INTRODUCTION

The publication of this volume of the Wisconsin D.H.I.A. Record (previously the Yearbook) has been made possible by the splendid cooperation of association fieldmen who have made current identification and lactation production reports from a total of 121 associations for the period June 1st, 1936 to May 31st, 1937. Since the permanent filing of eartag identification and production records was begun in 1934, 49,964 animals have been identified and production information has been recorded on 45,400 cows and on the daughters of 5698 sires.

During the twelve months (from June 1936 to the end of May 1937) covered by this bulletin, a total of 24077 lactation records providing progeny test information has been accumulated on the daughters of 287 new sires; 212 bulls (8 Brown Swiss, 47 Guernseys, 148 Holsteins, 7 Jerseys, and 2 Milking Shorthorns) had five or more tested daughters from tested dams, while 75 other sires had ten or more tested daughters but less than five from tested dams. This publication also gives information on 333 outstanding brood cows, and on 840 herds now in at least their third consecutive year of a herd testing program. All of the records of all of the cows in such herds have been used to estimate the average level of production of such units. It is to be hoped that the location of superior brood cow families and of promising sires in herds on a continuous testing program may do much to get the proper distribution and dissemination of good dairy stock among the dairy herds of this state. Safeguards must be set up to encourage the dairy cattle breeder to check his own farm management and testing program against that of farms from which he may select breeding stock for his own herd.

The Farm and Dairy Records Office of the Wisconsin College is at the present time making available to association members and other dairymen a permanent file of breeding information, a pedigree on each herd sire in a dairy herd improvement association herd, a live breeding list of proved and promising dairy sires, and, in addition, every attempt will be made to assist county agricultural agents, instructors of vocational agriculture and association members to locate dairy animals of apparent breeding worth.

During the past year the system of permanent recording of identification and production records for animals in D.H.I.A. tested herds has been adopted on a national scale, the central filing agency being the Division of Dairy Herd Improvement Investigations, Bureau of Dairy Industry. Beginning with June 1937, all identification and production records have been reported to the Bureau on their forms. The preparation of the 1938 Volume of the Record will be based upon production records reported for the period May 1937 to July 1, 1938, for all association cows that have finished the first 305 days of their lactation period. Wisconsin's 140 dairy herd improvement associations are now cooperating with the Bureau of Dairy Industry, in the establishment of the most comprehensive dairy cattle improvement program ever inaugurated.

METHOD OF USING PRODUCTION RECORDS

Information published in this bulletin is based on lactation records reported by the D.H.I.A. Fieldmen. The number of milkings per day, the length of lactation, the age at calving to the nearest month, the length of the preceding dry period, and any abnormal conditions which might affect production are reported for each record. Checking of the accuracy of this information is confined to periodic field inspection of the fieldman's work, and to mistakes detected in his reports. The age, days in milk, and average per cent butterfat are checked by the Records Office.

Registered animals are reported under their registry name and number, and the sire, dam, and date of birth are checked with the breed herd registry books before being accepted and filed by the Records Office. Unregistered animals are reported under their official Wisconsin (T.B. or Bang's Test) ear tag number. It will soon be possible to check the date of birth, sire, and dam of unregistered animals in tested herds with the Ear Tag Identification File in the Division of D.H.I.A. Investigations, Bureau of Dairy Industry, U. S. D. A.

All production records are calculated, where necessary, to a two milkings per day, 305 day complete lactation, mature cow basis. The average of all normal records is used as the production of any individual cow. This makes it possible to compare different cows, or daughters with their dams, under more nearly the same conditions of test.

Incomplete lactation records adjusted to a 305 day basis are used whenever the cow has no other complete lactation record. In cases where several daughters of a sire are sold for low production before completing a lactation period, this policy helps in obtaining an unselected sample of each sire's daughters.

Averaging several records for each cow tends to remove the effect of any particularly poor or particularly good feed years. However, in many cases of young cows or of sires "proved" in the last two years, the effects of the 1934 and 1936 droughts have lowered the production level considerably. *As yet, no satisfactory practical method of adjusting for the feed conditions under which the record was made is available.*

FACTORS USED IN ADJUSTING RECORDS

The factors used in adjusting actual lactation records to the "Standard Milking Period" basis are as follows:

1. Factors for Adjusting Records to a Two Milkings Per Day Basis for All Breeds. Worked out by H. W. Norton, Jr., Superintendent of Advanced Registry, Holstein-Friesian Association, from a study of 19,000 Holstein Semi-Official records.
 - Multiply records made under 3 milkings per day for more than 90 days by .80.
 - Multiply records made under 4 milkings per day for more than 90 days by .66.

2. Factors for Adjusting Complete Lactation Records For All Breeds to a Standard Milking Period of 305 Days. Based on a study of 600 Holstein complete lactation records obtained from daily milk weights, by G. E. Dickerson, Departments of Genetics and Dairy Records, University of Wisconsin.

Length of Lactation—days	Range in Class—days	Conversion Factor	Length of Lactation—days	Range in Class—days	Conversion Factor
245	240-249	1.19	395	390-399	.81
255	250-259	1.16	405	400-409	.79
265	260-269	1.12	415	410-419	.77
275	270-279	1.09	425	420-429	.76
285	280-289	1.06	435	430-439	.74
295	290-299	1.03	445	440-449	.73
305	300-309	1.00	455	450-459	.71
315	310-319	.97	465	460-469	.70
325	320-329	.95	475	470-479	.69
335	330-339	.93	485	480-489	.67
345	340-349	.90	495	490-499	.66
355	350-359	.88	505	500-509	.65
365	360-369	.86	515	510-519	.64
375	370-379	.84	525	520-529	.62
385	380-389	.82	535	530-539	.62
			545	540-549	.61

For complete and normal lactation records shorter than 240 days, the 240-249 day factor is used, because practically never is a cow bred back soon enough to prevent a lactation at least this long.

For complete lactation periods longer than 550 days (usually due to breeding trouble or delayed breeding), the production during the first nine months (275 days) is used as the equivalent of a complete normal lactation in which the cow carries a calf for seven months and is dry 305 days after calving.

3. Factors for Adjusting Records For All Breeds to a Mature Cow Basis. Based on a study of 4058 D.H.I.A. records, by J. F. Kendrick, Bureau of Dairy Industry, U.S.D.A.

Lactations in which a cow aborts *after* carrying calf longer than 150 days are terminated at the abortion and treated as incomplete records. When the abortion occurs *before* the calf has been carried 150 days, the record is continued until the cow is dry, and is treated as a complete lactation.

Example: The record of a cow freshening at two years, 5 months of age, and milked twice daily for 340 days to produce 350 pounds of butterfat, would be corrected as follows: No correction for number of milkings per day. To correct to a mature basis the factor is 1.22; $1.22 \times 350 = 427$. To correct to a 305 day milking period the factor is .90; $.90 \times 427 = 384$ pounds of fat on a mature, 305 day, 2x basis. The milk is corrected in the same manner.

I. PRODUCTION TESTED HERDS

Herds in at Least Their Third Consecutive Year of D.H.I.A. Testing

Herds were omitted from this list for three reasons:

1. Not yet started on the third consecutive year of testing;
2. No list of living cows in the herd (July 1937) reported by the D.H.I.A. fieldman;
3. Lactation records on cows with one or more completed lactations on test not all reported to the Records Office by the D.H.I.A. fieldman.

The herds are listed alphabetically according to the herd owner's name under each breed. Each herd is given an index number by which it is referred to in the Progeny Tested Sire and Dam lists.

Immediately after the herd owner's name and address is given information on herds certified as free from Bang's disease (C.B.F.) by the offices of Dr. J. S. Healy, Federal Veterinarian and the State Department of Livestock Sanitation, up to July 1, 1937.

Following this are the breed of the herd, the number of years of continuous D.H.I.A. testing since last period out of association, the total number of cows of milking age in the herd in July, 1937, the number with one or more completed lactation records on file in the Records Office, the total number of records on file for those living cows, and their average level of milk production, test, and fat production on a mature cow, 305 day lactation, two milkings per day basis. Herd No. 43 will serve as an example:

HERD OWNER	Breed	Yrs. Contin. Testing	No. Cows Milking Age	No. Cows With Lact. Records	Total No. Records	HERD PRODUCTION LEVEL			NO. OF COWS PRODUCING (Lbs. Butterfat)
						Mature, 305 Day, 2x Basis	Fat %	Fat lbs.	
43 BALSON , Chas. E.; Fond du Lac (C.B.F.) Sire: 79*. Dam: 10*	R&GG	6	21	18	37	6791	5.11	347	249 or less 250-299 300-349 350-399 400-449 450-499 500 or more

Here we see that the herd owned by Chas. E. Balson at Fond du Lac has been certified as free of Bang's disease as of July 1, 1937; is made up of both registered and grade Guernseys; is in its sixth (6th) year of continuous D.H.I.A. testing; that in July 1937 it had 21 cows of milking age and 18 cows with one or more lactation records reported; that the 18 cows have a total of 37 records and that the average production level for the 18 cows is 6791 lbs. milk, 5.11% fat, and 347 lbs. fat.

On the right a formula shows the number of living cows with records falling in the following production levels. There were

1 cow with 249 lbs. or less	4 cows with 400-449 lbs.
1 cow with 250-299 lbs.	no cows with 450-499 lbs.
8 cows with 300-349 lbs.	no cows with 500 lbs. or over
4 cows with 350-399 lbs.	

This gives some idea of the degree of uniformity in production within the herd.

Beneath the herd owner's name reference is made by index number to any Progeny Tested Sires used or Progeny Tested Dams in that herd. Progeny Tested Sire No. 79 was proved, and Progeny Tested Dam No. 10 and her daughters were tested in this herd. Both the sire and the dam are still living.

The asterisk (*) after the number referring to the sire and the dam indicates that they were still alive in July 1937.

A double asterisk (**) after a sire's number indicates that he is still in the herd under which his number is given.

II. PROGENY TESTED SIRES

Sires Having at Least 5 Daughter-Dam Comparisons or at Least 10 Daughters with Lactation Records

The sires are listed alphabetically under each breed and are numbered consecutively. Unregistered sires with no name are arranged numerically by ear tag number at the end of each breed. An example will illustrate the information available for each sire:

		PRODUCTION LEVEL			NO. PRODUCING		Range in Yrs. Tested
		Mature, 305 Day, 2x Basis			(lbs. Butterfat)		
		No. Rec. Averaged	Milk lbs.	Test %	Fat lbs.	249 or less 250-299 300-349 350-399 400-449 450-499 500 or more	
*66	GUERNSEY GROVE BUSTER 163411	13 Dau. Av. 20	6927	5.37	372	(1-1-2-4-3-2-0)	33-36
	Born: 11-10-28 Herd 249*	13 Dams Av. 44	6972	5.02	350	(0-2-5-4-1-1-0)	28-34
	Sire: Royal of Maple Hill 59522,	(12-7) Difference		+ .35	+ 22		
	135	Equal Parent Index	6888	5.72	394		
	Dam: Willalvin's Royal May Blossom 135527						

The figure **135** in bold type following the registry number of the bull's sire indicates that Royal of Maple Hill is also a proved sire and that his daughter-dam comparisons, etc., may be found under number **135** in the Progeny Tested Sire list. A similar number after the dam's registry number would indicate that the dam was a brood cow and that her records and her daughters' records could be found under that number in the list of Progeny Tested Dams.

The herd number **249** given opposite the sire's date of birth indicates that this sire's daughters were tested in herd number **249** in the Production Tested Herds list, the herd in this case belonging to Schlesner Bros. at Johnson Creek, Wisconsin. The asterisk (*) preceding this sire's index number indicates that he is still in service. The asterisk (*) following the herd number indicates that the sire is still in service in that herd in July, 1937.

Below the dam's name and number, reference is made in bold type to the index numbers of any daughters which are listed as Progeny Tested Dams or of any sons which are listed as Progeny Tested Sires.

On the right we see that this sire has 13 tested daughters with a total of 20 lactation records. The average for the 13 daughters is 6927 lbs. of milk, 5.37% fat, and 372 lbs. of fat. All records used have been adjusted to a standard 305 day lactation, mature cow, 2 milkings per day basis, when necessary.

The formula (1-1-2-4-3-2-0) following the average production indicates that:

- 1 daughter produced less than 249 lbs. fat
- 1 daughter produced from 250-299 lbs. fat
- 2 daughters produced from 300-349 lbs. fat
- 4 daughters produced from 350-399 lbs. fat
- 3 daughters produced from 400-449 lbs. fat
- 2 daughters produced from 450-499 lbs. fat
- no daughters produced over 500 lbs. fat

The figures "33-36" following the formula indicate that the 10 daughters made most of their records during the feed years beginning May 1933 and ending May 1937. A feed year begins with the pasture season in May and ends with May the following year.

Exactly the same information is given for the dams of these 13 daughters. Comparing the 13 daughters with their dams, we note that the daughters averaged .35% higher in test than their dams, and 22 lbs. higher in butterfat production, giving the sire an Equal Parent Index or estimated transmitting level of 6888 lbs. milk, 5.72% fat, and 394 lbs. fat. Plus or minus signs indicate whether the daughters averaged higher or lower than their dams.

The sire's Equal Parent Index or estimated transmitting level is obtained by *adding* the difference between daughters and dams to the daughter average, if the daughters average *higher* than their dams. If the daughters average *lower* than their dams, the difference is *subtracted* from the daughter average. The Index for average per cent butterfat and total butterfat production are both calculated in the same manner. No index is calculated for sires having less than 5 daughter-dam comparisons.

The two figures in parenthesis (12-7) below the number of "Dams" indicate the number of daughters actually higher than their dams in butterfat test and in total butterfat production, respectively.

This information provides the answers to most of the questions concerning the dependability of a sire's index of transmitting ability, with the exception of the feed conditions under which a sire's daughters and their dams were tested. *Until a satisfactory method of classifying feed conditions according to effect on production is developed, it will be necessary to keep in mind the feed conditions in the locality or herd where and during the years when the sire's daughters and their dams were being tested.* Such information is recorded at the Farm and Dairy Records Office but is too bulky to permit publication in this volume.

III. PROGENY TESTED DAMS

Tested Dams with 3 Tested Daughters or Progeny Tested Sons

Only dams whose estimated transmitting ability is 350 lbs. fat (mature, 10 months lactation, 2 daily milkings basis) are listed. The average of the daughters was averaged with the average production of the dams in evaluating each dam.

The dams are arranged alphabetically under each breed and numbered consecutively. Unregistered dams without names are arranged numerically by ear tag number at the end of each breed. An example will illustrate the information given for each dam:

*50 **ROSES BONNIE OF RIVERSIDE** 227213

Born: 4-13-27 **Herd 41**

Sire: Chubby Lad 86520, **39**

Dam: Roses Sequel of Riverside 82679

7 Records Average 9922M-4.80%-476F 29-36

3 Daus: (1R-4.43%-418F 34) **Sire 29**

(1R-4.86%-324F 35) **Sire 70**

(1R-5.36%-217F 36) **Sire 70**

"**Herd 41**" in bold type following the date of birth indicates that this dam and her three daughters were tested in the herd of John Babbs, Richland Center, which is number 41 in the list of Production Tested Herds.

The **39** in bold type after the registry number of the brood cow's sire indicates that he is a proved sire whose daughter-dam comparisons can be found under number **39** in the list of Progeny Tested Sires. A similar figure after the dam's registry number would mean that she was a "brood" dam and could be found under that number in the list of Progeny Tested Dams.

Directly opposite the dam's name and number we see that she had 7 normal lactations on test averaging 9922 lbs. milk, 4.80% fat, and 476 lbs. fat on a 305 day lactation, mature cow, 2 milkings per day basis. The "29-36" after her production indicates that her records were made during the feed years from May 1929 to May 1937.

Below the dam's production, the information for each daughter is given in a parenthesis. If a daughter herself has 3 or more tested progeny a figure in bold face type immediately preceding the parenthesis gives the index number of that daughter in the Progeny Tested Dam list. In each parenthesis the number of normal records averaged, the average butterfat test, and the average butterfat production (mature, 305 day, 2x basis) and the years tested, respectively, are given. The first daughter of this dam had 1 normal record of 4.43% fat, and 418 lbs. fat during 1934.

If the sire of a daughter is "proved", his index number in the list of Progeny Tested Sires is given immediately following the parenthesis. The first daughter of this dam is by Sire No. 29 and the other two by Sire No. 70. Below the information for the daughter reference is made by index number to any sons of that dam which are Progeny Tested Sires.

Dams listed in Volume III not having at least 1 new tested daughter or 2 new daughter records are listed by name only with reference to Volume III.
