examined by the microſcope, are found to be covered with yellowiſh prominent triangular bodies.

As this worm has no legs, it is eaſy to determine, that theſe innumerable ſmall protuberances were allotted it, in ſome ſort, to ſupply the place of them, to fix itſelf by to any place, and to aſſiſt it in moving; and may, beſides this, ſerve to the continual irritation of the inſide of the tumor, and keep up the ſeparation of a matter neceſſary to the creature's life. When the worm has attained its full growth, and is to make its way out of the hole in the tumor, this, as yet, appears much too ſmall to give it paſſage. Nature, however, has inſtructed this worm to do what our ſurgeons practiſe on a like occaſion; when they are to open the orifice of a wound, they often do it by means of large tents; the creature incloſed in this tumour makes the hinder part of its own body ſupply the office of a tent on this occaſion: for three or four days before it is to make its way out, it forces its hinder part into the orifice, and keeps it there a long time; then takes it back, and afterwards thruſts it thither again, and continues without intermiſſion repeating this operation; and when, by this means, the hole is ſufficiently enlarged, it crawls out ſlowly, with its hinder part backward.

As ſoon as it is out of its habitation, it falls to the earth, where it crawls ſlowly about till it finds a place where it may reſt, to go through its ſeveral changes, under a ſtone, or in any quiet place.

Stags and ſome other animals are ſubject to theſe worms in the ſame manner as oxen, and the ſeveral ſtages they go through in the tumors on theſe animals are the ſame with thoſe of the ox.

When they have fixed upon a place to reſt in for their changes, they loſe all motion, and their ſkin becomes black and hard, and makes a ſhell for their remaining in through their ſucceeding changes.

When the time of the egreſs of the fly is come, it appears a two-winged one indeed, but ſo extremely like the humble-bees of a middling ſize, that it is not eaſily to be diſtinguiſhed for what it is: one humble-bee cannot be more like another, than theſe flies are to that ſpecies of them; their bodies are as ſhort, all of the ſame colours, and are even more hairy.

This fly, cloſely examined, appears to be of the ſecond claſs, and to have a mouth without teeth or lips, and its mouth very ſmall. The antennæ are ſhort, rounded at their ends, and of a gloſſy hue. The reticular eyes are of a deep cheſnut colour.

The female has, in the under and hinder part of her body, a cylindric tube, which ſhe can thruſt out at pleaſure, and which is the inſtrument with which ſhe pierces the ſkin of the animal, to depoſit her egg. *Reaumur* Hiſt. Inſect. Vol. 4. p. 503, ſeq. to 537.

Ox-*gang*, or OXENGATE. A term uſed in Scotland for a portion of arable land, containing 13 acres. Tr. Pract. Geom. P. 86.

OXALME, in the materia medica of the antients, the name of a compoſition of vinegar and brine, made by a ſolution of ſea-ſalt in water. This was uſed externally in ulcers, and ſuppoſed of great ſervice againſt the bites of venomous animals, and for the curing childrens ſcabby heads. It was alſo uſed as a ſtyptic poured into wounds, and was ſometimes given warm in clyſters; but theſe were always followed by thoſe of milk.

OXELÆUM, a word uſed by many authors to expreſs a mixture of vinegar and oil, for outward application, in caſes of bruiſes and other injuries.

OXUCIÆ, in natural hiſtory, the name of a genus of foſſils of the claſs of the *ſelenitæ*, but of the columnar not the rhomboidal kind. The word is derived from the Greek ὀξὺς ſharp, and κίων a column; and expreſſes a body of a columnar form, and pointed or ſharp at the ends. The *ſelenitæ* of this genus conſiſt of ſix equal planes, having their top or bottom no broader or more depreſſed than the others; and in this differing from the *iſchnambluces*, or flatted columnar *ſelenitæ*, as they do from the *iſambluces* or *cryſtaliform*, but broken ended ones, by having their ends naturally tapering off to a point. See Tab. of Foſſils, Claſs 2. *Hill*'s Hiſt. of Foſſils, p. 121.

The bodies of this genus, like thoſe of the other genera of the columnar *ſelenitæ*, are liable to a longitudinal crack in their middle; and this ſometimes includes a little clay, in form of an ear of graſs. See SELENITES.

Of this genus there are only two known ſpecies: 1. A fine kind, with thin flakes and tranſverſe filaments, found in the clayey banks of the river Neu, near Peterborough, in Northamptonſhire; and, 2. A dull kind, with thick plates and longitudinal filaments. This is not uncommon in Yorkſhire, and lies ſometimes in a yellow, ſometimes in a blue clay. *Hill*'s Hiſt. of Foſſ. p. 141, 142.

OXYA, in botany, a name by which many authors, eſpecially the Greeks, have called the *fagus* or *beech-tree*. *J. Bauhin*, Vol. I. p. 117.

OXYBLATTA, among the antients, is uſed to denote a bright and gloſſy kind of purple colour. *Hoffm.* Lex. in voc.

OXYCEDRUS, in botany, a name given by ſome authors to the *cedrus folio cupreſſi*, or the *berry-bareing cedar*. *Chabræus*, p. 72.

OXYCOCCUS, in botany, the name of a genus of plants, the characters of which are theſe: the flower is of the roſaceous kind, being compoſed of ſeveral petals, arranged in a circular form; the cup finally becomes a roundiſh fruit or berry, which is divided into four cells, containing roundiſh ſeeds.

The ſpecies of *oxycoccus* enumerated by Mr. Tournefort, are theſe: 1. The common *oxycoccus*, or *moor-berries*; and, 2. The broad-leaved *oxycoccus*. *Tourn.* Inſt. p. 655.

OXYGARUM, a word uſed by the antients to expreſs a mixture of vinegar and *garum*, which is a pickle for the preſerving fiſh, or a ſimple mixture of ſea-ſalt and water.

OXYGLUCA, a word uſed by the antients to expreſs a liquor made of a mixture of honey, water, and vinegar. The common way of making it was by macerating the combs, after the honey was preſſed out, in water; and then adding a ſmall portion of vinegar, to give it a tartneſs. It was ſometimes made without the addition of the acid, and made a weaker ſort of mead, uſed as a common drink in hot weather. Galen ſays, it was the ſame with the *apomeli*.

OXYLIPES, a word uſed by ſome authors as a name for bread, which has a mixture of vinegar in it; intended ſometimes for eating, ſometimes for medicinal uſes.

OXYMYRSINE, in botany, a name by which ſome authors have called the *ruſcus*, or *butcher's broom*.

OXYPHŒNICON, in botany, a name uſed by ſome authors for the tree whoſe fruit is the *tamarind* of the ſhops. Mant. Exot. p. 10.

OXYPYCNI, ὀξύπυκνοι, in the antient Greek muſic, was a name given to ſuch chords as formed the higheſt ſounds of the *ſpiſſa*. There were five *oxypycni* in the ſcale. See the articles PYCNI and SPISSUM.

OXYREGMIA, a word uſed by the antients to expreſs acid eructations.

OXYRYNCHUS, in zoology, the name of a fiſh of the truttaceous kind, called by ſome *hautin*, and *outin*. It is caught frequently in the Engliſh and other ſeas, and is frequently carried to market in Holland among the whitings. It is very much of the ſhape and figure of the trout, but a little flatter, and is covered with large white ſcales. The back is of a ſomewhat duſky colour, and the lines on the ſides a little bent near their origin. The tail is forked; but the mark by which it is moſt readily diſtinguiſhed from all other fiſh of this genus, is the figure of its ſnout, or upper jaw, which runs out beyond the under, and goes off rounding and tapering to a point, making in the whole a ſort of conic figure. The head is ſomewhat tranſparent. It has no teeth, but a conſiderably rough tongue. *Aldrovand.* de Piſc. l. 5.c. 24.

OXYS, in botany, the name by which authors call *wood-ſorrel*. The characters of this genus of plants are theſe: the flower conſiſts of one leaf formed into a bell, and wide open at the mouth, where it is alſo divided into ſeveral ſegments. From the cup of the flower there riſes a piſtil, which is fixed like a nail into the bottom of the flower, and ripens into an oblong membranaceous fruit, uſually divided into five cells, opening outward from the baſe to the apex, and full of ſmall ſeeds, which uſually fly out forcibly on the touching the ſeed-veſſel, by means of the elaſticity of ſome of its parts. *Tourn.* Inſt. p. 89.

The ſpecies of *oxys* enumerated by Mr. Tournefort, are theſe: 1. The common white flowered one, called by authors *trifolium acetoſum*, and *alleluja flore albo*. 2. The purple flowered kind. 3. The blue flowered kind. 4. The common yellow one. 5. The upright American yellow flowered one. 6. The fibroſe rooted American one, with red flowers. 7. The yellow ſhrubby American *wood-ſorrel*, having the appearance of the ſtinking trefoil. 8. The ſcaly rooted purple *wood-ſorrel* of Virginia. 9. The bulboſe-rooted African *oxys*, with roundiſh leaves and with purple ſtalks and large purple flowers. 10. The bulboſe-rooted round-leaved African *oxys*, with green ſtalks and large purple flowers. 11. The Æthiopian bulboſe-rooted *oxys*, with heart faſhioned leaves, and large purpliſh white flowers. See Tab. 1. of Botany, Claſs 1.

The ſeveral ſpecies of this plant are uſually diſtinguiſhable even when they are not in flower, by their having their leaves growing regularly three at the top of every ſtalk; and being each uſually of the figure of a heart at cards, and theſe are generally of an agreeably acid flavour. See SORREL.

OXYSAL-*diaphoreticum*, the name of a compound medicine greatly recommended by ſeveral authors, and invented by Angelus Sala. The manner of preparing it is this: take fine ſalt of carduus benedictus, put it into an earthen pot, and pour upon it gradually ſome ſtrong wine-vinegar, or ſpirit of ſugar; continue to pour this on till the ebullition ceaſes and an agreeable ſmell ariſes, and the matter has an agreeable tho' ſomewhat acid taſte; let all the humidity from this mixture be evaporated over a gentle heat, and after this, let all the ſalt be again diſſolved in water, and ſet in digeſtion in balneo mariæ for eight days: a liquor of a beautiful and pellucid colour is there produced, which, when poured carefully off into another veſſel, is to be again evaporated to a dryneſs with a very gentle heat, and the remaining matter, which is the ſalt, is to be collected together, and kept in a phial carefully ſtopt; for it is ſubject to run, if left to the acceſs of the air, like the common alcali ſalts.

OXYSCHÆNOS, in the materia medica, the name of the *juncus acutus capitulis ſorgli*; or *hard pricking large ſea-ruſh*. *Dale*, Pharm. p. 258. See JUNCUS.

OXYTOCHA, in medicine, a term uſed by many authors to expreſs ſuch medicines as are given to promote delivery.

OXYTRIPHYLLUM, in botany, a name uſed by ſome authors for the *trifolium bituminoſum*, or *ſtinking trefoil*. *Chabræus* p. 110.

OYSTER, or OISTER, *oſtrea*, in zoology. See the article OSTREA.

The *oiſter* affords the curious in microſcopic obſervations a very pleaſing entertainment. In the clear liquor many little round living animalcules have been found, whoſe bodies being conjoined, form ſpherical figures, with tails not changing their place otherwiſe than by ſinking to the bottom, as being heavier than the fluid; theſe have been ſeen frequently ſeparating, and then coming together again. In other *oiſters*, animalcules of the ſame kind were found, not conjoined, but ſwimming by one another, whence they ſeemed in a more perfect ſtate, and were judged by Mr. Lewenhoek, to be the animalcules in the row or ſemen of the *oiſter*.

A female *oiſter* being opened, incredible multitudes of ſmall embryo *oiſters* were ſeen, covered with little ſhells, perfectly tranſparent, and ſwimming along ſlowly in the liquor: and in another female, the young ones were found of a browner colour, and without any appearance of life or motion.

Monſieur Job'ot alſo kept the water running from *oiſters* three days, and it appeared full of young *oiſters* ſwimming about nimbly in it; theſe increaſed in ſize daily, but a mixture of wine, or the vapour of vinegar, killed them.

In the month of Auguſt *oiſters* are ſuppoſed to breed, becauſe young ones are then found in them. Mr. Lewenhoek, on the fourth of Auguſt, opened an *oiſter*, and took out of it a prodigious number of minute *oiſters*, all alive, and ſwimming nimbly about in the liquor, by means of certain exceeding ſmall organs, extending a little way beyond their ſhells; and theſe he calls their beards. In theſe little *oiſters* he could diſcover the joinings of the ſhells, and perceived that there were ſome dead ones, with their ſhells gaping. Theſe, tho' ſo extremely minute, are ſeen to be as like the large *oiſters* in form, as one egg is to another.

As to the ſize of them, he computes, that a hundred and twenty of them in a row would extend an inch; and conſequently, that a globular body, whoſe diameter is an inch, would, if they were alſo round, be equal to a million, ſeven hundred and twenty-eight thouſand of them. He reckons three or four thouſand are in one *oiſter*, and found many of the embryo *oiſters* among the beards; ſome faſtened thereto by ſlender filaments, and others lying looſe: he likewiſe found animalcules in the liquor five hundred times leſs than the embryo *oiſters*. *Lewenhoek* Arcan. Nat. T. 4. p. 513.

It is not very uncommon to ſee on *oiſter* ſhells, when in a dark place, a ſhining matter or bluiſh light, like a flame of brimſtone, which ſticks to the fingers when touched, and continues ſhining and giving light for a conſiderable time, tho' without any ſenſible heat. This ſhining matter being examined with a microſcope, was found to conſiſt of three ſorts of animalcules: the firſt, whitiſh, and having twenty-four or twenty-five legs on a ſide, forked, a black ſpeck on one part of the head, the back like an eel with the ſkin ſtripped off. The ſecond ſort, red, reſembling the common glow-worm, with folds on its back, but legs like the former; a noſe like a dog's, and one eye in the head. The third ſort, ſpeckled, with a head like a ſoal, with many tufts of whitiſh hairs on the ſides of it. Some much larger and greyiſh might be ſeen, having great heads, two horns like a ſnail's, and ſix or eight whitiſh feet; but theſe did not ſeem to ſhine. Philoſ. Tranſact. N. 279.

As the bodies of lobſters, and ſome other ſorts of fiſh, tainted fleſh, rotten wood, and other ſubſtances, are ſometimes found to ſhine with a light like that on *oiſter* ſhells, may it not very probably proceed from the ſame cauſe? Some alſo have gone ſo far as to imagine the willow-wiſp, ſo common in fenny countries, to be only a collection of flying inſects, which emit light from ſome part of their body, as the glow-worm and lantron-fly do; and the place, motion, and ſome other circumſtances of that lambent flame, as it is called, ſeem, indeed, not a little to favour that conjecture. *Baker's* Microſcope, p. 241.

Foſſile-OYSTERS. The greateſt bed of *foſſile-oiſters* any where known of, is that near Reading, in Berkſhire. They have the entire ſhape, figure, and are of the ſame ſubſtance with the recent *oiſter* ſhells, and yet muſt have lain there for a long time, the oldeſt hiſtories that mention the place giving an account of them. They are extended over no ſmaller a ſpace than ſix acres of ground, and juſt above them there is a large ſtratum of a greeniſh loam, called by ſome writers a green earth, and by others a green ſand. It is compoſed of a crumbly marle, and a very large portion of ſand. Under them there is a thick ſtratum of chalk. They all lie in a level bed, and as the ſea comes no where near this part of the kingdom, it ſhould ſeem, that the deluge only could give place to them here. It has been idly imagined by ſome, that the Roman ſoldiers once quartered there, threw away theſe ſhells from the *oiſters* they fed on in vaſt quantities, but this is anſwered by obſerving, that the ſtrata above the ſhells are natural, and have never been dug thro' till the time of finding the ſhells.

The *oiſter* ſhells and green earth together, make a ſtratum of about two foot thick; and over this, a much thicker ſtratum, of a bluiſh and very brittle clay, but this has never been dug through, except where we find the ſhells. The people call this *piercy-clay*, and ſay it is fit for no uſe. This bed of clay is about a yard deep, and above it is a ſtratum of fuller's earth, about two foot and an half deep. It is of a very good kind, and is uſed by the clothiers. Over this there lies a ſtratum of a fine white ſand, unmixed either with the clay or fuller's earth: this is near ſeven foot deep, and above this there is a ſtratum of a ſtiff red clay, of which they make tiles in the place. This is covered with a little vegetable mould, and the depth of this ſtratum of tile-clay cannot be aſcertained, becauſe of the unevenneſs of the hill.

Theſe *oiſters* are ſometimes found whole, but more uſually in ſingle ſhells. When they are in pairs, there is uſually ſome of the green ſand found within them: they ſeldom ſtick very faſt together, ſo that unleſs very carefully taken up, it is not eaſy to get them in pairs. Phil. Tranſ. N. 261, p. 484.

OYSTER-*ſhells*. Theſe are an alcali of a more powerful kind than is commonly ſuppoſed, and probably are in reality much better medicines than many of the more coſtly and pompous alkalies of the ſame claſs. The proof of alkalies is in their ſolution by acid ſpirits; and Mr. Homberg found, that they diſſolved much more eaſily in the acids of nitre and ſea-ſalt, than pearls, coral and the reſt; which he ſuppoſes owing to their containing in the body of the ſhell a conſiderable portion of ſal-ſalſus, which is eaſily perceived upon the tongue, and which keeps the whole ſubſtance of the ſhell in a ſort of half diſſolved ſtate. Theſe ſhells are found to produce very great effects on the ſtomach, when injured by acid humours; and Mr. Homberg is of opinion, that this their eaſineſs of ſolution is one great reaſon of their good effects, and that the quantity of ſal-ſalſus

which

which it contains, contributes not a little towards it, ſince we are not to look upon that as a mere ſalt, but a ſalt of a peculiar kind, formed of ſea ſalt by the organs of the animal, and the ſeveral fermentations it undergoes in the body of it, in the ſame manner as the nitrous and other ſalts of the earth ceaſe to be nitrous, *&c.* as ſoon as they have been blended with the juices of plants, and form with them a ſalt peculiar to that plant; and this is plainly the caſe in regard to this ſalt, ſince it is evidently of a more penetrating taſte, and of a different ſmell, from the ſalt left by the ſea water between the ſeveral external ſcales, or flakes of the ſhell.

As *oiſter* ſhells were found by Mr. Homberg to be a very valuable medicine, and as one of the common methods of preparing them is by calcination, which he obſerves cannot but much impair their virtues, he gives the following method of preparing them for taking inwardly, which was what he always uſed:

Take the hollow ſhells of the *oiſters*, throwing away the flat ones as not ſo good; waſh them perfectly clean, and then lay them to dry in the ſun; when they appear dry, beat them to pieces in a marble mortar, they will be then found to contain yet a large quantity of moiſture; lay them again in the ſun till perfectly dried, and then finiſh the powdering them, and ſift the powder thro' a fine ſieve. Give twenty or thirty grains of this powder every morning, and continue it three weeks or a month. Mem. Acad. Par. 1700.

OYSTER-*worm*, in natural hiſtory, a name given by writers to a kind of ſmall worm found in *oiſters*, which ſhines in the dark, in the manner of the glow-worm; but with an univerſal light, and not in a peculiar part only, like this animal.

The firſt obſerver of theſe *oyſter-worms* was Mr. De Lavoye, who communicating his obſervations to Mr. Auzout, gave occaſion to a very diſtinct account of them from this author.

The firſt thing that preſents itſelf on the opening the *oiſters* which contain theſe worms, is only a ſort of ſhining clammy moiſture, which appears like a ſtar of a blueiſh colour, and being drawn out, will extend itſelf to near half an inch long, and ſhine as much for that whole length as in the contracted ſtate: it will alſo ſhine for ſome time after it is taken out of the *oiſter*.

On a ſtricter obſervation, theſe ſhining ſubſtances are found to be real living worms, and there are indeed three diſtinct ſpecies of them. One ſort is whitiſh, and has twenty-four or twenty-five feet on each ſide: there is a black ſpeck on one ſide the head, and the back exactly reſembles that of an eel, when the ſkin is ſtriped off. The black ſpeck in the head is certainly an eye, and it is remarkable that the creature has but one. The ſecond ſort of theſe worms, is red: this alſo has but one eye: its body is made up of ſeveral rings; its noſe is like that of a dog, and it has the ſame number of feet with the former. The third ſort is very different from the other two; it is ſpeckled, and its head is like that of a ſoal, and has a tuft of hair on each ſide. There are other worms found alſo in the *oiſter*, particularly a large greyiſh one with two horns, a great head, and ſeven or eight whitiſh feet; but theſe do not ſhine. The two firſt ſorts are eaſily miſtaken for ſhining moiſture only, their ſubſtance being ſo tender, and eaſily reſoluble, that on the leaſt ſhaking or touching, they turn into a viſcous jelly. This, however, has the property of ſhining as much as the living worm, and when taken from the ſhell, will ſhine on the obſerver's fingers for twenty or thirty ſeconds; and if any part of this matter be let to fall to the ground, it ſhines as long, and exactly reſembles a piece of burning brimſtone. Sometimes when ſhaken off nimbly, it becomes a ſhining line, which diſſipates itſelf before it comes to the ground. The ſhining matter in this caſe, is in ſome whitiſh, in others reddiſh; but yet in both caſes it gives a violet appearance to the eye. The white ones are the tendereſt of all: theſe ſo eaſily burſt, and become a mere lump of jelly, that if it were not for the feet which are ſeen among it, one would ſcarce imagine that they were ever worms, or any thing living. When they are large and robuſt, they move their heads and tails about, and this is a great addition to the luſtre of their ſhining; every motion of this kind giving a flaſh of light brighter than the reſt. On forcibly ſhaking the *oiſter* in the dark, the whole ſhell is ſometimes ſeen full of lights, which are now and then as big as the finger's end; after this, a great deal of this clammy matter, both red and white, may be obſerved; ſo that it is probable great numbers of the worms are burſt in their holes. In the ſhaking it may be diſtinguiſhed, that their holes run into, and communicate with one another, like the holes made by worms in wood. This light occurs more frequently in large, than in ſmall *oiſters*: there are few of theſe large ones that do not yield it in the ſhells, and in ſome it is ſeen in the *oiſters* themſelves.

Thoſe ſhells which are viſibly pierced by the worm, more frequently emit the light than thoſe which are not; and the convex ſhell more than the flat one. The worms are not apt to give light when irritated, but if they do, it laſts only a little time; but when they are at reſt, the light they give uſually laſts ſeveral hours. The outſide of the ſhell being a little ſcaled, the communication of the holes may be ſeen; the form of the worms is generally deſtroyed in doing this, but there is the jelly like moiſture left, and this ſmells like the *oiſter* liquor. Journal de Scavans, 1666.

OZE, a word uſed by ſome writers to expreſs a *fœtor*, or *ill ſmell of the mouth*.

OZEMAN, a word uſed by ſome of the chemical writers for the white of an egg.

OZO, a word uſed by ſome of the chemical writers for *arſenic*, or *ratsbane*.

P.

PABOS, in botany. See CAAMINI.

PACA, in zoology, the name of an American animal of the Guinea-pig kind, having the general characters of the rat kind, and the voice and hair of the hog.

This is the largeſt of all the animals of this kind, being of the ſize of a ſmall pig, and uſually very fat. Its head is like that of a rabbit, and its beard long, and reſembling that of the hare: its ears are naked, and a little pointed; its noſtrils very wide and large; the upper chop is longer than the under one, and the hinder legs than the fore ones. Its feet have all four toes a-piece; its hair is hard and harſh, like that of a hog, and of a duſky brown colour: it has ſeveral grey ſpots diſpoſed in a longitudinal direction along the ſides, and its belly is white. It does not uſe its fore feet in the nature of hands, as the other ſpecies do, but eats it on the ground in the manner of the hog. It is uſually fat, and the fleſh very well taſted. *Ray*'s Syn. Quad p. 226.

PACAMO, in zoology, the name of a long-bodied fiſh of the muſtela kind, caught among the rocks, and of a very well-taſted fleſh. It is uſually about eleven fingers long, and grows narrower and ſmaller toward the tail. Its head is large, broad, and thick. Its mouth is of the ſhape of a half-moon, and has very ſolid, but not ſharp teeth. Its eyes are ſmall, black, and placed very cloſe together. Behind the gills are two fins ſoft and skinny; and lower on its belly, two more. Its back and belly fin, which runs from the middle of the back to the anus, is very ſoft and ſkinny alſo; the tail fin is more than a finger long, and is ſkinny like the reſt. The ſkin is ſmooth, and has on each ſide four rows of white ſpots running from the gills to the tail. Its ſkin eaſily ſlips off from the body like that of an eel. *Marggrave*'s Hiſt. Braſ. p. 113.

PACHODECARHOMBIS, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ.

The word is derived from the Greek παχυς thick, δεκα ten, and ῥομβος, a *rhombus*, and expreſſes a thick rhomboidal body, compoſed of ten planes. See Tab. of Foſſ. Claſs 2.

The characters of this genus are, that the ſelenitæ of it conſiſt of ten planes; but as the top and bottom in the leptodecarhombes, or moſt common kind of the ſelenitæ, are broader and larger planes than any of the reſt, the great thickneſs of this genus, on the contrary, make its four longer planes in all the bodies of it, meeting in an obtuſe angle from its ſides, its largeſt planes. *Hill*'s Hiſt. of Foſſ. p. 120.

Of this genus there are only four known ſpecies: 1. A very pellucid one, with ſlender tranſverſe ſtriæ. This is frequent in the clay-pits of Northamptonſhire, and ſome other counties; and the ordinary people have an opinion, that it is good to ſtop hæmorrhages; whence it has acquired among them the common name of *ſtaunch*. 2. A dull-looking kind, with very fine tranſverſe filaments. This is found in the clay-pits of Northamptonſhire, Staffordſhire, and Yorkſhire. 3. A fine and beautiful kind, with very ſlender longitudinal filaments. This is common in Yorkſhire, and ſeems almoſt peculiar to that county; it is not only found there in digging, but frequently lies on the ſurface of the earth. And 4. A brown pellucid kind, found very frequently in Germany, and ſometimes in England. *Hill*'s Hiſt. of Foſſ. p. 130—133.

PACHUNTICA, a term uſed by ſome medical writers to expreſs incraſſating medicines.

PACOS, in zoology, the name of a ſpecies of camel, uſually, but very improperly accounted a ſpecies of ſheep; and known among many by the name of the *Indian ſheep*, or *Peruvian ſheep*.

It very much reſembles that ſpecies of camel uſually known by the name of *glama*, and found in the ſame countries; but this is much ſmaller, and is much leſs tractable, and a very obſtinate animal.

The reaſon of this creature's having been accounted a ſheep, is, that its hair is ſo long as to reſemble wooll, and it is cloathed prodigiouſly thick with it. Its head and neck alone, have more wooll on them than the whole body of our largeſt ſheep. Its body is cloathed in the ſame proportion with a woolly hair, equally fine. It is a much weaker creature than the glama, and is never uſed for carrying burthens, but is kept as our ſheep for the ſake of its wooll and its fleſh, which is very well-taſted, and is a rich food. *Ray*'s Syn. Quad. p. 147.

PACQUING, in natural hiſtory, a name given by the people of the Philippine iſlands to a ſmall bird of the ſparrow kind, but very beautifully variegated. It feeds on the ſeeds of graſs.

PADDLE, in glaſs-making, the name of an inſtrument with which the workman ſtirs about the ſand and aſhes in the calcar. *Neri*'s Art of Glaſs, Appendix.

PÆCILIA, in ichthyology, a name given by Schoneveldt [a], and ſome others [b], to the fiſh called by moſt authors the *muſtela foſſilis*. It is properly a ſpecies of *cobitis*, and is called by Artedi the *bluiſh cobitis*, with five longitudinal black lines on the body.—[[a] *Schonoveldt* de Piſc. [b] *Willughby*'s Hiſt. Piſc. p. 124.]

PÆDARTHROCACES, in ſurgery, is a diſeaſe of the bones, raiſing them into tumors near the joints, and differing from the ſpina ventoſa, in that it is not attended either with violent pains, or eroſions of the bone and adjacent parts. The word is derived from the Greek παις a child, αρθρον a joint, and κακον an evil, ſignifying that it is a diſorder of the joints, to which children are principally ſubject; which is the caſe, becauſe the bones of children being ſofter than thoſe of adults, are therefore the more eaſily diſtended by humors, and more frequently raiſed into tumors: theſe are hard in this caſe, and the adjacent ſoft parts are not inflated, and are free from redneſs, inflammation and pain. It is, however, to be obſerved, that this diſorder, tho' at firſt very different from the ſpina ventoſa, is ſometimes known to degenerate into that diſorder. *Heiſter*'s Surg. p. 261.

PÆDEROTA, in botany, a name by which Linnæus has diſtinguiſhed a plant nearly related to the veronicæ or ſpeedwells, and called *bonarota*, by Micheli. This, in the Linnæan ſyſtem of botany, is alſo a diſtinct genus of plants, the characters of which are, that the cup is a perianthium, divided into four ſegments, and remaining after the flower is fallen. The ſeveral ſegments are ſtrait and pointed; the flower is compoſed of a ſingle petal, which forms a cylindric tube, nearly of the length of the cup, placed erect at its extremity, and divided into two labia; the upper of which is long, hollow, and narrow; the under expanded, but ſomewhat erect, broadeſt in its upper part, lightly divided into three ſegments, and thoſe all equal. The ſtamina are two filaments bent downward, and of the ſame length with the cup: the antheræ are ſomewhat erect: the piſtil has a roundiſh germen, a thread-like ſtyle of the ſame length with the ſtamina, and a truncated ſtigma. The fruit is a flatted capſule of an oval figure, but bifid and pointed at the top, conſiſting of two cells with four valves. The ſeeds are very numerous, oblong, and obtuſe, and adhere to a columnar receptacle. *Linnæi* Genera Plantar. p. 4.

PÆDEROTA, among ſome of the old botanical writers, is alſo a name given to the *acanthus*, or *bear's-breech*. *Ger.* Emac. Ind. 2.

PÆDOTHYSIA, παιδοθυσια, in antiquity, an inhuman cuſtom that prevailed among the antient Heathens of ſacrificing their children. Thus it is related in the Scriptures, that the king of Moab being beſieged by the Iſraelites in his capital, and reduced to great ſtraits, took his eldeſt ſon that ſhould have reigned in his ſtead, and offered him for a burnt offering upon the wall, on which the ſiege was raiſed. 2 *Kings* iii. 27.

From Phœnicia this cruel practice paſſed into Europe, and Africa, and ſpread itſelf far and wide: and it is reported, that the Mexicans are, at preſent, guilty of it. *Hoſm.* Lex. in voc.

PÆNULA, among the Romans, a thick garment fit for a defence againſt cold and rain. *Pitiſc.* Lex. Ant. in voc.

PÆONIA, *piony*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the roſaceous kind, conſiſting of ſeveral petals diſpoſed in a circular form. The cup is alſo compoſed of ſeveral leaves, and from it ariſes a piſtil, which finally becomes a fruit, compoſed, as it were, of ſeveral capſules collected into a head: theſe all bend downwards, and are uſually hoary; they ſplit open longitudinally when ripe, and contain roundiſh ſeeds.

The ſpecies of *piony*, enumerated by Mr. Tournefort, are theſe: 1. The common male *piony*, with a ſhining blackiſh flower. 2. The male *piony*, with fleſh-coloured flowers. 3. The white-flowered male *piony*. 4. The male *piony*, with larger ſegments to the leaves. 5. The great male *piony*, with fleſh-coloured flowers. 6. The late flowering male *piony*. 7. The common female *piony*. 8. The narrower-leaved female *piony*. 9. The broader-leaved female *piony*. 10. The dwarf roſe-flowered winter *piony*. 11. The purple-flowered *piony*, with finely divided leaves, hoary underneath. 12. The whitiſh-flowered *piony*, with leaves hoary underneath. 13. The aquiline-leaved *piony*. 14. The orange-coloured *piony*. 15. The *piony* with variegated flowers. 16. The *piony* with very deep-red flowers. 17. The Conſtantinople *piony*, with pale-red flowers. 18. The large-flowered double deep red *piony*. 19. The ſmaller-flowered double deep red *piony*. 20. The common *piony*, with double large pale red flowers. 21. The common *piony*, with ſmaller double pale red flowers. 22. The ſmaller-flowered whitiſh double *piony*. *Tourn.* Inſt. p. 273. See PIONY.

PÆONITES, in natural hiſtory, a name given by ſome writers to the ſtone called by others *pæanites*, and eſteemed of great

uſe to women in labour. It ſeems to have been called *pæonites*, from Pæonia in Macedonia, where it was found.

PAGANELLUS, in ichthyology, the name of a fiſh of the ſea-gudgeon, or rock-fiſh kind, called by authors *gobius maximus marinus flaveſcens*. This name, however, which was given it by Rondeletius, is a very erroneous one, ſince it is ſmaller than the common kind, which it much reſembles; it is alſo of a paler colour, and has a fine yellow line ſurrounding the edge of its firſt back fin, and has but a ſlight furrow on its back, whereas that has a much larger one. Its head alſo is ſhorter, and its jaws more tumid; and its belly fins more regularly connected into the ſhape of a funnel. It is common in the Mediterranean and other ſeas, and is frequently brought to market at Rome, Venice, &c. *Willughby*'s Hiſt. Piſc. p. 207. See the article GOGET.

PAGANINA, an Italian word uſed by ſome authors to expreſs the firſt excrements of children: theſe dried and reduced to power, are eſteemed by ſome a very great and powerful medicine againſt epilepſies. It is to be taken in ſmall doſes every day, for ſome time.

PAGEL, in ichthyology, a name given by the Spaniards to that fiſh which authors in general call the *erythrinus*, or *rubellio*, and ſome the *xathus* and *pagrus*. It is properly a ſpecies of the *ſparus*, and is diſtinguiſhed by Artedi from the reſt of that genus, by the name of the *ſilver-eyed red bodied ſparus*. See the article SPARUS.

PAGOYUM, a word uſed by Paracelſus and his followers, to expreſs an imaginary being which preſides over, or is the occaſion of diſeaſes, whoſe cauſes are leſs known, and which have been ſuppoſed to ariſe from inchantment. Such is the doctrine of this ſtrange writer, and on this ſubject he has written a treatiſe called *Pagoyus*.

PAGRUS, in ichthyology, the name of a ſea-fiſh, known in Engliſh by the name of the *ſea-bream*. It is a conſiderably large fiſh, growing ſometimes to ten or twelve pounds weight. It is very broad in proportion to its length, and is alſo conſiderably thick; its head is flatted at top, and at the baſis of the gill fins, it has on each ſide a large black ſpot. Its gill-fins are large and long, and the extremities of all its fins are hid, and as it were involved in ſkin, which is a very ſingular circumſtance in regard to this fiſh. The eyes are large, and their hairs white, and the mouth is frequently of a fine red within; it has broad teeth in the forepart of its mouth, and rough tubercles in the place of teeth in the hinder. Its tail is forked, and it has one long back-fin; the nerves, or rays of the anterior part of which are ſharp and prickly, and thoſe of the hinder part ſoft and ſmooth to the touch. It is caught in conſiderable plenty in the Mediterranean, and is common in the markets of Italy. Some account it a very delicate fiſh, but many think it eats too dry. See Tab. of Fiſhes, N. 58. *Aldrovand* de Piſc. l. 2. c. 7. *Rondelet.* de Piſc. l. 5. c. 15. p. 142. *Geſner* de Piſc. p. 173.

PAGRUS is alſo uſed by Joannes Cuba, and others, for the fiſh commonly called *dentex*, the *ſynodon*, and *ſynagris* of the Greeks. It is a ſpecies of the ſparus, and is accurately diſtinguiſhed by Artedi, by the name of the *variegated ſparus*, with a ſharp back, and with four large teeth. See SPARUS.

PAGRUS is alſo a name given by Paulus Jovius, and ſome other authors, to the fiſh called *erythrinus* and *rubellio*, and by Appian, *xathos*. It is of the ſparus kind, and is diſtinguiſhed by Artedi, by the name of the *ſilver-eyed red bodied ſparus*. See PAGAL.

PAGRUS *indicus*, a name by which ſome authors have called the Eaſt Indian fiſh, more uſually known by the name of *brama ſaxatilis*. *Ray*'s Ichthyology, Append. p. 1. See the article BRAMA *ſaxatilis*.

PAIN *d'abeiles*, a word uſed by ſome to expreſs the yellow ſubſtance found concreted in lumps on the legs of bees, and ſuppoſed by the generality of the world to be real wax.

Experiments made by Mr. Reaumur and others, have ſufficiently proved that this ſubſtance is not wax, nor has it any of the properties of wax; but it alſo appears, that it is the matter out of which wax is finally made.

In tracing this ſubſtance up to its origin, we find that the bees collect the farina of flowers, which when moulded by their feet into a lump, makes this matter. It is very probable that they feed on this matter, and that after paſſing thro' certain changes in their bodies, it becomes wax. This was an opinion ſo old as the days of Pliny; ſome of the authors he quotes calling this ſubſtance *ambroſia*, or the food of theſe little deities; but late obſervations overthrow this opinion, till it again got credit under the more accurate examinations made by Mr. Reaumur, on the ſtructure and parts of the bee.

Swammerdam exploded this notion, from the orifice of the trunk of the bee being infinitely too ſmall to give admiſſion to this matter, the ſeveral particles of which always retained, in the lumps, their original form and ſize; and the opinion eſtabliſhed by this author, of the bees receiving nouriſhment only by its trunk, made it neceſſary to ſuppoſe, that only honey, or the ſaccharine juices of vegetables, could be the food of this creature; ſince nothing ſolid could poſſibly be received thro' that minute orifice: but Mr. Reaumur has ſuſpected even the exiſtence of any ſuch orifice, or any aperture at all in the trunk, and has plainly proved, that the bee has a real mouth, and that large enough to receive ſolid food. This mouth is ſituated in the anterior part of the head, very near the origin of the trunk, and by means of this, the yellow matter collected on the thighs may be eaſily received into the body, and thence evacuated again in form of wax; all the parts of its compoſition having been received as nouriſhment by the animal, except this indiſſoluble ſubſtance. The poſſibility of the bees feeding on this matter, is not, however, all the argument we have in favour of this opinion; for it is evidently ſeen on diſſecting them, that they really do feed on it, their ſtomachs being uſually found filled with it, and that in its proper form, the figures of the globules not being deſtroyed.

This is a food not only eaten occaſionally by the bees, but neceſſary to their ſupport, and is found ſtored up in their hives againſt a bad ſeaſon. The combs have their different cells made for different purpoſes; and beſide that, ſome are deſtined for receiving honey, and ſome for the young worms which are hereafter to become bees; there are ſome alſo which ſerve to contain this yellow matter, collected on the legs of theſe inſects. In fine weather, when more of this matter is collected than is eaten for immediate nouriſhment, the bees ſcrape off the lumps of it from their legs into ſome of the holes, or cells of the combs, where others following their example, there finally become large reſerves of it; which are eaten on ſuch days as they cannot go out in ſearch of more.

When one bee has depoſited her load of this matter in a cell, and is flown out to work again, another always enters immediately head foremoſt into the cell, and flats and preſſes down the matter into the bottom of the cell; others afterwards depoſit more of it, and others ſtill repeat the work of preſſing it down; and as they preſs it, they break and bruiſe it with their teeth, and pour in ſome of their honey upon it, and by this means they finally compleat the magazine of food, by rendering the mixt maſs in condition to keep, and to be taken out with great eaſe upon occaſion. It is evident from all this, that the yellow matter collected on the thighs of bees, and uſually ſuppoſed to be wax, is really a ſubſtance which ſerves for the food of the bees, and that after it has been diveſted of the nutritious matter it contained, it is again thrown out of the body in form of wax. It might be naturally ſuppoſed from this, that the wax was an excrement voided by way of fæces thro' the anus; but this is by no means the caſe, what is voided by that paſſage is true fæcal matter, of no farther uſe or ſervice to the animal; and the wax in its perfect form is voided out of the body by the ſame paſſage by which it was taken in while in its rough ſtate, that is, by the mouth; and is, on being thus voided, immediately worked into cells, &c. by the teeth of the animal. This was a diſcovery in the œconomy of this little animal reſerved for that excellent naturaliſt Reaumur.

Swammerdam, who had ſtudied the creature's operations very accurately, had been in no condition to obſerve this particular, for want of the advantage of glaſs hives; and Maraldi, tho' he had theſe, yet had them ſo ill conſtructed, that they could not give him an opportunity of ſeeing with ſufficient accuracy.

The teeth of the bee, tho' the principal part concerned in the working the wax, are not, however, the only part; the tongue of the creature is very greatly aſſiſtant on the occaſion: it is darted with incredible velocity on the ſeveral parts of the work, and ſeems to do great matters toward the forming it. Beſide this, the bee has a method of rendering the wax fit for receiving any form, in a manner we do not know any thing of. In order to manage this ſubſtance, we are obliged to heat it, and it ſo becomes ductile; but this is not in the power of the bee, and muſt be of very deſtructive conſequence to the whole if it was, ſince the circumjacent parts muſt be heated, as well as that on which it was at work, and then they would burſt with the load of honey they contain, or break under the weight of the bees at work on them: as this would be a deſtructive method, nature has given the animals another; ſhe has furniſhed them with a liquid, with which, when the wax is properly wetted, it becomes as ſoft as a gum, and as ductile as the filaments of ſilk when ſpun from the caterpillar.

The bee collects this yellow matter, which is the prime conſtituent of the wax, from whatever flowers happen to be moſt plentiful about the hives; and tho' generally yellow, as the farina of moſt plants is ſo, yet it is ſometimes ſeen in red, or green lumps on their thighs; but whatever be its natural colour, it is always turned yellow before it is diſcharged from the body of the animal; and when the ſtomach of any of them is diſſected, after the feeding on a red ſubſtance collected from flowers, the farina of which is of that colour, the change is found to be made as to colour in this part, for the whole is found there in form of a yellow jelly. This matter, if taken out of the ſtomachs of ſeveral bees and dryed, is found to be of a diſagreeable ſmell, like fermented matter, and of a pungency ſomewhat reſembling that of the volatile ſalts. Mr. Reaumur was hence induced to try the effect of the volatile ſalts in turning the bees bread, or rough wax, into perfect wax by digeſtions, continued a long time, but in vain. If we may give credit, however, to the German

man Ephemerides, there is a much more eaſy way of reducing this matter, while yet contained in the apices of the plant, into true wax; and that without the aſſiſtance of the work of the bees. Mr. David Maja gives an account in thoſe papers, that the perſons he employed in beating roſes into conſerve, always obſerved in the pounding of the roſes, before the ſugar was put to them, that a piece of ſolid but ſoft matter was found adhering to the peſtle of the mortar, which, on a ſtrict examination, proved to be true and genuine wax. It appeared from this experiment, that the juice of the petals or leaves of the roſes, was able, by the aſſiſtance of beating, to convert into true wax the farina contained in the apices of that flower. Mr. Reaumur tried what effect the juice of roſes would have on the yellow matter collected on the legs of the bees and on the farina of plants, but no treatment he could give theſe ſubſtances was ever able to produce wax.

Mr. Reaumur brought it to an abſolute proof, that the bees eat the rough wax or bees bread, by obſerving the bees of a certain hive to come home loaded with it every day, ſeveral times over, during the month of April and a great part of May; and after this, opening and examining the hive they belonged to, there were found no new combs, nor were the old bees enlarged in ſize: it is true, that there were ſome cells found, filled with magazines of this matter, but as the far greater part was brought to no ſort of account, it ſeems very plain that they had eat it. It is to be obſerved, that the bees have their ſeveral periods of going out in ſearch of this matter and of honey: it would be too fatiguing for them to be always thus at work, and to avoid this there is always a very large part of them, even more than half the hive, found at reſt within it; theſe are ſuch as have worked till they are tired, and the others in turn take this manner of reſting, and ſend theſe out to work again. *Reaumur*'s Hiſt Inſ. Vol. X. p. 68. See WAX.

PAINTED *lady*, among the floriſts, a term for a particular ſort of carnations, the flowers of which have all their petals red or purple on the out ſide, and white underneath.

PALA, in botany, a name by which ſome authors have called the *nutmeg-tree*. *Piſo*, Mant. Arom. p. 173.

PALA, in zoology, a name uſed by ſome authors for a fiſh of the truttaceous kind, more uſually known by the name of *ferra*. *Willughby*'s Hiſt. Piſc. p. 185. See the article FERRA.

PALÆSTE, the name of a Greek meaſure of length, being the ſame with the *dochme* and *doron*, and containing four finger-breadths, or digits.

PALALACA, in natural hiſtory, the name given by the people of the Philipine iſlands to a bird common among them, and ſomewhat reſembling the *upupa*. It has a very coarſe and harſh voice; its head is brown, and has a comb or creſt of feathers like the *upupa* or *hopoe*; its beak is as ſtrong as iron, and in the building ſeaſon it cuts its way with this into the firmeſt part of trees, and builds its neſts in the holes it makes in this manner; it is of the ſize of a common hen, and is of a very beautiful green colour, ſometimes variegated with other colours, ſometimes plain. This is the deſcription Father Camelli gives of this bird, and it ſeems very plainly to be a ſpecies of *woodpecker* of a very large and beautiful kind. They have got an opinion there, that if the opening into this creature's neſt be ſtopped up with a large iron pin, the bird knows a plant which has the effect of ſoftening iron; and that it procures this plant, and applying it to the iron ſoon makes its way in. A ſtory ſomething like this the common people of England alſo have of the *woodpecker*.

PALALIA, in botany, a name uſed by ſome authors for the *cyclamen* or *ſowbread*. *Ger.* Emac. Ind. 2. See CYCLAMEN.

PALAPARIJA, in zoology, the name of a ſpecies of Eaſt India ſerpent, found in the iſland of Ceylon. It is a large kind, and beautifully variegated in colour, with a great deal of red about it. It is one of thoſe ſpecies which naturally live under ground. *Ray*'s Syn. Anim. p. 33.

PALARIA, among the Romans, a kind of excerciſe performed at a ſtake by the ſoldiers.

The ſtake being fixed immoveable in the ground, and ſix feet high above it, the young undiſciplined ſoldiers advanced againſt it armed with a hurdle and cudgel, inſtead of a ſhield and ſword, and went through all the rules of attack and defence, as if actually engaged with an adverſary. Sometimes they ſtood at a diſtance, and attacked it with miſſive weapons, at the ſame time uſing all the requiſite motions for defending themſelves, and warding off what might be thrown againſt them. *Pitiſc.* Lex. Ant. in voc.

PALATE (*Cycl.*)—Wounds of the *palate* and other parts of the mouth are only to be healed by being anointed with honey of roſes, either alone or mixed with balſam of Peru, or with oil of myrrh *per deliquium*. *Heiſter*'s Surg. 81.

Bones of the PALATE. There are two bones ſituated in the poſterior part of the arch of the *palate*, between the *pterygoide apophyſis* and the *oſſa maxillaria*, and running up on the ſides of the *naſal foſſæ* all the way to the bottom of each orbit. The figure of theſe bones is not ſquare, as has been ſaid by thoſe who have only ſeen that portion of them which belongs to the *palate*, and from thence have named them *oſſa palati*. The entire bone is crooked, hooked, pointed and uneven, tho' of a ſmall ſize. Each of theſe may be divided into four portions, one ſuperior, one middle, and two lower; whereof one is the anterior, the other the poſterior.

The lower and anterior portion, to be called properly the *portio palatina*, is the baſis or body of the bone, and the only part of it which the antient anatomiſts, except Vidus Vidius, have obſerved. It completes the arch of the *palate*, and the bottom of the *naſal foſſa*; the inner edge of it is raiſed, and that, joined to the like edge of the other bone, forms a groove which receives part of the *ſeptum narium*, in the ſame manner as the other part of it is received in a like groove of the *oſſa maxillaria*. The poſterior edge is gently ſloped, and ends inward in a point, which joins a like point in the other bone.

The lower and poſterior portion, to be called properly the *pterygoide*, is pointed and hollowed on each ſide, to join the *pterygoide apophyſis*, of which it completes the *foſſa*, being fixed like a wedge in the irregular notch of that proceſs. Exteriorly it is uneven, the better to be connected with the *os maxillare*. This portion is diſtinguiſhed from the *portio palatina*, and alſo from the middle portion, by an oblique half canal, which with the half canal in the maxillary tubercle, forms an entire canal, the lower end of which is the poſterior *foramen palatinum*.

The middle portion, properly to be called the *naſal*, is very thin, and is ſituated laterally. The internal ſide of it is a little concave, the outſide a little convex; the concavity is turned toward the nares, and at the lower part of it there is a tranſverſe eminence or bony line, which diſtinguiſhes this portion from the *portio palatina*. The convex outſide partly covers the opening of the maxillary lines. At the lower part of it is a tranſverſe groove, anſwering to the eminence on the other ſide, and moulded, as it were, by the tranſverſe exterior eminence of the *os maxillare*.

The upper portion, properly called the *orbitary portion*, is diſtinguiſhed from the *naſal portion* by a notch, which, together with the *pterygoide apophyſis* of the ſpheroidal bone, forms an opening more or leſs conſiderable, which may be called the *foramen ſpheno-palatinum*, or *pterygo-palatinum*. This portion has five little ſides, three of which are rather cavities. One ſuperior, which completes the extremity of the bottom of the orbit, and is more or leſs flat, very ſmall, ſmooth, and triangular. One anterior, which is a little hollow, covering the upper part of the maxillary tubercle, and by a ſmooth raiſed edge compleating the *fiſſura ſpheno-maxillaris*. The third ſide is likewiſe anterior, more hollow than the former, and joins the back part of the labyrinth of the *os ethmoides*. The fourth is poſterior, and more or leſs hollow, anſwering to the ſphenoidal *ſinus*. The fifth is lateral and external, covering the poſterior and upper part of the maxillary *ſinus*. Theſe ſides and cavities, however, ſometimes vary; being in ſome ſubjects found ſingle, in others complex: there is very little diploe in theſe bones, except in the *palatine* and *pterygoide* portions. They are joined to each other by the *portio palatina*; to the vomer by the common groove, formed by their raiſed edges; to the maxillary bones before and laterally; and behind to the ſphenoidal bone; to the inferior ſhells of the nares by their tranſverſe eminences; and laſtly, by their orbitary portions, to the *os ethmoides*. *oſſa maxillaria*, and *os ſphenoides*. They complete the arch of the *palate*, the *pterygoide* and *naſal foſſæ*, and the orbit. They aſſiſt alſo in ſupporting the vomer and the *conchæ narium inferiores*. *Wiſlow*'s Anatomy, p. 37.

PALATO-*ſtaphylinus*, in anatomy, a name given by Douglaſs to the muſcle called by Morgagni *columellæ muſculus teres*, and by Albinus and ſome others, the *azygos uvulæ*, and by ſome the *epiſtaphylinus*.

PALINCOTOS, a term uſed by Hippocrates to expreſs ſuch diſeaſes as are wont to return with all their violence upon the patient, after their ſeeming to have left him, whether for a longer or a ſhorter period of time.

PALINDROMIA, a term uſed by Hippocrates and many other writers to expreſs a preternatural running of the peccant matter of diſeaſes to the more noble parts.

PALINGENESIA, is uſed among chemiſts for the reproducing a mixed body from its aſhes.

This has been pretended to by many, as well as the philoſopher's ſtone and other wonderful powers; but as to the *palingeneſia*, or reſuſcitation of plants, the inſtances produced are no more than ſome of thoſe artificial vegetations which the learned Monſ. Homberg has obſerved and deſcribed many times. See *Homberg* in Mem. Acad. Sciences, 1710; and *Boyle*'s works abridg. Vol. I. p. 69.

PALINGMAN, in our old ſtatutes, ſeems to be a merchant-denizen, one born within the Engliſh pale. Stat. 22. Ed. IV. c. 23. and 11 H. VII. c. 22. *Blount*, *Cowel*.

PALINIDRYSIS, a word uſed by Hippocrates to expreſs the ſubſiding of a tumour by the diſperſion of the matter that occaſioned it without its breaking.

PALIRRHŒA, a word uſed by the old Greek authors to expreſs the reflux or retrograde courſe of the humours, as in caſes of the cholera morbus, where people vomit up their ſtools.

PALIURUS, *Chriſt-thorn*, in botany, the name of a genus of trees, the characters of which are theſe: the flower is of the roſaceous kind, and is compoſed of ſeveral petals arranged in a circular form; from the cup of the flower there ariſes a piſtil,

piſtil, which finally becomes a clypeiform or ſhield-like fruit, containing a roundiſh ſtone, divided into three cells, in which there are three roundiſh kernels. *Tourn.* Inſt. p. 616.

There is only one known ſpecies of the *paliurus*, which is the common *Chriſt-thorn*.

PALLAS, in aſtronomy, a name given by ſome to the firſt ſatellite of Jupiter. *Lowthorp*'s Abr. Phil. Tranſ. Vol. I. p. 407.

PALLAX, a name given by ſome of the affected chemical writers to an imaginary factitious ſtone, compoſed of the heaven and earth, of the moon or ſilver, with an equal weight of the ſun or gold. This is their own explication of it.

PALLET *(Cycl.)*—PALLET, in ſhip-building, is a room within the hold, cloſely parted from it, in which, by laying ſome pigs of lead, *&c.* a ſhip may be ſufficiently ballaſted, without loſing room in the hold; which, therefore, will ſerve for ſtowing the more goods.

PALLIUM *(Cycl.)*—PALLIUM-*ducale*, in natural hiſtory, a name given by writers on ſhells to a kind of *pecten* or *ſcallop*, of a large ſize and beautiful appearance, tho' ſimple colour: there are two ſpecies of this, a red and a yellow one. See the article PECTEN.

PALLIUM-*purpureum*, a name given by Baſil Valentine, and others of the affected writers in chemiſtry, to a powder of a purple colour, prepared from gold. It is made by preparing an amalgama of gold and mercury, and after the mercury is driven off by the retort, the remaining matter is mixed with ſulphur, and calcined by a well regulated fire till reduced to a purple powder. This is called alſo the *ſolar powder*, and has, like the other preparations of this metal, many imaginary virtues aſcribed to it.

PALMETTO-*royal*, a name given by Ligon to a tree of the palm kind. Its trunk is very tall and ſtreight, and hollowed regularly in the center; yet ſo tough, that it is never blown down, nor deſtroyed by ſtorms. It is recommended for the making long teleſcopes for celeſtial obſervations.

PALM *(Cycl.)*—The famous cabbage-tree of Barbadoes is a kind of *palm:* it grows to the height of three hundred feet, and tho' the ſprouts of one year's growth are ſo tender, that they are eaten as cabages, yet the tree itſelf is one of the moſt durable woods we are acquainted with, and will not rot on any account, but is ſo firm, that it is ſcarce poſſible to make a nail enter it. Phil. Tranſ. N. 36.

PALM-*tree*. The ſeveral ſpecies of this tree may be all raiſed with us from the ſeeds, which muſt be ſown in pots of light earth, and plunged into a bark hot-bed. When the young plants come up, they muſt be tranſplanted into ſingle pots, and preſerved in the ſtove. The ſoil they ſucceed beſt in is made of one third paſture land, one third ſea ſand, and the other third rotten tanner's bark, or rotten horſe-dung; and they muſt be planted in pots, in proportion to their ſize, but theſe ſhould not be too large. They will require to be removed once a year, but this muſt be done with great care. *Miller*'s Gard. Dict.

PALMARIS *cutaneus*, a muſcle commonly known by the name of the *palmaris brevis*. It is a ſmall thin plane of fleſhy fibres, ſituated tranſverſely, or more or leſs obliquely, under the ſkin of the large eminence in the palm of the hand, between the carpus and the little finger; its fibres adhering to the ſkin, and being in ſome meaſure interwoven with the *membrana adipoſa*. Theſe fibres are fixed along the edge of the *aponeuroſis palmaris*, from the large ligament of the *carpus* toward the little finger: and they run in for ſome ſpace on the plane of the *aponeuroſis*, but without any connection with the bones of the *metacarpus*. Near the *aponeuroſis* theſe fibres are more or leſs tendinous, and ſome of them often croſs each other. They are ſometimes ſo thin and pale, as hardly to be ſenſible; and in ſome ſubjects the muſcle ſeems to be divided into ſeveral parts. *Winſlow*'s Anatomy, p. 193.

It is a doubt with ſome authors whether the *palmaris cutaneus* or *brevis* be a diſtinct muſcle. Fallopius calls it, *caro quædam quæ muſculorum effigiem habet*; a portion of fleſh which has the appearance of a muſcle. And Douglaſs calls it, *caro quadrata*; a ſquare portion of fleſh: tho' he adds the name *palmaris brevis*, given it, on its ſuppoſition of being a muſcle, by another author.

PALMATED-*roots*, are tuberoſe-roots of a flattiſh ſhape, and divided into ſeveral oblong and ſlender branches, reſembling ſo many fingers. Of this ſort are the roots of ſome of the orchis kind, called hence *palmated*.

PALMATED-*leaf*, among botaniſts. See LEAF.

PALMATED-*ſtone*, *palmati-lapides*, in natural hiſtory, a name given by the antients to a ſort of ſtones which were always found of the ſhape of a hand with its fingers. They were frequent in Spain, and ſome which were found of a fine black were reputed to be a kind of marble. The greater number were white, and were compoſed of the matter of one of the ſofter and leſs beautiful quarry-ſtones.

PALMIPEDES, *web-footed*, in zoology, the name of a genus of birds living about waters, and furniſhed by nature with feet for ſwimming. The general characters of theſe birds are theſe: they have all ſhort legs, excepting only three, the *flamingo*, *corrira*, and *avoſetta*, which are ſingular and of a peculiar genus. Their thighs are feathered to the joint; their hinder toes, if any, are ſhort; their rumps are leſs prominent than in other birds; and they have in general broad beaks, and have an appendage on the extremity of their upper chap. *Ray*'s ornithology, p. 241.

PALMIPES, among the Romans, a long meaſure, containing a foot and a *palm*, or five *palms*; and was leſs than the cubit by one *palm*. *Pitiſc.* in voc.

PALMITES, in botany, a name given by ſome authors to the *palma humilis*, or *dwarf palm*, called by others *chamærops*. Gen. Herb. 1335.

PALPÆBRA *(Cycl.)*—PALPEBRÆ *ſuperioris primus*, in anatomy, a name given by Coſſerius and ſome others to one of the muſcles of the face, whoſe office it is to lift up the upper eye-lid, and by that means open the eye: it is hence called by Cowper and Douglaſs, *aperiens palpebram*; by ſome, *aperiens oculum*; and by Albinus, the *levator palpebræ ſuperioris*. See APERIENS, *Cycl.*

PALPITATION *of the heart*, *(Cycl.)* a term uſed by medical writers to expreſs a ſpaſtic contraction of the heart, when it leaps and beats violently at different intervals.

This is ſometimes idiopathic, or a diſeaſe in itſelf, and attendant on no other; but that rarely happens, and it is uſually ſymptomatic, and merely an attendant on other diſorders. In general we are to diſtinguiſh a *palpitation of the heart* thus conſidered as a diſeaſe, or at leaſt as a ſymptom of one, from thoſe commotions of the heart which we occaſionally bring on by running or any other violent exerciſe, which throw the blood into commotions.

Signs of it. The evident and obvious ſymptom of this complaint, is the vehement pulſation of the heart againſt the ſolid parts of the breaſt, which is often ſo great, that it may be ſeen or even heard by the perſons who ſtand by. To this there are uſually joined an anxiety of the *præcordia*, which throws the perſon into a ſweat, a languor and laſſitude of the limbs in general, a paleneſs of the face, a difficulty of reſpiration and cardialgia, with frequent faintings; and finally, there is uſually a coſtiveneſs and flatulences of the abdomen attending on it.

Perſons ſubject to it. It is a complaint that chiefly affects perſons of ſedentary lives, and of a plethoric habit of body. Scorbutic, hyſteric, and hypochondriac perſons are alſo frequently ſubject to it; and ſuch as have obſtructions of the menſes. Thoſe people who have been uſed to regular bleedings, and have afterwards neglected them, are alſo ſubject to this complaint; and thoſe who are ſubject to ſudden paſſions, and frequently ſuppreſs them. Sleeping in the open fields has alſo been known to bring it on; and perſons of a melancholic habit are uſually more than others ſubject to it. Young women, whoſe menſes have not appeared, or who have had them ſuppreſſed by ſome accident, and in whom nature is labouring to bring them on again, are alſo very ſubject to violent *palpitations*; and ſuch as have acute or intermittent fevers coming upon them. Perſons of plethoric habits are often ſeized with *palpitations of the heart* in their ſleep, and when they wake they feel them for ſome minutes afterwards. Finally, perſons who have polypuſes of the heart are always grievouſly afflicted with *palpitations*, attended with difficulties of breathing.

Cauſes of it. Beſides what has been already obſerved, it is to be remarked, that the paſſions of the mind very frequently occaſion this diſorder; thus, ſudden terror, fear, a ſuppreſſion of anger, and the like, will at any time bring on a *palpitation*, without any other cauſe. A high diet and eaſe, with a ſedentary life, alſo often occaſion them; and in young people, not arrived at puberty, they are often found to be occaſioned by worms in the inteſtines.

Prognoſtics in it. The beginnings of complaints of this kind, and ſlighter caſes, when they continue ſo, are attended with no great danger; but when the diſorder grows into a habit, it is not only very troubleſome, but very dangerous. When more cauſes than one conſpire to produce it, it is not only more violent, but the patient is more ſubject alſo to relapſes; and in the end, inflammations, ſpittings of blood, polypuſes of the heart, and infarctions of the viſcera come on: not unfrequently alſo are left fevers, which become dangerous. Sometimes alſo convulſions and other affections of a like kind, even palſies are brought on by theſe diſorders. Finally, when an habitual *palpitation of the heart* has been brought on by terror alone, it always proves very difficult of cure, whatever means are uſed.

Method of cure. The primæ viæ muſt be firſt cleanſed by infuſions of rhubarb and ſena, and other gentle purges: after this it is proper to bleed in the foot; but it is to be obſerved, that if the orifice be not large, nor the blood taken away in ſufficient quantity, it is of not the leaſt effect in this caſe. After this the blood is to be attenuated by drinking plentifully of warm and weak liquors, and by moderate exerciſe. After this, ſome of the gentle alexipharmics are to be given, and the ſpring juices of brook-lime, water-creſs, and the like. Finally, there are to be given ſuch things as promote an equal diſtribution of the blood and humors: mixtures of volatiles and alcalies, as of ſpirit of hartſhorn and tincture of ſalt of tartar, and gentle anodynes, if neceſſary. Beſides theſe, clyſters will often do great good, as will alſo the frequent waſh-

ing the feet with warm water, and the hanging camphor near the part, and ſpirit of caſtor, ſaffron, and the like, do well to be rubbed on the breaſt.

Bleeding muſt never be omitted in this caſe, for without it no medicines will be able to take effect. In caſes when a hypochondriac habit conſpires in the cauſe of this complaint, the attemperating powders of nitre, cinnabar, and the like, always prove of very great ſervice. In caſes of a chloroſis with this complaint, bitters and chalybeates uſually prove a remedy; and when a ſuppreſſion of the menſes, or hæmorrhoids is the cauſe, the bringing them to their priſtine regular ſtate is a cure. It is never proper to allay the motion till the plethora, which occaſions it is removed, unleſs in caſes of its coming on merely by the paſſions, without any antecedent cauſe in the blood; in this caſe, gentle opiates may be given without danger. Steel medicines and the volatile ſalts, when they are given in an imprudent manner, always make the diſeaſe worſe, inſtead of doing any thing toward a cure. Finally, a change of a ſedentary life, into a moderately active one, will do more than any medicines. *Junck.* Conſp. Med. p 626, ſeq.

Monſieur de la Hire was cured of a chronical *palpitation* of the heart, by a quartan ague. See *Fontenelle*, in his Eloge.

PALSY *(Cycl.)* — Among other remarkable caſes of this terrible diſeaſe, we have, in the philoſophical tranſactions, one of a periodical *palſy*. The author quotes two inſtances of a like kind, by way of countenance to that which he relates. The German Ephemerides mention a young paralytic man who ſpoke only one hour in every four-and-twenty, and that always at a regular time, beginning between twelve and one at noon every day, and his power of ſpeech ceaſing always between one and two: this continued twelve years upon him. The other caſe is not recorded in books, tho' well atteſted.

The caſe in the tranſactions, is of a ruddy ſanguine young woman who fell into a *palſy*, in which ſhe loſt her voice and the uſe of her legs. This was at firſt carried off by medicines, but afterwards returning again at times, at length became regularly periodical, ſeizing her on the Tueſday of every week, and going off again on the Friday. This courſe it obſerved very regularly for the firſt year, except twice.

After this, on taking proper medicines for ſome conſiderable ſpace of time, ſhe became ſo well, that her fits laſted only a day and a half, coming on always on a Tueſday morning, and going off again on a Wedneſday. In this manner ſhe continued to have them ſeveral months, but ſhe was at length perfectly recovered. Phil. Tranſ. N° 242. p. 60.

This diſtemper, according to Dr. Cheyne, may be cured by a total cow-milk diet. He thinks the medicines commonly preſcribed in ſuch caſes may retard the progreſs of the diſtemper, but that it is never to be eradicated if the ſtroke be deep, or life far ſpent, but by cow-milk only. See Nat. Method of curing, p. 265.

Mr. Boyle gives an account of an *hemiplegia*, or *palſy* of one ſide, occaſioned by a ſmall ſplinter of a bone preſſing on the dura mater. The patient in leſs than five hours after the bone was taken out, found himſelf able to move his finger, and within two or three days to lift his arm, which had been reduced to ſkin and bone, but ſoon recovered its proper ſize. Works Abr. Vol. 1. p. 37.

Hofman diſtinguiſhes *palſies* into ſerous and ſanguineous. In the firſt kind, raiſing an artificial fever by hot, acrid, nervous, and volatile medicines, by ſtrong exerciſe, and hot bathing, often effects a cure. But in the ſanguineous kind, accompanied with febrile motions, ſuch remedies ought not to be applied. Oper. T. 3. p. 198. §. 26.

There is a kind of *palſy* called *beriberii*, to which the natives of the Eaſt Indies are peculiarly ſubject.

The word in the Indian language ſignifies a ſheep; and Bontius ſuppoſes it was attributed to this diſeaſe, becauſe the perſons afflicted with it thruſt out their knees, and lift up their legs ſo much in walking, as in ſome ſort to imitate the gate of ſheep. It is a kind of tremor, or *palſy*, in which the uſe of the hands and feet are in a great meaſure taken away; and ſometimes it extends itſelf to the whole body.

The principal cauſe of this diſeaſe is ſaid to be a thick viſcous humor, which in the night ſeaſon, eſpecially in the rainy time, which holds inceſſantly from November to May, falls upon the nerves, while people fatigued with the heat of the day, throw aſide their cloaths and ſleep without any covering; by which means the phlegmatic humor which before generated principally in the brain, eaſily ſeizes upon the nerves; for the nights in theſe countries, compared to the days, are very cold. The conſequence of this is, that the joints become lengthened, the pituitous humors inſinuating themſelves between the junctures, ſo as to relax the nerves and ligaments. Tho' this diſeaſe for the moſt part comes on very gradually, and by ſlow advances, yet ſometimes it ſeizes a perſon all at once, as when any one being very much fatigued and hot, drinks a vaſt quantity of any cold liquor. And thus we ſee, even in our own country, that when any one has been violently heated by exerciſe, and drinks an immoderate quantity of a cold liquor, it often throws him into the utmoſt hazard of his life.

The ſymptoms of this diſeaſe are always manifeſt, even to the ſight. There is ever an univerſal laſſitude of the whole body. All motion, but particularly that of the hands and feet, becomes vitiated and depraved; and the ſame ſort of throbbing and titillation is felt as we feel in our fingers and toes in cold weather, only the pain is leſs acute; and ſometimes the voice is ſo far affected, that the patient can ſcarce ſpeak articulately.

Bontius himſelf was once afflicted with this diſtemper, while in the Eaſt Indies, and had this particular ſymptom of it in ſo great a degree, that for a whole month thoſe who ſat cloſe by him could not, without great difficulty, hear what he ſaid. Theſe are the common ſymptoms of the diſeaſe; but beſide theſe, it is at times attended with all thoſe others which may be ſuppoſed to ariſe from a cold cauſe.

The cure is uſually very tedious; for theſe cold humors are very ſlowly, and with difficulty diſcuſſed. The diſeaſe is not naturally mortal, however, unleſs it affects the breaſt; in which caſe it ſometimes wholly ſtops the breath. In order to a cure, the patient is of all things to avoid confining himſelf to his bed; walking, riding, and all ſorts of exerciſe are uſeful; ſtrong and ſmart frictions are alſo very uſeful, and the Bengal ſervants are uſed to theſe, and are very dextrous in the uſe of them.

There is alſo great relief had from fomentations made of decoctions of the herb *lagondi*, which has all the virtues of our chamæmile and melilot, but in a much greater degree. The leaf of this plant is like that of our perſicaria or arſmart; and its ſmell very aromatic. The hands and feet are alſo to be anointed with oil of cloves, or mace mixed with oil of roſes. But more than all theſe, there is relief found in a kind of naphtha, which is very common in Sumatra, and is called *miniac tarnoh*, or *oil of the earth*. This is of a ſtrong, but not very nauſeous ſmell, and is ſo great a remedy, that being rubbed on the hands and legs, it is always an almoſt immediate relief. The Barbarians know as well as we the value of this precious balſam; and the king of Achin, who is the moſt powerful prince in that iſland, has forbidden its exportation, under the pain of death; ſo that the inhabitants can only bring it off by ſtealth in the dead of the night, to the Dutch and Engliſh ſhips which happen to lie in the way.

Theſe are the things which give temporary relief; but as the diſeaſe is of the chronic kind, the cure is to be performed by long courſes of the decoctions of the roots of China, and ſarſaparilla, and guaiacum wood, which by their gentle heat diſcuſs the cold humors which are the root of the diſeaſe, and carry them off by perſpiration or urine. Purging at proper intervals is alſo highly neceſſary; and the cathartics moſt in uſe there in this caſe, are, aloes and gamboge. Bleeding is by all means to be forbid; and the relicks of the diſeaſe are uſually very happily carried off by Venice treacle, and other ſudorific and nervous medicines, and gentle exerciſe is the beſt remedy to prevent its return. *Bontius* de Medicina Ind.

PALUM *ſanctum*, in botany, a name by which ſome authors have called a ſpecies of the *guaicum tree*, called the *lignum ſanctum*, or *holywood*. *Park.* Theatr. p. 1587.

PALUMBARIUS *accipiter*, the *goſhawk*, a ſpecies of hawk of the ſhort-winged kind. It is larger than the common buzzard, and is brown on the back, and very white on the belly, with tranſverſe ſtreaks of browniſh black; theſe are of an undulated figure, and laid very near one another. Its legs and feet are yellow, and its beak black, with a yellow membrane covering its baſe. Its wings, when cloſed, do not nearly reach to the end of its tail; by which, and by its ſize it is eaſily diſtinguiſhed from all other hawks. Its tail is long and of a browniſh grey, with three or four tranſverſe ſtreaks on it, placed very diſtant from one another. It will ſeize on pheaſants, geeſe, and even hares, but its moſt common prey is the partridge. *Ray*'s Ornithology, p. 51.

PALUMBES, the *ring-dove*, in zoology. See RING-*dove*.

PAMBŒOTIA, Παμβοιωτια, in antiquity, a feſtival celebrated by all the Bœotians who aſſembled near Coronea, at the temple of Minerva, ſurnamed Itonia. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 419.

PAMMACHION, Παμμαχιον, a name by which the exerciſe *pancratium* is ſometimes called, whence the combatants were likewiſe called *pammachi*, Παμμαχοι. *Potter*, Archæol. Græc. l. 2. c. 22. T. 1. p. 444.

PAMUCHLEN, in zoology, a name by which ſome call the ſpecies of *cod-fiſh*, commonly named by authors *aſellus ſtriatus*. *Willughby*'s Hiſt. Piſc. p. 172.

PANACIA, Πανακεια, in antiquity, a feſtival in honour of Panace. *Potter*, T. 1. p. 422.

PANALETHES, a name uſed by many authors for a plaiſter ſuppoſed to be of the greateſt virtues. It is deſcribed by Aëtius. Tetrabib. 4. Serm. 3. cap. 2.

PANAMA-*ſhell*, a ſpecies of *dolium*. See DOLIUM.

PANARITIUM, a word uſed by ſome authors to expreſs a *whitlow*, or *paronychia*.

PANCALA-*aurea*, a name of a famous antidote, compoſed of many ingredients, deſcribed by Myrepſus.

PANCARPIA, the name of a ſort of cake much uſed at Alexandria,

andria, and usually covered with paper for the sake of its keeping the longer.

PANCH, or PANTCH, in the sea language. See PAUNCH.

PANCHRESTARII, among the Romans, those who prepared the *pancrest*, or *universal remedy*. *Pitisc.* in voc. See the article PANCHREST, *Cycl.*

PANCHRUS, the name given by some of the antient writers on natural history to a gem which they say has all colours: probably the opal.

PANCLADIA, Πανκλαδια, in antiquity, a festival celebrated by the Rhodians when they pruned their vines. *Potter*, Archæol. Græc. T. 1. p. 419.

PANCRASIUM, in the materia medica, a name used by some authors for the *squill*, of the root of which the oxymell of squills is made. *Park.* Parad. p. 133.

PANCRATIASTES, in antiquity, a combatant in the exercise called *pancratium*. *Potter*, Archæol. Græc. T. 1. p. 444. See PANCRATIUM, *Cycl.*

PANCRATIASTES was also applied to one who had gained the victory in all the kinds of exercise used in the *pancratium*. *Pitisc.* in voc. See PANCRATIUM, *Cycl.*

PANDEMON, Παυδημον, in antiquity, the same with the festival Chalceia and Athenæa. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 422.

It was so called from the great concourse of people that used to meet at this solemnity. See CHALCEIA and ATHENÆA.

PANDIA, Παυδια, in antiquity, an Athenian festival in honour of Jupiter. For the origin of this solemnity, see *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 422.

PANDROSOS, Παυδροσος, in antiquity, an Athenian festival in memory of *Pandrosus* the daughter of king Cycrops. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 423.

PANDURIFORM *leaf*, among botanists. See LEAF.

PANDYSIA, Παυδυσια, in antiquity, public rejoicings when the season through its coldness and intemperance forced the sailors to stay at home. *Potter*, T. 1. p. 423.

PANEGYRIS, Παυηγυρις, among the Greeks, a fair, or festival day, on which the people used to meet together. It exactly corresponded to the Nundinæ of the Romans. *Pitisc.* in voc. See NUNDINÆ.

PANELLENIA, Παυελληνια, in antiquity, a public festival celebrated by an assembly of people from all parts of Greece. *Potter*, Archæol. Græc. T. 1. p. 423.

PANEMUS, in chronology, the Bœotian name of the Athenian month *metagitnion*, which was the second of their year, and answered to the latter part of our July and beginning of August. See METAGITNION and MONTH.

PANEROS, the name of a beautiful stone dedicated to Venus. It was called also by some *pausebastos*, and was probably one of the beautiful agates.

PANGONIA, in natural history, the name of a genus of crystal. See Tab. of Fossils, Class 3.

The word is derived from the Greek πᾶς, numerous, and γόνυ, an angle, or bending, and expresses a crystal, composed of many angles.

The bodies of this genus are single-pointed, or imperfect crystals, composed of dodecangular or twelve-planed columns, terminated by twelve-planed pyramids, and the whole body, therefore, made up of twenty four planes.

Of this genus there are only three known species: 1. A brownish-white one, with a long pyramid. This is found in Silesia and Bohemia; sometimes in mountains, and sometimes on the sides of rivers, and is esteemed a very valuable crystal. 2. A yellowish-brown one, with a short pyramid. This is often brought over to us under the name of *Saxon topaz*, among the other crystals commonly known by that name. And 3. A clear colourless one, with a very short pyramid. This is a very valuable crystal, and is produced in the East Indies, being often brought over among the Indian ballast. *Hill*'s Hist. of Foss. p. 187.

PANICASTRELLA, in botany, the name by which Micheli has called a genus of plants named by Linnæus *cenchrus*. See the article CENCHRUS.

PANICUM, in the Linnæan system of botany, the name of a distinct genus of plants, of the grass kind, the distinguishing characters of which are, that the calyx is composed of several leaves, and contains only one flower; the leaves of it are capillary and unequal in their insertions. The glume is made of two valves, and contains only one flower: the valves are oval and pointed, and are both small, but one more so than the other. The flower is also composed of two valves, both oval and pointed, but the one smaller and flatter than the other. The stamina are three short capillary filaments. The antheræ are oblong. The germen of the pistil is roundish; the styles are capillary and two in number, and the stigmata are feathered. The flower surrounds and incloses the seed, and never opens to drop it out. The seed is single and roundish, but something flatted. *Linnæi*, Genera Plantatum, p. 17.

PANIONIA, Παυωνια, in antiquity, a festival in honour of Neptune, celebrated by a concourse of people from all the cities of Ionia.

One thing is remarkable in this festival, that if the bull offered in sacrifice happened to bellow, it was accounted an omen of the divine favour; because that sound was thought to be acceptable to Neptune. *Potter*, Archæol. Græc. T. 1. p. 423.

PANIS-*dæmonum*, in natural history, a name given by authors to a sort of coarse stone, common in Sweden, and some other places, and usually found in roundish, but somewhat flatted masses, resembling a loaf in form.

PANNEL, in the Scotch law, denotes the prisoner at the bar, or person who takes his trial before the court of justiciary, for some crime.

PANNONICA-*bolus*, in the materia medica, a name by which Kentman, and some others, have called the earth more usually known by the name of *bolus toccaviensis*. *Kentman*'s Nomenclator Foss. p. 7. See the article TOCCAVIENSIS.

PANOCHIÆ, a name by which some chirurgical authors call *bubos* in the groin.

PANOMPHÆUS, Παυομφαιος, in antiquity, a designation given to Jupiter, because he was looked upon as the original author of all sorts of divination, having the books of fate, and out of them revealing either more or less, as he pleased, to inferior dæmons. *Potter*, T. 1. p. 263.

PANOPSIA, Παυοψια, in antiquity. See PYANEPSIA, *Cycl.*

PANSAPAN, in botany, a name by which some authors have called the tree whose wood is the logwood, used in dying, and in medicine. *Herm.* Mus. p. 42.

PANTARBE, in natural history, a name given by authors to an imaginary stone, the virtues of which were similar to those of the magnet; but exerted upon gold as those of the loadstone upon iron. The antients as well as later writers, seem to have all had an opinion, that there was such a stone as this, and the *amphitane* of Pliny is described as possessing this remarkable quality; but neither they nor we, ever found reason from any experiment to believe, that there was any such stone.

PANTER, in the sea language. See SHANK-PANTER.

PANTHERA, in zoology, a name by which many have called the *leopard*, more properly called *pardalis*. See PARDALIS.

PANTHERA-*lapis*, in natural history, the name of a species of stone found in Egypt, and the East Indies, and described to be of a yellowish colour, variegated with dusky spots of the colour of those on the skin of the panther. The writers of the middle ages have attributed many absurd properties to it: it seems to have been a species of agate.

PANTHERINE *tables*, *pantherinæ mensæ*, among the Romans, tables made of citron wood, which were held in such high esteem, as to equal the value not only of silver and gold, but likewise of pearls. They had this name from their being spotted after the manner of panthers. *Hofm.* Lex. in voc.

PANTICES, a word used by some medical writers to express the intestines.

PANTOMIME, Παυλομιμος, among the antients, a person who could imitate all kinds of actions and characters by signs and gestures, without speaking.

The *pantomimes* made a part in the theatrical entertainments of the antients; their chief employment was to express in gestures and action, whatever the chorus sung, changing their countenance and behaviour as the subject of the song varied. They were very antient in Greece, being derived from the heroic times, according to some; but however this may be, they were certainly known in Plato's time. In Rome it was so late as the time of Augustus before they made their appearance. As to their dress, it was various, being always suited as near as possible to that of the person they were to imitate. The crocota was much used among the Roman *pantomimes*, in which and other female dresses they personated women. *Pitisc.* in voc. See MIME, *Cycl.*

PANTON-*shoe*, in the manege, a horse-shoe contrived for receiving narrow and hoof-bound heels. Its spunges are much thicker on the inside than on the outside; so that the part which rests upon the horn or hoof, runs slope-wise to the end, that the thickness of the inside of the shoe may bear up the heel, and throw or push it to the outside.

Panton-shoes are likewise proper for horses that have false quarters.

PAPAN, in natural history, the name given by the inhabitants of the Philippine islands, to a species of duck common in their lakes and marshes. This is very large and beautiful, and is called by Father Camelli *anas regia*, or the *royal duck*: it is not so common, however, as a little kind which they call *salagosir*; this is not larger than a man's fist. See SALAGASIR.

PAPAVER, *poppy*, in botany, the name of a genus of plants, the characters of which are these: The flower is of the rosaceous kind, consisting usually of four leaves, disposed in a circular form. The cup is composed of two leaves, and from it there arises a pistil, which finally becomes a seed vessel, of a sort of oval oblong figure, and adorned with a head or covering; under which, in many species, there are a chain of apertures. Within the head or fruit, there are numerous lamellæ, to which the seeds adhere in the manner of placentæ. The seeds are usually small, and of a roundish figure. See Tab. 1. of Botany, Class 6.

The species of *poppy*, enumerated by Mr. Tournefort, are these: 1. The white *poppy*, or garden *poppy*, with white seeds.

2. The

2. The white-ſeeded garden *poppy*, with pale purple flowers. 3. The garden white-ſeeded *poppy*, with greyiſh flowers with purple bottoms to the petals. 4. The garden *poppy*, with flowers of a fair white, variegated with red, and with yellow ſeeds. 5. The garden *poppy*, with black ſeeds; the wild *poppy* of Dioſcorides, and black *poppy* of other authors. 6. The garden *poppy*, with double flowers of a deep violet colour. 7. The garden *poppy*, with double flowers of a pale violet colour. 8. The hoary-ſeeded *poppy*, with apertures in the heads. 9. The red-flowered *poppy*, with brown ſeeds. 10. The creſted *poppy*, with white flowers and white ſeeds. 11. The creſted *poppy*, with red flowers and black ſeeds. 12. The creſted *poppy*, with variegated red and white flowers. 13. The ſingle flowered creſted *poppy*, with purple petals with bluiſh grey bottoms. 14. The double fleſh coloured garden *poppy*. 15. The double purple *poppy*. 16. The double bright red *poppy*. 17. The double ſilver white *poppy*. 18. The double white *poppy*, with red edges. 19. The ſnow-white double *poppy*. 20. The double deep purple *poppy*. 21. The blood-red double *poppy*. 22. The violet coloured double *poppy*. 23. The ſmall white many flowered *poppy*. 24. The double flowered black *poppy*. 25. The double *poppy*, with variegated and jagged flowers. 26. The jagged flowered *poppy*, with bluiſh and whitiſh bottoms to the leaves. 27. The common wild red *poppy*. 28. The greater wild red *poppy*, with variegated flowers. 29. The common wild corn *poppy*, with white flowers. 30. The red corn *poppy*, with white bottoms to the petals. 31. The wild corn *poppy*, with fleſh-coloured flowers. 32. The double flowered corn *poppy*. 33. The corn *poppy*, with a double red lead coloured flower. 34. The corn *poppy*, with double fiery red flowers. 35. The double corn *poppy*, with fiery red flowers with white edges to the petals. 36. The double purple flowered corn *poppy*. 37. The double red corn *poppy*, with white bottoms to the leaves. 38. The common ſmaller corn *poppy*. 39. The corn *poppy*, with oblong hairy heads. 40. The longer hairy-headed corn *poppy*. 41. The very long ſmooth headed corn *poppy*. 42. The corn *poppy*, with undivided leaves. 43. The yellow flowered pyrenæan *poppy*. 44. The coriander-leaved alpine rock *poppy*. *Tourn.* Inſt. p. 237. ſeq.

PAPAYA, in botany, the name of a genus of plants, the characters of which are theſe: the flowers are of two kinds; the one ſort is tubulated and divided into ſegments, like the rays of a ſtar, at the end: the flowers of this kind are the barren or male ones. The others are of the roſaceous kind, being compoſed of ſeveral petals arranged in a circular form; from the cup of theſe flowers there ariſes a piſtil, which finally becomes a fleſhy fruit, of the ſhape of a melon, containing ſtriated ſeeds covered with huſks.

The ſpecies of the *papaya* enumerated by Mr. *Tournefort*, are theſe: 1. The *papaya* tree, with a fruit like the melopepo, or melon pompion, called the platanus-leaved *papaya*, and by ſome the male mamolla. 2. The *papaya*, with very large fruit, of the ſhape of the pompion. 3. The *papaya* with oblong or melon-ſhaped fruit. *Tourn.* Inſt. p. 659.

PAPER (*Cycl.*)—Mr. Boyle tells us, that *paper*, beſides its common uſes, may be made into frames for pictures, fine embоſſed work, and other parts of furniture. For this purpoſe, a convenient quantity of the beſt white ſort may be ſteeped for two or three days in water, till it becomes very ſoft; then reducing it by the mortar and hot water into a thin pulp, it is laid on a ſieve to draw off its ſuperfluous moiſture; then putting it into warm water, wherein a conſiderable quantity of freſh glue, or common ſize, has been diſſolved, it may afterwards be put into moulds to acquire the deſigned figure; and when taken out may be ſtrengthened, as occaſion requires, with plaiſter or moiſtened chalk, and, when dry, painted or overlaid. *Boyle*'s works abr. Vol. I. p. 149.

Another uſe of *paper* is to ſtop up cracks or fiſſures in wooden veſſels, to hold water; for, in this caſe, it will forcibly dilate, and fill the place wherein it is to lodge.

PAPER-*office*, an antient office within the palace of Whitehall, wherein all the public papers, writings, matters of ſtate and council, letters, intelligences, negotiations of the king's miniſters abroad, and generally all the papers and diſpatches that paſs through the offices of the two principal ſecretaries of ſtate, are lodged and tranſmitted, and there remain diſpoſed in the way of library. *Blount.*

PAPER-*office* is alſo the name of an office belonging to the court of King's-bench. *Blount.*

PAPHIS, in zoology, a name by which ſome have called the gar-fiſh. *Willughby*'s Hiſt. Piſc. p. 231.

PAPIA, in botany, the name of a genus of plants, called by Linnæus *orvala*. It has a monopetalous flower, ſucceeded by four ſeeds. *Micheli*, 17. See ORVALA.

PAPILIO, *butterfly*. For the ſeveral parts of the *butterfly*, ſee the articles ANTENNÆ, WING, TRUNK, &c.

Their arrangement into genera and claſſes are in a great meaſure taken from theſe ſeveral parts, and from the great uſes which they make of them. The general diſtinction is that which divides them into the day and night kinds; we have among the birds ſome few that fly abroad only by night, but theſe bear only a ſmall proportion in number to the day-fliers: on the contrary, the number of *butterflies* which we ſee fluttering about the fields and gardens, are ſcarce ſo many as thoſe which fly abroad only by night. We often meet with theſe even in our houſes, flying about the candles, aud the hedges ſwarm with them: in the day-time we find them hid under the leaves of plants, and often, as it were, in a torpid ſtate. In this condition they remain till evening, but they are ſo cunning in hiding themſelves at this time, that it is difficult to ſee one even in places where there are a great number. The way to diſcover them is to beat and diſturb the buſhes, or ſhake the branches of trees in places where they are ſuſpected to be, and they will often be driven out in ſwarms. In this caſe, they never fly far, but ſettle again upon the firſt tree or buſh they come to; and in ſummer, if any one goes out into the fields or gardens, with a candle, in a calm and ſtill night, there will numbers of different kinds of them almoſt immediately gather about it. Theſe are called by naturaliſts *night-butterflies*, *phalenæ*, and *moths*. *Reaumur*'s Hiſt. Inſ. Vol. I. p. 1. 330.

The ſeveral kinds of *butterflies* that have thoſe various inclinations, have alſo external characters by which they may be diſtinguiſhed; all thoſe which have buttoned *antennæ*, or *club antennæ* are of the diurnal kind, and are never ſeen flying about candles in the night. There are other forms of the *antennæ* alſo, which are peculiar to the day *butterflies*; and the night ones are diſtinguiſhed by their having the plumoſe, the priſmatic, or the conic ones. See ANTENNÆ.

Thoſe which fly about our candles are always of one of theſe three kinds. It is not, indeed, to be wholly affirmed, that no one of theſe kinds is ever ſeen flying by day-light, ſince in woods and thickets we often ſee them fluttering about without having been diſturbed; but all that are thus caught flying are males, and are that time ſeeking after the females to couple with them, theſe being all fixed immoveably under the leaves and on the branches of trees.

The common kinds that we ſee fly about from flower to flower are all of the day kind: a few ſpecies of the *phalenæ* ſometimes flutter about the thiſtle flowers, and ſeem to ſuck them; but theſe are ſeldom ſeen; and among the moths, or night kinds, as we call them, there are a great many that never fly about by night any more than by day, and, indeed, make no uſe of their wings at all.

It is alſo a ſingular obſervation, that the moths which fly about our candles, whether in the houſe or abroad in the gardens, are all males: the females never do it. The male of the glow-worm flies in the ſame manner at a candle, thinking it the light of his female; and it is poſſible, that the female moths may, in the night, yield a light that affects the eyes of the male of the ſame ſpecies, tho' it be inſenſible to our view. See Tab. of Inſects, N° 10.

The great general diſtinctions of the *butterflies* into day and night kinds being made, it is neceſſary to have recourſe to numbers of other ſub-diſtinctions, in order to arrange them in any method; and theſe can by no means be taken from them in their prior ſtate of caterpillars, many of them being in that ſtate alike in all their general characters, tho' of different genera in their flying ſtate.

As the *antennæ* ſerve for diſtinctions of the *butterflies* into claſſes, ſo do their trunks into genera; but theſe are only capable of diſtinguiſhing a few, the flat and the round being their principal diſtinction. Mr. Reaumur has obſerved, that the day *butterflies* all have theſe trunks, but that many of the night kinds want them. The wings, however, give the greateſt variety of generical characters among theſe animals. The ſhape of theſe, and the manner in which theſe creatures carry them, when walking and at reſt, ſerve as great and eſſential diſtinctions. *Reaumur*'s Hiſt. Inſ. Vol. I. P. 1. p. 334.

The inferior wings, in ſome certain poſitions of the animal, hide the ſuperior ones; but this is rare, and as the ſuperior are moſt in ſight and obvious, the characters are moſtly drawn from them. All the wings are of a triangular form, but they have their differences; ſome being rectilinear, ſome curvilinear, and ſome mixtilinear: one of theſe angles is the place of joining of the wing to the body of the animal, and this is called by naturaliſts the ſummit of the wing; the angle is here broke off, to give more room to a firm joining on, otherwiſe this would be that part of the wing which would make the ſummit of the triangle. The two ſides are called interior and exterior; the firſt, is that neareſt the body of the creature; the other, the oppoſite one. The baſe or end of the wing, is that part which is oppoſite to the ſummit, and forms the verge of the wing endways. The different proportions which theſe three parts of the wing bear to one another, are the origin of a great variety of figures in the whole. When the exterior and interior ſide, or as they may be called in other words, the upper and under rib or verge of the wing, are nearly ſtrait and equal, the whole wing then forms an iſoſceles triangle, or a ſection of a curve, according as the baſe is ſtrait or convex; and the angle is larger or ſmaller according as the baſe is more or leſs broad. The differences of the exterior and anterior edges from one another, give alſo a great number of varieties in the form. The inner edge is uſually the ſhorteſt, and this is the caſe in various different ſpecies. The baſe alſo has its varieties in figure, as remarkable as the reſt; it is ſometimes ſtrait or plane, ſome-

times concave, and often convex: in ſome ſpecies the edge of it is perfectly ſmooth and even, and in others it is more or leſs deeply indented; and in ſome of the ſpecies it is jagged, and in ſome few inſtances one of the jaggs is ſo far extended from the reſt of the wing, as to form a ſort of tail. The wings are alſo in ſome very large, in others ſmall, in proportion to the body. The two pairs have alſo great varieties in their proportion one to the other; in ſome ſpecies the inferior pair are nearly or wholly as large as the ſuperior, and in others they are very ſmall in compariſon of them; and in ſome ſpecies the under wings are remarkably longer than the upper.

The differences in the manner of the *butterflies* carrying their wings has been more conſidered by Reaumur than by any author who went before him. He obſerves, that ſome of the ſpecies carry their wings perpendicular to the thing they ſit upon; others carry them plain or level with the horizon; and others let them fall below that level: theſe are called the drooping-wing kind. Some others form a ſort of canopy with them, to cover their bodies; and others makes them as it were embrace their bodies. The colours of the wings make excellent diſtinctions for the ſeveral ſpecies; but they are not at all fit for generical diſtinctions.

It has been already obſerved, that there are three kinds of antennæ which are peculiar to the day *butterfly*, but the diſtribution under theſe alone would be too large; the ſpecies of the button-horned ones being alone greatly too numerous to be held altogether. It is neceſſary, therefore, to take in with theſe the poſitions of the wings, according to the preceding differences, and the day *butterflies*, or *papilios*, are thus diſtinguiſhed into ſeven claſſes. *Reaumur*'s Hiſt. Inſ. Vol. I. P. 1. p. 344.

Claſs 1. Contains thoſe *papilios* whoſe antennæ are terminated by buttons, and whoſe wings, when at reſt, are placed in a perpendicular direction to the thing the creature ſits upon, the under edges of which embrace the lower part of the body, and whoſe ſix legs are all employed in ſuſtaining the body, and in walking. The black-ſpotted white *butterfly*, produced from the beautiful cabbage carterpillar, is one of the *papilios* of this claſs.

Claſs 2. Contains the *papilios* of the ſame characters with the former in all reſpects, except that they uſe only four of their legs in ſuſtaining the body and in walking. The two anterior legs in the flies of this claſs are held in a bent poſture, and are furniſhed with a downy part at their ends, and ſeem to ſerve as a ſort of arms. Theſe *papilios* in general are produced from the prickly caterpillars. The ſolitary nettle kind gives us an inſtance in its *papilio*.

Claſs 3. Contains thoſe *papilios* which agree in all reſpects with the former, except that their two anterior legs, which they uſe as arms and never in walking, are not terminated by downy ends, but are faſhioned like the other legs at the extremity, only ſo ſmall, that it requires a microſcope to diſtinguiſh them. There is an inſtance of this claſs in a common grey and yellow *papilio*, that is found in paſtures among the graſs in June, July, and Auguſt.

Claſs 4. Contains thoſe *papilios* which have buttoned antennæ, as the others, and which carry their wings, when at reſt, in a perpendicular direction to the thing they ſit upon; but, as the former have the inferior edge of their wings bent round the under part of their body, ſo in theſe the inferior edge is bent upwards in both pair of wings, and embraces and covers the upper part of the body. However obvious this diſtinction may be, there is another yet more plain one in this, that all of this claſs have one of the jaggs of the wing ſo far extended beyond the reſt of the verge, that it forms a kind of tail, and they are called the tailed *butterflies*. Theſe uſe all their ſix legs in walking.

Claſs 5. Contains thoſe *papilios* which have ſix real legs, which they uſe as ſuch, and their horns terminated by buttons as the others; but whoſe wings, when they are in repoſe, are not elevated perpendicularly to the thing they ſit on, as in the four preceding claſſes, but are held in an horizontal direction, or at the utmoſt never meet in an angle over the back. We have an inſtance of this claſs in a *butterfly* bred from a ſmooth caterpillar of the marſh mallow.

Claſs 6. Contains thoſe *papilios* which have club antennæ, that is, ſuch antennæ as gradually increaſe in thickneſs from their origin to their extremity. See FEELERS. Theſe are that claſs of *papilios* which are always upon the wing, and buzz about flowers without ever ſettling upon them. They dart their trunks into the flower while they ſuſtain themſelves in the air, and have a way of holding themſelves in poize, like a kite or other bird of prey; but when they are buſy about the flowers, they have their wings in continual motion, and make a humming noiſe, like the humble bees. Mad. Merian has called all theſe *phalenæ*, or night *butterflies*, but they are all truly of the day kind. The French, from their poizing themſelves on the wing, and making that humming noiſe, call them *eperviers*, and *papilions-bourdons*. Of this claſs are thoſe ſmall ſpecies called the fly *butterflies*, whoſe wings are only covered in part with duſt or ſcales, the remainder being tranſparent and glaſſy, as ſome expreſs it. *Reaumur*'s Hiſt. Inſ. Vol. I. p. 1, 356.

Claſs 7. In this laſt claſs are comprehended thoſe *papilios* whoſe antennæ are large at their origin, ſmaller afterwards, and finally terminated by an oval head; and which differ from the club antennæ in having no pencils of hairs at the end. This claſs is not very numerous, and the moſt frequent inſtance we have of it is in a painted kind, which we frequently find on blades of graſs, in meadows in July. This flies little in the day time, but is uſually found fixed to a plant, as the moths are. Mad. Merian and others have thence called it a *phalena*, or *night-fly*; but the truth is, that it flies no more by night than by day light, but is a lazy creature which makes very little uſe of its wings. See PHALENÆ.

There is ſome appearance from one of Mad. Merian's tables, *viz* the 20th, that an eighth claſs of theſe day *papilios* ſhould be found, ſhe having figured one with conic granulated antennæ, common to ſome of the moths. If this obſervation be juſt, or if any new ones of a like kind ſhould demand it, the claſſes may be eaſily enlarged. *Reaumur*'s Hiſt. Inſect.

The world is well acquainted with the beauties of this part of the animal creation, but Mr. *Reaumur* has given accounts of ſome very ſingular ſpecies, which deſerve a peculiar regard.

One ſpecies of theſe he has called the *bundle of dry leaves*. This, when it is in a ſtate of reſt, has wholly the appearance of a little cluſter of the decayed leaves of ſome herb. The poſition and colour of its wings greatly favour this reſemblance, and they have very large ribs, wholly like thoſe of the leaves of plants, and are indented in the ſame manner at their edges as the leaves of many plants are. This ſeems to point out the care of nature for the animal, and frequently may preſerve it from birds, *&c.*

The *ſkull butterfly* is another ſingular ſpecies, ſo called from its head reſembling, in ſome degree, a death's head, or human ſkull. This very remarkable appearance is terrible to many people, but it has another yet greater ſingularity attending it; which is, that, when frighted, it has a mournful and harſh voice. This appeared the more ſurprizing to Mr. Reaumur, as no other known *butterfly* had any the leaſt voice at all; and he was not ready of belief that it was a real voice, but ſuſpected the noiſe, like that of the cicadæ, to be owing to the attrition of ſome part of the body; and, in fine, he, by great pains, diſcovered that this noiſe was not truly vocal, but was made by a hard and briſk rubbing of the trunk againſt two hard bodies between which it is placed.

Another *butterfly* there is, ſo ſmall, that it might be miſtaken for a very ſmall fly. This is certainly the extreme in degree of ſize of all the known *butterflies*, and cannot but have been proportionably ſmall in the ſtate of a caterpillar and chryſalis: this creature ſpends its whole life in all the three ſtages of caterpillar, chryſalis, and *butterfly*, on the leaf of the celandine. It lives on the under ſide of the leaf, and tho' in the caterpillar ſtate it feeds on it, yet it does no damage. It does not eat the ſubſtance of the leaf, but draws from it only a fine juice, which is ſoon repaired again, without occaſioning any change in the appearance of the leaf. This ſpecies is very ſhort lived, and paſſes through its three ſtates in ſo ſhort a time, that there are frequently ten generations of it in one year; whereas in all the other *butterflies*, two generations in the year are all that are to be had. Theſe two generations are ſufficient to make a prodigious increaſe: in a large garden, if there are twenty caterpillars in ſpring, theſe may be overlooked, and there may be eaſily concluded to be none there, even on a narrow ſearch; but if theſe twenty caterpillars afterwards become twenty *butterflies*, ten of which are male and ten female, and each female lay the ſame number of eggs that the common ſilk-worm does, that is four hundred; if all the caterpillars hatched of theſe become *butterflies*, and theſe lay eggs in the ſame proportion, which remain the winter, and come to be hatched in the ſucceeding ſpring; then from theſe twenty, in only one year, you will have eight hundred thouſand; and if we add to this the increaſe of theſe in a ſucceeding year, the account muſt appear terrible, and ſuch as no art could guard againſt. The great ruler of the world has put ſo many hinderances in the way of this over-abundant production, that it is very rare ſuch years of deſtruction happen. Some ſuch have happened, however, and much miſchief has been dreaded from them, not only from their eating all the herbage, but from themſelves being eaten with herbs in ſallads and otherwiſe; but experiments has proved this an erroneous opinion, and they are found to be innocent, and eatable as ſnails or oyſters.

Caterpillars in general are by ſome ſuppoſed poiſonous to the touch. Mr. Reaumur has proved by repeated experiments, that all the ſmooth ones are perfectly clear from this accuſation, and may be handled with perfect ſafety; but the hairy ones are capable of producing great pain and itching after the touching them. Theſe pains are not only felt in the hands, but alſo in the face, or any other part; and that even tho' the animal have not been touched, if it have only been brought near the part. The ſpolia, or caſt ſkin of theſe animals, have alſo the ſame effect; but then it is abſolutely neceſſary they ſhould be touched. This unqueſtionably carries the appearance of the effect of a poiſon to vulgar eyes, but the caſe will appear otherwiſe to thoſe who will examine into the whole more nearly. The miſchief occaſioned by theſe creatures

comes on very quick, and ſometimes continues many hours, ſometimes even three or four days.

The explication of this by Mr. Reaumur, is only this, that theſe caterpillars have, beſide their coarſe and large hairs which we ſee them covered with, a vaſt number of others, which are ſo extremely ſmall and fine, as to be inviſible to our eyes. Theſe are ſharp-pointed, very rigid, and are looſely faſtened to the creature's body; ſo that they ſeparate from it on the lighteſt touch: theſe make a ſort of atmoſphere of fine darts ſurrounding them every way; and many of the ſpecies of hairy caterpillars have evidently a method of darting theſe out in great numbers. When the hand of any one is put toward this creature, ſo as to come within the reach of theſe ſmall darts, it immediately diſcharges a whole ſhower of them, and of theſe a great number enter the pores of the ſkin, and a great number more lie along upon it, ready to enter, as ſoon as any accident changes their poſture. If while the hand be thus covered with theſe weapons, whoſe ſmallneſs, tho' it makes them inviſible, yet does not incapacitate them from being very troubleſome, be moved up to the face, or the cheeks, or eyes, rubbed with it, it is eaſy to conceive, that many of theſe little darts will be made to lodge in the ſkin on which the hand where they lie is rubbed; and the conſequence muſt be a greater itching, pain, and ſwelling in theſe tender parts, than on the hand. And thus is produced by ſimple means, what is by many eſteemed the effect of a piercing and penetrating poiſon. And thus are the ſtrangeſt appearances often explained by the moſt ſimple means.

As it has been obſerved, that the abundance of caterpillars would be a terrible miſchief to mankind if they were ſubject to no accidents in their increaſe, it may be proper to examine what are the means by which gracious providence has provided againſt an over ſupply of them. Many of the ſpecies are great devourers, and feed on one another; but they have all much more deſtructive enemies; theſe are reptiles like themſelves, a ſort of worms, in a ſtate of paſſage, at the end of which they are to paſs thro' the chryſalis ſtate into that of flies or beetles. Even the ſmall ſpecies of butterfly, which lives on the celandine, has its enemies proportioned to its own ſize; and the ſame leaf of the plant is uſually covered at the ſame time with theſe butterflies, their chryſaliſes, and their caterpillars, and with theſe ſmall beetles, their chryſaliſes and worms all confuſedly together; and by their ſmallneſs they are not eaſily diſtinguiſhed one from another. The caterpillars of this ſmall ſpecies are very unhappily circumſtanced; they have not only an open war to carry on with the worms of theſe beetles, which are continually attacking them, and piercing their bodies and ſucking their juices; but they have much more terrible inteſtine enemies, a ſort of ſmall worms which they carry within their bodies, and which eat away their fleſh within the ſkin.

The firſt people who obſerved theſe creatures, ſuppoſed them the young of the caterpillars; but this was not only wholly out of the courſe of nature, but the cruelty of the thing gave it no title to belief. The true hiſtory of theſe little worms bred within the body of the caterpillar, is, that they are not its children, but its moſt cruel enemies; they are depoſited there by a ſpecies of fly, which at the time of laying her eggs pierces the ſkin of the caterpillar with an inſtrument ſhe carries on the hinder part of her body for that purpoſe; in the ſame manner in which the fly which occaſions the galls on oaks, pierces their wood. She depoſits her eggs in the wound ſhe has made, the ſkin of the caterpillar heals over the place, and the creature feels no inconvenience at firſt from the wound; but the heat of her body ſoon hatches theſe eggs, and they producing maggots, which are naturally fleſh-eaters, they feed on the fleſh among which they are produced, and eat the miſerable creature up alive, without breaking its skin; and they are often ſo numerous, that when they are increaſed to their deſtined ſize, they fill up the whole body of the caterpillar, ſcarce leaving a ſufficient ſpace for the entrails. What might appear very ſingular, is, that during all this time the animal which carries theſe inteſtine enemies, ſeems well and at eaſe; it eats and grows larger, as it would do without them. Mr. Reaumur inquiring into the reaſon of this, found that caterpillars have a long canal reaching from the mouth to the anus, and ſerving for ſtomach, œſophagus and inteſtines; and beſides this, there is throughout its whole body, a cellular and fatty ſubſtance. It is on this that theſe devourers feed, without touching the inteſtine, or breaking its communication, which would kill the animal, and deprive them of a ſupply of food. Thus they are ſupplied from the great quantity of food the caterpillar takes, with a renewed fleſh; and when the caterpillars which are infeſted with them are opened, this always is found to be the caſe; they being lodged in, and feeding intirely on this celluſar ſubſtance, or the fat contained in it.

When theſe worms have arrived at their full growth, they come out of the body of the caterpillar, but this not all the ſame way, or by any natural paſſage, but each eats its way thro' the ſkin. As ſoon as they are got out they go to work, to ſpin themſelves ſhells, or caſes for their transformation: theſe they make upon the ſpot, and place them ſide by ſide, either upon the body of the caterpillar, or cloſe by it; and ſtick ſo cloſe to one another, that they appear one caſe or ſhell. This is a circumſtance which has contributed not a little to the belief of their being the natural produce of the caterpillar, as people have thought they were all incloſed in one caſe of that creature's ſpining for them. The caterpillar dies of the wounds it has received by their eating their way out, added to the loſs of what they had eat from it; and after a few days, the worms hatch out of this their chryſalis ſtate into that of the fly, like the parent that lodged the eggs, from whence they aroſe in the body of their ſuppoſed parent. Sometimes the caterpillar enters into its chryſalis ſtate before theſe worms arrive at the time of their going out of its body; and in this ſtate ſometimes they eat thro' the ſides of the caſe, but more frequently they remain in it, and become flies there, ſaving themſelves, by this means, the trouble of ſpining. Some ſpecies of caterpillars are ſo greatly infeſted with theſe worms, that they are very ſeldom found free from them; and it is not more than one in twenty that by this means comes to the butterfly-ſtate. Here then is one great ſtop to the increaſe of theſe deſtructive animals. Another cauſe of their deſtruction is alſo very common, and not leſs ſingular: a ſort of flies lay their eggs in the eggs of the butterflies; and the maggots produced from theſe eat up the embryo caterpillars.

Theſe worms are very terrible to the caterpillars by their number, but the ſmall birds are much more ſo by their ſtrength; multitudes of caterpillars are annually deſtroyed by theſe creatures, either for their own food, or for that of their young. In this alſo there ſeems a ſort of regularity; for as the caterpillars have their taſte for pecu iar ſpecies of plants, ſo the birds have theirs for peculiar ſpecies of caterpillars. In general, they do not love the hairy kinds; but tho' this accident is a defence to them in that ſtate, it is but a temporary one; for they are as ſubject to be devoured when butterflies, as thoſe of the ſmooth ſorts; and thoſe which have eſcaped danger in their two firſt ſtates of life, are by their ſize and conſpicuous colours, very much expoſed to theſe devourers in this their laſt ſtage. Each of their ſtates has its appropriated enemies; and it is the ſame with reſpect to us, whether it is in the caterpillar, the chryſalis, or the fly-ſtate, that the creature is deſtroyed; ſince the propagation is equally ſtopped in which ever it happens, provided only that it be before the laying of the eggs; all the difference, at the utmoſt, however, is, that if they are deſtroyed in the beginning of the caterpillar-ſtate, a few leaves or herbs are ſaved that would have been eaten by them. Memoirs Acad. Science, Ann. 1736. See Tab. of Inſects.

PAPILIO-*muſca*, in natural hiſtory, a name given by ſome authors to a ſeries of ſmall inſects, which ſeem to be of a middle nature, between the fly and the butterfly claſſes. Its wings are in part covered with thoſe ſcales in form of duſt, which render the wings of the butterfly kinds opake, and in part are tranſparent and glaſſy. Reaumur has called the wings *ailes vitrees*, glaſſy wings. *Reaumur*'s Hiſt. of Inſ.

PAPILION-*bourdon*, in natural hiſtory, a name given by the French authors to a ſort of butterflies, which while they feed keep upon the wing with a humming noiſe like that of the humble-bee. *Reaumur*'s Hiſt. of Inſects. See the articles EPERVIERS and PAPILIO.

PAPILION-*a-queue*, *tailed butterflies*, a name given by the French naturaliſts to a ſort of butterfly, of which there are ſeveral ſpecies. The ſeeds of the wings of theſe butterflies are jagged, and one of the jaggs runs out ſo far beyond the reſt as to repreſent a ſort of tail iſſuing from the creature. *Reaumur*'s Hiſt. of Inſects.

PAPILLARIS, in botany, a name uſed by ſome authors for the common *lampſana*, or *nipple-wort*. *Chabræus*, p. 318. See the article LAMPSANA.

PAPILLOSE, among botaniſts. See LEAF.

PAPIO, in zoology, the name of thoſe ſpecies of monkeys which we call *baboons*. The word ſeems not yet properly determined as to the ſpecies which are to be comprehended under it; but what we uſually acknowledge for *papiones* or *baboons*, are ſuch as have long heads like a dog, and very long tails, and are of the number of thoſe called by authors *cynocephali*.

PAPULÆ, a name uſed by many authors for eruptions of various kinds upon the ſkin, but appropriated by Bontius to thoſe reddiſh and rough eruptions thrown out upon the body by ſweat in the Eaſt Indies. Theſe are thrown out all over the ſurface of the body, and at their firſt appearance are accompanied with an intolerable itching and deſire of ſcratching.

Strangers are more expoſed to theſe eruptions at their firſt arrival in theſe countries, than the natives, or thoſe who have long reſided there; as they are alſo to the bitings of the muſquitos, than which they are not leſs frequent: hence a new comer into the country is diſtinguiſhed by theſe troubleſome maladies. The natives call him *organ bearon*, that is, a new arrived man; and tell him theſe complaints are a tax upon him for conſuming the proviſions. They call themſelves *organ lamme*, or *veterans*, and honour with the ſame name ſuch ſtrangers as have lived long in the country.

The *papulæ* are in themſelves no way dangerous; but when they are raſhly and ignorantly treated, or when the ſkin is torn

off

off from them by the nails, they often are the occaſion of malignant and very troubleſome ulcers, that are not eaſily cured.

Bontius, whoſe long reſidence in this part of the world gave him many opportunities of obſerving theſe *papulæ* in all their ſtages, adviſes people, to prevent danger and remove their troubleſome itching, to foment all the parts where they appear with a mixture of vinegar, water, and ſaltpetre; or if this be required yet more acrid, to add to it juice of lemons, and uſe it as before. The effect of this application is at firſt an intenſe pain, but this ſoon decreaſes ſo far, as to become leſs troubleſome than the intolerable itching of the parts. He gives great caution alſo againſt purging medicines, however mild; for by theſe the matter which cauſes the *papulæ* is often carried to the bowels, and produces dyſenteries. The cure is either to be wholly left to nature, or aſſiſted by ſudorifics. *Bontius* de Med. Ind.

PAR (*Cycl.*)—PAR *acceſſorium*, in anatomy, See the article ACCESSORY, *Cycl.*

PARABELE, in ichthyology, a name given by Marggrave to the flying fiſh, the *milvus hirundo* and *cuculus* of ſeveral authors. Theſe are names, however, ſo little expreſſive of the characters of fiſh, that they are applied by different authors to the different ſpecies. Artedi is the only author who has reduced this part of natural hiſtory to a regular ſyſtem; he makes this fiſh a ſpecies of the *triglia*, and diſtinguiſhes it by the name of the *triglia* with the head a little aculeated, and with a ſingular fin placed near the pectoral fins. See the articles MILVUS and TRIGLIA.

PARABOLIC (*Cycl.*)—PARABOLIC *aſymptote*, in geometry, is uſed for a *parabolic* line approaching to a curve, ſo that they never meet; yet by producing both indefinitely, their diſtance from each other becomes leſs than any given line.

There may be as many different kinds of theſe *aſymptotes* as there are parabolas of different orders. See *Mac Laurin*'s Flux. B. 1. ch. 10.

When a curve has a common parabola for its *aſymptote*, the ratio of the ſubtangent to the abſciſs approaches continually to the ratio of two to one, when the axis of the parabola coincides with the baſe; but this ratio of the ſubtangent to the abſciſs approaches to that of one to two, when the axis is perpendicular to the baſe. And by obſerving the limit to which the ratio of the ſubtangent and abſciſs approaches, *parabolic aſymptotes* of various kinds may be diſcovered. See *Mac Laur.* Flux. Art. 337.

PARABOLIC *ſpiral*, in conics. See HELICOID *parabola*, *Cycl.*

PARACENTESIS (*Cycl.*)—See TAPPING.

PARACOPE, a word uſed by Hippocrates to expreſs a ſlight delirium in fevers.

PARACRUSIS, a word uſed by Hippocrates, and by many other writers, and expreſſing the ſame as *paracope*, a ſlight delirium in a fever.

PARADIGRAMMATICE, is uſed by ſome for the art of making all ſorts of figures in plaiſter. The artiſts in this are called *gypſochi*.

PARADISÆA, in zoology, a name uſed by ſome authors for the bird *manucodiata*, or *avis paradiſæa*, the bird of paradiſe, by others. In the Linnæan ſyſtem this makes a diſtinct genus of birds of the order of the *picæ*, the diſtinguiſhing characters of which are, that they have two ſingular and extremely long feathers, which are neither inſerted in the wings nor rump. See Tab of Birds, N°. 6 and *Linnæi* Syſtem. Nat. p. 44.

PARADISIACA, in botany, a name given by ſome authors to the *arbor* vitæ, or *thuya*. *Chabræus*, p. 73.

PARADOX (*Cycl.*)—Geometricians have of late been accuſed of maintaining *paradoxes*; and it muſt be owned, that ſome uſe very myſterious terms in expreſſing themſelves about aſymptotes, the ſums of infinite progreſſions, the areas comprehended between curves and their aſymptotes, and the ſolids generated from theſe areas, the length of ſome ſpirals, &c. But all theſe *paradoxes* and myſteries amount to no more than this: that a line or number may be continually acquiring increments, and thoſe increments may decreaſe in ſuch a manner, that the whole line or number ſhall never amount to a given line or number.

The neceſſity of admitting this is obvious from the nature of the moſt common geometrical figures: thus, while the tangent of a circle increaſes, the area of the correſponding ſector increaſes, but never amounts to a quadrant. Neither is it difficult to conceive, that if a figure be concave towards a baſe, and have an aſymptote parallel to the baſe, as it happens when we take a parallel to the aſymptote of the logarithmic curve, or of the hyperbola, for a baſe; it is not difficult to conceive, I ſay, that the ordinate in this caſe always increaſes while the baſe is produced, but never amounts to the diſtance between the aſymptote and the baſe. In like manner, a curvilinear area may increaſe while the baſe is produced, and approach continually to a certain finite ſpace, but never amount to it; and a ſolid may increaſe in the ſame manner, and yet never amount to a given ſolid. See LOGARITHMIC *curve*.

A ſpiral may in like manner approach to a point continually, and yet in any number of revolutions never arrive at it; and there are progreſſions of fractions which may be continued at pleaſure, and yet the ſum of the terms ſhall be always leſs than a given number. See *Mac Laurin*'s Fluxions, B 1. ch. 10. ſeq. where various rules are demonſtrated, and illuſtrated by examples, for determining the aſymptotes and limits of figures and progreſſions, without having recourſe to thoſe myſterious expreſſions which have of late years crept into the writings of mathematicians. For, as that excellent author obſerves elſewhere, tho' philoſophy has, and probably always will have myſteries to us, geometry ought to have none.

PARÆA, in zoology, the name of a ſpecies of ſerpent, called alſo *anguis æſculapii*. It is a perfectly innocent and harmleſs creature, and is ſo little dreaded by the inhabitants, that it is common about their houſes, and even ſometimes gets into their beds. Its mouth is full of very ſmall teeth, and when much provoked, it is ſometimes known to bite, tho' without any bad ſymptoms attending the wound. It is a very long kind, and is of a yellowiſh green colour on the ſides and blackiſh on the back: it has two ſmall eminences on the neck, and between them two ſmall ſinews. It is very common in Spain, Italy, and moſt other of the warm countries. *Ray*'s Syn. Anim. p. 291.

PARAGAUDÆ, among the Romans, a ſort of wreaths, either wholly of gold, or of ſilk adorned with gold, which were interwoven in garments, and not ſowed to them. The garment was ſometimes of one colour, in which was woven one *paragauda*; others were of two colours, and had two *paragaudæ*; and ſome had three colours, and three *paragaudæ*. They were worn both by men and women.

PARAGOGE (*Cycl.*) a word uſed by medical writers to expreſs a reduction of luxated bones.

PARAGONE, in natural hiſtory, the name given by many to the baſaltes, a black marble, uſed as a touchſtone. See the article BASALTES.

PARAGUA, in zoology, the name of a Braſilian parrot, of the ſize of our common green parrot; but its back is all black, and its breaſt and the forepart of its belly are of a beautiful red. Its eyes are black, with a red circle round them; its beak brown, or a very duſky grey, and legs and feet grey. *Marggrave*, Hiſt. of Braſil.

PARALAMPSIS, a word uſed by medical writers to expreſs a cicatrix in the tranſparent part of the cornea of the eye.

PARALIA, Παραλια, in antiquity, a day kept in memory of an antient hero, called Paralus. *Potter*, Archæol. Græc. l. 2. c. 20. T. 1. p. 424.

PARALIA was alſo the name of one of the Athenian tribes. *Potter*, ibid. T. 1. p. 49.

PARALLAXIS, in the medical writers, expreſſes a mutual change in the ſituation of the parts of a broken bone, as when the two fragments ſlip to the ſides of one another.

PARALLEL (*Cycl.*)—PARALLELS *of declination*, in aſtronomy, are circles parallel to the equinoctial, imagined to paſs through every degree and minute of the meridians, between the equinoctial and each pole of the world.

PARALLELA, a word uſed by medical writers to expreſs a ſort of ſcurf or leprous appearance, affecting only the palms of the hands. It is a ſymptom of the pox.

PARALLELOGRAM (*Cycl.*)—PARALLELOGRAM *of the hyperbola*, in geometry, is uſed for the *parallelogram* formed by the two aſymptotes of an hyperbola, and the parallels to them, drawn from any point of the curve. A *parallelogram* thus formed, is of an invariable magnitude in the ſame hyperpola; and the rectangle of its ſides is equal to the power of the hyperbola. L' Hopital, Sect. Coniq. Art. 99—101. See the article POWER, *Cycl.*

This *parallelogram* is the modulus of the logarithmic ſyſtem; and if we take it as unity, the hyperbolic ſectors and ſegments will correſpond to Napier's or the natural logarithms. If the *parallelogram* be taken = 0. 43429, &c. theſe ſectors and ſegments will repreſent Briggs's logarithms. See the article LOGARITHM.

Huygens has made uſe of this term, De cauſ. gravitat. in fin. See LOGARITHMIC-*curve*.

PARALLELOGRAM-*protractor*, a mathematical inſtrument, conſiſting of a ſemicircle of braſs, with four rulers in form of a *parallelogram*, made to move to any angle: one of theſe rulers is an index, which ſhews on the ſemicircle the quantity of any inward or outward angle.

PARALLELLOPIPED (*Cycl.*)—The *parallellopiped* with oblique angles, is a figure very common to many kinds of ſtones, eſpecially of the ſofter ſort. The common cryſtalizations of grottos break naturally into fragments of this ſhape; and the ſtalactitæ which hang down from their roofs in form of icicles, are originally ſmall hollow pipes formed by the water which continually trickles down drop by drop; and whoſe outer ſurfaces, fixing themſelves by their ſmall baſes, form by degrees a ſort of blunted pyramids, which, like ſo many rays from the axis, which is the hollow pipe, grow hollow at laſt. This axis ſeems to be compoſed of plates, almoſt cylindrical, laid one over another; but if broken, the whole divides into fragments of a *parallellopiped* figure: the blunted pyramids that are about the axis divide themſelves at firſt into other blunted pyramids; but afterwards almoſt all theſe fragments divide of themſelves into other fragments of a *parallellopiped* figure, this ſeeming every where the ultimate ſhape of the particles.

In the mountain of Barege there is found a vaſt quantity of aſbeſtus; the ſtone upon which this grows, tho' in itſelf of

no determinate figure externally, yet always breaks into regular *parallellopipeds*: nor is this peculiar to theſe ſtones found naturally concreted on the ſurface or within the bowels of the earth, but it is alſo found in ſuch as are concreted by means of art out of the water in which they are originally ſuſpended. The water of the fountain de Salut, near Bagneres in Gaſcony, when evaporated to a certain degree, yields a ſcum on the ſurface, which alſo adheres to the ſides of the veſſel; and this ſcum, examined by the microſcope, is found to be compoſed of many regular *parallellopipeds*. If the ſame waters, and thoſe of ſeveral other ſprings, be evaporated to a drineſs, there remains a white ſhining powder, out of which the microſcope can direct us to ſeveral the like regular figures. Phil. Tranſ. N. 472, p. 32.

PARALLELLOPIPEDIA, in natural hiſtory, the name of a genus of ſpars, thus called, becauſe regularly of a *parallellopiped* form.

They are pellucid cryſtaline ſpars, externally of a determinate and regular figure, always found looſe, detached, and ſeparate from all other bodies, and in form an oblique *parallellopiped*, with ſix parallelogram ſides and eight ſolid angles, eaſily fiſſile, either in an horizontal or perpendicular direction, being compoſed of numbers of thin plates, and thoſe of very elegantly and regularly arranged bodies, each of the ſame form with the whole maſs, except that they are thinner in proportion to their horizontal planes; and naturally fall into theſe and no other figures, on being broken with a ſlight blow.

Of this genus there are four known ſpecies. 1. The hard pellucid and colourleſs one, called the iſland cryſtal of authors. See ISLAND *cryſtal*. 2. A dull and whitiſh kind, found in France, Germany, and England, particularly in the Derbyſhire and Yorſhire lead-mines, and about Scarborough. This has the ſame property with the former, of giving a double refraction; but it is ſo dull and opake, that it does not ſhew it ſo elegantly. 3. A ſoft, whitiſh, and very bright one, found principally in the lead-mines of Yorkſhire and about the ſeaſhores of that county. And, 4. a dull, hard, and pale brown one: this is found in the lead-mines of the ſame county, and in ſome parts of Ireland. All theſe ſpecies have the ſame power of double refraction with the firſt, but are too opake to ſhew it ſo beautifully, and often have not tranſparence enough to make it at all diſtinguiſhable. *Hill*'s Hiſt. Foſſ. p. 333.

PARALOPHIA, a word uſed by Keil and ſome other anatomical writers, to expreſs the lower and lateral part of the neck.

PARALOURGES, Παραλουργες, among the antients, a kind of garment, with a purple clavus on each ſide. *Pitiſc.* Lex. Ant. in voc. See CLAVUS.

PARALYSIS, in botany, *&c.* the ſame with *primula veris*. See PRIMULA *veris*.

PARAMERIA, a word uſed by the antients to expreſs the internal part of the thighs.

PARAMESE, in the Greek diagram, or ſcale, was the note above the meſe, which anſwers to a-la-mi-re of Guido's ſcale. V. *Wallis*'s Append. Ptolem. Harm. p. 157. Hence, as the *parameſe* was the firſt of the diazeugmenon tetrachord, it will be equivalent to Guido's higheſt ♮ mi. See DIAGRAM.

PARAMESOS, a word uſed by ſome to expreſs the ring-finger, that next the little one.

PARANETE, in the antient muſic, was a name ſometimes uſed to ſignify the next note, or chord to the nete, or laſt note of a tetrachord. See TETRACHORD.

Hence it might be called the penultimate chord. It was otherwiſe, and more properly called, *lichanos*, or index: the reaſon of which ſee under LICHANOS.

PARANETE *diezeugmenon*, in the Greek muſic, was the penultimate note of the *diezeugmenon* tetrachord, and anſwers to Guido's de-la-ſol-re. *Wallis*'s Append. Ptolem. Harm. p. 157. See DIAGRAM.

PARANETE *hyperbolæon*, in the Greek muſic, was the penultimate note of the *hyperbolæon* tetrachord, and anſwers to Guido's g-ſol-re-ut. *Wallis*'s Appen. Ptolem. Harm. p. 157. See DIAGRAM.

PARAPHORA, a word uſed by the antients to expreſs a ſlight kind of delirium, or light-headedneſs in a fever: ſome have made it ſignify a delirium in general.

PARAPHRENITIS, in medicine, the name of a diſtemper which conſiſts in an acute ſymptomatic fever; which is the means uſed by nature to break through inflammatory ſtates in the diaphragm. The alienation of the mind in this diſeaſe is owing to the conſent of the nerves.

Signs of it. This is always attended with a moſt violent and painful cardialgia, or heart-burn; inſomuch, that the perſon cannot bear the leaſt touch of a finger on the region of the breaſt or ſtomach. It always brings on alſo a tumor of the præcordia, and an alienation or roving of the mind, which is always ſenſible in the words and actions of the perſon, but is not ſo great as in the true *phrenitis*. The reſpiration is interrupted by frequent ſighings; belchings are very frequent; as alſo the diſcharge of a black matter by vomit. The mouth is dry and parched, and the tongue very white and furred; and there is great thirſt.

Cauſes of it. The moſt frequent cauſe of this is a ſudden tranſlation of the morbific matter in fevers to the diaphragm; a ſuppreſſion of natural hæmorrhages by the noſe, the hæmorrhoidal veſſels, or by the menſes; an omiſſion of habitual bleedings, and the drinking cold liquors when the blood is heated by exerciſe; and finally, a tranſlation of the matter of a quinſey to this part.

Prognoſtics in it. This is a dangerous diſeaſe, but it has three ways of terminating, according to the diſpoſition of the patient's blood and humours: 1. Sometimes the matter which cauſed the obſtruction is eaſily diſcuſſed, and ſweats happening on the critical days, carry off the diſtemper. 2. Sometimes the matter is reſolved, indeed, but not ſo happily; the reſolution takes longer time, and the matter finally does not evacuate itſelf by ſweat, but is tranſlated to the ears, where it occaſions deafneſs, tumors, and other accidents; or to the joints, where it brings on either the gout or eryſipelatoſe diſorders: or, 3. The matter comes to ſuppuration; in which caſe, the perſon dies either within ſeven days, or, at the utmoſt within fourteen. The ſigns which preſage a gangrene in this diſeaſe, are violent hiccoughs, coldneſs of the extremities, violent internal heat, and clammy ſweats.

Method of cure. When, by a preceding error in the perſon's diet, the peccant matter remains in the primæ viæ, a gentle emetic is to be given, with the digeſtive medicines before it; and if the vomit does not operate, a few grains of emetic tartar are to be given afterwards. When the patient is of a plethoric habit, bleeding is extremely neceſſary; and ſometimes, where the ſymptoms require it, may be repeated to a third time. Twenty drops of the mixtura ſimplex may afterwards be given at a doſe, every four hours, in the morning; and in the afternoon, powders of purified nitre, with vitriolated tartar and crabs eyes ſated with juice of lemons: beſides theſe, there may be externally applied, plaiſters, with a large portion of camphor, to the breaſt and back; ſinapiſms, and other hot cataplaſms, to the ſoals of the feet; ſtimulating clyſters, and acrid ſuppoſitories have alſo their uſe in this caſe; and the application of leeches to the hæmorrhoidal veins, in people who have been ſubject to diſcharges from thence, are very often of ſingular ſervice. All the while there muſt be kept up a gentle tranſpiration, either by copious draughts of warm and weak liquors, or by lightly accidulating medicines. *Junker*'s Conſp. Med. p. 307, ſeq.

PARAPHROSYNE, a word uſed by ſome medical writers to expreſs a delirium, or an alienation of mind in fevers, or from whatever cauſe.

PARAPOTAMIA, in the materia medica of the antients, a word uſed at firſt as an epithet of diſtinction for a kind of Œnanthe, from which the œnanthine ointment of the Greeks was made; but afterwards uſed ſimply as the name of that plant. This kind of œnanthe was the moſt fragrant of all the kinds, and was therefore uſed for the making the ointment preferably to the reſt.

Theophraſtus makes a very great difference in the œnanthe of different places, obſerving, that the Cyprian kind was fragrant, and fit for making this ſweet ointment; but that the Grecian had no ſmell at all: and thence it probably aroſe, that the Greeks uſed afterwards the flowers of the wild vine for this purpoſe, and called them by the ſame name.

Pliny's account of this ointment is by no means to be depended upon. The whole paſſage where he names it, and the others of the like kind, is taken from the account of Apollodorus, in Athenæus; but it is ſo careleſly tranſlated by Pliny, that the author's ſenſe can ſcarce any where be made out. *Athenæus*, l. 15.

PARAPROSDOCIA, Παραπροσδοκια, in rhetoric, the ſame with *paradox*. See PARADOX, *Cycl.* and *Suppl.*

PARARTHREMA, a word uſed by medical writers to expreſs a ſlight luxation.

PARARYTHMOS, an epithet uſed by the antients to expreſs any kind of pulſe which did not ſeem ſuitable to the age and ſtate of the perſon.

PARASCEUE, (*Cycl*) in antiquity, a Greek word which ſignifies *preparation*. The Jews gave the name of *paraſceue* to Friday, becauſe being not allowed on the Sabbath to prepare their food, they provided the day before. Exod. xvi. 23. xxxv. 2. 3. *Calmet*. Dict. Bibl.

PARASCHIDES, a word uſed by chirurgical writers to expreſs the ſplinters of fractured bones, or the fragments of bones corroded by ſharp humours.

PARASEISMA, a ſort of exerciſe preſcribed by the Greek phyſicians in many caſes. It was a general concuſſion of the body.

PARASEMUM, Παρασημον, among the antients, a ſign painted or carved on the prow of ſhips, by which they were diſtinguiſhed from one another. This ſign was commonly the figure or picture of ſome animal, as the bull, lion, *&c.* or of any other thing, as a mountain, tree, flower, *&c.* *Pitiſc.* in voc. and *Potter* Archæol. Græc. T. 2. p. 128.

PARASIOPESIS, Παρασιώπησις, in rhetoric. See the article PARALEPSIS, *Cycl.*

PARASITIUM, among the antients, a granary or place where the ſacred corn, deſigned for religious purpoſes, was preſerved. *Pitiſc.* Lex. Ant. in voc. See PARASITE, *Cycl.*

PA-

PARASPHAGIS, a word uſed by ſome anatomical writers to expreſs that part of the neck which is contiguous to the clavicles.

PARASTREMMA, a name given by medical writers to a convulſive diſtortion of the mouth, or of any part of the face.

PARATHENAR-*major*, a pretty long muſcle forming part of the outer edge of the ſole of the foot. It is commonly called *hypothenar*, but very improperly, according to the proper ſignification of that word. It is fixed backward by a fleſhy body to the outer part of the lower ſide of the os calcis, from the ſmall poſterior external tuberoſity all the way to the anterior tuberoſity, there it joins the metatarſius; and at the baſis of the fifth metatarſal bone, ſeparates from it again, and forms a tendon which is inſerted in the outſide of the firſt phalanx of the little toe near its baſis, and near the inſertion of the *parathenar*-minor. *Winſlow*'s Anatomy, p. 226.

PARATHENAR-*minor*, a fleſhy muſcle fixed along the poſterior half of the outer and lower ſide of the fifth bone of the metatarſus; it terminates under the head of that bone in a tendon which is inſerted in the lower part of the baſis of the firſt phalanx of the little toe.

The tendinous inſertion of this muſcle is very cloſely united to the cartilaginous ligament; and the ſame thing is to be obſerved of the other muſcles, which go to the baſis of the firſt and ſecond phalanges of the toes. In aged perſons, ſome part of theſe ligaments are often turned to bone, and thereby form thoſe bony portions which many have taken for diſtinct ſeſamoide bones. *Winſlow*'s Anatomy, p. 226.

This muſcle is more expreſſively named by Albinus, the *flexor brevis digiti minimi pedis*.

PARATI, in zoology, the name of a Braſilian fiſh of the mullet kind, much reſembling that ſpecies called *curema*, or *taintra*, in all reſpects but ſize; and in the colour of its eyes, the iris of which, inſtead of the ſilvery colour it has in the *curema*, is of a fine yellow. Its fleſh alſo when dreſſed, is drier than that of the *curema*. *Piſo*'s Hiſt. of Braſ. See the article CUREMA.

PARBUNCLE, in a ſhip, the name of a rope almoſt like a pair of ſlings; it is ſeized both ends together, and then put double about any heavy thing that is to be hoiſed in or out of the ſhip; having the hook of the runner hitched into it to hoiſe it up by.

PARCELLING, in ſhip-building, is caulking the ſeam of a ſhip, then laying over it a narrow piece of canvas, and then pouring on it hot pitch and tar. See PAYING.

PARDALIS, in zoology, a name by which many authors call the bird more commonly known by the name of *pluvialis*, and called in Engliſh the *grey* and *green plover*; birds of the ſize of the lapwing, and much eſteemed at table. *Ray*'s Ornithology, p. 229.

PARDALIS is alſo uſed as the name for the leopard, called alſo *pardus*, *panthera*, and *varia*, by ſome. It is diſtinguiſhed from the lion by its variegation of colour, and from the tyger by the diſpoſition of thoſe colours; which are in this creature always in round ſpots like eyes, as in the tyger they are in long ſtreaks. The leopard is alſo leſs than the tyger.

PARDUS, in zoology, a name uſed by many for the *leopard*; the more accurate authors, however, uſe the word *pardalis*. See PARDALIS and LEOPARD.

PARDUS, in conchyliology, a name given by authors to a kind of ſhells, of the genus of the volutæ. We have three kinds of this ſhell: 1. A voluta ſpotted with black. 2. Another ſpotted with yellow. And 3. A very elegant one ſpotted with a rediſh colour. They are called *pardi*, or *leopard-ſhells*, from their diſtinct ſpots reſembling thoſe on the ſkin of a leopard.

PARE, in the manege. To *pare* a horſe's foot is to cut his nails; *i. e.* the horn and ſole of his foot; which is done with a butteris, in order to ſhoe him. See BUTTRESS, *Cycl.*

In England, the ſmith or farrier holds the horſe's foot between his knees; in which poſture he *pares* the foot, ſets on the ſhoe, drives the nails, and rivets them, and this all alone without any aſſiſtance from the groom.

PARECBASIS, Παρεκβασις, in rhetoric, is uſed to ſignify the exaggeration of a crime, and not a digreſſion from the queſtion in hand, as ſome have thought. *Voſſ.* Rhet. l. 3. p. 364.

PARECHESIS, Παρήχησις, in rhetoric, the too frequent repetition of the ſame ſyllable, thus, *perire me malis malim modis*. *Voſſ.* Rhet. l. 5. p. 331.

PAREDRIA, a term uſed by Hippocrates to expreſs an aſſociation of two or more diſeaſes in the ſame patient, making what we call a complicated illneſs.

PAREDRI, Παρεδροι, among the Athenians. When the Archon, Baſileus, or Polemarchus, by reaſon of their youth happened not to be ſo well ſkilled in the laws and cuſtoms of their country, as might have been wiſhed, it was cuſtomary for each of them to make choice of two perſons of age, gravity, and reputation, to ſit with them upon the bench, and direct them as there was occaſion. And theſe aſſeſſors, or *paredri*, were obliged to undergo the ſame probation in the ſenate-houſe and public forum, with the other magiſtrates; and like them too, to give an account how they had behaved themſelves in their reſpective truſts, when their office was expired. *Potter*, Archæol. T. 1. p. 77.

PAREIRA-*brava* (*Cycl.*)—The Portugueſe name ſignifies the wild vine, and is given to a root firſt brought into Europe by Mr. Amelot, and celebrated by many at that time for its extraordinary virtues. The plant which produces it is not known, but is generally ſuppoſed to be of the vine kind. Mr. Geoffroy examined into its virtues carefully, and alſo its characters and diſtinctions; he found that there were properly two kinds of it: The one brown on the outſide, and yelloviſh within. This is what was then moſt frequent in uſe; and the other white on the outſide, and of a paler yellow or lemon colour within. This is ſaid to be of a fleſh colour on the outſide where recent, and to turn white in drying; both are of a ſpungy or porous texture, yet conſiderably hard and woody; of a bitter taſte, but with an admixture of a ſweetiſh flavour like that of liquorice; and their uſual ſize is from that of one's middle finger, to that of one's thumb.

The Portugueſe were informed of the virtues of this root by the natives of the Braſils; and on trial extolled it above all the medicines in uſe. Their accounts of its efficacy were too exaggerated to gain credit with the judicious part of the world; but Mr. Geoffroy's experiments, which ſet its virtues in a much modeſter light, yet ſhew them to be very great; and that the root deſerves to be for ever continued in uſe in medicine, and rekoned among the moſt valuable ſimples. The Portugueſe pretend, that it diſſolves the ſtone in the bladder; but tho' this is not true, Mr. Geoffroy found that it was admirable for breaking the common weaker ſabulous concretions in the kidneys and ureters; and that the taking it was always attended with the voiding of large quantities of gravel. He gave it alſo with great ſucceſs, to perſons afflicted with ulcers in the kidneys and bladder, and whoſe urine was purulent, and at many times totally ſuppreſſed: theſe ſuppreſſions of urine were always cured by it, and their urine became leſs thick and purulent; many alſo were perfectly cured of theſe complaints by a courſe of it, with the addition of balſam of capivi toward the end of the courſe.

This property of the *pareira-brava*, of diſſolving thick humors, gave Mr. Geoffroy an opinion of trying it in humorous aſthmas; and theſe obſtinate caſes often were greatly abated, and ſometimes perfectly cured by it. The uſual way of taking it, is in decoction, ſweetening it in the manner of tea. Mem. Acad. Par. 1710.

PAREMBOLE, Παρεμβολή, in rhetoric, a figure wherein ſomething relating to the ſubject is inſerted in the middle of a period. All the difference between the *parembole* and *parentheſis*, according to Voſſius, is, that the former relates to the ſubject in hand, whereas the latter is foreign to it. An example of each we have in Virgil, and firſt of the *parembole*.

Æneas (neque enim patrius conſiſtere mentem
Paſſus amor) rapidum ad naves præmittit Achatem.

The following is an inſtance of the *parentheſis*:

——— ipſique ſuos jam morte ſub ægrâ
(Di meliora piis, erroremque hoſtibus illum)
Diſciſſos nudis laniabant dentibus artus.

Voſſ Rhet. l. 5. p. 334. See PARENTHESIS, *Cycl.*

PARENCEPHALIS, a name given by ſome authors to the *cerebellum*.

PARENTHESIS, Παρενθεσις, in rhetoric, is frequently confounded with *parembole*. See the articles PAREMBOLE, *Suppl.* and PARENTHESIS, *Cycl.*

PARERGON, in painting, an appendix, or piece added to the main deſign by way of ornament. *Hoſm.* Lex. in voc.

PARER, in the manege, a term formerly uſed as a command to ſtop, but now exploded; all the riding-maſters, when they have a mind the ſcholar ſhould ſtop the horſe, calling out *hola*. *Guillet*, in voc. See STOP.

PARETONIUM, in natural hiſtory, the name of an earth antiently found on the ſhores of Egypt, Cyrene, and the iſland of Crete; and uſed by the antients in painting.

It had its name either from a part of Egypt near which it was gathered, or from the name of a town in that kingdom where it was uſually ſold. Vitruvius is of the firſt opinion, and Volaternus of the other.

There have been ſome differences among the earlier writers about the nature and origin of this ſubſtance; and much confuſion and miſtake among the moderns. Pliny imagined it formed of the froth of the ſea coaleſced into a ſolid maſs, with the addition of ſome mud: Aldrovand thought it formed of the diſunited particles of what he calls the fatter ſtones, ſuch as lime-ſtones, and the like, waſhed from them by the motion of the water, and afterwards got together in that form. And Daleſchamp eſteemed it a chalk, produced about the ſhores, which he adds was very white, fat, and glutinous, and could not be taken up without a mixture of ſome of the mud along with it. It is very clear, however, according to this very account, that the ſubſtance could be no chalk: viſcidity and fatneſs, are qualities that cannot belong to an earth of that claſs; neither are we to imagine, that it was ever dug up from the flat parts of the ſhores; ſince if there was a ſtratum of it there, tho' ever ſo thin, it might certainly have been taken up pure.

Such were, however, the opinions of authors about this ſubſtance. Of late we have been taught to think it loſt; but it is ſtill common on the ſhores of moſt of the iſlands of the Archipelago, tho' not obſerved or regarded; and is truly a very heavy and tough clay of a fine white colour, found in maſſes of different ſizes, generally as ſoft as the ſofter clays within the ſtrata; and by rolling about on the beech in this ſtate, it gathers up the ſand, ſmall ſhells, and other foulneſſes we always find about it. It is moſt probable, that there are ſtrata of it fine and pure in the cliffs there, and that the ſea waſhes off maſſes of them in ſtorms and high tides, which are what we find. *Hill*'s Hiſt. of Foſſ. p. 17.

PARGET, in natural hiſtory, a name given to the ſeveral kinds of gypſum or plaiſter-ſtone, which when ſlightly calcined, make what is called *plaiſter of Paris*, uſed in caſting ſtatues, in ſtuccoing floors and cielings, and many other like occaſions.

The word *parget*, tho' generally underſtood of all the gypſums, is, however, by the workmen principally applied to the two ſpecies which make up the firſt genus of that claſs, called by Dr. Hill the *pholides*. Theſe are the Montmartre kind, and that of Derbyſhire. See PHOLIS.

The firſt of theſe, or *parget* of Montmartre, is dug in the place from whence it has its name, and is very pure; of a conſiderably bright and gloſſy appearance: when freſh broken, of a cloſe, firm, and compact texture, and ſomewhat ſoft and ſmooth to the touch. It is found in maſſes of different ſizes, from four inches to as many feet in diameter; and of no determinate ſhape or figure, but uſually ſomewhat flatted. It is uſually of a pure and fine white, tho' ſometimes a little browniſh; and in both caſes ſo exactly reſembles in ſtructure and appearance, a lump either of coarſer or finer loaf ſugar, as not to be eaſily diſtinguiſhed from it at ſight. When broken, it looks conſiderably bright, and is ſeen to be compoſed of ſmall flat particles laid together with no order or regularity. It will not give fire with ſteel, nor ferment with aqua fortis; but very freely calcines to a fine white powder, the uſes of which are well known. We have none of this kind in England. *Hill*'s Hiſt. of Foſſ. p. 112.

The Derbyſhire *parget* of this genus, (for there are many of the others dug in the ſame county, which are much leſs valuable) the *pholis* of that country, as it ought diſtinctly to be called, which is what our workmen diſtinguiſh by the name of *Derbyſhire parget*, of all the gypſums comes the neareſt the nature of the French. This is diſtinguiſhed from all the other Engliſh gypſums by its ſuperior hardneſs, its brightneſs, and the breadth of its conſtituent particles. It is of an extremely irregular, rough, coarſe, and unequal texture, and is not at all ſoft to the touch. It is very beautifully variegated in colour with a fine bright white, and a duſky pale red. The white is uſually the ground, and the red is diſpoſed in form of clouds, ſpots, or veins in it. It is found in broad flat maſſes of uneven and rugged ſurfaces; ſome of theſe are four or five feet in breadth, and two or three in thickneſs.

Theſe are of a duſky ſurface, but very bright and ſhining when broken, and its conſtruction is very irregular; ſome parts of it, where the broad faces of its flakes are ſeen, appearing of a foliaceous ſtructure, and others, where their egdes come in view, of a ſtriated one. Its conſtituent particles are ſcaly, but longer and narrower than thoſe of the French kind. It is much heavier than the French kind, and will neither give fire with ſteel, nor ferment with acids; and calcines a little more ſlowly than the other to a white plaiſter. This is dug in vaſt quantities in Derbyſhire, in Yorkſhire, and ſome other parts of England. *Hill*'s Hiſt. of Foſſ. p. 113.

PARHELIUM *(Cycl.)*—The frequent appearances of *parhelia* in cold climates, ſeem to confirm Deſcartes's hypotheſis, of their proceeding from icy particles ſuſpended in the air. See Phil. Tranſ. N° 465. Sect. 2.

PARHOMOLOGY, Παρομολογια, in rhetoric, a figure wherein part is yielded to the opponent, and the reſt denied: thus, *Sume hoc ab judicibus noſtrâ voluntate: neminem illi propiorem cognatum, quam te, fuiſſe, concedimus: officia tua nonnulla in illum extitiſſe, ſtipendia vos unà feciſſe aliquamdiu, nemo negat ſed quid contra teſtamentum dicis, in quo ſcriptus hic eſt. Voſſ.* Rhet. l. 5. p. 389. See CONCESSION, *Cycl.*

PARIETALIA *oſſa*. Theſe are ſituated on the ſuperior, lateral, and a little on the poſterior parts of the ſkull. They are of a larger extent than any other bone of the ſkull; and their figure is nearly that of an irregular convex ſquare. They have each an external and convex ſide, and an internal and concave one, four edges, one ſuperior or ſagittal, one inferior or temporal, one anterior or frontal, and one poſterior or occipital. The ſuperior edge is the longeſt; the inferior the ſhorteſt; in this laſt there is a very large ſquammoſe ſlope, which may be properly named the temporal ſlope; the upper and poſterior edges are indented thro' their whole length; the anterior edge is indented alſo, except at its lower part; and all the lower edge is ſquammous, except a ſmall portion next the os occipitis. It has four angles, the anterior and upper, the anterior and lower; the poſterior and upper, and the poſterior and lower: the anterior and lower angle ends in a ſquammous production, which from it ſituation may be called the *temporal angle*, or *apophyſis*. On the outſide above the temporal ſlope, is ſeen the moſt conſiderable portion of the ſemi-circular plane of the temporal muſcle; near the upper edge toward the poſterior angle, is a ſmall hole called the *parietal hole*, which is ſometimes found only in one of the bones, ſometimes in the ſagittal ſuture, and in ſome ſubjects is intirely wanting. In ſome this hole alſo goes only to the diploe, in others it perforates both tables.

Theſe bones are the weakeſt of all the eight that compoſe the ſkull. The diploe is found between the tables thro' the whole length of the ſagittal and occipital edges, and thro' the upper half of the coronal ſuture. Theſe bones contain a large portion of the brain, form part of the temples, and ſerve for the inſertion of the temporal muſcles. *Winſlow*'s Anatomy, p. 24.

PARIETARIA, *pellitory of the wall*, in botany, the name of a genus of plants, the characters of which are theſe: The flower is of the apetalous kind, and conſiſts uſually of only four ſtamina, which ariſe out of a cup divided into four ſegments. This is ſometimes of the bell-ſhape, ſometimes of the funnel-ſhape, and ſometimes rotated. The piſtil finally becomes an oblong ſeed, which is contained in the cup of the flower.

The ſpecies of *parietaria*, enumerated by Mr. Tournefort, are theſe: 1. The common *parietaria*, or *pellitory of the wall*. 2. The Baſil-leaved *parietaria*. 3. The leaſt annual Portugal *parietaria*. *Tourn.* Inſt. p. 509.

This is a plant of a long time famous in medicine. It is cooling and abſtergent. It is preſcribed in ſtranguries, and in caſes of gravel or ſmall ſtones in the kidneys; and is an ingredient in many of the ſhop-compoſitions, intended for thoſe purpoſes. It is ſometimes made an ingredient in decoctions for clyſters, to be given in nephretic caſes, and externally is much recommended in the eryſipelas, and for the ſoftening of hard tumors.

PARISTHIMA, a word uſed by ſome authors to expreſs the tonſils. See TONSILS.

PARIUM *marmor*, in the natural hiſtory of the antients, the white marble uſed then, and to this day, for carving ſtatues, *&c.* and called by us at this time *ſtatuary marble*.

Too many of the later writers have confounded all the white marbles under the name of the *parian*; and among the workmen, this and all the other white marbles have the common name of *alabaſters*; ſo that it is in general forgotten among them, that there is ſuch a thing as alabaſter different from marble; which, however, is truly the caſe. Almoſt all the world alſo have confounded the Carrara marble with this, tho' they are really very different; the Carrara kind being of a finer ſtructure and clearer white than the *Parian*, but leſs bright and ſplendid, harder to cut, and not capable of ſo glittering a poliſh.

The true *Parian* marble has uſually ſomewhat of a faint blueiſh tinge among the white, and often has blue veins in different parts of it. It is ſuppoſed by ſome to have had its name from the iſland Paros, one of the cyclades in the Ægean ſea, where it was firſt found; but others will have it to have been ſo called from Agoracritus Parius, a famous ſtatuary, who ennobled it by cutting a ſtatue of a Venus in it. *Hill*'s Hiſt. of Foſſ. p. 462.

PARK *(Cycl.)*—A *park* ought to have three ſorts of ground in it: 1. Mountainous and barren. 2. Hilly and yet fertile. And 3. Plains that are ſufficiently fruitful. The mountainous part ſhould be well covered with high woods over at leaſt a third part of it. The downs and hilly part ſhould have one third part coppices and low woods; and the plains ſhould be at leaſt one third part paſture ground, with ſome arable or corn land. There ſhould be a river contrived to run thro' ſome part of it, and a ſpring or brook to go through a great part, and at length fall into the river.

Theſe are the natural advantages to be wiſhed in a *park*; but when they are wanting, they are to be ſupplied as far as may be by art, as by ponds to preſerve rain water, to ſupply the place of rivers and ſprings and proper plantations, and expoſures for the reſt; only the perſon who is to make a *park* ſhould know what the natural advantages are, that he may take in as many of them as he can. When ponds are to be made to ſupply the place of natural brooks and rivers, they ſhould be made large enough; the extraordinary expence in this will be eaſily repaid, by breeding fiſh in them, and fowl may alſo be kept in plenty on them. The *park* ſhould alſo be well ſtored with trees; oaks ſhould not be wanting in it; but beech and cheſnut are the quickeſt of growth, and are eaſy to be had: theſe, therefore, ſhould be planted in conſiderable numbers. Apple-trees and plum-trees alſo ſhould be planted, as generally thriving very well, and affording good food to the deer, *&c.*

The beſt incloſure for a *park* is a brick or ſtone wall; but as the expence of this is very great, it may be done by paling; the pales muſt, in this caſe, be of ſound heart of oak; and ſo cloſe planted, that no animal of prey can make its way in between them; and for a farther defence, a good-quick ſet hedge is very proper, and ſhould be kept in good order. Some part of the mountain and high wood, may conveniently be made a heronry, and ſome part of the

middle

middle may be a warren for hares and rabbits. Colts and horſes may be bred at large in the *park*, and in the ſummer ſeaſon it will be proper to have cows in the paſture ground on the plains.

There ſhould be at leaſt five or ſix encloſures in the *park*, that the deer may be ſhut out or let in as occaſion requires. In the coldeſt ſeaſons they ſhould always be kept altogether in the high woods, where they have good ſhelter, and are to be fed conſtantly with provender by the keepers. In the ſummer ſuch a number as are intended to be uſed may alſo be kept on the beſt ground, that they may thrive quicker than thoſe intended only for ſtore. Some artificial holes and caverns ſhould alſo be made for the deer to retire into in the hot weather, as well as in the cold.

PARK-*bote*, in our old writers, ſignifies to be quit of incloſing a *park* or any part thereof. 4. Inſt. 308. *Blount.*

PARKINSONIA, in botany, the name of a genus of plants, ſo called in honour of the Engliſh botaniſt, Parkinſon. The characters are theſe: the perianthum is deciduous, and is formed of one leaf divided into five ſegments at the edge. The flower is compoſed of five petals, nearly equal in ſize, and larger than the ſegments of the cup. They are diſpoſed in a circular form, and the four uppermoſt are oval, the under one kidney-ſhaped. The ſtamina are two filaments, ſomewhat crooked; the anthenæ are oblong; the germen of the piſtil is oblong, ſlender, and ſomewhat bent; there is ſcarce any ſtyle; the ſtigma is oblate and aſſurgent. The fruit is an extremely long pod, of a cylindric figure, and ſwelling out in the places where the ſeeds are, ſo that it looks like a necklace. The pod terminates in a point, and contains as many round ſeeds as there are protuberances on it. *Linnæi* Gen. Pl. p. 179i *Plum.* Gen. 3.

PARLIAMENT (*Cycl.*)—From the inquiries and reaſonings of our antiquarians, it ſeems there has always been ſomething of the nature of a *parliamentary* aſſembly, as antient as any thing we know of our conſtitution. This aſſembly was ſometimes called *magnates regni, omnes regni nobiles, proceres et fideles regni, diſcretio totius regni, generale concilium regni.* *Spelm.* Gloſſ. voc. *Parliament.* *Prynn*'s Rights of Commons, 99.

But tho' this in general ſeems ſettled, yet many have been the diſputes of antiquaries, with reſpect to the power and authority of theſe aſſemblies; as alſo about the perſons who compoſed them. The firſt formation of the houſe of commons has been particularly the ſubject of warm debates.

Cambden, in his *Britannia* [a], dates the original of the houſe of commons, as now elected, from the 39th of Henry III. and ſays he has it *ex ſatis antiquo ſcriptore*, but does not name his author. Pryn, in his plea for the lords, follows him [b]; and ſo do Dugdale, Heylin, Brady, Filmer, and others. Among other reaſons this is one, that the firſt writ of ſummons of any knights, citizens and burgeſſes, now extant, is no antienter than the 49th of Henry III. and it ſeems the moſt probable, and moſt commonly received opinion, that the houſe of commons was eſtabliſhed during the reign of Henry III. after he had vanquiſhed the barons. Before that it is ſcarce credible they would have ſuffered any power in oppoſition to their own. Thus much is certain, that in the reign of Edward I. we find a houſe of lords, and alſo a houſe of commons, conſiſting of knights, citizens, and burgeſſes. [a *Cambd.* p. 13. b Pryn. l. c. p. 182.]

Sir Edward Coke, in his fourth inſtitute [a], ſays, that the lords and commons at firſt ſate together. Whether they did or did not, does not well appear, nor does Selden [b] determine the point. [a p. 2. b Tit. of Hon. 704.]

The parliament commences by the king's writ or ſummons: antiently ſome of the peers only were ſummoned, as it might have often proved inconvenient to ſummon them all, if it be true that they were once about 3000 in number [a]. When a parliamentary peerage was eſtabliſhed, all were ſummoned: hence my lord Coke ſays [b], that every lord, ſpiritual and temporal, of full age, ought to have a writ of ſummons *ex debito juſtitiæ*. [a Vid. *Spelm.* Gloſſ. 67. *Seld.* Tit. of Hon. 692. b 4 Inſt. 1. For the form of ſuch ſummons, ſee *Cotton*'s Records, 3, 4.]

Antiently the tenure firſt created the honour, and ſuch as held *per baroniam* were ſummoned to do ſuit and ſervice in parliament; and as ſuch a ſummons was an evidence of the tenure, ſo it has been ſince ſettled, that the ſummons and ſitting in parliament makes the baron. But in all degrees of quality above a baron, a ſummons is not ſufficient; becauſe there are other ceremonies requiſite, which muſt be performed, unleſs diſpenſed with by letters patent; and theſe being matters of record muſt be produced [a]. [a *Seld.* Tit. of Hon. 495, 530. *Show.* P. C. 5. *Spelm.* Gloſs. 142.]

The firſt ſummons of a peer to *parliament* differs from an ordinary ſummons, becauſe in the firſt ſummons he is called up by his proper chriſtian and ſurnames, not having the name and title of dignity in him till he has ſat; but after that, the name of dignity becomes part of his name: but the writ of creation, in all other things, is the ſame with the ordinary writ that calls him. *Co. Litt.* 16.

The writ of ſummons iſſues out of chancery, and recites, that the king *de aviſamento concilii*, reſolving to have a *parliament*, deſires *quod interſitis cum*, &c. Each lord of *parliament* is to have a diſtinct ſummons, and each ſummons is to iſſue at leaſt forty days before the parliament begins. Vid. 7 and 8 of *Will.* and *Mar.* c. 25.

Of the manner of ſummoning the judges, barons of the exchequer, king's council, and civilians, maſters in chancery, who have no voices, and how the writs differ from that to a lord of *parliament*, Vide Reg. 261. F. N. B. 229. 4 Inſt. 4.

Alſo a writ of ſummons muſt be directed to every ſheriff of every county in England and Wales, for the choice and election of knights, citizens, and burgeſſes, within each of their reſpective counties [a]. [a 4 Inſt. 6. 10. *Co. Litt.* 109. Vid. 7 and 8 *Will.* and *Mar.* c. 25.]

So a writ of ſummons muſt iſſue out to the lord warden of the cinqueports, for the elections of the barons for the ſame; who in law are burgeſſes. 4 Inſt. 6.

The ſubſtance of thoſe writs ought to continue in their original eſſence, without any alteration or addition, unleſs it be by act of *parliament*. 4 Inſt. 10.

At the return of the writ, the *parliament* cannot begin but by the royal preſence of the king, either in perſon or by repreſentation: by repreſentation two ways; either by a guardian of England by letters patent under the great ſeal, when the king is out of the realm, or by commiſſion under the great ſeal of England to certain lords of *parliament*, repreſenting the perſon of the king, he being within the realm, in reſpect of ſome infirmity. 4 Inſt. 6.

Every lord ſpiritual and temporal, and every knight, citizen, and burgeſs, ſhall, upon ſummons, come to the *parliament*, except he can reaſonably and honeſtly excuſe himſelf; or he ſhall be amerced. That is, reſpectively, a lord by the lords, nd one of the commons by the commons. 4 Inſt. 43, a 4.

If any member of the houſe of commons votes, or ſits there during any debate, after the ſpeaker is choſen, without having firſt taken the oaths of allegiance and ſupremacy, *&c.* between the hours of nine and four, in full houſe, he ſhall be adjudged a popiſh recuſant convict, be incapable of any office, and ſhall forfeit 500l. Stat. 30. *Car.* II. c. 1. But ſee 1 *Will.* and *Mar.* by which the form of the oath is altered; and 13 and 14 *Will.* III. which enjoins the abjuration oath, with like penalties, which is altered in its form by 4 *Ann.* c. 5.

The rights and qualifications of elections depend for the moſt part on ſeveral acts of *parliament*. But it is to be obſerved, that the rights and qualifications of voters in cities, towns, and boroughs, depend on their charters, and ſuch cuſtoms as have prevailed in them time immemorial. *Hobart.* 120, 126, 141.

The 2 Geo. II. c. 24, was made for the better aſcertaining in general the right of voting, and for the greater ſecurity of returning officers.

Antiently the manner of proceeding in bills was very different from what it is at this day: formerly the bill was in the nature of a petition, and theſe petitions were entered upon the lords rolls; upon theſe rolls the royal aſſent was likewiſe entered; and upon this, as a ground work, the judges uſed, at the end of the parliament, to draw up the act into the form of the ſtatute, which was afterwards entered upon the rolls called the *ſtatute rolls*: this was different from thoſe called the *lords rolls*, or the rolls of *parliament*. Upon theſe *ſtatute rolls*, neither the bill, nor the petition from the commons, nor the anſwer of the lords, nor the royal aſſent, was entered; but only the ſtatute, as it was drawn up and penned by the judges. This was the method till about Henry Vth's time; but then it was deſired, that the acts of *parliament* might be drawn up and penned by the judges before the end of the *parliament*; by reaſon of a complaint then made, that the ſtatutes were not equally and fairly drawn up and worded. After the *parliament* was diſſolved or prorogued in Henry VIth's time, the former method was altered; and then bills *continentes formam actus parliamenti*, were firſt brought into the houſe. Theſe bills, before they were brought into the houſe, were ready drawn in form of an act of *parliament*, and not in the form of a petition, as before: upon which bills it was written by the commons, *ſoit baile al ſeigneurs*; and by the lords, *ſoit baile al roy*; and by the king, *le roy le voit*. The bill thus endorſed, was to remain with the clerk of the *parliament*, and he was to enter the bill thus drawn at firſt in the form of an act of *parliament*, or ſtatute, upon the *ſtatute rolls*, without entering the anſwer of the king, lords, or commons; and then he iſſued writs to the ſheriffs, with tranſcripts of theſe *ſtatute rolls*, to proclaim the ſtatute.

To the paſſing of a bill the aſſent of the knights, citizens, and burgeſſes muſt be in perſon; but the lords may give their votes by proxy: and the reaſon hereof is, that the barons did always ſit in *parliament* in their own right, as part of the *pares curtis* of the king; and therefore, as they were allowed to ſerve by proxy in the wars, ſo they had leave to make their proxies in *parliament*; but the commons coming only as repreſenting the *barones minores*, and the ſocage tenants in the county, and the citizens and burgeſſes as repreſenting the men of their cities and boroughs, they could not conſtitute proxies, becauſe they themſelves were but proxies and repreſentatives

of others, and therefore could not conſtitute a proxy in their place; according to that maxim of law, *delegata poteſtas non poteſt delegari*. 4 Inſt. 12.

Both houſes muſt be prorogued together, and diſſolved together; for one cannot ſubſiſt without the other [a]. [a Sir *Robert Atkin*'s argument.]

PARNASSIA, in botany, the name of a genus of plants, the characters of which are theſe: 1. The flower is of the roſaceous kind, being compoſed of ſeveral petals, ſome large and others ſmaller, fimbriated and arranged in a circular form. The piſtil ariſes from the cup, and finally becomes a membranaceous fruit of an oval figure, unicapſular, and containing ſmall ſeeds affixed to a four-fold placenta. There is only one known ſpecies of this plant. See Tab. 1. of Botany, Claſs 6. and *Tourn.* Inſt. p. 246.

PARNOPS, in natural hiſtory, the name of a ſpecies of waſp, found very frequently in vineyards, and among the wine-preſſes, eſpecially in hot countries. It is diſtinguiſhed from all the other waſps by the roundneſs of its body, which is not ſlender or flatted in the common way, but round and tumid.

PAROCHETEUSIS, a term uſed by Hippocrates to expreſs a derivation of the humors from one part, in order to the evacuating them by another not far diſtant. This is often a very happy turn for the cure of a diſeaſe.

PAROCHUS, among the Romans, one who provided mules, tents, and carriages, with all other neceſſaries, for the provincial magiſtrates in their journies, as alſo for ambaſſadors. For in the early times of the republic, they had their charges borne by the public, that the allies or provincials might not be burthened. *Pitiſc.* in voc.

PARONYCHIA, *whitlowgraſs*, in botany, the name of a genus of plants, the characters of which are theſe: the flower has no petals, but is compoſed of numerous ſtamina, ariſing from a cup formed into the ſhape of a baſin and divided into five ſegments. The piſtil finally becomes an orbicular ſeed, which is contained in a ſort of pentangular capſule, which was once the cup of the flower.

The ſpecies of *paronychia*, enumerated by Mr. Tournefort, are theſe: 1. The Spaniſh *paronychia*, called by ſome the *white anthyllis*, and *white ſmall knot-graſs*. 2. The upright Narbonne *paronychia*. 3. The broad-leaved procumbent *paronychia*. 4. The chickweed-leaved procumbent Spaniſh *paronychia*, with leſs compact heads. 5. The ſhrubby myrrh leaved Spaniſh *paronychia*. 6. The knotgraſs-leaved Portugal *paronychia*, with echinated heads. *Tourn.* Inſt. p. 507.

PARRELS, in a ſhip, are frames made of trucks, ribs, and ropes, which having both their ends faſtened to the yards, are ſo contrived as to go round about the maſts, that the yards by their means may go up and down upon the maſts. Theſe alſo, with the breaſt ropes, faſten the yards to the maſts.

PARROT, the Engliſh name expreſſing in general the whole pſittacus kind, but appropriated by uſe to that claſs only of them, which is of a middle ſize between the macaw and paroquette.

The common green *parrot* is of this kind, and beſides that, there are eleven other known ſpecies: 1. The white creſted *parrot*. 2. The ſpotted beaked kind. 3. The black beaked kind. 4. The white headed one. 5. The changeable, or red and blue *parrot*. 6. The blue-grey one, common in our cages. 7. The red and white one. 8. The Ajuracura, or blue and green *parrot* of the Braſils; of which there are two ſubordinate ſpecies beſide the common one, the one with a ſea-green, and the other with an admixture of black about the head. 9. The paragua, a black *parrot* with a red belly. 10. The tarabe, a green one with a red head. And 11. The ajuracatinga, a *parrot* of conſiderable ſize, all over of a beautiful green, except that the beak is white and the legs grey; and of this there is a ſmaller ſpecies, no way different except in ſize. The four laſt are Braſilian birds, the reſt are natives of both the Eaſt and Weſt Indians; but many of them have never been ſeen amongſt us. *Ray*'s onrithology, p. 74, 75, 76.

PARSLEY, *apium*, in botany, *&c.* See APIUM.

PARSNEP, *paſtinacha*, in botany, ſee PASTINACHA.

The *parſnep* is to be propagated by ſowing the ſeeds in February or March, in a rich mellow ſoil, which muſt be deep dug, that the roots may be able to run deep without hindrance.

It is a common practice to ſow carrots at the ſame time, upon the ſame ground with the *parſneps*; and if the carrots are deſigned to be drawn young, there is no harm in it. The *parſneps* when they are grown up a little, muſt be thinned to a foot diſtance, and carefully kept clear of weeds. They are fineſt taſted juſt at the ſeaſon when the leaves are decayed; and ſuch as are deſirous to eat them in ſpring, ſhould have them taken up in autumn, and preſerved in ſand. When the ſeeds are to be ſaved, ſome very ſtrong and fine plants ſhould be left for it at four feet diſtance, and towards the end of Auguſt, or in the beginning of September, the ſeeds will be ripe: they muſt then be carefully gathered, and dried on a coarſe cloth. They ſhould always be ſown the ſpring following, for they do not keep well. *Miller*'s Gard. Dict.

The common wild *parſnep* is frequent by road-ſides and in dry paſtures; it flowers in autumn and ripens its ſeed ſoon after. The ſeeds deſerve to be brought into uſe in medicine much more than they are at preſent. They are warm and carminative, tho' not ſo violently hot as the caraway ſeeds and others which we commonly uſe on theſe occaſions. They diſpel flatuſes, and are in great eſteem among the country people for curing the colic. They alſo are diuretic and aperient, and gently promote the menſes.

PART *(Cycl.)*—PART, in the manege, in French *partir*, is uſed to ſignify the motion and action of a horſe when put on at full ſpeed. From the horſe's *parting* to his ſtop there is commonly two hundred paces of ground. To make your horſe *part* with a good grace, you muſt put your bridle three fingers lower, and preſs gently with your heels, or only with the calves of your legs. See ECHAPER.

To PART *again*. See REPART.

PART *owners*, thoſe that are concerned in ſhip matters, and who have joint ſhares therein.

PARTERRE, *(Cycl.)* in gardening, a level diviſion of ground, which for the moſt part faces the ſouth, or beſt front of a houſe, and is generally furniſhed with ever greens, flowers, *&c.* There are two kinds of theſe, the plain ones and the *parterres* of embroidery.
