FOREWORD

Events in 1940 have demonstrated again that in this age of mechanization minerals are indeed the sinews of war. The British have shown that valor can offset, to a remarkable extent, the advantages of superior armament and munitions; but the experience of Finland, Belgium, Greece, and others has revealed the ineffectiveness of heroic men against an avalanche of iron, manganese, aluminum, and petroleum utilized in tanks and airplanes, bullets and bombs. It is not surprising, therefore, that in our own defense program major emphasis has been placed upon the problems of mineral supply and that in 1940 the activities of the Bureau of Mines, the Government agency chiefly concerned with the mineral industries, were largely directed toward furtherance of defense objectives.

All branches of the Bureau have contributed to the defense effort. Facts and figures were the first requirement of the agencies created to direct the preparedness program, for without them planning would have been difficult if not ineffective. Knowledge as to location of mineral supplies, domestic and foreign; past and current rates of production, consumption, and imports; stocks; and anticipated supplies and demand was indispensable. Accordingly, the facilities of the Bureau's Economics and Statistics Branch immediately were drafted for defense work. Statistical inquiries were expanded and speeded up, and experienced personnel was temporarily loaned to defense agencies to facilitate their organization. The Technologic Branch, under authorization of the Strategic Materials Act, greatly extended its investigation of domestic deposits of strategic minerals and its search for new processes to convert low- and off-grade domestic reserves into usable products. The work has yielded results that can be translated into production to relieve possible emergency shortages. The promotion of safety by the Health and Safety Branch assumed even greater importance as attention was focused on the need for maximum efficiency of labor, accompanied by safety for workers, in achieving defense objectives.

In presenting this year's edition of Minerals Yearbook, the Bureau of Mines has endeavored to record the highlights of the defense program as it affected the mineral industries. Despite the fact that much of the new data compiled cannot be published at this time because of military or commercial expediency, the current volume contains considerable information not previously available.

It is a pleasure again to record with grateful recognition the extensive cooperation given by many sources outside Government, without which the Bureau of Mines could not function effectively. Limited space precludes mention of all individuals, companies, and trade associations that have responded generously to requests for information and counsel. Their number is legion and their contribution invaluable. The cooperation of State officials who, through formal agreements with the Bureau of Mines, assist in collecting mineral

DEC 20 1941

statistics, thereby eliminating duplication of effort by the State and Federal agencies and promoting more accurate statistics, is deeply appreciated. State agents cooperating in the 1940 canvass were: Stewart J. Lloyd, acting State geologist, University, Ala.; Herman Gunter, State geologist, Tallahassee, Fla.; Garland Peyton, director, division of mines, mining, and geology, department of natural resources, Atlanta, Ga.; M. M. Leighton, chief, and Walter H. Voskuil, mineral economist, State geological survey division, Urbana, Ill.; A. C. Trowbridge, director, Iowa Geological Survey, Iowa City, Iowa; Raymond C. Moore, State geologist, Lawrence, Kans.; Edward B. Mathews, State geologist, Baltimore, Md.; R. A. Smith, State geologist, Lansing, Mich.; H. A. Buehler, State geologist, Rolla, Mo.; Meredith E. Johnson, State geologist, Trenton, N. J.; Jasper L. Stuckey, State geologist, Raleigh, N. C.; Robert H. Dott, director, Oklahoma Geological Survey, Norman, Okla.; E. P. Rothrock, State geologist, Vermillion, S. Dak.; E. H. Sellards, director, bureau of economic geology, Austin, Tex.; Arthur Bevan, State geologist, and Linwood H. Warwick, chief clerk, Virginia Geological Survey, Charlottesville, Va.; Harold E. Culver, supervisor, division of geology, department of conservation and development, Pullman, Wash.; Paul H. Price, State geologist, Morgantown, W. Va.; and E. F. Bean, State geologist, Madison, Wis. In addition, Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for California.

R. R. Sayers, *Director*.

July 1, 1941.

CONTENTS

INTRODUCTION

National defense activities of the Bureau of Mines, particularly special canvasses for the various defense agencies by the Economics and Statistics Branch, have made available for publication in Minerals Yearbook, Review of 1940, much information that has not appeared in earlier volumes. Typical of such new information are statistics of magnesium production in the last 3 years and of magnesium consumption in each industry, results of a survey made to determine the adequacy of reserves of bauxite, data on the coke-producing capacities of byproduct and beehive ovens in the United States as of the close of 1940 and 1941, records of the shipments of coke in 1940 by States of destination and principal uses, discussion of stocks of and requirements for nickel, and estimates by the more important producers of mercury as to reserves and probable output at various price levels. In addition to these data much information has been compiled to supply the defense agencies with adequate background material needed in the administration of the rearmament program, which cannot be published because of either national defense requirements or confidential commitments to industry. It is hoped that at the close of the emergency these data may be published in future editions of Minerals Yearbook as part of the historical record of the current period.

In publishing Minerals Yearbook, Review of 1940, an effort has been made to increase the value of the volume to the reader through not only expanding wherever possible the field covered in the various chapters but also improving the physical features of the book. A paper stock of slightly less weight than that used heretofore but of equal durability has made possible a small reduction in thickness that should materially extend the period of service of those copies that ordinarily receive much handling. A number of additional charts have been developed, and all the charts that have appeared in earlier volumes and are published again in this volume have been redrawn in a manner that should improve their usefulness.

Adoption of a publishing plan that involved determination of the size of each chapter, in pages, before its preparation has made possible the issuance of preprints of every chapter and much earlier publication of the volume than in recent years. This plan, which has been effected without the omission of essential material from any of the chapters, required close adherence to manuscript-due dates by authors, careful coordination of the preparation of chart copy with the receipt of manuscript, and complete cooperation of the Government Printing Office. Successful execution of the plan bespeaks for those contributing to it more than usual interest and devotion to the several objectives sought and is the more noteworthy because of the many demands that have simultaneously been made on those same individuals for their services in connection with other national defense activities.

Acknowledgments.—After the National Bituminous Coal Commission was created July 1, 1937, collection of production statistics of the

bituminous-coal industry, previously conducted by the Bureau of Mines, was transferred to it. Through the cooperation of this agency and its successor, the Bituminous Coal Division, United States Department of the Interior, the statistical record of the industry, maintained by the Geological Survey and the Bureau of Mines since 1880, remains unbroken. The cooperation of the Bituminous Coal Division in contributing the chapter on Bituminous Coal in this volume is gratefully acknowledged.

Presentation of data on imports and exports in Minerals Yearbook is made possible through the cooperation of the Bureau of Foreign and Domestic Commerce.

The statistical program of the Bureau of Mines depends entirely on the good will and voluntary cooperation of those interested in minerals. It is a pleasure to acknowledge the generous support of thousands of individual mine operators, distributors, and consumers, as well as the many public officials and agencies that have returned questionnaires or otherwise supplied information. In addition, the Bureau is indebted to a large number of trade associations for liberal contributions of data.

The publishing staff of Minerals Yearbook, which includes economic analysts, copy editors, printing estimators, and statistical draftsmen, is wholly competent and has had much experience over a period of years in issuing the volume; to them belongs the credit for the achievement that publication of the book represents. Martha B. Clark, besides preparing the statistical summary of mineral production each year, has been largely responsible for the maintenance of continuity of data and uniformity of statistical presentation throughout the Minerals Yearbook volumes. Elva T. Shuey has served as editorial associate in reviewing and verifying chapters. Mabel E. Winslow acted as editorial consultant and was responsible for the editing of the entire manuscript. Cecilia W. Justice directed the stenographic and typing service incident to publication of the book. Shirley F. Colby supervised the preparation of charts and developed the numerous improved features incorporated in them. The Graphic Section of the Bureau, in Pittsburgh, Pa., Louis F. Perry, Chief, prepared most of the charts. Max Abel assisted in the administrative details of the Yearbook program and had charge of estimates of space requirements for printing. John H. Ady, Chief of the Publications Section of the Department and liaison officer between the Department and the Government Printing Office, contributed invaluable counsel in the development and execution of the publishing program.

H. D. Keiser.

July 1, 1941.

PART I. GENERAL SUMMARY

REVIEW OF THE MINERAL INDUSTRIES IN 1940

By E. W. Pehrson and H. D. Keiser

SUMMARY OUTLINE

The record of mineral production in 1940 presents convincing evidence of the outstanding contribution of the mineral industries to the national welfare and of the priceless endowment given the United States in the abundance and variety of its natural resources. Responding to the Nation's call for more and more raw materials from which to fabricate the instruments of national defense and national well-being, our mines and quarries in 1940 yielded the greatest quantity of minerals in history. The physical volume of production rose 11 percent above that in 1939 and exceeded the previous peak of 1937 by 5 percent; it was 10 percent higher than the predepression record established in 1929 and 45 percent above production levels of the World War of 1914–18. A further increase is indicated for 1941. All classes of minerals shared the advance—metals, nonmetals, and the fuels—solid, liquid, and gaseous.

Importance of conservation.—Production in such quantity and variety is ample testimony to the enormous extent of our mineral reserves, but prudence requires realization of the fact that these reserves are not inexhaustible and that current rates of extraction constitute a terrific drain on an irreplaceable national asset. Although the present emergency requires that, regardless of cost, every effort be made to make our country impregnable, the fact that minerals are so vital to national defense emphasizes the need for conservation more strongly than ever. During this period when defense preparations consume such a large proportion of our mineral supply, the best interests of the Nation would seem to be served by curtailing the less essential uses of minerals and by avoiding extravagant practices in production. True conservation implies wise use of natural resources without waste or needless exploitation and the preservation of such resources for the well-being of future generations insofar as such action is compatible with present needs. National preparedness requires sacrifices in the interests of speed, but in our haste to create military strength we should not overlook the fact that the extent to which we indulge in needless depletion at this time will impair our ability to meet similar emergencies in the future.

PRODUCTION

Value of mineral output.—The quantity of minerals produced in 1940 exceeded all previous records, but the value was considerably below former peaks due to the fact that average prices, though roughly 1 percent above those in 1939, were much lower than in previous years of high productive activity. The total value of the mineral output of the United States for 1940 was approximately $5,582,500,000—14 percent over 1939. It was the highest since 1926 and more than double that for each of the depression years 1932 and 1933. The highest annual value was reached in 1920, when high prices for minerals prevailed generally and coal prices soared to extraordinary heights in consequence of heavy export trade precipitated by the United Kingdom's inability (partly because of strikes) to meet heavy world demands for coal. In that year, the domestic mineral output was valued at $6,981,340,000. The 6-billion mark was exceeded in only one other year, 1926, when again a shortage of British coal occasioned by strikes caused a heavy increase in domestic export trade, production, and prices. The value of domestic mineral production in 1940 also was exceeded in 1923 and 1925.

Of the total value of mineral production in 1940, fuels contributed $3,080,200,000 (55 percent), metals $1,677,700,000 (30 percent), and nonmetallics other than fuels $824,600,000 (15 percent). The effects of the defense program were felt most strongly by metals, because of the demand for airplanes, ships, tanks, guns, and ammunition. The value of metal production increased 30 percent, whereas the output of fuels and other nonmetallics rose only 9 and 5 percent in value, respectively. Figure 1 shows the growth in value of various branches of mineral production from 1880 to 1940. Before 1908, metals were the principal product, but since then fuels have ranked first consistently, except in 1915 and 1916. The predominant position of the mineral fuels during the last 3 decades has been due largely to the phenomenal growth of the petroleum and natural-gas industries. In 1940, oil and gas wells contributed products worth over $2,000,000,000 or 36 percent of the total mineral output.

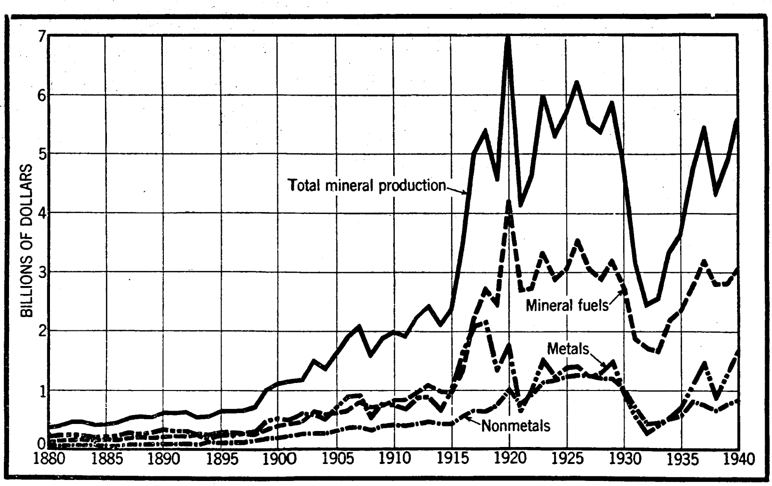

FIGURE 1.—Trends in value of mineral production in the United States, 1880–1940.

Trends in physical volume of production.—Figure 2 compares the physical volume of mineral production during the last 40 years with industrial and agricultural production and with growth of population, each expressed in terms of an index based upon the average for 1923–25.[1] The long-time trend of production during this 40-year period has been steadily upward, although year-to-year and cyclical fluctuations have been prominent. The production of minerals, which furnish tools, fuels, and raw materials for manufacture, has naturally been closely correlated with the trend of industrial production, experiencing the same violent ups and downs, whereas agricultural production has exhibited more moderate fluctuations.

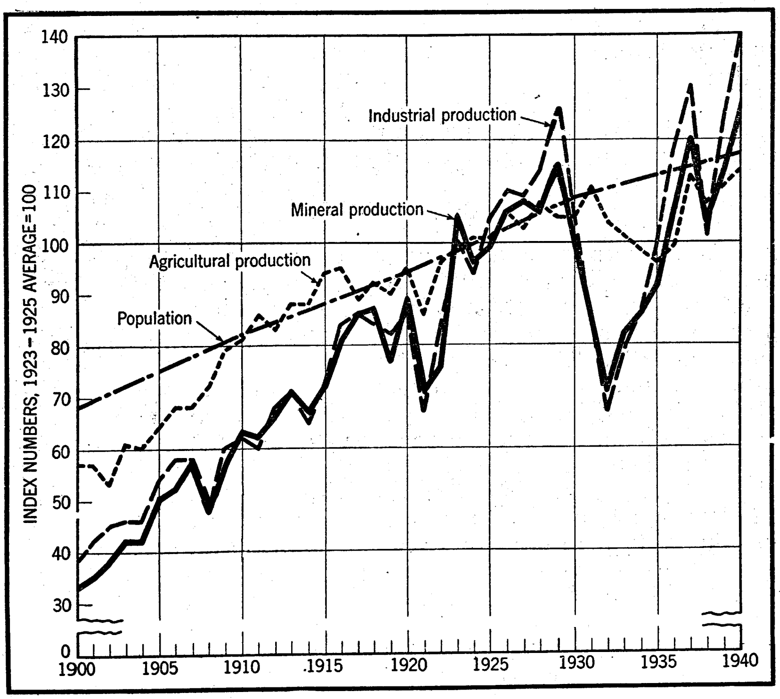

FIGURE 2.—Comparison of growth of physical volume of mineral production with that of agricultural and industrial production and population, 1900–1940.

The importance of metals in the manufacture of armament and in other defense needs is shown by the sharp upswing of mineral production between 1914 and 1918, when a rise of 20 points (30 percent) took place, and by that in 1940, when an all-time high was established in both mineral and industrial output. This record undoubtedly will be far surpassed in 1941, inasmuch as the Nation is confronted with the necessity of rapidly expanding the yield of all commodities required for national defense.

[1] The following indexes have been used: Volume of farm production, U. S. Dept. of Agriculture; mineral production, 1900–1918, from Warren Persons' Forecasting Business Cycles; mineral production, 1919–40, and industrial production, Federal Reserve Board; total population of the United States, Bureau of the Census.

STOCKS

Metal inventories during 1940 trended predominantly downward. Producers' stocks of the nonferrous metals were reduced drastically during the year, and consumers' stocks appear to have followed a similar though less-pronounced trend. A notable exception was tin, stocks of which increased abruptly as imports soared to unequaled heights. Stocks of foreign lead in the United States also increased and at the close of the year were the highest on record. Consumer stocks of manganese ore, chromite, and tungsten ore scored net gains, although the trend for chromite and tungsten ore was downward during the latter part of the year.

The quantity of pig iron and iron and steel scrap on hand at suppliers' and consumers' plants was lower at the end of 1940 than at the beginning. Inventories of cement and anthracite likewise decreased slightly; but those of petroleum and bituminous coal rose, and the latter reflected the improved rate of consumption. The Government acquired a substantial tonnage of strategic minerals during 1940 under its program of stock-piling for national defense.

CONSUMPTION

Although there were sharp advances in the consumption of most mineral commodities and new records were established for some, the average rate for all minerals in 1940 probably did not equal predepression peaks. The Federal Reserve Board index of industrial production (1935–39 average=100) rose from 108 in 1939 to a new high of 122 in 1940; the previous record of 110 had been established in 1929. Industrial activity sagged in the early months of 1940, as indicated by the decline in the adjusted index from 126 in December 1939 to 111 in April 1940, but as the defense program got under way the trend reversed abruptly. By December the index had reached 139. Failure of mineral consumption to reach new high points in 1940 in the face of such an outstanding advance in industrial production may be ascribed to the relatively low rate of building activity. The index of construction contracts awarded (value basis, 1923–25=100) was 81 in 1940—a substantial rise from 72 in 1939 but far below the 135 achieved in 1928. Because of this, the consumption of many nonmetallic minerals and some metals used extensively in building lagged in 1940 compared with predepression levels. The use of coal in recent years has been notably less than in predepression years because of competition from the liquid and gaseous fuels.

Outstanding records for actual consumption in 1940 were made by aluminum, chromite, magnesium, manganese, nickel, zinc, and petroleum, all of which reached new peaks.

PRICES

No precise composite index of average prices of mineral raw materials is available, but a weighted average for 22 major commodities, which comprised 95 percent of the total value of mineral production in 1940, indicates an increase of about 1 percent in 1940 compared with 1939. A somewhat larger increase in prices of nonferrous metals was offset by declines in unit realizations on sales of the liquid fuels, mineral building materials, and the fertilizer minerals.

According to the Bureau of Labor Statistics the wholesale price index (1926=100) of metals and metal products rose from 94.4 in 1939 to 95.8 in 1940. That of nonferrous metals, including some fabricated products, advanced from 78.0 to 81.3. Prices for aluminum and tin were reduced, whereas those of copper, lead, zinc, antimony, and mercury gained. Larger gains were discouraged by warnings issued during the latter part of the year by the Price Stabilization Division of the Advisory Commission to the Council of National Defense. The index for iron and steel products declined from 95.8 to 95.1; quotations for pig iron and scrap averaged higher in 1940 than in 1939, but iron-ore prices were lower. Coal prices moved upward compared with 1939, and anthracite made a larger gain than bituminous coal. The index for petroleum and its products dropped from 52.2 to 50.0, and lower prices also were realized by producers of lime, tile, cement, sand and gravel, stone, phosphate rock, and potash. The index number of wholesale prices for all commodities increased from 77.1 in 1939 to 78.6 in 1940.

Mineral prices in 1940 were far below previous peaks. The 1940 index for nonferrous metals, for example, was 23 percent lower than in 1929 and 44 percent below 1918. The iron and steel index, though slightly higher than in 1929, was 35 percent below that in 1918. Prices for petroleum and products were unusually low; the 1940 index was 30 percent lower than in 1929 and 63 percent below 1918. The 1940 index for all commodities was 18 percent below that in 1929 and 40 percent lower than in 1918.

EMPLOYMENT AND SAFETY

The year 1940 was signalized by increased employment in the mineral industries of the United States. Incomplete data indicate a rise of about 23,000 in the number of workers at mines, mills, smelters, etc., making an estimated total of 812,000 men employed in the industry in 1940. Bituminous-coal mines made notable gains in employment, although there were also large increases at mines producing iron ore, copper, and zinc. Employment at milling and smelting operations also increased, as did that at coking operations. Lesser gains in employment, and in some instances actual decreases, were shown by reports from stone-quarrying companies. No major strikes occurred in 1940.

Occupational hazards in the mineral industries resulted in accidents estimated to have caused 1,690 deaths and more than 78,000 disabling injuries to workers. The number of persons killed or injured was larger than in 1939, but as employment also increased the death rate per million man-hours of exposure to accident hazards increased only slightly (from 1.14 to 1.30) and the injury rate actually declined (from 64.56 to 60.28). Bituminous-coal mining suffered the largest increase in its fatality rate, mainly because of a series of mine disasters. Whereas only 1 major explosion occurred in 1939 with a loss of 28 lives, 6 major explosions occurred in 1940 with a loss of 276 lives. These catastrophies, with their heavy loss of life, hastened the enactment of a Federal law authorizing the Bureau of Mines to inspect all coal mines in the United States whose production of coal enters interstate commerce or whose output affects interstate commerce. The law was approved by President Roosevelt on May 7, 1941.

NATIONAL DEFENSE ACTIVITY

Because the national defense program dominated the mineral industries in 1940, a review of the year would be incomplete without listing the principal Government defense agencies concerned with problems in the mineral field. It will be recalled that, following the World War of 1914–18, Congress passed the National Defense Act of 1920, which charged the Assistant Secretary of War with the responsibility of developing plans for industrial mobilization to be used in case of emergency. The plans announced by this office in 1939 contemplated, in the event of war, the appointment of a civilian Administrator of War Resources, responsible only to the President.

To assure effective action before the actual outbreak of war, the plans also provided that, before M-day, the agency would be organized in skeleton form, or the Army and Navy Munitions Board (established in 1922 by the Secretaries of War and Navy to handle industrial planning problems requiring coordination of Army and Navy procurement activities) would undertake preliminary planning.

War Resources Board.—When war in Europe became imminent in the summer of 1939, the first step in the program outlined above was taken as a precautionary measure. On August 9, 1939, the Assistant Secretaries of War and Navy, then serving as acting heads of their respective departments, announced the formation of a civilian War Resources Board to act as advisor to the Army and Navy Munitions Board. However, the new Board was short-lived. On September 8 the President issued an Executive order providing for the establishment, within his Executive Office and in the event or threat of a national emergency, of such office for emergency management as he shall determine. Late in September the President announced that the War Resources Board would complete its report and disband in 10 days or 2 weeks. The report was not made public.

Minerals Advisory Committee.—At the close of 1938, a Minerals Advisory Committee to the Army and Navy Munitions Board was appointed, with Dr. C. K. Leith as chairman. Other members included J. W. Furness (secretary), Col. A. S. Dwight, D. F. Hewett, and M. W. Tuthill, with representatives of the War and Navy Departments as liaison members. Tuthill resigned from the committee in May 1939, and J. E. Pogue was appointed in June 1939. E. W. Pehrson became a member in April 1940 and was designated secretary after Furness relinquished that post, though continuing as a member of the committee. Seventeen civilian commodity subcommittees were organized and each prepared confidential reports on the national defense aspects of their respective minerals. These and a general summary prepared by the Minerals Advisory Committee were submitted during the latter part of 1939 and were used extensively by the Army and Navy Munitions Board in revising its official procurement plans. In April 1940, the Minerals Advisory Committee began a review of the official plans, but in June this work was transferred to the defense agencies set up to expedite the preparedness program.

Advisory Commission to the Council of National Defense.—The speedy success of Germany in invading the Low Countries and France in May 1940 gave considerable impetus to defense preparations in the United States. Billions of dollars were promptly appropriated by Congress to meet the threat of Germany's air force and mechanized mode of warfare. On May 28, the President appointed the Advisory Commission to the Council of National Defense under authority granted by Congress in 1916, which provides for the creation of an ex officio National Defense Council with an appointive Advisory Commission of no more than seven members. The purpose of the new Commission was to translate legislation into action. The seven members of the Commission and their fields of activity were:

Ralph Budd, transportation.
Chester Davis, agriculture.
Harriet Elliott, consumer protection.
Leon Henderson, price stabilization.
Sidney Hillman, labor.
William S. Knudsen, industrial production.
Edward R. Stettinius, Jr., industrial materials.

Several collateral divisions subsequently were added to the organization, including a Coordinator of Purchases to coordinate the various purchasing activities of the Government concerned with defense.

The Mining and Mineral Products Division of the Industrial Materials Department, with W. L. Batt as division executive and C. K. Leith as consultant, began functioning June 3. Dr. Leith maintained headquarters with the Bureau of Mines while preliminary plans for the enlarged program were being formulated and until a large enough staff could be obtained to administer it. Several outstanding mineral experts were engaged as consultants. Activities of the division were directed chiefly to speeding up and expanding the stock-piling program inaugurated in 1939 under the Strategic Materials Act; stimulating production at home and abroad; revising procurement plans; estimating future requirements and supplies; and coordinating supply and essential demand as shortages of some minerals developed in the latter part of 1940. Frequent upward revisions in and the ultimate immensity of military requirements for planes, tanks, ships, and munitions necessitated drastic upward alteration of previously conceived notions of the potential wartime demand for mineral raw materials. In some instances it appeared that military objectives for matériel would not be met because the resources of the country could not produce the minerals required therefor. In January 1941, the personnel and functions of the division were transferred to the Office of Production Management.

Office for Emergency Management.—This office is essentially an administrative agency of the Executive Office designed to assist the President. The creation of this office was authorized in the Executive order of September 8, 1939, previously mentioned, but the organization was not formally established until May 25, 1940. On January 7, 1941, the Office for Emergency Management was designated as the agency to coordinate the activities of the Council of National Defense and its Advisory Commission, the Office of Production Management, and certain other defense agencies.

Office of Production Management.—The Office of Production Management was created by Executive order on January 7, 1941, as a branch of the Office for Emergency Management. The agency has four divisions—Production, Procurement, Priorities, and Labor—to which the equivalent functions and personnel of the advisory Commission to the Council of National Defense were transferred.

The Production Division, of which John D. Biggers is director and W. L. Batt deputy director, has within it a Materials Branch, which includes a Metals and Minerals Section. The function of this group is to recommend means for obtaining adequate supplies of mineral raw materials for defense needs. As of June 15, 1941, the following were serving as raw material consultants in this section:

C. K. Leith, minerals.
S. E. Hackett, iron, steel, and ferrous alloys.
R. C. Allen, ferrous raw materials.
R. H. Ridgway, iron and steel scrap.
Andrew Leith, manganese and chromium.
Louis Jordan, nickel.
J. A. Church, copper, zinc, and brass.
H. C. Sykes, mica.
E. Vogelsang, tin and lead.
H. K. Masters, antimony, tungsten, and molybdenum.
R. J. Lund, miscellaneous minerals.
F. B. Cliffe and G. R. Holden, aluminum and magnesium.

Similar responsibility for petroleum, natural gas, and petroleum and coal products is delegated to the Chemical Section, of which E. R. Weidlein is chief.

The Priorities Division, headed by E. R. Stettinius, Jr., has charge of allocating supplies of deficient materials for defense purposes.

Office of Price Administration and Civilian Supply.—This department of the Office for Emergency Management, established by Executive order on April 11, 1941, combined the functions of the Price Stabilization and Consumer Protection divisions of the Advisory Commission. The Office has two divisions, one for price stabilization and the other for administration of priorities for civilian supplies. The latter function is conducted in cooperation with the Priorities Division of the Office of Production Management. Donald H. Wallace is price executive for nonferrous metals, M. Q. Shaughnessy for fuels, and Roswell Whitman for ferrous metals. J. L. Maury is in charge of civilian allocations for nonferrous metals, E. T. McCormick for fuels, and M. G. de Chazeau for ferrous materials.

Administrator of Export Control.—By an act of Congress approved July 2, 1940, the President was authorized to prohibit or curtail exports as needed in the interests of national defense. The office of Administrator of Export Control, responsible directly to the President, was created by Executive order on the same date. The first proclamation under the law, also issued July 2, 1940, prohibited the exportation of all strategic and critical minerals except under license. Subsequent proclamations extended control to other commodities, so that by the latter part of June 1941 exports of virtually all the important minerals except coal and some nonmetallics required Government license. Administration of export control has been directed toward conserving supplies of materials essential to the national defense program and preventing strategic commodities from getting into the hands of unfriendly powers.

Other agencies.—Several other temporary defense agencies have functions less directly concerned with the mineral industry than those discussed above. The Office for Coordination of Commercial and Cultural Relations Between the American Republics, for example, has been instrumental in promoting geological studies of strategic mineral deposits in Latin America by the staff of the Geological

Survey and in strengthening commercial and cultural ties within the Western Hemisphere.

Many regular Government organizations share major responsibility on defense problems with the temporary agencies. The Bureau of Mines and the Geological Survey, for example, are conducting an extensive investigation of domestic resources looking toward larger domestic supplies. To assist in the procurement of strategic minerals from Latin America four mining engineers of the Bureau of Mines have been assigned to the United States embassies in Argentina, Peru, Brazil, and Chile. In furtherance of the policy of Western Hemisphere solidarity a law was approved September 26, 1940, authorizing the Export-Import Bank of Washington, a subsidiary of the Reconstruction Finance Corporation, to make loans to develop the resources, stabilize the economies, and assist in orderly marketing of the products of the countries of the Western Hemisphere.

GOVERNMENT STOCK PILES

Early in May 1940, it became evident that the Government stock-piling program authorized by the Strategic Materials Act (Public, No. 117—76th Cong.) would have to be greatly expanded and accelerated. The methods of purchase prescribed by the act did not permit buying by private negotiation, and the slower procedure of advertised bidding was entirely impracticable under conditions then prevailing in world markets. Moreover, the funds available under the act were inadequate to complete a satisfactory stock-piling program. For these reasons, it was decided to transfer procurement of some of the major items on the strategic materials list, such as tin, manganese, and rubber, to the Reconstruction Finance Corporation, where speedier methods of purchase could be adopted. This was accomplished on June 28, 1940, by creation of the Metals Reserve Co., an organization capitalized at $5,000,000, to which the Reconstruction Finance Corporation authorized immediately an additional loan of $100,000,000 for financing the purchase of tin, manganese, and other metals. Additional loans were made as the purchasing activity of the company was expanded to include a variety of mineral products. As of April 30, 1941, the Metals Reserve Co. had negotiated purchase contracts for antimony, asbestos, chromite, copper, graphite, manganese ore, mica, tungsten ore, tin, and zinc totaling $608,935,000.

Purchases were continued throughout 1940 by the Procurement Division of the Treasury Department under Public No. 117. Subsequent legislation changed the purchasing procedure stipulated in the original act to permit buying by private negotiation instead of by public bidding, as required formerly. Of the $100,000,000 authorized by the act, $70,000,000 had been appropriated as of June 15, 1941.

Details of the Government purchasing programs, insofar as they are available for publication, are given in the commodity chapters of this volume.

STIMULATION OF DOMESTIC PRODUCTION

Domestic production is being stimulated by direct Government aid to individual producers rather than by general appeals to the public at large, as was the case during the World War of 1914–18.

The consensus among officials in Washington is that a general appeal should be avoided to prevent repetition of the War Minerals Relief aftermath of the last war. The Government is prepared to consider giving assistance, by purchase contract or otherwise, to any sound proposal for increasing production, wherever increased output is required for national defense purposes. No one should risk engaging in unprofitable production with the expectation that the Government will reimburse him for losses at some later date.

The Government program of direct aid is carried out chiefly through the Reconstruction Finance Corporation and its subsidiaries, the Metals Reserve Co. and the Defense Plant Corporation. The Metals Reserve Co. assists prospective producers by guaranteeing a market for a fixed tonnage at fixed prices by advance contracts. The Defense Plant Corporation, organized August 22, 1940, and the Reconstruction Finance Corporation assist chiefly by financing new plants either for private or Government operation. Details of the activities of these agencies are given in the commodity chapters of Minerals Yearbook.

With a view to meeting possible needs for emergency production, the Bureau of Mines and the Geological Survey speeded up their investigation of domestic deposits of low- or off-grade strategic minerals. The metallurgical research program of the Bureau of Mines likewise was expanded. Processes for treating low-grade manganese ores reached the pilot-plant stage in 1940, and construction of several plants was begun. Research on chromium and magnesium, as well as other strategic or critical minerals, was continued with the expectation that feasible methods of utilizing domestic resources would be developed.

STATISTICAL SUMMARY OF MINERAL PRODUCTION

(GENERAL UNITED STATES SUMMARY AND DETAILED PRODUCTION BY STATES)

By Martha B. Clark

SUMMARY OUTLINE

INTRODUCTION

This report continues the series of annual statistical summaries published in previous years as chapters of Mineral Resources and Minerals Yearbook.

UNIT OF MEASUREMENT

The unit of measurement used by the Bureau of Mines for each mineral product in reports on the mineral resources is that common to the industry concerned, and the variation in these units makes it impracticable, if not impossible, directly to combine and compare the different minerals except as to value. Although most of the products are measured by weight, some are measured by volume and some by number of "pieces," etc.; for some no total quantity figures are available.

ELIMINATION OF DUPLICATION

In the totals for the United States, shown in the following "general" tables, duplication has been eliminated wherever practicable, and in the State totals given in the State tables virtually all duplication has been eliminated. For instance, in both general and State tables the output of coke is shown but its value is not included in the totals, as the value of the coal used in its manufacture enters into the value of the coal production which is included in the totals. For asphalt, both native and oil are shown in the general tables, but the value of the oil asphalt is excluded from the totals as it duplicates that of the petroleum from which it is manufactured. For the clay industries, no figures have been available for total clay produced. For years before 1936, the total value of clay products is included in both general and State totals as representing the first marketable form of the greater part of the clay produced; the quantity and value of the clay mined and sold in the raw state by miners to users of clay are shown separately also, but the value is not included in the totals as it is duplicated largely in that for clay products. For years beginning with 1936, as the Bureau of Mines believes that a closer approach to

GENERAL TABLES

Mineral products of the United States, 1938–40 [1]

Product	1938 Quantity	1938 Value	1939 Quantity	1939 Value	1940 Quantity	1940 Value
METALLIC						
Aluminum ... pounds	286,882,000	$56,659,000	327,090,000	$64,600,000	412,560,000	$75,292,000
Antimonial lead ... short tons (2,000 pounds)	[2] 24,123	(2)	[2] 21,995	(2)	[2] 29,762	(2)
Antimony:

Sand (molding, building, etc.) and gravel ... do	179,216,771	82,321,113	223,540,000	101,785,000	235,548,000	105,806,000
Sand-lime brick [13] ... thousands of brick	94,978	938,912	137,523	1,411,796	[13]	[13]
Silica (quartz) ... short tons	18,611	88,197	34,959	153,038	31,865	176,390
Slate ... do	492,690	5,655,313	531,380	6,682,214	473,450	5,738,269
Sodium salts (carbonates and sulfates) (natural) ... do	180,220	1,832,140	262,222	2,556,686	317,267	3,157,916
Stone [25] ... do	124,838,940	139,255,046	147,447,130	158,461,515	153,733,040	160,044,115
Sulfur ... long tons	1,628,847	27,300,000	2,233,817	35,500,000	2,558,742	40,900,000
Sulfuric acid (60° Baumé) (byproduct) [26] ... short tons	687,176	5,558,926	778,441	6,213,027	[27]	[27]
Talc, pyrophyllite, and ground soapstone [25] ... do	212,775	2,302,560	253,976	2,700,834	281,375	3,008,320
Tripoli ... do	22,188	329,081	33,474	466,380	30,212	366,569
Vermiculite ... do	20,700	192,000	21,174	174,587	22,209	148,723
Other nonmetallic [28]		1,848,890		2,363,251		2,791,146
Total value of nonmetallic products (approximate)		3,470,600,000		3,623,100,000		3,904,800,000
SUMMARY						
Total value:						
Metallic		892,600,000		1,291,200,000		1,677,700,000
Nonmetallic:						
Fuels		2,820,300,000		2,834,200,000		3,080,200,000
Other		650,300,000		788,900,000		824,600,000
Grand total approximate value of mineral products		4,363,200,000		4,914,300,000		5,582,500,000

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1940 are subject to revision. For details see following chapters of this volume.

[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.

[3] Largely from foreign ore; Bureau of Mines not at liberty to publish figures.

[4] Value not included in total value.

[5] Product from domestic ores only.

[6] According to Bureau of the Mint. Valued at $35 per ounce.

[7] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.

[8] Value calculated at nominal price—27 cents per pound.

[9] Figures not available.

[10] Figures showing values not available.

[11] According to Bureau of the Mint.

[12] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1938: Bismuth, iron ore sold for magnets (2 long tons), and iron ore sold for paint (9,694 long tons, $44,249).

1939: Bismuth and iron ore sold for paint (12,235 long tons, $66,817).

1940: Beryllium ore (beryl), bismuth, cobalt oxide, and iron ore sold for paint (8,912 long tons, $45,578).

[13] Figures obtained through cooperation with Bureau of the Census. Figures for 1940 not yet available; estimate of value included in total value of nonmetallic products.

[14] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

[15] According to Bituminous Coal Division; figures for 1939 and 1940 are preliminary.

[16] Value is estimated from various sources and includes selling expenses.

[17] Value is estimated from incomplete returns to the Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.

[18] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.

[19] No canvass. Estimate of value included in total value of nonmetallic products.

[20] Figures cover fiscal year ended June 30 of year stated.

[21] Largely for use in manufacture of pigments. Figures for quantity of pigment not available.

[22] Canvass discontinued after 1915. Figures for iron ore sold for paint given in footnote 12.

[23] Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.

[24] Equivalent as K_2O.

[25] Figures for soapstone used as dimension stone included in figures for stone.

[26] From copper and zinc smelters and zinc roasters and from roasting of high-sulfide gold and silver concentrates.

[27] Figures not yet available; estimate of value included in total value of nonmetallic products.

[28] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1938: Natural sulfonated bitumen, chats (2,836,700 short tons, $414,300), flint lining for tube mills, optical fluorspar (5 ounces, $5), pebbles for grinding, and silica sand and sandstone (ground) (237,167 short tons, $1,425,445).

1939: Andalusite, aplite, natural sulfonated bitumen, calcite (Iceland spar), chats (2,237,200 short tons, $294,200), dumortierite, flint lining for tube mills, optical fluorspar (undetermined quantity, $25), pebbles for grinding, silica sand and sandstone (ground) (310,512 short tons, $1,930,301), and sulfur ore (79 long tons, $743).

1940: Andalusite, aplite, natural sulfonated bitumen, chats (3,725,587 short tons, $557,266), dumortierite, flint lining for tube mills, pebbles for grinding, silica sand and sandstone (ground) (342,218 short tons, $2,088,314), strontium ore, and sulfur ore (280 long tons, $3,203).

the value of domestic clay in its first marketable form results from the inclusion of the value of clay sold by producers and of clay products other than pottery and refractories, the United States and State totals include such values for the clay industries. This change in practice should be borne in mind when comparing the values beginning 1936 with those for earlier years.

United States totals.—In the general tables both iron ore and pig iron are shown, but the value of the pig iron rather than the iron ore is included in the United States totals, as that is considered the better means of presenting the statistics for iron in its first marketable form. For gold, silver, copper, lead, and zinc the value of "smelter output" is included in the general totals, and to account more fully for the value of the ores treated these smelter figures are supplemented by the value of the byproduct sulfuric acid. The value of pigments (white lead, red lead, lithopone, litharge, and orange mineral) manufactured from metals is not included in the general tables, as the base from which they are made is included in the output of lead or zinc, whereas the value of sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide is included, as these are made in large part direct from the ores and do not enter into the lead or zinc totals, which represent smelter output.

State totals.—In the State tables also iron ore and pig iron are both shown. As blast-furnace products cannot be traced to the States in which the ore is mined, the value of the ore is used in the State totals. For ores of gold, silver, copper, lead, and zinc no values are shown, and in fact none are recorded; instead, for each of these metals the recoverable content of the ores is used as the basis of valuation. The value of the zinc and lead pigments is not included in the State total, as the recoverable zinc and lead content of the ores from which the products were made is included under zinc or lead. The value of the sulfuric acid produced as a byproduct of copper and zinc smelting and zinc roasting is not included in the State total, as tracing this product back to the State producing the ore has not been possible.

The sum of the State totals on page 18 does not reach the total for the United States given in the table on page 17 partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the table on pages 19–21.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron ore values in State totals and pig iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to

Value of mineral products of the United States, 1880–1940 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190, 881, 000	$120, 241, 000	$56, 341, 000	$176, 582, 000	$367, 463, 000

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. State totals for 1940 not yet available.

Mineral products of the United States and principal producing States in 1939

Rank in value	Product	Principal producing States [1]	
		In order of quantity	In order of value
15	Aluminum	New York, Tennessee, North Carolina	Rank same as for quantity.
82	Andalusite	California, Nevada	Do.
(2)	Antimonial lead	Not separable by States	Not separable by States.
87	Antimony ore	Idaho, Alaska, California, Nevada	Idaho, Alaska, Nevada, California.
84	Aplite	Virginia	Rank same as for quantity.
61	Arsenious oxide	Montana, Utah	Do.
60	Asbestos	Vermont, Arizona, Georgia and North Carolina, Maryland	Vermont, Arizona, Maryland, Georgia and North Carolina.
	Asphalt:		
36	Native	Texas, Kentucky, Oklahoma, Alabama	Utah, Kentucky, Oklahoma, Texas.
19	Oil	Not separable by States	Not separable by States.
39	Barite (crude)	Missouri, Georgia, Tennessee, California	Rank same as for quantity.
41	Bauxite	Arkansas, Alabama, Georgia	Do.
56	Bismuth	Not separable by States	Not separable by States.
95	Bitumen (natural sulfonated)	Utah	Rank same as for quantity.
32	Boron minerals	California, Nevada	Do.
29	Bromine	North Carolina, Michigan, California, West Virginia	Do.
38	Cadmium	Not separable by States	Not separable by States.
54	Cadmium compounds	do	Do.
94	Calcite (Iceland spar)	New Mexico	Rank same as for quantity.
52	Calcium-magnesium chloride	Michigan, West Virginia, Ohio	Do.
7	Cement	Pennsylvania, California, Michigan, New York	Pennsylvania, California, Texas, Michigan.
69	Chats	Oklahoma, Missouri, Kansas	Rank same as for quantity.
83	Chromite	California, Oregon	Do.
	Clay:		
11	Products (other than pottery and refractories).		Ohio, Pennsylvania, California, Illinois.
25	Raw (sold by producers)	Pennsylvania, Georgia, Ohio, Missouri	Georgia, Pennsylvania, South Carolina, Missouri.
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Illinois, Kentucky	Rank same as for quantity.
	Pennsylvania anthracite	Pennsylvania	Do.
5	Coke	Pennsylvania, Ohio, Indiana, New York	Pennsylvania, Indiana, Ohio, New York.
10	Copper	Arizona, Utah, Montana, Nevada	Rank same as for quantity.
49	Diatomite	California, Oregon, Washington, Nevada	California, Oregon, Washington, Massachusetts.
96	Dumortierite	Nevada	Rank same as for quantity.
93	Emery	New York	Do.
53	Feldspar (crude)	North Carolina, South Dakota, New Hampshire, Colorado	North Carolina, New Hampshire, South Dakota, Colorado.
14	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Ohio.
91	Flint lining for tube mills	Minnesota	Rank same as for quantity.
35	Fluorspar	Kentucky, Illinois, Colorado, New Mexico	Do.
46	Fuller's earth	Georgia, Texas, Florida, Illinois	Georgia, Florida, Texas, Illinois.
70	Garnet (abrasive)	New York, North Carolina, New Hampshire, Vermont	New York, New Hampshire, North Carolina, Vermont.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1939—Continued

Rank in value	Product	Principal producing States: In order of quantity	Principal producing States: In order of value
(3)	Gems and precious stones	No canvass for 1939	No canvass for 1939.
6	Gold	California, Alaska, South Dakota, Colorado	Rank same as for quantity.
88	Graphite:		
	Amorphous	Nevada, Georgia	Georgia, Nevada.
	Crystalline	New York	Rank same as for quantity.
65	Grindstones and pulpstones	Ohio, West Virginia, Washington	Do.
33	Gypsum (crude)	New York, Michigan, Iowa, Texas	New York, Michigan, Iowa, Nevada.
80	Helium	Texas	Rank same as for quantity.
67	Iodine (natural)	California	Do.
	Iron:		
8	Ore	Minnesota, Michigan, Alabama, Pennsylvania	Do.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Do.
58	Sinter	Tennessee	Do.
81	Kyanite	California, Georgia, Virginia, North Carolina	Georgia, California, North Carolina, Virginia.
18	Lead	Missouri, Idaho, Utah, Oklahoma	Rank same as for quantity.
21	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
78	Lithium minerals	South Dakota, California	California, South Dakota.
50	Magnesite (crude)	Washington, California, Nevada, Vermont	Rank same as for quantity.
40	Magnesium	Michigan	Do.
42	Magnesium salts (natural)	Michigan, Nevada, California, Washington	Michigan, California, Nevada, Washington.
57	Manganese ore	Montana, Tennessee, Arkansas, Georgia	Rank same as for quantity.
43	Manganiferous ore	Minnesota, New Mexico, Colorado, Georgia	Do.
71	Manganiferous zinc residuum	New Jersey	Do.
	Marl:		
85	Calcareous	West Virginia, Virginia, Nevada, Minnesota	Do.
75	Greensand	New Jersey	Do.
44	Mercury	California, Oregon, Idaho, Nevada	Do.
63	Mica	North Carolina, Georgia, Virginia, California	North Carolina, Connecticut, Georgia, Virginia.
	Scrap	do	North Carolina, Georgia, Virginia, South Dakota.
	Sheet	North Carolina, Connecticut, South Dakota, New Hampshire.	Rank same as for quantity.
90	Millstones		North Carolina, New York, Virginia.
24	Mineral paints (zinc and lead pigments)	Pennsylvania, Illinois, Kansas, Indiana	Rank same as for quantity.
(3)	Mineral waters	No canvass for 1939	No canvass for 1939.
23	Molybdenum	Colorado, Utah, New Mexico, Arizona	Rank same as for quantity.
4	Natural gas	Texas, California, Louisiana, Oklahoma	Texas, California, West Virginia, Louisiana.
13	Natural gasoline	Texas, California, Oklahoma, Louisiana	California, Texas, Oklahoma, Louisiana.
72	Nickel	Not separable by States	Not separable by States.
77	Oilstones, etc	Ohio, Arkansas, New Hampshire, Indiana	Arkansas, New Hampshire, Ohio, Indiana.
89	Olivine	North Carolina	Rank same as for quantity.
(4)	Ores (crude), etc.:		
	Copper	Utah, Arizona, Nevada, Michigan	Value not available.
	Dry and siliceous (gold and silver)	California, Alaska, Nevada, South Dakota	Do.

	Lead	Missouri, Idaho, Utah, Montana	Do.
	Lead-copper	Utah, Colorado, New Mexico, Nevada	Do.
	Zinc	Oklahoma, Kansas, Tennessee, New Jersey	Do.
	Zinc-copper	Arizona	Do.
	Zinc-lead	Oklahoma, Kansas, Idaho, Virginia	Do.
	Zinc-lead-copper	Utah	Do.
68	Peat	New York, New Jersey, Michigan, California	New York, New Jersey, Michigan, Maine.
92	Pebbles for grinding	California, Minnesota	Minnesota, California.
1	Petroleum	Texas, California, Oklahoma, Illinois	Rank same as for quantity.
26	Phosphate rock	Florida, Tennessee, Idaho, Montana	Do.
47	Platinum metals	Alaska, California, Oregon	Do.
27	Potassium salts	New Mexico, California. Utah, Maryland	New Mexico, California, Maryland, Utah.
66	Pumice	Kansas, California, Nebraska, New Mexico	California, Kansas, New Mexico, Nebraska.
48	Pyrites	Tennessee, Virginia, New York, California	Rank same as for quantity.
22	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Ohio.
12	Sand and gravel	New York, California, Washington, Michigan	New York, Pennsylvania, California, Ohio.
51	Sand lime brick	New York, New Jersey, Michigan, Minnesota	Rank same as for quantity.
59	Selenium	Not separable by States	Not separable by States.
74	Silica (quartz)	Wisconsin, California, North Carolina, Ohio	California, Wisconsin, North Carolina, New York.
45	Silica sand and sandstone (ground)	Illinois, New Jersey, Ohio, Pennsylvania	New Jersey, Illinois, Ohio, West Virginia.
17	Silver	Idaho, Utah, Montana, Colorado	Rank same as for quantity.
30	Slate		Pennsylvania, Vermont, Virginia, New York.
28	Sodium salts (other than NaCl) (natural)	California, Texas, Wyoming, Utah	Rank same as for quantity.
9	Stone	Pennsylvania, Michigan, Ohio, New York	Pennsylvania, Ohio, New York, Tennessee.
20	Sulfur	Texas, Louisiana, California, Utah	Rank same as for quantity.
31	Sulfuric acid from copper and zinc smelters and roasters and from roasting of high-sulfide gold and silver concentrates.	Pennsylvania, Illinois, Tennessee, Arizona	Pennsylvania, Illinois, Tennessee, Oklahoma.
97	Sulfur ore	Nevada, Colorado	Colorado, Nevada.
37	Talc, pyrophyllite, and ground soapstone [5]	New York, Vermont, North Carolina, California	New York, California, Vermont, North Carolina.
98	Tantalum ore	New Mexico, South Dakota, Wyoming	Rank same as for quantity.
79	Tellurium	Not separable by States	Not separable by States.
86	Tin	Alaska, South Dakota, Montana, New Mexico	Rank same as for quantity.
	Titanium ore:		
76	Ilmenite	Virginia, California	Do.
64	Rutile	Virginia, Arkansas	Do.
62	Tripoli	Missouri, Illinois, Oklahoma, Arkansas	Missouri, Illinois, Arkansas, Oklahoma.
34	Tungsten ore	Nevada, California, Colorado, Idaho	Rank same as for quantity.
55	Uranium and vanadium ores	Arizona, Colorado, Utah	Colorado, Utah, Arizona.
73	Vermiculite	Montana, Colorado, North Carolina, Wyoming	Rank same as for quantity.
16	Zinc	Oklahoma, New Jersey, Kansas, Idaho	Do.

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.
[2] Separate figures for antimonial lead from primary sources not available.
[3] No canvass for 1939.
[4] Value not available.
[5] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1939 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	20	1.23	Coal, iron ore, cement, stone.
Alaska	30	.61	Gold, platinum metals, coal, silver.
Arizona	15	1.77	Copper, gold, silver, lead.
Arkansas	29	.70	Petroleum, coal, bauxite, natural gas.
California	3	11.04	Petroleum, natural gas, gold, natural gasoline.
Colorado	17	1.51	Molybdenum, coal, gold, silver.
Connecticut	44	.10	Stone, clay products, sand and gravel, lime.
Delaware	50	.01	Clay products, stone, sand and gravel, raw clay.
District of Columbia	49	.01	Clay products.
Florida	35	.31	Phosphate rock, cement, stone, sand and gravel.
Georgia	34	.35	Stone, raw clay, clay products, cement.
Idaho	26	.78	Silver, lead, zinc, gold.
Illinois	6	4.97	Petroleum, coal, stone, cement.
Indiana	19	1.26	Coal, cement, stone, clay products.
Iowa	31	.60	Cement, coal, stone, clay products.
Kansas	8	2.91	Petroleum, natural gas, zinc, cement.
Kentucky	11	2.67	Coal, natural gas, petroleum, stone.
Louisiana	7	3.99	Petroleum, natural gas, sulfur, natural gasoline.
Maine	45	.09	Stone, sand and gravel, cement, clay products.
Maryland	37	.28	Coal, sand and gravel, cement, clay products.
Massachusetts	39	.19	Stone, sand and gravel, lime, clay products.
Michigan	10	2.74	Iron ore, petroleum, cement, copper.
Minnesota	12	2.51	Iron ore, stone, sand and gravel, manganiferous ore.
Mississippi	42	.12	Natural gas, sand and gravel, clay products, raw clay.
Missouri	21	1.08	Lead, cement, coal, stone.
Montana	18	1.50	Copper, gold, natural gas, silver.
Nebraska	43	.10	Cement, sand and gravel, stone, clay products.
Nevada	25	.82	Copper, gold, silver, tungsten ore.
New Hampshire	47	.03	Stone, clay products, sand and gravel, feldspar.
New Jersey	28	.71	Zinc, clay products, sand and gravel, stone.
New Mexico	16	1.65	Petroleum, copper, natural gas, potassium salts.
New York	14	1.85	Natural gas, cement, petroleum, stone.
North Carolina	33	.44	Stone, clay products, bromine, sand and gravel.
North Dakota	46	.06	Coal, sand and gravel, clay products, natural gas.
Ohio	9	2.83	Coal, clay products, natural gas, stone.
Oklahoma	5	5.58	Petroleum, natural gas, natural gasoline, zinc.
Oregon	38	.20	Gold, stone, cement, sand and gravel.
Pennsylvania	2	12.57	Coal, petroleum, natural gas, cement.
Rhode Island	48	.02	Stone, sand and gravel, clay products, lime.
South Carolina	41	.13	Stone, clay products, raw clay, gold.
South Dakota	32	.59	Gold, stone, cement, sand and gravel.
Tennessee	23	.95	Coal, stone, cement, phosphate rock.
Texas	1	16.57	Petroleum, natural gas, sulfur, natural gasoline.
Utah	13	1.89	Copper, gold, silver, coal.
Vermont	40	.16	Stone, slate, lime, asbestos.
Virginia	22	1.03	Coal, stone, clay products, cement.
Washington	27	.75	Cement, sand and gravel, coal, gold.
West Virginia	4	6.51	Coal, natural gas, petroleum, stone.
Wisconsin	36	.30	Stone, iron ore, sand and gravel, cement.
Wyoming	24	.93	Petroleum, coal, natural gas, natural gasoline.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis.

Prices of gold, silver, copper, lead, and zinc, 1932–40 [1]

Year	Gold [2]	Silver [3]	Copper [4]	Lead [4]	Zinc [4]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1932	[5] $20.67+	$0.282	$0.063	$0.030	$0.030
1933	25.56	.350	.064	.037	.042
1934	34.95	[6] .646+	.080	.037	.043
1935	35.00	.71875	.083	.040	.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[6] .646+	.098	.046	.048
1939	35.00	[7] .678+	.104	.047	.052
1940	35.00	[8] .711+	.113	.050	.063

[1] Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ per fine ounce. For table of prices for silver, copper, lead, and zinc from 1850 to 1931, by years, see Mineral Resources, 1931, pt. 1, p. A115.
[2] 1932: Legal coinage value; 1933–34: Yearly average weighted Government price; 1935–40: Price under authority of Gold Reserve Act of January 31, 1934.
[3] 1932–33: Average New York price for bar silver; 1934 and 1938–40: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.
[4] Yearly average weighted price of all grades of primary metal sold by producers.
[5] $20.671835. [6] $0.64646464. [7] $0.67878787. [8] $0.71111111.

STATE TABLES

Mineral production of Alabama, 1938–39

Product	1938		1939	
	Quantity	Value	Quantity	Value
Asphalt (native) short tons	(1)	(1)	(1)	(1)
Barite do			(1)	(1)
Bauxite long tons	(1)	(1)	(1)	(1)
Cement barrels	[2] 4,548,079	[2] $6,114,246	[2] 5,042,921	[2] $6,690,765
Clay:				
Products (other than pottery and refractories)		[3] 1,487,067		[3] 2,306,712
Raw (sold by producers) short tons	25,871	41,885	51,015	83,933
Coal do	[4] 11,061,493	[5] 26,769,000	[4] 11,995,000	[6] 27,708,000
Coke do	3,378,044	[7] 9,888,292	3,854,505	[7] 10,917,559
Ferro-alloys long tons	19,446	[7] 1,707,736	28,071	[7] 1,802,917
Gold troy ounces	41	1,435	3	105
Iron:				
Ore long tons	4,281,332	7,341,620	5,985,208	9,971,024
Pig do	1,990,342	[7] 29,190,091	2,717,502	[7] 43,902,681
Lime short tons	151,937	911,033	176,513	1,004,785
Manganese ore long tons	202	3,030	187	3,742
Manganiferous ore do	356	2,797	519	4,561
Mineral waters gallons sold	(8)	(8)	(8)	(8)
Ore (dry and siliceous) (gold and silver) short tons	300	(9)	10	(9)
Sand and gravel do	3,110,183	782,131	1,283,577	687,265
Silver troy ounces	4	3		
Stone short tons	1,326,160	1,809,379	1,855,990	2,516,584
Miscellaneous [10]		1,032,667		1,146,906
Total value, eliminating duplications		46,296,293		52,124,382

[1] Value included under "Miscellaneous."
[2] Exclusive of puzzolan, value for which is included under "Miscellaneous."
[3] Figures obtained through cooperation with Bureau of the Census.
[4] According to Bituminous Coal Division; figures for 1939 are preliminary.
[5] Value is estimated from various sources and includes selling expenses.
[6] Value is estimated from incomplete returns to Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.
[7] Value not included in total value for State.
[8] No canvass.
[9] Not valued as ore; value of recoverable metal content included under the metals.
[10] Includes minerals indicated by "1" and "2" above.

Mineral production of Alaska, 1938–39

Product	1938		1939	
	Quantity	Value	Quantity	Value
Antimony ore (concentrates) short tons	(1)	(1)	(1)	(1)
Arsenic do	(2)	(2)	(2)	(2)
Coal do	[3] 159,230	[3] $620,900	[3] 146,250	[3] $585,000
Copper pounds	29,098,000	2,851,604	256,000	26,624
Gold troy ounces	664,973	23,274,055	676,737	23,685,795
Lead short tons	994	91,448	937	88,078
Mercury flasks (76 pounds)	8	604		
Ores (crude), etc.:				
Copper short tons	89,174	( )	165	(4)
Dry and siliceous (gold and silver) do	4,767,545	(4)	4,751,492	(4)
Platinum metals (crude) troy ounces	39,889	1,229,300	31,300	997,000
Sand and gravel short tons	(1)	(1)	[5] 42,332	[5] 23,112
Silver troy ounces	479,853	310,208	201,054	136,473
Stone short tons	189,090	204,232	(1)	(1)
Tin (metallic equivalent) do	105	89,100	37	37,300
Miscellaneous [6]		125,302		94,184
Total value, eliminating duplications		28,796,753		25,673,566

[1] Value included under "Miscellaneous."
[2] Figures not available.
[3] According to the Alaskan Branch of the Geological Survey.
[4] Not valued as ore; value of recoverable metal content included under the metals.
[5] "Government-and-contractor." Value of "Commercial" included under "Miscellaneous."
[6] Includes minerals indicated by "1" and "5" above.

Mineral production of Arizona, 1938–39

Product	1938		1939	
	Quantity	Value	Quantity	Value
Arsenious oxide short tons	(1)	(1)	(1)	(1)
Asbestos do	942	$31,063	904	$95,807
Barite do	(2)	(2)	(2)	(2)
Clay:				
Products (other than pottery and refractories)		[3] 180,305		[3] 237,542
Raw (sold by producers) short tons	(2)	(2)	(2)	(2)
Coal do	(2 4)	(2 5)	(2 4)	(2 6)
Copper pounds	421,594,000	41,316,212	524,224,000	54,519,296
Feldspar (crude) long tons	(2)	(2)	(2)	(2)
Fluorspar short tons	1,093	(2)	(2)	(2)
Gems and precious stones		(7)		(7)
Gold troy ounces	305,043	10,676,505	316,453	11,075,855
Gypsum (crude) short tons			(2)	(2)
Lead do	10,571	972,532	10,771	1,012,474
Lime do	39,568	353,224	57,233	448,860
Mercury flasks (76 pounds)			(2)	(2)
Mica, scrap short tons	(2)	(2)	(2)	(2)
Molybdenum pounds	1,061,995	(2)	711,192	(2)
Ores (crude), etc.:				
Copper short tons	13,047,356	(8)	17,468,926	(8)
Dry and siliceous (gold and silver) do	928,707	(8)	1,042,004	(8)
Lead do	6,072	(8)	9,778	(8)
Lead-copper do	201	(8)	30	(8)
Zinc do	160	(8)	670	(8)
Zinc-copper do	32,974	(8)	67,074	(8)
Zinc-lead do	187,694	(8)	204,778	(8)
Sand and gravel do	1,184,965	549,294	655,155	261,316
Sand-lime brick thousands of brick	(2 3)	(2 3)	(2 3)	(2 3)
Silica (quartz) short tons	(2)	(2)	(2)	(2)
Silver troy ounces	7,479,153	4,835,008	7,824,004	5,310,839
Stone short tons	431,310	337,078	665,290	626,281
Sulfuric acid [9] do	(2 10)	(2 10)	(2 10)	(2 10)
Tungsten ore (60-percent concentrates) do	37	30,863	100	103,980
Vanadium ores do	165,465	(2)	(2)	(2)
Zinc do	5,814	558,144	6,711	697,944
Miscellaneous [11]		1,406,991		1,152,950
Total value, eliminating duplications		60,756,253		75,056,965

[1] Figures not available.
[2] Value included under "Miscellaneous."
[3] Figures obtained through cooperation with Bureau of the Census.
[4] According to Bituminous Coal Division; figures for 1939 are preliminary.
[5] Value is estimated from various sources and includes selling expenses.
[6] Value is estimated from incomplete returns to Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.
[7] No canvass.
[8] Not valued as ore; value of recoverable metal content included under the metals.
[9] From copper smelting.
[10] Value not included in total value for State.
[11] Includes minerals indicated by "[2]" above.

Mineral production of Arkansas, 1938–39

Product	1938 Quantity	1938 Value	1939 Quantity	1939 Value
Bauxite ... long tons	293,280	$1,679,663	361,256	$2,074,954
Cement ... barrels	(1)	(1)	(1)	(1)
Clay:				
Products (other than pottery and refractories)		[2] 656,637		[2] 944,661
Raw (sold by producers) ... short tons	(1)	(1)	(1)	(1)
Coal ... do	[3] 1,197,047	[4] 4,013,000	[3] 1,122,000	[5] 3,590,000
Gems and precious stones		(6)		(6)
Iron ore sold for magnets ... long tons	2	(1)		
Lead ... short tons	7	644		
Lime ... do	(1)	(1)	(1)	(1)
Manganese ore ... long tons	2,987	(1)	5,365	(1)
Manganiferous ore ... do	3,477	(1)	1,970	(1)
Mercury ... flasks (76 pounds)	(1)	(1)	364	37,834
Mineral waters ... gallons sold	(6)	(6)	(6)	(6)
Natural gas ... M cubic feet	11,301,000	2,168,000	10,107,000	1,996,000
Natural gasoline ... gallons	25,648,000	905,000	24,634,000	962,000
Oilstones ... short tons	41	43,777	(1)	(1)
Ores (crude), etc.:				
Lead ... do	(7)	(8)	(7)	(8)
Zinc ... do	(7)	(8)	(7)	(8)
Petroleum ... barrels	18,180,000	16,900,000	21,238,000	16,790,000
Sand and gravel ... short tons	1,697,600	779,219	2,646,793	1,030,270
Slate		(1)		(1)
Stone ... short tons	[9] 308,760	[9] 293,497	641,460	640,330
Titanium minerals: Rutile ... do	(1)	(1)	(1)	(1)
Tripoli ... do	(1)	(1)	(1)	(1)
Zinc ... do	152	14,592	123	12,792
Miscellaneous [10]		1,941,057		1,428,353
Total value, eliminating duplications		29,395,086		29,507,194

[1] Value included under "Miscellaneous."
[2] Figures obtained through cooperation with Bureau of the Census.
[3] According to Bituminous Coal Division; figures for 1939 are preliminary.
[4] Value is estimated from various sources and includes selling expenses.
[5] Value is estimated from incomplete returns to Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.
[6] No canvass.
[7] Figures not available.
[8] Not valued as ore; value of recoverable metal content included under the metals.
[9] Exclusive of unclassified stone, value for which is included under "Miscellaneous."
[10] Includes minerals indicated by "1" and "9" above.

Mineral production of California, 1938–39

Product	1938		1939	
	Quantity	Value	Quantity	Value
Andalusite .... short tons..	(1)	(1)	(2)	(2)
Antimony ore (concentrates) .... do....	(2)	(2)	(2)	(2)
Arsenious oxide .... do....	(1)	(1)	(1)	(1)
Asphalt (native) .... do....	(2)	(2)	(2)	(2)
Barite .... do....	(2)	(2)	(2)	(2)
Boron minerals .... do....	215, 662	$4, 739, 291	244, 984	$5, 685, 297
Bromine .... pounds..	(2)	(2)	(2)	(2)
Cement .... barrels..	10, 539, 010	15, 689, 210	11, 293, 989	15, 889, 395
Chromite .... long tons..	812	10, 730	3, 514	(2)
Clay:				
Products (other than pottery and refractories)...	------------	[3] 6, 636, 860	------------	[3] 8, 304, 038
Raw (sold by producers) .... short tons..	307, 122	966, 438	310, 710	894, 809
Copper .... pounds..	1, 612, 000	157, 976	8, 360, 000	869, 440
Diatomite .... short tons..	(2)	(2)	(2)	(2)
Feldspar (crude) .... long tons..	1, 396	7, 675	2, 076	12, 655
Fuller's earth .... short tons..	(2)	(2)	(2)	(2)
Gems and precious stones	------------	(4)	------------	(4)
Gold .... troy ounces..	1, 311, 129	45, 889, 515	1, 435, 264	50, 234, 240
Gypsum (crude) .... short tons..	162, 056	334, 208	188, 364	306, 350
Iodine .... pounds..	(2)	(2)	(2)	(2)
Iron ore—				
Sold to furnaces, etc .... long tons..	28, 378	(2)	17, 173	(2)
Sold for paint .... do....	(2)	(2)	------------	------------
Kyanite .... short tons..	(1)	(1)	(2)	(2)
Lead .... do....	495	45, 540	526	49, 444
Lime .... do....	71, 596	712, 388	87, 407	833, 326
Lithium minerals .... do....	(2)	(2)	(2)	(2)
Magnesite .... do....	(2)	(2)	(2)	(2)
Magnesium salts (natural) .... pounds..	(2)	(2)	(2)	(2)
Manganese ore .... long tons..	------------	------------	6	(2)
Marl, calcareous .... short tons..	(2)	(2)	(2)	(2)
Mercury .... flasks (76 pounds)..	12, 277	926, 545	11, 127	1, 156, 540
Mica, scrap .... short tons..	(2)	(2)	(2)	(2)
Mineral paints (zinc and lead pigments) .... do....	(2 5)	(2 5)	(2 5)	(2 5)
Mineral waters .... gallons sold..	(4)	(4)	(4)	(4)
Molybdenum .... pounds..	------------	------------	(2)	(2)
Natural gas .... M cubic feet..	315, 168, 000	88, 225, 000	348, 361, 000	91, 572, 000

Gems and precious stones		(6)		(6)
Gold troy ounces	872	30,520	670	23,450
Graphite:				
Amorphous short tons			(1)	(1)
Crystalline pounds	(1)	(1)		
Iron ore—				
Shipped to furnaces, etc long tons	9,221	11,375	25,846	51,078
Sold for paint do			487	2,063
Kyanite short tons	(7)	(7)	(1)	(1)
Lime do	7,046	54,150	6,815	57,663
Manganese ore long tons	3,058	46,443	2,646	45,171
Manganiferous ore do	2,807	12,057	7,156	35,959
Mica:				
Scrap short tons	(1)	(1)	(1)	(1)
Sheet pounds	(1)	(1)	(1)	(1)
Mineral waters gallons sold	(6)	(6)	(6)	(6)
Ore (dry and siliceous) (gold and silver) short tons	841	(8)	730	(8)
Sand and gravel do	395,758	207,048	328,173	146,355
Silver troy ounces	71	46	58	39
Slate		(1)		(1)
Stone short tons	1,465,680	3,581,319	1,988,530	4,838,623
Talc and ground soapstone do	15,117	130,595	20,090	177,881
Miscellaneous [9]		1,888,671		2,279,349
Total value, eliminating duplications		11,598,421		14,633,361

[1] Value included under "Miscellaneous."
[2] Figures obtained through cooperation with Bureau of the Census.
[3] According to Bituminous Coal Division; figures for 1939 are preliminary.
[4] Value is estimated from various sources and includes selling expenses.
[5] Value is estimated from incomplete returns to Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.
[6] No canvass.
[7] Figures not available.
[8] Not valued as ore; value of recoverable metal content included under the metals.
[9] Includes minerals indicated by "1" above.

Mineral production of Idaho, 1938–39

Product	1938		1939	
	Quantity	Value	Quantity	Value
Antimony ore (concentrates) short tons	(1)	(1)	2,677	(1)
Arsenious oxide do	(1)	(1)	(2)	(2)

Coal ... do	[3] 1,281,413	[4] 2,705,000	[3] 1,468,000	[5] 2,995,000
Coke ... do	1,105,262	(1 6)	1,578,973	(1 6)
Feldspar (crude) ... long tons			(1)	(1)
Gold ... troy ounces	855	29,925	71	2,485
Iron, pig ... long tons	1,219,611	(1 6)	1,805,080	(1 6)
Lime ... short tons	62,479	446,013	59,504	396,201
Mineral waters ... gallons sold	(7)	(7)	(7)	(7)
Ore (dry and siliceous) (gold and silver) ... short tons	1,701	(8)	220	(8)
Potassium salts ... do	(1)	(1)	(1)	(1)
Sand and gravel ... do	2,177,162	1,848,211	3,311,029	2,827,268
Silica (quartz) ... do	377	6,000	515	8,010
Silver ... troy ounces	24	16	2	1
Slate		(1)		(1)
Stone ... short tons	[9] 947,390	[9] 1,167,518	1,024,130	1,327,830
Talc and ground soapstone ... do	(1)	(1)	(1)	(1)
Miscellaneous [10]		28,491,245		40,697,718
Total value, eliminating duplications		9,407,723		11,837,593

1 Value included under "Miscellaneous."
2 Figures obtained through cooperation with Bureau of the Census.
3 According to Bituminous Coal Division; figures for 1939 are preliminary.
4 Value is estimated from various sources and includes selling expenses.
5 Value is estimated from incomplete returns to Bureau of the Census. Producers were asked by that Bureau to exclude selling expenses in reporting value, but a number of them included such expenses.
6 Value not included in total value for State.
7 No canvass.
8 Not valued as ore; value of recoverable metal content included under the metals.
9 Exclusive of crushed sandstone, value for which is included under "Miscellaneous."
10 Includes minerals indicated by "1" and "9" above.

Mineral production of Massachusetts, 1938–39

EFFECT OF INTERNATIONAL SITUATION ON UNITED STATES TRADE IN MINERALS

By J. S. McGrath

SUMMARY OUTLINE

Stimulation of import trade by national defense program.—The position of the United States with respect to its dependence on foreign sources of supply for certain strategic and critical minerals as listed and defined by the Army and Navy Munitions Board in March 1940 was improved considerably during the year through effective administration of the Strategic Materials Act (Public No. 117—76th Congress), which became law in June 1939. Certain restrictions inserted in this act, however, retarded stock-pile purchases to such a degree that in June 1940 the Metals Reserve Co. was created by the Reconstruction Finance Corporation to acquire and carry a reserve supply of strategic and critical minerals, principally tin and manganese, in connection with the national defense program. During 1940 the Procurement Division of the Treasury Department—the agency responsible for administering the purchasing and stock-piling features of the Strategic Materials Act—and the Metals Reserve Co. endeavored to coordinate their activities directly concerned with the procurement features of the national defense program.

The rapidly changing conditions in world markets since May 1940 and the continual revisions of estimated requirements of mineral raw materials necessary to meet unprecedented and in certain instances unanticipated industrial demands prompted direct negotiations between the Government of the United States on one hand and foreign governments and producers on the other; these negotiations have resulted in contracts for the purchase of certain minerals essential in the present emergency.

In September 1940 the Metals Reserve Co. contracted with the National Resources Commission of China for the purchase of tungsten ore, the total value of which will approximate $30,000,000; the ore will be delivered over a period of years at prices established by existing market conditions at the time of delivery. In November 1940 the same agency contracted with tin-ore producers of Bolivia for annual delivery to the United States during the next 5 years of tin concentrates equivalent to 18,000 tons of refined metallic tin a year; the Bolivian Government has guaranteed the performance of this contract. To refine the Bolivian concentrates the Reconstruction Finance Corporation agreed to underwrite the construction of a tin smelter to be built at Texas City, Tex., by the Tin Processing Corporation of New York, a subsidiary of N. V. Billiton Maatschappij, Netherlands East Indies. The plant will be owned by the United States Government and operated for its account. The smelter will have an annual capacity of 50,000 tons of tin concentrates or 18,000 tons of fine tin.

Although the chief concern of United States Government purchasing agencies is the procurement of strategic materials of which this country has inadequate domestic reserves, in December 1940 the Metals Reserve Co. announced that it had contracted to purchase 100,000 tons of copper produced in Latin America. Early in 1941 a contract for an additional 100,000 tons involving the same foreign producers was negotiated, with delivery beginning in March 1941. In January 1941 the Metals Reserve Co. also contracted for 300,000 short tons of Chilean sodium nitrate.

Control of exports essential to procurement program.—As the national defense program expanded during the year it became increasingly clear that to insure domestic industries against serious shortages of vital raw materials some method of export control had to be applied whenever a deficiency could be anticipated. The need for such control was foreseen, and on July 2, 1940, H. R. 9850, "an act to expedite the strengthening of the national defense," became law. This act provides legal authority for the control, by a licensing scheme, of exports of munitions, materials, and machinery essential to national defense from the United States.

Although the control of exports is principally a matter of national defense and as such is a function of the Administrator of Export Control, War Department, the Department of State actually issues the licenses under which all controlled items may be exported. Seven Presidential proclamations and two Executive orders were issued between July 2, 1940, and January 10, 1941, specifying commodities of which the export was subjected to control through the issuance of licenses. This list of controlled mineral products, comprising ore, metals, nonmetallic minerals, fuels, chemicals, semifabricates, and manufactures, was virtually all-inclusive by the beginning of 1941. These proclamations and Executive orders are registered at the National Archives, Washington, D. C., under Presidential Proclamations Nos. 2413, 2417, 2423, 2428, 2441, 2449, 2453, and Executive Orders Nos. 8607 and 8617.

Alternative sources of strategic minerals.—Dislocation in ocean traffic that extended throughout 1940, shortage of carriers, and transport difficulties incident to the delivery of essential raw materials to the United States, which interrupted the flow of Turkish and Greek chromite and Russian manganese ore, may, if extended to the Pacific Ocean, reduce or entirely cut off delivery of such supplies as Chinese tungsten, Malayan and Netherlands East Indian tin, and Indian mica. The present and potential difficulties in this direction have prompted the United States to focus attention on sources of such essential minerals in the Western Hemisphere.

Latin America as potential source of supply.—Latin America has important mineral resources, but situation of the deposits, transportation difficulties, and lack of capital have retarded their development.

Most of these Latin American mineral commodities are produced principally, if not entirely, for export. Without a foreign market these minerals would find only limited use within the countries that produce them, therefore the volume of foreign trade has a profound effect on the internal economies of most Latin American countries. Closer collaboration between the United States and Latin America so far as the term affects the mineral industries is predicated on recognition of this condition of fact; permanent solution is by no means a simple matter. Latin America is not industrialized as the term is generally understood. Of the mineral resources regarded as basic to modern industry—coal, iron, and petroleum—only petroleum has been developed to any significant extent. South America ranks last among the continents in production of coal. Iron is found to some extent in most Latin American countries, but the deposits have remained largely undeveloped because of their inaccessibility, lack of adequate transportation facilities, and the absence of conveniently situated coal deposits. Consequently nearly all of the minerals (including petroleum) produced in the several countries, must be exported, and before September 1939 countries of destination were principally in Europe.

To illustrate the dependence of certain countries on foreign trade in minerals, several examples are cited. In 1938 mineral products exported from Chile represented 79.4 percent of the total exports in value, while agricultural and related products comprised 17 percent and manufactures 3.6 percent; copper constituted 57.4 percent and nitrates 22.4 percent of the value of all mineral products exported. The influence of the two mineral commodities, copper and nitrates, on Chile's economic welfare is evident. In the same year the value of Bolivia's mineral exports (chiefly tin, tungsten, antimony, and precious metals) was over 96 percent of the total value of all exports. In 1938 the exportation of crude petroleum from Venezuela represented 90 percent of the total value of all exports from that country. In 1938, 26 percent of Colombia's export trade was in crude petroleum; and 60.1 percent of Peru's export trade was in mineral products, chiefly petroleum (33.9 percent), copper (16.9 percent), bismuth, gold, and other mineral concentrates (8.1 percent). To a minor degree the remainder of the mineral-producing countries of Latin America are similarly situated; that is, their principal source of revenue is in the sale abroad of minerals of which in many instances the United States normally has exportable surpluses. No real solution of this problem had been achieved by the end of 1940, but definite progress was made and negotiations were under way between the Government of the United States and several countries of Latin America whereby the latter may ultimately market their entire output of certain minerals in this country under arrangements that will be acceptable to all parties concerned.

With particular reference to the strategic minerals produced in Latin America, opportunities exist for negotiations whereby immediate and mutual benefits can be derived by the United States and the Latin American countries involved. In 1940 the United States imported 1,282,079 long tons of ferro-grade manganese ore, of which approximately 24 percent originated in Latin America, chiefly in Brazil and Cuba. Domestic production last year was about 6 percent of apparent consumption in the United States. It is reliably reported that if rail facilities in Brazil are improved and ocean shipping space is available about half of the United States requirements for 1941 may be obtained from Brazil alone. Cuba can supply 10 to 15 percent of our needs, and Chile may be able to reduce this country's dependence on other foreign sources of supply even further.

In 1940 the United States imported 2,138 metric tons of tungsten ore, of which about 35 percent originated in Latin America. The United States produced about 65 percent of its apparent consumption of tungsten, and under the impetus of prevailing demand this figure may be increased. However, if the United States acquires the entire output of Bolivia and Argentina it is believed that no serious deficit will develop in 1941.

In 1940 about 96 percent of the antimony imported into the United States originated in Latin America; 90 percent was supplied by Mexico and Bolivia and the remainder by Peru and Argentina.

The only Latin American source that contributed to imports of chromite by the United States in 1940 was Cuba, which supplied about 11 percent of the total imports. However, Brazil has the largest deposits of chromite in South America, and although the output has been limited to only a few thousand tons a year it is believed that with mine development, improved transport facilities, and favorable prices an annual production of possibly 100,000 tons can be attained.

Until the smelter that the Reconstruction Finance Corporation is erecting in Texas is completed and operating, tin concentrates available in Bolivia and Argentina cannot materially reduce dependence of the United States on far eastern sources of supply; even with these smelting facilities available, this country's dependence would be reduced only to a limited extent. However, the output of ore in both Bolivia and Argentina can be increased to some extent, and if the entire production becomes available to the United States the position of this country will be less vulnerable than in the past. Electrical-grade mica, quartz crystals, and industrial diamonds of Brazil are vital in the national defense program, and there are indications that Brazil's entire output of these materials may be contracted for by the United States before the end of 1941.

PART II. METALS

GOLD AND SILVER

By Chas W. Henderson

SUMMARY OUTLINE

Gold production (mine report) in the United States (Territories included) increased in 1940 for the eleventh consecutive year and set a new high annual record. In the 7 years 1934–40, during which gold was valued at $34.95 per fine ounce in 1934 and at $35 in 1935–40 in terms of United States currency (compared with $20.67+ from 1837 to 1932, inclusive), the annual domestic output has more than doubled; it totaled 5,984,163 fine ounces in 1940 compared with 2,628,775 fine ounces in 1933, when the average weighted price was $25.56 per fine ounce. The increase in 1940 over 1939, however, was only 5 percent compared with 10 percent in 1939 over 1938. Although final figures on the total output of gold in the world in 1940 are not yet available, preliminary data indicate that the world output increased about 3 percent over 1939 to 41,560,000 ounces—the highest in history. The Union of South Africa continued to be the principal gold-producing country, followed, in order, by the United States (including Territories), Canada, and U. S. S. R.; these four nations produced approximately 73 percent of the total world output of gold in 1940.

The mine output of recoverable silver in the United States (Territories included) in 1940 was 71,824,746 fine ounces, a 10-percent increase over 1939, resulting from the rise in production of copper, zinc-lead, and lead ores caused by the advance in base-metal prices. Approximately 70 percent of the total world output of silver in 1940—estimated at 275,654,000 fine ounces—came from Mexico, United States, Canada, and Peru, listed in order of quantity produced.

DOMESTIC REFINERY PRODUCTION

The figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines and were agreed upon after conference and adjustment between the two Bureaus.

The State totals are based upon bullion deposits in the United States mints and assay offices and upon returns to the Bureau of the Mint from smelting and refining companies. The State distribution is adjusted further by the Bureau of Mines from its geographical records of sources and production, both historical and current, from the producing mines and is tabulated for the mine reports discussed later. The data for the total production and in part for the distribution are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices; (2) the domestic gold and silver in fine bars reported by private refineries, supplemented by data of content of unrefined mattes, blister copper, copper anodes, and lead bullion; and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

Gold and silver produced in the United States, 1936–40, and approximate distribution of source, by States and Territories, in 1940

[Refinery figures supplied by U. S. Bureau of the Mint]

State or Territory	Gold [1]		Silver [2]	
	Fine ounces	Value	Fine ounces	Value
1936	4,357,394	$152,508,800	63,812,176	$49,422,530

Wyoming	711	24,900	74	53
	6,003,105	210,108,700	69,585,734	49,483,189

[1] Gold valued at $35 per fine ounce.
[2] Silver valued as follows: 1936, $0.7745; 1937, $0.7735; 1938, $0.646+; 1939, $0.678787+; 1940, $0.7111+.

The quantity of gold reclaimed in 1939 from old jewelry, dental waste, scrap, and other material received at private refineries and the United States mints and assay offices was 895,096 ounces and that sold for industrial use 1,108,256 ounces; the difference (213,160 ounces) represents the quantity of new gold used in the arts and industries during the year. Secondary silver recovered in 1939 from silverware, photographic film, and other sources totaled 24,972,260 ounces and that issued for the industrial arts 69,585,265 ounces, indicating that 44,613,005 fine ounces of new silver were required for industry.

Gold and silver produced in the United States, 1792–1940

[From Report of the Director of the Mint. The estimate for 1792-1873 is by R. W. Raymond, commissioner of mining statistics, and since then by the Director of the Mint]

Period	Gold		Silver	
	Fine ounces	Value [1]	Fine ounces	Value [2]
1792–1847	1,187,170	$24,537,000	309,500	$404,500
1848–72	58,279,778	1,204,750,000	118,568,200	157,749,900
1873–1940	201,981,810	4,641,950,700	3,538,095,665	2,663,884,894
	261,448,758	5,871,237,700	3,656,973,365	2,822,039,294

[1] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto at $20.67+ per fine ounce. Dollar figures are rounded.
[2] Silver valued in 1934 and thereafter at Government's average buying price for domestic product: In 1934 and 1938 at $0.64+ per fine ounce, in 1935 at $0.71875, in 1936 at $0.7745, in 1937 at $0.7735, in 1939 at $0.678787+, and in 1940 at $0.7111+.

The average commercial value per fine ounce of silver for the total recorded domestic production is $0.772.

PRICES OF GOLD AND SILVER

Gold.—Under the Gold Reserve Act of 1934 the value of gold was fixed by Presidential proclamation on January 31, 1934, at $35 per fine troy ounce and has remained at that figure through 1940. From January 18, 1837,[1] through 1932, the price was $20.67+ per ounce, and in 1933 the legal coinage value was continued at $20.67+. The average weighted price per fine ounce in 1933, as computed by the Bureau of Mines, was $25.56 and in 1934, $34.95. A complete account of regulations pertaining to gold and silver in 1933–34 is given in the chapter on Gold and Silver in Minerals Yearbook, 1934 (pp. 25–46), issued by the Bureau of Mines.

Silver.—The Government price for newly mined domestic silver was maintained throughout 1938 and to June 30, 1939, at $0.646464646+ per fine ounce. The act of Congress approved July 6, 1939, fixed the price of domestic silver mined after July 1, 1939, at $0.711+ per ounce. The annual average prices [2] used for domestic silver from 1932 to 1939 are as follows: 1932, $0.282; 1933, $0.350; 1934, $0.646464646+; 1935, $0.71875; 1936, $0.7745; 1937, $0.7735; 1938, $0.646464646+; 1939, $0.678787878+; 1940, $0.711111111+.

The following table, copied from the Annual Report of the Director of the Mint for the Fiscal Year Ended June 30, 1940, shows the price of silver in London and in New York in 1939 and the first half of 1940.

[1] For Congressional acts with reference to coinage from April 2, 1792, to January 31, 1934, see Minerals Yearbook, 1937, p. 113; for gold prices in London, 1931–36, p. 114.
[2] For highest, lowest, and average price of silver in New York, 1874–1935, see Minerals Yearbook, 1937, p. 115; for ratio of silver to gold, 1687–1935, p. 121.

UNITED STATES AND WORLD MONETARY STOCKS

According to figures published in the Federal Reserve Bulletin, the gold reserves of the United States increased $4,351,000,000 in 1940 and totaled $21,995,000,000 at the end of the year. The reserves continued to increase in 1941, although at a lower rate than in 1940, and were shown by the daily statement of the United States Treasury, June 2, 1941, to be 644,998,521.7 fine ounces valued at $22,574,948,258.76. The Treasury silver holdings on December 31, 1940, approximated 3,135,000,000 fine ounces.

Gold reserves (including stabilization funds) held by central banks and governments in the world at the end of 1939 totaled approximately $29,122,000,000. Adding $1,400,000,000 for new gold produced in 1940 raises the total reserves of the world (52 countries) to about $30,522,000,000.

IMPORTS AND EXPORTS

Value of gold and silver imported into and exported from the United States, 1939–40, by classes

	Imports	Exports	Excess of imports over exports

DOMESTIC SUPPLY

The domestic supply of new gold comes chiefly from dry and siliceous ore and from placer gravel. These two sources yielded 90 percent of the domestic gold (excluding Philippine Islands and Puerto Rico) in 1915, 80 percent in 1930, 87 percent in 1931, 93 percent in 1932, 1933, and 1934, 91 percent in 1935, 88 percent in 1936, 85 percent in 1937, 90 percent in 1938, 88 percent in 1939, and 87 percent in 1940. The proportionate output of gold from copper ore was 7 percent in 1915, 16 percent in 1930, 10 percent in 1931, 4 percent in 1932, 5 percent in 1933 and 1934, 7 percent in 1935, 10 percent in 1936, 12 percent in 1937, 8 percent in 1938, 10 percent in 1939, and 11 percent in 1940. These sources represented 96 to 98 percent of the gold supply in 1915 and 1930–40.

In 1915 dry and siliceous ore yielded in rounded figures 36 percent of the total silver; copper ore, 26 percent; lead ore, 27 percent; and zinc-lead ore, 9 percent. In 1939 dry and siliceous ores yielded 47 percent and in 1940, 41 percent; copper ore, 29 and 29 percent; lead ore, 5 and 4 percent; and zinc-lead ore (including zinc-copper and zinc-lead copper ores), 19 and 24 percent.

WORLD PRODUCTION OF GOLD AND SILVER

According to the Bureau of the Mint, the world output of gold and silver from 1493 to 1939 is 1,334,725,710 fine ounces of gold, valued at $30,494,725,785, and 16,979,933,601 fine ounces of silver, valued at $15,358,454,596.

The following tables show the world output of gold and silver from 1936 to 1940.

World production of gold, 1936–40, by countries, in fine ounces [1]

MINE REPORT

METHOD OF COLLECTING STATISTICS

The first table in this report presents the official refinery figures for production of gold and silver in the United States from 1936 to 1940, as agreed upon by the Bureau of the Mint and the Bureau of Mines. These figures record the output of gold and silver bullion from domestic ore in marketable form as metals, either refined or unrefined.

To trace the gold and silver produced back to its source by States, counties, and mining districts, the Bureau of Mines systematically investigates the "mine production" of ores containing gold and silver and the output of the placer mines, the total being classified by methods of production and by kinds of ore, as well as by mining districts. The resulting figures form the basis of the mine reports.

Of the two systems for ascertaining the production of gold and silver, one is a measure of the metallurgic industry and the other of the mining industry; one reports the metal actually recovered in marketable form and the other the mine output and its recoverable content. The two methods will not produce identical results, but data for a period of years long enough to compensate for overlap or lag should agree within allowable limits of error.

Gold and silver produced in the United States, 1905–40, in fine ounces, according to mint and mine returns, in terms of recovered metals

Year	Mint		Mine	
	Gold	Silver	Gold	Silver
1905–35	105,062,800	1,762,274,813	104,785,467	1,754,133,405
1936	4,357,394	63,812,176	4,405,118	61,647,455
1937	4,804,540	71,941,794	4,834,062	72,128,397
1938	5,089,811	62,665,335	5,170,743	62,873,450
1939	5,611,171	65,119,513	5,672,485	65,565,024
1940	6,003,105	69,585,734	5,984,163	71,824,746
	130,928,821	2,095,399,365	130,852,038	2,088,172,477

Compared with the mine reports, the mint reports for the 36 years show a total excess of gold of 76,783 ounces (a difference of 0.06 percent) and a total excess of silver of 7,226,888 ounces (a difference of 0.34 percent).

UNITS OF MEASUREMENT

All tonnage figures are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced. Prices of gold and silver are discussed in a preceding section of this report.

MINES PRODUCING

LEADING GOLD PRODUCERS

The output of the 30 largest gold producers in the United States (Philippine Islands and Puerto Rico excluded) in 1940, none of which

Largest producers of gold in the United States in 1940, in order of output [1]

Rank	Operator	State	Mining district	Source of gold
1	Homestake Mining Co	South Dakota	Whitewood	Dry and siliceous ore.
2	United States Smelting, Refining & Mining Co.	Alaska	Fairbanks and Nome	Dredging gravel.
3	Utah Copper Co	Utah	West Mountain	Copper ore.
4	Yuba Consolidated Gold Fields.	California	Callahan, Oroville, Snelling, Yuba River.	Dredging gravel.
5	Golden Cycle Corporation [2]	Colorado	Cripple Creek, etc	Dry and siliceous ore.
6	Idaho Maryland Mines Corporation.	California	Grass Valley-Nevada City.	Do.
7	Alaska Juneau Gold Mining Co.	Alaska	Juneau	Do.
8	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Copper ore.
9	Empire Star Mines Co., Ltd	California	Grass Valley - Nevada City, Bear Valley, Browns Valley.	Dry and siliceous ore.
10	Natomas Co	do	Folsom	Dredging gravel.
11	Getchell Mine, Inc	Nevada	Potosi	Dry and siliceous ore.
12	Howe Sound Co	Washington	Chelan	Copper ore.
13	Lava Cap Gold Mining Corporation.	California	Grass Valley - Nevada City.	Dry and siliceous ore.
14	Alaska - Pacific Consolidated Mining Co.	Alaska	Willow Creek	Do.
15	New Jersey Zinc Co., Empire Zinc Division.	Colorado	Battle Mountain	Copper ore.
16	Consolidated Coppermines Corporation.	Nevada	Robinson	Do.
17	Mammoth-St. Anthony, Ltd	Arizona	Old Hat	Dry and siliceous ore.
18	United States Smelting, Refining & Mining Co.	Utah	West Mountain and Tintic.	Zinc-lead ore, lead ore, dry and siliceous ore.
19	Nevada Consolidated Copper Corporation.	Nevada	Robinson	Copper ore.
20	United States Smelting, Refining & Mining Co. (Gold Road).	Arizona	San Francisco	Dry and siliceous ore.
21	Snyder Mines, Inc	Utah	Camp Floyd	Do.
22	Bald Mountain Mining Co	South Dakota	Trojan	Do.
23	Central Eureka Mining Co	California	Mother Lode	Do.
24	Capital Dredging Co	do	Folsom	Dredging gravel.
25	Manhattan Gold Dredging Co.	Nevada	Manhattan	Do.
26	Carson Hill Gold Mining Corporation.	California	Mother Lode	Dry and siliceous ore.
27	Veta Mines, Inc	Colorado	Upper San Miguel	Do.
28	Anaconda Copper Mining Co. (West Mayflower mine).	Montana	Renova	Do.
29	St. Joseph Lead Co	California	East Belt	Do.
30	Argonaut Mining Co., Ltd	do	Mother Lode	Do.

[1] Philippine Islands excluded.
[2] Custom mill. Includes mainly ore from Cresson, Portland, Ajax, Vindicator, and other mines in Cripple Creek district, Colorado, but also from other districts in Colorado.

produced less than 19,000 ounces, was 2,439,394 fine ounces (50 percent of the total). Five of the companies, working placer mines with floating connected-bucket dredges, recovered 519,457 ounces of gold; the rest of the output of the largest producers came from lode mines. The total output of lode mines and placers producing less than 19,000 ounces each was 2,430,555 ounces.

The Benguet Consolidated Mining Co. (including the Balatoc mine, controlled by Benguet stockholders) in the Philippine Islands ranked between the Homestake Mining Co. and the United States Smelting, Refining & Mining Co. Alaska operations.

LEADING SILVER PRODUCERS

The output of silver from the 49 leading silver-producing companies in 1940, none of which produced less than 200,000 ounces, was 55,947,996 ounces—79 percent of the total mine output of the United States (Philippine Islands and Puerto Rico excluded); the remaining 14,401,296 ounces (placer production excluded) came from about 5,000 lode mines, many of which derive a substantial net income from the silver content.

Largest producers of silver in the United States in 1940, in order of output

Rank	Operator	State	Mining district	Source of silver
1	Sunshine Mining Co	Idaho	Evolution	Dry and siliceous ore.
2	Anaconda Copper Mining Co.	Montana	Summit Valley or Butte.	Copper ore, zinc-lead ore.
3	New Jersey Zinc Co., Empire Zinc Division.	Colorado	Battle Mountain	Copper ore.
4	Phelps Dodge Corporation	Arizona	Ajo, Copper Mountain, Verde, Warren.	Do.
5	United States Smelting, Refining & Mining Co.	Utah	West Mountain, Tintic.	Zinc-lead ore, lead ore, dry and siliceous ore.
6	Utah Copper Co	do	West Mountain	Copper ore.
7	Tintic Standard Mining Co	do	Tintic	Dry and siliceous ore, lead ore.
8	Bunker Hill & Sullivan Mining & Concentrating Co.	Idaho	Yreka	Zinc-lead ore, dry and siliceous ore.
9	Federal Mining & Smelting Co.	do	Hunter, Lelande, Yreka.	Zinc-lead ore.

39	Veta Mines, Inc	Colorado	Upper San Miguel	Dry and siliceous ore.
40	Summit King Mines, Ltd	Nevada	Sand Springs	Do.
41	Reymert Mining Co	Arizona	Pioneer	Do.
42	Walker Mining Co	California	Genesee	Copper ore.
43	Philipsburg Mining Co	Montana	Flint Creek	Dry and siliceous ore.
44	Shenandoah-Dives Mining Co	Colorado	Animas	Zinc-lead ore.
45	St. Joseph Lead Co	Missouri	Southeastern Missouri	Lead ore.
46	Golden Queen Mining Co	California	Mojave	Dry and siliceous ore.
47	Rip Van Winkle Mining Co	Nevada	Merrimac	Zinc-lead ore.
48	Sullivan Mining Co	Idaho	Hunter	Do.
49	Iron King Mining Co	Arizona	Big Bug	Do.

NUMBER OF MINES

The following table indicates the number of mines that produced gold and silver in 1939 and 1940. The placers are those in which gold and silver in natural alloy and, in a few placers, platinum are recovered from gravel and sand, whether by hand washing, sluicing, hydraulicking, drifting (in frozen ground or ancient buried river channels), or dredging. The lode mines are those yielding gold and silver from ore as distinguished from gravel, mainly from underground workings, and include those that yield ore mined chiefly for copper, lead, or zinc but that contribute the precious metals as byproducts. In addition to the producing mines enumerated here many properties were being prospected and developed, and many other mining claims were being held by assessment work only.

The enumeration of placer mines is less satisfactory than that of lode mines, because some are operated only temporarily and are individually small. As far as possible the unit, as for lode mines, is not the operator but the mining claim or group of claims.

Number of mines in the United States producing gold and silver, 1939–40, by States [1]

State	Lode		Placer		Total	
	1939	1940	1939	1940	1939	1940

MINE PRODUCTION

SUMMARY

The following table gives the mine production of gold and silver in 1939 and 1940, by States, in terms of recovered metals, as calculated by the Bureau of Mines from reports from the producing mines. The annual percentage gains in gold production in the years following the 69-percent increase in the price of gold are as follows: 1934 over 1933, 19 percent; 1935 over 1934, 18 percent; 1936 over 1935, 19 percent; 1937 over 1936, 9 percent; 1938 over 1937, 7 percent; 1939 over 1938, 10 percent; and 1940 over 1939, 5 percent. The total gain in 1940 over 1933 was 128 percent. The output of silver increased 10 percent in 1940 over 1939 and was 208 percent above that in 1933.

Mine production of gold and silver in the United States, 1939–40, by regions and States, in terms of recovered metals

Region and State	Gold: Fine ounces 1939	Gold: Fine ounces 1940	Gold: Increase or decrease (percent)	Gold: Value (at $35 per ounce) 1939	Gold: Value (at $35 per ounce) 1940	Silver: Fine ounces 1939	Silver: Fine ounces 1940	Silver: Increase or decrease (percent)	Silver: Value 1939 (at $0.67878+ per ounce)	Silver: Value 1940 (at $0.71111+ per ounce)

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67+; 1933, $25.56; 1934, $34.95; 1935-40, $35.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The best index of lode mining is the quantity and metallic content of ore mined rather than the number of mines or operators. The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that produced gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1940. The individual State chapters from which these tables were compiled contain additional tables and text on the subject and may be found elsewhere in this volume.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little lead or copper that by itself in quantity it would not satisfy the requirements for the smelter charge in lead smelting or copper smelting, respectively. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present), or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

Siliceous (silica [3] in excess of iron) gold, gold-silver, and silver ores

[3] Except where mineralization approaches a matte, ores in their natural state generally contain more silica than iron and usually are highly siliceous.

containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry and siliceous ores" thus, by elimination, include both dry siliceous and irony, but chiefly siliceous, ores valuable for their gold and silver content, regardless of method of treatment, and dry fluxing ores carrying considerable quantities of iron and manganese oxides, or iron sulfide, and very small quantities of gold and silver. Dry and siliceous gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made arbitrarily on a basis of value, using the rule that the metal of lower value is not used in the bimetal classification unless its value is equal to or over one-quarter of the combined value of gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report.

Ore produced in the United States and average recovery in fine ounces of gold and silver per ton in 1940 [1]

[2] Less than 0.005 percent.

PLACERS

Dredging.—Placer gold is obtained largely from gravels handled by connected-bucket floating dredges, which recovered approximately 60 percent of the total output from placers in the United States (Philippine Islands and Puerto Rico excluded) in 1940 and 59 percent in 1939. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1940 is recorded as 17,517,997 ounces, originating by States as follows: California, 10,837,697 ounces; Alaska, 4,601,109 (including the production from two Becker-Hopkins single-dipper dredges and some gold by hydraulicking); Montana, 625,956; Idaho, 523,302; Colorado, 430,050; Oregon, 421,274; and other States, 78,609. The output in 1940 was 904,149 ounces from 122 dredges, of which California produced 414,966 ounces from 46 dredges; Alaska, 354,806 from 49 dredges; Idaho, 41,262 from 12 dredges; Montana, 39,012 from 7 dredges; Oregon, 24,951 from 6 dredges; and Colorado, 4,975 from 1 dredge.

[1] Colorado, Idaho, Montana, Nevada, and Oregon.

Other placer-mining methods.—From 1932 through 1940 dragline and power-shovel excavators operated in connection with dry-land and floating amalgamating and sluicing plants have been widely used in placer mining. In 1940 approximately 30 percent of the total output of placer gold, including that of Alaska and excluding that of the Philippine Islands, was recovered at these plants, and 10 percent was produced by old-established mining methods, such as hydraulicking, drift mining, sluicing, and rocking.

Additional information on placer-mining methods may be found in the State reviews in the Minerals Yearbook and Mineral Resources series.

PRODUCTION IN PHILIPPINE ISLANDS

Gold production in the Philippine Islands in 1940 continued to increase, as it has each year since 1927, reaching an all-time high of 1,114,201 fine ounces valued at $38,997,035—an increase of 11 percent over 1939, the previous record year, when 999,408 fine ounces valued at $34,979,280 were produced. The total value of gold output from 1907 to 1940, inclusive, is computed at $229,581,441. The annual value from 1931 to 1940 was as follows:

Mine production of gold in the Philippine Islands, 1931–40

Year	Gold (fine ounces)	Value [1]	Year	Gold (fine ounces)	Value [1]
1931	182,008	$3,762,433	1936 [2]	621,968	$21,768,880
1932	244,298	5,050,084	1937 [2]	716,967	25,093,845
1933	325,039	8,308,009	1938 [2]	903,265	31,614,275
1934	340,314	11,893,975	1939 [3]	999,408	34,979,280
1935	451,818	15,813,630	1940 [3]	1,114,201	38,997,035

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67; 1933, $25.56; 1934, $34.95; 1935–40, $35.
[2] Division of Statistics, Department of Agriculture and Commerce, Manila.
[3] United States refineries' receipts.

The largest producers of gold, in approximate order of output in 1940, included: Benguet Consolidated Mining Co., Balatoc Mining Co., Philippine Smelting Co. (custom smelter), Masbate Consolidated Mining Co., Itogon Mining Co., Antamok Goldfields Mining Co., I. X. L. Mining Co., Baguio Gold Mining Co., Mindanao Mother Lode Mines, Inc., Surigao Consolidated Mining Co., Inc., Atok Gold Mining Co., Suyoc Consolidated Mining Co., North Camarines Gold Mining Co., Inc., Coco Grove, Inc., and Pan Philippine Corporation. Most of these, as well as other important operations, were controlled by three large operating groups—Benguet Consolidated Mining Interests, Marsman & Co., Inc., and Soriano Mining Interests.

Important dredging operations were: Coco Grove, Inc., with two Bucyrus-Erie bucket-line dredges, each with a capacity of 185,000 cubic yards a month; Mindanao Mining Co. with one dragline floating dredge, having a capacity of 100,000 cubic yards a month; and Tambis Gold Dredging Co. with a 7-cubic foot floating connected-bucket type dredge, having a capacity of 36,000 cubic yards a month.

All of the silver produced in 1940 (1,275,383 fine ounces valued at $906,939), as well as 2,246 tons of recoverable copper and 991 tons of recoverable lead at United States refineries, were byproducts of gold-mining operations. Some copper concentrates and copper smelting ore with very low content of gold and silver have been shipped direct to Japan since October 1937.

COPPER

By T. H. Miller, H. M. Meyer, and Allan F. Matthews

SUMMARY OUTLINE

Substantially increased rates of production in the United States and British Empire countries, further dislocation of markets, and Government-influenced prices at moderate levels—all in response to war conditions—characterized the world copper industry in 1940. Smelter output in 1940 is estimated at the record high of 2,930,000 short tons—a 20-percent gain over 1939—of which approximately 86 percent came from the United States, Chile, Northern Rhodesia, Canada, the U. S. S. R., the Belgian Congo, and Japan. The greatest tonnage advance over 1939 was achieved by the United States. Of Chile's 1940 copper exports, 87 percent went to the United States and 5 percent each to Japan and Italy. Northern Rhodesia spurted ahead of a steadily increasing Canadian output to become the world's third largest source of copper. Copper Cartel restrictions were inoperative after the outbreak of war.

The domestic copper situation in 1940 was in many ways a peculiar one. In the first part of the year, American producers dejectedly watched their European markets dwindle and wondered where they were going to dispose of their metal. By the end of the year the same producers were straining to meet the demand of American fabricators and were even reconciled to an influx of foreign copper to ease their load. According to smelter returns, domestic production of copper in 1940 was 28 percent higher than in 1939 and was the sixth most active year in the history of the Nation. The larger outputs were during the World War years 1916–18 and the boom years 1928–29. The United States supplied approximately 35 percent of the world copper output in 1940 and easily maintained, by a wide margin, its position as the foremost producer. Arizona, Utah, and Montana contributed 73 percent of the United States total in 1940, and Nevada, New Mexico, and Michigan supplied an additional 22 percent. Electrolytic refineries, which are responsible for the principal output, operated at 90 percent of rated capacity. Early in 1941, brass manufacturers were considering an outlay of $37,000,000 to expand the capacity of their plants by 79 percent. The quantity of new copper withdrawn on domestic account in 1940 was 41 percent larger than in 1939 and established an all-time record. In 1940, for the first time since 1932, when the 4-cent tariff was placed on foreign copper, imports exceeded exports. Imports of unmanufactured copper were the highest on record and came principally from Chile and the Belgian Congo but also from Canada, Mexico, Peru, and British South Africa. United States exports of copper in 1940 went chiefly to Japan, United Kingdom, and the U. S. S. R., and in smaller quantities to France and Italy.

Salient statistics of the copper industry in the United States, 1925–29 (average) and 1937–40, in short tons

	Average (1925-29)	1937	1938	1939	1940

[1] Includes old tailings.
[2] Exclusive of Alaska, figures for which the Bureau of Mines is not at liberty to publish.
[3] Figures not yet available.
[4] Data include copper imported for immediate consumption plus material entering the country under bond.
[5] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[6] Approximate.

Despite the reversal in the American copper-supply situation during 1940—from plenty to want—there was surprisingly little change in producers' stocks and in prices. Stocks at smelters and refineries at the end of 1940 were only 6 percent less than at the close of 1939. They decreased in January, then increased until the end of July, and decreased again gradually during the remainder of the year. Prices held within the relatively narrow limits of 10.5 to 12.5 cents a pound. The high was quoted only during the first 2 weeks of 1940, and the low was reached in July. A new daily sales record was made on September 7, when 113,106 short tons were purchased. The price of copper, delivered to Connecticut points, reached 12 cents on September 24 and remained there throughout the remainder of the year.

Stability of the price at such a moderate level is attributed mainly to pointed suggestions by officials of the price agencies of the Federal defense organization. There was talk during 1940 of relaxing the 4-cent copper tariff, varying it on a sliding scale with price and consumption levels, but nothing specific was done. Subsidization of Michigan mines and small mines in Arizona was suggested; and in June 1941 Leon Henderson, Administrator of the Office of Price Administration and Civilian Supply, stated "If we can get any considerable amount from Michigan, we will allow what price is necessary." No fixed restrictions were placed on copper consumption in 1940, but by the spring of 1941 consideration was being given to the institution of some modified form of priority. Exports of copper, brass, and bronze from the United States were placed under license control on February 3, 1941.

Government purchasing.—When it became apparent in the last quarter of 1940 that production in the United States was not adequate to meet the needs of industry, the Metals Reserve Co. (a subsidiary of the Reconstruction Finance Corporation) began making arrangements to buy Latin American copper. Receipts were to form a buffer stock pile, and manufacturers who were unable to obtain their copper requirements from domestic refiners were to be permitted to draw upon the Government stocks. Deliveries from the stock pile to domestic consumers were begun in March 1941.

The first Government contracts were announced on December 19, 1940, and totaled 100,000 short tons, distributed as follows: 57,000 tons from Anaconda Copper Mining Co., 28,000 from Kennecott Copper Corporation, 10,000 from American Metal Co., Ltd. (sales agent for the Cerro de Pasco Co.), and 5,000 from Phelps Dodge Corporation. Contracts made public in February 1941 covered an additional 135,000 short tons and included 73,000 tons from Anaconda Copper Mining Co., 49,000 from Kennecott Copper Corporation, 10,000 from American Metal Co., Ltd., and 3,000 from Phelps Dodge Corporation. The Anaconda metal will come principally from Chile but also from Mexico, the Kennecott metal from Chile, the American Metal copper from Peru, and the Phelps Dodge metal from Mexico. The price was set at 10 cents a pound, f. a. s. New York, on condition that if at any time the cost of freight and insurance exceeded one-half cent a pound such excess would be borne by the Metals Reserve Co., or 9½ cents a pound, f. a. s. Chilean ports. By April 30, 1941, the Metals Reserve Co. had arranged to buy 500,499 tons of copper; of this quantity, 106,722 tons had been delivered, 195,617 tons were on order or afloat, and there were 198,160 tons for which the purchase contract had not yet been executed. These figures indicate that the Government has been active in acquiring the full annual production of the Latin American countries.[1] These purchases are believed to be making an important contribution to Western Hemisphere economics.

John A. Church, consulting mining engineer, of New York, was appointed consultant on copper and zinc to the Industrial Materials Department of the Advisory Commission to the Council of National Defense in October 1940 and later, in 1941, served in the same capacity with the Production Division of the Office of Production Management.

[1] Engineering and Mining Journal Metal and Mineral Markets, vol. 12, No. 20, May 15, 1941, pp. 1 and 3.

British copper situation.—In 1913 the British Empire produced 98,000 short tons of copper, and consumption approximated 170,000 tons. Rapid development of deposits in Northern Rhodesia and Canada, however, permitted a jump in production from 99,000 short tons in 1925 to 212,000 in 1930, 458,000 in 1935, 658,000 in 1938, and 685,000 in 1939.[2] Consumption was reported at 422,000 short tons in 1937 and 366,000 in 1938.

The absence of official data at this time makes it impossible to obtain an accurate perspective of the British copper situation in the war year 1940. But rather than omit discussion of this important phase, an appraisal is given upon the basis of information published in reputable mining journals. It should be kept clearly in mind that the figures in this paragraph, though believed to approximate the facts, are estimates, and the reader must wait for post-war editions of Minerals Yearbook to procure official data. The total copper production of the British Empire in 1940 is estimated at 840,000 short tons, about 86 percent of which was shipped to Great Britain and the remainder fabricated in the Colonies. Exports to the United Kingdom from the United States, Belgian Congo, and Chile, reshipments from France to the United Kingdom, and exports from the United States to British India and Hong Kong raise the total amount of new copper made available to the British Empire in 1940 to approximately 1,000,000 short tons. Of this amount, about 880,000 tons were shipped to the United Kingdom, but an unknown proportion of it was sunk before it could reach its destination. So far as possible, the above figures do not include copper recovered from scrap or that included in ammunition, machinery, and other finished products sent from the United States to Great Britain.

German-Japanese copper situation.—Germany proper has a meager copper production of little more than 33,000 short tons yearly compared with an annual apparent consumption that averaged (including Austria and Czechoslovakia) 266,000 short tons in 1924–28, 219,000 tons in 1929–33, and 308,000 tons in 1934–38. The deficit was filled by imports, principally from the Western Hemisphere and Africa. Germany stock-piled large supplies of copper in 1938 and 1939 and in spite of judicious use of scrap, substitutes, and confiscated metal probably had to draw on these stocks in 1940. If Germany commandeered the total copper output of the Continent of Europe (exclusive of U. S. S. R.), it would have available about 190,000 short tons annually, an amount that is doubtless well below its wartime requirements. Acquisition of the Russian deposits, however, would bring Germany's potential annual new supply to about 350,000 short tons.

Japan is the seventh largest world producer of copper; its output in 1939 was 114,600 short tons, but this was considerably short of its needs. Imports have increased progressively from 51,800 short tons in 1934 to 110,000 tons in 1938, according to the American Bureau of Metal Statistics. The Japanese experienced some difficulty in buying copper on the world market during 1940, and most foreign sources may be closed to that country in 1941. Japan continued in 1940 to buy large quantities of American copper in spite of reports

[2] Some of these tonnages are a little higher than those given in a corresponding section of Minerals Yearbook, 1940. In the previous discussion, certain minor copper-producing colonies were not considered.

of discriminatorily high prices. Chile reserved the right to suspend contracts with Japanese interests when the copper was needed in America, and in October 1940 Canada banned shipments to Japan.

Market dislocations.—As six of the seven world powers were at war during part or all of 1940, it was natural that there would be profound disruption in copper markets, even in addition to those shuffled in 1939. The United States sent no copper to Germany in 1940, and by the middle of the year shipments to France, Italy, and Sweden had been suspended. The American copper diverted from these normal markets augmented the tonnages sent to the United Kingdom and the U. S. S. R. Chile, suffering from the closure of most of its usual European markets, shipped to Italy and France early in 1940 but by the end of the year was sending the bulk of its copper exports to the United States. Northern Rhodesia and Canada sent even larger proportions of their output to the United Kingdom. Belgian Congo sent no copper to the mother country after its invasion in May 1940 and diverted it principally to the United States and United Kingdom.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled on a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better for showing the actual recovery of metal and are fairly accurate for showing the source of production; and refinery statistics give precise information regarding metal recovery but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, part 1, contains a discussion of the differences among the three sets of figures.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1936–40, in pounds

Year	Mine	Smelter	Refinery
1936	1,229,030,719	1,222,819,396	1,290,924,195
1937	1,683,996,000	1,669,322,278	1,644,505,129
1938	1,115,525,160	1,124,656,539	1,105,148,323
1939	1,456,639,000	1,425,349,488	1,409,745,816
1940	1,756,172,000	1,818,167,516	1,854,478,996

PRIMARY COPPER

Smelter production.—The recovery of copper by United States smelters from ores of domestic origin totaled 1,818,167,516 pounds in 1940—a 28-percent increase over 1939. Domestic smelter output constituted 51 percent of world production during 1925–29. The proportion dropped sharply in the succeeding years until 1934, when it was only 17 percent. From then it increased until it reached 32 percent in 1936 and 1937, declined to 25 percent in 1938, and rose again to 29 percent in 1939. The proportion for 1940 is estimated at 31 percent.

The figures for smelter production are based upon confidential returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included.

The figures for blister represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The precise quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930, part 1.

Copper produced in the United States from domestic ores, 1936–40, by States

Copper produced (smelter output) in the United States, 1936–40, and total 1845–1940

[Values rounded]

Year	Short tons	Value
1936	611,410	$112,499,000
1937	834,661	201,988,000
1938	562,328	110,216,000
1939	712,675	148,236,000
1940	909,084	205,453,000
Total 1845–1940	27,498,478	8,252,020,000

Mine production.—The figures for mine production are based upon reports supplied to the Bureau of Mines by all domestic mines that produce copper. Details of the method of collecting the statistics and reasons for the discrepancy between mine-, smelter-, and refinery-production figures are given in the Copper chapter of Mineral Resources of the United States, 1930, part 1.

Mine production is more accurate than either refinery or smelter production for showing the distribution of domestic production by States and districts. It also indicates the production by calendar years more exactly, because additional time is required for smelting and refining. Mine production in 1940 was 1,756,172,000 pounds—an increase of 21 percent over that in 1939 and less than 1 percent below the average for 1925–29.

Production by States and districts.—The following tables show mine and smelter production by States for 1939 and 1940 and by districts for 1936–40. In 1940 Arizona, Utah, and Montana led in production, with 73 percent of the smelter total compared with 74 percent in 1939. If the output of Nevada, New Mexico, and Michigan is added to the above, 95 percent of the production of the country is represented, the same as in 1939. Arizona's proportion of the total dropped from 37 percent in 1939 to 32 percent in 1940. Utah's rose from 23 to 27 percent, and Montana's and Nevada's remained unchanged at 14 and 9 percent, respectively. New Mexico's proportion of the total increased from 5 to 8 percent, while Michigan's share dropped from 6 to 5 percent. A comparison of present production with that of the past century shows that Arizona supplied 32 percent of the country's output in 1940 and about the same (33 percent) during 1845–1940. Proportionate decreases for Montana and Michigan (14 and 5 percent in 1940 compared with 22 and 17 percent, respectively, in 1845–1940) were offset mainly by Utah's large increase—27 percent in 1940 and 12 percent in 1845–1940. Gains also have been made in recent years by Nevada and New Mexico, whose respective proportions were 9 and 8 percent in 1940 compared with 5 and 3 percent during 1845–1940.

Copper produced in the United States, according to smelter and mine returns, by States, 1939–40 and 1845–1940 in short tons

[3] Included under "Undistributed"; Bureau of Mines not at liberty to publish figures.
[4] Less than 1 ton.
[5] Approximate production through 1928. Figures for 1929–40 are confidential and are included under "Undistributed."
[6] Includes Tennessee for 1929–40.
[7] Less than 0.01 percent.

In 1940, for the fifth consecutive year, the Bingham (Utah) district was the largest copper producer in the United States, and its output was nearly double that of the second-ranking district—Butte, Mont. The Globe-Miami district (Arizona) again was third in 1940, and the Central (New Mexico) district climbed into fourth place from eighth position in 1939.

Details of mine production, by districts and companies, in 1940 are available in other chapters of this volume dealing with the production of gold, silver, copper, lead, and zinc in the various States.

Mine production of copper in the principal districts,[1] 1936–40, in terms of recovered copper, in short tons

Quantity and estimated recoverable content of copper-bearing ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by United States mines in 1939; figures for 1940 are not yet available. Of the total copper produced from copper ores in the United States in 1939, 81 percent was obtained from ores concentrated before smelting and 16 percent from direct-smelting ores. Ore concentrated in 1939 included 5,018,377 tons treated by combined leaching and flotation. In addition to the above, 2,114,407 tons of copper ore were treated by straight leaching. The percentages for 1939 are to be compared with 79 percent obtained from concentrated ore and 18 percent from direct-smelting ores in 1938.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that the estimated recoverable tenor is close to the actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only those that contain 2.5 percent or more copper but also those that contain less than this percentage if they are valuable chiefly for copper. Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

Copper ore, old tailings, etc., sold or treated in the United States in 1939, with copper, gold, and silver content in terms of recovered metals

[1] Includes old tailings, etc.
[2] Exclusive of a small quantity from California, which the Bureau of Mines is not at liberty to publish.
[3] Exclusive of Alaska, figures for which the Bureau of Mines is not at liberty to publish.

REFINERY PRODUCTION

The refinery output of copper in the United States in 1940 was made by the 10 plants listed in the following table. The table also includes a refinery idle since 1933—Quincy Smelting Works in Michigan—and a plant in Arizona equipped to make electrolytically refined copper direct from the liquors obtained from leaching operations; this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes.

Copper refineries in the United States, 1940

Location	Company	Process
Arizona: Inspiration	Inspiration Consolidated Copper Co.[1]	Electrolytic.
Maryland: Baltimore	American Smelting & Refining Co	Do.
Michigan: Hancock	Quincy Smelting Works [2]	Furnace.
Houghton	Copper Range Co	Do
Hubbell	Calumet & Hecla Consolidated Copper Co	Do.
Montana: Great Falls	Anaconda Copper Mining Co	Electrolytic.
New Jersey: Barber	American Smelting & Refining Co	Do.
Carteret	U. S. Metals Refining Co	Do.
Perth Amboy	International Smelting & Refining Co.; Raritan Copper Works.	Do.
New York: Laurel Hill	Phelps Dodge Refining Corporation	Do.
Texas: El Paso	do	Do.
Washington: Tacoma	American Smelting & Refining Co	Do.

[1] Product shipped as cathodes to other refineries for casting into merchant shapes.
[2] Idle since 1933.

The 12 plants tabulated constitute what commonly are termed "regular refineries." Of these plants, 9 employ the electrolytic process and 3 the furnace process. The electrolytic plants have a rated capacity of 1,549,000 tons [3] of refined copper a year. As they produced 1,388,000 short tons in 1940, this part of the industry was operating at 90 percent capacity.

The following tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which it is cast.

Primary and secondary copper produced by regular refining plants in the United States and imported, 1936–40, in pounds

	1936	1937	1938	1939	1940
Primary:					
Domestic: [1]

Grand total	1, 920, 370, 365	2, 461, 813, 721	1, 773, 519, 355	2, 284, 783, 923	2, 999, 123, 979

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as an accurate separation at this stage of manufacture is not possible.
[2] Some copper from Michigan was electrolytically refined at an eastern refinery and is included as electrolytic copper.
[3] Data include copper imported for immediate consumption plus material entering the country under bond.
[4] Includes some secondary Lake copper.

[3] This figure for rated capacity, quoted from the American Bureau of Metal Statistics, is less than that given in the preceding edition of Minerals Yearbook; the change is a result of recalculation rather than any decrease in physical plant capacity.

Copper cast in forms in the United States, 1939–40

Form	1939		1940	
	Pounds	Percent	Pounds	Percent
Wire bars	1,077,000,000	47.83	1,245,000,000	43.50
Cathodes	532,000,000	23.62	906,000,000	31.66
Cakes	330,000,000	14.65	293,000,000	10.24
Ingots	137,000,000	6.08	175,000,000	6.11
Other forms	176,000,000	7.82	243,000,000	8.49
	2,252,000,000	100.00	2,862,000,000	100.00

In addition to the regular refineries, numerous plants throughout the country operate on scrap exclusively, producing metallic copper and a great variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement of secondary-copper production.

Copper sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 44,308,107 pounds having a copper content of 11,286,000 pounds in 1940 compared with 38,219,447 pounds having a copper content of 9,735,000 pounds in 1939.

The output of copper sulfate by plants other than the regular primary refineries was 89,723,720 pounds with a reported copper content of 22,808,000 pounds in 1940 compared with 48,312,400 pounds containing 12,290,000 pounds of copper in 1939.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1936–40. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary copper produced in the United States, 1936–40, in short tons

	1936	1937	1938	1939	1940
Copper as metal	260,000	285,600	192,400	151,370	170,839
Copper in alloys	224,600	246,500	167,400	[1] 348,330	[1] 361,207
Total secondary copper	484,600	532,100	359,800	499,700	532,046
From new scrap	101,900	123,200	92,500	212,800	198,156
From old scrap	382,700	408,900	267,300	286,900	333,890
Percent of domestic mine output	79	63	65	69	61

Includes 3,200 tons in chemicals in 1939 and 9,431 in 1940.

CONSUMPTION AND USES

New supply.—The total available supply of new copper consists of the total output of primary copper by refineries plus the imports of refined copper. In 1940 it was 2,763,786,187 pounds—a 35-percent increase from 1939. If this figure is reduced by the quantity of refined copper exported and adjusted for changes in stocks at refineries the quantity of new copper made available for domestic consumption may be estimated. This computation is made in the table that follows. It should be noted, however, that exports and stocks include some refined secondary copper that cannot be determined separately and that actual consumption of new copper would differ from the figures shown in the table by the changes in consumers' stocks, on which data are not available.

New refined copper withdrawn from total year's supply on domestic account, 1936–40, in pounds

	1936	1937	1938	1939	1940
Total supply of new copper	1, 654, 540, 642	2, 148, 602, 618	1, 588, 434, 754	2, 051, 558, 228	2, 763, 786, 187
Stock at beginning of year	350, 000, 000	220, 000, 000	358, 000, 000	362, 000, 000	191, 000, 000
Total available supply	2, 004, 540, 642	2, 368, 602, 618	1, 946, 434, 754	2, 413, 558, 228	2, 954, 786, 187
Copper exported [1]	472, 182, 922	620, 791, 029	770, 446, 945	792, 812, 995	754, 215, 509
Stock at end of year	220, 000, 000	358, 000, 000	362, 000, 000	191, 000, 000	183, 000, 000
	692, 182, 922	978, 791, 029	1, 132, 446, 945	983, 812, 995	937, 215, 509
Withdrawn on domestic account	1, 312, 357, 720	1, 389, 811, 589	813, 987, 809	1, 429, 745, 233	2, 017, 570, 678

[1] Includes refined copper in ingots, bars, rods, or other forms.

As shown in the foregoing table, the quantity of new copper withdrawn on domestic account in 1940 was 41 percent larger than in 1939. Furthermore, it established a new record by being 13 percent larger than in 1929.

Estimated use of copper in the United States, 1936–40, in short tons

Use	1936	1937	1938	1939	1940

	749, 000	860, 000	608, 000	801, 000	1, 070, 000

[1] Generators, motors, electric locomotives, switchboards, light bulbs, etc.
[2] Transmission and distribution wire and bus bars, accounting only for the public utility companies.
[3] Includes industrial wire and cable, wire in buildings, railway cars and ships, radio broadcasting, railway and municipal signaling, railway electrification, trolley wire, rod and wire for Government projects, blasting wire, flexible cord, and sundries.
[4] Does not include starter, generator, and ignition equipment.
[5] Excludes electrical work.
[6] Bearings, bushings, lubricators, valves, and fittings.
[7] Includes air conditioning.
[8] Excludes electrical equipment.
[9] Other than railway.
[10] Includes condenser tubes, oil-burner tubing, welding rod, screw-machine products, nickel-silver and phosphor bronze products, rivets and burrs, toilet pins, eyelets and grommets, electrotyping and engraving sheet, spark plugs, inner-tube valve stems, jar tops and rouge boxes, flashlight tubes, kerosene lamps, kitchen utensils, kitchen-range boilers, linotype matrices, safety razors, blasting caps, asbestos textiles, water meters, thermostats, soldering coppers, yacht fittings, coinage, washing machines, household water heaters, fire extinguishers, pumps, airplanes, engines, and sundry machinery, etc., all reckoned in terms of copper content.

Industrial use of copper.—The American Bureau of Metal Statistics estimates the actual consumption of new and old copper in the United States by uses. Data for the past 5 years are shown in the accompanying table.

The table shows that the estimated quantity of copper going into use in 1940 was 34 percent larger than in 1939 but 8 percent less than in 1929. The most important use of copper is for electrical manufactures, which took 34 percent more than in 1939 and 5 percent less than in 1929. Copper consumption in light and power lines increased 10 percent over 1939, and that in telephones and telegraphs increased 26 percent over 1939, but it fell 42 percent and 70 percent, respectively, from 1929. However, other rod and wire, the second largest outlet for copper, took not only 26 percent more than in 1939 but 13 percent more than in 1929. The quantity of copper used in automobiles was 21 percent larger than in 1939 but dropped 25 percent from 1929. Castings gained only 6 percent over 1939 and were 56 percent below 1929, and refrigerators were 5 percent higher and 39 percent lower, respectively. In addition to other rod and wire, the important uses of copper that improved in 1940 over both 1939 and 1929 were buildings, with increases of 15 percent and 73 percent respectively; radios, with 19 percent and 106 percent; ammunition, with 79 percent and 277 percent; and shipbuilding, with 2 percent and 263 percent. The consumption of copper in manufactures for export rose 186 percent over 1939 and 98 percent over 1929. The use of copper in the United States, measured in pounds per person, was 14.0 in 1940, 11.4 in 1939, and 19.1 in 1929.

A new type of copper designed to meet the need of the electrical industry for a copper of greater conductivity, ductility, fatigue resistance, and surface quality was announced by Phelps Dodge Corporation in March 1940. The metal is made, without melting, from cathode copper, which is plastically converted by tremendous pressure in a reducing atmosphere at elevated temperatures into smooth, dense copper bar, rod, strip, or other commercial shape. The metal is said to be particularly applicable where severe vibration is a problem.

STOCKS

The following table lists domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister copper in transit from smelters to refineries are included under blister copper.

Stocks of copper in the United States, January 1, 1937–41, in pounds

Year	Refined copper	Blister and materials in process of refining	Year	Refined copper	Blister and materials in process of refining
1937	220,000,000	391,000,000	1940	191,000,000	520,000,000
1938	358,000,000	428,000,000	1941	183,000,000	486,000,000
1939	362,000,000	466,000,000			

At the end of 1940, inventories of refined copper were 4 percent lower than at the close of 1939. Stocks of blister and anode copper at smelters, in transit to refineries, and blister and unfinished materials in process of refining at refineries decreased 7 percent, so that total stocks at smelters and refineries were 6 percent less than at the end of 1939.

Figures compiled by the Copper Institute and published in the press show that domestic stocks of refined, duty-free copper totaled 159,485 tons at the end of 1939. The trend of large deliveries cutting into inventories, characteristic of the latter half of 1939, continued into the first month of 1940, and refined stocks totaled 135,441 tons at the end of January. Subsequent deliveries declined, and supplies on hand rose monthly until the end of July, when they reached the highest level of 1940—215,823 tons. During the remainder of the year, deliveries were increased, and refined stocks diminished progressively to 142,772 tons at the end of 1940. The Copper Institute reported that blister stocks were decreased by 41,417 tons in 1940.

Copper Institute figures for the United States presumably include some metal held by consumers or at some secondary plants, as reports to the Bureau of Mines from primary refineries indicate that stocks of refined copper at refineries (shown in the foregoing table), were 91,500 tons at the end of 1940 and 95,500 tons at the end of 1939 (compared with 142,772 and 159,485 tons, respectively). Data for consumers' stocks are not available.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 1,014,000 short tons of copper were delivered to domestic and foreign purchasers in 1940 at an average price (f. o. b. refinery) of 11.3 cents a pound compared with 10.4 cents in 1939, 9.8 cents in 1938, and 12.1 cents in 1937.

Fluctuations in copper prices during 1940 were within the relatively narrow range of 10.5 and 12.5 cents a pound. (The prices in this discussion are those quoted by the American Metal Market for producers' electrolytic copper delivered to Connecticut points and are slightly higher than those shown in the accompanying tables, which are calculated prices, f. o. b. New York refinery equivalent.) The high of 12.5 cents for producers' electrolytic copper delivered to Connecticut points was quoted during the first 2 weeks of 1940 and was a continuation of the price gains that followed the outbreak of war in September 1939. Realization of changes in conditions of supply since the previous war and Government restraint on price raising helped to hold down January (1940) domestic sales of copper to 24,987 tons. On January 17 the price of copper began a steady trend downward. It was quoted at 11.25 cents a pound on February 7, and domestic sales skyrocketed to 147,112 tons in that month. By July 23 the pressure of increasing stocks had brought the prices to its 1940 low of 10.5 cents. Domestic sales from March to August ranged from 20,300 tons to 110,500 monthly. Rising prices and decreasing stocks during August and September stimulated record-breaking domestic sales of 254,277 tons in September. On September 24 the price reached 12 cents and stayed there throughout the remainder of the year. Domestic sales in the final quarter of 1940 were 125,531 tons in October, 85,633 tons in November, and 89,517 tons in December.

Producers' Lake copper delivered to Connecticut points was quoted at 12.5 cents a pound at the beginning of 1940 and 12 cents at the end—both the same as for producers' electrolytic copper. During the year, however, prices of the Lake copper changed relatively few times. The price dropped three times in late January and early February to 11.25 cents on February 7. It recovered on February 20 to 11.5 cents, where it remained until August 7, when it hit the 1940 low of 11 cents. Half-cent gains on September 5 and September 24 brought the price of Lake copper to 12 cents, where it stayed during the remainder of the year.

In early February 1940 custom smelters declared wide-open market; that is, they no longer had an established price (usually the same as that quoted by primary producers) but began booking business at individual quotations for each order.

Average monthly quoted prices of electrolytic copper for domestic and export shipments, f. o. b. refineries, United States, and for spot copper at London, 1939–40, in cents per pound

Month	1939				1940			
	Domestic f. o. b. refinery [1]	Domestic f. o. b. refinery [2]	Export f. o. b. refinery [2]	London spot [2] [3]	Domestic f. o. b. refinery [1]	Domestic f. o. b. refinery [2]	Export f. o. b. refinery [2]	London spot [3] [4]

[5] Average for 8 months.
[6] No quotations.

Outside prices for electrolytic copper delivered at Connecticut points opened in 1940 at 12.6 cents a pound and closed at 12.375

cents. The highest quotation on this type of copper in 1940 was 13.125 cents, and the lowest was 10.425; the average was 11.676.

Transactions on the London Metal Exchange were suspended at the beginning of the war. The maximum buyers' price on standard copper was fixed by the British Ministry of Supply at 62 pounds throughout 1940.

FOREIGN TRADE [4]

United States imports and exports of copper constitute a well-balanced trade through which the smelting, refining, and manufacturing facilities of this country are utilized to treat foreign raw materials and to return refined copper and manufactures of copper abroad. Eighty-six percent of the copper imported in 1940 was contained in ore, concentrates, and unrefined furnace products, nearly 14 percent was refined copper, and most of the remainder consisted of ingots to be remelted and recast in the United States. The proportion of refined metal receipts increased from 0.7 percent in 1938 to 5 percent in 1939 and 14 percent in 1940; the loss of normal markets by Chile—the principal contributor of refined copper—was chiefly responsible for this trend. In contrast to the import situation in the United States, 98 percent of the exports comprised refined copper and primary manufactures therefrom.

The United States has long had an exportable surplus of copper and for many years exported more copper than it imported. In 1930–32, imports exceeded exports, and a tariff of 4 cents a pound was placed on copper in 1932. During 1933–39 exports exceeded imports, the principal part of which were for smelting, refining, and export. In 1940, however, imports again exceeded exports; the latter remained about the same as in 1939, but imports rose sharply to meet the demands of national defense.

Separation of total exports to show the quantity of domestic copper shipped from the United States is not possible. Data on hand, however, indicate that exports of domestic copper declined appreciably in the past 2 years. Excess of total exports over imports of unmanufactured copper fell from 340 million pounds in 1938 to 183 million pounds in 1939, and imports surpassed exports by 127 million pounds in 1940. In addition to the copper shown in the accompanying tables, an unrecorded quantity of metal is exported in manufactures, such as electrical machinery, automobiles, and similar equipment.

Imports.—Unmanufactured copper imports were 46 percent greater in 1940 than in 1939 and were the highest on record, though less than 1 percent above the previous record, established in 1929. The increase was shared by all classifications except scrap and was sharpest for regulus—120 million pounds in 1940 compared with 6 million in 1939—and for refined—137 million pounds in 1940 and 33 million in 1939. Other import classifications in 1940 showed increases over 1939 of 83 percent for ore, 15 percent for concentrates, and 13 percent for unrefined blister and converter copper. Scrap imports declined 52 percent in 1940 compared with 1939. Imports of unmanufactured copper of all types in 1938 came principally from Chile, Mexico, Canada, Peru, Cuba, and Yugoslavia. Chile retained its leading position in 1939 and 1940 by a wide margin. Belgian Congo, which

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

had not sold copper in the American market since 1930, was the second largest source of imports in 1940. Canada, a rapidly growing exporter of copper in recent years, nearly equaled Mexican shipments to the United States in 1939 and surpassed them in 1940. Imports from Peru and British South Africa were the fourth and fifth largest, respectively, in 1939 and fifth and sixth, but in reverse order, in 1940. Next in line in 1939 were Newfoundland and Cuba in that order, which was reversed in 1940. Imports of copper from Yugoslavia decreased in recent years and were absent in 1940.

Imports of ore were mainly from Chile, the Union of South Africa, Mexico, and Peru. This is the first time since 1921 that South Africa has contributed over a million pounds of copper in ore. Cyprus, the second largest source in 1937–39, sent no untreated copper ore to the United States in 1940, although it did send concentrates. Canada, Cuba, Newfoundland, Mexico, Cyprus, and Bolivia were the sources of the principal portion of concentrates received. Of this group, small decreases from Canada and Newfoundland were much more than balanced by the shipments from Cyprus, a new contributor to the concentrates classification, and by increases from Bolivia, Cuba, and Mexico. Imports of other unrefined copper (regulus, unrefined blister, and converter copper), which gained so heavily in 1940, were primarily from Chile, the Belgian Congo, Mexico, and Peru. Virtually all refined copper entered is from Chile, and this class increased sharply in 1940. The small amount of scrap copper imported in 1939 and 1940 came chiefly from Canada, the Union of South Africa, and Peru.

Copper (unmanufactured) imported into the United States in 1940, in pounds [1]

[1] Data include copper imported for immediate consumption plus material entering the country under bond.

Exports.—The recorded quantity of copper of all classes exported in 1940 was a trifle more than in 1939 and the largest since 1929. This quantity, however, does not include the copper exported in machinery, which probably gained appreciably in 1940. This is indicated in that the value of exported industrial and other electrical machinery, automobiles, aircraft engines, and accessories increased 25 percent in 1940. There was a definite trend in 1940 to turn more of the refined copper to be exported into primary products, such as wire, pipes, and sheets, before shipment. The principal class continued to be refined bars and ingots, but it declined 4 percent, and rods and scrap fell 13 percent and 59 percent, respectively. Insulated wire, the second-ranking class in 1940, advanced 263 percent, and all other classes showed tremendous increases—144 percent for uninsulated wire, 144 percent for pipes and tubes, 342 percent for plates and sheets, and 375 percent for ores and unrefined copper.

The principal recipients of copper exported from the United States in 1938 were Japan, Germany, France, Czechoslovakia, United Kingdom, and Italy. The 1939 exports were characterized by increases to France and Italy and decreases to Germany, making the order Japan, France, Italy, Germany, Sweden, and the U. S. S. R. Japan held its leading position in 1940, followed by the United Kingdom and the U. S. S. R., which took 262 percent and 135 percent more, respectively, than in 1939. France was a large purchaser in the first part of the year, but its capitulation relegated it to fourth place in 1940, followed by Italy. Of the copper exports, Japan, Germany, and Italy together took 52 percent in 1938, 44 percent in 1939, and 36 percent in 1940 (though none went directly to Germany in 1940).

Copper exported from the United States in 1940,[1] in pounds

1938	842, 023, 197	844, 027, 426	86, 119, 848				

[1] Exclusive of "other copper manufactures" valued at $585,568 in 1936, $851,697 in 1937, $689,008 in 1938 $863,561 in 1939 and $1,584,441 in 1940; quantity not recorded.
[2] Exclusive of ore, concentrates, and composition metal. Exclusive also of unrefined copper, figures for which are not separable from those for ore and concentrates.

The value of brass and bronze exported from the United States in 1940 was $45,228,774, a five-fold gain over 1939 and the third largest on record. It was exceeded in 1916 and 1917; in the latter of those years the peak value of $239,891,109 was reached, and that figure was for brass alone. Exports of brass and bronze plates and sheets were 52 times greater in 1940 than in 1939, and exports of bars, rods, and wire were 6 times greater. All classes of unmanufactured brass (ingots, bars, rods, plates, and sheets) exported in 1940 totaled 181,814,478 pounds—14 times that of 1939 and standing third only to the record of 328,346,666 pounds in 1917 and to exports of 244,531,706 pounds in 1916. Shipments of copper sulfate to foreign countries were much larger in 1940 than ever before—90 percent higher than in 1939, 78 percent above the former record in 1938, and 91 percent over 1917 exports.

WORLD ASPECTS OF COPPER INDUSTRY

A perspective of the world copper situation in 1940 and of the outlook for 1941 is given in the introductory pages of this chapter. Some of the details are discussed, by countries, in the following pages.

Albania.—Two new mines in the Rubico district are expected to have an annual output of ore equivalent to 6,000 metric tons of metallic copper.[5]

Australia.—The copper production in Australia in 1940 is estimated at 17,700 metric tons.[6] The British Government has a contract to purchase any exportable surplus up to 7,000 tons a year, but wide expansion of the local munitions industry is absorbing the entire output of the Commonwealth. The maximum price of copper was raised on February 16, 1940, from £63 17s. 6d. to £76 a ton but was still below that fixed by the British Ministry of Supply, the Australian equivalent of which was £77 10s. The increased price was to stimulate copper production in Australia, and it was established with the understanding that the two principal operators would

[1] Data not available.
[2] Copper content of blister produced.
[3] Smelter output from domestic and foreign ores, exclusive of scrap. The production from domestic ores only, exclusive of scrap, was as follows: 1938, 510,133 tons; 1939, 646,524 tons; 1940, 824,703 tons.
[4] Copper content of exports.
[5] Figures represent blister copper only. In addition to blister copper, Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from the Belgian Congo and would therefore duplicate output reported under the latter country.
[6] Approximate production.
[7] Exclusive of material from scrap.
[8] Smelter output from ores.
[9] Output from U. S. S. R. in Asia included under U. S. S. R. in Europe.
[10] Smelter product.
[11] Exports of ingots and slabs.
[12] Less than 1 ton.
[13] Approximate production based upon output of countries shown, which in 1938 contributed about 95 percent of total world output.

set aside £4 a ton produced for development and expansion. Improvements at Mount Morgan, Ltd., Queensland, involving extension of the smelter and conversion of the former oxide ore-treatment plant to a sulfide mill, will double its copper output, raising it to 6,000 tons yearly.[7] Copper imported into Australia in the form of blocks, ingots, wirebars, pigs, or scrap was exempted on August 29, 1940, from the payment of certain duties. This exemption was in response to expanded defense demands and facilitates the entry of copper imports, most of which are reported to be coming from Africa.

Belgian Congo.—Copper production in the Belgian Congo during 1940 was about 156,000 metric tons. Early in 1940, as a result of the war, the center of the Belgian copper trade was transferred from Brussels, and sales of Belgian Congo copper were placed on a cash-and-carry basis, f. a. s. Matadi (the Congo river port) or f. a. s. New York. The tendency for the Belgian Congo to smelt and refine a larger proportion of its copper output was accentuated in 1940. Domestic industries in Belgium continued to be supplied until the German invasion in May 1940, after which time shipments to the mother country ceased. From June 1 to December 31, 1940, the Belgian Congo exported 32,270 metric tons of matte—all to the United States—and 59,709 tons of cathode copper and ingots, of which 59 percent went to the United States, 30 percent to England, 8 percent to France, and 3 percent to other countries. Union Minière du Haut Katanga, the principal producer, operated at approximately 75 percent of capacity in 1940, apparently working in loose cooperation with the other leading copper producers of the world.[8] Early in 1941 the United Kingdom contracted for 126,000 metric tons of Congo copper, 12,000 tons to be delivered each month beginning with March. Development of the Ruwe deposits, believed to contain 2,000,000 tons of copper, in the western section of the company properties, was reported in 1940.[9] Copper mining in the Katanga district was described by Birchard.[10]

Bulgaria.—The visible and probable copper reserves of Bulgaria are estimated at 250,000 tons of ore and the possible reserves at twice that amount.[11]

Canada.—Canada has broken copper-production records annually in recent years, and 1940 marked another forward step. According to an estimate by the Northern Miner, mine output was 317,000 metric tons—a gain of 14 percent over 1939. The same journal states that Canada's facilities for the manufacture of semifinished and finished copper and brass products have grown so rapidly that as much as one-third of its copper output is expected to be fabricated locally before the end of 1941. On October 9, 1940, Canada placed a ban on copper exports to all countries except those of the British Empire and, under certain conditions, the United States. This embargo principally affects shipments of copper concentrates by the Granby Consolidated Mining, Smelting & Power Co., Ltd., British Columbia, to Japan. Nearly all of the copper mines of Canada are under contract to sell everything over domestic requirements to

the British Government. Early in 1940, such contracts were reported to total 190,500 metric tons of electrolytic copper.[12]

More than half of the copper produced in the Dominion comes from the nickel-copper mines of the Sudbury district, Ontario. The principal producer is the International Nickel Co. of Canada, Ltd., which refines the major part of the copper it mines in the company refinery at Copper Cliff and exports the remainder as matte. Falconbridge Nickel Mines, Ltd., also exports matte from the same district. Quebec is the second largest copper-producing Province, and about 62 percent of its output comes from Noranda Mines, Ltd., 21 percent from Waite Amulet, 7 percent from Aldermac Mines, Ltd., and 6 percent from Normetal Mining Corporation, Ltd. During most of 1940 the Waite Amulet mill was treating 900 metric tons of ore a day, and the quantity was expected to be increased in October of that year to 1,100 tons daily.[13] Concentrates from this mill in 1940 were anticipated to contain 13,600 metric tons of copper.[14] The entire Quebec output is refined at Montreal East by Canadian Copper Refiners, Ltd., a subsidiary of Noranda Mines, Ltd. In 1940 this refinery raised its capacity to 101,600 metric tons of copper annually, according to the Northern Miner. The principal copper producers in British Columbia are Britannia Mining & Smelting Co., subsidiary of Howe Sound Co., at Howe Sound, and Granby Consolidated Mining, Smelting & Power Co., which operates the Copper Mountain mine at Allenby. Brittannia concentrates contain about 16,500 metric tons of copper annually and formerly were sent to Europe and some indirectly to Japan.[15] Granby concentrates average 16,300 metric tons of copper yearly, and reserves at the beginning of 1940 were estimated at 13,100,000 metric tons of ore averaging 1.38 percent copper. Operations at the Copper Mountain mine were described in 1940.[16] The Granby company has been exporting its entire production to Japan and in March 1940 extended its agreement with Japanese interests for another 3 years. Following the copper embargo, however, both Britannia and Granby concentrates were shipped to the Tacoma (Wash.), refinery of the American Smelting & Refining Co. under an agreement whereby the British and Canadian Governments reserve the right to buy the copper refined and whereby the American company guarantees not to reexport the copper to any countries unfriendly to the British Empire. Copper is produced along the Manitoba-Saskatchewan border in the Flin Flon district by Hudson Bay Mining & Smelting Co., Ltd., and by Sherritt Gordon Mines Co., Ltd. Ore from both properties is treated at the Hudson Bay smelter and refinery in Flin Flon.

Chile.—Smelter production of copper in Chile in 1940 was 4 percent greater than in 1939 but 15 percent less than in the record year 1937. Mine production was also 4 percent ahead of that in 1939. Exports of copper of all classes totaled 362,914 metric tons in 1940. Of this amount, 316,963 tons went to the United States, 19,257 to Japan, 18,473 to Italy, 2,926 to Argentina, 2,794 to France, 2,058 to Sweden, 432 to United Kingdom, 9 to Peru, and 2 to other countries. The exports included 181,496 tons of electrolytic copper (a 16-percent

gain over 1939), 172,063 tons of standard copper, 6,713 tons of ore and concentrates, 2,543 tons of blister, 81 tons of precipitate, and 18 tons of cement copper. It was reported that Chilean contracts for shipments to Japan contain a clause permitting the producer to cancel the order if the metal is needed either for Chilean or United States defense requirements.

The bulk of Chile's copper production is by American companies—Chile Copper Co. and Andes Copper Co., subsidiaries of Anaconda Copper Mining Co., and Braden Copper Co., a subsidiary of Kennecott Copper Corporation. The Chile Copper Co., which owns the Chuquicamata mine—the world's largest copper deposit—produced 150,864 tons in 1940 compared with 139,543 in 1939. The Andes Copper Co. had outputs of 72,917 and 55,120 tons in 1940 and 1939, respectively, and the Braden Copper Co. of 109,164 and 118,336 tons, respectively. A report by Charles Will Wright of the Bureau of Mines, cited in the preceding edition of Minerals Yearbook, describes the principal copper mining and reduction operations in Chile and contains general information regarding labor organizations, marketing of ores and concentrates, and other matters.[17]

China.—Copper deposits in Szechwan, Sikang, and the southwestern Provinces are being worked, and the Chinese Government is building an electrolytic copper refinery.[18]

Cuba.—Copper production in Cuba increased 5 percent in 1940 compared with 1939. The output comes principally from the Matahambre mine, Pinar del Rio Province, and after flotation is shipped to Carteret, N. J., for smelting. Operations at this mine were described in 1940.[19]

Finland.—Outokumpu Copper Co., the Government-controlled principal copper producer in Finland, has instituted an expansion program and is erecting a concentration plant at Makola in the Nevala district in order to commence mining operations there in the summer of 1941. The annual output of the new mine is expected to be 45,000 metric tons of ore yielding 9,100 tons of copper and copper-nickel concentrates. The Outokumpu company has been sending its blister copper (and some concentrates) to Germany for reduction to electrolytic copper, which was returned to the Finnish company for rolling in its new mill completed in October 1940. The mill is situated near Pori and produces sheet copper, brass pipe, bars, telephone and telegraph wire, and other products. The firm is erecting an electrolytic copper refinery at Imatra which was to begin operation in April 1941. This smelter will enable Finland to carry on within its own borders every step in the manufacture of copper products.

France.—During the German invasion in June 1940, France was able to reship 75,000 metric tons of copper from Bordeaux to Great Britain, the United States, and French Morocco. The Germans are estimated to have found 25,000 to 50,000 tons of copper at various ports in addition to industrial stocks. In October 1940, about 30,000 tons of copper not yet confiscated remained in the hands of importers, dealers, and manufacturers. In addition, there were supposed to be 50,000 tons of unseized copper scrap in French arsenals, but some

[17] Wright, Charles Will, The Mining Industries of Chile, Their Production and Future Possibilities: Bureau of Mines Foreign Minerals Quart., vol. 3, No. 2, April 1940, 80 pp.
[18] Daily Metal Reporter, vol. 41, No. 45, March 6, 1941, p. 3.
[19] Murdock, T. G., Mining Copper in Cuba: Compressed Air Mag., vol. 45, No. 9, September 1940, pp. 6233–6236.

believe this figure to be exaggerated. In October 1940 Germany ordered French industrialists to use copper in a quantity not exceeding 25 percent of their 1938 rate of consumption and not to utilize the metal in certain specified products, including electric cables, which could be made from aluminum and other substitutes. In April 1941 French manufacturers were reported by the press [20] to have been told that they could no longer use any copper or most other nonferrous metals; they were allowed 3 months to find substitutes and forbidden to accept orders for goods containing the prohibited metals.

Germany.—For many years, the output of copper from domestic ores has averaged less than 30,000 metric tons. During these years Germany has alternated with the United Kingdom as the second-largest consuming nation in the world, with an average annual apparent consumption of 162,000 tons for 1913–38 and 237,000 tons for 1934–38. In 1938 and 1939, the apparent consumption is believed to have been considerably above actual consumption because large stocks had been accumulated in preparation for war. The wide divergence between mine output and consumption of copper in Germany must necessarily be filled by imports. In 1938, more than 85 percent of the German imports were from the Western Hemisphere and Africa, sources closed to it in 1940. If every ton of copper mined on the Continent of Europe (exclusive of the U. S. S. R.) were sent to Germany, the total, judging from the most recent data available, would be about 175,000 tons a year. This includes 30,000 tons from Spain, whose production is below normal and apparently is being consumed entirely at home, and 4,900 tons from Portugal, which probably is not shipping to Germany. The most important improvement in Germany's copper situation during 1940 was its acquisition of French metal stocks and supplies from the Bor mine in Yugoslavia, formerly French-operated, which produced 64,200 tons of copper in 1939. It is doubtful if Germany obtained any significant amounts of copper in 1940 from the U. S. S. R., the largest European producer, because the Soviets have been importing metal to meet their own requirements. During 1940, Germany completed installation of haulage systems and other improvements at the Mansfeld mine (the principal producer in Germany proper), developed the adjacent Kur-Hesse mines, and claimed to have shown by diamond drilling the existence of a million metric tons of copper in the Permian limestone regions of Bunzlau, Goldberg, and Löwenberg in Lower Silesia, but the deposits are of even lower grade than those at Mansfeld.[21] In general, in spite of the use of confiscated metal, scrap, and substitutes, it appears that Germany must have drawn on its stocks of copper in 1940 to meet the wartime demand. The established price of electric copper was 605 marks a metric ton at the beginning of 1939 and 615 marks by the middle of October; it rose to 740 marks on October 17, where it remained during the balance of 1939 and the first quarter of 1940. The price was 750 marks during the second and third quarters of 1940.

India, British.—The Indian Copper Corporation (the only copper producer in the country) in 1939 milled 338,879 metric tons of ore and refined 6,430 tons of copper. Increased Government demand for refined copper prompted the company to build a second refinery

---

[20] Chemical Age, vol. 44, No. 1138, April 19, 1941, p. 225.
[21] Mining Journal (London), vol. 211, No. 5493, November 30, 1940, p. 706.

soon after the war began. As the capacity of the two refineries exceeds India's production ot copper ore, Rhodesian blister copper is being imported and treated for the Government. Production of copper in the first 5 months of 1940 was 2,732 tons. Reserves at the beginning of 1940 are estimated at 866,000 tons of ore averaging 2.86 percent copper.[22] Operations by the Indian Copper Corporation were described in 1940.[23]

Italy.—During the first 7 months of 1939, Italy produced 1,602 metric tons of copper and imported 57,462 tons. In the first half of 1939 imports were 53,863 tons, 97 percent of which was shipped by sea. Of the sea-borne shipments, 257 tons originated in the Mediterranean basin, 14,117 tons came through the Suez Canal from East and South Africa, and the remainder came through the Straits of Gibraltar—17,526 tons from North America, 14,412 tons from South America, 5,497 tons from North and West Europe, and 355 tons from West and South Africa. Italian copper mines produced 1,000 tons in 1938 and 335 tons in 1935 compared with a consumption of 80,000 and 90,000 tons, respectively. The substitution of aluminum for copper, especially in the electrical industry, is expected to save 20,000 tons yearly.[24] The use of copper oxychloride as a fungicide in Italian vineyards in place of copper sulfate (of which Italy is the world's chief producer and consumer) will constitute a saving of 35 percent—12,300 tons—in the quantity of copper required. The official price of cathode copper at the beginning of 1940 was 6.40 lire a kilogram.

Japan.—Smelter production in Japan in 1939 was 104,000 metric tons; data for 1940 are not available. Japanese imports of copper, which have advanced materially in recent years, were approximately 146,000 tons in 1940. Of these, 109,000 came from the United States, 19,000 from Chile, about 12,000 from Canada, and about 6,000 from the Philippine Islands. According to the American Bureau of Metal Statistics, Japanese imports were 1,181 tons in 1930, 13,327 in 1933, and 65,261 in 1935, and are estimated at 95,000 tons in 1937 and 100,000 in 1938. The same source estimated Japan's new supply of copper as 183,000 tons in 1937 and 201,000 in 1938.

Mexico.—Mine production of copper in Mexico decreased 15 percent and smelter output 22 percent in 1940 compared with 1939. It was reported that the Mexican Government expropriated the French copper mines of Compagnie de Boleo, Santa Rosalia, Baja California, in June 1940.[25]

Newfoundland.—Copper-ore reserves of Newfoundland are estimated at 6,700,000 metric tons, of which 4,100,000 tons averaging 1.5 percent Cu are at the Buchans mine and 2,000,000 tons averaging 2.62 percent Cu at the unworked Gull Pond deposit. An exhaustive study of Newfoundland's copper deposits was published in 1940.[26]

Northern Rhodesia.—Copper output from the three principal mines—Roan Antelope, Mufulira, and Rhokana—is estimated in 1940 at a new record of 370,000 metric tons, all of which was contracted for by the British Government.[27] Assuming that this estimate represents

the total for the country, the 1940 output was apparently 45 percent more than that of 1938. Prices of £43 10s. for blister and £48 10s. a long ton for electrolytic, the quotations that obtained immediately before the war, prevailed in 1940 for most of the Rhodesian copper, but a much higher price was believed to have been paid later in the year.[28] Miners at the Mulfulira mine and another mine in the Nkana area were on a strike for about 10 days in March 1940.[29] Mining methods in Northern Rhodesia were described in 1940.[30]

Norway.—None of the Norwegian copper mines was destroyed during the German invasion in April 1940. The Röros mine, one of the principal producers, was shut for about 2 months but resumed normal operations in June. The entire output, which used to go chiefly to France and Belgium, is being shipped to the Reich. Plans are being made for expansion of the Röros copper works, and ore reserves are reported to justify the proposed work.

Peru.—Mine and smelter production decreased 1 and 2 percent, respectively, in 1940 compared with 1939. The Peruvian export tax on electrolytic copper had been $1.25 a short ton when the New York quotation was 11 cents a pound. In September 1940 the same tax was made effective on a 9-cent base, and higher taxes were designated when higher prices prevail.[31] The exportation of copper scrap from Peru was prohibited on January 2, 1941.

Philippine Islands.—The mine output in 1940 was 9,259 metric tons—a gain of 24 percent over 1939 and 162 percent over 1938. Japan takes most of the production, which is exported in the form of ores and concentrates. Nielson & Co., Inc., which owns the Lepanto and Hixbar mines, is the principal operator.

Spain.—Production of copper in Spain in 1940 is estimated at 4,400 metric tons, of which approximately 3,000 tons were blister copper and 1,400 tons were black copper. This 40-percent decline in output was attributed to loss of markets by extension of the war, inability to secure ocean transportation, shortages of dynamite and coal, and general disorganization within the country. Figures for mine shipments by the British-owned Rio Tinto Co., Ltd. (the principal operator in Spain), are not available for 1940, but were 820,000 tons of copper ore in 1939 compared with 1,283,000 tons in 1938. The company's entire 1939 output was consumed in Spain; it was stated in May 1940 that no shipments had been made to Germany—normally its largest customer—or to any German-occupied countries since May 1939.

Sweden.—In December 1940 the Swedish Riksdag appropriated 2,000,000 crowns ($476,190) for a plant and equipment required to increase the domestic production of copper. It also transferred (until the end of 1945) exclusive mining rights to the Boliden Mining Co. at the state-owned Adak, Bjurfors, and Rävliden fields in the Province of Västerbotten. Field work by the Swedish Geological Survey in 1940 indicated that the Adak mine will yield 750,000 metric tons of copper ore.

Union of South Africa.—Copper production in 1940 totaled 17,963 metric tons, of which 9,000 tons were ingots, 4,624 blister, and 4,338 in gold concentrates; 1 ton was in ore. Exports in 1940 included

3,701 tons of blister, all of which went to the United Kingdom, and 7,978 tons of ingots, of which 6,598 went to the United Kingdom, 1,345 to India, and 35 tons to the Netherlands East Indies and Malaya. Domestic sales of ingots in 1940 were 1,002 tons.

The principal producer in recent years has been the Messina mine, but in addition the Rustenburg platinum mines ship a platinum-nickel-copper matte to Great Britain. Operations in the Namaqualand field, which ceased in 1919 and were on a greatly reduced scale from 1922 to 1932, were resumed in the middle of 1940 by the O'okiep Copper Co., Ltd., which is owned by the Newmont Mining Corporation and other American and British interests. Production in the third quarter of 1940 was 1,232 tons, but full utilization of the new smelter and of other machinery and equipment is expected to permit a production of 11,800 tons of copper annually, all of which is to be sold to the British Ministry of Supply. Reserves in the district are estimated as follows: 6,260,000 tons of ore averaging 2.52 percent Cu at the Nababeep mine, 2,427,000 tons averaging 2.33 percent at the O'okiep mine, and 567,000 tons averaging 2.18 percent at the Narrap mine. The company owns a 90-mile narrow-gage railroad from the mines to the Atlantic coast at Port Nolloth. The above information, with flow-sheet diagrams and other details, appeared in the South African Mining and Engineering Journal.[32]

U. S. S. R.—The output of copper during the first 5 months of 1940 was 35 percent ahead of the same period in 1939, although operations are still relatively inefficient, according to an editorial in the Moscow Industriya of June 20, 1940.[33] Efforts of the U. S. S. R. not only to become self-sufficient in regard to copper but to produce a large exportable surplus have thus far fallen short of plans. The Central Urals copper smelter at Revda (25 miles west of Sverdlovsk) began operations in 1940 but is not expected to be working at full capacity until 1942, when it alone is supposed to produce one and one-half times as much crude metal as all the smelters in Russia as of 1913. Ore supplies will be drawn from the Degtyarsk pyrites deposits, which are estimated to contain about half the total Urals copper reserve.[34] In Central Kazakhstan during 1940 a flotation mill to produce tens of thousands of tons of copper concentrates a year was constructed, and the Karsakpai mill was rebuilt. Both these mills treat ore from the Jezkazgan mines, which have a capacity ranging from 400,000 to 1,200,000 metric tons of ore yearly. Operations were expanded at the Balkhash and Irtysh flotation mills, which treat ore from the Kounrad mines.[35]

United Kingdom.—Supplies of copper in the United Kingdom during 1940 equaled the requirements of the national war effort, and a certain amount of copper appears to have been available for the manufacture of exportable products, such as copper sheets.[36] For example, about 338,000 pounds of copper, brass, and bronze manufactures were exported to Burma in 1940. It is estimated that about 800,000 metric

tons of copper were shipped to the United Kingdom during 1940—370,000 tons from Northern Rhodesia, 250,000 from Canada, 74,000 from the United States, 50,000 reshipped from France, 24,000 from Cyprus, 20,000 from the Belgian Congo, 10,000 from the Union of South Africa, 1,500 from South-West Africa, and 500 tons from Chile.[37] What proportion of this tonnage of copper reached Great Britain safely is not known. The outlook for 1941 is that the United Kingdom will count on increases of 100,000 metric tons from the Belgian Congo and of at least 10,000 tons from the Union of South Africa, where the reopened O'okiep mine will have swung into full production.

The Ministry of Supply in August 1940 began buying all the domestic secondary copper it could get. The prices paid were £53 for 97.25 percent Cu and £54 for 99 percent Cu.[38] In accordance with a 1939 control order, owners of stocks of virgin copper were asked to submit a report of such supplies to the Controller of Nonferrous Metals by July 22, 1940.[39] From the standpoint of consumption, the following commentary is interesting:[40]

> With reference to the expenditure of brass by aircraft in the form of spent cartridge cases, investigation shows that on the basis of the standard .303 small arms cartridge, which is used quite extensively in aircraft machine guns, one minute's full firing by a fighter aircraft with eight guns (9,600 rounds) results in some 240 pounds of cartridge cases being spread over the countryside or over the sea, and so irrecoverable. In bomber aircraft, however, the bulk of the cartridge cases are recovered, since they fall within the machine.

Yugoslavia.—Smelter production of copper in Yugoslavia increased 3 percent in 1940. The principal output is from the Bor mine, which was French-operated and sold its output to Allied countries until the capitulation of France in June 1940. From that time, German interests were given free access to the mine, but they had to arrange for shipments with the Yugoslav Metal and Ore Control Board until after the German invasion in April 1941.[41]

[37] These amounts were deduced as follows: Northern Rhodesia, total production from trade-journal estimate; Canada, 80 percent of trade-journal estimate of total output; United States, official figures of Bureau of Foreign and Domestic Commerce; France, estimate based on United States consular report of total reshipped to the United Kingdom, United States, and Morocco; Cyprus, official 1939 total production; Belgian Congo, United States consular report of exports for last half of 1940 (note—figure does not include any that might have been shipped in first half of 1940); Union of South Africa, official export figures; South-West Africa, official total production; Chile, official export figures.

LEAD [1]

By E. W. Pehrson and A. L. Ransome

SUMMARY OUTLINE

Reflecting in part the pressure of the national defense program, the domestic lead industry in 1940 scored moderate statistical gains over 1939. The output of refined primary lead from domestic and foreign ores was 10 percent above that in 1939 and the largest recorded since 1929. Production from domestic ores increased only 3 percent, but that from foreign ores and base bullion advanced 59 percent. The estimated industrial use of primary and secondary pig lead rose 17 percent, but the quantity used in 1940 was still 17 percent below the record established in 1929. As production failed to pace demand, year-end stocks of domestic refineries declined for the sixth consecutive year. Prices for lead were remarkably stable in view of world events. The average price at New York increased from 5.05 cents a pound in 1939 to 5.18 cents in 1940. The quotation at the beginning and end of 1940 was the same, despite the fact that domestic shipments in December were 42 percent greater than in January.

An unusual feature of the industry in 1940 was the record quantity of lead received from abroad. Imports of pig lead were more than four times those in the previous peak year 1920. The enormous receipts of metal resulted largely from disruption of normal trade caused by the war. For example, little Mexican lead was sent to European countries in 1940, whereas in previous recent years somewhat more than half of the total was shipped there. The United States received 128,680 short tons of refined metal from Mexico in 1940 compared with only 298 tons in 1939 and none in 1938, but receipts of Mexican bullion declined from 47,915 tons in 1939 to 19,009 in 1940. The drop in the latter category was more than offset by increased imports of ore and matte from other countries; the lead content of ore and matte, including that imported from Mexico, jumped to 111,300 tons in 1940 from 30,842 tons in 1939. Peru and Argentina shipped more lead ore to the United States in 1940, and ore was received in sizable tonnages from Newfoundland, Australia, and South Africa.

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For full details of mining operations, see separate reports issued for the various States.

Salient statistics of the lead industry in the United States, 1925–29 (average) and 1936–40, in short tons

	1925–29 (average)	1936	1937	1938	1939	1940
Production of refined primary lead:						
From domestic ores	660, 525	387, 698	443, 142	331, 964	420, 967	433, 065
From foreign ores and base bullion	123, 104	11, 458	24, 175	51, 705	63, 068	100, 114
	783, 629	399, 156	467, 317	383, 669	484, 035	533, 179
Recovery of secondary lead	280, 000	262, 900	275, 100	224, 900	241, 500	260, 300
Imports: [1]						
Lead in pigs, bars, and old	4, 592	2, 590	4, 903	3, 235	7, 139	151, 568
Lead in base bullion	95, 747	312	1, 800	15, 296	48, 902	19, 624
Lead in ore	40, 096	20, 713	34, 103	45, 370	30, 842	111, 300
Exports of refined pig lead	98, 048	18, 313	20, 091	45, 866	74, 392	[2] 49, 079
Lead remaining in bonded warehouses at end of period	136, 969	35, 331	60, 131	87, 811	79, 215	211, 826
Refined primary lead available for consumption	690, 916	383, 433	449, 464	339, 708	415, 031	633, 989
Estimated consumption of primary and secondary lead	900, 250	633, 550	678, 700	546, 000	667, 000	782, 000
Prices:						
New York:						
Average for year cents per pound	7. 47	4. 71	6. 01	4. 74	5. 05	5. 18
Quotation at end of year do	6. 25	6. 03	4. 75	4. 85	5. 50	5. 50
London average do	5. 87	3. 91	5. 15	3. 33	[3] 3. 09	[4]
Mine production of recoverable lead	664, 230	372, 919	464, 892	369, 726	413, 979	457, 392
World smelter production of lead	1, 850, 000	1, 629, 000	1, 851, 000	1, 878, 000	1, 919, 000	[5]

[1] Data include lead imported for immediate consumption plus material entering the country under bond.
[2] Includes 25,324 tons of foreign refined lead reexported, according to the American Bureau of Metal Statistics; official figures not available.
[3] Average for 8 months; London Metal Exchange dealings suspended for duration of war.
[4] Official maximum price fixed by British Ministry of Supply at £25 per long ton.
[5] Data not yet available.

Because exports were much lower in 1940 than in 1939, a large quantity of foreign lead accumulated in bonded warehouses during the year. Although this growing inventory had a restraining effect pricewise, the tonnage on hand at the end of 1940 provided a reservoir from which the increased requirements anticipated for 1941 could be obtained with assurance.

Figure 1 shows trends in the domestic lead industry since 1900.

Events outside the United States were obscured by censorship. According to trade estimates, world production declined about 1 percent; substantial decreases in Mexico, Belgium, France, and Italy largely were almost offset by advances in the United States, Canada, Germany, Spain, India, and Australia. The British Empire increased its output 11 percent, whereas Reich-dominated continental Europe suffered a 12-percent decline. World consumption also is estimated to have declined about 1 percent, with decreases assigned to many countries, including the United Kingdom and Germany. The increase in lead consumption in the United States was outstanding.

National defense activities.—Except for ammunition, very little lead is used directly in the manufacture of armament. There are, of course, several important secondary or indirect uses, such as lead for storage batteries and bearing metals employed in motorized equipment, lead paints for military structures, chemical lead for the construction of explosive plants, and tetraethyl lead employed in making high-octane gasoline, but the defense program affected none of these as it did copper and zinc, with the sharply increased demand for brass, aluminum, and magnesium vital to the expanding airplane schedule. Consequently there was little concern as to lead supplies during 1940, whereas acute shortages of copper, zinc, aluminum, and magnesium were in sight before the year closed.

Because of this situation, only nominal surveillance over the lead industry was necessary by the Industrial Materials Division of the Advisory Commission to the Council of National Defense in 1940, and early in 1941 by the Production Division of the Office of Production Management. The Price Stabilization Division of the Advisory Commission was more active. On September 27, 1940, a series of advances in nonferrous metal prices prompted Leon Henderson, the commissioner directing the price group, to warn the copper, lead, and zinc industries that Government action to control prices would be invoked

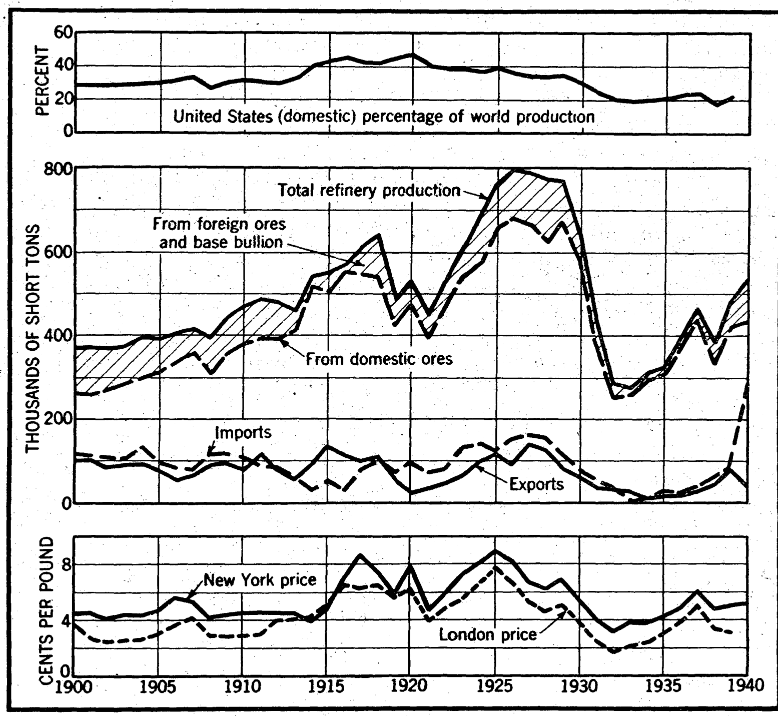

FIGURE 1.—Trends in the lead industry in the United States, 1900–1940. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap lead exported in manufactures with benefit of drawback.

"if the apparently artificial price-supply-demand pressure continues." This announcement halted the upward trend in copper and zinc quotations, but lead prices rose much higher in the succeeding months. Again, on April 5, 1941, the commissioner threatened ceiling prices on lead if the advances (two in March) were not checked. Up to the time this was written (June 20) no further increases had occurred.

In the early months of 1941, consumption of lead was expanding rapidly as the defense industries began requiring more lead products and as nondefense industries turned to lead and its alloys as substitutes for the scarcer metals. To conserve supplies and to prevent lead from getting into unfriendly hands, the metal was placed under export control as of March 24, 1941. Thereafter shipments of lead—

including ore, matte, pigs, bars, and lead manufactures—to foreign countries could be made only under Government license. Export control was extended to the lead pigments on May 6.

On May 1, 1941, the Director of Priorities of the Office of Production Management issued General Metals Order No. 1 establishing inventory control of 16 metals and alloys, including lead. This order was designed to prevent the accumulation of excess stocks and required manufacturers to keep inventories down to the minimum necessary to assure efficient operations.

DOMESTIC PRODUCTION

Pig lead is produced at primary plants that treat mainly ore and at secondary plants that treat scrap exclusively. Both types of plants may produce refined lead or antimonial lead. Because of the large quantity of battery scrap treated at secondary smelters, their output comprises antimonial-lead alloys chiefly. Figures for production of refined lead at secondary plants previously given under this heading were in error because they included substantial quantities of antimonial lead. The canvass of secondary producers was revised in 1939, and a more accurate classification of product has been developed. These data are shown in a succeeding table.

The following table shows the production of refined lead and antimonial lead at primary refineries from 1936 to 1940.

Refined and antimonial lead produced at primary refineries in the United States, 1936–40, in short tons

Year	Refined lead				Antimonial lead
	From domestic ores and base bullion	From foreign ores and base bullion	From scrap	Total	
1936	387,698	11,458	34,556	433,712	23,230
1937	443,142	24,175	29,986	497,303	27,524
1938	331,964	51,705	24,800	408,469	24,123
1939	420,967	63,068	29,011	513,046	21,995
1940	433,065	100,114	16,588	549,767	29,762

PRIMARY LEAD

Refinery production.—Production of refined primary lead increased 10 percent in 1940 but was only 68 percent of the 1925–29 average (783,629 short tons). Output from domestic ores and base bullion increased 3 percent and that from foreign ores and base bullion increased 59 percent in 1940. The production from foreign materials was the largest since 1929 and represented 81 percent of the 1925–29 average (123,104 short tons); it comprised 19 percent of the total output of refined primary lead.

Refined primary lead produced in the United States, 1936–40

Year	Production by— Classes (short tons): Desilverized lead [1] [2]	Soft lead [3]: Desilverized	Soft lead [3]: Undesilverized	Total production [1]	Sources (short tons): From domestic ores and base bullion	From foreign ores	From foreign base bullion	Value: Average per pound	Value: Total
1936	239,944	47,462	111,750	399,156	387,698	11,401	57	$0.046	$36,722,000
1937	272,051	55,317	139,949	467,317	443,142	23,393	782	.059	55,143,000
1938	243,891	31,986	107,792	383,669	331,964	32,862	18,843	.046	35,298,000
1939	280,356	65,349	138,330	484,035	420,967	24,652	38,416	.047	45,499,000
1940	336,456	43,400	153,323	533,179	433,065	83,563	16,551	.050	53,318,000

[1] The lead content of antimonial lead is excluded. [2] Desilverized soft lead is excluded.
[3] Includes lead derived from Missouri ores and other nonargentiferous ores.

Sources of primary lead.—Of the total refined primary lead produced in 1940, 81 percent was derived from domestic ores and 19 percent from foreign material. Production from foreign ores increased 239 percent to reach an all-time high. Refining of foreign bullion declined 57 percent in 1940. Details of the sources of lead from domestic ores are given in the section on Mine Production.

Refined primary lead produced in the United States, 1936–40, by sources, in short tons

Source	1936	1937	1938	1939	1940
Domestic ore	387,698	443,142	331,964	420,967	433,065
Foreign ore:

Other foreign			575	944	390
	57	782	18,843	38,416	16,551
Total foreign	11,458	24.175	51,705	63,068	100,114
Grand total	329.156	467,317	383,669	484,035	533,179

Antimonial lead.—Antimonial or hard lead is an important byproduct of the refining of base bullion, but the quantity derived from this source is only a small part of the country's yearly production. The major part is obtained from the smelting of antimonial lead scrap, and some is produced by mixing metallic antimony with refined soft lead.

Several lead-smelting plants handle scrap materials exclusively. Production data from such plants are summarized in the following section and discussed in detail in the chapter on Secondary Metals—Nonferrous. A large quantity of hard-lead scrap also is treated at primary smelters and refineries; the production of antimonial lead at these plants is shown in the following table.

Antimonial lead produced at primary lead refineries, 1936–40

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total
1936	23,230	2,162	9.3	7,442	696	12,930	21,068
1937	27,524	2,579	9.4	7,833	1,721	15,391	24,945
1938	24,123	2,809	11.6	6,759	3,385	11,170	21,314
1939	21,995	2,031	9.2	4,117	3,189	12,658	19,964
1940	29,762	2,944	9.9	7,364	3,023	16,431	26,818

SECONDARY LEAD

As previously stated, some scrap lead is treated at primary plants but the greater part is refined at a large number of plants that operate exclusively on secondary materials. Secondary lead is recovered in the form of refined lead, antimonial lead, other alloys, and chemicals. Recovery at primary and other plants in 1939 and 1940 is shown in the following table. Total secondary lead recovered in 1940 was 8 percent greater than in 1939 and was equivalent to 60 percent of the domestic refined primary lead output. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary lead recovered in the United States, 1939 and 1940, in short tons

Lead content recovered	1939	1940
As refined metal:		
At primary plants	29,011	16,588
At other plants	57.889	42,992
	86,900	59,580
In antimonial lead:		
At primary plants	12,658	16,431
At other plants	100,392	110,256
	113,050	126,687
In other alloys [1]	41,550	74,079
Grand total	241,500	260,346
Value	$22,701,000	$26,034,600

[1] Includes some lead in chemical compounds.

LEAD PIGMENTS

Lead pigments manufactured in 1940 contained 213,104 tons of lead—a 1-percent decrease from 1939. Of this total, 196,235 tons were derived from refined pig lead; litharge comprised 43 percent, white lead 35 percent, red lead 20 percent, sublimed lead and orange mineral 1 percent, and leaded zinc oxide 1 percent. Leaded zinc oxide and sublimed lead are the principal pigments in which the lead content is derived from ores. Details of the production and consumption of lead pigments are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

Lead in pigments, 1936–40, by sources, in short tons [1]

Year	Lead in pigments from— Domestic ore [2]	Metal	Scrap	Total	Year	Lead in pigments from— Domestic ore [2]	Metal	Scrap	Total
1936	15,062	204,997	37	220,096	1939	15,171	200,390	--------	215,561
1937	17,363	204,961	127	222,451	1940	16,869	196,235	--------	213,104
1938	12,025	163,815	--------	175,840					

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] No pigments from foreign ore.

MINE PRODUCTION

The output of recoverable lead from domestic mines in 1940 increased 10 percent over that in 1939. Lead from the Western States and Alaska increased 35,760 tons in 1940 and from the Central States 9,106 tons; but lead from the Eastern States continued to decline, the decrease amounting to 1,453 tons. Lead production from Southeastern Missouri rose 16,386 tons (11 percent) in 1940, whereas the output from Oklahoma and Kansas declined 23 and 13 percent, respectively, from the 1939 figures. Idaho continued to be the leading producer in the Western States group, followed by Utah and Montana. All of the principal producing States in the western group showed increases; the total for all States (including Alaska) advanced 17 percent. Idaho, the second largest lead-producing State in the United States, increased 15 percent in output over 1939; nearly 92 percent of the State total was recovered from zinc-lead ores. Utah increased its output 12 percent; three districts—Bingham, Park City, and Tintic—together produced 85 percent of the recoverable lead output of the State. The first two districts increased and the Tintic district decreased.

Lead from Montana increased 39 percent in 1940 to a total of 23,036 tons of recoverable metal—the largest output of lead in the history of the State. Most of the gain was in increased production from the lead-zinc properties of the Anaconda Copper Mining Co. at Butte, but gains were also reported from the Jack Waite mine in Sanders County, the Flathead mine in the Hog Heaven district, the Comet-Gray group in Jefferson County, the slag-fuming plant at East Helena, and the Hecla tailing dump in Beaverhead County. Production of lead in Arizona increased 23 percent; the largest lead-producing mine is the Trench near Patagonia. In Colorado, lead was produced in nearly all the lode-mining counties, and the total output increased 40 percent over 1939. Production in Nevada, chiefly from zinc-lead ore from the Pioche district and from dry and siliceous ores mined throughout the State, increased 77 percent. Lead from New Mexico declined 29 percent owing to closing of the Pecos mine in May 1939. Gains in output from Grant County were insufficient to offset the loss. The largest lead producer in New Mexico during 1940 was the Ground Hog mine of the American Smelting & Refining Co. near Hanover, Grant County. A decrease of 31 percent in lead production in Washington was noted for 1940; three properties at Metaline Falls produced nearly all the recoverable lead output of the State. Additional details of production by mines, districts, and States can be found in the State chapters.

Mine production of recoverable lead in the United States, 1925–29 (average) and 1936–40, in short tons

[2] Total for Virginia but almost entirely from Austinville district.

STOCKS

Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by most refiners of secondary material who produce common lead. Foreign lead refined in the United States and entered for domestic consumption is included.

Lead stocks at end of year at smelters and refineries in the United States, 1936–40, in short tons

	1936	1937	1938	1939	1940
Refined pig lead	165,159	119,837	102,489	52,783	32,458
Antimonial lead	6,697	9,294	13,413	5,994	8,468
	171,856	129,131	115,902	58,777	40,926
Lead in base bullion:					
At smelters and refineries	9,187	10,959	18,693	10,337	9,166
In transit to refineries	1,070	2,219	2,339	3,521	3,457
In process at refineries	14,100	14,413	16,690	15,958	18,141
	24,357	27,591	37,722	29,816	30,764
Lead in ore and matte and in process at smelters	50,098	52,081	56,332	59,486	71,722
	246,311	208,803	209,956	148,079	143,412

During the first quarter of 1940, the excess of output over shipments resulted in increasing inventories. Stocks of refined and antimonial lead at refineries, which totaled 58,800 tons at the end of 1939, rose to 74,700 tons by the end of March—the peak for the year. Accelerated demand thereafter (largely as a result of intensification of the national defense program) resulted in a steady monthly decline in stocks until at the end of October they reached the lowest point of the year—35,400 tons. In November, a virtual balance was reached between production and shipments, and at the end of the month stocks were slightly higher than at the beginning. During December production increased over shipments, but refinery inventories (which rose to 40,900 tons at the end of the year) were only 70 percent of those on hand at the end of 1939. Stocks of lead in ore and matte and in process at smelters, and base bullion at smelters and refineries, in transit to refineries, and in process at refineries, were 15 percent higher at the end than at the beginning of the year.

DOMESTIC CONSUMPTION

New supply.—The following table shows the refined primary lead available for consumption from 1936 to 1940. The figures do not consider variation in producers' stocks, and as these have changed considerably during the past 5 years the quantities stated do not indicate the true trend in actual consumption of new lead. The supply available for consumption in 1940 was 53 percent higher than in 1939 and was equivalent to 92 percent of the 1925–29 average (690,916 tons). Although domestic production of refined pig lead from both foreign and domestic ores increased 10 percent and exports (including reexports of foreign refined lead amounting to 25,324 short tons) declined 34 percent, the greatest factor contributing to the larger available supply was the great increase in imports, which is directly attributable to diversion to the United States of metal formerly shipped to foreign markets now closed by blockade.

Refined primary pig lead for consumption in the United States, 1936–40, in short tons

	1936	1937	1938	1939	1940
Supply:					
Imports	[1] 2,590	2,238	1,905	5,388	149,889
Production	399,156	467,317	383,669	484,035	533,179
	401,746	469,555	385,574	489,423	683,068
Withdrawn: Exports	18,313	20,091	[2] 45,866	74,392	[3] 49,079
Supply available for consumption	383,433	449,464	339,708	415,031	633,989

[1] Includes small quantities of old, reclaimed, and scrap lead.
[2] Includes a small quantity, not separable, of "sheets."
[3] Includes 25,324 tons of foreign refined lead reexported, according to the American Bureau of Metal Statistics; official figures not available.

Consumption by uses.—Owing to the return of large quantities of secondary lead in discarded and obsolete articles and from the lead-consuming industries, the total consumption of pig lead greatly exceeds the supply of new lead available. The following table gives the American Bureau of Metal Statistics estimate of the total consumption of lead by industries, 1936–40.

Lead consumed in the United States, 1936–40, in short tons [1]

Purpose	1936	1937	1938	1939	1940
White lead	85,500	86,000	71,000	75,000	65,500
Red lead and litharge	54,000	57,000	43,000	57,200	59,400
Storage batteries	191,000	192,000	167,000	198,000	220,200
Cable covering	61,400	90,000	60,000	74,400	107,400
Building	40,000	45,000	36,000	50,000	65,000
Automobiles	11,100	12,000	6,000	8,900	11,000
Ammunition	32,500	39,500	31,200	42,300	56,000
Terneplate	6,200	6,400	4,300	6,000	6,000
Foil	28,500	21,700	22,000	21,800	23,500
Bearing metal	16,500	15,000	9,000	12,800	14,000
Solder	22,000	22,000	15,000	20,000	24,000
Type metal	17,000	17,000	12,000	14,000	16,800
Calking	13,500	15,000	12,000	16,000	19,200
Castings	5,750	6,000	6,000	7,500	9,000
Other uses	48,600	54,100	51,500	63,100	85,000
	633,550	678,700	546,000	667,000	782,000

[1] American Bureau of Metal Statistics. These estimates are for total consumption of lead, irrespective of whether its origin is primary or secondary. Antimonial lead is included.

Consumption of lead in the United States during 1940 was 17 percent above 1939 and 17 percent below the record established in 1929. The principal use of lead is in the manufacture of storage batteries, and in recent years requirements of lead for that purpose have averaged approximately 30 percent of the total. Consumption of lead in storage batteries during 1940 reached an all-time high, having exceeded (by a slight margin) the record total of 220,000 tons in 1928. The 1940 figure indicates that the registration of motor vehicles was the largest on record. Lead withdrawn from use in storage batteries noticeably curtails the need for newly mined metal, as it rapidly returns to the trade in the form of scrap and there competes with the primary market. Second place in uses for lead has been divided about equally between white lead and cable covering during the past 20 years. For 3 of the last 5 years, white lead took second place over cable covering; in 1939, by a very slight margin; in 1940, the amount of lead consumed for this purpose declined 12.7 percent, whereas that for cable covering increased 44 percent to the highest total since 1931. Of the total amount of lead used during 1940, that required for white lead was 8 percent and for cable covering 14 percent compared with 11 percent for each in 1939. This increase in cable covering, which reflects especially an increased use for telephones, is encouraging, as the failure of the utility industry to purchase its proportionate share of the total lead requirements of the country for several years has been a depressing influence on the lead industry. The building industry has also lagged behind most others with respect to consumption of lead but has been on the upgrade in recent years and used 30 percent more lead in 1940 than in 1939; nevertheless, the quantity was 32 percent below the total for 1929.

Red lead and litharge—exclusive of quantities used in storage batteries—consumed nearly 8 percent of the total lead used in 1940 and 98 percent more than the quantity used for this purpose in 1929. Ammunition (usually among the smaller uses for lead) took 32 percent more lead in 1940 than in 1939 and amounted to a little more than 7 percent of the total. The increase in this use is due principally to the expanded ammunition-manufacturing program, largely for export. It was one of the four uses indicated by the foregoing table to have been higher in 1940 than in 1929, having been 36 percent larger than in that year. The large increase of "other uses" can be ascribed chiefly to the consumption of lead in the manufacture of tetraethyl lead for tempering gasoline; greater amounts of this fuel were produced in 1940.

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced in this country is sold at prices based upon quotations in these markets. As the New York quotations are influenced to some extent by the lower prices usually prevailing on the London market, the New York price seldom exceeds the St. Louis price by as much as the freight difference, which normally is 0.35 cent a pound.

Again, as in 1939, the average prices for lead fluctuated less during 1940 than those for the other common nonferrous metals in spite of the abnormal conditions of world trade plus a large and growing domestic demand for the metal. The price for pig lead at New York, outside market, at the beginning of the year was 5.50 cents a pound. The pressure of unusually large supplies of foreign metal had a depressing effect on the domestic market, and the price declined to the low point of 4.75 cents in August. Thereafter the trend was reversed, and early in November, quotations reached 5.80 cents but declined again to 5.50 cents, where they remained throughout December.

In the early months of 1940, production of refined lead exceeded shipments, and stocks rose until the end of March. Excess of shipments thereafter caused a steady decline in stocks until November, when a virtual balance was reached between production and shipments. During December, production exceeded shipments, and stocks rose slightly. The average price for 1940 was 5.18 cents compared with 5.05 cents in 1939 and 4.74 cents in 1938.

Quotations on the London Metal Exchange were discontinued at the outbreak of the war in September 1939. In September 1939 it was announced that the British Ministry of Supply had established the maximum price of Empire lead at £17 per long ton ex ship, and of foreign lead at £16 12s. 6d. ex ship. In December (1939) control prices for Empire and foreign lead were raised to £25 per long ton, duty paid, delivered. There was no reported change from this figure during 1940.

Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1938–40, in cents per pound [1]

Month	1938			1939			1940

New York: American Metal Market, daily issues. Pig lead, New York (outside market), prompt shipment from West.
London: Metal Statistics, 1941, p. 469. Average price of foreign lead. Price per long ton, as published in Metal Statistics, converted to cents per pound at average exchange rate reported by the Federal Reserve Board.
[2] London Metal Exchange dealings suspended for duration of war. Official maximum price fixed by British Ministry of Supply at £25.
[3] London quotations in pounds sterling per long ton, as follows: 1938, £15.2667; 1939 (8 months), £14.7083.
[4] Average for 8 months; comparable average for New York was 4.83 cents.

FOREIGN TRADE [2]

Most significant during 1940 was the sharp increase in imports of lead in ore, matte, and pigs and bars, amounting to 592 percent. In consequence of the inability of foreign producers of lead ore and metal to find markets outside of this country, the United States has virtually become the metallurgical center of the world with respect to custom smelting. To many foreign producers, the United States was the only market available for their products. Exports of pig lead from the United States, although 68 percent less than in 1939, still supplied the total consumption of some countries.

Imports.—Several notable features characterize the large increase in total imports of lead in 1940. Mexico, for years the principal source of unrefined lead imports, contributed 53 percent of the total tonnage imported in 1940, principally in the form of pigs, bars, and old scrap amounting to 85 percent of the total of that category, which total showed a tremendous increase over 1939. Lead imported in base bullion, of which Mexico also supplies almost the entire amount, declined 60 percent in 1940. The greater part of the total Mexican imports remained in warehouses under bond at the close of 1940. The total tonnage of lead imported in the form of ore and matte rose 261 percent in 1940, all countries showing an increase except Mexico. This increase was credited chiefly to Newfoundland and Labrador, Peru, Australia, and Argentina, nations (with the exception of Peru) which, before 1940, had shipped their entire output to European plants now cut off because of the war.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Total lead imported into the United States, 1936–40, by classes, in short tons [1]

Year	Lead in ore and matte	Lead in base bullion	Pigs, bars, and old	Total lead content
1936	20,713	312	2,590	23,615
1937	34,103	1,800	4,903	40,806
1938	45,370	15,296	3,235	63,901
1939	30,842	48,902	7,139	86,883
1940	111,300	19,624	151,568	282,492

[1] Data include lead imported for immediate consumption plus material entering the country under bond.

Total lead imported into the United States, in ore, base bullion, and refined, 1936–40, by countries, in short tons [1]

Year	Canada	Mexico	New-found-land	South America	Europe	Other countries	Total
1936	1,692	10,501	3,955	[2] 6,861	341	265	23,615

Exports.—Significant during 1940 were the decreases in exports of pig lead to Europe and to Asia, principally Japan. These factors are largely responsible for the 68-percent decline from 1939, although exports to South American countries, particularly to Brazil, increased. Exports to the United Kingdom declined from 9,411 tons in 1939 to almost nothing, largely because an adequate supply was available from British sources. Exports to Mexico continued to decline, being almost nil in 1940 due in large part to increased refining of bullion in that country.

[1] Includes sheets and pipes; figures not separable.
[2] In addition, 25,324 tons of foreign lead were reexported, according to American Bureau of Metal Statistics; official figures not available.
[3] Less than 1 ton.

WORLD ASPECTS OF LEAD INDUSTRY

World production.—Lack of production data from the British Empire and other important producers of lead precludes an official statement of world output in 1940. The Metal Bulletin, London, estimates world smelter production at 1,700,000 metric tons—a slight decline from the 1,723,000 tons reported for 1939 by the American Bureau of Metal Statistics. The Bureau of Mines estimate for 1939 is 1,741,000 tons. The Metal Bulletin records substantial increases in the United States, Canada, Germany, Spain, India, and Australia, whereas declines are noted for Mexico, Belgium, France, and Italy. The British Empire contributed 34 percent of the estimated 1940 total and increased its production 11 percent over that of 1939. Continental Europe, now under German domination, exclusive of the U. S. S. R. and Spain, produced 20 percent of the world total and suffered a 12-percent decline in output.

World production of lead, 1936–40, in metric tons [1]

[1] By countries where smelted, but not necessarily refined.
[2] Data not yet available.
[3] Approximate production.
[4] Estimate included in total.
[5] Exclusive of secondary material (Metallgesellschaft, Frankfort on the Main).
[6] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.

The last reported world figure for lead in ore production was 1,772,334 metric tons in 1938, as given by the American Bureau of Metal Statistics. The only available total for 1940 is for South America, which produced 89,715 metric tons, according to the American Bureau of Metal Statistics. This output was just under the 1939 total of 90,902 tons and compares with 95,891 tons for 1938, as reported from the same source. Peru and Argentina were the principal producing countries, with outputs of 46,253 and 30,300 metric tons, respectively. The total for North America is unavailable, due to absence of Canadian statistics, but a slight increase over 1939 is indicated; mine production increased in the United States but declined in Mexico. Incomplete data for the Western Hemisphere indicate little change in 1940 from 1939.

World consumption.—For the same reasons as outlined under world production, the total consumption of lead in 1940, by countries, cannot be given. In 1938, the American Bureau of Metal Statistics reported the world consumption of lead as 1,638,100 metric tons. Estimates of world consumption for 1939 and 1940, given by the Metal Bulletin (London), amounted to 1,780,500 and 1,760,000 metric tons, respectively. Many countries consumed a smaller amount of lead in 1940 than in 1939, with the notable exception of the United States, which is the largest consumer of lead, followed by the United Kingdom and Germany. According to this authority, both of the latter countries showed a decline in consumption.

REVIEW BY COUNTRIES

As a preface to the world review, it is pertinent to call attention to the meagerness of published statistical data, particularly from countries outside of the Western Hemisphere. The war has affected communication of news concerning foreign operations, and censorship bans on production, import, and export figures add further restrictions.

Argentina.—Lead production in Argentina, though not large, has considerable commercial importance as it supplies domestic needs and there is a large surplus of lead concentrates for export. Because of the smelting facilities in Argentina, several thousand tons of high-grade lump galena ore are imported from Bolivia each year by local smelters. At the National Lead Co. smelter this lump ore is advantageously mixed with the flotation concentrates from the Aguilar district, Province of Jujuy. The Aguilar mining district 75 miles north of Jujuy comprises the Aguilar mine and six other groups of mining claims in the heart of the Aguilar Mountains covering a length of about 10 miles from north to south and a width of 3 to 4 miles. The known ore reserves containing 11 to 12 percent lead will last 12 years or more at the present rate of production. Among other known lead deposits in Argentina, the Largo Fontana deposit is the most important potentially. It is situated in the Territory of Chubut close to the Chilean border. A new 400-ton mill is being considered for construction at this property to treat ore averaging 6.25 percent lead, 7 percent zinc, and 20 grams of silver a ton.

During 1940, Argentina produced 40,275 metric tons of lead concentrates containing 30,300 tons of lead compared with 36,728 tons in 1939 containing 29,700 tons of lead. From January to September 1940, 2,888 metric tons of lead ore were imported, chiefly from Bolivia, compared with 3,211 tons for the same period in 1939. The National Lead Co. subsidiary smelter at Puerto Vilelas made about 90 percent of Argentina's primary lead, and although the total is not known it is estimated that in 1940 the production was above the 1939 figure of 14,150 metric tons. The concentrator recovers 80 percent of the lead as a 74-percent concentrate. The National Lead Co. has a lead-manufacturing plant in Argentina where most of the lead products consumed in the country are made.

Australia.—The mines at Broken Hill, Rosebery, and Mt. Isa all produced a greater amount of lead ore during 1940. Although figures relating to production are not available for 1940, the smelter output of lead has been estimated by the Metal Bulletin (London) to be 275,000 metric tons compared with 252,383 in 1939. The Broken Hill Associated Smelters Pty., Ltd., whose annual capacity for refined lead totals 203,000 long tons, agreed early in the war to sell 75 percent of its production to the British Ministry of Supply at £15 1s. 3d. a ton f. o. b. Port Pirie.

Belgium.—During the first part of 1940, the lead industry in Belgium was working at various degrees of capacity. Overpelt-Lommel was reported to have worked at only one-third capacity, while Campine was fairly well employed. A decline in the importation of ores owing to lack of ships and high freight rates caused the curtailment of production. Following the German invasion in May, the British blockade shut off all importation of sea-borne supplies, and production was reduced still more. Although no direct information has since been available, it has been estimated that the 1940 production totaled only 55,000 metric tons compared with 82,000 in 1939. The Germans issued a decree on July 9, calling for a census of the non-ferrous metal industry.

Bolivia.—Mine production of lead, derived principally from small mines in the La Quiaca region, amounted to 11,662 metric tons in 1940 (14,119 tons in 1939). A total of 23,636 tons of ore containing 11,663 tons of lead was exported during 1940. All concentrates are generally exported to smelters in Argentina, but during the past year ore containing 2,468 short tons of lead was shipped to the United States.

Brazil.—Numerous deposits of argentiferous galena are reported in the southern part of the State of São Paulo. A treatment plant at Palmital, planned for completion in 1940, was to have a capacity of 35 tons daily, with a production of 10 metric tons of refined lead and 50 kilograms of silver. During 1940, 296 metric tons of lead ore were exported.

Bulgaria.—Production from an ore deposit in the Rhodope Mountains containing 15 to 23 percent lead, 6 to 9 percent zinc, 0.4 to 0.7 percent copper, and 100 to 300 grams of silver a ton, by the Pirin Co.—a German-Bulgarian firm—was scheduled to begin at the end of 1940; no definite word has since been received. If development continues as planned, the annual capacity is expected to be 10,000 to 15,000 tons, chiefly lead, and the mine will be the leading producer in the country. There are no smelting facilities in Bulgaria, and all potential production will have to be reduced abroad. As of July 1940, ore reserves were estimated at 350,000 metric tons, visible and probable, with an additional 1,000,000 tons of possible ore.

Burma.—Following the outbreak of war the Burma Corporation contracted with the British Ministry of Supply for a large tonnage of lead, increased its sales in an expanding Indian market, and continued to supply considerable quantities to Japan. However, during the fiscal year 1940, exports of 72,824 long tons of lead represented a decline from the 82,366 tons exported during same period in 1938–39. For the fiscal year ended June 30, 1940, the Bawdwin mines produced 473,568 long tons of ore assaying 14.4 ounces of silver, 19.0 percent lead, 10.8 percent zinc, and 0.6 percent copper per ton. Improvements in operating costs and metallurgical efficiency enabled the corporation to mine ore of lower grade than when the original estimate of ore reserves was made. On June 30 the reserves were estimated at 3,411,200 tons assaying 15.7 ounces of silver, 20.4 percent lead, 12.6 percent zinc, and 0.9 percent copper per ton.

Canada.—Although data on the production of lead in Canada during 1940 are not available, all branches of the Canadian metal industry were operating at a rate never attained before. Lead production in Canada is derived mainly from the Sullivan silver-lead-zinc mine at Kimberley, British Columbia. Other sources include the Monarch silver-lead-zinc mines near Field, British Columbia, and the Mayo district, Yukon Territory. In Nova Scotia the Stirling lead-zinc mine was back in full production after a shut-down of several years. According to estimates of the Metal Bulletin (London), the smelter production of lead was 210,000 metric tons in 1940 compared with 177,865 tons in 1939.

China.—The Ching chen tzu lead mine in the Antung Province, South Manchuria, is reported to produce a concentrate averaging 40 to 50 percent lead, 400 grams of silver, 2 grams of gold, and 1 percent zinc per ton. The mine production of lead in China (including Hong Kong) is estimated to be 5,000 metric tons for 1940—a decline from 6,000 tons in 1939.

France.—After the fall of France in July 1940, no further data on lead have been available from that country. It is reported that the Germans seized 19,000 metric tons of lead stocks in September. Production for 1940 has been estimated at 20,000 tons, approximately half of the 1939 output.

Germany.—The German position with regard to lead is less satisfactory than with zinc. Immediately before the present war, it still relied on foreign ore (chiefly from Yugoslavia, Australia, and South-West Africa) for more than half its supply. The same conditions apply to imports of pig lead, which came from the United States, Mexico, Peru, Belgium, and Australia. Of these countries, Yugoslavia with ore supplies and Belgium with smelting capacity are now under German control, but for the most part German reliance for lead must now be placed on the territories of the old Reich, including Upper Silesia and the deposits in the Harz Mountains. Because production from domestic mines is inadequate for home needs, the drive for expansion of domestic production and restriction of use continued in 1940. Efforts are being made to develop an electric storage battery that will dispense with or reduce the need for lead and other metals. It is reported that some progress is being made which, if successful, would be significant because the large amount of lead needed for this use, particularly as an adjunct to war, would be released for other purposes.

Germany ranks as the third largest lead-consuming nation, following the United States and the United Kingdom; consumption for 1940 has been estimated at 250,000 metric tons. Production from Germany (and Austria) was reported to be 181,440 metric tons in 1939 and has been estimated at 200,000 tons for 1940.

Hong Kong.—Operations at the Lin Ma Hang mine, managed by the Hong Kong Mines, Ltd., were continuous during the first 6 months of 1940, and additional ore bodies were discovered; production increased. In June the smelter was almost completed and was expected to be in operation within a short time. Stocks of lead concentrate at the beginning of July 1940 amounted to 7,000 metric tons, of which 5,000 were sold to Great Britain.

Italy.—Information regarding lead in Italy is very meager for 1940. Although Italy is more nearly self-sufficient with regard to lead than most other metals, there are indications that this situation has not improved during 1940. Production during the past year has been estimated at 35,000 metric tons and consumption at 50,000 tons; for comparison, production for 1939 was reported to be 38,102 tons, whereas consumption for that year was estimated to be 52,000 tons.

Mexico.—Mine production of lead in Mexico during 1940 amounted to 196,250 metric tons, representing a considerable decrease from the 219,506 tons produced in 1939. Exports of lead in all forms in 1940 totaled 172,744 metric tons compared with 207,199 tons in 1939. Of this total, 135,724 tons (nearly 79 percent) were exported to the United States compared with approximately 50 percent in 1939.

A large percentage of the remainder accumulated as producers' stocks; there was no way to dispose of it in the European market.

Difficulties arising from labor problems at home and the war abroad beset Mexico during 1940. The American Smelting & Refining Co. closed its Matahuala refinery in the State of San Luis Potosi, the company asserting that such a move was imperative because of unprofitable operation.

Taxation underwent some changes in 1940; on October 21 the existing 12-percent export tax on lead was removed. On the other hand, the income tax on excess profits created at the end of 1939 and retroactive with respect to that year remained in effect during 1940.

The lead cartel formed in 1939 by the local smelter and major mining companies in the Chihuahua district was active in 1940. As the result of efforts to sustain production through the metal-price slump, the cartel was worked to the limit, but fewer contracts were made to purchase the lead production of small mines, and those in operation were run on a minimum price cancellation basis. Mineral production in the district was lower for 1940 than for any year since 1934.

Newfoundland.—In Newfoundland about 445,900 metric tons of ore were milled during 1940, providing 41,900 tons of lead concentrates containing approximately 23,900 tons of lead. In 1939 the comparable figures were 425,167, 37,332, and 21,223 tons, respectively. The Buchans Mining Co. installed two 33-foot air-lift flotation machines at this plant in 1940 to treat copper-lead flotation tailings.

Peru.—Mine production in Peru in 1940 totaled 46,253 metric tons—within a few tons of the 1939 total. Exports from Peru during 1940 included 5,430 tons of lead ore, 19,086 tons of concentrate, and 23,241 tons of pig lead compared with 8,998, 26,099, and 20,966 tons, respectively, in 1939. Peru's largest lead production is from the mines of the Cerro de Pasco Copper Corporation, and the Casapalca is the principal mine. Large reserves of ore have been developed in the Cerro de Pasco district that average 17 percent zinc and 6 percent lead a ton. The corporation is building a new 800-ton lead-zinc concentrator, to be ready in 1941. If production is maintained at the planned capacity the reserves would last 40 years. Next to the Casapalca mine, the largest producer of lead is the Huaron mine, 30 miles northwest of Cerro de Pasco in the district of Shelby. No estimates of the known ore reserves are available, but they are said to be adequate for several years at the present rate of production. Several important lead-zinc deposits are known in the southern part of Peru; when transport facilities are extended, these deposits may also become important producers. The Oroya lead smelter, operated by the corporation, is the only one in Peru; about half of the total ore produced is refined here. An increase in lead-smelting capacity is being contemplated.

Spain.—Little information is available regarding reconstruction of the Spanish lead industry following the conclusion of the Spanish Civil War in 1939. The sale of lead is under control of the Spanish Government, and stocks are reported to be negligible. In June 1940 production was reported to be 2,450 metric tons a month, and Italy and Germany were the principal purchasers. Few or no old mines are being reopened owing to the low price set by the Government for its own purchases. The production of lead in 1939 was estimated at 27,000 tons, and estimates from as low as 31,700 to as high as 56,500 tons have been given for 1940.

Sweden.—Early in 1940, Sweden, anticipating difficulties if Germany occupied Belgium and Holland, announced plans for developing domestic resources looking toward an annual production of 15,000 long tons of metallic lead. .

United Kingdom.—During 1940 the Ministry of Supply Nonferrous Metals Control drew all supplies of lead from Empire countries; these supplies have been adequate to meet reduced demands. Under normal conditions, the building industry is the main consumer of lead; but during 1940 only small amounts were used, owing to the cessation of private building. On the other hand, requirements of battery and cable makers are reported to have expanded. According to the Metal Bulletin, the production of lead in the United Kingdom declined from 11,000 metric tons in 1939 to an estimated 10,000 tons in 1940. The same authority has estimated the consumption of lead during 1940 to have been 350,000 metric tons—a decrease from 385,000 tons in 1939. Stocks of lead were increasing. This fact, coupled with the reduced level of consumption, is highly desirable from the strategic reserve point of view.

U. S. S. R.—Official statistical information concerning the lead industry, as of all metallic industries, in the U. S. S. R. is meager. It is reported, however, that the output of nonferrous metals is being pushed and that during 1940 new lead and zinc works, mines, and power stations were being built and developed in the Altai region. A new raw material base for the Chimkent lead works was reported under construction in South Kazakhstan. In Aral-Tan a new lead deposit is being exploited. The production of lead for 1940 has been variously estimated at 75,000 to 77,000 metric tons, which indicates that the output may be far short of the total necessary to fulfill the planned annual production of 134,000 tons to be reached by 1942.

Uruguay.—Minor deposits of lead occur in Uruguay in the Department of Lavalleja; the principal mine is that of Valencia, 6 miles from the railway station at Minas and 487 feet above sea level.

Yugoslavia.—Mine production in Yugoslavia in 1940 was reported to be 68,800 metric tons of lead in ore compared with 69,000 tons in 1939. Smelter production in 1940 is estimated as 14,000 tons compared with 10,624 in 1939. Trepca Mines, Ltd., continued operation successfully during the year and reported a large increase in profit over 1939. The lead smelter built by a subsidiary of Trepca has been in operation since December 21, 1939. Early in 1941, Yugoslavia fell under control of the German Government following armed occupation, and the effect on the lead industry has not yet been reported.

ZINC[1]

By E. W. Pehrson and A. L. Ransome

SUMMARY OUTLINE

The national defense program dominated the domestic zinc industry in 1940. In an endeavor to meet the unprecedented demand for metal for domestic defense and British orders, the smelting industry increased its output 33 percent over that in 1939 to a new high record and reduced its stocks 77 percent to the lowest year-end level experienced since 1925. The augmented supply, however, was inadequate to meet consumer requirements, and in consequence manufacturers' inventories of slab zinc declined substantially. The exceptionally heavy call for high-grade metal resulted in an 81-percent increase in output compared with a 9-percent gain for the lower grades. The demand for the special high-grade variety was particularly emphasized. At the close of 1940 smelters were operating near capacity, and additional capacity was being constructed and planned with vigor.

Domestic mines could not pace the advance in consumption. Mine output increased only 14 percent and was 14 percent below the record production of 1926. To maintain capacity operations, smelters turned to foreign ores, which were available in substantial tonnages at favorable prices because the British blockade prevented their shipment to the continental European smelters. Imports exceeded all previous records, and were sufficient to provide the second largest domestic output of zinc from foreign sources to date as well as a substantial increase in ore inventories at the smelters.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports. Some zinc ore is used directly in the manufacture of zinc pigments. (See chapter on Lead and Zinc Pigments and Zinc Salts.)

Salient statistics of the zinc industry in the United States, 1925–29 (average) and 1936–40

[1] Average for 8 months; London Metal Exchange dealings suspended in September.
[2] Data not available.

Prices responded to the rapid increase in demand. The quotation for Prime Western zinc at St. Louis was 5.75 cents a pound at the beginning of the year and 7.25 cents at the close and averaged 6.34 cents for the year compared with 5.12 cents in 1939 and 4.61 in 1938. During the closing months of 1940, the statistical position of zinc was such that under normal conditions official quotations probably would have moved to higher levels. Largely in deference to the Government's desire to avoid run-away markets that might precipitate a general increase in prices, official quotations were stabilized at 7.25 cents beginning September 24. On December 4, following complaints from Washington that the Commodity Exchange was facilitating trading in zinc at prices considerably above official market quotations, the exchange appointed a committee to examine the open market position; in consequence, the opening of new future positions for zinc was banned on and after March 4, 1941. Contracts for liquidation of open accounts as of that date were permitted.

Figure 1 shows trends in the domestic zinc industry since 1900.

National defense activity.—The German invasion of Belgium, Netherlands, and France gave considerable impetus to defense preparations in the United States. The various agencies created to administer the program are described in the chapter entitled Review of the Mineral Industries in 1940. In early summer, activities in minerals were confined largely to the strategic items, but as defense orders began to be translated into requirements for raw materials it became evident that bottlenecks were to be encountered elsewhere. By late summer zinc shortages were in sight, and during the last quarter of the year expansion of smelting capacity was being pushed vigorously. On October 28, 1940, John A. Church, consulting mining engineer of New York, was appointed consultant on zinc and copper to direct those activities of the Industrial Materials Department of the Advisory Commission to the Council of National Defense; later he occupied the same position with the Production Division of the Office of Production Management.

As the year progressed, shortages became more acute, and by the latter part of December individual producers were allocating supplies to customers. Imposition of Government priorities in deliveries was

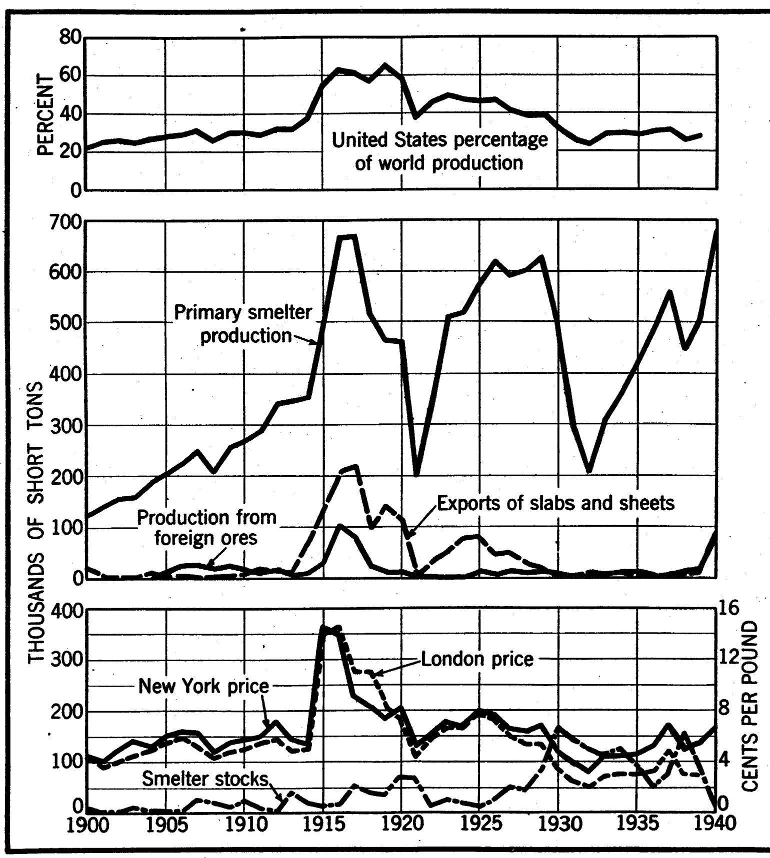

FIGURE 1.—Trends in the zinc industry in the United States, 1900–1940. Imports of slab and sheet zinc are not shown. Before 1936 they seldom exceeded 500 tons annually, but in recent years they have increased, amounting to 37,439 tons in 1937, 7,456 tons in 1938, 31,138 tons in 1939, and 10,164 tons in 1940.

suggested as early as November, but no positive action was taken until March 1941. On January 30, 1941, a Priorities Committee for Nonferrous Metals was established in the Priorities Division of the Office of Production Management. Exports of zinc ores, slab zinc, and manufactures of zinc were added to the list of commodities subject to export control on February 3. On February 20 the American Zinc Institute appointed a committee to coordinate supplies to consumers. These steps proved to be inadequate, as demand continued to exceed supplies and nondefense consumption of zinc was being curtailed. On March

7 the Office of Production Management requisitioned 5 percent of each producer's January output to create a pool from which shortages in defense industries in March could be relieved. Subsequently the pool requirements for May were increased to 17 percent of the March production and for June to 22 percent of April production. As of June 1, establishment of full priority control was imminent.

Smelting capacity.—In October 1940 the Bureau of Mines, at the request of the Advisory Commission to the Council of National Defense, surveyed zinc-smelting capacity and estimated production. The inquiry revealed that the maximum possible output at primary smelters in October would be at the annual rate of 754,000 short tons. By May 1941 the capacity would be increased to 789,000 tons and by August to 810,000 tons. Estimated production for 1941 at primary plants was 792,000 tons and at secondary smelters 33,000 tons, indicating a presumable total output of 825,000 tons. Subsequent extensions to plants have resulted in further increases in capacity. In April 1941, Young[2] estimated the domestic production of zinc from primary and secondary sources in 1941 as 880,000 to 890,000 tons, and in 1942 at 956,000 tons. Although it is impossible to forecast the requirements for 1941 and 1942 because of uncertainty regarding the magnitude of the defense program, this substantial expansion of smelting facilities apparently assures adequate zinc for all defense needs and an appreciable proportion of civilian requirements.

Supply of zinc concentrates.—As a result of a canvass conducted in January 1941, the Bureau of Mines forecast mine output for 1941 at 714,000 tons of recoverable zinc at current prices. It was estimated that smelters would require 830,000 tons and other industries using zinc ore 100,000 tons—a total of 930,000 tons of recoverable metal in ore. A deficit of 216,000 tons was thus revealed that would have to be obtained from sources other than current domestic production. A canvass of smelter ore inventories and available concentrates abroad indicated that ample supplies of zinc were available for 1941.

Smelter stocks of concentrates, as of February 28, 1941, totaled 377,000 tons containing 185,000 tons of recoverable zinc. The latter included 125,000 tons in domestic ores and 60,000 tons in foreign ores. In addition, the smelting industry had on order 288,000 tons of foreign ores, delivery of which was reasonably certain.

A survey of foreign sources indicated that these advance purchases of foreign ores constituted a large proportion of the more accessible supplies but only a relatively small part of the total obtainable from all sources. Information received by the Bureau of Mines indicated that over 270,000 tons of concentrates were potentially available from stocks in South America and Mexico and that an additional 300,000 tons annually over present commitments to other consumers could be sent from these areas to the United States. Very large tonnages likewise might be imported from the British Empire, so that if necessary a considerable further increase in domestic smelting capacity probably could be supported by foreign ores. This would require continued control of the seas by the British and American fleets and a more favorable shipping situation than now prevails. Doubtless higher prices would be required to move some of these ores at present ocean freight rates.

[2] Young, Howard I., Slab Zinc Review: Am. Zinc Inst., Ann. Convention, April 29, 1941; published in mimeographed form by that agency.

The foregoing résumé indicates that ample supplies of foreign concentrates are available if ships can be found to bring them to the United States. As of June 1, 1941, the outlook for adequate shipping facilities for this purpose was poor, and consideration was being given to methods for stimulating domestic mine production should such action become necessary.

The senior author [3] of this chapter discussed the zinc concentrate situation in detail at the annual convention of the American Zinc Institute.

DOMESTIC PRODUCTION

Production of primary and redistilled secondary slab zinc.—Production of primary slab zinc from both domestic and foreign ores in 1940 was the highest ever recorded, exceeding the previous peak of 1917 by 0.9 percent. It was 33 percent higher than in 1939 and 12 percent more than the average annual output in the 5 years 1925–29. Both domestic and foreign ores contributed to the increase, as production from the former advanced by 20 percent and that from the latter by 427 percent. The domestic output was the largest since 1929, and the quantity produced from foreign ores was exceeded only in 1916.

The production of redistilled secondary slab zinc dropped 3 percent. Figures for the output of remelted secondary slab zinc previously reported under this heading frequently have been in error on account of inadvertent duplication by reporting companies. In 1940, only 2,704 tons were recovered by remelting purchased scrap. Zinc rolling mills and other consumers recover much more than this from home scrap, but such metal normally does not enter the market. It is not measured statistically.

Primary and redistilled secondary slab zinc produced in the United States, 1936–40, in short tons

Year	Primary			Redistilled secondary	Total (excludes remelted)
	Domestic	Foreign [1]	Total		
1936	491,803	329	492,132	42,209	534,341
1937	551,165	5,739	556,904	51,554	608,458
1938	436,007	10,334	446,341	31,613	477,954
1939	491,058	16,178	507,236	50,428	557,664
1940	589,988	85,287	675,275	48,917	724,192

[1] All foreign zinc smelted in the United States in 1936 was derived from Mexican ores; in 1937–38, most of it originated in Peru; in 1939, in Mexico, Peru, and Argentina; and in 1940, principally in Mexico, Canada, Newfoundland, and Peru.

Distilled and electrolytic zinc.—Of the primary zinc produced in 1940, 72 percent was distilled and 28 percent electrolytic compared with 75 and 25 percent, respectively, in 1939.

Because of the importance of special high-grade zinc in the manufacture of munitions, producers were requested to report their output of it in 1940. The figures reveal the exceptional demand for metal of this grade. Statistics for 1939 are not available, but it is apparent that the major part of the tonnage increase for all grades was supplied

[3] Pehrson, E. W., Zinc Concentrates—the Available Supply at Home and Abroad: Am. Zinc Inst., Ann. Convention, April 29, 1941; published in mimeographed form by that agency.

by special high-grade zinc. Production of special and ordinary high-grade metal increased 81 percent compared with an increase of only 9 percent for all other grades.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1936–40, in short tons

APPORTIONED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled primary	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1936	127,175	364,957	22,142	20,067	534,341
1937	117,511	439,393	24,131	27,423	608,458
1938	93,272	353,069	14,003	17,610	477,954
1939	127,056	380,180	23,471	26,957	557,664
1940	187,040	488,235	20,003	28,914	724,192

APPORTIONED ACCORDING TO GRADE

Year	Grade A		Grade B (Intermediate)	Grades C and D (Brass Special and Selected)	Grade E (Prime Western)	Total
	Special high grade (99.99%Zn)	Ordinary				
1936	183,841		59,879	65,728	224,893	534,341
1937	196,052		67,132	72,993	272,281	608,458
1938	140,256		58,128	73,724	205,846	477,954
1939	162,345		66,591	86,274	242,454	557,664
1940	195,119	98,940	65,321	80,681	284,131	724,192

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

Production of primary slab zinc by States.—Pennsylvania continued to be the leading producer of primary slab zinc in the United States—a distinction it has held without interruption since 1934. Next in order of importance ranked Montana and Illinois, closely followed by Oklahoma; the last two States reversed their respective positions compared with 1939. All producing States made impressive gains, particularly Idaho, the West Virginia-Texas group, and Arkansas; these increased 103, 94, and 78 percent, respectively. Again, as in 1939, Montana and Idaho produced electrolytic zinc only, and the other States named produced distilled zinc only.

Primary slab zinc produced in the United States, by States, 1936–40, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Other States [1]	Total	
								Short tons	Value
1936	18,005	21,223	81,174	105,952	62,963	150,425	52,390	492,132	$49,213,000

1940	35,497	37,477	101,819	149,563	96,689	175,352	78,878	675,275	85,084,650

[1] Texas and West Virginia.

Secondary zinc.—In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab is produced and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the chapter on Secondary Metals—Nonferrous.

Byproduct sulfuric acid.—Sulfuric acid made from the sulfur dioxide gases produced in the roasting of zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of sulfur as well. The production of sulfuric acid at zinc blende roasting plants from 1935 to 1939, inclusive, is shown in the following table. Data for 1940 are not yet available.

Sulfuric acid (60° B. basis) made at zinc blende roasting plants in the United States, 1935–39 [1]

Year	Made from zinc blende		Made from sulfur		Total		
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Value [2]: Total	Value [2]: Average per ton
1935	[3] 443,476	$3,756,242	90,884	$769,787	534,360	$4,526,029	$8.47
1936	505,882	4,497,291	161,169	1,432,792	667,051	5,930,083	8.89
1937	[3] 542,356	5,060,181	151,090	1,409,670	693,446	6,469,851	9.33
1938	[3] 466,879	4,253,268	30,996	282,373	497,875	4,535,641	9.11
1939	[3] 528,872	4,765,137	102,663	924,993	631,535	5,690,130	9.01

[1] Figures for 1940 not yet available.
[2] At average of sales of 60° acid.
[3] Includes acid from small quantity of foreign blende.

Rolled zinc.—Contrary to general industrial trends, the production of rolled zinc declined 7 percent in 1940, but owing to advances in prices the average value increased 17 percent (from $0.086 a pound in 1939 to $0.101 in 1940). Some mills that manufacture their rolled zinc into various products, other than those shown in the accompanying table, remelt and reroll the resulting scrap. The scrap thus treated in 1940 was 10,183 tons—a 21-percent decrease from the 1939 figure. The zinc lost in such waste products as skimmings, dross, and pot losses totaled 1,500 tons in 1940—equivalent to about 2.6 percent of the net production of rolled zinc. Zinc purchased for rolling in 1940 comprised 41 percent Brass Special, 24 percent Electrolytic and Intermediate grades, 16 percent Prime Western, 14 percent High Grade, and 5 percent Selected. These figures compare with the 1939 figures of 39, 4, 24, 14, and 19 percent, respectively. This pronounced shift toward the use of higher grades of zinc in 1940 probably reflects the congested market conditions during the latter part of the year rather than technologic changes within the industry. Stocks of slab zinc on hand at zinc rolling mills were about 8,200 tons (revised figure) at the beginning and 5,700 tons at the end of the year.

Rolled zinc produced and quantity available for consumption in the United States, 1939–40

	1939			1940		
	Short tons	Value		Short tons	Value	
		Total	Average per pound		Total	Average per pound
Production:						
Sheet zinc not over 0.1 inch thick	15,599	$3,282,000	$0.105	21,415	$5,016,000	$0.117
Boiler plate and sheets over 0.1 inch thick	1,098	184,000	.084	1,904	363,000	.095
Strip and ribbon zinc [1]	45,185	7,148,000	.079	34,080	6,256,000	.092

Value of slab zinc (all grades)			.052			.063
Value added by rolling			.034			.038

[1] Figures represent net production. In addition, 12,916 tons of strip and ribbon zinc in 1939 and 10,183 tons of strip and ribbon zinc in 1940 were rerolled from scrap originating in fabricating plants operated in connection with zinc rolling mills.

Zinc dust.—Production of zinc dust in 1940 increased 23 percent over 1939 and was the largest on record. As in 1939, the zinc content of dust produced ranged from 94.0 to 98.5 percent and averaged 97.0 percent. Zinc dust is finding increasing markets in the chemical-manufacturing industry, chiefly as a reducing agent in the printing and dyeing of textiles. Another expanding use for zinc dust in this country is in the Schori process of metal spraying, by which a protective coating of zinc is applied to any surface. The increasing metallurgical use of zinc dust in the cyanide process by the gold mines of the Transvaal is shown by the higher export figure for this material from the United States, the chief source of supply during the past year.

Zinc dust [1] produced in the United States, 1936–40

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound

[1] All produced by distillation.

Zinc pigments and salts.—The principal zinc pigments are zinc oxide, leaded zinc oxide, and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinciferous materials—ores, metal, and secondary substances. Details of the production of zinc pigments and salts are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

Mine production.—Mine production increased 14 percent in 1940, owing to gains of 41 percent in the Western States and 6 percent in the Central States. Production from the Eastern States declined 1 percent. Tonnages advanced 70,141 tons in the Western States and 13,260 tons in the Central States, but decreased 2,140 tons in the Eastern States. New Jersey continued to be the leading producer among the Eastern States and maintained its rank as second in importance in the country. In the Eastern States gains in New Jersey and Tennessee did not offset decreases in New York and Virginia. The output of the Eastern States comprised 27 percent of the country's total in 1940.

All the Western States gained in production during 1940 and together produced 36 percent of the total domestic output. This gain can be attributed entirely to the favorable price of zinc. As in 1939, Idaho continued to be the largest producer in this region, with an output exceeding all previous records. Montana ranked second and Utah third. Notwithstanding the permanent closing of the Pecos mine in 1939, the New Mexico total still showed a slight increase in 1940. Arizona's production was the largest in the history of the State. The output from Washington increased 14 percent; it came from three properties at Metaline Falls. About 90 percent of the Nevada zinc production was recovered from ores in the Pioche district.

The Central States supplied 37 percent of the total domestic zinc produced in 1940. Production increased 6 percent over 1939 owing to increased demand and continued higher prices. Oklahoma (the principal zinc-producing State) showed an increased output, but production from the other two States of the Tri-State region—Kansas and Missouri—declined slightly. The Tri-State (or Joplin) region supplied 35 percent and the remaining Central States only 2 percent of the total domestic production.

Mine production of recoverable zinc in the United States, 1925–29 (average) and 1936–40, in short tons

[1] Virginia included with Tennessee for 1936–39. Bureau of Mines not a tliberty to publish separately.
[2] Includes a very small quantity produced elsewhere in the State.
[3] Bureau of Mines not at liberty to publish.

STOCKS

Producers' stocks.—Stocks of zinc at primary reduction plants fell 77 percent during 1940 and were the lowest on record since the end of 1925. Stocks at secondary distilling plants decreased 70 percent, and total stocks dwindled a little less than 77 percent. Of the total stocks on hand at the end of the year, 9,710 tons were of the higher grades of zinc (A and B) and 10,263 tons of the lower grades (C, D, and E) compared with 34,334 and 51,949 tons, respectively, at the end of 1939.

Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1936–40, in short tons

	1936	1937	1938	1939	1940
At primary reduction plants	55,500	79,144	157,511	83,728	19,212
At secondary distilling plants	626	1,969	1,915	2,555	761
	56,126	81,113	159,426	86,283	19,973

According to the American Zinc Institute, stocks of slab zinc increased moderately during the first quarter of 1940 and reached the peak for the year at the end of April. There was a gradual decline for the remainder of the second quarter, but throughout the balance of the year, as shipments to consumers increased, the decline continued at a more rapid pace so that the year-end figure was less than one-quarter of that at the beginning of 1940.

Stocks of zinc ore (60 percent concentrates) in the Tri-State district at the end of 1939 totaled 12,000 tons. During the first part of 1940, shipments greatly exceeded production, and stocks were reduced to 2,900 tons on March 2. This was followed by a fairly steady advance to a midyear high of 7,700 tons on June 22. A reduction to 5,100 tons on August 17 was followed by an increase to 8,200 tons on September 7. This cycle was repeated, with a low point on October 12 of 5,400 tons followed by a rise to 9,800 tons on November 16—the peak for the year. A subsequent sharp increase in shipments, accompanied by a fairly steady decline in production throughout the balance of November and December, caused a rapid depletion of stocks to 2,800 tons on December 28, with a continued drop to 1,200 tons on January 4, 1941. Thus, at the year-end period, stocks were at their lowest point for the year.

Data on stocks of metallic zinc outside the United States are not available for 1940 owing to the disruption of international trade in zinc ore caused by the war. A discussion of zinc concentrate stocks abroad is included in the introductory pages of this chapter.

Consumers' stocks.—In September 1940 the Bureau of Mines, at the request of the Advisory Commission to the Council of National Defense, made a telegraphic survey of consumers' stocks. The 132 companies cooperating in that canvass reported inventories of 94,400 tons on April 30 and 82,300 on September 21. This group also accounted for 90 percent of the inventories held by the 178 companies that reported on September 30. Applying this proportion to the April 30 inventory, stocks held at that time by the group of 178 companies may be estimated at nearly 105,000 tons. Data for July through October were obtained by a monthly mail canvass of the group of 178, but the canvass for November was expanded to include 304 companies, and figures for September and October have been revised upward to include the additional consumers. The April inventories were not strictly comparable with those of September, but a steady decline in each month except September was indicated. After September 30, inventories showed a rapid and continual decline throughout the remainder of the year and into 1941. By April 30, 1941, stocks declined 42 percent. Comparable stock totals for this period are summarized in the following table.

Consumers' stocks of slab zinc at month's end, September to December 1940 and January to April 1941, by industries, in short tons [1]

	Galvanizers	Die casters	Brass mills	Zinc rolling mills and oxide plants	Others	Total
1940:						
September	52,500	17,700	21,600	10,800	500	103,100
October	47,301	18,039	21,446	9,590	752	97,128
November	40,147	16,149	17,101	8,457	706	82,560
December	35,889	13,604	19,550	8,348	803	78,194
1941:						
January	34,947	13,046	14,834	7,051	762	70,640

March	31,941	8,740	14,592	8,295	862	64,430
April	29,665	6,830	15,719	6,344	856	59,414

[1] Based upon a canvass of approximately 300 companies.

DOMESTIC CONSUMPTION

New supply.—Establishing a new high record in 1940, the supply of new slab zinc available for consumption increased to 677,168 tons —a rise of 11 percent over the previous record of 1939 (607,464 tons) and of 23 percent over the 1925–29 average (548,472 tons). By comparison, supplies of copper, lead, and pig iron in 1940 increased 41, 59, and approximately 15 percent over 1939, respectively. As was the case in 1939, larger production from both domestic and foreign ores and a substantial reduction in producers' stocks during the year explained the record supply of zinc available in 1940.

In addition to primary zinc, redistilled secondary metal was available for consumption in 1940. Allowing for depletion of stocks at secondary smelters, the total supply to consumers aggregated 50,711 tons, which, added to the 677,168 tons of primary, gives a total of 727,879 tons of slab zinc available for consumption. Although over 6,000 tons of metal imported in 1940 did not enter domestic consumption in that year, actual consumption probably exceeded the foregoing calculation because of the decline in consumers' stocks. Incomplete data on stocks, as of January 1, 1940, indicate a possible depletion of 20,000 tons in consumers' inventories for the year.

Primary slab zinc available for consumption in the United States, 1936–40, in short tons

[1] General imports.
[2] Not separately recorded; estimated.

Industrial use of slab zinc.—The estimated industrial use of primary and secondary zinc, as calculated by the American Bureau of Metal Statistics, is shown in the following table:

Estimated industrial use of zinc in the United States, 1936–40, in short tons [1]

Purpose	1936	1937	1938	1939	1940
Galvanizing:					
Sheets	132,000	139,000	108,500	147,500	147,700
Tubes	36,000	37,000	29,300	43,300	51,200
Wire	30,000	33,000	23,600	33,000	33,900
Wire cloth	6,000	7,000	5,600	7,700	8,400
Shapes [2]	38,000	40,000	31,000	43,500	45,800
	242,000	256,000	198,000	275,000	287,000
Brass making	165,000	169,000	102,000	175,000	232,000
Rolled zinc	55,000	58,000	46,000	62,000	58,000
Die castings	72,000	88,000	48,000	84,000	116,000
Other uses [3]	48,000	39,000	27,000	30,000	26,000
	582,000	610,000	421,000	626,000	719,000

[1] American Bureau of Metal Statistics, Year Book, 1939.
[2] Includes pole-line hardware, hollow ware, chains, and all articles not elsewhere mentioned.
[3] Includes slab zinc used for manufacture of French oxide, zinc for wet batteries, slush castings, the desilverization of lead, wire for metalizing, etc., and sundries.

The quantity of zinc used by industry in 1940 as estimated by the American Bureau of Metal Statistics was 15 percent higher than in 1939 and 14.5 percent higher than the record amount established in 1929 (628,300 tons). All of the principal uses except rolled zinc increased in 1940—galvanizing 4 percent, brass making 33 percent, and die castings 38 percent; the largest use—galvanizing—took 40 percent of the total tonnage in 1940 compared with 44 percent in 1939. This item includes zinc used in electro-galvanizing and that used in sheradizing. The former increased from 5,740 tons in 1939 to 6,071 in 1940 and the latter from 511 tons to 618. Zinc used in rolled products in 1940 (1939 figures in parentheses) included 20,985 tons (21,670) in battery cans, 17,000 (20,000) in glass-jar tops, 1,000 (1,000) in automobile manufacture, 5,000 (5,000) in photoengraving sheet, 1,904 (1,100) in boiler plate, and 426 (340) in brake lining. The remaining tonnage was absorbed in miscellaneous other uses or was exported. The chief item in "other uses" is the slab zinc employed in making French-process zinc oxide, which totaled about 20,000 tons in 1940 compared with 17,000 in 1939.

PRICES

With the exception of a slight drop in January, the price of zinc remained unchanged during the first half of 1940 but advanced consistently during subsequent months to a high that remained constant for the last quarter of the year. During the early months of the year, the market was fairly stable but after the invasion of Norway and Belgium (both important zinc-producing countries) prices moved upward. At the beginning of the year the St. Louis price of Prime Western zinc was 5.75 cents; on January 19 it dropped to 5.50 cents, but on February 26 it rose again to 5.75 cents, where it remained until May 24, when the quotation reached 6.00 cents. As production failed to meet the rapidly expanding demand, stocks trended downward, and prices responded with a rise to 6.25 cents on June 3, to 6.50 cents on August 14, and to 6.85 cents on September 5. On September 23 the price reached a peak of 7.25 cents—apparently raised to this point by advance buying by consumers—and remained there for the remainder of the year. During the closing months of 1940, substantial premiums over official quotations were being paid in the open market for spot and future metal, but the tonnages available were relatively small. During this period the statistical position of zinc was such that under normal conditions official quotations probably would have moved higher. Largely in deference to the desire of the Advisory Commission to the Council of National Defense to avoid run-away markets that might precipitate a general increase in prices, official quotations were stabilized at 7.25 cents, beginning September 23. The average price of zinc for the year was 6.34 cents compared with 5.12 cents in 1939—an increase of nearly 24 percent.

London Metal Exchange dealings were suspended at the outbreak of the war, and zinc quotations in London have not been available since August 1939.

On December 18, 1939, the Nonferrous Metal Control for the United Kingdom fixed the price of zinc at £25 15s., delivered consumers, duty paid, for foreign zinc, and £26 10s. for domestic metal. These established prices did not change during 1940.

Prime Western; spot quotation at St. Louis	4.9	6.5	4.6	5.1	6.3

[1] American Metal Market quotes average prices of High Grade and Brass Special as follows: High Grade (f.o.b. New York)—1936, 5.90 cents; 1937, 7.76 cents; 1938, 5.74 cents; 1939, 6.16 cents; 1940, 7.38 cents; Brass Special (f.o.b. East St. Louis)—1936, 4.98 cents; 1937, 6.62 cents; 1938, 4.71 cents; 1939, 5.22 cents; 1940, 6.44 cents.

ZINC-REDUCTION PLANTS

Zinc smelters.—During 1940 there were 17 active zinc smelters; 1 idle plant at Peru, Ill., was partly dismantled. Of the active plants, 13 operated exclusively with horizontal retorts, 1 with both horizontal and vertical retorts, 2 with large vertical retorts exclusively, and 1 with electrothermic furnaces. The total number of retorts reported at the regular horizontal-retort primary plants was 62,368, considerably below the 69,180 retorts recorded for December 31, 1939, because most companies wrote off their obsolete equipment in 1940. This decrease was larger than the figures indicate but was balanced by the construction of 832 new retorts during the year. An appreciable number of the retorts still reported at plants represent equipment that has been idle for several years and cannot be brought into production without extensive repairs or the addition of roasting or sintering devices. The usable capacity is therefore somewhat less than is indicated by the retorts reported at plants. Of the total retorts reported, 55,328 were in use, a 12.6-percent increase over the 49,151 in operation at the close of 1939. Smelting operations were believed to be nearly at usable capacity levels at the close of 1940. At the end of 1940, 6,480 new retorts were under construction, and more than 800 additional units were planned for 1941. All of the 52 large vertical retorts were in use at the year's end, and 14 new units were being installed.

Many primary smelters treat scrap as well as ore. Horizontal-retort plants at Beckemeyer and Sandoval, Ill., and large graphite-retort plants at Trenton, N. J., Philadelphia and Bristol, Pa., Wheeling, W. Va., Tottenville, N. Y., and Fairfield, Ala., handle scrap exclusively. The Torrance (Calif.) plant of the Pacific Smelting Co., Ltd., uses small clay retorts as well as large graphite retorts for treating secondary materials. At the close of 1940, additional retorts were under construction at Beckemeyer for treatment of secondary zinc.

Electrolytic plants.—Three electrolytic zinc plants were in operation during 1940. The plant of the Sullivan Mining Co. at Kellogg, Idaho, made full use of its newly increased capacity. The Anaconda Copper Mining Co. plant at Anaconda, Mont., operated at capacity and the Great Falls plant at near capacity at the end of the year. The Evans-Wallower plant at East St. Louis, Ill., idle since 1931, was purchased late in 1940 by the American Zinc Co. of Illinois and was being reconditioned for 1,400 ton-a-month production beginning in the spring of 1941. At the three active plants, 2,204 cells out of a total of 2,228 were in use at the end of 1940 compared with 1,904 out of 2,192 at the end of 1939. The American Smelting & Refining Co. recently announced plans to construct an electrolytic zinc plant at Corpus Christi, Tex., which will have capacity for producing 25,000 tons of metal annually.

FOREIGN TRADE [4]

Imports.—The following tables give zinc imports into the United States, 1936–40, inclusive, and a record of bonded-warehouse inventories.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Zinc ores (zinc content) imported into the United States, 1936–40, in short tons[1]

	1936	1937	1938	1939	1940
Argentina				1,544	6,723
Canada		84		1,613	33,993
Mexico	172	338	7,253	23,221	93,789
Newfoundland and Labrador					23,640
Peru		8,373	11,330	9,722	17,285
Other countries		17			[2] 4,890
Total	172	8,812	18,583	36,100	180,320

[1] Data include ore imported for immediate consumption plus material entering the country under bond.
[2] Includes 2,530 tons imported from Bolivia, 1,749 tons from Australia, and 611 tons from Chile.

Zinc[1] *remaining in warehouse in the United States, December 31, 1936–40*

	Pounds		Pounds
1936	10,690,832	1939	20,295,817
1937	24,904,405	1940	184,442,754
1938	51,058,373		

[1] Includes zinc ore (zinc content), zinc blocks, pigs, old, and sheets.

Imports of zinc ore and concentrates in 1940 advanced 400 percent over 1939 owing to sharply increased shipments, chiefly from Canada, Mexico, and Newfoundland, whose ores formerly were treated in Europe. Shipments from Mexico represented approximately 52 percent of the total and were 304 percent greater than in 1939. Imports from Canada comprised 19 percent of the total and those from Newfoundland 13 percent. Most of the remainder came from Peru and Argentina; smaller amounts were imported from Bolivia, Australia, and Chile.

Imports of slab zinc for consumption decreased from 30,960 short tons in 1939 to 10,146 in 1940. The 1940 tonnage (1939 figures in parentheses) included 6,877 tons (6,402) from Canada, 2,647 tons (16,506) from Mexico, and 336 tons (4,790) from Belgium. In comparison, the total imports of slab zinc (general imports) decreased from 30,898 tons in 1939 to 16,100 in 1940. In 1939 the total import figure very closely approximated the imports for consumption, whereas in 1940 the total was higher than the imports for consumption by about 600 tons. This increased amount of zinc remaining in warehouse was principally from Mexico. The 1940 tonnage (1939 figures in parentheses) included 8,600 tons (16,600) from Mexico, 6,900 tons (6,900) from Canada, and 330 tons (4,700) from Belgium.

Zinc imported for consumption in the United States, 1936–40

Year	Blocks, pigs, or slabs		Sheets		Old, dross, and skimmings[1]		Zinc dust		Value of manufactures	Total value
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value		
1936	11,660	$770,496	242	$23,077	16	$769	57	$3,647	$540	$798,529
1937	37,208	3,852,884	231	30,398	678	70,460	69	6,169	828	3,960,739
1938	7,230	480,169	226	25,989	96	8,944	64	5,074	463	520,639
1939	30,960	1,890,236	178	21,166	203	14,067	41	3,388	1,545	1,930,402
1940	10,146	801,331	18	2,796	520	36,689			32	840,848

[1] Includes dross and skimmings: 15 tons valued at $721 in 1936; 560 tons valued at $59,635 in 1937; 30 tons valued at $1,918 in 1939; and 356 tons valued at $21,815 in 1940. None reported in 1938.

Exports.—The total value of the 1940 exports of zinc ore and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) was $11,302,228, more than five times the 1939 figure of $2,075,000. Nearly all the increase was in slabs, plates, and blocks. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. The American Bureau of Metal Statistics estimates that 22,900 tons of zinc were exported in galvanized products in 1940. Export data on zinc pigments and chemicals are given in the chapter in this volume on Lead and Zinc Pigments and Zinc Salts. Much of the zinc used in the manufacture of these products is of foreign origin, and when it is exported a draw-back of 99 percent of the import duty is paid. In 1940 draw-back was paid on 19,306 tons of zinc, of which 7,206 tons had been imported as slabs and 12,100 tons as ore. The totals for previous years were: 1939, 16,213 tons; 1938, 11,550 tons; 1937, 9,253 tons; 1936, 8,909 tons; and 1935, 7,297 tons.

Zinc ore and manufactures of zinc exported from the United States, 1936–40

Year	Zinc ore, concentrates, and dross (zinc content)		Slabs, plates, or blocks		Sheets, strips or other forms, n. e. s.		Zinc dust	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1936	245	$5,902	37	$4,962	4,483	$723,142	1,793	$273,813
1937	314	10,145	249	25,706	5,813	1,103,533	2,145	418,376

[2] Less than 1 ton.
[3] Includes 514 tons to Burma in 1940; not separately classified in 1937; none reported in 1938 and 1939.

WORLD ASPECTS OF ZINC INDUSTRY

Choatic conditions in Europe during 1940 left no room for international cooperation in economic matters, and consequently the world zinc industry was seriously jolted from its normal balance. As a result of the progressive subjugation of Norway, Netherlands, Belgium, and France, the Axis Powers gained control of zinc-reduction capacity which, added to their own, amounted to three-fourths of the world total. However, they did not gain control of the corresponding sources of ore supply; therefore increasing amounts of ore and concentrates originating in countries affected by the British sea blockade were diverted to the United States and the United Kingdom.

World smelter production.—The dislocation of the zinc industry throughout Europe, plus the war's affect upon communication of news concerning foreign operations, have made it impossible to give a figure for world smelter production. The Axis-dominated zinc-producing plants in countries that depend on imported concentrates have undoubtedly been forced to reduce output, but the degree of increase or decrease in total production for all of the Axis-controlled countries is unknown. The total output of this group in 1939 was estimated at approximately 760,000 short tons. Production in U. S. S. R., Japan, and Indochina during 1940 likewise is unknown. Exclusive of the United States, where the yield of slab zinc during the year increased 33 percent to an all-time high, the output of those countries on which reliable data are available (including Mexico and Canada and other countries of the British Empire) increased approximately 7 percent above 1939.

World smelter production of zinc, 1936–40, by countries where smelted, in metric tons [1]

[Compiled by L. P. Lounsbery]

[1] Statistical data derived in part from American Bureau of Metal Statistics, Year Book.
[2] Data not available.
[3] Includes the following tonnages of electrolytic zinc: 1936, 6,366 tons; 1937, 7,830 tons; and 1938, 8,670 tons. Data not available for 1939 and 1940. Production of electrolytic zinc begun in August 1935.
[4] Included with Germany.
[5] Some secondary metal included.
[6] Includes Czechoslovakia.
[7] Estimate included in total.
[8] Approximate production.

World consumption.—World consumption of slab zinc in 1940, as in 1939, cannot be estimated, as all of the belligerent countries continued the ban on publication of essential data that has been in effect since the outbreak of the war. Undoubtedly there has been a substantial increase above the last available figure of 1,489,800 metric tons reported for 1938 by the American Bureau of Metal Statistics. This assumption is indicated in view of the drastic change in the war from a state of inactivity during 1939 to one of total conflict during 1940, accompanied by sharply increased industrial activity, particularly in Great Britain and in the United States, where the zinc industry set new records in meeting national defense requirements. Zinc consumption in the United States, as measured by supplies of primary metal available for use, reached new peaks in 1940, and the tonnage was 11 percent above 1939. Larger consumption was indicated for Canada, but data for other foreign countries are not complete enough for comparison.

REVIEW BY COUNTRIES

By way of preface to this brief world review of the zinc industry, it is pertinent to emphasize the comparative lack of specific information for 1940. Censorship restrictions imposed by belligerent countries and the general effect of the war on communications have made it difficult to obtain published statistical data from Newfoundland, Canada, and countries outside of the Western Hemisphere.

Argentina.—Argentina produced about 50,000 metric tons of 53-percent zinc concentrates in 1940, principally from the Aguilar mine, Province of Jujuy, controlled by the St. Joseph Lead Co. Before 1940 the total output was shipped to Europe. During the year, 6,723 short tons were shipped to the United States, but a large percentage of the balance accumulated as stocks. A new 400-ton mill is being considered for construction at the Largo Fontana mines.

Australia.—Base-metal production statistics for 1940 are not available. The Sulfide Corporation ceased operations at its Broken Hill property, New South Wales, as the ore reserves have become exhausted, but at the North Broken Hill mine reserves were increased to over 5,000,000 tons as of June 30, 1939. The new 10,000-ton-per-week all-flotation mill of the Zinc Corporation, Ltd., is an outstanding metallurgical development in simplicity of operation and lay-out. Recoveries are: Lead, 96.4 percent; silver, 93.9 percent; and zinc, 87.5 percent.

On the New Broken Hill property, adjoining the Zinc Corporation on the south and managed by that company, diamond drilling continued to disclose ore of good grade and considerable width. Sinking of the new circular air shaft was progressing; mining operations will be served by the new Freeman shaft of the Zinc Corporation. The Mt. Isa lead-zinc mines, Queensland, operated throughout 1940.

Belgium.—During the first 4 months of 1940, the Belgian zinc smelters were operating, but at reduced capacity, because high freight rates—two to three times the f. o. b. value of the ore—and a shortage of ships caused a reduction in receipts of concentrates; neutral countries were reluctant to send ships to Europe. The lead and zinc works of Overpelt-Lommel were operating only at one-third capacity, and the Vieille Montagne zinc plants were also affected by the shortage of ore. On May 10, 1940, Germany invaded Belgium and soon assumed control of the zinc smelters. No further information has been obtained, other than an official German decree of July 9 that provided for a census of nonferrous metal industries, including zinc. Presumably at least a portion of the zinc-reducing capacity is being utilized to handle ores from sources under control of the Axis Powers.

Bolivia.—Bolivia produced about 24,400 short tons of zinc concentrates during 1940 (16,200 in 1939) containing approximately 10,500 tons of recoverable zinc; 2,530 tons were exported to the United States. There is no apparent reserve stock of ore in Bolivia, and the outlook for increased production is not favorable. The 1941 output is contracted for delivery to the United States.

Burma.—The Burma Corporation, Ltd., operating the Bawdwin mines, produced 59,500 long tons of concentrates in 1939—the total for the country. This is the last available figure, as the British Government officially requested the corporation to discontinue publication of production figures early in 1940. Since the outbreak of war, stocks have accumulated there as well as in Australia. The British Government has acquired a substantial share of these inventories and exercises rigid control over all shipments. At the end of the fiscal year (June 30, 1940), reserves of the Bawdwin mines were estimated to be 3,411,200 tons of ore assaying 15.7 ounces of silver, 20.4 percent lead, 12.6 percent zinc, and 0.9 percent copper per ton.

Canada.—War restrictions prevent the publication of base-metal production figures. It is known, however, that, among others, Hudson Bay Mining & Smelting (Flin Flon), Consolidated Mining & Smelting (Sullivan Mines), Waite Amulet, and Normetal increased operations during 1940 and that several zinc-producing mines that were inactive at the outbreak of the war are now in full production. Of the total output in 1940, three-fourths was produced from the Sullivan mines at Kimberley, B. C., the remainder coming from Flin Flon (about 20 percent), Sherritt Gordon, and a number of smaller properties in British Columbia and northwest Quebec. Beginning in April 1940, the Waite Amulet mines produced zinc concentrates from the newly installed differential flotation plant. The Hudson Bay Mining & Smelting Co. increased its daily output by 400 short tons and is enlarging the flotation mill and zinc-leaching plant to provide another 700-ton increase. In Nova Scotia the Stirling mine, controlled by the British Metal Corporation, was back in production after a shut-down of several years. Canadian zinc-ore exports went largely to the United States during 1940 (33,993 short tons) rather than to Belgium, as in past years. The United Kingdom was the chief market for slab-zinc exports. The Metals Controller of the Department of Munitions and Supply announced on November 25, 1940, that no further exports of zinc dross, remelted zinc in slabs, or high-grade zinc scrap would be permitted; export licenses are prohibited.

France.—The industrial areas of France fell into German hands in midyear 1940, and no information concerning the French zinc industry is available.

Germany.—Since the capture of the Polish zinc mines and smelters early in the fall of 1939, Germany continued to gain control of the European zinc industry through subjugation during 1940 of the Netherlands, Belgium, and France and in May 1941 of Yugoslavia. Based upon 1938 statistics, at the end of 1940 Germany controlled over 70 percent of Europe's zinc productive capacity. This majority control, plus expanded ore production from zinc mines within Germany and the subjugated countries, should make Germany self-sufficient in zinc without reliance upon imported ore. Zinc is the premier domestic substitute, and although its use is carefully controlled, has been promoted for all purposes where other more abundant material could not suitably be employed. Many new zinc alloys have been placed on the market; the use of zinc in coins has been contemplated. Zinc output has been increased in Germany by extensive use of flotation at existing mines in the Rammelsburg district in the lower Harz Mountains, the Rhein-Lahn district, and the Ramsbeck Basin. In the Meggen district the supply of zinc has been expanded through the processing of pyrite ore containing 7 to 8 percent zinc. There are no available 1940 statistics to show production, imports, or exports.

Italy.—Rolling mills for the production of zinc and its alloys were completed in May 1940 by the Montecatini group at Porto Marghera; it was reported that operations would begin soon. The existing electrolytic plant is to be enlarged. "Zama" alloys (zinc and aluminum) have been produced regularly and in most instances form a substitute for copper and bronze.

Japan.—It is reported that Japanese production increased somewhat during 1940 through the installation of three small plants having a capacity of 20,000 to 25,000 short tons of zinc a year, principally high grade.

Mexico.—Mine production of zinc in Mexico totaled 109,000 metric tons compared with 134,000 in 1939; the decline resulted from the loss of European markets for concentrates. Although the figure for smelter output was not available for 1940, production was indicated as being lower than the 1939 total of 38,000 tons, principally because of the 4-month strike at the Rosita smelter of the American Smelting & Refining Co., which was settled in February 1941; the smelter has a capacity of 3,500 tons of zinc a month. During 1939 and early 1940, because of the blockades resulting from the European War, substantial quantities of zinc ore and concentrates formerly refined in Europe were temporarily stored by the larger companies. For the remainder of 1940, increasing amounts of concentrates were exported to the United States; for the entire year, this aggregated an amount equivalent to approximately 42,500 tons of recoverable zinc.

Netherlands.—The zinc smelters in the Netherlands fell into German hands in May 1940, and no information concerning the zinc industry in this country has since been available.

Newfoundland.—Zinc concentrates produced in Newfoundland by the Buchans Mining Co., Ltd., totaled 116,400 short tons in 1940 (105,600 in 1939). Exports increased from 61,000 tons to 122,800, indicating a decrease in producers' stocks during 1940. Most of the exports went to the United Kingdom. A considerable tonnage has been contracted for in advance for reduction in the United States during 1941 at the East St. Louis (Ill.) electrolytic plant.

Peru.—Production of zinc concentrates in Peru during 1940 totaled 31,588 metric tons, with an extractable zinc content of 17,000 tons (19,000 in 1939), largely produced by the Cerro de Pasco Copper Corporation. When the new lead-zinc concentrator under construction by this corporation is ready for operation in 1941, the output of Peruvian concentrates will be greatly increased; there are reported to be 10,000,000 tons of 17-percent ore that can be treated in the new plant. The Cerro de Pasco Corporation constructed a pilot electrolytic zinc plant in the latter part of 1940. Almost all of the Peruvian concentrates, normally shipped to Europe, were exported to the United States during 1940.

United Kingdom.—The Nonferrous Metal Control continued its fixed prices for zinc for all grades during 1940. In January the Control refused to grant export licenses for hard spelter, and in April an import-licensing system was introduced for zinc and lead alloys containing more than 50 percent by weight of the metal named. Continental complaints were heard during the early part of the year that British maximum official prices for zinc did not replace the former London Metal Exchange quotations as a satisfactory basis for international dealings. After the fall of France in July, the British position was assisted by the fact that the Metal Control no longer had to worry over supplying the former ally. Throughout the year zinc-supply conditions were rather tight, as there was a heavy demand in the brass, galvanizing, and die-casting factories, particularly during the latter half of the year, because of the greatly intensified armament drive. This condition was clearly indicated in November by the fact that use of alternative finishes to take the place of galvanizing was encouraged.

Yugoslavia.—During 1940, Trepca Mines, Ltd., continued its operations successfully and reported a net profit of £178,124 for the first 9 months of the year (£50,691 for 1939). Production was at the rate of about 600,000 tons of ore a year; 44,100 tons of zinc concentrates were produced from the Stantrg mine. Work preparatory to the construction of an electrolytic zinc plant by Topionica Cinka (a Trepca subsidiary) at Sabac has been suspended. From September 1939 until June 30, 1940, difficulties were experienced with the exportation of concentrates from Yugoslavia and the remittance of funds to that country. For the balance of 1940, a satisfactory arrangement was made whereby a portion of Trepca's production was sold by the Yugoslav Government for dinars, whereas the balance was sold by the company and proceeds were retained in London. Ore reserves in the Stantrg mine were resampled above the 435-meter level during 1940 and calculated to be 4,848,000 tons. Preparations were being made at the end of the year to produce ore from the company Kopaonik mine at the rate of 10,000 tons a month. The effect on the zinc industry of the German occupation of Yugoslavia early in 1941 has not yet been reported.

LEAD AND ZINC PIGMENTS AND ZINC SALTS

By H. M. MEYER and A. W. MITCHELL

SUMMARY OUTLINE

Features of the lead and zinc pigments industries in 1940 included the poor showing made by white lead, the continuation of record performance by leaded zinc oxide, and the lower price for lithopone against the trend for other pigments in the group. Little improvement could be noted for the pigments as a whole, despite the gains made by industries that are the principal consumers of these products—automobiles, rubber, storage batteries, and paint. The use of litharge in the manufacture of storage batteries actually declined, while sales of red lead for this purpose made only a small gain. The record-breaking use of black oxide or suboxide of lead, not included in pigment totals, by the storage-battery manufacturers explains the apparent discrepancy. The use of white lead in paints dropped 21 percent in 1940, and an increase for leaded zinc oxide was almost counteracted by a decline in sales of the lead-free class. Basic lead sulfate and lithopone sales for paint, however, rose 8 and 3 percent, respectively, in part offsetting the drop in white lead. Statistics covering sales of litharge and white lead to the ceramic industry indicated sharp gains for that purpose in 1940.

Zinc pigments made a better record than lead pigments in 1940, both in relation to 1939 and to the prosperous period in the late twenties. The total weight of zinc pigments gained 3 percent over 1939 and was only 13 percent below the 1925–29 average; that for lead pigments fell 6 percent below 1939 and was 26 percent below the 1925–29 average. The total value of lead pigments in 1940 was 8 percent lower than in 1939, and the total for zinc pigments was relatively unchanged from that year.

The expectation of record-breaking plant construction for the production of armament requirements, of increased building for housing a growing army, and of plant construction subsidiary to the above indicates possibilities for considerable expansion in the use of pigments both for paints and for other purposes.

A larger share of the market for white pigments in 1940 was again met by titanium pigments, a group which again reported record-breaking activity in that year.

Average price quotations and average values received by the producers showed little change on the whole, but for the most part were somewhat higher. Quotations for lithopone throughout the year were lower than in 1939, following a drop in January 1940. In December 1940, however, it was announced that increased prices for lithopone, zinc sulfide, and titanium pigments would become effective on January 2, 1941.

Early in January 1941 representatives of the National Paint, Varnish and Lacquer Association and the United States Bureau of Standards presented recommendations for types of paint to be used on Army cantonments, and for tinting such paints, to the Construction Division of the Quartermaster Corps, United States Army. These recommendations covered the use of lead-zinc-titanium paint, both white and tinted, with cream and gray the suggested colors. The suggestions were accepted and are now in use.

Paint specifications of the United States Government bureaus are stated in a circular (No. 618) issued by the scientific section of the National Paint, Varnish and Lacquer Association.

Substitution for lead in pigments in Germany is indicated by the development of an aluminum-silicon alloy, said to contain 87 percent aluminum and 13 percent silicon.[1]

Salient statistics of the lead and zinc pigments industry of the United States, 1925–29 (average) and 1936–40

	1925–29 (average)	1936	1937	1938	1939	1940
Production (sales) of principal pigments:						
White lead (dry and in oil) short tons	154,483	118,407	98,213	100,213	98,429	80,562
Litharge do	84,845	86,246	83,902	68,711	89,518	89,841
Red lead do	41,362	34,896	33,931	30,183	39,976	42,200
Zinc oxide do	154,208	126,800	114,652	79,129	114,552	113,213
Leaded zinc oxide do	26,609	40,512	40,343	38,216	42,684	45,362
Lithopone do	177,745	158,319	154,771	125,746	142,759	151,802
Value of products:						
All lead pigments	$60,092,000	$34,206,000	$35,676,000	$28,351,000	$35,485,000	$32,628,000
All zinc pigments	41,314,000	27,862,000	28,038,000	23,301,000	28,794,000	28,747,000
Total	101,406,000	62,068,000	63,714,000	51,652,000	64,279,000	61,375,000
Value per ton received by producers:						
White lead (dry)	178	126	140	123	138	137

PRODUCTION

In this chapter stress is placed on sales rather than production because they are a better measure of activity in the industry. Data on stocks are not available at the beginning and the end of the year; and the lack of such information makes statistics on output, taken alone, of questionable value. Moreover, there have been instances where materials reported as one commodity for production have been sold later under another classification. Therefore, sales figures are a more accurate guide to the pigments actually going into consumption. Even sales figures have to be handled carefully to avoid duplication, because some pigments that are reported to be sales of finished products at one plant actually are used by other plants as an intermediate product in the manufacture of another pigment covered by the lead and zinc pigments canvass. Basic lead sulfate used in the manufacture of leaded zinc oxide is the principal offender in this connection, but it does not represent the only problem. Production figures are used in this report only in calculating the metal content of pigments and salts in the section of this report on Raw Materials Used in Manufacture of Lead and Zinc Pigments and Zinc Salts. Pigments used by producers in manufacturing products at their own plants are included under sales throughout this report.

The total value of sales of lead and zinc pigments showed a 5-percent drop from $64,279,000 in 1939 to $61,375,000 in 1940. The decrease was due principally to lower sales of white lead (dry and in oil), although the lower average value for sales of lithopone was a contributory factor. Increased total values for several pigments, including red lead, litharge, and leaded zinc oxide, in part counteracted the lower values for white lead and lithopone.

Lead pigments.—The failure of lead pigments to make a good showing in 1940 was due entirely to lower sales of white lead (dry and in oil); in fact, the white lead in oil grade fell 26 percent. Of the other pigments, sales of litharge were virtually the same as in 1939; those of red lead, basic lead sulfate, and orange mineral showed increases ranging up to 12 percent. Average price quotations trended upward slightly, and values received by producers on the whole confirmed the rise, the gain in average values for the most part approximating $1 a ton. Sales of red lead were slightly above the average for 1925–29 and were the largest on record since 1929. Sales of litharge in 1940 were also above the 1925–29 average.

Lead pigments sold by domestic manufacturers in the United States, 1939–40

Pigment	1939			1940		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average
Basic lead sulfate or sublimed lead:

1940	30,115	50,447	5,493	707	42,200	137	89,841

Zinc pigments and salts.—Sales of leaded zinc oxide in 1940 continued the uptrend of recent years, and a new record was established—the third since 1935. Sales of zinc oxide in 1940 were 1 percent below 1939 and those of lithopone were 6 percent higher, so that total zinc pigments were higher in 1940 than in the previous year, the increase in total tonnage being 3 percent. Despite the higher tonnage the total value for this group was slightly lower than in 1939, owing to the drop in the average price for lithopone. Sales and average values for lithopone have been running in opposite directions in recent years. The former gained 14 and 6 percent, respectively, in 1939 and 1940, while the latter declined 8 percent in each year. Price quotations for the various grades of zinc oxide (lead-free and leaded) were higher than in 1939. Values reported for leaded zinc oxide by producers were unchanged for 1939 and 1940, while those for lead-free zinc oxide rose $1 a ton.

Zinc pigments and salts sold by domestic manufacturers in the United States, 1939–40

Pigment or salt	1939			1940

[1] Zinc oxide containing 5 percent or more lead is classed as leaded zinc oxide. [2] Data not avaliable.

Zinc pigments and salts sold by domestic manufacturers in the United States, 1936–40, in short tons

Year	Zinc oxide	Leaded zinc oxide	Lithopone	Zinc chloride (50° B.)	Zinc sulfate
1936	126,800	40,512	158,319	(1)	9,721
1937	114,652	40,343	154,771	(1)	10,521
1938	79,129	38,216	125,746	(1)	7,757
1939	114,552	42,684	142,759	(1)	10,157
1940	113,213	45,362	151,802	(1)	11,937

[1] Data not available.

Complete data covering the production of zinc chloride in recent years are not available owing to the absence of a reliable report for one producer, believed to be large.

Sales of zinc sulfate in 1940 established a new high record rate—13 percent above the previous record for 1937.

CONSUMPTION BY INDUSTRIES

White lead.—This product failed to keep pace with other pigments in 1940, as its sales declined 18 percent from 1939, while others were relatively unchanged or higher. Normally 95 percent of the white lead consumed is used in the manufacture of paints. Only 91 percent of the 1940 total was reported to be so used, and the use in ceramics rose to nearly 4 percent.

Late in the year it was announced that new Government specifications for dry and paste basic carbonate white lead (TT-W-251A) would become effective November 15.

Distribution of white lead (dry and in oil) sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Paint	113,363	93,580	95,018	92,380	73,137
Ceramics	2,653	2,506	1,918	1,767	3,029
Other	2,391	2,127	3,277	4,282	4,396
	118,407	98,213	100,213	98,429	80,562

Basic lead sulfate.—The outstanding use of basic lead sulfate is also in the manufacture of paint. In recent years the quantities of this pigment used in the manufacture of leaded zinc oxide have risen rapidly, reaching a peak of 7,700 tons in 1939; in 1940 it amounted to 6,500 tons. These quantities are included in the totals for leaded zinc oxide and not in those for basic lead sulfate.

In May a new Federal specification (TT-P-20) for ready-mixed linseed oil paint with a blue lead (basic lead sulfate) base was announced, to become effective August 15.

Distribution of basic lead sulfate sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Paints	8,124	8,255	5,024	5,170	5,593
Rubber	126	213	91	140	128
Storage batteries	28	6	3	4	4
Other	144	148	683	224	475
	8,422	8,622	5,801	5,538	6,200

Red lead.—This pigment had a good year in 1940; sales totaled 42,200 tons and were the largest since 1929—2 percent above the 1925–29 average. Red lead is one of the most effective protective paints for iron and steel. Consequently plans for plant expansion to meet increased armament needs promise large demands for this product. Actually storage batteries consume the principal part of the sales of red lead, taking 63 percent in 1940 while paints took 28 percent.

Distribution of red lead sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Storage batteries	20,323	20,275	19,057	24,709	26,718
Paints	11,786	10,440	8,698	11,421	11,949
Ceramics	807	854	655	1,123	1,117
Other	1,980	2,362	1,773	2,723	2,416
	34,896	33,931	30,183	39,976	42,200

Orange mineral.—There appears to be no definite pattern in the sales of orange mineral; ink manufacture and color pigments usually vie for first place with widely varying quantities.

Distribution of orange mineral sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Ink manufacture	71	76	20	64	51
Color pigments	77	51	94	40	18
Other	100	79	13	27	68
	248	206	127	131	137

Litharge.—Sales of litharge in 1940 were virtually unchanged from 1939, continuing the comparatively favorable showing for that year. These quantities were 30 to 31 percent above 1938 and 6 percent higher than the average annual rate in 1925–29. There were, however, some rather marked changes in sales to various industries between 1939 and 1940. In 1940 relatively small declines in sales for storage batteries (the principal use) and in insecticides and greater decreases in chrome pigments and oil refining were almost entirely offset by a sharp gain in use of litharge for ceramics. The larger requirements for ceramics coincide with gains in the use of white lead for that purpose. Sales of litharge for varnish and rubber manufacture also gained in 1940. Black oxide or suboxide of lead used by storage-battery manufacturers continued the uptrend of recent years, except for a set-back in 1938, and established another new record in 1940. In that year 53,000 tons were so used compared with the previous peak of 45,000 tons in 1939. Sales of black oxide are not included in Bureau of Mines totals for litharge.

Distribution of litharge sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Storage batteries	38,700	32,228	32,514	39,754	38,303

Other	4,553	4,925	[1] 3,011	[1] 3,558	3,082
	86,246	83,902	68,711	89,518	89,841

[1] Revised figures.

Zinc oxide.—Sales of zinc oxide in 1940 differed little from those for 1939, as they declined 1 percent. The insignificant decrease in 1940 was not reflected in sales for rubber manufacture, which gained slightly. This use represented 63 percent of all zinc oxide sold by producers in 1940. Less zinc oxide was purchased for use in paints in 1940, and a small drop was also noted in the quantity required by the ceramics industry, although the amount taken for ceramics compared very favorably with the rate for recent years. The use of zinc oxide in the manufacture of floor coverings and textiles has showed a declining tendency in recent years in relation to total sales of zinc oxide. In 1935 it represented 7 percent and in 1937, 8 percent of the total; but in 1938, 1939, and 1940 it was 4, 5, and 4 percent, respectively. Of the zinc oxide produced in 1940, 64 percent was made by the American process and 36 percent by the French process compared with 59 and 41 percent, respectively, in 1939 and 62 and 38 percent in 1938. The higher proportion of American-process zinc oxide produced in 1940 may have been due to the increasingly tight situation that developed in regard to slab zinc supplies as the year progressed. The proportion of French-process oxide made from scrap zinc (which had been increasing for a number of years and amounted to 49 percent in 1939, 32 percent in 1938, and 25 percent in 1937) reacted to 45 percent in 1940. A large quantity of zinc oxide used in the manufacture of leaded zinc oxide is included under leaded zinc oxide and is excluded from zinc oxide totals.

Additional information supplied to the Bureau of Mines recently makes it possible to publish the distribution of sales of zinc oxide (lead-free and leaded) by uses for 1929 and 1930.

Distribution of zinc oxide sales, 1929–30 and 1936–40, by industries, in short tons

Industry	1929	1930	1936	1937	1938	1939	1940
Rubber	80,892	58,073	72,885	67,061	46,266	70,187	70,979
Paints	54,440	40,986	33,149	27,987	20,884	25,334	23,268
Ceramics	5,109	3,691	6,102	5,216	4,908	6,572	6,352
Floor coverings and textiles	4,068	4,469	7,178	9,019	3,030	5,641	4,752
Other	16,102	11,923	7,486	5,369	4,041	6,818	7,862
	160,611	119,142	126,800	114,652	79,129	114,552	113,213

Leaded zinc oxide.—Sales of leaded zinc oxide again established a new high record rate in 1940—6 percent above the previous record for 1939 and 70 percent over the 1925–29 average. Paint manufacturers take the preponderant part of sales of this pigment—usually more than 97 percent. The total for leaded zinc oxide in 1940 includes 6,500 tons of basic lead sulfate used to increase the lead content of this product; this tonnage is excluded from basic lead sulfate totals to avoid duplication in reporting data on metals.

Additional information recently received makes possible the publication of sales of leaded zinc oxide by uses for 1929 and 1930.

Distribution of leaded zinc oxide sales, 1929–30 and 1936–40, by industries, in short tons

Industry	1929	1930	1936	1937	1938	1939	1940
Paints	26,981	16,717	40,156	39,584	37,348	41,519	44,341
Rubber		77	32	97		1	
Other	168	485	324	662	868	1,164	1,021
	27,149	17,279	40,512	40,343	38,216	42,684	45,362

Lithopone.—Lithopone statistics are reported upon the basis of the regular lithopone content of high-strength lithopone plus normal lithopone sold as such. Before 1936 the figures were upon the basis of standard-strength plus high-strength product. Paints, varnish, and lacquers requisition the principal part of the total lithopone sold, and sales to these users increased 3 percent in 1940. For several years this use had taken about 80 percent of the total, but only 77 percent in 1940. Floor coverings and textiles have used 12 to 13 percent of the total in recent years and rubber 2 to 3 percent. Upon the basis of somewhat incomplete information, separation of the quantities shown in the following table for floor coverings and textiles indicates that 14,900 tons were used for linoleum and felt-base floor coverings and the remainder for coated fabrics and textiles (oilcloth, shade cloth, artificial leather, and similar products). Other uses in 1940 included 4,678 tons for paper and 851 tons for printing ink. An additional quantity for printing ink cannot be separated from the total for paints.

The Chemical Age (London) of September 7, 1940, stated that a lithopone plant was to be installed at Port Pirie, South Australia, by the Electrolytic Zinc Co. of Australasia, Ltd. All lithopone used in Australia, reported as about 3,000 tons a year, has previously been imported.

Distribution of lithopone sales, 1936–40, by industries, in short tons

Industry	1936	1937	1938	1939	1940
Paints, etc	122,461	122,915	101,924	113,995	117,075
Floor coverings and textiles	23,085	20,194	15,400	17,429	18,738
Rubber	4,908	4,383	3,148	3,189	3,387
Other	7,865	7,279	5,274	8,146	12,602
	158,319	154,771	125,746	142,759	151,802

The use of ordinary-strength lithopone in the manufacture of titanated lithopone (which usually contains 15 percent TiO_2) has increased rapidly since the output of this product was begun. It declined, however, in 1938, fell sharply in 1939, and in 1940 recovered only part of the ground lost. The lithopone figures in the following table are included in Bureau of Mines totals for ordinary lithopone.

Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1936–40, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1936	21,300	18,400	1939	16,100	13,700
1937	23,000	19,400	1940	18,100	15,200
1938	20,100	17,000			

Zinc sulfide.—Although zinc sulfide is produced by four plants in the United States, one producer dominates the industry; therefore, the Bureau of Mines is not at liberty to release data on this commodity.

Zinc chloride.—The Bureau of Mines cannot report zinc chloride production because one producer, whose output is believed to be large, has refused to supply reliable data. Returns from producers representing more than two-thirds of the total indicate the following distribution of sales by uses in 1940:

	Percent		Percent
Soldering flux	35	Vulcanized fiber	12
Wood preserving	18	Others	20
Dry-cell batteries	15		100

The first commercial output of zinc chloride in Canada was announced by Canadian Industries, Ltd., in 1940. The material was produced at Hamilton, Ontario, and the project did not involve construction of new buildings.

Zinc sulfate.—Sales of zinc sulfate rose from 1933 to 1937, declined in 1938, and continued the uptrend in 1939 that resulted in new high record sales in 1940. Sales of 11,937 tons in 1940 were 13 percent above the previous record of 10,521 tons in 1937. Of the 1940 sales, 3,649 tons were for rayon manufacture, 2,366 tons for agricultural purposes, 2,151 tons for chemical manufacture (including the medicinal trade), 1,509 tons for paints and varnish, 348 tons for electrogalvanizing, 320 tons for glue manufacture, and 161 tons for flotation reagents; 1,433 tons were undistributed.

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND SALTS

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such miscellaneous secondary materials as scrap and waste from various industrial processes. In 1940, 92 percent of the lead pigments was derived from pig lead and 8 percent from ore. The proportions for zinc pigments in 1940 were 66 percent from ore, 13 percent from slab zinc, and 21 percent from secondary materials.

Metal content of lead and zinc pigments produced by domestic manufacturers, 1939–40, by sources, in short tons

Source	1939		1940	
	Lead in pigments [1]	Zinc in pigments	Lead in pigments [1]	Zinc in pigments
Domestic ore	15, 171	83, 829	16, 869	94, 491
Metal	200, 390	17, 169	196, 235	19, 421
Secondary material [2]		30, 138		29, 675
	215, 561	131, 136	213, 104	143, 587

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] Zinc ashes, skimmings, drosses, and old metal.

The following tables give the source of the metal used in the manufacture of each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral and is used also in the manufacture of basic lead sulfate. The lead content of leaded zinc oxide made from basic lead sulfate, which in turn was made from pig lead, is credited to

[1] Data not available.

pig lead in the table. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone and zinc chloride made in the United States is derived from secondary material. There has been a decided increase in the quantity of secondary zinc consumed in the manufacture of zinc oxide since 1933.

PRICES

The total values reported by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. The average values for lead pigments showed little variation, being, for the most part, about $1 higher than in 1939. Market quotations for the year exhibited an upward tendency; the lower part of the price range coincided with that for 1939, but the upper part was ¼ to ½ cent a pound higher. During the year prices for litharge, red lead, and orange mineral followed in general the changes in quotations for pig lead; they sagged until the third quarter and snapped back in the final quarter to reach the highest points of the year. Prices of basic carbonate white lead and basic lead sulfate were unchanged from the beginning of the year until November, then rose ½ and ¼ cent, respectively. Producer values for zinc pigments and salts generally were also about $1 higher in 1940 than in 1939, except lithopone, for

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1937–40, in cents per pound

Product	1937	1938	1939	1940
Basic lead sulfate, or sublimed lead, less than carlots, barrels	6.50–8.75	5.50–6.50	6.25–6.50	6.25–6.75
White lead, or basic lead carbonate, dry, carlots, barrels	6.75–9.00	6.00–7.00	7.00	7.00–7.50
Litharge, commercial, powdered, barrels	6.25–10.00	5.50–7.50	6.25–7.75	6.25–8.25
Red lead, dry, 95 percent or less, less than carlots, barrels	7.75–11.00	7.00–8.50	7.75–9.00	7.75–9.25
Orange mineral, American, small lots, barrels:				
Ex-white lead Ex-red lead	10.25–13.50	9.50–11.00	10.25–11.25	10.25–11.75
Zinc oxide:				
American process, lead-free, bags, carlots	5.25–7.50	6.25–7.50	6.25–7.50	6.25–7.50
American process, 5 to 35 percent lead, barrels, carlots	5.38–6.88	5.90–6.38	6.25–6.38	6.25–6.75
French process, red seal, bags, carlots	5.75–7.50	7.50	7.50	7.50–7.75
French process, green seal, bags, carlots	6.25–8.00	8.00	8.00	8.00–8.25
French process, white seal, barrels, carlots	7.00–8.75	8.75	8.75	8.75–9.00
Lithopone, domestic, 5-ton lots, bags	4.25–4.63	4.38–4.63	4.00–4.38	3.85–4.00
Zinc sulfide, less than carlots, bags, barrels	9.25–9.50	8.63–9.50	7.75–8.88	7.75–8.00
Zinc chloride, works:				
Solution, tanks	2.00–2.25	2.25	2.25	2.25
Fused, drums	4.25–5.75	4.25–5.75	4.25–5.75	4.25–5.75
Zinc sulfate, crystals, barrels	2.80–4.05	2.65–4.05	2.90–3.65	2.90–3.90

which the average fell $6. Prices for zinc pigments are more independent of price movements for the metal than those for lead pigments, because zinc ores represent a high percentage of the zinc used in zinc pigments. Nevertheless, quotations for zinc pigments (except lithopone), as well as for slab zinc, were at their highest levels in the final quarter of 1940. Lithopone quotations were unchanged in 1940 following a drop in January of that year which coincided with a reduction in prices for titanium pigments. December trade journals however, promised increases in prices for lithopone, titanium pigments, and zinc sulfide, to become effective January 2, 1941.

FOREIGN TRADE[2]

The principal item of interest in connection with foreign trade in lead and zinc pigments was the acute rise in exports of lithopone in 1940. Largely because of this advance, the value of lead and zinc pigments and salts exported in 1940 gained 34 percent. Values of exports of other pigments and salts covered by the following table (except lead arsenate) decreased during the year. Imports of the items covered by the table declined sharply, and the total value for the group fell 80 percent. The principal value in the import group continued to be that for zinc oxide.

Value of foreign trade of the United States in lead and zinc pigments and salts, 1939–40

	1939		1940	
	Imports	Exports	Imports	Exports
Lead pigments:				
White lead	$2,108	$275,311	$249	$211,148

Grand total	346,087	1,800,703	68,280	2,420,897

[1] Data not available.

Lead pigments and salts.—Imports of these commodities are insignificant. The most important item under this classification has been that for lead compounds, which included lead acetate, nitrate, and others, but none was entered under this heading in 1940. Imports of suboxide of lead increased from 20 tons in 1939 to 31 tons in 1940.

Lead pigments and salts imported for consumption in the United States, 1936–40

Year	Short tons					Total value
	Basic carbonate white lead	Red lead	Litharge	Orange mineral	Lead compounds	
1936	32	2	1	5	185	[1] $37,878

1939	11	2		1	104	[1] 28,248
1940	2		(2)	1		[1] 13,357

[1] Includes also—1936: Lead pigments, n. s. p. f., $19 (33 pounds), sublimed lead (basic sulfate) $9 (15 pounds), and suboxide of lead, n. s. p. f., $5,264 (39,010 pounds); 1937: Lead pigments, n. s. p. f., $8 (100 pounds), sublimed lead (basic sulfate), $2 (10 pounds), and suboxide of lead, n. s. p. f., $9,396 (55,453 pounds); 1938: Lead pigments, n. s. p. f., $198 (2,330 pounds), and suboxide of lead, n. s. p. f., $5,335 (31,834 pounds); 1939: Lead pigments, n. s. p. f., $690 (5,270 pounds), and suboxide of lead, n. s. p. f., $6,620 (40,445 pounds); 1940: Suboxide of lead, n. s. p. f., $12,959 (62,412 pounds).
[2] Less than 1 ton.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

The principal exports are usually white lead and litharge. These two pigments lost ground in 1940, while red lead remained stationary at the increased tonnage for 1939 and lead arsenate made important gains.

White lead exports went principally to Panama, the Philippine Islands and Canada; those to North American countries comprised 56 percent and to South American countries 21 percent of the total. Shipments of red lead and litharge to foreign countries were largely to Canada, Argentina, the Philippine Islands, and Netherlands Indies; North America received 37 percent and South America 28 percent.

Zinc pigments and salts.—Lithopone is normally the principal item in imports of zinc pigments and salts, but none of this pigment entered the country in 1940; in 1939 receipts amounted to 2,641 tons. All of the other products covered declined in 1940; zinc oxide and zinc chloride showed notable losses.

1 Less than 1 ton.

Exports of zinc oxide dropped 7 percent from the rate established in 1939 and amounted to 3 percent of the sales of lead-free zinc oxide by domestic producers. Shipments were principally to Canada, Netherlands Indies, Mexico, and Brazil. Lithopone shipments to foreign countries were the feature of foreign trade in pigments in 1940. They totaled 14,298 tons compared with 4,845 tons in 1939, which was, in turn, greatly above shipments of 1,734 tons in 1938. Exports in 1940 were 9 percent of total sales of domestic producers and went mainly to Canada, Australia, Argentina, Chile, and Brazil.

GOLD, SILVER, COPPER, AND LEAD IN ALASKA

(MINE REPORT)

By Chas. W. Henderson and S. A. Gustavson

SUMMARY OUTLINE

Gold recovered from Alaska ores and gravels in 1940 totaled 755,970 fine ounces valued at $26,458,950—an increase of 12 percent over the 676,737 ounces valued at $23,685,795 in 1939—owing to increased output from all types of placer mines. The value of the gold in 1940 was over 99 percent of the total gross value of the gold, silver, copper, and lead produced. The copper produced in 1940 was a byproduct of gold mining, and the output of recovered metal was only 110,000 pounds—less than one-half the 1939 production.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.
[6] 0.71111111.

The following tables show the mine production of gold, silver, copper, and lead in Alaska in 1936–40 and 1880–1940 in terms of recovered metals; the output of gold and silver in 1940, by types of operation; and the output of gold, silver, copper, and lead from amalgamation and cyanidation mills (with or without concentration equipment) in 1940, by regions.

Mine production of gold, silver, copper, and lead in Alaska, 1936–40, and total, 1880–1940, in terms of recovered metals

Year	Gold (lode and placer)		Silver (lode and placer)	
	Fine ounces	Value	Fine ounces	Value
1936	540,580	$18,920,300	484,306	$375,095
1937	627,940	21,977,900	494,340	382,372
1938	664,973	23,274,055	479,853	310,208
1939	676,737	23,685,795	201,054	136,473
1940	755,970	26,458,950	191,679	136,305
1880–1940	24,456,563	568,994,307	19,371,146	13,779,478

Year	Copper		Lead		Total value
	Pounds	Value	Pounds	Value	
1936	37,700,000	$3,468,400	1,882,000	$86,572	$22,850,367
1937	34,672,000	4,195,312	1,646,000	97,114	26,652,698

1940	110,000	12,430	1,558,000	77,900	26,685,585
1880–1940	[1] 685,736	226,531,990	[1] 23,479	2,579,553	811,885,328

[1] Short tons.

Mine production of gold and silver in Alaska in 1940, by types of operation, in terms of recovered metals

Type of operation	Mines producing	Material treated	Gold			Silver			Total value
			Fine ounces	Percent of total		Fine ounces	Percent of total		
				1940	1939		1940	1939	
Lode mines	73	[1] 4,885,023	214,097	28	31	116,931	61	87	$7,576,546
Floating connected-bucket dredges	[2] 49	[3] 23,393,453	354,806	47	45	47,700	25	8	12,452,130
Placers (dragline and dry-land dredges, hydraulic, drift mining, and sluicing)	[4] 1,020	([5])	187,067	25	24	27,048	14	5	6,566,579
	1,142		755,970	100		191,679	100		26,595,255
Total, 1939	1,187		676,737		100	201,054		100	23,822,268

[1] Short tons of ore.
[2] Number of dredges, including 2 single-dipper dredges. In addition, a floating dredge was operated primarily to produce platinum.
[3] Cubic yards of gravel (average recovered per yard, $0.53).
[4] Includes all types and sizes of placer operations excluding floating connected-bucket dredges.
[5] Cubic yards of gravel; figures not available.

Gold.—The value of the gold output of Alaska in 1940 was over 99 percent of the total gross value of the gold, silver, copper, and lead produced. The source of gold has been divided in this report into only three types of operations—placers using floating connected-bucket dredges; other placer operations, large and small; and lode mines. The output from dredges was by far the largest, followed in order by lode mines and by other placer mines. The increased output from floating connected-bucket dredges was due directly to the 18-percent increase in cubic yards of gravel washed in 1940 compared with 1939. The average tenor of the gravels washed in the Territory as a whole was about the same in 1940 as in 1939. The output of gold from lode mines was 4,931 ounces more than in 1939. The steady increase in use of mechanical equipment—such as draglines, slackline scrapers, bulldozers, portable washing plants, pumps, and hydraulic machinery—caused the output from placer mines, other than those with bucket dredges, to increase 24,491 ounces over 1939. The wider use of mechanical moving equipment has lengthened the operating season for hydraulic miners by allowing them to prepare ground in advance by removing overburden formerly hydraulicked, by transferring some of the gold-bearing gravel into position for hydraulicking, and by removing tailings. Thus they can make more efficient use of available water, whether seasonal rain or run-off.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Alaska in 1940, by regions, in terms of recovered metals

Region	Ore treated	Recovered in bullion		Concentrates smelted and recovered metal				
		Gold	Silver	Concentrates produced	Gold	Silver	Copper	Lead
	Short tons	*Fine ounces*	*Fine ounces*	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Cook Inlet-Susitna	63,902	43,398	2,518	1,464	8,874	728	6,176	200
Copper River	514	286	71	2	8	1		
Kenai Peninsula	2,110	2,177	694	5	14	6		
Seward Peninsula	30	41	4					
Southeastern Alaska	4,788,518	110,271	22,700	3,194	27,251	79,384	41,201	1,547,062
Yukon River Basin	22,299	19,529	6,854	104	635	1,697	500	4,100
	4,877,373	175,702	32,841	4,769	36,782	81,816	47,877	1,551,362
Total, 1939	4,729,057	172,035	29,877	4,046	32,257	94,029	62,962	1,839,450

Silver.—All the silver produced in Alaska in 1940 was a byproduct of gold mining.

Copper.—The output of recoverable copper in Alaska in 1940, produced only as a byproduct of gold mining, was negligible compared with that in 1938 and was less than half that in 1939.

Lead.—The bulk of the recovered lead output of Alaska in 1940 came from lead concentrates produced at the flotation mill of the Alaska Juneau Gold Mining Co. at Juneau.

MARKETS AND METALLURGY

More than 95 percent of the gold and about 56 percent of the silver produced from Alaska ores and gravels in 1940 were obtained in the form of gold-silver bullion, which was sold finally to the Seattle Assay Office and the San Francisco Mint. As there are no smelters or refineries in Alaska, all the remaining gold and silver produced and all the lead and copper were obtained from high-grade ore and concentrates shipped to smelters and refineries in the States, largely to the Tacoma (Wash.) and Selby (Calif.) smelters.

More than 190,000 ounces of fine gold were handled in 1940 by banks and bullion buyers throughout the Territory. The gold-silver bullion was either sent direct to the mints or cast into bars for shipping; in many instances the banks acted merely as agents for the lode and placer operators. The six largest purchasers (or agents) of bullion (handling over 182,000 fine ounces of gold) were: The First National Bank of Fairbanks, Fairbanks; the Miners and Merchants Bank of Alaska, Nome; the Miners and Merchants Bank of Iditarod, Flat; the First National Bank, Anchorage; and the Northern Commercial Co. and the Seattle First National Bank, Seattle, Wash.

Sixty-six mines in Alaska in 1940 were equipped with amalgamation or cyanidation plants (with the exception of the Alaska Juneau none had a mill with a daily capacity of over 75 tons); of these, 28 were equipped also with flotation, table, or jig concentrators. Five properties were equipped with straight concentration mills, chiefly flotation. Virtually all the lead concentrates produced in 1940 were obtained from concentration by flotation of the dry gold ore of the Alaska Juneau Gold Mining Co. property at Juneau. Most of the copper came from copper concentrates produced by the Alaska Gold and Metals Co. in Southeastern Alaska. Concentrates obtained from the amalgamation-concentration and cyanidation-concentration mills averaged 8 ounces of gold and 17 ounces of silver to the ton and were shipped chiefly to the Tacoma (Wash.) plant; concentrates from the straight concentration mills averaged 7 ounces of gold and 13 ounces of silver to the ton. Dry gold ore shipped direct to smelters averaged more than 1 ounce of gold and less than 1 ounce of silver to the ton. Mill heads averaging more than 1 ounce of gold to the ton were not uncommon.

The United States Assay Office at Seattle, Wash., reports the following receipts from Alaska in 1940.

Bullion of Alaskan origin deposited at United States Assay Office, Seattle, Wash., during year ended December 31, 1940, in fine ounces

District	Gold	Silver	District	Gold	Silver
Circle	17,376.819	1,803.33	Kuskokwim	23,997.896	2,735.90
Cook Inlet	58,561.650	5,873.27	Nome	136,006.960	14,959.11
Copper River	3,892.042	541.24	Southeastern Alaska	111,410.297	22,888.33
Eagle	4,318.074	728.76	Tanana [1]	281,587.892	45,694.17
Iditarod	66,090.856	10,000.07			
Koyukuk	2,114.042	271.32		705,356.528	105,495.50

[1] Includes mainly Bonnifield, Fairbanks, Hot Springs, Kantishna, and Tolovana districts in the Yukon Basin region.

REVIEW BY REGIONS

Cook Inlet-Susitna region.—This region, which includes the Prince William Sound, Valdez Creek, Willow Creek, and Yentna-Cache Creek districts, produced 24 percent of the total gold output from lode mines of Alaska in 1940. Although the number of producing mines in the region was 1 less than the 18 operating in 1939, the output of gold was 33 percent greater than in 1939.

The Alaska-Pacific Consolidated Mining Co., operating the Independence, Martin, and Free Gold mines, all on the west branch of Fishhook Creek, in the Willow Creek district, was the largest producer of gold in the Cook Inlet-Susitna region and the second-largest producer of lode gold in Alaska. The company amalgamation-flotation mill, which has operated continuously since its completion in 1937, treated an average of 72 tons of ore daily during 1940. An ore sorting and washing plant was being constructed during the year. Additional Diesel power equipment was installed, which brought the total power available to 735 hp., and a new bunkhouse and dry room were constructed. The mine produced 30,654 tons of ore averaging 1.2 ounces of gold to the ton. Development work in the mine consisted of 330 feet of shaft work, 4,719 feet of drifts, and 2,140 feet of diamond drilling; also, 1,506 feet were driven in a new low-level tunnel. The ore produced was transported to the mill by a ¼-mile aerial tram.

The Willow Creek Mines Co. operated the Lucky Shot mine in conjunction with the Lucky Shot 60-ton amalgamation-flotation-cyanidation mill. The mine is on Cragie Creek approximately 1½ miles above the junction of Cragie Creek and Willow Creek and is connected with the mill by a ¼-mile aerial tram. The output of ore in 1940 was 15,270 tons, averaging about 0.64 ounce of gold to the ton. In treatment the ore is crushed and sent to a closed circuit consisting of a ball mill, rake classifiers, and gold jigs. The jig concentrates are amalgamated. The classifier overflow passes into the flotation cells. The flotation concentrate goes to a regrind circuit (where more gold is amalgamated) and is then thickened, sacked, and shipped to the Tacoma (Wash.) smelter. The tails from the flotation cells are either sent to the cyanide plant or discharged into the creek.

Rapp & Till continued to operate their 35-ton cyanide mill in 1940 and treated 3,335 tons of gold tailings from the Willow Creek mines.

Other leading lode-gold producers in the Cook Inlet-Susitna region were the Fern Gold Leasing Co. (operating the Fern, Goodel, and Talkeetna groups), Al Renshaw (operating the Gold Cord mine), and Mabelle Mines, Inc. (operating the Mabelle mine), all in the Willow Creek district, and Cliff Gold Mines, Inc., operating the Cliff mine in the Prince William Sound district. No lode mines were operated in the Valdez Creek or Yentna-Cache Creek districts.

No floating connected-bucket dredges were operated in the Cook Inlet-Susitna region during 1940. Placer operations, using principally hydraulic giants, produced considerable gold from stream and bench gravel and gravels of ancient river beds. Among the larger placer-gold producers in the region were John E. Carlson and partners on Valdez Creek (operating on the Jopplin Bench and other claims) and L. S. Wickersham (operating on White Creek, a tributary of Valdez Creek), both in the Valdez Creek district; and Ray Jenkins (operating on Willow Creek), the Dutch Creek Mining Co. (operating on Dutch Creek), the Alaska Exploration & Mining Co. (operating on Bird Creek—hydraulic mining), and Devault, Devault & Seitz (operating on Pass Creek—hydraulic mining), all in the Yentna-Cache Creek district.

Copper River region.—The Copper River region includes the Chistochina, Nabesna, Nelchina, and Nizina districts. There were four operating lode mines in the region in 1940. The largest lode operator was the Nabesna Mining Corporation, in the Nabesna district. The ore reserves in old workings were depleted, and development work on the Golden Eagle group was begun in 1940; 1,972 tons of dry and siliceous gold ore and 2,102 tons of old tailings from the Nabesna mine were treated in the 60-ton flotation mill, producing 89 tons of copper concentrates which were sent to the Tacoma (Wash.) smelter. The Yellow Band Gold Mines, Inc., operated the Yellow

Band group of claims in the Nizina district and treated 461 tons of dry gold ore in an amalgamation mill. Other lode operations were carried on in the Copper River region by Nunatak Gold Mines, Inc., in the Nizina district, and McKinley Gold, Inc., in the Nelchina district.

Gravels were worked by hydraulic giants, sluices, and dragline dredges in the Copper River region in 1940. The largest producer of placer gold in the region was the Chititu Mines Co., operating on bench ground in Rex Gulch (a tributary of Chititu Creek) in the Nizina district. Two 3-inch Fisher hydraulic giants moved approximately 180,000 cubic yards of gravel, recovering 1,615.50 ounces of bullion with an average fineness of 0.906 in gold and 0.089½ in silver. Other producers were Green Mining Associates on Dan Creek in the Nizina district and Belanger, Cameron & Sullivan on Albert Creek in the Nelchina district.

Kenai Peninsula region.—The Kenai Peninsula region includes the Girdwood, Moose Pass-Hope, and Nuka Bay districts. The bulk of the gold and silver output in 1940 came from lode mining, principally in the Moose Pass-Hope district.

The United Mining & Development Co., operating the Gilpatrick mine and a small amalgamation mill in the Moose Pass-Hope district, treated 440 tons of dry gold ore; some new equipment was installed at this mine and mill in 1940. Other lode operators in the district included George Lindsay, operating the Alaska Oracle Extension; Case & Edwards, operating the Gladiator; and the Crown Point Mining Co., operating the Crown Point mine. In the Girdwood district, the only lode mining done was by the Crow Creek Gold Corporation on the Monarch and Jewel claims.

No floating connected-bucket dredges were in operation in the Kenai Peninsula region. The placer output came from small-scale operations throughout the region, the largest being the Palmer Creek Mining Co. on Resurrection Creek in the Moose Pass-Hope district.

Kodiak Island region.—The output of metals from Kodiak Island during 1940 came entirely from beach placering carried on by individuals.

Kuskokwim region.—The Kuskokwim region includes the Goodnews Bay, Nixon Fork, and Tuluksak-Aniak mining districts. No lode operations were carried on in the region in 1940.

Placers were worked in all the districts. Two dredges were operated in the Goodnews Bay district and two in the Tuluksak-Aniak district.

The New York Alaska Gold Dredging Co., largest gold producer in the region in 1940, operated two floating connected-bucket dredges (one 2-cubic foot and one 4-cubic foot) in the Tuluksak-Aniak district.

The Bristol Bay Mining Co. operated a floating connected-bucket dredge with sixty-four 2½-cubic foot buckets and a washing plant (both built by the W. W. Johnson Co.). On Wattamuse Creek in the Goodnews Bay district, this company was the second-largest producer of gold in the region. Dredging was carried on from May 1 to November 15.

Platinum was recovered by the Goodnews Bay Mining Co., operating on Salmon River and Squirrel and Platinum Creeks (tributaries of Salmon River). A Yuba floating connected-bucket dredge with ninety-two 8-cubic foot buckets and a sluice fed by a 1½-cubic yard dragline moved over a million yards of gravel during 1940. Of the total metals produced by these operations, 68 to 72 percent was platinum and 0.78 to 2.00 percent gold. The Goodnews Bay Mining Co. also operated a gold placer in Snow Gulch on the Arolic River, using a Joshua Hendy 3-inch hydraulic giant, a Bucyrus-Erie ¼-cubic yard Diesel-operated dragline, and an RD–8 caterpillar Diesel bulldozer. All the Goodnews Bay Mining Co. operations were in Goodnews Bay district.

Among the other larger operators in the region were: John B. Huff, using a Hydraulic Supply Co. 1-inch hydraulic giant and ID–40 Diesel International bulldozer on ground at Butte Creek, a tributary of the Arolic River, in the Goodnews Bay district; Strandberg & Sons, Inc., on Candle Creek in the Nixon Fork district; and the Garrison Co., with a Diesel-operated dragline, two bulldozers, and dry-land washing plant, working ground on Tuluksak River and Granite Creek, and Al Jones, using two bulldozers and sluice boxes, working ground on Rainey Creek, both in the Tuluksak-Aniak district.

Northwestern Alaska region.—Mining in the Northwestern Alaska region—comprising the Kiana and Shungnak districts and covering the area of the Kobuk River Valley—was confined to small placer operations in 1940.

Seward Peninsula region.—The Seward Peninsula region—comprising the Bluff, Council, Fairhaven, Kougarok, Koyuk, Nome, Port Clarence, and Solomon districts—had 22 floating connected-bucket dredges, numerous placer operations other than floating connected-bucket dredges, and only 1 operating lode mine in 1940. Gold recovered by dredges increased 26 percent in 1940 over 1939, and one more dredge was put into operation during the season. The average value of the gravel worked by dredges was about 50 cents a cubic yard—a slight increase over 1939. The active season for the average dredge operator started during the first week of June and lasted until the first week of October. The longest dredge operation began about the middle of May and continued until the middle of November. Preparation of dredging ground is started well ahead of actual dredging, and in some instances preparation of ground and general repair work are carried on throughout the year. Other types of placer operations averaged about 120 days for mines mechanically equipped, except hydraulic mines which averaged 10 to 20 days less. In rare instances, drift mining was done during the entire year.

The United States Smelting, Refining & Mining Co., in the Nome district, was the largest producer of gold in the region. The company operated three electrically powered Yuba dredges (one with 112, one with 103, and one with 78 9-cubic foot buckets). A small amount of hydraulicking also was done. Gravel washed in 1940 totaled 3,700,000 cubic yards—an increase of 19 percent over 1939; the gold production increased 21 percent. The Thirty-fifth Annual Report of the United States Smelting, Refining & Mining Co. for the year ended December 31, 1940 (dated March 19, 1941), says—

At Nome, Alaska, dredging operations started for the season on May 12 and continued until November 21. The three dredges on this property aggregated 567 dredging days compared with 483 dredging days in 1939. The yardage handled was considerably greater than in the previous year with average grade about the same. The new large deep-digging dredge which was ordered in 1940 is now under construction and, barring delays in delivery, should be put to work before the end of the 1941 season.

Arctic Circle Exploration, Inc., operated two dredges, each with seventy 4-cubic foot buckets, on Candle Creek in the Fairhaven district and ranked second in production of gold in the region in 1940.

Castleton & Keenan, operating a Washington Iron Works Diesel-powered dredge equipped with eighty-five 2¼-cubic foot buckets and a dragline on the Kougarok River in the Kougarok district, began dredging June 1 and ceased October 6.

Lee Brothers Dredging Co. operated two floating connected-bucket dredges on the Solomon River in the Solomon district. Dredge No. 1 operated from June 7 to November 12 and dredge No. 2 from June 30 to November 6. The combined production of the two dredges was over 5,000 fine ounces of gold and about 500 fine ounces of silver.

Other companies operating floating connected-bucket dredges in the Seward Peninsula region were: The Alaska Placer Co., Camp Creek Dredging Co., Council Dredging Co., Inland Dredging Co., and Ophir Gold Dredging Co., all in the Council district; Dry Creek Dredging Co. (flume dredge) and Forsgren Dredging Co., both in the Fairhaven district; Fox Bar Dredging Co. (Yuba dredge with 53 3-cubic foot buckets) in the Kougarok district; Dime Creek Dredging Co. and Ungalik Syndicate, both in the Koyuk district; Osborn Creek Dredging Co. and Tolbert Scott (Kimball type dredge with 29 2½-cubic foot buckets), both in the Nome district; Bartholomae Oil Co. (flume type dredge) in the Port Clarence district; and Casa de Paga Gold Co. in the Solomon district.

There were several large placer operations, other than those worked by floating connected-bucket dredges, in the Seward Peninsula region in 1940. Worthy of mention were the following: Topkuk Chief Mining Co. and Crabtree & Sullivan in the Bluff district; Grant Mining Co. and Laurin Bros. in the Kougarok district; Arthur W. Johnson in the Koyuk district; Arctic Mines, Inc., in the Port Clarence district; and E. W. Quigley in the Solomon district. The Topkuk Chief Mining Co., in the Bluff district, used a slackline cable outfit and the others mentioned used hydraulic giants with some combination of bulldozers, draglines, and pumping equipment in addition.

Southeastern Alaska region.—Southeastern Alaska—including the Admiralty Island, Chichagof Island, Hyder, Juneau, Ketchikan, and Windham Bay districts—produced 64 percent of the total lode gold and most of the silver, copper, and lead output of Alaska as a whole. There were 23 active mines in 1940—2 more than in 1939.

The Alaska Juneau was by far the largest producer of silver and lead and was second only to the United States Smelting, Refining & Mining Co. in output of gold in the Territory in 1940. The Twenty-sixth Annual Report of the Alaska Juneau Gold Mining Co. for the year ended December 31, 1940 (dated February 1, 1941), says—

During 1940 the amount of rock trammed from the mine was 4,739,790 tons, which is slightly in excess of the 1939 tonnage. The North ore body furnished 16 percent of this tonnage, the South ore body, 43 percent, while the Perseverance section of the mine supplied 41 percent of the total.

During the year 504,150 pounds of powder were used in blasting powder drifts; 55,250 pounds were used in Deep stoping in the blasting of long hole stations, making a total of 559,400 pounds of powder for primary breaking, or 0.12 pound per ton. Total powder consumption for primary and secondary breaking was 0.32 pound per ton trammed in 1940, as against 0.32 pound in 1939, and 0.36 in 1938.

In the North ore body, the main shaft extension of 450 feet from 10 level to 13 level was finished during the year. Work on the ore pockets and skip loading apparatus on 13 level still remains to be done. The main haulage drift on 13 level will be enlarged later to accomodate 10-ton box-type cars. Hoisting and haulage facilities, as well as stope preparation, should all be completed and ready for production before the end of 1941. The outlining of ore in the western part of the Deep workings between 13 and 9 levels was continued throughout the year. In the 91 winze area, on the east end of the Deep North ore body, an ore-way raise from 10 level to 6 level is being driven to expedite closer exploratory work and probable future preparatory mining.

In the Upper Perseverance Mine, work is still being done to gain access to the old Alaska Gastineau Co.'s workings for the purpose of further exploration, drainage, and actual mining. Many of these upper levels have been lost entirely, and other parts have become isolated by caving, which took place many years ago. During the year 740 feet of small size drain tunnel was driven in the Perseverance Mine, thus completing 10,000 feet of main haulage-level drainage system.

Mill.—The only alteration to the flow sheet during the year was the completion of a 6-foot by 12-foot regrind mill installation started during the previous year. Part of the hillside water system, providing a supply of fresh water for the mill, steam power plant, and for fire protection, was replaced with a 2,500-foot water tunnel and new pipe lines. The new system is entirely free from the danger of slides and is a decided improvement over the old in many other ways.

Power plants.—The work of relocating part of the Annex Creek electric transmission line was continued throughout the summer months, and while good progress was made, the job will not be completed until the summer of 1941. During the summer of 1940, a good start was made on the repairing of the top 30 feet of the upper face of Salmon Creek Dam. This dam has been in operation for 27 years, during which time the weather has caused a deterioration of the concrete, especially during the winter months when the water is drawn down from the top. The repair job is about one-third finished and will be continued this summer.

Labor.—In general, the supply of unskilled labor was ample, but there was a shortage of skilled labor during most of the year. Labor turn-over was higher for the year 1940 than for the past several years.

In May 1940 a new contract and wage agreement with the Union, which is the certified bargaining agent for all employees, was signed. From that date, all time worked in excess of 40 hours per week was paid for at the overtime rate. The average wage per day was $6.69 in 1940, as against $6.63 in 1939.

The over-all cost per man per day was $10.87 in 1940, as against $11.22 for 1939. (See page 184 for tables of metal recoveries, production, and operating costs.)

Gold content of ore from Alaska Juneau mine, 1936–40, and total, 1893–1940

Year	Rock to mill from mine (tons)		Gold (ounce)				
			Recovery per ton fine-milled		Losses per ton of tailings		Content of rock from mine to mill
	Ore fine-milled	Coarse tailings rejected	In bullion	In galena concentrates	Fine	Coarse	
1936	2,462,046	1,904,754	0.0544	0.0061	0.0089	0.0069	0.0422
1937	2,251,079	2,191,681	.0594	.0080	.0116	.0082	.0441

1939	2,377,718	2,270,342	.0454	.0088	.0083	.0066	.0352
1940	2,308,397	2,431,393	.0442	.0089	.0081	.0065	.0331
Total and average, 1893–1940	42,217,033	37,288,455	.0510	.0115	.0121	.0086	.0436

The Hirst-Chichagof Mining Co. on Chichagof Island operated its mine continuously and, according to its report, produced 12,552 tons of crude ore which was treated in the company 35-ton amalgamation-flotation mill. The bullion product was sent direct to the Seattle Assay Office and the concentrates were shipped to the Tacoma (Wash.) smelter. The company was again the second-largest producer of gold in the region.

Gold, silver, and lead recoveries from Alaska Juneau mine, 1893–1940

Year	Gold		Silver		Lead		Total value recovered
	Fine ounces	Value	Fine ounces	Value	Pounds	Value	
1893–1913	34,239.49	$707,730.15	(1)	(1)	(1)	(1)	$707,730.15
1914–35	1,903,589.57	43,581,134.13	1,190,106.61	$675,700.10	27,366,149	$1,525,127.88	45,781,962.11

Profit before depreciation, depletion, and income taxes	1,165,079.77	----------	1,329,756.06	----------	20,470,216.80	----------

The Chichagof Mining Co. at Klag Bay, in the Chichagof Island district, worked old tailings and produced bullion that was sent to the Seattle Assay Office and dry gold concentrates that were shipped to the Tacoma (Wash.) smelter.

Other lode-mining companies operating in the region were: Nelson & Tift, working the N & T mine in the Ketchikan district; Alaska Gold and Metals Co., (which produced nearly half of the copper output from Alaska in 1940) working the Salt Chuck, Rush, and Brown mines, and Wendell Dawson, working the Davis claim, both in the Ketchikan district; and Howard C. Hayes, working old tailings of the Alaska Juneau mine, and Polson & Lundgren, working old tailings from the Ready Bullion and Homestead mines, both in the Juneau district.

No large placer operations were carried on in the region during 1940. The placer output came chiefly from small sluicing operations in the Juneau and Windham Bay districts.

Yukon River Basin region.—The Yukon River Basin—comprising the Bonnifield, Chandalar, Chisana, Circle, Eagle, Fairbanks, Fort Gibbon, Fortymile, Hot Springs, Iditarod, Innoko, Kantishna, Koyukuk, Marshall, Rampart, Richardson, Ruby, and Tolovana districts—yielded 67 percent of the total output from connected-bucket dredges in Alaska during 1940; it ranked first in gold recovered from other placers, and third in that from lode mines.

Twenty-four floating connected-bucket dredges (including two single-dipper dredges) were operating in the region, five more than in 1939.

The United States Smelting, Refining & Mining Co., operating eight floating connected-bucket dredges (two more than in 1939), was by far the largest producer of gold and silver in the Yukon River Basin region. The company operated two 10-cubic foot Bethlehem dredges (with 111 and 93 buckets, respectively), one 10-cubic foot new Yuba dredge (with 106 buckets), three 6-cubic foot Bethlehem dredges (with 78, 78, and 68 buckets, respectively), one new 5-cubic foot Yuba dredge (with 84 buckets), and one 3-cubic foot Yuba dredge (with 68 buckets); all the dredges are electrically operated. More than 300 Joshua Hendy hydraulic giants were used to remove the bulk of the overburden; some of the material moved by hydraulic giants was washed. At the open pit on Cripple Creek a Bucyrus walking dragline with 8- and 12-cubic yard buckets fed a movable, self-propelling loading plant connected with a belt-conveyor system 1 mile or more long; a carry-all stacks the material handled. At the Cripple Creek operation the banks of the dredge cut, which are 50 to 100 feet high, are frozen so they will stand.

The Thirty-fifth Annual Report of the United States Smelting, Refining & Mining Co. for the year ended December 31, 1940 (dated March 19, 1941), says—

At Fairbanks, Alaska, dredging operations started for the season on March 13 and continued until December 7. All of the eight dredges were operated, including the two new dredges referred to in last year's report, the newly acquired small dredge starting on May 3, and the newly constructed large dredge starting on August 8. In all, the dredges aggregated 1,799 dredging days compared with 1,462 dredging days in 1939. The yardage handled in 1940 was larger and of higher average grade than in the previous year.

At both the Fairbanks and Nome properties the gold output for the season was the highest in their history, due to the fact that the two new dredges at Fairbanks operated a part of the season. Acquisition and development of additional dredging ground and preparation of ground ahead of the dredges have been actively continued, with the result that the gold reserves and the yardage of prepared ground are greater at the end of 1940 than at any time in the past.

In the Circle district three dredges were again operated in 1940. During the season from May 30 to October 13, at its properties on Coal Creek, Gold Placers, Inc., operated its W. W. Johnson Co. dredge equipped with sixty 4-cubic foot buckets; the dredge washed 356,000 cubic yards of gravel, and eight 2-inch Joshua Hendy hydraulic giants moved 317,000 cubic yards of overburden. The C. J. Berry Dredging Co. operated on lower Mammoth Creek. Alluvial Golds, Inc., operating six 2-inch Joshua Hendy hydraulic giants and a W. W. Johnson Co. dredge (with seventy-two 4-cubic foot buckets) on Woodchopper Creek, moved 261,000 cubic yards of overburden and washed 372,800 cubic yards of gravel. The output by these three dredges ranked the Circle district second in gold produced by dredges in the Yukon River Basin in 1940.

In the Hot Springs district the American Creek Operating Co., Inc., mining on American Creek, operated the only dredge active in 1940. The company has a Diesel-powered Yuba dredge equipped with 2½-cubic foot buckets.

In the Bonnifield district two dredges, both of the Becker-Hopkins single-dipper type, were operated in 1940. The dipper is mounted on a steel framework at the digging end of the dredge in such a manner as to permit it to be elevated to an angle that allows the gold-bearing gravel to be discharged into a trommel screen on the floating washing plant. The washing plant and stacker unit are similar to those used on lightweight dredges. The Triple X Placers Co. worked one of the dredges on Moose Creek, and Standard Mines, Inc., worked the other on Eva Creek; both operations were managed by C. W. Pringle.

On Wade Creek in the Fortymile district the Wade Creek Dredging Co. continued to operate its Risdon steam-powered dredge equipped with seventy 3½-cubic foot buckets; the dredge washed 160,600 cubic yards of gravel, and a caterpillar RD–7 Diesel-powered bulldozer moved 40,000 cubic yards of overburden during the 1940 season, beginning June 20 and ending October 11. The other dredge in the district—a W. W. Johnson Co. dredge with fifty-nine 2⅝-cubic foot buckets—was operated by the Boundary Dredging Co. on Canyon Creek.

In the Iditarod district two dredges were operated on Otter Creek in 1940—one by the J. E. Riley Investment Co. and the other by the North American Dredging Co.

In the Innoko district four dredges were operating in 1940—one by the Ganes Creek Dredging Co. on Ganes Creek and in Mack Gulch, one by Moss & Larson on Ganes Creek, one (flume type) by Nels J. Vibe on Yankee Creek, and one by Waino F. Puntilla on Little Creek.

In the Tolovana district the Nome Creek Mining Co. operated a W. W. Johnson Co. dredge having 4-cubic foot buckets and washed 692,000 cubic yards of gravel in 1940; work was begun May 11 and ended November 3. The Livengood Placers, Inc., operated on Livengood Creek the only other dredge in the district. The company has a Yuba dredge with eighty-eight 6-cubic foot buckets.

Placer operations of all types—other than floating connected-bucket dredges—were to be found throughout the Yukon River Basin region, some with production as large as or larger than the average dredge and many producing over 500 fine ounces of gold. The combined production of these operations was over 90,000 fine ounces of gold in 1940.

In the Bonnifield district the Gold King Mining Co., using three hydraulic giants and a hydraulic elevator, washed 36,000 cubic yards of gravel on Gold King Creek between May 15 and September 20 and was the largest operator among the other types of placers.

In the Circle district, some of the larger placer operators included: The C. J. Berry Dredging Co., hydraulicking on Mastodon Creek; the Berry Holding Co., using a slackline scraper and bulldozer on Eagle Creek; the Central Mining Co. (property purchased from the Deadwood Mining Co. April 9, 1940), hydraulicking on Deadwood Creek; Johnston & Blondo, operating a dragline and bulldozer in conjunction with a dry-land washing plant; and the Mastodon Mining Co., hydraulicking with dragline and bulldozer as auxiliary equipment on Deadwood Creek.

Among the larger placer producers in the Fairbanks district, which was the largest gold-producing district in the Yukon River Basin region, were: The Alder Creek Mining Co., with a dragline and bulldozer, operating on Butte Creek; Blake & Larson, operating a drift mine in lower Chatanika River; the Faith Creek Mining Co., hydraulicking on Faith Creek; the Gilmore Mining Co., using a dragline on Gilmore Creek; Helmer Johnson, with bulldozer and highline stacker, operating on upper Cleary Creek; William Basham & E. F. Schrieber, operating on Nome Creek; and the Wolf Creek Mining Co., operating a dry-land washing plant in conjunction with a dragline, bulldozers, and hydraulic giants (the company washed about 140,000 cubic yards of gravel and recovered over 3,000 fine ounces of gold).

On Utopia Creek in the Fort Gibbon district L. McGee (Utopia Creek Mining Co.) operated a dragline and bulldozer in conjunction with hydraulic giants, washed 70,000 cubic yards of gravel, moved 110,000 cubic yards of overburden, and recovered over 2,000 fine ounces of gold.

In the Fortymile district Skoland & Kirkpatrick working bench gravels for 5 months and using hydraulic giants and a bulldozer on Lost Chicken Hill, Oliver & Dodson hydraulicking on Jack Wade Creek, and the Central Development Syndicate, also hydraulicking on Jack Wade Creek, were large producers among these types of placer operations.

In the Hot Springs district, the larger placer operators included: The Montana Mining Co., using hydraulic giants with a dragline and bulldozer on Omega Creek and Alpha Creek; J. R. Frank & Co., hydraulicking on Pioneer Creek; and the Cleary Hill Mines Co., hydraulicking on Sullivan Creek.

In the Iditarod district, the larger producers from these types of placer operations were: The Awe Mining Co., operating two draglines, bulldozers, highline scraper, and hydraulic giants in conjunction with a dry-land washing plant on Chicken Creek; Peter Miscovich & Sons, hydraulicking on Otter Creek; Uotila & Ogriz, operating with dragline, hydraulic giants, and a bulldozer in conjunction with a dry-land washing plant on Slate Creek; Sakow & Tomoff, hydraulicking with dragline and bulldozer auxiliary equipment on Willow Creek; and the Northland Development Co. on Willow Creek.

In the Innoko district, the larger of these placer operations included: Degnan & Rosander, operating a dry-land washing plant on Little Creek; Sid Paulson, hydraulicking on Colorado Creek; the Cripple Creek Mining Co., with a dry-land washing plant on Cripple Creek; Hard, Uotila & Hansen, hydraulicking on Beaver, lower Cripple, Bear, and Graham Creeks; Uotila & Hard, operating a dry-land washing plant on Ophir Creek; Three Miners, Inc., operating a dry-land washing plant during the season (April 15 to October 15) on Madison Creek; and Nels J. Vibe & Andrew Schwaesdall (Vibe bought Schwaesdall's interest in October 1940), operating a dry-land washing plant on Spaulding Creek.

In the Kantishna district, the Caribou Mines operated a dry-land washing plant on Caribou Creek.

John Repo & Andrew Schwaesdall, operating hydraulic giants and two RD-8 bulldozers on Myrtle Creek, were the largest gold producers of all types of operation in the Koyukuk district.

Large gold producers in the Marshall district included: Johnston & Ostnes, hydraulicking on Willow Creek; Vance Hitt, hydraulicking on Stuyohok Creek (moved in August 1940 to Flat Creek, a tributary of Poorman Creek, in the Ruby district); the Wilson Creek Mining Co., operating a dry-land washing plant in Elephant Gulch, a tributary of Wilson Creek; and the Yukon Mining Co., operating a dry-land washing plant on Bobtail, Windy, and Buster Creeks.

In the Rampart district Minook, Ltd., operating a dry-land washing plant with a shovel and a bulldozer on Little Minook Creek, was the only large producer.

In the Ruby district, the two largest placer operators were A. J. Burk (Midnight Mining Co.) and the Long Creek Mining Co., each operating bulldozers and a dragline on Long Creek.

The second-largest gold producer in the Tolovana district was Parker & Sons, operating on Olive Creek and using hydraulic giants and bulldozers.

The season of operation for the average dry-land washing plant began between May 1 and May 15 and closed about October 1; the season for hydraulicking and sluicing operations was about the same.

Lode mining in the Yukon River Basin region produced 20,164 fine ounces of gold and 8,551 fine ounces of silver in 1940, increases of 3 percent in gold and 55 percent in silver over 1939.

Of the 20 lode mines operating in the region in 1940, the leading producers were: The Cleary Hill Mines, Inc., working the Cleary Hill mine, the United States Smelting, Refining & Mining Co. operating the McCarty mine, and the Hi Yu Mining Co. operating the Hi Yu mine, all in the Fairbanks district; and the Red Top Mining Co., operating the Banjo vein in the Red Top mine, in the Kantishna district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN ARIZONA

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

The total value of the output of recoverable metals from mines in Arizona was $82,167,759 in 1940, compared with $72,616,408 in 1939—an increase of 13 percent (see fig. 1); it was the greatest (with the exception of 1937) since 1929, when the total value was $155,567,133. There were substantial increases in both quantity and total value of copper, lead, and zinc in 1940 but decreases in gold and silver. The total value of the copper was $9,024,898 more than in 1939, lead $314,126, and zinc $1,249,512; gold declined $757,610 and silver $279,575. The total value of the metals recovered from copper ore was $70,731-122 in 1940, or 86 percent of the State total. Since 1869, Arizona has produced 9,120,479 short tons of net copper; the peak year was 1929, when 415,314 tons were produced. The output of copper in 1940 has been exceeded only in 1937 during the past decade, the output of zinc was the largest in the history of the State, and the output of lead has been exceeded in only 1 year (1916, with 27,062,087 pounds). The increase in the average sales price of copper to 11.3 cents a pound in 1940 caused substantial increases in output of copper in nearly all the copper-producing districts, and the rise in the average sales price of silver, lead, and zinc resulted in a marked increase in output of zinc-lead ore. The decline in output of gold and silver resulted from the drop in output of siliceous ores and from the lower content of gold and silver in copper ore.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1936–40, and total, 1860–1940, in terms of recovered metals

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[3] Figures for sluicing include those for drift mining.
[4] Figures for dragline floating dredges include those for dry-land dredges.

Gold.—The output of recoverable gold in Arizona in 1940 was 294,807 fine ounces—a decline of 7 percent from 1939. Gold from siliceous ores (chiefly dry and siliceous gold ore) decreased 13,937 ounces, owing to marked decreases in gold ore treated by cyanidation in the Oatman section of the San Francisco district and in the Weaver district in Mohave County. Gold from copper ore declined 10,807 ounces, principally because of the large decrease in output of gold from the Verde district, but gold from zinc-lead ore increased 3,437 ounces as a result of the gain in output of zinc-lead ore from the Tennessee mine at Chloride and the Shattuck Denn mine at Bisbee. Gold from placers decreased slightly; 42 percent of the total placer gold was recovered by dragline dredging at properties on Lynx Creek and Big Bug Creek in Yavapai County. The Copper Queen (Bisbee) branch of the Phelps Dodge Corporation was, as usual, the leading gold producer in Arizona; it was followed by the New Cornelia mine in Pima County, the Mammoth-St. Anthony Limited property in Pinal County, the Goldroad mine (United States Smelting, Refining & Mining Co.) in Mohave County, and the United Verde mine in

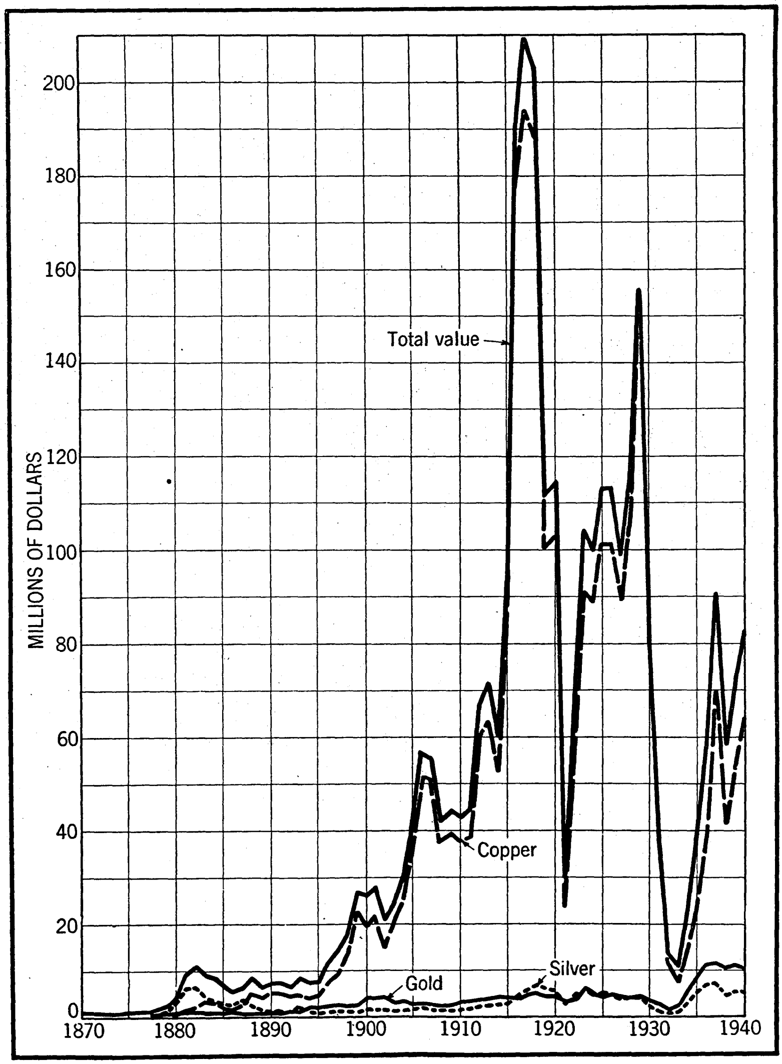

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1940. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Yavapai County. These five properties produced more than 55 percent of the State total output. Other large gold producers were the Octave mine (American Smelting & Refining Co.) in Yavapai County, the Shattuck Denn mine in Cochise County, the Tyro mine (Gold Standard Mines Corporation) in Mohave County, the Magma mine in Pinal County, and the Iron King mine in Yavapai County. Siliceous ore yielded 49 percent of the State total gold, copper ore nearly 44 percent, and zinc-lead ore more than 4 percent. The chief gold-producing districts in Arizona were the Warren (mostly copper ore), San Francisco (nearly all gold ore), Ajo (copper ore), Old Hat (gold ore), Verde (mostly copper ore), and Weaver (Yavapai County) (gold ore).

Silver.—The output of recoverable silver in Arizona in 1940 was 7,075,215 fine ounces—a decline of 10 percent from 1939. Silver from siliceous ores declined 560,999 ounces, that from copper ore 356,767 ounces, and that from lead ore 15,832 ounces, but silver from zinc-lead ore increased 179,706 ounces. Copper ore yielded 63 percent of the State total silver, siliceous ores 19 percent, zinc-lead ore nearly 14 percent, zinc-copper ore nearly 3 percent, and lead ore 1 percent. The Phelps Dodge Corporation continued to be the chief silver producer in Arizona, although its output was 12 percent less than in 1939; its three properties (Copper Queen, United Verde, and New Cornelia) produced nearly half of the State total. Other large silver producers in 1940 were the Magma, Shattuck Denn, Reymert, Trench, and Iron King mines. Silver output decreased substantially in the Oro Blanco, Ash Peak (Duncan), Verde, Wallapai (Chloride), and Warren districts but increased sharply in the Harshaw, Vulture, Pioneer, and Patagonia districts. The chief silver-producing districts were the Warren (Bisbee), Verde (Jerome), Pioneer (Superior), Harshaw, Ajo, and Wallapai (Chloride).

Copper.—The output of recoverable copper in Arizona in 1940 was 562,338,000 pounds—a 7-percent gain over 1939. There was a general increase in five of the seven chief copper-producing districts, as follows: Mineral Creek (Ray) district increased 20,292,974 pounds; Globe-Miami district, 16,011,483 pounds; Ajo (New Cornelia) district, 3,388,528 pounds; Warren (Bisbee) district, 1,274,783 pounds; and Pioneer (Superior) district, 989,708 pounds; the output of copper from the Copper Mountain (Morenci) district declined 4,750,252 pounds and that from the Verde (Jerome) district 970,595 pounds. These seven districts contributed 99 percent of the State total copper, and the Globe-Miami district continued as the leading producer. Copper ore and its products yielded 557,900,895 pounds of copper, as follows: 15,530,822 tons of copper ore treated by concentration yielded 56 percent; 1,555,100 tons of copper ore shipped crude to smelters, 25 percent; and 3,198,904 tons of copper ore leached and 20,460 tons of cement copper (from mine-water precipitates and underground leaching operations), 19 percent. The New Cornelia property continued to be the largest copper producer in Arizona; its output was 3 percent greater than in 1939, and it was followed in order by the Copper Queen, Inspiration, United Verde, Miami, Ray (Nevada Consolidated Copper Corporation), Magma, and Morenci (Phelps Dodge Corporation).

Lead and zinc.—The output of recoverable lead in Arizona in 1940 was 26,532,000 pounds—an increase of 23 percent over 1939; the output of recoverable zinc was 30,912,000 pounds—largest in any year in the history of the State and more than double that in 1939. About 45 percent of the State total lead and 27 percent of the zinc came from Santa Cruz County, 18 percent of the lead and 28 percent of the zinc from Mohave County, and 16 percent of the lead and 21 percent of the zinc from Pinal County; nearly all the remainder of the lead and zinc came from Yavapai and Cochise Counties. More than 72 percent of the total lead and more than 79 percent of the total zinc came from zinc-lead ore; nearly all the rest of the lead came from siliceous ores, lead ore, and zinc-copper ore, and the rest of the zinc from zinc-copper ore. The Trench mine of the American Smelting & Refining Co. near Patagonia in Santa Cruz County was the largest producer of lead in the State; it was followed by the Tennessee mine at Chloride, Mammoth-St. Anthony Limited property at Tiger, Flux mine near Patagonia, Montana mine at Ruby, Iron King mine at Humboldt, Duquesne property near Patagonia, and Shattuck Denn mine at Bisbee. The largest producer of zinc in the State was the Tennessee mine; it was followed by the Magma, Trench, Shattuck Denn, Iron King, Duquesne, Flux, and Montana properties. The marked increase in output of lead and zinc from the Tennessee, Trench, Flux, Shattuck Denn, and Duquesne properties more than offset the large decrease from the Montana mine.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1940, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	63	8	65,064	$2,277,240	2,574,564	$1,830,801

[1] Includes placer sands treated by dry concentration plants.

[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

[3] Figures for dragline floating dredges include those for dry-land dredges.

MINING INDUSTRY

The increased sales price of copper, silver, lead, and zinc in 1940 caused substantial improvement in the mining industry of Arizona, especially in the mining of copper ore and zinc-lead ore. The output of copper ore increased to 20,284,826 tons (the greatest since 1929), and that of zinc-lead ore increased to 271,000 tons (the largest in any year in the history of the State). The output of siliceous ores, however, declined 11 percent. Nearly all the copper ore came from Gila, Pima, Pinal, Cochise, Yavapai, and Greenlee Counties; virtually all the zinc-lead ore came from Santa Cruz, Yavapai, Mohave, and Cochise Counties; 92 percent of the gold ore came from Mohave, Yavapai, and Pinal Counties; 58 percent of the silver ore came from Pinal County; 59 percent of the gold-silver ore came from Yavapai County; nearly half the lead ore came from Cochise County; and all the zinc-copper ore came from Pinal County.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Arizona in 1940, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	620	783, 234	129, 938	210, 312	334, 107	3, 979, 458	
Dry and siliceous gold-silver ore	77	104, 235	13. 660	570, 363	433, 072	998, 109	
Dry and siliceous silver ore	102	40, 979	863	597, 643	221, 594	140, 611	
	[1] 759	928, 448	144, 461	1, 378, 318	988, 773	5, 118, 178	
Copper ore	164	20. 284, 826	128, 720	4, 463, 702	[2] 557, 900, 895	178, 667	
Lead ore	120	8, 813	895	68, 376	43, 494	1, 879, 819	
Lead-copper ore	3	44	7	1, 350	2, 407	16, 917	
Zinc-copper ore	1	79, 044	982	191, 800	2, 348, 000	200, 000	6, 350, 000
Zinc-lead ore	12	271, 000	13, 501	970, 561	1, 054, 431	19, 138, 419	24, 562, 000
Total, lode mines	[1] 1, 024	21, 572, 175	288, 566	7, 074, 107	[2] 562, 338, 000	26, 532, 000	30, 912, 000
Total, placers	276		6, 241	1, 108			
	1, 300	21, 572, 175	294, 807	7, 075, 215	[2] 562, 338, 000	26, 532, 000	30, 912, 000
Total, 1939	1, 118	18, 793, 260	316, 453	7, 824, 004	[3] 524, 224, 000	21, 542, 000	13, 422, 000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 103,327,137 pounds recovered from ore leached and mine-water precipitates.
[3] Includes 86,058,553 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

The output of ore of all classes treated in Arizona increased from 18,793,260 tons in 1939 to 21,572,175 in 1940—the greatest output since 1929; copper ore increased from 17,468,926 to 20,284,826 tons and zinc-lead ore from 204,778 to 271,000 tons. About 94 percent of the total in 1940 was copper ore, nearly 4 percent gold ore, and the rest principally zinc-lead ore, gold-silver ore, zinc-copper ore, and silver ore.

Gold ore treated at amalgamation mills decreased from 5,000 tons in 1939 to 4,162 in 1940, but siliceous material treated at cyanidation plants increased from 733,943 to 742,801 tons. Cyanidation plants were operated continuously in 1940 at the Goldroad, Gold Standard, Producers Mines, Inc., Vivian, Congress, Octave, Mammoth-St. Anthony, Alvarado, Yarnell, and Vulture properties. Cyanidation plants used 195,000 pounds of sodium cyanide, 636,900 pounds of Aero Brand calcium cyanide, 75,000 pounds of zinc dust, 121,000 pounds of zinc shavings, 2,260,000 pounds of lime, and 515 pounds of lead acetate.

Ore treated at concentration plants increased from 14,017,765 tons in 1939 to 15,941,271 in 1940; the ore concentrated in 1940 comprised 6,296 tons of gold ore, 47,540 of gold-silver ore, 4,353 of silver ore, 15,530,822 of copper ore (compared with 13,542,200 in 1939), 2,357 of lead ore, 79,044 of zinc-copper ore, and 270,859 of zinc-lead ore. Copper ore from the Miami property (5,300,604 tons) was treated by a combination of leaching and concentration, and this tonnage is included in figures for ore treated at straight concentration plants. Ore from the Inspiration mine in 1940 was treated by straight leaching, but 237,274 tons of slimes discarded from the leaching-plant feed were concentrated. The concentrator at Ajo (20,000-ton-a-day), the ferric sulfate leaching plant at Inspiration (9,000-ton), the concentrator (18-000-ton) and leaching plant (3,000-

ton) at Miami, the concentrator at Clarkdale (1,600-ton), the concentrator at Hayden (12,000-ton), the concentrator at Superior (850-ton), and the test concentrator at Morenci (1,500-ton) were operated continuously on copper ore in 1940 at an increased rate over 1939. Copper-smelting plants at Douglas (5,000-ton), Clarkdale (5,000-ton), Hayden (1,000-ton), Miami (1,500-ton), and Superior (450-ton) were operated throughout the year.

The following tables give details of the treatment of all ores produced in Arizona in 1940.

Mine production of metals in Arizona in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	4,162	882	321			
Ore, old tailings, and slimes cyanided	742,801	72,141	125,009			
Concentrates smelted	862,160	101,451	2,658,647	318,549,746	24,115,117	30,874,492
Ore smelted	1,685,544	114,092	4,290,130	140,461,117	2,416,883	37,508
Copper precipitates smelted	20,460			[1] 32,737,425		
Copper ore leached	[2] 3,198,904			70,589,712		
Placer		6,241	1,108			
		294,807	7,075,215	562,338,000	26,532,000	30,912,000
Total, 1939		316,453	7,824,004	524,224,000	21,542,000	13,422,000

[1] Distributed as follows: Cochise County, 2,626,000 pounds; Gila County, 4,406,837 pounds; Greenlee County, 18,740,000 pounds; Pinal County, 6,218,000 pounds; and Yavapai County, 746,588 pounds.
[2] Treated by straight leaching at 1 plant in Gila County.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Arizona in 1940, by types of mills and by counties, in terms of recovered metals

County	Material treated (short tons)	Recovered in bullion: Gold (fine ounces)	Recovered in bullion: Silver (fine ounces)	Concentrates smelted and recovered metal: Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)

REVIEW BY COUNTIES AND DISTRICTS

COCHISE COUNTY

California district (Hilltop).—The metal output of the California district in 1940 was mostly lead ore from the Hilltop and Solution properties.

Cochise district.—In 1940, as in 1939, a little copper ore was produced from the Centurion mine.

Dos Cabezas and Tevis district.—The most important production in the Dos Cabezas and Tevis district in 1940 was placer gold recovered by a dry-land dredge at the Inspiration property and lode gold from the Dives and Gold Prince mines.

Golden Rule (Dragoon) district.—Virtually all the output of the Golden Rule district in 1940 was gold ore from the Golden Rule mine, which was treated by amalgamation.

Hartford (Huachuca Mountains) district.—The Armistice group near Hereford was worked in 1940, and several cars of crude lead ore were shipped to a smelter. The rest of the output from the Hartford district was chiefly gold ore from various prospects and placer gold from the Gold Nugget claim.

Swisshelm district (Elfrida).—The value of the metal output of the Swisshelm district was much greater in 1940 than in 1939, due largely to increased output of lead ore from the Scribner mine; the Chance and Great American mines also produced lead ore.

Tombstone district.—The Tombstone Development Co. continued in 1940 to be the most important producer in the Tombstone district; 6,680 tons of gold-silver-lead ore were shipped to the smelter at El Paso, Tex. The remainder of the district output was chiefly old tailings (gold-silver) from the Contention dump, lead ore from the Tombstone Extension mine, and silver ore from the Mellgren, Old Guard, and Solstice properties.

Turquoise district (Courtland, Pearce, Gleeson).—Several hundred tons of lead-silver ore were shipped in 1940 from the Defiance mine, by far the largest producer in the Turquoise district.

Warren district (Bisbee, Warren).—In 1940, as in 1939, the value of metal output in the Warren district was the greatest in any district of Arizona; it gained 10 percent over 1939. Crude copper ore (more than 1,000,000 tons) from the Copper Queen branch of the Phelps Dodge Corporation was, as usual, the principal output; the property also yielded 491 tons of lead ore and 1,924 tons of copper precipitates. It remained the largest producer of gold and silver in the State and again ranked second in copper.

The Bisbee mines of the Copper Queen branch of the Phelps Dodge Corporation, according to the annual report of the corporation for 1940, produced 804,926 tons of ore from the Limestone division. In comparison with 1939, a larger tonnage of ore was mined, the copper content of the ores mined was lower, and the production of copper increased slightly. From the Porphyry ore body, 187,539 tons were mined and shipped to the Douglas reduction works as siliceous flux. Production by leasers was greatly curtailed and, including a small tonnage of lead ore, totaled 16,381 tons. The surface and underground precipitation plants produced 1,924 tons of copper precipitates. The advance in exploration, development, and stope preparation amounted to 65,646 feet; in addition, 19,427 feet of diamond drilling were done. The results of the year's exploration and development campaign are considered encouraging, according to the report, as important ore extensions were developed in several known ore areas of the mine and scattered but extensive mineralization was encountered in drifting east of the Campbell fault on levels between the 2,000 and 2,566. In the Cole mine, the Dallas fault zone has opened up in a very satisfactory way. Pockets and skip-hoisting facilities were installed at the Cole shaft late in the year. Two 2,000-gallon centrifugal pumps were installed on the 2,700 level of the Campbell shaft to hasten drainage of the area east of the Campbell fault and permit necessary exploration in that area. This installation was ready for service in December. The average pumping rate at the Junction shaft was 6,379 gallons a minute, or slightly less than in 1939.

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1940, by counties and districts, in terms of recovered metals

[1] Rincon district lies in both Cochise and Pima Counties.
[2] Ellsworth district lies in both Maricopa and Yuma Counties.
[3] Old Hat district lies in both Pima and Pinal Counties.

The output of copper ore from the Denn mine increased to 124,811 tons, and the property was also a large producer of zinc-lead ore. The Shattuck Denn Mining Corporation remodeled its 100-ton flotation plant during the year and treated 17,789 tons of zinc-lead ore. Most of the remainder of the district output was gold ore from the Sure Thing mine.

COCONINO COUNTY

Francis district.—Small lots of copper ore were produced in 1940 from various prospects.

Jacob Canyon and Warm Springs district.—Lessees operated the Mackin, Petoskey, and Brown Derby properties in 1940 and shipped carbonate copper ore to the smelter at Garfield, Utah.

GILA COUNTY

Banner and Dripping Springs district.—The principal output in the Banner and Dripping Springs district in 1940 was crude copper ore from the Christmas mine and crude gold ore from the Columbia and Gold Queen-Gold Nugget properties. Virtually all the placer gold produced in the district was recovered by a dry-land dredge at the Bywater claim.

Globe-Miami district.—The Globe-Miami district continued in 1940 to be the chief copper-producing area in Arizona on account of the large output of copper ore from the Inspiration and Miami properties. The Inspiration property, with a yield of 76,119,435 net pounds of copper, was the largest producer of copper in the district. According to the printed annual report of the Inspiration Consolidated Copper Co. for the year ended December 31, 1940, 3,187,037 tons of copper ore from which the slimes had been removed were treated by ferric sulfate leaching. The ore averaged 1.25 percent copper, of which 0.651 percent was oxide and 0.60 percent sulfide; extraction was 98.464 percent of the oxide and 77.629 percent of the sulfide. The slimes (237,274 tons) removed from the ore were treated at the concentrator to recover the sulfide copper, and the tailings were treated with sulfuric acid to dissolve the oxide copper. The Miami Copper Co. operated its 18,000-ton concentrator and 3,000-ton leaching plant throughout the year and treated 5,300,604 tons of ore containing an average of 0.736 percent copper; according to the printed annual report of the company, the net yield of copper was 64,129,683 pounds, and 383,124 pounds of molybdenum were recovered in the copper sulfide concentrates. Most of the district gold and silver output was recovered from copper ore from the Miami mine and from gold-silver ore (10,680 tons) shipped from the Continental mine. The rest of the district output was chiefly silver ore from the Rescue mine and copper ore from the Old Dominion mine.

Green Valley district (Payson).—The principal output in the Green Valley district in 1940 was crude gold ore from the Blue Goose, Rodeo, Royal Flush, Squatter, Planet, and Quertzel properties.

Pioneer (Pinal Mountains) district.—Gold-silver ore was produced from the Bobtail and Samsel mines in 1940, silver ore was produced chiefly from the Vindicator, Greater Republic, and Pioneer properties, and small lots of gold ore, lead ore, and copper ore were mined at various prospects.

Summit district.—A little copper ore was produced in 1940 from the Arizona-Globe, Gibson, and Yan properties.

GRAHAM COUNTY

The output of Graham County in 1940 was principally lead-silver ore from the Grand Reef mine in the Aravaipa district and gold ore from the Powers mine in the Rattlesnake district.

GREENLEE COUNTY

Ash Peak district (Duncan).—The Ash Peak mine was taken over early in 1940 by the Ash Peak Mines Co., and during the year 4,035 tons of silver ore were shipped to a smelter; silver ore was shipped also from the Hardy mine.

Copper Mountain district (Morenci).—Production in the Copper Mountain district in 1940 was, as usual, chiefly copper concentrates and copper precipitates from the Morenci branch of the Phelps Dodge Corporation; the rest of the district output was mostly crude gold ore from the Gold Belt and Keating mines. The corporation treated 546,173 tons of copper ore in its testing concentrator, shipped 11,425 tons of copper precipitates, continued developing a large open pit, and began building a new 25,000-ton concentrator and a smelting plant.

At the Morenci branch of the Phelps Dodge Corporation, according to the annual report of the corporation for 1940, the work of stripping the overburden in the open-pit mine proceeded on schedule. A total of 12,349,165 tons was removed compared with 8,868,278 tons in 1939. The total tonnage stripped to date, beginning with 1937, amounts to 28,916,706 tons. Approximately 17,500,000 tons of waste remain to be moved before mining is begun. Stripping operations were largely in the Clay Mountain, Colorado, and Liverpool areas. Disposal of the waste material was planned to tie in with railroad construction by dumping to preliminary alinement of the Coronado waste track and to sections of the railroad between the pit and the reduction works. After July 1 truck haulage was supplemented by rail service, and trains handled over 4,000,000 tons of material. Five benches are now serviced by rail. New pit equipment purchased in 1940 included electric shovels, Diesel electric locomotives, and 30- and 40-yard dump cars. A locomotive- and car-repair shop and an oil storage house were constructed near the pit. In all, 748,727 wet tons of material were mined from the area in which ore has been exposed in the pit. Of this, 565,968 tons of ore were delivered to the test mill, and the rest of the tonnage was waste and heap-leach material. The test mill treated 546,173 dry tons of ore. All major equipment tests were completed, and the flow sheet for the new mill was decided upon in September. Excavation and grading at the site of the reduction works were begun in December 1939 and continued through 1940, although the main yard was completed by the end of March. General excavation comprised 559,000 yards of natural surface and 52,000 yards of tailings. In early September a contract was awarded for the concrete work, and during the remainder of the year 13,836 yards of concrete were placed. In addition, a contract was let for steel erection, and steel has been placed as rapidly as foundations were ready. Nearing completion at the end of the year were the machine shop, carpenter shop, electric shop, warehouse, change room, and time office.

Metcalf (Greenlee) district.—Zinc-lead ore was shipped from the Lime Cap mine in 1940, gold ore from the Polaris and South Sycamore properties, and lead ore from the Midnight mine.

Red Hill district.—A little copper ore was produced in 1940 from the Chonga prospect near Clifton.

San Francisco district.—Placer operators continued in 1940 to recover a little gold from various claims along the San Francisco River.

MARICOPA COUNTY

Big Horn district.—The output of the Big Horn district in 1940 was chiefly gold ore from the Alice (Pump) and Tiger mines and placer gold, largely from the Borian and Davenport claims.

Cave Creek and Camp Creek district.—Copper-silver ore (3,465 tons) from the Red Rover mine on Camp Creek was the principal output in the Cave Creek and Camp Creek district in 1940; nearly all the ore was concentrated. The rest of the district output was mostly old tailings (gold) from the Van Buskirk dump cyanided, crude copper ore from the Black Mountain mine, and crude gold ore from the Maricopa mine.

Ellsworth (Harqua Hala) district.—Nearly all the output of the Ellsworth district in 1940 was gold-copper ore from the Copper Prince mine.

McDowell district.—Silver ore from the Dixie mine was treated in a concentration mill in 1940.

New River district.—Copper ore was shipped to a smelter in 1940 from the Orizaba, Lucky Strike, and Daisy properties.

Osborn district.—A new group of lessees took over the Belmont-McNeil mine in 1940 and shipped 1,352 tons of gold-silver ore and 108 tons of lead ore to various smelters. The remainder of the Osborn district output was largely old tailings (gold) shipped from the Belmont-McNeil dump.

Pikes Peak (Morgan City) district.—The value of the metal output of the Pikes Peak district increased greatly in 1940 owing to the large output of crude gold ore from various properties. The chief producers were the Keystone-Pikes Peak, Prince of Arizona, and Beacon properties.

Salt River Mountains district.—The Delta mine (most important producer in the Salt River Mountains district) was taken over in 1940 by the Park View Mining Co., and during the year 2,782 tons of gold ore were shipped to a smelter; other producers of gold ore were the North Delta and Young America mines.

San Domingo.—Placer gold recovered by various small-scale operators continued in 1940 to be the chief output of the San Domingo district.

Sunflower district.—In 1940, as in 1939, the principal output of the Sunflower district was gold ore from the Little Daisy mine.

Vulture district.—The value of the metal output of the Vulture district increased from $19,507 in 1939 to $197,798 in 1940. This large gain resulted from increased output of gold ore from the Vulture mine and from operation of the Newsboy (Pitt) mine; 35,272 tons of gold ore and 7,573 tons of old tailings from the Vulture property were treated by cyanidation and concentration, and 9,265 tons of crude gold-silver ore were shipped from the Newsboy mine. The rest of the district output was mostly old tailings (gold) from the Last Chance dump and gold ore from the Sunrise mine.

Webb (Gila Bend Mountains) district.—A little gold ore was produced in 1940 from the High Five mine and a small lot of copper ore from the Digmore prospect.

Winifred district.—The principal output of the Winifred district in 1940 was crude gold ore from the Jack White mine.

MOHAVE COUNTY

Cedar Valley district.—The Boriana mine was operated throughout 1940 by the Molybdenum Corporation of America, and several thousand tons of tungsten ore were concentrated; tungsten concentrates were shipped to a smelter in the East and copper concentrates to a smelter in Arizona. The remainder of the output from the Cedar Valley district was mostly crude gold-silver ore from the Arnold mine.

Chemehuevis district.—A little gold ore was produced in 1940 from various claims in the Chemehuevis district; placer gold was recovered principally from the Chief claim.

Cottonwood district.—The North Star, Bill George, and Deer Trail properties were producers of gold ore in 1940.

Gold Basin district.—The production of gold in the Gold Basin district was greater in 1940 than in 1939, due chiefly to operation of the Cyclopic mine; about 7,000 tons of gold ore and 4,200 tons of old tailings were treated in a cyanide plant. The Malco Gold Mining Co. operated its 25-ton concentration mill on gold ore from company mines and on custom ores; 3,007 tons of gold ore, largely from the O. K.-Excelsior group owned by the company, were treated. Other producers included the Climax, Eldorado, Cold Hill, M. O., Morning Star, Narrow Gauge (Fry), and Queen Anne properties. Placer gold and silver were recovered by various small-scale operators.

Greenwood district.—Small lots of gold ore were produced in 1940 from various prospects near Wikieup.

Indian Secret (White Hills) district.—The output of the Indian Secret district in 1940 was gold-silver ore from the Accident and White Hills properties.

Lost Basin district.—Placer gold recovered by various small-scale operators was the principal output in the Lost Basin district in 1940.

Minnesota district.—The value of the metal output of the Minnesota district declined from $60,832 in 1939 to $15,708 in 1940 owing to decreased output of gold ore from the Pope mine; the mine was idle in 1940, but about 800 tons of gold ore were shipped from the waste dump. The rest of the district production was largely silver ore from the Horn Silver mine.

Music Mountain district.—Lessees operated the Roosevelt mine in 1940 and shipped 334 tons of rich gold ore to a smelter. Other producers of gold ore included the Music Mountain, North Star, and Portland & Mizpah properties.

Owens (McCracken and Potts Mountain) district.—The output of the Owens district in 1940 was principally old tailings (lead) from the McCracken dump, gold-copper ore from the New England mine, silver ore and gold ore from the North Star mine, and gold ore from the Double Eagle and Gold Leaf properties.

San Francisco (Oatman, Goldroad, Katherine, Vivian) district.—Siliceous gold ore from the Goldroad mine of the United States Smelting, Refining & Mining Co. continued in 1940 to be the most important output in the San Francisco district; 153,280 tons of gold ore were treated in the company 300-ton cyanide plant, and the mine ranked fourth in gold production in the State.

Production of gold at Oatman, Goldroad, and Vivian in 1940 was 32,044 fine ounces compared with 37,403 in 1939, and that at Katherine was 9,565 ounces compared with 7,354; 92 percent of the gold output at Katherine came from the Tyro mine worked by the Gold Standard Mines Corporation. The company operated its 300-ton cyanide mill throughout the year on ore from company mines and on custom ores; 76,100 tons of gold ore and gold-silver ore were treated. About 74,000 tons of gold ore came from the Tyro mine—a substantial increase over 1939—and the remainder, largely from the Katherine, Pyramid, Minnie, and Philadelphia properties. The chief producers of gold ore at Oatman and Vivian were the Western, Vivian, Telluride, Tin Cup, Gold Dust, Pioneer, Moss, and Mossback properties. The Vivian Mining Co. worked the Western mine the first 6 months of the year and treated 9,954 tons of gold ore in the Vivian custom cyanide mill; 1,782 tons of gold ore produced by lessees from the Vivian-Lelande group and 6,596 tons of old tailings from the Vivian dump were treated also in the Vivian mill. The closing in November 1939 of the 300-ton custom cyanide mill of the Tom Reed Gold Mines Co. was a severe loss to many small gold producers at Oatman.

Wallapai district (Cerbat, Chloride, Mineral Park, Stockton Hill).—The value of the metal output of the Wallapai district was $1,284,039 in 1940—a gain of 62 percent over 1939; the principal output was zinc-lead ore from the Tennessee mine. The Tennessee-Schuylkill Corporation operated the mine continuously and treated 55,521 tons of zinc-lead ore in its 150-ton flotation plant—an increase of 43,933 tons over 1939; the mine was the largest producer of zinc in Arizona in 1940 and ranked second in lead. The Keystone mine was operated the first 6 months of the year by H. K. Ward Mines, and 3,410 tons of silver ore were treated in the company flotation plant—a decided decrease from 1939. Gold ore (2,810 tons) from the Golden Gem mine was concentrated; gold-silver ore (2,441 tons) from the White Eagle mine was shipped to a smelter; gold-silver ore (1,900 tons) from the Golconda group was concentrated; gold ore (1,142 tons) from the Golden Eagle mine was treated in the custom cyanide mill of Producers Mines, Inc.; and zinc-lead ore (855 tons) from the Juno mine was concentrated. Other fairly important producers were the Blue Bell, Rainbow, Columbus, Rico, Silver Hill, Summit, Minnesota-Connor, Tuckahoe, and Shooting Star properties. The Diana property (a large producer of gold-silver ore from 1935 to 1939, inclusive) was closed in January 1940 after the flotation mill had treated about 1,500 tons of ore.

Weaver (Mocking Bird, Pilgrim, Portland) district.—The production of gold in the Weaver district declined sharply in 1940 owing chiefly to idleness of the Klondyke and Portland mines, both large producers of gold ore in 1939. More than 92 percent of the district gold output in 1940 and nearly all the silver output came from the Pilgrim mine near Chloride operated by Producers Mines, Inc. The company operated its 300-ton custom cyanide plant throughout the year and treated a total of 50,000 tons of siliceous ores, mostly gold ore (39,027 tons) from the Pilgrim mine. Other producers of gold ore included the Dixie Gold, Dixie Queen, and Pershing properties.

PIMA COUNTY

Ajo district.—The output of copper ore (6,443,980 tons) from the New Cornelia mine in 1940 was nearly 6 percent greater than that in 1939, resulting in a substantial increase in production of copper; however, production of silver was less and that of gold virtually the same as in 1939. The property was again the largest producer of copper in Arizona and ranked second in gold.

Operations at the New Cornelia branch of the Phelps Dodge Corporation, according to the annual report of the corporation for 1940, were on a continuous basis throughout the year, broken only by a summer shut-down of 2 weeks. There were mined at the open pit 6,438,740 tons of ore and 6,491,333 tons of waste, of which 1,082,120 tons came from Arkansas Mountain stripping operations. The waste ratio was 1.01, of which 0.84 was in the pit proper. The reserves of broken ore were slightly reduced. Mining costs were well-maintained. Better ore breakage was achieved, with correspondingly improved crushing results. All loading was done by full-revolving electric shovels. The Diesel electric locomotives were taken out of service in July and transferred to Morenci. Twenty 30-cubic yard cars were purchased during the year. The concentrator treated 6,443,980 tons of ore. Metallurgy remained about constant, but costs improved, largely owing to improved ore breakage in the mine and to the adoption of single-stage grinding in the mill. Mechanical department, power-plant, and pumping operations were largely routine, according to the report.

Amole district.—Copper ore was produced from the Gould mine in 1940 and lead ore from the Old Yuma property.

Arivaca district.—Most of the output of the Arivaca district in 1940 was gold ore from the Oreona, Ajax, and Mother Lode properties.

Baboquivari district.—Production of gold and silver in the Baboquivari district was much greater in 1940 than in 1939 due to shipments of crude gold-silver ore from the Allison mine by the Tombstone Mining Co. In December the company completed building a 100-ton cyanide plant, and during the month treated about 400 tons of gold ore. The remainder of the district output was principally gold ore from the Allison waste dump, which was amalgamated.

Cababi (Comobabi) district.—Lessees operated the Wayne mine in 1940 and shipped crude gold ore, gold-silver ore, and lead-silver ore to various smelters; however, the chief output of the Cababi district was gold ore from the Jaeger mine, which was treated by amalgamation and concentration.

Empire district.—Nearly all the output of the Empire district in 1940 was lead ore from the Chief and Bonnie Jean mines and silver ore from the Dutchman group.

Greaterville district.—Small lots of lead ore and gold ore were produced in 1940 from various prospects in the Greaterville district, and placer gold was recovered chiefly from the Jones claim.

Helvetia (Rosemont) district.—Virtually all the output of the Helvetia district in 1940 was crude copper ore from the Helvetia property, operated by lessees.

Old Baldy district.—Copper ore was produced in 1940 from the Parber group.

Old Hat district (Oracle).—The value of the metal output of the Old Hat district in Pima County increased from $11,175 in 1939 to $131,037 in 1940 as a result of steady operations at the Daily and Geesaman groups by Control Mines, Inc.; about 24,000 tons of copper ore were treated in a flotation plant, and some crude copper ore was shipped to a smelter.

Pima (Sierritas, Papago, Twin Buttes) district.—The principal output of the Pima district in 1940 was silver-lead ore from the Paymaster mine.

Quijotoa district.—Gold ore was produced in 1940 from the Cara Voca and Valley View mines. The rest of the Quijotoa district output was largely placer gold recovered chiefly from the Right Spot claim.

PINAL COUNTY

Bunker Hill district (Copper Creek).—There was a substantial decrease in production of copper in the Bunker Hill district in 1940 owing to idleness of the Childs mine. Nearly all the output of the district was lead ore from the Bluebird property, which was treated by concentration.

Casa Grande district.—The output of the Casa Grande district in 1940 was mostly gold-silver ore from the Greenback mine, silver ore from the Orizaba and Silver Reef mines, gold ore from the Turning Point and Mammon mines, and copper ore from the Reward mine.

Cottonwood and Black Mountain district.—Gold ore was produced in 1940 principally from the Grand View and Mountain View properties.

Goldfields (Superstition Mountains) district.—About 1,500 tons of old tailings (gold) from the Bulldog dump were cyanided in 1940, and 462 tons of first-class gold ore from the Superstition mine were shipped to a smelter.

Hackberry district.—Gold ore was produced in 1940 from the Venado mine and a small lot of copper-silver ore from the Deer claim.

Martinez Canyon district.—Lessees continued in 1940 to work the Silver Bell mine and shipped 1 car of silver ore and 1 car of lead ore.

Mineral Creek district (Ray).—The gain of $2,686,510 in value of metal output in the Mineral Creek district in 1940 resulted from the increase in output of copper ore from the Ray mine. The Nevada Consolidated Copper Corporation operated the mine throughout the year and shipped 127,837 tons of copper concentrates and 3,519 tons of copper precipitates to the smelter at Hayden; 2,103,004 tons of copper ore were treated by flotation. The remainder of the district output was chiefly gold ore (2,685 tons) shipped from the Broken Hill mine.

Mineral Hill district.—There was a substantial gain in production of gold in the Mineral Hill district in 1940 due to increase in output of gold ore from the Sunset and Horace properties. The chief producers of silver ore were the Gorham & Hall and Silver Pick mines.

Old Hat district (Oracle).—In 1940, as in 1939, the principal output of the Old Hat district was gold-molybdenum-lead ore from the Mammoth-St. Anthony & New Year-Mohawk groups. The Mammoth-St. Anthony, Ltd., operated both groups and treated a total of 186,110 tons of mixed ores compared with 191,892 tons in 1939.

The ore was treated by gravity concentration followed by flotation, and the flotation tailings were treated by cyanidation. Lead concentrates containing considerable gold, molybdenum, and vanadium were smelted in the company 20-ton lead furnace, and gold precipitates were shipped to an eastern refinery; the property ranked third in both gold and lead production in Arizona in 1940. The remainder of the district output was largely crude gold ore from the Old Gold Camp and Southern Belle properties.

Picacho district.—Lessees operated the Better Pay mine in 1940 and shipped 141 tons of gold ore and 27 tons of lead ore.

Pioneer district (*Superior*).—The output of ore and the production of each of the five metals in the Pioneer district were greater in 1940 than in 1939 due chiefly to increases in output of copper ore and zinc-copper ore from the Magma mine. The Magma Copper Co. operated its mine, 850-ton concentrator, and 450-ton copper smelter continuously, except for the usual summer shut-down. According to the company printed annual report, the mill treated 237,003 tons of copper ore averaging 5.16 percent copper and 79,044 tons of zinc-copper ore averaging 1.74 percent copper and 7.31 percent zinc; in addition, 62,158 tons of copper ore were sent direct to the smelter. Production, after all losses (including refining) were deducted, was 11,307 ounces of gold, 629,417 ounces of silver, 34,281,249 pounds of copper, and 5,992,796 pounds of zinc. The average net cost of producing copper after deduction of gold, silver, and zinc concentrate values was 7.8 cents a pound. Lessees continued to work the Lake Superior & Arizona group of the Magma Copper Co. and shipped 6,357 tons of gold ore to a smelter. Wm. J. Forbach operated the Reymert mine continuously and shipped 20,700 tons of silver ore to various smelters. The rest of the district output was chiefly silver ore from the Belmont and Picket Post properties.

Ripsey district.—Nearly all the output of the Ripsey district in 1940 was crude gold-silver ore from the Norman group (Old Ripsey), but the output was much less than in 1939.

Riverside district.—A little gold ore was produced in 1940 from the Arizona Gold and Mendoza properties.

Rockhouse district.—Copper ore was produced in 1940 from claims 17 miles southeast of Coolidge Dam.

Roger district.—The Iron Mountain mine was operated in 1940 and 33 tons of silver ore were shipped to a smelter.

Saddle Mountain district.—The chief output of the Saddle Mountain district in 1940 was copper ore from the Senator mine and gold ore from the Hoosier and Columbia properties.

Summit district.—A small lot of copper-silver ore from the American mine was sold in 1940.

SANTA CRUZ COUNTY

Harshaw district.—The value of the metal output of the Harshaw district increased from $492,490 in 1939 to $1,072,018 in 1940 owing chiefly to the large gain in output of zinc-lead-silver ore from the Trench mine operated by the American Smelting & Refining Co. The mine was the largest producer of lead in the State in 1940 and ranked third in zinc; about 42,000 tons of zinc-lead-silver ore were treated in the company 200-ton flotation plant. The Flux mine was operated under lease the first 8 months of the year by the Flux Mining Co. and the last 4 months by the American Smelting & Refining Co.; 7,147 tons of zinc-lead-silver ore were treated in the Trench mill. Lessees continued working the American mine and shipped 3,386 tons of silver ore to various smelters. The remainder of the district output was largely lead-silver ore from the Hardshell and World's Fair properties and silver ore from the Salvador mine.

Nogales (Gold Hill) district.—The output of the Nogales district in 1940 was mostly gold ore from the Bacon, Hardscrabble, Silent Friend, and Golden properties.

Oro Blanco district (Ruby).—The output of ore and the production of each of the five metals in the Oro Blanco district were much less in 1940 than in 1939 due to exhaustion of ore reserves at the Montana mine. During the first 4½ months of the year, the mill treated 53,038 tons of zinc-lead-silver-gold-copper ore; both the mine and 300-ton flotation plant were closed May 15. The property was the largest producer of lead and zinc in Arizona from 1935 to 1939, inclusive. The rest of the district output was principally crude silver ore from the Rubiano and Brick mines, gold ore from the Oro Blanco, Austerlitz, and Brown Bird properties, and gold-silver ore from the Old Soldier mine.

Palmetto district.—Several cars of copper ore from the Three R mine were shipped to a smelter in 1940, and a small lot of silver-lead ore was produced from the La Palma prospect.

Patagonia (Duquesne) district.—The output of silver, copper, lead, and zinc from the Patagonia district increased greatly in 1940 owing to output of zinc-lead-copper ore from the Duquesne group. The Callahan Zinc-Lead Co. operated the property throughout the year and in March completed building a 100-ton flotation plant; about 17,500 tons of zinc-lead-copper ore were treated during the remainder of the year. Nearly all the rest of the district output was copper ore from the Gladstone mine.

Tyndall district.—The principal output of the Tyndall district in 1940 was crude copper-silver ore and lead-silver ore from the Alto group operated by the Long Contact Mining Co.

Wrightson district.—A little lead-silver ore was produced in 1940 from the Armada and El Rosario prospects.

YAVAPAI COUNTY

Agua Fria district.—A lessee worked the old Binghampton mine in 1940 and shipped several cars of copper ore to a smelter.

Ash Creek district.—Nearly all the output of the Ash Creek district in 1940 was crude gold ore from the Gold Coin, Bird, and Red Bird properties.

Big Bug district.—The increase in production of zinc and lead in the Big Bug district in 1940 resulted from the gain in output of zinc-lead ore from the Iron King mine; the output of placer gold was greater owing to the operation of a dragline dredge at the Hill property. The Iron King Mining Co. operated its mine and 225-ton flotation plant continuously and shipped 5,389 tons of lead concentrate, 3,847 tons of zinc concentrate, and 6,648 tons of iron concentrate; 65,812 tons of zinc-lead-iron ore were treated in the mill. During the last quarter of the year the company built a cyanide plant and treated 6,900 tons of current flotation tailings. The remainder of the district lode output was chiefly crude gold ore from the Wizard, Red Rock, Belcher, and Union Jessie properties. The Big Bug Dredging Co. operated a 2¼-yard dragline dredge at the Hill property the last 4 months of the year and recovered 1,100 fine ounces of gold. The rest of the placer gold was recovered chiefly by a dry-land dredge and a dragline dredge; each worked a few months at the Shanks & Savoy property.

Black Canyon district.—The principal output of the Black Canyon district in 1940 was, as usual, gold-silver-lead ore from the Golden Turkey group; 43,544 tons of ore were treated by flotation. Placer gold was recovered from various claims near Bumble Bee.

Black Rock district.—Small lots of gold ore and copper ore were produced in 1940 from various prospects and sold to the Wickenburg Ore Market. A little placer gold was recovered from gravel along the Hassayampa River.

Blue Tank district.—A little gold ore was produced in 1940 from the Franklin D. and Lone Star claims.

Bullard (Pierce) district.—Nearly all the output of the Bullard district in 1940 was crude gold-copper ore from the Bullard mine operated by Bullard Gold Mines, Inc.

Castle Creek district.—The chief production in the Castle Creek district in 1940 was lode gold from the Gold Rock mine and placer gold from the Buckhorn claim.

Cherry Creek district.—In 1940, as in 1939, virtually all the output of the Cherry Creek district was crude gold ore shipped to smelters; the principal producers were the Sitting Bull, Sunnybrook, Leghorn-Falls, Volcano, and Gold Eagle properties.

Copper Basin district.—The chief production in the Copper Basin district in 1940 was placer gold from the Queen of Sheba, Forback & Easton, Bennett, and Stoop properties and lode gold from the McNary mine.

Eureka district.—The Bagdad Copper Corporation operated its mine and 275-ton concentrator continuously in 1940 and shipped 1,728 tons of copper concentrate; 73,644 tons of copper ore were milled in 1940 compared with 14,196 tons in 1939. The Hillside mine and mill were leased to the Boulder Mining Co. in 1940, and during the last 5 months of the year the 125-ton mill treated 10,956 tons of zinc-lead-gold-silver ore—a substantial decrease from 1939. The remainder of the district output was largely crude gold ore from the Doughboy, Anarchist, and Southern Cross mines.

Granite Creek district.—Placer gold was recovered in 1940 from gravel along Granite Creek.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) district.—The principal output of the Hassayampa district in 1940 was crude gold ore from the Oro Flame, Evergreen, Nevada, U. P., Alma, Hidden Treasure, Ibex, Independence, Railroad, and Sundown properties and old tailings (gold-silver) from the Big Pine dump treated by cyanidation. Numerous small lots of ore from various prospects were sold to ore buyers in Prescott. Most of the placer gold produced in the district was recovered by a dragline dredge working at the Hobbs property.

Humbug district.—Nearly all the output in the Humbug district in 1940 was lode gold from the Little Joseph mine and placer gold recovered from gravel along Cow, French, and Humbug Creeks.

Kirkland district.—Crude gold ore (221 tons) from the Venus mine was the chief output of the Kirkland district in 1940.

Lynx Creek district.—The Lynx Creek Placer Mine Co. operated its two draglines and floating washer in 1940 from January to September 1, when the property and equipment were taken over by Placer King Mines, Inc.; the total output of gold during the year was 1,393 fine ounces compared with 2,350 in 1939. The remainder of the district output was placer gold and silver, recovered principally by dry-land dredges working at the Fitzmaurice and Pioneer properties.

Martinez (*Congress*) district.—The most important output in the Martinez district in 1940 was, as usual, old tailings and waste-dump ore containing gold and silver from the Congress dumps; 51,576 tons of old tailings and 39,731 tons of ore were treated in a 300-ton cyanide plant.

Mineral Point district.—Virtually all the output in the Mineral Point district in 1940 was crude gold ore from the Buster mine.

Mint Valley district.—Small lots of gold ore were produced in 1940 from the Lobo and Tip Top claims.

Peck district.—The output of the Peck district in 1940 was crude gold ore from the Black Jack, E. H. C., and Good Hope properties and high-grade silver ore from the Swastika mine.

Pine Grove district (*Crown King*).—Operations at the Gladiator-War Eagle group were continuous throughout 1940, and 4,378 tons of crude gold ore containing some silver and copper were shipped to a smelter. The rest of the district output was mostly gold-silver ore concentrated from the Union & Eagle property and crude gold ore from the Del Pasco mine.

Silver Mountain district (*Wagoner*).—A little gold ore was produced in 1940 from the Fenton and Golden Wizard claims, silver ore from the Little Joker mine, and lead ore from the Silver King prospect.

Thumb Butte district.—In 1940, as in 1939, nearly all the output of the Thumb Butte district was crude gold ore from the Last Chance Extension mine.

Tiger district.—The chief output of the Tiger district in 1940 was gold ore from the Southern Belle, Fortuna, Oro Belle, and Pilgrim properties.

Tip Top district.—Small lots of rich silver ore were produced in 1940 from the "76", Bramlet, Ensign, Chloride, and Silver Basin claims and gold ore from the Midway and San Domingo prospects.

Turkey Creek district.—The principal production in the Turkey Creek district in 1940 was lode gold from the Cumberland and Parker mines and placer gold from the Barnes property.

Verde district (*Jerome*).—The output of ore and the production of gold, silver, and copper in the Verde district in 1940 were less than in 1939 owing to decline in output of copper ore from the United Verde mine. The Phelps Dodge Corporation operated the mine and concentrator continuously and shipped 263,773 tons of copper concentrate, 306,915 tons of crude copper ore (694,716 tons in 1939), 14,094 tons of old tailings (copper), and 448 tons of copper precipitates to the company smelter at Clarkdale; 561,310 tons of copper ore were concentrated in 1940 compared with 294,933 tons in 1939. The property ranked second in the State in production of silver and fourth in copper. Lessees continued to work the Iron King Equator group and shipped 9,122 tons of gold-silver ore to a smelter. The remainder of the district output was mostly crude copper ore from the United Verde Extension mine dump.

Walker district.—The chief output of the Walker district in 1940 was crude gold-silver ore from the Sheldon mine and gold ore from the Oro-Plata, Virgin Mary, Lucky Strike, Alturas, Alturas Extension, Emma, Last Chance, and Mohawk properties. Numerous small lots of ore from various prospects were sold to ore buyers in Prescott. Placer gold and silver were recovered by various small-scale operators working on Lynx Creek near Walker.

Walnut Grove district.—The principal production in the Walnut Grove district in 1940 was lode gold from the Granite and Moyer mines and placer gold recovered from various claims on Placeritas Gulch, French Gulch, Blind Indian Creek, and Mill Creek.

Weaver district (*Octave*).—Production of gold in the Weaver district increased from 17,847 ounces in 1939 to 19,319 in 1940; nearly 97 percent of the total came from three properties—the Octave, Alvarado, and Yarnell. The most important producer was, as usual, the Octave mine operated by the American Smelting & Refining Co.; 29,099 tons of gold ore were treated by flotation, and the flotation tailings were cyanided. About 37,300 tons of gold ore from the Alvarado mine were treated in a 100-ton cyanide plant operated by Liberty Hill Gold Mines, Ltd. The Yarnell mine was worked continuously by the Winslow Gold Mining Co., and 32,379 tons of gold ore were treated in the company cyanide plant compared with 1,200 tons treated by concentration in 1939. Other producers of gold ore included the Alto, Beehive, George Myers, Leviathan, and Rincon properties. Placer gold was recovered chiefly from the Merrill, June, McIntosh, Lucero, and Johns properties.

White Picacho district.—Nearly all the output of the White Picacho district in 1940 was crude gold ore from the Young mine and lead-silver ore from the Independence mine.

YUMA COUNTY

Castle Dome district.—Lessees worked the Big Eye mine in 1940 and shipped 441 tons of first-class gold ore and 206 tons of old tailings to the smelter at Hayden. The remainder of the output of the Castle Dome district was chiefly placer gold recovered at the Ocatilla property by a Stebbins dry concentrator.

Cienega district.—The output of the Cienega district in 1940 was copper-gold ore from the Black Hill, Golden Ray, Sue, White Cloud, and Yuma Chief properties.

Dome (*Gila City*) *district.*—Placer gold and silver were recovered by various operators working along the Gila River near Dome.

Ellsworth district (*Salome*).—The principal output of the Ellsworth district in 1940 was crude gold ore from the Alaskan, Blue Eagle, Blue Jay, Centroid, and Golden Treasurer properties and gold-copper ore from the Critic, Copper Belt, and Oro Fino mines. Numerous small lots of gold ore from prospects were sold to an ore buyer in Wickenburg.

Fortuna district.—Lessees continued in 1940 to operate the Fortuna mine; 327 tons of gold ore were treated by amalgamation and cyanidation.

Kofa district.—Nearly all the output of the Kofa district in 1940 was gold-silver ore from the Sheep Tanks mine and gold ore from the Quartette and Verdstone mines.

Laguna district.—Placer gold was recovered by various small-scale operators working in the Laguna Dam area.

La Paz and Middle Camp district.—The chief production in the La Paz and Middle Camp district in 1940 was placer gold recovered principally by a dry-land dredge at the Golden Anchor (Jones) property and lode gold from the Copper Bottom mine.

Las Flores district.—Lessees operated the Las Flores mine in 1940 and hauled 180 tons of gold ore to the Burton custom mill at Blaisdell.

Plomosa and La Cholla district.—The output of gold and silver from lode mines in the Plomosa and La Cholla district increased substantially in 1940, but that of gold from placer properties declined sharply. The chief output from lode mines was crude gold-copper ore from the Little Butte mine, silver ore from the R. & A. mine, and copper ore from the Apache mine. The Arizona Drift property was by far the largest producer of placer gold in the district, but its output of gold was much less than in 1939. The remainder of the district output was largely gold ore from the Dutchman, Moon Mountain, and Julius properties.

San Pablo district.—A little placer gold was recovered in 1940 from gravel along the Colorado River near San Pablo.

Santa Maria (Planet, Bill Williams) district.—Gold ore was produced in 1940 from the Diana Mae and Townsend mines and copper ore from the Oversight mine.

Trigo district.—Placer gold was recovered in 1940 chiefly from the Trigo claim.

Yuma district.—In 1940 gold ore from the Jude and McIntyre properties was treated by amalgamation in the Burton custom mill at Blaisdell.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN CALIFORNIA

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

The total value of the gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels in California in 1940—$54,268,690—was greater than in any year since 1856 (see fig. 1); the increase over 1939, however, was only $1,350,678 or 3 percent. Most of the increase was due to the advance in gold and copper production.

Gold increased 1 percent in both quantity and value; silver decreased 9 percent in quantity and 5 percent in value; and copper increased 54 percent in quantity and 67 percent in value, lead 237 percent in quantity and 258 percent in value, and zinc 1,217 percent in quantity and 1,495 percent in value. Of the total value of the five metals in 1940, gold represented 94 percent, silver 3 percent, copper almost 3 percent, and lead and zinc combined less than 0.4 percent.

Nevada County, despite a 1-percent decline in 1940 in total value of production, continued to be the largest contributor to the metal-mining output of California; it supplied 21 percent of the State total value of the five metals, 22 percent of the total gold, and 40 percent of the lode gold. Sacramento County (largely from gold dredging) contributed 10 percent of the total value of the five metals; Amador County (two-thirds from gold ore and one-third from placer gravels), 8 percent; Yuba County (largely from gold dredging), 7 percent; Kern County (largely from gold and gold-silver ores), 6 percent; Calaveras County (almost two-thirds from gold ore and one-third from placer gravels), 6 percent; Plumas County (largely from gold and copper ores), 5 percent; Butte County (largely from placer gravels), 5 percent; and Siskiyou County (largely from placer gravels), 4 percent. Thus, the foregoing 9 of the 44 counties producing the metals in California in 1940 contributed over $2,000,000 each to the State total value and supplied over 71 percent of that total.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4].646+	.098	.046	.048
1939	35.00	[5].678+	.104	.047	.052
1940	35.00	[6].711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January, 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in California, 1936–40, and total, 1848–1940, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	903	639	4,635,691	1,077,442	$37,710,470	2,103,799	$1,629,392
1937	913	838	4,925,014	1,174,578	41,110,230	2,888,265	2,234,073
1938	927	676	4,648,249	1,311,129	45,889,515	2,590,804	1,674,863
1939	1,028	749	5,577,853	1,435,264	50,234,240	2,599,139	1,764,264
1940	1,030	836	4,669,433	1,455,671	50,948,485	2,359,776	1,678,063
1848–1940	--------	--------	(2)	98,853,966	2,161,992,462	100,878,000	81,804,036

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1936	8,762,000	$806,104	964,000	$44,344	16,000	$800	$40,191,110
1937	10,502,000	1,270,742	2,372,000	139,948	40,000	2,600	44,757,593

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property worked. Total number of placers each year, 1907–30, inclusive, revised to include number of properties worked by dredges instead of number of dredges.
[2] First year for which this method was reported used in California.
[3] Revised figures.
[4] Data not available.
[5] Corrected figure.
[6] Includes all operations where hand labor is the principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[7] For division of total gold output prior to 1903 between lode and placer mines and authority therefor, *see* Mineral Resources of the United States, 1930, pt. 1, p. 964, and Bureau of Mines Econ. Paper 3, 1929, 22 pp.
[8] Complete data not available.
[9] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

Gold.—Since 1929, when the value of the California gold output reached a low of $8,526,703, the value of production has expanded sixfold, although the gain in 1940 over 1939 was the smallest in a decade. In quantity, the 1940 output of gold was greater than in any year since 1862, and in value it was greater than in any year since 1856; the output was less in 1940 than in 1939. Placer-gold output in 1940 rose to a point where it nearly equaled lode output, and its total value was the highest since 1862.

The 25 leading gold-producing mines in California in 1940, listed in the following table, yielded 55 percent of the total gold output of the State in that year. Four lode mines (all gold ore) and one placer (connected-bucket dredge) in the 1939 list were displaced in 1940 by two lode mines (both gold ore) and three placers (two connected-bucket dredge and one dragline dredge). A dragline-dredge operation ranked in 1940 for the first time among the 25 leading gold producers in the State.

Twenty-five leading gold-producing mines in California in 1940, in order of output

Rank	Mine	District	County	Rank in 1939	Operator	Source of gold
1	Idaho Maryland-Brunswick.	Grass Valley-Nevada City.	Nevada	1	Idaho Maryland Mines Corporation.	Gold ore.
2	Empire Star mines	do	do	2	Empire Star Mines Co., Ltd.	Do.
3	Natomas Co	Folsom	Sacramento	3	Natomas Co	Dredge.
4	Yuba Unit	Yuba River	Yuba	4	Yuba Consolidated Gold Fields.	Do.
5	Lava Cap	Grass Valley-Nevada City.	Nevada	6	Lava Cap Gold Mining Corporation.	Gold ore.
6	Butte Unit	Oroville	Butte	11	Yuba Consolidated Gold Fields.	Dredge.
7	Central Eureka and Old Eureka.	Mother Lode	Amador	5	Central Eureka Mining Co.	Gold ore.
8	Capital dredges	Folsom	Sacramento	7	Capital Dreding Co	Dredge.
9	Carson Hill	Mother Lode	Calaveras	8	Carson Hill Gold Mining Corporation.	Gold ore.
10	Sheepranch	East Belt	do	18	St. Joseph Lead Co	Do.
11	Argonaut	Mother Lode	Amador	10	Argonaut Mining Co., Ltd.	Do.
12	Golden Queen	Mojave	Kern	9	Golden Queen Mining Co.	Do.
13	Cactus Queen	do	do	21	Cactus Mines Co	Gold-silver ore.
14	Iron Mountain	Flat Creek (Iron Mountain).	Shasta	15	The Mountain Copper Co., Ltd.	Gold ore and copper ore.
15	Alabama	Ophir	Placer	20	Alabama California Gold Mines Co.	Gold ore.
16	Snelling	Snelling	Merced	14	Snelling Gold Dredging Co.	Dredge.
17	Walker	Genesee	Plumas	22	Walker Mining Co	Copper ore.
18	Merced Unit	Snelling	Merced	16	Yuba Consolidated Gold Fields.	Dredge.
19	Original Sixteen to One.	Alleghany	Sierra	27	Original Sixteen to One Mine, Inc.	Gold ore.
20	Siskiyou Unit	Callahan	Siskiyou	33	Yuba Consolidated Gold Fields.	Dredge.
21	Golden Center	Grass Valley-Nevada City.	Nevada	28	Cooley Butler	Gold ore.
22	Carrville	Trinity Center	Trinity	147	Carrville Gold Co	Dredge.
23	Sliger	Mother Lode	Eldorado	19	Middle Fork Gold Mining Co.	Gold ore.
24	Starlight	Mojave	Kern	23	Lodestar Mining Co	Do.
25	Stockton Reservoir	Mother Lode	Calaveras	34	Lord & Bishop	Dragline.

Silver.—The bulk of the silver output of California in 1940 was more centralized than that of the gold; the 10 leading silver-producing mines, listed in the following table, yielded 75 percent of the State total recoverable silver in that year. The list is similar to that of 1939, except for some changes in rank and replacement of the Alabama mine (Placer County) by the Iron Mountain mine (Shasta County). In addition to the mines listed, some silver was reported recovered from almost every lode and placer mine operating in the State in 1940.

Ten leading silver-producing mines in California in 1940, in order of output

Rank	Mine	District	County	Rank in 1939	Operator	Source of silver
1	Cactus Queen	Mojave	Kern	1	Cactus Mines Co	Gold-silver ore.
2	Lava Cap	Grass Valley-Nevada City.	Nevada	4	Lava Cap Gold Mining Corporation.	Gold ore.
3	Walker	Genesee	Plumas	6	Walker Mining Co	Copper ore.
4	Golden Queen	Mojave	Kern	2	Golden Queen Mining Co.	Gold ore.
5	Starlight	do	do	5	Lodestar Mining Co	Do.
6	Grigsby (Palisade)	Calistoga	Napa	3	Graham Loftus Oil Corporation.	Gold-silver ore.
7	Kelly	Randsburg	San Bernardino.	7	F. Royer and lessees	Do.
8	Iron Mountain	Flat Creek (Iron Mountain).	Shasta	12	The Mountain Copper Co., Ltd.	Gold ore and copper ore.
9	Standard	Bodie	Mono	9	Roseklip Mines Co	Gold ore.
10	Empire Star mines	Grass Valley-Nevada City.	Nevada	8	Empire Star Mines Co., Ltd.	Do.

Copper.—The Walker mine in the Genesee district, Plumas County, continued to lead in copper production and supplied 82 percent of the total recoverable copper output of the State in 1940. The Iron Mountain mine in the Flat Creek (Iron Mountain) district, Shasta County, made a substantial shipment of high-grade copper ore during the year.

Lead.—Almost 60 percent of the small output of recoverable lead in California in 1940 came from Inyo County; and 30 percent came from Riverside County.

Zinc.—Production of zinc in California in 1940 was valued at $9,954.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in California in 1940, by counties, in terms of recovered metals

MINING INDUSTRY

The tonnage of material from lode mines in California treated in 1940 decreased 16 percent compared with 1939, but the yardage at placer mines increased 14 percent; the output of lode gold declined 6 percent, but that of placer gold rose 11 percent. The average grade of lode material rose 15 percent, but the average gold content of gravels declined 3 percent. Of the State total gold output in 1940, 52 percent was from lode mines and 48 percent from placers.

Dredges of the connected-bucket type handled 71 percent of the gravel mined and recovered 59 percent of the State total placer gold in 1940.

The next most important method of placer mining—dragline dredging—continued in 1940 its spectacular rise as a means of recovering gold. The first dragline dredge production in the United States was reported in California in 1933, when two outfits began work late in the year and recovered less than 100 ounces of gold. In 1940, 106 dragline dredges worked 198 properties; they washed 23 percent of the total placer-gravel yardage worked and recovered 29 percent of the total placer gold. The following, taken from reports of 52 dragline operators for 1939 and 89 for 1940, summarizes the size of buckets and number of boats:

Size of buckets (cubic yards):	Number of boats 1939	Number of boats 1940	Size of buckets (cubic yards):	Number of boats 1939	Number of boats 1940
7½	--	1	2	10	15
6	1	--	1¾	2	3
5	--	2	1½	17	25
4	--	1	1¼	5	9
3½	1	--	1	4	9
3	3	4	¾	1	7
2½	4	8	½	2	3
2¼	2	1	⅜	--	1

The Becker-Hopkins type of dredge made its first appearance in California in 1940, when units were installed in Fresno and Sacramento Counties.

Nonfloating washing plants to which gravel was delivered by mechanical means washed about the same yardage in 1940 as in 1939, but recovery of gold fell 32 percent. Equipment was moved from one property to another, as was the practice with dragline dredges, and 105 plants worked 131 properties. Some of these nonfloating washing plants are stationary; others are built to move on skids, wheels, or tracks or by other means. Dragline excavators, power shovels, slackline excavators, trucks, bulldozers, and other machines were used to deliver gravel to these washing plants.

Hydraulic production of gold in 1940 was nearly twice that in 1939. Completion of Government-financed debris dams promises further expansion in hydraulic mining. Output by small-scale hand methods increased, but that by drift mining declined.

Consumption of quicksilver at California placer mines totaled 21,872 pounds in 1940 compared with 19,617 pounds in 1939. The following quantities of gold were recovered to the pound of quicksilver used in 1940 (1939 figures in parentheses): Connected-bucket dredging, 41 ounces (41); dragline dredging, 39 ounces (29); nonfloating washing plants with mechanical gravel handling, 10 ounces (31); hydraulicking, 12 ounces (21); small-scale hand operation, 15 ounces (13); and drift mining, 115 ounces (26).

ORE CLASSIFICATION

Of the 4,669,433 tons of ore (including 849,961 tons of old tailings) sold or treated in 1940, 89 percent was dry gold ore and old tailings, 10 percent copper ore, and most of the remainder dry gold-silver ore.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in California in 1940, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead	Zinc
	Ore	Old tailings

Total, 1939	4,939,962	637,891	1,435,264	2,599,139	8,360,000	1,052,000	12,000

[1] Includes metals recovered from tungsten ore not included in material treated.

METALLURGIC INDUSTRY

During 1940, as in former years, most of the ore and virtually all the old tailings were treated at amalgamation and cyanidation mills (with or without concentrating equipment); 89 percent of the total ore and old tailings was treated at such mills in 1940. Almost all the remaining ore was treated at concentrating mills; only 25,380 tons of crude ore and 3,794 tons of old tailings were shipped for direct smelting. Smelters received 51,061 tons of flotation concentrates and 1,636 tons of gravity concentrates from California mine operators in 1940. Comparing 1940 with 1939, there was a 25-percent decrease in ore and a 33-percent increase in old tailings treated at amalgamation and cyanidation mills; ore and old tailings combined decreased 18 percent. The quantity of material treated at concentrating mills decreased 1 percent, and the quantity of crude ore smelted increased 129 percent.

Quicksilver consumption at California amalgamation mills was 7,876 pounds in the treatment of 2,429,974 tons of material to recover 339,707 ounces of gold and 97,618 ounces of silver in 1940. In the treatment of 1,196,267 tons of ore, 612,452 tons of old tailings, and 11,487 tons of concentrates to recover 163,680 ounces of gold and 660,420 ounces of silver, cyanide consumption was 507,443 pounds of 91-percent sodium cyanide and 1,520,235 pounds of commercial calcium cyanide (50-percent NaCN equivalent); in terms of 98-percent NaCN, the consumption was 1,216,112 pounds or 0.67 pound to the ton. A substantial part of the cyanide was consumed at custom mills in California.

Companies producing most of California's lode gold in 1940 owned and operated their own metallurgical plants, but a number of custom mills were active and served small-scale miners principally. The leading operators of metallurgical plants receiving custom material were: Burton Bros., Inc., Rosamond, Kern County; Golden Queen Mining Co., Mojave, Kern County; Mineral Reduction Co., Benton, Mono County; Gold Crown Mining Co., Ltd., east of Twentynine Palms, San Bernardino County; and F. W. Royer, Red Mountain, San Bernardino County. All these mills were cyanidation plants and accepted ore and old tailings for treatment. The Idaho Maryland

Mines Corporation and Empire Star Mines Co., Ltd., Grass Valley, Nevada County, cyanided some lots of concentrates during the period (July 1 to November 9) when the Selby smelter was closed by a labor strike. The largest metallurgical custom plant in California continued to be the State's only smelter—the Selby lead plant of the American Smelting & Refining Co. at Selby, Contra Costa County.

Mine production of metals in California in 1940, by methods of recovery, in terms of recovered metals

1 Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 17 and their output included under "Other counties and districts."

2 Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

3 Source of total silver as follows: 2,295,606 ounces from lode mines and 64,170 ounces from placers.

4 East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

5 Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

6 Included under "Other counties and districts."

7 Exclusive of placer output, which is included under "Other counties and districts."

8 Camanche district lies in Amador, Calaveras, and San Joaquin Counties.

9 Jenny Lind district lies in Calaveras and Stanislaus Counties.

10 Chidago district lies in Inyo and Mono Counties.

11 White Mountain district lies in Inyo and Mono Counties.

12 Randsburg district lies in Kern and San Bernardino Counties.

13 Exclusive of lode output, which is included under "Other counties and districts."

14 Output of property not classed as a "mine."

15 Dale district lies in Riverside and San Bernardino Counties.

16 Slate Range district lies in Inyo and San Bernardino Counties.

17 Includes following: Camanche district in Amador County; Butte Creek (placer) and Yankee Hill (placer) in Butte County; Bishop Creek and Slate Range in Inyo County; Silver Mountain (Antelope Valley) in Los Angeles County; Bodie and Homer (lode) in Mono County; Monterey County (Los Burros district); Napa County (Calistoga district); Greenville (Crescent Mills) (placer) in Plumas County; Lava Bed, Randsburg (placer), and Washington in San Bernardino County; Bellota (Linden) in San Joaquin County; Flat Creek (lode) and Igo (lode) in Shasta County; Jenny Lind in Stanislaus County; Big Bar (placer), Coffee Creek (lode), and Hayfork (lode) in Trinity County; Browns Valley and Yuba River in Yuba County.

18 Includes metals from tungsten concentrates from ore not included in ore and old tailings tonnage.

ALPINE COUNTY

Monitor district.—Lessees worked the Zaca mine during 1940; the principal product was gold concentrates shipped to a smelter.

AMADOR COUNTY

Camanche district.—The Gold Hill Dredging Co. operated a connected-bucket dredge with sixty-six 7¾-cubic foot buckets along the Mokelumne River during 1940.

East Belt district.—The Belama Corporation worked the Belden mine in the Volcano section of the East Belt during 1940 and treated 4,000 tons of ore in a 25-ton flotation mill; amalgamation, cyanidation, and smelting of concentrates yielded 2,044 ounces of gold and 1,130 ounces of silver. The Gwalia Gold Mining Co. and a lessee worked the Pioneer mine; gold was recovered by amalgamation and smelting of flotation concentrates. Garibaldi Bros. operated a nonfloating washing plant, to which gravel was delivered by mechanical means, on the Garibaldi mine, Pioneer Creek, one-half mile east of Volcano from January 1 to July 30 and November 10 to December 8. E. A. Kent operated two dragline dredges along Sutter Creek between Sutter Creek and Volcano; one dragline excavator had a 1¾-cubic yard bucket and the other a 2½-cubic yard bucket.

Ione district.—The Arroyo Seco Gold Dredging Co. worked a property 3 miles west of Ione throughout 1940; the company electrically powered connected-bucket dredge had eighty-six 6-cubic foot buckets. The San Andreas Gold Dredging Co. operated a dragline dredge, using a dragline excavator with a 1½-cubic yard bucket, on the Arroyo Seco ranch from January 1 to February 9. The Lancha Plana Gold Dredging Co. operated a connected-bucket dredge on Jackson Creek the entire year; the electrically powered dredge was of Yuba type, with sixty-five 4½-cubic foot buckets. The Horseshoe Dredging Co. operated a dragline dredge from May 2 until July 26. Pacific Placers Engineering Co. operated a dry-land plant on the John McCulloh property from October 14 until December 23.

Mother Lode district.—The Argonaut Mining Co., Ltd., operated the Argonaut mine throughout 1940; gold ore was treated by amalgamation and flotation, and the concentrates were shipped to a smelter. In addition to operations at the Argonaut mine, the company cyanided and floated a large tonnage of old tailings at the Plymouth mine; concentrates were shipped to a smelter. The Central Eureka Mining Co. operated the Central Eureka and Old Eureka mines; the ore was treated by amalgamation and flotation, and the sands and concentrates were cyanided. The Delta Tailings Co. continued to cyanide material derived from old tailings collected as a delta on one of the streams draining a section of the Mother Lode district. The Fremont Gover mine was closed in April after exploration and development work carried on for many months by the Fremont Gover Co. failed to yield promising results. The Black Hills Mining Co. worked the Italian mine in 1940. The Kennedy Mining & Milling Co. operated the Kennedy mine throughout the year; gold ore was treated by amalgamation and flotation, and the concentrates were smelted. The Keystone Mine Syndicate worked the Keystone mine; 86,513 tons of ore were treated in the company 300-ton amalgamation-flotation mill; gold recovery was 2,534 ounces in bullion and 8,167 ounces in 2,710 tons of concentrates shipped to a smelter. The River Pine Mining Co. operated the most productive dragline dredge in the district in 1940. The Placeritas Mining Co. operated a dragline dredge on the following properties (all within a radius of 4 miles from Plymouth): Associated Mining Co., G. W. Easton, G. Kretcher, J. Orr, Levaggi, and the W. F. Detert estate. The Rim Cam Gold Dredging Co. operated a dragline dredge on the J. Rich property 1 mile west of Drytown, the Blakeley ranch 2½ miles south of Drytown, and the Pester property on the Cosumnes River between Plymouth and Nashville. J. C. Pantle washed 265,000 cubic yards of gravel on Willow Creek with a dry-land dredge from April 1 to December 31; 1,154 ounces of gold and 139 ounces of silver were recovered. E. L. Lilly operated a dragline dredge on the Sally property from September 3 to December 31; the same equipment had worked the Wolin-Hall property from January 1 to September 2.

BUTTE COUNTY

Butte Creek district.—The Little Butte lode mine was operated during 1940.

Magalia district.—The Lemroh Mining Co. operated a dragline dredge from August 15 until the end of 1940.

Merrimac district.—Piombo Bros. & Co. operated a dragline dredge using a dragline excavator with a 1½-cubic yard bucket on French Creek throughout 1940.

Oroville district.—The Butte Operating Co. operated a dragline dredge throughout 1940. Yuba Consolidated Gold Fields (Butte Unit) operated four electric-powered connected-bucket dredges in the Oroville district during 1940; the dredge-bucket equipment per boat was as follows: Eighty-four 9-cubic foot buckets, eighty-nine 9-cubic foot buckets, eighty-seven 9-cubic foot buckets, and seventy-one 6-cubic foot buckets. William Richter & Sons operated a dragline dredge on the Douglas Jacob, Mary Harrin, V. Gamble, and John Bilkli properties. Baker and McCowan operated a dragline dredge on the Farnan ranch. The Golden Feather Dredging Co. operated a dragline dredge, using a dragline excavator with a 5-cubic yard bucket, on the Feather River opposite the town of Oroville from February 8 to December 31. Interstate Mines, Inc., moved a dragline dredge from Trinity County to the Gianella ranch, where it operated from September 11 to December 13. The Humphreys Gold Corporation operated a dry-land dredge on the L. L. Kister property intermittently from January 1 to May 15. Lord & Bishop (Lobicasa Co. after January 1, 1941) washed 66,300 cubic yards of gravel by dragline dredging between November 12 and December 31 and recovered 336 ounces of gold and 11 ounces of silver; the dragline excavator used a

1½-cubic yard bucket. The Placer Development Co. operated a dragline dredge from September 16 until the end of the year. The Sunmar Dredging Co. operated a dragline dredge in Weymans Ravine 4 miles from Oroville from January 1 until March 20; the dragline excavator used a 2-cubic yard bucket. The Gold Hill Dredging Co. operated a connected-bucket dredge with seventy-four 9-cubic foot buckets on the Wilton Kister property throughout 1940.

Yankee Hill district.—Hoefling Bros. worked the Surcease mine during 1940; the company milling plant was completely reconstructed as a 125-ton flotation-cyanidation mill; cyanidation of concentrates was not begun until 1941.

CALAVERAS COUNTY

Camanche district.—The Midas Placer Co. washed 50,000 cubic yards of gravel in a dry-land plant between April 14 and the end of 1940; 659 ounces of gold and 52 ounces of silver were recovered. The Lancha Plana Gold Dredging Co. operated its dredge No. 2 on the Mokelumne River in Calaveras County from January 1 to February 21; the dredge had eighty-four 6-cubic foot buckets.

Campo Seco district.—Glo-Bar Mines operated the Glo-Bar drift mine throughout 1940; 4,464 cubic yards of gravel yielded 321 ounces of gold and 44 ounces of silver.

Copperopolis district.—The Jumbo Consolidated Mining Co. operated the Mountain King mine in the Madam Felix section of the Copperopolis district from January 1 until June 30, 1940, when the company entered bankruptcy; a substantial quantity of ore was treated in the 250-ton amalgamation-flotation mill on the property, and the concentrates were shipped to a smelter. F. S. Tower worked the Royal mine in the Madam Felix section of the district; 14,154 tons of ore yielded amalgamation bullion containing 1,118 ounces of gold and 315 ounces of silver and 311 tons of flotation concentrates containing 721 ounces of gold and 629 ounces of silver.

East Belt district.—The St. Joseph Lead Co. worked the Sheepranch mine throughout 1940; the ore was treated in a 150-ton amalgamation-flotation mill, and the resulting concentrates were shipped to a smelter.

Jenny Lind district.—The Stagan Mining Co. operated a dragline dredge on the Hunt and Robie ranches during 1940; at the Hunt ranch 86,000 cubic yards of gravel yielded 615 ounces of gold and 37 ounces of silver, and at the Robie ranch 414,000 cubic yards of gravel yielded 2,287 ounces of gold and 145 ounces of silver. In addition, a dry-land plant on the Robie ranch washed a small quantity of gravel. The Milton Gold Dredging Enterprise operated a dragline dredge on South Gulch. W. C. Thompson operated a dragline dredge on the Calaveras River 1½ miles southwest of Jenny Lind throughout 1940.

Mother Lode district.—C. E. Gruwell worked the Big Springs mine from January 1 to September 21, 1940. The Carson Hill Gold Mining Corporation treated 385,028 tons of gold ore at the Carson Hill mine during the year and produced amalgamation bullion containing 7,061 ounces of gold and 723 ounces of silver, cyanidation bullion containing 16,655 ounces of gold and 6,223 ounces of silver, and 5 tons of gravity concentrates containing 79 ounces of gold and 407 ounces of silver; flotation replaced the table concentration used in 1939. All the ore was amalgamated and cyanided, and the flotation concentrates were reground and cyanided separately. During 1940 the company paid $72,000 in dividends, bringing its total dividend disbursements to the end of 1940 to $288,000. LeRoi Mines, Inc., operated the Easyz Bird mine from January 1 to March 15; later in the year enlargement, retimbering, and re-equipment of the mine shaft were begun. The San Andreas Gold Dredging Co. operated two dragline dredges on properties along the Mother Lode; each dragline excavator had a 1½-cubic yard bucket. Gravel was washed at the Airola-Costa, Albert Guttinger, John Guttinger, Batten, Bonnie, Bishop (Bowling Green), Calaveras Cement Co., Reed, Canepa, Byers, Fisher, Nuland, Nuner, Tanner, Bishop (Lot 29), and Solari properties. C. E. Gruwell operated a dragline dredge on the Hogate ranch 3½ miles north of Angels Camp. Gravel was hydraulicked at the Cat Camp property. The R. & M. Mining Co. operated a dragline dredge on Coyote Creek from January 1 to April 15; the dragline excavator had a 1¼-cubic yard bucket. J. H. Henry washed 17,200 cubic yards of gravel by dragline dredging on the E. A. Marsh property 4 miles southeast of Valley Springs between May 30 and July 27 and recovered 137 ounces of gold and 13 ounces of silver. The same equipment washed 45,600 cubic yards of gravel on the Genochio property on the North Fork of Calaveras River 1½ miles north of San Andreas between September 16 and the end of the year; 362 ounces of gold and 40 ounces of silver were recovered. Young & Son Co., Ltd., moved 40,000 cubic yards of gravel at the Yale and Allyn property to a stationary washing plant with tractors and carry-alls between April 9 and August 28; 420 ounces of gold and 37 ounces of silver were recovered. Lord & Bishop (now Lobicasa Co.) operated three dragline dredges on the Stockton Reservoir property on the Calaveras River 3 miles from Valley Springs; the dragline excavators used 3-, 1½-, and 1¾-cubic yard buckets, respectively. The Vallecito Mining Co., Inc., worked the Vallecito Western drift mine throughout 1940 and recovered 221 ounces of gold and 25 ounces of silver from 685 cubic yards of gravel. The Wolhall Dredging Corporation operated a dragline dredge on San Domingo Creek from July 4 to December 31; the dragline excavator had a 2-cubic yard bucket.

ELDORADO COUNTY

East Belt district.—The Cosumnes Mines, Inc., treated a substantial quantity of gold ore from a group of claims in the Grizzly Flat section of the East Belt by amalgamation and concentration in 1940. The Greenhorn Dredging Co. operated a dragline dredge on the Middle Fork of Cosumnes River near Youngs from November 3 until December 31; the dragline excavator had a 2-cubic yard bucket.

Mother Lode district.—The Alhambra-Shumway Mines, Inc., operated the Alhambra-Shumway mine throughout 1940. Although the output of the mine was substantial it was much less than that in 1939, when the company extracted one of the richest bonanzas found in California in recent years. The Briarcliffe Mines, Ltd., operated the Briarcliffe mine from January 1 to June 30; 2,904 tons of ore treated by amalgamation yielded bullion containing 38 ounces of gold and 5 ounces of silver and 79 tons of flotation concentrates containing 200 ounces of gold, 26 ounces of silver, and 487 pounds of copper; the concentrates were smelted. The Middle Fork Gold Mining Co. operated the Sliger mine throughout 1940 and treated the ore in a 160-ton amalgamation-flotation mill; during the year a new steel head frame was completed. The General Dredging Corporation operated a dragline dredge in 1940 on the South Fork of American River near the point where James Marshall discovered gold in 1848; the dragline excavator had a 1½-cubic yard bucket. The El Dorado Dredging Corporation operated a dragline dredge using a 1½-cubic yard bucket on Greenwood Creek from June 7 to August 22; on the latter date the plant was moved to Coloma Creek, where work continued until the end of the year. The Irish Creek Mining Co. moved its nonfloating washing plant to the Morgan property and operated from May 2 to October 18. McQueen & Downing operated a dragline dredge on Carson Creek from February 1 until July 8.

West Belt district.—The Mountain Copper Co., Ltd., closed its Big Canyon operation late in 1939 but produced a small quantity of gold during the clean-up of the mill in 1940. El Dorado Crystal Mine worked the El Dorado Crystal mine from January 1 to June 5, when exhaustion of known ore bodies terminated operations; 15,588 tons of ore yielded 2,393 ounces of gold and 881 ounces of silver by cyanidation. The Big Canyon Dredging Co. operated a dragline dredge for 8 months in 1940; the dragline excavator had a 3-cubic yard bucket. The dragline dredge of the Horseshoe Dredging Co. operated on the Frank Kipp property from January 26 to March 20. The Lemroh Mining Co. worked a dragline dredge from January 3 to 23.

FRESNO COUNTY

Friant district.—Griffith Co. and Bent Co., which supplied gravel for the Friant dam in 1940, recovered 443 ounces of gold and 73 ounces of silver in preparing 400,000 tons of gravel.

HUMBOLDT COUNTY

Orleans district.—Hydraulicking at the Pearch mine yielded a substantial quantity of gold in 1940.

IMPERIAL COUNTY

Cargo Muchacho district.—In 1940 the Holmes & Nicholson Mining & Milling Co. shipped a substantial quantity of gold ore from the Cargo

Muchacho group of claims to the company 80-ton cyanide mill 12 miles from the mine and 4 miles west of Winterhaven. T. L. Woodruff and J. M. Rogers worked the Queen mine from May 15 until the end of the year; 1,749 tons of ore containing 1,160 ounces of gold, 222 ounces of silver, and 9,850 pounds of copper were shipped to a smelter; 603 tons of old tailings shipped to a custom cyanide plant yielded 166 ounces of gold and 75 ounces of silver. The Sovereign Development Co. cyanided 5,521 tons of ore from the Sovereign group during 1940 and recovered 1,401 ounces of gold and 145 ounces of silver; the mill was closed October 3 owing to the decline in grade of ore, but exploration and development work continued. The company was reorganized and renamed Tumco Mines, Inc., November 16, 1940.

Mesquite district.—Vanderpool & Murphy operated the Mary Lode mine during 1940. The amalgamation of 92 tons of ore yielded 246 ounces of gold and 115 ounces of silver; in addition, 121 tons of ore containing 144 ounces of gold and 423 ounces of silver were shipped to a smelter.

INYO COUNTY

Bishop Creek district.—The United States Vanadium Corporation produced a copper concentrate containing a substantial quantity of gold as a byproduct of ore treated primarily for tungsten in 1940.

Chloride Cliff district.—J. C. Anderson subleased the Big Bell mine to K. M. Woods January 18, 1940; 4,800 tons of ore treated in a 30-ton amalgamation-concentration plant at the mine yielded amalgamation bullion containing 1,087 ounces of gold and 170 ounces of silver and 13 tons of concentrates containing 52 ounces of gold, 23 ounces of silver, and 930 pounds of lead.

Resting Springs district.—The Shoshone Mines, Inc., reopened the Columbia No. 2 on February 10 and continued operations to the end of 1940; lead ore containing substantial quantities of the precious metals was shipped to a smelter.

Sherman district.—The Argus Mining Co. ceased operation of the Orondo mine April 20, 1940; a successor—the Orondo Mining Co.—reopened the property September 28 and worked until the end of the year. Each company treated a small quantity of ore by cyanidation. Burton Bros., Inc., continued operations at the Ruth mine, where a very porous ore was cyanide-leached after crushing.

Union district.—A number of lessees shipped a substantial quantity of ore, averaging over an ounce of gold to the ton, from the Reward or Brown Monster mine to custom cyanide mills in 1940.

Wild Rose district.—The Del Norte Mining Co. and lessees operated the Del Norte-Skidoo group of mines in the Skidoo section of the Wild Rose district in 1940. The principal operator (the Del Norte Mining Co.) built a 30-ton cyanide plant and began milling May 15; 5,468 tons of ore cyanided yielded 2,587 ounces of gold and 2,599 ounces of silver.

KERN COUNTY

Cove district.—Kern Mines, Inc., operated the Big Blue and Lady Belle groups throughout 1940; 41,598 tons of ore yielded amalgamation bullion containing 2,948 ounces of gold and 1,239 ounces of silver and 694 tons of flotation concentrates containing 3,095 ounces of gold, 7,151 ounces of silver, 355 pounds of copper, and 18,581 pounds of lead; the concentrates were shipped to a smelter.

Mojave district.—Lessees shipped gold ore from the Bob Tail mine to a custom cyanide mill in 1940. The Cactus Mines Co. operated the Cactus Queen mine in the Middle Butte section of the Mojave district throughout the year; gold-silver ore was treated in the company 125-ton cyanidation-flotation mill, and the resulting concentrates were shipped to a smelter. In 1940, for the third year, this property was the State's leading silver producer. M. Albertoli shipped 2,856 tons of ore from the Desert Queen mine to a custom cyanide mill; 541 ounces of gold and 77 ounces of silver were recovered. Lessees worked the Four Jacks mine and shipped 1,097 tons of ore to custom cyanide plants; 295 ounces of gold and 3,748 ounces of silver were recovered. The Golden Queen Mining Co. operated the Golden Queen mine the entire year; in addition to treating a large tonnage of company ore in its 425-ton cyanide mill it did a substantial custom-mill business. The Lodestar Mining Co. shipped 65,119 tons of ore to the Golden Queen cyanide mill; 11,663 ounces of gold and 179,018 ounces of silver were recovered. A number of lessees and sublessees shipped 3,886 tons of ore from the Standard mine to custom cyanide plants during 1940; 1,450 ounces of gold and 15,240 ounces of silver were recovered. Burton Bros., Inc., operated the Tropico mine both on company account and through lessees. This company operated a cyanide plant which, in addition to treating the Tropico ore, treated custom material from more than 300 shippers. As a pioneer in California custom milling east of the Sierra Nevada Mountains, Burton Bros., Inc., has been an important factor in the development of mineral resources within a radius of many miles. Owing to good roads and cheap truck transportation, ore has been sent to this mill from mines over 100 miles away. Lessees on the Yellow Dog mine shipped 424 tons of ore to custom cyanide plants; 382 ounces of gold and 398 ounces of silver were extracted. Lessees on the Yellow Rover mine shipped 593 tons of ore to custom plants; 381 ounces of gold and 998 ounces of silver were recovered by cyanidation.

Randsburg district.—Wegman, Movold & Wegman operated the G. B. and Boston No. 2 claims during 1940; 1,255 tons of ore, part of which was treated by amalgamation and part shipped to a custom cyanide plant, yielded 346 ounces of gold and 8 ounces of silver. The King Solomon Mines Lease worked the King Solomon mine and treated a substantial quantity of ore by amalgamation and cyanide leaching of sands. The operators of the Lucky Boy mine treated 329 tons of ore in the Big Butte Mining Co. mill and recovered 379 ounces of gold and 94 ounces of silver. Lessees shipped 1,098 tons of ore from the Wade property to custom cyanide plants in 1940, where 797 ounces of gold and 4 ounces of silver were recovered. Lessees operated the White mine and shipped 1,029 tons of ore to custom cyanide plants; 345 ounces of gold and 36 ounces of silver were recovered. The Anglo American Mining Corporation, Ltd.—largest operator in the Randsburg district—resumed cyanidation of old tailings at the Yellow Aster mine April 1 after a labor strike had suspended operations for several months; the open pit, which produced a larger tonnage of ore than any other mine in the State in 1939, was not reopened. According to the company printed annual report for the year ended December 31, 1940, 363,715 tons of accumulated tailings were treated.

LOS ANGELES COUNTY

Cedar district.—The Governor Mine Co., operator of the Governor mine, was the principal producer in the Cedar district in 1940.

MARIPOSA COUNTY

East Belt district.—The Bondurant Mining & Milling Co. worked the Bondurant mine during 1940. The San Juan Ramsey Co. operated the Ferguson mine under lease agreement with the Original Mining & Milling Co. during part of 1940. Amalgamation of 3,673 tons of ore from the Nutmeg mine yielded bullion containing 511 ounces of gold and 126 ounces of silver. Schroeder, Odgers & Schroeder operated the Schroeder mine in the Colorado section of the East Belt; 111 tons of ore yielded 590 ounces of gold and 73 ounces of silver.

Hunter Valley district.—Mount Gaines Mining Co. worked the Mount Gaines mine during 1940. The Barker Corporation moved its dragline dredge to Eldorado Creek 1 mile from Hornitos. The Trebor Corporation operated a dragline dredge on the Chase ranch from March 16 to the end of the year; the dragline excavator had a 2-cubic yard bucket.

Mother Lode district.—The Granite King mine was operated during 1940. The Boston California Mining Co. worked the Malvina mine. Pacific Mining Co. worked the Pine Tree and Josephine mines throughout the year and treated 59,249 tons of ore by amalgamation and flotation; the amalgamation bullion contained 1,400 ounces of gold and 285 ounces of silver, and the flotation concentrates shipped to a smelter contained 7,582 ounces of gold, 1,788 ounces of silver, and 4,781 pounds of copper.

MERCED COUNTY

Snelling district.—The Snelling Gold Dredging Co. operated two connected-bucket dredges on the Merced River between Snelling and Merced Falls throughout 1940—one with sixty-six and the other with seventy-two 7-cubic foot buckets. The Merced Dredging Co. operated a connected-bucket dredge with sixty 10-cubic foot buckets one-half mile southwest of Snelling. Four miles east of Snelling, Yuba Consolidated Gold Fields (Merced Unit) operated a connected-bucket dredge with seventy-two 9-cubic foot buckets. P. H. Bottoms operated a dragline dredge from January 1 to November 1; the dragline excavator had a 2-cubic yard bucket. The San Joaquin Mining Co. operated a connected-bucket dredge with sixty-four 10-cubic foot buckets 3 miles west of Snelling in 1940.

MONO COUNTY

Blind Springs district.—The Mineral Reduction Co. continued to operate its custom cyanidation-flotation mill throughout 1940; 94 shippers sent the plant over 7,000 tons of ore during the year. A marked increase in production from prospects and small mines in Mono County has resulted from the service offered by this custom plant. Silver ore mined at the Comanche mine was treated at this plant.

Bodie district.—The Roseklip Mines Co. cyanided dump ore from the Standard mine in a 500-ton plant during 1940.

Chidago district.—R. G. Jones shipped a substantial quantity of gold ore from the Gold Crown mine to the Mineral Reduction Co. cyanidation-flotation plant during 1940.

Homer (May Lundy) district.—The Log Cabin Mines Co. operated the Log Cabin (Simpson) mine from January 1 until December 23, 1940; the ore was treated by amalgamation.

Mammoth Lakes district.—The Monte Christo Mining Co. shipped ore from the Monte Christo mine to a custom cyanide-flotation plant from May 1 until December 16, 1940; 1,640 tons of ore yielded 803 ounces of gold and 12,947 ounces of silver.

White Mountain district.—Between November 1 and 28, 1940, Molini Bros. shipped 135 tons of silver ore from the Green Monster mine to a smelter; the content of the ore was 2 ounces of gold, 9,947 ounces of silver, 818 pounds of copper, and 10,328 pounds of lead.

NAPA COUNTY

Calistoga district.—The Graham Loftus Oil Corporation floated a large quantity of gold-silver ore from the Grigsby (Palisade) mine in 1940; gold-silver concentrates were shipped to a smelter.

NEVADA COUNTY

Grass Valley-Nevada City district.—Grass Valley Bullion Mines, Inc., operated throughout 1940 and shipped its ore to the nearby Idaho Maryland Mines Corporation mill. Empire Star Mines Co., Ltd., operated the Empire, North Star, and Pennsylvania mines at Grass Valley, the Murchie mine at Nevada City, the Zeibright mine in Bear Valley, and the Pennsylvania mine at Browns Valley in Yuba County; the Grass Valley unit was the main producer, work at the Murchie mine was principally exploratory, and production at the

Zeibright mine was suspended early in the year when a storm washed out the company tailings dam. Cooley Butler operated the Golden Center mine throughout 1940. Ore from the Green Mountain mine was amalgamated in a 5-stamp mill. The Idaho Maryland Mines Corporation operated the Idaho Maryland-Brunswick group. According to the company printed annual report for the year ended December 31, 1940, 129,309 ounces of gold and about 34,000 ounces of silver were recovered from 406,707 tons of ore, compared with a recovery of 115,001 ounces of gold from 410,411 tons of ore in 1939. In 1940, 101,028 tons of ore were derived from development headings and 305,679 tons by stoping. In addition to company ore, 24,564 tons of custom ore (24,438 tons of which came from Grass Valley Bullion Mines, Inc.) and 753 tons of custom concentrates were treated. Dividends declared and paid in 1940 totaled $1,073,250.80, bringing total disbursements in dividends to $5,723,965.60. The Idaho Maryland Mines Corporation held first rank as a gold (lode) producer, despite the fact that its output came from a single operation, whereas several other companies—notably the Empire Star Mines Co., Ltd.—derived output from two or more properties widely separated in the State. The Lava Cap Gold Mining Corporation operated the Lava Cap mine throughout the year; 138,580 tons of ore were treated by amalgamation and flotation, and the resulting concentrates were shipped for smelting. Amalgamation bullion contained 5,196 ounces of gold and 33,954 ounces of silver, and 6,661 tons of flotation concentrates contained 34,373 ounces of gold, 288,508 ounces of silver, 43,330 pounds of copper, and 836 pounds of lead. During the year additions were made to the company 400-ton amalgamation-flotation plant to provide for daily cyaniding of 25 tons of concentrates, 20 tons of middlings, and 350 tons of flotation tailings. Lintecum & Garden cyanided 5,000 tons of the Old North Star old tailings on the MacDonald ranch and recovered bullion containing 324 ounces of gold and 148 ounces of silver. The Dakin Co. operated a dragline dredge at Champion Flat along Deer Creek from January 1 to March 1, 1940; the dragline excavator had a 1½-cubic yard bucket. The Pilot Dredging Co. operated intermittently a dragline dredge on the Coleburn property. Kaufield & McKinley operated a nonfloating washing plant on the Parker ranch from June 27 until September 13. The Wyandotte Dredging Co. operated a dragline dredge using a 2½-cubic yard bucket on the Perrin and Pingree ranches from October 18 until December 31; 87,000 cubic yards of gravel yielded 771 ounces of gold and 109 ounces of silver. William Richter & Sons operated a dragline dredge at Scotts Flat from January 1 to October 13.

Washington district.—The Arctic mine was operated by the Utter Mining Co., which leased the property to the Kemmerer Exploration Co. September 1, 1940; the 50-ton flotation mill at the property was started October 12. The Bradley Mining Co. worked the Spanish mine; 989 tons of ore were treated by cyanidation and flotation, and the resulting 58 tons of concentrates were shipped to a smelter; the cyanide bullion contained 51 ounces of gold and 422 ounces of silver, and the concentrates contained 194 ounces of gold, 2,107 ounces of silver, 3,904 pounds of copper, 4,626 pounds of lead, and 9,387 pounds of zinc. The company removed equipment and abandoned all underground workings, except for a small portion known as the Spanish Pit. Several operators worked the Trood mine by drifting and with surface mechanical equipment.

You Bet district.—The Wyandotte Dredging Co., the San Carlos Gold Dredging Co., and the Pilot Dredging Co. operated dragline dredges on the Alpha Stores property during 1940. The Greenhorn Dredging Co. operated a dragline dredge at Quaker Hill from January 1 until December 31; the dragline excavator had a 2-cubic yard bucket. The Calaveras Gold Dredging Co. operated a dragline dredge at Steep Hollow from April 8 to August 20.

ORANGE COUNTY

Santa Rosa district.—The Blue Light Silver Mines, Inc., worked the Silverado or Blue Light mine in Silverado Canyon throughout 1940; 1,296 tons of ore treated in the company 50-ton flotation mill yielded 215 tons of concentrates containing 41 ounces of gold, 15,169 ounces of silver, 2,900 pounds of copper, 38,715 pounds of lead, and 77,195 pounds of zinc.

PLACER COUNTY

Dutch Flat district.—The Canyon Mines Corporation worked the Rawhide mine in 1940. The Lost Camp Mining Co. hydraulicked a substantial quantity of gravel at the Lost Camp mine.

Foresthill district.—The Volcano Mining Co., Ltd., and lessees worked the Volcano drift mine 3 miles east of Foresthill in 1940.

Iowa Hill district.—El Oro Dredging Co. operated a dragline dredge on Indian Canyon from February 4 until September 19, 1940, and a second dredge in Shirttail Canyon from August 6 until October 21.

Lincoln district.—Pantle Bros. operated a dry-land placer machine equipped with four Ainlay bowls on the Ahart and Ferreva and Kaneko ranches during 1940; 179,800 cubic yards of gravel yielded 632 ounces of gold and 111 ounces of silver; the gravel was delivered with a 1-cubic yard dragline excavator. The Innis Dredging Co. operated a dragline dredge on Dry Creek from January 1 to June 1. H. J. Aalders & W. W. Prather operated a dragline dredge using a 1½-cubic yard bucket on the Gladding ranch 4½ miles north of Lincoln from January 1 to July 15. The Midland Co., Inc., moved its dragline dredge from the Lincoln district to the North Fork of Salmon River in Siskiyou County during 1940; the dragline excavator had a 1¼-cubic yard bucket. The Jasper-Stacy Co. (Recalp Co.) worked out its ground in Auburn Ravine 2 miles east of Lincoln in May; a dragline excavator with a 2-cubic yard bucket was used. C. N. Chittenden operated a nonfloating washing plant on the Rizzi ranch from January 1 to July 20 and moved it to the Mulligan ranch August 1, where operations were continued until the end of 1940; 222 ounces of gold and 45 ounces of silver were recovered from 75,000 cubic yards of gravel and 132 ounces of gold and 31 ounces of silver from 26,000 cubic yards of gravel at the respective properties.

Ophir district.—The Alabama California Gold Mines Co. operated the Alabama mine throughout 1940; the ore was treated by amalgamation and flotation, and the concentrates were shipped to a smelter. Duncan Hill Consolidated Mines worked the Duncan Hill mine, and the Ophir Nevada Mining & Milling Co. operated the Eclipse mine during 1940. Highway Forty Mines, Inc., operated the Highway Forty mine; 1,050 tons of ore yielded amalgamation bullion containing 514 ounces of gold and 202 ounces of silver and 23 tons of concentrates containing 64 ounces of gold, 952 ounces of silver, 604 pounds of copper, and 1,628 pounds of lead. Oro Fino Consolidated Mines worked the Oro Fino mine; 22,549 tons of ore were treated by amalgamation and flotation, from which 3,917 ounces of gold and 149 ounces of silver were recovered as amalgamation bullion, and 794 ounces of gold and 3,377 ounces of silver were derived from the cyanidation of 416 tons of concentrates at the Idaho Maryland Mines Corporation plant. The Panob Gold Dredging Co. operated two dry-land outfits on the Forsyth & Lewis and G. E. Stoll properties during 1940. Kaufield & McKinley operated a nonfloating washing plant using a mechanical excavator on the Love ranch from February 20 until June 28. Hallstrom & Lindblad operated a nonfloating washing plant to which gravel was delivered by a dragline excavator with a 1¼-cubic yard bucket; 124,000 cubic yards of gravel yielded 355 ounces of gold and 9 ounces of silver at the Baker ranch 6 miles east of Roseville, and 165,000 cubic yards of gravel yielded 471 ounces of gold and 30 ounces of silver at the Placer Realty Corporation property in Miners Ravine. The Antelope dredge was taken over by the Roseville Gold Dredging Co. and moved to Strap Ravine 6 miles east of Roseville, where operations were begun January 23 and continued until the end of 1940; the electrically powered connected-bucket dredge had seventy-two 3-cubic foot buckets.

PLUMAS COUNTY

Genesee district.—The Walker mine of the Walker Mining Co. (affiliate of the Anaconda Copper Mining Co.) has been the outstanding mine in Plumas County for many years and was the State's principal copper producer in 1940. According to the company printed annual report for the year ended December 31, 1940, 437,450 tons of ore were milled and 20,881 tons of concentrates produced; shipments consisted of 21,010 tons of concentrates, lime scale, and precipitates, with a net recoverable content of 10,524,345 pounds of copper, 14,176 ounces of gold, and 237,891 ounces of silver.

Greenville (Crescent Mills) district.—A substantial quantity of gold ore from the Cherokee mine was treated by cyanidation and flotation in 1940. The Indian Valley Mining Co., Inc., operated the Standart mine; the gold ore was treated by amalgamation and flotation.

Johnsville district.—Several operators worked the Jamison mine during 1940. Portola Corporation reopened the Plumas Eureka mine and rebuilt the mill on the property.

Lights Canyon district.—Innis Dredging Co. moved its dragline dredge from Nevada County to Lights Creek and resumed operations August 4, 1940; the dragline excavator had a 2-cubic yard bucket.

Quincy district.—The Imperial mine was the principal producer of lode gold in the Quincy district in 1940. Baker and McCowan moved a dragline dredge from Butte County to Meadow Valley, where operations continued through August to December; the dragline excavator had a 1½-cubic yard bucket.

Rich Bar district.—The Virgilia Mining Corporation operated the Ohio Point mine during 1940; the ore was treated by flotation, and the concentrates were shipped to a smelter.

RIVERSIDE COUNTY

Dale district.—Bird & McLeod operated the Golden Rod 1, 2, and 3 claims in the Pinto Basin section of the Dale district throughout 1940; 193 tons of ore and 144 tons of old tailings yielded amalgamation bullion containing 8 ounces of gold and 3 ounces of silver and cyanidation bullion containing 321 ounces of gold and 43 ounces of silver. The amalgamation of 86 tons of ore from the Standard mine yielded 18 ounces of gold; the cyanidation of 152 tons of ore yielded 476 ounces of gold. The Mission Mining Corporation, Ltd., worked the Water Well No. 1 mine throughout the year. The more productive section of the Dale district extended into San Bernardino County.

Eagle Mountain district.—Thirty percent of the lead produced in California in 1940 came from ore from the Black Eagle mine operated by the Imperial Smelting & Refining Co.; the ore was shipped to a smelter.

SACRAMENTO COUNTY

Cosumnes River district.—The Cosumnes Gold Dredging Co. operated a connected-bucket dredge with sixty-three 12-cubic foot buckets 7 miles southwest of Sloughhouse during 1940. The Lancha Plana Gold Dredging Co. operated its connected-bucket dredge at Sailors Bar, American River, from April 20 until December 31; the dredge had eighty-four 6-cubic foot buckets. The Humphreys Gold Corporation operated a dragline dredge, using a dragline excavator with a 2½-cubic yard bucket, on the Fassett-Parker-Hanlon property on Cosumnes River from January 1 to December 5; the equipment was moved to the Hutchison property, where operations continued. The Hutchison property was also worked by the Hoosier Gulch Placers from January 5 to October 31; the company used a dragline dredge equipped with a dragline excavator with a 2½-cubic yard bucket. F. O. Bohnett used a nonfloating washing plant on the Hutchison property from July 5 to December 22. Hoosier Gulch Placers operated a dragline dredge on Katesville Gulch and on the Logtown property; the dragline excavator had a 2-cubic yard bucket.

Folsom district.—The Capital Dredging Co. operated two connected-bucket dredges on its property 5 miles south of Folsom throughout 1940; one dredge had 88 18-cubic foot buckets and the other 100 18-cubic foot buckets. McQueen & Downing operated a dragline dredge on Deer Creek from September 10 until December 17. The General Dredging Corporation worked at its placer operation on the American River from January 1 to May 23 and from July 5 to the end of the year; the dragline excavator had a 4-cubic yard bucket. H. W. McKinley operated a nonfloating washing plant on the Hoxsie property from April 15 to September 12. The Carson Creek Dredging Co. washed gravel on the Martin Quinn estate from September 11 until the end of the year; the dragline excavator used a 1¾-cubic yard bucket. The Natomas Co. fleet of seven dredges at Natoma produced more placer gold than any other operation in the State in 1940. The number and size of buckets per dredge were: No. 1, 62 16-cubic foot buckets; No. 4, 67 15-cubic foot buckets; No. 5, 105 12-cubic foot buckets; No. 6, 106 11-cubic foot buckets; No. 7, 98 9-cubic foot buckets; No. 8, 105 12-cubic foot buckets; and No. 10, 83 15-cubic foot buckets.

SAN BERNARDINO COUNTY

Black Hawk district.—The Santa Fe (Arlington) mine produced a substantial tonnage of gold ore during 1940. The Ramsey Mining Co. worked the Wheeler group in March, April, and May; 500 tons of ore treated by cyanidation and table concentration yielded bullion containing 167 ounces of gold and 73 ounces of silver and 10 tons of concentrates containing 168 ounces of gold and 66 ounces of silver; the concentrates were shipped to a smelter.

Buckeye district.—Gold ore was shipped to a smelter from the Bagdad Chase property during 1940.

Dale district.—The Camco Mining Co. and a lessee produced a substantial quantity of gold ore at the Carlyle mine in 1940. Gold Crown Mining Co., Ltd., worked the Gold Crown mine; in addition to treating company ore, the mill handled a large quantity of custom material in its 50-ton all-slime cyanide plant. L. A. Wilson shipped 494 tons of ore from the Gold Stone group to custom cyanide plants; the recovery was 658 ounces of gold.

Randsburg district.—F. W. Royer operated the Kelly mine largely through lessees during 1940. A custom cyanide plant was put into operation January 1 and treated over 8,000 tons of ore from approximately 100 shippers (in addition to the Kelly ore) by the end of the year.

Solo district.—Lessees shipped 452 tons of ore from the Telegraph mine to custom cyanide plants in 1940; 931 ounces of gold and 793 ounces of silver were recovered.

Vanderbilt (Hart) district.—W. W. Hartman operated the Valley View mine throughout 1940.

SAN JOAQUIN COUNTY

Bellota (Linden) district.—The San Gruco Co. and C. E. Gruwell operated dragline dredges on the McGurk property in 1940; each operator used a dragline excavator with a 1½-cubic yard bucket. A. G. Watkins & Sons continued operations of a dragline dredge in the Linden area.

Camanche district.—The connected-bucket dredges of the California Gold Dredging Co. and the Gold Hill Dredging Co., operating on the Mokelumne and Calaveras Rivers, crossed the county line into San Joaquin County for short periods in 1940.

SHASTA COUNTY

Flat Creek (Iron Mountain) district.—The Mountain Copper Co., Ltd., largest mineral producer in Shasta County, worked the Iron Mountain mine throughout 1940. Most of the ore was mined by the open-cut method and was cyanided in a 720-ton sand-leaching and countercurrent-slime plant; for the first time in a number of years underground methods of mining were used, and 10 percent of the ore was produced by top-slicing. Another unusual event for the company was a substantial shipment of copper ore to a smelter.

French Gulch district.—The Willow Creek Mines, Inc., which reopened the Greenhorn mine in 1939, operated throughout 1940 and treated its ore in a 350-ton sand-leaching and slime-countercurrent decantation-cyanide plant. The Niagara Summit Mining Co. amalgamated 600 tons of ore from the Montezuma, Spring, and Summit claims of the Niagara Summit mine and recovered 243 ounces of gold and 69 ounces of silver. A. P. Robillard worked the Philadelphia and Roosevelt claims. The J. H. Scott Co. worked the Washington mine during 1940. The French Gulch Dredging Co. installed a connected-bucket dredge with seventy-six 4½-cubic foot buckets on Clear Creek near French Gulch and began operations September 2.

Igo district.—R. S. Olson operated a dragline dredge from January 1 to March 10, 1940, on China Gulch and from June 18 to December 5 on Daly Gulch. The Clear Creek Dredging Co. operated a dragline dredge, using a 1½-cubic yard bucket, on Clear Creek. J. P. Brennan operated a dragline dredge on Tadpole Creek from January 1 until October 7, then moved the equipment to Champion Gulch and continued operations until the end of the year; the dragline excavator used a 1¼-cubic yard bucket. Crow Creek Dredging Co. operated a dragline along Crow Creek intermittently between May 16 and the end of the year; the dragline excavator used a 1¼-cubic yard bucket. San Gruco Co. moved its dragline dredge, equipped with a dragline excavator with a 1½-cubic yard bucket, to property of the Happy Valley Land and Water Co. and operated from November 1 until the end of 1940. Thurman Gold Dredging Co. installed a connected-bucket dredge with seventy-two 9-cubic foot buckets on Clear Creek and began operations December 1. The Pioneer Dredging Co. operated a dragline dredge, equipped with a dragline excavator using a 3-cubic yard bucket, in Happy Valley from January 1 to August 21.

Old Diggings district.—Walker Mines, Consolidated, operated the Walker mine throughout 1940 and treated 15,285 tons of ore in the company 100-ton cyanide plant; cyanide bullion contained 939 ounces of gold and 670 ounces of silver, and 1 ton of gravity concentrates contained 42 ounces of gold and 97 ounces of silver.

Redding district.—The Blue Gravel mine owned by the City of Redding was lease-operated throughout 1940. Columbia Construction Co., Inc., recovered a substantial quantity of gold in preparing 1,781,466 tons of gravel to be used in the construction of Shasta Dam.

SIERRA COUNTY

Alleghany district.—Dickey Exploration Co. operated the Oriental mine throughout 1940. Original Sixteen to One Mine, Inc., largest gold producer in Sierra County, continued operation of its Original Sixteen to One mine. Allied Mines, Inc., worked the Plumbago mine from January 1 to August 8, 1940.

Pike (*Slate Range*) *district.*—The owner and a lessee produced 1,024 tons of ore at the Bowman mine in 1940; amalgamation bullion contained 229 ounces of gold and 39 ounces of silver.

Poker Flat (*Table Rock*) *district.*—The Loftus Blue Lead Mining Co. hydraulicked 60,000 cubic yards of gravel at the Loftus Blue Lead mine and recovered 352 ounces of gold and 25 ounces of silver.

Port Wine district.—The Poverty Hill mine, worked by A. J. Oyster, was the largest hydraulic operation in the State in 1940.

Sierra City district.—R. D. Compton operated the Colombo mine from January 1 to December 6, 1940.

SISKIYOU COUNTY

Callahan district.—Oils Incorporated of California operated the Oro Grande (McKeen) mine in 1940. During 5 months of operation at the 75-ton flotation plant 3,560 tons of ore were treated, and 63 tons of concentrates containing 524 ounces of gold, 310 ounces of silver, and 76 pounds of copper were shipped to a smelter. The Etna Gold Dredging Co. operated a connected-bucket dredge with eighty 3-cubic foot buckets on Wildcat Creek 2 miles north of Callahan; 800,000 cubic yards of gravel yielded 4,299 ounces of gold and 642 ounces of silver. Okoro Mines, Inc., operated a dry-land dredge intermittently from January to June and washed 45,000 cubic yards of gravel, from which 218 ounces of gold and 31 ounces of silver were recovered. Yuba Consolidated Gold Fields (Siskiyou Unit) was the leading gold producer in Siskiyou County in 1940; the company operated a Yuba-type connected-bucket dredge with seventy-two 9-cubic foot buckets.

Greenhorn district.—The Cal Oro Dredging Co. operated a connected-bucket dredge on the Lange property from January 28 to September 22, 1940. The Yreka Gold Dredging Co. completed its operation 2 miles north of Yreka during 1940 and moved its connected-bucket dredge to Seiad Valley.

Humbug district.—Von der Hellen & Webber operated a dragline dredge, using a dragline excavator with a 2-cubic yard bucket, throughout 1940.

Klamath River district.—Merriman Mining Merger operated the Buzzard Hill mine in 1940. The Happy Camp Dredging Co. operated a dragline dredge on the Allen property from May 1 to July 31; the dredge was moved to the Grant Smith property and operated there from September 1 to November 30. William von der Hellen Mines (renamed May 1 William von der Hellen Mining Co.) operated a dragline dredge, with a dragline excavator having a 2½-cubic yard bucket, throughout 1940. Larsen Bros. & Harms Bros. operated a dragline dredge on the Klamath River from February 25 until the end of 1940; the dragline excavator had a 5-cubic yard bucket. This company also operated a dragline dredge, using a dragline excavator with a 2-cubic yard bucket, on Horse Creek throughout the year. The Yreka Gold Dredging Co., which operated near Yreka during the early part of the year, resumed operations in Seiad Valley September 15; the dredge had sixty-seven 6-cubic foot buckets.

Liberty district.—The King Solomon Mines Co. discontinued operations at the King Solomon mine early in 1940; all mining and milling machinery was sold. Operators of the Joubert mine recovered 354 ounces of gold and 55 ounces of silver by hydraulicking.

Salmon River district.—P. D. Sacchi, E. L. Spellenberg, and F. Kubli operated a dragline dredge, using a dragline excavator with a 1½-cubic yard bucket, at Forks of Salmon intermittently during 1940; 365 ounces of gold and 53 ounces of silver were recovered.

Scott River district.—The Quartz Hill mine was worked in 1940. The Oro Trinity Gold Dredging Co. operated a dragline dredge on Kangaroo property; the dragline excavator had a 1½-cubic yard bucket.

STANISLAUS COUNTY

Jenny Lind district.—The California Gold Dredging Co. operated a connected-bucket dredge south of the Calaveras River and spent most of the year on the Stanislaus side of the county line.

Knights Ferry district.—The C & E Dredging Co. operated a dragline dredge, with a dragline excavator having a 1½-cubic yard bucket, on Littlejohn Creek 2 miles northwest of Knights Ferry intermittently between September 20 and December 17; the same equipment was used in dredging on the adjoining Jack Welsh ranch. Placer Properties Co. operated a dragline dredge on the Stanislaus River 9 miles east of Oakdale throughout 1940; a 6½- and a 7½-cubic yard bucket were tried on a 5-cubic yard dragline excavator at various times during the year; the washing plant used a shaking screen in place of a trommel.

La Grange district.—The La Grange Gold Dredging Co. dredge No. 4 operated on the Tuolumne River throughout 1940; the dredge had sixty-two 10-cubic foot buckets. The Tuolumne Gold Dredging Corporation operated a connected-bucket dredge with one hundred 12-cubic foot buckets from February 22 until the end of the year.

TRINITY COUNTY

Hayfork district.—The Cinco Mineros Co. operated a dragline dredge, using a dragline excavator with a 1½-cubic yard bucket, near Hayfork throughout 1940.

Junction City district.—G. H. Bergin operated the Canyon Placers by hydraulicking in 1940. The Junction City Mining Co. operated an electrically powered connected-bucket dredge, with seventy-six 10-cubic foot buckets, on Trinity River near Junction City continuously throughout the year. La Grange Placer Mines, Ltd., hydraulicked gravel on Oregon Gulch from March 1 to July 1 and from December 23 to the end of the year. The Weaver Dredging Co. operated a dragline dredge on Oregon Gulch from February 2 to June 1; the dragline excavator used a 2-cubic yard bucket. The Red Hill mine was worked by hydraulicking, dragline dredging, and small-scale hand methods during the year.

Lewiston district.—The Lincoln Gold Dredging Co. worked the A. E. Lunden and Adrian ranches and the Lowden & Thomas, Phillips, Fancelli, and Van Matre properties during 1940. C. R. and T. D. Harris operated the Trinity (Mary Smith) dredge on Trinity River from January 1 to November 15, when the gravel deposit was exhausted; the dredge was of flume type and had forty-two 11-cubic foot link-connected buckets.

Salyer district.—The Swanson Mining Corporation hydraulicked a small yardage of very high grade gravel between February 9 and May 24, 1940.

Trinity Center district.—The property of the Carrville Gold Co. on Trinity River between Trinity Center and Carrville was operated by the company's agent (Yuba Consolidated Gold Fields) throughout 1940; the property was equipped with a connected-bucket dredge with seventy-five 12-cubic foot buckets.

Weaverville district.—Arbuckle Bros. carried on hydraulic operations at the Arbuckle mine during 3 months of 1940. B. H. K. Mines operated a dragline dredge, equipped with a dragline excavator using a 1½-cubic yard bucket, on Little John Creek from July 1 to the end of the year; 184,000 cubic yards of gravel washed yielded 789 ounces of gold and 40 ounces of silver. The Dawn Mining Co. operated the Dawn hydraulic mine. The Viking Dredging Co. operated throughout 1940 a dragline dredge, equipped with a dragline excavator with a 2-cubic yard bucket, on Filibuster Flat, Shanahan Bar, and Hidden Channel near the confluence of Redding Creek and Trinity River. The Weaver Dredging Co. operated a dredge, using a dragline excavator with a 1-cubic yard bucket, on East Weaver Creek from January 1 to June 12, when the equipment was shipped to Montana. The company operated a second dragline dredge, equipped with a dragline excavator with a 2½-cubic yard bucket, on the La Grange property from October 8 until the end of the year. Interstate Mines, Inc., operated a dragline dredge on the Lowden ranch from January 4 to July 14. The Oro Trinity Dredging Co. operated a Diesel-powered dragline dredge, equipped with a dragline excavator using a 1½-cubic yard bucket, near Weaverville from January 1 to June 18; the equipment then was moved to the Scott River district, Siskiyou County, where operations were resumed August 10.

TUOLUMNE COUNTY

East Belt district.—The Densmore mine was worked during 1940, and lessees operated the Hidden Treasure mine. La Guria Gold Mining Co. worked the La Guria mine the entire year; the cyanide-leaching plant was replaced by a 50-ton flotation mill, and equipment to cyanide the concentrates was added later. After a short trial the company decided to ship the concentrates to a smelter. The Ryan Mining Co. worked the Ryan mine throughout the year; 1,700 tons of ore yielded amalgamation bullion containing 991 ounces of gold and 114 ounces of silver and table concentrates containing 20 ounces of gold and 30 ounces of silver; the concentrates were shipped to a smelter. R. H. Hallock crushed 375 tons of ore from the Sleepy Hollow mine in the Saw Mill Flat section of the East Belt; 373 ounces of gold and 15 ounces of silver were recovered. J. A. McMahon recovered 386 ounces of gold and 22 ounces of silver from 2 tons of pocket ore taken from the Stockton mine. L. R. Harris operated a dragline dredge on the Jackass property from April 20 to May 22.

Mother Lode district.—Allied Mines, Inc., worked the Heslep, App, Dutch, and Sweeney mines during 1940. Miller & Clemson operated the Eagle-Shawmut mine and treated 72,000 tons of ore by amalgamation and flotation; amalgamation bullion contained 1,623 ounces of gold and 471 ounces of silver, and 2,150 tons of concentrates contained 4,186 ounces of gold, 1,550 ounces of silver, 5,547 pounds of copper, and 85 pounds of lead. Lord & Bishop (now Lobicasa Co.) worked the Jumper mine from August 22 until the end of 1940; 2,585 tons of ore yielded amalgamation bullion containing 388 ounces of gold and 64 ounces of silver. The Barker Corporation operated a dragline dredge on Tuolumne River near Jacksonville from January 1 until November 18, when the equipment was moved to Hornitos, Mariposa County. A. E. Kent began operations with dredge No. 1 on Six Bit Gulch near Chinese Camp December 13; the dragline excavator had a 1¾-cubic yard bucket. The same company operated dredge No. 2 on Sanguinetti Ridge near Chinese Camp from June 29 until the end of the year; the dragline excavator had a 2½-cubic yard bucket. E. Z. Bowan operated a nonfloating washing plant on the La Bienvenita mine. Mullin & Co. washed 55,700 cubic yards of gravel by dragline dredging on Sullivan Creek and recovered 419 ounces of gold and 41 ounces of silver.

YUBA COUNTY

Bear River district.—The Empire Star Mines Co., Ltd., continued operations at its Pennsylvania mine in 1940.

Smartville district.—The Parks Bar Co. operated a Diesel-powered dragline dredge, equipped with a dragline excavator with a 1½-cubic yard bucket, in Big Ravine from May 1 until October 31, 1940; the recovery from 95,000 cubic yards of gravel was 429 ounces of gold and 20 ounces of silver. The Sunmar Dredging Co. operated a dragline dredge on Mammoth Mining Co. ground; the dragline excavator had a 2-cubic yard bucket. The Arundel Corporation produced a substantial quantity of gold in preparing gravel for concrete aggregate. Williams Bar Dredging Co. operated throughout 1940 a connected-bucket dredge with eighty-four 6-cubic foot buckets on the Yuba River 4 miles northwest of Smartville. A large number of snipers camping along the Yuba River worked gravel by small-scale hand methods.

Strawberry Valley district.—The R. & M. Mining Co. operated a dragline dredge on the Corley and Princess Pines properties in 1940.

Yuba River district.—Yuba Consolidated Gold Fields operated a fleet of six dredges at its property in the Yuba River Basin near Hammonton. All the dredges were equipped with 18-cubic foot buckets and electric power; two of them had 87 buckets each, two had 100 buckets each, one had 126 buckets, and one had 135 buckets.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE CENTRAL STATES

(MINE REPORT)

By A. J. Martin

SUMMARY OUTLINE

Mine production of zinc in the Central States in 1940 was the highest in quantity since 1929 and that of lead the highest since 1930; the output of copper, which had decreased annually from 1937 to 1939, inclusive, rose slightly in 1940. The principal factor contributing to the moderate increase over 1939 in output of lead and zinc was the advance in metal prices to a level that permitted utilization of the leaner portions of ore bodies in old mines, but one newly developed zinc-lead-fluorspar mine in southern Illinois made substantial production of zinc and lead. The output of recoverable zinc in the Tri-State region (Kansas, Oklahoma, and southwestern Missouri) increased 4 percent over 1939, but that of lead decreased 20 percent; however, lead production in southeastern Missouri—chief lead-producing district—increased 11 percent. The rise in metal prices had the usual effect of stimulating activity at small lead and zinc mines. The total number of producing mines, large and small, in the Central States increased from 251 in 1939 to 416 in 1940. The copper ore produced in 1940 came from Michigan mines, but some copper was recovered in treating residues from the smelting of lead concentrates from southeastern Missouri. The silver output was that recovered as a byproduct from lead, copper, and zinc-lead ores. The gold came from a placer prospect.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4].646+	.098	.046	.048
1939	35.00	[5].678+	.104	.047	.052
1940	35.00	[6].711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in the Central States, 1936–40, in terms of recovered metals

Year	Mines producing	Ore sold or treated (short tons)	Gold		Silver	
			Fine ounces	Value	Fine ounces	Value
1936	179	21,530,800			165,500	$128,180
1937	283	26,516,112	51.44	$1,800	206,041	159,374
1938	229	19,037,105			386,210	249,671
1939	251	22,972,151	[1] 4.00	140	315,953	214,465
1940	416	25,532,085	[1] 5.00	175	353,737	251,546

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
1936	96,350,019	$8,864,202	148,536	$13,665,312	235,447	$23,544,700	$46,202,394
1937	95,466,000	11,551,386	204,885	24,176,430	244,045	31,725,850	67,614,840
1938	93,486,000	9,161,628	158,873	14,616,316	198,721	19,077,216	43,104,831
1939	87,970,000	9,148,880	198,481	18,657,214	231,716	24,098,464	52,119,163
1940	91,766,000	10,369,558	207,587	20,758,700	244,976	30,866,976	62,246,955

[1] From placer prospecting.

Gold.—The 5 fine ounces of gold reported produced in the Central States in 1940 came from small placer prospecting in Vigo County, Ind.

Silver.—Production of silver in the Central States in 1940 totaled 353,737 fine ounces. The output of Illinois (4,766 ounces) came from galena concentrates recovered in milling zinc-lead ore and fluorspar, that of Missouri (260,314 ounces) from the refining of lead bullion, and that of Michigan (88,657 ounces) from copper ore. Mines in the other Central States yielded no recoverable silver in 1940.

Copper.—The copper output of the Central States in 1940 came from copper ore from Michigan and lead ore from Missouri; no copper ore was shipped from Missouri during the year, and the copper reported was derived from the treatment of residues from lead smelting. The output of refined copper in Michigan increased from 87,970,000 pounds in 1939 to 90,396,000 in 1940 and the average recovery per ton of rock from 19.1 to 20.4 pounds.

Lead.—The lead recovered from shipments of lead ore and concentrates in the Central States increased from 198,481 tons in 1939 to 207,587 in 1940, owing mainly to increased production from southeastern Missouri. Shipments from the Tri-State region decreased—those of Kansas from 13,697 tons in 1939 to 11,927 in 1940, southwestern Missouri from 2,759 to 2,144 tons, and Oklahoma from 27,720 to 21,240 tons. The combined output from other Central States (Arkansas, Illinois, Kentucky, and Wisconsin) was 2,368 tons, an increase of 1,585 tons over 1939.

Zinc.—The recoverable zinc in ore and concentrates shipped from mines in the Central States in 1940 was 244,976 tons; 232,437 tons (95 percent) of the total came from the Tri-State region. Oklahoma contributed 70 percent of the Tri-State output and Kansas 25 percent compared with 63 and 31 percent, respectively, in 1939. Stocks of zinc concentrates totaled 2,764 tons at the end of 1940 compared with 12,012 tons (revised figure) in 1939. The recoverable zinc in shipments from Missouri mines decreased from 15,096 to 12,703 tons; in 1939 the entire output came from southwestern Missouri, but in 1940 central and southeastern Missouri yielded 233 tons. The Wisconsin output (5,770 tons) was 2 percent under 1939, but Illinois production jumped from 334 to 4,818 tons.

MINE PRODUCTION BY STATES AND REGIONS

Mine production of gold, silver, copper, lead, and zinc in the Central States in 1940, by States, in terms of recovered metals

State	Mines producing	Ore (short tons)	Gold		Silver	
			Fine ounces	Value	Fine ounces	Value
Arkansas	27	(1)				
Illinois	6	[2] 41,940			4,766	$3,389
Indiana	(3)		5	$175		
Kansas	34	3,153,800				
Kentucky	13	(1)				
Michigan	6	4,438,219			88,657	63,045
Missouri	89	6,457,400			260,314	185,112
Oklahoma	100	11,250,400				
Wisconsin	141	190,326				
	416	25,532,085	5	175	353,737	251,546
Total, 1939	251	22,972,151	4	140	315,953	214,465

State	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
Arkansas			55	$5,500	440	$55,440	$60,940
Illinois			1,508	150,800	4,818	607,068	761,257
Indiana							175
Kansas			11,927	1,192,700	57,032	7,186,032	8,378,732
Kentucky			360	36,000	1,278	161,028	197,028
Michigan	90,396,000	$10,214,748					10,277,793
Missouri	1,370,000	154,810	172,052	17,205,200	12,703	1,600,578	19,145,700
Oklahoma			21,240	2,124,000	162,935	20,529,810	22,653,810
Wisconsin			445	44,500	5,770	727,020	771,520
	91,766,000	10,369,558	207,587	20,758,700	244,976	30,866,976	62,246,955
Total 1939	87,970,000	9,148,880	198,481	18,657,214	231,716	24,098,464	52,119,163

1 Figures not available for small quantity of ore treated in Arkansas or Kentucky.
2 Excludes lead-bearing material mined along with fluorspar, from which some lead was recovered as a byproduct of the mining and milling of fluorspar.
3 Gold produced in Indiana was from small placer prospecting.

The report of this series for 1930 (chapter of Mineral Resources of the United States, 1930, pt. I) gives the areas included in the seven lead- and zinc-producing regions of the Central States. Mineral Resources, 1914, contains brief reviews of the history of lead and zinc mining in the Central States, the yearly production of each State from 1907 to 1914, inclusive, and historical notes and estimates of the total production of lead and zinc in each State before 1907. Subsequent records year by year are found in Mineral Resources and Minerals Yearbook.

Of a total of 428,971 tons of blende concentrates produced in 1940 in the Tri-State region, 74,506 tons—1,575 tons more than 1939—were derived from old tailings.

Quantity and tenor of ores.—The quantity and tenor of ores and old tailings treated in Kansas, Michigan, Missouri, Oklahoma, and Wisconsin from 1938 to 1940 are shown in the table that follows. Comparable figures for Kentucky and Illinois cannot be given because the lead and zinc concentrates shipped from some of the mines are recovered as byproducts in the concentration of the fluorspar that they accompany, and the metal content of the crude ore raised cannot be calculated. In Arkansas very little ore was mined annually from 1918 to 1940, and the tenor of most of the ore treated (generally by small mills or hand jigs) was not determined by the operators.

Mine production of lead and zinc in the Central States in 1940, by regions

Region	Lead[1]		Zinc[2]		Total value
	Short tons	Value	Short tons	Value	
Concentrates:					
Joplin or Tri-State	46,212	$2,724,795	429,778	$18,062,867	$20,787,662
Southeastern Missouri [3]	232,871	14,269,600	815	20,000	14,289,600
Upper Mississippi Valley [4]	631	35,460	10,887	447,890	483,350
Kentucky-southern Illinois	3,326	132,373	[5] 11,837	376,902	509,275
Northern Arkansas	5	345	[6] 1,565	30,879	31,224
	283,045	17,162,573	454,882	18,938,538	36,101,111
Total, 1939	269,691	15,793,344	426,522	14,628,408	30,421,752
Recoverable metal:					
Joplin or Tri-State	35,311	3,531,100	232,437	29,287,062	32,818,162
Southeastern Missouri [7]	169,908	16,990,800	233	29,358	17,020,158
Upper Mississippi Valley [4]	453	45,300	5,776	727,776	773,076
Kentucky-southern Illinois	[8] 1,860	186,000	6,090	767,340	953,340
Northern Arkansas	[9] 55	5,500	440	55,440	60,940
	207,587	20,758,700	244,976	30,866,976	51,625,676
Total, 1939	198,481	18,657,214	231,716	24,098,464	42,755,678

[1] Includes galena and small quantity of lead carbonate concentrates.
[2] Includes sphalerite and small quantity of zinc carbonate and zinc silicate concentrates.
[3] Includes 20 tons of lead concentrates and 315 tons of zinc concentrates from central Missouri.
[4] Region includes Iowa, northern Illinois, and Wisconsin; no production in Iowa in 1939 or 1940.
[5] Includes 152 tons of zinc-lead concentrates averaging 50 percent zinc and 7.24 percent lead.
[6] Includes 812 tons of zinc-lead carbonate ores and concentrates.
[7] Includes 15 tons of lead and 127 tons of zinc from central Missouri.
[8] Includes 10 tons contained in zinc-lead concentrates.
[9] Includes 51 tons contained in zinc-lead carbonate ores and concentrates.

Quantity and tenor of copper, lead, and zinc ores, old tailings, etc., produced in some [1] Central States, 1938–40, by States

State	1938		1939		1940	
	Ore, etc.	Metal content [2]	Ore, etc.	Metal content [2]	Ore, etc.	Metal content [2]
	Short tons	*Percent*	*Short tons*	*Percent*	*Short tons*	*Percent*
Kansas	3,751,300	2.58	3,701,300	2.45	3,153,800	2.40
Michigan	3,757,705	1.24	4,603,751	.96	4,438,219	1.02
Missouri	4,148,000	3.28	5,650,800	3.12	6,457,400	2.94
Oklahoma	7,321,400	1.71	8,802,900	2.00	11,250,400	1.80
Wisconsin	58,700	4.46	213,400	3.26	190,326	3.61
	19,037,105	----------	22,972,151	----------	25,490,145	----------

[1] Figures not available for small quantity of ore treated in Arkansas; Kentucky and Illinois excluded because part of the metal output (lead and zinc) was a byproduct of fluorspar mining, and the quantity of metal-bearing material hoisted could not be determined.
[2] The percentages represent metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in other Central States the metals are lead and zinc combined, relative proportions of which are shown in third table of this chapter and in tables of tenor of ore given in sections devoted to the respective States.

MINING AND METALLURGIC INDUSTRY

The ability of the mining industry, through improvements in mining methods and metallurgy, to mine and treat ores and tailings of such low average metal content as those of the Central States is an important contribution to prolongation of the productive life of the mining districts. Most of the ore is concentrated by the companies producing it, but that mined by some of the large producing companies in the Tri-State and southern Wisconsin districts is sent to central mills, which also afford an outlet for crude ore produced by individuals and partnerships working small mines or gouging in large mines abandoned by former operators. Gravity concentration continues to be an important factor in the treatment of the ores, although flotation is used in nearly all the large mills to supplement the gravity method or as the principal method of treatment. The concentrates generally have an established market. In 1940 copper concentrates from Michigan were smelted at plants at Hubbell and Houghton, Mich.; lead concentrates from southeastern Missouri were sent to smelters at Herculaneum, Mo., and Alton, Ill.; and lead concentrates from the Tri-State district went to smelters at Galena, Kans., and Alton, Ill. Zinc concentrates from the Tri-State district moved to smelters or pigment plants at Bartlesville, Blackwell, and Henryetta, Okla.; Coffeyville, Kans.; Fort Smith and Van Buren, Ark.; Danville, East St. Louis, Hillsboro, and La Salle, Ill.; Donora and Langeloth, Pa.; and Meadowbrook and Moundsville, W. Va. The lead and zinc concentrates from Wisconsin, southern Illinois, and other scattered districts in the Central States were shipped to the plants that treated the concentrates from southeastern Missouri and the Tri-State district.

REVIEW BY STATES

ARKANSAS

Mines in Arkansas yielded 440 tons of recoverable zinc in 1940 compared with 123 tons in 1939 and an annual average of 159 tons during the 5 years ended with 1938. The output of lead in 1940 was 55 tons. The zinc and most of the lead recovered in 1940 were contained in 812 tons of zinc-lead concentrates and lump ore averaging 28.57 percent zinc and 7.02 percent lead, and 753 tons of zinc concentrates averaging 34 percent zinc; all were carbonates or silicates and were sold to the Ozark Smelting & Mining Co. at Coffeyville, Kans. Galena ore shipped during the year amounted to only 5 tons. The principal shipper was the Manda Industrial Corporation at Harrison, which purchased the ore and concentrates in small lots from individuals and partnerships working mines and prospects in Boone, Lawrence, Marion, Newton, and Searcy Counties. The ore from most of the mines was hand-jigged, cobbed, or concentrated in small mills before shipment. The producing mines included the Boggs, Coon Hollow, Gloria, Jackpot, and Minnie Lee in the Zinc district; the King Jack near Smithfield; the Edith-Yellow Rose, Mineral Point, and Silver Hollow near Rush; and the Bonanza, Brewer, Chimney Rock, Confederate (mine and mill), and Ponca in Newton County. A custom mill with a capacity of 50 tons of ore daily was built late in the year on the McIntosh property in the Rush district, was operated about 30 days, and treated 1,000 tons of ore.

ILLINOIS

Northern Illinois.—All the lead and zinc mines of northern Illinois are in Jo Daviess County, the extreme northwestern county of the State. No production was reported from any of them from 1931 to

1939, inclusive. In 1940 the output was only 8 tons of recoverable lead and 6 tons of zinc contained in 10 tons of lead concentrates washed from old tailings and 60 tons of material, mostly from a clean-up at the old Blewett mine in the Galena district, shipped to the Vinegar Hill Zinc Co. flotation mill at Cuba City, Wis.

Southern Illinois.—The output of lead and zinc from southern Illinois in 1940 was the largest in any year since statistics of actual mine production in Illinois were first collected in 1907. From 1906 through 1939 shipments of silver-bearing galena concentrates, mostly byproduct of fluorspar mining and milling, totaled 20,763 tons—an average of 611 tons annually; shipments of zinc concentrates during the same period (except for a small undetermined quantity in 1906) totaled only 3,013 tons—produced in 1923, 1924, 1925, and 1939. In 1940 the output of lead concentrates totaled 2,813 tons averaging 56.13 percent lead and 3.4 ounces of silver to the ton, and that of zinc concentrates was 8,517 tons averaging 62.78 percent zinc. Production (in terms of recovered metals) amounted to 1,500 tons of lead, 4,766 ounces of silver, and 4,812 tons of zinc in 1940 compared with 308 tons of lead, 675 ounces of silver, and 334 tons of zinc in 1939. The large increase was due to expanded operations by the Mahoning Mining Co., which in 1938 and 1939 developed a body of fluorspar and zinc-lead ore near Cave in Rock, Hardin County, and constructed a 200-ton all-flotation plant that was run throughout 1940. Other shippers of lead concentrates from Rosiclare included Hillside Fluor Spar Mines and the Illinois Fluor Spar Co.

INDIANA

Placer prospecting in Vigo County yielded 5 fine ounces of gold in 1940.

KANSAS

The recoverable metal in concentrates from Kansas mines shipped in 1940 totaled 11,927 tons of lead and 57,032 tons of zinc compared with 13,697 and 68,971 tons, respectively, in 1939. The output of zinc concentrates from tailing mills decreased 35 percent in quantity and that from mine ore 14 percent. About 639,900 tons of Kansas crude ore from 12 mines were concentrated at Oklahoma mills. In all, about 34 mines and 20 mills were operated in Kansas in 1940 compared with 30 mines and 23 mills in 1939. Prices of concentrates and other general details of mining in the Tri-State region, which includes the Kansas lead- and zinc-mining area, are given in the pages of this chapter devoted to southwestern Missouri.

Mines and mills near Baxter Springs yielded 3,714 tons of lead concentrates and 18,739 tons of zinc concentrates. The largest producer was the St. Louis Smelting & Refining Co., which operated its Ballard (No. 8) mill continuously on ore from the Ballard, Bailey, Clark, English "O", and Shanks mines. The Bilharz Mining Co. operated its mill on ore from the Brewster mine in Oklahoma. The Sunflower mine and mill were operated part of the year by the Sunflower Mining Co. and from October 12 to December 31 by the Madison Mining Co. Ore from the Robob mine was shipped to the Central mill at Cardin, Okla. The Wade custom mill treated mostly ore from Oklahoma mines. Mines and mills in the Blue Mound-Treece area shipped 11,663 tons of galena and 80,924 tons of blende.

The Vinegar Hill Zinc Co. operated its Barr mine and mill early in the year but sold them in April to the Jane E. Mining Co. which, after a short period of operation, sold the property to the Eagle-Picher Mining & Smelting Co.; the mine then became part of the Eagle-Picher Westside group and the mill (since called Westside) treated ore from this group during the rest of the year. The Eagle-Picher Webber mine and mill were operated continuously. The Federal Mining & Smelting Co. ran its Muncie mill on ore from the Tar Creek and Semple mines; most of the ore from the Federal Jarrett mine was treated in the company Gordon central mill in Oklahoma. Kansas Explorations, Inc., continued operations at its Jarrett lease and mill northeast of the Federal Jarrett. The Oklahoma Interstate Mining Co. worked the Cherokee mine, sending the ore to the company Woodchuck mill at Cardin, Okla. Ore from the Robinson mine was treated in the Beck mill at Picher, Okla., and that from the Black Eagle, Big John, Chubb, Wilbur, and Mid-Continent Lead & Zinc Co. leases (Bendelari, Grace B, and Wright) was shipped to the Central mill at Cardin, Okla. The Lula Bell Mining Co. operated its

Mine shipments of lead and zinc in Kansas, 1936–40

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1936	60	14, 789	$765, 746	149, 095	$5, 473, 457	11, 409	$1, 049, 628	79, 017	$7, 901, 700
1937	42	20, 559	1, 454, 507	151, 646	6, 476, 064	16, 008	1, 888, 944	80, 300	10, 439, 000

Sphalerite concentrates	34. 39	32. 11	42. 56	38. 13

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Opperman lease and mill from August to December. The New Blue Mound Mining Co. and the J. P. Dines Mining Co. also operated mine mills. The principal producers from old tailings were the Captain Milling Co., C. Y. Semple, J. L. Smith Chat Co., and Youngman Milling Co.

Production from the Kansas part of the Waco district in 1940 was 47 tons of galena concentrates and 5,407 tons of blende. The St. Louis Smelting & Refining Co. operated its 800-ton mill and No. 9 mine from January to May, and the R. H. & G. Mining Co. ran its mill on ore and old tailings from the Barnsdall No. 3, Acme, and Butte-Kansas properties in Kansas and the Barnsdall No. 2 and other properties on the Missouri side of the Waco district. No output for 1940 was reported from the Lawton or Crestline camps, and scrapping only was done at Galena.

KENTUCKY

The Kentucky output of lead and zinc in 1940 came from Caldwell, Crittenden, and Livingston Counties in the western or fluorspar region of the State. Shipments comprised 2,716 tons of zinc sulfide concentrates averaging 42.84 percent zinc, 152 tons of zinc-lead sulfide concentrates averaging 50 percent zinc and 7.24 percent lead, 452 tons of zinc carbonate averaging 40 percent zinc, and 513 tons of lead sulfide averaging 69.59 percent lead. The recoverable metal content of the combined concentrates was 360 tons of lead and 1,278 tons of zinc compared with 87 and 909 tons, respectively, in 1939.

The Eagle Fluor Spar Co. of Salem, Livingston County, which operated its "Hutson" mine and 100-ton gravity-concentration mill most of the year, was the principal shipper of zinc concentrates. Avery H. Reed of Marion, Crittenden County, shipped 348 tons of 40-percent zinc carbonate concentrates from ore mined on land owned by the K–K–Mining Co. and treated by log washing. The National Fluorspar Co. and the Kentucky Fluor Spar Co. shipped byproduct lead concentrates, part of which were recovered in the milling of fluorspar purchased from other producers; and the United States Coal & Coke Co. Fluorspar Division shipped byproduct zinc-lead and lead concentrates. From Princeton, Caldwell County, C. F. Lester shipped 2 cars of zinc sulfide concentrates produced in 1939. The zinc concentrates produced in Kentucky in 1940 were shipped to the Ozark Smelting & Mining Co. plant at Coffeyville, Kans., and the lead concentrates to the American Smelting & Refining Co. Federal smelter at Alton, Ill.

MICHIGAN

Production of copper in Michigan was 90,396,000 pounds in 1940, a 3-percent increase over 1939. The output in both years came from mines of the Calumet and Hecla Consolidated Copper Co. (including Peninsula group), Copper Range Co. (Globe and Champion), Isle Royal Copper Co., and Quincy Mining Co. There was little variation in rates of operation by individual companies in 1940 and 1939. The total copper-bearing material milled or treated in 1940 amounted to 4,438,219 tons, comprising 1,827,119 tons of crude ore and 2,611,100 tons of old tailings or sands.

Output of silver in Michigan (all from copper ore) decreased from 101,878 fine ounces in 1939 to 88,657 in 1940.

Mine production of gold, silver, and copper in Michigan, 1936–40 [1]

Year	Gold (fine ounces)	Silver (fine ounces)	Copper [2]			Concentrate ("mineral") [3]		Ore ("rock") (short tons) [4]
			Pounds	Yield				
				Pounds per ton of ore ("rock")	Percent	Pounds	Yield (percent copper)	
1936			95,968,019	29.8	1.49	141,166,376	68.0	3,225,600
1937	51.44	25,454	94,928,000	22.6	1.13	148,172,000	64.1	[5] 4,197,881
1938		93,634	93,486,000	24.9	1.24	144,964,890	64.5	3,757,705
1939		101,878	87,970,000	19.1	.96	136,771,339	64.3	4,603,751
1940		88,657	90,396,000	20.4	1.02	138,451,495	65.3	4,438,219

1 Figures based upon actual recovery of copper from "mineral" smelted and estimated recovery from "mineral" not smelted during year.
2 Includes copper from sands.
3 Includes "mineral" from sands.
4 Includes sands.
5 Excludes 600 tons of siliceous ore.

Value of silver and copper produced in Michigan mines, 1936–40

Year	Silver	Copper		Total	Year	Silver	Copper		Total
		Total	Per ton of ore ("rock")				Total	Per ton of ore ("rock")	
1936		$8,829,058	$2.74	$8,829,058	1939	$69,154	$9,148,880	$1.99	$9,218,034
1937	$19,689	11,486,288	2.74	11,505,977	1940	63,045	10,214,748	2.30	10,277,793
1938	60,531	9,161,628	2.44	9,222,159					

The following data are abstracted from reports of the companies to their stockholders:

In 1940 the mines of the Calumet and Hecla Consolidated Copper Co. produced 20,728,000 pounds of copper at an average cost sold of 9.02 cents a pound; in addition, the reclamation plants at Lake Linden and Hubbell produced 29,682,000 pounds of copper at an average cost sold of 5.64 cents a pound. These figures do not include depreciation and depletion. The average selling price for the year was 11.82 cents a pound.

At the Ahmeek mill 731,403 tons of Kearsarge amygdaloid rock from the Ahmeek mine and 92,300 tons from the Peninsula Copper Co. group were stamped. At Lake Linden the Hecla mill and sand wheels were scrapped. Both the Lake Linden and the Tamarack reclamation plants operated throughout the year under normal conditions. Of the 1940 recovery at these plants 8,646,000 pounds were from table treatment, 17,251,000 pounds from leaching, and 3,785,000 pounds from flotation. The smelter received 43,396 tons of concentrates and mass and smelted 43,890 tons. From the material smelted 55,835,544 pounds of refined copper were produced. Copper oxide shipped to customers amounted to 2,738 tons containing 4,169,004 pounds of copper. Besides development work done in the course of mining operations, the company continued geological studies concerning the problem of exploring the district (with special reference to Calumet and Hecla lands) and did 36,336 feet of diamond drilling, largely on the surface in Houghton and Keweenaw Counties. In addition to providing geological information of value, these holes encountered many copper showings, a few of which are encouraging enough to justify further investigation.

Operations at the Calumet and Hecla reclamation plants at Lake Linden and Hubbell in 1940 and for the entire period of their operation

	1940	Since beginning
Quantity treated short tons	2,398,000	36,070,000
Assay headings percent	0.721	0.661
Assay tailings do	.098	.123
Refined copper produced pounds	29,682,000	387,025,000
Refined copper produced per ton treated do	12.38	10.73

The Copper Range Co. in 1940 produced 18,889,160 pounds of copper compared with 18,109,409 pounds in 1939. Champion and Globe ore treated totaled 315,480 tons with an average yield of 57.715 pounds to the ton compared with 330,605 tons in 1939 with an average yield of 54.011 pounds to the ton. The tailings recovery plant ran for about 6 months in 1940, and 661,727 pounds of refined copper were recovered from the operation. Reserve areas at the Champion mine were held to about 75 percent of the estimate as of January 1, 1940. Diminishing prospective areas are partly responsible for the loss in reserves, but the principal contributing factor was the loss of time on development work caused by an accident in No. 4 shaft in August. Development and production at the Globe were also affected by the accident, as the openings in the Globe mine are reached from the 9th and 18th levels of the Champion.. The Globe mine produced 1,164,687 pounds of copper compared with 1,075,582 pounds in 1939. Because of the spotty and broken condition of the vein, exploration has been difficult and slow, but showings encountered recently are more promising. Old mine workings of the White Pine mine were unwatered to the second level, and laboratory and mill tests were made on ore from the Nos. 1 and 2 sandstone beds and the parting shale. Results thus far have been encouraging. During 1940 the smelter continued to handle custom shipments in addition to the mineral produced by the company. The amount smelted totaled 28,633 tons or approximately 7 percent more than in 1939. Operations of the company for 5 years are shown in the following table:

Copper produced by the Champion mine of the Copper Range Co., 1936–40

Year	Rock stamped	Copper produced	Yield per ton	Cost per pound [1]	Price received
	Short tons	*Pounds*	*Pounds*	*Cents*	*Cents*
1936	320,815	17,486,019	54.51	8.87	9.59
1937	[2] 306,075	16,131,277	[3] 51.59	11.45	12.375
1938 [4]	[5] 333,190	18,066,891	[3] 54.06	9.50	9.80
1939 [4]	[6] 330,605	18,109,409	[3] 54.01	10.12	10.81
1940 [4]	[7] 315,480	18,889,160	[3] 57.72	(8)	(8)

[1] Excludes depreciation and depletion.
[2] Excludes 133,594 tons of tailings treated.
[3] Yield from ore only.
[4] Includes Globe mine.
[5] Excludes small unstated quantity of tailings treated.
[6] Excludes 85,842 tons of tailings treated.
[7] Excludes 213,100 tons of tailings treated.
[8] Not given in company report.

MISSOURI

The total value of the recovered silver, copper, lead, and zinc shipped from Missouri mines in 1940 was $19,145,700, which compares with silver, lead, and zinc valued at $16,405,251 in 1939 when the mines of the State yielded no recoverable copper. The silver output in 1940 (260,314 fine ounces valued at $185,112) and the copper (1,370,000 pounds valued at $154,810) were byproducts recovered in smelting and refining lead concentrates from southeastern Missouri. These two metals occur in such small quantity to the ton of concentrates that no value is attached to them in the sale of the concentrates. The lead came largely from the disseminated-lead district centering around Flat River and Bonne Terre in St. Francois County in southeastern Missouri; the zinc came mostly from southwestern Missouri, which is part of the Tri-State or Joplin region extending into Kansas and Oklahoma. The central district of Missouri has produced lead and zinc intermittently, but it was inactive from 1928 to 1939 and yielded only 15 tons of recoverable lead and 127 tons of zinc in 1940.

Mine production of lead and zinc in southeastern and central Missouri, 1936–40

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value [2]	Short tons	Value	Short tons	Value	Short tons	Value
1936	145,575	$7,278,750	112	$2,016	108,422	$9,974,824	44	$4,400
1937	209,937	14,360,271	24	720	153,205	18,078,190	11	1,430
1938	163,500	9,040,593			118,870	10,936,040		
1939	210,526	12,339,360			153,522	14,431,068		
1940	232,871	14,269,600	[3] 815	20,000	169,908	16,990,800	233	29,358

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[2] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.
[3] Includes 500 tons of zinc carbonate ore containing 106 tons of recoverable zinc.

Tenor of lead ore and concentrates in southeastern Missouri disseminated-lead district, 1936–40

	1936	1937	1938	1939	1940
Total lead ore .... short tons	3,418,800	5,012,631	3,668,400	5,127,000	5,837,400

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

Tenor of lead and zinc ore and old tailings treated and concentrates produced in southwestern Missouri, 1936–40

	1936	1937	1938	1939	1940
Total ore and old tailings treated ....short tons..	[1] 871,200	[2] 980,100	[3] 479,600	[4] 523,800	[5] 614,500

[1] Includes 408,700 tons of old tailings and slimes yielding 5 tons of galena concentrates and about 6,200 tons of 59.8-percent sphalerite concentrates.
[2] Includes 422,000 tons of old tailings yielding 40 tons of galena concentrates and 6,932 tons of 57.9-percent sphalerite concentrates.
[3] Includes 126,600 tons of old tailings and slimes yielding 1,420 tons of 55.8-percent sphalerite concentrates.
[4] No tailings treated in 1939.
[5] Includes 117,000 tons of old tailings yielding 795 tons of 59.5-percent sphalerite concentrates.
[6] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Southeastern and central Missouri.—Lead production in southeastern Missouri in 1940 was the highest since 1930; the increase over 1939 was 11 percent. In St. Francois County the St. Joseph Lead Co. operated four mills—the Bonne Terre, with a daily capacity of 2,500 tons; Desloge, 3,450 tons; Federal, 10,000 tons; and Leadwood, 4,500 tons. All the mills used gravity concentration and flotation. In Madison County the Mine La Motte mine and 1,000-ton mill were operated steadily. The Ozark Lead Co. continued mining on the Fleming tract near Fredericktown; its crude ore was treated in the Clark & Hallock mill, which is of the Joplin type, using jigs and flotation machines. At Annapolis, Iron County, the Basic Metals Mining Corporation operated its mine and 500-ton mill intermittently before closing them in November. Of the lead concentrates (232,851 tons) made in 1940 in southeastern Missouri 108,518 tons were flotation concentrates, compared with 94,488 tons in 1939. About 500 tons of zinc carbonate ore and a little galena from the vicinity of St. Clair, Franklin County, were shipped to smelters. Local buyers shipped 223 tons of galena recovered in shallow workings (including barite mines) in Crawford, Jefferson, St. Francois, and Washington Counties.

In central Missouri the Wemhaner Mining Corporation produced 315 tons of zinc sulfide concentrates and 20 tons of lead concentrates from ore removed during stripping on the Rannells land in Moniteau County northeast of Versailles. The ore, which is in a general confused mass of coal, selvage, flint, and lime, was treated in a 100-ton (per 8 hours) gravity-concentration mill erected in 1940.

Southwestern Missouri.—The method of marketing the mine output in the Tri-State or Joplin lead and zinc region (southwestern Missouri, Kansas, and Oklahoma) differs from that employed in other parts of the country where miners receive pay for ore upon the basis of the assay content of metal at a certain price per unit f. o. b. smelter and freight charges are deducted from the smelter settlement if not paid in advance or guaranteed by the shipper. In the Tri-State region compensation is paid per ton of concentrates f. o. b. mine bins. In effect, however, this is equivalent to paying for the metal contained, inasmuch as the price per ton is based upon a sliding scale determined by the assay content. The standard for zinc sulfide concentrates is 60 percent zinc and for lead sulfide 80 percent lead. No base prices have been quoted in recent years for zinc silicate and lead carbonate concentrates, as the output has been scattered and small.

The total value given in this report for all concentrates produced in the Tri-State region is based upon actual receipts by the sellers and not upon quoted prices. In 1940, as in 1939, the quoted price was that paid for medium quantities or carlots; small lots brought less. The quoted weekly prices a ton for Tri-State zinc blende concentrates at Joplin in 1940 were as follows: From the week ended January 6 to that ended January 20, inclusive, $37.50; January 27 to February 24, $35.50; March 2 to May 18, $37.50; May 25 to June 1, $39; June 8 to August 10, $41; August 17 to September 21, $42.50; and September 28 to December 28, $48. The $48 price was still being quoted on May 1, 1941. The quoted prices for galena concentrates changed 16 times in 1940, ranging downward from the opening price of $64.54 a ton for the week ended January 6 to $53.74 (a low for the year) for the week ended August 10, then upward to $68.86 (highest price of the year) for the week ended November 9. The quotation dropped on November 30 to $66.70 and on December 7 to $64.54, which held until the end of December. The price paid for the zinc silicate shipped in 1940 averaged only $13.59 a ton, as much of the tonnage sold was low-grade concentrates.

Total zinc concentrate shipments from the Tri-State region increased from 413,139 tons valued at $14,199,263 in 1939 to 429,778 tons valued at $18,062,867 in 1940, and lead concentrate shipments decreased from 57,941 tons valued at $3,399,068 to 46,212 tons valued at $2,724,795. The Tri-State Zinc & Lead Ore Producers Association reported that stocks at mines in the Tri-State region as of December 28, 1940, totaled 2,764 tons of zinc concentrates and 186 tons of lead concentrates compared with 12,012 (revised figure) and 491 tons, respectively, on the same date in 1939. Flotation concentrates comprised

52 percent of the total blende and 14 percent of the galena in 1940. The galena from jigs and tables averaged 80.07 percent lead and that from the flotation machines only 65.02 percent; most of the flotation zinc concentrates, however, were higher in grade than the gravity zinc concentrates.

Production of recoverable zinc in southwestern Missouri decreased from 15,096 tons in 1939 to 12,470 in 1940 and lead from 2,759 to 2,144 tons. However, there was an increase in the number of active small mines, and the total number of producing mines rose from about 43 in 1939 to 80 in 1940 and the number of mills (including those operated intermittently) from 13 to 17. Mines near Oronogo, Joplin, Waco, and Stark City yielded the bulk of the ore treated. Operations were continued at the old Oronogo Circle open pit, from which the ore was removed by power shovels and trucks. At the end of 1940 the pit was 140 feet deep. The mining was done by the Oronogo Mutual Mining Co., and the crude ore was milled at the American mill. This mill (capacity, 900 tons daily) also treated ore from the Red Dog, Sucker Flat, D. C. & E., and Wingfield mines. Part of the ore from the D. C. & E. and Wingfield and that from other mines at Oronogo operated by the Hickam Mining Co. and Fenix & Son were shipped to the Central mill at Cardin, Okla. The F and M Mining Co. operated its 200-ton mill and LaTosca lease steadily. The Playter custom mill at Waco received crude ore from mines at Waco, Neck City, Webb City, Cave Springs, and Belleville. Ore from the Boulder Lead & Zinc Co. property and from several small mines near Joplin was treated in the Burton mill. The High Grade Mining Co. constructed a mill at Chitwood, but it was destroyed by fire after a short period of operation. The Eagle-Picher Mining & Smelting Co. continued to ship ore from Stark City to its Central mill at Cardin, Okla., and constructed a new 45-ton (an hour) mill at the Navy Bean mine near Wentworth and began operating it late in December. Other producers of lead or zinc concentrates in 1940 included Luther Eakens (custom mill), the Happy Hollow Mining Co., Hays & Manning Mining Co., Independent Gravel Co., and Jayenel Metals Corporation in Jasper County; Midwestern Mining & Sand Co., Pilant & Ogle, Spurgeon Mining Co., and Success Mining Co. (tailing mill) in Newton County; and Chapman & Doane, Mary Arnold Mining Co., and J. C. Shepherd in Ozark County.

OKLAHOMA

The method of marketing concentrates, prices quoted for them in 1940, and other general details of mining in the Tri-State region—which includes northeastern Oklahoma—are given in the preceding pages on southwestern Missouri. The combined value of the zinc and lead concentrates shipped from Oklahoma mines was $14,328,683, a 29-percent increase over 1939. Part of the higher value in 1940 was due to the advance in metal prices and part to the 17-percent increase in tonnage of zinc concentrates shipped; the tonnage of lead concentrates shipped decreased 23 percent.

Mine shipments of lead and zinc in Oklahoma, 1936–40

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1936	34,833	$1,735,732	244,740	$7,628,448	25,427	$2,339,284	129,175	$12,917,500

	1,307,555	105,743,005	7,641,459	299,000,497	4,183	106,933

[1] Includes Quapaw and Sunnyside.

During 1940 mine and mill operating schedules in Oklahoma were generally maintained at a steady rate except for interruptions in January caused by extremely cold weather. About 100 mines were producing during the year, and 31 mills were in operation at the end of the year. The advent of centralized milling enables groups of miners with little capital to work small mines or to mine ore left in old workings of large mines that can no longer support a mill. At least 65 operators, large and small, did not mill their crude ore but shipped it to custom or to central mills.

About 2,859,600 tons more old tailings than crude ore were treated in Oklahoma in 1940, and the tailings yielded 21 percent of the total zinc concentrates.

The Eagle-Picher Mining & Smelting Co. continued to be the largest producer of both lead and zinc in Oklahoma and in the Tri-State region. The company Central mill near Cardin has a capacity of more than 10,000 tons daily and treats company and custom ore. It is equipped with a cone plant using a heavy-density fluid-separation process of gravity concentration which discharges a large part of the mill feed at coarse size as a finished tailing, thereby reducing the quantity to be handled by the jigs and flotation machines. The total ore treated was 2,795,963 tons in 1940 compared with 1,881,079 in 1939. The improvements made in 1940 included a new sampling plant. Company-operated mines in Oklahoma shipping to the mill were the Blue Goose Nos. 1 and 3; Crystal No. 1, Central, and Velie; Grace Walker Nos. 1 and 2; John Beaver Nos. 1 and 2; Hum-bah-wat-tah Nos. 1 2, and 3; La Salle; Ohimo; See Sah; South Side Nos. 1 and 2; Stanley; Swift; and Wesah Greenback. The company sank a new shaft on the Blue Goose lease to the 325-foot level. Its Bird Dog central mill operated at less than capacity, mostly on ore from the Pelican mine.

The Federal Mining & Smelting Co. operated its Gordon central mill on ore from the Gordon, Lucky Bill, Lucky Syndicate, and Quapaw-Davenport mines in Oklahoma and the Jarrett mine in Kansas; in addition, the company sent ore from the Huttig-Beck mine to the Beck mill. The Beck Mining Co., operator of the Beck mill, also treated company ore from the Dobson and Sequoyah mines and other custom ore, mostly from the Andrews Mining & Milling Co. (Dobson and Texas), Harris Mining Co. (Robinson), L. & H. Mining Co., and Twin Mounds Mining Co. The United Zinc Smelting Corporation operated its Royal mill, treating mostly company ore but also custom ore largely from the Smoky Hill Mining Co., B. & H. Mining Co., and Indian Head Mining Co. The St. Louis Smelting & Refining Co. ran its No. 4 mill on ore from the Imbeau mine. Other producers of concentrates from mine mills included the Bilharz Mining Co., operating the Brewster mine in Oklahoma and Bilharz mill in Kansas; Davis Big Chief Mining Co., Kropp mine; Evans Wallower Zinc, Inc., No. 4 and No. 7 mines; Guaranty Mining & Royalty Co.; Hudson Lead & Zinc Co., Goodeagle; Kansas Explorations, Inc., Ritz; Lavrion Mining Co.; Lawyers Lead & Zinc Co., mine dirt and tailings; Mission Mining & Royalty Co.; Oklahoma Interstate Mining Co., Townsite and Woodchuck; Romo Mining Co., Mission; and Skelton Lead & Zinc Co., mine ore and tailings. The Rialto Mining Corporation completed the mill for its No. 3 mine late in the year. In April the Scott mine east of Hockerville was acquired by the Jane E. Mining Co. which operated it the rest of the year, treating the ore in the mill on the property until October 5 and then sending it to the Central mill.

Companies operating tailing mills comprised the Atlas Milling Co., Big Chief Tailing Co., Britt Mining Co., Captain Milling Co. (also treated tailings from Kansas), Cardin Mining & Milling Co. (Nos. 2 and 3), Cortez King Brand Mining Co., Rialto Mining Corporation, Semple Mining Co., Tri-State Zinc, Inc. (Sooner and Ottawa), and Western Mining & Milling Co.

No activity was reported in the Peoria district in either 1939 or 1940, and no output was made from the Davis district, Murray County, from 1918 to 1940, inclusive.

WISCONSIN

The lead- and zinc-mining area of Wisconsin is in Grant, Iowa, and Lafayette Counties in the southwestern part of the State. In 1940, 445 tons of recoverable lead and 5,770 tons of zinc were produced compared with 388 and 5,904 tons, respectively, in 1939. In recent years the Vinegar Hill Zinc Co. has been the principal producer in the State; in 1940 the company continued operations at the Winskill-Petersen mine until August, when the mine was closed owing to exhaustion of the ore body. After August the company mined ore from the Mullen No. 2, reopened in September. Ore from these two mines was treated in the Winskill mill near Shullsburg, yielding low-grade rougher zinc-iron-lead concentrates that were sent to the company all-flotation central plant near Cuba City and re-treated. The central plant also treated mine dirt and concentrates purchased from companies, individuals, and small partnerships mining (and in some instances operating mills) in the Benton, Cuba City, Dodgeville, Hazel Green, Highland, Leadmine, Linden, New Diggings, Platteville, Shullsburg, and other scattered districts. The quantity of purchased material treated was 19,984 tons from 191 operators in 1940 compared with 10,243 tons from 75 operators in 1939. The larger shippers to the central plant in 1940 included the Bootjack Mining Co. at Tennyson, Cherrey & Welsh at Shullsburg, the Dodgeville Mining Co. and

Mine production of lead and zinc in Wisconsin, 1936–40

Year	Lead concentrates		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1936	1,277	$61,198	38,276	$400,899	904	$83,168	8,126	$812,600
1937	1,590	109,468	37,060	444,531	1,091	128,738	6,938	901,940

[1] In calculating metal content of the ores from assays allowance has been made for roasting and smelting losses of both lead and zinc. In comparing the values of ores and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[2] The zinc concentrates shipped in 1938 were a flotation product or raw concentrates roasted at Cuba City, Wis. No raw concentrates were shipped in 1938; about 13,000 tons were produced.

[3] Virtually all the raw concentrates in 1939 were milled at the Winskill-Petersen mill and re-treated at the flotation plant of the Vinegar Hill Zinc Co., yielding 10,169 tons of 60-percent zinc concentrates. No raw concentrates were shipped in 1939; about 32,360 tons were produced.

[4] Most of the ore mined in Wisconsin in 1940 was first treated in gravity-concentration mills producing bulk concentrates (averaging about 20 percent zinc, 19.5 percent iron, and 0.9 percent lead), which were re-treated by flotation. A considerable quantity of crude ore was floated direct. The finished flotation concentrates averaged 58.94 percent zinc.

the Four S. & B. Mining Co. at Dodgeville, the Farrey Mining Co. and the Meloy & Baker Mining Co. at Benton, the Oak Ridge Mining Co. at Leadmine, and Shaak & Minter at Highland.

All the zinc concentrates shipped to smelters from Wisconsin in 1940 (10,875 tons averaging 58.94 percent zinc) were a finished product of the Vinegar Hill Zinc Co. flotation mill. The iron sulfide concentrates made in the mill were roasted in a flash-roasting furnace to produce sulfuric acid. Of the 621 tons of lead concentrates shipped, 347 tons were a flotation product.

Tenor of lead and zinc ore and concentrates produced in Wisconsin, 1936–40

	1936	1937	1938	1939	1940
Total ore ... short tons	284,800	285,000	58,700	213,400	190,326

Zinc ... do	3.61	3.12	3.91	3.07	3.37
Average lead content of galena concentrates ... do	72.2	70.1	67.0	70.0	73.1
Average zinc content of sphalerite concentrates percent	27.0	24.0	18.5	20.2	[3] 58.94
Average value per ton:					
Galena concentrates	$48.08	$68.85	$42.70	$51.72	$56.12
Sphalerite concentrates	10.47	11.99	[5] 31.11	[6] 35.00	[6] 41.14

[1] The zinc concentrates shipped in 1938 (3,895 tons) were a flotation product or raw concentrates roasted at Cuba City, Wis. No raw concentrates were shipped in 1938; about 13,000 tons, averaging 18.5 percent zinc, were produced.

[2] All sphalerite shipped in 1939 (10,169 tons) was a flotation product. No raw concentrates were shipped in 1939; 32,360 tons, averaging 20.2 percent zinc, were produced.

[3] Percentage represents finished flotation concentrates. Most of the ore mined in Wisconsin in 1940 was first treated in gravity-concentration mills producing bulk concentrates (averaging about 20 percent zinc, 19.5 percent iron, and 0.9 percent lead), which were re-treated by flotation. A considerable quantity of crude ore was floated direct.

[4] Percentages represent metal content of the ore insofar as it is recovered in the concentrates.

[5] Value is that of roasted or flotation concentrates shipped. No value can be assigned for zinc concentrates prior to roasting or re-treatment by flotation.

[6] Value is that of flotation concentrates shipped, which averaged 60 percent zinc in 1939 and 58.94 percent in 1940.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN COLORADO

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

SUMMARY OUTLINE

The Colorado output of gold, silver, copper, lead, and zinc in 1940 was valued (in terms of recovered metals) at $24,293,665—an increase of 9 percent over 1939 and the highest value in any year since 1918 (see fig. 1). Although some of the gain in value in 1940 resulted from moderate advances in prices of silver and the base metals, the larger part was due to increases in the quantity of silver, lead, and zinc produced; gold output was approximately the same as in 1939, and copper decreased (8 percent) in quantity but varied little in total value in the 2 years. Virtually all the large mines that were active in 1939 continued producing throughout 1940, and the tonnage of low-grade material from mine dumps and old tailing piles sold or treated increased. The number of small producing mines, prospects, and dumps (each of which is counted in this report as a producing mine if the material sold yielded any recoverable metal) was less than in 1939. Placer mines contributed only 5 percent of the State output of gold in 1940 and 6 percent in 1939.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producer.
[4] $0.64646464.
[5] $0.67878787.
[6] $0.71111111.

Annual figures for the 5 years ended with 1940 and total production from 1858 to 1940 are given in the table that follows. Colorado has produced more silver in the past than any other State and ranks second in total recorded output of gold.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1936–40, and total, 1858–1940, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	714	601	2,151,849	366,607	$12,831,245	5,902,776	$4,571,700

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

Gold.—In total value gold was the leading metal produced in Colorado from 1858 to 1940, but in annual value it was surpassed by silver from 1874 to 1896 and by molybdenum from 1937 to 1940. The principal gold-producing districts in 1940, in order, were: Cripple Creek, Teller County; Red Cliff, Eagle County; Mosquito, Park County; Upper San Miguel, San Miguel County; Empire and Idaho Springs, Clear Creek County; Gold Hill, Boulder County; Animas, San Juan County; Summitville, Rio Grande County; and Sneffels, Ouray County. The largest gold-producing properties, in order, were the United Gold Mines and Cresson at Cripple Creek, "Eagle

Mine" group in the Red Cliff district, Smuggler-Union at Telluride, London in the Mosquito district, Shenandoah-Dives in the Animas district, Minnesota Mines at Empire, Summitville Consolidated Mines (Inc.) group in Rio Grande County, Camp Bird at Ouray, and the Stratton-Cripple Creek M. & D. Co. group at Cripple Creek. Important gains in gold production were made in Eagle, Boulder, and Clear Creek Counties; the largest decreases were in Teller, Park, and San Miguel Counties. Dry and siliceous ores yielded 82 percent of the total gold; copper ore 8 percent; zinc-lead, lead, and lead-copper ores 5 percent; and placers 5 percent.

Silver.—Silver production in Colorado has increased annually since 1932, when the output (1,860,408 ounces) was the lowest in 59 years; the output in 1940 (9,710,709 ounces—in terms of recovered metal) was the highest since 1907. Eagle County contributed 70 percent of the total in 1940, Mineral County 9 percent, San Miguel County

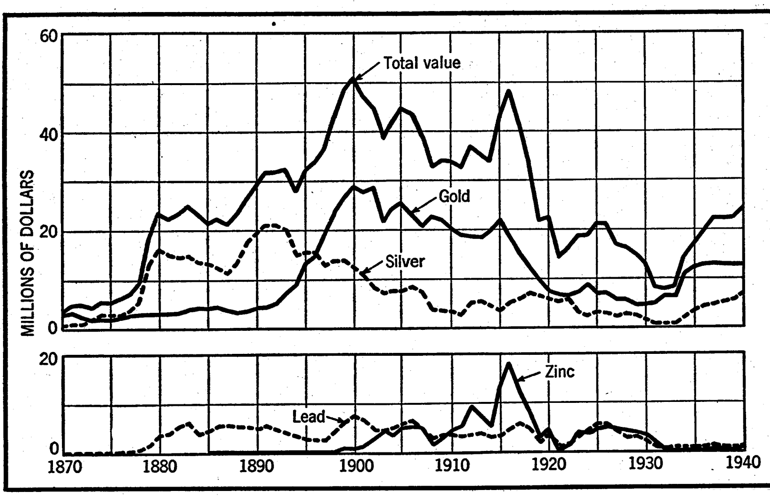

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1940. The value of copper has been less than $2,000,000 annually, except in a few years.

5 percent, San Juan County 4 percent, and other counties (chiefly Pitkin, Ouray, Dolores, and Clear Creek) 12 percent. The principal silver-producing properties were: "Eagle Mine" group, Eagle County; Amethyst-Commodore-Last Chance-New York and others, Mineral County; Smuggler-Union group, San Miguel County; and Shenandoah-Dives-Mayflower group, San Juan County. Copper ore yielded 70 percent of the total silver; dry and siliceous ores 19 percent; and other types of ore, together with a very small quantity of silver from placer mines, 11 percent.

Copper.—The mine output of recoverable copper in Colorado decreased 8 percent in 1940 from 1939. Eagle County produced 87 percent of the State total; the remainder came chiefly from Dolores, San Juan, Ouray, and Clear Creek Counties. The only sizable copper producer in the State was the Empire Zinc Division ("Eagle Mine") of the New Jersey Zinc Co. at Gilman, Eagle County, which shipped copper-iron-silver-gold-lead ore direct to the copper smelter at Garfield, Utah.

Lead.—Although the total recorded production of recoverable lead in Colorado from 1858 through 1940 was nearly 10 times that of copper, the annual recovered output from 1932 to 1940 was less than that of copper; the average over the 9 years was 13,477,100 pounds for lead and 17,965,200 pounds for copper. Of the 22,952,000 pounds of lead recovered in 1940 (highest production since 1930), 32 percent was contained in concentrates made from dry and siliceous gold, gold-silver, and silver ores, mostly from San Miguel, Clear Creek, Mineral, Park, and Ouray Counties; 43 percent was contained in concentrates from zinc-lead ore, mostly from San Juan and Dolores Counties; and the remainder was recovered principally from copper and lead ores shipped from Eagle and Lake Counties direct to smelters.

Zinc.—Of the 10,120,000 pounds of zinc (highest production since 1931) recovered from Colorado ores in 1940, Dolores County contributed 52 percent, San Juan 29 percent, Park 7 percent, and Summit 5 percent; Lake, Pitkin, Gunnison, Ouray, Saguache, San Miguel, and Hinsdale Counties together contributed 7 percent. The principal producers of zinc were the Rico Argentine Mining Co. at Rico, Dolores County, and the Shenandoah-Dives Mining Co. at Silverton, San Juan County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1940, by counties, in terms of recovered metals

MINING INDUSTRY

Significant features of the mining industry of Colorado in 1940 were the maintenance of steady operations in all the principal producing mining districts and a material increase in the output of ore from Clear Creek, Dolores, Lake (mostly from dumps), Ouray, San Juan, and San Miguel Counties. The most ambitious projects under way were the 32,000-foot Carlton drainage tunnel at Cripple Creek, which was advanced 19,326 feet during 1940 to a total length of 26,634 feet, and the 10,000-cubic yard (per day) steel connected-bucket dredge of the South Platte Dredging Co. in Park County, for which the hull and part of the superstructure were completed before the end of the year.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Colorado in 1940, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	1,367,102	292,830	736,298	1,059,775	4,912,272	
Dry and siliceous gold-silver ore	75,472	7,196	252,554	145,635	1,204,779	
Dry and siliceous silver ore	86,163	1,020	918,320	43,673	1,691,921	
	1,528,737	301,046	1,907,172	1,249,083	7,808,972	
Copper ore	334,312	30,331	6,765,877	21,254,198	2,822,832	
Lead ore	10,199	1,854	291,905	12,780	2,095,766	
Lead-copper ore	1,037	45	16,630	56,469	295,734	
Zinc ore	27					6,519
Zinc-lead ore	283,453	17,060	725,487	1,731,470	9,928,696	10,113,481
	629,028	49,290	7,799,899	23,054,917	15,143,028	10,120,000
Total, lode mines	2,157,765	350,336	9,707,071	24,304,000	22,952,000	10,120,000
Total, placers		17,000	3,638			
	2,157,765	367,336	9,710,709	24,304,000	22,952,000	10,120,000
Total, 1939	1,914,593	366,852	8,496,488	26,430,000	16,444,000	3,660,000

METALLURGIC INDUSTRY

Ore treated in 1940 by all mills in Colorado handling ores of gold, silver, copper, lead, and zinc totaled 1,773,566 tons, of which 1,126,881 tons were treated in company mills at mines and dumps; 550,521 tons by the Golden Cycle custom roast-amalgamation-cyanidation-flotation mill at Colorado Springs; and 96,164 tons by custom flotation mills in or near the mining districts (some of which also treated company ore included above), comprising the following: Clear Creek-Gilpin, Clear Creek Consolidated, Commonwealth, Dumont (burned in July), Gustafson, Hoosac, Ruth, Silver Spruce, and Watrous (Silver Leaf) in Clear Creek County; Creede Mills (Emperius) in Mineral County; Banner American in Ouray County; Record in Park County; Shenandoah-Dives in San Juan County; Smuggler-Union in San Miguel County; and Cameron in Teller County. All these custom mills except the Shenandoah-Dives and Banner American treated gold, gold-silver, or silver ores, with minor content of lead and copper. Zinc-lead ore (2,907 tons) containing gold and silver and some copper from Dolores, Gunnison, Hinsdale, Lake, Ouray, Saguache, San Juan, San Miguel, and Summit Counties was shipped to custom mills at Bauer, Midvale, and Tooele, Utah. The samplers at Boulder and Idaho Springs were idle throughout 1940.

Direct-smelting ores comprised 18 percent of the State total output of ore in 1940. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the gold, silver, and gold-silver-lead-copper ores and concentrates shipped to smelters during the year. Ore and concentrates were shipped to smelters in other States as follows: Zinc-lead sulfide and zinc-lead carbonate ores from Lake County to Coffeyville, Kans.; zinc concentrates from Dolores, Ouray, Park, Pitkin, and San Juan Counties to Amarillo, Tex.; and copper-iron-silver-gold ore from Eagle County, copper-silver and copper-silver-gold ores from Garfield, Jefferson, Mesa, and Montrose Counties, and gold-silver-lead-copper ores and concentrates from the San Juan region to Utah smelters.

The quantity of gravel handled in 1940 by 1 floating connected-bucket dredge and 27 dry-land dredges was approximately 2,340,000 cubic yards averaging 22.8 cents to the yard. Specific data on yardage handled at small-scale placer operations are not obtainable because of lack of knowledge by the operators of the quantity of gravel sluiced.

Mine production of metals in Colorado in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated [1]	940,866	74,705	17,803			
Ore, old tailings, concentrates, sands, and slimes cyanided [2]	[3] 658,744	122,030	49,706			
Concentrates smelted	79,624	108,533	2,333,341	3,001,103	17,312,806	9,838,578
Ore smelted	381,292	45,068	7,306,221	21,302,897	5,639,194	281,422
Placer [1]		17,000	3,638			
		367,336	9,710,709	24,304,000	22,952,000	10,120,000
Total, 1939		366,852	8,496,488	26,430,000	16,444,000	3,660,000

[1] Quicksilver purchased (which is close to quantity used) by amalgamation mills was 3,664 pounds. Placer mines used approximately 600 pounds.
[2] Cyanide (in terms of 96- to 98-percent NaCN) used was 854,159 pounds.
[3] Comprises 364,157 tons of sands and slimes from ore and iron concentrates first roasted and amalgamated, 186,309 tons of tailings from ore first floated, 38,365 tons of tailings from ore first treated by jigging, and 69,913 tons of combined flotation concentrates, crude ore, and old tailings cyanided direct.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Colorado in 1940, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal

ADAMS COUNTY

Most of the output of gold and silver from Adams County in 1940 was recovered as a byproduct from the gravel-washing plant of the Brannan Sand & Gravel Co. on Clear Creek north of Denver.

ARAPAHOE COUNTY

Sluicing on Little Dry Creek south of Denver recovered a little gold in 1940.

BOULDER COUNTY

Central (Jamestown) district.—The Wano mine continued in 1940 to be the principal producer of gold in the Central district; it was operated throughout the year by the owner and several sets of lessees, who shipped the ore to the Golden Cycle mill at Colorado Springs. Lessees at the Smuggler mine shipped to the Golden Cycle mill 7,801 tons of stope fill and sorted dump ore containing 1,866.47 ounces of gold. Associated Metal Mines, Inc., operated the John Jay mine throughout 1940; part of the ore was treated in the 40-ton flotation mill at the mine, and part was shipped to the Golden Cycle mill.

Gold Hill district.—In 1940, as in 1939, Slide Mines, Inc., was the leading producer of gold, silver, copper, and lead in the Gold Hill district and in Boulder County. The company operated continuously its Slide-Klondyke group of mines and 70-ton gravity- and flotation-concentration mill. The gold concentrates caught on burlap tables between the classifier and Wilfley tables were amalgamated, and the rest were shipped to the Leadville smelter. Most of the ore from the other producing mines and dumps in the district was shipped to the Golden Cycle mill.

Grand Island district.—No mill was operated in the Grand Island district in 1940, and the ore produced was shipped to the Golden Cycle mill, the Ruth custom mill at Idaho Springs (Clear Creek County), and the Leadville smelter. Producing mines included the Amy Paul, Eagle Bird, Enterprise-Mogul, First National, New York, Shirley, and St. Louis.

Magnolia district.—The principal producers in the Magnolia district in 1940 were the Cash-Rebecca, Keystone, Hereafter, Senator Hill, Ben C. Lowell, India, and Poorman mines.

Sugar Loaf district.—Nearly all the ore produced from mines and dumps in the Sugar Loaf district in 1940 was shipped to the Golden Cycle mill. The Poorman group, worked steadily by lessees, was again the largest producer of gold in the district; it was followed by the Alpine Horn, Nancy, Empress, Tambourine, Wood Mountain, Grand Republic, Livingston, Gladys, Herold, and Logan. The 75-ton flotation mill built in 1939 at the Logan mine was idle throughout 1940.

Ward district.—The Boston and Utica mines were operated throughout 1940 under lease by the Ward United Mines Co. and yielded the greater part of the output of gold and copper and a large part of the silver from the Ward district during the year. The ore, which was shipped to the Leadville smelter, averaged 1.84 ounces of gold and 2.23 ounces of silver to the ton and 2.15 percent copper. Kissell & Co. treated ore from the B & M mine and dump by flotation in a leased mill near Ward; the concentrates produced, containing gold, silver, copper, and a little lead, were shipped to the Leadville smelter.

Gold ore from the Golden Queen mine and gold-silver-copper-lead ore from the Columbia were shipped to the Golden Cycle mill and the Leadville smelter.

CHAFFEE COUNTY

Chalk Creek district (Romley, St. Elmo).—Lessees continued to work the Mary Murphy mine on a small scale in 1940 and shipped 114 tons of gold-silver-lead-copper-[zinc] ore to the Leadville smelter.

Granite district (see also Lake County).—Lode mines in the Chaffee County part of the Granite district yielded only small quantities of ore in 1940; those producing comprised the Buckhorn, Deer, and Marion Belle claims and the Granite Tunnel group. The Raeanna Mining Co. worked placer ground on Cache Creek with a dragline, caterpillar bulldozer, and washing plant from May 15 to July 3. In November the company gave up its lease on the property. During the summer Len Savage operated his placer in Lost Canyon, using a power shovel and screening-sluicing plant. Wolfe and Hesser operated their ¾-cubic yard power shovel and screening and sluicing plant in Lost Canyon from July 20 to August 2 and handled 20,994 cubic yards of gravel from which 570 fine ounces of gold and 82 fine ounces of silver were recovered. The Deep Lead, Independent, Franklin, Georgia Bar, and other placers on the Arkansas River near Granite were worked on a small scale with sluices, and drift mining was done at the Channel and North Star placers.

Monarch district.—The output of ore from the Monarch district in 1940 comprised 402 tons of lead-silver-gold ore (of which 333 tons came from the Hawkeye mine and 69 tons from the Lilly group) and 24 tons of lead-silver ore (21 tons from the Monarch lime quarry and 3 tons from the Mary J. claim); the ore was shipped to the Leadville smelter.

CLEAR CREEK COUNTY

Alice district (Yankee, Lincoln).—A lessee worked the Gold King mine during most of 1940 and shipped the ore produced to the Golden Cycle mill at Colorado Springs. The owner operated the San Juan mine from September 1 to November 15 and amalgamated 40 tons of ore in the 10-ton mill on the property; he recovered bullion containing 26.81 fine ounces of gold and 10 fine ounces of silver.

Argentine district.—The 50-ton flotation mill at the Santiago mine was operated several months in 1940 and treated about 4,750 tons of ore from the dump and 150 tons from the mine; the concentrates produced, containing gold, silver, copper, and lead, were shipped to the Leadville smelter.

Cascade and Ute Creek district (Idaho Springs).—A lessee at the Cecil claim shipped 23 tons of gold-silver-lead ore to the Ruth custom mill at Idaho Springs in 1940.

Dailey and Atlantic district (Empire).—One ton of lead-silver ore was shipped from the Grand Clear Creek mine in 1940.

Empire district.—In 1940 Minnesota Mines, Inc., operated continuously its consolidated group of claims in the area north of Empire; since 1935 this company has been the largest producer of gold in Clear Creek County. The ore is treated in the 250-ton mill at the mine by concentration on mats in launders and by flotation followed by cyanidation of the flotation concentrates. After cyanidation the flotation concentrates, containing chiefly iron sulfide, are sold to the General Chemical Co. of Denver for the manufacture of sulfuric acid; the mat concentrates, containing mostly free gold, are amalgamated. The Conqueror Operating Co. worked the Conqueror group throughout 1940; the ore was trucked to the Clear Creek-Gilpin mill at Idaho Springs for concentration, and the concentrates (containing gold as the only commercial metal) were shipped to the Leadville smelter. The Tenth Legion-Gold Dirt-Sprankel-Empress Tunnel group was under development during most of the year by the Indiana Empire Gold Mining Trust, which treated some ore in the 100-ton flotation- and table-concentration mill on the property.

Geneva Creek district.—The small cyanide mill built in 1939 on the Sill property was operated part of 1940; the gold-silver bullion produced was sold to the Denver Mint.

Griffith (Georgetown-Silver Plume) district.—Lessees worked the Clara B lode in the Commonwealth Tunnel group for a period in 1940 and produced silver-lead ore, which was concentrated in the Commonwealth mill. The mill also treated custom silver-lead ore from dumps near Silver Plume. Fargo Mines Operators drove 100 feet of drifts on the Fargo property and shipped about 1 ton of copper-silver ore. A lessee operated the Watrous mill from July to November on material containing silver and lead from dumps in the vicinity of the mill. Gold-silver-lead ore from the St. George mine was shipped to the Ruth mill at Idaho Springs.

Idaho Springs district.—The Alma-Lincoln Mining Co., a consistent producer since 1933, operated the Lincoln-South Lincoln-Elliott Barber group continuously in 1940 and treated 36,404 tons of ore by mat concentration and flotation in the company mill. The Dixie mine on Ute Creek, operated by LeRoy Giles & Co., continued to be a substantial producer of gold; the ore was treated in the Ruth custom mill at Idaho Springs. The East Dixie mine, which had been under development by the Ute Creek Syndicate, began producing in 1940; part of the ore was trucked to the Silver Spruce mill for treatment and part to the Ruth mill. The Silver Spruce mill is situated just east of Idaho Springs; it was built in the latter part of 1939 by the Silver Spruce Gold Mining Co., which had acquired leases on a number of mines in the Idaho Springs district. The ore treated in the mill in 1940 totaled 15,530 tons, comprising 14,230 tons of company ore (mostly from the Lord Byron mine) and 1,300 tons of custom ore from six mines in Clear Creek County and one mine in Gilpin County. The Clear Creek Corporation (merged with the Newton Development Corporation April 27, 1940) operated the Mattie group throughout the year and produced 16,630 tons of gold-silver ore containing some lead, copper, and zinc; the ore was trucked 8 miles to the Clear Creek Consolidated mill at Dumont and treated by flotation and gravity concentration. Gold Mines Consolidated, Inc., treated 1,965 tons of gold-silver-lead-copper ore from the Dona Juanita group in the Gustafson mill; the mill also treated 415 tons of custom ore from other mines. Ore from the Metropolitan and several other mines was treated in the Hoosac mill. The Clear Creek-Gilpin mill adjacent to the sampler at Idaho Springs treated custom ore in addition to ore from the Conqueror mine (Empire district); the sampler was not run during the year. The Specie Mining Co. operated the Specie Payment and Diamond Joe groups after April 3, 1940, and produced more than 8,000 tons of ore, most of which was milled in the Gold Ridge mill (Gilpin County). Colorado Silver Mines, Inc., pulled stopes from the Bald Eagle mine during January and part of February and treated the ore in the company mill near Blackhawk.

Montana district (*Lawson, Dumont*).—The Dumont mill was run as a custom plant from January 1940 until early in July, when it was destroyed by fire. The Red Elephant group was operated from January to July 31 and yielded silver-lead ore, part of which was shipped to the Leadville smelter and part to local custom mills.

Trail Creek district.—Lamartine Mines, Inc., operated the Lamartine-Falcon group of mines continuously in 1940 and was the second-largest producer of gold in Clear Creek County. The ore (25,855 tons) was treated in the company mill by flotation supplemented by jigs in the ball mill-classifier circuit to extract free gold for amalgamation. Bullion sold to the Denver Mint contained 1,908 fine ounces of gold and 503 fine ounces of silver, and concentrates shipped to the Leadville smelter contained 2,794 ounces of gold, 9,075 ounces of silver, 220,910 pounds of lead, and some zinc and copper. A lessee at the Phoenix mine had 977 tons of ore treated in the Dumont mill and shipped the concentrates to the Leadville smelter.

CONEJOS COUNTY

Platoro district (*Ute*).—A lessee did development work at the Forest King mine in 1940 and shipped some ore to the Golden Cycle mill for testing.

COSTILLA COUNTY

Grayback district.—Sluicing in Grayback Gulch on the property of the Drum Estate recovered placer gold in 1940.

Plomo district.—The Rito Seco Gold Mines Co. shipped 44 tons of gold ore from the Rito Seco property to the Golden Cycle mill in 1940.

CUSTER COUNTY

Hardscrabble district (*Westcliffe, Silver Cliff*).—Shore, Kettle, Henning & Stroehlke operated its 10-ton cyanide plant at Silver Cliff from May 1 to November 20, 1940, on tailings hauled from the Nemaha claim; gold-silver precipitates produced were shipped to the Midvale (Utah) refinery.

Ilse district.—A lessee on the dump at the Terrible mine shipped material containing lead and silver to the Leadville smelter in 1940.

DOLORES COUNTY

Lone Cone district (*Dunton*).—Modern Gold Mines, Inc., operated the Emma and Smuggler-Almont mines under lease from August 27, 1940, to the end of the year.

Pioneer district (*Rico*).—The Rico Argentine Mining Co. operated its group of mines and 135-ton selective-flotation mill continuously in 1940 at an average rate of 104 tons of ore daily. The products of the mill were copper-iron-silver concentrates (carrying some lead and zinc and a little gold) shipped to the Garfield (Utah) smelter; lead-silver concentrates (containing some zinc and copper and a little gold) shipped to the Leadville smelter; and zinc concentrates (carrying also silver, lead, copper, and a little gold) shipped to the Amarillo (Tex.) smelter.

DOUGLAS COUNTY

Individuals sluicing on Dry Creek and Newlin, Russellville, and other gulches near Parker and Franktown in 1940 recovered small lots of gold dust, some of which were sold to dealers in Denver and some to the Denver Mint.

EAGLE COUNTY

Burns-McCoy district.—Hand sluicing and experimental testing with a dragline and sluices on placer ground on the Colorado River recovered a little placer gold in 1940.

Holy Cross district.—Thos. E. and Donald B. Knight worked their Glengarry mine from May 15 to November 1, 1940, and shipped 22 tons of lead-copper-gold-silver ore to the Leadville smelter.

Red Cliff district (Battle Mountain).—In 1940 the Red Cliff or Battle Mountain district again contributed the bulk of the Colorado output of silver and copper and ranked first among the districts of the State in combined value of gold, silver, copper, and lead. The New Jersey Zinc Co. Empire Zinc Division continued to ship large quantities of copper-iron-silver-gold sulfide ore from its Eagle mine at Gilman to the Garfield (Utah) smelter. The company 600-ton underground flotation mill in Eagle Canyon, used in 1930–31 to treat zinc-lead ore (large reserves of which are also developed in the mine), was idle from 1932 to 1940, inclusive; however, preparations were being made early in 1941 to reopen the mill. The Ben Butler Corporation worked the Ben Butler mine throughout 1940 and shipped gold-silver-copper ore to the Garfield (Utah) smelter.

ELBERT COUNTY

A floating "pony dredge" using 23 buckets (7 by 7 by 12 inches) was run from April 1 to October 1, 1940, on the Crail ranch on Ronk Creek near Elizabeth.

EL PASO COUNTY

GOLDEN CYCLE MILL

The Golden Cycle custom mill at Colorado Springs recovered 41 percent of the total Colorado output of gold from lode mines in 1940. It treated 550,521 tons of ore averaging 0.2905 ounce of gold to the ton, of which 485,155 tons were gold-[silver]-sulfotelluride ores from the Cripple Creek district (Teller County) and 65,366 tons comprised miscellaneous gold, gold-silver, and gold-silver-lead ores from other districts, mainly in Boulder, Clear Creek, and Gilpin Counties. Ores purchased vary in character and grade; therefore, all are not treated by the same methods. Average-grade Cripple Creek ores, comprising most of the mill feed, together with iron concentrates made from low-grade ores treated by flotation, are roasted, amalgamated,[1] and cyanided. Miscellaneous ores containing appreciable quantities of

[1] Free gold saved on lightweight canton-flannel blankets and amalgamated in iron arrastre.

base metals are treated by selective flotation. The tailings from all operations are separated into sand and slime fractions and cyanided. In 1940 the mill recovered more than 99 percent of its total gold output in the form of gold-silver bullion; the remainder was contained in clean-up material around the plant shipped to the Leadville smelter.

The 80-ton cyanide plant of the Mill Tailings Recovery Co. continued to treat tailings from the old Portland mill dump near Colorado Springs. The output from this dump is included in the figures for the Cripple Creek district (Teller County), where the material originated.

FREMONT COUNTY

A new cyanide mill built in 1940 to treat tailings from the Metallic dump 2 miles northwest of Florence was placed in operation during the year. As this dump is composed of tailings from mills that treated Cripple Creek ores, the metals recovered are included in the production of Teller County.

GARFIELD COUNTY

Rifle Creek district.—The lessee at the Gray Eagle mine 8½ miles from New Castle continued to ship gold-silver-copper sulfide ore to smelters in 1940.

GILPIN COUNTY

Southern districts (Blackhawk, Central City, Nevadaville, Russell Gulch).—Production of gold, copper, and lead in the southern districts of Gilpin County increased in 1940 over 1939, and that of silver decreased. The leading lode producers of gold, silver, lead, and copper were the Frontenac-Aduddell group and the Monmouth-Kansas group. Most of the ore from these mines was treated in concentrating mills in Gilpin and Clear Creek Counties, and the concentrates produced were sold to the Leadville smelter. The New Brunswick mine ranked third in the southern districts in lode gold output; it is equipped with a 15-ton stamp amalgamation-table concentration mill, which was operated throughout the year. Lessees on the Carr, First National-Kansas, Granite, and Mammoth West claims in the consolidated group owned by the California-Hidden Treasure Mines Co. shipped 250 tons of ore to custom plants, and the lessee on dumps on this company's property at Nevadaville treated 5,996 tons of material in the Monmouth-Kansas amalgamation-flotation mill. The lease on the dumps and mill was forfeited about April 1, 1940. A lessee at the Pittsburg-Notoway group shipped high-grade gold-copper-silver ore to the Leadville smelter. The mill on the property was remodeled during the latter part of the year and was placed in operation in February 1941. Colorado Silver Mines, Inc., treated ore from the Lotus mine and Saratoga dump in its flotation mill near Blackhawk.

The Manion Placer Co. operated its land dredge during part of 1940 on ground on North Clear Creek owned by the City of Blackhawk and part of the year 6 miles downstream on the Homesite, Pay Dirt, and Hamilton placers. The equipment comprised a 1½-cubic yard power shovel, ½-cubic yard dragline, caterpillar bulldozer, screening plant on crawlers, and separate sluicing plant on wheels. The Colorado-Nevada Mining Co. worked the Nugget placer for about 6 months, using two tractor bulldozers, a dragline, power shovel, and washing plant. At the Missions Mines Co. placer a ⅜-cubic yard dragline and sluice boxes were operated from April to December. Dunfield & James and the Pleasant Valley Placer Co. each used portable machinery for handling gravel at placers in lower Russell Gulch and North Clear Creek.

Northern districts.—Gold production in the northern districts dropped sharply in 1940 from 1939, owing to the ending in 1939 of the dragline-dredge operation by the Cooley Gravel Co. on the Pactolus placer. The only producer of more than a few ounces of placer gold in the northern districts in 1940 was the Gamble Gulch Mining Co., which operated a ½-cubic yard dragline and sluicing plant on the Perigo placer ground in Gamble Gulch during the summer. Tip Top Gold Mines, Inc., lessee on the Perigo group of lode mines, treated 2,920 tons of ore by amalgamation and flotation in the Monarch mill. Ore from the Lone Star group was shipped to the Golden Cycle mill and the Leadville smelter.

GRAND COUNTY

Shipments of ore from lode mines in Grand County in 1940 comprised 28 tons of silver-lead-gold ore from the Wolverine group about 22 miles north of Granby and 6 tons of lead-silver ore from the Ready Cash claim near Jones Pass.

GUNNISON COUNTY

Elk Mountain district.—Small lots of silver-lead ore were shipped from the Blue Streak and Painter Boy claims to the Leadville smelter in 1940.

Gold Brick district.—The Carter Mines Co. operated its mine and mill on Gold Creek continuously in 1940. The mill is equipped with amalgamation plates, jig, flotation machine, tables, and corduroy-lined launders. Ore treated during the year totaled 8,291 tons, from which were recovered bullion containing 1,217 fine ounces of gold and 792 fine ounces of silver, and concentrates containing 264 ounces of gold, 5,184 ounces of silver, and 8,772 pounds of lead. Burleson Mines, Inc., operated the Raymond group and 60-ton flotation mill from January 1 to October 4; the mill product was bulk concentrates (containing chiefly gold, silver, and lead), which were sold to the Leadville smelter.

Goose Creek district.—Roberts & Laws shipped 21 tons of gold-silver-copper ore from the Surprise claim to the Garfield (Utah) smelter in 1940.

Green Mountain district.—Small tonnages of ore were shipped in 1940 from the Lucky Strike and two other claims in or near the Green Mountain district.

Rock Creek district.—Several lots of silver-gold-lead ore from the Black Eagle claim were sold to the Leadville smelter in 1940.

Taylor Park (Tin Cup) district.—The Star mine was operated from June to October 1940 and yielded 319 tons of zinc-lead-silver ore, which was shipped to custom plants at Midvale, Utah. Some gold ore was treated in a small mill at the Red Buck-Trail Horse group, and 88 tons of smelting ore were shipped from another property in Taylor Park.

Tomichi district.—Fourteen tons of lead-copper-silver ore from the Morning Glim claim were shipped to the Leadville smelter in 1940.

HINSDALE COUNTY

Galena district.—The M. B. Burke Mining & Investment Co. operated its Ute and Ulay group and flotation mill from May 15 to August 25, 1940; the concentrates produced, containing lead, copper, silver, and a little gold, were sold to the Leadville smelter.

Lake district.—One car of zinc-lead-silver-gold ore from the George III-St. Jacobs group was shipped to the Midvale (Utah) custom concentrator in 1940, and 18 tons of lead-silver-gold ore from the Belle of the West mine were sold to the Leadville smelter.

JACKSON COUNTY

The Pure Gold placer on Independence Mountain was worked from April to September 1940 with sluices and a small placer machine.

JEFFERSON COUNTY

The old Malachite mine 3½ miles northwest of Morrison, which produced ore in the 1890's and early 1900's and again in 1931, was reopened in 1940 and operated several months during the latter part of the year. The ore, which contained copper, gold, and silver, was concentrated in custom mills at Idaho Springs and the concentrates produced were shipped to the Garfield (Utah) smelter.

LAKE COUNTY

LEADVILLE DISTRICT

Lake County (chiefly Leadville—sixth principal mining district in the United States up to the close of 1940) produced from 1859 through 1940 a total of 343,948 fine ounces of placer gold valued at $7,271,575, and 19,495,693 tons of ore from which were recovered 2,377,387 fine ounces of gold valued at $50,415,099; 235,378,421 fine ounces of silver (including a negligible quantity from placers) valued at $192,363,746; 51,004 tons of copper valued at $14,584,784; 1,018,291 tons of lead valued at $92,689,445; and 697,151 tons of zinc valued at $95,254,850—a grand total of $452,579,499. These figures do not include the bismuth, iron, manganese, and sulfuric acid produced.

Owing to the filling of four fault-blocked basins of ore deposits by water, output fell off heavily in 1931 and still more in 1932, revived somewhat in 1933 with the increased price for gold, and improved again in 1934 with fixation of the gold price at $35 an ounce and Government regulation of the silver price. In 1939 and 1940 the production was mainly in the treatment of gold-bearing dumps, with some shipments of newly mined and dump gold ore and lead-silver ore and of dump zinc-lead ore. The principal new work in the Leadville district was that by the Newmont Mining Corporation (of New York) and the Hecla Mining Co. (of Idaho) at the Resurrection mine at the end of the Yak tunnel, where water is not a problem. Ore has been developed at the Resurrection mine in sufficient quantity to furnish gold-silver-lead-zinc ore for a 300-tons-a-day concentration mill. Early in 1941 these companies acquired the Yak tunnel with its tracks, right-of-way, and certain mining property contiguous to the Yak drainage-transportation tunnel. These companies plan a drainage tunnel from the east fork of the Arkansas River, starting at

10,000 feet altitude and running southeastward across the district. This tunnel will be 350 feet lower than the Yak tunnel and about 150 feet below the Canterbury tunnel.

The H. G. N. Mining & Milling Co. operated its 300-ton flotation- and gravity-concentration mill from June 24 to December 31, 1940, and treated 44,099 tons of ore from dumps of the St. Louis, Ibex, Valley, and Fanny Rawlings mines. Before being sent to the mill the ore was crushed or screened to minus-1½-inch size. The jig concentrates were amalgamated, and the flotation and table concentrates were shipped to the Leadville smelter. The California Gulch Milling Co. operated its mill in California Gulch on ore from the Venir dump. Andy Caine & Co. erected a 45-ton gravity-concentration mill to treat low-grade ore from the Fanny Rawlings property and operated it from October 7 to the end of the year. A small tonnage of ore from the "Lilian" group was cyanided in the plant of the Leadville Cyanide Corporation. The principal shippers of ore direct to the Leadville smelter (in approximate order of tonnage) were the Breece mine and dump, Chippewa, New Monarch, Dolly B, Wolftone, Morgan dump, Ollie Reed and Tenderfoot, and Ibex. The Ibex was shut down 2 months for shaft repairs. About 300 tons of zinc-lead-silver-gold ore from the Leadville district were shipped to the Midvale (Utah) custom concentrator, and 730 tons of zinc-lead sulfide and carbonate ores, mostly from the Tucson and Moyer dumps and the F. J. Irwin operation, were shipped to the Ozark pigment plant at Coffeyville, Kans.

The Arkansas Valley lead bullion-leady copper matte custom smelter of the American Smelting & Refining Co. at Leadville was operated continuously (one furnace) in 1940. Receipts of ore and concentrates totaled 114,371 tons (all but 27 tons from Colorado mines) compared with 111,526 tons (all but 50 tons from Colorado mines) in 1939.

OTHER DISTRICTS

Less than 900 tons of ore were shipped in 1940 from mines in Lake County outside the Leadville district. Producing lode properties comprised the Mount Champion in the Lackawanna Gulch district; the Dinero and Fanchon in the St. Kevin-Sugar Loaf district; and the Gordon, Mary Jane, and White Star in the Twin Lakes district. Small lots of placer gold were recovered at the Cureton, Oregon, and other placers in the Granite district and at the Wye placer in the Tennessee Pass district. The dry-land dredge of the Mt. Elbert Mining Corporation on the Derry Ranch placers in the Box Creek district 12 miles south of Leadville was operated from April 10 to December 11.

The Climax Molybdenum Co. at Climax, 13 miles north of Leadville, operated its 12,000-ton flotation mill continuously in 1940, treating 3,833,838 tons with an average of 10,500 tons of ore daily for the year, and produced molybdenum sulfide concentrates containing 22,782,608 pounds of elemental molybdenum.

LA PLATA COUNTY

The American Smelting & Refining Co. lead bullion-leady copper matte smelter at Durango was dismantled in 1940. Sintering equipment was sent to the Amarillo (Tex.) plant, and other parts went to the Leadville smelter.

California (or La Plata) district (Hesperus, La Plata).—The metal output from the La Plata district in 1940 was contained in small tonnages of gold-silver ore shipped to smelters from the Bessie G, Delaware, Gold King, May Day, Mountain Lilly, and an unidentified property.

LARIMER COUNTY

A little gold ore was shipped to the Leadville smelter in 1940 from the Free Gold claim in the Manhattan district and the Little Mary Mason group in the Masonville district.

MESA COUNTY

Sinbad district.—One car of copper-silver ore was shipped from the Precipice claim to the Garfield (Utah) smelter in 1940.

MINERAL COUNTY

Creede district.—Silver production in the Creede district increased 45 percent in 1940 over 1939, following a 30-percent increase in 1939 over 1938 and a 42-percent increase in 1938 over 1937. The output of gold and lead recovered from the silver ore also increased in 1940. Much high-grade silver ore was shipped direct to the Leadville smelter, but the bulk of the ore from the district was concentrated in the custom flotation mill of Creede Mills, Inc., and the concentrates produced were shipped to the Leadville smelter. The mill was operated by Creede Mills, Inc., from January 1 to September 1, when it was leased to the Emperius Mining Co., which ran it the rest of the year. The Emperius Mining Co. also acquired the mining leases of Creede Mills, Inc., in the Sunnyside area.

MOFFAT COUNTY

Fourmile (or Timberlake) district.—Small lots of placer gold were recovered in 1940 by sluicing at the Gooldy, Grubstake, Old Faithful, and other placers in the Fourmile district.

MONTEZUMA COUNTY

The Red Arrow Gold Corporation operated its Red Arrow mine throughout 1940 and produced 3,039 tons of ore, of which 3,000 tons were concentrated in the company mill by jigging, blanket-tabling, and flotation and 39 tons were shipped crude to the Leadville smelter. The concentrates were amalgamated and yielded 1,354.92 fine ounces of gold and 295 fine ounces of silver in retorts sold to the Denver Mint; the ore shipped crude contained 179 ounces of gold and 585 ounces of silver.

MONTROSE COUNTY

La Sal district.—Lessees at the Cashin group and the Talbert claim shipped copper-silver ore to the Garfield (Utah) smelter in 1940. Most of the output of placer gold from the La Sal district during the year came from the Honora claim.

Naturita district.—Individuals sluicing on San Miguel River in 1940 recovered small lots of placer gold.

Paradox Valley district.—An increased output of vanadium ore was made in the Paradox Valley area in 1940. The United States Vanadium Corporation continued to operate its 260-ton roasting, leaching, and vanadium oxide precipitation plant at Uravan. A similar plant at Naturita was reopened by the Vanadium Corporation of America. Custom ore was bought by both companies. The North Continent Mines, Inc., also built a mill for the treatment of vanadium ores near Cedar (San Miguel County).

OURAY COUNTY

Red Mountain district.—The Guston, Yankee Girl, and Robinson claims in the Red Mountain group were operated under lease from January 1 to June 1, 1940, by G. A. Franz, Inc., which shipped to the Leadville smelter 412 tons of stope filling from the old Guston stopes, containing 55.5 ounces of gold, 4,479 ounces of silver, and a little lead, copper, and zinc. Some ore from the Koehler tunnel and the Micky Breen mine was shipped to the Shenandoah-Dives mill at Silverton (San Juan County).

Sneffels district.—The King Lease new 100- to 125-ton mill built in 1939 within the old Camp Bird stamp-mill building 6 miles south of Ouray was placed in operation January 1, 1940, and ran continuously throughout the year on ore from the Camp Bird mine. The ore was transported from the mine workings through the lower 11,000-foot adit to the mill bins, from which it was fed to jaw crushers and then to ball mills; the pulp from the ball mills was amalgamated on plates, and the pulp from the plates was sent to the flotation circuit where bulk gold-silver-copper-lead-[zinc] concentrates were made for shipment to smelters. The gold-silver bullion recovered was sold to the Denver Mint.

Uncompahgre district.—Lessees working the Bachelor Consolidated group in 1940 shipped some of the ore produced to the Leadville smelter but had most of it milled in the Banner American mill at Ouray, operated by G. A. Franz, Inc. Zinc-lead-silver dump ore from the Syracuse Tunnel was milled at the Shenandoah-Dives mill at Silverton. Zinc-lead ore cleaned up at the Pony Express group also was concentrated in the Banner American mill, yielding lead concentrates (shipped to the Leadville smelter) and zinc concentrates (shipped to the Amarillo (Tex.) smelter). The McCullough Lease continued to ship gold-silver-copper ore to the Leadville smelter from the American Nettie and Wanakah groups and treated 250 tons of old tailings from the Wanakah mill dump in the flotation mill on the property; the daily capacity of this mill was raised during the year from 30 to 50 tons by the installation of a new ball mill. Silver ore from the Senorita group was shipped to the Midvale (Utah) smelter, and zinc-lead ore from the Ophir group was sent to the Midvale custom concentrator.

PARK COUNTY

Alma Placers district.—The Alplaco Mining Co. was the principal producer on the Alma Placers in 1940; the company used a central slucing plant, to which gravel dug from open pits by power shovels was hauled by trucks.

Beaver Creek district.—The Timberline Dredging Co. operated its electric floating connected-bucket dredge on Beaver Creek near Fairplay from April 5 to December 25, 1940, and handled 876,760 cubic yards of gravel yielding 4,975 fine ounces of gold and 1,068 fine ounces of silver; the dredge is equipped with 84 buckets, each with a capacity of 7½ cubic feet. A lessee at the Shelton placer recovered 75 fine ounces of gold and 16 fine ounces of silver, using a 1¼-cubic yard gasoline shovel, four trucks, a bulldozer, and a screening-sluicing plant to handle the gravel. Output was made from other placers on Beaver Creek during the year.

Buckskin district.—The 2-3-4 Mines, Inc., continuing exploration and development work at the Philips group, opened some new ore in 1940 and reopened old workings containing zinc ores carrying lead, copper, gold, and silver. The company leased the Alma Betts 50-ton mill and operated it from June to the end of the year. The zinc concentrates made (containing also some gold, silver, copper, and lead) were shipped to the Amarillo (Tex.) smelter, and the lead concentrates (containing also gold, silver, copper, and zinc) were sold to the Leadville smelter.

Consolidated Montgomery district.—The Magnolia Gold Mining Co. continued operations at the Magnolia mine in 1940 and completed the rebuilding of its mill, which had burned in 1939. The mill was operated from April 1 to the end of the year and treated 6,900 tons of ore by table and flotation concentration. Small lots of ore were shipped to the Golden Cycle mill from the Kansas mine and to the Leadville smelter from other properties in the Consolidated Montgomery district.

Fairplay district.—Placer mining was continued in 1940 on the Snowstorm placer and at various places on the Platte River in the vicinity of Fairplay. A large part of the gold output was produced from gravel dug by power shovels and hauled by truck to central sluicing plants, but individuals continued to recover some gold by hand sluicing. At the close of 1940 the South Platte Dredging Co. had completed the hull and part of the superstructure of a 10,000-cubic yard (per-day) steel connected-bucket dredge, equipped with 100 buckets of 11 cubic feet capacity each, on the bench below Fairplay. Natomas Co. (of California) which owns an interest in the South Platte Dredging Co. reports that 80,000,000 cubic yards of gravel have been thoroughly tested.

Hall Valley district.—About 3 tons of lead-silver ore were shipped from the Ypsilanti claim to the Leadville smelter in 1940.

Horseshoe district.—One car of lead-silver ore was shipped in 1940 from the Hill Top group.

Mosquito district.—The London Mines & Milling Co. maintained production throughout 1940 from its consolidated group of mines on London Mountain and continued to be the principal metal producer in the Mosquito district and in Park County. The ore was transported from the mine workings through the 4,400-foot London Extension tunnel and was put through a sorting plant before being treated in the company 200-ton flotation- and gravity-concentration mill. Besides gold—the metal of chief value—the concentrates contained some silver, a little copper, and considerable lead and zinc; they were sold to the Leadville smelter. The London-Butte Gold Mines Co. operated its Butte mine and 100-ton flotation mill throughout the year. During part of the year the Record mill was operated by the Chicago Mines Co., for the fourth season, on ore from the American and South London waste dumps, and part of the year by the London Extension Mining Co. on mine and dump ore from the American mine and Huron claim and dump ore from the Champaign. Operations by W. A. Ellis, Inc., at the American mine were discontinued June 8.

Tarryall district.—The Peerless Mining Co., which from 1934 to 1939, inclusive, operated its 1¼-cubic yard gasoline shovel and portable four-bowl washing machine in Park Gulch about 7 miles southeast of Como, moved the equipment in 1940 to the Fortune placer northwest of Como and ran it from May 10 to October 7. Gage L. Odell worked the Roberts placer on Tarryall Creek 2½ miles northwest of Como from May 25 to November 3 with a 1¼-cubic yard gasoline shovel and screening and sluicing plant. A four-bowl land dredge and steam shovel were installed on the Little Mint-Storming Jordan property 10 miles east of Como and operated for 2 days. A little gold was recovered by individuals sluicing on Tarryall Creek. In 1940 Cooley Bros. took a royalty lease on the Cline bench placer and Peabody and Fortune placers and began installation in 1941 of a 3½-cubic yard dragline floating dredge. Some 9,000,000 cubic yards of gold-bearing gravel have been developed by pits and churn drilling. About 9 tons of gold ore were shipped from the Black Butterfly lode claim.

PITKIN COUNTY

Independence district.—A 2-ton lot of gold-silver-copper ore was shipped from the Mount Hope dump to the Leadville smelter in 1940.

Roaring Fork district (Aspen).—The Midnight Mining Co. operated the Midnight mine and mill continuously 6 days a week in 1940. The ore mined (7,000 tons) was treated in the company 60-ton flotation mill. The products were lead-silver concentrates, which were sold to the Leadville smelter, and zinc concentrates, which were shipped to the Amarillo (Tex.) zinc smelter. D. P. Rohlfing continued to ship to the Leadville smelter lime fluxing material carrying silver and lead from the Smuggler, Spar Consolidated, and other groups under his management. A lessee of the Hunter Creek flotation mill treated about 15,000 tons of silver- and lead-bearing material from the Mollie Gibson dump.

RIO GRANDE COUNTY

Summitville district.—Summitville Consolidated Mines, Inc., maintained production throughout 1940 from its consolidated group of mines and 125- to 150-ton mill at Summitville. Part of the ore is mined from underground workings and part from glory holes. In treatment, the ore is ground in a ball mill with cyanide solution to minus-100-mesh. A jig between the ball mill and classifier removes coarse high-grade gold-silver-pyrite concentrates, which are shipped to the Leadville smelter. The classifier overflow goes to primary thickeners to remove pregnant solution; the primary thickener underflow goes to agitators and from them to three stages of countercurrent decantation. The pregnant solution is precipitated in Merrill-Crowe units, and the precipitates are acid-treated and reduced to bullion for shipment to the Denver Mint.

SAGUACHE COUNTY

Kerber Creek district (Bonanza).—The metal output from the Kerber Creek district in 1940 was contained in lead-silver-copper-gold, lead-silver-gold, and copper-silver-gold ores shipped to smelters in Colorado and Utah and in zinc-lead-silver-copper-gold ore shipped to the Midvale (Utah) custom concentrator. The only shippers of more than 100 tons of ore during the year were the Rawley and Warwick groups; other producers included the Hornet, Jupiter, Liberty, and Minnie Lynch properties.

SAN JUAN COUNTY

Animas district.—Operations of the Shenandoah-Dives Mining Co., a large annual producer since 1928, were continued without interruption throughout 1940. The company owns and operates a consolidated group of claims on King Solomon Mountain opened by the Mayflower Tunnel and a 750-ton selective-flotation mill on Animas River near Silverton. Company and custom ore treated in 1940 totaled 221,801 tons (of which 8,910 tons were custom) and yielded 9,292 tons of combined lead, zinc, and iron (lead) concentrates, containing in all 15,303 ounces of gold, 336,066 ounces of silver, 847,340 pounds of copper (wet assay), 5,060,276 pounds of lead (wet assay), and 4,024,906 pounds of zinc; the lead and iron (lead) concentrates were shipped to the Leadville smelter, and the zinc concentrates (2,607 tons of 58.5-percent zinc content, with also gold, silver, and minor lead and copper content) to the Amarillo (Tex.) smelter. Part of the custom ore came from the Mystery, Little Fannie, and other mines in the Animas district and part from mines in other districts in San Juan and Ouray Counties. The new Pride of the West 50-ton flotation mill at Howardsville was completed and placed in operation July 21, 1940, and to the end of the year treated 7,389 tons of ore and produced 955 tons of lead concentrates averaging 0.36 ounce of gold and 18.8 ounces of silver to the ton, 50 percent lead (wet assay), 2.87 percent copper (wet assay), and 7.26 percent zinc, and 164 tons of zinc concentates averaging 0.04 ounce of gold and 5.05 ounces of silver to the ton, 2.25 percent lead (wet assay), 0.91 percent copper (wet assay), and 58.6 percent zinc. The Highland Mary mine and mill were operated from September 3 to November 25. Small tonnages of smelting ore were shipped from the Coming Wonder, Delaware, Kankakee (Crusader Lease), and other mines. From inside the Mayflower Tunnel the Shenandoah-Dives Mining Co. during the last several years had completed a 3,000-foot crosscut to the Silver Lake property of the American Smelting & Refining Co., and during 1940 several raises were made on the Stelzner vein.

Eureka district.—Most of the output of ore from the Eureka district in 1940 was sold to the Shenandoah-Dives mill. The largest shipper to the mill was Superior Metal Mines, Inc., which hauled by truck 1,703 tons of material containing chiefly gold and silver but also some zinc, lead, and copper, from the leased Mammoth and Polar Star dumps on the south slope of Engineer Mountain. The second-largest shipper was the Esmeralda Lease, with 1,637 tons of silver-gold-zinc-lead-copper ore. Other shippers included the Mountain Queen mine, Golden Fleece and San Juan Queen dumps, and Robert Bonner and Lead Carbonate mines. Gold-silver ore from the Brooklyn mine was shipped to the Leadville smelter. The Sunnyside mine and 1,000-ton selective-flotation mill at Eureka, closed June 30, 1938, remained idle throughout 1940.

Ice Lake Basin district.—The Blanco Mining Co. operated the Bandora group from May 4 to October 31, 1940, and shipped 1,579 tons of lead-silver-zinc-gold-copper ore to the Shenandoah-Dives mill. The company surrendered its lease on the property at the end of 1940.

SAN MIGUEL COUNTY

Iron Springs district (Ophir).—In 1940 Butterfly Consolidated Mines, Inc., continued working its Butterfly-Terrible-Silver Bell group of mines and treated 12,000 tons of ore in its 250-ton flotation mill. The concentrates produced (1,373 tons) contained 920 ounces of gold, 80,157 ounces of silver, 323,099 pounds of lead (wet assay), 39,173 pounds of copper (wet assay), and some zinc; they were sold to the Midvale (Utah) smelter. The mill was destroyed by fire December 6. Belisle Bros. shipped several cars of zinc-lead-gold-silver-copper ore to the Midvale (Utah) custom mill from the New Dominion mine, which was under development throughout the year. Other small producers included the Carbonero, Hattie, Sulphurette, and Yellow Jacket.

Lower San Miguel district (Sawpit, Vanadium).—Sluicing on the San Miguel River recovered a little gold in 1940.

Mount Wilson district.—Small lots of high-grade gold ore were shipped to smelters in 1940 from the Chindey and Shenandoah claims.

Upper San Miguel district (Telluride).—Veta Mines, Inc., operated its amalgamation-flotation mill at Pandora 2½ miles east of Telluride at an average rate of 486 tons daily for 365 days in 1940 compared with 375 tons in 1939. Improvements made in 1940 raised the daily capacity of the mill (formerly 500 tons) to 700 tons. The company ore treated came from the Smuggler-Union and Cimarron mines and dumps and the custom ore (119 tons) from the Gold Queen, Little Mary, Shoemaker, and Wasatch claims and a prospect. Mine development during the year comprised 4,281 feet of drifts, 1,660 feet of tunnel, 15 feet of winze, and 174 feet of diamond drilling. A crushing plant was installed at the portal of the Pennsylvania Tunnel and an aerial tramway erected from this point to the Cimarron dump. Alta Mines, Inc., operated the Alta-St. Louis group steadily throughout 1940. The mine is developed by 6 to 8 miles of tunnels and drifts, of which 500 feet of tunnel and 1,000 feet of drifts were driven during the year. The ore produced (45,988 wet tons) was treated in the company 150-ton mill by jig, flotation, and table concentration; the jig concentrates were amalgamated, and the flotation and table concentrates were shipped to the Leadville smelter.

SUMMIT COUNTY

Breckenridge district.—Ores shipped to the Leadville smelter from the Breckenridge district in 1940 comprised chiefly silver-lead ore from the Fredonia mine; gold-silver-lead ore from the Carbonate, Jumbo, Laurium (Blue Flag), Minnie B, Silver King, and Standard-Bulwer; and gold-silver ore from the Hoosier. Zinc-lead ore from the Mountain Pride and Wellington mines and zinc ore from the Sally Barber were shipped to custom concentrators in Utah. Some gold was recovered from ore amalgamated at other lode properties in the district.

The Bemrose-Bostwick, Louis D, and Ford-Bedrock placers, equipped with power shovels, trucks, and central sluicing plants, yielded most of the output of placer gold from the Breckenridge district in 1940. The Beaver Head, Long Island, Pittsburg, and other placers were worked by sluicing or hydraulicking. The Blue River Co. floating connected-bucket dredge at Breckenridge was not run in 1940.

Montezuma district.—The output of ore and concentrates from the Montezuma district in 1940 was sold to the Leadville smelter. The Bullion mine was operated by a lessee who concentrated the ore in a small gravity-concentration mill near the mine. The Marlin Mining Co. treated ore from its property in a small mill equipped with a crusher, ball mill, and tables. Direct-smelting ore was shipped from the Florado-Sts. John, Gold Arrow, Maid of Orleans, Pennsylvania, Revenue, and Tip Top mines. Silver and lead were the chief metals contained in most of the ore.

Ten Mile (Kokomo, Robinson) district.—The Wilfley Leasing Co. cleaned out and retimbered old workings in the Wilfley mine and treated in the Wilfley mill 150 tons of low-grade gold-silver-lead ore cleaned up from the Tabor incline. A six-cell flotation machine was installed in the mill, formerly equipped for gravity concentration only. The Gold Crest Mining Co. drove 600 feet of tunnel at the Gold Crest group and shipped 177 tons of gold-silver ore to the Leadville smelter. Small shipments of smelting ore were made from the Boston and other properties in the Ten Mile district.

Wilkinson and Green Mountain district.—Walter McDaniel continued producing rich zinc-silver-lead-gold-copper ore from his Big Four mine, opened on Green Mountain in 1937; he shipped part of the ore to the Combined Metals Reduction Co. at Bauer, Utah, and part to the United States Smelting, Refining & Mining Co. at Midvale, Utah. Output in 1940 was 755 tons of ore containing 633,800 pounds of zinc, 34,002 ounces of silver, 29,907 pounds of lead, 43.84 ounces of gold, and 5,247 pounds of copper. Other output from the Wilkinson district comprised gold-silver ore from the Excelsior and lead-silver-gold ore from the Chief Mountain and another property.

TELLER COUNTY

CRIPPLE CREEK DISTRICT

Cripple Creek is the leading gold-producing district in Colorado. From 1891, when gold was discovered in that area, through 1940 it has yielded a total of 18,182,819 fine ounces valued at $389,973,147, or 48 percent of the State total output of gold from 1858 to 1940, inclusive. In 1940 the district produced 128,932 ounces (35 percent of the State total), compared with 134,003 ounces (37 percent) in 1939 and 145,215 ounces (40 percent) in 1938. Output in 1939 and 1940 was reduced by the temporary suspension of operations in the lower levels of the Ajax and Cresson mines, pending completion in 1941 of the Carlton drainage tunnel. The portal of the Carlton tunnel is at an altitude of 6,893 feet above sea level, and drainage will be approximately 1,110 feet lower than the Roosevelt tunnel. Approximate additional depths to connect some of the deeper shafts are: Cresson, 700 feet; Ajax, 500 feet; Vindicator, 1,000 feet; and Portland, 200 feet. The total output of ore from mines and dumps in the district proper in 1940 was 536,504 tons, of which 485,155 tons were shipped to the Golden Cycle mill (operations reviewed under El Paso County), 31,454 tons were treated by flotation in the Cameron mill, and 19,895 tons were treated by cyanide leaching in the Kavanaugh plant. Other output credited to the Cripple Creek district in 1940 is 36,050 tons of old tailings treated in cyanide plants at the old Portland mill dump at Colorado Springs and the Metallic dump at Florence. These dumps are composed entirely of tailings from ore shipped from the Cripple Creek district many years ago. Cripple Creek ores generally contain gold as the only commercial metal, but some silver ore has been shipped from two or three veins in the district; a small quantity of silver is recovered annually in bullion and concentrates produced from the gold ores.

MINES REVIEW

Operations of the Golden Cycle Corporation, which owns and operates the Golden Cycle mill at Colorado Springs and several mines in the Cripple Creek district, are described in the following extract from the corporation's annual report to stockholders for the year ended December 31, 1940 (dated March 1, 1941):

During the year 1940, the Cripple Creek district shipped to the Golden Cycle mill at Colorado Springs a total of 485,155 tons of ore of an average value of $9.058 per ton. This is an increase in tonnage over the previous year, but a decrease in the average value. All this ore came from above the Roosevelt Tunnel level. A consiaerable part of this tonnage is also dump ore, which is naturally lower in value than mine ore. Lessees accounted for the greater part of the tonnage shipped. The leasing system as is practiced in the Cripple Creek district is the most economical way mining can be carried on, due to the character of the small and erratic nature of the ore chutes. However, it is, of course, necessary for the companies to take the lead on development work and mine all the larger and better grade bodies of ore possible.

The United Gold Mines Co. was the largest shipper from the district, with the Cresson Consolidated Gold Mining & Milling Co. a close second. These two properties accounted for 60 percent of the ore shipped from the district. The ore mining division of the Golden Cycle Corporation shipped 34,179 tons with a gross value of $377,347 or an average value of $11.04 per ton. This is a decrease over the previous year, due to the curtailment of operations on the Ajax mine.

Ajax operation.—In July 1939, it was decided to stop pumping operations on the Ajax mine due to the heavy expense, and due to the fact that as long as the corporation had commenced the driving of the Carlton Tunnel, which would drain these workings, it seemed senseless to keep on with the heavy expense of pumping, which the Carlton Tunnel would eliminate when completed. Consequently, the mine workings were flooded up to the Roosevelt Tunnel level.

Almost the entire production of the Ajax, prior to this time, came from the flooded area. Since that time production has been maintained by lessees on the upper levels, and by the company washing and sorting the ore house waste dump, which was put out prior to 1939.

The Ajax shipped 22,202 tons of ore during 1940, with a gross value of $226,628. Of this amount the company shipped 8,644 tons, with an average value of $7.90 per ton (mainly dump ore), while the lessees shipped 13,558 tons with an average value of $11.675 per ton.

The Ajax has 14 sets of lessees working through the main Ajax shaft, employing about 35 men. During the past year they have done 1,041 feet of development work, including drifting, crosscutting, raising, and winzing.

The company did 686 feet of development work in 1940. The Queen of the Hill system on the 20th level was thoroughly prospected with very little ore being discovered.

The Ajax shaft has been retimbered from the collar down 50 feet. Some surface buildings, that were a big fire hazard, have been removed and the remaining buildings have been repaired and painted. The plant is in much better shape today than it was 2 years ago.

It is quite probable that enough drainage will take place, within the next few months, to permit work to be resumed late this year on some of the levels now under water.

Index operation.—The Index mine, which was purchased in 1939, started operations early in 1940. A development campaign was at once started and is being continued in the hope of discovering ore in undeveloped territory. Four sets of lessees are also operating through this shaft and shipping some ore.

During the past year, the company shipped 962 tons with a gross value of $10,706, and the lessees shipped 2,460 tons with a gross value of $15,629. A total of 1,724 feet of drifts, crosscuts, and raises was accomplished by the company and lessees.

Anchoria Leland operation.—Operations upon the Anchoria Leland were very successful during the year. The Anchoria Leland was the only operation to show a profit for the year. Company and lessees shipped a total of 8,554 tons with an average value of $14.54 per ton. A total of 1,175 feet of drifting, crosscutting, and raising was done by the company and lessees with very successful results. The Anchoria Leland shipped a grade of ore considerably higher than the average grade of the district.

The Carlton Tunnel.—This tunnel was started in July of 1939, for the purpose of draining the mines of the district. It will be 32,000 feet in length when it reaches its objective at the Portland No. 2 shaft. All records for speed on driving a tunnel of this size have been broken. The ground through which this tunnel has been driven has been extremely hard, requiring more powder than the ordinary tunnel job, as well as causing a very large consumption of drill steel and bits. Providing no unforeseen difficulties arise or extremely large flows of water are encountered, we should reach the Portland No. 2 shaft in May 1941.

During the year 1940, the Carlton Tunnel was advanced 19,326 feet. On March 1, 1941, the heading was in 28,973 feet from the portal. 1,787 feet was driven in October 1940, which is the greatest monthly footage made to date. 78 feet was the highest footage made in one day.

The average, over-all costs, per foot of tunnel driven since its start is $32.18 per foot. This figure includes all costs, including such items as road building, equipment used, engineering, etc.

The annual report of the United Gold Mines Co., an operating and holding company for property scattered throughout the Cripple Creek district, for the year ended December 31, 1940 (dated February 15, 1941), includes a report of the mine superintendent, which gives the following details on operations at individual mines:

Production of the United Gold Mines Co. reached the highest point in the history of the company during the year 1940, a total of 159,239.44 tons with a gross value of $1,463,544.45. Of this amount over 95 percent, or 149,652.30 tons with a gross value of $1,399,449.15, was accounted for by lessees on the various properties. The following shafts were operated on company account mainly for the accommodation of split-check lessees: The Portland No. 1 and No. 2, Vindicator, Theresa, Rose Nicol, Hull City, and Last Dollar. Some company development work was done on the Theresa and Portland No. 2, but by far the greater part of all work accomplished was accounted for by lessees.

Portland Group.—A disastrous fire in January totally destroyed the Portland No. 1 ore house and stopped the production in this shaft for over 3 months. In planning to rebuild this ore house it was decided to tear down Portland No. 2 ore house, another fire hazard, and build an all-steel ore house at Portland No. 1 to handle the Portland production from both shafts. This program has been completed. All of the Portland buildings have been repaired and painted and the physical condition of the surface plants have all been much improved. Three shafts on the Portland were operated on company account for the accommodation of split-check lessees, namely, the Portland No. 1 and No. 2 and the Last Dollar. There were employed a total of 25 sets of lessees working through these shafts; 10 sets working in other small shafts, making in all, including company employees, about 125 men. The Portland made a very good production during the year despite the fire in January.

Vindicator Group.—The Vindicator and Hull City were operated on company account during the year, while the Glorietta, Anna J., Tateman, and LaBelle were operated by royalty lessees. The Vindicator Group has about 48 sets of lessees, employing in the neighborhood of 153 men, with an additional 30 employed by the company. During the past year lessees produced a considerable tonnage of medium-grade ore from the Logan Tract. Most of the work on company account was done through the Theresa Shaft.

Rose Nicol.—Early in the year the shaft was sunk 100 feet to the 11th level, where extensive development work has been carried on. At the present time, four different bodies of ore are being mined on that level. Two of them being of fairly good grade and the other two low grade. Work through the Cresson Shaft on the 1,700-foot level was suspended about the middle of the year, so that all work now being carried on by the Rose Nicol is through the Rose Nicol Shaft. As in the other properties, lessees account for a large part of the production on this property. Nine sets of lessees are employed upon the property at the present time. They accomplished 3,401 feet of development work during the year. The company accounted for 1,565 feet.

Miscellaneous properties.—Lessees operated many blocks of ground on the various properties owned by the company not included in the above groups. They accounted for a very large share of the production of the United Gold Mines Co.

Production of company ore by United Gold Mines Co. in 1940

Mine	Net tons	Gross value [1]	Company ore cash receipts	Average gross value per ton [1]
Vindicator	2, 634	$11, 488. 67	$3, 782. 28	$4. 36
Rose Nicol	4, 270	37, 055. 31	20, 221. 99	8. 68
Portland	896	7, 427. 24	3, 946. 50	8. 29
Theresa	58	189. 27	24. 51	3. 25
No. 2 Plant	1, 729	7, 934. 81	2, 819. 17	4. 59
	9, 587	64, 095. 30	30, 794. 45	6. 69

[1] Gross value in 1940 is calculated at $32.76 per fine ounce of gold content.

Production of lessee ore of United Gold Mines Co. in 1940

Group	Net tons	Gross value [1]	Royalties received	Lessees' receipts	Average gross value per ton [1]
Vindicator	34, 485	$308, 899. 24	$73, 006. 97	$100, 574. 83	$8. 96
Rose Nicol	7, 387	87, 491. 16	25, 053. 53	27, 878. 31	11. 84
Portland-Last Dollar	36, 584	383, 298. 05	92, 309. 75	133, 562. 42	10. 48
Theresa	10, 566	120, 404. 50	37, 788. 15	34, 432. 70	11. 40

Hardwood group	8, 998	72, 052. 45	4, 435. 42	27, 868. 89	8. 01
Londonderry group	3, 897	28, 792. 31	1, 786. 84	10, 998. 22	7. 39
W. P. H. group	2, 748	29, 570. 85	3, 459. 06	12, 936. 78	10. 76
	149, 652	1, 399, 449. 15	275, 822. 71	499, 054. 13	9. 35

[1] Gross value in 1940 is calculated at $32.76 per fine ounce of gold content.

Production of properties of United Gold Mines Co. before and after organization of the company (May 15, 1902) to December 31, 1940

	Net tons	Gross value
Ore mined before consolidation	26, 310	$456, 806. 19
Production under operation of United Gold Mines Co	2, 044, 519	21, 944, 826. 63
Total to Dec. 31, 1940	2, 070, 829	22, 401, 632. 82

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the 12 months ended December 31, 1940 (dated January 15, 1941), says—

The following is a summary of the development work for the 12 months ending December 31, 1940:

Development

	Feet	Feet
Drifts and crosscuts:		
Company	2, 655	
Hart group	180	
Lessees	1, 311	
		4, 146
Raises and winzes:		
Company	1, 425	
Lessees	807	
		2, 232
		6, 378

The Cresson mine shaft was kept running to full capacity for 11 months during the year. On August 15, it was necessary to close down for 30 days in order to repair part of the shaft. From the collar down to a point 110 feet below, steel and concrete was used. This part of the shaft was in very bad condition and always gave considerable trouble. In addition, 200 feet of timber sets were placed between the 4th and 6th levels. The size and condition of this shaft greatly handicap hoisting ore, besides being very costly to maintain. It is necessary to work a maintenance crew every night in order to keep the shaft in running order.

Due to the shut-down, production was slightly less than the preceding year. Split-check lessees account for more than 50 percent of the ore produced, and every effort is made to encourage leasing on all ground the company does not wish to work.

Development work was continued throughout the year by both the company and lessees. However, the main ore-bearing zone above the water level has been pretty thoroughly prospected, and it is below this level that we must look for new ore in the future. At the present time the company is mining in a large low-grade stope between the 16th and 17th levels, that was opened during the past year. 26 sets of split-check lessees are also operating through the Cresson shaft, and at the present time production is being maintained up to our hoisting capacity.

The Gold Sovereign is still under a royalty lease to Blackwood & Co., who have maintained a good production throughout the year.

A drift has been started by the Cresson Co. from the Empire shaft to drive into the Hart group in order to prospect this ground. This group is located on the north slope of Bull Hill, adjacent to some very productive territory. A large amount of work will be necessary in order to thoroughly develop this ground.

The 32,000-foot Carlton Drainage Tunnel being driven by the Golden Cycle Corporation to the Portland No. 2 shaft has been driven with record-breaking speed during the year and is now in approximately 27,500 feet. It is very possible that it will reach this shaft early this year. After the main tunnel reaches its objective at the Portland No. 2 shaft, it will undoubtedly be necessary for the Cresson Co. to drive, at its own expense, a lateral of about 4,000 feet in order to drain the Cresson ground. This will give us 1,100 feet of additional ground in depth to prospect. It will also permit the sinking of the Cresson shaft and the prospecting of ground which we have been unable to develop. This drainage program is of the utmost importance to the Cresson, as well as other mines in this district, as it will show whether the ore chutes that have been worked above the Roosevelt Tunnel persist at greater depth. Of course, to accomplish this program we must within the next few years spend more money on development than has hitherto before been spent. To a great extent the future life of the mines depends upon whether the ore does go to a greater depth or not.

The average cost per ton shipped by company and the lessees during 1940 was $3.040 on a total of 114,375 tons.

Federal taxes	$0.124
State income taxes	.022
State and county taxes	.105
Capital stock taxes	.009

Compensation insurance	.092
Fire insurance	.018
Salaries of officers and directors	.042
Mining operations	2.457
General expense	.054

Production of Cresson Consolidated Gold Mining & Milling Co., 1903 to December 31, 1940

Period	Dry short tons	Gross value	Freight and treatment	Net value
1903 to Dec. 31, 1939	2,848,634	$42,662,297.48	$13,841,979.97	$28,820,317.51
1940:				
Company ore	51,779	[1] 401,542.03	186,829.12	214,712.91
Lessee ore	62,596	[1] 777,334.22	286,298.69	491,035.53
1903 to Dec. 31, 1940	2,963,009	43,841,173.73	14,315,107.78	29,526,065.95

Period	Royalties received by company	Amount paid lessees	Average gross value per ton	Average net value per ton	Dividends
1903 to Dec. 31, 1939			$14.98	$10.12	$13,284,072.50
1940:					
Company ore			[1] 7.75	4.15	97,600.00
Lessee ore	$234,518.08	$256,517.45	[1] 12.42	7.84	
1903 to Dec. 31, 1940			14.80	9.96	[2] 13,381,672.50

[1] Gross value in 1940 is calculated at $32.76, $33.12, and $33.47 per fine ounce of gold content.
[2] Represents 30.52 percent of gross value and 45.32 percent of net value.

Ore shipped in 1940 from mines owned by the Stratton Cripple Creek Mining & Development Co. totaled 32,567 tons, which brought a net return of $190,669 after freight, treatment, hauling, and umpire charges had been deducted. Most of the ore was mined by lessees under the royalty system. Producing mines were the American Eagle, Block 219, Favorite, Logan, Longfellow, Orpha May, Specimen, and War Eagle on Bull Hill and Block 107 and Geneva on Globe Hill. A considerable part of the ore shipped came from dumps.

In approximate order of gold output, the Free Coinage, Empire Lee, Elkton, Acacia, Doctor Jack Pot, New Gold Dollar, Le Clair (Mary McKinney), Mary Nevin, El Paso, and Jerry Johnson properties continued to be important producers in 1940. Cameron Mines, Inc., operated the Cameron and Pinnacle groups and the Cameron flotation mill throughout the year. Company ore treated totaled 28,792 tons, which yielded 1,382 tons of concentrates containing 6,956 ounces of gold and 3,015 ounces of silver. Custom ore milled comprised 2,662 tons of dump rock from the El Paso and Tenderfoot properties. All the concentrates produced were sold to the Leadville smelter. The Kavanaugh 100-ton cyanide leaching plant was in operation about 8½ months and treated 19,895 tons of ore from the Iron Clad group, recovering 1,031 fine ounces of gold and 165 fine ounces of silver. Some of the other producing mines and dumps were the Atlanta, Atlas (Midget Bonanza King), Ben Hur, Black Belle, Buckeye, Cardinal-Great West, Delmonico, Economic Dump, Golden Swan, Hamlet Dexter, Hiawatha, Hoosier, Irving Howbert (Conundrum), Joe Dandy, Katinka-Chicken Hawk, Krug property (Amanda), Moose, Morning Star, Raaler, School Section, Smith Moffat (Victor), Strong, and Wagner (Little Ida).

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE EASTERN STATES

(MINE REPORT)

By A. J. Martin

SUMMARY OUTLINE

The mine output of gold, silver, and copper in the Eastern States increased and that of lead decreased in both quantity and value in 1940 compared with 1939; the output of zinc, however, varied little in quantity (1-percent decrease) but rose 14 percent in value owing to the advance in average price. Prices of silver, copper, and lead also averaged higher in 1940, and the total value of the recovered output of the five metals amounted to $28,217,995, an increase of 15 percent over 1939 and of 24 percent over 1938 but a decrease of 3 percent from 1937. Zinc represented 86 percent of the total value in 1940, 1939, and 1937 and 84 percent in 1938. The mines producing zinc in 1940 (some of which yielded lead also) are in New Jersey, New York, Tennessee, and Virginia. Copper ranked next to zinc in total value; most of it came from copper mines in Tennessee and North Carolina and the Cornwall magnetite-pyrite-chalcopyrite mine in Pennsylvania. Gold mines in South Carolina, North Carolina, Georgia, Virginia, and Alabama supplied 89 percent of the total gold and 10 percent of the silver; the rest of the gold was a byproduct of iron and copper mining and the rest of the silver a byproduct of copper, zinc-lead, iron, and lead mining. All the large mines and mills that were in operation at the end of 1939 ran steadily throughout 1940, and one medium-size gold mine in North Carolina was reopened September 1 and operated to the end of the year, contributing substantially to the gold output of the Southern Appalachian region.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.
[6] $0.71111111.

Annual figures for the 5 years ended with 1940 are given in the table that follows. The figures for tonnage of ore sold or treated do not include magnetite ore containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts.

Mine production of gold, silver, copper, lead, and zinc in the Eastern States, 1936–40, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)[1]	Gold (lode and placer)[2]		Silver (lode and placer)[3]	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	30	47	2,984,659	10,377.10	$363,199	83,350	$64,554
1937	39	40	3,407,883	10,680.90	373,832	106,873	82,667
1938	51	26	3,159,880	19,928.00	697,480	94,945	61,380
1939	47	24	3,409,619	17,414.00	609,490	94,083	63,862
1940	40	18	3,674,815	18,456.00	645,960	102,825	73,120

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
1936	22,907,700	$2,107,508	5,996	$551,632	161,740	$17,053,710	$20,140,603
1937	24,444,000	2,957,725	5,539	653,602	189,353	24,894,159	28,961,985
1938	21,079,160	2,065,758	7,900	726,800	172,501	19,211,235	22,762,653
1939	21,295,000	2,214,680	6,284	590,696	180,955	21,100,174	24,578,902
1940	25,490,000	2,880,370	4,831	483,100	178,815	24,135,445	28,217,995

[1] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[2] Includes placer gold as follows: 1936, 339 ounces; 1937, 632 ounces; 1938, 667 ounces; 1939, 413 ounces; 1940, 452 ounces.
[3] Placer silver did not exceed 39 ounces in any year during the 5-year period.

Gold.—South Carolina was the leading gold-producing State among the Eastern States from 1937 to 1940, inclusive, and most of the gold came from the Haile mine in Lancaster County near Kershaw. In 1940, however, the output of gold in the State decreased 5 percent from 1939. The principal changes in output in other Eastern States in 1940 were increases of 1,448 ounces in North Carolina and 291 ounces in Georgia. The gold from Pennsylvania and Tennessee, as well as a small portion of that from North Carolina, was recovered in the refining of copper bullion. The estimated output of gold in the Southern Appalachian States from 1799 to 1940 is recorded as follows:

Mine production of gold in the Southern Appalachian States, 1799–1940

State	Period	Fine ounces	Value
Alabama	1830–1940	49,458	$1,197,690
Georgia	1830–1940	870,168	18,071,727
Maryland	(1)–1940	6,102	163,940
North Carolina	1799–1940	1,157,115	24,066,288
South Carolina	1829–1940	295,322	$6,740,360
Tennessee	1831–1940	19,811	441,015
Virginia	1828–1940	167,015	3,558,504
Total	1799–1940	2,564,991	54,239,524

[1] Year of first production not recorded.

Silver.—The quantity of silver recovered from ores mined in the Eastern States increased 9 percent in 1940 over 1939. The gain was mostly in silver derived from the copper ores of Tennessee and North Carolina, but that recovered from gold ore in South Carolina, North Carolina, and Georgia also increased. There were small decreases in silver produced from zinc-lead and iron (magnetite-pyrite-chalcopyrite) ores.

Copper.—As the three mines that produced nearly all the copper output of the Eastern States in 1940 are in different States (North Carolina, Pennsylvania, and Tennessee), it is not possible to show the production of each State without disclosing that of individual mines; the combined output of the three States is shown under Tennessee in the following table. The total for the Eastern States increased 20 percent over 1939. Tennessee, the largest producer, gained 31 percent; Pennsylvania, which ranked second, 3 percent; and North Carolina, 36 percent. Mines in Georgia, South Carolina, and North Carolina produced 26,100 pounds of copper from gold ore. Copper ore yielded, in recovered metals, about 0.0004 ounce of gold and 0.06 ounce of silver to the ton of crude ore. Copper concentrates from the magnetite-pyrite-chalcopyrite ore of the Cornwall mine in Pennsylvania contained a little recoverable gold and silver.

Lead.—The lead recovered from mines in the Eastern States in 1940 came chiefly from zinc-lead sulfide ores from the Austinville mine in Virginia and the Balmat in New York and lead carbonate ore from the Embree mine in Tennessee. Some lead was recovered from zinc-lead sulfide and carbonate ores shipped from the Imperial mine in Claiborne County, Tenn., and from zinc-lead carbonate ore taken from an old mine dump in Russell County, Va. Production of recoverable lead totaled 4,831 tons in 1940, a decrease of 1,453 tons from 1939.

Zinc.—From 1935 to 1939, inclusive, mines in the Eastern States produced from 28 to 33 percent (average 31) of the total domestic mine output of zinc; in 1940, however, owing to increased production in the Western and Central States and a small decrease in the Eastern States, the proportion dropped to 27 percent. New Jersey continued to be the largest producer of zinc in the Eastern States, and its output was exceeded in the United States only by that of Oklahoma. Zinc production was higher in New Jersey and Tennessee than in 1939 but lower in New York and Virginia. Zinc ore yielded 76 percent of the total zinc output and zinc-lead ore and copper ore together 24 percent.

MINE PRODUCTION BY STATES

Mine production of gold, silver, copper, lead, and zinc in the Eastern States in 1940, by States, in terms of recovered metals

[For historic gold figures, see p. 317]

State	Mines producing		Ore (short tons)	Gold			Silver		
				Fine ounces		Total value	Fine ounces		Total value
	Lode	Placer		Lode	Placer		Lode	Placer	
Alabama	2		900	5		$175	3		$2
Georgia	7	14	6,963	533	428	33,635	610	20	448

[1] Ore is magnetite-pyrite-chalcopyrite, flotation copper concentrates from which yielded gold, silver, and copper; Bureau of Mines not at liberty to publish figures for ore and copper.
[2] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[3] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[4] North Carolina and Pennsylvania included under Tennessee; Bureau of Mines not at liberty to publish separate figures.
[5] Excludes value of copper, which is included under Tennessee.
[6] Includes also value of copper from North Carolina and Pennsylvania.

MINING INDUSTRY

The total output of ores yielding gold, silver, copper, lead, or zinc in the Eastern States in 1940, excluding the magnetite-pyrite-chalcopyrite ore from Pennsylvania, was 3,674,815 tons—an increase of 8 percent over 1939. The quantity of gold-bearing sand and gravel handled at placer mines using draglines and other mechanical equipment in the Southern Appalachian region was 75,512 cubic yards; in addition, a small quantity of gravel for which figures are not obtainable was sluiced by hand. The gravel handled by machinery averaged 18.2 cents to the cubic yard in gold and silver. The gold ore (most of which was treated by cyanidation) averaged $3.84 to the ton in gold and about $0.07 in silver and copper. The copper, zinc, and zinc-lead ores of the Eastern States yield byproducts (besides gold and silver), the value of which would have to be considered to show the full value of the crude ore mined. Copper-iron ore from Tennessee and zinc-lead-pyrite ore from New York yield pyrite concentrates that are used in the manufacture of sulfuric acid, and sulfuric acid is also made from gases produced in roasting zinc sulfide concentrates from zinc and zinc-lead ores of Tennessee, New York, and Virginia. New Jersey zinc ore yields manganiferous zinc residuum which is converted into spiegeleisen, and zinc ore milled in Tennessee yields a tailing salable for its lime content. The quantity of the various types of ore mined in the Eastern States is shown in the table that follows.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in the Eastern States in 1940, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (short tons)	Zinc (short tons)
Dry and siliceous gold ore	144,877	15,889	10,179	26,100	----------	----------
Copper ore	725,885	275	43,303	[1] 25,463,900	----------	(2)
Magnetite-pyrite-chalcopyrite ore	(3)	1,840	13,064	(1)	----------	----------
Lead ore	8,709	----------	529	----------	518	----------
Zinc ore	1,878,988	----------	----------	----------	----------	136,370
Zinc-lead ore	916,356	----------	35,720	----------	4,313	[2] 42,445
Total, lode mines	[4] 3,674,815	18,004	102,795	25,490,000	4,831	178,815

	[4] 3,674,815	18,456	102,825	25,490,000	4,831	178,815
Total, 1939	[4] 3,409,619	17,414	94,083	21,295,000	6,284	180,955

[1] Copper from magnetite-pyrite-chalcopyrite ore included with that from copper ore.
[2] Zinc from copper ore included with that from zinc-lead ore; Bureau of Mines not at liberty to publish separate figures.
[3] Bureau of Mines not at liberty to publish separate figures for ore and copper.
[4] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

METALLURGIC INDUSTRY

All the principal producing base-metal mines in the Eastern States except the Fontana copper mine in North Carolina have concentrating mills at or near the mines, but a considerable tonnage of copper ore is smelted direct and some of the crude zinc ore is shipped to oxide plants. The ore from the Fontana mine is shipped to the Tennessee Copper Co. plant in Tennessee. The methods of treatment used in the various mills and other operating details, including the tonnage and grade of concentrates produced by some of the mills, are given in the Review by States that follows. Most of the concentrates are shipped to smelters operated by the companies that own the mines. The methods of recovering the gold and silver are shown in the following table.

Mine production of gold and silver in the Eastern States in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)
Ore and old tailings amalgamated	10,630	932	361
Ore cyanided	134,096	14,655	9,204
Concentrates smelted	57,596	2,157	87,957
Ore smelted	20,642	260	5,273
Placer	----------	452	30
	----------	18,456	102,825
Total, 1939	----------	17,414	94,083

REVIEW BY STATES

ALABAMA

Only 5 fine ounces of gold and 3 fine ounces of silver were produced in Alabama in 1940. The metals were contained in a small lot of amalgam sold by an individual at Talladega and in several small lots recovered from about 900 tons of old tailings amalgamated at the Gold Log mine in Talladega County. The Hog Mountain mine in Tallapoosa County was idle throughout 1940.

GEORGIA

Gold production in Georgia increased from 670 fine ounces in 1939 to 961 ounces in 1940 and silver from 58 to 630 fine ounces; the State yielded also 25,200 pounds of recoverable copper in 1940 but none in 1939. The gold output in 1940 comprised 392 ounces recovered from ore amalgamated at lode mines and 428 ounces of placer gold, all sold to the New Orleans Mint, and 141 ounces contained in flotation copper concentrates shipped to smelters. Of the six mines that produced 94 percent of the State output of gold during the year, three were placers in White County—the Allison (Dixie Gravel Co.), equipped with a hydraulic elevator; the Ferey Mining Co. placer at Nacoochee, worked with a dragline, trommel screen, and sluices; and the Loud placer, equipped with a dragline and land dredge. The three lode mines among these six were the Hamilton in McDuffie County (ore treated in a 5-stamp amalgamation mill), the Lockhart in Lumpkin County, and the Magruder (or Seminole) in Lincoln County. The Magruder produced, besides gold, all the copper and most of the silver output of the State; the ore (about 3,760 tons) was concentrated by flotation in the 100-ton mill built in 1939 and operated 6 months in 1940, and the concentrates produced totaled 181 tons averaging 0.78 ounce of gold and 3.11 ounces of silver to the ton and 7.1 percent copper and 0.5 percent lead. Part of the concentrates were shipped to the Perth Amboy (N. J.) smelter and part to the Carteret (N. J.) smelter. Other lode properties producing a little gold during the year were the Arnold, Calhoun, and Rex in Lumpkin County and the Russell in Paulding County. Various small placers in Cherokee, Dawson, and Lumpkin Counties yielded some gold, most of which was purchased by dealers at Canton and Dahlonega for shipment to the New Orleans Mint.

MARYLAND

No production of gold or silver was made from mines in Maryland in 1940. The output in 1939 was 71 fine ounces of gold and 2 fine ounces of silver, produced in Montgomery County.

NEW JERSEY

The output of zinc ore in New Jersey in 1940 totaled 556,031 tons containing 91,406 tons of recoverable zinc as metal or in oxide compared with 606,504 and 88,716 tons, respectively, in 1939. The producing mines were the Mine Hill at Franklin and the Sterling Hill at Ogdensburg, both in Sussex County. The ore bodies in these mines are unique in that they are said to be the only ones in the world from which all three of the minerals franklinite, willemite, and zincite are being mined in commercial quantities. The minerals, ore deposits, and mining methods are described in recent publications of the Geological Survey and the Bureau of Mines.[1] In the reduction of the ores the franklinite (an iron-manganese-zinc oxide mineral) is removed from the crushed ore by magnetic separators and the willemite and zincite are concentrated on jigs and tables. The concentrates and some crude ore are shipped to smelters at Palmerton, Pa. Zinc is recovered as metal or in oxide, and a residue high in iron and manganese is converted into spiegeleisen.

New Jersey has a few deposits of copper ore, but none has been worked for many years. At Carteret and Perth Amboy are copper and lead smelters and refineries that treat ores, scrap, byproducts, and bullion from various States and foreign countries.

NEW YORK

The production of silver, lead, and zinc in New York continued in 1940 to come from St. Lawrence County in the northern part of the State. The producing mines were the Balmat about 8 miles southeast of Gouverneur and the Edwards at the town of Edwards about 12 miles northeast of the Balmat. Both mines are owned and operated by the St. Joseph Lead Co. The Balmat ore contains zinc, iron, and lead sulfides, with some silver associated with the lead; it is mined through a 1,300-foot inclined shaft and treated in the 1,000-ton selective flotation plant at the mine. The mill feed in 1940 totaled 316,048 tons of ore; it yielded 3,379 tons of lead concentrates averaging 59.58 percent lead, 46,991 tons of zinc concentrates averaging 56.23 percent zinc, and 72,238 tons of pyrite concentrates averaging 41.53 percent iron and about 50 percent sulfur. The lead concentrates contained considerable silver. The Edwards mine, which produces zinc ore, is opened by a vertical shaft 1,500 feet deep and an inclined shaft from the 1,500- to the 2,100-foot level. The mine is equipped with a 500-ton flotation mill, which treated 116,171 tons of ore and produced 22,678 tons of zinc concentrates assaying 58.33 percent zinc. The concentrates shipped from both mills contained (in terms of recoverable metals) 35,720 ounces of silver, 1,973 tons of lead, and 35,686 tons of zinc compared with an output in 1939 of 37,250 ounces of silver, 2,387 tons of lead, and 36,014 tons of zinc. The Universal Exploration Co. did some development at its Hyatt property near Emeryville and nearly completed construction of a 200-ton flotation mill.

NORTH CAROLINA

Production of gold in North Carolina increased from 495 fine ounces in 1939 to 1,943 in 1940 and that of silver from 3,961 to 6,480 fine ounces. The output of copper from the Fontana copper mine in Swain County—only producer of copper ore in the State during the year—increased 36 percent over 1939. The mine is operated by the North Carolina Exploration Co., which ships the crude ore to the Tennessee Copper Co. at Copperhill, Tenn. The ore contains very small quantities of gold and silver, some of which are recovered as

[1] Palache, Charles, The Minerals of Franklin and Sterling Hill, Sussex County, N. J.: Geol. Survey Prof. Paper 180, 1935, 135 pp.
Jackson, Chas. F., Knaebel, John B., and Wright, C. A., Lead and Zinc Mining and Milling in the United States, Current Practices and Costs: Bureau of Mines Bull. 318, 1935, pp. 44, 134.

byproducts in refining the copper bullion. The gain in gold production was due to reopening of the Condor (old Howie) mine near Waxhaw, Union County. The mine was under development during the first 8 months of the year and in production from September 1 through December; the ore was treated by cyanidation in the Capps mill near Charlotte, Mecklenburg County. The silver recovered from the gold ore treated at this mill and that derived from the Fontana copper ore comprised more than 99 percent of the State output of silver during the year. A little gold was recovered from ore amalgamated at the Nile property in Caldwell County, the Bucro in Franklin County, the Tribro in Halifax County, the Empire in Mecklenburg County, and the Golden Valley in Rutherford County. A 25-ton lot of ore containing 12 ounces of gold, 13 ounces of silver, and 131 pounds of copper was shipped to the Carteret (N. J.) smelter from the Aurum mine in Gaston County. A small lot of bullion and 2 tons of gold concentrates were shipped from the Nicholson mine in Halifax County. The 7 ounces of placer gold produced in the State during the year were recovered by individuals sluicing stream gravel in the vicinity of Morganton, Burke County; Essex, Halifax County; and Bostic, Rutherford County.

PENNSYLVANIA

Gold, silver, and copper are recovered as byproducts of iron mining at the Cornwall mine of the Bethlehem Steel Co. in Lebanon County. The mine is developed by an open pit and three inclined shafts 1,300 feet deep. The ore contains magnetite, and pyrite and chalcopyrite carrying a little gold and silver; it is treated in the company plants at Lebanon, comprising a 6,000-ton magnetic separation plant producing iron concentrates, a 2,000-ton sintering plant for handling the iron concentrates, and a 2,500-ton flotation mill in which the tailings from the magnetic plant are concentrated for the recovery of copper, gold, and silver.

SOUTH CAROLINA

From 1938 through 1940 South Carolina contributed the bulk of the output of gold from the Eastern States. The chief producer was the old Haile mine in the southern part of Lancaster County 3½ miles northeast of Kershaw. The mine is equipped with a 400-ton cyanide plant. The ore is mainly quartz and pyrite; part of that treated in 1940 was mined from open pits and part from underground workings. Operations at the property are described in a recent Bureau of Mines information circular.[2] According to this publication the total production from the mine, 1829 to 1936, inclusive, was 1,046,300 tons of ore yielding, in recovered gold calculated at $20.67 a fine ounce, a net value of $4,492,183. Adding the value of the gold recovered from 1937 to 1940 ($1,319,477 at $35 a fine ounce) makes a total of $5,811,660 in gold recovered from the mine from 1829 through 1940. The value of the silver recovered during the earlier years is not given, but it totaled only $10,902 during the last 4 years. The material treated from 1937 to 1939 (191,089 tons) included some old tailings, but all of that in 1940 (126,261 tons) was crude ore. The quantity of gold recovered in 1940 was 12,861 ounces compared with 13,551 in 1939.

[2] Newton, Edmund, Gregg, D. B., and Mosier, McHenry, Operations at the Haile Gold Mine, Kershaw, S. C.: Bureau of Mines Inf. Circ. 7111, 1940, 42 pp.

In York County, Southern Golds, Ltd., drove 60 feet of drift at the old Terry mine near Smyrna and shipped 63 tons of ore containing 81 ounces of gold, 38 ounces of silver, and 847 pounds of copper to the Carteret (N. J.) smelter. W. K. Hunter, of Hickory Grove, shipped 63 tons of gold ore to the Tennessee Copper Co. smelter at Copperhill, Tenn. In Union County, development was done at the Notts Hill property near Pauline and 120 tons of ore were treated in a 10-stamp amalgamation mill. In Chesterfield County near Jefferson, A. M. Miller worked the Kirkley mine on a small scale, and the Wandalyn Mining Co. recovered some gold from its Brewer placer.

TENNESSEE

The mine production of gold, silver, copper, lead, and zinc in Tennessee increased in 1940 over 1939. The output of zinc (principal metal produced) rose 7 percent and that of copper (second in importance) 31 percent. The gold, most of the silver, and some of the zinc were byproducts of the copper-iron mining, milling, and smelting operations of the Tennessee Copper Co. at Ducktown and Copperhill in Polk County. Important commercial products derived from the copper-iron ores (besides copper bullion and zinc concentrates) included sulfuric acid and copper sulfate manufactured in the company plants and iron sinter sold to blast furnaces in the Birmingham (Ala.) district. The copper bullion is shipped to an electrolytic refinery on the Atlantic seaboard, where the byproduct gold and silver are recovered; the zinc concentrates are shipped to the Donora (Pa.) smelter. In 1940 the company operated the Burra Burra and Eureka mines and the London and Isabella selective flotation mills. The rated capacity of the London mill is 1,350 tons of ore daily and that of the Isabella 850 tons; the tonnages treated during the year averaged less than the capacity of the mills. In addition to the ore from its own mines the company treated considerable copper-iron sulfide ore from the Fontana mine in Swain County, N. C., and a small tonnage of gold ore from a mine in South Carolina.

The principal zinc-producing mines of Tennessee continued to be the Mascot group in Knox County and the Grasselli and Davis groups in Jefferson County. The Mascot and Grasselli groups were operated by the American Zinc Co. of Tennessee, which concentrated the ore from both mines in its 3,800-ton Mascot mill. The mill is equipped with a differential-tension density cone, jigs, and flotation machines. Production from the Mascot mine in 1940 totaled 584,675 tons of ore yielding 25,142 tons of concentrates averaging 60.39 percent zinc, and that of the Grasselli was 328,424 tons yielding 14,848 tons of concentrates averaging 62.03 percent zinc. The Mascot is opened by a 520-foot shaft and an inclined shaft from the 520-foot level to the maximum depth of 850 feet. The Grasselli has two operating shafts and is 350 feet deep. Power-operated scrapers are used in both mines. The Davis group near Jefferson City is owned and operated by the Universal Exploration Co. The company 800-ton flotation mill used for treating sulfide ore was operated at near capacity throughout 1940, but the plant for concentrating carbonate ore remained idle. The average grade of the concentrates shipped in 1940 was 64.632 percent zinc, which is probably higher than that for any other mine in the United States. The Embree Iron Co.

produced lead, zinc, and manganese from its property near Embreeville, which is partly in Washington County and partly in Unicoi County. The output of lead and zinc in 1940 came from Unicoi County. The lead and zinc ores, of which 12,779 tons were produced in 1940, are carbonates and are mined from separate veins. The lead ore is concentrated in a separate plant by jigging and tabling; the zinc ore is treated in the log-washing plant, which is also used at times for treating manganese ore. The Imperial Mining Co. shipped 549 tons of zinc-lead sulfide and carbonate ores from the Imperial mine about 2 miles northwest of Goin, Claiborne County, to the Ozark Smelting & Refining Co. plant at Coffeyville, Kans.

VIRGINIA

Virginia mines produced 458 fine ounces of gold and 271 fine ounces of silver in 1940 compared with 364 and 1,780 ounces, respectively, in 1939. The silver in 1940 was derived from gold ore; none was reported recovered from zinc-lead ore, which yielded 1,396 ounces in 1939. No recoverable copper has been produced in the State since 1938. The peak year of gold production in Virginia since the $35 price for gold was established in January 1934 was 1938, when 2,943 ounces were recovered. Most of the output of gold in 1940 came from the Red Bank mine near Virgilina, Halifax County, which is equipped with a small amalgamation mill; the other gold-producing mines were the London-Virginia near Dillwyn, Buckingham County, and the Ruth in Goochland County.

From 1924 to 1940 the metal output of Virginia comprised chiefly zinc and lead, most of which came from one mine in Wythe County. Production from this mine increased materially after completion of a 750-ton mill in 1927, but the Bureau of Mines was not at liberty to publish the figures from 1928 to 1939 and therefore combined the Virginia figures, which included some zinc from another mine in a few of the years, with those of Tennessee for publication in the tables of this series showing production by States. For 1940, however, the operators of zinc and lead mines in Virginia and Tennessee permit figures reported by them to be published in such a manner as to show the output of each State. The recoverable zinc in concentrates shipped from Virginia mines was 16,927 tons in 1940 and the lead 2,285 tons. Some of the concentrates produced were not shipped during the year; they will be credited to production for the year of shipment. The Austinville zinc-lead mine and 2,000-ton flotation mill of the New Jersey Zinc Co. in Wythe County were operated throughout 1940. The Lacy-Butler Co., while prospecting 12 miles from Castlewood, Russell County, concentrated some zinc-lead carbonate ore from an old dump, using a washer, crusher, and jigs.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN IDAHO

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

The total value of the metal output from mines in Idaho was \$37,744,393 in 1940 compared with \$29,794,144 in 1939—an increase of nearly 27 percent (see fig. 1). The quantity and total value of each metal increased; the greatest gain in value was \$3,950,630 in zinc. The value of the gold production represented about 13 percent of the State total, silver 33 percent, copper 2 percent, lead 28 percent, and zinc nearly 24 percent. Production of gold in Idaho in 1940 (146,480 fine ounces) was the largest since 1871, and the output of zinc (141,202,000 pounds) was the largest in any year in the history of the State. Compared with 1939 the gold output increased nearly 26 percent, silver 2 percent, copper 33 percent, lead 15 percent, and zinc 48 percent. The gain in gold output was due chiefly to increased output from old producing lode mines and to new operations of bucket dredges at placer properties; the gain in output of zinc and lead resulted from a marked increase in output of zinc-lead ore from mines in the Coeur d'Alene region caused by the rise in the average sales price of zinc and lead; and the gain in output of silver and copper was due principally to the increase in production of silver-copper ore from the Mineral Point mine near Kellogg.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	\$35.00	\$0.7745	\$0.092	\$0.046	\$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was \$20.67+ (\$20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] \$0.64646464. [5] \$0.67878787. [6] \$0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1936–40, and total, 1863–1940, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	281	828	1,807,530	80,291.40	$2,810,199	14,537,530	$11,259,317

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline floating dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Figures for sluicing and hydraulic include those for drift mining and dry-land and dragline dredging.

Gold.—The output of recoverable gold in Idaho was nearly 26 percent greater in 1940 than in 1939 and was the largest since 1871, when 212,850 ounces were produced. The output of gold from lode mines increased nearly 27 percent over 1939; most of the gain came from gold ore. The output of gold from placers increased 24 percent, owing to larger output from dredging. Approximately 46 percent of the State total in 1940 came from siliceous gold ore and 36 percent from all types of dredging operations. Twelve floating (bucket) dredges—4 more than in 1939—treated 7,941,853 cubic yards of gravel and recovered 41,262 ounces of gold—an increase of 12,289 ounces over 1939; 7 dragline dredges and 15 dry-land dredges treated 1,997,921 cubic yards of gravel and recovered 12,192 ounces of gold—a decrease of 1,859 ounces. Of the total placer gold, 82 percent came from the Boise Basin, Warren, Elk City, Pierce, Hoodoo, Orogrande, Beaver, and Carson districts, where dredges were operated. Of the total lode gold, 81 percent came from the Middle Boise, Yellow Pine, Warm Springs, Burgdorf-Marshall Lake, Carson, Mineral Hill, Ten Mile, Yankee Fork, and Boise Basin districts and the Coeur d'Alene

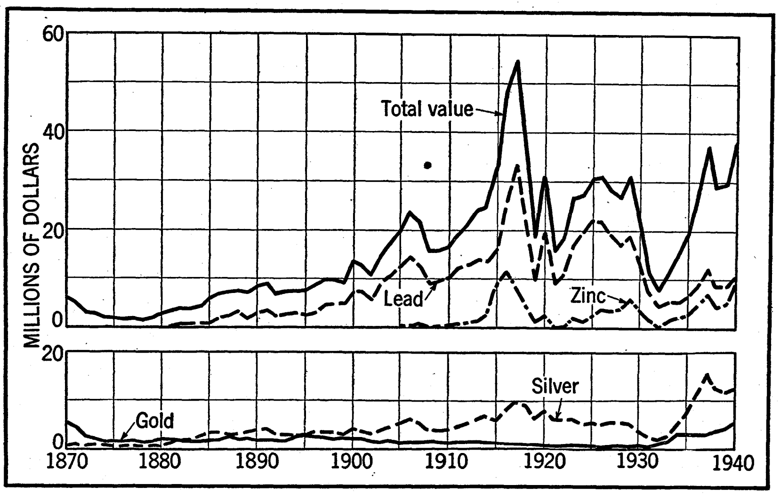

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1940. The value of copper has been less than $2,000,000 annually, except in a few years.

region. Substantial increases in output of gold were recorded in the Middle Boise, Yellow Pine, Elk City, Boise Basin, Hoodoo, Yankee Fork, and Orogrande districts, but large decreases in the Newsome, Warm Springs, and Burgdorf-Marshall Lake districts.

Talache Mines, Inc., operating lode property at Atlanta, was the largest gold producer in Idaho in 1940. It was followed by the Fisher-Baumhoff Co., which operated two bucket dredges near Centerville; Yellow Pine mine at Stibnite; Triumph mine near Ketchum; Warren Dredging Co. at Warren; Idaho-Canadian Dredging Co. at Idaho City; Golden Anchor mine at Burgdorf; De Lamar Milling Corporation at De Lamar; and Gold Producers, Inc., at Shoup.

Silver.—The output of recoverable silver in Idaho was 17,552,240 fine ounces in 1940—a 2-percent increase over 1939. Production from the Sunshine mine declined 1,230,618 ounces; but increases from the Mineral Point, Bunker Hill & Sullivan, Star, Silver Dollar, Page, Hecla, Tamarack, and Sherman properties more than offset this decrease. The Coeur d'Alene region produced 89 percent of the State total silver in 1940; the rest came chiefly from the Warm Springs, Bayhorse, Carson, Port Hill, Pend d'Oreille, Middle Boise, Blue Wing, and Boise Basin districts. Silver ore yielded 61 percent of the State total silver, zinc-lead ore nearly 31 percent, lead ore 5 percent, and gold-silver ore and gold ore nearly 3 percent. The yield of silver from silver ore decreased 453,502 ounces and from gold-silver ore 458,742 ounces, but that from zinc-lead ore increased 1,146,092 ounces, from gold ore 57,946 ounces, and from lead ore 42,448 ounces.

Eight mines—the Sunshine, Bunker Hill & Sullivan, Morning, Polaris, Hecla, Mineral Point, Triumph, and Page—produced 86 percent of the silver output of the State in 1940. All these mines except the Triumph are in the Coeur d'Alene region.

Copper.—The output of recoverable copper in Idaho in 1940 was 6,698,000 pounds—a 33-percent increase over 1939. The gain resulted chiefly from increased output of silver-copper ore from the Mineral Point mine and from shipments of copper ore from the Empire (Mackay Metals) mine. Silver ore (chiefly from mines in the Coeur d'Alene region) yielded 66 percent of the State total copper, zinc-lead ore 19 percent, copper ore 10 percent, and gold ore and lead ore together 4 percent.

The Sunshine mine produced about one-third of the total copper output of the State in 1940; most of the remainder came from the Mineral Point, Empire, Bunker Hill & Sullivan, Polaris, Triumph, Morning, and Hecla properties.

Lead.—The output of recoverable lead in Idaho was 209,668,000 pounds in 1940—a 15-percent increase over 1939. There were marked increases at the Star, Tamarack, Bunker Hill & Sullivan, Hecla, Sherman, and Page properties, but a large decrease at the Morning mine. More than 91 percent of the State total lead came from the Coeur d'Alene region and 5 percent from the Warm Springs district; considerable lead was produced also in the Port Hill, Bayhorse, and Pend d'Oreille districts. Zinc-lead ore from the Coeur d'Alene region and the Warm Springs district yielded 84 percent of the State total lead; and lead ore, chiefly from the Coeur d'Alene region, yielded 11 percent. Lead recovered from zinc-lead ore increased 27,229,995 pounds and that from lead ore 3,032,882 pounds.

In 1940 the combined lead output of the three largest producers—the Bunker Hill & Sullivan, Morning, and Hecla—was 138,817,322 pounds (135,073,600 pounds in 1939), or 66 percent of the State total; other important producers were the Page, Star, Triumph, Tamarack, Idaho-Continental, Blackhawk, and Dayrock properties.

Zinc.—The output of recoverable zinc in Idaho was 141,202,000 pounds in 1940—a 48-percent increase over 1939. The gain was due chiefly to increased output of zinc from mines in the Coeur d'Alene region; production in the Warm Springs district declined 718,822 pounds. The largest increase (22,023,000 pounds) in zinc output was attained by the Star mine, but substantial increases were made also at the Hecla, Tamarack, Bunker Hill & Sullivan, Page, and Morning properties. More than 89 percent of the State total zinc in 1940 came from the Coeur d'Alene region and nearly all the remainder from the Warm Springs and South Mountain districts. Zinc-lead ore concentrated yielded virtually all the zinc in 1940.

Five mines—the Morning, Star, Bunker Hill & Sullivan, Hecla, and Triumph—produced 82 percent of the State total zinc in 1940; the rest came chiefly from the Tamarack, Page, Frisco, and Interstate-Callahan properties.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1940, by counties, in terms of recovered metals

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline floating dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Recovered from 794,821 cubic yards of gravel treated by 15 dry-land dredges.
[3] Recovered from 1,203,100 cubic yards of gravel treated by 7 dragline floating dredges.
[4] Recovered from 7,941,853 cubic yards of gravel treated by 12 floating bucket dredges.

MINING INDUSTRY

Increased activity at both lode and placer mines in Idaho in 1940, which was centered chiefly at properties near Atlanta, Stibnite, Elk City, Idaho City, Harvard, Custer, and Orogrande, resulted in the largest total output of gold in the State since 1871. The average sales price of zinc rose from 5.2 to 6.3 cents a pound, resulting in a large increase in the output of zinc-lead ore. The production of zinc in 1940 was by far the largest in the history of the State; there were also substantial increases in the output of copper and lead, but the output of silver increased only 2 percent.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Idaho in 1940, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	215	354,785	67,243	217,516	156,896	264,721	------------

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Of the 2,556,687 tons of ore produced in 1940 in Idaho, 2,368,572 tons (93 percent) were treated at concentration plants, 142,457 tons (5 percent) were treated at amalgamation and cyanidation mills, and 45,658 tons (2 percent) were shipped crude to smelters.

Ore treated at concentration plants in 1940 comprised 202,967 tons of gold ore, 61,210 tons of gold-silver ore, 445,584 tons of silver ore, 160 tons of copper ore, 150,628 tons of lead ore, 101 tons of zinc ore, and 1,507,922 tons of zinc-lead ore.

Ore treated at straight amalgamation mills in 1940 comprised 4,026 tons, yielding 1,603 ounces of gold and 628 ounces of silver. Ore treated at combined amalgamation and concentration plants comprised 123,126 tons, yielding 18,138 ounces of gold and 10,407 ounces of silver in amalgamation bullion and 2,044 tons of concentrates containing 13,848 ounces of gold, 131,171 ounces of silver, and some copper and lead. About 800 pounds of quicksilver were consumed at amalgamation plants in Idaho.

Ore (15,305 tons) treated at straight cyanidation plants in 1940 yielded 2,228 ounces of gold and 4,607 ounces of silver; the plants used about 27,000 pounds of sodium cyanide (91-percent grade), 5,000 pounds of zinc dust, 5,000 pounds of zinc shavings, 125,000 pounds of lime, and 950 pounds of lead acetate.

The lead smelter and refinery of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley were operated continuously in 1940 on ore and concentrates, chiefly from the Bunker Hill & Sullivan, Hecla, Sunshine, Polaris, and Crescent mines. The company early in the year completed building a plant designed to recover antimony and bismuth from concentrates produced at mills in the "Dry-Belt" section of the Coeur d'Alene region to eliminate these metals from regular lead-smelting operations; the new plant operated intermittently throughout the year. The electrolytic zinc plant of the Sullivan Mining Co. near Bradley operated throughout the year at a greatly increased rate, chiefly on zinc concentrates from the Bunker Hill & Sullivan, Star, and Hecla mills.

Details of the treatment of all ores produced in Idaho in 1940 are given in the tables that follow.

Mine production of metals in Idaho in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc

ADA COUNTY

Black Hornet district.—Small lots of gold ore from the Adelmann Brothers and Black Hornet mines were treated by amalgamation.

Highland (Boise River) district.—Small-scale placer operators along the Boise River recovered 49 fine ounces of gold and 14 fine ounces of silver in 1940.

Snake River district.—The only production in the Snake River district of Ada County in 1940 was cleanings from a dry-land washing plant. The Osborn and Hot Shot properties near Grand View were idle.

ADAMS COUNTY

Rock Flat (Thorn Creek) district.—Birdwell Bros. recovered a little gold from the Victory placer by hydraulicking in 1940.

Seven Devils district.—Gold ore from the Placer Basin mine treated by cyanidation in the Smith Mountain custom mill and copper ore from the Helena and South Peacock properties comprised the output of the Seven Devils district in 1940.

Snake River district.—Placer operators recovered a little gold in 1940 by sluicing at claims along the Snake River.

BENEWAH COUNTY

The output of Benewah County in 1940, as usual, was placer gold recovered by sluicing stream gravel from Tyson Creek.

BLAINE COUNTY

Mineral Hill and Camas district.—The value of the metal output of the Mineral Hill and Camas district was $54,128 in 1940, a 29-percent gain over 1939.

Sawtooth (Vienna) district.—Lessees shipped crude gold and gold-silver ore from the Vienna mine. High-grade silver ore was shipped from the Pilgrim and Silver King properties.

Warm Springs district.—With the exception of the Coeur d'Alene region, the Warm Springs district was the most important producing area in Idaho in 1940, although the value of its metal production decreased 9 percent from 1939. The chief output was, as usual, zinc-lead-silver ore from the Triumph-North Star-Independence groups operated the first quarter of the year by Snyder Mines, Inc., and the remainder by the Triumph Mining Co.

BOISE COUNTY

Banner district.—Small lots of high-grade silver ore were produced in 1940 from the Banner mine, and placer gold was recovered from claims on Crooked River, Gold Fork, and Edna Creek.

Boise Basin district (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—In 1940 the Boise Basin district remained the chief gold-producing area in Idaho, and its output was 19 percent greater than in 1939. About 89 percent of the gold was recovered from placer operations, mostly by bucket dredges. The Fisher-Baumhoff Co., operating two bucket dredges, was the largest producer of placer gold; it was followed by the Idaho-Canadian Dredging Co. and The Grimes

Co. (operations suspended June 1), both using bucket dredges. An aggregate of 4,277,746 cubic yards of gravel was washed, from which 21,407 ounces of gold were recovered.

Boise River (Twin Springs) district.—Placer gold was recovered in 1940 by sluicing, chiefly at the Little Wonder and Last Chance claims near Twin Springs.

Eight Mile Creek district.—The Birthday mine near Lowman was operated throughout the year by Birthday Consolidated Gold Mines, Inc.; 2,131 tons of gold ore were concentrated, and 258 tons of crude ore were shipped to a smelter.

Garden Valley district.—Placer operators recovered gold from claims near Garden Valley; the chief producer was the Wash Creek property.

Grimes Pass district.—Sun Gold Mines, Inc., operated the J. S. mine near Grimes Pass in 1940 and shipped 57 tons of gold ore to a smelter in Utah. The remainder of the district output was mostly ore from the Golden Wave, Independence, and Grimes Pass properties.

North Fork district.—The output from the North Fork district in 1940 was silver ore from the Packer John claim near Smiths Ferry.

South Fork of Payette River district.—Placer gold and silver were recovered by hydraulicking and sluicing in 1940, chiefly at the Mary Antonette and Treasury No. 1 properties.

Summit Flat district.—The greater output of gold in 1940 from the Summit Flat district resulted from increases at the King, Rock Creek, and San Cristobal mines. The most important producer was the King mine, from which gold ore was treated by amalgamation.

BONNER COUNTY

Lakeview district.—A small lot of silver-lead ore was produced in 1940 from the Hewer mine.

Pend d'Oreille district.—The value of the metal output of the Pend d'Oreille district was nearly 18 percent greater than in 1939, owing to increased output of silver-lead ore from the Whitedelf mine near Clark Fork.

BONNEVILLE COUNTY

Mt. Pisgah district.—The Rosana, Lottie, McCoy Creek, and Lucky Strike placer claims were operated in 1940, and 69 fine ounces of gold were recovered by hydraulicking.

South Fork of Snake River district.—Placer gold was recovered by sluicing in 1940 at claims near Heise.

BOUNDARY COUNTY

The production from Boundary County in 1940 was 30,000 tons of silver-lead ore treated in the 70-ton flotation mill of the Idaho-Continental Mining Co.

BUTTE COUNTY

Antelope Creek district.—One car of crude copper ore was shipped in 1940 from the Copper Queen mine.

Lava Creek district.—A little silver ore from the Hub mine and lead ore from the Cactus Queen were produced in 1940.

CAMAS COUNTY

Beaver Creek (Mineral Hill) district.—The value of the metal output of the Beaver Creek district increased from $6,625 in 1939 to $82,817 in 1940 as a result of the large increase in output of gold ore from the Princess-Blue Ribbon mine near Fairfield; shipments of crude ore by the Royal Mining Corporation, Ltd., and by lessees aggregated 6,204 tons.

Little Smoky and Carrietown district.—There was a substantial rise in value of metal output in the Little Smoky and Carrietown district in 1940 owing to increased output of silver ore from the Silver Star mine and to shipments of gold-silver ore from the Grant mine.

Skeleton Creek district.—Virtually all the output of the Skeleton Creek district in 1940 was high-grade gold ore from the Red Horse mine and old mill cleanings from the El Oro mill.

CANYON COUNTY

A little placer gold was recovered by sluicing along the Snake River near Melba. The dry-land dredge operated near Wilder in 1939 by J. R. Rhodes was removed late in that year.

CASSIA COUNTY

Blackpine district.—A little silver ore was produced in 1940 from the Joveon & Busy Bee group and some gold ore from the Virginia mine.

Stokes district.—Gold ore was shipped from the Golden Eagle mine in 1940 and lead ore from the Lucky Strike claim.

CLEARWATER COUNTY

Burnt Creek district.—Nearly all the output in the Burnt Creek district in 1940 was placer gold from the Frank Bish claim near Elk River.

Clearwater River district.—Placer gold was recovered in 1940 by sluicing at various bars near Greer and Orofino.

Moose Creek and Independence Creek district.—A little placer gold was recovered in 1940 from the First Chance, Lilly, Pioneer, White Diamond, and Moose claims.

North Fork of Clearwater River district.—Various placer operators recovered small lots of gold in 1940 by sluicing at bars near Dent and Elk River.

Pierce district.—The value of the metal output of the Pierce district was 65 percent greater in 1940 than in 1939, due to increase in output of placer gold from bucket dredging and to new operation by a drag-line equipped with a floating washer. The Quartz Creek Dredging Co., operating a 2½-cubic foot bucket dredge, was by far the most important producer in Clearwater County.

CUSTER COUNTY

Alder Creek district.—The Empire mine at Mackay was operated continuously in 1940 by the Mackay Exploration Co., resulting in a substantial increase in total value of the metal output of the Alder Creek district. About 4,500 tons of crude copper ore containing gold and silver were shipped to a smelter in Utah. The rest of the district output was principally crude silver-lead ore from the White Knob and Horseshoe mines.

Bayhorse district.—Clayton Silver Mines continued to be the largest producer of silver and lead in Custer County. The company operated its mine and 100-ton flotation mill throughout 1940 and treated 39,292 tons of silver-lead ore. Lessees operated the Ramshorn mine and shipped several hundred tons of crude silver ore and copper-lead-silver ore. Other producers included the Riverview, Turtle, South Butte, and Big Ben properties.

Boulder district.—Lessees operated the Livingston mine in 1940 and shipped 2 cars of silver-lead ore.

Seafoam district.—The output of the Seafoam district in 1940 was principally silver ore from the Greyhound mine and gold ore from the Lake View mine.

Stanley and Stanley Basin district.—The value of the metal output of the Stanley and Stanley Basin district was much greater in 1940 than in 1939, owing to the increase in output of gold-silver ore from the Valley Creek mine operated by the Western Gold Exploration Co.

Yankee Fork district.—A gain of more than $92,500 in the value of metal output in the Yankee Fork district in 1940 resulted from the treatment, by amalgamation and concentration, of several thousand tons of gold ore and old tailings from the General Custer-Lucky Boy property and from the operation of a new bucket dredge by the Snake River Mining Co. This new 8-cubic foot bucket dredge was completed in August by the company at Sunbeam and washed 452,816 cubic yards of gravel during the last quarter of the year.

ELMORE COUNTY

Bear Creek district.—The output of the Bear Creek district in 1940 was principally old gold tailings (cyanided) from the Bonaparte property and gold ore (amalgamated and concentrated) from the Avalanche-Richmond group.

Black Warrior district.—Small lots of high-grade gold ore were produced in 1940 from the B. & A. Road claim.

Boise River (Twin Springs) district.—Placer gold and silver were recovered in 1940 by hydraulicking, chiefly at the Five Bars, Sunflower, and Honey Bee claims near Twin Springs.

Middle Boise (Atlanta) district.—The value of the metal output of the Middle Boise district was 60 percent greater in 1940 than in 1939, owing to the large increase in output of gold ore from the Boise-Rochester-Monarch groups. Talache Mines, Inc., operated the groups throughout the year, treated 79,119 tons of gold ore by amalgamation and concentration, and shipped 178 tons of rich gold ore to a smelter; this property, with a production of 18,160 fine ounces of gold in 1940, was the largest producer of gold in Idaho. Old tailings (2,681 tons) from the Minerva dump, containing gold and silver, were concentrated in a 60-ton flotation plant.

Snake River district.—A little placer gold was recovered in 1940 by sluicing bars along the Snake River near King Hill.

GEM COUNTY

West View district.—The $49,621 increase in value of metal output in the West View district in 1940 resulted from production of gold ore at the Lincoln group and from increase in output of placer gold. Huron Mines, Inc., treated about 3,600 tons of gold ore in its new 60-ton flotation mill from July 1 to October 3. M. A. Stickler placed a dry-land dredge on a property near Montour early in the year and treated about 100,000 cubic yards of gravel.

IDAHO COUNTY

American Creek (Bully, Mill, and Castle Creeks) district.—A little placer gold was recovered in 1940 from the Buck Meadows and Red Fir properties.

Burgdorf-Marshall Lake district.—The Golden Anchor mine continued to be the most important producer in the Burgdorf-Marshall Lake district, although its output of gold in 1940 was 24 percent less than that in 1939; 15,459 tons of gold ore were treated by amalgamation and flotation compared with 16,301 tons in 1939.

Camp Howard (Salmon River) district (White Bird).—The output of the Camp Howard district in 1940 was placer gold and silver; the chief operation was a power shovel and stationary washer at the Horseshoe Bend Bar.

Clearwater River (Pardee) district.—Placer gold and silver were recovered in 1940 from various claims along the Clearwater River.

Dixie district.—Most of the output in the Dixie district in 1940 was placer gold from the Dixie Placers (where a ¾-cubic yard dragline and stationary washer were operated nearly all the year) and lode gold from the Surprise, Ontario, and Slip Easy mines.

Elk City district.—There was a large increase in output of gold in the Elk City district in 1940, owing chiefly to gain in output of placer gold from dredging operations. Six dredges (one bucket line, three dry-land, and two dragline) operated in the district in 1940 compared with three dredges (one dragline and two dry-land) in 1939.

Florence and French Creek district.—Most of the output in the Florence and French Creek district in 1940 was placer gold from the Shamrock, Vinegar Jug, Water Lilly, and First Chance properties and lode gold from the Golden Dyke mine.

Kitchen Creek district.—In 1940, as in 1939, the output of the Kitchen Creek district was placer gold from the Kitchen Creek claim.

Lower Salmon River district.—The Sunshine placer south of Forest was the most important producer in the Lower Salmon River district in 1940.

Maggie and Pete King Creeks district.—Nearly all the output in the Maggie and Pete King Creeks district in 1940 was placer gold and silver from the Nugget claim.

Newsome district.—The output of gold in the Newsome district was much smaller in 1940 than in 1939, as the Ferris Mining Co. suspended dredging operations in July owing to exhaustion of profitable gravel.

Orogrande district.—The value of the metal output of the Orogrande district was $140,130 in 1940, a substantial gain over 1939. Nearly all the output came from two properties—the Penman Lode mine and the 2-cubic foot bucket dredge of the Mt. Vernon Gold Mining Co.

Ramey Ridge district.—There was a sharp decline in output of gold in the Ramey Ridge district in 1940, owing to decreased output of gold ore from the Snowshoe mine; the mine and 25-ton mill were closed in April.

Riggins (Salmon River) district.—The output in the Riggins district in 1940 was mostly gold clean-ups from the dredging plant of the Shorts Bar Mining Co., which was idle in 1940.

Robbins (Buffalo Hump) district.—In 1940, as in 1939, nearly all the output of the Robbins district was gold ore (concentrated) from the St. Louis mine.

Salmon River (Shoup) district.—Placer gold and silver were recovered in 1940 by drift mining and sluicing at various claims along the Salmon River below Shoup.

Simpson (Salmon River) district (Lucile).—The output of the Simpson district in 1940 was placer gold and silver, recovered principally by drift mining at the Katie B., Betty Jean, J. K. T., Twileger Bar, and Butcher Bar properties.

Snake River district.—Sluicing at claims on the Snake River below Lewiston recovered more gold in 1940 than in 1939.

Ten Mile district (Golden).—The most important output in the Ten Mile district in 1940 was gold ore (6,538 tons concentrated) from the Center Star mine.

Warren district.—The Warren Dredging Co. operated its 3½-cubic foot bucket dredge throughout the year and was again the most important gold producer in the Warren district. The 2½-cubic foot bucket dredge that formerly operated near Fairfield was moved in July to company property at Warren and began digging August 25.

JEROME COUNTY

Sluicing at various claims along the banks of the Snake River near Jerome, Murtaugh, Hansen, and Eden recovered more gold in 1940 than in 1939.

LATAH COUNTY

Gold Creek district.—A little placer gold was recovered in 1940 from the Busy Lee, Lead To, and Midway claims, and a small lot of gold ore was produced from the Warrior prospect.

Hoodoo district.—There was a notable increase in output of gold in the Hoodoo district in 1940, owing to new operation by Northwest Goldfields from May 30 to December 31 of a 4½-cubic foot bucket-line dredge on the North Fork of Palouse River.

Moscow Mountain district.—A little placer gold was recovered in 1940 from the Christenson and Leith claims.

LEMHI COUNTY

Blackbird district.—The output of the Blackbird district in 1940 comprised 189 tons of gold ore from the Blackbird mine and 191 tons of copper ore from the Uncle Sam group.

Blue Wing district.—Ima Mines Corporation operated its mine and 150-ton mill continuously in 1940 and treated 41,946 tons of ore containing hübnerite, galena, tetrahedrite, pyrite, and molybdenite. The tungsten mineral is concentrated by jigs, tables, and flotation followed by magnetic concentration, and bulk sulfide flotation is used to recover the lead and silver contents.

Boyle Creek district.—The metal ouput of the Boyle Creek district was small in 1940, as the Gibbonsville Mining & Exploration Co. was idle.

Eldorado district.—A little copper ore was produced in 1940 from the Mountain View claim, and placer gold was recovered from Wimpey Creek.

Eureka district.—There was a substantial increase in output of gold in the Eureka district in 1940, resulting chiefly from operation of a 3½-cubic foot bucket dredge by Fisher & Higgins at the McNutt property near Salmon; the dredge formerly operated at Warren but was moved to the McNutt property in June.

Gibbonsville district.—Placer gold recovered by hydraulicking at the Sundown property continued to be the chief output in the Gibbonsville district. Other placer producers included the Bingham, Bingo, Hughes Creek, Minnie Moore, Ransack, and Sheep Creek properties. Crude gold ore was shipped from the Clara Morris, Poormans Luck, Providencia, and Talisman mines.

Indian Creek district.—The Kittie Burton & Ulysses mine was operated in 1940 by the American-Idaho Gold Corporation, and about 900 tons of gold ore were treated in a 50-ton flotation plant.

Kirtley Creek district.—Placer gold and silver were recovered in 1940 by drift mining at various claims on Kirtley Creek.

McDevitt district.—The Tendoy Copper Queen Syndicate at Tendoy milled 7,085 tons of ore from the Copper Queen mine, which yielded amalgamation bullion containing 35 ounces of gold and 5 ounces of silver and 106 tons of copper concentrate containing 368 ounces of gold, 1,113 ounces of silver, and 109,434 pounds of copper.

Mackinaw district.—The Richardson placer at Leesburg was by far the largest producer of gold in the Mackinaw district in 1940; a 1¾-cubic yard dry-land dredge was operated at the property from May 16 to November 10. Other placer producers included the K. G. W., Mae Belle, and Big Jureano properties. The lode output of the district was principally gold ore concentrated from the Ringbone Cayuse mine.

Mineral Hill district.—In 1940, as in 1939, the most important operation in the Mineral Hill district was milling gold ore from the Grunter mine at Shoup; Gold Producers, Inc., operated the mine continuously and treated 27,500 tons of gold ore by flotation. Gold ore was produced also from the Monolith and Gold Hill properties. The producers of placer gold included the Cove Creek, Boulder, and Lord's Bounty claims.

Parker Mountain district.—A little gold ore from the White Rock claim was the only output in the Parker Mountain district in 1940.

Salmon River district.—Placer gold and silver were recovered in 1940 by various operators along the Salmon River from Shoup to the county line; most of the output was recovered by a floating washer, equipped with a suction nozzle, operated by Salmon River Dredging Co.

Spring Mountain district.—The output of the Spring Mountain district in 1940 was crude silver-lead ore, chiefly from the South Gilmore and Red Warrior mines.

Texas district.—There was a substantial increase in output of gold in the Texas district in 1940 but large decreases in output of silver and lead. The gain in gold resulted from the treatment by cyanidation of several thousand tons of gold ore from the Falls Creek property near Gilmore, and the loss in silver and lead resulted from the decline in shipments of crude silver-lead ore from the Latest Out mine.

Yellow Jacket district.—Gold ore (treated by concentration) from the Yellow Jacket mine continued in 1940 to be the chief output in the Yellow Jacket district. Gold ore was produced also from the Bryan mine, and small lots of placer gold were recovered from various claims along the Middle Fork of Salmon River.

LEWIS COUNTY

The metal output of Lewis County in 1940 was placer gold and silver recovered by sluicing, principally at the Spinner and Luoto properties on the Salmon River.

NEZ PERCE COUNTY

The metal output of Nez Perce County in 1940 was placer gold and silver recovered by various operators working along the Snake River below Lewiston.

OWYHEE COUNTY

Carson district (Silver City, De Lamar).—The output of gold and silver in the Carson district was greater in 1940 than in 1939, owing chiefly to the increase in treatment of old tailings (gold-silver) from the De Lamar dumps; about 59,000 tons were treated during the year in a 200-ton flotation plant by the De Lamar Milling Corporation.

Castle Creek district.—Crude gold-silver ore was produced in 1940 from the Friday and Knutson claims and silver ore from the Silver Rock mine.

Snake River district.—Four dry-land dredges operated in 1940 at various properties on the Snake River near Grand View, resulting in an increase of about 700 ounces in gold. The chief operators were John R. Rhodes at the Gray property, Cecil Rhodes at the Red Gold Bar & Gold Island group, and F. R. Knowlton at the Knowlton Placer.

South Mountain district.—The old Golconda mine was operated the last 6 months of 1940 by the South Mountain Mining Co., and about 5, 000 tons of zinc-lead-silver ore were shipped to the custom flotation mill at Tooele, Utah.

Steele district.—The output of the Steele district in 1940 comprised a little crude gold-silver ore from the Demming mine, a small lot of gold ore from the Morning Glory property, and a little placer gold from claims on Meadow Creek.

POWER COUNTY

The metal output of Power County in 1940 was, as usual, placer gold recovered at various claims along the Snake River near American Falls.

SHOSHONE COUNTY

COEUR D'ALENE REGION

The value of the metal output of the Coeur d'Alene region increased 29 percent in 1940, owing chiefly to the gain in output of zinc-lead-silver ore. The output of each of the metals increased—gold 16 percent, silver 3 percent, copper 30 percent, lead 17 percent, and zinc 57 percent. The output of zinc was the largest in the history of the region and resulted chiefly from marked increases at the Star, Hecla, and Tamarack mines; there were also substantial gains in output of lead from these properties. One of the most important features of the year was the substantial increase in production of silver and copper from the Mineral Point mine operated by the Coeur d'Alene Mines Corporation. Silver output from the Sunshine mine continued to drop, but the gold output of the region rose owing to operation of a new dry-land dredge at properties near Murray. More than 73 percent of the material produced in Shoshone County in 1940 was zinc-lead ore and old tailings, 22 percent silver ore, and 4 percent lead ore.

The following table gives the production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region in 1939 and 1940 and the total for 1884 to 1940.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1939–40, and total, 1884–1940, in terms of recovered metals

Year	Mines producing		Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
	Lode	Placer							
			Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1939	34	18	1,611,068	5,928	15,204,934	4,136,115	163,397,979	80,129,962	$22,805,024
1940	49	25	1,917,235	6,886	15,616,852	5,359,000	191,218,460	125,896,000	29,444,265
Total, 1884–1940			(1)	378,978	372,888,252	2 54,289	2 5,043,460	2 739,912	906,812,391

1 Figures not available.
2 Short tons.

Beaver district.—The value of the metal production of the Beaver district was $413,667 in 1940 compared with $63,819 in 1939. The largest output was zinc-lead ore and old tailings from the Interstate-Callahan property treated in the Galena flotation mill; the mine was worked throughout the year by Interstate Lease, and the tailings dump and 150-ton Galena mill were operated under lease by Zanetti Bros. The old Sunset mine was taken over in September by Sunset Lease, and several thousand tons of zinc-lead ore were treated in the Golconda custom mill. The rest of the district lode output was mostly gold ore from the Pony Gulch (Kennan) mine. The output of placer gold in the district increased greatly in 1940 owing to operation of a new 2½ cubic yard dry-land dredge at three properties—the Eyster, Mather & Harwood, and Thiard—by the Beaver Dredging Co.

Coeur d'Alene district.—The metal output of the Coeur d'Alene district in 1940 was mostly placer gold from the Beehive Bar and Mountain Lion properties.

Eagle district.—The Jack Waite mine was the only producer in the Eagle district in 1940; the output comprised 1,151 tons of zinc-lead milling ore and 51 tons of high-grade crude lead ore.

Evolution district.—There was a decrease in silver output from the Evolution district in 1940 but a large increase in copper output; the loss in silver resulted from the decline in output of silver ore from the Sunshine mine, and the gain in copper resulted from the increase in output of silver-copper ore from the Mineral Point mine. However, the Sunshine Mining Co. remained the largest producer of silver in the United States; it treated 278,810 tons of ore containing tetrahedrite, galena, pyrite, and siderite in its 1,100-ton flotation plant compared with 320,990 tons in 1939, and the output of silver fell from 9,414,514 to 8,183,896 ounces and that of copper from 2,711,416 to 2,510,537 pounds. The company built an experimental pilot plant for the extraction of antimony from the concentrates; the capacity of the plant is about 1,000 pounds of electrolytic antimony a day, and 1,980,374 pounds were recovered in 1940. The Polaris Mining Co. treated 48,860 tons (virtually the same quantity as in 1939) of silver ore in its 200-ton flotation plant. In October the Coeur d'Alene Mines Corporation completed building a 300-ton flotation plant at the Mineral Point mine and during the last 2 months of the year treated 9,216 tons of silver-copper ore in the new mill; during the first 10 months of the year the ore (41,993 tons) was treated in the Hercules custom mill. The Silver Dollar Mining Co. operated its property continuously, and 10,750 tons of silver ore were treated in the Silver Crescent mill. Several hundred tons of silver ore were also produced from the St. Elmo mine.

Hunter district (*Mullan*).—The value ($8,501,482) of the metal output of the Hunter district in 1940 was the greatest of any district in Idaho. The chief output was, as usual, zinc-lead ore from the Morning mine of the Federal Mining & Smelting Co.; 336,603 tons of zinc-lead ore were treated in the company 1,250-ton flotation mill, 357 tons of crude silver-lead ore were smelted, and 1,736 tons of old tailings (zinc-lead) were hauled by lessees to the Golconda custom mill. The property ranked first in the State in zinc output, second in lead, and third in silver. The Sullivan Mining Co. treated 214,464 tons of zinc-lead ore from its Star mine in 1940, compared with 48,860 tons in 1939. The company reported that the concentrates produced contained 220,150 ounces of silver, 14,577,946 pounds of lead, and 33,520,906 pounds of zinc. About 38,500 tons of silver-lead ore from the Gold Hunter mine were produced by lessees and treated in the 500-ton Gold Hunter mill.

Lelande district (*Burke, Mace, Frisco*).—The output of ore and the yield of silver, lead, and zinc in the Lelande district were much greater in 1940 than in 1939 owing to increased output of zinc-lead ore from the Hecla mine—by far the most important producer in the district. About 203,900 tons of zinc-lead ore were treated in the company 900-ton flotation mill, and 8,425 tons of crude silver-lead ore were smelted. The Hull Leasing Co. continued to work the Frisco property and treated 20,758 tons of zinc-lead ore by flotation. The Sherman Lead Co. operated its mine throughout the year, shipped 17,289 tons of silver-lead ore to the Hercules custom mill and 1,220 tons of similar ore to a smelter, and in November completed building a 300-ton flotation mill.

Placer Center district.—The large increase of $852,500 in value of the metal output of the Placer Center district in 1940 resulted chiefly from the marked rise in output of zinc-lead ore from the Tamarack mine. The Tamarack & Custer Consolidated Mining Co. worked the mine throughout the year and in February completed building a 300-ton flotation mill; 51,003 tons of zinc-lead ore were treated in the new mill and 5,118 tons of similar ore in the Hercules custom mill.

St. Joe district.—The metal output of the St. Joe district in 1940 was placer gold recovered by sluicing at the Grizzly, Haystack, Iron Hill, and Helen Evelyn claims.

Summit district (Murray).—The Golden Chest mine operated by Consolidated Gold Mines, Inc., continued in 1940 to be the most important producer in the Summit district, but its output of gold ore declined from 12,190 tons in 1939 to about 8,500 in 1940.

Yreka district (Kellogg).—The value of the metal output of the Yreka district was $7,273,477 in 1940—a 25-percent gain over 1939. Zinc-lead ore from the Bunker Hill & Sullivan mine continued to be by far the chief output in the district; 383,886 tons were concentrated in 1940 compared with 343,019 in 1939. The property was the largest producer of lead in Idaho in 1940 and ranked second in output of silver and third in zinc. There was also a large increase in zinc-lead ore production from the Page and Blackhawk mines, both operated by the Federal Mining & Smelting Co.; 88,660 tons of zinc-lead ore from the Page and 16,567 tons of similar ore from the Blackhawk were treated in the 500-ton Page flotation plant.

TWIN FALLS COUNTY

The metal output of Twin Falls County in 1940 was placer gold and silver recovered by sluicing at various properties along the Snake River.

VALLEY COUNTY

Big Creek district.—Lead ore containing considerable gold from the Sunday mine and placer gold recovered from the Hoot Mon claim were the chief output of the Big Creek district in 1940.

Deadwood Basin district.—A little gold ore was produced in 1940 from the Ranger claim and silver ore from the Rolling Stone prospect; small lots of placer gold came from various claims.

Lake City (McCall) district.—The metal output of the Lake City district in 1940 was placer gold recovered by hydraulicking at the Neely Hill and New Deal properties.

Pistol Creek district.—In 1940, as in 1939, the output of the Pistol Creek district was rich gold-lead ore from the Lucky Boy mine.

South Fork of Salmon River district.—Placer gold and silver were recovered in 1940, principally by sluicing at the Little Nugget, North Pole, Southwest Placer, and Repass properties.

Thunder Mountain district.—Nearly all the metal output of the Thunder Mountain district in 1940 was, as in 1939, placer gold and silver recovered by the sluicing of eroded-vein material from the Sunnyside property.

Yellow Pine district.—Virtually all the output from the Yellow Pine district in 1940 was antimony-gold ore from the Yellow Pine mine; 132,297 tons of ore containing stibnite, pyrite, and arsenopyrite were treated in a 400-ton flotation plant compared with 56,074 tons in 1939.

WASHINGTON COUNTY

Monroe Creek (Weiser) district.—A little gold ore from the Blue Dog mine was treated in 1940 by amalgamation and concentration.

Snake River district.—Small-scale placer operators worked various claims along the Snake River in Washington County in 1940; the chief producers were the Last Chance, Smith Bar, and Nagging Wife properties.

Washington district.—The metal output of the Washington district in 1940 comprised several cars of crude silver ore from the Silver Still mine and 1 car of silver-copper ore from a prospect near Mineral.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN MONTANA

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

The total value of the recoverable metals produced from Montana mines in 1940 was $55,825,078—a 36-percent increase over 1939 (see fig. 1). Although there were substantial gains in both quantity and value of each of the five metals, the greatest advances were in copper, zinc, and silver—the value of each rising more than $2,000,000. Metal production in Silver Bow County, by far the most productive area in Montana, was valued at $40,871,719 in 1940—a 48-percent gain over 1939 caused by the high rate of operations at the copper mines and zinc mines of the Anaconda Copper Mining Co. at Butte. There was a decrease in output of gold but a gain in that of silver from siliceous ores; the decline in gold output from lode mines, however, was more than offset by gains at placer mines.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Montana, 1936–40, and total, 1862–1940, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	570	284	3,853,116	180,209.20	$6,307,322	11,600,563	$8,984,636
1937	615	406	4,898,009	202,252.00	7,078,820	11,812,093	9,136,654
1938	482	265	2,724,466	203,313.00	7,115,955	6,403,962	4,139,935
1939	594	282	3,792,780	264,173.00	9,246,055	9,087,571	6,168,533
1940	687	285	5,099,241	272,602.00	9,541,070	12,361,050	8,790,080
1862–1940			(1)	16,434,043.00	359,644,717	700,815,985	512,388,192

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1936	219,088,000	$20,156,096	38,118,000	$1,753,428	99,434,000	$4,971,700	$42,173,182
1937	289,056,000	34,975,776	35,914,000	2,118,926	78,336,000	5,091,840	58,402,016
1938	154,426,000	15,133,748	18,654,000	858,084	17,688,000	849,024	28,096,746

1940	2,163.00	272	281.00	41	11,252.00	2,640	11,439.00	1,302	39,012.00	7,400	64,147.00	11,655

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."
[2] Figures for sluicing and hydraulic include those for drift mining.

Gold.—Montana ores and gravels yielded 272,602 fine ounces of gold in 1940 compared with 264,173 ounces in 1939—a gain of 3 percent; this output was the greatest since 1887, when 289,212 ounces were produced. In 1940, lode mines yielded 76 percent of the State total gold and placers 24 percent; output from lode mines decreased 719 ounces, but that from placer gravels increased 9,148 ounces. Siliceous ores yielded 66 percent of the total gold and base-metal ores 10 percent; there was a decrease from siliceous ore but increases from copper, lead, and zinc-lead ores. Gains were noted in output of recovered gold from Broadwater, Silver Bow, Park, Granite, Madison, and Beaverhead Counties but losses from Phillips, Deer Lodge, Lewis and Clark, and Jefferson Counties. Gold ore mined in 1940 totaled 803,173 tons compared with 815,949 tons in 1939; 555,214 tons were treated in amalgamation and cyanidation mills and 171,650 tons in concentrating mills, and 76,309 tons were shipped crude to smelters. Ore treated at amalgamation and cyanidation plants yielded 32 percent of the State total gold, that at concentrating mills 18 percent, and ores of all classes shipped crude to smelters 26 percent.

The leading producer of gold in Montana was again the West Mayflower property in Madison County, which was operated by the Anaconda Copper Mining Co. It was followed by the Winston dredge, operating on Prickly Pear Creek near Clancey; all the company-operated copper mines of the Anaconda Copper Co. at Butte;

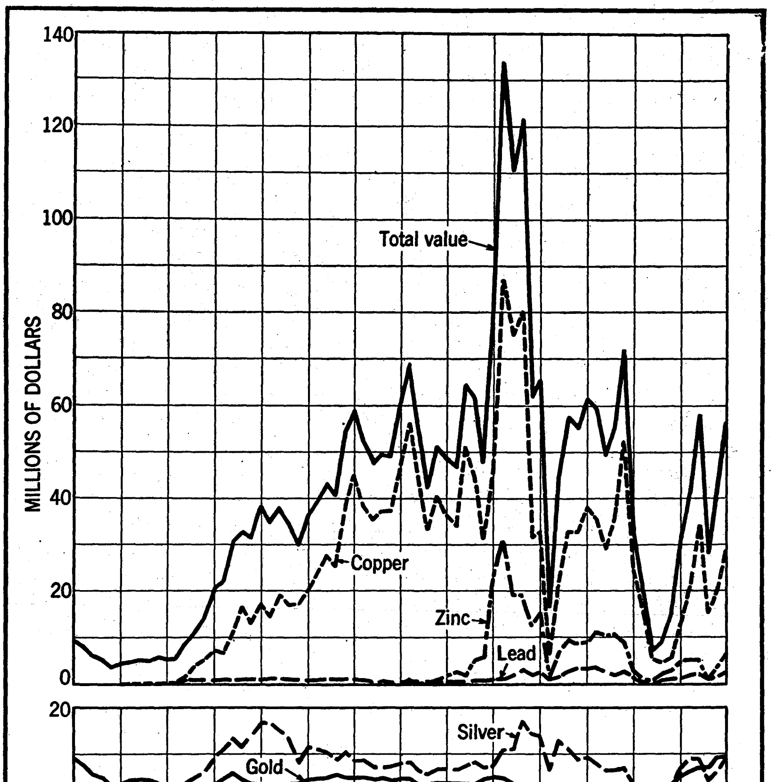

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Montana, 1870–1940.

the Ohio Keating mine in Broadwater County; the Jardine mine in Park County; the Ruby Gulch mine at Zortman; the Golden Messenger mine in Lewis and Clark County; the Perry-Schroeder dredge, also in Lewis and Clark County; the Highlands group in Silver Bow County; and the Porter Bros. dredge near Helena.

Silver.—The output of recoverable silver in Montana in 1940 was 12,361,050 fine ounces compared with 9,087,571 ounces in 1939—a 36-percent gain, which came mostly from the zinc-lead and copper ores of the Butte district in Silver Bow County although siliceous ores also made substantial gains. Copper ore yielded 49 percent of the State total silver, zinc-lead ore 25 percent, and siliceous ore 24 percent. Production of silver from Silver Bow, Beaverhead, Cascade, and Flathead Counties increased. Ores treated at concentration mills yielded 79 percent of the total silver and crude smelting ores 19 percent. The output of silver ore was 104,812 tons (a 41-percent decrease from 1939) and gold-silver ore 120,538 tons (a 117-percent gain).

The copper mines and zinc mines at Butte, operated by the Anaconda Copper Mining Co., and the Flathead mine in Flathead County, owned and operated by the same company, produced 71 percent of the State total silver. Other large silver producers included the Comet mine in Jefferson County; the Hecla mine (tailings) in Beaverhead County; the Lexington group in the Montana district, Cascade County; the Emma mine at Butte; and the Granite-Bimetallic mine (tailings) in Granite County.

Copper.—The value of the output of recoverable copper in Montana in 1940 showed the greatest gain of any of the metals under discussion. Copper ore and precipitates yielded recoverable gold, silver, copper, and lead valued at $32,873,902 or 59 percent of the State total value. The Anaconda Copper Mining Co. was, as usual, the only important copper producer in the State. The output of copper from the company mines increased 29 percent over 1939 but was less than in 1937. The company shipped 2,737,572 tons of copper ore to the mills in 1940 compared with 2,197,863 tons in 1939 and 3,068,665 in 1937; in addition, 510,972 tons of dump ore were treated at company mills, and 37,835 tons of copper ore were shipped crude to the smelter.

Lead and zinc.—The value of the output of recoverable lead and zinc in Montana showed sharp increases over 1939; production of lead rose 12,962,000 pounds and that of zinc 35,576,000 pounds as a result of the activities of the Anaconda Copper Mining Co. at company-owned and company-leased properties. The zinc mines owned by the company produced 362,479 tons of zinc-lead ore; and the Emma mine, leased by the company, produced 77,353 tons of zinc-lead ore. Gains were noted in the output of both lead and zinc at the Jack Waite mine. The Comet mine in Jefferson County showed an increase in lead but a decrease in zinc, owing to a higher lead content and a lower zinc content; the tonnage of zinc-lead ore milled was nearly the same as in 1939. Other producers of lead or zinc included the Flathead and Wild Pat mines. Concentrates smelted yielded 66 percent of the lead and 72 percent of the zinc; crude ore smelted yielded 28 percent of the lead and a little zinc; and slag fumed yielded 6 percent of the lead and 28 percent of the zinc.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1940, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

Continuous operation of the zinc and copper mines at Butte by the Anaconda Copper Mining Co. was responsible for most of the increase in metal output in Montana in 1940, although gains were made in metals from ore treated at cyanidation and amalgamation mills and crude ore shipped direct to smelters.

Placer gravels yielded 9,148 fine ounces more gold and 21 fine ounces more silver than in 1939. Seven connected-bucket floating dredges were in operation in 1940; they treated 9,280,898 cubic yards of gravel and recovered 39,012 fine ounces of gold. The gold was valued at $1,365,420, indicating an average recoverable gold value of 14.7 cents to the cubic yard treated. Draglines and power shovels with both dry-land and floating washing plants were reported in operation at 32 properties. The plants washed 4,761,812 cubic yards of gravel and recovered gold valued at $794,185, indicating an average recoverable gold value of 16.7 cents to the cubic yard washed.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Montana in 1940, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	410	803,173	167,186	459,052	215,113	617,767	----------
Dry and siliceous gold-silver ore	75	120,538	11,230	881,541	244,959	633,521	----------

Zinc-lead ore	22	579,209	12,095	3,110,810	2,239,872	28,884,053	75,604,400
Total, lode mines	[1] 687	5,099,241	208,455	12,349,395	[2] 252,782,000	46,072,000	105,174,000
Total, placers	285	----------	64,147	11,655	----------	----------	----------
	972	5,099,241	272,602	12,361,050	[2] 252,782,000	46,072,000	105,174,000
Total, 1939	876	3,792,780	264,173	9,087,571	[4] 195,654,000	33,110,000	69,598,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 5,624,886 pounds recovered from precipitates.
[3] Includes 163,923 tons of current slag fumed.
[4] Includes 4,004,361 pounds recovered from precipitates.

METALLURGIC INDUSTRY

Lode mines in Montana produced 5,099,241 tons of ore in 1940 compared with 3,792,780 tons in 1939. The ore was treated as follows: 89,361 tons at amalgamation plants, 466,024 tons at cyanidation mills, 4,101,902 tons at concentration mills, 278,031 tons shipped crude to smelters, and 163,923 tons treated at a slag-fuming plant.

Ten cyanidation mills treated 333,504 tons of gold ore, which contained 65,229 ounces of gold and 345,533 ounces of silver; the bullion and precipitates shipped contained 56,734 ounces of gold and 153,965 ounces of silver, indicating an average recovery of 87 percent of the gold and 45 percent of the silver. Ten mills treating 289,208 tons of gold ore reported the consumption of 140,210 pounds of sodium cyanide (91-percent grade), 210,163 pounds of calcium cyanide, 74,166 pounds of zinc dust, and 2,138,718 pounds of lime.

Ore treated at straight concentration plants increased from 2,836,478 tons in 1939 to 4,101,902 in 1940. The 1940 total comprised 259,019 tons of siliceous ores, 3,248,544 of copper ore, 5,130 of lead ore, 10,000 of zinc ore, and 579,209 of zinc-lead ore.

Details of the treatment of all ores produced in Montana in 1940 are given in the tables that follow.

Mine production of metals in Montana in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds	Zinc (pounds)
Ore amalgamated	89,361	9,664	2,178			
Ore cyanided	466,024	72,874	180,559			
Concentrates smelted [1]	662,832	54,596	9,810,936	243,768,261	30,653,348	76,011,400
Copper precipitates smelted	3,812			5,624,886		
Ore smelted	278,031	71,321	2,355,722	3,388,853	12,692,652	238,600
Slag fumed	163,923				2,726,000	28,924,000
Placer		64,147	11,655			
		272,602	12,361,050	252,782,000	46,072,000	105,174,000
Total, 1939		264,173	9,087,571	195,654,000	33,110,000	69,598,000

[1] Includes zinc concentrates treated at electrolytic plants.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Montana in 1940, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

BEAVERHEAD COUNTY

Argenta district.—The value of the metal output of the Argenta district was slightly higher in 1940 than in 1939. The Ermont property, largest producer in the district, operated throughout 1940 and treated 33,217 tons of gold ore in the 100-ton countercurrent cyanide mill. The gold output about equaled that of 1939. Among other producing mines in the district were the Goldfinch, May Day, Shafer, Ground Hog, Iron Mountain, Rosemont, and Hardly Able; all shipped ore crude to a smelter.

Bald Mountain district.—Lessees shipped gold ore from the Faithful group to a custom cyanide mill at Bannack in 1940.

Bannack district.—Placer gravels continued in 1940 to be the chief source of gold output in the Bannack district, although production from lode mines increased over 1939. Two cyanidation mills were active and treated the bulk of the ore. The Bannack-Apex Mining Co. operated its 50-ton cyanidation mill on company and custom ore from January until October and treated 8,218 tons of gold ore. The Priscilla property, with its 100-ton cyanidation mill, was operated from February to October and treated 1,120 tons of gold ore. Other producing lode mines in the district included the Gold Bug and Amazon. The Ralph E. Davis Syndicate used a dry-land dredge, removed 405,290 cubic yards of overburden, and washed 170,310 cubic yards of gravel from which about 2,000 ounces of gold were recovered. Equipment comprised a 5-cubic yard dragline, a 1½-cubic yard dragline, and two electric-powered washing plants. A small hydraulic plant at the Dark Horse placer washed about 20,000 yards of gravel.

Big Hole district.—The bulk of the metal output in 1940 from the Big Hole district came from the smelting of crude gold ore from the Star mine on Meadow Creek and from the amalgamation of gold ore from the North mine in Spring Gulch. A little placer gold was recovered by sluicing.

Blue Wing district.—The output from the Blue Wing district in 1940 was siliceous silver ore shipped crude to smelters from the Silver Buckle, Federal Star, Ingersoll group, and Silver Snow properties.

Bryant district.—There were 43,084 tons of silver tailings and 5 tons of lead ore shipped crude to smelters in 1940 from the Hecla mine west of Melrose.

Horse Prairie Creek district.—A dry-land dredge, operated at the Gold Leaf placer, recovered all the output from the Horse Prairie Creek district in 1940.

Polaris district.—Two small lots of siliceous silver ore shipped direct to smelters from the Homestake and Silver King properties comprised the production from the Polaris district in 1940.

Vipond district.—Lessees working the Lone Pine & Argyle property shipped 2,411 tons of silver ore to the Anaconda smelter in 1940; the rest of the output from the Vipond district was silver ore shipped crude from the Monte Cristo mine.

BROADWATER COUNTY

Backer district.—The value of the metal output from the Backer district declined in 1940 owing to the decrease in gold recovered from placer gravels. The Fair Play Placers, Inc., operating in Confederate

Gulch, was again the largest producer of placer gold in the district; the dragline floating dredge of the company washed 170,000 cubic yards of gravel. Three other properties (the Rose, Confederate Gulch, and Boulder Bar group), each equipped with a dry-land dredge, washed a total of 156,000 cubic yards of gravel. The remainder of the placer gold produced was recovered from several small sluicing operations, principally in Confederate Gulch. Most of the lode output came from the unusually rich gold ore at the Superior mine, treated by amalgamation. Among other producing lode mines were the Blind Mike, Cooper, and Elizabeth.

Beaver district.—The Custer mine and 75-ton flotation mill, operated by lessees, was again the largest producer in the Beaver district, but the quantity of gold ore shipped crude and gold concentrates was slightly less than in 1939. A new 50-ton flotation mill was completed in November on the property of the Native Silver Mining Co. about 5 miles from Winston; after treating a small tonnage of gold ore the mill was closed for the remainder of the winter. Gold ore shipped crude to a smelter and gold ore milled, making lead concentrates, comprised the output from the East Pacific property. Among other producing mines in the district in 1940 were the Iron Age, Vosburg, Midas, and Emma.

Cedar Plains district.—The value of the metal output from the Cedar Plains district was $132,457 greater in 1940 than in 1939, owing to increased output from the Ohio Keating and Keating properties. The M & M Mining Co., operating the Ohio Keating mine, produced and shipped over 6,000 tons of gold concentrates from its 80-ton flotation mill. The 100-ton flotation plant of the C. G. Gold Corporation treated 30,129 tons of gold ore from the Keating property during 1940 and made 4,000 tons of gold concentrates; in addition, considerable gold ore from the property was shipped crude to a smelter. Other production from the district included lead ore from the Camp Bird and gold ore from the Robert E. Lee and Hard Cash properties, all shipped crude to smelters.

Park district.—The value of metal production from the Park district was more than double that in 1939 (a gain of $155,402), owing to the large increase in placer-gold output. The Cooley Gravel Co., formerly operating in Colorado, moved its dragline floating dredge to Indian Creek; dredging was begun in April and terminated in December; and during this period, 662,119 cubic yards of gravel were washed. The Wilson Placers, which began operating the dry-land dredge in March, washed 500,000 cubic yards of gravel and recovered 2,063 fine ounces of gold. The rest of the placer output came from small sluicing operations near Warm Springs. The Marietta Mines shipped considerable lead and gold ore crude to smelters and produced most of the metal output from lode mines in the district. Gold ore from the Diamond Hill mine was treated in a 5-stamp amalgamation plant.

CASCADE COUNTY

Montana district.—Seven flotation mills operated in the Montana district in 1940 and treated a total of 74,405 tons of ore of all classes. Concentrates derived from these ores raised the total value of metal production in the district to more than twice that in 1939. The Montana Silver Queen Mining Co., which changed its name to Lexington Mining Co. in June 1940, treated 22,097 tons of gold-silver ore in its 75-ton flotation mill and produced the bulk of the gold and silver output of the district. A new 70-ton flotation mill was constructed and put in operation by the Klies Mining Co. during June 1940; the 20,800 tons of zinc-lead ore treated contained 60 ounces of gold, 78,208 ounces of silver, about 7,800 pounds of copper, 1,693,120 pounds of lead, and 2,371,200 pounds of zinc. Among other important producers in the Montana district were the Florence Mining Co., which treated 11,000 tons of silver ore in a 50-ton flotation mill; the Hartley property, from which about 8,500 tons of zinc-lead ore were treated in a 40-ton flotation mill; the London & Star property, from which 2,030 tons of lead ore were treated in a 35-ton flotation plant; and the Queen of the Hills property, from which 550 tons of silver ore were milled in a 60-ton flotation plant. Some ore was shipped crude to smelters from the Commonwealth, Peabody, and Silver Belt mines.

DEER LODGE COUNTY

Dry Gulch district.—Sluicing on Modesty Creek recovered some gold in 1940.

French Gulch district.—Sluicing operations on California Creek in the French Gulch district recovered some gold and silver.

Georgetown district.—The Southern Cross Holdfast group continued to be the chief producer in the Georgetown district. During 1940 consolidation of the Holdfast group and the Southern Cross mine was effected, enabling the operators of both properties to treat gold ore in the 65-ton cyanide plant at the Holdfast property; 17,443 tons of gold ore, containing 4,700 ounces of gold and 700 ounces of silver, were handled at the plant. In addition, 3,507 tons of gold ore were shipped crude to the Anaconda Copper smelter from the Southern Cross group. The 100-ton amalgamation-concentration plant at the Cable property was operated from May to October and treated a small tonnage of gold ore for testing purposes. Among other producers were the Gold Coin and Revenue properties. A small amount of placer gold was recovered from sluicing.

Heber district.—A little placer gold was obtained from gravels in the Heber district in 1940.

Oro Fino district.—Crude ore was shipped to smelters in 1940 from the Champion, Independent, Banker, and Grizzly Bear mines.

Silver Lake district.—Silver ore was shipped crude to smelters from the Silver Reef and Silver King properties in 1940.

FERGUS COUNTY

Cone Butte district.—A total of 154 tons of gold ore from the Thomas group and Old Glory mines was treated by cyanidation in 1940.

North Moccasin district.—The lode output of the North Moccasin district came from the Barnes King property 20 miles north of Lewiston. A larger tonnage was treated in 1940 than in 1939, but it was of lower grade; the mine was equipped with a 200-ton cyaniding plant.

Warm Springs district.—Most of the metal production from lode mines in the Warm Springs district was crude ore shipped to smelters; the Mathiews, Argentite, and Betty were the chief producers. A little gold ore from the Maginnis group was treated by amalgamation.

FLATHEAD COUNTY

Hog Heaven district.—The Flathead property, worked by the Anaconda Copper Mining Co., shipped crude to smelters 16,277 tons of silver ore and 15,700 tons of lead ore in 1940. The rest of the production from the Hog Heaven district was gold-silver ore from the Eudora mine and silver ore from the Grant property.

GALLATIN COUNTY

Gold ore from the Beacon mine, lead ore from the Last Chance mine, and a small amount of placer gold from the Jewel Placer comprised the production reported from Gallatin County in 1940.

GRANITE COUNTY

Alps district.—The output from the Alps district in 1940 comprised gold ore (amalgamated) from the Bitterroot Lemhi Mining property, a car of copper ore shipped crude to a smelter from the Hidden Treasure mine, and a little placer gold.

Boulder district.—Most of the gold recovered from lodes in the Boulder district came from the Gold King and Gold Mountain mine; the output comprised 383 tons of gold ore containing 314 ounces of gold. A little gold was recovered from the Montana-Tonopah Placer.

Dunkleberg district.—A car of lead ore was shipped crude from the Blue Belle property, and a car of zinc-lead ore was shipped to the Anaconda zinc plant from the Forest Rose mine.

First Chance district.—The value of the metal output from the First Chance district was more than double that in 1939 due to placer operations. The 6-cubic foot electrically driven Yuba bucket dredge of the Star Pointer Exploration Co. operated near Bearmouth all of 1940 and washed 1,943,700 cubic yards of gravel. A small dry-land dredge was operated on the Cayuse ground. The rest of the placer output came from small slucing operations. During 1940, lessees continued to operate the Mitchell-Mussigbrod group, again the largest lode producer in the district. The Grant & Hartford group of claims also was operated by lessees and produced a substantial quantity of gold.

Flint Creek district.—Old tailings from the Granite-Bimetallic, operated by the Philipsburg Mining Co., were shipped to the Washoe and Tacoma smelters in 1940 and yielded the bulk of the gold and silver output of the Flint Creek district. The Taylor-Knapp Co. shipped silver ore crude to smelters from the Two Percent mine. The Contact Mines Corporation operated the Silver Prince (Scratch All) group throughout 1940 and shipped silver ore crude to smelters and zinc-lead milling ore to the Anaconda zinc mill. Old tailings from manganese concentrates and zinc-lead ore treated in the Anaconda plant comprised the output of the Trout Mining Division of American Machine & Metals, Inc. Gold-silver smelting ore was shipped to the smelter from the property of the Moorlight Mining Co.

Gold Creek district.—Most of the lode output from the Gold Creek district in 1940 came from the Golden Gate mine, which shipped gold ore crude to Washoe. Nearly all the placer gold produced was recovered from hydraulic and drift mining operations by the Master Mining Co. on upper Gold Creek.

Henderson district.—Lessees shipped gold ore crude to a smelter from the Sunrise property in 1940. The dry-land dredge operated by H. J. Schneider & Bros. on the New Deal ground was the chief producer of placer gold.

Maxville district.—The Miller mine was the only producer in the Maxville district in 1940; it shipped gold ore and gold-silver ore crude to Washoe.

Moose Lake district.—A small lot of gold ore was shipped from the Banner property in 1940.

Red Lion district.—The total value of metal output from the Red Lion district declined in 1940, chiefly because of the small tonnage of gold ore treated in the cyanide plant of the Red Lion Mining Co. Virtually all the remaining output came from gold ore shipped crude from the Lilly Dixon mine.

Rock Creek district.—A little gold-silver ore was shipped from the Ozark property to Washoe. Placer gold was recovered principally from the Basin property in Basin Gulch.

JEFFERSON COUNTY

Amazon district.—Crude ore was shipped to smelters in 1940 from the Adolphus, Wilbur Silver, Pilot, East Mint, Gold Point, and Winchester mines.

Bigfoot district.—A small lot of gold ore was shipped to smelters from the State property in 1940.

Boulder district.—Crude ore was shipped to smelters from several mines in the Boulder district in 1940, including the Baltimore, Ida, and Ing properties. Some gold was produced from placers near Boulder.

Cataract district.—The total value of metal output of the Cataract district gained $121,500 in 1940 over 1939, due almost entirely to increased output of metals from zinc-lead ore at the Comet property. The Basin Montana Tunnel Co. operated the property and 200-ton flotation mill throughout the year. Although the quantity treated was 57,825 tons in 1940 compared with 59,420 in 1939, the zinc-lead ore had a higher gold, silver, and lead content, which increased the value. The Boulder, Congo, Crystal, Bullion, Morning Glory, and Josephine mines were among the other producers in 1940. Most of the gold recovered from placer gravels came from the dragline floating dredge operated on Basin Creek 13 miles north of Basin.

Clancey district.—In 1940, as usual, the bulk of the metal output from the Clancey district came from placer operations. Winston Bros. Co. operated its 6-cubic foot electrically powered Yuba dredge throughout the year and was again the largest producer of placer gold in Montana. A total of 1,880,436 cubic yards of gravel was washed compared with 1,787,413 in 1939. The Jefferson Placers operated a dry-land dredge on Clancey Creek from July to November and washed 195,420 cubic yards of gravel, from which 588 ounces of gold were recovered. Otis Williams Co. recovered some gold on Prickly Pear Creek, using a small dry-land dredge. The rest of the placer output came from several small sluicing operations. The output from lode mines was ore shipped crude to smelters and came chiefly from the Sullivan, Panama, and Emma mines.

Colorado district.—The Alta property near Wickes was operated all of 1940 by Eathorne & Fox and was again the leading producer in the Colorado district. Old tailings totaling 43,810 tons were treated in the 200-ton flotation mill, and 1,741 tons of lead concentrates were shipped to East Helena. About 1,500 tons of gold-silver ore were shipped crude to smelters from the Bluebird mine, which was operated throughout 1940. Other active mines in the Colorado district included the Pen Yan, Yellow Jacket, and Blizzard.

Elkhorn district.—The placer gold produced in the Elkhorn district in 1940 came from gravels on Elkhorn Creek. Winston Bros. Co., using a Bodinson floating washing plant and a 3½-cubic yard electric-powered dragline, began operations May 19 and continued until November 4, except for a shut-down during August and September; during this period, 272,766 cubic yards of gravel were washed. Most of the lode output came from crude ore shipped to smelters from the Golden Curry, Klondyke, and Center Reef mines.

Golconda district.—The output from the Golconda district in 1940 comprised gold ore and lead ore shipped crude to smelters.

Homestake district.—The output from the Homestake district in 1940 comprised gold, silver, and lead ore shipped crude to smelters and some gold recovered from sluicing operations on Betty Creek.

Lowland district.—Virtually all the placer-gold output from the Lowland district came from operations on the Autumn placer. Kit Carson Placers operated this property from April through October and used a dry-land washing plant, a 2-cubic yard Diesel dragline, and a ¾-cubic yard gasoline-powered dragline. The plant treated 180,000 cubic yards of gravel and recovered 1,283 ounces of fine gold. The lode output came from the Montreal Star, Golden Eagle, and Storehouse properties.

Mitchell district.—Placer gold was produced from the Lewis Placer and the John & Jim group in 1940.

Warm Springs district.—Gold ore was shipped crude to smelters from the Katie mine near Blue Grouse Creek.

Whitehall district.—Lessees operating the Golden Sunlight mine throughout 1940 shipped crude to Washoe 10,854 tons of gold ore, which contained 4,693 ounces of gold and 20,109 ounces of silver.

Willow Creek district.—The output from the Willow Creek district in 1940 comprised gold ore from the Deer Horn mine, treated by amalgamation and concentration, and a small shipment of crude gold ore.

JUDITH BASIN COUNTY

Barker district.—Production from the Glendennin group, operated by Thorson Bros., comprised 419 tons of lead ore sent crude to East Helena for treatment. This was the only output in 1940 reported from Judith Basin County.

LEWIS AND CLARK COUNTY

Dry Gulch district.—The Golden Messenger mine was operated all of 1940 by the Golden Messenger Corporation; the metal output was higher in 1940 because higher-grade ore was treated in the 150-ton cyanidation mill. The production comprised 44,152 tons of gold ore cyanided, which contained 8,535 ounces of gold and 22,076 ounces of silver.

Greenhorn district.—Placer gold was recovered in 1940 by sluicing operations, chiefly in Skelly, Louis, and Jeff Davis Gulches. A small lot of lead ore was shipped crude from the Lincoln mine.

Heddleston district.—A total of 1,520 tons of gold ore and old tailings from the Andrew Brown property was cyanided in 1940. The Mike Horse Mining & Milling Co. shipped several cars of lead ore crude to smelters.

Helena district.—Both placer and lode production in the Helena district decreased in 1940 from 1939; however, placer gravels remained the chief source of metal values. Porter Bros. Corporation operated its 6-cubic foot electric-powered Yuba dredge on the Last Chance Gulch placer all the year and washed 1,720,557 cubic yards of gravel. The rest of the placer output came from small sluicing operations near Helena. The Montana Consolidated Mines Corporation treated gold ore from the Spring Hill mine by cyanidation and concentration and produced the bulk of the lode output; operations stopped in April.

Lincoln district.—Placer gold contributed the larger portion of the value of the metal output from the Lincoln district in 1940. Sluicing was carried on chiefly in McClellan Gulch, Park Creek, and Sauer Kraut Gulch. The Gold Dollar, Lincoln, and Mazuma mines shipped ore crude to a smelter.

Marysville district.—The value of the metal output of the Marysville district in 1940 increased $46,453 over 1939, chiefly because of gains at lode mines. The Martin Mining Co. treated over 30,000 tons of old tailings from the Eck mine in a 125-ton roasting and cyanide plant and was the largest producer of lode gold and silver. Lessees shipped 914 tons of gold ore and 6 tons of lead ore, which contained 1,001 ounces of gold and 1,360 ounces of silver, to smelters from the Shannon mine. The J. C. Archibald Co. treated 11,107 tons of tailings from the Bald Butte mine in a 100-ton cyanide plant, and the precipitates sold to the Midvale refinery contained 956 ounces of gold and 1,339 ounces of silver. The 50-ton flotation mill of the Rex Mining Co. treated 6,505 tons of gold ore from the Empire group of mines; 267 tons of lead concentrates were produced, which contained 636 ounces of gold, 2,559 ounces of silver, 9,520 pounds of copper, and 170,173 pounds of lead. Lessees operated the Bald Butte and Drumlummon properties throughout 1940 and shipped 2,099 tons of gold ore crude to smelters. Other mines producing included the Penobscot, Piegan-Gloster, and Neenan groups. Ralph Davis, Inc., operating a dragline floating dredge on Silver Creek, treated 776,505 cubic yards of gravel and was again the leading producer of placer gold in the district. The Holmes Gulch Mining Co., Inc., using a dry-land dredge, washed 289,000 cubic yards of gravel.

Missouri River district.—The Perry-Schroeder Mining Co. operated throughout 1940 its Yuba bucket dredge on the Missouri River 15 miles from Helena and treated 1,736,200 cubic yards of gravel. The dredge is electric-powered and is equipped with ninety-two 6-cubic foot buckets.

Ophir Gulch district.—Gold ore was shipped direct to smelters from the Nora Darling and Beverly properties in 1940.

Rimini district.—Most of the lode production in the Rimini district in 1940 came from crude lead ore shipped from the Armstrong mine and gold-silver ore milled from the Little Lilly mine; output was reported at 12 other lode properties in the district. Some gold was recovered from placers, chiefly in Monitor Gulch.

Scratch Gravel district.—The Ajax property, largest producer in the Scratch Gravel district in 1940, shipped 273 tons of gold ore which contained 116 ounces of gold and 420 ounces of silver.

Smelter district.—The fuming plant of the Anaconda Copper Mining Co. continued to treat slag from the lead smelter of the American Smelting & Refining Co. at East Helena and was active throughout 1940. The value of the output of zinc-lead fume sent to Great Falls was $509,972 higher than in 1939.

Spokane Hills district.—Gold ore from the Grubstake mine shipped crude to a smelter and lead ore from the Black Jack mine comprised the output from the Spokane Hills district in 1940.

Stemple district.—The Gould mine operated by the Standard Silver-Lead Mining Co. produced nearly all the metal output in the Stemple district in 1940. Gold ore treated in the 80-ton cyanide plant totaled 23,044 tons; cyanide bullion shipped to the Seattle Assay Office and slag to East Helena contained 5,238 ounces of gold and 19,940 ounces of silver.

LIBERTY COUNTY

A little placer gold was recovered from the Antelope mine in the Corral district in 1940.

LINCOLN COUNTY

Libby district.—The Courageous Mining Co. treated 7,500 tons of gold ore from the Branagan mine in its 150-ton amalgamation and flotation-concentration mill. The Glacier Silver-Lead Mining Co. treated 8,473 tons of gold ore in its 150-ton flotation mill and produced 240 tons of lead concentrates. The Snowshoe mine near Libby was equipped with a new 100-ton concentrating mill by the operators, Roark and Clark, and 300 tons of lead ore were treated as a test in 1940.

Sylvanite district.—The Morning Glory Mines, operating the Sylvanite (Keystone) property, ceased work in August after treating 10,575 tons of gold ore by amalgamation and concentration.

Troy district.—The output from the Troy district in 1940 was zinc-lead milling ore from the Red Shirt mine and gold ore from the Big Nugget mine.

MADISON COUNTY

Cherry Creek (Havana) district.—Gold-silver ore was shipped crude to smelters in 1940 from the East Riverside, New Havana, and September Syndicate properties.

Norris district.—There was a substantial increase in lode-gold output from the Norris district in 1940, owing chiefly to large gains in gold by cyanidation. The 60-ton cyanide plant of the Boaz mine treated 15,965 tons of gold ore in 1940 compared with about 1,500 tons in 1939; the bullion sent to the Seattle Assay Office contained 7,072 ounces of fine gold compared with a total of 2,511 ounces of gold from shipments of crude ore and bullion in 1939. The Revenue mine was operated the entire year by Revenue Mine Developing Group, Inc.; 20,533 tons of gold ore were cyanided compared with 26,280 tons in 1939, but the gold contained in the cyanide bullion totaled 4,044 fine ounces, or slightly more than in 1939. Among other lode mines making sizable production were the Emperor, Grubstake, New York Belle, Galena, and Lexington. Virtually all the placer-gold output came from the bucket dredge operated by Homer Wilson on Norwegian Placer. The dredge is equipped with sixty-three 5-cubic foot buckets and in 1940 washed 190,000 cubic yards of gravel from which 1,328 ounces of gold were recovered—a slight increase over 1939.

Pony district.—The value of metal output from mines in the Pony district decreased from $275,762 in 1939 to $219,576 in 1940, owing chiefly to the smaller tonnage of gold ore treated from the Mammoth mine (18,624 tons compared with 28,324 in 1939) by the Liberty Montana Mines Co. in its 120-ton flotation mill. Gold ore milled from the Atlantic-Pacific by the Montana Southern Mining Co. was 36,583 tons, about the same as in 1939.

Renova district.—The West Mayflower mine, owned and operated by the Anaconda Copper Mining Co., was again the largest gold producer in Montana. In 1940, 23,823 tons of gold ore containing 20,933 ounces of gold and 131,192 ounces of silver were shipped to the Anaconda smelter.

Rochester (Rabbit) district.—The Lively Mining Co. operated the Hidden Treasure mine from April to December and produced most of the lode output in the Rochester district in 1940. Crude ore shipped to smelters included ore from Franz group, Gold Crown, Gold Hill, and Half Sole mines.

Sheridan district.—The Sheridan Gold Mining & Milling Co. was again the largest producer in the Sheridan district; in 1940 the company shipped gold ore crude to a smelter from the Homestake and Uncle Sam, Occidental, and Lakeshore mines. Zinc-lead milling ore also was shipped from the Lakeshore mine to the Anaconda mill.

Silver Star district.—Victoria Mines, Inc., operating the Broadway (Victoria) mine, treated 37,174 tons of gold ore in 1940 (32,991 in 1939) in the 100-ton straight cyanidation mill and shipped 1,282 tons of gold ore (5,314 in 1939) direct to smelters. The Green Campbell Mining Co. operated the Green Campbell mine throughout the year, treated 6,650 tons of gold ore in the 25-ton amalgamation-flotation mill, and shipped 341 tons of gold ore crude to smelters; the output of gold from the property increased 417 ounces.

Tidal Wave district.—The Hi-Ridge mine in Dry Gulch was operated throughout 1940 by lessees and was the chief producer in the Tidal Wave district. About 600 tons of gold ore, which contained over 1,000 ounces of gold, were shipped to Anaconda.

Virginia City district.—The decline in lode output in the Virginia City district in 1940 was due to smaller tonnages of gold ore shipped crude to smelters. Five mines—the Bartlett, East & West Mapleton, High Up, St. John, and Alameda—shipped an aggregate of 5,661 tons of gold ore, which contained 2,534 ounces of gold; the Bartlett mine was the largest producer. Among other producing lode mines in the district were the Apex, Easton-Pacific, El Fleda, and U. S. Grant. Gold was recovered by amalgamation from the Cedar Hill, Gold Bar, Mitchel, and Valley View. The Howe Dredging Co., operating claims in Alder Gulch, was the largest producer of placer gold; equipment was a dry-land dredge, and 42,500 cubic yards of gravel were washed.

Washington district.—In 1940 the Gold Creek Mining Co., operating a floating connected-bucket dredge equipped with seventy-six 4½-cubic foot buckets, washed 772,955 cubic yards of gravel and recovered 1,986 ounces of fine gold.

MEAGHER COUNTY

Beaver Creek district.—A dry-land dredge operated on Thomas Creek by the T. C. Mines treated 107,000 cubic yards of gravel in 1940 and recovered 723 ounces of gold.

Camas Creek district.—Some gold was recovered by sluicing.

Thompson Gulch district.—Nearly all the placer output came from operation of a dry-land dredge on the Josephine placer. The lode output came from the Snowbank mine in upper Thompson Gulch.

MINERAL COUNTY

Cedar Creek district.—Placer gravels treated by Superior Mines, Inc., using a dry-land dredge, yielded the bulk of the gold output from the Cedar Creek district in 1940.

St. Regis district.—The metal output from the St. Regis district in 1940 consisted of silver ore shipped crude from the Last Chance mine, gold concentrates from gold ore milled at the Lenora mine, and lead ore from the Wilson mine shipped crude to a smelter.

MISSOULA COUNTY

Coloma district.—Nearly all the metal output from the Coloma district came from gold ore shipped crude to smelters from the Mammoth and East Mammoth group, Dandy, and Dixie mines. A little gold ore from the Dandy mine was treated in a 25-ton flotation mill.

Copper Cliff district.—Lessees shipped gold ore from the Copper Cliff mine in 1940.

Elk Creek district.—Most of the gold produced in the Elk Creek district in 1940 came from a dry-land dredge operated by Norman Rogers at Elk Creek, which treated 110,000 cubic yards of gravel.

Nine Mile district.—The Weaver Dredging Co. moved a dragline floating dredge from California to Montana in 1940 and operated it from July 5 to December 12. During this period, 250,636 cubic yards of gravel from Nine Mile Creek were washed and yielded 1,681 fine ounces of gold. Smelting ore was shipped from the Martina mine 10 miles north of Stark.

Wallace district.—Copper ore from the Hidden Treasure mine was shipped crude to a smelter in 1940.

PARK COUNTY

Emigrant Creek district.—Most of the placer gold produced in the Emigrant Creek district in 1940 was recovered by the Crown Mining Co., using mechanical equipment.

New World district.—The McLaren Gold Mines Co. treated 9,291 tons of gold ore and tailings from the Estelle mine by flotation and shipped copper concentrates rich in gold to a smelter. Lead ore was shipped crude from the Irma, Big Blue, and Black Warrior mines.

Sheepeater (Jardine) district.—The Jardine Mining Co. operated throughout 1940 at the Jardine property 6 miles north of Gardiner. The amalgamation and concentration mill (capacity raised from 185 to 300 tons) treated 57,812 tons of gold ore.

PHILLIPS COUNTY

Little Rockies district.—The Ruby Gulch Mining Co. continued to operate the Ruby Gulch property in 1940 and treated about 84,000 tons of gold ore in the 300-ton cyanidation plant; the output was slightly larger than in 1939. The Little Ben Mining Co. operated throughout the year, and 40,009 tons of ore from the August mine were treated in the 150-ton cyanide plant; the output of gold decreased about 1,200 ounces from 1939.

POWELL COUNTY

Big Blackfoot district.—A little gold ore was shipped crude to smelters from the Higgins and Hill Top mines in 1940.

Nigger Hill (Elliston) district.—Big Dick Mines, Inc., treated 5,500 tons of gold ore from the Big Dick property in the 50-ton flotation plant. The gold concentrates (578 tons) were shipped to East Helena for smelting.

Ophir district.—Lessees recovered some placer gold by hydraulicking on the Levi Davis placer. Gold ore and copper ore were shipped crude to smelters from the Victory and Morning Star mines.

Pioneer district.—The Pioneer Placer Dredging Co., operating its bucket dredge in 1940 from January 1 to November 14 in Pioneer Gulch, Gold Creek, and Pike's Peak Creek, treated 1,037,050 cubic yards of gravel and recovered slightly less gold than in 1939. The dredge is equipped with eighty 9-cubic foot buckets.

Washington Gulch district.—A dry-land dredge, operated by the McKenzie Placers at the Toole Patent in Jefferson Gulch, recovered most of the placer gold output in the Washington Gulch district in 1940.

Zozell (Emery) district.—Nearly all the output from the Zozell district in 1940 came from ore shipped crude to smelters; the active mines included the Blue Eyed Maggie, Emery Consolidated, Emma Darling, and Hidden Hand.

RAVALLI COUNTY

Curlew district.—The output from the Curlew district in 1940 came from the Curlew mine; it comprised 10,000 tons of old tailings which were treated in the 70-ton flotation mill and produced 491 tons of zinc concentrates, and 47 tons of gold-silver ore which was shipped crude to a smelter.

Eight Mile district.—Gold ore was shipped crude from the Gold Leaf mine in 1940.

Overwich district.—A little gold ore from the Washington mine was amalgamated in 1940. Placer gold was recovered from the gravels of Hughes Creek.

SANDERS COUNTY

Eagle district.—The Jack Waite mine, which extends over the State line into Idaho, was worked throughout 1940 by the American Smelting & Refining Co. The output was greater than in 1939, as 41,711 tons of zinc-lead ore (36,028 tons in 1939) of about the same grade were treated in the flotation plant at Duthie, Idaho. In addition, the company shipped 1,563 tons of rich lead ore crude to a smelter.

Revais Creek district.—Copper ore from the Drake group was shipped crude by the Green Mountain Mining Co. in 1940.

Vermillion district.—Gold ore from the Razorback mine and a small lot of custom ore were milled in a 5-ton flotation plant.

Other districts.—Production was also reported from the Heidelburg mine in the Noxon district, the Dog Lake mine in the Plains district, the Montana Standard property in the Prospect Creek district, and the Ambassador group in the Trout Creek district.

SILVER BOW COUNTY

The total value of the metal output from mines in Silver Bow County in 1940 gained $13,194,360 over 1939, as production of both copper ore and zinc-lead ore from mines at Butte increased. The following table gives the output of mines in Silver Bow County, which includes the Butte or Summit Valley district, in 1939 and 1940 and the total from 1882 to the end of 1940.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1939–40, and total, 1882–1940, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1939	57	2,498,922	22,036	6,114,455	194,533,471	9,415,341	40,032,288	$27,677,359
1940	58	3,764,610	25,107	8,766,398	250,884,000	17,718,500	71,798,000	40,871,719
1882–1940		(1)	1,923,326	508,783,544	[2] 5,879,248	[2] 207,106	[2] 1,471,821	2,373,911,414

[1] Figures not available. [2] Short tons.

Butte or Summit Valley district.—The output of copper ores from all copper mines of the Anaconda Copper Mining Co. at Butte gained sharply in 1940 over 1939 owing to the greatly increased rate of operations throughout the year. In 1940, 2,737,572 tons of copper ore were sent to the copper concentrator at Anaconda compared with 2,197,863 tons in 1939, and 3,812 tons of mine-water precipitates were treated compared with 2,007 in 1939. In addition, 510,972 tons of mine-dump material containing about 1 percent copper were concentrated at Anaconda, and 37,835 tons of copper ore were sent crude to the smelter. All zinc mines of the Anaconda Copper Mining Co. were operated throughout 1940; the output comprised 362,479 tons of zinc-lead ore treated at the Anaconda zinc concentrator compared with 200,036 tons in 1939. The output of recoverable metals in 1940 (from all classes of ore) increased decidedly over 1939—gold over 5,500 ounces, silver over 2,000,000 ounces, copper about 56,000,000 pounds, lead nearly 5,000,000 pounds, and zinc over 18,000,000 pounds. Development work at the copper mines comprised 1,278 feet of shaft sinking, 183,578 feet of drifting, and 11,776 feet of diamond drilling; development at the zinc mines comprised 20,632 feet of drifts and 2,765 feet of diamond drilling. Operations were continued throughout the year at the Emma mine, leased by the Anaconda Copper Mining Co. from the Butte Copper & Zinc Co.; the production was 77,353 tons of zinc-lead ore treated at the Anaconda zinc concentrator. In addition, the company produced 34,813 short tons of manganese ore. The Timber Butte mill was cleaned up in 1940, and 238 tons of high-grade zinc cleanings were shipped to the Anaconda zinc smelter.

Divide Creek district.—The output from the Divide Creek district in 1940 was gold ore and silver ore shipped crude to smelters, chiefly from the Climax mine.

Highland district.—The Butte Highlands Mining Co. operated the Highlands Group (Tilton) throughout 1940 and treated 17,125 tons of gold ore in the 75-ton cyanide plant.

Independence district.—Silver ore was shipped crude to smelters from the Brilliant, Deadwood, and Goldflint mines.

Melrose district.—A little gold-silver ore was shipped from the Annie property in 1940.

STILLWATER COUNTY

Placer gold was recovered in Stillwater County in 1940 from sluicing operations on the Yellowstone River.

TOOLE COUNTY

Placer gold was recovered in the Gold Butte district in 1940 from drift and sluice mines.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEVADA

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

The total value of gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels in Nevada in 1940—$37,089,777—was greater than in any year since 1918 (see fig. 1). The quantity of gold produced exceeded that in any year since 1916, and its value was greater than in any year since 1912. The quantity of copper produced in 1940 was surpassed only in the record year 1928, when the output was 158,876,883 pounds. Each of the five metals exceeded 1939 in both quantity and value—gold increased 6 percent in both quantity and value, silver 20 percent in quantity and 26 percent in value, copper 18 percent in quantity and 28 percent in value, lead 77 percent in quantity and 88 percent in value, and zinc 90 percent in quantity and 130 percent in value. The total value of the five metals was 22 percent greater than in 1939; of this total, copper comprised 48 percent, gold 36, silver 10, zinc 4, and lead 2 percent.

White Pine County continued in 1940 to be the largest contributor to the mineral output of the State; it ranked first in copper and second in gold production. Humboldt County was the leading gold producer, and Esmeralda the leading silver producer; Lincoln County led in both lead and zinc output.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.

[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1936–40, and total, 1859–1940, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	661	119	6, 584, 138	286, 370	$10, 022, 950	5, 068, 786	$3, 925, 775
1937	682	117	7, 565, 466	281, 332	9, 846, 620	4, 864, 750	3, 762, 884
1938	795	130	5, 880, 021	296, 434	10, 375, 190	4, 355, 471	2, 815, 658
1939	891	104	6, 894, 999	361, 518	12, 653, 130	4, 316, 029	2, 929, 668
1940	895	115	8, 338, 259	383, 933	13, 437, 655	5, 175, 928	3, 680, 660

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Compiled by Chas. W. Henderson, supervising engineer, field offices, Denver, Colo. From 1904 (when first satisfactory annual canvass of mine production was made) to 1940, inclusive, the output was as follows: Gold, 12,582,166.51 ounces, valued at $288,394,948; silver, 286,463,243 ounces, $192,974,231; copper, 1,384,657 short tons, $401,224,898; lead, 269,545 short tons, $31,374,799; zinc, 243,710 short tons, $33,193,934; total value, $947,162,810.
[3] Figures not available.
[4] Short tons.

Gold.—Almost three-fourths of the recoverable gold output of Nevada in 1940 was derived from dry ores, chiefly gold ore, and virtually all the gold from base-metal ores came from copper ore; placer gold comprised 10 percent of the State total. Four companies

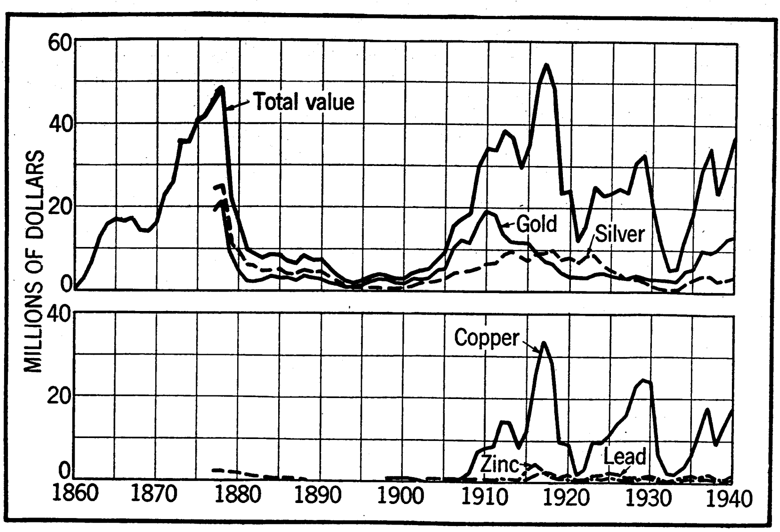

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada, 1860–1940.

produced 38 percent of the State total gold; the 10 leading mines, listed in the following table, supplied 56 percent. Four of the mines listed (Getchell, Manhattan dredge, Northumberland, and Gold Standard) have begun production since March 1, 1938, and together they produced 29 percent of the State total gold in 1940.

Ten leading gold-producing mines in Nevada in 1940, in order of output

Rank	Mine	District	County	Rank in 1939	Operator	Source of gold
1	Getchell	Potosi	Humboldt	1	Getchell Mine, Inc	Gold ore.
2	Emma Nevada, Pit, and Taylor.	Robinson	White Pine	2	Consolidated Coppermines Corporation.	Copper ore.
3	Ruth and Copper Flat Pit.	do	do	4	Nevada Consolidated Copper Corporation.	Do.
4	Manhattan dredge	Manhattan	Nye	5	Manhattan Gold Dredging Co.	Dredge.
5	Mary	Silver Peak	Esmeralda	3	Black Mammoth Consolidated Mining Co. and Prescott Lease.	Gold ore.
6	Keystone	Comstock	Storey	7	Dayton Consolidated Mines Co. and lessees.	Do.
7	Northumberland	Northumberland	Nye	61	Northumberland Mining Co.	Do.
8	Gold Standard	Imlay	Pershing	65	Standard Cyaniding Co.	Do.
9	Overman	Comstock	Storey	11	Consolidated Chollar Gould & Savage Mining Co.	Do.
10	Silver Hill and Succor	do	do	10	Silver Hill Mining Co	Do.

Silver.—The 10 leading silver-producing mines in Nevada in 1940, listed in the following table, produced 54 percent of the State total recoverable silver; the first 2 yielded almost one-fourth of the total. As in preceding years, most of the silver was a byproduct of ore mined chiefly for other metals.

Ten leading silver-producing mines in Nevada in 1940, in order of output

Rank	Mine	District	County	Rank in 1939	Operator	Source of silver
1	Nivloc	Silver Peak	Esmeralda	1	Desert Silver, Inc	Silver ore.
2	Pioche Nos. 1 and 2	Pioche	Lincoln	3	Combined Metals Reduction Co.	Zinc-lead ore and gold-silver ore.
3	Mizpah	Tonopah	Nye	2	Lessees of The Tonopah Mining Co. of Nevada.	Gold-silver ore.
4	Dan Tucker	Sand Springs	Churchill	51	Summit King Mines, Ltd.	Do.
5	Rip Van Winkle	Merrimac	Elko	22	Rip Van Winkle Mining Co.	Zinc-lead ore.
6	El Dorado Rover group.	Eldorado Canyon	Clark	13	El Dorado Rover Mining Co.	Gold-silver ore.
7	Crown Point	Comstock	Storey	7	Sutro Tunnel Coalition, Inc.	Do.
8	Overman	do	do	5	Consolidated Chollar Gould & Savage Mining Co.	Gold ore.
9	Bristol Silver	Jack Rabbit	Lincoln	8	Bristol Silver Mines Co.	Copper ore.
10	Techatticup, Jubilee, and Red Butte.	Eldorado Canyon	Clark	9	Diamond Gold Mining Co.	Gold-silver ore.

Copper.—Nearly 99 percent of the recoverable copper output of Nevada in 1940 came from mines operated by the following companies: The Nevada Consolidated Copper Corporation, working the Ruth mine at Ruth and the open pit at Copper Flat (in the Robinson district, White Pine County); the Consolidated Coppermines Corporation, working the Emma Nevada, open pit, and Taylor mines at Kimberly (also in the Robinson district); and the Mountain City Copper Co., working the Mountain City mine at Mountain City (in the Cope district, Elko County).

Lead and zinc.—The Combined Metals Reduction Co. in the Pioche district, Lincoln County, produced 91 percent of the recoverable zinc and 70 percent of the recoverable lead output of Nevada in 1940.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Nevada in 1940, by counties, in terms of recovered metals

County	Mines producing [1]		Gold						Silver (lode and placer)	
			Lode		Placer		Total			
	Lode	Placer	Fine ounces	Value	Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Churchill	37		10,337	$361,795			10,337	$361,795	484,179	$344,305
Clark	56		24,927	872,445			24,927	872,445	468,348	333,047
Douglas	4		13	455			13	455	1,042	741
Elko	58	4	3,808	133,280	569	$19,915	4,377	153,195	345,871	245,953
Esmeralda	58	9	36,447	1,275,645	100	3,500	36,547	1,279,145	812,738	577,947

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

MINING INDUSTRY

Expansion of production at the three large copper mines and several new and expanded gold-mine operations in Nevada in 1940 were the principal causes for the greater tonnage of ore treated compared with 1939. Increases were as follows: Copper ore, 25 percent; gold ore, 41 percent; and zinc-lead ore, 183 percent. The tonnage of old tailings treated declined 28 percent. Cessation of old-tailings cyanidation by the Bradshaw Syndicate, Inc., in the Goldfield district, Esmeralda County, and the Caliente Cyaniding Co. in the Ferguson district, Lincoln County, terminated the large-scale working of old tailings in the State; both operations had been profitable owing to the revaluation of gold. The connected-bucket dredge of the Manhattan Gold Dredging Co. in the Manhattan district, Nye County, was the principal producer of placer gold in the State in 1940. In addition, 3 dragline dredges, 10 nonfloating washing plants with mechanical excavators, 85 (45 dry) small-scale hand-method mines, and 17 drift mines were in operation. Late in the year the world's largest dragline dredge, equipped with a dragline excavator using a 14-cubic yard bucket, was installed at Dayton, Lyon County. Quicksilver consumption at placer mines was 745 pounds in 1940.

ORE CLASSIFICATION

The following table classifying ores produced in Nevada in 1940 shows that nearly 74 percent of the tonnage of ore (including old tailings) sold or treated was copper ore, 20 percent gold ore and old tailings, 3 percent gold-silver ore and old tailings, almost 2 percent zinc-lead ore, 1 percent silver ore and old tailings, and the remainder lead, zinc, and lead-copper ores.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Nevada in 1940, with content in terms of recovered metals

METALLURGIC INDUSTRY

Of the 8,338,259 tons of lode material sold or treated in 1940 in Nevada 76 percent was ore sent to concentrating mills, 17 percent was ore sent to amalgamation and cyanidation mills, 5 percent was old tailings sent to amalgamation and cyanidation mills, and 2 percent was ore (including small quantity of old tailings) sent to smelters. The principal metallurgic change that took place during 1940 was the cessation of cyanidation at two large old-tailings dumps—Goldfield and Delamar. Flotation was employed at concentration mills to the virtual exclusion of gravity concentration. A much larger tonnage of material was cyanided in 1940 than was amalgamated, and cyanidation was used in treatment of old tailings almost to the exclusion of other methods. Of the gold recovered as bullion, cyanidation supplied 90 percent and amalgamation 10 percent; of the silver recovered as bullion, 99 percent was derived by cyanidation and 1 percent by amalgamation. The total quantity of crude ore shipped to smelters increased 6 percent over 1939. The Northumberland Mining Co., Northumberland district, Nye County, operated its 280-ton countercurrent-cyanidation plant (completed late in 1939) throughout 1940; plans were made for expanding the daily capacity to 360 tons in 1941. Summit King Mines, Ltd., began to operate its new 65-ton cyanide plant in the Sand Springs district, Churchill County, January 5, 1940. The Combined Metals Reduction Co., Pioche district, Lincoln County, had a 1,000-ton selective-flotation mill under construction. Adelaide Crown Mines, Gold Run district, Humboldt County, built a 150-ton cyanide plant. The West Coast Mines Co., Inc., Barrett Springs district, Humboldt County, began to construct a 200-ton flotation mill late in 1940.

Quicksilver consumption in Nevada in 1940 at mills using amalgamation was 3,791 pounds in recovering 23,131 ounces of gold and 24,741 ounces of silver from 121,010 tons of material treated.

Data obtained on cyanide consumption in 1940 at Nevada mills are nearly complete. In the treatment of 981,853 tons of the ore, 418,662 tons of the old tailings, and 204 tons of concentrates, 375,342 pounds of 91-percent sodium cyanide and 1,405,560 pounds of commercial-grade calcium cyanide (50-percent NaCN equivalent) were used, with a recovery of 141,611 ounces of gold and 1,436,729 ounces of silver; in terms of 98-percent NaCN, the consumption was 1,037,256 pounds, or 0.74 pound to the ton of material treated compared with 0.64 pound in 1939. The decline in proportion of old tailings treated accounts for the higher average consumption of cyanide in 1940.

Custom mills were operated in various parts of Nevada during 1940. Those of importance were at Silver City, Lyon County; Westgate, Churchill County; Gold Point, Esmeralda County; and Nelson, Clark County. Most of the custom mills obtained part of their mill feed from mines controlled by the mill operators. Large quantities of ore and concentrates were shipped out of the State, principally to lead and copper smelters in the Salt Lake Basin. The Bauer (Utah) plant of the Combined Metals Reduction Co. treated all the company zinc-lead ore mined at Pioche, Lincoln County. The McGill copper smelter at McGill in White Pine County, operated by the Nevada Consolidated Copper Corporation, continued in 1940 to be the only smelter and the most important metallurgical plant in the State; the concentrator (18,000 tons daily capacity), operated by the same company, was the largest mill in the State.

Mine production of metals in Nevada in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 9 and their output included under "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 5,162,906 ounces from lode mines and 13,022 ounces from placers.
[4] Included under "Other districts."
[5] Exclusive of placer output, which is included under "Other districts."
[6] Output from property not classed as a "mine."
[7] Central and Sawtooth districts lie in both Humboldt and Pershing Counties.
[8] Battle Mountain district lies in both Humboldt and Lander Counties.
[9] Includes following districts: Desert (White Plains), Dixie Valley, and Eagleville in Churchill County; Cope (placer) in Elko County; Battle Mountain (all placer), Florence, and Potosi in Humboldt County; Bellehelen, Cactus Springs, and San Antone in Nye County; Haystack and Loring in Pershing County; and Pyramid and Stateline Peak in Washoe County.

CHURCHILL COUNTY

Operation of a custom cyanide mill by the Westgate Mining & Milling Corporation continued to be an important factor in the expanding metal production of Churchill County; in 1940 the company handled over 9,000 tons of ore from more than 60 shippers.

Dixie Valley district.—The Comstock-Keystone Mining Co. cyanided high-grade ore from the Dixie mine throughout 1940; the company added five cyanide tanks to its plant.

Eastgate district.—I. L. Kent operated the Sonny Boy mine in 1940 and shipped 1,414 tons of gold-silver ore; 1,185 tons treated in a custom cyanide plant yielded 483 ounces of gold and 8,291 ounces of silver, and 229 tons shipped to a smelter contained 121 ounces of gold and 2,357 ounces of silver.

Fairview district.—Lessees shipped a small tonnage of argentiferous lead ore from the Chalk Mountain mine to a smelter in 1940. Several groups of lessees worked the Nevada Hills mine and produced a substantial quantity of gold-silver ore, most of which was shipped to a custom cyanide plant.

Sand Springs district.—Summit King Mines, Ltd., operated the Dan Tucker mine in 1940; operation of a new 65-ton cyanide plant was begun January 5 and continued throughout the year. The Dan Tucker Extension Mining Co. shipped 287 tons of ore yielding 43 ounces of gold and 12,781 ounces of silver to a custom cyanide plant.

Wonder district.—Several groups of lessees worked the Nevada Wonder mine in 1940; 4,871 tons of ore shipped to a custom cyanide plant yielded 972 ounces of gold and 64,146 ounces of silver, and 756 tons of ore shipped to a smelter contained 220 ounces of gold, 21,227 ounces of silver, and 1,284 pounds of copper.

CLARK COUNTY

Eldorado Canyon district.—The El Dorado Rover Mining Co. operated the Rand, Quaker City, Magnolia, Poppy, Crown, Nevada-Eagle, and Cross mines throughout 1940; 38,188 tons of ore treated in the company 100-ton all-slime cyanide plant yielded 6,044 ounces of gold and 185,101 ounces of silver. The Oro Plata (Belmont Phoenix) mine was worked by P. H. Springer, Jr., until taken over by the Tonopah Belmont Development Co. in April 1940; the combined production was 882 tons of smelting ore, which contained 220 ounces of gold, 59,663 ounces of silver, 285 pounds of copper, and 6,884 pounds of lead. The Diamond Gold Mining Co. operated the Techatticup, Jubilee, and Red Butte mines throughout 1940; the ore was treated in a 135-ton flotation mill. W. W. Hartman worked the Wall Street mine and treated the ore in a 50-ton amalgamation-flotation mill.

Gold Butte district.—The Lakeshore Gold Mining Co. operated the Utah mine in 1940.

Searchlight district.—The Blossom mine was productive in 1940. Lessees at the Quartette mine shipped 533 tons of ore and 200 tons of old tailings to various plants using different metallurgical methods; the total metal recovery was 204 ounces of gold, 278 ounces of silver, 16,800 pounds of copper, and 10,600 pounds of lead. F. P. Jackson worked the Valley mine.

Yellow Pine district.—The Chiquita Mining Co., Ltd., operated the Chiquita mine and the 100-ton cyanide plant at the property during 1940. O. F. Schwartz (Barefoot Lease) worked the Keystone-Barefoot mine; 9,343 tons of ore treated by amalgamation and concentration yielded bullion containing 1,134 ounces of gold and 107 ounces of silver and 377 tons of concentrates containing 1,347 ounces of gold, 102 ounces of silver, and 1,844 pounds of copper; in addition, 13 tons of smelting ore contained 30 ounces of gold, 4 ounces of silver, and 212 pounds of copper. J. A. Frederickson shipped lead ore and zinc-lead ore from the Milford No. 2 mine. The Yellow Pine Mining Co. shipped a substantial tonnage of zinc ore from the Yellow Pine mine during the year.

ELKO COUNTY

Centennial district.—The Bull Run mine was productive in 1940.

Cope district.—The Mountain City Copper Co. (third-largest copper producer in Nevada) was active throughout 1940. Part of the ore was treated in the company 400-ton flotation mill, and high-grade ore was shipped for direct smelting. Morrison & Knudsen Co., Inc., operated a dragline dredge, equipped with a dragline excavator using a 2-cubic yard bucket, on upper Van Duzer Creek from September 22 to November 16.

Delano district.—Lessees on the Net Group shipped a substantial tonnage of lead ore to a smelter during 1940.

Gold Circle district.—Esmeralda Gold Mines, Ltd., worked the Esmeralda mine in 1940; gold ore was treated in a 30-ton cyanide plant.

Lime Mountain district.—Lessees operated the Lime Mountain mine throughout 1940 and shipped to a smelter 1,098 tons of ore and 55 tons of old tailings containing 399 ounces of gold, 1,876 ounces of silver, and 40,912 pounds of copper.

Merrimac district.—The Rip Van Winkle Mining Co. treated argentiferous zinc-lead ore from the Rip Van Winkle mine by selective flotation in 1940; lead concentrates and zinc concentrates were shipped to smelters.

Spruce Mountain district.—Lessees worked the Missouri Monarch group (Black Forest and Monarch mines) during 1940; 143 tons of silver ore, 38 tons of copper ore, and 407 tons of lead ore shipped to a smelter contained 3 ounces of gold, 7,882 ounces of silver, 8,106 pounds of copper, and 128,618 pounds of lead.

ESMERALDA COUNTY

Desert (Gilbert) district.—Lessees at the Homestake mine in 1940 shipped to custom cyanide plants 418 tons of ore from which 346 ounces of gold and 726 ounces of silver were recovered; in addition, 1 ton of high-grade ore shipped to a smelter contained 32 ounces of gold and 46 ounces of silver.

Divide district.—Lessees on the Tonopah Divide mine shipped 1,195 tons of ore containing 756 ounces of gold and 8,365 ounces of silver to a smelter during 1940.

Goldfield district.—The Goldfield Combination Fraction Mining Co. operated the Combination Fraction mine in 1940. Lessees working underground at the Goldfield Consolidated property shipped 1,085 tons of ore containing 1,527 ounces of gold, 519 ounces of silver, and

3,892 pounds of copper. At the same property, the Bradshaw Syndicate, Inc., cyanided old tailings in a 1,400-ton cyanide plant from March 1 to November 15; old tailings that can be worked profitably have been exhausted.

Hornsilver district.—The Ohio Mines Corporation operated the Gold Point and Tokop groups throughout 1940; in addition to company ore, custom material was treated in the company 65-ton all-slime cyanide plant.

Silver Peak district.—The Black Mammoth Consolidated Mining Co. and E. L. Cord (Prescott Lease) worked the Mary mine until August 1, 1940, when the latter became the sole lessee of the property. Desert Silver, Inc., leading silver producer in the State, worked the Nivloc mine; 69,016 tons of silver ore cyanided in the company 300-ton plant yielded 4,215 ounces of gold and 743,032 ounces of silver.

EUREKA COUNTY

Cortez district.—The Cortez Metals Co. shipped 1,468 tons of silver ore containing 98 ounces of gold, 51,011 ounces of silver, 6,447 pounds of copper, and 97,802 pounds of lead to a smelter in 1940. Greenan & Co., Inc., worked the Roberts group (Mill Canyon) from January 1 until August 19; 3,895 tons of ore treated in the company 40-ton cyanide plant yielded 1,257 ounces of gold and 3,328 ounces of silver, and 3,413 tons of ore shipped to a smelter contained 1,608 ounces of gold and 25,314 ounces of silver. Lessees worked the Ventura mine and shipped 1,221 tons of ore containing 763 ounces of gold, 2,932 ounces of silver, 799 pounds of copper, and 3,559 pounds of lead.

Diamond district.—J. L. Bay, G. Sharer, and C. J. Samuel began production at the new Eagle Roost mine July 1, 1940; 410 tons of ore contained 4 ounces of gold and 10,630 ounces of silver. At the end of the year, the mine consisted of an open stope 8 feet wide, 20 feet long, and 30 feet deep.

Eureka district.—Lessees shipped 686 tons of ore and 80 tons of old tailings containing 280 ounces of gold and 8,987 ounces of silver from the Eureka-Croesus mine in 1940. The Eureka Corporation, Ltd., shipped gold ore from the Oswego and Richmond-Eureka mines, and the Windfall Mining & Milling Co. shipped gold ore from the Windfall mine.

HUMBOLDT COUNTY

Awakening (Slumbering Hills) district.—The Austin Bros. Gold Mining Co. operated the Jumbo group from May 1 until December 15, 1940; 5,000 tons of ore amalgamated in the company 25-ton mill contained 993 ounces of gold and 686 ounces of silver. G. Lowell worked the Morning mine.

Barrett Springs district.—The West Coast Mines Co., Inc., operated the Pansy Lee mine throughout 1940; 1,318 tons of ore shipped to a smelter contained 495 ounces of gold, 41,102 ounces of silver, 7,838 pounds of copper, and 99,500 pounds of lead. During the year, construction was begun on a 200-ton flotation plant, change house, assay office, shop buildings, and roads.

Gold Run district.—Adelaide Crown Mines operated the Adelaide Crown mine from September 8 until the end of 1940; 21,691 tons of ore yielded 1,470 ounces of gold and 30,674 ounces of silver; the ore was treated in the company's new 150-ton cyanide plant. Marigold Mines, Inc., shipped gold ore from the Marigold mine to a smelter during the year.

Potosi district.—Getchell Mine, Inc., operated the Getchell mine throughout 1940 and continued to hold first rank among Nevada gold producers. Ore was treated in the company 1,000-ton cyanide plant; oxidized ore was treated by agitation of slimes and leaching of sands, and sulfide ore containing a large percentage of arsenic was roasted and treated in the cyanide slime plant. During the year the company paid $585,000 in dividends, bringing the total dividend disbursements to $1,305,000 during less than 3 years of production.

Warm Springs district.—In 1940 the Curley Luck Gold Corporation treated 3,394 tons of ore from the Ashdown mine by amalgamation and concentration; amalgamation bullion contained 509 ounces of gold and 76 ounces of silver, and 2 tons of concentrates shipped to a smelter contained 10 ounces of gold and 9 ounces of silver. The Homer Verne Mining Co. worked the Homer Verne mine in the Boyd Basin section of the Warm Springs district from May 1 to October 30; 2,165 tons of ore amalgamated yielded 484 ounces of gold and 173 ounces of silver.

LANDER COUNTY

Battle Mountain district.—In 1940, as in former years, lessees at the numerous small mines in the Battle Mountain district produced much of the ore shipped to smelters. The Copper Canyon Mining Co., which operated mines of the Copper Canyon and Copper Basin groups, was the leading producer in the district; 8,247 tons of copper ore containing 1,559 ounces of gold, 15,506 ounces of silver, and 843,400 pounds of copper were shipped to a smelter. On September 6 a 6-month option to acquire a substantial equity in the company for examination and exploration was granted to the International Smelting & Refining Co. Lessees on the Plumas mine shipped 2,277 tons of ore containing 535 ounces of gold, 16,455 ounces of silver, 1,466 pounds of copper, and 16,061 pounds of lead to a smelter during 1940. Other productive properties were the Annex, Armor-Trinity, Bailey Day, Bentley, Bluebird, Bon Ami, Buena Vista, Buzzard, Eldorado, Galena, Gold Butte, Gold Cash, Good Chance, Honeycomb, Independence group, Moonlight, Nevada, San Miguel, Treasure Vault, Vail, and White. The treatment of 9,276 cubic yards of gravel, largely in a dry concentrator to which gravel was delivered by a tractor and scraper, yielded 426 ounces of gold and 59 ounces of silver at the Box Canyon Placers. Battle Mountain Placers operated a dragline dredge at the Vail placers for a short period in 1940.

Bullion district.—Ore was coarsely crushed and cyanided at the Goldacres property during 1940. Triplett Gulch Mines, Inc., operated a nonfloating washing plant, to which gravel was delivered by bulldozers and carry-alls, from January 1 until December 15; 120,000 cubic yards of gravel yielded 1,627 ounces of gold and 160 ounces of silver.

Hilltop district.—Lessees shipped gold-silver ore from the Paymaster mine during 1940.

McCoy district.—The Nevada United Gold Mining Co. worked the Gold Dome mine in 1940.

New Pass district.—W. H. Smith amalgamated 320 tons of ore from the Thomas W. mine; the bullion contained 1,778 ounces of gold and 29 ounces of silver.

LINCOLN COUNTY

Ferguson (Delamar) district.—The Caliente Cyaniding Co. operated a 600-ton cyanide plant and recovered 1,688 ounces of gold and 9,778 ounces of silver from 110,700 tons of old tailings at the Delamar and Bamberger dumps between January 1 and December 9, 1940; the operation was discontinued with the exhaustion of old tailings of value. The Delamar Exploration Co. shipped gold ore to a smelter.

Jack Rabbit district.—The Bristol Silver Mines Co. operated the Bristol Silver mine throughout 1940; 10,530 tons of ore shipped to a smelter contained 118 ounces of gold, 119,052 ounces of silver, 772,112 pounds of copper, and 448,578 pounds of lead.

Pioche district.—Lessees shipped both silver ore and lead ore from the Apex mine in 1940. The Combined Metals Reduction Co. (affiliate of the National Lead Co.) worked the Pioche Nos. 1 and 2 mines throughout the year and was the largest producer of both lead and zinc in the State. Virtually all the ore was shipped to the company 600-ton selective-flotation mill at Bauer, Utah. After midyear a 1,000-ton selective-flotation mill was under construction at the Pioche property for early completion and operation in 1941.

LYON COUNTY

Palmyra district.—Gold-silver ore from the Hully-Logan mine was shipped to a custom cyanide plant during 1940.

Silver City district.—A lessee shipped 835 tons of ore containing 331 ounces of gold and 540 ounces of silver from the Buckeye mine to custom cyanide and amalgamation plants in 1940. The Dayton mine was operated by lessees, who delivered their ore to the Dayton Consolidated Mines Co. custom cyanide mill on the property. The Dayton Douglas Cyanidation Co. treated 14,752 tons of old tailings in a cyanide leaching plant between April 1 and November 15 and recovered 407 ounces of gold and 10,890 ounces of silver. Lessees shipped 1,226 tons of ore containing 544 ounces of gold and 1,532 ounces of silver from the South Comstock mine. The Oro Neva Dredging Co. operated a dragline dredge, equipped with a dragline excavator using a 4-cubic yard bucket, on the Rae placers between Dayton and Silver City and recovered 3,365 ounces of gold and 1,703 ounces of silver from 644,455 cubic yards of gravel. The Contractor's Corporation operated a dry-land washing plant on Gold Canyon from March 1 to August 15.

Talapoosa district.—The Talapoosa mine was worked during 1940.

Yerington district.—A. Lilja operated the Mason Valley mine from January 1 to May 30, 1940; 358 tons of ore containing 2 ounces of gold, 81 ounces of silver, and 128,318 pounds of copper were shipped to a smelter.

MINERAL COUNTY

Bell district.—Lessees operated the Olympic (Omco) mine throughout 1940 and shipped 407 tons of ore to a custom mill; 441 ounces of gold and 314 ounces of silver were recovered.

Columbus (Candelaria) district.—Lessees shipped 749 tons of silver ore from the Diablo mine to a smelter in 1940; the ore contained 28 ounces of gold, 15,224 ounces of silver, 1,780 pounds of copper, and 20,621 pounds of lead. The Silver King and Silver Surprise mines were active.

Garfield district.—The Mabel mine was operated continuously in 1940; 130 tons of gold-silver ore shipped to a custom cyanide plant yielded 48 ounces of gold and 1,669 ounces of silver, and 668 tons of gold-silver ore shipped to a smelter contained 389 ounces of gold, 40,966 ounces of silver, 2,707 pounds of copper, and 46,083 pounds of lead.

Hawthorne district.—The Ashby (Eldorado No. 1) and Lucky Boy mines were the leading producers in the Hawthorne district in 1940.

NYE COUNTY

Athens district.—Ore from the Warrior mine was treated at a custom cyanide plant in 1940.

Bullfrog district.—C. A. Liddell operated the Homestake mine and shipped 3,665 tons of ore to custom cyanide plants; 1,277 ounces of gold and 2,664 ounces of silver were recovered. The Polaris mine was worked in 1940.

Jackson district.—A. L. Nelson and lessees worked the War Eagle and Lookout mines and shipped 196 tons of ore to a custom cyanide plant; 106 ounces of gold and 720 ounces of silver were recovered.

Manhattan district.—A lessee operated the Jumbo mine in 1940 and recovered 689 ounces of gold and 296 ounces of silver from 3,985 tons of ore amalgamated. The Manhattan Gold Mines Co. operated the Manhattan mine. The Reliance Mining Co. worked the Verden mine; 7,517 tons of ore were treated in a 90-ton flotation mill, and the resulting concentrates (101 tons) shipped to a smelter contained 1,957 ounces of gold, 1,080 ounces of silver, and 184 pounds of copper. The White Caps Gold Mining Co. and lessees shipped a substantial quantity of gold ore from the White Caps mine. The Manhattan Gold Dredging Co. (largest producer of placer gold in Nevada in 1940) operated a connected-bucket dredge, with 108 9½-cubic foot buckets, in Manhattan Gulch throughout the year. Lessees washed 392 ounces of gold and 159 ounces of silver from 7,165 cubic yards of gravel produced at the Orphant drift mine.

Morey district.—A lessee on the Morey mine shipped 774 tons of direct-smelting ore containing 43 ounces of gold and 16,859 ounces of silver during 1940.

Northumberland district.—The Northumberland Mining Co. operated a 280-ton cyanide plant at the Northumberland mine throughout 1940; 76,466 tons of ore yielded 11,918 ounces of gold and 8,646 ounces of silver.

Phonolite district.—The Penelas Mining Co. ceased operations at the Penelas mine during 1940 after known ore bodies were exhausted.

Quartz Mountain district.—A lessee shipped lead ore from the San Rafael mine to a smelter in 1940.

Round Mountain district.—Morrin & Steigmeyer operated the Gold Hill mine during 1940. Dodge Construction, Inc., a lessee, operated a power shovel and washing plant on the Hillside placer of the Nevada Porphyry Mining Co. from April to June.

Tonopah district.—The Tonopah Belmont Development Co. operated the Tonopah Belmont mine on the leasing system during 1940; the fire that broke out October 31, 1939, however, has made most of the mine workings inaccessible. The Tonopah Mining Co. of Nevada also worked its property on the leasing system; all ore was shipped crude to smelters.

Tybo district.—Hall Bros. and lessees shipped 10,368 tons of gold-silver ore and 740 tons of silver ore from the 2–G mine dump in 1940; in all, the ores contained 890 ounces of gold, 100,424 ounces of silver, 194 pounds of copper, and 48,420 pounds of lead.

PERSHING COUNTY

Imlay district.—The Standard Cyaniding Co. operated a 600-ton cyanide plant at the Gold Standard mine throughout 1940. Eavey, Swank & Van Galder produced a substantial quantity of placer gold from a drift mine in Willow Creek.

Rosebud district.—The Rio Seco Mining Co. washed 35,000 cubic yards of gravel in a nonfloating washing plant, to which gravel was delivered by a ¾-cubic yard power shovel; 295 ounces of gold and 33 ounces of silver were recovered between January 1 and June 15. The company passed into receivership May 16.

Seven Troughs district.—Leases operated the Portland mine in 1940.

STOREY COUNTY

Comstock district.—Several groups of lessees on the Chollar-Potosi mine shipped 1,642 tons of ore to a custom cyanide plant during 1940; 604 ounces of gold and 12,368 ounces of silver were recovered. The Consolidated Virginia Mining Co. worked the Consolidated Virginia mine; 17,479 tons of ore treated at the Sierra Nevada and Dayton cyanide mills yielded 1,497 ounces of gold and 5,000 ounces of silver. Sutro Tunnel Coalition, Inc., operated the Crown Point mine during the year; the output of gold-silver ore was treated in the company cyanide plant. The Hartford Mining Co. worked the Hartford mine; in addition, some custom ore was treated in the company cyanide plant. Several groups of lessees shipped 1,892 tons of gold-silver ore from the Justice mine to the Dayton Consolidated custom cyanide plant; 448 ounces of gold and 7,407 ounces of silver were recovered. The Dayton Consolidated Mines Co. produced 46,363 tons of ore at the Keystone mine; 16,408 ounces of gold and 41,205 ounces of silver were recovered by cyanidation at the company mill. The Nevada

Securities Co. worked the Overland mine in 1940. The Consolidated Chollar Gould & Savage Mining Co. operated the Overman mine; 132,064 tons of ore treated in the company 400-ton cyanide plant yielded 7,320 ounces of gold and 152,151 ounces of silver; during the year the company stripped a section of the Comstock Lode preparatory to mining it by the open-pit method. Sierra Nevada, Ltd., worked the Sierra Nevada mine. The Silver Hill and Succor mines were productive in 1940.

WASHOE COUNTY

Granite Range district.—The Burm Ball Mining Co. worked the Mountain View mine 20 miles northeast of Gerlach from January 1 to December 15, 1940; gold ore was shipped to a smelter.

White Horse district.—G. F. Dallimore operated the Renegade mine throughout 1940; 80 tons of ore treated by amalgamation yielded 191 ounces of gold and 62 ounces of silver, and 57 tons of ore shipped to a custom cyanide mill yielded 119 ounces of gold and 31 ounces of silver.

WHITE PINE COUNTY

Aurum district.—Grand Deposit Consolidated Mines, Inc., shipped zinc, copper, and lead ores from the Grand Deposit mine in 1940.

Cherry Creek district.—A number of lessees operated the Egan mine during 1940; 4,325 tons of fluxing ore containing 568 ounces of gold and 12,250 ounces of silver were shipped to the McGill smelter. The Imperial Leasing Co. operated the Exchequer mine and shipped silver ore to a smelter. The Nevada Standard Mining Corporation shipped gold-silver ore from the Goodman Tunnel to a smelter. Lessees worked the Mary Ann mine and shipped 2,181 tons of ore containing 36 ounces of gold and 14,289 ounces of silver to a smelter.

Osceola district.—The Gilded Age Mining Co. operated the Gilded Age mine throughout 1940; gold ore was shipped to a smelter. Operators of the Golden Eagle mine also shipped gold ore to a smelter. W. M. Stout worked the Sunshine mine from July 15 to October 10; 300 tons of ore containing 344 ounces of gold and 120 ounces of silver were shipped to a smelter.

Robinson district.—C. Caviglia shipped siliceous ore from the Chainman mine to a smelter during 1940. Farnsworth-Ely Combination Metals worked the Cuba mine; 6,347 tons of ore shipped to a smelter contained 938 ounces of gold and 38,784 ounces of silver. The Consolidated Coppermines Corporation, second-largest copper producer in the State in 1940, was active throughout the year; copper ore mined on company account was shipped to McGill for concentration and smelting. Lessees on company properties produced a small quantity of both zinc carbonate ore and siliceous ore; the zinc carbonate ore was shipped to a zinc smelter and the siliceous ore to the McGill smelter for flux. According to the company printed annual report for the year ended December 31, 1940, 2,769,084 tons of ore yielded (on the basis of smelter settlements) 52,976,621 pounds of copper, 29,340 ounces of gold, 74,453 ounces of silver, 966 pounds of lead, and 214,410 pounds of zinc. During 1940 dividends of $794,-087.55 were declared and paid, bringing the total dividend disbursements to the end of 1940 to $1,866,069.36. D. F. Paine worked the Hayes mine. L. Piombo shipped 2,536 tons of siliceous ore containing 430 ounces of gold and 2,880 ounces of silver from the Jupiter mine during 1940. The Ely Gold Mining Co. worked the Revenue mine. The Nevada Consolidated Copper Corporation (operating subsidiary of the Kennecott Copper Corporation and largest industrial company in Nevada) operated the Ruth mine at Ruth and the open pit at Copper Flat throughout the year; it handled more ore and produced more copper than any other operation in the State. In addition to its mining activities, the company operated the McGill copper smelter (only smelter in the State) and the McGill flotation concentrator (18,000 tons daily capacity); both of these plants did some custom work. C. Luther operated the Sophie mine during the year.

Taylor district.—In 1940 the Ely Gold Mining Co. operated the Monitor mine and shipped silver ore to a smelter.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEW MEXICO

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

SUMMARY OUTLINE

Production of copper in New Mexico in 1940 was much larger in quantity than in any other year on record, and that of zinc was the highest since 1933; the increases over 1939 were 51 and 3 percent, respectively. The output of silver was about the same as in 1939, gold decreased 3 percent, and lead decreased 29 percent. The total value of the recovered output of the five metals in 1940 (see fig. 1) was $22,246,421 (the highest since 1929) and compares with $15,402,572 in 1939. Although the increase in copper output accounted for the largest part of the gain in total value, a substantial part also was due to the moderate advance in average prices of silver and the base metals. New mills placed in operation during the year were the 150-ton flotation mill at the San Pedro copper-gold-silver mine in Santa Fe County and the 50-ton cyanidation mill at the East Camp gold-silver mine in Grant County. All the large mines and mills that were active in 1939, except the Pecos in San Miguel County (permanently closed May 31, 1939), continued operations throughout 1940.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.
[6] $0.71111111.

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1936 to 1940; also the total production from 1848 to 1940. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records year by year may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1936–40, and total, 1848–1940, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	136	169	514,966	33,037	$1,156,295	1,163,255	$900,941
1937	159	160	4,191,092	41,171	1,440,985	1,243,766	962,053
1938	166	164	2,414,857	43,050	1,506,750	1,229,860	795,061
1939	214	168	4,977,375	36,979	1,294,265	1,400,878	950,899
1940	164	179	7,089,903	35,943	1,258,005	1,407,839	1,001,130
1848–1940			(1)	2,120,935	47,566,918	63,948,259	50,205,625

Year	Copper		Lead		Zinc		Total value

[2] Short tons.

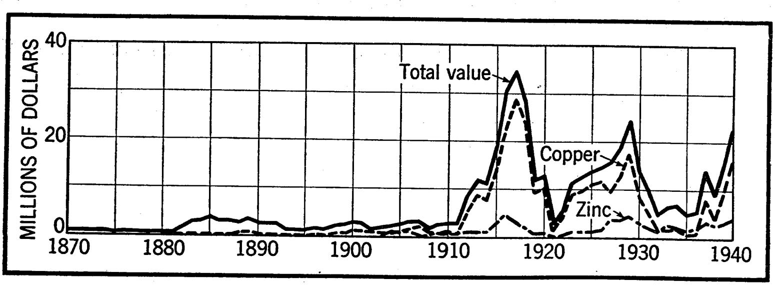

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1940. The value of gold, silver, and lead produced annually has been relatively small.

Gold and silver produced at placer mines in New Mexico, 1936–40, in terms of recovered metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1936	3,378	$118,230	235	$182	$118,412	1939	3,474	$121,590	209	$142	$121,732
1937	3,027	105,945	203	157	106,102	1940	2,928	102,480	263	187	102,667
1938	2,626	91,910	167	108	92,018						

Gold.—The principal gold-producing districts in New Mexico in 1940 were: Mogollon, Catron County, which contributed 27 percent of the State total recoverable output of gold; Central, Grant County, 24 percent; Steeple Rock, Grant County, 15 percent; San Pedro, Santa Fe County, 8 percent; Las Animas, Sierra County (mostly from placers), 7 percent; and Lordsburg, Hidalgo County, 6 percent. Dry and siliceous ores yielded 53 percent of the State total gold in 1940; copper ore, 37 percent; lead and zinc-lead ores, 2 percent; and placers 8 percent.

Silver.—Silver production in New Mexico in 1940 varied little (0.5-percent increase) from that in 1939. The Mogollon district contributed 39 percent of the State total silver, Central 34 percent, Steeple Rock 15 percent, Lordsburg 5 percent, and San Pedro 2 percent. Dry and siliceous ores yielded 57 percent of the total silver; copper ore, 26 percent; zinc-lead ore, 16 percent: and lead ore, together with a small quantity of silver from placers, 1 percent.

Copper.—The output of recoverable copper from New Mexico mines in 1940 (139,696,000 pounds) was the highest in the history of mining in the State, surpassing the former record annual output of 1917 by 34,128,000 pounds and representing a 51-percent increase over 1939. The Chino open-pit mine of the Nevada Consolidated Copper Corporation at Santa Rita, Grant County, was by far the largest producer. Other sizable producers were the Bonney mine near Lordsburg, Hidalgo County; the San Pedro near Golden, Santa Fe County; and the Ground Hog-San Jose group near Hanover, Grant County. Copper ore and mine-water precipitates yielded 99 percent of the total copper; most of the remainder was recovered from concentrates produced from the milling of zinc-lead ore.

Lead.—The 29-percent decrease in 1940 from 1939 in the New Mexico output of lead reflected the effect of the closing in May 1939 of the Pecos mine in the Willow Creek district, San Miguel County, formerly the largest producer of lead (as well as of gold, silver, and zinc) in the State. Zinc-lead ore (mostly from the Central district, Grant County) yielded 76 percent of the State total output of lead, copper ore 14 percent, lead ore 7 percent, and other types of ore 3 percent.

Zinc.—The output of recoverable zinc from New Mexico increased 3 percent in 1940 over 1939. The Central district contributed 98 percent of the State total in 1940. Other producing districts were the Pinos Altos and Swartz, Grant County; San Simon, Hidalgo County; Cooks Peak, Luna County; and Magdalena, Socorro County. Zinc-lead ore yielded 69 percent and zinc ore 31 percent of the total.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1940, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

The greater part of the 7,089,903 tons of ore produced in New Mexico in 1940 was copper ore, mined with power shovels, from the Chino open-pit mine at Santa Rita, Grant County. Underground mining was done at the other principal mines of the State. The quantity of each type of ore produced, with its content in terms of recovered metals, is shown in the table that follows. Operating details at both lode and placer mines are given in the following review by counties and districts.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in New Mexico in 1940, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	33, 490	4, 895	15, 951	59, 975	67, 710	-----------
Dry and siliceous gold-silver ore	91, 965	14, 245	775, 228	10, 048	78, 867	-----------
Dry and siliceous silver ore	1, 559	12	13, 156	5, 226	50, 000	-----------
	127, 014	19, 152	804, 335	75, 249	196, 577	-----------
Copper ore	6, 606, 471	13, 202	369, 968	[1] 137, 851, 531	1, 099, 534	-----------
Lead ore	1, 901	505	13, 404	26, 517	517, 192	-----------
Zinc ore	123, 126	---------	-----------	-----------	3, 108	18, 900, 506
Zinc-lead ore	231, 391	156	219, 869	1, 742, 703	5, 827, 589	41, 725, 494
	6, 962, 889	13, 863	603, 241	[1] 139, 620, 751	7, 447, 423	60, 626, 000
Total, lode mines	7, 089, 903	33, 015	1, 407, 576	[1] 139, 696, 000	7, 644, 000	60, 626, 000
Total, placers	----------	2, 928	263	-----------	-----------	-----------
	7, 089, 903	35, 943	1, 407, 839	[1] 139, 696, 000	7, 644, 000	60, 626, 000
Total, 1939	4, 977, 375	36, 979	1, 400, 878	[2] 92, 284, 000	10, 784, 000	58, 712, 000

[1] Includes 8,258,984 pounds of copper recovered from mine-water precipitates.
[2] Includes 3,237.257 pounds of copper recovered from mine-water precipitates.

METALLURGIC INDUSTRY

All the principal flotation mills operating in New Mexico in 1940 treated ores containing all or a large part of their value in copper, lead, and zinc; they comprised the Chino at Hurley, Empire Zinc at Hanover, Banner near Lordsburg, Peru near Deming, Combination near Hanover, and San Pedro near Golden. Most of the gold and gold-silver ores were treated in the Little Fanney cyanidation mill at Mogollon, the East Camp cyanidation mill in the Steeple Rock district (Grant County), and the Aztec amalgamation-flotation mill in Colfax County. The Chino reverberatory copper smelter of the Nevada Consolidated Copper Corporation at Hurley (first blown in early in May 1939) was operated throughout 1940 on company concentrates, ore, and mine-water precipitates. Concentrates and ore produced by other operators in the State were shipped to smelters in other States, mentioned in the following review by counties and districts. About 448,645 cubic yards of gravel were treated at four placer mines using dry-land dredges, and considerable gravel for which figures are not obtainable was handled at small placers worked by hand methods.

Mine production of metals in New Mexico in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	20,264	314	325			
Ore cyanided [1]	92,520	12,384	680,426			
Concentrates smelted	276,738	12,804	426,184	[2] 134,580,984	5,879,669	60,120,764
Ore smelted	99,670	7,513	300,641	5,115,016	1,764,331	505,236
Placer		2,928	263			
		35,943	1,407,839	139,696,000	•7,644,000	60,626,000
Total, 1939		36,979	1,400,878	92,284,000	10,784,000	58,712,000

[1] Cyanide used was approximately 292,000 pounds of Aero Brand calcium cyanide (approximately 48 to 49 percent NaCN) and 6,272 pounds of sodium cyanide (91 percent).
[2] Includes 8,258,984 pounds of copper recovered from smelting of mine-water precipitates.

Mine production of metals from amalgamation and cyanidation mills (with or withou concentration equipment) in New Mexico in 1940, by counties, in terms of recovered metals

County	Ore treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal				
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)

BERNALILLO COUNTY

Coyote district.—A lessee at the Franklin claim 14 miles east of Albuquerque shipped a car of gold-silver-copper-lead ore to the El Paso smelter in 1940.

CATRON COUNTY

Mogollon district.—Production of gold and silver in the Mogollon district in 1940 increased 27 and 44 percent, respectively, over 1939. Most of the output in both years was contained in gold-silver bullion shipped to the Denver Mint by the Black Hawk Consolidated Mines Co., which operated the Little Fanney cyanide mill and the Consolidated group (comprising the Andrew Jackson Consolidated, Lexington Contention, and Lexington Gunboat claims on the Queen vein) under lease from the Lehigh Metals Co. Besides ore from the Consolidated group, the mill in 1940 treated custom ore from the Ann Arbor, Champion, Eberle, Gold Bullion group, Golden Eagle, Little Fanney, Lone Star No. 2, Last Chance group, Maud S, and Pacific; all operated on a small scale. Company and custom ore treated in 1940 totaled 68,549 tons, from which 9,336 fine ounces of gold and 536,350 fine ounces of silver were recovered.

COLFAX COUNTY

Mount Baldy district (Baldy, Elizabethtown, Eagle Nest).—In 1940 the Maxwell Land Grant Co. operated its 140-ton Aztec mill from April 1 to September 15 and treated 1,698 tons of ore from the Aztec mine and 17,648 tons from the dump. Treatment was by jigging in the ball mill-classifier circuit, followed by flotation; the jig concentrates were amalgamated in an amalgam barrel, and the flotation concentrates (containing gold, silver, and copper) were shipped to the El Paso smelter. The Deep Tunnel Mining Co. operated its 40-ton cyanide plant at the Moreno-Red Bandana group part of the year and shipped gold-silver bullion to the Denver Mint. A lessee at the Golden Ajax mine shipped 215 tons of gold-silver-copper ore to the El Paso smelter. Sluicing on Ute and Willow Creeks and Big Nigger and Hamburg Gulches recovered small lots of placer gold. Late in the year Fullroe, Inc., moved a caterpillar bulldozer, 1¼-cubic yard dragline, and portable screening and sluicing plant to the Lynch Homestead placer near Elizabethtown and had them ready to operate in December.

DONA ANA COUNTY

Organ district.—The Donalco Mining Co. operated the Mormon mine on a small scale from January 1 to October 4, 1940, and shipped several cars of gold-silver ore to the El Paso smelter. The mine was idle the rest of the year, and the company was being liquidated in in March 1941. At the leased Torpedo-Bennett Stephenson-Memphis group the Willett Mining Co. retimbered a 400-foot vertical shaft and drove 300 feet of drifts, encountering a high-grade shoot of zinc-silver-copper-lead ore on the 200-foot level of the Memphis claim 638 feet north of the Memphis shaft. The company ceased operations in October soon after reaching the ore but planned to do some diamond drilling on the property in the near future; output from the mine in 1940 was 31 tons of silver-lead-copper ore, shipped to the El Paso smelter.

GRANT COUNTY

Bullards Peak district.—The Cora Miller mine about 15 miles northwest of Silver City was worked by the owner and lessees during November and December 1940 and yielded 292 tons of silver-copper-gold-lead ore, part of which was shipped to the El Paso smelter and part to the Ira L. Wright assay office at Silver City.

Burro Mountain district (Tyrone).—Development work was done at the Calcutta claim in 1940, and a test lot of gold-silver ore was shipped to Hawley & Hawley at Douglas, Ariz.

Central district (Bayard, Fierro, Georgetown, Hanover, Santa Rita).—The Nevada Consolidated Copper Corporation, Chino Mines Division, largest producer of copper in New Mexico, operated its open-pit mine at Santa Rita and flotation mill and reverberatory copper smelter at Hurley continuously through 1940. The output of copper increased 57 percent over 1939 and was the highest in any year on record. The ore is mined with electric shovels and transported 10 miles over the Atchison, Topeka & Santa Fe Railway to the mill, which has a daily capacity of 17,500 tons. The copper concentrates carry a low content of gold and silver to the ton. Molybdenite concentrates are recovered in the mill as a byproduct. The material smelted in 1940 included, besides concentrates from the mill, a considerable tonnage of carbonate copper ore (used as a flux) and copper precipitates recovered from leaching operations. The Twenty-sixth Annual Report of the Kennecott Copper Corporation, dated March 15, 1941, contains the following paragraphs regarding operations at the Chino property in 1940:

A total of 37,649,967 tons of ore having a calculated average assay of 1.06 percent copper was treated at the properties in Utah, Nevada, Arizona, and New Mexico whose copper production aggregated 721,766,162 pounds, equivalent to an average of slightly over 30,000 tons per month. During the last quarter output averaged in excess of 32,000 tons monthly.

In addition to ore, approximately 46,000,000 tons of noncommercial overburden were handled at the open-pit shovel mines in Utah, Nevada, and New Mexico.

The Chino property also showed a large increase in production, the copper output exceeding that of any prior year. Capital expenditures, which were comparatively large, were devoted primarily to installations to effect reductions in cost. At the mine the shovel pit was equipped for electric haulage and partially double-tracked, with operating results fully justifying the expenditures. Thirteen 30-yard dump cars and a 5-yard electric shovel were added to mine equipment, and the shops serving the mine were moved to the pit entrance and greatly improved. A larger high-tension transmission line was installed between the power plant at Hurley and the mine. At the power plant the installation of a high-pressure boiler and of a turbo-generator was completed, and the modernized plant is now operating with marked economies.

The Empire Zinc Co., operating its Hanover mine group and 300-ton selective-flotation mill, was again the largest producer of zinc in New Mexico. The zinc concentrates produced were shipped to the American Zinc Co. plant at East St. Louis, Ill. (for roasting in transit) and the New Jersey Zinc Co. plants at Depue, Ill. (Mineral Point Zinc Division), and Palmerton, Pa.; the byproduct lead-copper concentrates made were shipped to the El Paso smelter. The Peru Mining Co. operated its Pewabic mine at Hanover and 500-ton mill near Deming throughout 1940. Besides ore from the Pewabic mine, the mill handled some zinc tailings from the Cleveland mine near Pinos Altos and a few lots of zinc ore from properties at Vanadium and Central. The concentrates produced were shipped to retort plants at Dumas, Tex., and Fort Smith, Ark.

The principal producer of lead in the Central district and the State in 1940 was the Ground Hog-San Jose group which, with the Lucky Bill group, was operated by the American Smelting & Refining Co. The greater part of the ore produced was mill-grade zinc-lead-copper-silver ore, which was treated by selective flotation in the leased Combination (Black Hawk) mill near Hanover; the rest was copper-lead-silver-gold and lead-copper-silver ores, shipped crude to the El Paso smelter. The zinc concentrates produced were shipped to the Amarillo (Tex.) smelter and the lead-copper concentrates to El Paso. The mill feed in 1940 included some custom ore from the Grandview mine in the Swartz district and Bull Frog, Gran Kibira, and September in the Central district. Zinc-lead ore from the Peerless group was shipped to the Ozark pigment plant at Coffeyville, Kans.

Chloride Flat district.—Prospecting in the Chloride Flat district yielded a few lots of silver-lead-copper ore in 1940.

Eureka district (see also Hidalgo County).—Intermittent small-scale operations at the King 400 and other properties resulted in the shipment of a few cars of smelting ore from Hachita.

Gold Hill district (see also Hidalgo County).—Lessees on the Reservation claim in the Standard group shipped 132 tons of gold-silver-copper ore in 1940, part of which was sold to Hawley & Hawley, Douglas, Ariz., and part to the International Smelting & Refining Co., Miami, Ariz.

Pinos Altos district.—Most of the ores produced from mines in the Pinos Altos district in 1940 were gold-silver and gold-silver-lead-copper ores and were shipped crude to the El Paso smelter, the Ira L. Wright assay office at Silver City, and Hawley & Hawley at Douglas, Ariz. About 175 tons of zinc-lead-gold-silver-copper ore from the Silver Hill mine were treated in the Calumet 20-ton custom mill and yielded zinc concentrates (containing gold, silver, copper, and lead), sold to the Amarillo (Tex.) smelter, and lead concentrates (containing gold, silver, copper, and some zinc), sold to the El Paso smelter. Old zinc-bearing tailings from the mill dump on the Cleveland property were shipped to the Peru mill at Deming.

The Bear Creek Mining Co., which late in 1939 took over operations at the Sunny Spot placer on Bear Creek 3 miles north of Pinos Altos, continued producing until February 3, 1940, and then closed down. The property was idle from February 4 to May 1, when it was taken over by the Momex Mining Co., which operated intermittently (owing to lack of water) during the rest of the year. The equipment used included a ¾-cubic yard dragline, washer, and sluices.

Red Rock district.—Lead-silver-copper-gold ore totaling 62 tons was shipped in 1940 from the Colard and another property in the Red Rock district.

Steeple Rock district.—The East Camp group, operated in 1940 by The Exploration Syndicate, Inc. (formerly East Camp Exploration Syndicate, a partnership), was again the leading producer of gold and silver in the Steeple Rock district; the output of ore totaled 16,126 tons, of which 2,175 tons containing 852 ounces of gold and 53,360 ounces of silver were shipped crude to the International Smelting & Refining Co., Miami, Ariz., and 13,951 tons were treated in the company new cyanide mill, yielding 2,442 fine ounces of gold and 132,125 fine ounces of silver in bullion sold to the Denver Mint. The mill, which was completed in April and operated steadily from May through December, has a capacity of 50 tons daily and is powered by two 240-hp. Diesel motors. Mine development and exploratory work done during the year totaled about 2,600 feet. Lessees at the Carlisle group shipped 2,460 tons of gold-silver and gold-silver-lead-copper ores and 172 tons of lead-gold-silver-copper ore to smelters in Arizona and Texas. The Willmont Mining Co. continued to work the Laura mine; part of the ore was treated in the 30-ton cyanide plant on the property, and part was shipped direct to smelters.

Swartz (or Carpenter or Camp Monarch) district.—The Black Range Development Co. worked throughout 1940 on development and mining at the Grandview group; the ore produced (3,159 tons averaging about 13 percent zinc and 9 percent lead and 0.75 ounce of silver to the ton) was sold to the Combination mill near Hanover.

White Signal district.—Small lots of gold ore from the Apache Trail and Reward claims and 18 tons of gold-silver ore from the Combination claim were shipped to the Ira L. Wright assay office at Silver City in 1940.

GUADALUPE COUNTY

The Stauber copper mine in the "Red Beds" 2½ miles north of Pastura was worked on a small scale under lease by Alex Bonnyman, Jr., about 10 months in 1940. The ore is oxidized and contains a little silver; shipments during the year totaled 2,604 tons, all sold to the El Paso smelter.

HIDALGO COUNTY

Eureka (Sylvanite) district (see also Grant County).—Lessees operated the Buckhorn-Barney-Woods group 16 miles southwest of Hachita 3 months in 1940 and shipped gold-silver-copper-lead ore to the El Paso smelter. A lessee on the Hardscrabble group shipped 48 tons of ore containing 64.13 ounces of gold, 33 ounces of silver, and 200 pounds of copper. Lewis Croom worked the Rincon mine from September through December and shipped 60 tons of ore containing 3,161 ounces of silver and a little lead and copper.

Gold Hill district (see also Grant County).—Most of the output from mines and prospects in the Hidalgo County part of the Gold Hill district in 1940 was gold-silver-lead and gold-silver-copper ore sold in small lots to Hawley & Hawley at Douglas, Ariz.

Lordsburg district.—The Banner Mining Co. operated the Bonney mine and the company flotation mill 6 miles south of Lordsburg continuously in 1940. The vertical main shaft (formerly 1,213 feet deep) was sunk to a depth of 1,300 feet, 4,663 feet of development drifts were driven, and 1,093 feet of diamond drilling were done. The product of the mill is copper-gold-silver-[iron] concentrates, which are sold to the El Paso smelter. A lessee at the "85" mine shipped 75 tons of copper-gold-silver ore to the Copper Queen branch of the Phelps Dodge Corporation at Douglas, Ariz.

San Simon district (Steins).—The Carbon Hill Mines group 6 miles south of Steins was operated from September 1 to 27, 1940, by the New Mexico Western Mining Corporation, which reconditioned the 50-ton mill and treated some zinc-lead-silver ore, recovering a small tonnage of zinc and lead concentrates; the zinc concentrates were shipped to the Amarillo (Tex.) smelter, and the lead concentrates and some crude ore were sold to the El Paso smelter. R. A. Custer shipped 67 tons of lead-silver-copper ore from the Bob Montgomery mine, and lessees at the "66" mine shipped some gold-silver ore.

LINCOLN COUNTY

Cedar Creek district.—A lessee installed a 10-ton gravity- and flotation-concentration mill at the Silver Cap No. 2 mine and treated about 78 tons of ore, from which were produced 7 tons of silver-lead concentrates that were trucked 145 miles to the El Paso smelter.

Jicarilla district.—Placer miners continued to recover gold in 1940 by rocking and sluicing in the Jicarilla Mountains southeast of Ancho.

Nogal district.—A lessee on the Great Western property milled 84 tons of ore in 1940 and produced 4 tons of gold-silver concentrates, sold to the El Paso smelter.

White Oaks district.—Gold-silver-copper ore was shipped to the El Paso smelter from two properties in the White Oaks district in 1940.

LUNA COUNTY

Cooks Peak district.—A lessee on the Ethel-"85" group in the Cooks Peak district shipped lead-silver ore through the Ira L. Wright assay office at Silver City in 1940, and another operator in the district shipped a few cars of zinc-lead ore to the Ozark pigment plant at Coffeyville, Kans.

Deming.—In 1940 the Peru Mining Co. operated continuously its 500-ton selective-flotation mill at Wemple near Deming and treated mostly company zinc ore from the Pewabic mine in the Central district, Grant County, with some custom ore from other districts in Grant County.

Tres Hermanas district.—C. R. Morrill shipped 4 tons of silver ore and 2 tons of lead-silver ore from the Red Bird Nos. 1 and 2 group to the El Paso smelter in 1940.

Victorio district.—Shanks Carpenter continued to ship gold-silver-lead-copper-[zinc]-iron-lime ore to the El Paso smelter from the Victorio group until May 10, 1940, when he ceased operations and canceled his lease; the property was idle the rest of the year.

OTERO COUNTY

Orogrande district.—About 2 cars of copper-gold-silver ore and 8 tons of lead-silver-gold ore were shipped to the El Paso smelter from Orogrande in 1940.

Sacramento district.—A 20-ton lot of copper-silver ore was shipped in 1940 from the Sacramento district.

RIO ARRIBA COUNTY

Headstone district.—The small mill on the property of the Amarillo Gold Mining Co. near Tres Piedras was operated for a short period in 1940.

SANTA FE COUNTY

Ortiz Mountains district (Cerrillos).—On old placer ground about 6 miles south of Cerrillos in the Old Placers district of the Ortiz Grant, the Universal Placer Mining Corporation continued operations (begun March 27, 1939) to April 22, 1940, when activity ceased. The excavating unit began with a 1-cubic yard dragline which in December 1939 was replaced by a 2½-cubic yard dragline. The plant included a dry-separation machine at the property and a two-bowl amalgamator at Santa Fe where the highly concentrated gold-bearing material underwent wet treatment.

San Pedro or New Placers district.—Raskob Mining Interests, Inc., operated its San Pedro mine continuously in 1940. The company 150-ton flotation mill completed at the mine about the first of the year treated 31,671 tons of ore, which yielded 3,049 tons of concentrates containing 1,336 ounces of gold, 19,739 ounces of silver, and 1,823,543 pounds of copper; additional output from the mine was 3,297 tons of smelting ore containing 1,275 ounces of gold, 12,823 ounces of silver, and 1,044,463 pounds of copper. Both the ore and concentrates were shipped to the El Paso smelter. A lessee at the Candelari mine did some retimbering, cleaned out the 435-foot tunnel, and installed track and air lines; he produced 225 tons of ore and amalgamated it in a 10-ton mill, recovering bullion containing 74 fine ounces of gold and 19 fine ounces of silver. A lessee at the Shamrock claim concentrated 19 tons of ore in a 5-ton mill and produced 2½ tons of concentrates containing 1.90 ounces of gold.

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) district.—The Empire Mines & Metals Co., which built a mill and did development work at the Bald Eagle mine in 1939, ran its mill in 1940 for a period and shipped a car of lead-silver-copper-gold concentrates. A. B. Stewart operated the Great Republic through January to December 4 and shipped 762 tons of gold-silver ore to the El Paso smelter.

Kingston district.—A car of silver ore sorted from the Southern Cross-Independence group and a small lot of silver ore from the Norris property were shipped to the El Paso smelter.

Lake Valley district.—Several cars of silver ore were shipped to the El Paso smelter from the Lake Valley district in 1940.

Las Animas district (*Hillsboro*).—Drunzer and Everheart, lessees, operated the Wicks mine steadily in 1940 and shipped several hundred tons of gold-silver-copper ore to the El Paso smelter.

The John I. Hallett Construction Co. continued throughout 1940 to operate its movable dry-land Coulter-Ainlay four-bowl gold-recovery plant on placer ground 6 miles northeast of Hillsboro. A very considerable yardage of overburden was removed before the gold-bearing gravel was dug and washed. The excavating unit consists of two butane-powered draglines of 1 and 1¼ cubic yards capacity, respectively.

Pittsburg and Caballos Mountains district.—Many individuals, local and itinerant, panned for gold in 1940 on placer ground in the Pittsburg and Caballos Mountains district; the yield was sold through the Myers Co. store at Hatch.

Tierra Blanca district.—In 1940, L. E. Cleveland shipped 10 tons of silver smelting ore from his Silver Bell claim through the Ira L. Wright sampling plant at Silver City.

SOCORRO COUNTY

Magdalena district.—The Waldo mine of the Ozark Smelting & Mining Co. was operated by the company for 2 months in 1940, resulting in the shipment of several hundred tons of zinc-lead sulfide ore to the company pigment plant at Coffeyville, Kans. A lessee on the Kelly group shipped lead-silver ore to El Paso and zinc-lead ore to Coffeyville.

San Mateo Mountains district.—Cleaning of tailings at the mill of the San Mateo Gold Mines resulted in a 2-ton shipment, containing gold, to El Paso.

TAOS COUNTY

Red River district.—A 6-ton lot of gold-silver ore was shipped to the El Paso smelter from the Lipton property.

The Molybdenum Corporation of America continued to produce molybdenum ore from the Phyllis group on Sulphur Creek. The ore is treated in the company 40-ton (per 24 hours) flotation mill at the junction of Sulphur Creek and Red River above Questa.

VALENCIA COUNTY

Grants district.—Two small lots of copper-silver smelting ore were shipped from Grants in 1940.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN OREGON

(MINE REPORT)

By Charles White Merrill and H. M. Gaylord

SUMMARY OUTLINE

The total value (in terms of recovered metals) of the gold, silver, copper, and lead produced in Oregon in 1940—$4,148,271—exceeded that in each year since mining was begun in 1852 and represents a 24-percent increase over 1939. It was divided among the metals as follows: Gold, almost 96 percent; silver, almost 4 percent; and copper and lead combined, less than 0.6 percent. No recovery of zinc was reported for the year. Baker County continued to be the leading metal producer and contributed 43 percent of the State total value; Grant County yielded 29 percent, Jackson County 15 percent, Josephine County 9 percent, and the other 15 producing counties only 4 percent. Despite small increases in the total value of production in Baker and Grant Counties (leading producers in the State) compared with 1939, their percentages of total State production dropped, largely because Jackson County nearly doubled its output during the year.

Cornucopia Gold Mines, which worked the Cornucopia mine in the Cornucopia district of Baker County, not only continued as the largest producer of lode gold in Oregon in 1940 but also led again in output of total gold, silver, and copper.

Another feature in the mining industry of the State in 1940 was the record output of gold by dragline dredges, which accounted for nearly half of the placer total. Production by nonfloating washing plants, to which gravel was delivered by mechanical means, almost doubled; but the output of placer gold by each of the other methods, except hydraulic and dry small-scale hand-operated methods, declined.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1936–40, and total, 1852–1940, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1936	93	166	136,338	60,753	$2,126,355	85,061	$65,880
1937	104	150	77,230	52,662	1,843,170	60,564	46,846
1938	84	157	74,936	81,729	2,860,515	100,507	64,974

1937	[6] 150	7,831,000	34,219.00	1,197,665	.153
1938	157	11,355,000	54,331.00	1,901,585	.167
1939	201	13,322,000	60,779.00	2,127,265	.160
1940	[6] 192	16,684,000	71,577.00	2,505,195	.150

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.

[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[4] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.

[5] None reported for 1936–37, inclusive.

[6] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

Gold.—Production of gold in Oregon in 1940 increased 21 percent over 1939; the output from placers increased 18 percent and that from lode mines 28 percent. Of the total placer gold, 49 percent was recovered by dragline dredges, 35 percent by connected-bucket dredges, 6 percent each by wet small-scale hand methods and nonfloating washing plants with mechanical excavators, and 4 percent by hydraulicking, drift mining, and dry small-scale hand methods combined. Virtually all the lode gold was derived from dry ores and most (97 percent) of it from dry gold ore. Although 304 properties produced in 1940, the bulk of the gold came from relatively few mines; the following 10 properties, listed in order of output, supplied 62 percent of the State total: Cornucopia Gold Mines (gold ore), Sumpter Valley Dredging Co. (connected-bucket dredge), Northwest Development Co. (dragline dredge), Porter & Co. (connected-bucket dredge), Cougar-Independence Lessees (gold ore), Murphy-Murray Dredging Co. (connected-bucket dredge), Ferris Mining Co. (Grant County operation) (dragline dredge), Lewis Investment Co. (gold ore), Timms Gold Dredging Co. (connected-bucket dredge), and The B-H Co. (dragline dredge).

Silver.—Silver production in Oregon in 1940 increased 108 percent in quantity and 118 percent in value over 1939. Of the State total Baker County contributed 61 percent (55 percent coming from the Cornucopia mine), Grant County 26 percent, and Jefferson County 9 percent; dry gold ore yielded 64 percent, dry gold-silver ore 29 percent, placer gravel 6 percent, and base-metal ores 1 percent. Nearly 81 percent of the total lode silver was recovered by concentration followed by smelting of the resulting concentrates; virtually all the rest of the output came from smelting of ore.

Copper, lead, and zinc.—Nearly 68 percent of the copper output of Oregon in 1940 was a byproduct of gold production at the Cornucopia mine. The lead output of the State totaled only 70,000 pounds. No zinc was reported recovered.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, and lead in Oregon in 1940, by counties, in terms of recovered metals

County	Mines producing [1]		Gold						Silver (lode and placer) [2]

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Sources of total silver as follows: 1940, 206,317 ounces from lode mines and 12,795 ounces from placers; 1939, 94,794 ounces from lode mines and 10,594 ounces from placers.
[3] Output from property not classed as a "mine."
[4] Lake, Linn, and Marion.

MINING INDUSTRY

Of the 105,469 tons of ore (including 3,219 tons of old tailings) sold or treated in Oregon in 1940 Baker County produced 55,941 tons or 53 percent, Grant County 23,889 tons (including 60 tons of old tailings) or 23 percent, and Josephine County 20,623 tons (including 2,175 tons of old tailings) or 20 percent. Nearly 94 percent of the ore was dry gold ore, and virtually all the remainder was dry gold-silver ore. In addition to the ore 3,219 tons of old tailings, of value principally in gold, were treated.

The six properties worked by connected-bucket dredges had one dredge each, none of which was moved elsewhere during 1940. Among the properties worked by dragline dredges, however, one had two dredges and a number of the dredges worked more than one property; in consequence, 16 dragline outfits worked 23 properties during the year. The dragline excavators were equipped as follows: 6 with 1½-cubic yard buckets, 5 with 1¼-cubic yard buckets, and 1 each with a 5-, 4-, 3-, 2½-, and 2-cubic yard bucket. Twenty-three nonfloating mechanical outfits worked 29 placer properties, indicating some movement of plants from one property to another.

Reports on the use of quicksilver at Oregon placer mines indicate that 1,317 pounds were consumed during 1940. The four connected-bucket dredges reporting consumption of quicksilver in 1940 recovered 61 ounces of gold for each pound used, compared with an average recovery of 53 ounces in 1939. For the nine properties worked by dragline dredges reporting consumption of quicksilver, a recovery of 51 ounces of gold per pound was recorded, compared with a recovery of 42 ounces in 1939. The quantities of gold recovered per pound of quicksilver used at other types of placer operations were as follows: Nonfloating washing plants with mechanical excavators, 13 ounces; hydraulic mines, 22 ounces; and small-scale hand operations, 5 ounces.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Oregon in 1940, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead
	Ore	Old tailings				
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Dry and siliceous gold ore	96,076	3,219	40,620	140,487	131,800	25,700
Dry and siliceous gold-silver ore	6,023		1,193	62,965	14,000	43,000
Copper ore	146		6	2,696	30,100	
Lead ore	5		6	169	100	1,300
Total, lode mines	102,250	3,219	41,825	206,317	176,000	70,000
Total, placers			71,577	12,795		
	102,250	3,219	113,402	219,112	176,000	70,000
Total, 1939	65,261	3,764	93,372	105,388	96,000	30,000

METALLURGIC INDUSTRY

Of the State total ore and old tailings (105,469 tons), 69 percent was treated in concentrating mills, most of which used flotation; 23 percent was treated in amalgamation and cyanidation mills, with or without concentration equipment; and 8 percent was shipped crude to smelters. Ultimate recovery of 71 percent of the total lode gold was from the smelting of concentrates; 12 percent from direct smelting of ore and old tailings; 10 percent as bullion from cyanidation of ore and old tailings; and 7 percent as bullion from amalgamation of ore and old tailings. All material requiring smelting was shipped out of the State, as Oregon has no smelters.

Data furnished by operators of gold and silver mills show that 11,139 pounds of 91-percent sodium cyanide were consumed in recovering 3,811 ounces of gold and 305 ounces of silver from 16,420 tons of ore and 579 tons of old tailings, and that 34 pounds of quicksilver were used in recovering 1,007 ounces of gold and 242 ounces of silver from 659 tons of ore and 250 tons of old tailings.

Mine production of metals in Oregon in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*
Ore and old tailings amalgamated	4,721	2,819	556		
Ore and old tailings cyanided	19,639	4,001	403		
Concentrates smelted:					
Flotation	5,345	29,595	166,090	127,900	39,700
Gravity	97	300	925		8,000
Ore and old tailings smelted	8,270	5,110	38,343	48,100	22,300
Total, lode mines		41,825	206,317	176,000	70,000
Total, placers		71,577	12,795		
		113,402	219,112	176,000	70,000
Total, 1939		93,372	105,388	96,000	30,000

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Oregon in 1940, by types of mills and by counties, in terms of recovered metals

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 10 and their output included under "Combined counties and districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 206,317 ounces from lode mines and 12,795 ounces from placers.
[4] Included under "Combined counties and districts."
[5] Output from a property not classed as a "mine."
[6] Exclusive of lode output, which is included under "Combined counties and districts."
[7] Greenhorn district lies in both Baker and Grant Counties.
[8] Mormon Basin district lies in both Baker and Malheur Counties.
[9] Greenback district lies in both Jackson and Josephine Counties.
[10] Includes following districts: Eagle Creek (lode) in Baker County, Mule Creek (all placer) in Curry County, Canyonville (all placer) and Myrtle Creek (all placer) in Douglas County, High Grade (all lode) in Lake County, Quartzville (all lode) in Linn County, and Gold Butte (all lode) in Marion County.

BAKER COUNTY

Baker district.—The Midas mine in the Pocahontas section of the Baker district was worked by hydraulic mining during 1940; 304 ounces of gold and 22 ounces of silver were recovered from 20,000 cubic yards of gravel.

Bull Run district.—The Ferris Mining Co. operated a dragline dredge with a 3-cubic yard dragline excavator on Bull Run Creek 6 miles southwest of Unity from October 3 until the end of 1940; 124,820 cubic yards of gravel yielded 529 ounces of gold and 56 ounces of silver.

Cornucopia district.—The Cornucopia mine, operated by Cornucopia Gold Mines, continued to be the outstanding producer of lode gold and of total gold, silver, and copper in Oregon in 1940. The flotation of 49,060 tons of gold ore yielded 2,266 tons of copper concentrates containing 22,570 ounces of gold, 120,743 ounces of silver, 122,448 pounds of copper, and 24,650 pounds of lead; the concentrates were shipped to a smelter. In terms of recovered metals, the mine supplied 54 percent of the lode gold produced in the State, 20 percent of the total gold, 55 percent of the total silver, 68 percent of the copper, and 21 percent of the lead. The company paid its first dividend—$28,725—during the year.

Cracker Creek district.—The dragline dredge of Consuelo Oregon Mines was the larger of the two placer-gold producers in the Cracker Creek district in 1940. Oregon-Argonaut Gold, Inc., operated the Argonaut mine 10 months and produced 509 tons of smelting ore containing 643 ounces of gold, 128 ounces of silver, and 630 pounds of copper; the property was deeded back to its former owners late in the year. A group of lessees and sublessees shipped 3,948 tons of ore containing 2,173 ounces of gold, 5,992 ounces of silver, and 7,211 pounds of copper from the Cracker Creek group of mines near Bourne; the group included the North Pole, Columbia, Tabor Fraction, and E and E properties.

Greenhorn district.—From June 15 to December 1, 1940, the Triangle Construction Co. operated a dragline dredge with a Diesel-electric washing plant and a Diesel dragline excavator with a 1½-cubic yard bucket.

Mormon Basin district.—The Ancient Channel Syndicate operated a nonfloating washing plant on Burnt River 2 miles southeast of Bridgeport during 1940.

Sumpter district.—The Sumpter Valley Dredging Co., largest producer of placer gold in Oregon in 1940, washed 3,311,112 cubic yards of gravel and recovered 7,697 ounces of gold and 1,663 ounces of silver; the dredge was of the connected-bucket electric-power type, with seventy-two 9-cubic foot buckets. Consuelo Gold Mines operated a dragline dredge on McCully Fork a short time. The Northwest Development Co. operated two dragline dredges in the Sumpter Valley section of Powder River throughout the year; 1,210,080 cubic yards of gravel yielded 6,934 ounces of gold and 1,776 ounces of silver. On November 1, 1940, a general copartnership by K. R. Nutting, J. E. Little, Louis L. Harris, and Harry F. Wolfinger acquired the assets of the Northwest Development Co., the Nutting Dredging Co., and Little, Harris & Wolfinger.

Virtue district.—Work at the Columbian mine in 1940 yielded 822 tons of smelting ore containing 320 ounces of gold, 74 ounces of silver, and 1,363 pounds of copper.

DOUGLAS COUNTY [1]

Riddle district.—Lobicasa Co. operated a dragline dredge using a dragline excavator with a 1½-cubic yard bucket on the Weaver and Benton property from May 24 until October 14, 1940; a substantial quantity of gold was recovered from 220,586 cubic yards of gravel washed.

GRANT COUNTY

Canyon district.—The Ferris Mining Co. operated a dragline dredge from January 1 until September 21, 1940; 1,152,210 cubic yards of gravel yielded 4,065 ounces of gold, 416 ounces of silver, and 14 ounces of platinum-group metals; the dragline excavator used a 4-cubic yard bucket. The Western Dredging Co. operated a connected-bucket dredge with seventy-two 6-cubic foot buckets on the John Day River near John Day during 1940.

Granite district.—Porter & Co. operated a connected-bucket dredge with sixty-one 4½-cubic foot buckets on Granite, Clear, Olive, and Crane Creeks during 1940. The Oroplata Mining Co. moved its dragline dredge from the Granite district, Grant County, to the Camp Carson district in Union County August 20, 1940. The Intermountain Mining Co. washed 110,000 cubic yards of gravel by dragline dredging from May 10 to the end of the year and recovered 1,719 ounces of gold and 403 ounces of silver. Operations at the Bellevue mine yielded 4,800 tons of ore, which was treated in the company 50-ton flotation plant; 1,001 tons of gold-silver concentrates containing 811 ounces of gold, 40,444 ounces of silver, 8,243 pounds of copper, and 33,732 pounds of lead were shipped to a smelter. The Constitution Gold Mining Co. shipped a small quantity of high-grade gold ore. Cougar-Independence Lessees produced 18,427 tons of gold ore, of which 664 tons were shipped for direct smelting and 17,763 tons were treated at the 75-ton flotation mill on the property; the shipping ore contained 414 ounces of gold, 3,473 ounces of silver, 1,907 pounds of copper, and 630 pounds of lead, and the 2,066 tons of concentrates contained 6,146 ounces of gold, 4,696 ounces of silver, 1,564 pounds of copper, and 187 pounds of lead.

Quartzburg district.—H. F. England Co. operated a dragline dredge on Dixie Creek 2 miles from Prairie City during 1940; 650,000 cubic yards of gravel yielded 3,119 ounces of gold and 525 ounces of silver; the dragline excavator had a 1½-cubic yard bucket.

Susanville district.—The Timms Gold Dredging Co. operated a connected-bucket dredge with sixty 4-cubic foot buckets at its new location on the Middle Fork of John Day River.

JACKSON COUNTY [2]

Elk Creek district.—Al Sarena Mines, Inc., operated the Buzzard or Al Sarena mine from January 1 to 26, 1940, and shipped lead concentrates to a smelter.

See also State of Oregon Department of Geology and Mineral Industries, Reconnaissance Geologic Map of the Butte Falls Quadrangle: 1941 (to accompany Bull. 22, Geology of the Butte Falls Quadrangle).

Gold Hill district.—Gold Hill Placers operated a nonfloating washing plant to which gravel was delivered by a 1¼-cubic yard power shovel on the E. C. Fiene, Ralph Dusenberry, G. L. Smith, Perry L. Waite, and W. L. Wright properties during 1940. The Lance mine was operated by hydraulicking early in the year; later a nonfloating washing plant, to which gravel was delivered by a 1¼-cubic yard bucket Diesel-electric dragline, was installed. The Murphy-Murray Dredging Co. operated a connected-bucket dredge with seventy 3½-cubic foot buckets from February 12 until the end of the year; 627,261 cubic yards of gravel yielded 4,253 ounces of gold and 616 ounces of silver. The Pleasant Creek Mining Corporation operated a dredge of the connected-bucket type on Pleasant Creek for a short period. The Lucky Eagle Mining Co. suspended operations at the Lucky Bart mine May 10 and opened the property to leasing.

Upper Applegate district.—Charles C. Stearns operated a dragline dredge on the Alaska of Oregon, Belle, Holzgang, and Mee properties in 1940. The B-H Co. worked the B-H (Sturgis) mine on Forest Creek with a dragline dredge; the dragline excavator had a 1½-cubic yard bucket. The Crescent Pacific Mining Co. operated a dragline dredge using a dragline excavator with a 1¼-cubic yard bucket on the Matney ranch intermittently in 1940; the company also used the same equipment on the Offenbacher and Smith ranches. The Sterling Mines, Inc., hydraulicked a substantial quantity of gravel at the Sterling mine. The Southern Oregon Mining Co. worked the Taylor property with a dragline dredge from November 14 until the end of the year. D. A. Wright recovered 678 ounces of gold and 170 ounces of silver from 50 tons of ore mined at the Steamboat group in the Steamboat section of the Upper Applegate district during the early months of the year.

JEFFERSON COUNTY

Ashwood district.—The Oregon King Mines, Inc., started operations at the Oregon King mine September 1, 1940, and shipped 1,062 tons of ore containing 329 ounces of gold, 20,313 ounces of silver, 6,169 pounds of copper, and 29,474 pounds of lead to a smelter before the end of the year.

JOSEPHINE COUNTY [3]

Galice district.—The Lewis Investment Co. worked the Benton mine throughout 1940 and was again the third-largest producer of lode gold in the State; the ore was treated in a cyanide plant with a 60-ton daily capacity. W. S. Robertson amalgamated a small quantity of very rich ore at the Bunker Hill mine and cyanided old tailings; the mine ranked fifth in production of lode gold in the State.

Greenback district.—The Blue Channel mine was operated by hydraulicking from January 1 to May 20, 1940. P. B. Wickham operated the Greenback mine from January 1 until September 10, after which the lease was suspended.

Waldo district.—The Esterly mine was worked by hydraulicking from the first of the year until July 1 and from October 20 until the end of 1940. The Atlas Gold Dredging Co. operated a dragline dredge on the Leonard property on Althouse Creek.

[3] *See also* Wells, Francis G., Preliminary Geologic Map of the Grants Pass Quadrangle, Oregon: State of Oregon Department of Geology and Mineral Industries, 1940.

MALHEUR COUNTY

Malheur district.—The Pacific Placers Engineering Co. operated a nonfloating washing plant on the State Veterans Aid property during May and June; the operation was taken over by Pacific Placers late in 1940.

Snake River district.—J. M. Rhodes washed 36,039 cubic yards of gravel in a nonfloating washing plant from April 28 to August 3; gravel was excavated with a ⅜-cubic yard power shovel and delivered to the washing plant in 1½-ton dump trucks.

UNION COUNTY

Camp Carson district.—The Oroplata Mining Co. moved its dragline dredge from Grant County to the Golden West Placers and resumed production September 23, 1940; the dragline excavator had a 2½-cubic yard bucket. Hydraulicking was also carried on at this property by F. M. Cronkhite.

OTHER COUNTIES

Small outputs in 1940 were reported also from Coos, Curry, Harney, Lake, Lane, Lincoln, Linn, Marion, Morrow, Umatilla, and Wallowa Counties.

Details of production by counties and districts are given in the preceding table.

GOLD, SILVER, COPPER, AND LEAD IN SOUTH DAKOTA

(MINE REPORT)

By Chas. W. Henderson

SUMMARY OUTLINE

Lode gold mining is the principal mineral industry of South Dakota. The placer gold output is small. Silver is produced annually as a by-product, and copper and lead are produced occasionally. There is also production of minor metals such as columbo-tantalite, minor non-metals such as lithium minerals, and a little tin. The mineralized area of the State is included in Custer, Lawrence, and Pennington Counties in the mountain group known as the Black Hills. At Lead, Lawrence County, is the Homestake mine, largest producer of gold in the United States; it was operated steadily during 1940. Details of producing mines are given in the review by counties. The output of recovered gold in South Dakota in 1940 was 586,662 fine ounces valued at $20,533,170, a 5-percent decrease from the peak output of 618,536 ounces and $21,648,760 in 1939. Recovered silver in 1940 was 175,514 ounces, copper 12,000 pounds, and lead 14,000 pounds.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1939–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.
[5] $0.67878787.
[6] $0.71111111.

	586,662	20,533,170	175,514	124,810	12,000	1,356	14,000	700	20,660,036

MINING AND METALLURGIC INDUSTRY

The total ore mined and sold or treated by producers of lode gold and silver in South Dakota in 1940 was 1,667,370 tons yielding in recovered metals 586,433 fine ounces of gold, 175,493 ounces of silver, 12,000 pounds of copper, and 14,000 pounds of lead. By methods of treatment, 1,433,737 tons were treated by amalgamation followed by cyanidation of sands and slimes; 176,072 tons by cyanidation only (36,708 tons of which were first roasted, and part of 130,643 tons was also first roasted); 45,168 tons by jigging, amalgamation of the jig concentrates, and flotation of the remaining pulp (concentrates carrying gold, silver, and some copper were shipped to smelters); 200 tons by amalgamation only; 800 tons by amalgamation with flotation of tailing; 11,288 tons by countercurrent-decantation cyanidation with jig in ball-mill circuit (gold concentrates to smelter); and 105 tons (containing 220.84 ounces of gold, 1,004 ounces of silver, and 15,557 pounds of lead) shipped crude to smelters. Operating details at both lode and placer mines are given in the following review by counties.

METALLURGIC RECOVERY

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1936–40

Year	Ore treated	Gold in bullion	Silver in bullion	Quicksilver used
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*
1936	1,393,450	330,052.08	66,585	15,093
1937	1,414,772	329,975.10	66,640	10,178
1938	1,430,391	328,044.50	62,602	7,744
1939	1,461,283	336,424.93	64,710	9,221
1940	1,479,905	313,964.15	60,254	4,997

Gold and silver bullion produced at mills in South Dakota by cyanidation, 1936–40

Year	Material treated				Gold in bullion product	Silver in bullion product	Sodium cyanide used [1]
	Crude ore	Concentrates	Sands and slimes	Total			
	Short tons	*Short tons*	*Short tons*	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*
1936	155,652		1,382,676	1,538,328	255,849.83	77,811	749,923
1937	182,406		1,394,252	1,576,658	249,980.70	72,883	786,072
1938	155,667		1,416,899	1,572,566	262,913.21	98,777	860,762
1939	170,270	[2] 61	1,443,548	1,613,879	279,889.77	102,317	887,888
1940	187,360		1,432,244	1,619,604	269,518.82	111,607	[3] 883,849

[1] In terms of 96- to 98-percent strength.
[2] From 1,143 tons of ore treated by flotation.
[3] Actually 1,753,137 pounds of calcium cyanide (48- to 49-percent strength) and 8,000 pounds of sodium cyanide (91-percent strength); all reduced to equivalent of 96- to 98-percent strength to conform with earlier use of figures for high-strength NaCN and KCN.

REVIEW BY COUNTIES

CUSTER COUNTY

Small hand-method placering was done on French Creek. Development work at the Spokane lode mine resulted in the shipment of 81 tons of lead-silver-gold ore to the Helena (Mont.) smelter.

LAWRENCE COUNTY

Homestake mine.—The Homestake mine includes a large acreage of consolidated lode claims at Lead, operated by the Homestake Mining Co. The Homestake Mining Co. in 1877 acquired original discoveries of the year 1876 known as the Homestake and Golden Star claims but continued subsequently to add to its acreage by purchase and consolidation of other companies. Development of the mine from the 3,200- to the 5,000-foot level has been under way since 1932. One new shaft, the Ross, has been in operation since 1934 and had been completed to the 4,100-foot level at the end of 1938. Another new shaft, the Yates, was begun in 1938; in 1939 pilot raises were completed 3,426 feet, and a winze from the 4,100-foot level was sunk to the 4,550-foot level; in 1940 all pilot raises from the 4,100-foot level were completed, the winze from the 4,100-foot level was continued to the 4,700-foot level, and drifting on the 4,700-foot level was begun. The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1940, says—

Operations during 1940 were normal in all departments. Ore production from the mine was 1,433,737 tons. This is 2.41 percent higher than in 1939. The gross income for gold and silver produced was 4.56 percent lower than in 1939. It is expected that production for 1941 will be approximately the same as in 1940.

Operating expenses exclusive of taxes were slightly lower than in 1939. Total taxes were $3,589,344.32, which is $456,832.21 more than in 1939.

There are 397,603 tons of broken ore remaining in shrinkage stopes.

The reserve of developed ore is 18,636,797 tons. As in previous reports this includes the broken ore. Of the total reserve 7,974,600 tons are in the new ledge referred to in recent reports. This ore is materially lower in grade than that in the main ledges. Production from this ledge gradually increased and reached an average of 848 tons per day in December. It is expected that the average grade of all ore produced in 1941 will be substantially the same as that for 1940.

Yates shaft construction has continued to make good progress. Pilot raises have all been completed to the 4,100-foot level, and the shaft is stripped to size and timbered from the surface to 50 feet below the 3,350-foot level. The hoists were placed in operation in May and have since been continuously operated for shaft construction work. The shaft has not yet been used for production because hoisting at the Ellison shaft is still possible. The winze from the 4,100-foot level was sunk to the 4,700-foot level and drifting on the 4,700-foot level was begun.

Ore milled, receipts, and dividends, Homestake mine, 1936–40 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1936	1,383,929	$19,506,534.78	$14.0950	$9,041,760
1937	1,394,773	19,304,076.45	13.8403	9,041,760
1938	1,377,314	19,284,459.67	14.0015	9,041,760
1939	1,400,015	19,922,964.60	14.2300	9,041,760
1940	1,433,737	19,014,767.73	13.2624	9,041,760

[1] From 1876 to 1940, inclusive, this mine yielded bullion and concentrates that brought a net return of $399,012,747 and paid $133,229,242 in dividends.

In the course of mining and development in 1940 the company sank 1,711 feet of shaft, drove 29,155 feet of drifts and 12,238 feet of raises, and did 46,481 feet of diamond drilling. Surface treatment plants operated (besides the primary crushing plants at the hoists) comprised the South mill, which includes the main secondary crushing (including 180 stamps), grinding, and amalgamating plant, with a capacity of 3,900 tons per 24 hours, cyanide sand plant No. 1, cyanide sand plant No. 3, and the refinery—all at Lead; and the slime plant at Deadwood. At the refinery silver is parted from the gold and virtually pure metals are shipped to the Denver Mint.

Other mines.—The Bald Mountain Mining Co., second-largest producer of gold and silver in South Dakota in 1940, continued to operate its consolidated group of mines and 350-ton all-sliming countercurrent-cyanidation plant at Trojan. Much of the ore of the Bald Mountain group is oxide, but in 1938 the company installed a 110-ton gas-fired rotary hearth furnace to treat refractory sulfide or "blue ores" and continued in 1940 to mine both sulfide and oxide ores. The yield in recovered metals from 130,643 tons of ore treated in the mill and 10 tons of high-grade ore shipped to the Omaha (Nebr.) smelter was 25,849 fine ounces of gold and 50,077 fine ounces of silver. The ore is brought to the mill by rail tramway and trucks. The company did 4,485 feet of development work in the mine during the year.

At the Maitland group 5½ miles northwest of Deadwood the Canyon Corporation continued to operate steadily its 100-ton roast-cyanide mill on its refractory sulfide ores. Besides gold and silver the ores contain pyrite, silica, dolomite, and some undetermined arsenic mineral. The yield in recovered metals from 36,708 tons was 12,503 fine ounces of gold and 1,730 fine ounces of silver. Lime-hydrating equipment and a diaphragm pump were added to the mill equipment. The mine is opened by a vertical shaft 600 feet deep. Drifts driven in 1940 totaled 3,260 feet of prospecting work and 3,627 feet of mine development work; 2,540 feet of diamond drilling were done.

Gilt Edge Mines, Inc., continued operation at the Gilt Edge-Dakota Maid-Oro Fino-Rattlesnake Jack group in the Bear Butte district. The ores are both oxide and sulfide and contain gold, silver, and iron, and enough copper to be troublesome in the cyanide circuit. So, in February–March 1940 flotation cells were installed, and the larger part of the production in 1940 was in gold-silver concentrates, containing some copper, sold to Montana smelters. Amalgamation also continued by amalgamating jig concentrates; and a small quantity of slimes was cyanided. Development work in 1940 consisted of 100 feet of shaft, 1,900 feet of drifts, and 2,700 feet of diamond drilling. The Oro-Fino shaft was unwatered. At the end of 1940 development of the property was reported as three shafts 100, 450, and 335 feet deep and 10,000 feet of drifts and crosscuts.

The Frerichs Mining Co. operated a group of claims in Whistler Gulch 1½ miles from Deadwood and ran its 30- to 50-ton all-sliming cyanidation plant for 10 months. In 1940 a flotation unit and a thickener were added to the mill equipment. The object of the flotation unit was to remove graphite, a cyanicide.

The Black Hills Tin Co. mined a few hundred tons of gold ore from part of its property at Tinton and produced a small gold-silver bar. Within its mill building in 1940 experiments were made in working out a flow sheet for treating tin ore, and several hundred tons of tin ore were treated; some tin concentrate was sold.

Sluicing at small placers near Deadwood and Tinton yielded some gold.

PENNINGTON COUNTY

The receiver for Empire Gold Mines, Inc., former operator of the Golden Slipper mine and amalgamation-flotation mill 5 miles east of Hill City, made a small clean-up of material around the mill. The Bald Mountain Mining Co. of Trojan took a lease on this property and began work January 15, 1941.

The Gold Lode mine and mill 5 miles northwest of Hill City were operated for 10 weeks. The 25-ton mill was enlarged to 75-ton capacity. Flotation cells were added to the jigs, amalgamating plates, and tables. James A. Murphy operated a small amalgamation mill for 60 days, when water was available, on ore from the Western Bell, 6 miles from Hill City.

The once famous Holy Terror-Keystone mine at Keystone was reopened in 1940; the 100-ton cyanide plant was rebuilt in July and was operated the remainder of the year. The mill process is countercurrent-decantation cyanidation, with a jig in the ball-mill circuit. Gold-silver bullion was shipped to the Denver Mint and gold-silver concentrates to Montana. The mine is opened by a 500-foot shaft, which first had to be retimbered. The ore carries pyrite and arsenopyrite.

Individuals sluicing, rocking, and panning, principally on Battle, Rapid, and Spring Creeks, continued to recover small lots of gold dust, most of which was sold to dealers or traded for groceries at stores in the vicinity.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN TEXAS

(MINE REPORT)

By Chas. W. Henderson

SUMMARY OUTLINE

Silver was found in Texas in 1880 at the Presidio mine at Shafter, Presidio County, but it was not until 1885 that shipments were begun. From 1885 through 1940 this mine has been by far the principal producer of the State—chiefly of silver but also of gold and lead. Another early producer was the Hazel mine in Culberson County. The American Metal Co. of Texas continued to operate the Shafter mine and 400-ton cyanidation mill in 1940 and made a slightly increased tonnage output containing less silver to the ton than in 1939. About 1,000 tons of silver smelting ore, carrying some copper, were shipped from the Hazel mine to the El Paso smelter. Of interest in 1940 was the shipment of 3 tons of copper ore from an open-cut on the Bob Cat location 10 miles south and 6 miles east of Quanah, Hardeman County, where copper ore has been reported for many years. About 600 tons of silver smelting ore, carrying some copper, were shipped from the Sancho Panza mine near Allamoore, Hudspeth County, to the El Paso smelter. About 600 tons of silver smelting ore, carrying copper and lead, were shipped from the Plata Verde mine in Hudspeth County, southwest of Van Horn, to the El Paso smelter. Smelting lead-silver ore, carrying some copper, was shipped from the Black Hill mine near Sierra Blanca, Hudspeth County, to El Paso.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1936 to 1940, as well as the total metal production from 1885 to 1940.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1936–40, and total, 1885–1940, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1936	104,990	613	$21,455	1,361,459	$1,054,450
1937	120,145	562	19,670	1,325,660	1,025,398
1938	131,002	439	15,365	1,433,008	926,389
1939	141,795	324	11,340	1,341,945	910,896
1940	146,936	312	10,920	1,326,150	943,040
1885–1940	(1)	7,735	204,670	31,417,729	22,094,896

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1936	53,000	$4,876	935,000	$43,010			$1,123,791
1937	320,000	38,720	790,000	46,610			1,130,398

Presidio	1	144,558	309	1,294,803		382,000
	6	146,936	312	1,326,150	60,000	410,000
Total, 1939	7	141,795	324	1,341,945	68,000	454,000

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Texas in 1940, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)
Dry and siliceous silver ore	4	146,811	309	1,322,364	59,308	386,703
Copper ore	1	3			300	
Lead ore	1	122	3	3,786	392	23,297
	6	146,936	312	1,326,150	60,000	410,000
Total, 1939	7	141,795	324	1,341,945	68,000	454,000

SMELTING AND REFINING PLANTS IN TEXAS

In 1940 the American Smelting & Refining Co. continued to purchase gold, silver, copper, and lead ores and concentrates from operators in Arizona, California, New Mexico, and Texas for reduction in its lead and copper smelters at El Paso. The smelters were not operated at full capacity because of decreasing receipts from Mexico; termination on March 22, 1939, of the company's contract under which it had treated the copper concentrates from the 15,000-ton Chino concentrator at Hurley, N. Mex.; and the closing on May 31, 1939, of the Pecos zinc-lead-copper-silver-gold mine and 600-ton flotation mill in San Miguel County, N. Mex., for 13 years an important shipper of lead-copper-silver-gold concentrates to the El Paso smelter. In addition to the lead and copper furnaces the plant contains a unit for the recovery of arsenic. The Nichols electrolytic copper refinery at El Paso, a unit of the Phelps Dodge Corporation, continued to refine copper anodes produced at corporation smelters in Arizona. The Illinois Zinc Co. gas-retort zinc smelter at Dumas (idle from March 25, 1939, through the remainder of that year) was leased by the American Zinc Co. of Illinois and was reopened in February 1940 to treat zinc concentrates from the Peru mill at Wemple near Deming, N. Mex., and concentrates from Mexico. Additions to the roasting and smelting works of the Dumas plant, which will increase the capacity 50 percent, were completed by February 1941. Additions in March and April will increase the capacity 100 percent over that of 1939. The American Smelting & Refining Co. gas-retort zinc smelter at Amarillo was operated continuously on zinc ores and concentrates purchased from operators in Arizona, Colorado, Nevada, New Mexico, Utah, and Mexico.

MINES REVIEW BY COUNTIES

Culberson County.—Silver ore totaling 1,055 tons, containing 18,903 ounces of silver, 34,945 pounds of copper, and 1,984 pounds of zinc, was shipped from the Hazel mine 14 miles northwest of Van Horn to the El Paso smelter by A. P. Williams, lessee. The mine is opened by a vertical shaft 320 feet deep. Only 60 feet of development work were done in 1940.

Hardeman County.—From an open-cut near Quanah, 3 tons of copper ore containing 320 pounds of copper were shipped to the El Paso smelter.

Hudspeth County.—Sancho Panza Mines and Garren Lease together shipped 577 tons of silver smelting ore containing 1,102 ounces of silver and 24,778 pounds of copper to the El Paso smelter from the Sancho Panza mine, northeast of Allamoore. The Yodina Mining Co., prospecting in Culberson and Hudspeth Counties, shipped several lots of lead-silver-gold ore by truck to El Paso. Lessees on the Plata Verde mine southwest of Van Horn shipped several hundred tons of silver smelting ore containing copper and lead.

Presidio County.—The American Metal Co. of Texas, by maintaining its mill at capacity and by reducing mining costs, was able to operate continuously in 1940 on lower heads into the mill than in 1939. The quantity treated in 1940 was 144,558 tons compared with 138,934 in 1939. The mine is developed by two vertical shafts, one 400 and one 600 feet deep; three underground subshafts, one 100, one 250, and one 450 feet deep; and other openings totaling about 52 miles of underground workings. Development work in 1940 totaled 47 feet of shaft, 7,957 feet of drifts, and 37,395 feet of diamond drilling. The minerals contained in the ore are argentite, cerargyrite, galena, anglesite, and cerussite. The ore is transported 1¼ miles by rail and aerial tramways from the shafts to the mill. The crushing plant operates an average of 14 hours a day. The discharge from the gyratory crusher is elevated over a 15-inch Dings magnetic pulley onto a ⅝- by ½-inch-mesh stationary screen. The oversize goes to a 3-foot Symons cone crusher set at ¼ inch. From storage tanks the ore is elevated to fall over a 3- by 5-foot 10-mesh Hum-mer screen. The oversize from the Hum-mer screen goes to a conical ball mill with 10-mesh discharge screen. The oversize from the ball mill goes to a Dorr Duplex classifier. The fines from the discharge screen of the ball mill and the undersize from the Hum-mer screen go to 11 Wilfley tables. The table tails go to tube mills where they are ground to between 80 to 90 percent minus-200-mesh. Six Pachuca tanks connected in series make up the agitation unit; the average agitation is 20 hours. The clarified solution passes to a Merrill-Crowe zinc-dust precipitation plant. In 1940 the mill produced 1,113,806 ounces of silver and 291 ounces of gold, in cyanide precipitates, and 469 tons of table concentrates containing 180,997 ounces of silver, 18 ounces of gold, and 381,783 pounds of lead. The cyanide precipitates carried 27,458 pounds of lead dissolved by the cyanide, an unusual phenomenon. The concentrates and precipitates were shipped to the Carteret (N. J.) smelter. Electric power for the mine and mill is obtained from a 1,300-horsepower Diesel plant.

Production of silver from the Presidio mine,[1] *1885–1940*[2]

GOLD, SILVER, COPPER, LEAD, AND ZINC IN UTAH

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

Utah led all the States in value of combined production of gold, silver, copper, lead, and zinc in 1940; the total value for the State—in terms of recovered metals—was $86,585,499. This output, compared with $62,725,551 in 1939, represents a 38-percent gain. Greater production of all five metals (including an all-time high for gold and copper) was stimulated by moderately higher prices for silver and the base metals. Most of the gains in gold and copper and much of that in silver were in the Bingham district and resulted chiefly from the high rate of operations by the Utah Copper Co. The Park City region showed the greatest gain in silver, marked gains in gold and copper, and nearly doubled its 1939 production of lead and zinc. The output of each of the five metals in the Tintic district decreased. Tooele County showed a slight gain in total value of metal output.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065

[1] 1864–1901: Figures not available; 1902–40: 389,413,166 tons produced.
[2] Short tons.

Gold.—The output of recoverable gold in Utah increased 77,743 ounces in 1940 compared with 1939. Copper ore yielded 63 percent of the total and siliceous ore 24 percent; the remainder was recovered from lead, lead-copper, zinc-lead, and zinc-lead-copper ore, and placers. Gold recovered from placer gravels was negligible. Ore of all classes treated at concentration mills yielded 74 percent of the total gold, ore shipped crude 21 percent, and ore cyanided and amalgamated and placers the remainder. The Bingham (West Mountain) district, which produced 72 percent of the State total gold, showed a gain of 66,005 ounces. There was a moderate decline in gold recovered from ore of the Tintic district because of decreases at the Centennial-Beck-Victoria group and the Eureka Standard mine. Gold recovered from ore of the Park City region nearly trebled, owing principally to a sharp increase from the New Park Mining Co. Gold recovered from ore of Tooele County gained, chiefly because of greater output from mines in the Camp Floyd district. The Utah Copper Co., which supplied over 60 percent of the total gold production of Utah, was followed by the Con Mercur, United States & Lark, Tintic Bullion, and Mayflower mines.

Silver.—The output of recoverable silver from Utah mines in 1940 increased 13 percent over 1939, owing to greater production of zinc-lead, zinc-lead-copper, and copper ore. Zinc-lead and zinc-lead-copper ore yielded 47 percent of the State total silver, siliceous ore 25 percent, copper ore nearly 18 percent, and lead and lead-copper ore 10 percent. The Bingham district was the largest producer (39 percent of the State total silver) followed by the Park City region, the Tintic district, and Tooele County. Concentrates yielded 67 percent of the silver output of the State and ore shipped crude to smelters virtually all the remainder. The Utah Copper Co. was the largest producer of silver in Utah in 1940; it was followed by the United States & Lark (first in silver production in Utah in 1939), Tintic Standard, Silver King

Coalition, and Park City Consolidated properties, the Judge group of the Park Utah Consolidated Mines Co., the Mayflower tunnel of the New Park Mining Co., and the Chief Consolidated property. These eight properties produced 76 percent of the silver output of Utah in 1940.

Copper.—The output of recoverable copper in Utah in 1940 set a new high mark and was 119,948,000 pounds greater than in 1939. The previous record was in 1937, when 411,988,000 pounds were produced. The Utah Copper Co. open-cut mine at Bingham and mills at Magna and Arthur operated at a high rate during 1940 and in December reached a record production rate of 42,000,000 pounds of

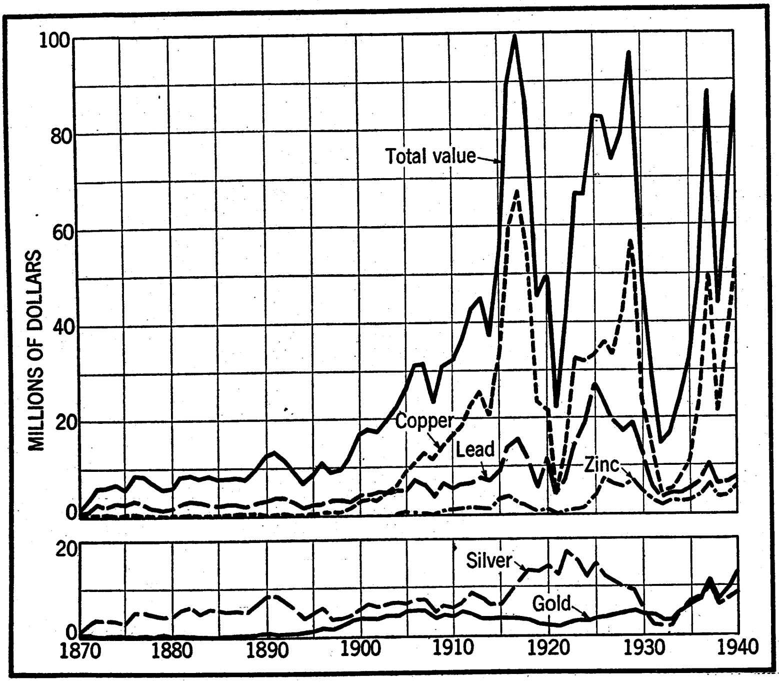

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Utah, 1870–1940.

copper a month; copper ore mined in 1940 totaled 25,950,500 tons, compared with 19,310,200 tons in 1939, and exceeded the previous high point of 23,119,800 tons in 1937. Copper ore and mine-water precipitates yielded 98 percent of the State total copper in 1940; the remainder came from zinc-lead, zinc-lead-copper, and lead-copper ore sent to flotation mills and siliceous ore shipped crude to smelters. Other important copper producers in Utah were the United States & Lark and Ohio Copper properties in the Bingham district, the Ophir Hill in Tooele County, and the Tintic Standard in the Tintic district.

Lead.—There was a 12-percent gain in output of recoverable lead in Utah in 1940 over 1939. The Bingham district continued to be the largest lead-producing area in the State, and the bulk of the output came from the United States & Lark property (operated by the United States Smelting, Refining & Mining Co.). The Park City region made the greatest increase in lead output, as the Silver King Coalition Mines

Co. and the Park Utah Consolidated Mines Co. properties were operated at an increased rate in 1940 and produced over 33,000,000 pounds of recovered lead—a sharp gain over 1939. The output of lead from the Tintic district decreased, owing chiefly to the drop in production at the Eureka Standard mine. The Calumet and Hidden Treasure mines in Tooele County showed increases. The principal lead-producing properties in Utah in 1940 were the United States & Lark, Silver King Coalition, Park Utah Consolidated, Calumet, Hidden Treasure, and Tintic Standard; these six properties produced 77 percent of the State total.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1940, by counties, in terms of recovered metals

[1] Includes 275 ounces of placer gold distributed as follows: Garfield County, 1 ounce; Grand County, 82 ounces; Millard County, 74 ounces; San Juan County, 35 ounces; and Uintah County, 83 ounces.

[2] Includes 145 ounces of placer gold distributed as follows: Garfield County, 7 ounces; Grand County, 70 ounces; Millard County, 19 ounces; San Juan County, 21 ounces; and Uintah County, 28 ounces.

Zinc.—The output of recoverable zinc in Utah in 1940 rose 27 percent over 1939. The Park City region showed the greatest gain, followed by the Bingham district; there were losses in the Tintic district and in Tooele County. The source of virtually all the zinc output was zinc-lead ore treated by selective flotation at four plants; all the zinc ore (only 26 tons containing 27,712 pounds of zinc) was shipped crude to a smelter. The United States & Lark property at Bingham was the chief producer of zinc, followed by the Park Utah Consolidated and Silver King Coalition in the Park City region and the Calumet in Tooele County; these four properties produced 82 percent of the State total.

MINING INDUSTRY

The output of copper ore in Utah in 1940 represented 94 percent of the total tonnage of ore of all classes. The Utah Copper Co. open-cut mine at Bingham, which began the year with a gross copper production of nearly 40,000,000 pounds a month, gradually increased its output until more than 42,000,000 pounds a month were being produced in December. This copper ore, carrying a low content of gold and silver, accounted for nearly all the gain in output of copper and much of the gain in gold and silver in the State. Production of zinc-lead ore from the Park City region was greatly increased, whereas that from Bingham showed a slight gain and that from Tintic declined. The value of the metal output of Tooele County increased in 1940, owing principally to the large production of siliceous ore at Mercur. The increase in the Rush Valley district in Tooele County was responsible for the gain in output of lead in that county. Production in the Ophir district declined, owing chiefly to completion of the treatment of Ophir Hill tailings by the International Smelting & Refining Co.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Utah in 1940, with content in terms of recovered metals

Source	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	33	376,859	54,881	118,265	633,974	357,194	
Dry and siliceous gold-silver ore	36	176,369	23,961	1,057,672	1,304,653	3,864,286	
Dry and siliceous silver ore	36	241,895	4,996	1,856,848	2,544,605	7,775,175

Total, placers	21		275	31			
	212	27,939,346	355,494	12,172,299	[1]463,728,000	151,376,000	87,576,000
Total, 1939	186	21,094,097	277,751	10,758,657	[4]343,780,000	135,268,000	69,052,000

[1] Includes 14,223,006 pounds recovered from mine-water precipitates.
[2] Zinc-lead-copper ore all from 1 mine; Bureau of Mines not at liberty to publish figures.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 7,923,790 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

In 1940 the largest tonnage on record of ore containing gold, silver, copper, lead, and zinc was mined in Utah. It was treated as follows: 27,215,217 tons at concentration mills compared with 20,393,488 tons in 1939; 297,567 tons at cyanidation mills compared with 230,224 tons in 1939; 520 tons at amalgamation plants compared with none in 1939; and 426,042 tons shipped crude to smelters compared with 470,385 tons in 1939.

All the ore cyanided was treated at plants of two companies at Mercur, each treating considerable custom ore. The 297,567 tons cyanided yielded 17,537 ounces of gold and 518 ounces of silver. These two plants reported the consumption of 96,069 pounds of sodium cyanide (91-percent grade), 39,800 pounds of calcium cyanide, 1,704,510 pounds of lime, and 26,589 pounds of zinc dust.

Ten concentration plants were operated in Utah in 1940. Three plants (Arthur, Magna, and Ohio Copper) treated 26,296,475 tons of copper ore and old tailings; four mills (Bauer, Midvale, Silver King, and Tooele) treated 768,652 tons of zinc-lead and zinc-lead-copper ore; one mill (Ophir Hill) treated 147,585 tons of silver tailings; and two gravity-concentration plants, one in Tooele County and one in Utah County, treated 2,505 tons of lead ore.

The following tables give details of treatment for all the ore produced in Utah in 1940.

Mine production of metals in Utah in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

[1] Detroit district lies in both Juab and Millard Counties.

[2] Tintic district lies in both Juab and Utah Counties.

BEAVER COUNTY

Beaver Lake district.—Small shipments of crude silver-lead ore, principally from the Beaver Gold & Copper Co. property northwest of Milford, comprised the output in 1940.

Bradshaw district.—The Cave property produced 1 car of gold ore shipped crude to a smelter and 1 car of zinc-lead ore shipped to a custom mill in 1940.

Granite district.—Gold ore from the Hope Chest property at the mouth of Big Canyon Gulch and lead ore from the Beaver View property were shipped crude to a smelter.

Newton district.—A small lot of gold ore was shipped crude to a smelter from the Big 4 property.

Rocky district.—The Old Hickory group, incorporated as the Prospect Mining Co. in June 1940, was the only property operated in the Rocky district. In October the presence of scheelite was noted in the copper ore that had been shipped crude to smelters. Shipments were discontinued, and construction of a 25-ton concentration mill was begun.

San Francisco district.—The value of the metal output of the San Francisco district in 1940 was less than in 1939, owing largely to decreased output from the Horn Silver property. Other producers were the Quad Metals Corporation and the King David Mining Co.

Star and North Star district.—Regular shipments of lead-copper ore and zinc-lead ore were made in 1940 to Tooele from the Moscow Silver property. Most of the remaining production came from zinc-lead ore shipped to Tooele by the New Majestic Mining Co.

BOX ELDER COUNTY

Ashbrook district.—Silver ore shipped crude to a smelter yielded the entire metal output of the Ashbrook district in 1940. The Vipont mine was the largest producer.

Crater Island district.—Gold ore was shipped from the Copper Blossom mine in 1940.

Lucin district.—Four cars of zinc-lead ore shipped to Midvale from the Eldorado mine comprised the bulk of the output of the Lucin district in 1940.

EMERY COUNTY

Small test lots of silver ore were shipped crude from properties in the Cedar Mountains.

GARFIELD COUNTY

A little placer gold was recovered in the Imperial (Crescent Creek) district.

GRAND COUNTY

The entire output of Grand County came from placer gravels along the Colorado River.

IRON COUNTY

Stateline district.—The value of the metal output of Iron County (all from the Stateline district) decreased sharply in 1940, owing to the closing of the Creole property in August and the decrease in gold ore shipped crude to a smelter by Aetna Gold Mines, Inc. The company began to construct a 75-ton flotation mill in 1940. Other producers in the district were the Wonder, Ophir, Badger, Blue Rock, and New Arrow properties.

JUAB COUNTY

Detroit district.—Production in the Detroit district decreased sharply in 1940 owing to suspension of mining (after 3 months of work) at the Ibex property—only active mine in the Juab County section of the district.

Fish Springs district.—The Carnation, Galena, and Utah properties shipped lead ore rich in silver direct to smelters in 1940.

Mount Nebo district.—The Syndicate Oil Mineral Co. shipped 1 car of lead ore from the Earl No. 5 property.

Tintic district.—The Tintic district, which lies in both Juab and Utah Counties, is reviewed here. The table that follows gives the metal production in each section of the district for 1940, a comparison with the total output in 1939, and the grand total from 1869 to 1940.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1939–40, and total, 1869–1940, in terms of recovered metals

	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value
1940		*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
Juab County	22	157,101	18,321	1,007,422	941,363	5,495,120	301,000	$1,757,717
Utah County	12	125,945	20,454	1,945,890	1,649,354	7,577,600	148,714	2,674,260
	34	283,046	38,775	2,953,312	2,590,717	13,072,720	449,714	4,431,977
Total, 1939	35	294,628	41,080	3,227,808	2,825,433	17,236,618	1,702,904	4,821,314
Total, 1869-1940		(1)	2,474,382	250,713,384	234,838,164	1,779,164,079	39,151,738	372,387,082

[1] Figures not available.

In 1940 the Chief Consolidated Mining Co. operated at the Chief No. 1, Gemini, Eureka Hill, and Plutus mines in Juab County and continued development work at the Apex Standard property in Utah County. Large tonnages of tailings were shipped direct to a smelter from the Chief No. 1 and the Eureka Hill dumps. According to the company printed annual report, production of gold and silver increased, but that of lead, copper, and zinc decreased. The total output in 1940 comprised 27,780 tons of siliceous ore, 1,445 tons of lead ore, and 1,843 tons of zinc-lead ore from the Chief No. 1 mine; 5,844 tons of siliceous ore and 237 tons of lead ore from the Gemini mine; 6,596 tons of siliceous ore and 174 tons of lead ore from the Eureka Hill mine; and 2,609 tons of siliceous ore from the Plutus mine—an aggregate of 46,528 tons of ore of all classes, which contained 4,684 ounces of gold, 392,116 ounces of silver, 100,162 pounds of copper, 776,294 pounds of lead, and 341,550 pounds of zinc. In addition, the company reported shipments of manganese ore that contained 527,984 pounds of manganese. The United States Smelting, Refining & Mining Co. operated the Centennial-Beck, Victoria, and Eagle & Blue Bell properties; lessees worked the American Star mine from May

6 to the end of the year. Production from these properties comprised about 37,000 tons of siliceous ore and 2,500 tons of lead ore shipped crude to a smelter. The Empire-Star, Dragon, Martha Washington, and Treasure groups, all owned or controlled by the International Smelting & Refining Co., shipped crude ore to smelters; the bulk of the ore (siliceous gold-silver) came from the Dragon property. The Mammoth Mining Co. operated throughout the year and shipped 39,319 tons of crude ore (chiefly siliceous gold ore) direct to a smelter. The Grand Central mine of the American Smelting & Refining Co. was operated by lessees and shipped about 500 tons of siliceous ore direct to smelters. The Godiva mine, operated by a lessee during 1940, produced 2,564 tons of silver, lead, and zinc-lead ore which contained 1,098,672 pounds of lead, 53,350 ounces of silver, 50,840 pounds of zinc, and 42 ounces of gold The remainder of the output from the Juab County section of the Tintic district came from the Undine (Windrige), Hope, and Alaska mines.

The Tintic Standard Mining Co. and its subsidiary companies were the largest producers in the Utah County section of the Tintic district. The printed annual report of these companies gives the following operating details for 1940. Ore production at the Tintic Standard mines (including the Iron Blossom) increased 17,588 tons over the 86,757 tons produced in 1939 and resulted in an increase in output of gold but a decrease in silver, copper, and lead. The bulk of the ore was company-mined. Development work at the Eureka Standard mine was discontinued about September 1, 1940. The Eureka Lilly Consolidated mines were operated largely by lessees, incident to further development of the property. At the Colorado Consolidated and Sioux mines all operations were carried on by lessees. The 112,012 tons of ore of all classes mined from properties of the Tintic Standard Mining Co. in 1940 contained 6,437 ounces of gold, 1,872,227 ounces of silver, 1,292,095 pounds of copper, 9,442,054 pounds of lead, and 190,686 pounds of zinc. Active mines in the Utah County section of the Tintic district, owned or controlled by the International Smelting & Refining Co. and its subsidiaries, were the Eureka Bullion, May Day (Mountain View), North Lily, Tintic Bullion, and Yankee.

West Tintic district.—Crude lead ore shipped to smelters, principally from the Scotia dump, comprised the output of the West Tintic district in 1940.

MILLARD COUNTY

Cricket Mountain district.—A small lot of lead ore was shipped crude to a smelter from the Galena mine in 1940.

Detroit district.—Virtually all the production in the Millard County section of the Detroit district came from gold ore shipped crude from the property of the Charm Mining Co.

Sawtooth Mountains district.—Gold was recovered at two placer operations in Granite Canyon about 50 miles southwest of Delta.

MORGAN COUNTY

Argenta district.—A small lot of lead ore from the Dan Heiners mine was shipped crude to a smelter in 1940.

PIUTE COUNTY

Gold Mountain district.—The production from the Gold Mountain district in 1940—all from lessee operations on the Annie Laurie property—totaled 2,912 tons of gold ore shipped crude to smelters.

Mount Baldy district.—Shipments of crude gold ore were made by lessees on the Deer Trail mine until November 23, 1940, when operations were suspended.

Ohio district.—Gold-silver ore from the Bully Boy mine and the Shamrock claim of the Tushar Mines group was shipped crude to smelters in 1940 by lessees. Other active properties were the Copper Belt, Gold Strike, and Great Western.

SALT LAKE COUNTY

Big and Little Cottonwood districts.—Lessees operated the Cardiff property in the Big Cottonwood district during 1940 and shipped 538 tons of ore of all classes direct to smelters. The Mountain Mines Co. operated the Lake Blanch property from June 1 to the end of the year and shipped gold and silver ore crude to smelters. The rest of the output from the district comprised several small lots of lead ore shipped crude to smelters.

Most of the production from the Little Cottonwood district came from silver and lead ore shipped crude to smelters by the Wasatch Mines Co. and the Alta United Mines Co.

Smelter district.—Most of the output from the Smelter district in 1940 comprised shipments from the Mingo dump near Sandy.

West Mountain (Bingham) district.—The Bingham district is by far the most important mining region in Utah. The total value of the district output of gold, silver, copper, lead, and zinc has doubled since 1938, owing principally to doubling of the output of gold and copper. In 1940 the district produced these five metals valued at $70,540,717, or 81 percent of the State total. The following table gives the output from mines at Bingham in 1939 and 1940 and the total for the district from 1865 to 1940.

Mine production of gold, silver, copper, lead, and zinc in Bingham or West Mountain district, Salt Lake County, Utah, 1939–40, and total, 1865–1940, in terms of recovered metals

Year	Mines producing	Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1939	14	20,039,432	190,553	4,120,296	335,712,875	73,684,979	41,721,903	$50,013,034
1940	14	26,753,382	256,558	4,760,252	457,010,531	75,713,100	43,623,397	70,540,717
Total, 1865–1940	--------	(1)	4,195,808	117,138,653	[2] 3,161,215	[2] 1,385,850	[2] 371,749	1,285,177,699

[1] Figures not available.
[2] Short tons.

Virtually all the gain in output of gold, silver, and copper in 1940 can be ascribed to the increased rate of operations at the Utah Copper properties. According to the printed annual report of the Kennecott Copper Corporation, more than 42,000,000 pounds of copper were produced in December, when the mills treated an average of about 80,000 tons of ore a day, with high recoveries. The Arthur and Magna mills have a combined rated capacity of 80,000 tons daily. In addition to the copper recovered from the copper concentrates, several million pounds of cement copper were recovered from the mine-water precipitation plant at Copperton. The output of molybdenum concentrates in 1940 showed a marked increase, although somewhat less than 60 percent of the 1940 output was sold. The Boston Consolidated property of the Utah Copper Co. was operated the entire year by the American Smelting & Refining Co.

Most of the lead and zinc produced in the Bingham district in 1940 came from the United States & Lark property, which was operated continously by the United States Smelting, Refining & Mining Co. The tonnage of gold-silver ore and lead ore shipped for smelting decreased. The tonnnage of zinc-lead ore concentrated at Midvale was more than 44,000 tons greater than in 1939 and accounted for much of the increase in lead and zinc output. The production of gold increased, but that of silver decreased, chiefly because of the lower silver content of milling ores. The Montana-Bingham Consolidated shipped over 7,500 tons of ore of all classes. Other active properties in the Bingham district, operated or controlled by the United States Smelting, Refining & Mining Co., were the Bingham Metals, Niagara, and Utah Metal & Tunnel.

The National Tunnel & Mines Co. operated the Apex Delaware group throughout 1940 on company and lessee account. The output of zinc-lead mill ore increased about 8,000 tons over 1939, but a corresponding decrease was noted in shipments of gold ore; the result was an increase in lead and zinc output but a decrease in gold. The Elton tunnel, being driven by the National Tunnel & Mines Co., was reported in May 1941 to have reached 23,475 feet of the projected length of 24,100 feet; completion is expected about the middle of 1941.

The Ohio Copper Co. treated 345,975 tons of old tailings in its 1,000-ton flotation mill during 1940 and made a larger output of copper. In addition, an underground precipitation plant began to operate in July 1940, and 204 tons of copper precipitates were recovered.

Over 38,000 tons of zinc-lead ore from the Bingham (Lavagnino) group of the Combined Metals Reduction Co. were shipped to Bauer for milling in 1940; this was nearly double the output of milling ore from this property in 1939.

The remainder of the output from the Bingham district came principally from gold ore shipped crude from the Ophir group.

SAN JUAN COUNTY

Bluff district.—A little placer gold was recovered from the I-Hope property in 1940.

Colorado River district.—Placers near Hanksville in the Colorado River district produced some gold.

La Sal district.—The Lisbon Copper group south of Moab shipped a test lot of 37 tons of copper ore in 1940.

SEVIER COUNTY

Henry district.—Gold ore from the Patsey H. mine was amalgamated in 1940. Small lots of gold-silver ore principally from the B. W. & H. property were shipped crude to smelters.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The Park City region, which includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County, produced gold, silver, copper, lead, and zinc valued at $7,314,323 in 1940, or nearly double the total value in 1939. The following table gives the production from the Park City region in 1939 and 1940 and the total since 1870.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1939–40, and total, 1870–1940, in terms of recovered metals

Year	Mines producing	Ore	Gold	Silver	Copper	Lead	Zinc	Total value
		Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1939	11	182,344	6,548	2,229,645	824,673	23,262,127	18,107,866	$3,863,331
1940	12	311,906	17,300	3,333,122	1,296,000	39,497,400	35,195,000	7,314,323
Total, 1870–1940		(1)	453,638	223,396,935	61,820,513	2,249,758,834	552,699,911	329,081,220

[1] Figures not available.

The Silver King mine and 800-ton selective-flotation mill operated throughout 1940. According to the company printed annual report production in 1940 comprised 98,891 tons of milling ore and 2,345 tons of crude lead ore. In addition, 5,732 tons of 62-percent zinc concentrates held in storage were sold to smelters. The gross metal content of ore and concentrates (produced and stored) sold to smelters in 1940 was 1,975 ounces of gold, 1,132,850 ounces of silver, 572,566 pounds of copper, 17,058,797 pounds of lead, and 21,632,294 pounds of zinc. On January 1, 1941, 1,092 tons of zinc concentrates remained in storage. Dividends declared in 1940 totaled $488,187.

The Park Utah Consolidated Mines Co. operated the Judge (City Unit) property continuously in 1940. All the ore was sent to the International smelter and mill for treatment. According to the company printed annual report the 84,625 tons of ore produced contained 2,094 ounces of gold, 559,623 ounces of silver, 22,194 pounds of copper, 19,627,980 pounds of lead, and 21,385,160 pounds of zinc. Development was carried on regularly in 1940. Operations were also carried on at the Liberty property near Keetley by the Park City Utah Mines Co. (affiliate of the Park Utah Consolidated Mines Co.).

The Park City Consolidated Mines Co. produced from the Roosevelt group 65,625 tons of zinc-lead ore, which contained 2,462 ounces of gold, 1,035,610 ounces of silver, 190,228 pounds of copper, 1,505,550 pounds of lead, and 2,875,918 pounds of zinc; all the ore was shipped to the Midvale concentrator for treatment. Operations at the Park Galena and Mayflower mines of the New Park Mining Co. were continuous in 1940, and the output of zinc-lead ore shipped to Midvale was about 42,500 tons—nearly triple the quantity in 1939. The company was by far the largest gold producer in the region. During 1940 all operations were transferred to the Mayflower tunnel, which intersects the Park Galena fissure at depth. The Mayflower tunnel and the Park Galena mine are now connected by raises. Lessees operated the American Flag property of the Park Flag Mines Co. and shipped about 6,600 tons of gold-silver ore crude to smelters.

The remainder of the production from the Park City region in 1940 comprised shipments of zinc-lead ore to custom mills and crude silver ore to smelters from the New Quincy property and old tailings, principally from Silver Creek.

TOOELE COUNTY

Mines in Tooele County produced metals valued at $3,747,433 in 1940 compared with $3,609,803 in 1939. Gains in value of output from the Camp Floyd and Rush Valley districts more than offset the sharp drop in value of production from the Ophir district.

Camp Floyd district.—Gold output from Mercur increased moderately in 1940 compared with 1939. The bulk of the gold ore mined in the Camp Floyd district was treated in the cyanidation mills of Snyder Mines, Inc., and the Geyser Marion Gold Mining Co. The Snyder properties again were the largest producers of gold in the district, their output (company and lessee) being exceeded in the State only by that of the Utah Copper property at Bingham. About 43,000 tons of gold ore were shipped crude to smelters from the Snyder properties and about 1,300 tons from the Geyser Marion properties. Other producers at Mercur in 1940 included the Boston Sunshine, Herschel, Silver Lode, Omaha, and Rover.

Clifton (Gold Hill) district.—Nearly all the output from the Clifton district in 1940 was lead ore shipped crude to a smelter from the Rube mine and silver ore from the Success mine.

Columbia district.—Two shipments of crude lead ore from prospects near Vernon were made in 1940.

Dugway district.—Zinc-lead ore from the Four Metals mine was shipped to Tooele in 1940 for milling.

Free Coinage district.—The output from the Free Coinage district in 1940 consisted of silver ore from the Humdinger group and lead ore from the Golden Globe Consolidated Mines (Ltd.) property (formerly the Utah-Bunker Hill Mining Co.).

Lakeside district.—The Lakeside Monarch Mining Co. made most of the output in the Lakeside district in 1940. Lead concentrates were shipped from the Georgia Lyn property, which is equipped with a 100-ton gravity-concentration plant.

North Tintic district.—A small lot of lead ore was shipped direct to a smelter from the Scranton property in 1940.

Ophir district.—The total value of the metal output from the Ophir district decreased sharply in 1940, owing principally to completion of the treatment of Ophir Hill tailings by the International Smelting & Refining Co. The 700-ton flotation plant of this company was operated until August 1940, when the mill was closed and dismantling was begun. In 1940, 147,585 tons of old tailings were treated, and the lead-copper concentrates produced were sent to Tooele. Operations of the United States Smelting, Refining & Mining Co. at the Hidden Treasure mine were regular, but there was a sharp drop in tonnage of zinc-lead ore shipped to Midvale. The tonnage of lead-copper ore shipped for smelting was twice that in 1939. The complex milling ore was treated in a separate circuit at the Midvale mill, making lead, copper, zinc, and iron concentrates. Gains were noted at the Ophir Hill and Ophir Coalition Mines Co. properties, both operated by the Ophir Development Co. Other producers included the Kearsarge, Mono, Ophir, Zella, Wandering Jew, Northern Light, and Queen of the Hills.

Rush Valley district.—The value of the metal output from the Rush Valley district was $1,186,416 in 1940—a 47-percent gain compared with 1939. The operation of the Combined Metals Reduction Co. at the Calumet property, which produced 46,255 tons of zinc-lead mill ore compared with 32,738 tons in 1939, was responsible for most of the increase. Other producing mines in the district in 1940 were the Commodore group, Cyclone (Bluestone), Honerine, Muirbrook, and Salvation-Hercules.

Silver Island district.—A small test lot of lead ore from a prospect was shipped crude to a smelter in 1940.

Willow Springs district.—In 1940, as in 1939, almost all the output from the Willow Springs district came from lessee operations at the Oro Del Rey mine. A small lot of ore from the Depression property was shipped direct to a smelter.

UINTAH COUNTY

A little copper ore from the dump of the Dyer mine was sent to a smelter in 1940. The rest of the output from Uintah County was placer gold from the Big Ben, Big Lizard, and Utah State Lease No. 788, all on Green River.

UTAH COUNTY

American Fork district.—There was a marked gain in output from the American Fork district in 1940 compared with 1939. The Pacific Consolidated Mining Co. shipped about 130 tons of lead concentrates. High-grade zinc-lead ore was shipped to Midvale from the Dutchman mine. Other mines active in 1940 included the Yankee, Globe, Silver Bell, Silver Dipper, and Red Cloud.

North Tintic district.—A trial lot of lead ore from the Lehi Tintic mine was shipped to a smelter in 1940.

Santaquin district.—A little gold ore from the Golden Leaf property was amalgamated in 1940.

Tintic district.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

A small amount of gold ore from the Bull Run mine in the Bull Valley district was amalgamated in 1940. Some copper ore was shipped direct to a smelter from the Dixie property of the Utah Southern Mining Co. in the Tutsagubet district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN WASHINGTON

(MINE REPORT)

By G. E. Woodward and Paul Luff

SUMMARY OUTLINE

Mines in Washington produced gold, silver, copper, lead, and zinc valued at $7,018,812 in 1940, a 4-percent gain compared with $6,739,467 in 1939. This increase in total value resulted from greater output of copper and zinc, which was stimulated by moderately higher prices; the output of gold, silver, and lead decreased. The chief factor in maintaining the production of gold and silver at a level comparable with that of 1939 was the increased output of copper-gold-silver ore from the Holden property of the Howe Sound Co. in Chelan County; the company operated its 2,000-ton flotation concentrator throughout 1940. The output of gold and silver declined sharply in Ferry, Okanogan, and Whatcom Counties; there was a slight gain in gold output from Stevens County, but a decrease in silver. The output of lead from Pend Oreille County was less, but there was a substantial increase in output of zinc. All the State output of zinc and nearly all the lead came from zinc-lead ore from Pend Oreille County. The decline in lead production resulted chiefly from the smaller tonnage of zinc-lead ore and lower lead content of ores treated by the Pend Oreille Mines & Metals Co. The Metaline Mining & Leasing Co. treated a larger tonnage of zinc-lead ore of slightly higher grade than in 1939.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4].646+	.098	.046	.048
1939	35.00	[5].678+	.104	.047	.052
1940	35.00	[6].711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1936–40, and total, 1860–1940, in terms of recovered metals

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value

Gold and silver produced at placer mines in Washington, 1936–40, in terms of recovered metals

Year	Gold: Fine ounces	Gold: Value	Silver: Fine ounces	Silver: Value	Total value
1936	657.20	$23,002	133	$103	$23,105
1937	371.00	12,985	48	37	13,022
1938	1,575.00	55,125	218	141	55,266
1939	2,261.00	79,135	358	243	79,378
1940	2,747.00	96,145	720	512	96,657

Gold.—The output of recoverable gold in Washington in 1940 declined 9 percent from 1939, owing chiefly to a smaller tonnage of gold ore cyanided and a sharp decrease in gold ore shipped crude to smelters. Gold from copper ore increased 3,465 ounces, but that from gold ores declined 12,297 ounces. Gold from ores treated in cyanidation plants (with or without concentration) decreased 1,468 ounces in Ferry County and 2,652 ounces in Whatcom County, but 769 ounces of gold in 1940 came from ores treated in the First Thought cyanidation plant in Stevens County, which was idle in 1939. Gold from gold ores sent crude to smelters declined 4,907 ounces in Ferry County, 4,183 ounces in Okanogan, and 215 ounces in Chelan. Gold ores treated in amalgamation mills yielded 568 ounces, principally from ores of Whatcom and Okanogan Counties. Copper concentrates produced by the Howe Sound Co. from its Holden property in Chelan County yielded over 60 percent of the State output of gold. Other important gold producers were the Aurum, Knob Hill, Mountain Lion, and Republic properties in Ferry County; the Alder property in Okanogan County; and the Orient property in Stevens County. The total output of gold ore was 202,502 tons, compared with 261,651 in 1939; it comprised 145,582 tons cyanided, 1,418 amalgamated, 9,580 concentrated, and 45,922 tons of ore sent crude to smelters. Production of gold from placer mines increased from 2,261 fine ounces in 1939 to 2,747 in 1940.

Silver.—The production of recoverable silver in Washington in 1940 decreased 17 percent in quantity from 1939. The bulk of the silver came from copper ore of Chelan County and gold ore of Ferry County and the remainder principally from copper and silver ores of Stevens and Snohomish Counties and silver ore of Okanogan County. Of the total silver output, copper ore yielded 60 percent, gold ore 31, silver ore 5, and zinc-lead, lead, and gold-silver ores and placers combined 4 percent. The Holden mine in Chelan County was again the largest producer of silver; it was followed by the Aurum, Knob Hill, and Mountain Lion in Ferry County and the Amazon and Copper King in Stevens County. These six properties produced 85 percent of the State silver output. Placer gravels yielded 720 fine ounces of silver.

Copper.—The output of recoverable copper in Washington increased 7 percent in quantity and 16 percent in value over 1939. About 97 percent of the State total came from copper concentrates produced from copper ore of the Holden property of the Howe Sound Co. The value of the gold in the copper concentrates was equivalent to 86 percent of the value of the copper. Copper produced in Okanogan County during 1940 more than doubled the 1939 output.

Lead and zinc.—The production of recoverable lead in Washington decreased 31 percent in quantity in 1940, but that of zinc increased 14 percent. Three mines in Pend Oreille County were responsible for 97 percent of the lead and all the zinc output in 1940. The quantity of zinc-lead ore treated in the two flotation-concentration mills in Pend Oreille County was 13,907 tons greater than in 1939. The 700-ton flotation mill of the Pend Oreille Mines & Metals Co. was operated all year, and the 450-ton Grandview mill of the Metaline Mining & Leasing Co. operated from August 19 to the end of 1940. The Grandview mill also treated zinc-lead ore from the Grandview property of the American Zinc, Lead & Smelting Co. during the last quarter of 1940. Most of the remaining lead output came from the Electric Point and W. J. Bryan properties in the Northport district of Stevens County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1940, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

A total of 1,103,842 tons of ore (95 percent of the State output) was mined in 1940 from six properties. This total includes copper ore from the Holden property in Chelan County; zinc-lead ore from the Pend Oreille, Metaline, and Grandview properties in Pend Oreille County; and gold ore from the Knob Hill and Mountain Lion properties in Ferry County. Considerable development work was reported from these six properties, which included 89,916 feet of diamond drilling and 1,575 feet of churn drilling; development work was also reported at several smaller lode operations in the State.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Washington in 1940, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	41	202,502	27,682	111,619	350,946	952	----------

Total, 1939	172	1,124,564	90,420	442,063	17,996,000	7,436,000	20,262,000

METALLURGIC INDUSTRY

Lode mines in Washington produced 1,166,798 tons of ore in 1940; it was treated as follows: 972,848 tons in straight concentrating mills, 145,582 tons at cyanide plants, 1,418 tons at amalgamation plants, and 46,950 tons shipped crude to smelters.

Amalgamation plants.—Seven straight amalgamation plants treated 1,418 tons of dry gold ore in 1940. The Boundary Red Mountain property in Whatcom County was the chief producer.

Cyanidation mills.—The 400-ton cyanidation-concentration plant of Knob Hill Mines, Inc., at Republic, Ferry County, treated the bulk of the gold ore cyanided; flotation concentration was begun November 7, 1940, on ores from the Knob Hill and Mountain Lion groups. The First Thought Mine Corporation treated gold ore in its 50-ton plant from the First Thought mine in the Orient district, Stevens County. Together these two mills treated 145,582 tons of gold ore and reported the consumption of 5,391 pounds of sodium cyanide (91-percent grade), 200,200 pounds of calcium cyanide, 31,750 pounds of zinc dust, and 1,248,575 pounds of lime.

Concentration mills.—The 972,848 tons of ore treated at 16 flotation mills were divided as follows: 688,946 tons of copper ore treated at 4 plants, 273,227 tons of zinc-lead ore at 2 plants, 9,580 tons of gold ore at 3 plants, 625 tons of gold-silver ore at 3 plants, and 470 tons of silver ore at 4 plants.

Details of the treatment of all ore produced in Washington in 1940 are given in the following tables.

Mine production of metals in Washington in 1940, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	1,418	568	161			
Ore cyanided	145,582	12,154	39,676			
Concentrates smelted	65,371	53,834	245,428	18,958,139	4,993,708	23,120,000
Ore smelted	46,950	12,833	79,190	265,861	116,292	
Placer		2,747	720			
Total		82,136	365,175	19,224,000	5,110,000	23,120,000
1939		90,420	442,063	17,996,000	7,436,000	20,262,000

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Washington in 1940, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

ASOTIN COUNTY

The quantity of gold recovered from gravel bars along the Snake River by small dragline and washer plants declined in 1940. A slight increase was noted in gold from small-scale sluicing operations.

BENTON COUNTY

The placer gold output of Benton County came entirely from small-scale sluicing operations along the Columbia River near Paterson and Richland.

CHELAN COUNTY

Chelan Lake district.—The Holden property of the Howe Sound Co. was again the leading producer of gold, silver, and copper in Washington during 1940. Ore milled totaled 687,429 tons, averaging 0.09 ounce of gold and 0.344 ounce of silver to the ton, 1.45 percent copper, and 1.02 percent zinc. The copper concentrates produced averaged over 1.25 ounces of gold and over 5 ounces of silver to the ton and about 25 percent copper. The company reported that mine development in 1940 comprised sinking a 250-foot inclined shaft and driving 12,575 feet of drifts and 4,606 feet of raises, in addition to 37,785 feet of diamond drilling. The value of the gold, silver, and copper produced was $409,901 greater in 1940 than in 1939.

Entiat district.—A small lot of gold ore from the Rex property near Entiat was amalgamated in 1940.

Leavenworth district.—A few tons of copper concentrates were shipped to Tacoma from the property of the Royal Development Co. as mill clean-up in 1940.

Peshastin Creek district.—Several lots of crude gold ore were shipped to smelters in 1940; the Old Blewett mine was the largest shipper, followed by the Tip Top and Apex mines. A small amount of placer gold was reported recovered from gravels along Peshastin Creek.

Wenatchee River district.—A small amount of placer gold was recovered from bars along the Wenatchee River.

CLALLAM COUNTY

A few small-scale sluicing operations on beach sands near Ozette recovered some gold.

DOUGLAS COUNTY

The placer gold output from Douglas County decreased owing chiefly to completion of work by a bulldozer and sluicing plant on the Hopkins property near Alameda in 1940. A small amount of gold was recovered from other bars along the Columbia River.

FERRY COUNTY

Columbia River district.—The bulk of the placer gold produced in 1940 came from dragline operations at the Fish properties along the Columbia River; the remainder was recovered by small-scale sluicing.

Danville district.—The tonnage of gold ore shipped to the Tacoma, Trail, and Bunker Hill smelters from the Morning Star mine increased sharply in 1940.

Enterprise district.—A small lot of crude silver ore from the Silver Bell property was shipped to Tacoma in 1940 for smelting.

Republic district.—Mines of the Republic district produced gold, silver, and copper valued at $849,448 in 1940, a decrease of $257,274 from 1939. The entire output came from siliceous gold ore and siliceous silver ore. Gold ore was by far the more important and comprised 140,393 tons treated by cyanidation, 60 tons amalgamated, and 39,213 tons shipped crude to smelters; 317 tons of silver ore also were shipped to smelters. All the ore from the Knob Hill and Mountain Lion groups, operated by Knob Hill Mines, Inc., was treated in the 400-ton cyanide-flotation plant at the Knob Hill mine; in addition to the gold bullion, 515 tons of gold concentrates were recovered from these ores. Knob Hill Mines, Inc., reported that flotation units had been added to its cyanide plant in November 1940. Gold recovered by amalgamation in the district came from small experimental lots sent to Seattle for testing. Most of the crude ore shipped for smelting came from company and leasing operations on properties of the Aurum Mining Co. Other important shippers of crude ore were the Eureka Mining & Milling Co., operating its Republic and Quilp properties on company and leasing accounts; Golden Valley, Inc., operating the Valley claim; and operators of the Anecia property.

GRANT COUNTY

Virtually the entire output of placer gold from Grant County was recovered by Miller Bros., who washed gravels of the Columbia River about 4 miles east of Priest Rapids.

KING COUNTY

Most of the gold from King County in 1940 was contained in dry gold concentrates produced from gold ore at the Apex property. Most of the year was spent in development work, and it was not until December that the 75-ton flotation mill was operated. Small lots of siliceous gold-silver and siliceous silver ores were shipped from the Silver Dollar and Cleopatra properties, respectively, for smelting.

KITTITAS COUNTY

Columbia River district.—A little gold was recovered during 1940 from placer operations along the Columbia River near Priest Rapids.

Swauk district.—The Swauk district produced over half of the State output of placer gold in 1940. Virtually all the gold came from operations of Needham & Hinds on Swauk Creek; about 394,000 cubic yards of gravel, supplied by a 2¼-cubic yard Diesel-powered Northwest dragline excavator, were treated in a portable washing plant. Operations were begun May 1 and ended November 15. The remainder of the placer gold from the district was recovered by small sluicing operations. Gold was recovered by amalgamation from a few tons of siliceous gold ore from the Nellie and Sunshine properties.

OKANOGAN COUNTY

Cascade district.—The entire output of the Cascade district was gold ore from the Bodie group near Wauconda. Over half of the gold and silver from this property was contained in crude ore sent to smelters; the remainder was recovered by amalgamation.

Columbia River district.—All the placer gold from this district was recovered by sluicing the sands and gravels of the Columbia River.

Conconully district.—Lead-copper concentrates produced from silver ores of the Sonny Boy and Arlington properties comprised the bulk of the metal output from the Conconully district.

Loomis-Oroville district.—Gold ore shipped crude to the smelter yielded the bulk of the gold output from the Loomis-Oroville district. Nearly all the recovered silver was contained in silver concentrates and crude silver ore shipped to Tacoma for smelting. Placer gravels yielded a small amount of gold.

Methow district.—The value of the metal output from the Methow district was $177,579 in 1940, a decrease of $69,617 from 1939. The Methow Gold Corporation operated the Alder group near Twisp and was by far the largest producer of gold and copper in the district; over 9,000 tons of gold ore from the property were treated in the 40-ton Red Shirt mill about ½ mile south of Twisp. Other producers were the Hunter, Independence, Highland Light, Hidden Treasure, and Oriental properties.

Myers Creek and Mary Ann Creek district.—A little gold was recovered from gravels along Mary Ann Creek near Chesaw. Small lots of gold ore were shipped crude to the smelter from the Mother Lode and Morning Glory properties.

Similkameen River district.—Small-scale placer operations along the Similkameen River recovered a few ounces of gold in 1940.

PEND OREILLE COUNTY

Metaline district.—The value of the metal output from Pend Oreille County increased from $1,391,570 in 1939 to $1,712,157 in 1940, owing entirely to increased output of zinc, as production of both lead and silver declined. During 1940, 273,227 tons of zinc-lead ore were treated in two flotation mills compared with 259,320 tons in 1939. The Pend Oreille Mines & Metals Co. operated the Sullivan, Josephine, Hidden Falls, Open Cut, and Yellow Head groups and milled an average of 675 tons of ore a day in its 700-ton flotation mill, producing the bulk of the zinc and lead output of the Metaline district. The average content of the zinc-lead ore milled in 1940 was 1.06 percent lead, 5.43 percent zinc, and a trace of silver—slightly lower than in 1939. Development work reported by the company totaled 12 feet of shafts, 2,204 feet of drifts and raises, and 18,584 feet of diamond drilling. The remainder of the zinc and nearly all the rest of the lead output of the district were contained in zinc and lead concentrates shipped by the Metaline Mining & Leasing Co. and the American

Zinc, Lead & Smelting Co. The Grandview mill, a 450-ton flotation plant, began treatment of zinc-lead ore from the property of the Metaline Mining & Leasing Co. about the middle of August. Ore (15,757 tons) from the Grandview mine, under lease from Grandview Mines, Inc., by the American Zinc, Lead & Smelting Co., was treated during the last quarter of 1940.

SKAMANIA COUNTY

Niggerhead district.—At the Camp Creek property in 1940, the Primary Gold Co. amalgamated a small amount of gold ore which had been mined during its development program.

SNOHOMISH COUNTY

Index district.—Copper ore and concentrates were shipped in 1940 to Tacoma for smelting from the property of Sunset Cooperative Mines, and crude copper ore was shipped by lessees of the Sunset Copper Co.

Stilaguamish district.—Gold-silver concentrates were shipped to Tacoma for smelting from properties operated by the Ore Recoveries Corporation and Mine Operators, Inc., both at Silverton.

Sultan district.—The Kromona Mines Corporation operating the Florence Rae property and the Sultan Basin Mining Co. operating the Iowa mine shipped crude copper ore to Tacoma for smelting. The Haines Construction Co. recovered a little gold from gravels along the Sultan River.

STEVENS COUNTY

Chewelah district.—Copper concentrates shipped from properties of the Chinto Mining Co. yielded the entire output of gold, silver, and copper from the Chewelah district in 1940. A 25-ton flotation plant was reported put into operation late in the year.

Columbia River district.—The Columbia River district of Stevens County ranked second in importance as a producer of placer gold in the State in 1940. The bulk of the gold was recovered from three properties along the Columbia River—the B & W operated by K. E. Boissoneau, the Valbush Bar worked by August and L. W. Grein, and the Gibson operated by the Harvey R. Cline Co.; all used mechanical equipment. The remainder of the gold output was recovered by small sluicing operations along the river.

Colville district.—A car of crude silver ore was shipped in 1940 to the Bunker Hill smelter from the Old Dominion mine.

Deer Trail district.—Lessees operating the Venus and Providence mines milled a small tonnage of silver ore and produced silver concentrates. A small shipment of high-grade silver ore was made from the Silver Seal mine to the Bunker Hill smelter.

Kettle Falls district.—Lessees milling ore from the Silver Queen mine in the 40-ton flotation plant on the property produced a few tons of lead-copper concentrates, which were shipped to the Bunker Hill smelter.

Northport district.—High-grade lead ore, chiefly from the W. J. Bryan and Electric Point properties, was responsible for the entire output of recovered metal in the Northport district in 1940.

Orient district.—The First Thought Mine Corporation treated 5,189 tons of siliceous gold ore in its 50-ton cyanidation mill and recovered the bulk of the metal output of the Orient district in 1940.

Springdale district.—Operators of the Lucky Boy mine shipped small lots of copper ore to the smelter.

WHATCOM COUNTY

Mount Baker district.—Ore from the Boundary Red Mountain mine, treated by amalgamation, yielded the bulk of the gold produced in Whatcom County in 1940. A little gold was recovered from placers on Ruby Creek.

WHITMAN COUNTY

All the output of gold in 1940 from Whitman County was recovered from placer gravels along the Snake River.

GOLD, SILVER, COPPER, AND LEAD IN WYOMING

(MINE REPORT)

By Chas. W. Henderson

SUMMARY OUTLINE

Gold placer mining—chiefly in the Atlantic City district, Fremont County—contributed 722 fine ounces of gold and 73 fine ounces of silver to the very small output of metals (except iron) produced in Wyoming during 1940. Lode mines yielded 18 ounces of gold, 41 ounces of silver, and 4,000 pounds of recoverable copper; nearly half of both the lode gold and silver and one-eighth of the copper came from the Atlantic City district. The bulk of the placer gold output from the Atlantic City district was produced by two dry-land dredges. The third-largest producer of gold was a dry-land dredge in the Douglas Creek district, Albany County. All other placers except a small dragline, with sluices, in Big Horn County were small and hand-operated. The most ambitious lode project was at the Golden Clover group in Carbon County, 15 miles south of Encampment. A mill building was either newly erected or an old one repaired; a 30-ton Marcy mill, a Wilfley table, and other machinery, as well as a 50-hp. Diesel engine for power, were installed in 1940. A small quantity of gold was recovered by amalgamation, and 3 tons of gold concentrates of very good grade were shipped to smelter in consequence of activity that lasted from June 1 to August 1. Other lode operators carried on small-scale amalgamation or made minor shipments of smelting ore.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1936–40

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1936	$35.00	$0.7745	$0.092	$0.046	$0.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[4] .646+	.098	.046	.048
1939	35.00	[5] .678+	.104	.047	.052
1940	35.00	[6] .711+	.113	.050	.063

[1] Price under authority of Gold Reserve Act of January 31, 1934. Treasury legal coinage value of gold from January 18, 1837, to January 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1936–37: Yearly average weighted Treasury buying price for newly mined silver; 1938–40: Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464. [5] $0.67878787. [6] $0.71111111.

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1936 to 1940; it also gives the total production of metals from 1867 to 1940. About three-fourths of the total recorded value of the four metals is in copper, most of which was mined before 1924 in the Encampment district in Carbon County and the Hartville district in Laramie County.

Mine production of gold, silver, copper, and lead in Wyoming, 1936–40, and total, 1867–1940, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1936	344	1,964.40	$68,754	1,113	$862					$69,616
1937	17	1,776.00	62,160	203	157					62,317

REVIEW BY COUNTIES AND DISTRICTS

ALBANY COUNTY

Centennial district.—The Sterling and Tenderfoot placer locations near Centennial each yielded by hand-sluicing less than 1 ounce of fine gold in 1940.

Douglas Creek district (*Holmes, Keystone*).—From July 17 to October 17 F. H. Pethick moved gravel to a sluice with a ¾-cubic yard dragline shovel and caterpillar bulldozer at the Nevada placers on Douglas Creek.

BIG HORN COUNTY

From September 10 to November 10, George E. Frame worked his placer ground at Narrow Bend on the Big Horn River approximately 7 miles north of Kane. A ½-cubic yard dragline moved the gravel to a 150-foot washing flume, then over a ⅝-inch screen to sluice boxes. Frame moved 3,000 cubic yards to recover 10.56 crude ounces of gold (after melting) with a fineness of 0.920¼ in gold and 0.076½ in silver.

CARBON COUNTY

Encampment or Upper Platte district.—The Golden Clover claim, a prospect hole in 1939, was developed in 1940 by sinking the shaft to 100 feet and extending drifts to 120 feet. A 30-ton amalgamation-concentration mill was built, and several hundred tons were treated before it was closed.

Elkhorn Mountains district.—Three ounces of gold were recovered by sluicing at the Golden Sun placer in the Elkhorn Mountains district.

Savery Creek district.—Ground sluicing was done at three placer claims in the Savery Creek district between April 20 and November 20. The gold recovered at the Working Boy placer had an average fineness of 0.936¾.

FREMONT COUNTY

Atlantic City district.—In 1940 the E. T. Fisher Co. operated its 1¼-cubic yard dragline and screening-amalgamation plant (movable on railroad tracks) for the eighth consecutive season on placer ground in the vicinity of Atlantic City. The output of gold was less than in 1939; in 1940 the digging was done on the Croft placer and on the lower claim of the Timba-Bah Mining Co. property. The E. T. Fisher Co. gold had an average fineness of 0.890 in gold and 0.105 in silver. In 1940 John E. Whisenand operated a 3-cubic yard dragline and washing plant on property adjacent to Dead Horse No. 67 on Wilson Bar in the vicinity of Atlantic City; his gold had an average fineness of 0.899 in gold and 0.071 in silver. The ½-cubic yard dragline of the Wyoming Mining Co. washing plant was moved away and hand-mining was done when water was available (only 2 months) on placer ground in Dutch Tom Flats and Poorman's and O'Marres Gulches. There was other small placering on Rock Creek, Meadow Gulch, and Wilson Bar.

Lode output from the Atlantic City district in 1940 comprised a 4-ton lot of copper-silver-gold smelting ore shipped from the Antelope No. 2 claim; 9 tons of gold ore from the Gold Leaf-Mint and 2 tons from the Jack Rabbit, amalgamated; and 15 and 6 tons, respectively, from the Lone Star and the Mary B, amalgamated.

LARAMIE COUNTY

A 13-ton lot of ore carrying a little copper and silver was shipped to smelter from a prospect in the Silver Crown district.

PARK COUNTY

A 1-ton lot from Eagle Creek Gold Mines in the Clark Fork River district was amalgamated to recover 1 ounce of gold.

PLATTE COUNTY

A small lot of copper ore carrying silver, encountered in mining iron ore at Sunrise, was shipped to the Garfield (Utah) smelter by the Colorado Fuel & Iron Co. The Sunrise iron mine was originally opened as a copper mine and during the World War of 1914–18 shipped much copper ore.

SHERIDAN COUNTY

A 3.25-ounce deposit of placer gold from Sheridan, which melted down to 2.58 ounces with a fineness of 0.960¾ in gold and 0.035½ in silver, was made at the Denver Mint in 1940.

TETON COUNTY

Sluicing on the Mercury placer on Snake River 7 miles southeast of Moran recovered less than 2 ounces of gold, with a fineness of 0.910½ in gold and 0.075 in silver.

SECONDARY METALS—NONFERROUS

By T. H. Miller and F. H. Wright [1]

SUMMARY OUTLINE

The survey of consumption and stocks of secondary metals in 1940 was conducted by the Bureau of Mines according to the procedure first used in 1939. In both years, a vigorous attempt was made to measure completely all of the most important nonferrous scrap metals at the point where they are prepared for reuse. Users of scrap metals were divided into two groups, and returns from remelters, smelters, and refiners were tabulated apart from those from manufacturers and foundries.

The canvass of remelters, smelters, and refiners covered all metal companies in the United States that produce refined and alloyed products for sale to consumers, whereas the convass of manufacturers and foundries covered all companies that consume purchased scrap for use in the manufacture of finished products. Only the manufacturers and foundries were asked to report inventories of plant scrap on hand at the beginning and end of 1940. All manufacturers were not reached, therefore the figures for home scrap represent only the trend in inventories rather than complete totals.

The tables showing the recovery of metals in 1939 and 1940, with the exception of the table reporting tin recovered at detinning plants, are not directly comparable with recovery tables published in years preceding 1939 because of changes in survey procedure.

The greater number of companies reporting consumption of scrap in the last 2 years has naturally resulted in increased totals for secondary recovery, but examination of earlier yearly reviews reveals a continuation of past trends. A historical table of nonferrous secondary metals recovered during the 10-year period 1929–38 was published in the Secondary Metals chapter of Minerals Yearbook, 1940. New tables showing the gross weights of scrap used in 1940, as well as inventories of purchased scrap at the end of 1940, have been included in the current chapter. In many instances, several kinds of scrap having the same general classification have been included as one item owing to space limitations.

The figures on recovery of metals from secondary sources in 1940 were derived from consumption data on the following items of scrap:

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Aluminum:
- Pure clippings
- Pure wire and cable
- Castings
- Die castings
- Pistons
- Crankcases
- Clean sheet
- Painted sheet
- Dural sheet and clippings
- Borings and turnings
- Foil
- Plant-process scrap
- Drosses and skimmings
- Sweepings
- Slag

Antimony:
- Battery-lead plates
- Hard lead
- Common babbitt
- Genuine babbitt
- No. 1 babbitt
- No. 1 pewter
- Cable lead
- Type metals
- Type-metal dross
- Battery mud

Copper:
- No. 1 wire
- No. 2 wire
- No. 1 heavy
- Mixed heavy
- Light
- Composition or red brass
- Railroad car boxes
- Cocks and faucets
- Heavy yellow brass
- Yellow brass castings
- Light brass
- Old rolled brass
- Brass clippings
- Brass pipe
- Low brass
- No. 1 Red composition turnings
- No. 1 Yellow rod-brass turnings
- No. 1 Yellow brass turnings
- Automobile radiators (unsweated)
- Electrotype shells
- Engravers' plates
- Brass backs
- Aluminum-base alloys
- Bronze
- Manganese-bronze
- Aluminum-bronze
- Silicon-bronze
- Phosphor-bronze
- Nickel-silver
- Bell metal
- Secondary blister
- Copper oxide
- Buffings
- Grindings
- Washings
- Brass ashes
- Brass skimmings
- Slags

Copper—Continued.
- Residues
- Miscellaneous copper-bearing materials

Lead:
- Soft lead
- Hard lead
- Cable lead
- Battery-lead plates
- Common babbitt
- Solder
- Type metals
- Dross
- Battery mud
- Copper-base alloys
- Type-metal dross
- Solder dross
- Solder joints
- Lead oxide
- Lead foil
- Slag

Nickel:
- Nickel clippings, anodes, hangers, etc.
- Monel metal
- Stainless steel
- Nickel-silver
- Secondary blister copper
- Nichrome wire
- Nickel-steel
- Nickel-iron
- Nickel brass
- Nickel catalyst
- Batteries
- Slag

Tin:
- New tin-plate clippings
- Old tin-coated containers
- Block-tin pipe
- Tinfoil
- Tin scruff and dross
- No. 1 pewter
- Genuine babbitt
- No. 1 babbitt
- Residues
- Copper-base alloys
- Lead-base alloys
- Condensers
- Music metal
- Pattern metal

Zinc:
- Clippings
- Sheet
- Skimmings
- Dross
- Die castings
- Flue dust
- Residues
- Zinc ashes
- Remelt zinc
- Die-cast slabs
- Castings
- Copper-base alloys
- Addressing-machine plates
- Engravers' plates
- Battery cans

As scrap users had an additional year in which to become accustomed to the revised canvass, the final tables for 1940 include data covering 177 plants of remelters, smelters, and refiners and 1,664 plants of manufacturers and foundries reporting compared with 154 remelters, smelters, and refiners, and 1,367 manufacturers and foundries in 1939.

"New scrap" is defined as the refuse produced during the manufacture of articles for ultimate consumption, including all finished and semifinished articles that are to be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slags.

"Old scrap" is defined as scrap derived from metal articles that have been discarded after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, automobile crankcases, cocks and faucets, and lithographers' plates.

"Plant scrap" is defined as scrap produced within the plant and, although inventories of plant scrap at manufacturers and foundries at the beginning and end of the year were reported, the quantity of home scrap used was not measured, as it had not entered the market.

GENERAL SUMMARY

The value of the more common nonferrous metals recovered from secondary sources as metal and in alloys and chemical products totaled $236,964,748 in 1940 compared with $201,415,865 in 1939. Metals recovered from market scrap produced as a result of manufacturing operations (new scrap) comprised $91,287,888 and metals returning from use (old scrap) $145,676,860 of the total value.

Salient statistics of nonferrous secondary metals recovered in the United States in 1939–40

Metal	New scrap		Old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1939						
Aluminum	[1] 16,184	[1] $6,392,680	[1] 37,763	[1] $14,916,385	[1] 53,947	[1] $21,309,065

[1] Revised figures.

The nonferrous metal market exhibited declining activity during the first part of 1940 as the reaction from the 1939 flurry continued. A mild buying spurt occurred in June as the war situation became tense, but activity decreased after the capitulation of France. When serious defense production was begun in the United States, secondary metals became more in demand as primary stocks were used up. When the year closed, serious shortages were beginning to develop in several types of scrap.

As a natural reflection of world-wide increased demand, the average prices paid for scrap metals in 1940 were much higher than in 1939. The efforts of responsible leaders in the industry to hold prices within reasonable bounds resulted in withholding of Government control throughout 1940.

The total recorded use of all the more common nonferrous scrap metals in the United States was greater in 1940 than in any previous year, except for the peak of 1928–29.

Movements of aluminum scrap declined in the spring of 1940, following the price reduction in primary metal. Demand early in the year was unpredictable, coming in sudden spurts and falling again as consumers watched European developments. As increased use of aluminum in aircraft production became evident, sales of scrap strengthened in May and June on the prospect of larger demand for scrap to replace primary aluminum withdrawn from the usual channels. During the latter half of 1940, readily available supplies of aluminum scrap became so scarce that prices far above the primary level sometimes were paid for scrap needed to meet sudden demand. There was a serious shortage of aluminum scrap at the end of the year.

Copper scrap displayed its highest price for the year at the beginning of 1940; however, quotations fell sharply as export demand for electrolytic copper and copper scrap vanished. A mild revival of activity was experienced when consumers increased stocks during the critical war period in June, but demand again relaxed after the capitulation of France. Scrap moved more actively during August, and the uptrend continued through October, remaining fairly constant to the end of December. Only selected grades of copper scrap evidenced unusual demand toward the close of the year.

More lead scrap was used in 1940 than in 1939, but a plentiful supply of primary lead prevented any unusual demand. Stocks of lead at consumers' plants at the beginning of 1940 were the lowest in 10 years and apparently remained low most of the year. A scarcity of heavy soft scrap caused a flurry in the market late in October; however, demand then slowed to a normal pace for the balance of the year.

Nickel scrap followed practically the same trend as tin scrap in 1940. Movement was slow early in the year, but increased manufacture of munitions brought increased demand in the latter half. Loss of the European market for nickel scrap raised the problem of development of new refining methods in the United States to reclaim much of the nickel scrap formerly exported.

Tin-scrap market activity in 1940 was strongly marked by fluctuations in tune with the changing international situation. The combination of invasion of the Netherlands and increasing domestic consumption of tin, as well as Government stock-piling, brought strength to the tin-scrap market late in May 1940. Scrap demand continued fairly heavy for the balance of the year.

Zinc-scrap purchases declined after the break in primary zinc price soon after the beginning of 1940, and the consumption of redistilled zinc dropped, particularly in galvanizing operations. With the prospect of renewed activity in the steel and brass industries, scrap movement began to gain strength late in February. Elimination of Belgian zinc production from world markets as a result of the German invasion strongly affected the domestic zinc market, and demand for good scrap was strong for the remainder of the year. Consumers' stocks dropped steadily as the year drew to a close. As in the case of aluminum, premium prices higher than primary zinc levels were paid for zinc scrap to fill urgent orders near the end of the year.

SECONDARY ALUMINUM [2]

The quantity of secondary aluminum recovered totaled 68,045 short tons valued at $24,836,425 in 1940 compared with 53,947 tons valued at $21,309,065 in 1939. The value was computed at 18.25 cents a pound of weight recovered in 1940 compared with 19.75 cents in 1939.

Aluminum recovered from secondary sources in 1940 included 3,237 tons of pure metal (98+ percent) and 64,808 tons of aluminum alloys. The aluminum content of the recovered alloys was approximately 59,394 tons (92 percent).

Secondary aluminum recovered in the United States in 1939–40, in short tons

	1939	1940
Aluminum as metal	2,900	3,237
Aluminum alloys produced and recovered from aluminum scrap	[1] 51,047	64,808
	[1] 53,947	68,045
From new scrap	[1] 16,184	28,936
From old scrap	[1] 37,763	39,109

[1] Revised figures.

Consumption and stocks of aluminum scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Pure clippings, wire, and foil	5,242	620	800	134	6,042
Castings	22,035	1,657	11,865	1,520	33,900
Alloy sheet	6,658	543	422	33	7,080
Scrap sheet and sheet utensil	11,128	309	1,889	96	13,017
Borings and turnings	14,106	999	551	14	14,657
Die castings	415	36	14	(1)	429
Miscellaneous aluminum and dross	8,139	570	195	111	8,334
	67,723	4,734	15,736	1,908	83,459

[1] Less than 1 ton.

[2] Stock figures for the beginning of 1940 do not agree with those previously published for the end of 1939 owing to an increase in the number of firms reporting.

Of the 68,045 tons of aluminum recovered in 1940, remelters supplied 54,073 tons (79 percent) and manufacturers and foundries 13,972 tons (21 percent). The 54,073 tons recovered by remelters included 22,543 tons (42 percent) derived from new scrap and 31,530 (58 percent) from old scrap. The 13,972 tons reported by manufacturers and foundries included 6,393 tons (46 percent) obtained from new scrap and 7,579 (54 percent) from old scrap. Thus, the 68,045 tons of secondary aluminum produced included 28,936 tons (43 percent) recovered from new scrap and 39,109 (57 percent) from old scrap.

Stocks of unmelted aluminum scrap at remelting plants decreased 18 percent from 5,758 tons at the beginning of 1940 to 4,734 at the end. Stocks of purchased aluminum scrap at manufacturing and foundry plants decreased 25 percent from 2,535 tons to 1,908. Total stocks of purchased scrap on hand at all plants dropped from 8,293 tons to 6,642—a net decrease of 20 percent—reflecting the heavy demand for aluminum toward the end of the year. A 23-percent increase in stocks of plant scrap at manufacturing and foundry plants (from 4,907 tons to 6,033) indicated increased activity at those plants.

Aluminum prices in 1940 presented an unusual picture. Owing to economic improvement in production, primary aluminum ingot at New York gradually dropped from 20 cents a pound in January to 17 in December, averaging 18.69 cents for the year. In comparison, secondary ingot composed of remelted high-purity scrap averaged 18.74 cents a pound for the year.

Dealers' scrap-buying prices averaged substantially higher in 1940 than in 1939. Scrap cast aluminum in New York averaged 8.95 cents a pound compared with 7.47 in 1939. Average monthly quotations in 1940 ranged from 9.48 cents in January to 8.55 in September and rose again to 9.70 cents in December.

The average price of new aluminum clippings was 14.47 cents a pound in 1940 compared with 13.90 in 1939. Average monthly quotations dropped from 15.50 cents in January to a low of 13.75 cents in August and September and rose slowly to 13.92 cents in December.

Schedule of maximum Government prices for aluminum scrap in effect May 5, 1941, in cents per pound [1]

Grade	Maximum price	
	Sale by maker	Sale by dealer
Pure clips and cable	13.00	14.50
Segregated alloy-sheet clips	12.00	13.50
Old sheet and utensils	11.00	12.50
Mixed-sheet clips	11.00	12.50
Cast scrap and forged scrap, old and new, clean and dry	11.00	12.00
Borings and turnings other than No. 12, clean and dry	10.00	11.50
No. 12 type borings and turnings, clean and dry	9.50	11.00
Pistons free of struts, clean and dry	11.50	12.50
Pistons with struts, clean and dry	9.50	10.50

[1] F. o. b. point of shipment.

The price trend for most scrap items was downward from January through September but turned upward in October and was still climbing at the end of the year. Early in 1941 the heavy demand of consumers, denied their normal supplies by defense requirements, pushed scrap prices to such high points that maximum prices were set by the Advisory Commission to the Council of National Defense on March 25 and later amended by the Office of Price Administration and Civilian Supply on May 5. Further amendments of the price schedule on June 3, 1941, changed regulations concerning quantity differentials and removed price ceilings on certain classes of scrap but did not affect basic prices.

The effect of the shortage of aluminum was to push the flow of scrap out of normal channels, with the result that efficient remelters were idle while inexperienced consumers attempted to substitute scrap aluminum for unavailable ingot metal. To conserve supplies, the Office of Production Management on June 10, 1941, issued Supplementary Order M–1–c prohibiting all deliveries of aluminum scrap that was to be melted or otherwise processed unless a preference rating of A–10 or higher had been assigned to such delivery or unless such delivery had been specifically authorized by the Director of Priorities. The intention of the order was not to govern sales between dealers who did not process the scrap but to allow shipments only to remelters supplying defense orders.

Imports of aluminum scrap into the United States were only 648 tons in 1940 compared with 5,046 in 1939, whereas exports rose to 955 tons from 476 tons.

Aluminum, including scrap, was placed under export control on July 2, 1940, by proclamation of the President. Effective July 5, 1940, a license was required for exporting materials containing over 10 percent aluminum.

SECONDARY ANTIMONY

A total of 11,421 short tons of secondary antimony valued at $3,197,880 was recovered in 1940 compared with 9,810 tons valued at $2,425,000 in 1939. The value was computed at 14 cents a pound in 1940 (the average price for ordinary brands of American-grade antimony) and at 12.36 cents in 1939.

Antimony recovered in lead-base alloys (in oxide and as metal) totaled 11,073 tons in 1940 and that recovered in tin-base alloys 348 tons.

Secondary antimony recovered in the United States in 1939–40, in short tons

	1939	1940
In lead-base alloys [1]	9,520	11,073
In tin-base alloys	290	348
	9,810	11,421
From new scrap	150	245
From old scrap	9,660	11,176

[1] Includes antimony recovered as metal and in oxide and other compounds; 923 tons of antimony were recovered in antimonial lead produced at primary lead refineries in 1939 and 867 tons in 1940.

Remelters, smelters, and refiners furnished 7,773 tons (68 percent) and manufacturers and foundries 3,648 tons (32 percent) of the 11,421 tons of antimony recovered in 1940. Of the 7,773 tons recovered by remelters, smelters, and refiners, 128 tons (1.6 percent) came from new scrap and 7,645 (98.4 percent) from old scrap. Of the 3,648 tons recovered by manufacturers and foundries, 117 tons (3.2 percent) were obtained from new scrap and 3,531 (96.8 percent) from old scrap. Thus, it may be seen that by far the greater part of the secondary antimony was recovered from old scrap metals. Only 245 tons (2 percent) of the 11,421 tons came from new scrap, whereas 11,176 tons (98 percent) came from old scrap.

Consumption and stocks of antimony-bearing scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Lead-base scrap:					
Hard lead	12,049	1,039	2,063	169	14,112
Cable lead	23,618	1,594	765	56	24,383
Battery-lead plates	139,298	13,925	26,089	2,564	165,387
Mixed common babbitt	5,709	558	9,299	1,368	15,008
Type metals	5,243	544	7,830	576	13,073
Type-metal dross	117	4	609	9	726
Lead sludge	771	106	5	13	776
	186,805	17,770	46,660	4,755	233,465
Tin-base scrap:					
No. 1 pewter	225	16	54	1	279
Genuine babbitt	930	110	171	5	1,101
No. 1 babbitt	701	116	384	36	1,085
	1,856	242	609	42	2,465
	188,661	18,012	47,269	4,797	235,930

Discarded lead storage batteries—the principal source of secondary antimony—provided 52 percent of the antimony recovered in 1940. Other scrap-lead alloys, including hard or antimonial lead, common babbitt, type metals, and drosses, supplied 45 percent and scrap-tin alloys 3 percent.

Antimony, including scrap, was placed under export control on July 2, 1940, by proclamation of the President. Effective July 5, 1940, a license was required for exporting materials containing over 5 percent antimony.

SECONDARY COPPER AND BRASS [3]

Copper recovered from scrap metals, including that in alloys, totaled 532,046 short tons valued at $120,242,396 in 1940 compared with 499,700 tons valued at $103,937,600 in 1939. The value was computed at 11.3 cents a pound in 1940, while the average price of 10.4 cents was used in 1939.

In all, 170,839 tons of copper were recovered in 1940 as essentially pure metal, most of which was refined electrolytically. Alloys other than brass yielded 177,756 tons and brass alloys 174,020 tons of copper. In addition to that recovered as metal and in alloys, 9,431 tons of copper were recovered from scrap metals in the form of chemicals.

[3] Stock figures for the beginning of 1940 do not agree with figures previously published for the end of 1939 owing to an increase in the number of firms reporting.

Secondary copper recovered in the United States in 1939-40, in short tons

	1939	1940		1939	1940
As metal	151,370	170,839	In new scrap:		
In brass and other alloys	348,330	361,207	Brass [1]	111,600	121,531
			All other [1]	101,200	76,625
	499,700	532,046		212,800	198,156
As metal:			In old scrap:		
At primary plants	116,613	117,669	Brass	50,800	52,489
At other plants	34,757	53,170	All other	236,100	281,401
	151,370	170,839		286,900	333,890
In brass [1]	162,400	174,020			
In alloys other than brass [1]	182,730	177,756			
In chemicals [2]	3,200	9,431			
	499,700	532,046			

[1] Includes some plant scrap at brass mills.
[2] Apparent increase in 1940 figures over 1939 owing to inclusion of larger number of concerns in survey.

Of the 532,046 tons of copper recovered in 1940, remelters, smelters, and refiners supplied 290,465 tons (55 percent) and manufacturers and foundries 241,581 tons (45 percent). The 290,465 tons recovered by remelters, smelters, and refiners included 55,958 tons (19 percent) derived from new scrap and 234,507 (81 percent) from old scrap. The 241,581 tons reported by manufacturers and foundries included 142,198 tons (59 percent) obtained from new scrap and 99,383 (41 percent) from old scrap. Thus, the 532,046 tons of copper included 198,156 tons (37 percent) recovered from new scrap and 333,890 (63 percent) from old scrap.

Consumption and stocks of copper-base scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
No. 1 wire and heavy	47,553	2,979	25,785	2,112	73,338
No. 2 wire, mixed heavy, and light	98,428	4,920	37,845	1,533	136,273
Composition or red brass	78,536	15,699	43,836	8,008	122,372
Railroad-car boxes	2,076	495	34,056	4,363	36,132
Yellow brass	87,662	9,020	170,716	9,555	258,378
Automobile radiators (unsweated)	32,497	2,813	632	69	33,129
Electrotype shells	180	164	41	74	221
Bronze	2,857	429	4,946	924	7,803
Low brass	169	9	7,293	616	7,462
Nickel silver	1,177	187	7,636	460	8,813
Low-grade scrap and residues	23,260	7,864	743	107	24,003
	374,395	44,579	333,529	27,821	707,924

Stocks of purchased copper scrap at remelting, smelting, and refining plants dropped from 46,098 tons at the beginning of 1940 to 44,579 at the end of the year—a loss of 3 percent. Stocks of purchased copper scrap at manufacturing and foundry plants decreased 24 percent from 36,525 tons to 27,821. Total stocks of purchased scrap on hand at all plants declined from 82,623 tons to 72,400—a net loss of 12 percent. Stocks of plant scrap at manufacturing and foundry plants decreased 5 percent from 32,887 tons at the beginning of the year to 31,272 at the end.

Dealers' buying prices for copper scrap in 1940 closely followed domestic quotations for primary metal. In the New York market, heavy copper scrap averaged 8.20 cents a pound in 1940 compared with 7.80 cents in 1939 and 6.81 in 1938. Average monthly quotations began with 8.91 cents a pound in January and, with the exception of a temporary peak in June, eased to 7.46 cents in July. Thereafter the price rose steadily to an average of 8.87 cents in December.

No. 1 composition averaged 7.68 cents a pound in 1940 compared with 7.04 cents in 1939 and 6.36 in 1938. The monthly trend followed that of heavy copper scrap.

The fall of prices during the first half of the year has been attributed to lessened demand while consumers were retrenching from an overstocked position, whereas the upswing that followed reflected a surge of defense business of such extent that unfilled orders for brass and bronze ingots were in the range of 30,000 short tons during the last 4 months of the year.

Imports of brass scrap totaled 1,232 tons in 1940 (no imports were reported in 1939), and exports rose slightly. Imports of copper scrap increased slightly in 1940, whereas exports dropped sharply.

Copper and brass and bronze, including scrap, were placed under export control on January 10, 1941, by proclamation of the President. Effective February 3, 1941, a license was required for exporting materials containing over 15 percent copper.

Brass and copper scrap imported into and exported from the United States, 1939–40, in short tons

	1939	1940
Brass scrap imported		1,232
Scrap copper imported	132	135
Brass scrap exported	5,338	5,887
Scrap copper exported	17,643	7,149

SECONDARY GOLD AND SILVER

Mints and refineries reported the recovery of 895,096 fine ounces of gold valued at $31,328,360 and 24,972,260 ounces of silver valued at $16,950,867 in 1939. The value of gold recovered was computed at $35 a fine ounce and that of silver at 67.878787 cents an ounce. Data for 1940 were not completed in time to be included in this report.

SECONDARY LEAD [4]

Secondary lead recovered totaled 260,346 short tons in 1940, or 49 percent of the total production of refined lead from domestic and foreign sources in the United States; the value was $26,034,600, computed at 5 cents a pound. This compares with 241,500 tons valued at $22,701,000 in 1939, averaging 4.7 cents a pound.

Lead, recovered as metal, from secondary sources totaled 59,580 short tons, antimonial lead 126,687 tons, other lead alloys 58,586 tons, and alloys other than lead alloys (principally copper alloys) 15,493 tons, in 1940.

[4] Stock figures for the beginning of 1940 do not agree with figures previously published for the end of 1939 owing to an increase in the number of firms reporting.

Secondary lead recovered in the United States in 1939–40, in short tons

	1939	1940
As metal:		
At primary plants	29,011	16,588
At other plants	57,889	42,992
	86,900	59,580
In antimonial lead [1]	113,050	126,687
In other lead alloys [2]	27,900	58,586
In alloys other than lead alloys	13,650	15,493
	241,500	260,346
From new scrap	30,700	33,763
From old scrap	210,800	226,583

[1] Includes 12,658 tons of lead recovered from secondary sources at primary plants in 1939 and 16,431 tons in 1940.
[2] Includes some lead in chemical compounds.

By far the greater part of the lead reclaimed in 1940 was recovered by remelters, smelters, and refiners, who supplied 204,192 tons (78 percent); scrap lead and lead in alloys recovered by manufacturers and foundries totaled 56,154 tons (22 percent). Of the 204,192 tons recovered by remelting, smelting, and refining processes, 23,603 tons (12 percent) came from new scrap and 180,589 (88 percent) from old scrap. Of the 56,154 tons recovered at plants of manufacturers and foundries, 10,160 tons (18 percent) were obtained from new scrap and 45,994 (82 percent) from old scrap. Thus, the 260,346 tons of secondary lead comprised 33,763 tons (13 percent) from new scrap and 226,583 (87 percent) from old scrap.

Consumption and stocks of lead scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Soft lead	19,830	1,621	7,520	201	27,350
Hard lead	12,049	1,039	2,063	169	14,112
Cable lead	23,618	1,594	765	56	24,383

Type metals	5,243	544	7,830	576	13,073
Dross	25,620	5,550	7,098	792	32,718
Lead oxide	941	178			941
Residues	1,421	741	5	13	1,426
	243,627	26,143	63,731	6,005	307,358

Stocks of purchased lead scrap at remelting, smelting, and refining plants increased 15 percent from 22,642 tons at the beginning of 1940 to 26,143 at the end of the year. Stocks of purchased lead scrap at manufacturing and foundry plants decreased 13 percent from 6,902 tons to 6,005. Total stocks of purchased scrap on hand at all plants rose 9 percent from 29,544 tons to 32,148. Plant scrap at manufacturing and foundry plants dropped 5 percent from 1,369 tons at the beginning of the year to 1,306 at the end.

Dealers' buying prices for heavy lead scrap in New York averaged 4.27 cents a pound in 1940 compared with 4.19 cents in 1939. From 4.35 cents a pound in January the monthly average dropped to 3.95 cents in February and then held steady at 4.12 cents, except for a slight drop in August and September. With the defense program really under way, lead scrap averaged 5.02 cents in November and subsided to 4.72 cents in December.

Buying prices for battery plates ranged from 2 to 2.50 cents a pound in 1940 until late in September and then increased to as much as 3.05 cents in November, closing the year at 2.90 cents. Battery-plate smelting charges remained at $16 and $17 per ton throughout the year.

Imports of lead scrap into the United States dropped to 24 tons in 1940 from 36 tons in 1939.

Lead, including scrap, was placed under export control on March 4, 1941, by proclamation of the President. Effective March 24, 1941, a license was required for exporting materials containing over 15 percent lead.

SECONDARY NICKEL [5]

Recovery figures for secondary nickel are much larger for 1940 than for previous years owing to expansion of the survey to cover more ferronickel scrap. It is not claimed that the totals presented are truly representative of the secondary nickel industry in 1940 because of the difficulty of measuring the nickel present as a minor percentage of a wide variety of both ferrous and nonferrous scrap.

Secondary nickel recovered totaled 5,150 short tons valued at $3,605,000 in 1940 compared with 2,920 tons valued at $2,044,000 in 1939. The value for both years was computed at 35 cents a pound—the spot-delivery price of electrolytic nickel, including duty.

Nickel recovered as metal from secondary sources totaled 3 tons in 1940. The quantity recovered also included 3,032 tons of nickel in nickel-copper alloys, 864 tons in nickel-iron alloys, 1,117 tons in Monel metal, and 134 tons in stainless steel.

Secondary nickel recovered in the United States in 1939–40, in short tons [1]

	1939	1940
As metal	45	3
In Monel metal	315	1,117
In copper alloys	2,180	3,032
In stainless steel	50	134
In iron alloys	330	864
	2,920	5,150
From new scrap	1,910	2,788
From old scrap	1,010	2,362

[1] Exclusive of nickel recovered from secondary copper treated at electrolytic refineries.

Of the 5,150 tons of nickel recovered in 1940, remelters, smelters, and refiners produced 1,609 tons (31 percent) and manufacturers and foundries 3,541 tons (69 percent). The 1,609 tons recovered by remelters, smelters, and refiners included 334 tons (21 percent) derived

[5] Stock figures for the beginning of 1940 do not agree with figures previously published for the end of 1939 owing to an increase in the number of firms reporting.

from new scrap and 1,275 tons (79 percent) from old scrap. Of the 3,541 tons recovered by manufacturers and foundries, 2,454 tons (69 percent) came from new scrap, whereas 1,087 (21 percent) came from old scrap. Thus, of the total 5,150 tons of secondary nickel recovered, 2,788 tons (54 percent) were derived from new scrap and 2,362 (46 percent) from old scrap.

Consumption and stocks of nickel scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Pure nickel scrap	268	77	829	61	1,097

Ferronickel-chrome iron	21	2	895	201	916
Ferronickel-iron alloy	208	11	30	1	238
Stainless steel	680	124	1,176	145	1,856
Nickel steel, 2½-3 percent nickel			10,492	639	10,492
Nickel silver	1,177	187	7,636	460	8,813
Miscellaneous high-nickel alloys	324	454	416	483	740
	3,858	1,030	22,048	2,054	25,906

Stocks of purchased nickel scrap at remelting, smelting, and refining plants decreased 20 percent from 1,052 tons at the beginning of 1940 to 843 at the end of the year. Stocks of purchased nickel scrap at plants of manufacturers and foundries dropped 26 percent from 2,140 tons to 1,594. Total stocks of purchased scrap on hand at all plants declined from 3,192 tons to 2,437—a net loss of 24 percent. Stocks of plant scrap in the hands of manufacturers and foundries decreased 25 percent from 6,918 tons at the beginning of the year to 5,187 at the end.

Dealers' buying prices for new nickel clips in New York averaged 35.30 cents a pound in 1940 compared with 27.30 cents in 1939. The daily quotation stood at 31.50 cents a pound until early in June, when it changed overnight to 38 cents and remained so to the end of the year.

Quotations for Monel clippings in 1940 changed at the same time. Having remained at 15.50 cents a pound for 5 months, the price jumped to 18 cents in June, dropped to 16 cents in September, and regained the 18-cent level for the balance of the year.

Nickel, including scrap, was placed under export control on January 10, 1941, by proclamation of the President. Effective February 3, 1941, a license was required for exporting materials containing over 10 percent nickel.

SECONDARY TIN [6]

Secondary tin recovered totaled 33,222 short tons valued at $33,102,401 in 1940 compared with 29,160 tons valued at $29,276,600 in 1939. The value was computed at 49.82 cents a pound—the average price of Straights tin in New York for the year—in 1940 and at 50.20 cents in 1939.

Metallic tin recovered from secondary sources totaled 5,056 short tons in 1940. The greater portion of the metallic tin recovered in 1940 (4,147 tons) came from tin-plate scrap, whereas other sources con-

[6] Stock figures for the beginning of 1940 do not agree with figures previously published for the end of 1939 owing to an increase in the number of firms reporting.

tributed only small amounts (909 tons). Tin recovered in alloys and chemical compounds represented 28,166 tons. The quantity recovered also included 13,950 tons of tin in copper alloys, 7,848 tons in lead alloys, 5,671 tons in tin alloys, and 697 tons in chemical compounds.

Secondary tin recovered in the United States in 1939–40, in short tons

	1939	1940
As metal:		
At detinning plants	4,089	4,147
At other plants	371	909
	4,460	5,056
In copper alloys	12,420	13,950
In lead alloys	6,925	7,848
In tin alloys	4,675	5,671
In chemical compounds	680	697
	29,160	33,222
From new scrap	12,300	12,736
From old scrap	16,860	20,486

Remelters, smelters, and refiners produced 17,903 tons (54 percent) and manufacturers and foundries (including detinning plants) 15,319 tons (46 percent) of the 33,222 tons of tin recovered in 1940. The 17,903 tons recovered by remelters, smelters, and refiners included 5,661 tons (32 percent) derived from new scrap and 12,242 (68 percent) from old scrap. Of the 15,319 tons recovered by manufacturers and foundries, 7,075 tons (46 percent) were obtained from new scrap and 8,244 (54 percent) from old scrap. Thus, the 33,222 tons of tin recovered included 12,736 tons (38 percent) derived from new scrap and 20,486 (62 percent) from old scrap.

Consumption and stocks of tin scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Block-tin pipe, scrap, and foil	696	65	257	50	953

Miscellaneous tin and alloys	439	41	(1)	3	439
	9,521	800	875	99	10,396

1 Less than 1 ton.

Stocks of purchased tin-base scrap at remelting, smelting, and refining plants rose from 786 tons at the beginning of 1940 to 800 at the end of the year—a 2-percent increase. Stocks of purchased tin-base scrap at manufacturing and foundry plants (not including detinning plants) decreased 22 percent from 127 tons to 99. Total stocks of purchased tin-base scrap on hand at all plants receded 2 percent from 913 tons to 899. Stocks of plant scrap in the hands of manufacturers and foundries declined 22 percent from 542 tons at the beginning of the year to 425 at the end.

Dealers' buying prices for block-tin pipe in New York averaged 42.90 cents a pound in 1940 compared with 40.07 cents in 1939. The monthly average dropped from 40.89 cents a pound in January to 37.32 cents in February and rose to 46.50 cents in June, when the international situation threatened primary tin imports. Thereafter prices gradually declined, showing an average of 44.50 cents in December.

Detinning plants.—The 268,269 long tons of new tin-plate clippings treated at detinning plants in 1940 exceeded the record quantity of 248,676 tons in 1939 by 19,593 tons (8 percent). Old tin-coated containers treated dropped to 4,963 long tons in 1940 from 6,429 tons in 1939. Tin recovered as metal and in chemical products (4,844 short tons) exceeded the high record of 4,769 tons in 1939 by 75 tons. Tin reclaimed was equivalent to 35.65 pounds per long ton of new tin-plate clippings treated in 1940 compared with 37.70 pounds in 1939.

During the past few years the quantity of pig tin produced from tin-plate clippings has increased while decreases were indicated in the quantity recovered in chemicals until 1940; however, in that year recovery in both pig and chemicals increased 2 percent, and the ratio of one to the other (which stood at 1.8:1 in 1938) was 5.9:1 in both 1939 and 1940. One new detinning plant began operations in October 1940, and another was under construction late in 1940 and began operations early in the new year.

The average cost of new tin-plate clippings delivered at detinning plants, which follows roughly the changes in price of No. 1 Heavy-melting steel, advanced to $16.59 a long ton in 1940—a gain of 10 percent over the average of $15.06 in 1939.

Imports of tin-plate scrap into the United States, largely from Canada, totaled 16,615 long tons valued at $201,213 in 1940 compared with 12,633 tons valued at $126,518 in 1939.

Exports of tin-plate scrap, waste-waste, circles, strips, cobbles, etc., from the United States amounted to 29,370 long tons valued at $1,227,558 in 1940 compared with 25,888 tons valued at $1,121,153 in 1939. Exports of tin-plate scrap or that portion subject to export licensing (Public, No. 448, 74th Cong.) totaled 3,536 long tons valued at $68,122 in 1940 compared with 10,204 tons valued at $186,393 in 1939.

Export allotments of tin-plate scrap.—Export allotments of tin-plate scrap in 1940 were based upon the individual producer's request therefor, with the provision that no allotment of more than 25 long tons should exceed 20 percent of the producer's output of tin-plate scrap during the calendar year 1938. The United States Department of State issued 57 licenses in 1940 authorizing the exportation of 4,334 tons of tin-plate scrap valued at $80,947.20. All licenses issued in 1940 named Japan as the country of destination.

Tin-plate and terneplate scrap were included in the export-license regulations as iron and steel scrap in the Presidential proclamation of July 26, 1940, effective August 1, 1940. As interpreted by the Administrator of Export Control, the order affected tin-plate circles, strips, cobbles, and scroll-shear butts; waste-waste tin plate; and terneplate waste-waste, clippings, and scrap.

The new order also included all types of tin-plate scrap that had been under export control since April 16, 1936.

SECONDARY ZINC [7]

Zinc recovered from secondary sources totaled 205,921 short tons valued at $25,946,046 in 1940 compared with 189,640 tons valued at $19,722,600 in 1939. The value was computed at 6.3 cents a pound in 1940 (the average selling price of all grades) and at 5.2 cents in 1939.

Zinc recovered as metal from distillation and remelting of purchased secondary metals totaled 35,529 short tons in 1940; moreover, 112,306 tons of zinc were recovered in copper alloys, 15,810 tons in zinc oxide, 1,958 tons in zinc sulfate, 9,132 tons in zinc chloride, 17,321 tons in zinc dust, and 13,865 tons in lithopone.

Secondary zinc recovered in the United States in 1939–40, in short tons

	1939	1940
As metal:		
By distillation [1]	33,135	32,825
By remelting	2,835	2,704
	35,970	35,529
In copper alloys [2]	98,879	112,306
In chemical products:		
Zinc oxide	16,429	15,810
Zinc sulfate	1,674	1,958
Zinc chloride	6,686	9,132
Zinc dust	16,293	17,321
Lithopone	13,709	13,865
	189,640	205,921
From new scrap	144,540	141,717
From old scrap	45,100	64,204

[1] In addition, 17,293 tons of zinc were recovered by redistillation of plant scrap in 1939 and 16,092 tons in 1940. Reported output of redistilled secondary zinc was 50,428 tons in 1939 and 48,917 tons in 1940.
[2] Includes some plant scrap at brass mills.

Of the 205,921 tons of zinc recovered in 1940, remelters, smelters, and refiners supplied 109,455 tons (53 percent) and manufacturers and foundries 96,466 tons (47 percent). The 109,455 tons recovered by remelters, smelters, and refiners included 55,366 tons (51 percent) derived from new scrap and 54,089 (49 percent) from old scrap. The 96,466 tons reported by manufacturers and foundries included 86,351 tons (90 percent) obtained from new scrap and 10,115 (10 percent)

[7] Stock figures for the beginning of 1940 do not agree with figures previously published for the end of 1939 owing to an increase in the number of firms reporting.

from old scrap. Thus, the 205,921 tons of zinc recovered included 141,717 tons (69 percent) derived from new scrap and 64,204 (31 percent) from old scrap.

Consumption and stocks of zinc scrap in the United States in 1940, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total used
	Used	Stocks, Dec. 31, 1940	Used	Stocks, Dec. 31, 1940	
Clippings	2,759	175	915	150	3,674
Sheet	11,936	640	72	10	12,008
Castings	822	66	18	2	840
Skimmings and ashes	26,582	7,106	527	340	27,109
Dross	29,045	2,600	1,257	376	30,302
Die castings	17,087	2,261	169	1	17,256
Flue dust and residues	7,589	6,342	13,288	732	20,877
	95,820	19,190	16,246	1,611	112,066

Stocks of purchased zinc scrap on hand at remelting, smelting, and refining plants increased 12 percent from 17,162 tons at the beginning of 1940 to 19,190 at the end. Stocks of purchased zinc scrap on hand at manufacturing and foundry plants decreased 46 percent from 2,982 tons to 1,611. Total stocks of purchased scrap on hand at all plants rose 3 percent from 20,144 tons to 20,801. Stocks of plant scrap at manufacturing and foundry plants advanced from 972 tons at the beginning of the year to 1,346 at the end—a rise of 38 percent.

Dealers' buying prices for new zinc clips in New York averaged 4.81 cents a pound in 1940 compared with 3.58 cents in 1939—a rise of 34.4 percent. Monthly averages began with 4.35 cents a pound in January and held at 4.19 cents for 4 months, then rose evenly to 6.02 cents in December. On December 31, 1940, the quotation was 6.75 cents a pound, and the first quarter of 1941 brought March quotations to 8.50 cents. Effective March 31, 1941, maximum prices for zinc scrap were set by the Advisory Commission to the Council of National Defense.

Schedule of maximum Government prices for zinc scrap in effect Mar. 31, 1941 [1]

Grade	Maximum price (cents per pound)
New zinc clippings and trimmings	[2] 6.75
Engravers' and lithographers' plates	[2] 6.75
Old zinc scrap	[2] 5.10
Unsweated zinc dross	[3] 5.10
Die-cast slab	[3] 4.95
New die-cast scrap	[3] 4.60
Radiator grilles, old and new	[3] 4.60
Old die-cast scrap	[3] 4.25

[1] Maximum prices to be paid for zinc-scrap materials after the free iron and other foreign materials are removed. [2] Delivered buyer's plant. [3] F. o. b. point of shipment.

The importance of secondary zinc in defense production was demonstrated by its inclusion in the General Preference Order M-11 relating to the distribution of zinc, which was announced by the Office of Production Management on June 11, 1941. It was stated that a definite shortage of zinc existed (which might increase in future, as the domestic supply was insufficient for all defense and civilian needs) and that conservation by means of priority control was needed to insure the satisfaction of requirements for national defense.

Full priority control replaced the partial control to which zinc had been subject through a production pool established voluntarily by producers beginning April 1.

The new order, effective July 1, 1941, provides that all defense needs would be filled ahead of all other requirements, that an emergency pool would be created to meet urgent needs, and that the remaining zinc would be allocated among competing civilian demands. Deliveries of all defense orders that did not bear a higher preference rating were assigned a rating of A–10, which afforded priority over civilian requirements.

As defined in the order, "zinc" meant all grades of metallic zinc (spelter) produced directly from ores, concentrates, and other primary material or redistilled from scrap, including dross, skimmings, and ashes; all zinc oxide, both lead-free and leaded; and zinc dust.

During each month, beginning July 1, each producer of metallic zinc, zinc oxide, and zinc dust was to set aside from his total production an amount to be determined from time to time by the Director of Priorities, to be delivered only upon his express direction. Zinc that remained after the required amount had been set aside in a pool was to be shipped in such manner that each customer should receive a percentage of the producer's commitments to him for the month, including both defense orders and nondefense orders, equal to the percentage received by every other customer. The restrictions on shipments applied not only to outside customers but also to affiliates, subsidiaries, and agents of the seller and to shipments of zinc from the producing branch of a single business enterprise to any other business enterprise owned or controlled by the same person or corporation.

The order was accompanied by the disclosure that 1,165,000 short tons of zinc were estimated by the Office of Production Management to be the 1941 requirements for both military and civilian needs, whereas available figures indicated that the total supply for the year would be 890,000 to 950,000 tons, indicating an over-all shortage of from 215,000 to 275,000 tons, even if the 200,000 short tons to be produced from foreign ores were made available. Inability to get ships to move concentrates from South America could reduce seriously the estimated supply for the year. In addition, potential demands in cartridge brass as new cartridge facilities came into production were expected to intensify the shortage.

In 1940, the reported production of secondary zinc in the United States as metal redistilled from scrap (including dross, skimmings, and ashes) and as zinc oxide and zinc dust produced from scrap amounted to 65,956 short tons or 32 percent of the total recovery of secondary zinc in all forms.

Imports of zinc scrap into the United States dropped to 164 tons in 1940 from 173 in 1939, and imports of zinc dross rose to 356 tons from 30.

Zinc, including scrap, was placed under export control on January 10, 1941, by proclamation of the President. Effective February 3, 1941, a license was required for exporting materials containing over 15 percent zinc.

IRON AND STEEL SCRAP [1]

By Robert H. Ridgway and Harold E. Carmony

SUMMARY OUTLINE

The iron and steel scrap industry in 1940 was characterized by the unprecedented consumption of scrap and by increases in prices and in consumers' stocks of scrap. Reflecting the 27-percent rise in steel ingot production in 1940, the use of ferrous scrap increased 23 percent over that in 1939 and 17 percent above that in the record year 1937. During the first 4 months of 1940, scrap consumption followed the downward trend of the steel-ingot production rate, which gradually declined as an aftermath of the abrupt upturn in production following the advent of war in 1939. However, as steel production soared to record proportions during the latter half of the year, the demand for scrap improved. The consumption of scrap probably reached an all-time peak in October 1940.

The proportion of purchased scrap used in open-hearth furnaces—the largest consumers of purchased scrap—has, in general, trended downward for a number of years. Again in 1940 the ratio of scrap to pig iron decreased; practically all of this decline was due to the reduced proportion of purchased scrap used, while the proportion of home scrap used dropped only slightly. The decline in the proportion of purchased scrap used in 1940 was accentuated by the enlarged demand for steel and resulted in an increased amount of steel produced from duplexing operations. The rise in steel production to record heights created an abnormal demand for scrap, and for a short period the price of scrap exceeded that of pig iron. During November and December, many consumers were obliged to increase the amount of pig iron used because of the high cost of scrap and the curtailment of available supplies caused by the continued large demand.

The total consumption of ferrous scrap and pig iron in 1940 increased 27 percent over that in 1939. Of the 90,715,499 net tons used, 73,933,517 were charged to steel-making furnaces and 16,781,982 to iron furnaces. In making the average ton of steel in 1940, less scrap and more pig iron were used than in 1939; the relative consumption of purchased scrap declined in 1940 from 1939, while that of home scrap increased slightly. In iron furnaces, moreover, the relative use of total scrap decreased while that of pig iron increased, owing to a smaller consumption of purchased scrap in 1940 compared with 1939.

[1] Minerals Yearbook, 1939, p. 513, gives definitions of the various scrap terms used in this chapter.

Exports of ferrous scrap from the United States in 1940 declined 21 percent from 1939 mainly because exports to several countries that were involved in the European War were eliminated and because exports to countries other than the United Kingdom and the Western Hemisphere were restricted beginning in October. Consignments to Japan, which in 1939 comprised 56 percent of the total, declined to 34 percent of the 1940 exports, while those to the United Kingdom and Canada were greater than in 1939. Shipments to Italy in the first 6 months of 1940 were 17 percent greater than in the corresponding period in 1939 but disappeared when Italy entered the war in June. Several bills and resolutions that would directly or indirectly impose restrictions on scrap exports from the United States were introduced during the third session of the Seventy-sixth Congress. On July 2, 1940, after extensive testimony, H. R. 9850 was approved and became Public, No. 703, 76th Congress.

Immediately after war broke out in September 1939 the International Scrap Convention—a centralized buying agency for European consumers—suspended operations. Consequently, all of the European countries that purchased scrap in 1940 acted independently in their buying, while purchases in the United States by Japan were negotiated by the several large mercantile houses of that nation.

Prices for scrap fluctuated within narrower limits in 1940 than in 1939. According to Iron Age, the quotation for No. 1 Heavy-melting steel scrap at Pittsburgh ranged from a low of $16.25 a gross ton the first week in April to a high of $22.75 the second week in December. The average for 1940 was $19.26 compared with $17.17 in 1939 and was the highest yearly average since 1923. Scrap prices received little support in the first 6 months of 1940 from either domestic or foreign markets; however, increased domestic demand and greater activity in export loading early in the third quarter strengthened the price structure, and prices trended upward in sympathy with the increased rate of steel production. The increasing price of scrap during the last few months of 1940 caused the Office of Price Stabilization of the Advisory Commission to the Council of National Defense to confer with representatives of the steel and scrap industries early in October to discuss the scrap-market situation. Although no Government control was exercised, these conferences tended to result in voluntary halting of the advancing trend in scrap-steel prices. However, this stability was short-lived, and prices continued to rise until December, when scrap was quoted above the price for basic pig iron. This new increase brought about another series of conferences late in December and during the first week of the new year between steel-mill and scrap-trade representatives and the Office of Price Stabilization, when both prices and the supply situation were discussed. The quoted price of basic pig iron remained stationary in 1940 until the latter part of December, when it increased $1.00 a gross ton to $23.50 at Valley furnaces and held at the higher level into 1941.

The high operating rates in steel production during the latter half of 1940 precipitated such an abnormal demand for scrap that dealers and brokers found it difficult to cover commitments. This occasioned considerable alarm as to the depleted condition of domestic stocks of iron and steel scrap. The Bureau of Mines survey of suppliers' and consumers' stocks for the last quarter of 1940 [2] indicated inventories

[2] Bureau of Mines, Quarterly Iron and Steel Scrap Stock Reports: No. 8, February 27, 1941, 10 pp.

exceeding 7,843,000 net tons which was equivalent to approximately a 2-month supply at the December rate of consumption. Some authorities interpreted this as representing an adequate supply. Consumers' stocks of scrap increased from 5,310,098 tons at the beginning of 1940 to 5,471,554 at the close.

Salient statistics of ferrous scrap and pig iron in the United States, 1939–40

	1939	1940	Change in 1940 (percent)

PRICES [3]

The undertone of scrap prices in 1940 was moderate, except for the last 5 months when steel-ingot production consistently exceeded 90 percent. Market quotations for No. 1 Heavy-melting steel and No. 1 Cast cupola scrap, which had averaged $18.50 and $19.38 a gross ton (Pittsburgh), respectively, in December 1939, eased off with No. 1 Heavy-melting steel dropping to $16.25 and No. 1 Cast cupola scrap dropping to $17.75 (the low point of the year) in the first week of April. However, this weakness was short-lived, and there was a gradual uptrend in prices until the last of June, when—after the capitulation of France—French steel orders were suspended and scrap markets

[3] Pittsburgh price quotations from Iron Age.

assumed a sympathetic tone. During the middle of August, domestic demand having increased, the weakness in the markets was reversed, and the price structure strengthened gradually. Quotations for scrap reached the high point of the year during the second week of December, when No. 1 Heavy-melting steel and No. 1 Cast cupola scrap were both quoted at $22.75 a ton. The average price of scrap during 1940 increased in a more orderly fashion than after the advent of the renewed Allied and German hostilities in 1939. In the closing weeks of 1940 prices remained stable, with an average of $22.94 a ton for No. 1 Heavy-melting steel and $22.75 for No. 1 Cast cupola scrap.

In contrast to the relatively wide fluctuations in scrap prices in 1940, the price of basic pig iron, established at $22.50 a gross ton at Valley furnaces late in September 1939, remained unchanged until the final weeks of December 1940, when it rose to $23.50 and held there during the remainder of the year.

Export scrap prices in 1940, as indicated by the declared value of iron- and steel-scrap exports, averaged $16.87 a gross ton for the year and were slightly above the 1939 average of $15.40. In recent years the 1940 average price—$16.87—was surpassed in only 1 year—1937—when the average was $18.91. In the first 3 months of 1940 the price structure was weak because of the lack of shipping facilities and the amount of material in dealers' yards with which to cover orders, but in the second quarter prices were strengthened when shipping increased. The average value of exports in April—$15.85—represented the low monthly average of the year. Exports increased in the second and third quarters of the year even though Italy—one of the large purchasers of scrap—was out of the market after entering the war in June. Although licensing of exports of No. 1 Heavy-melting steel became effective on August 1, exports continued at accelerated rate until October 16, when the restriction of foreign shipments was extended to include all grades of iron and steel scrap, except to Great Britain and the Western Hemisphere. After October exports decreased approximately 75 percent; but, on account of the increased demand for scrap in the inland steel districts, which was the dominant factor in the domestic market, export prices trended upward. Export values advanced steadily through the last half of the year and reached an average of $17.89 a ton in October.

LEGISLATION

Several new bills [4] calling for the licensing or restricted embargoing of iron and steel scrap were introduced during the third session of the Seventy-sixth Congress. After extensive testimony before the Committee on Military Affairs of the House of Representatives and considerable debate in Congress, the efforts of the proponents for an embargo or a licensing system were successful when H. R. 9850, 76th Congress, was approved and became Public, No. 703, on July 2, 1940. Section 6 of this law provides for the licensing, under proclamation by the President, of exports of materials deemed necessary

[4] S. 3037. A bill to protect the domestic iron and steel industry of the United States in the interest of national defense.
S. 4025. A bill to expedite the strengthening of the national defense.
H. R. 7658 and 10059. Bills to provide for the protection and preservation of domestic sources of iron and steel.
H. R. 9802, 9825, and 9850. Bills to expedite the strengthening of the national defense.

in the interest of national defense. Acting under this law, the President on July 2, 1940, proclaimed that certain listed articles and materials should be exported only when authorized by license. This proclamation did not include iron and steel scrap, but on July 26 was extended to include No. 1 Heavy-melting scrap, providing for licensing effective August 1. On September 26, the proclamation was again extended, this time to include all grades of iron and steel scrap, with the provision that all existent licenses permitting the exportation of No. 1 Heavy-melting steel scrap would be revoked, effective October 15. Under the new regulations, effective October 16, licenses would be issued to permit shipments only to countries of the Western Hemisphere and to Great Britain. Japan, which received 56 percent of all iron and steel scrap exported from the United States in 1939, was the nation principally affected by the new licensing controls.

STOCKS

Visible supplies of iron and steel scrap and pig iron in the United States were determined by the regular annual canvass of consumers of these materials and the quarterly canvass of suppliers (including scrap-iron dealers, automobile wreckers, and selected lists of railroads and manufacturers). The final results of the annual survey indicate that total consumers' and suppliers' stocks of iron and steel scrap totaled 7,662,865 net tons on December 31, 1940, or 180,135 tons less than the 7,843,000 previously published as a result of the quarterly survey. This total of 7,662,865 tons represents a 6-percent decrease from the 8,178,069 tons on hand December 31, 1939.

Consumers' stocks.—Consumers' stocks of home and purchased scrap were slightly larger at the end of 1940 than at the beginning of the year. The supply of 1,783,920 net tons of home scrap on hand December 31, 1940, represented an 8-percent decrease from the 1,936,735 tons on hand at the beginning of the year, while the supply of 3,687,634 tons of purchased scrap on hand at the end of 1940 was a 9-percent increase over the 3,373,363 tons on hand at the beginning of the year. Thus, stocks of scrap totaling 5,471,554 tons at the year end were 3 percent greater than the 5,310,098 tons on hand at the beginning of the year.

In contrast to consumers' stocks of scrap, stocks of pig iron totaling 3,242,324 tons at the end of the year had decreased 14 percent from the 3,773,432 tons on hand at the beginning of the year.

Suppliers' stocks.—Stocks held by dealers, automobile wreckers, railroads, and manufacturers declined from 2,867,971 net tons (reported by 4,680 concerns) on December 31, 1939, to 2,191,311 (reported by 4,848 concerns) on December 31, 1940. Thus, supplies of iron and steel scrap held by suppliers at the year end were 24 percent less than those on hand at the beginning of the year. Stocks in the hands of the larger suppliers were 36 percent lower at the end of 1940 than at the end of 1939, and railroad inventories declined 37 percent during the same period. Although suppliers' stocks declined, nine States, which represented 11 percent of the total replies in the December 1940 canvass and 13 percent of the total suppliers' stocks, showed actual increases, notably Indiana and Missouri, both of which contain large scrap-consuming areas.

Consumers' stocks of ferrous scrap and pig iron on hand in the United States on Dec. 31, 1939–40, by States and districts, in net tons

[1] Includes 2,580 dealers, 1,832 automobile wreckers, 66 railroads, and 202 manufacturers in December 1939; and 2,717 dealers, 1,884 automobile wreckers, 77 railroads, and 170 manufacturers in December 1940.
[2] Includes 118,670 tons in transit to yards or to shipping point for export and at docks awaiting export in December 1939; and 48,958 tons in December 1940.

CONSUMPTION

In the canvass of consumers of ferrous scrap and pig iron, statistics are compiled to show the consumption of scrap and pig iron by districts and States and by types of furnace. To avoid disclosing details concerning individual plants reporting, figures for some States must be combined in certain instances. All such combinations are made to reveal details of consumption by types of furnace rather than by geographic subdivisions.

The importance of scrap from the standpoint of conservation is illustrated by the relative quantities of scrap and ore used in the domestic iron and steel industry. The total scrap consumed in 1940 was equivalent to 111 percent of the iron content of all domestic and foreign iron and manganiferous ores used in blast furnaces, and purchased scrap alone equaled 48 percent of the iron content of the ores; in 1939 the comparable percentages were 121 and 56.

Scrap constitutes by far the greater part of the ferrous raw materials used in iron and steel plants in the Southwestern, Pacific Coast, and New England districts. These regions, however, used less than 5 percent of the total scrap consumed in 1940. In the New England, Middle Atlantic, and North Central districts, proportionately less scrap was used in 1940 than in 1939, whereas in the Southeastern, Southwestern, Rocky Mountain, and Pacific Coast districts—areas remote from pig-iron-producing centers—proportionately more scrap was used.

Ferrous scrap and pig iron consumed in the United States and percent of total derived from home scrap, purchased scrap, and pig iron, 1939–40, by districts

[1] Includes data for 2 Brackelsberg furnaces.

Open-hearth steel furnaces use by far the largest quantities of ferrous scrap and pig iron. They consumed 70 percent of the total scrap in 1940 (70 percent in 1939), 73 percent of the home scrap (73 percent in 1939), 65 percent of the purchased scrap (67 percent in 1939), and 79 percent of the pig iron (76 percent in 1939).

Cupolas, the second largest consumers of scrap, took 22 percent of the purchased scrap in 1940 compared with 21 percent in 1939. Their relative consumption of home scrap did not change from 1939, when the percentage was 15; however, their consumption of pig iron decreased to 9 percent in 1940 from 10 percent in 1939.

Open-hearth and cupola furnaces together consumed 88 percent of both home and purchased scrap and 87 percent of the pig iron in 1940. Bessemer converters used 8 percent of the pig iron consumed in 1940 but only relatively small quantities of scrap (0.58 percent of the total). Although electric furnaces consumed only 6 percent of the total scrap in 1940, 98 percent of the total charge to this type of equipment was home and purchased scrap.

CONSUMPTION BY DISTRICTS AND STATES

All 48 States, the District of Columbia, and Alaska contain plants consuming ferrous scrap or pig iron. The greatest consumption, however, is concentrated in the steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas include the 8 largest consuming States, which used 83 percent of the total scrap, 92 percent of the pig iron, and 87 percent of the total scrap and pig iron charged into furnaces in 1940. These States (whose relative position changed only slightly from 1939) and the percentage of the total ferrous scrap and pig iron each consumed in 1940 were as follows: Pennsylvania 28, Ohio 19, Indiana 11, Illinois 9, Michigan 6, New York 5, Alabama 5, and Maryland 4.

Consumption of ferrous scrap and pig iron in the United States, 1936–40, by districts

CONSUMPTION BY TYPE OF FURNACE

Open-hearth furnaces.—Ferrous scrap and pig iron consumed in open hearths in 1940 totaled 67,304,994 net tons—a 29-percent increase over 1939. Of the 1940 total, home scrap comprised 27 percent, purchased scrap 19 percent, and pig iron 54 percent; in 1939 the percentages were 27, 22, and 51, respectively. The use of home scrap increased 28 percent, purchased scrap 13 percent, and pig iron 35 percent.

Charges to open-hearth furnaces in 1940 consisted of 46 percent total scrap and 54 percent pig iron compared with percentages in 1939 of 49 and 51, respectively. Of the total scrap consumed in open hearths in 1940, 41 percent was purchased scrap compared with 44 percent in 1939 and 46 percent in 1938. Higher proportions of purchased scrap are used in areas remote from pig-iron-producing centers, but the practice of using scrap exclusively is relatively rare. In 1940, only 4 plants out of a total of 135 operated on a 100-percent scrap basis; they consumed only 369,650 tons, less than 1 percent of the total consumption of ferrous raw materials in open hearths.

Pennsylvania, the leading steel-producing State, outranked all other States in 1940 in the consumption of ferrous scrap and pig iron in open hearths, followed by Ohio, Indiana, and Illinois.

Consumption of ferrous scrap and pig iron in the United States, 1939–40, by type of furnace, in net tons

Bessemer converters.—The consumption of ferrous scrap and pig iron in bessemer converters in 1940 totaled 4,087,168 net tons—a 7-percent increase over 1939. The proportion of scrap consumed in converter practice is low (amounting to only 6.3 percent in 1940), and virtually the entire quantity was home or plant scrap. Almost all of the small tonnage of purchased scrap consumed in converters was used in small steel-foundry plants.

Ohio was the principal consumer of scrap in bessemer converters in 1940.

Electric steel furnaces.—Ferrous scrap and pig iron consumed in electric furnaces in 1940 totaled 2,541,355 net tons—a 49-percent increase over 1939. Pig iron comprised less than 2 percent of the total ferrous raw materials used in electric furnaces in 1940. Of the 280 active plants reporting in 1940, 94 operated exclusively on scrap and consumed 681,636 tons—about 27 percent of the total scrap and pig iron used.

Ohio led all States in 1940 in the consumption of scrap in electric furnaces, followed by Pennsylvania, Illinois, Michigan, and New York.

Cupola furnaces.—Consumption of ferrous scrap and pig iron in cupola furnaces in 1940 totaled 12,135,944 net tons—a 24-percent increase over 1939. Use of home scrap increased 28 percent, purchased scrap 23 percent, total scrap 25 percent, and pig iron 23 percent. Thus, the proportion of purchased scrap held its own with that of pig iron, although the relatively low prices of scrap as compared to pig iron during the first 9 months of the year were an important factor.

Charges to cupola furnaces in 1940 consisted of 30 percent home scrap, 36 percent purchased scrap, and 34 percent pig iron; in 1939 the percentages were 29, 37, and 34, respectively. Many cupola plants operate on a 100-percent scrap charge; a total of 456 plants reported the use of 1,086,456 tons of ferrous scrap without pig iron in 1940 compared with 472 plants that reported the use of 784,634 tons in 1939.

The relative position of States that are large consumers of scrap in cupola furnaces was not changed in 1940. Michigan continued to be the principal consumer, followed in order by Ohio, Pennsylvania, Illinois, and New York.

[1] Includes some pig iron used in making direct castings.

Air furnaces.—Ferrous scrap and pig iron consumed in air furnaces in 1940 amounted to 1,020,215 net tons—a 17-percent increase over 1939. The use of home scrap increased 21 percent, while that of purchased scrap and pig iron both increased only 14 percent, respectively, with the use of total scrap increasing 18 percent. Thus, equipment of this type used relatively more total scrap than pig iron in 1940, in contrast to 1939 when relatively more pig iron than total scrap was used. Only four operators of air furnaces reported exclusive use of scrap in 1940, the quantity amounting to 15,673 tons.

Pennsylvania led all States in 1940 in the consumption of scrap in air furnaces, followed in order by Ohio, Indiana, Illinois, Michigan, and Wisconsin

Blast furnaces.—Ferrous scrap constitutes only a small proportion of the metal-bearing materials consumed in blast furnaces. The other materials used in 1940 were 80,348,923 net tons of iron and manganiferous iron ores, 5,506,967 tons of cinder and scale, and 2,674,000 tons of flue dust. Total consumption of scrap in 1940, as reported by 79 plants operating blast furnaces, was 2,080,329 tons, an 8-percent increase over 1939. Of the 1940 total, 62 percent was home scrap and 38 percent purchased scrap.

The proportion of scrap used in blast furnaces again declined in 1940, amounting to 4.5 percent of the pig iron produced in 1940 compared with 5.6 percent in 1939 and 5.7 percent in 1938. Purchased scrap was equivalent to 1.7 percent of the pig iron produced in 1940 compared with 2.3 percent in 1939 and 1.6 percent in 1938.

Blast furnaces in Ohio continued to consume more scrap than those in any other State, in 1940, using 3 percent more than Pennsylvania, the second ranking State; in 1939, Ohio furnaces consumed 52 percent more than Pennsylvania furnaces.

Total United States: 1940	79	1,286,985	793,344	2,080,329
1939	77	1,125,113	807,840	1,932,953

FOREIGN TRADE [5]

Imports.—Imports of iron and steel scrap into the United States, which never have been very significant, totaled only 2,199 net tons valued at $47,979 in 1940 compared with 33,031 tons valued at $301,513 in 1939. Of the 1940 total, 737 tons came from Mexico, 661 from Canada, 454 from Europe (mainly Sweden), and only 347 from other countries. In addition, 18,609 tons of tin-plate scrap were imported in 1940, largely from Canada, compared with 14,149 in 1939 and 11,697 in 1938.

Exports.—Ferrous scrap exports (all types) from the United States in 1940 were only 79 percent as large in tonnage and 86 percent as great in value as those during 1939; this decrease was caused by the restriction of exports of all grades of scrap, except to Great Britain and the Western Hemisphere, on October 16. In all, 3,159,284 net tons valued at $48,314,146 were exported in 1940 compared with 4,014,572 tons valued at $55,911,516 in 1939. The shipments included 15,923 tons of tin-plate scrap, waste-waste tin plate, tin-plate strips, cobbles, etc., valued at $753,184 in 1940 compared with 28,995 tons valued at $1,121,153 in 1939. The following table shows the principal countries to which shipments of scrap were consigned during the 5-year period 1936–40.

[5] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Ferrous scrap exported from the United States, 1936–40, by countries, in net tons

Country	1936	1937	1938	1939	1940
Canada	71,357	207,840	103,283	196,556	411,571
Germany	7,615	98,731	258,611	18,574	
Italy	319,341	427,161	486,883	477,004	357,627
Japan	1,184,536	2,140,889	1,547,617	2,279,315	1,079,141
Netherlands	5,350	160,609	231,341	60,665	165
Poland and Danzig	34,837	308,680	169,625	173,161	
United Kingdom	408,659	948,838	433,829	569,288	1,100,774
Other countries	136,773	300,987	127,233	240,009	210,006
	2,168,468	4,593,735	3,358,422	4,014,572	3,159,284
Total value	$24,684,084	$79,387,459	$45,829,533	$55,911,516	$48,314,146

Of the total exports of ferrous scrap from the United States in 1940, 1,498,840 net tons cleared through customs districts on the Atlantic coast (2,241,053 tons in 1939), 896,688 tons from districts bordering the Gulf of Mexico (982,213 tons in 1939), 437,944 tons from districts along the Pacific coast (609,900 tons in 1939), and 325,812 tons from other customs districts (181,405 tons in 1939).

Exports were drawn largely from seaboard areas where the cost of transportation from the point of origin to the port of exportation is relatively low and where the cost of transportation to domestic iron and steel plants not within the area is high.

WORLD ASPECTS

The additional increase in world steel production in 1940 over that in 1939, resulting from the continued turbulent conditions among the powerful foreign nations, resulted in further expansion of the use and demand for iron and steel scrap compared with 1939. According to Metal Statistics 1941,[6] world production of steel in 1940 created a new all-time record, totaling 159,600,000 net tons and representing a 6-percent increase over the 1939 record production of 150,416,000 tons and a 33-percent increase over the 1938 production of 119,840,000 tons. In the United States, Canada, Russia, and Japan, steel production increased 15,716,000 net tons in 1940, whereas the remaining countries reduced production 6,532,000 tons. World production of steel in 1940 (excluding the United States) declined to 92,600,000 tons—a 5-percent decrease from the all-time record (97,617,000 tons) established in 1939, but 5 percent higher than the 1938 figure (88,088,000 tons). Steel production in the United States in 1940 increased 27 percent over 1939 and was 6 percent greater than in the record year 1929.

World production of pig iron (including ferro-alloys) also made a new all-time record in 1940 and totaled 120,960,000 net tons—an increase of 8,904,000 tons over the 1939 production of 112,056,000 tons and of 6,104,000 tons over the previous record of 114,856,000 tons established in 1937. In four countries (United States, Russia, Canada, and the United Kingdom), pig-iron production increased 17,825,000 tons, while the remaining countries reduced their output 8,921,000 tons. World production of pig iron in 1940 (excluding the United States), declined to 68,096,000 tons—a decrease of 8,282,000 tons from the 1939 output of 76,378,000 tons.

[6] American Metal Market, Metal Statistics, 1941: New York City, 1941, p. 233.

The increased spread between the production of pig iron and steel in 1940 compared with 1939 indicates a continued rise in the world use of iron and steel scrap during 1940.

Cartel activities.—The International Scrap Convention suspended operations after the outbreak of war in September 1939, hence there was no activity for purchasing of iron and steel scrap by any cartel on behalf of individual nations.[7] Throughout 1940 each European nation that purchased scrap bought independently; the pro-Axis nations procured less scrap than formerly, whereas the democracies increased their purchases and the United Kingdom and Canada almost doubled the quantities bought in 1939. As in former years, all purchases of scrap by Japan (until licensing of exports was made effective in October) in the United States during 1940 were negotiated by the several large mercantile houses of that nation.

REVIEW BY COUNTRIES

Germany.—Steel output in Germany, which had proceeded feverishly during 1939 and established new records, declined almost 500,000 net tons in 1940 but was approximately twice as large as that of the United Kingdom. The productive capacity of Germany again was augmented—this time by the conquests of Norway, Belgium, Holland, Luxemburg, and France—which tended to relieve the raw-material supply situation as concerned iron ore and scrap, although steel production remained dependent to a certain extent on imports of iron ores from the Scandanavian Peninsula. The stringent measures that Germany adopted in 1939 to conserve its domestic supplies of iron and steel scrap were extended in 1940 to include plants not previously controlled. The use of pig iron produced from low-grade domestic ores and high-grade imported ores was continued.

Italy.—Steel production in Italy, which reached new records in 1939, declined slightly in 1940, although it was still greater than in previous years. Italian production of pig iron also declined from the record set in 1939, causing the iron and steel industry to remain dependent on foreign raw materials by a wide margin. Italian imports of iron and steel scrap from the United States during the first 6 months of 1940 (or until Italy entered the war) had increased considerably, approximating 75 percent of the total imported in 1939. Italy is keenly aware of the vulnerability of its iron and steel industry and, to minimize the demand for raw materials from foreign sources, has by Royal Decree Laws promulgated stringent regulations governing the use and possession of scrap.[8] A Royal Decree Law was also issued which required that all railings of iron or other metals, unless specifically exempt, such as the entrance gates or railings of the Holy See, and diplomatic or consular property of foreign governments, etc., must be dismantled and delivered as scrap to the Scrap Distribution Board.[9]

[9] Bureau of Mines, Mineral Trade Notes: Vol. 11, No. 1, July 20, 1940, pp. 5, 6.

Japan.—The Japanese steel industry, which has maintained a spectacular growth during the past decade, established new production records in 1940. The problem of raw materials (serious even in previous years) assumed greater importance in 1940, especially after the export-licensing provisions on iron and steel scrap, as set up by the United States, eliminated Japan from that market.[10] This difficulty is evidenced by the fact that steel production, which has practically tripled since 1930, has not been accompanied by proportionate increases in the output of pig iron, a commodity that was produced in smaller amounts in 1940 than in 1939. Consequently the maintenance of present production rates depends entirely on imports of pig iron and iron and steel scrap. Although sources of scrap within the empire are not large, strict Government control is exercised over all available supplies. The announced restriction on exports of iron and steel scrap from the United States and the further spread of the war in Europe caused no little apprehension within Japanese iron and steel circles during the last 6 months of 1940, as Japan depends for its aircraft, automobile, and machine-tool industries on iron and steel scrap imports from the United States, iron ore and pig iron brought in from colonial possessions of belligerent countries, and importation of special and alloy steels.[11]

United Kingdom.—Scrap remained an extremely significant factor in the production of steel in the United Kingdom in 1940, even though less steel was produced than in 1939. All domestic iron and steel scrap collected was rapidly absorbed as soon as received at the consuming centers. Imports of scrap from the United States established a new high during 1940, even though shipping was difficult due to lack of ships. In addition to house-to-house scrap-collection campaigns, requests were made to enterprises that ordinarily do not produce scrap to make all obsolete equipment available.[12] Even though industry undertook to use higher ratios of pig iron in furnace charges, the demand for scrap material continued unabated and consistently exceeded the supply.[13] Additional control of iron and steel scrap by stabilizing collection and conserving supplies was inaugurated with issuance of an order requiring purchasers of scrap to obtain a license for acquiring more than 1 ton in any 1 week.[14] Official orders were also issued for conserving supplies of iron and steel scrap by further limiting allocations for nonessential uses and for construction.[15] Pig-iron production in the United Kingdom in 1940 was exceeded in recent years only by that in 1937.

IRON ORE, PIG IRON, FERRO-ALLOYS, AND STEEL

By Robert H. Ridgway, H. W. Davis, and N. B. Melcher [1]

SUMMARY OUTLINE

The sharp rise in world production of iron and steel in the latter half of 1939 continued throughout 1940, elevating it to new records during 1940. The major part of the world increase in 1940 was due largely to the gain in American output, which established a new high during the year. Although the iron and steel industry in Germany proper and the United Kingdom probably operated at near capacity during 1940, some restriction may have been imposed, as in other belligerent countries, by destruction incident to actual warfare. The present annual steel capacity of the Reich (including that of seven conquered countries) is estimated by Iron Age to be 48,000,000 net tons, and is obtained by adding to Germany's own capacity the following approximate amounts gained by territorial accession: France 10,000,000 tons, Belgium 4,300,000 tons, Luxemburg 2,800,000 tons, Poland 2,100,000 tons, Czechoslovakia, 1,750,000 tons, Hungary 750,000 tons, Rumania 250,000 tons. Although Germany's conquests have solved some difficulties in augmenting steel-making capacity, it is probable that new problems of fuel, labor, and transportation, in addition to destruction by bombing, will limit output considerably. Iron Age has estimated that production in the present Reich, although higher during 1940, was lower than the combined tonnage of these eight countries in 1939. Although no official data are available regarding the production of iron and steel in foreign countries other than Canada during 1940, probably the U. S. S. R. broke all previous records for steel production.

[7] Small quantity of brown ore included with magnetite.

Trends in production.—During the first half of 1940 the domestic iron and steel industry operated at a slightly lower rate than during the latter half of 1939, and steel plants were operating at about 72 percent of capacity compared with about 53 percent for the same period of 1939. During the latter half of 1940, however, production increased rapidly, amounting to nearly 1,508,000 net tons weekly in November (96.6 percent of capacity) compared with 93 percent in November—

the peak month in 1939. About 29 percent of the 1940 output was made in the final 3 months, when the production rate for steel ingots rose to new heights. At the close of 1940 activities were off a little but were still at a high rate (94 percent of capacity for December); the average rate of production in the last quarter of 1940 was 96 percent compared with 73 percent in the second quarter. The operating rate during 1940 was 82 percent compared with 64 percent in 1939. The producers of such mineral products as iron ore, manganiferous iron ore, fluorspar, fluxing stone, and coke, which depend on iron and steel furnaces for their chief market, felt the increased demand during 1940. Domestic production of iron ore, the principal raw material, increased 42 percent over 1939—13 percent above the 1925–29 average—and

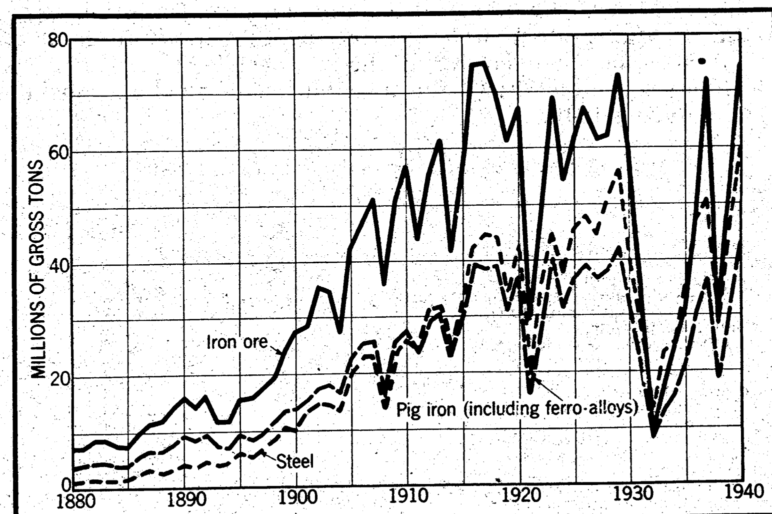

FIGURE 1.—Trends in production of iron ore, pig iron, and steel in the United States, 1880–1940.

was the third highest on record. Figure 1 shows the trends in domestic production of iron ore, pig iron, and steel for more than half a century.

Steel-consuming industries.—The automobile industry, with a strong fourth-quarter demand, was the largest consuming outlet for steel. The production of automobiles in 1940 increased 25 percent over 1939 and totaled 4,469,354 units, which was still somewhat below the 5-million car year 1929. According to the American Iron and Steel Institute, 8,099,000 tons (17.7 percent) of the total of 45,851,000 tons of finished steel shipped by companies representing 98 percent of the total domestic output was for export, principally to England and South America. The automobile industry consumed 7,185,000 tons (15.7 percent). Shipments to jobbers and dealers amounted to 14.6 percent of the total, construction took 10.8 percent, and the railroads and allied trades 8.2 percent.

The capital-goods industries expanded in 1940, and more steel was consumed in this outlet. The railroads bought large quantities of equipment during the entire year 1940, under the stimulus of heavier traffic. Freight carloadings followed a trend similar to that of earnings and held above the 1939 level until October. The fall seasonal rise in traffic stopped slightly short of the peak reached in 1939, largely because of a lag in movement of coal, and was responsible for the inability of earnings to match their improvement of earlier months.

Naval expansion that would have been considered fantastic a year ago is under way in the United States. The program assures capacity operations in the country's shipyards, not only for 1941 but for several years to follow, and will require, in addition, the greatest expansion of ways and yards in this country's history.

Construction, the first industry to feel defense-program needs for steel, lifted orders for fabricated structural material to approximately 1,700,000 tons last year. Both public and private work contributed to the increase, and residential building and defense construction were especially active. Despite the increase, total expenditures for construction in 1940 were less than three-fourths those in the peak years 1926–29; however, the physical volume and consumption of raw material, including steel, were greater, as the distribution of construction costs has changed during the last decade.

The following table shows the distribution of steel to consuming industries during 1940.

Distribution of steel to consuming industries—1940 [1]

	Net tons	Percent of total
Steel converting and processing industries:		
(a) Wire drawers and wire product manufacturers	504,000	
(b) Bolt, nut, and rivet manufacturers	708,000	
(c) Forging manufacturers	574,000	
(d) All other steel plants and foundries	1,143,000	
Total	2,929,000	6.4
Jobbers, dealers, and distributors:		
(a) Oil and natural-gas industry	654,000	
(b) All other	6,033,000	
Total	6,687,000	14.6
Construction industry	4,968,000	10.8
Shipbuilding industry	940,000	2.0
Pressing, forming, and stamping industry:		
(a) Metal furniture and office equipment	470,000	
(b) Hardware and household equipment	950,000	
(c) All other	740,000	
Total	2,160,000	4.7
Container industry	2,985,000	6.5
Agricultural, including implement and equipment manufacturers	920,000	2.0
Machinery and tools:		
(a) Machinery and tools, excluding electric	1,108,000	
(b) Electrical machinery and equipment	777,000	
Total	1,885,000	4.1
Automotive industry	7,185,000	15.7
Aircraft industry	48,000	0.1
Railroad industry:		
(a) All railroads	2,575,000	
(b) Car and locomotive builders and parts manufacturers	1,202,000	
Total	3,777,000	8.2
Oil, natural-gas, and mining industry:		
(a) Oil and natural gas, including pipe lines	991,000	
(b) Mining, quarrying, and lumbering	141,000	
Total	1,132,000	2.5
Other industries	2,136,000	4.7
Export, all industries	8,099,000	17.7
Total	45,851,000	100.0

[1] American Iron and Steel Institute.

Prices.—After a slight decline in the early part of 1940, the metals group moved above its 1937 peak. The composite price of finished steel, as compiled by Iron Age, remained at 2.261 cents a pound throughout 1940. Scrap prices advanced weekly from $16.22 a net ton on August 6 to $18.75 on November 26; in December the upward movement in scrap was slowed until the final week of the year, when it advanced to $19.49. Pig iron held firm at $20.19 a net ton during the year but advanced to $20.93 during the last week of 1940.

Despite the sharp advance in prices for scrap, the iron-and-steel component in the Bureau of Labor Statistics wholesale index, which is based upon posted prices was lower for Decemebr than it had been for January and 6 percent under the 1938 peak for the decade. Structural steel and many other finished-steel prices stayed the same throughout the year—unchanged, in fact, from July 1938. Consequently, the boost in metal prices for the year as a whole is traceable largely to the other metals.

The price of ferromanganese at seaboard remained steady at $89.29 a net ton through May, rose to $98.21 during June, and reached

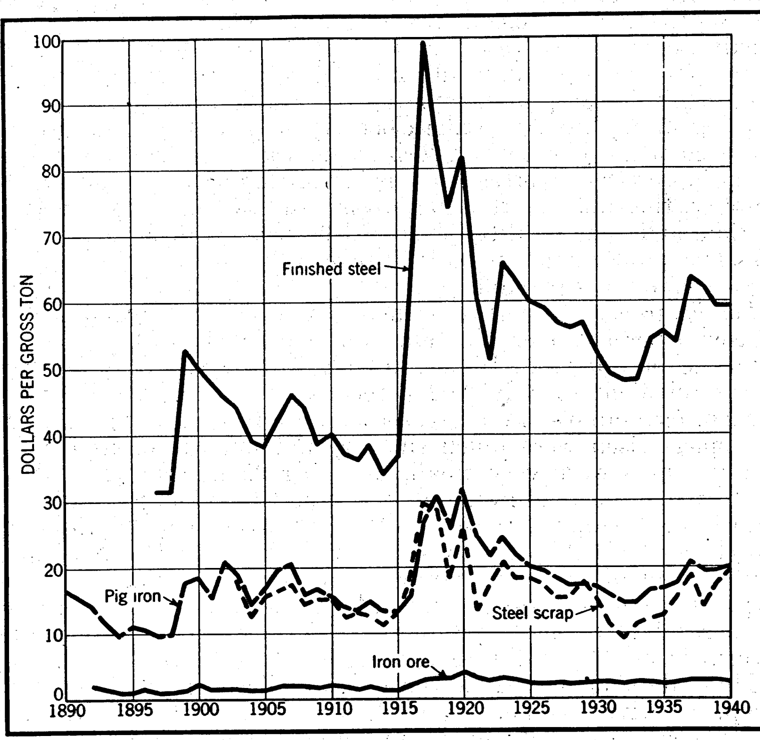

FIGURE 2.—Trends in prices of iron ore, pig iron, finished steel, and steel scrap, 1890–1940. The prices of iron ore and pig iron are the averages f. o. b. mines and furnaces, respectively, as reported to the Bureau of Mines; the price of finished steel is an average composite computed by American Metal Market; that of steel scrap is an average at Pittsburgh of No. 1 Heavy Melting, computed by Iron Age.

$107.14 in July. Spiegeleisen, as quoted by Steel, rose from $28.57 to $30.71 a net ton in June and to $32.14 in July. Lake ores were reduced 50 cents a ton on April 17, 1940.

Figure 2 gives trends in prices of iron ore, pig iron, steel, and steel scrap since 1890.

Employment and wages.—Time lost as a result of industrial disputes was cut to one-third of that for 1939. The total number of persons employed in the United States in the final quarter of 1940 was larger than at any other time since 1929. The Bureau of Labor Statistics reports an increase of 25,600 employees in the steel industry from December 1939 to December 1940. According to the American Iron and Steel Institute, average hourly earnings were 84.6 cents—the highest for any year in the history of the industry. The same source states that total pay rolls in the industry in 1940 were $961,000,000 compared with $810,000,000 in 1939. The wages-and-hours law, which provided for a change from 42 to 40 hours as of October 24, 1940, had little or no effect on the iron and steel industry.

Meeting demand for steel.—The record rate of activity in the steel industry during 1940 brought production nearly to capacity. As record production was inadequate to meet the unprecedented demand for steel, attention was drawn to increasing iron and steel capacity during 1940.

The brisk demand for steel in the last quarter of 1939 had prompted the repairing and remodeling of much equipment. Thus, many beehive ovens were restored to workability. In the second half, many predictions of impending bottlenecks were made, mentioning coke, pig iron, scrap, armor plate, and forging departments and heat-treating units, but up to the close of the year no significant delays had occurred. There was a rush to build new electric steel units, and many bessemer converters were being made ready to start again. In October, the first month when output of steel ingots reached a new all-time high, the industry averaged 96 percent of capacity, whereas bessemer production was only 80 percent of capacity, indicating that further effort was possible.

Foreign trade.—Imports of iron ore into the United States in 1940 increased 3 percent over 1939 and were equivalent to 3 percent of the domestic production. Imports of pig iron declined 73 percent and were equivalent to only 0.02 percent of the domestic output. Imports of ferro-alloys also decreased because receipts of ferromanganese and spiegeleisen were much smaller, and imports of iron and steel manufactures were very small, dropping 92 percent from the total for 1939. Exports of iron and steel products, which are much higher than imports, topped those of 1939 by 211 percent. Exports of pig iron totaled 620,336 net tons and were much higher than in 1939, and exports of iron ore (largely to Canada), increased 31 percent. Exports of ferro-alloys were much higher than in 1939 and comprised 3.4 percent of domestic production. Exports of scrap decreased 21 percent from 1939 and were 31 percent below the 1937 total.

These data do not show the effect of licensing all iron and steel scrap, effective October 16, 1940, which will virtually stop exports to some countries and will substantially decrease total exports.

Import duties on iron and steel products were unchanged during 1940, and no new trade agreements were made during the year.

CONSUMPTION OF FERROUS SCRAP AND PIG IRON

Data on the consumption of ferrous scrap and pig iron, formerly included in this chapter, will be found in the chapter on Iron and Steel Scrap. Data on the consumption of pig iron will be found in the pig-iron section of this chapter.

IRON ORE

Production and shipments.—Iron-ore mining in the United States experienced its best year since 1917; in fact, 1940 was the third best year on record. Production totaled 73,695,899 gross tons—a gain of 42 percent over 1939 and of 13 percent over the 1925–29 average. Output in 1940 came from 230 [2] mines, of which 15 produced more than 1 million tons each compared with 209 [2] mines (revised figure) having only 11 in the million-ton class in 1939. Nineteen States were active producers in 1940 compared with 17 (revised figure) in 1939. Minnesota, with 47,736,810 tons, supplied 64 percent of the domestic total; and Michigan, with 12,472,448 tons or 17 percent, was the second largest producer. These two States and mines in northern Wisconsin (1,261,467 tons or 2 percent) constitute the Lake Superior region, which supplied 83 percent of the domestic total. Of the 1940 output, about two-thirds came from open-pit operations compared with about three-fifths in 1939. Shipments of iron ore likewise were much larger in 1940, amounting to 75,198,084 gross tons—an increase of 37 percent over 1939 and of 12 percent over the 1925–29 average. The greater part of the iron ore mined in the United States is employed in the manufacture of iron and steel, but 54,627 tons of domestic ore were shipped in 1940 for other uses, as follows: Cement, 30,689 tons; paint, 8,912 tons; ferromagnesite, 3,592 tons; flux at nonferrous smelters, 3,863 tons; and other industries, 7,571 tons.

The quantities of iron ore in the following tables include ore that was beneficiated—that is, treated in any way—as well as ore that did

Iron ore mined in the United States in 1940, by States and varieties, in gross tons

[1] Excludes an undetermined number of small pits. Output of these pits included in tonnage given.
[2] Small quantity of brown ore included with magnetite.
[3] Small quantity of hematite included with magnetite.
[4] Revised figure.
[5] Small quantity of magnetite included with hematite.

[2] This figure does not include an undetermined number of small operations whose aggregate output is only a fraction of 1 percent of the total.

not require treatment. Although included in the figures on production, the iron ore sold for the manufacture of paint—8,912 tons in 1940 valued at $45,578 ($5.11 a ton) compared with 12,235 tons in 1939 valued at $66,817 ($5.46 a ton)—is not included in shipments from mines. The output of manganiferous ore that contained 5 to 35 percent manganese also is not included; 1,136,547 tons (valued at $3,348,042) were shipped in 1940 compared with 709,247 tons (valued at $2,148,321) in 1939. Moreover, the statistics do not include iron sinter recovered from the roasting of domestic pyrite concentrates in Tennessee.

Principal mines.—The importance of large mining units in the iron-mining industry is shown by the fact that 15 yielding more than 1,000,000 tons each produced over half of the entire output in 1940. In years of heavy demand this situation is more pronounced; thus concentration of production was considerably greater in 1940 than in 1939, when 11 mines yielding more than a million tons each furnished somewhat less than half the smaller output for that year. Of the 15 million-ton producers in 1940, 11 were in Minnesota (all on the Mesabi range), 2 in Alabama, and 1 each in Pennsylvania and Wisconsin. Of the 15 principal producers in 1940, 9 were open pits, 3 were operated by underground methods, and 3 were combinations. Except for 1 mine that produced magnetite, all the principal mines produced hematite.

Iron-ore mines of the United States in 1940, by size of output

[1] Output of 2 mines producing more than 500,000 tons included with mines producing between 400,000 and 500,000 tons each.
[2] Excludes an undetermined number of small pits. The output of these pits is included in the tonnage given.

Beneficiation.—Beneficiation of iron ore was reported at 70 mines in 8 States compared with 52 mines in 9 States in 1939. At many mines, the ore is crushed and screened to improve its structure, but ore so improved is not included in the statistics on beneficiated ore. Some iron ore is recovered in the form of dust from blast furnaces; data on ore so recovered, however, have been accounted for previously in shipments from mines.

Beneficiated ore shipped from domestic mines in 1940 increased 37 percent over 1939 and comprised 17 percent of the total shipments both in 1939 and 1940.

Beneficiated iron ore shipped from mines in the United States, 1939–40

[Exclusive of ore containing 5 percent or more managanese and of ore sold for paint]

[1] Revised figures.

The quantity of crude ore beneficiated in the Lake Superior district (all in Minnesota) in 1940 totaled 14,547,504 gross tons and the beneficiated ore recovered 9,439,921 tons—a ratio of 1.541:1. In 1939 the crude ore treated totaled 10,194,506 tons and the beneficiated ore recovered therefrom 6,170,779 tons—a ratio of 1.652:1. Most of the concentration in this district is done by washing, but a few plants are equipped with jigs, and two plants sinter ore after washing. Processes have been described by Zappfe and Hunner.[3] Most of the concentrated ore shipped from Minnesota is obtained in the treatment of wash ores from the western end of the Mesabi range, which yield 65 percent concentrates and 35 percent tailings containing about 22 percent iron.

In April 1940 the Evergreen Mines Co. put into operation at the Chandler mine at Ely, Minn., a concentrator designed to beneficiate Vermilion ores.[4] This concentrator is of unusual interest because it is the first beneficiation plant erected on the Vermilion iron range. The metallurgical process consists of washing the ore and screening it into three products—a plus-2½-inch material, which is hand-picked to produce open-hearth lump; a minus-2½-inch, plus-⅞-inch material, which is crushed to pass ⅞-inch; and a minus-⅞-inch material. This crushed 2½-inch material, combined with the original minus-⅞-inch material, is all handled through three 3-cell Wood's jigs, which can be regulated to make a wide range of products from a material suitable for open-hearth charge ore, analyzing 62 percent (natural) iron, to relatively lean material running 48 percent (natural) iron. Whether the concentrator has any application on low-grade ore of the Ely district will not be known until the plant has been operated on this type of material.

Holt [5] has described in detail the method and results of heavy fluid concentration at the Harrison concentrator of Butler Bros. at Cooley, Minn., using 15-percent ferrosilicon as a medium. During the summer of 1937, a commercial-size unit was built at the Merritt plant at Ironton, Minn., following experimental work at the University of Minnesota during the winter of 1936 to 1937. Definite tests as to suspension qualities were made on crushed steel and ferrosilicon in the early fall of 1937 by Butler Bros. staff in conjunction with Henry Wade of the Minnesota Mines Experimental Station. During the ensuing test work various shapes of cones were used in small laboratory models, and the inverted-top type was found to be best of several tried.

A 3-foot-diameter cone of this type, with complete magnetic recovery flow sheet, was used at the experimental station, followed by a 4-foot-diameter cone unit with a complete magnetic recovery flow sheet installed at the Patrick plant in the summer of 1938.

This 4-foot cone treated tonnages up to 40 gross tons feed an hour and operated throughout the shipping season of 1938. As a result of this pilot unit, two cones 7½ feet in diameter were installed in the Harrison plant in 1939, capable of treating over 350 gross tons an hour. These cones operated steadily during the shipping season, except for time spent in remodeling the units to remove unsatisfactory features. These units replaced a battery of 60 coarse jig cells.

[3] Zappfe, Carl, and Hunner, E. E., Preparation for Market Requirements, Shipment, and Reduction: Lake Superior Iron Ores, chap. 6, Lake Superior Iron Ore Assoc., Cleveland, 1938, pp. 77–84.
[4] Skillings' Mining Review, Duluth, Minn., vol. 29, No. 6, June 1, 1940, pp. 1–2.
[5] Holt, Grover J., Development of Sink-and-float or Heavy Fluid Concentration on the Minnesota Iron Ranges: Mining Cong. Jour., September 1940, pp. 25–29.

A medium of 15-percent ferrosilicon was found to be most economical from the first-cost standpoint. For specific purposes, however, other alloys may be used. The particle size of the ferrosilicon used is preferably minus-65-mesh, with about 96 percent minus-100-mesh and about 65 percent minus-200-mesh. In practice, the material is mixed with water to give the desired gravity and is changed at will by regulation of the water content of the pulp.

A true specific-gravity separation has been the aim of development in all forms of jigs, tables, and other gravity-concentration equipment. The heavy-fluid concentration process does not depend on the laws of either free- or hindered-settling ratios of mineral and gangue. Other methods depending on these laws are found to be affected by the size and shape of particles, as well as by ratios of concentration, which require adjustment even on ores similar in structure.

Beneficiated ore in 1940 comprised the same proportion (17 percent) of the total shipments as in 1939 and in 1937, a year of high production. As pressure for production increases, a relatively larger proportion of the total comes from direct-shipping ores. Furthermore, in 1940 the immediate need for a high tonnage late in the year also favored production of the more easily obtainable direct-shipping ores. Data for recent years are shown in the following table, and corresponding statistics for 1914 (the first year for which they were gathered) to 1929 are given in Mineral Resources, 1930, part 1. Data for 1930 to 1934, inclusive, are given in Minerals Yearbook, 1935, and for 1932 to 1936, inclusive, in Minerals Yearbook, 1937.

Iron ore shipped from mines in the United States, 1925–29 (average) and 1936–40, in gross tons, and percentage of beneficiated ore compared to the total shipped

[Exclusive of ore containing 5 percent or more manganese and of ore sold for paint]

Year	Beneficiated	Total	Proportion of beneficiated to total (percent)	Year	Beneficiated	Total	Proportion of beneficiated to total (percent)
1925–29 (av.)	8,653,590	66,697,126	13.0	1938	4,836,435	26,430,910	18.3

[1] Revised figures.

Average value.—The average value per gross ton of iron ore at the mines was $2.51 in 1940 compared with $2.89 in 1939.

The table that follows gives the average value at the mines of the different classes of iron ore in 1939–40 for each of the producing States or groups of States, except where there are fewer than three shippers of a certain variety of ore in a State and permission was not given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately, as not all reports are comparable. Some evidently include mining costs only; others contain, in addition, the cost of selling and insuring the ore; others include an allowance for a sinking fund; and still others comprise only costs charged against blast furnaces. None of the reports, however, is supposed to include freight charges.

Average value per gross ton of iron ore at mines in the United States, 1939–40

[Exclusive of ore containing 5 percent or more manganese and of ore sold for paint]

State	Hematite		Brown ore		Magnetite	
	1939	1940	1939	1940	1939	1940
Alabama	$1.62	$1.65	$2.16	$2.33		
Georgia	2.53	2.24	1.74	1.79	(1)	
Michigan	3.29	2.94				
Minnesota	3.00	2.48				
Missouri	2.14	2.32	(1)	2.50		
New Jersey					$4.73	$4.80
New York } Pennsylvania }					2.75	2.78
Wisconsin	3.00	2.68				
Other States [2]	1.13	1.11	[3] 2.77	3.13	2.83	2.82
	2.89	2.48	[3] 2.14	2.31	2.99	3.13

[1] Less than 3 producers; permission to publish not given, therefore value may not be shown.
[2] 1939: California, Tennessee, Texas, Utah, Virginia, Washington, and Wyoming; 1940: California, Mississippi, Oklahoma, Tennessee, Texas, Utah, Virginia, Washington, and Wyoming.
[3] Revised figures.

Consumption.—The production of 46,203,967 net tons of pig iron in 1940 required 80,348,923 net tons of iron and manganiferous iron ores, 5,506,967 tons of mill cinder and roll scale, and 793,344 tons of purchased scrap, an average of 1.875 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of iron made.

The greater part of the iron ore used in Alabama furnaces in 1940 was hematite, chiefly from mines in Jefferson County, but some hematite came from Etowah and Cherokee Counties. Considerable brown ore, iron sinter, pyrite ash, and imported iron ore and manganese ore and small quantities of domestic manganese-bearing ores were used. The brown ore originated chiefly in mines of the Birmingham and Russellville districts, Alabama. In addition to iron sinter (sintered pyrite ash) from Tennessee, considerable pyrite ash was shipped to Birmingham in 1940 from acid plants in other Southern States. The pyrite from which this ash was made was of both domestic and foreign origin. The domestic manganese-bearing ores come chiefly from Alabama, Arkansas, Georgia, and Tennessee. Imported manganese-bearing ores come from Cuba. In 1940, Alabama furnaces consumed an average of 2.454 tons of ore in making 1 ton of pig iron—the highest average for any State.

Maryland furnaces consumed considerable domestic ore in 1940, in addition to ores from Africa, Asia, Brazil, Chile, and Cuba. These furnaces used an average of 1.572 tons of ore per ton of pig iron; however, they used proportionately more cinder, scale, and scrap than any other State.

Illinois, Indiana, Kentucky, Michigan, Minnesota, and West Virginia blast furnaces handled Lake Superior iron ore and manganiferous iron ore almost exclusively. Kentucky furnaces had the lowest consumption of metal-bearing material per ton of iron.

In New York the furnaces in the Buffalo district used ore chiefly from the Lake Superior district, as well as considerable magnetite from New York, and the furnace at Troy consumed magnetite from the Chateaugay mine at Lyon Mountain, N. Y.

Blast furnaces in Ohio consumed considerable magnetite from New York and hematite and brown ore from Missouri, in addition to ore from the Lake Superior district.

Virtually all the ore consumed in western Pennsylvania furnaces comes from the Lake Superior district. Those in the eastern part of the State used some Lake ore; magnetite ores from Pennsylvania, New Jersey, and New York; and some ore from Africa, Australia, Brazil, Chile, Cuba, Spain, Sweden, and U. S. S. R.

The Pueblo (Colo.) blast furnaces handled hematite from the Sunrise mine in Wyoming and manganese-bearing ores, chiefly from Colorado and New Mexico.

The Provo (Utah) furnace treated chiefly semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, manganese tailings from Montana, and manganiferous ore from Utah.

The Tennessee furnace used chiefly Tennessee brown ore and iron sinter.

Iron ore and other metallic materials consumed and pig iron produced in 1940, by States, in net tons

State	Metalliferous materials consumed				Pig iron produced, exclusive of ferro-alloys	Materials consumed per ton of iron made

[1] Revised figures.

Foreign trade.—Imports of iron ore increased 3 percent over 1939. Chile continued to be the chief source of imports into this country, furnishing 68 percent of the 1940 total; Canada and Cuba supplied 9 percent each, and Sweden 8 percent. In addition to the figures in the following table, 3,908 tons of dross or pyrite ash were imported from Canada in 1940.

Iron ore imported for consumption in the United States, 1938–40, by countries, in gross tons

Country	1938		1939		1940

Exports of iron ore from the United States totaled 1,386,304 gross tons valued at $4,624,555 ($3.34 a ton) in 1940 compared with 1,057,304 gross tons valued at $3,578,086 ($3.38 a ton) in 1939. Of the 1940 total, 1,386,097 tons went to Canada.

Mining in Cuba.—Shipments of iron ore from Cuba to the United States decreased 25 percent in 1940 from 1939. The 1940 total of 210,068 gross tons included 91,120 tons of hematite, carrying (dried) 54.37 percent iron, and 85,924 tons of siliceous ore, carrying (dried) 29.84 percent iron—from the Daiquiri-Juragua mines on the southern coast; and 32,463 tons of nodulized brown ore, carrying (dried) 55.09 percent iron, and 561 tons of crude ore, averaging (dried) 47.68 percent iron—from the Mayari district near the northern coast. The Mayari mine was nonproductive in 1940.

The total stock of ore reported on hand was 111,797 gross tons at the end of the year compared with 164,059 tons at the end of 1939.

The following table shows shipments of iron ore from Cuba since the mines were opened in 1884. The statistics on shipments of Cuban iron ore are collected by the Bureau of Mines.

Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1940, in gross tons

Year	Juragua (hematite and magnetite), Daiquiri (hematite and a little magnetite)	Sigua (hematite)	Mayari (brown ore)	Guamá (hematite)	El Cuero (hematite)	Total
1884–1938	[1] 21,925,710	20,438	3,858,464	41,241	903,103	26,748,956
1939	236,414		42,719			279,133
1940	177,044		33,024			210,068
	22,339,168	20,438	3,934,207	41,241	903,103	27,238,157

[1] Of this quantity, 5,932 tons were sent to Pictou, Nova Scotia, and 64,228 tons to other ports outside of the United States.

REVIEW OF LAKE SUPERIOR DISTRICT

Production and shipments.—Activities in the Lake Superior district (the principal producing district) were at a greatly increased rate throughout the year. The season began with much larger shipments than in 1939; and as the output of iron and steel increased, shipments of iron ore were accelerated. Over three-fourths (83 percent in 1940) of the domestic output comes from the Lake Superior region, where schedules were held at high levels, and available lake transportation capacity was pressed into service. Monthly shipments down the Lakes, the main artery of iron ore movement, were exceptionally large. As much of the Lake ore comes from the Mesabi range (74 percent in 1940), where open-pit operations predominate, great flexibility in output is attained, and large increases are possible on short notice. Although the shipping season was not exceptionally long, the increased demand for ore permitted a lake movement of 63,352,768 tons of iron ore and manganiferous iron ore compared with 45,002,085 tons in 1939. More ore could have moved if the season had been longer, but the tonnage shipped was sufficient to raise combined stocks at furnaces and lower Lake ports at the end of the season above those on hand at the end of the 1939 season, notwithstanding the fact that consumption was at a much higher rate. Total shipments of ore by water and all-rail from the Lake Superior district totaled 63,949,536 gross tons (62,884,545 gross tons of iron ore and 1,064,991 of manganese ores containing 5 percent or more manganese) compared with 44,849,573 tons (44,197,610 tons of iron ore and 651,963 of manganese-bearing ore containing 5 percent or more manganese) in 1939. The iron-ore-shipment figures given above include 598 tons of paint ore in 1940 and 872 in 1939.

Production in the Lake Superior region in 1940 increased 47 percent over 1939 but still was slightly below the record. The district furnished 83 percent of the United States total compared with 81 percent in 1939 and thereby continued to gain ground lost to other districts in recent years. Several ranges contributed to the district total. The Mesabi was the largest producer, furnishing 74 percent of the district and 62 percent of the United States total. The output, by ranges, is listed in the following table. After 1905 the figures do not include manganiferous iron ore containing 5 percent or more manganese.

Iron ore mined in the Lake Superior district, 1854–1940, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Year	Marquette	Menominee	Gogebic	Vermilion	Mesabi	Cuyuna	Total

In 1940, 73 percent of the ore produced on the iron ranges of the Lake Superior district came from open-pit mines. A large part of the open-pit production originates in the Mesabi range, which in 1940 supplied 95 percent of the open-pit ore mined in the district. There is no open-pit mining in northern Wisconsin and relatively little in Michigan. In addition to the output on the Mesabi range, there is some open-pit production in Minnesota on the Cuyuna and Vermilion ranges.

Recent years have witnessed significant changes in open-cut mining practice in the iron country.[6] The use of small tractor shovels, tractor wagons, scrapers, scraper hoists, heavy trucks, and conveyors continued to expand in 1940. Beginning the season in May, the Canisteo mine of the Canisteo Mining Co. employed a new method of gathering by truck and delivering by conveyor belt, as compared with previous practice of both gathering and delivering by steam locomotive;[7] four or five 15-ton trucks haul from two shovels. A 600-ton-an-hour supply of crude ore is trucked to the pit pocket, and the haul averages 2,400 feet, with a maximum grade of 8 percent. The crude ore is dumped into the 100-ton pocket and carried by an 8-foot pan conveyor to a 4-inch grizzly. The grizzly undersize is fed through a chute direct to the 36-inch belt conveyor. The oversize falls onto a 5-foot pan conveyor, leading to a 40- by 42-inch primary jaw crusher. The large rock is scalped from the 5-foot pan conveyor and dropped into the rock chutes, from which it is hauled by truck to adjacent waste dumps. Oversize ore material is crushed to 4 inches in the primary crusher and fed through a chute to the 36-inch belt conveyor, where it falls upon a cushion of undersize. By means of the conveyor, it is delivered 1,000 feet on an 18° slope to the top of the washing plant; the ore then passes through the two transfer houses at the top of the mill and is dumped onto a 5- by 41-foot double-decked vibrating screen; the undersize goes directly to log washers. The oversize is carried on a 36-inch picking belt, from which additional rock is removed by hand-picking, to secondary cone crushers (which reduce the material to five-eighths inch); it is then fed into the log washers. The log product is passed over 4- by 6-foot vibrating screens, where it is deslimed, and delivered directly into the concentrate bin. The log

tailings and the tailings from the desliming screens are carried to 17-foot Dorr bowl classifiers for further concentration. The classifier product is taken by 24-inch cross conveyors to the concentrate bin, where it is mixed with the log product and delivered directly into ore cars for shipment. The classifier tailings are carried through the tailings-disposal system to the settling basin. The operations at the Canisteo mine for the 1940 shipping season were completed early in October after yielding 478,339 tons of concentrates.

Transport by conveyor had been installed before the 1940 season at four other open-pit operations in the iron ranges—the La Rue, St. Paul, Spruce, and Judd mines.

Hubbell [8] has described the effect on a moderate-size open-cut iron mine of replacing locomotive haulage of ore with truck haulage, as illustrated by the Albany pit of Pickands, Mather & Co. during 1940.

In 1939, with railroad haulage, the trackage from the yards to the pit bottom totaled 11,400 feet, including six switch-backs and the main line. The average grade was 3.6 percent, compensated 0.04 percent for each degree of curvature. Three locomotives (20- by 24-inch) were required per shift and either two 75-ton-capacity cars or three 50-ton cars were handled per trip. A seventh switch-back was being developed when the change was made to truck haulage. With railroad haulage, ore shipments from this pit were 323,207 tons in 1939. With the truck installation, which was used throughout the 1940 season, shipments from the pit totaled 524,742 tons. The length of truck road from the ultimate pit bottom out to the dumping ramp is 5,200 feet. The grade of the main truck road is 8 percent, except on curves, where it is dropped to 6 percent; on the ore benches the grade varies; and the average grade from the ultimate bottom to the ramp is 7 percent. There are seven trucks in the fleet, each of 15 tons capacity.

Trucks and related equipment in considerable variety are also being used for cleaning up in the larger pits and elsewhere, in places where a small but worth-while tonnage of ore is so situated that larger shovels and cars cannot be put to work on it. Equipment recently noticed on such work included conventional rear-dump trucks, Athey crawler wagons, La Plant-Choate (and other) wheeled scrapers, and the Koehring Dumptor—a quick-dumping Diesel-driven unit designed for being shuttled back and forth, without turning, between loading and dumping points. A not-unusual combination in this clean-up work is a 1½-cubic-yard shovel and two trucks for a 700- to 800-foot haul. The advent of truck haulage has brought to the operators the need of knowing how to construct a good road out of a pit, one that is able to withstand the punishment inflicted by heavy trucks, loaded or unloaded. The portion of the road that is likely to be permanent must be especially well constructed. One operator (the E. W. Coons Co., of Hibbing, which is also in the contracting business) has built 1,200 feet of concrete ribbons 36 inches wide, at its nearby pit to facilitate the movement of its trucks out and their quick return.

Of interest is the extent to which road-maintenance equipment is being adapted to open-pit work; tractors (with and without the bull-dozer blade), road graders, and sprinklers are being introduced, in some instances calling for shop changes to permit servicing.

[8] Hubbell, A. H., Iron Country Jottings: Eng. and Min. Jour., vol. 142, No. 1, January 1941, pp. 37–39.

Shipments from the Michipicoten range in Ontario, Canada, continued in 1940. Although this output is not included in Bureau of Mines production figures, it enters the same commercial channels. The ore comes from the old Helen mine of the Algoma Steel Corporation, which in August 1939 began production from new open-pit operations and made shipments for the first time since 1922. A total of 361,394 tons of sinter, made from the carbonate ores, was shipped during the season, compared with 111,307 tons in 1939.

Analyses.—The following table, compiled by the Lake Superior Iron Ore Association, summarizes the average analyses of the total tonnages of all grades of ore shipped and shows the remarkable uniformity maintained during the past 5 years. This uniformity does not mean, of course, that the average grade of available Lake Superior ore is not declining. The grade of shipments has been maintained partly by beneficiation and partly by mixing ores from different deposits. The method of sampling and grading Lake Superior iron ores has been described by Bayer [9] and the method of classification and sampling by Murray.[10]

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron ore from all ranges of Lake Superior district, 1936–40

Year	Gross tons	Iron (natural)	Phosphorus	Silica	Manganese	Moisture
		Percent	*Percent*	*Percent*	*Percent*	*Percent*
1936	44,745,754	51.45	0.091	8.62	0.81	10.92
1937	61,972,823	51.53	.091	8.27	.82	11.31
1938	19,353,497	51.90	.089	8.25	.81	10.13
1939	44,983,754	51.75	.085	8.27	.76	10.73
1940	63,308,413	52.09	.085	8.00	.77	10.93

Stocks at Lake Erie ports.—At the close of navigation in 1940, according to the Lake Superior Iron Ore Association, 4,786,643 gross tons were in stock at Lake Erie ports compared with 5,216,496 tons on the corresponding date in 1939. At the opening of navigation in May 1941, 1,935,069 tons were in stock at these ports—a decrease of 1,015,683 tons from the figure on May 1, 1940. Withdrawals from docks were therefore 2,851,574 tons during the winter of 1940–41.

Prices of Lake Superior ore.—The prices established April 17, 1940, for the four standard grades of Lake Superior ore were 50 cents a ton lower than the price maintained during 1937, 1938, and 1939 and 5 cents a ton lower than the price maintained from 1929 to 1936. Beginning April 17, 1940, the unit prices for base ore of the various grades quoted at Lake Erie ports were as follows: Old-range bessemer, 9.223 cents; Mesabi bessemer, 8.932 cents; old-range nonbessemer, 8.932 cents; and Mesabi nonbessemer, 8.641 cents. The prices that correspond to these unit prices are, respectively, \$4.75, \$4.60, \$4.60, and \$4.45 a gross ton. The base of the four standard grades for 1925–40 is an iron content of 51.5 percent natural. For the bessemer grades, the phosphorus content is 0.045 percent (dry), and for the nonbessemer grades the phosphorus content ranges from 0.045 to 0.18

percent. Ores containing more than 0.18 percent phosphorus are classed as high-phosphorus ores, whereas those containing 18 percent or more silica are classed as siliceous ores.

Reserves.—Estimates of ore reserves for Minnesota, furnished by the Minnesota Tax Commission, and for Michigan, furnished by the Michigan Board of Tax Commissioners, are shown in the following tables. These estimates reveal decreases from 1939 of 7,219,612 gross tons in Minnesota and 7,831,796 tons in Michigan. Reserves in Wisconsin have been estimated recently at 5,500,000 tons.

Unmined iron-ore reserves in Minnesota, May 1, 1936–40, in gross tons

Range	1936	1937	1938	1939	1940
Mesabi	1,164,802,947	1,173,108,376	1,150,817,768	1,132,513,348	1,122,593,126
Vermilion	13,074,509	13,943,325	14,274,025	13,631,484	13,208,699

MINING BY STATES

Alabama.—Production of iron ore in Alabama during 1940 increased 23 percent over 1939 and was the largest in its history, exceeding the previous record, made in 1925, by 3 percent. About 89 percent of the 1940 production came from underground mines and the remainder from open-cuts. One mine used combination open-pit and underground methods. Hematite represented 89 percent of the 1940 total, and much of this red ore contained enough or nearly enough lime to be self-fluxing. The hematite is derived chiefly from underground mines on Red Mountain near Birmingham in Jefferson County, where, in 1940, Raimund Nos. 1 and 2, Red Mountain group (comprising the Muscoda, Wenonah, and Ishkooda groups), Ruffner, Sloss Nos. 1 and 2, Spaulding, and Woodward No. 3 mines were producers. Several smaller mines (open-pit and underground) in Etowah, Jefferson, and Cherokee Counties contributed to the total output of hematite ore. The hematite produced in 1940 averaged (natural) 35.22 percent iron, 0.16 percent manganese, 0.31 percent phosphorus, and 15.43 percent lime. The Red Mountain group, with 3,857,417 tons, was the fourth largest producer in the United States in 1940.

Limonite (brown ore) is mined from a number of widely scattered deposits in Alabama, but production is not nearly as large as that of red ore. In 1940, the output of brown ore comprised 11 percent of the Alabama total. Brown ores, however, are higher-grade and usually have been subjected to beneficiation, although some operations are rather crude. The brown ore mined in 1940 averaged (natural) 47 percent iron and 0.78 percent manganese. Brown ore is mined from open-cuts and was produced chiefly from the Tecumseh mine in Cherokee County, the Russellville and Parish mines in Franklin County, and the Martaban and Reno mines in Tuscaloosa County.

California.—Production in California in 1940 was small, and virtually all came from one mine in Inyo County. All of the ore was magnetite and averaged 63 percent iron.

Georgia.—Production of iron ore in Georgia increased 285 percent in 1940 over 1939, totaled 101,286 tons, and was the largest since 1924. The output from Georgia in 1940 comprised 94,123 tons of brown ore—chiefly from Bartow and Polk Counties—containing (natural) 35 to 60 percent iron and 0.14 to 2.40 percent manganese; and 7,163 tons of hematite—from Walker County—containing (natural) 46 to 50 percent iron and 0.16 percent manganese. Shipments of iron ore comprised 87,202 tons to blast furnaces, 13,140 tons to cement plants, and 944 tons to paint manufacturers.

Michigan.—Output from Michigan comes from three ranges—the Marquette, the Menominee, and the Gogebic. All ranges increased their production in 1940, the Marquette showing the largest gain in tonnage. Production in Michigan rose 36 percent in 1940 over 1939 and totaled 12,472,448 gross tons. Of the 1940 total, 88 percent came from underground mines; the Negaunee mine—an underground producer on the Marquette range—was the largest producer. The iron content (natural) of the ore mined in Michigan in 1940 averaged 52.03 percent compared with 51.68 percent in 1939.

Iron-ore reserves in Michigan at the end of 1940 totaled 135,825,631 gross tons—a decrease of 7,831,796 tons during the year.

A report of the iron-ore mines of Michigan for 1940, published by the Geological Survey Division of the Michigan Department of Conservation,[11] shows that the average number of men employed was 6,743 (5,818 in 1939), the average number of days worked 213 (206 in 1939), the average daily wage $7.48 ($7.07 in 1939), the average yearly earning $1,593.82 ($1,457.12 in 1939), and the average tons of ore mined per man per day 5.10 (6.63 in 1939).

The data in the following table on average per-ton costs of mining ore at underground mines and at siliceous open pits have been abstracted from statistics published in much greater detail by the Geological Survey Division of Michigan.

Average costs, per gross ton, of mining iron ore at underground mines and at siliceous open pits in Michigan in 1940

Item	Underground				Siliceous open pits
	Gogebic	Marquette	Dickinson and Iron	Total	
Cost of mining	$1.3829	$1.5555	$1.4986	$1.4827	$0.4740
Deferred mining cost	.1801	.0649	.1556	.1258	.0422
Taxes	.2380	.2187	.1646	.2127	.0430
General overhead	.1863	.2182	.1970	.2021	.0990
Transportation	1.6918	1.4172	1.5562	1.5481	1.4405
Marketing	.0660	.0912	.0744	.0790	.0826
Royalty	.3657	.2245	.2244	.2704	.0912
Interest on borrowed money	.0002	.0113	.0080	.0067	.0036
Total ore cost	4.1110	3.8015	3.8788	3.9275	2.2761
Lake Erie value per ton	4.7432	4.7252	4.4874	4.6757	2.2441
Gross ore profit [1]	.6322	.9237	.6086	.7482	-.0320

[1] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

[11] Eddy, G. E., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., Lansing, 1941.

Minnesota.—Nearly a billion and a quarter gross tons (1,214,170,998, to be exact) of iron ore have been produced in Minnesota. In 1940, the output increased 51 percent over that in 1939 and was only 1.4 percent under the peak established in 1937. Three ranges contribute to Minnesota's production—the Cuyuna, the Mesabi, and the Vermilion. The Mesabi range supplies a large part of the Minnesota total and in 1940 produced 45,483,450 tons. The output from open-pit mines in 1940 furnished 91 percent of the total compared with 88 percent in 1939 and 77 percent in 1938. Of the 15 domestic mines producing more than 1 million tons each in 1940, 11 were in Minnesota; of these 9 were open pits, and 2 used combination open-pit and underground methods. Of the 79 mines in Minnesota active in 1940 (65 in 1939), 52 (45 in 1939) yielded more than 100,000 tons each. The iron content (natural) of the ore mined in 1940 averaged 52.36 percent compared with 52.43 percent in 1939.

According to the annual report of the mine inspector of St. Louis County, the average number of men employed in iron mines in St. Louis County was 5,547 in 1940 (4,589 in 1939), and the average daily wage was \$6.70 (\$6.61 in 1939) for 8 hours. In 1940, 2,728,306 cubic yards of overburden were removed compared with 3,098,991 in 1939.

According to the annual report of the mine inspector of Itasca County, the average number of men employed in iron mines was 3,047 in 1940 (2,567 in 1939), and the average daily wage was \$6.40 (\$6.08 in 1939) for 8 hours. In 1940, 4,395,650 cubic yards of overburden were removed compared with 4,555,471 in 1939.

Unmined iron-ore reserves in Minnesota on May 1, 1940, totaled 1,200,828,105 gross tons, a decrease of 7,219,612 tons from 1939.

Missouri.—An undetermined number of small mines and pits in Bollinger, Butler, Carter, Crawford, Dent, Iron, Madison, Miller, Phelps, St. Francois, Texas, Washington, and Wayne Counties supplied the iron-ore output of Missouri in 1940, which gained 37 percent over 1939. The ore, which averaged 51.66 percent iron, comprised both hematite and brown ore, was mined by open-pit and underground methods, and was shipped to paint and steel plants as well as to nonferrous smelters.

New Jersey.—The output of iron ore in New Jersey increased 65 percent in 1940 over 1939 and totaled 659,425 tons. The ore, all magnetite and all from underground operations, came from three mines in Morris County and one mine in Warren County in the northern part of the State. New Jersey ores are crushed and concentrated before shipment. Most of the concentration is done magnetically, although some nonmagnetic martite is recovered by gravity methods and some hand-sorting is practiced, principally to recover high-grade lump used in open-hearth steel furnaces. The concentrates produced in 1940 averaged (natural) 62.35 percent iron. The largest output came from the Scrub Oaks mine, which produced 806,634 gross tons of crude ore averaging 27.97 percent iron. Concentrates from this ore totaled 292,990 gross tons averaging 66.47 percent iron. Other producers were the Mt. Hope, Richard, and Washington mines.

New York.—The iron ore produced in New York during 1940 was chiefly magnetite from underground operations at the Harmony and Old Bed shafts in Essex County and the Chateaugay mine in Clinton County. Some hematite was mined for paint in Oneida and St. Lawrence Counties. Shipments from New York in 1940 included sinter, averaging 68 percent iron; lump, averaging 62 percent iron; and concentrates, averaging 67 percent iron.

The largest producer was the Republic Steel Corporation, which operates properties at Mineville near Port Henry and Lyon Mountain.

Oklahoma.—The iron ore accredited to Oklahoma in 1940 came from two operations in Johnson County. All was brown ore and was used in the manufacture of cement.

Pennsylvania.—Pennsylvania is the most important source of magnetite in the United States. The output comes from the Cornwall mine in Lebanon County, where the ore is extracted by both open-pit and underground methods. The ore is shipped to Lebanon, Pa., where it is concentrated magnetically. In addition, some carbonate ore for use in paint was mined in Carbon County in 1940. Hickok [12] has summarized the history of iron-ore production in Pennsylvania and the changing economic conditions that affect the industry and control its history; he also discussed the geological environment, mode of origin, and future reserves of the various types of iron ore.

South Dakota.—A small quantity (640 gross tons) of brown ore was mined at a property in Pennington County and shipped to paint plants in 1940.

Tennessee.—The output of iron ore (brown ore and hematite) in Tennessee in 1940 came from three mines (one each in Hickman, Lewis, and Hamilton Counties); it contained 47.24 percent iron and was shipped to blast-furnace and paint plants.

In addition, considerable sintered pyrite ash was made at the plants of the Tennessee Copper Co. in Ducktown Basin. This sinter, which contained 67.5 to 67.6 percent iron and 0.004 to 0.006 percent phosphorus in 1940, moved largely to the blast furnaces in the Birmingham district, where it was added to the blast-furnace burden. Such sinter is not included in iron-ore production or shipment figures for the United States.

Texas.—The output of iron ore from Texas in 1940 (all brown ore) came from one mine in Cass County.

Utah.—Two operators in Iron County supplied the Utah total in 1940. By far the larger output came from the Iron Mountain mine, while a relatively small quantity came from the Great Western. The ore, principally semialtered magnetite, contained (natural) 54.97 percent iron and moved largely to the blast furnace at Provo, Utah, although small quantities went to steel plants.

Virginia.—The output of iron ore in Virginia is small. The entire 1940 production was brown ore from Botetourt and Roanoke Counties and was shipped for use in the manufacture of hydrogen gas and pig iron.

Washington.—Two open-pit mines and one underground mine produced the total output of Washington in 1940. Two mines—the Big Iron mine in Stevens County and the Neutral in Okanogan County—yielded magnetite averaging (natural) about 68 percent iron, which was used in making ferromagnesite, and the Keystone mine in Pend Oreille County yielded hematite averaging (natural) 57 percent iron, which was used in the manufacture of cement.

[2] Undetermined number of small pits. The output of these pits is included in the tonnage given.
[3] Revised figures.

Wisconsin.—The Montreal underground mine in Iron County was the largest producer of iron ore in Wisconsin, contributing 1,015,463 gross tons of the 1,262,065 produced in 1940. The ore—hematite—averaged (natural) 53.52 percent iron, 1.19 percent manganese, and 0.056 percent phosphorus. The Cary underground mine also in Iron County, furnished 264,004 tons of hematite containing (natural) 52.76 percent iron, 1.51 percent manganese, and 0.047 percent phosphorus. Paint ore totaling 598 tons was mined at the Iron Ridge mine in Dodge County. Shipments (exclusive of paint ore) from Wisconsin mines totaled 1,227,840 tons in 1940.

Wyoming.—The output of iron ore from Wyoming in 1940 came from the Sunrise mine and comprised 831,314 gross tons of hematite containing (dry) 54.29 percent iron, 0.08 percent manganese, and 0.062 percent phosphorus. Much of the ore is a red, earthy hematite similar to Mesabi ore. Production came from both open-pit and underground operations.

MEN EMPLOYED AND OUTPUT PER MAN AT MINE

Although complete information on employment at iron-ore mines in 1940 is not yet available, incomplete figures indicate that about 25,000 men working about 49,000,000 man-hours were required to produce 73,695,899 tons of merchantable ore—an average of about 1.5 tons per man-hour, an all-time record. Thus, the total man-hours worked in 1940 advanced 25 percent over 1939, whereas the output of merchantable ore increased 42 percent; in consequence, output per man-hour increased 13 percent. The gain in output per man-hour in 1940 compared with 1939 was due mainly to a further shift in the production of ore from underground to open-pit mines and to nearer-capacity operation of large units. Specifically, about two-thirds of the output came from open-pit mines in 1940 compared with about three-fifths in 1939, and 15 mines produced more than 1 million tons each in 1940 compared with 11 in 1939.

Figure 3 shows trends in employment and output at iron-ore mines in the United States from 1923 to 1939.

During 1939 (the last year for which complete statistics are available) a substantial increase in iron-ore output resulted in an increase in employment at the mines. The average number of men increased, as did the average number of days and total man-hours worked. In 1939, 21,859 men working 39,055,362 man-hours produced 51,731,730 gross tons of merchantable ore—an average output of 1.325 tons per man-hour—whereas in 1938, 19,788 men working 30,625,760 man-hours produced 28,447,282 tons of merchantable ore—an average output of 0.929 ton per man-hour. Thus, although the average number of men employed increased 10 percent from 1938 to 1939 and the number of man-hours gained 28 percent, the output of merchantable ore advanced 82 percent, resulting in a 43-percent increase in the output per man-hour. The labor requirements in 1939 were relatively smaller than in 1938 due to several factors—proportionately larger outputs of open-pit mines and of direct shipping ore, nearer capacity production of operating units, and the stripping of proportionately less overburden in preparation for future mining.

In 1939 the number of man-hours of labor increased over 1938 in all districts, but the increase (20 percent) was relatively less in the

Lake Superior district than in the other chief producing districts. The increases in the Southeastern, Northeastern, and Western districts were 36, 52, and 43 percent, respectively. In the Lake Superior district, the output of merchantable ore per man-hour in 1939 reached 1.715 tons—62 percent more than in 1938 and only 3.6 percent less than in 1937. The large gain (20,371,198 tons or 96 percent) in output in 1939 over 1938 required the employment of only 4.4 percent more men; this, plus a 15-percent increase in the average number of days worked, resulted in a 20-percent rise in the number of man-hours worked. Much of the Lake Superior output comes from Minnesota, where open pits furnished 88 percent of the State total in 1939. Because of this preponderant production from open pits, the output per man-hour in Minnesota is greater than in any other State or district and in 1939 amounted to 2.580 tons—an 86-percent increase over 1938. Although, as was pointed out in Minerals Yearbook, 1934 (p. 322),

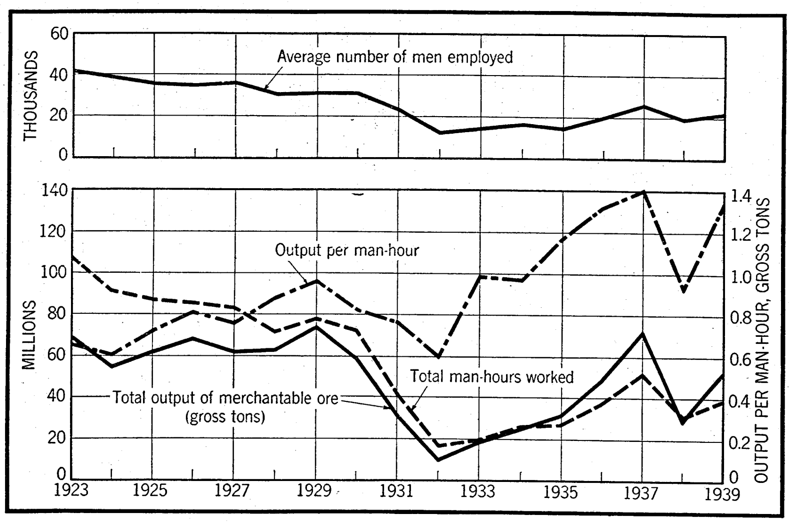

FIGURE 3.—Trends in number of men employed at iron-ore mines, output of merchantable ore, man-hours worked, and output per man-hour in the United States, 1923–39.

the improved performance in mining ore has been closely related to advances in mechanization, better mining methods, operation of larger units, and more efficient management of mines, the gain in the 7-year period 1933–39 compared with the 10-year period 1923–32 was due chiefly to expansion of open-pit operations in Minnesota. For example, although about 75 percent of the merchantable ore produced in Minnesota came from open-pit mines in 1923–32, 85 percent was so produced in 1933–39. The significance of this shift can be appreciated when it is recalled that Minnesota contributed 61 percent of the total merchantable ore produced in 1923–39 and that during this period the output of men at open-pit mines averaged 2.082 tons per man-hour compared with only 0.702 ton per man-hour for workers at underground mines.

The greater output per man-hour in recent years also was due partly to the stripping of proportionately less overburden in preparation for future mining in Minnesota in 1933–39 than in 1923–32, In 1933–39 about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined in Itasca and St. Louis Counties, Minn., whereas in 1923–32 about one-half cubic yard of overburden was removed for each ton of merchantable ore mined. Any material shift in the labor force used for direct mining of the ore at the expense of that used in stripping will result in a much higher output per man-hour for any year. This is illustrated strikingly in figure 4, which shows that in 1926, 1933, 1935, 1936, 1937, and 1939,

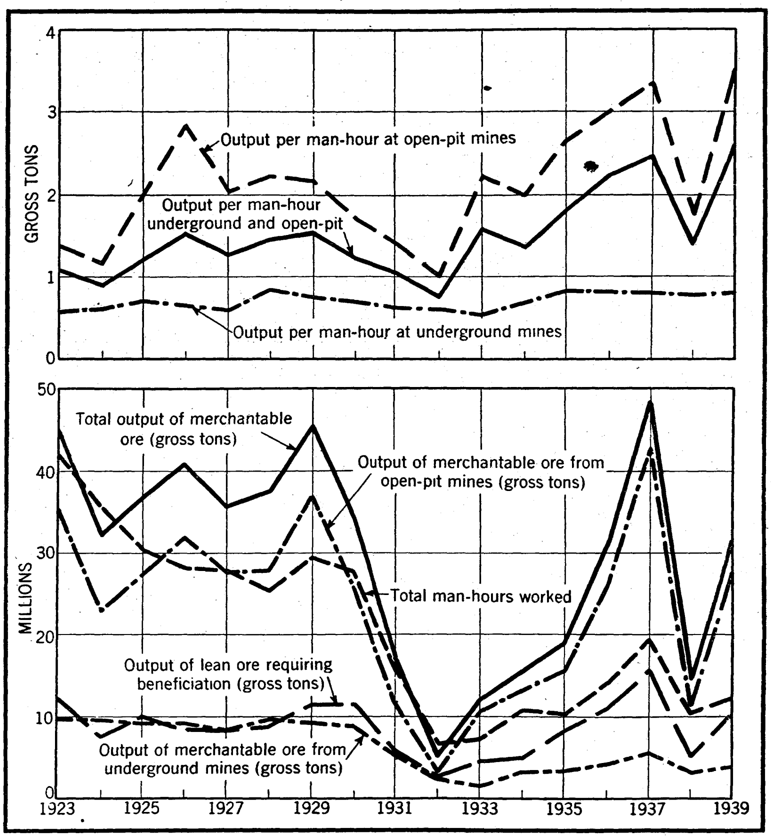

FIGURE 4.—Trends in output of merchantable iron ore per man-hour at open-pit mines in Minnesota compared with production of merchantable and lean ore and total man-hours worked, 1923–39.

when only about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined at both open-pit and underground mines, the output per worker increased substantially, whereas in the other years, when one-third to four-fifths cubic yard of overburden was removed for each ton of ore mined, the ore output per worker was lower.

Another factor that affects the output per man-hour is the tendency to mine leaner ore. Proportionately more lean ore requiring beneficiation has been mined in Minnesota in recent years than in 1923–32. In 1933–39, for instance, beneficiated ore represented 21 percent of the total merchantable ore compared with an average of only 16 percent in 1923–32.

Most of the ore mined in the Southeastern district—the second largest producing region—is obtained from underground operations. The output of merchantable ore per man-hour in this area increased slightly to 0.644 ton in 1939 from 0.631 ton in 1938. The largest and most consistent producing mines in the Southeastern district are in Jefferson County, Ala., where 4,102 men working 7,608,440 man-hours in 1939 produced 5,443,372 tons of merchantable ore, equivalent to an average output of 0.715 ton per man-hour. Virtually all ore produced in Jefferson County comes from underground mines. In comparing the man-hour cost of mining ore in Jefferson County, Ala., with that at underground mines in the Lake Superior district one should remember that, whereas the ore in the Lake Superior district is much richer in iron, the ore from the Jefferson County mines contains enough or

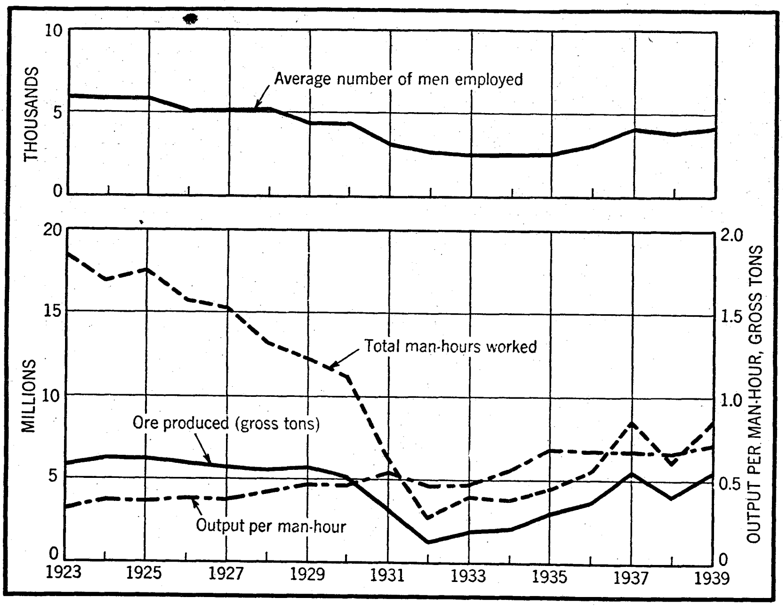

FIGURE 5.—Trends in production, man-hours worked, output per man-hour, and number of men employed at iron-ore mines in Jefferson County, Ala., 1923–39

almost enough lime to make it self-fluxing. Thus, the lower iron content is partly offset by the self-fluxing nature of the ore, although it is impossible to show this important characteristic in the productivity figures.

Figure 5 shows trends in production and employment at iron-ore mines in Jefferson County, Ala., 1923–39.

In the Northeastern district the average output of merchantable ore per man-hour decreased to 0.654 ton in 1939 from 0.735 ton in 1938. The drop in productivity was due in part to proportionately larger output from mines in New Jersey and New York, where virtually the entire output came from underground operations, resulting in a relatively higher expenditure of labor than in Pennsylvania, where output is predominantly from the open pit at Cornwall and productivity is higher.

Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1939, by districts and States

[Exclusive of ore containing 5 percent or more manganese]

Trends in the technology, employment, and output per man in iron-ore mining over the past half century are covered in a recent report by Yaworski, Kiessling, and others.[13]

The accompanying table shows employment at iron mines and beneficiating plants, quantity and tenor of ore produced, and average output per man by districts and States in 1939. Corresponding statistics and supplementary data are given in Minerals Yearbook, 1934 to 1940, inclusive.

WORLD PRODUCTION

The following table shows the production of iron ore, by countries, from 1936 to 1940, insofar as statistics are available. Although complete returns for 1940 are not yet available it is evident that world production was much greater than in 1939.

World production of iron ore, 1936–40, by countries, in metric tons

1 In addition to the countries listed, China, Egypt, Finland, Madagascar, and New South Wales report production of iron ore, but complete data are not available.
2 Data not available.
3 Production of Tofo Mines.
4 Estimate included in total.
5 Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
6 Estimated.
7 U. S. S. R. in Asia included with U. S. S. R. in Europe.
8 Exclusive of bog ore, which is used mainly for purification of gas.

PIG IRON

Production and shipments.—Domestic production of pig iron, exclusive of ferro-alloys, increased 33 percent in 1940 over 1939 and was only 1.2 percent under the record established in 1929. The output in 1940 comprised 46,117,296 net tons using coke and 86,671 tons using charcoal as fuel. Pennsylvania was the largest producer of pig iron in 1940, with 31 percent of the total; Ohio ranked second, with 22 percent. Of the pig iron manufactured in 1940, it is calculated that 1,445,583 tons valued at $22,229,706 were made from 2,443,115 tons of foreign ores, including ore from Africa, Australia, Brazil, Canada, Chile, Cuba, Newfoundland, Norway, Palestine, Spain, Sweden, and the U. S. S. R., indicating an average yield of 59.17 percent from imported ore. Domestic ore (77,905,808 tons) and cinder, scale, and purchased scrap (6,300,311 tons) totaling 84,206,119 tons were reported as used in the manufacture of 44,758,384 tons of pig

Pig iron produced and shipped in the United States, 1939–40, by States

iron, indicating an average pig-iron yield of 53.15 percent from domestic materials. In addition, 1,286,985 tons of home scrap and 2,674,000 tons of flue dust were consumed in making pig iron in 1940.

Shipments of pig iron, exclusive of ferro-alloys, increased 31 percent in quantity and 34 percent in value in 1940 over 1939. The values given represent the approximate amounts received for the iron f. o. b. furnaces and do not include freight costs, selling commissions, and other items that are figured in some of the market prices for pig iron published by trade journals.

Pig iron shipped from blast furnaces in the United States, 1939–40, by grades

Grade	1939			1940		
	Net tons	Value		Net tons	Value	
		Total	Average		Total	Average
Charcoal	64,711	$1,404,719	$21.71	72,461	$1,755,735	$24.23

Value at blast furnaces.—The average value of all kinds of pig iron given in the accompanying table is based upon reports of manufacturers to the Bureau of Mines. The figures represent the approximate values f. o. b. blast furnaces and do not include the values of ferro-alloys. The general average value for all grades of pig iron at the furnaces was $17.90 a net ton in 1940—46 cents more than in 1939.

Average value per net ton of pig iron at blast furnaces in the United States, 1936–40, by States

State	1936	1937	1938	1939	1940
Alabama	$13.40	$14.89	$13.10	$14.42	$14.30

Foreign trade.—Imports of pig iron for consumption in 1940 decreased 73 percent from 1939, the only sources being Canada and British India, which supplied 33 and 67 percent, respectively.

Pig iron imported for consumption in the United States, 1939–40, by countries, in net tons

Consumption.—Consumption of pig iron rose 31 percent in 1940 over 1939. Pig iron, a product of the blast furnace, is a semiraw material and, except for the small quantity used in direct castings, moves to other-type furnaces for further refining or mixture with other required ingredients. In general, it goes to steel-making or iron-making furnaces. By far the larger part is taken to steel-making furnaces (open-hearth, bessemer, and electric) for refining and processing into steel. In 1940, 87.0 percent of the pig iron was consumed in steel-making. Direct castings took 3.2 percent of the 1940 total, and the remaining 9.8 percent was consumed in iron-making furnaces, of which the cupola is by far the most important. The consumption of pig iron, by types of furnace, for 1937 to 1940 is shown in the following table. Typically, the quantities of pig iron used in these furnaces are supplemented by the addition of ferrous scrap. The proportion of pig iron to scrap used in steel furnaces increased in 1940 compared with 1939, whereas the proportion of pig iron in cupola furnaces decreased.

Consumption of pig iron in the United States, 1937–40, by type of furnace

Type of furnace or equipment	1937		1938		1939		1940

sumption is concentrated largely in the iron- and steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas in 1940 used 98 percent of the pig iron, Pennsylvania (the leading consumer) taking nearly 32 percent of the total and Ohio (the second largest consumer) nearly 20 percent. Of the chief consuming areas in 1940, the Middle Atlantic district made the largest gain over 1939—42 percent, compared with 28 percent in the North Central district and 18 percent in the Southeastern district (including the Birmingham district of Alabama). The preceding table shows the distribution of pig-iron consumption by States from 1937 to 1940.

World production.—The following table shows the production of pig iron (including ferro-alloys) by countries from 1936 to 1940, insofar as statistics are available. Although many of the leading world producers have been operating at capacity or virtual capacity through 1939 and 1940, the probable increase in world production during the year was due largely to the rise in United States production, which increased 33 percent over 1939.

World production of pig iron (including ferro-alloys), 1936–40, by countries, in metric tons

[1] Pig iron is produced in Chile, New Zealand, and the Philippine Islands in addition to countries listed, but production figures are not available.
[2] Year ended June 30.
[3] Approximate production as published by Steel, vol. 196, No. 1, January 1940, p. 269.
[4] Data not available.
[5] Estimated production.
[6] Beginning with March 1935, production of the Saar is included with that of Germany.

FERRO-ALLOYS

Production and shipments.—The production of ferro-alloys totaled 1,224,360 net tons in 1940 compared with 823,392 tons in 1939—an increase of 49 percent. In 1940 ferro-alloys were made at 14 blast-furnace plants, 18 electric furnace plants, and 3 aluminothermic plants; in addition, 3 plants made ferrophosphorus and 2 plants made ferrosilicon as a byproduct. Of the 1940 total, 790,430 tons were made in blast furnaces and 420,363 tons in electric furnaces.

Shipments of all classes of ferro-alloys in 1940 rose 37 percent in quantity and 68 percent in total value over 1939. Compared with the 5-year average for 1925–29 (801,080 net tons), shipments in 1940 increased 61 percent.

Ferro-alloys shipped from furnaces in the United States, 1939–40, by varieties

Variety of alloy	1939		1940	
	Net tons	Value	Net tons	Value

[1] Ferroboron, ferrochromium, ferrocolumbium, ferromolybdenum and calcium-molybdenum compounds, ferrotitanium, ferrovanadium, ferrozirconium, silicomanganese, silicospiegeleisen, and zirconium ferrosilicon.

Ferromanganese.—Shipments of ferromanganese in 1940 increased 51 percent over 1939 and were 48 percent above the 5-year average for 1925–29 (340,349 net tons). The average value per net ton, f. o. b. furnaces, reported for ferromanganese was $84.95 in 1940 compared with $72.65 in 1939.

The production of ferromanganese in 1940 (an all-time high) increased 70 percent over 1939 and was made at 10 blast-furnace plants and 1 electric-furnace plant compared with 7 blast-furnace plants and 1 electric-furnace plant in 1939. In both years most of the output was made in blast furnaces.

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1936–40

Year	Ferromanganese produced			Materials consumed (net tons)				Manganese ore used per ton of ferromanganese made (net tons)
	Net tons	Mn contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	Cinder, scale, and purchased scrap	
		Percent	Net tons	Foreign	Domestic			
1936	353,920	79.09	279,925	666,528	6,705	13,963	3,160	1.902
1937	421,616	79.54	335,356	781,818	10,577	19,612	6,739	1.879
1938	272,153	78.65	214,036	466,747	25,254	10,860	9,477	1.808
1939	302,524	79.24	239,725	563,344		9,323	7,000	1.862
1940	514,682	79.45	408,903	976,332	13,419	5,889	8,868	1.923

The tenor of the manganese ore utilized in 1940 was lower than in 1939, and as a consequence the tonnage of manganese ore used per ton of ferromanganese produced increased slightly. As shown in the preceding table, nearly 99 percent of the manganese ore used in making ferromanganese in 1940 came from foreign sources.

Quantity and tenor of manganese ore used in manufacture of ferromanganese in the United States, 1939–40

Source of ore	1939		1940	
	Net tons	Manganese content (percent, natural)	Net tons	Manganese content (percent, natural)
Africa	144,734	48.14	233,370	45.89

	563,344	47.72	989,751	46.45

Spiegeleisen.—Shipments of spiegeleisen from domestic furnaces in 1940 rose 26 percent over 1939. The average value per net ton at the furnaces was $29.18 in 1940 compared with $26.17 in 1939. The entire production, which increased to 114,119 net tons in 1940 from 102,470 tons in 1939, was made in blast furnaces. Output in 1940 averaged 20.42 percent manganese. Most of the spiegeleisen was manufactured from domestic ores in 1940, as only 33 tons of foreign manganese ore were used.

Ferrosilicon.—Shipments of ferrosilicon in 1940 increased 25 percent over 1939. The production of ferrosilicon in 1940 totaled 409,699 net tons, including 190,310 tons made by blast furnaces, 219,141 tons by electric furnaces, and 248 tons as a byproduct in the manufacture of artificial abrasives in electric furnaces. The silicon content of the production in 1940 ranged from 7 to 95 percent but averaged 28 percent. Most of the raw materials used in making ferrosilicon were of domestic origin.

Ferrophosphorus.—Production of ferrophosphorus increased slightly to 17,969 net tons containing 24.35 percent phosphorus in 1940 from 17,321 tons containing 24.37 percent phosphorus in 1939, but shipments from furnaces decreased 22 percent. All the 1940 output was made in electric furnaces and was manufactured from domestic materials.

Ferrotungsten.—Shipments of ferrotungsten gained 99 percent in quantity and 107 percent in total value over 1939. The 1940 shipments contained 77.70 percent (5,573,680 pounds) tungsten and were valued at $1.80 per pound of contained tungsten. Production totaled 3,604 net tons containing 77.70 percent tungsten (5,600,688 pounds). In addition to domestic ores (chiefly from California, Colorado, and Nevada), foreign ores (chiefly from Australia, China, Portugal, and South America) were used. All ferrotungsten was made in electric furnaces.

Foreign trade.—Imports of all alloys of the rarer metals are not recorded separately but are grouped as shown in the following table. Ferromanganese and spiegeleisen comprised most of the imports in both 1939 and 1940. Imports of ferromanganese for consumption (all from Norway and the Netherlands) were 11,613 net tons—75 percent less than in 1939. Imports of spiegeleisen for consumption (all from Canada) were 17,455 net tons—a decrease of 59 percent over 1939.

Exports of ferro-alloys, which have been relatively unimportant in tonnage, rose substantially in 1940 over 1939. Exports of ferromanganese and spiegeleisen in 1940 were 14,600 net tons and of other ferro-alloys 27,401 tons.

1 Less than 1 ton.
2 For statistical purposes, trade with the Sudeten area, as far as ascertainable, is included with Germany, while trade with the other Czechoslovak Provinces occupied by Germany and Poland has been included with these countries since March 18 or 19, 1939. After November 16, 1939, trade with Danzig and that part of Poland occupied by Germany has been included with Germany.

Ferro-alloys and ferro-alloy metals exported from the United States, 1939–40, by varieties

Variety of alloy	1939		1940	
	Net tons	Value	Net tons	Value
Ferromanganese and spiegeleisen	3,274	$247,798	14,600	$1,366,087
Other ferro-alloys [1]	4,527	1,024,826	27,401	7,064,823

[1] Includes ferrosilicon, ferrotungsten, ferrovanadium, and other ferro-alloys.

STEEL

Production.—The domestic steel industry operated at 72.4 percent of capacity during the first half of 1940—a rate slightly less than during the second half of 1939. During the second half of 1940, however, the operating rate increased progressively from 83 percent of capacity in July to 96.6 percent in November but dropped slightly to 94.1 percent in December. About 29 percent of the 1940 output of steel was made in the final 3 months, when the production rate rose to an all-time high. The average operating rate was 82 percent in 1940 compared with 64 percent in 1939. The following figures covering the output of steel were compiled by the American Iron and Steel Institute. The production of steel ingots and castings in 1940 established a new record and totaled 66,982,686 net tons—21 percent above the 1925–29 average, 27 percent over 1939, and 6 percent over the previous record made in 1929.

Of the 1940 total, 91.9 percent was made in the open hearth, 5.5 percent in bessemer converters, 2.6 percent in electric furnaces, and only 1,024 tons in crucible furnaces. The bulk (60,882,840 tons) of the total open-hearth output in 1940 was made in basic furnaces.

Of the total output of steel ingots and castings, 66,649,864 net tons were ingots in 1940 compared with 52,537,439 tons in 1939.

A large part of the steel production comes from the contiguous States Pennsylvania and Ohio. In 1940 these States produced about 50 percent of the total steel, 49 percent of the open-hearth steel, and 76 percent of the bessemer steel.

Open-hearth steel ingots and castings manufactured in the United States, 1936–40, by States, in net tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Bessemer-steel ingots and castings manufactured in the United States, 1936–40, by States, in net tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

State	1936	1937	1938	1939	1940
Ohio	1,836,048	1,957,435	1,202,916	1,439,629	1,459,807
Pennsylvania	1,067,328	930,093	389,827	1,109,081	1,366,017
Other States	970,096	976,390	513,597	810,206	882,749
	3,873,472	3,863,918	2,106,340	3,358,916	3,708,573

Steel electrically manufactured in the United States, 1936–40, in net tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Year	Ingots	Castings	Total	Year	Ingots	Castings	Total
1936	788,718	76,432	865,150	1939	951,522	77,545	1,029,067
1937	912,027	34,975	947,002	1940	1,608,032	91,974	1,700,006
1938	524,843	40,784	565,627				

The steel output for 1940 includes 4,965,887 net tons of alloy-steel ingots and castings, which represent 7 percent of the total. This figure includes steels in which the minimum of the range specified in any of the elements named exceeds the following percentages: Nickel, 0.40 percent; chromium, 0.30 percent; copper, 0.50 percent; manganese, 1.65 percent; silicon, 0.50 percent; molybdenum, 0.10 percent; vanadium, tungsten, cobalt, titanium, and zirconium, any percent. The output of alloy steels in 1940 increased 55 percent and that of total steel 27 percent over 1939. Of the total alloy-steel output in 1940, 69 percent came from basic open hearths, 5 percent from acid open hearths, 26 percent from electric furnaces, 255 tons from crucible furnaces, and 3,990 tons from bessemer furnaces.

Production of alloy-steel ingots and castings, 1936–40, by processes, in net tons

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

Process	1936	1937	1938	1939	1940
Open hearth, basic	2,508,671	2,559,200	1,179,031	2,302,273	3,421,961
Open hearth, acid	129,658	164,455	102,089	156,581	252,965
Bessemer	----------	----------	13	3,486	3,990
Crucible	234	270	5	231	255
Electric	591,094	672,616	372,372	749,384	1,286,716
	3,229,657	3,396,541	1,653,510	3,211,955	4,965,887

From the foregoing tables it will be seen that most of the steel made in electric furnaces (76 percent in 1940) is alloy steel. Typically, steels with higher alloy content are made in electric furnaces, and steels with lower alloy content by the open-hearth process.

Foreign trade.—Exports of iron and steel products (excluding scrap) in 1940 broke all records and increased 211 percent over 1939. Because of unsettled conditions and expanded armament activities, foreign producers have been unable to meet demands in their own

1 Less than 1 ton.

sources of raw materials and the construction and equipment of new plants are under way, the demand for these products has reached heights far above expectations only a year ago. No information is available regarding the extent of these operations abroad, but it is doubtful that demand will decrease even if they are successful.

Exports of iron ore, pig iron, and ferro-alloys are covered in other sections of this report. All important items in the 1940 movement of iron and steel products gained. Exports of iron and steel scrap (including tin-plate scrap) dropped 21 percent from 1939 and amounted to 3,159,285 net tons. Of the 1940 scrap exports, 93 percent went to four countries—United Kingdom (35 percent), Japan (34 percent), Canada (13 percent), and Italy (11 percent).

Although exports of American iron and steel products in 1940 reached most of the world markets, six countries took 72 percent of the total—United Kingdom, 44.8 percent; Canada, 11.4 percent; Japan, 5.0 percent; Argentina, 4.7 percent; Brazil, 3.3 percent; and Union of South Africa 2.8 percent.

Imports for consumption of iron and steel (exclusive of scrap) in 1940 were 81 percent below those in 1939. The import trade was much lower than the export trade. Leading commodities in the 1940 trade, in point of tonnage, were spiegeleisen (17,455 net tons imported against 42,856 tons in 1939), pig iron (receipts of which dropped to 11,471 net tons from 43,223 tons), and ferromanganese (of which only 11,613 tons were received in contrast with 46,175 tons in 1939). Imports came principally from Canada, Sweden, Norway, and British India. Imports of scrap in 1940 were small, totaling only 2,199 net tons (93 percent below 1939), and came largely from Mexico, Canada, and Sweden.

MANGANESE AND MANGANIFEROUS ORES

By Robert H. Ridgway, H. W. Davis, and Allan F. Matthews [1]

SUMMARY OUTLINE

War in Europe, a 27-percent increase in American steel production, and the stock-piling of strategic minerals by the United States Government exercised an outstanding influence on the manganese industry in 1940. The U. S. S. R., British India, Union of South Africa, Gold Coast, and Brazil in 1940 probably continued to produce over 85 percent of the world supply. The Union of South Africa diverted a large proportion of its output from Europe to the United States. Cuba and the Philippine Islands, whose ores have the advantage of entering the United States duty free, stepped up their yield to meet American demands. Shipping restrictions were felt in 1940, and ocean-freight and war-risk-insurance rates increased sharply. Except for this, the controlled price of manganese ore in the United Kingdom remained throughout 1940 at pre-war levels; the basis for ferro-grade Indian ore was about 1s. 2d. per unit c. i. f.[2] Quoted prices of foreign manganese ore at United States ports increased 3 to 7 cents per long-ton unit during 1940, but those of Cuban ore decreased 4 cents per unit. American ferromanganese and spiegeleisen prices increased $20 and $4, respectively, in the middle of 1940. Most of the large manganese-consuming countries in the world exercised tight control over their supplies of the strategic metal, but there were no restrictions on manganese consumption in the United States during 1940.

Manganese mining in the United States improved somewhat in 1940 but supplied only 3 percent of the apparent domestic consumption and less than 1 percent of the world output. Mine shipments totaled 40,123 long tons of manganese ore (35 percent or more Mn) in 1940 compared with the high of 305,869 tons in 1918. Between 1906 and 1940, inclusive, domestic mines shipped 1,433,669 long tons of manganese ore. Manganese deposits in the United States and methods of beneficiating ores were studied intensively during 1940, and the results are expected to be evidenced in greatly increased production during the next few years. Imports from Latin America and the Philippine Islands were encouraged during 1940. Brazilian manganese deposits will be far more accessible after railroad service from the mines to the coast is rehabilitated as planned. Bonded

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.
[2] Metal Bulletin (Lond.), No. 2549, December 10, 1940, p. 11.

stocks of manganese ore in the United States were greater at the end of 1940 than at any time in history. Estimated supplies of manganese on hand, afloat, or readily available to the United States at the end of 1940 were equal to 2 years' supply at maximum requirements as then foreseen. Shipments from furnaces in the United States of ferromanganese and spiegeleisen increased 51 percent and 26 percent, respectively, in 1940 compared with 1939. Manganese products exported from the United States on and after July 5, 1940, were subjected to licensing requirements; such commodities were stated to include "manganese ores or concentrates containing 45 percent or more of metallic manganese and alloys containing in excess of 10 percent metallic manganese."

Salient statistics of the manganese industry in the United States, 1925–29 (average) and 1936–40, in long tons

	1925–29 (average)	1936	1937	1938	1939	1940
Manganese ore:						
Total shipments containing 35 percent or more Mn	59,312	32,119	40,241	25,321	29,307	40,123
Shipments of metallurgical ore	[1] 41,892	18,557	26,419	16,989	18,580	27,158
Shipments of battery ore	17,420	7,747	6,447	4,959	7,767	9,271
Imports for consumption	600,000	813,362	911,919	483,586	627,131	1,282,079
Stocks in bonded warehouses at end of year	304,000	366,381	681,290	842,048	903,561	913,016
Indicated consumption (35 percent or more Mn)	659,000	848,491	954,503	509,930	656,438	1,322,202
Ferro-alloys:						
Production of ferromanganese	306,360	316,000	376,443	242,994	270,111	459,538
Imports of ferromanganese [2] [3]	[4] 50,590	30,593	23,888	21,118	33,414	8,573
Production of spiegeleisen	95,463	95,137	([5])	11,311	91,491	101,892

Strategic aspects of manganese.—Manganese is one of the most vital strategic metals as far as this country is concerned because about 12.5 pounds are needed to desulfurize and deoxidize every short ton of steel, because 97 percent of the present supply must be imported (fig. 1), and because substitution would be extremely difficult. Only high-grade ore (48 percent or more Mn) is generally used in the manufacture of standard "ferro" grades, the form in which manganese is usually added in steel manufacture, so only high-grade ore is considered strategic. Although there are large quantities of low-grade manganese ore in the United States, domestic supplies of high-grade ore are small because few such deposits exist and because the capacity of plants to beneficiate the low-grade ores remains insignificant.

The strategic aspects of manganese in the national defense program are under the constant surveillance of R. C. Allen, consultant, ferrous minerals and alloys, Office of Production Management, but priorities on manganese ores or alloys were not instituted during 1940. Acting in an advisory capacity is the Technologic Committee on Manganese of the National Academy of Sciences and the National Research Council, an organization appointed on July 25, 1940, to review projects for developing new processes for recovery of manganese from low-grade domestic ores and to study conservation of manganese for the Office of

Production Management. The committee is composed of nine eminent scientists and engineers from Government and industry. During 1940, the committee issued two reports [3] showing how ferromanganese requirements in the United States during an emergency period could be reduced at least 40 percent. An abstract of these reports follows:

Under emergency conditions spiegeleisen could be substituted for at least 20 percent of the required ferromanganese. This substitution could be facilitated and even further extended by the manufacture of spiegeleisen with a higher manganese content than the usual 20 percent Mn, and this could be done using domestic ores. Another 20-percent saving in ferromanganese requirements could be ob-

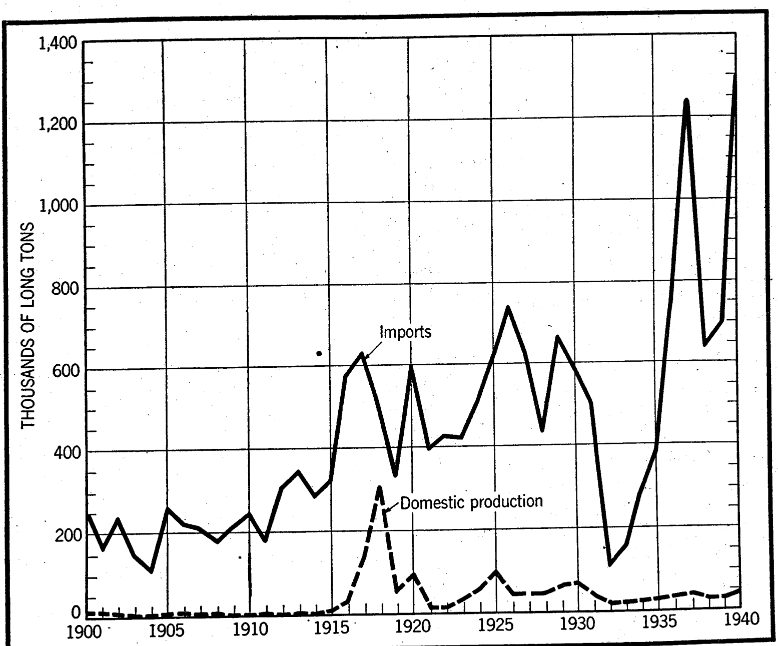

FIGURE 1.—Imports and domestic production (mine shipments) of manganese ore, 1900–1940. Statistics on imports shown in the graph represent "general imports" for the period 1900–1933; beginning with 1934, data classified as "general imports" were not available, and the figures plotted for 1934–40 represent imports for consumption adjusted for changes in stocks in bonded warehouses and are closely comparable with the record for earlier years.

tained by following these practices: (a) Where the maximum permissible content of phosphorus could be raised, a greater proportion of basic open hearth slag could be returned to the blast furnace. (b) The slag volume in the open-hearth furnace could be lowered by decreasing the silicon content of the pig iron and keeping silica from other sources to a minimum. (c) Ladle additions of manganese rather than furnace additions should be used to the fullest practicable extent. Use of a preliminary deoxidizing addition (such as 10- to 15-percent ferrosilicon) is recommended where feasible. (d) Equivalent physical properties may be obtained by substituting other (more expensive) metals for manganese in many of the higher-manganese steels.

Government stock pile.—The Strategic Materials Act (Public, No. 117, 76th Cong., 1st sess., ch. 190), which was signed by the President June 7, 1939, authorized the expenditure of $100,000,000 over a

[3] Office of Production Management, Technologic Committee on Manganese, Emergency Conservation of Manganese. The use of Spiegel as a Substitute for Ferromanganese: PM 89, February 21, 1941, pp. 1–11.

4-year period for the purchase of strategic materials. Of all strategic mineral commodities, manganese ore is required in the largest quantities. Two agencies of the United States Government—the Metals Reserve Co. (a subsidiary of the Reconstruction Finance Corporation) and the Procurement Division of the Treasury Department—are signing contracts with domestic producers and with importers for the delivery of ferro-grade manganese ore to Government stock piles over a period of years. The following table, which shows the status of this activity in 1940, is based upon data courteously supplied by the respective agencies.

Contracts and deliveries of manganese ore to the United States Government, 1940, by States and countries of origin, in long tons

Origin	Metals Reserve Co.		Treasury Department		Total deliveries
	Contracted	Deliveries	Contracted	Deliveries	
United States:					
California	80,000				
Colorado	20,000				
Montana	400,000				
Nevada	150,000		7,500		
New Mexico	240,000				
Pennsylvania	180,000				
Tennessee	15,000				
Virginia	100,000				
West Virginia	150,000				
Total domestic	1,335,000		7,500		
Other countries:					
Brazil	18,000				
Chile	2,000	2,000			2,000
Cuba	248,000		2,500		
India, British	283,700	14,700	7,918	7,952	22,652
Mexico	10,000				
Philippine Islands	53,000	3,500	31,500	27,155	30,655
Union of South Africa	199,500	8,600	13,882	14,046	22,646
U. S. S. R.	1,000	1,000			1,000
Total foreign	815,200	29,800	55,800	49,153	78,953
Total	2,150,200	29,800	63,300	49,153	78,953

One of the largest contracts was with the Anaconda Copper Mining Co., Butte, Mont., which is to supply 80,000 long tons of nodulized rhodochrosite ore containing at least 55 percent Mn annually for 3 years. The ore will come from the Emma mine and adjacent property in Butte and will be treated at a plant expected to be finished in May 1941. The Cuban purchases are also particularly significant because delivery is virtually assured in contrast to the uncertainty attached to shipments from other overseas sources.

Government exploration.—Under section 7 of the Strategic Materials Act, the Bureau of Mines and the Geological Survey are searching for and appraising ore deposits containing strategic metals. The bill authorized the expenditure of $500,000 a year ($350,000 by the Bureau of Mines and $150,000 by the Geological Survey) for each of the fiscal years ending June 30, 1940, 1941, 1942, and 1943.

By the end of the spring of 1941, 375 selected manganese deposits in Alabama, Arizona, Arkansas, California, Colorado, Georgia, Montana, Nevada, New Mexico, North Carolina, Tennessee, Texas, Utah, Virginia, Washington, and West Virginia had been examined by Bureau of Mines engineers. About 1 property in 10 of these more-or-less-selected properties probably would warrant exploration projects of various kinds, chiefly by trenching and diamond drilling, if adequate funds should be available. Detailed prospecting had been undertaken by the Bureau on 19 of the deposits examined by April 1941.[4] The results are summarized in the following paragraph. It is essential to bear in mind, when considering this appraisal, that almost all of the ore developed is of subcommercial grade and would require concentration or processing of some sort to make it usable for metallurgical purposes.

The existence in *Arizona* of several million tons of manganiferous ore containing 761,000 tons of metallic manganese in previously known deposits was substantiated by diamond drilling. Elsewhere in the State are estimated to be 121,000 tons of manganiferous material containing 28,000 tons of metallic manganese and 150,000,000 tons of 3½-to 5-percent material carrying 5,000,000 tons of manganese. In the Batesville-Cushman district of *Arkansas* 350,000 tons of wad ore estimated to contain 80,000 tons of metallic manganese have been revealed to date. It is expected that further exploration will indicate about three times that tonnage. One deposit in *California* has 57,500 tons of manganiferous ore with a metal content of 16,000 tons, and 13 other properties in the State account for 225,000 tons of ore containing 63,000 tons of metallic manganese. Known reserves in *Nevada's* Las Vegas district have been increased to 1,280,000 tons of ore equivalent to 312,500 tons of manganese metal. Reserves in the Virgin River area of Nevada are estimated at 100,000 tons of metallic manganese and in Lander and Pershing Counties at 300,000 tons of ore carrying 60,000 tons of metallic manganese. In *New Mexico*, work on one deposit has indicated 220,000 tons of manganiferous ore containing 46,000 tons of metal. In the Drum Mountains of *Utah* are reserves of 200,000 tons of ore carrying 30,000 tons of metallic manganese and elsewhere in the State at least 33,000 tons of ore containing 7,400 tons of manganese. In *Washington* a small, high-grade deposit now being worked has an estimated reserve of 11,000 tons of ore containing 5,500 tons of metallic manganese. Three other properties in the State are believed to aggregate 25,000 tons of ore or 6,500 tons of metallic manganese.

The possibilities of manganese production at Leadville, Colo., were studied by Hedges,[5] who states that the district contains over 2,000,000 tons of ore carrying 16 to 25 percent Mn but that the ore has mineralogical associations that would make recovery of the manganese very expensive. Furthermore, most of the mines are under water and a million dollars and 2 years' time would be needed for rehabilitation.

The Geological Survey examined many manganese deposits during 1940. Reports were published on those in the Little Florida Mountains, New Mexico,[6] and the Philipsburg district, Mont.[7]

Government beneficiation tests.—Since it has been ascertained that the tonnage of high-grade manganese ore in the United States is relatively small, it is apparent that large-scale production of manganese is possible only through beneficiation of low-grade material. With this in mind, a $2,000,000 Government appropriation, authorized by Public, No. 667, 76th Congress, in the summer of 1940, was made available in the fall of 1940 to the Bureau of Mines for the construction and operation of pilot plants to beneficiate low-grade manganese ores (1 to 30 percent Mn), for the production of metallic manganese from such ores, and for the development of manganiferous deposits.

Microscopic studies of the physical characteristics of some low-grade manganese ores were made by Head,[8] who found that many of the low-grade manganese ores will require fine-grinding to 65-mesh or smaller to liberate the included gangue particles. Ore-dressing tests were made in 1940 on low-grade manganese ores from Idaho, Nevada, and Utah; in most instances, by using a combination of methods, plus-48-percent Mn concentrates resulted. Experiments on matte smelting of manganiferous ores from Colorado, Idaho, Minnesota, South Dakota, and Utah are under way.[9] Preliminary results indicate that a matte containing 50 to 55 percent Mn, 5 to 8 percent iron, and 33 to 35 percent sulfur (which would be suitable for the manufacture of ferromanganese) can be produced. In 1940 the Bureau of Mines began to build several pilot plants near Boulder Dam in Clark County, Nev. Ore from the Three Kids mine in Nevada and from the Artillery Peak district in Arizona will be used first. Funds were also set aside for building a pilot plant at Chamberlain, S. Dak., to test the low-grade ores along the Missouri River in South Dakota.[10] Testing has shown that low-grade ores from Arizona, Minnesota, New Mexico, and Tennessee could be beneficiated to meet specifications for ferromanganese.[11] Methods and costs of mining and beneficiating ores in eastern Tennessee and other Appalachian districts were described by Newton.[12] Concentration tests were run on the ferruginous manganese ore associated with the lead-zinc veins at Leadville, Colo.[13]

DOMESTIC PRODUCTION [14]

The domestic production (shipments from domestic mines) of manganese ore in 1940 increased 37 percent over 1939. Of the manganese ore shipped to metallurgical plants in 1940, 8,333 long tons contained (natural) 48 percent or more Mn; essentially all of this came from Montana.

Manganiferous raw materials shipped by producers in the United States, 1936–40, in long tons

Year	Metallurgical ore (ferrous metallurgy only)				Battery ore	Miscellaneous manganese ore
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		
1936	18,557	98,962	841,557	124,288	7,747	5,815
1937	26,419	151,955	1,189,017	115,998	6,447	7,375

[14] Throughout this chapter, unless otherwise indicated, percentages expressing the manganese content of ores refer to ores in the natural (undried) state.

Shipments of the various grades of manganese ore during the last 5 years are given, by States, in the following tables. In addition, battery-grade ores were produced in Montana; manganiferous zinc residuum was produced from New Jersey zinc ores; and miscellaneous manganese ores came from Alabama, Arizona, Montana, Tennessee, and Virginia.

Wisconsin	405				
	841,557	1,189,017	275,240	469,703	816,541

Alabama.—Manganese ore was shipped in 1940 from Walnut Grove, Etowah County, by J. B. Bynum and by R. F. Jefferies, F. C. Curvin, and Dorris Mars. Shipments were also made by the Manganese Corporation, which buys ore from numerous small operators in Alabama and Georgia and mills it at Anniston, Ala. Shipments comprised 57 long tons averaging 43.9 percent Mn to metallurgical plants and 186 tons averaging 37.6 percent Mn for miscellaneous uses. Shipments of ferruginous manganese ore were made from Calhoun and Cherokee Counties and averaged 30.7 percent Mn.

[1] Included under "Undistributed."
[2] 1 producer in Montana, 3 in Tennessee, and 5 in Virginia shipped both metallurgical and miscellaneous ore.
[3] Mills through which all ore was shipped; producers not counted.

Arizona.—Shipments of manganese ore were made in 1940 by R. B. Silverman, Tombstone, Cochise County; W. W. Linesba, Winslow, Coconino County; Norman W. McGregor, Artillery Peak district, Mohave County; and Bradley & Ekstrom, Mayer, Yavapai County. Of this ore, 311 tons averaging 43.7 percent Mn went to metallurgical plants, and 58 tons averaging 52.1 percent Mn was for miscellaneous uses.

Arkansas.—Two shippers—Walter H. Denison Manganese & Contracting Co., Inc., and Arkansas Manganese Co.—supplied the Arkansas total of 6,079 long tons of manganese ore in 1940 from operations in the Batesville-Cushman district of Independence County. The ore averaged 44.2 percent Mn. In addition, the former company shipped ferruginous manganese ore averaging 23.7 percent Mn. Late in 1940 the North American Manganese Corporation opened a mine in northern Pike County near Glenwood and stockpiled 500 tons of ore.

California.—S. F. Brock, at Baker, San Bernardino County, and West Coast Chrome Co., Patterson, Stanislaus County, produced California's 1940 output of manganese ore, which averaged 41.8 percent Mn. From Silver Lake and Yermo in San Bernardino

County, Natural Resources, Inc., shipped ferruginous manganese ore averaging 31.0 percent Mn.

Colorado.—In 1940 J. D. Thomas shipped manganese ore averaging 39.7 percent Mn from the Paymaster mine in Gunnison County. From the All Right mine in Leadville the Chrysolite Co. shipped ferruginous manganese ore averaging 15.6 percent Mn, but operations ceased after March 31, 1940.

Georgia.—The White Manganese Corporation (purchased at the close of 1940 by J. M. Neel) and the Knight & Beatty Mining Co. made most of the 1940 shipments of manganese ore, which averaged 41.1 percent Mn and came chiefly from the Cartersville district, Bartow County. Shipments of ferruginous manganese ore averaging 18.6 percent Mn and of manganiferous iron ore averaging 6.4 percent Mn came from Bartow and other counties. Between 1886 and 1940, inclusive, the Cartersville district has produced about 175,000 long tons of manganese ore, 225,000 of ferruginous manganese ore, and 51,000 of manganiferous iron ore. The geology of these deposits was described by Kesler of the Geological Survey.[15]

Idaho.—The Lava Manganese Mining Co., operating the Vanza mine in Bannock County, shipped ferruginous manganese ore containing 31.8 percent Mn in 1940.

Massachusetts.—Anson G. Betts shipped ferruginous manganese ore averaging 25 percent Mn in 1940 from the Taconic mine in Hampshire County.

Michigan.—The Castile Mining Co. in 1940 shipped ferruginous iron ore averaging 6.04 percent Mn and 46.27 percent iron from the Eureka mine in Iron County.

Minnesota.—All 1940 shipments of manganese-bearing ore (that is, ore containing 5 percent or more Mn), came from the Cuyuna range in Crow Wing County. The ferruginous manganese ore averaged 13.02 percent Mn and 33.68 percent iron and came from the Alstead-Hillcrest, Louise, and Merritt mines. The manganiferous iron ore contained 7.34 percent Mn and 38.28 percent iron and came from the Louise, Mahnomen, Sagamore, Merritt, Armour No. 1, and Hopkins mines.

Montana.—Shipments of manganese ore in 1940 from Montana, the largest producing State, totaled 19,343 long tons—a 74-percent gain over 1939. The portion of this shipment destined for metallurgical plants was nodulized rhodochrosite averaging 58.8 percent Mn from the Emma mine near Butte. This mine also supplied the tonnage of selected crude rhodochrosite containing 39.9 percent Mn going to miscellaneous consumers. All the battery-grade ore, except for a single ton, came from the Philipsburg district and averaged about 70 percent MnO_2. Shipments of ferruginous manganese ore comprised 2,686 long tons of ore and 931 of tailings from operations at the Trout mine in the Philipsburg district.

Nevada.—Manganese ore averaging 35.8 percent Mn was shipped in 1940 by Hollis E. Chatwin and R. H. Richards from the Black Diabalo mine in Humboldt County. Shipments of ferruginous manganese ore carrying 27.9 percent Mn were made from the same mine.

New Mexico.—A little manganese ore averaging 48.2 percent Mn was shipped in 1940 from the Black Mask mine by the Newalpitt

[15] Kesler, Thomas L., Structure and Ore Deposition at Cartersville, Ga.: Am. Inst. Min. and Met. Eng. Tech. Pub. 1226, Mining Technol., September 1940, pp. 1–18.

Corporation. Shipments of ferruginous manganese ore averaged 13.2 percent Mn and were made almost exclusively by the Luck Mining & Construction Co. from the Boston Hill mine near Silver City, Grant County.

North Carolina.—Weber, Magann & Co. in 1940 shipped ferruginous manganese ore averaging about 33 percent Mn from the North Cove mine in McDowell County.

Tennessee.—Shipments of manganese ore in 1940 from Tennessee (the second largest producing State) averaged 36.3 percent Mn for the tonnage going to metallurgical plants and 43.9 percent Mn for that sold to other consumers. The principal producers were the Embree Iron Co., Embreeville, Unicoi County, and the East Tennessee Manganese Co., Neva, Johnson County. Ferruginous iron ore shipped averaged 31.5 percent Mn. The mining of manganese in the Embreeville district was described by Reichert.[16]

Utah.—A small quantity of manganese ore, containing 37.3 percent Mn, was shipped by J. E. Stafford from a mine near Floy and was the only shipment of such ore from Utah in 1940. Shipments of ferruginous manganese ores averaged 28.4 percent Mn and for the most part were made by the Chief Consolidated Mining Co., Eureka, Utah County, and by the Ward Leasing Co., Delta, Juab County.

Virginia.—In 1940, shipments of manganese ore to metallurgical plants averaged 41.0 percent Mn and to miscellaneous industries 44.5 percent Mn. It was mined in Appomattox, Bland, Campbell, Craig, Page, and Smyth Counties. Shipments of ferruginous manganese averaged 19.9 percent Mn and came from Augusta, Bland, and Smyth Counties. A little manganiferous iron ore containing about 6.5 percent Mn and 36 percent iron was shipped from Augusta and Smyth Counties.

Washington.—No manganese-bearing ore was shipped from Washington in 1940.

West Virginia.—Some manganese ore averaging 44 percent Mn was shipped in 1940 by the Appalachian Ores Co. from the Sweet Springs mine in Monroe County.

IMPORTS OF MANGANESE ORE

Imports for consumption of manganese ore containing 35 percent or more Mn increased 104 percent in 1940 over 1939, and comprised 1,254,674 long tons of metallurgical ore containing 601,943 tons of manganese valued at $17,635,455 and 27,405 tons of battery-grade ore containing 15,158 tons of manganese valued at $596,432. All contributing countries made larger shipments, but especially large increases were noted from the Union of South Africa, the Philippine Islands, and Brazil. The U. S. S. R., Gold Coast, and British India—the three largest sources in 1940—supplied 58 percent of the total. Of the battery-grade ore, 20,271 tons came from the Gold Coast, 4,297 tons from the Union of South Africa, 2,799 tons from British India, and 38 tons from France.

General imports (containing 35 percent or more Mn), which represent the movement of ore into this country, exceeded imports for consumption and totaled 1,294,316 long tons containing 615,943 tons of manganese. Of this quantity of ore, 241,014 tons came from Gold

[16] Reichert, Stanley, Manganese Ores of the Embreeville District of East Tennessee: Am. Inst. Min. and Met. Eng. Contrib. 117, New York Meeting, February 1941, pp. 1–11.

Manganese ore (35 percent or more Mn) imported for consumption in the United States, 1938–40, by countries

Country	Manganese ore (long tons)			Mn content (long tons)			Value		
	1938	1939	1940	1938	1939	1940	1938	1939	1940
Brazil	29,698	42,713	168,241	13,307	19,499	75,060	$220,328	$366,597	$1,678,395
Chile		49	7,849		23	3,718		300	155,680

Gold Coast	126,857	242,923	246,983	63,890	122,769	124,221	1,500,813	3,019,368	4,468,383
India, British	25,480	89,545	189,473	13,121	45,556	95,100	236,945	1,054,718	2,323,880
Netherlands Indies			5,245			2,753			144,131
Philippine Islands	4,002	6,966	43,515	1,600	3,483	21,824	44,075	89,784	627,243
Union of South Africa		3,401	177,739		1,697	78,508		45,716	1,802,537
U. S. S. R.	166,042	135,243	311,748	80,673	68,881	151,367	2,661,557	2,204,304	3,947,766
Other countries	85	353	640	43	184	375	13,254	27,716	24,137
	483,586	627,129	1,282,079	234,168	313,810	617,101	6,919,397	8,498,050	18,231,887

Coast, 238,400 from the Union of South Africa, 221,851 from Brazil, 215,740 from British India, 179,251 from the U. S. S. R., 130,646 from Cuba, 43,515 from the Philippine Islands, and 23,899 from nine other countries. These imports include 26,125 tons of battery-grade ore containing 14,045 tons of manganese, principally from the Gold Coast in the fall of the year.

In addition to the 1940 imports shown in the above table and listed in the preceding paragraph, there were imports of 38,883 long tons of ore (28 percent Mn) containing 11,074 long tons of manganese and valued at $116,758. Of this amount of ore, 14,640 long tons came from Egypt, 14,090 tons from the Union of South Africa, 7,750 from Brazil, 2,400 from Chile, 2 from Canada, and 1 ton from Peru.

STOCKS

Stocks of manganese ore in bonded warehouses rose for the fourth consecutive year and, according to figures of the Bureau of Foreign and Domestic Commerce, reached a peak of 913,016 long tons containing 439,303 tons of metallic manganese at the end of 1940.

PRICES

Prices of manganese ore (except battery ore) are on a unit basis, the unit being 1 percent of a long ton or 22.4 pounds of contained manganese. Prices of battery-grade ore are quoted on a per-ton basis, with a minimum requirement of manganese dioxide.

Prices for domestic metallurgical manganese ore are not quoted, but in 1940 the average value of ores reported to the Bureau was about 50 cents per long-ton unit for ore containing 35 percent or more Mn. Quotations on imported ore in the following table are from Engineering and Mining Journal. A duty of one-half cent per pound of contained manganese is imposed on all imported manganese ore except that from Cuba and the Philippine Islands, which enters duty free.

According to Engineering and Mining Journal, the prices for chemical (battery-grade) ores per long ton in carloads at the end of 1940 were as follows: Domestic, containing 70 to 72 percent MnO_2, f. o. b. mines, $45 to $50; Brazilian or Cuban, 80 percent MnO_2, $50 to $60; Javan or Caucasian, 85 percent MnO_2, nominal.

Domestic prices of metallurgical manganese ore in 1940, in cents per long-ton unit

[C. i. f. North Atlantic ports, cargo lots, exclusive of duty]

	Beginning of year	End of year		Beginning of year	End of year
Brazilian, 46–48 percent Mn	$0.45	$0.48–$0.50	Cuban (not dutiable):		
Chilean, 47–48 percent Mn	.45	.52	50–52 percent Mn	----------	$0.65
South African, 50–52 percent Mn	.49	.55	45–47 percent Mn	$0.59	.55

CONSUMPTION OF MANGANIFEROUS RAW MATERIALS

The following table shows the indicated consumption of manganiferous raw materials in the United States in 1940. The table does not consider differences in consumers' stocks at the beginning and end of the year. As such stocks are largely imported ore and the import figures used in the table are those for imports for consumption only, it is believed that the change in stocks was not great. Imported manganese ore usually is kept in bond until withdrawn for consumption, when the duty is paid and the ore is reported as imports for consumption.

Indicated consumption of manganiferous raw materials in the United States in 1940

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Long tons	Mn content (percent)	Long tons	Mn content (percent)	Long tons	Mn content (percent)
Domestic shipments	40,123	45	474,461	14	816,541	7.3
Imports for consumption	1,282,079	48	38,883	28	[1] 12,428	6.5
Total available for consumption	1,322,202	48	513,344	15	828,969	7.3

[1] Estimated.

Besides the material shown in the foregoing table, 737,400 long tons of domestic ore containing 2 to 5 percent Mn were used in 1940, presumably in the manufacture of manganiferous pig iron, compared with 652,900 tons in 1939 and 358,200 in 1938. Figures for imports of ore of this class are not available.

METALLURGICAL INDUSTRY

Although some manganese is used in both the ferrous and nonferrous metallurgical industries, the bulk is consumed in the manufacture of iron and steel. Most of the ore entering this industry is used in the manufacture of ferromanganese and spiegeleisen, the forms in which manganese usually is added to steel.

Ferromanganese.—The domestic output of ferromanganese in 1940, which increased 70 percent over 1939, was produced at the following plants:

Bethlehem Steel Co., Johnstown, Pa.
Carnegie-Illinois Steel Corporation, Etna and Duquesne, Pa.
Colorado Fuel & Iron Corporation, Pueblo, Colo.
Electro Metallurgical Co., Alloy, W. Va.
Jones & Laughlin Steel Corporation, Aliquippa, Pa.
E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.
Tennessee Products Corporation, Rockdale, Tenn.

Chief manganese alloys imported into and made from domestic and imported ores in the United States, 1939–40, in long tons

[1] Estimated.
[2] Less than 0.01 percent.

In addition to the above plants, shipments were made by the Pittsburgh Metallurgical Co., Niagara Falls, N. Y.

The larger part of the ferromanganese produced in this country is made from foreign ores, as shown in the following table:

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1936–40

Year	Ferromanganese produced			Materials consumed (long tons)				Manganese ore used per ton of ferromanganese made (long tons)
	Long tons	Manganese contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	Cinder, scale, and purchase scrap	
		Percent	Long tons	Foreign	Domestic			
1936	316,000	79.09	249,933	595,114	5,987	12,467	2,821	1.902
1937	376,443	79.54	299,425	698,052	9,444	17,511	6,017	1.879

Cuba	32,317	60,012	36,295	58,999	100,767
India	105,289	62,199	55,965	86,309	167,928
Philippine Islands					11,400
U. S. S. R.	171,501	313,305	107,720	169,311	167,220
Undistributed					41,522
	595,114	698,052	416,738	502,986	871,725

Shipments of ferromanganese in 1940 increased 51 percent over 1939. The record of shipments during the past 5 years is as follows:

Ferromanganese shipped from furnaces in the United States, 1936–40

Year	Long tons	Value	Year	Long tons	Value
1936	322,353	$24,088,298	1939	296,631	$24,137,211
1937	359,842	30,696,748	1940	449,367	42,755,485
1938	223,720	19,144,884			

There was such a decrease in imports of ferromanganese and such a rise in exports during 1940 that the latter exceeded the former. Ferromanganese imported for consumption in 1940 included 1,409 long tons containing not over 1 percent carbon, 7,254 tons containing over 1 and less than 4 percent carbon, and 1,706 tons containing not less than 4 percent carbon.

Ferromanganese imported into and exported from the United States, 1936–40

Year	Imports for consumption			Exports [1]	
	Gross weight (long tons)	Mn content (long tons)	Value	Gross weight (long tons)	Value
1936	37,953	30,594	$2,251,951	466	$26,540
1937	29,559	23,888	2,163,616	1,725	72,502
1938	26,258	21,118	1,770,948	247	18,799
1939	41,227	33,414	2,935,214	2,923	247,798
1940	10,369	8,573	1,321,369	13,036	1,366,087

[1] Includes spiegeleisen; not separately classified.

Norway supplied virtually all of the imports in 1940. Distribution of imports, by countries, is shown in the following table.

Ferromanganese imported for consumption in the United States, 1939–40, by countries

Country	1939		1940	
	Mn content (long tons)	Value	Mn content (long tons)	Value
Canada	(1)	$50		
Czechoslovakia	2,050	162,091

[1] Less than 1 ton.
[2] For statistical purposes, trade with the Sudeten area, as far as ascertainable, is included with Germany, while trade with the other Czechoslovak Provinces occupied by Germany and Poland has been included with these countries since March 18 or 19, 1939. After November 16, 1939, trade with Danzig and that part of Poland occupied by Germany has been included with Germany.

Customs districts through which imported ferromanganese entered in 1939 and 1940 are as follows:

Manganese content of ferromanganese imported for consumption in the United States, 1939–40, by customs districts, in long tons

Customs district	1939	1940	Customs district	1939	1940
Buffalo	892	992	New York	934	529
Chicago	3,434		Ohio	2,497	
Connecticut	362		Oregon	249	38
Galveston	425		Philadelphia	2,773	
Los Angeles	257	79	San Francisco	296	
Maryland	18,079	6,731	Washington (State)	118	47
Massachusetts	243				
Michigan	1,773			33,414	8,573
New Orleans	1,082	157			

Stocks of ferromanganese in bonded warehouses at the end of 1940 were 1,514 long tons containing 754 tons of Mn compared with 4,253 tons containing 3,603 tons of Mn at the end of 1939.

The quoted price of ferromanganese increased $20 a long ton in July 1940, as shown in the following table.

Prices per long ton of ferromanganese in the United States, 1938–40 [1]

[80 percent—delivered at Pittsburgh]

Month	1938	1939	1940	Month	1938	1939	1940

[1] Steel, vol. 108, January 6, 1941.

Spiegeleisen.—Shipments of spiegeleisen in 1940 increased 26 percent over 1939 and 328 percent over 1938.

Spiegeleisen produced and shipped in the United States, 1936–40

Year	Produced (long tons)	Shipped from furnaces		Year	Produced (long tons)	Shipped from furnaces	
		Long tons	Value			Long tons	Value
1936	95,137	92,336	$2,249,217	1939	91,491	84,739	$2,484,042
1937	(1)	134,983	3,969,822	1940	101,892	106,707	3,487,565
1938	11,311	24,939	728,830				

1 Bureau of Mines not at liberty to publish figures.

Spiegeleisen was manufactured at the following plants in 1940:

Carnegie-Illinois Steel Corporation, Duquesne, Pa.
E. J. Lavino & Co., Reusens, Va.
New Jersey Zinc Co., Palmerton, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

Most of the spiegeleisen produced in the United States in recent years has been made from domestic raw materials, but 33 long tons of Cuban ore containing 50.2 percent Mn were consumed in 1940 in the manufacture of spiegeleisen. Imports of spiegeleisen for consumption in 1940 decreased 59 percent compared with 1939. The total supply came from Canada.

Spiegeleisen imported for consumption in the United States, 1936–40

Year	Long tons	Value	Year	Long tons	Value
1936	52,011	$1,404,983	1939	38,264	$1,329,814
1937	16,841	589,766	1940	15,585	638,732
1938	17,248	625,480			

The prices of spiegeleisen (20 percent) at producers' furnaces as quoted by Steel increased $4 a long ton in mid-year to $36.00 a ton.

Manganiferous pig iron.—Precise data on the consumption of manganiferous ores in the production of manganiferous pig iron are not available; however, 816,541 long tons of domestic ore containing 5 to 10 percent Mn and 737,400 tons containing 2 to 5 percent Mn were shipped in 1940. Foreign manganiferous iron ore (12,428 tons) also was consumed in the manufacture of pig iron.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1938–40, in long tons

Source of ore	Ferruginous manganese ore			Manganiferous iron ore

Nonferrous manganese alloys.—Production of manganese metal by the electrolytic process developed and patented by the Bureau of Mines was begun late in 1939 at a small commercial plant in Knoxville, Tenn., by the Electro Manganese Corporation of Minneapolis, Minn. Production to the end of 1940 is estimated at 225 metric tons of 99.9+ percent manganese metal, all of which was consumed in nonferrous alloys.[17] The electrolytic process was described by Shelton [18] and Dean.[19]

BATTERY INDUSTRY

Shipments of manganese ore to battery makers by domestic producers in 1940 totaled 9,271 long tons, all from Montana. Imports for consumption of battery-grade ore were 27,405 long tons containing 15,158 tons of manganese.

MISCELLANEOUS INDUSTRIES

The chemical, pottery, and glass industries utilize ores containing about 85 percent MnO_2 and not more than 1 percent iron.

WORLD PRODUCTION

Brazil.—Production of manganese ore in Brazil was at a higher rate in 1940 (especially in the latter half of the year) than in 1939. Exports totaled 217,342 metric tons in 1940 compared with 192,077 tons in 1939 (the low was 2,337 tons in 1934 and the high 541,519 tons in 1917). Nearly all of the 1940 exports went to the United States. Stocks on hand in Rio de Janeiro on December 31, 1940, were 68,212 metric tons compared with 44,275 tons at the end of 1939.

Chile.—During 1940, Chile exported 19,518 metric tons of manganese ore; 19,308 tons went to the United States and 210 tons to the Netherlands.

Cuba.—Exports of manganese ore from Cuba to the United States in 1940 were 132,745 metric tons—23 percent more than in 1939 and less than 1 percent below the record of 1938. All the manganese ore from Cuba is mined in the Province of Oriente, and the principal producer is the Cuban-American Manganese Corporation, operating at Cristo near Santiago.

Gold Coast.—Exports of manganese ore during the first 4 months of 1940 are estimated at 190,000 tons.

Japan.—In 1940 the discovery was announced of deposits estimated to contain 10,000,000 tons of manganese ore at Hsihsien, Chinchow Province, Manchukuo.

Philippine Islands.—Exports of manganese ore averaging 45 to 50 percent Mn totaled 58,038 metric tons in 1940—a 61-percent gain over 1939 and an 18-percent gain over 1938. In 1940 the proportion of exports of manganese ore to the United States rose to 89 percent compared with 32 percent in 1939 and those to Japan dropped to 10 percent from 65 percent in the earlier year. The economics of Philippine manganese was discussed by Boericke.[20]

[1] In addition to countries listed, Belgium and Spain produce manganese ore, but data of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

[2] Data not available.

[3] Shipments by rail and river.

[4] Estimate included in total.

CHROMITE

By Robert H. Ridgway and N. B. Melcher

SUMMARY OUTLINE

Greatly increased steel production resulting from war conditions abroad created unusual demands for chromite in 1940. Although the effect of this higher demand was offset somewhat by the scarcity of ship bottoms and high ocean-freight and war-risk-insurance rates, the world output of chromite may have exceeded the 1937 peak.

The strategic nature of chromite was emphasized during 1940. Germany acquired the smelting facilities of France and Norway and a considerable stock of chromite, but no producing area was occupied. Despite these acquisitions, it is believed that the Axis Powers were short of this valuable raw material. England, on the other hand, bought the entire Turkish output, contracted for a substantial tonnage of Greek ore, and deflected much of the Yugoslav output to friendly channels. These achievements plus dominance of the seas, gave England virtual control of chromite supplies.

Although a number of the principal consuming countries, notably Germany, France, and Norway, were unable to procure chromite during all or part of the year, movement to other important consuming nations increased appreciably. Thus, imports into the United States doubled the 1939 figure in 1940, and were greater than in any other year. This heavy movement into the United States was prompted by a program initiated by the Government and industry to increase stocks as insurance against a more stringent shipping situation. At the end of the year all ore offered was being moved as rapidly as ships were available.

Aside from the enlarged domestic demand for products made from chromite, in connection with this country's defense efforts, there was a heavy demand for chromium alloys and chemicals in export trade. This obtained for two reasons: (1) Necessity of supplying Britain with ferro-alloys, particularly after the fall of Norway, and (2) efforts to supply chromium chemicals to Latin American and British Empire countries that formerly had obtained supplies from the European Continent, principally Germany. The actual outbound movement, however, was restricted somewhat by export licensing the latter part of the year. All these factors lifted the demand for chromite during the closing months of 1940 to an annual rate of over 600,000 tons—somewhat less than the total imports for the year.

Higher prices accompanied the greater demand but were related mostly to increased transportation costs and did not revert to the producers.

Unsettled world conditions and higher prices continued to focus attention on the development of domestic production. Although output was small (less than 3,000 tons), known deposits and promising areas were being examined by private concerns and Government agencies. Alaska, California, Oregon, Montana, Washington, and Wyoming were the scene of much of this activity. So far, however, with the exception of Alaska, exploration has revealed no extensive deposits of high-grade metallurgical ore but has developed deposits suitable for the refractory and chemical industries. The largest output in 1940 came from California, where the principal producer was the Pilliken mine in El Dorado County.

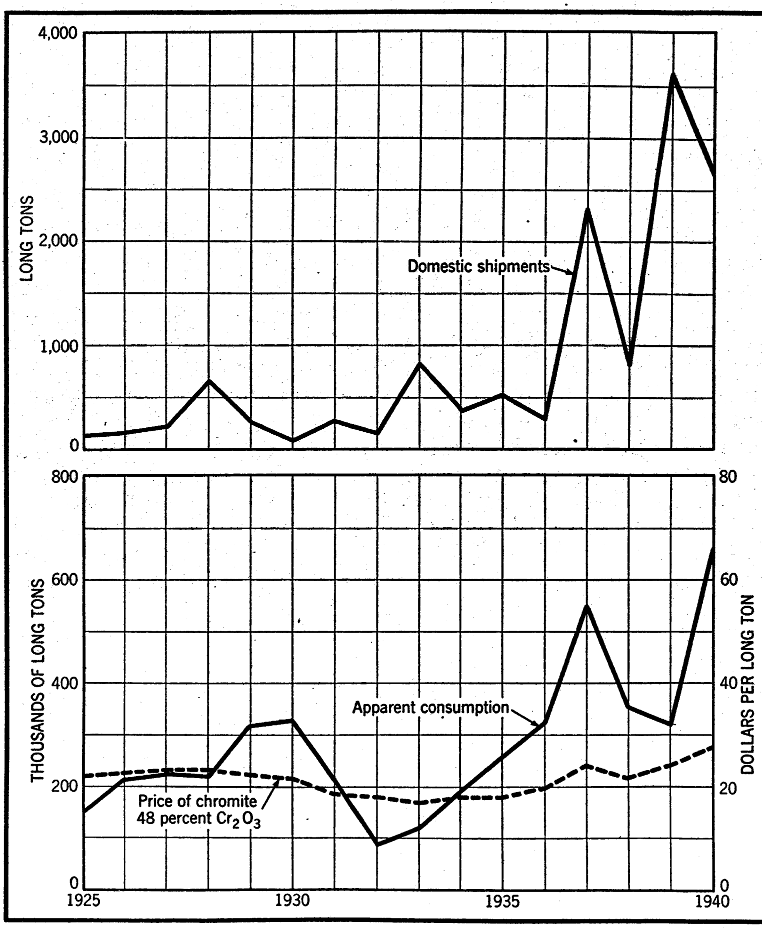

FIGURE 1.—Trends in shipments, domestic prices, and consumption of chromite, 1925–40.

Figure 1 shows trends in domestic shipments, consumption, and prices, during the past 16 years.

The following table compares the salient statistics of the chromite industry during the last 5 years with the yearly average from 1925 to 1929.

Salient statistics of the chromite industry in the United States, 1925–29 (average) and 1936–40

	1925–29 (average)	1936	1937	1938	1939	1940

[1] Originated in Southern Rhodesia and Union of South Africa.
[2] Data not available.

Emergency stock pile.—Purchases under the Strategic Materials Act (Public, No. 117, 76th Cong., ch. 190, 1st sess.) continued during 1940. Purchases were restricted largely to the high-priority mineral commodities on the strategic list. Chromite is one of the four mineral commodities comprising the first priority class for stock-pile reserves. Its importance is appreciated more readily when it is realized that the steel industry is charged with three-fourths of the domestic consumption.

The following specifications were drawn for high-grade metallurgical lump ore:

Cr_2O_3 (minimum)	48 percent
Fe (maximum)	⅓ of Cr content
S (maximum)	0.50 percent
P (maximum)	0.20 percent

The specifications also provided that all lumps shall pass a 6-inch screen and that not more than 10 percent shall pass a ½-inch sieve.

On October 31, 1940, the specification on metallurgical lump ore was reduced to 45 percent Cr_2O_3.

During 1940 the Procurement Division of the Treasury Department awarded contracts for the purchase of chrome ore totaling 97,200 gross tons. Deliveries under these contracts totaled 57,254 gross tons during the year. The following table shows contracts and deliveries, by countries, during 1940 in gross tons:

Source:	*Contract quantity*	*Delivery, 1940*
Rhodesia	62,000	29,794
Turkey	28,700	27,460
New Caledonia	6,500	None

Purchases to December 31, 1940, by this agency totaled 182,200 long tons, of which 78,350 tons have been delivered. All chromite delivered is of foreign origin; the contract for ore from Kenai Peninsula, Alaska, was canceled because of nondelivery.

Purchases of refractory and chemical grades of chromite were inaugurated late in the year by the Metals Reserve Co. upon recommendation of the Advisory Commission to the Council of National Defense; 200,000 tons (100,000 tons of refractory from the Philippine Islands and 100,000 tons of chemical from the Union of South Africa) have been purchased, but movement to this country has been delayed by shortage of bottoms.

Government exploration.—Under section 7 of the Strategic Materials Act the Geological Survey and the Bureau of Mines undertook to search for and appraise ore deposits containing metals that have been designated as strategic by the Secretaries of War, Navy, and the Interior upon advice of the Army and Navy Munitions Board. The bill authorized the expenditure of $500,000 a year—$350,000 by the Bureau of Mines and $150,000 by the Geological Survey—for each of the four fiscal years ending June 30, 1940, 1941, 1942, and 1943. The two Bureaus are cooperating closely in order to facilitate accomplishment of the objectives of the act.

The Bureau of Mines, in carrying out its part[1] of the program, seeks to determine (1) the extent and quality of the ore, (2) the most suitable method of mining and beneficiating it, and (3) the cost at which it may be produced.

Chromite deposits in Stillwater County, Mont., which Bureau of Mines surface exploration by trenching and large-scale sampling during 1939 had demonstrated to be extensive, were diamond-drilled during 1940. Although the drilling campaign had to be recessed before its completion because of weather conditions, enough work was done on one group of claims to indicate that the continuity, size, and grade of the deposit down the dip were of the same order as along the strike and that over 1 million tons of ores in workable widths could be estimated to a depth of 300 feet below the outcrop; this depth was the maximum reached by the drilling.

Drilling on another group of claims at high altitude had to be discontinued on account of extreme weather conditions before the downward extension of ore uncovered at surface during 1939 was reached.

Chromite deposits in Siskiyou, Shasta, and Eldorado Counties, Calif., and Chester and Lancaster Counties, Pa., were examined and plans formulated for conducting exploratory projects during 1941 on deposits in Siskiyou and Shasta Counties, Calif., and in Pennsylvania.

The following reports were published by the Geological Survey during 1940 on field work in connection with the strategic minerals investigation:

PEOPLES, J. W., AND HOWLAND, A. L. Chromite Deposits of the Eastern part of the Stillwater Complex, Stillwater County, Mont.
RYNEARSON, G. A., AND SMITH, C. T. Chromite Deposits in the Seiad Quadrangle, Siskiyou County, Calif.
THAYER, T. P. Chromite Deposits of Grant County, Oreg. (a preliminary report).
WELLS, F. G., PAGE, L. R., AND JAMES, H. L. Chromite Deposits of the Pilliken Area, Eldorado County, Calif.
————. Chromite Deposits in the Sourdough Area, Curry County, and the Briggs Creek Area, Josephine County, Oreg.

In line with meeting domestic chromium requirements, investigations of methods for the recovery of chromium from domestic ores have been stressed by the Metallurgical Division of the Bureau of Mines during 1940.[2]

[1] Finch, John W., Strategic Minerals Investigations—Procedure Followed by the Bureau of Mines: Bureau of Mines Inf. Circ. 7097, 1939, pp. 1–5.
[2] Dean, R. S., Progress Reports—Metallurgical Division, 42. Annual Report of the Metallurgical Division Fiscal Year 1940: Bureau of Mines Rept. of Investigations 3547, 1941, pp. 23–25.

To expedite solution of the chromium problem, several methods of attack were followed: (1) Electrolysis in fused baths, (2) electrolysis in aqueous baths, (3) matte smelting, and (4) electrothermal smelting.

Electrolysis of chromium metal from molten baths offered no practical solution. Chromium metal and ferrochromium metal could be formed in a powder, which was difficult to handle. The consumption of energy was about 15 kilowatt-hours per pound of metal. This method was soon abandoned.

Studies of the chromium-iron-sodium-sulfur system were made to determine whether separations similar to those of the Orford nickel process would occur. It was concluded, however, that no Orford-type separations were possible and that no appreciable concentration of chromium could be realized in either the metal or matte layers.

The electrothermal smelting process gives good indication of success and could be used on off-grade domestic chrome ores in times of emergency.

The production of Electrolytic chromium from an aqueous solution of trivalent salts has been the subject of an intensive research campaign. This technique requires only half the energy used for ordinary chromic acid baths.

The electrolysis of chromic sulfate solutions, using insoluble anodes, has been worked out to a point that permits the announcement of laboratory-scale production of electrolytic chromium from trivalent chromium salts at efficiencies of current as high as 63 percent. It is believed that a 45-percent efficiency of current could be obtained in operation on a commercial scale.

DOMESTIC PRODUCTION

Domestic production, as measured by shipments from the mines, decreased to 2,662 long tons in 1940 from 3,614 tons in 1939. Except for a small quantity from Oregon, the entire output was from California. The bulk of the chromite came from the Pilliken mine, where operations during 1940 were conducted by the Rustless Mining Co. The concentrates, all of which were shipped for consumption, contained about 43 percent Cr_2O_3, 22 percent FeO, and 6 percent SiO_2. When the Rustless Mining Co. took over the Pilliken mine on November 1, 1939, it immediately dismantled the mill to install new equipment; plans for increased production have been delayed pending development of new mill practice. Much smaller shipments came from Fresno, Del Norte, Placer, Plumas, Siskiyou, and Shasta Counties, Calif., and from Grant County, Oreg.

The Oregon Department of Geology and Mineral Industries has been studying the commercial possibilities of the chrome content of the black sands along the coast line of southern Oregon. These sands have long attracted miners and investors, usually with little success, but may eventually be developed commercially as a source of chromite.[3] However, this work has not advanced beyond the experimental stage, and no statements as to future production can be made.

[3] Nixon, Earl K., Chromite Recovery from Black Sands May Prove Commercial: Min. World, vol. 4, No. 4, April 1940, p. 22.

Chromite (ores and concentrates) shipped from mines in the United States, 1936–40

[All from California in 1936 and 1938]

Year	Ore containing 45 percent or more chromic oxide		Ore containing 35 to 45 percent chromic oxide		Total	
	Long tons	Value	Long tons	Value	Long tons	Value
1936	(1)	(1)	[1] 269	[1] $2,978	269	$2,978

[1] Ore containing 45 percent or more chromic oxide included with ore containing 35 to 45 percent.
[2] Includes 288 long tons of ore valued at $880 shipped from mines in Oregon, a small part of which contained 35 to 45 percent chromic oxide.
[3] A small quantity of ore containing 35 to 45 percent chromic oxide included with ore containing 45 percent or more.
[4] Includes a small quantity of ore containing less than 35 percent chromic oxide from California in 1937 and from Oregon in 1940.
[5] Included in total value: Bureau of Mines not at liberty to publish figures separately.
[6] Includes 100 tons of ore from Oregon.

IMPORTS [4]

Imports of chromite in 1940 increased 107 percent from the 1939 total and 19 percent from the previous record year of 1937. Substantial improvement in business conditions and the national defense program created a heavy demand for imports of chromite, which was offset by high shipping and ocean freight rates and scarcity of ship bottoms. The chromite imported in 1940 contained on an average 46 percent Cr_2O_3—a 10-percent increase over 1939, due to larger receipts from Africa; its chromite, particularly that from Rhodesia, is high-grade. Of the principal imports in 1940, those from New Caledonia had the highest content of chromic oxide (53 percent) and those from Cuba the lowest (33 percent). All countries showed a substantial increase in shipments except Cuba, which showed a slight decrease.

Crude chromite imported into the United States, 1936–40, by countries

1 60 pounds.
2 1,020 pounds.
3 1,000 pounds.

CONSUMPTION

Owing to lack of published data on consumers' stocks, statistics on actual consumption of chromite in the United States in 1940 cannot be given. However, toward the end of 1940 consumers were using chromite at a rate approaching 600,000 tons per annum. The apparent available supply increased in 1940 in comparison with 1939 because imports were higher even after movement into the Government stock pile was deducted.

Domestic sales, imports, and apparent available supply of crude chromite in the United States, 1936–40 in long tons

Year	Sales from domestic mines	Imports	Apparent available supply	Year	Sales from domestic mines	Imports	Apparent available supply
1936	269	324,258	324,527	1939	3,614	317,511	321,125
1937	2,321	553,916	556,237	1940	2,662	657,689	660,351
1938	812	352,085	352,897				

The steel industry consumes more than three-fourths of the supply of chromite either in refractories or as a source of an important alloying element. The improvement in the steel industry during the entire year increased the demand for chromite and resulted in a rise in price. The domestic automobile industry—one of the important users of alloy steel and chromium plating—expanded its output from 3,577,058 units in 1939 to 4,469,354 in 1940. The construction industry uses stainless steel for decorative purposes and large quantities of chromium-plated plumbing fixtures. Activity in this field, which has been increasing since 1933, improved over 1939 but was only about three-fourths of the average volume of the peak years 1926 to 1929, inclusive.

USES

Industrial uses of chromite fall into three groups—metallurgical, refractory, and chemical.

Metallurgical.—Chromium is one of the principal elements used in the manufacture of alloy steel. For this purpose most of the chromite is converted into ferrochromium in the electric furnace before it is added to the steel bath, although one domestic concern makes chromium-alloy steels in the electric furnace directly from alloy-steel scrap, mild-steel scrap, and chromite. Standard grades of ferrochromium contain 60 to 70 percent chromium, and a lower content generally is not acceptable. Ferrochromium is made in two grades, depending on the carbon content; the high-carbon grade contains 4 to 6 percent carbon, while the low-carbon grade contains less than 2 percent. High carbon ferrochromium is made by smelting chromite in a single-phase electric furnace with coke as a reducing agent. Recovery is approximately 65 percent.[5] Low-carbon grades are produced by smelting the high-carbon alloy with SiO_2 and coke to produce a ferro-chrome-silicon low in carbon, which is then smelted in a Heroult-type furnace. Ores containing 48 to 50 percent Cr_2O_3 and as little iron as possible are required in this process; the chromium-iron ratio should be at least 3:1 as, if the ratio is less, the melt will not yield a 60- to 70-percent chromium content in the ferro even if the ore contains as much as 50 percent Cr_2O_3.

Although chromium is used in many alloy steels, its largest and best-known use is in the manufacture of stainless steels. Increasing quantities are being used also in the field of low-alloy, high-strength steels, where chromium imparts strength and adds to corrosion resistance. In recent years chromium plating has had a wide field of uses and become important industrially, but the amount of raw material consumed is small owing to the thinness of the layer of metal deposited. The nature of hard-chromium deposits and the many uses for hard-chromium plating, including files, gages, bearing surfaces, cutting tools, and molds, have been described by Goodsell.[6]

Refractory.—Chromite with certain physical and chemical properties is used for refractories. Lump and ground chromite and chromite cements are used in bricks and in building and patching furnaces. The possible use of chromite in open-hearth roofs continued to attract attention in 1940.

During 1940 domestic trade-journal quotations for chromite brick rose from $47 to $50 a short ton at producers' plants.

Chemical.—In addition to the chromite used in the manufacture of chromic acid for electroplating, considerable chromite is consumed in chemicals employed principally in the dyeing, tanning, and pigment industries. In recent years increasing quantities of chromium chemicals have also been used in pickling solutions in the nonferrous-metals industry.

The entire domestic production of chromium chemicals, made by only five companies, is from foreign ores. The results of a study conducted by the Federal Bureau of Mines and the State College of Washington of methods for producing chromates and dichromates

from domestic ores and estimates of the economic possibilities of the methods have been given by Doerner [7] and others.

PRICES

Prices of chromite quoted in the domestic trade journals cover imported ore and are given in dollars per long ton, c. i. f. North Atlantic ports. The quotations are largely nominal, and the market was strong at the beginning of 1940. During the year the continued rise in steel operations increased the demand for chromite; and although imports reached an unprecedented high, the price of chromite moved upward. Shortage of ship bottoms during the latter part of 1940 tended to increase prices but was offset somewhat by the knowledge that industry stocks were abnormally large. According to Engineering and Mining Journal Metal and Mineral Markets, chromite containing 48 percent Cr_2O_3 opened the year at $26 to $28 a gross ton. In December the quotation rose to $28 to $30 a gross ton.

WORLD PRODUCTION AND TRADE

Complete data are not yet available on world output of chromite in 1940. The large increase of imports into the United States indicates a probable increase over 1939 in world production. Available data indicate that, excluding the U. S. S. R., the largest producer in 1940 was Turkey, followed by Southern Rhodesia and the Union of South Africa.

World production of crude chromite, 1936–40, by countries, in metric tons [1]

[1] In addition to countries listed, chromite mining was reported in Albania in 1938; no production figures are available.
[2] Data not yet available.
[3] Imports into the United States.
[4] Estimate included in total.

Except for the U. S. S. R., the principal producing countries consume only small quantities of chromite, and the major consuming countries

[7] Doerner, H. A., and others, A Study of the Methods for Producing Chromate Salts from Domestic Ores: State College of Washington Bull. 5, 1939, pp. 1-51.

produce only a small fraction of their requirements. Most of the chromite output thus enters international trade. Turkey, Southern Rhodesia, and the Union of South Africa were the principal exporters in 1940.

Figures on imports of chromite into consuming countries are not yet complete. The United States is by far the outstanding importing country.

A brief summary of the activities in the principal chromite producing and consuming countries follows:

Albania.—It was reported during 1940 that the tonnage of chrome ore so far discovered in Albania amounts to 500,000 metric tons and that further prospecting is giving good results. The ore is said to contain 50 percent Cr_2O_3; consequently, enough chrome ore has already been discovered to satisfy Italy's present annual consumption of 20,000 to 25,000 tons for several years. The deposits are being developed by the Azienda Minerali Metallici Italiani (Italian Metallic Minerals Concern), of Rome. The first shipment of 1,000 metric tons of chromite from Albania reached Genoa April 10, 1940.

Canada.—Chromite production in Canada is small and is confined to the Thetford-Black Lake area in the Eastern Township of Quebec. No information is available on output in 1940. It was reported that what is believed to be an important discovery of chrome iron ore was made recently on Fox Island by two prospectors employed by the Newfoundland Government.

Cuba.—The entire Cuban production is shipped to the United States; imports into the United States from Cuba in 1940 were 52,789 metric tons compared with 67,061 in 1939. Cuban ores have a low content of Cr_2O_3 and are used in the refractory industry.

Germany.—Germany does not produce chromite. A large share of its chromite (62 percent in 1939) has been imported from Turkey. Under terms of a new trade agreement with Turkey concluded on July 25, 1940, one of the most important products to be shipped to Germany was chromite. Many sources of large quantities of chromite were cut off from Germany during 1940, including Greece, the Union of South Africa, and the British Mediterranean. The extent to which these supplies are being replaced by those from Russia is not known.

Greece.—Deposits of chrome ore in Greece are small in extent but cover a wide area; some of the ore is of high grade. The principal mines are the Donokos northwest of Lamia and that at Tsagli west of Volos.

India.—The State of Mysore is one of the principal sources of Indian chromite and contributes nearly 50 percent of the total production and export. Virtually all of the output is exported—15,000 to 30,000 long tons annually. Export licenses have been required on chromite shipped from India since September 1939.

Italy.—No chromite has been producedin Italy, and imports are not shown in the official statistics. The first shipment of 1,000 metric tons of chromite from Albania reached Genoa on April 10, 1940.

New Caledonia.—Exports of chromite from New Caledonia in 1940 were 66,382 metric tons compared with 39,394 in 1939. A large part of the New Caledonia ore comes from two mines—the Tiebaghi operated by British interests and the Fantouche operated by American interests. New Caledonia ores are high-grade, the Tiebaghi ore running 55 to 56 percent Cr_2O_3. An armament tax on the export of chromite amounting to 12½ percent of the official valuation was established November 1, 1939, for a period of 2 years.

Norway.—Imports of chromite into Norway in 1940 were heavy during the first 3 months, when 12,646 metric tons were received. Only 19,579 metric tons were imported during all of 1939. No information is available regarding imports of chromite after March 1940.

Philippine Islands.—The largest deposit of chrome ore in the Philippines is that of Consolidated Mines at Masinloc, Zambales. The property, which is managed by Benguet Consolidated Mining Co., was discovered in 1933 and is estimated to contain 10,000,000 tons of ore. It has been developed to handle 1,000 tons a day. Production was begun in 1937; in 1940, 79,450 tons valued at 972,226 pesos were shipped. The chromite is low-grade (about 34 percent Cr_2O_3) and is used principally for refractories. Shipments move to the United States.

The Acoje Mining Co. started shipments from its property at Santa Cruz, Zambales Province, in 1937 and in 1940 production was 67,784 tons valued at 1,069,855 pesos. Ore reserves are estimated at 150,000 tons of 48- to 51-percent Cr_2O_3 ore.

Development work of the Tagobomar Development Co., Inc., property on Dinagat Island, a little north of Mindanao, was begun in 1938. Production in 1940 was 1,239 tons valued at 20,726 pesos. Ore reserves are said to be low.

The Zambales Chromite Mining Co., under the management of the Union Management Co., is at Santa Cruz, Zambales. Development work was begun in 1936, and shipments were commenced in 1939. Production for 1940 was 15,243 tons valued at 216,072 pesos. The ore is high-grade (about 49 percent Cr_2O_3), and ore reserves are reported at 100,000 tons.

Dinagat Mines, Inc., produced 5,859 tons in 1940 valued at 86,540 pesos, and Filipinas Mines Corporation produced 18,377 tons valued at 285,112 pesos.

Southern Rhodesia.—Export of chromite from Southern Rhodesia decreased in 1939 to 107,708 metric tons from 204,905 tons in 1938. The output of chromite in Southern Rhodesia comes from two districts—deposits in the Selukwe district and the Great Dike seams extending north from Darwendale approximately 70 miles. The Rhodesian Corporation owns the chrome-ore deposit of the Selukwe district, with a current production of approximately 300,000 tons per annum. Chrome Producers (Rhodesia), Ltd., is an association of five leading independent producers of chromite in Southern Rhodesia which obtains its supply from the Great Dike seams. The output of Chrome Producers is said to be of the metallurgical grade required—3 parts chrome to 1 part iron. The concern guarantees the minimum of 48 percent Cr_2O_3, although at times the chrome content rises as high as 51 percent, with an FeO content around 14 percent. Production from the independent producers is limited to about 1,000 tons a month because of labor-supply difficulties.

Turkey.—Exports from Turkey during 1940 were 110,037 metric tons compared with 192,842 tons in 1939.

Upon request of the Turkish Ministry of Finance, the Council of Ministers on July 4, 1940, approved a decree whereby the sum of

300,000 Turkish pounds allotted to the Eti Bank by decree effective May 20, 1940, to be used in facilitating the sale and export of chromite produced in the country, is increased to 1,000,000 pounds to enable the bank to extend its administration of the production and export of chromite under present war conditions.

Union of South Africa.—Production of chromite in the Union of South Africa in 1940 was 163,646 metric tons; in 1939 production was 160,014 tons. Exports were 107,658 metric tons in 1940 compared with 169,037 tons in 1939.

The monthly production of chromite concentrates (averaging 50 to 53 percent Cr_2O_3) in the Union of South Africa has increased from 5,000 to 10,000 long tons. The African Mining & Trust Co., Ltd., is the only producer and works through its subsidiary company, The Ore & Metal Co., Ltd. The company is said to own large chromite deposits and could greatly increase production provided the necessary machinery could be obtained.

U. S. S. R.—The U. S. S. R. is one of the largest producers of chromite, but data on output are not available for recent years.

United Kingdom.—Imports of chromite into the United Kingdom in 1939 were 51,432 metric tons, of which 74 percent came from countries of the British Empire; no data are available for 1940. The imports are used in the chemical and refractory industries, as no ferrochrome is made in the United Kingdom. Imports of ferrochromium, largely from Norway and Sweden, were 14,953 tons in 1939 compared with 10,654 tons in 1938.

Yugoslavia.—Data on 1940 production of chromite in Yugoslavia are not yet available. New chromite deposits were reported located west of Skoplje during 1940.

NICKEL AND COBALT

By H. W. Davis [1]

SUMMARY OUTLINE

NICKEL

A greater volume of nickel was produced and sold in 1940 than in any previous year, chiefly as a result of marked increases in consumption in the British Empire and the United States. The consumption of nickel during 1940, including that for war and defense requirements, was well-distributed among the principal consuming industries—steel and nonferrous mills; iron, steel, and nonferrous foundries; manufacture of alloys; and electroplating and chemical industries. Steel mills, which took more than half of the deliveries of nickel in 1940, absorbed a larger proportion of the total than in 1939 because of British war requirements and the United States defense program. However, foundries and copper and brass mills consumed more nickel than in 1939. To assure an adequate supply of nickel the International Nickel Co. of Canada, Ltd., installed additional facilities in Canada to enable it to refine not only the increasing output of its mines but also the

Salient statistics for nickel, 1938–40

	1938	1939	1940

[1] Figures not yet available.
[2] Excludes "All other manufactures of nickel"; weight not recorded.
[3] Excludes "Manufactures"; weight not recorded.
[4] Price quoted by International Nickel Co. of Canada, Ltd., for electrolytic nickel at New York, in 2-ton minimum lots.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

accumulated matte stock and the current matte production of Falconbridge Nickel Mines, Ltd.; and thus making this source of supply available will help to counteract that lost as a result of the invasion of Norway. Furthermore, emergency adaptation of existing equipment in the United States and alterations and extensions thereto now under way will provide for the treatment of intermediate products and furnish additional nickel during this period.

Despite the record importation of nickel in 1940, the pressure for delivery of the metal to meet not only the requirements of the defense program but for regular commercial uses resulted in frequent reports that a tight situation existed in United States supply. The situation was believed to be due partly to the disposition of some domestic consumers to acquire unnecessarily large inventories and partly to the fact that when plants employing nickel or nickel products are accelerating production the volume of nickel contained in their process inventories usually must be increased. "It is not uncommon to find in the case of metal mills, for example, that for each pound of nickel delivered out of a plant per month during such periods, 2 or even more pounds may have to be retained 'in process' in order to support the increased production." [2] To provide a statistical basis for whatever action might be deemed appropriate a comprehensive survey of the requirements and stocks of nickel of rolled and forged alloy-steel makers was undertaken on February 21, 1941, by the Bureau of Mines at the request of the Office of Production Management. On March 8, 1941, a similar survey of the requirements and stocks of nickel of nonferrous rolling mills was made by the Bureau. The survey of makers of rolled and forged alloy steel showed that they had not acquired large inventories of primary nickel but, on the contrary, had smaller stocks on January 31 and February 28, 1941, than on June 30 and December 31, 1940. However, the nickel content of "in process" inventories had increased substantially. The survey of nonferrous mills showed a similar trend. Meanwhile, because of the accelerated needs of the national defense program, the President issued a proclamation placing nickel under the export-licensing system, effective February 3, 1941. On March 7, 1941, all supplies of nickel were put under priority control by the Priorities Division of the Office of Production Management, which made it possible for the Priorities Division and the industry to facilitate the prompt flow of the metal into defense industries working on both British and Canadian orders and orders for the Army and Navy.

As usual, the domestic production of primary nickel was insignificant (554 short tons). Figures on the output of secondary nickel are not yet available for 1940; however, such production is small, averaging only 2,300 tons annually during the 5 years 1935–39. Domestic quotations for electrolytic nickel remained unchanged at 35 cents a pound throughout 1940.

Although figures are not available, Canada undoubtedly furnished a larger proportion of the world nickel supply than in 1939.

Search for commercial deposits of nickel in the United States was continued in 1940. In connection with the Strategic Materials Act, the Bureau of Mines and the Geological Survey have cooperated to investigate a number of showings of nickel, and projects have been

[2] Office of Production Management, The Current Nickel Situation: 1941, pp. 1–20.

conducted on one each in Nevada and Montana. The Nevada deposit was found to be small and the ore of low grade; the work on the Montana project is being continued. The Cobalt Gold Mining Co. reported doing 160 feet of drifting at its property near Gold Hill, Colo. The ore body was said to be about 22 feet wide and the ore to average 3 percent nickel with lesser amounts of cobalt and copper. Since July 1940 the company has been constructing a smelter with which it expects to produce a matte containing 45 to 55 percent nickel and 3 to 10 percent each cobalt and copper. The Eastern Magnesia Talc Co., Inc., reported the production of a small quantity of concentrate containing 20 percent nickel and 2 percent cobalt in 1940; none was sold, however. The concentrate is recovered at a froth-flotation plant at Johnson, Vt. The plant, which has been described in detail by Trauffer,[3] makes possible the recovery of talc formerly wasted because of the difficulty of removing magnesite, nickel, cobalt, and other impurities; about 150 pounds of nickel concentrate are recovered daily.

The recovery of nickel from nickel-containing iron ores is the subject of United States Patent 2,212,459. According to this patent,

> * * * The process * * * is particularly applicable to certain ores found in large quantities in Cuba, although it is applicable to other similar ores. The Cuban ores referred to occur in the eastern portion of that island. These deposits are of great extent and large tonnages of iron ore exist carrying from 0.05 to 1.75 percent nickel and from 0.05 to 0.2 percent cobalt. The nickel in these ores occurs as an oxide or a hydroxide, * * * The nickel is in d microscopic state of division such that very little grinding of the ore is requirea before removing the nickel. * * *

PRODUCTION

Domestic production of nickel includes only minor quantities of secondary metals recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal) and small quantities of primary metal recovered in copper refining, as listed in the following table. In addition, a small quantity of nickel concentrate was produced (but not sold) as a byproduct of talc production. Further details on the production of secondary nickel will be found in the chapter on Secondary Metals.

Nickel produced in the United States, 1936–40

Year	Primary [1]		Secondary [2]	
	Short tons	Value	Short tons	Value
1936	107	(3)	1,965	$1,375,000
1937	219	(3)	2,400	1,680,000
1938	416	(3)	2,300	1,610,000
1939	394	(3)	2,920	2,044,000
1940	554	(3)	(4)	(4)

[1] Nickel content of nickel salts and metallic nickel produced as a byproduct in the electrolytic refining of copper.
[2] Nickel recovered as metal and in nonferrous alloys and salts.
[3] Bureau of Mines not at liberty to publish value.
[4] Figures not yet available.

FOREIGN TRADE

The principal nickel imports of the United States are metallic nickel and nickel alloys, matte (containing approximately 55 percent nickel and 25 percent copper), and nickel oxide. All the oxide, 34,884,970 pounds of ore and matte, and 140,497,158 pounds of metallic nickel and alloys were obtained from Canada in 1940; the remainder (5,000 pounds) of the ore and matte came from the Philippine Islands; and the balance of the metallic nickel and alloys (562,639 pounds) was from Europe, chiefly the United Kingdom (454,551 pounds) and Norway (107,666 pounds). The matte is refined to Monel metal and other products at the plant of the International Nickel Co., Inc., Huntington, W. Va. Imports of nickel in 1940 were the largest on record.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of all classes increased substantially. The United Kingdom (12,812,624 pounds), Japan (3,655,890 pounds), Canada (1,439,665 pounds), France (1,321,647 pounds), and Italy (1,160,046 pounds) were the chief markets for nickel, Monel metal, and other alloys exported in 1940.

Nickel imported for consumption in the United States, 1938–40, by classes

Class	1938		1939		1940	
	Pounds	Value	Pounds	Value	Pounds	Value
Unmanufactured:						
Nickel ore and matte	14, 579, 441	$1, 939, 888	28, 433, 530	$3, 749, 992	34, 889, 970	$4, 705, 454

WORLD ASPECTS

World production.—Because of Government restrictions on the publication of statistics for many countries, few figures for 1940 are available; however, production during 1940 was undoubtedly the largest on record.

World production of nickel (content of ore), 1936–40, by countries, in metric tons

[Compiled by L. P. Lounsbery]

REVIEW BY COUNTRIES

Brazil.—The only deposits of nickel-bearing ore in Brazil to attract attention in recent years are those at Livramento, in the State of Minas Gerais, and those near São José de Tocantins, in the State of Goiás. The deposits at Livramento are the only ones that have been worked recently. The ore, which consists largely of garnierite, is treated in an electric furnace to produce ferronickel containing about 20 percent nickel. Ore reserves have been estimated at 4 to 10 million metric tons of 1 to 4 percent nickel. The Livramento mine has a direct railroad connection with Rio de Janeiro, a distance of 176 miles. The São José de Tocantins deposits are situated more unfavorably with respect to transportation and fuel than those at Livramento; the nearest railroad is over 200 miles away, and fuel is lacking within a reasonable distance for treating the ore. Despite these handicaps, the deposits were developed to some extent at Jacumbá by the Empreza Commercial de Goiás, S. A., which made shipments to Germany for trial purposes in 1933, 1934, and 1935. Analyses of 15 samples of ore from the deposits were reported to average 7.86 percent nickel. In 1939 the nickel mines and rights of the Empreza Commercial de Goiás, S. A., were reported to have been purchased by a Japanese organization, which had bought 10 trucks for transporting the ore to the railroad; however, no shipments are known to have been made.

Burma.—The nickel produced in Burma is derived from a nickel-bearing speiss made by the Burma Corporation, Ltd., at Namtu in the Northern Shan States. The speiss contains approximately 30 percent nickel, 8 percent copper, and 7 percent cobalt, as well as 17 ounces of silver to the ton. A new market for nickel speiss, which went to Germany before the war, has not yet been developed.[5]

Canada.—Virtually all of the Canadian output is derived from the copper-nickel ores of the Sudbury district, Ontario; and two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Although figures are not available, the output was larger in 1940 than in 1939 when 113,053 short tons were produced.

The International Nickel Co. of Canada, Ltd.,[6] operated its mines continuously, and the tonnage of ore extracted again increased substantially over 1939 when 7,273,835 short tons were produced at the Frood (4,722,563 tons), Creighton (1,298,752 tons), Levack (926,908 tons), and Garson (325,612 tons) mines. Shaft sinking was completed at the Garson mine in August 1940. The surface plant is nearly completed, and underground development is progressing rapidly. Schedules call for this new shaft and surface plant to commence producing ore late in 1941. Development work in connection with the sinking of a new underground shaft at the Creighton mine was continued, and actual shaft sinking will be started during the summer of 1941. The new crushing plant at the Frood open pit was put into service during August 1940. This plant will also crush ore from the Stobie open pit, from which production of ore is scheduled to begin by midyear 1941. A shaft will be started at the Stobie mine in 1941 to bring this large, low-grade ore body into a productive status.

[5] Brady, A. C., American Consul, Rangoon, Burma, January 20, 1941.
[6] International Nickel Co. of Canada, Ltd., Annual Report, 1940: 1941, p. 6.

Development work was carried on at a rate to conform with ore requirements. The total development advances of shafts, drifts and crosscuts, raises, winzes, and box holes was 56,609 feet, making total underground workings in all mines 835,022 feet or approximately 158 miles.

During 1940 the capacity of the concentrator was enlarged, and additional equipment was installed in the smelter. Metallurgical results were very satisfactory. Losses of metal in tailings were reduced for the tenth consecutive year. Further expansion of mill capacity is in progress. The concentrator treated 5,876,501 tons in 1939. The capacity of the nickel refineries was augmented, and the output of refined nickel in 1940 increased markedly over 1939, when 89,695 tons were produced. Sales of nickel in all forms were also greater than in 1939, when 105,097 pounds were sold.

Falconbridge Nickel Mines, Ltd.,[7] operated at a reduced rate in 1940 because of the serious disarrangement resulting from the loss of its refinery in consequence of German occupation of Norway in April. For 8 months of 1940 the ore dressing and reduction plants were operated at about two-thirds capacity. Matte formerly shipped to Norway for refining was stock-piled for a period, pending completion of new refining arrangements. Consequently, much less ore was treated in 1940 than in 1939—576,801 short tons. In January 1941 the mine and smelter output was restored to full capacity. The current production of matte as well as the accumulated stock will be refined by the International Nickel Co. of Canada, Ltd.

Cuba.—Decree 2533 of September 6, 1940, grants exemption from municipal taxes for 5 years to the Nicaro Nickel Co. for establishment of a nickel-refining industry in Mayari, Oriente Province.[8] A process particularly applicable to certain nickel-containing iron ores found in large quantities in Cuba is the subject of United States Patent 2,212,459.

Finland.—The Undersecretary to the Ministry of Economic Warfare stated on November 19, 1940, that the nickel mine at Petsamo was being kept under careful observation, that the mine was not producing, and that there was no reason to believe that any Finnish nickel has been reaching Germany.[9] Before the invasion of Finland in November 1939 the indications were that the mine would begin to produce not later than the early months of 1941.

Italy.—In recent years Italy has purchased nickel chiefly from Norway, which has been unable to make adequate deliveries because of the invasion. Consequently, Italy has had difficulty in obtaining adequate supplies of nickel. To help supply the country's needs of metal for war purposes the Italian Government withdrew from circulation nickel coins of lire 1.00 and lire 2.00, which resulted in the recovery of about 1,600 metric tons of nickel. The withdrawal from circulation of 20- and 50-centesimi coins is expected to yield about 2,900 tons of nickel.

Japan.—Like Italy, Japan experienced difficulty in procuring adequate supplies of nickel, and efforts were made to use substitutes wherever possible; meanwhile, Japanese producers attempted to increase their output, and the Government endeavored to stop

[7] Falconbridge Nickel Mines, Ltd., 12th Annual Report, 1940: 1941, pp. 1-9.
[8] Ducote, C. H., assistant commercial attaché, Habana, October 2, 1940.
[9] Somerville, James, assistant commercial attaché, London, December 3, 1940.

irresponsible attempts to develop home production and planned to restrict the exploitation of the low-grade deposits to technically skilled and experienced concerns.[10] To overcome the problems resulting from the stoppage of imports from Canada it was proposed to establish a nickel-controlling guild, whose object was to lower costs of domestic production and to distribute the output of ore, ferronickel, and pure nickel.[11] The rationalization of the nickel industry has provided problems for some producers, who find they cannot produce refined metal at the maximum price fixed by the authorities.[12] Consequently, there is a tendency to concentrate on the production of nickeliferous pig iron and ferronickel. The Kamogawa Nickel Kaisha is reported to have stopped producing pure nickel at its Funabashi works but is continuing to produce ferronickel. The Nippon Soda Kaisha, which has been making nickel from imported ore, is also to make ferronickel. The Oyeyama Nickel Kogyo K. K. has increased its capital greatly to permit more extensive development of its Oyeyama nickel mine and to erect a nickel works in Kyoto Prefecture.[13] The company has been developing its ore reserves for some years; the ore contains about 29 percent iron, 0.16 percent nickel, 0.1 percent cobalt, and 1.3 percent chromium. Apparently a concentrating plant is to be erected in Kyoto, as the company intends to produce ferronickel at its Hashidate works.

Netherlands Indies.—The Oost-Borneo Maatschappij, N. V., continued to operate the deposits on the island of Celebes, and the ore, of low nickel content, is shipped to Japan. Before the outbreak of the war production of nickel-iron concentrates was contemplated through the use of the Krupp-Renn process; the Nickel and Cobalt chapter of Minerals Yearbook 1940 stated erroneously that Fried. Krupp A. G. was a partner in the enterprise.

New Caledonia.—Ore production in New Caledonia—which produces the second largest quantity—was 459,000 metric tons averaging 3.8 percent nickel in 1940. The output of matte (about 77 percent nickel) was 8,570 metric tons in 1940. It is not known how the product was distributed in 1940, but before the war ore was exported chiefly to France, Germany, and Japan and matte to Belgium and France.

Norway.—The Falconbridge refinery at Kristiansand was operated steadily by Falconbridge Nickel Mines, Ltd., until the German occupation of Norway on April 9, 1940. In consequence, production and sales of nickel in 1940 slumped disastrously in comparison with 1939, when the figures were 9,233 and 9,337 short tons, respectively.

Union of South Africa.—Nickel appeared in the mineral statistics of the Union of South Africa in 1938, when 49 short tons were produced; the output advanced to 439 short tons in 1939. Many years ago, however, two trial shipments of 5 tons each, reported to contain 5.3 percent nickel and cobalt, from deposits at Insizwa were sent to Great Britain. The nickel produced since 1938 was derived from matte containing about 40 percent nickel, which is produced from sulfide ore by the Rustenburg Platinum Mines, Ltd.

The nickel deposits of the Union of South Africa have been described recently.[14]

U. S. S. R.—"A large electrolytic nickel-refining plant has been opened at Montschegorsk, center of the Russian nickel-mining industry, near Korowsk on the Kola Peninsula." [15] Nickel has been found in the Neulinsk district of the Kola Peninsula,[16] and deposits of nickel and cobalt have been discovered near the village of Chenger-Sai, Aktyubinsk Province.[17] It is proposed to recover the nickel contained in the copper ores treated at the smelter of Pyshma.[18]

COBALT

The consumption of cobalt in the United States increased substantially during 1940; except for a small domestic production, the demand was supplied by imports, chiefly from the Belgian Congo. Total imports (exclusive of re-exports to Japan) measured by cobalt content increased about 53 percent over the all-time high established in 1939. A noteworthy shift in the flow of cobalt resulted from the war. Because of the invasion of Belgium cobalt-bearing residues from Belgian Congo and Northern Rhodesia, which formerly were shipped to Belgium for refining, are now being shipped to the United States and Canada, where equipment has been installed to convert the residues into the required finished cobalt products. Domestic quotations for 97- to 99-percent metal in 100-pound lots and black oxide (70- to 71-percent grade) in 350-pound lots remained unchanged throughout 1940 at $1.50 and $1.84 a pound, respectively.

PRODUCTION

In 1940, for the first time since 1931, there was a marketed production of cobalt ore from domestic sources. The Pyrites Co., Inc., Wilmington, Del., treated cobalt ores and produced cobalt oxide. The cobalt ore was recovered from iron pyrites concentrates produced at Lebanon, Pa., from iron ore mined at Cornwall, Pa. Cobalt has long been known to occur as a minor constituent of these iron ores, and increased amounts have been found in the ore bodies now being mined. The Eastern Magnesia Talc Co., Inc., Burlington, Vt., recovered a small quantity of concentrate containing 2 percent cobalt and 20 percent nickel in 1940; none was sold, however. The concentrate is recovered as a byproduct of froth flotation of talc. The Sullivan Mining Co., Kellogg, Idaho, recovered 93 short tons of residue containing 3.29 percent cobalt at its electrolytic zinc plant in 1940, but none was shipped. Jonathan Gordon, Tombstone, Ariz., reported a production of about 7 short tons of 16-percent cobalt concentrate from the Blue Bird mine in Graham County, Ariz. The Cobalt Gold Mining Co., Boulder, Colo., continued development at its property near Gold Hill, Colo., during 1940 and since July has been constructing a smelter to produce a matte containing 3 to 10 percent each cobalt and copper and 45 to 55 percent nickel. The Uncle Sam Mining & Milling Co., Inc., Salmon, Idaho, continued development work and reported producing a concentrate containing 12 to 14 percent cobalt. John Carroll, Las Vegas, Nev., did development work at a property in the Goodsprings district, Clark County,

[15] Daily Metal Reporter, vol. 40, November 14, 1940, p. 4.
[16] Mining Journal (London), vol. 207, December 23, 1939, p. 1066.
[17] Metal Bulletin (London), No. 2470, March 5, 1940, p. 14.
[18] Metal Bulletin (London), No. 2478, April 9, 1940, p. 12.

Nev., in 1940. Ore blocked out was estimated by Carroll at 40,000 tons containing an average of 1.16 percent cobalt and 1.10 percent copper. Ore-dressing tests of ores in the Goodsprings (Nev.) district have been made by the ore-dressing section of the Bureau of Mines Metallurgical Division [19] and resulted in development of a flotation procedure to produce a bulk concentrate containing cobalt and copper. The electrometallurgical section of the Metallurgical Division has undertaken some work on the separation of copper and cobalt from the Goodsprings ores.[20] According to Dean:

> The minerals are stainierite, malachite, dolomite, some quartz, and iron oxides. Further ore-dressing tests along the lines of differential flotation were made, with indications of ultimate success. However, a good ore-dressing result as such would not produce a product free enough from copper to meet all specifications for cobalt oxides. Consequently, other methods are being tested. Good evidence has been obtained that cobalt can be leached from the bulk flotation concentrates and economically recovered by electrolysis. This investigation was begun only recently, and results will be published when conclusive data are obtained.

The separation of cobalt is the subject of United States Patent 2,232,527. According to this patent:

> * * * The invention may advantageously be applied to the recovery of cobalt from iron pyrites in which it is found to occur. Such iron pyrites may contain up to 2 percent of cobalt, together with copper, zinc, lead, and other nonferrous metals in smaller proportions. In one iron pyrites from which cobalt has been recovered in accordance with the present invention, there is found 1.4 percent cobalt, 1.0 percent copper, 0.3 percent zinc, and small quantities of nickel, manganese, and lead.

FOREIGN TRADE

Imports of cobalt into the United States established an all-time record in 1940. Whereas in 1939 the imports comprised chiefly metal refined in Belgium from Belgian Congo and Northern Rhodesia cobalt alloy, in 1940, because of the invasion of Belgium, they consisted largely of cobalt alloy from Belgian Congo. Consequently, imports of cobalt alloy and ore increased to 10,497,719 pounds in 1940 (611,083 in 1939), and receipts of metal declined to 130,321 pounds (2,130,296 in 1939). Imports of cobalt oxide increased 11 percent over 1939. Although there was a substantial importation of cobalt ore from Canada, the greater part of it is reported to have been re-exported to Japan. On and after January 6, 1941, cobalt could be exported from the United States only when authorized by a license.

Other salts and compounds	45	187	56	98	1,374	3,405		

USES

As a result of extensive research, the use of cobalt continues to expand; consequently, world production has increased greatly. Cobalt oxide is used in the ceramic industry; cobalt salts are employed in the preparation of driers for use in paints, varnishes, and linoleums and as a catalyst; and cobalt metal is utilized in cutting tools and drills, welding rod, stock for tipping tools, dies, valve steel, magnets, electroplating, and dental restorations and as a catalyst. Much success has been achieved by applying cobalt to supplement pasture deficiencies that cause various types of sickness among animals.

WORLD PRODUCTION

Government restrictions on the publication of statistics giving the output of cobalt in the chief producing countries in 1940 and lack of data for Belgian Congo (one of the outstanding producers) and for several smaller producing countries in 1938 and 1939 preclude giving an accurate statement of total world output in those years. Nevertheless, such figures as are available for 1938 and 1939 indicate a production of 4,500 to 5,000 metric tons in each year. Despite the fact that cobalt is reported to be produced in 14 countries, three countries (the Belgian Congo, French Morocco, and Northern Rhodesia) contribute about 75 to 80 percent of the total.

World production of cobalt, 1938–40, by countries, in metric tons [1]

[Compiled by L. P. Lounsbery]

Country [1]	Cobalt-bearing material	1938		1939		1940	
		Gross weight	Cobalt content	Gross weight	Cobalt content	Gross weight	Cobalt content
Bolivia	Cobalt ore	(2)	(2)	(2)	(2)	29	2
Burma [3]	Cobaltiferous nickel speiss	3,399	238	3,322	229	(2)	(2)
Canada: Ontario	Cobalt ores, oxide, and metal	(2)	208	(2)	332	(2)	(2)
Morocco, French	Cobalt ore [4]	6,541	720	(2)	(2)	(2)	(2)
Northern Rhodesia	Cobalt alloy [5]	3,756	1,502	3,891	1,556	(2)	(2)

[1] In addition to the countries listed, Belgian Congo, Chile, China, Finland, Germany, Italy, Japan, and Mexico produce cobalt, but production data are not available; the United States produced cobalt ore in 1940, but the Bureau of Mines is not at liberty to publish the figures.
[2] Data not available.
[3] Year ended June 30 of year stated.
[4] Average cobalt content estimated at 11 percent.
[5] Average cobalt content estimated at 40 percent.

Belgian Congo.—Belgian Congo is one of the largest producers of cobalt, but figures for output have not been reported for several years. Imports of cobalt alloy into the United States from Belgian Congo were 3,922 short tons in 1940. Before Belgium was invaded, the cobalt alloy was exported to that country for refining.

Burma.—Cobalt is produced in Burma largely as a byproduct of lead-zinc mining at the Bawdwin mines of the Burma Corporation, Ltd. A nickel speiss obtained at the lead smelter contains about 7 percent cobalt. It was formerly shipped to Germany for treatment.

Canada.—Data on the output of cobalt in Canada are not available because of Government restriction on publication. The decreased production of Ontario mines during the past few years, owing to depletion of the ores, curtailed smelting by the Deloro Smelting & Refining Co., Ltd., to such an extent that enough cobalt-arsenical ore was not available to keep the smelter in operation continuously.[21] As an alternative, the company remodeled its plant to refine copper-cobalt alloy from Africa.

Northern Rhodesia.—Although figures for 1940 are not available, the Rhokana Corporation, Ltd., has stated that the production of cobalt proceeded satisfactorily. During the year ended June 30, 1939, the company sold 1,124 short tons of cobalt in alloy and refined products, and the cobalt plant produced 4,511 short tons of alloy containing 1,761 tons of cobalt.

MOLYBDENUM, TUNGSTEN, AND VANADIUM

By Robert H. Ridgway and H. W. Davis [1]

SUMMARY OUTLINE

MOLYBDENUM

Domestic production of molybdenum rose to an all-time high of 34,313,000 pounds (contained molybdenum), which exceeded shipments by about 9,000,000 pounds. Information concerning molybdenum production in other countries is meager, but the general trend appeared to be downward, and the United States probably supplied more than 93 percent of the world output. No data on molybdenum production in Norway have been available since that country came under German control; in Mexico and Peru production dropped, but recovery of molybdenum at the Braden operations in Chile, begun in 1939, continued at an accelerated pace.

As the United States has ample supplies of molybdenum, attention was devoted to substituting molybdenum for nickel and tungsten in alloy steels, thereby relieving the pressure of demand for these less-available metals. For several years, molybdenum high-speed steels employing only small percentages of tungsten have been in commercial use; they are manufactured in the United States by a number of the larger manufacturers of high-speed steels, who market them under various trade names. In previous years, a large proportion of domestic production went to foreign markets (67 percent in 1939) but in 1940 exports of molybdenum concentrates declined sharply and totaled only 6,339 short tons (19 percent of domestic output) valued at $4,904,000 compared with 21,777 tons valued at $14,066,501 in 1939.

The Climax Molybdenum Co. continued to lead the world as a producer of molybdenum and supplied 66 percent of the domestic output. The recovery of molybdenite concentrates as a byproduct of copper operations at Bingham, Utah, Chino, N. Mex., and Miami, Ariz., has become increasingly important in the United States and in 1940 represented about 30 percent of the domestic output.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Salient statistics of the molybdenum industry in the United States, 1938–40

	1938	1939	1940
Concentrates:

[2] Not separately recorded.
[3] Not recorded.

Moral embargo.—Following the President's statement of December 2, 1939, regarding exports of airplanes and materials essential in airplane manufacture to nations guilty of unprovoked bombing of civilian populations from the air, the State Department on December 15 addressed a letter to all producers of molybdenum, which added this metal to the embargo list. Molybdenum steels have been widely employed in aircraft construction during the last decade.

Consuming nations to which domestic supplies of molybdenum were available were restricted, therefore, chiefly to the United States, Canada, and the United Kingdom—France was eliminated after its capitulation to Germany. The moral embargo was lifted for Russia on January 22, 1941.

Export control.—On July 2, 1940, the President issued a proclamation providing for the licensing of exports of "molybdenum ores, concentrates, metal, alloys containing in excess of 10 percent molybdenum and molybdenum compounds" and other specified materials vital to defense and appointing an Administrator of Export Control. Ferromolybdenum is one of a number of ferro-alloys coming within the definition of "iron" and "steel," which were included in the licensing requirement under a Presidential proclamation issued October 10, to become effective December 30, 1940. Under authority of an Executive order of January 15, 1941, the Secretary of State issued general licenses for the export of molybdenum and ferromolybdenum to Canada.

PRICES

Prices for molybdenite concentrates carrying 90 percent MoS_2 were quoted nominally by the Engineering and Mining Journal at 45 cents per pound of contained MoS_2 throughout 1940; this is equivalent to 75 cents per pound of contained Mo. London quotations for 85- to 90-percent concentrates were 52 shillings per long-ton unit during the greater part of the year; however, the equivalent in United States currency ranged from 38 cents per pound of contained MoS_2 in May to 46.85 cents in November, according to the rate of exchange in effect at a given time.

DOMESTIC PRODUCTION

Arizona.—Molybdenum was recovered by the Miami Copper Co. as a byproduct of copper-mining operations at Miami, Gila County, and by the Mammoth-St. Anthony, Ltd., which recovers gold, silver, lead, molybdenum, and vanadium by selective flotation of ores from Mammoth. At Miami most of the molybdenum, which is present in minute quantities (0.009 percent MoS_2), is floated along with the sulfide copper. The molybdenum sulfide is separated from the copper sulfide by steaming off the reagents by which both sulfides are floated and refloating with a reagent that will float the molybdenum sulfide but not the copper. About 30 tons of molybdenum concentrates per month are produced at Miami.[2]

California.—There was a small production of molybdenite concentrates from a tungsten operation in Inyo County in 1940.

Colorado.—The Climax Molybdenum Co., Climax, Colo., continued to be the world's largest producer of molybdenum, operating continuously, but not at capacity, its mine and 12,000-ton flotation mill; the production of 22,782,608 pounds of elemental molybdenum was nearly a million pounds greater than in 1939. Health and safety conditions at Climax were described in articles in the technical press by Feiss [3] and Richardson.[4]

Molybdenum (element) contained in concentrates produced from the Climax deposit, Colorado, 1935–40

	Pounds		Pounds
1935	10, 168, 635	1938	28, 242, 085
1936	15, 216, 806	1939	21, 796, 116
1937	22, 750, 368	1940	22, 782, 608

The Molybdenum Corporation of America undertook preliminary work on a molybdenum property in the Red Mountain district of Clear Creek County near Empire, Colo., acquired several months earlier from the Vanadium Corporation of America.

New Mexico.—Molybdenum concentrates were produced by the Molybdenum Corporation of America from its property near Questa and by the Nevada Consolidated Copper Corporation at the Chino property, incident to the treatment of copper ores.

Utah.—All production in 1940 came from the Utah Copper Co., where molybdenite is recovered as a byproduct in the concentration of copper ores and re-treatment of molybdenum-bearing concentrates. The molybdenum concentrate is freed of its small amount of copper and "insoluble" by roasting in a hearth furnace at a temperature that oxidizes the copper but not the molybdenum sulfide. The "insoluble" is then floated off and finally the molybdenum sulfide.[5]

IMPORTS AND EXPORTS

As data covering exports of molybdenum concentrates by countries of destination were not available prior to 1939, figures for that year provide the only basis for comparison. Exports declined about 71 percent, as shipments to Belgium, Czechoslovakia, Germany, Hungary, and Norway ceased abruptly and those to Japan, Netherlands, Sweden, and U. S. S. R. dwindled to small percentages of the 1939 exports. Shipments to the United Kingdom were little more than half of the 1939 total, but exports to Canada, France, and Italy rose appreciably.

	43,554,310	14,066,501	12,677,794	6,584,714	4,904,000

[1] Molybdenum content not shown in 1939.

Imports of molybdenum or molybdenum compounds are usually small; in 1940 there were none.

Molybdenum ore and concentrates, ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum imported for consumption in the United States, 1939–40

Year	Molybdenum content (pounds)	Value	Year	Molybdenum content (pounds)	Value
1936	49	$213	1939	26,347	$32,327
1937	7,707	13,491	1940		
1938	25	81			

There were no imports of molybdenum ore and concentrates for smelting, refining, and export in 1940 although 87,232 pounds of ore and concentrates, containing 49,613 pounds of molybdenum, were entered under this classification in 1939.

USES

Molybdenum is used principally in the iron and steel industry for making special alloy steels. Continued research is broadening the field of applications, both in new outlets and as a substitute for and in addition to other alloying elements. This is true particularly with respect to the substitution of molybdenum for strategic metals; as ample supplies of molybdenum are available in the United States it is not classed as a strategic material, but it is, nevertheless, important, for molybdenum is being substituted for other alloying metals, such as nickel, tungsten, and manganese, which are strategic. Molybdenum may be used alone to impart certain desired properties to iron and steel, but more frequently it is employed with one or more of the other ferro-alloying elements. Alloy steels containing molybdenum are finding increased favor in the aircraft industry. The newer developments include a 3-percent chromium steel with molybdenum, introduced from England and used successfully for crankshafts; a nitriding steel containing chromium, molybdenum, and nickel (but no aluminum) that is being specified by aircraft producers; and a steel containing 2 percent chromium with 0.50 percent molybdenum, which has been successful for cylinder liners in aircraft engines.[6] Modernized railway-locomotive construction utilizes nickel-chromium-molybdenum rods, pistons, axles, shafts, and pins to reduce fatigue failures and save weight; molybdenum steels and cast irons are also being used increasingly by railroads in tires, car wheels, flues, and cylinders. Oil-well drilling and oil refining absorb additional quantities of molybdenum steels, and molybdenum high-speed steels are receiving increased attention. Several of these uses, applicable to die steels, have been described by Herzig.[7]

For most purposes molybdenite (MoS_2), the principal raw material, is converted, before use, to ferromolybdenum (a product carrying 60 to 65 percent molybdenum) or to calcium molybdate (a compound containing 35 to 45 percent molybdenum and resulting from the roasting of molybdenite with lime). The latter is the cheaper method of preparing molybdenum for industrial uses. Molybdenum oxide briquets also are used in making additions of molybdenum to iron and steel.

Molybdenum compounds are used to a limited extent in the chemical and ceramic industries, but consumption is not large. Translations of expired German patents recently issued by the Climax Molybdenum Co. describe the use of molybdenum compounds in dyeing furs, feathers, hair, skins, and similar products.[8] Certain molybdenum compounds are reported to promote adherence in ground coats for enamels.[9]

WORLD PRODUCTION

Aside from the very large output of molybdenum in the United States, world production of molybdenum comes from a small number of mines that furnish up to a few hundred tons annually. Of these, operations in Mexico, Norway, and Peru are of leading interest.

Canada.—Production of molybdenite in Canada dwindled to insignificant proportions following the World War of 1914–18, but in 1939 interest in developing new sources of supply revived as a result of war needs for alloy-steel metals and continued during 1940 in British Columbia, Manitoba, Ontario, and Quebec. A recent bulletin issued by the British Columbia Department of Mines describes molybdenum deposits in that Province.[10]

Chile.—The recovery of molybdenite concentrates from copper operations of the Braden Copper Co. at Sewell was inaugurated in 1939, when 111,561 pounds of molybdenite were produced in an experimental plant. During 1940 operations were reported to be proceeding at the rate of 800 to 900 tons a year; exports totaled 680 metric tons of ore and concentrate.

United States (Mo content)	7,795	13,344	15,103	13,755	15,564
Yugoslavia		84	19	60	(3)

[1] In addition to countries listed, molybdenum ore is also produced in China, but data on production are not available.
[2] Less than 1 ton.
[3] Data not available.

Greece.—The Krupp interests were reported to have installed a plant with a capacity of 10,000 tons of crude ore a year at the Axiopolis molybdenum property in Greece, for the production of 85-percent concentrates.

Mexico.—Output in Mexico declined from 523 metric tons (molybdenum content) in 1939 to 310 in 1940. Early in the year, the 3,500-ton selective flotation plant of the Cananea Consolidated Copper Co., S. A., Cananea, Sonora, Mexico, was reported to be treating about 2,000 tons of copper, gold, silver, and molybdenum ore daily and employing 1,350 men.

Norway.—Before 1933, Norway was the only important source of molybdenum outside of the United States; since then world sources of molybdenum have expanded, but Norway furnishes concentrates containing a few hundred tons of molybdenum annually. Since the country came under German control little or no information as to its molybdenum industry has been made public, although production probably is continuing at an increased rate.

Peru.—In recent years, Peru has become one of the more important foreign sources of molybdenum. During the first half of 1940 it was reported that molybdenum production had been stepped up to about 38 tons a month, or over 400 tons annually, nevertheless the total output for the year declined to 293 metric tons of concentrates compared with 342 tons in 1939. Molybdenum prospects are reported to occur in the Provinces of Huarochiri and Cajatambo in the Department of Lima, in the districts of Bolognesi, Recuay, Ticapampa, and Conchucos in the Department of Ancash, and near Solceantay in the Urubamba district of Cuzco. The principal producing mine, however, is that of the "Peru Molibdeno" near Ricran in the Department of Junin.

Sweden.—Discovery of molybdenum at the Algruvan mine in Lillhärad Parish, Sweden, was the reward of the Toftgruvans Silverintrissenters Aktiebolag, Västerås (a company formed in 1937 to exploit silver deposits at Toftgruvan), when it proceeded with prospecting after failing to find silver of marketable grade. The Algruvan deposit is said to be fairly extensive and easily accessible; tests by the Swedish Government Testing Institute placed the MoS_2 content of the ore at 4.8 percent.

U. S. S. R.—Considerable publicity was given to the announcement that the first molybdenum smelter in the U. S. S. R. would begin operation on Lake Balkhash in Kazakstan as a unit of the Balkhash copper smelter for recovery of molybdenum in concentrates of copper ore mined at Kounrad north of Lake Balkhash. A crushing mill and concentrating plant near Nalchik, 10,000 feet up among the northeast foothills of Mount Elbrus, was reported being equipped for handling molybdenum ore in the Caucasus.

TUNGSTEN

Universal armament activities in 1940 put further emphasis on the strategic nature of tungsten. Increased demands and disturbed flow from producing areas upset usual commercial relations, and supplies became a matter of national concern to the larger consuming countries. Despite increasing difficulties in moving Chinese tungsten—the principal world supply—exports from China continued, although at a greatly reduced rate. With Japanese occupation of most of the Chinese ports, movement of tungsten shifted to flow out of Indochina; this was stopped in July but was offset somewhat by reopening of the Burma Road in October. With the diminution of Chinese concentrates, output in other countries was stimulated in 1940, notably in Portugal, the United States, and Latin America.

Shipments of tungsten concentrates from domestic mines increased 24 percent from 1939 to a near-all-time high of 5,319 short tons (60 percent WO_3) in 1940, and imports for consumption rose to nearly four times their volume in 1939, greatly augmenting the supplies of tungsten available in the United States during 1940. General imports from China were more than three times as great as in 1939, and Latin American countries assumed real importance as foreign sources of supply when Argentina, Bolivia, Brazil, Chile, Cuba, Mexico, and Peru furnished 3,362,778 pounds (tungsten content), which was more than total general imports from all sources in 1939. The search for domestic deposits of tungsten ores was greatly stimulated, and many small lots ranging from a few hundred pounds to several tons were produced from new or previously abandoned deposits.

Although the supply may suffice for current demand, efforts directed to the substitution of other materials for tungsten, especially for war purposes, were increased. As the defense program progresses it is expected that molybdenum will be substituted for certain tungsten high-speed steels. Consumption of cemented carbide is increasing rapidly, but a pound of tungsten goes much farther in machining operations as cemented carbide than as high-speed steel. Small quantities of tantalum carbide and titanium carbide are also used, but tungsten carbide dominates the cemented-carbide industry.

Tables of domestic shipments, imports, exports, and apparent consumption of tungsten in the United States from 1910 to 1938, which present the historical background for considering the strategic nature of tungsten, are given in Minerals Yearbook, 1939 (p. 621).

Salient statistics of the tungsten industry in the United States, 1939–40

	1939		1940	
	Short tons	Value	Short tons	Value
Production (60 percent WO_3)	3,603	(1)	5,120	(1)
Concentrates shipped (60 percent WO_3)	4,287	$4,402,182	5,319	$6,576,318
Imported for consumption (W content)	743	997,971	2,805	4,690,723
Stocks in bonded warehouses, Dec. 31:				
Ore (W content)	843	1,357,219	2,196	3,956,825
Metal (W content)	6	14,975	7	23,587

[1] Figures not available.

The basic patents on tungsten carbide (including the Schroeder and hot-press process patents) were held invalid in a decree handed down by Judge Arthur J. Tuttle on August 14, 1940, in the case of General Electric Co. and Carboloy Co. versus Willey's Carbide Tool Co., et al. There was no appeal from the decision by the plaintiff. As a result of the decision, American manufacturers were relieved of royalty payments to foreign holders of the patents.

Following price reductions early in 1939, tungsten carbide prices were reduced further in 1940.

Toward the end of 1940, concerted efforts were being made by tool-steel manufacturers to accumulate their high-speed mill scale and grindings and have them converted into a "super-high-speed scrap," the tungsten content being "not less than twice the tungsten analysis of scale or grindings." This action was taken in an effort to maintain adequate supplies of scrap, which is an essential part of the charge in making steel, and thereby ease prices for scrap, which were tending to soar.[11]

Emergency stock pile.—Purchases of tungsten, authorized by the Strategic Materials Act of 1939, were continued during 1940. In June the Advisory Commission to the Council of National Defense was informed that there was a large tonnage of Chinese tungsten ore at the ports of Haiphong and Saigon, Indochina, which the Chinese Government wished to move to the United States before shipment could be stopped by Japanese or French authorities. Events moved rapidly; the Reconstruction Finance Corporation agreed to purchase all ore available from Indochina, space was obtained on two American vessels, authority for clearance was obtained from officials at Bordeaux and Haiphong, and shipment was made within about 2 weeks. Later in the year, the Metals Reserve Co.—subsidiary of the Reconstruction Finance Corporation—arranged to accept $30,000,000 worth of tungsten from China in repayment of a loan by the Export-Import Bank. Delivery will be made over a period of years at prices agreed upon from time to time. Subsequently another loan of $60,000,000 was arranged, to be repaid by sales of tungsten, antimony, and pig tin to the United States.

Government purchases of tungsten ores during 1940 included 2,000 short tons of California scheelite, in addition to the Chinese wolframite, contracted for by the Metals Reserve Co.; and 7,300 short tons of tungsten ores from China, South Africa, and South American coun-

[11] Steel, Reclaiming Tungsten Scrap Is Economy Move: Vol. 107, No. 19, November 4, 1940, pp. 121–122.

tries, contracted for by the Procurement Division of the Treasury Department with five firms in the United States.

A plant to clean tungsten ores imported for stock-pile purposes was put into operation by the National Reconditioning Co. at the Foreign Trade Zone, Stapleton, Staten Island.

To relieve a temporary stringency in spot supply of tungsten and assure adequate future deliveries to industry, part of the Government-held stock pile of tungsten was released for sale to industry early in February 1941, under authority granted to the Procurement Division of the Treasury Department. The order authorized the Procurement Division to sell or otherwise dispose of its tungsten stocks for defense production "to such buyers or users and in such amounts as may be requested from time to time by the Office of Production Management." Applications from industrial users for the purchase of Government stocks were to be made to the Procurement Division and granted upon approval of the Office of Production Management, the sale price to be the same as the cost of acquisition to the Government.

Export control.—On July 2, 1940, tungsten (defined as "tungsten ores and concentrates, metal, alloys containing in excess of five percent tungsten and tungsten compounds") was proclaimed by the President as one of a number of materials vital to defense for which export licenses would be required. Ferrotungsten was included in a later Presidential proclamation and Executive order which provided for the licensing, as of December 30, 1940, of iron ore, pig iron, ferro-alloys, and certain iron and steel manufactures and semimanufactures. On January 15, 1941, the Secretary of State issued general licenses for the export of tungsten and ferrotungsten to Canada.

Government exploration.—Continuing the search for ore deposits of stragetic metals, as authorized under section 7 of the Strategic Materials Act, the Bureau of Mines explored tungsten deposits in six areas in California and Nevada. In two areas, the deposits were definitely proved to be shallow as well as low-grade. In another instance, some additional low-grade ore was found, but the deposits were so erratic that it was impossible to calculate appreciable reserves. The remaining three projects are still active. Surface trenching and diamond drilling revealed additional reserves near Mill City and Shoshone, Nev., and in the Huachuca Mountains, Ariz. In connection with another project undertaken to determine reserves of antimony ore in the Yellow Pine District, Valley County, Idaho, a strike of high-grade tungsten ore was made. By May 15, 1941, seven drill holes had penetrated tungsten-bearing material of commercial grade within a length of over 400 feet along the strike; the limits of the deposit have not yet been determined. Some of the richer zones appear to be up to 25 feet thick. The discovery is believed to be important, as it can be developed rapidly; it is near the surface and in an established camp with an experienced operating staff in charge. The deposit is being developed as rapidly as possible by the owners of the property.

As part of its program of investigation of strategic mineral deposits the Geological Survey published reports describing tungsten deposits of the Atolia district, San Bernardino and Kern Counties, Calif.; Tungsten Hills, Inyo County, Calif.; Benton Range, Mono County, Calif.; and Boulder County, Colo., which are abstracted elsewhere in this chapter. Mapping of the Mill City district in the Eugene Mountains, Nev., was completed, and detailed examinations were made of the tungsten deposits in the Osgood Range, Humboldt County, and in the Minerva district, White Pine County. The Blue Wing district, Lemhi County, Idaho; Germania district, Stevens County, Wash.; and Silver Hill district, Spokane County, Wash., were also mapped in detail.

PRICES

Quotations on tungsten ore or concentrates were relatively steady throughout 1940. Chinese ore was quoted in the Engineering and Mining Journal at $23.00 to $24.50 per short-ton unit of WO_3, duty-paid, until December, when the quotation rose to $26.00; Bolivian and Portuguese ores were quoted at $21.50, duty-paid, early in 1940, rising gradually to $23.50 in October and $25.00 to $26.00 in December. Quotations for domestic scheelite, in carlots, delivered, were within the range of $21.00 to $25.00 during the year; western buyers were offering $17.00 and $18.00 a unit, delivered at Boulder, Colo. The average price for the 1940 shipments, as reported to the Bureau of Mines, was $20.61 per short-ton unit of WO_3. London prices for wolframite containing 65 percent WO_3 were nominal at 50 shillings per long-ton unit.

DOMESTIC PRODUCTION

Stimulated by defense activities, production of tungsten ore and concentrates in the United States rose to 5,120 short tons of concentrates (reduced to an equivalent of 60 percent WO_3) in 1940—a 42-percent increase over 1939. Development work was begun at many new properties, and output was reported from a number of widely scattered operations in Arizona, California, Colorado, Idaho, Missouri, Montana, Nevada, New Mexico, Utah, and Washington. California produced the most tungsten of any state in 1940, replacing Nevada. Total shipments from domestic mines, which were 24 percent larger than in 1939, were not only the largest since 1917 but have been exceeded in only one other year—1916.

Tungsten ore and concentrates shipped from mines in the United States, 1936–40

Year	Quantity		Reported value f. o. b. mines		
	Ore and concentrates, 60 percent WO_3 (short tons)	Tungsten content (pounds)	Total	Average per unit of WO_3	Average per pound of tungsten
1936	2,612	2,485,893	$2,323,818	$14.83	$0.93
1937	3,500	3,331,020	4,094,000	19.50	1.23
1938	3,044	2,897,036	3,161,498	17.31	1.09
1939	4,287	4,080,024	4,402,182	17.11	1.08
1940	5,319	5,062,199	6,576,318	20.61	1.30

Arizona.—Shipments of tungsten concentrates from Arizona operations totaled 302 short tons containing 69.33 percent WO_3 in 1940 compared with 88 tons containing 68.38 percent WO_3 in 1939. The output comprised scheelite, wolframite, huebnerite, and ferberite. The Boriana mine of the Molybdenum Corporation of America in Mohave County, which provided the major part of production in the State, operated its mine on two shifts and its mill on one shift during most of the year. The remaining output was reported by a number of small producers. The Williams mine, in Mohave County 72 miles southeast of Kingman, was being prospected and developed during 1940 by the Continental Mining Corporation. The 100-ton mill, which was erected and put into operation in July, was closed temporarily later in the year.

California.—Shipments of tungsten concentrates from California amounted to 2,076 short tons containing 59.83 percent WO_3 in 1940 compared with 1,250 short tons containing 60.63 percent in 1939. Four producers—the Atolia Mining Co., in San Bernardino County; the Tungstore Mines, in Tulare County; and the Tungstar Corporation and the United States Vanadium Corporation, both in Inyo County—shipped 1,848 short tons of concentrates or 89 percent of the shipments reported from the State. The remainder came from 28 smaller operations.

Tungsten deposits of California are described in three papers in Strategic Minerals Investigations, 1940, of the Geological Survey. In one describing tungsten deposits of the Atolia District, Lemmon and Dorr [12] express the belief that with favorable prices an annual production of 300 to 400 tons of 60 percent WO_3 concentrates may be maintained over a short period of years.

With reference to tungsten deposits in the Tungsten Hills of Inyo County, Calif., Lemmon [13] states that although the larger known ore bodies apparently are nearly exhausted, numerous small, low-grade deposits, ranging in size from a few hundred to a few thousand tons, remain undeveloped. It is estimated that there are 100,000 tons of probable ore containing 0.25 to 0.5 percent WO_3 in reserve. Additional ore bodies may be found at depth in the Round Valley deposit.

According to another report in the Strategic Minerals Investigations series,[14] of the four scheelite deposits found in the Benton Range, Mono County, prior to 1940, only one—that at the Black Rock mine—has been productive, although another (on the Coos claims) is being developed.

At the Black Rock mine the proved ore does not exceed 10,000 tons and averages less than 1 percent WO_3. The possible ore reserves may total several hundred thousand tons if the isolated outcrops prove to be connected underground or if new discoveries are made.

At Pine Creek in the Bishop (Calif.) area, the United States Vanadium Corporation operated its 350-ton-per-day mill at the mine and had under construction a 1,200-ton mill at the junction of Pine and Morgan Creeks at an elevation of about 7,600 feet. The mine is at an elevation of about 11,000 feet and will be connected to the new mill by an aerial tramway. Large tonnages of complex tungsten-molybdenum ore have been blocked out, and a suitable method of separation has been developed involving selective flotation, with chemical treatment of the flotation concentrates to raise the tungsten in the final product to the 60-percent range. There is a chemical plant on Pine Creek. The company also purchases low-grade flotation concentrates from other producers.[15]

A comprehensive survey of tungsten resources of California was

[15] Lenhart, Walter B., Milling Scheelite at Tungstar Mine: Mining Cong. Jour., vol. 27, No. 4, April 1941, p .67.

published by the California State Department of Mineral Resources.[16]

Colorado.—Total shipments rose to 849 short tons of ferberite concentrates averaging 48.95 percent WO_3 in 1940 from 617 short tons averaging 46.59 percent WO_3 in 1939. The greater part of the output came from properties of the Wolf Tongue Mining Co. and the Vanadium Corporation of America near Nederland.

The total production of ferberite concentrates in Boulder County[17] from 1900, when mining began, through 1938 has been equivalent to 20,650 tons containing 60 percent WO_3. Much of the ore mined averaged about 7 percent WO_3, and the lower limit of commercial grade is regarded as about 1½ percent WO_3.

It is probable that very few outcrops of ore shoots have remained undiscovered in the district, and although many blind shoots may exist the cost of finding them would be high. A small annual production may be expected to continue for many years but is unlikely ever again to reach 1,000 tons a year.

Idaho.—The Ima mine on Patterson Creek about 11 miles east of May was the only producer in Idaho in 1940 and shipped 240 short tons of huebnerite concentrates averaging 65 percent WO_3.

A deposit of high-grade tungsten ore was discovered in the Yellow Pine District, Valley County, Idaho, by engineers of the Bureau of Mines and geologists of the Geological Survey in connection with their search for ore deposits of strategic metals.

Montana.—The Jardine Mining Co.—the only producer in Montana in 1940—shipped 42 tons of scheelite concentrates averaging 70.62 percent WO_3 from operations at the Jardine mine in Park County. The principal output is gold, and tungsten is produced entirely as a byproduct.

Nevada.—Shipments of concentrates (virtually all scheelite) totaled 1,748 short tons averaging 61.67 percent WO_3. The Nevada-Massachusetts Co. near Mill City (the leading producer in the State) is also the largest individual source of tungsten ores in the United States. At the end of 1940, a new tailings plant at Mill City and chemical plant at Golconda were nearly completed and were expected to go into production in February 1941.

Washington.—Virtually all shipments of tungsten concentrates from Washington in 1940 came from the Germania mine near Fruitland, Stevens County, where the General Electric Co. worked over surface float and tailings to recover 53 short tons of wolframite concentrates averaging 67.78 percent WO_3 and 33 tons of wolframite jig concentrates averaging 14 percent WO_3. No new development was undertaken at the property during 1940.

FOREIGN TRADE

Domestic supplies of tungsten are supplemented by imports, principally of concentrates but also in other forms. Imports of ore and concentrates for consumption (tungsten content) rose sharply from 1,485,157 pounds in 1939 to 5,610,882 in 1940, Bolivia and China supplying 22 and 34 percent of the 1940 total, respectively. The distribution of imports for consumption is shown in the following table for 1939 and 1940.

General imports of tungsten ore or concentrates, which represent the movement of ore to this country, amounted to 18,481,342 pounds containing 9,666,228 pounds of tungsten in 1940. Of the total general imports of tungsten, China supplied 46 percent, Bolivia 20 percent, Argentina 10 percent, Portugal and Australia 6 percent each, Peru 4 percent, Thailand and Burma 2 percent each, and Mexico 1 percent.

In addition, 1,348,495 pounds of tungsten in concentrates were imported for smelting, refining, and export in 1940 compared with 589,828 pounds in 1939. Material brought in under this classification is free of duty. There is no record of any exports of tungsten ore or concentrates from this country.

Imports of tungsten metal and tungsten carbide declined from 39,498 pounds in 1939 to 36,652 (metallic content) in 1940. No tungstic acid nor other compounds of tungsten were imported in 1940.

Exports of tungsten metal, wire, shapes, and alloys other than ferrotungsten (for which export data are not available) increased to 237,940 pounds in 1940 from 195,002 pounds in 1939.

Tungsten in metal and compounds imported for consumption in the United States, 1939–40, by countries

[1] Includes combinations containing either metal or carbide.

USES

The principal use of tungsten, according to quantity, is in the manufacture of tools for metal cutting. For this purpose it is employed either in high-speed tool steels or in cemented carbides, used in making the tips of cutting tools and in the production of hard dies. New types of steel employing only 1 or 1.50 percent tungsten in place of the usual 18 percent tungsten - 4 percent chromium - 1 percent vanadium steel (the tungsten deficiency being compensated for by as much as 9.50 percent molybdenum) are being used successfully and should aid materially in meeting the increased demand for tungsten in high-speed tool steels. The need for stretching tungsten supplies also favors greater use of tungsten carbide. The use of tungsten in electric-light and radio-tube filaments is also important, but the quantities consumed are not large. For military purposes, tungsten is used as a core in armor-piercing bullets, as an erosion-resistant liner in heavy ordnance, in armor plate, and in gun breeches. Tungsten salts are used in the chemical, pigment, and tanning industries.

WORLD PRODUCTION

The sharp decline of tungsten production in China of more than 8,000 metric tons (as shown by exports) was compensated for only in part by substantally increased output in the United States, Bolivia, and Portugal. Complete figures are not available, but preliminary data indicate that world production in 1940 was lower than in any year since 1936.

Argentina.—Argentina has become increasingly important as a source of tungsten and now ranks fifth or sixth among producing countries. High prices offered by local buyers were largely responsible for increased output and tended not only to stimulate production by established operators but attracted many new ones. At the year's end at least 50 small operations were reported to be active, and their yield ranged from a few hundred pounds to several tons monthly. All tungsten mines in the Department of Iglesias, 700 miles northwest of Buenos Aires in the Andean Province of San Juan, have been leased for 10 years to Granfor, Keen & Co., an American concern. Exports to Europe have virtually ceased since September 1939. Aside from one small shipment to Sweden, all exports of tungsten ores from Argentina during 1940, amounting to about 1,400 short tons, were consigned to the United States or to Japan; the latter country took about 19 percent of the tonnage exported.

Bolivia.—Bolivia is the largest tungsten producer in South America, and output in 1940 (as indicated by exports) was exceeded only by that from the United States and Portugal, and possibly Burma. Tungsten production was begun in a small way in Bolivia in 1908 and was stimulated by war demand in 1917. Many mines were unable to survive the subsequent drop in the price of tungsten, but as a result of active operation of the rich Conde Auque scheelite property near Oruro in 1929, Bolivian tungsten production again took an upturn. By 1934 a number of scattered properties were producing, and the industry was well-established. Wolframite is the principal tungsten mineral mined, scheelite comprising only a small percentage of exports. According to Reagan,[18] the following four companies

[1] In addition to countries listed, tungsten ore is produced in Spain and the U. S. S. R., but no data of production are available for the period under discussion.
[2] Data not available.
[3] Less than 1 ton.
[4] Exclusive of Japan.

furnish about 50 percent of the Bolivian exports of tungsten: International Mining Co. (W. R. Grace & Co.), Cia. Aramayo Mines de Bolivie, Bolivian Tin & Tungsten Mines Corporation, and Sociedad Empresa de Estano Araca. The production from these companies probably could be expanded; comprehensive mine-development work has been undertaken, and modern mills are in use. The small companies that supply the remainder of Bolivian production have mined the easily available ore by hand and treated it in small, crude, hand mills. The output from most of these operations is purchased by the Banco Minero de Bolivia, the Government ore-buying agency. The principal tungsten-producing districts are, from north to south, Sorata, La Paz, Araca-Quime, Chicote-Kami, Conde Auque, Tazna, and Esmoraca.

Burma.—Exports of tin-tungsten concentrates during 1940 were 8,973 metric tons, compared with 12,212 in 1939. Exports from Burma are controlled by the Ministry of Supply in London, which fixed a price of 50 shillings per long-ton unit (22.4 pounds), f. o. b. Rangoon; shipments are permitted to Great Britain only.

Canada.—A considerable amount of exploration and development work was done in Canada. Deposits of tungsten-bearing minerals, usually scheelite, are known in Nova Scotia, New Brunswick, Manitoba, British Columbia, and the Yukon Territory, and small commercial shipments were made by Columbia Tungstens Co., Ltd., at Wells, British Columbia, in 1939 and by the Kirkpatrick Tungsten Syndicate from a deposit at Goff, Halifax County, Nova Scotia, in 1940.

China.—Difficulties of production, transport, and shipment caused by temporary closing of the Burma Road, the Indochina crisis, and other effects of the Sino-Japanese hostilities affected the tungsten industry of China adversely. Exports of tungsten concentrates dropped sharply in 1940 to 3,118 metric tons from 11,580 tons in 1939. During recent years, export centers have shifted from place to place as a result of war difficulties. In 1936 and 1937, 60 to 70 percent of all exports of tungsten from China were shipped from Shanghai; in 1938, virtually all exports left from the southern ports of Canton, Kowloon, Wuchow, and Mengtsz; following the capture of Canton in the fall of 1938, export clearance shifted to Lungchow on the southern Kwangsi border. Hong Kong was an active trading center for tungsten ores during the first 6 months of 1940, but as the months passed it became increasingly difficult for ores from the interior to reach that port. Shipments from Hong Kong to the United States dropped sharply during the third quarter of 1940 and apparently were nonexistent during the remainder of the year. Receipts from the adjacent Province of Kwangtung were interrupted by hostilities, and apparently increasing shipments were made direct to Japan, as Kwangtung was largely under Japanese control. Such small quantities as reached Hong Kong direct from Kwangtung were said to be below standard market grade, requiring further treatment at Hong Kong. The opinion was expressed in some sources that supplies of tungsten from Kiangsi and Hunan Provinces, ordinarily passing through the Hong Kong market, were being diverted to Japanese interests. Official trade statistics indicated that shipments of tungsten from Hong Kong during the first 6 months of 1940 were about equally divided between the United States and Japan. At the end of 1940 it was reported that, aside from the small production of about 25 tons a month in Hong Kong Province, supplies of tungsten were obtainable in Hong Kong only by means of porters or small boats on inland water routes.

Great Britain.—Effective April 8, 1940, the Ministry of Supply placed the sale and purchase of tungsten ores under a licensing scheme, whereby persons handling these materials were required to keep records and produce them for inspection upon demand.

Peru.—Within recent years, tungsten deposits have been developed in primitive fashion in the Provinces of Ancash and Santiago de Chuco in the Department of La Libertad. The Julcani mine, an old lead-silver property in the central part of Peru, was to be reopened in 1940; reserves of low-grade ore are estimated at 2½ million tons and are said to average 1 to 2 percent WO_3 in the upper levels.[19]

Portugal.—Responding to attractive prices offered by Germany, the United States, and the British Ministry of Economic Warfare (75 to 80 shillings per long-ton unit of WO_3), production of tungsten ores in Portugal rose 26 percent in 1940. The Beralt Tin & Wolfram, Ltd., with properties at Panasqueira in the Province of Beira Baixa, district of Castello Branco, was the largest producer.

U. S. S. R.—The most important source of tungsten in the U. S. S. R. is the Dzidha Tungsten Combine, which has been developing deposits and since May 1939 has been operating a concentrating plant. It is reported that favorable results have not been achieved as rapidly as anticipated, and the Commissariat for Nonferrous Metals was attempting to expedite developments by expanding visible ore reserves.

VANADIUM

Vanadium production continued at about the same rate in 1940 as in 1939. The world supply comes from a limited number of operations, principally in four countries, of which Peru and the United States are the most important. The yield in Peru, all from the Minasragra mine, was 23 percent higher in 1940 than in 1939. Domestic shipments of vanadium from all sources increased only about 5 percent. Further attention was devoted to the recovery of vanadium from sources other than ore. Germany was reported to be obtaining vanadium from blast-furnace slag in large enough quantities to render itself virtually independent of imports; in Italy, vanadium oxide was being recovered from the caustic-soda solution employed in the Bayer process of refining bauxite and from naphtha soot collected from smoke stacks of ships and industrial plants; an American firm reports the accumulation of considerable quantities of flue dust containing 20 to 40 percent V_2O_5 from the boilers of ships burning Venezuelan fuel oil.

In the United States, the Anaconda Copper Mining Co. undertook to recover vanadium in the treatment of phosphates under a patented process [20] whereby the vanadium content of a phosphoric acid solution is converted to the pentoxide form by an oxidizing agent such as potassium persulfate, and the vanadium content is extracted by the action of a selective solvent, such as ethyl ether, ethyl acetate, or butyl acetate. The company contemplates production of 100,000 pounds of vanadium annually.

Vanadium is not classed as a strategic metal, but its principal field of usefulness lies in special alloy steels, and as such it was included among the materials vital to defense that the President placed under the export-licensing system on July 2, 1940. The term "vanadium,"

[19] Wright, Charles Will, South America as a Source of Strategic Minerals: Min. and Met., vol. 21, No. 402, June 1940, pp. 284–285.

[20] Frick, Frederick F., and Woodman, Frank W., Recovery of Vanadium: U. S. Patent 2,193,092, March 12, 1940.

as employed in the act, includes vanadium ores and concentrates, alloys containing more than 10 percent vanadium, and vanadium compounds. Later in the year the President announced that, effective December 30, 1940, iron ore, pig iron, ferro-alloys and certain iron and steel manufactures and semimanufactures would be subjected to the licensing requirement; in the accompanying regulations, ferrovanadium was specifically mentioned as one of the ferro-alloys falling within the definition of "iron" and "steel." On January 15, 1941, the Secretary of State issued general licenses for the export of vanadium and ferrovanadium to Canada.

[6] Includes vanadium content of complex ores.

DOMESTIC PRODUCTION

United States production (as measured by shipments) of vanadium contained in all types of ore from which it was recovered totaled 2,090,601 pounds in 1940 compared with 1,984,068 pounds in 1939. Shipments in 1940 comprised chiefly vanadium and carnotite ores (containing 2,067,106 pounds of vanadium) but also included salts obtained as a byproduct of complex ores (containing 23,495 pounds of vanadium). Output came from Arizona, Colorado, New Mexico, and Utah.

Arizona.—Vanadium was produced from operations of the Mammoth-St. Anthony, Ltd., near Mammoth, where complex ores containing recoverable gold, silver, lead, molybdenum, and vanadium are treated in the company flotation mill.

Colorado.—The output of vanadium in Colorado in 1940 amounted to 1,953,293 pounds in vanadium and carnotite ores. Purchase of custom ores by the United States Vanadium Corporation and the Vanadium Corporation of America stimulated the output of vanadium ore by small producers. The United States Vanadium Corporation continued to operate its 260-ton roasting, leaching, and vanadium oxide precipitation plant at Uravan. Some ore treated there came from an old operation at Rifle, Colo. The company also completed a uranium-concentration plant to reclaim uranium from accumulated tailings at its vanadium mill. The Vanadium Corporation of America reopened its property at Naturita, Colo., which had been idle since 1920. The North Continent Mines, Inc., built a mill for treating vanadium ores near Cedar, San Miguel County.

Utah.—Vanadium-bearing ores were produced from a number of rather widely scattered places in Utah. Shipments, which were higher than in 1939, totaled 203,238 pounds of contained V_2O_5 (113,813 pounds of V) in 1940 and originated in Grand and San Juan Counties in the southeastern part of the State.

FOREIGN TRADE

Imports of vanadium ores in 1939, all from Peru, totaled 22,551 short tons containing 2,574,951 pounds of V. Data on exports are not given by the Bureau of Foreign and Domestic Commerce. Producers reported no exports in 1940.

USES

The principal use of vanadium is in the manufacture of special alloy steels and irons; the trend toward higher vanadium content in modern high-speed tool steels is apparent, especially in those steels where all or part of the tungsten has been replaced by molybdenum. Chrome-vanadium steels find widespread use in railway, bus, and truck operation and are proving their usefulness in ordnance. A new class of ferro-alloys has been placed on the market under the trade name "Grainal." These are primarily vanadium-titanium-aluminum ferro-alloys, and it is claimed that they not only increase the hardening capacity of ferritic constructional steels of given chemical composition but also reduce the variability of a given composition in successive heats.[21] A minor quantity of vanadium is employed as a catalyst, in the form of ammonia metavanadate, in the manufacture of sulfuric acid, and in the nonferrous, glass, ceramic, and color industries. Vanadium is classified by the Army and Navy Munitions Board as one of the "critical" materials that are as essential as strategic materials and may be difficult to obtain but for a number of reasons probably will not present as serious a problem of supply.

WORLD PRODUCTION

The world output of vanadium in 1940 proceeded at about the same rate as in 1939, with Peru still the principal producing country. By obtaining greatly increased quantities of vanadium from blast-furnace slag, Germany is said to have become virtually independent of foreign sources of supply. A national cartel, Vanadium G. m. b. H., comprising three companies, is responsible for supplying German requirements. In Italy, vanadium is recovered from naphtha soot collected from the smokestacks of ships and industrial plants at a plant at Rivarole, Genoa; 50 metric tons of V_2O_5 were obtained from 974 metric tons of soot from July 1938 to June 1939. Construction of a new plant at Serra Rico near Genoa is contemplated. During the first 9 months of 1940, vanadium ores were produced and exported by the Southwest Africa Co., Ltd., of Grootfontein from its mines at Abenad and Baltika and by the Otavi Minen und Eisenbahn Gesellschaft of Tsumeb from its Nageib mine and prospecting claims.

[21] Strauss, Jerome, Vanadium in Steel: Metal Progress, vol. 38, No. 4, October 1940, pp. 389–390.

All production from the latter mine ceased on September 25, 1940. Ore reserves of 2,400,000 tons of oxide at properties of the Rhodesian Broken Hill Development Co., Ltd., are reported to contain 23.5 percent zinc and 0.83 percent V_2O_5. Additions to the acid and leaching plants and erection of a small flotation plant were expected to make vanadium production possible for many years.

World production of vanadium in ores and concentrates, 1936–40, in metric tons

BAUXITE AND ALUMINUM

By Herbert A. Franke and M. E. Trought[1]

SUMMARY OUTLINE

Spurred onward by the national defense program, production of aluminum in the United States during 1940 exceeded by 26 percent the high point reached in 1939. Consumption rose 35 percent above the 1937 and 1939 records to establish an all-time peak. During 1940 the basic price of aluminum was reduced 3 cents, an expansion in ingot and fabricating capacity was inaugurated for completion within 2 years on a scale that normally would take 2 decades, and the demand for aluminum became so great that priorities had to be imposed on the metal early in 1941 to conserve and wisely allocate it for defense and nondefense purposes. The price reduction from 20 to 17 cents a pound was made possible by economies brought about by increased production. The Aluminum Co. of America began expansions that will cost almost $200,000,000. The Reynolds Metals Co. announced the extension of its fabricating capacity and its entrance into the aluminum-ingot-producing field. Thus in 1941, for the first time in the history of the industry there will be more than one substantial producer.

By April 1941 military requirements were taking most of the aluminum supply, leaving only a fractional quantity for very important civilian needs. Imports of crude and semicrude aluminum increased 26 percent; exports declined 25 percent compared with 1939 but were the second highest on record.

The production of bauxite in the United States was the largest in 18 years, and imports climbed to a new high. Demand for the ore by the aluminum industry attained an unprecedented level in 1940. The abrasive and chemical industries, stimulated by defense activities, also consumed more bauxite than in 1939. Shipments (dried bauxite equivalent) from Arkansas mines continued to advance, enabling domestic output to rise 17 percent over that in 1939. Imports of bauxite advanced 21 percent over the 1939 record; and ex-

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

ports, chiefly to Canada, increased 39 percent. Apparent consumption in 1940 rose 22 percent over that in 1939, and domestic output was equivalent to 47 percent and net imports to 53 percent of the total. Quoted prices for bauxite were slightly above those in 1939.

Salient statistics of the bauxite and aluminum industries in the United States, 1938–40

[3] Estimated.
[4] New York: 99 percent plus, pure virgin ingot, according to Metal Statistics 1941, published by American Metal Market.
[5] Figures not yet available.

World output of bauxite and aluminum in 1940 is believed to have exceeded all previous records. Although official data are lacking it is estimated that world production of bauxite increased 7 percent and production of aluminum 20 percent over that in 1939. Defense and war efforts were focused on aluminum because lightness and high strength are essential in the manufacture of more efficient fighting aircraft and other military equipment.

BAUXITE

PRODUCTION

Production (mine shipments), dried bauxite equivalent, of bauxite in the United States in 1940 increased 17 percent in quantity and 19 percent in value over that in 1939 and was the highest on record since 1923 (see fig. 1). Mines in Saline and Pulaski Counties, Ark., supplied 97 percent of the total output and virtually all of the increased domestic production. For the first time Virginia produced a small tonnage of ore from very limited reserves in Augusta County. Shipments from Alabama (Barbour and Henry Counties) and Georgia (Sumter County) continued to decline.

Stocks of bauxite on hand at all mines and processing plants on December 31, 1940, totaled 167,828 long tons of crude ore and 9,088 of processed ore, compared with 149,377 tons of crude ore and 9,367 of processed ore on December 31, 1939.

Domestic bauxite mining and processing companies active in 1940 were: The Aluminum Ore Co., East St. Louis, Ill. (operated in Arkansas—processor only); American Cyanamid & Chemical Corporation, 30 Rockefeller Plaza, New York, N. Y. (in Arkansas and Georgia); Arkansas Bauxite Corporation, Bauxite, Ark. (in Arkansas—active only first 7 months of 1940); Bauxite Co. of Alabama, 1215 First National Bldg., Birmingham, Ala. (in Alabama); Consolidated Chemical Industries, Inc., 811 Petroleum Bldg., Houston, Tex. (in Arkansas); Crouch Mining Co., Inc., P. O. Drawer D, Bridge Station, Niagara Falls, N. Y. (in Arkansas); Dixie Bauxite Co., Inc., Sweet Home, Ark. (in Arkansas); Benjamin Easterlin, Americus, Ga. (in Georgia); Floridin Co., 220 Liberty St., Warren, Pa. (in Alabama); Norton Co., Worcester, Mass (in Arkansas—processor only); Porocel Corporation, 260 South Broad St., Philadelphia, Pa. (in Arkansas—processor only); and Republic Mining & Manufacturing Co., 230 Park Ave., New York, N. Y. (in Arkansas, Alabama, and Virginia). In addition to the above (except the Arkansas Bauxite Corporation), the following concerns definitely plan to produce bauxite in 1941: Bauxite Mining Corporation, subsidiary of Reynolds Metals Co., Federal Reserve Bank Bldg., Richmond, Va. (in Arkansas); Dulin Bauxite Co., 2222 Vance St., Little Rock, Ark. (in Arkansas); J. C. Hebble, Cartersville, Ga. (in Georgia and Alabama); and Reynolds Ore Co., subsidiary of Reynolds Metals Co., Federal Reserve Bank Bldg., Richmond, Va. (in Alabama, Georgia, Tennessee, and Mississippi).

[1] Includes small quantity of activated.
[2] Includes Virginia.
[3] Includes sintered.

In Arkansas in 1940 the American Cyanamid & Chemical Corporation shipped ore from the Rauch, Heckler, Ozark Nos. 24 and 28, and Townsend mines and the newly opened Cleveland mine. On August 1, 1940, the company acquired the recently developed Townsend mine and the West Bauxite drying plant of the Arkansas Bauxite Corporation. At the same time the Porocel Corporation purchased the West Bauxite activating plant. The Arkansas Bauxite Corporation abandoned its operations at the McDonald mine in the spring of 1940. In June 1940 the Crouch Mining Co. began to mine and calcine bauxite at its new Young property in Saline County, after abandoning its operations on the England property in Pulaski County. The new circular vertical shaft at the Young mine (about 300 feet deep) was sunk by the Layne-Arkansas Co., which employed a special 84-inch rotary drilling bit in sinking through difficult quicksand. The Republic Mining & Manufacturing Co., subsidiary of the Aluminum Co. of America, continued its former extensive open-pit and underground mining operations and early in 1941 began to expand its bauxite-drying-kiln capacity. In reply to the antitrust suit charges that the Aluminum Co. of America monopolizes the raw materials

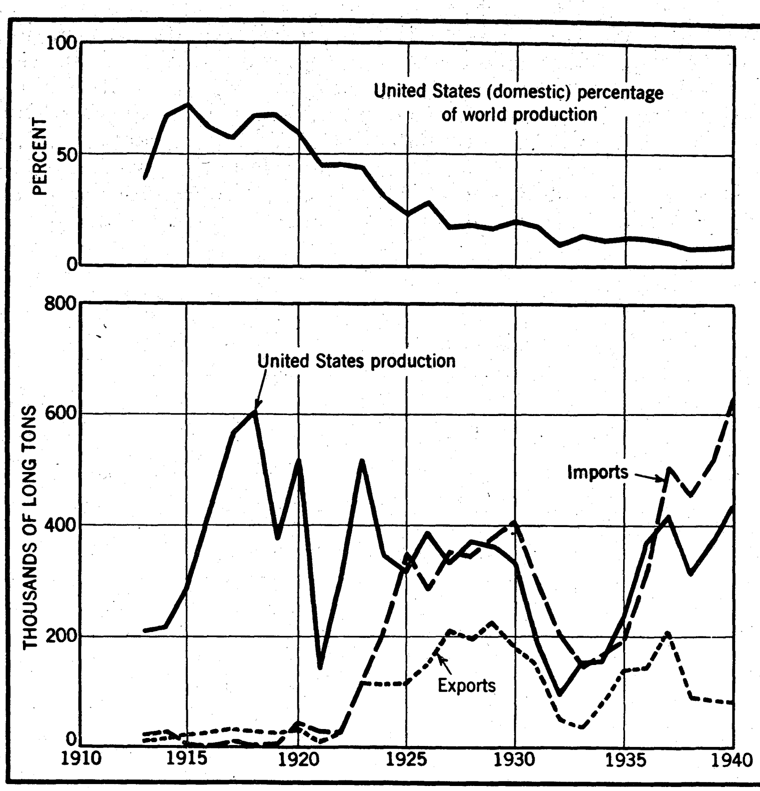

FIGURE 1.—Trends in production, imports, and exports of bauxite, 1913–40.

used in the production of aluminum, a Republic official testified that the company owned approximately 6,000,000 tons out of about 11,500,000 tons of known commercially recoverable bauxite in Arkansas. During most of 1940 Arkansas bauxite operators worked one shift 5 days a week or more instead of the former 4-day-week schedule.

In the other bauxite-producing States of the South, the Republic Co. continued to ship dried ore from southeastern Alabama and commenced a new small mining operation at Spottswood, Augusta County, Va.; the Bauxite Co. of Alabama—a new producer—and the Floridin Co. shipped crude ore from Barbour and Henry Counties, Ala.; and the American Cyanamid & Chemical Corporation and B. Easterlin continued to ship small quantities of dried ore from near Andersonville, Ga.

CONSUMPTION

The apparent domestic consumption of bauxite shown in the following table actually should be increased by a quantity almost equivalent to the exports reported, inasmuch as Canada takes most of the bauxite and alumina exported and uses it to manufacture crude abrasives, which are returned to the United States for final manufacture and consumption. Viewed from this standpoint, in 1940 the United States actually consumed approximately 1,072,000 tons of bauxite (dry basis). Net imports (imports minus exports) comprised 53 percent of the apparent consumption of bauxite in 1940 (shown in the table) compared with 55 percent in 1939 (see fig. 1).

Shipments, imports, exports, and apparent consumption of bauxite in the United States, 1936-40, in long tons

[Dried-bauxite equivalent]

Year	Domestic shipments from mines and processing plants to industry			Imports	Exports	Apparent consumption
	Arkansas	Alabama and Georgia	Total			
1936	352,919	17,056	369,975	322,790	144,445	548,320
1937	415,050	17,614	432,664	507,423	210,657	729,430

1939	335,647	13,689	349,336	520,179	86,540	782,975
1940	437,595	[1] 11,603	[1] 449,198	629,552	120,055	958,695

[1] Includes Virginia.

BY INDUSTRIES

The following table reports shipments of domestic bauxite from mines and intermediate processing plants to ultimate consuming industries. The consumption picture is incomplete insofar as it does not include imported or foreign bauxite. Although most of the bauxite imported from Surinam and British Guiana in 1940 was consumed by the aluminum industry a small part was used by the chemical industry. Netherlands Indies ore was received for manufacture of aluminum.

Litchfield [2] gives a timely description of the properties, uses, and preparation of bauxite and Lee [3] outlines the successive steps used in producing alumina from bauxite.

Aluminum.—Domestic shipments of bauxite from Arkansas and Alabama to the aluminum industry increased 33 percent over those in 1939 and comprised 48 percent of the total 1940 shipments. However, as in the year before, about three-fourths of the industry's ore requirements were imported from Surinam.

Abrasive.—Canadian and American aluminous abrasive manufacturing plants were consigned 29 percent of the domestic bauxite, or a quantity of ore 56 percent greater than that shipped to the industry in 1939.

Total value	$2,282,301		$2,722,403		$1,823,307		$2,448,038		$3,075,317	

[1] Includes crude, dried, and calcined, 1936–40; also activated, 1938–40, and sintered, 1939–40.
[2] Small quantity of bauxite shipped to makers of refractories probably included under "Abrasive."

Chemical.—Shipments of domestic bauxite to manufacturers of aluminum salts increased 2 percent in 1940 and comprised 18 percent of the total tonnage. Chemical consumers reported the consumption in 1940 of approximately 182,000 long tons of dried bauxite (58 percent domestic, 42 percent foreign), 8,047 short tons of alumina (dry equivalent), 2,076 tons of aluminum, and a quantity of clay, alunite, beryl, and chromite residue. Aluminum salts produced and shipped from these raw materials increased 4 percent. Shipments of alumina advanced 9 percent; of the total quantity, 31 percent was consumed in the manufacture of aluminum salts. Exports of aluminum salts, which were placed under export control April 15, 1941, advanced 25 percent in 1940 over those in 1939.

Oil refining, cement, refractory, and other.—Thermally activated bauxite has been used in oil refining as a highly efficient adsorbent; this use has been extended to the sugar [4] and other industries. A small percentage of domestic bauxite was consumed in the manufacture of aluminous refractories and as a flux in the steel and ferroalloy industries.

PRICES

The average selling price, f. o. b. mines and processing plants, in 1940 was $3.44 per long ton for crude (undried) bauxite; $5.51 for crushed dried bauxite; $14.30 for calcined bauxite; and $36.97 for activated bauxite. The average value for all grades of domestic ores as shipped by mine producers was $5.93 per ton ($5.77 in 1939).

Nominal quotations given in the following table are from Engineering and Mining Journal Metal and Mineral Markets:

Range of quotations on bauxite, 1938–40

Type of ore	Chemical specifications (percent)		Prices during year		
	Al_2O_3	SiO_2	1938	1939	1940
Domestic ore (per long ton):					
Chemical, crushed and dried [1]	55–58	[2]	$6.00–$7.50	$6.00–$7.00	$6.00–$8.00
Other grades [3]	56–59	5–8	6.00– 7.50	6.00– 7.00	6.00– 8.00
Pulverized and dried [3]	56–59	8–12	9.00–12.00	9.00–11.00	9.00–16.00

FOREIGN TRADE

Imports of bauxite in 1940 exceeded the previous peak reached in 1939 by 21 percent. Exports (dry equivalent) increased 39 percent. Of the 1940 imports Surinam supplied 585,993 long tons, British

[4] LaLande, Jr., W. A., Bauxite as a Sugar-refining Adsorbent: Ind. Eng. Chem., vol. 33, No. 1, January 1941, pp. 108–111: U. S. Patent 2,211,727.

Guiana 29,929, and Netherlands Indies 13,630. Imports by customs districts were as follows: 387,283 tons to Mobile, 190,282 to New Orleans, 45,450 to Philadelphia, 3,426 to Massachusetts, 2,611 to Sabine and 500 to New York. Of the exports in 1940, 75,035 tons were classified as bauxite and other aluminum ores, 6,860 tons as other bauxite concentrates, and 18 tons as alumina; of these, Canada was consigned 74,908, 5,318, and 14 tons, respectively. Of the remaining "other bauxite concentrates" 1,002 tons went to Sweden, 505 to Japan, 30 to Mexico, 4 to Switzerland, and 1 to France. Effective April 15, 1941, bauxite was subjected to export license.

Bauxite imported into and exported from the United States, 1936–40

Year	Imports for consumption [1] [2]		Exports (including bauxite concentrates) [3]	
	Long tons	Value	Long tons	Value
1936	322,790	$2,370,778	84,471	$2,322,915
1937	507,423	3,609,063	123,191	3,456,916
1938	455,693	3,521,325	57,726	1,459,491
1939	520,179	$3,765,140	51,635	$1,117,564
1940	629,552	4,298,969	81,913	1,542,703

[1] Also "alumina" as follows: 1936, 117 long tons valued at $11,618; 1937, 182 tons, $16,461; 1938, 64 tons, $5,464; 1939, 1 ton, $432; 1940, 11 tons, $1,743.
[2] Chiefly dried ore.
[3] As shipped.

ALUMINUM

PRODUCTION

Primary.—Impelled by the aircraft and rearmament programs, domestic production of primary aluminum in 1940 surpassed the peak reached in 1939 by 26 percent in quantity and 17 percent in value. The Aluminum Co. of America attained this large output by expanding aluminum-reduction facilities at existing plants and beginning operations in September 1940 at a fifth plant at Vancouver, Wash. Of the 412,560,000 pounds of new aluminum produced, 164,512,530 pounds were made at Alcoa, Tenn.; 142,003,223, at Massena N. Y.; 58,882,397 at Badin, N. C.; 37,173,893 at Niagara Falls, N. Y.; and 9,987,957 at Vancouver, Wash. At the end of 1940 aluminum was being produced at a rate exceeding 500,000,000 pounds a year, and the Aluminum Co. planned to produce about 585,000,000 pounds during 1941. By the end of 1941 the Aluminum Co. and its new competitor—the Reynolds Metals Co.—are expected to be producing at a rate exceeding 800,000,000 pounds a year. Further expansion in production and fabrication appears likely and it is reported that the government may finance some of the additional facilities. The value of aluminum produced in 1940 averaged 18.25 cents a pound compared with 19.75 cents in 1939.

It is understood that the Aluminum Co. of America will spend approximately $200,000,000 on increased facilities for defense purposes before the end of 1942, constructing permanent buildings and installing up-to-date equipment that can be used to whatever extent the market may require after the emergency is past. Any additional increases in production of aluminum will depend on the amount of power the company can obtain. Projects completed during 1940 and the first quarter of 1941 include: A large expansion in aluminum-reduction facilities at Alcoa, Tenn., and Vancouver, Wash.; a 375-ton addition to the 500-ton alumina plant at Mobile, Ala. (875 short tons capacity a day); a new carbon electrode plant at Vancouver, Wash. (60,000 tons capacity a year); a bauxite crushing and drying plant at Paranam, Surinam (150 metric tons capacity an hour); mining operations at Topibo Hill in Para Creek district, Surinam; acquisition of 10 old vessels from the Maritime Commission and 2 new ships by the Alcoa Steamship Co., for carrying bauxite from Surinam; extension of casting and forging plants and construction of a new extrusion plant at Los Angeles, Calif.; extension of the extrusion plant and construction of a new tube mill at La Fayette, Ind.; extension of the rolling mill at Alcoa, Tenn.; and addition of the Templin universal metal working or testing machine at Aluminum Research Laboratories, New Kensington, Pa. Work scheduled for completion later in 1941 and before the end of 1942 includes: Extensions to aluminum-producing facilities at Vancouver, Wash., Badin, N. C., Alcoa, Tenn., and Massena N. Y., and to alumina plants at East St. Louis, Ill., and Mobile, Ala.; the construction of a new large strong-alloy sheet mill of 60,000 short tons capacity a year at Alcoa, Tenn.; extension of the rolling mill at Edgewater, N. J., forging plants at Cleveland, Ohio, and Los Angeles, Calif., the wire, rod, and bar mill at Massena, N. Y., and the castings plant at Detroit, Mich.; hydroelectric projects at Glenville (27,000 kw.) on the Tuckasegee River in Jackson County, N. C., and at Nantahala (54,000 kw.) on the Nantahala River in Macon County, N. C.; the purchase of four foundry buildings in Bridgeport, Conn., to expand the company Fairfield (Conn.) operations; and the acquisition of six new ore-carrying vessels. Late in 1940 the company requested Bonneville power in addition to the 162,500 kw. already contracted for, but its request was refused. The company did obtain 10,000 kw. of additional power from Canada in 1940 but seeks more from this source as well as from the Tennessee Valley Authority. Completion of the Santee-Cooper hydroelectric project near Charleston, S. C., late in 1941 probably will provide the company with 30,000 kw. of electric energy. The company abandoned its intention to construct the Fontana hydroelectric project in February 1941 when the Federal Power Commission ruled that a license was required. If the additional power desired is obtained the Aluminum Co. of America will further increase its ingot production substantially at its Massena (N. Y.) and Alcoa (Tenn.) works.

A strike of workers at several Aluminum Co. of America plants was averted in July 1940, when a compromise wage increase of 2 cents an hour was effected for all employees whose wage-rate classification had not already been increased by that amount or more since October 1939. In October 1940 the company announced that employees drafted for military duty will receive 1 to 2 months' pay, depending on length of service, be permitted to accumulate seniority while on leave, and be reemployed after discharge from duty. Workers of the Congress of Industrial Organizations at the New Kensington sheet mill went on strike from November 21 to November 29, 1940, and at the Edgewater (N. J.) rolling mill from March 12 to March 24, 1941. The alumina plant at East St. Louis, Ill., was closed 37 days—from October 25 to November 30, 1940—by a strike of American Federation of Labor workers. The company made general wage increases to all employees in its 18 plants, effective April 26, 1941, which, when added to other increases made since October 1, 1939, will total 10 cents an hour. Salaried personnel also will receive increases.

The consolidated net income of the Aluminum Co. was $44,146,297 in 1940 compared with $36,633,389 in 1939.

The suit opened April 23, 1937, by the Department of Justice asking dissolution of the Aluminum Co. of America, charging that it is a monopoly in violation of the antitrust laws, continued from 1939 into 1940. On August 15, 1940, the Government and the defendants rested their cases, and Federal Judge Francis G. Caffey set December 2, 1940, for the filing of briefs and January 10, 1941, for the filing of reply briefs. On March 12, 1941, all hearings closed, and both sides awaited the judge's final decision. The long record is said to contain testimony approximating 41,700 pages and 1,800 exhibits of 15,000 pages.

In July 1940 the Reconstruction Finance Corporation authorized an industrial expansion loan of $15,800,000 to the Reynolds Metals Co., Federal Reserve Bank Building, Richmond, Va., for producing and processing aluminum. In November 1940 construction was begun at Lister near Sheffield, Ala., on plants capable of producing annually 100,000 short tons of alumina and 30,000 tons of aluminum. Operations commenced late in April 1941 at the alumina plant, and the aluminum-reduction plant is expected to be in production shortly thereafter. The company entered into a contract with the Tennessee Valley Authority in October 1940 for 60,000 kw. of electricity. In February and March 1941 the Bonneville Power Administration announced that it would grant the company 60,000 kw. of power for the production of 30,000 tons of aluminum in the Northwest, and the Reconstruction Finance Corporation advanced an additional $4,200,000. The reduction plant, to be at Longview, Wash., is scheduled to commence operations in August 1941 and will employ alumina shipped from Lister. A 10,000-ton reduction unit was transferred from Lister to Longview, thus making the Reynolds total aluminum-producing capacity 50,000 tons a year. The Soderberg continuous electrode furnace will be employed in both reduction plants.

With the aid of the Defense Plant Corporation, Reconstruction Finance Corporation subsidiary, the company is expanding its former aluminum-fabricating facilities and will operate a new $13,600,000 strong aluminum-alloy-sheet and shape plant at Lister with a capacity over 3,250 tons a month; a new $2,500,000 extrusion plant at Louisville, Ky., with a capacity of 2,000 tons a month; equipment added to the Louisville plant, increasing sheet-rolling capacity to 1,500 tons and rod-mill capacity to 750 tons a month at a cost of $3,000,000; and a portion of the foil-rolling mill at Richmond, Va., which will be converted to a strong alloy sheet mill. In addition to the Richmond plant the company operates aluminum-foil rolling mills at Louisville and at Glendale, Long Island, N. Y. The new strong alloy-sheet mill at Lister will be operated by a subsidiary, the Reynolds Alloys Co.

Up to May 1, 1941, the Reconstruction Finance Corporation had loaned Reynolds $20,000,000—including $13,500,000 for the Lister works and $6,500,000 for the Longview plants—and the Defense Plant Corporation had allotted $9,801,200 to the Lister alloy-sheet mill and $2,504,600 to the Louisville extrusion plant. In addition, the company is spending considerable sums from its own funds on an ambitious expansion program.

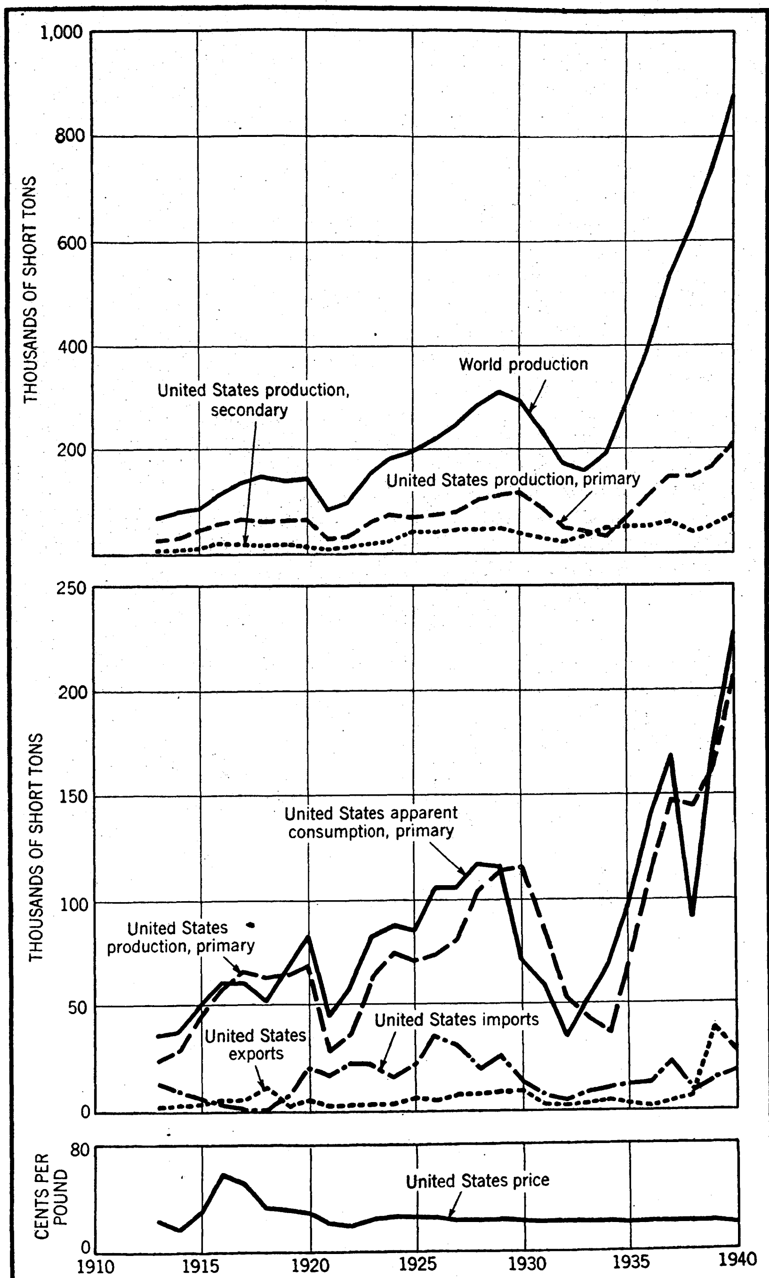

FIGURE 2.—Trends in production, imports and exports, apparent consumption, and average quoted prices of aluminum, 1913–40. Price is for No. 1 virgin 98–99 percent at New York through 1929, thereafter for 99-percent-plus virgin ingot, as reported by American Metal Market.

Reynolds will derive bauxite from Netherlands Indies, South America (Brazil and Surinam), and domestic deposits. The company has an exclusive contract with the Bauxite Co. of Alabama for its output and has organized two wholly owned subsidiaries—the Bauxite Corporation, to mine in Arkansas, and the Reynolds Ore Co., to mine in Alabama, Georgia, Tennessee, and Mississippi.

During 1940 Reynolds fabricated more than 20,000 tons of aluminum and earned a consolidated net profit of $2,428,277 compared with $1,526,891 in 1939.

Other concerns considering the domestic production of aluminum early in 1941 included the Standard Aluminum & Alloy Co., 11 South LaSalle Street, Chicago, Ill., which proposes to utilize the Seailles alumina process on low-grade or siliceous bauxite and the Ferrand aluminum-reduction cell; Kalunite, Inc., 81 Navajo Street, Salt Lake City, Utah, which owns patented processes for the recovery of alumina and potassium sulfate from alunite; and Aluminum, Inc., Marysvale, Utah, which also owns patents based upon alunite as raw material.

Secondary.—Complete data on the production of secondary aluminum in 1940 were not available when this report was prepared. A preliminary estimate places production at about 68,000 short tons in 1940. Of the 50,000 tons of secondary aluminum produced in 1939 by remelters, manufacturers, and foundries 34,900 tons (70 percent) were recovered from old scrap and 15,100 tons (30 percent) from new scrap. Further data on secondary aluminum in 1940 are given in the chapter on Secondary Metals—Nonferrous.

CONSUMPTION

In 1940 the apparent consumption of primary aluminum in the United States rose 35 percent above that in 1939 and in 1937—the two previous peak years (see fig. 2). The consumption of secondary aluminum also increased. Airplane makers used slightly more than four times the large quantity of metal consumed in 1939. The aircraft, ordnance, quartermaster, and other divisions of the Army and Navy placed large orders for air, land, and water transport equipment and for weapons, rolling field kitchens, mess kits, and other portable supplies requiring the use of aluminum because of its high strength and lightness. A 15-percent reduction in price made aluminum increasingly competitive with copper, steel, and other metals.

The United States produced 12,636 airplanes in 1940 (5,888 military and 6,748 commercial aircraft) compared with 5,856 in 1939 (2,141 military and 3,715 commercial aircraft). About 90 percent of the commercial planes are in the light-plane category, which consumes only minor quantities of aluminum, whereas most military planes use very large quantities of the metal. Of the finished weight of the average military airplane, aluminum comprises approximately 69 percent of the airframe, 23 percent of the engine, and 24 percent of the propeller.[5] Thus when the average monthly production of military aircraft advanced from 178 planes in 1939 to 490 in 1940 and approximately 1,100 in March 1941 it follows that increased consumption of aluminum in the aircraft industry alone has been enormous. Airplane output is expected to exceed 2,000 planes monthly by the end of 1941[6] and

[5] Brett, George, Procurement for Defense: Aviation, vol. 39, No. 8, August 1940, page 42.
[6] Fortune, How Many Planes When?: Vol. 23, No. 3, March 1941, pp. 82, 188, 190.

doubtless greater numbers of larger, heavier planes will be constructed, which will consume more aluminum per plane.

As long as aluminum remains on an industry-wide mandatory priority status new uses will be discouraged, and employment of the metal in some very important civilian fields must be discontinued in favor of substitutes. After the war is over capacity will be available to produce much more aluminum than ever before, and it is believed that the price will be lowered further to enable the metal to find new and more diversified markets.

Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1936–40

Year	Primary aluminum					Secondary aluminum	
	Production		Imports (pounds)	Exports (pounds)	Apparent consumption [2] (pounds)	Pounds	Value [1]
	Pounds	Value					
1936	224,929,000	$41,612,000	[3] 25,562,571	1,605,753	275,443,818	103,000,000	$19,055,000
1937	292,681,000	55,609,000	[3] 45,178,069	5,383,516	335,958,553	125,120,000	23,773,000
1938	286,882,000	56,659,000	[3] 17,740,281	12,618,078	179,045,203	77,600,000	15,326,000
1939	327,090,000	64,600,000	18,579,940	73,264,458	335,291,482	100,000,000	19,750,000
1940	412,560,000	75,292,000	34,870,887	53,771,478	454,034,409	(4)	(4)

1 Based on average price of primary aluminum as reported to Bureau of Mines.
2 Data not available on fluctuations in consumers' stocks. Withdrawals from producers' stocks totaled 26,558,000 pounds in 1936, 3,483,000 in 1937, 62,886,000 in 1939, and 60,375,000 in 1940; additions to producers' stocks totaled 112,959,000 pounds in 1938.
3 Crude and semicrude, some of which may be secondary aluminum.
4 Figures not yet available.

The percentage of primary aluminum used by industry in the United States in 1940 was approximately as follows: Transportation (air, land, and water), 40 percent; foundry and metal working, 23; machinery and electrical appliance, 9; cooking utensil, 6; electrical conductor, 5; building construction, 5; chemical, 5; ferrous and nonferrous metallurgy, 4; food and beverage, 2; and general miscellaneous, 1.

PRICES

Contrary to the trend for many other materials greatly in demand for the rearmament program, the open-market quotations in New York for 99-percent-plus pure ingot aluminum, delivered, in lots of 10,000 pounds or more, declined 3 cents during 1940—from 20 cents a pound at the beginning of the year to 17 cents before the close of the year. The first 1-cent price reduction was effective March 25, the second August 1, and the third November 18, 1940. Quotations for smaller lots down to 1 ton demanded a ½-cent premium and for less-than-ton lots a 1-cent premium. The 1940 reductions also included a downward adjustment in prices of fabricated products. The Aluminum Co. of America announced that these price reductions followed the company policy of passing along to the public the benefits of research and economies of operation.

The three successive price reductions for primary aluminum brought about uncertain conditions in the secondary market, and in the summer of 1940 quotations on scrap and secondary aluminum were regarded as purely nominal. In consequence of the keen competition for aluminum in the fall of 1940, consumers offered dealers sizable premiums for the immediate delivery of primary metal, and remelters could sell secondary metal at prices several cents above the official quotation for primary. Toward the end of the year the secondary-aluminum market became completely disorganized. Remelters were paying dealers 17 cents and more for old sheet scrap, and in turn quotations were raised to 22.5 cents for 99-percent-plus remelt aluminum. Conditions became worse; even the high price level for scrap did not materially alleviate the demand, and early in 1941 remelters were bidding against each other, disregarding price. Endeavors by leading smelters to discourage the runaway market were of little avail, and early warnings by the Price Stabilization Division of the National Defense Advisory Committee were unheeded. On February 24 and March 6, 1941, the Priorities Division of the Office of Production Management instructed companies with certain high-grade alloy scrap (17S, 17S Alclad, 24S, 24S Alclad, and 52S) to return it to the original source of supply for toll fabrication while mixed and other scrap was to be released to secondary smelters. On March 3, 1941, 11 cents a pound was established as a top price for mixed aluminum scrap sold by airplane manufacturers. To maintain price stability and prevent excessive and speculative price increases, Leon Henderson, Director of the Price Stabilization Division, on March 24, 1941, set ceiling prices on all scrap and secondary aluminum that allowed scrap dealers a margin of 1 to 1½ cents a pound and remelters a spread of 3 to 4 cents a pound on secondary ingot. In April 1941 trading between scrap dealers and remelters was practically at a standstill, as dealers were unwilling to take losses on metal that had been collected at higher prices and remelters complained that their spread was too small and that the lack of metal was forcing a curtailment in operations.

According to Metal Statistics 1941, dealers' 1940 buying prices per pound in New York for the principal grades of domestic aluminum scrap averaged 8.95 cents for cast aluminum (7.47 cents in 1939) and 14.47 cents for new-aluminum clippings (13.90 cents in 1939). The average selling price of remelted metal, 98½- to 99-percent grade, was 18.74 cents (19.38 cents in 1939), and of No. 12 alloy, No. 2 grade, 14.66 cents (13.28 cents in 1939). The Government price schedule sets a maximum price of 11 cents on cast and forged scrap when sold by makers and 12 cents when sold by dealers and 13 and 14½ cents, respectively, on pure clippings and cable, f. o. b. point of shipment. The price on secondary aluminum ingot, 98-percent pure, is set at 17 cents, and on No. 12 alloy at 16 cents a pound. Some amendments to the price schedule became effective May 5, 1941.

FOREIGN TRADE

Imports of crude and semicrude aluminum were 26 percent greater in 1940 than in 1939. Early in 1941 Canada, which supplied 84 percent of the metal imported in 1940, reduced its stipulated regular monthly shipments to the Aluminum Co. of America (1,500 short tons of ingot) because of increased British requirements. In 1940 imports (exclusive of scrap) comprised only 8 percent of the apparent consumption of primary aluminum. Of the imports of crude (17,435 short tons) 15,053 tons came from Canada, 2,240 from France, and 133 from Norway; of scrap (648 tons), 265 came from France, 196 from Canada, and 160 from the United Kingdom; and of semicrude less than 1 ton was received. The value of aluminum manufactures imported decreased 69 percent.

Aluminum imported into and exported from the United States in 1940

Class	Imports for consumption		Exports	
	Pounds	Value	Pounds	Value
Crude and semicrude:				
Crude metal, ingots, and alloys	34,869,763	$4,628,601	24,453,795	$5,352,151
Scrap	1,296,738	108,035	1,910,723	331,757
Plates, sheets, bars, rods, etc	1,124	592	29,317,683	12,235,124

Exports of crude and semicrude aluminum in 1940 were exceeded only by the record shipments in 1939 and were 25 percent less than that record. Most of the exports were made during the first half of the year, when aluminum exports were under moral embargo only. On July 5, 1940, the exportation of aluminum and its products was specifically prohibited, except under license from the Administrator of Export Control. Of the exports of crude in 1940 (12,227 short tons) 4,533 tons went to the United Kingdom, 1,735 to China, 965 to Brazil, 859 to France, 788 to Sweden, 693 to Argentina, 594 to Rumania, 535 to Australia, and 476 to Switzerland; of scrap (955 tons) 559 tons went to Japan; and of semicrude (14,659 tons) 6,351 tons went to the United Kingdom, 4,846 to France, 1,126 to Australia, 843 to Canada, and 341 to China. The value of aluminum manufactures exported increased 61 percent.

TECHNOLOGIC DEVELOPMENTS

Although aluminum and its alloys now constitute the most important structural material in aircraft manufacturing, Jackman[7] reports that the use of aluminum-alloy castings is still increasing because industry has been able to develop more rigid manufacturing control, X-ray analyses of all major castings, and designs checked by casting destruction tests. The tensile and compressive strength of strong aluminum alloys used in aircraft has been increased by cold-working methods that involve prestretching and precompressing. Forging billets of new strong aluminum alloys now are hot-pressed or kneaded before being forged into propellers and other aircraft parts to produce a product with more uniform fine-grain structure. Some aircraft

[7] Jackman, K. R., Modern Aircraft Materials and Their Testing: Jour. Soc. Auto. Eng. (Trans.), vol. 47, No. 5, November 1940, pp. 461–473, 496.

makers employ the relatively new stamping process to manufacture aluminum-alloy-sheet parts in small lots, using rubber pads in conjunction with simple dies of wood and metal in large hydraulic presses.[8] To speed aircraft production, fabricators have developed new methods for spot-welding aluminum.[9]

NATIONAL DEFENSE AND PRIORITIES

Aluminum and its ore, bauxite, were transferred from the strategic-material list of the Army and Navy Munitions Board to the critical-material group in March 1940; yet, paradoxically enough, aluminum was the first metal upon which formal mandatory priorities were invoked, and on May 1, 1941, it ranked as one of five metals (aluminum, magnesium, nickel, nickel steel, and tungsten) so distinguished. Nevertheless, aluminum has always been regarded as a material essential to national defense, and although a normal supply now depends largely on imported bauxite, in time of war the supply could be obtained entirely within the continental limits of the United States. However, if domestic production of bauxite had not been supplemented by imported South American ore during the past decade and a half the very limited commercial ore reserves would have been depleted to a very dangerous point. Under the present accelerated aluminum-production program commercial domestic reserves would last only a few years if all demands were focused upon them. Larger quantities of lower-grade high-silica ore, at present uneconomical, are believed available and could be utilized at greater cost in an emergency.

At the request of the Office of Production Management the Bureau of Mines made a survey late in March 1941 to check the production, capacity, and proved reserves of domestic bauxite. This survey revealed that reserves of ore are adequate at present and that production could be multiplied several fold within a few months with present equipment at the mines or under construction. Thus, if the importation of bauxite should become disrupted industry could for a short time depend on domestic reserves and facilities, chiefly in Arkansas, largely by changing operations from a one-shift-a-day to a three-shift-a-day basis. In March 1941 domestic production of bauxite (55,000 long tons) was running about 50 percent ahead of the monthly average for 1940, and if that rate should continue the 1941 output will set a new high record.

As the demand for aluminum was enhanced early in 1940 by preparations for national defense and the wars abroad, the Aluminum Co. of America began to expand its production facilities. In the summer of 1940 the National Defense Advisory Commission, however, estimated that further increases in production would be necessary to meet requirements of the defense program, and the Commission recommended that the Tennessee Valley Authority [10] and other power facilities be increased. The Reynolds Metals Co. then announced its intention

to produce ingot. In the fall of 1940 the Commission stated that completed facilities and contemplated increases in the production of aluminum ingot and fabricated products would be adequate to meet military and civilian requirements. Consumers were cautioned, however, that temporary delays were to be expected in the supply of some fabrications, particularly forgings, extrusions, and castings. Toward the end of 1940 shortages of aluminum in the aircraft and other industries were publicized by the press, but official investigations showed no serious deficiency in supplies for aircraft and other military items. As the aluminum situation became "tighter" during the fall months, unofficial or cooperative priorities were invoked by the Aluminum Co. of America upon request of defense authorities. Consumers were asked to show the necessity for their aluminum requirements.

Despite previous predictions to the contrary, early in 1941 it became obvious that the supply of aluminum would not suffice for all defense and all civilian needs. Aluminum scrap had failed to flow back into the market as expected; the British increased their consumption of aluminum and reduced the 3,000,000-pound monthly importation of ingot into the United States from Canada; the expansion in fabricating facilities necessitated the accumulation of larger working stocks, and for protection many industrial users had begun piling up inventory and making forward orders; and the rising national income increased civilian purchases of aluminum products. On February 24, 1941, aluminum was put under industry-wide, formal mandatory priority control by the Priorities Division of the Office of Production Management. At the same time aluminum was placed on the Priorities Critical List, enabling the Army and Navy to issue preference ratings against it. The general preference order issued by the Division on March 21, 1941, went into effect in April, as the Government began rationing aluminum supplies; defense orders received A preference ratings, and nondefense orders were given ratings from B-2 to B-8 which allots manufacturers certain stipulated percentages of their 1940 average consumption of low- and of high-grade metal. The Division, however, reserved the right to issue higher ratings for very important civilian needs above less-important military needs. Aluminum producers were required to set aside, under a B-1 rating, a reserve pool of 1 percent of production each month for an emergency stock pile. Aluminum producers also were told to submit monthly their complete booking of orders for the ensuing month, so that the Division could determine the relative preferences to be accorded to customers. Equal standing was given orders to be used directly or indirectly in filling British and Army and Navy defense requirements. Consumers were ordered to file reports regarding consumption, uses, and inventories. Although it is expected that defense needs will require most of the high-grade aluminum for some time, efforts are being made to free as much secondary and low-grade metal as possible for civilian use. Chaos ruled the secondary-aluminum market late in 1940 and early in 1941 (see Prices).

During the first quarter of 1941 all nondefense users of aluminum were warned informally to find substitute materials, and on March 8, 1941, E. R. Stettinius, Jr., Director of Priorities, issued an order reducing the number of aluminum ice trays furnished domestic users to conserve aluminum.

It appears that, although the demand for bauxite in the manufacture of aluminum, chemicals, abrasives, and other products will increase materially, 1941 consumption requirements will be met by a domestic production exceeding 600,000 long tons and imports exceeding 1,000,000 long tons. With domestic aluminum production exceeding 300,000 short tons in 1941, supplemented by metal imported from Canada, the United States also should be able to meet military but not all civilian metal needs in 1941, provided military requirements are not greatly increased.

WORLD BAUXITE AND ALUMINUM INDUSTRIES

It is estimated that world production of bauxite in 1940 totaled approximately 4,627,000 metric tons—a 7-percent increase over the 4,306,000 tons estimated for 1939.

The world output of aluminum is believed to have totaled approximately 803,000 metric tons in 1940—a 20-percent increase over the 667,000 tons estimated for 1939.

[1] Estimated production. Estimates for 1939 and 1940 by the authors.

REVIEW BY COUNTRIES

Foreign trade, production, and industrial data are not available for most countries for 1940 due to the hostilities in Europe and Asia. All "estimated" bauxite- and aluminum-production figures given in the foregoing tables for 1939 and 1940 are based upon various press releases and the personal opinion of the authors and others. Official data probably will not become available until after war ceases.

Australia.—The Australian Aluminum Co. Pty., Ltd., began to construct an aluminum strip and sheet rolling mill at Granville, New South Wales, in the fall of 1940. Although aluminum ingots will be imported for this mill another concern—White Metals (Australia) Pty.—plans to produce 2,000 tons of primary aluminum annually near Sydney, utilizing low-grade bauxite from New South Wales.

Brazil.—The Companhia Geral de Minas, through Byington & Co., has contracted to supply the Reynolds Metals Co. with 100,000 metric tons of aluminum-grade bauxite in 1941 and 1942 from its Poços de Caldas deposits in Minas Gerais. In the past the company has mined and processed ore chiefly for shipment to São Paulo and Buenos Aires for the manufacture of aluminum sulfate. Other producers of bauxite include Lindolpho Pio da Silva Dias, Poços de Caldas; M. C. Fonseca e Co., Muquy, Espirito Santo; and Co. Electro-Chimica Brasileira, Ouro Preto, Minas Gerais. The exportation of large quantities of bauxite from Brazil, though favored by large, high-grade ore reserves and low mining costs, has been hindered by high freight rates and the lack of transportation facilities. Exports to Argentina totaled 18,279 tons in 1939 and only 82 tons in 1940.

Canada.—It is understood that the Aluminum Co. of Canada, Ltd., has expansions underway at Arvida, Quebec, more than doubling its former aluminum-producing capacity. Although the British Ministry of Supply contracted for all of the exportable surplus aluminum for 1940 and 1941, on April 20, 1941, it was announced that the United States also would receive a share of the Canadian aluminum output for use in its defense program. On October 16, 1940, Canada prohibited the importation of aluminum and its products without a license from the Minister of National Revenue to help conserve the supply in the United States and to prevent confusion in the rationing regulations of Canada. Rigid control on aluminum not only applies to imports and exports, but domestic consumption for nonwar purposes also has been drastically curtailed. The basic price on 99-percent aluminum in 1-ton lots advanced from 20 cents to 22 cents a pound in November 1939 and to 23 cents in March 1941. During the first 4 months of 1940 Canada exported 25,588 metric tons of crude aluminum.

Germany.—By early 1941 Germany had gained control of the largest aluminum industry in the world; the conquest of France made available bauxite mines and alumina and aluminum plants, the occupation of Norway cheap hydroelectric power and aluminum plants, and the "protection" of Denmark large stocks of Greenland cryolite. Germany's dominating influence over Hungary, Italy, Rumania, Austria, and Switzerland also provides an adequate supply of bauxite and additional aluminum producing and fabricating works. After completion of its expansion program in 1939, making the total annual aluminum capacity exceed 200,000 tons, the German industry immediately proceeded with further extensions. The output of aluminum in 1940 probably was restricted somewhat by the limited facilities for transporting bauxite, the large demand for steam and hydroelectric power by other industries, and the British Royal Air Force bombing of aluminum works, railroads, and canals. Of the eight aluminum-reduction and five alumina plants in Germany and Austria,[11] at least the Rheinfelden, Lautawerk, Erftwerk, Lippewerk, and Bitterfeld works were British Air Force targets.[12] Large quantities of aluminum continued to be substituted for deficient metals. To simplify utilization of large quantities of scrap, German industry planned to standardize and reduce the number of aluminum alloys. On December 7, 1940, the basic price on aluminum, which had remained unchanged at 133 reichsmarks per 100 kilograms since 1938, advanced slightly.

Greece.—Inasmuch as large stocks of undisposed bauxite had accumulated by early 1941 and exports totaled only 1,000 tons during the first 9 months of 1940 it is reasonable to assume that bauxite mines suspended operations in Greece owing to the lack of shipping facilities.

Guiana, British.—It is estimated that in 1941 the Demerara Bauxite Co., Ltd. exported over 600,000 tons of bauxite to Canada, the United Kingdom, and the United States. It is understood that the Berbice Co., Ltd., is proceeding to construct a plant in British Guiana to process ore from its 4,000-acre concession.

Guiana, Dutch.—The new bauxite crushing and drying plant of the Surinaamsche Bauxite Maatschappij at Paranam commenced operations February 15, 1941. Ore is transported to the plant by rail from the newly developed mines about 7 miles away at Topibo Hill in the Para Creek district. The Paranam plant has a capacity for 150 tons of dried bauxite an hour, whereas the older company plant at Moengo Hill on the Cottica River can produce only 100 tons an hour. Early in 1941 the N. V. Billiton Maatschappij began to construct a plant on the Surinam River near Paranam for treating bauxite, which also will be mined and transported from the Para Creek district.

Hungary.—Another alumina plant, of 20,000 tons annual capacity, and an aluminum-reduction works, of 10,000 tons capacity, are to be erected at Ajka by the Hungarian Bauxite Mine, Ltd., and the United Incandescent Lamp & Electric, Ltd. A 250,000,000-kw. steam power plant is to be built at the same time and will commence operations in 1942.

India, British.—In July 1940 alumina was conditionally exempted by the Government from an import duty, apparently to encourage the production of aluminum at a plant proposed in Travancore by the Aluminium Production Co. of India, Ltd. The Aluminium Corporation of India, Ltd., did not complete construction of its aluminum works in 1940 in Bihar, using Indian bauxite, as the war delayed deliveries of equipment.

Italy.—In 1940 Italy produced an estimated 40,000 tons of primary and 10,000 tons of secondary aluminum, 178,500 tons of alumina, and 3,000 tons of artificial cryolite. Of the primary metal, Montecatini plants at Bolzano and Mori supplied 51 percent, the Soc. Alluminio Veneto An. plant at Porto Marghera 41 percent, and the Canadiain plant at Borgofranco 8 percent. On September 23, 1940, the Monte-

[11] Anderson, Robert J., The German Aluminum Industry: Mining Mag. (London), vol. 62, Nos. 4 and 5, April 1 and May 4, 1940, pp. 201-212, 274-284.

[12] Engineer (London), Air-force Targets in Germany: Vol. 170, Nos. 4423, 4424, and 4425, October 18, October 25, and November 1, 1940, pp. 252-253, 263-265, and 279-280.

~~catini and~~ Soc. Alluminio Veneto An. organizations were authorized to increase capacity further. A 450,000,000-kw. hydroelectric project at Bressanone began operations in September 1940, and a 600,000,000-kw. project at the Resia Lakes will be completed in 1941. Of the alumina produced in 1940, Montecatini's two works at Porto Marghera produced 42 percent, Soc. Alluminio Veneto An. works at Porto Marghera, Bussi, and Civitavecchia 56 percent, and the Soc. An. Industrie Chimiche at Traviglio 2 percent. The Civitavecchia works first began operations late in 1940. Early in 1940 experiments were begun at Bagnoli by the Soc. Italiana Potassa to recover alumina from leucite as the industry became apprehensive about the adequacy of the Istrian bauxite reserves and bauxite-mining operations had to be extended to southern Italy. The Soc. An. Leucite Potassa Alluminio is extending its alumina and potash plant at Castellina Chianti and expects to construct a new one at Orvieto based upon leucite raw material. Plans are to produce 50,000 tons of aluminum in 1941, 60,000 in 1942, and eventually 100,000. Aluminum plants at Porto Marghera are said to have been bombed in 1940 by the British Royal Air Force.

Japan.—Japanese industry claims that it would be impractical for the Government to carry out its proposed merger of the many small aluminum concerns into two big groups—one using imported bauxite and the other employing subsidized Empire alunite, alum shale, aluminiferous schist, clay, and phosphatic alum. Present alumina and aluminum producers using bauxite raw material are: Japan Electro-Industrial Co. (Ohmachi and Koyasu); Japan Aluminium Co. (Takao, Formosa Island and Kurosaki, Kyushu Island); Japan Soda Co. (Takaoka); Japan-Manchuria Aluminium Co. (Koriyama and Iwase); Sumitomo Aluminium Reduction Co. (Niihama); and the Japan Light Metals Co. (Higashi-Gambara). Although the Manchuria Light Metals Co. (Antung and Fushun, Manchuria) apparently is the only active metal producer using Empire raw material, the Kokusan Light Metals Co. (Toyama Prefecture), Toa (Asia) Light Metals Co., Korea Nitrogen Fertilizer Co. (Konan, Chosen), Korean Chemical Industrial Co. (Shingishu, Chosen), and the Korea Riken Metals Co. plan to employ it in the future. The Oriental Aluminium Co. (Kamioka and Omuta) and the Oriental Metals Co. (Yakushima) propose to use Palao or other bauxite and the North East Aluminium Development Co. (Koriyama) intends to purchase manufactured alumina. Bauxite shipments to Japan in 1940 aggregated 234,894 tons from the Netherlands Indies, 59,320 from the Federated Malay States (Johore), and possibly a small tonnage from Palao Island.

Netherlands Indies.—In 1940 the N. V. Billiton Maatschappij produced 275,345 tons of bauxite on the island of Bintan [13] and shipped 234,894 tons to Japan, 39,623 to the United States, and 14,469 to the United Kingdom. Construction of the new company power, alumina, and aluminum-reduction plants in Sumatra is expected to be completed in 1942.

Norway.—Operations are believed to have been curtailed severely in 1940 at the six aluminum-reduction plants owing to the lack of imported bauxite and alumina. Domestic labradorite has been mentioned as a possible raw material for the industry. Late in 1940, however, German interests organized the Nordische Aluminium

[13] Van Bemmelen, R. W., Bauxite in Netherlands Indies: Dienst van den Mijubouw in Nederlandsch-Indië No. 23 (Landsdrukkerij, Batavia), 1940, 115 pages.

Aktiengesellschaft to augment German aluminum supplies, and perhaps the plants now are being supplied with alumina. In April 1941 the British bombed the Hoyanger aluminum works. During the first quarter of 1940 Norway exported 9,647 tons of crude and 195 tons of semicrude aluminum.

Nyasaland.—Development work by the Anglo-American Corporation of South Africa reveals reserves of about 60,000,000 tons of commercial bauxite on Mlanje Mountain, southeastern Nyasaland.

Sweden.—Experiments by the Svenska Aluminiumkompaniet and the Boliden Mining Co. on the extraction of alumina from andalusite are said to have been successful, and an alumina plant to supply the Månsbo reduction works is contemplated. A scrap-collecting campaign conducted in the summer of 1940 netted considerable aluminum.

U. S. S. R.—The three Soviet aluminum-reduction plants operated at only partial capacity in 1940; it is estimated that, of the total metal output, Dnepr supplied 32,000 tons, Volkhov 13,000 tons, and the new partly completed Kamensk (Ural) works 10,000 tons. The present annual capacity of the Dnepr and Volkhov plants is believed to be 35,000 and 15,000 tons, respectively, and the final capacity of the Kamensk plant will be 50,000 tons. However, the total capacity of these plants is to be increased from 100,000 to 110,000 tons by 1942, and reduction plants are to be added at Kandalaksha (Karelia) and Rybinsk. The U. S. S. R. should be able to produce about 90,000 tons of metal in 1941 and 115,000 tons in 1942. The industry remains essentially dependent for raw material on bauxite, which apparently is not too plentiful. Soviet secondary-aluminum output in 1940 is estimated at 18,000 tons.

United Kingdom.—Aluminum production capacity is believed to have been greatly increased during 1940, as the reduction plant at Lochaber, Scotland, was extended and the new plant at Resolven, Wales, probably was completed. On August 14, 1940, the control of aluminum, bauxite, cryolite, and silicon was transferred from the Minister of Supply to the Minister of Aircraft Production and a licensing system put into effect on the use of secondary aluminum. All primary aluminum produced is sold to and distributed by the Ministry. The public appeal for pots and pans and other aluminum household articles in July 1940, the collection of aluminum from fallen German aircraft, and the careful sorting and melting of manufacturers scrap have yielded a substantial production and consumption of secondary aluminum. Virtually all of the output of aluminum is absorbed for aircraft and naval construction, and by September 1940 aluminum released for civilian use had been restricted to 46 tons or 2 percent of pre-war consumption.

In 1939 the United Kingdom imported 306,961 metric tons of bauxite—243,433 tons from France, 34,600 from Greece, 12,369 from British Guiana, and 16,559 from other countries. After the fall of France in June 1940 bauxite imports from that country ceased, and importations from Greece became negligible.

Yugoslavia.—In 1939 Yugoslavia exported 266,513 tons of bauxite, including 257,495 tons to Germany and 8,703 to Sweden. The production of bauxite declined appreciably in 1940, as exports to Germany were largely blockaded. Of the 1,642 tons of crude aluminum exported in 1939, 995 tons went to Japan. In 1940 the capacity of the aluminum-reduction works at Lozovac was increased to about 3,000 tons a year.

MERCURY

By H. M. Meyer and A. W. Mitchell

SUMMARY OUTLINE

The outstanding feature of the mercury industry in the United States in 1940 was the response of domestic mines to the record-breaking average price for the year. Under the stimulus of an average annual quoted price at New York of $176.87 a flask domestic output more than doubled, amounting to 37,777 flasks compared with 18,633 in 1939, and was the highest on record since 1883. This sharp advance was brought about by an increased rate of operations at producing properties, the reopening of idle mines, and the opening of new ones. In consequence, for the first time since the World War of 1914–18 (except in 1931) domestic mines filled domestic requirements and had a surplus for exportation. In 1931 the high price for mercury abroad coupled with the depressed condition of industry in the United States resulted in a price differential in favor of selling in world markets. In 1940 cartel-supported prices again sharply favored disposing of metal in the international market despite the record-breaking annual price in the United States, where the market is protected by a tariff of $19 a flask. Disruption of ocean transportation, scarcity of bottoms, and blockades caused by the war brought demand for United States metal in markets ordinarily supplied by the international cartel. Exports for the first 6 months of the year aggregated 5,469 flasks. By May shipments of domestic metal had risen to nearly 2,300 flasks, or to considerably more than the normal average monthly output of domestic mines. The May rate of exportation defeated the beneficial effects of increased domestic production and prompted consumers to draw on stocks to fill requirements. Although exports dropped to 1,383 flasks in June, domestic consumption plus exports continued above the increased supplies from domestic mines. On July 2 the President signed a measure placing certain strategic materials, including mercury, under export control. The effects of this measure were evident immediately. In May and June shipments to Japan totaled 1,265 flasks and in July 278 flasks; for the remainder of the year they were nonexistent. On the other hand, following the Government policy of all-out aid to the British Empire, exports to the United Kingdom were 2,507 flasks in the first half and 2,671 flasks in the latter half of the year. The export-control measure succeeded in curtailing total exports in the latter part of the year, and domestic production continued to rise, so that, temporarily, at least, the problem of adequate supplies of metal was solved. Producers' statements, however, disclosed that higher prices were enabling them to treat ores containing a lower average grade of metal, and several properties that were opened under the stimulus of high prices produced for a short time and quickly exhausted their ore reserves. Opinion varied as to whether or not peak effort at domestic mines was desirable when the country was not even at war. Some authorities felt that depletion of limited ore reserves was too high a price to pay for temporary self-sufficiency. On the other hand, the domestic industry has solved a critical problem of supply at a time when mercury was urgently needed and when adequate alternative sources of the metal were available only at much higher prices.

As in 1914, the first year of World War I, consumption did not advance appreciably over the average for the previous 5-year period. Large Navy purchases of mercuric oxide for antifouling paint in the first quarter of 1941 sent monthly consumption figures soaring. The average monthly consumption for 1940 was 2,200 flasks, but that for the first 3 months of 1941 was 3,900 flasks. Use of metal in filling Navy needs was almost completed in January-March 1941, however, and additional requirements for the current year were expected to be very small.

As a result of the large domestic production in 1940, the export-control provision that prevented expansion of shipments to some countries, and the failure of domestic consumption to increase appreciably, conditions of supply and demand were in satisfactory relationship despite the absence of normal imports, and stocks in consumers' and dealers' hands at the end of the year were higher than at its beginning.

Salient statistics of the mercury industry in the United States, 1936–40

[Flasks of 76 pounds]

	1936	1937	1938	1939	1940
Production flasks	16, 569	16, 508	17, 991	18, 633	37, 777
Number of producing mines	87	101	91	107	159
Average price per flask:					
New York	$79. 92	$90. 18	$75. 47	$103. 94	$176. 87
London	$64. 33	$69. 65	$66. 92	$88. 26	201. 10
Imports for consumption:					
Pounds	1, 374, 652	1, 437, 712	179, 522	265, 944	12, 971
Equivalent flasks	18, 088	18, 917	2, 362	3, 499	171
Exports:					
Pounds	19, 980	34, 485	54, 161	91, 789	730, 877
Equivalent flasks	263	454	713	1, 208	9, 617
Apparent new supply flasks	34, 400	35, 000	19, 600	20, 900	[1] 26, 600
From domestic mines percent	47	46	88	83	100
Stocks in warehouses (bonded) at end of year flasks	2, 513	4, 286	553	3, 110	901

[1] Actual consumption as reported by consumers.

Reserves.—At the request of the Office of Production Management the Bureau of Mines undertook a questionnaire survey of domestic mercury-ore reserves as of March 1, 1941. The reserves to be reported were those available at prices prevailing when the study was made (about $175 a flask) and were also to show their mercury content. Information was also requested on the amounts of production possible at various price levels, beginning at $100. It is a well-known geologic fact that mercury occurs too erratically to justify development of reserves in advance of production; consequently, engineers disagreed regarding the value of any data compiled on this subject. Nevertheless, mines that represented 78 percent of production in 1940—29,500 flasks—furnished data that could be translated into reserve estimates by making relatively conservative assumptions. For these properties a reserve of nearly 92,000 flasks at about $175 was indicated, or about 37 months' production at the 1940 rate. The total quantity reported was to come from ore averaging 4.5 pounds to the ton, whereas production for 1937–39 came from ore averaging 6.6 to 7.4 pounds; in 1940 it was from ore averaging 6.3 pounds. As reserves were distributed unevenly these figures do not indicate that output could be maintained at these properties for over 3 years at the 1940 rate. Of the 92,000 flasks, 56,000 were in California and 31,000 in Oregon. Statements for other areas were less complete than for those two States. Mines that contributed 61 percent of the 1940 production total attempted to estimate production at various price levels. They reported reserves of 80,000 flasks, of which only 8 percent would be available at less than $100, 36 percent at $100 to $150, and 56 percent at over $150. The compilations indicate the exceptionally pessimistic outlook of the industry for continuance of domestic production under more normal prices. Several producers felt that prices of about $175 a flask or more are needed to maintain their production at 1940 levels. This feeling apparently is at variance with opinion in the Price Stabilization Division of the National Defense Advisory Commission, which issued a statement on March 28, 1941, warning that prices for mercury were too high, after considering several factors in addition to domestic supply, such as the possibility of importation and substitution and alternative methods of price administration. One result of the study of reserves was to point out the effects of depletion at four mines that produced nearly 10 percent of the 1940 output but were idle in March 1941 due to exhaustion.

Procurement Division contracts.—During 1940 the Procurement Division of the Treasury Department signed contracts with producers for the delivery of certain quantities of mercury over about a year. The Procurement Division released no information on these purchases, but the technical press published a report that the New Idria Quicksilver Mining Co. had signed a contract to deliver 5,000 flasks of metal at $150 a flask. A company in Arkansas was unable to make deliveries against its contract, and the contract was canceled.

Monthly compilations.—With completion of final data covering 1940 production the Bureau of Mines was able to test the accuracy of its monthly reports on this phase of the industry. Addition of monthly figures indicated a production for the year of 36,300 flasks, and final figures were 37,777 flasks—a difference of 4 percent. Monthly output data were based upon reports from 36 to 59 mines that had produced 94 to 97 percent of the output in 1939 and from 4 to 14 new mines. The final canvass covered several hundred names; 159 mines reported production. Monthly consumption reports represent all that is available on the actual use of mercury in 1940. The same applies to consumers' and dealers' stocks, which represent figures given by reporting companies and which were increased so that they are believed to cover virtually all stocks of mercury in the form of metal available for consumption. Stocks in the hands of persons or companies not identified with the industry and metal in boilers and other plants that could be used if required are not covered by the Bureau of Mines figures. The assistance of D. E. Adams in the preparation of monthly reports is acknowledged.

Production, consumption, and stocks of mercury in the United States in 1940, by months, in flasks of 76 pounds

Month	Production	Consumption	Stocks at end of period		
			Consumers and dealers	Producers	Total
January	1,800	2,300	13,000	528	13,600
February	2,200	2,000	12,500	346	12,800
March	2,500	1,800	13,200	859	14,100
April	2,700	1,900	13,200	624	13,800
May	3,100	2,100	12,300	510	12,800
June	3,000	2,400	11,500	634	12,100
July	3,200	2,200	12,000	592	12,600

December	3,700	2,100	14,100	607	14,700
	36,300	26,600	14,100	607	14,700

Bureau of Mines and Geological Survey activity.—The Mining Division of the Bureau of Mines explored by bulldozing and surface sampling in the Bottle Creek district, Humboldt County, Nev. A small deposit of commercial ore was uncovered, which was estimated to contain a few thousand flasks of mercury, the quantity depending on the depth to which the deposit is ultimately found to extend. The investigation helped to add materially to previous knowledge of the conditions favorable to localization of ore shoots and to develop exploration technic. Plans were made for exploring mineral deposits at Coso Hot Springs, Inyo County, Calif., and for trenching and diamond drilling in two localities in Pike County, Ark., in 1941.

The mercury deposits in San Luis Obispo County and some in Monterey County, Calif., were studied by the Geological Survey. They investigated the Coso district, Inyo County, geologically and are cooperating in the drilling now being done there by the Bureau of Mines. Field work was begun in the New Idria district, San Benito County and preliminary work was done on several other quicksilver districts in California. Two reports on earlier studies by the Geological Survey are Bulletin 922–B on the Mount Diablo district and Bulletin 922–L on the Mayacmas and Sulphur Bank districts.

A preliminary study was made of prospects in the Steens and Pueblo Mountains, Harney County, Oreg. The Opalite, Bretz, and nearby mines in Malheur County and in the neighboring part of Nevada were also studied, as were several scattered mines in other parts of Oregon.

The Ivanhoe district (Elko County), Wild Horse district (Lander County), and Relief, or Antelope Springs, and Mt. Tobin districts (Pershing County), Nev., as well as some smaller districts, were studied. In addition, several mercury districts and scattered prospects were visited for the purposes of bringing up to date information acquired in previous investigations and of taking preliminary steps toward study of promising areas. Bulletin 922–E on the Buckskin Peak mercury mine (Humboldt County) and Bulletin 922–A on the Bottle Creek district (Humboldt County) were issued in 1940.

The deposits in and near Pike County, Ark., were studied by geologists of the Survey in connection with explorations by the Bureau of Mines.

PRICES

During the first half of 1940 domestic prices for mercury continued the uptrend begun in September 1939, when war was declared abroad, and only a minor set-back in April interrupted the steady advance. The monthly peak of $197.36 for a flask of 76 pounds, obtained in June, had been exceeded on only two previous occasions—January and February 1916—when the quoted averages were $231.50 and $283.50, respectively, for flasks containing 75 pounds.

With domestic production reaching high levels and with restrictions placed on exports early in July prices began to drop, trending downward throughout the second half of the year.

Although monthly prices for mercury in 1940 had been exceeded previously the annual average of $176.87 was the highest ever recorded. There can be little doubt that this high price enabled domestic mines to produce more than enough metal for domestic requirements during the year. In recent years it has been normal to import an appreciable part of domestic needs.

Average monthly prices per flask (76 pounds) of mercury at New York and London and excess of New York price over London price, 1938–40

Month	1938			1939			1940		
	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London

[1] Engineering and Mining Journal, New York.
[2] Mining Journal (London) prices in terms of pounds sterling converted to American money by using average rates of exchange recorded by the Federal Reserve Board, through August 1939 and from April 1940 to the end of that year; during the intervening period prices were quoted in American money.
[3] London excess.

London monthly quoted prices ranged from $13.20 a flask under the New York price in May to $51.55 over it in November. Except for May and June the London price was consistently larger than the domestic one; this condition prevailed despite the tariff of $19 a flask for metal imported into the United States. Mercurio Europeo continued to market metal in London for a few weeks in 1940, apparently because of difficulties attending the establishment of a new agency in a strategic location. Plans to sell mercury in Brussels collapsed, and the cartel began to sell mercury directly to customers. Later the Consortium International du Mercure, Basle, Switzerland, was formed to handle cartel metal. Early in 1940 cartel prices for mercury were quoted at $200 a flask f. o. b. ports of origin. In December the price was raised to $250 a flask.

CONSUMPTION

The Bureau of Mines has compiled monthly statistics covering actual consumption of mercury from September 1939 to date (May 1941). These indicate that consumption in 1940 totaled 26,600 flasks, whereas apparent consumption calculated by the conventional method of production plus imports minus exports would be 28,300 flasks. A comparison of the two totals for 1940 would indicate an increase in stocks, and consumers' and dealers' stocks actually did show a gain approximating the difference.

Supply of mercury in the United States, 1936–40

[Flasks of 76 pounds]

Year	Production (flasks)	Imports for consumption (flasks)	Exports (flasks)	Apparent new supply		
				Total (flasks)	From domestic mines (percent)	Imported (percent)
1936	16,569	18,088	263	34,400	47.4	52.6
1937	16,508	18,917	454	35,000	46.0	54.0
1938	17,991	2,362	713	19,600	88.0	12.0
1939	18,633	3,499	1,208	20,900	83.3	16.7
1940	37,777	171	9,617	[1] 26,600	100.0	----------

[1] Actual consumption as reported by consumers.

REVIEW BY STATES

Production of mercury in the United States in 1940 was double the quantity reported for 1939. Notable production gains were made in virtually all States. The principal producing mines in 1940 were as follows:

Arizona—Gila County, Ord group; Maricopa County, Pine Mountain mine.

Arkansas—Pike County, Parker Hill mine.

California—Contra Costa County, Mount Diablo mine; Lake County, Great Western, Mirabel, and Sulphur Bank mines; Napa County, Oat Hill mine; San Benito County, Aurora and New Idria (including San Carlos) mines; San Luis Obispo County, Klau mine; Santa Barbara County, Falcon (Santa Ynez) mine; Santa Clara County, New Almaden mine; Sonoma County, Cloverdale and Mount Jackson mines; Yolo County, Reed mine.

Idaho—Washington County, Idaho-Almaden mine.

Nevada—Churchill County, Wild Horse mine; Humboldt County, Blue Bird, Blue Can (including Baldwin), and Cahill mines; Mineral County, Mina Mercury (Lost Steers) mine; Pershing County, Mount Tobin mine.

Oregon—Douglas County, Bonanza mine; Jefferson County, Horse Heaven mine; Lane County, Black Butte mine; Malheur County, Bretz mine.

Texas—Brewster County, Chisos and Rainbow mines.

The 29 mines produced 86 percent of the United States total. The 16 most important mines in 1939 produced 88 percent of the total.

Mercury produced in the United States, 1937–40

Year and State	Producing mines	Flasks of 76 pounds	Value [1]
1937:			
Arizona	3	37	$3,337
California	54	9,743	878,624
Nevada	20	198	17,855

	159	37,777	6,681,618

[1] Value calculated at average price at New York.

Alaska.—Mellick & Halverson recovered 151 flasks of mercury in 1940 and 11 flasks in 1939 in a D retort at the Red Devil mine, Kuskokwim district. This was all included in 1940 totals.

Arizona.—The increased activity at mercury properties, mentioned in the chapter of this series covering 1939 operations, resulted in production at six mines in Gila and Maricopa Counties in 1940, notably the Ord group, Pine Mountain, and Sunflower. The output for the State totaled 740 flasks, the largest for any year since 1929. Ore at Pine Mountain was treated in a new Gould rotary furnace with a reported daily capacity of 40 to 45 tons of ore, which went into service in midyear. The Cornucopia, Slate Creek, and one other property contributed to Arizona production in 1940.

Arkansas.—Mercury production was reported by 10 mines in 1940—the largest number that has ever been active in Arkansas at one time. These mines recovered 1,152 flasks of metal from about 16,300 tons of ore and 7 flasks from dumps. The output represented the second highest annual total for the State. Active mines included the Caddo in Clark County, the Mid-Continent in Clark and Pike Counties, and the following in Pike County: Parker Hill, Big Six, Hales, U. S. Mercury, Lulu Bell, Jack Fork, Old Funk, and one other. S. L. Craig reported in February 1941 that ground was being broken for a new rotary furnace at the Jack Fork mine. A new Gould rotary furnace was installed at the Superior mercury mine property late in the year, and National Quicksilver Corporation stated that it planned to install a 3- by 48-foot rotary furnace of 50-ton estimated capacity. Some operators claimed that insufficient capital hampered development of the Arkansas mercury field.

California.—California maintained its predominant position among mercury-producing States in 1940, with an output that represented 49 percent of the total for the country. High prices for mercury brought sharper gains from other States, however, for in the 10-year period 1930–39 California's share of the total was 54 percent. The greater production in 1940 was due mainly to enlarged operations at the New Idria, Klau, Sulphur Bank, Oat Hill, New Almaden, Reed, and Falcon (Santa Ynez) mines and to reopening of the Mount Jackson and Cloverdale mines.

A recent report [1] covered two districts in the State.

The Mount Diablo mine in Contra Costa County again was operated by the Bradley Mining Co., and a large quantity of mercury was produced in a 50-ton rotary furnace. The greater part of production in 1940 was derived from surface deposits mined by power shovels and trucks. A Geological Survey report [2] issued in 1940 described the Mount Diablo district.

Lake County produced 4,943 flasks of mercury in 1940—a 20-percent increase over 1939. Thus Lake County, which led all counties in the United States in 1939, ranked below San Benito in California and Douglas in Oregon in 1940. The larger producing mines again included the Sulphur Bank, Mirabel, and Great Western, and the following contributed to the county total: Big Injun, Anderson Springs, Downey, Konocti, Helen, Otto and Bullion, Big Chief, Chicago, and Midway. There was much activity at the Abbott mine during the year, but this mine, which had a substantial output before 1900, did not begin producing until January 1941. A 10-ton rotary furnace installed during 1940 at the Chicago prospect was abandoned in July as unprofitable.

Ten mines in Napa County reported a total production of 1,478 flasks of mercury in 1940; chief among them was the Oat Hill mine operated by Gould interests. In October press reports credited this property with production at a monthly rate of 125 to 150 flasks. A 25-ton Cottrell furnace was installed at the Manhattan mine in 1940. Old waste and slag dump material at the Knoxville mine was treated in a rotary kiln and preparations were under way for reopening the mine. Operations proceeded almost without interruption at the Aetna mine, where mercury was recovered from ore and dump material in a 50-ton rotary furnace. Other producing mines included the Oat Hill Extension, Ivanhoe, Crona, and three operations on James Creek.

San Benito County had the largest county total in the United States in 1940, with a production of 6,021 flasks. Twelve mines contributed to the total output; but, as is well-known, the New Idria mine towered above all other producers. This mine and the Bonanza in Oregon were the two largest producing properties in the United States. Press reports credited the New Idria mine with a monthly output of well over 500 flasks in the latter part of the year.

The Aurora mine ranked next to the New Idria in San Benito County in 1940, with an output much greater than in 1939. The Valley View mine changed hands and was later operated as the Panoche mine. A new rotary furnace was installed.

Production in San Luis Obispo County totaled 1,464 flasks in 1940 and was made by 8 properties. The outstanding mine was the Klau, operated by Gould interests. The county output for 1940 was a marked advance over the 253 flasks reported for 1939. Before 1939, when it was closed, the Oceanic mine had dominated San Luis Obispo production in recent years. Sharply increased output at Klau in

[2] Ross, Clyde P., Quicksilver Deposits of the Mount Diablo District, Contra Costa County, California: Geol. Survey Bull. 922-B, 1940, pp. 31-54.

particular, renewed production at Oceanic, and increases elsewhere were responsible for the large quantities of metal recovered in 1940.

Santa Barbara County produced 507 flasks of mercury in 1940—a sharp advance over output in 1939. The Falcon (Santa Ynez), Lion Den, and Red Canyon (Red Rock) mines were responsible for the entire production. A new 30-foot by 30-inch rotary kiln was added at the Falcon, doubling the plant capacity for that property, and a third unit of the same size was reported to be in prospect. The new 30-ton Gould rotary furnace at the Lion Den mine began operating in 1940. Additional retort capacity was installed at the Red Canyon (Red Rock) mine.

The outstanding development in Santa Clara County, where 1,026 flasks of mercury were produced in 1940, was the initiation of large-scale mining operations at the New Almaden mine, whose output in recent years has been almost exclusively from the working of old dumps. A new 5- by 60-foot rotary kiln went into steady production in December. A report to stockholders for December 1940 and January 1941 indicated that in the 2 months, 10,841 and 10,966 tons of waste were handled, 3,057 and 2,842 tons of ore treated, and 113 and 100 flasks of mercury produced. The reported production includes output from dump material. Independent production from part of the New Almaden dumps and production of the Guadalupe mine completed the activity in the county.

Reopening of the Mount Jackson mine on a large-scale basis featured mercury activity in Sonoma County in 1940. The county as a whole produced 1,146 flasks and six mines participated in the total. Local mining men operated the Mount Jackson mine early in the year; but a new company took it over, installed a Gould rotary furnace of 75 tons capacity, and began production in September. From September until the end of the year 425 flasks were recovered from 7,965 tons of ore and, in addition, 23 flasks from dumps. Another important development was reopening of the Cloverdale mine, in recent years the largest producer in the county but idle in 1939. A new 25-ton Cottrell furnace was installed at the Culver Baer mine in 1940. The Reed mine in Yolo County reported a continuous rate of output after the first quarter of the year.

Idaho.—Output at the Idaho-Almaden mine, west of Weiser was continuous throughout 1940. The monthly rate, however, was somewhat below the average for the period from May 1939 (when it began to produce) to the end of that year.

Nevada.—There was a greater proportionate increase in the production of mercury for 1940 in Nevada than in any other important State, as it rose from 828 flasks in 1939 to 5,924 flasks. Activity was widespread; six mines yielded more than 400 flasks each and one more than 1,000 flasks. A somber note is sounded, however, by the statement that three mines that were responsible for nearly half the total in 1940 were at least temporarily without reserves early in 1941. Two of these properties were recent developments and produced a relatively large quantity of metal before becoming exhausted. At the third property more hope is held for the development of new reserves in future. Humboldt County led in total production and was followed by Mineral, Churchill, and Pershing Counties.

The outstanding producing mine in Churchill County was the Wild Horse, where mercury was recovered in a 25-ton Gould furnace.

Production at the Mayflower and Wildhorse claims dominated activity in Elko County in 1940, although five other properties reported outputs. The county total was 341 flasks. A new 4- by 64-foot Gould rotary furnace was installed at the Governor mine in 1940. This plant was idle at the end of the year, pending development of higher-grade ore reserves.

The Red Rock and B. & B. mines in Esmeralda County produced mercury in 1940.

Humboldt County ranked fourth among the mercury-producing counties in the United States in 1940, and Bottle Creek ranked high among the districts. Production for Humboldt County totaled 2,713 flasks compared with 404 in 1939. Outstanding producers in the county were the Blue Can and Baldwin (operated as one property), White Peak and Red Ore (Scossa), Blue Bird, and Cahill mines. The Blue Can and Baldwin mine yielded 976 flasks, from 6,701 tons of ore, almost entirely from furnace operations between May 10 and October 21. After October 21 efforts were concentrated toward the development of additional reserves of ore, with little success. The Gould furnace, new in 1940, was credited with a daily capacity of 43 tons of ore. A comparatively steady rate of production was maintained in 1940 at the White Peak and Red Ore claims, where metal is recovered in a 20-ton Cottrell rotary furnace. The mines changed hands during the year. A Herreshoff rotary furnace of 30 tons daily capacity was completed at the Blue Bird mine early in August. The three properties briefly mentioned here are in the Bottle Creek district. The Bottle Creek district [3] was described in a recent article. The furnace at the Cahill mine treated 1,000 tons of ore to recover 490 flasks of metal in 1940. A Gould rotary furnace of 100 tons rated capacity was completed at the McCormick-Dermody mine, which was recently described.[4]

There was greatly increased activity in Mineral County in 1940, when nine mines produced 1,221 flasks compared with five mines and 26 flasks in 1939. The principal reason for the abrupt advance was the reopening on a large scale of the mine of the Mina Development Co. (including the Lost Steers group). A new Gould rotary furnace was installed at the mine, and trade reports indicated that, in midyear, capacity was about 150 flasks a month. The rotary furnace used at the Hitt property was installed in 1940.

The five mines that contributed the total mercury recovered in Nye County in 1940 were all relatively small producers.

Production of mercury in Pershing County rose to 646 flasks. A principal reason for the advance in 1940 was the showing made at the Mount Tobin (Miner's Dream) mine, where metal was recovered in a new 25-ton Gould rotary furnace. The Goldbanks and Eldorado mines also produced fair amounts; both used retorts.

Oregon.—Production of mercury in Oregon virtually doubled in 1940 and totaled 9,043 flasks compared with 4,592 flasks in 1939. This sharp increase was due largely to the more than doubled output at the Bonanza mine, Douglas County (the largest producer in the State and one of the two largest in the country), and to reopening of the Bretz mine, Malheur County. Output at the other two important

[4] Roberts, R. J., Quicksilver Deposit at Buckskin Peak, National Mining District, Humboldt County, Nev.: Geol. Survey Bull. 922-E, 1940, pp. 115-133.

producing mines—the Horse Heaven and Black Butte, in Jefferson and Lane Counties—was maintained throughout the year at about the 1939 rate. There was greatly increased activity in Crook County, but the average output per mine was small. Clackamas and Jackson Counties also contributed to the total.

Twelve properties in Crook County produced 299 flasks of mercury in 1940 compared with six mines and 117 flasks in 1939.

As already stated, the Bonanza mine in Douglas County was the largest producing mine in Oregon and one of the two largest in the country. Two new Gould rotary furnaces were installed at the mine in 1940 (one in the early part and one late in the year), supplementing the 40-ton Herreshoff plant already there. The Mining Journal of Arizona, November 30, 1940, stated that the Bonanza mine produced 2,622 flasks of mercury in the first 6 months of the year. The Red Cloud mine used a 25-ton Lacy furnace for production.

The Horse Heaven mine in Jefferson County was one of the largest producers in the State and in the country. The Axehandle mine produced mercury in a 20-ton Lacy rotary furnace.

Black Butte, in Lane County, was again one of the principal producing properties in Oregon although output trended downward from recent records.

The Opalite plant, which burned in December 1938, was rebuilt in the spring of 1940 and treated ore from both the Bretz and Opalite mines in Malheur County, of the Bradley Mining Co. This plant has a capacity of 40 to 100 tons a day, depending on the type of ore treated.

Texas.—Mercury was again recovered at the Chisos and Rainbow mines, where production was continuous throughout the year. The Big Bend and Texas Almaden mines, also in Brewster County, were reopened during 1940 by the Texas Mercury Co. Another property to enter production was the Fresno mine in Presidio County 102 miles south of Alpine, where ore was treated in a retort. A new rotary furnace is under construction there. The paper by Ross [5] on the mercury deposits of the Terlingua region, referred to on page 672 of Minerals Yearbook, 1940, was published in 1941.

Utah.—The Utah Quicksilver Co. produced 53 flasks of mercury from 200 tons of ore treated in a rotary furnace in 1940. Operations at this Tooele County mine were discontinued on September 30 because the property was worked at a loss.

Washington.—The Roy Mining Co. (2 miles from Morton, Lewis County) treated 1,000 tons of ore in retorts and recovered 65 flasks of mercury.

FOREIGN TRADE [6]

Imports of mercury for consumption in 1939 totaled 3,499 flasks; more than 3,000 covered the period that followed the beginning of hostilities abroad in September. They amounted to only 147 flasks in January 1940 and to 24 flasks in the next 3 months, but were nonexistent from May throughout the remainder of the year. Meanwhile general imports, which are a measure of metal actually entering the country during a given period, aggregated 1,861 flasks in all of 1940;

[5] Ross, Clyde P., The Quicksilver Deposits of the Terlingua Region, Texas: Econ. Geol., vol. 36, No. 2, March–April 1941, pp. 115–142.

[6] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

1,535 flasks were entered during the first 4 months. The failure of imports during a period when increased consumption was anticipated is not surprising if price movements are considered. During most of 1940 prices for mercury in the international market were substantially above the domestic price, including the import duty of $19 a flask. Nonetheless, domestic prices had risen enough to stimulate domestic production to a point where consumers' immediate needs were filled, with an excess for exportation. Exports aggregated 9,617 flasks—the only important shipments from the country (except for those in 1931) since 1919. In 1931 the high price maintained for metal abroad, coupled with the depression in the United States, resulted in a price differential in favor of selling in the London market, and 4,984 flasks of mercury were exported.

In 1940, Mexico supplied 128 flasks of the mercury imported for consumption, Spain 40 flasks, and Italy 3. Of general imports, 1,471 flasks were received from Mexico and 390 from Italy. In addition to the mercury imported from Mexico as metal nearly 1,300 flasks were produced in the United States from antimony-mercury concentrates received from that country. Data covering this class of imports are not shown separately in customs statistics.

Mercury imported into the United States, 1939–40, by countries

Country	1936		1937		1938		1939		1940	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value
Hong Kong			5	$5					3	$6
Italy	491,714	$385,236	747,266	649,406	84,454	$50,434	25,528	$29,818	228	316
Mexico	26,393	21,708	116,497	104,730			42,745	61,313	9,698	13,681
Spain	774,785	544,072	535,156	440,804	95,068	82,176	197,671	245,613	3,042	3,958
United Kingdom	81,760	66,801	38,788	33,046						
	1,374,652	1,017,817	1,437,712	1,227,991	179,522	132,610	265,944	336,744	12,971	17,961

The possible increase in imports of mercury compounds, suggested in the chapter of this series for 1940, failed to materialize when virtually all movement of mercury-bearing materials from Italy and Spain to the United States ceased in 1940. The imports for February were approximately the totals for the entire year.

Mercury compounds imported for consumption in the United States, 1939–40

Compound	1939		1940	
	Pounds	Value	Pounds	Value
Chloride (mercuric) (corrosive sublimate)	300	$174		
Chloride (mercurous) (calomel)	6,850	5,011	19,513	$16,374
Mercury preparations (not specifically provided for)	15,061	8,755	21,863	15,362
Oxide (red precipitate)	18,200	14,948	9,000	9,234
Vermilion reds (containing quicksilver)	22,624	19,755	14,332	13,114
		48,643		54,084

As already indicated, exports of mercury totaled 9,617 flasks in 1940; in May 2,277 and in June 1,383 flasks were exported. This large movement from the country of a metal designated by the Army and Navy Munitions Board as strategic did not meet the approval of the Government. In July mercury was placed under export-control provisions, and thereafter shipments to foreign countries slowed; those to certain countries, including Japan, ceased.

Mercury exported from the United States, January–June and July–December 1940, by countries of destination

Country	January–June (pounds)	July–December (pounds)	Total	
			Pounds	Value
North America:				
Canada	20,941	37,982	58,923	$145,063

	415,651	315,226	730,877	1,743,149

Metal withdrawn from warehouse for export, re-exports not included above, totaled 3,899 flasks in 1940.

WORLD PRODUCTION

The following table shows available data on world production of mercury by countries from 1936 to 1940.

Canada.—No statistics covering production of mercury in Canada in 1940 are available. Such information as was released during the year makes it appear that the new discovery of mercury at Pinchi Lake in the Omineca mining division of British Columbia not only has become the principal source of mercury in the British Empire but that it has already contributed an important quantity. The mercury deposits of British Columbia were recently described by Stevenson.[7]

China.—Persistent rumors concerning sharp advances in production of mercury in China yielded to established fact during 1940. A source

[7] Stevenson, John S., Mercury Deposits of British Columbia: British Columbia Dept. of Mines Bull. 5 1940, 93 pp.

believed to be reliable indicated that output of mercury in China in 1939 was probably about 5,000 flasks or more. It stated that properties in Kweichow and Hunan, idle for years, had reopened and were producing in that year. Shipments of metal were going into foreign markets from French Indochina in 1940 and were expected to go through India following reopening of the Burma road. Official figures on exports showed that a negligible amount—13 flasks—left the country in 1939 but indicated that shipments abroad had jumped to 6,260 flasks in 1940. This mercury was reported to be chiefly for consumption in the United Kingdom, Australia, and U. S. S. R.

World production of mercury, 1936–40, by countries

Germany.—Mercury is one of the commodities of which the Axis powers have a plentiful supply. Recent data indicate that Italy's annual output was not much below 70,000 flasks. Spain, a friendly power, has exceeded that quantity and is believed to be able to produce considerably more than that in future. These two countries dominate world production, and the close ties between them have made it easy to dictate the price for the metal in the international market. Consumption of mercury in the two countries is small. For the 4-year period, 1935–38, Germany imported an average of nearly 26,000 flasks a year. In the first 7 months of 1939 imports totaled nearly 14,000 flasks or nearly the annual rate indicated for previous recent years. Consequently Germany, undoubtedly having first call on the yield of the two leading sources of the world, is more than amply supplied with this commodity. Data from unofficial sources on Spanish and Italian exports of mercury from August 1 to December 31, 1940, indicated that in that period nearly 42,000 flasks went to Germany; most of it had been ordered before August 1. This source claimed that Germany's consumption of mercury in 1940 was almost double normal consumption on account of a very heavy but nonrecurrent demand for the installation of plants to manufacture artificial rubber.

Italy.—The chapter of this series in Minerals Yearbook, 1940 indicated that Italy dominated the world mercury situation in 1939 for the third successive year, partly or largely as a result of temporary conditions. The largest and highest-grade mercury-ore reserves are in Spain, and for many years the two countries have alternated as leaders in production. No data are available concerning the rate of production maintained in 1940, and such information as could be obtained on exports from Spain and Italy are given in the discussion on Spain.

Mexico.—Disturbed world conditions in 1940 focused the attention of the United States on the Western Hemisphere for prospective sources of strategic materials. Mexico, for years the second largest producer of mercury in the area, appeared to be the country's most promising potential source of appreciable quantities. Production in Mexico increased sharply in 1940 and totaled 11,653 flasks compared with 7,376 in 1939; it did not show an increase of consequence until late in the year, however, lagging greatly behind the United States in its response to high prices for the metal. The average rate of output during the first 11 months of 1940 was 875 flasks, but official reports credited the country with 2,023 flasks in December. Failure of Mexican mines to respond more quickly to increased prices probably was attributable to lack of organization in the industry, to widespread and disputed ownership of properties, to lack of capital for development of mines and installation of reduction equipment, and in part at least to political conditions within the country. Inefficient reduction methods and equipment are said to cause losses approaching 50 percent.

From January to August 1940, 89 percent of the total exports went to the United States (believed to be largely transshipments to the United Kingdom), 8 percent to Japan, and the remainder to other countries. In the period September to December, 32 percent went to the United States and 66 percent to Japan. Total exports in 1940 aggregated 11,560 flasks compared with 7,168 in 1939. Of the quantity for 1940, 7,112 flasks went to the United States but were largely reshipped to the United Kingdom and elsewhere, 4,146 flasks went to Japan directly, 97 to Manchuria, 79 to Norway, 54 to Sweden, 32 to New Guinea, 30 directly to the United Kingdom, and 10 to Nicaragua. It was rumored that metal sold to Japan in the latter part of 1940 was chiefly at $190 to over $200. Occurrences of mercury in Mexico are widespread, and reorganization of the industry is said to promise largely increased output.

Mercury-antimony concentrates shipped from the Huitzuco mine to Los Angeles for reduction totaled 714 short tons that yielded 1,286 flasks of mercury in 1940 compared with 942 tons that yielded 2,005 flasks in 1939. Ore milled at the mine in Mexico totaled 45,776 short tons containing 163,318 pounds of mercury on which a 66.37-percent recovery was obtained. The 714 tons of concentrates shipped to the

United States contained 106,281 pounds of mercury; a 92-percent recovery.

Spain.—Since the beginning of the civil war in Spain, now ended, very little authentic data on production have been available to the public. The increasing scope of war activities in Europe has accentuated this already difficult situation. Information from one source in 1940 stated that an "average" rate of production was believed to have been maintained during the year. Just what an "average rate" would indicate is open to question, however. The average annual figure for the 5-year period 1932–36 was about 31,000 flasks; that for the preceding 5-year period, 1927–31 (which cut across some boom and some depression years), amounted to about 49,400 flasks. The report mentioned stated that year-end stocks were believed to have been large. Another authority supplied figures covering exports of mercury from Spain and Italy to Germany and Central European countries from August 1 to December 31, 1940, which claimed that exports to Germany during that period were 41,800 flasks and to other Central European countries 500 flasks. It said also that during that period the two countries exported 20,422 flasks to Japan. Of the above total to Germany and other European countries, 22,100 flasks were credited to the Almaden mine, Spain, and 14,676 to the Monte Amiata and 5,560 to the Siele mines, Italy. Of exports to Japan 12,246 flasks were from the Almaden mine and 8,176 from the Monte Amiata. Thus, the above data indicate that 34,346 flasks of mercury were exported from the Almaden mine, 22,852 flasks from the Monte Amiata, and 5,560 flasks from the Siele mines, from August 1 until December 31, 1940.

Data covering the movement of Spanish and Italian metal to foreign countries during the early months of 1940 are not available. In addition to the quantities already reported for Japan 7,000 flasks purchased late in 1939 were said to have been delivered in 1940.

TIN

By E. W. Pehrson and John B. Umhau

SUMMERY OUTLINE

The outstanding feature of the tin industry in 1940 was the aggressive action taken by the United States Government to improve its vulnerable position with respect to tin supplies. Not only was the stock-piling program, initiated in 1939 under the Strategic Materials Act, greatly expanded by direct negotiation between the Reconstruction Finance Corporation and the International Tin Committee, but a substantial tonnage of Bolivian ore was contracted for and steps were taken to build a large domestic tin smelter to treat it. In addition, rigid export-control measures were adopted, surveillance over uses was carried on by the defense agencies to conserve supplies, and investigation of domestic tin occurrences was continued. Although substantial progress has thus been made toward meeting the emergency, as of May 1941, adequate security was not in sight owing chiefly to the late date at which stock-piling was begun. Because the Western Hemisphere is far from self-sufficient in tin, the success of the program depends largely on the maintenance of capacity operations and exports from southeastern Asia until stock-piling objectives are achieved. The recent movement of Japan southward, plus her pact with the Axis signed in September, raises a question as to how long free movement of tin from southeastern Asia can be relied upon. Fortunately, industry has been accumulating stocks for the past few years so that the total amount of tin now held publicly and privately represents well over a year's supply.

Statistically, new world mine production and export records were established in 1940, and smelters outside of continental Europe were operated near maximum capacity. Although statistics are not available, smelter output likewise must have exceeded previous records. Despite large increases in production and exports, world consumption in 1940 advanced only 2 percent over 1939 and according to trade reports was 15 percent below the peak established in 1937.

The excess of supply over consumption was used to build up large stocks in the United States and the British Empire. Estimates of consumption for the United States, United Kingdom, and Japan indicate sizable advances over 1939, whereas tin used in Axis-controlled Europe and the U. S. S. R. is reported to have declined. Shortage of tin in Germany was partly relieved by stocks acquired when the Netherlands, Belgium, and France were occupied, and some tin is believed to have reached Germany via Japan and the U. S. S. R.

Prices fluctuated within remarkably narrow limits, considering the trend in international affairs. A comparatively stable market in New York during the first 4 months of the year gave way to a mild panic when Germany invaded the Low Countries early in May, reaching a peak in mid-June with the defeat of France. A sharp downward trend the latter half of June was followed by the announcement on July 1 that for 1 year the United States Government would buy all surplus tin on the market at 50 cents a pound. This action virtually resulted in a pegged price, and for the latter half of the year open-market fluctuations had minor significance. The average New York price for Straits tin in 1940 was slightly lower than in 1939. The London quotation for standard tin, in sterling, was considerably higher in 1940 than in 1939, but owing to the decline in foreign exchange the dollar equivalent of the 1940 quotation was only moderately higher.

Salient statistics for tin in the United States, 1925–29 (average) and 1936–40

Appointment of tin consultant.—The outstanding success of Germany's assault on Belgium, the Netherlands, and northern France in May 1940 provided the incentive for a greatly intensified national defense effort in the United States. The emergency agencies created to accomplish this objective are described in the chapter of this volume entitled "Review of the Mineral Industries in 1940." On June 17, 1940, Erwin Vogelsang, formerly president of the New York Metal Exchange and National Metal Exchange, Inc., and American representative of the London firm of Malcolm Bowley & Son, metal dealers, was appointed consultant on tin to the Advisory Commission to the Council of National Defense.

Government stock-piling program.—At the beginning of 1940 the Procurement Division of the Treasury Department was acquiring a stock pile of tin under the provisions of the Strategic Materials Act

(Public, No. 117, 76th Cong.), as described in Minerals Yearbook, 1940. The Navy Department already had completed purchase of a small quantity of tin under the stock-piling program authorized in its appropriation bills for the fiscal years 1938, 1939, and 1940. With inauguration of the intensified defense effort, it was evident that the funds provided in Public 117 and the procedure prescribed for purchasing were inadequate and that the acquisition of stock piles would have to be speeded up. These results were accomplished by transferring to the Metals Reserve Co. the purchase of some of the major items on the strategic materials list, including tin.

As the quantity of tin available for purchase was limited by the production quotas established under the Tin Control Scheme, the Government entered into negotiations with the International Tin Committee with a view to removal of restrictions on production by the latter in exchange for a guarantee that the United States would purchase all surplus tin at a stipulated price. The discussions were successful, and on July 1, 1940, the terms of the agreement were announced. The International Tin Committee agreed to raise production quotas from the 80 percent established for the second quarter of 1940 to 130 percent for 1 year beginning July 1, which was understood to represent virtually unrestricted production. The United States contracted to purchase all surplus tin offered up to 75,000 tons, at not less than 50 cents a pound, c. i. f. domestic ports, purchases to be made for 1 year or until June 30, 1941. Tin so acquired will be held for not less than 3 years from January 1, 1941. Thereafter it may be liquidated upon written notice to the International Tin Committee, provided that 3 months after such notice has been given not more than 5 percent of the total stocks or a maximum of 5,000 tons can be liquidated in any 3-month period. Tin purchasable under the contract includes the brands acceptable under Procurement Division specifications of December 15, 1939 (see Minerals Yearbook, 1940, p. 679), but the company may purchase other qualities with appropriate price differentials.

News of this contract was well-received by the trade, particularly the announcement that the Government would coordinate its buying program with that of industry to minimize competition for available supplies. Demand from consumers was to be met before the Government would negotiate purchases. During the first few months of the contract most of the increase in imports was absorbed by industry, and Government acquisitions were relatively small. Some authorities felt that a price of 45 cents a pound would have been ample to assure capacity production, but in general there was satisfaction at the prospect of a partly stabilized price around 50 cents. The provision permitting liquidation of the stock pile after 3 years was a keen disappointment to those who had labored for 20 years to have the Government adopt a policy of establishing permanent stock piles as insurance against a war shortage. Present difficulties in obtaining adequate supplies of strategic and even nonstrategic raw materials may demonstrate the wisdom of holding indefinitely any tin that may be left at the close of the emergency as a protection against future contingencies.

In May 1941 the Metals Reserve Co. contract with the International Tin Committee was extended to July 1, 1942.

Additional purchases of tin are contemplated under Government loans to China to be repaid by deliveries of tin, tungsten, antimony, and other commodities. As of May 1, 1941, $90,000,000 had been loaned for this purpose, but no deliveries of tin had as yet been reported.

At the close of 1940 the Government stock pile contained 21,419 long tons of tin, of which the Metals Reserve Co. held 13,985 tons, the Procurement Division 5,479 tons, and the Navy Department 1,955 tons. The Procurement Division inventory included 89 tons of tin produced in the United States from Bolivian ores.

Government purchases of Bolivian ores.—As stated in Minerals Yearbook, 1939, the permanent smelting of Bolivian tin ores in the United States cannot be justified solely as a national defense measure because the higher smelting costs here compared to Europe would increase the cost of the resultant metal to domestic consumers. Events in 1940, however, clearly demonstrated the necessity for just such action as an emergency measure, regardless of costs. German occupation of the Netherlands and Belgium and the British blockade of Germany cut off markets for substantial quantities of Bolivian ore, and the vulnerability of British smelters to aerial attack raised doubts as to the continuation of those outlets. As sales of tin ore constitute an important part of the national income of Bolivia, its internal economy was seriously threatened by actual and possible loss of these markets. By contracting for the erection of a tin smelter, thereby providing a market for surplus Bolivian ores, the United States acted in a manner wholly consonant with its "Good Neighbor" policy and at the same time, in view of the small domestic reserve stocks, took a realistic step toward ameliorating the potential threat to the democracies' tin supply arising from Japan's tie with the Axis and its aggression in southeast Asia.

On November 4, 1940, the Metals Reserve Co. contracted to buy ore from several Bolivian producers, including Compagnie Aramayo de Mines en Bolivie, Compania Minera de Oruro Group, Compania Minera Unificada del Cerro de Potosi, Associacion Nacional de Mineros Medianos, and Banco Minero de Bolivia. For 5 years the United States agrees to purchase annually ores containing approximately 18,000 tons of tin. The contract provides a market for a major share of the lower-grade Bolivian ores containing 18 percent or more tin. Patino Mines & Enterprises, Inc., which produces a large part of the higher-grade ores, was not a party to the agreement because its output is obligated to British smelters under a 10-year contract.

The agreement stipulates that if production quotas are reduced below 130 percent of standard tonnages by the International Tin Committee contract shipments to the Metals Reserve Co. will be reduced proportionately. The contract has been guaranteed by the Bolivian Government, which will determine the shipments to be made by the individual producers.

During the first year tin will be paid for at 48.5 cents a pound less treatment charges, penalties, and smelting losses. Thereafter the base price will be 1.5 cents below the Metals Reserve Co. buying price established under agreements with the International Tin Committee, or, in the absence of such agreement, 1.5 cents below the average American Metal Market New York quotation for Straits tin, prompt and 3 months forward delivery.

The agreement contains an elaborate schedule of treatment charges and penalties based upon the various grades of ore acceptable for delivery, details of which are published in the December 1940 issue of Engineering and Mining Journal.

Government tin smelter.—The possibility that the United States might establish a tin-smelting industry to provide a market for Latin American tin ores was discussed at the meeting of the foreign ministers of the American republics at Havana, Cuba, in July 1940. Soon thereafter the Government, acting through the Advisory Commission to the Council of National Defense, solicited suggestions from industry on construction of the smelter. By October proposals had been received from Williams, Harvey & Company, Ltd., of Liverpool; the Billiton interests (operators of the Arnhem smelter in the Netherlands); Guggenheim Bros.; Phelps Dodge Corporation; American Metal Co.; American Smelting & Refining Co.; Hooker Chemical Co.; and the Port Wentworth Corporation of New York. Plans were reviewed by a technologic committee on tin smelting appointed October 10 by the Advisory Commission and the Reconstruction Finance Corporation; and, after considerable negotiation and investigation, it was announced in February 1941 that a tentative agreement had been reached with the Billiton interests. The Tin Processing Corporation of New York—a subsidiary of N. V. Billiton Maatschappij of Batavia, Netherlands Indies—will build the plant at Texas City, Tex., at an estimated cost of $3,500,000. The smelter will have capacity to treat 50,000 tons of concentrates a year and produce 18,000 long tons of fine tin. The plant will be owned by a subsidiary of the Reconstruction Finance Corporation but will be managed by the Billiton group. The contract contains a clause permitting the Government corporation to take over the plant or change the management. The Tin Processing Corporation will receive a construction fee of 4 percent on the cost of the plant and a management fee of a little less than 1 percent of the value of the finished tin produced. The Army and Navy Munitions Board and the National Resources Planning Board recommended that the smelter be established in the Gulf area. The plant will be erected on land donated by the Texas City Terminal Co. The deciding factors in locating the plant at Texas City were cheap gas for fuel; hydrochloric acid for ore treatment, available at low cost from a nearby refinery; good terminal, port, and warehouse facilities; a large movement of foreign cargo ships into the Galveston-Houston marine district, making it possible to handle less than cargo lots of tin concentrates coming from South America; and availability of barge transportation of finished tin to market. Construction will require the better part of a year, and production is expected in 1942. Direct freighter service between Gulf Coast ports and the West coast of South America for the transportation of tin concentrates from Bolivia will be inaugurated by the Grace Line.

The agreement actually involved two contracts for the Netherlands interests—one with the Defense Plant Corporation, which advanced the loan for plant construction, and one with the Metals Reserve Co., covering management and operation. G. Temple Bridgman, consulting mining engineer, was engaged as technical advisor to the Metals Reserve Co. and later became its vice president.

Reclamation and conservation.—Looking forward to possible need for conserving tin, the Advisory Commission to the Council of National

Defense promptly began investigating various means of accomplishing it and held informal conferences with various branches of the tin-consuming industry to initiate planning along this line. In March 1941 a Conservation Unit was established in the Production Division of the Office of Production Management to direct the conservation, reclamation, and substitution of scarce materials. In April 1941 representatives of can-making companies advised the Office of Production Management that if necessary a 10-percent reduction in the weight of the tin coating of cans could be made safely for about 95 percent of all tin-can uses. At the same time, a committee of the National Academy of Sciences estimated that a maximum of 12,000 long tons of tin might be reclaimed annually from used tin cans, but it advised against Government financing of new detinning plants for such operations unless the emergency developed to a point where it became imperative to conserve tin, regardless of cost.

Investigations of domestic tin deposits.—The investigation of domestic tin deposits authorized by the Strategic Materials Act was continued by the Bureau of Mines and the Geological Survey in 1940. In March 1941 the Bureau of Mines issued a progress report [1] on its exploration of tin deposits, which contained the following conclusion:

> These early results tend to strengthen the conviction that no appreciable part of the tin required by American industry can be supplied from known domestic sources, regardless of how great the stringency or how high the price. Stockpiling, the discovery of new deposits, and the development of substitutes appear to be the only alternatives for insurance against acute shortage should access to overseas supplies be denied.

The same report describes the results of work completed at Tinton, S. Dak., and in the Taylor Creek district, New Mexico; Fries [2] discusses the tin deposits of the latter.

A preliminary manuscript report on the tin deposit at Majuba Hill, Pershing County, Nev., was prepared by the Geological Survey and placed in its open files at Washington, D. C. In 1938 the Bureau of Mines conducted concentrating tests on samples of tin ore from Majuba Hill.[3]

Selected copper-rich sulfides from material gathered from a mine shaft and six mine dumps at Goldfield, Nev., reported to contain tin, were analyzed by the Geological Survey. The available evidence does not indicate that the tin content would add enough value to the copper ores to warrant mining from known bodies or searching for richer ores at lower levels. Reports by the Geological Survey covering work done on the tin deposits of Irish Creek, Va.; the tin belt of North and South Carolina in the vicinity of Gaffney, Lincolnton, and Kings Mountain; the Temescal district and the Bernice group of claims in California; at Spokane, Wash.; and in Lander County, Nev., are in process of publication. New geologic studies of areas in western Seward Peninsula, Alaska, that have especial importance as possible sources of tin are being made by the Alaskan Branch of the Geological Survey.

H. R. 10641, introduced October 21, 1940, authorizing an appropriation of $2,000,000 for exploration and development of Alaska tin deposits, was reintroduced January 3, 1941, in the 77th Congress, first session, as H. R. 96 and referred to the Committee on Mines and Mining.

Licensing of exports.—Export restrictions were extended to tin products other than tin-plate scrap in 1940. Section 6 of "An Act to expedite the strengthening of the national defense" (54 Stat., 712, 714), approved July 2, 1940, authorized the President to control exports of munitions, materials, and machinery essential to national defense. Determination of the commodities subject to the controls provided for in the Act was delegated to the Office of Administration of Export Control, although the Department of State actually issues the licenses. Tin and tin manufacturers were included in the first proclamation and became subject to export control after July 5, 1940. Tin plate (December 30, 1940) and brass and bronze (February 3, 1941) later were added to the list of commodities subject to export restrictions.

Before this act was passed a "moral embargo" on tin had been in effect as a result of Government warnings against the exportation of strategic materials. On October 11, 1939, the Army and Navy Munitions Board issued a statement condemning the re-export of such materials as being detrimental to the stock-pile program. The warning was repeated January 19, 1940, following large exports of pig tin in December 1939. Shipments continued large during January 1940 but fell in February and March and thereafter comprised only small quantities sent to countries within the Western Hemisphere.

DOMESTIC PRODUCTION

Mine output.—Only 44 long tons of tin were produced in 1940—an increase, however, of 29 percent from 1939. Alaska again supplied virtually all the output. According to the Federal Geological Survey, tin mining in Alaska in 1940 was confined mainly to placer deposits that have been developed in the western part of the Seward Peninsula, but small amounts of stream tin were recovered in the course of placer-gold mining in the Ruby and Hot Springs districts of the Yukon region. No lode tin was mined during 1940 from any Alaska deposits. H. R. 96, of January 3, 1941, which has been referred to the Committee on Mines and Mining, authorizes an appropriation of $2,000,000 for the exploration and development of Alaska tin deposits.

In addition to Alaska, small quantities were reported produced in South Dakota, Montana, and New Mexico in 1940. Producers included the Black Hills Tin Co. and the Dakota Tin & Gold Co.—both near Tinton, S. Dak.; George A. Mayer, near Basin, Mont.; and Paul Bellamy, Hardcastle Creek area, and the Tin Gulch placer mine, Squaw Creek area, Catron County, N. Mex.

The Bear Creek mine near Tinton, S. Dak., formerly operated by the Fansteel Mining Corporation, has been abandoned.

A historical table of mine production of tin in the United States, by States, from 1910 to 1939, inclusive, was published in Minerals Yearbook, 1939, page 679.

Mine production of tin (content) in the United States, 1936–40, by States

Year	Long tons				Value
	Alaska	South Dakota	Other States [1]	Total	
1936	101	(2)		101	105,000
1937	166	0.8	1.6	168.4	205,300
1938	94	1		95	90,000

Domestic tin smelting.—Tin ores are now treated on a small scale by several plants in this country. In 1940 these plants produced 1,746 long tons of tin, including 510 tons in the form of pig tin and 1,236 tons in the form of alloys (mostly solder) made direct from the ores. The ores treated in 1940 were obtained chiefly from Latin American countries, principally Bolivia, although small quantities produced by domestic mines were also purchased. Companies reporting the recovery of tin from ores in 1940 included Phelps Dodge Corporation, American Metal Co. (tin smelter at Carteret, N. J.), American Smelting & Refining Co., Nassau Smelting & Refining Co., Kansas City Smelting Co., Metal & Thermit Corporation, and Vulcan Detinning Co.

The 1940 Annual Report of the Phelps Dodge Corporation contains the following statement regarding its "P. D." tin:

> Construction of the experimental tin-smelting plant at Laurel Hill was completed, and it was put into operation during August. Early results have been encouraging, but certain details of the process have not been fully worked out, and it will require additional time to determine the possibilities of the plant. Both electrolytic and fire-refined tin have been produced from low-grade Bolivian concentrates. Small tonnages of both grades of tin have been sold and have been well-received by consumers.

The Vulcan Detinning Co. stated in its 1940 report that:

> The Company has continued to smelt selected high-grade Bolivian and other tin ores and has renewed its research work in the smelting of all grades of tin ores; but until methods of recovering high-quality tin from the more refractory ores upon a cost basis competitive with foreign smelters under peace-time conditions are developed, or protective import or excise taxes are imposed, the heavy investment required to properly treat inferior grades cannot be considered.

Secondary tin.—Complete statistics on the recovery of secondary tin in 1940 were not available when this summary was written. Over 40 percent of the secondary tin produced in the United States is recovered from industrial or new scrap, and curtailment in the consumption of virgin tin is thus reflected immediately in secondary-tin production figures. Moreover, a large proportion of the secondary tin reported statistically is contained in copper alloys of relatively low tin content made from scrap from which it is impractical to separate the tin on account of the high cost of such an operation. Because of these facts, the significance of secondary tin from the standpoint of national defense frequently has been overemphasized. Should foreign sources of tin be cut off the quantity of secondary tin available soon would shrink to small proportions. Although the reclamation of tin is highly desirable as a conservation measure it should be borne in mind that it is not to be depended on for large tonnages of metal in an emergency. Most of the uses of tin are dissipative, and there is no great store of metal in use that could be tapped should regular imports stop. Additional information on secondary tin is given in the chapter on Secondary Metals (Nonferrous).

Secondary tin recovered in the United States, 1925–29 (average) and 1936–40

Year	Tin recovered at detinning plants			Tin recovered from all sources			
						Total	
	As metal (long tons)	In chemicals (long tons)	Total (long tons)	As metal (long tons)	In alloys and chemicals (long tons)	Long tons	Value
1925–29 (average)	900	2,000	2,900	7,500	23,100	30,600	$38,034,120
1936	2,300	1,500	3,800	6,500	18,500	25,000	25,621,500
1937	2,500	1,500	4,000	7,400	19,700	27,100	32,124,100
1938	2,200	1,300	3,500	4,300	16,700	21,000	19,284,600
1939	3,600	600	4,200	4,000	22,000	26,000	29,276,600
1940	3,700	600	4,300	(1)	(1)	(1)	(1)

1 Data not yet available.

CONSUMPTION

Apparent consumption.—The apparent consumption of primary pig tin is determined by adding domestic smelter production to net imports. As there was no smelter output from 1925 to 1939, inclusive, the apparent consumption for this period was equivalent to net imports. The computation does not consider fluctuations in dealer and consumer stocks (information on which is not always available) nor the large accumulation in Government stocks in 1940; consequently, the figures do not reveal the actual trend in consumption. Nevertheless, statistics on apparent consumption have been useful in determining long-time trends. A table giving these data from 1910 to 1938 was published in Minerals Yearbook, 1939, page 680.

The apparent consumption of primary pig tin, computed by the above formula, reached an all-time record of 123,892 tons in 1940—an 82-percent increase over the 67,997 tons consumed in 1939—but, as indicated above, the 1940 figure exaggerates actual consumption because of very large increases in consumers' and Government stocks. Although the actual consumption of primary tin in 1940 probably was substantially higher than in 1939, it was, nevertheless, considerably below the all-time peak established in 1929.

Consumption by uses.—The following tables show the actual consumption of primary and secondary tin as reported to the Bureau of Mines. Final figures for 1940 were not available when this manuscript was prepared. The items included in the table of consumption by uses represent the products of the first cycle of manufacture. In computing the figures shown in the table, any virgin tin emerging from the first stage of manufacture as scrap was recorded as secondary metal. The figures thus understate consumption of primary tin, and much of the secondary tin listed duplicates the virgin metal shown because it is reclaimed from such byproducts as tin-plate clippings and virgin drosses from tin-plate and tinning mills and other plants consuming virgin tin. In 1939, for example, domestic consumers purchased 70,732 tons of virgin metal, of which 3,149 tons were added to inventories and 67,583 tons processed. Of the tin processed, about 2,000 tons were sold as scrap, lost, or added to stocks of metal in process, and the remainder emerged from the first stage of manufacture in the products shown in the following tables.

Consumption of primary and secondary tin in the United States, 1937–39, in long tons

	1937	1938	1939
Stocks on hand Jan. 1	17,978	25,984	25,260

[1] Includes small quantity of pig tin derived from detinning operations; Bureau of Mines not permitted to publish separate figures.
[2] Small quantity included under "Miscellaneous."
[3] Revised figures.
[4] In 1937 pure tin tubing required 1,286 tons and tin-lined tubing 10 tons; not reported separately after 1937.

Tin is employed principally in the manufacture of tin plate. Normally this industry consumes approximately half of the virgin tin used in the United States. The production of tin plate (which was the largest in history) increased 3 percent in 1940 compared with 1939. and was attributed to an increase in the total food pack and the 23-percent increase in exports of tin plate.

According to the American Bureau of Metal Statistics, the use of virgin tin in various other products increased as follows in 1940: Solder, 13 percent; babbitt, 10 percent; bronze, 40 percent; and collapsible tubes and foil, 7 percent.

FOREIGN TRADE

The principal items in the foreign trade of the United State in tin are imports of pig tin (which supply virtually all the domestic tin requirements) and exports of tin plate. Of minor importance are the import and export trade in tin-plate scrap; exports of tin-plate circles, strips, cobbles, etc.; and exports of waste-waste tin plate. There is also an appreciable export of miscellaneous tin manufactures, tin-plated hollow ware, and tin compounds.

Imports of metallic tin in 1940 were 78 percent greater than in 1939, establishing an all-time record. Ninety-one percent of the total imports came from Asia, 4 percent from Europe, 4 percent from Africa, and 1 percent from other sources. Receipts from Asia more than doubled, whereas shipments from Europe dropped 62 percent owing to restrictions on exports from the United Kingdom and occupation of the Low Countries by German military forces. For the most part, shipments from the Belgian Congo have been diverted from Belgium to the United States. Imports of tin concentrates, although small, were the largest since 1923; they came largely from Bolivia and were consigned for treatment in private plants in this country. No shipments were made from Bolivia during 1940 for treatment by the new smelter to be built by the Government. Receipts of Bolivian ore will be much larger in 1941.

Foreign trade of the United States in tin and tin concentrates, 1936–40

Year	Imports				Exports of tin (metal)[1] (long tons)
	Tin (metal)		Tin concentrates (tin content)		
	Long tons	Value	Long tons	Value	
1936	76,029	$75,450,941	179	$94,738	386
1937	88,115	104,284,762	151	132,810	313

1940 [2]	16, 615	3, 536	4, 590	6, 091	137	383, 328

[1] Tin-plate circles, strips, cobbles, etc., included in waste—waste tin plate.
[2] In addition, 15,153 long tons of terneplate clippings and scrap valued at $474,374 were exported in 1940, not separately classified before January 1, 1940.

Foreign trade in miscellaneous tin manufactures and tin compounds, 1936–40

Year	Miscellaneous tin manufactures		Tin compounds (pounds)	
	Imports [1]	Exports [2]	Imports	Exports
1936	$86, 962	$1, 295, 484	5, 959	344, 578
1937	50, 545	2, 532, 747	1, 715	218, 006
1938	19, 453	2, 064, 515	865	172, 467
1939	20, 106	1, 098, 140	5	204, 362
1940	12, 429	706, 425	271	131, 019

[1] Includes tin manufactures, n. s. p. f.; tin foil, tin powder, flitters, and metallics.
[2] Includes tin dross and tin-bearing scrap material other than tin-plate scrap.

Exports of tin plate, etc., increased 23 percent in 1940, chiefly on account of purchases by Latin America, formerly supplied in large part by European manufacturers. During the latter half of the year export demand slackened and by the end of 1940 had reached small proportions. Shipments to Latin America and Canada, which represented 47 percent of the total, increased 34 percent in 1940. Those to Europe (22 percent of the total) increased 13 percent owing to increased shipments to Russia, Greece, Italy, and Switzerland, formerly supplied largely by Germany and England. There was also a 7-percent increase in exports to Asiatic countries (comprising 21 percent of the total); China, India, and Japan received more than in 1939. Exports to the Union of South Africa almost doubled, while shipments to Egypt and Syria declined.

Tin plate, terneplate (including long ternes), and taggers tin exported from the United States, 1939–40, by principal countries and customs districts

PRICES

The average price of Straits tin for prompt delivery in New York in 1940 was slightly below that in 1939 and 8 percent below the 1937 average, which was the high for the last decade. At the beginning of 1940 the quotation was 48.75 cents a pound, having dropped 0.25 cent over the New Year holidays. Lack of demand for tin in this country was evidenced by the downward trend of prices during the early part of the year. The action of the International Tin Committee in the latter part of February in lowering production quotas for the second quarter from 120 percent to 80 percent effected a rise in price to 49 cents on March 11. New sterling exchange regulations effective March 25 required all sales from British sources to be based upon the official rate of $4.04. As importers were no longer able to take advantage of free sterling (at that time about $3.74) some confusion in markets resulted. However, during the latter part of March, prices began to decline and reached the low for the year—44.75 cents—on April 1. The decline was prompted by heavy sales in the East in anticipation of an announcement of an additional export duty of 2½ percent ad valorem to be levied in Malaya on companies not registered in the United Kingdom.

Early in April 1940 uncertainty regarding war developments stimulated a demand for tin, and by April 11 the quotation had risen to 47.50 cents. Something of a panic occurred in May, when the German army overran the Low Countries, causing fear that Germany might obtain control of Netherlands Indies and curtail tin supplies from that source. The price rose from 47.625 cents on May 9 to 53.50 cents on May 10 and to 54.00 cents on May 13. The market soon recovered, however, and for a short time prices trended downward, only to advance again as the defeat of France became imminent and Italy's entrance into the war was announced. By June 13 the price had risen to 58.00 cents—the high of the year. A few days later markets eased, when it was realized that tin supplies to Italy and France would be stopped by the British blockade, and broke sharply on June 18, when France capitulated.

By July 1, when the United States Government announced that it had contracted for 75,000 tons of tin at 50.00 cents, the New York quotation had declined to 52.25 cents a pound. For the remainder of the year the price fluctuated between 50.05 and 52.75 cents; the latter was in effect late in July, when there were threats of short supplies of prompt metal in the Far East. A quotation of 51.875 cents was reached October 10 to 15, following the announcement that Japan had joined the Axis. At the close of the year the price stood at 50.10 cents.

In London the monthly average price for standard tin, spot delivery, in 1940 ranged from £240.7 a long ton in January to £273.4 in June. It was £257.0 in December; the average for the year was £256.4 compared with £226.3 in 1939. Based upon Federal Reserve Board averages of the free rate of sterling exchange the London quotations for standard tin were equivalent to 44.8 cents a pound in 1939 and 43.9 cents in 1940. New York quotations for Straits tin for the same periods were 50.2 and 49.8 cents, respectively. Normally Straits tin commands a premium of about 1 cent a pound over the standard tin market in London.

STOCKS

Total stocks of virgin tin on hand in the United States at the end of 1940, including all metal afloat but excluding Government stock piles in the United States, increased 109 percent over 1939. Visible supplies rose almost 100 percent and consumers' stocks 116 percent. Metal on hand at the end of the year, including tin afloat, was equivalent to a 12.5-month supply at the average rate of consumption in 1940. Government buying for national defense purposes is reflected in the exceedingly high rate of increase in metal afloat and at landings. At the close of the year the various Government agencies acquiring tin for stock-piling purposes had 21,419 tons of metal on hand.

World visible supply, exclusive of consumers' stocks, increased 17 percent in 1940, as the accompanying table shows. These data do not include stocks of metal accumulated by various countries as war reserves.

Stocks of virgin pig tin in the United States, December 31, 1936–40, in long tons

[1] Metal Statistics, 1941; pp. 411 and 413. In this table figures for world stocks, 1936–40, include carry-over in the Straits Settlements (on lighters and warrants) and carry-over at principal European smelters.

During 1940 the Bureau of Mines canvassed tin consumers on a monthly basis to determine stocks and rate of use for the national defense agencies. According to these preliminary reports the consuming industry had 45,500 tons of virgin pig tin on hand in the United States at the end of 1940, of which 34,200 tons were held by tin-plate manufacturers. The industry also had 1,300 tons of secondary pig tin in stock at the end of the year.

WORLD ASPECTS OF TIN INDUSTRY

World mine production.—World mine production of tin established a new record in 1940; it was estimated at 231,700 long tons—an increase of 34 percent over 1939 and 11 percent above the previous record established in 1937. Statistics for production represent exports for some countries; therefore the figure for 1940 output probably overstates actual mine activity, as mine stocks were depleted to a considerable extent in that year. Production in the countries participating in the International Tin Control Scheme in 1940 was 43 percent higher than in 1939, whereas that elsewhere was 10 percent lower. The output of the unrestricted producers comprised 11 percent of the total in 1940 compared with 16 percent in 1939, 19 percent in 1938, and 11 percent form 1925 to 1929.

World smelter production.—The European War has altered the flow of tin ores to some extent. The smelter at Arnhem, Netherlands, was partly shut down in September 1939 and presumably has been idle since the German invasion in May 1940. Ore from the Netherlands Indies, formerly smelted at this plant, has been diverted to smelters in British Malaya, while smelting capacity in the Netherlands Indies is being increased. Some Bolivian ore formerly was smelted in Germany, but the Allied blockade has stopped this flow. The greater part of the Bolivian output has been moving to the United Kingdom, although small tonnages come to the United States. Flow to the United States is increasing and will assume substantial proportions in 1941 in anticipation of the new smelter to be built. Smelting facilities in the Belgian Congo were enlarged to treat local ores that formerly were shipped to Belgium.

International tin control scheme.—During the first quarter of 1940 countries signatory to the production-control scheme were operating under quotas representing 120 percent of standard tonnages. On February 26 production quotas for the second quarter were established at 80 percent and on May 27 those for the third quarter at 100 percent. However, to provide for accumulation of the reserve stock of 75,000 tons of tin by the Metals Reserve Co. under its agreement with the International Tin Committee, this quota was revised on July 8 to 130 percent, to remain in force for 1 year from July 1, 1940.

World smelter production of tin, 1925–29 (average) and 1936–40, by countries, in long tons

[7] Average for 1926–27.
[8] Average for 1926–28.
[9] Less than 1 ton.

The 130-percent quota was designed to permit virtually full capacity operations, but despite this action the signatory countries were unable to meet the permissible tonnages so established. Estimates indicate that for the entire year exports were 31,817 tons less than allotments. The discrepancy between exports and quotas would have been greater had not substantial quantities of ore in stock at mines been available in some countries, which permitted immediate increases in smelter output that would not have been possible otherwise, owing to the delays incident to bringing idle properties into production. Moreover, in Malaya full use of facilities was not possible because of the abnormal conditions resulting from military preparations for defense. In some quarters it has been claimed that the 100-percent excess profit tax on British companies has slowed expansion because such expansion merely would result in the depletion of the companies' principal asset with no benefit accruing to the owners.

On March 20, 1941, the International Tin Committee decided that the quota should continue at 130 percent for the remainder of 1941 and that the present control agreement (which expires at the end of 1941) is to be extended 5 years.

No official data for 1940 are available on production in the principal tin-smelting countries of the world. Output in 1939 was 170,700 long tons. Substantial curtailment of smelting in the Netherlands and China in 1940 doubtless was more than offset by increases elsewhere, so that a decided advance for 1940 over 1939 may be assumed.

World consumption.—Apparent world consumption of tin in 1940 totaled 169,500 tons—a 2-percent increase over 1939—according to a preliminary estimate of the Metal Bulletin (London) based upon data issued by the Tin Research Institute.

Apparent tin consumption of the world, 1926–29 (average) and 1936–40, by countries, in long tons [1]

Country	1926–29 (average)	1936	1937	1938	1939	[2] 1940

REVIEW BY COUNTRIES

Argentina.—According to C. W. Wright[4] the present tin output of Argentina is about sufficient for domestic consumption, and the main placer deposits that supply the smelter are nearing exhaustion, although the tailings might be reworked to yield about half the present output. As regards future operations he states:

Tests of the placer tailings thus far sampled show 1,187,900 cubic meters with a content of 0.905 kilo of 60 percent tin concentrate. There is at least an equal amount of workable tailings still to be tested. A transportable plant to treat about 3,000 tons a day is being studied, and it is estimated that there is a sufficient tonnage of tailings for about 5 years.

At the mine the developments of the sulfide zones in depth are expected to keep the mill plants in operation for about 2 years.

Belgian Congo.—According to a report by Jacques Relecom submitted before the National Colonial Congress at Brussels in April 1940, the Congo is likely rapidly to reach an annual output of 30,000 tons of metallic tin.[5]

Bolivia.—The tin content of ore exported from Bolivia in 1940 was 37,923 long tons compared with 27,211 in 1939. Despite the 39-percent increase, exports were 15,018 tons under the permissible quota of 52,941 tons allowed under the control scheme. The greater portion of the exports went to Great Britain. In an effort to increase exports the Bolivian Government on May 15, 1940, granted concessions on foreign exchange regulations and taxation. This move apparently met with some success because monthly exports increased considerably during the latter part of the year.

At the close of 1940, 20,000 tons of Bolivian tin ore were reported to be in Chilean and Peruvian ports awaiting shipment; a large proportion presumably was destined for smelting in the United States under the new ore-purchasing contract previously mentioned.

The Patino interests, while not participants in the ore contract, have indicated an interest in plans for tin smelting in the United

[5] The Metal Bulletin (London), No. 2487, May 7, 1940, p. 6.

States. The 1940 annual report of Patino Mines & Enterprises Consolidated, Inc., states:

> With regard to the smelting of tin in the United States, this Corporation gave assurances to the agencies of the United States Government in Washington of its readiness to cooperate and submitted more than one proposal for the construction of a smelting plant of adequate capacity. For this purpose it would have the cooperation of the technical staff of Consolidated Tin Smelters, whose long experience is unequaled in any country, in the treatment of the complex minerals produced by Bolivia. In spite of the fact that this matter appears to have been definitely closed, the corporation will be happy to cooperate at any time, should our cooperation be requested.

The company produced ores containing 12,978 long tons of tin in 1940 compared with 7,017 tons in 1939.

British Malaya.—The 1940 quota for Malaya under the Tin Control Scheme was 88,935 long tons; 85,384 tons were exported, leaving an underexport of only 3,551 tons. Exports—the highest ever recorded—were 52 percent greater than in 1939. Mine production likewise reached an all-time peak in 1940. In the Federated Malay States production totaled 80,651 tons compared with 49,525 in 1939 and the previous peak of 75,117 in 1937.

During the latter part of 1940 there was in effect in Great Britain a 100-percent excess profit tax, which left little financial incentive to expand production because mining companies were reluctant to deplete their ore reserves without benefit to the stockholders. On the grounds that special consideration should be given to concerns working wasting assets, the law has been amended, effective April 1, 1941, so that 20 percent of the tax paid becomes a post-war credit to be refunded when the war is over.

Ores imported for reduction in smelters of the Straits Settlements from Netherlands Indies, Burma, Siam, Indochina, Japan, and Africa totaled 45,576 tons in 1940—an increase of about 10 percent over 1939. Toward the latter part of the year imports from Indochina ceased.

Apparently official consideration of the Fermor report, which was summarized in last year's chapter, has been postponed until the war is over.

China.—Shipments from China declined 39 percent in 1940, apparently due mainly to transportation difficulties, as the mines at Kokiu were reported to be working day and night to accelerate production.

The extent of Japanese control over tin-mining areas appears to have been overstated in Minerals Yearbook, 1940. From a source believed to be reliable it has been ascertained that only the tin-mining areas in the coastal region of Kwangtung Province, which produce about 100 tons of tin annually, have been occupied by the invaders. Tin mining in Kiangsi and Kwangsi Provinces has not been affected. These two Provinces normally contribute about 20 percent of China's tin.

Extensions and improvements were reported to be under way at the smelting plant of the Yunnan Tin Corporation at Kokiu, but it is not known whether the work was completed. Late in the year dispatches indicated that large tin refineries at Kokiu were either destroyed or seriously damaged by Japanese bombs. The Yunnan Tin Corporation plant has been producing 2,500 to 3,000 tons of tin slabs annually or about one-third of the total output of Kokiu. There are about 60 native smelting places in the area, which supply the remainder. For a while tin from Kokiu was being shipped through Indochina by rail to Haiphong, but this route eventually was cut off by the Japanese. With the reopening of the Burma Road in October some tin may now be exported by way of Burma, but the quantity is believed to be small.

Up to May 19, 1940, the United States, through the Metals Reserve Co., had arranged for purchases of wolframite, antimony, and tin from the National Resources Commission of China to the total value of $90,000,000, to be delivered during the next few years.

Germany.—Apparent consumption of tin in Germany amounted to 10,000 tons in 1940 compared with 13,000 tons in 1939, according to estimates of the Metal Bulletin (London). A. Strauss & Co., Ltd., of London, stated on August 1, 1940, that

> Substantial stocks of tin were in Holland, Belgium, and France when the German conquest of those countries took place. Contrary, therefore, to the rather wishful-thinking statements that have been made in some quarters concerning the famine of tin in Germany, there can be no acute shortage there at the moment.

According to reports, the German army secured 5,600 tons of tin in the Netherlands and France when it overran those countries.

For several years Germany has been seeking substitutes for tin. Sheet iron coated with a phosphate film by the Bonder rustproofing process has been developed to replace tinplate in the manufacture of tin cans. A new kind of collapsible tube using cellulose plastic and metal sheet is being produced in limited quantities, and another type made manually on a small scale from plastics has been in commercial use for some time. Plastic bearings and tooth gears are playing an increasingly important role in replacing bronze, and aluminum and magnesium alloys are used extensively instead of bronze in the manufacture of worm gears.

Italy.—The small quantity of tin produced in Italy in recent years has been derived largely from tin cans and other scrap, although some is obtained from tin deposits and ore dumps in Tuscany and Sardinia. Domestic sources are insufficient to meet requirements, which are supplied largely by imports. According to trade reports, consumption declined more than 15 percent in 1940. During the year the shortage in tin plate affected operations of small canneries. To conserve stocks of tin plate the Government limited nonmilitary uses and restricted the size of containers.

Japan.—Consumption in Japan is estimated to have increased 12 percent in 1940 inasmuch as imports were at a much greater rate. A. Strauss & Co., Ltd., of London, comments on the larger imports as follows:

> These have risen from 800 to 900 tons a month to 1,500 tons from the Straits Settlements and the Netherlands East Indies combined. It is important to know the final destination of this metal. Is it the Japanese armament workshops, or does the metal go through Russia to Germany? The Ministry of Economic Warfare have no doubt got their eye on this matter. It is obviously necessary to give it close and constant attention.

Netherlands Indies.—The permissible export quota of Netherlands Indies for 1940 was 44,914 long tons; 44,447 tons were exported, leaving an underexport of only 467 tons. Shipments in 1940 were 42 percent more than in 1939. From January to April Banka produced 7,187 tons of tin, while Billiton and Singkep produced 5,266; figures for the remainder of the year have not been published.

United Kingdom.—Tin consumption established a new peak in 1940. Although official statistics are not available, the Metal Bulletin of London estimates that 32,000 tons were used—a 17-percent increase over the 27,279 tons reported for 1939. This sharp rise in consumption was accompanied by sizable declines in deliveries of metal to the United Kingdom from foreign sources and in receipts of English tin in the United States. Imports of ore from Bolivia and Nigeria apparently were higher in 1940 than in 1939; but substantial stocks, particularly of the lower-grade ores, were accumulated during the year. Visible stocks were considerably higher at the end of 1940 than at the beginning. The data at hand suggest an increase in smelter output in 1940. The mines of Cornwall produced 1,800 tons of tin, 5 percent more than in 1939.

During the latter part of the year relatively large quantities of 99-percent tin smelted in the United Kingdom from low-grade ore normally treated in the Netherlands were shipped to the United States. Supplies evidently were expanded sufficiently to permit authorities to grant export licenses more freely. Tin, and various alloys containing tin, require licenses for export from the United Kingdom to any destination. In June 1940 imports of tin metal and alloys also became subject to license. Imports of tin ores and concentrates, and residues from any source, do not require license.

The United Kingdom ranks second among the world producers of tinplate, most of which it usually exports, but restrictions on the use of steel have curtailed production. In July 1940 the use of tinplate in the manufacture of containers for home use was placed under control. Its employment for "dry" packs of food, certain toilet preparations, tobacco, trays, counter displays, oil cabinets, and similar uses is prohibited. Canned foods must be packed in specified can sizes. The smaller sizes and freak shapes not representing the most economical use of tinplate are banned. Manufacture for export was not affected by regulations prescribed in 1940. The new restriction will save 40,000 to 50,000 tons of tinplate and sheet steel annually for munitions. It has been estimated that owing to this urgent need for steel the South Wales tinplate industry will reduce its output to 45 percent.

U. S. S. R.—Tin production statistics for 1940 for U. S. S. R. are not available. Consumption, however, decreased 20 percent—from 10,000 tons in 1939 to 8,000 tons in 1940, according to estimates of the Metal Bulletin (London). The Third 5-Year Plan calls for a large increase in tin production by 1942, which will require new construction and improved operations in existing enterprises. Little has been done to date toward developing deposits discovered by Russian geologists, although trade reports indicate that exploitation was expected to begin in 1940 in eastern Siberia. Detailed prospecting work is reported to be far behind geological discovery. Insufficient mine production appears to have resulted in shortages of ore supplies available for smelting operations. According to Soviet reports, a rich tin-bearing region has been discovered near the headwaters of the Bureya River in the Khabarovsk Kray.

During the year some supplies of tin were reported to have been transshipped from the United States and Japan to Germany via Russia.

ARSENIC AND BISMUTH

By Herbert A. Franke [1]

SUMMARY OUTLINE

ARSENIC

Domestic and world output of white arsenic in 1940 exceeded all previous records. Production in the United States advanced 12 percent. Domestic producers sold more arsenic than ever before and received a price slightly above the low of 1939 as competition from European sources of supply diminished. Of the total arsenic consumed, imports comprised but 31 percent compared with 43 percent in 1939. Consumption dropped 7 percent, because farmers employed less calcium arsenate in destroying the cotton boll weevil and Government agencies used smaller quantities of arsenicals in their war on insect pests. White arsenic quotations rose from 3 to 3½ cents a pound.

Salient statistics for arsenic in the United States, 1925–29 (average) and 1937–40

PRODUCTION

Influenced by national defense demands for nonferrous metals in 1940, domestic smelters and refineries recovered and also sold more white arsenic than in any year in the history of the industry. White arsenic (As_2O_3) production increased 12 percent over the record 1939 output. As heretofore, the Anaconda Copper Mining Co., American Smelting & Refining Co., and United States Smelting Refining & Mining Co. recovered all of the domestic arsenious oxide as a byproduct, chiefly from complex copper, lead, and gold ores.

Crude and refined white arsenic produced and sold by producers in the United States, 1936–40

Year	Crude			Refined			Total		
	Production (short tons)	Sales		Production (short tons)	Sales		Production (short tons)	Sales	
		Short tons	Value [1]		Short tons	Value [1]		Short tons	Value [1]
1936	9,937	8,755	$266,113	5,442	6,826	$352,713	15,379	15,581	$618,826
1937	9,936	10,903	290,733	6,878	6,733	250,822	16,814	17,636	541,555

1940	18,241	16,688	365,700	6,742	6,651	195,600	24,983	23,339	561,300

[1] Partly estimated.

Production, as reported by the Bureau of Mines, is measured after the low-grade flue dusts containing 20 to 30 percent As_2O_3 are subjected to a roasting or preliminary refining process. This crude arsenic usually contains 97 to 98 percent As_2O_3. Most of the crude arsenic and a small quantity of better-grade arsenic obtained in certain parts of smelter flue systems are marketed without further refining. Some crude arsenic is refined further. Bureau of Mines statistics on refined arsenic include only products containing 99 percent or more As_2O_3. The arsenic reported as a refined product is not duplicated in the crude arsenic statistics.

Metallic arsenic, formerly imported from Germany, France, and Belgium, was produced in the United States for the first time in many years. The Anaconda Copper Mining Co. began production on a small scale at Anaconda, Mont., in March 1940, utilizing a process somewhat similar to that employed by Hoskins in 1920.[2] The metal was marketed during the year by Philipp Bros., Inc., 70 Pine Street, New York, N. Y., and was used chiefly as a flux, alloy, and metal hardener in lead, copper, brass, white bearing, and other metals.

Only in recent years has the United States produced artificial red and yellow arsenic sulfide (As_2S_2 and As_2S_3), which are used as depilatories in tanning, as pigments in paints, and in the manufacture of rubber, chemicals, and pyrotechnics. The Rare Metal Products Co., Belleville, N. J., now produces these arsenic sulfides, formerly imported from France, Belgium, and Germany.

CONSUMPTION

Domestic white arsenic sold during 1940 not only rose 4 percent over that in 1939 but netted a better price per pound. Both advances are attributed to the great decline in imports and the less severe competition. Imports comprised only 31 percent of the consumption in 1940, compared with 43 and 57 percent in 1939 and 1938, respectively. Imports of arsenicals other than white arsenic also decreased (see details in table of salient statistics). Apparent domestic consumption of white arsenic (sales plus imports minus approximate exports) declined 7 percent and totaled only 31,668 short tons compared with 33,913 in 1939. Nevertheless, consumption ranked fourth highest in the history of the United States and was exceeded only by the greater use of arsenic during 1937, 1939, and 1936. Of the domestic arsenic sold, 72 percent was crude and only 28 percent refined. The distribution in sales of domestic arsenic in the United States in 1940 was approximately as follows: Insecticides, 68 percent; weed killer, 19; glass manufacture, 3; wood preservative, 2; and miscellaneous (including arsenical drugs), 1. Exports comprised 7 percent.

The principal arsenical insecticides are lead and calcium arsenate, sodium arsenite, paris green, and london purple. In 1939 the production of lead arsenate totaled 59,568,596 pounds (63,291,440 in 1937), of calcium arsenate 39,281,788 pounds (37,001,959 in 1937), and of paris green 2,040,307 pounds (1,834,340 in 1937).[3] Large stocks of arsenical insecticides, particularly calcium arsenate, were carried by manufacturers from 1939 over into 1940, as insect infestations were not serious during 1939. Demands for insecticides also were not heavy during 1940, as southern cotton fields were not greatly troubled with boll weevils, except in Texas and parts of the Gulf Coast States. Cotton-leaf worms were not abundant. Consumption of lead arsenate probably remained steady (at about 60,000,000 pounds) in 1940, as it was necessary to spray fruit and shade trees to exterminate codling and gypsy moths and to treat soil in the East to destroy the Japanese beetle grub. In August 1940 the Federal Security Agency accepted the recommendations of the United States Public Health Service and doubled the permissible tolerance of lead-arsenic spray residue on apples and pears. Nevertheless fruit growers must continue to wash their produce, inasmuch as the spray residue usually exceeds the new tolerances—0.025 grain of As_2O_3 and 0.05 grain of lead per pound of fruit. Although Federal and State agencies consumed larger quantities of arsenicals to fight Mormon crickets in the West and white-fringed beetles in the South, they used less insecticide in 1940 than in 1939 to kill grasshoppers in the western United States. The Department of Agriculture reports that in 1940 Federal and State agencies consumed 700,000 gallons of liquid sodium arsenite in grasshopper bait (550,000 gallons estimated for 1941), 105,000 pounds of dry sodium arsenite in combatting Mormon crickets (120,000 pounds estimated for 1941), and 718,000 pounds of calcium arsenate and 93,000 gallons of liquid sodium arsenite in destroying white-fringed beetles (410,000 pounds and 56,000 gallons estimated

[3] U. S. Department of Commerce, Census of Manufactures, 1939, Insecticides, Fungicides, and Related Industrial and Household Chemical Compounds (Prel. Rept.): Industry No. 933, December 23, 1940, 2 pp.

for 1941). Sodium fluosilicate, largely imported from Europe in the past, probably would replace much of the sodium arsenite now used by the agencies if more of it were available. Truck gardeners may be forced to employ larger quantities of arsenicals in 1941, inasmuch as the war has made difficult the importation of the rotenone-bearing root poisons grown in Asia and South America, which only recently were largely substituted for arsenic. The warm winter of 1940–41 and heavy early rains in Texas also can be expected to increase the cotton boll-weevil population of the South in 1941.

Manufacturers and distributors sold 13,371,490 doses of arsenical drugs for treatment of syphilis in 1940 compared with 12,390,837 in 1939.

The consumption of white arsenic in 1941 may be greater than in 1940, in view of prospective insect infestations and the efforts being made to produce as much food as possible to feed the British. Railroad and highway departments probably will decide to kill more weeds with sodium arsenite so that labor may be employed on more important jobs. The use of arsenic to manufacture chemical warfare materials may become necessary. It should be possible, however, to meet all civilian and defense arsenic requirements in 1941 from accumulated stocks and a slight increase in domestic byproduct arsenic production (though it was near capacity in 1940), plus imports from Mexico and Canada. Any great increase in demands would necessitate the construction of additional recovery plants to treat the abundant reserves of arsenic-bearing ore.

PRICES

Quotations on domestic white arsenic at New York rose in July 1940 from 3 to 3¼ cents and in November 1940 to 3½ cents a pound, packed in barrels, carlots. These price increases are attributed to the decline in European arsenic imports and the subsequent removal of cut-price competition, thereby permitting domestic prices to rise slightly from the previous low level. To meet competition from European sources on arsenic for domestic delivery, American producers had been obliged to accept offers substantially less than the nominal quoted price of 3 cents a pound. During 1940 the average selling value was only 1.10 cents a pound for crude and 1.47 cents for refined arsenic—an increase of only 10 and 4 percent, respectively, over the record low values of 1939. Minimum quotations during 1940 on calcium arsenate were reduced from 6¾ to 6 cents a pound and on lead arsenate from 10 to 8½ cents a pound as a result of the price war among manufacturers that developed in March. The minimum price, however, was raised ½ cent on calcium arsenate in May and on lead arsenate in November and December 1940. No official prices were quoted for arsenic metal throughout 1940, but the nominal price is reported at 75 cents a pound. The red arsenic quotations given are only for the period from January 29 to May 20, 1940.

The great rise in price for white arsenic in London in 1939 from £12 a long ton to £22 in October and £31 in December for Cornish brands declined and leveled off during 1940 as Swedish and Mexican arsenic at £29 to £30 and Cornish brands at £31 per long ton in January 1940 were largely replaced by American arsenic in February 1940, which sold during the year at £14 to £25 for crude and £20 to £30 a long ton for refined.

Range of quotations on arsenic and its compounds at New York (or delivered in East), 1939–40, in cents per pound [1]

	1939	1940
Arsenic metal, lump, cases	40.00–60.00	(2)
White arsenic (As_2O_3), domestic, kegs, carlots	3.00	3.00– 3.50
Red arsenic (As_2S_2), imported, cases	15.75–20.00	17.50–18.00
Calcium arsenate, wholesale, drums, carlots	6.75– 7.25	6.00– 7.25
Lead arsenate, wholesale, drums, carlots	10.00–11.50	8.50–11.00
Sodium arsenate, wholesale, drums	8.00	7.00– 8.00
Sodium arsenite, dry, works, drums, white	9.00–11.00	8.00– 8.75
Sodium arsenite, dry, works, drums, gray	7.50– 9.50	6.50– 7.50

FOREIGN TRADE

The 32-percent drop in imports of white arsenic into the United States in 1940 is attributed to the diversion of Mexican supplies to the United Kingdom, South America, and Africa and to the curtailment of shipments from Europe because of the war. Imports of Mexican arsenic declined 7 percent. Of the 1940 imports, Mexico supplied 76 percent, France 17 percent, and Canada, Japan, and Sweden virtually all of the remaining 7 percent.

The table on salient statistics contains data on the foreign trade in arsenical compounds other than white arsenic. Arsenic metal imports (13,228 pounds—all from Belgium) declined 66 percent and arsenic sulfide imports (220,445 pounds—121,230 from France and 99,125 from Belgium) also declined 66 percent. Imports of calcium arsenate (chiefly from Japan) and of paris green and london purple (from France and the United Kingdom) dropped 73 and 44 percent, respectively, whereas shipments of sheep dip (from the United Kingdom) advanced 11 percent.

Official white arsenic export data are not available, but domestic producers report the shipment of only about 1,600 tons for export in 1940 compared with 3,200 tons in 1939. Calcium arsenate exports (4,879,391 pounds) declined 28 percent and went chiefly to Peru (3,702,300 pounds), Mexico (498,752), Colombia (130,000), Argentina (121,115), Venezuela (107,000), and Nicaragua (100,050). Exports of lead arsenate (2,900,250 pounds), however, increased 69 percent and went chiefly to Brazil (1,538,313 pounds), Argentina (420,012), the Union of South Africa (293,602), Chile (154,360), and Colombia (135,084).

White arsenic imported for consumption in the United States, 1936–40, by countries

Country	1936		1937		1938		1939		1940

[1] Less than 1 ton.

WORLD PRODUCTION AND CONSUMPTION

Capacity operation of nonferrous smelters is believed to have increased world production of marketable white arsenic from an estimated 58,000 metric tons in 1939 to 65,000 or more in 1940. Official data are available only for Brazil, Mexico, and the United States; these countries increased their output 53, 31, and 12 percent, respectively.

Brazil.—The St. John d'el Rey Mining Co. at Nova Lima, Minas Gerais, and the Companhia Minas da Passagem at Passagem, Minas Gerais, gold-mining companies, recover arsenic from arsenical pyrite tailings.

Italy.—During 1940 the S. A. Stabilimenti di Rumianca of Borgaro, Turin, largest Italian producer of white arsenic, began producing about 100 kilograms of metallic arsenic monthly at Pieve Vergonte (Novara). A new plant at Apuania, to begin operations late in 1941, is expected to produce 2,000 kilograms of metal monthly.

Mexico.—White arsenic export declarations in 1940 totaled 9,204 metric tons; 8,027 tons were consigned to the United States, 648 to the United Kingdom, 351 to the Union of South Africa, 150 to Argentina, and 28 to Cuba.

Portugal.—White arsenic was produced in 1940 at the newly reopened Pintor mine, which is owned by a sheep-dip firm locally known as "Cooper's." Imports of white arsenic totaled 24 metric tons and of arsenic acid 35 tons.

Sweden.—Unsubstantiated rumors report the movement of large quantities of white arsenic from Sweden to Germany. The Bolidens Gruv A.-B. is operating about 12 arsenic-impregnating timber plants in Sweden, in addition to some in Norway and Finland. A new process is employed whereby zinc and chromic arsenates are introduced into the wood to protect it against decay and insects.

U. S. S. R.—The plant recently built in the mountains of Svanetia, Caucasus, to recover white arsenic from a rich body of arsenic-bearing ore is expected to be expanded further.

United Kingdom.—Arsenic requirements are being met with the domestic output of Cornwall supplemented by imports from Mexico, the United States, Australia, Canada, and Portugal.

World production of white arsenic, 1936–40, by countries, in metric tons [1]

[1] Arsenic is also believed to be produced in Czechoslovakia, Peru, Turkey, and U. S. S. R. Production figures are not available for these countries.
[2] Data not available.
[3] Data not available. Estimate included in total.
[4] Arsenic content of ores mined is as follows: 1936, 23,312 tons; 1937, 20,954 tons; 1938, 21,480 tons; 1939 and 1940, data not available.

BISMUTH

Production of bismuth in the United States paced the increased smelter-refinery output of lead and copper during 1940. Although complete data are lacking, it is believed that domestic consumption remained about the same as in 1939. Consumers used stocks accumulated in 1939, and thus producers' stocks were enlarged by an output that was greater than sales. Exports were heavy early in 1940 but declined later in the year as shipments to many European countries were discontinued. New York prices remained at $1.25 a pound throughout 1940. Quotations on bismuth compounds also were unchanged.

World bismuth output probably advanced, but consumption is believed to have dropped slightly in 1940 as the European and Asiatic Wars cut off supply routes and thereby forced the employment of substitutes, expecially in important pharmaceutical applications.

PRODUCTION

In 1940 the American Smelting & Refining Co., Anaconda Copper Mining Co., and United States Smelting, Refining & Mining Co. substantially increased the domestic production of bismuth obtained as a byproduct in smelting lead and copper ores mined in and imported into the United States. The American Smelting & Refining Co. was assigned new patents for the recovery of bismuth from lead,[4] one of which involves the addition of organic compounds in the debismuthization of lead. Bunker Hill & Sullivan Mining & Concentrating Co. did

[4] U. S. Patents 2,205,387 and 2,213,197.

not produce any refined bismuth during the year in its new hydro-, pyro-, and electro-metallurgical plant for the treatment of complex silver ores. The Argenta Mining & Milling Co., Dillon, Mont., recovered 7,000 pounds of bismuth concentrates. As heretofore, the Cerro de Pasco Copper Corporation supplied the domestic market with considerable metal imported from Peru.

CONSUMPTION

Purchase of bismuth was heavy early in 1940, presumably because consumers feared a runaway market; but when it became evident that no price rise was imminent a slack period averaged up sales. Actual domestic consumption probably continued around the 500,000-pound mark in 1940 as consumers used up large stocks that had been accumulated in 1939 and early in 1940 in anticipation of a price increase similar to that which occurred in the World War of 1914–18. Bismuth used in alloys increased owing to business activity, whereas that consumed as salts in the manufacture of pharmaceuticals shrunk as the war restricted export trade and encouraged the use of substitutes.

The low-melting-point and nonshrinking bismuth alloys were used more widely during 1940 in such national defense industries as the manufacture of machine tools and dies, aircraft, alloys, and automobiles. For instance, "Cerrobend," a low-melting-point alloy of bismuth, lead, tin, and cadmium, was used extensively in bending thin-walled aluminum alloy aircraft oil and gas tubes. When molten bismuth alloy is poured into tubing, it reveals any holes that may be present, because the metal will squeeze out. As the filler metal solidifies during cooling, any weak seams in the tubing will split open because the bismuth alloy expands slightly in cooling from the liquid to the solid state. After bending, the alloy can be melted out of the tubing in a steam or boiling water bath and reused. Considerable progress was made during 1940 on experiments covering the use of bismuth alloys for centering machine-tool bearings and making spotting or fender die fixtures.

According to the Census of Manufactures, the production of bismuth subnitrate increased 39 percent from 1937 (262,867 pounds) to 1939 (365,522 pounds), the production of bismuth subgallate advanced 6 percent from 1937 (40,861 pounds) to 1939 (43,347 pounds), and the output of bismuth subcarbonate declined 2 percent from 1937 (247,609 pounds) to 1939 (241,817 pounds). The average value of these three leading bismuth compounds advanced 13, 95, and 15 percent, respectively; the increases were due in part to the 5-cent and later 15-cent rise in the price of bismuth during 1939. The various bismuth compounds, salts, and mixtures are utilized in indigestion remedies, antiacid compounds, ointments, salves, dusting powders, venereal disease doses, and other medicinal applications. Early in 1941, the Army and Navy began to make heavier purchases of bismuth pharmaceuticals.

PRICES

New York quotations for bismuth metal remained firm at $1.25 a pound, ton lots, throughout 1940, according to the Engineering and Mining Journal Metal and Mineral Markets. Consumers' fears of a runaway price market, similar to that which occurred in the World War of 1914–18, when bismuth was quoted as high as $4.00 a pound, did not develop during 1940 or early 1941. According to the Oil, Paint, and Drug Reporter, prices for bismuth compounds also were steady during 1940; bismuth subcarbonate was $1.73 a pound (fiber drums), subnitrate $1.48, subgallate $1.68, and subsalicylate $2.50 (where it had advanced early in the year).

FOREIGN TRADE

The quantity of bismuth metal imported in 1940 (all from Peru) declined 32 percent compared with that in 1939. Imports of compounds, mixtures, and salts of bismuth were virtually nonexistent as the customary shipments from Germany ceased. Imports not valued chiefly for lead in 1940 totaled 189,906 pounds (264,782 in 1939), of which 90,816 pounds (176,135 in 1939) comprised metals other than lead. This classification included shipments from Peru, the United Kingdom, and Germany (Belgium, Peru, and the United Kingdom in 1939). Of the 148,762 pounds from Peru (81,573 in 1939), only 66,704 were lead (36,300 in 1939); probably the remainder was chiefly bismuth.

Official data on the export of bismuth metal are not available, but it is reliably estimated that 1940 shipments totaled over 600,000 pounds. The bulk of the metal was shipped to the United Kingdom, the U. S. S. R., and France. The export of bismuth compounds and medicinals probably advanced because of larger markets in South America resulting from curtailment of supplies from Germany and other European countries. Effective July 2, 1941, bismuth was subject to export license.

Bismuth and "compounds, mixtures, and salts of bismuth" imported for consumption in the United States, 1936–40

Year	Bismuth		Compounds, mixtures, and salts of bismuth	
	Pounds	Value	Pounds	Value
1936	113,443	$86,722	564	$4,807
1937	67,225	54,007	3,145	9,117
1938	92,298	74,583	2,004	3,387
1939	182,832	154,339	297	649
1940	123,880	118,260	4	31

WORLD PRODUCTION AND CONSUMPTION

World production of bismuth in 1940 probably was in the neighborhood of 3,000,000 pounds, or more than ample to supply the demand. The United States, Peru, Canada, and Mexico continued to supply the bulk of the output, and Bolivia, Spain, Japan, China, Yugoslavia, Sweden, Argentina, Belgium, the U. S. S. R., Australia, France, the Union of South Africa, and Germany produced most of the remainder. Europe is the largest world consumer of bismuth and normally takes about 1,500,000 pounds annually. In 1940, Germany and Italy probably found it difficult to meet all demands as the British-influenced cartel refused to sell them bismuth and they probably had to depend on small importations from Japan and the U. S. S. R., plus the minor production of countries under their control.

North America.—Mexico produced 408,810 pounds of bismuth in 1940 (360,859 in 1939). Data are not available for Canada, where the metal is derived chiefly from the treatment of silver-lead ores by the Consolidated Mining & Smelting Co. at Trail, British Columbia, and of silver-cobalt ores by the Deloro Smelting & Refining Co., Ltd., at Deloro, Ontario.

South America.—The 1940 output of the Cerro de Pasco Copper Corporation in Peru, one of the largest producers of bismuth in the world, included 757,061 pounds of refined bismuth (886,320 in 1939) and 155,966 pounds of bismuth-lead bullion containing 86,562 pounds of bismuth (89,820 pounds of bullion with 71,620 pounds of bismuth in 1939). Exports from Peru comprised 760,434 pounds of refined bismuth in bars (848,182 in 1939), of which 574,791 pounds went to the United States, 185,230 to the United Kingdom, and 412 to Chile; and 86,562 pounds of bismuth in lead (171,385 in 1939), all to the United States. The Peruvian Government imposed an export tax on bismuth and its crude products in June 1940 which amounts to 5 percent ad valorem when the New York quotation on the metal does not exceed $1.00 a pound and to 10 percent when the quotation is above that. The Fabulosa Mines Consolidated, in Bolivia, increased its production of bismuth ore in the Carmen mine from 4,868 pounds in 1938 to 11,967 in 1939. Bolivian exports of bismuth in concentrates totaled 41,230 pounds in 1940 (28,660 in 1939).

Europe.—Since the war Germany and Italy have probably obtained small supplies of bismuth from Spain and Sweden. However, the fall of France in June 1940 is believed to have yielded the Axis Powers large stocks of the metal. Control over Yugoslavia early in 1941 gave Germany the Trepca lead mines and their byproduct bismuth output. Such export data as are available indicate that the United Kingdom probably imported substantial quantities of bismuth from Peru, Mexico, the United States, and Canada in 1940. Another new bismuth plant is reported to have begun operations in the U. S. S. R.—at Adrasinan, in Tadzhikistan.

Africa, Asia, and Australia.—In 1939 the Union of South Africa produced 4,398 pounds of bismuth ore containing 69 percent bismuth. A small quantity of bismuth was produced in China, and doubtless the bismuth-tungsten and tungsten-molybdenum mines in Queensland, Australia, continued to produce bismuth as a byproduct during 1940.

MAGNESIUM

By Herbert A. Franke and M. E. Trought

SUMMARY OUTLINE

Despite the fact that production of primary magnesium in 1940 was the largest in the history of the domestic industry, national defense requirements for the metal were so great that early in 1941 it became necessary to place it under a mandatory priority status. Production in 1940 exceeded the 1939 peak output by 87 percent. The Dow Chemical Co. again was the sole domestic producer, as has been the case since 1927. This company expects to more than double its 1940 output in 1941 by producing 30,000,000 pounds of magnesium, and its plants in Midland, Mich., and Freeport, Tex., are to be expanded further to produce at a rate of 52,500,000 pounds annually by early 1942. The chemical engineering division of the Todd-California Shipbuilding Corporation plans to commence production in August 1941 at its Permanente plant near San Jose, Calif., with the expectation that an annual rate of 24,000,000 pounds will be attained by 1942. A much greater expansion of domestic production through Government-financed facilities is contemplated.

Apparent consumption of magnesium in 1940 rose 73 and 310 percent above that in 1939 and 1938, respectively. A much larger increase was prevented by the limited supply of metal available. The extraordinary growth in demand is attributed to the requirements of the aircraft industry for structural materials of high strength and low weight characteristics and of the munitions industry for pyrotechnic materials. Although larger quantities of magnesium-rich alloys now are used per airplane, aluminum-base alloys continue to comprise by far its major structural weight. These aluminum alloys, however, contain small percentages of magnesium and represent a substantial quantity of the lighter metal. Of the magnesium actually consumed by industry in the United States during 1940, 64 percent was used in the manufacture of magnesium-rich alloy structural products, 32 percent in aluminum, zinc, and other alloys, and 4 percent as a scavenger and deoxidizer in metallurgical works and in pyrotechnic, chemical, and other uses. The fabrication of magnesium-alloy structural products rose 132 percent and of magnesium nonstructural products 50 percent. Of the structural products sold or used, the aircraft industry took 75 percent; the automotive industry 10 percent; the portable machine, equipment, and tool industries 6 percent; and the textile, foundry equipment, and other industries 9 percent.

Salient statistics of the magnesium industry in the United States, 1938–40

	1938	1939	1940
Production of primary magnesium pounds	6,433,390	6,700,122	12,521,726
Quoted price per pound[1] cents	30.0	27.0	27.0
Imports pounds	60	76	
Exports do	[2]2,100,000	[2]4,200,000	1,718,444
World production (estimated) short tons	27,200	34,200	44,000

[1] Lowest nominal price (New York) for primary metal ingot 99.8 percent pure, carlots.
