CYCLOPÆDIA:

OR, AN

UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES;

T.c. a.7

CONTAINING

The DEFINITIONS of the TERMS,

And ACCOUNTS of

The THINGS signify'd thereby,

In the ſeveral ARTS,

Both *LIBERAL* and *MECHANICAL*,

And the ſeveral SCIENCES,

HUMAN and *DIVINE*:

The Figures, Kinds, Properties, Productions, Preparations, and Uſes, of Things NATURAL and ARTIFICIAL;

The Riſe, Progreſs, and State of Things ECCLESIASTICAL, CIVIL, MILITARY, and COMMERCIAL:

With the ſeveral Syſtems, Sects, Opinions, *&c.* among Philoſophers, Divines, Mathematicians, Phyſicians, Antiquaries, Criticks, *&c.*

The Whole intended as a Courſe of Antient and Modern LEARNING.

Compiled from the beſt Authors, Dictionaries, Journals, Memoirs, Tranſactions, Ephemerides, *&c.* in ſeveral Languages.

In TWO VOLUMES.

By *E. CHAMBERS* Gent.

Floriferis ut apes in ſaltibus omnia libant,
Omnia nos——————————LUCRET.

VOLUME the SECOND.

HUMANITIES.

I The ninth Letter of the *Engliſh* Alphabet, is both a Vowel and a Conſonant; agreeable to which two different Powers, it has two different Forms. The *Hebrews* call the *j* Conſonant *Jod* יוד from יד, Hand and Space, in regard it is ſuppoſed to repreſent the Hand clench'd, ſo as to leave the Space underneath, void. With them, it was pronounced as the Conſonant *y*, as it ſtill is among the *Germans* and ſome other People. The *Greeks* had no *j* Conſonant, and for that reaſon, uſed their Vowel *i* inſtead of it, as coming the neareſt in Sound. The *French* and *Engliſh* have two kinds of *j* Conſonants; the firſt has a ſnuffling kind of Sound, and ſerves to modify that of the Vowels, pretty much in the manner of *g*, as Jew, juſt, jovial; the latter is pronounced like the *Hebrew* Jod, Inſtances of which we have in ſome of our Words, which are indifferently written with a *y* or an *i* before a Vowel, as Voiage, Voyage, Loial, Loyal, *&c.* in which caſes, the *i* is apparently a Conſonant, as being a Motion of the Palate, which gives a Modification to the following Vowel. The Vowel *i*, according to *Plato*, is proper for expreſſing fine and delicate things: On which account, that Verſe in *Virgil*,

Accipiunt inimicum imbrem, rimiſque fatiſcunt;

Which abounds in *i*'s, is generally admired. The Vowel *i* was the only Vowel which the *Romans* did not mark with a Daſh of the Pen, to ſhew when it was long; inſtead of which, to denote its Length, they uſed to make it bigger than ordinary, as in *Piſo*, *Vivus*, &c. According to *Lipſius*, they repeated it, when it was to be long; as in *Dii*. They ſometimes alſo denoted the Length of this Letter, by adding *e* to it, and turning it into a Dipthong, as *Divei* for *Divi*, *Omneis* for *Omnis*, &c. *I* was antiently a Numeral Letter, and ſignified a Hundred, according to the Verſe, *I. C. Compar erit*, *& Centum ſignificabit*. *I* in the ordinary *Roman* way of Numbering ſignifies One; and when repeated, ſignifies as many Units as it is repeated times. In Abbreviations and Cyphers, *I.* frequently repreſents the whole Word Jeſus, whereof it is the firſt Letter.

JABAJAHITE, the Name of a Sect among the Muſſulmen, who, according to *Ricaut*, teach, That God is not perfectly wiſe, that his Knowledge does not extend to every thing; and that Time and Experience have furniſhed him with the Knowledge of many things whereof he was before ignorant: Thus, ſay they, not being apprized from all Eternity of every Event that ſhall happen in the World, he is obliged to govern it according to the Chance and Occurrence of thoſe Events.

JACK *in a Ship*, is that Sail that is hoiſted up at the Sprit-Sail-Top-Maſt-Head. In Falconry, *Jack* is the Male of the Birds of Sport.

JACK *by the Hedge*, is an Herb that grows wild by Hedge-ſides, and under Banks, with a broad Leaf, and hath the Smell of Garlick: It is eaten as other Sallad-Herbs, eſpecially by Country People, and much uſed in Broth.

JACK *in a Lanthorn*, or *Will with a Wiſp*, and ſometimes *Ignis Fatuus*, is a certain Meteor, or clammy Vapour in the Air, which reflects Light in the Dark, commonly haunting Church-yards, Fens, and Privies, as ſteaming out of a fat Soil: It alſo flies about Rivers, Hedges, *&c.* where there is a continual Flux of Air, and leads Perſons, who unwarily follow it, out of their way.

JACOB's *Staff*, is a Mathematical Inſtrument for taking Heights and Diſtances; the ſame with Croſs-Staff.

JACOBIN, Dominican. A Name given in *France* to the Religious who follow the Rule of St. *Dominic*, on occaſion of their principal Convent, which is near the Gate of *St. James* at *Paris*, and which before they became poſſeſſed of it in the Year 1218, was an Hoſpital of Pilgrims dedicated to the ſaid Saint. Others maintain, that they have been called *Jacobins* ever ſince they were eſtabliſhed in *Italy*, in regard they pretended to imitate the Lives of Apoſtles. They are alſo called Friars Predicants, and make one of the four Orders of Mendicants. See *Dominican*.

JACOBITE, a Sect of Hereticks who were antiently a Branch of the *Eutychians*, and are ſtill ſubſiſting in the *Levant*. They were ſo called from one *James* of *Syria*, who was one of the Heads of the *Monophyſites*, or Sectaries, who own'd but one Nature in Jeſus Chriſt. The *Monophyſites* are a Sect of vaſt Extent, comprehending the *Armenians*, *Cophti*, and *Abyſſinians*, but thoſe among them who are properly *Jacobites*, are but few; and among thoſe too, there is a Diviſion, ſome being Romaniz'd, and others perfectly averſe to the Romiſh Church: Each of which Parties have their ſeveral Patriarchs, the one at *Caremit*, and the other at *Derzapharan*. As to their Faith, all the *Monophyſites*, both *Jacobites* and others, follow the Doctrine of *Dioſcorus* touching the Unity of Nature and Perſon in Jeſus Chriſt. *Jacobite* in *England*, is a Term of Reproach beſtow'd on ſuch Perſons as diſallow the late Revolution, and ſtill aſſert the Rights, and adhere to the Intereſts of the late King *James* and his Line.

JACOBUS, a Gold Coin worth 25 Shillings; ſo called from King *James* the firſt of *England*, in whoſe Reign they were ſtruck. We uſually diſtinguiſh two kinds of *Jacobus*, the Old and the New; the former worth 25 Shillings, weighing 6 Penny Weight 10 Grains; the latter, called alſo *Carolus*, worth 23 Shillings, in Weight 5 Penny Weight 20 Grains.

JADE, a greeniſh Stone, bordering on the Colour of Olive, much eſteem'd for its Hardneſs, which exceeds that of Porphyry, Agat, and Jaſper, and only to be cut with Powder of Diamond. It is in mighty eſteem among the *Turks* and *Poles*, who adorn all their fine Works with it, and eſpecially the Handles of their Sabres. This Stone applied to the Reins, is ſaid to be a Preſervative from the Nephritic Cholic. Mr. *Bernier* tells us, that the Caravans of *Thibet* carry it to *Cachemire*, and that the *Gallibis* prize it as highly as Diamond. The Natives of *South-America* value it on account of the Virtues they attribute to it in the Epilepſy, Diſeaſes of the Reins, the Stone and Gravel. In a Treatiſe of it printed at *Paris*, 'tis called the Divine Stone.

JALAP, is the Root of a Plant not much unlike our Bryony, and is therefore by ſome called *Bryonia Peruviana*; for it is brought to us chiefly from *Peru* and *New-Spain*. The *Mechoacan* and this are reckoned of a Species, and therefore as this is ſometimes called *Mechoacana nigra*, that goes as often by the Name of *Jalapium album*. As this does not appear to have been known to the Antients, it has its place in Medicine only ſince thoſe parts of *America*, which produce it, have been traded to by *Europeans*. That which breaks blackeſt, moſt brittle, ſound, and ſhining within ſide, is the beſt; by reaſon the reſinous Parts, which give it thoſe Properties, are ſuppoſed to contain its Medicinal Virtues. Some take great pains to extract its Reſin, which is to be done with any ſpirituous Menſtruum, and afterwards want Correctors for it. The moſt common, is Salt of Tartar or Loaf-Sugar; but if correcting conſiſts in ſeparating its Parts, as it certainly does, the drawing it from the Root, and making it into a Reſin, muſt be very needleſs. Monſieur *Boldue*, who hath made ſeveral Experiments upon it, ſays, it is one of the beſt Cathartics we have, taken as Nature only has prepared it. See *Quincy*'s Diſpenſatory.

IAMBUS, in the *Greek* and *Latin* Poetry, is the Name of a Foot in a Verſe, conſiſting of a long and ſhort Syllable, as *Horace* expreſſes it,

Syllaba longa brevi ſubjecta vocatur Iambus.

The ſame Poet calls the *Iambus* a ſwift rapid Foot, *Pes Citus*. The Word, according to ſome, takes its Name from *Iambus*, the Son of *Pan* and *Echo*, who invented this Foot, or rather uſed ſharp biting Expreſſions to *Ceres*, when afflicted for the Death of *Proſerpine*. Others rather derive it from the Greek ἰὸς, *Venenum*, *Poiſon*, or from ἰαμβίζω, *maledico*, *I rail* or *revile*, becauſe the Verſes compoſed of *Iambus's* were at firſt only uſed in Satire.

IAMBIC, a kind of Verſe, found in the *Greek* and *Latin* Poets. An *Iambic* is a Verſe conſiſting wholly, or at leaſt in great part, of *Iambus's*, or Feet ſo called. *Iambic* Verſes may be conſidered, either with regard to the Diverſity or the Number of their Feet. Under each of which Heads there are diſtinct kinds, which have different Names. (1.) Pure *Iambics* are thoſe which conſiſt entirely of *Iambus's*, as the fourth Piece of *Catullus*, made in praiſe of a Ship:

Phaſelus ille, quem videtis Hoſpites.

The ſecond kind are thoſe called ſimply *Iambics*. Theſe have no *Iambus's* but in the even Feet, tho' there are ſometimes *Tribrachia* added to them, excepting to the laſt, which is always an *Iambus*; and in the uneven Feet they have Spondees, Anapeſts, and even a Dactyle in the firſt: Such is that of *Medea* in *Ovid*,

Servare potui, perdere an poſſim rogas?

The third kind are the *Free Iambic* Verſes, in which 'tis not abſolutely neceſſary there ſhould be any *Iambus*, excepting in the laſt Foot; of which kind are all thoſe of *Phædrus*:

Amittit meritò proprium, qui alienum appetit.

In Comedies the Authors ſeldom confine themſelves more, frequently leſs, as we may obſerve in *Plautus* and *Terence*: but the ſixth is always indiſpenſibly an *Iambus*.

As to the Varieties, occaſioned by the Number of Syllables, we call an *Iambic*, or *Dimetre Iambic*, that which has but four Feet:

Queruntur in Sylvis Aves.

Thoſe which have ſix are called *Trimetres*: Theſe are the moſt beautiful, and are uſed principally for the Theatre, particularly in Tragedy; wherein they are vaſtly preferable to the Verſes of ten or twelve Feet uſed in our modern Drama, in regard they come nearer to the Nature of Proſe, and ſavour leſs of Art and Affectation.

Dii Conjugales, tuque genialis Tori
Lucina Cuſtos, &c.

Thoſe with eight are called *Tetrametres*, and are only uſed in Comedies:

Pecuniam in Loco negligere maximum interdum eſt Lucrum. Terence.

Some add an *Iambic* Monometre, with two Feet:

Virtus beat.

They are called *Monometres*, *Dimetres*, *Trimetres*, and *Tetrametres*, that is, of one, two, three, and four Meaſures, becauſe a Meaſure conſiſted of two Feet, the *Greeks* meaſuring their Verſes two Feet by two Feet, or by Epitrites, joining the Iambus and Spondee together. All the *Iambics* hitherto mentioned are perfect; they have their juſt Number of Feet, without any thing either deficient or redundant. The imperfect *Iambics* are of three kinds, the *Catalectic*, which want a Syllable;

Muſæ Jovem canebant.

The *Brachycatalectic*, which want an entire Foot;

Muſæ Jovis Gnatæ.

The *Hypercatalectic*, which have either a Foot or a Syllable too much:

Muſæ Sorores ſunt Minervæ,
Muſæ Sorores Palladis lugent.

Many of the Hymns and Anthems, uſed in the Church, are Dimetre Iambics, that is, conſiſting of four Feet.

S. JAMES *of the Sword*, a Military Order in *Spain* inſtituted in 1170, under the Reign of *Ferdinand* II. King of *Leon* and *Galicia*. Its End was to put a ſtop to the Incurſions of the *Moors*; three Knights obliging themſelves by a Vow to ſecure the Roads. An Union was propoſed and agreed to in 1170, between theſe and the Canons of *St. Eloy*; and the Order was confirm'd by the Pope in 1175. The higheſt Dignity in this Order, is that of Grand Maſter, which has been united to the Crown of *Spain*. The Knights are obliged to make proof of their Deſcent from Families, that have been noble for four Generations on both ſides: They muſt alſo make it appear, that their ſaid Anceſtors have neither been *Jews*, *Saracens*, nor *Heretics*, nor ever to have been called in queſtion by the Inquiſition. The Novices are obliged to ſerve ſix Months in the Galleys, and to live a Month in a Monaſtery; heretofore they were truly Religious, and took a Vow of Celibacy: But *Alexander* III. gave them a Permiſſion to marry. They now make no Vows but of Poverty, Obedience, and Conjugal Fidelity; to which, ſince the Year 1652, they have added that of defending the immaculate Conception of the Holy Virgin. Their Habit is a white Cloak with a red Croſs on the Breaſt. This is eſteem'd the moſt conſiderable of all the Military Orders in *Spain*. The King carefully preſerves the Office of Grand Maſter in his own Family, on account of the rich Revenues and Offices, whereof he gives them the Diſpoſal. The Number of Knights is much greater now than formerly, all the Grandees chuſing rather to be received into this, than into the Order of the Golden Fleece; inaſmuch as this puts them in a fair way of attaining to Commands, and gives them many conſiderable Privileges in all the Provinces of *Spain*, but eſpecially in *Catalonia*.

JANIZARIES, the Grand Signior's Guard, or Soldiers in the *Turkiſh* Infantry. As, in the *Turkiſh* Army, the *European* Troops are diſtinguiſhed from thoſe of *Aſia*, the *Janizaries* are alſo diſtinguiſhed into *Janizaries* of *Conſtantinople* and of *Damaſcus*. Their Pay is from two Aſpers to twelve *per Diem*; for when they have a Child, or do any ſignal Piece of Service, their Pay is augmented. Their Dreſs conſiſts of a Dolyman, or long Robe, with ſhort Sleeves, which is given them annually, by the Grand Signior, on the firſt Day of *Ramazan*. They wear no Turban, but in lieu of that a kind of Bonnet, which they call *Zarcola*, and a long Hood of the ſame Stuff hanging on their Shoulders. On ſolemn Days they adorn them with Feathers, which they ſtick into a little Caſe in the forepart of the Bonnet. Their Arms in *Europe*, in a time of War, are a Sabre, a Carabine, or Muſquet, and a Cartouch-Box hanging on the left Side. At *Conſtantinople*, in a time of Peace, they wear only a Staff in their Hand. In *Aſia*, where Powder and Fire-Arms are more uncommon, they wear a Bow and Arrows, with a Poniard, which they call *Baniare*. The *Janizaries* were heretofore a Body formidable even to their Maſters the Grand Signiors: *Oſman* they firſt ſtripped of his Empire, and afterwards of his Life; and Sultan *Ibrahim* they depoſed, and at laſt ſtrangled in the Caſtle of the *Seven Towers*; but they are now much leſs conſiderable. Their Number is not fixed. The *Janizaries* are Children of Tribute, raiſed by the *Turks* on the Chriſtians, and bred up to the military Life. They are taken at the Age of twelve Years, to the end, that forgetting their Country and their Religion, they may know no other Parent but the Sultan. However, generally ſpeaking, they are not now-a-days raiſed by way of Tribute; for the Carach, or Tax, which the *Turks* impoſe on the Chriſtians, for allowing them the Liberty of their Religion, is now paid in Money, excepting in ſome Places, where Money being ſcarce, the People are unable to pay in Specie, as in *Mingrelia*, and other Provinces near the *Black-Sea*. The Officer who commands the whole Body of *Janizaries*, is called *Janizar Agaſi*; in *Engliſh*, Aga of the *Janizaries*, who is one of the chief Officers of the Empire. Tho' the *Janizaries* are not prohibited Marriage, yet they rarely marry, nor then, but with the Conſent of their Officers, as imagining a married Man to make a worſe Soldier than a Batchelor. It was *Oſman*, or *Ottoman*, or, as others will have it, *Amurath*, who firſt inſtituted the Order of *Janizaries*. They were at firſt called *Jaja*, that is, Footmen, to diſtinguiſh them from the other *Turks*, the Troops whereof conſiſted moſtly of Cavalry. *Menage*, after *Voſſius*, derives the Word from *Genizers*, which, in their Language, ſignifies *Novos Homines*, or *Milites*. *Herbelot* tells us, that *Jenitcheri* ſignifies a new Band or Troop, and that the Name was firſt given by *Amurath* I. called the Conqueror, who chuſing out one fifth part of the Chriſtian Priſoners, whom he had taken from the *Greeks*, and inſtructing them in the Diſcipline of War, and the Doctrines of their Religion, ſent them to *Hagi Bektaſche* (a Perſon whoſe pretended Piety rendered him extremely revered among the *Turks*) to the end that he might confer his Bleſſing on them, and at the ſame time give them ſome Mark to diſtinguiſh them from the reſt of the Troops. *Bektaſche*, after bleſſing them in his manner, cut off one of the Sleeves of the Fur-Gown which he had on, and put it on the Head of the Leader of this new Militia; from which time, *viz.* the Year of Chriſt 1361, they have ſtill retained the Name *Jenitcheri*, and the Fur-bonnet. *Viginerus* tells us, that the Diſcipline obſerved among the *Janizaries* is extremely conformable, in a great many things, to that uſed in the *Roman* Legions.

JANIZARY, at *Rome*, is the Name of an Officer or Penſioner of the Pope, called alſo *Participant*, by reaſon of certain Rights or Dues which they have in the Annates, Bulls, or Expeditions of the *Roman* Chancellory. Moſt Authors are miſtaken in the nature of their Office; but the truth is, they are Officers of the third Bench or College of the *Roman* Chancellory. The firſt Bench whereof conſiſts of Writers, the ſecond of Abbreviators, and the third of *Janizaries*, who are a kind of Correctors and Reviſers of the Pope's Bulls.

JANSENISM, the Doctrine of *Cornelius Janſen*, commonly called *Janſenius*, late Biſhop of *Ypres* in *France*, with relation to Grace and Free-Will. *Janſeniſm* made no great Noiſe in the World, till after the Death of its Author in 1638. when *Fromond* and *Calenus*, his Executors, publiſhed his Book, entitled *Auguſtinus*. The whole Doctrine was reduced by the Biſhops of *France* into five Propoſitions, which follow: I. Some Commands of God are impoſſible to righteous Men, even tho' they endeavour, with all their Powers, to accompliſh them: the Grace being wanting by which they ſhould be enabled to perform them. II. In the State of corrupted Nature, a Man never reſiſts inward Grace. III. To merit and demerit in the preſent State of corrupt Nature, 'tis not requiſite a Man ſhould have that Liberty which excludes Neceſſity: that which excludes Conſtraint is ſufficient. IV. The *Semi-Pelagians* admitted the Neceſſity of inward preventing Grace to each Act in particular, and even to the beginning of Faith; but they were Heretics, in regard they aſſerted that this Grace was ſuch, as that the Will of Man might either reſiſt or obey it. V. It is *Semi-Pelagianiſm* to ſay, that Jeſus Chriſt died, or ſhed his Blood for all Men in general. *Janſeniſm* conſiſts in maintaining this Doctrine, which is done two ways; (1.) By aſſerting that theſe Propoſitions are ſound and orthodox. (2.) In affirming that they are evil and heretical in the Senſe wherein the Church has condemned them; but that this Senſe is

not

not of *Janſenius*. *Janſeniſm* has been condemned by the Popes *Urban* VIII. *Innocent* X. *Alexander* VII. and *Clement* XI.

JANUARY, the Name of the firſt Month of the Year, according to the Computation now uſed in the *Weſt*. The word is derived from the *Latin Januarius*, a Name given it by the *Romans*, from *Janus*, one of their Divinities, to whom they attributed two Faces; becauſe, on the one Side, the firſt Day of *January* looked towards the New Year, and on the other towards the Old one. The word *Januarius* may alſo be derived from *Janua*, *Gate*; in regard this Month being the firſt, is, as it were, the Gate of the Year. It was introduced into the Year by *Numa Pompilius*: *Romulus*'s Year beginning in the Month of *March*. The Chriſtians heretofore faſted the firſt Day of *January*, by way of Oppoſition to the Superſtition of the Heathens, who, in honour of *Janus*, obſerved this Day with Feaſtings, Dancings, Maſquerades, &c.

JAPAN-EARTH, alſo called *Catechu*, is an Earth of a dark purple Colour. It is very auſtere upon the Palate, ſeems to melt, like the Bole, in the Mouth, and leaves ſomewhat of a ſweetiſh Taſte behind it. It is famous for ſtopping Fluxes of all kinds.

JAPANNING, the Art of varniſhing and drawing Figures on Wood, &c. after the ſame manner as the Workmen do who are Natives of *Japan*, a famous Iſland not far from the Coaſt of *China*. The manner of it is this; they take a Pint of Spirit of Wine well dephlegmated, and four Ounces of Gum-Lacca (which laſt is firſt broke from the Sticks and Rubbiſh) and bruiſing it roughly in a Mortar, they put it to ſteep in Spring-water, tyed up in a Bag of coarſe Linen, together with a little Caſtile-Soap, for the ſpace of twelve Hours. This done, they rub out all the Tincture, and add to it a little Allum, and reſerve it a-part; then add as much Maſtick and white Amber, diſtilled in a Matraſs, with the Spirit of Wine, by a two Days Digeſtion, frequently ſtirring it, that it don't ſtick to the Glaſs; then ſtrain and preſs it out into another Veſſel. This done, they take the Wood to be japanned, and cover it with a Layer of this Varniſh, till it be ſufficiently drenched with it; then taking ſome of the Colour, of which the Figures are to be, they incorporate it with ſeven times as much of the Varniſh, and apply it with a Pencil, going over each part three ſeveral times, each a quarter of an Hour after the other: two Hours after this they poliſh it with Preſtle, or *Dutch* Reeds. As to the Colours uſed in this Art, for a fair Red, they take *Spaniſh* Vermillion, with a fourth part of *Venice* Laque. Black, they make of Ivory calcined between two Crucibles; for Blue they uſe Ultramarine, and only twice as much Varniſh as Colour. The reſt are applied as above directed, except the Green, which is difficult to make fair and lively, and therefore ſeldom uſed. Night-*Japanning* is performed, by applying three or four Layers with the Colours firſt, then two of pure Varniſh uncoloured, made according to the former Proceſs. Before it be dry, they ſift ſome Venturine, or Gold Wire, reduced to Powder, over it, and then cover it with as many Layers of pure Varniſh, as render it like poliſhed Glaſs; and, laſtly, rub it over with Tripoli, Oil of Olive, or a Hatter's Felt.

JARR *of Oil*, is an earthen Veſſel containing from 18 to 26 Gallons. A *Jarr* of green Ginger is about 100 Pounds Weight.

JASPER, a precious Stone, not much different from the Agate, excepting in this, that it is more ſoft, and does not take ſo good a Poliſh. In ſome of theſe, Nature has amuſed herſelf, in repreſenting Rivers, Trees, Animals, Landskips, &c. as if they were painted. The *florid* Jaſper, found in the *Pyreneans*, is uſually ſtained with various Colours, tho' there are ſome that have but one Colour, as Red or Green; but theſe are the leaſt valuable. The moſt beautiful is that bordering on the Colour of Laque, or Purple, next to that the Carnation; but what is now uſually taken is Green, ſpotted with Red. Jaſper is a *Hebrew* Word, and has neither been changed by the *Latins*, nor us. Some *Greek* Verſions give it the Name of *Beryl*. *Onkelos* calls it *Panther*, in regard of its being ſpotted like that Animal.

JATRALEPTIC, the Name of that part of Phyſick which cures by Frictions, by the Application of Fomentations and Plaiſters. It was one *Prodicus*, a Diſciple of *Hippocrates*, and a Native of *Corinth*, who firſt inſtituted it.

JAVELIN, a kind of Spear, or Half-Pike, uſed by the Antients, both on Horſeback and on Foot. It was five Foot and an half long, and the Steel, wherewith it was headed, had three Sides or Faces, which all terminated in a Point.

JAUNDICE, a Diſeaſe, which conſiſts in an overflowing of the Bile. Of this there are three kinds; the firſt, properly called the *Jaundice*, is owing to the yellow Bile, which, in this Caſe, is too exalted or too abundant in the Maſs of Blood; or perhaps to an Obſtruction of the Glands of the Liver, which prevents the Gall's being duly ſeparated from the Blood. The ſecond, called, the Black *Jaundice*, is owing to the ſame yellow Bile, mingled with Acids. The third, bordering on Green, takes its Riſe alſo from a Mixture of Bile with an Acid; this is uſually called the Green-Sickneſs, and is a Diſtemper pretty common in young Women. In the *Jaundice*, the White of the Eye and the Skin are yellow, and troubled with an Itching; in the Black *Jaundice* the natural Colour is loſt, by reaſon of an atrabilary Humour ſpread underneath the Skin; it firſt appears browniſh, and afterwards of a Lead-Colour. The *Jaundice* often proves a Forerunner of the Dropſy. A Doctor of the Faculty of *Montpellier*, calls the Yellow *Jaundice*, attended with periodical Pains, a Rheumatiſm of the Liver; and another of the ſame place, calls it a Quartan Ague of the Liver. In the Journal of *Leipſic*, 'tis aſſerted that the *Jaundice* is not occaſioned by Obſtructions. The Acid Spirit of *Sal Ammoniac* is ſaid to be an excellent Remedy againſt the *Jaundice*. The word is derived from the *French*, *Jauniſſe*, *Yellowneſs*, of *Jaune*, *Yellow*.

JAW, ſee *Maxilla*.

ICADES, the Name of an antient Feaſt, celebrated every Month by the *Epicurean* Philoſophers, in memory of their Maſter *Epicurus*. The Day on which it was held was the 20th Day of the Moon or Month, which was that whereon *Epicurus* came into the World. And hence came the Name *Icades*, εικάς ſignifying a Score, from εἴκοσι, twenty. They adorned their Chambers on this Day, and bore his Image in State about their Houſes, making Sacrifices.

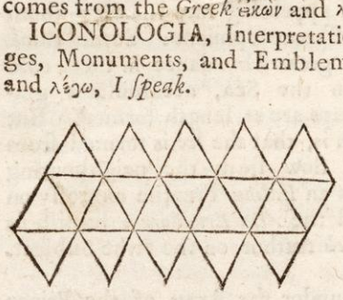
ICE, a hard tranſparent Body form'd from ſome Liquor congeal'd or fix'd. Towards the *Poles* are found vaſt Piles of *Ice* reaching two or three hundred Feet above the Surface of the Water, and appearing like Iſlands; about whoſe Origin there are different Opinions: Some think 'tis Snow, which falling in great Abundance in theſe cold Climates, and melting in the Sea, accumulates gradually, till thoſe huge Heaps are at length formed. But the more common Opinion is, that the *Ice* is formed from the freſh Waters which flow from the neighbouring Lands. *Bartoli* has written an *Italian* Treatiſe expreſly on Ice and Coagulation. And the *Acta Eruditorum* furniſh us with an Account of a *French* Author on the ſame Subject. See *Freezing* and *Cold*.

ICH-DIEN, the Motto under the Arms of the Prince of *Wales*, which Sir *H. Spelman* judges to be in *Saxon Ic Thien*, the *Saxon D*, with a tranſverſe Stroke, being the ſame with *Th*, and ſignifying, I ſerve, or am a Servant; as the *Saxon* Kings Miniſters were called *Thiens*.

ICHNOGRAPHY in Perſpective, is the View of any thing cut off by a Plane parallel to the Horizon, juſt at the Baſe or Bottom of it. In Architecture it is taken for the Geometrical Plan, or Platform of an Edifice, or the Ground-Plot of an Houſe or Building delineated upon Paper, deſcribing the Form of the ſeveral Apartments, Rooms, Windows, Chimneys, &c. and this is properly the Work of the Maſter Architect or Surveyor, being indeed the moſt abſtruſe and difficult of any. In Fortification it is, in like manner, the Plan or Repreſentation of the Length and Breadth of a Fortreſs, the diſtinct Parts of which are marked out, either on the Ground itſelf, or upon Paper. The word is derived from the *Greek*, ἴχνος, *Veſtigium*, and γράφω, *ſcribo*, as being a Deſcription of the Footſteps or Traces of a Work. See *Plan*.

ICHOGLANS, the Grand Signior's Pages, or white Eunuchs ſerving in the Seraglio. They are the Children of Chriſtians, and are bred up in an Auſterity ſcarcely to be conceived. Theſe the Sultan prefers to Offices more or leſs conſiderable, as they appear more or leſs devoted to his Service; but 'tis to be obſerved, they are incapable of Offices till forty Years of Age, unleſs they have ſome particular Diſpenſation from the Grand Signior. They are educated with a great deal of Care in the Seraglios of *Pera*, *Adrianople*, and *Conſtantinople*. They are under the Direction of a Capi Aga, who preſides over their Exerciſes, and treats them with a World of Severity. They are principally converſant in the Oda, or Halls, where, according to their ſeveral Talents or Inclinations, they are inſtructed in the Languages, in their Religion, or in Exerciſes of the Body. The word, according to ſome Authors, is compoſed of the two *Turkiſh* words, *ich*, or *itch*, which ſignifies *within*, and *Oglan*, *Page*. In which Senſe *Ichoglan* is a Page ſerving within-ſide the Palace or Seraglio. Others derive it from the barbarous *Greek*, ἰγκολας, or ἰγκολῶ, which was formed from the *Latin Incola*. Theſe two Etymologies give nearly the ſame Senſe to *Ichoglan*, taking *Incola* for *Domûs Incola*.

ICHOR ſtrictly ſignifies a thin watry Humour, like Serum, but it is ſometimes alſo uſed for a thicker kind, flowing from Ulcers. The word is originally *Greek*, and ſignifies *Sanies*, Rottenneſs.



ICHTHYOPHAGI, Fiſh-eaters, the Name given to a People, or rather to ſeveral different People, who lived wholly on Fiſhes. *Pliny* places them in the Provinces of *Nanquin* and *Xantun*. *Agatharcydes* calls all the Inhabitants from the *Anteans* and *Ethiopia* to the *Indus*, *Gedroſia*, *Caramania*, *Perſia*, and all the neighbouring Iſlands, by the Name *Ichthyophagi*. From the Accounts given us of them by *Herodotus*, *Strabo*, *Solinus*, *Plutarch*, &c. it appears, indeed, that they had Cattle, but that they made no uſe of them excepting to feed their Fiſhes withal. They made their Houſes of large Fiſh-Bones, the Ribs of Whales ſerving them for their Beams. The Jaws of theſe Animals ſerved them for Doors, and the Mortars wherein they pounded their Fiſh, and baked it at the Sun, were nothing elſe but their *Vertebræ*. The word is derived from the *Greek*, ἰχθὺς, *Piſcis*, *Fiſh*, and φάγομαι, *edo*, *I eat*.

ICONOCLASTES, a Breaker of Images; a Name which the Church of *Rome* attributes to all who reject the Uſe of Images in religious Matters; in which Senſe, not only the Reformed, but alſo the *Eaſtern* Churches are called *Iconoclaſtes*, and eſteem'd by them Heretics, as oppoſing the Worſhip of the Images of God and the Saints, and breaking their Figures and Repreſentations in Churches. The word is formed from the *Greek*, εἰκὼν, *Imago*, *Image*, and κλαειν, *rumpere*, *to break*.

ICONOGRAPHIA, Deſcription of Images, or of antient Statues of Marbles and Copper, of Buſts and Semibuſts, of Penates, Paintings in Freſco, Moſaic Works, and antient Pieces of Mignature. The word is derived from εἰκὼν, *Imago*, and γεάφω, *ſcribo*.

ICONOLATER, one who worſhips Images, a Name which the *Iconoclaſtes* give to thoſe of the *Romiſh* Communion, on account of their adoring Images, and of rendering to them the Worſhip only due to God. The word comes from the *Greek* εἰκὼν and λατρεύω, *colo*.

ICONOLOGIA, Interpretation of various antient Images, Monuments, and Emblems, from the *Greek* εἰκὼν, and λέγω, *I ſpeak*.

ICOSIHEDRON, is a Solid, which conſiſts of twenty triangular Pyramids, whoſe Vertices meet in the Center of a Sphere, that is imagined to circumſcribe it, and therefore have their Height and Baſes equal; wherefore the Solidity of one of thoſe Pyramids, multiplied by twenty, the Number of Baſes, gives the ſolid Content of the *Icoſihedron*. This Figure being drawn on Paſteboard, cut half through, and then folded up neatly together, will repreſent an *Icoſihedron*.

ICTERIC, a Term in Phyſic, apply'd to ſuch Perſons as have the Jaundice, which the *Latins* call *Iterus*, *Aurigo*, or *Morbus Regius*. *Ictteric* Medicines are ſuch as are preſcribed in Caſes of the Jaundice. The Word is derived from the *Greek* ἴκτερος, which ſome derive further from ἰκτὶς, a kind of Weaſel with yellow Eyes.

ICTHYOCOLLA, *Iſinglaſs*: *Schroder* ſays, that this is made from a Fiſh, which is common in the *Danube*; the Fiſh having no Bones but about the Head. After it is cut in ſmall pieces, they boil it in Water to a thick Jelly, which is ſpread abroad and dried, then rolled up, and brought to us in the form we ſee it in the Shops. It is of a very glutinous Quality, and conſequently good in all Diſorders, which ariſe from too thin and ſharp a State of the Fluids. The Word is derived from the *Greek* ἰχθὺς, *Piſcis*, Fiſh, and κόλλα, *Gluten*, Glue.

IDEA, A Term by which we mean that immediate Object of the Mind about which we are employ'd when we perceive or think: Thus, when we look at the Sun, we do not ſee that Luminary itſelf, but its Image or Appearance convey'd to the Soul by the Organ of Sight; and this Image we call *Idea*. The Origin of *Ideas* has been a long time diſputed among the Philoſophers. The *Peripatetics* maintain, that external Objects emit Species that reſemble them all around, and that theſe Species ſtriking on our Senſes, are by them tranſmitted to the Underſtanding; that being material and ſenſible, they are rendered intelligible by the active Intellect, and are at length received by the paſſive. Others are of opinion, that our Souls have of themſelves the power of producing *Ideas* of Things that we would think upon; and that they are excited to produce them by the Impreſſions which Objects make on the Body, tho theſe Impreſſions are not Images in any reſpect like the Objects that occaſioned them. And in this, ſay they, it is, that Man is made after the Image of God, and that he partakes of his Power; for as God made all things out of nothing, and can reduce 'em to nothing when he pleaſes, ſo Man can create as many *Ideas* as he pleaſes, and annihilate them when he he has done. Others maintain, that the Mind has no occaſion for any thing beſides itſelf to perceive Objects; and that by conſidering itſelf and its own Perfections, it is able to diſcover all things that are without. Others with *Deſcartes* hold, that our *Ideas* were created and born along with us. *Malebranch* and his Followers aſſert, that God has in himſelf the *Ideas* of all Beings that he hath created; that thus he ſees all things, in conſidering his Perfections to which they correſpond; and that as he is intimately united to our Souls by his Preſence, our Mind ſees and perceives things in Him which repreſent created Beings; and that it is thus we come by all our *Ideas*. He adds, that tho we ſee all ſenſible and material things in God, yet that we have not our Senſations in him. When we perceive any ſenſible Object, in our Perception is included both a Senſation and a pure *Idea*. The Senſation is a Modification of the Soul, and it is God who cauſes it in us: but for the *Idea* join'd with the Senſation, it is in God, and it is in him that we ſee it. The *Carteſians* diſtinguiſh three kinds of *Ideas*. The firſt innate, and ſuch is that we have of God, as of a Being infinitely perfect. The ſecond adventitious, which the Mind receives in proportion as bodily Objects preſent themſelves to our Senſes. Such is the *Idea* of Body, Sound, Figure, Light, &c. The third, according to theſe Philoſophers, are factitious, which are thoſe which the Mind forms, by uniting and aſſembling the *Ideas* which it already had: and theſe are called complex. But our great Mr. *Locke* ſeems to have put this Matter out of diſpute, having made it appear that all our *Ideas* are owing to our Senſes; and that all innate, created, factitious, &c. *Ideas*, are mere Chimera's. He proves, that our Mind has not abſolutely any *Ideas* beſides thoſe preſented to it by the Senſes, and thoſe which it forms by its own Operations, on thoſe others which the Senſes furniſh. So that a Man deſtitute of one of his Senſes, would never have any *Idea* belonging to that Senſe; and ſuppoſing him deſtitute of all the Senſes, he would never have any *Idea* at all: External Objects having no other way of producing *Ideas* in him, but by means of Senſation. He would have no *Idea*, not even of Reflexion, becauſe in wanting all Senſation, he wants that which ſhould excite in him the Operations of his Mind, which are the Objects of his Reflexion. 'Tis plain therefore there is no innate *Idea*; no general Truth, or firſt Principle inherent in the Soul, and created with it; no immediate Object of the Mind before it had perceived external Objects by means of the Senſes, and reflected on that Perception. Thoſe *Ideas* only ſeem to be innate, becauſe we find we have them as ſoon as we come to the Uſe of Reaſon, but are, in effect, what we formed from the *Ideas* wherewith the Mind was inſenſibly filled by the Senſes. Thus, when the Mind is employ'd about ſenſible Objects, it comes by the *Ideas* of bitter, ſweet, yellow, hard, &c. which we call Senſation; and when employ'd about its own Operations, perceiving and reflecting on them, as employ'd about the *Ideas* before got by Senſation, we get the *Ideas* of Perception, Thinking, Doubting, Willing, &c. which we call inward Senſation, or Reflexion: And theſe two, *viz.* external material Things as the Objects of Senſation, and the Operations of our own Minds as the Objects of Reflexion, are the only Originals, whence all our *Ideas* have their Riſe. When we have conſidered theſe, and their ſeveral Modes and Combinations, we ſhall find they contain our whole Stock of *Ideas*; inſomuch, that the Underſtanding does not ſeem to have the leaſt Glimmering of any *Ideas* that it did not receive from one of thoſe Sources. And thus far the Mind appears merely paſſive, as not having it in its power to chuſe whether it will have theſe firſt Beginnings or Materials of Knowledge, or not. For the Objects of Senſe will obtrude their *Ideas* upon the Mind, and the Operations of the Mind will not let us be without ſome (however obſcure) Notion of them.

The ſame excellent Author diſtinguiſhes *Ideas* into two kinds, *viz.* Simple and Complex. Of the former kind are all thoſe *Ideas* which come into the Mind by Senſation: And though the Qualities of Bodies that affect our Senſes are in the things themſelves ſo mix'd and united, that there is no Separation between them; yet the *Ideas* they produce in the Mind are ſimple and unmix'd. Again, ſome *Ideas* we acquire purely by means of one Senſe, as the *Ideas* of Colours only by the Eye, of Sounds by the Ear, of Heat by the Touch, &c. Other *Ideas* we gain by ſeveral Senſes, as of Space, Extenſion, Figure, Reſt, Motion, &c. for theſe have their Effect both on the Sight and the Touch. There are other ſimple *Ideas*, again, form'd in the Mind both by Senſation and Reflexion jointly, as Pleaſure, Pain, Power, Exiſtence, Unity, Succeſſion, &c. And of ſome of theſe kinds of *Ideas* are all, or at leaſt the moſt conſiderable of thoſe ſimple *Ideas* which the Mind hath, and out of which is made all its other Knowledge. The better to comprehend the Nature of theſe ſimple *Ideas*, it will be convenient

nient to distinguish between them as they are *Ideas* or Perceptions in our Minds, and as they are Modifications of the Bodies that cause such Perceptions in us; that we may not think, as is usually done, that they are exactly the Images and Resemblances of something inherent in the Subject: for most of those of Sensation, are in the Mind no more the Likeness of any thing existing without us, than the Names that stand for 'em are the Likeness of the *Ideas*. But here the Qualities of Bodies which produce those *Ideas* in our Minds, are to be distinguish'd into Primary and Secondary. Primary Qualities are such as are utterly inseparable from the Body, in what State soever it be; and such as our Senses constantly find in every Particle of Matter, which are Solidity, Extension, Figure, Mobility, and the like. Secondary Qualities are such as are, in reality, nothing in the Objects themselves, but only Powers to produce various Sensations in us by means of their primary Qualities; that is, by the Figure, Bulk, Texture, &c. of their Particles, as Colour, Sounds, Taste, &c. Now the *Ideas* of primary Qualities are in some sense Resemblances of them, and their Patterns do really exist in the Bodies themselves; but the *Ideas* produced in us by those secondary Qualities have no Resemblance of them at all. There is nothing like our *Ideas* existing in the Bodies themselves that occasion them. They are in the Bodies we denominate from them, only a Power to produce those Sensations in us; and what is sweet, warm, blue, &c. in the *Idea*, is no more than the Bulk, Figure and Motion of the Particles of the Bodies themselves that we call so.

The Mind hath several Faculties of managing these simple *Ideas* that are worthy of notice: as, 1. That of discerning justly and distinguishing rightly between one and another; in this consists the Accuracy of Judgment. 2. That of comparing them one with another in respect of Extent, Degree, Time, Place, or any other Circumstances of Relation or Dependance one on another. 3. The Faculty of compounding or putting together the simple *Ideas* received by Sensation and Reflexion, in order to make complex ones. 4. Children by repeated Sensations having got some *Ideas* fix'd in their Memories, by degrees learn the Use of Signs; and when they can speak articulately, they make use of Words to signify their *Ideas* to others: Hence, the Use of Words being to stand as outward Marks of our internal *Ideas*, and those *Ideas* being taken from particular things; if every particular *Idea* that we take in, should have a particular Name affixed to it, Names would grow endless. To prevent this Inconvenience, the Mind has another Faculty whereby it can make the particular *Ideas* received from such Objects, become general; which is done, by considering them as they are in the Mind such Appearances, separate from all other Existences and Circumstances of Existence, as Time, Place, and other concomitant *Ideas*: and this is called Abstraction; whereby *Ideas* taken from particular Things become general Representatives of all of that kind, and their Names, general Names applicable to whatever exists conformable to such abstract *Ideas*. Thus the same Colour being observed today in Chalk or Snow, which we observed yesterday in Paper or Milk, we consider that Appearance alone, make it a Representative of all the same Kind, and give it the Name of Whiteness: By which Sound we always signify the same Quality, wheresoever to be met with or imagined.

From the Power which the Mind has of combining, comparing, and separating or abstracting the simple *Ideas*, which it acquires by Sensation and Reflexion, all its complex *Ideas* are formed; and as before in the Perception of *Ideas*, the Understanding was passive, so here 'tis active, exerting the Power it hath in the several Acts and Faculties abovementioned, in order to frame compound *Ideas*. All complex *Ideas*, tho their Number be infinite, and Variety endless, yet may they be all reduced to these three Heads, *viz.* Modes, Substances, and Relations. Modes are such complex *Ideas*, as however compounded, are not supposed to exist by themselves, but are consider'd as Dependencies on, or Affections of Substances: Such are the *Ideas* signified by the words Triangle, Gratitude, Murder, &c. And these Modes are of two kinds: 1. Such as are only Variations, or different Combinations of the same simple *Idea*, without the Mixture of any other, as a Dozen, a Score, &c. and these may be called simple Modes. 2. There are others compounded of simple *Ideas* of several sorts put together, to make one complex one, as Beauty, Theft. Substances have their *Ideas* from such Combinations of simple *Ideas*, as are taken to represent distinct particular things, subsisting by themselves, in which the supposed or confused *Idea* of Substance, such as it is, is always the first and chief. Relations are a kind of complex *Ideas*, arising from the Consideration or Comparison of one *Idea* with another. Of these, some only depend on the Equality or Excess of the same simple *Idea* in several Subjects, and these may be called proportional Relations, such as equal, more, bigger, sweeter. Another occasion of comparing things together, is owing to the Circumstances of their Origin and Beginning; which, not being afterwards to be altered, make the Relations depending thereon as lasting as the Subjects to which they belong. Thus it is with natural Relations, such as Father, Mother, Uncle, Cousin, &c. Thus also it is with Relations by Institution, as Prince and People, General and Army, &c. As to moral Relations, they are the Conformity or Disagreement of Mens free Actions to Laws and Rules, whether Human or Divine.

Further, with regard to our *Ideas* it may be observed, that some are clear and distinct, others obscure and confused. Our simple *Ideas* are clear, when they continue such as the Objects represent them to us, when our Organs of Sensation are in a good Tone and Order, when our Memories retain them, and can produce and present them to the Mind whenever it hath occasion to consider them; and when, with this, the Mind sees that these simple *Ideas* are severally different one from another: The contrary to which, is what we call Obscurity and Confusion.

Again, *Ideas*, with respect to the Objects whence they are taken, or which they are supposed to represent, come under a threefold Distinction; being, 1. Either real or fantastical. 2. True or false. 3. Adequate or inadequate. By real *Ideas* is meant such as have a Foundation in Nature, such as have a Conformity with the real Being or Existence of Things, or with their Architypes. Fantastical are such as have no Foundation in Nature, nor any Conformity with that Being to which they are referred as their Architypes.

Now if we examine our several kinds of *Ideas*, we shall find that, 1. All our simple *Ideas* are real; not that they are Images or Representations of what does exist, but as they are the certain Effects of Powers in Things without us, ordained by our Maker to produce in us such Sensations. They are real *Ideas* in us, in regard, by them we distinguish the Qualities that are really in the Bodies themselves: their Reality lies in the steady Correspondence they have with the distinct Constitutions of real Beings, but whether with those Constitutions to Causes or Patterns, it matters not, so long as they are constantly produced by them. As to complex *Ideas*, in regard they are arbitrary Combinations of simple *Ideas* put together, and united under one general Name, in forming whereof the Mind useth its own Liberty, some are found real, and some imaginary. 1. Mix'd Modes and Relations having no other Reality than what they have in the Minds of Men, are real; nothing more being required to their Reality, but a Possibility of existing conformable to them. These *Ideas* being themselves Architypes, cannot differ from their Architypes, and so cannot be chimerical, unless any one jumbles inconsistent *Ideas* in them: Indeed, those that have Names assign'd to them, ought to have a Conformity to the ordinary Signification of those Names, to prevent their appearing fantastical. 2. Our complex *Ideas* of Substances being made in reference to things existing without us, whose Representations they are thought, are no further real, than as they are Combinations of simple *Ideas* really united and co-existing in things without us. Those are fantastical, that are made up of several *Ideas* that never were found united, as *Centaur*, &c.

As to true and false *Ideas*, it may be observed, that Truth and Falshood in Propriety of Speech belong only to Propositions; and when *Ideas* are term'd true or false, there is some tacit Proposition, which is the Foundation of that Denomination. Our *Ideas* being nothing else but Appearances or Perceptions in the Mind, can no more be said to be true or false, than single Names of things can be said to be so; for Truth and Falshood lying always in some Affirmation or Negation, our *Ideas* are not capable of them, till the Mind passeth some Judgment of them. In a Metaphysical Sense they may be said to be true, *i.e.* to be really such as they exist; tho in things called true, even in that Sense, there seems to be a secret Reference to our *Ideas*, look'd upon as the Standards of that Truth; which amounts to a mental Proposition. When the Mind refers its *Ideas* to any thing extraneous to it, they are then capable of being true or false, because in such a Reference, the Mind makes a tacit Supposition of their Conformity to that thing; which Supposition, as it is true or false, so the *Ideas* themselves come to be denominated. Real *Ideas* are either adequate or inadequate. Those are adequate which perfectly represent those Architypes which the Mind supposeth them taken from, and which it makes them stand for. Inadequate are such as do but partially or incompleatly represent those Architypes to which they are referred. See *Adequate*, *Truth*, *Pleasure*, *Name*, *Knowledge*, *Association*, *Modes*.

IDENTITATE NOMINIS, is a Writ that lies for him who upon a Capias or Exigent is taken and committed to Prison for another Man of the same Name.

IDENTITY of a thing, is its Sameneſs, or that by which it is itſelf, and not any thing elſe. Our Ideas of *Identity* we owe to that Power which the Mind has of comparing the very Beings of Things, whereby conſidering any thing as exiſting at any certain Time and Place, and comparing it with itſelf as exiſting at any other Time, &c. we accordingly pronounce it the ſame or different. When we ſee any thing in any certain Time and Place, we are ſure it is that very thing; and can be no other, how like ſoever it may be in all other reſpects: In regard we conceive it impoſſible, that two things of the ſame kind, ſhould exiſt together in the ſame Place, we conclude, that whatever exiſts any where at the ſame Time, excludes all of the ſame kind, and is there itſelf alone. When therefore we demand, whether any thing be the ſame or no, it refers always to ſomething, that exiſted at ſuch a Time, in ſuch a Place, which it was certain, at that inſtant, was the ſame with itſelf, and no other. We have Ideas of three ſorts of Subſtances. *Firſt*, of Gods; *Secondly*, of Finite Intelligences; *Thirdly*, of Bodies. *Firſt*, God being Eternal, Unalterable, and every where, concerning his *Identity* there can be no doubt. *Secondly*, Finite Spirits having had their determinate Place and Time of beginning to exiſt, the Relation to that Time and Place will always determine to each, its *Identity*, as long as it exiſts. *Thirdly*, The ſame will hold of every Particle of Matter to which no Addition or Subſtraction is made. Theſe three exclude not one another out of the ſame Place, yet each exclude thoſe of the ſame kind, out of the ſame Place. The *Identity* and Diverſity of Modes and Relations are determined after the ſame manner, that Subſtances are: only the Actions of Finite Beings, as Motion and Thought, conſiſting in Succeſſion, cannot exiſt in different Times and Places, as permanent Beings: For no Motion or Thought conſidered as at different Times, can be the ſame, each Part thereof having a different beginning of Exiſtence. From whence it is plain, that Exiſtence itſelf is the *Principium Individuationis*, which determines a Being to a particular Time and Place incommunicable to two Beings of the ſame kind. Thus, ſuppoſe an Atom exiſting in a determined Time and Place, it is evident, that conſider'd in any inſtant, it is the ſame with itſelf, and will be ſo, as long as its Exiſtence continues. The ſame may be ſaid of two, or more, or any Number of Particles, whilſt they continue together. The Maſs will be the ſame, however jumbled: but if one Atom be taken away, it is not the ſame Maſs. In Vegetables, the *Identity* depends not on the ſame Maſs, and is not applied to the ſame Thing. The Reaſon of this, is the difference between an animate Body, and Maſs of Matter; this being only the Coheſion of Particles any how united; the other, ſuch a Diſpoſition, and Organization of Parts, as is fit to receive and diſtribute Nouriſhment, ſo as to continue and frame the Wood, Bark, Leaves, &c. (of an Oak, for inſtance) in which conſiſts the Vegetable Life. That therefore, which hath ſuch an Organization of Parts, partaking of one common Life, continues to be the ſame Plant, tho' that Life be communicated to new Particles of Matter vitally united to the living Plant. The Caſe is not ſo much different in Brutes, but that any one may hence ſee what makes an Animal, and continues it the ſame. The *Identity* of the ſame Man likewiſe conſiſts in a Participation of the ſame continued Life, in ſucceeding Particles of Matter vitally united to the ſame organized Body. To underſtand *Identity* aright, we muſt conſider what Idea, the Word it is applied to, ſtands for: it being one thing, to be the ſame Subſtance; another, the ſame Man; and a third, the ſame Perſon. An Animal is a living organized Body: and the ſame Animal is the ſame continued Life communicated to different Particles of Matter, as they happen ſucceſſively to be united to that organized living Body; and our Notion of Man, is but of a particular ſort of Animal. Perſon ſtands for an intelligent Being, that reaſons, and reflects, and can conſider itſelf the ſame thing in different Times and Places; which it doth by that Conſciouſneſs, that is inſeparable from Thinking. By this every one is to himſelf, what he calls Self, without conſidering, whether that Self be continued in the ſame or diverſe Subſtances. In this conſiſts Perſonal *Identity*, or the Sameneſs of a Rational Being: and ſo far as this Conſciouſneſs extends backward to any paſt Action, or Thought, ſo far reaches the *Identity* of that Perſon. It is the ſelf-ſame now, it was then: And it is by the ſame Self, with this preſent one, that now reflects on it, that *that* Action was done. Self is that conſcious Thinking Thing, whatever Subſtance, it matters not, which is conſcious of Pleaſure and Pain, capable of Happineſs or Miſery; and ſo is concerned for itſelf, as far as that Conſciouſneſs extends. That with which the Conſciouſneſs of this preſent Thinking Thing can join itſelf, makes the ſame Perſon, and is one Self with it; and ſo attributes to itſelf, and owns all the Actions of that thing, as its own, as far as that Conſciouſneſs reacheth. This Perſonal Identity is the Object of Reward and Puniſhment, being that by which every one is concerned for himſelf. If the Conſciouſneſs went along with the little Finger, when that was cut off, it would be the ſame Self, that was juſt before concern'd for the whole Body. If the ſame *Socrates*, waking, and ſleeping, did not partake of the ſame Conſciouſneſs, they would not be the ſame Perſon: *Socrates* waking could not be in juſtice accountable for what *Socrates* ſleeping did; no more than one Twin, for what his Brother Twin did, becauſe their Outſides were ſo like, that they could not be diſtinguiſh'd. But ſuppoſe I wholly loſe the Memory of ſome Parts of my Life, beyond a poſſibility of retrieving them, ſo that I ſhall never be conſcious of them again; am I not again the ſame Perſon that did thoſe Actions, tho' I have forgot them? I anſwer, We muſt here take notice what the word *I* is applied to, which in this Caſe is the Man only: And the ſame Man being preſumed to be the ſame Perſon, *I* is eaſily here ſuppoſed to ſtand alſo for the ſame Perſon. But if it be poſſible for the ſame Man, to have diſtinct incommunicable Conſciouſneſs at different times, it is paſt doubt the ſame Man would at different times make different Perſons. Which we ſee is the Senſe of Mankind in the ſolemneſt Declaration of their Opinions; Human Laws not puniſhing the Madman for the ſober Man's Actions, nor the ſober Man, for what the Madman did; thereby making them two Perſons. Thus we ſay in *Engliſh*, Such an one is not himſelf, or is beſides himſelf; in which Phraſes it is inſinuated, that Self is changed, and the ſelf-ſame Perſon is no longer in that Man. But is not a Man, drunk or ſober, the ſame Perſon? Why elſe is he puniſhed for the ſame Fact he commits when drunk, tho' he be never afterwards conſcious of it? Juſt as much the ſame Perſon, as a Man that walks, and does other things in his Sleep, is the ſame Perſon, and is as anſwerable for any Miſchief he ſhall do in it. Human Laws puniſh both with a Juſtice ſuitable to their way of Knowledge: Becauſe, in theſe Caſes, they cannot diſtinguiſh certainly, what is real, and what is counterfeit; and ſo the Ignorance in Drunkenneſs or Sleep is not admitted as a Plea. For tho' Puniſhment be annexed to Perſonality, and Perſonality to Conſciouſneſs, and the Drunkard is not conſcious perhaps of what he did; yet Human Judicatures juſtly puniſh him, becauſe the Fact is proved againſt him, but want of Conſciouſneſs cannot be proved for him. But in the great Day, wherein the Secrets of all Hearts ſhall be laid open, it may be reaſonable to think no one ſhall be made to anſwer for what he knows nothing of, but ſhall receive his Doom, his own Conſcience accuſing, or elſe excuſing him. To conclude, Whatever Subſtance begins to exiſt, it muſt, during its Exiſtence, be the ſame: Whatever Compoſition of Subſtances begin to exiſt, during the Union of thoſe Subſtances, the Concrete muſt be the ſame. Whatſoever Mode begins to exiſt, during its Exiſtence it is the ſame: And ſo if the Compoſition be of diſtinct Subſtances, and different Modes, the ſame Rule holds. Whence it appears, that the Difficulty or Obſcurity that has been about this matter, rather ariſes from Names ill uſed, than from any Obſcurity in the things themſelves. For whatever makes the ſpecifick Idea, to which the Name is applied, if that Idea be ſteadily kept to, the Diſtinction of any thing into the ſame and diverſe, will eaſily be conceived.

IDEOT in the original *Greek* ἰδιώτης, ſignifies a private Perſon who has no public Office. Among the *Latins* it is uſed for *Illiteratus*, *Imperitus*; and in our *Engliſh* Law, for a Perſon *non compos mentis*, or a natural Fool. A Perſon that has Underſtanding enough to meaſure a Yard of Cloth, number 20 rightly, tell the Days of the Week, &c. is not an Ideot in the Eye of the Law.

IDES, is a Word which was uſed by the *Romans*, in their Calendar, to diſtinguiſh the Days of the Month by. They commonly fell out the 13th of every Month, except in the Months of *March*, *May*, *July*, and *October*, for in theſe, the *Ides* were on the 15th of the Month. This word is ſaid to be derived from the *Hetrurian* word *Iduare*, that is, to divide; becauſe the Month is, in a manner, equally divided into two Parts by the *Ides*; and the *Nones* were perhaps ſo called from *Nono Idus*, the ninth of the *Ides*, becauſe they were in the room of the ninth of the *Ides*. Some others obſerving, that there were three conſiderable Varieties in the Motion of the Moon; the firſt, when ſhe is quite hid under the Beams of the Sun; the ſecond at the firſt Day of her appearing, when we ſee her in an Evening, with her Horns proceeding out of his Rays; and the third when ſhe is in her full Light: The common Opinion was, that from thence *Romulus* took occaſion to divide the Days of the Months; which he began always by the Calends, in the time that the Moon, *ſub Radiis Solis celaretur*, was hid under the

Beams

Beams of the Sun; then gave the Name of *Nonæ*, or *Novæ Lunæ*, to the Day of the first appearing of the New Moon; and *Idus*, say they, took the Name when she was full, and appeared in her Beauty, from the *Greek* word εἶδος, that is, Beauty. From thence they draw an Argument for the Inequality of the Days of the *Nones*: for as it falls out by the Composition of the Motions of the Sun and the Moon, that the Moon comes out of the Beams of the Sun, sometimes sooner, and sometimes later, and that this Diversity is commonly included in the space of two Days; it is likely, they say, that in the time that *Romulus* instituted his Calendar, the Moon was kept a longer time hid under the Beams of the Sun, in the Month of *March*, *May*, *July*, and *October*: wherefore he allowed seven Days to the *Nones* in those four Months, and five Days only to the others, during which, it may be, the Moon got off from these Beams, and appeared sooner. Others draw the word *Idus* from *Idulium*, which was the Name of the Victim offered to *Jupiter*, the Day of the *Ides*, that was consecrated to him. Some derive it from the *Tuscan* word *Itis*, which signifies, amongst that Nation, the same as *Idus* among the *Romans*. They allowed eight Days for the *Ides*: Thus the eighth Day of the Month, in those four Months, and the sixth, in the other eight, were accounted the eighth of the *Ides*, and so on, always decreasing to the 12th or 14th, which was called the *Pridie*, or *Eve of the Ides*, and on the 13th or 15th was the Day of the *Ides*. This way of accounting is still in use in the *Roman* Chancery, and in the Calendar of the Breviary.

The *Ides* of *May* were consecrated to *Mercury*; the *Ides* of *March* were ever esteemed unhappy, after *Cæsar*'s Murder on that Day; the Time after the *Ides* of *June* was reckoned fortunate for those who entered into Matrimony; the *Ides* of *August* were consecrated to *Diana*, and were observed as a Feast-Day by the Slaves. On the *Ides* of *September* Auguries were taken for appointing the Magistrates, who formerly entered into their Offices on the *Ides* of *May*, afterwards on those of *March*. See *Rosinus*, and others, who have written of the *Roman Antiquities*.

IDIOM, *Dialect*, the Language of some particular Province, differing, in some respects, from the Language of the Nation in general, whence it is derived. The word comes from the *Greek*, ἰδίωμα, *Propriety*, of ἴδιος, *proper*, *self*.

IDIOPATHY, a Disease or Indisposition proper to some particular Member, or Part of the Body, not caused by any other Disease, or preceding Affection, nor having any thing to do with the rest of the Body. It is opposed to Sympathy, which happens when the Indisposition takes its Rise from a Disorder in some other Part of the Body. Thus a Cataract in the Eye is an *Idiopathy*: an Epilepsy is either *Idiopathic* or *Sympathic*; *Idiopathic* when it happens purely thro' some Fault in the Brain, *Sympathic* when it is preceded by some other Disorder. The word is derived from the *Greek*, ἴδιος, *proper*, *particular*, and πάθος, *Passion*, *Affection*.

IDIOSYNCRASY, in Physic, is a Temperament peculiar to some Body, in consequence whereof, whether in Sickness or in Health, it has a more than ordinary Aversion or Inclination to certain things, or is more affected with them, than others usually are. The word is derived from the *Greek*, ἴδιος, *proper*, σύν, *with*, and κρᾶσις, *Crasis*, *Mixture*, *Temperament*.

IDIOTA *Inquirenda vel Examinanda*, is a Writ issued out to the Escheator or Sheriff of any County, where the King has notice that there is an Ideot naturally born, so weak of Understanding, that he cannot govern or manage his Inheritance, directing him to call before him the Party suspected, and examine him: for the King has the Protection of his Subjects, and by his Prerogative the Government of the Lands and Substance of such as are naturally defective in their own Discretion.

IDIOTISM, in Grammar, is an Inflexion of some Verb, a particular Construction of some Phrase or Particle that is anomalous, and deviates from the ordinary Rule of the Language of the Nation, but which is in use in some particular Province of it. Several Authors have written of the *Idiotisms* in the *Greek* and *Latin* Languages; that is, of the particular Turns in those Tongues which vary the most from each other, and from the more popular among the modern Tongues: But the Examples of these *Idiotisms* being borrowed from the best Authors, *Idiotism*, in this Sense, cannot properly be called an Irregularity. The word is derived from the *Greek*, ἴδιος, *proper*.

IDOL, a Statue or Image of some false God, to whom Divine Honours are paid, Altars and Temples erected, and Sacrifices made. Thus the *Colossus* at *Rhodes* was an Idol of the Sun, the *Palladium* an Idol of *Minerva*, &c. The word comes from the *Greek* εἴδωλον, of εἶδος, *Imago*, *Figura*.

IDOLATRY, the Worship and Adoration of false Gods, or the giving those Honours to Creatures, or the Works of Man's Hand, which are only due to God. Several Authors have written of the Origin and Causes of Idolatry, and among the rest *Vossius*, *Selden*, *Goodwin*, and *Tennison*; but 'tis still a Doubt who was the first Author of it. 'Tis generally allowed, however, that it had not its Beginning till after the Deluge, and many are of Opinion that *Belus*, who is supposed to be the same with *Nimrod*, was the first Man that was deified. But whether they had not paid Divine Honours to the Heavenly Bodies before that time, cannot be determined, our Acquaintance with those remote Times being extremely slender. All that can be said with Certainty, is, That 426 Years after the Deluge, when God lead *Thara* and his Family out of *Chaldea*, and *Abraham* passed over *Mesopotamia*, *Canaan*, the Kingdom of the *Philistines* and *Egypt*, it does not appear that Idolatry had then got any footing in any of those Countries, tho' some pretend that *Abraham* himself was an Idolater. The first mention we find made of it, is in *Genesis*, *chap.* xxxix, *ver.* 19. where *Rachel* is said to have taken the Idols of her Father; for tho' the meaning of the *Hebrew* word תרפים be disputed, yet 'tis evident they were Idols. *Laban* calls them his Gods, and *Jacob* calls them strange Gods, and looks on them as Abominations. *Cluverius*, *Germ. Antiq. l.* 1. maintains *Cain* to have been the first Idolater, and the false Gods that he worshipped to have been the Stars, to whom he supposed God had left the Government of the lower World: but this is mere Conjecture. The principal Causes that have been assigned for Idolatry, are these: (1.) The indelible Idea which every Man has of a God, and the Evidence which he gives of it to himself. (2.) An inviolable Attachment to Sense, and an Habitude of judging and deciding by it, and it only. (3.) The Pride and Vanity of the human Soul, which is not satisfied with simple Truth, but mingles and adulterates it with Fables. (4.) The Ignorance of Antiquity, or of the first Times, and the first Men, whereof we have but a very dark and confused Knowledge by Tradition, they having left no written Monuments or Books. (5.) The Ignorance and Changes of Languages. (6.) The Style of the *Oriental* Languages, which is figurative and poetical, and personifies every thing. (7.) The Superstition, Scruples, and Fears, inspired by Religion. (8.) The Flattery of Writers. (9.) The false Relations of Travellers. (10.) The Fictions of Poets. (11.) The Imaginations of Painters and Sculptors. (12.) A smattering of Physics, that is, a slight Acquaintance with natural Bodies, and Appearances, and their Causes. (14.) The Establishment of Colonies, and the Invention of Arts, which have been perverted by barbarous People. (15.) The Artifices of Priests. (16.) The Pride of certain Men, who have affected to pass for Gods. (17.) The Affection and Gratitude bore by the People to certain of their Great Men and Benefactors. (18.) The Scriptures themselves ill understood. The word comes from the *Greek* εἰδωλολάτρης, which is composed of εἶδος, *Imago*, *Image*, and λατρεύειν, *servire*, *to serve*.

IDYLLION, in Poetry, is a little gay Poem, containing the Description or Narration of some agreeable Adventures. *Theocritus* is the oldest Author who has written *Idyllions*. The *Italians* imitate him, and have brought the *Idyllion* into modern Use. The *Idyllions* of *Theocritus* have a world of Delicacy; they appear with a clowniſh, rustic kind of Simplicity, but are full of the most exquisite Beauties; they seem drawn from the Breast of Nature herself, and to have been dictated by the Graces. The *Idyllion* is a kind of Poetry, which paints the Objects it describes; whereas the *Epic* Poem relates them, and the *Dramatic* acts them. The modern Writers of *Idyllions* don't keep up to that original Simplicity observed by *Theocritus*; the People of our Days would not bear an amorous Fiction, resembling the clumsy Gallantries of our Peasants. *Boileau* observes that the shortest *Idyllions* are usually the best. The word is derived from the *Greek* εἰδύλλιον, of εἶδος, *Figure*, *Representation*; in regard this Poetry consists in a lively natural Image, or Representation of Things.

JEAT, sometimes called *Black Amber*, is a Mineral, or a fossile Stone, extremely black, formed of a lapidific or bituminous Juice in the Earth, in the manner of Coal: It works like Amber, and has most of its Qualities. It abounds in *Dauphine*, but the best in the World is said to be produced in some of the *Northern* Parts of *England*. There is also a factitious *Jet* made of Glass, in imitation of the Mineral *Jet*. This is drawn out into long hollow Strings, which are cut, and formed at pleasure. It is much used in Embroideries, and in the Trimmings of Mourning, and may be made of any Colour, tho 'tis usually black and white.

JECTIGATION, in Physic, is a Trembling or Palpitation felt in the Pulse of a sick Person, which shews that the Brain, which is the Origin of the Nerves, is attacked and threatned with Convulsions.

JECUR. See *Liver*.

JECUR UTERINUM: The *Placenta* is by ſome thus called, from the ſuppoſed Similitude of its Office with that of the Liver.

JEJUNUM. See *Inteſtines*.

JEOFAYLE; a Compound of three *French* words, *Je ay faille*, *I have failed*. It is uſed in a legal Senſe, when the Parties to any Suit have, in pleading, proceeded ſo far, that they have joined Iſſue, which ſhall be tryed, or is tryed by a Jury, and this Pleading or Iſſue is badly joined, ſo that it will be Error if they proceed. In this Caſe one of the Parties might, by their Counſel, ſhew it to the Court, as well after Verdict given, as before the Jury was charged: But this occaſioning great Delays in Suits, for the Redreſs thereof ſeveral Statutes were made, *viz.* 32 *H.* VIII. *c.* 30. by which it was enacted, 'That if the Jury have once paſſed upon the 'Iſſue, tho' afterwards there be found a *Jeofayle* in the 'Pleading, yet ſhall Judgment be given according to 'the Verdict of the Jury.' Other Statutes have alſo been made relating to the ſame thing, in the time of King *James* I. and Queen *Elizabeth*, and yet the Fault little mended.

S. JEROM, the Name of four ſeveral Orders of Religious, who are ſometimes alſo called *Jeronymites*. The firſt, called the Order of St. *Jerom* of *Spain*, owe their Origin to the third Order of St. *Francis*, whereof the firſt *Jeronymites* were Members. *Gregory* the Eleventh confirmed this Order, under the Name of St. *Jerom*, whom they had choſen for their Patron and their Model, and gave them the Conſtitutions of the Convent of *St. Mary of the Sepulchre*, with the Rule of St. *Auguſtine*; and for Habit, a white Tunic, with a Scapulary, a little Capuche, and a Mantle, all of their natural Colour, without Dying, and of a mean Price. The *Jeronymites* are in poſſeſſion of the Convent of *St. Laurence*, in the *Eſcurial*, where the Kings of *Spain* are buried. In *Spain* is likewiſe an Order of Nuns of St. *Jerom*, founded by a Lady towards the cloſe of the 15th Century. *Sixtus* put them under the Juriſdiction of the *Jeronymites*, and gave them the Conſtitutions of the Monaſtery of *St. Martha* of *Cordova*, which were afterwards changed by *Leo* X. for thoſe of the Order of St. *Jerom*. The ſecond Order of St. *Jerom* is that of *Lombardy*, called *St. Jerom of the Obſervance*, founded by *Loup d'Olmedo* in 1424. in the Mountains of *Cazalla*, in the Dioceſs of *Sevil*. The third Order of *Jeronymites* was founded by *Peter Gambacorti* about the Year 1377; but the Vows they made were only ſimple till 1568, when *Pius* V. appointed them to be ſolemn. They have Houſes in *Tirol*, *Italy*, and *Bavaria*. The fourth Congregation of *Jeronymites*, are the Hermites of St. *Jerom* of *Fiezoli*, begun in 1360, when *Charles de Montegraneli*, of the Family of the Count of that Name, retiring into Solitude, firſt eſtabliſhed it at *Verona*. It was approved by *Innocent* VII. under the Rule and Conſtitutions of St. *Jerom*. But *Eugenius*, in 1441 changed it for that of St. *Auguſtin*. As the Founder was of the third Order of St. *Francis*, they preſerved that Habit; but in 1460, *Pius*, permitting ſuch as pleaſed to change it, occaſioned a Diviſion among them. This Order was finally ſuppreſſed by *Clement* XI. in 1668.

JESILBASCH, Green-Head, is the Name which the *Perſians* give to the *Turks*, becauſe their Emirs wear a Green Turband.

JESSANT, a Term in Heraldry, uſed when, in a Coat of Arms, a Lion or other Beaſt is borne over ſome Ordinary; as over a Chief, a Bend, a Feſſe, &c. that Lion or Beaſt is blazoned *Jeſſant*, or *Jacent*, that is, lying over all.

JESUATES, an Order of Religious, otherwiſe called *Apoſtolical Clerks*. They were founded by *John Columbin*, and approved of by *Urban* V. in 1367. at *Viterba*; where he himſelf gave, to ſuch as were preſent, the Habit they were to wear. They followed the Rule of St. *Auguſtine*, and were ranked by *Pius* V. among the Orders of Mendicants. They were called *Jeſuates*, becauſe their firſt Founders had the Name of Jeſus continually in their Mouths. For two Centuries the *Jeſuates* were mere Seculars; but in 1606, *Paul* V. gave them leave to enter into Holy Orders. In moſt of their Houſes they were employed in Pharmacy, others practiſed Diſtillation, and ſold *Aqua Vitæ*, which occaſioned their being called *Aqua Vitæ-mongers*. Being very rich in the State of *Venice*, that Republick ſollicited their Suppreſſion, and obtained it of *Clement* IX. their Effects being employed towards ſupporting the Expences of the War in *Candia*.

JESUITS, an Order of Religious, founded by *Ignatius Loyola*, who are alſo called *the Company of Jeſus*. This Order has rendered itſelf very conſiderable by its Miſſions into the *Indies*, and by its other Employments relating to the Study of the Sciences, and the Education of Youth. The Council of *Trent* calls them, *Clerks Regulars of the Company of Jeſus*. It was in the Year 1538. that *Ignatius* having aſſembled ten of his Companions at *Rome*, choſen moſtly out of the Univerſity of *Paris*, propoſed to them to make a new Order. After this he preſented the Plan of his Inſtitution to *Paul* III. who appointed three Commiſſioners to examine it; upon whoſe Report, the Pontiff confirmed the Inſtitution, under the Name of *The Company of Jeſus*, by a Bull in 1540. By this Bull, their Number was reſtrained to Sixty, but that Reſtriction was taken away, two Years afterwards, by another Bull. The Order has ſince been confirmed by ſeveral ſucceeding Popes, who have added many new Rights and Privileges to it. The End principally propoſed by this Order, is to gain Converts to the Romiſh Church, with which View they diſperſe themſelves in every Country and Nation, and with amazing Induſtry and Addreſs purſue the End of their Inſtitution. No Difficulty ſo great that they cannot ſurmount, no Danger ſo imminent that they will not undergo, no Crimes ſo ſhocking that they will not perpetrate, provided it may be of any Service to their Cauſe. They have no particular Habit, but change and accommodate it to Times and Occaſions. This Order conſiſts of five different Claſſes; Fellows, ſpiritual Coadjutors, approved Scholars, Lay-Brothers, called alſo temporal Coadjutors, and Novices. The Fellows, which make the Body of the Company, make the three ſolemn Vows of Religion publickly, and to theſe add a ſpecial Vow of Obedience to the Head of the Church, as to what regards Miſſions among Idolaters, Heretics, &c. The ſpiritual Coadjutors alſo make public Vows of Chaſtity, Poverty, and Obedience, but omit the fourth relating to Miſſions. Approved Scholars are thoſe, who, after two Years Noviciate, have been admitted, and have made three Vows of Religion; not ſolemn, indeed, but yet declared. Theſe are in the way to become Fellows, or ſpiritual Coadjutors, according as the General thinks fit. Theſe Degrees, eſpecially that of Fellow, are never conferred till after two Years Noviciate, and ſeven Years Study, ſeven of Regency, a third Year of Noviciate, and thirty three Years of Age. The Vows of the Scholars are abſolute on their ſide, but only conditional on the ſide of the Order; the General having it in his power to diſpenſe with them.

The Order is divided into Aſſiſtances, the Aſſiſtances into Provinces, and the Provinces into Houſes. It is governed by a General, who is perpetual and abſolute. He reſides at *Rome*, and is elected by a General Congregation of the Order. He has with him, five Perſons, who are, as it were, his Miniſters. They are called Aſſiſtants, and bear the Name of the Kingdom or Country to which they belong, and by whom they are appointed, *viz.* of *Italy*, *France*, *Spain*, *Germany*, and *Portugal*. To theſe belongs the Care of preparing the Matters of their reſpective Aſſiſtances, and of putting them in a Method to facilitate their Expedition. It is by theſe, that both Inferiors and Superiors go regularly before the General. They are choſen by the Congregation, and are not only the General's Counſellors to aſſiſt him in his Buſineſs, but alſo to obſerve his Conduct; and, if they find occaſion, they may call a general Congregation without his Conſent, who may depoſe him in form; or they have it in their power to depoſe him, themſelves, after having, by Letter, obtained the Suffrages of their Provinces.

Each Province has four kinds of Houſes, *viz.* profeſſed Houſes, which can have no Lands belonging to them; Colleges, where the Sciences are taught; Reſidences, where are a Number of Workmen employed in ſuch Offices, as have any immediate relation to Preaching, Confeſſion, Miſſions, &c. and Houſes of Novices. Among the Colleges there are ſome called ſimply Colleges, and others called Seminaries. Theſe laſt are ſet aſide, for the young *Jeſuits* to go through their Courſes of Philoſophy and Theology in; the others are for Strangers. Each Province is governed by a Provincial, and each Houſe by a Superior, who is called a Rector in the Colleges, and a Superior in the other Houſes. *Ignatius* regulated the Diſcipline of theſe Houſes, and eſpecially of the Colleges, by what he had obſerv'd in the *Sorbonne*, while he ſtudied at *Paris*. The Fellows of this Order renounce, by a ſolemn Vow, all Preferment, and eſpecially Prelacy; and cannot receive any, unleſs enjoin'd thereto by the Pope under pain of Sin. This the Pope ſometimes does; inſomuch that they have had eight Cardinals of their Order.

JET D'EAU, a *French* Word ſignifying a Fountain, that caſts up Water to any conſiderable Height in the Air. Mr. *Mariotte* ſaith, That a *Jet d'Eau* will never riſe ſo high as its Reſervatory, but always falls ſhort of it by a Space, which is in a ſubduplicate Ratio of that Height; and this he proves by ſeveral Experiments. He ſaith alſo, That if a greater, branches out in many ſmaller ones, or is diſtributed thro' ſeveral *Jets*, the Square of the Diameter of the main Pipe, muſt be proportioned to the Sum of all the

the Expences of its Branches; and particularly, That if the Reſervatory be 52 Foot high, and the Adjutage half an Inch in Diameter, the Pipe ought to be three Inches in Diameter. See *Fountain*, *Water*, &c.

JETSON. See *Flotſon*.

JEWEL-OFFICE. An Office that takes care of faſhioning and weighing the King's Plate, and delivering it out by ſuch Warrants, as they receive from the Lord Chamberlain. When his Majeſty makes any Preſent of Plate, &c. they have the Charge of providing it, with ſome other things leſs material. The principal Officer is the Maſter of the Jewel-Office, whoſe Salary is 450*l. per ann.* and beſides, the Yeoman and Groom, at 106*l.* 15*s. per ann.* each, and a Clerk at 13*l.* 6*s.* 8*d.* which are in the King's Gift. Beſides, there are in this Office, in the Gift of the Lord Chamberlain, the Poet-Laureat, at 100*l. per ann.* Salary; the King's Hiſtoriographer, at 200*l. per ann.* the Hiſtory Painter, and Principal Painter, at 200*l. per ann.* the Painter in Enamel, and the Surveyor and Keeper of the Pictures at 200*l. per ann.* The Goldſmith and Jeweller are employ'd by the Maſter, and are uſually in his Gift.

JEWS-EAR; a kind of Fungus, Muſhroom, or ſpungy Subſtance, that grows about the Root of the Elder-Tree. It is chiefly uſed in Decoction, which is found Detergent and Vulnerary, and a good Gargle in ſore Throats.

JEZIDE, or *Jezidean*, a Term uſed among the Mahometans to ſignify an Heretic. *Leunclavius* tells us, that the Name is derived from an Emir call'd *Jezide*, who kill'd the two Sons of *Ali*, *Haſan* and *Huſſein*, two Nephews of *Mahomet* on their Mother's ſide, and perſecuted the Poſterity of the Prophet. The *Agarenians*, whoſe Emir or Prince he was, look'd on him as an Impious and Heretical Perſon; and hence took occaſion to call all whom they accounted Heretics, *Jezideans*. Some Authors mention the *Jezides* as a particular People, ſpeaking a Language different both from the *Turkiſh* and *Perſian*, tho' ſomewhat akin to the laſt. They further tell us, that there are two kinds of *Jezides*; the one Black, the other White. The White have no Slit in the Boſom of their Shirt; but barely an Opening for the Head to paſs thro': a thing that they obſerve with a great deal of ſtrictneſs, in memory of a Circle of Gold and Light which fell from Heaven upon the Neck of their Grand Scheik or Chief of their Sect. The Black *Jezides* are Fakirs, or Religious. The *Turks* and *Jezides* bear a ſtrong averſion to each other; and the greateſt Affront one can put on a *Turk*, is to call him *Jezide*. On the contrary the *Jezides* love the Chriſtians, being perſuaded that *Jezide*, their Chief, is Jeſus Chriſt: Or rather becauſe ſome of their Traditions mention that *Jezide* made an Alliance with the Chriſtians againſt the Muſſulmen. They drink Wine even to Exceſs when they can get it, and eat Swine's Fleſh. They never undergo Circumciſion, excepting when they are forced to it by the *Turks*. Their Ignorance is ſurprizing; they have no Books. Indeed they pretend to believe in the Goſpel, and in the Sacred Books of the Jews, but go without ever reading either one or other of 'em. They make Vows, and go in Pilgrimage; but have no Moſques, Temples, nor Oratories, no Feaſts nor Ceremonies; all their Religious Worſhip conſiſting in ſinging Hymns to Jeſus Chriſt, the Virgin, *Moſes*, and *Mahomet*. When they pray, they look towards the Eaſt, in imitation of the Chriſtians; whereas the Muſſulmen turn towards the South. They believe the Devil may poſſibly, one day, come into favour again with God; and that he is the Executor of God's Juſtice in the other World: for which reaſon they make it a Point of Conſcience not to ſpeak ill of him, leſt he ſhould revenge himſelf of 'em.

The Black *Jezides* are reputed Saints, and 'tis forbidden to weep at their Death; inſtead whereof, they make Rejoicings: and yet for the generality they are no more than Shepherds. They are not allow'd to kill the Animals they eat; that Office belongs to the White *Jezides*. The *Jezides* go in Companies like the *Arabs*. They often change their Habitations, and live in black Tents made of Goats-Hair, and encompaſs'd with large Ruſhes and Thorns interwoven. They diſpoſe their Tents in a Circle, placing their Flocks in the middle. They buy their Wives; the ſtated Price whereof is 200 Crowns, be they better or worſe. They are allow'd Divorce, provided it be to become Hermites. 'Tis a Crime among them to ſhave the Beard, tho' ever ſo little. They have ſome Cuſtoms which intimate that they ſprang originally out of ſome Sect of Chriſtians: for inſtance, in their Feaſts one of 'em preſents a Cup full of Wine to another, bidding him take the Cup of the Blood of Jeſus Chriſt; which laſt kiſſes the Hand of him who preſents it, and drinks.

IGNIS FATUUS. See *Jack with a Lantborn*.

IGNITION, in Chymiſtry, ſignifies the Application of Fire to Metals, till ſuch time as they become red-hot, without melting: which happens in Gold and Silver, but eſpecially in Iron. Lead and Tin are too ſoft and fuſible to bear *Ignition*.

IGNORAMUS is a Word uſed by the Grand Inqueſt, impannel'd in the Inquiſition of Cauſes Criminal, and Publick, and written upon the Bill, when they diſlike their Evidence, as defective or too weak to make good the Preſentment. The Effect of which is, that all farther Enquiry upon that Party for that Fault is thereby ſtopt, and he deliver'd without farther Anſwer.

IGNORANCE, or *Want of Knowledge*, is chiefly owing to theſe three Cauſes; *Firſt*, Want of Ideas; *Secondly*, Want of a diſcoverable Connection between the Ideas we have; *Thirdly*, Want of tracing and examining our Ideas. *Firſt*, There are ſome things we are ignorant of for want of Ideas. All the ſimple Ideas we have, are confined to the Obſervation of our Senſes, and the Operations of our own Minds, that we are conſcious of in ourſelves. What other Ideas it is poſſible other Creatures may have, by the aſſiſtance of other Senſes or Faculties, more or perfecter than we have, or different from ours, it is not for us to determine: but to ſay or think there are no ſuch, becauſe we conceive nothing of them, is no better an Argument, than if a blind Man ſhould be poſitive in it, there was no ſuch thing as Sight and Colours, becauſe he had no manner of Idea of any ſuch thing. What Faculties therefore other Species of Creatures have, to penetrate into the Nature and inmoſt Conſtitutions of Things, we know not: This we know, and certainly find, that we want other Views of them, beſides thoſe we have, to make Diſcoveries of them more perfect. The Intellectual and Senſible World are in this perfectly alike, that the Parts which we ſee of either of them, hold no proportion with that we ſee not; and whatſoever we can reach with our Eyes, or our Thoughts of either of them, is but a Point, almoſt nothing in compariſon of the reſt. Again, the Want of Ideas, which we yet ſeem capable of, is another great Obſtacle in our way, and keeps us in Ignorance of things, we conceive capable of being known. Bulk, Figure and Motion we have Ideas of; yet not knowing what is the particular Bulk, Motion, and Figure of the greateſt part of the Bodies of the Univerſe, we are ignorant of the ſeveral Powers, Efficacies and Ways of Operation, whereby the Effects we daily ſee are produced. Theſe are hid from us in ſome things, by being too remote, in others by being too minute. When we conſider the vaſt Extent of the known and viſible Parts of the World, and the Reaſons we have to think, that what lies within our Ken, is but a ſmall Part of the immenſe Univerſe; we ſhall then diſcover an huge Abyſs of *Ignorance:* What are the particular Fabricks of the great Maſſes of Matter, which make up the whole ſtupendous Frame of Corporeal Beings, how far they are extended, and what is their Motion, and how continued, and what influence they have upon one another, are Contemplations, that at firſt glimpſe our Thoughts loſe themſelves in. If we confine our Thoughts to this little Canton, this Syſtem of our Sun, and the groſſer Maſſes of Matter, that viſibly move about it; what ſeveral ſorts of Vegetables, Animals, and Intellectual Corporeal Beings, infinitely different from thoſe of our little Spot of Earth, may probably be in other Planets, to the knowledge of which, even of their outward Figures and Parts, we can no way attain, whilſt we are confin'd to this Earth, there being no natural Means, either by Senſation or Reflexion, to convey their certain Ideas into our Minds? There are other Bodies in the Univerſe no leſs conceal'd from us by their Minuteneſs. Theſe inſenſible Corpuſcles being the active Parts of Matter, and great Inſtruments of Nature, on which depend all their ſecondary Qualities and Operations, our Want of preciſe diſtinct Ideas of their primary Qualities keeps us in incurable *Ignorance* of what we deſire to know about them.

Did we know the mechanical Affections of Rhubarb or Opium, we might as eaſily account for their Operations of purging and cauſing Sleep, as a Watchmaker can for the Motions of his Watch. The diſſolving of Silver in *Aqua Fortis*, or Gold in *Aqua Regia*, and not *vice verſâ*, would be then perhaps no more difficult to know, than it is to a Smith, to underſtand, why the turning of one Key will open a Lock, and not the turning of another. But whilſt we are deſtitute of Senſes acute enough to diſcover the minute Particles of Bodies, and to give us Ideas of their mechanical Affections, we muſt be content to be ignorant of their Properties and Operations; nor can we be aſſured about them any farther, than ſome few Tryals we make, are able to reach: but whether they will ſucceed again another time, we cannot be certain. This hinders our certain Knowledge of univerſal Truths concerning natural Bodies; and our Reaſon carries us herein

very little beyond particular Matter of Fact; and therefore it is Matter of Doubt, that how far ſoever human Induſtry may advance uſeful and experimental Philoſophy in Phyſical Things, yet ſcientifical will ſtill be out of our reach; becauſe we want perfect and adequate Ideas of thoſe very Bodies which are neareſt to us, and moſt at our Command. This, at firſt ſight, ſhews us how diſproportionate our Knowledge is to the whole Extent, even of material Beings: to which, if we add the Conſideration of that infinite Number of Spirits that may be, and probably are, which are yet more remote from our Knowledge, and whereof we have no cognizance; we ſhall find this Cauſe of *Ignorance* conceals from us, in an impenetrable Obſcurity, almoſt the whole Intellectual World; a greater, certainly a more beautiful World, than the material: For abating ſome very few Ideas of Spirit, which we get from our own Mind by Reflection, and from thence the beſt we can collect of the Father of all Spirits, the Author of them, and us, and all things, we have no certain Information, ſo much as of the Exiſtence of other Spirits, but by Revelation; much leſs have we diſtinct Ideas of their different Natures, States, Powers, and ſeveral Conſtitutions, wherein they agree, or differ one from another, and from us: and therefore in what concerns their different Species and Properties, we are under an abſolute *Ignorance*.

The ſecond Cauſe of *Ignorance*, is the want of diſcoverable Connection between thoſe Ideas we have: where we want that, we are utterly incapable of univerſal and certain Knowledge, and are, as in the former Caſe, left only to Obſervation and Experiment. Thus the mechanical Affections of Bodies, having no Affinity at all with the Ideas they produce in us, we can have no diſtinct Knowledge of ſuch Operations beyond our Experience, and can reaſon no otherwiſe about them, than as the Effects or Appointment of an infinitely wiſe Agent, which perfectly ſurpaſs our Comprehenſions. The Operation of our Minds upon our Bodies is as unconceivable: How any Thought ſhould produce a Motion in Body, is as remote from the Nature of our Ideas, as how any Body ſhould produce any Thought in the Mind. That it is ſo, if Experience did not convince us, the Conſideration of the Things themſelves would never be able, in the leaſt, to diſcover to us. In ſome of our Ideas there are certain Relations, Habitudes, and Connections, ſo viſibly included in the nature of the Ideas themſelves, that we cannot conceive them ſeparable from them by any Power whatſoever; in theſe only we are capable of certain and univerſal Knowledge. Thus the Idea of a right-lined Triangle neceſſarily carries with it an Equality of its Angles to two right ones; but the Coherence and Continuity of the Parts of Matter, the Production of Senſation in us, of Colours and Sounds, *&c.* by Impulſe and Motion, being ſuch wherein we can diſcover no natural Connection with any Ideas we have, we cannot but aſcribe them to the arbitrary Will and Good-Pleaſure of the wiſe Architect. The Things that we obſerve conſtantly to proceed regularly, we may conclude do act by a Law ſet them; but yet by a Law we know not, whereby tho Cauſes work ſteadily, and Effects conſtantly flow from them, yet their Connections and Dependencies being not diſcoverable in our Ideas, we can have but an experimental Knowledge of them. Several Effects come every day within the notice of our Senſes, of which we have ſo far ſenſitive Knowledge; but the Cauſes, Manner, and Certainty of their Production, we muſt, for the foregoing Reaſons, be content to be ignorant of. In theſe we can go no further than particular Experience informs us of Matter of Fact, and, by Analogy, gueſs what Effects the like Bodies are upon other Trials like to produce. But as to perfect Science of natural Bodies (not to mention ſpiritual Beings) we are ſo far from being capable of any ſuch thing, that it may be reckoned loſt Labour to ſeek after it.

The third Cauſe of *Ignorance*, is our want of tracing thoſe Ideas we have, or may have; and finding out thoſe intermediate Ideas, which may ſhew us what Habitude of Agreement or Diſagreement they may have one with another: and thus many are ignorant of Mathematical Truths for want of Application, in enquiring, examining, and by due ways comparing thoſe Ideas. See *Knowledge*.

ILIAC, a Term in Phyſick, applied to a violent and dangerous Diſeaſe, called the *Iliac Paſſion*, or *Miſerere*. It conſiſts in an Expulſion of feculent Matter by the Mouth, accompanied with a Swelling of the lower Ventricle, an intenſe Pain, and a total Conſtipation. The immediate Cauſe of the *Iliac* Paſſion ſeems owing to an Irregularity in the Periſtaltic Motion of the Guts, *viz.* when it begins with the lower, and is continued to the higher. Other Cauſes are the Hardneſs of the Excrements, Inflammation of the Inteſtines, and their Engagement in the Anus or Scrotum, as it frequently happens in Hernia's, their twiſting, and their entering within one another. Perſons afflicted with the *Iliac Paſſion*, have ſometimes been found to return Suppoſitories and Glisters by the Month. Some have been cured of it by ſwallowing a great Quantity of Quick-ſilver, or a Muſket-Ball: When the Guts are twiſted, or enter one within another, the Weight of theſe Bodies ſometimes ſetting them to rights again. The *Iliac Paſſion* takes its Name from the Inteſtine *Ilion*, in regard of its being uſually affected in that Diſtemper, or perhaps from the *Greek* Verb ειλεῖν, *to turn, twiſt*; whence alſo the *Latins* call it *Volvulus*.

ILIAC VESSELS. See *Artery* and *Vein*.

ILIACUS EXTERNUS, or *Pyriformis*, is a Muſcle of the Thigh, which ariſes from the internal concave Part of the *Os Sacrum*, towards the bottom, and deſcending obliquely along the great Sinus of the *Os Ilium*, from a round fleſhy Origin, joins the *Glutæus Medius*, and is inſerted by a round Tendon at the Bottom of the Great Trochanter.

ILIACUS INTERNUS, the Name of the Muſcle of the Thigh, which ariſes fleſhy from the internal concave Part of the *Os Ilium*; and in its Deſcent over the inferior Part of it, joins with the *Pſoas magnus*, and is inſerted with it, under the Termination of the *Pectineus*. This, with the *Pſoas magnus*, moves the Thigh forward, in walking.

ILIAD, the Name of the firſt of *Homer*'s Poems. The Poet's Deſign in the *Iliad*, was to ſhew the *Greeks*, who were divided into ſeveral little States, how much it was their Intereſt to preſerve an Harmony and good Underſtanding among them. In order to which, he ſets before their Eyes, the Calamities that befel their Anceſtors from the Wrath of *Achilles*, and his Miſunderſtanding with *Agamemnon*, and the Advantages that accrued to them from their Union. The *Iliad* is divided into twenty four Books, which are marked with the Letters of the Alphabet. *Pliny* gives us an Account of an *Iliad* written on ſo very ſlender a Paper, that the whole might be contained in a Nut-ſhell. For the Conduct of the *Iliad*, ſee F. *Boſſu*, Madam *Dacier*, and M. *de la Motte*. The Critics maintain the *Iliad* to be the firſt, and yet the beſt Poem that ever appeared in the World. *Ariſtotle*'s Poetics are almoſt taken wholly from it; the Philoſopher had nothing to do but to form Precepts from the Poet's Practice. Some Authors tell us, that *Homer* invented not only Poetry, but all other Arts and Sciences; and that there are the viſible Marks of a perfect Knowledge in every one of them, to be ſeen in the *Iliad*. The ingenious Mr. *Barnes* of *Cambridge* had prepared a Work for the Preſs, to prove *Solomon* to have been the Author of the *Iliad*. The word is derived from the *Greek* ἰλιάς, of ἴλιον, *Ilium, Troy*, a famous City in *Aſia*, which the *Greeks* beſieged for the ſpace of ten Years, and at laſt deſtroyed, on account of the Rape of *Helena*, which makes the Subject of the Work.

ILIUM. See *Inteſtines*.

ILIUM OS. See *Oſſa Innominata*. Theſe are both derived from εἰλέω, *circumvolvo, to roll about*; becauſe the Gut, which is principally called by this Name, is long, and lies in Folds towards the bottom of the Abdomen, and therefore gives many of the adjacent Parts theſe Appellations.

ILLEVIABLE in Law, ſignifies ſomething that cannot be levied, and therefore the word *Nihil* is ſet on a Debt or Due that is illeviable.

ILLUMINATION, the Action of a luminous Body, or Body that emits Light, or the Paſſion of an opake Body that receives it.

ILLUMINED, a Church-Term, antiently applied to ſuch Perſons as had received Baptiſm. This Name was occaſioned by a Ceremony in Baptiſm, which conſiſted in putting a lighted Taper in the Hand of the Perſon baptized, as a Symbol of the Faith and Grace he had received in the Sacrament.

ILLUMINED, is alſo the Name of a Sect of Hereticks, who ſprang up in *Spain* about the Year 1575, and called by the *Spaniards*, *Alumbrados*. Their Leaders were *Villalpando*, a Prieſt, originally of the *Iſle of Tenarif*, and a Carmelite called *Catherine de Jeſus*. Theſe had a great Number of Diſciples and Followers, moſt of whom were apprehended, and clapp'd up in the Inquiſition at *Cordoua*; ſome whereof were put to death, and the reſt abjured their Errors. Their principal Doctrines were, That by means of a ſublime manner of Prayer, which they had attained to, they entered into ſo perfect a State, that they had no occaſion for Ordinances, Sacraments, nor good Works, and that they could give way, even to the vileſt Actions without Sin. The Sect of *Illumined* was revived in *France* in the Year 1634, and were ſoon after joined by the *Guerinets*, or Diſciples of *Peter Guerin*, who together, made but one Body, called alſo *Illumined*; but they were ſo hotly purſued by *Louis* XIII.

that

that they were ſoon deſtroyed. The Brothers of the Roſy-Croſs are alſo called *Illumined.*

ILLUSTRIOUS, heretofore in the *Roman* Empire was a Title of Honour peculiar to People of a certain Rank. It was firſt given to the moſt diſtinguiſhed among the Knights, who had a right to bear the *Latus Clavus*, afterwards they were entitled *Illuſtrious*, who held the firſt Rank among thoſe called *Honorati* ; that is, to the *Præfecti Prætorii*, the *Præfecti Urbis*, *Treaſurers*, *Comites*, &c. There were, however, different Degrees among the *Illuſtres* : As in *Spain* they have Grandees of the firſt and ſecond Claſs, ſo in *Rome* they had their *Illuſtres*, whom they called *Great*, *Majores*, and others *Leſs*, called *Minores*. For inſtance, the *Præfectus Prætorius* was a Degree below the Maſter of the Offices, tho' they were both *Illuſtres*. The Novel of *Valentinian* diſtinguiſhes as far as five kinds of *Illuſtres*, among whom the *Illuſtres Adminiſtratores* bear the firſt Rank.

IMAGE, a natural, lively Repreſentation of an Object, oppoſed to a ſmooth well-poliſhed Surface. The *Latin* word *Imago*, comes originally from the *Greek* μιμεῖσθαι, *imitari*. *Image* alſo ſignifies any artificial Repreſentation performed by Man, as in Painting, Sculpture, and the like: In which ſenſe, the word is now generally uſed in ſpeaking of Things holy, or Things imagined to be ſo.

The Uſe, and Adoration of Images, are Things that have been a long time controverted in the World. The *Lutherans* condemn the *Calviniſts*, for breaking the Images in the Churches of the Catholics, looking on it as a kind of Sacrilege ; and yet they condemn the *Romaniſts*, (who are profeſſed Image-worſhippers) as Idolaters : nor can theſe laſt keep pace with the *Greeks*, who go far beyond them in this Point, which has occaſioned abundance of Diſputes among them. The *Jews* abſolutely condemn all *Images*, and don't ſo much as ſuffer any Statues or Figures in their Houſes, much leſs in their Synagogues, or Places of Worſhip. The *Mahometans* have a perfect Averſion to *Images*, which was what led them to deſtroy moſt of the beautiful Monuments of Antiquity, both Sacred and Profane, at *Conſtantinople*.

The noble *Romans* preſerved the *Images* of their Anceſtors with a great deal of Care and Concern, and had them carried in Proceſſion at their Funerals and Triumphs. They were commonly made of Wax or Wood, tho' ſometimes of Marble or Braſs : They placed them in the Veſtibles of their Houſes, and they were to ſtay there, even if the Houſes happened to be ſold : it being accounted impious to diſplace them. *Appius Claudius* was the firſt who brought them into the Temples, in the Year of *Rome* 259, and he added Inſcriptions to them, ſhewing the Origin of the Perſons repreſented, and their brave and vertuous Atchievements. It was not, however, allowed for all, who had the Images of their Anceſtors in their Houſes, to have them carried at their Funerals ; this was a thing only granted to ſuch as had honourably diſcharged themſelves of their Offices, for thoſe who failed in this reſpect forfeited that Privilege, and in caſe they had been guilty of any great Crime, their *Images* were broken in pieces.

IMAGE, *in Philoſophy*, ſignifies the Trace or Mark which outward Objects impreſs on the Mind, by means of the Organs of Senſe. *Image*, in Opticks, ſignifies an Object projected on the Baſe of a Convex-Mirror. As the Diſtance of the Object from the Mirror, is to the Diſtance from the *Image* to the Glaſs ; ſo is the Diameter of the Object, to the Diameter of the *Image*. This is a Rule which Mr. *Molyneux* gives us for finding the Diameter of an *Image* on the Baſe of a Convex-Glaſs. See *Optics*. *Image* alſo ſignifies the Deſcription of any thing in a Diſcourſe.

IMAGES, *in Diſcourſe*, are defined, by *Longinus*, to be, in general, any Thoughts proper to produce Expreſſions, and which preſent a kind of Picture to the Mind. But, in the more limited Senſe, he ſays, *Images* are ſuch Diſcourſes as come from us, when by a kind of Enthuſiaſm, or an extraordinary Emotion of the Soul, we ſeem to ſee the Things whereof we ſpeak, and preſent them before the Eyes of thoſe who hear.

IMAGES, *in Rhetoric*, have a very different Uſe from what they have among the Poets ; the End principally propoſed in Poetry is Aſtoniſhment and Surprize, whereas the thing chiefly aimed at in Proſe, is to paint things naturally, and to ſhew them clearly. They have this, however, in common, that they both tend to move, each in its kind. Theſe *Images*, or *Pictures*, are of vaſt uſe, to give Weight, Magnificence, and Strength to a Diſcourſe. They warm and animate a Diſcourſe, and when managed with Art, according to *Longinus*, ſeem, as it were, to tame and ſubdue the Hearer, and put him in the power of the Speaker.

IMAGINATION, a Power or Faculty of the Soul, by which it conceives, and forms Ideas of Things, by means of certain Traces and Impreſſions that had been before made in the Fibres of the Brain, by Senſation. The Organs of our Senſes are compoſed of little Threads, or Fibres, which, at one end, terminate in the outward Parts of the Body and Skin, and at the other in the middle of the Brain. Theſe little Fibres may be moved two ways ; either beginning at that end which terminates in the Brain, or that which terminates without. Now the Agitation of theſe Fibres cannot be communicated to the Brain, but the Soul will perceive ſomething. If then the Agitation begins where Objects make their firſt Impreſſion, *viz.* on the external Surface of the Fibres of our Nerves, and is communicated thence to the Brain, the Soul, in that Caſe, judges that what ſhe perceives is without, that is, ſhe perceives an Object as preſent : but if only the interior Fibres be moved by the Courſe of the animal Spirits, or in ſome other manner, the Soul then imagines, and judges, that what ſhe perceives is not without, but within the Brain ; that is, ſhe perceives an Object as abſent : And herein lies the Difference between Senſation and *Imagination*.

But in order to give a more preciſe and diſtinct Idea of the *Imagination*, it muſt be obſerved, that as often as there happens to be any Alteration in that part of the Brain where the Nerves terminate, there alſo happens an Alteration in the Brain ; that whenever there is any Motion in that part, to change the Order of its Fibres, there alſo happens a new Perception in the Soul, and ſhe finds ſomething new, either by way of Senſation or *Imagination* ; neither of which can be without an Alteration of the Fibres in that part of the Brain. So that the Faculty of *Imagining*, or *Imagination*, only conſiſts in the Power which the Soul has of forming Images of Objects, by producing a Change in the Fibres of that part of the Brain, which may be called the principal Part, becauſe it correſponds to all the Parts of our Body, and is the Place where the Soul (if it may be ſo ſaid) immediately reſides. It matters not which that Part is, nor whether the Opinion of *Willis* be true, who places the common Senſe in the two Bodies, called *Corpora Striata*, and the *Imagination* in the *Corpus Calloſum* ; or that of *Fernelius*, who places Senſation in the *Pia Mater*, that encompaſſes the Subſtance of the Brain ; or that of *Deſcartes*, who places it in the Pineal Gland : it ſuffices that there is ſome ſuch Part.

Since then the *Imagination* only conſiſts in a Power which the Soul has of forming Images of Objects, by impreſſing them on the Fibres of the Brain, it follows, that the larger and more diſtinct the *Veſtigia*, or Tracks of the animal Spirits, which are the Lines or Strokes, as it were, of thoſe Images, are, the more ſtrongly and diſtinctly the Soul imagines thoſe Objects. Now as the Breadth, Depth, and Cleanneſs of the Strokes of a Graving depend on the Force wherewith the Graver acts, and the Obedience which the Copper yields ; ſo the Depth and Cleanneſs of the Tracks of the *Imagination* depend on the Force of the animal Spirits, and the Conſtitution of the Fibres of the Brain ; and it is that Variety which is found in thoſe two things, to which we owe almoſt all that vaſt Difference which we obſerve in Peoples Minds. Thus, on the one ſide are Abundance and Scarcity, Briskneſs and Slowneſs, Largeneſs and Smallneſs of the animal Spirits ; and on the other hand Delicacy or Groſſneſs, Humidity or Dryneſs, Stiffneſs or Flexibility of the Fibres of the Brain ; and, laſtly, a particular Relation which the animal Spirits may have with thoſe Fibres. From the various Combinations of which Things, will reſult a ſufficiently great Variety, to account for all the different Characters which appear in the Minds of Men : and from the ſame Principle flows that Difference which is obſerved in the ſame Perſon's Mind, at different Times, and under different Circumſtances, as in Childhood, Manhood, and Old Age, in Sickneſs, Health, &c. See *Animal Spirits*. It may here be obſerved, that the Fibres of the Brain are much more agitated by the Impreſſion of Objects, than by the Courſe of the animal Spirits ; and for this reaſon the Soul is more affected with Objects, which it perceives by Senſation, and which it looks on as preſent, and capable of giving it Pleaſure or Pain, than by thoſe perceived by *Imagination*, which it judges to be diſtant. And yet it ſometimes happens, that in Perſons, whoſe animal Spirits are extremely agitated by Faſting, Waking, Drinking, a Fever, or ſome violent Paſſion, theſe Spirits move the inward Fibres of the Brain as forcibly as outward Objects do ; ſo that thoſe Perſons perceive things by Senſation, which they ſhould only perceive by *Imagination* ; for *Imagination* and *Senſation* only differ from each other, as the greater from the leſs. See Father *Malebranch*, *Recher. de la Verité*, *lib. 2.*

IMAM or IMAN : A Miniſter in the *Mahometan* Church anſwering to a Vicar among us. The Word properly ſignifies Prelate, or Chief ; but the Muſſulmen frequently

apply

apply it to a Perſon who has the Care and Intendancy of a Moſque, who is always there the firſt, and reads Prayers to the People, which they repeat after him.

The word *Imam* is alſo applied by way of Excellence to the four Chiefs, or Founders of the four principal Sects in the *Mahometan* Religion. Thus *Ali* is the *Imam* of the *Perſians*, or of the Sect of *Schiaiens*; *Abu-beker* the *Imam* of the *Sunniens*, which is the Sect follow'd by the *Turks*. *Saphii* or *Safi-y*, the *Imam* of another Sect, *&c.* The *Mahometans* don't agree among themſelves about the *Imamat* or Dignity of the *Imam*. Some think it of divine Right, and attach'd to a ſingle Family, as the Pontificate of *Aaron*. Others hold, that it is indeed of divine Right, but deny it to be ſo attach'd to any ſingle Family, as that it may not be transfer'd to another. They add, that the *Imam* is to be clear of all groſs Sins, and that otherwiſe he may be depoſed, and his Dignity confer'd on another. However this be, 'tis certain that after an *Imam* has once been own'd as ſuch, by the Muſſulmen, he who denies that his Authority comes immediately from God, is accounted impious; he who does not obey him, a Rebel; and he who pretends to contradict what he ſays, a Fool, among the orthodox of that Religion.

IMBARGO, a Stop or Stay put upon Ships uſually by public Authority.

IMBECILITY, is a State of Languor, or Decay, wherein the Body is not able to perform its uſual Exerciſes or Functions.

IMBEZZLE, to waſte, ſcatter and conſume; as where a Perſon intruſted with Goods, waſtes and diminiſhes them, he is ſaid to *imbezzle* them.

IMBIBE, is uſed commonly in the ſame Senſe as *abſorb*; as where a dry porous Body takes up another that is moiſt.

IMBRICATED, is uſed by ſome Botaniſts to expreſs the Figure of the Leaves of ſome Plants, which are hollow like an *Imbrex*, or Gutter Tile.

IMITATION, in Muſic, is where one Party imitates the ſinging of another either throughout the whole Piece, which is one of the Kinds of Canon, or only during ſome Meaſures, which is a ſimple *Imitation*. Sometimes the Motion or the Figure of the Notes, alone, is imitated; and that, ſometimes even by a contrary Motion, which makes what they call a Retrograde *Imitation*. The *Imitation* differs from the Fugue, in regard, in the former the Repetition muſt be a 2d, a 3d, a 6th, 7th, or 9th, either above or below the firſt Voice: Whereas were the Repetition to an Uniſon a 4th, 5th, or 8th, it would be a Fugue.

IMMACULATE, *without Stain or Sin:* A Term much uſed among the *Romaniſts*, when ſpeaking of the Conception of the Bleſſed Virgin, they call it *immaculate:* intimating that ſhe was free from Original Sin. When the Cap is given to a Doctor of the *Sorbonne*, he is obliged to ſwear that he will defend the *immaculate* Conception. This was decreed by an Act of the *Sorbonne* in the 14th Century; in imitation of which, 80 other Univerſities made the ſame Order. The Military Orders in *Spain* are all ſolemnly obliged to defend this Prerogative of the Virgin. See *Conception*.

Congregation of the Immaculate Conception. In moſt Nunneries there is a Society of ſecular Maids, whoſe End is to honour the *immaculate* Conception: Of which they make a public Proteſtation every Year, and a private one every Day.

IMMANENT: A Term in Logic. The Schoolmen diſtinguiſh two kinds of Actions; the one tranſitory, which paſs from the Agent to the Patient; the other *immanent*, which continue in the Agent.

IMMATERIAL, ſomething devoid of Matter; or that is pure Spirit. Thus God, Angels, the Human Soul, are *immaterial* Beings. *Plato* argues the *Immateriality* of the Soul from theſe ſix Topics. 1. From its Simplicity. 2. From its Independency on the Body, which is two-fold; in its *Eſſe* and its *Operare*, in exiſting, and in acting or operating ſeparately. 3. From its Rule and Authority over the Body. 4. From its Likeneſs and Similitude to God, which diſcovers itſelf in the Pleaſure it enjoys in ſpiritual Things, in its aiming at ſpiritual Objects, *&c.* 5. From its ſpiritual Manner of perceiving material Objects. Laſtly, From its Indiviſibility, Capacity, Activity, Immortality, *&c.*

IMMEDIATE, that which precedes or follows ſome other thing without any Interpoſition.

IMMEDIATE, alſo ſignifies ſomething that acts without Means, without Medium, as *immediate* Grace, an *immediate* Cauſe, *&c.* There have been great Diſputes among Divines about *immediate* Grace. The queſtion in debate was, Whether Grace acted on the Heart and Mind by an *immediate* Efficacy, independent of all external Circumſtances; or, Whether a certain Aſſemblage and Improvement of Circumſtances join'd to the Miniſtery of the Word, might produce a Converſion of Soul.

IMMEMORIAL, an Epithet given to the Time or Duration of any thing, whoſe Beginning we know nothing of: in a legal Senſe, a thing is ſaid to be of Time *immemorial*, or Time out of mind, that was before the Reign of our King *Edward* II.

IMMENSE, is that whoſe Amplitude or Extenſion no Finite Meaſure whatſoever, or how oft ſoever repeated, can equal.

IMMERSION, an Action by which any thing is plunged into Water or other Fluid. In the firſt Ages of Chriſtianity, Baptiſm was performed by *Immerſion*; by three *Immerſions*. The Cuſtom of *Immerſion* is ſtill preſerved in *Portugal*, and among the Anabaptiſts in other Parts. *Immerſion*, in Pharmacy, is a Preparation of ſome Medicine, by letting it ſteep for ſome time in Water, in order to take ſome ill Faculty or Taſte from it: as is done in Rhubarb, to moderate its Force; in Lime, to take away its Salt; and in Olives, which are preſerved in Brine.

IMMERSION, in Aſtronomy, is when a Star or Planet is ſo near the Sun with regard to our Obſervations, that we cannot ſee it; being as it were envelop'd and hid in the Rays of that Luminary. *Immerſion* is alſo the Beginning of an Eclipſe of the Moon; that is, the moment when the Moon begins to be darkned, and to enter into the Shadow of the Earth. And the ſame Term is uſed with regard to an Eclipſe of the Sun, when the Disk of the Moon begins to cover it. Emerſion is the Term oppoſite to *Immerſion*, and ſignifies the moment wherein the Moon begins to come out of the Shadow of the Earth; or the Sun begins to ſhow the Parts of his Disk which were hid before. *Immerſion* is frequently applied to the Satellites of *Jupiter*, and eſpecially to the firſt Satellite; the Obſervation whereof is of ſo much Uſe for diſcovering the Longitude. The *Immerſion* of that Satellite is the moment in which it appears to enter within the Disk of *Jupiter*; and its Emerſion the moment wherein it appears to come out. The *Immerſions* are obſerved from the Time of the Conjunction of *Jupiter* with the Sun, to the Time of his Oppoſition: And the Emerſions from the Time of his Oppoſition to his Conjunction. The peculiar Advantage of theſe Obſervations, is, that during eleven Months of the Year, they may be made, at leaſt, every other Day. The Perfection of this Theory, and the Praxis thereon, we owe to M. *Caſſini*.

IMMORTAL, that which will laſt to all Eternity, that has in itſelf no Principle of Alteration or Corruption. Thus God and the Human Soul are *immortal*. *Plato* defines *Immortality*, ἀΐδια ἐμψυχοῦ τῆ αἰδίῳ μονῆ, *animated Eſſence and eternal Manſion*; and proves the *Immortality* of the Soul from two kinds of Arguments; the one Artificial, the other Inartificial. Inartificial Arguments are Teſtimonies and Authorities, whereof he cites ſeveral, and adds in general, that all the great Men and Poets, who had any thing divine in 'em, aſſerted the *Immortality* of the Soul. His Artificial or proper Arguments are either ſpeculative or practical: Of the firſt kind are thoſe drawn, 1. From the ſimple, uniform, ſpiritual and divine Nature of the Soul. 2. From its infinite Capacity. 3. From its deſiring and longing after *Immortality*, and its inward Horror of falling into Nothing; proving it abſurd that the Soul ſhould die, when Life is its proper and adequate Object. 4. From its rational Activity; proving that whatever has in itſelf a Principle of rational and ſpontaneous Motion, by which it tends towards ſome ſupreme Good, is immortal. 5. From the various Ideas which it has of ſpiritual things; particularly from the Idea it has of *Immortality*. 6. From its Immateriality. His practical or moral Arguments for the *Immortality* of the Soul, are drawn, 1. From the Juſtice of God, which can never ſuffer the Wicked to eſcape unpuniſhed, nor the Good unrewarded after Death. 2. From that Dependance which Religion has on this Opinion, in regard, without this Perſuaſion there would be no Religion in the World. 3. From the Opinion which Men have, that Juſtice and every kind of Virtue are to be cultivated, that they may at laſt live with God. 4. From the Stings of Conſcience, and anxious Sollicitude we are under about a future State.

IMMUNITY, a Privilege or Exemption from ſome Office, Duty, or Impoſition: It is particularly underſtood of the Liberties granted to Cities and Communities. The Princes heretofore granted all kind of *Immunities* to Eccleſiaſtics, exempting them from all Impoſitions; but the Eccleſiaſtics of thoſe Days were not ſo rich as thoſe of ours: They gave all they had to the Poor. There is ſtill a Privilege of *Immunity* in ſome Places, and eſpecially in *Italy*, belonging to Eccleſiaſtical Things and Perſons; theſe are exempted from certain Dues, and are ſhelter'd from the Purſuits of Juſtice. Tho, there are ſome Crimes for which they cannot plead the Privileges of *Immunity*, as premeditated Murder *&c.*

IMMUTABILITY, the Condition of ſomething that cannot change. *Immutability* is one of the Divine Attributes.

butes. There is a two-fold *Immutability* in God; a Phyſical and a Moral one. The Phyſical *Immutability* conſiſts in this, that the Subſtance of God does not, nor cannot receive any Change or Alteration. His Moral *Immutability* conſiſts in his not being liable to any Change in his Thoughts, or Deſigns; but that what he wills, he has will'd from all Eternity.

IMPALED, when the Coats of Arms of a Man and his Wife (who is not an Heireſs) are borne in the ſame Eſcutcheon, they muſt be marſhalled in Pale, *i. e.* the Huſband's on the Right-ſide, and the Wife's on the Left; and this the Heralds call *Baron and Femme*, two Coats impaled. If a Man hath had two Wives, he may impale his Coat in the middle between theirs; and if he hath had more than two, they are to be marſhalled on each ſide of his, in their proper Order.

IMPALPABLE, that, whoſe Parts are ſo extremely minute, that they cannot be diſtinguiſh'd by the Senſes, particularly by that of Feeling.

IMPANATION, a Term uſed among Divines to ſignify the Opinion of the *Lutherans* with regard to the Euchariſt; who believe, that the Species of Bread and Wine do remain, together with the Body of our Saviour, after Conſecration.

IMPARLANCE, or *Emparlance*, is a Motion made in Court, on the account of the Demandant by the Tenant, or Declaration of the Plaintiff by the Defendant, whereby he craveth Reſpite, or any other Day to put in his Anſwer.

Imparlance is either general or ſpecial. Special is with this Clauſe, *Salvis omnibus Advantagiis, tam ad Juriſdictionem Curiæ, quam breve & Narrationem.* General is made at large, without inſerting that, or any like Charge.

IMPASSIBLE, that which is exempt from Suffering, which cannot undergo Pain or Alteration. The *Stoics* place the Soul of their Wiſe Man in an *impaſſible* imperturbable State.

IMPASTATION, a Work of Maſonry, made of Stuc, or Stone beaten and wrought up in manner of a Paſte. Authors are of opinion that the Obelisks, and the huge Antique Columns ſtill remaining, were made ſome by *Impaſtation*, and others by Fuſion.

IMPEACHMENT *of Waſte*, comes from the *French Empeſchement*, Impediment, and ſignifies a Reſtraint from committing of Waſte upon Lands and Tenements. And therefore he that hath a Leaſe without *Impeachment of Waſte*, hath by that, a Property or Intereſt given him in the Houſes and Trees, and may make waſte in them without being called to account for it.

IMPECCABILITY, the State of a Perſon who cannot ſin. The Word alſo ſignifies the Grace, Privilege, or Principle which puts him out of a condition of ſinning. The Schoolmen diſtinguiſh ſeveral kinds and degrees of *Impeccability:* That of God belongs to him by Nature: That of Jeſus Chriſt conſider'd as Man, belongs to him by the Hypoſtatical Union: That of the Bleſſed is a Conſequence of their Condition: That of Men is the Effect of a Confirmation in Grace, and is rather called Impeccance than *Impeccability*; accordingly the Divines diſtinguiſh between theſe two, this being found neceſſary in the Diſputes againſt the *Pelagians*, in order to explain certain Terms in the *Greek* and *Latin* Fathers, which without this Diſtinction are eaſily confounded.

IMPENETRABILITY, Quality of that which cannot be pierced or penetrated; a Property of Body which ſo fills up a certain Space, as that there is no room in it, for any other Body. Dr. *Harris* defines *Impenetrability*, the Diſtinction of one extended Subſtance from another, by means whereof the Extenſion of one thing is different from that of another: ſo that two extended things cannot be in the ſame place, but muſt neceſſarily exclude each other. See *Solidity*.

IMPENITENCE, a Hardneſs of Heart, which makes a Perſon perſevere in Vice, and prevents his Repentance. Final *Impenitence* is the Sin againſt the Holy Ghoſt, which is neither pardoned in this Life nor that to come.

IMPERATIVE, in Grammar, is one of the Modes or Manners of Conjugating a Verb, ſerving to expreſs a Commandment; as *Go, Come*, &c. In the *Hebrew* and other Oriental Languages, the Future Tenſe has frequently an *Imperative* Signification.

IMPERFECT TENSE, in Grammar, ſignifies an indefinite Time between the preſent and the paſt: as, *I taught, I heard.*

IMPERFECT FLOWERS, are thoſe which have ſome Defects, and either want the *Petala*, the little Leaves which ſtand round the *Flowers*, or the like.

IMPERFECT NUMBERS, in Arithmetic, are thoſe whoſe aliquot Parts taken together, don't make the juſt *Number* itſelf, but either come ſhort of it; in which caſe they are called *deficient Numbers*; or exceed it, and then they are called *abundant Numbers.*

IMPERFECT PLANTS, among the Botaniſts are ſuch as either really want Flower, and Seed, or are ſuppoſed to want them; ſince no Flower or Seed hath yet been diſcover'd to belong to the greateſt part of them. Theſe Mr. *Ray* diſtinguiſhes according to the Place of their Growth, into,

(1.) Aquatics, or ſuch as grow in the Water: and that either, 1. In the Sea, and then they are called *Marine Plants*; and thoſe are either of an hard and ſtony Conſiſtence, as the Corals, Corallines; or Porous, that is, of a more ſoft and herbaceous one. Of theſe ſome are like Herbs, and are of two kinds; the greater, which are Cauliferous, as the Fucus; the leſſer, as the Alga: the others are more of the Muſcus, or Fungus Appearance, as the Spongia. 2. Freſh Water *Plants*, and thoſe have either no Leaves, but are Capillaceous, as the Confervæ; or their Leaves divided into three Parts, as the *Lens Paluſtris, Lenticula.*

(2.) Such *imperfect Plants* as grow in dry Ground, he divides into, Firſt, Such as have Subſtance, either woody or fleſhy; and theſe have ſcarce any thing common to the *perfect Plants*, neither the green herbaceous Colour, nor the Texture of Herbs, nor Flower, Seed, nor Leaf, properly ſpeaking, as all the Fungi, which are, 1. Such as grow on Trees, and therefore called Arboreous, as the *Fungus Laricis*, called Agarick, and the *Fungus Sambuci*, which we call Jews-Ear. 2. Terreſtrial, and theſe are either Cauliferous, with Heads either lamellated, or poroſe underneath, or without Stalks, as the *Pezicæ* of *Pliny*, and *Fungus Pulverulentus, Crepitus Lupi*, or common Puff-Balls. 3. Subterraneous, as the *Tuberæ Terræ*, or Truffles. Secondly, Such as have a more ſoft and dry Conſiſtence, and more like that of Herbs; of which ſome are both cauliferous and branched, as the *Muſci*, or Moſſes: Others are without Stalks, adhering like a Cruſt to the Surface of the Earth, Stones, Trees, or Wood; as the *Lichen Terreſtris* and *Arboreus.*

IMPERIAL, ſomething belonging to the Empire; thus we ſay, his *Imperial* Majeſty, the *Imperial* Crown, *&c.*

Imperial Cities in *Germany* are thoſe which own no other Head but the Emperor. Theſe are a kind of little Commonwealths, the chief Magiſtrate whereof does Homage to the Emperor, and pays him the *Roman* Month; but in other reſpects, and in Adminiſtration of Juſtice, he is Sovereign. *Imperial* Cities have a Right of Coining Money, and of Keeping Forces and fortified Places. Their Deputies aſſiſt at the *Imperial* Diets, where they are divided into two Branches, that of the *Rhine*, and that of *Suabia.* There were formerly 22 in the former, and 37 in the latter; but there are now only 48 in all.

Imperial Chamber is a Sovereign Court, eſtabliſh'd for the Affairs of the immediate States of the Empire.

Imperial Diet, is an Aſſembly or Convention of all the States of the Empire. It is uſually held at *Ratisbon*; where the Emperor, either in Perſon, or by his Commiſſioner, the Electors, Secular and Eccleſiaſtical Princes, Prelates, Princeſſes, Counts, and Deputies of *Imperial* Cities, aſſiſt. The *Diet* is divided into three Colleges, which are thoſe of the Electors, the Princes, and the Cities. The Electors alone form the firſt; the ſecond conſiſts of Princes, Prelates, Princeſſes, and Counts; and the third of the Deputies of *Imperial* Cities. Each College has its Director, who preſides in the Conſultations. The Elector of *Mentz* in the College of Electors; the Archbiſhop of *Saltzbourg* in that of the Princes; and the Deputy of the City of *Cologne* in that of the Cities. In the *Diet*, each Principality has a Voice; but all the Prelates (ſo they call the Abbots and Provoſts of the Empire) have but two Voices, and all the Counts but four. Tho the three Colleges agree, yet the Emperor has a negative Voice: when he too conſents, the Reſolutions paſs into a Law, which oblige all the States of the Empire, both mediate, and immediate.

IMPERSONAL, Verb in Grammar, is ſuch an one, as is only uſed in the third Perſon Singular; as *Oportet, Licet*, &c.

IMPERVIOUS, expreſſes ſuch a Cloſeneſs of Pores, or particular Configuration of Parts, as will not admit another thro'.

IMPETIGO, is a Cutaneons Foulneſs, divided into many kinds by the Antients; but a better Knowledge in Secretion, and the Office of the Cutaneous Glands, has taught us the Cure of all ſuch Diſorders, without having any neceſſary Recourſe to ſuch Diſtinctions: The Itch and Leproſy take in the ſeveral kinds, from the moſt eaſy to the moſt obſtinate degree of Infection, according to which the Means of Cure are proportioned.

IMPETRATION, an obtaining by Requeſt or Prayer; this Word is uſed in our Statutes for the pre-obtaining of Benefices and Church-Offices in *England* from the Court of *Rome*, which did belong to the Diſpoſal of the King and other Lay-Patrons of the Realm; the Penalty whereof was the ſame with Proviſors, 25 *E.* 3.

IMPING, is a Term uſed in Falconry, and ſignifies the inſerting of a Feather in the Wing of a Hawk, in the place of one that is broke.

IMPLANTATION: One of the ſix kinds of Tranſplantation; uſed by ſome People for the Cure of certain Diſeaſes. *Implantation* is performed by placing Plants, or at leaſt the Roots of Plants, in a Ground prepared for that purpoſe, and water'd with what the Patient uſed to waſh himſelf withal. By which means 'tis pretended the Diſeaſe is tranſlated into the Plant. If the Plant happen to die before the Cure be perfected, by reaſon of the ill Qualities it imbibes, other Plants muſt be placed inſtead of it, and the Proceſs be continued as in the firſt.

IMPLEAD, from the *French Plaider*, to ſue, arreſt, or proſecute by Courſe of Law.

IMPLEMENTS, comes either from the *French* Word *Employer*, to employ, or the *Latin Impleo*, to fill up; and is uſed for all things neceſſary for a Trade, or the Furniture of an Houſhold: in which Senſe we frequently find it uſed in Wills, and Conveyances of Moveables.

IMPLICITE, ſomething tacitly comprized or underſtood; that is, contain'd in a Diſcourſe, Clauſe, or Propoſition, not in expreſs Terms, but only by Induction and Conſequence. The Word is derived from the *Latin Plico*, I fold.

IMPLY a Contradiction; a Term uſed among Philoſophers to ſignify the Object of Divine Omnipotence. Thus we ſay, God can do every thing that does not *imply* a Contradiction proceeding from God: By which is not meant a Reſpect of the Action to the Executive Power of God; for God by this Power could do whatever does not *imply* a Contradiction proceeding from this Power, which would be to ſay, that God can do what he can do. In that Propoſition therefore is intended a Reſpect to the other Attributes and ſimple Perfections of God. Thus God can do whatever does not *imply* a Contradiction to ſome other of his Attributes. For inſtance, he cannot atteſt a falſe Religion by his Word, or by Miracle, becauſe this is repugnant to his Goodneſs and Truth. But becauſe all things that *imply* a Contradiction, cannot be ſaid to have ſuch a Reſpect to the Attributes of God; therefore we may ſay more generally, that thoſe things *imply a Contradiction*, which involve a Contrariety from the Terms or Object. For there are two things requiſite to the Being of any thing; the one on the ſide of the Agent, *viz.* a Power of Acting; the other on that of the Patient or Object, *viz.* a Non-reſiſtance. For want of the firſt Condition, there are a thouſand things which we cannot do; and for want of the ſecond Condition, there are many things that God cannot do: for that which, when it is affirmed, is yet denied, is impoſſible.

IMPORTATION, is the importing or bringing in of Merchandizes from foreign Countries.

IMPOSITION OF HANDS, an Action by which the Evangelical Miſſion, and the Power of Abſolving, is convey'd. *Impoſition of Hands* was a *Jewiſh* Ceremony, introduced, not by any Divine Authority, but by Cuſtom; it being the Practice among thoſe People, whenever they pray'd to God for any Perſon, to lay their Hands on his Head. Our Saviour obſerv'd the ſame Cuſtom, both when he conferred his Bleſſing on Children, and when he cured the Sick; adding Prayer to the Ceremony. The Apoſtles likewiſe *laid Hands* on thoſe whom they beſtow'd the Holy Ghoſt on. The Prieſts obſerved the ſame Cuſtom when any one was received into their Body. And the Apoſtles themſelves underwent the *Impoſition of Hands* a-freſh, every time they entred upon any new Deſign. In the antient Church *Impoſition of Hands* was practiſed on Perſons when they married; which the *Abyſſinians* ſtill obſerve. But this Term, which in its original Signification, is general; is reſtrain'd by Cuſtom, to that *Impoſition* which is practiſed at Ordination. *Spanheim* has written a Treatiſe *de Impoſitione Manuum*; and *Tribenhorius* and *Braunius* have done the ſame.

IMPOSITION, is alſo a kind of Tranſplantation practiſed for the Cure of certain Diſeaſes. It is performed, by taking ſome of the implanted Spirit or Excrement of the Part affected, or of both together, and placing them in a Tree, or a Plant, between the Bark and the Wood, after which it is covered up with Mud. Inſtead of this, ſome bore a Hole in the Tree with an Auger; and ſhutting up the Hole again with a Tampion of the ſame Wood, cover it over with Mud. If 'tis deſired the Effect ſhould be laſting, a Tree is choſen that will continue long, as an Oak. If 'tis deſired the Effect ſhould be ſpeedy, they chuſe a Tree that grows faſt; in which laſt caſe, the Matter ſerving as the Medium of Tranſplantation muſt be taken out of the Tree as ſoon as the Effect has followed, becauſe the too great Alteration of the Spirit, might be ſome prejudice to the Patient.

IMPOSSIBLE, that which cannot be done: A Thing is ſaid to be *impoſſible*, when it contains two Ideas which mutually deſtroy each other, and which can neither be conceived, nor united together in the Mind. Thus it is *impoſſible* that a Circle ſhould be a Square; becauſe we conceive clearly that Squareneſs and Roundneſs deſtroy each other by the Contrariety of their Figure. There are two kinds of *Impoſſibilities*; the one Phyſical, the other Moral. A Phyſical *Impoſſibility* is that which cannot be done by the Powers of Nature. A thing is morally *impoſſible*, when of its own nature it is poſſible, but yet is attended with ſuch Difficulties, as that all things conſider'd, it appears *impoſſible*. Thus it is morally *impoſſible* that all Men ſhould be virtuous; or that a Man ſhould throw the ſame Number with three Dyes an hundred times ſucceſſively.

Any thing contrary to Decency and good Senſe is alſo ſaid to be *impoſſible*, among thoſe who reaſon from Moral Topics; thus the Lawyers ſay, *Omne turpe impoſſibile*: Thoſe Conditions are *impoſſible*, which Senſe and Decorum don't allow to be perform'd, tho in themſelves very *poſſible* to thoſe who have no regard to good Senſe, *&c.*

IMPOST, in Law, is the Tribute or Tax appointed by the Prince, for ſuch Merchandize as is brought into any Haven in his Dominions from foreign Nations: 31 *Eliz.* 5. It may be diſtinguiſh'd from Cuſtom, in that, Cuſtom properly ſignifies the Duties paid to the King for Goods ſhipp'd off or exported: but they are frequently confounded together.

IMPOSTHUME, is a Collection of Matter or Pus in any Part of the Body, either from an Obſtruction of Fluids in that Part, which makes them change into ſuch Matter; or from a Tranſlation of it from ſome other Part where it is generated.

IMPOSTS, in Architecture, are what are ſometimes called Chaptrels: being the Parts on which the Feet of Arches ſtand; or the Capitals of Pillars, that ſupport Arches. Theſe *Impoſts* conform to their proper Orders. The Tuſcan hath a Plinth only; the Dorick two Faces crown'd; the Ionick a Larmier, or Crown, over the two Faces, and its Mouldings may be carved; the Corinthian and Compoſite have a Larmier, Freeze, and other Mouldings. The Projectures of the *Impoſts* muſt not exceed the Naked of the Pilaſter. Sometimes the Entablature of the Order ſerves for the *Impoſt* of the Arch; and this looks very grand and ſtately. The *Impoſt* is a thing very eſſential to the Compoſition of the Ordonnances; inſomuch that without it, in the place where the curve Line of the Arch meets with the perpendicular Line of the Pillar, there always ſeems a kind of Elbow.

IMPOTENCE, a Want of Strength, Power, or Means to perform any thing. *Impotence* alſo ſignifies a natural Defect or Inability to Generation. The Decretals diſtinguiſh three kinds of *Impotence*, *viz.* Frigidity, Enchantment, and Inability to the Act. *Impotency* annuls Marriage. The Word is derived from the Prepoſition *in*, taken privatively, and *Potentia* Power.

Divines and Philoſophers diſtinguiſh two kinds of *Impotency*. The one Natural, the other Moral. The firſt is a Want of ſome Phyſical Principle neceſſary to an Action, or is ſomething abſolutely defective, or that is not free, and at liberty to act; the ſecond is only a great Difficulty, as a ſtrong Habitude to the contrary: a violent Paſſion or Inclination.

IMPRECATION, a Curſe, or Wiſh that ſome Evil may befall any one. The Antients had their Goddeſſes call'd *Imprecations*, in *Latin Diræ*, i. e. *Deorum Iræ*, who were ſuppoſed to be the Executioners of evil Conſciences. They were called *Imprecations* in Heaven, *Furies* on Earth, and *Eumenides* in Hell. The *Romans* own'd but three of theſe *Imprecations*, and the *Greek* two. They invoked them with Prayers and Pieces of Verſes to deſtroy their Enemies. The Word is derived from the *Latin in* and *precor*.

IMPREGNATION, is the Emiſſion of the Seed of the Male in Coition, by which the Female conceives, or becomes with young. It is alſo, hence, figuratively uſed in Pharmacy, when a Liquor imbibes the Juice of ſome other Body: Thus a Menſtruum is ſaid to be impregnated with a Body diſſolved in it, as much as its Pores are able to receive. The Word is derived from the *Latin Imprægnare*, of *Prægnans*, a Woman with Child.

IMPRESSION, a Term in Philoſophy, apply'd to the Species of Objects, which are ſuppoſed to make ſome Mark or *Impreſſion* on the Senſes, the Mind, and the Memory. The *Peripatetics* tell us, that Bodies emit Species reſembling them, which Species are convey'd by the exterior Senſes to the common Senſe. Theſe *Impreſſions*, or impreſs'd Species, being material and ſenſible, are render'd intelligible by the active Intellect; and when thus ſpiritualiz'd, are called Expreſſions or expreſs Species, as being expreſs'd from the others.

IMPRESSION, is alſo frequently uſed in ſpeaking of the Editions of a Book, or of the Number of Times that they

they have been printed. Thus M. *Arnaud* aſſures us, there were above 200 *Impreſſions* of the *Lovain* Bible in one Age; and 'tis affirm'd, that *Thomas à Kempis* of the *Imitation of Chriſt*, has undergone more *Impreſſions* than there have been Months ſince it was firſt compoſed. *Impreſſion*, however, differs from Edition. *Impreſſion*, properly ſpeaking, takes in no more, than what belongs to the Printing, the Letter, Paper, Margin, Page, Diſtances of Words and Lines, and the Diſpoſition of every thing that may have a good or bad Effect on the Eye. Edition, beſides all this, takes in the Care of the Editor, who reviſed the Copy, corrected or augmented it, adding Notes, Tables, and other like things, which he judg'd might contribute towards making the Book more uſeful, and correct. Indeed very frequently the word Edition only refers to this latter part; as when, in ſpeaking of the Works of St. *Auguſtin*, we quote the Edition of *Eraſmus*, the *Lovaniſts*, *Benedictins*, *&c.* where we have no regard to the Printing Part, but only to the Care and Pains of the Editors.

IMPROPER FRACTIONS, are ſuch as have their Numerators equal to, or greater than their Denominators; as $\frac{6}{5}$, $\frac{12}{12}$, *&c.* which, properly ſpeaking, are not *Fractions*, but either whole, or mixed Numbers; and are only put into the Form of *Fractions*, in order to be added, ſubſtracted, multiplied, or divided, *&c.* See *Fractions*.

IMPROPRIATION is a Term uſed where the Profits of an Eccleſiaſtical Benefice are in the hands of a Layman: As Appropriation is the Term when it is in the hands of a Biſhop, College, *&c.* tho theſe two are often now uſed promiſcuouſly; there are ſaid to be 3845 *Impropriations* in *England*.

IMPROPRIETY, Quality of ſomething that is not fit or proper. Grammarians obſerve three kinds of Faults in Language, a Solæciſm, a Barbariſm, and an *Impropriety*. An *Impropriety* is committed when a Word is uſed that is not proper, or that has not a ſuitable Signification.

IMPULSIVE, a Term in Philoſophy, applied to the Action of a Body that impels or puſhes another; as the Arm is ſaid to give an impulſive Motion to the Stone that it throws. Sir *I. Newton* accounts for moſt of the Phænomena of Nature from attractive and *impulſive* Powers.

IMPUTATION, a Term much uſed among Divines, ſometimes in a good, and ſometimes in an ill Senſe; in the latter it is uſed to ſignify the Attribution of a Sin committed by another. Thus the *Imputation* of *Adam*'s Sin is made to all his Poſterity; all his Deſcendants, by his Fall, becoming criminal in the ſight of God, as if they had fallen themſelves, and bearing the Puniſhment of his firſt Crime. *Imputation*, when uſed in a good Senſe, ſignifies the *Imputation* of another's Juſtice or Merit. Thus the Juſtice of Jeſus Chriſt is imputed to us, his Merits and the Price of his Sufferings being applied to us: So that the *Imputation* of the Merits of Chriſt ſignifies no more among the Reformed, than an extrinſick Juſtice, which does not make us truly juſt, but only appear ſo, which hides our Sins, but does not efface them. For this reaſon thoſe of the *Romiſh* Communion decline the Uſe of the word *Imputation*, and aſſert that the juſtifying Grace, which applies to us the Merits of Jeſus Chriſt, not only covers our Sins, but alſo effaces them; that this Grace is intrinſic and inherent, renewing entirely the inward Man, and renders him pure, juſt, and without ſpot before God, and that this Juſtice is given him on account of the Juſtice of Jeſus Chriſt, that is, by the Merits of his Death and Paſſion. In a word, ſay they, tho' 'tis the Obedience of Jeſus Chriſt that has merited juſtifying Grace for us, yet it is not the Obedience of Jeſus Chriſt that renders us formally juſt: And in like manner 'tis not the Diſobedience of *Adam* that makes us formally Sinners, but 'tis this Diſobedience that has merited for us, both that we ſhould be Sinners, and that we ſhould undergo the Puniſhment of Sin. The Proteſtants ſay, that the Sin of the firſt Man is imputed to his Deſcendants; they being looked on as culpable, and puniſhed as ſuch, becauſe of the Sin of *Adam*. The Catholics hold, that this is not enough; we are not eſteemed and puniſhed as Criminals, ſay they, but we are actually criminal ourſelves by original Sin. Again, the Proteſtants ſay, that the Juſtice of Jeſus Chriſt is imputed to us, and that our Juſtification is no more than the *Imputation* of that of Chriſt; his Sufferings ſtanding inſtead of ours, and God accepting his Death as a Satisfaction in lieu of our own. But the Catholics teach, that the Juſtice of Chriſt is not only imputed, but actually communicated to the Faithful, by the Operation of the Holy Ghoſt: So that they are not only reputed juſt, but alſo made ſo.

INACCESSIBLE Height, or Diſtance, is that which cannot be meaſured, by reaſon of ſome Impediment in the way, as Water, *&c.* See *Height*.

INACTION, Ceſſation of Action, a Term much in uſe in the myſtical Divinity; by which is underſtood a Privation of Motion, or an Annihilation of all the Faculties; by which the Door is, as it were, ſhut to all external Objects, and a kind of Extaſy is procured, during which God ſpeaks immediately to the Heart. 'Tis this State of *Inaction* that is the moſt proper for receiving the Holy Spirit, and in this Fit of Dozing, it is that God communicates ſublime and ineffable Sentiments and Graces to the Soul. Some don't make it conſiſt in this ſtupid kind of Indolence, or general Suſpenſion of all Senſation. They ſay that by *Inaction* they only mean a Ceſſation of Deſires, in which the Soul does not determine itſelf to certain poſitive Acts, nor does it abandon itſelf to uſeleſs Meditations, or the vain Speculations of Reaſon; but demands in general every thing that may be agreeable to God, without preſcribing any thing to him. This latter is the Doctrine of the antient myſtic Divines; and the former, that of the modern ones, or Quietiſts. In general, however, it may be ſaid, that *Inaction* is not the moſt likely way of pleaſing God; 'tis our Actions chiefly by which we are to gain his Favour: he will have us to act, ſo that *Inaction* cannot be agreeable to him.

INACTIVITY of Matter. See *Vis Inertiæ*.

INADEQUATE Idea, is a partial or incompleat Repreſentation of any thing to the Mind. See *Adequate Idea*.

INALIENABLE, that which cannot be validly alienated, or made over to another; thus the Dominions of the King, the Church, Minors, *&c.* are *inalienable*, unleſs it be with a Reſerve of the Right of Redemption, for ever.

INANIMATE, a Body that has loſt its Soul, or that is not of a Nature capable of having any. Thus a dead Man is an *inanimate* Lump, and Metals are *inanimate* Bodies. The word is derived from the *Latin* Prepoſition *in* taken pritvively, and *Anima*, *Soul*.

INANITION, a Term in Phyſic, ſignifying Emptineſs, or the State of the Stomach, when it is empty, and needs Food. There are Flatuoſities which proceed from Repletion, and others from *Inanition*, which laſt are the more dangerous.

INARTICULATE, an Epithet applied to ſuch words as are not pronounced diſtinctly.

INAUGURATION, the Ceremony performed at the Coronation of an Emperor or King, or the Conſecration of a Prelate; ſo called, in imitation of the Ceremonies uſed by the *Romans*, when they were received into the College of Augurs. The word comes from the *Latin Inauguratio*, *inaugurare*, which ſignifies to dedicate a Temple, or to raiſe any one to the Prieſthood, having, in order to that, firſt taken Auguries.

INCA, or YNCA, the Name which the Natives of *Peru* give to their Kings, and Princes of the Blood. The Chronicle of *Peru* relates the Origin of the *Yncas*, and ſays, that this Country had been a long time the Theatre of all ſorts of Wars, horrible Crimes, and Diſſenſions, till at length appeared two Brothers, the one called *Mangocapa*, of whom the *Indians* uſe to tell Wonders; he built the City of *Cruſco*, ſettled Laws and Policy, and taught them to adore the Sun; and he and his Deſcendants took the Name of *Ynca*, which, in the Language of *Peru*, ſignifies *King*, or *Great Lord*. They grew ſo powerful, that they made themſelves Maſters of the whole Country, from *Paſto* to *Chili*, 1300 Leagues long, and held it till the Diviſions between *Ynca Guaſcar*, and *Atabalipa*; which the *Spaniards* laying hold of, made themſelves Maſters of *Peru*, and put an end to the Empire of the *Incas*. They do but number twelve of theſe *Incas*. 'Tis ſaid the moſt conſiderable among the Nobles of the Country, ſtill bear the Name of *Inca*.

INCALESCENCE denotes the growing hot of any thing by Motion and Friction, or as Quick-lime does, by pouring Water on it, *&c.* from *in* and *caleo*, *to grow warm*.

INCAMERATION, a Term uſed in the Apoſtolical Chancery, ſignifying the Union of ſome Land, Right, or Revenue to the Dominion of the Pope. The word is derived from the *Latin in*, and *Camera*, *Chamber*.

INCANTATION, Enchantment, Words and Ceremonies uſed by Magicians to raiſe Devils; or rather to abuſe the Simplicity of the People. The word is derived from the *Latin*, *in*, and *canto*, *I ſing*.

INCAPACITY in Matters of Benefices, among the *Romaniſts*, &c. is of two kinds; the one renders the Proviſion of a Benefice null in its Original; the other is acceſſionary, and annuls the Proviſions, which at firſt were valid. *Incapacities* of the firſt kind, are the want of a Diſpenſation for Age in a Minor, for Legitimation in a Baſtard, for Naturalization in a Foreigner, *&c.* Of the other kind, are grievous Offences and Crimes, the being concerned in ſeeing a Sentence of Death executed, *&c.* which vacate the Benefice to all intents, or render the holding it irregular.

INCARNATION, *in Divinity*, ſignifies the Union of the Son of God with the Human Nature. The Myſtery by which Jeſus Chriſt, the Eternal Word, was made Man,

in

in order to accompliſh the Work of our Salvation. The *Indians* own a kind of Trinity in the Godhead, and ſay, that the ſecond Perſon thereof, has been incarnate nine times, and will be incarnate a tenth, and give him a different Name in each of theſe *Incarnations*. See *Kercher. China Illuſt.* The Æra uſed among Chriſtians, whence they number their Years, is the time of the *Incarnation*. This Æra was firſt eſtabliſhed by *Dionyſius Exiguus* about the beginning of the 6th Century, till which time the Æra of *Dioclesian* had been in uſe. Some time after this, it was conſidered, that the Years of a Man's Life were not numbered from the time of his Conception, (as was done in that Æra) but from that of his Birth: which occaſioned them to poſtpone the beginning of this Æra, for the ſpace of one Year, retaining the Cycle of *Dionyſius* entire, in every thing elſe. At *Rome* they reckon their Years from the *Incarnation*, or from the Birth of Chriſt, that is, from the 25th of *December*, which Cuſtom has obtained from the Year 1431. In *France*, *England*, and ſeveral other Countries, they alſo reckon from the *Incarnation*; but then they differ from the others in the Day of the *Incarnation*, fixing it not to the Day of the Birth, but to the Conception of our Saviour. However, the *Florentines* ſtick to the Day of the Birth, and begin their Year from *Chriſtmas*. See *Petav. de Doct. Temp. Grandamicus de Die Nat.*

INCARNATION ſignifies the healing and filling up Ulcers and Wounds with new Fleſh; and the Medicines which effect this, are commonly called *Incarnatives*, from *in* and *caro*, *Fleſh*.

INCARNATIVE, *in Chirurgery*, is ſomething that makes Fleſh grow, rejoin, or unite, and is applied to Remedies, Bandages, and Sutures. An *incarnative* Remedy is ſuch a one as makes the Fleſh heal and unite; an *incarnative* Bandage, is a Fillet, with an Eye or Nooſe at one end of it, ſo as the other end may be put thro' it. To make uſe of this Bandage, they apply the middle of it to the Side oppoſite to the Wound, ſo that the Aperture may be over the Wound itſelf; and ſlipping the other end thro' it, draw the Lips of the Wound cloſe to each other, that they may grow together. An *incarnative* Suture, is ſuch a one as, by rejoining the Lips of a Wound, and keeping them together, by means of a Thread drawn thro' them with a Needle, occaſions them to grow up and heal.

INCARTATION, *in Chymiſtry*, is a Purification of Gold, by means of Silver and *Aqua-Fortis*.

INCENSE, an aromatic, odoriferous Reſin. It diſtils from a Tree, that, according to *Theophraſtus*, has Leaves like thoſe of a Pear-Tree, and grows in the Country of *Saba*, in *Arabia Felix*, called by the Antients *Thurifera*, Incenſe-bearing. The Inciſion for the Reſin to ooze out at, is made in the Dog-Days. The Male *Incenſe* is the beſt; it is in round, in white drops, fat within, and inflames immediately, when laid on the Fire. This is alſo called *Olibanum*. The Female *Incenſe* is ſofter, and more reſinous, but of leſs Virtue than the former. *Incenſe* is of conſiderable Uſe in Phyſic, it warms, dries, and binds. It is uſed in ſeveral Diſeaſes of the Head and Breaſt, in caſe of Vomiting, a Diarrhæa, or a Dyſentery; externally it is uſed to fortify the Brain, and in healing of Wounds.

Bark of Incenſe, is the Bark of the Tree whence the *Incenſe* flows, which has the ſame Qualities with the *Incenſe* itſelf. There is another Bark brought from the *Indies*, called alſo *Bark of Incenſe*, and ſometimes *Jews Incenſe*, in regard the *Jews* make frequent Uſe thereof in their Perfumes.

Manna of Incenſe, is the Flower or Farina of *Incenſe*, occaſioned by the Friction of the Grains againſt each other in the Sacks wherein they carry it. There is alſo a Soot of *Incenſe*, which is a Preparation of it.

Incenſe was formerly burnt in the Temples of all Religions, to do honour to the Divinities that were there adored. Many of the Primitive Chriſtians were put to death, becauſe they would not offer *Incenſe* to Idols. In the *Romiſh* Church they ſtill retain the Uſe of *Incenſe* in many of their Ceremonies, particularly at ſolemn Funerals, beſtowing it on ſuch Perſons as they would honour, as on Prelates, *&c.* and ſometimes alſo on the People. The word comes from the *Latin*, *incenſum*, burnt; taking the Effect, for the Thing itſelf.

INCEPTIVE, a Word uſed to expreſs ſuch Moments, or firſt Principles, which tho' of no Magnitude themſelves, are yet capable of producing ſuch. Thus a Point hath no Magnitude itſelf, but is *inceptive* of a Line which it produceth by its Motion. A Line, conſidered one way, has no Magnitude as to Breadth, but is capable, by its Motion, of producing a Surface which hath Breadth, *&c.*

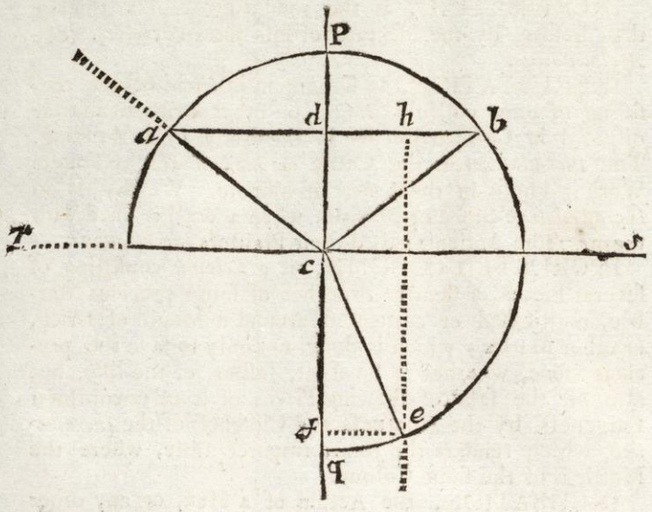
INCEST, a Crime committed by Perſons having to do with each other, who are related in a Degree prohibited by the Laws of the Country. Some are of opinion that Marriage ought to be permitted between Kinſfolks, to the end that the Affection, ſo neceſſary in Marriage, might be heightened by this double Tye; and yet the Rules of the Church have formerly extended this Prohibition even to the ſeventh Degree, but time has brought it down to the third or fourth Degree. The words *Adultery* and *Inceſt* are not infamous and indecent, tho' they ſignify very infamous things; becauſe they repreſent them as covered with a Veil of Horror, which makes us look on them only as Crimes: the words, therefore, rather ſignify the Crime of thoſe Actions, than the Actions themſelves. Moſt Nations look on *Inceſt* with Horror, *Perſia* alone excepted. In the Hiſtory of the antient Kings of that Country, we meet with Inſtances of the Brother's marrying the Siſter: the Reaſon was, becauſe they thought it too mean to join in Alliance with their own Subjects, and ſtill more ſo, to have married into the Families of any foreign Princes.

INCEST, SPIRITUAL, is a Crime committed, in like manner, between Perſons who have a ſpiritual Alliance, by means of Baptiſm or Confirmation. *Spiritual Inceſt* is alſo underſtood of a Vicar, or other Beneficiary, who enjoys both the Mother and the Daughter; that is, holds two Benefices, the one whereof depends on the Collation of the other. Such a *Spiritual Inceſt* renders both the one and the other of thoſe Benefices vacant.

INCESTUOUS, the Name of a Sect that aroſe in *Italy* about the Year 1065. It had its Beginning at *Ravenna*; the Learned of which Place being conſulted by the *Florentines* about the Degrees of Affinity which prohibit Marriage, made anſwer, that the ſeventh Generation, mentioned in the Canons, was to be taken on both ſides together; ſo that four Generations were to be reckon'd on one ſide, and three on the other. They proved this their Opinion by a Paſſage in *Juſtinian*'s Inſtitutes, where 'tis ſaid, That a Man may marry his Brother's or Siſter's Grandaughter, though ſhe be but in the fourth Degree: Whence they concluded, that if my Brother's Grandchild be in the fourth Degree with reſpect to me, ſhe is in the fifth with reſpect to my Son, in the ſixth with reſpect to my Grandſon, and in the ſeventh with reſpect to my great Grandſon. *Peter Damian* wrote againſt this Opinion, and Pope *Alexander* II. condemn'd it in a Council held at *Rome*.

INCH, is a known Meaſure, the twelfth Part of a Foot, containing the Space of three Barley Corns in length.

Goods are ſaid to be ſold by *Inch of Candle*, when a Merchant, or Company of Merchants, as the *Eaſt-India* Company, *&c.* having a Cargo of Foreign Goods arrived, are inclined to make a ſpeedy Sale of them; in which caſe, notice is uſually given upon the *Exchange* by Writing, and elſewhere, when the Sale is to begin: againſt which time the Goods are divided into ſeveral Parcels, called Lots, and Papers printed of the Quantity of each, and of the Conditions of Sale, as that none ſhall bid leſs than a certain Sum more than another has bid before. During the time of Bidding, a ſmall Piece of about an *Inch* of Wax-Candle is burning, and the laſt Bidder, when the Candle goes out, has the Lot or Parcel expoſed to Sale.



INCHOATIVE, a Term ſignifying the Beginning of a Thing or Action. *Inchoative* Verbs, according to the ſtrict Rules of the *Latin* Tongue, are uſed by the beſt Authors indifferently with Primitives, having almoſt all the Tenſes in common with them; nay, ordinarily they expreſs our Sentiments with more Violence, and the Actions themſelves in a more perfect State.

INCIDE. Thoſe Medicines are ſaid to *incide*, which conſiſt of pointed and ſharp Particles, as Acids, and moſt Salts; by the Force or Inſinuation of which, the Particles of other Bodies are divided from one another, which before cohered. And thus ſome expectorating Medicines are ſaid to *incide*, or cut the Phlegm, when they break, it ſo as to occaſion its Diſcharge.

INCIDENCE, expreſſes the Direction with which one Body ſtrikes upon another, and the Angle made by that Line, and the Plane ſtruck upon, is called the *Angle of Incidence*. In the Occurſions of two moving Bodies, their *Incidence* is ſaid to be perpendicular or oblique, as their Directions or Lines of Motion, make a ſtrait Line, or an oblique Angle at the Point of Contact. Beſides what is ſaid under *Angle of Incidence*, (which ſee) Sir *Iſaac Newton* ſaith in his Opticks, That the Sine of *Incidence* is either accurately, or very nearly in a given Ratio to the Sine of Refraction: (And the Angles of *Incidence*, Reflexion, and Refraction, are all in one and the ſame Plane.) Wherefore if that Proportion be known in any one Inclination of the incident Ray, it is known in all; and thereby the Refraction in all Caſes of *Incidence* on the ſame Refracting Body, may be determined. Thus if the Refraction be made out of Air into Water, the Sine of *Incidence* of the Red Light, is to the Sine of Refraction, as 4 to 3. If out of Air into Glaſs, the Sines are as 17 to 11. In

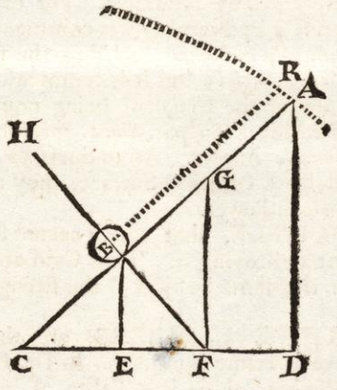
Light

Light of other Colours, the Sines have indeed other Proportions; but the Difference is ſo little, that it need ſeldom be conſider'd. As for example; Let *r s* (in the Figure) be the Surface of the ſtill Water, *c* the Point of *Incidence*, in which any Ray coming in the Air from *a* in the Line *a c*, is reflected or refracted: To know whither this Ray ſhall go after ſuch Reflexion, or Refraction; on the Sur-

face of the Water *r s*, and in the Point *c*, erect the Perpendicular *c p*, and produce it downwards to *q*. Knowing therefore that the Ray after Reflexion or Refraction will be found ſomewhere in the Plane of the *Angle of Incidence a c p* produced; let fall the Sine of that Angle (viz. *a d*) on the Perpendicular *p c*; and then if the Reflected Ray be ſought, produce *a d* to *b*, ſo that *d b* = *a d*, and draw *c b*, which ſhall be the reflected Ray, becauſe the Angle of Reflexion, and its Sine, are equal to the Angle and Sine of *Incidence*, as they ought to be. But if the refracted Ray be ſought, produce *a d* to *b*; ſo that *d b* may be to *a d*, as the Sine of the Refraction, to that of *Incidence*: that is, as 3 to 4. Then with the Radius *a c* deſcribing the Circle *a b e*, and in the Plane *a c p*; draw the Line *b e* parallel to *p q*, and cutting the Circumference in *e*: Then drawing *c e*, That ſhall be the refracted Ray. For if *e f* be let fall perpendicularly on the Line *p q*, it ſhall be the Sine of the Angle of Refraction of the Ray *c e*; and this Sine is equal to *d b*, and conſequently in proportion to the Sine of the *Angle of Incidence a d*, as 3 to 4.

Incidence Point, in Opticks, is that Point in which a Ray of Light is ſuppoſed to fall on a Piece of Glaſs.

INCIDENT, an Event or particular Circumſtance. *Incident*, in a Poem, is an Epiſode or particular Action, tack'd to the principal Action, or depending on it. Thus a good Comedy is full of agreeable *Incidents*, which divert the Spectators, and form the Intrigue. The Poet ought always to make choice of ſuch *Incidents* as are ſuſceptible of Ornaments ſuitable to the Nature of his Poem. The Variety of *Incidents* well conducted make the Beauty of an Heroic Poem, which ought always to take in a certain number of *Incidents* to ſuſpend the Cataſtrophe, that would otherwiſe break out too ſoon.



INCINERATION, in Chymiſtry, is the Reduction of Vegetables into Aſhes; which is done by burning them gently. Thus Fern is reduced into Aſhes for the making of Glaſs. The Word is derived from the *Latin* Prepoſition *in*, and *Cinis*, Aſhes.

INCISIVE, in Anatomy, is underſtood of ſeveral Teeth, a double Muſcle, and certain Orifices belonging to thoſe Teeth. The *inciſive* Teeth, *Inciſores* or Cutters, ſometimes alſo called *Riſores*, becauſe they ſhow themſelves in Laughing, are eight in number, four in each Jaw, ſituate in the Fore-ſide, and in the middle of the others. They are ſhorter and ſharper than the others, and are inſerted into their *Alveoli* by a ſingle Root or Twang; for which reaſon they fall eaſily, eſpecially thoſe of the upper ſide. They are called *inciſive*, becauſe their Office is to cut or incide the Meat. The firſt proper Muſcle of the upper Lip has alſo the Epithet of *inciſive*, becauſe it has its Origin in the Bone of the upper Jaw, near the Place of the *inciſive* Teeth; hence it paſſes, and is inſerted into the upper Lip, which it ſerves to draw up. The maxillary Bones have four internal Orifices, two whereof are called *inciſive*, as being directly under the *inciſive* Teeth.

INCLINATION, a Term uſed in Medicine and Chymiſtry, when a clear Liquor is poured off from ſome Fæces, or Sediment, by only gently ſtooping the Veſſel; which is alſo called Decantation.

INCLINATION, in Phyſics, expreſſes the mutual Approach or Tendency of two Bodies, Lines, or Planes towards one another; ſo that their Directions make either a ſtrait Line at the Point of Contact, or an Angle of a greater or leſſer Magnitude. What the *Angle of Inclination* ſignifies in Opticks, ſee in *Angle of Incidence*. The *Inclination* of two Planes is the acute Angle made by two Lines drawn one in each Plane, and perpendicular to their common Section. *Inclination* of the Axis of the Earth is the Angle which it makes with the Angle of the Ecliptick; or the Angle between the Planes of the Equator and Ecliptick. *Inclination* of a Planet is an Arch of the Circle of *Inclination*, comprehended between the Ecliptick, and the Place of a Planet in his Orbit. *Inclination* of a Plane in Dialling, is the Arch of a vertical Circle, perpendicular to both the Plane and the Horizon, and intercepted between them. To find this, take a Quadrant and apply its ſide to the ſide of a Square, and apply the other ſide of your Square to your Plane; if the Plummet fall parallel to the ſide of the Square, then the lower ſide of the Square ſtands level; by which draw an Horizontal Line, whereon erect a Perpendicular, and apply your Square to that Perpendicular; and if the Plummet falls parallel to the ſide of the Square, then that is alſo a level Line, and your Plane ſtands horizontally: If the Plummet falls not parallel to the ſide of the Square, then turn your Square, until it does, and draw an horizontal Line, on which erect a Perpendicular, to which apply your Square, and obſerve what Angle your Plummet makes on the Quadrant, with the ſide of the Square; that is, the Angle of the *Inclination* of the Plane. *Inclination* of a Ray in Dioptricks, is the Angle which this Ray makes with the Axis of Incidence in the firſt Medium, at the Point where it meets the ſecond Medium. *Inclination* of a Right Line to the Plane is the acute Angle, which this Right Line makes with another Right Line drawn in the Plane thro the Point where the inclined Line interſects it, and thro the Point, where it is alſo cut by a Perpendicular drawn from any Point of the inclined Lines. *Inclinations* of the Planes of the Orbits of the Planets to the Plane of the Ecliptick, are thus. *Saturn*'s Orbit makes an Angle of 2 Degrees 30 Minutes. *Jupiter*'s 1 Degree, and $\frac{1}{2}$. *Mars*'s little leſs than 2 Degrees. *Venus*'s is 3 Degrees and $\frac{1}{2}$. *Mercury*'s is almoſt 7 Degrees.

INCLINED PLANE. Beſides what has been ſaid under *Deſcent* of heavy Bodies upon *inclined Planes*, it may be here added: If a Body as B be partly ſupported by the *inclined Plane* A C, and partly by the Power R acting on a Direction parallel to the Plane A C; then that Power R: is to the Body, or Weight B:: as the Sine of the Angle of the *Plane*'s Inclination A C B: is to the Radius C A. C D, A D, G F, E D, and H F, being drawn, as in the Figure; the Body B will be ſuſtained, as it

were, by three Forces, or Powers, all acting according to different Directions, and in Equilibrio one to another. The firſt of which is the Force of Gravity, expreſſed by B E perpendicular to the Horizon C D. The ſecond the Power R, according to the Direction B R parallel to the Plane A C. And the third is ſupplied by the Reſiſtance or Contranitence of the *Plane* A C; and is expreſſed by B H perpendicular thereunto. For Action and Re-action being equal, and one acting directly contrary to the other; the *Plane* which is preſſed by the Body or Weight B, according to the Direction of the Perpendicular H B, muſt act on that Body by a contrary Direction, *viz.* that of F B or B H. And ſince theſe three Powers are all mutually in Equilibrio, and that the Body B is ſuſtained by them, it is plain (when G F is drawn perpendicular to C D, or parallel to B E) that the Force of Gravity will be expreſſed by G F; and that the Power R: will be to the Power of Gravity:: as G B: to G F; but in the Right-angled Triangle C F G, (F B being a Perpendicular to the Baſe C G) B G: G F:: G F: G C, and as F G: G C:: A D: A C (by ſimilar Triangles) wherefore the Power R: is to the Force of Gravity:: as A D: to A C, or as the Sine of the Angle of Inclination to the Radius. Wherefore the Force by which any heavy Body would deſcend on any *inclined Plane*, to the Force of the Deſcent in the Perpendicular, is as the Sine of the Angle of the

Plane's Inclination, to the Radius. From hence alſo it follows, the Inclination of the *Plane* may be ſo little, that the greateſt Weight may be ſuſtained on it by the leaſt Power. For practice therefore, Let the Weight of any Body be W, and P the Power wanted to ſuſtain it on an *inclined Plane*. By this Theorem, R : W : : S. Incl. : P; that is, As Radius is to the Weight : : ſo is the Sine of the Angle of the *Plane*'s Inclination to the Horizon : to the Power ſought. The three firſt of which are given, wherefore the fourth is known.

INCOGNITO, a Term borrow'd literally from the *Italian*, uſed when a Perſon is in any Place where he would not be known. It is particularly applied to Princes or Great Men, who enter Towns or walk the Streets without their ordinary Train, or the uſual Marks of their Diſtinction. The Grandees in *Italy* make a common Cuſtom of walking the Street *incognito*; and always take it amiſs, on ſuch Occaſions, when People pay their Compliments to them. 'Tis not barely to prevent their being known, that they take theſe Meaſures, but becauſe they would not be treated with Ceremony, nor receive the Honours due to their Rank. When the Horſes in Princes, Cardinals, and Ambaſſadors Coaches have no Taſſels, which they call *Fiocchi*; and the Curtains, which they call *Bandinelle*, are drawn, they are judg'd to be *incognito*; and no body that meets them is obliged to ſtop or make his Honours to them. The Cardinals alſo, when they would be *incognito*, leave off the red Hat or Calotte.

INCOMBUSTIBLE, that which cannot be burnt or conſumed by Fire. Metals melt, Stones calcine, and are yet *incombuſtible*. Cloth made of *Lapis Amianthus* is *incombuſtible*; it is clean'd by Fire, but not burnt. See *Aſbeſtos*. At *Dole* in *France* is an *incombuſtible* Taper. *Gregory* of *Tours* ſpeaks of ſome wooden Kettles in his Time that bore the Fire as long as thoſe of Iron. *Sylla* undertook to burn down a Tower of Wood which defended *Archelaus*, one of *Mithridates*'s Lieutenants, but he could not attain his End, it being plaiſter'd with Alumn. 'Tis Alumn Water wherewith thoſe People beſmear themſelves, who handle burning Coals, and melt *Spaniſh* Wax on their Tongues.

INCOMMENSURABLE, a Term in Geometry, uſed where two Lines, when compared to each other, have no common Meaſure, how ſmall ſoever, that will exactly meaſure them both. So that after ever ſo many Repetitions and Subſtractions of equal Parts, there will always remain ſome Part, by which the one is greater than the other. And in general, two Quantities are ſaid to be *incommenſurable*, when no third Quantity can be found that will exactly meaſure them both; or when thoſe Quantities are not to one another as Number to Number, or cannot be expreſs'd by Numbers. For every thing that may be expreſs'd by Number, is commenſurable. The Side of a Square is *incommenſurable* to the Diagonal, as is demonſtrated by *Euclid*; but it is commenſurable in Power: the Square of the Diagonal being equal to twice the Square of the Side. *Pappus*, *lib.* 4. *prob.* 17. ſpeaks alſo of *incommenſurable* Angles. As to Surfaces which cannot be meaſured by a common Surface, they are ſaid to be *incommenſurable* in Power.

INCOMPATIBLE, that which cannot ſubſiſt with another without deſtroying it. Thus Cold and Heat are *incompatible* in the ſame Subject; the ſtrongeſt overcomes the weakeſt.

INCOMPOSITE NUMBERS, are the ſame with thoſe *Euclid* calls Prime Numbers. In Dr. *Pell*'s Edition of *Brancker*'s Algebra, there is a Table of *incompoſite Numbers*: It doth not only give an orderly Enumeration of all odd Numbers which are not *compoſite*; but it ſhews alſo, that none of the reſt are ſo. This Table being of good uſe, the Reader is refer'd to it.

INCORPORATION, is the mixing of the Particles of different Bodies ſo together, as to make an uniform Subſtance or Compoſition of the whole, without leaving a poſſibility of diſcerning the Ingredients, or Bodies mixed in any of their particular Qualities. From *in* and *Corpus* Body.

INCORPOREAL, a ſpiritual Subſtance; that has no Body. Thus the Soul of Man is *incorporeal*, and may ſubſiſt independent of the Body. Thoſe Ideas which are independent of Bodies, can neither be corporeal themſelves, nor be received within a corporeal Subject. They diſcover to us the Nature of the Soul, which receives within itſelf what is *incorporeal*, and receives it in a corporeal Manner too. Whence it is that we have *incorporeal* Ideas even of Bodies themſelves. *Fenelon.*

INCORRUPTIBLE, that which cannot corrupt. Thus ſpiritual Subſtances, as Angels, Human Souls, &c. and thus alſo Glaſs, Salt, Mercury, &c. may be called *incorruptible*.

INCORRUPTIBLES, is the Name of a Sect that ſprung out of the *Eutychians*. Their diſtinguiſhing Tenet was, That the Body of Jeſus Chriſt was *incorruptible*; by which they meant, that after and from the Time wherein he was formed in the Womb of his holy Mother, he was not ſuſceptible of any Change or Alteration; not even of any natural and innocent Paſſions, as of Hunger, Thirſt, &c. So that he eat without any occaſion, before his Death, as well as after his Reſurrection. And hence it was that they took their Name.

INCRASSATING, is the rendering Fluids thicker than before, by the Mixture of leſs fluid Particles. See *Agglutinating*.

INCRUSTATION, an Ornament in Architecture, conſiſting of hard poliſh'd Stones, or other brilliant Matter diſpoſed in Compartiments in the Body of a Building. The *Incruſtations* in the Caſtle at *Madrid* are of Potters Work: Thoſe in the *Louvre* of Marble. We ſay 'tis an *Incruſtation* of Stone or Marble, when a Wall is lined with them. The Antients call'd their Plaiſters *Incruſtations*.

INCRUSTED COLUMN, is a *Column* conſiſting of ſeveral Pieces or ſlender Branches of ſome precious Marble, maſticated or cemented around a Mould of Brick, or other Matter; which is done, not only to ſave the precious Stone, whether it be Agat, Jaſper, or the like, but alſo for the ſake of ſhewing Pieces of it of uncommon Largeneſs, by the Neatneſs and Cloſeneſs of the *Incruſtation*, which renders the Joints imperceptible, where the Maſtic is of the ſame Colour.

INCUBATION, the Action of a Hen, or any other Fowl, hatching their Eggs.

INCUBUS, or the *Night-Mare*, is the Name of a Diſeaſe conſiſting in an Oppreſſion of the Breaſt, ſo very violent, that the Patient cannot ſpeak, or even breathe. In this Diſeaſe the Senſes are not quite loſt, but drown'd and aſtoniſh'd, as is the Underſtanding and Imagination; ſo that the Patient ſeems to think ſome huge Weight thrown on him ready to ſtrangle him. Children are very liable to this Diſtemper; ſo are fat People, and Men of much Study and Application of Mind: By reaſon the Stomach in all theſe finds ſome difficulty in Digeſtion. The *Incubus* ſeems to be Couſin-German to the Epilepſy and Apoplexy; for if it laſts long, it degenerates into one or other of thoſe Diſtempers. Others reckon it a kind of Aſthma, and call it *Aſthma Nocturnum*, and ſay it proceeds from the ſame Cauſes, and is helped by the ſame Means as the common Aſthma. The word *Incubus* is derived from the *Latin Incubare*, to lie down on any thing and preſs it. The *Greeks* called it ἐφιάλτης, *Saltator*, Leaper, or one that ruſhes on a Perſon.

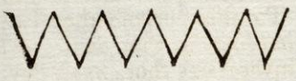
INCUMBENT, in Law, is a Clerk reſident in his Benefice with Cure, who is called *Incumbent* of that Church, becauſe he ought to bend his whole Study to diſcharge his Cure.

INCURVATION, is the bending a Bone, or any other Body from its natural Shape. For *Incurvation* of the Rays of Light, ſee *Light* and *Refraction*. From *in* and *curvus*, crooked.

INCUS. See *Ear*.

INDEFEISIBLE, in our Law, ſignifies what cannot be defeated or made void: As a good and *indefeiſible* Eſtate.

INDEFINITE, indeterminate, that which has no certain Bounds, or to which the Human Mind cannot conceive any. *Deſcartes* uſes this Word, in his Philoſophy, inſtead of infinite, both in Numbers and Quantities, to ſignify an inconceivable Number, or Number ſo great, that an Unit cannot be added to it: and a Quantity ſo great, as not to be capable of any Addition. Thus he ſays, Stars, viſible and inviſible, are in Number *indefinite*, and not as the Antients held, infinite; and that Quantities may be divided into an *indefinite* Number of Parts, not an infinite Number. *Indefinite* is ſometimes uſed in the Schools to ſignify ſomething that has but one Extreme; as for inſtance, a Line drawn from any Point, and extended infinitely: Thus what they call Eternity *à parte ante*, or Eternity *à parte poſt*, are *indefinite* Durations.



Indefinite, in Grammar, is underſtood of Nouns, Pronouns, Verbs, Participles, Articles, &c. that are left in an uncertain indeterminate Senſe, and not fix'd to any particular Time, Thing, or other Circumſtance.

INDELIBLE, that which cannot be blotted out, or effaced. Thus, Baptiſm, and the Order of the Prieſthood, are *indelible* Characters. The Word is form'd from the *Latin delere*, to blot, with the Prepoſition *in* taken negatively.

INDEMNITY, an Act by which one promiſes to guarantee or ſave harmleſs ſome other Perſon from any Loſs or Damage that might accrue to him on any particular account. From the Negative *in* and *Damnum*, Loſs.

INDEMNITIES. When a Church is appropriated to an Abbey or College, then the Arch-Deacon loſeth his Induction-

duction-Money for ever: In recompence whereof, he ſhall have yearly out of the Church ſo appropriate, one or two Shillings, more or leſs, for a Penſion, as was agreed at the time of the appropriating. And this Penſion is call'd an *Indemnity*.

INDENTED, is a Term in Heraldry, when the Out-Line of a Bordure, Ordinary, &c. is in the Form of the Teeth of a Saw. Thus

INDENTURE, in Law, is a Writing comprizing ſome Contract between two at leaſt; being indented at top anſwerable to ſome other, which likewiſe containeth the ſame Contract. It differs from a Deed-Poll; in that this laſt is a ſingle Deed, and is unindented.

INDEPENDENTS. The Name of a Religious Sect in *England* in *Holland*. They are ſo call'd, as denying not only any Subordination among their Clergy, but alſo all Dependency of any other Aſſembly. They teach, that every ſeparate Church or particular Congregation among them has in itſelf radically and eſſentially every thing neceſſary for its own Government; that it has all Eccleſiaſtical Power and Juriſdiction; and is not at all ſubject to other Churches or their Deputies, nor to their Aſſemblies or Synods. Tho the *Independents* don't think it very neceſſary to aſſemble Synods; yet, they ſay, if any are held, they look on their Reſolutions as wiſe and prudential Councils, not as Deciſions to be peremptorily obey'd. They agree, that one or more Churches may help another Church with their Advice and Aſſiſtance, and even reprove it when it offends, provided they don't pretend to any ſuperior Authority or Right to excommunicate, &c. In Matters of Faith and Doctrine, the *Independents* agree with the reſt of the Reformed; ſo that the Difference is rather Political than Religious. During the Civil Wars in *England*, the *Independents* becoming the moſt powerful Party, and getting to the Head of Affairs, moſt of the other Sects that were averſe to the Church of *England*, join'd them: Which occaſion'd them to be diſtinguiſh'd into two Sects. The firſt are in effect *Presbyterians*, only differing from them in Matters of Diſcipline. The others, whom M. *Spanheim* calls *Pſeudo-Independents*, are a confuſed Aſſemblage of *Anabaptiſts*, *Socinians*, *Antinomians*, *Familiariſts*, *Libertines*, &c.

F. *Orleans* ſpeaks of their Riſe in the following Terms. 'Out of the ſame Sect (the Presbyterians) had riſen 'ſome time ago, on pretence of further Reformation, a 'new Sect, that was not only averſe to the Monarch, but 'the Monarchy, both which it undertook to deſtroy; and 'in lieu thereof to form a Republic-----They were called 'by the Name of *Independents*, in regard that profeſſing 'to carry the Goſpel-Liberty ſtill further than the Puri-'tans, they rejected not only Biſhops, but alſo Synods, 'pretending each Aſſembly ought to govern itſelf inde-'pendently of all others; in which, ſaid they, conſiſts 'the Liberty of the Children of God. At firſt they were 'only diſtinguiſh'd among the Presbyterians as the more 'zealous from the more indifferent, the more rigid from 'the more remiſs, by a greater Averſion to all Pomp and 'Pre-eminence both in Church and State, and by a more 'ardent Deſire to reduce the Practice of the Goſpel to 'its primitive Purity. It was their Maxim of Indepen-'dency that firſt diſtinguiſh'd them, and render'd them 'ſuſpected to the reſt. But they had Addreſs and Arti-'fice enough to gain ground, and in effect made abun-'dance of Proſelytes out of all other Parties and Perſua-'ſions.'

INDEPENDENTISM is peculiar to *Great Britain*, the *Britiſh* Colonies, and the *United Provinces*. One *Morel* in the 16th Century endeavour'd to introduce it into *France*, but it was condemn'd at the Synod of *Rochel*, where *Beza* preſided, and again at the Synod of *Rochel* in 1644.

INDETERMINATE, in Geometry, is underſtood of a quantity of Time or Place that has no certain or definite Bounds; ſee *Indefinite*. An *indeterminate* Problem is that, whereof there may be various Solutions. For inſtance, if a Number is required that may be a Multiple of 4 and 5; the Anſwer may be 20, 40, 60, &c. to Infinity. Mr. *Preſtet* calls an *indeterminate* Analyſis, that which admits of an infinite Number of different Solutions.

INDEX, the Fore-Finger, from *indico*, to point or direct; becauſe that Finger is generally ſo uſed. Hence alſo the *Extenſor Indicis* is call'd Indicator. The *Greeks* call it λιχάνω, *Licker*; this Finger being us'd to be dip'd in Sauces, &c. in order to taſte 'em; after which 'tis uſually lick'd: or, as others will have it, becauſe the Nurſes uſe it to take up the Food wherewith they feed their Infants; firſt licking it, to taſte whether or no it be hot.

Index, in Arithmetic, is the ſame with what is ſometimes call'd the Characteriſtic, or Exponent of a Logarithm; and ſhews always of how many Places the abſolute Number belonging to the Logarithm doth conſiſt, and of what nature it is, that is, whether an Integer or a Fraction: Thus, In this Logarithm 2.521293, the Number ſtanding on the Left-hand of the Point is called the *Index*; and becauſe it is 2, ſhews you that the abſolute Number anſwering to it, conſiſts of 3 places: for it is always one more than the *Index*, becauſe the *Index* of 1 is 0; of 10 is 1; and of 100 is 2, &c. As in this Example:

0 1 2 3 4 5 6 7 8 9
1 2 3 4 5 6 7 8 9 Where the upper Numbers are *Indices* to the lower, And therefore in thoſe ſmall Tables of *Briggs*'s Logarithms, where the *Index* is omitted, it muſt be always ſupply'd, before you can work by them. If the abſolute Number be a Fraction, then the *Index* of the Logarithm hath a negative Sign, and is marked thus, $\bar{2}.562293$; which ſhews the correſponding Number to be a Decimal Fraction of three Places, *viz.* 1.365. Mr. *Townly* hath a peculiar way of noting theſe *Indices*, when they expreſs Fractions, and it is now much in uſe, *viz.* by taking, inſtead of the true *Index*, its Arithmetical Complement to 10; and therefore he would write the Logarithm now mention'd, thus, $\overline{8}.562293$. How they are added and ſubſtracted, ſee in *Addition* and *Subſtraction*.

Index of a Globe, is a little Stile fitted on to the North-Pole, and turning round with it, pointing to certain Diviſions in the Hour-Circle. It is ſometimes alſo call'd *Gnomon*. See *Globe*.

Index, or *Indice*: At *Rome* there is a Congregation that goes by this Name, whoſe Buſineſs is to examine Books, and to put ſuch as they think fit to prohibit the reading and the ſelling of, into an *Index*: *Indices*, or expurgatory *Indices*, being the Name by which the Catalogues of prohibited Books are call'd; among which, however, there is this difference, that ſome are condemn'd purely and abſolutely; and others only *donec corrigantur*, till they be corrected. *Philip* II. of *Spain*, was the firſt who procured an *Index* to be printed of the Books condemn'd by the Inquiſition of *Spain*. Pope *Paul* IV. took the hint, and in 1559 order'd the Congregation of the Holy Office at *Rome* to print a ſecond. *Pius* V. recommended the Matter to the Council of *Trent*, who made another. After this, the Duke of *Alva* procured another to be printed at *Antwerp* in 1571. *Clement* VIII. in 1596. printed a very copious one, call'd by the Name of the *Roman*. There were two others publiſh'd in 1583 and 1612, by the Cardinals *Guirois* and *Sandovel*, and ſeveral others by the Inquiſitors and Maſters of the Sacred Palace. The moſt conſiderable of all the *Indices* is that of *Sottomayor*, which was made by all the States ſubject to the King of *Spain*, and comprehends all the others; coming down as low as the Year 1667.

INDIAN WOOD, call'd alſo *Jamaica* and *Campeche Wood*, is taken out of the Heart of a large Tree growing plentifully in the Iſles of *Jamaica*, *Campeche*, &c. It is uſed in Dying; its Decoction is very red: and it has been obſerv'd, that putting ſome of this Decoction into two Bottles, and mixing a little Powder of Alumn with the one, it will become of a very beautiful Red, which will hold; the other in a day's time becoming yellow, though both Bottles were ſtop'd from the Air alike: and if a little of the ſame Decoction were expoſed to the Air, it would become black as Ink in the ſame ſpace of Time.

INDICATION, a Sign diſcovering or pointing out ſomething to be done. The Phyſicians uſe the Word to ſignify the Invention of a Remedy proper to cure a Diſeaſe, from the Knowledge which they have of the Qualities of that Remedy. *Indication* either tends to preſerve a natural ſound State, which is call'd vital *Indication*, or to remove ſomething diſagreeable to Nature. The ſecond *Indication* either relates to Sickneſs, and is call'd curative *Indication*; or to ſome antecedent Cauſe, in which caſe 'tis call'd preſervative or ſymptomatic *Indication*. That part of Phyſic which treats of *Indications*, is call'd *Semeiotica*.

INDICATIVE, in Grammar, is the firſt Mode or Manner of Conjugating Verbs, ſhewing either the Time preſent, paſt, or future. *I love*, is the preſent Tenſe; *I loved*, the paſt; and *I will love*, the future of the *Indicative* Mode.

INDICATOR, in Anatomy, a Muſcle of the Index, or ſecond Finger following the Thumb. The *Indicator* is the firſt proper Muſcle of the Index; and is ſo call'd, becauſe it ſerves us to point at any thing withal. It has its Origin in the middle and hind part of the Cubitus, and is inſerted by a double Tendon into the ſecond Phalanx of the Index, and to the Tendon of the great Extenſor, acting in conjunction with it, in ſtretching out that Finger.

INDICTION ſignifies the Convocation of an Eccleſiaſtical Aſſembly, as of a Synod or Council, and even a Diet. The word is alſo uſed of the ſeveral Seſſions of the ſame Councils. And hence it is, that at the end of the Seſſions of the Council of *Trent*, the Decree by which the Council appoints the Day of the future Seſſion, is called the *Indiction* of that Seſſion.

By *Roman Indiction* is meant an Epoche, or Manner of accounting Time uſed by the *Romans*, containing a Cycle or Revolution of fifteen Years, which when expired it returns to Unity again. This Method of Computation has no Dependance on the heavenly Motions. *Petavius* ſays, there is nothing in Chronology leſs known than the *Roman Indiction*; he means, than its Origin and Commencement. 'Tis the general Opinion it was inſtituted in the time of *Conſtantine*, but this is a mere Gueſs. There were *Indictions* in the time of the Emperor *Conſtans*, as appears from the *Theodoſian* Code. The Learned hold that the *Indictions* were no more than certain annual Taxes, the Tarif whereof was publiſhed every Year: but why they were ſo called, why confined to a Cycle of fifteen Years, when or on what Occaſion inſtituted, is not known. We find three kinds of *Indictions* mentioned in Authors; the *Indiction* of *Conſtantinople*, beginning on the Calends of *September*; the Imperial or *Cæſarian Indiction*, on the 24th of *September*; and the *Roman Indiction*, which is that uſed in the Pope's Bulls, and begins on the 1ſt of *January*. The Popes have dated their Acts by the Year of *Indiction*, ever ſince *Charlemaign* made them Sovereign; before which time they dated them by the Years of the Emperors. At the time of the Reformation of the Calendar in 1582, was reckoned the tenth Year of the *Indiction*: So that beginning to reckon hence, and dividing the Number of Years elapſed between that time and this by 15, the Remainder will be the Year of *Indiction*, correſponding to the preſent Year of our Lord 1722. *viz.* 15. This may alſo be found by adding 3 to the Year of our Lord, and dividing the Sum by 15. The word *Indiction* comes from *Indictio*, which ſignifies Eſtabliſhment, Order, or Denunciation. The Time of the *Indiction* among the *Romans*, was that wherein the People were ſummoned to pay a certain Tribute; and 'tis for this Reaſon that the Imperial *Indiction* began towards the end of *September*, becauſe the Harveſt being then got in, it was ſuppoſed the People could eaſily pay their Tribute.

INDICTIVE, an Epithet given to certain Feaſt-Days appointed by the *Roman* Magiſtrates, *viz.* the Conſul or Prætor. See *Feriæ*.

INDICTMENT, or ENDITEMENT, in our common Law, ſignifies as much as *Accuſatio* among the Civilians; tho' in ſome Points it differs. An *Indictment* is a Bill, or Declaration, made in form of Law for the Benefit of the Commonwealth, exhibited as an Accuſation of one for ſome Offence, either criminal or penal, unto Jurors, and by their Verdict found to be true, and preſented before an Officer that has Power to puniſh the ſame Offence. It ſeems to be an Accuſation, becauſe the Jury that enquireth of the Offence does not receive it, till the Party that offereth the Bill, appearing, ſubſcribe his Name, and proffer his Oath for the Truth of it. It is always at the Suit of the King, and differs from an Accuſation in this, that the Preferrer is no way tied to the Proof thereof upon any Penalty, if it be not proved, except there appear a Conſpiracy. The word is derived from the *French enditer*, *indicare*, or according to Mr. *Lambert*, ἐνδείκνυμι.

INDIGESTION, a want of Digeſtion. In the Syſtem of Trituration, *Indigeſtion*, which is a Crudity, may be very naturally accounted for, from the Relaxation of the Fibres of the Stomach. A bilious *Indigeſtion*, in the Opinion of *Hecquet*, a great Advocate for Trituration, is owing to too much Force in the Stomach, too much Vivacity in its Oſcillations, which ſpoil the Digeſtion, by rendering the Trituration imperfect. But this is hardly ſatisfactory, for it ſhould ſeem that Digeſtion would be the more perfect, in proportion as the Force of the Stomach increaſed. See *Digeſtion*.

INDIGETES, a Name which the Antients gave to their Gods, or at leaſt to ſome of them. There are various Opinions about the Origin and Signification of this word; ſome pretending it was given to all the Gods in general, and others only to the Great Men whom they deified; others ſay it was given to ſuch Gods as were originally of the Country, or rather ſuch as were the Gods of the Country that bore this Name; and others again hold it was aſcribed to ſuch Gods as were Patrons and Protectors of Cities.

Thoſe of the firſt Opinion maintain, that the Gods were ſo called by *Antiphraſis*, becauſe they wanted nothing; the word coming from the Verb *indigeo*, *I want*. If this were true, the word *Indigetes* would ſignify nearly the ſame thing in *Latin* with the *Hebrew* שדי, *Schaddai*, which the Scripture frequently gives to God, as ſignifying, that he is ſufficient for himſelf, and needs nothing. Thoſe of the ſecond Opinion derive the word from *indigitare*, *to call*, *invoke*; it being theſe Gods who were ordinarily invoked, and who lent the readieſt Ear to the Vows that were made them. To this purpoſe they cite *Macrobius*, who uſes the word *indigitare* in that Senſe, telling us the Veſtals make their Invocations thus, *Apollo Phyſician! Apollo Pæan! Veſtales ita indigitant*, *Apollo Medice! Apollo Pæan!* They add, that their Book of Prayers and Forms of Invocation were called *Indigitamenta*. Laſtly, others hold *Indigetes* to be derived from *inde genitus*, or *in loco degens*, or from *inde* and *ago* for *dego*, *I live*, *I inhabit*; which laſt Opinion ſeems the moſt probable. In effect it appears, that theſe *Indigetes* were alſo called *Local Gods*, *Dii Locales*, or *Topical Gods*, which is the ſame thing. (2.) The *Indigetes* were ordinarily Men deified, who indeed were, in effect, Local Gods, being eſteemed the Protectors of thoſe Places where they were deified; ſo that the ſecond and third Opinion are very conſiſtent. (3.) *Virgil* joins *Patrii* with *Indigetes*, as being the ſame thing, *Geor.* I. *Dii Patrii*, *Indigetes*. (4.) The Gods to whom the *Romans* gave the Name *Indigetes*, were *Faunus*, *Veſta*, *Æneas*, *Romulus*, all the Gods of *Italy*; and at *Athens Minerva*, ſays *Servius*, and at *Carthage Dido*. 'Tis true we meet with *Jupiter Indiges*, but that *Jupiter Indiges* is *Æneas*, not the Great *Jupiter*; as we may ſee in *Livy*, *l.* 1. *c.* 3. in which laſt ſenſe *Servius* aſſures us, *Indiges* comes from the *Latin*, *in Diis ago*, *I am among the Gods*.

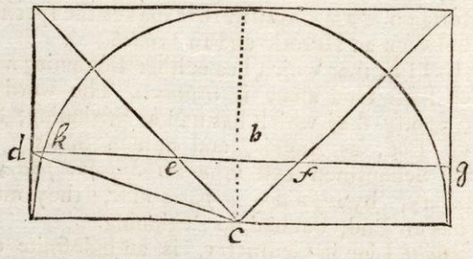
INDIGNATORIUS MUSCULUS, that Muſcle is thus called, which is ſuppoſed to draw the Eye from its inner Corner outwards, which gives an Appearance of Scorn and Anger; but this is properly a compound Motion of two Muſcles: for which ſee *Eye*.

INDIGO, a Drug of a deep blue Colour, brought hither from the *Weſt-Indies*. It is drawn from the Leaves of a Plant which the *Spaniards* call *Anil*, and we *Indigo*. The Method of Preparation is this. When the Plant has attained to a certain height, and its Leaves are in a good Condition, they cut them down, and throw them into a kind of Vat, covering them with Water. Theſe they boil together for the ſpace of twenty four hours: at the Top ſwims a Scum, with all the different Colours of the Rainbow. Then the Water is let off into another Veſſel, where they agitate and churn it, as it were, with five or ſix long Poles, fitted together for that purpoſe. This they continue to do till the Water becomes of a deep Green, and till the Grain, as they call it, forms itſelf, which they diſcover by taking a little of it out into another Veſſel, and ſpitting in it; for if then they perceive a bluiſh Dreg ſubſiding, they ceaſe to beat. The Matter then precipitates of itſelf to the Bottom of the Veſſel, and when it is well ſettled, they pour off the Water. After this they take out the *Indigo*, and put it into little Linen Bags, and let it drain; this done, they put it into ſhallow wooden Boxes, and when it begins to dry, they cut it into ſlices, and let them harden in the Sun.

There are ſeveral kinds of *Indigo*; the beſt is that called *Serquiſſe*, from the Name of a Village where 'tis prepared. We chuſe it in flat Pieces, of a moderate thickneſs, pretty hard, clean, light enough to ſwim in the Water, inflammable, of a fine blue Colour, marked a little on the Inſide with Silver Streaks, and appearing reddiſh when rubbed on the Nail.

Indigo is uſed among the Painters, who grind and mix it with white to make a blue Colour; for without that Mixture it would paint blackiſh. They mix it with Yellow, to make a Green Colour. It is alſo uſed in Dying, and by the Laundreſſes, to give a bluiſh Caſt to their Linen.

In the *Hortus Malabaricus* is an Account of the Plant whence *Indigo* is drawn: The Decoction of whoſe Root is ſaid to be excellent againſt Nephritic Cholics; its Leaves, applied to the lower Ventricle, good to promote Urine; and the *Indigo* itſelf of good Uſe in drying Tumours.



INDIRECT Modes of Syllogiſms in Logic, are the five laſt Modes of the firſt Figure, expreſſed by the barbarous words *Baralipton*, *Celantis*, *Dabitis*, *Friſeſomorum*. 'Tis the Converſion of the Concluſion which renders the *Modes indirect*. For inſtance, a Syllogiſm in *Darii*, and another in *Dabitis* would be perfectly alike, were it not for that Converſion; the Propoſitions having the ſame Quantity, and the ſame Quality, and the middle Term being the Subject in the Major, and the Attribute in the Minor in both. It remains then, that to make a Diſtinction, that which is the Subject of the Concluſion in *Darii*, is the Attribute in the Conluſion of *Dabitis*; and that which is the Attribute in the firſt, the Subject in the laſt.

D A- Every thing that promotes Salvation is advantageous:
R I- There are Afflictions which promote Salvation;
I. Therefore there are Afflictions which are advantageous.

D A- Every thing that promotes Salvation is advantageous:
B I- There are Afflictions which promote Salvation;
T I S. Therefore ſome things promoting Salvation are Afflictions, or afflicting.

INDIVIDUAL, or INDIVIDUUM, in Logic, is a particular Being of any Species, or that which can't be divided into two or more Beings, equal or alike. The uſual Diviſion in Logic is made into Genera, or Genus's, thoſe Genera into Species, and thoſe Species into *Individuals*. The Schoolmen make a fourfold Diſtinction of *Individuals*: (1.) *Individuum Vagum*, is that, which tho' it ſignifies but one thing, yet may be any of that kind; as when we ſay a Man, a certain Perſon, or one ſaid ſo and ſo, tho' but one Perſon is meant, yet that Perſon, for ought that appears to the contrary, may be any body. (2.) *Individuum Determinatum*, is when the thing is named and determined; as *Alexander*, the River *Nile*, &c. this is alſo called *Signatum*. (3.) *Individuum Demonſtrativum*, is when ſome demonſtrative Pronoun is uſed in the Expreſſion; as this Man, that Woman. (4.) *Individuum ex Hypotheſi*, or by Suppoſition, when an univerſal Name or Term is reſtrained, by the Suppoſition, to a particular thing; as when we ſay, the Son of ſuch an one, and it be known that he had but one Son.

INDIVISIBLES, in Geometry, are underſtood of ſuch Elements or Principles, as any Body or Figure may ultimately be reſolved into; and theſe Elements, or *Indiviſibles*, are, in each peculiar Figure, ſuppoſed to be infinitely ſmall. With regard to which Notion, a Line may be ſaid to conſiſt of Points, a Surface of parallel Lines, and a Solid of parallel and ſimilar Surfaces; and then becauſe each of theſe Elements is ſuppoſed indiviſible, if in any Figure, a Line be drawn thro' the Elements perpendicularly, the Number of Points in that Line will be the ſame, as the Number of the Elements. Whence we may ſee, that a Parallelogram, Priſm, or Cylinder, is reſolvable into Elements or *Indiviſibles*, all equal to each other, parallel, and like to the Baſe: A Triangle into Lines parallel to the Baſe, but decreaſing in Arithmetical Proportion; and ſo are the Circles, which conſtitute the Parabolic Conoid, and thoſe which conſtitute the Plane of a Circle, or the Surface of an Iſoceles Cone. A Cylinder may be reſolved into Cylindrical Curve Surfaces, having all the ſame Height, and continually decreaſing inwards, as the Circles of the Baſe do, on which they inſiſt. This Method of *Indiviſibles* is only the antient Method of Exhauſtion, a little diſguiſed and contracted, and is now allowed to be of excellent Uſe in the ſhortning of Mathematical Demonſtrations. Of which take the following Inſtance in that famous Propoſition of *Archimedes*, That a Sphere is two Thirds of a Cylinder circumſcribing it. For ſuppoſe (as in the Figure) a Cylinder, Hemiſphere, and an inverted Cone to have the ſame Baſe and Altitude, and

to be cut by infinite Planes, all parallel to the Baſe, of which *d g* is one; it is plain, the Square of *d h* will every where be equal to the Square of *k c* (the Radius of the Sphere) the Square *h c* = *e h* ſquare; and conſequently ſince Circles are to one another as the Squares of the Radii, all the Circles of the Hemiſphere will be equal to all thoſe of the Cylinder, deducting thence all thoſe of the Cone: wherefore the Cylinder, deducting the Cone, is equal to the Hemiſphere; but it is known, that the Cone is one Third of the Cylinder, and conſequently the Sphere muſt be two Thirds of it.

INDORSEMENT is any thing written on the Back of a Deed or Inſtrument; as a Condition, written on the back of an Obligation, is commonly called an *Indorſement*, from *in* and *Dorſum*, *Back*.

INDUCTION, *in Logic*, a Conſequence drawn in reaſoning from ſeveral eſtabliſhed Principles. Thus the Concluſion of a Syllogiſm is an *Induction* made from the Premiſes. An *Induction*, however, may be juſtly ſaid to be a Syllogiſm of itſelf, being a kind of Medium between an Enthymeme and a Gradation, in regard it wants a Propoſition (which, however, is underſtood) as in the Enthymeme, and abounds in Aſſumptions (which yet are collateral, or of the ſame degree) which is the Caſe in a Gradation. Thus, for inſtance, every Terreſtrial Animal lives, every Aerial Animal alſo lives, every Aquatic Animal lives, and every Reptile Animal lives; therefore every Animal lives. There are, it may be obſerved, various Aſſumptions, from the more general Species of the Animal Kind collected into one, which this Propoſition is ſuppoſed to precede, *viz.* every Animal is either Terreſtrial, Aerial, Aquatic, or Reptile.

Suidas reckons three kinds of *Induction*; that juſt mentioned, which concludes or gathers ſome general Propoſition from an Enumeration of all the Particulars of a kind, he calls the *Dialectic Induction*. The ſecond, which proceeds by Interrogation, and concludes probably, or with a Veriſimilitude, by the *Greeks* called ἐπαγωγὴ, and was that which *Socrates* ordinarily made uſe of, as *Cicero* in his Topics, and *Quintilian* have obſerved. The third kind of *Induction* is properly rhetorical; being a Concluſion drawn from ſome Example or Authority. This is a very imperfect *Induction*, all its Force lying in a Propoſition which is concealed, and which will hardly bear being expreſſed. Thus he that ſays, *Codrus* died bravely for his Country, therefore I muſt die bravely for my Country, proves nothing, unleſs this Propoſition be carried in mind, that I muſt do the ſame with *Codrus*. Again, *Archimedes*, and the other Mathematicians ſay, the Sun is much bigger than the Earth; therefore it muſt be owned the Sun is much bigger than the Earth. Where the Propoſition is underſtood, *viz.* whatever *Archimedes* and the other Mathematicians ſay is true.

INDUCTION, in the *Engliſh* Cuſtoms, is uſually taken for the giving Poſſeſſion to an Incumbent of his Church, by leading him into it, and delivering him the Keys by the Commiſſary or Biſhop's Deputy, and by his ringing one of the Bells. When a Clerk is inſtituted into a Benefice, he is to exhibite his Mandate from the Biſhop to the Arch-Deacon, or other Perſon to whom it is directed, and hath a Right thereby to be inducted into his Living; and if he be refuſed *Induction*, he hath a Remedy both in the Eccleſiaſtical Court, and alſo an Action of the Caſe in the Common Law, againſt the Arch-Deacon. If the Inductor, or Perſon to be inducted, be kept out of the Church or Houſe by Laymen, the Writ *de vi Laica* lies for the Clerk, which is directed out of the Chancery to the Sheriff of the County, to remove the Force, &c. If another Clergyman, preſented by the ſame Patron, keep poſſeſſion, a Spoliation is grantable out of the ſpiritual Court, whereby the Tithes, &c. ſhall be ſequeſtred, till the Right be determined. The Arch-Deacon rarely inducts a Clerk by himſelf in Perſon, but iſſues out a Warrant to all Clerks and Lettered Perſons within the Arch-Deaconry, impowering any of them to do it in his ſtead. The uſual Form and Manner of *Induction*, is, for the Inductor to take the Clerk by the Hand, and then to lay it on the Key of the Church, which muſt be then in the Door, and to ſay, 'By virtue of this Inſtrument, I induct 'you into the real, actual, and corporal Poſſeſſion of the 'Rectory or Vicarage of ------, with all its Fruits, Profits, 'Members, and Appurtenances.' This done, he opens the Door, and puts the Clerk in poſſeſſion of the Church, and ſhuts the Door upon him; who after he hath tolled a Bell (if there be any) comes out, and deſires the Inductor to indorſe a Certificate of his *Induction* on the Arch-Deacon's Warrant, and that all preſent will ſignify it under their Hands. If the Church-Key cannot be had, it is ſufficient that the Clerk lays hold of the Ring of the Door, and within the time limited read the Common-Prayer, and Thirty-nine Articles of the Church in the Church-Porch. Within two Months after this, the Clerk muſt read the Thirty-nine Articles, and all the Service of the Day, both at Morning and Evening-Prayers, and declare his Aſſent and Conſent; he muſt alſo then read the Biſhop's *Engliſh* Certificate, in which is the Declaration of his Conformity; and of all this he muſt have two or three good Witneſſes, who muſt ſign that they heard him do it, and be ready to atteſt it, *viva voce*, if required; and within three Months after *Induction*, he muſt alſo take the Abjuration-Oath at the Quarter-Seſſions, or in ſome one of the Courts at *Weſtminſter-Hall*. The word *Induction* is derived from the *Latin in*, and *duco*, *to lead*.

INDULGENCE, *in the* Romiſh *Theology*, is the Remiſſion of the Puniſhment due to a Sin, granted by the Church, and ſuppoſed to ſave the Sinner from Purgatory. They found their *Indulgences* on the infinite Treaſure of the Merits of Jeſus Chriſt, the Holy Virgin, and all the Saints, which they ſuppoſe the Church has a right of diſtributing, by virtue of the Communion of Saints. The *Roman* Jubilee carries with it a plenary or full *Indulgence* for all the Crimes committed therein. The Pope alſo grants Bulls of plenary *Indulgence* to ſeveral Churches,

Monaſteries, and even to private Perſons; and 'tis a frequent thing to have general *Indulgences* for the time of the principal Feaſts of a Year. Their Caſuiſts ſay, that a plenary *Indulgence* does not always prove effectual, for want of complying with the Conditions whereon it was granted.

Indulgence, *Indult*, or *Indulto*, ſignifies alſo a ſpecial Favour or Privilege, conferred either on a Community, or a particular Perſon, by the Pope's Bulls, in virtue whereof he is licenſed to do or obtain ſomething contrary to the Intention and Diſpoſition of the common Laws. There are two kinds of *Indulto's*; the one active, which conſiſts in a Power of nominating and preſenting freely, and without reſerve, to Benefices that are otherwiſe limited and reſtrained by the Laws of the Apoſtolical Chancery; ſuch are thoſe ordinarily granted to Secular Princes, Cardinals, Biſhops, *&c.* Paſſive *Indulto's* conſiſt in a power of receiving Benefices and expectative Graces; of which kind are thoſe of a Parliament, of Graduates, and Mandatories. The *Indulto* of Kings is the Power given them of preſenting to Conſiſtorial Benefices, either by Treaty, by Favour, or ſpecial Privilege. The *Indulto* of Cardinals is a Licence for holding Regular as well as Secular Benefices, in diſpoſing of them *in commendam*, or continuing them, *&c.* *Indulto* of Parliament is a Right or Privilege granted to the Chancellor, Preſidents, Counſellors, and other Officers in the Parliaments, to obtain a Benefice of the Collator, upon the King's Nomination directed to him. This is a kind of Advowſon or Patronage belonging to the *French* King, the *Indulto* being a Mandate or Grace, by which he is permitted to name to any Collator he pleaſes, a Counſellor, or other Officer of Parliament, on whom the Collator ſhall be obliged to beſtow a Benefice: ſo that the Right of the *Indulto* reſides radically in the King, the Officers being only the Objects thereof. See *Diſpenſation*.

INDURATING, a Term applied to ſuch Things as give a harder or firmer Conſiſtence to others, by a greater Solidity of their Particles, or as diſſipate the thinner Parts of any Matter, ſo as to leave the Remainder harder. Thus a Tumour is indurated, either by the Addition of earthy and ſolid Particles, as in *Schirri* and knotty Swellings, or by tranſpiring the thinner Parts thro' the Skin, whereby the Remainder grows more fixed, as in an *Oedema*.

INEQUALITY of Natural Days. See *Equation*.

INERTIÆ VIS. See *Vis Inertiæ*.

INESCATION, a kind of Tranſplantation, practis'd for the Cure of certain Diſeaſes; it conſiſts in impregnating a proper Medium or Vehicle, with ſome of the Mumia or vital Spirit of the Patient, and giving it to ſome Animal to eat. 'Tis pretended the Animal unites and aſſimilates that Mumia with itſelf, correcting it, and imbibing its vicious Quality, and by that means reſtoring Health to the Perſon whereto the Mumia belonged. If the Animal happens to die before the Cure be effected, a ſecond Animal muſt be pitched on, and the Experiment repeated. Some tell us, that the Blood of the Patient well putrefied or fermented, does the Buſineſs better than any other Part. The word is derived from the privative Prepoſition *in*, and *eſca*, *Food*.

INESCUTCHEON, *in Heraldry*, ſignifies all the *Eſcutcheons* containing ⅓ of the Field, and is borne within it, as an Ordinary. Thus, 'tis ſaid, he beareth Ermin, an *Ineſcutcheon* Gules. This is alſo ſometimes called an *Ineſcutcheon of Pretence*, which is borne when a Man marries an Heireſs; for then he bears her Coat of Arms on an *Ineſcutcheon*, or *Eſcutcheon of Pretence*, in the middle of his own Coat.

IN ESSE, Authors make this Difference between a thing *in eſſe*, and a thing *in poſſe*; a thing that is not, but may be, they ſay is *in poſſe*, or *potentia*; but a thing apparent and viſible, they ſay is *in eſſe*, that is, has a real Being *eo inſtanti*, whereas the other is caſual, and at beſt but a Poſſibility.

INFALLIBLE, that which cannot deceive, or be deceived. Upon this Term ſtands one of the principal Heads of Controverſy between the Reformed and the Catholicks. The latter of whom maintain, that the Church, aſſembled in General Council, is *infallible*, which the former deny. The principal Reaſons they give for the *Infallibility*, are drawn from the Obſcurity of the Scriptures, the Inſufficiency of private Judgment, and the Neceſſity there is of ſome *infallible* Judge for the Deciſion of Controverſy. The *Infallibility* of the Pope is a Doctrine of a late ſtanding, and not entirely acquieſced in even in their own Communion. *Du Pin*, a Doctor of the *Sorbonne*, has written againſt it, and the late Behaviour of the Cardinal *de Noailles*, and the proteſting Biſhops, ſeconded by a conſiderable Part of the Clergy of *France*, ſhew to how low an Ebb the Pope's *Infallibility* is reduced in that Country. The word comes from the *Latin* Prepoſition *in*, taken privatively, and *fallo*, *I deceive*.

INFAMOUS, in the ordinary Uſe of the Word, ſignifies ſomething notoriouſly contrary to Virtue or Honour. *Aulus Gellius* uſes the words *Infames Materias*, for what we ordinarily call *Paradoxes*, i. e. Diſcourſes remote from the common Opinion; Propoſitions that appear oppoſite to Truth, *&c.* as the Elogy of *Therſites*; the Praiſe of a Quartan Ague, *&c.*

Infamous, in Law, is ſomething void of Honour, that has no Repute or Eſteem in the World. There are two kinds of *Infamy*; ſome being *infamous* by Right, *de Jure*, as thoſe who have been noted by the Laws, or ſtigmatized by publick Judgments: Others are *infamous* in Fact, *de Facto*, as thoſe who exerciſe ſome ſcandalous Profeſſion, as a Catchpole, a Merry Andrew, a Hangman, an Informer, *&c.* Heretofore there were Crowns of *Infamy* given by way of Puniſhment to Criminals: they were made of Wooll. The word *infamous* is derived from the *Latin*, *in*, and *Fama*, *Fame*, *Report*.

INFANT, any Man or Woman under the Age of one and twenty Years is an *Infant* in Law. An *Infant* eight Years of Age, or upwards, may commit Homicide, and be hanged for it, if it appear by any other Act that he had Knowledge of Good and Evil; for here *Malitia ſupplebit Ætatem*; yet *Coke* on *Littleton*, *Sect.* 405. ſays, *An Infant ſhall not be puniſhed till the Age of Fourteen*; which, according to him, is the Age of Diſcretion.

INFANTE, INFANTA, a Title of Honour given to the Children of ſome Princes, particularly to thoſe of the Houſe of *Spain* and *Portugal*. It is uſually ſaid that this Title was introduced into *Spain*, on occaſion of the Marriage of *Eleanor* of *England* with King *Ferdinand* of *Caſtile*, and that their Son *Sancho* was the firſt that bore it. But this is contradicted by *Pelagius* Biſhop of *Oviedo*, who lived in the Year 1100, and informs us, that the Titles *Infante* and *Infanta*, were uſed in *Spain* ever ſince the Reign of King *Evremond* II.

INFANTRY, Troops, or Forces, conſiſting of Foot-Soldiers.

INFATUATE, to prepoſſeſs any one in favour of a Perſon or Thing that does not deſerve it, ſo far as that he can't eaſily be diſabuſed. The *Romans* called thoſe infatuated Perſons *Infatuati*, who fancied they had ſeen Viſions, or imagined the God *Faunus*, whom they called *Fatuus*, had appeared to them. The word *infatuate* comes from the *Latin Fatuus*, *Fool*, of *fari*, *to ſpeak out*, which is borrowed from the *Greek* φάσμαι, whence φάτις, which ſignifies the ſame with *Vates* in *Latin*, or *Prophet* in *Engliſh*; and the reaſon is, becauſe their Prophets or Prieſts uſed to be ſeized with a kind of Madneſs or Folly, when they began to make their Predictions, or deliver Oracles.

INFECTION, is the catching a Diſeaſe by ſome Effluvia or fine Particles, which fly off from ſome diſtempered Bodies, and mixing with the Juices of others, occaſion the ſame Diſorders, as in the Bodies they came from. The word comes from the *Latin* Verb *inficere*, which properly ſignifies *to dye of ſome other Colour*; *inficere*, *i.e. facere ut aliquid intus ſit*, *to occaſion ſomething to be imbibed*. See *Poiſon*.

INFIDEL, a Term applied to ſuch Perſons as are not baptized, and that do not believe the Truths of the Chriſtian Religion. 'Tis Baptiſm that makes the ſpecific Difference between an Heretic and an *Infidel*.

INFINITE, that which has neither Beginning nor End; in which ſenſe God alone is *infinite*. The word is alſo uſed to ſignify that which has had a Beginning, but will have no End, as Angels, and human Souls. This is what the Schoolmen call *infinitum à parte poſt*; as, on the contrary, by *infinitum à parte ante*, they mean that which has an End, but had no Beginning.

An *infinite* Line in Geometry, is an indefinite or indeterminate Line, to which no certain Bounds or Limits are preſcribed.

Infinite Quantity. See *Quantity Infinite*.

Infinite Series. See *Series*.

INFINITELY INFINITE FRACTIONS, a Term uſed where all the Fractions, whoſe Numerator is 1, are together equal to an Unit: and hence it is deduced, that there are not only *infinite* Progreſſions, or Progreſſions *in infinitum*; but alſo *infinitely* farther than one kind of Infinity. That theſe *infinitely* infinite Progreſſions are notwithſtanding computable, and to be brought into one Sum; and that not only finite, but into one ſo ſmall, as to be leſs than any aſſignable Number: That of Infinite Quantities, ſome are equal, others unequal; that one infinite Quantity may be equal to two, three, or more Quantities, whether infinite or finite.

INFINITIVE, in Grammar, is the Name of one of the Modes ſerving for the conjugating of Verbs. It does not denote any preciſe time, nor does it determine the Number or Perſons, but expreſſes things in a looſe indefinite Senſe, as *to teach*, *&c.* In moſt Languages, both antient and modern, the *Infinitive* is diſtinguiſhed by a Termina-

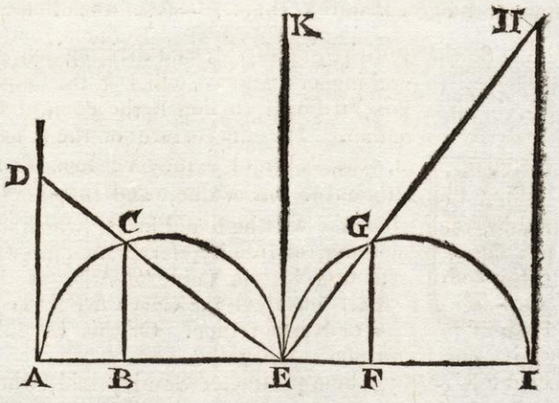
Termination peculiar to it, as *ωσλειν* in the *Greek*, *ſcribere* in the *Latin*, *ecrire* in the *French*, *ſcrivere* in the *Italian*, &c. but the *Engliſh* is defective in this point; ſo that to denote the *Infinitive*, we are always obliged to have recourſe to the Article *to*, excepting ſometimes when two or more *Infinitives* follow each other. The Practice of uſing a Number of *Infinitives* ſucceſſively, is a great, but a common Fault in Language, as *he offers to go to teach to write* Engliſh. Indeed, where theſe *Infinitives* have no dependence on each other, they may be uſed elegantly enough; as *to mourn, to ſigh, to ſink, to ſwoon, to die.*

INFINITY. The Idea ſignified by the name *Infinity* is beſt examined, by conſidering to what *Infinity* is by the Mind attributed, and then how it frames it. Finite and Infinite are looked upon as the Modes of Quantity, and attributed primarily to things that have Parts, and are capable of Increaſe or Diminution, by the Addition or Subſtraction of any the leaſt Part. Such are the Ideas of Space, Duration, and Number. When we apply this Idea to the Supreme Being, we do it primarily in reſpect of his Duration and Ubiquity; more figuratively, when to his Wiſdom, Power, Goodneſs, and other Attributes, which are properly inexhauſtible and incomprehenſible: For when we call them infinite, we have no other Idea of this Infinity, but what carries with it ſome Reflection on the Number or the Extent of the Acts or Objects of God's Power and Wiſdom, which can never be ſuppoſed ſo great, or ſo many, that theſe Attributes will not always ſurmount and exceed, tho we multiply them in our Thoughts with the *Infinity* of endleſs Number. We do not pretend to ſay, how theſe Attributes are in God, who is infinitely beyond the reach of our narrow Capacities; but this is our way of conceiving them, and theſe our Ideas of their *Infinity*. We come by the Idea of *Infinity* thus. Every one that has any Idea of any ſtated Lengths of Space, as a Foot, Yard, &c. finds that he can repeat that Idea, and join it to another, to a third, and ſo on, without ever coming to an end of his Additions. From this Power of enlarging his Idea of Space, he takes the Idea of infinite Space, or Immenſity. By the ſame Power of repeating the Idea of any Length or Duration we have in our Minds, with all the endleſs Addition of Number, we come by the Idea of Eternity. If our Idea of Infinity be got, by repeating without end our own Ideas, why do we not attribute it to other Ideas, as well as thoſe of Space and Duration; ſince they may be as eaſily and as often repeated in our Minds as the other? yet no body ever thinks of infinite Sweetneſs, or Whiteneſs, tho he can repeat the Idea of Sweet or White, as frequently as thoſe of Yard or Day? To this it is anſwer'd, that thoſe Ideas which have Parts, and are capable of Increaſe by the Addition of any Parts, afford us by their Repetition an Idea of *Infinity*; becauſe with the endleſs Repetition there is continued an Enlargement, of which there is no end: but it is not ſo in other Ideas; for if to the perfecteſt Idea I have of White, I add another of equal Whiteneſs, it enlarges not my Idea at all. Thoſe Ideas, that conſiſt not of Parts, cannot be augmented to what proportion Men pleaſe, or be ſtretch'd beyond what they have received by their Senſes; but Space, Duration, and Number being capable of Increaſe by Repetition, leave in the Mind an Idea of an endleſs room for more; and ſo thoſe Ideas alone lead the Mind towards the Thought of *Infinity*. We are carefully to diſtinguiſh between the Idea of the *Infinity* of Space, and the Idea of a Space infinite. The firſt is nothing but a ſuppoſed endleſs Progreſſion of the Mind over any repeated Idea of Space: But to have actually in the Mind the Idea of a Space infinite, is to ſuppoſe the Mind already paſſed over all thoſe repeated Ideas of Space, which an endleſs Repetition can never totally repreſent to it; which carries in it a plain Contradiction. This will be plainer, if we conſider *Infinity* in Numbers. The *Infinity* of Numbers, to the End of whoſe Addition every one perceives there is no Approach, eaſily appears to any one that reflects on it: But how clear ſoever this Idea of the *Infinity* of Numbers be, there is nothing yet more evident, than the Abſurdity of the actual Idea of an infinite Number.

INFIRMARY, a Place where the Sick belonging to any Society or Community are diſpoſed.

INFLAMMATION, in Phyſic, is underſtood of a Tumour, occaſioned from an Obſtruction; by means whereof the Blood flowing into ſome Part faſter than it can run off again, ſwells up, and cauſes a Tenſion, with an unuſual Soreneſs, Redneſs, and Heat. The immediate Cauſe, therefore of all *Inflammations*, is an overflowing of Blood. Other Cauſes, more remote, may be the Denſity and Coagulation of the Blood, or the Relaxation and Contuſion of the Fibres. Phyſicians have given particular Names to the *Inflammations* of ſeveral Parts. That of the Eyes is call'd *Ophthalmia*, that of the Lungs *Peripneumonia*, and that of the Liver *Hepatites*. The word *Inflammation* comes from the *Latin in*, and *Flamma*, Flame.

INFLATION, a blowing up; is the ſtretching or filling any flaccid or diſtendable Body, with a flatulent or windy Subſtance. From the *Latin in* and *flatus*, of *flo*, I blow.



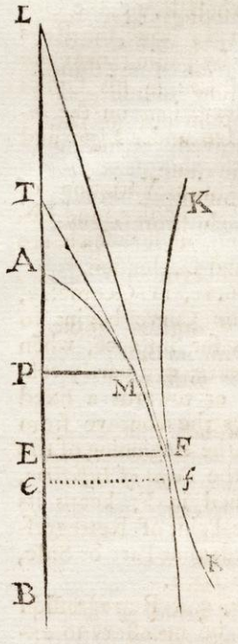
INFLECTION, in Optics, is a multiplicate Refraction of the Rays of Light, cauſed by the unequal Denſity of any Medium, whereby the Motion or Progreſs of the Ray is hindred from going on in a right Line, and is inflected or deflected by a Curve, ſaith Dr. *Hook*, who firſt took notice of this Property: And this, he ſaith, differs both from Reflection and Refraction, which are both made at the Superficies of the Body, but this in the middle of it within. Sir *Iſaac Newton*, as you will find under *Light*, diſcover'd alſo by plain Experiment this *Inflection* of the Rays of Light; and M. *de la Hire* ſaith, he found, That the Beams of the Stars being obſerved in a deep Valley, to paſs near the Brow of a Hill, are always more refracted, than if there were no ſuch Hill, or the Obſervations were made on the top thereof; as if the Rays of Light were bent down into a Curve by paſſing near the Surface of the Mountain. Sir *Iſaac Newton* in his Optics makes ſeveral Experiments and Obſervations on the *Inflection* of the Rays of Light; which ſee under *Light* and *Rays*.

INFLECTION, in Grammar, is the Variation of Nouns and Verbs, in their ſeveral Caſes, Tenſes, and Declenſions. *Inflection* is a general Name, under which are comprehended both the Conjugation and Declenſion.

INFLECTION POINT of any Curve, in Geometry, ſignifies the Point or Place where the Curve begins to bend back again a contrary way: As for inſtance, when a curve Line, as A F K, is partly concave, and partly convex towards any right Line, as A B, or towards a fixed Point, then the Point F, which divides the concave from the convex Part, and conſequently is at the Beginning of the one, and End of the other, is called the *Point of Inflection*, as long as the Curve, being continued in F, keeps its Courſe the ſame; but it is called the Point of Retrogreſſion, when it inflects back again towards that Part or Side, from whence it took its Original. See *Fig.* 2.

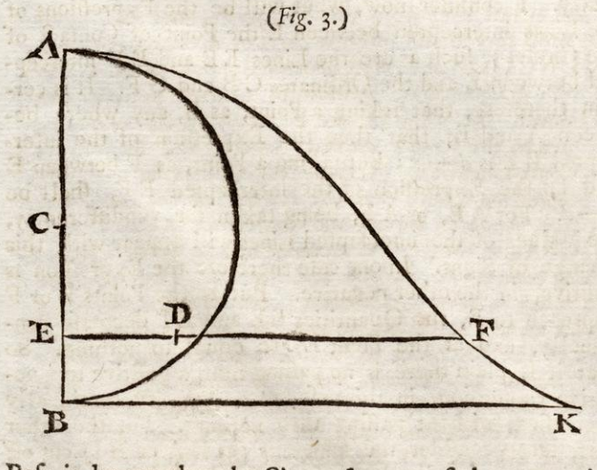
Before the Theory of this *Inflection*, and Retrogreſſion of Curves, can be underſtood, it may be neceſſary to explain this general Principle. Whatſoever finite Quantity (or if it be a Fluxion, it is all one) goes on continually increaſing or decreaſing, it cannot change from a poſitive to a negative Expreſſion, or from a negative to a poſitive one, without firſt becoming equal to an infinite or nothing. It is equal to nothing, if it doth continually decreaſe, and equal to an infinite, if it doth continually increaſe. To illuſtrate this, let there be two Circles touching one another in the Point E (*Fig.* 1.) their Diameters A E and E I lying in one and the ſame right Line. Let A E or E I be $= d$. Let the Diſtance between the Extremity A and any Ordinate in either of the Circles be $=$ to x perpe-

(*Fig.* 1.)



tually. I conſider now, what will be the Expreſſions of the Lines intercepted between E the Point of Contact of the Circles; ſuch as are the Lines E B and E F intercepted between E and the Ordinates C B and G F. It is certain therefore, that taking a Point, as B, any where between A and E, that then the Expreſſion of the intercepted B E is $d - x$; but taking a Point, as F between E and I, the Expreſſion of the intercepted E F, ſhall be $x - d$. For A B, or A F, being taken for x indifferently, the Values of the intercepted Lines will appear with this Change of Signs. In one caſe therefore the Expreſſion is poſitive, in the other negative. But as the Points B or F approach to E, the Quantities B E and E F decreaſe continually, and at the Point E are equal to nothing. So that it is plain there is no paſſing from a poſitive to a negative Expreſſion, in this caſe, of a Quantity continually decreaſing, without paſſing thro nothing. For the other part, let us conſider the Tangents (as D A or H I) cut off by Lines continually drawn from E, the Point of the Circle's Contact. If C B, or G F, be put equal to y, the

Expreſſion



Expreſſion of any ſuch Tangent will be $\frac{y\,d}{d-x}$, or $\frac{y\,d}{x-d}$, according as we take it on the one or the other ſide of the Point E; in one caſe therefore it is poſitive, in the other negative. But as the Points B or F approach to E, the Tangents D A and H I increaſe continually, and at the Point E they become infinite. Therefore a Quantity that continually increaſeth, cannot paſs from a poſitive to a negative Expreſſion, without being infinite. All this is univerſally true, whether it be a finite Quantity or a Fluxion that we conſider. There is no changing from poſitive to negative, without paſſing thro nothing or infinite. Applying this therefore to a Fluxion, it will follow from hence, That the Fluxion of a Quantity that expreſſeth a *Maximum* or a *Minimum*, muſt be equal to nothing, or to infinite. And upon this Foundation, we may now eaſily proceed to the Points of *Inflection* and Retrogreſſion. In order to find a general Theorem to aſſiſt us in this Matter, let us conſider the Curve A F K, (*Fig.* 2.) whoſe Diameter is the right Line A B; and its Ordinates P M, *e f*, parallel to one another. If through the Point F be drawn the Ordinate Applicate E F, together with the Tangent F L; and from any other Point, as M on the ſame ſide with A F, be drawn the Ordinate Applicate M P, as likewiſe the Tangent M T: It is evident, (1.) In theſe Curves that have a Point of *Inflection*, that the *Abſciſſa* A P increaſes continually, and that the Part A T of the Diameter, intercepted between A the Origin of the Axis, and T the Concourſe of the Tangent and the Axis, increaſeth ſuch time as the Point P fall upon E, and after it again begins to diminiſh: From whence it is apparent, that A T muſt become the *Maximum* A L, when the Point P falls upon the Point E required. (2.) In thoſe Curves that have a Point of Retrogreſſion, it is evident that the Part A T increaſeth continually, and that the *Abſciſſa* increaſeth ſo long, till the Point T fall upon L, after which it again diminiſheth: From whence it is clear, that A P muſt become a *Maximum*, when the Point T falls upon L. Now if A E be put $=x$, E F $=y$, then will A L be $=\frac{y\dot{x}-x\dot{y}}{\dot{y}}$, whoſe Fluxion, which is $\frac{y^2\dot{x}-y\dot{x}\ddot{y}-x\dot{y}\ddot{y}}{y^2}$ (ſuppoſing $\dot{x}$ invariable) being divided by $\dot{x}$; the Fluxion of A E muſt become nothing or infinite; that is, $\frac{-y\ddot{y}}{y^2}$ = nothing or infinite: So that multiplying by y^2, and dividing by $-y$, $\ddot{y}$ will be = to nothing or infinite; which in the Sequel will ſerve for a general Form to find F the Point of *Inflection* or Retrogreſſion. For the nature of the Curve A F K being given, the Value of $\dot{y}$ may be found in $\dot{x}$; and taking the Fluxion of this Value, and ſuppoſing $\dot{x}$ invariable, the Value of $\ddot{y}$ will be found in x^2, which being put equal to nothing, or Infinity, ſerves in either of theſe Suppoſitions to find ſuch a Value of A E, as that the Ordinate E F ſhall interſect the Curve A F K in F, the Point of *Inflection* or Retrogreſſion. Of this we ſhall only give one Example.

(*Fig.* 2.)

Let A F K (*Fig.* 3.) be a protracted Semicycloid, whoſe

(*Fig.* 3.)

Baſe is longer than the Circumference of the generating Circle A D B, whoſe Center is C. It is required to find E in the Diameter A B; ſo that the Ordinate Applicate E F ſhall cut the Semi-cycloid in F, the Point of contrary Flexion. Suppoſe the known Quantities A D B $=a$, B K $=b$; A B $=2c$, and the unknown Quantities A E $=x$, E D $=z$, the Ark A D $=u$, E F $=y$; then by the Property of the Cycloid $y=z+\frac{b\,u}{a}$, and therefore $\dot{y}=\dot{z}+\frac{b\,\dot{u}}{a}$: But by the Property of the Circle $z=\sqrt{2cx-xx}$, conſequently $\dot{z}=\frac{c\,\dot{x}-x\,\dot{x}}{\sqrt{2cx-xx}}$, and $\dot{u}\,(\sqrt{\dot{x}^2+\dot{z}^2})=\frac{c\,\dot{x}}{\sqrt{2cx-xx}}$: Therefore ſubſtituting for $\dot{z}$, and $\dot{u}$ their reſpective Values, we have $\dot{y}=\frac{ac\dot{x}-ax\dot{x}+bc\dot{x}}{a\sqrt{acx-xx}}$, and the Fluxion thereof, (ſuppoſing $\dot{x}$ invariable) is $\frac{bcx-acx-bcc\times x}{2cx-xx\times\sqrt{2cx-xx}}=0$, that is, A E $(x)=c+\frac{ac}{b}$ and C E $=\frac{ac}{b}$. Hence it is evident, That to have F a Point of contrary Fluxion, b muſt be greater than a; for if it be leſs, then C E would exceed C B. Concerning the *Inflection* of the Rays of Light, ſee *Light*.

INFLUENCE, a Quality ſuppoſed to flow from the Bodies of the Stars, or the Effect of their Heat and Light, to which the Aſtrologers vainly attribute all the Events that happen on the Earth. The Alchymiſts, who make it the Philoſopher's Stone, tell us, that every thing in Nature is produced by the *Influence* of the Stars, which, in their Paſſage thro' the Atmoſphere, imbibe many of its moiſt Parts, the groſſeſt whereof they depoſite in the Sands and Earths where they fall; that theſe filtrating thro' the Pores of the Earth, deſcend even to the Center, whence they are driven, by the central Fire, back again to the Surface, and in their Aſcent, by a natural kind of Sublimation, as they find Earths well diſpoſed, they form natural Bodies, as Metals, Minerals, and Vegetables, &c. Thus Chymiſtry conſiſting in an artificial Imitation of theſe natural Operations, and in applying active Principles to paſſive Principles, 'tis pretended it can form natural Bodies, make Gold, &c.

INFLUENT, a Term uſed where any Liquor or Juice, by the Contrivance of Nature, and the Laws of Circulation, falls into another Current and Receptacle. Thus with reſpect to the common Receptacle in the human Body, the Chyle is its *influent* Juice, and ſo is the Bile to the Gall-Bladder, and Venal-Blood to the Heart in its Diaſtole; and the like.

IN FORMA PAUPERIS, in Law, is when any Man that hath a juſt Cauſe or Suit, either in the Chancery, or any of the Courts of Common Law, will come before the Lord-Chancellor, or Maſter of the Rolls, or either of the Chief Juſtices, or Chief Baron, and make Oath, that he is not worth five Pounds, his Debts paid; either of the ſaid Judges will, in his own proper Court, admit him to ſue *in Forma Pauperis*, and he ſhall have Counſel, Clerk, or Attorney aſſigned to do his Buſineſs, without paying any Fees.

INFORMATION, in Law; ſee *Inditement*. *Information* for the King is the ſame; that for a common Perſon we call Declaration, and is not always done directly by the King, or his Attorney, but ſometimes by another, who ſues as well for the King as himſelf; on a Breach of ſome Penal Law or Statute, wherein a Penalty is given to the Party that will ſue for the ſame.

INFORMATUS NON SUM, or *Non ſum Informatus*; a formal Anſwer made of courſe by an Attorney, who is commanded by the Court to ſay any thing he thinks good in behalf of his Client; who having nothing material to ſay, makes anſwer he is not inform'd: on which, Judgment paſſes for the other Party.

INFORMIS, *informed*, that which has not the Form or Perfection it ſhould have. In Aſtronomy we uſe the Terms *Stellæ Informes*, for ſuch Stars as have not yet been reduced into any Conſtellation. Of which kind there was a great Number left by the antient Aſtronomers, tho' *Hevelius*, and ſome others of the Moderns, have provided for the greateſt part of them, by making new Conſtellations.

INFRACTION, a Rupture or Violation of a Treaty, a Law, Ordinance, &c. from the Prepoſition *in*, and the Supine of *frango*, *to break*.

INFRA-LAPSARII, the Name of a Sect, who maintain, that God has created a certain Number of Men only to be damned, without allowing them the means neceſſary to ſave themſelves, if they would. This Doctrine they maintain in different manners, the Sect itſelf being divided into two Branches. Some of them hold, that

that God independently of every thing, and antecedently to all Knowledge or Foreſight of the Fall of the firſt Man, reſolved to ſignalize both his Mercy and his Juſtice; his Mercy, by creating a certain Number of Men, to make them happy to all Eternity; and his Juſtice, by creating likewiſe a Number of other Men, to be miſerable to all Eternity. Others hold, that God did not take this Reſolution, but in conſequence of Original Sin, and of the Knowledge which he had from all Eternity, that *Adam* would commit it: for, ſay they, Man, by this Sin, having forfeited all Pretences to his original Juſtice, deſerves nothing now but Puniſhment. All Mankind is become a Maſs of Corruption, which God may abandon to eternal Deſtruction, without any Impeachment of his Juſtice. However, to ſhew his Mercy too, as well as his Juſtice, he has reſolved to ſelect ſome out of this Maſs, to ſanctify them, and to make them happy. Thoſe who maintain the Doctrine in the firſt manner, are called *Supra-lapſarii*, as believing that God formed the Reſolution of damning a Number of Men, *ſupra Lapſum*, before *Adam*'s Fall, and independently of it. Thoſe of the ſecond Opinion, are called *Infra-lapſarii*, as holding that God made that Reſolution, *infra Lapſum*, after his Knowledge of the Fall, and in conſequence thereof.

INFRA-SPINATUS, a Muſcle that ariſes from the inferior Parts of the Baſis, Spine, and Under-Coſta of the Scapula, and filling the lower Interſcapulum, paſſes on between the Spine and Teres Minor in a triangular Form, and growing tendinous at the Cone, is inſerted into the Head of the Humerus, and draws directly backwards.

INFULA, a Name antiently given to ſome of the Pontifical Ornaments. *Feſtus* tells us, that the *Infulæ* were Filaments or Fringes of Wooll, wherewith the Antients uſed to adorn their Prieſts, their Victims, and even their Temples. Several Authors confound the *Infula* with the Mitre, Tiara, or Cap wore by the Prieſts; but there was a great deal of Difference. The *Infula* was properly a Fillet or Headband of white Wooll, covering that Part of the Head where the Hair grows, as far as the Temples, whence, on each Side, hung down two Strings, called *Vittæ*, to bind it withal; and this has given occaſion to ſome Authors to confound the *Infulæ* with *Vittæ*. The *Infula* was the ſame thing to Prieſts that the Diadem was to Kings, *viz.* the Badge of their Dignity and Authority. The Difference between the Diadem and the *Infula* conſiſted in this, that the Diadem was flat and broad, and the *Infula* rounded and twiſted.

INFUNDIBULUM, a *Latin* Word, ſignifying a Funnel; whence many Parts in an human Body, having a Reſemblance thereto in Shape, are thus called; as the *Infundibulum Cerebri*, and *Infundibulum Renum*; for which ſee *Brain and Kidneys*: and ſome Parts of Plants, for the ſame reaſon, are called *Infundibuliformes*. See *Flowers*.

INFUSION is a Part of Pharmacy, whereby the Virtues of Plants, Roots, and the like, are drawn out, by letting them ſteep in ſome convenient Menſtruum. *Infuſion* is uſed in Bodies of a lax Texture, whoſe Parts are ſo light, as not to admit of a greater Motion, without hazard of flying away in Vapour. Its Uſe is to communicate the Virtues out of Bodies to Liquors, either in order to augment their Force, or correct their ill Qualities. Some *Infuſions* are made in common Water, others in Wine, Vinegar, Milk, Spirit of Wine, &c.

Infuſion is alſo uſed to ſignify the Action of conveying a Liquor into the Body by the Veins. Some Phyſicians have found out a new Method of Purging, by infuſing a Cathartic into the Veins, which operates pretty much after the manner of a Clyſter.

INGEMINATED FLOWERS, are when one Flower ſtands on, or naturally grows out of another.

INGENIT, inborn, ſignifies any Diſeaſe, or Habit, that comes into the World with a Perſon, and is nearly the ſame with Hereditary.

INGENUOUS, among the *Romans*, was a Title applicable to a Perſon who was born free, or of free Parents. A Perſon was accounted *ingenuous* if only the Mother were free, and the Father a Servant. Theſe could give their Votes, and enjoy Offices, from which the *Liberti*, or Freed Men, &c. were debarred. *Iſidore* ſays, they are called *Ingenui qui Libertatem habent in Genere, non in Facto*, who are born free, not thoſe who acquire their Freedom.

Ingenuous is ſometimes alſo uſed to ſignify the Native of a Country, in contradiction to a Foreigner.

INGLUVIES, or Crop, a part which in granivorous Fowls ſerves for the immediate Reception of the Food, where it remains ſome time for Maceration, before it be tranſmitted to the Stomach. This *Ingluvies* is furniſhed with Glands, which, the Patrons of Fermentation maintain, convey a Menſtruum thither, that impregnates the Aliment, and ſerves inſtead of Maſtication.

INGOT is a little Wedge or Maſs of Gold and Silver, or an uncertain Quantity of Bullion.

INGREDIENTS are all the Simples which go into the Compoſition of any Medicine, Ointment, Sauce, &c.

INGRESS, in Aſtronomy, ſignifies the Sun's entering the firſt Scruple of one of the four Cardinal Signs, eſpecially *Aries*.

INGRESSU, in Law, a Writ of Entry, whereby a Perſon ſeeks Entry into Lands or Tenements. It lies in various Caſes, and has various Forms.

INGROSSATOR MAGNI ROTULI, is the ſame as Clerk of the Pipe, which ſee.

INGROSSER, in Common Law, is one that buys Corn growing, or any Proviſions, before the Market, to ſell again; it alſo ſignifies a Clerk, who writes Records or Inſtruments of Law in Skins of Parchment.

INGUEN is that Part of the Body, reaching from the Head of the Thigh to above the ſecret Parts, and is commonly called the Groin. *Inguinalis* is given to any Subdiviſions made of that Part, or any thing therein contained, or applied thereunto by way of Medicine, or the like. The word is pure *Latin*, and is derived, according to ſome, from *Unguen*, *Ointment*, becauſe theſe Parts are frequently anointed. Others derive it from *ango*, becauſe Pains happen frequently there; others again from *ingenor*, becauſe the genital Parts are here.

INHARMONICAL RELATION is a Term in Muſic. See *Relation inharmonical*.

INHERENCE, a Term in Philoſophy, applied to the Juncture or Connexion of an Accident with its Subſtance. Thus Quantity has a neceſſary *Inherence* with a natural Body.

INHERITANCE is a Perpetuity in Lands and Tenements to a Man and his Heirs: This word *Inheritance* is not only underſtood where a Man hath *Inheritance* of Lands and Tenements by Deſcent or Heritage, but alſo every Fee-Simple and Fee-Tail, that a Man hath by his Purchaſe, may be ſaid to be by *Inheritance*, for that his Heirs may inherit after him.

INHIBITION is a Writ to inhibit or forbid a Judge from farther proceeding in the Cauſe depending before him; ſometimes *Prohibition* and *Inhibition* are put together: but *Inhibition* is moſt commonly a Writ iſſuing out of a higher Court to a lower and inferior; and *Prohibition* out of the King's Court to an inferior Court.

INJECTION, in Pharmacy, is any liquid Medicine made to be injected by a Syringe, Clyſter-Pipe, or any other Inſtrument into any Part of the Body. It is likewiſe a common Term for filling the Veſſels with coloured Wax, or any other proper Matter, to ſhew their Figures and Ramifications; a thing frequent among Anatomiſts.

INITIALIA, a Name antiently given to the Myſteries of *Ceres*. See *Cerealia*.

INITIATED, a Term properly uſed in ſpeaking of the Religion of the antient Heathens, where it ſignifies to be admitted to a Participation of the Myſteries of Religion; tho' the word is alſo ſometimes uſed in ſpeaking of other Religions, and even of Philoſophy and other Sciences. The Antients never diſcovered the deeper Myſteries of their Religion, nor even permitted ſome of their Temples to be open to any but thoſe who had been *initiated* in certain Orders. The word comes from the *Latin initiatus*, of *initiare*, *initiari*. *Initiari* properly ſignifies to begin ſacrificing, or to receive or admit a Perſon to the beginning of Myſteries, or of Ceremonies of leſs importance. *Caſaubon*, upon *Athenæus*, obſerves, that all the Myſteries were not communicated at once to the Perſons who preſented themſelves for the Prieſthood, but that at firſt they purified them, then admitted them to the leſs conſiderable Matters to diſpoſe them for the more important, and at laſt they drew the Veil quite, and laid open all the moſt ſacred and ſolemn Parts of Religion.

INJUNCTION is a Writ grounded upon an interlocutory Order in Chancery, ſometimes to give poſſeſſion to the Plaintiff, for want of the Defendant's Appearance; ſometimes to the King's ordinary Court, and ſometimes to the Court-Chriſtian, to ſtop Proceedings in a Cauſe, upon Suggeſtion made, that the Rigour of the Law, if it take place, is againſt Equity and Conſcience in that Caſe.

INJURY, in the general meaning of the word, ſignifies any thing contrary to Juſtice and Equity. The Civilians define *Injury* a private Offence, committed deſignedly, and with an evil Intention, to any Man's Prejudice. The Author of the Rhetorics to *Herennius* ſays, *Injuria eſt quæ aut Pulſatione, aut Convicio, aut Turpitudine, Corpus, Aures, aut Vitam alicujus violavit.* Action on an *Injury* is annual, that is, no Reparation could be required after the Expiration of a Year. By the Law of the twelve Tables, where the *Injury* was the breaking of a Limb, the injured Perſon might demand *Talionem*, that is, he might break the

ſame Limb of the Criminal. For the breaking of a Bone there were conſiderable pecuniary Puniſhments aſſigned: For other *Injuries* only twenty *Aſſes* were decreed, which the Poverty of thoſe times thought a ſufficient Penalty; but the Prætors afterwards finding this too ſlender a Satisfaction, in lieu thereof appointed the injured Perſon to ſet a Rate on the *Injury*, which they afterwards increaſed or leſſened as they thought good. The word is derived from the *Latin* Preposition *in*, which here has a negative Power, and *Jus*, *Law*, *Right*; *Injuria dicitur omne quod non Jure fit.* The Antients made a Goddeſs of *Injury*, and called her *Ate*. *Homer* makes her the Daughter of *Jupiter*, and ſays, ſhe did miſchief to every body, even to her Father; that ſhe was very nimble and tender-footed, and walked altogether on Mens Heads, without ever touching the Ground.

INK, the common Writing-Ink is a Compoſition of Vitriol, Galls, Gum and Water. Printing-Ink is made of Nut-Oil or Linſeed-Oil, Turpentine, and a kind of Black.

Indian, or *Chineſe Ink*, is an admirable Compoſition, and has been in vain attempted to be imitated in *Europe*. It is not fluid like our Writing-Inks, but ſolid, like our Mineral Colours, tho much lighter. They make it of all Figures, but the moſt uſual is rectangular about a quarter of an Inch thick. Some of them are gilt with Figures of Dragons, Birds, Flowers, *&c.* In order to this, they have little wooden Molds, ſo curiouſly wrought, that we could hardly equal them in Metals. Before you uſe this *Ink*, there muſt be a little hollow Marble, or other Stone, with Water in it, on which the Stick of *Ink* muſt be ground, till the Water becomes of a ſufficient Blackneſs. It makes a very black ſhining *Ink*, and tho' it be apt to ſink when the Paper is thin, yet it never runs or ſpreads; ſo that the Letters are always ſmooth and evenly terminated, how big ſoever they be. It is of great Uſe in deſigning, becauſe it may be weakened or diminiſhed to any degree one pleaſes; and there are abundance of things which can't be repreſented to the Life without it. The *Chineſe* make it with Smoak-Black of different kinds, but the beſt is made of the Smoak of fat Pork, burnt at a Lamp. They mix a kind of Oil with it, to make it more ſmooth, and add other odorous Ingredients to take away the Rankneſs of the Smell. After they have mixed it into a Paſte of a proper Conſiſtence, they put it into a Mold to figure it.

INLAND, implies any thing ſituated in the main Land, or Heart of a Country far from the Sea-Coaſts. Hence *Inland* Bills in Traffic are ſuch Bills as are payable in the ſame Land wherein they are drawn.

INMATES, are ſuch Perſons as are admitted (for their Money) to live in the ſame Houſe with another Man, tho in different Rooms, and which go in at the ſame Door jointly with others to whom the Houſe belongeth, and which are not able to maintain themſelves. Theſe are inquirable in a Court-Leet.

INNATE HEAT. See *Calidum Innatum.*

INNATE IDEAS, or Principles, are certain primary Notes or Characters, ſuppoſed to be ſtamped on the Mind of Man when it firſt receives its Being, and which it brings into the World with it; but the Doctrine of *Innate Ideas* is abundantly confuted by Mr. *Locke*. See *Idea*.

INNINGS; Lands recovered from the Sea, by draining and banking, are ſo called.

INNOCENTS-DAY, the Name of a Feaſt celebrated in Commemoration of the Infants murdered by *Herod.* heretofore it was the Cuſtom to have Dances in the Churches on this Day, wherein were Perſons who repreſented Biſhops, by way of Deriſion of the Epiſcopal Dignity. This appears by a Canon of the Council of *Cognac*, held in 1260, which expreſly forbids it.

INNOMINATI, *Gli Innominati*, *Anonymi*, Perſons who have no Names; a Title by which the Academiſts of *Parma* diſtinguiſh themſelves. Moſt Cities in *Italy* have an Academy, and each has its proper Name; thus thoſe at *Parma* entitle themſelves *Gli Innominati*, as if it was their Name to have no Name at all.

INNOMINATUM, in general, ſignifies any thing without a Name. Many Parts of the Body are left under this indiſtinct Term, as the *Innominata Glandula Oculi*, now called *Caruncula Oculi*. See *Eye*. *Innominata Tunica Oculi*. See *Eye*. *Innominatum Os*. See *Ilium*.

INNS. Our Colleges of Municipal or Common Law, Profeſſors, and Students, are ſtill called *Inns*; the old *Engliſh* word for Houſes of Noblemen, Biſhops, and others of extraordinary Note, which is of the ſame Signification with the *French* word *Hôtel*.

Inns of Court, are ſo called, as ſome think, becauſe the Students there are to ſerve the Courts of Judicature, or elſe becauſe antiently theſe Colleges received none but the Sons of Noblemen and better ſort of Gentlemen, as *Forteſcue* affirms. Of theſe we have four; *viz.* the two *Temples*, heretofore the Dwelling of the Knights-Templers, purchaſed by ſome Profeſſors of the Common Law about 300 Years ago; and *Lincolns-Inn* and *Grays-Inn*, antiently belonging to the Earls of *Lincoln* and *Gray*. Theſe Societies are no Corporations, nor have any Judicial Power over their Members, but have certain Orders among themſelves, which have, by Conſent, the force of Laws: for lighter Offences they are only excommoned, or put out of Commons; for greater, they loſe their Chambers, and are expelled the College; and when once expelled out of one Society, they are never received by any of the others. The whole Company of Gentlemen in each Society may be divided into four Parts, Benchers, Utter-Barriſters, Inner-Barriſters, and Students. See *Bencher* and *Barriſter*.

Inns of Chancery were probably ſo called, becauſe antiently inhabited by ſuch Clerks as chiefly ſtudied the forming of Writs, which regularly belonged to the Curſitors, who are Officers of Chancery. The firſt of theſe is *Thavies-Inn*, begun in the Reign of *Edward* III. and ſince purchas'd by the Society of *Lincolns-Inn*; then *New-Inn*, *Clements-Inn*; *Cliffords-Inn*, antiently the Houſe of the Lord *Clifford*; *Staple-Inn*, belonging to the Merchants of the Staple; *Lyons-Inn*, antiently a common Inn with the Sign of the Lion; *Furnivals-Inn*, and *Bernards-Inn*.

Theſe were heretofore preparatory Colleges for younger Students, and many were entered here before they were admitted into the *Inns* of Court. Now they are moſtly taken up by the Attorneys, Sollicitors, *&c.* They belong all to ſome of the *Inns* of Court, who ſend yearly ſome of their Barriſters to read to them.

INNUENDO, from *innuo*, *to beck or nod with the Head*, is a word frequently uſed in Writs, Declarations, and Pleadings. The Uſe of it is only to declare and aſcertain the Perſon or Thing which was named, or left doubtful before; as he (*innuendo*, the Plaintiff) is a Thief, mention being before made of another Perſon.

INOCULATION, in Agriculture, is a kind of Grafting, or an artificial Operation, by which the Bud of one Fruit-Tree is ſet into the Stock or Branch of another, ſo as to make different ſorts of Fruit grow on the ſame Tree. There are various ways of performing this. The antient Method was by making a ſhallow Inciſion in the Bark, where the Knot of a Shoot or Oculus (whence the Operation takes its Name) begins to bud forth, into which a promiſing Shoot of another kind was inſerted, and the Inciſion cloſed up with fat Earth or Clay. The Method of *Inoculation*, now in the beſt Repute, is as follows: They cut off a vigorous Shoot from the Tree that is to be propagated, a Month before or after *Midſummer*; then chuſe out a ſmooth Place in the Stock (which ſhould not be of above three or four Years Growth) making a perpendicular Slit in the Bark a little above an Inch long, and another at right Angles to it, at the lower end, to give way to the opening of the Bark. This done, the Bark is gently looſened from the Wood on both Sides with a Penknife, beginning at the bottom; they then prepare the Bud, cutting it off from the aforeſaid vigorous Shoot, and taking with it as much of the Wood above as below it, and as near as may be to the Length of the ſlit in the Stock. When the Bud is thus cut off, they take out the woody part of the Bud, and put the Bud itſelf in, between the Bark and the Wood of the Stock, at the Croſs-ſlit before opened, leading it upwards by the Stalk, where the Leaf grew, till it exactly cloſes. They then bind it about with Woollen Yarn, the better to make all Parts of it cloſe exactly, that the Bud may imbody itſelf with the Stock, which it will do in three Weeks time. This Operation is ſaid to be beſt performed in a cloudy Day, or in an Evening; and 'tis obſerved, that the quicker 'tis done, the better it ſucceeds. This Practice has the advantage of Engrafting in a great many reſpects, both as it is more ſecure, it ſeldom failing of having effect, eſpecially if two or three Buds are put into the ſame Stock, and as its Succeſs is more readily diſcovered. Indeed when large Stocks are to be practiſed on, *Inoculation* is not proper, and they are obliged to have recourſe to Grafting. This one Rule is obſerved to hold univerſally, *viz.* that no Succeſs is to be expected in *Inoculation*, if the Sap does not run well, that is, if the Bark won't part readily from the Wood of the Stock.

In a Phyſical Senſe, *Inoculation* is uſed for the Tranſplantation of Diſtempers from one Subject to another, particularly for the Ingraftment of the Small-Pox, which is a new Practice among us, but of antient Original in the *Eaſtern* Countries. The beſt Method of performing the Operation is as follows: After the Body is rightly diſpoſed and prepared, by proper Diet and Evacuations, two ſmall Inciſions are made, one in the muſcular part of the Arm, about the Place where an Iſſue is uſually cut, and the other in the Leg of the oppoſite Side; then being provided of a ſmall Quantity, as a Drop or leſs of well-concocted *variolous Matter*, choſe from the diſtinct or beſt ſort of Puſtules, before the Turn of the Diſtemper, and imbibed

imbibed by two ſmall Doſſils of Lint; theſe are immediately put into the Inciſions, whilſt the *Matter* remains warm, and are kept on by a proper Bandage. In a day or two the Bandages are opened, the Lint thrown away, and only Colewort-Leaf applied over the Inciſions. This Dreſſing is continued daily. The Inciſions uſually grow ſore, inflame and inlarge of themſelves, and diſcharge Matter more plentifully as the Diſtemper riſes. The Eruptions generally appear within eight or ten days after the Operation, during which time the Patient is not confined, or obliged to obſerve a very ſtrict Regimen. The Practice ſeems to be uſeful, becauſe the moſt proper Age, the moſt favourable Seaſon of the Year, moſt regular Method of Preparation, and all poſſible Precautions may here be uſed, according to the Wiſhes of the Patient, his Parents, and Phyſician; Advantages impoſſible to be had when the Diſtemper is caught in the natural way. It has alſo been conſtantly obſerved, that the beſt ſort of Small-Pox is hereby occaſioned, that the Eruptions are few, the Symptoms light, the Danger next to none, the Recovery eaſy, and that the Patient is equally ſecured from this Diſtemper for the future, as he would be by having gone thro' it in the natural manner.

INORDINATE PROPORTION is thus: Suppoſing three Magnitudes in one Rank, and three other proportional to them in another, you compare them in a different Order; as if there are in one Rank theſe three Numbers, 2, 3, 9; and in another Rank theſe other three, 8, 24, 36, proportional to the precedent, in a different Order, ſo that 2 ſhall be to 3 as 24 to 36, and 3 to 9 as 8 to 24. Then caſting away the mean Terms in each Rank, conclude the firſt 2 in the firſt Rank is to the laſt 9, as 8, the firſt of the other Rank, to the laſt 36.

INOSCULATION. See *Anaſtomaſis* and *Artery*.

IN PACE, a *Latin* Term, in uſe among the Monks, to ſignify a Priſon, where ſuch of them are ſhut up as have committed any grievous Fault. Formerly there us'd to be a world of Ceremony at the putting a Religious *in pace*, but now 'tis not much regarded. Such as are ſhut up in perpetual Impriſonment, are alſo ſaid to be *in pace*. Sometimes alſo the words *requieſcat in pace* are uſed by way of Alluſion to a Cuſtom in the *Romiſh* Church, of praying that the Souls of the Defunct may reſt in Peace. Thoſe words are alſo frequently ſeen at the bottom of Epitaphs, in lieu of thoſe uſed by the antient *Romans*, S.T.T.L. *i. e. Sit tibi Terræ levis*, Light lie the Earth; *& ſit humus Cineri non oneroſa tuo.*

IN PROMPTU, a *Latin* word uſed among the *French*, tho' but rarely in the *Engliſh*. It ſignifies a Piece made off-hand, extemporary, without any previous Meditation, by the mere Vivacity of Imagination. Many Authors pique themſelves on their *in promptu's*, which yet were done at leiſure, and in cold blood.

INQUIRENDO, is an Authority given to a Perſon, or Perſons, to enquire into ſomething for the King's advantage.

INQUISITION, or the Holy Office, an Eccleſiaſtical Juriſdiction eſtabliſhed in *Spain*, *Portugal*, and *Italy*, for the Trial and Examination of ſuch Perſons as are ſuſpected to entertain any religious Opinions contrary to thoſe profeſſed in the Church of *Rome*. It is called *Inquiſition*, becauſe the Judges of this Office take cognizance of Crimes on common Report, without any legal Evidence. Some People fancy they ſee the Original of the *Inquiſition* in a Conſtitution made by Pope *Lucius*, at the Council of *Verona*, in 1184. in regard he there orders the Biſhops to get Information, either by themſelves, or by their Commiſſaries, of all ſuch Perſons as were ſuſpected of Hereſy; and diſtinguiſhes the ſeveral Degrees, of Suſpected, Convicted, Penitent, and Relapſed, *&c.* However, 'tis generally allowed, that it was Pope *Innocent* III. who laid the firſt Foundations of the Holy Office, and the *Vaudois* and *Albigenſes* were what gave the occaſion to it. He ſent ſeveral Prieſts, with St. *Dominic* at their head, to *Tholouſe*, in order to blow up a Spirit of Zeal and Perſecution amongſt the Prelates and Princes. Theſe Miſſionaries were to give an account to the Pope of the Number of Heretics in thoſe Parts, and of the Behaviour of the Princes and Perſons in Authority, and thence they acquired the Name of *Inquiſitors*; but theſe original Inquiſitors had not any Court, or any Authority, they were only a kind of Spiritual Spies, who were to make Report of their Diſcoveries to the Pope. The Emperor *Frederic* II. at the beginning of the 13th Century, extended their Power very conſiderably, and committed the taking cognizance of the Crime of Hereſy to a Set of Eccleſiaſtical Judges; and as Fire was the Puniſhment decreed for the Obſtinate, the Inquiſitors determined indirectly with regard both to the Perſons and to the Crimes: by which means the Laity was cut off from its own Juriſdiction, and abandoned to the Zeal and devout Madneſs of the Eccleſiaſtics. After the Death of *Frederic*, who had long ago repented the Power he had given the Churchmen, as having ſeen ſome of the Fruits of it; Pope *Innocent* IV. erected a perpetual Tribunal of Inquiſitors, and deprived the Biſhops and Secular Judges of the little Power the Emperor *Frederic* had left them. And this Juriſdiction, which depended immediately on himſelf, he took care to introduce into moſt of the States in *Europe*. But the Inquiſitors were ſo fiery hot, and made ſuch horrible Butchery among the reputed Heretics, that they raiſed an univerſal Deteſtation, even in ſome Catholic Countries, themſelves. Hence it was that their Reign proved very ſhort both in *France* and *Germany*, nor was even *Spain* entirely ſubject to them till the time of *Ferdinand* and *Iſabella* in 1448, when their Power was increaſed, under pretence of clearing the Country of *Judaiſm* and *Mahometaniſm*.

The Power of the *Inquiſition* is very much limited in ſome Countries, particularly at *Venice*, where it is received under ſuch Modifications, as prove a great Check on its Authority. Indeed at *Venice* it ſeems rather a political than a religious Contrivance, and ſerves rather for the Security of the State than of the Church. There are Appeals from the Subaltern *Inquiſitions* in *Italy*, to the Congregation of the Holy Office reſiding at *Rome*. 'Tis the conſtant Practice of the *Inquiſition*, to affect, in all their Procedures, to inſpire as much Terror and Amazement as poſſible; every thing is done with the profoundeſt Silence and Secrecy, and with the greateſt Rigour and Impartiality. When a Perſon is ſeized, all the World abandons him, not the neareſt Friend dares ſpeak a Word in his Defence; that alone would be enough to render them ſuſpected of Hereſy, and would bring them within the Claws of the *Inquiſition*. The Criminals are ſeized, examined, tried, tortured, and, unleſs they recant, condemned and executed, without ever ſeeing or knowing their Accuſers; whence the Revengeful have a fair occaſion of wreaking their Malice on their Enemies. When the *Inquiſition* has done with them, and condemned them to death, they are turned over to the Secular Arm, with a world of Prayer and pious Intreaty, that their Lives may not be touched. Time is no manner of Security in points of Hereſy, nor does the Grave itſelf ſhelter the Accuſed from the Purſuits of the *Inquiſition*; even the Deceaſed have their Trials, and they proceed in all their Form and Solemnity againſt dead Carcaſes. The Executions are always deferred till the Number of the Condemned is very great, that the Multitude of Sufferers may ſtrike the deeper Horror, and make the Scene more terrible and ſhocking.

The *Inquiſition* of *Rome* is a Congregation of twelve Cardinals, and ſome other Officers, where the Pope preſides in Perſon. This is accounted the higheſt Tribunal in *Rome*; it began in the time of Pope *Paul* IV. on occaſion of the ſpreading of *Lutheraniſm*.

The *Inquiſition* is very ſevere in the *Indies*. 'Tis true, there muſt be the Oaths of ſeven Witneſſes to condemn a Man; but then the Depoſitions of Slaves or Children are taken. The Perſon is tortured till he condemns himſelf, for his Accuſers are never brought to confront him. Perſons are accuſed for the ſlendereſt Expreſſion againſt the Church, or even for a diſreſpectful Word of the *Inquiſition*. The Standard of the *Inquiſition* is a red Damask, on which is painted a Croſs, with an Olive-Branch on one ſide, and a Sword on the other, with thoſe words of the Pſalm, *Exurge, Domine, & judica Cauſam meam.*

INQUISITION, in Law, is a manner of proceeding in Matters criminal by the Office of the Judge, or by the great Inqueſt before Juſtices in Eyre. Inquiſitors among us are Sheriffs, Coroners *ſuper viſum Corporis*, or the like, who have Authority to enquire into certain Caſes.

INROLMENT, in Law, is the Regiſtring, Recording, or Entring of any lawful Act in the Records of Chancery; as a Recognizance acknowledg'd, or a Statute, or a Fine levied: or in the Rolls of the Exchequer, King's-Bench, or Common-Pleas, or in the Huſtings at *Guild-Hall*, *London*, or by the Clerk of the Peace in any County.

INSCONCED, is a Term in the Military Art, implying that a Part of an Army have fortified themſelves with a Sconce or ſmall Fort, in order to defend ſome Paſs, *&c.* See *Sconces*.

INSCRIBED, in Geometry: A Figure is ſaid to be inſcribed in another, when all the Angles of the Figure inſcribed touch either the Angles, Sides, or Planes of the other Figure.

Inſcribed Hyperbola, is ſuch an one, as lies intirely within the Angle of its Aſſymptotes, as the Conical Hyperbola doth.

INSCRIPTION, a Title affixed to any thing, to give ſome particular Knowledge thereof. Antiquaries are very curious, in examining antient *Inſcriptions* found on Stones, and other Monuments of Antiquity. *Sanchoniatho*, Cotemporary, as 'tis ſaid, with *Gideon*, drew moſt of the Memoirs, whereof

whereof his Hiſtory is compoſed, from *Inſcriptions*, which he found in Temples and on Columns, both among the Heathens and the *Hebrews*. It appears indeed that the Antients ingraved upon Pillars the Principles of Sciences, as well as the Hiſtory of the World. Thoſe mentioned by *Herodotus* ſhew, that this was the firſt way of inſtructing People, and tranſmitting Hiſtories and Sciences to Poſterity. This is confirmed by *Plato*, in his *Hyparchus*, wherein he ſays, that *Piſiſtratus* engraved, on Stone-Pillars, Precepts uſeful for Husbandmen. *Pliny* aſſures us, that the firſt publick Monuments were made with Plates of Lead; and the Treaties of Confederacy, made between the *Romans* and the *Jews*, were written upon Plates of Braſs; that, ſays he, the *Jews* might have ſomething to put them in mind of the Peace and Confederacy concluded with the *Romans*. The *Greeks* and *Romans* were great Dealers in *Inſcriptions*, and were extremely fond of being mentioned in them; and hence it is that we find ſo many, in thoſe Countries of antient Learning, as that large Volumes have been compoſed of them; as the Collection of *Gruterus*, &c. Since *Gruter*'s Collection, *Th. Reineſius* has publiſhed another huge Volume of *Inſcriptions*. M. *Fabretti* publiſhed another Volume at *Rome* in 1699, wherein he has corrected abundance of Errors that had eſcaped *Gruter*, *Reineſius*, and other Antiquaries, &c. and added a great Number of *Inſcriptions* omitted by them. Since all theſe, *Grævius* has publiſhed a compleat Collection of *Inſcriptions*, in three Volumes in *Folio*.

In *France* is an Academy of *Inſcriptions* and Medals, conſiſting of ten honorary and ten penſionary Members, ten Aſſociates, and as many Novices, who are to meet twice a Week, and to employ themſelves in the Examination of Medals and antient Monuments, and other Parts of *Greek* and *Roman* Literature, and to compoſe a Hiſtory of the Kings of *France*, from Medals. Such was the Academy at the time of its Inſtitution, or rather Reſtauration, in the beginning of this Century; but as they are not now wholly employed about Medals and *Inſcriptions*, they have changed their Name for one of a greater Latitude, and are called the Academy *des Belles Lettres*.

INSCRUTABLE, in Theology, is uſually underſtood of the Secrets of Providence, and the Judgments of God, which cannot be found out, or into which Human Reaſon cannot penetrate.

INSECTS, a kind of little Animals ſo called by the Antients, becauſe in ſome of 'em the Body ſeems to be cut; as in Ants, whoſe Belly ſeems divided into two: or perhaps, becauſe the Bodies of *Inſects* are compoſed of ſeveral Circles or Rings, as Worms, Caterpillars, &c. which are a kind of Inciſions, whence the Name might probably ariſe. Mr. *Ray*, in his *Methodus Inſectorum*, thus diſtinguiſheth the ſeveral kinds of *Inſects*. *Inſects* are either, 1. Ἀμεταμόρφωτα, or ſuch as do not change their Form: Or, 2. Μεταμορφούμενα, ſuch as do really change their Form. Thoſe that do not change their Form, are either, (1.) Ἄποδα, without Feet; or, (2.) *Pedata*, with Feet: and of theſe there are ſome kinds that caſt their Skins, and others that do not. *Inſects* without Feet are either Terreſtrial or Land-Inſects, or Aquatic. Terreſtrial *Inſects* are, 1*ſt*, either ſuch as are produced on the Land, or in the Earth, and not in Water; as the *Lumbrici Terreſtres*, which are either of the larger ſort, and are call'd Dew-Worms; or of a ſmaller ſize: And of theſe, there are ſome Red, and others Green with yellow Tails; which laſt are commonly call'd Gilt-Tails. Or, 2*dly*, ſuch as are found in the Bowels of Animals: And of theſe ſome are found in the Inteſtines of Men; as, (1.) The *Lumbrici Teretes*; (2.) *Lumbrici Lati*, which are alſo call'd *Tæniæ*; (3.) *Cucurbitini*, which ſome will have to be only the Fragments of the *Tæniæ*. (4.) The *Aſcarides*, which are chiefly found in the *Rectum*. Thoſe Worms which are found in the Inteſtines of Beaſts are of two ſorts, the *Oblongi*, and *Pellucidi*, of the thickneſs of an Horſe-hair, and therefore call'd *Vermiculi Setiformes*: And the *Breves* and *Craſſiores*, which often are found in Horſes, and are call'd the Botts. To this Genus of Terreſtrial *Inſects*, many natural Hiſtorians refer Snails, whether with or without Shells.

Water *Inſects* without Feet, not changing Form, are either, 1*ſt*, of the greater ſort, which have a peculiar way of moving, by firſt fixing their Head to the ground, and then drawing up their Tail towards it, &c. Of theſe, ſome are *Teretes*, round and ſmooth, of which there are three ſorts; as the Medicinal *Hirudines* or Leaches, the common black Horſe-Leaches, and the aſh-colour'd Sea-Leaches: But there is alſo a ſort of this kind, which is ſmaller and flatter, which are found ſticking to Stones in the bottom of little Brooks. Or, 2*dly*, of the Leſſer ſort, which have a different way of crawling or moving from the former. Theſe are alſo either round or flat: Of the round ſort, there is one that is black with two ſmall Horns on its Head, and is found ſticking to wet Stones in the watry Tops of Hills; and another which is red, of about a finger's length, with a Forceps at the Tail, found at the bottom of Fiſhponds, and ſtagnant Waters. The flat ſort are very ſmall and thin, and are call'd Flukes, being ſometimes found in Waters, and ſometimes in the Branches of the *Porus Bilarius* in Sheep.

Inſects not changing Form, and having Feet, are either, 1. *Hexapoda*, with 6 Feet. 2. *Octapoda*, with 8 Feet. 3. *Decateſſarapoda*, with 14 Feet. 4. *Polypoda*, with many Feet. Thoſe that have but ſix Feet, are either, (1.) Terreſtrial, and theſe are, firſt, of a larger kind; as, [1.] The yellowiſh *Inſect*, found in rotten decaying Oaks. [2.] The black one, on the Ground, called by *Mouffet*, *vermivorous*. [3.] The black one, living under Ground, with a Forceps at the Tail. [4.] A white ſort, with ſquare black Spots on its Back. [5.] The *Farinarium*, bred in Meal, of a whitiſh Colour. Or, ſecondly, a Smaller Sort; ſome of which are found about the Bodies of Animals: as, (1.) The *Cimex*, Bug or Wall-Louſe, of a ſtinking Smell. (2.) *Ricinus*, the Tick. (3.) *Pediculus*, the common Louſe. (3.) *Pediculus ferus ſeu inguinalis*, the Crab-Louſe. (5.) *Pulex*, the Flea; of all which there are various kinds. Others are not troubleſome to Animals, as, 1. One that in Bigneſs and Figure reſembles a Louſe, but is very nimble and ſwift, and is found in Books and rotten Wood. 2. Another there is with a very long Body, and a forcipital Tail. 3. The black *Inſect*, found often in the Flowers of the *Chelidonium*. 4. A ſubterraneous Sort, a little whitiſh. 5. One that skips like a Graſhopper, but is much leſs.

(II.) Aquatic; as, [1.] The *Pediculus Marinus Grandis*, which adheres to Fiſhes. [2.] The *Squilla Fluviatilis*, with a Pyramidal Tail, and two Hairs or Briſtles at the end. *Inſects* not changing Form, and having eight Feet, are either with a Tail, as the Scorpion, or without, as the Spider; of which ſome ſpin no Web, have but two Eyes, and very long Legs, as the *Opilio* or the Shepherd. Some do ſpin a Web, and of theſe they count three ſorts: 1. The *Aranea Colceſtrenſis Abdomine tumido, ſubrotundo, & elato*. 2. The Spider with the Thorax, or middle part of his Body, as big as the Abdomen. 3. The Spider with the long Abdomen, found among Reeds, Ruſhes, Graſs, &c. (2.) The *Ricini Octopedes*, which are ſome more flat and compreſs'd; as the rambling Ticks that run over the Bodies of Animals, but don't faſten; and ſome more round and thick, which do adhere to the Skin. (3.) The *Syrones* or Mites.

Inſects not changing Form, and with fourteen Feet, and therefore call'd Τεσσαρεσκαιδεκάποδα, are the *Aſelli*; of which there are three ſorts: As, 1. the *Sea-Aſellus*; the longeſt and largeſt of all; living amongſt the Rocks. 2. *Aſellus Lividus*, which rolls itſelf up into a Ball. The common Wood-Lice, Sows, or Cheſs-bugs. 3. *Aſellus Aſininus*, with a forked Tail; not rolling itſelf up. To this Species may be added, (1.) The *Aſellus Marinus figuræ brevioris*, rolling itſelf up. (2.) *Aſellus Aquarum dulcium*, with long Legs and two Briſtles on its Tail. (3.) *Pulex Aquaticus*, both in freſh and ſalt Water. (4.) *Pediculus Aquaticus*, which faſtens upon Fiſh.

Inſects not changing Form, with twenty-four Feet. Theſe have the eight Fore-Feet leſſer, and the ſixteen hinder-ones larger. There are two kinds of them obſerved; both with long Bodies, one larger and of an obſcure Colour, among the Rocks by the Sea-ſide; the other of a Silver Colour, found in Houſes. There is a Kind with thirty Feet, of an oblong Shape, Cheſnut Colour, and full flattiſh Body, uſually lying under Logs, and Trunks of Trees. It is very agile and ſwift.

Inſects, not changing Form, with many Feet, called, πολυπόδα, are ſome on Land, and either roundiſh in Body, with all their Legs riſing out of the middle of the Belly, (nearly) as the *Julus*, or more flat and compreſſed, with their Legs, not riſing, as before, from a Point in the middle of their Body, but growing along on the Sides; as the *Scolopendra*. And ſome of this kind are aquatic, of which Mr. *Ray* makes three Differences: (1.) The *Corniſh* Lugs, uſed for Baits in catching Fiſh, with 38 Legs, and a ſmooth roundiſh Body. (2.) The *Scolopendra Marina Corpore plano*. (3.) *Animalculum Bicorpor*, or rather *Bicaudatum*, lying in the Clefts of Stones, under the Salt-water.

Inſects which do really undergo a Change of their Form, are called Μεταμορφούμενα; of which *Swammerdam* hath given the beſt Account: Tho' he ſhews that this word is improperly uſed, ſince there is by no means any real Transformation, but only an Explication of the Parts of the Animal, latent before, in miniature, (as it were in the *Ovum*, or *Nympha*, like the Plant in the Seed) and an Increaſe of all the Parts by proper Degrees.

The firſt Species of Tranſmutation or Change, which *Swammerdam* makes the ſecond, is inſtantaneous, there being no ſenſible Reſt or Stop between the old and the new Form. And the *Inſects* of this Order do not loſe their Motion at the time they ſhift the *Pellicula*, at leaſt not to appearance. And *Swammerdam* deſcribes the ſecond Order

der of Change to be, when the *Vermiculus* (leaving the former Shape of the *Nympha*, with which it appeared in the Egg, and ſubſiſted without Food) now beginning to feed, hath its Members or Parts viſibly increaſed and ſtretched out, and takes the Form of a new *Nympha*, which is not without Motion; and from thence becomes a flying *Inſect*. Of this ſort are, (1.) The *Libellæ*, or *Perlæ*, which are produced from an *Inſect* of ſix Feet, and which *Mouffet* takes for the *Pulex Marinus*, or, as before he calls it, *Locuſta Aquatica*. Out of the cruſtaceous Skin, or Husk, of this *Inſect*, the *Libella* breaks by a Fiſſure, which begins between the Eyes, and is continued to the Roots of the Wings, and is there joined to the lateral Fiſſures. (2.) The *Cimices Sylveſtres*, whoſe characteriſtic Marks (according to *Willoughby*) are, 1. A long *Proboſcis*, not ſpiral, but ſtrait. 2. Their upper Wings to the middle are thick, and like Leather; thence to the Ends thin and membranous. 3. There is the Figure of St. *Andrew's-Croſs* on their Backs. (3.) The *Locuſta*, which *Willoughby* refers to the Ἀμεταμόρφωτα. (4.) The *Grylli-Campeſtres*. (5.) The *Grylli-Domeſtici*, or Crickets. (6.) The *Grylio-Talpa*, Mole-Cricket. (7.) The *Cicada*, or Graſhopper. (8.) The *Blatta*, according to *Swammerdam*. (9.) The *Tipulæ Aquaticæ*, which run very ſwiftly on the Surface of the Water, and have a Sting in their Mouths like the *Cimices*, or *Ticks*. (10.) The *Scorpius Aquaticus*, with a Sting alſo in its Mouth. (11.) The *Muſcæ Aquaticæ*, called by *Androvandus*, *Apes Amphibiæ*. (12.) The *Hemerobius*, or *Ephemera*, or *Diaria* of *Swammerdam*. (13.) The *Forficula*, or *Auricularia*.

The ſecond Species of Tranſmutation includes ſuch *Inſects*, as undergo a double Metamorphoſis, or Change of Shape. (1.) Into a *Chryſalis*, or ſomething analogous to it. (2.) Into a flying *Inſect*. Theſe Kinds of *Inſects*, a while before they change, lie quite ſtill, without Feeding, or changing Place; and in reſpect of their Wings are, (1.) Κωλεόπτερα, or *Vaginipennia*, as the *Scarabæi*, Beetles. (2.) Ἐλύτρα, whoſe Wings are open and expanded: And the Wings of theſe are either farinaceous, as the *Papiliones*, &c. or membranous, as the *Apes*, *Muscæ*, &c. and theſe are either Δίπτερα with two Wings, or Τετράπτερα, with four Wings.

The *Scarabæi* may be divided, (1.) In reſpect of their Horns, into the *Naſicornis*, *Bucerota*, and *Cervus volans*, or *Taurus*. (2.) In reſpect of their *Antennæ*, which are of many Kinds; whereof the moſt eminent are thoſe called *Capricorni*. (3.) With regard to their Motion, as the *Saltatrices* (4.) With regard to their Colour, as *Cantharides*. To the Beetle-kind may be referr'd the *Cicindela*, or Glow-Worm; the *Staphylinus* called by *Willoughby* ἡμικολεόπτερος; the *Proſcarabæus*, or Oil-Beetle, ſo called from its emitting from its Joints a kind of Oil, on its being preſſed or ſqueezed. The *Anelytra*, with farinaceous or mealy Wings, are called *Papiliones*, Butter-flies; and theſe are either Diurnal, or Nocturnal. The ſpecific Diſtinction of the Diurnal is, that they always ſettle with their Wings erect, are produced from an angulous *Aurelia*, and have their *Antennæ* ſtudded: of theſe there are about fifty ſorts obſerved in *England*. The nocturnal Butterflies, or *Phalænæ*, are vaſtly numerous, and cannot very clearly be methodized. But for Memory and Diſtinction's ſake, they may be divided into, (1.) The *Geometrigenæ*, which come from the *Eruca*, (called *Geometra* from the Manner of its Walk, which is *Anſatinus*, by curling up its Back like the Handle of a Cup) with 8 or 10 Feet. (2.) Such as come from *Erucæ* with 14 Feet: Of this kind, which is very numerous, there hath been diſtinguiſhed the *Phalæna Faſciata*, whoſe Wings are in Patches or Area's of different Colours. *Phalæna Lineata*, whoſe Wings are marked with tranverſe Lines. *Phalæna Punctata*, whoſe Wings are marked with one or more Points: and theſe excepted, all the others are diſtinguiſhed into greater and leſſer, and of a middle Size, between both. One of the larger Kinds may be diſtinguiſhed alſo by their inner Wings running out beyond the upper, when they ſit, or reſt: And another by the Appearance of the Figure of Eyes upon the Wings: And a third, by their long Tails, and narrow ſharp Wings; which by ſome are called *Phalænæ Prædatrices*, or *Accipitrinæ*. The *Anelytra*, with membranous Wings, are Bees, Flies, Waſps, *Bombylii*, *Crabrones*, &c. And to this kind the *Culex Vulgaris*, according to *Swammerdam*, or Gnat is referred; as alſo the *Formica*, or Ant. And hither muſt be referred ſuch Water *Inſects*, as are covered by a *Theca*, according to the Obſervations of *Willoughby*. Theſe have either, (1.) an immoveable *Theca*, or Caſe, which is fixed to the Stones; and this Caſe is either of a round Figure, or one more compreſs'd and flat, (2.) A moveable, portable *Theca*, and theſe are commonly called *Phryganæa*: And this *Theca* is either, (1.) Strait, and that either compoſed of Straws, and little *Feſtucæ* lying parallel one to another; of which there are two Kinds; a greater, where the *Feſtucæ* are two Inches long; and a leſſer, which are very common, and are called Straw-Worms. Or elſe the *Feſtucæ* lie tranſverſly, and are ſhorter, having ſometimes pieces of Shells, or Stones, intermixed with them: Others, whoſe Caſes are ſtrait alſo, have no *Feſtucæ*; but always either Sand, or Gravel: And of theſe ſome have the *Thecæ* round, and are called Cod-baits; others are flat and compreſſed. (2.) Crooked, or horned, which run tapering; of theſe Mr. *Ray* reckons four Kinds; a greater and leſs Black ſort; and a greater and leſs Aſh-colour'd one. Theſe all produce Flies with large Wings like Butter-flies.

The third Species of Tranſmutation, is a ſimple Change from a *Vermiculus* to a flying *Inſect*; but yet with a ſenſible ἀστάσια, reſt, or ſtop, between one Form and the other. This Change *Swammerdam* thus deſcribes: "The *Vermicle* "excluded from the Egg gets Nouriſhment by little and "little from without, and under that firſt Skin, or Cover-"ing, hath its Members increaſed by Degrees; not ſlip-"ping it, or putting it off as other *Vermiculi* do when they "change into *Nymphæ*, but aſſuming the Figure of a *Nym-"pha* in it: For a time it is quite motionleſs, till the ſu-"perfluous Moiſture is evaporated, and then, in a few "Days, recovers its Motion again, and caſting off "this Skin, which is as it were double, it becomes a Fly." Of this kind are our Fleſh-flies, and all the *Nymphæ Vermiformes*, the *Veſpæ Ichneumones*, &c.

As to the Generation of *Inſects*, the World is now generally convinced that they are not bred of Corruption, but *ex Ovo*; tho the contrary was believ'd by the Ancients, becauſe of the vaſt Numbers that were ſometimes hatch'd as it were at once, and becauſe they cou'd not diſcern the particular Manner of their Propagation. *Malpighi*, *Swammerdam* and *Redi*, have abundantly diſproved the Doctrine of Equivocal Generation, as well as the Chimerical Tranſformation of the Caterpillar into the Butter-fly, and other the like Metamorphoſes; and have ſhewn, that all the Members of the Butter-fly were encloſed under the Skin or *Nympha* of the Caterpillar, as the Parts of a Plant are in the Seed.

Inſects take particular Care to depoſite their Eggs, or Seed, in ſuch Places where they may have a ſufficient Incubation, and where the Young when hatch'd may have the Benefit of proper Food till they become able to ſhift for themſelves. Thoſe whoſe Food is in the Water, lay their Eggs in the Water; thoſe to whom Fleſh is a proper Food, in Fleſh; and thoſe to whom the Fruits, or Leaves of Vegetables are Food, are accordingly repoſited, ſome in this Fruit, ſome in that Tree, and ſome in that Plant, and ſome on another, but conſtantly the ſame Kind on the ſame Tree, &c. As for others that require a more conſtant and greater Degree of Warmth, they are provided by the Parent Animal with ſome Place in or about the Body of other Animals; ſome in the Feathers of Birds, ſome in the Hair of Beaſts, ſome in the Scales of Fiſhes, ſome in the Noſe, ſome in the Fleſh, nay ſome in the Bowels, and inmoſt Receſſes of Man, and other Creatures. And as for others to whom none of thoſe Methods are proper, they make them Neſts by Perforation in the Earth, in Wood, in Combs, and the like, carrying in and ſealing up Proviſions that ſerve both for the Production of their Young, and for their Food, when produced.

In Flies, Butter-flies, &c. it is obſerv'd, there is a kind of Gluten, by which the Female faſtens her Eggs to the bearing Buds of Trees, &c. ſo that the Rains cannot waſh them off. Theſe Eggs will not be hurt by the greateſt Froſt. Mr. *Andry*, in his Book *De la Generation de Vers dans le Corps de l'Homme*, takes notice, that the Antients were miſtaken in denying that *Inſects* did breathe, on the account of their wanting Lungs: For modern Obſervations convince us, that *Inſects* have a greater Number of Lungs than other Animals. The Antients thought alſo that *Inſects* had no Blood, becauſe many of them had no red Liquor like our Blood: But it is not the Colour, but the Uſe of the Liquor that is to be regarded. They believed alſo that *Inſects* had no Hearts; whereas our Microſcopes do now diſcover, that when *Inſects* have ſeveral Lungs, they have alſo ſeveral Hearts; and in particular, it is found, that Silk-Worms have a continued Chain of Hearts, from the Head almoſt to the very Extremity of the Tail. And it is this Number of Hearts and Lungs that occaſions thoſe *Inſects* to give Signs of Life a long while after they are divided into ſeveral Parts. He obſerves alſo, that it is wrong to call *Inſects* imperfect Animals, ſince they want no Parts either neceſſary or convenient for their Uſe, or to render them compleat in their Kind. There are ſome, who affirm that the Earth-Worms, and thoſe Round-tailed Worms, which are found in the Inteſtines of Men and Horſes, &c. alſo Snails and Horſe-Leaches are Hermaphrodites; but that ſuch Worms as become Flies, and Silk-Worms are not ſo, being of no Sex, but are Neſts full of real Animals, which we ſee in time come out with Wings.

The Moderns have proceeded much further in the Knowledge of *Inſects* than the Antients, as having the Advantages of the Microſcope which diſtinguiſhes their minute Parts, whereof they have publiſh'd Draughts and Deſcriptions. Dr. *Hook* has publiſh'd a Micrography in *Folio*; and *Fran. Redi*, a Phyſician at *Florence*, has publiſh'd ſeveral Figures with new and curious Experiments of his own. Sig. *Malpighi*, *Bartholin*, the *Philoſophical Tranſactions* of *London*, *Paris*, and *Leipſic*, have a great Number of fine Obſervations and Experiments on *Inſects*. *Swammerdam* has written a general Hiſtory of *Inſects* in *Dutch*, and aſſures us, there are above 400 Writers on this Subject; among others are *Wotton*, *Geſner*, *Aldrovandus*, *Mouffet*, *Harvey*, *Fabricius ab Aquapendente*, *Goedart*, &c. *Hoeffnagel*, Painter to the Emperor *Rudolphus*, has given very good Deſigns of above 300 Species, *Goedart* has deſcribed above 400, and Mr. *Albin* has given us a new Hiſtory of our *Engliſh Inſects*, with very beautiful Figures.

INSEMINATION, one of the four Kinds of Tranſplantation, in uſe for the Cure of certain Diſeaſes. It is performed by mixing the Medium impregnated with the *Mumia* taken from the Patient with ſome fat Earth wherein has been ſown the Seed of a Plant appropriate to that Diſeaſe; but Care muſt be taken from time to time to ſprinkle it with the Water wherein the Part affected has been waſh'd. 'Tis ſuppoſed the Diſeaſes will decline in proportion as the Plant grows. By *Mumia*, is here meant a Part of the vital Spirit of the Patient.

INSERTION, a Term frequently us'd in Phyſic, to ſignify the Implication of one Part within another. The *Inſertion* of the Bones, Muſcles, and Nerves in the Members of an Animal, is exceedingly artful. The *Vena Cava* has its *Inſertion* in the right Ventricle of the Heart. *Inſertion* is alſo uſed in Agriculture for the Incloſing a Graft within the Cleft of a Tree.

INSESSUS, is a kind of Half-Bath, uſually prepared with a Decoction of ſeveral Herbs, proper for the lower Parts, wherein the Patient ſits down to the Navel. It has ſeveral Uſes, as the eaſing of Pain, ſoftening of Parts, diſpelling of flatulent Matter, and frequently, promoting of the *Menſes*.

INSINUATION, a cunning and covert way of creeping into Favour. *Inſinuation* of a Will, among the Civilians, is the firſt Production of it, or the leaving it with the Regiſter in order to its Probate.

INSIPID, that which has nothing in it ſharp or pungent enough to affect the Palate, Tongue, &c. and to occaſion that Senſation we call Taſting.

INSITIO, a Term in Botany, uſed in the ſame Senſe with engrafting; ſignifying in general the Inſertion and Uniting of any Cyon, Bud, &c. into the Subſtance of the Stock: And is of various kinds.

INSOLATION, in Pharmacy, is a Preparation of Fruits, Drugs, &c. by expoſing them to the Heat of the Sun's Rays; either to dry them, or to bake or ſharpen them, as is done in Vinegar, Figs, &c. The Word comes from the *Latin* Verb *inſolare*, which is uſed by *Pliny* and *Columella*, and ſignifies to *expoſe to the Sun*.

INSOLVENT, a Term applied to ſuch Perſons as have not wherewithal to pay their juſt Debts: A Perſon dying, and not leaving Eſtate ſufficient to diſcharge theſe, is ſaid to die *inſolvent*.

INSPECTOR, a Perſon to whom the Care and Conduct of any Work is committed.

The *Jews* have an Officer in their Synagogue, whom they call *Inſpector*, חזן, *Hbazan*. His Buſineſs conſiſts principally in inſpecting or overlooking the Prayers and Leſſons, in preparing and ſhewing them to the Reader, and in ſtanding by him to take care he reads right, and if he make Miſtakes, to correct him. In the *Roman* Law, *Inſpectors* were ſuch Perſons as examin'd the Quality and Value of Lands and Effects, in order to the adjuſting or proportioning Taxes and Impoſitions to every Man's Eſtate.

INSPIRATION, among Divines, &c. implies the conveying of certain extraordinary and ſupernatural Notices or Motions into the Soul. Thus the Prophets are ſaid to have ſpoken by Divine *Inſpiration*; and the Sinner is converted, when he ceaſes to reſiſt the *Inſpiration* of Grace. Some Authors reduce the *Inſpiration* of the Sacred Writers to a particular Care of Providence, which prevented any thing they had ſaid from failing, or coming to nought; maintaining they never were really inſpired, either with Knowledge or Expreſſion. According to M. *Simon*, *Inſpiration* is no more than a Direction of the Holy Spirit, which never permitted the Sacred Writers to be miſtaken. And it is a common Opinion, that the *Inſpiration* of the Holy Spirit regards only the Matter, not the Style or Words; which ſeems to fall in with M. *Simon*'s Doctrine of Direction. Among the Heathens, their Prieſts and Prieſteſſes were ſaid to be divinely inſpired when they gave Oracles. The Poets, too, laid claim to it; and to this end, always invoked *Apollo* and the Muſes at the beginning of any great Work.

Inſpiration, in Phyſic, is underſtood of that Action of the Breaſt, by which the Air is admitted within the Lungs. This Admiſſion of the Air depends immediately on its Spring or Elaſticity, at the time when the Cavity of the Breaſt is enlarged by the Elevation of the Thorax and Abdomen, and particularly by the Motion of the Diaphragm downwards: ſo that the Air does not enter the Lungs, becauſe they are dilated; but thoſe dilate, becauſe the Air enters within them. Nor is it the Dilatation of the Breaſt which draws in the Air, as is commonly thought; tho this is a Condition abſolutely neceſſary to *Inſpiration*, but an actual Intruſion of the Air into the Lungs. See *Reſpiration*.

INSPISSATE, a Term uſed in Pharmacy for that Operation whereby a Liquor is brought to a thicker Conſiſtence, by evaporating the thinner Parts: and thus Juices, as that of Liquorice, are *inſpiſſated*.

INSTALMENT, is a Settlement, or inſtating any Perſon in his proper Place. It is ſometimes confounded in Law with Abatement. The Word is chiefly uſed for the Induction of a Dean, Prebendary, or other Eccleſiaſtical Dignitary into the Poſſeſſion of his Stall, or proper Seat in the Cathedral Church to which he belongs: it is ſometimes called *Inſtallation*. This Term is likewiſe commonly uſed for that Ceremony wherein the Knights of the Garter are placed in their Rank at *Windſor*. The Word is derived from the *Latin in* and *Stallum*, a Term uſed for a Seat in Church, in the Choir, or a Seat or Bench at a Court of Juſtice, &c. Tho *Voſſius* is of opinion, the Word is pure *German*.

INSTANT, is ſuch a part of Duration, wherein we perceive no Succeſſion; or is that which takes up the time of only one Idea in our Minds. The Schools diſtinguiſh three kinds of *Inſtants*; a temporary, a natural, and a rational *Inſtant*. A temporary *Inſtant* is a part of Time immediately preceding another: Thus the laſt *Inſtant* of a Day precedes immediately and really the firſt *Inſtant* of the following Day. A natural *Inſtant* is what we otherwiſe call a Priority of Nature, which is obſerved in things that are ſubordinated in acting; as firſt and ſecond Cauſes; Cauſes and their Effects. For the nature of things requires, that if there be a ſecond Cauſe, there muſt be a firſt; and that there muſt be a Cauſe, if there be an Effect. A rational *Inſtant*, is not any real *Inſtant*, but a Point which the Underſtanding conceives to have been before ſome other *Inſtant*, founded on the nature of the things which occaſion it to be conceiv'd. For inſtance, as God has made ſeveral things voluntarily, which he could, otherwiſe, have let alone; there is a reaſonable Foundation to conceive God ſuch as he is in himſelf, before he had made any of thoſe voluntary Determinations: but as there was no real *Inſtant*, when God had not form'd any Determination, this *Inſtant* is call'd a rational *Inſtant*, by way of oppoſition to an *Inſtant* of Time.

INSTAURATION, the Re-eſtabliſhment of a Religion, a Church, &c. The Word is derived from the old *Latin Inſtaurum*, which ſignified every thing neceſſary for the tilling and managing of Grounds; as Cattel, Tools, Harneſs, &c.

INSTINCT, a Diſpoſition or natural Sagacity wherewith Animals are endued, by virtue whereof they are enabled to provide for themſelves, know what is good for them, and determined to preſerve and propagate the Species. It bears ſome Analogy to Reaſon, and ſupplies the Defect of it in Brutes.

INSTITUTE, to ordain, found, or eſtabliſh any thing. Thus *Moſes inſtituted* the Ceremonies of the Old Law, and Jeſus Chriſt the Sacraments of the New.

INSTITUTION, is the Act of the Biſhop, or one commiſſion'd by him to act, whereby any Clerk is inveſted with the Spiritualities of a Rectory or Vicarage. The Clerk kneels down before the Biſhop, whilſt he pronounces theſe Words of *Inſtitution*: (*Inſtituo te Rectorem Eccleſiæ de* A. B. *cum Curâ Animarum, & accipe Curam tuam & meam*) and the Clerk holds the written Inſtrument, with the Epiſcopal Seal annexed, in his hand during the Ceremony. But the Clerk muſt have Induction after this, without which he has no Right to his Temporalities, if the Benefice be not a Donative. Before the Clerk is inſtituted, he muſt ſubſcribe the 39 Articles of Religion, in the Preſence of the Ordinary (or his Subſtitute) and the Ordinary is not bound to offer them, but the Clerk is to offer to ſubſcribe them: and he muſt ſubſcribe them without Reſerve, Exception, or Qualification, or elſe his *Inſtitution* is *ipſo facto* void, and null, and the Church is ſtill vacant. At the ſame time the Ordinary requires the Clerk to ſubſcribe the other two Articles, mention'd in the 26th Canon about the King's Supremacy, and the Lawfulneſs and Uſe of the Liturgy. The Clerk muſt alſo before *Inſtitution* ſubſcribe to that part of the Declaration enjoin'd by the Act of Uniformity, 14 *Car.* 2. *c.* 24. viz.

I will conform to the Liturgy of England, *as by Law eſtabliſhed.* Before *Inſtitution*, he muſt alſo take the Oaths mention'd in the firſt Statute of *William* and *Mary*, *c.* 8. inſtead of the former Oaths of Allegiance and Supremacy required by *Stat.* 1 *Eliz.* And then he muſt take the Oath againſt Simony, enjoin'd by the 40th Canon, and the Oath of Canonical Obedience. And he is to have Certificates given him of his ſubſcribing the Declaration contained in the Act of Uniformity, in *Engliſh*, in a diſtinct Inſtrument, under the Hand and Seal of the Biſhop; and of his other Subſcriptions and Oaths in *Latin*. The Clerk ought by all means to have Witneſſes of his *Inſtitution*, his taking the Oaths, making Subſcriptions, *&c.* and therefore he ſhould deſire ſome preſent to write their Names on the back of his Inſtruments; and make Memorandums who they are, and where they live. The Church, by *Inſtitution*, is full againſt all Perſons, but the King; and the Clerk by it may enter upon the Glebe, and take the Tythes: but he cannot let or grant them, nor ſue for them, if they are refuſed to be paid. After *Inſtitution* the Clerk is to receive a written Mandate from the Ordinary to the Arch-Deacon, or other proper Perſon, in order to his Induction: which ſee.

INSTITUTIONS, or *Inſtitutes:* Part of the firſt of the four Tomes or Volumes of the Civil Law; being a Compendium or Summary of the whole in four Books, compoſed by *Tribonianus*, *Theophilus* and *Dorotheus*, by order of the Emperor *Juſtinian*, for the Uſe of young Students; who having the firſt Elements of the whole Profeſſion in this little Treatiſe, might the ſooner gain a competent Knowledge of it, without being diſcouraged by the Bulk of the former Books. *Inſtitutions* are likewiſe a Syſtem of Laws, or Rules in any particular Science; and ſo Phyſical or Medicinal *Inſtitutions* are ſuch as teach the neceſſary *Præcognita* to the Practice of Medicine, or the Cure of Diſeaſes.

INSTRUMENT, properly ſignifies any thing that ſerves as a Cauſe to produce an Effect.

Inſtrument, is alſo uſed in Law to ſignify ſome public Act or authentic Deed, by means whereof any Truth is made apparent, or any Right or Title eſtabliſh'd in a Court of Juſtice.

Inſtruments of Sacrifice, are Ornaments in the Antique Architecture; as Vaſes, Pateræ, Candleſticks, Knives, wherewith the Victims were kill'd, *&c.* Inſtances of which, we ſee in a Corinthian Freeze in the Remains of a Temple behind the Capitol at *Rome*, *&c.*

INSULATED, by the *French* called *Iſolee*, and the *Latins Inſulatus*; is a Term apply'd to a Column that ſtands alone, or free from any contiguous Wall, *&c.* like an Iſland in the Sea; whence the Word is derived.

INSULT, a Military Term, uſed for the attacking of any Poſt with open Force, without the Apparatus of Trenches, Saps, or any regular Approaches.

INSUPER is a Word uſed by the Auditors of the *Exchequer:* In their Accompts, they ſay, ſo much remains *inſuper* to ſuch an Accomptant; that is, ſo much remains due on ſuch an Accompt.

INSURANCE, is Security given in Conſideration of a Sum of Money paid in hand, to make good Ships, Merchandizes, Houſes, *&c.* to the Value of that for which the Reward is received, in caſe of Loſs by Storm, Pirates, Fire, *&c.*

INTACTÆ are Right Lines to which Curves do continually approach, and yet can never meet with them: Theſe are uſually called *Aſymptotes*, which ſee.

INTAGLIO's, precious Stones, having the Heads of great Men, Inſcriptions, and the like, engraven on 'em; ſuch as we frequently ſee ſet in Rings, Seals, *&c.*

IN-TAKER, a Name antiently given to certain Banditti or Robbers, who inhabited a part of the *North* of *England*, and who made frequent Excurſions into the very middle of *Scotland*, plundering the Inhabitants wherever they came. Thoſe who made the Expeditions were called *Out-Parters*, and thoſe who were left behind to receive the Booty *In-Takers.*

INTEGERS, from the *Latin Integrum*, ſignifies, in Arithmetic, whole Numbers, in contradiction to Fractions.

INTEGRAL: the *Integral* Calculus in the new Analyſis, is that which anſwers to the differential Calculus. This laſt has been compleatly explained by the Marquiſs *de l'Hoſpital*, but the other ſtill remains imperfect, having been but little cultivated.

Integral, among the Schoolmen, is underſtood of thoſe Parts which enter the Compoſition of any Whole. Thus the Arms, Legs, *&c.* are *integral* Parts of the Body.

INTEGUMENT, a Term in Anatomy, applied to the Skins or Membranes, which cover the Parts within the Body, as the Coats or Tunics of the Eye. The word is originally *Latin*, and ſignifies any kind of Covering.

INTELLECT, a Term uſed among the Philoſophers, to ſignify that Faculty of the Soul, uſually called the Underſtanding. The *Peripatetics* make two kinds of *Intellect*, the Active and the Paſſive; the Active is that which receives the impreſſed Species emitted by Objects to the exteriour Senſes, which convey to the common Senſorium. Theſe impreſſed Species being material and ſenſible, are rendered intelligible by the Active *Intellect*, and fit to be received into the Paſſive *Intellect*. The Species, ſo ſpiritualized, are called expreſſed Species, as being expreſſed from thoſe others impreſſed, and it is by theſe that the *Intellect* comes to know material things: in effect, however, the two *Intellects* have nothing really diſtinct from each other.

INTELLIGIBLE, any thing capable of being underſtood or conceived by the Mind. The Philoſophers have invented certain Beings that are purely intelligible, and only ſubſiſt in the Underſtanding; ſuch are the *Entia Rationis*, Univerſal Ideas, and other Chimeras. The *intelligible*, or intellectual World, is the Idea of the World in the Divine Mind, frequently referred to by *Malebranch.*

INTENDANT, one who has the Conduct, Inſpection, and Management of any thing. This is a Title very frequent among the *French:* they have their *Intendants* of the Marine, who are Officers in the Sea-Ports, whoſe Buſineſs is to take care the Ordinances and Regulations relating to Sea-Affairs be obſerved; *Intendants* of the Finances, who have the Direction of the Revenues; *Intendants* of Provinces, who are appointed by the King, to take care of the Reformation of Juſtice, Policy, and Finances in the Provinces; *Intendants* of Buildings, of Houſes, *&c.*

INTENDMENT OF LAW, the Underſtanding, Intention, and true Meaning of the Law. The Judges ought to judge according to the common *Intendment* of the Law. *Coke.*

INTENT, in the Civil Law, is to begin or commence an Action or Proceſs.

INTENTION, in Law, is a Writ which lies againſt him who enters after the Death of the Tenant in Dower, or other Tenant for Life, and holds out him in the Reverſion or Remainder.

INTENTION, in Phyſic, is that Judgment or particular Method of Cure, which a Phyſician forms to himſelf from a due Examination of Symptoms.

In Phyſics, it ſignifies the Increaſe of any Power or Quality, as Heat, Cold, *&c.* as Remiſſion ſignifies its Decreaſe or Diminution.

In Metaphyſics, it is uſed for the Exertion of the intellectual Faculties with more than ordinary Vigour: When the Mind with Earneſtneſs fixes its View on any Idea, conſiders it on all ſides, and will not be called off by any Sollicitation.

The Schoolmen alſo uſe the Terms firſt and ſecond *Intention.* A Term of firſt *Intention* is that which ſignifies a thing; the firſt *Intention* of Man, in eſtabliſhing Words, being to expreſs Things, or the Ideas they have of Things. A Thing of ſecond *Intention* is that which does not ſignify a Thing, but another Term or Sign. Thus a Tree, a Man, *&c.* are Terms of firſt *Intention*, and the Terms in Rhetoric, Grammar, *&c.* as Figure, Kind, *&c.* are Terms of ſecond *Intention.*

INTERCALARY-DAY, is uſually underſtood of the odd Day inſerted in the Leap-Year. The Word is derived from the *Latin Intercalaris*, of *Calo calare*, which antiently ſignified to *call with a loud Voice:* an *Intercalary* among the *Romans* ſignifying a Day inſerted between two other Days; which for that reaſon was proclaim'd by the Prieſts with a loud Voice.

INTERCOLUMNS, or *Intercolumniation*, in Architecture, ſignify the Spaces between the Columns. The *Intercolumns* muſt always be proportion'd to the Height and Bulk of the Columns. *Vitruvius* calls it *Intercolumnium:* And according to that Author, the *Intercolumniation* is of five kinds; *viz.* Pychnoſtyle, Siſtyle, Euſtyle, Dioſtyle, and Araeoſtyle: which ſee explain'd in their places. For a Medium, ſome Authors have laid down the following Proportions for the *Intercolumns.* In the Tuſcan Order, the *Intercolumn* muſt be four Diameters of the Body of the Column below; in the Doric three; in the Ionic two; in the Corinthian two, one quarter; in the Compoſite one and a half.

INTERCESSOR, a Perſon who prays or intercedes in behalf of another. In the *Roman* Law *Interceſſor* was the Name of an Officer, whom the Governours of Provinces appointed principally to raiſe Taxes and other Dues. See *the third Law of Juſt. Code.*

Interceſſor was alſo a Term heretofore applied to ſuch Biſhops, as, during the Vacancy of a See, adminiſter'd the Biſhopric, till a Succeſſor to the deceaſed Biſhop had been elected. The third Council of *Carthage* calls theſe *Interventors.* The word *Interceſſor* comes from the *Latin inter* and *cedo*, *I go between.*

INTERCOMMONING, is when the Commons of two Mannors lie together, and the Inhabitants of both have

time out of mind cauſed their Cattel to feed promiſcuouſly in each.

INTERCOSTAL, in Anatomy, ſignifies any thing between the Ribs. There are two *intercoſtal* Nerves, which are ſo call'd, becauſe in deſcending they paſs near the Roots of the Ribs. They are formed in the Brain, by three Branches of Nerves, two whereof come from the ſixth Pair, and the third from the fifth. The *intercoſtal* Nerves have a great Communication with thoſe of the eighth Pair, and ſend ſeveral Branches to the Breaſt and lower Ventricle. There are alſo two *intercoſtal* Arteries; the upper, which comes from the Subclavian, and diſtributes itſelf within the four Spaces of the upper Ribs; and the under, which comes from the lower Trunk of the great Artery, and diffuſes itſelf within the Spaces between the eight lower Ribs and the neighbouring Muſcles. There is alſo a Vein call'd *Intercoſtal*, which ariſes from the four Spaces between the upper Ribs, and terminates in the Subclavian.

Intercoſtal Muſcles are the external and internal, which are forty-four in number, one of each ſort being between every two Ribs: They ariſe from the lower Edges of each ſuperior Rib, and are inſerted into the upper Edges of each inferior Rib. Their Fibres croſs one another; thoſe of the external run obliquely from the back-part forwards; but thoſe of the internal from the fore-part backwards: they are thin and fleſhy.

INTERDICT, a Cenſure inflicted by a Pope or Biſhop, ſuſpending the Prieſts from their Functions, and depriving the People of the Uſe of Sacraments, Divine Service, and Chriſtian Burial.

Interdict is properly underſtood of a general Excommunication of a Country or City, as appears by the Decretals. There is a local and a perſonal *Interdict*; where theſe two are join'd, the *Interdict* is ſaid to be mix'd. This Puniſhment, as well as general Excommunications, were but little known till the Time of Pope *Gregory* VII. In Excommunicating a Prince, all his Adherents, that is, his Subjects who retain their Allegiance, are excommunicated, and the whole Country is under an *Interdict*. In the Reign of King *John*, the Kingdom of *England* lay under a Papal *Interdict* for above ſix Years together: It began *A. D.* 1208. In Imitation of the Popes, the Biſhops alſo began to *interdict*; and it became a common thing for a City or Town to be excommunicated for the ſake of a ſingle Perſon whom they undertook to ſhelter. But this Severity was found to have ſuch ill Effects, that they have been oblig'd to moderate it. An *Interdict* is denounced, and taken off again, with the ſame Formalities as an Excommunication.

In the Common Law, the word *Interdiction* is uſed alſo in the ſame Senſe as in the Canon Law, where it is defin'd to be *Cenſura Eccleſiaſtica prohibens Adminiſtrationem Divinorum.*

Interdicts, in the *Roman* Law, were certain *Formulæ* of Words, by which the Prætor, when the Poſſeſſion of any thing was conteſted between many, order'd or forbid ſomething to be done with it, till the Buſineſs of Right or Property ſhould be legally determin'd. Which *Formulæ* were call'd *Interdicts*, becauſe they related to the Poſſeſſion of the thing in the *interim*; or till the Right was aſcertain'd. They had three kinds of *Interdicts*, *Prohibitoria*, *Reſtitutoria*, and *Exhibitoria*. *Prohibitoria* were thoſe by which the Judges forbad any one to vex another in the Poſſeſſion of any thing legally belonging to him. *Reſtitutoria* were thoſe by which the Judges appointed any one, who had been expelled out of his Eſtate, to be repoſſeſſed before his Right was legally aſcertain'd; and this was the ſame with what they call'd the *Reintegrant*. *Exhibitoria* were thoſe by which any thing in diſpute was order'd to be exhibited, as a Teſtament, *&c.*

There was alſo a ſecond Diviſion of *Interdicts*, *viz.* into *Adipiſcendæ*, *Retinendæ*, and *Recuperandæ*. The firſt tended to the acquiring a new Poſſeſſion, as the *Interdict quorum bonorum*, &c. the ſecond to the keeping an old one till it was further determin'd, as the *Uti poſſidetis*, &c. the laſt to the recovering one loſt, as *Unde vi*, &c.

Interdiction of Water and Fire; a Sentence antiently pronounced againſt ſuch, as for ſome Crime were to be baniſh'd. They were not directly adjudged to Baniſhment; but by giving order that no body ſhould receive them, but deny them Fire and Water, they were condemned, as it were, to a Civil Death; and this they call'd *Legitimum Exilium. Livy.*

INTEREST, is the Sum reckoned for the Loan and Forbearance of ſome principal Sum lent for, or due at a certain time, according to ſome certain Rate, and therefore called Principal, becauſe it is the Sum that procreates the *Intereſt*, or from which the *Intereſt* is reckoned, and is either Simple or Compound.

(1.) Simple *Intereſt* is counted from the Principal only, and is eaſily computed by the Simple or Compound Golden Rule, thus: Let that which is the principal Cauſe of the *Intereſt* be put in the firſt place, and that which betokeneth Time be in the ſecond place, and the remaining in the third; under this conditional Part place the two other Terms, each under its like, and there will be a Blank to ſupply under one of thoſe above, either under the firſt, ſecond, or third: As for Example, if 100 *l.* in twelve Months gain 6 *l.* (this is the conditional Part) what ſhall 50 *l.* get in three Months? Place them down as in the Rule.

l.	*Months.*	*l.*
100	12	6
50	3	

Here the Blank will be under the third Place, multiply the three laſt for a Dividend, and the two firſt for a Diviſor, the Quotient of theſe gives the ſixth; that is, $6 \times 50 \times 3 = 900$, and $100 \times 12 = 1200$. Now 1200) 900.0(73 = 15 *s.* required. But if the Demand had been, In how many Months would 50 *l.* have gained 15 *s.* or if 100 *l.* in twelve Months gain 6 *l.* what ſhall the Principal be that in three Months would gain 15 *s.* In theſe two Caſes the Blank would have been under the firſt or ſecond Term: Then, by the Rule, multiply the firſt, ſecond, and laſt for a Dividend, and the third and fourth for a Diviſor; the Quotient is the Anſwer.

l.	*Months.*	*l.*
100	12	6
3	75 = 15 *s.*	

Then by the Rule $100 \times 12 \times 75 = 900.00$ and $6 \times 3 = 18$) 900. (50 *l.* required.

This Rule ſhews Simple *Intereſt*, and all that belongs to it with Eaſe, and was thus found: Put P for the Principal, T for the Time, and G for the Gain in the Conditions, and p, t, g anſwering, it will be, $P : G :: t : p : \frac{G\,p.}{P}$ And $T : G\,p :: t : \frac{G\,p\,t}{T\,P} = g$, which is the firſt Rule; that is, multiply the three laſt for a Dividend, and the two firſt for a Diviſor. And becauſe $\frac{G\,p\,t}{T\,P} = g$, therefore $G\,t\,p = T\,P\,g$, and conſequently $t = \frac{T\,P\,g}{G\,p}$ and $p = \frac{T\,P\,g}{G\,t}$, which is the ſecond Rule.

(2.) *Compound Intereſt* is that which is counted from the Principal, and Simple *Intereſt* forborn, called alſo *Intereſt upon Intereſt*; but becauſe this hath now no Place in human Affairs, it being rendered illegal, it is not worth while to know how to compute it. But beſides the ways of computing *Intereſt*, we ſhall here give another very plain, eaſy, and ready Method of computing all Simple *Intereſt* and Diſcount; as alſo the way to find the Amount or preſent Value of any Sum of Money, or of any Annuity, or other yearly Payment, *&c.* for any Term not exceeding an hundred Years. And in order to this, the following Table of Shillings, Pence, and Farthings, reduced to the Decimal Parts of Pounds, is previouſly neceſſary.

SHILLINGS, PENCE, and FARTHINGS, reduced to the Decimal Parts of a POUND.

s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.	s.	d.	Decimal Parts of a Pound.
—	—	.	—	—	.	--1	--2¼	.059375	--1	--9¼	.089583

Examples of the Uſe of the preceding TABLE.

What Decimal Part of a Pound is 7 *d*? Look in the Table for 7 *d.* and even with it you will find 029167, which is the Decimal required. What Decimal Part of a Pound is 17 *s.* 6 *d*? You will find the Decimal of 17 *s.* to be 85, and the Decimal of 6 *d.* to be 025; which added, makes 875. and anſwers the Queſtion. What is the Value of this Decimal .09375 in Shillings, Pence, and Farthings? Look in the Table, and you will find it to be 1 *s.* 10 *d.* ½. Obſerve, that if you cannot find in the Table the exact Decimal ſought for, to take that which is neareſt to it, and you can never err above half a Farthing. Knowing thus the Uſe of theſe Decimal Tables, all the Buſineſs of *Simple Intereſt* will be very eaſily underſtood, and diſpatched as followeth.

The yearly *Intereſt* of any Sum of Money is had, by only multiplying the principal Sum by the hundredth Part of the Rate of *Intereſt*: For the Product in Decimals is the true Anſwer. For Example, what is the Intereſt of 75 *l.* for one Year, at the Rate of ſix *per Cent*?

75 = Principal.
06 = the hundredth Part of 6 *l.*

l. s. d.

4.50 the Product, which is 4 10 00

What is the yearly Intereſt of 157 *l.* 17 *s.* 6 *d.* at 5 *l. per cent*?

157.875 is the Decimal for 157 *l.* 17 *s.* 6 *d.*
05 the Hundredth Part of five Pounds.

7.89375 which is the Decimal anſwering to 7 *l.* 17 *s.* 10 *d.* ½, the *Intereſt* of 157 *l.* 17 *s.* 6 *d.* for one Year at 5 *l. per Cent.* and ſo for any other Rate or Sum whatſoever. When thus the *Intereſt* for one Year is found, divide it by 365, and the Quotient will be the *Intereſt* for one Day. Thus 01 being the *Intereſt* of one Pound for one Year, if you divide that Decimal by 365, (continuing the Work as long as you pleaſe) you will have 000027397260 28, &c. for a Quotient, which will be the Intereſt of one Pound for one Day, and at one *per Cent.* Then will this Decimal 000027, &c. found as above, if you multiply it continually by the Principal, the Number of Days, and the Rate of *Intereſt*, become of itſelf an *Intereſt*-Table for any Sum of Money, for any Time, and at any Rate: As for Example, what is the Intereſt of 150 *l.* for 365 Days at 6 *l. per Cent.*

```
000027397260 28
            150
-------------
4109589042 00
          365
-------------
1500000000 33000
             6
-------------
```

9.000000001980 00, which Decimal gives the Anſwer, near enough for any Uſe, to be nine Pounds.

By the ſame Rule .02 divided by 365, will give, in the Quotient, the Intereſt of one Pound for one Day, at 2 *per Cent.* and 03, divided by 365, will do the ſame at 3 *per Cent.* and thus theſe Numbers following were found.

The Intereſt of one Pound for one Day, at all Rates, from 1 to 10 *per Cent.*

At 1 *l. per Cent.* is 000027397260, &c. as above.
2 —— 000054794512
3 —— 000082191781
4 —— 000109589041
5 —— 000136986301
6 —— 000164383562
7 —— 000191780822
8 —— 000219178082
9 —— 000246575342
10 —— 000273972603, &c.

And when thus the Intereſt of one Pound for one Day and any Rate is found, then that *Intereſt*, multiplied by 2, 3, 4, 5, 6, 7, 8, and 9, &c. gives the *Intereſt* of any Sum of Money at the ſame Rate.

Take an Example at 3 *l. per Cent.*

Intereſt of 1 *l.* for 1 Day is 00008219178
2 —— 00016438356
3 —— 00024657534
4 —— 00032876712
5 —— 00041095890
6 —— 00049315068
7 —— 00057534246
8 —— 00065753424
9 —— 00073972602

And then it is eaſy to find that the *Intereſt* of 1 *l.* being, as before, .000082, *&c.* that of

10 will be 000822 *
100 —— 008219
1000 —— 082192 *
10000 —— 8.219178 *
100000 —— 82.191781

Becauſe moving the Point of Separation ſtill one Place nearer to the Left-Hand, multiplies any Decimal by 10, 100. 1000, *&c.* as is ſhewn under Decimals. And thus Tables of daily *Intereſt* may be made at pleaſure. The Reaſon of the Stars above ſet to ſome of the Numbers, is to ſhew, that in the Contraction of a Decimal Fraction to fewer Places, it is proper to add one to the laſt Figure retained, when the next Figure to it, which is omitted, exceeded 5.

To finiſh this Account of Intereſt, we ſhall here ſubjoin the ingenious Mr. *Barton's* new and univerſal Method of Simple Intereſt, correctly, conciſely, and eaſily finding the Intereſt of any Sum, for any Number of Days, at any Rate *per Cent.* by one General Rule.

Places 1 2 3 4 5 6 7 8 9 10
RADIX .0000273 97 $\frac{19}{73}$ *l.* Sterling.
(*General Rule*) multiply the Principal, Time, Rate, and Radix one into another, and it's done.

EXAMPLE 1.

Intereſt of *l.* 271 for 112 Days at *l.* 3 *per cent. per ann.*

112
20352
3
91056

2.4657
273
13
1
2.494 Anſw. *l.* 2 : 9 : 10 $\frac{3}{4}$

EXAMPLE 2.

Intereſt of *l.* 110 for 71 Days at *l.* 5 *per cent. per ann.*

11
781
5
3905

1.069 Anſw. *l.* 1 : 1 : 4 $\frac{3}{5}$

EXAMPLE 3.

Intereſt of 5000 *l.* for 60 Days at *l.* 4. *per cent. per ann.*

6
3
4
12

32. 876 Anſw. *l.* 32 : 17 : 6 $\frac{3}{4}$

EXAMPLE 4.

Intereſt of *l.* 800 for 125 Days at *l.* 6 *per cent. per ann.*

8
1
6
6

16.438 Anſw. *l.* 16 : 8 : 9 $\frac{3}{4}$.

Any Annual Sum given, to find what that is *per* Day.

EXAMPLE 5.

l. 164 *per ann.* what is that *per* Day?

.2739
.1643
109
.449 Anſw. *s.* 8 : *d.* 11 $\frac{3}{5}$

EXAMPLE 6.

l. 1000 *per ann.* what is that *per* Day?

2.739 Anſw. *l.* 2 : 14 : 9 $\frac{3}{5}$

EXPLICATION.

In Example 1. the principal Time and Rate multiplied one into another, make 91056, by which I multiply the Radix thus; becauſe 9 is in the * 5th Place, with my Left-hand I hold a Quill's Point in the * 5th Place in the Radix; then I multiply by the ſaid 9, beginning five Figures (more or leſs) to the right of the Quill, and when I come to the fourth Figure, on the right of the Quill, I ſet its Product down, and all the reſt onwards, obſerving when I come to the ſaid 5th Place to make the [.] and the Product is 2.4657: Then I remove the Quill into the fourth Place of the Radix (becauſe 1 ſtands there in the whole Number) and multiply by 1 (ever obſerving punctually the laſt Rule) and the Product is .0273; then 0 in the third place makes nothing, for 5 in the ſecond place (putting the Quill there) the Product is .0013: and for 6 in the firſt Place the Product is .0001: (placing them ever in the Order you ſee) I add them together (never ſetting but three Decimals down) and find their Sum 2.494, and its Value thus.

* Note, *The Places in whole Numbers are reckoned from Right to Left, in Decimals contrary.*

If any thing is to the left of the [.] it's Pounds (*l.* 2) the firſt Figure to the right of the [.] doubled is Shillings (8 *s*): from the ſecond Figure take 5 if you can (if you cannot its whole is Tens) and make the Shillings one more (9): the Remainder (4) in the ſecond place, is Tens, which added to the third (as Units) is Farthings (44 Farthings): for every 20 in that put away 1 (44 Farthings put away 2 is 42 Farthings): the Remainder brought into Pence (10 *d* $\frac{3}{4}$) compleats the Anſwer (*l.* 2. 9. 10 $\frac{3}{4}$.)

Contraction.] A Cypher or Cyphers (having no Figure to the Right) may be cancelled (I have noted them with a Daſh) multiplying the real Figures one into another; but obſerve that the Figures by which you are to multiply the Radix, are to be uſed as if every cancelled Cypher ſtood before them. In Example 2. the 3905 is uſed like and in reality is 39050. In Example 3. five 0's are cancelled, therefore I uſe 12 like 1200000, putting the Quill for the 2 in the 6th Place in the Radix, and, for brevity's-ſake, multiply by 12 ot once.

Any annual Sum given, to find what that is *per* Day; ever imagine two 0's put to the Right of it, then multiply the Radix by it, and it's done.

Remarks.] (1.) If Cyphers be added to the Numerator of the Vulgar Fraction, and that Dividend be divided by the Denominator, the Radix may be increaſed to any Number of Places.

(2.) If the Radix be multiplied by 3, 4, 5, 6, *&c.* it will be a Radix for 3, 4, 5, 6, *&c. per cent.* and ſave the trouble of always multiplying by the Rate.

INTERJECTION, in Grammar, is an Expreſſion uſed to denote ſome ſudden Motion or Paſſion of the Mind; as *oh! ha! &c.* As the greateſt part of the Expreſſions uſed on theſe occaſions, are taken from Nature alone; the real *Interjections* in moſt Languages are Monoſyllables. And as all Nations agree in thoſe natural Paſſions, ſo do they agree in the Signs and Indications of them; as of Love, Mirth, *&c.* Some deny the *Interjections* to be Words, or any part of Speech, and make them mere natural Signs of the Motions or Paſſions of the Mind, expreſs'd by theſe inarticulate Sounds, ſeveral whereof, Brutes have in common with us. But as theſe are Paſſions, and muſt be repreſented in Diſcourſe, the *Interjection* has a good Foundation in Nature, and is a neceſſary Part of Speech. The *Greeks* confound their *Interjections* with Adverbs, and the *Hebrews* confound them with their Adverbs and Prepoſitions, calling them all by the general Name *Particle.*

INTERIM: A Term borrow'd from the *Latin*, ſignifying *in the mean time. Charles* the Vth was the firſt who brought it into uſe, in order to compoſe the Diſturbances of *Germany.* It was a kind of Ordonnance or Regulation to be obſerv'd in the Empire, with regard to the Articles of Religion then controverted, till ſuch time as they ſhould be determin'd by a Council; and was therefore call'd *Interim.* It was ſaid to have been drawn up by two Catholics and a Proteſtant. But as it retain'd moſt of the Doctrines and Ceremonies of the *Romaniſts*, excepting that of Marriage, which was allow'd to Prieſts, and Communion, which was adminiſter'd to the Laity under both Kinds; moſt of the Proteſtants rejected it: thoſe who admitted it, were nick-named *Interimiſts* or *Adiaphoriſts*: Indeed the *Interim* equally diſguſted both Parties, the Proteſtants and Catholics. Beſides this, there were two other

Interims

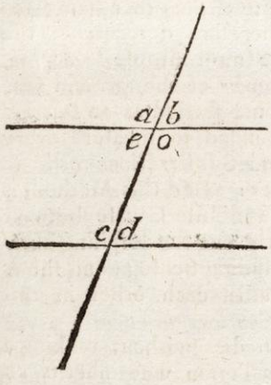
Interims made; the one call'd the *Interim* of *Leipſic*; the other made by the Divines of *Franconia*, who refuſing to accept the two former, made another for themſelves.

INTERLINEATION, ſomething inſerted between two Lines.

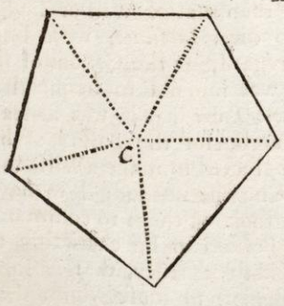
INTERLOCUTORY ORDER, is that which decides not the Cauſe, but only ſettles ſome intervening Matter relating to the Cauſe; as where an Order is made by Motion in Chancery, for the Plaintiff to have an Injunction, to quit his Poſſeſſion till the hearing of the Cauſe: This, or any other ſuch Order, not being final, is *interlocutory*.

INTERLOPE, is to intercept or diſturb the Traffic of a Company; to take up a new Trade or Employment, to the prejudice of thoſe who were brought up in it: And *Interlopers* are properly thoſe, who without due Authority hinder the Trade of a Company or Corporation lawfully eſtabliſh'd, by dealing in the ſame way.

INTERLUCATION, in Husbandry, is a letting in of Light between, by lopping, or cutting away of Boughs.



INTERLUDE, an Entertainment exhibited on the Theatre between the Acts of a Play; to amuſe the Spectators while the Actors take breath, and ſhift their Dreſs; or to give time for changing the Scenes and Decorations. Theſe *Interludes* uſually conſiſt of Songs, Dances, Feats of Activity, Conſorts of Muſic, &c. In the antient Tragedy, the Chorus ſung the *Interludes*, to ſhew the Intervals between the Acts. *Ariſtotle* and *Horace* give it for a Rule, that the *Interludes* ſhould conſiſt of Songs built on the principal Parts of the Drama: But ſince the Chorus has been laid down, Dancers, Buffoons, &c. ordinarily furniſh the *Interludes*.



INTERMEDIATE, ſomething betwixt two. It is uſually underſtood of the Space of Time elapſed from any certain Point to any other.

INTERMEWING, in Falconry, is an Hawk's *Mewing* from the firſt Change of her Coat till ſhe turn white.

INTERMITTENT ſignifies a Ceſſation of any particular Action for ſome time, and that Time is called the *Interval*: Thus Fevers which go off, and ſoon return again, as alſo any other Diſtempers, are called *Intermittents*, in oppoſition to thoſe which are always continued; and a Pulſe which after ſo many Strokes, ſtops, or loſes one in its due time, is call'd an intermitting Pulſe. With regard to this it has been obſerved, that as often as the Ventricle is much inflated with Wind, the *Nervus* or *Plexus Cardiacus* at its Orifice muſt ſuffer a Contraction, which being continued to the Heart, will occaſion a Twitching; and this, as it is more or leſs violent, will produce a ſimple Intermiſſion of Pulſe, or a real Palpitation of the Heart.

INTERNAL ANGLES, are all *Angles* made by the Sides of any right-lin'd Figure within: alſo the two *Angles* between the parallel Lines on each ſide the croſſing Line, as *o* and *d*, *e* and *c* in the Figure are call'd the two *internal Angles*, and are always equal to two right ones. The *Angles c* and *d* are alſo called *internal* and oppoſite *Angles* in reſpect of *a* and *b*. The Sum of all the *internal Angles* of any right-lin'd Figure, is equal to twice as many right *Angles* as the Figure hath Sides, except 4. For ſince every ſuch Figure from a Point taken within it, can be divided into as many Triangles as it hath Sides, and ſince the Sum of the *Angles* of each Triangle is equal to 2 right *Angles* (32, *Prop.* 1. *Eucl.*) that will make twice as many *Angles* as the Figure hath Sides; from which Sum take away all thoſe *Angles* about the Point *c*, which (by 13. *Prop.* 1. *Eucl.*) are equal to 4 right *Angles*; wherefore the remaining Sum of all the *internal Angles* is equal to twice as many right *Angles*, as the Figure hath Sides, except 4.

INTERNODII, in Botany, are thoſe little Spaces contained between any two Knots or Joints of the Stalk of a Plant; and in Anatomy, the *Extenſores Pollicis*, which ſee, are alſo ſo called.

INTEROSSEI MANUS, are the Muſcles which move the Fingers, thus called from their Situation, as being contained between the Spaces of the Bones of the *Metacarpus*: Some reckon ſix of them, and others eight; the one half lie between the Spaces theſe Bones leave towards the Palm of the Hand, and they are called the internal *Interoſſei*, ariſing from the upper part of the Bones of the *Metacarpus* next the *Carpus*; and being inſerted on the internal Sides of the firſt Bones of the Fingers with the *Lumbricales*, they are the *Adductores Digitorum*, for they bring the Fingers to the Thumb. The other half are contained in the Spaces that the Bones of the *Metacarpus* leave on the Back of the Hand; they riſe from the upper Part of the Bones of the *Metacarpus*, next the *Carpus*, and are inſerted on the external Sides of the firſt Bones of the Fingers; and theſe are the *Adductores Digitorum*, for they draw the Fingers from the Thumb.

Interoſſei Pedis, the Muſcles which move the Toes; in Number, Uſe, Origin, and Inſertion, they anſwer exactly to thoſe of the Hand. See *Interoſſei Manus*.

INTERPOLATION, a Term uſed by the Critics in ſpeaking of antient Writings and Manuſcripts, to which ſome ſpurious Additions or Alterations have been ſince made. For the aſcertaining an *Interpolation*, *P. Ruinart* gives us the five following Rules. 1. That the Piece ſuppoſed to be interpolated appear to have all the Antiquity it pretends to. 2. That there be good Proofs that it has been interpolated. 3. That the ſuppoſed *Interpolations* agree to the Time of the Interpolator. 4. That the *Interpolations* don't touch the Foundation of the Work, be not too frequent, nor entirely diſfigure the Piece. 5. That the Reſtitution made, agree perfectly to the reſt of the Work.

INTERPOSITION, the Situation of a Body between two others hiding them, or preventing their Action. Thus the Eclipſe of the Sun is occaſion'd by an *Interpoſition* of the Moon between the Sun and us; and that of the Moon by the *Interpoſition* of the Earth between the Sun and Moon.

INTERPRETER, a Perſon who explains the Thoughts, Words, or Writings of ſome others, which before were unintelligible. The word *Interpres*, according to *Iſidore*, is compoſed of the Prepoſition *inter* and *partes*, as ſignifying a Perſon in the middle betwixt two Parties, to make them mutually underſtand each other's Thoughts. Others derive it from *inter* and *præs*, i. e. *Fidejuſſor*, a Perſon who cautions another.

There have been great Debates about interpreting the Scripture: The *Romaniſts* contend, that it belongs abſolutely to the Church, adding, that where ſhe is ſilent, Reaſon may be conſulted; but where ſhe ſpeaks, Reaſon is to be diſregarded. The Proteſtants generally allow Reaſon the Sovereign Judge in the Caſe; tho ſome among them have a ſtrong regard to Synods and others to the Authority of the Primitive Fathers. Laſtly, others have recourſe to the Spirit within every Perſon to interpret for them. Which is what *Bochart* calls ἀπόδειξις τῶ πνεύματος.

INTERREGNUM, the Time during which a Throne is vacant, or a Kingdom without a Head. In Hereditary Kingdoms there are no *Interregnums*, at leaſt they are very rare. In Elective Kingdoms, the *Interregnums* are extremely liable to Factions and Diſorders. In *Germany*, the Emperors have loſt the greateſt part of their Dominions during the *Interregnums*.

INTERREX, a Magiſtrate who governs during an *Interregnum*, or in the Interval between the Death of a Monarch, and the Election or Inauguration of his Succeſſor. This Magiſtrature was eſtabliſh'd in old *Rome*, and was almoſt as antient as the City itſelf. After the Death of *Romulus* there was an *Interregnum* of a Year, during which the Senators were each *Interrex* in their turn, five Days a-piece. After the Eſtabliſhment of Conſuls and a Commonwealth, tho there were no Kings, yet the Name and Function of *Interrex* was ſtill preſerved. For when the Magiſtrates were abſent, or there was any Irregularity in their Election, or they had abdicated, ſo that the *Comitia* could not be held, provided they were unwilling to create a Dictator, they made an *Interrex*, whoſe Office and Authority was to laſt five Days; after which they made another. To the *Interrex* was delegated all the Regal and Conſular Authority, and he perform'd all their Functions. He aſſembled the Senate, held *Comitia* or Courts, took care the Election of Magiſtrates was according to the Rules. Indeed, at firſt it was not the Cuſtom for the *Interrex* to hold *Comitia*; at leaſt we have no Inſtance of it in the antient *Roman* Hiſtory. The *Patricii* alone had the Right of electing an *Interrex*. This Office fell with the Republic, when the Emperors made themſelves Maſters of every thing.

INTERROGATE, a Judiciary Act, performed by a Judge or Commiſſioner deputed to examine or queſtion a Party; who firſt gives his Oath that he will anſwer truly to every thing he is *interrogated*.

INTERROGATION is a Figure in Rhetoric, in which the Paſſion of the Speaker introduceth a thing by way of Queſtion, to make its Truth more conſpicuous. It is a kind of Apoſtrophe which the Speaker

makes to himſelf; and it muſt be own'd, that this Figure adds an uncommon Briskneſs, Action and Force to Diſcourſe.

Interrogation, in Grammar, is a Point which ſerves to diſtinguiſh ſuch Parts of a Diſcourſe, where the Author ſpeaks as if he were asking Queſtions. Its Form is this ?

INTERRUPTION, is the ſame with Disjunction of Proportion in Geometry, it is noted thus (: :) and ſignifieth the breaking off of the Ratio in the middle of four disjunct or diſcrete Proportionals, as A : B :: C : D; that is, as A is to B ſo is C to D.

Interruption is alſo a Figure in Rhetoric, wherein a Perſon breaks off his Diſcourſe ſuddenly, to ſhew ſome Paſſion.

INTERSECTION, in Mathematics, ſignifies the Point or Line wherein two Lines or two Planes cut each other. Thus we ſay, that the mutual *Interſection* of two Planes is a Right Line. The Centre of a Circle is in the *Interſection* of two Diameters. The Central Point of a regular or irregular Figure of four Sides is the Point of *Interſection* of the two Diagonals. The Equinox happens when the Sun is in the *Interſection* of the Equator and Ecliptic.

INTERSOILING, in Husbandry, is laying one kind of Soil or Mould upon another; as Clay on Sand, Sand on Earth, *&c.*

INTERSPINALES COLLI, the Name of five Pair of ſmall Muſcles diſcover'd by Mr. *Cowper*; and by him ſo call'd from their Poſition. They ariſe from each double Proceſs of the Spine of the Neck, and run from the upper one to the next below, into which they are inſerted. They ſerve to approximate and draw together the *Vertebræ* of the Neck, and are more eſpecially proper to this Part, as having both Origin and Inſertion in it.

INTERSTELLAR, is a Word uſed by ſome Authors to expreſs thoſe Parts of the Univerſe that are without and beyond our Solar Syſtem; in which are ſuppoſed to be ſeveral other Syſtems of Planets moving round the fixed Stars as the Centers of their reſpective Motions: And if it be true, as it is not improbable, That each fixed Star is thus a Sun to ſome habitable Orbs, that move round it, the *Interſtellar* World will be infinitely the greater part of the Univerſe.

INTERTIES, or INTERDUCES, in Architecture, are thoſe ſmall Pieces of Timber that lie horizontally betwixt the Summers, or betwixt them and the Sell or Reſon.

INTERTRANSVERSALES COLLI: Certain Muſcles between the tranſverſe Proceſſes of the *Vertebræ* of the Neck, of the ſame Size and Figure with the *Interſpinales*, and obſerved by the ſame Author. See *Philoſoph. Tranſact. vol.* 21. *p.* 132.

INTERVAL, the Diſtance or Space between two Extremes, either of Time or Place. The Word comes from the *Latin Intervallum*, which, according to *Iſidore*, ſignifies the Space *inter Foſſam & Murum*, between the Ditch and the Wall. Others ſay, that the Stakes or Piles, driven into the Ground in the antient *Roman* Bulwarks, were called *Valla*, and the Interſtices or Vacancy between them *Inter-valla*.

INTERVAL, in Muſic, is the Difference between two Sounds in reſpect of Acute and Grave, or that imaginary Space terminated by two Sounds differing in Acuteneſs or Gravity. When two or more Sounds are compared in this Relation, they are either equal or unequal in the Degree of Tune. Such as are equal are call'd *Uniſons*, with regard to each other, as having one Tune; the other being at a diſtance from each other, conſtitute what we call an *Interval* in Muſic, which is properly the Diſtance in Tune between two Sounds. *Intervals* are diſtinguiſh'd into Simple and Compound. A ſimple *Interval* is without Parts or Diviſion, a Compound conſiſts of ſeveral leſſer *Intervals*. But this Diſtinction regards Practice only, becauſe there is really no ſuch thing as a leaſt *Interval*. Beſides, by a ſimple *Interval* is not meant here the leaſt practiſed, but ſuch as tho it were equal to two or more leſſer which are in uſe, yet when we would make a Sound move ſo far up or down, we always paſs immediately from one of its Terms to the other. What is meant then by a compound *Interval*, will be very plain: It is ſuch, whoſe Terms are in Practice taken either in immediate Succeſſion, or ſuch where the Sound is made to riſe and fall from the one to the other, by touching ſome intermediate Degrees; ſo that the whole becomes a Compoſition of all the *Intervals* from one Extreme to the other. What we here call a ſimple *Interval*, the Antients call'd a *Diaſtem*, and the Compound they call'd a *Syſtem*. Each of theſe has Differences; even of the Simple there are ſome greater, and others leſs: but they are always Diſcord; but of the Compound or Syſtem, ſome are Concord, others Diſcord. *Uniſons*, 'tis plain, cannot poſſibly have any Variety; for where there is no difference, as in Uniſonance, which flows from a Relation of Equality, 'tis plain there can be no Diſtinction: Uniſons therefore muſt all be Concords. But an *Interval* depending on a Difference of Tune, or a Relation of Inequality, admits of Variety; and ſo the Terms of every *Interval*, according to their particular Relation or Difference, make either Concord or Diſcord. Some indeed have reſtrained the word *Concord* to *Intervals*, making it include a Difference in Tune, but this is precarious; for as the word *Concord* ſignifies an Agreement of Sounds, 'tis certainly applicable to Uniſons in the firſt Degree: *Intervals*, 'tis plain, may differ in Magnitude, and there may be an infinite Variety according to the poſſible Degrees of Tune; for there is no Difference ſo great or little, but a greater or a leſs may poſſibly be conceived. 'Tis true, with regard to Practice, there are Limits which are the greateſt and leaſt *Intervals* our Ears are Judges of, and which may be actually produced by Voice or Inſtrument.

The Degrees of Tune are proportional to the Numbers of Vibrations of the ſonorous Body in a given Time, or the Velocity of their Courſes and Recourſes. Now theſe Differences in Tune conſtitute, as has been already ſaid, the *Intervals* in Muſic; theſe therefore muſt be greater or leſs, as the Differences are; and 'tis the Quantity of theſe, which is the Subject of the Mathematical Part of Muſic. Thoſe *Intervals* are meaſured not in the ſimple Differences or Arithmetical Ratio's of the Numbers expreſſing the Lengths or Vibrations, but in their Geometric Ratio's; ſo that the ſame *Interval* depends on the ſame Geometrical Ratio, and *vice verſâ*. It is however to be obſerved, that in comparing the Equality of *Intervals*, the Ratio's expreſſing them muſt be all of one Species; otherwiſe this Abſurdity will follow, that the ſame two Sounds may make different *Intervals*. To deſcribe the particular Methods of meaſuring the Inequality of *Intervals*, would be too tedious: this one Rule may be obſerved, that, to determine in general, which of two or more *Intervals* are the greateſt, take all the Ratio's as proper Fractions, and the leaſt Fraction will be the greateſt *Interval*.

The Antients were extremely divided about the meaſuring of *Intervals*. *Pythagoras* and his Followers meaſur'd them by the Ratio's of Numbers. They ſuppoſed the Differences of Gravity and Acuteneſs to depend on the different Velocities of the Motion that cauſes Sound; and thought, therefore, that they could only be accurately meaſured by the Ratio's of thoſe Velocities. Which Ratio's were firſt inveſtigated by *Pythagoras*, on occaſion of his paſſing by a Smith's Shop, and obſerving a Concord betwixt the Sounds of Hammers ſtriking on the Anvil. *Ariſtoxenus* oppoſed this. He thought Reaſon and Mathematics had nothing to do in the caſe, and that Senſe was the only Judge in the Diſpute; the other being too ſubtile to be of any uſe. He therefore determined the 8ve, 5th, and 4th, which are the moſt ſimple Concords, by the Ear; and by the Difference of the 4th and 5th, he found out the Tone: which once ſettled as an *Interval* the Ear could judge of, he pretended to meaſure every *Interval* by various Additions and Subſtractions made of theſe mentioned one with another: But this Method is very inaccurate. *Ptolemy* keeps a middle Courſe betwixt the two. He finds fault with the one for deſpiſing Reaſon, and with the other for excluding Senſe; and ſhews how theſe two may mutually aſſiſt each other in this Matter. See *Tone*, *&c.*

INTESTATE, a Perſon who dies without making a Will. An Heir *ab Inteſtato*, is a Perſon who inherits an Eſtate by ſome other Right, than that of Will or Teſtament. Heretofore, thoſe who died *Inteſtate*, were held infamous, and accurſed; in regard, by the Canons of ſeveral Councils, every Perſon was injoin'd to bequeath a part of his Eſtate (and *Matthew Paris* ſays it was at leaſt to be a tenth part) to the Church, for the Safety of his Soul; which, a Perſon who neglected to make a Will, and to leave this Legacy to the Church, was judg'd to have abandon'd. Several Councils took on them to command the Prieſts to ſollicite dying Perſons to be charitable to the Church; and this they did ſo earneſtly, that Abſolution and the Viaticum were denied to thoſe whom they could not prevail on; ſo that they made no difference between theſe *Inteſtates* and Self-Murderers: and they were alike denied Chriſtian Burial. *Du Cange* adds, that all who died without Abſolution, without receiving the Viaticum, and without leaving Alms to the Church (even tho they died ſuddenly) had their Effects ſeiz'd and confiſcated to the Uſe of the Church, the Biſhop, *&c.*

In our *Engliſh* Law there are two kinds of *Inteſtates*; the one *de facto*, which are thoſe who make no Will at all, the other *de jure*, which are thoſe who make a Will; but it is null and void, either from the Executors refuſing to act, or from ſome other Cauſe in which he is judg'd to die *inteſtate*.

INTESTINE MOTION, *of the Parts of Fluids.* Where the attracting Corpuſcles of any Fluid are elaſtick, they muſt neceſſarily produce an *Inteſtine Motion*; that is, a viſible Motion or Change of Place among the minute Parts of a fluid Body: and this greater or leſs according to the Degrees of their Elaſticity, and attractive Forces. For two elaſtic Particles after meeting will fly from one another (abſtracting the Reſiſtance of the Medium) with the ſame degree of Velocity, with which they met: But when in flying back from one another, they approach other Particles, their Velocity will be increaſed. See *Elaſticity* and *Fermentation.*

INTESTINES, in Anatomy, are the ſame with what we ordinarily call the Guts or Bowels. Theſe ſeem to be nothing but a Continuation of the Stomach, conſiſting of the ſame Number of Coats, and fabricated in the ſame manner; they are protended with various Circumvolutions and Inflexions to the *Anus*, thro' which they diſcharge the excrementitious part of their Contents out of the Body. They are, when ſeparated from the Meſentery, to which they are all along connected, of a very great Length, ordinarily about ſix times as long as the Perſons whoſe they were. And tho they ſeem to be but one continued Channel or Fiſtula, yet becauſe in ſeveral Parts their Magnitude, Figure, and Thickneſs are different, they are in general divided into the thick and thin, and theſe again are each of them ſubdivided into three; the three thin are called *Duodenum*, *Jejunum*, and *Ileum*; and the thick *Cæcum*, *Colon*, and *Rectum*. They have all of them in common a kind of Vermicular Motion, which, beginning at the Stomach, is propagated downwards, and is called the *Periſtaltic Motion*. To facilitate that, they are generally lubricated with a great deal of fat, eſpecially the thick ones, whoſe Surface being ſomewhat more uneven, and the Contents leſs fluid than thoſe of the thin, they need ſomewhat more to make them ſlide eaſy.

The firſt of the thin Guts is called *Duodenum*, and reaches from the right Orifice of the Stomach, as far as the *Vertebræ* of the Back on the left Side, where, at the firſt Angle made by the *Inteſtines* it ends, which is about 12 Inches, from which Meaſure it ſeems to have taken its Name. This Meaſure however is far from being very exact, as being much too largely computed. Into this Gut the Gall-Duct and Pancreatic-Duct empty themſelves, and their ſeveral Liquors mix with the Chyle. The next *Inteſtine* is the *Jejunum*, ſo called, becauſe it is generally found more empty than the reſt; which may be occaſioned partly by the Fluidity of the Chyle, which is greater in this *Inteſtine* than in any of thoſe that follow it; and partly by its Capacity, being ſomewhat larger than that of the *Duodenum*, and therefore it gives a freer Paſſage, and perhaps alſo the Irritation of this Gut thro' the Acrimony of the Bile, which is diſcharged upon the *Inteſtines* a little before the beginning of this Gut, may contribute ſomething towards accelerating the Paſſage of the Contents. However, it may ſeem ſufficient, that thro' the great Number of Lacteals, with which this Gut abounds more than any other, the Deſcent of the Contents, which are here deprived of the moſt fluid Parts, ſhould in the reſt be more ſluggiſh, by reaſon of their greater Conſiſtence. This *Inteſtine* is allowed to poſſeſs almoſt the whole Umbilical Region, and its Length is generally computed to be about twelve or thirteen Hands breadth. The *Ileum*, which is the third *Inteſtine*, is ſituated below the Navel, and fills the *Ilia* with its numerous Folds and Convolutions. It is the longeſt of all the *Inteſtines*, being eſteemed to be one and twenty Hands long: But theſe Eſtimates are ſomewhat arbitrary, becauſe it is not exactly ſettled among Anatomiſts, where the *Jejunum* ends, or the *Ileum* begins; neither is it eaſy or neceſſary to do it. In both this and the preceding *Inteſtine*, the Inner Tunic is much corrugated, the looſe Folds of which have been thought to do in ſome meaſure the Office of Valves, and have therefore by Authors been called *Valvulæ Conniventes*; which are framed, as in the Stomach, only by the inner Coat being larger than the outward.

Next follow the thick *Inteſtines*, the firſt of which is called the *Cæcum*, which has a lateral Inſertion into the upper end of the *Colon*, and is not perforated at its other Extremity, but hangs to it like the Finger of a Glove, and is about three or four Inches long. The true Uſe of this part is not yet determined, and ſome late Anatomiſts have thought that the Name likewiſe is miſtaken, not allowing this to be the *Cæcum* of the Antients, which they imagined to be that thick globous part of the *Colon*, which is immediately appended to the *Ileum*, and therefore they have given this part the Name of *Appendicula Vermiformis*. This *Cæcum*, or Appendix, is proportionably bigger in Infants than Adults, and in many other Animals even ſmaller than in Men, and is, at the unperforated Extremity, ſlightly connected to the right Kidney. The next of the thick *Inteſtines* is the *Colon*, which is much the largeſt, and moſt capacious of them all. It begins with the *Cæcum*, and is with that connected to the right Kidney. Thence with a winding Courſe it proceeds towards the Liver, where it is ſometimes tied to the Gall-Bladder, and by that tinged with yellow. From the Liver it runs a-croſs under the Bottom of the Stomach, where it is by very fine thin Membranes faſtned to the Spleen, and marches over the left Kidney, where its Cavity is ſometimes very much ſtreightned, and deſcending ſo to the bottom of the *Os Ileum*, and from thence returning to the upper part of the *Os Sacrum*, and there making the Figure of a Circumflex, it ends in the *Rectum*. At the Entrance of the *Ileum* into this Gut is placed a *Valve*, formed out of the Production of the inward Coat of the *Ileum*, which, like the Finger of a Glove, when its Extremity is cut off, hangs looſe in the Cavity of the *Colon*, by which means it ſtops the return of the Excrements, tho' ſometimes, as in Inverſions of the Periſtaltic Motion, it proves not ſufficient for that Uſe. It has a great many *Cellulæ*, or, as it were, diſtinct Cavities, framed by a Coarctation of the Gut by two Ligaments, or Bundles of membranous fleſhy Fibres, about half a Finger broad, each running on either ſide the Gut oppoſite to each other, the whole Length of it, and as it were girting it in at certain Diſtances, thereby making it reſemble a Glaſs Incorporator, uſed in mixing Oil and Vinegar. The next and laſt of the *Inteſtines* is the *Rectum*, which reaches from the *Os Sacrum* to the *Anus*, and is plain without Cells. It is faſt tied to the *Oſſa Sacrum* and *Coccygis*, by means of the *Peritonæum*, and in Men to the Neck of the Bladder of Urine, in Women to the *Vagina Uteri*, to which it is ſtrongly connected by a membranous Subſtance. That Subſtance of the *Vagina* and *Inteſtine* are hardly diſtinguiſhable from one another. The Length of this Gut is ordinarily about a hand's Breadth and an half, and its Capacity about the Thickneſs of three Fingers; its lower end, the *Anus*, is furniſhed with three Muſcles, *viz.* the *Sphincter Ani*, and *Levatores Ani*; which ſee.

There are alſo in the *Inteſtines*, a great Number of *Glands*, which, in the *Inteſtina Tenuia*, are gathered together in Heaps, as it were like Bunches of Grapes. In theſe *Inteſtines* they are very ſmall, and were it not for their Coacervations, ſcarce remarkable. But in the *Inteſtina Craſſa* they are much larger, not gathered like the others, but diſperſed; and, tho' very numerous, come under the Denomination of *Solitary Glands*. Theſe Glands diſcharge a Liquor into the *Inteſtines*, whether ordinarily for any thing more than the Lubrication of the *Inteſtines*, and diluting their Contents, is not certain; tho' thro' theſe ſeems the greateſt part of the Diſcharge to be made, which, either upon extraordinary Fluxes, or upon the Adminiſtration of Cathartics, we have frequent Occaſion to obſerve. Theſe *Inteſtines*, in general, are furniſhed with Blood from the Meſenteric Arteries, which is returned by the Meſeraic Veins: But the *Duodenum* receives a Branch of an Artery from the *Cæliac*, which is called *Duodena*, to which anſwers a Vein of the ſame Name, that likewiſe returns the Blood to the *Porta*; the *Rectum* receives others, which are called *Hemorrhoids*; the internal from the inferior Meſenteric, and the external from the Hypogaſtric, with Veins correſponding of the ſame Name, that alſo go to the *Porta*. Theſe Veſſels ſpread the *Inteſtines* with abundance of Ramifications, and are frequently diverſified in ſeveral Subjects of the ſame Species; much leſs are they to be depended upon for an uniform Appearance in Animals of different kind. The *Nerves* of the *Inteſtines* come ſome of them from thoſe of the Stomach, and ſome from the great Meſenteric Plexus, which diſtributes Branches to all the *Inteſtines*. The remaining Veſſels of the *Inteſtines* are the *Lymphæducts*, and *Venæ Lacteæ*, which ſee.

INTRIGUE, an Aſſemblage of Events or Circumſtances occurring in an Affair, and perplexing the Perſons concerned in it. *Tripaud* tells us the word is properly underſtood of Chickens, that have their Feet intangled in Hair, and is derived from the *Greek* ἐν and δελεξ.

In this ſenſe *Intrigue* is uſed to ſignify the Nodus, or Plot of a Play or Romance, or that Point wherein the principal Characters are the moſt embaraſſed, through the Artifice and Oppoſition of certain Perſons, or the unfortunate falling out of certain Accidents and Circumſtances. In a Tragedy, Comedy, or Epic Poem, there are always two Deſigns; the firſt and principal is that of the Hero of the Piece; the ſecond contains the Deſigns of all thoſe who oppoſe him. Theſe oppoſite Cauſes produce oppoſite Effects, to wit, the Efforts of the Hero for the Execution of his Deſign, and the Efforts of thoſe who thwart it. As thoſe Cauſes and Deſigns are the beginning of the Action, ſo thoſe Efforts are the middle, and form a Knot or Difficulty, which we call an *Intrigue*, that makes the greateſt part of the Poem. It laſts as long as the Mind of the Reader or Hearer is ſuſpended about the Event of thoſe oppo-

ſite Efforts; the Solution or Cataſtrophe commences when the Knot begins to unravel, and the Difficulties and Doubts begin to clear up. The *Intrigue* of the Iliad is twofold; the firſt comprehends the three Days fighting in *Achilles*'s Abſence, and conſiſts, on the one ſide, in the Reſiſtance of *Agamemnon* and the *Greeks*, and on the other in the inexorable Temper of *Achilles*. The Death of *Patroclus* unravels this *Intrigue*, and makes the beginning of a ſecond. *Achilles* reſolves to be revenged, but *Hector* oppoſes his Deſign, and this forms the ſecond *Intrigue*, which is the laſt Day's Battel. In the Æneid there are alſo two *Intrigues*; the firſt is taken up in the Voyage and Landing of *Æneas* in *Italy*, the ſecond in his Eſtabliſhment there. The Oppoſition he met with from *Juno*, in both thoſe Undertakings, forms the *Intrigue*. As to the Choice of the *Intrigue*, and the Manner of unravelling it, 'tis certain they ought both to ſpring naturally from the Ground and Subject of the Poem. *Boſſu* gives us three Manners of forming the *Intrigue* of a Poem; the firſt is that already mentioned; the ſecond is taken from the Fable and the Deſign of the Poet; in the third the *Intrigue* is ſo laid, as that the Solution follows from it of courſe. See *Cataſtrophe*.

INTRINSIC, a Term applied to the inner, real, genuine Values, Properties, &c. of any thing, in oppoſition to their extrinſic, apparent, or popular Values, &c.

INTRONATI, the Name of an Academy at *Sienna* in *Italy*. The Members of this Academy contented themſelves, at their firſt Inſtitution, with eſtabliſhing the following ſix ſhort Laws: (1.) To pray. (2.) To ſtudy. (3.) To be merry. (4.) To offend no body. (5.) Not to credit too lightly. (6.) To let the World talk.

INTRUSION, in the Canon Law, ſignifies the Enjoyment of a Benefice, or the Exerciſe of an Office, without a good Title to it. *Intruſion* diſqualifies the Party from ever holding the Benefice. The word is derived from the *Latin* Verb *intrudere*, *to thruſt in*, or *enter by Force*.

INVALID, a Perſon wounded, maimed, or diſabled for Action by Age. At *Chelſea* and *Greenwich* are magnificent Hoſpitals, or rather Colleges, built for the Reception and Accommodation of *Invalids*, or Soldiers wore out and diſabled in the Service. At *Paris* is a College of the ſame kind, called *les Invalides*, which is accounted one of the fineſt Buildings in that City.

INVECTED, in Heraldry, ſignifies the juſt Reverſe of *Engrail'd*; which ſee.

INVENTION, a Subtilty of Mind, or ſomewhat peculiar in a Man's Genius, which leads him to the Diſcovery of things that are new.

Invention, in Rhetoric, ſignifies the finding out, and the Choice of Arguments which the Orator is to uſe for the proving of his Point, or the moving of his Hearers Paſſions. *Invention*, according to *Cicero*, is the principal Part of Oratory. He wrote four Books *de Inventione*, whereof we have but two remaining. This *Invention* of the Orators cannot, according to my Lord *Bacon*, be properly called *Invention*; to *invent* is to diſcover things not yet known, not to recollect thoſe that are; whereas the Uſe and Office of this Rhetorical *Invention* is only out of the Stock of Knowledge laid up in the Mind, to ſelect ſuch Articles as make for the purpoſe. The ſame Author divides this Faculty of *Invention* into two Parts, the one topical, the other promptuary; the firſt points out the way in which we are to purſue the Argument, the latter only lays up and diſpoſes things, for which we have frequent occaſion in the Mind.

Invention, in Poetry, is underſtood of every thing, that the Poet adds to the Hiſtory of the Subject he has choſen, and of the Turn that he gives it.

Invention, in Painting, is the Choice which the Painter makes of the Ojects that are to enter the Compoſition of his Piece. *Du Pile* obſerves, that *Invention* is different from Diſpoſition, and that 'tis thoſe two things together that form Compoſition: For after having made a good Choice of Objects proper for the Subject, they may be ill-diſpoſed; and then tho' the *Invention* be never ſo good, the Diſpoſition or Ordonnance will be faulty, and the Piece will diſpleaſe. Of all the Parts of Painting, *Invention*, doubtleſs, is that which gives the Painter the faireſt Occaſions of ſhewing his Genius, his Imagination, and good Senſe. M. *Felibien* gives the general Name *Invention* to every thing that depends on the Genius of the Painter, as the Ordonnance, the Diſpoſition of the Subject, and even the Subject itſelf, when it is new. But the Term *Invention*, taken in this Senſe, is no Term peculiar to Painting, but agrees alſo to other Arts. In another place M. *Felibien* diſtinguiſhes *Invention* into two kinds; to wit, that which ariſes immediately from the Mind of the Painter, and that which he borrows from ſome other. The firſt is, when he invents the Subject himſelf, and the ſecond when he borrows it from Hiſtory, Fable, &c. but he always affixes the ſame Idea to *Invention*.

Janſon d'Almeloveen has written an Onomaſticon of *Inventions*, wherein are ſhewn, in an Alphabetical Order, the Names of the Inventors, and the Time, Place, &c. where they were made. *Pancirollus* has written a Treatiſe of old *Inventions* that are loſt, and new ones that have been made: *Polydore Virgil* has alſo publiſhed ſix Books of the *Inventions* of Things.

INVENTORY, in Law, is a Catalogue or Repertory orderly made of all a dead Man's Goods and Chattels, prized by four or more credible Men, which every Executor or Adminiſtrator is obliged to exhibit to the Ordinary at ſuch time as he ſhall appoint. The Uſe of the *Inventory* is borrow'd from the Civil Law, for whereas by the Law of the antient *Romans*, the Heir was obliged to anſwer all the Teſtator's Debts; by which means, Heritage ſometimes became rather prejudicial than profitable: To obviate this Inconvenience, *Juſtinian* ordained, That if the Heir would firſt exhibit a true *Inventory* of all the Teſtator's Effects, he ſhould be no farther charged than to the Value of the *Inventory*.

Inventory, in Trade, is a Liſt or particular Valuation of Goods, &c.

INVERSE is underſtood of a manner of working the Rule of Three, or of Proportion, that ſeems to be inverted, or to go backwards. In the Rule of Three direct the firſt Term is to the ſecond, as the third is to the fourth; that is, if the ſecond be greater than the third, or leſs than the firſt, in any Proportion, the fourth is leſs than the third in the ſame Proportion. But in the *Inverſe* Rule, the fourth Term is as much greater than the third, as the ſecond is leſs than the firſt. In the *inverſe* Rule, therefore, the Proportion is not, as the firſt is to the ſecond, ſo is the third to the fourth; but as the fourth is to the firſt, ſo is the ſecond to the third. For inſtance, in the Direct Rule we ſay, If three Yards of Tapeſtry coſt twenty Pound, how many will ſix coſt? The Anſwer is forty. In the *Inverſe* Rule we ſay, If twenty Workmen make ten Yards in four Days, in how many Days will forty do it? The Anſwer is in two Days.

INVERSE PROPORTION. See *Proportion*.

INVERSION, an Action, by which any thing is inverted, or turned backwards. Problems in Geometry and Arithmetic are often proved by *Inverſion*, or making a contrary Rule or Demonſtration.

INVERSION, in Grammar, is where the Words of a Phraſe are ranged in a manner, not ſo natural as they might be; for inſtance, Of all Vices the moſt abominable, and that which leaſt becomes a Man, is Impurity. Here's an *Inverſion*; the natural Order is this, The moſt abominable of all Vices, and that which leaſt becomes a Man, is Impurity. An *Inverſion* is not always diſagreeable, but ſometimes has a good Effect, and is uſed with Deſign.

INVEST ſignifies to confer on any one the Title of a Fee, Dignity or Office, or to ratify and confirm what has been obtained elſewhere. The Emperor pretends to a Right of inveſting ſeveral Princes both in *Germany* and *Italy*. There was formerly a particular Ceremony for the inveſting of Biſhops.

Inveſt, in the military Art, ſignifies the opening of the Siege of a Place, and the incamping an Army round it to block up all its Avenues, and to prevent all Ingreſs and Egreſs. 'Tis the Cavalry that always begin to *inveſt* a Place. The word comes from the *Latin in* and *veſtire*, *to clothe*.

Inveſt, in Law, ſignifies to put in poſſeſſion. A Tenant is *inveſted* by giving him a Verge or Rod into his Hands, and adminiſtring an Oath, which is call'd *Inveſting*. Others define it thus, *Inveſtire eſt in ſuum Jus aliquem introducere*, to give Livery of Seiſin or Poſſeſſion. See *Inveſtiture*.

INVESTIGATION properly ſignifies the ſearching or finding any thing out by the Tracks or Prints of the Feet. Hence the Mathematicians and Schoolmen, &c. came to uſe the Term in their reſpective Reſearches. *Inveſtigation* of a Theme is the Art, Method, or Manner of finding the Themes in Verbs, that is, the primitive Tenſe, Mode, and Perſon of any Verb, far removed from its Source. To underſtand a *Greek* Author, 'tis abſolutely neceſſary to be well acquainted with the Method of inveſtigating a Theme. This Theme, in the *Greek* Tongue, is the preſent Tenſe of the Indicative Mood. *Clenard* was the firſt who introduced this Term into Grammar; he gives the Title *Inveſtigatio Thematis*, to that part where he teaches the manner of finding whence any Perſon or Tenſe of a Verb proceeds, and of reducing it to its primitive Diction, or of finding its Indicative.

INVESTITURE is uſed both for the Right of inveſting any one, and the Act of inveſting him. This conſiſts in receiving the Faith and Homage, by which the Vaſſal becomes ſeized and poſſeſſed of a Fee by his Lord. *Inveſtiture* was antiently performed by a Form of Words, afterwards by the Delivery of ſuch things as had the neareſt

Reſem-

Reſemblance to what was transferred. Thus Land paſſed by the Delivery of a Turf, and to ſhew the Trees were transferred at the ſame time, a Bough was cut, and delivered along with it. But in After-times the things by which *Inveſtitures* were made, were not ſo ſtrictly obſerved. Many were inveſted by the Delivery of a Staff, a Glove, a Knife, a Piece of a Cloak, of a Strap, and a Girdle, by pricking the Thumb, by giving the Keys, a Spit, a Blow, a Ring, a Turf, a Bough, a Straw, &c. The *Inveſtiture* of a Kingdom, or Lordſhip, was performed by a Standard, a Banner, a Cap, a Sword, a Bow, Arrows, Spurs, &c. The Symbols were ſometimes preſerved in the Repoſitories of the Houſes, and were annexed to the Titles.

Inveſtiture was alſo uſed with regard to ſpiritual Benefices. This was frequently performed by delivering the Croſier and Paſtoral Ring. The Kings of *England* and *France*, the Emperors of *Germany*, &c. had formerly this Right: ſo that on the Death of a Prelate, his Clergy ſent the Croſier, &c. to their Sovereign, to be uſed at the Ceremony of inveſting his Succeſſor. The firſt who diſputed this Privilege with them, was *Gregory* VI. *Gregory* VII. did it to ſome purpoſe; he excommunicated the Emperor *Henry* IV. and forbad all Eccleſiaſtics, under pain of Excommunication, to receive the *Inveſtiture* at the hands of Secular Princes. *Paſchal* II. however, was obliged to confirm *Henry* V. in the Right of giving *Inveſtitures*; but repenting what he had done, he excommunicated him, and reduced him to a Neceſſity of begging Abſolution. At length that Emperor was obliged, by Pope *Gelaſus* II. ſolemnly to renounce all *Inveſtitures* and Elections. In antient Authors we meet with eighty different Forms of *Inveſtiture*.

INVOCATION, an Action by which we adore God, and call on him for his Aſſiſtance. The *Romaniſts* alſo practiſe *Invocation* of Saints, begging them to intercede with God in their behalf. This is one of the grand Articles of Diſpute between the *Romaniſts* and the *Reformed*.

Invocation, in Poetry, is an Addreſs which the Poet makes at the beginning of his Work, wherein he calls for the Aſſiſtance of ſome God, particularly of his Muſe, or the Divinity of Poetry. This part is abſolutely neceſſary in an Epic Poem, in regard the Poet relates things which he could not be ſuppoſed to know, unleſs ſome Deity inſpired him. Beſides, this ſerves his Readers as an Example of Piety and Devotion, which is the Foundation of his whole Work. To theſe it may be added, that the Gods themſelves are to have a part in the Action, and 'tis not decent he ſhould ſet them to work, without firſt asking them leave. Indeed in the Courſe of an Epic Poem, there are uſually ſeveral *Invocations*, particularly where any thing extraordinary or miraculous comes to be related: as when *Virgil* deſcribes the Metamorphoſis of *Æneas*'s Fleet into Sea-Nymphs; but the firſt *Invocation* is always the moſt conſiderable.

In the *Invocation*, *Boſſu* conſiders two things; the firſt is what the Poet requeſts, the ſecond to what Deity he addreſſes his Requeſt. As to the firſt, *Homer* has joined the *Invocation* ſo cloſely to the Propoſition, that he ſeems to invoke his Muſe for the whole Work. *Virgil*, on the contrary, only requeſts his Muſe to furniſh him with a part of his Subject, and even mentions what particular Part it is he deſires. After propoſing his Matter in all its Extent, he begs the Muſe to acquaint him with the Cauſe of it. As to the Deity invoked, the ſame Author obſerves, that it muſt always be, either the Divinity that preſides over Poetry in general, or that which preſides over the particular Subject of this Work. *Ovid*'s *Invocation*, in his *Metamorphoſes*, is of this latter kind, and ſo is that of *Lucretius*, thoſe of *Homer* and *Virgil* are of the former kind; they only invoke the Muſes, and thus they diſtinguiſh between the Divinities who preſide over Poetry, and thoſe who preſide over the Actions of the Poem, and who have Parts in it. By the way, it may be obſerved, that the Deities invoked are not looked on, even by the Poets themſelves, as Divine Perſonages, whence they expect any real Aſſiſtance. Under the Name of Muſe, they wiſh for the Genius of Poetry, and for all the Conditions and Circumſtances neceſſary for the Execution of their Deſign. Theſe are mere Allegories, or Manners of expreſſing themſelves poetically; juſt as when they make Gods of Sleep, of Reſt, Fame, and other natural and moral Things. Thus the Muſes come to be of all Ages, Countries, and Religions; there are *Pagan*, *Chriſtian*, *Greek*, *Latin*, and *Engliſh* Muſes.

INVOLUTION, a Term in Algebra ſignifying the raiſing of any Quantity from its Root to any Height aſſign'd. Suppoſe, for inſtance, $a+b$ were to be ſquared or raiſed to its ſecond Power; we ſay, *involve* $a+b$; that is, multiply it into itſelf, and it will produce $aa+2ab+bb$ of the ſame Quantity. And if it be *involved* again, or if that Square be multiplied by the Root, the Cube or third Power will be produced, *viz.* $aaa+3aab+3bba+bbb$. See *Evolution*.

INVOYCE: A particular Account of Commodities, Cuſtom, Proviſion, Charges, &c. ſent by a Merchant to his Factor or Correſpondent in another Country.

JOACHIMITES: The Name of a Sect the Followers of *Joachim*, Abbot of *Flora* in *Calabria*, who was eſteemed a Prophet while he lived, and left, at his Death, ſeveral Books of Prophecies, beſides other Works. In 1215, he and his Works were condemn'd together by the Council of the *Lateran*, and by the Council of *Arles* in 1260. It ſeems they were particularly fond of certain Ternaries. The Father, ſaid they, operated from the Beginning till the Coming of the Son; the Son from that time to theirs, *viz.* the Year 1260. and the Holy Spirit then took it up, and was to operate in his turn. They divided every thing that related to Men, Time, Doctrine, and Manner of Living, into three Claſſes or States, according to the three Perſons in the Trinity; every one of which States either had already, or was hereafter to ſucceed in its turn: and hence they call'd their Diviſions *Ternaries*. The firſt Ternary was that of Men. This comprehended three States or Orders of Men; the firſt State was that of married People, which had laſted, according to them, the whole Period of the Father; that is, the time of the Old Teſtament: The ſecond was that of Clerks, which laſted during the time of the Son: The third was that of Monks, wherein was to be an uncommon Effuſion of Grace, by the Holy Spirit. The ſecond Ternary was that of Doctrine, which they divided alſo into three: The Old Teſtament, which they attributed to the Father; the New, which they attributed to the Son; and the Everlaſting Goſpel, which they attributed to the Holy Spirit. In the Ternary of Time, they gave all the Time elapſed from the Beginning of the World till the Coming of Chriſt, to the Father; in which Time, ſaid they, the Spirit of the Law of *Moſes* prevailed. They gave to the Son the 1260 Years from Jeſus Chriſt to their Time; during which, the Spirit of Grace prevailed. Laſtly, the third, which was to come, and which they call'd the Time of the greateſt Grace, was for the Holy Spirit. Another Ternary conſiſted in the Manner of Living. In the firſt Time, under the Father, Men lived according to the Fleſh; in the ſecond, under the Reign of the Son, Men lived according to the Fleſh and the Spirit; in the third, which was to laſt to the end of the World, they were to live according to the Spirit. The *Joachimites* maintain'd, That in the laſt Times all Sacraments and Signs were to ceaſe; and the Truth was to appear openly, and without any Veil.

JOBBER, a Perſon who undertakes *Jobbs*, or ſmall Pieces of Work. In ſome Statutes it is uſed for a Perſon who buys and ſells Cattel for others.

JOGHI'S: The Name of a Sect of Heathen Religious in the *Eaſt-Indies*. They never marry, nor hold any thing in private Property; but live on Alms, and practiſe ſtrange Severities. They are ſubject to a General, who ſends them from one Country to another to preach. They are properly a kind of penitent Pilgrims, and are ſuppoſed to be a Branch of the antient *Gymnoſophiſts*. They frequent principally ſuch Places as are conſecrated by the Devotion of the People; and pretend to live ſeveral Days together without eating or drinking. After having gone thro a Courſe of Diſcipline for a certain Time, they look on themſelves as impeccable, and privileged to do any thing: upon which they give a Looſe to their Paſſions, and run into all manner of Debauchery.

JOINING OF ISSUE. See *Iſſue*.

JOINT, the Juncture, Articulation, or Aſſemblage of two or more things. *Joint*, in Architecture, is the Separation between the Stones, which is fill'd with Mortar, Plaiſter, or Cement. In Carpentery, &c. *Joint* ſignifies the ſeveral Manners of aſſembling or fitting Pieces of Wood together: Thus we ſay, *A Dove-tail Joint*, &c.

JOINT-RULE. See *Carpenters Joint-Rule*.

JOINT-TENANTS, in Law, are thoſe who come to, and hold Lands and Tenements by one Title, *pro Indiviſo*, or without Partition. Theſe are diſtinguiſh'd from ſole or ſeveral Tenants, from Parceners and from Tenants in Common: Antiently they were call'd *Participes*, and not *Hæredes*. They muſt jointly plead, and jointly be impleaded by others; which is common to them and Coparceners. But *Joint-Tenants* have a ſole Quality of Survivorſhip, which Coparceners have not. So that if there be two or three *Joint-Tenants*, and one hath Iſſue, and dies; then he, or thoſe *Joint-Tenants* that ſurvive, ſhall have the whole by Survivorſhip.

JOINTURE, is a Covenant whereby the Husband, or ſome other Friend in his behalf, maketh over to his Wife, on condition of Marriage, certain Lands and Tenements for Term of Life, or otherwiſe.

JOISTS, in Architecture, are thoſe Pieces of Timber framed into the Girders and Summers, on which the Boards

Boards of the Floors are laid: They are from ſix to eight Inches ſquare, and ought ſeldom to lie at a greater diſtance from each other than ten Inches, never than twelve; nor ought they ever to be longer than ten Foot, or to lie leſs into the Wall than eight Inches. Sometimes the Carpenters furr their *Joiſts*, as they call it, that is, lay two Rows of *Joiſts* one over the other.

JONCTURE, or JOINTURE: The ſame with Joint.

IONIC, in Architecture, is the Name of one of the five Orders. The firſt Idea of it was given by the People of *Ionia*; who, according to *Vitruvius*, form'd it on the Model of a young Woman, dreſs'd in her Hair, and of an eaſy elegant Shape: whereas the Doric had been form'd on the Model of a ſtrong, robuſt Man. The *Ionic* Column is the third in order; and is diſtinguiſh'd from the Compoſite, in that it has none of the Leaves of Acanthus in its Capital; and from the Tuſcan, Doric and Corinthian, by the Volutes, or Rams-Horns, which adorn its Capital: and from the Tuſcan and Doric, too, by the Channels or Flutings in its Shaft. Theſe Flutings are in number 24. They are not always concave from the top of the Shaft to the bottom; but for that third of it next the Baſe, are fill'd up with a kind of Rods or Canes, by the *French* call'd *Batons:* and in the other two thirds, are left hollow, or ſtriated, in imitation of the Folds or Plaits of a Garment. This Column is a Medium between the Maſſive and the Delicate Orders, the Simple and the Rich. Its Height is 18 Modules, or 9 Diameters of the Column taken at the bottom. When it was firſt invented, its Height was but 16 Modules; but the Antients, to render it ſtill more beautiful than the Doric, augmented its Height, by adding a Baſe to it, which was unknown in the Doric. M. *le Clerc* makes its Entablement 4 Modules and 10 Minutes, and its Pedeſtal 6 entire Modules: ſo that the whole Order makes 28 Modules 10 Minutes. 'Tis ſaid, the Temple of *Diana* at *Epheſus*, the moſt celebrated Edifice of all Antiquity, was of this Order. At preſent it is properly uſed in Churches and Religious Houſes, in Courts of Juſtice, and other Places of Tranquillity and Devotion. This Order has one advantage above any of the reſt, and it conſiſts in this, that the fore and hind-parts of its Capital are different from its Sides. But this is attended with an Inconvenience, when the Ordonnance is to turn from the Front of the Building to the Side: To obviate which, the Capital may be made Angular, as is done in the Temple of *Fortuna Virilis*. *Scamozzi*, and ſome other modern Architects, have introduced the upper part of the Compoſite Capital in lieu of the *Ionic*; imitating that of the *Temple of Concord*, whoſe four Sides are alike: to render it more beautiful, the Volute may be made a little oval and inclining. See *Order* and *Volute*.

Ionic Dialect, in Grammar, is a manner of Speaking peculiar to the People of *Ionia*. At firſt it was the ſame with the antient *Attic*, but paſſing into *Aſia*, did not arrive at that Delicacy and Perfection to which the *Athenians* attain'd. Inſtead of that, it rather degenerated, in *Aſia Minor*; being corrupted with the Admiſſion of foreign Idioms. In this *Dialect* it was that *Herodotus* and *Hippocrates* wrote.

Ionic Tranſmigration was heretofore a very celebrated *Epocha*. It took its Riſe from the Retreat of the *Athenian* Colonies, who, upon the Death of *Codrus*, put themſelves under the Command of his Son *Neleus*, and eſtabliſh'd the twelve Cities of *Ionia* in *Aſia*. Theſe Colonies, according to *Eratoſthenes*, were eſtabliſh'd 50 Years after the Return of the *Heraclidæ*; and, according to *Marſham*, 77 Years after the taking of *Troy*.

Ionic Sect, was the firſt of the antient *Sects* of Philoſophy; the others were the *Italic* and *Eleatic*. The Founder of this *Sect* was *Thales*, who being a Native of *Miletus* in *Ionia*, occaſion'd his Followers to aſſume the Appellation of *Ionic*. 'Twas the diſtinguiſhing Tenet of this *Sect*, That Water was the Principle of all Natural Things. This is what *Pindar* alludes to in the beginning of his firſt *Olympic Ode*.

JOURNAL, a Day Book, Regiſter, or Account of what paſſes daily.

In Merchants Accounts, the *Journal* is a Book into which every particular Article is poſted out of the Waſte-Book, and made Debtor: This is to be very clearly expreſs'd, and fairly engroſs'd.

Journal, in Sea-Affairs, is a Regiſter kept by the Pilots; wherein particular notice is taken of every thing that happens to the Ship from Day to Day, and from Hour to Hour, with regard to the Winds, the Rhumbs, the Rake, Soundings, &c. in order to enable them to adjuſt their Reckoning, and determine the Place where they are.

Journal is now become a common Name for many of our News-Papers, which detail the daily Tranſactions of *Europe*. It is alſo uſed for the Title of ſeveral Books which come out at ſtated Times, and give Abſtracts, Accounts, &c. of the ſeveral new Books that are publiſh'd, and the ſeveral new Improvements daily made in Arts and Sciences. The firſt *Journal* of this kind was the *Journal des Sçavans*, printed at *Paris*. The Deſign was ſet on foot for the Eaſe of ſuch as are too buſy or too lazy to read the entire Books themſelves. It ſeems an excellent way of ſatisfying a Man's Curioſity, and of becoming learned upon eaſy Terms: And ſo uſeful is it found, that it has been executed in moſt other Countries, tho under a great Variety of Titles. Of this kind are the *Philoſophical Tranſactions* of *London*; the *Acta Eruditorum* of *Leipſic*; the *Republique des Lettres*; the *Bibliotheque Univerſelle & Choiſie* of M. *le Clerc*; the *Memoirs* of *Treeves*, &c. In 1692, *Juncker* printed in *Latin*, *An Hiſtorical Treatiſe of the* Journals *of the Learned*, publiſh'd in the ſeveral Parts of *Europe*; and *Wolfius*, *Burchardus*, *Gottelfius*, and *Struvius*, have done ſomething of the ſame kind. The *Memoirs of the Academy of Sciences*; thoſe of the *Academy des Belles Lettres*; The *Miſcellanea Naturæ Curioſorum*, which ended in 1706; The Experiments of the Academy *del Cimento*: The *Acta Philo-Exoticorum Naturæ & Artis*, which appear'd from *March* 1686 to *April* 1687, and which are a Hiſtory of the Academy of *Breſſe*; and the *Miſcellanea Berolinenſia*, or Memoirs of the Academy of *Berlin*, are not properly *Journals*, tho they are frequently rank'd in the Number.

Juncker and *Wolfius* give the Honour of the firſt Invention of *Journals* to *Photius*. His *Bibliotheca*, however, is not altogether the ſame with our *Journals*; nor was his Deſign the ſame. It conſiſts of Abridgments and Extracts of Books that he had read during his Embaſſy in *Perſia*.

M. *Salo* firſt began the *Journal des Sçavans* at *Paris* in 1665, under the Name of the Sieur *Hedouville*; but his Death ſoon after interrupted the Work. Upon this the Abbot *Gallois* took it up, and he in the Year 1674. gave way to the Abbot *de la Roque*, who continued it nine Years, and was ſucceeded by M. *Couſin*, who carried it on till the Year 1702, when the Abbot *Bignon* inſtituted a new Society, and committed the Care of continuing the *Journal* to them. It was now improved, and publiſhed under a new Form. This Society is ſtill continued, and M. *de Voyer* has the Inſpection of the *Journal*; which is no longer the Work of any ſingle Author, but of a great Number. The other *French Journals* are the Memoirs and Conferences on Arts and Sciences, by M. *Denis*, during the Years 1672, 1673, and 1674. New Diſcoveries in all the Parts of Phyſic by M. *de Blegny*. The *Journal* of Phyſic, begun in 1684, and ſome others diſcontinued almoſt as ſoon as begun. The *Nouvelles de la Republique des Lettres*, News from the Republic of Lettres, were begun by M. *Bayle* in 1684, and carried on by him till the Year 1687, when M. *Bayle* being diſabled by Sickneſs, his Friends M. *Bernard* and M. *de la Roque* took 'em up, and continued 'em till 1699. After an Interruption of nine Years, M. *Bernard* reſumed the Work, and continued it to the Year 1710. The *Hiſtory of the Works of the Learned*, by M. *Baſnage*, was begun in 1686, and ended in 1710. The *Univerſal Hiſtorical Dictionary*, by M. *le Clerc*, was continued to the Year 1693, and contained twenty five Volumes. The *Bibliotheque Choiſie*, of the ſame Author, began in 1703. The *Memoirs for a Hiſtory of Sciences and Arts*, uſually called *Memoires de Trevoux*, from the Place where they are publiſhed, began in 1701. The *Eſſays of Literature* reached but to a twelfth Volume in 1702, 1703, and 1704; theſe only take notice of antient Authors. The *Journal Litteraire*, by Father *Hugo*, begun and ended in 1705. At *Hambourgh* they have made two Attempts for a *French Journal*, but the Deſign failed: an *Ephemeris Sçavans* has alſo been undertaken, but that ſoon diſappeared. A *Journal des Sçavans*, by M. *Dartis*, appeared in 1694, and was dropt the Year following. That of M. *Chauvin* begun at *Berlin* in 1696, held out three Years; and an Eſſay of the ſame kind was made at *Genoa*. To theſe may be added, the *Journal Litteraire*, begun at the *Hague* in 1713, and that of *Verdun*, and the *Hiſtoire Litteraire de la Grande Bretagne*, by M. *de la Roche*, whereof there have already been four Volumes, and which is confined to *Engliſh* Books alone.

The *Engliſh Journals* of this kind are the *Hiſtory of the Works of the Learned*, begun at *London* in 1699. *Cenſura Temporum* in 1708. About the ſame time there appeared two new ones; the one under the Title of *Memoirs of Literature*, containing little elſe but an *Engliſh* Tranſlation of ſome Articles in the foreign *Journals*, by M. *de la Roche*; the other a Collection of thoſe Tracts, entitled *Bibliotheca Curioſa*, or a *Miſcellany*.

The *Italian Journals* are that of Abbot *Nazari*, which laſted from 1668 to 1681, and was printed at *Rome*. That of *Venice* began in 1671, and ended at the ſame time with the other; the Authors were *Peter Moretti* and *Francis Miletti*. The *Journal* of *Parma*, by *Roberti* and Father *Bacchini*,

chini, was dropped in 1690, and resumed again in 1692. The *Journal* of *Ferrara*, by the Abbot *de la Torre*, begun and ended in 1691. *La Galeria di Minerva* begun in 1696, is the Work of a Society of Men of Letters. Signior *Apostolo Zeno*, Secretary to that Society, begun another *Journal* in 1710. under the Auspice of the Grand Duke; it is printed at *Venice*, and several Persons of Distinction have a hand in it. The *Fasti Eruditi della Bibliotheca Volante* were published at *Parma*.

The principal among the *Latin Journals* is that of *Leipsic*, under the Title of *Acta Eruditorum*, begun in 1682. *P. P. Manzani* begun another at *Parma*. The *Nova Literaria Maris Baltkici*, lasted from 1698 to 1708. The *Journal* of *Hambourg* begun in 1703. The *Acta Literaria ex Manuscriptis*, and the *Bibliotheca Curiosa*, begun in 1705, and ended in 1707, are the Work of M. *Struvius*. M. *Kuster* and M. *Sike* in 1697, begun a *Bibliotheca* of new Books, and continued it for two Years. The *Swiss Journal*, called *Nova Literaria Helvetica* was begun in 1702 by M. *Scheucher*; and the *Acta Medica Hafnensia*, published by *F. Bartholin*, make five Volumes, from the Year 1671, to 1679.

There are two *Low-Dutch Journals*; the one under the Title of *Boockz alvan Europe*; it was begun at *Rotterdam* in 1692, by *Peter Rabbus*, and continued from 1702 to 1708, by Messieurs *Sewel* and *Gavern*; the other is by a Physician, called *Ruiter*, who began in 1710.

The *German Journals* of best Note are the *Monatlichen Unterredungen*, which held from 1689, to 1698. The *Bibliotheca Curiosa*, begun in 1704, and ended in 1707, both by *M. Tenzel*. The *Journal* of *Hannover*, begun in 1700, and continued for two Years by M. *Eccard*, under the Direction of M. *Leibnitz*, and was afterwards carried on by others. The *Theological Journal*, published by M. *Lescher*, under the Title of *Altes* and *Neues*, that is, Old and New. A third at *Leipsic* and *Francfort*, the Authors Messieurs *Wolterck*, *Krause*, and *Groschuffius*; and a fourth at *Hall*, by M. *Turk*.

JOURNEY-MAN, from the *French Journée*, Day or Days-Work, antiently signified a Person who wrought with another by the Day; tho now by the Statute it extends to those likewise who covenant to work with another in their Occupation or Trade by the Year.

JOY. See *Pleasure* and *Pain*.

JOYNDER, in Law, is the coupling or joining of two Persons in one Action or Suit against another.

JOYNERY, the Art of working in Wood, and of fitting or assembling various Parts or Members of it together: The *French* call it *Menuiserie*, from *Minutaria*, small Work, by which it is distinguish'd from Carpentry, which is conversant in the larger and less curious Works.

IPECACUANHA, a little Root, about the Thickness of a moderate Quill, brought hither from several Places in the *West-Indies*. There are three kinds of it, *viz.* a brown, a grey, and a white one; the first is most esteemed in Physic; it is firm, twisted, difficult to break, of a sharp bitter Taste, and grows in *Brazil* in the Gold-Mines. The Root of the grey *Ipecacuanha*, in its Virtue and Colour, is inferior to the former; it grows at the feet of Mountains, and in Meadows, and other moist Places. The *Spaniards* call it *Bexugillo*. The white *Ipecacuanha* differs from both the others, not only in Colour, but in Figure too, not being twisted or rugged like them, but rather resembling the Root of white Dittany. The *Ipecacuanha* is purgative and astringent, it is also a gentle Vomitive, and is found one of the best and surest Remedies hitherto discovered for a Dysentery.

IRASCIBLE, a Term in the old Philosophy, applied to an Appetite, or a Part of the Soul where Anger, and the other Passions that animate us against things difficult or odious, reside. Of the eleven kinds of Passions attributed to the Soul, the Philosophers ascribe five to the *Irascible* Appetite; to wit, Wrath, Boldness, Fear, Hope, and Despair; the six others are charged on the concupiscible Appetite, *viz.* Pleasure, Pain, Desire, Aversion, Love, and Hatred. *Plato* divided the Soul into three Parts, the reasonable, *irascible*, and concupiscible Parts. The two last, according to that Philosopher, are the corporeal and mortal Parts of the Soul, which give rise to our Passions. *Plato* fixes the Seat of the *Irascible* Appetite in the Heart, of the Concupiscible in the Liver, as the two Sources of Blood and Spirits, which alone affect the Mind.

IRENARCHA, the Name of a military Officer in the *Greek* Empire; his Business was to provide for the Peace, Security, and Tranquillity of the Provinces. In *Justinian*'s Code 'tis mentioned, that the *Irenarchæ* are sent into the Provinces to maintain the public Peace, by punishing Crimes, and putting the Laws in execution. Besides this, there was another *Irenarcha* in the Cities, to whom belonged the preserving of Peace, and quelling Sedition among the Citizens. This Officer was sometimes called *Præfectus Urbis*. The Emperors *Theodosius* and *Honorius* suppressed the Office of the *Irenarchæ*, on account of their abusing their Trust, and distressing and persecuting the People, instead of maintaining Peace among them. The word is composed of the *Greek* εἰρήνη, *Peace*, and ἀρχὴς, *Prince*, from ἀρχὴ, *Command*, *Office*.

IRIS, a Rainbow, occasioned by a Reflection of the Rays of the Sun in a watry Cloud. The word is derived from the *Greek* εἴρω, *to speak*, *to tell*; as being a Meteor that is supposed to foretel Rain. See *Rain-bow*.

Iris signifies also that fibrous Circle next the Pupil of the Eye: See *Eye*. It also signifies those changeable Colours, which sometimes appear in the Glasses of Telescopes, Microscopes, &c. which are so call'd from their Similitude to a Rain-bow: as is that colour'd Spectrum, which a Triangular Prismatic Glass will project on a Wall, when placed at a due Angle in the Sun-beams.

IRON, a hard, fusible and malleable Metal, of vast Use in the Affairs of Life. It consists of an Earth, Salt, and Sulphur, but all impure, ill mix'd and digested, which render it extremely liable to rust. It is the hardest, dryest, and the most difficult to melt of all Metals. It may be soften'd by heating it often in the Fire, hammering it, and letting it cool of itself; and it is harden'd by extinguishing it in Water. It may be render'd white, by cooling it in Sal Armoniac and Quick-lime. The strongest Temper of *Iron* is said to be that, which it takes in the Juice of strain'd Worms. A red-hot *Iron* applied to a Roll of Sulphur, dissolves and sinks into a fine Dust. *Iron* has a great Conformity with Copper, and they are not easily separated when solder'd together; whence arises that uncommon Friendship which the Poets feign between *Mars* and *Venus*. It has a great Conformity, too, with the Loadstone. *Rohault* says, it is itself an imperfect Loadstone, and that if it be a long time exposed in a certain Situation, it becomes a real Loadstone; and mentions the *Iron* in the Steeple of *Notre Dame* at *Chartres* as an Instance.

There are several kinds of *Iron*, that have Properties very different from one other. As, 1. *English*, which is coarse, hard, and brittle, fit for Fire-Bars and such Uses. 2. *Swedish*, which, of all others, is the best used in *England*: It is a fine tough sort, will best endure the Hammer, and is softest to file, and in all respects the best to work upon. 3. *Spanish*, which would be as good as the *Swedish*, were it not subject to red-fear, that is, to crack betwixt hot and cold. 4. *German Iron*. This kind goes by the Name of *Dort Square*, because it is brought hither from thence, and is wrought into Bars of three quarters of an Inch square. This is a coarse *Iron*, and only fit for ordinary Uses. There is another sort used for making of Wire, which is the softest and toughest of all. This is not peculiar to any Country, but is indifferently made wherever *Iron* is made, tho of the worst sort; for 'tis the first *Iron* that runs from the Mine-Stone, when 'tis melting, and is reserved purely for the making of Wire.

Generally speaking, the best *Iron* is the softest and toughest, and that which, when it breaks, is of an even greyish Colour, without any of those glittering Specks, or any Flaws or Divisions like those seen in broken Antimony.

To give *Iron* a blue Colour, with a Grind-stone rub off the black Scurf, then heat it in the Fire, and as it grows hot it will change Colour by degrees; become first of a gold Colour, and then of a beautiful blue. Sometimes the Workmen rub a Mixture of Indigo and Salad-Oil on it, while 'tis heating, and let it cool of itself.

Square and flat Bars of *Iron* are sometimes twisted, for Ornament; and the manner of doing it is this: After the Bar is square or flat forged, they give it a flame Heat, or if the Work be small, but a blood-red Heat; and then 'tis easy to twist it about as much or as little as they please, with the Tongs, Vice, or the like.

The several Heats which Smiths give their *Iron* in working, are, 1. A sparkling or welding Heat, which is used when they double up their *Iron*, or weld two Pieces of *Iron* together, end to end. 2. A flame or white Heat, which is used when the *Iron* has not its Form and Size, but must be forged into both. 3. A blood-red Heat, which is used when the *Iron* has already its Form and Size, but wants a little hammering to smooth and fit it for the File. If the *Iron* be made too hot, it will red-fear, *i. e.* break or crackle under the Hammer while 'tis working, between hot and cold. For the Manner of making and preparing *Iron*, see *Iron-Works*. To make *Iron* into Steel, see *Steel*.

IRON-MOULDS are certain yellow Lumps of Earth or Stone, found in Chalk-pits, about the Chiltern in *Oxfordshire*, which are really a kind of indigested *Iron* Ore.

IRON-ORES, and *Iron-Works*: Of these we have a great number in most parts of *England*, but those in the *Forest of Dean* in *Glocestershire* are in the most repute. The *Ore* is there found in great abundance, differing much in Colour, Weight and Goodness. The best, call'd *Brush Ore*, is of a blueish Colour, very ponderous, and full of little

ſhining Specks, like Grains of Silver; this affords the greateſt Quantity of *Iron*, but being melted alone, produceth a Metal very ſhort and brittle, and therefore not ſo fit for common Uſe. For the remedying whereof, the Workmen make uſe of another ſort of Material, termed *Cinder*, which is nothing but the Refuſe of the *Ore*, after the Metal has been extracted; and which being mingled with the other, in a due Quantity, gives it the excellent Temper of Toughneſs, that cauſeth this *Iron* to be preferred before any other brought from foreign Parts. After they have provided their *Ore*, their firſt Work is to calcine it, which is done in Kilns, much after the faſhion of our ordinary Lime-Kilns: theſe they fill up to the top with Coal and *Ore*, *ſtratum ſuper ſtratum*; that is, one Layer upon another: and ſo putting Fire to the bottom, they let it burn till the Coal be waſted, and then renew the Kilns with freſh *Ore* and Coal in the ſame manner as before. This is done without Fuſion of the Metal, and ſerves to conſume the more droſſy part of the *Ore*, and to make it malleable, ſupplying the beating, and waſhing, that are uſed in other Metals. From hence they carry it to their Furnaces, which are built of Brick or Stone, about twenty-four Foot ſquare on the outſide, and near thirty Foot in Height within, not above eight or ten Foot over where it is wideſt, which is about the middle; the top and bottom having a narrow Compaſs, much like the Shape of an Egg. Behind the Furnace are fixed two huge Pair of Bellows, the Noſes of which meet at a little hole near the bottom; theſe are compreſs'd together by certain Buttons, placed on the Axis of a very large Wheel, which is turned about by Water, in the manner of an Overſhot-Mill. As ſoon as theſe Buttons are ſlid off, the Bellows are raiſed again by the Counterpoiſe of Weights, whereby they are made to play alternately, the one going its Blaſt the time the other is riſing. At firſt they fill theſe Furnaces with *Ore* and Cinder, intermix'd with Fuel, which in theſe Works is always of Charcoal, laying them hollow at the bottom, that they may more eaſily take fire; but after they are once kindled, the Materials run together into a hard Cake or Lump, which is ſuſtained by the faſhion of the Furnace: and through this the Metal, as it meets, trickles down into the Receivers ſet at the bottom, where there is a Paſſage open, by which the Men take away the Scum and Droſs, and let out the Metal, as they ſee occaſion. Before the Mouth of the Furnace lies a great Bed of Sand, where they make Furrows of the Shape into which they would have their *Iron* caſt. As ſoon as the Receivers are full, they let in the Metal, which is made ſo very fluid by the Violence of the Fire, that it not only runs to a conſiderable diſtance, but ſtands afterwards boiling for a good while. When the Furnaces are once at work, they keep them conſtantly employ'd for many Months together, never ſuffering the Fire to ſlacken Night or Day, but ſtill ſupplying the waſting of the Fuel, and other Materials, with freſh, poured in at the top: Charcoal is uſed altogether in this Work, for Sea-Coal will not do. From theſe Furnaces the Workmen bring their Sows and Pigs of *Iron*, as they call them, to their Forges, where it is wrought into Bars.

IRON-SICK: A Ship or Boat is ſaid to be *Iron-ſick*, when her Spikes are ſo eaten with Ruſt, or Nails, and ſo worn away, that they make Hollows in the Planks, whereby the Ship leaks.

IRONY, is a Figure in Speech, wherein we plainly intend ſomething very different from what our Words expreſs; as when we ſeem to praiſe a Perſon at a time when we evidently railly and diſcommend him. Hence *Quintilian* calls it *Diverſiloquium*, *Diſſimulation*, and *Illuſion*. Thus we ſay, *John*'s a very honeſt Fellow; meaning, he's a rank Knave. The *Irony* diſcovers itſelf rather in the Tone of the Speaker than in the Words. It is derived from the *Greek*, εἰρωνέια, *Diſſimulation*.

IRRADIATION, ſignifies an Emanation or ſhooting out of ſubtile Effluvia from one Body to another. See *Quality*.

IRRATIONAL NUMBERS, are the ſame as *Surd Numbers*; which ſee.

Irrational Quantities: See *Rational Quantities*.

IRREGULAR, ſomething that deviates from the common Forms or Rules. Thus we ſay an *irregular* Fortification, an *irregular* Building, an *irregular* Figure, &c. In Grammar there are ſeveral Declinations and Conjugations that are *irregular*, anomalous, or Heteroclites. Among Caſuiſts the Term *irregular* is applied to a Perſon who is unqualified for entering into Orders, as being a Baſtard, Maimed, &c. or to an Eccleſiaſtic, who is interdicted, ſuſpended, or cenſured, and by that means rendered incapable of holding a Benefice, or diſcharging any of the ſacred Functions.

IRREGULAR BODIES, are Solids not terminated by equal and like Surfaces.

IRREGULAR COLUMN, in Architecture, is ſuch a one as not only deviates from the Proportions of any of the five Orders, but whoſe Ornaments, whether in the Shaft or Capital, are abſurd and ill-choſen.

IRREPLEVIABLE, in the Common Law, ſignifies what may not be replevied, or ſet at large, upon Sureties.

IRRORATION, a kind of Tranſplantation uſed for the Cure of certain Diſeaſes. It conſiſts in the ſprinkling every Day either Trees, or other proper Plants, with the Urine or Sweat of the Patient, or with the Water wherein his Body, or at leaſt the Part affected, has been waſhed, till ſuch time as the Diſeaſe is removed. As ſoon as the Sprinkling has been made, they throw freſh Earth on it, in order to prevent the Virtue of the Mumia, that is, of the vital Spirit of the Liquid, from evaporating into the Air.

ISCHIADIC, an Epithet given by the Phyſicians to two Veins of the Foot, which terminate in the Crural. The firſt, called the *Great Iſchiadic*, is formed by ten little Branches, proceeding from the Toes, which uniting together, paſs by the Muſcles of the Calf of the Leg. The leſſer *Iſchiadic* is formed from ſeveral Ramifications, proceeding from the Skin and Muſcles, which incompaſs the Articulation of the Thigh. They are alſo called *Sciatic*. The Word is derived from the *Greek* ἰσχιας, or ἰσχιον, *Coxa, the Hip*.

ISCHIATICA. See *Sciatica*.

ISCHIUM, in Anatomy, is the Name of one of the Bones of the Thigh, wherein is a deep Cavity, called *Cotyla*, or *Acetabulum*, which receives the Head of the Thigh-Bone. This Cavity is incompaſſed with a cartilaginous Circle, which ſerves to ſtrengthen the Thigh. The *Iſchium* is one of the *Oſſa Innominata*, which ſee. The word is derived from the *Greek* ἰσχος, *Robur, Strength*.

ISCHURIA, in Phyſic, is a Diſeaſe that conſiſts in an entire Suppreſſion of Urine. It is occaſioned by any thing that may obſtruct the Paſſages of the Reins, Ureters, or the Neck of the Bladder, as Sand, Stone, Phlegm, &c. It may alſo be occaſioned by an Obſtruction of the Nerves, which paſs to the Reins or Bladder, as we ſee it is, in a Paralyſis of the lower Parts from the Diaphragm. The too great Diſtenſion of the Bladder may alſo produce the ſame Effect; for the Fibres being much lengthened, and conſequently condenſed, the Spirits neceſſary for their Contraction cannot get Admittance; whence it is that Perſons, who have retained their Urine a long time, find a great deal of difficulty in diſcharging it. The word is derived from the *Greek* ἰσχω, *I ſtop*, and οὖρον, *Urine*.

ISELASTIC, the Name of a kind of Combat, or Game, celebrated in the Cities of *Greece* and *Aſia* in the time of the *Roman* Empire. The Victor at theſe Games had very conſiderable Privileges conferred on him, after the Example of *Auguſtus*, and the *Athenians*, who did the like to the Conquerors at the *Olympic*, *Pythian*, and *Iſthmian* Games. They were crowned on the ſpot, immediately after their Victory, had Penſions allowed them, were furniſhed with Proviſions at the public Coſt, and were carried in Triumph into their Country.

ISIA, Feaſts and Sacrifices antiently ſolemnized in honour of the Goddeſs *Iſis*. The *Iſia* were full of abominable Impurities, and for that reaſon thoſe who were initiated were obliged to take an Oath of Secrecy. They held for nine Days ſucceſſively, but were ſo abominable, that the Senate aboliſhed them at *Rome*, under the Conſulate of *Piſo* and *Gabinius*. Two hundred Years after this they were re-eſtabliſhed by the Emperor *Commodus*, who himſelf aſſiſted at them, appearing among the Prieſts of that Goddeſs with his Head ſhaven, and carrying the *Anubis*.

ISIACI, Prieſts of the Goddeſs *Iſis*. *Dioſcorides* tells us, they bore a Branch of Marine Abſynthium in their hands inſtead of Olive. They ſung the Praiſes of the Goddeſs twice a-day, *viz.* at the riſing of the Sun, when they opened her Temple; after which they begged Alms the reſt of the Day, and, returning at night, repeated their Oriſons, and ſhut up the Temple. Such was the Life and Office of the *Iſiaci*; they never covered their Feet with any thing but the thin Bark of the Tree *Papyrus*, which occaſioned *Prudentius* and others to ſay they went barefooted. They wore no Garments but Linnen, becauſe *Iſis* was the firſt who taught Mankind the Culture of this Commodity. See *Diodorus Siculus*, and *Plutarch*'s *Iſis* and *Oſiris*.

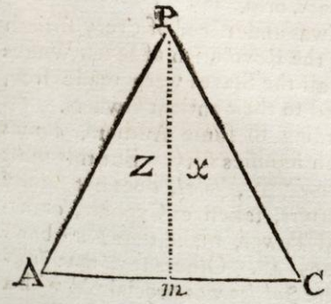
ISING-GLASS: See *Ichthyocolla*.

ISLAND, a Tract of Ground encompaſſed round with the Sea, or with Rivers. This Term is oppoſed to the Continent or *Terra Firma*. Some conclude from *Gen.* x. 5. and from *Eccl.* xliii. 25. that *Iſlands* are as antient as the World, and that there were ſome at the beginning. Whatever become of this Proof, 'tis by no means probable, that the large *Iſlands*, far remote from the Continent, are new, or that they either aroſe out of the Sea, or were torn from the main Land. Nor is it leſs true, that there have been

new

new *Islands* formed, by the casting up of vast Heaps of Clay, Mud, Sand, &c. as that for instance of *Tsongming*, in the Province of *Tonquin* in *China*: or by the Violence of the Sea, which have torn off large Promontories from the Continent, as the Antients imagined *Sicily*, and even *Great Britain* were formed. It is also certain, that some have emerged above the Waves, as *Santorini* formerly, and three other Isles near it lately; the last in 1707, which rose from the bottom of the Sea after an Earthquake, that was suppos'd to have loosen'd it from its hold.

Several Naturalists are of opinion, that the *Islands* were formed at the Deluge; others think they have been separated from the Continent by violent Storms, Inundations, and Earthquakes. These last have observed, that the *East-Indies*, which abound in *Islands* more than any other part of the World, are likewise more annoyed with Earthquakes, Tempests, Lightning, Vulcano's, &c. than any other Part. *Varenius* thinks most of these Opinions true in some Instances, and believes that there have been *Islands* produced each of these ways. *St. Helena*, *Ascension*, and other steep rocky *Islands*, he supposes to have become so, by the Sea's overflowing their neighbouring Champains. By the heaping up huge Quantities of Sand, and other terrestrial Matters, he thinks the *Islands* of *Zealand*, *Japan*, &c. were form'd. *Sumatra* and *Ceylon*, and most of the *East-Indian Islands* he thinks were rent off from the main Land; and concludes, that the *Islands* of the *Archipelago* were form'd in the same way; imagining it probable, that *Deucalion*'s Flood might contribute towards it. The Antients had a Notion, that *Delos*, and some few other *Islands*, rose from the bottom of the Sea. Which, how fabulous soever it may appear, agrees with later Observations. *Seneca* takes notice that the *Island Therasia* rose thus out of the *Ægean* Sea in his time, of which the Mariners were Eye-witnesses. They had also an opinion, that there are some *Islands* which swim in the Sea. *Thales*, indeed, thought that the whole Earth which we inhabit, floated, thus, in the Sea; but his Opinion is easily refuted, the Channel of the Sea being found continuous to the Shore: But floating *Islands* are no ways improbable, especially if the Earth whereof they consist be light and sulphureous. *Seneca* says, that near the *Cutyliæ* he saw such an *Island*, and mentions several others of the same kind; and it was even a common Opinion among the Antients, that all the *Cyclades* had done the same. *Gryphiander* has written a *Latin* Treatise expresly on *Islands*, *de Insulis*.



ISLES, in Architecture, are Sides or Wings of a Building.

ISOCHRONAL LINE, is that in which a heavy Body is supposed to descend without any Acceleration. *Leibnitz* in the *Act. Erud. Lipsi.* for *February* 1689, hath a Discourse on this Subject, in which he shews, That a heavy Body with a degree of Velocity acquired by the Descent from any Height, may descend from the same Point, by an infinite Number of *Isochronal* Curves, which are all of the same Species, differing from one another only in the Magnitude of their Parameters, such as are all the Quadrato-Cubical Paraboloids, and consequently similar to one another. He shews also, there, how to find a Line, in which a heavy Body descending shall recede uniformly from a given Point, or approach uniformly to it.

ISOCHRONE; a Term applied to such Vibrations of a Pendulum as are performed in equal Times: of which kind are all the Vibrations or Springs of the same Pendulum, whether the Arcs it describes be longer or shorter; for when it describes a shorter Arc, it moves so much the slower; and when a long one, proportionably faster.

ISOMERIA, in Algebra, is a Method of freeing an Equation from Fractions, which is done by reducing all the Fractions to one common Denominator, and then multiplying each Member of the Equation by that common Denominator. Thus *e. g.* $\frac{1}{4}x^3 + \frac{axx}{a} = abb$ becomes $ax^3 + 4aaxx - 4bcx = 4aabb$.

ISOPERIMETRAL FIGURES, are such as have equal Perimeters or Circumferences.

ISOSCELES Triangle, is a Triangle which hath two equal sides; to which it may be added, that the Angles opposite to the equal Sides are equal, and a Line drawn from the Top or Vertex, cutting the Base into two equal Parts, is perpendicular to the Base. *e.g.* Let the *Isosceles* Triangle be A P C, and let its Base A C be supposed to be divided into two equal Parts in *m*: I say, P *m* is perpendicular to A C, and the Angle P C A is equal to the Angle P A C; for the Triangle Z hath all its Sides equal to those of X, and therefore must have all its Angles equal also respectively to those in X: And then the Angle P *m* A = P *m* C, because they are both right; therefore P *m* is perpendicular to A C, and the Angle P A *m* = P C *m*.

ISSUANT, a Term in Heraldry, understood of a Lion, or other Animal, in a Coat of Arms, that seems just issuing out from under a Chief, Fesse, a House, a Wood, or the like, and only shews half his Body. It is not easy to distinguish the Lion *Issuant* from the Lion *Naissant*. Some say, the *Issuant* is that which comes out from behind the Field of some ample Ordinary, shewing his Head, Neck, the Tips of his Fore-Legs and his Tail against the chief of the Coat; whereas the *Naissant* has its Rise about the middle of the Field, and shews all his Fore-part, with the Tip of his Tail, as if he were rising out of the Earth.

ISSUE, is a Term in Common Law, having divers Applications; sometimes it is taken for the Children begotten between a Man and his Wife; sometimes for Profits growing from Amerciaments or Fines; and sometimes from Profits of Lands and Tenements; sometimes for that Point of Matter depending in Suit, whereupon the Parties join, and put their Cause to the Tryal of the Jury: And yet in all these it hath but one Signification, which is an Effect of a Cause preceding; as the Children are the Effect of the Marriage between the Parents: The Profits growing to the King or Lord, from the Punishment of any Man's Offence, is the Effect of his Transgression: The Point referred to the Tryal of twelve Men, is the Effect of Pleading or Process. *Issue*, in this last Signification, is either General or Special.

General Issue seemeth to be that whereby it is referred to the Jury to bring in their Verdict, whether the Defendant hath done any such thing as the Plaintiff lays to his charge: For example, If it be an Offence against any Statute, and the Defendant plead Not Guilty; this being put to the Jury, is call'd the *General Issue*. And if a Man complain of a private Wrong, which the Defendant denieth, and pleads no Wrong, nor Disseisin; and if this be referred to the Jury, it is likewise the *General Issue*.

The *Special Issue* then must be that, when Special Matters being alledged by the Defendant in his Defence, both Parties join thereupon, and so grow rather to a Demurrer, if it be *Quæstio Juris*; or to a Tryal by the Jury, if it be *Quæstio Facti*.

ISSUES, in Physic, are small artificial Apertures in a fleshy part of the Body, to drain off superfluous Moisture, or give vent to any noxious Humour. They are usually made in the Arms, Legs, or Back, either by Caustics or Incision. Caution is used to place them about the middle of a Muscle, that the necessary Motion of the Parts may not incommode them, or pain the Patient. There is an easy way of making an *Issue*, which succeeds best in Children; 'tis done after this manner: Having applied a small piece of blistering Plaister, about the bigness of a small Pea, to the Part where you would have an *Issue*, and letting it lie on for a few Hours, it will cause a Blister; the Skin being rais'd, apply a Pea as usual, and compress it tight with a Bandage, till by degrees it sinks in, and forms an *Issue*. *Issues* are very useful in many Distempers, several of which, when obstinate, cannot be cured without them; as an *Hydrocephalus*, *Opthalmia*, *Old Ulcers*, &c.

ISTHMUS, a narrow Neck or Slip of Ground that joins two Continents, or joins a Chersonesus or Peninsula to the *Terra firma*; and separates two Seas. The most celebrated *Isthmus's* are those of *Panama* or *Darien*, which joins *North* and *South America*; that of *Suez*, which connects *Asia* and *Africa*; that of *Corinth*, or *Peloponnesus*, in the *Morea*; that of *Crim-Tartary*, otherwise called the *Taurica Chersonesus*; that near the Island of *Romania* and *Eriffo*, or the *Isthmus* of the *Thracian Chersonesus*, twelve Furlongs broad; being that which *Xerxes* undertook to cut through. The Antients had several Designs of cutting the *Isthmus* of *Corinth*, which is a rocky Hillock, about ten Miles over; but they were all vain, the Invention of Sluices being not then known. There have been Attempts, too, for cutting the *Isthmus* of *Suez*, to make a Communication between the *Red-Sea* and the *Mediterranean*. The word comes from the *Greek* ἰσθμὸς, *a Neck*. Hence Anatomists use the Term for several Parts of the human Body, particularly that narrow part of the Throat situate betwixt the two Tonsils; and the Ridge that separates the two Nostrils.

ISTHMIAN GAMES were sacred Sports, the third, in order, of those so much celebrated in antient *Greece*. *Plutarch*, in the Life of *Theseus*, tells us, they were instituted by that Hero in imitation of *Hercules*, who had before instituted the *Olympian* Games; but *Archias* refers their Institution to *Melicerta* or *Palæmon*, whom the *Latins* call *Portunus*. Others say they were instituted by *Nisis*, Son of *Neptune*; and others by *Sisyphus*, Brother of *Athamas*,

mas, King of *Corinth*, about 1350 Years before Chriſt: however this be, 'twas in the *Iſthmus* of *Corinth* they were celebrated, and hence aroſe their Name. *Archias* and others ſay, the Conqueror's Prize at theſe Games was a Crown of Parſley. *Plutarch* and *Strabo* ſay, it was at firſt a Crown of Pine, that this was afterwards changed for one of Parſley, but that at length the Pine was reſumed; and to this was added a Reward of 100 Silver Drachmæ. Theſe Games were held every three Years, and eſteemed ſo ſacred, that after the Deſtruction of *Corinth*, the *Sicyonians* were charged with the keeping them up. They were ſo celebrated, and the Concourſe at them was ſo great, that only the Principals of the moſt remarkable Cities could have place in them. The *Athenians* had only as much room allotted them as the Sail of a Ship, which they ſent yearly to *Delos*, could cover.

ITALIAN, the Language ſpoke in *Italy*. This Tongue is derived principally from the *Latin*, and of all the Languages formed from the *Latin*, there is none that carries with it a more viſible Character of its Original than the *Italian*. It is accounted one of the moſt perfect among the modern Tongues, containing Words and Phraſes to repreſent all Ideas, to expreſs all Sentiments, to deliver one's ſelf on all Subjects, to name all the Inſtruments and Parts of Arts, &c. 'Tis complained indeed, that it has too many Diminutives and Superlatives, or rather Augmentatives; but without any great reaſon: for if thoſe words convey nothing further to the Mind beſides the juſt Ideas of Things, they are no more faulty than our Pleonaſms and Hyperbole's. The Character of the *Italian* Tongue it muſt be owned, however, is very different from that of our own, which is the Reaſon perhaps why we are ſo apt to find fault with it: for though the *Italian* be proper for all kinds of Writing, for all Stiles, and for all Subjects; yet there are many of their celebrated Authors that don't ſucceed when tranſlated into *Engliſh*, and which an *Engliſhman* cannot read, with pleaſure, even in their Original. The Language correſponds to the Genius of the People, they are ſlow and thoughtful, and accordingly their Language runs heavily, though ſmoothly, and many of their Words are lengthened out to a great degree. They have a good Taſte in Muſic, and to gratify their Paſſion this way, have altered abundance of their primitive Words, leaving out Conſonants, taking in Vowels, ſoftening and lengthening out their Terminations for the ſake of the Cadence. Hence the Language is rendered extremely muſical, and ſucceeds better than any other in Opera's, and ſome Parts of Poetry, but it fails in Strength and Nerves; hence alſo a great part of its Words, borrowed from the *Latin*, become ſo far diſguiſed, that they are not eaſily known again. The Multitude of Sovereign States into which *Italy* is divided, has given occaſion to a great Number of different Dialects in that Language; which, however, are all good in the Place where they are uſed. The *Tuſcan* is uſually preferred to the other Dialects, and the *Roman* Pronunciation to that of the other Cities; whence came the *Italian* Proverb, *Lingua Toſcana in Bocca Romana*. The *Italian* is generally pretty well underſtood throughout *Europe*, and is frequently ſpoken in *Germany*, *Poland*, and *Hungary*. At *Conſtantinople*, in *Greece*, and in the Ports of the *Levant*, the *Italian* is uſed as commonly as the Language of the Country; indeed in thoſe Places it is not ſpoke ſo pure as in *Tuſcany*, but is corrupted with many of the proper Words and Idioms of the Place, whence it takes a new Name, and is called *Frank Italian*. See *Language*.

ITALIAN HOURS, are the 24 Hours of the natural Day, accounted from the Sun-ſetting of one Day to the ſame again the next Day. This way of reckoning was uſed by the *Jews* of old, and by the *Italians* to this day.

ITALIC, the Name of a Character in Printing. See *Printing*.

Italic, the Name of a Sect of antient Philoſophers, founded by *Pythagoras*; they were ſo called, becauſe that Philoſopher taught in *Italy*, ſpreading his Doctrine among the People of *Tarentum*, *Metapont*, *Heraclea*, *Naples*, &c. See *Pythagoric*.

ITCH, a Diſeaſe of the Skin, wherein it is corrupted by the ouzing out of certain ſharp ſaline Humours, which gather into Puſtules, and occaſion a Pruritus or Itching. There are two kinds of *Itch*, a humid and a dry kind. The latter has been uſually ſuppoſed to be owing to an atrabilarious Humour, and the former to a ſaline Pituita: They are both contagious. Dr. *Bononio* has given a much more rational Account of the Cauſe of this Diſtemper than any Author before him. He examined ſeveral Globules of the Matter pick'd out of the Puſtules of itchy Perſons with a Microſcope, and found them to be minute living Creatures, in ſhape reſembling a Tortoiſe, of brisk Motion, with ſix Feet, a ſharp Head, and two little Horns at the end of the Snout. Hence he makes no ſcruple to impute this contagious Diſeaſe to the continual biting of theſe Animalcules in the Skin, by means of which ſome Portion of the Serum ouzing out thro the ſmall Apertures of the *Cutis*, little watry Bladders are made, within which the Inſects continuing to gnaw, the Infected are forced to ſcratch, and by ſcratching increaſe the Miſchief; breaking not only the little Puſtules, but the Skin too, and ſome little Blood-Veſſels, and ſo make Scabs, cruſty Sores, &c. Hence we may eaſily perceive how the *Itch* comes to be catching, ſince theſe Creatures, by ſimple Contact, eaſily paſs from one Body to another, their Motion being wonderfully ſwift, and they crawling on the Surface of the Body, as well as under the *Cuticula*. Hence alſo we learn the reaſon of the Cure of this Diſeaſe by Lixivial Waſhes, Baths and Ointments, made of Salts, Sulphurs, Mercury, &c. theſe being very powerful in killing the Vermine lodged in the Cavities of the Skin, which ſcratching will never do; they being too minute to be caught under the Nails. And if in Practice it is found that this Diſeaſe, after it ſeem'd to be cured by Unction, frequently returns again; this is eaſily accounted for, ſince tho' the Ointment may have killed all the living Creatures, yet it may not, poſſibly, have deſtroy'd all their Eggs laid, as it were, in the Neſts of the Skin; from which they afterwards breed again, and renew the Diſtemper.

ITINERANT JUDGES, or *Juſtices*, are ſuch as were formerly ſent with Commiſſions into divers Countries, to hear chiefly ſuch Cauſes as were call'd Pleas of the Crown; the ſame with *Juſtices in Eyre*: which ſee.

ITINERARY: The Deſcription that a Traveller makes of the Courſe of his Journey, and of the Curioſities, &c. that he obſerved. The *Itinerary* of *Antonine* ſhews all the grand *Roman* Roads in the Empire, and all the Stations of the *Roman* Army. It was made by order of the Emperor *Antoninus Pius*, but is now very defective, having ſuffer'd extremely under the hands of the Copiſts and Editors.

JUBILEE, a Church-Solemnity, or Ceremony obſerved at *Rome*, wherein the Pope grants a Plenary Indulgence to the Univerſal Church; as many of them, at leaſt, as viſit the Churches of St. *Peter* and St. *Paul* at *Rome*. The *Jubilee* was firſt eſtabliſh'd by *Boniface* VIII. in 1300. in favour of thoſe who ſhould go *ad Limina Apoſtolorum*, and was only to return every hundred Years. The firſt Celebration brought in ſuch ſtore of Wealth to *Rome*, that the *Germans* call'd this the Golden Year. This occaſion'd *Clement* VI. to reduce the Period of the *Jubilee* to 50 Years. *Urban* VI. appointed it to be held every 35 Years, that being the Age of our Saviour; and *Sixtus* IV. brought it down to every 25, that every Perſon might have the Benefit of it once in his Life. *Boniface* IX. granted the Privilege of holding *Jubilees* to ſeveral Princes and Monaſteries: For inſtance, to the Monks of *Canterbury*, who had a *Jubilee* every 50 Years.

Jubilees are now become more frequent, and the Pope grants them as often as the Church or himſelf have occaſion for them. There is uſually one at the Inauguration of a new Pope. To be entitled to the Privileges of the *Jubilee*, the Bull enjoins Faſting, Alms, Prayers. It gives the Prieſts a full Power to abſolve, in all caſes, even thoſe otherwiſe reſerved to the Pope; to make Commutations of Vows, &c. in which it differs from a Plenary Indulgence. During the Time of *Jubilee*, all Indulgences are ſuſpended.

One of our Kings, *viz. Edward* II. cauſed his Birth-Day to be obſerved in manner of a *Jubilee*, when he became 50 Years of Age; but not before or after. This he did, by releaſing Priſoners, pardoning all Offences but Treaſon, making good Laws, and granting many Privileges to the People.

There are particular *Jubilees* in certain Cities, when ſeveral of their Feaſts fall on the ſame Day: At *Puy* in *Velay*, for inſtance, when the Feaſt of the *Annunciation* happens on *Good Friday*; and at *Lyons*, when the Feaſt of St. *John Baptiſt* concurs with the Feaſt of *Corpus Chriſti*. In 1640 the *Jeſuits* celebrated a ſolemn *Jubilee* at *Rome*: that being the Centenary, or hundredth Year from their Inſtitution; and the ſame Ceremony was obſerved in all their Houſes throughout the World.

Jubilee, among the *Jews*, was underſtood of every fiftieth Year, being that following the Revolution of ſeven Weeks of Years; at which time all the Slaves were made free, and all Inheritances reverted to their antient Owners.

The word *Jubilee*, according to ſome Authors, comes from the *Hebrew Jobel*, which ſignifies fifty. But this muſt be a Miſtake; for the *Hebrew* יובל, *Jobel*, does not ſignify fifty; neither does its Letters, taken as Cyphers, or according to their Numerical Power, make that Number; being 10, 6, 2, and 30, that is 48. Others ſay, that *Jobel* ſignifies a Ram, and that the *Jubilee* was proclaim'd with a Ram's-horn, in memory of the Ram that appear'd to *Abraham* in the Thicket. *Maſius* derives the Word from *Jubal*, the firſt Inventor of Muſical Inſtruments, which for that reaſon

ſon were call'd by his Name; whence the words *Jobel* and *Jubilee* came to ſignify the Year of Deliverance and Remiſſion, becauſe proclaim'd with the Sound of one of thoſe Inſtruments, which at firſt was no more than the Horn of a Ram.

Jubilee, or *Jubilæus*, is alſo uſed among the *Romaniſts* to ſignify a Religious who has been fifty Years in a Monaſtery, or an Eccleſiaſtic who has been in Orders fifty Years. Such veteran Religious are diſpenſed with in ſome places from attending Mattins, or a ſtrict Obſervation of any other of their Rules. *Jubilæus* alſo ſignified a Man a hundred Years old; and a Poſſeſſion or Preſcription for fifty Years. *Si Ager non invenietur in Scriptione, inquiratur de Senioribus; & ſi ſub certo Jubilæo non ſit, ſine Vituperatione maneat in æternum.*

JUDAICUS LAPIS, a grey, ſoft, brittle Stone, in form of an Acorn, having Lines drawn regularly on its Surface, as if they were turn'd: It is uſed in Phyſic to diſſolve the Stone in the Bladder.

JUDAISM: The Religious Doctrines and Rites of the *Jews*. *Judaiſm* was warranted by Divine Authority, being deliver'd to that People immediately from Heaven; it was, however, but a temporary Diſpenſation, and was to give way, at leaſt the Ceremonial Part of it, at the Coming of the *Meſſias*. For a compleat Syſtem of *Judaiſm*, ſee the Books of *Moſes*. *Judaiſm* was antiently divided into ſeveral Sects; the principal whereof were the *Phariſees*, *Sadduces*, and *Eſſenians:* which ſee. At preſent there are but two, *viz.* the *Karaites*, who admit of no Rule of Religion, but the Law written by *Moſes*; and the *Rabbiniſts*, who add to the Law, the Traditions of the *Talmud*. It has been obſerved, that *Judaiſm*, of all other Religions, is that which is the moſt rarely abjured. In the 18th of *Edward* I. the Parliament granted the King a Fifteenth for the Expulſion of *Judaiſm*. See *Cuneus*, *Spencer*, and *Goodwin*.

In *England*, formerly, the *Jews* and all their Goods belonged to the chief Lord where they lived, and he had ſuch abſolute Property in them, that he might ſell them, for they had not liberty to remove to another Lord without leave. *Mat. Paris* tells us, that *Henry* III. ſold the *Jews* to Earl *Richard* his Brother for a Term of Years, that *quos Rex excoriaverat*, *Comes eviſcereraret.*

They were diſtinguiſhed from the Chriſtians both living and dying, for they had proper Judges and Courts wherein their Cauſes were tried, and they wore a Badge on their outward Garments upon the Breaſt, in the ſhape of a Table, and were fined if they ſtirred abroad without ſuch Badges. They were never buried in the Country, but brought up to *London*, and buried without the Walls.

JUDGE, an Officer appointed by the Powers of any Country, to diſtribute that Juſtice to their Subjects which they can't adminiſter in Perſon. The Character of *Judge* is a part of the Regal Authority, whereof the Prince diveſts himſelf.

The *Engliſh Judges* are all choſen out of the Sergeants at Law, and are conſtituted by Letters Patents. Their Commiſſions are bounded with this Limitation, *Facturi quod ad Juſtitiam pertinet ſecundum Legem & Conſuetudinem Angliæ*; and at their Creation they take an Oath, that they will indifferently miniſter Juſtice to all them that ſhall have any Suit or Plea before them; and this they will not forbear to do, tho the King by his Letters, or by expreſs Word of Mouth, ſhould command the contrary. They have Salaries of 1000 *l. per annum* each from the King, beſides very conſiderable Perquiſites, and this Salary is granted them, *quamdiu bene ſe geſſerint*, to keep them free and independent of the Court. See *Juſtices*.

Judge, in Scripture, is underſtood of certain eminent Perſons choſen by God himſelf to govern the *Jews*, from the time of *Joſhua* to the Eſtabliſhment of the Kings. The *Judges* were not ordinary Magiſtrates, being only ſent on extraordinary Occaſions, as, to head the Armies, to deliver the People from their Enemies, &c. *Salian* has obſerved, that they not only preſided in the Courts of Juſtice, but were alſo at the Head of Councils, of Armies, and of every thing that concerned the Government of the State; tho' they never aſſumed the Title either of Princes, Governors, or the like. The ſame Author has obſerved ſeven Points wherein they differed from Kings: (1.) They were not hereditary. (2.) They had no abſolute Power of Life and Death, but only according to the Laws, and dependantly of them. (3.) They never undertook War at their own pleaſure, but only when they were appointed by God, or called to it by the People. (4.) They exacted no Tribute. (5.) They did not ſucceed each other immediately, but after the Death of one there was frequently an Interval of ſeveral Years e'er a Succeſſor was appointed. (6.) They did not uſe the Enſigns of Sovereignty, the Scepter or Diadem. (7.) They had no Authority to make any new Laws, but were only to take care of the Obſervation of the Laws of *Moſes*. In ſome reſpects they reſembled Kings, *viz.* 1. Their Authority was given them for Life, and not for a limited Time. 2. They ruled alone, and without any dependence, which occaſioned *Joſephus* to call their State Monarchical. The *Hebrews* were governed by fifteen *Judges* for the Space of 340 Years, *viz.* from the time of *Othniel* their firſt, to that of *Heli* their laſt *Judge*.

JUDGES, or the Book of *Judges*, is a Canonical Book of the Old Teſtament, containing the Hiſtory of the *Judges*, whereof we have been ſpeaking. The Author is not known. 'Tis probable the Work did not come from any ſingle Hand, being rather a Collection of ſeveral little Hiſtories, which at firſt were ſeparate, but were afterwards collected by *Eſdras* or *Samuel* into a ſingle Volume; and, in all likelihood, were taken from the antient Journals, Annals, or Memoirs, compoſed by the ſeveral *Judges*.

JUDGMENT, a Faculty of the Soul, by which ſhe perceives the Relation that is between two or more Ideas. Thus when we judge that the Sun is greater than the Moon, the Underſtanding firſt compares the two Ideas of the Sun and the Moon, and finding the Idea of the Sun greater than that of the Moon, the Will perfectly acquieſces in that Perception, nor puts the Mind upon any farther Enquiry. 'Tis not the Underſtanding then that judges, as is ordinarily thought; *Judgments* and Reaſonings, on the part of the Underſtanding, are but mere Perceptions: 'tis the Will alone that judges in reality, in acquieſcing in what is repreſented to it by the Underſtanding. The only Difference, then, between Perception, Judgment, and Reaſoning, ſo far as the Underſtanding is concerned in them, is this, That it perceives a thing ſimply, without any relation to any other thing in a ſimple Perception, that it perceives the Relations between two or more things in *Judgments*, and laſtly that it perceives the Relations that are between the Relations of things in Reaſonings: So that all the Operations of the Underſtanding are in effect no more than pure Perceptions.

When we perceive, for inſtance, twice 2, or 4, this is no more than a ſimple Perception; when we judge that twice 2 are 4, or that twice 2 are not 5, the Underſtanding does no more than barely perceive the Relation of Equality that is between twice 2 and 4, or of Inequality between twice 2 and 5. Further, Reaſoning conſiſts in perceiving the Relation, not between two or more things, for that would be a *Judgment*, but of two or more Relations of two or more things. Thus when I conclude that four being leſs than ſix, twice two being four, are by conſequence leſs than ſix; I perceive not only the Relation of Inequality between two and two and ſix, (for this were only a *Judgment*) but alſo the Relation of Inequality between the Relation of twice 2 and 4, and the Relation between 4 and 6: Which conſtitutes a Reaſoning. The Underſtanding therefore only perceives, and 'tis the Will that judges, and reaſons in aſſenting voluntarily to what the Underſtanding repreſents.

Indeed, when the things which we conſider, appear clear, and perfectly evident, it ſeems as if it were not voluntarily that the Mind conſents to 'em; whence we are led to think, that 'tis not the Will, but the Underſtanding, that judges of 'em. But to clear this Point, it muſt be obſerved, that the things which we conſider, never appear intirely evident till the Underſtanding has examined them on all ſides, and has perceiv'd all the Relations neceſſary to judge of 'em; whence it happens, that the Will not being able to will any thing without Knowledge, cannot act on the Underſtanding; that is, cannot deſire it to repreſent any thing new in its Object, as having already view'd it on all the ſides that have any relation to the Queſtion in hand. It is obliged, then, to reſt in what has been already repreſented, and to ceaſe to agitate and diſturb it any further: in which Ceſſation it is, that *Judgment* conſiſts. This Reſt or *Judgment*, then, not being free, when things are in their laſt Evidence we are apt to imagine that it is not the Effect of the Will. So long as there is any thing obſcure in the Subject that we conſider, or that we are not fully ſatisfied that we have diſcover'd every thing neceſſary to reſolve the Queſtion, as it happens in moſt of thoſe things that are difficult, and that contain various Relations; we are then at liberty not to acquieſce, the Will may command the Underſtanding to purſue its Enquiries further, and to make new Diſcoveries: whence it is, that we are more ready to allow the *Judgments* formed on theſe Subjects to be voluntary.

Moſt Philoſophers, however, maintain that even the *Judgments* which we form on obſcure things are not voluntary, and will have our conſenting to the Truth to be an Action of the Underſtanding, which they call Aſſent, to diſtinguiſh it from our conſenting to Goodneſs, which they attribute to the Will, and call it Conſent. But their

Error is owing to this, that in our preſent State, we frequently ſee things to be evidently true without the leaſt reaſon to doubt of 'em; in which caſe the Will is not at liberty either to give or refuſe her Aſſent: but it is not ſo in Matters of Goodneſs; there being nothing, which we don't know ſome reaſon for forbearing to love. So that we here perceive a manifeſt Indifference, and are fully convinced that when we love any thing, even God for inſtance, we uſe our Liberty, and do it voluntarily. But the Uſe we make of our Liberty is not ſo apparent, when we conſent to the Truth, eſpecially when it appears perfectly evident: And this leads us to think that our Conſent to Truth, that is, our *Judgment*, is not voluntary; as if an Action, to be voluntary, muſt be indifferent: As if the Bleſſed above did not love God voluntarily, becauſe they cannot be diverted from it by any other thing; nor we conſent freely to this evident Propoſition, That twice 2 are 4, becauſe we have no appearance of Reaſon to diſſuade us from it. See *Will*, *Liberty*, *Truth*, *Goodneſs*.

Judgment, in a legal Sentence, is a Sentence or Deciſion pronounced by Authority of the King, or other Power, either by their own Mouth, or by that of their Officers whom they appoint to adminiſter Juſtice in their ſtead. Of *Judgments* ſome are definitive, others only preparatory, proviſional, or interlocutory. The antient words of *Judgment* are very ſignificant, *Conſideratum eſt*, &c. becauſe *Judgment* is ever given by the Court upon Conſideration had of the Record before them. In every *Judgment* there ought to be three Perſons, *Actor*, *Reus*, and *Judex*.

JUDICATURE, the Profeſſion of thoſe who adminiſter Juſtice. *Judicature*, is a kind of Prieſthood. The word is alſo uſed to ſignify the Extent of the Juriſdiction of a Judge, and the Court wherein he ſits to do Juſtice.

JUDICIUM DEI, *Judgment of God*, was a Term antiently underſtood of any extraordinary Trials of ſecret Crimes; as thoſe by Arms and ſingle Combat, thoſe by Fire or red-hot Plow-ſhares, by plunging the Arm in boiling Water, or the whole Body in cold Water, in hopes God would work a Miracle rather than ſuffer Truth and Innocence to periſh: *Si ſe ſuper defendere non poſſit*, Judicio Dei *ſcil. Aqua vel Ferro ſieret de eo Juſtitia*. Theſe Cuſtoms were a long time kept up, even among Chriſtians, and are ſtill in Uſe in ſome Nations. See *Ordeal*, *Water*, &c. Theſe Trials were held in the Churches, in preſence of the Biſhops, Prieſts, and Secular Judges, after three Days Faſting, Confeſſion, Communion, and a world of Adjurations and Ceremonies, deſcribed at large by *du Cange*.

JUGULAR, a Term, among Anatomiſts, applied to certain Veins of the Neck, which terminate in the Subclaveans. There are two on each Side; the one external, receiving the Blood from the Face and the external Parts of the Head; and the other internal, which receives the Blood from the Brain.

Jugular is alſo applied to certain Glands of the Neck, in the Spaces between the Muſcles. They are in Number 14, and are found of different Figures, ſome larger, others leſs; they are faſtened to each other by certain Membranes and Veſſels, and their Subſtance is like that of the Maxillaries. They ſeparate a Lympha, which is conveyed by thoſe Veſſels to the adjacent Muſcles. 'Tis an Obſtruction in thoſe Glands which occaſions the King's-Evil. *Dionis*.

JUICE, a liquid Subſtance, which makes part of the Compoſition of Plants, communicating itſelf to all the other Parts, and ſerving to feed and increaſe them. *Juice* is that to Plants, which Blood is to Animals. There are *Juices* aqueous, vinous, oleaginous, gummous, reſinous, and bituminous, of all Taſtes and Colours. Dr. *Liſter* obſerves, that moſt *Juices* of Plants coagulate, whether they be ſuch as are drawn from the Wounds of a Plant, or ſuch as ſpontaneouſly exſude; he having made Curds and Cakes of the *Juices* of a great Number of Plants. He adds, that as the *Juices* of Plants ſeem to be compounded and mixed of Liquors of different kinds; 'tis probable, if the Caſeous Part be narcotic, for inſtance, the Whey may not be ſo; or the one may be hurtful, and the other a good and uſeful Medicament. See *Sap*, *Gum*, &c.

The word *Juice* is alſo applied to ſeveral of the Fluids in an animal Body. The nervous *Juice* is a Liquor which, according to ſome Phyſicians, is found in the Nerves, whence it takes its Name. *Gliſſon*, *Wharton*, and *Willis* were the firſt who made mention of the nervous *Juice*; they take it to be a kind of Vehicle to the animal Spirits, preventing them from diſſipating too haſtily, and think it alſo ſerves to nouriſh the Parts of the Body: but a great part of our modern Phyſicians deny the Exiſtence of this *Juice*.

Pancreatic Juice is a Liquor ſeparated in the Glands of the Pancreas. See *Pancreas*.

Juice is alſo applied to the Vapours and Humidities incloſed in the Earth. Thus they ſay Chryſtal is formed of a lapidific *Juice*, and Metals are formed of Vapours and *Juices* condenſed in the Earth.

JUJUBE, the Fruit of a Tree of the ſame Name, growing very commonly in *Provence*, and ſome other Parts. The *Jujubes* are about the Size of a Plumb, oval, red without, yellow within, of a ſweet, very commonly, vinous Taſte; they are pectoral and aperitive, ſoften the Acrimony of the Humours, and promote a Diſcharge by the *Sputum*. *Pliny* tells us, that *Sextus Papinius* brought the firſt *Jujubes* from *Syria*, and Truffles from *Africa*, towards the End of *Auguſtus*'s Reign.

JULAP, in Pharmacy, is an eaſy agreeable Potion preſcribed to ſick Perſons: It uſually conſiſts of diſtilled Waters, or light Decoctions, frequently ſweeten'd with Sugar or clarified Juices. It is ſometimes uſed as the ordinary Drink in certain Diſeaſes, but uſually as a Vehicle for other Forms of Medicines; ſerving to correct the peccant Humours, to reſtore the declining Strength of the Heart, and to promote Sleep. The word, according to *Menage*, is derived from the *Arabic*, *Giulep*, or rather from the *Greek* ζυλάπα. *Olearius* derives it from *Gulap*, a *Perſian* Word, ſignifying *Roſe-Water*.

IULE, a kind of antient Hymn ſung by the *Greeks*, and after them by the *Romans*, during the time of their Harveſt, in honour of *Ceres* and *Bacchus*; in order to render thoſe Deities propitious. The word is derived from the *Greek* ὅλος, or ἰυλὸς, a Sheaf. This Hymn was ſometimes alſo called *Demetrule*, or *Demetriule*, that is, *Iule* of *Ceres*.

JULIAN YEAR, is the old Account of the Year, ſtill in uſe among us in *England*; it is ſo called from its Founder *Julius Cæſar*, and by that Name is diſtinguiſhed from the new, or *Gregorian* Account, uſed in ſeveral Parts of *Europe*. It is either Common or Biſſextile; the Common conſiſts of 365 Days, and the Biſſextile of 366. *Soſigenes*, whom *Cæſar* made uſe of in the Reformation of the Calendar, judged the mean Solar Year to conſiſt of juſt 365 Days and ſix Hours; and on this Ground it was that *Cæſar* appointed one Year in four to be Biſſextile, and the other three Common. See *Year*.

The *Julian* Period is of great Uſe in Chronology, and was invented by *Scaliger*; it conſiſts of 7980 Years, the Product of the three Cycles multiplied into each other, *viz.* the Indiction, which is 15; the Golden Number 19; and the Cycle of the Sun 28. It is made to commence before the Creation of the World, and that more or leſs, according to the Hypotheſis that is followed. Its principal Advantage conſiſts in this, that the ſame Years of the Cycles of the Sun, Moon, and Indiction, belonging to any Year of this Period, will never fall together again till after the Expiration of 7980 Years, which, according to the received Opinions, will ſcarce happen before the Conſummation of all things. The firſt Year of the Chriſtian Æra, in all our Syſtems of Chronology, is always the 4714th of the *Julian* Period.

To find what Year of the *Julian* Period any given Year of Chriſt anſwers to, work thus: To the given Year of Chriſt add 4713 (becauſe ſo many Years of the *Julian* Period were expired before *A. D.* 1.) and the Sum gives the Year of the *Julian* Period ſought. For Inſtance, I would know what Year of the *Julian* Period *A. D.* 1720 anſwers to: Now 1720 + 4713 = 6433, the Year ſought of the *Julian* Period. On the contrary, having the Year of the *Julian* Period given, to find what Year of Chriſt anſwers thereto: From the Year of the *Julian* Period given, ſubſtract 4713 (for the Reaſon above-mentioned) and the Reſidue will be the Year ſought. For inſtance, I would know what Year of Chriſt anſwers to the *Julian* Period 6433; wherefore 6433 — 4713 = 1720 the Year ſought. If the Year of the *Julian* Period given be leſs than 4713, then ſubſtract the ſame from 4714 (which is the Year of the *Julian* Period that anſwers to the Year of Chriſt 1.) and the Reſidue will ſhew how long before (the beginning of the common Computation from the Nativity of) Chriſt, the given Year of the *Julian* Period was. For inſtance, the City of *Rome* is ſaid to have been built, *J. P.* 3960, I would know therefore how long it was built before Chriſt. Now 4714—3960=754, wherefore *Rome* was built 754 Years before Chriſt. It is called *Julian* as being adapted to the *Julian* Year. See *Period*.

JULUS, a Name which the Botaniſts give to thoſe Wormlike Tufts, or Palms, as they are called, in Willows, which, at the beginning of the Year, grow out, and hang pendulous down from Hazels, Wallnut-Trees, &c. Mr. *Ray* thinks them to be a kind of Collection of the Stamina of the Flowers of the Tree, becauſe in fertile Trees and Plants they have abundance of ſeminal Veſſels and Seed-Pods.

JULY, the ſeventh Month in the Year, when the Sun enters the Sign of *Leo*. About the 24th Day of this Month

Month the Dog-Days begin. The *French* call this the Month of *Red-Fruits*, and with Reaſon, ſays *Quintinie*, becauſe they are then in their height. On the 17th Day of this Month, according to *Hippocrates* and *Pliny*, the Dog-Star riſes, the Sea boils, Wine turns, Dogs go mad, the Bile is increaſed and irritated, and all Animals decline and languiſh, *&c.* The word is derived from the *Latin Julius*, the Sirname of *C. Cæſar* the Dictator, who was born in it. *Mark Anthony* firſt gave it this Name; before, it was called *Quintilis*, as being the fifth Month of the Year, in the old *Roman* Calendar eſtabliſhed by *Romulus*, which begun in the Month of *March*. For the ſame reaſon *Auguſt* was called *Sextilis*, and *September*, *October*, *November*, and *December* ſtill retain the Name of their firſt Rank.

Quæ ſequitur, Numero turba notata ſuo. Ovid. Faſt.

JUNCTURE, is any kind of Joint, or cloſing of two Bodies.

JUNE, the ſixth Month of the Year, when the Sun enters the Sign of *Cancer*. In this Month is the Summer Solſtice. The word comes from the *Latin Junius*, which ſome derive *à Junone*. *Ovid*, in the 6th of his *Faſti*, makes the Goddeſs ſay,

Junius à noſtro Nomine Nomen habet.

Others rather derive it *à Junioribus*, this being for young People, as the Month of *May* was for old ones.

Junius eſt Juvenum qui fuit antè Senum.

JUNIPER-BERRIES, the Fruit of a Shrub of the ſame Name; much uſed in Medicine. *Etmuller* had a vaſt Opinion of them, and thought they deſerved a whole Treatiſe to be wrote of them. The Rob (a Form of Medicine now out of uſe) made of the expreſſed Juice of the Green Berries, has been called the *Theriaca Germanorum*; ſo much have they been in eſteem amongſt them for anti-peſtilential Qualities. They are certainly carminative, but their moſt remarkable Properties are in ſcouring the Viſcera, and particularly the Reins and Urinary Paſſages, as all of the Turpentine-kind do. The Wood of this Shrub is alſo of conſiderable Uſe in Phyſic, it ſtrengthens the Stomach, expels Wind, clears the Lungs, provokes the Menſes, and removes Obſtructions of the Viſcera. It is further ſaid to be Sudorific, Cephalic, and Hyſteric. From it they draw a Spirit, a Tincture, an Elixir, Extract, and a Ratifia. 'Tis ſaid it will laſt an hundred Years without corrupting; and the Chymiſts add, that a Coal of *Juniper*, covered with Aſhes of the ſame kind, will keep fire an entire Year.

JUNTA, an Aſſembly, Council, or Society, of ſeveral Perſons meeting for the Diſpatch of any Buſineſs. This Term is particularly in uſe in the *Spaniſh* and *Portugueſe* Affairs. On the Death of *Charles* II. King of *Spain*, the Kingdom was governed, during the Abſence of *Philip* V. by a *Junta*. In *Portugal* they have three conſiderable *Junta's*, the *Junta* of Commerce, that of the three Eſtates, and that of Tobacco. The firſt was eſtabliſhed by King *John* IV. this is a Council of Marine. The ſame King aſſembled the States of his Kingdom to create the Tribunal of the *Junta* of the three Eſtates. K. *Peter* II. created the *Junta* of Tobacco in 1675, it conſiſts of a Preſident and ſix Counſellors.

Junta was the Name of a Society of Bookſellers or Printers at *Venice*, who publiſhed many beautiful and correct Editions of Books, which ſtill go by the Name of *Junta's*.

IVORY, the Tooth or Tuſk of an Elephant growing on each ſide of his Trunk, in form of an Horn. *Ivory* is much eſteem'd for its Colour, its Poliſh, and the Fineneſs of its Grain when wrought. *Dioſcorides* ſays, that by boiling it the ſpace of ſix hours with the Root of Mandragoras, it becomes ſo ſoft and tractable, that one may manage it as he pleaſes. The *Ivory* of the Iſle of *Ceylon* and that of the Iſle of *Achem* have this Peculiarity, that they never become yellow, as that of the *Terra-firma* and *Eaſt-Indies* does; on which account 'tis much dearer.

Black Ivory is no more than *Ivory* burnt, and drawn into a Leaf when it is become black. It is ground with Water, and made up into little Cakes or Troches, uſed by the Painters.

JUPITER, one of the ſeven Planets: its Character is ♃. Its Orbit is ſituate between *Saturn* and *Mars*. It has a Rotation round its own Axis in 9 Hours, 56 Minutes; and a periodical Revolution round the Sun in 4332 Days, 12 Hours. It is the biggeſt of all the Planets. Its Diameter to that of the Sun appears, by Aſtronomical Obſervations, to be as 1077 is to 10000, to that of *Saturn* as 1077 to 889, to that of the Earth as 1077 to 104. The Force of Gravity on its Surface is to that on the Surface of the Sun as 797,15 is to 10000, to that of *Saturn* as 797,15 to 534,337, to that of the Earth as 797,15 to 407,832. The Denſity of its Matter is to that of the Sun as 7404 to 10000, to that of *Saturn* as 7404 to 6011, to that of the Earth as 7404 to 3921. The Quantity of Matter contained in its Body is to that of the Sun as 9,248 to 10000, to that of *Saturn* as 9,248 to 4,223, to that of the Earth as 9,248 to 0,0044. The mean Diſtance of *Jupiter* from the Sun is 5201 of thoſe Parts, whereof the mean Diſtance of the Earth from the Sun is 1000, tho' *Kepler* makes it 5196 of thoſe Parts. M. *Caſſini* calculates *Jupiter*'s mean Diſtance from the Earth to be 115,000 Semi-Diameters of the Earth. *Gregory* computes the Diſtance of *Jupiter* from the Sun to be above five times as great as that of the Earth from the Sun; whence he gathers, that the Diameter of the Sun, to an Eye placed in *Jupiter*, would not be a fifth part of what it appears to us; and therefore his Disk would be twenty-five times leſs, and his Light and Heat in the ſame Proportion. The Inclination of *Jupiter*'s Orbit, that is, the Angle formed by the Plane of its Orbit, with the Plane of the Ecliptic, is 1 Deg. 20 Min. His Excentricity is 2505 and *Huygens* computes his Surface to be four hundred times as large as that of our Earth. See *Solar Syſtem*.

Jupiter is one of the ſuperior Planets, that is, one of the three above the Sun. Hence it has no Parallax, its Diſtance from the Earth being too great, to have any ſenſible Proportion to the Diameter of the Earth. Though it be the greateſt of the Planets, yet its Revolution about its Axis is the ſwifteſt. Its Polar Axis is obſerved to be ſhorter than its Equatorial Diameter; and Sir *I. Newton* determines the Difference to be as 8 to 9. So that its Figure is a Spheroid, and the Swiftneſs of its Rotation occaſions this Spheroidiſm to be more ſenſible than that of any other of the Planets. *Jupiter* appears almoſt as large as *Venus*, but is not altogether ſo bright. He is eclips'd by the Moon, by the Sun, and even by *Mars*. *Hevelius* obſerved *Jupiter*'s Diameter 7 Inches, having Inequalities like the Moon. He has three Appendages, call'd Zones, or Belts, which Sir *I. Newton* thinks are form'd in his Atmoſphere. In theſe are ſeveral *Maculæ*, or Spots; from whoſe Motion, the Motion of *Jupiter* round its Axis is ſaid to have been firſt determined. The Diſcovery of this is controvered between *Euſtachio*, *P. Gotignies*, *Caſſini*, and *Campani*.

The four little Stars, or Moons, which move round *Jupiter*, were firſt diſcover'd by *Galileo*, who call'd them the *Aſtra de Medicis*; but we the Satellites of *Jupiter*. *Caſſini* obſerved, that the firſt or innermoſt of theſe Satellites was five Semi-diameters of *Jupiter* diſtant from *Jupiter* itſelf, and made its Revolution in 1 Day, 18 Hours, and 32 Minutes. The ſecond, which is ſomewhat greater, he found 8 Diameters diſtant from *Jupiter*, and its Revolution 3 Days, 13 Hours, and 12 Minutes. The third, which is the greateſt of all, is diſtant from *Jupiter* 13 Semi-diameters, and finiſhes its Courſe in 7 Days, 3 Hours, and 50 Minutes. The laſt, which is the leaſt of all, is diſtant from *Jupiter* 23 Semi-diameters; its Period is 16 Days, 18 Hours, and 9 Minutes. Theſe four Moons muſt make a very pleaſing Spectacle to the Inhabitants of *Jupiter*, if it be true there are any; for ſometimes they riſe all together; ſometimes they are all together in the Meridian, ranged one under another; and ſometimes all appear in the Horizon, and frequently undergo Eclipſes: the Obſervations whereof are found of eſpecial Uſe in determining the Longitude. *Caſſini* has made Tables for calculating the Immerſions and Emerſions of *Jupiter*'s firſt Satellite.

The Day and Night are of the ſame Length in *Jupiter* all over his Surface, *viz.* five Hours each; the Axis of his Diurnal Rotation being nearly at right Angles to the Plane of his Annual Orbit. Though there are four primary Planets below *Jupiter*, yet an Eye placed on his Surface would never perceive any of them, except *Saturn*; unleſs, perhaps, as Spots paſſing over the Sun's Disk, when they happen to come between the Eye and the Sun. The Parallax of the Sun, view'd from *Jupiter*, will ſcarce be ſenſible, no more than that of *Saturn*; neither being much above 20 Seconds; ſo that the Sun's apparent Diameter in *Jupiter* will not be above ſix Minutes. The outermoſt of *Jupiter*'s Satellites will appear almoſt as big as the Moon does to us, *viz.* five times the Diameter, and 25 times the Disk of the Sun. Dr. *Gregory* adds, that an Aſtronomer in *Jupiter* would eaſily diſtinguiſh two kinds of Planets, four nearer him, *viz.* the Satellites, and two, *viz.* the Sun and *Saturn*, more remote. The former, however, will fall vaſtly ſhort of the Sun in Brightneſs, notwithſtanding the great Diſproportion in the Diſtances and apparent Magnitudes. From thoſe four different Moons, the Inhabitants of *Jupiter* will have four different kinds of Months, and the Number of Moons in their Year will not be leſs than 4500. Theſe Moons are eclips'd as often as, being in oppoſition to the Sun, they fall within the Shadow of *Jupiter*;

piter; and again, as oft as being in conjunction with the Sun, they project their Shadows to *Jupiter*, they make an Eclipse of the Sun to an Eye placed in that part of *Jupiter* where the Shadow falls. But in regard the Orbits of these Satellites are in a Plane which is inclined to, or makes an Angle with the Plane of *Jupiter*'s Orbit, their Eclipses become central when the Sun is in one of the Nodes of these Satellites; and when out of this Position, the Eclipses may be total, tho not central, because the Breadth of *Jupiter*'s Shadow is nearly decuple to that of the Breadth of any of the Satellites; and the apparent Diameter of any of these Moons is nearly quintuple the apparent Diameter of the Sun. 'Tis owing to this remarkable Inequality of Diameters, and the small Inclination the Plane of the Orbits of these Satellites has to the Plane of *Jupiter*'s Orbit, that in each Revolution there happen Eclipses both of the Satellites and of the Sun: tho the Sun be at a considerable distance from the Nodes. Further, the inferior among these Satellites, even when the Sun is at its greatest distance from the Nodes, will occasionally eclipse and be eclipsed by the Sun to an Inhabitant of *Jupiter*; tho the remotest of them, in this case, escapes falling into *Jupiter*'s Shadow, and *Jupiter* into his, for two Years together. To this it may be added, that one of these Satellites sometimes eclipses another, where the Phasis must be different, nay frequently opposite to that of the Satellite falling into the Shadow of *Jupiter* just mention'd; for in this, the Eastern Limb immergeth first, and the Western immergeth last: but in the others 'tis just the Reverse.

The Shadow of *Jupiter*, tho it reaches far beyond its Satellites, yet falls short of any other Planet; nor could any other Planet, *Saturn* alone excepted, be immerged in it, even tho it were infinite. Indeed, *Jupiter*'s Shadow could not reach *Saturn*, unless *Jupiter*'s Diameter were half that of the Sun; whereas, in effect, 'tis not one ninth of it.

The Courses of *Jupiter*'s Satellites, and their various Eclipses, would render Navigation very sure and easy on the Globe of *Jupiter*. Even we, at this distance, can make very good use of them; those Eclipses being found one of our best means for determining the Longitude at Sea. For the Manner of calculating them, *&c.* see *Satellites*.

Among the Alchymists, *Jupiter* signifies the Philosophers Stone. The Gentlemen of this Profession apply every thing to their Art which the Fable mentions of the God *Jupiter*; pretending the Fables are to be understood in a figurative Sense: for instance, *Jupiter* is the Master of the Gods, and Gold, say they, is the most precious of Metals. Mercury is the Ambassador of *Jupiter*; and this shows with how much ease *Mercury* insinuates into every thing. *Jupiter* holds the Thunderbolt as his Scepter; which evidently points out the external Sulphur used in Projection. *Jupiter* has the Heavens for his ordinary Habitation; this shews the volatile, dry, and hot. The Debauches of *Jupiter*, who sought for Pleasure in the low, but prolific and fruitful Earth, discover, say they, its Fecundity; and that Gold might be formed, were the way of preparing it discover'd. In a word, *Jupiter* is the Son of *Saturn*, which shews some Resemblance between the Qualities of Gold and Lead.

JURATS are in the nature of Aldermen, for government of their several Corporations: as the Mayor and *Jurats* of *Maidstone*, *Rye*, *Winchelsea*, &c. So *Jersey* hath a Bailiff and twelve *Jurats*, or sworn Assistants, to govern the Island.

JURIS-CONSULTUS, among the *Romans*, was a Person learned in the Law, a Master of Juris-prudence, and who was consulted on the Interpretation of Laws and Customs, and on the difficult Points in Law-Suits. The fifteen Books of the *Digest* were compiled wholly from the Answers or Reports of the antient *Juris-Consulti*. *Tribonianus*, in destroying the two thousand Volumes whence the *Code* and *Digest* were taken, has deprived the Public of a world of things which would have given 'em light into the Office of the antient *Juris-Consulti*. We should scarce have known any thing beyond their bare Names, had not *Pomponius*, who lived in the second Century, taken care to preserve some Circumstances of their Office. The *Roman Juris-Consulti* seem to have been the same with our Chamber Counsellors, who arrived at the Honour of being consulted, through Age and Experience, but never pleaded at the Bar. Their pleading Advocates or Lawyers never became *Juris-Consulti*. In the Times of the Commonwealth the *Advocati* had by much the more honourable Employment; as being in the ready way to attain to the highest Preferments. They then despised the *Juris-Consulti*, calling them in derision *Formularii* and *Legulei*, as having invented certain Forms, and certain Monosyllables, in order to give their Answers the greater appearance of Gravity and Mystery. But in process of time they became so much esteem'd, that they were call'd *Prudentes* and *Sapientes*, and the Emperors appointed their Judges to follow their Advice. *Augustus* advanced them to be public Officers of the Empire; so that they were no longer confined to the petty Counsels of private Persons. *Bern. Rectilius* has written the Lives of the most famous *Juris-Consulti*, who have lived within these 2000 Years.

JURISDICTION is a Power or Authority which a Man hath to do justice in cases of Complaint made before him. There are two kinds of *Jurisdiction*, the one Ecclesiastical, the other Secular. Secular belongs to the King and his Delegates: Ecclesiastical to Bishops and their Deputies. Bishops, *&c.* have two kinds of *Jurisdiction*, the one Internal, which is exercised over the Conscience in things purely Spiritual; and this they are supposed to hold immediately of God: The other is a Privilege which some Princes have given them of terminating Disputes between Ecclesiastics and Laymen.

JURIS-PRUDENCE, the Knowledge of what is just and injust, or of the Laws, Rights, Customs, Statutes, *&c.* necessary for the doing of Justice. *Civil Juris-Prudence* is that of the *Roman* Law, *Canonical* that of the Canon Law, *Feudal* that of Fees.

JUROR, in a legal sense, is one of those twenty-four or twelve Men, who are sworn to deliver Truth upon such Evidence as shall be given them touching any matter in question. The Punishment of Petty Jurors attainted of giving a Verdict contrary to Evidence, willingly, is very severe. See *Attaint*.

JURY, in Common Law signifies either Twenty-four or Twelve Men sworn to enquire of the Matter of Fact, and declare the Truth upon such Evidence, as shall be delivered them touching the Matter in question. The *Jury* is to be chosen out of the same Class or Rank with the Accused, and if he be a Foreigner, he may demand a Jury half Foreigners and half *Englishmen*. There are ordinarily Thirty-six impannel'd, whereof in Criminal Cases the Person accused has the Liberty to challenge or set aside Twenty-four, and to pick out Twelve at his pleasure. These Twelve are present at the Trial, after which they withdraw into a Chamber by themselves, where they are to be shut up without Fire or Candle, Victuals or Drink, till such time as they agree in their Verdict, and declare unanimously that the Defendant is either Guilty of the Charge laid against him, or Not Guilty. Upon which, the Judge passes the Sentence prescribed by the Law. In *England* there are three sorts of Trials, *viz.* One by Parliament, another by Battle, and a third by Assize or Jury. The Trial by Assize (be the Action Civil or Criminal, Public or Private, Personal or Real) is referred for the Fact to a Jury, and as they find it, so passeth the Judgment. This *Jury* is not only used in Circuits of Justices Errant, but also in other Courts and Matters of Office: But tho' it appertains to most Courts of the Common Law, yet is it most remarkable in the Half-Year Courts of the Justices Errant, commonly call'd the Great Assizes, and in the Quarter-Sessions; and in them it is most ordinarily called a *Jury*, and that in a Civil Cause: whereas in other Courts, it is usually called an Inquest, and in the Court-Baron a *Jury* of the Homage. In the General Assize there are usually many *Juries*, because there are a great many Causes, both Civil and Criminal, commonly to be tried; whereof one is called the *Grand Jury*, and the rest the *Petit Juries*; of which, it seems, there should be one in every Hundred.

The *Grand Jury* consists of Twenty-four Grave and Substantial Gentlemen, or some of the better sort of Yeomen, chosen indifferently by the Sheriff out of the whole Shire, to consider of all Bills of Indictment prefer'd to the Court; which they do either approve, by writing upon them *Billa vera*; or else disallow, by indorsing *Ignoramus*. Such as they do approve, if they touch Life and Death, are farther refer'd to another *Jury*, to be consider'd of, because the Case is of much importance; but others of lighter moment are, upon their allowance, without more work, fined by the Bench: except the Party traverse the Indictment, or challenge it for Insufficiency, or remove the Cause to a higher Court by *Certiorari*; in which two former Cases it is refer'd to another *Jury*, and in the latter, transmitted to a higher. And presently upon the allowance of this Bill, by the Grand Inquest, a Man is said to be indicted: Such as they disallow, are delivered to the Bench, by whom they are forthwith cancelled or torn.

The *Petit Jury* consists of Twelve Men at the least, and are impannel'd as well upon Criminal as upon Civil Causes: Those that pass upon Offences of Life and Death, do bring in their Verdict either Guilty or Not Guilty; whereupon the Prisoner, if he be found Guilty, is said to be convicted, and so afterwards receiveth Judgment and Condemnation; or otherwise is acquitted, and set free. Those that pass upon Civil Causes Real, are all, or so many, as can conveniently be had, of the same Hundred, where the Land or Tenement in question doth lie, being four at least; and they, upon due Examination, bring in their Verdict either for the Demandant or Tenant.

JURY-MAST: ſo the Seamen call whatever they ſet up in the room of a Maſt, loſt in a Fight or by a Storm, with which they make ſhift to ſail, inſtead of the Maſt which they have loſt.

JUS CORONÆ, the *Rights of the Crown*, is part of the Law of *England*, which differs in many things from the general Law concerning the Subject. *Coke* on *Litt.*

JUS PATRONATUS, in Law, is the Right of preſenting a Clerk to a Benefice.

JUS and JURA, ſee *Law*, *Right*.

JUST, a Combat on Horſeback, Man againſt Man, arm'd with Lances. Antiently, *Juſts* and Tournaments made a part of the Entertainment at all ſolemn Feaſts and Rejoicings. The *Spaniards* borrow'd theſe Exerciſes from the *Moors*, and call them the *Cane-Play*. This is the ſame with the *Ludus Trojanus* antiently practiſed by the Youth of *Rome*. The *Turks* uſe it ſtill, and call it lancing the *Gerid*. The difference between *Juſts* and Tournaments conſiſts in this, That the latter is the Genus, of which the former is the Species. Tournaments were all kinds of Military Races and Engagements, made out of Gallantry and Diverſion. *Juſts* were ſuch particular Combats where Parties were near each other, and engaged with Lance and Sword: The Tournament was frequently performed by a Number of Cavaliers, who fought in a Body. The *Juſt* was a ſingle Combat of one Man againſt another: Though the *Juſts* were uſually made in a Tournament, after the general Rencounter of all the Cavaliers, yet they were ſometimes ſingly, and independent of any Tournament. He who appear'd for the firſt time at a *Juſt*, forfeited his Helm or Caſque, unleſs he had forfeited before at a Tournament.

The Word is derived from the *Latin juxta*, becauſe the Combatants fought near one another. *Salmaſius* derives it from the modern *Greek* ζουſτρα, or rather τζυστρα, which is uſed in this ſenſe by *Nicephorus Gregorius*. Others derive it from *Juſta*, which in the corrupt Age of the *Latin* Tongue was uſed for this Exerciſe; this being ſuppoſed to be a more juſt and equal Combat than the Tournament.

JUSTICE, is a conſtant Deſire or Inclination to give every one his Due, or a Habit by which the Mind is always diſpoſed and determined to give every Man his own. *Juſtice* may be divided into Diſtributive, Commutative, and Legal. *Diſtributive Juſtice* is concern'd in Matters of Government, and of Beneficence, and is either remuneratory or punitive; it obſerves an Equality in dealing Rewards and Puniſhments, according to each Man's Condition and Merit: for as Actions are either good or evil, for the good, Rewards muſt be aſſigned, and for the evil, Puniſhments; and herein a Geometrical Proportion is obſerved. *Commutative Juſtice* is converſant in Matters of Commerce, and in the equal Commutation or Exchanging of things, and proceeds according to an arithmetrical Equality, without any regard to Perſons and Circumſtances. *Legal Juſtice* is that which reſides in the State or Monarch, by whoſe Power and Authority the Effects of commutative and diſtributive *Juſtice* are frequently ſuperſeded or ſuſpended; as in a Dearth of Corn, if a Perſon that has a Stock by him will not ſell it, it ſhall be taken from him: and the like.

JUSTICE is likewiſe the Name of an Officer appointed by the King or Commonwealth, to do Right by way of Judgment. He is called *Juſtice*, and not Judge, becauſe he was antiently called *Juſticia*, and not *Juſticiarius*, and becauſe he has his Authority by Deputation, as Delegate to the King, and not *Jure Magiſtratus*; and therefore cannot depute any other in his ſtead, the *Juſtice* of the Foreſt only excepted. Of theſe *Juſtices* we have various kinds in *England*.

Juſtice, or *Chief Juſtice* of the *King's-Bench*, is the capital *Juſtice* of *Great Britain*, and a Lord by his Office. His Buſineſs is chiefly to hear and determine all Pleas of the Crown, that is, ſuch as concern Offences againſt the Crown, Dignity, and Peace of the King, as Treaſons, Felonies, &c. See *King's-Bench*.

Juſtice, or *Chief Juſtice* of the *Common-Pleas*, is he who, with his Aſſiſtants, hears and determines all Cauſes at the Common Law, that is to ſay, all Civil Cauſes between common Perſons, as well Perſonal as Real, and he is a Lord by his Office. This Officer was formerly not only *Chief Juſtice*, but alſo Chief Baron of the *Exchequer*, and Maſter of the Court of Wards. He uſually ſat in the King's Palace, and there executed that Office, formerly performed *per Comitem Palatii*; he determined, in that Place, all the Differences happening between the Barons and other Great Men. He had the Prerogative of being Vicegerent of the Kingdom, whenever the King went beyond Sea, and was uſually choſen to that Office out of the prime Nobility; but his Power was reduced by King *Richard* I. and King *Henry* I. His Office is now divided, and his Title changed from *Capitalis Angliæ Juſticiarius*, to *Capitalis Juſticiarius ad Placita*, &c. See *Common-Pleas*.

Juſtice of the Foreſt is a Lord by his Office, and hath Power and Authority to determine Offences committed in the King's Foreſts, &c. which are not to be determined by any other Court or *Juſtice*, except ſuch as are appointed by ſpecial Commiſſion to aſſiſt him in his Office. Of theſe there are two, whereof the one hath Juriſdiction over all the Foreſts on this ſide *Trent*, and the other beyond it. By many antient Records it appears to be a Place of great Honour and Authority, and is never beſtowed but on ſome Perſon of great Diſtinction. The Court where this *Juſtice* ſits, is called the *Juſtice-Seat of the Foreſt*. This is the only *Juſtice* who may appoint a Deputy; he is alſo called *Juſtice in Eyre of the Foreſt*.

Juſtices in Eyre, *Juſticiarii Itinerantes*, or *Errantes*, are ſo termed from the old *French* word *Erre*, i. e. *Iter*. Theſe, in antient time, were ſent with Commiſſion into divers Counties to hear ſuch Cauſes, eſpecially, as were termed Pleas of the Crown; and that for the Eaſe of the Subject; who muſt elſe have been hurried to the Courts of *Weſtminſter*, if the Cauſe were too high for the County-Courts. According to ſome, theſe *Juſtices* were ſent once in ſeven Years, but others will have them to be ſent oftner. *Cambden* ſays, they were inſtituted in the Reign of King *Henry* II. but they appear to be of an older Date. They were much like our *Juſtices* of Aſſize at this Day, tho' for Authority and Manner of Proceeding very different.

Juſtices of Aſſize, are ſuch as were wont, by ſpecial Commiſſion, to be ſent into this or that County, to take Aſſizes, for the Eaſe of the Subjects: for whereas theſe Actions paſs always by Jury, ſo many Men might not, without great Damage and Charge, be brought up to *London*; and therefore *Juſtices*, for this purpoſe, by Commiſſion particularly authorized, were ſent down to them. Theſe continue twice every Year to paſs the Circuit, by two and two, thro' all *England*, diſpatching their ſeveral Buſineſſes by ſeveral Commiſſions; for they have one Commiſſion to take Aſſizes, another to deliver Goals, and another of Oyer and Terminer, &c. See *Aſſize*.

Juſtices of Goal-Delivery, are ſuch as are commiſſioned to hear and determine Cauſes appertaining to thoſe, who for any Offence are caſt into the Goals. Their Commiſſion is now turned over to the *Juſtices of Aſſize*.

Juſtices of Niſi Prius are now all one with *Juſtices of Aſſize*, for it is a common Adjournment of a Cauſe in the *Common Pleas* to put it off to ſuch a Day; *Niſi Prius Juſticiarii venerint ad eas Partes ad capiendas Aſſiſas*: and from the Clauſe of Adjournment, they are called *Juſtices of Niſi Prius*, as well as *Juſtices of Aſſize*, by reaſon of the Writ and Actions they have to deal in.

Juſtices of Oyer and Terminer, were *Juſtices* deputed, on ſome ſpecial Occaſions, to hear and determine ſome particular Cauſes. The Commiſſion of Oyer and Terminer is directed to certain Perſons, upon any Inſurrection, heinous Demeanour, or Treſpaſs committed.

Juſtices of the Peace, are Perſons of Intereſt and Credit, appointed by the King's Commiſſion to attend the Peace of the Country where they live; of whom, ſome, for ſpecial Reſpect, are made of the *Quorum*, becauſe no Buſineſs of Importance may be diſpatched without the Preſence, or Aſſent of them, or one of them. See *Quorum*. The Office of a *Juſtice of the Peace* is to call before him, examine, and commit to Priſon all Thieves, Murderers, wandring Rogues, thoſe that hold Conſpiracies, Riots, and almoſt all Delinquencies, that may occaſion the Breach of the Peace and Quiet of the Subject; to commit to Priſon ſuch as cannot find Bail, and to ſee them brought forth in due time to Trial. The Original of *Juſtices* of the Peace is referred to the fourth Year of *Edw.* III. They were at firſt called *Wardens of the Peace*.

JUSTIFICATION, in Theology, is that Grace which renders a Man juſt in the Sight of God, and worthy of eternal Happineſs. The *Romaniſts* and *Reformed* are extremely divided about the Doctrine of *Juſtification*; the latter contending for *Juſtification* by Faith alone, and the former by good Works. See *Imputation*.

JUSTNESS, the Exactneſs or Regularity of any thing. The word is particularly uſed in Matters of Language or Thought. The *Juſtneſs* of a Thought conſiſts in a certain Preciſeneſs or Accuracy, by which every part of it is perfectly true, and pertinent to the Subject. *Juſtneſs* of Language conſiſts in uſing proper and well-choſen Terms; in not ſaying either too much or too little. M. *de Mere*, who has written on *Juſtneſs* of Mind, diſtinguiſhes two kinds of *Juſtneſs*; the one ariſing from Taſte and Genius, the other coming from good Senſe or right Reaſon. There are no certain Rules to be laid down for the former, *viz.* to ſhew the Beauty and Exactneſs in the Turn, or Choice of a Thought; the latter conſiſts in the juſt Relation which things have to one another.

JUVENALIA, Games, Exerciſes of Body, or Combats, inſtituted by *Nero* the firſt time his Beard was ſhaved. They were celebrated in private Houſes, and even the

Women had a ſhare in them; they were the ſame with the *Neroniana*.

JUXTA-POSITION, is that Diſpoſition of Parts in any Body, whereby they are joined and combined together.

K

K A double Conſonant, and the 10th Letter of the Alphabet. It is borrowed from the *Greek Kappa*; and was but little uſed among the *Latins*. *Priſcian* looked on it as a ſuperfluous Letter, and ſays, it was never to be uſed except in words borrowed from the *Greek*. *Dauſquius*, after *Saluſt*, obſerves, that it was unknown to the antient *Romans*. Indeed we ſeldom find it in any *Latin* Authors, excepting in the word *Kalends*, where it ſometimes ſtands in lieu of a C. *Karthage* is frequently ſpelt on Medals with a K, SALVIS AUGG. CAES. F E L. KART. and ſometimes the Letter K alone ſtood for *Carthage*. M. *Beger* has obſerved, that a Capital K, on the Reverſe of the Medals of the Emperors of *Conſtantinople*, ſignified KONSTANTINUS; and on the *Greek* Medals he will have it to ſignify ΚΟΙΑΗ ΣΤΡΙΑ, *Cœle-Syria*. *Lipſius* obſerves, that K was a Stygma antiently marked on the Foreheads of Criminals with a red-hot Iron; and *Quintilian* tells us, that in his time ſome People had gotten a miſtaken Notion, that wherever the Letters C and A occurred at the beginning of a Word, K ought to be uſed inſtead of the C.

The Letter K has various Significations in old Charters and Diploma's; for Inſtance, K R ſtood for *Chorus*, K R. C for *Cara Civitas*, K R M for *Carmen*, K R. A M. N, *Carus Amicus noſter*, K S *Chaos*, K T *Capite tonſus*, &c.

The *French* never uſe the Letter K, excepting in a few Terms of Art, and proper Names borrowed from other Countries. *Ablancourt*, in his Dialogue of the Letters, brings in K complaining, that he has been often in a fair way to be baniſhed out of the *French* Alphabet, and confined to the Countries of the *North*. In *Engliſh* the K is uſed much more than needs be, particularly at the ends of Words after C, as in Publick, Phyſick, &c. where it is of no manner of Service.

K is alſo a Numeral Letter, ſignifying 250, according to the Verſe;

K *quoque ducentos & quinquaginta tenebit.*

When it had a Stroke at top, it ſtood for 150000.

KABIN, or KEBIN, a temporary Marriage, in uſe among the *Mahometans*. The *Kabin* is contracted before the Cadi, in whoſe Preſence the Man eſpouſes the Woman for a certain time, upon condition that if he quits her at the end of that Term, ſhe ſhall be allowed a certain Sum of Money. Some Authors ſay, that the *Kabin* is only permitted among the *Perſians*, and in the Sect of *Ali*; but others maintain that it is alſo practiſed among the *Turks*.

KADARE, or KADARITE, the Name of a Sect among the *Mahometans*, who deny the Favourite Tenet of the Muſſulmen, Predeſtination; and maintain the Doctrine of Liberty and Free-Will in all its Latitude.

KALENDAR, See *Calendar*.

KALENDS. See *Calends*.

KALI, a Plant, otherwiſe called *Glaſſwort*; it grows in the Sands on the Sea-ſhore, where the People ſow it in order to burn it green. Of its Aſhes they make Soap, Glaſs, Alkali-Salt, &c. This Plant grows in great abundance in *Egypt* and *Syria*; its Name *Kali* was given it by the *Arabs*. It is found pretty plentifully, too, in *Languedoc*, where the People turn it to a very good account. Their manner of preparing it is this: When the Tree is grown up to its pitch, they cut it down, and let it dry; afterwards they burn and calcine it in certain Pits like Lime-Kilns dug in the Ground for that purpoſe, which are cloſe covered up with Earth, ſo as no Air may come at the Fire. The Matter by this means is not reduced into Aſhes only, but made into a very hard Stone, like Rock-Salt, which they are forced to break with Hammers to get it out, and this Matter they call *Salicor*, or *Soude en Pierre*. They make ſuch Quantities of it here, that they export it into ſeveral other Countries, but principally into *Italy*, where the *Venetians* manufacture it into thoſe beautiful Glaſſes, which they afterwards return into moſt Countries in *Europe*. However, the *Salicor* made here is inferiour to that brought from *Alicant*. The beſt is in little dry ſonorous Stones, of a blueiſh grey Colour, and full of little Eyes or Holes.

KAN, the Name of an Officer in *Perſia*. The *Kans* are the ſame things in *Perſia* that Governours are in *Europe*: There are *Kans* of Provinces, Countries, and Cities, who have different Additions to diſtinguiſh them.

KAPI, a Term in the *Eaſtern* Countries for Gate. Thus the chief Gate of the Palace of the Emperor of *Perſia* is called *Alla Kapi, the Gate of God*. Thus alſo the Officer who has the Command of the Grand Signior's Palace-Gates, is called *Kapighi Bachi*.

KARATA, a kind of Aloes growing in *America*. Its Leaves, when boiled, are made into a Thread, of good uſe in making Cloth, Fiſhing-Nets, &c. Its Root, or Leaves, thrown into the River, ſtun the Fiſhes to that degree, that they are eaſily taken with the Hand. Its Stalk, when dried and burnt, burns like a Match; and when briskly rubbed on a harder Wood, takes fire, and conſumes itſelf.

KARKRONI, a Building where the Royal Manufactures of *Perſia* are carried on. Here are made their Tapeſtries, Cloth of Gold, Silk, Wool, and Brocades, Velvets, Taffeta's, Coats of Mail, Sabres, Bows, Arrows, and other Arms. There are alſo Painters in Miniature, Goldſmiths, Lapidaries, &c.

KARLE, a *Saxon* Word, uſed in our Laws, ſometimes for a Man, and ſometimes for a Servant, or Clown. Hence the *Saxons* call a Seaman a *Buſcarle*, and a Domeſtic Servant *Huſcarle*: whence, by Corruption, comes our word *Churle*.

KASI, a Term in the *Eaſt*, applied to the fourth Pontiff of *Perſia*, who, at the ſame time, is the ſecond Civil Lieutenant, and judges of Temporal as well as Spiritual Affairs. He has two Deputies who determine Matters of leſs Conſequence, particularly Quarrels ariſing in Coffee-houſes, which make a great part of their Buſineſs.

KAURYSAOUL, a Body of Soldiers, who form the laſt of the five Bodies of the King of *Perſia*'s Guards. They are in Number 2000, all Horſe, commanded by the Conſtable, and in his Abſence by the Captain of the Watch. They keep watch in the Night around the Palace, ſerve to keep off the Crowd when the King goes on Horſeback, keep Silence at the Audience of Ambaſſadors, ſeize the Kans and other Officers when diſgraced, and cut off their Heads when the King commands it.

KAY, a Wharf or Place by the Water-ſide, in a Sea-Port, for the loading and unloading of Merchandize; the Number of theſe in *England* is determined by Act of Parliament. The Verb *cajare*, in old Writers, according to *Scaliger*, ſignifies to keep in or reſtrain; and hence came our Term *Kay*; the Ground where they are made being bound in with Planks and Poſts.

KAYAGE, the Money, or Toll, paid for loading or unloading Wares at Kays.

KEBER, the Name of a Sect among the *Perſians*. Thoſe of this Sect are, for the generality, rich Merchants. Tho' they inhabit in the middle of *Perſia*, and are found in great Numbers in the Suburbs of *Iſpahan*, yet 'tis not known, whether or no they are originally *Perſians*, as having nothing in common with the other *Perſians* but the Language. They are diſtinguiſhed by their Beard, which they wear very long, and by their Dreſs, which is quite different from the reſt. They are in effect Heathens, but are in great Reputation for the Regularity of their Life. Some Authors ſay they adore the Fire, in imitation of the antient *Perſians*; but this is contradicted by others: They believe the Immortality of the Soul, and have ſome things like what the Antients taught of Hell and the *Elyſian* Fields. When any of them die, they let looſe a Cock in his Houſe, and drive it out into a Field; if a Fox ſeizes it, and bears it off, they make no doubt but the Soul of the Defunct is ſaved. If this firſt Experiment don't ſatisfy them, they have recourſe to a ſecond, which is concluſive; they carry the Carcaſs into the Church-yard, and prop it up againſt the Wall with a Fork: if the Birds peck out the right Eye, they look on him as one of the Predeſtinated, and bury him with a great deal of Ceremony, letting him down gently into the Grave; but if the Birds begin with the left Eye, they conclude him a Reprobate, and throw him headlong into a Ditch. The word *Keber* ſignifies Infidel, from the *Turkiſh Keapher*, a Renegado, or, rather, they both come from כפר, *Caphar*, which, in the *Chaldee*, *Syriac*, and *Arabic*, ſignifies to deny.

KEBLEH, or KIBLEH, a Term uſed among the *Turks*, for that Point or Quarter to which they turn themſelves when they make their Prayers. *Mahomet* at firſt durſt not propoſe any other *Kebleh* to his Followers but the Temple

of

of *Jeruſalem*, which was the *Kebleh* of the *Jews* and *Chriſtians*. In courſe of time, however, being willing to bring his own, off from any Communication in Matters of Religion with the *Jews* and *Chriſtians*, he appointed them, in the Alcoran, to turn themſelves, at Prayer, towards the Temple of *Mecca*, from which time they called thoſe two Temples the *Kebletan*, or two *Keblehs*. *Ricaut* adds, that 'tis not the Temple of *Mecca*, properly ſpeaking, that the *Turks* call *Kebleh*, but rather the large ſquare Tower in the middle of the Amphitheatre of the Moſque.

Kebleh is alſo uſed for an Altar, or rather a Niche, as *Ricaut* calls it, which the *Mahometans* have in all their Churches, and which is placed very exactly on that Side towards the Temple of *Mecca*. Hence the word *Kebleh* comes to be uſed metaphorically for the Object or End propoſed, or the Intention a Man has in doing a thing. Thus the *Kebleh* of Kings is their Crown and Authority, that of Men of Buſineſs Money, that of Gluttons good Cheer, *&c.*

KEBLEH-NOMA, the Name which the *Turks* and *Perſians* give to a little Pocket Compaſs, which they always carry with them, in order to place themſelves the more exactly when they go to Prayers.

KEDGING, a Sea-Term, uſed when a Veſſel is brought up or down a narrow River by the Wind, tho the Tide be contrary to it. To do this the Seamen ſet their Fore-ſail, or Foretop-ſail, and the Mizen, and let her drive with the Tide, that they may ſtat her about; if ſhe come too near the Shore, they have a little Anchor ready, called the *Kedger*, or *Kedge-Anchor*, with a Hawſer faſtened to it from the Ship: and this Anchor they drop in the midſt of the Current, by which means they wind her Head about, and this done, take up the Anchor again.

KEEL, the Name of the loweſt Piece of Timber in a Ship, in the Bottom of her Hull, one End whereof is at the Stern, the other at the Stem; into this are all the Ground-Timbers and Hooks faſtened and bolted fore and aft. When a Ship hath a deep *Keel*, ſhe is ſaid to have a rank *Keel*, and this ſerves to keep her from rolling.

KEEPER *of the Foreſt*, otherwiſe called *Chief Warden of the Foreſt*, is an Officer that hath the principal Government of all things belonging to a Royal Foreſt, and the Check of all the other Officers. The Lord Chief Juſtice in Eyre of the Foreſt, when he thinks fit to hold his Juſtice-Seat, ſends out his general Summons to the *Keeper* forty Days before, to warn all Under-Officers to appear before him at a Day aſſigned in the Summons.

Keeper of the Great Seal is a Lord by his Office, and ſtiled *Lord Keeper of the Great Seal*. He is one of the King's Privy Council, through whoſe Hands paſs all Charters, Commiſſions, and Grants of the King under the Great Seal, without which Seal, all ſuch Inſtruments, by Law, are of no force; for the King is, in the Interpretation of the Law, a Corporation, and paſſeth nothing firmly but under the ſaid Seal, which is, as the public Faith of the Kingdom, in the higheſt Eſteem and Reputation. The Lord *Keeper* hath the ſame Place, Authority, Preeminence, Juriſdiction, Execution of Laws, and all other Cuſtoms, Commodities, and Advantages as the Lord Chancellor of *England* hath for the time being. Both theſe Officers cannot properly ſubſiſt at the ſame time, ſince the Statute of 5 *Eliz.*

Keeper of the Privy Seal is a Lord by his Office; thro' whoſe Hands paſs all Charters, ſigned by the King, before they come to the Great Seal, and ſome things which do not paſs the Great Seal at all. He is of the King's Privy Council, and was antiently called Clerk of the Privy Seal.

KERAMIAN, the Name of a Sect among the Muſſulmen, ſo called from *Mohammud Ben Keram* its Author. The *Keramians* maintain, that whatever the Alcoran ſays of the Arms, Eyes, and Ears of God, is to be underſtood literally; ſo that they admit the *Targiaſſum*, that is, a kind of Corporeity in God; which however they explain variouſly.

KERANA, a long Trumpet, in form of a Speaking-Trumpet, uſed by the *Perſians*: To the Sound of this they add a confuſed Noiſe of Hautboys, Timbrels, Drums and other Inſtruments every Evening at Sunſet, and two Hours after Midnight.

KERMES, a kind of Husk or Excreſſence, as 'tis generally thought, about the Bigneſs of a Juniper-Berry, round, ſmooth, and ſhining, of a beautiful Red, and full of a mucilaginous Juice of the ſame Colour. It is found ſticking to the Leaves and Bark of a kind of *Ilex* or Holm-Oak, in *Spain*, *Languedoc*, and other hot Countries. It has a vinous Smell, a bitter, tho agreeable Taſte, and its Liquor contains an infinite Number of little round or oval Eggs. The Origin of the *Kermes* is ſuppoſed owing to a little Worm, which pricking the Holm-Oak, to draw its Food from it, raiſes a little Tumor or Veſſel, which fills with Juice, and as it ripens becomes red. When the *Kermes* is dried, there comes out of it an infinite Number of little Inſects and Flies, ſo ſmall that they are ſcarce ſenſible; inſomuch that the whole inward Subſtance ſeems converted into them: For this reaſon it is that they ſometimes call it *Vermillion*, (unleſs, perhaps, it be ſo call'd from its beautiful Vermillion Colour.) To prevent that Inconvenience, they uſually ſteep the *Kermes* in Vinegar before they dry it. They draw the Juice or Pulp from the *Kermes*, and make a Syrup of it, by adding a ſufficient Quantity of Sugar. Sometimes they dry the Pulp ſeparate from the Husk, which Pulp, thus dried, they call *Paſtel of Kermes*. The Grain of *Kermes* is of great uſe in Phyſic. It is Cardiac, Deſiccative, Aſtringent, fortifies the Stomach, and prevents Abortion; of this, is made that celebrated Confection, call'd *Alkermes*. It is, however, of greater uſe in dying Scarlet.

The manner of preparing it for Dying, is as follows: The Grain being taken when ripe, they ſpread it on Linnen; and at firſt, while it abounds moſt in Moiſture, turn it twice or thrice a day, to prevent its heating: till ſuch time as there appears a red Powder among it; then they ſeparate it, paſſing it thro a Searce, and then again they ſpread abroad the Grain on the Linnen, till they perceive the ſame Redneſs of Powder, when they repeat the ſifting: and thus they proceed, till they diſcover a red Powder on the Surface of the Grain, which is ſtill paſs'd thro the Searce till it yield no more. In the beginning, when the ſmall red Grains are ſeen to move, as they will do, they are ſprinkled over with ſtrong Vinegar, and rubb'd between the Hands. Were not this Precaution taken, out of every Grain would be formed a little Fly, which would skip and fly about for a day or two, and at laſt changing its Colour, fall down dead. The Grain being quite emptied of its Pulp or red Powder, is waſh'd in Wine, and then expoſed to the Sun; after this, 'tis put up in ſmall Sacks, putting along with it, the Proportion of red Duſt that the Grain had afforded.

According to M. *Marſilli*'s Experiments made at *Montpellier*, the Grain of *Kermes* has the Effect of Galls when mix'd with Vitriol, and makes a good Ink. Mix'd with Oil of Tartar or Lime-Water, its Colour turns from a Vermillion to a Crimſon Colour. In a Decoction of Tournſoil Flowers it retains its proper Colour. They have not been able to get a fix'd eſſential Salt from it, but a volatile Salt it yields in abundance; which, in M. *Marſilli*'s opinion, would have a better Effect in Medicine, if taken in a Liquid, than when incloſed in Conſerves and Confections, which hinder its Action. Thoſe who have obſerved the Manner of producing the *Kermes* in the hot Countries tell us, that the little Grains gather'd on the *Ilex Coccigera* change into a great number of little Maggots of a red Colour, which run backwards and forwards in the Tree where they were bred; and wherever they ſtay any time, leave the Semen of thoſe Grains, which break out the Year following. Theſe the *Greeks* call *Coccos*, the *Latins Vermiculus*, and thoſe of the Country, *Grain of Vermillion*, becauſe of the Worms, Maggots, or Butterflies, into which the Grain changes.

KERNE, a Term in the antient *Iriſh* Militia, ſignifying a Foot-Soldier. *Camden* tells us, the Armies of *Ireland* conſiſted of Cavalry, call'd *Galloglaſſes*, and Infantry lightly armed, called *Kernes*. The *Kernes* bore Swords and Darts; to the laſt were fitted Cords, by which they could recover them after they had been launched out. *Kerne*, in our Laws, ſignifies idle Perſons or Vagabonds.

KEY, a little Iron Inſtrument for the opening of Locks. Its Uſe and Figure are too well known to need a particular Deſcription. *L. Molineus* has written a Treatiſe of *Keys*, printed at *Upſal*. He derives the *Latin* Name *Clavis* from the *Greek* κλείω, *claudo*, *I ſhut*, or from the Adverb *clam*, *privately*; and adds, that the Uſe of *Keys* is not known in ſome Parts of *Sweden*. The firſt Invention of *Keys* is owing to one *Theodore* of *Samos*, according to *Pliny* and *Polydore Virgil*; but this muſt be a Miſtake, the Uſe of *Keys* having been known before the Siege of *Troy*, and mention is even made of them in the 19th Chapter of *Geneſis*. *Molineus* is of Opinion, that *Keys*, at firſt, only ſerved for the untying certain Knots, wherewith they antiently ſecured their Doors; but the *Laconic Keys*, he maintains, were nearly a-kin in uſe to our own: they conſiſted of three ſingle Teeth, and made the Figure of an E, of which Form there are ſome ſtill to be ſeen in the Cabinets of the Curious. There was another *Key*, called Βαλάναγες, made in the manner of a Male-Skrew, which had its correſponding Female in a Bolt affixed to the Door. *Key*, hence, becomes a general Name for ſeveral things that ſhut up, or cloſe other things.

Key of an Arch or Vault is the laſt Stone placed a-top of a Vault, which being wider and fuller at the Top than Bottom, wedges, as it were, and binds in all the reſt. This *Key* is different in the different Orders; in the *Tuſcan* and *Doric* 'tis a plain Stone, having a Projecture; in the *Ionic* 'tis cut and waved in Veins, after

ter the manner of *Conſoles*; in the *Corinthian* and *Compoſite*, 'tis a *Conſole* enriched with Sculpture, Foliages, &c.

Key is alſo uſed for Eccleſiaſtical Juriſdiction, and for the Power of Excommunicating and Abſolving. Thus the *Romaniſts* ſay, the Pope has the power of the *Keys*, and can open and ſhut Paradiſe as he pleaſes, grounding their Opinion on that Expreſſion of Jeſus Chriſt, *I will give thee the Keys of the Kingdom of Heaven.* In S. *Gregory* we read, that 'twas the Cuſtom heretofore for the Popes to ſend a Golden *Key* to Princes, wherein they incloſed a little of the Filings of St. *Peter*'s Chains, kept with a world of Devotion at *Rome*, and that theſe *Keys* were wore in the Boſom, as being ſuppoſed to contain ſome wonderful Virtues.

Key is alſo a Term in Polygraphy and Steganography, ſignifying the Alphabet of a Cypher, which is a Secret known only to the Perſon who writes the Letter, and him who decyphers it. Some Cyphers have a ſingle *Key*, where the ſame Characters are uſed throughout, in other Cyphers the Characters are varied, and the *Key* muſt be double. In this Senſe it is that we uſe the words *Key* of a Book, *Key* of an Author, as being let by it into ſome Secrets, with regard to Perſons, Times, Places, &c. which don't appear without it.

Key, in Muſic, is a certain fundamental Note or Tone, to which the whole Piece, be it Concerta, Sonata, Cantata, &c. is accommodated, and with which it uſually begins, but always ends. To get an Idea of the Uſe of the *Key*, it may be obſerved, that as in an Oration there is a Subject, *viz.* ſome principal Perſon or Thing to which the Diſcourſe is referred, and which is always to be kept in view, that nothing unnatural and foreign to the Subject may be brought in; ſo in every regular Piece of Muſic there is one Note, *viz.* the *Key*, which regulates all the reſt. The Piece begins, and ends in this; and this is, as it were, the muſical Subject, to which a regard muſt be had in all the other Notes of the Piece. Again, as in an Oration there are ſeveral diſtinct Articles, which refer to different Subjects, yet ſo as that they have all a viſible Connection with the principal Subject, which regulates and influences the whole; ſo in Muſic there may be various ſubaltern Subjects, that is, various *Keys*, to which the different Parts of the Piece may belong: but then they muſt be all under the Influence of the firſt and principal *Key*, and have a ſenſible Connection with it. Now to give a more diſtinct Notion of the *Key*, we muſt obſerve, that the Octave contains in it the whole Principles of Muſic, both with reſpect to Conſonance or Harmony, and Succeſſion or Melody; and that if either Scale be continued to a double Octave, there will, in that Caſe, be ſeven different Orders of the Degrees of an Octave, proceeding from the ſeven different Letters with which the Terms of the Scale are marked. Any given Sound therefore, *i.e.* a Sound of any determinate Pitch or Tune, may he made the *Key* of the Piece, by applying to it the ſeven natural Notes ariſing from the Diviſion of an Octave, and repeating the Octave above or below at pleaſure. The given Note is applied as the principal Note or *Key* of the Piece, by making frequent Cloſes or Cadences upon it; and in the Progreſs of the Melody no other but thoſe ſeven natural Notes can be admitted, while the Piece continues in that *Key*, every other Note being foreign to the Fundamental, or *Key*: For Inſtance, ſuppoſe a Song begun in any Note, and carried on upwards or downwards by Degrees and Harmonical Diſtances, ſo as never to touch any Notes but what are referable to that firſt Note as a Fundamental, *i.e.* are the true Notes of the natural Scale proceeding from the Fundamental; and let the Melody be ſo conducted thro' thoſe natural Notes, as to cloſe and terminate in the Fundamental, or any of its Octaves above or below, that Note is called the *Key* of the Melody, becauſe it governs all the reſt, limiting them ſo far, as that they muſt be, to it, in relation of the ſeven eſſential Notes of an Octave; and when any other Note is brought in, 'tis called, going out of the *Key*. From which way of ſpeaking, *viz.* a Song's continuing in, or going out of the *Key*, it may be obſerved, that the whole Octave, with its natural Notes, come under the Idea of a *Key*, tho the Fundamental, or principal Note is, in a peculiar Senſe, called the *Key*. In which laſt Senſe of the word *Key* (*viz.* where it is applied to one fundamental Note) another Note is ſaid to be out of the *Key*, when it has not the Relation to that Fundamental of any of the natural Notes belonging to the concinnous Diviſion of the Octave. Here too it muſt be added, with reſpect to the two different Diviſions of the Octave, that a Note may belong to the ſame *Key*, *i. e.* have a juſt muſical Relation to the ſame Fundamental in one kind of Diviſion, and be out of the *Key* with reſpect to the other.

Now a Piece of Muſic may be carried through ſeveral *Keys*; i. e. it may begin in one *Key*, and be led out of that into another, by introducing ſome Note foreign to the firſt, and ſo on to another: but a regular Piece muſt not only return to the firſt *Key*, but thoſe other *Keys*, too, muſt have a particular Connection with the firſt. It may be added, that thoſe other *Keys* muſt be ſome of the natural Notes of the principal *Key*, tho' not any of them at pleaſure.

As to the Diſtinctions of *Keys*, we have already obſerved, that to conſtitute any given Note or Sound, a *Key*, or fundamental Note, it muſt have the ſeven eſſential or natural Notes added to it, out of which, or their Octaves, all the Notes of the Piece muſt be taken, while it keeps within the *Key*, i. e. within the Government of that Fundamental. 'Tis evident therefore there are but two different Species of *Keys*, which ariſe according as we join the greater or leſs Third, theſe being always accompanied with the ſixth and ſeventh of the ſame Species; the third *g*, for inſtance, with the ſixth and ſeventh *g*; and the third *l* with the ſixth and ſeventh *l*. And this Diſtinction is expreſſed under the Names of a *Sharp-Key*, which is that with the third *g*, &c. and the *Flat-Key*, which is that with the third *l*, &c. whence 'tis plain, that how many different Cloſes ſoever there be in a Piece, there can be but two *Keys*, if we conſider the eſſential Difference of *Keys*; every *Key* being either flat or ſharp, and every *Sharp-Key* being the ſame, as to Melody, as well as every flat one. It muſt be obſerved, however, that in common Practice the *Keys* are ſaid to be different, when nothing is conſidered but the different Tune, or Pitch of the Note, in which the different Cloſes are made: In which Senſe the ſame Piece is ſaid to be in different *Keys*, according as it is begun in different Notes, or Degrees of Tune. To prevent any Confuſion which might ariſe from uſing the ſame Word in different Senſes, M. *Malcolm* propoſes the word *Mode* to be ſubſtituted inſtead of the word *Key*, in the former Senſe; that is, where it expreſſes the melodious Conſtitution of the Octave, as it conſiſts of ſeven eſſential, or natural Notes, beſides the Fundamental; and in regard there are two Species of it, he propoſes, that with a third *g* be called the greater Mode, and that with a third *l* the leſſer Mode; appropriating the word *Key* to thoſe Notes of the Piece in which the Cadence is made; all of which may be called different *Keys*, in reſpect of their different Degrees of Tune. To diſtinguiſh then accurately between a Mode and a *Key*, he gives us this Definition, *viz.* an Octave, with all its natural and eſſential Degrees, is a Mode, with reſpect to the Conſtitution or Manner of dividing it; but with reſpect to its Place in the Scale of Muſic, *i.e.* the Degree or Pitch of Tune, it is a *Key*; tho' that Name is peculiarly applied to the Fundamental: whence it follows, that the ſame Mode may be with different *Keys*, i. e. an Octave of Sounds may be rais'd in the ſame Order and Kind of Degrees which makes the ſame Mode, and yet be begun higher or lower, *i.e.* be taken at different Degrees of Tune with reſpect to the whole, which makes different *Keys*; and, *vice verſa*, that the ſame *Key* may be with different Modes, *i. e.* the Extremes of two Octaves may be in the ſame Degree of Tune, yet the Diviſion of them be different. See *Modulation*, *Harmony*, *Melody*, *Clef*.

Keys alſo ſignify thoſe little Pieces in the forepart of an Organ, Spinette, or Virginal, by means whereof the Jacks play, ſo as to ſtrike the Strings of the Inſtrument; and Wind given to the Pipes, by raiſing and ſinking the Sucker of the Sound-board. They are in number 28 or 29. In large Organs there are ſeveral Sets of theſe *Keys*, ſome to play the ſmall ſecondary Organ, ſome for the main Organ, ſome for the Trumpet, and ſome for the Echoing-Trumpet. In ſome there are but a part that play, the reſt being for Ornament. There are twenty Slits in the large *Keys*, which make the Half-Notes. M. *Baljouski* of *Douliez* pretends to have invented a new kind of *Keys* vaſtly preferable to the common ones. With theſe, he ſays, he can expreſs Sounds, which follow each other in a continual Geometrical Proportion, and ſo can furniſh all the Sounds in Muſic, and by conſequence all the imaginary Intervals and Accords; whereas the common *Keys* do but furniſh ſome of them.

KHAZINE, the Grand Signior's Treaſury. Here are kept Regiſters of Receipts, Accounts of Provinces, in Drawers mark'd with the Years and the Places Names. Here alſo is kept part of the Emperor's Wardrobe. Every Day of the Divan this Treaſury is opened, either to take out or put ſomething in. And the Principal Officers who have the Charge of it, are all to aſſiſt at this Opening. The *Tchaouch-Bachi*, in their Preſence, firſt breaks the Wax wherewith the Key-hole had been ſeal'd up, and carrying it to the Grand Viſier, that Miniſter firſt kiſſes it, and then draws out of his Boſom the Grand Signior's Gold Seal; in the mean time he looks narrow-

ly

ly after the Officer, who, when he has done his Buſineſs in the Treaſury, locks and ſeals up the Place, and returns the Seal to the Vizier with the ſame Ceremony as before. Beſides this, there are other Apartments for the Money, where the Officers are never allowed to enter with any Clothes that have Pockets in them.

KIDNEY, or Rein, a Part of an Animal, whoſe Uſe is to ſeparate the Urine. The *Kidneys* are ſituate on each Side, the one between the Liver and *Muſculus Lumbaris*, on the right Side; the other between the Spleen and the ſame Muſcle on the left Side. In Man the right is lower than the left, but in Quadrupedes 'tis uſually the contrary; they are faſtened to the Loins and the Diaphragm by their exterior Membrane, and to the Bladder by the Ureters; the right is alſo faſtened to the Inteſtine Cæcum, and the left to the Colon: their Figure reſembles a Bean, or rather a Creſcent, being curve on the ſide of the *Vena Cava*, and on the outſide gibbous. There are ordinarily but two *Kidneys*, tho' ſometimes there are found three, and ſometimes four, and ſometimes but one. In Men they are commonly about five Inches long and three broad, and one and an half thick: Their Subſtance is compoſed of Glands, and very ſmall urinary Pipes, or Canals; the Glands form the Circumference, and ſerve to ſeparate the Urine; the Papillæ, or urinary Tubes, form the inner part, they come out of the Glands, and carry the Urine into a Cavity, in the concave Part of the *Kidney*, called the *Pelvis*, whence it paſſes thro' the Ureters into the Bladder. The *Kidneys* are covered with two Membranes, they have each of them Arteries and Veins; the Arteries come from the *Aorta*, and the Veins terminate in the *Cava*; theſe are all called Emulgents. They have Nerves alſo, which take their Origin from the *Plexus Renalis*, formed by the Ramifications of the intercoſtal Nerve, and the Nerves of the Loins. The *Kidneys* ſecrete the Urine from the Blood, which, by the Motion of the Heart, is driven thro' the Arteries into the emulgent Arteries, and theſe carry it into the little Glands, where its Seroſity being ſeparated, is received in at the Orifices of the urinary Pipes, which go from the Glands to the Pelvis, and thence runs by the Ureters into the Bladder: the Blood, which could not enter the Glands, is brought back by the emulgent Veins. See *Urine*, *Secretion*, &c.

KILDEKRIN, is a kind of Liquid Meaſure, which contains two Firkins, or eighteen Gallons; and two ſuch *Kilderkins* make a Barrel.

KING, a Monarch or Potentate, who rules ſingly and ſovereignly over a People. *Cambden* derives the word *King* from the *Saxon Cyning*, of *Can*, *Power*, or *Ken*, *Knowledge*, wherewith every Monarch is ſuppoſed to be inveſted. The *Latin Rex*, the *Scythian Reiks*, the *Punic Reſeh*, and the *Spaniſh Rey* and *Roy*, come all, according to *Poſtel*, from the *Hebrew* ראש, *Roſeh*, *Chief*, or *Head*.

Kings, both among the antient *Greeks* and *Romans*, were Prieſts as well as Princes. *Virgil* ſpeaking of *Anius*, King of *Delos*, ſays,

Rex Anius, Rex idem Hominum Phœbique Sacerdos.

As to the *Romans*, *Livy* and *Dionyſius* are expreſs; they ſay, that tho' *Numa* inſtituted a great Number of Orders of Prieſthood, yet ſome he diſcharged himſelf, and in Perſon. After the Expulſion of *Kings*, they were obliged to create a *Rex Sacrorum*, *a King of the Sacrifices*, for the Adminiſtration of the Prieſtly Part of the Royalty.

Among the *Greeks*, the King of *Perſia* had antiently the Appellation of *the Great King*; the King of *France* now has that of the *Moſt Chriſtian King*, and the *King* of *Spain* that of *Catholic King*. The *King* of the *Romans* is a Prince choſen by the Emperor, as a Coadjutor in the Government of the Empire. The *Hungarians* formerly gave the Name *King* to their Queen *Mary*, to avoid the Infamy which the Laws of that Country caſt on thoſe who are governed by Women: Accordingly ſhe bore the Title of *King Mary*, till her Marriage with *Sigiſmund*, at which time ſhe laid aſide her Kingſhip, and took up the Quality of Queen.

The *Kings* of *England*, by the *Lateran* Council under Pope *Julian* II. had the Title of *Chriſtianiſſimus* conferred on them, and that of *Defender of the Faith* was added by Pope *Leo* X. tho' it had been uſed by them ſome time before. The Title of *Grace* was firſt given to our *Kings* about the time of *Henry* IV. and that of *Highneſs* and *Majeſty* to *Henry* VIII. In all public Inſtruments and Letters the King ſtiles himſelf *Nos*, *We*, tho' till the time of King *John* he ſpoke in the ſingular Number. Our Lawyers ſay, the *King* of *England* is a mixed Perſon, a Prieſt as well as a Prince. At his Coronation he is anointed with Oil, as the Prieſts and *Kings* of *Iſrael* were, to intimate, that his Perſon is ſacred. The Laws make it High-Treaſon barely to imagine or intend the Death of the *King*; and, becauſe the Deſtruction of the *King* may enſue that of his Great Counſellors or Officers, 'tis Felony in any of the King's Servants to conſpire even that: tho' in other capital Caſes, 'tis a Rule, that *Voluntas non reputabitur pro Facto*, and an *Engliſhman* ſhall not, in any other Caſe, be put to death, unleſs the Deed follow the Intent.

His Office (as he promiſes at his Coronation) is to preſerve the Rights and Privileges of the Church, the Prerogative of the Crown, the Laws and Cuſtoms of the Realm, &c. or, as *Forteſcue* has it, he is *pugnare Bella Populi ſui & eos rectiſſime judicare*. He acknowledges no Precedence in any other Prince but the Emperor. He has the ſupreme Right of Patronage, called *Patronage Paramount*, over all the Eccleſiaſtical Benefices in *England*.

He has Power, by his Prerogative, without any Act of Parliament, to make War or Peace, make Leagues and Treaties, give Commiſſions for impreſſing Soldiers, diſpoſe of Magazines, Caſtles, Ships, public Moneys, &c. He convokes, adjourns, prorogues, and diſſolves Parliaments, and may refuſe his Aſſent to any Bill paſſed by both Houſes, without giving his Reaſons for it. He may increaſe the Number of Members of either Houſe at pleaſure, by creating new Peers, and beſtowing Privileges on other Towns for ſending Burgeſſes to Parliament. He has power to enfranchiſe an Alien, and make him a Denizen. Debts due to him are always to be ſatisfied in the firſt place, in caſe of Executorſhip, &c. and till his Debt is diſcharged, he may protect the Creditor from the Arreſts of others. He may diſtrain for the whole Debt on a Tenant that holds but part of the Land, is not obliged to demand his Rent as others are, may ſue in what Court he pleaſes, and diſtrain where he liſts. In all doubtful Caſes, *ſemper præſumitur pro Rege*: no Statute reſtrains him unleſs he be particularly named. In all Caſes where the *King* is Plaintiff, his Officers, with an Arreſt, may enter; and if Entrance be denied, break open a Houſe, and ſeize the Party: tho', in other Caſes, a Man's Houſe is his Caſtle, and has a Privilege to protect him againſt all Arreſts. He has the Cuſtody of the Perſons and Eſtates of Idiots and Lunatics; he is *Ultimus Hæres Regni*, to him revert all Eſtates, when no Heir appears. All Treaſure-Trove (*i. e.* Money, Plate, or Bullion found, and the Owners not known) belongs to him; ſo all Waifs, Strays, Wrecks, Lands recovered from the Sea, Gold and Silver Mines, Royal Fiſhes, &c. belong to him. He can unite, ſeparate, enlarge, or contract the Limits of Biſhoprics or Eccleſiaſtical Benefices, and by his Letters erect new Biſhoprics, Colleges, &c. He can diſpenſe with the Rigour of the Eccleſiaſtical Laws, except thoſe that have been confirmed by an Act of Parliament, or declared by the Bill of Rights, as for a Baſtard to be a Prieſt, for a Biſhop to hold a Benefice *in commendam*, &c. He has Power to diſpenſe with ſeveral Acts of Parliament and penal Statutes, by a *Non obſtante*, where he himſelf is alone concerned; to moderate the Rigour of the Law, according to Equity; to pardon a Man condemned by Law, except in Appeals of Murder; to interpret by his Judges in Statutes and Caſes not defined by Law.

The Laws eſteem him God's Vicegerent on Earth, and aſcribe various Perfections to him, not belonging to any other Man. No Flaw or Weakneſs is found in him, no Injuſtice or Error, no Negligence, Infamy, Stain, or Corruption of Blood. By his Crown he is *ipſo facto* cleared of all Attainder: No Nonage or Minority are allowed in him, and his very Grants of Lands, tho' held in his natural Capacity, cannot be avoided by Nonage. Nay more, the Law aſcribes a kind of Perpetuity, or Immortality, to him; *Rex Angliæ non moritur*. His Death is termed his Demiſe, becauſe the Crown is thereby demiſed to another. He is ſaid not to be liable to Death, as being a Corporation of himſelf, that lives for ever. There is no *Interregnum*, but the Minute one *King* dies, his Heir is *King*, fully and abſolutely, without any Coronation, Ceremony, &c. To theſe it may be added, that the Law attributes a kind of Ubiquity to the *King*; he is, in a manner every where, in all his Courts, and therefore cannot be nonſuited.

Some things, however, there are which he cannot do, *viz.* he cannot do Wrong, nor can he diveſt himſelf, or Succeſſors, of any part of his Regal Prerogative, Authority, &c. There are ſeveral things alſo which he cannot do, *Salvo Jure*, *Salvo Juramento*, & *Salva Conſcientia ſua*. In particular there are two things which he cannot do without the Conſent of Parliament, *viz.* Make new Laws, or raiſe new Taxes.

King of the Sacrifices, was the Title of a Prieſt or Miniſter of Religion in antient *Rome*. He was ſuperior to the *Flamen Dialis*, but inferior to the *Pontifex Maximus*. He was created at the *Comitia*, or Aſſembly of the Centuries, and was at firſt choſen out of the Number of the *Patricii*. He could not, during his Office, hold any Magiſtracy, nor harangue the People. He preſided at all the Sacrifices, proclaimed the Feaſts, &c. His Wife bore the Title of *Queen of the Sacrifices*, and had herſelf a part in the Ceremonies of Religion.

KINGDOM, among the Chymiſts, is a Term, which they apply to each of the three Orders, or Claſſes of natural Bodies; Animal, Vegetable, and Mineral.

KINGS AT ARMS, Officers of great Antiquity, and antiently of great Authority; they direct the Heralds, preſide at their Chapters, and have the Juriſdiction of Armory. In *England* we have three kinds, *viz. Garter*, *Clarencieux*, and *Norroy*.

The firſt and principal is called *Garter*, inſtituted by *Henry* V. His Office is to attend the Knights of the Garter at their Aſſemblies, to marſhal the Solemnities at the Funerals of the higheſt Nobility, and to carry the Garter to Kings and Princes beyond the Sea; on which occaſion he uſed to be joined in Commiſſion with ſome principal Peer of the Kingdom.

The next is *Clarencieux*, ſo called from the Duke of *Clarence*, to whom he firſt belonged. His Office is to marſhal and diſpoſe the Funerals of all the inferior Nobility, as Baronets, Knights, Eſquires, and Gentlemen, on the South-ſide of the *Trent*.

The third is *Norroy*, or *Northern*, whoſe Buſineſs is to do the ſame on the North-ſide of the River *Trent*. Theſe two laſt are called *Provincial Heralds*, in regard they divide the Kingdom between them into two Provinces.

Theſe two laſt, by Charter, have power to viſit Noblemens Families, to ſet down their Pedigrees, diſtinguiſh their Arms, appoint Perſons their Arms, and, with *Garter*, to direct the Heralds.

Antiently the *Kings at Arms* were created and ſolemnly crowned by the Kings of *England* themſelves; but of later Days the Earl Marſhal has a ſpecial Commiſſion, at every Creation, to perſonate the King.

To the former may be added *Lyon, King at Arms* for *Scotland*, who is the ſecond *King at Arms* for *Great Britain*; he is inveſted and crown'd with great Solemnity. To him belongs the publiſhing the King's Proclamation, the marſhalling Funerals, reverſing Arms, *&c.*

KING'S-BENCH, a Court, or Judgment-Seat, ſo called, in regard the King is ſuppoſed to ſit in Perſon as Judge of the Court, and may do ſo whenever he pleaſeth; for which reaſon all Writs, and other Proceſs in this Court, are made returnable *coram nobis*, that is, before the King himſelf, and not *coram Juſticiariis noſtris*, as is the Form in the *Common Pleas*. The Judges of this Court are the Chief Juſtice, and three other Judges. In this Court are principally determined Matters relating to the Crown, and the Peace. When any Perſon is aggrieved by any Order of Juſtices, or Quarter-Seſſions, they have recourſe hither; the Rights of Elections of Mayors, Bailiffs, Conſtables, *&c.* are often, upon *Mandamus's*, brought before this Court to be ſettled, and Prohibitions are hence iſſued out to ſtay Proceedings in the Eccleſiaſtical, Admiralty, or any inferior Court, where the Matters appear to be tryable at Common Law. The Subject hath alſo a Right to ſue any Perſon in this Court for any Debt or Contract, as well as in any other Court, and may as advantageouſly and expeditiouſly proceed. The Chief Juſtice is conſtituted by Writ, and is to hold, *Quamdiu ſe bene geſſerit*, and ſo cannot be diſplaced without ſome great Miſdemeanour; tho' formerly the Chief Juſtice, and other inferior Judges, were made only *durante bene placito*, and accordingly were turned out at the King's pleaſure. The Salary of the Lord Chief Juſtice uſed to be but 1500 *l. per ann.* but 'tis now 500 *l. per* Term. He preſides under his Majeſty in this Court; but when the Court divides, in giving Judgment upon any ſpecial Argument, he hath but one Voice: ſo that if the Opinion of the Court ſhould be equally divided, the Matter muſt reſt till one of the Judges ſhall ſee juſt Reaſon to alter his Opinion. He is to attend the Lords in Parliament, tho' he has no Vote, unleſs he be a Peer himſelf, but is to give his Opinion and Advice to the Houſe by virtue of a Writ of Aſſiſtance; and is frequently therefore conſulted by them, both in making and repealing Laws, and in altering or explaining them. He makes a Return of all Writs of Error in Parliament directed to this Court, and with his own Hand delivers the Writ of Error, and a Tranſcript of the Proceedings in the Cauſe into the Houſe of Lords. The three inferior Judges of this Court go the Circuits, and are in Commiſſion of Oyer and Terminer at the *Old-Bailey*, their Salary is 375 *l. per* Term, to which they, as well as the Chief Juſtice, are entitled, tho' they happen not to ſit one Day in Court in the Term, unleſs they give their Aſſent ſo ſlightly, as, on a *Scire Facias*, to be charged with Negligence; and theſe alſo hold by *Quamdiu ſe bene geſſerint*. There are ſeveral Officers belonging to this Court, as two chief Clerks or Prothonotaries, who are ſuppoſed to enter all the Pleadings and Judgments between Party and Party, altho' this is done by an Entring-Clerk under them; and all Writs of *Latitat*, *non omittas*, Bills of *Middleſex*, *Habeas Corpus*, &c. are ſubſcribed with the Names of theſe chief Clerks. The Secondary acts as the Maſter of the Office on the Pleas Side, and is the Chief Clerk's Deputy; his Office is to examine any Perſon, who is to be ſworn an Entring-Clerk, or Attorney at large, whether he is duly qualified, and to preſent him to the Chief Juſtice. He alſo ſigns all Judgments, and gives Coſts upon them; and the Court, upon any Motion, in relation to the irregular Practice of any Clerk or Attorney, generally refers the Examination thereof to him. He alſo takes all Affidavits in Court (unleſs on the Crown-ſide) and takes the Acknowledgment of all Deeds in Court.

KING's-SILVER, is that Money due to the King in the Court of Common-Pleas, *pro Licentia Concordandi*, in reſpect of a Licence there granted to any Man for levying a Fine.

KINTAL, or *Quintal*, is a Weight of One Hundred Pounds, more or leſs, according to the different Uſage of divers Nations. The *Kintal* of *Smirna* is 123 Pounds, 3 Ounces, 9 Drams; or 120 Pounds, 7 Ounces, 12 Drams; but that of *Aleppo* is 465 Pounds, 11 Ounces, 15 Drams.

KIPPER-TIME is a Space of Time between the Feſtival of the *Finding of the Holy Croſs*, *May* the 3d, and *Twelfth-Day*; during which, Salmon-Fiſhing in the River *Thames*, from *Graveſend* to *Henley*, is forbidden by *Rot. Parl.* 50 *Edw.* 3.

KIRKMOTE, a Synod; ſometimes 'tis taken for a Meeting in the Church or Veſtry.

KIRK-SESSIONS, the Name of a petty Eccleſiaſtical Judicatory in *Scotland*. Each Pariſh, according to its Extent, is divided into ſeveral particular Diſtricts, every one of which has its own Elder and Deacon to overſee it. A Conſiſtory of the Miniſters, Elders, and Deacons of a Pariſh form a *Kirk-Seſſions*. This meets once a Week, the Miniſter being Moderator, but without a negative Voice. It regulates Matters relating to publick Worſhip, Elections, Catechizing, Viſitations, *&c.* It judges in Matters of leſs Scandal; but greater, as Adultery, are left to the Presbytery, and in all Caſes an Appeal lies from it to the Presbytery.

KIZILBACHE, a *Turkiſh* word, ſignifying *Red-Head*. This Term the *Turks* have applied, by way of Obloquy, to the *Perſians*, ever ſince *Iſhmael Sophi*, Founder of the Family now reigning in *Perſia*, ordered his Soldiers to wear a red Cap, round which is a Scarf or Turban with a dozen Plaits in it, in memory of the twelve *Imams*, Succeſſors of *Ali*, from whom he pretended to deſcend. *Viginere* writes the word *Kezeilbaſs*, and adds, that according to the vulgar Interpretation among the *Perſians*, the twelve Plaits ſignify the twelve Sacraments of their Law. But as this does not ſatisfy him, he looks out for another Original, and tells us there is a Myſtery in it, derived from the antient Paganiſm, when the *Perſians* adored the Fire, whoſe Heat is denoted by the red Colour, which in ſome meaſure ſymbolizes with the Sun, held by them in the higheſt Veneration. He adds, that the twelve Plaits ſhew the twelve Months of the Year, and the twelve Signs in which that Luminary performs his Courſe.

KNAVE is an old *Saxon* Word for a Man-Servant, and is ſo uſed in 14 *E.* 3. *Stat.* 1. *c.* 3. *Verſtegan* thinks it comes from the *Dutch Cnapa*, ſignifying the ſame. It ſometimes alſo ſignifies a Male-Child, or Boy, in which ſenſe a *Knave* Child hath been frequently uſed, formerly, in contradiſtinction to a Girl; and in this ſenſe *Wickcliff* uſes the word in his Tranſlation of *Exodus* 1. 16. and other Places of the Bible. In the old *Saxon* Tranſlation of *Mat.* 8. 6. *Puer meus jacet in Domo Paralyticus*, was turned, Myn Knapa.

Knave was ſometimes alſo uſed as an additional Title, as *Willielmus Cowper de Denby*, *Knave*, *&c.* 'Tis a common Opinion, that *Rom.* 1. 1. was tranſlated, *Paul a Knave of Jeſus Chriſt*. This Miſtake has been occaſioned by a Bible in the Duke of *Lauderdale's* Library, where the word *Kneawe* is inſerted in leſs Characters than the others, and a Raſure may be eaſily diſcerned.

KNIGHT, in its original *German*, *Knecht*, ſignifies a luſty Servant. The Word has ſince been uſed for a Soldier or Man of War. We have but one Inſtance among us, where the word *Knight* is uſed in the firſt Senſe, and that is in *Knight of the Shire*, who properly ſerves in Parliament for ſuch a County. In the *Latin*, *French*, *Spaniſh*, *Italian*, and *Dutch* Languages, *Knight* is expreſs'd by a Word which properly ſignifies a Horſeman, as being uſually employ'd on horſeback. Indeed our Common Law calls them *Milites*, Soldiers, becauſe they commonly held Lands, in *Knight-Service*, to ſerve the King as Soldiers in his Wars; in which ſenſe the word *Miles* was uſed *pro Vaſſallo*. The word *Knight* now ſignifies a Perſon, who for his Vertue and martial Proweſs, is, by the King, raiſed above the Rank of Gentlemen, into an higher Claſs of Dignity and Honour. *Knighthood* being uſually conferred

for

for perſonal Deſert, dies with the Perſon deſerving, and does not deſcend to his Heirs.

Knight was the firſt Degree of Honour, in the antient Militia, and was conferred with a great deal of Ceremony on thoſe who had diſtinguiſh'd themſelves by ſome notable Exploit in Arms. They were originally ſaid to be adopted, which we now call dubb'd; as being ſuppoſed, in ſome meaſure, the Sons of him who knighted them. The Ceremonies at the Creation of a *Knight* have been various. The principal were a Box on the Ear, and a Stroke with a Sword on the Shoulder. Afterwards they put on him a Shoulder-belt and gilt Sword, Spurs, and the other military Accoutrements; after which, being armed as a *Knight*, he was led in great Pomp to the Church. The Manner of making a *Knight* with us, is deſcribed by *Cambden* in a few words: *Qui Equeſtrem Dignitatem ſuſcipit, flexis Genibus leviter in Humero percutitur, Princeps his Verbis affatur, Sus vel ſois Chevalier au Nom de Dieu, Surge vel ſis Eques in Nomine Dei.* This is meant of *Knights-Batchelors*, which is the loweſt, tho the moſt antient Order of *Knighthood* among us. *Knights* grew ſo very numerous, that the Dignity became of much leſs Repute. *Charles* V. is ſaid to have made 500 in a ſingle Day: On which account therefore, new Orders of *Knighthood* were inſtituted, in order to diſtinguiſh the more deſerving from the Croud. For the ſeveral kinds of *Knights* among us, ſee *Batchelor*, *Banneret*, *Baronet*, *Bath*, &c.

Knight is alſo underſtood of a Perſon admitted into any Order, either purely military, or military and religious, inſtituted by ſome King or Prince according to a certain *Formula*, with certain Marks and Tokens of Honour and Diſtinction: as the *Order of the Garter*, *of the Elephant*, *of the Holy Ghoſt*, *of* Malta, &c. All which ſee under their proper Names.

Knight, among the *Romans*, was the ſecond Degree of Nobility, following immediately that of the Senators. At the time of founding the City of *Rome*, the whole Militia of *Romulus* conſiſted in 3000 Foot and 300 Horſe; which three hundred Horſe were the Original of the *Roman Equites* or *Knights*. Theſe made the ſecond Order that had Places in the Senate. *Manutius* and *Sigonius* are of opinion, that beſides the Equeſtrian Order, and thoſe *Knights* immediately below the Senators, *Romulus* inſtituted a Military Order in oppoſition to the Infantry. But no antient Author takes notice of any Order of Knighthood, inſtituted on purpoſe for the War, nor any other *Knights* but thoſe 300, which, as we have obſerved, were the firſt Foundation of the Equeſtrian Order. They had a Horſe kept then at the public Charge; but when they were taken in among the Senators, they reſign'd that Privilege. To be a *Knight*, 'twas neceſſary they ſhould have a certain Revenue; that their Poverty might not diſgrace the Order: And when they fail'd of the preſcribed Revenue, they were expunged out of the Liſt of *Knights*, and thruſt down among the Plebeians. Ten thouſand Crowns is computed to have been the Revenue required. The *Knights* grew ſo very powerful, that they became a Balance between the Power of the Senate and the People. They neglected the Exerciſes of War, and betook themſelves principally to Civil Employments in *Rome*; inſomuch that *Pliny* obſerves, in his time they had no longer a Horſe kept at the public Expence. Some ſay, that the Order of *Knights*, diſtinct from the People, did not begin before the Time of the *Gracchi*, Others ſay, the Privilege was then firſt granted them, that no Judge ſhould be choſen, but out of their Order: Some time after which, they took 'em into the Senate. This however is certain, 'twas only from that time that a certain Revenue was neceſſary, and that this intitled them to the Knighthood, without being deſcended from antient *Knights*.

KNIGHT-ERRANT, a pretended Order of *Knights*, whereof ample mention is made in old Romances. They were a kind of Heroes who travel'd the World in ſearch of Adventures, redreſſing Wrongs, reſcuing Damſels, and taking all occaſions of ſignalizing their Proweſs. This Romantic Bravery of the Old *Knights* was heretofore the Chimæra of the *Spaniards*; among whom, there was no Cavalier but had his Miſtreſs, whoſe Eſteem he was to gain by ſome heroic Action. The Duke of *Alva*, for all his Age and Gravity, is ſaid to have vow'd the Conqueſt of *Portugal* to a young Lady.

KNIGHTHOOD, a Military Order or Honour; a Mark or Degree of antient Nobility, or Reward of Perſonal Virtue and Merit. There are four kinds of *Knighthood*; Military, Regular, Honorary, and Social. Military is that of the antient Knights, who acquired it by high Feats of Arms. Theſe are call'd *Milites* in antient Charters and Titles, by which they were diſtinguiſh'd from bare Batchelors, &c. Several Princes have been inſtalled Military Knights with a great deal of Ceremony. Theſe Knights were girt with a Sword and a Pair of gilt Spurs, whence they were call'd *Equites Aurati*. Regular *Knighthood* is underſtood of ſuch of the Military Orders, which profeſs to wear ſome particular Habit, to bear Arms againſt the Infidels, to ſuccour and aſſiſt Pilgrims in their paſſage to the Holy Land, and to ſerve in Hoſpitals where they ſhould be receiv'd; as Knights Templars, Knights of *Malta*, &c. which ſee. Honorary *Knighthood* is that which Princes confer on other Princes, and even on their own Great Miniſters and Favourites; as Knights of the Garter, of St. *Michael*, &c. Social *Knighthood* is that which is not fixed, nor confirmed by any formal Inſtitution, nor regulated by any laſting Statutes; of which kind there have many riſen on occaſion of Factions, of Tilts and Tournaments, Maſquerades, &c.

Knighthood is not hereditary, but acquired. It does not come into the World with a Man, like Nobility; nor can it be revoked. The Sons of Kings, and Kings themſelves, with all other Sovereigns, heretofore had *Knighthood* conferr'd on 'em as a Mark of Honour. They were uſually knighted at their Baptiſm or Marriage, at their Coronation, before or after a Battel, &c.

The Abbot *Bernardo Juſtiniani*, at the beginning of his Hiſtory of *Knighthood*, gives us a very compleat Catalogue of the ſeveral Orders, according to whoſe Computation they are in number 92. *Favin* has given us two Volumes of 'em, under the Title of *Theatre of Honour and Chivalry*. *Menenius* has publiſh'd *Deliciæ Equeſtrium Ordinum*, and *And. Mende* has written *de Ordinibus Militaribus*. *Beloi* has traced their Original, and *Geliot* in his *Armorial Index* has given us their Inſtitutions. To theſe may be added, Father *Meneſtrier*'s *Antient and Modern Knighthood*, *Michieli*'s *Treſor Militaire*, *Caramuel*'s *Theologia Regolare*, *Miræus*'s *Origines Equeſtrium ſive Militarium Ordinum*.

KNIGHT-MARSHAL, is an Officer in the King's Houſe, having Juriſdiction and Cognizance of any Tranſgreſſion within the King's Houſe and Verge; as alſo of Contracts made there, whereof one of the Houſe is Party.

KNIGHTS OF THE SHIRE, or *Knights of Parliament*, are two *Knights* or Gentlemen of Worth choſen on the King's Writ *in pleno Comitatu*, by ſuch of the Freeholders of every County as can expend 40 *s. per annum* Theſe, when every Man who had a Knights-Fee were cuſtomarily conſtrain'd to be *Knights*, were of neceſſity to be *Milites Gladio cincti*, for ſo the Writ runs to this day; but now Cuſtom admits Eſquires to be choſen to this Office. They muſt have at leaſt 500 *l. per annum*; and their Expences are to be defray'd by the County, though this be ſeldom, now, required.

KNIGHTS, in a Ship, are two Pieces of Timber, to each of which go four Shivers, three for the Halliards, and one for the Top-Ropes: they are uſually in the figure of ſome Head. One of 'em ſtands aft the Main-Maſt, and for that reaſon is call'd the *Main-Knight*; another ſtands abaft the Fore-Maſt, on the ſecond Deck, and is call'd the *Fore-Knight*.

KNIGHT-SERVICE, a Tenure whereby ſeveral Lands in this Nation were antiently held of the King; which drew after it Homage, Eſcuage, Wardſhip, Marriage, &c. But taken away by the Statute 12 *Car.* 2.

KNIGHTS-FEE, an antient Law-Term, ſignifying ſo much Inheritance as is ſufficient to maintain a Knight with ſuitable Retinue; which, in *Henry* the Third's days was reckon'd at Fifteen Pounds. But Sir *T. Smith* rates it at 40 *l.* By a Stat. 1 *Edw.* 2. ſuch as had 20 *l. per annum* in Fee or for Life, might be compelled to be Knights; but this Statute is repeal'd 17 *Car.* 1.

Stow ſays, that there were found in *England*, at the time of the Conqueror, 60,211 *Knights-Fees*; according to others, there were 60,215, whereof the Religious Houſes, before their ſuppreſſion, were poſſeſs'd of 28,015. According to *Coke*, a *Knights-Fee* contain'd twelve Plow-Lands.

KNOT, part of a Tree whence it ſhoots out Branches or Roots. The Wood is harder and cloſer in the *Knots* than in any other part, but it is alſo more ſubject to ſplit. Vines and low Fruit-Trees are lopp'd at the ſecond *Knot* of the new Shoot. The Uſe of the *Knots* of Plants is to ſtrengthen the Stem: They ſerve alſo as Searces to filtrate, purify, and refine the Juice rais'd up for the Nouriſhment of the Plant.

The Diviſions of the Log-Line at Sea are alſo call'd *Knots*. Theſe are uſually ſeven Fathoms or forty-two Feet aſunder, but they ſhould be fifty Feet; and then as many *Knots* as the Log-Line runs out in half a Minute, ſo many Miles doth the Ship ſail in an Hour, ſuppoſing her to keep going at any equal rate, and allowing for Yaws, Lee-way, &c.

Knot, in Medicine, is a Tuberoſity form'd in the Joints of old Gouty People, conſiſting of a thick viſcous, crude, indigeſted Pituita, accompanied with a bilious Humour, hot and acrimonious; the groſſeſt and moſt terreſtrial part whereof clogs and converts into a ſtony Subſtance like Chalk: whence *Knots* are ingendred, like Stones

in

in the Bladder. The Phyſicians ſometimes call 'em *Tophi*.

Knot, or *Nodus*, is alſo uſed for the Intrigue of a Romance or Dramatic Piece: that is, for that part where the Perſons are the moſt embaraſs'd, by a Conjuncture of Affairs whoſe End it is not eaſy to foreſee. *Ariſtotle*, under this Term, includes all the Incidents of a Tragedy, from its Beginning to the Place where it begins to unravel. The *Knot* holds as long as the Mind is kept ſuſpended on the Event. The *Knot* ought always to laſt to the middle of the fifth Act, otherwiſe the reſt of the Piece becomes feeble and languiſhing.

Order of the Knot, the Name of a Military Order in the Kingdom of *Naples*, inſtituted in the Year 1352, by Queen *Jane* I. on occaſion of the Peace eſtabliſh'd between her and the King of *Hungary*, by means of her Marriage with *Louis* Prince of *Tarentum*. The Order conſiſted of ſixty Knights. *Clement* VI. approved this Order, and gave it the Rule of St. *Baſil*: It choſe St. *Nicholas* for its Protector, but dwindled away after the Death of its Foundreſs.

KNOWLEDGE, according to Mr. *Locke*, conſiſts in the Perception of the Connection and Agreement, or Diſagreement and Repugnancy of our Ideas. Thus we *know* that White is not Black, by perceiving that theſe two Ideas do not agree. Again, in *knowing* that the three Angles of a Triangle are equal to two right ones; what do we more than perceive that Equality to two right ones doth neceſſarily agree to, and is inſeparable from the three Angles of a Triangle? As to the Agreement or Diſagreement of Ideas, we may reduce the whole Doctrine, (conſequently the whole Stock of our *Knowledge*) to theſe four Heads; *viz.* Identity or Diverſity, Relation, Co-exiſtence, and Real Exiſtence.

With regard to the Identity or Diverſity of our Ideas, we may obſerve, That 'tis the firſt Act of the Mind to perceive its own Ideas, and ſo far as it perceives them, to know each what it is, and thereby to perceive their difference, that is, the one not to be the other: By this the Mind clearly perceives each Idea to agree with itſelf, and to be what it is; and all diſtinct Ideas to diſagree. This it does without any Pains or Deduction, by its natural Power of Perception, and Diſtinction; and this Men of Art have reduced to thoſe general Rules, *viz.* What is, is; and, It is impoſſible for the ſame thing to be, and not to be. But no Maxim can make a Man know it clearer, that Round is not Square, than the bare Perception of thoſe two Ideas which the Mind at firſt ſight perceives to diſagree. The next kind of Agreement or Diſagreement the Mind perceives in any of its Ideas, may be call'd Relative, and is nothing but the Perception of the Relation between any two Ideas, of what kind ſoever; that is, their Agreement or Diſagreement one with another, in the ſeveral ways or reſpects the Mind takes of comparing them. The third ſort of Agreement or Diſagreement to be found in our Ideas, is Co-exiſtence or Non-Co-exiſtence in the ſame Subject, and this belongs particularly to Subſtances. Thus when we pronounce concerning Gold that it is fixed, it amounts to no more but this, that Fixedneſs, or a Power to remain in the Fire unconſumed, is an Idea that always accompanies that particular Sort of Yellowneſs, Weight, Fuſibility, *&c.* which makes our complex Idea ſignified by the word *Gold*. The fourth Sort is that of actual and real Exiſtence, agreeing to any Idea. Within theſe four Sorts of Agreement or Diſagreement, ſeems contained all the *Knowledge* we have, or are capable of; for all that we know or can affirm concerning any Idea, is, That it is, or is not the ſame with ſome other; as that Blue is not Yellow: that it does or does not co-exiſt with another in the ſame Subject; as that Iron is ſuſceptible of magnetical Impreſſions: that it hath that or this Relation to ſome other Ideas, as That two Triangles, upon equal Baſes, between two Parallels, are equal: or that it has a real Exiſtence without the Mind, as, That God is.

The Mind becomes poſſeſſed of Truth in ſeveral manners, each of which comes under the Term *Knowledge*. Thus when the Mind has a preſent View of the Agreement or Diſagreement of any of its Ideas, or of the Relation they have one with another, it is called actual *Knowledge*. Secondly, A Man is ſaid to *know* any Propoſition, when having once evidently perceived the Agreement or Diſagreement of the Ideas whereof it conſiſts, and ſo lodged it in his Memory, that whenever it comes to be reflected on again, the Mind aſſents to it without Doubt or Heſitation, and is certain of the Truth of it: And this may be called *Habitual Knowledge*. And thus a Man may be ſaid to *know* all thoſe Truths which are lodged in his Memory, by a foregoing, clear, and full Perception. Of Habitual *Knowledge* there are two ſorts; the one conſiſts of ſuch Truths laid up in the Memory, as whenever they occur to the Mind, it actually perceives the Relation that is between their Ideas; and this is in all thoſe Truths where the Ideas themſelves, by an immediate View, diſcover their Agreement or Diſagreement one with another. The other is of ſuch Truths, whereof the Mind having been convinced, it retains the Memory of the Conviction, without the Proofs. Thus a Man that remembers certainly, that he once perceived the Demonſtration, That the three Angles of a Triangle are equal to two right ones, knows it to be true, when that Demonſtration is gone out of his Mind, and cannot poſſibly be recollected: But he knows it in a different way from what he did before, namely, not by the Intervention of thoſe immediate Ideas, whereby the Agreement or Diſagreement of thoſe in the Propoſition was at firſt perceived; but by remembring, that is, knowing, that he was once certain of the Truth of this Propoſition, That the three Angles of a Triangle are equal to two right ones. The Immutability of the ſame Relations between the ſame immutable things, is now the Idea, that ſhews him, that if the three Angles of a Triangle were once equal to two right ones, they will always be ſo. And hence he comes to be certain, that what was once true, is always true; what Ideas once agreed, will always agree; and conſequently, what he once knew to be true, he will always know to be true, as long as he can remember that he once knew it.

As to the different Degrees, or Clearneſs of our *Knowledge*, it ſeems to lie in the different way which the Mind has of perceiving the Agreement or Diſagreement of any of its Ideas. When the Mind perceives this Agreement or Diſagreement of two Ideas immediately by themſelves, without the Intervention of any other, we may call it *Intuitive Knowledge*, in which Caſes the Mind perceives the Truth, as the Eye doth Light, only by being directed towards it. Thus the Mind perceives, that White is not Black; that three are more than two, and equal to one and two. This Part of *Knowledge* is irreſiſtible, and, like the bright Sun-ſhine, forces itſelf immediately to be perceived, as ſoon as ever the Mind turns its View that way. It is on this Intuition that depends all the Certainty and Evidence of our other *Knowledge*, which Certainty every one finds to be ſo great, that he cannot imagine, and therefore cannot require a greater. The next Degree of *Knowledge* is, where the Mind perceives not this Agreement or Diſagreement immediately, or by the Juxta-Poſition, as it were, of the Ideas, becauſe thoſe Ideas, concerning whoſe Agreement or Diſagreement the Enquiry is made, cannot by the Mind be ſo put together as to ſhew it. In this Caſe the Mind is obliged to diſcover the Agreement or Diſagreement, which it ſearches for, by the Intervention of other Ideas: and this is that which we call Reaſoning. And thus if we would know the Agreement or Diſagreement in Bigneſs, between the three Angles of a Triangle, and two right Angles, we cannot do it by an immediate View and Compariſon of them, becauſe the three Angles of a Triangle cannot be brought together at once, and compared with any other one or two Angles; and ſo of this the Mind has no immediate, or intuitive *Knowledge*. But we muſt find out ſome other Angles, to which the three Angles of a Triangle have Equality; and finding thoſe equal to two right ones, we come to know the Equality of theſe three Angles to two right ones. Thoſe intervening Ideas, which ſerve to ſhew the Agreement of any two others, are called *Proofs*; and where the Agreement or Diſagreement is by this means plainly and clearly perceived, it is called *Demonſtration*. A Quickneſs in the Mind to find thoſe Proofs, and to apply them right, is that which is called *Sagacity*. This *Knowledge*, tho it be certain, is not ſo clear and evident as intuitive *Knowledge*; it requires Pains and Attention, and ſteady Application of Mind, to diſcover the Agreement or Diſagreement of the Ideas it conſiders, and there muſt be a Progreſſion by Steps and Degrees before the Mind can in this way arrive to any Certainty. Before Demonſtration there was a Doubt, which, in intuitive *Knowledge*, cannot happen to the Mind, that has its Faculty of Perception left in a Degree capable of diſtinct Ideas, no more than it can be a Doubt to the Eye (that can diſtinctly ſee White and Black) whether this Ink and Paper be all of a Colour. Now in every Step that Reaſon makes in Demonſtrative *Knowledge*, there is an Intuitive *Knowledge* of that Agreement or Diſagreement it ſeeks with the next intermediate Idea, which it uſes as a Proof; for if it were not ſo, that yet would need a Proof, ſince without the Perception of ſuch Agreement or Diſagreement there is no *Knowledge* produced. By which it is evident, that every Step in Reaſoning, that produceth *Knowledge*, has intuitive Certainty; which when the Mind perceives, there is no more required but to remember it, to make the Agreement or Diſagreement of the Ideas, concerning which we enquire, viſible and certain. This intuitive Perception of the Agreement or Diſagreement of the intermediate Ideas in each Step, and Progreſſion

of

of the Demonſtration, muſt alſo be exactly carried in the Mind; and a Man muſt be ſure that no part is left out, which, becauſe in long Deductions, the Memory cannot eaſily retain, this *Knowledge* becomes more imperfect than intuitive, and Men often embrace Falſhoods for Demonſtrations.

It has been generally taken for granted, that Mathematicks alone are capable of demonſtrative Certainty; but to have ſuch an Agreement or Diſagreement, as may be intuitively perceived, being, as we imagine, not the Privilege of the Ideas of Number, Extenſion, and Figure alone; it may poſſibly be the want of due Method and Application in us, and not of ſufficient Evidence in Things, that Demonſtration has been thought to have ſo little to do in other Parts of *Knowledge*. For in whatever Ideas the Mind can perceive the Agreement or Diſagreement immediately, there it is capable of intuitive *Knowledge*; and where it can perceive the Agreement or Diſagreement of any two Ideas, by the intuitive Perception of the Agreement or Diſagreement they have with any intermediate Ideas, there the Mind is capable of Demonſtrations, not limited to the Ideas of Figure, Number, Extenſion, or their Modes. The Reaſon why it has been generally ſuppoſed to belong to theſe only, is becauſe, in comparing their Equality or Exceſs, the Modes of Numbers have every, the leaſt Difference, very clear and perceivable: And in Extenſion, tho' every the leaſt Exceſs is not ſo perceptible, yet the Mind has found out ways to diſcover the juſt Equality of two Angles, Extenſions, or Figures; and both Numbers and Figures can be ſet down by viſible and laſting Marks. But in other ſimple Ideas, whoſe Modes and Differences are made, and counted by Degrees, and not Quantity, we have not ſo nice and accurate a Diſtinction of their Differences, as to perceive or find ways to meaſure their juſt Equality, or their leaſt Differences. For thoſe other ſimple Ideas being Appearances or Senſations produced in us, by the Size, Figure, Motion, &c. of minute Corpuſcles ſingly inſenſible, their different Degrees alſo depend on the Variation of ſome, or all of thoſe Cauſes; which ſince it cannot be obſerved by us in Particles of Matter, whereof each is too ſubtile to be perceived, it is impoſſible for us to have any exact Meaſures of the different Degrees of theſe ſimple Ideas. Thus, for inſtance, not knowing what Number of Particles, nor what Motion of them is fit to produce any preciſe Degree of Whiteneſs, becauſe we have no certain Standard to meaſure them by, nor means to diſtinguiſh every, the leaſt Difference; the only help we have, is from our Senſes, which in this Point fail us. But where the Difference is ſo great as to produce in the Mind Ideas clearly diſtinct, theſe Ideas of Colours as we ſee in different kinds, Blue and Red (for inſtance) are as capable of Demonſtration, as Ideas of Number and Extenſion. What is here ſaid of Colours, holds true in all ſecondary Qualities. Theſe two then, Intuition and Demonſtration, are the Degrees of our *Knowledge*; whatever comes ſhort of one of theſe, is but Faith, or Opinion, not *Knowledge*, at leaſt in all general Truths. There is indeed another Perception of the Mind employed about the particular Exiſtence of finite Beings without us, which going beyond Probability, but not reaching to either of the foregoing Degrees of Certainty, paſſes under the Name of *Knowledge*.

Nothing can be more certain, than that the Idea we receive from an external Object, is in our Minds: This is intuitive *Knowledge*; but whether we can thence certainly infer the Exiſtence of any thing without us, correſponding to that Idea, is that whereof ſome Men think there may be a Queſtion made, becauſe Men may have ſuch an Idea in their Minds, when no ſuch Thing exiſts, no ſuch Object affects their Senſes. But it is evident, that we are invincibly conſcious to ourſelves of a different Perception, when we look on the Sun in the Day, and think on it by Night; when we actually taſte Wormwood, or ſmell a Roſe, or only think on that Savour, or Odour: ſo that we may add to the two former ſorts of *Knowledge*, this alſo of the Exiſtence of particular external Objects, by that Perception and Conſciouſneſs we have of the actual Entrance of Ideas from them, and allow theſe three Degrees of *Knowledge*, *viz.* intuitive, demonſtrative, and ſenſitive. But ſince our *Knowledge* is founded on and imployed about our Ideas only, will it follow thence, that it muſt be conformable to our Ideas, and that where our Ideas are clear and diſtinct, obſcure and confuſed, there our *Knowledge* will be ſo too? We anſwer, No: For our *Knowledge* conſiſting in the Perception of the Agreement or Diſagreement of any two Ideas, its Clearneſs or Obſcurity conſiſts in the Clearneſs or Obſcurity of that Perception, and not in the Clearneſs or Obſcurity of the Ideas themſelves. A Man (for inſtance) who hath a clear Idea of the Angles of a Triangle, and of Equality to two right ones, may yet have but an obſcure Perception of their Agreement, and ſo have but a very obſcure *Knowledge* of it: But obſcure and confuſed Ideas can never produce any clear or diſtinct *Knowledge*, becauſe as far as any Ideas are obſcure or confuſed, ſo far the Mind can never perceive clearly, whether they agree or diſagree: Or, to expreſs the ſame thing in a way leſs apt to be underſtood, he that hath not determined Ideas to the Words he uſeth, cannot make Propoſitions of them, of whoſe Truth he can be certain.

From all this it follows; (1.) That we can have no *Knowledge* farther than we have Ideas. (2.) That we have no *Knowledge* farther than we can have Perception of the Agreement or Diſagreement of our Ideas, either by Intuition, Demonſtration, or Senſation. (3.) We cannot have an intuitive *Knowledge*, that ſhall extend itſelf to all our Ideas, and all that we would know about them; becauſe we cannot examine and perceive all the Relations they have one to another by Juxta-Poſition, or an immediate Compariſon one with another. Thus we cannot intuitively perceive the Equality of two Extenſions, the Difference of whoſe Figures makes their Parts uncapable of an exact immediate Application. (4.) Our rational *Knowledge* cannot reach to the whole Extent of our Ideas, becauſe between two different Ideas, which we would examine, we cannot always find ſuch Proofs as we can connect one to another, with an intuitive *Knowledge* in all the Parts of the Deduction. (5.) Senſitive *Knowledge* reaching no farther than the Exiſtence of Things, actually preſent to our Senſes, is yet much narrower than either of the former. (6.) From all which it is evident, that the Extent of our *Knowledge* comes not only ſhort of the Reality of Things, but even of the Extent of our own Ideas. We have the Ideas of a Square, a Circle, and Equality, and yet perhaps ſhall never be able to find a Circle equal to a Square.

The Affirmations or Negations we make concerning the Ideas we have, being reduced to the four Sorts abovementioned, *viz.* Identity, Co-exiſtence, Relation, and Real Exiſtence, let us enquire how far our *Knowledge* extends in each of theſe. (1.) As to Identity and Diverſity, our intuitive *Knowledge* is as far extended as our Ideas themſelves; and there can be no Idea in the Mind, which it does not preſently, by an intuitive *Knowledge*, perceive to be what it is, and to be different from any other. (2.) As to the Agreement or Diſagreement of our Ideas of Co-exiſtence, our *Knowledge* herein is very defective, tho' 'tis in this that the greateſt and moſt material Parts of our *Knowledge* concerning Subſtances conſiſts: For our Ideas of Subſtances being nothing but certain Collections of ſimple Ideas, co-exiſting in one Subject, (our Idea of Flame, for inſtance, is a Body hot, luminous, and moving upwards.) When we would know any thing farther concerning this or any other ſort of Subſtance, what do we but enquire what other Qualities or Powers theſe Subſtances have or have not? which is nothing elſe but to know what other ſimple Ideas do, or do not exiſt with thoſe that make up that complex Idea. The Reaſon of this is, becauſe the ſimple Ideas, which make up our complex Ideas of Subſtances, have no viſible neceſſary Connection or Inconſiſtence with other ſimple Ideas, whoſe Co-exiſtence with them we would inform ourſelves about. Theſe Ideas being likewiſe for the moſt part ſecondary Qualities, which depend upon the primary Qualities of their minute or inſenſible Parts, or on ſomething yet more remote from our Comprehenſion; it is impoſſible we ſhould know which have a neceſſary Union or Inconſiſtence one with another, ſince we know not the Root from whence they ſpring, or the Size, Figure, and Texture of Parts on which they depend, and from which they reſult. Beſides this, there is no diſcoverable Connection between any ſecondary Quality, and thoſe primary Qualities that it depends on. We are ſo far from knowing what Figure, Size, or Motion produceth, (for inſtance) a yellow Colour, or ſweet Taſte, or ſharp Sound; that we can by no means conceive how any Size, Figure, or Motion, can poſſibly produce in us the Idea of any Colour, Taſte, or Sound, whatſoever; there being no conceivable Connection between the one and the other. Our *Knowledge* therefore of Co-exiſtence reaches little further than Experience. Some few indeed of the primary Qualities have a neceſſary Dependance, and viſible Connection one with another: As Figure neceſſarily ſuppoſeth Extenſion; receiving or communicating Motion by Impulſe, ſuppoſeth Solidity: but Qualities co-exiſtent in any Subject, without this Dependence and Connection, cannot certainly be known to co-exiſt any farther, than Experience by our Senſes informs us. Thus tho', upon Tryal, we find Gold yellow, weighty, malleable, fuſible, and fixed; yet becauſe none of theſe have any evident Dependance or neceſſary Connection with the

other, we cannot certainly know, that where any four of theſe are, the fifth will be there alſo, how highly probable ſoever it may be. But the higheſt Degree of Probability amounts not to Certainty, without which there can be no true *Knowledge*: For this Co-exiſtence can be no farther known, than it is perceived; and it cannot be perceived but either in particular Subjects, by the Obſervation of our Senſes, or, in general, by the neceſſary Connection of the Ideas themſelves. As to Incompatibility or Repugnancy to Co-exiſtence, we know that no Subject can have of each ſort of primary Qualities, more than one Particular at once, as one Extenſion, one Figure; and ſo of ſenſible Ideas peculiar to each Senſe: For whatever of each kind is preſent in any Subject, excludes all other of that ſort; for inſtance, one Subject cannot have two Smells, or two Colours at the ſame time. As to Powers of Subſtances, which makes a great part of our Enquiries about them, and is no inconſiderable Branch of our *Knowledge*; our *Knowledge*, as to theſe, reaches little farther than Experience, becauſe they conſiſt in a Texture and Motion of Parts, which we cannot by any means come to diſcover; and, I doubt, whether with thoſe Faculties we have, we ſhall ever be able to carry our general *Knowledge* much farther in this Part. Experience is that which in this Part we muſt depend on, and it were to be wiſhed that it were more improved. We find the Advantages ſome Mens generous Pains have this way brought to the Stock of natural *Knowledge*; and if others, eſpecially the Philoſophers by Fire, had been ſo wary in their Obſervations, and ſincere in their Reports, as thoſe who call themſelves Philoſophers ought to have been, our Acquaintance with the Bodies here about us, and our Inſight into their Powers and Operations, had been yet much greater. As to the third ſort, the Agreement or Diſagreement of our Ideas in any other Relation; this is the largeſt Field of *Knowledge*, and it is hard to determine how far it may extend: this Part depending on our Sagacity in finding intermediate Ideas, that may ſhew the Habitudes and Relations of Ideas, it is an hard matter to tell when we are at an end of ſuch Diſcoveries. They, who are ignorant of Algebra, cannot imagine the Wonders of this kind that are to be done by it: and what farther Improvements and Helps, advantageous to other Parts of *Knowledge*, the ſagacious Mind of Man may yet find out, it is not eaſy to determine. This at leaſt we may believe, that the Ideas of Quantity are not thoſe alone that are capable of Demonſtration and *Knowledge*; and that other, and perhaps more uſeful Parts of Contemplation would afford us Certainty, if Vices, Paſſions, and domineering Intereſt did not oppoſe or menace Endeavours of this kind.

The Idea of a ſupreme Being, infinite in Power, Goodneſs, and Wiſdom, whoſe Workmanſhip we are, and on whom we depend; and the Idea of ourſelves, as underſtanding rational Creatures; would, if duly conſidered, afford ſuch Foundations of our Duty, and Rules of Action, as might place Morality among the Sciences capable of Demonſtration; wherein we need not doubt, but that from Principles as inconteſtable as thoſe of the Mathematicks, by neceſſary Conſequences the Meaſure of Right and Wrong might be made out to any one, who will apply himſelf, with the ſame Indifferency and Attention to the one, as he doth to the other of theſe Sciences. The Relations of other Modes may certainly be perceived, as well as thoſe of Number and Extenſion. Where there is no Property, there is no Injuſtice, is a Propoſition as certain as any Demonſtration in *Euclid*; for the Idea of Property being a Right to any thing, and the Idea of Injuſtice being the Invaſion or Violation of that Right, it is evident, that theſe Ideas being thus eſtabliſhed, and theſe Names annexed to them, I can as certainly know this Propoſition to be true, as that a Triangle has three Angles equal to two right ones. Again, no Government allows abſolute Liberty; the Idea of Government being the Eſtabliſhment of Society, upon certain Rules or Laws, which require Conformity to them; and the Idea of abſolute Liberty being for any one to do whatever he pleaſes, I am as capable of being certain of the Truth of this Propoſition, as of any in Mathematicks.

What has given the Advantage to the Ideas of Quantity, and made them thought to be more capable of Certainty and Demonſtration, is, *Firſt*, That they can be repreſented by ſenſible Marks, which have a nearer Correſpondence with them than any Words or Sounds. Diagrams drawn on Paper are Copies of the Ideas, and not liable to the Uncertainty that Words carry in their Signification; but we have no ſenſible Marks that reſemble our moral Ideas, and nothing but Words to expreſs them by, which tho', when written, they remain the ſame; yet the Ideas they ſtand for may change in the ſame Man, and it is very ſeldom that they are not different in different Perſons. *Secondly*, Moral Ideas are commonly more complex than Figures; whence theſe two Inconveniences follow, (1.) That their Names are of more uncertain Signification: the preciſe Collection of ſimple Ideas they ſtand for, not being ſo eaſily agreed on, and ſo the Sign that is uſed for them in Communication always, and in Thinking often, does not readily carry with it the ſame Idea. (2.) The Mind cannot eaſily retain thoſe preciſe Combinations ſo exactly and perfectly, as is neceſſary in the Examination of the Habitudes and Correſpondencies, Agreements or Diſagreements of ſeveral of them one with another, eſpecially where it is to be judged of by long Deductions, and the Intervention of ſeveral other complex Ideas, to ſhew the Agreement or Diſagreement of two remote ones. One part of theſe Diſadvantages in moral Ideas, which has made them be thought not capable of Demonſtration, may in a good meaſure be remedied by Definitions, ſetting down that Collection of ſimple Ideas which every Term ſhall ſtand for, and then uſing the Term ſteadily and conſtantly for that preciſe Collection.

As to the fourth ſort of *Knowledge*, *viz.* of the real actual Exiſtence of Things, we have an intuitive *Knowledge* of our own Exiſtence, a demonſtrative *Knowledge* of the Exiſtence of God, and a ſenſitive *Knowledge* of the Objects that preſent themſelves to our Senſes. And hitherto we have examined the Extent of our *Knowledge*, in reſpect of the ſeveral Sorts of Beings that are. There is another Extent of it in reſpect of Univerſality, which will alſo deſerve to be conſidered; and this in regard our *Knowledge* follows the Nature of our Ideas. If the Ideas, whoſe Agreement or Diſagreement we perceive, are abſtract, our *Knowledge* is univerſal; for what is known of ſuch general Ideas, will be true of every particular thing in which that Eſſence, that is, that abſtract Idea is found: And what is once known of ſuch Ideas, will be perpetually and for ever true; ſo that, as to all general *Knowledge*, we muſt ſearch, and find it only in our own Minds; and it is only the examining our own Ideas that furniſhes us with it. Truths belonging to Eſſences of Things (that is, to abſtract Ideas) are eternal, and are to be found out by the Contemplation only of thoſe Eſſences; as the Exiſtence of Things is to be known only from Experience. As to the Reality of our *Knowledge*, it is evident, that the Mind knows not Things immediately, but by the Intervention of the Ideas it has of them. Our *Knowledge* therefore is real only ſo far, as there is a Conformity between our Ideas, and the Reality of Things. But how ſhall we know when our Ideas agree with Things themſelves? To which it is anſwered, There are two Sorts of Ideas, that we may be aſſured agree with Things; theſe are, (1.) Simple Ideas, which ſince the Mind can by no means make to itſelf, muſt be the Effect of Things operating upon the Mind in a natural way, and producing therein thoſe Perceptions, which, by the Will of our Maker, they are ordained and adapted to. Hence it follows, that ſimple Ideas are not Fictions of our Fancies, but the natural and regular Productions of Things without us, really operating upon us; which carry with them all the Conformity our State requires, which is to repreſent Things under thoſe Appearances they are fitteſt to produce in us. Thus the Idea of Whiteneſs, as it is in the Mind, exactly anſwers that Power which is in any Body to produce it there; and this Conformity between our ſimple Ideas, and the Exiſtence of Things, is ſufficient for real *Knowledge*. (2.) All our complex Ideas, except thoſe of Subſtances, being Archetypes of the Mind's own making, and not referred to the Exiſtence of Things as to their Originals, cannot want any Conformity neceſſary to real *Knowledge*; for that which is not deſigned to repreſent any thing but itſelf, can never be capable of a wrong Repreſentation. Here the Ideas themſelves are conſidered as Archetypes, and Things no otherwiſe regarded than as conformable to them. Thus the Mathematician conſiders the Truth and Properties belonging to a Rectangle or Circle only, as they are Ideas in his own Mind, which poſſibly he never found exiſting mathematically, that is, preciſely true; yet his *Knowledge* is not only certain, but real, becauſe real Things are no farther concerned, nor intended to be meant by any ſuch Propoſitions, than as Things really agree to thoſe Archetypes in the Mind. It is true of the Idea of a Triangle, that its three Angles are equal to two right ones; it is true alſo of a Triangle, where-ever it exiſts: What is true of thoſe Figures, that have barely an Ideal Exiſtence in the Mind, will hold true of them alſo, when they come to have a real Exiſtence in Matter. Hence it follows, that moral *Knowledge* is as capable of real Certainty as Mathematicks: For Certainty being nothing but the Perception of ſuch Agreement, by the Intervention of other Ideas, our moral Ideas, as well as mathematical, being Archetypes themſelves, and ſo adequate

or

or compleat Ideas, all the Agreement or Diſagreement we ſhall find in them, will produce real *Knowledge*, as well as in mathematical Figures. That which is requiſite to make our *Knowledge* certain, is the Clearneſs of our Ideas; and that which is required to make it real, is that they anſwer their Archetypes. But it will here be ſaid, That if moral *Knowledge* be placed in the Contemplation of our own moral Ideas, and thoſe are of our own making, what ſtrange Notions will there be of Juſtice and Temperance? What Confuſion of Virtues and Vices, if every Man may make what Ideas of them he pleaſes? To which it is anſwered, No Confuſion or Diſorder at all in the Things themſelves, nor the Reaſonings about them, no more than there would be a Change in the Properties of Figures, and their Relations one to another, if a Man ſhould make a Triangle with four Corners, or a Trapezium with four right Angles; that is, in plain *Engliſh*, change the Names of the Figures, and call that by one Name which is called ordinarily by another The Change of Name will indeed at firſt diſturb him, who knows not what Idea it ſtands for; but as ſoon as the Figure is drawn, the Conſequences and Demonſtration are plain and clear. Juſt the ſame is it in moral *Knowledge*: Let a Man have the Idea of taking from others, without their Conſent, what they are juſtly poſſeſſed of, and call this Juſtice if he pleaſeth; he that takes the Name there, without the Idea put to it, will be miſtaken, by joining another Idea of his own to that Name; but ſtrip the Idea of that Name, or take it, ſuch as it is, in the Speaker's Mind, and the ſame things will agree to it, as if you called it Injuſtice. One thing we are to take notice of, That where God, or any other Law-maker, has defined any moral Names, there they have made the Eſſence of that Species to which that Name belongs; and there it is not ſafe to apply or uſe them otherwiſe; but in other Caſes it is bare Impropriety of Speech to apply them contrary to the common Uſage of the Country they are uſed in. (3.) But the complex Ideas, which we refer to Archetypes without us, may differ from them, and ſo our *Knowledge* about them may come ſhort of being real; and ſuch are our Ideas of Subſtances. Theſe muſt be taken from ſomething, that does, or has exiſted, and not be made up of Ideas arbitrarily put together, without any real Pattern. Herein therefore is founded the Reality of our *Knowledge* concerning Subſtances, that all our complex Ideas of them muſt be ſuch, and ſuch only, as are made up of ſuch ſimple ones, as have been diſcovered to co-exiſt in Nature: And our Ideas being thus true, tho' not perhaps very exact Copies, are the Subjects of real *Knowledge* of them. Whatever Ideas we have, the Agreement we find they have with others, will be *Knowledge*. If thoſe Ideas be abſtract, it will be General *Knowledge*; but to make it real concerning Subſtances, the Ideas muſt be taken from the real Exiſtence of Things. Where-ever therefore we perceive the Agreement or Diſagreement of our Ideas, there is certain *Knowledge*; and where-ever we are ſure thoſe Ideas agree with the Reality of Things, there is certain real *Knowledge*.

As to the Improvement of our *Knowledge*, it being the received Opinion amongſt Men of Letters, that Maxims are the Foundation of all *Knowledge*, and that Sciences are each of them built upon certain *Præcognita*, from whence the Underſtanding was to take its Riſe, and by which it was to conduct itſelf in its Inquiries in the Matters belonging to that Science; the beaten Road of the Schools has been to lay down, in the beginning, one or more general Propoſitions, called *Principles*, as Foundations whereon to build the *Knowledge* that was to be had of that Subject. That which gave occaſion to this way of Proceeding, was the good Succeſs it ſeemed to have in Mathematicks, which, of all other Sciences, have the greateſt Certainty, Clearneſs, and Evidence in them. But if we conſider it, we ſhall find that the great Advancement and Certainty of real *Knowledge* Men arrived to in theſe Sciences, was not owing to the Influence of theſe Principles, but to the clear, diſtinct, and compleat Ideas their Thoughts were employed about; and the Relation of Equality and Exceſs ſo clear between ſome of them, that they had an intuitive *Knowledge*, and by that a way to diſcover it in others, and this without the help of thoſe Maxims. For is it not poſſible for a Lad to know, that his whole Body is bigger than his little Finger, but by virtue of this Axiom, The whole is bigger than a Part; nor be aſſured of it, till he has learned that Maxim? Let any one conſider from what has been ſaid, which is known firſt and cleareſt by moſt People, the particular Inſtance, or the general Rule, and which it is that gives Life and Birth to the other. Theſe general Rules are but the comparing our more general and abſtract Ideas, which Ideas are made by the Mind, and have Names given them, for the eaſier Diſpatch in its Reaſonings: But *Knowledge* began in the Mind, and was founded on Particulars, tho' afterwards perhaps no Notice be taken thereof; it being natural for the Mind to lay up thoſe general Notions, and make the proper Uſe of them, which is to disburden the Memory of the cumberſome Load of Particulars. The way to improve in *Knowledge*, is not to ſwallow Principles with an implicite Faith, and without Examination, which would be apt to miſlead Men, inſtead of guiding them into Truth; but to get and fix in our Minds clear and compleat Ideas, as far as they are to be had, and annex to them proper and conſtant Names: and thus barely by conſidering our Ideas, and comparing them together, obſerving their Agreement or Diſagreement, their Habitudes and Relations, we ſhall get more true and clear *Knowledge* by the Conduct of this one Rule, than by taking up Principles, and thereby putting our Minds into the Diſpoſal of others. We muſt therefore, if we will proceed as Reaſon adviſes, adapt our Methods of Inquiry to the Nature of the Ideas we examine, and the Truth we ſearch after. General and certain Truths are only founded in the Habitudes and Relations of abſtract Ideas; therefore a ſagacious methodical Application of our Thoughts for the finding out theſe Relations, is the only way to diſcover all, that can with Truth and Certainty be put into general Propoſitions. By what Steps we are to proceed in theſe, is to be learned in the Schools of the Mathematicians, who from very plain and eaſy Beginnings, by gentle Degrees, and a continued Chain of Reaſonings, proceed to the Diſcovery and Demonſtration of Truths, that at firſt ſight appear beyond human Capacity. This may reaſonably be ſaid, that if other Ideas, that are real as well as nominal Eſſences of their Species, were purſued in the way familiar to Mathematicians, they would carry our Thoughts farther, and with greater Evidence and Clearneſs than, poſſibly, we are apt to imagine. This is Reaſon ſufficient to advance that Conjecture above-mentioned, *viz.* That Morality is capable of Demonſtration as well as Mathematicks; for moral Ideas being real Eſſences, which have a diſcoverable Connection and Agreement one with another, ſo far as we can find their Habitudes and Relations, ſo far we ſhall be poſſeſſed of real and general Truths.

In our *Knowledge* of Subſtances, we are to proceed after a quite different Method; the bare Contemplation of their abſtract Ideas (which are but nominal Eſſences) will carry us but a very little way in the Search of Truth and Certainty. Here Experience muſt teach us what Reaſon cannot, and it is by trying alone, that we can certainly know what other Qualities co-exiſt with thoſe of our complex Idea; for inſtance, whether that yellow, heavy, fuſible Body, I call Gold, be malleable or no; which Experience (however it prove in that particular Body we examine) makes us not certain that it is ſo in all, or any other yellow, heavy, fuſible Bodies, but that which we have tried: becauſe it is no Conſequence one way or the other from our complex Idea. The Neceſſity or Inconſiſtence of Malleability hath no viſible Connection with the Combination of that Colour, Weight, and Fuſibility in any Body. What is here ſaid of the nominal Eſſence of Gold, ſuppoſed to conſiſt of a Body of ſuch a determinate Colour, Weight, and Fuſibility, will hold true, if other Qualities be added to it. Our Reaſonings from thoſe Ideas will carry us but a little way in the certain Diſcovery of the other Properties in thoſe Maſſes of Matter wherein all thoſe are to be found. As far as our Experience reaches we may have certain *Knowledge*, and no farther. It is not denied, but that a Man, accuſtomed to rational and regular Experiments, ſhall be able to ſee farther into the Nature of Bodies, and their unknown Properties, than one that is a Stranger to them: But this is but Judgment and Opinion, not *Knowledge* and Certainty. This would make it ſuſpected, that Natural Philoſophy is not capable of being made a Science. From Experiments and Hiſtorical Obſervations we may draw Advantages of Eaſe and Health, and thereby increaſe our Stock of Conveniences for this Life; but beyond this, it is to be feared, our Talents reach not, nor are our Faculties able to advance farther. From whence it is obvious to conclude, that ſince our Faculties are not fitted to penetrate the real Eſſence of Bodies, but yet plainly to diſcover to us the Being of a God, and the *Knowledge* of ourſelves, enough to give us a clear Diſcovery of our Duty and great Concernment, it will become us, as rational Creatures, to employ our Faculties about what they are moſt adapted to, and follow the Direction of Nature where it ſeems to point us out the way. For it is rational to conclude, that our proper Employment lies in thoſe Enquiries, and that ſort of *Knowledge* which is moſt ſuited to our natural Capacities, and carries in it our greateſt Intereſt; and therefore it is that Morality is

the proper Science and Buſineſs of Mankind in general (who are both concerned and fitted to ſearch out their *Summum Bonum*) as ſeveral Arts, converſant about the ſeveral Parts of Nature, are the Lot and private Talent of particular Men, for the common Uſe of human Life, and their own particular Subſiſtence in this World.

The Ways to enlarge our *Knowledge*, as far as we are capable, ſeem to be theſe two: The firſt is, to get and ſettle in our Minds, as far as we can, clear, diſtinct, and conſtant Ideas of thoſe Things we would conſider and know; for it being evident that our *Knowledge* cannot exceed our Ideas, where they are either imperfect, confuſed, or obſcure, we cannot expect to have certain, perfect, or clear *Knowledge*. The other Art is of finding out the intermediate Ideas, which may ſhew us the Agreement or Repugnancy of other Ideas, which cannot be immediately compared. That theſe two, (and not relying on Maxims, and drawing Conſequences from ſome general Propoſitions) are the right Method of improving our *Knowledge* in the Ideas of other Modes, beſides thoſe of Quantity, the Conſideration of mathematical *Knowledge* will eaſily inform us: Where, Firſt, we ſhall find, that he who has not clear and perfect Ideas of thoſe Angles or Figures, of which he deſires to know any thing, is utterly thereby incapable of any *Knowledge* about them. Suppoſe a Man not to have an exact Idea of a right Angle, Scalenum, or Trapezium, and it is clear that he will in vain ſeek any Demonſtration about them. And farther it is evident, that it was not the Influence of Maxims, or Principles, that had led the Maſters of this Science into thoſe wonderful Diſcoveries they have made. Let a Man of good Parts know all the Maxims of Mathematicks never ſo well, and contemplate their Extent and Conſequences as much as he pleaſeth, he will, by their Aſſiſtance, ſcarce ever come to know, that the Square of the Hypothenuſe, in a right-angled Triangle, is equal to the Squares of the two other Sides. This, and other mathematical Truths, have been diſcovered by the Thoughts otherwiſe applied. The Mind had other Objects, other Views before it, far different from thoſe Maxims, which Men, well enough acquainted with thoſe received Axioms, but ignorant of their Method who firſt made theſe Demonſtrations, can never ſufficiently admire.

Our *Knowledge*, as in other Things, ſo in this, has ſo great a Conformity with our Sight, that it is neither wholly neceſſary, nor wholly voluntary. Men, who have Senſes, cannot chuſe but receive ſome Ideas by them; and if they have Memory, they cannot but retain ſome of them; and if they have any diſtinguiſhing Faculty, cannot but perceive the Agreement or Diſagreement of ſome of them one with another. As he that has Eyes, if he will open them by Day, cannot but ſee ſome Objects, and perceive a Difference in them; yet he may chuſe whether he will turn his Eyes towards an Object, curiouſly ſurvey it, and obſerve accurately all that is viſible in it. But what he doth ſee, he cannot ſee otherwiſe than he doth; it depends not on his Will to ſee that Black which appears Yellow. Juſt thus it is with our Underſtanding: All that is voluntary in our *Knowledge*, is the employing or with-holding any of our Faculties from this or that ſort of Objects, and a more or leſs accurate Survey of them; but they being employed, our Will hath no power to determine the *Knowledge* of the Mind one way or other; that is done only by the Objects themſelves, as far as they are clearly diſcovered. Thus he that has got the Ideas of Numbers, and has taken the pains to compare one, two, and three, to ſix, cannot chuſe but know they are equal. He alſo that hath the Idea of an intelligent, but weak and frail Being, made by, and depending on another, who is Eternal, Omnipotent, perfectly Wiſe, and Good, will as certainly know that Man is to honour, fear, and obey God, as that the Sun ſhines when he ſees it. But yet be theſe Truths never ſo certain, never ſo clear, he may be ignorant of either, or both of them, who will not take the pains to employ his Faculties as he ſhould, to inform himſelf about them.

KUL, or KOUL, a *Turkiſh* Term, properly ſignifying a Slave, or Servant. *Meningsky* tells us, the Name is given to all the Soldiers in the *Ottoman* Empire, particularly to thoſe of the Grand Signior's Guard, and the Infantry. The Captains of the Infantry, and thoſe who command the Guards, are called *Kul Zabytlers*, and the Soldiers of the Guard *Kapu Kulleri*, i. e. *Slaves of the Court*. Others ſay, that all who hold any Places depending on the Crown, or receive Wages from it, in a word, all who are in any meaſure the Grand Signior's Servants, take the Title of *Kul*, as more creditable than that of Subject; even the Grand Vifier and the Baſhaws value themſelves upon it. A *Kul*, or Slave, of the Grand Signior has Authority to abuſe any who are only his Servants; but a Subject that ſhould affront a *Kul*, or Slave, would be ſeverely puniſhed. The *Kuls* are entirely devoted to the Will of the Grand Signior, and look on it as a kind of Martyrdom that merits Heaven, when they die either by his Order, or in the Execution of his Commands.

KURTCHI, the Name of a Militia among the *Perſians*. The word, in its Original, ſignifies Army, and is applied to a Body of Cavalry, conſiſting of the Nobility of the Kingdom of *Perſia*, and the Poſterity of the conquering *Turks*, who placed *Iſmael Sophi* on the Throne. They are in Number about 18000 Men. Their Commander is called *Kurtchi Baſchi*, which was formerly the firſt Poſt in the Kingdom.

KYPHONISM, an antient Puniſhment, frequently undergone by the Martyrs in the Primitive Times. The Body of the Perſon who was to ſuffer was anointed with Honey, and ſo expoſed to the Sun, that the Flies and Waſps might be tempted to torment him. This was performed in three Manners; ſometimes they only tied the Patient to a Stake; ſometimes they hoiſted him up into the Air, and ſuſpended him in a Basket; and ſometimes they ſtretched him out on the Ground, with his Hands tied behind him. *Suidas* gives us the Fragment of an old Law, which puniſhed thoſe, who treated the Laws with Contempt, with *Kyphoniſm* for the ſpace of twenty Days, after which they were to be precipitated from a Rock, dreſſed in Womens Habit. The word is originally *Greek*, and comes from *κύφων*, which ſignifies the Stake to which the Patient was tied, the Collar fitted to his Neck, or an Inſtrument wherewith they tormented him. The Scholiaſt, on *Ariſtophanes*, ſays, it was a wooden Lock, or Cage, and that it was called *κύφων* from the Verb *κυπτεῖν*, *to crook, or bend*, becauſe it kept the Tortured in a crooked bowing Poſture. Others ſay, Logs of Wood were laid over their Heads, to prevent their ſtanding upright. *Heſychius* defines the *κύφων*, a Piece of Wood, whereon Criminals were ſtretched and tormented; and 'tis probable the word might ſignify all theſe ſeveral things. It was a Generical Name, whereof theſe were the Species.

KYSTUS, in Medicine, is the Name of a Bag, or Membrane, in form of a Bladder, full of unnatural Humours. The word comes from the *Greek κύστις*, *Bladder*.

L, *El* is the Name of the Eleventh Letter of the Alphabet; it has a ſweet Sound, and is pronounced by applying the Tongue to the Palate. *Paſſerat* obſerves, that *l* has been frequently uſed for *b*, as *cillibæ* for *cibillæ*; for *d*, as *alipe* for *adipe*, *rallus*, *rallum*, from *radens*; for *c*, as *mutila* for *mutica*; for *n*, as *arvilla* for *arvina*, *belle* for *bene*, *colligo* for *conligo*; for *r*, as *fratellus* of *frater*, *balatrones* for *baratrones*; for *ſ*, as *ancile* of *am* and *cæſum*, *equilio* for *equiſio*; for *t*, as *equiſelis* for *equiſetis*, *Thelis* for *Thetis*. The double *ll* is a modern Contrivance, and was never uſed among antient *Roman* Authors They wrote *alium* not *allium*, *macelum* not *macellum*, *polucere* not *pollucere*. Two *ll* were changed into *li*, ἄλλομαι *ſalio*, ἄλλος *alius*, φύλλον *folium*; and *r* into two *ll*, as *hira hilla*, *ſaturare ſaturlare*, &c. and *l* into *x* or *xill*, as *ala axilla*, *mala maxilla*, *velum vexillum*. *d* was alſo uſed for *l*, *n* for two *ll*, and *r* for one *l*. *l* is frequently uſed inſtead of *d*, as in *Ulyſſes* from the *Greek* Ὀδυσσεύς, in the *Æolic* Dialect Ὄλυσσης. Thus alſo for *Dautia* we ſay *Lautia*; for *dacrumæ*, *lacrymæ*, &c.

There are ſeveral People, for inſtance, the *Chineſe* in *Aſia*, the *Ilinois* in *America*, &c. who cannot pronounce the *r* but always change it into *l*. Thus when any of 'em have been baptiz'd by the Name of *Petrus*, *Franciſcus*, &c. they always pronounce it *Petlus*, *Flanciſcus*, &c. The *Spaniards* and *Welſh* uſually double the *l* at the beginning of a Word, which ſounds nearly the ſame with our *hl* or *fl*.

The Figure of our L we borrow'd from the *Latins*, they from the *Greeks*, and they again from the *Hebrews*, whoſe *Lamed* is perfectly like ours, excepting that the Angle is ſomewhat more acute.

L was alſo a numeral Letter among the Antients, and is ſtill ſo in the *Roman* Cyphering, ſignifying fifty; according to the Verſe,

Quinquies L *denos numero deſignat habendos.*

When a Daſh was added at top L, it ſtood for fifty thouſand. L was uſed for fifty as being half a C, which ſignified a hundred, and was formerly written thus Ↄ, which according to *Paſquier* makes two L L, the one upright, the other inverted.

The *French* Louis d'Ors have a Croſs on 'em, conſiſting of eight L's interwoven and diſpoſed in form of a Croſs.

The Epocha's on *Greek* Medals are uſually written with the antient *Lambda* Λ; which, according to the Tradition of the Antiquaries, ſtands for Λυκόβαντος, a Poetical Word, unknown in common Speech, ſignifying *Anno*, and which 'tis probable was more uſed in *Egypt* than *Greece*.

LABARUM, an Enſign or Standard bore before the *Roman* Emperors in the Wars: It conſiſted of a long Lance, with a Staff at top, croſſing it at right Angles; from which hung a rich Streamer, of a purple Colour, adorn'd with precious Stones. Till the Time of *Conſtantine* it had an Eagle painted on it, but that Emperor, in lieu thereof, added a Croſs with a Cypher expreſſing the name of Jeſus. He choſe fifty of the braveſt Men in his Guards to bear it on their ſhoulders, each in his turn. *Euſebius* tells us, that in the Battel againſt *Maxentius*, the Perſon who bore it being fatigued gave it to another, and that he had no ſooner parted with it but he was kill'd; all the Strokes he receiv'd while the *Labarum* was in his charge, not being able to wound him. The Author adds, he had this Miracle from the Emperor's mouth. This Standard the *Romans* took from the *Germans*, *Dacæ*, *Sarmatæ*, *Pannonians*, &c. whom they had overcome.

The Name *Labarum* was not known before the Time of *Conſtantine*, but the Standard itſelf, in the form we have deſcribed it, abating the Symbols of Chriſtianity, was uſed by all the preceding Emperors. Some derive the word from *Labor*, as if this finiſhed their Labours; ſome from εὐλαβεια, Piety; others from λαμβάνω, to take; and others from λάφυρον, Spoils. The *Labarum* has afforded ample matter for Criticiſm, and has been diſcourſed of by *Fuller*, *Alciatus*, *Cujas*, *Gyraldus*, *Lipſius*, *Meurſius*, *Voſſius*, *Hoffman*, *Valois*, *Du Cange*, &c.

LABEL, is a long thin Braſs Ruler, with a ſmall Sight at one end, and a Centre Hole at the other; commonly uſed with a Tangent Line on the Edge of a Circumferenter, to take Altitudes, &c.

Label in the Law is a narrow Slip of Paper or Parchment affixed to a Deed or Writing, in order to hold the appending Seal. So any Paper annexed by way of Addition, or Explication, to any Will or Teſtament, is called a *Label* or Codicil.

Label, in Heraldry, a kind of Addition to the Arms of a younger Brother, to diſtinguiſh him from the elder. It is eſteem'd the moſt honourable of all others, and is formed by a Fillet uſually placed in the middle, and along the Chief of the Coat without touching its Extremities. Its Breadth ought to be a ninth part of the Chief. It is adorn'd with Pendants ſomewhat like the Drops under the Triglyphs in the *Doric* Freeze. When there are above three Pendants, the Number muſt be ſpecified in Blazoning: There are ſometimes ſix in the Coats of younger Brothers.

LABIAL, a Term in Law uſed in the ſame ſenſe with Oral. *Labial* Offers are ſuch as are only made by Word of Mouth, or even by Writing, where there is no valuable Conſideration: In Courts of Equity theſe are not regarded. The Grammarians, and eſpecially the Orientals, apply the Terms *Labial*, *Dental*, *Guttural*, to ſuch Letters as are pronounced with the Lips, the Teeth, or the Throat.

LABIATE FLOWERS, from the word *Labium*, a Lip, is a Term applied by Herbaliſts to ſuch Flowers, as have one or two Lips, ſome of which repreſent a kind of Helmet or Monk's Hood. See *Flower*.

LABORATORY, or *Elaboratory*, in Chymiſtry, the Place where the Chymiſts perform their Operations, where their Furnaces are built, their Veſſels kept, &c. In general, the Term *Laboratory* is applied to any Place, where Phyſical Experiments and Operations in Pharmacy, Chymiſtry, &c. are performed. The *Laboratory* of an Hoſpital is the Place where the Remedies are made up.

LABYRINTH, among the Antients was a large intricate Edifice cut out into various Iſles and Meanders running into each other, ſo as to render it difficult to get out of it. There is mention made of four celebrated *Labyrinths* of Antiquity. That of *Crete* is the moſt famed; it was built by *Dædalus*, and it was hence that *Theſeus* made his Eſcape by means of *Ariadne*'s Clue. That of *Egypt*, according to *Pliny*, was the oldeſt of all, and was ſubſiſting in his Time, after having ſtood 3600 Years. He ſays it was built by King *Peteſucus* or *Tithoës*, but *Herodotus* makes it the Work of ſeveral Kings: it ſtood on the Banks of the Lake *Myris*, and conſiſted of 12 Palaces and 1500 Apartments: *Mela* ſays, *ter mille domos*. That of *Lemnos* was ſupported by Columns of wonderful Beauty, there were ſome Remains of it at the Time when *Pliny* wrote. That of *Italy* was built by *Porſenna* King of *Hetruria*, for his Tomb.

Labyrinth, in Anatomy, is the Name of the ſecond Cavity of the Internal Ear, which is hollowed out of the *Os Petroſum*, and is ſo call'd as having ſeveral Windings in it. This Cavity is divided into three Parts; the firſt is that call'd the *Veſtibulum* of the *Labyrinth*, becauſe it leads in to the other two. The ſecond comprehends three Canals crooked ſemicircularly, and thence call'd Semicircular Canals, placed on one ſide of the *Veſtibulum*, towards the back of the Head; and the other call'd the *Cochlea*, ſituate on the other ſide. See *Ear*. Dr. *Vieuſſens* obſerves, that the Bone out of which the *Labyrinth* is dug, is white, hard, and very compact, that the Ethereal Matter of Sounds laden with Impreſſions ſtriking againſt its ſide, may loſe little or nothing of its Motion, but communicate it entire to the Nerves of the Ear.

LACCA, a Gum, or rather Wax, hard, red, brittle, clear and tranſparent, brought from *Malabar*, *Bengall*, and *Pegu*, and uſed in dying of Scarlet, &c. Authors differ as to the Production of this curious Wax. F. *Tachard*, who was on the ſpot, tells us that a kind of little Ants fixing themſelves to the Branches of ſeveral Trees, leave behind them a reddiſh Moiſture, which lying expoſed to the Air and Sun, hardens in five or ſix days time. Some imagine this is not the Production of the Ants, but a Juice which they draw out of the Tree, by making little Inciſions in it; and in effect, the Trees where the *Lacca* is found, do yield a Gum: but then 'tis of a very different Nature from the *Lacca*. The Ants are, as it were, a kind of Bees, and the *Lacca* is their Honey. They work at it eight Months in the Year, and the reſt of the time lie by, becauſe of the Rains.

To prepare the *Lacca*, they firſt ſeparate it from the Branches to which it adheres, pound it in a Mortar, and throw it into boiling Water; and when the Water is well dyed, they pour on freſh, till ſuch time as it will tinge no more. Part of the Water thus tinged is evaporated in the Sun; after which, the thicken'd Tincture is ſtrain'd through a Linnen Cloth.

M. *Geoffroy* examining the Gum *Lacca*, found it to be a kind of Comb, ſuch as the Bees and ſome other Inſects are accuſtomed to make. Upon breaking it into pieces, it appears divided into a great number of *Alveoli* or little Cells of an uniform figure, and which plainly ſhew that it never ouz'd from Trees. Theſe Cells are not mere Excrements, as ſome imagine, but are intended for ſomething to be depoſited in 'em. And accordingly are found to contain little Bodies, which the firſt Obſervers took

for the Wings or other Parts of the Inſects that produced the *Lacca*. Theſe little Bodies are of a beautiful Red; and when broke, make a Powder as fine as Cochineal. 'Tis moſt probable theſe Cells are deſtined to lodge the young Brood, as thoſe of the Bees; and that theſe little Carcaſſes are the Embryo's of Inſects, or perhaps their Skins.

There are ſeveral ſorts of *Lacca*: that mention'd in the laſt Article is the natural: when it is prepared, as in the former, thoſe kinds of dry Cells are not ſeen. M. *Geoffroy* reckons ſix or ſeven different Kinds; beſides which, there are ſeveral Paſts uſed by the Painters, that go by this name, or that of *Laque*. This Gum boil'd in Water with Acids, makes a beautiful Red Dye. The *Engliſh* and *Dutch* uſe it in Scarlet.

Lemery having examined the Gum *Lacca* chymically, judges it to be a mean Mixture between a Gum and a Reſin, more abundant in Salt than Oil.

Artificial Lacca, or *Laque*, is a coloured Subſtance, drawn from ſeveral Flowers; as the Yellow from the Flower of the Juniper, the Red from the Poppy, and the Blue from the Iris or Violet. The Tinctures of theſe Flowers are expreſs'd by diſtilling them ſeveral times in *Aqua Vitæ*, or by boiling them over a Stove-Fire in a Lixivium of Pot-Aſhes and Alumn. Artificial *Lacca* is alſo made of Braſile boil'd in a Lixivium of the Branches of the Vine, adding a little Cochineal, Terramerita, Alumn calcin'd, and Arſenic incorporated with the Bones of the Cuttle-fiſh pulveriz'd, made up into little Cakes and dry'd. If it is to be very red, they add Juice of Citron to it; to make it brown, they add Oil of Tartar. Dove-colour'd or Colombine *Lacca* is made with Braſile of *Fernambouc* ſteep'd in diſtill'd Vinegar for the ſpace of a month, mix'd with Alumn incorporated in the Bones of the Cuttle-fiſh.

LACERNA, the Name of a Garment worn by the Antients. It was a kind of Cloke made of Wool, only uſed by the Men: they wore it over the *Toga*, and when that was not on, over the *Tunica*. It was at firſt very ſhort, but growing popular in the *Roman* Army, was ſoon lengthen'd. The *Lacerna* was ſcarce known in *Rome* till the Time of the Civil Wars and the Triumvirate. Then indeed it came into faſhion, for the Soldiers being then frequently in the City, or at the City-Gates, the Sight became familiar to the Citizens, and they fell into the Uſe of it; inſomuch that it became the common Dreſs of the Knights and Senators, till the Time of *Valentinian* and *Theodoſius*, when the Senators were prohibited the wearing of it in the City. The *Lacerna* was the ſame with the *Chlamys* and *Birrus*. *Martial* mentions *Lacernæ* of ten thouſand Seſterces price. The word comes from the *Greek* λάκη or λάκκη, a Garment.

LACHRYMALIS GLANDULA, in Anatomy, the Name of a ſmall oblong Gland ſituate above the Eye, near the little Canthus, whence proceed two or three ſmall Ducts, which opening on the inner Surface of the Eye-lid, filtrate a Seroſity ſerving to moiſten the Ball of the Eye, and to facilitate its Motion. Near the larger Angle is alſo a little Eminence, in form of a Caruncle, which ſome have taken for another *Glandula Lachrymalis*, but by miſtake, this being no more than the Duplicature of the inner Membrane of the Eye-lids. On the ſame ſide, near the leſſer Angle, are two little Perforations, call'd *Puncta Lachrymalia*; which are the Openings of a little membranous Bag at the Entrance of the Excretory Canal, that deſcends into the Cavity of the Noſe, by which means the ſuperfluous Moiſture of the Eye is diſcharged into the Noſe. On the ſame ſide is a very ſmall Bone, one of thoſe of the upper Jaw, ſometimes call'd *Os Lachrymale*, but more uſually *Os Unguis*.

Fiſtula Lachrymalis is a Fiſtula in the larger Angle of the Eye. It uſually happens after an Abſceſs formed in the Bag above mention'd, by means of the Seroſity lodg'd there; which being retain'd too long, becomes acrimonious, and occaſions an Ulcer which frequently degenerates into a Fiſtula.

LACHRYMALIA PUNCTA, in Anatomy, two little Apertures in the extreme Angles of each Eye-lid, into which an aqueo-ſaline pellucid Humour, ſecreted from the Blood by the *Glandula Lachrymalis*, is convey'd, and thence carried off by the Lachrymous Canals into a little Bag in the Canal of the Noſe; whence by a Pipe, always open, it is carried into the Cavity of the Noſe immediately under the lower *Os Spongioſum*. Hence appears the Reaſon why People in crying run at the Noſe. This Humour ſeparated by the *Glandula Lachrymalis*, ſerves to moiſten and lubricate the Ball of the Eye, and prevent any hurtful Attrition: When it is ſecreted in any great quantity, ſo as to overflow the Eye-lids, it is call'd Tears.

LACHRYMATORIES were antiently ſmall Earthen Veſſels, wherein the Tears of the weeping Friends that ſurvived were repoſited, and buried with the Aſhes and Urns of the Dead. Some of theſe are ſtill ſeen in the Cabinets of the Curious.

LAC LUNÆ, *Milk of the Moon*. See *Milk*.

LACONISM, a ſhort, brisk, ſententious Speech, in the manner of the *Lacedemonians*, who were remarkable for the Cloſeneſs and Conciſeneſs of their way of delivering themſelves.

LACTATION, the giving of Suck, and the Time the Mother doth that Office to her Young.

LACTEAL VEINS, a kind of long ſlender Tubes for the Conveyance of the Chyle from the Inteſtines to the common Reſervatory: They were firſt diſcovered by *Aſellius* an *Italian* Phyſician in 1622, and call'd *Lacteal*, from the Liquor they contain, which reſembles that of Milk. Their Coats are ſo thin, as to be inviſible, except when diſtended with Chyle or Lympha. They ariſe from all the Parts of the ſmall Guts, and as they run from the ſides of the Guts to the Glands in the Meſentery, unite and form larger Branches, called *Venæ Lacteæ primi generis*. The Mouths of theſe *Lacteals*, which are open into the Cavity of the Guts, from whence they receive the Chyle, are ſo ſmall as not to be ſeen by the beſt Microſcope. It was neceſſary they ſhould be ſmaller than the fineſt Arteries in the Body, that nothing might enter to ſtop the Circulation of the Blood. The ſame Extremity of the *Lacteals* has likewiſe communication with the Capillary Arteries of the Guts, by which they receive a Lympha that dilutes, and propels the Chyle forwards, and waſhes the *Lacteals* and Glands, that they might not fur, and be obſtructed by the Chyle's ſtaying in them upon faſting. The other Extremity of the *Lacteals* diſcharges the Chyle into the veſicular Cells of the Glands diſperſed up and down the Meſentery: And from theſe ariſe other *Lacteals* of a larger ſize, which carry the Chyle immediately into the *Receptaculum Chyli*; theſe are called *Lacteæ ſecundi generis*. The *Lacteal* Veins have Valves at ſeveral diſtances, which hinder the Chyle from returning back into the Inteſtines.

It is ſtill doubted whether or no the *Inteſtina Craſſa* afford any *Lacteals* or not. The Impoſſibility of human Diſſection proper for ſuch an Enquiry, gives no room either to affirm or deny. But the Contents of the *Inteſtina Craſſa* ſeem not likely to afford much Chyle, and therefore if there be any, 'tis probable they are very few.

In Brutes, if diſſected at a reaſonable time after feeding, as two or three hours, the *Lacteals* appear very tumid and white; and if wounded, the Chyle flows plentifully from 'em. But if inſpected when the Stomach of the Animals has lain ſome time empty, they appear like Lymphaticks, viſible indeed, but fill'd with a tranſparent Liquor. That the *Lacteals* have a Communication from the Cavities of the Inteſtines, is demonſtrated by their Contents, the Chyle; but how their Pores are diſpoſed to receive it, has not yet been diſcovered: Nor is there any way known whereby to fill the *Lacteals* from the Cavities of the Guts after Death. 'Tis probable then, their Entrance into the Gut is oblique, ſince neither Wind nor Liquors can paſs from thence. As 'tis found theſe Pores can only receive any thing in the living State, we may be allow'd to imagine that 'tis the Periſtaltic Motion of the Guts which diſpoſes them in that State to receive the Chyle. And this may be done by means of the Circular and Longitudinal Fibres of the Inteſtines ſtill applying the Internal Coats of the Guts to their Contents, by which means its Pores abſorb the Chyle from the Excrementitious Part.

LACTEA VIA, *the Milky Way*. See *Galaxy*.

LACUNÆ, among Anatomiſts the Name of certain excretory Canals. Between the fleſhy Fibres of the Ureter and the Membrane of the Vagina in Women, is found a whitiſh glandulous Body about a finger thick, running round the Neck of the Bladder, having a great number of excretory Ducts, which *Graef* calls *Lacunæ*, and which terminate in the lower part of the Orifice of the Womb, conveying thither a ſlimy Matter, that mixes with the Seed of the Male. See *Generation*.

LACUNAR, in Architecture, an arched Roof or Cieling, more eſpecially the flanking or flooring above the Portico's and Piazza's.

LADANUM, or *Labdanum*, in Pharmacy, the Name of a Gummous or Reſinous Matter ouzing out of the Leaves of a Shrub call'd *Ciſtus Ladanifera*, which is very common in the hot Countries, and whereof there are various kinds. They gather the *Ladanum* by means of Goats, which brouzing on the Leaves of this Shrub, return to the Stable with their Beards loaden with a fat Subſtance, which the Peaſants rake off, with a kind of Combs made for that purpoſe. This Matter they thus collect into Lumps, and, as 'tis mix'd with the Goats Hair and other Impurities, call it *Ladanum* in the Beard, or natural *Ladanum*. Others draw Cords over the Leaves and other Parts of the Shrub, and ſcraping off what had ſtuck to the Cords, make up the *Ladanum* into little Balls. *Ladanum* is uſed in Phyſick to ſoften, digeſt, attenuate

and

and reſolve. That which is brittle, of an aſh-colour, ſweet-ſcented, &c. is the beſt. *Pietro della Valle* tells us he was inform'd by the *Indians*, that *Ladanum* is formed like Dew, and falls from Heaven like Manna, that it is gather'd on the Leaves of a Plant, a Palm and an half high; that after gathering they boil it, by which means it becomes ſoft like Wax.

Liquid Ladanum is a Preparation of the natural *Ladanum*, by melting and purifying it from the Hairs, &c. This is ſometimes ſold for a black Amber.

LAGAN, at firſt was the Right which the chief Lord of the Fee had to take Goods caſt on the Shore by the Violence of the Sea, but afterwards ſignified a Right which any one had to Goods ſhipwrecked and floating in the Sea, becauſe being remote from the Shore, it could not be determined to whoſe Fee they properly belonged. The word *Lagan* comes from the *Saxon* Liggan, *cubare*, *to lie*, and not from *ligare*, *to bind*, as ſome will have it, becauſe the Goods are frequently tied together to prevent their ſinking.

LAGOPHTHALMIA, a Diſeaſe of the Eye-Lids, when the upper Lid is ſo contracted that the Eye can't be quite ſhut, but remains open even in the time of Sleep. The word comes from the *Greek* λαγὼς, *Hare*, and ὀφθαλμὸς, *Eye*: this being the Property of the Eyes of Hares.

LAIR is a Term in Hunting, for the Place where Deer harbour by day; alſo a Place where Cattel uſually reſt under ſome Shelter, the Ground being enriched by their Dung.

LAKE, a large Quantity of Water incloſed in the Cavity of ſome Inland Place, of a conſiderable Extent and Depth. Properly ſpeaking, however, thoſe only are called *Lakes*, which receive and emit Rivers. *Lakes* are of four kinds; (1.) Such as neither emit nor receive Rivers. (2.) Such as emit Rivers without receiving any. (3.) Such as receive without emitting any. (4.) Such as both receive and emit Rivers. Of the firſt kind ſome are perennial, others temporary; the temporary owe their Origin moſt of them to Rain, and to the Cavity or Depreſſion of the Place where they are lodged. In the *Indies* they make artificial *Lakes*, which they wall about, to catch the Rain in wet Seaſons, and preſerve it for their Uſe in the dry ones. There are ſeveral of this kind of *Lakes*, formed by the Inundations of the Sea and Rivers, particularly the *Nile* and *Niger*; which, when they retire within their Banks, leave Floods of Water, which the Inhabitants take care to incloſe, to ſerve as a Magazine for the enſuing Months. The Generation of perennial *Lakes* may be alſo referred to Rain, where the Cavity is ſo deep as to receive a Quantity in Winter more than the Heat of the Sun will exhale in Summer; tho 'tis probable many of theſe *Lakes* have their Springs at bottom, by which they are continually ſupplied. To this Claſs may be referred the Turloughs, *i. e. Terreus Lacus*, or Land-Lakes in *Ireland*, which are *Lakes* one part of the Year, and the reſt very ſmooth Fields: At the bottom of theſe Turloughs are found Holes, through which the Water runs in Winter, and ſinks towards Summer.

The ſecond Species of *Lakes*, which emit without receiving Rivers, is very numerous; they owe their Origin to Springs, the Cavities where the Spring is found not being able to contain all the Waters it yields.

The third kind, *viz* thoſe which receive Rivers without emitting any, apparently owe their Origin to thoſe Rivers, which, in their Progreſs from their Source, falling into ſome ample Cavity, are collected together, and form a *Lake* of ſuch Dimenſions as may loſe as much by Exhalation as it continually receives from its Spring; or ſometimes happening on a ſoft ſpongy Soil, that imbibes the Water, and tranſmits it to the neighbouring Grounds. The Number of theſe is ſmall.

The fourth Species both receives and emits Rivers. Of theſe we reckon three different kinds, as the Quantity of Water they emit is greater, equal, or leſs than that they receive. If the Quantity they emit be greater, 'tis plain they muſt have a Spring at the bottom; if leſs, there muſt be ſome ſubterraneous Ducts or Canals, or elſe the Earth muſt be ſpongy; if it be equal, we gather that they have neither any hidden Springs nor Canals. Of theſe *Lakes* we have a great Number, and thoſe very conſiderable ones.

The Generality of *Lakes* conſiſt of freſh Waters, as moſt of thoſe which are ſupplied either from ſome Spring far from the Sea, or a River, or from the Rain: Some few of Salt-water; as thoſe produced by the Inundation of the Sea, or by its Immiſſion through ſome Duct of the Earth, or that have Salt Springs at bottom. Dr. *Halley* is of Opinion, that all great perennial *Lakes* are ſalt, either in a greater or leſs Degree, and that this Saltneſs increaſes with Time, and on this Foundation propoſes a Method for determining the Age of the World.

The large *Lakes*, wherewith the *Northern* Regions abound, ſerve for very good Purpoſes, inaſmuch as the warm Vapours ariſing from them ſerve for a Defenſative againſt the pinching Cold of thoſe Climates. To this it is owing, that *Ireland*, *Scotland*, &c. are leſs affected with Froſts than much warmer Countries.

LAMA, the Title of an Order of Prieſts among the *Weſtern Tartars*, on the Frontiers of *China*; theſe *Lama's* are held in great Veneration. They have a Grand *Lama*, who is their High-Prieſt, and who is the ſecond Perſon in the Kingdom, being the next in Authority to the King. He receives Homage and Adoration not only from the People, but from the neighbouring Kings; none of whom are ever inthroned, without ſending Ambaſſadors to him to obtain his Benediction. The *Lama's* are extremely ſuperſtitious, and are remarkably given to Magick.

LAMBATIVES, a Form of Medicines to be lick'd off the End of a Liquorice-Stick. The ſame with *Linctus's*, *Lohocks*, and *Eclegmas*, which ſee.

LAMBDOIDES, in Anatomy, an Epithet applied to the third proper Suture of the Cranium, in regard it reſembles the Form of a *Greek* λ *Lambda*; for the ſame reaſon it is ſometimes called *Ypſiloides*, as bearing ſome Reſemblance to a *Greek* ϒ *Ypſilon*.

LAMELLÆ, a Diminutive of *Laminæ*, little thin Plates, whereof the Scales and Shells of Fiſhes, &c. are compoſed.

LAMIÆ, among the Antients, were eſteemed a kind of Demons, or evil Spirits, who, under the Form of beautiful Women, devoured Children. *Horace* makes mention of them in his *Art of Poetry*. Some Authors call them *Laniæ*, *à laniando*. *Philoſtratus* ſays, they are alſo called *Larvæ*, or *Lemures*, as if they were the ſame thing. *Bochart* will have the word to be *Phœnician*, and derives it from לחם, *to devour*, alledging the Fable of the *Lamiæ* came from *Lybia*.

LAMINÆ, thin Plates or Tables, whereof any thing conſiſts, particularly the human Skull, which are two, the one laid over the other.

LAMMAS-DAY, *quaſi Lamb-mas*, is the firſt of *Auguſt*, ſo called, as ſome will have it, becauſe Lambs were not then fit to eat, as being grown too big. Others derive it from a *Saxon* word, ſignifying *Loaf-Maſs*, becauſe on that Day our Forefathers made an Offering of Bread made with new Wheat. On this Day the Tenants, who formerly held Lands of the Cathedral Church in *York*, were bound by their Tenure to bring a Lamb alive into the Church at High-Maſs. See *Gale*.

LAMP, a Preparation of Oil, &c. in a proper Veſſel, for burning. The Uſe of lighted Lamps in Churches and Places of Devotion is very antient. In the City of *Fez* is a Moſque wherein are 900 brazen *Lamps* burning every Night. In *Turkey* all their Illuminations are with *Lamps*. *Polydore Virgil* aſcribes the firſt Invention of *Lamps* to the *Egyptians*, and *Herodotus* deſcribes a Feaſt of *Lamps* held annually in *Egypt*.

Kircher ſhews the manner of preparing Lamps which diffuſe a Light ſo diſpoſed, as to make the Faces of thoſe preſent appear black, blue, red, or any other Colour. There has been a great Diſpute among the Learned about the Sepulchral Lamps of the Antients: ſome maintain they had the Secret of making Lamps that were inextinguiſhable, alledging ſeveral that had been found burning at the opening of Tombs 15 or 16 Hundred Years old. But others treat theſe Relations as Fables; and others think that the Lamps which before were extinguiſh'd, take Light a-freſh upon the Admiſſion of freſh Air. Dr. *Plott* however is of Opinion ſuch perpetual Lamps are things practicable, and has himſelf made ſome Propoſals of this kind. The *Linum Aſbeſtinum* he thinks may do pretty well for the Wick, and that Naptha, or Liquid Bitumen, conſtantly ſpringing into ſome of the Coal Mines, will anſwer for the Oil. If the Aſbeſtos won't make a perpetual Wick, he thinks there is no matter in the World that will; and argues that the Tradition of ſuch Lamps muſt be fabulous, or that they made them without Wicks. Of this Kind he thinks it poſſible to make one of the Bitumen ſpringing into the Coal Mines at *Pitchford* in *Shropſhire*; which, he ſays, like other liquid Bitumens, will burn without a Wick. He makes a Propoſal too, for imitating thoſe Lamps that kindle on the Immiſſion of freſh Air; by incloſing ſome of the liquid Phoſphorus in the Recipient of an Air-Pump; which, under thoſe Circumſtances, will not ſhine at all, but on letting in the Air into the Recipient, there will poſſibly, ſays he, appear as good a perpetual Lamp as ſome that have been found in the Sepulchers of the Antients.

Cardan's Lamp, is a Contrivance of that Author which furniſhes it ſelf with its own Oil. It conſiſts of a little Column of Braſs, Tin, or the like, well cloſed every where, excepting a ſmall Aperture at Bottom, which opens into the Middle of a little Neck where the Wick is placed. Here the Oil cannot get out, but in proportion as

it

it ſpends, and ſo clears the Paſſage of that little Aperture. This Kind of Lamp has become much in Uſe within theſe twenty or thirty Years; but it has ſeveral Inconveniences, as that the Air gets into it by Starts and Gluts; and that when the Air in the Cavity comes to be much rarefied by Heat, it drives out too much Oil, ſo as ſometimes to extinguiſh the Lamp. Dr. *Hook* and Mr. *Boyle* have invented other Lamps that have all the Conveniences of *Cardan*'s, without the Inconveniences. See ſome Improvements in the Doctrine of Lamps under *Mirror*.

LAMPADARY, an Officer in the antient Church of *Conſtantinople*. His Buſineſs was to ſee the Church well lighted, and he bore a Taper before the Emperor, the Empreſs, and the Patriarch, when they went to Church, or in Proceſſion. The Taper born before the Emperor was incompaſſed with various Circles of Gold in manner of Crowns, thoſe held before the Empreſs and Patriarch had but one. It ſeems they were of emblematical Uſe, and were intended to keep thoſe great Perſons in mind, that their Light was to illumine thoſe underneath them. See the *Greek* Euchology, *Balſamon*, &c.

There were alſo *Lampadaries* in the Emperor's Palaces; at firſt the Privilege was only granted to the Great Officers of the Crown, and the Chief Magiſtrates, but afterwards the Emperor allowed it to other inferior Officers, as Queſtors, Treaſurers, *&c.* Together with the Taper, they bore before the Magiſtrates the Emperor's Image, *&c.* On which account, 'tis probable, they were firſt permitted to have a Lampadary. The word is formed from the *Latin*, *Lampas* a Lamp.

LAMPADIAS is a kind of bearded Comet, reſembling a burning Lamp, tho' of ſeveral Shapes; for ſometimes its Flame or Blaze runs tapering upward like a Sword, and ſometimes is double or triple pointed.

LAMPERS, is a kind of Swelling in the Mouth of an Horſe, ſo called becauſe it is cured by burning with a Lamp, or an hot Iron: it proceeds from abundance of Blood reſorting to the firſt Furrow of the Mouth, near the Fore-teeth, that cauſes the ſaid Furrow to ſwell as high as his Gathers, which will hinder his feeding, and makes him let his Meat fall half chewed out of his Mouth again. It is a natural Infirmity which every Horſe has firſt or laſt, and every common Smith can cure.

LAMPETIANS, a Sect of antient Hereticks who fell in with ſome of the Opinions of the *Arians*. Their Founder *Lampetius* is ſaid to have been one of the Chiefs of the *Marcionites*. They condemn'd all Kind of Vows, particularly that of Obedience, as inconſiſtent with the Liberty of the Sons of God.

LAMPROPHORUS, a Name antiently given to the *Neophytes* during the ſeven Days that ſucceeded their Baptiſm. In the Ceremony of Baptiſm the new Chriſtian was cloath'd with a white Robe, which he wore for the Week following, and was thence call'd *Lamprophorus*, which ſignifies a Perſon wearing a ſhining Garment, from λαμπρὸς and φέρω, I carry. The *Greeks* alſo give this Name to the Day of the Reſurrection, in regard their Houſes were adorned and illumined on this Day with an infinite Number of Torches as a Symbol of the Light which that Myſtery diffuſed in the World.

LANAR. See *Lanner*.

LANCE, an offenſive Weapon, bore by the ancient Cavaliers in form of a half Pike. It conſiſted of three Parts, the Handle, the Wings, and the Dart. *Pliny* attributes the Invention of Lances to the *Etolians*. *Varro* and *Aulus Gellius* ſay, the Word *Lance* is *Spaniſh*; whence others conclude the Uſe of this Weapon was borrow'd by the People of *Italy* from the *Spaniards*. *Diodorus Siculus* derives it from the *Gauliſh*, and *Feſtus* from the Greek λόγχη; *Pezron* from the *Celtic*, and *Borell* from the *Hebrew*.

LANCETI, a Name given by the antient Laws of *England* to a kind of Vaſſals who were obliged to work for their Lord one Day in a Week from *Michaelmas* to *Autumn*, either with Fork, Spade, or Flail, at the Option of the Lord.

LANCETTE, is a Chirurgeon's little Kniſe, ſtreight-pointed, two edged, uſed in opening Veins, *&c.*

LANDAU, a Tree in the *Molucca*'s, whereof the Natives make their Bread. When it is fell'd they cleave it into two in the Middle, and dig out the Pith, which is even eatable when it comes freſh out of the Tree. They chop it very ſmall, till ſuch time as it is reduced into a kind of Powder ſomewhat like Meal. This done, they put it in a Searce made of the Bark of the ſame Tree, and place the Searce over a Ciſtern made of its Leaves, pouring Water upon it, and by this means ſeparating the pure Part of the Powder from the Veins of Wood wherewith the Pith abounds. The Flower thus filtrated, they call Sagu; they make it into Paſte, and bake it in earthen Furnaces; and this they do with ſo much Expedition, that in three or four hours a Man makes as much Bread as will feed an hundred Perſons a day. From the ſame Tree they draw a Liquor as agreeable to drink as our Wines. The Leaves, when they are young, are cover'd with a kind of Cotton, whereof they make their Cloth, and as they grow older they ſerve them to tile their Houſes. The larger Veins of theſe Leaves ſerve 'em for Stakes in building; and of the ſmaller they make a kind of Hemp, wherewith they make very good Ropes.

LAND-CHEAP, is an antient cuſtomary Fine paid either in Cattle or Money, upon the alienating or ſelling of Land in ſome particular Mannor, or within the Liberty of ſome Borough; as at *Malden* in *Eſſex*, a Payment is ſtill made of 13 *d.* in every Mark of the Purchaſe-Money, for certain Lands and Houſes ſold in that Town.

LAND-FALL, is a Sea-Term, ſignifying to fall in with the Land. Thus when a Ship out at Sea expects to ſee Land in a little time, and it ſo happens that ſhe doth, they ſay they have made a good *Land-fall*.

LAND-GABLE, an antient Term for a Tax or Rent iſſuing out of Land.

LAND-LOCKED. A Ship is ſaid to ride *Land-locked*, when ſhe is at Anchor in ſuch a Place where there is no Point open to the Sea, ſo that ſhe is ſafe from the Violence of Winds and Tides.

LANDSKIP, or *Landſchape*, the View or Proſpect of a Country, extended as far as the Eye will carry. *Landſkips* in Painting, are Pieces repreſenting ſome Champaign or Rural Subject, as Hills, Vales, Rivers, Country Houſes, *&c.* where human Figures are only introduced as Accidents or Circumſtances. This is eſteemed one of the loweſt Branches of Painting.

LANGREL SHOT, is a ſort of Shot uſed at Sea; it is made of two Bars of Iron, with a Joint in the Middle, by which means it can be ſhortened, and ſo put the better into the Gun; and at each End there is an half Bullet either of Lead or Iron. When it is diſcharged, it flies out at length, and is of uſe to cut the Enemies Rigging, *&c.*

LANGUAGE, a Set of Words which any People have agreed upon, in order to communicate their Thoughts to each other. The firſt Principles of all *Languages*, *F. Buffier* obſerves, may be reduced to Expreſſions ſignifying, 1*ſt*, The Subject ſpoke of. 2*dly*, The Thing affirmed of it. 3*dly*, The Circumſtances of the one and the other: But as each *Language* has its particular Ways of expreſſing each of theſe; *Languages* are only to be looked on as an Aſſemblage of Expreſſions, which Chance or Caprice has eſtabliſhed among a certain People; juſt as we look on the Mode of Dreſſing, *&c.* 'Tis Uſe and Cuſtom is the Rule of a *Language*, and theſe hold their Empire independent of Reaſon or any other Cauſe: Nor has Reaſon any thing to do in *Language*, unleſs to ſtudy or teach it, ſuch as it is: Here then commences Grammar; a juſt Plan of which, ſuppoſes a *Language* already introduced by Uſe, and without pretending to alter or amend a tittle, only furniſhes Reflections, call'd Rules, to which the Manners of ſpeaking uſed in that *Language* can be reduced; which Aſſemblage of Reflections is what we call the Grammar of that *Language*. This Remark may obviate an Abuſe introduced among Grammarians, who are ever crying out, *Uſe is in this Point oppoſite to Grammar, or the* Language *here frees itſelf from* the Rules of Grammar, *&c.*

'Tis Chance then to which we owe Uſage and Uſage that makes the Rules and Meaſures of a *Language*. Uſe indeed is ſomewhat dubious, and may be divided into good and bad: If 'tis ask'd wherein the difference between theſe lies; 'tis in this, that the one is better eſtabliſhed or authorized than the other: And if it be ask'd wherein that Difference of Authority conſiſts, 'tis anſwer'd, that in dead Languages, that which makes the good Uſe is the Writings of the beſt Authors in that *Language*: And if it be further queſtioned, which are the beſt; thoſe are allow'd ſuch who wrote when that State was in its greateſt Glory. Thus the Age of *Auguſtus* being the moſt diſtinguiſhed by great Men who then flouriſh'd, we call that good *Latin* which is conformable to the Manners of Speaking uſed by Authors who wrote fifty Years before, and fifty after the Reign of that Emperor. As to the living *Languages*, their good Uſe, or their Mode, is derived from the Expreſſions uſed by the moſt eminent Perſons among that People; whether as to Quality and Authority, or as to Learning and the Reputation of writing well. With this View M. *Vaugelas* defines the Uſe of a *Language*, The Manner of Speaking uſed by the beſt Part of the Court, conformably to the Manner of Writing among the beſt Part of the Authors of the Time. But this Definition, how judicious ſoever, may occaſion infinite doubt; for which is to be deem'd the beſt Part of the Court and of the Writers? Each Party doubtleſs thinks itſelf the beſt. *F. Buffier*, therefore, very juſtly, inſtead of the beſt Part ſubſtitutes the *greateſt* Part, which brings the Matter to a Certainty; the moſt numerous

rous Part being ſomething fix'd and palpable, whereas the moſt ſound Part may be inſenſible or arbitrary. See *Grammar*.

There is found a conſtant Reſemblance between the Genius or Natural Complexion of each People and the Language they ſpeak. Thus the *Greeks*, a polite but voluptuous People, had a *Language* perfectly ſuitable, full of Delicacy and Sweetneſs. The *Romans*, who ſeemed only born to command, had a *Language* noble, nervous, and auguſt; and their Deſcendants, the *Italians*, are ſunk into Softneſs and Effeminacy, which is as viſible in their *Language* as their Manners. The *Language* of the *Spaniards* is full of that Gravity and Haughtineſs of Air which make the diſtinguiſhing Character of the People. The *French*, who have a World of Vivacity, have a *Language* that runs extremely brisk and lively. And the *Engliſh*, who are naturally blunt, thoughtful, and of few Words, have a *Language* exceedingly ſhort, conciſe, and ſententious.

The Diverſity of Languages is generally allowed to have took its Riſe from the Confuſion of *Babel*, both by *Jews*, *Chriſtians*, and *Mahometans:* But the Manner in which this Diverſity was effected, is ſtill in diſpute among the Learned. The Queſtion is, Whether God only expunged the Remembrance of the Signification of Terms in thoſe who built the Tower; or whether he immediately inſpired them with new Words. *Scaliger* holds that they only forgot the Meaning of the Words, and named one thing inſtead of another; tho' all indifferently ſpoke the *Hebrew* Tongue. Nor does *Caſaubon* allow that they immediately ſpoke different *Languages*: the Confuſion of Tongues he thinks might be very well effected, without introducing a Multiplicity of *Languages*. *See* Ziegra *de Confuſione Linguarum Babylonica ad Geneſ. XI.*

As to the Point of Antiquity, that too has been extremely controverted. *Herodotus* tells us, that in the Diſpute between the *Egyptians* and *Phrygians* about the Antiquity of their *Languages*, *Pſammeticus* King of *Egypt*, ordered two Children to be brought up, with expreſs Prohibition not to have one Word pronounced before them, but to leave Nature to ſpeak of her ſelf; and the firſt Word they ſpoke happen'd to be *Beccos*, which in the *Phrygian Language* ſignifies Bread. The *Egyptians* however were not convinced with this Proof. The *Arabs* diſpute the Point of Antiquity with the *Hebrews:* But the *Jews*, jealous even to Exceſs of the Honour of their Nation, poſitively inſiſt on it, that the *Hebrew* Tongue, ſuch as it is found in the Holy Scriptures, is the primitive Language, and that ſpoken by the firſt Man. Others maintain that the *Language* ſpoken by *Adam* is loſt, and that the *Hebrew*, *Chaldee*, and *Arabic*, are only Dialects of that original Tongue. So far are they from giving the Priority to the *Hebrew*, that they maintain *Abraham* ſpoke *Chaldee* before he paſs'd the *Euphrates*; and that he firſt learn'd the *Hebrew* in the Land of *Canaan:* ſo that this was not a ſpecial *Language* conſecrated to the People of God, but was originally the Language of the *Canaanites*.

M. *le Clerc* is of Opinion the *Hebrew* is far inferior to the *Greek*, both in Copiouſneſs, Elegancy and Perſpicuity; it is dry and deſtitute of Ornaments, inſomuch that wanting Expreſſions to vary the Phraſe, the ſame Periods are perpetually returning. The *Rabbins* ſay 'tis ſo pure and chaſte, that it has no proper Names for the Parts of Generation, nor for thoſe by which the Excrements are diſcharged. The *Arabic* is held the moſt copious of all *Languages*; it has 300 different Words to expreſs a Lion, and no leſs than 1200 for a Sword.

Languages are divided into matriculate or original *Languages*, as the *Hebrew* and *Arabic* in the Eaſt, the *Teutonic* and *Sclavonic* in the Weſt; and into ſecundary or derived *Languages*, which are thoſe formed out of a Mixture of ſeveral Tongues, as *Latin*, *French*, &c. *Kircher* will have the *Cophtic* a Mother Tongue, independent of all others; and *Du John* maintains the *Gothic* to be primitive, and the Mother of all the *Teutonic* Tongues; that is, of all thoſe ſpoke in the North. Some add the *Baſque* and *Low Briton* to the Number of Mother Tongues, imagining them to have been thoſe of the antient *Celtæ* or *Gauls*.

The learned or dead Languages are thoſe which only ſubſiſt in Books, which muſt be learned by the Rules of Grammar, as the *Greek*, *Hebrew*, *Syriac*, and *Chaldee*. See theſe under *Hebrew*, *Greek*, &c. *Raimond Lully* ſollicited the Eſtabliſhment of the Study of theſe Languages a long time in the 13th and 14th Centuries. At length, in the Year 1312, Pope *Clement* and the Council of *Vienna*, appointed that in the Court of *Rome*, and in the Univerſities of *Paris*, *Oxford*, *Boulogne*, and *Salamanca*, there ſhould be inſtituted Profeſſors of each, who ſhould have Salaries from the reſpective Courts. The Monks however vigorouſly oppoſed the ſpreading of theſe Studies, and with ſo much Succeſs, that *Eraſmus* tells us in his Time, *Græce noſſe ſuſpectum Hebraice prope Hæreticum.*

The living *Languages* are thoſe ſtill ſpoke in ſome Country or other, and which may be learn'd by Converſation. The moſt popular among theſe are the *French*, *Italian*, *Spaniſh*, and *Engliſh*; which ſee under their reſpective Names.

The *Spaniards* ſeem to place the Nobleneſs and Gravity of their *Language*, in the Number of Syllables, and the Swelling of Words; and ſpeak leſs to make themſelves underſtood, than to make themſelves admired. Their Terms are big and ſonorous, their Expreſſions haughty and boiſterous, and Pomp and Oſtentation run thro' all they ſay: their *Language* cannot paint a Thought to the Life; it always magnifies it, frequently diſtorts it; and does nothing if it do not exceed Nature. The *Italian* Tongue does not ſwell up Things to that Degree, but it adorns and embeliſhes them more; yet theſe Ornaments and Embeliſhments are not real Beauties. The *Italian* Expreſſions, thus rich and brillant, are like thoſe Faces cover'd with Patch and Paint, which make a fine Show; but that Finery, all Deceit. The *French Language* (as ſome of their Authors expreſs themſelves) is ſimple without Lowneſs, bold without Indecency, elegant and florid without Affectation, harmonious without Swelling, majeſtick without Pride, delicate without Softneſs, and ſtrong without Roughneſs. As to the Points of Strength and Majeſty, the *French* muſt give Way to the *Engliſh*, which in theſe, as well as in Copiouſneſs, exceeds moſt of the living *Languages*; as far as it comes behind ſome of them in Smoothneſs and Delicacy. Of all the modern *Languages*, the *Engliſh* is allowed to be the cloſeſt and the moſt clear, the chaſteſt and the moſt reſerved in its Diction, the moſt judicious and ſevere in its Ornaments: Of all others it is the moſt honeſt, open, and undeſigning; it won't bear double-meanings, nor can it palliate or hide Nonſenſe: bad Senſe and good *Engliſh* being Things inconſiſtent. With all its Sublimity it is gay and pleaſant on occaſion; but its Gaiety is ſtill moderated and reſtrained by good Senſe; it hates exceſſive Ornaments, and for the greater Simplicity, would almoſt chuſe to go naked: It never dreſſes more than Decorum and Neceſſity requires. The *Spaniſh* reſembles thoſe Rivers whoſe Waters are always ſwelling, and always muddy and turbulent; that never keep long within their Channel, but are ever overflowing, and their Overflowings ever noiſy and precipitate. The *Italian* is like thoſe pleaſing Rivulets that purl agreeably among the Stones, and glide in Meanders through Meadows full of Flowers. The *French* reſembles one of thoſe beautiful Streams that always run briskly, but at the ſame time ſmoothly and equally; without much Noiſe or much Depth. The *Engliſh*, like the *Nile*, preſerves a Majeſty even in its Abundance; its Waters roll rapidly, notwithſtanding their Depth; it never roars but when its Banks are too narrow, nor overflows without enriching the Soil. The *Latin* is the common Mother of the three former, but the Daughters have very different Genius's and Inclinations. The *Spaniſh*, a haughty Dame, that piques herſelf on her Quality, and loves Exceſs and Extravagancy in every thing. The *Italian*, a Coquette, full of fine Airs; always appearing dreſs'd, and taking all Occaſions of ſhewing her Finery: to be admired, being all ſhe aims at. The *French*, an eaſy Prude, that has her Share of Modeſty and Diſcretion, but on occaſion can lay them both aſide. The *Engliſh* is of a more Maſculine Temperament. 'Tis not only of a different Family from the others, but appears of a different Sex too: Its Virtues are thoſe of a Man: indeed 'tis the Product of a colder Climate and a rougher People, and its Features may be ſomewhat coarſer than thoſe of its Neighbours; but its Faculties are more extenſive, its Conduct more ingenuous, and its Views more noble. See *Engliſh*, *French*, &c.

Ennius and *Cecrops* are celebrated for their Knowledge of various *Languages*. *Mithridates* King of *Pontus* underſtood twenty two Tongues, which was the Number of different People over whom he commanded; and thoſe *Languages* he knew ſo well, that he was able to harangue each of his People in their own *Language*. 'Twas a Saying of *Charles* the Vth, that ſo many *Languages* as a Man underſtands, ſo many times he is Man. Sultan *Soliman's* Interpreter ſpoke perfectly well 17 different *Languages*. But among the Moderns none have been more remarkable in this Way than *Poſtellus*, who, beſides a perfect Knowledge of all the dead *Languages*, was ſo well acquainted with the living, that 'tis ſaid he could have made the Tour of the Globe without the Uſe of an Interpreter.

Bibliander has written of the Analogy and Proportion of all *Languages* and Letters, *De ratione Communi Linguarum*, in 1518. *Geſner* of the difference of *Languages* in 1572. *Lazius* publiſhed an Introduction to the Learning of the politeſt *Languages* in a common Method, in 1548. *Megiſſier* a Scheme of 40 different *Languages*, and different Dia-

lects, Specimens of each whereof he gives in the Lord's-Prayer, in 1593. *De Recoles*, in his Addition to the World of *Daviti*, has publiſhed the *Pater-noſter* in all the *Languages* ſpoke among Chriſtians; and M. *Chamberlayne* has lately propoſed to do the ſame in 100 *Languages*, a Specimen of which has been already publiſhed. *Alberia Gentilis* wrote of the Mixture of *Languages*, in 1603. And Father *Reinier*'s Diſcourſe on Etymologies, is a Work of the ſame Kind. In 1613, *Duret* publiſhed a Treaſure of the Hiſtory of *Languages*; and *Guichart* of the Etymological Harmony of *Languages*, in 1619. *Brerewood* has made curious Enquiries into the Difference of *Languages* and Religions.

Among the *Malteſe*, the Word *Language* is uſed for Nation. The Order of Knights is divided into eight *Languages*, three whereof are for *France*, *viz.* the *Language* of *Provence*, of *Auvergne*, and of *France*; two for *Spain*, thoſe of *Caſtile* and *Arragon*; the other three are the *Languages* of *Italy*, *England*, and *Germany*. Each of theſe *Languages* has its Chief, who preſides in Aſſemblies of the *Language* to which he belongs.

LANGUED, a Term in Heraldry, applied to ſuch Animals whoſe Tongue appears out of their Mouths, being of a Colour different from that of the Animal.

LANGUOR ſignifies a Faintneſs, which may ariſe from a Want or Decay of Spirits thro' Indigeſtion, or too much Exerciſe; or from an additional Weight of Fluids, from a Diminution of Secretion by the common Diſcharges.

LANIGEROUS, any thing that bears Wool. Hence *Lanigerous* Trees, among Herbaliſts, are thoſe Trees that bear a woolly downy Subſtance, as the black, white, and trembling Poplars, Oſiers, and Willows of all Sorts.

LANTHORN, an Utenſil of tranſparent Matter, ſerving for the Preſervation and Conveyance of Light, notwithſtanding the Inconveniences of Wind or Weather. *Epictetus*'s *Lanthorn* is ſaid to have been ſold for 3000 Drachms. *Lanthorns* are made of Glaſs, Horn, Paper, &c. That of *Diogenes* was held in great Veneration among the Antients; and that of *Judas* is ſtill preſerved in the Treaſury of St. *Denys*, as a very curious Piece of Antiquity. *Lanthorns* were formerly made of the Horn of a wild Bull call'd *Urus*; which when cut into thin Laminæ, *Pliny* tells us was very tranſparent. A Dark *Lanthorn*, is a *Lanthorn* with only one Opening, or Light, which, too, may be cloſed up, when the Light is to be intirely hid, and may be preſented to the Perſon one would ſee, without being perceiv'd one's ſelf. The Antients had their Dark *Lanthorns*, but they differ'd from ours; they were covered with four Skins, one of each Side or Light, three whereof were black, and only the fourth tranſparent. *Caſaubon* who gives us the Deſcription, took it from a Manuſcript of *Julius Frontinus*. Theſe were principally uſed in their Armies when they were to march privately off from their Enemies in the Night-time. The Word *Lanthorn* is derived from the Latin *laterna* of *lateo*, I am hidden, *eo quod lucem habeat interius clauſam*, in regard the Light is hidden within, ſays *Iſidore* and *Lambin*. But according to *Pezron*, *Laterna* comes from the *Celtic Letern*; and according to *Salmaſius*, *Lanthorn* comes from *lato*, in regard it bears a Lamp or a Light.

In *China* they have a celebrated Feaſt call'd the Feaſt of *Lanthorns*, held on the 15th Day of the firſt Month: 'Tis ſo call'd from the infinite Number of *Lanthorns* hung out in the Houſes and Streets; which, 'tis ſaid, is not leſs than two hundred Millions: inſomuch that it rather appears a Fit of Madneſs than of Feaſting. On this Day are expoſed *Lanthorns* of all Prices, whereof ſome are ſaid to coſt 2000 Crowns. Some of their Grandees retrench ſomewhat every day out of their Table, out of their Dreſs, Equipage, &c. to appear the more magnificent in *Lanthorns*. They are adorn'd with Gilding, Sculpture, Painting, Japanning, &c. and as to their Size, 'tis extravagant; ſome are from 25 to 30 Foot Diameter: they repreſent Halls and Chambers, and two or three ſuch Machines together would make handſome Houſes; ſo that in *China* they are able to eat, lodge, receive Viſits, have Balls, and act Plays in a *Lanthorn*. To illumine them, they ſhould have Bonefires; but as that would be inconvenient, they content themſelves with lighting up in them an infinite Number of Torches or Lamps, which at a diſtance have a beautiful Effect. In theſe they exhibit various Kinds of Shews to divert the People. Beſides theſe monſtrous *Lanthorns*, there is an infinite Number of leſs: theſe uſually conſiſt of ſix Faces or Lights, each about 4 Feet high, and one and a half broad, framed in Wood finely gilt and adorned; over theſe they ſtretch a fine tranſparent Silk, curiouſly painted with Flowers, Trees, and ſometimes Human Figures: the Painting is very extraordinary, and the Colours extremely bright; and when the Torches are lighted, they appear very beautiful and ſurprizing.

Lanthorn in Architecture, a kind of little Dome raiſed over a large one, or over the Roof of a Building, to give Light, and to ſerve for a Corona, or to finiſh the Building. The Word is alſo uſed for a ſquare Cage of Carpentry, with Glaſs in it, placed over the Ridge of a Corridor, or a Gallery between two Rows of Shops, to illumine them, as that in the *Royal-Exchange*, *London*.

Magic Lanthorn, in Opticks, the Name of a Machine, which in the Dark repreſents various Images and Spectres on a Wall, or other white Surface, ſo odd and ſurprizing, that thoſe who are not in the Secret, think them the Effect of Magic. See *Magic*.

LANUGO ſignifies a Down, or ſoft woolly Subſtance, which grows upon ſome Plants, which therefore are called lanuginous Plants.

LAPIDARY, an Artificer who cuts precious Stones. The Word is alſo applied to Merchants who trade in 'em, and Vertuoſo's well vers'd in their Nature, Kind, &c. in which Senſe, the preſent *Great Mogul* is ſaid to be one of the greateſt Lapidaries in the World.

The Art of cutting precious Stones is very antient; but like other Arts, its Original was very imperfect: The *French* have ſucceeded in it the beſt; and the Lapidaries of *Paris*, who have been a Corporation ſince the Year 1290, have carried it, eſpecially cutting of Diamonds call'd Brillants, to its laſt Perfection. There are various Machines uſed in the curting of precious Stones, according to the Quality of the Matter to be cut. The Diamond, which is extremely hard, is cut and form'd on a Wheel of ſoft Steel, turn'd by a kind of Mill, with Diamond Duſt, temper'd in Oil of Olives; and this ſerves to poliſh 'em as well as to cut 'em. Oriental Rubies, Saphires, and Topazes, are cut and form'd on a Copper Wheel, with Oil of Olives, and Diamond Duſt: they are poliſh'd on another Copper Wheel, with Tripoli and Water. Rubies, Emeralds, Hyacinths, Amethyſts, Grenats, Agats, and other Stones leſs hard, are cut on a Leaden Wheel, with Smalt and Water, and poliſhed on a Tin Wheel with Tripoli. Turquois of the old and new Rock, Lapis, Giraſol, and Opal, are cut and poliſh'd on a Wooden Wheel with Tripoli. See *Diamond*, *Ruby*, &c.

Lapidary Stile, is a Stile proper for Inſcriptions. This is a kind of Medium between Proſe and Verſe; the jejune and the brillant are here equally to be avoided. *Cicero* has preſcribed the Rules of it; *Accedat oportet Oratio varia, vehemens, plena Spiritus. Omnium Sententiarum Gravitate, omnium Verborum ponderibus eſt utendum.* The *Lapidary Stile*, which was loſt with the ancient Monuments, has been retriev'd at the Beginning of this Age, by Count *Emanuel Theſauro*: It is now uſed various Ways at the beginning of Books; and even Epiſtles Dedicatory are compoſed in it, whereof we have no Example among the Antients.

LAPIDESCENT, from *Lapis* a Stone, any thing which has a Property of turning Bodies into a ſtony Nature, as many Spring-Waters will do to Pieces of Wood, and other like Subſtances. See *Petrifaction*.

LAPIDIFICATION, in Chymiſtry; an Action by which any Subſtance is converted into Stone: This is done by diſſolving a Metal, for inſtance, in a corroſive Spirit or Menſtruum, and afterwards boiling that Diſſolution into the Conſiſtence of a Stone. *Lapidification* is practiſed in Metals, fixed Salts, and Salts of Plants. The Term is alſo uſed in making artificial Stones. See *Petrifaction*.

LAPIS CALAMINARIS. See *Calamine*.

LAPIS DE GOA. See *Goa*-Stone.

LAPIS INFERNALIS, a cauſtick Stone prepared various Ways; ſometimes of ſtrong Soap-Lees evaporated to a Dryneſs, and the Remainder kept in a Glaſs well ſtopp'd from the Air: ſometimes it is made of Vitriol and Tartar, calcined Sal Armoniac, and Quick-Lime boil'd in Water to a ſtrong Lixivium, then ſtrain'd and evaporated till it is dry.

LAPIS LAZULI, a Mineral Stone of a blue Colour. *Pliny* and *Dioſcorides* make it a Sand, *Agricola* a Mineral found in the Veins of the Earth; but the truth is, 'tis a mere Stone, call'd by way of Excellence *Lapis*, or *Lapis Lazuli*. When perfect, 'tis ſtudded with little Specks or Stars of Gold; for which Reaſon, *Meſue* calls it *Lapis Stellatus*: and to be good, ſhould be able to reſiſt Fire and Smoak, and to come out of 'em with new Luſtre. It is found in Mines of Gold, Silver, and Copper, as alſo in Pits of Marble; which laſt is that generally in Uſe. Naturaliſts diſtinguiſh three Kinds of *Lapis*. The firſt call'd old Rock, which is pure, ſmooth, a fine blue, with beautiful yellow Streaks like Veins of Gold, which yet are frequently no more than Veins of Pyrites. The ſecond called the new Rock, is ſtuffed with common Stones; its Colour is weaker, and its Price lower: theſe two Kinds are brought from *Perſia* and *Siam*; the third Kind is brought from the Mountains of *Auvergne*. This is mix'd with the common Rock whence it is dug, it is of a pale blue, and is ſprinkled with greeniſh Spots, with Veins

of

of Pyrites. This when ſufficiently charged with Spots of Green, is ſold for the *Armenian* Stone. The *Lapis* is of ſome Uſe in Medicine; they prepare it by calcining and waſhing it ſeveral times; which done, it makes an Ingredient in the famous Confection of *Alkermes*. Sometimes, in ſpight of all its Lotions, it continues to be a Purgative, by reaſon of the Vitriolic Matter it contains.

LAPIS MEDICAMENTOSUS, the medicinal Stone, a Compoſition of green and white Vitriol, Alum, Anatron of *Sandiver*, common Salt, and Salt of Tartar, melted over the Fire, and ſtirr'd till they thicken; then mix'd with Powder of Venice, Ceruſs, and *Armenian* Bole, ſtirring the whole till it grows hard. This is ſaid to faſten the Teeth, preſerve the Gums, heal and dry up Ulcers and Wounds, and is uſed in Injections, and in Compoſitions for ſore Eyes.

LAPSE, a Slip or Omiſſion of a Patron to preſent a Clerk to a Benefice within ſix Months of its being void; in which Caſe the Benefice is ſaid to be in *Lapſe*, or lapſed.

LAQUEARIUS, the Name of a Kind of Athleta among the Antients: In one Hand he held a kind of Snare, wherewith to embaraſs and intangle his Antagoniſt, and in the other a Poniard to ſtab him. The Word comes from the Latin *Laqueus*.

LAQUEUS in Chirurgery is a Band ſo tied, that if it be attracted, or preſſed with Weight, it ſhuts up cloſe. Its Uſe is to extend broken or disjointed Bones, to keep them in their Places, when they are ſet, and to bind the Parts cloſe together.

LAR-BOARD is the Left-hand Side of a Ship when you ſtand with your Face to the Head.

LARCENY, in Law, is a Theft of perſonal Goods or Chattels in the Owner's abſence. In reſpect of the Thing ſtolen, it is either great or ſmall; great *Larceny* is when the Things ſtolen, tho' ſeverally, exceed the Value of 12 *d.* Petty *Larceny* is when the Goods ſtolen exceed not that Value. The ſtealing of a Horſe or a Cow, was formerly reckoned petty *Larceny*. The Civilians define *Larceny*, a fraudulent Subtraction of another Man's Property, with deſign to appropriate it without the Owner's Leave. When it is done by Force, it is called a Robbery. By the *Roman* Law, the Penalty of ſimple and ſecret *Larceny*, was the returning it twofold; and of manifeſt *Larceny* fourfold: Manifeſt *Larceny* was where the Criminal was taken in the Fact; ſimple, where he was not. The *Lacedemonians* never puniſhed *Larceny*, provided the Perſon were not caught in the Fact; but on the contrary, it was applauded as a Mark of Dexterity and Addreſs: The *Circaſſians* are ſaid to honour it at this day; inſomuch that at their publick Feaſts their Youth are not ſuffered to drink, if they have not performed ſomething remarkable in that Way. *Solinus* tells us, that in *Sardinia* there was a Fountain that had the Virtue of diſcovering a Perſon that had committed *Larceny*. The Word comes from the French *Larcin*, and that from the Latin *Latrocinium*.

LARENTINALIA, the Name of a Feaſt among the *Romans*. Some take this for a Feaſt of the *Lares*, but 'tis no wiſe probable, that the 22d Day of *December* being conſecrated to them under the Name of *Compitales*, the 23d ſhould alſo be devoted to them under a new Name. *Manutius*, *Goltzius*, *Roſinus*, and others take *Larentinalia* to be the ſame with *Laurentinalia*, which ſee.

LARES, among the Antients, were a kind of Domeſtic Genii, or Divinities, worſhip'd in Houſes, and eſteem'd the Guardians and Protectors of Families; ſuppoſed to reſide in the Chimney-Corner. *Plutarch* diſtinguiſhes between Good and Evil *Lares*, as he had before done between Good and Evil *Genii*. There were ſome public, others private. *Apuleius* tells us the Domeſtic *Lares* were no more than the Souls of departed Perſons, who had lived well, and diſcharged the Duties of their Station; whereas thoſe who had done otherwiſe, were Vagabonds, wandering about and frightening People, and call'd *Larvæ* and *Lemures*. The firſt were alſo call'd *Penates*, and were worſhip'd under the figures of little Marmouſets, or Images of Wax, Silver, or Earthen Ware. The Pantheons, or Images repreſenting ſeveral Gods at once, were alſo call'd *Lares*. *Harpocrates* had one of theſe. *Varro* and *Macrobius* ſay the *Lares* were the Children of *Mania*. *Ovid* makes them the Children of *Mercury* and the Naid *Lara*, whom *Lactantius* and *Auſonius* call *Larunda*. The Temple of the *Lares* was in the eighth Region of *Rome*. T. *Tatius* King of the *Sabins* was the firſt who built a Temple to the *Lares*. The Chimney and Fire-place in the Houſe were particularly conſecrated to 'em. The *Lares* were alſo genial Gods, and were ſuppoſed to take care of Children from their birth. 'Tis for this reaſon, that when *Macrobius* tells us the *Egyptians* had four Gods who preſided over the Births of Children, *viz.* the *Genius*, *Fortune*, *Love* and *Neceſſity*, call'd *Præſtites*; ſome interpret him as if he had ſaid the *Egyptians* had *Lares*: but there was a world of difference between the *Lares* of the *Romans* and the *Præſtites* of the *Egyptians*.

The public *Lares* were alſo call'd *Compitales*, from *Compitum* a Croſs-Way, and *Viales* from *Via* a Way or public Road; as being placed at the Meetings of Roads and in the High-ways, and eſteem'd the Patrons and Protectors of Travellers. Their private *Lares* took care of particular Houſes and Families: Theſe they alſo call'd *Præſtites* from *præſto*,

Quod præſtant oculis omnia tuta ſuis. Ovid. Faſt.

They gave the name *Urbani*, *i. e. Lares* of Cities, to thoſe who had Cities under their Care; and *Hoſtilii*, to thoſe who were to keep their Enemies off. There were alſo *Lares* of the Country, called *Rurales*, as appears by ſeveral Antique Inſcriptions.

The Antients differ extremely about the Origin of the *Lares*: *Apuleius* aſſures us they were the Poſterity of the *Lemures*. *Nigridius*, according to *Arnobius*, made 'em ſometimes the Guardians and Protectors of Houſes, and ſometimes the ſame with the *Curetes* of *Samothracia*, which the *Greeks* call *Idean Dactyles*, and whereof we have made mention under the words *Curetes* and *Dactyle*. Nor was *Varro* more conſiſtent in his Opinion of theſe Gods; ſometimes making them the *Manes* of Heroes, and ſometimes Gods of the Air.

Tertullian tells us, the Cuſtom of worſhipping the *Lares* aroſe from this, that they antiently interred their Dead in their Houſes, whence the credulous People took occaſion to imagine their Souls continued there alſo, and proceeded to pay 'em divine Honours. To this it may be added, that the Cuſtom being afterwards introduced of burying in the Highways, hence they might take occaſion to regard 'em as Gods of the Highways. The Victim offered to the *Lares* in the public Sacrifices, was a Hog: In private they offered 'em Wine, Incenſe, a Crown of Wool, and a little of what was left at the Table. They crown'd them with Flowers, particularly the Violet, Myrtle, and Roſemary. Their Symbol was a Dog, which was uſually repreſented by their ſide, on account of its Fidelity and the Service it does to Man, in watching his Houſe. They were alſo repreſented as clothed in a Dog's Skin. See *Penates*. On the *Lares*, ſee alſo *Arnobius*, *Lactantius*, *Auguſtin de Civit.* *Natalis Comes*, *Lambin* on *Plaut. Aulul.* and on *Hor. Caſaubon* on *Sueton.* &c.

LARGE, a Sea-Term. See *Veering*.

LARMIER, in Architecture, a flat ſquare maſſive Member of the Cornice, between the Cymatium and Ovalo; ſo called from its Uſe, which is to diſperſe the Water, and to cauſe it to fall at a diſtance from the Wall drop by drop, or as it were by Tears, *Larme* in *French* ſignifying a Tear. The *Larmier* is alſo call'd *Corona*: See *Entablature* and *Corona*.

LARYNGOTOMIA, a Chirurgical Operation, or an Inciſion in the *Trachea* or Wind-pipe between two of its *Annuli* or Rings, in order to give paſſage for the Breath, when there is danger of Suffocation, from an Inflammation of the Larynx, &c. Dr. *Muſgrave* obſerves, that in all Medicine there is not one Method that works ſo great a Change, for the better, in ſo ſhort a time. However, it is ſeldom practiſed, in regard that Gap which appears on the cutting a Throat, (the divided Parts being then drawn towards their more fixed Ends) together with the great Efflux of Blood when the Jugulars and Carotid Arteries are alſo wounded, create in moſt Men a Dread of the Operation, and make many believe all Wounds of the *Trachea* mortal. The ſame Author makes no ſcruple however to ſay it ought to be practiſed in Quinzies, and other Dangers of Suffocation from Cauſes of a like nature with 'em; from an extraordinary Cure which he himſelf had wrought in this way. The word is derived from the *Greek* λαρυγξ and τέμνω, *ſeco*. This is the ſame with *Bronchotomy*. See *Bronchotomy*.

LARYNX, in Anatomy, is the upper Part, or Head of the Trachea, lying below the Root of the Tongue, and before the Pharynx. It is one of the Organs of Reſpiration, and the principal Inſtrument of Voice. Its Body is almoſt wholly cartilaginous, and it is to be conſtantly open to give room for the Air to paſs and repaſs. Its Figure is circular, tho' it jets out a little before, and is a little flatted behind, leſt it ſhould incommode the Oeſophagus whereon it is placed. The *Larynx* is of different Diameters, according to the different Ages; in young People 'tis narrow, whence their Voice comes to be acute; in thoſe more advanced in Years, 'tis more ample, which occaſions their Voice to be ſtronger and deeper. In Men 'tis bigger than in Women, for which reaſon Mens Voice is more grave than that of Women. It appears the leſs in Women, in regard the Glands, ſituate at the bottom of the *Larynx*, are bigger in Women than in Men. The *Larynx* moves at the time of Deglutition; when the Oeſophagus is lowered for the Reception

Reception of the Food, the *Larynx* raiſes itſelf to compreſs it, and facilitate its Deſcent.

There are five different kinds of Parts belonging to the *Larynx*, *viz.* Cartilages, Muſcles, Membranes, Nerves, and Glands. Its Cartilages are the Thyroides, Cricoides, Arytænoides, Glottis, and Epiglottis, by means of which it can eaſily dilate and contract, ſhut and open itſelf. Theſe form the whole Body of the *Larynx*, and grow dry and harden, in proportion as the Perſon grows old, whence the *Larynx* ſometimes appears as if it were bony. The biggeſt of theſe is the Thyroides or Scutiformis, this guards the Forepart, and has its Name from ſome ſuppoſed Reſemblance it bears to a Shield. It is of a Concavo-convex ſquare figure, the hollow part being inward, and the gibbous outward, having a little Prominence in the middle, called *Pomum Adami*, as if ſome of the forbidden Fruit had ſtuck in *Adam*'s Throat, and occaſioned that Swelling. The ſecond is called *Cricoides*, or *Annularis*, from its Reſemblance to a Ring which the *Turks* put on their Thumb for the drawing of their Bows. The forepart of this is very narrow, coming under the other Cartilage, but behind it is broad, thick, and ſtrong, being as it were the Baſis of all the others. The third and fourth are called *Arytænoides*, or *Guttales*, from the Figure of an Ewer, which theſe two together ſomewhat reſemble. At the Juncture of theſe two there is a little Cleft, or Chink, in form of a little Tongue, and for that reaſon called *Glottis*, or *Lingula*. Through this Chink the Air deſcends into the Lungs, and the pituitous Matter ejected by coughing in Catarrhs is let out. It ſerves alſo for modulating the Voice, and is imitated in Flutes and the Pipes of Organs. Over the Glottis lies a fifth Cartilage called the Epiglottis, which is very thin and ſoft, and in Non-adults almoſt membranous, concave on the under Side, and convex on the upper: It defends the Entrance of the *Larynx*, and hinders the Liquids which in drinking ſlip over it into the Oeſophagus, from falling into the Trachea. The *Larynx* has ſeven Pair of Muſcles, which ſerve to move its ſeveral Cartilages, and to contract or dilate them at pleaſure; two Pair of them are common, the other five proper: the proper are thoſe which have both their Origination and Inſertion into the *Larynx*, the common have only their Inſertion there. Of the former Kind are the Crycothyroides, which moves the ſcutiform Cartilage; the Crico-arytænoides Poſticum, which ſerves, by its Contraction, to draw the Arytænoides Cartilage, and to open the Rima. The third is the Arytænoides; this ſerves to bring the two Cartilages of that Name together, and to ſhut the Rima. The fourth is the Crico-arytænoides Laterale; and the fifth the Thyreo-arytænoides, which ſhuts the *Larynx*. The common Muſcles are the Sternothyroides, which ſerve to draw down the Thyroide Cartilage, and the Hyothyroides which lift up that Cartilage. The *Larynx* has but too Membranes, the one external, which is a Continuation of that which covers the Trachea; and the other internal, which is the ſame that lines the whole Mouth: It receives two Branches of Nerves from the Recurrents, and it is moiſtened by four large Glands, two ſituate above called Tonſils, and two underneath call'd Thyroides.

The *Larynx* is of very conſiderable Uſe, not only in forming and modulating the Voice, by the different Apertures of its Rima or Chink, but alſo in compreſſing the Lungs in a greater or leſs Degree by the Air: For if the internal Diameter of the *Larynx* had been equal to that of the Trachea, the Lungs could have undergone little or no Compreſſion at all; nor, conſequently, without the *Larynx* could we have reaped any Advantage from Breathing, in regard the Air would not have reſiſted that Force wherewith it is driven out in Expiration, nor conſequently could the Compreſſion have been made in the Lungs, which is found neceſſary for the Comminution of the Globules of the Blood, and the mixing of the two Fluids, Air and Blood, together. For the Action of the *Larynx* in Sound, ſee *Glottis* and *Sound*; ſee alſo *Epiglottis*, *Trachea*, &c.

LASH, the Sea-Word for binding up to the Ship's ſide Muskets, Butts of Water or Beer, or Pieces of Timber to make ſpare Top-Maſts. When any thing is thus faſten'd to the Ship, it is called *Laſhing*. But the *Laſhers* are properly thoſe Ropes only, which bind faſt the Tackles, and the Breeches of the Ordnance, when they are haled, or made faſt within board.

LASKING, a Sea-Term. See *Veering*.

LASSITUDE, among Phyſicians, expreſſes that Wearineſs or Heavineſs of Members that proceeds from a diſtempered State of Body, and not from Exerciſe; either from an Increaſe of Bulk, from a Diminution of proper Evacuation, or from too great a Conſumption of that Fluid which is neceſſary to maintain the Force and Spring of the Solids, as in Fevers and Convulſions; or from a vitiated Secretion of that Juice, whereby the Fibres are not ſupplied either in due Quantity or Quality. The Remedy in the firſt Caſe is Evacuation, in the latter proper Diet, or ſuch Alterative Medicines as influence ſuch a Secretion.

LAST, or *Leſt*, in general ſignifies the Burden, or Load of a Ship. It is alſo uſed for a certain Weight and Meaſure, which is various in various Countries; tho in the general, the *Laſt* is eſtimated at 4000 *lib.* weight. A *Laſt* of Cod-Fiſh, White Herrings, Meal, and Aſhes for Soap, is 12 Barrels for each: Of Corn or Rape-Seed 10 Quarters: Of Gunpowder 24 Barrels, or 2400 *lib.* weight: Of Red Herrings 20 Cades: Of Hides 12 Dozen: Of Leather 20 Dickers: Of Pitch or Tar 14 Barrels: Of Wool 12 Sacks: Of Stock-fiſh 1000: Of Flax or Feathers 1700 *lib.* weight.

LASTAGE, or *Leſtage*, according to *Raſtal*, is a Duty exacted in ſome Fairs and Markets to carry things bought where one will. *Laſtage*, ſays another Author, is properly that Cuſtom, which is paid for Wares ſold by the Laſt. In a Law of *R.* 1. the ſecond *Laſtage* is taken for the Balance or Lading of a Ship. Laſtly, *Laſtage* is ſometimes uſed for Garbage, Rubbiſh, or ſuch Filth.

LAST HEIR, is he to whom Lands come by Eſcheat for want of lawful Heirs; which in many Caſes is the Lord whereof they are held, but in others the King.

LATERAL EQUATION, in Algebra, an Equation having only one Root; whereas a Quadratick hath two, and a Cubick 3 Roots, *&c.* And ſuch Equations can be determined and conſtructed by the Interſection of two Right Lines, which is a Compoſition of $1+1=2$. But a Quadratick cannot be determined or conſtructed, without a Strait Line and a Circle cutting each other.

LATERAN, was originally the proper Name of a Man, whence it deſcended to an antient Palace in *Rome*, and to the Buildings ſince erected in its place: Particularly to a Church called *St. John of the Lateran*, which is the principal See of the Popedom.

Councils of the Lateran are thoſe held in the Baſiliſque of the *Lateran*: Of theſe there have been five, held in 1123, 1139, 1179, 1215, and 1513.

Canon Regular of the Congregation of the Lateran, is a Congregation of Regular Canons, whereof that Church is the principal place. 'Tis pretended, there has been an Uninterrupted Succeſſion of Clerks, living in common, from the Time of the Apoſtles, and that a number of theſe were eſtabliſh'd in the *Lateran* in the Time of *Conſtantine*. But the Canons were not introduced till the Time of *Leo* I. and theſe held the Church 800 Years, till the Reign of *Boniface*, who took it from 'em, and placed Secular Canons in their room, 150 Years after, the Regulars were reinſtated.

A LATERE, a *Latin* Term uſed for the Qualification of Cardinals whom the Pope ſends as Legates into foreign Courts, who are called Cardinals *a latere*, as being his Holineſs's Counſellors in ordinary and Aſſiſtants. See *Legate*. The Guards of Princes were heretofore called *Laterones*, becauſe always attending at their Sides, *a latere*. *Du Cange*, in his Gloſſary, ſays there were antiently Counts *a latere*, and Monitors *a latere*.

LATH, in Building, long, thin, narrow Slips of Wood uſed in Tyling and Walling. Theſe are divided into three kinds, with regard to the different Woods they are made of, *viz.* Heart of Oak, Sap-Laths and Deal-Laths: the two laſt uſed only for Ceiling and Partitioning, and the firſt only for Tyling. Again, *Laths* are diſtinguiſh'd into three kinds more, with regard to their Length, *viz.* into 5 foot, 4 foot, and 3 foot *Laths*; tho the Statute allows but of two lengths, *viz.* thoſe of 5 foot and of 3, each of which are to be an inch and half in breadth, and half an inch in thickneſs. Theſe are what *Vitruvius* calls *Ambrices*.

LATHE, or *Leathe*, a very uſeful Engine for the turning of Wood, Ivory, Metals, and other Materials. The Invention of the *Lathe* is very antient. *Diodorus Siculus* ſays, the firſt who uſed it was a Nephew of *Dædalus*, named *Talus*. *Pliny* aſcribes it to *Theodore* of *Samos*, and mentions one *Thericles*, who render'd himſelf very famous by his Dexterity in managing the *Lathe*.

With this Inſtrument the Antients turn'd all kinds of Vaſes, many whereof they enrich'd with Figures and Ornaments in Baſſo Relievo. Thus *Virgil*,

Lenta quibus Torno facili ſuperaddita Vitis.

The *Greek* and *Latin* Authors make frequent mention of the *Lathe*, and *Cicero* calls the Workmen who uſed it *Vaſcularii*. 'Twas a Proverb among the Antients, to ſay a thing was formed in the *Lathe*, to expreſs its Delicacy and Juſtneſs.

The *Lathe* is compoſed of two wooden Cheeks or Sides, parallel to the Horizon, having a Groove or Opening between; perpendicular to theſe, are two other Pieces called Puppets, made to ſlide between the Cheeks, and to be fix'd down at any Point at pleaſure. Theſe have two

Points,

Points, between which the Piece to be turned is ſuſtained; the Piece is turn'd round, backwards and forwards, by means of a String put round it, and faſtened above to the End of a pliable Pole, and underneath to a Tredle or Board moved with the Foot. There is alſo a Reſt which bears up the Tool, and keeps it ſteady.

As 'tis the Uſe and Application of this Inſtrument that makes the greateſt Part of the Art of Turning, we refer the particular Deſcription thereof, as well as the Manner of applying it in various Works, to that Head. See *Turning*.

LATHE, in our Law. See *Lethe*.

LATIAR, a Feaſt, or Ceremony inſtituted by *Tarquinius Superbus*, in honour of *Jupiter Latialis*. The Founder only appointed one Day for this Feaſt; the firſt Conſuls added another to it upon concluding the Peace with the *Latins*; a third was added after the People who had retired to the *Mons Sacer* were returned to *Rome*; and a fourth after appeaſing the Sedition raiſed on occaſion of the Conſulate, in which the People would needs have a Share. Theſe four Days were called the *Latin Feriæ*, and every thing done during the Courſe of theſe *Feriæ*, as Feaſts, Sacrifices, Offerings, &c. were called *Latiares*. *Tarquin* having made a Treaty of Alliance with the *Latins*, propoſed, in order for perpetuating it, to erect a common Temple, where all the Allies, the *Romans*, *Latins*, *Hernici*, *Volſci*, &c. ſhould aſſemble themſelves every Year, hold a kind of Fair, exchange Merchandizes, feaſt, ſacrifice, and make merry together. Such was the Inſtitution of the *Latiar*.

LATICLAVUS, a Garment of Diſtinction and Dignity among the *Romans*. It was a kind of Tunic, or long Coat faced with one or two Slips of Purple applied lengthwiſe to the two Sides of the Tunic. In the *Laticlavus* theſe Slips were pretty broad, and in the *Anguſticlavus* narrower; though there is nothing about which the Learned differ more, than the Difference between thoſe two Habits. There were Buttons ſet on the *Laticlavus*, which appear'd like the Heads of large Nails; whence ſome think it took its Name. The Senators, Prætors, and the chief Magiſtrates of Colonies and municipal Cities, had a Right to wear it. The Robe called Prætexta, was wore over the *Laticlavus*. When the Prætor pronounced Sentence of Death, he put off the Prætexta, but retained the *Laticlavus*.

LATINE, a dead Language firſt ſpoken in *Latium*, and afterwards at *Rome*, and ſtill uſed in the *Romiſh* Church, and among the Men of Learning. Some Authors rank the *Latin* among the Number of original Languages, but by Miſtake: It is formed principally from the *Greek*, and particularly the *Æolic* Dialect of that Tongue; tho' it has a great Number of Words which it borrow'd from the Languages of the *Etruri*, *Oſci*, and other antient People of *Italy*; and their foreign Commerce and Wars, in courſe of Time, added a great many more. The *Latin* is a ſtrong, firm Language, perfectly ſuitable to the Character of the People who ſpoke it. We have, ſtill, Works of every kind, admirably well written in *Latin*, tho' there are an infinite Number loſt. The *Latin* is more figurative than the *Engliſh*, leſs pliant than the *French*, leſs copious than the *Greek*, leſs pompous than the *Spaniſh*, leſs delicate than the *Italian*, but cloſer and more nervous than any of them. For a while, the *Latin* Tongue was confined almoſt wholly within the Walls of *Rome*; nor would the *Romans* allow the common Uſe of it to their Neighbours, or to the Nations they ſubdued. *Cicero* obſerved that even in his Time *Greek* was uſed almoſt among every People, but the *Latin* only confined to a very narrow Compaſs; *Græca leguntur in omnibus ferè Gentibus, Latina ſuis finibus exiguis ſanè continentur*. By degrees they were brought to grant the Uſe of it as a Favour, and in time became ſenſible of the Neceſſity there was of its being generally underſtood for the Conveniency of Commerce; and accordingly uſed their utmoſt Endeavours that all the Nations ſubject to their Empire, ſhould be united by ſome common Language; ſo that at length they impoſed that as a Law, which they had before granted as a Favour. After the Tranſlation of the Seat of the Empire, from *Rome* to *Conſtantinople*, the Emperors of the Eaſt, being always deſirous of retaining the Titles of *Roman* Emperors, appointed the *Latin* to be ſtill retained in Uſe both in their Reſcripts and Edicts, as appears by the Conſtitution of the Eaſtern Emperors collected in the *Theodoſian* Code: But at length the Emperors neglecting the Empire of the Weſt, abandon'd all Care of the *Latin* Tongue, and allowed their Judges to paſs Sentence in *Greek*; and accordingly we find the Emperor *Juſtinian*'s Novels compoſed in *Greek*. *Charlemagne* coming to the Empire of the Weſt, appointed the Proceedings in ſovereign Courts to be in *Latin*; and the Notaries were to draw their Acts and Inſtruments in the ſame Tongue: This Practice continued a long time through a great Part of *Europe*, but at length it gave way, and the *French* took place of the *Latin*, not only in *France*, but in ſome meaſure in *England* too: and the Reaſon given for it, was, that abundance of Difficulties aroſe about the underſtanding of *Latin* Terms. The *Latin* however was prodigiouſly degenerated and corrupted e'er it came to be laid aſide. The Incurſions of the *Goths* and *Vandals* into *Italy*, brought an Inundation of foreign Words and Phraſes into it; inſomuch that *Valla* and *Naudeus* call *Boetius* the laſt *Latin* Author. However, that was not all, but when it once got into the Courts of Juſtice, it was ſtill worſe handled; till at laſt being introduced amongſt the Monks, and become the common Language of Miſſals and Breviaries, it was debauched to that degree, that it was almoſt become ſcandalous to uſe it. In this Condition it was found at the time of the Reformation; when *Vives*, *Eraſmus*, &c. began to open the way for its Recovery: ſince which time, Monkiſh Latinity has been declining, and all Endeavours have been uſed to retrieve the pure Language of the *Auguſtan* Age. 'Twas ſaid of Cardinal *Bembo*, that he would never read the Breviary, for fear of corrupting his fine *Latin*.

LATIN CHURCH, is a Term uſed for the *Romiſh* Church, by way of Oppoſition to the *Greek* Church.

LATISSIMUS DORSI, in Anatomy, is a Muſcle called ſo from its Shape, covering almoſt the whole Back. It hath a thin broad tendinous Beginning, which comes from the poſterior part of the Spine of the Ilium, from the ſuperior Spines of the *Os Sacrum*, from all the Spines of the Vertebræ of the Loins, and from the ſeven lower of the Thorax; it paſſeth by the inferior Angle of the Scapula, from which ſome of its fleſhy Fibres ſometimes ariſe, and is inſerted with the Teres major, by a ſtrong and broad Tendon, with which it pulls the Arm downwards: It is alſo called *Ani Scalptor*, becauſe it carries the Arm to the *Anus*.

LATITAT, a Writ, whereby all Men in perſonal Actions are called originally to the *King's-Bench*; and it hath this Name, as ſuppoſing the Defendant does lurk, and lie hid, and therefore being ſerved with this Writ, he muſt put in Security for his Appearance at the Day: by this Writ, a Man being brought in, is committed to the Marſhal of the *King's-Bench*, in whoſe Cuſtody when he is, he may be ſued upon an Action in that Court.

LATITUDE, in Geography, is the Diſtance between the Equator and Zenith, or vertical Point of any Place, reckoned on the Degrees of the Meridian, or the Secundaries of the Equator. *Latitude* of a Place is its Diſtance from the Equator; and is either Northern or Southern, according as the Place whoſe *Latitude* is ſpoke of, is on this or that Side of the Equator. Thus *London* is ſaid to be in 52 Degrees, thirty Minutes, Northern Latitude.

Circles parallel to the Equator, are called Circles of *Latitude*, becauſe they ſhew the *Latitudes* of Places by their Interſection with the Meridian. If through the Poles of the World we conceive innumerable great Circles drawn, theſe are called Secundaries of the Equator; and by their help the Poſition of every Point, either on Earth, or in the Heavens, with regard to the Equinoctial (that is, the *Latitude* of any Point) is determined. One of theſe Secundaries paſſing thro' any Place in the Earth's Surface, is called the Meridian of that Place, and on it the *Latitude* of that Place is meaſured.

The *Latitude* of a Place, and the Elevation of the Pole of that Place above the Horizon, are Terms uſed indifferently for each other, in regard the *Latitude* and the Elevation of the Pole are always equal, (as will appear by *Fig.* 4. *Plate Geography*) where the Circle H Z Q repreſents the Meridian, H O the Horizon, Æ C Q the Equator, Z the Zenith, and P the Pole. Here the *Latitude* of the Place, or its Diſtance from the Equator, is the Arch Z Æ, and the Elevation of the Pole, or its Diſtance from the Horizon, the Arch P O. Now the Arch P Æ between the Pole and the Equator, is a Quadrant of a Circle, and the Arch Z O, from the Zenith to the Horizon, is likewiſe a Quadrant. Therefore the two Arches Z Æ and P O muſt be equal; and taking away the Arch Z P, which is common to both, there will remain the Arch Z Æ equal to the Arch P O: that is, the *Latitude* of the Place equal to the Height of the Pole above the Horizon. Thence we have a Method of meaſuring the Circumference of the Earth, or of determining the Quantity of a Degree on its Surface: For by going directly Northward or Southward, till the Pole be elevated one Degree more or leſs, and then meaſuring that Interval accurately, we ſhall have the Number of Miles in a Degree of a great Circle of the Earth's Globe. See *Degree*.

The Knowledge of the *Latitude* of the Place, is of the utmoſt Conſequence both in Geography, Navigation, and Aſtronomy: The Methods of determining it both at Sea and Land, are as follow.

We have already obſerved that the Altitude of the Pole is always equal to the *Latitude*, for which Reaſon the *Latitude* might be beſt found by obſerving the Pole's Height: But in regard the Pole is only a mathematical Point, and no ways to be obſerved by our Senſes, its Height cannot be determined in the ſame manner as that of the Sun and Stars, &c. for which Reaſon another Manner has been contrived. In order to this, a Meridian Line is firſt drawn; the Method of doing which, ſee under the Word *Meridian*. Place your Quadrant on this Line, ſo as its Plane may be in the Plane of the Meridian; then take ſome Star near the Pole, *v. g.* the Pole Star, which never ſets, and obſerve both its greateſt and leaſt Altitude (ſee *Quadrant*.) Let the greateſt, *v. g.* be S O, (*Fig.* 5. *Plat. Geography*) and the leaſt *s* O; the Half of which P S or P *s*, deducted from the greateſt Altitude S O, or added to the leaſt *s* O will give P O, the Altitude of the Pole above the Horizon, which is equal to the *Latitude* of the Place.

The *Latitude* may alſo be found, by having the Sun's, or a Star's Declination, and Meridian Altitude taken with a Quadrant or Aſtrolabe. The Method is this: Obſerve the Meridian Diſtance of the Sun from the Vertex or Zenith, which is always the Complement of his Meridian Altitude; and add to this the Sun's Declination, when the Sun and the Place are on the ſame Side the Equator, or ſubſtract the Declination when they are on different Sides: the Sum in the former Caſe, and the Difference in the latter, will be the *Latitude* required. But when the Declination of the Sun is greater than the *Latitude* of the Place, which is known from the Sun's being nearer to the elevated Pole than the Vertex of the Place is, as it frequently happens in the Torrid Zone; then the Difference between the Sun's Declination, and his Zenith Diſtance, is the *Latitude* of the Place. If the Sun, or Star, have no Declination, but move in the Equinoctial that Day; then the Elevation of the Equator will be equal to his Meridian Altitude, and conſequently his Meridian Altitude is the Complement of the *Latitude* to 90. This latter Method is beſt accommodated to the Uſes of Navigation, as being practicable at Sea: but the former Method preferable at Land.

Latitude, in Aſtronomy, is the Diſtance of a Star or Planet from the Ecliptic, or from the Sun's Orbit, towards one of the Poles of the Zodiac. Through the Poles of the Ecliptic are ſuppoſed to paſs an indefinite Number of great Circles, cutting the Ecliptic at Right Angles, called Circles of *Latitude*, or Secundaries of the Ecliptic: By means of which, every Star and Point of the Heavens is reduced to the Ecliptic, and has its Place in regard thereto determined. The *Latitude* of a Star is an Arch of one of theſe Secundaries, intercepted between that Star and the Point where it interſects the Ecliptic; in which it differs from the Declination, which is the Diſtance of a Star from the Equator towards one of the Poles of the World: So that the Geographical *Latitude* is the ſame thing with the Aſtronomical Declination, and the Aſtronomical *Latitude* a quite different thing. The Sun never has any *Latitude*, but the Planets have: For which reaſon, in the common Sphere the Zodiac has ſome Breadth. The Antients only allow'd ſix Degrees on each Side the Ecliptic, but the Moderns have extended it to nine. According to the Obſervation of ſome of the modern Aſtronomers, the greateſt *Latitude* of the Planets is not always the ſame; but *Venus* never exceeds 9 Degrees Northern *Latitude*, *Mercury* 5 Degrees, the *Moon* in her Quadrant with the *Sun* 5 Degrees; *Saturn* 2 Degrees, 50 Minutes; *Jupiter* 1 Degree, 50 Minutes; *Mars* 7 Degrees, 31 Minutes. When they have no *Latitude*, they are ſaid to be in the Nodes of the Ecliptic, or in the Interſection of their Orbit with that of the Sun; and in this Situation it is that they eclipſe, or are eclipſed by the Sun.

North Aſcending *Latitude* is when the Moon proceeds from the Aſcending Node towards her Northern Limit, or greateſt Elongation; North Deſcending *Latitude*, when the Moon returns from her Northern Limit to the Aſcending Node: South Deſcending *Latitude*, is when ſhe proceeds from the Deſcending Node to her Southern Limit; South Aſcending *Latitude*, is when ſhe returns from her Southern Limit to her Aſcending Node: And the ſame holds good of the other Planets. Heliocentric *Latitude* of a Planet, is its Diſtance from the Ecliptic, ſuch as it is ſeen from the Sun; and this, when the Planet comes to the ſame Point of its Orbit, is always the ſame, and unchangeable. Geocentric *Latitude* of a Planet, is the Diſtance of the Planet from the Ecliptic, as it is ſeen from the Earth: And this, though the Planet be in the ſame Point of its Orbit, yet is not conſtantly the ſame, but alters according to the Poſition of the Earth, in reſpect to the Planet. See *Heliocentric* and *Geocentric*.

Dr. *Halley* has ſome Conſiderations in the *Philoſophical Tranſactions*, which make it probable the *Latitudes* of ſome of the principal fix'd Stars, particularly *Palilicium*, *Sirius*, and *Arcturus*, alter in time; whence it may be argued, the reſt likewiſe alter, tho' the Variation may be leſs conſpicuous in theſe, by reaſon they are ſuppoſed at a greater Diſtance from us. See *Star*.

LATITUDINARIAN, among the Divines, ſignifies a moderate Perſon, not over-cloſely tied to any religious Opinions, but thinks there is a Breadth or Latitude in the Road to Heaven.

LATOMIA properly ſignifies a Quarry, or Place whence Stones are dug. Theſe were antiently uſed as Goals for Criminals. *Dionyſius* had a Place of this kind dug in a Rock near *Syracuſe*, where an infinite Number of People were ſhut up. *Cicero* reproaches *Verres* with impriſoning *Roman* Citizens in *Latomia's*; ſo that *Latomia* became a general Name for a Priſon, and the Priſoners incloſed in 'em, were called *Laatomarii*. The Word comes from the Greek λᾶς Stone, and τέμνω I cut.

LATRIA, in Theology, is a religious Worſhip due only to God. The *Romaniſts* ſay they honour God with the Worſhip of *Latria*, and the Saints with the Worſhip of *Dulia*. But theſe Terms, however diſtinct, are uſually confounded. This Worſhip of *Latria*, beſides its inner Characters, has its external Marks to diſtinguiſh it; the principal whereof is Sacrifice, which cannot be offered to any other but God himſelf, as being a ſolemn Acknowledgment or Recognition of the Sovereignty of God, and our Dependance on him. Mr. *Daille* ſeems to own that ſome of the Fathers of the fourth Century allowed the Diſtinction between *Latria* and *Dulia*. The Word comes from the Latin *latere*, to lie hid. See *Idolatry*.

LATUS RECTUM, a Term in Conicks, the ſame with *Parameter*; which ſee.

LATUS TRANSVERSUM of the Hyperbola, is a Right Line intercepted between the Vertices of the two oppoſite Sections; or that part of the common Axis which is between the Vertices of the upper and lower Cone, as the Line E D (in *Fig.* 5. *Plat. Conicks*) where alſo D *d* and E *e* may be the Parameters, or Latus Rectums belonging to the two oppoſite Sections G L R O, and O E O R. To this *Latus Tranſverſum* anſwers the longeſt Diameter in the Ellipſis; which *Apollonius* calls the tranſverſe Axis or Diameter. *Latus Primarium* is a Right Line belonging to a Conick Section drawn thro' the Vertex of the Section of the Cone, and within it; as the Line E E or D D in the Figure above referr'd to.

LAVATORY, or LAVADERO, a Name given to certain Places in *Chili* and *Peru*, where Gold is got out of Earth by waſhing. M. *Frezer* gives us the following Deſcription of the *Lavatories* of *Chili*: They dig deep into the Earth, in ſuch Places as they have reaſon to expect Gold in; and in order to facilitate this Digging, turn a Stream of Water upon the Spot, looſening the Earth as much as poſſible all the time, that the Current may have the greater Effect, and tear up the Earth more ſtrongly. When they are got to the Earth they want, they turn off the Stream, and dig dry. The Earth that they, now, get is carried on Mules, and diſcharged into a Baſon, made ſomewhat in the manner of a Smith's Bellows, into which a little Rivulet of Water runs with a great deal of Rapidity, diſſolving the Parts of the Earth, and carrying every thing away with it excepting the Particles of Gold, which by their great Weight precipitate to the Bottom of the Baſon, and mix with a fine black Sand, where the ſmaller Parts are almoſt as much hidden as before they were in the Earth. Sometimes they find very conſiderable Pieces in *Lavatories*, particularly Pieces of twenty-four Ounces each. There are ſeveral *Lavatories*, where they find *Pepitas*, or Grains of Virgin Gold, of a prodigious Size. Among others they tell of one that weighed 512 Ounces, bought by the Count *de la Moncloa*, Viceroy of *Peru*. Nine or ten Leagues to the *Eaſt* of *Coquimbo*, are the *Lavatories* of *Andacoll*, the Gold whereof is twenty-three Carats fine. Their Work, here, always turns to great Profit, excepting when the Water fails them. The Natives maintain that the Earth is *creadice*, that is, it produces Gold continually; becauſe after having been waſhed ſixty or eighty Years, they find it impregnated afreſh, and draw almoſt as much out of it as at firſt.

LAUDANUM, a Name given by the Chymiſts to certain Preparations of Opium, by reaſon of their excellent Qualities, as who ſhould ſay *laudandum* from *laudare*, *to praiſe*. To theſe ſeveral add Coral, Pearls, Treacle, &c. *Laudanum* is eſteemed an excellent Medicine, it aſſuages Pain, ſtops the ſpitting of Blood, the Flux of the Menſes and Hemorrhoides, &c.

LAUDS, or LAUDES, the ſecond Part of the ordinary Office of the Breviary, ſaid after Matins, though heretofore it ended the Office of the Night. The *Laudes* conſiſt principally of Pſalms, Hymns, &c. whence they took their Name. See *Matins* and *Breviary*.

LAUGH-

LAUGHTER, an Action which Authors attribute to the fifth Pair of Nerves, which by ſending Branches to the Eye, Ear, Lips, Tongue, Palate and Muſcles of the Cheek, Parts of the Mouth, *Præcordia*, &c. there hence ariſes a Sympathy between all theſe Parts, *i. e.* when one of them is acted upon, the other are proportionably affected. Hence a ſavoury thing ſeen or ſmelt, affects the Glands and Parts of the Mouth; a thing ſeen or heard, that is ſhameful, affects the Cheeks with Bluſhes: on the contrary, if it pleaſe and tickle the Fancy, it affects the Præcordia and Muſcles of the Mouth and Face with Laughter; if it cauſe Sadneſs and Melancholy, it likewiſe affects the Præcordia, and demonſtrates itſelf, by cauſing the Glands of the Eyes to emit Tears. And Dr. *Willis* accounts for the Pleaſure of Kiſſing from the ſame Cauſes, the Branches of this fifth Pair being ſpread to the Lips, the Præcordia, and the genital Parts; whence ariſes a Sympathy between thoſe Parts.

LAUNCH, in the Sea-Phraſe, is to put out; thus they ſay, *launch a Ship out of the Dock*, or *out of the Key*, &c.

LAURA, a Place where Monks antiently dwelt. Authors can't agree about the Difference between a *Laura* and a Monaſtery. Some pretend that a *Laura* was a Monaſtery, wherein there lived at leaſt a thouſand Monks; but this is in no wiſe credible. The more credible Opinion is, that the antient Monaſteries were the ſame with the Modern, conſiſting of large Buildings, divided into Halls, Chapels, and Cells, poſſeſſed by the Monks, each of whom had his Apartment; but the *Lauræ* were a kind of Villages, whereof, each ſeveral Houſe was inhabited by one or two Monks at the moſt: ſo that the Houſes of the Chartreux ſeem, in ſome meaſure, to repreſent the antient *Lauræ*, and thoſe of the other Monks proper Monaſteries. The Term *Laura* was only underſtood of the religious Places in *Egypt* and the *Eaſt*, where their Houſes ſtood apart from each other, and were not joined by any common Cloiſter, the Monks that inhabited them only meeting in publick once a Week. The word comes from the *Greek* λαῦραι, *Hamlet*, *Village*.

LAUREATION, a Term in the *Scottiſh* Univerſities, uſed for the Action of taking up the Degree of a Maſter of Arts, to which the Students are admitted after four Years Study in the Univerſity.

ST. LAURENCE, an Order of Regular Canons, ſo called from the Monaſtery of *St. Laurence d'Oulx* in *Dauphiné*. This Congregation is ſaid to have been founded by St. *Bennet*. It was deſtroyed by the *Vandals*, and continued uninhabited till the middle of the XIth Century. In 1057, *Odo* Count of *Savoy* gave it to one *Gerrard* and his Canons. This Donation was confirmed in 1065, by *Cumbert* Biſhop of *Turin*, who added to it above forty other Churches. By which means a very conſiderable Congregation was formed, to whom the ſucceeding Popes and Counts of *Savoy* granted a great many Privileges. It had thirty Priories. The Chief, who is the Prior of the Congregation, bears the Title of Provoſt, and exerciſes a ſpiritual Juriſdiction throughout his Provoſtſhip.

LAURENTALIA were Feaſts inſtituted by the *Roman* People, in Honour of *Acca Laurentia*, kept during the Feaſts called *Saturnalia*, which afterwards were ſolemnized as a part thereof. She was a debauched Woman, and nurſed *Romulus* and *Remus*, which occaſioned the Fable to ſay, *That a She-Wolf ſuckled them*. She afterwards married a very rich Man, who brought her great Wealth, which, at her death, ſhe left to the *Roman* People, in conſideration whereof they performed her theſe Honours.

LAW, a Command or Precept coming from ſome ſuperior Authority, to which an inferior is obliged to obey; or, more properly, a Command or Mandate of ſome Perſon, or Power, whoſe Precept carries with it the Reaſon of Obedience. Thus the Commands of God with reſpect to Men, of a City with regard to the Citizens, and univerſally of all powerful Beings in reſpect to thoſe who cannot reſiſt, are called their *Laws*. The Nature of a *Law* will be the moſt clearly diſcovered, by ſhewing wherein it differs from Covenant, Counſel, and Right or Equity, with all which it is frequently confounded. The Difference between a Counſel and a *Law* will be beſt determined from the Difference between Counſel and Command. Now a Counſel is a Precept wherein the Reaſon of Obedience is taken from the Thing itſelf preſcribed; a Command is a Precept, wherein the Reaſon of Obedience depends on the Will of the Preſcriber; for we cannot properly ſay, *ſic volo, ſic jubeo*, unleſs *ſtet pro ratione Voluntas*. But ſince in *Laws* we do not obey for the ſake of the thing itſelf, but for the ſake of the Perſon who preſcribes it, a *Law* is not properly a Counſel, but a Command. A *Law* comes from a Perſon who has a power over thoſe whom he commands, a Counſel from him who has no ſuch power. To do what is enjoined by a *Law* is an Act of Duty, what by a Counſel an Act of Choice or Free-will. A Counſel is directed to his Advantage who receives it, a *Law* to his who gives it. A Counſel only takes effect over thoſe who are willing, a *Law* over thoſe that are unwilling. Laſtly, the Authority of the Counſellor is taken away at the Diſcretion of him to whom the Counſel is given; but the Authority of the Legiſlator is not taken away at the Diſcretion of him on whom the *Law* is impoſed.

Law is always confounded with Covenant, by thoſe who take *Laws* to be nothing elſe but ὁμολογηματα or Forms of Living determined by the Conſent of Mankind: Among whom is *Ariſtotle*, who defines a *Law*, a *Declaration determined by the common Conſent of a City, ſhewing in what manner Things are to be done*; which is not ſo much the Definition of a *Law*, as of a *Civil Law*: nor yet properly of a *Civil Law*; for this common Conſent is no more than a mutual Covenant, which does not oblige any Perſon, and conſequently is not any *Law*, till ſome ſupreme Power be conſtituted with a Power to compel, and to make it penal to tranſgreſs it. Here then the Covenant is confounded with the *Law*, which leads into Abſurdities; for a Covenant is a Promiſe, a *Law* a Command. In a Covenant 'tis ſaid, *I will do*; in a Law, *do*. By a Covenant we are obliged, (that is, we muſt perform becauſe of our Promiſe) by a *Law* we are preſerved under that Obligation (that is, we are forced to perform for fear of the Puniſhment awarded by it;) a Covenant obliges by itſelf, a *Law* preſerves the Obligation by force. In a Covenant therefore we conſider what is to be done e'er we are obliged to do it; in a *Law* we are obliged *to do*, in the firſt place, and what is to be done is determined afterwards.

Law is confounded with Right or Equity, by thoſe who perſiſt in doing what is permitted by the *Divine Law*, tho prohibited by the *Laws* of the Country. What is prohited by the *Divine Law*, cannot be permitted by the Civil *Law*, nor what is commanded by the Divine *Law* be prohibited by the *Civil Law*; but what is permitted by the Divine *Law*, may notwithſtanding be prohibited by the *Civil Law*: for the inferior *Laws* have a power of reſtraining the Liberty left the ſuperior *Laws*, tho' they cannot enlarge it. Now Right or Equity is a natural Liberty, not conſtituted by *Laws*, but free of them; for take away *Laws*, and Liberty is compleat. This Liberty is firſt reſtrained by the *Natural* and the *Divine Law*, the reſt reſtrained by the *Civil Laws*; and what remains unreſtrained by the Civil *Law*, may be again reſtrained by the Conſtitutions of particular Cities and Societies. There is a great Difference therefore between *Law* and Right, *Lex & Jus*; for *Law* is a Chain, but Right, a Liberty; and they differ as two Contraries.

All *Law* may be divided, with reſpect to its different Authors, into Divine and Human. The Divine, again, may be conſidered as twofold, with reſpect to the two different Manners in which God notifies his Will to Man, *viz.* Natural (or Moral) and Poſitive. Natural is that which he has made known to all Mankind, by that innate Light, called *Natural Reaſon*; Poſitive is that which He has revealed by his Prophets; as thoſe *Laws* delivered to the *Jews*, relating to the Divine Worſhip and Polity, which may be called *Divino-Civil Laws*, as being peculiarly directed to that People. Again, *Natural Law* may be divided into that natural *Law* of Men, which, in a peculiar Senſe, is called *The Law of Nature*, and the natural *Law* of Countries, commonly called *The Law of Nations*. The Precepts are the ſame in both. But becauſe, when Societies are once inſtituted, certain perſonal Properties become veſted in Men, that *Law* which, when we ſpeak of the Duties of Men ſeverally, we call *The Natural Law*, when transferred to Cities or Countries, we call *The Law of Nations*.

Again, All *Human Laws* are Civil; for, according to *Hobbes*, the State of Man out of Society is a State of War, wherein no one being ſubject to another, there can be no other *Law* beſides the Dictates of Natural Reaſon, which is the *Divine Law*. *Civil Laws* may be divided with regard to the Difference of the ſubject Matter, into Sacred and Secular. Sacred are thoſe that relate to Religion, that is, to the Ceremonies and Worſhip of the Deity, and which are not preſcribed by any *poſitive Divine Law*. Secular are thoſe that relate to Property, &c. commonly call'd by the name Civil.

Further, *Civil Laws* conſidered with regard to the two Offices of the Legiſlator, *viz.* to judge, and to compel, may be divided into two Branches; the one Diſtributive, the other Vindicative and Pœnary. Diſtributive is that Branch by which every Man has his Right; or that which conſtitutes the Rules and Meaſures of Things, whereby we know what belongs to us, and what to others, ſo as we may not diſturb or interrupt others in the Enjoyment of their own, nor be interrupted by them, and what each Man may lawfully do or not do. Vindicative is that Branch by which the Puniſhments to be inflicted on thoſe who

who violate the *Laws* are determined. The Diſtributive and Vindicative are not two Species of *Laws*, but two Parts of the ſame *Law*. For if a *Law* ſay no more than *Whatever you catch in your Net in the Sea ſhall be yours*, 'tis in vain; for tho another take from you what you have caught, 'tis ſtill yours; in regard in the State of Nature, where all things are common, yours and another's are the ſame thing. So that what the *Law* defines to be yours, was yours before that *Law*, and will be yours after it, tho poſſeſs'd by another. A *Law* therefore is but an empty Sound, unleſs it determine the thing to be yours in ſuch a ſenſe, as to forbid every body elſe from diſturbing you in the poſſeſſion of it. But ſuch Prohibition will be vain, unleſs there be a Penalty annex'd to it. A *Law* therefore muſt contain both thoſe Parts, that which prohibits, and that which puniſhes. The firſt whereof, which is call'd Diſtributive, is prohibitory, and ſpeaks to all. The latter, call'd Vindicative or Pœnary, is Mandatory, and ſpeaks only to the public Officers. Whence it follows, that to all *Civil Laws* there is annex'd a Penalty, either implicitly or explicitly: and where that Puniſhment is not aſcertain'd, either by Writing or by Example, 'tis ſuppoſed to be Arbitrary, and to depend on the Pleaſure of the Legiſlator; for that is no *Law*, which may be violated *impunè*.

Moreover, *Civil Laws* conſidered with regard to the different Manners of promulging them are of two kinds; *Scriptæ* and *Non-Scriptæ*, thoſe written, and thoſe not written. By written, I mean thoſe which require either the Voice or ſome other Sign of the Legiſlator's Will to become *Laws*. Thoſe unwritten, are ſuch as need no other Promulgation beſides the Voice of Nature, or Natural Reaſon; of which kind are all Natural *Laws*. Hence it appears, that tho the Natural *Laws* be deſcribed in the Writings of Philoſophers, they are not therefore to be call'd, *Written Laws*. Nor are the Writings of Lawyers *Laws*, for want of the Supreme Authority: nor the *Reſponſa Prudentum*, or Opinions of Judges *Laws*, excepting ſo far as they are allow'd by the Supreme Power to paſs into Uſe; and then they are call'd *Leges ſcriptæ*, *written Laws*; not becauſe of their Uſe, but becauſe of the Will of the Supreme Power, which is argued from their paſſing into Uſe.

The firſt Principle, or *Law* of Nature, according to *Hobbes*, is Self-preſervation. *Thomaſſius* will have it to be our own Happineſs, which falls in at laſt with the Sentiment of *Hobbes*. *Puffendorf* maintains it to be Sociality. *Valentine Alberti*, the Belief that we are the Image of God. *Henry* and *Samuel Cocceius*, the Will of God. *Grotius*, Right Reaſon. *Velthenius*, the intrinſic Decency or Turpitude of Actions. *Strimeſius* and *Janus*, that we are to love God, Ourſelves, and our Neighbour. *M. Regis* ſays, that the *Laws* of Nature are the Dictates of Right Reaſon, which teach every Man how he is to uſe his natural Right; and the *Laws* of Nations, the Dictates in like manner of Right Reaſon, which teach every State how to act and behave themſelves towards others.

Law is alſo uſed for the ſeveral Policies of States and People, or the Maxims and Rules they have agreed upon or receiv'd from their Magiſtrates, to live in Peace and mutual Society. The *Laws* of the Twelve Tables were the antient *Laws* of the *Romans*, for which the *Decemviri* were ſent into *Greece*, and which ſerv'd them for the Ground-work of all their Juriſprudence. The celebrated *Laws* of the more modern Days are thoſe of the *Angli*, *Verines*, or *Thuringi*, of the *Boii* or *Bavarians*, thoſe of the *Burgundi*, of the *Rymarii*, *Germans*, *Danes*, and *Norwegians*, of the *Franks*, the *Friſons*, the *Lumbards*, the *Gothic Laws*, the *Martiane* or *Mercian Law*; the *Laws* of the *Saxons*, *Scots*, *Sicilians*, *Viſigoths*, the *Laws* of *Oleron*, the *Molmutin Law*, the *Salic Law*, the *Law Gombette*. See *Salic*, *Sumptuary*, &c.

Among the firſt *Romans*, the word *Law* properly ſignified an Ordonnance of the People made at the Requeſt of a Magiſtrate, particularly a Conſul. Theſe Ordonnances differ'd from the *Plebiſcita* and *Senatus-Conſulta*, and even from other Ordonnances made at the Requeſt of any other Magiſtrate beſides a Conſul, tho thoſe too bore the name of *Law*. Thus tho *Aquilius* and *Falcidius* were only Tribunes when they made their Requeſt, yet we ſtill ſay the *Aquilian Law*, the *Falcidian Law*. The *Laws* of the *Romans* are diſtinguiſhed, *1ſt*, By the Name of him at whoſe Requeſt they were paſs'd; as the *Cornelian Law*, the *Julian Law*, &c. *2dly*, By the Matter or Subject of the Law; and hence came the Terms *Teſtamentary Laws*, *Judiciary Laws*, *Agrarian Laws*, &c. *3dly*, Sometimes by the Crimes againſt which they were made; for inſtance, the *Laws* touching Poiſonings, Parricides, &c. the *Laws* of Concuſſion, Peculate, &c. The *Codex* and *Authenticæ* are the *Laws* and Conſtitution of the *Roman* Emperors: The *Digeſt* a Compilation made by the Emperor *Juſtinian*'s Order of the ſeveral Opinions and Judgments of the moſt Learned in the *Roman Law*; to which he gave the Sanction of Laws, as appears by the Epiſtle prefix'd to the Work: And 'tis this that conſtitutes the *Roman Law*.

The *Lex Talionis*, or *Law of Like for Like*, is the moſt antient and equitable *Law* in the World. It was obſerv'd by the *Hebrews*.

The *Law* of *England* conſiſts of three Parts. 1. The Common *Law*, which is the moſt antient and general *Law* of the Realm. 2. Statutes, or Acts of Parliament. 3. Particular Cuſtoms. The Common *Laws* of *England* are derived from the *Engliſh*, *Saxons*, and *Danes*, and were antiently divided into three Parts, *viz.* the *Mercian Laws*, the *Weſt-Saxon Laws*, and the *Daniſh Laws*. Thoſe call'd *Mercian* were compoſed by *Martia* Queen of the *Britons*, from whom there was a Province call'd *Provincia Merciorum*. Many *Laws* were publiſhed by *Ethelred* King of *Kent*, by King *Ina* and *Offa*: But *Alfred*, who ſubdued the whole Kingdom, having reviſed all the *Laws* of his Predeceſſors, retain'd thoſe which he thought proper, and aboliſh'd the reſt; whence he was call'd *Anglicarum Legum Conditor*, and theſe *Laws* were call'd *Weſtſenelagan*. But the Kingdom being afterwards ſubdued by the *Danes*, they introduced another *Law* call'd *Danalag*, by which their People were governed: And they being afterwards deſtroy'd, *Edward the Confeſſor* out of the former *Laws* compoſed that which we now call the *Common Law*; for which reaſon he is call'd by our Hiſtorians, *Anglicarum Legum Reſtitutor*. Theſe *Laws* were only general Cuſtoms obſerved thro the Nation, and for that reaſon were call'd *Common*: And perhaps alſo becauſe *Leges omnibus in commune reddidit*, to be obſerv'd by all with ſuch Amendments as were made by his Father. *William the Conqueror* did not enact many new *Laws*, but confirm'd the old; *viz.* St. *Edward*'s *Laws*, and abrogated none that any way concern'd Compoſitions or Mulcts of Delinquents.

The *Common Law* is alſo call'd *Lex non ſcripta*, (not but that we have moſt of 'em written in the old *Norman* Dialect) but becauſe it cannot be made by Charter or Parliament; for thoſe are always Matters of Record, whereas Cuſtoms are only Matters of Fact, and are no where but in the Memory of the People, and of all *Laws* muſt be the beſt for the *Engliſh*: for the Written *Laws* made by King and Parliament, are impoſed upon the Subjects before any Probation or Trial whether they are beneficial to the Nation, or agreeable to the Nature of the People, except where they are firſt made temporary, and for their experienc'd Uſefulneſs afterwards made perpetual; but Cuſtoms bind not till they have been tried and approved Time out of Mind.

Beſides the *Common Law* of *England* in general, there are in ſeveral Parts of it certain Cuſtoms and Common Uſages, which have the force of *Common Law* among thoſe People to whoſe Property they belong; as *Borough-Engliſh*, a Cuſtom ſo call'd as not being in uſe out of *England*, where the youngeſt Son, or for want of Sons the youngeſt Brother, is to inherit, the eldeſt being ſuppoſed to have learnt the Father's Trade, and the youngeſt the leaſt able to ſhift for himſelf. See *Gavelkind*.

Where the Common *Law* is ſilent, there we have *Statute Laws* made by the ſeveral Kings of *England*, with the Advice and Conſent of both Houſes of Parliament.

Beſides theſe, we make uſe of the Civil and Canon *Laws* in Eccleſiaſtical Courts. See *Civil* and *Canon*. We have alſo *Military* or *Martial Law*, in uſe among the Soldiery in time of War; and *Foreſt Law*, for the Regulation of Foreſts. See *Military*, *Foreſts*, &c.

Law has alſo a ſpecial Signification, wherein it is taken for that which is lawful with us, and not elſewhere; as *Tenant by the Courteſy of England*. Thus we alſo ſay, to *wage Law* (*vadiare Legem*) and to *make or do Law* (*facere Legem*.) When an Action of Debt is brought againſt one upon ſome ſecret Agreement or Contract, the Defendant may *wage his Law* if he pleaſes; that is, ſwear, and certain Perſons with him, that he owes the Plaintiff nothing: But this is only allow'd in caſe of the Plaintiff's want of Evidence, and when he cannot prove his Surmiſe by any Deed or open Act. When one *wages his Law*, he ſhall bring with him ſo many of his Neighbours as the Court ſhall aſſign (Sir *Ed. Coke* ſays, eleven) to ſwear with him that they believe in their Conſciences he hath ſworn truly; and theſe in the Civil *Law* are call'd *Compurgators*. The Offer to make Oath is call'd the *Wager of Law*, and when it is accompliſh'd, it is call'd the making or doing of *Law*. This Cuſtom is ſaid to have obtained, formerly, among the *Egyptians*.

The Word *Law* is alſo uſed figuratively, in ſpeaking of the Rules or Order according to which any thing is perform'd. Thus we ſay, the *Laws of Motion*, the *Laws of Mechanics*, the *Laws of Fluids*, the *Laws of a Game*, &c. See *Motion*, &c.

LAW OF ARMS, is that which gives Precepts how rightly to proclaim War, to make and obſerve Leagues, to attack the Enemy, and to puniſh Offenders in the Camp.

LAWING OF DOGS, a Term uſed in our Law-Writers. Thus Maſtiffs muſt be *Lawed* every three Years; *Crompton Juris*, fol. 163. that is, three Claws of the Fore-Foot ſhall be cut off by the Skin, or the Ball of the Fore-Foot cut out.

The Word *Law* is derived from the *Saxon*, *Lag* or *Laugh*.

LAWLESS COURT. On *Kings-hill* at *Rochford* in *Eſſex* every Wedneſday Morning next after *Michaelmas*-Day, at Cock-Crowing, is held a Court vulgarly call'd the *Lawleſs Court*. They whiſper, and have no Candle, nor any Pen and Ink but a Coal; and he that owes Suit or Service there, forfeits double his Rent every hour he is miſſing. This Court is call'd *Lawleſs*, becauſe held at an unlawful Hour, or *quia dicta ſine lege*. It is mention'd by *Cambden*, who ſays this ſervile Attendance was impoſed on the Tenants for conſpiring at the like unſeaſonable Time to raiſe a Commotion.

LAWLESS MAN, *Exlex*. See *Outlaw*.

LAW OF MARQUE, from the *German* Word *March*, a Bound or Limit, is a Law ſo call'd, by which thoſe who are driven to make uſe of it, take the Goods or Shipping of the Party that has done 'em wrong, and of whom they cannot get ordinary Juſtice whenever they can take them within their own Bounds or Precincts. See *Repriſals*.

LAW MERCHANT, is become a Part of the Laws of the Kingdom; it conſiſts in this, that if there be two joint Merchants of Wares, and one of 'em dies, his Executor ſhall have the Moiety: which is not ſo in the Caſe of others, not Merchants.

LAW OF THE STAPLE, the ſame with *Law Merchant*.

LAWS OF MOLMUTIUS. See *Molmutian Laws*.

LAWS OF MOTION, or of *Nature* (taken in a phyſical Senſe.) See *Motion*.

LAWS OF OLERON. See *Oleron*.

LAW SPIRITUAL, is the Eccleſiaſtical or Canon Law allow'd by the Laws of the Realm; ſo far as it is not againſt the Common Law, nor againſt the Statutes and Cuſtoms of the Kingdom. And regularly, according to ſuch Eccleſiaſtical Laws, the Ordinary and other Eccleſiaſtical Judges do proceed in Caſes within their Cognizance. See *Canon*.

LAXATIVE, in Medicine, is uſed to ſignify a looſe State or Diſpoſition of the Body, ſo as to go frequently to ſtool. Hence *laxative* Medicines are ſuch as promote that Diſpoſition, which they do by ſome ſmooth ſoftening Quality, taking away the Tenſity of the Fibres, and facilitating the Paſſage of the Contents of the inteſtinal Tube thro it; for which Reaſon all oily Subſtances come under this Claſs. See *Purgatives*.

LAY, an old *French* Word, ſignifying Moan, or Complaint. *Lay* is alſo the Name of a kind of antient Poetry, conſiſting of very ſhort Verſes. There were two ſorts of *Lays*, the great and the little; the great *Lay* was a Poem, conſiſting of twelve Couplets of Verſes of different Meaſures; the little *Lay* was a Poem conſiſting of ſixteen or twenty Verſes, divided into four Couplets. Theſe *Lays* were the *Lyric* Poetry of the old *French* Poets, who were imitated by ſome among the *Engliſh*. They were principally uſed on melancholy Subjects, and are ſaid to have been formed on the Model of the Trochaic Verſes of the *Greek* and *Latin* Tragedies. Father *Morgues* gives us an extraordinary Inſtance of one of theſe antient *Lays* in his Treatiſe of *French* Poetry:

Sur l'Appui du Monde
Que faut il qu'on fonde
D'Eſpoir?
Cette Mer profonde,
En Debris feconde
Fait voir
Calme au Matin, l'Onde
Et l'Orage y gronde
Le Soir.

LAY THE LAND, a Sea-Phraſe, uſed for ſailing out of ſight of Land, in which Caſe, they ſay, *they have laid the Land*; and if another Point of Land exclude the ſight of the former, they ſay, *They have ſhut the firſt Land in*. *Lay-Land* in Husbandry is alſo Fallow Ground which lies untilled.

LAY-BROTHER, among the *Romaniſts*, is a pious but illiterate Perſon, who devotes himſelf, in ſome Convent, to the Service of the Religious. He wears a Habit different from theirs, nor ever enters into the Choir or the Chapter. He is not in any Orders, nor does he make any Vow, excepting of Conſtancy and Obedience. A *Lay-Brother* is alſo uſed for an illiterate Religious, who takes care of ſome of the temporal Concerns of the Convent, as the Kitchin, the Gate, &c. There are alſo *Lay-Brothers*, who make the three Vows of Religion. In the Nunneries are alſo *Lay-Siſters*, who never enter the Choir, &c. and who are only retained for the Service of the Convent. The Inſtitution of *Lay-Brothers* began in the eleventh Century. The Perſons on whom this Title was conferred, were ſuch as were too ignorant to become Clerks, and who therefore applied themſelves wholly to bodily Work. It ſeems to have taken its Riſe from hence, that the Laity in thoſe Days had not, for the generality, the leaſt Tincture of Learning; whence alſo thoſe came to be called Clerks, by way of Diſtinction, who had ſtudied a little, and were able to read. The word comes from the *Latin Laicus*, of the *Greek* λαὸς, *People*.

LAYERS, are the low Branches of Trees or Shrubs, which are covered with good Mould when you would raiſe their Kind from them, leaving out their Ends till they are rooted; when they are to be cut off.

LAYMAN, a Perſon not engaged in any Order of Eccleſiaſticks.

Layman, among Painters, is a Statue of Wood, whoſe Joints are ſo made that it may be put into any Poſture. its chief Uſe is for the caſting and adjuſting of Draperies for the clothing of Figures.

LAZARETTO, or LAZAR-HOUSE, a publick Building in form of an Hoſpital, for the Reception of poor Sick. In ſome Countries it is appointed for Perſons coming from Places ſuſpected of the Plague to quarantain in. This is uſually a large Building, at a diſtance from any City, whoſe Apartments ſtand at a diſtance from each other, &c. where Ships are unladen, and their Equipage is laid up for forty Days, more or leſs, according to the Time and Place of Departure.

ST. LAZARUS, the Name of a military Order inſtituted at *Jeruſalem* by the Chriſtians of the *Weſt*, when they became Maſters of the *Holy Land*. They received Pilgrims under their Care, guarded them on the Roads, and defended them from the Inſults of the *Mahometans*. Some ſay it was inſtituted in 1119. Pope *Alexander* IV. confirmed it by a Bull in 1255, giving it the Rule of St. *Auguſtine*. The Knights of this Order being driven out of the *Holy Land*, part of them retired into *France*, and were eſtabliſhed there under *Louis* the IIId, who beſtowed on them the Country of *Boigny* near *Orleans*. *Innocent* VIII. ſuppreſſed the Order of St. *Lazarus* in *Italy* in 1490, or rather united it to that of *Maltha*. *Leo* X. reeſtabliſhed it in *Italy* in the beginning of the 16th Century. In 1572, *Gregory* XIII. united it in *Savoy* to that of St. *Maurice*, juſt inſtituted by Duke *Emanuel Philibert*. In *France* this Order was united to that of *N. D.* of *Mount Carmel* in 1608, and had ſome new Advantages conferred on it by the late King *Louis* XIV. The Knights of St. *Lazarus* are allowed to marry, and yet have Penſions upon Benefices.

Fathers of St. Lazarus, or *Lazarites*, a Name given to certain Regular Clerks of a Congregation inſtituted in *France* in the 17th Century by M. *Vincent*. They take their Name from a Houſe in the *Fauxbourg* of *Paris*. They have a Seminary in *Paris*, called *The Seminary des Bons Enfants*. The Vows they make are ſimple, and on occaſion may be diſpenſed withal.

LEAD, a coarſe, heavy, impure Metal, of all others the ſofteſt and moſt fuſible, when purified; called by the Chymiſts *Saturn*. Thoſe who have made an Analyſis of it, find it contains a little Mercury, ſome Sulphur, and a great deal of bituminous Earth. *Lead* is found in various Countries, but abounds particularly in *England*. 'Tis found, too, in ſeveral kinds of Soils and Stones, ſome whereof, beſides, contain Gold, ſome Silver, others Tin, &c. 'Tis melted on a Furnace provided for the purpoſe, with a ſtrong Coal-Fire upon it; as it melts, it runs thro' a Canal on one Side of it, leaving the Earth, Stone, and Scoria, with the Aſhes of the Coals. 'Tis purified by skimming it e'er cold, and throwing Suet and other fat Bodies into it. Some very able Naturaliſts obſerve, that the Weight of *Lead* increaſes, either in the open Air, or under Ground. Mr. *Boyle* obſerves this particularly of the *Lead* of Churches, which, he ſays, frequently grows both in Bulk and Weight, ſo as to become too ponderous for the Timber that before ſuſtained it; which ſome account for from the Impurity, Heterogeneity, and looſe Texture of its Parts, by means whereof the Particles of the Air getting Admiſſion within its Pores, are attracted, and eaſily aſſimilated to it. But others, who rely wholly on Experience, abſolutely deny the Effect, as alſo that it is reproduced in Mines before exhauſted, by letting them lie long open to the Air, which others aſſert. *Lead* is found of a lighter or deeper Colour, according as it is more or leſs purified, tho' ſome make a difference in the Colour of the Ore, always eſteeming that moſt which is the whiteſt.

Lead is a Metal of much Uſe; it eaſily melts, and mixes with Gold, Silver, and Copper, and communicates, as they talk, its Humidity to them; but not be-

ing able to endure the Violence of the Fire which they undergo, it retires, and carries with it all that was heterogeneous in them; ſo as neither Gold nor Silver are refined without *Lead*. To which it may be added, that the coarſer kind of precious Stones, boiled in Lead, are thereby rendered much more brillant.

Lead is much uſed in Building, particularly for Covering, Gutters, Pipes, and Glaſs. *Lead* is either caſt into Sheets in a Mold, or milled; which laſt is found by much the leaſt ſerviceable, not only on account of its Thinneſs, but alſo becauſe 'tis ſo exceedingly ſtretched in milling; that when it comes to lie in the hot Sun, it ſhrinks and cracks, and conſequently will not keep out the Water. The *Lead* uſed by Glaziers is firſt caſt into ſlender Rods, twelve or fourteen Inches long, called *Canes*; which being afterwards drawn thro' their Vice, comes to have a Groove on either Side for the Panes of Glaſs; and this they call *Turned Lead*.

The Method of paling or ſoldering *Lead* for fitting on of Imboſs'd Figures, &c. is by placing the Part whereon the Figure is to be paled, horizontal, and ſtrewing on it ſome pulverized Roſin; under this place ſome Coals, till ſuch time as the Roſin becomes reddiſh, and riſes in Pimples; then apply the Figure, and rub ſome ſoft Sodder in tothe joining: when this is done, the Figure will be paled on, and as firm as if it had been caſt on it.

Borrichius aſſerts, that *Lead* reverberated into Minium, melted into Glaſs, reduced into Ceruſs, and burnt into Litharge, immediately reſumes its original Figure, upon the dexterous Application of a lixivial Salt. The Antients, according to *Schindlerus*, uſed to compoſe Books of Plates of Leaves of *Lead*.

For the Manufacture of *Lead*, ſee *Plumbery*.

There are various Preparations of *Lead*, ſerving for various Purpoſes:

Lead-Duſt, a Preparation uſed by the Potters, made by throwing Charcoal-Duſt in melted *Lead*, and ſtirring them a long time together; to ſeparate the Coal again, they only waſh it in Water, and dry it afreſh. Its Uſe is to give a Varniſh and Gloſs to their Works.

Burnt-Lead is a Chymical Preparation uſed in Medicine, made of Plates of *Lead* melted in a Pot with Sulphur, and reduced into a brown Powder.

White Lead, uſed by Painters, is only thin Plates of *Lead* diſſolved by Fumes of boiling Vinegar. See *Ceruſs*.

Maſſicots of ſeveral Colours, and the Sandix, are alſo Preparations of *Lead*. See *Maſſicot* and *Sandix*.

Litharge of Gold or Silver, is only the *Lead* uſed in purifying Copper. See *Litharge*.

Red Lead, a Preparation of Mineral *Lead* calcined, uſed by Painters, Potters, and Phyſicians. See *Minium*.

By help of Chymiſtry there are alſo drawn from *Lead*, Salts, Balſams, Oils, Vinegar, a Magiſtery, &c. diſguiſed under the Name of *Saturn*, to amuſe the Ignorant.

Salt or Sugar of Lead, or *Saccharum Saturni*, is an eſſential Salt of Vinegar, incorporated with the proper Subſtance of *Lead*, diſſolved in the Spirit of Vinegar. *Balm of Lead*, or *Saturn*, is an Oil drawn from the Salt of *Lead* by Diſtillation, after having diſſolved it in Spirit of Turpentine. Magiſtery of *Lead* is the Calx of *Lead* purified and ſubtilized, which is made of *Lead* diſſolved in *Aqua fortis*, pouring a filtrated Salt-water into it; whence reſults a Magiſtery extremely white, which, when ſoftened by ſeveral Lotions, is mixed with Pomatums for the Face and Complexion.

Black Lead, a kind of Mineral Stone, of a black Colour, but ſilvered, and ſhining, found in *Lead* Mines, and appearing to be nothing elſe but *Lead* not yet arrived at Maturity; much uſed for Pencils or Crayons for deſigning. 'Tis melted like the common *Lead*.

Mr. *Glanvil* obſerves, that the Smoke of the *Lead*-Works in *Somerſetſhire* is a prodigious Annoyance, and ſubjects both the Workmen, and the Cattel that graze about them, to a mortal Diſeaſe. The Trees that grow near them have their Tops burnt, and their Leaves and Outſides diſcoloured and ſcorched.

When the *Lead-Ore* is dug out, they beat it ſmall, then waſh it clean in a running Stream, and ſift it in Iron Rudders. Their Hearth or Furnace is made of Clay or Fire-ſtone; this they ſet in the Ground, and on it build their Fire, which they light with Charcoal, continuing it with young Oaken Gads, blown with Bellows, by Mens treading on them. After the Fire is lighted, and the Fire-Place hot, they throw their *Lead*-Ore on the Wood, which melts down into the Furnace, and then with an Iron Ladle they take it out, and upon Sand caſt it into what Form they pleaſe.

The Mine-Men ſometimes find the Vein run up into the Roots of Trees, and yet don't obſerve any Difference between thoſe and other Trees. When the Mine is near the Surface, the Graſs is ſometimes found yellow. They make no account of the *Virgula Divinatoria*; yet ſay, that when a Mine is open, they may gueſs by it how far the Vein will lead. The Ore runs ſometimes in a Vein, ſometimes diſperſed in Banks; it lies many times between Rocks; ſome of it is harder, others milder; ſometimes they have branched Ore in the Spar; about the Ore is Spar and Chalk, and another Subſtance, which they call *Crootes*.

LEAF, LEAVES, part of a Plant, ordinarily very thin and flat, growing in the Spring, and falling off in Autumn. There are ſome Plants without *Leaves*, as Truffles and Muſhrooms. As to the Structure of *Leaves*, Dr. *Grew* obſerves, that their Fibres never ſtand on the Stalk in an even Line, but always in an angular or circular Poſture, and their vaſcular Fibres or Threads are 3, 5, or 7. The Reaſon of which Poſition is for their more erect Growth and greater Strength of the *Leaf*. Another Obſervable in the Fibres of Leaves, is their orderly Poſition, ſo as to take in an eighth part of a Circle, as in Mallows; in ſome a tenth, but in moſt a twelfth. The ſame Author obſerves ſix ſeveral Parts intended by Nature for the Preſervation of Gems; *viz.* *Leaves*, Sunfoils, Interfoils, Stalks of *Leaves*, Hoods, and Mantlings that cover them. The Skin or Coat of the *Leaves* is no more than that of the Branches extended, as Gold, by beating, is reduced into *Leaves*. In the Gem they are folded, ſometimes in two, and ſometimes in ſeveral Plaits, ſomewhat after the manner of a Fan. If the *Leaves* be too thick to plait commodiouſly in two, and to be ranged againſt each other; or if they be in too ſmall a Number, and their Fibres too delicate, inſtead of being plaited, they are rolled up, and form either a ſingle Roll, as the *Leaves* of the Mountain Cowſlip, which are thick; or two Rolls, which begin at each Extremity of the *Leaf*, and meet in the middle. There are ſome Plants whoſe *Leaves* form three Rolls, as Fern; ſeveral *Leaves* are covered with Hair of ſeveral Figures, thoſe of Lavender and Olive-Tree have Hair reſembling Stars.

Botaniſts conſider the *Leaves* of Plants, with regard to their Structure, to their Surface, Figure, Conſiſtence, their Edges, Situation, and Size. With regard to their Structure, *Leaves* are either ſingle, as thoſe of the Apple-Tree, Pear-Tree, &c. or double, as thoſe of Angelico, Parſley, &c. With regard to their Surface, *Leaves* are either flat, as the Nummularia, Aſarum, Organy, Androſæmum, Brionia Canadenſis, &c. or hollow, as thoſe of the Onion and Aſphodel; or in Bunches, as ſeveral kinds of Kali, Salicot, and Houſe-Leeks. With regard to their Conſiſtence, *Leaves* are either thin and fine, as thoſe of St. *John*'s-Wort, and Dog's Graſs; or thick and groſs, as thoſe of Porculata; or fleſhy, as thoſe of ſeveral kinds of Houſe-Leeks; or woolly, as thoſe of the Wooll-Blade. With regard to their Edges, *Leaves* are either cut ſlightly, as ſome Species of Geum, and Cannabis Lutea; or deep, as Trefoil, &c. With regard to their Situation, *Leaves* are either alternate, that is, ranged alternately, as the Phylica; or oppoſite to each other, as the Phyllyrea, and ſome Species of the Rubia. With regard to their Size, *Leaves* are either very big, as thoſe of the Colocaſia and Sphondylium; or moderate, as thoſe of Biſtort, the Fig-Tree; or ſmall, as thoſe of the Apple-Tree, Pear-Tree, Peach-Tree; or very ſmall, as thoſe of Mille-Pertuis, or St. *John*'s-Wort.

Leaf, or *Leaves*, is alſo uſed to expreſs the moſt ſenſible and agreeable Parts of Flowers. 'Tis true, all Flowers have not *Leaves*, and 'tis ſometimes difficult to determine which is to be called the *Leaves*, and which the Calix of the ſame Flower. To prevent the confounding of the *Leaves* of the Flower with thoſe of the reſt of the Plant, the former are called *Petala*, from a *Greek* Word which the Botaniſts have adopted into their *Latin* Deſcriptions, when they ſpeak of the *Leaves* of Flowers. The *Leaves* of Plants they call *Folia*, and thoſe of the Flowers *Petala*. See *Petalum*.

Leaves in Architecture, an Ornament in the *Corinthian* Capital, and thence borrowed into the Compoſite; conſiſting in the Repreſentation of a double Row of *Leaves* covering the Vaſe, Tympanum, or Neck of the Column. Theſe *Leaves* are uſually made in imitation of thoſe of the Acanthus, ſometimes of thoſe of Olive, and ſometimes of Laurel. The *Leaves* are divided, each making three Ranges of leſſer, and are bent, a-top, one third of their Height. See *Capital*, *Acanthus*, &c.

LEAGUE, an Extent of Ground, conſidered lengthwiſe, ſerving to meaſure the Diſtances of one Place from another, and containing more or leſs Geometrical Paces, according to the different Uſages and Cuſtoms of Countries.

A *Sea League* is 3000 Geometrical Paces, or three *Engliſh* Miles; the large *Leagues* of *France*, are uſually 3000, and in ſome Places 3500 Paces; the mean or common *League* is 2400 Paces, and the little *League* 2000. *Chorier* obſerves, that the antient *Gauliſh Leagues* were but 1500 Paces. The *Spaniſh Leagues* are larger than the *French*, 17 *Spaniſh*

Leagues

Leagues make a Degree or 20 *French Leagues*, or 69 ½ *Engliſh* Statute Miles. The *Leagues* of *Germany* and *Holland* contain four Geographical Miles each. The *Perſian Leagues* are nearly the ſame with the *Spaniſh*, that is, they are equivalent to four *Italian* Miles; which comes pretty near to what *Herodotus* mentions of the *Paraſanga*, an antient Meaſure among the *Perſians*, containing thirty Stadia, eight whereof, according to *Strabo*, make a Mile. The *Perſians* mark their *Leagues* by Trees, as the antient *Romans* did by Stones, *Lapides*; for which reaſon they call them *Agag*, a *Turkiſh* Word ſignifying Tree. In *Japan* the *League* conſiſts of 1800 Fathoms. Theſe are all diſtinguiſhed by little Hillocks, raiſed on purpoſe by the Road-ſide. See *the Leagues of moſt Countries, reduced to the* Roman *Foot, under the word* Mile.

The word comes from *Leuca*, or *Leuga*, an antient *Gauliſh* Word, as *Menage* has proved from *Iſidore*, St. *Jerom*, *Am. Marcellinus*, &c. Some derive the word *Leuca* from λευκὴ *white*, in regard the *Gauls*, in imitation of the *Romans*, marked the Spaces and Diſtances of their Roads by white Stones.

LEAGUE, an Union or Confederacy between Princes and States for their mutual Aid, either in attacking ſome common Enemy, or in defending themſelves. There have been ſeveral holy *Leagues* entered into by the Chriſtians againſt the *Saracens* and *Infidels*, ſometimes alſo called *Cruſado's*. The *League* is uſed by way of Eminence for that famous one on foot in *France*, from the Year 1576, to 1593. Its Intent was to prevent the Succeſſion of *Henry* IV. who was of the Reformed Religion, to the Crown, and it ended with his Abjuration of that Faith. The *Leaguers*, or Confederates, were of three kinds: The *zealous Leaguers* aimed at the utter Deſtruction, not only of the *Hugonots*, but alſo of the Miniſtry. The *Spaniſh Leaguers* had principally in view the transferring the Crown of *France* to the King of *Spain*, or the Infanta his Daughter. The *moderate Leaguers* aimed only at the Extirpation of Calviniſm, without any Alteration of the Government. The Word comes from *liga*, which, in the corrupt *Latin*, was uſed for Confederation, *Quâ quis cum alio ligatur.*

LEAKAGE, is a Leaking or Leak in a Veſſel, through which the Liquor runs out: Alſo an Allowance made to a Merchant in Liquid Goods of 12 *l. per cent.* Alſo an Allowance of Brewers of 2 in 22 Barrels of Ale, and 3 in 23 Barrels of Beer.

LEAP-YEAR, or Biſſextile, is every fourth Year, ſo called from its *leaping* a Day more that Year than in a Common Year; for in the Common Year any fixed Day of the Month changeth ſucceſſively the Day of the Week, but in the *Leap-Year* it skips or leaps over one Day. The Common Year hath 365 Days in it, but the *Leap-Year* 366 Days, and then *February* hath 29 Days, which, in the Common Year hath but 28. To find the *Leap-Year*, this is the Rule;

Divide by 4, *what's left ſhall be,*
For Leap-Year 0, *for paſt* 1, 2, *or* 3.

For Example, what is the Year 1720, a *Leap-Year*, or Common Year

4) 1720 (430

There is 0 Remainder, ſo that it is *Leap-Year.*

LEASE, *in Law*, ſignifies a Demiſe, or letting of Lands, Tenements, Right of Common, Rent, or any Hereditament unto another, for Term of Years, or for Life, for a Rent reſerved, and is either written, called alſo *Indenture*, *Deed Poll*, or *Leaſe* in writing; or by word of Mouth, called *Leaſe Parol.* The Party that letteth this *Leaſe* is called the *Leſſor*, and the Party to whom it it is lett the *Leſſee.* A *Leaſe* hath in it ſix Points; (1.) Words ſufficient to import a Demiſe. (2.) A Leſſee named. (3.) A Commencement from a Day certain. (4.) A Term of Years. (5.) A Determination. (6.) A Reſervation of Rent.

LEASH is a Term uſed in the Game for three Creatures of any Kind, as a *Leaſh* of Greyhounds; as a Brace expreſſeth two.

LEAVEN, any thing that will make a Body ſwell by means of the moſt ſubtile and penetrating of its Parts; which being agitated and divided, divide and agitate the more groſs, as we may obſerve in Paſte, in ſeveral Liquors, &c. The word comes from *levanum*, *a levando*, becauſe *Leaven* makes the Paſt, &c. riſe. See *Ferment.*

LEAVER. See *Lever.*

LECTICARIUS, an Officer in the *Greek* Church, whoſe Buſineſs it was to bear off the Bodies of thoſe who died, and to bury them. The chief of the *Lecticarii* was the Deacon. The *Romans* had two Kinds of *Lecticarii* different from thoſe of the *Greeks*, and who anſwered nearly to the Office of our Chairmen.

LECTISTERNIUM, a religious Ceremony among the antient *Romans*; it conſiſted in a Feſtival prepared, and ſolemnly given in the Temple. And becauſe, according to the Cuſtom of thoſe Times, they placed Beds a-round the Tables, and ſet the Statues of the Gods on thoſe Beds, in the ſame manner as Men ſate at Meals: They call'd this Practice *Lectiſternium*, from *Lectus*, Bed, and *ſternere* of *ſterno* to ſpread, prepare. In this Ceremony the *Epulones* (mentioned under that Head) preſided. *Caſaubon* has obſerved from a Paſſage in the Scholiaſt of *Pindar*, that the *Greeks* had alſo the *Lectiſternium* in Uſe. *Livy* obſerves that the firſt *Lectiſternium* ſeen in *Rome*, was that which held for eight Days ſucceſſively, in honour of *Apollo*, *Latona*, *Diana*, *Hercules*, *Mercury*, and *Neptune*, on occaſion of a contagious Diſeaſe that kill'd all their Cattle, in the Year of *Rome* 354, tho *Valerius Maximus* mentions one before that.

LEE, a Term variouſly uſed at Sea, but its general Uſe is to ſignify the Part oppoſite to the Wind: Thus the *Lee*-ſhore is that on which the Wind blows, and therefore to be under the *Lee* of the Shore, is to be cloſe under the Weather-ſhore, or under Wind. When they ſay *A-Lee the Helm*, they mean, put the Helm to the *Lee-ward* Side of the Ship. They ſay alſo, take care of the *Lee-latch*, which is a Word of Command to the Man at the Helm, to take care that the Ship do not go to the *Lee-ward* of her Courſe; wherefore they call a *Lee-ward* Ship one that is not faſt by a Wind, or which doth not ſail ſo near the Wind, nor make ſo good way as ſhe ſhould. To lay a Ship by the *Lee*, or to come by the *Lee*, is to bring her ſo, that all her Sails may lie flat againſt her Maſts and Shrouds, and that the Wind may come right upon her Broad-ſide. The *Lee-way* of a Ship, is the Angle made by the Line on which the Ship ſhould run, according to her Courſe, or the Point of the Compaſs ſteered upon, and the real Line of the Ship's Way; for all Ships are apt to make ſome *Lee-way*, wherefore in caſting up the Log-board, ſomething muſt always be allowed for *Lee-way*. The ordinary Rules are theſe: (1.) If the Ship be upon a Wind, you muſt allow one Point for *Lee-way*. (2.) If the Wind blow hard, ſo that you are forced to take in one Top-ſail, allow two Points for *Lee-way*. (3.) If it blow ſo hard, that both Top-ſails muſt be taken in, and the Sea runs high, allow three Points for *Lee-way*. (4.) If her Fore-ſail being furled, ſhe try under a Main-ſail or Mizzen, ſhe will make her way four Points before the Beam. (5.) If ſhe try with a Main-ſail only, ſhe will make her way near three Points before the Beam. But (6.) If under a Mizzen only, ſhe will make her way about two Points before the Beam.

LEES, the groſſeſt and thickeſt Parts of Wine, Oil, and other Liquors; or the Sediment found at bottom of the Veſſel. A kind of gravelly Sand is made with the *Lees* of Wine burnt and prepared, uſed by Dyers, &c. which ought to ſtand as a Caution to People troubled with the Stone, &c. The Word comes from the *French Lie*, and that either from *Limus Mud*, or from *Lyeus* one of the Surnames of *Bacchus*; or, according to *Du Cange*, from *Lia*, a corrupt Latin Word ſignifying the ſame thing. The Vinegar-Makers make a great Trade of the *Lees* of Wine dried and made into Cakes, after having ſqueez'd out the Remains of the Liquor in Preſſes.

LEET, an old *Saxon* Word for a Law-day; from the *Saxon Lite* little, *quaſi* a little Court; or from the *German Laet*, i. e. a Country Judge. The Court-*Leet* is a Court held by the Lord of a Mannor, tho' in reality 'tis the King's Court, in whoſe Mannor ſoever it is held, in regard the Authority thereof belongs originally to the Crown, and is derived thence to other Perſons: It is a Court of Record, and inquires of all Offences under High-Treaſon, tho it cannot puniſh many, but muſt certify them to the Juſtices of Aſſize.

LEGACY in Law, any particular Thing given by a Laſt Will and Teſtament; for if the whole Eſtate be ſo given, it is ſaid to be Hereditary, and he to whom it is ſo given, is called *Hæres* by the Civilians; though in common Law, the Diſtinction is this, that he to whom all the Man's Lands and Hereditaments deſcend by Right of Blood, is *Hæres Natus*; the other to whom 'tis bequeath'd is called *Hæres Factus.* In the Eccleſiaſtical Senſe *Legacy* was formerly a Soul-Seat, a Bequeſt to the Church, or accuſtomed Mortuary: and this was to hold good, even tho' the Teſtament it ſelf were declar'd null and invalid.

LEGALIS HOMO, in Law; a Perſon who ſtands *rectus in Curia*, not out-law'd, nor excommunicated, nor defamed; and in this Senſe are thoſe Words ſo often uſed, *Probi & Legales Homines.* Hence Legality is taken for the Condition of ſuch a Man.

LEGATE, a Prelate whom the Pope ſends as Embaſſador to any ſovereign Prince. There are three Kinds of *Legates*, viz. *Legates à latere*, *Legates de latere*, and *Legates* by Office, or *Legati Nati.* Of theſe the moſt conſiderable are the *Legates à latere*; ſuch are thoſe whom the Pope commiſſions to take his Place in Councils, ſo called, in regard the

the Pope never gives this Office to any but his greateſt Favourites and Confidents, who are always at his Side, *à latere*: that is, to the Cardinals. He may confer Benefices without Mandate, legitimate Baſtards to hold Offices, and has a Croſs carried before him as the Enſign of his Authority. The *Legates de latere*, are thoſe who are not Cardinals, but are yet intruſted with an Apoſtolical Legation. *Legates* by Office are thoſe who have not any particular Legation given them, but who by virtue of their Dignity and Place in the Church become *Legates*. Such are the Archbiſhops of *Rheims* and *Arles*. But the Authority of theſe *Legates* is much inferior to that of the *Legates à latere*. The Power of a *Legate* is ſometimes given without the Title. Some of the Nuntio's are inveſted with it.

The Term *Legate* comes from that of *Legatus*, which *Varro* derives from *legere* to chuſe, and others from *legare*, *delegare*, to ſend, delegate. See *Wicquefort*.

LEGATORY, a Term uſed in ſpeaking of the Government of the antient *Romans*; *Auguſtus* divided the Provinces of the Empire into Conſular, *Legatory*, and Preſidial. *Legatory* Provinces were thoſe whereof the Emperor himſelf was Governour, but where he did not reſide, but adminiſtred Affairs by his Lieutenant or *Legatus*.

LEGATUS, or LEGAT, among the *Romans*, was an Officer of Diſtinction, who commanded under the firſt or leading Officer. Of theſe there were two Kinds, *viz.* a *Legatus* in the Army under the General, anſwering to our Lieutenant-General, and a *Legatus* in the Provinces under the Proconſul or Governour. When any conſiderable Perſon among the *Roman* Citizens had occaſion to paſs thro' any of the Provinces, the Senate gave him the Title of *Legatus*; that is, of Envoy from the Senate, to the end he might be received with the greater Reſpect, and that the Cities and Towns thro' which he travelled might defray his Expences. This they call'd a free Legation, in regard the Perſon was not incumber'd with any Truſt, and might lay it aſide as ſoon as he pleaſed.

LEGEND, was originally a Book uſed in the old *Romiſh* Churches, containing the Leſſons that were to be read in the holy Office: hence the Lives of Saints and Martyrs came to be call'd *Legends*; becauſe Chapters were to be read out of them at Matins, and in the Refectories of the Religious Houſes. The *Golden Legend* is a Collection of the Lives of the Saints, compiled by *James de Varaſe*, better known by his Latin Name of *J. de Voragne*, Vicar General of the *Dominicans*, and afterwards Archbiſhop of *Genoa*, who died in 1298. It was received into the Church with a world of Applauſe, which it maintained for 200 Years; but, in effect, is ſo full of ridiculous and romantic Accounts, that the *Romaniſts* themſelves are now generally aſhamed of it. The Word *Legend* it ſelf is on that account come into diſrepute.

Legend is alſo uſed to ſignify the Words or Letters engraven about the Edges, &c. of Coins. Thus the *Legend* of a *French* Crown, is, *Sit nomen Domini Benedictum*; that of a *Moidore*, *In hoc Signo vinces*; and on thoſe of the laſt Emperors of *Conſtantinople*, we find, *Jeſus Chriſtus Baſileus Baſileon*, IHS XPS NIKA, *Jeſus Chriſtus Vincit*.

Legend, is alſo uſed for the Inſcriptions of Medals, which ſerve to explain the Figures or Device. In ſtrictneſs, the *Legend* differs from the Inſcription; this laſt properly ſignifying Words placed on the Reverſe of a Medal, in the place of Figures. It ſeems as if the Antients had intended their Medals ſhould ſerve both as Images and as Emblems; the one for the common People, and the other for Perſons of Quality and Parts: the Images to repreſent the Faces of Princes, and Emblems to repreſent their Virtues and great Actions: So that the *Legend* is to be looked on as the Soul of the Medal, and the Figures as the Body. Every Medal has two *Legends*, that on the Front, and that on the Reverſe. The firſt, for the generality, ſerves only to diſtinguiſh the Perſon by his Name, Titles, Offices, &c. the latter is intended to expreſs his noble and virtuous Sentiments, his good Deeds, and the Advantages the Public has reap'd by him; this however does not hold univerſally, for we ſometimes find the Titles ſhared between both Sides, and ſometime the *Legend*. In the Medals of Cities and Provinces, as the Head is uſually the Genius of the Place, or at leaſt ſome Deity adored there; the *Legend* is the Name of the City, Province, or Deity, or of both together; and the Reverſe, ſome Symbol of the City, &c. frequently without a *Legend*; ſometimes with that of one of its Magiſtrates. The Subjects of *Legends* are the Virtues of Princes, the Honours they have receiv'd, Conſecrations, ſignal Events, public Monuments, Deities, public Vows, Privileges, &c.

Legends and Inſcriptions of Medals, are either in *Latin* or *Greek*. The *Greek* Character, conſiſting of Majuſcule or Capital Letters, appears uniform on all the Medals, no Change or Alteration appearing in confronting the ſeveral Characters, tho 'tis certain there was in the ordinary Uſe and Pronunciation. All we obſerve on Medals, is ſometimes a Mixture of *Greek* and *Latin* Letters. The Character was preſerved in all its Beauty till the time of *Gallian*. From the time of *Conſtantine*, and for the Space of 500 years, the *Latin* Tongue alone was uſed in the *Legends* of Medals, even in thoſe ſtruck at *Conſtantinople*. *Michael* begun the firſt, whoſe *Legend* was in *Greek*, and from his Time the Language, as well as the Characters, began to alter for the worſe.

LEGION, a kind of Regiment or Body of Forces, whereof the *Roman* Armies were compoſed. The Number of Soldiers and Officers whereof the *Legion* conſiſted, was different at different Times: But 'tis impoſſible to determine the preciſe Time and Manner of their Alteration. In the Time of *Romulus* each Legion contained 3000 Foot, and a Hundred *Equites*, or Knights: Theſe were divided into three Bodies, which made as many Orders of Battel. Each Body conſiſted of ten Companies, or Manipules, ranged at ſome diſtance from each other, tho in the ſame Front. Each Body had two General Officers to command it, called *Tribunes*, and each Manipule two Centurions. Under the Conſuls the *Legion* conſiſted of 4000 Men, who made four Bodies, commanded by a Conſul or one of his Lieutenants, and each *Legion* had its ſhare of Cavalry, which was from two to three hundred Horſe. Afterwards, in the time of *Marius*, theſe four Diviſions of the *Legion* were united into one, and augmented, and Cohorts were appointed from five to ſix hundred Men, each under the Command of a Tribune. Each Cohort conſiſted of three Companies or Manipules, each Manipule of two Centuries, and the *Legion* divided into ten Cohorts, who made as many diſtinct Battalions diſpoſed in three Lines; ſo that the *Legion*, then, conſiſted of five or ſix Thouſand Men. *Iſidore* tells us, that the *Legion* conſiſted of ſix Thouſand Men, divided into ſixty Centuries, thirty Manipules, twelve Cohorts, and two Hundred Troops. According to the *French* Academy, the *Legion* conſiſted of ſix Thouſand Foot, and ſeven Hundred twenty-five Horſe. The *Legions* were by far the moſt conſiderable part of the *Roman* Army; their Number in the time of *Auguſtus* was thirty-three; they were compoſed wholly of *Roman* Citizens. The Allies formed a Body of Auxiliary Forces. The Standard bore by the *Legions* was as various. At firſt a Wolf, in honour of that which ſuckled *Romulus*, afterwards a Hog; by reaſon, ſays *Romulus*, War is only undertaken with a View to Peace, which was concluded by ſacrificing a Hog. Sometimes they bore the Minotaur, to remind their General that their Deſigns were to be kept ſecret, and inacceſſible as the Minotaur in the Labyrinth. They alſo bore a Horſe, a Boar, &c. *Pliny* tells us, that *Marius* was the firſt who changed all theſe Standards into Eagles. The Word *Legion* comes from the Latin *legere*, *to chuſe*; becauſe when the *Legions* were raiſed, they made choice of ſuch of their Youth as were the moſt proper to bear Arms.

LEGISLATOR, he who makes the Laws of a Kingdom, or State, which he has founded. The principal antient *Legiſlators* are, *Moſes*, *Legiſlator* of the *Hebrews*; *Mercurius Triſmegiſtus* and *Bococes* of the *Egyptians*; *Italus* of the *OEnotrians*; *Theſeus*, *Draco*, and *Solon* of the *Athenians*; *Zoroaſter* of the *Bactrians*; *Charondas* of the *Cappadocians*; and *Charondas*, or *Phaleas*, of the *Carthaginians*; *Androdamas* of the *Chalcidians*; *Eudoxus* of the *Cnidians*; *Phido* of the *Corinthians*; *Ephorus* and *Minos* of the *Cretans*; *Pythagoras* of the *Crotoniates*, and moſt of the Cities of *Græcia Major*; *Parmenides* and *Zeno* of *Elea* in *Lucania*; *Arribas*, or *Tharcitas*, of the *Epicores*; *Zamolnis* of the *Getæ*; *Phoroneus* of the *Greeks*; *Bacchus* of the *Indians*; *Saturn* of *Italy*; *Macarius* of the *Iſle of Lesbos*; *Zaleucus* of the *Locrians*; *Nicodorus Athleta* of the City of *Mutina*; *Hippodonne* of *Miletus*; *Charonidas* of *Rheggio*; *Lycurgus* of the *Lacedemonians*; *Archytas* of *Tarentum*; *Philolaus* of the *Thebans*. At *Rome* the People were, in great meaſure, their own *Legiſlators*, tho' *Solon* may be ſaid, in ſome ſenſe, to have been their *Legiſlator*, in regard the *Decemviri*, who were created for the making of Laws, borrowed a great Number from thoſe of *Solon*.

LEGITIMATION, an Act by which Natural Children are rendered legitimate. The Father and Mother by marrying render their Children begotten before Marriage legitimate, and this is called *Legitimation*, *per ſubſequens Matrimonium*. The Right of *Legitimation* was a thing unknown to Princes till the time of *Conſtantine*, but ſince his Time has been exerciſed by moſt of them. The *Greek* Emperors invented ſeveral kinds of *Legitimation*. *Anaſtaſius* put it in the power of the Father to legitimate his natural Children by a bare Adoption, provided he had no legitimate Children. But *Juſtin* by his Conſtitution, and *Juſtinian* by his Novel 74, aboliſhed this *Legitimation*, as fearing the too eaſy acceſs to *Legitimation* ſhould encourage Concubinage. In lieu of this he eſtabliſhed a

way

way of *Legitimation* by the Emperor's Letters. This rendered Baſtards capable of attaining to Honours, and even of ſucceeding to Inheritances, provided the Perſons were legitimated with the Conſent of their Father and Mother; which is agreeable to the Canon Law.

LEGS, the lower Parts of the Bodies of Animals, ſerving them for Support and for Motion. Some Anatomiſts divide the Foot of Man into three Parts, *viz.* the Thigh, the *Leg*, and the leſſer Foot. In the *Leg* there are two conſiderable Bones, the one called *The Great Focile*, or the *Tibia*; the other *The Little Focile*, or the *Fibula*.

The *Legs* and Feet of the ſeveral Animals, Mr. *Derham* obſerves, are exactly conformable to the Poſture, Make, nay to the Motion and Exerciſes of thoſe Animals. In ſome they are made for Strength only, in others for Agility and Swiftneſs; in ſome for walking and running, in others for ſwimming, in others for digging, and in others for flying. In ſome more lax and weak for traverſing the plain Land, in others ſtiff and rigid for Ice and Precipices. In ſome ſhod with tough and hard Hoofs, ſome whole, ſome cleft. In ſome the Feet are compoſed of Toes, ſome ſhort for only going, others long to ſupply the Place of Hands; ſome armed with Talons to catch and tear their Prey, ſome with ſhort Nails to confirm their Steps in running and walking. In Birds the *Legs* are curved for their eaſy Perching, Rooſting, and Reſt, as alſo to help them on the Wing in taking their Flight, and to be therein com modiouſly tucked up to the Body, ſo as not to obſtruct their Flight. In ſome long for wading, *&c.*

Legs of a Triangle; when one Side of a Triangle is taken as a Baſe, the other two are called *Legs*.

LEGUMEN, in Botany, is that Species of Plants called *Pulſe*; which are ſo named as being gathered with the Hand, by which they are diſtinguiſhed from Wheat, Corn, *&c.* which are mowed or reaped. Of this kind are all that grow in Pods, as Beans, Peaſe, *&c.* In the general, all Plants, which have a Papilionaceous, or Butterfly-like Flower, are reckoned by Mr. *Ray* among the *Legumina*. The word *Legumen*, according to *Varro* and *Servius*, is formed *ex eo quod Manu legatur, & non ſecatur*; *in regard it is gathered with the Hand, and not cut.*

LEMMA, a Term chiefly uſed in Geometry. It ſignifies an Aſſumption, or preparatory Propoſition, laid down to clear the way for ſome following Demonſtration: frequently prefix'd to Theorems, in order to render their Demonſtration leſs perplex'd and intricate, and to Problems in order to make their Reſolution more eaſy and ſhort. Thus to prove a Pyramid one third of a Priſm, or Parallelopiped, of the ſame Baſe and Height with it; the Demonſtration whereof in the ordinary way, is difficult and troubleſome, this *Lemma* may be premiſed, which is proved in the Rules of Progreſſion; That the Sum of the Series of the Squares in Numbers in Arithmetical Progreſſion, beginning from 0, and going on 1, 4, 9, 16, 25, 36, *&c.* is always ſubtriple of the Sum of as many Terms equal to the greateſt; or is always $\frac{1}{3}$ of the greateſt Term multiplied by the Number of Terms. Thus to find the Inflection of a Curve Line, this *Lemma* is firſt premiſed; That a Tangent may be drawn to the given Curve in a given Point. Thus in Phyſics, to the Demonſtration of moſt Propoſitions, ſuch *Lemmata* as theſe are neceſſary firſt to be allowed; That there is no Penetration of Dimenſions; That all Matter is diviſible; and the like. As alſo in the Theory of Medicine, That where the Blood circulates, there is Life, *&c.*

LEMNIAN EARTH, a Medicinal Aſtringent, uſed in the ſame Caſes as Bole, which ſee. It hath its Name from the Iſland of *Lemnos*, whence it is chiefly brought: Many form it into round Cakes, and impreſs a Seal upon it, whence it is call'd *Terra Sigillata*.

LEMONADE, a Drink prepared of Water, Sugar, and Citrons or Lemons. This factitious Liquor is ſo popular in *Paris*, that it has given its Name to a new eſtabliſh'd Company, call'd *Lemonadiers*.

LEMURES, Sprites, Hobgoblins; Reſtleſs Ghoſts of departed Perſons, who return to torment the Living. Theſe are the ſame with the *Larvæ*, which the Antients imagined to wander round the World, to frighten good People, and plague the bad. For this reaſon, at *Rome* they had their *Lemuralia*, or Feaſts inſtituted to appeaſe the *Manes* of the Defunct. *Socrates* explains the *Manes* thus: The Soul of Man releaſed from the Bands of the Body, and freed from performing his bodily Functions, becomes a kind of Demon or Genius, formerly called *Lemures*. Of theſe *Lemures*, thoſe that were kind to their Families, were called *Lares Familiares*; but thoſe, who for their Crimes were condemned to wander continually without meeting with any Place of Reſt, and terrified good Men, and hurt the bad, were vulgarly called *Larvæ*. An antient Commentator on *Horace* mentions, that the *Romans* uſed the Term *Lemures* for *Remures*; which laſt Word was formed from *Remus*, who was kill'd by his Brother *Romulus*, and who returned to Earth to torment him. But *Apuleius* obſerves, that in the antient *Latin* Tongue *Lemures* ſignified the Soul of a Man ſeparated from the Body by Death.

LEMURIA, or *Lemuralia*, the Name of a Feaſt ſolemnized at *Rome* on the ninth of *May*, to pacify the *Manes* of the Dead, or in honour of the *Lemures*. The Inſtitution of this Feaſt is aſcribed to *Romulus*, who to rid himſelf of the Phantoms of his Brother *Remus* (whom he had ordered to be murdered) appearing always before him, ordained a Feaſt called after his Name *Remuria*, and *Lemuria*. They offered Sacrifices for three Nights together, during which time all the Temples of the Gods were ſhut up, nor any Marriage permitted. There were a world of Ceremonies in this Feaſt, chiefly intended to exorciſe the *Lemures*, and to prevent their appearing or giving any diſturbance to the Living.

LENITIVE, in Phyſic, is any ſoftening reſolutive Remedy, that moiſtens the Part diſeaſed, and diſſipates any ſharp Humour collected there. *Lenitive*, in Pharmacy, is a gentle Electuary, compoſed of Sena, Polypody, *&c.* ſo called in regard it purges eaſily, and by reſolving.

LENS, in Dioptricks, is any Glaſs (not very thick) which either collects the Rays of Light into a Point, in their paſſage through it, or diſperſes them further apart, according to the Laws of Refraction. *Lens's* have various Figures; that is, are terminated by various Surfaces, from which they acquire various Names. Some are plane on one ſide, and convex on the other; others convex on both ſides; both which are ordinarily called Convex *Lens's*: tho when we ſpeak accurately, the former is call'd Plano-Convex. Again, ſome are plane on one ſide and concave on the other, and others are concave on both ſides, which are both uſually rank'd among the Concave *Lens's*; tho when diſtinguiſh'd, the former is call'd a Plano-Concave. Others again are concave on both ſides; others are concave on one ſide, and convex on the other, which are call'd Convexo-Concave or Concavo-Convex *Lens's*, according as the one or the other Surface is more curve, or a Portion of a leſs Sphere. It is to be here obſerv'd, that in every *Lens* terminated in any of the forementioned manners, a right Line perpendicular to the two Surfaces is call'd the Axis of the *Lens*. Which Axis, when both Surfaces are ſpherical, paſſes thro both their Centres; but if one of 'em be plain, it falls perpendicularly upon that, and goes thro the Centre of the other.

For *Convex Lens's*, the Laws of their Refraction, and their Effects depending thereon, are as follow.

A Ray of Light E G near the Axis, (*Fig.* 1. *Plate Opticks*) and parallel thereto, ſtriking on the plane Surface of a Plano-Convex *Lens*, directly oppoſite to the luminous Body, after Refraction concurs with the Axis in the Point F; and if C be the Centre of the Convexity, C F will be to C L, that is, the Diſtance of the Centre from the Point of Concourſe or Focus, will be to the Diſtance of the Centre from the Convex Surface, in the Ratio of the Refraction. See *Refraction*.

For the plane Surface being directly oppoſed to the luminous Body, the Ray E G is perpendicular to A B, and therefore will paſs unrefracted to H: Thus it ſtrikes on A H B ſtill parallel to the Axis; and therefore coming out of a denſer Medium into a rarer, will meet the Axis of the *Lens* in F, and ſo, as that C F will be to E L in the Ratio of the Sine of the refracted Angle to the Sine of the Angle of Inclination. As will be demonſtrated under the Head *Refraction*.

Cor. If then the Refraction be out of a Glaſs *Lens* into Air C F : E L :: 3 : 2, and therefore F L = 2 C L. That is, parallel Rays near the Axis will concur with it at the diſtance of the Diameter. Again, if the Refraction were out of a *Water-Lens*, *i. e.* out of a *Plano-Convex Lens* fill'd with Water, C F : E L = 4 : 3, and therefore E L = 3 C L. *i. e.* parallel Rays near the Axis will concur with it at the diſtance of half the Diameter. So that if a lighted Candle be placed in the Focus of a *Plano-Convex Lens*, that is, in the Point F, diſtant from the Surface of the *Lens* A L B, by the length of the Diameter, and from the Surface of the *Water-Lens*, by half the Diameter, its Rays after Refraction will become parallel. See *Refraction*.

If the Ray K I (*Fig.* 2. *Plate Opticks*) near the Axis of a *Plano-Convex Lens*, and parallel thereto, ſtrike on its convex Surface A H B, after a double Refraction it will meet the Axis in F; ſo as that H G will be to G C, and G E to F H in the Ratio of the Refraction.

For the Ray K I, parallel to the Axis E G, by virtue of the firſt Refraction in I, will tend to the Point G, ſo as G H will be to G C in the Ratio of the Sine of the Angle of Inclination to the Sine of the Refracted Angle: therefore by virtue of the ſecond Refraction in L, it will

concur with the Axis in F; ſo as G D will be to E D in the Ratio of the Sine of the refracted Angle, to the Sine of the Angle of Inclination: (See *Refraction*) So that the Semidiameter and Thickneſs of the *Plano-Convex Lens*, with the Ratio of Refraction being given, hence ariſes a Method of determining the Focus of parallel Rays ſtriking on the Convex Surface. For

Cor. Hence, if the *Lens* be Glaſs, F D = 2 C H — $\frac{2}{3}$ H D. So that if two thirds of the Thickneſs of the *Lens* be inconſiderable (as in Practice it uſually happens) parallel Rays meet with the Axis at the Diſtance of the Diameter from the *Lens*, even when they ſtrike on the Convex Surface.

So that as to the Place of the Focus, 'tis the ſame thing whether the plane Surface, or the convex one, be turned to a Luminary of parallel Rays; tho' it appears both from Experience and trigonometrical Calculation, that there are more Rays united in a leſs Space, if the convex Surface, than if the plane one be turn'd towards the Sun.

If the *Lens* were full of Water E D = 3 C H — $\frac{3}{4}$ H D. Wherefore if $\frac{3}{4}$ H D be inconſiderable F D = 3 C H, or if $\frac{1}{4}$ H D be inconſiderable F H = 3 C H. Parallel and near Rays, therefore, are united at the Diſtance of half the Diameter, if the Refraction be in Water, even when the Convex Surface is oppoſed to the luminous Body. Hence, alſo, ariſes a Method of determining the Focus of parallel Rays ſtriking on a *Lens* Convex on both Sides, the two Semidiameters, and the Thickneſs of the *Lens*, being given.

On theſe Principles is founded the Structure of refracting Burning-Glaſſes; the Sun's Light and Heat being exceedingly augmented in the Focus of a *Lens*, whether Convex or Plano-Convex: ſince the Rays falling parallel to the Axis of the *Lens*, are reduced into a much narrower Compaſs; ſo that 'tis no wonder they burn ſome Bodies, melt others, and produce other extraordinary Phænomena. See *Burning-Glaſs*.

If a luminous Body be placed in the Focus behind a *Lens*, whether Plano-Convex, or Convex on both Sides; or whether equally or unequally, the Rays after Refraction become parallel.

Hence by means of a *Convex-Lens*, or a little Glaſs Bubble full of Water, a very intenſe Light may be projected to a vaſt Diſtance. See *Mirror*.

And this furniſhes us with the Structure of a Lamp or Lanthorn, to project an intenſe Light to any immenſe Diſtance: For a *Lens* convex on both Sides, being placed oppoſite to a Concave Mirror; if in the common Focus of both be placed a lighted Candle, or Wick, the Rays reflected back from the Mirror to the *Lens*, will be parallel to each other; and after Refraction will converge, till they arrive at the Diſtance of the Semi-diameter, after which they will again diverge. But the Candle being likewiſe in the Focus of the *Lens*, the Rays it throws on the *Lens* will be parallel: and therefore a very intenſe Light meeting with another equally intenſe, at the Diſtance of the Diameter from the *Lens*, the Light will be ſurprizing: and tho' it afterwards decreaſe, yet the parallel and diverging Rays going a long way together, it will be very great at a very great Diſtance. Lanthorns of this kind are of conſiderable Service in the Night-time to diſcover remote Objects, and are uſed with Succeſs by Fowlers and Fiſhermen, to gather their Prey together, in order to take them.

If it be required to have the Light at the ſame time tranſmitted to ſeveral Places, as through ſeveral Streets, &c. the Number of *Lens's* and Mirrors are to be encreaſed. See *Lamp*.

If the luminous Body placed in the Focus, be of a large Extent, the Rays flowing from Points ſenſibly diſtant from each other, can't be parallel, but will conſtitute ſeveral Trains or Pencils of Rays parallel to each other.

The Images of Objects oppoſed in any manner to a Convex-*Lens*, are exhibited, invertedly, in its *Focus*.

Hence if a Paper be applied to a *Convex-Lens* (eſpecially in a dark Room) at the diſtance of its *Focus*, the Images of Objects ſhining upon it, will be repreſented diſtinctly, and in their natural Colours thereon: Nor is the Focus of the Sun's Rays any thing elſe, in effect, but the Image of the Sun. Hence in Solar Eclipſes, the Sun's Image, eclipſed as it is, may be burnt by a large *Lens* on a Board, &c. a very entertaining Phænomenon!

Hence alſo, if a *Convex-Lens* of any kind, be expoſed both to nearer and remoter Objects, and a Paper at the ſame time be applied, ſo as to receive the Images of Objects diſtinctly, the Diſtance of the Focus from the *Lens*, and thence the Diameter of the Convexity, may be determined.

If a Concave-Mirror be ſo placed, as that an inverted Image formed by Refraction thro' a *Lens*, be found between the Centre and the Focus, or even beyond the Centre; it will again be inverted by Reflexion, and ſo appear erect in the firſt Caſe beyond the Centre, and in the latter between the Centre and the Focus. On theſe Principles is built the *Camera Obſcura*; which ſee.

The Diameter of the Image of an Object delineated beyond a *Convex-Lens*, is to the Object it ſelf in a Ratio of the Diſtance of the Image, to that of the Object.

Since then the Image of a remoter Object, is leſs diſtant from the *Lens*, than that of the nearer, the Image of the more remote, will be leſs than that of the nearer. And becauſe the Diſtance of the Image from the *Lens* is greater, if the *Lens* be a Segment of a greater Sphere, than of a leſs; hence the Image will be greater in the former Caſe than in the latter. The Image therefore will be of ſuch a Magnitude, as it would be of, were the Object to ſhine into a dark Room thro' a little Hole upon a Wall, at the ſame Diſtance from the Hole, at which the Focus is from the *Lens*. When an Object is leſs diſtant from a *Lens* than the Focus of parallel Rays, the Diſtance of the Image is greater than that of the Object, otherwiſe the Diſtance of the Image is leſs than that of the Object; in the former Caſe, therefore, the Image is greater than the Object, in the latter, leſs.

If the Images be made greater than the Objects, they will not appear diſtinctly; becauſe in that Caſe there are fewer Rays which meet after Refraction in the ſame Point; whence it happens that Rays proceeding from different Points of an Object, terminate in the ſame Point of an Image, which is the cauſe of Confuſion. Hence it appears that the ſame Aperture of a *Lens* mayn't be admitted in every Caſe, if we would keep off the Rays which produce Confuſion. However, tho' the Image is then moſt diſtinct, when no Rays are admitted but thoſe near the Axis, yet for want of Rays the Image is apt to be dim.

If the Eye be placed in the Focus of a *Convex-Lens*, an Object view'd thro' it, appears erect and enlarg'd, in a Ratio of the Diſtance of the Object from the Eye, to that of the Eye from the *Lens*, if it be near; but infinitely, if remote. See *Microſcope*; ſee alſo *Priſm*.

For *Concave-Lens's*, their Laws are as follow.

If parallel Rays ſtrike on a *plano-Concave-Lens* K L, and F C be to F B in the Ratio of the Refraction, the Rays will diverge from the Axis, and the Point of Divergency, or Diſperſion, call'd the virtual Focus, will be F. (*Fig.* 3. *Plate Opticks*)

For the Ray H I, parallel to the Axis, is perpendicular to K L, and will therefore paſs unrefracted to E. Wherefore F C being to F B in the Ratio of Refraction, F will be the virtual Focus. See *Refraction*.

If then the *Lens* be Glaſs, F B = 2 B C; *i. e.* the virtual Focus F will be diſtant from the *Lens* K L by the Space of the Diameter 2 B C.

If the Refraction be in Water F B = 3 C B; *i. e.* the virtual Focus F will be diſtant from the *Lens* K L a Diameter and an half 3 B C.

If the Ray A E, parallel to the Axis F P, ſtrike on a *Lens* Concave on both ſides; and both F C be to F B, and I P to P H in the Ratio of Refraction: and F P : P H :: F B : B G; G will be the Point of Diſperſion, or the virtual Focus. (*Fig.* 4. *Plate Opticks*)

If therefore the Refraction be in a *Glaſs Lens*, the Sums of the Semi-diameters C B and H I, will be to the Diameter of the Concavity of either 2 H I, as the Semi-diameter of the other C B, to the Diſtance of the virtual Focus from the *Lens* B G.

Hence the Sun's Rays ſtriking on a *Concave Lens*, their Light after Refraction will be conſiderably weakened; ſo that the Effect of *Concave-Lens's* is oppoſite to that of convex ones.

Laſtly, An Object view'd thro' a *Concave Lens*, appears erect, and diminiſhed in a Ratio compounded of the Ratio's of the Space in the Axis, between the Point of Incidence, and the Point to which an oblique Ray would paſs without Refraction, to the Space in the Axis between the Eye and the Middle of the Object; and the Space in the ſame Axis between the Eye and the Point of Incidence, to the Space between the Middle of the Object and the Point, the oblique Ray would paſs to without Refraction.

Tho' the Properties of *Lens's* have been here conſidered principally with regard to Rays falling near the Axis, and parallel thereto; yet the Reaſoning will be eaſily transferr'd to Rays remoter from the Axis, and falling in any Direction. Thus we may ſay univerſally, that in a *Convex Lens*, all parallel Rays become converging, and concur in a Focus; that diverging Rays either become leſs diverging, or run parallel, or converge; and that converging Rays converge the more: All which Alterations are more ſenſible in oblique Rays, than in perpendicular ones, by reaſon the Angles of Incidence in that Caſe are greater.

In *Concave Lens's* all parallel Rays become diverging, diverging Rays diverge more; converging Rays either converge leſs, or become parallel, or go out diverging: all which things hold of oblique as well as direct Rays, but more ſenſibly in the firſt.

A *Lens*, one of whoſe Surfaces is Convex, and the other Concave, is called a *Meniſcus*; the Properties of which ſee under *Meniſcus*. See alſo *the Theory of Lens's demonſtrated* under *Refraction*, and the Application thereof under *Microſcope*, *Teleſcope*, *Burning-Glaſs*, *Focus*, &c.

Some confine *Lens's* within the Diameter of five or ſix Lines, and will have ſuch as exceed that Diameter, call'd Lenticular Glaſſes. *Lens's* are diſtinguiſh'd with regard to their Preparation into ground and blown: *blown Lens's* are little Globules of Glaſs melted in the Flame of a Lamp or Taper: (ſee *Microſcope*) but the Figure of theſe is ſeldom exact; beſides that the Smoke of the Lamp cleaves to the Surface in melting: on both which accounts they come ſhort of the Clearneſs of thoſe that are ground, or turned and poliſh'd in the Lathe, in little Copper Baſons or Diſhes. The Secret is now found of making theſe exquiſitely ſmall, ſo as ſome of 'em don't exceed in Diameter the ſixth part of a Line, which are found to magnify Objects ſeveral Millions of times.

The Manner of grinding Lens's: A little Piece of Copper is cemented to the End of the Arbor of a Lathe, and turned, till it form a Diſh or Baſon of the Diameter of the *Lens* required. Then a Piece of clear Glaſs is cemented on one of its flat Sides to the end of a little Mandrel with black *Spaniſh* Wax, and thus ground, on the Side not cemented, on a Grindſtone, with Water, till it have nearly acquired a Convex Figure. 'Tis finiſhed in the Lathe, by turning it in the Baſon, with fine wet Sand, or Free-ſtone. (See *Baſon*.) The Free-ſtone muſt be often repeated freſh, till the *Lens* appear very round; when it is come to that Point, they ceaſe to take any freſh Stone, but continue to turn it in the Baſon, till the Remains of the Sand be become ſo fine as to have poliſhed it. This, they perceive, when, upon wiping it, the Image of the Window of the Place is ſeen painted on its Surface; if it don't, 'tis wetted in Water without any Sand, and turned till it have got a Poliſh. The Baſon is then covered, within-ſide, with two or three Folds of Linnen, and the Poliſh finiſhed with Putty, or *Tripoly* of *Venice* ſteeped in Water. 'Tis known to be perfectly poliſhed, when, viewing it with a Magnifier, there appear no Traces of the Sand. The Cement is then broke off, and the Side poliſhed, cemented; to work and grind the other as before, till the Edges of the *Lens* be become ſharp, and it be perfectly poliſhed on either ſide. When finiſhed, 'tis waſhed in Spirit of Wine, to take off all Remains of the Wax. See *Microſcope*.

LENT, *Quadrageſima*, or *Quarantine*, a Time of Mortification, conſiſting of the Space of forty Days, wherein thoſe eſpecially of the *Romiſh* Church are enjoined to faſt, in Commemoration of our Saviour's miraculous Faſting ſo long in the Deſart, and by way of Preparation for the Feaſt of *Eaſter*. In the antient *Latin* Church, *Lent* only conſiſted of 36 Days. In the IXth Century, to come ſomewhat nearer the Miracle, ſome took upon them to add four Days more, which, in time, became a general Practice; tho the Church of *Milan* is ſaid ſtill to take up with the antient 36.

According to St. *Jerom*, St. *Leo*, St. *Auguſtine*, and others, *Lent* muſt have been inſtituted by the Apoſtles. Their way of Reaſoning is thus: Whatever is generally received throughout the whole Church, and whoſe Inſtitution we don't find in any Council, muſt be eſteemed to have been eſtabliſhed by the Apoſtles. Now ſuch, they ſay, is the Faſt of *Lent*. Its Inſtitution is not ſpoke of in any Council, but many of the antient Councils, particularly that of *Nice*, that of *Laodicea*, &c. and ſome of the Fathers, particularly *Tertullian*, ſpeak of it as a thing of ſome ſtanding. The Reformed generally hold *Lent* to be a ſuperſtitious Inſtitution, ſet on foot by ſome vain Enthuſiaſts, who durſt undertake to ape the Miracles of Jeſus Chriſt, as in effect it appears to have been from a Paſſage of *Irenæus*, quoted by *Euſebius*. Some will have it to have been firſt introduced by Pope *Teleſphorus*, in the IId Century; others, who own that there was a kind of Abſtinence obſerved in the antient Church before *Eaſter*, yet contend that it was voluntary, and was never enjoined by any Law till the IIId Century.

There was ſome Difference between the Practice of the *Greek* and the *Latin* Church as to the Buſineſs of *Lent*; the *Greeks* beginning it a Week ſooner, but at the ſame time allowing more Days of Intermiſſion than the *Latins*: thoſe who held it ſeven Weeks, did not faſt on Saturdays, as thoſe who obſerved it but ſix did.

The antient *Latin* Monks had three *Lents*; the Grand *Lent* before *Eaſter*; another before *Chriſtmas*, call'd, *The Lent of St. Martin*; and a third after *Whitſunday*, call'd that of St. *John Baptiſt*: each of which conſiſted of forty Days. The *Greeks*, beſides that before *Eaſter*, obſerved four others; that of the *Apoſtles*, of the *Aſſumption*, of *Chriſtmas*, and of the *Tranſfiguration*; but they reduced each of them to the ſpace of ſeven Days. The *Jacobites* added a fifth, which they call *The Repentance of* Nineveh; and the *Maronites* a ſixth, call'd *The Exaltation of the Holy Croſs*. By the 8th Canon of the Council, 'tis ordain'd, That if any Perſons, without evident Neceſſity, eat Fleſh in *Lent*, they ſhall be deprived the Uſe of it all the reſt of the Year.

The forty Days in *Lent*, ſay ſome, are obſerved in remembrance of the forty Days wherein the World was drowned; others of the forty Years wherein the *Jews* wandered in the Deſart; of the forty Days allowed *Nineveh* for Repentance; the forty Stripes by which Malefactors were to be corrected; the forty Days faſted by *Moſes* at the receiving of the Law; the forty Days faſted by *Elias*; or the forty Days faſted by our Saviour.

LENTIGO, a freckly or ſcurvy Eruption upon the Skin, ſuch eſpecially as is common to Women in the time of Child-bearing. Authors diſtinguiſh this Eruption into ſeveral kinds.

LENTIL, the Name of a Weight among the old *Romans*. It was the hundred and eighth Part of a Drachm. A *Lentil* and an half made a Grain. The Word is a Diminutive of *Lens*.

LENTISCUS, the Wood of a Tree of the ſame Name, of ſome Uſe in Phyſic; it is aſtringent and fortifying, and much uſed for Tooth-Picks. It contains a kind of Gum, or rather reſinous Pitch, much like Maſtic, or perhaps the Maſtic itſelf or Incenſe of *Perſia*, ſo highly commended by *Strabo*. The *Lentiſcus* has nearly the ſame Properties with the *Saunders*, but has more of the Turpentine in it, and ſometimes paſſes by Urine.

LEO, *Lion*, the fifth of the twelve Signs of the Zodiack. This the Aſtrologers account a hot dry Sign, and the Houſe of the Sun. The Antients gave it 27 Stars, beſides 8 *Informes*: *Kepler* gives it 40, and *Bayer* 43; two whereof are of the firſt Magnitude, two of the ſecond, five of the third, &c. See *Star*.

Cor Leonis, *the Lion's Heart*, one of the moſt conſiderable Stars in the Heavens. See *Star*

LEONTICA, the Name of a Feaſt or Sacrifice celebrated among the Antients, in honour of the Sun. They were called *Leontica*, and the Prieſts who officiated at them *Leoni*, in regard they repreſented the Sun under the Figure of a Lion radiant, bearing a Tiara, and griping in his two fore Paws the Horns of a Bull, who ſtruggled in vain to diſengage himſelf. The Critics are extremely divided about this Feaſt, ſome will have it to be anniverſary, and make its Return not in a Solar, but a Lunar Year; but others hold its Return to be more frequent, and give Inſtances where the Period was not above 220 Days. The Ceremony was ſometimes alſo call'd *Mithriace*, *Mithra* being the Name of the Sun among the antient *Perſians*. There was always a Man ſacrificed at theſe Feaſts till the time of *Hadrian*, who prohibited it by a Law. *Commodus* introduced the Cuſtom afreſh, after whoſe time it was again exploded.

LEONTINE, *in Poetry*, a kind of Verſes which rhyme at every Hemiſtic, the middle always chiming to the end; of which kind we find ſeveral antient Hymns, Epigrams, Prophecies, &c. For inſtance, *Muretus* ſpeaking of the Poetry of *Lorenzo Gambara* of *Breſſo*, ſays,

Brixia, veſtratis merdoſa Volumina Vatis,
Non ſunt noſtrates tergere digna Nates.

The following one is from the School of *Salerna*;

Ut Vites Pœnam *de potibus incipe* Cœnam.

The Origin of the Word is ſomewhat obſcure, *Paſquier* derives it from one *Leoninus*, or *Leonius*, who excelled in this way, and dedicated ſeveral Pieces to Pope *Alexander* III. Others derive it from Pope *Leo*, and others from the Name of *Lion*, as being the loftieſt of all Verſes. M. *Fauchet* makes the *Leonine* Rhyme the ſame with what the *French* call *The Rich*, and we *The Double Rhyme*; i. e. where two Syllables have the ſame Orthography, Accentuation, and Pronunciation with two others.

LE ROY LE VEUT. By theſe Words the Royal Aſſent is ſignified by the Clerk of the Parliament to public Bills; to private Bills this Aſſent is expreſſed by *ſoit fait comme il eſt Deſiré*.

LE ROY S'ADVISERA. By theſe Words to a Bill, preſented to the King by his Parliament, are underſtood his abſolute Denial of that Bill in a more civil way; and the Bill thereby becomes wholly null and void.

LEPIDOIDES, *in Anatomy*, the Name of the ſcaly Suture of the Cranium, from the *Greek* λεπὶς, *Scale*, and εἶδος, *Form*, *Figure*.

LEPRA, *Leproſy*, a foul contagious Diſeaſe, ſeated in the Cuticle or Surface of the Skin, ariſing, as moſt other cutaneous Diſeaſes do, from thin ſalt Humours, thrown off from the Blood, and arreſted by the Denſity and Cloſeneſs of the Cuticula. This Diſtemper has been much more frequent in former Times than at preſent, and much more in the hot Countries of the *Eaſt*, particularly among the *Jews*, than among us; for the Salts which, by

by the Appointment of Nature, are to be eliminated thro' the Pores of the Skin, along with the recrementitious Serum, their proper Vehicle, are, in hot Countries, conveyed in greater plenty to the Surface of the Body, than in theſe *Northern* Regions they ordinarily are; and ſticking in their Paſſage in the thin dry Membrane of the Cuticle, the aqueous Parts, which are their Vehicle, ſlip away from them by inſenſible Evaporation, and leave them there to corrode and fret it, till at length, thro' the Quantity ſo gathered, the Membrane becomes dry, brittle, and white, which is the Cauſe of that Diſquamation, or falling away in white Scales: that Whiteneſs as well as the Brittleneſs proceeding merely from the Quantity of theſe Salts, which are themſelves white; and when the Moiſture is drawn from them, being aculeated, and having inſinuated themſelves into the Pores of the Cuticle, diſſolve the Continuity of it by their Points and Edges, which, ſo dead and broken, is apt, on the leaſt Friction, to fall off as above-mentioned. This is what they call the *Lepra Græcorum*, from its Frequency among that People.

Lepra Arabum was another Species of the Diſtemper, which tho' different in Appearance, as carrying a dry ſcabby Cruſt, yet ſeems only a different Degree of the ſame Diſeaſe. For as in the former Caſe the Salts, being left deſtitute of their Humidity, are not ſo active, and therefore affect only the Cuticle; in the latter Caſe theſe Salts, with their Vehicle, crowding faſter than they can be evaporated thro' the Pores of the Skin (being ſtill *in fluore*, and ſo more cauſtic) corrode deeper, and eat not only the Cuticle, but the excretory Veſſels, and Surface of the Skin itſelf, which thereby ſpews out a Liquor ſomewhat thicker than uſual; which, when the thinneſt and moſt aqueous Parts are evaporated, are condenſed into that Cruſt or Scab, which is the diſtinguiſhing Character of this Diſeaſe.

Galen defines the *Lepra* to be an Effuſion of thick diſorderly Blood, that corrupts the whole Habitude of the Body. *Avicenna* calls it *An Univerſal Cancer*. The *Greeks* give it the Name of ἐλεφάντιασις, in regard the Patient has his Skin rough, wrinkled, and unequal, like that of an Elephant. The *Lepra* begins within-ſide, a long time before it appears without-ſide. It was frequent in *Europe* in the Xth and XIth Centuries, but ſeems at preſent quite extinct, unleſs we allow the Venereal Diſeaſe to be the ſame with the *Lepra*; as it was the Opinion, among many others, of the Great *Pitcairn*, and as has been lately endeavoured to be proved by Mr. *Becket*, in a Treatiſe expreſly on the Subject in the *Philoſophical Tranſactions*. The Symptoms of the antient *Lepra*, as laid down by *Galen*, *Aretæus*, *Pontanus*, *Ægineta*, *Cardan*, *Varanda*, *Gordon*, *Paræus*, and others, are as follow: The Patient's Voice is hoarſe, and comes rather thro' the Noſe than the Mouth; the Blood full of little white ſhining Bodies, like Grains of Millet, that upon filtration ſeparate themſelves from it; the Serum is ſcabious, and deſtitute of its natural Humidity, inſomuch that Salt applied to it does not diſſolve; it is ſo dry, that Vinegar poured on it boils; and is ſo ſtrongly bound together by little imperceptible Threads, that calcined Lead thrown into it ſwims. The Face reſembles a Coal half extinct, unctuous, ſhining, and bloated, with frequent hard Knobs, green at bottom, and white at top. The Hair is ſhort, ſtiff, and brinded, and not to be torn off without bringing away ſome of the rotten Fleſh to which it adheres; if it grows again, either on the Head or Chin, 'tis always white. Athwart the Forehead run large Wrinkles, or Furrows, from one Temple to the other; the Eyes red and inflamed, and ſhine like thoſe of a Cat; the Ears ſwollen and red, eaten with Ulcers towards the bottom, and incompaſſed with little Glands; the Noſe ſunk, becauſe of the rotting of the Cartilage; the Tongue dry and black, ſwollen, ulcerated, divided with Furrows, and ſpotted with Grains of white; the Skin covered with Ulcers, that die and revive on each other, or with white Spots or Scales like a Fiſh; it is rough and inſenſible, and when cut, inſtead of Blood, yields a ſanious Liquor. It arrives in time to ſuch a Degree of Inſenſibility, that the Wriſt, Feet, or even the large Tendon may be pierced with a Needle, without the Patient's feeling any Pain. At laſt the Noſe, Fingers, Toes, and even Privy Members fall off entire, and by a Death peculiar to each of them anticipate that of the Patient. 'Tis added, that the Body is ſo hot, that a freſh Apple, held on the Hand an Hour, will be dried and wrinkled, as if expoſed to the Sun for a Week.

Matthew Paris ſays, that in *Chriſtendom* there were fifteen Thouſand Hoſpitals for *Lepers*; but the Diſeaſe having been diſcontinued for two Hundred Years, the Revenues of thoſe Hoſpitals were abuſed, and Perſons feigned themſelves *leprous*, to be entitled to the Proviſion; which occaſioned their Regulation in ſome Countries, and their entire Suppreſſion in others. In *France* they were united to the Order of the Religious of St. *Lazarus* and Mount *Carmel* in 1664, and the Adminiſtration of them given to the Knights of that Order; in *England* they have been converted to other Purpoſes.

Formerly the Cauſes of *Lepers* were committed to the Eccleſiaſtical Tribunals, and it was prohibited to proſecute a *Leper* before a Lay-Judge, in regard they were under the Protection of the Church, which ſeparated them from the reſt of the People by a Ceremony ſtill to be ſeen in the Rituals.

The *Lepra* appeared differently in different Nations, according to the Climate and the Manner of Living; whence it was diſtinguiſhed into ſeveral kinds, as the *Lepra Arabum*, *Lepra Græcorum*, &c. As to the Cure, that which proved effectual in thoſe *Southern* Countries, fails among us, where the ſtrongeſt Medicaments, and the moſt powerful Mercurials are neceſſary. Bathing is judged to be of good Uſe in the *Lepra*. Dogs and Hares are ſaid to be ſubject to this Diſeaſe. Among the *Indians* a white Man is deſpiſed, this paſſing with them for the Mark of a *Leper*. The word *Lepra* is derived from the *Greek* λεπὶς, *Scale*, in regard this Diſeaſe forms a kind of Scales on the Skin.

LEPUS, the Hare, is a *Southern* Conſtellation. See *Star* and *Conſtellation*.

LESSOR and LESSEE, are Terms of the Common Law. The *Leſſor* is he that leaſeth out Lands or Tenements to another for Term of Life, for Years, or at Will; and the Perſon to whom ſuch a Leaſe is made, is called the *Leſſee*.

LETHARGY, in Medicine, a Diſeaſe conſiſting in a profound Drowſineſs or Sleepineſs, wherein the Patient can ſcarce be awaked; or, if awaked, remains ſtupid, without Senſe or Memory, and preſently ſinks again into his former Sleep. The *Lethargy* is uſually accompanied with a Fever and Delirium. The *Lethargy*, *Boerhaave* makes a gentle Apoplexy, ariſing from the ſame Cauſes, and to be known and cured in the ſame manner. Some Authors diſtinguiſh the *Lethargy* from the *Carus*, in that this latter is without a Fever, or at moſt is preceded with a violent one, whereas the *Lethargy* is attended with a ſlow one. *Celſus* ranks the *Lethargy* in the Number of acute Diſeaſes, the Patient uſually dying on the 7th Day. A *Lethargy* frequently ſucceeds a Frenzy. The Word comes from the *Greek* λήθη, *Oblivion*, and ἀργία, *Numbneſs*, *Lazineſs*.

LETHE, or LATHE, a Meaſure or Portion of Lands, making one of the antient Diviſions in *England*. King *Elfred* divided *England* into Counties, as it ſtands at preſent, thoſe Countries he divided into Hundreds or Tithings. The Hundred was a Diviſion, wherein were an hundred Officers to ſecure the Peace; the *Lethe* or *Lathe* comprehended three or four of theſe Hundreds. *Lethe* was alſo the Juriſdiction of a Vicount, or a kind of Aſſize, held once a Year in each Village about *Michaelmas*. Whether this was inſtituted by *Elfred*, or no, is a Queſtion.

LETTER, a Sign or Character either in Print or in Writing, by which any People have agreed to expreſs the ſeveral Sounds, uſed in conveying their Thoughts to each other in Speech: Or a *Letter* may be defined, A ſimple uncompounded Sound of the Voice, that cannot be ſubdivided into any more ſimple, and generally marked with a particular Character. It muſt be owned however, ſtrictly ſpeaking, a *Letter* is not the Sound itſelf, but rather the Sign of a Sound, for the γράμματα of the *Greeks* comes from writing, and the *Litera* of the *Latins* from *lineando*, or *linendo*, each ſignifying ſomething marked on Paper. Where a Sign or Character does not expreſs a Sound entirely ſimple, but one reſolvible into ſeveral, it is not ſo properly a *Letter* as an Abbreviation, containing in itſelf as many *Letters* as its Power does ſimple Sounds. This is evident in the *Latin* &, x, and the *Greek* ξ, ψ, ϛ, &c. which are compoſed of *et*, *cs*, κ ϛ, π ϛ, σ τ, &c. On the contrary, a ſimple Sound, tho expreſſed by ſeveral Characters, is yet to be eſteemed one *Letter*, for *th*, *ph*, are ſingle *Letters*, as much as φ, θ, and *f*.

Letters make the firſt part or Elements of Grammar; an Aſſemblage of theſe make Syllables, of thoſe Words, and of theſe Sentences. The Alphabet of every Language conſiſts of a certain Number of theſe *Letters*, which ought each to have a different Sound, Figure, and Signification. As the Difference of articulate Sounds was to expreſs the different Ideas of the Mind, ſo one *Letter* was originally intended to ſignify only one Sound, and not, as at preſent, to expreſs ſometimes one Sound, and ſometimes another; which Practice has brought a great deal of Confuſion into the Languages, and render'd the learning of the modern Tongues infinitely more difficult than it would otherwiſe have been. This Conſideration, together with the Poverty of all the known Alphabets, and their want of ſome *Letters* to expreſs certain Sounds by, has occaſioned ſeveral Attempts towards an univerſal Alphabet, to contain an Enumeration of all ſuch ſingle

Sounds

Sounds or *Letters* as are uſed in any Language. A thing of very conſiderable Uſe; a Specimen of which is given us by Mr. *Lodwick*, in the *Philoſophical Tranſactions*.

There are few things on which there has been ſo much written as on the Original *Hebrew Letters*; ſince *Origen*, *Euſebius Cæſarienſis*, St. *Jerom*, &c. have made it the Subject of their Enquiry. If they don't always go back to the Beginning of the World, and the Origin of *Letters*, 'tis at leaſt enquired what were the Characters made uſe of by *Moſes* to tranſmit the Law to Poſterity, or thoſe uſed by the other Hiſtorians and Prophets of the Old Teſtament, or even thoſe uſed by the *Hebrews* before the *Babylonian* Captivity. With regard to which, there are three principal Opinions: Some imagine the antient *Hebrew Letters* the ſame with thoſe now in Uſe; of this Opinion are ſeveral Doctors of the Thalmud, *Poſtellus*, *Buxtorf*, &c. The ſecond Opinion is of thoſe who believe the *Samaritan Letters* the more antient; which is now the more common Opinion, as without doubt it is the elder: Several *Miſchnique* and *Gemaric* Doctors, many of the Rabbins and Fathers, *Origen*, *Jerom*, *Euſebius*, *Beda*, *Genebrard*, *Ramban*, *Bellarmine*, *Scaliger*, *Druſius*, *Capella*, *Bibliander*, *Brerewood*, *Montanus*, *Walton*, the two *Voſſius's*, *Bochart* and *Bernard* are of this Opinion. The third is, that from the beginning there were two Characters, the one ſacred, the other profane; which is the Opinion of *Azarias*, *A. de Bartenora*, *Poſtel*, *Buxtorf*, *Conringius*, &c. But this Diſtinction of two kinds of Characters ſeems a mere Chimera. See *P. Souciet* on the *Samaritan* Medals, where he proves that the *Letters* in the Inſcriptions of thoſe Medals are the genuine original *Hebrew* Characters.

As to the firſt *Letters*, what they were, who firſt invented them, and among what People they were firſt in uſe, there is ſtill room to doubt; however, ſetting aſide Conjectures and Prejudice, the Buſineſs of Antiquity ſeems to lie between the *Egyptians* and *Chineſe*. *Philo* attributes the firſt Invention of *Letters* to *Abraham*; *Joſephus*, S. *Irenæus*, and others, to *Enoch*; *Bibliander*, to *Adam*; *Eupolemes*, *Euſebius*, *Clemens Alexandrinus*, *Corn. Agrippa*, &c. to *Moſes*; *Pomponius Mela*, *Herodian*, *Rufus*, *Feſtus*, *Pliny*, *Lucan*, &c. to the *Phœnicians*; S. *Cyprian* to *Saturn*; *Tacitus* to the *Egyptians*, and ſome to the *Ethiopians*.

The *Egyptian* Mummies and Obelisks prove a great Antiquity on the Side of the Hieroglyphics; but if the *Chineſe* Chronology may be credited, their Characters are vaſtly more antient than thoſe of the *Egyptians*. The *Chineſe* make *Fohi*, the firſt of their Kings, the Inventor of their *Letters*, and compute him to have lived 2950 Years before Chriſt. During all which time they pretend to have certain and written Accounts in their Books. If this holds true, their Character muſt be older than *Moſes* by 1400 Years, and even before *Menes* the firſt King of *Egypt* by 500 Years: So that the *Chineſe Letters* appear to be the moſt antient of that kind, and the Book *Yekim*, ſaid to be written by *Fohi*, the moſt antient Book.

But as *China* is ſo remote, and had ſo little Communication with theſe Parts of the World, we may reaſonably make another Enquiry into the Original of *Letters* in the hither Parts of *Aſia*, *Egypt*, and *Europe*. Here indeed the *Egyptians* ſeem to have the beſt Title. 'Tis more than probable from the Obelisks, &c. that their Hieroglyphics were the firſt manner of writing, and the Original Characters in theſe Parts, as being prior to *Moſes*, and made, at leaſt in great meaſure, while the *Iſraelites* were Slaves among them, and of conſequence not well qualified for Inventions ſo very curious and judicious. Whether *Cadmus* and the *Phœnicians* learnt *Letters* from the *Egyptians*, or from their nearer Neighbours of *Judah* and *Samaria*, is a queſtion; ſince ſome of the Books of the Old Teſtament being written in *Letters*, is more likely to have given them the Hint than the Hieroglyphics of *Egypt*. But when or whereſoever the *Phœnicians* learnt this Art, it is generally agreed, that *Cadmus*, the Son of *Agenor*, firſt brought *Letters* into *Greece*, whence, in the following Ages, they ſpread over the reſt of *Europe*.

According to *Crinitus*, *Moſes* invented the *Hebrew Letters*, *Abraham* the *Syriac* and *Chaldee*; the *Phœnicians* that of *Attica*, brought into *Greece* by *Cadmus*, and thence by the *Pelaſgians* into *Italy*; *Nicoſtrata* the *Latin*; *Iſis* the *Egyptian*; and *Vulfila* that of the *Goths*.

Rudbecks, who in his *Atlantica* claims the Glory of all Inventions from all other Nations for the *Swedes*, maintains that the *Ionians* had Letters before *Cadmus*; that at the time of the Siege of *Troy*, the *Greeks* had but 16 Letters, whereas the *Phœnicians* had 22: whence he concludes, that it was not either *Cadmus* or the *Phœnicians* who taught this Art to the *Greeks*. But in regard the antient Northern Nations had juſt 16 *Letters*, like the *Greeks*, he concludes the *Greeks* muſt either have taught them to the People of the *North*, or have learnt 'em of them. But becauſe the Form and Make of the *Runic Letters* is more coarſe than that of the *Greek Letters*, he concludes that theſe laſt muſt be derived from the former; taking it as a Principle, that thoſe who derive any thing from another, poliſh and perfect it. He even aſſerts, that by the Golden Apples which *Hercules* was obliged to ſteal, muſt be underſtood the *Letters* in uſe among the *Hyperboreans*.

The *Letters* F, G, H, K, Q, X, Y, Z, were unknown to the antient *Romans*, as is proved by *Daſqueius* in his *Orthography*, where he traces the Origin of the ſeveral *Letters*.

The Grammarians diſtinguiſh *Letters* into Vowels and Conſonants; into Mutes, Dipthongs, Liquids, and Characteriſtics. The *Hebrews* divide their *Letters* into Guttural, *a*, *b*, *ch*, *gn*, aleph, he, cheth, hain; Dental, *z*, *ts*, *r*, zain, tſade, reſch; Labial, *b*, *m*, *u*, *p*, beth, mem, vau, phe; Lingual, or thoſe of the Tongue, *d*, *t*, *l*, *n*, daleth, tau, lamed, nun; and thoſe of the Palate, *g*, *i*, *c*, *k*, ghimel, jod, caph, coph.

The Art of aſſembling *Letters* to form Words, and of combining the one and the other into a number of different Senſes, is a Secret unknown to the *Chineſe*. Inſtead of the Letters of an Alphabet, they at firſt, like the *Egyptians*, uſed Hieroglyphics; they painted rather than wrote: ſtriving by the Natural Images of Things drawn on Paper, to expreſs and communicate their Ideas to one another. To write a Bird, they were obliged to paint its Figure; and to ſignify a Foreſt, they drew a great number of Trees. A Circle ſerved for the Sun, and a Creſcent for the Moon. But this Manner of writing was not only very incommodious, but alſo very imperfect. For beſides that they could but expreſs their Thoughts by halves, even that little that they could expreſs was but very imperfectly conceiv'd; and it was ſcarce poſſible not to be frequently deceived in it. Further, they were under a neceſſity of writing large Volumes to ſay very little Matters, in regard their Pictures took up a great deal of room. To remedy theſe Inconveniences, they changed by little and little their Manner of Writing, making it more ſimple, tho leſs natural. They even invented ſeveral Characters, to expreſs things that did not come within the reach of Painting to repreſent, as Voice, Smell, Thoughts, Paſſions, and a thouſand other Objects that have no Body or Figure. From ſeveral ſimple Strokes, they afterwards framed others more compound, and in this manner multiplied their Letters and Characters to Infinity; contriving one or more for every Word. This Abundance of *Letters* ſeems the Source of that Ignorance which we find among the *Chineſe*. Their whole Lives being ſpent in learning their *Letters*, they have no time to apply themſelves to the Study of Things, but think themſelves very learned when they are able to read. There are ſcarce any of 'em that know all their *Letters*: They think 'tis a great progreſs they have made, when after forty or fifty Years hard Study they are able to underſtand fifteen or twenty thouſand. But the Generality of their learned Men come far ſhort of this: Father *le Compte* is of opinion, that the greateſt Doctor among 'em never underſtood half of their *Letters* well; for the whole Number he reckons Eighty Thouſand. This is a prodigious Inconvenience to Foreigners, of which the Miſſionaries into that Country make loud Complaints. Among the *Chineſe Letters*, there are ſome now almoſt wore out of uſe, and only preſerved out of Reſpect to Antiquity. There is a ſecond Claſs much leſs antient than the former, only uſed in public Inſcriptions. A third much more regular and beautiful, uſed in Printing, and even in ordinary Writing. However, as the Strokes are to be diſtinctly formed, they can't be wrote with any expedition. For this reaſon they have invented a fourth kind, where the Strokes being cloſer, and leſs diſtant from each other, allow them to be writ with more eaſe and readineſs. And this they call the running *Letter*.

The *Americans* had no *Letters* before the Diſcovery of that Country by the *Spaniards*. The *Acaanibas* engrave their Memorable Events and Epocha's on Stones and Metals. Their Songs ſupply the reſt. In *Peru* and *Chili*, to keep an Account of their Goods and Chattels, and to preſerve the Memory of their particular Affairs, the *Indians* have recourſe to certain Knots of Wool, which by the Variety of their Colours and Ties, ſerve inſtead of Characters and Writing. The Knowledge of theſe Knots, which they call *Quipos*, is one of their great Sciences; but which is always kept as a Secret, and never revealed to the Children till the Fathers think themſelves at the end of their days.

The Printers diſtinguiſh their *Letters* into Capital, Majuſcule, or Initial *Letters*, which ſerve for the Titles of Books, proper Names, &c. And Minuſcule or Small *Letters*, which are again divided according to their Size, into *Pearl*, *Nonpareil*, *Pica*, *Great Canon*, &c. See *Type* and *Printing*. They have alſo their Hiſtory or Figured Letters engraven on Wood or Metal, which take place of the Illumined *Letters* of the antient Manuſcripts.

Numeral Letters, are thoſe uſed by the antient *Romans* inſtead of Cyphers, to expreſs their Numbers by. Theſe *Numeral Letters* are ſeven in number, C, D, I, L, M, V, X; which are all form'd in deſcribing a Circle, and drawing two Lines thro it, croſſing each other at right Angles in the Center.

Dominical Letter, ſee *Dominical*.

Nundinal Letter, ſee *Nundinalia*.

LETTERED, *Letrados*, *Litterati*, an Epithet given to ſuch Perſons among the *Chineſe* as are able to read and write their Language. Theſe alone are capable of being made *Mandarins*.

This is alſo the Name of a particular Sect either in Religion, Philoſophy, or Politicks, conſiſting principally of the Learned Men of that Country: among whom 'tis called *Jukio*, *i. e.* Learned. It had its Riſe in the Year of Chriſt 1400; when the Emperor, to awaken the native Affection of the People for Knowledge, which had been quite baniſhed by the preceding Civil Wars among 'em, and to ſtir up Emulation among the *Mandarins*, choſe out forty-two of the ableſt among their Doctors, to whom he gave a Commiſſion to compoſe a Body of Doctrine agreeable to that of the Antients, which was then become the Rule or Standard of the Learned. The Delegates applied themſelves to the Buſineſs with a world of Attention; but they ſeem rather to have wreſted the Doctrine of the Antients, to make it conſiſt with theirs, than to have built up theirs to the Model of the Antients. They ſpeak of the Deity as if it were no more than mere Nature; or the Natural Power or Virtue that produces, diſpoſes, and preſerves the ſeveral Parts of the Univerſe. It is, ſay they, a pure, perfect Principle without Beginning or End; 'tis the Source of all Things, the Eſſence of every Being; and that which determines it to be what it is. They make God the Soul of the World, ſay he is diffuſed throughout all Matter, and produces all the Changes that happen there. In ſhort, 'tis not eaſy to determine whether they reſolve God into Nature, or lift up Nature into God; for they aſcribe to it many of thoſe things which we attribute to God. This Doctrine, in lieu of the Idolatry that prevailed before, introduced a refin'd kind of Atheiſm. The Work being compoſed by ſo many Perſons of Learning and Parts, and approved by the Emperor himſelf, was received with infinite Applauſe by all the World. Many were pleaſed with it, in regard it ſeem'd to ſubvert all Religion: others approved it, becauſe the little Religion that it left 'em could not give 'em much trouble. And thus was form'd the Sect of the *Litterati*; which conſiſts of the Maintainers and Adherents to this Doctrine. The Court, the Mandarins, and the Perſons of Fortune and Quality, *&c.* are generally Retainers to it; but a great part of the common People ſtill hold to their Worſhip of Idols. The *Litterati* freely tolerate the *Mahometans*, becauſe they adore, with them, the King of Heaven and Author of Nature; but they bear a perfect Averſion to all other Sects of Idolaters among 'em, and it was once reſolved to extirpate them. But the Diſorder this would have occaſion'd in the Empire, prevented it: they now content themſelves with condemning them in general as Hereſies; which they do ſolemnly every Year at *Pekin*.

LETTER OF CREDIT, among Merchants, a Letter which a Merchant or Banker gives a Perſon he truſts in, to take up Money of his Correſpondents in remote places, in caſe of need. *Letters of Credit*, tho different from thoſe of *Exchange*, yet have the ſame Privileges, to compel the Payment of Sums received in conſequence of 'em.

LETTER OF EXCHANGE, ſee *Bill of Exchange*; ſee alſo *Exchange*.

LETTER OF LICENCE, in Trade, is an Inſtrument or Writing granted to a Man who has fail'd or broke, ſign'd and ſeal'd by his Creditors; which *Letter* uſually gives a longer Time for Payment: ſo that the Debtor having ſuch an Aſſurance, can go about his Buſineſs without fearing an Arreſt.

LETTERS OF ATTORNEY, are Writings authorizing an Attorney, that is, a Man appointed to do a legal Act in our ſtead. As a Letter of Attorney to give Seiſin of Lands, to receive Debts, to ſue a third Perſon, *&c.*

LETTERS OF MART, are Letters under the Privy-Seal, granted to the King's Subjects; impowering them to take by Force of Arms, what was formerly taken from them contrary to the Law of *Mart*: and regards any Nation with whom Truce is broken. See *Reprizal*.

LETTERS PATENTS, are Writings ſealed with the Great Seal of *England*, whereby a Man is authorized to do, or enjoy any thing, that otherwiſe of himſelf he could not. And they are ſo call'd by reaſon of their Form, becauſe they are open, with the Seal affixed, ready to be ſhewn for the Confirmation of the Authority given by them. Common Perſons may grant *Letters Patents*; but they are rather call'd *Patents* than *Letters Patents*, yet for difference thoſe granted by the King are call'd *Letters Patents Royal*. *Letters Patents* conclude with *Teſte meipſo*, *Charters* with *hiis Teſtibus*.

LETTERS OF RESPITE, Letters iſſued out by a Prince in favour of honeſt unfortunate Debtors, againſt too rigorous Creditors, whereby Payment is delay'd, for a certain Term. The Uſe of theſe Letters is very antient: *Caſſiodorus* obſerves, they were in uſe in the Time of *Theodoric* King of the *Goths*; others will have 'em introduced towards the End of the eleventh Century by Pope *Urban* II. in favour of thoſe who went on the Cruzados. They are ſtill in uſe in *France*, and ſome other Countries: and take their Name *à reſpirando*, becauſe they give the Debtor a breathing while.

LEVANT, in Geography, ſignifies any Country ſituate to the Eaſt of us, or the Eaſtern ſide of any Continent or Country, or that on which the Sun riſes. In Matters of Commerce, *&c.* the Word is generally reſtrain'd to the *Mediterranean Sea*, or the Country on the Eaſtern part of it: Hence our Trade thither is call'd the *Levant* Trade, and a Wind that blows from thence out of the *Streights*-mouth, is call'd a *Levant* Wind.

LEVANT AND COUCHANT, in Law, is when Cattel have been ſo long in another Man's Ground, that they have lain down, and have riſen again to feed.

LEVARI FACIAS, a Writ directed to the Sheriff for the Levying a Sum of Money on his Land and Tenements who has forfeited a Recognizance.

LEVATOR, an Epithet which the Anatomiſts give to ſeveral Muſcles, whoſe Uſe is to raiſe or lift up the Parts to which they belong. There are *Levators* of the Eye-Lids, ſee *Attollens Palpebr.* of the Omoplate, ſee *Omoplate*; of the Anus, ſee *Anus*; and of the Scapula, ſee *Scapula*.

LEUCOMA, in Phyſic, is a little white Spot on the Cornea of the Eye, call'd by the *Latins*, *Albugo*. It is occaſioned by an Humour gather'd in this Membrane, or by the Scar following a Wound, or by an Ulcer in this Part, as ſometimes happens in the Small-Pox. The Word is *Greek*, and is formed from λευκὸς, *white*.

LEUCOPHLEGMATIA, a kind of Dropſy, otherwiſe call'd *Anaſarcha*. It conſiſts in a Tumor or Bloating of the whole outer Surface of the Body, or ſome of its Parts; white and ſoft, eaſily giving way to the Touch, and preſerving the Impreſſion made by the Finger for ſome time. It may either be owing to ſome Diſorder of the Blood, which in this Diſeaſe is of a pale Colour, viſcid, and cold; or to an aqueous Humour extravaſated, and gathered together in the Muſcles and the Pores of the Skin. The Word is *Greek*, and comes from λευκὸς, *white*, and φλεγμα, *Pituita*, *Phlegm*.

LEVEL, a Mathematical Inſtrument, ſerving to draw a Line parallel to the Horizon, to lay off Floors, the Courſes of Maſonry, *&c.* horizontally, to meaſure the difference of Aſcent or Deſcent between ſeveral Places, to convey Waters, drain Fens, *&c.* The Word comes from the *Latin Libella*, the Croſs Beam that forms the Brachia of a Balance, which to be juſt, muſt ſtand horizontally. There are ſeveral Inſtruments of different Contrivance and Matter, that have been invented for the Perfection of Levelling; all of which, for the Practice, may be reduced to theſe that follow.

Water Level, which ſhews the horizontal Line by means of a Surface of Water, or other Liquid; founded on this Principle, that Water always naturally places itſelf *level*. The moſt ſimple is made of a long wooden Trough or Canal, whoſe Sides are parallel to its Baſe; ſo that being equally fill'd with Water, the Surface thereof ſhews the Line of *Level*: this is the *Chorobates* of the Antients, deſcribed by *Vitruvius*, *Lib.* 8. *Chap.* 6. This *Level* is alſo made with two Cups fitted to the two Ends of a Pipe, 3 or 4 Foot long, about an Inch in Diameter; by means whereof the Water communicates from the one to the other Cup: and this Pipe being moveable on its Stand, by means of a Ball and Socket, when the two Cups become equally full of Water, their two Surfaces mark the Line of *Level*. This Inſtrument, inſtead of Cups, may be made with two ſhort Cylinders of Glaſs 3 or 4 Inches long, faſten'd to each Extreme of the Pipe with Wax or Maſtic. Into the Pipe is fill'd ſome common or coloured Water, which ſhews itſelf through the Cylinders, by means whereof, the Line of *Level* is determined; the Height of the Water, with reſpect to the Center of the Earth, being always the ſame in both Cylinders. This *Level*, tho' very ſimple, is yet very commodious for levelling of ſmall Diſtances.

Air Level, that which ſhews the Line of *Level*, by means of a Bubble of Air incloſed with ſome Liquor in a Glaſs Tube of an indeterminate Length and Thickneſs, whoſe two Ends are ſealed hermetically; that is, are cloſed with the Glaſs itſelf, by heating it with the Flame of a Lamp, till it become ſoft and tractable. When the Bubble of Air fixes itſelf at a certain Mark made exactly

in

in the Middle of the Tube, the Plan or Ruler wherein it is fixed is *level*. When it is not *level*, the Bubble will riſe to one End. This Glaſs Tube may be ſet in another of Braſs, having an Aperture in the Middle, whence the Bubble of Air may be obſerved. The Liquor wherewith the Tube is fill'd, is ordinarily either Oil of Tartar, or *Aqua ſecunda*; thoſe not being liable to freezing as common Water, nor to Rarefaction and Condenſation as Spirit of Wine. The Invention of this Inſtrument is aſcribed to Mr. *Thevenot*.

Air Level with Sights, is an Improvement on that laſt deſcribed, which by the Addition of more Apparatus, becomes more commodious and exact: It conſiſts of an *Air Level* 1, (*Plat. Surveying, Fig.* 4.) about eight Inches long, and ſeven or eight Inches in Diameter, ſet in a Braſs Tube 2, with an Aperture in the Middle. The Tubes are carried in a ſtrong ſtreight Ruler, a Foot long, at whoſe Ends are fixed two Sights exactly perpendicular to the Tubes, and of an equal Height, having a ſquare Hole, form'd by two Fillets of Braſs, croſſing each other at right Angles, in the Middle whereof is drilled a very little Hole; through which little Hole, a Point on a *Level* with the Inſtrument is deſcried. The Braſs Tube is faſtened on the Ruler by means of two Screws, one whereof, mark'd 4, ſerves to raiſe or depreſs the Tube at pleaſure, for bringing it towards a *Level*. The Top of the Ball and Socket is riveted to a little Rule that ſprings, one End whereof is faſten'd with Screws to the great Ruler, and the other End has a Screw 5, ſerving to raiſe and depreſs the Inſtrument when nearly *level*. This Inſtrument is yet leſs commodious than the following one, becauſe tho' the Holes be ever ſo ſmall, yet they will ſtill take in too great a Space to determine the Point of *Level* preciſely.

Air Level with Teleſcope Sights. This *Level* (*Plate Surveying, Fig.* 5.) is like the laſt *Plate Fig.* with this Difference, that inſtead of plain Sights, it carries a Teleſcope to determine exactly a Point of *Level* at a good diſtance. The Teleſcope is in a little Braſs Tube, about 15 Inches long, faſtened on the ſame Rule as the *Level*. At the End of the Tube of the Teleſcope, mark'd 1, enters the little Tube 1, carrying the Eye-Glaſs, and a Hair horizontally placed in the Focus of the Object-Glaſs 2; which little Tube may be drawn out, or puſh'd into the great one, for adjuſting the Teleſcope to different Sights. At the other End of the Teleſcope is placed the Object-Glaſs: The Screw 3, is for raiſing or lowering the little Fork carrying the Hair, and making it agree with the Bubble of Air when the Inſtrument is *level*; and the Screw 4, is for making the Bubble of Air agree with the Teleſcope. The whole is fitted to a Ball and Socket. M. *Huygens* is ſaid to have been the Inventor of this *Level*; which has this Advantage, that it may be inverted, by turning the Ruler and Teleſcope half round: And if then the Hair cut the ſame Point that it did before the Turn, 'tis a Proof the Operation is juſt. It may be here obſerved, that one may add a Teleſcope to any kind of *Level*, by applying it upon, or parallel to the Baſe or Ruler, when there is occaſion to take the *Level* of remote Objects.

Plumb or *Pendulum Level*: That which ſhews the Horizontal Line by means of another Line perpendicular to that deſcribed by its Plummet or Pendulum. This Inſtrument (*Plate Surveying, Fig.* 6.) conſiſts of two Legs or Branches, join'd together at Right Angles; whereof that which carries the Thread and Plummet, is about a Foot and an half long. This Thread is hung towards the Top of the Branch, at the Point 2. The Middle of the Branch where the Thread paſſes is hollow, that ſo it may hang free every where but towards the Bottom at the Place 3, where there is a little Blade of Silver, whereon is drawn a Line perpendicular to the Teleſcope. The ſaid Cavity is cover'd by two Pieces of Braſs, making, as it were, a kind of Caſe, leſt the Wind ſhould agitate the Thread; for which reaſon the Silver Blade is covered with a Glaſs, to the end that it may be ſeen when the Thread and Plummet play upon the Perpendicular. The Teleſcope 1, is faſtened to the other Branch or Leg of the Inſtrument, and is about two Foot long, having a Hair placed horizontally a-croſs the Focus of the Object-Glaſs; which determines the Point of *Level*, when the String and Plummet hang againſt the Line on the Silver Blade. All the Accuracy of this Inſtrument depends on the Teleſcope's being fitted at Right Angles to the Perpendicular. It has a Ball and Socket, by which it is faſten'd to its Foot, and is ſaid to have been the Invention of M. *Picard*.

Reflecting Level: That made by means of a pretty long Surface of Water, repreſenting the ſame Object inverted, which we ſee erect by the Eye; ſo that the Point where thoſe two Objects appear to meet, is in a *Level* with the Place where the Surface of Water is found. This is the Invention of M. *Marriotte*. There is alſo another *Reflecting Level*, conſiſting of a Mirror of Steel or the like, well poliſh'd, and placed a little before the Object-Glaſs of a Teleſcope ſuſpended perpendicularly. This Mirror muſt make an Angle of 45 Degrees with the Teleſcope; in which Caſe the Perpendicular Line of the ſaid Teleſcope is converted into an Horizontal; which is the ſame with the Line of *Level*. The Invention of this is owing to Mr. *Caſſini*.

We have another *Level* of Mr. *Huygens*'s Invention, conſiſting of a Teleſcope *a*, (*Plate Surveying, Fig.* 7.) in form of a Cylinder, going through a Ferril, in which it is faſten'd by the middle. This Ferril has two flat Branches *b b*, one above, and the other below; at the ends whereof are faſten'd little moving Pieces, which carry two Rings, by one of which the Teleſcope is ſuſpended to a Hook at the end of the Screw 3, and by the other a pretty heavy Weight is ſuſpended, in order to keep the Teleſcope *in Equilibrio*. This Weight hangs in the Box 5, which is almoſt fill'd with Linſeed Oil, Oil of Wallnuts, or other Matter that will not eaſily coagulate, for more aptly ſettling the Ballance of the Weight and Teleſcope. The Inſtrument carries two Teleſcopes cloſe and very parallel to each other, the Eye-Glaſs of the one being againſt the Object-Glaſs of the other, that one may ſee each way without turning the *Level*. In the Focus of the Object-Glaſs of each Teleſcope muſt a little Hair be ſtrain'd horizontally, to be rais'd and lower'd as occaſion requires, by a little Screw. If the Tube of the Teleſcope be not found level when ſuſpended, a Ferril or Ring 4 is put on it, to be ſlid along, till it fixes to a *Level*. The Hook on which the Inſtrument is hung, is fix'd to a flat Wooden Croſs, at the Ends of each Arm whereof, there is a Hook ſerving to keep the Teleſcope from too much Agitation in uſing or in carriage. To the ſaid flat Croſs is applied another hollow Croſs, that ſerves as a Caſe for the Inſtrument; but the two Ends are left open, that the Teleſcope may be ſecured from the Weather, and always in a condition to uſe. The Foot of this Inſtrument is a round Braſs Plate, to which are faſten'd three Braſs Ferrils moveable by means of Joints wherein are put Staves: And on this foot is placed the Box. See the *Figure*.

Maſons Level, is compoſed of three Rules, ſo joined as to form an Iſoſceles Rectangle, ſomewhat like a Roman A; at the Vertex whereof is faſtened a Thread, from which hangs a Plummet; which paſſes over a fiducial Line marked in the Middle of the Baſe, when the thing to which the *Level* is applied, is horizontal; but declines from the Mark, when the Thing is lower on one Side than the other.

Carpenters and Paviours Level, conſiſts of a long Ruler, in the Middle whereof is fitted, at Right Angles, another ſomewhat bigger, at the Top whereof is faſtened a Line with a Plummet; which, when it hangs over a fiducial Line at Right Angles with the Baſe, ſhews that the ſaid Baſe is horizontal. Theſe two laſt Levels, tho' very common, are eſteemed the beſt for the Practice of Building, tho' the Operations made by 'em muſt needs be ſhort.

Gunners Level, for levelling Cannons and Mortars, is an Inſtrument (*Plate Surveying, Fig.* 8.) conſiſting of a Triangular Braſs Plate about four inches high, at the bottom of which is a Portion of a Circle divided into 450; which Number is ſufficient for the higheſt Elevation of Cannons and Mortars, and for giving Shot the greateſt Range. On the Center of this Segment of a Circle is ſcrewed a piece of Braſs, by means whereof it may be fix'd or moved at pleaſure. The End of this Piece of Braſs is made ſo as to ſerve for a Plummet and Index, in order to ſhew the Degrees of different Elevations of Pieces of Artillery. This Inſtrument has alſo a Braſs Foot to ſet upon Cannon or Mortars, ſo as when thoſe Pieces are horizontal, the whole Inſtrument will be perpendicular. The Uſe of the Inſtrument is obvious; and conſiſts in placing the Foot thereof on the Piece to be elevated, in ſuch manner as that the Point of the Plummet may fall on the proper Degree: this is what they call *levelling* the Piece.

Artillery Foot Level, is in form of a Square, having its two Legs or Branches of equal Length; at the Juncture whereof is a little Hole, whence hangs a Thread and Plummet playing on a perpendicular Line in the Middle of the Quadrant: it is frequently divided into 90 Degrees, or rather into twice 45 Degrees from the Middle. This Inſtrument may be uſed on ordinary Occaſions, by placing the Ends of its two Branches on a Plane; for when the Thread plays perpendicularly over the middle Diviſion of the Quadrant, that Plane is aſſuredly *level*. To uſe it in Gunnery, place the two Ends on the Piece of Artillery, which you may raiſe to any propoſed Height by means of the Plummet, whoſe Thread will give the Degree above the *Level*.

LEVELLING, an Operation with a Level, for finding a Line parallel to the Horizon, at one or more Stations, in order to determine the Height of one Place with reſpect to another; for the laying off Grounds even, regulating

of

of Deſcents, draining of Moraſſes, conducting of Waters, &c. One Place is ſaid to be higher than another, or out of Level with it, when it is more remote from the Centre of the Earth; and a Line equally diſtant from the Centre of it in all its Points, is called the Line of true Level: whence, becauſe the Earth is round, that Line muſt be a Curve, and make a part of the Earth's Circumference, or an Arch concentrical with it, as the Line B C F G; *Plate Surveying, Fig.* 9. all the Points whereof are equally diſtant from the Centre of the Earth A. But the Line of Sight which the Operations of Levels give, is a Tangent or a Right Line perpendicular to the Semi-diameter: One Extreme of which Tangent, being the Point of Contact, the other will be that of a Secant drawn from the Centre of the Earth; and the Point which determines it, will be above the Surface of the Earth, and of the true Level, as much as that Secant exceeds the Radius or Semi-diameter of the Earth.

This Extremity of the Tangent is ſaid to be in the apparent Level, as being that given by the Sight, but is eaſily reduced to the true Level, becauſe we know by Trigonometry, how much each Secant exceeds the Radius; and becauſe by meaſuring we have diſcovered the preciſe Length of that Radius. It was for want of the Knowledge of this, the Antients were not able to reduce the apparent Level to the true one; and accordingly, to prevent falling into an Error, never levell'd above 20 Feet at once, where ſuch Reduction was not neceſſary. By the Tables ſince made, it appears that at the Diſtance of 100 Yards, the apparent Level is raiſed above the true one about $\frac{3}{4}$ of a Line: So that the Antients, in this reſpect, were more ſcrupulous than needed. By means of this Reduction, we are now able to level Diſtances of one or two Miles, at one Operation, which the Antients could not do in leſs than 300.

The Operation of *Levelling* is as follows: Suppoſe the Height of the Point A (*Plate Surveying, Fig.* 10.) on the Top of a Mountain, above that of the Point B, and at the Foot thereof required: Place the Level about the middle Diſtance, between the two Points, as in D, and Staffs in A and B, and let there be Perſons inſtructed with Signals for raiſing and lowering on the ſaid Staffs little Marks of Paſteboard, or other Matter. The *Level* being placed horizontally by the Bubble, &c. look towards the Staff A E, and cauſe the Mark to be raiſed or lowered, till the Middle, upper Edge, or other moſt conſpicuous Part appear in the viſual Ray. Then meaſuring exactly the perpendicular Height of the Point A above the Point E, which ſuppoſe 6 Feet 4 Inches, ſet that down in your Book; then turn the Level horizontally about, that the Eye-Glaſs of the Teleſcope may be ſtill next the Eye when you look the other way (if you have only plain Sights, the Inſtrument need not be turned) and cauſe the Perſon at the Staff B to raiſe or lower his Mark, till ſome conſpicuous part of it fall in the viſual Ray, as at C. then meaſure the perpendicular Height of C above B, which ſuppoſe 16 Feet, 16 Inches; ſet this alſo down in the Book above the other Number of the firſt Obſervation; ſubſtract the one from the other, the Remainder will be 10 Feet, 4 Inches, which is the Difference of Level between A and B, or the Height of the Point A above the Point B. Where Note, that if the Point D, where the Inſtrument is fixed, be in the middle between the two Points A and B, there will be no Neceſſity for reducing the apparent Level to the true Level, the viſual Ray in that Caſe being raiſed equally above the true Level.

If it be further required to know whether there be a ſufficient Deſcent for conveying Water from the Source A to the Point B, *Plate Surveying, Fig.* 11. Here in regard the Diſtance from A to B is conſiderable, 'tis required that ſeveral Operations be made. Having then choſen a proper Place for the firſt Station, as at I, ſet up a Staff in the Point A near the Source, with a proper Mark to ſlide up and down the Staff as L, and meaſure the Diſtance from A to I, which ſuppoſe 2000 Yards. Then the Level being adjuſted in the Point I, let the Mark L be raiſed and lowered till ſuch time as you ſpy ſome conſpicuous Part of it thro' the Teleſcope or Sights of the Level, and meaſure the Height A L, which ſuppoſe 13 Foot 5 Inches. But in regard the Diſtance A I is 2000 Yards, you muſt have recourſe to your Table for a Reduction, ſubſtracting 11 Inches, which will leave the Height A L 12 Foot 6 Inches; and this note down in your Book. Now turn the Level horizontally about, ſo as the Eye-Glaſs of the Teleſcope may be towards the Staff at A; and fixing up another Staff at H, cauſe the Mark G to be moved up and down, till you ſpy ſome conſpicuous Part thro the Teleſcope or Sights. Meaſure the Height H G, which ſuppoſe 6 Yards, 4 Feet, 2 Inches. Meaſure likewiſe the Diſtance of the Points I H, which ſuppoſe 1300 Yards; for which Diſtance, according to the Table, 4 Inches, 8 Lines, muſt be ſubſtracted from the Height H G, which conſequently will but leave 6 Yards, 3 Feet, 9 Inches, 4 Lines, to be taken down in your Book.

This done, remove the Level forwards to ſome other Eminence, as E, whence the Staff H may be view'd, as alſo another Staff at D, the Place whither the Water is to be convey'd. The Level being again adjuſted in the Point E, look back to the Staff H; and managing the Mark as before, the viſual Ray will give the Point F. Meaſure the Height H F, which ſuppoſe 11 Feet, 6 Inches. Meaſure likewiſe the Diſtance H E, which ſuppoſe 1000 Yards; for which Diſtance the Table gives 2 Inches, 9 Lines of Abatement; which being taken from the Height H F, there will remain 11 Feet, 3 Inches, 3 Lines, which enter in your Book. *Laſtly*, turning the Level to look at the next Staff D, the viſual Ray will give the Point D. Meaſure the Height of D from the Ground, which ſuppoſe 8 Feet, 3 Inches. Meaſure alſo the Diſtance from the Station H to B, which ſuppoſe 900 Yards; for which Diſtance the Table gives 2 Inches, 3 Lines of Abatement; which being taken from the Height B D, there will remain 8 Feet, 9 Lines, which enter as before.

For the Manner of entering down Obſervations in your Book, obſerve that when a proper Place or Station for the Level, between the two Points, has been pitched upon, you muſt write down the two Heights obſerved at that Station, in two different Columns, *viz.* under the firſt Column, thoſe obſerved in looking thro' the Teleſcope when the Eye was from the Source, or towards the Point, which we may call *Back-Sights*; and under the ſecond Column thoſe obſerved, when the Eye was next the Source, which we call *Fore-Sights*, in the manner following:

Back-Sights. *Foot. Inc. Line.*		Fore-Sights. *Foot. Inc. Lin.*	
Firſt Height Corrected	12 : 6 : 0	Second Height	21 : 9 : 4
Third Height	11 : 3 : 3	Fourth Height	8 : 0 : 9
	23 : 9 : 3		29 : 10 : 1

Having ſummed up the Heights of each Column ſeparately, ſubſtract the leſſer from the greater, the Remainder will be the Difference of Level between the Points A and B; as in this Example,

Feet.	*Inch.*	*Lin.*	
29 :	10 :	1	
23 :	09 :	3	
6 :	00 :	10	*The Difference of Height or Level between the Points* A *and* B.

If the Diſtance of the two Points be required, add all the Diſtances meaſured, together, and dividing the Difference of Height by the Yards of the Diſtances, for each 200 Yards you will have a Deſcent of about 2 Inches, 9 Lines.

Levelling Staffs are Inſtruments uſed in *Levelling*, ſerving to carry the Marks to be obſerv'd, and at the ſame time to meaſure the Height of thoſe Marks from the Ground. They uſually conſiſt each of two long ſquare Wooden Rulers, made to ſlide over one another, and divided into Feet, Inches, &c.

For the common Occaſions of *Levelling* to be perform'd without much Apparatus of Inſtruments, Time, or Trouble, the following Method is recommended. Set a Pole upright in a Spring, Pond, River, or other Place whence Water is to be brought, and mark how many Feet and Inches of it are above Water. Then ſet up another Pole, of equal length with the other, in the place to which the Water is to come. Place the Center of a Quadrant on the top of this laſt Pole, the Plummet hanging free; ſpy thro the Sights the Top of the Pole that is in the Water, and if the Thread cuts any Degree of the Quadrant, the Water may be convey'd by a Pipe laid in the Earth. If you can't ſee from one Extreme to the other, the Operation may be repeated in the manner already directed.

Dr. *Halley* ſuggeſts a new Method of *Levelling*, which has been put in practice by ſome of the *French* Academy: This is performed wholly by means of the Barometer, in which the Mercury is found to be ſuſpended to ſo much the leſs Height, as the Place is further remote from the Centre of the Earth. Hence it follows, that the different Heights of the Mercury in two Places give the Difference of Level. Mr. *Derham*, from ſome Obſervations he made at the top and bottom of the Monument, found that the Mercury fell $\frac{1}{10}$ of an Inch at every 82 Foot of perpen-

perpendicular Aſcent, when the Mercury is at 30 Inches. Dr. *Halley* allows of $\frac{1}{10}$ of an Inch for every 50 Yards; which, conſidering how accurately the Barometers are now made, an Inch in ſome of 'em being divided into an hundred or more Parts, all very ſenſible, he thinks this Method ſufficiently exact to take the Levels for the Conveyance of Water, and leſs liable to Errors than the common Levels. The ſame Author found a Difference of 3 Inches 8 Tenths between the Height of the Mercury at the top and bottom of *Snowdon* Hill in *Wales*.

LEVER, in Mechanics, an inflexible Right Line ſupported by a ſingle Point on a Fulcrum or Prop; and uſed for the raiſing of Weights: being either void of Weight itſelf, or at leaſt having ſuch a Weight as may be balanced. The *Lever* is the firſt of thoſe call'd *Mechanical Powers* or *Simple Machines*, as being of all others the moſt ſimple, and is chiefly applied for raiſing Weights to ſmall Heights. It has its Name *Lever* from its Office *levare* or *lever*, to raiſe.

In a *Lever* there are three things to be principally conſidered: 1. The Weight to be rais'd or ſuſtain'd, as O, (*Plate Mechanicks*, *Fig.* 1.) 2. The Power by which it is to be rais'd or ſuſtain'd, as B. 3. The Fulcrum or Prop D, whereon the *Lever* is ſuſtain'd, or rather on which it moves round, the Fulcrum remaining fixed.

The *Lever* is threefold: Sometimes the Fulcrum is placed between the Weight and the Power, as in *Fig.* 1. *Plate Mechanicks*; and this we call a *Lever* of the firſt kind. Sometimes the Weight is between the Fulcrum and the Power, which is the ſecond kind; as in *Fig.* 2. And ſometimes the Power acts between the Weight and the Fulcrum; *Fig.* 3. the third kind.

The Power of the *Lever* is founded on the following Theorem, *viz.* That the Space or Arch deſcribed by each Point of a *Lever*, and conſequently the Velocity of each Point of a *Lever* is as its Diſtance from the Fulcrum or Prop.

From hence it follows, that the Action of a Power and the Reſiſtance of the Weight increaſe in proportion to their Diſtance from the Fulcrum. And hence alſo it follows, that a Power will be able to ſuſtain a Weight, if the Diſtance of the Point in the *Lever* to which it is applied, be to the Diſtance of the Weight, as the Weight to the Intenſity of the Power; which if it be ever ſo little increaſed, muſt raiſe the Weight. See this Doctrine demonſtrated under the Word *Mechanic Powers*, and further illuſtrated under the Word *Balance*: between which and the *Lever* there is a great Analogy; a *Lever* of the firſt kind being a ſort of Steel-yard to raiſe Weights.

The Power and Action of the *Lever* will be fully illuſtrated by the following Propoſitions.

I. If the Power applied to a *Lever* of any kind ſuſtain a Weight, the Power is to the Weight in a reciprocal Ratio of the Diſtances from the Fulcrum. This is the Converſe of that demonſtrated under the Head *Mechanic Powers*.

II. The Weight of a *Lever* of the firſt and ſecond kind AB, the Diſtance of the Centre of Gravity from the Fulcrum CV, and the Diſtances of the Weight and the Power AC and CB, being all given; to find the Power that will ſuſtain it.

Suppoſe the *Lever* void of Gravity, but in lieu thereof a Weight hung at V; if then AC be made to CV as the Gravity of the *Lever* to a fourth Number, we ſhall have the Weight which the *Lever* is able to ſuſtain, and this ſubſtracted from the given Weight, the Remainder will be the Weight to be ſuſtain'd by the Power. Let CB then be to CA as the remaining Weight to a fourth Weight; and we ſhall have the Power to be applied in B, in order to ſuſtain the given Weight with the given *Lever*.

III. The Gravity of a *Lever* of the firſt or ſecond kind AB, the Diſtance of its Centre of Gravity from the Fulcrum CV, the Diſtances of the Power and the Weight BC and CA being all given, to find the Weight to be ſuſtain'd.

Find the Part of the Weight ſuſtain'd by the *Lever* alone, as in the former Problem; in the ſame manner find the other Part of the Weight which the Power applied in B is able to ſuſtain: Add the two Numbers together, the Sum is the Weight required.

IV. The Gravity and Centre of Gravity F of a *Lever* of the ſecond kind CB, with the Weight G, its Diſtance from the Fulcrum CA, and from the Power CB, being given; to find the Power capable to ſuſtain the Weight.

Suppoſe the *Lever* void of Gravity, but in lieu thereof a Weight equal thereto hung in F, the Power required to ſuſtain the *Lever* alone. Then find the Power requiſite to ſuſtain the given Weight G; add the Powers together, the Sum will be the Power required.

V. If a Power applied to a *Lever* of any kind lift a Weight, the Space of the firſt is to that of the laſt, as this laſt to a Power able to ſuſtain the ſame Weight; whence it follows, that the Gain of Force is always attended with the Loſs of Time, and *vice verſa*.

LEVERET, a young Hare, ſo call'd in the firſt Year of its Age.

LEVIGATION ſignifies the Reduction of any hard ponderous Bodies, as Coral, Tutty, Precious Stones, &c. into a light ſubtile Powder, by grinding upon Porphyry, a Sea-ſhell, Marble, Stone, &c. as Painters do their Colours. This is much uſed in Pharmacy and Chymiſtry, but unleſs the grinding Inſtruments are extremely hard, they will wear away, ſo as ſometimes to double the Weight of the Medicine thus managed.

LEVITE, a *Hebrew* Prieſt, or Sacrificer, ſo call'd as being of the Tribe of *Levi*, or the Deſcendant of the Patriarch of that Name. In the Primitive Church they alſo gave the Name *Levite* to the Deacons, and Miniſters of the Altar. The *Levites* of the Old Law had no ſettled Lands allotted 'em for their Maintenance, but lived chiefly of the Offerings made to God. They were diſtributed through all the Tribes, each of which gave ſome of their Cities to the *Levites*, with Grounds in their Neighbourhood for the Subſiſtence of their Flocks. According to the Numeration made by *Solomon*, from the Age of Twenty there were Thirty-eight Thouſand capable of ſerving: Twenty-four Thouſand of theſe he appointed for the daily Miniſtery under the Prieſts; Six Thouſand to be inferior Judges in the Cities, and to decide Matters relating to Religion, and of no great conſequence to the State; Four Thouſand to be Door-keepers, and to take care of the Riches of the Temple; and the reſt to do the Office of Chanters or Singers.

The Word comes from the *Latin Levita*, which is form'd from the *Greek* λευίτης; the Root of which is the Name *Levi*, which was given to this Patriarch by his Mother *Leah*, from the *Hebrew* לוה *lavah*, *to be tied* or *united*; *Leah* hoping, by the Birth of this Son, to be more cloſely link'd to her Husband *Jacob*.

LEVITY, the Privation or Want of Weight in any Body, when compared with another that is heavier, in which ſenſe it is oppoſed to Gravity. The Schools maintain that there is ſuch a thing as poſitive and abſolute *Levity*, and impute to this the Riſe or Emergency of Bodies lighter in Specie than the Fluids wherein they riſe. But beſides that the common Senſe of Mankind diſcovers that *Levity* is only a Relative Term, we find by Experience that all Bodies tend toward the Earth, ſome ſlower, and ſome faſter, in all Fluids or Mediums, whether Water, Air, &c. Thus Cork is ſaid to be lighter than Gold, becauſe under equal Dimenſions the Gold will ſink in, and the Cork ſwim upon Water. *Archimedes* hath demonſtrated, That a ſolid Body will float any where in a Fluid of the ſame ſpecifick Gravity, and that a lighter Body will keep above a heavier. The Reaſon of this is becauſe of Bodies falling towards the Earth, thoſe which have a like number of equal Parts have equal Gravity; ſince the Gravity of the Whole is the Sum of the Gravity of all its Parts. Now two Bodies have an equal number of equal Parts, if under the ſame Dimenſions there are no Intervals deſtitute of Matter; whence it follows, that as no Portion of Matter is ſo ſmall, but that Body wherein it is contained may be wholly divided into Parts equally ſmall, there can be no reaſon for the Deſcent of theſe, which will not equally hold for the Deſcent of that. Hence it may be concluded, that thoſe Bodies which do not equally gravitate under the ſame Dimenſions, do not contain the ſame equal Portions of Matter; and therefore when we ſee, that a Cube of Gold ſubſides in Water, at the ſame time that an equal Bulk of Cork ſwims upon it, 'tis evident that the Gold muſt have a greater number of equal Parts of Matter under the ſame Bulk than the Cork, or the Cork muſt have a greater number of Vacuities than the Gold; and that there are alſo in the Water, a greater number of Vacuities than in Gold. Hence we have a clear Idea both of Denſity or Gravity, and of *Levity*; and know, that the latter cannot in a ſtrict ſenſe be accounted any thing poſitive, but a mere Negation or Abſence of Body, which determines that Body to be lighter than another which contains more Matter.

Dr. *Hook*, 'tis true, ſeems to maintain ſomething like a poſitive *Levity*. This, if we miſtake not, is what he means by the Term *Levitation*; *viz.* a Property of Bodies directly contrary to that of Gravitation towards the Sun. This he thinks he has diſcovered in the Steams of Comets, which tho they had a Deſcent from the Nucleus of the Comet towards the Sun, yet they quickly return'd, and went oppoſite to the Sun, and that to a prodigious Extent. In effect, where the Power of Gravitation ceaſes, it ſhould ſeem ſome ſuch contrary Force does begin, whereof we have Inſtances in the Phænomena of Attraction. This is what Sir *I. Newton* calls the *Vis Repellens*, and appears

pears to be one of the Laws of Nature; without which it would be hard to account for Rarefaction, and some other Appearances. See *Repulsion*.

LEURE, in Falconry, a piece of red Leather, cut in form of a Bird, or a Ball set off with a Beak, Claws, and Wings, hung out on a Crook by the Falconer to reclaim his Birds. They sometimes tie Meat to the *Leure*, wherewith to feed the Bird. The Word comes from the *Latin Lorum*, tho others derive it from *Leora*, *Craftiness*, *Deceit*.

LEVY signifies to gather or exact; as to *levy* Money, to *levy* Troops. *Levy* is sometimes also used to erect or set up; as to *levy* a Mill; also to raise or cast up, as to *levy* a Ditch, to *levy* a Fine, *&c.* from the *French lever*, to *raise*.

LEX, see *Law*.

LEX AMISSA, or *Legem amittere*, in Law is understood of an infamous perjured Person, who is said to *lose his Law*; or, as *Bracton* has it, *non est ulterius dignus Lege*.

LEX JUDICIALIS, is properly *Purgatio per Judicium Ferri*, sometimes call'd simply *Judicium*.

LEX SACRAMENTALIS; *Purgatio per Sacramentum*.

LEX TERRÆ, is the Law and Custom of the Land, by which Name it is distinguish'd from the Civil Law.

LEXICON, the same with Dictionary. The Word is seldom used, excepting in speaking of certain antient *Greek* Dictionaries which bear this Name. 'Tis derived from the *Greek* λέξις *Diction*, of λέγω *I speak*.

LIBATION, a Ceremony in the Heathen Sacrifices, wherein the Priest spilt some Wine, Milk, or other Liquor, in honour of the Deity to whom the Sacrifice was offered, after having first tasted it himself. *Alexander* is said to have sacrificed a Bull to *Neptune*; and for an Offering to the Sea-Gods, threw the Golden Vessel, used for the *Libation*, into the Sea. *Libations* were also in use under the Law of *Moses*, being injoined by God in *Exodus* xxix. and *Numbers* xv. See *Lipsius* on *Libations*.

LIBEL, a Writing containing Injuries, Reproaches, or Accusations against the Honour and Reputation of any Person, particularly of a Superior or Governour. *Platina* is of opinion that a Writing, how injurious soever it is, cannot be call'd a *Libel*, if the Author's Name be to it. Libellers, among the antient *Romans*, were punish'd with Death, but in After-Times they were only whipp'd. *Augustus* rank'd *Famosos Libellos*, Defamatory Libels, among the Crimes *Læsæ Majestatis*, of High-Treason. *F. Baudoin* has publish'd a Comment on the Imperial Laws against *Libels*. Scandalous Pictures are reckoned amongst *Libels*.

The Lawyers say a *Libel* may be either *in Scriptis*, or *sine Scriptis*. *In Scriptis*, when a Writing is composed or published to another's Disgrace, which may be done *Verbis*, *aut Cantilenis*; as where this is maliciously repeated or sung in the presence of others: Or else *Traditione*, when the *Libel*, or any Copy of it, is delivered out to scandalize the Party. *Famosus Libellus sine Scriptis*, may be two-fold. (1.) *Picturis*, as to paint the Party in a shameful, or ignominious manner: Or, (2.) *Signis*, as to fix a Gallows, or other ignominious Signs, at the Door of the Party, or elsewhere. The Punishment of Libelling in *England*, is putting the Criminal on the Pillory, Whipping, *&c.*

Libel also signifies the Original Declaration of any Action in the Civil Law.

LIBELLATICI. Under the Persecution of *Decius* there were several Christians, who, to prevent their being obliged to renounce the Faith, and sacrifice to Idols in Public, made Application to the Magistrates, and abjured their Faith in private, obtaining Certificates of 'em, either by Intreaty, or by Money; by which they were attested to have complied with the Orders of the Emperor, and were thereby sheltered from any further Molestation on account of their Religion. These Certificates were called *Libelli*, whence the People who obtained them came to be denominated *Libellatici*. Others, particularly the *Centuriators* of *Magdeburg*, are of Opinion, that the *Libellatici* were only such as fed the Magistrates with Money, to skreen them from Persecution, and from being obliged to renounce Christianity. M. *Tillemont* retains somewhat of each Opinion; he thinks the *Libellatici* applying themselves to the Magistrates, bought off the Sacrificing and Abjuration, and obtained Letters, by which they were declared to have renounced Christ, and sacrificed to Idols, tho' in effect they had done neither.

LIBERAL ARTS, in opposition to Mechanical *Arts*, are such as depend more on the Labour of the Mind, than on that of the Hand; that consist more in the Speculation than the Operation, and that have a greater Regard to Amusement and Curiosity, than the servile Mechanical Works: Such are Grammar, Rhetoric, Painting, Sculpture, Architecture, Music. The *Liberal Arts* used formerly to be summed up in the following *Latin* Verse.

Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra.

And the Mechanical *Arts*, which however are innumerable, under this;

Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates.

The Word comes from the Latin *Liberalis*, which among the *Romans* signified a Person who was not a Slave, and whose Will, of consequence, was not check'd by the Command of any Master.

LIBERALIA, Feasts celebrated by the antient *Romans* in honour of *Bacchus*. These were the same with those which the *Greeks* call'd *Dionysiaca* and *Agonia*; which see.

They took their Name from *Liber*, i. e. Free; a Title conferred on *Bacchus*, in memory of the Liberty or Freedom which he granted to the People of *Bœotia*; or perhaps because Wine, whereof he was the reputed Deity, delivers Men from Care, and sets their Minds at ease and freedom. *Varro* derives the Name of this Feast from *Liber*, considered as a Noun Adjective, and signifying Free; because the Priests were free from their Function, and eas'd of all Care during the Time of the *Liberalia*. For, in effect, it was the old Women who officiated in the Ceremonies and Sacrifices of these Feasts.

LIBERIA, a Feast held among the *Romans* on the Day wherein their Children laid aside their Juvenile Habits, and assumed the Robe called *Toga libera*. The *Liberia* were kept on the sixteenth of the Calends of *April*; that is, the 17th of *March*.

LIBERTIN, among the *Romans*, was what we call a Freed Man, a Person set free from a Legal Servitude. These still retain'd some Mark of their antient State. He who made a Slave free, had a Right of Patronage and of Patron over the *Libertin*; if the *Libertin* fail'd of shewing due Respects to his Patron, he was restored to his Servitude; and if the *Libertin* died without Children, his Patron was his Heir.

LIBERTINES, the Name of a Sect in Religion, that arose in the Year 1525. Their principal Tenets were, That there is but one only Spirit, which is that of God; who is diffused through all Things, who is and lives in all Creatures; that our Souls are nothing but this Spirit of God: That the Soul dies with the Body; that Sin is a mere Chimæra, and only subsists in Opinion, for that it was God that did all, both Good and Evil; that Paradise is a Dream, and Hell a Phantom, invented by the Divines, and Religion a State-Trick to keep Men in Awe; that spiritual Regeneration consists in nothing but stifling the Remorse of Conscience; Repentance in avowing to have done no Evil; and that it is lawful, and even expedient to dissemble in Matters of Religion. To these they added horrible Blasphemies against Jesus Christ, saying, he was nothing but a mere *Je ne sçai quoi*, composed of the Spirit of God, and of the Opinion of Men. These Maxims occasioned their being called *Libertines*; and the Word has been used in an ill Sense ever since.

They spread principally in *Holland* and *Brabant*. Their Leaders were one *Quintin* a *Picard*, and another called *Chopin*, who associated with him, and became his Disciple.

LIBERTY, is usually understood of that State wherein a Man acts freely; or that Power by which he determines himself voluntarily either to Good or Evil, to this thing or to that: Or *Liberty* is an active Indifference of the Will, to will, or not will any thing. *F. Malbranch* gives us a still more Philosophical Definition. The Will he defines to be that Impression, or natural Motion, which inclines towards Good in the general; and by *Liberty* he understands, that Power which the Mind has of determining this general Impression towards such Objects as please us; and so of directing our general Inclinations to some particular Things: whence it is easy to perceive, that tho' all natural Inclinations be voluntary, yet they are not all free; not, we mean, with a Freedom of Indifference, which includes a Power of willing, or not willing; or of willing quite the contrary to that which our natural Inclinations lead us to: For tho' 'tis voluntarily and freely that we love Good in general, it being absurd to suppose we should love any thing without the Will, or that the Will can ever be constrain'd; yet we don't love freely, (in the Sense just laid down) because 'tis not in the power of the Will not to desire to be happy. It must be observed, however, that the Mind, considered as determined towards Good in general, cannot divert its Motion to any particular Good, unless the same Mind, considered as capable of Ideas, have some Knowledge of that particular Good. That is, in plainer Terms, the Will is a blind Power, that cannot apply itself to any thing but what the Understanding represents to it: So that the Power which the Will has to determine its Impression towards general Good, or its natural Inclinations, variously, consists in the Power it has to command the Understanding to represent

some

ſome particular Good. Thus, a Perſon, for inſtance, repreſents ſome Dignity to himſelf as a Good to be wiſh'd for, immediately the Will deſires this Good; that is, the Impreſſion which the Mind continually receives towards Good in general, determines it to this Dignity. But as that Dignity is not the univerſal Good, nor is conceived clearly and diſtinctly as ſuch by the Mind, (for the Mind cannot conceive a thing clearly which is not;) the Impreſſion we have towards Good in general, is not entirely exhauſted by that particular Good; the Mind has an Inclination to go further; it does not love that Dignity neceſſarily or invincibly, and in this reſpect is free. Now its *Liberty* conſiſts in this, that not being fully convinced that this Good contains in it all the Good it is capable of loving, it may ſuſpend its Judgment and its Love. The Caſe is nearly the ſame with regard to the Knowledge of Truth. We love this as we do the Enjoyment of Good, by a natural Impreſſion; which Impreſſion is not invincible in the latter, excepting Evidence be full, and our Knowledge of the Object compleat: We have the ſame *Liberty* in our falſe Judgments, that we have in our irregular Appetites. See *Judgment*, *Will*, &c.

Moſt of the Schoolmen confound *Liberty* and the Will together, and make one Definition ſerve for 'em both. They diſtinguiſh *Liberty* into a great many Kinds; as *Liberty* of Contrariety, *Contrarietatis*; which is a *Liberty* of doing two things not only different, but contrary to each other. *Liberty* of Contradiction, is a Power of doing a thing, or letting it alone. Jeſus Chriſt had not the *Liberty* of Contrariety, with regard to Good and Evil, for he could not do Evil; but he had a *Liberty* of Contradiction with regard to Good. *Next Liberty*, *Proxima*, is a full abſolute Freedom of doing any thing. *Liberty remote*, is a *Liberty* that comprehends a natural Power, tho' embarraſs'd with Obſtacles, which it is in its power to remove, and to attain to a *next Liberty*. Thus he who has not actual Grace neceſſary for the fulfilling of his Duty, but has yet the actual Grace of Prayer, has a *next Liberty* with regard to Prayer, and a *remote Liberty* with regard to his Duty.

Cicero defines *Liberty* the Power of living after a Man's own Deſire, without any Cauſe or Impediment to oblige him to do one thing rather than another. The Doctrine of *Pelagius*, with regard to *Liberty*, is built on Philoſophy, which does not allow us to have loſt our original *Liberty* of doing good.

LIBERTY OF CONSCIENCE, a Right or Power of making Profeſſion of any Religion that a Man ſees fit. This ſeems to be a natural Right; it is vigorouſly oppoſed by the Generality of the *Romaniſts*, and even by many of the Reformed, tho' it ſeems as if the Reformation could ſcarce ſubſiſt without it.

LIBRA, *Balance*, one of the twelve Signs of the Zodiack, exactly oppoſite to *Aries*.

LIBRA, one of the Mechanical Powers. See *Balance*.

LIBRA, the antient *Roman* Pound, borrowed from the *Sicilians*, who called it *Libra*. It was divided into twelve Unciæ, or Ounces, equal to about 10 ½ Ounces of our Weight. The Diviſions of their *Libra* were the *Uncia* $\frac{1}{12}$, the *Sextans* $\frac{1}{6}$, the *Quadrans* $\frac{1}{4}$, the *Triens* $\frac{1}{3}$, the *Quincunx* five Ounces, the *Semis* ſix, the *Septunx* ſeven, the *Bes* eight, the *Dodrans* nine, the *Dextrans* ten, the *Deunx* eleven; laſtly, the *As* weighed twelve Ounces, or one *Libra*. The *Roman Libra* was uſed in *France* for the Meaſure of their Coin till the time of *Charlemagne*, or perhaps till that of *Philip* I. in 1093. their Sols being ſo proportioned, as that twenty of them were equal to the *Libra*. By degrees it became a Term of Account, and every thing of the Value of twenty Sols was called a Livre. See *Livre*. The *Romans* had alſo a Coin called *Libra*, equal to twenty *Denarii*. *Scaliger* will have it, that *Libra* was even among them a Term of Account, not a Coin. See *Pound*.

LIBRA PENSA, in our Law-Books, is a Pound of Money in Weight: it being uſual in former Days not only to tell the Money, but to weigh it; in regard many Cities, Lords, and Biſhops having their Mints, coin'd Money, and often very bad too: for which reaſon, tho the Pound conſiſted of 20 Shillings, they always weigh'd it.

LIBRARII, among the Antients, were properly thoſe who tranſcribed in beautiful, or at leaſt legible Characters, what had been wrote by the *Notarii* in Notes and Abbreviatures. The Word was alſo uſed for Copiſts, or thoſe who wrote Books for the Bookſellers.

LIBRARY, an Apartment or Place deſtined for the placing of Books; or the Books themſelves lodg'd in that Apartment. Some Authors refer the Origin of *Libraries* to the *Hebrews*, and obſerve that the Care they took for the Preſervation of their Sacred Books, and the Memory of what concern'd the Actions of their Anceſtors, became an Example to many other Nations, and particularly the *Egyptians*. *Oſymandrias* King of *Egypt* is ſaid to have taken the hint firſt, and had a *Library* built in his Palace, with this Inſcription over the door, Ψυχῆς Ἰατρεῖον. Nor were the *Ptolemys*, who reign'd in the ſame Country, leſs curious and magnificent in Books. The Scripture ſpeaks of a *Library* of the Kings of *Perſia*, *Eſdras* V. 15. VI. 1. which ſome imagine to have conſiſted of the Hiſtorians of that Nation, and of Memoirs of the Affairs of the State; but, in effect, it appears rather to have been a Depoſitory of Laws, Charters, and Ordinances of the Kings. The *Hebrew* Text calls it *the Book of Treaſures*, and afterwards *the Houſe of the Books of Treaſures*. We may with more juſtice call that a *Library*, mention'd in the ſecond of *Eſdras* to have been built by *Nehemiah*, and in which were preſerv'd the Books of the Prophets and of *David*, and the Letters of their Kings.

The firſt who erected a *Library* at *Athens*, was the Tyrant *Piſiſtratus*; and yet *Strabo* refers the Honour of it to *Ariſtotle*. That of *Piſiſtratus* was tranſported by *Xerxes* into *Perſia*, and afterwards brought by *Seleucus Nicanor* to *Athens*. Long after, it was plundered by *Sylla*, and re-eſtabliſhed by *Hadrian*. *Plutarch* ſays, that under *Eumenes* there was a *Library* at *Pergamus* containing 200000 Books. *Tarannion*, a celebrated Grammarian, Cotemporary with *Pompey*, had a *Library* of 3000 Volumes: That of *Ptolemy Philadelphus*, according to *Ammianus Marcellinus*, contain'd 7000, all in Rolls, burnt by *Cæſar*'s Soldiers. *Conſtantine* and his Succeſſors erected a magnificent one at *Conſtantinople*, which in the eighth Century contain'd 300000 Volumes, all burnt by order of *Leo Iſauricus*; and among the reſt, one wherein the *Iliad* and *Odyſſee* were written in Letters of Gold on the Guts of a Serpent.

The moſt celebrated *Libraries* of antient *Rome* were the *Ulpian* and the *Palatin*. They alſo boaſt much of the *Libraries* of *Paulus Emilius*, who conquer'd *Perſius*; of *Lucilius Lucullus*, of *Aſinius Pollio*, *Atticus*, of *Julius Severus*, *Domitian*, *Seranus*, *Pamphylus*, *Martyr*, and the Emperors *Gordian* and *Trajan*.

Antiently every large Church had its *Library*; as appears by the Writings of St. *Jerom*, *Anaſtaſius*, and others. Pope *Nicholas* laid the firſt Foundation of that of the *Vatican* in 1450. It was deſtroy'd by the Conſtable *Bourbon* in the ſacking of *Rome*, and reſtored by Pope *Sixtus* V. and has been conſiderably enrich'd with the Ruins of that of *Heidelberg*, plunder'd by Count *Tilly* in 1622.

One of the moſt compleat *Libraries* in *Europe* is ſaid to be that erected at *Florence* by *Coſmo de Medicis*; over the Gate whereof is wrote, *Labor abſque Labore*. Tho it is now exceeded by that of the *French* King; begun by *Francis* I. augmented by Cardinal *Richlieu*, and compleated by M. *Colbert*. The Emperor's *Library*, according to *Lambecius*, conſiſts of 80000 Volumes, and 15940 Curious Medals.

The *Bodleian Library* at *Oxford*, built on the Foundation of that of Duke *Humphry*, exceeds that of any Univerſity in *Europe*, and even thoſe of all the Sovereigns of *Europe*, except the Emperor's and *French* King's, which are each of 'em older by a hundred Years. It was firſt open'd in 1602, and has ſince found a great number of Benefactors; particularly Sir *Rob. Cotton*, Sir *H. Savil*, Archbiſhop *Laud*, Sir *Kenelm Digby*, Mr. *Allen*, Dr. *Pocock*, Mr. *Selden*, and others. The *Vatican*, the *Medicean*, that of *Beſſarioni* at *Venice*, and thoſe juſt mention'd, exceed the *Bodleian* in *Greek* Manuſcripts; which yet outdoes 'em all in Oriental Manuſcripts. As to printed Books, the *Ambroſian* at *Milan*, and that of *Wolfenbuttel*, are two of the moſt famous, and yet both inferior to the *Bodleian*. The *Cotton* Library conſiſts wholly of Manuſcripts, particularly of ſuch as relate to the Hiſtory and Antiquities of *England*; which, as they are now bound, make about 1000 Volumes.

LIBRATA TERRÆ, a Portion of Ground containing 4 Oxgangs, and every Oxgang 13 Acres. With us it is ſo much Land as is yearly worth 20 *s.* In *Henry* the IIId's time, he that had *quindecim Libratas Terræ*, was to receive the Order of Knighthood.

Some ſay, that as Money is divided into Pounds, Shillings, Pence, and Farthings, the ſame Degrees are to be obſerved in the Diviſion of Lands; and therefore as *Quadrans* ſignifies a Farthing, ſo *Quadrantata* is the fourth part of an Acre, *Oblata* an half, *Denaria* a whole Acre, *Solidata* 12 Acres, and *Librata* 20 times 12 Acres, *i. e.* 240 Acres.

Spelman compares an Acre to a Mark in Money; and as in one there are 160 Pence in Money, ſo in the other there are 160 Perches of Land.

LIBRATION, in Aſtronomy, which ſome call *Trepidation*, an apparent Irregularity in the Motion of the Moon, by which ſhe ſeems to librate or ſhake about her own Axis, ſometimes from the Eaſt to the Weſt, and ſometimes from the Weſt to the Eaſt: whence ſome Parts in her Weſtern Limb or Margin recede from the Centre of the Disk, and ſometimes move towards it.

Some

Some of thoſe Parts which were before viſible, ſet and hide themſelves in the inviſible ſide of the Moon, and afterwards become again conſpicuous. This *Libration* of the Moon is owing to her equable Rotation round her own Axis, and her unequal Motion in the Perimeter of her Orbit. For if the Moon moved in a Circle, whoſe Centre co-incided with the Centre of the Earth, and turn'd round its Axis in the preciſe Time of its Period round the Earth; the Plane of the ſame Lunar Meridian would always paſs thro the Earth, and the ſame Face of the Moon would be conſtantly and exactly turn'd towards us. But ſince the real Motion of the Moon is an Ellipſis, in whoſe Focus is the Earth, and the Motion of the Moon about the Earth is equable; or, which is the ſame thing, every Meridian of the Moon by the Rotation deſcribes Angles proportional to the Times: the Plane of no one Meridian will conſtantly paſs thro the Earth.

LIBRATION OF THE EARTH, that Motion, whereby the Earth is ſo retain'd in its Orbit, as that its Axis continues conſtantly parallel to the Axis of the World. This, *Copernicus* calls the *Motion of Libration*; and may be illuſtrated thus: Suppoſe a Globe, with its Axis parallel to that of the Earth, painted on the Flag of a Maſt, moveable on its Axis, and conſtantly driven by an Eaſt Wind, while it ſails round an Iſland, 'tis evident the painted Globe will be ſo librated, as that its Axis will be parallel to that of the World in every Situation of the Ship.

LICENCE, a Permiſſion or Leave granted by a Superior. *Juſtinian* appointed four Years to be ſpent in the Study of the Law; after which, thoſe who had diſcharged this Obligation, were ſaid to have *Licence*, or Permiſſion, to retire from Study. And hence the Word comes to be uſed in this ſenſe among us.

Licence is alſo uſed for the Letters or Certificates taken out in the Univerſities, whether in Law, Phyſic, or Divinity. *Licence* in the *Sorbonne* is a Period of two Years, which the Batchelors are obliged to paſs in aſſiſting at Acts, and diſputing in 'em, to qualify themſelves for being admitted Doctors.

LICENCES, in Painting, are the Liberties which the Painter takes in diſpenſing with the Rules of Perſpective, and the other Laws of his Art.

Poetical Licence is the Liberty which Poets claim of diſpenſing with the ordinary Rules of Grammar; and antiently the Poets had much greater *Licences* than are now allow'd. The *Greeks*, by having recourſe to the ſeveral Dialects of their Tongue, could lengthen out a Word if it were too ſhort, or retrench ſomething from it if it were too long. The old Poets did what they pleas'd with their Language, and ſubjected it not only to all their Neceſſities, but their Caprices too.

Et data Romanis venia eſt indigna Poetis.

But theſe became ridiculous in courſe of Time; and the Poets are now deſpoil'd of moſt of their antient Privileges.

LICENCE TO ARISE, in Law, is a Liberty or Space of Time given by the Court to a Tenant, to ariſe out of his Bed, who is eſſoin'd *de Malo Lecti* in a real Action.

LICENTIATE, he who has obtain'd the Degree of a Licence. Moſt of the Officers of Judicature in *Spain* are known by no other Name than that of *Licentiates*. To paſs *Licentiate* in the Canon Law, Civil Law, or Phyſic, they muſt have ſtudied ſeven Years, in Divinity ten. A *Licentiate* among us is uſually underſtood of a Phyſician who has a Licence to practiſe, granted him by the College or Biſhop of the Dioceſe. A Perſon practiſing Phyſic without ſuch Licence, in caſe his Patient dies under his hands, is guilty of Felony in the eye of the Law.

LICHEN, a cutaneous Diſtemper, in many reſpects the ſame with a Leproſy; for which, a Moſs of the ſame name is ſaid to be an extraordinary Remedy: but this the preſent Practice ſeldom meets with.

LIEGE, properly ſignifies a Vaſſal who holds a kind of Fee, that binds him in a cloſer Obligation to his Lord than other People. The Term ſeems to be derived from the *French lier, to bind*; in regard of a Ceremony uſed in rendering Faith or Homage, which was by locking the Vaſſal's Thumb or his Hand in that of the Lord, to ſhew that he was faſt bound by his Oath of Fidelity. *Cujas*, *Viginer*, and *Bignon* chuſe rather to derive the Word from the ſame Source with *leudis* or *leodi*, *loyal*, *faithful*. But *Du Cange* falls in with the Opinion of thoſe who derive it from *Litis*; a kind of Vaſſals ſo firmly attach'd to their Lord on account of Lands or Fees held of him, that they were obliged to do him all manner of Service, as if they were his Domeſtics. He adds, this was formerly call'd *Litgium Servitium*, and the Perſon *Litge*. In this ſenſe the Word is uſed *Leg. Edw. cap.* 29. *Jur. ſub Tutela Regis Ligea debeat eſſe*; that is, wholly under his Protection.

By *Liege Homage* the Vaſſal was obliged to ſerve his Lord towards all, and againſt all, excepting his Father. In which ſenſe, the Word was uſed in oppoſition to *ſimple Homage*; which laſt only obliged the Vaſſal to pay the Rights and accuſtomed Dues to his Lord, and not to bear Arms againſt the Emperor, Prince, or other Superior Lord: So that a *Liege Man* was a Perſon wholly devoted to his Lord, and intirely under his Command.

However, as the Word *Liege* is variouſly uſed by Authors, it muſt be obſerved that there were formerly two kinds of *Liege Homage*: the one by which the Vaſſal was obliged to ſerve his Lord, againſt all without exception, even his Sovereign; the other, by which he was to ſerve him againſt all, except ſuch other Lords as he had formerly owed *Liege Homage* to.

In our old Statutes, *Lieges* and *Liege People* are Terms peculiarly appropriated to the King's Subjects, as being *Liges*, *Ligati*, or obliged to pay Allegiance to him, 8 *Hen.* 6. 14 *Hen.* 8. &c. Tho private Perſons had their *Lieges* too——*Reinaldus Dei gratia Abbas Ramuſiæ, præpoſito & hominibus de Brancestre, & omnibus vicinis Francis & Anglis, Salutem. Sciatis me dediſſe terram Ulfe, in Depedene (hodie Depedalé) huic Boſelino & Uxori ejus Alfniæ——ea Conditione quod effecti ſint homines* Liges. *Lib. Rames.*

Omnibus, &c. Reginaldus Rex Inſularum, Salutem. Sciatis quod deveni homo Ligeus *Domini Regis Angliæ Johannis, contra omnes Mortales quamdiu vixero, & inde ei fidelitatem & ſacramentum præſtiti, &c.* MS *penes* W. Dugdale.

LIENTERY, in Phyſic, a kind of Looſeneſs wherein the Food paſſes ſo ſuddenly thro the Stomach and Guts, as to be thrown out by Stool with little or no Alteration. The *Lientery* is owing either to a Defect in the Ferment of the Stomach, or to a Relaxation of the Pylorus, attended with ſo briſk an Irritation of the Fibres of the Ventricle, that inſtead of retaining the Aliment it lets it paſs. Exceſs of Drinking ſometimes occaſions this Diſeaſe, by relaxing the Stomach, and eſpecially the Pylorus, too immoderately. The Antients were of opinion the *Lientery* was owing to the too great Smoothneſs and Slipperineſs of the Inſide of the Inteſtines, by which they let the Food ſlip off before it was digeſted: and hence they gave it this Name, which is formed from λεῖος, *poliſhed*, and ἔντερον, *Inteſtine*.

LIE UNDER THE SEA: The Sailors ſay, a Ship *lies under the Sea*, when her Helm being made faſt a-Lee, ſhe lies ſo a-Hull, that the Sea breaks upon her Bow, or Broad-ſide.

LIEUTENANT, a Deputy or Officer who holds the place of a Superior, and diſcharges that Function in his abſence, which he ought to exerciſe in perſon. Of theſe ſome are Civil, as *Lords Lieutenants* of Kingdoms, who are the King's Viceroys, and govern in his ſtead; *Lords Lieutenants* of Counties, ſee *County*. But the Term is moſt popular with Military Men, among whom there is a Variety of *Lieutenants*. As,

Lieutenant-General, the ſecond Officer in an Army, who commands a Body of Forces, a Detachment, Quarter-Attack, &c. under the General.

In *France* they have alſo *Lieutenants-General* of their Naval Forces, who command immediately under the Admirals.

In *Holland* they have a *Lieutenant-Admiral*, which is the ſame with what we call a Vice-Admiral.

Lieutenant-General of the Ordnance, is he who has the Charge of the Artillery, Batteries, &c. under the Maſter-General, or in his abſence.

Lieutenant-Colonel, in a Body of Horſe, is the firſt Captain of the Regiment; he commands in the abſence of the Colonel, taking place of all the other Captains.

Lieutenant-Colonel of Foot, is the ſecond Officer in the Regiment; he commands in the abſence of the Colonel, and in a Battel takes poſt at his Colonel's Left. The Dragoons have alſo a *Lieutenant-Colonel*; but the Horſe have not, properly, any.

LIFE, the Duration of Animal Being, or the Space of Time that paſſes between their Birth and Death. *Life* is alſo uſed for the Conſtitution; or the Principle of Heat and Motion that animates Bodies, and makes 'em Perceive, Act, and Grow; in which ſenſe, *Life* is divided into Animal, Senſitive, and Vegetative. *Life*, in a ſtrictly phyſical ſenſe, is the Circulation of the Blood.

My Lord *Bacon* makes the Prolongation of *Life* one of the three Branches of Medicine; the other two relating to the Preſervation of Health, and the Cure of Diſeaſes. And the Theory of this he numbers among the *Deſiderata*. Some Means or Indications that ſeem to lead to it, he lays down as follows.

Things are preſerved in two manners; either in their Identity, or by Reparation. In their Identity, as a Fly or Ant in Amber, a Flower or Fruit or Wood in a Conſervatory of Snow; a dead Carcaſs in Balſams. By Reparation, as a Flame, and as Mechanical Engines, &c. To

attain

attain to the Prolongation of *Life*, both these Methods must be used, and the Human Body must be preserved both as Inanimates, as Flame, and as Mechanical Instruments are preserved. Hence arise three Intentions for the Prolongation of *Life*: Retardation of Consumption, proper Reparation, and Renovation of what begins to grow old. Consumption is occasion'd by two kinds of Depredation; a Depredation of the Innate Spirit, and a Depredation of the Ambient Air. These may be each prevented two ways; either by rendering those Agents less predatory, or by rendering the passive Parts (*viz.* the Juices of the Body) less liable to be prey'd on. The Spirit will be render'd less predatory, if either its Substance be condensed, as by the Use of Opiates, Grief, *&c.* or its Quantity diminished, as in spare and monastic Diets; or its Motion calm'd, as in Idleness and Tranquillity. The Ambient Air becomes less predatory, if it be either less heated by the Rays of the Sun, as in cold Climates, in Caves, Mountains, and Anchorites Cells; or be kept off from the Body, as by a dense Skin, the Feathers of Birds, and the Use of Oil and Unguents without Aromatics. The Juices of the Body are rendered less liable to be prey'd on, either by making them harder, or more moist and oily. Harder, as by a coarse sharp Diet, living in the Cold, robust Exercises, and some Mineral Baths. Moister, as in the Use of sweet Foods, *&c.* in abstaining from Salts and Acids, and especially in such a Mixture of Drink, as consists wholly of fine subtile Particles without any Acrimony or Acidity. Reparation is performed by means of Aliment. Alimentation is promoted four ways: By the Concoction of the *Viscera*, so as to extrude the Aliment; by exciting the exterior Parts to the Attraction of the Aliment, as in proper Exercises and Frications, and some Unctions and Baths; by the Preparation of the Food it self, so as it may more easily insinuate it self, and in some measure anticipate the Digestion, as in various Ways of dressing Meats, mixing Drinks, fermenting Breads, and reducing the Virtues of these three into one; by promoting the Act of Assimilation it self, as in seasonable Sleep, some external Applications, *&c.* The Renovation of what begins to grow old, is performed two ways, by the Inteneration of the Habit of the Body, as in the Use of Emollients, Emplasters, Unctions, *&c.* of such a nature, as do not extract, but impress; or by purging off the old Juices, and substituting fresh ones, as in Seasonable Evacuations, Attenuating Diets, *&c.*

The same Author adds these three Axioms: That the Prolongation of *Life* is to be expected rather from some stated Diets, than either from any ordinary Regimen, or any extraordinary Medicines; more from operating on the Spirits, and mollifying of the Parts, than from the Manners of feeding: and this mollifying of the Parts without, be performed by Consubstantials, Imprints, and Occludents. See *Longævity*.

LIGAMENT, a Term in Anatomy. In its general Signification, *Ligament* is any thing that ties or binds one Part to another, in which Sense the Antients used the Word for Membranes, Skin, Flesh, Veins, and Arteries, as being common *Ligaments*. But in its more proper Signification, *Ligament* is a white, tough, solid inflexible Body, inclosing and keeping together the Jonctures of the Body. It has no conspicuous Cavities, nor has it any Sense; lest it should suffer on the moving of the Bones, and is very different according to the different Parts where it is found. It is harder than a Membrane, yet softer than a Cartilage; its principal Use is to gird and strengthen the Jonctures, to prevent the Dislocation of the Bones, and even to fasten them together when they have no Articulation. It also serves as a Covering to the Tendons, to separate them from the Muscles, and to hold up the suspended Entrails, lest their Weight should throw them down; such are the *Ligaments* of the Liver, the Bladder, and Matrix. They are of different Substances, some hard, others soft, membranous, nervous, and cartilaginous, as also of different Figures and Situations: Some arise from Bones, others from Cartilages, and others from Membranes. The *Ligament* is the most Terrestrial of all the Parts of the Body after the Bone and Cartilage, being cold, dry, hard, and insensible like them.

In particular, the several *Ligaments* of the Body are the cartilaginous *Ligaments*, which bind the four Bones of the Metacarpus with the Carpus. The *Ligaments* of the Spine are very strong, being fitted to the Articulations of the Vertebræ, to prevent their Luxations in violent Motions. They are of two kinds, the one thick and fibrous, in form of a Crescent, which bind them both at top and bottom; and the others membranous, serving to fasten them the more securely. The *Ligaments* of the Liver are two in Number, the first, which is the chief, called *Ligamentum Suspensorium*, holds it suspended to the Diaphragm, penetrating into the Substance of the Liver, to hold it the more firmly; the latter is larger, but more lax, it comes from the external Coat of the Liver, and is fastened to the Cartilage Xiphoides. Some add a third, which is formed out of the Umbilical Vessels, which in Adults dry up and become a *Ligament*. There are two *Ligaments* belonging to the Tongue, one that fastens it by its Root to the *Os Hyoides*, and another larger, inserted into the middle and inferior Part; this last is called, *The Bridle of the Tongue*. There are also *Ligaments* belonging to the Spleen. The *Penis* has a strong *Ligament*, call'd *Suspensorium Penis*, from its Office in holding up the *Penis* to the *Ossa Pubis*; it arises from the Foreparts of those Bones, and is fastened to the upper Part of the *Corpora Cavernosa Penis*; it has another *Ligament*, which fastens the Prepuce to the Glans. The *Uterus* has four *Ligaments*, two of them called broad, and two round from their Figure; the broad *Ligaments* are membranous, and arise from the *Processus* of the *Peritonæum*, and are fastened to the lateral Parts of the *Fundus* or Bottom of the *Uterus*, and serve to prevent the *Fundus* from falling down upon the Neck, as it sometimes happens when these *Ligaments* are too much relaxed. The round *Ligaments* arise from the Sides of the Womb, at the place where the *Tubæ Fallopianæ* are joined to it. At their first Rise they are broad, but, by degrees, as they recede farther from the Womb, grow round and smooth; and as the spermatic Vessels do in Men, pass betwixt the Duplicature of the *Peritonæum*, and so out of the *Abdomen* thro' the *Foramina* of the oblique and transverse Muscles of the *Abdomen*, and running obliquely on the *Os Pubis*, terminate under the Fat near the *Clitoris*. By the Passages of these *Ligaments*, Women, and Girls especially, are exposed to inguinal Ruptures, as Men are by the Passages of the spermatic Vessels. The Substance of the broad *Ligaments* is membranous, loose, and soft, whence some have compared them to the Wings of a Batt, and called them *Alæ Vespertilionum*. The round *Ligaments* are of a firmer Texture, and consist of a double Membrane, wrapping up in it Veins, Arteries, Nerves, and Lymphæducts, and both these and the former have been sometimes taken for Muscles. By these *Ligaments* the *Uterus* is kept so tight, that no Violence of internal Flatus or Humours can raise it above its Place.

LIGAMENTUM ANNULARE. See *Wrist*.

LIGAMENTUM CILIARE. See *Ciliare Ligamentum*.

LIGAMENTUM LATUM, and ROTUNDUM. See *Generation, Parts of, proper to Women*.

LIGATURE, in Chirurgery, a Bandage or Fillet of Cloth or Linnen, serving to bind the Arm, and facilitate the Operation of bleeding. *Ligature* is also the Art and Manner of disposing and applying Bandages for the closing of Wounds, and performing many of the Operations of Chirurgery. There are various kinds of *Ligatures*. Some Authors reckon them upwards of five hundred.

Ligature, among the mystic Divines, signifies a total Suspension of the superior Faculties or intellectual Powers of the Soul. They pretend that when the Soul is arrived at a perfect Contemplation, she remains deprived of all her Operations, and ceases to act, in order to be more ready and prepared to receive the Impulse and Communications of Divine Grace. This passive State of these contemplative People they call their *Ligature*.

Ligature is also used to signify a kind of Bandage or Fillet, tied round the Neck, Arm, Leg, or other Part of the Bodies of Men or Beasts, to divert or drive off some Disease, Accident, *&c.*

Kempfer tells us of an uncommon kind of *Ligature* in use among the People of *Macassar*, *Java*, *Malaja*, *Siam*, &c. By this Charm, or Spell, a Man binds up a Woman, and a Woman a Man, so as to put it out of their power to have to do with any other Person; the Man being thereby rendered impotent to any other Woman, and all other Men impotent to the Woman. Some of their Philosophers pretend, that this *Ligature* may be effected by the shutting of a Lock, the drawing of a Knot, the sticking of a Knife in the Wall at the Point of Time wherein the Priest is joining a Couple together, and that a *Ligature* thus effected may be dissolved by the Spouse's urining through a Ring. This Piece of Superstition is said to obtain also amongst the Christians of the *East*. The same Author tells us, that during the Ceremony of Marriage in *Russia*, he observed an old Fellow lurking behind the Church-Door, and mumbling over a Heap of Words, and at the same time cutting a long Rod which he held under his Arm into pieces; which, it seems, is a common Practice at the Marriages of great Persons, and done with Design to elude and counterwork any other Person that might possibly be inducing the *Ligature*.

The Secret of inducing a *Ligature* is delivered by the ſame Author, as he was taught it on the Spot by one of their Adepts; which being a Curioſity, we ſhall not ſcruple to add: *Puella Amaſium, vel Conjux matritum Ligaturus, abſterget a Concubitus Actu, Priapum, Induſio——ut Seminis quantum poteſt excipiet. Hoc probe convolutum ſub limine Domus ſuæ in Terram ſepeliat. Ibi quamdiu ſepultum reliquerit, tamdiu ejus haſta in nullius præterquam ſui (faſcinantis) Servitium obediet, & prius ab hoc Nexu non liberabitur quam ex clauſtro liminis liberetur ipſum linteum. Vice verſa, Vir Lecti Sociam Ligaturus, menſtruatum ab eo linteum comburito; ex cineribus cum propria Urina ſubactis, efformato Figuram Priapi, vel ſi Cineres Icunculæ fingendæ non ſufficiant eoſdem ſubigito cum Parte Terræ quam recens perminxerit. Formatam Iconem cauté exſiccato, ſiccamque aſſervato Loco ſicco, ne Humorem contrahat. Quamdiu ſic ſervaverit, omnes Arcus dum ad Scopum Sociæ collimaverint, momento contabeſcent: Ipſe vero Dominus——Abrunum hunc ſuum prius humectato, quamdiu ſic manebit, tamdiu ſuſpenſo nexu Priapus ipſi parebit, quin & alios quotquot Fœmina properantes admiſerit.*

M. *Marſhal* mentions another Form of *Ligature* which he received from a Bramine at *Indoſtan*: 'If, *ſays he*, 'the little Worm in the Wood *Lukerara Kara* be cut in- 'to two, and the one Part ſtirs, and the other not; if the 'ſtirring Part be bruiſed and given with half a Beetle to 'a Man, and the other half to a Woman, the Charm will 'keep each from ever having to do with any other Per- 'ſon.' *Philoſophical Tranſactions, Numb.* 268.

Ligatures, among Printers, are Types conſiſting of two Letters, or Characters which ſerve to connect two Letters together, as *ff*, *ſt*, *fi*. The old Editions of the *Greek* Authors are extremely full of *Ligatures*; the *Ligatures* of *Stephens* are by much the moſt beautiful. Some Editions have been lately printed without any *Ligatures* at all, and there was a Deſign to explode them quite out of Printing. Had this ſucceeded, the fineſt antient Editions would in time have grown uſeleſs, and the reading of old Manuſcripts have been rendered almoſt impracticable to the Learned themſelves.

LIGHT, a Term uſed in various Senſes: Sometimes it ſignifies that Senſation occaſioned in the Mind by the View of luminous Bodies; ſometimes that Property in thoſe Bodies, whereby they are fitted to excite thoſe Senſations in us; and, laſtly, ſome mean by it a certain Action of the luminous Body on the Medium, between that and the Eye, by means whereof they ſuppoſe the one to act on the other, and this they call *ſecundary*, or *derived Light*, to diſtinguiſh it from that of luminous Bodies, which is called *primary*, or *innate*.

Ariſtotle explains the Nature of *Light*, by ſuppoſing ſome Bodies to be tranſparent, as Air, Water, Ice, &c. but ſince in the Night-time we don't ſee any thing thro' thoſe Bodies, he ſays, they are only tranſparent potentially; whereas in the Day they become really and actually tranſparent: and ſince 'tis *Light* alone that can reduce that Power into Act, he defines *Light* to be the Act of the tranſparent Body conſidered as ſuch; Φῶς δὲ ἐστιν ἡ τοῦτο ἐνεργειᾳ τοῦ διαφανοῦς ἢ διαφανές. He adds, that *Light* is not Fire, nor is it any thing bodily radiating from the luminous Body, and tranſmitted thro the tranſparent one; but the mere Preſence of Fire, or ſome other luminous Body at the tranſparent one. This is *Ariſtotle*'s Doctrine of *Light*, which his Followers miſtaking, have foiſted on him another, very different; making *Light* and Colours to be Qualities of the luminous and colour'd Bodies themſelves, and in all reſpects like thoſe Senſations which they occaſion in us: adding, that Lucid or Colour'd could not produce any Senſations in us, unleſs they had ſomething ſimilar in themſelves, ſince *nihil dat quod in ſe non habet*. But the Sophiſm is apparent; for we find that a Needle in pricking the Fleſh gives us Pain, which no body ever imagined to exiſt in the Needle. But that 'tis not neceſſary there ſhould be any Similitude between the Quality of the Object, and the Senſation it produces, appears ſtill more evident from a Glaſs Priſm, which is found to exhibite Blue, Yellow, Red, and other Colours extremely vivid, and yet no body will ſay there is any thing in the Glaſs Priſm like thoſe Senſations.

The *Carteſians* have refined conſiderably on this Notion of *Light*, and own, that *Light*, as it exiſts in the luminous Body, is nothing elſe but a Power or Faculty of exciting in us a very clear and vivid Senſation; adding, that what is required to the Perception of Light, is, that we be ſo formed as to be capable of ſuch Senſations, that in the hidden Pores of tranſparent Bodies there be a certain ſubtile Matter, which by reaſon of its exceeding Smallneſs may penetrate even Glaſs, and yet be ſtrong enough to ſhake certain Capillaments at the bottom of the Eye; and, laſtly, that this Matter be impelled by the luminous Body, ſo as to move the Organ of Sight. Primary *Light* therefore, they ſay, conſiſts in a certain Motion of the Particles of the luminous Body, whereby they are enabled to propel every way the *Materia Subtilis* lodged in the Pores of tranſparent Bodies, and ſecundary or derived *Light* in a *Conatus* to Motion, or an Inclination of that Matter to recede from the Centre of the luminous Body in right Lines.

Father *Malebranch* explains the Nature of *Light*, from a ſuppoſed Analogy between it and Sound; the latter, 'tis allowed, is produced by the ſhaking or Vibrations of the inſenſible Parts of the ſonorous Body, which Vibrations, if they be greater or leſs, that is, if they run through greater or leſs Arches of the ſame Circle, are ſtill performed in the ſame time, and the Sounds produced by them only differ in a greater or leſs Degree of Strength; but if there be a greater Number of Vibrations, in the ſame time, in one ſonorous Body than in another, theſe being cloſer, become of a different kind: and thus their Sounds alſo differ, forming what we call different Tones or Notes; the quick Vibrations forming the acute, and the ſlower the grave Notes. Thus he ſuppoſes it to be with *Light* and Colours. All the Parts of a luminous Body are in a very rapid Motion, which, by very quick Shakes, is conſtantly compreſſing the ſubtle Matter between the luminous Body and the Eye, and excites Vibrations of Preſſion. As theſe Vibrations are more great, the Body appears more luminous; as they are more quick or more ſlow, the Body is of this or that Colour.

This Hypotheſis, how ingenious ſoever, is now deſervedly diſcarded, ſince the great Diſcoveries made by Sir *Iſaac Newton* on this wonderful Phænomenon. The *primary Light* they talk of, we now know conſiſts wholly in a certain Motion of the Particles of the lucid Body, whereby they don't propel any fictitious Matter ſuppoſed to be lodged in the hidden Pores of tranſparent Bodies, but throw off, from the luminous Body, certain very ſmall Particles, which are emitted every way with great force: And the *ſecundary* or *derived Light* conſiſts, not in a *Conatus*, but a real Motion of theſe Particles receding every way from the luminous Body in right Lines, and with an incredible Velocity. For if *Light* conſiſted in a mere Preſſure or Pulſe, it would be propagated to all Diſtances in the ſame Inſtant of Time; the contrary of which appears from the Phænomena of the Eclipſes of *Jupiter*'s Satellites, whoſe Immerſions, as the Earth approaches towards *Jupiter*, are found to anticipate ſomewhat on the true time, and to commence ſooner; and again as the Earth retires from *Jupiter*, their Emerſions, which alone in that Caſe can be obſerved, happen later and later, loſe time: deviating thus, very conſiderably on either ſide, from the true time marked by the Tables. This was firſt obſerved by M. *Romer*, and ſince by other Aſtronomers; the Reaſon of which is not owing to any Eccentricity, but does apparently follow from this, that the *Light* of the Sun reflected from the Satellites has further to travel, e'er it reaches the Eye, in the one Caſe than in the other, by a Space equal to the Diameter of the Earth's annual Orbit. *Light* therefore, like other real Bodies, does not move inſtantaneouſly, but in Time. Sir *Iſaac Newton* has ſhewn paſt contradiction, that the *Light* of the Sun is near ſeven Minutes in its Paſſage to the Earth, which is the Space of 50,000,000 Miles; a Velocity 10,000,000 Times greater than that wherewith a Ball flies out of the Mouth of a Cannon.

Further, if *Light* were not a Body, but conſiſted in a mere Preſſure or Pulſion, it would never be propagated in right Lines, but would be continually inflected *ad Umbram*. Thus Sir *Iſaac Newton*, 'A Preſſure on a fluid 'Medium (*i. e.* a Motion propagated by ſuch a Medium) 'beyond any Obſtacle which impedes any Part of its Mo- 'tion, cannot be propagated in right Lines, but will be 'always inflecting and diffuſing itſelf every way to 'the quieſcent Medium beyond that Obſtacle. The 'Power of Gravity tends downwards, but the Preſſure of 'Water riſing from it tends every way with an equable 'Force, and is propagated with equal Eaſe and equal 'Strength in Curves as in ſtreight Lines. Waves, on the 'Surface of the Water, gliding by the Extremes of a- 'ny very large Obſtacle, inflect and dilate themſelves, 'ſtill diffuſing gradually into the quieſcent Water be- 'yond that Obſtacle. The Waves, Pulſes, or Vibrations 'of the Air, wherein Sounds conſiſt, are manifeſtly in- 'flected, tho' not ſo conſiderably as the Waves of Wa- 'ter, and Sounds are propagated with equal Eaſe thro' 'crooked Tubes, and thro' ſtreight Lines; but *Light* was 'never known to move in any Curve, nor to inflect itſelf 'ad *Umbram*.' The Rays of *Light* therefore are ſmall Corpuſcles, emitted with exceeding Celerity from the luminous Body. As to the Force wherewith theſe Corpuſcles are emitted, ſo as to enable them to move at the inconceivable Rate of 7,000,000 Miles in a Minute, hear the ſame great Author: 'Among Bodies of the ſame

'Kind

'Kind and Virtue, by how much any one is ſmaller, by 'ſo much is its attractive Power greater, in proportion 'to its Bulk. This Power we find ſtronger in ſmall 'Magnets than in large ones, regard being had to the 'Difference of their Weights; and the Reaſon is, that 'the Particles of ſmall Magnets being nearer each other, 'more eaſily unite their Forces intimately together, and 'act conjointly. For the ſame Reaſon the Rays of '*Light*, being of all other Bodies the moſt minute, it 'may be expected that their attractive Powers ſhould be 'of all others the ſtrongeſt. And how ſtrong in effect 'they are, may be gathered from the following Rules: 'The Attraction of a Ray of *Light*, according to the 'Quantity of its Matter, is to the Gravity which any pro-'jected Body has, according likewiſe to the Quantity of 'its Matter, in a Ratio compounded of the Velocity of 'the Ray of *Light*, to the Velocity of that projected 'Body, and of the Bending or Curvature of the Line, 'which the Ray deſcribes in the Place of Refraction, to 'the Bending or Curvature deſcribed by that projected 'Body; provided, however, the Inclination of the Ray 'to the refracting Surface be the ſame with that of the 'projected Body to the Horizon. From which Propor-'tion I gather, that the Attraction of the Rays of *Light* is 'above 1,000,000,000,000,000 times greater than the Gra-'vity of Bodies on the Surface of the Earth, in pro-'portion to the Quantity of Matter in each, if the *Light* 'paſs from the Sun to the Earth in the Space of ſeven 'Minutes. But now as in Algebra, where affirmative 'Quantities ceaſe, there negative ones begin; ſo in Me-'chanics, where Attraction ceaſes, there the repelling 'Power muſt ſucceed: Therefore a Ray of *Light*, as 'ſoon as it is caſt off from the luminous Body by the vi-'brating Motion of its Parts, and is got out of the 'Sphere of its Attraction, is propelled with an immenſe 'Velocity.' See *Attraction* and *Repulſion*.

The wonderful Diviſibility of the Parts of Matter is no where more apparent than in the Minuteneſs of the Particles of *Light*. Dr. *Niewentiit* has computed, that an Inch of Candle, when converted to *Light*, becomes divided into 269617040 Parts. The Expanſion or Extenſion of any Portion of *Light* is inconceivable; Dr. *Hook* ſhews 'tis as unlimited as the Univerſe; proving it from the immenſe Diſtance of ſome of the fixed Stars, the *Light* whereof becomes ſenſible to the Eye by means of a Teleſcope; nor, adds he, is it only the great Bodies of the Sun or Stars that are thus able to diſperſe their *Light* thro' the vaſt Expanſum of the Univerſe; but the ſmalleſt Spark of a lucid Body muſt do the ſame, even the ſmalleſt Globule ſtruck from a Steel by a Flint.

Dr. *s' Graaveſand* affirms a lucid Body to be that, which emits or gives Fire a Motion in right Lines; and makes the Difference between *Light* and Heat to conſiſt in this, That to produce the former, the fiery Particles muſt enter the Eye in a rectilinear Motion, which is not required in the latter: On the contrary, an irregular Motion ſeems more proper for it, as appears from the Rays coming directly from the Sun to the Top of the Mountain, which have not near that Effect with thoſe in the Valley, agitated with an irregular Motion by ſeveral Reflections. Whether or no there be always *Light* where there is Fire, is diſputed among Authors, as alſo whether or no there be any luminous Body without Heat; Heat being a Motion that may be infinitely diminiſhed, and *Light* a Matter that may be infinitely rare; to which we may add, that no Heat is ſenſible to us, unleſs it be more intenſe than that of our Organs of Senſe.

Sir *Iſaac Newton* obſerves, that Bodies and *Light* act mutually on one another; Bodies on *Light*, in emitting, reflecting, refracting, and inflecting it; and *Light* on Bodies, by heating them, and putting their Parts into a vibrating Motion, wherein Heat principally conſiſts. For all fix'd Bodies, he obſerves, when heated beyond a certain Degree, do emit *Light*, and ſhine; which Shining, *&c.* appears to be owing to the vibrating Motion of the Parts; and all Bodies abounding in earthy and ſulphureous Particles, if ſufficiently agitated, emit *Light*, which way ſoever that Agitation be effected. Thus Sea-Water ſhines in a Storm, Quick-ſilver when ſhaken *in Vacuo*, Cats or Horſes when rubb'd in the dark; and Wood, Fiſh, and Fleſh when putrefied.

The late Mr. *Hawksbee* has furniſh'd us with a great Variety of Inſtances of the artificial Production of *Light* on the Attrition of Bodies naturally not luminous; as of Amber rubb'd on Woollen Cloth *in vacuo*, of Glaſs on Woollen, of Glaſs on Glaſs, of Oyſter-Shells on Woollen, and of Woollen on Woollen, all *in vacuo*. On the ſeveral Experiments whereof, he makes the following Reflections: That different ſorts of Bodies afford remarkably different kinds of *Light*, different both in Colour and in Force; That the Effects of an Attrition are various, according to the different Preparations and Managements of the Bodies that are to endure it; and that Bodies which have yielded a particular *Light*, may be brought by Friction to yield no more of that *Light*.

M. *Bernoulli* found by Experiment that Mercury amalgamated with Tin, and rubb'd on Glaſs, produced a conſiderable *Light* in the Air; that Gold rubb'd on Glaſs did it ſtill in a greater degree: but that of all others the moſt exquiſite *Light* was that produced by the Attrition of a Diamond; being equally vivid with that of a burning Coal briskly agitated with the Bellows.

Mr. *Boyle* tells us of a piece of ſhining rotten Wood, which upon exhauſting the Air from it was extinguiſh'd; but upon its Re-admiſſion, ſeemed to come to life again, and ſhone as before: being no doubt a real Flame, and like other Flames not to be preſerved without Air. See *Phoſphorus*.

That the Particles of Light are attracted by thoſe of other Bodies, is evident from innumerable Experiments. This Phænomenon was firſt obſerved by Sir *I. Newton*, who found by repeated Tryals, that the Rays of *Light* in their paſſage near the Edges of Bodies, whether opake or tranſparent, as Pieces of Metals, the Edges of Knives, broken Glaſſes, *&c.* are diverted out of the right Lines, and always inflected or bent towards thoſe Bodies. This Action of Bodies on *Light* is found to exert itſelf at a ſenſible Diſtance, tho it always increaſes as the Diſtance is diminiſh'd; as appears very ſenſibly in the paſſage of a Ray between the Edges of two thin Planes at different Apertures, in which there is ſomething very peculiar, the Attraction of one Edge being increaſed as the other is brought nearer it. The Rays of *Light* in their paſſage out of Glaſs into a *Vacuum* are not only inflected towards the Glaſs, but if they fall too obliquely, will revert back again to the Glaſs, and be totally reflected. The Cauſe of which Reflection cannot be attributed to any Reſiſtance of the *Vacuum*, but muſt be entirely owing to ſome Force or Power in the Glaſs, which attracts or draws back the Rays as they were paſſing into the *Vacuum*. And this appears farther from hence, that if you wet the poſterior Surface of the Glaſs with Water, Oil, Honey, or a Solution of Quickſilver, then the Rays which would otherwiſe have been reflected will paſs into and through that Liquor: which ſhews that the Rays are not reflected till they come to that poſterior Surface of the Glaſs, nor even till they begin to go out of it; for if at their going out they fall into any of the foreſaid Mediums, they will not then be reflected, but perſiſt in their former Courſe, the Attraction of the Glaſs being in this Caſe counter-balanced by that of the Liquor.

From this mutual Attraction between the Particles of *Light* and other Bodies, ariſes two other grand Phænomena, which we call the *Reflexion* and *Refraction* of *Light*.

We know that the Determination of a Body in Motion is chang'd by the Interpoſition of another Body in its way. Thus *Light* impinging on the Surface of ſolid Bodies, ſhould be turn'd out of its courſe, and beaten back or reflected, ſo as like other falling Bodies to make the Angle of its Reflexion equal to that of Incidence. This 'tis found by experience *Light* does, and yet the Cauſe of this Effect is different from that juſt now aſſign'd: the Rays of *Light* are not reflected by ſtriking on the very Parts of the reflecting Bodies, but by ſome Power equably diffuſed throughout the whole Surface of the Body, whereby it acts on the *Light*, either attracting or repelling it without Contact: by which ſame Power, in other Circumſtances the Rays are refracted; and by which alſo, the Rays are firſt emitted from the luminous Body; as is abundantly proved, by great variety of Arguments, by Sir *I. Newton*. See *Reflexion*.

That great Author puts it paſt doubt, that all thoſe Rays which are reflected, tho they approach the Body infinitely near, yet never touch it; and that thoſe which do really ſtrike on the ſolid Parts of Bodies, adhere to 'em, and are as it were extinguiſh'd and loſt. If it be ask'd, how it happens, ſince we aſcribe the Reflexion of the Rays to the Action of the whole Surface of the Body without Contact; how, I ſay, it happens that all the Rays are not reflected from every Surface, but while ſome are reflected, others paſs through and are refracted: The Anſwer given by Sir *I. Newton* is as follows——Every Ray of *Light* in its paſſage thro any refracting Subſtance, is put into a certain tranſient Conſtitution or State, which in the progreſs of the Ray returns at equal Intervals, and diſpoſes the Ray at every Return to be eaſily tranſmitted thro the next refracting Surface, and between the Returns to be eaſily reflected by it: which Alternation of Reflexion and Tranſmiſſion appears to be propagated from every Surface and to all Diſtances. What kind of Action or Diſpoſition this is, and whether it conſiſt in a circulating or vibrating Motion of the Ray or the Medium, or ſomewhat elſe, he does not inquire; but allows thoſe who are fond of Hypotheſes to ſuppoſe that the Rays

of

of *Light*, by impinging on any reflecting or refracting Surface, excite Vibrations in the reflecting or refracting Medium, and by that means agitate the ſolid Parts of the Body. Theſe Vibrations, thus propagated in the Medium, move faſter than the Rays, ſo as to overtake them; and when any Ray is in that part of the Vibration which conſpires with its Motion, its Velocity is increaſed, ſo that it eaſily breaks thro a refracting Surface: but when it is in a contrary part of the Vibration, which impedes its Motion, it is eaſily reflected, and conſequently that every Ray is ſucceſſively diſpoſed to be eaſily reflected or tranſmitted by every Vibration which overtakes it. The Return of which Diſpoſition of any Ray to be reflected, he calls *Fits of eaſy Reflexion*; and thoſe of its Diſpoſition to be tranſmitted, he calls *Fits of eaſy Tranſmiſſion*; and the Space between the Returns, the *Interval of the Fit*. The Reaſon then why the Surface of all thick tranſparent Bodies reflect part of the *Light* incident on 'em, and refract the reſt, is, that ſome Rays at their Incidence are in Fits of eaſy Reflexion, and others of eaſy Tranſmiſſion. For the Properties and Laws of reflected *Light*, ſee *Reflexion* and *Mirrour*.

Further, a Ray of *Light* paſſing out of one Medium into another of different Denſity, and in its paſſage making an oblique Angle with the Surface that ſeparates the Mediums, will be refracted or turn'd out of its right Line; by reaſon the Rays are more ſtrongly attracted by a denſer than a rarer Medium.

That theſe Rays are not refracted by ſtriking on the ſolid Parts of Bodies, but without any Contact, by that ſame force wherewith they are emitted and reflected, exerting itſelf differently in different Circumſtances, is proved in great meaſure by the ſame Arguments which demonſtrate Reflexion to be perform'd without Contact. For the Properties, &c. of refracted *Light*, ſee *Refraction*, *Lens*, &c. In Iſland Chryſtal is obſerved a kind of double Refraction, very different from what we find in any other Body: the Rays that fall obliquely being not only diſperſed, with a double Refraction in one and the ſame Surface, but even the perpendicular Rays themſelves are moſt of 'em divided into two Beams by means of the ſame double Refraction; which Beams are of the ſame Colour with the incident Beams, and are equal in degree of *Light*, at leaſt nearly, to each other: Whence the great Philoſopher, ſo often cited, takes occaſion to ſuſpect that there are in *Light* ſome other original Properties beſides thoſe hitherto deſcribed; and particularly, that the Rays have different Sides endued with ſeveral original Properties. For of theſe Refractions, the one is performed in the uſual manner, *i. e.* the Sine of Incidence is to that of Refraction as 5 is to 3; and the other in an unuſual manner: and yet the ſame Ray is refracted ſometimes in the one manner, and ſometimes in the other, according to the various Poſitions which its ſeveral Sides have, in reſpect of the Chryſtal. Theſe Diſpoſitions, he ſhews, muſt have exiſted originally in the Beams, without having undergone any Alterations in that reſpect, by the Chryſtal. Every Ray of *Light* therefore has two oppoſite Sides, the one originally endued with a Property whereon its unuſual Refraction depends, and the other not endued with that Property.

Sir *I. Newton* having obſerved the vividly colour'd Image projected on the Wall of a darken'd Room, by the Sun-Beams tranſmitted thro a Priſm, to be five times as long as broad; ſetting himſelf to inquire into the Reaſon of this Diſproportion, was led from other Experiments to the *Experimentum Crucis*; whence he diſcovered the Cauſe of the Phænomenon to be, that ſome of the Rays of *Light* were more refracted than others, and therefore exhibited ſeveral Images of the Sun under the appearance of one, extended lengthwiſe. Thence he proceeded to conclude, that *Light* itſelf is an heterogeneous Mixture of Rays differently refrangible. Hence he diſtinguiſhes *Light* into two kinds, *viz.* that whoſe Rays are equally refrangible, which he calls Homogeneal, Similar or Uniform *Light*; and that whoſe Rays are unequally refrangible, which he calls Heterogeneal *Light*.

There are but three Affections of *Light*, wherein he obſerved its Rays to differ, *viz.* Refrangibility, Reflexibility, and Colour; and thoſe Rays which agree in Refrangibility, agree alſo in the other two: whence they may be well defined Homogeneal, tho in ſome other reſpects they may poſſibly be Heterogeneal. Again, the Colours exhibited by Homogeneal *Light*, he calls Homogeneal Colours; and thoſe produced by Heterogeneal *Light*, Heterogeneal Colours. Theſe Definitions laid down, he advances ſeveral Propoſitions.

As 1*ſt*, That the Sun's *Light* conſiſts of Rays differing by indefinite Degrees of Refrangibility. 2*dly*, That Rays which differ in Refrangibility, when parted from one another, do proportionably differ in the Colours which they exhibit. 3*dly*, That there are as many ſimple and homogeneal Colours, as Degrees of Refrangibility, for to every Degree of Refrangibility belongs a different Colour. 4*thly*, Whiteneſs in all reſpects like that of the Sun's immediate *Light*, and of the uſual Objects of our Senſes, cannot be compounded of ſimple Colours, without an indefinite Variety of them; for to ſuch a Compoſition there are required Rays endued with all the indefinite Degrees of Refrangibility, which infer as many ſimple Colours. 5*thly*, The Rays of *Light* do not act on one another in paſſing thro the ſame Medium. 6*thly*, The Rays of *Light* do not ſuffer any Alteration of their Qualities from Refraction, nor from the adjacent quieſcent Medium. 7*thly*, There can no Homogeneal Colours be produced out of *Light* by Refraction, which are not commix'd in it before; ſince Refraction, as was before obſerv'd, changes not the Qualities of the Rays, but only ſeparates thoſe which have divers Qualities by means of their different Refrangibility. 8*thly*, The Sun's *Light* is an Aggregate of Homogeneal Colours; whence Homogeneal Colours may be call'd Primitive or Original.

We have already obſerved that the Rays of *Light* are compoſed of diſſimilar or heterogeneous Parts; ſome of them being in all probability greater, others leſs. Now the ſmaller the Parts are, by ſo much the more refrangible they are, *i. e.* they are ſo much the more eaſily diverted out of their rectilinear Courſe; and thoſe Parts which differ in Refrangibility, (*i. e.* in Bulk) we have alſo obſerved differ in Colour. Hence ariſes the whole Theory of Colours. Thoſe Parts, *v. g.* which are the moſt refrangible, conſtitute Violet Colour; that is, the moſt minute Particles of *Light* when ſeparately impelled on the Organ, do there excite the ſhorteſt Vibrations in the Retina, which are thence communicated by the ſolid Parts of the Optic Nerve into the Brain, and excite in us the Senſation of Violet Colour, the dimmeſt and moſt languid of all other Colours: And thoſe Particles, on the contrary, which are the leaſt refrangible, conſtitute a Ray of a Red Colour; *i. e.* the greateſt Particles of *Light* excite the longeſt Vibrations in the Retina, and ſo convey the Senſation of a Red Colour, as being the moſt bright and vivid of all others. The other Particles being diſtinguiſhed into little Rays, according to their reſpective Magnitudes and Degrees of Refrangibility, excite intermediate Vibrations, and ſo occaſion the Senſations of the intermediate Colours; in like manner as the Vibrations of the Air, according to their different Magnitudes, excite the Senſations of different Sounds. The Colours then of theſe little Rays not being any adventitious Modifications of them, but connate, primitive, and neceſſary Properties, reſulting, in all probability, from their different Magnitudes, muſt be perpetual and immutable, not to be altered by any Reflexion, Refraction, or other ſubſequent Modification. See *the Doctrine of Colours, laid down under* Colour. For the Manner in which *Light* affects our Senſes, and how it contributes to Viſion, ſee *Viſion*.

LIGHT is alſo uſed to ſignify the Diſpoſition of Objects with regard to the receiving of *Light*; thus we ſay, a Painting is ſeen in its proper *Light*, when its Situation, with regard to the *Light*, is the ſame with that for which it was painted.

LIGHTS ABOARD SHIPS. See *Signals*.

LIGHTS, in Architecture, are underſtood of the Openings of Gates and Windows, and other Places thro' which the Air and *Light* have a Paſſage. In the Pantheon all the *Light* comes from on high; it has no *Lights* but in the Dome.

LIGHTS, in Painting, are thoſe Parts of a Piece that are illumined, or that lie open to the Luminary, by which the Piece is ſuppoſed to be enlightened; and that for this reaſon are painted in bright vivid Colours: in which ſenſe *Light* is oppoſed to Shadow. *Light* is alſo uſed for the luminous Body that emits it. There are various kinds of *Lights*; general *Lights*, as the Air; particular *Lights*, as a Fire, a Candle, and even the Sun. Different *Lights* have very different Effects on the Piece, and occaſion a Difference in the Management of every Part. A great deal therefore depends on the Painters chuſing a proper *Light* for his Piece to be illumined by, and a great deal more in the Conduct of the *Lights* and Shadows when the Luminary is pitched upon. The Strength and Relievo of a Figure, as well as its Gracefulneſs, depends entirely on the Management of the *Lights*, and the joining of thoſe to the Shadows. The *Light* a Figure receives, is either direct or reflected, to each of which ſpecial Regard muſt be had. The Doctrine of *Lights* and Shadows makes that Part of Painting, called *Clair-obſcure*, which ſee.

LIGHT-HORSE, an antient Term in our *Engliſh* Cuſtoms, ſignifying an ordinary Cavalier or Horſeman lightly armed, and ſo as to enter a Body or Regiment; in oppoſition to the others, who were heavily accoutred, and armed at all Points.

LIGHTER,

LIGHTER, a ſmall floating Veſſel. *Lighters* are of ſeveral kinds; as,

A Ballaſt Gin, A cloſe *Lighter*, A Kiele,
A Camel, A Huy, An open *Lighter*.

LIGHTNESS, ſee *Levity*.

LIGNUM ALOES, or *Wood of Aloes*; ſee *Aloes*. *Lignum Caſſiæ*, ſee *Caſſia*. *Lignum Balſami*, ſee *Balſam*.

LIKE QUANTITIES, in Algebra, are ſuch as are expreſſed by the ſame Letters, equally repeated in each Quantity. Thus $2b$, and $3b$, and $9ff$, and $3ff$ are *like Quantities*; but $2b$, and $3bb$, and $9ff$, and $3fff$ are unlike ones, becauſe the *Quantities* have not every where the ſame Dimenſions, nor are the Letters equally repeated. *Like Signs* in Algebra are when both are Affirmative, or both Negative; but if one be Affirmative, and the other Negative, they are unlike Signs. Thus $+64d$, and $+5d$, have like Signs; but $9f$, and $-7f$ have unlike Signs. *Like Figures* in Geometry are ſuch as have their Angles equal, and the Sides about theſe equal Angles proportional. *Like Arcs* in the Projection of the Sphere *in Plano* are Parts of leſſer Circles, containing an equal Number of Degrees with the correſponding Arcs of greater ones. *Like ſolid Figures* in Geometry, are ſuch as are contained under like Planes, equal in Number.

LIMB, the outermoſt Border or graduated Edge of a Quadrant, or the like Mathematical Inſtrument; or the Circumference of the Primitive Circle in any Projection of the Sphere *in Plano*. Aſtronomers obſerve the lower and the upper *Limb* of the Sun, in order to find its true Height, which is that of his Center.

Limb alſo ſignifies the outermoſt Border or Edge of the Sun or Moon, when the Middle or Disk is hid in an Eclipſe of either Luminary.

Limb is alſo uſed among Botaniſts for the outer Edge or Border or Plants, their Leaves, and Flowers.

LIMB, or LIMBUS, is alſo a Term in the *Romiſh* Theology, uſed for that Place where the Patriarchs are ſuppoſed to have waited for the Redemption of Mankind, and where they imagine our Saviour continued from the time of his Death to that of his Reſurrection. *Du Cange* ſays, the Fathers called this Place *Limbus, eo quod ſit Limbus Inferorum*. The word *Limbus* is alſo uſed by the Catholics for the Place deſtined to receive the Souls of Infants who die without Baptiſm; who have not deſerved Hell, as dying in Innocence, nor yet are worthy of Heaven, becauſe of the Imputation of Original Sin.

LIME, Calcined Stone, Marble, Free-ſtone, Chalk, or other Matter burnt by a large Fire in a Kiln or Furnace built expreſs; to be afterwards uſed in the Compoſition of Mortar, for building; the Fire taking away all its Humidity, and opening its Pores, ſo that it becomes eaſily reducible to Powder. Quick *Lime* or Unſlack'd *Lime* is that which comes out of the Furnace; Slack'd *Lime* is that waſh'd or ſteep'd in Water, and reſerv'd for the making of Mortar. The beſt *Lime* is that made of the hardeſt and firmeſt Stones, and which is ſlack'd at its coming out of the Furnace. Sir *H. Wotton* looks on it as a great Error in the *Engliſh* to make *Lime* as they do, of Refuſe, and Stuff without any Choice; whereas the *Italians*, at this day, and much more the Antients, burnt their firmeſt Stones, and even Fragments of Marble where it was plentiful; which in time became almoſt Marble again for its hardneſs, as appears in their ſtanding Theatres, &c.

We have two kinds of *Lime* in common uſe in *England*; the one made of Stone, and the other of Chalk; whereof the former is much the ſtrongeſt. That made of ſoft Stone or Chalk is fitteſt for plaiſtering of Ceilings and Walls within doors; and that made of hard Stones, for Buildings and for plaiſtering without doors. Good *Lime* may alſo be made of Mill-ſtone, not coarſe and ſandy, but fine and greaſy; as alſo of all kinds of Flints; tho 'tis hard to burn 'em, unleſs in a Reverberatory Furnace, as being apt to run to Glaſs.

Dieuſſant recommends *Lime* made of Sea-ſhells as the beſt, but *Goldman* finds fault with it, as being impatient of Moiſture, and therefore eaſily peeling off from the Outſides of Walls: It is, however, the common *Lime* uſed in the *Indies*.

Before the Stones be thrown into the Kiln, they are to be broke in pieces; otherwiſe the Air contain'd in their Cavities, too much expanded by the Heat, makes 'em fly with ſo much violence as to damage the Kiln. According to *Alberti* and *Palladio*, *Lime* will not be ſufficiently burnt in leſs than ſixty Hours intenſe Heat.

The Marks of a well-burnt *Lime*, according to *Alberti*, are, that its Weight is to that of the Stone in a ſeſquialterate Proportion; that it is white, light, and ſonorous; that when ſlaked it ſticks to the Sides of the Veſſel: To which *Boeckler* adds, that when ſlaked it ſends forth a copious thick Smoak; and *Dieuſſant*, that it needs a great deal of Water to ſlake it.

To preſerve *Lime* ſeveral Years, ſlake and work it up; dig a Pit under ground, into which let it paſs thro a hole open at the bottom of the Veſſel. As ſoon as the Pit is full, cover it up with Sand, to prevent its drying; thus keeping it moiſt till it be uſed. *Boeckler* gives another Method: Cover a Stratum of *Lime* two or three foot high with another of Sand of the like height; pour on Water enough to ſlake the *Lime*, but not to reduce it to duſt after ſlaking. If the Sand cleave into Chinks, as the Smoak aſcends, cover 'em up, ſo as no Vent may be given thereto. This *Lime*, he adds, kept ten or twelve Years, will be like Glue; and will, further, be of particular Uſe in painting Walls, as being no way prejudicial to the Colours. See *Mortar*.

Lime is much uſed by Tanners, Skinners, &c. in the Preparation of their Leather.

Lime, or *Calx*, in Chymiſtry, is a kind of fine Powder, or Aſhes remaining of Metals or Minerals, that have been a long time in a violent Fire. See *Calx*.

Lime is of ſome medicinal Uſe, being applied externally in Deſiccative and Conſumptive Medicines. Its Water is ſaid to be an excellent Medicine, taken internally. M. *Burlet* has written an ample Account of its Effects in the *French Memoirs*, in good meaſure from his own Experience. But he obſerves it ſucceeded much better in *Holland*, &c. than in *France*. It is a powerful Alterant, and like a pure Alkaline Water, fitted to blunt and deſtroy acid Ferments, which are the Principles of all Obſtructions, and the Cauſe of moſt Chronic Diſeaſes. Its principal Uſe is in a Cachexy, Green-ſickneſs, Dropſy, Scurvy, Obſtructions of the Liver, Spleen, &c. It is made by pouring ſix Pounds of hot Water on one of Quick-Lime, leaving them to ſoak and macerate for the ſpace of 24 hours.

LIME-STONE, is a Stone of a whitiſh Colour, which being burnt in a Kiln, enters the Compoſition of Mortar, Plaiſter, &c. which ſee.

LIMITATION OF ASSIZE, in Law, is a certain Time ſet down by the Statute, wherein a Man muſt alledge himſelf or his Anceſtors to have been ſeiz'd of Lands ſued for by Writ of Aſſize.

LIMITED PROBLEM, ſignifies a Problem that has but one only Solution, or which can be done only one way; as to make a Circle paſs through three Points given, not lying in a Right Line, to deſcribe an equilateral Triangle on a Line given, &c.

LIMITS of a Planet, its greateſt Excurſion or Diſtance from the Ecliptic.

LIMNING, the Art of Painting in Water-Colours; in contradiſtinction to Painting properly ſo called, which is done in Oil-Colours.

Limning is much the more Antient Kind of Painting: Till a *Flemiſh* Painter, one *John van Eyck*, better known by the Name of *John* of *Bruges*, found out the Art of Painting in Oil, the Painters all painted in Water and in Freſco alone, both on their Walls, on Wooden Boards, and elſewhere. When they made uſe of Boards, they uſually glued a fine Linnen Cloth over 'em, to prevent their opening; then laid on a Ground of White; laſtly, they mix'd up their Colours with Water and Size, or with Water and Yolks of Eggs, well beaten with the Branches of a Fig-Tree, the Juice whereof thus mix'd with the Eggs; and with this Mixture they painted their Pieces.

In *Limning* all the Colours are proper enough, excepting the White made of Lime, which is only uſed in Freſco. But the Azure and Ultramarine muſt always be mix'd up with Size, or with Gum, in regard the Yolks of Eggs give yellow Colours a greeniſh Tincture. But there are always applied two Lays of hot Size e'er the Colours, mix'd even with Size, are laid on: the Compoſition made with Eggs, and the Juice of the Fig-tree, being only uſed for touching up and finiſhing, and to prevent the Neceſſity of having a Fire always at hand to keep the Size hot; yet 'tis certain, that the Size-Colours hold the beſt, and are accordingly always uſed in Cartoons, &c. This Size is made of Shreds of thin Leather, or of Parchment.

To *limn* on Linnen, they chuſe that which is old, half worn, and cloſe. This they ſtamp with White Lead, or with a fine Plaiſter beaten up with Size; which once dry, they go over it with a Lay of the ſame Size.

The Colours are all ground in Water, each by itſelf; and in proportion as they are required in working, are diluted with Size-Water. If the Yolks of Eggs are deſired, they dilute 'em with Water made of equal Quantities of common Water and Vinegar, with the Yolk, White and Shell of an Egg, and the Ends of the little Branches of a Fig-tree cut ſmall, all well beaten together in an Earthen Pan.

If 'tis deſired to varniſh the Piece when finiſh'd, they go over it with the White of an Egg well beaten, and then with Varniſh. This, however, is only to preſerve it from the Wet: for the great Advantage of *Limning* conſiſts in its being free from any Luſtre; in regard all its Colours thus void of Luſtre may be ſeen in all kinds of Lights; which Colours in Oil, or cover'd with Varniſh, can't.

LINCTUS, a Form of Medicine the ſame as *Lambative*, and probably from the ſame Derivation; or from *Lingua* the Tongue, as being to be licked up with the Tongue. See *Eclegma*.

LINE, a ſmall *French* Meaſure, conſiſting of the 12th part of an Inch, or 144th part of a Foot. The Geometricians, notwithſtanding its Smallneſs, conceive it divided into ſix Points.

LINE, in Genealogy, is a Series or Succeſſion of Relations in various Degrees, all deſcending from the ſame common Father. *Direct Line* is that which goes from Father to Son, which is the Order of Aſcendants and Deſcendants. *Collateral Line* is the Order of thoſe who deſcend from ſome common Father related to the former, but out of the *Line* of Aſcendants and Deſcendants. In this are placed Uncles, Aunts, Couſins, Nephews, &c.

LINE, in Geometry, is a Quantity extended in Length only, without either Breadth or Thickneſs, and is formed by the Motion of a Point. There are two kinds of *Lines*, *viz.* Right *Lines* and Curve *Lines*. Thus if the Point A move towards B, (*Fig.* 1. *Plat. Geometry*) by its Motion it deſcribes a *Line*; and this, if the Point go the neareſt way towards B, will be a Right or Streight *Line*, whoſe Definition therefore will be the neareſt or ſhorteſt Diſtance between any two Points, or a *Line* all whoſe Points tend the ſame way. If the Point go any way about, as in any of the *Lines* A C B, A *c* B, it will trace out either a crooked *Line*, as the upper A *c* B; or elſe two or more ſtreight ones, as in the lower A C B.

Lines conſidered as to their Poſitions, are either *Parallel*, *Perpendicular*, or *Oblique*; the Conſtruction and Properties whereof, ſee under *Parallel*, *Perpendicular*, &c.

Euclid in his ſecond Book treats moſtly of *Lines*, and of the Effects of their being divided, and again multiplied into one another; the Subſtance of his Doctrine may be thus demonſtrated Algebraically. (1.) If there be two *Lines* z and x; one of which, as z, is divided into any number of Parts, as into $a+e+i+o$, the Rectangle under the two whole *Lines* $z\,x$ is equal to the Sum of all the Rectangles made by x multiplied into the Parts of z.

Z | a | e | i | o |
X |

that is, $z\,x = x\,a + x\,e + x\,i + x\,o$. This is ſo plain, it needs no proof. (2.) If a Right *Line*, as z, be divided into two Parts $a+e$, the Rectangles made by the whole *Line*, and both its Parts, are equal to the Square of the whole *Line*: That is, $z\,a + z\,e = z\,z$. For $z\,a = a\,a + a\,e$; and $z\,e = a\,e + e\,e$; therefore $z\,z = a\,a + z\,a + e\,e$. (3.) Let the *Line* z be cut into $a+e$; then ſhall the Rectangle under the whole *Line* (Z) and the Part (a) be equal to the Square of that Part a, together with the Rectangle made by the two Parts a and e; that is, $Z\,a = a\,a + a\,e$. Z a | e | For $Z = a+e$. And $a+e \times a = a\,a + a\,e$. (4.) The Square of any *Line*, as Z, divided into any two Parts, a and e, is equal to both the Squares of thoſe Parts, together with the Rectangles made out of thoſe Parts, that is, $Z\,z = a\,a + 2\,a\,e + e\,e$. Z a | e | Multiply $a+e$ by itſelf, and the Thing is plain.

$$\begin{array}{r} a+e \\ a+e \\ \hline a\,a+e\,e \\ +a\,e+e\,e \\ \hline a\,a+2\,a\,e+e\,e. \end{array}$$

Hence it is plain, that the Square of any *Line* is equal to four times the Square of its Half. For ſuppoſe Z to be biſected, then each Part will be a; and multiplying $a+a$ by itſelf, the thing will plainly appear.

Z a | a |

$$\begin{array}{r} a+a \\ a+a \\ \hline a\,a+a\,a+a\,a+a\,a = 4\,a\,a. \end{array}$$

(5.) If a *Line* be divided into two Parts equally, and into two other Parts unequally, the Rectangle under the unequal Parts, together with the Square of the intermediate Part, will be equal to the Square of half that *Line*. Let the whole *Line* be $2\,a$, then each Part will be a. Let the leſſer unequal Part be e, then the greater unequal Part will be $2\,a - e$; which multiplied by e, produces $2\,a\,e - e\,e$: To which adding the Square of the Difference or intermediate Part $a - e$, which is $a\,a - 2\,a\,e + e\,e$, the Sum will be only $a\,a$, the Square of half the *Line*. (6.) If a *Line* be biſected, and then another Right *Line* be added to it, the Rectangle or Product of the whole augmented *Line* multiplied by the Part added, together with the Square of the half *Line*, will be equal to the Square of the half *Line*, and Part added, as one *Line*.

Z a | a | .....

Let the firſt *Line* be $2\,a$, and the Part added e, then the whole will be $2\,a+e$, which multiplied by e, produceth $2\,a\,e + e\,e$; and the Square of half the *Line* $a\,a$ being added to it, it will be $2\,a\,e + e\,e + a\,a$, which is equal to the Square of $a+e$. (7.) If a Quantity or *Line* be divided any how into two Parts, the Square of the Whole added to the Square of one of the Parts, ſhall be equal to two Rectangles contained under the whole *Line*, and that part, added to the Square of the other Part.

Z a | e |

Let a be one Part, and e the other; the Square of the Whole, and of the leſſer Part e makes $a\,a + 2\,a\,e + 2\,e\,e$. then if the Whole $a+e$ be multiplied by twice e, it will produce $2\,a\,e + 2\,e\,e$; and if to this be added the Square of the other Part $a\,a$, the Sum will be $a\,a + 2\,a\,e + 2\,e\,e$, equal to the former. (8.) If a *Line* be cut any how into two Parts, the Rectangle under the whole *Line* and one of the Parts taken four times, and added to the Square of the other Part, is equal to the Square of the Whole, and the other Part added to it, as if it were but one *Line*.

Z a | e |

Let the whole *Line* be $a+e$, then four times that multiplied by e (or the Quadruple Rectangle under that and e) will be $4\,a\,e + 4\,e\,e$; to which adding the Square of the other Part $a\,a$, the Sum will be $a\,a + 4\,a\,e + 4\,e\,e$. And if you ſquare $a+2\,e$, which expreſſeth the whole *Line* with e added to it, the Product will be the former Sum of $a\,a + a\,4\,a\,e + 4\,e\,e$. (9.) If a *Line* be biſected, and alſo cut into two other unequal Parts, the Sum of the Squares of the unequal Parts will be double the Sum of the Squares of the half *Line*, and of the Difference between the two unequal Parts. Let the whole *Line* be $2\,a$, and the Difference between the equal and unequal Parts b; then the greater unequal Part will be $a+b$, and the leſſer $a - b$: The Sum of the Squares of the unequal Parts will be $2\,a\,a + 2\,b\,b$, which is double to the Square of half the *Line* added to the Square of the Difference. (10.) If a *Line* be biſected, and then another *Line* added to it; the Square of the whole increaſed *Line*, together with the Square of the Part added, is double the Sum of the Squares of the half *Line*, and of the half *Line* and Part added, taken as one *Line*.

Z a | a | e |

Let the whole *Line* be $2\,a$, and the Part added e; then the whole increaſed *Line* will be $2\,a+e$, and the half *Line* and Part added will be $a+e$; the Sum of the Squares of $2\,a+e$, and of e, is $4\,a\,a + 4\,a\,e + 2\,e\,e$; which is plainly double to $a\,a$, and $a\,a + 2\,a\,e - e\,e$ added together.

LINE, in Geography and Aſtronomy, is uſed by way of Eminence for the Equator or Equinoctial *Line*, which, in the Heavens, is a Circle deſcribed by the Sun in his Courſe on the 21ſt Day of *March*, and the 21ſt of *September*. On the Earth 'tis an imaginary Circle, anſwering to that in the Heavens. It divides the Earth from *Eaſt* to *Weſt* into two equal Parts, and is at an equal Diſtance from the two Poles; ſo that thoſe who live under the *Line*, have the Poles always in their Horizon. The Latitudes commence from the *Line*. The Seamen uſe to duck their Paſſengers the firſt time they cut the *Line*.

LINE, in the Art of War, is underſtood of the Diſpoſition of an Army ranged in Order of Battel. An Army uſually conſiſts of three *Lines*; the firſt is the Front, Van, or Advance Guard; the Main Body forms the ſecond, in which is the General's Poſt; the third is a Reſerved Body or Rear-Guard. 'Tis a Rule to leave 150 Paces diſtance between the firſt *Line* and the ſecond, and twice as much between the ſecond and third, to give room for rallying.

Line is alſo underſtood of the Diſpoſition of a Fleet on the Day of Engagement; on which occaſion the Veſſels are always drawn up in one *Line*: A Ship of the *Line*, is a Veſſel large enough to be drawn up in the *Line*, and to have place in a Sea-Fight.

LINE of *Demarcation*, or *Alexandrian Line*, is a Meridian paſſing over the Mouth of the River *Maragnon*, and by the Capes of *Hoamas* and *Malabrigo*. 'Tis ſo call'd from Pope *Alexander* VI. who to end the Diſputes between the Crowns of *Caſtile* and *Portugal*, about their Boundaries in 1493, drew an imaginary *Line* on the Globe, which was to terminate the Pretenſions of each. By which Partition the *Eaſt-Indies* fell to the Lot of the *Portugueſe*, and the *Weſt-Indies*, then newly diſcovered, to the *Caſtilians*.

LINE of *Direction*, in Mechanics, is that, according to which a Body endeavours to move. The Term is alſo uſed to ſignify the *Line* that paſſes thro' the Center of Gravity of the heavy Body to the Center of the Earth; which muſt alſo paſs thro' the *Fulcrum* or Support of the heavy Body; without which it would fall.

LINE, in Fencing, is that directly oppoſite to the Enemy, wherein the Shoulders, the right Arm, and the Sword ought always to be found; and wherein are alſo to be placed the two Feet at the diſtance of 18 Inches from each other. In this ſenſe a Man is ſaid to be in his *Line*, to go out of his *Line*, &c.

LINE, in Fortification, is ſometimes taken for a Ditch bordered with its Parapet, and ſometimes for a Row of Gabions, or Sacks of Earth, extended in Length on the Ground, to ſerve as a Shelter againſt the Enemies Fire. Thus they ſay, when the Trenches were carried on within thirty Paces of the Glacis, they drew two *Lines*, one on the Right, and the other on the Left, for a Place of Arms. *Line* fundamental is the firſt *Line* drawn for the Plan of a Place, and which ſhews its Area. *Line Capital* is that which is drawn from the Angle of the Gorge to the Angle of the Baſtion. *Line Cogritel* is that which is drawn from the Angle of the Center to that of the Baſtion. *Line of Defence*, is that which repreſents the Courſe of the Bullet of any ſort of Fire-Arms, more eſpecially of a Muſquet-Ball, according to the Situation which it ought to have to defend the Face of the Baſtion. *Line of Defence Fixed*, or *Fichant*, is that which is drawn from the Angle of the Curtain to the flank'd Angle of the oppoſite Baſtions, but yet without touching the Face of the Baſtion. This muſt never exceed 800 Feet, which they reckon the Diſtance at which a Muſquet-Ball will do Execution. *Line of Defence Razant*, is that which being drawn from a certain Point of its Curtain, razeth the Face of the oppoſite Baſtion; this is alſo called the *Line of Defence, Stringent*, or *Flanking*. *Line of Approach*, or *Attack*, ſignifies the Work which the Beſiegers carry on under Covert, to gain the Moat, and the Body of the Place. *Line of Circumvallation*, is a *Line* or Trench cut by the Beſiegers within Cannon-Shot of the Place, which rangeth round their Camp, and ſecures its Quarters againſt the Relief of the Beſieged. *Line of Contravallation* is a Ditch bordered with a Parapet, which ſerves to cover the Beſiegers on the Side of the Place, and to ſtop the Sallies of the Gariſon. *Lines of Communication* are thoſe which run from one Work to another; but the *Line of Communication*, more eſpecially ſo call'd, is a continued Trench, with which a Circumvallation, or Contravallation, is ſurrounded, and which maintains a Communication with all its Forts, Redoubts, and Tenailles. *Line of the Baſe* is a right *Line*, which joins the Points of the two neareſt Baſtions. To *line* a Work, is to ſtrengthen a Rampart with a firm Wall, or to encompaſs a Parapet or Moat with good Turf, &c.

LINE *Geometrical*, in Perſpective, is a right *Line* drawn in any manner on the Geometrical Plane. *Line Terreſtrial*, or *Horizontal*, in Perſpective, is a right *Line*, wherein the Geometrical Plane and that of the Picture or Draught interſect one another. *Line of the Front*, in Perſpective, is any right *Line* parallel to the *Terreſtrial Line*. *Line Vertical* in Perſpective, is the common Section of the Vertical and of the Draught. *Line Viſual* is the *Line* or Ray imagined to paſs from the Object to the Eye. *Line of Station* in Perſpective, according to ſome Writers, is the common Section of the Vertical and Geometrical Planes; others mean by it the perpendicular Height of the Eye above the Geometrical Plane; others a *Line* drawn on that Plane, and perpendicular to the *Line*, expreſſing the Height of the Eye. *Line Objective*, in Perſpective, is the *Line* of an Object, from whence the Appearance is ſought for in the Draught or Picture.

LINE of *Gravitation* of an heavy Body, is a *Line* drawn thro' its Centre of Gravity, and according to which it tends downwards.

LINE, *Horizontal*, in Dialling, is the common Section of the Horizon, and the Dial-Plane. *Line Horary*, or the *Hour-Lines*, are the common Interſections of the Hour-Circles of the Sphere, with the Plane of the Dial. *Line Subſtylar*, is that *Line* on which the Style or Cock of the Dial is erected, and is the Repreſentation of ſuch an Hour-Circle as is perpendicular to the Plane of that Dial. *Line Equinoctial*, in Dialling, is the common Interſection of the Equinoctial, and the Plane of the Dial.

LINE *of Meaſures*; ſo Mr. *Oughtred* calls the Diameter of the Primitive Circle in the Projection of the Sphere *in Plano*, or that *Line* in which the Diameter of any Circle to be projected falls. In the Stereographick Projection of the Sphere *in Plano*, it is that *Line* in which the Plane of a great Circle perpendicular to the Plane of the Projection, and that oblique Circle, which is to be projected, interſects the Plane of the Projection; or it is the common Section of a Plane, paſſing thro' the Eye-Point, and the Centre of the Primitive; and at right Angles to any oblique Circle which is to be projected, and in which the Centre and Pole of ſuch Circle will be found.

LINE *of the ſwifteſt Deſcent* of an heavy Body, is that Curve which a Body would deſcribe in its Deſcent, if it moved the ſwifteſt poſſible.

LINE of the *Apſides*, in Aſtronomy, is the *Line* which joins the *Apſides*, or the greater Axis of the Orbit of a Planet. See *Apſides*.

LINE FIDUCIAL. See *Fiducial Line*.

HORIZONTAL LINE, a *Line* Parallel to the Horizon. See *Horizon*.

MERIDIAN LINE. See *Meridian*.

LINE of the Nodes, in Aſtronomy, is the *Line* which joins the Nodes of the Orbit of a Planet, or the common Section of the Plane of the Orbit with the Plane of the Ecliptic. See *Nodes*.

LINE of a Projectile. See *Projectile*.

LINES *on the Plain Scale*, are the *Line* of Chords, *Line* of Sines, *Line* of Tangents, *Line* of Secants, *Line* of Semi-Tangents, *Line* of Longitude. The Conſtruction and Application whereof, ſee under the word *Plain Scale*.

LINES *on* Gunter's *Scale*, are, the *Line* of Numbers, *Line* of Artificial Sines, *Line* of Artificial Tangents, *Line* of Artificial Verſed Sines, *Line* of Artificial Sines of Rhumbs, *Line* of Artificial Tangents of the Meridian *Line*, and *Line* of equal Parts. The Conſtruction and Application whereof, ſee under the Word *Gunter's Scale*.

LINES *of the Sector*, are, the *Line* of equal Parts, or *Line* of *Lines*, *Line* of Chords, *Line* of Sines, *Line* of Tangents, *Line* of Secants, *Line* of Polygons, *Line* of Numbers, *Line* of Hours, *Line* of Latitudes, *Line* of Meridians, *Line* of Metals, *Line* of Solids, *Line* of Planes. The Conſtruction and Uſe whereof, ſee under the word *Sector*.

LINES Converging. See *Converging Lines*.

LINES Diverging. See *Diverging Lines*.

LINES Proportional, the Manner of conſtructing them, their Properties, &c. See *Proportional Lines*.

LINES Reciprocal. See *Reciprocal*.

LINEA ALBA, in Anatomy, is the Concourſe of the Tendons of the oblique and tranſverſe Muſcles, dividing the Abdomen in two, in the middle It is called *Linea*, *Line*, as being ſtrait, and *Alba* from its Colour, which is white. It receives a Twig of a Nerve from the Intercoſtals in each of its Digitations or Indentings, which are viſible to the Eye, in lean Perſons eſpecially.

LINEAMENT, a fine Stroke or Line obſerved in the Face, and forming the Delicacy thereof; being that which preſerves the Reſemblance, and occaſions the Relation of Likeneſs or Unlikeneſs to any other Face. 'Tis by theſe that the Phyſiognomiſts pretend to judge of the Temper and Manners of People. The word *Lineament* is uſed by the Painters for the Out-Line of a Face.

LINEAR PROBLEM, in Mathematicks, is ſuch an one as may be ſolved Geometrically by the Interſection of two right Lines; as to meaſure an inacceſſible Height by the means of two unequal Sticks, &c. This is alſo called a *Simple Problem*, and is capable but of one Solution. *Linear* Numbers are ſuch as have Relation to Length only, as ſuch as repreſent one Side of a Plane Figure; if the Plane Figure be a Square, the *Linear* Number is called a Root.

LINE-SEED, a Grain, that has ſeveral uſeful Properties. It enters the Compoſition of ſeveral Medicines, and yields, by Expreſſion, an Oil that has moſt of the Qualities of Nut-Oil, and is accordingly ſometimes uſed in lieu thereof in Painting, and to burn. That drawn without the Aſſiſtance of Fire, is of much Eſteem in Medicine, and ſuppoſed good in the Cure of ſeveral Diſeaſes.

LINGOT, or INGOT, a Bar or Piece of Gold, Silver, &c. from the Mines, melted down, but not coined or wrought.

Lingot, is alſo a Term in Chymiſtry, for the Molds they make to caſt melted Metals, or the Regulus of Antimony, &c. into.

LINGUA, the Tongue, in Anatomy, an oblong Member, whoſe Form and Situation are ſufficiently known, and whoſe Uſe is to be the Organ of Taſte, and the principal Inſtrument of Speech and Deglutition. It is faſtened to the *Os Hyoides*, the *Larynx*, and to the *Fauces*, by means of a membranous Ligament running along the lower Side of it, about half way, called the *Frænum*. See *Os Hyoides*, &c.

The main Bulk and Body of the Tongue is made up of Muſcles, which are covered on the upper Part with a papillar nervous Subſtance, over which are ſpread two Membranes. The outer of theſe Membranes is pretty thick and ſhort, and full of *Papillæ*, of a Pyramidal Figure, eſpecially towards the Tip; which *Papillæ* ſtand pointing towards the Root of the Tongue in a bending Poſture; which makes their Figure to be Concavo-convex.

Theſe *Apices* or *Papillæ* are ſo very minute and ſlender in Men, that they make the Coat appear on the upper Part to be villous; eſpecially as they approach nearer to the Root. The Figure of the *Papillæ*, in human Tongues, is not ſo plainly diſcernible to the naked Eye as not to need the Microſcope. In Brutes they are generally larger, ſtiffer, and more conſpicuous, and in ſome almoſt cartilaginous, as may be felt in the Tongues of Cats, Oxen, but more ſenſibly in Lions. On the upper ſide, at a little diſtance from the Tip, this Membrane becomes thin, ſmooth, and glabrous, and, as it were, poliſhed by the lower Parts of the Mouth whereon it ſlides.

Under this lies a thin ſoft reticular kind of Coat, punched through with innumerable Holes, and always lined with a thick and white yellowiſh Mucus. This Membrane is ſo exceeding tender, and full of Mucus, that it is not to be examined by the naked Eye unleſs boiled; by which it grows tough, and eaſily ſeparable from the external Membrane, and from the nervous Part of the Tongue which lies immediately under it. After boiling it appears like a kind of Gawſe, between whoſe Threads innumerable Holes appear, through which the Apices of the papillary Body underneath it are exerted. This Membrane on the upper Side, next the outward, appears white, with a Caſt towards yellow, but black on the Side next the Tongue.

Many Authors don't allow this to be a Membrane, and will only have it to be a Mucus hardened by boiling; but ſince it has ſo much of the Reſemblance of a Membrane, and that Authors agree in allowing two Membranes to the Tongue, Dr. *Drake* does not ſcruple to number it among them; ſince there does not appear to be any other ſecond Membrane: reckoning, with *Malpighi*, the ſmooth Part under the Tongue, a Part of the outer Membrane.

Immediately under this appears a nervous papillary Body ſpreading itſelf to a pretty Thickneſs over the whole Surface of the Tongue. This Body, on the under Side, is every where level and ſmooth, except in ſome few Places, where it is connected to the ſubjacent muſculous Part by ſome nervous Twigs which it ſends into it. *Malpighi* diſtinguiſhes the *Papillæ*, which make the principal Part hereof, into three kinds, from their different Magnitudes and Figures when obſerved with the Microſcope; of which, thoſe ſeated on the Sides and Tip are very ſingular, reſembling little round Pyramids, with Globes on their Tops like the Horns of Snails. All theſe *Papillæ*, which are the immediate Organs of Taſting, ſend their Apices, or Extremities, through the mucous Membrane, into the pyramidal *Papillæ* of the outward Membrane, which are hollow to receive them, and ſeem to be nothing elſe but a kind of Caſes to defend theſe nervous *Papillæ* from Injuries which the Salts and Aſperities of thoſe Bodies, which we take into our Mouths, might do them.

The reſt, and much the greateſt Part, of the Body of the Tongue is muſculous, conſiſting of Plans of Fibres in different Directions: The firſt, or external Plan, conſiſts of ſtrait Fibres, which cover the Tongue from one Extreme to the other; when theſe contract, they ſhorten it. Under this are ſeveral other Plans, running from the under to the upper Side, which ſerve to make it broad and thin. Theſe two kinds of Fibres lie *ſtratum ſuper ſtratum*, a Plate of the one, and then a Plate of the other. Authors are not agreed about the Number of Muſcles which compoſe the Tongue, ſome confounding thoſe of the *Os Hyoides* with thoſe of the Tongue, reckon eight, others nine, others ten, and more Pair. Some number thoſe proper to the Tongue alone ſix Pair, others five, others four, and ſome no more than three. Of this laſt Opinion is our accurate Mr. *Cowper*, who allows no more than three genuine Pair of Muſcles to the Tongue, *viz.* the Pair *Genioglo ſſum*, which pull the Tongue forwards, and put it out of the Mouth; the *Ceratoglo ſſum*, which draws it into the Mouth, or pulls it on one ſide; and the *Styloglo ſſum*, which draws the Tongue up in the Action of Deglutition. See *Genioglo ſſum*, &c. under their proper Heads.

Beſides the Muſcles, the Tongue is alſo moved by a Bone ſituated at its Root, and making as it were its Baſis, called *Os Hyoides*, which ſee.

Down the middle of the Tongue, lengthwiſe, runs a Seam, call'd *Linea Mediana*, which divides it to the bottom into two equal Parts, but not ſo effectually, but that the Blood-Veſſels of one Side communicate with thoſe of the other. Theſe Veſſels are Arteries from the Carotides and Veins called *Ranulæ*, and are very conſpicuous about the *Frænum* under the Tongue, ſerving to reconvey the Blood to the external Jugulars. Theſe Veins are frequently opened in the Angina, and are the laſt Reſort of old Women in this Caſe. The Nerves of the Tongue come from the fifth, ſixth, and ninth Pairs; the two firſt of which have been called *Guſtatorii*, and the latter *Motorii Linguæ*.

Howſoever neceſſary an Organ the Tongue be in Speech, &c. yet *Jac. Rolandus* has publiſhed an Account of a Mouth without a Tongue, which ſpake perfectly, and perform'd its other natural Functions; the Perſon he ſpeaks of is *Pet. Durand*, who loſing his Tongue by a Gangreen, could yet ſpeak perfectly, as alſo taſte, ſwallow, and chew his Food; which laſt, however, he could only do on that Side he put it into, being unable to turn it to the other Side of his Mouth.

LINIMENT, a Topical Remedy, ſerving to ſoften the Aſperities of the Skin, and to moiſten thoſe Parts that are to be ſoftened, for reſolving the Humours that afflict the Patient, and give him Pain. There are various kinds of *Liniments* uſed according to the various Occaſions. The *Liniment* is of a mean Conſiſtence, between an Oil and an Unguent. The word comes from the *Latin linire, to anoint gently.*

LINSTOCK, is a ſhort Staff of Wood, about three foot long, having at one end a Piece of Iron divided into two Branches, each of which hath a Notch to hold a Piece of Match, and a Screw to faſten it there; the other end of the Staff is alſo ſhod with Iron, and pointed, to ſtick into the Ground. It is uſed by the Gunners in firing Cannon.

LINTEL, in Architecture, the Piece of Timber that lies horizontally over Door-Poſts and Window-Jaums, as well to bear the Thickneſs of the Wall over it, as bind the Sides of the Walls together.

LINUM CATHARTICUM, Mountain-Flax; this is much uſed by common People. It is a rough harſh Purge, and powerfully deterges, and evacuates viſcid and watery Humours from the moſt remote Lodgments; which makes them fond of it in Rheumatiſms: but it is only fit for robuſt Conſtitutions

LINUM INCOMBUSTIBILE, a Mineral Subſtance, of a whitiſh Silver Colour, and a woolly Texture; conſiſting of ſmall Threads or Longitudinal Fibres, endued with the wonderful Property of reſiſting Fire, and remaining unconſumed in the intenſeſt Heat. This lanuginous Mineral is ſometimes called *Amianthus* and *Aſbeſtos*, which ſee; ſometimes *Salamandra*, or *Salamander's Wooll*, from the Candle-Wicks ſaid to be made antiently of it. From a pungent Quality, which *Agricola* ſays it has on the Tongue without Aſtringency, it is call'd *Alumen*, having the Epithet of *Plumeum* added to it, taken from its downy Filaments, to diſtinguiſh it from the other Alums. From its light grey Colour it is call'd *Polia* and *Corſoides*; and from its Likeneſs to the hoary Fibres of ſome ſorts of Mat-Weed, *Spartapolia*. From the Capacity it has of being ſpun into Thread, it is call'd *Linum*, with ſome diſtinguiſhing Epithet, taken either from its Quality, as *Linum Aſbeſtinum Vivum*, or *Incombuſtible*; or from the Place where it is found, as *Linum Foſſile*, *Linum Indicum*, *Creticum*, *Cypricum*, and *Carpaſium*, or *Caryſtium*. Beſides the Places whence it borrows Names, it is alſo found in *Tartary*, at *Namur* in the *Low Countries*, in *Thuringia*, among the Mines in the *Old Noricum* in *Egypt*, in the Mountains of *Arcadia*, at *Puteoli* in the Iſland of *Corſica*, in the Iſland of *Angleſey* in *Wales*, and in *Aberdeenſhire* in *Scotland*.

The Naturaliſts generally reckon it among the Stones, whence its Appellation of *Lapis Aſbeſtos*, &c. but Dr. *Plot* rather judges it a *Terra Lapidoſa*, or middle Subſtance, between Stone and Earth. As to its Generation, the ſame Author takes it to be a Mixture of ſome Salt, and a pure Earth without Sulphur, coagulated in the Winter, and hardened by the Heats in Summer. The Salt *J. Heſſus* ſays is a liquid Alum, of a milky Subſtance, inclining to yellow, that ſweats out of the Earth, and ſmells like rotten Cheeſe.

As to the Art of managing this Mineral, and of ſpinning and weaving it, &c. the Accounts we have are various. Signior *Caſtagnata*, Superintendant of ſome Mines in *Italy*, gives us the Art of reducing it either into a very white Skin, or a very white Paper, either of which reſiſts the moſt violent Fire.

Mr. *Lloyd* took ſome of that found in *Angleſey*, and pounding it in a Stone Mortar till it became a downy Subſtance, ſifted it thro a fine Searce; by which means the earthy Parts were ſeparated from it: the *Linum* remaining. He then brought it to a Paper-Mill, and putting it in Water, in a proper Veſſel, ſtirred it pretty much, ordering the Workmen to proceed on it in their uſual manner of making Paper, with their Writing-Paper Mold; only to ſtir it about conſtantly before putting their Mold in; conſidering it as a far more ponderous Subſtance than what they uſed, and conſequently, if not immediately taken up after it was agitated, it would ſubſide. The

Paper

Paper thus made of it proved coarſe, and apt to tear, but endured both Ink and Fire very well; the Ink only turning Red with the Violence of the Fire.

M. *Paulus Venetus* gives us the Manufacture of the *Linum* found in the Province of *Chinchinthelas* in *Tartary*, from one *Curſicar* a *Turk*, Superintendant of the Mines of that Country, as follows: The lanuginous Mineral, or Amianthus, being firſt dried in the Sun, is then pounded in a Braſs Mortar, and the earthy part ſeparated from the woolly, which is afterwards well waſhed from Filth; being thus purged, it is ſpun into Thread like other Wool, and after, wove into Cloth, which, if foul or ſpotted, they cleanſe, he ſays, by throwing it into the Fire for an hour's time, whence it comes out unhurt, as white as Snow: Which very Method, according to the Account given us by *Strabo*, ſeems to have been uſed in ordering the *Cretan* Amianthus; with this Addition, that after it was pounded, and the earthy Part ſeparated from the woolly, he ſays it was combed; and ſo does *Agricola*.

Signior *Campani*, after deſcribing four ſorts of the *Linum*, whereof he had Specimens in his *Muſæum*; the firſt ſent him from *Corfu*, the ſecond from *Seſtri di Ponente*, the third coarſer and darker than the reſt, and the fourth from the *Pyreneans*; and after obſerving, tho' he kept it three Weeks in a Glaſs-houſe Fire, yet found it unaltered, tho it would not preſerve a Stick wrapp'd in it from the Fire: he proceeds to ſhew the manner of ſpinning it, and making it into Cloth, which he effected thus: He firſt laid the Stone in Water, if warm the better, for ſome time to ſoak; then opened and divided it with his Hands, that the earthy parts might fall out of it, which are whitiſh like Chalk, and ſerve to bind the thready Part together. This makes the Water thick and milky. That Operation he repeated ſix or ſeven times with freſh Water, opening and ſqueezing it again and again, till all the heterogeneous Parts were waſhed out, and then the Flax-like Parts were collected and laid in a Sieve to dry. As to the ſpinning, he firſt ſhews a Method diſcovered to him, which is thus: Lay the Amianthus, cleanſed as before, between two Cards, ſuch as they card Wooll withall, where let it be gently carded, and then clapp'd in between the Cards, ſo that ſome of it may hang out of the ſides; then lay the Cards faſt on a Table or Bench; take a ſmall Reel made with a little Hook at the end, and a Part to turn it by, ſo that it may be eaſily turned round. This Reel muſt be wound over with fine Thread: then having a ſmall Veſſel of Oil ready, with which the Forefinger and Thumb are conſtantly to be kept wet, both to preſerve the Skin from the corroſive Quality of the Stone, and to render the Filaments thereof more ſoft and pliant; by continuing to twiſt about the Thread on the Reel in the Arbeſtos hanging out of the Caſes, ſome of the latter will be worked up together with it; and by little and little the Thread may, with Care, be woven into a coarſe ſort of Cloth; and by putting it into the Fire, the Thread and Oil will be burnt away, and the incombuſtible Cloth remain. But finding this way of uniting the Stone with the Thread very tedious, inſtead of the Thread he put ſome Flax on a Diſtaff, and by taking three or four Filaments of the Aſbeſtos, and mixing them with the Flax, he found they might be eaſily twiſted together, and the Thread thus made much more durable and ſtrong; ſo that there is no need of Carding, which rather breaks the Filaments than does any good: only open and ſeparate the Filaments after waſhing on a Table, and take them up with the Flax, which is ſufficient. As to the making of Paper, he ſays, in the waſhing of the Stone there will remain ſeveral ſhort Pieces in the bottom of the Water, of which Paper may be made in the common Method. He concludes with the beſt way of preſerving the Cloth, or any thing made of the Linnen, which, by reaſon of its exceſſive Dryneſs, is very apt to break and twiſt; and it conſiſts in keeping it always well oiled, which is the only Preſervative. When the Cloth is put in the Fire, the Oil burns off, and the Cloth comes out white and purified.

This kind of Linnen-Cloth was highly eſteemed by the Antients; tho' then better known and more common than among us, being held equally precious with the richeſt Pearls; nor is it now of mean Value even in the Country where 'tis moſt generally made, a *China* Cover, (*i. e.* a Piece of twenty-three Inches and three quarters long) being worth 80 Tale, *i. e.* 36 *l.* 13 *s.* 4 *d.* *Pliny* ſays, he himſelf had ſeen Napkins thereof, which being taken foul from the Board, after a Feaſt, were thrown into the Fire, and by that means were better ſcowered than if they had been waſhed in Water, &c. But its principal Uſe, according to *Pliny*, was for the making of Shrowds for Royal Funerals; to wrap up the Corps, ſo as the Aſhes might be preſerved diſtinct from that of the Wood, &c. which made the Funeral Pile; and the Princes of *Tartary*, according to the Accounts in the *Philoſophical Tranſactions*, ſtill uſe it at this day in burning their Dead. Some of the Antients are ſaid to have made themſelves Clothes of it, particularly the Brachmans among the *Indians*. The Wicks for their perpetual Lamps, according to Dr. *Liſter*, were made of it; and we are told that *Septalla* Canon of *Milan* had Thread, Ropes, Nets, and Paper of it. A Handkerchief or Pattern of this Linnen was preſented to the Royal Society, a foot long, and half a foot broad. This gave two Proofs of its reſiſting Fire; tho' in both Experiments it loſt above three Drams in its Weight. When taken out red-hot, it did not burn a Piece of white Paper, on which it was laid. Mr. *Villette* pretends, that his large burning Concave uſually vitrifies the Asbeſtos.

LIONCELES, in Heraldry, a Term for Lions, when there are more than two of them born in any Coat of Arms, and no Ordinary between them.

LIPOTHYMIA, or LIPOPSYCHIA, in Medicine, is a ſudden Diminution or Failure of animal and vital Actions, otherwiſe called a Swooning or Deliquium. In the *Lipothymia* the Pulſe is very faint, the Senſes both internal and external, and the animal Motions, both voluntary and natural, extremely weakened, and the Reſpiration ſcarce viſible. The ordinary Cauſes of the *Lipothymia* are great Loſſes of Blood, exceſſive Evacuations, immoderate Exerciſe, groſs hot Air, ſuch as that in the midſt of Crowds of People. The word *Lipothymia* comes from the *Greek* λειπω, *deficio*, and θύμος, *Animus*; and *Lypopſychia* from λειπω, and ψυχὴ, *the Soul*.

LIPPITUDO is a Diſorder of the Eyes, otherwiſe call'd *Blear-Eyedneſs*; conſiſting in the Oozing out of a thick viſcous Humour, which hardening, binds the Eye-lids together. Some, after *Celſus*, give the Name *Lippitudo* to the *Opthalmia*; which ſee.

LIPS, *Labia*, the Edge or exterior Part of the Mouth, or that muſculous Extremity which ſhuts and covers the Mouth both above and below. The *Lips*, beſides the common Integuments, conſiſt of two Parts, the exterior, hard, and muſculous; the interior, ſoft, ſpungy, and glandulous, covered with a fine Membrane, the fore and protuberant Parts of which are red, and called *Prolabia*. Authors generally content themſelves with calling the Subſtance of this Part ſpungy, but in reality 'tis glandulous, as appears by the ſcrophulous and cancrous Humours to which it is ſubject. The Muſcles of which the outer Parts of the *Lips* conſiſt, are either common to them with other Parts, or proper; the common are the third Pair of the Noſe, the Subcutaneus, and the Buccinator.

The *Lips* have ſix Pair of Muſcles belonging to them, and an odd one; of theſe, three are peculiar to the upper and under *Lip*, the other three and the ſingle one are common to both *Lips*: The peculiar are the *Attollens Labiorum Superius*, *Deprimens Labiorum Inferius*, *Attollens Labiorum Inferius*; the three common Pair are, the *Zygomaticus*, the *Depreſſor Labiorum*, the *Attollens Labiorum*; the odd one, *Orbicularis*, which ſee.

All theſe Parts are ſerved with Blood by ſome Branches of the Carotids, which the Veins carry back to the external Jugulars. Their Nerves come from the 5th, 6th, and 8th Pair of the Head, and ſome from the *Par Acceſſorium*. The *Lips* have a great ſhare in the Action of Speech, and are of good Uſe in taking in the Food, &c.

Lips are alſo uſed to ſignify the two Edges of a Wound, and the exterior Parts of a Woman's Privities.

LIQUEFACTION, an Operation, by which a ſolid Body is reduced into a Liquid; or the Action of Fire or Heat on fat fuſible Bodies, which puts their Parts into Motion. The *Liquefaction* of Wax, &c. is performed by a moderate Heat, that of *Sal Tartari* by the mere Moiſture of the Air. All Salts liquify. Sand, mix'd with Alkalies, are liquified in the Fire of the Reverberatory to make Glaſs. In ſpeaking of Metals, inſtead of *Liquefaction*, we ordinarily uſe the word *Fuſion*, which ſee.

LIQUID, a Body that has the Property of Fluidity; and beſides that, a peculiar Quality of wetting other Bodies immerged in it, ariſing from ſome Configurations of Particles, which diſpoſes them to adhere to the Surfaces of Bodies contiguous to them. See *Fluid*.

Liquid, among Grammarians, is a Name applied to certain Conſonants oppoſed to Mutes; L, M, N, and R are *Liquids*.

Liquid is ſometimes alſo uſed by the Civilians; thus Goods or Effects, that are clear and out of diſpute, are ſaid to be *liquid*.

LIQUIDATION, a Reduction and Aſcertainment either of ſome dubious diſputable Sum, or of the reſpective Pretenſions which two Perſons may have to the ſame liquid or clear Sum. *Liquidation* is alſo uſed for the Order and Method a Dealer endeavours to eſtabliſh in his

Affairs. *Liquid* Debts and Effects are ſuch as are not only really exiſting, but ſuch as there can be no Diſpute about.

LIQUORICE. See *Glycyrrhiza*.

LIST, or LISTEL, in Architecture, called alſo a *Cincture*, *Fillet*, and *Reglet*; a little ſquare Moulding, diſpos'd in certain Parts of Columns, ſerving to crown or accompany larger Mouldings, and to ſeparate the Flutings of Columns.

Liſt is alſo uſed to ſignify the incloſed Field, or Ground wherein the antient Knights held their Jouſts and Combats. It was ſo called, as being hemm'd round with Pales, Barriers, or Stakes: ſome of theſe were double, one for each Cavalier; which kept them apart, ſo that they cou'd not come nearer each other than a Spear's length. *Du Cange* derives the Word from *Liciæ*, which in the Age of corrupt Latin, was uſed for the Incloſures of Fields and Cities, as being antiently made with Cords inter-laced; or from *Liſtæ*, *quia Campum claudebant inſtar Liſtarum panni*.

Liſt, the Border of a Stuff, or that which bounds its Width on each Side. All Stuffs of Silk, Wool, or Cotton have *Liſts*. *Liſts* contribute to the Goodneſs of the Stuff, and further ſerve to ſhew their Quality; which has given occaſion to ſeveral Regulations relating to their Matter, Colour, Work, &c.

LISTENING, according to *Rohault*, conſiſts in the Extenſion or Bracing of the Tympanum of the Ear, and putting it into ſuch a Condition, as that it ſhall be the more affected by any tremulous Motion of the external Air. See *Tympanum*.

LITANY, an old Church-Term, ſignifying the Proceſſions, Prayers, and Supplications, uſed to appeaſe the Wrath of God, to avert his Judgments, or to procure his Mercies. Eccleſiaſtic Authors, and the *Roman* Order, by the Word *Litany* mean the People who compoſe the Proceſſion, and who aſſiſt at it. And *Du Cange* adds, that the Word antiently ſignified Proceſſion. *Simeon* of *Theſſalonica*, mentions, that in the antient *Litanies*, the People went out of the Church, to denote the Fall of *Adam*, and return'd into it again, to ſhew the Return of a pious Soul to God by Repentance. On occaſion of a Plague that ravaged *Rome* in the Year 590, Pope *Gregory* appointed a *Litany*, or Proceſſion, conſiſting of ſeven Bands, or Companies, who marching from the ſeveral Churches of the City, met at St. *Mary Major*. The firſt Company conſiſted of the Clergy; the ſecond of Abbots, with their Monks; the third of Abbeſſes, with their Nuns; the fourth, of Children; the fifth, of Laymen; the ſixth, of Widows; and the ſeventh, of married Women. And from this general Proceſſion, that of St. *Mark*, called the *Grand Litany*, is judged to have taken its Riſe.

Litany, among us, is a Form of Prayer ſung or ſaid in Churches, conſiſting of ſeveral Periods, or Articles; at the End of each whereof, is an Invocation in the ſame Terms. The Word comes from the *Greek* λιτανεία, *Supplication*. *Pezron* would go further, and derive the λίτ]ω, or λίωω of the *Greeks*, from the *Celtic Lit*, Feaſt, Solemnity.

LITHARGE; there are two Kinds of *Litharge*, the one natural, the other artificial. Natural *Litharge* is a Mineral ſometimes found in Lead Mines, reddiſh, ſcaly, brittle, and ſomewhat reſembling white Lead. This *Litharge* is ſo exceeding rare, that the Shops ſell none but the artificial.

Artificial Litharge is of two Kinds, *viz.* that of Gold, and that of Silver; or rather 'tis the ſame, with this difference, that the one having undergone a greater Degree of Fire than the other, has occaſioned different Colours, and thence different Names. Indeed Naturaliſts are not over-well agreed what the *Artificial Litharge* is: Some ſay 'tis a Metallic Scum rais'd on the Surface of Lead, when melted; after having ſerv'd to purify Gold, Silver, or Copper. Others ſay 'tis a Metallic Smoak ariſing from thoſe Metals mix'd with the Lead, uſed in purifying them; which ſticking to the Top of the Chimneys of Furnaces, is there form'd in a kind of Scales. Laſtly, others ſay 'tis the Lead itſelf uſed in the refining of thoſe Metals, and eſpecially Copper; which laſt Opinion appears the moſt credible; and the rather, on account of the great Quantities of theſe *Litharges* brought from *Poland*, *Sweden*, and *Denmark*; where Copper-Mines are much more frequent than thoſe of Gold and Silver.

Litharges are deſiccative, deterſive, and cooling; they make the Conſiſtence of ſeveral Plaiſters. The Potters uſe them to give a beautiful Gloſs to their Ware; and they are alſo uſed by Painters, Dyers, Skinners, and Glaziers. When mix'd with Wine, they give it a bright ſprightly Colour, but render it extreamly unwholeſome. The Word is compoſed of the *Greek* λίθ⊖ and ἀργυρ⊖ *Silver*.

LITHIASIS, in Phyſic, ſignifies the Formation of the Stone, or the Manner in which it grows in the Body. See *Stone*.

LITHOCOLLA, a Cement uſed by the Lapidaries to faſten their precious Stones, in order for cutting them. It is compoſed of Roſin and Brick-Duſt. For Diamonds they uſe melted Lead, putting them into it before it be quite cold. For other *Cements* they mix Marble-Duſt with ſtrong Glue; and to faſten their Sparks, add the White of an Egg and Pitch. The Word comes from the *Greek* λίθ⊖, *Stone*, and κολλα, *Glue*.

LITHONTHRIPTICS, are Medicines proper to diſſolve the Stone in the Bladder and Kidneys; of which Kind are the Lithoſpermum, Saxifrage, &c. The Word comes from the *Greek* λίθος, *Stone*, and τείβειν, to break or wear.

LITHOTOMY, an Operation in Chirurgery, performed upon a human Body in order to extract the Stone out of the Bladder. This is performed three ſeveral Ways, *viz.* by the ſmall *Apparatus*, the great *Apparatus*, and the high *Apparatus*. The firſt is by cutting thro' the *Perinæum* near the Suture, on the left Side, after the Stone, by the Fingers of the Operator, has been brought to that Part. This is called cutting upon the Gripe; but 'tis almoſt diſuſed, by reaſon it ſubjects the Patient to great Hazard and Inconveniences.

In the great *Apparatus*, which is that ordinarily practiſed, after the Patient is conveniently placed and bound, the Operator introduces a proper Inſtrument thro' the urinary Paſſage into the Bladder, in order to ſearch for the Stone; which being found, that Inſtrument is withdrawn, and another grooved one introduced the ſame way; which bulging in the *Perinæum*, ſerves to direct the Knife to the Neck of the Bladder. After the Inciſion, a third Inſtrument is thruſt into the Aperture, till it join the former, that was laſt introduced thro' the urinary Paſſage, at which time that is withdrawn, whilſt this remains to guide the Forceps directly into the Bladder, to bring away the Stone. This way is called cutting upon the Staff.

The third Method, called alſo the High Operation, has been long ſince deſcribed, and ſtrenuouſly pleaded for by a Chirurgical Writer, *Roſſet*; but the Practice is of a late Date among us, and was firſt attempted by Mr. *Douglas*. Whether, upon the whole, this Method is preferable to the larger *Apparatus*, remains a Queſtion. Tho' the great Succeſs which Mr. *Cheſelden* has found in it, gives Encouragement to hope others may hereafter prove as happy, and at length render the Practice univerſally advantageous.

The Manner of proceeding herein, is this: After the Bladder is injected with a ſufficient Quantity of warm Water, and the Patient conveniently placed, the Operator ſlowly makes an Inciſion above the *Os Pubis*, along the *Linea Alba*, till he gets ſight of the Bladder, into which he directly plunges his Knife, and afterwards draws out the Stone. The Advantages attending this Method, are, That 'tis perform'd in a very ſhort Time; That the Wound eaſily heals; That the *Dilaceration* of Parts, frequent in the other Ways, is prevented; and That there is no danger of the *Incontinentia Urinæ*. On the other hand, 'tis thought to be chiefly practicable upon young Perſons, and ſuch as are lean; the Wound in old and fat Perſons being apt to mortify: moreover, if the Operator be not very cautious, he may eaſily let out the Inteſtines.

LITTER, a kind of Coach, or Vehicle born upon Shafts, antiently eſteemed the moſt eaſy and genteel Way of Carriage. *Pliny* calls it the Travellers Chamber. It was much in uſe among the *Romans*, among whom it was born by Slaves, kept for that purpoſe; as it ſtill continue to be in the Eaſt. The *Roman Litter* made to be born by four Men, was called *Tetraphorum*; that born by ſix, *Hexaphorum*; and that born by eight, *Octaphorum*. The Invention of *Litters*, according to *Cicero*, was owing to the Kings of *Bithynia*. In the time of *Tiberius* they were grown very frequent at *Rome*; as appears from *Seneca*; and even Slaves themſelves were born in them, tho' never by more than two Perſons, whereas Men of Quality had ſix or eight. *Du Cange* derives the Word from *Lectieria*, or *Literia*, q. d. a Bed for Beaſts. Others will rather have it come from *Lectus*, Bed, there being ordinarily a Quilt and a Pillow to a *Litter*; in the ſame manner as to a Bed.

LITTORAL SHELLS are, with the Writers of Natural Hiſtory, ſuch Sea-Shells as are always found near the Shores, and never far off in the Deep: ſuch as are found in the bottom of the Sea, remote from the Shore, they call ἐμβύθιοι, and *Pelagiæ*.

LITURGY, a Term ſignifying all the Ceremonies belonging in general to the Divine Office and Service. In a more reſtrained Signification, it is uſed among the *Romaniſts* to ſignify the Maſs, and among us the Common-Prayer.

Prayer. All who have written on *Liturgies* agree, that in the Primitive Days, Divine Service was exceedingly ſimple, only clogged with a very few Ceremonies, and conſiſting of but a ſmall Number of Prayers; but by degrees they increaſed the Number of external Ceremonies, and added new Prayers, to make the Office look more aweful and venerable to the People. At length things were carried to ſuch a pitch, that a Regulation became neceſſary; and it was found proper to put the Service, and the Manner of performing it, into Writing, and this was what they call'd a *Liturgy*. The *Liturgies* have been different at different Times, and in different Countries. We have the *Liturgy* of St. *Chryſoſtom*, that of St. *Peter*, of St. *James*, the *Liturgy* of St. *Baſil*, the *Armenian Liturgy*, the *Liturgy* of the *Maronites*, of the *Cophtæ*, the *Roman Liturgy*, the *Gallican Liturgy*, the *Engliſh Liturgy*, the *Ambroſian Liturgy*, the *Spaniſh* and *African Liturgies*. The word comes from the *Greek* λειτυργία, *Service, Public Miniſtery*.

LITUS is the ſame as *Linimentum*, which ſee.

LITUUS, among Medaliſts, is a Staff uſed by the Augurs, made in form of a Crozier. We frequently ſee it in Medals, along with other Pontifical Inſtruments. *Aulus Gellius* ſays, it was bigger in the place where it was crooked than elſewhere. Some derive the Word from the *Greek* λίγω, ſomething that makes a ſhrill acute Sound, which was a Property of this Inſtrument.

LIVER, a large glandulous Viſcus, of a red ſanguine Colour, ſituated immediately under the Diaphragm, in the right Hypochondrium, which it almoſt fills; and thence ſtretching itſelf over the right Side of the Stomach towards the left Hypochondrium, reaches behind the *Cartilago Enſiformis*, growing gradually thinner and narrower. Its Uſe is to purify the Maſs of Blood, by making a Secretion of the bilious Humours it contains. Its upper Part is convex, and perfectly ſmooth or poliſhed, the under concave, and ſomewhat more uneven, having four large Fiſſures; one thro' which the Umbilical Ligament paſſes; a ſecond on the left Side, receiving the *Pylorus* and the beginning of the *Duodenum*; a third on the right Side near the Margin, in which the Gall-Bladder is lodged; and the laſt in the upper Part, affording a Paſſage to the *Vena Cava*. Its Figure is ſomewhat approaching to round, with thin Edges not altogether even, but notched in ſome Places. Its Magnitude is various in different Subjects, according to the Proportion of the Body, tho' in a Fœtus, or very young Animal, it is always larger, in proportion, than in Adults. In Dogs and other Animals of the Quadruped Kind, it is divided into ſeveral diſtinct Lobes, but in Men it is generally continued; having one ſmall Protuberance, which ſome account a little Lobe. It is ſometimes, however, obſerved in Men to have been divided into two or three Lobes.

The *Liver* is connected to ſeveral Parts, but eſpecially to the Diaphragm, to which it is faſtened by a broad, thin, but ſtrong ſemicircular Ligament, call'd *the Suſpenſory Ligament*, and derived from the common *Capſula* of the *Porta* and Gall Ducts. The Continuity of this Ligament being interrupted by the Perforation of the *Vena Cava*, has given occaſion to ſome Anatomiſts to divide it into two. Is is likewiſe by another ſtrong Ligament, which has its Origin from the external Coat of the *Liver*, or which is all one, from the *Peritonæum*, tied to the *Cartilago Xyphoides*; and by a third, which is formed out of the Umbilical Veſſels, which in Adults dry up and become a Ligament, it is connected to the Tendons of the abdominal Muſcles in the *Linea alba* at the Navel. Theſe ſeveral Ligaments ſerve to keep it in its due ſituation: beſides which it has ſome other Connections by the Blood-Veſſels.

The *Liver* has a Motion, though not proper to itſelf, but depending on that of the Diaphragm, to which being very firmly connected, it muſt needs obey its Motion, and in Expiration be drawn up, and in Inſpiration let down again. It is covered with a thin ſmooth Membrane, derived from the *Peritonæum*, which may be ſeparated from the Subſtance of the *Liver*, tho' not without ſome danger of Laceration. The Subſtance of the *Liver* is vaſcular and glandulous; which latter Part is very ſoft and friable, and pretty eaſily ſcraped off from the Veſſels, to which the Glands every way adhere, as it were in Bunches; which has made the Anatomiſts call the conſiderable ones, *The Internal Lobes of the Liver*.

The Glands adhering thus to the Veſſels, and conſtituting thoſe Lobes, are wrapped up together in proper Membranes; whence this Appearance of diſtinct Lobes. Every one of theſe Glands, according to *Malpighi*, is compoſed of ſix unequal Sides or Faces. They are all cloth'd with their proper Membranes, and have each an excretory Duct, ſeveral of which joining together, form little Trunks, which run all along with the Branches of the *Porta*; and theſe again uniting, form longer Trunks, which are always found full of Bile, and conſtitute the *Porus Bilarius*; which being diſtributed all over the *Liver*, receives, in the foregoing manner, the Bile; which is ſeparated by theſe Glands, and terminating in the *Meatus Hepaticus*, and that in the *Ductus Communis*, at length diſcharges the Bile into the *Duodenum*.

Beſides this Diſcharge by the *Porus Bilarius*, which is ſuppoſed to be the great one, the *Liver* alſo delivers Part of its Bile into the Gall-Bladder, by a Duct, call'd the *Cyſt Hepatic Duct*, firſt diſcovered by Dr. *Gliſſon*; by means whereof there is an immediate Communication between the *Porus Bilarius* and the Gall-Bladder; a particular Deſcription of which two laſt Parts, ſee under the words *Gall* and *Bile*.

Beſides theſe Gall-Veſſels, which are peculiar to the *Liver*, it abounds with Blood-Veſſels, eſpecially Veins; whereof the *Porta* and *Cava* are diſſeminated thro' the whole Subſtance of it. And here it is particularly remarkable of the *Porta*, that after the manner of Arteries it ſhoots itſelf from a Trunk into Branches, and being at laſt loſt in Capillaries, delivers the Blood into the *Cava*, by which it is immediately reconveyed to the Heart.

The *Porta* is formed out of the Concurrence of divers Veins, which, meeting together, make one of the moſt conſiderable venous Trunks of the Body, as to its Bulk; tho', contrary to the Courſe of other Veins, it runs not far in a Trunk, but is ſoon diſtributed again by Ramifications into the *Liver*. See *Vena Porta*.

The Blood conveyed into the *Liver* by the Porta, after the manner of the Arteries, is received again, after having been purged of its Bile in the Glands of the *Liver* into innumerable Veins, which empty themſelves into the *Cava*, and are vulgarly, tho' improperly, call'd *Branches of the Cava*; but ought to be eſteemed the proper Blood-Veſſels of the *Liver*, as the Emulgents are of the Kidneys; and which, as all the reſt do, except the Pulmonary Vein, empty themſelves into the *Cava*; the common Channel by which the Blood returns to the Heart.

The Arteries, which are call'd the *Hepatic*, come from the right Branch of the *Cœliac*. Dr. *Gliſſon* thinks the *Porta* does ſo much the Office of an Artery, that no more Arteries are neceſſary than thoſe which furniſh Nouriſhment to the Membranes and Capſula; but Dr. *Drake* thinks they ſerve for the Nouriſhment of the whole Part. Theſe Arteries are much bigger in Men than in other Animals. Mr. *Cowper* had ſeveral Preparations, wherein the Stem of each Hepatic Artery was as large as a Gooſe-Quill, and the Branches in the *Liver* every where equal in Magnitude to thoſe of the *Porus Bilarius*, which they accompany. Dr. *Drake* conjectures, that in this Viſcus in a human Body, a larger Stream and directer Impetus of arterious Blood is required to drive on the Venous, becauſe of the erect Poſture, than in Animals of an horizontal Poſition of Body. For which reaſon Horſes, *&c.* though of much larger Size, and having much bigger *Livers*, have theſe Arteries much ſmaller than Men; and not only ſo, but curled like the Tendrils of a Vine, to break the Impetus, which in that Poſture is not ſo neceſſary as in the Erect. See *Bile*.

The *Liver* has its Nerves from the Hepatic Plexus, found on the right Hypochondrium by the Branches of the Intercoſtal, which wrapping themſelves about the Arteries, make a ſort of Net-work; and after ſpreading themſelves on the Membrane and Surface, diſappear. The Lymphæducts are numerous, tho' not eaſily diſcernible in human Subjects, for want of live Diſſections; but in other Animals, that may be diſſected alive, become very conſpicuous, by applying a Ligature to the *Porta* and the bilary Duct. *For the Uſe of the* Liver *in the Secretion of Bile, ſee* Bile.

Plato, and others of the Antients, fix the Principle of Love in the *Liver*; whence the *Latin* Proverb, *Cogit amare Jecur*: And in this ſenſe *Horace* frequently uſes the word, as when he ſays, *Si torrere Jecur quæris Idoneum*. The *Greeks*, from its concave Figure, call'd it ὄπως, *vaulted, ſuſpended*; the *Latins* call'd it *Jecur*, *q. d. juxta Cor*, as being near the Heart. The *French* call it *Foye* from *Foyer*, *Focus*, or Fire-place; agreeable to the Doctrine of the Antients, who believed the Blood to be boiled and prepared in it. *Eraſiſtratus* at firſt call'd it *Parenchyma*, i. e. Effuſion, or Maſs of Blood; and *Hippocrates*, by way of Eminence, frequently calls it the *Hypochondrium*.

LIVERY, properly ſignifies a Colour, to which a Perſon has ſome particular Fancy, and by which he chuſes to diſtinguiſh himſelf from others. *Liveries* are uſually taken out of Fancy, or continued in Families by Succeſſion. The antient Cavaliers, at their Tournaments, diſtinguiſhed themſelves by wearing the *Liveries* of their Miſtreſſes. Thus People of Quality make their Domeſtics wear their *Livery*. Father *Meneſtrier*, in his Treatiſe of *Carouſals*, has given a very ample Account of the Mixtures of Colours in *Liveries*. *Dion* tells us, that *Onomaus* was the firſt who invented green and blue Colours for

for the Troops which in the Circus were to repreſent Land and Sea-Fights. The *Romiſh* Church has alſo her ſeveral Colours and *Liveries*, white for Confeſſors and Virgins, and in times of rejoicing; black for the Dead; red for Apoſtles and Martyrs, blue or violet for Penitents, and green in times of Hope.

Formerly Great Men gave *Liveries* to ſeveral who were not of their Family or Servants, to engage them in their Quarrels for that Year; but this was prohibited by the Statute 1 *Hen.* 4. and no Man, of whatever Condition, was allow'd to give any *Livery* but to his Domeſtic Officers and Council learned in either Law.

LIVERY, in Law, is the Delivery of Poſſeſſion to thoſe Tenants which held of the King *in Capite*, or Knights Service. In another Signification, *Livery* is the Writ which lies for the Heir to obtain the Poſſeſſion or Seizin of his Lands at the King's hands.

Livery of Seizin is a Delivery of Poſſeſſion of Lands or Tenements, or Things Corporeal (for of Things Incorporeal there can be no *Livery of Seizin*) to him who hath Right, or Probability of Right to them. This is a Ceremony uſed in the Common Law, in Conveyance of Lands, Tenements, *&c.* where an Eſtate in Fee-ſimple, Fee-tail, or Freehold ſhall paſs; and is a Teſtimonial of the willing departing of him who makes the *Livery*, from the Thing whereof *Livery* is made, as well as of a willing Acceptance by the other Party of all that whereof the firſt has diveſted himſelf. The common Manner of the Delivery of *Seizin* is thus: If it be in the open Field where is no Houſe nor Building, and if the Eſtate paſs by Deed, one openly reads it, or declares the Effect of it; and after that is ſealed, the Vendor takes it in his hand with a Clod of Earth on a Twig or Bough, which he delivers to the Vendee in the name of Poſſeſſion or Seizin, according to the Effect of the Deed. If there be a Houſe or Building on the Land, this is to be done at the Door of it, none being then left within; and the Ring of the Door is delivered to the Vendee, who enters alone, ſhuts the Door, and preſently opens it again. If it be a Houſe without Land or Ground, the *Livery* is made and Poſſeſſion given by Delivery of the Ring of the Door and Deed only; and where it is without Deed either of Lands or Tenements, there the Party declares by Word of Mouth before Witneſſes the Eſtate he parts with, and then delivers Seizin or Poſſeſſion as aforeſaid, in which Caſe the Land paſſes as well as by Deed, by virtue of the *Livery of Seizin*. Antiently, there were a Pair of Gloves, a Ring, Knife, Ear of Wheat, *&c.* delivered in ſign of *Livery* and *Seizin*. See *Inveſtiture*.

LIVRE, an Imaginary *French* Coin, conſiſting of twenty Sols, each Sol again containing twelve Deniers: which way of computing the Coin has been in uſe in that Country ever ſince the Time of *Charlemagne*; before whom they uſed the *Roman Libra*. The *Livre* is of two kinds, the *Livre Tournois* and *Pariſis*. The *Livre Tournois*, as above, contains 20 Sols *Tournois*, and each Sol 12 Deniers *Tournois*. The *Livre Pariſis* is 20 Sols *Pariſis*, each Sol *Pariſis* worth 12 Deniers *Pariſis*, and each Sol *Pariſis* worth 15 Deniers *Tournois*. So that a *Livre Pariſis* is equivalent to 25 Sols *Tournois*: the word *Pariſis* being uſed in oppoſition to *Tournois*, by reaſon of the Rate of Money, which was $\frac{1}{4}$ more at *Paris* than at *Tours*. One Penny Sterling is equal to 13 $\frac{1}{2}$ Deniers *Tournois*: ſo that the *Engliſh* Pound *Sterling* is equal to 13 Livres, 6 Sols, 8 Deniers of *French* Money, ſuppoſing the Exchange to be on the foot of 54 Pence *Sterling* to a *French* Crown of 60 Sols *Tournois*; which is the preſent *Par* between *England* and *France*.

The Origin of the Word is fetch'd hence, that antiently the *Roman Libra* or Pound was the Standard by which their Money was regulated; twenty Sols being made equal to the *Libra*. By degrees the *Libra* became a Term of Account, ſo that any Coin juſt worth 20 Sols was a *Livre* or *Libra*; and ſince the Time of *Charlemagne* all Contracts have been made on the foot of this Imaginary Coin: Tho the Sols have frequently chang'd their Weight and Alloy. Since, there have been Pieces of Gold ſtruck of 20 Sols, and under *Henry* III. in 1575, Species of Silver of like Value: Both the one and the other were call'd *Francs*, and thus the Imaginary Coin became Real.

It appears that the *Romans* had a kind of Money which they call'd *Libra* or *Libella*; which was the 10th part of their *Denarius*; ſo call'd becauſe equivalent to an *As*; which, at firſt, weigh'd a *Libra* or Pound of Copper. *Scaliger* adds, that they uſed *Libra* as a Term of Account, not as a Coin: *Libra erat Collectio Nummorum, non Nummus.* See *Pound*.

LIXIVIOUS, in Chymiſtry, is underſtood of Salts extracted by a Lixivium or Lotion. *Lixivious Salts* are the fix'd Salts of Plants, *&c.* extracted by calcining the Plants or reducing them to Aſhes; and afterwards making a Lixivium of thoſe Aſhes with Water; whence that Name is derived. Mr. *Boyle* obſerves, that the difference between *Lixivious* and Urinous Salts conſiſts in this, That the former change the Diſſolution of Sublimate in common Water into a yellow Colour.

LIXIVIUM, a Liquor made by the Infuſion of Wood-Aſhes, or any burnt Subſtances; which is more or leſs pungent and penetrating, as it is more or leſs impregnated with Salts, and fiery Particles abounding therein. What is left after the Evaporation of ſuch a Liquor, is called a *Lixivial* or *Lixiviate Salt*; ſuch as all thoſe are, which are made by Incineration. *Lixiviums* are of notable uſe not only in Medicine, but alſo in Bleaching, Sugar-Works, *&c.* which ſee.

LOADSTONE, ſee *Magnet*.

LOAM, Clay uſed in Grafting; a kind of Mortar made of Clay and Straw; alſo a ſort of Clay or Plaiſter uſed by Chymiſts to ſtop up their Veſſels with.

LOBBY, ſee *Antichamber*.

LOBE, among Anatomiſts, is uſed for each of the two Parts whereof the Lungs conſiſt. This Separation into *Lobes* is of uſe in dilating the Lungs, in cauſing them to receive more Air, and in preventing their being too much ſqueez'd, when the Back is bent. For this reaſon it is, that Beaſts, which are always inclining towards the Earth, have more Lobes in their Lungs than Men: Even their Liver is divided into *Lobes*, whereas that of Man is continued.

Lobe is alſo uſed for the Tip of the Ear; which is more fat and fleſhy than any other part. *Du Laurent* ſays, that the word *Lobe* in this laſt ſenſe comes from the *Greek* λώβειν, *to be aſhamed:* this part of the Ear being ſaid to bluſh, when the Perſon is aſhamed.

Lobe is uſed, likewiſe, in ſpeaking of Fruits and Grains. Thus the Bean conſiſts of two equal parts, call'd *Lobes*, which compoſe the Body thereof, and are encompaſs'd with the outer Skin. And all other Grains, even the ſmalleſt, are divided, like the Bean into two *Lobes*, or equal Parts; as Dr. *Grew* has ſhewn in his *Anatomy of Plants*.

LOBULE, in Anatomy, a little Lobe. Each Lobe of the Lungs is divided into ſeveral other Lobes or *Lobules*, which are faſten'd on each ſide to the largeſt Branches of the Trachea. Each *Lobule* conſiſts of a great number of little round Veſicles, which have, all, a Communication with one another. 'Tis into theſe Veſicles that the Air enters by the Trachea in Inſpiration; ſtill quitting them again in Expiration. The word *Lobule* is derived from *Lobe*, whereof it is a Diminutive.

LOCAL, ſomething ſuppoſed to be tied or annexed to any particular place. Thus, in Law, a thing is ſaid to be *Local*, *i. e.* annexed to the Freehold. An Action of Treſpaſs for Battery, *&c.* is Tranſitory, not *Local*; that is, it is not neceſſary, that the Place where Battery was committed, ſhould be ſet down as material in the Declaration; or if it be ſet down, the Defendant cannot traverſe it, by ſaying, he did not commit the Battery in the Place mention'd in the Declaration, and ſo avoid the Action.

Local Cuſtoms are thoſe peculiar to ſome Lordſhip, or other Diſtrict, and not agreeable to the General Cuſtoms of the Country.

Local Problem, in Mathematicks, is ſuch an one, as is capable of an infinite number of different Solutions: as where the Point, that is to ſolve the Problem, may be indifferently taken within a certain Extent; *v. g.* any where, in ſuch a Line, within ſuch a Plane Figure, *&c.* which is called a Geometrical *Locus*, and the Problem is ſaid to be a *Local* or indeterminate one. This *Local Problem* may be either Simple, as when the Point ſought is in a right Line; Plane, when the Point ſought is in the Circumference of a Circle; Solid, when the Point required is in the Circumference of a Conick Section; or Surſolid, when the Point is in the Perimeter of a Line of the ſecond Gender, as the Geometers call it. See *Locus*.

Local, or *Artificial Memory*; ſee *Memory*.

Local Colours, in Painting, are ſuch as are natural and proper for each particular Object in a Picture: and are ſo called, to diſtinguiſh them from the Clair, obſcure, which conſiſts wholly of Black and White.

Local Motion, ſee *Motion*.

LOCATION, in the Civil Law, an Action by which any thing is lett out, on Rent. The ſecond Title of the 19th Book of the *Digeſt*, is on the Subject of *Location* and Conduction. *Location* and Conduction are relative Terms, and are uſed as well for the Action of him that letts, as for that of him who takes on that letting. *Tacit Location* is when the Perſon who takes, continues on the Premiſes beyond the Term of his Leaſe; which by the Civil Law he is allow'd to do, at leaſt for the ſpace of a Year; on the ſame Terms.

LOCH, or *Loboch*, in Pharmacy, is a Compoſition, of a Conſiſtence between that of a Syrup and that of a ſoft Electuary, deſtined for Diſeaſes of the Lungs. The Word is originally *Arabic*; but continues ſtill in uſe among

among the Apothecaries. The *Latins* call it *Linctus*, and the *Greeks* ἔκλεγμα, by reaſon the manner of taking it is by licking. There are various kinds of *Loches*. See *Eclegma*.

LOCHIA, or *Loches*, the Evacuations conſequent on the Delivery of a Woman in Child-bed. As ſoon as the *Uterus* is eaſed of its Load, its Fibres, as alſo thoſe of the Peritonæum, Muſcles of the Abdomen, &c. which had been extremely diſtended during the laſt Period of Geſtation, begin to contract themſelves and their Veſſels; particularly the *Uterus*, which by this means expels the Blood amaſs'd in it. At firſt, pure Blood is evacuated, and in conſiderable quantities; afterwards it is diluted, and comes out more ſparingly; at length it becomes viſcid, pale, &c. Theſe are called the *Loches*.

LOCK, a little Inſtrument uſed for the ſhutting of Doors, Cheſts, &c. The *Lock* is reckon'd the Maſterpiece in Smithery; a great deal of Art and Delicacy being required in contriving and varying the Wards, Springs, Bolts, &c. and adjuſting them to the Places where they are to be uſed, and the various Occaſions of uſing them.

From the various Structure of *Locks*, accommodated to their different Intentions, they acquire various Names. Thoſe placed on outer Doors are called *Stock-Locks*; thoſe on Chamber-Doors, *Spring-Locks*; thoſe on Trunks, *Trunk-Locks*, *Pad-Locks*, &c. Of theſe, the *Spring-Lock* is the moſt conſiderable, both for its Frequency and the Curioſity of its Structure. Its principal Parts are, the Main-Plate, the Cover-Plate, and the Pin-hole: To the Main-Plate belong the Key-hole, Top-hook, Croſs-wards, Bolt, Bolt-toe or Bolt-nab, Drawback Spring, Tumbler, Pin of the Tumbler, and the Staples; to the Cover-Plate belong the Pin, Main-ward, Croſs-ward, Step-ward or Dap-ward; to the Pin-hole belong the Hook-ward, Main Croſs-ward, Shank, the Pot, or Bread, Bow-ward, and Bit. See *Smithery*.

LOCULAMENTA, ſtrictly ſignifies little Pockets; and thence the Term is made uſe of in Botany, to expreſs thoſe little diſtinct Cells, or Partitions, within the common *Capſula Seminalis* of any Plant: as thoſe within the Seeds of Poppies, &c.

LOCUS, or the Place of any Body, is rightly diſtinguiſhed into Abſolute and Relative; and ſo ought Space to be accounted. The *Locus Abſolutus*, or *Primarius*, of any Body, is that part of the abſolute and immovable Space, or extended Capacity to receive all Bodies, which this individual one takes up. *Locus Relativus*, or *Secundarius*, is that apparent and ſenſible Place, in which a Body is determined to be placed by ourſelves, and with relation to other adjoining or contiguous Bodies. The *Locus Apparens* is a Term in Optics: ſee *Apparent Place of any Object*. It is alſo, in Aſtronomy that Place, in which any Planet or Star appears, when view'd from an Eye at the ſenſible Horizon.

LOCUS GEOMETRICUS, a Line by which an Indeterminate Problem is ſolved. This, if a right Line ſuffice for the Conſtruction of the Equation, is called *Locus ad Rectum*; if a Circle, *Locus ad Circulum*; if a Parabola, *Locus ad Parabolam*; if an Ellipſis, *Locus ad Ellipſin*; and ſo of the reſt of the Conic Sections.

The *Loci* of ſuch Equations as are Right Lines or Circles, the Antients call'd *Plain Loci*; and of thoſe that are Parabolas, Hyperbolas, &c. *Solid Loci*. *Wolfius*, and others of the Moderns, divide the *Loci* more commodiouſly into Orders; according to the Number of Dimenſions to which the Indeterminate Quantities riſe. Thus it will be a *Locus* of the firſt Order if the Equation $x = ay : c$. A *Locus* of the ſecond or quadrate Order, if $y^2 = ax$, or $y = a^{\frac{1}{2}}x$, &c. A *Locus* of the third or cubic Order, if $y^3 = a^2x$, or $y^3 = a \times a^{\frac{1}{2}}x^3$, &c.

The better to conceive the Nature of the *Locus*, ſuppoſe two unknown and variable right Lines AP, PM, (*Fig.* 3, 4. *Plate Analyſis*) making any given Angle APM with each other; the one whereof, as AP, we call x, having a fixed Origin in the Point A, and extending itſelf indefinitely along a right Line given in Poſition; the other PM, which we call y, continually changing its Poſition, but always parallel to itſelf. An Equation only containing theſe two unknown Quantities x and y, mix'd with known ones, which expreſſes the Relation of every variable Quantity AP (x) to its correſpondent variable Quantity PM (y): the Line paſſing thro' the Extremities of all the Values of y, i. e. thro' all the Points M, is called a *Geometrical Locus*, in general, and the *Locus* of that Equation in particular.

All Equations whoſe *Loci* are of the firſt Order, may be reduced to ſome one of the four following Formula's:

1. $y = \frac{bx}{a}$. 2. $y = \frac{bx}{a} + c$. 3. $y = \frac{bx}{a} - c$. 4. $y = c - \frac{bx}{a}$. Where the unknown Quantity y is ſuppoſed always to be freed from Fractions, and the Fraction that multiplies the other unknown Quantity x, to be reduced to this Expreſſion $\frac{b}{a}$; and all the known Terms to this c.

The *Locus* of the firſt Formula being already determined: To find that of the ſecond, $y = \frac{bx}{a} + c$; in the Line AP, (*Fig.* 5.) take AB $= a$, and draw BE $= b$, AD $= c$, parallel to PM. On the ſame ſide AP draw the Line AE of an indefinite length towards E, and the indefinite ſtrait Line DM parallel to AE. I ſay, the Line DM is the *Locus* of the aforeſaid Equation or Formula; for if the Line MP be drawn from any Point M thereof parallel to AQ, the Triangles ABE, APF, will be ſimilar: and therefore AB (a) : BE (b) :: AP (z) : PF $= \frac{bx}{a}$; and conſequently PM (y) $=$ PF $\left(\frac{bx}{a}\right)$ + FM (c).

To find the *Locus* of the third Form $y = \frac{bx}{a} - c$ proceed thus. Aſſume AB $= a$, (*Fig.* 6.) and draw the right Lines BE $= b$, AD $= c$, parallel to PM, the one on one ſide AP, and the other on the other ſide; and thro' the Points A, E, draw the right Line AE of an indefinite length towards E, and thro' the Point D the Line DM parallel to AE: I ſay, the indefinite right Line GM ſhall be the *Locus* ſought; for we ſhall have always PM (y) $=$ PF $\left(\frac{bx}{a}\right)$ − FM (c).

Laſtly, To find the *Locus* of the fourth Formula $y = c - \frac{bx}{a}$; in AP (*Fig.* 7.) take AB $= a$, and draw BE $= b$, AD $= c$, parallel to PM, the one on one ſide AP, and the other on the other; and thro' the Points A, E, draw the Line AE indefinitely towards E, and thro' the Point D draw the Line DM parallel to AE. I ſay, DG ſhall be the *Locus* ſought; for if the Line MP be drawn from any Point M thereof parallel to AQ, then we ſhall have always PM (y) $=$ FM (c) − PF $\left(\frac{bx}{a}\right)$.

Hence it appears, that all the *Loci* of the firſt Degree are ſtrait Lines, which may be eaſily found, becauſe all their Equations may be reduced to ſome one of the foregoing Formula's.

All Loci *of the ſecond Degree* are Conic Sections, *viz.* either the Parabola, the Circle, Ellipſis, or Hyperbola; if an Equation therefore be given, whoſe *Locus* is of the ſecond Degree, and it be required to draw the Conic Section, which is the *Locus* thereof; firſt draw a Parabola, Ellipſis, and Hyperbola; ſo, as that the Equations expreſſing the Natures thereof, may be as compound as poſſible: In order to get general Equations or Formula's, by examining the peculiar Properties whereof, we may know which of theſe Formula's the given Equation ought to have regard to; that is, which of the Conic Sections will be the *Locus* of the propoſed Equation. This known, compare all the Terms of the propoſed Equation with the Terms of the general Formula of that Conic Section which you have found will be the *Locus* of the given Equation; by which means you will find how to draw the Section which is the *Locus* of the Equation given.

For example, let AP (x), PM (y), be unknown and variable ſtrait Lines, (*Fig.* 8.) and let m, n, p, r, s, be given right Lines: In the Line AP take AB $= m$, and draw BE $= n$, AD $= r$, parallel to PM, and thro' the Point A draw AE $= e$, and thro' the Point D the indefinite right Line DG parallel to AE. In DG take DC $= s$, and with CG as a Diameter, having its Ordinates parallel to PM, and the Line CH $= p$, as the Parameter, deſcribe a Parabola CM: then the Portion thereof included in the Angle PAD will be the *Locus* of the following general Formula.

$$yy - \frac{2n}{m}xy + \frac{nn}{mm}xx - 2ry + \frac{2nr}{m}x + rr = 0.$$
$$- \frac{ep}{m}x + ps.$$

For if from any Point M of that Portion there be drawn the right Line MP, making any Angle APM with MP; the Triangles ABE, APF, ſhall be ſimilar, therefore AB (m) : AE (e) :: AP (x) : AF or DG $= \frac{ex}{m}$. And

$AB(m) : BE(n) :: AP(x) : PF = \frac{nx}{m}$. And conſequently GM or PM — PF — FG $= y - \frac{nx}{m} - r$, and CG or DG — DC $= \frac{ex}{m} - s$. But from the Nature of the Parabola $\overline{GM}^2 = CG \times CH$, which Equation will become that of the general Formula, by putting the Literal Values of thoſe Lines.

Again; if thro' the fixed Point A you draw the indefinite right Line AQ (*Fig.* 9.) parallel to PM, and you take $AB = m$, and draw $BE = n$ parallel to AP, and thro' the determinate Points A, E, the Line $AE = e$; and if in AP you take $AD = r$, and draw the indefinite ſtrait Line DG parallel to AE, and take $DC = s$: this being done, if with the Diameter CG, whoſe Ordinates are parallel to AP, and Parameter the Line $CH = p$, you deſcribe a Parabola CM; the Portion of this Parabola contain'd in the Angle BAP, ſhall be the *Locus* of this ſecond Equation or Formula,

$$xx - \frac{2n}{m} yx + \frac{nn}{mm} yy - 2rx + \frac{2nr}{m} y + rr = o. \\ - \frac{ep}{m} y + ps.$$

For if the Line MQ be drawn from any Point M, therein, parallel to AP; then will $AB(m) : AE(e) :: AQ$ or $PM(y) : AF$ or $DG = \frac{ey}{m}$. And $AB(m) : BE(n) :: AQ(y) : QF = \frac{ny}{m}$. And therefore GM or QM — QF — FG $= x - \frac{ny}{m} - r$; and CG or DG — DC $= \frac{ey}{m} - s$. And ſo by the common Property of the Parabola, you will have the aforegoing ſecond Equation or Formula.

So likewiſe may be found general Equations or Formula's to the other Conic Sections.

Now if it be required to draw the Parabola, which we find to be the *Locus* of this propoſed Equation $yy - 2ay - bx + cc = o$; compare every Term of the firſt Formula with the Terms of the Equation, becauſe yy in both is without Fractions; and then will $\frac{2n}{m} = o$, becauſe the Rectangle xy not being in the propoſed Equation, the ſaid Rectangle may be eſteem'd as multiplied by o; whence $n = o$, and $m = e$; becauſe the Line AE falling in AB, that is, in AP in the Conſtruction of the Formula, the Points B, E, do coincide. Therefore deſtroying all the Terms adfected with $\frac{n}{m}$ in the Formula, and ſubſtituting m for e, we ſhall get $yy - 2ry - px + rr + ps = o$. Again, by comparing the correſpondent Terms $-2ry$ and $-2ay$, as alſo $-px$ and $-bx$, we have $r = a$, and $p = b$; and comparing the Terms wherein are neither of the unknown Quantities x, y, we get $rr + ps = cc$, and ſubſtituting a and b for r and p, then will $s = \frac{cc - aa}{b}$, which is a negative Expreſſion when a is greater than c, as is here ſuppoſed. There is no need of comparing the firſt Terms yy and yy, becauſe they are the very ſame. Now the Values of n, r, p, s, being thus found, the ſought *Locus* may be conſtructed by means of the Conſtruction of the Formula, after the following manner.

Becauſe BE $(n) = o$, (*Fig.* 10.) the Points B, E, do coincide, and the Line AE falls in AP; therefore thro' the fixed Point A draw the Line AD $(r) = a$ parallel to PM, and draw DG parallel to AP, in which take $DC = \frac{aa - cc}{b} - s$; then with CG, as a Diameter, whoſe Ordinates are right Lines parallel to PM, and Parameter the Line CH $(p) = b$, deſcribe a Parabola: I ſay the two Portions OMM, RMS, thereof, contain'd in the Angle PAO, form'd by the Line AP, and the Line AO drawn parallel to PM, will be the *Locus* of the given Equation, as is eaſily proved. If in a given Equation, whoſe *Locus* is a Parabola, xx is without a Fraction, then the Terms of the ſecond Formula muſt be compared with thoſe of the given Equation.

Thus much for the Method of Conſtructing the *Loci* of Equations, which are Conic Sections. If, now, an Equation whoſe *Locus* is a Conic Section be given; and the particular Section whereof it is the *Locus*, be required:

All the Terms of the given Equation being brought over to one ſide, ſo that the other be equal to o, there will be two Caſes.

Caſe 1. When the Rectangle xy is not in the given Equation. 1. If either yy or xx be in the ſame Equation, the *Locus* will be a Parabola. 2. If both xx and yy are in the Equation with the ſame Signs, the *Locus* will be an Ellipſis or a Circle. 3. If xx and yy have different Signs, the *Locus* will be an Hyperbola: or the oppoſite Sections; regarding their Diameters.

Caſe 2. When the Rectangle xy is in the given Equation. 1. If neither of the Squares xx or yy, or only one of them, be in the ſame, the *Locus* of it will be an Hyperbola between the Aſymtotes. 2. If yy and xx be therein, having different Signs, the *Locus* will be an Hyperbola, regarding its Diameters. 3. If both the Squares xx and yy are in the Equation, having the ſame Signs, you muſt free the Square yy from Fractions, and then the *Locus* will be a Parabola, when the Square of $\frac{1}{2}$ the Fraction multiplying xy, is equal to the Fraction multiplying xx; an Ellipſis or Circle, when the ſame is leſs; and an Hyperbola, or the oppoſite Sections, regarding their Diameters, when greater.

LOCUSTÆ, the Beards and pendulous Seeds of Oats, and of the *Gramina Paniculata*; to which the Botaniſts gave this Name, from their Figure, which ſomething reſembles that of a Locuſt.

LODESMAN, or *Locman*, a Pilot eſtabliſh'd for conducting Veſſels in and out of Harbours, up and down navigable Rivers. See *Pilot*.

LODGMENT, in Military Affairs, is ſometimes an Incampment made by an Army; but oftener, a Retrenchment dug for a Cover or Shelter, when the Counterſcarp, or ſome other Poſt is gain'd. It is alſo taken for the Place where the Soldiers quarter among the Burghers, in Huts, Barracks, or Tents. *Lodgment* of an Attack, is a Work caſt up by the Beſiegers, during their Approaches in a dangerous Poſt, where it is abſolutely neceſſary to ſecure themſelves againſt the Enemies Fire; as in a Covert-Way, in a Breach, in the Bottom of the Moat, &c. This *Lodgment* conſiſts of all the Materials that are capable to make reſiſtance, *viz.* Barrels, and Gabions of Earth, Palliſadoes, Wool-packs, Mantelets, Faggots, &c.

LOG, a Sea-Term ſignifying a piece of Board or Timber 7 or 8 Inches long, and of a triangular figure, on board a Ship; into one end whereof, a convenient quantity of Lead is caſt, to make it ſwim upright in the Water.

Log-Line is a little Cord or Line faſten'd to one end of the *Log*, and wound round a Reel fix'd for that purpoſe in the Gallery of the Ship. This Line, from the diſtance of about ten Fathom off the *Log*, has certain Knots or Diviſions, which ought to be at leaſt 50 foot from each other: tho 'tis the common practice at Sea, not to have them above 42 feet aſunder. The Uſe of the *Log* and *Line* is to keep account, and make an eſtimate of the Ship's Way: which is done by obſerving the Length of Line unwound in half a Minute's time, told by a Half-Minute Glaſs; for, ſo many Knots as run out in that time, ſo many Miles the Ship ſails in an Hour. Thus if there be four Knots veer'd out in half a Minute, the Ship is computed to run four Miles an hour. To heave the *Log*, as they call it, they let it down into the Water, letting it run till it comes without the Eddy of the Ship's Wake; when one holding the Half-Minute Glaſs, turns it up juſt as the firſt Knot turns off the Reel (tho ſome turn the Glaſs as ſoon as the *Log* touches the Water) as ſoon as the Glaſs is out, the Reel is ſtopt, and the Knots run off are told, and their Parts eſtimated.

The *Log* is a very precarious Way of computing, and muſt always be corrected by Experience and Good Senſe, there being a great deal of Incertainty both in the Heaving of it, in the Courſe of the Currents, and in the Strength of the Wind, which ſeldom keeps the ſame Tenor for two Hours together, which is the Interval between the Times of uſing the *Log* in ſhort Voyages, tho in longer ones they heave it every hour. Yet is this a much more exact Way of Computing than any other in uſe; much preferable certainly to that of the *Spaniards* and *Portugueſe*, who gueſs at the Ship's Way by the running of the Froth or Water by the Ship's ſide; or to that of the *Dutch*, who uſe to heave a Chip over-board, and to number the Paces they walk on the Deck while the Chip ſwims between any two Marks or Bolt-heads on the ſide.

Log-Board is a Table divided into four or five Columns, whereon are mark'd the Reckonings of every Day, from whence they are enter'd into the *Log-Book*, or Traverſe-Book, ruled and column'd juſt as the *Log-Board* is: Whence it may be tranſcribed into the Journals, and how much the Ship gains in her Courſe eſtimated daily. In the firſt Column of the *Log-Board* are ſhewn the Hours of the Day from 1 to 1. In the ſecond is ſhewn the Rhumb,

or

or the Direction of the Veſſel with regard to the Points of the Compaſs. In the third, the Number of Knots run off the Reel each time of heaving the *Log*. In the fourth, the Wind that blows: and in the fifth, Obſervations made of the Variation of the Compaſs, *&c.*

LOGARITHMIC, or LOGISTIC CURVE, a Curve generated by the equable Motion of the Radius of a Circle, thro' equal Arcs of the Circumference; while at the ſame time a Point in that Radius is ſuppoſed to move from the Arc towards the Centre, with a Retardation of Motion in a Geometrick Proportion. As ſuppoſe there be a Quadrant of a Circle, B C A, (*Plate Analyſis*, *Fig.* 11.) and any equal Diviſions in the Arc, as A F = F *f* = *ff*, *&c.* with five correſponding Radii, as ſuppoſe C A, C F, C *f*, &c. whoſe Parts or Portions C 1, C *a*, C *a*, &c. are geometrically Proportional; then if a Line, as 1, *a*, *a*, *b*, *d*, C, be drawn thro' thoſe Points, it will be the *Logarithmic* or *Logiſtic Spiral*.

LOGARITHMS (from λόγος *ratio*, and ἀριθμὸς *numerus*) are uſually defined *Numerorum Proportionalium equidifferentes Comites*; but this Definition Dr. *Halley* and *Stifelius* think deficient, and more accurately define them, *The Indices or Exponents of the Ratio's of Numbers*; Ratio being conſider'd as a Quantity *ſui generis*, beginning from the Ratio of Equality, or 1 to 1 = 0; and being affirmative when the Ratio is increaſing, and negative when it is decreaſing. The Nature and Genius of *Logarithms* will be eaſily conceiv'd from what follows.

A Series of Quantities increaſing or decreaſing according to the ſame Ratio, is call'd a Geometrical Progreſſion; *e.g.* 1. 2. 4. 8. 16. 32. &c. A Series of Quantities increaſing or decreaſing according to the ſame Difference, is called an Arithmetical Progreſſion; *e.g.* 3. 6. 9. 12. 15. 18. 24. Now if underneath the Numbers proceeding in a Geometrical Ratio, be added as many of thoſe proceeding in the Arithmetical one; theſe laſt are call'd the *Logarithms* of the firſt.

Suppoſe *v. g.* two Progreſſions:

Geomet.	1.	2.	4.	8.	16.	32.	64.	128.	256. 512
Arithmet.	0.	1.	2.	3.	4.	5.	6.	7.	8. 9

Logarithms.

0 will be the *Logarithm* of the firſt Term, *viz.* 1; 5 of the 6th, 32; 7 the *Logarithm* of the 8th, 128, &c.

Theor. I. *If the Logarithm of Unity be* 0, *the Logarithm of the Factum or Product will be equal to the Sum of the Logarithms of the Factors.*

Dem. For as Unity is to one of the Factors, ſo is the other Factor to the Product. So that the *Logarithm* of the Product is a fourth equidifferent Term to the *Logarithm* of Unity and thoſe of the Factors: but the *Logarithm* of Unity being 0, the Sum of the *Logarithms* of the Factors muſt be the *Logarithm* of the Factum or Product. *q. e. d.*

Corol. 1. Since the Factors of a Square are equal to each other, *i. e.* a Square is the Factum or Product of its Root multiplied into itſelf; the *Logarithm* of the Square will be double the *Logarithm* of the Root.

Corol. 2. In the ſame manner it appears that the *Logarithm* of the Cube is triple, of the Biquadrate, quadruple; of the fifth Power, quintuple; of the ſixth, ſextuple, *&c.* of the *Logarithm* of the Root.

Corol. 3. Unity, therefore, is to the Exponent of the Power, as the *Logarithm* of the Root to the *Logarithm* of the Power.

Corol. 4. So that the *Logarithm* of the Power is had, if the *Logarithm* of the Root be multiplied by its Exponent; and the *Logarithm* of the Root is had, if the *Logarithm* of the Power be divided by its Exponent.

Schol. *Hence we derive one of the great Uſes of* Logarithms, *which is to expedite and facilitate the Buſineſs of Multiplication and Extraction of Roots; the former of which is here perform'd by mere Addition, and the latter by Multiplication.* Thus 3, the Sum of the *Logarithms* 1 and 2, is the *Logarithm* of 8, the Product of 2 and 4. In like manner 7, the Sum of the *Logarithms* 2 and 5, is the *Logarithm* of 128, the Product of 4 and 32. Again, 3, the *Logarithm* of the Square Root 8, is half the *Logarithm* of 6, the Square Root of 64; and 2, the *Logarithm* of the Cube Root 4, is ſubtriple the *Logarithm* 6 of the Cube 64.

Theor. II. *If the Logarithm of Unity be* 0, *the Logarithm of the Quotient will be equal to the Difference of the Logarithms of the Diviſor and Dividend.*

Dem. For as the Diviſor is to the Dividend, ſo is Unity to the Quotient; therefore the *Logarithm* of the Quotient is a fourth equidifferent Number to the *Logarithms* of the Diviſor, the Dividend, and the *Logarithm* of Unity. The *Logarithm* of Unity therefore being 0, the Difference of the *Logarithm* of the Diviſor and that of the Dividend, is the *Logarithm* of the Quotient. *q. e. d.*

Schol. *Hence appears another great Advantage of* Logarithms, *viz. their expediting the buſineſs of Diviſion, and performing it by a bare Subſtraction. E.g.* 2 the Difference between 7 and 5, is the *Logarithm* of the Quotient 4 out of 128 by 32. In like manner, 5 the Difference between 8 and 3, is the *Logarithm* of the Quotient 32, out of 256 by 8.

An Example or two will render the Uſe of *Logarithms* in Multiplication, Diviſion, *&c.* obvious.

	Num.	*Log.*		*Num.*	*Log.*	
Multiply	68	1.83250	Divide	816	2.91168	9
by	12	+ 1.07918	by	12	1.07918	9
	816	2.91168		68	1.83250	*Sq.* 81
9	0.95424		9	0.95424		
9	0.95424		9	0.95424		
			9	0.95424		
Sq. 81	2)1.90848(0.95424 *Sq. R.*		*Cube* 729	3)2.86272(0.95424 *Cube R.*		

The Properties of the *Logarithms* hitherto mention'd, and their various Uſes, are taken notice of by *Stifelius*: but come all far ſhort of the Uſe of *Logarithms* in Trigonometry, firſt diſcover'd by the Lord *Neper*.

To find the Logarithm of any Number, and to conſtruct a Canon of Logarithms for Natural Numbers.

1. Becauſe 1. 10. 100. 1000. 10000. *&c.* conſtitute a Geometrical Progreſſion, their *Logarithms* may be taken at pleaſure: To be able, then, to expreſs the *Logarithms* of the intermediate Numbers by Decimal Fractions, take 0.00000000, 1.00000000, 2.00000000, 3.00000000, 4.00000000, *&c.*

2. 'Tis manifeſt that for thoſe Numbers which are not contained in the Scale of Geometrical Progreſſion, the juſt *Logarithms* cannot be had: yet may they be had ſo near the Truth, that as to Matters of Uſe they ſhall be altogether as good as if ſtrictly juſt. To make this appear, Suppoſe the *Logarithm* of the Number 9 were required: between 1.0000000 and 10.0000000 find a Mean Proportional, and between their *Logarithms* 0.00000000 and 1.00000000 an Equidifferent Mean, which will be the *Logarithm* thereof, that is, of a Number exceeding Three by $\frac{1622777}{10000000}$, and therefore far remote from Nine. Between 3 and 10 therefore find another Mean Proportional, which may come ſomewhat nearer Nine; and between 10 and this Mean, another ſtill; and ſo on between the Numbers next above and next underneath Nine, till at laſt you arrive at 9.00000000, that is, $9\frac{0000000}{10000000}$, which not being one Millionth Part from Nine, its *Logarithm* may, without any ſenſible Error, be taken for that of Nine itſelf. Seeking then in each Caſe for the *Logarithms* of the Mean Proportionals, and you will at laſt have 0.954251, which is exceedingly near the true *Logarithm* of Nine.

3. If in like manner you find Mean Proportionals between 1.0000000 and 3.1622777, and aſſign convenient *Logarithms* to each, you will at length have the *Logarithm* of the Number 2, and ſo of the reſt.

4. There needs not, however, be ſo much Pains taken in inveſtigating the *Logarithms* of all Numbers; ſince thoſe that conſiſt of aliquot Parts being divided, and others mutually multiplying each other, their *Logarithms* are eaſily found. Thus if the *Logarithm* of the Number 9 be biſſected, we ſhall have the *Logarithm* 0.47712125 of the Number 3.

Schol. The Indices or Characteriſtics of *Logarithms* correſpond to the denominative Part of the natural Numbers, as the other Member of the *Logarithm* does to the denominative Part of the Number: *i. e.* the Index ſhews the Denomination or Place of the laſt (or left Hand) Figure of the Number, and conſequently of all the reſt. Thus 0, affixed to a *Logarithm*, denotes the laſt Figure of the Number to which the *Logarithm* anſwers to be nothing diſtant (*i. e.* is in) the Place of Units. The Index 1 ſhews the laſt Figure of its Number to be diſtant 1 Place from the Place of Units, *i. e.* to be in the Place of Tens, and conſequently the Number itſelf to be either 10, or ſome Number between that and 100, and ſo of the other Indices. Hence all Numbers, which have the ſame denominative, but not the ſame numerative Parts, as all Numbers from 1 to 10, from 10 to 100, &c. will have *Logarithms* whoſe Indices are the ſame, but the other Members different. Again, all Numbers which have the ſame numerative, but not denominative Part, will have different Indices; but the reſt of the *Logarithms* the ſame. If a Number be purely decimal, to its *Logarithm* is affixed a negative Index, ſhewing the Diſtance of its firſt ſignificative Figure from the Place of Units. Thus the *Logarithm* of the Decimal ,256 is $\bar{1}$.40824, of the Decimal ,0256 is $\bar{2}$.40824, &c.

Schol. The firſt Canon of *Logarithms* for natural Numbers, from 1 to 20000, and from 90000 to 100000, was conſtructed by *Hen. Briggs*, with the Approbation of the Inventor the Lord *Neper*, and the Manner of conſtructing them ſhewn. The Chaſm between 20000 and 90000 was filled up by *Adrian Ulack*. In the common Tables we have only a Canon from 1 to 10000. There are various other Methods of conſtructing *Logarithms* by Dr. *Halley*, Mr. *Cotes*, Dr. *Brook*, *Taylor*, &c. which the Reader, who has a Curioſity that way, will find in the *Philoſophical Tranſactions*.

To find the Logarithm *for a Number greater than any in the Common Canon, but leſs than* 10000000. Cut off four Figures on the left of the given Number, and ſeek the *Logarithm* in the Table; add as many Units to the Index as there are Figures remaining on the right; ſubſtract the *Logarithm* found from that next following it in the Table: then as the Difference of Numbers in the Canon is to the Tabular Diſtance of the *Logarithms* anſwering to them, ſo are the remaining Figures of the given Number to the Logarithmic Difference; which if it be added to the *Logarithm* before found, the Sum will be the *Logarithm* required; *v. g.* the *Logarithm* of the Number 92375 is required. Cut off the four Figures 9237, and to the Characteriſtic of the *Logarithm* correſponding to them, add an Unit; then

From the *Logarith.* of the Numb. 9238=3.9655780
Subſtract. *Logarith.* Numb.——9237=3.9655309

Remains Tabular Difference 471

10—471—5

2) 235 1

Now to the *Logarithm*——4.9655309
Add the Difference found——235
The Sum is the *Logarithm* required—4.9655544

To find the Logarithm *of a Fraction*: Subſtract the *Logarithm* of the Numerator from that of the Denominator, and to the Remainder prefix the Sign of Subſtraction—Thus ſuppoſe it is required to find the *Logarithm* of the Fraction $\frac{3}{7}$,

Logarithm of 7=0.8450980
Logarithm of 3=0.4771213

Logarithm of $\frac{3}{7}$=0.3679767

The Reaſon of the Rule is, That a Fraction being the Quotient of the Denominator, divided by the Numerator;

tor, its *Logarithm* muſt be the Difference of the *Logarithms* of thoſe two; ſo that the Numerator being ſubſtracted from the Denominator, the Difference becomes negative. *Sefelius* obſerved, that the *Logarithms* of a proper Fraction muſt always be negative, if that of Unity be 0; which is evident, a Fraction being leſs than one.

For an improper Fraction, *v. g.* $\frac{9}{5}$, its Numerator being greater than its Denominator, its *Logarithm* is had, by ſubſtracting the *Logarithm* of the latter from that of the former.

The *Logarithm* of 9 = 0.9542425
Logarithm of 5 = 0.6989700

Logarithm $\frac{9}{5}$ = 0.2553725

In the ſame manner may a *Logarithm* of a mixed Number, as $3\frac{2}{7}$ be found, it being firſt reduced into an improper Fraction $0\frac{23}{7}$.

To find the Number corresponding to a Logarithm, *greater than any in the Table*: Firſt from the given *Logarithm*, ſubſtract the *Logarithm* of 10, or 100, or 1000, or 10000, till you have a *Logarithm* that will come within the Compaſs of the Table; find the Number corresponding to this, and multiply it by 10, or 100, or 1000, or 10000, the Product is the Number required.

Suppoſe, for Inſtance, the Number corresponding to the *Logarithm* 7.7589982 be required; ſubſtract the *Logarithm* of the Number 10000, which is 4.0000000 from 7.7589982, the Remainder is 3.7589982, the Number corresponding to which is 5741 $\frac{11}{100}$, this multiplied by 10000, the Product is 57411100, the Number required.

To find the Number corresponding to a negative Logarithm. To the given negative *Logarithm*, add the laſt *Logarithm* of the Table, or that of the Number 10000; *i.e.* ſubſtract the firſt from the ſecond, and find the Number corresponding to the Remainder; this will be the Numerator of the Fraction, whoſe Denominator will be 10000; *v. g.* ſuppoſe it be required to find the Fraction corresponding to the negative *Logarithm* 0.3679767, ſubſtract this from 4.1000000

The Remainder is—3.6320233, the Number corresponding to which is 4285$\frac{71}{100}$, the Fraction ſought therefore is $\frac{428571}{1000000}$. The Reaſon of the Rule is, that as a Fraction is the Quotient ariſing on the Diviſion of the Numerator by the Denominator, Unity will be to the Fraction as the Denominator to the Numerator; but as Unity is to the Fraction corresponding to the given negative *Logarithm*, ſo is 10000 to the Number corresponding to the Remainder; therefore if 10000 be taken for the Denominator, the Number will be the Numerator of the Fraction required.

To find a fourth Proportional to three given Numbers. Add the *Logarithm* of the ſecond to that of the third, and from the Sum ſubſtract the *Logarithm* of the firſt, the Remainder is the *Logarithm* of the fourth required. *E. g.* let the given Number be 4. 68. and 3.

Logarithm 68 = 1.8325089
Logarithm 3 = 0.4771213

Sum = 2.3096302
Logarithm 4 = 0.6020600

Logarithm required 1.7075702

The Number in the Tables corresponding to which is 51. This Problem is of the utmoſt Uſe in Trigonometry. See *Trigonometry*.

LOGIC is the Art of Thinking juſtly; or of making a right Uſe of our rational Faculties in defining, dividing, and reaſoning. The word is derived from λόγος, *Sermo*, *Diſcourſe*; Thinking being no more than an inward, mental Diſcourſe, wherein the Mind converſes with itſelf. *Logic* is ſometimes alſo call'd *Dialectics*, from διαλεγεσθαι, *to reaſon*; and ſometimes the *Canonical Art*, as being a Canon or Rule for directing us in our Reaſonings. As, in order to think aright, 'tis neceſſary that we apprehend, judge, diſcourſe, and diſpoſe or methodize rightly: hence Apprehenſion, Judgment, Diſcourſe, and Method become the four fundamental Articles of this Art; and 'tis from our Reflections on thoſe Operations of the Mind, that *Logic* is, or ought to be wholly drawn. My Lord *Bacon* divides *Logic* into four Branches, according to the Ends propoſed in each: for a Man reaſons either to find what he ſeeks, or to judge of what he finds, or to retain what he judges, or to teach what he retains; whence ariſe ſo many Arts of Reaſoning, *viz.* the Art of Inquiſition or Invention, the Art of Examining or Judgment, the Art of Preſerving or of Memory, and the Art of Elocution or Delivering, which ſee. *Logic* having been extremely abuſed, is now in a general Diſrepute. The Schools have ſo clogged it with barbarous Terms and Phraſes, and have run it out ſo much into dry uſeleſs Subtilties, that it ſeems rather intended to exerciſe the Mind in Wrangling and Diſputation, than to aſſiſt it in thinking juſtly. 'Tis true, in its Original, it was rather intended as the Art of Cavilling than of Reaſoning; the *Greeks*, among whom it had its Riſe, being a People who piqued themſelves mightily upon their being able to talk *ex tempore*, and to argue by Turns on either Side the Queſtion. Hence their Dialectici, to be always furniſhed with Arms for ſuch Rencounters, invented a Set of Words and Terms, rather than Rules and Reaſons, fitted for the Uſes of Contention and Diſpute. *Logic*, then, was only an Art of Words, which frequently had no Meaning, but ſerved well to hide Ignorance, inſtead of improving Knowledge, to baffle Reaſon inſtead of aſſiſting it, and to confound the Truth inſtead of clearing it. All that Heap of Words, which we have borrowed from the old *Logic*, is of little Uſe in Life, and is ſo far out of the common Uſage; that the Mind does not attend to them without Trouble, and finding nothing in them to reward its Attention, ſoon diſcharges itſelf, and loſes all Ideas it had conceived of them: But *Logic* diſengaged from the Jargon of the Schools, and reduced into a clear and intelligible Method, is the Art of conducting the Reaſon in the Knowledge of Things, and the Diſcovery of Truth. From its proper Uſe we gain ſeveral very conſiderable Advantages; for, (1.) The Conſideration of Rules incites the Mind to a cloſer Attention and Application in Thinking, ſo that we hereby become aſſured that we make the beſt Uſe of our Faculties. (2.) We hereby more eaſily and accurately diſcover and point out the Errors and Defects in our Reaſonings; for the common Light of Nature, unaſſiſted by *Logic*, frequently obſerves an Argumentation faulty, without being able to determine wherein the preciſe Failure conſiſts. (3.) By theſe Reflections on the Order and Manner of the Operations of the Mind, we are brought to a more juſt and compleat Knowledge of the Nature of our own Underſtanding.

LOGISTA, the Title of a Magiſtrate at *Athens*, whoſe Buſineſs was to receive and paſs the Accounts of Officers upon their laying down their Poſts. The *Logiſtæ* were in Number ten.

LOGISTIC, or *Logarithmic Line*, a Curve ſo called, from its Properties and Uſes in conſtructing and explaining the Nature of Logarithms. If the right Line A X, (*Tab. Analyſis, Fig.* 12.) be divided into any Number of equal Parts, and to the Points of thoſe Diviſions A P *p*, &c. be drawn Lines continually proportional, the Points N M *m*, &c. form the *Logiſtic Curve*.

Cor. 1. The Abſciſſes A P, A *p*, &c. are the Logarithms of the Semiordinates P M, *p m*, &c.

Hence if A P = *x*, A *p* = *v*, P M = *y*, *p m* = *z*, and their Logarithms *y* and *z* = *l y* and *l z*, *x* will be = *l y*, and *v* = *l z*, conſequently *x* : *v* = *l y* : *l z*, that is the Denominators of the Ratio's A N, P M, and A N *p m*, are to one another as the Abſciſſes A P and A *p*.

Cor. 2. Hence it follows, that there may be infinite other Logiſtic Lines invented, provided *x m* : *v m* :: *l y* : *l z*, that any of the Roots or Powers may be the Logarithms of the Semiordinates.

Cor. 3. The Logiſtic will never concur with the Axis except at an infinite Diſtance, ſo that A X is its Aſymptote.

LOGISTIC, or *Logarithmic Spiral*, a Line, whoſe Conſtruction is as follows: Divide the Quadrant of a Circle into any Number of equal Parts in the Points P, *p p*, &c. (*Tab. Analyſis, Fig.* 11.) and from the Radii C P, C *p*, C *p*, &c. cutting off C M, C *m*, C *m*, &c. continually proportional, the Points M *m*, *m*, &c. form the *Logiſtic Spiral*.

Cor. The Arches therefore A P, A *p*, &c. are the Logarithms of the Ordinates C M, C *m*, &c. whence alſo it follows, that there may be infinite *Logiſtic* Spirals.

LOGISTICAL ARITHMETIC, was formerly the Arithmetic of Sexageſimal Fractions, uſed by Aſtronomers in their Calculations. It was ſo called from a *Greek* Treatiſe of one *Barlaamus Monætias*, who wrote about Sexageſimal Multiplication very accurately, and entituled his Book Λογιστικὴ. This Author, *Voſſius* places about the Year 1350, but miſtakes the Work for a Treatiſe of Algebra. Thus alſo *Shakerly*, in *Tabulæ Britannicæ*, hath a Table of Logarithms adapted to Sexageſimal Fractions, which therefore he calls *Logiſtical Logarithms*; and the expeditious Arithmetic of them, which is by this means obtained, and by which all the Trouble of Multiplication and Diviſion is ſaved, he calls *Logiſtical Arithmetic*, though ſome by Logiſtics will underſtand the

firſt general Rules in Algebra, of Addition, Subſtraction, &c.

LOGOGRIPHE, a kind of Symbol or Riddle, propoſed to Students for their Solution in order to exerciſe and improve the Mind. It uſually conſiſts in ſome equivocal Alluſion or Mutilation of Words, which, literally taken, ſignify ſomething different from the thing intended by it; ſo that it is a kind of Medium between a Rebus and proper Ænigma. According to *Kircher*, *Logogriphes* are a kind of ſpeaking Arms. Thus a Perſon called *Leonard*, who bore in his Arms a Lion, and Nard or Spikenard, according to that Father, made a *Logogriphe*; *Oedip. Egypt.* In another Place however he defines a *Logogriphe* to be an Ænigma, which under one Name or Word will bear various Meanings, by adding or retrenching ſome Part of it. Theſe kind of Ænigma's are well known to the *Arabs*, among whom are Authors who treat expreſly of them. The Word comes from the *Greek* λόγος, *Diſcourſe*, and γρίφος, *Net*.

LOHOCH. See *Loch*.

LOINS, in Anatomy, are the lower Part of the Spine of the Back, compoſed of five Vertebræ, larger than thoſe of the Back, and ſerving them as a Baſe, having their Articulations pretty looſe, that the Motion of the *Loins* may be more free.

LOLLARDS, the Name of a Sect that roſe in *Germany* about the beginning of the 14th Century. It took its Name from its Author *Lollard Walter*, who began to dogmatize in 1315. Beſides exploding many of the *Romiſh* Doctrines, he is likewiſe ſaid to have ſet aſide Baptiſm as a thing of no effect, and Repentance as not abſolutely neceſſary, &c. *Lollard* was burnt alive at *Cologne* in 1322. In *England* the Followers of *Wickliff* were called, by way of Reproach, *Lollards*, from ſome Affinity there was between ſome of their Tenets; others, however, are of Opinion, that the *Engliſh Lollards* came from *Germany*. They were ſolemnly condemned by the Archbiſhop of *Canterbury* and the Council of *Oxford*. The Monk of *Canterbury* derives the Uſe of the Word *Lollard* among us from *Lolium*, *a Tare*, as if the *Lollards* were the Tares ſown in Chriſt's Vineyard. *Abelly* ſays, that the Word *Lollard* ſignifies *praiſing God*, from the *German loben*, *to praiſe*, and *Herr*, *Lord*, becauſe the *Lollards* imploy'd themſelves in travelling about from Place to Place, ſinging Pſalms and Hymns.

LONGUS, *Long*, an Epithet given by the Anatomiſts to a great Number of Muſcles. The ſecond Extenſor of the *Carpus* is called the *Longus*, in compariſon of the third Extenſor, which is called *brevis*, *ſhort*. The *Longus* has its Origin in the bottom of the *Humerus*, and lying along the *Radius*, paſſes underneath the *Ligamentum Annulare*, and is inſerted into the *Carpus*.

The ſecond Muſcle of the Flexors of the Neck is alſo called the *Longus*, and ſometimes the *Rectus*. It has its Origin in the lateral Part of the Body of the four upper *Vertebræ* of the Back, and is inſerted into the Body of the four *Vertebræ* of the Neck, and ſometimes into the *Occiput*; this, in conjunction with the *Scalenum*, bends the Neck.

The third of the ſix Muſcles of the Elbow or Arm, which is the firſt of its Extenſors, is alſo called the *Longus*, as being the longeſt of the Extenſors. It has its Origin on the upper Side of the *Omoplate*, near the Neck, and deſcending by the hind Part of the Arm, is inſerted into the *Olecranum* by a ſtrong *Aponeuroſis*, which is common to it and the ſecond and third Extenſor of the Arm.

The ſecond Muſcle of the Thumb, which is the firſt of its Extenſors, is alſo called *Longus*, as being longer than another Extenſor of the ſame Thumb, called *Brevis*. The *Longus* proceeds from the upper and external Part of the Bone of the Elbow, and riſing over the *Radius*, is inſerted by a forked Tendon into the ſecond Bone of the Thumb, which it extends.

One of the four Muſcles of the *Radius* is alſo called the *Longus*. This is the firſt of the two Supinators, and has its Origin three or four Fingers breadth above the outer *Apophyſis* of the *Humerus*, whence running along the *Radius*, it is inſerted into the inner Part of its lower *Apophyſis*. It is called *Longus* with regard to the other Supinator, which is called *Brevis*. Theſe two Muſcles ſerve to turn the *Radius*, ſo as the Palm of the Hand looks upwards; which makes the Supination.

Laſtly, the firſt of the Abductors of the Leg is called the *Longus*, and bears this Title more juſtly than any of the others, as being the longeſt Muſcle in the whole Body. It is alſo called *Sartorius*, becauſe it ſerves to bend the Leg inwards, as the Taylors uſe to have it when at work. See *Sartorius*.

LONG ACCENT, in Grammar, &c. ſhews that the Voice is to ſtop upon the Vowel, that hath that Mark, and it is expreſſed thus (-).

LONG MEASURE. See *Meaſure*.

LONGÆVITY, *Length of Life*. From the different *Longævities* of Men in the beginning of the World, after the Flood, and in theſe Ages, Mr. *Derham* draws a good Argument for the Interpoſition of a Divine Providence. Immediately after the Creation, when the World was to be peopled by one Man and one Woman, the ordinary Age was 900 and upwards. Immediately after the Flood, when there were three Perſons to ſtock the World, their Age was cut ſhorter, and none of thoſe Patriarchs but *Shem* arrived at 500. In the ſecond Century we find none that reach'd 240, in the third none but *Terah* that came to 200 Years: The World, at leaſt a part of it, by that time being ſo well peopled, that they had built Cities, and were canton'd out into diſtant Nations. By degrees, as the Number of People increas'd, their *Longævity* dwindled; till it came down at length to 70 or 80 Years: and there it ſtood, and has continued to ſtand ever ſince the Time of *Moſes*. This is found a good Medium, and by means hereof the World is neither overſtock'd, nor kept too thin; but Life and Death keep a pretty equal pace. See *Mortality*.

That the common Age of Man has been the ſame in all Ages ſince the World was peopled, is plain both from Sacred and Profane Hiſtory. To paſs by others, *Plato* lived to 81, and was accounted an Old Man; and the Inſtances of *Longævity* produced by *Pliny*, *l.* 7. *c.* 48. as very extraordinary, may moſt of 'em be match'd in modern Hiſtories; particularly in Dr. *Plott*'s *Nat. Hiſt. of* Oxf. *and* Staff. Among others, he tells of twelve Tenants to the ſame Perſon, who made up 1000 Years; to ſay nothing of Old *Parre*, who lived 152 Years 9 Months; or of *H. Jenkins* of *Yorkſhire*, who lived 169 Years; or of the Counteſs of *Deſmond*, or Mr. *Eckleſton*, both of *Ireland*, who each exceeded 140 Years. See *Life*.

LONG-BOAT is the largeſt and ſtrongeſt Boat belonging to a Ship, that can be hoiſted a-board of her. Its Uſe is to bring any Goods, Proviſion, &c. to or from the Ship, or, on Occaſion, to land Men any where, and particularly to weigh the Anchor.

LONGIMETRY, the Art of meaſuring Lengths; both acceſſible, as Roads, &c. and inacceſſible, as Arms of the Sea, &c. *Longimetry* is a Part of Trigonometry, and a Dependant on Geometry, in the ſame manner as Altimetry, Planimetry, Stereometry, &c. The Art of *Longimetry* ſee under the Names of the Inſtruments uſed in it, particularly *Theodolite*, *Chain*, &c.

LONGISSIMUS DORSI is a Muſcle of the Back, that at its beginning is not to be diſtinguiſhed from the *Sacro-lumbaris*, ariſing with it from the hinder Part of the *Os Ilium*, and *Os Sacrum*, and the firſt *Vertebra* of the Loins; it runs upwards along the whole Tract of the Back, and is connected by Tendons to each tranſverſe Proceſs in its way, and ends ſometimes in the firſt *Vertebra* of the Back, and ſometimes in the firſt of the Neck; and, as ſome Authors ſay, reaches now and then to the *Proceſſus Mamillaris* of the *Os Petroſum*. In conjunction with ſome others, this helps to keep the Body erect.

LONGISSIMUS OCULI, the Name of a Muſcle. See *Obliquus Superior*.

LONGITUDE of a Place, in Geography, is its Diſtance from ſome firſt Meridian; or an Arc of the Equator intercepted between the Meridian of the Place, and the firſt Meridian; or the Difference Eaſt and Weſt between the Meridians of any two Places, counted on the Equator. To diſcover an exact Method of finding the *Longitude*, eſpecially at Sea, is a Problem, that has extremely perplex'd the Mathematicians of theſe two laſt Ages; and for the Solution whereof, great Rewards have been publickly offer'd by the *Engliſh*, *French*, *Dutch*, and other Nations: this being the only thing wanting to render Navigation perfect. Various are the Attempts that Authors have made for this purpoſe, and various the Methods they have propoſed, but ſtill without Succeſs; all their Schemes being found either falſe, precarious, impracticable, or in ſome way or other defective: ſo that the Palm is ſtill unaſcertain'd. What they moſt of 'em aim at, is a Method of determining the Difference of Time between any two Points on the Earth; for every 15 Degrees of the Equator anſwering to an Hour, *i. e.* one Degree to 4 Minutes of Time, and one Minute of a Degree to 15 Seconds of Time; the Difference of Time being known and turn'd into Degrees, will give the *Longitude*, and *vice verſa*. This ſome have pretended to effect by Clocks, Watches, and other *Automata*; but always in vain; no Time-keeper, excepting a Pendulum (which cannot be applied at Sea) being ſufficiently ſure and exact for the purpoſe.

Others, with more probability, and to better purpoſe, ſearch for it in the Heavens; for if the exact Times of any Celeſtial Appearance be known for two Places, the

Diffe-

Difference of those Times gives that of the *Longitude* of those Places. Now in the *Ephemerides*, we have the Motions of the Planets, and the Times of all the Celestial *Phænomena*, as the Beginning and Ending of Eclipses, Conjunctions of the Moon with other Planets, its Entrance into the Ecliptic, *&c.* accurately calculated for some one Place. Therefore if the Hour and Minute be known wherein any of the same *Phænomena* are observ'd in an unknown Place, the Difference between the Hour and Minute between that Place and that other, to which the Tables are calculated, and consequently the Difference of their Meridians, and their *Longitude* from each other, are known also. Now the Difficulty, here, does not consist in the exact finding of the Time, which is easily had from the Sun's Altitude or Azimuth; but the Defect lies in the Paucity of proper Appearances capable of being thus observ'd: For all slow Motions (*v.g.* that of *Saturn*) are at once excluded; as shewing but little Difference in a considerable Space of Time; and it being here required that the *Phænomenon* be sensibly varied in two Minutes Time, an Error of two Minutes in Time producing another of 30 Miles in the *Longitude*. Now there are no *Phænomena* in the Heavens that have these Requisites, excepting the several Stages of an Eclipse of the Moon; her *Longitude*, or Place in the Zodiac; her Distance from the fix'd Stars, or Appulse to them; her Ingress into the Ecliptic, or the Points of her Orbit where that cuts the Ecliptic; and the Conjunction, Distance and Eclipses of *Jupiter*'s Satellites. Of each of these in their Order.

1. The first Method, by the Eclipses of the Moon, is very easy and sufficiently accurate, were there but Eclipses every Night. At the moment wherein we see the beginning or middle of a lunar Eclipse by a Telescope, we have nothing to do but take the Altitude or Azimuth of some fixed Star, from which the Hour and Minute are easily found; or without the Altitude, if the Star be in the Meridian. This Hour and Minute therefore, thus found, and compared with that express'd in the Tables, give the *Longitude*.

2. The Moon's Place in the Zodiac is a *Phænomenon* more frequent than that of her Eclipses, but then the Observation thereof is difficult, the *Calculus* intricate and perplex'd, by reason of two Parallaxes; so that it's scarce practicable to any tolerable degree of Accuracy. Indeed by waiting till the Moon comes into the Meridian of the Place, and then taking the Altitude of some remarkable Star (the Latitude being supposed to be first known) from this Altitude and the Latitude, we shall be able to find the Time pretty accurately, tho 'twill be better to do it by some Star in the Meridian. Now the Time being found, 'twill be easy to find what Point of the Ecliptic is then in the Meridian or Mid-haven. Thus we shall have the Moon's Place in the Zodiac corresponding to the Time of our Place. Then in the *Ephemeris* we find what Hour it is in the Meridian of the *Ephemeris*, when the Moon is in that part of the Zodiac: Thus we shall have the Hour and Minute of the two Places for the same Time; the Difference of which will give the Difference of *Longitude*.

3. In regard there are many times when the Moon cannot be observ'd in the Meridian, there is therefore another still more frequent *Phænomenon* from which the *Longitude* is fought; *viz.* the Moon's Appulse and Recess from the fixed Stars: for from thence the Moon's true Place may be investigated for the given Time of Observation. But this Method, by reason of the Parallaxes, and the Solution of oblique spherical Triangles, and the various Cases, is so very difficult and perplex'd, that the Mariners are not able to make use of it; nor is it necessary to trouble the Reader with the Praxis thereof. Those however who are disposed to use it, will find very considerable Help from a starry Zodiac, publish'd under the Direction of Dr. *Halley*, containing all the Stars to which the Moon's Appulse can be observ'd.

4. To find the *Longitude* by the Moon's Ingress into the Ecliptic; observe the Moment of that Ingress: Then in the *Ephemeris*, see what Hour it is in the Meridian of the *Ephemeris*, when that Ingress happens. The Difference between these Times, gives the Difference of *Longitude*.

5. The *Phænomena* of *Jupiter*'s Satellites are generally preferred to those of the Moon, for finding the *Longitude*; by reason the former are less liable to Parallaxes, and do, further, afford a very commodious Observation in every Situation of that Planet above the Horizon. Their Motion is very swift, and must be calculated for every Hour, and for that reason are not found in the common *Ephemerides*, but are had elsewhere. Now to find the *Longitude* by means of these Satellites, with a good Telescope observe a Conjunction of two of them or of one of them with *Jupiter*, or any other the like Appearance, and at the same time find the Hour and Minute from the Meridian Altitude of some Star; then consulting Tables of the Satellites, observe the Hour and Minute wherein such Appearance happens in the Meridian of the Place to which the Tables are calculated. The Difference of Time, as before, will give the *Longitude*.

6. All Methods that depend on the *Phænomena* of the Heavens having this one Defect, that they are not to be observed at all times; and being, besides, very difficult of Application at Sea, by reason of the Motion of the Ship; there are some, who, leaving the Moon and the Satellites, have recourse to Clocks and other *Automata*; which, could they be made perfectly just and regular, so as to move with the Sun without either gaining or losing, and without being affected with the Change of Air and of Climates; the *Longitude* would be had with all the Ease and Accuracy imaginable, nothing more being required but to set the Machine by the Sun at the time of Departure; and when the *Longitude* of any Place is desired, to find the Hour and Minute from the Heavens, (which is done at Night by the Stars, and in the Day by the Sun) for the Difference between the Time, thus observed, and that of the Machine, gives the *Longitude*: But no such Machine has been yet discover'd. Wherefore Recourse has been still further had to other Methods.

7. Mr. *Whiston* and Mr. *Ditton* have proposed a Method of determining the *Longitude* by the Flash and Report of great Guns. Sounds, 'tis known, move pretty equably in all their Stages, whatever the sonorous Body be that occasions it, or whatever the Medium that conveys it. If then a Mortar or great Gun be exploded at a Place, whose *Longitude* is known, the Difference between the Time wherein the Flash (which moves, as it were, instantaneously) is seen, and the Sound, which moves at the rate of four Seconds in a Mile, is heard, will give the Distance of those Places from each other; whence, if their Latitudes be known, the Difference of *Longitude* will be likewise known. Again, if the Hour and Minute of the Explosion be known, (for the Place where it is made) by observing the Hour and Minute from the Sun or Stars, at the Place whose *Longitude* is required; the Difference between those Times will give the Difference of *Longitude*. Again, if the said Mortar be loaden with an Iron Shell full of combustible Matter, and posited perpendicularly, it will carry the same a Mile high, which will be seen near a hundred Miles; if therefore neither the Sound should be heard, nor the Flash seen, the Distance of any remote Place from the Place of the Mortar may be determin'd from the Altitude of the Shell above the Horizon of the Place unknown: and the Distance and Latitudes known, the *Longitude* is easily found. According to this Scheme 'twas proposed to have such Mortars fix'd at proper Distances, and at known Stations, on all the frequented Coasts, Islands, Capes, *&c.* and to be exploded at certain Hours for the Observation of Mariners. This Method, tho good in the Theory, yet is found useless in the Practice; as being extremely troublesome, and yet precarious. It supposes that Sounds may be heard 40, 50, or 60 Miles; of which, 'tis true, we have Instances, but they are very rare; and ordinarily the Report of a Cannon is not heard above half so far; and sometimes much less. It supposes, again, Sound to move always with equal Velocity; whereas, in fact, its Velocity is increased or diminished as it moves with or against the Wind. It supposes, again, the Strength of Powder uniform; and that the same Quantity carries the same Range; the contrary whereof is known to every Gunner. We say nothing of thick cloudy Nights, when no Lights can be seen; nor of stormy Nights, when no Sound can be heard; even at inconsiderable Distances.

8. We have another Method of finding the *Longitude*, proposed by the same ingenious Gentleman Mr. *Whiston*, *viz.* by the Inclinatory or Dipping-Needle. See *Dipping-Needle*.

Longitude of the Earth, is its Extent from West to East, according to the Situation of the Æquator; as the Latitude of the Earth is its Extent in Surface from one Pole to the other.

Longitude in the Heavens, is an Arc of the Ecliptic, counted from the beginning of *Aries*, to the Place where a Star's Circle of *Longitude* crosses the Ecliptic: so that it is much the same as the Star's Place in the Ecliptic, reckoned from the beginning of *Aries*; which to find, see *Place of the Sun or Star*. *Longitude* of the Sun or Star from the next equinoctial Point, is the Number of Degrees and Minutes they are from the beginning of *Aries* or *Libra*, either before or after them; which can never be more than 180 Degrees. *Longitude*, in Navigation, is also the Distance of a Ship or Place, East or West, from another.

To find the *Longitude* or Latitude of any Star by the Globe: Bring the Solſtitial Colure to the Braſs Meridian, and there fix the Globe; then will the Pole of the Ecliptic be juſt under 23 deg. 30 min. accounted from the Pole above the Horizon, and on the ſame Meridian: There ſcrew the Quadrant of Altitude, bring its graduated Edge to the Star, and there ſtay it; thus the Quadrant will cut the Ecliptic in the Star's *Longitude*, as alſo its Latitude reckoned on the Quadrant, from the Ecliptic. See *Globe*.

Longitude of Motion, is a Term uſed by Dr. *Wallis* in his Mechanics, for the Meaſure of Motion eſtimated according to the Line of Direction; ſo that it is the Diſtance, or Length, which the Center of any moving Body runs thro, as it moves on in a Right Line. And he calls the Meaſure of any Motion, eſtimated according to a Right Line or Line of Direction of the *Vis Motrix*, the Altitude of it.

Bellini alſo uſeth this Term of *Longitude* and Altitude in the ſame Senſe in many Places of his Writings, and which an ordinary Reader finds hard to underſtand for want of this Interpretation. By Altitude alſo, in his 19th Propoſition *de Febribus*, he means the Thickneſs of the viſcid Matter in the Blood-Veſſels; or the greateſt Length a viſcid Particle is extended into from the ſide of the Canal to its Axis.

LONGITUDINAL, according to the Etymology of the Word, ſignifies ſomething extended length-wiſe. Thus in Anatomy it is uſed to ſignify ſome Part or Member running in length, or poſited length-wiſe. The Membranes that compoſe the Veſſels are woven out of two kinds of Fibres, the one *Longitudinal*, and the other Circular, cutting the *Longitudinal* at Right Angles. The *Longitudinal* are tendinous and elaſtic; the Circular, muſculous and motrices, like Sphincters.

LONGUS COLLI, a Muſcle which ariſes chiefly fleſhy, tho partly tendinous, from the fore-part of the five upper Vertebræ of the Back, and is inſerted into the fore-part of every Vertebra of the Neck. Its Uſe is to bend the Neck forward.

LONGUS CUBITI, a Muſcle, that, in conjunction with others, extends the *Cubitus*: It ariſeth from the inferior Coſta of the Scapula, nigh its Neck, and paſſeth betwixt the two round Muſcles. It deſcends on the back-ſide of the Humerus, where it joins with the *Brevis* and *Brachiæus externus*.

LONGUS FEMORIS, in Anatomy. See *Sartorius*.

LOOF, or, as they uſually pronounce it, *Luff*, is a Term uſed in Conding of a Ship: Thus, *Loof up*, is to bid the Steerſ-man keep nearer to the Wind: To *loof into an Harbour*, is to ſail into it cloſe by the Wind: To *ſpring the Luff*, is when a Ship, that before was going large before the Wind, is brought cloſe by the Wind. When a Ship ſails on a Wind, that is, on a Quarter-Wind, they ſay to the Steerſ-man, *Keep your Luff! Veer no more! Keep her to! Touch the Wind! Have a care of the Lee-Latch!* All which Words ſignify much the ſame thing, and bid the Man at Helm to keep the Ship near the Wind.

Loof of a Ship, is that part of her aloft, which lies juſt before the Cheſs-Trees; and hence the Guns, which lie here, are called her *Loof-Pieces*.

LOOKING-GLASS, a plain Glaſs, Speculum, or Mirror, which being impervious to the Light, reflects its Rays, and ſo exhibits the Images of Objects placed before it.

The Theory of *Looking-Glaſſes*, and the Laws whereby they give the Appearances of Bodies, ſee under *Mirror*.

The Manner of grinding and preparing the Looking-Glaſſes is as follows: A Plate of Glaſs is fixed to a horizontal Table, and to another leſs Table is fixed another Plate, over the hind Part of which is added a Box loaded with Stones and other Weights. Over the firſt Plate is ſprinkled fine Sand and Water in a ſufficient Quantity for the Grinding, and the ſecond or leſs Plate is laid on it, and thus worked this and that way, till each has planed the others Surface. As they begin to grow ſmoother, finer Sand is uſed, and at laſt Powder of Smelt. Being thus fit for poliſhing, a wooden Parallelopiped, lined with *Tripoli* Earth, or burnt Tin, tempered with Water, is laid on the Plate, and worked to and again, till the Glaſs have got a perfect Politure.

'Tis found extremely difficult to bring the Glaſs to a perfect Plainneſs. *Hevelius* judges more Art required to bring a Glaſs to an exact Plane than to a Sphere. For poliſhing large Plates of Glaſs, they have a Machine for the purpoſe.

The Plates being thus poliſhed, a thin blotting Paper is ſpread on a Table, and ſprinkled with fine Chalk; and this done, over the Paper is laid a thin Lamina, or Leaf of Tin, on which is poured Mercury, which is to be equally diſtributed over the Leaf, with a Hare's Foot or Cotton. Over the Leaf is laid a clean Paper, and over that the Glaſs-Plate. With the left Hand the Glaſs-Plate is preſſed down, and with the right the Paper is gently drawn out; which done, the Plate is covered with a thicker Paper, and loaden with a greater Weight, that the ſuperfluous Mercury may be driven out, and the Tin adhere more cloſely to the Glaſs. When it is dried, the Weight is removed, and the *Looking-Glaſs* is compleat.

Some add an Ounce of Mercury to half an Ounce of Marchaſite, melted by the Fire; and left the Mercury evaporate in Smoke, pour it into cold Water, and, when cold, ſqueeze it thro' a Cloth or Leather. Some alſo add a Quarter of an Ounce of Lead and Tin to the Marchaſite, that the Glaſs may dry the ſooner.

LOOM, the Weaver's Frame; a Machine whereby ſeveral diſtinct Threads are wove into one Piece. *Looms* are of various Structures, accommodated to the various Kinds of Materials to be wove, and the various Manners of weaving them; *viz.* for Woollens, Silks, Linnens, Cottons, Cloths of Gold; and other Works, as Tapeſtry, Ribbands, Stockings, &c. Moſt of which will be found under their proper Heads.

LOOP-HOLES, in the Sea-Language, are *Holes* made in the Comings of the Hatches of Ships, and in their Bulk-heads to fire Muskets thro in a cloſe Fight. And the ſame are they in the Covert Defences of all Fortifications.

LORD, (from a *Saxon* Original, ſignifying a Bread-Giver, Bountiful or Hoſpitable) is a Title of Honour variouſly applied amongſt us; being ſometimes attributed to thoſe who are noble by Birth or Creation, otherwiſe call'd *Lords of Parliament*, and Peers of the Realm; ſometimes to thoſe ſo call'd by the Courteſy of *England*, as all Sons of a Duke and Marquiſs, and the eldeſt Son of an Earl: ſometimes to Perſons honourable by Office, as *Lord Chief Juſtice*, &c. And ſometimes to an inferior Perſon that has Fee, and conſequently the Homage of Tenants within his Mannor; for by his Tenants he is call'd *Lord*, and in ſome Places, for diſtinction ſake, *Land-lord*. 'Tis in this laſt Signification that the word *Lord* is principally uſed in our Law-Books; where it is divided into *Lord Paramount* and *Lord Meſn*: *Lord Meſn* is he that is Owner of a Mannor, and by virtue thereof hath Tenants holding of him in Fee, and by Copy of Court-Roll; and yet holds, himſelf, of a ſuperior *Lord*, call'd *Lord Paramount*, or above him. We alſo read of *Very Lord* and *Very Tenant*: *Very Lord* is he who is immediate *Lord* to his Tenant; and *Very Tenant*, he who holds immediately of that *Lord*: ſo that where there is *Lord Paramount*, *Lord Meſn*, and Tenant; the *Lord Paramount* is not *Very Lord* to the Tenant. He is alſo call'd *Lord in Groſs*.

Lord-High-Admiral of England, is one of the great Officers of the Crown, whoſe Truſt and Honour is ſo great, that it has ſeldom been given, excepting to ſome of the King's younger Sons or near Kinſmen. To him is, by the King, intruſted the Management of all maritime Affairs, as well in reſpect of Juriſdiction as Protection. He is that high Officer or Magiſtrate, to whom is committed the Government of the *Britiſh* Navy, with Power to decide all Controverſies, and Cauſes Maritime, as well Civil as Criminal, for which there is a peculiar Court; ſuch as happen either on our own Coaſts, or beyond Sea, amongſt his Majeſty's Subjects: and of ſuch Wrecks and Prizes, as are called *Lagon*, *Jetſon*, and *Flotſon*; that is, Goods lying in the Sea floating, or caſt on ſhore, excepting in ſuch Royalties as are granted to other Lords of the Mannor, &c. All great Fiſhes, call'd *Royal Fiſh*, except Whales and Sturgeon: A Share of Prizes in time of War, and the Goods of Pirates and Felons condemned. The *Lord-High-Admiral* hath under him many Officers of high and low Condition; ſome at Sea, others at Land; ſome of a Military, others of a Civil Capacity: ſome Judicial, others Miniſterial. And in his Court all Proceſſes iſſue in his Name, not the King's, as it does in all other Courts; ſo that the Dominion and Juriſdiction of the Sea may juſtly be ſtiled another Commonwealth, or Kingdom apart, and the *Lord-High-Admiral*, Viceroy of the Maritime Kingdom. He hath under him a Lieutenant, who is Judge of the Admiralty, commonly a Doctor of the Civil Law; the Proceedings in this Court in all Civil Matters, being according to the Civil Law: but in Criminal Matters, they proceed by a Special Commiſſion from the Secretary, according to the Laws of *England*.

Lord-Privy-Seal, hath his Office by Patent: before the 30th of *Henry* VIII. they were generally Eccleſiaſticks; ſince which, the Office hath been uſually confer'd on Temporal Peers, above the Degree of Barons. Under the *Privy-Seal* paſſeth all Charters and Grants of the Crown, and Pardons ſign'd by the Sovereign before they have the Great-Seal; as alſo ſeveral other Matters of leſs Concern, as the Payment of Money, &c. which have

no recourſe to the Great-Seal. The *Lord-Privy-Seal* receiving his Warrant from the Signet-Office, iſſues the *Privy-Seal*, which is an Authority to the Lord Chancellor to paſs the Great-Seal, where the nature of the Grant requires the Great-Seal. But *Privy-Seals* for Money begin in the Treaſury, from whence the firſt Warrant iſſues, counterſign'd by the Lord-Treaſurer. On the *Lord-Privy-Seal* are attendant four Clerks, who have two Deputies, to act for them. The Clerks of the *Privy-Seal* and Signet have no Salaries, but Board-Wages 30 *l. per Annum*, and pay Taxes; but they have conſiderable Fees upon Warrants, for Gift of any Office, Penſion, Annuity, Special Livery, Conge d'Elires, Preſentations, Pardons, Licences, *&c.*

Lord-Steward of the King's Houſhold, is the principal Officer for the Civil Government of the King's Servants below Stairs; over the Officers of which, he has Juriſdiction. He is conſtituted by the Delivery of the White Staff, which is eſteemed his Commiſſion. By virtue of his Office, without any other Commiſſion, he judges of all Offences committed within the Court, or the Verge thereof, and gives Judgment according to their ſeveral Deſerts. To him it belongs at the beginning of the Parliament to attend the King, and to adminiſter the Oaths of Allegiance and Supremacy to all the Members of the Houſe of Commons, and at the end of Parliament to adjuſt Parliamentary Expences. At the Death of the Sovereign he breaks his Staff over the Hearſe, in which the Royal Corps are depoſited, and thereby diſchargeth all the Officers under his Power.

Lord-Lieutenants of Counties, are Officers of great Diſtinction, appointed by the King for managing the ſtanding Militia of the Country, and all Military Matters: They are generally of the principal Nobility, and of the beſt Intereſt in the County: They are to form the Militia in caſe of a Rebellion, *&c.* and march at the Head of them, as the King ſhall direct. They have the Power of commiſſioning Colonels, Majors, Captains, and Subaltern Officers; alſo to preſent the King with the Names of the Deputy-Lieutenants; who are to be ſelected from the beſt Gentry in the County, and act in the Abſence of the *Lords-Lieutenants*. No Subject is to be charged with an Horſeman, unleſs he has 500 *l. per Annum*, or 6000 *l.* Perſonal Eſtate; nor with a Foot-Soldier, unleſs he hath 50 *l.* yearly, or 600 *l.* Perſonal Eſtate. Subſervient to the *Lords-Lieutenants*, and Deputy-Lieutenants, are the Juſtices of Peace, who, according to the Order they receive from them, are to iſſue out Warrants to the High and Petty-Conſtables, *&c.* for Military Service, *&c.*

LOT. See *Scot.*

LOTION, in Pharmacy, a Preparation of Medicines, by waſhing them in ſome Liquid, either made very light, ſo as to take away only the Dregs; or made to penetrate them, in order to clear them of ſome ſalt or corroſive Spirit; as the *Lotion* of Antimony, Precipitates, Magiſteries, *&c.* Or elſe intended to take away ſome ill Quality, or to communicate ſome good one.

Lotion is alſo the Name of a Remedy, holding a Medium between a Fomentation and a Bath. There are refreſhing and ſomniferous *Lotions* for feveriſh Perſons, made of Leaves, Flowers and Roots boil'd, wherewith the Feet and Hands of the Patient are waſh'd, and after waſhing, wrapp'd up in Linnen ſteep'd in the ſame Decoction till dry. There are *Lotions* alſo for the Head and Hair, made of the Aſhes of Vine-Twigs.

Lotion of the Philoſophers, in Chymiſtry, is a Cohobation which Nature makes of what is rais'd up, and afterwards falls back to the bottom of the Veſſel.

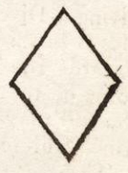
Lotion, Waſh, a Form of Medicine made up of liquid Matters, uſed for beautifying the Skin, and cleanſing it from thoſe Deformities which a diſtemper'd Blood ſometimes throws on it; or rather, which are occaſion'd by a preternatural Secretion; for, generally ſpeaking, thoſe Diſtempers of the Skin, which are accounted Signs of a foul Blood, proceed from the natural Salts thrown off by the cutaneous Glands, which ought to be waſh'd away thro the Kidneys: ſo that inſtead of Sweetners, which are uſually preſcribed on theſe Occaſions, Dr. *Quincy* thinks the Urinary Diſcharge ſhould be promoted, or that of the Skin rectified by proper *Lotions*, or Ointments and Frictions.

LOTTERY, a kind of Game at Hazard, wherein ſeveral Lots of Merchandize, or Sums of Money, are depoſited for the Benefit of the Fortunate. The Deſign of *Lotteries*, and the Manner of drawing them, are too well known among us to need a Deſcription here. They are very frequent in *England* and *Holland*, where they cannot be ſet on foot without the Permiſſion of the Magiſtrate. In *France* too they have had ſeveral in favour of their Hoſpitals. M. *le Clerc* has compoſed a Treatiſe of *Lotteries*, wherein is ſhewn what is laudable, and what blameable in 'em. *Gregorio Læti* alſo publiſh'd a Book on the Subject of *Lotteries*. And Father *Meneſtrier* has done the ſame in a Treatiſe publiſh'd in 1700. He there ſhews their Origin, and their Uſe among the *Romans*. He diſtinguiſhes ſeveral kinds of *Lotteries*, and takes occaſion to ſpeak of Chances, and reſolves ſeveral Caſes of Conſcience relating thereto.

LOVE and *Hatred*. See *Pleaſure* and *Pain*.

LOUIS, or LOUIS D'OR, a *French* Coin, firſt ſtruck in 1640. under the Reign of *Louis* XIII. and which has now a conſiderable Courſe. *Louis d'Ors* at firſt were valued at 10 Livres, afterwards at 11, and at length at 12 and 14. In the latter end of *Louis* XIV. they were riſen to 20, and in the beginning of that of *Louis* XV. to 30 and 36, nay 40 and upwards; with this Difference however, that in the laſt Coinings, the Weight was augmented in ſome proportion to the Price, which in the former Reign was never regarded. On one ſide of the Coin is the King's Head ſeen, with his Name; and on the other, a Croſs compoſed of 8 L's cantoned with Crowns. The Legend is, *Chriſtus regnat, vincit, imperat.* The Reverſe has been frequently changed; at preſent it bears a Hand of Juſtice croſs'd in a Saltier, with a Scepter.

There are alſo white *Louis's*, or *Louis d'Argent*; ſome of 60, of 30, 15, 5, and 4 Sols a-piece, called alſo *Ecus*, and among us *French Crowns*, *Half-Crowns*, &c. See *Crown*. On the one ſide whereof is the King's Head, and on the other the *French* Arms, with this Legend, *Sit nomen Domini benedictum.*



ST. LOUIS, the Name of a Military Order inſtituted by *Louis* XIV. in 1693. Their Collar is of a Flame-colour, and paſſes from Left to Right. The King is their Grand Maſter. There are in it 8 Grands-Croix, and 24 Commanders. The Number of Knights is not limited. At the time of their Inſtitution, the King charged his Revenue with a Fund of 300000 Livres, for the Penſions of the Commanders and Knights.

LOW-BELLERS, in our Statute-Books, are Perſons who go with Light and a Bell; whereby Birds ſitting on the Ground become ſtupefied, and ſo are cover'd with a Net and taken.

LOXODROMY, *Rhumb*, the Courſe of a Ship, or the Line it deſcribes in ſailing from any Point towards another, excepting a Cardinal Point; making equal Angles with every Meridian. The word *Loxodromy* is derived from the *Greek* λοξὸς, *oblique*, and δρόμος, *Courſe*; becauſe it cuts the Circles of the Sphere obliquely. See *Rhumb*.

LOXODROMIQUES, the Art or Method of oblique Sailing, by the *Loxodromy* or Rhumb. Hence *Loxodromic Triangle*, &c. See *Rhumb*.

LOZENGE or LOZANGE, a kind of Parallelogram or quadrilateral Figure, conſiſting of four equal and parallel Lines or Sides, whoſe Angles are not right, but whereof two oppoſite ones are acute, and the other two obtuſe; the Diſtance between the two obtuſe ones being always equal to the Length of one Side. Some Geometricians call the *Lozenge Hebmuaym*, and the *Trapezium Hebmuarepte*. In Geometry it is ordinarily call'd *Rhombus*, and when the Sides are unequal, *Rhomboides*. *Scaliger* derives the word *Lozenge* from *Laurengia*, this Figure reſembling in ſome Reſpects that of a Laurel-Leaf.

Lozenge is alſo a Term in Heraldry; and 'tis in this Figure that all unmarried Gentlewomen and Widows bear their Coats of Arms; becauſe, as ſome ſay, it was the Figure of the *Amazonian* Shield, or, as others, becauſe it is the antient Figure of the Spindle. The *Lozenge* differs from the Fuſil, in that the latter is narrower in the Middle, and not ſo ſharp at the Ends.

Lozenges, a Form of Medicine, made into ſmall Pieces, to be held or chewed in the Mouth, till they are melted or waſted.

LUCARIA, the Name of a Feaſt in uſe among the *Romans*. *Sextus Pompeius* obſerves, that the *Lucaria* were celebrated in the Wood, where the *Romans*, defeated and purſued by the *Gauls*, retired and concealed themſelves. It was held in the Month of *July*, in memory of the Aſylum they found in that Wood, which was between the *Tyber* and the Road call'd *Via Salaria*.

The Word, according to *Feſtus* and *Sex. Pompeius*, comes from *Lucus*, a Grove or Wood. *Varro* derives it from *Luce*, the Ablative of the word *Lux*, Light and Liberty. But former Etymology ſeems the more natural.

LUCIANIST, or LUCANIST: The Name of a Sect ſo called from *Lucianus* or *Lucanus*, a Heretic of the ſecond Century. He was a Diſciple of *Marcion*, whoſe Errors he follow'd, and added new ones to 'em. *Epiphanius* ſays, he abandon'd *Marcion*, teaching that People ought not to marry for fear of enriching the Creator: And yet other Authors mention, that he held this Error

in common with *Marcion* and the other *Gnoſtics*. He denied the Immortality of the Soul; aſſerting it to be material.

There was another Sect of *Lucianiſts*, who appear'd ſome time after the *Arians*. They taught, that the Father had been a Father always, and that he had the Name even before he had begotten the Son; as having in him the Power or Faculty of Generation: And in this manner accounted for the Eternity of the Son.

LUCID INTERVALS, the Fits or Paroxiſms of *Maniacs*, wherein the Phrenzy leaves them in poſſeſſion of their Reaſon. 'Tis ſaid they are capable of making a Will in their *Lucid Intervals*.

LUCIDA CORONA, a fix'd Star of the ſecond Magnitude in the Northern Garland. See *Star*.

LUCIDA LYRA, a bright Star of the firſt Magnitude in the Conſtellation *Lyra*. See *Star*.

LUCIFERIAN, the Name of a Sect, who adhered to the Schiſm of *Lucifer de Cagliari*, in the fourth Century. St. *Auguſtin* ſeems to intimate, that they believed the Soul tranſmitted to the Children by their Fathers. *Theodoret* ſays, that *Lucifer* was the Author of a new Error. The *Luciferians* increaſed mightily in *Gaul*, *Spain*, *Egypt*, &c. The Occaſion of this Schiſm was, that *Lucifer* would not allow any Acts he had done to be aboliſhed. There were but few *Luciferian* Biſhops, but a great Number of Prieſts and Deacons. The *Luciferians* bore a very ſtrong Averſion to the *Arians*.

LUES properly ſignifies a Plague or Contagion, tho' according to the modern Uſe of the Word, eſpecially when joined with *Gallica*, or *Venerea*, it is reſtrained only to the *French* Pox. See *Venereal Diſeaſe*.

LUFF, a Sea-Term, the ſame with *Loof*, which ſee.

LUMBAGO, Pains very troubleſome about the Loins and the Small of the Back, ſuch as precede Ague-Fits and Fevers. They ariſe commonly from Fullneſs and Acrimony; in common with a Diſpoſition to Yawnings, Shuddering, and erratick Pains in other Parts; and go off with Evacuation, generally by Sweat, and other critical Diſcharges of Fevers.

LUMBARES, an Epithet given to thoſe Branches of the *Arteria Aorta*, which carry the Blood to the Muſcles of the Loins. The Term is alſo applied to certain Veins, which bring back the Blood from the *Loins* into the Trunk of the *Vena Cava*. There is alſo a Muſcle of the Thigh that bears this Name. See *Pſoas*.

Lumbares Glandulæ. See *Lacteal Veins*.

Lumbares Venæ & Arteriæ, ſeveral ſo called, while in their Paſſage thro' the Loins; from *Lumbus*, *Loins*.

LUMBRICAL, an Epithet which the Phyſicians give to four Muſcles, that ſerve to move the Fingers. They are call'd *Lumbricales*, or *Vermiformes*, from the Reſemblance they bear to Worms. There is a like Number in the Feet.

Lumbricales Muſculi, (called alſo *Vermiculares*, in regard of the reſemblance they bear to Worms by their Smallneſs and Shape) are Muſcles of the Hands, commonly ſuppoſed to be nothing but Branches of the Tendons of the *Perforans*, which go to the Inſide of the firſt Bone on each Finger, and are ſuppoſed to contribute to the Variety of Motions with the Fingers, by giving a Diverſion to the direct Actions of the other Muſcles; but ſimply, they only ſerve to draw the Fingers towards the Thumb. Mr. *Cowper* indeed obſerves, that ſome of them have diſtinct Origins; and ſuſpects that the reſt may have ſo too, and therefore makes them diſtinct Muſcles.

There are alſo *Lumbricales* of the Foot, which ariſe as in the Hand, one from each Tendon of the *Perforans* or *Profundus*, and go to the Inſide of each of the leſſer Toes.

LUNA, in the Jargon of the Chymiſts, ſignifies Silver; from the ſuppoſed Influence of that Planet (the Moon) thereupon. The Medicinal Virtues of this Metal, Dr. *Quincy* ſays, are none at all, until it hath undergone very elaborate Preparations. See *Silver*.

LUNAR, ſomething belonging to the Moon. *Lunar Periodical Months* conſiſt of 27 Days and a few Hours; *Lunar Synodical Months* of 29 Days, 12 Hours, and three quarters of an Hour. See *Month*. *Lunar Years* conſiſt of 354 Days, or 12 Synodical Months. In the firſt Ages the Year accounted by all Nations was *Lunar*; the Variety in Courſe being more frequent in this Planet, and of conſequence more conſpicuous, and better known to Men than thoſe of any others. The *Romans* regulated their Year, in part, by the Moon till the time of *Cæſar*. See *Year*. The *Jews* too had their *Lunar* Months. Some Rabbins pretend that the *Lunar* Month did not commence till the moment the Moon began to appear, and that there was a Law, which obliged the Perſon who diſcovered it, firſt, to go and inform the Senate thereof. Upon which, the Preſident ſolemnly pronounced the Month began, and Notice was given of it to the People by Fires lighted on the Tops of Mountains. But this looks ſomewhat chimerical.

LUNATIC, ſomething affected or governed by the Moon. Hence mad People are called *Lunatics*, it having antiently been an Opinion, that ſuch Perſons were much influenced by that Planet. A much ſounder Philoſophy hath taught us, that there is ſomething in it; but not in the manner the Antients imagined; nor otherwiſe than what it has in common with other heavenly Bodies, occaſioning various Alterations in the Gravity of our Atmoſphere, and thereby affecting human Bodies. See *Comet*, *Planet*, &c. See alſo *Tides*.

LUNATION, a Revolution of the Moon, or the Time between one New Moon and another; which is called a *Synodical Month*, conſiſting of 29 Days, 12 Hours, and three quarters of an Hour. At the end of 19 Years the ſame *Lunations* always return, on the ſame Day, but not at the ſame preciſe Time of the Day; there being a Difference of one Hour, 27 Minutes, and 33 Seconds. Herein the Antients were miſtaken, taking the Uſe of the Golden Number to be more ſure and infallible than it is. It has been found ſince, that in 312 Years and an half the *Lunations* gained a Day on the beginning of the Month; ſo that when they came to reform the Calendar, the *Lunations* happened in the Heavens four or five Days ſooner than was ſhewn by the Golden Number. To remedy which, we now make uſe of the perpetual Cycle of Epacts. We take 19 Epacts, which anſwer to a Cycle of 19 Years; and when at the end of 300 Years the Moon has gain'd a Day, we take 19 other Epacts: which is alſo done, when by the Omiſſion of an Intercalary Day, which happens three times in 400 Years, the Calendar is adjuſted to the Sun. Care is taken that the Index of the Epacts muſt never be changed, excepting at the Concluſion of a Century, when there is occaſion for it, on account of the Metemptoſis or Proemptoſis; that is, of the Lunar or Solar Equation. When the Biſſextile or Intercalary Day is ſuppreſs'd without a Lunar Equation, the next following or lower Index is taken, as was done in 1700. When there is a Lunar Equation without ſuppreſſing the Biſſextile, the next preceding or higher Index is taken; as will be done in 2400. When there is both an Equation and a Suppreſſion, as in 1800; or neither the one nor the other, as in 2000; the ſame Index is retain'd. See *Month*, *Moon*, &c.

LUNE, or *Lunula*, in Geometry, a Plane, in figure of a Creſcent or Half-Moon, terminated by the Circumference of two Circles that interſect each other within.

Tho the Quadrature of the intire Circle was never yet effected, yet the Geometricians have found out the Squares of many of its Parts. The firſt partial Quadrature was that of the *Lunula*, given by *Hippocrates* of *Scio*, who of a ſhipwrecked Merchant commenced Geometrician. Let A E B (*Tab. Geometry*, *Fig.* 8.) be a Semicircle, and G C = G B; with the Radius B C deſcribe a Quadrant A F B; then will A E B F A be *Hippocrates's Lune*. And ſince $BC^2 = 2\,GB^2$, the Quadrant A G B C will be equal to the Semicircle A E B; taking away therefore from each the common Segment A F G A; A E B F A = to the Triangle A C B = GB^2.

LUNETTES, in Fortification, are Enveloppes, Counterguards, or Mounts of Earth caſt up before the Curtain, about five Fathom in breadth. They are uſually made in Ditches full of Water, and ſerve to the ſame purpoſe as Falſe Braies. Theſe *Lunettes* are compoſed of two Faces, which form a re-entering Angle; and their Platform being only twelve foot wide, is a little raiſed above the Level of the Water; and hath a Parapet three Fathom thick.

LUNGS, a Part in the Human Body, conſiſting of Veſſels and membranous Veſicles; and ſerving for Reſpiration. The *Lungs* are connected, above, to the Fauces, by means of the *Trachea*; and below, to the *Vertebræ* of the *Thorax*; and to the *Sternum* and *Diaphragma* by means of the *Pleura*. They are divided into two great Lobes by the *Mediaſtinum*, and thoſe again into others leſſer; the right ſometimes into three or four, by means of ſome Fiſſures running from the fore to the back Edge. The great Lobes, when inflated, reſemble each of them a Horſe's Hoof in Figure, but together they are liker an Ox's inverted.

The Subſtance of the *Lungs* is membranous, conſiſting chiefly of innumerable Cells or Veſicles; which ſeem to be nothing but Expanſions of the Membranes of the *Bronchia*, to which they hang like Grapes in Cluſters; ſo that by blowing into one of the Branches of the *Bronchia*, thoſe Cells or Veſicles belonging to it are blown up; the reſt, which do not, remaining ſtill flaccid and unaltered.

Theſe Cluſters of Veſicles or Cells are called the *Internal Lobules*, by which Name they are diſtinguiſhed from the leſſer Lobes ſpoken of. They are ſeparated from one

one another by Interſtices, which receive the Veſſels; and are filled up with Membranes propagated from the Lobules, and lying, ſome parallel, ſome angular. Theſe Lobules diſcover and diſplay themſelves very exactly, if the larger Trunks of the *Bronchia* be laid open, and the leſſer blown into; by which means every Lobule belonging to that Branch will be inflated, and riſe very diſtinctly, and ſhew its Extent.

The whole Subſtance of the *Lungs* is covered with a common Membrane, which is diviſible into two Coats; the outer thin, ſmooth, and nervous; the inner ſomewhat thicker and rougher, conſiſting moſtly of the Extremities of Veſſels and Veſicles, through the Impreſſion of which it is pitted, and reſembles in ſome meaſure a Honey-Comb. Some affirm that in this Coat are abundance of Perforations or Pores, ſo diſpoſed that they readily imbibe any Humidity from the Cavity of the *Thorax*, but ſuffer nothing to eſcape into it: but this ſeems little more than Fancy.

The Veſſels of the *Lungs* are the *Bronchia*, the Pulmonary and Bronchial Arteries and Veins, Nerves and Lymphatics. Of theſe Veſſels ſome are proper and ſome common, in reſpect of the Service they are of to the reſt of the Body. The common are the *Bronchia*, the Pulmonary Artery and Vein, the Nerves and Lymphatics; the proper are the Bronchial Artery and Vein. See each in its place.

The *Trachea*, juſt before it enters the *Lungs*, divides itſelf into two Branches, ſending to each Lobe one; which are again ſubdivided into innumerable Ramifications, call'd *Bronchia*. The *Bronchia* and their Branches conſiſt of Cartilages like the *Trachea*, only here the Cartilages are perfectly circular, without any membranous hinder Part; of which, having left the *Oeſophagus*, they have no need. Theſe circular Cartilages are joined together by the Membranes that inveſt them, and are capable of being ſhot out into Length upon Inſpiration, and of ſhrinking up and running into one another in Expiration, when the Cavity of the *Thorax* is leſſened. They ſend their little Ramifications to all the little Veſicles of the *Lungs*. Along with theſe Air-Veſſels run the Branches of the Pulmonary Artery and Vein; ſending their Ramifications exactly along with the other; the Artery bringing the Blood from the right Ventricle, and the Vein carrying it back to the left Ventricle of the Heart. Whether the Blood returns by the Vein impregnated with Air in the *Lungs*, is ſtill a Queſtion.

The Bronchial Artery ariſes from the hind Part of the *Aorta*, a little above the Baſis of the Heart, whence, turning off to the right, it embraces the *Trachea*; and after ſending off a Branch or two to the *Oeſophagus*, purſues the Courſe of the *Bronchia*, accompanying all their Branches through their whole Progreſs. This Artery is ſometimes ſingle, but oftener there are two of them, and ſometimes three, ariſing at near a Finger's breadth from each other. With theſe Arteries is a Vein, whoſe Branches ariſe from the Ramifications of the capillary Arteries: whether the Blood returns by one or more Trunks, does not appear. Theſe Veſſels bring Blood for the Nutriment of the *Bronchia* and Veſicles of the *Lungs*, and carry it back again.

Thro' the *Lungs* are diſtributed a great Number of Lymphatics, attending generally the Blood-Veſſels; and being at length collected, diſcharge themſelves into the Thoracic Duct.

Dr. *Willis*, contrary to the common Opinion, aſcribes to the *Lungs* a great Number of Nerves, which come from the Trunk of the *Par Vagum*; and which being diſtributed thro' the Subſtance of the *Lungs*, embrace the aërious and ſanguiferous Veſſels. He alſo aſſerts, that the *Veſiculæ* have muſculous Fibres, to enable them to exert a greater contractive Force in Expiration; tho' others deny any ſuch Fibres. *Diemerbroeck* obſerves, that the Veſicles admit not only of Air, but alſo of other groſſer Matters; and inſtances two Aſthmatic Perſons which he opened, the one a Stone-Cutter, the *Veſiculæ* of whoſe *Lungs* were ſo ſtuffed with Duſt, that, in cutting, his Knife went as if thro' a Heap of Sand; the other a Feather-Driver, in whom the Veſicles were full of the fine Duſt or Down of Feathers. For the Uſe and Action of the *Lungs*, ſee *Reſpiration*, *Voice*, &c.

LUNISOLAR, in Aſtronomy and Chronology, is underſtood of ſomething compoſed of the Revolution of the Sun, and of that of the Moon. Thus we ſay the *Luniſolar* Year; which is a Period of Years made by multiplying the Cycle of the Moon, which is 19, by that of the Sun, which is 28, the Product of which is 532; in which Space of Time thoſe two Luminaries return to the ſame Points

LUPERCALIA, Feaſts inſtituted in antient *Rome* in Honour of the God *Pan*. The *Lupercalia* were celebrated on the 15th of the Calends of *March*, that is, on the 15th of *February*, or, as *Ovid* obſerves, on the third Day after the Ides. They are ſuppoſed to have been eſtabliſhed by *Evander*. On the Morning of this Feaſt the *Luperci*, or Prieſts of *Pan*, run naked thro' the Streets of *Rome*, ſtroaking the Women they met on the Hands and Belly with the Skin of a Goat, and promiſing them Fecundity and happy Deliveries. The Reaſon of this indecent Cuſtom in celebrating the *Lupercalia*, took its Riſe from *Romulus* and *Remus*; for while they were aſſiſting at this Feaſt a Body of Robbers, taking hold of the Occaſion, plundered them of their Flocks. Upon this the two Brothers, and all the Youth that was with them, throwing off their Clothes, to be the more expedite, purſued the Thieves, and recovered their Prey. This ſucceeded ſo well, that thenceforward this Ceremony became a part of the *Lupercalia*. This Feaſt was aboliſhed in the time of *Auguſtus*, but afterwards reſtored, and continued to the Time of the Emperor *Anaſtaſius*. *Baronius* ſays, it was aboliſhed by the Pope in 496. *Natalis Comes* calls likewiſe *Lupercalia* the Feaſts celebrated in antient *Greece*, under the Name of *Lycæa*, which ſee. The Word comes from *Lupercal*, the Name of a Place under the *Palatine* Mountain, where the Sacrifices were performed.

LUPERCI, the Name given to the Prieſts of the God *Pan*. The *Luperci* were the moſt antient Order of Prieſts in *Rome*; they were divided into two Colleges or Companies, the one called *Fabius*, and the other *Quintilius*. To theſe *Cæſar* added a third, which he call'd *Julius*. *Suetonius* mentions the Inſtitution of this new College of *Luperci*, as a thing that render'd *Cæſar* more odious than he was; however, it appears from the ſame Paſſage of *Suetonius*, that this new Company was not inſtituted by *Cæſar*, nor in Honour of *Pan*, but by ſome Friends of *Cæſar*, and in Honour of himſelf.

LUPUS, the Wolf, a *Southern* Conſtellation, conſiſting of 19 Stars. See *Star*.

LUSTRAL, an Epithet applied by the Antients to the Water uſed in their Ceremonies to ſprinkle and purify the People. From them the *Romaniſts* have borrowed the Holy Water uſed in their Churches. The Antients call'd *Dies Luſtricus*, or *Luſtral Day*, that whereon the Luſtrations were performed for a Child, and its Name given; which was the ninth Day from the Birth of a Boy, and the eighth from that of a Girl. Others performed the Ceremony on the laſt Day of that Week wherein the Child was born, and others on the fifth Day from its Birth. Over this Feaſt-Day the Goddeſs *Nundina* was ſuppoſed to preſide. The Midwives, Nurſes, and Domeſtics handed the Child backwards and forwards around a Fire burning on the Altars of the Gods, after which they ſprinkled it with Water. The old Women mixed *Saliva* and Duſt with the Water. The whole ended with a ſumptuous Entertainment.

LUSTRATION; Expiation, Sacrifices, or Ceremonies, by which the *Romans* purified their Cities, Fields, Armies, or People defiled by any Crime or Impurity. Some of their *Luſtrations* were publick, others private. They had a kind of *Luſtration*, without Victims, for Children, on the eighth Day for Girls, and on the ninth for Boys. *Luſtration* was the ſame thing with Purification. There were three different Species of it, or it was performed in three different Manners, by Fire and Sulphur, by Water, and by Air; which laſt was performed by fanning and agitating the Air round the thing to be purified.

LUSTRE, the Brillant appearing on any thing, particularly Manufactures of Silk, Wooll, and Stuff. *Luſtre* is alſo uſed for the Compoſition or Manner of giving that Brillant. The *Luſtre* of Silks, which is their chief Quality, is given them by waſhing in Soap, then clear Water, and laying them in a cold Alumn Bath. The *Luſtre* of black Taffeta is given by double-brewed Beer, boiled with Orange or Lemon Juice; that of coloured Taffeta's with Water of Gourds, diſtilled in an Alembic. Curriers give their *Luſtre* ſeveral ways, according to the Colour to be illuſtrated: For Blacks, the firſt *Luſtre* is with Juice of Barberries; the ſecond with Gum Arabic, Ale, Vinegar, and *Flanders* Glue boiled together: For colour'd Leathers, they uſe the White of an Egg beaten in Water; *Morocco*'s have their *Luſtre* from Juice of Barberries, and Lemon or Orange: For Hats, the *Luſtre* is frequently given with ſimple Water, ſometimes a little black Teint is added. The ſame *Luſtre* ſerves the Skinners, except that in white Furs they never uſe any black Dye. For very black Furs they ſometimes prepare a *Luſtre* of Galls, Copperas, *Roman* Alumn, Ox's Marrow, and other Ingredients. The *Luſtre* is given to Cloths and Mohairs by preſſing them under the Calendar.

LUSTRUM, a Term uſed by the *Romans* to ſignify a Space of five Years. *Varro* derives the Word from *luo*, *to pay*, becauſe at the beginning of each five Years they paid the Tribute that had been impoſed by the Cenſors; whoſe Authority, at their firſt Inſtitution, was continued them for five Years; tho' afterwards it was abridged to

one,

one. This Cuſtom was eſtabliſhed by *Servius Tullius* in the Year of *Rome* 180. Others rather derive the Word from *luſtrare, to make a Review*, becauſe once in five Years the Cenſors reviewed the Army.

Luſtrum was alſo a Ceremony or Sacrifice uſed by the *Romans* after numbering their People once in five Years.

LUTE, in Chymiſtry, any ſort of Cement or Plaiſter; us'd either in the Conſtruction of Furnaces, or in fitting to them Veſſels of Glaſs or Earth; that are to reſiſt a very violent Fire. It is frequently made of Potter's Earth, River Sand, Horſes Dung, Powder of broken Pots, *Caput Mortuum* of Vitriol, Droſs of Iron, beaten Glaſs, Flocks of Wool mix'd with ſalt Water or Bullock's Blood.

The *Lute* us'd by *Lemery*, was only two Parts of Sand and one of Clay, tempered together in Water; which does very well for joining the Noſes of Retorts and their Receivers in diſtilling of volatile Spirits, *&c.* In diſtilling by the Alembic, or Veſica, or Copper Body, with its Head or Serpentine, a wet Bladder ſerves very well to *lute* the Junctures of the Veſſels: But for the Diſtillation of corroſive Spirits, as alſo to ſtop the Cracks of Glaſſes, *&c.* the following Compoſition is recommended, *viz.* Starch boiled, or Fiſh-Glue diſſolved in Spirit of Wine, with Flower of Sulphur, Maſtic, and Lime ſlacked in Milk. *Lutum Sapientiæ* is the Hermetical Seal, which is made by melting the End of a Glaſs Mattraſs by a Lamp, and twiſting it up with the Pliers. See *Hermetical Sealing*. The Word comes from the *Latin Lutum, Clay*.

LUTE, a Muſical Inſtrument with Strings. It had antiently but five Rows of Strings; but in courſe of time four, five, or ſix more have been added. The *Lute* conſiſts of four principal Parts, the Table, the Body or Belly, which has nine or ten Sides, the Neck, which has nine or ten Stops or Diviſions mark'd with Strings, and the Head or Croſs, wherein are Screws for raiſing or lowering the Strings to the proper Tone. In the middle of the Table is a Roſe or Paſſage for the Sound. There is alſo a Bridge that the Strings are faſtened to, and a Piece of Ivory between the Head and the Neck, to which the other Extremity of the Strings are fitted. In playing, the Strings are ſtruck with the right Hand, and with the left the Stops are preſſed. We call Temperament of the *Lute* the proper Alteration that is to be made in the Intervals, both with regard to Conſonances and Diſſonances, in order to render them more juſt on the Inſtrument. Some derive the word from the *German Laute*, which ſignifies the ſame thing, or from *lauten, ſonare*. *Scaliger* and *Bochart* derive it from the *Arabic, Allaud*. The *Lutes* of *Boulogne* are eſteem'd the beſt, on account of the Wood, which is ſaid to have an uncommon Diſpoſition for producing a ſweet Sound.

LUTHERANISM, the Sentiments of Dr. *Martin Luther*, with regard to Religion. *Lutheraniſm* had its Riſe in the 16th Century. Its Author was born at *Eiſleben* in *Thuringia* in 1483. After his Studies he enter'd himſelf among the *Auguſtines*. In 1512, took the Cap of a Doctor in Theology in the Univerſity of *Wittemburg*. In 1516, he attack'd the School-Divinity in ſeveral Theſes. In 1517, *Leo* X. having order'd Indulgences to be diſpens'd to thoſe who ſhould contribute towards the building of St. *Peter*'s at *Rome*, he gave a Commiſſion thereof to the *Dominicans*. The *Auguſtines* thinking they had a Title to it before any body elſe, *John Staupitz*, their Commiſſary-General, appointed *Luther* to preach againſt thoſe Diſpenſers of Indulgences. *Luther* acquitted himſelf in a manner that perhaps the Commiſſary had not imagin'd. From the Preachers of Indulgences he proceeded to Indulgences themſelves, and declaim'd very warmly both againſt the one and the other. At firſt he only advanc'd ambiguous Propoſitions, but being engag'd in diſpute about them, he maintain'd them openly and without Reſerve, inſomuch that in 1520 he was ſolemnly condemn'd and excommunicated by the Pope. But neither the Pope's Thunder, nor the Condemnation of ſeveral Univerſities, could make any Impreſſion of Terror upon him; but he continued preaching, writing and diſputing, not againſt Indulgences only, but ſeveral other Corruptions that then prevail'd in the Church. The Character of the Man, the Strength of his Arguments, and the Weakneſs of his Adverſaries Cauſe, ſoon procur'd him a Number of Followers. And thus it was that *Lutheraniſm* was form'd; the Adherents whereto were call'd *Lutherans*, from *Luther*, a Name that has a *Greek* Turn, and which he aſſum'd in lieu of his Family-Name, *Lotter* or *Lauther*; it being the Cuſtom of thoſe Days for Men of Learning to give themſelves *Greek* Names: witneſs *Eraſmus, Melanthon, Bucer*, &c. In 1523, *Luther* quitted the Habit of a Religious, and in 1524, married; after having been a happy Inſtrument of reforming a great part of *Germany*, under the Protection of *George* Duke of *Saxony*. He died at his native Place in 1546.

Lutheraniſm has undergone ſome Alterations ſince the time of its Founder. *Luther* rejected the Epiſtle of St. *James*, as inconſiſtent with the Doctrine of St. *Paul* in relation to Juſtification; he alſo ſet aſide the *Apocalypſe*: both which are now receiv'd as Canonical in the *Lutheran* Church. *Luther* firſt reduc'd the Number of Sacraments to two, *viz.* Baptiſm and the Euchariſt; but believ'd the Impanation or Conſubſtantiation: that is, that the Matter of the Bread and Wine remain with the Body and Blood of Chriſt; and 'tis in this Article that the main Difference between the *Lutheran* and *Engliſh* Churches conſiſts. *Luther* maintain'd the Maſs to be no Sacrifice; exploded the Adoration of the Hoſt, Auricular Confeſſion, Satisfactory Works, Indulgences, Purgatory, the Worſhip of Images, *&c.* which had been introduc'd in the corrupt Times of the *Romiſh* Church. He alſo oppos'd the Doctrine of Free Will, maintain'd Predeſtination, aſſerted that we are neceſſitated in all we do, that all our Actions done in a State of Sin, and even the Virtues themſelves, of Heathens, are Crimes; that we are only juſtify'd by the Imputation of the Merits and Satisfaction of Chriſt. He alſo oppos'd the Faſtings in the *Romiſh* Church, Monaſtical Vows, the Celibate of the Clergy, *&c.*

Some Authors reckon thirty-nine different Sects among the *Lutherans: viz.* the *Confeſſioniſts*, call'd alſo *Miricains*; *Antinomians, Samoſatenſes, Inferains, Antidiaphoriſts, Antiſwenfeldians, Antoſandrins, Anticalviniſts, Layers on of Hands, Biſſacramentals, Triſſacramentals, Majonites, Adiaphoriſts, Quadriſacramentals, Luthero-Calviniſts, Amnetiſtes, Mediosandrins, Confeſſioniſts firm and wavering, Sufeldians, Onandrins, Stanoanrians, Antiſancarians, Zuinglians ſimple, Zuinglians ſignificative, Carloſtatians, Evargic Tropiſts, Arrabonarii ſpiritual, Sucefeldians, Servetians, Daviticks* or *Davidi-Georgians, Memnonites*, &c. *Jovet* T. 1. p. 475.

LUTHERN, or *Dormer*, a kind of Window over the Cornice, in the Roof of a Building; ſtanding perpendicularly over the Naked of the Wall; and ſerving to illumine the Upper-Story. The *French* Architects diſtinguiſh theſe into various kinds, according to their various Forms; as Square, Semicircular, Bulls Eyes, flat Arches, *Flemiſh Lutherns*, &c. The Word comes from the *Latin Lucerna*, Light or Lanthorn.

LUXATION, in Chirurgery, a Relaxation of the Tendons or Ligaments, occaſioning the Bones to ſlip out of their Junctures, or at leaſt to remain very looſely in their natural Situation. The proper *Luxation* is when the Bone is entirely out of the Cavity it ſhould move in; which may be done various ways, and there are as many ways of reducing it; according to the particular Formation and Articulation of the Joint: for which, ſee the Books of Practical Surgery.

LYCANTHROPY, a kind of Phrenzy or Diſeaſe, that urges People to run thro the Streets and Fields in the Night; ariſing from the Bite of a mad Wolf. The Symptoms, *&c.* are in moſt reſpects the ſame with that of the *Hydrophobia*; which ſee. The Word comes from the *Greek* λύκος, *Lupus*, and ἄνθρωπος, *Homo*; as who ſhould ſay, *Man-Wolf*.

LYCEUM, the Name of a celebrated School at *Athens*, where *Ariſtotle* explain'd his Philoſophy. The Place was compos'd of Portico's, and Trees planted in the Figure of an V. Hence the Philoſophy of the *Lyceum* is us'd to ſignify the Philoſophy of *Ariſtotle*, or the *Peripatetic* Philoſophy.

Suidas obſerves, that the Place took its Name from its having been originally a Temple of *Apollo*, or rather a Portico or Gallery built by *Lycus*, Son of *Apollo*; but others mention it to have been built by *Piſiſtratus* or *Pericles*.

LYGMOS. See *Hiccup*.

LYMPH or LYMPHA, in Anatomy, a thin tranſparent Humour, ſomething like Water; ſecreted from the Serum of the Blood in all Parts of the Body, and return'd to the Blood again by proper Ducts of its own; ſuppoſed by ſome to be the immediate Matter of Nutrition. If the *Lymph* be chymically examin'd, it will be found to contain a great deal of volatile, but no fix'd Salt, ſome Phlegm, ſome Sulphur, and a little Earth.

The Uſe of the *Lymph* may be gather'd from the Conſideration of the Parts into which it diſchargeth itſelf. That which comes from the Head, Neck, and Arms, is thrown into the Jugular and Subclavian Veins. All the *Lymphatics*, which the Parts in the Cavity in the Thorax ſend out, empty themſelves into the Thoracic Duct; and the *Lympha*, from all the reſt of the Body, flows to the common Receptacle; ſo that there can be no doubt, but that its chief Uſe is to dilute and perfect the Chyle before it mixes with the Blood.

LYMPHATICS, or LYMPHÆDUCTS; very ſmall, fine, hollow Veſſels, generally ariſing from the Glands, and conveying back to the Blood a tranſparent Liquor, call'd *Lymph* or *Lympha*. Theſe, tho not ſo viſible as the

other

other Veſſels, becauſe of their Minuteneſs and Tranſparency, are however exiſtent in all Parts of the Body; but the Difficulty of finding them, has prevented their being deſcribed in many Parts. The *Lymphatics* are contracted at ſmall and unequal Diſtances, by two oppoſite ſemi-lunar Valves, which permit the *Lymph* to paſs through them towards the Heart, but ſhut, like Flood-Gates, upon its returning. They ariſe in all Parts of the Body, but after what manner, needs no great Diſpute; for, without doubt, all the Liquors in the Body, excepting the Chyle, are ſeparated from the Blood in the fine Capillary Veſſels, by a different Pipe from the common Channel in which the reſt of the Blood moves: but whether this Pipe be long or ſhort, whether it be viſible or inviſible, it is ſtill a Gland, whilſt it ſuffers ſome part of the Blood to paſs thro it; denying a Paſſage to the reſt. Now the Glands which ſeparate the *Lymph* muſt be of the ſmalleſt kinds, for they are inviſible to the fineſt Microſcope; but their excretory Ducts, the *Lymphatic* Veſſels, unite with one another, and grow larger, as they approach the Heart: yet they do not open into one common Channel, as the Veins do; for ſometimes we find two, or three, or more *Lymphatics*, running by one another; which only communicate by ſhort intermediate Ducts, and which unite, and immediately divide again. In their Progreſs, they always touch at one or two conglobate or veſicular Glands, into which they diſcharge themſelves of their *Lympha*. Sometimes the whole *Lymphatic* opens at ſeveral Places into the Gland, and ſometimes it ſends in only two or three Branches, whilſt the main Trunk paſſes over, and joins the *Lymphatics* which ariſe from the oppoſite ſides of the Glands, exporting again their *Lympha* to their common Receptacles. Now the Glands of the Abdomen, which receive the *Lymphatics* from all its Parts, as likewiſe from the lower Extremities, are the *Glandulæ Inguinales*, *Sacræ*, *Iliacæ*, *Lumbares*, *Meſentericæ*, and *Hepaticæ*; all which ſend out new *Lymphatics*, which pour their Contents into the *Receptaculum Chili*, as thoſe of the Cheſt, Head and Arms, do into the *Ductus Thoracicus*, Jugular, and Subclavian Veins. Theſe Glands are round and ſmooth Bodies, about the Bigneſs of a Hazle Nut, bigger or leſſer, according to the number of *Lymphatics* they receive. Their Subſtance is membranous, and their whole Bulk divided into little Cells, which receive the *Lymph* from the *Lymphatics*; and are therefore improperly call'd *Glands*, becauſe they ſeparate no Liquor from the Blood: It is true, that their exporting *Lymphatics*, communicating with their Arteries, do receive a *Lymph* from them; but this is done without the help of conglobate Glands; as the lacteal Veins do with the capillary Arteries of the Guts: the chief Uſe of their veſicular Bodies ſeems to be, that the ſlow-moving *Lympha* may receive a greater Velocity from the elaſtic Contraction of their membranous Cells, as well as from the new *Lymph* immediately derived from the Arteries. See *Gland.*

LYRA, or LYRE, the ſame with *Cithara*, a Harp; a ſtringed Inſtrument much uſed among the Antients; ſaid to have been invented by *Mercury*, on occaſion of his finding a dead Shell-Fiſh, call'd by the *Greeks Chelone*, and the *Latins Teſtudo*, left, on an Inundation of the *Nile*; of the Shell whereof he form'd his *Lyre*, mounting it with ſeven Strings, according to *Lucian*, and adding a kind of *Jugum* to it, to ſtretch or looſen the Strings. *Boethius* relates the Opinion of ſome, who ſay that *Mercury's Lyre* had but four Strings, in imitation of the Mundane Muſic of the four Elements. *Diodorus Siculus* ſays it had but three Strings, in imitation of the three Seaſons of the Year; which were all the *Greeks* counted, *viz.* Spring, Summer and Winter. *Nicomachus*, *Horace*, *Lucian*, and others, make it have ſeven Strings, in imitation of the ſeven Planets. This three, four, or ſeven-ſtringed Inſtrument *Mercury* gave to *Orpheus*; who being torn to pieces by the *Bacchanals*, the *Lyre* was hung up by the *Lesbians* in *Apollo*'s Temple. Others ſay, *Pythagoras* found it in ſome Temple in *Egypt*, and added an eighth String. *Nicomachus* ſays, that when *Orpheus* was kill'd, his *Lyre* was caſt into the Sea, and thrown up at *Antiſſa* a City of *Lesbos*; where the Fiſhers finding it, gave it to *Terpander*; who carried it into *Egypt*, and call'd himſelf the Inventor. The ſeven Strings were diatonically diſpoſed by Tones and Semi-Tones, and *Pythagoras*'s eighth String made up the Octave.

From the *Lyra*, which all agree to be the firſt Inſtrument of the ſtringed kind in *Greece*, aroſe an infinite Number of others, differing in Shape and Number of Strings; as the *Pſalterium*, *Trigon*, *Sambuca*, *Pectis*, *Magadis*, *Barbiton*, *Teſtudo*, (the two laſt uſed promiſcuouſly by *Horace* with the *Lyra* and *Cithara*) *Epigonium*, *Simmicium* and *Pandura*; which were all ſtruck with the Hand or a *Plectrum*.

The *Lyra* among Painters, Statuaries, &c. is an Attribute of *Apollo* and the Muſes.

Lyra is alſo a Conſtellation in the Northern Hemiſphere, conſiſting of thirteen Stars. See *Star*.

LYRIC; ſomething ſung, or play'd on the Lyre or Harp. The Word is particularly applied to the antient Odes and Stanza's; which anſwer to our Airs or Tunes, and may be play'd on Inſtruments. The Antients were great Admirers of *Lyric* Verſes, which Name they gave to ſuch Verſes as do not come under either of the two ordinary Kinds of Verſe, *viz.* Hexameters and Iambics. Theſe were principally uſed in Odes, and in the Chorus's of Tragedies. The Characteriſtic of *Lyric* Poetry, and that which diſtinguiſhes it from all others, is Sweetneſs. As Gravity rules in Heroic Verſe, Simplicity in Paſtoral, Tenderneſs and Softneſs in Elegy, Sharpneſs and Poignancy in Satire, Mirth in Comedy, the Pathetic in Tragedy, and the Point in Epigram; ſo in the *Lyric*, the Poet applies himſelf wholly to ſooth the Minds of Men by the Sweetneſs and Variety of the Verſe, and the Delicacy of the Words and Thoughts, the Agreeableneſs of the Numbers, and the Deſcription of Things moſt pleaſing in their own Nature. See *Ode*, *Song*, &c.

LYSIARCHA, the Name of an antient Magiſtrate or Pontiff of *Lycia*. *Strabo* obſerves, that the *Lyſiarcha* was created in a Council, conſiſting of the Deputies of twenty-three Cities, that is, of all the Cities in the Province; ſome of which Cities had three Voices, others two, and others but one. Cardinal *Noris* ſays, that the *Lyſiarcha* preſided in Matters of Religion; in effect, the *Lyſiarcha* was nearly the ſame with the *Aſiarcha* and *Syriarcha*; who, tho they were all the Heads of the Councils or States of thoſe Provinces, yet were they eſtabliſh'd principally to take care of the Games and Feaſts celebrated in honour of the Gods, whoſe Prieſts they were inaugurated at the ſame time that they were created *Lyſiarcha*, *Syriarcha*, or *Aſiarcha*.

M, A Conſonant, and the Twelfth Letter in the *Engliſh* Alphabet. It is pronounced by ſtriking the upper Lip againſt the lower; in which the Pronunciation of this Letter agrees with that of *b*: the only Difference between the two conſiſting in a little Motion made in the Noſe in the Pronunciation of *M*, and not in *b*: whence it happens that thoſe who have taken Cold, for *M* ordinarily pronounce *B*; the Noſe in that caſe being diſabled from making the neceſſary Motion. See *B*.

Quintilian obſerves, that the *M* ſometimes ends *Latin* Words, but never *Greek*; the *Greeks* always changing it in that Caſe into *N*, for the ſake of the better Sound.

M is alſo a Numeral Letter, and among the Antients was uſed for a Thouſand; according to the Verſe,

M *Caput eſt Numeri quem ſcimus Mille tenere.*

When a Daſh is added a top of it, it ſignifies a thouſand times a thouſand; $\overline{M}$.

The Letter *M* in Aſtronomical Tables, and other things of that kind, is uſed for Meridional or Southern.

M, in Medicinal Preſcription, is frequently uſed to ſignify a Manipule, or Handful; and is ſometimes alſo put at the end of a *Recipe*, for *Miſce*, mingle; or *Mixtura*, a Mixture.

M, in Law, was the Brand or Stigma of a Perſon convicted of Murder, and admitted to the Benefit of his Clergy. It was burnt on the Brawn of his left Thumb.

MACARONIC, or MACARONIAN; a kind of Burleſque Poetry; conſiſting of a Jumble of Words of different Languages, with Words of the vulgar Tongue latiniz'd, and *Latin* Words moderniz'd. For Inſtance, a bold Fellow, in the *Macaronic* Stile, ſays;

Enfilavi omnes Scadrones & Regimandos, &c.

Another Example:

Arcberos Piſtoliferos furiamque Manantum,
Et grandem eſmentam quæ inopinum facta Ruellæ eſt:
Toxinumque alto troublantem Corda Clochero, &c.

Macarone, among the *Italians*, as has been obſerved by *Cælius Rhodiginus*, ſignifies a coarſe clowniſh Man; and becauſe this kind of Poetry, being patch'd out of ſeveral Languages, and full of extravagant Words, is not ſo polite and ſmooth as thoſe of *Virgil*, &c. the *Italians*, among whom it had its Riſe, gave it the Name of *Macaronian* and *Macaronic* Poetry. Others rather chuſe to derive it *à Macaronibus*, from *Makarons*; a kind of little Cakes made of Meal not boulted, with Eggs and Cheeſe; accounted a great Dainty among the Country People in *Italy*; which, from their being compoſed of various Ingredients, occaſion'd this kind of Poetry, which conſiſts of *Latin*, *Italian*, *Spaniſh*, *French*, *Engliſh*, &c. to be called by their Name.

Theoph. Folingius, a *Benedictin* Monk of *Mantua*, was the firſt who invented, or at leaſt cultivated, this kind of Verſe: For tho we have a *Macaronea Ariminenſis* in a very old Letter, beginning, *Eſt Author Tiphis Leonicus atque Paranſus*; yet it ſeems to have been the Work of *Guarinus Capellus Sarſinas*, who in the Year 1526 printed ſix Books of *Macaronic* Poetry, *in Cabrinum Gagamogæ Regem*: but as both theſe came out after the firſt Edition of *Folingius*, which was publiſh'd under the Name of *Merlin Coccaye*, in 1520; ſo were they likewiſe much inferior to him both in the Stile, Invention and Epiſodes wherewith he has enrich'd the Hiſtory of *Baldus*; which makes the Subject of his Poem. The famous D. *Rabelais* tranſlated the *Macaronic* Stile out of the *Italian* Verſe into *French* Proſe, and on the Model thereof form'd ſome of the beſt things in his *Pantagruel*. *Merlin Coccaye* met with ſo much Succeſs in his new Way, that he compoſed another Book partly in *Macaronic* Stile, call'd *Il Chars del tri per uno*; but with very different Succeſs. After this, appear'd in *Italy*, *Macaronica de Syndicatu, & Condemnatione Doctoris Samſonis Lembi*, a low Performance; and *Macaronis Forza*, an excellent one, by *Stefonio* a Jeſuit. In 1620, *Bajani* publiſhed a *Carnavale Tabula Macaronea*. The laſt *Italian* who wrote in this way, was *Cæſar Urſinius*, to whom we owe *Capricia Macaronica Magiſtri Stopini Poetæ Pouzanenſis*, printed in 1636. The firſt who ſucceeded in the *Macaronic* Stile among the *French* was *Antonius de Arena Provenſalis de Bragardiſſima Villa de Soleriis*, in two Poems, which he has left us; *de Arte Danſandi*, & *de Guerra Neapolitana Romana & Genuenſi*. He was follow'd by another Lawyer, who wrote *Hiſtoria Braviſſima Caroli V. Imperat. a Provincialibus Payſanis triumphanter fugati*. Some time after *Remi Belleau*, among his other *French* Poeſies, printed *Dittamen Metrificum de Bello Hugonotico*, & *Ruſticorum Pigliamine ad Sodales*; a Piece much valued. This was ſucceeded by *Cacaſanga Reiſtro Suiſſo Lanſquenetorum per M. J. B. Lichiardum Spalſpercinum Poetam*; to which *Stephen Tabouret* return'd an Anſwer in the ſame Strain. Laſtly, *John Edward du Menin* enter'd the Liſts, and left us *inter teriſmata ſua Carmen Arenaicum de quorundam Nugigerulorum Piaffa inſupportabili*. The *Recitus Veritabilis ſuper terribili eſmeuta Paiſanorum de Ruellio*, is one of the beſt Pieces of this kind.

We have but little in *Engliſh* in the *Macaronian* Way; nothing ſcarce, but ſome little looſe Pieces collected in *Cambden*'s Remains: which is no Diſcredit to our Authors: for one may ſay of ſuch Pieces in general,

Turpe eſt Difficiles habere Nugas,
Et Stultus Labor eſt Ineptiarum.

The *Germans* and *Netherlanders* have had their *Macaronic* Poets; witneſs the *Certamen Catholicum cum Calviniſtis*, of one *Martinius Hamcenius Friſius*, which contains above twelve hundred Verſes, all the Words whereof begin with the Letter *C*.

MACE, a Medicinal Bark, the outermoſt of the three which covers the Nutmeg. It is of an aſtringent and drying Nature, and is uſed as a Corrector in Cardiac and Cathartic Compoſitions. See *Nutmeg*.

MACERATION, in Pharmacy and Chymiſtry, is underſtood of a certain Preparation of Medicines, otherwiſe expreſs'd by the Word *Digeſtion*. Others however reſtrain the Word to that particular kind of Digeſtion, which is performed in a thick Matter; as when, for inſtance, having mix'd Roſes with Fat to make *Unguent. Roſatum*, the Mixture is expoſed for ſome Days to the Sun, that the Virtue of the Roſes may be the better communicated to the Fat. See *Digeſtion*.

MACHINE, in the general, ſignifies any thing that ſerves to augment or regulate moving Powers; or *Machine* may be defined any Body deſtined to produce Motion, ſo as to ſave either Time or Force. There are ſix principal *Machines*, to which all the others may be reduced; *viz.* the Balance, Lever, Wheel, Pulley, Wedge, and Screw. Theſe are call'd *Simple Machines*; and of theſe all other compound ones conſiſt. For the Doctrine of theſe, ſee *Balance*, *Lever*, &c. See alſo *Mechanic Powers*.

The Number of compound *Machines* is now almoſt infinite; and yet the Antients ſeem to have out-done the Moderns in this reſpect. Their *Machines* of War, Architecture, &c. being deſcribed as vaſtly ſuperior to ours.

Machine for Building, is an Aſſemblage of Pieces of Wood ſo diſpoſed, as that by means of Ropes and Pulleys, a ſmall Number of Men may raiſe vaſt Loads, and lay 'em in their Places; as Cranes, &c. 'Tis hard to conceive what *Machines* the Antients muſt have uſed to raiſe thoſe immenſe Stones found in ſome of the antique Buildings.

Hydraulic, or *Water Machine*, is either uſed to ſignify a ſimple *Machine*, ſerving to conduct or raiſe Water; as a Sluice, Pump, &c. or ſeveral of theſe acting together, to produce ſome extraordinary Effect; as the *Machine* of *Marly*; the *Primum Mobile* whereof is an Arm of the River *Seine*, which by its Stream turns ſeveral large Wheels, which work the Handles, and theſe with Piſtons raiſe the Water up into the Pumps, and with other Piſtons force it up in Pipes againſt the Aſcent of a Hill to a Reſervoir in a Stone Tower, 62 Fathom higher than the River; ſufficient to ſupply *Verſailles* with a conſtant Stream 200 Inches in Diameter.

Machines of War: Theſe among the Antients were of three kinds; the firſt ſerving to launch Arrows, as the Scorpion; Javelins, as the Catapulta; Stones, as the Baliſta; or fiery Darts, as the Pyraboli; the ſecond ſerving to beat down Walls, as the battering Ram and Terebra; and the third to ſhelter thoſe who approach'd the Enemies Wall; as the Tortoiſe or Teſtudo, and the Towers of Wood. The *Machines of War* now in uſe, conſiſt in Artillery, Bombs, Petards, &c. Tho it muſt be obſerved, that in ſtrictneſs, a *Machine* is ſomething that conſiſts more in Art and Invention, than in the Strength and Solidity of the Materials; and for this reaſon it is that the Inventors of *Machines* are call'd *Ingenieurs* or *Ingeneers*. See *Engine*. The Word comes from the *Greek*, μηχανὴ, *Machine*, *Invention*, *Art*.

Machine, in Dramatic Poetry, a Term uſed, when the Poet brings ſome Divinity or ſupernatural Being upon the Stage; to perform ſome Exploit, or ſolve ſome Difficulty out of the reach of Human Power. The *Machines* of the Drama are Gods, Angels, Ghoſts, &c. which are ſo called from the *Machines* or Contrivances by which they are preſented upon the Stage, and afterwards removed again. Hence the Uſe of the Word has alſo paſſed into the Epic Poem; tho' the Reaſon of its Name be there wanting: The Word, however, is us'd in the ſame Senſe in both, *viz.* for the Intervention or Miniſtry

of

of ſome Divinity; but the Occaſion of *Machines*, in the one and the other, being ſomewhat different, the Rules and Laws of managing them are different likewiſe. The antient Dramatic Poets never brought any *Machine* on the Stage, but where there was an abſolute Neceſſity for the Preſence of a God; and were generally laughed at for ſuffering themſelves to be reduced to ſuch a Neceſſity. Accordingly *Ariſtotle* lays it down as an expreſs Law, that the unravelling of the Piece ſhould ariſe from the Fable itſelf; and not from any foreign *Machine*, as in the *Medea*. *Horace* is ſomething leſs ſevere; and contents himſelf with ſaying, that the Gods ſhould never appear, unleſs the *Nodus*, or Knot, were worthy of their Preſence; *Nec Deus interſit, niſi dignus Vindice Nodus,—inciderit.* But 'tis quite otherwiſe in the *Epopea*; there muſt be *Machines* every where, and in every Part. *Homer* and *Virgil* do nothing without them. *Petronius*, with his uſual Fire, maintains, that the Poets ſhould deal more with the Gods than with Men; that he ſhould every where leave Marks of his prophetic Raptures, and of the Divine Fury that poſſeſſes him; that his Thoughts be all full of Fables, that is, of Allegories and Figures: In fine, he will have a Poem diſtinguiſhed from an Hiſtory in all its Parts; not ſo much by the Verſes, as by that Poetical Fury which expreſſes itſelf wholly by Allegories; and does nothing but by Machines, or the Miniſtry of the Gods. A Poet therefore muſt leave it to the Hiſtorians to ſay, that a Fleet was diſperſed by a Storm, and driven to foreign Shores; and muſt himſelf ſay with *Virgil*, that *Juno* went to ſeek *Eolus*, and that this God, at her Requeſt, turned the Winds looſe againſt the *Trojans*. He muſt leave the Hiſtorian to write, that a young Prince behaved himſelf with a great deal of Prudence and Diſcretion on all Occaſions; and muſt ſay with *Homer*, that *Minerva* led him as it were by the hand in all his Enterprizes. Let an Hiſtorian ſay, that *Agamemnon*, quarrelling with *Achilles*, has a mind to ſhew him, tho' miſtakingly, that he can take *Troy* without his Aſſiſtance. The Poet muſt ſay that *Thetis*, piqued at the Affront her Son had received, flies up to Heaven to demand Vengeance of *Jupiter*; and that this God, to ſatisfy her, ſends the God *Somnus*, or *Sleep*, to *Agamemnon*, to deceive him, and make him believe that he ſhall take *Troy* that day. 'Tis thus that the Epic Poets uſed *Machines* in all Parts of their Works; In the *Iliad*, *Odyſſee*, and *Æneid*, the Propoſition mentions them; the Invocation is addreſſed to them; and the Narration is full of them: they are the Cauſes of Actions; they make the Knots, and at laſt they unravel them. This laſt Circumſtance is what *Ariſtotle* forbids in the Drama; but 'tis what *Homer* and *Virgil* have both practiſed in the *Epopea*. Thus *Minerva* fights for *Ulyſſes* againſt *Penelope*'s Lovers, helps him to deſtroy them; and the next Day herſelf, makes the Peace between *Ulyſſes* and the *Ithacans*, which cloſes the *Odyſſee*.

Further, the Uſe of *Machines*, in the Epic Poem, is, on ſome Accounts, entirely oppoſite to what *Horace* preſcribes for the Theatre. In Tragedy that Critic will never have them us'd without an abſolute Neceſſity; whereas in the *Epopea* they ſhould never be uſed but where they may be well let alone; and where the Action appears as if it did not neceſſarily require them. How many Gods and *Machines* does *Virgil* implore to raiſe the Storm that drives *Æneas* into *Carthage*? which yet might eaſily have happened in the ordinary Courſe of Nature. *Machines*, in the Epic Poem, therefore are not Contrivances of the Poet, to recover himſelf after he has made a falſe Step; nor to ſolve any Difficulty proper to ſome Parts of the Poem: but 'tis the Preſence of a Divinity, and ſome ſupernatural and extraordinary Action which the Poet inſerts in moſt of the Incidents of his Work, to render it more majeſtick and admirable; and to train his Readers to Piety and Virtue. This Mixture ſhould be ſo managed, as that the *Machines* may be retrenched, without retrenching any thing from the Action.

As to the Manner in which the *Machines* are to act; it may be obſerved, that in the old Mythology there are Gods both good, bad, and indifferent; and that our Paſſions may be converted into ſo many allegorical Divinities: ſo that every thing, both good and bad in a Poem, may be attributed to theſe *Machines*, and may be tranſacted by them. They don't however always act in the ſame manner; ſometimes they act without appearing, and by ſimple Inſpirations, which have nothing in them extraordinary or miraculous; as when we ſay the Devil ſuggeſted ſuch a Thought, *&c.* The ſecond Manner of their acting is entirely miraculous; as when a Divinity preſents itſelf viſibly before Men, ſo as to be known by them; or when they diſguiſe themſelves under ſome human Form without diſcovering themſelves. The third Manner partakes of each of the two, and conſiſts in Oracles, Dreams, and extraordinary Inſpirations; which *Boſſu* calls *Demi-Machines*. All theſe Manners ought to be ſo managed, as to carry a Veriſimilitude; and tho' Veriſimilitude be of a vaſt Extent in *Machines*, as being founded on the Divine Power; yet has it Bounds. *Horace* propoſes three kinds of *Machines* for the Stage; the firſt is a God viſibly preſent among the Actors, which, he ſays, ſhould never be introduc'd but on a great Occaſion. The ſecond contains more incredible and extraordinary *Machines*; as the Metamorphoſis of *Progne* into a Swallow, of *Cadmus* into a Serpent: and even theſe *Machines* he does not abſolutely condemn or exclude wholly out of the Poem, but only out of the Scene and the Sight of the Spectators: they are not to be repreſented, but may be recited. The third kind of *Machines* is abſolutely abſurd; and he rejects it entirely: the Inſtance he gives, is that of a Child taken alive out of the Belly of a Monſter that had devoured it. The other two Manners are allow'd indifferently in the *Epopea*; and without that Diſtinction of *Horace*, which only ſuits the Stage; it being in the Drama alone, that a Difference may be made between what paſſes in the Scene, or the Sight of the Spectators, and what behind the Curtain. See *Boſſu*.

MACROCEPHALUS, from μακρὸς *magnus, great*, and κεφαλὴ, *Caput, the Head*, is ſometimes uſed to ſignify an Head larger than of a natural Size.

MACROCOSM, a Term ſeldom uſed but in oppoſition to Microcoſm. By *Macrocoſm* we mean the World; and by Microcoſm, which ſignifies little World, we mean Man. The Word *Macrocoſm* is form'd from the *Greek* μάκρος, *Great*, and κοσμος, *World*.

MACULÆ, in Aſtronomy, dark Spots, of an irregular changeable Figure; obſerved in the face of the Sun: firſt taken notice of by *Scheiner* in 1611, and afterwards accurately obſerved by *Gallileus*, *Hevelius*, Mr. *Flamſtead*, *Caſſini*, *Kirch*, &c. Many of theſe *Maculæ* appear to conſiſt of heterogeneous Parts; whereof the darker and more denſe are call'd by *Hevelius*, *Nuclei*, and are incompaſſed, as it were, with Atmoſpheres ſomewhat rarer and leſs obſcure; but the Figure both of the *Nuclei* and entire *Maculæ* are variable. In 1644, *Hevelius* obſerv'd a ſmall thin Macula, which in two Days time grew to ten times its Bulk; appearing withal much darker, and with a larger *Nucleus*; and ſuch ſudden Mutations are frequent. The *Nucleus*, he obſerv'd, began to fail ſenſibly e'er the Spot diſappeared, and that, e'er it quite vaniſhed, broke into four, which in two Days reunited. Some *Maculæ* have laſted 2, 3, 10, 15, 20, 30, ſeldom 49 Days, tho' *Kirchius* obſerv'd one in 1681, from *April* 26 to the 17th of *July*. The Spots move over the Sun's Disk, with a Motion ſomewhat ſmaller near the Limb than near the Centre; that obſerv'd by *Kirch* was twelve Days viſible in the Sun's Disk; for fifteen Days more it lay hid behind it; it being their Rule to return to the Limb whence they departed in 27, ſometimes in 28 Days. Laſtly, it muſt be obſerved, that the *Maculæ* contract themſelves near the Limb, and in the middle of the Disk appear much larger; thoſe often running into one in the Disk, which in the Limb were ſeparate; that many of them ariſe in the middle of the Disk, and many diſappear in the ſame; and that none of them are obſerved to deviate from their Path near the Horizon: Whereas *Hevelius* obſerving *Mercury* in the Sun, near the Horizon, found him too low; being thruſt 27 Seconds beneath his former Path. From theſe Phænomena we collect,

(1.) That ſince *Mercury*'s Depreſſion below his Path ariſes from his Parallax, the *Maculæ* having no Parallax from the Sun, are nearer him than the Planet; but ſince they are hid behind the Sun three Days longer than they are in the Hemiſphere viſible to us, it follows alſo, that they don't adhere to the Surface of the Sun, but are at ſome diſtance from it.

(2.) That ſince they ariſe and diſappear in the middle of the Sun's Disk, and undergo various Alterations with regard both to Bulk, Figure, and Denſity, they muſt be formed *de novo*, and again diſſolved about the Sun; and are therefore, in all probability, a kind of Solar Clouds formed out of its Exhalations.

(3.) Since then the Solar Exhalations riſe over his Body; and are ſuſpended at a certain Height from it; it appears, from the Laws of Hydroſtatics, that the Sun muſt be incompaſſed with ſome Fluid to drive thoſe Exhalations upwards; which Fluid muſt be denſer, as it is lower; and rarer, as higher, like our Atmoſphere: And ſince the *Maculæ* diſſolve and diſappear in the very middle of the Sun's Disk, the Matter thereof, *i. e.* the Solar Exhalations muſt fall back again to the Sun; whence there muſt ariſe Changes in the Sun's Atmoſphere, and conſequently in the Sun itſelf.

(4.) Since

(4.) Since the Revolution of the *Maculæ* round the Sun is very regular; and ſince their Diſtance from the Sun is very ſmall, 'tis not properly the *Maculæ* that move round the Sun: But 'tis himſelf, together with his Atmoſphere, wherein the *Maculæ* ſwim, that in the ſpace of 27 Days moves round its own Axis; and hence it is that the *Maculæ*, being viewed obliquely near the Limb, appear narrow and oblong.

And, Laſtly, ſince the Sun appears with a circular Disk in every Situation; his Figure, as to Senſe, muſt be ſpherical. Some Authors likewiſe take notice of *Faculæ*, or bright Spots, in the Disk of the Sun, much more lucid than the reſt, much larger than the *Maculæ*, and very different from them both, as to Figure, Duration, *&c.* *Hevelius* mentions his ſeeing a *Facula* in 1634, which took up a third part of the Sun's Diameter; and adds, that the *Maculæ* frequently change into *Faculæ*; but the *Faculæ* ſeldom or never into *Maculæ*. But *Huygens*, and other great Aſtronomers, reject the Notion of the *Faculæ*; having never ſeen any thing like them (tho furniſh'd with the beſt Teleſcopes) excepting little bright Specks in the dim Clouds which frequently incompaſs the *Maculæ*; and which may be owing to the Refraction of the Sun's Rays in the rarer Parts of his Atmoſphere. And as to that little Inequality obſerved in the Circumference of the Sun's Disk, which is uſually aſcribed to the Wavings and Eructations of the Flames; it ſeems better accounted for from the tremulous Agitation of the Vapours in our own Atmoſphere.

MADDER, the Root of a Plant, much uſed by Dyers, to make the moſt ſolid and rich red Colour; it has its Uſes too in Medicine, being found of Service in Obſtructions of the Viſcera and Cachectic Conſtitutions; and is generally made up in forms of Decoctions, Diet-Drinks, and medicated Ales.

MADNESS, or MANIA, in Medicine, a kind of Delirium without a Fever, attended with Rage, and a total Deprivation of Reaſon. *Madneſs* conſiſting much in a Delirium, to explain the Nature of the former, Dr. *Quincy* premiſes that of the latter thus: As often as the Species of Things, wherewith we have been acquainted, are hurried together, we may be ſaid to dream, and thence in Sleep they are added with other things, and variouſly compounded, from the manifold Repercuſſions of the Animal Spirits, which ariſe from the Cauſe producing Sleep, and preſſing the Nerves, ſo as to revert the Fluctuations of their Juice. A Delirium is therefore the Dreams of waking Perſons, wherein Ideas are excited without Order or Coherence, and the Animal Spirits are drove into irregular Fluctuations. If therefore the Cauſe inducing a Delirium be of that nature, that it can excite Ideas or Motions of a conſiderable Impetus, without any manner of Certainty or Order, ſuch a Delirium will be attended with Boldneſs or Rage, and violent Motions of the Body; that is, a Madneſs will be produced. Now it is plain, that all the known Cauſes of this Diſtemper give a greater Diſpoſition to the Blood for Motion, and render it fluxile, but not conſiſtent, and uniformly thick enough; and therefore that they diſpoſe Perſons likewiſe to continued Fevers, ſince they occaſion the Blood to be thrown out of the Heart with an increaſed Force, unleſs ſome other Cauſe intervenes, whereby the Efficacies of theſe are interrupted in diſpoſing the Blood into Febrile Motions; and the Blood is ſo diſpoſed, as often as it can be rarefied into its minuteſt Parts; that is, ſo uniformly rarefied, that it can eaſily, with any Force by the Motion received from the Heart, go into Parts diviſible at the Occurſions of thoſe Orifices, into which it ought to be diſtributed: for then the Coheſion of the Parts, which can be but very ſmall, will not be any Obſtruction to the Increaſe and Propagation of the Blood's Velocity. But if it happens that the efficient Cauſe, or the Heart, throws the Blood with a greater Force, or that the Blood can the more eaſily be propelled in any given Time, it will occaſion, at the ſame time, that ſome Parts of the Blood be more nearly united, ſo as to form *Moleculæ*, conſiſting of cohering Particles; which *Moleculæ* will cohere to one another, and not ſo eaſily obey the Direction of the Heart's propelling Force. The Blood hereupon cannot be uniformly rarefied, nor enter ſo eaſily into the ſmall Orifices of the Veſſels, and ſo ſoon travel thro' them, and therefore there will no Fever ariſe; but a Delirium without a Fever, wherein the Heat of the Blood will be greater, and the Preſſure in the Brain uncertain: whence uncertain Recurſions of the Spirits, inordinate Undulations, confuſed Vibrations of the Nerves, and a remarkable Energy of Imagination; whence will proceed Audacity and Paſſion beyond meaſure. Some Authors ſay, that the Brain of a Cat eaten, produces *Madneſs*. 'Tis a Diſeaſe very hard to cure, and is generally found to baffle the Phyſician.

MADRIER, in the Military Art, a thick Plank armed with Iron Plates, having a Concavity ſufficient to receive the Mouth of the Petard when charged, with which it is applied againſt a Gate, or other Body deſigned to be broke down. *Madrier* is alſo the Name of a flat Beam fixed at the bottom of a Moat to ſupport a Wall. Beſides which, there are alſo *Madriers* lined with Tin, and covered with Earth, ſerving as a Defence againſt artificial Fires.

MADRIGAL, a Term in the modern *Italian*, *Spaniſh*, and *French* Poetry, ſignifying a little amorous Piece, containing a certain Number of looſe unequal Verſes, not tied either to the ſcrupulous Regularity of a Sonnet, or the Subtlety of an Epigram; but conſiſting of ſome tender, delicate, yet ſimple Thought, ſuitably expreſſed. The *Madrigal*, according to Mr. *le Brun*, is an Epigram without any thing very brisk and ſprightly in its Fall or Cloſe: ſomething very tender and gallant is uſually the Subject of it; and a certain beautiful, noble, yet chaſte, Simplicity, makes its Character.

The *Madrigal* is uſually looked on as the ſhorteſt of all the little kinds of Poems, and may conſiſt of fewer Verſes than either the Sonnet or Rondelay. There is no other Rule regarded in mingling the Rhimes and Verſes of different kinds, but the Choice and Convenience of the Author. This Poem, however, really allows of leſs Licence than any other; whether we regard the Rhyme, the Meaſures, or the Purity of Expreſſion.

Menage derives the Word from *Mandra*, which, in *Latin* and *Greek*, ſignifies a Company of Cattel; imagining it to have been originally a kind of Paſtoral or Shepherd's Song; whence the *Italians* formed their *Madrigale*, and we *Madrigal*. Others rather chuſe to derive the Word from *Madrugar*, which, in the *Spaniſh* ſignifies to riſe in the Morning: the *Madrigals* being formerly ſung early in the Morning, by thoſe who had a mind to ſerenade their Miſtreſſes.

MAGAS, or MAGADE, the Name of a muſical Inſtrument in Uſe among the Antients. There were two kinds of *Magades*; the one a ſtring Inſtrument, the Invention whereof is aſcribed by ſome to *Sappho*, and by others to the *Lydians*, and by others to *Timotheus* of *Miletum*. The other *Magade* was a kind of Flute, which at the ſame time yielded very high and very low Notes; the former kind was much improved by *Timotheus* of *Miletum*, who is ſaid to have been impeached of a Crime; for that by increaſing the Number of Chords, he ſpoiled and diſcredited the antient Muſic.

MAGAZINE, or Arſenal, is the Place in fortified Towns where all ſorts of Stores are kept, and where Carpenters, Wheelwrights, Smiths, *&c.* are employed in making all things needful to furniſh out the Train of Artillery.

S. MAGDALEN. There are ſeveral kinds of Nuns, or Religious, who bear this Name; conſiſting generally of penitent Courtezans: ſometimes alſo call'd *Magdalanettes*; as thoſe at *Metz* eſtabliſhed in 1452, thoſe at *Paris* in 1492; thoſe at *Naples*, firſt eſtabliſhed in 1324, and endowed by Queen *Sancha*, to ſerve as a Retreat to public Courtezans, who ſhould quit the Trade, and betake themſelves to Repentance; and thoſe of *Rouen* and *Bourdeaux*, which had their Original among thoſe of *Paris*. In each of theſe Monaſteries there are three kinds of Perſons and Congregations, *viz.* the firſt is of thoſe who are admitted to make Vows, and theſe bear the Name of St. *Magdalen*; the Congregation of St. *Martha* is the ſecond, and is compoſed of thoſe whom 'tis not judged proper to admit to Vows; the Congregation of St. *Lazarus* is compoſed of ſuch as are detained there by force. The Religious of St. *Magdalen* at *Rome* were eſtabliſhed by Pope *Leo* X. *Clement* VIII. ſettled a Revenue on them, and further appointed, that the Effects of all public Proſtitutes, dying without Teſtaments, ſhould fall to them; and that the Teſtaments of the reſt ſhould be invalid; unleſs they bequeathed a Portion of their Effects, which was to be at leaſt a fifth Part, to them.

MAGI, the Title the *Eaſtern* Nations, both antiently and at preſent, give to their Wiſe-men or Philoſophers. The antient *Magi*, according to *Ariſtotle* and *Laertius*, were the Authors and Conſervators of the *Perſian* Philoſophy; and the Philoſophy principally cultivated among them was Theology and Politics: they being always eſteem'd as the Interpreters of all Laws both Divine and Human; on which account they were wonderfully revered by the People. Hence *Cicero* obſerves, that none were admitted to the Crown of *Perſia*, but ſuch as were well inſtructed in the Diſcipline of the *Magi*; who taught the τὰ βασιλικὰ; and ſhew'd Princes how to govern. *Plato*, *Apuleius*, *Laertius*, and others, agree, that the Philoſophy of the *Magi* related principally to the Worſhip of the Gods; they were the Perſons who were to offer Prayers, Supplications, and Sacrifices, as

if the Gods would be heard by them alone. According to *Lucian*, *Suidas*, &c. the Theology or Worſhip of the Gods, about which the *Magi* were employ'd, was little more than the Diabolical Art of Divination. Hence μαγεία, ſtrictly taken, ſignifies Divination. *Porphyry* defines the *Magi* well, *Circa Divina Sapientes & in iiſdem miniſtrantes*; adding, that the word *Magus* implied as much in the *Perſian* Tongue. Theſe People, ſays he, are held in ſuch Veneration among the *Perſians*, that *Darius*, the Son of *Hyſtaſpes*, among other things, had this engraven on his Monument, that he was the Maſter of the *Magi*. Their Deſcendants, the modern *Magi*, are divided into three Claſſes; whereof the firſt and moſt learned neither eat nor kill Animals, but adhere to the old Inſtitution of abſtaining from living Creatures. The *Magi* of the ſecond Claſs refrain only from tame Animals; nor do the laſt kill all indifferently; it being the firm and diſtinguiſhing Dogma of them all, τὸν μετεμψύχωσιν εἶναι, *that there is a Tranſmigration of Souls*. To intimate the Similitude between Animals and Men; they uſe to call the latter by the Name of the former; thus their Fellow-Prieſts they call'd *Lions*, the Prieſteſſes *Lioneſſes*, the Servants *Crows*, &c. *Philo Judæus* deſcribes the *Magi* to be diligent Inquirers into Nature, out of the Love they bear to Truth; and who ſetting themſelves apart for theſe things, contemplate the Divine Virtues the more clearly, and initiate others in the ſame Myſteries.

The Origin of Magic and the *Magi* is aſcribed to *Zoroaſter*. *Salmaſius* derives the very Name from *Zoroaſter*, who, he ſays, was ſurnam'd *Mog*, whence *Magus*. Others, inſtead of making him the Author of the *Perſian* Philoſophy, make him only the Reſtorer and Improver thereof; alledging that many of the *Perſian* Rites, in Uſe among the *Magi*, were borrowed from the *Zabii* of the *Chaldeans*, who agreed in many things with the *Magi* of the *Perſians*; whence ſome make the Name *Magus* common both to the *Chaldeans* and *Perſians*. Thus *Plutarch* mentions, that *Zoroaſter* inſtituted *Magi* among the *Chaldeans*; in imitation whereof the *Perſians* had theirs too.

The Learned are in great perplexity about the Origin of the Word. *Plato*, *Xenophon*, *Herodotus*, *Strabo*, &c. fetch its Origin from the *Perſian* Language; in which it ſignified a *Prieſt*, or Perſon to officiate in Holy Things, as *Druid* among the *Gauls*, *Gymnoſophiſt* among the *Indians*, and *Levite* among the *Hebrews*. Others derive it from the *Greek* μέγας, *great*, which being borrowed of the *Greeks* by the *Perſians*, was returned in the form of μαγος; but *Voſſius*, with more probability, brings it from the *Hebrew* הגה, *haga*, *to meditate*; whence is formed מהגים, *Maaghim*, in *Latin* Meditabundi, q. d. *People addicted to Meditation*.

MAGIC, a Science that teaches to perform wonderful and ſurprizing Effects. The Word *Magic* originally carried with it a very innocent, nay laudable, Meaning; being uſed purely to ſignify the Study of Wiſdom; but in regard the antient *Magi*, or Magicians, engaged themſelves in Aſtrology, Divination, Sorcery, &c. the Term *Magic* in time became odious, and was only uſed to ſignify a Science ſcandalous and unlawful. If any wonder how ſo vain and deceitful a Science ſhould gain ſo much Credit and Authority over Mens Minds, *Pliny* gives the Reaſon of it; 'Tis, *ſays he*, becauſe it has poſſeſſed itſelf of three Sciences of the moſt Eſteem among Men; taking from each, all that is great and marvellous in it. Nobody doubts but it had its firſt Origin in Medicine, and that it inſinuated itſelf into the Minds of the People under pretence of giving extraordinary Remedies. To theſe fine Promiſes it added every thing in Religion that is pompous and ſplendid, and that appears calculated to blind and captivate Mankind. Laſtly, it mingled judiciary Aſtrology with the reſt; perſuading People, curious of Futurity, that it ſaw every thing to come in the Heavens.

Agrippa divides *Magic* into three kinds; *Natural Magic*, *Celeſtial Magic*, and *Ceremonial* or *Superſtitious Magic*. *Natural Magic* is no more than the Application of natural active Cauſes to paſſive Cauſes; by means whereof many ſurprizing, but yet natural, Effects are produced.

Celeſtial Magic borders very nearly on Judiciary Aſtrology. It attributes to Spirits a kind of Rule or Dominion over the Planets; and to the Planets a Dominion over Men; and on theſe Principles builds a ridiculous kind of Syſtem.

Superſtitious Magic conſiſts in the Invocation of Devils; its Effects are uſually evil and wicked; tho' very ſtrange, and ſurpaſſing the Powers of Nature; produced, by virtue of ſome Compact, either tacit or expreſs, with evil Spirits: but the truth is, theſe have not all the Power that is uſually imagined, nor do they produce half thoſe Effects ordinarily aſcribed to them.

Baptiſta Porta has written of natural *Magic*, or of Secrets for performing very extraordinary things by natural Cauſes. The natural *Magic* of the *Chaldeans* was nothing but the Knowledge of the Powers of Simples and Minerals. The *Magic*, which they called *Theurgia*, conſiſted wholly in the Knowledge of the Ceremonies, to be obſerved in the Worſhip of the Gods, in order to be acceptable. By virtue of theſe Ceremonies they believed they could converſe with ſpiritual Beings, and cure Diſeaſes. *Naude* has publiſhed an Apology for all the Great Men ſuſpected of *Magic*. *Agrippa* ſays, that the Words uſed by thoſe in compact with the Devil, to invoke him, and to ſucceed in what they undertake, are *Diesmies jeſquet bendoefet dou foima enitemaus*. There are an hundred other ſuperſtitious Formula's of Words compoſed at pleaſure, or gathered from ſeveral different Languages, or patch'd from the *Hebrew*, or formed in imitation of it.

MAGIC LANTHORN, an Optic Machine, by means whereof little painted Images are repreſented on an oppoſite Wall of a dark Room, magnified to any Bigneſs at pleaſure.

Conſtruction of the Magic Lanthorn. A B C D (*Tab. Opticks, Fig.* 10.) is a common Tin Lanthorn, to which is added a Tube to draw out, F G. In H is fixed a metallic concave Speculum of a Foot diameter at moſt, or four Inches at leaſt; or, in lieu thereof, near the Extremity of the Tube is placed a convex Lens, conſiſting of a Segment of a ſmall Sphere, its Diameter not exceeding a few Inches. In the Focus of the concave Speculum, or Lens, is placed a Lamp L; within the Tube, where it is ſoldered to the Side of the Lanthorn, is placed a ſmall Lens, convex on both Sides, being a Portion of a ſmall Sphere, having its Focus about the Diſtance of three Inches. The extreme Part of the Tube F M is ſquare, and has an Aperture quite thro'; ſo as to receive an oblong Frame N O, paſſed thro' it; in this Frame are round Holes an Inch or two in Diameter. According to the Bigneſs of thoſe Holes are drawn Circles on a plain thin Glaſs; and in theſe Circles are painted any Figures or Images at pleaſure, with tranſparent Water Colours. Theſe Images fitted into the Frame, and placed invertedly, at a little diſtance from the Focus of the Lens I; will be projected on an oppoſite white Wall of a dark Room, prodigiouſly magnified in all their Colours, and an erect Situation.

Theory of the Magic Lanthorn. The Lamp being placed in the Focus of the concave Speculum, or any Convex Glaſs, the Rays will be propagated parallel to each other, and the Image will be ſtrongly illumined, and will therefore emit a great Number of Rays into the Lens I. But being ſuppoſed to be placed near the Lens I, the inverted Image of the Picture inverted muſt be form'd on the oppoſite Wall, exceedingly magnified after its Refraction thro' the Lens; and it will be ſtill the more magnified as the Lens is a Segment of a leſs Sphere, and as the Picture is placed nearer the Focus of the Lens; in a dark Place therefore the Picture will be repreſented prodigiouſly large and extremely vivid. See *Lens*.

Another Magic Lanthorn. Every thing being managed as in the former, into the ſliding Tube F G, inſert another Convex Lens K, the Segment of a Sphere ſomewhat larger than I; now if the Picture be brought nearer I than to the Diſtance of the Focus, the diverging Rays will be propagated as if they proceeded from P: wherefore if the Lens K be ſo placed, as that P is very near its Focus, the Image will be exhibited on the Wall exceedingly magnified.

Schol. 1. To heighten the Light, Specula are preferred to Lens's; the Focus of a Speculum being nearer than that of the Lens.

2. *De Chales* orders the Diameter of the Lens I to be two, four, or five Digits, and in a ſubduple Proportion to the other K; *i. e.* if I be five Digits, K muſt be 10; and the Diameter of the Speculum, according to the ſame, is to be two Digits. *Zahnius* chuſes to have the Diameter of I $\frac{2}{10}$ of a Foot, and that of K one Foot and $\frac{1}{2}$, &c.

3. Little Animals being included in the *Magic Lanthorn*, in the manner obſerved in ſpeaking of the Microſcope; or any little tranſparent Objects faſtened to a Slice of Talk or Glaſs, and ſubſtituted inſtead of Images; the *Magic Lanthorn* will become a Microſcope.

MAGIC SQUARES, the ſeveral Numbers that compoſe any ſquare Number; (for Inſtance, 1, 2, 3, 4, 5, &c. to 25 incluſive, which compoſe the ſquare Number 25) being diſpoſed after each other in a ſquare Figure of 25 Cells, each in its Cell: if then you change the Order of theſe Numbers, and diſpoſe them in the Cells, in ſuch manner, as that the five Numbers, which fill any Horizontal Rank of Cells, being added together, ſhall make the ſame Sum, with the five Numbers, in any other Rank of Cells, whether horizontal or vertical; and even the ſame Number with the five in each of the two

Diagonal Ranks, this Diſpoſition of Numbers is called a *Magic Square*, in oppoſition to the former Diſpoſition, which is called a *Natural Square*. See the Figures adjoining.

Natural Square.

1	2	3	4	5

7	5	21	19	13

One would imagine that *Magic Squares* had that Name given them, in regard this Property of all their Ranks, which, taken any way, make always the ſame Sum, appeared extremely ſurprizing, eſpecially in certain ignorant Ages, when Mathematics paſſed for *Magic*: But there is a great deal of Reaſon to ſuſpect, that theſe Squares merited their Name ſtill further by the ſuperſtitious Operations they were imployed in, as the Conſtruction of *Taliſmans*, &c. for according to the childiſh Philoſophy of thoſe Days, which attributed Virtues to Numbers, what Virtues might not be expected from Numbers ſo wonderful?

However, what was at firſt the vain Practice of Makers of Taliſmans, and Conjurers, has ſince become the Subject of a ſerious Reſearch among the Mathematicians; not that they imagine it will lead them to any thing of ſolid Uſe or Advantage. *Magic Squares* ſavour too much of their Original to be of any Uſe. But only as 'tis a kind of Play, where the Difficulty makes the Merit; and as it may chance to produce ſome new Views of Numbers which Mathematicians will not loſe the Occaſion of.

Eman. Moſchopulus, a *Greek* Author of no great Antiquity, is the firſt that appears to have ſpoke of *Magic Squares*; and by the Age wherein he lived, there is Reaſon to imagine he did not look on them merely as a Mathematician. However, he has left us ſome Rules for their Conſtruction. In the Treatiſe of *Cor. Agrippa*, ſo much accuſed of *Magic*, we find the Squares of ſeven Numbers, *viz.* from three to nine incluſive, diſpoſed magically; and it muſt not be ſuppoſed that thoſe ſeven Numbers were preferred to all the others without a very good Reaſon. In effect, 'tis becauſe their Squares, according to the Syſtem of *Agrippa* and his Followers, are planetary. The Square of 3, for Inſtance, belongs to *Saturn*, that of 4 to *Jupiter*, that of 5 to *Mars*, that of 6 to the *Sun*, that of 7 to *Venus*, that of 8 to *Mercury*, and that of 9 to the *Moon*. M. *Bachet* applied himſelf to the Study of *Magic Squares*, on the Hint he had taken from the Planetary Squares of *Agrippa*; as being unacquainted with the Work of *Moſchopulus*, which is only in Manuſcript in the *French* King's Library; and, without the Aſſiſtance of any other Author, found out a new Method for thoſe Squares whoſe Root is uneven, for inſtance 25, 49, &c. but could not make any thing of thoſe whoſe Root is even.

After him came Mr. *Frenicle*, who took the ſame Subject in hand. A great Algebraiſt was of opinion, that whereas the ſixteen Numbers, which compoſe the Square, might be diſpoſed 20922789888000 different Ways in a natural Square (as from the Rules of Combination 'tis certain they may) could not be diſpoſed in a *Magic Square* above ſixteen different Ways. But M. *Frenicle* ſhewed, that they might be diſpoſed 878 different Ways; whence it appears how much his Method exceeds the former, which only yielded the 55th Part of *Magic Squares* of that of Mr. *Frenicle*. To this Enquiry he thought fit to add a Difficulty, that had not yet been conſidered: The *Magic Square* of 7, for inſtance, being conſtructed, and its 49 Cells filled, if the two Horizontal Ranks of Cells, and at the ſame time the two Vertical ones, the moſt remote from the middle, be retrenched, that is, if the whole Border or Circumference of the Square be taken away; there will remain a Square, whoſe Root will be 5, and which will only conſiſt of 25 Cells. Now 'tis not at all ſurprizing that the Square ſhould be no longer *Magic*, in regard the Ranks of the large one were not intended to make the ſame Sum, excepting when taken entire with all the 7 Numbers that fill their ſeven Cells; ſo that being mutilated each of two Cells, and having loſt two of their Numbers, it may be well expected that their Remainders will not any longer make the ſame Sum. But Mr. *Frenicle* would not be ſatisfied, unleſs when the Circumference or Border of the *Magic Square* was taken away, and even any Circumference at pleaſure, or in fine ſeveral Circumferences at once, the remaining Square were ſtill *Magic*: which laſt Condition, no doubt, made theſe Squares vaſtly more magical than ever.

Again, he inverted that Condition, and required that any Circumference taken at pleaſure, or even ſeveral Circumferences ſhould be inſeparable from the Square; that is, it ſhould ceaſe to be *Magic* when they were removed, and yet continue *Magic* after the Removal of any of the reſt. Mr. *Frenicle*, however, gives no general Demonſtration of his Methods, and frequently ſeems to have no other Guide but his groping. 'Tis true, his Book was not publiſhed by himſelf, nor did it appear till after his Death, *viz.* in 1693.

In 1703, Mr. *Poignard*, Canon of *Bruſſels*, publiſhed a Treatiſe of *Sublime Magic Squares*. Before him there had been no *Magic Squares* made but for Series's of natural Numbers that formed a Square; but M. *Poignard* made two very conſiderable Improvements: (1.) Inſtead of taking all the Numbers that fill a Square, for Inſtance, the 36 ſucceſſive Numbers, which would fill all the Cells of a natural Square, whoſe Side is 6, he only takes as many ſucceſſive Numbers as there are Units in the Side of the Square, which in this Caſe are 6; and theſe ſix Numbers alone he diſpoſes in ſuch manner, in the 36 Cells, that none of them are repeated twice in the ſame Rank, whether it be horizontal, vertical, or diagonal: whence it follows, that all the Ranks, taken all the Ways poſſible, muſt always make the ſame Sum, which Mr. *Poignard* calls repeated Progreſſion. (2.) Inſtead of being confined to take theſe Numbers according to the Series and Succeſſion of the natural Numbers, that is, in an Arithmetical Progreſſion, he takes them likewiſe in a Geometrical Progreſſion, and even an Harmonical Progreſſion. But with theſe two laſt Progreſſions the *Magic* muſt neceſſarily be different from what it was. In the Squares, filled with Numbers in Geometrical Progreſſion, it conſiſts in this, that the Products of all the Ranks are equal, and in the Harmonical Progreſſion, the Numbers of all the Ranks continually follow that Progreſſion: he makes Squares of each of theſe three Progreſſions repeated.

This Book of M. *Poignard* gave occaſion to M. *de la Hire* to turn his Thoughts the ſame way, which he did with good Succeſs, inſomuch that he ſeems to have well-nigh compleated the Theory of *Magic Squares*. He firſt conſiders uneven *Squares*: all his Predeceſſors on the Subject having found the Conſtruction of even ones by much the moſt difficult; for which Reaſon M. *de la Hire* reſerves thoſe for the laſt. This Exceſs of Difficulty may ariſe partly from hence, that the Numbers are taken in an Arithmetical Progreſſion. Now in that Progreſſion, if the Number of Terms be uneven, that in the middle has ſome Properties, which may be of Service; for inſtance, being multiplied by the Number of Terms in the Progreſſion, the Product is equal to the Sum of all the Terms.

M. *de la Hire* propoſes a general Method for uneven Squares, which has ſome Similitude with the Theory of compound Motions, ſo uſeful and fertile in *Mechanics*. As that conſiſts in decompounding Motions, and reſolving them into others more ſimple, ſo does M. *de la Hire*'s Method conſiſt in reſolving the Square, that is to be conſtructed, into two ſimple and primitive Squares. It muſt be owned, however, 'tis not quite ſo eaſy to conceive thoſe two ſimple and *primitive* Squares in the compound or *perfect* Square, as in an oblique Motion to imagine a Parallel and a Perpendicular one.

Suppoſe a Square of Cells, whoſe Root is uneven; for Inſtance 7, and that its 49 Cells are to be filled magically with Numbers, for inſtance, the firſt 7. M. *de la Hire*, on the one ſide, takes the firſt ſeven Numbers, beginning with Unity, and ending with the Root 7, and on the other 7, and all its Multiples to 49 excluſively; and as theſe only make ſix Numbers, he adds 0, which makes this an Aritmetical Progreſſion of ſeven Terms as well as the other. 0. 7. 14. 21. 28. 35. 42.

This done, with the firſt Progreſſion repeated, he fills the Square of the Root 7 magically. In order to this, he writes in the firſt ſeven Cells of the firſt Horizontal Rank the ſeven Numbers propoſed, in what Order he pleaſes, for that is abſolutely indifferent; and 'tis proper to obſerve here, that thoſe ſeven Numbers may be ranged in 5040 different Manners in the ſame Rank. The Order in which they are placed in the firſt Horizontal Rank, be it what it will, is that which determines their Order in all the reſt. For the ſecond Horizontal Rank, he places in its firſt Cell, either the third, the fourth, the fifth, or the ſixth Number from the firſt Number of the firſt Rank, and after that writes the ſix others in the Order as they follow. For the third Horizontal Rank, he obſerves the ſame Method with regard to the ſecond, that he obſerved in the ſecond with regard to the firſt, and ſo of the reſt. For inſtance, ſuppoſe the firſt Horizontal Rank filled with the ſeven Numbers in their natural Order, 1. 2. 3. 4. 5. 6. 7. the ſecond Horizontal Rank may either commence with 3, with 4, with 5, or with 6; but in this Inſtance it commences with

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

with 3, the third Rank therefore must commence with 5, the fourth with 7, the fifth with 2, the sixth with 4, and the seventh with 6. The Commencement of the Ranks which follow the first being thus determined, the other Numbers, as we have already observed, must be written down in the Order wherein they stand in the first, going on to 5, 6, and 7, and returning to 1, 2, &c. till every Number in the first Rank be found in every Rank underneath, according to the Order arbitrarily pitched upon at first. By this means, 'tis evident, no Number whatever can be repeated twice in the same Rank, and by consequence that the seven Numbers 1. 2. 3. 4. 5. 6. 7. being in each Rank, they must of Necessity make the same Sum.

It appears, from this Example, that the Arrangement of the Numbers in the first Rank being chosen at pleasure, the other Ranks may be continued in four different Manners; and since the first Rank may have 5040 different Arrangements, there are no less than 20160 different Manners of constructing the *Magic Square* of seven Numbers repeated.

1	2	3	4	5	6	7
2	3	4	5	6	7	1
3	4	5	6	7	1	2
4	5	6	7	1	2	3
5	6	7	1	2	3	4
6	7	1	2	3	4	5
7	1	2	3	4	5	6

1	2	3	4	5	6	7
7	1	2	3	4	5	6
6	7	1	2	3	4	5
5	6	7	1	2	3	4
4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The Order of the Numbers in the first Rank being determined; if in beginning with the second Rank, the second Number 2, or the last Number 7 should be pitched upon; in one of those Cases one of the Diagonal Ranks would have the same Number constantly repeated; and, in the other Case, the other Diagonal would have it repeated; of consequence therefore, either the one or the other Diagonal would be false, unless the Number repeated seven times should happen to be 4, for four times seven is equal to the Sum of 1. 2. 3. 4. 5. 6. 7. and, in general, in every Square consisting of an uneven Number of Terms, in Arithmetical Progression, one of the Diagonals would be false according to those two Constructions, unless the Term, always repeated in that Diagonal, were the middle Term of the Progression.

'Tis not however at all necessary to take the Terms in an Arithmetical Progression; for, according to this Method, one may construct a *Magic Square* of any Numbers at pleasure, whether they be according to any certain Progression or not. If they be in an Arithmetical Progression, 'twill be proper, out of the general Method, to except those two Constructions, which produce a continual Repetition of the same Term in one of the two Diagonals; and only take in the Case, wherein that Repetition would prevent the Diagonal from being just. Which Case being absolutely disregarded, when we computed that the Square of 7 might have 20160 different Constructions; 'tis evident, that by taking that Case in, it must have vastly more.

To begin the second Rank with any other Number besides the second and the last, must not however be looked on as an universal Rule. It holds good for the Square of 7, but if the Square of 9, for instance, were to be constructed, and the fourth Figure of the first Horizontal Rank were pitched on for the first of the second, the Consequence would be, that the fifth and eighth Horizontal Ranks would likewise commence with the same Number, which would therefore be repeated three times in the same vertical Rank, and occasion other Repetitions in all the rest. The general Rule therefore must be conceived thus: Let the Number in the first Rank pitched on, for the Commencement of the second, have such an Exponent of its Quota, that is, let the Order of its Place be such, as that if an Unit be taken from it, the Remainder will not be any just Quota Part of the Root of the Square; that is, cannot divide it equally. If, for Example, in the Square of 7, the third Number of the first Horizontal Rank be pitched on for the first of the second, such Construction will be just; because the Exponent of the Place of that Number, *viz.* 3, substracting 1, that is 2, cannot divide 7. Thus also might the fourth Number of the same first Rank be chosen, because 4 — 1, *viz.* 3. cannot divide 7, and for the same Reason the fifth or sixth Number might be taken: But in the Square of 9, the fourth Number of the first Rank must not be taken, because 4 — 1, *viz.* 3, does divide 9. The Reason of this Rule will appear very evidently, by considering in what manner the Returns of the same Numbers do or do not happen, taking them always in the same manner in any given Series. And hence it follows, that the fewer Divisions the Root of any Square to be constructed has, the more different Manners of constructing it there are, and that the prime Numbers, that is, those which have no Divisions, as 5. 7. 11. 13. &c. are those whose Squares will admit of the most Variations in proportion to their Quantities.

The Squares constructed, according to this Method, have some particular Property not required in the Problem: For the Numbers that compose any Rank parallel to one of the two Diagonals, are ranged in the same Order with the Numbers that compose the Diagonal, to which they are parallel. And as any Rank parallel to a Diagonal must necessarily be shorter, and have fewer Cells than the Diagonal itself, by adding to it the corresponding Parallel which has the Number of Cells, the other falls short of the Diagonal; the Numbers of those two Parallels, placed, as it were, end to end, still follow the same Order with those of the Diagonal; besides that, their Sums are likewise equal; so that they are magical on another account.

First Primitive.

1	2	3	4	5	6	7
3	4	5	6	7	1	2
5	6	7	1	2	3	4
7	1	2	3	4	5	6
2	3	4	5	6	7	1
4	5	6	7	1	2	3
6	7	1	2	3	4	5

Instead of the Squares, which we have hitherto form'd by Horizontal Ranks, one might also form them by Vertical Ones; the Case is the same in both.

All we have hitherto said regards only the first Primitive Square, whose Numbers, in the proposed Example, were 1. 2. 3. 4. 5. 6. 7; there still remains the second Primitive, whose Numbers are 0. 7. 14. 21. 28. 35. 42. M. *de la Hire* proceeds in the same manner here as in the former; and this may likewise be constructed in 20160 different Manners, as containing the same Number of Terms with the first. Its Construction being made, and of consequence all its Ranks making the same Sum, 'tis evident, that if we bring the two into one, by adding together the Numbers of the two corresponding Cells of the two Squares, that is, the two Numbers of the first of each, the two Numbers of the second, of the third, &c. and dispose them in the 49 corresponding Cells of a third Square; it will likewise be *Magic*, in regard its Ranks, formed by the Addition of equal Sums to equal Sums must of necessity be equal among themselves. All that remains in doubt is, whether or no, by the Addition of the corresponding Cells of the two first Squares, all the Cells of the third will be filled in such manner, as that each not only contain one of the Numbers of the Progression from 1 to 49, but also that this Number be different from that of any of the rest, which is the End and Design of the whole Operation.

Second Primitive.

0	7	14	21	28	35	42
21	28	35	42	0	7	14
42	0	7	14	21	28	35
14	21	28	35	42	0	7
35	42	0	7	14	21	28
7	14	21	28	35	42	0
28	35	42	0	7	14	21

As to this, it must be observ'd, that if in the Construction of the second *Primitive Square*, care has been taken in the Commencement of the second Horizontal Rank, to observe an Order with regard to the first, different from what was observ'd in the Construction of the first Square; for instance, if the second Rank of the first Square begun with the third Term of the first Rank, and the second Rank of the second Square commence with the fourth of the first Rank, as in the Example it actually does; each Number of the first Square may be combined once, and only once, by Addition with all the Numbers of the second. And as the Numbers of the first are here 1. 2. 3. 4. 5. 6. 7. and those of the second 0. 7. 14. 21. 28. 35. 42. by combining them in this manner, we have all the Numbers in the Progression from 1 to 49, without having any of 'em repeated; which is the *Perfect Magic Square* proposed.

Perfect Square.

1	9	17	25	33	41	49
24	32	40	48	7	8	16
47	6	14	15	23	31	39
21	22	31	38	46	5	13
37	47	4	12	20	28	29
11	19	27	35	36	46	3
26	42	42	2	10	18	25

The Necessity of constructing the two *Primitive Squares* in a different manner, does not at all hinder but that each of the 20160 Constructions of the one may be combined with all the 20160 Constructions of the other: of consequence therefore 20160 multiplied by itself, which makes 406425600, is the Number of different Constructions that may be made of the *Perfect Square*, which here consists of

the

the 49 first Numbers of the Natural Progression. But as we have already observed, that a *Primitive Square* of 7 Numbers repeated may have above 20160 several Constructions, the Number 40642560 must come vastly short of expressing all the possible Constructions of a perfect *Magic Square* of the 49 first Numbers.

As to the *Even Squares*, he constructs them like the *Uneven* ones, by two *Primitive Squares*; but the Construction of *Primitives* is different in the general, and may be so a great number of ways: and those general Differences admit of a great number of particular Variations, which give as many different Constructions for the same even Square. It scarce seems possible to determine exactly, either how many general Differences there may be between the Construction of the primitive Squares of an even Square and an uneven one; nor how many particular Variations each general Difference may admit of; and of consequence we are still far from being able to determine the Number of different Constructions of all those that may be made by the Primitive Squares.

MAGISTER, *Master*, a Title frequently found in old Writings. It noted, the Person who bore it had attained some Degree of Eminency *in Scientia aliqua præsertim Literaria*; and in old Times those we now call *Doctors*, were called *Magistri*.

MAGISTERY, a Term in Chymistry signifying a Precipitate of some Dissolution; made by a Salt, or some other Body, which breaks the Force of the Dissolvent. Thus we say, *Magistery of Bismuth*, which is a very fine Powder made by dissolving the Bismuth in Spirit of Nitre, and pouring on it Salt Water, which precipitates the *Magistery* to the bottom. See *Bismuth*. *Magistery of Lead* is a fine Powder, made by dissolving *Saccharum Saturni* in distill'd Vinegar, and then precipitating it with Oil of Tartar *per Deliquium*. The word *Magistery* is also used in speaking of Resins, Resinous Extracts of Scammony, Jalap, Turpeth, &c. which are made by dissolving the Matter in Spirit of Wine, and precipitating it with Water. Mr. *Boyle* takes the proper Notion of a *Magistery* to consist in a Preparation of a Body, whereby it is wholly, or at least in great measure, by means of some extraneous Additament converted into a Body of a different kind; as when Iron or Copper is turned into Chrystals of *Mars* and *Venus*.

MAGMA, among Chymists, &c. the Dregs or Residuum after Infusion or Distillation.

MAGNA ARTERIA, the same with the *Aorta*, which see.

MAGNA CHARTA, the *Great Charter*, granted the ninth Year of *Henry* the Third, and confirmed by *Edward* the First. The Reason why it is so term'd, is either because of the Excellency of the Laws and Liberties therein contained, or else because there was another Charter, call'd *Charta de Foresta*, establish'd with it, which was the less of the two; or because it contained more than any other Charters; or more than that of K. *Henry* the First; or in regard of the Wars and Troubles in the obtaining of it; or of the great and remarkable Solemnity in the denouncing Excommunications against the Infringers of it. *Holinshed* indeed tells us, that King *John*, to appease the Barons, yielded to Laws or Articles of Government much like to this great Charter; but we have now no antienter Law written than this; which was thought to be so beneficial to the Subject, and a Law of so great Equity, in comparison of those which were formerly in use, that King *Henry*, for the granting it, had the fifteenth Penny of all the moveable Goods, both of Temporality and Spirituality. Sir *Edw. Coke* says, it has been above thirty times confirmed. It is recorded, that when *Henry* III. confirm'd it, he swore on the word and Faith of a King, a Christian, and a Knight, to observe it. See *Charta Magna*.

MAGNES ARSENICAL, in Chymistry, a Mixture of equal Parts of Arsenic, Sulphur, and Antimony melted together over the Fire, and condensed in manner of a Stone. It is a very gentle Caustic, and was first invented by *Angelus Sala*. It has its Name *Magnet*, because being wore during Malignant Diseases, it is supposed to preserve the Wearer from Infection by a Magnetical Power.

MAGNET, or *Loadstone*, a Mineral Stone, or rather a Metal, or an imperfect Iron; in Weight and Colour resembling Iron Ore, tho somewhat harder and more heavy. It is usually found in Iron Mines, and sometimes in very large pieces, half *Magnet*, half Iron. Its Colour is different, according to the different Countries it is brought from. *Norman* observes, that the best are those brought from *China* and *Bengal*, which are of an Iron or Sanguine Colour; those of *Arabia* are reddish, those of *Macedonia* blackish; and those of *Hungary*, *Germany*, *England*, &c. the Colour of unwrought Iron. Neither its Figure nor Bulk are determined, but it is found of all Forms and Sizes.

The Antients reckon'd five kinds of *Magnets*, different in Colour and Virtue: the *Ethiopic*, *Magnesian*, *Bœotic*, *Alexandrian*, and *Natolian*. They also took it to be Male and Female: but the chief Use they made of it was in Medicine; especially for the Cure of Burns, and Defluxions on the Eyes: the Moderns, more happy, take it to conduct 'em in their Voyages.

The most distinguishing Properties of this wonderful Body, are, That it attracts Iron, and that it points to the Poles of the World; and in other Circumstances also dips or inclines to a Point beneath the Horizon, directly under the Pole; and that it communicates these Properties by Touch, to Iron. On which Foundation are built the Mariners Needles; both Horizontal, and Inclinatory, or Dipping Needles. See *Needle*.

The Attractive Power of the Magnet was known to the Antients, and is mention'd even by *Plato* and *Euripides*; who call it the *Herculean Stone*; because it commands Iron, which subdues every thing else: But the Knowledge of its Directive Power, whereby it disposes its Poles along the Meridian of every Place, and occasions Needles, Pieces of Iron, &c. touch'd with it, to point nearly North and South, is of a much later date; tho the exact Time of its Discovery, and the Discoverer himself, are yet in the dark. The first tidings we hear of it, is in 1260, when *Paulus Venetus* is said by some to have first introduced the Mariners Compass; tho not as an Invention of his own, but as derived from the *Chinese*, who are said to have had the Use of it long before: but others, and with good reason, think that the *Chinese* rather borrow'd it from the *Europeans*. *John de Goia*, a *Neapolitan*, who lived in the 13th Century, is the Person usually supposed to have the best Title to the Discovery: And yet Sir *G. Wheeler* mentions, that he had seen a Book of Astronomy much older, which supposed the Use of the Needle; tho not as applied to the Uses of Navigation, but of Astronomy. And in *Guyot de Provins*, an old *French* Poet, who wrote about the Year 1180, there is express mention made of the Loadstone and the Compass; and their Use in Navigation obliquely hinted at. See *Compass*.

The Variation of the Needle, or its Declination from the Pole, was first discovered by *Seb. Cabot*, a *Venetian*, in 1500; and the Variation of that Variation by Mr. *Gellibrand*, an *Englishman*, about the Year 1625. Lastly, The Dip or Inclination of the Needle, when at liberty to play vertically, to a Point beneath the Horizon, was first discover'd by another of our Countrymen, Mr. *R. Norman*, about the Year 1576. See *Needle*.

Some of the Phænomena of the Magnet *are as follow.* (1.) In every *Magnet* there are two Poles, the one whereof points Northward, the other Southward; and if the *Magnet* be divided into ever so many pieces, the two Poles will be found in each piece. (2.) These Poles in different parts of the Globe, are differently inclined towards a Point under the Horizon. (3.) These Poles, tho contrary to one another, do help mutually towards the *Magnet's* Attraction and Suspension of Iron. (4.) If two *Magnets* are Spherical, one will turn or conform itself to the other, so as either of them would do to the Earth; and after they have so conformed or turned themselves, they endeavour to approach or join each other; but if placed in a contrary Position, they avoid each other. (5.) If a *Magnet* be cut thro the Axis, the Parts or Segments of the Stone, which before were joined, will now avoid and fly each other. (6.) If the *Magnet* be cut by a Section perpendicular to its Axis, the two Points, which before were conjoined, will become contrary Poles; one in one, the other in the other Segment. (7.) Iron receives Virtue from the *Magnet* by application to it, or barely from an approach near it, tho it doth not touch it; and the Iron receives this Virtue variously, according to the Parts of the Stone it is made to touch, or made approach to. (8.) If an oblong Piece of Iron be any how applied to the Stone, it receives Virtue from it, only as to its length. (9.) The *Magnet* loseth none of its own Virtue by communicating any to the Iron; and this Virtue it can communicate to the Iron very speedily; tho the longer the Iron touches or joins the Stone, the longer will its communicated Virtue hold; and a better *Magnet* will communicate more of it, and sooner, than one not so good. (10.) Steel receives Virtue from the *Magnet*, better than Iron. (11.) A Needle touch'd by a *Magnet* will turn its Ends the same way towards the Poles of the World, as the *Magnet* will do it. (12.) Neither Loadstone nor Needles touch'd by it do conform their Poles exactly to those of the World, but have usually some Variation from them: And this Variation is different in divers places, and at divers times in the same place. (13.) A Loadstone will take up much more Iron when arm'd or capp'd than it can alone: And tho an Iron Ring or Key be suspended by the Loadstone, yet the Magnetical Particles do not hinder that Ring or Key from turning round any way, either to the right or left. (14.) The Force of a Loadstone may be variously increas'd or lessen'd

leſſen'd, by the various Application of Iron, or another Loadſtone to it. (15.) A ſtrong *Magnet* at the leaſt diſtance from a leſſer or a weaker, cannot draw to it a piece of Iron adhering actually to ſuch leſſer or weaker Stone; but if it come to touch it, it can draw it from the other: But a weaker *Magnet*, or even a little piece of Iron, can draw away or ſeparate a piece of Iron contiguous to a greater or ſtronger Loadſtone. (16.) In theſe Northern Parts of the World, the South Pole of a Loadſtone will raiſe up more Iron than the North Pole. (17.) A Plate of Iron only, but no other Body interpoſed, can impede the Operation of the Loadſtone, either as to its Attractive or Directive Quality. Mr *Boyle* found it true in Glaſſes ſealed hermetically; and Glaſs is a Body, as impervious as moſt are, to any Effluvia. (18.) The Power or Virtue of a Loadſtone may be impaired by lying long in a wrong Poſition, as alſo by Ruſt, Wet, *&c.* and may be quite deſtroy'd by Fire. (19.) A piece of Iron Wire well touch'd, will, upon being bent round in a Ring, or coyl'd round on a Stick, *&c.* generally, quite loſe its Directive Vertue; but always have it much diminiſh'd: and yet if the whole length of the Wire were not entirely bent, ſo that the Ends of it, tho but for the length of one tenth of an Inch, were left ſtrait, the Virtue will not be deſtroy'd in thoſe parts; tho it will in all the reſt. This was firſt obſerv'd by *Grimaldi* and *de la Hire*; and is confirm'd by the Experiments of Mr. *Derham*; who adds further, that tho coyling or bending the Wire as above, would always deſtroy its Virtue by Day, yet it would not do it in the Evening. (20.) The Sphere of the Activity of *Magnets* is greater and leſs at different times: in particular, that preſerv'd in the Repoſitory of the *Royal Society* will keep a Key or other Body ſuſpended to another, ſometimes, at the height of 8 or 10 feet; and at others, not above 4 feet. To which we may add, that the Variation of the Magnetical Needle from the Meridian, varies at various Times of the Day; as appears from ſome new Experiments of Mr. *Graham*. See *Variation*. (21.) By twiſting a piece of Wire touch'd with a *Magnet*, its Virtue is exceedingly diminiſh'd, and ſometimes ſo diſorder'd and confus'd, that in ſome parts it will attract, and at others repel; and even in ſome places one ſide of the Wire ſeems to be attracted, and the other ſide repell'd by one and the ſame Pole of the Stone. (22.) A piece of Wire that has been touch'd, being ſplit or cleft into two; the Poles are ſometimes chang'd; as in a cleft *Magnet*; the North becoming the South, and the South the North: And yet ſometimes one half of the Wire will retain its former Poles, and the other half have 'em changed. To which it may be added, that laying one or other ſide of the half uppermoſt, cauſes a great Alteration in its Tendency or Averſion to the Poles of the *Magnet*. (23.) A Wire being touch'd from End to End with the ſame Pole of the *Magnet*, the End whereat you begin will always turn contrary to the Pole which touch'd it: If it be again touch'd the ſame way with the other Pole of the *Magnet*, it will then be turn'd the contrary way. (24.) If a piece of Wire be touch'd in the middle with only one Pole of the *Magnet*, without moving it backwards or forwards, in that place will be the Pole of the Wire; and the two Ends will be the other Pole. (25.) If a *Magnet* be heated red hot; and again cool'd either with its South Pole towards the North in a horizontal Poſition, or with its South Pole downwards in a perpendicular Poſition; its Poles will be changed. (26.) Mr. *Boyle* (to whom we are indebted for the following Magnetical Phænomena) found he could preſently change the Poles of a ſmall Fragment of a Loadſtone, by applying them to the oppoſite vigorous ones of a large *Magnet*. (27.) Hard Iron Tools well temper'd, when heated by a brisk Attrition, as filing, turning, *&c.* will, while warm, attract thin Filings or Chips of Iron, Steel, *&c.* but not when cold; tho there are not wanting ſome Inſtances of their retaining the Virtue when quite cold. (28.) The Iron Bars of Windows, *&c.* which have a long time ſtood in an erect Poſition, grow permanently Magnetical; the lower Ends of ſuch Bars being the North Pole, and the upper the Southern. (29.) A Bar of Iron that has not ſtood long in an erect poſture, if it be only held perpendicularly, will become Magnetical; and its lower End the North Pole; as appears from its attracting the South Pole of a Needle: but then this Virtue is tranſient, and by inverting the Bar, the Poles will ſhift their places. In order therefore to render the Quality permanent in an Iron Bar, it muſt continue a long time in a proper Poſition. But the Fire will produce the Effect in a ſhort time: for as it will immediately deprive a Loadſtone of its Attractive Virtue; ſo, it ſoon gives a Verticity to a Bar of Iron, if being heated red hot, it be cool'd in an erect poſture, or directly North and South. Nay, Tongs and Fire-forks, by being often heated and ſet to cool again in a poſture nearly erect, have gain'd this Magnetical Property. (30.) Mr. *Boyle* found, that by heating a piece of *Engliſh* Oker red hot, and placing it to cool in a proper poſture, it manifeſtly acquired a Magnetic Virtue. And an excellent *Magnet* of the ſame Ingenious Gentleman's having lain near a Year in an inconvenient poſture, had its Virtue ſurprizingly impair'd; as if it had been by Fire. (31.) A Needle well touch'd, 'tis known, will point North and South: if it have one contrary Touch of the ſame Stone, it will be deprived of its Faculty; and by another ſuch Touch will have its Poles quite changed. (32.) A Bar of Iron that has gain'd a Verticity by being heated red-hot and cool'd again, North and South, and then hammer'd at the two Ends; its Virtue will be deſtroy'd by two or three ſmart Blows on the middle. (33.) By drawing the Back of a Knife, or long piece of Steel, Wire, *&c.* leiſurely over the Pole of a Loadſtone; carrying the Motion from the middle of the Stone to the Pole; the Knife or Wire does accordingly attract one End of a Needle: but if the Knife or Wire be paſs'd from the ſaid Pole to the middle of the Stone, it will repel that End of the Needle, which in the other Caſe it attracts. (34.) Either a *Magnet* or a piece of Iron being laid on a piece of Cork, ſo as to ſwim freely in Water; it will be found, that which ſoever of the two is held in the hand, the other will be drawn to it: ſo that Iron attracts the *Magnet* as much as it is attracted by it; Action and Reaction being always equal. In this Experiment, if the *Magnet* be ſet afloat, it will direct its two Poles to the Poles of the World. (35.) A Knife, *&c.* touch'd with a *Magnet*, acquires a greater or leſs degree of Virtue, according to the part it is touch'd on. It receives the ſtrongeſt Touch, when it is drawn leiſurely from the Handle towards the Point over one of the Poles: And if the ſame Knife thus touch'd, and thus in poſſeſſion of a ſtrong attractive Power, be retouch'd in a contrary Direction, *viz.* by drawing it from the Point towards the Handle over the ſame Pole, it immediately loſes all its Virtue. Laſtly, A *Magnet* acts with equal force *in Vacuo*, and in the open Air.

The Doctrine of the Magnet, *or the Laws of* Magnetiſm, Mr. *Whiſton* lays down in the following Propoſitions.

I. The Loadſtone has both an attractive and a directive Power united together; whereas Iron touch'd by it has only the former: *i. e.* the Loadſtone not only attracts Needles or Filings of Steel, but directs them to certain different Angles, with reſpect to its own Surface and Axis: whereas Iron touch'd with it, does little or nothing more than attract them; ſtill ſuffering them to lie along or ſtand perpendicular to its Surface and Edges in all places; without any ſuch ſpecial Direction.

II. Neither the ſtrongeſt nor the largeſt Loadſtones give a better directive Touch to Needles, than thoſe of a leſs Size or Virtue: to which it may be added, that whereas there are two Qualities in all *Magnets*, an Attractive and a Directive one; neither of 'em depend on, or are any Argument of the Strength of the other.

III. The Attractive Power of Loadſtones and of Iron, will greatly increaſe or diminiſh the Weight of Needles on the Ballance; nay, will overcome that Weight, and ſuſtain other additional Weights too: while the directive Power has much ſmaller effect. *Gaſſendus* indeed, as well as *Merſennus* and Dr. *Gilbert*, maintain it has none at all; but by a Miſtake; for Mr. *Whiſton* found from repeated Trials on large Needles, that after the Touch they weigh'd leſs than before. One of 4584 ½ Grains loſt 2 ⅝ Grains by the Touch; and another of 65726 Grains weight, no leſs than 14 Grains.

IV. 'Tis probable that Iron conſiſts almoſt wholly of the Attractive Particles; and the Loadſtone of the Attractive and Directive together; mix'd probably with other heterogeneous Matter; as having never been purg'd by the Fire, which Iron has: And hence may ariſe the reaſon why Iron, after it has been touch'd, will lift up much greater Weights than the Loadſtone that touch'd it.

V. The Quantity and Direction of *Magnetic* Powers, communicated to Needles, is not properly, after ſuch Communication, owing to the *Magnet* which gave the Touch; but to the Goodneſs of the Steel that receives it, and to the Strength and Poſition of the Terreſtrial Loadſtone, whoſe Influence alone thoſe Needles are afterwards ſubject to, and directed by: ſo that all ſuch Needles, if good, move with the ſame Strength and Point to the ſame Angle; what Loadſtone ſoever (provided it be good) they were excited by. Nor does the Touch ſeem to do much more in *Magnetical*, than Attrition in Electrical Caſes; *i. e.* it ſerves to rub off ſome obſtructing Particles that adhere to the Surface of the Steel, and open the Pores of the Bodies touched, and ſo make way for the Entrance and Exit of ſuch Effluvia as occaſion or aſſiſt the Powers we are ſpeaking of. Hence

he takes occaſion to obſerve, that the directive Power of the Loadſtone ſeems to be mechanical; and to be derived from magnetic Effluvia, circulating continually round it.

VI. The abſolute attractive Power of different armed Loadſtones, is, *cæteris paribus*, according to the Quantity, not of their Diameters or Solidities, but of the Surfaces of the Loadſtones; or in a Duplicate Proportion of their Diameters.

VII. The Power of good *Magnets* unarmed, not ſenſibly different in Strength, ſimilar in Figure and Poſition, but unequal in Magnitude, is ſometimes a little greater, ſometimes a little leſs than in the Proportion of their ſimilar Diameters.

VIII. The Loadſtone attracts Needles that have been touched, and others that have not been touched with equal Force, at Diſtances unequal, *viz.* where the Diſtances are to one another as 5 to 2.

IX. Both Poles of a Loadſtone equally attract Needles, till they be, tho' roughly, touched; then it is, and then only, that that one Pole begins to attract one End, and repel the other: tho' the repelling Pole will ſtill attract upon Contact, nay at very ſmall Diſtances notwithſtanding.

X. The attractive Power of Loadſtones, in their ſimilar Poſition to, but different Diſtances from Magnetic Needles, is in the Seſquiduplicate Proportion of the Diſtances of their Surfaces from thoſe Needles reciprocally; or as the mean Proportionals between the Squares and the Cubes of thoſe Diſtances reciprocally; or as the Square Roots of the fifth Powers of thoſe Diſtances reciprocally. Thus the Magnetic Power of Attraction, at twice the Diſtance from the Surface of the Loadſtone, is between a fifth and ſixth Part of that Power at the firſt Diſtance. At thrice the Diſtance the Power is between the 15th and 16th Part, at four times the Diſtance the Power is 32 times as ſmall, and at ſix times the Diſtance 88 times as ſmall. Where it is to be noted, that the Diſtances are not taken, as in the Law of Gravity, from the Center; but the Surface: all Experience aſſuring us, that the Magnetic Power reſides chiefly, if not wholly, in the Surfaces of Loadſtones and Iron; without any particular Relation to any Center at all. The Proportion here laid down was determined by Mr. *Whiſton*, from a great Number of Experiments of Mr. *Hauksbee*, Dr. *Brook*, *Taylor*, and himſelf. The Force they meaſured by the Chords of thoſe Arcs, by which the *Magnet*, at ſeveral Diſtances, draws the Needle out of its natural Direction, to which Chords (as he has demonſtrated) it is ever proportional. The Numbers in ſome of their moſt accurate Trials he gives us in the following Table, ſetting down half the Chords, or the Sines of half thoſe Arches of Declination, as the true Meaſures of the Power of Magnetiſm.

Diſtance in Inches.	*Degrees of Inclination.*	*Sines of ½ Arcs.*	*Rat. Seſquidupl.*
20	2	175	466
14 8/9	4	349	216
13 5/8	6	523	170
12 3/8	8	697	138
11 1/8	10	871	105
10 1/4	12	1045	87
9 1/4	14	1219	70

XI. An Inclinatory, or Dipping-Needle, of ſix Inches Radius, and of a Priſmatic or Cylindric Figure, when it oſcillates along the Magnetic Meridian, performs, here, every mean Vibration in about 6″ or 360‴; and every ſmall Oſcillation in about 5″ ½, or 330‴; and the ſame kind of Needle, four Foot long, makes every mean Oſcillation in about 24″, and every ſmall one in about 22″.

XII. The entire Power of Magnetiſm in this Country, as it affects Needles a Foot long, is to that of Gravity nearly as 1 to 300; and as it affects Needles four Foot long, as 1 to 600.

XIII. The Quantity of Magnetic Power accelerating the ſame Dipping-Needle, as it oſcillates in different vertical Planes, is ever as the Co-ſines of the Angles made by thoſe Planes, and the Magnetic Meridian taken on the Horizon.

Coroll. Thus if we would eſtimate the Quantity of Forces in the horizontal and vertical Situations of Needles at *London*; we ſhall find that the latter, in Needles a Foot long, is, to the entire Force along the Magnetic Meridian, as 96 to 100; and in Needles four Foot long, as 9667 to 10000: whereas in the former, the entire Force in Needles a Foot long, is as 28 to 100; and in thoſe four Foot long, as 2560 to 10000. Whence it follows, that the Power by which horizontal Needles are governed in theſe Parts of the World, is but one quarter of the Power by which the Dipping-Needle is moved.

Hence alſo, ſince the horizontal Needle is moved only by a Part of the Power which moves the Dipping-Needle; and that it only points to a certain Place in the Horizon, becauſe that Place is the neareſt its original Tendency, of any, its Situation will allow it to tend to: Whenever the Dipping-Needle ſtands exactly perpendicular to the Horizon, the horizontal Needle will not reſpect one Point of the Compaſs more than another, but will wheel about every way uncertainly.

XIV. The Times of Oſcillation and Vibration, both in dipping and horizontal Needles equally good, is as that of their Lengths directly; and the actual Velocity of their Points along their Arcs always equal.

Hence Magnetic Needles are, *cæteris paribus*, ſtill better the longer they are; and that in the ſame Proportion with their Lengths. See *Needle*.

XV. The Earth, on which we live, includes within it a vaſt Spherical *Magnet*, concentrical thereto, with its own Poles, Meridians, Equator, and Parallels; and all much of the ſame general Nature with thoſe of ſmall *Terrellæ*, or Spherical Loadſtones, in the poſſeſſion of the Curious among us.

XVI. The Power of a good *Terrella*, or Spherical Loadſtone, as it affects a Needle a Foot long, is equal to the Magnetic Power of that internal Loadſtone about two and an half, or three Diameters off ſuch Loadſtone. From which Conſideration the Quantity of Magnetic Attraction, at all Diſtances from the internal Loadſtone, for Needles a Foot long, may be determined; and from the ſame Conſideration it appears, that the Diameter of this internal Loadſtone is about 1150 Miles. To which we may add, that, in regard Sir *Iſaac Newton* has demonſtrated, that the Power of Gravity diminiſhes within the Earth, and is leſſer there than at its Surface nearly, in the proportion of its greater Nearneſs to the Center; the Magnetic Power at 2900 Miles diſtance from us, and nearly 1060 from the Earth's Center, which is $\frac{1}{24}^{o}$ of the Power of Gravity here, will be ſomewhat greater than the Power of Gravity there: Which Limit is worth our Attention, Gravity being ſtronger than Magnetiſm on the one Side of it, and weaker on the other; we mean as it affects Needles of one foot Diameter. At that Limit, therefore, at leaſt near the Magnetic Poles, Iron, a Foot long, will be twice as heavy, and fall twice as faſt as any other natural Body, *viz.* by the Union of thoſe two equal Powers, Gravity and Magnetiſm; and of conſequence, above that Limit, ſuch an Iron will be leſs than twice as heavy; below it, more than twice as heavy as any other natural Body.

XVII. The Earth's internal Loadſtone is not fixed to our upper Parts, but is moveable with reſpect thereto, and actually revolves on the Earth's Axis from *Eaſt* to *Weſt* in a certain long Period of Time; as appears, beyond Contradiction, from the conſtant Variation of the horizontal Needle Weſtward; as well as the regular Increaſe of Inclination of the Dipping-Needle.

The only way to render this Motion, *i. e.* the Variation, poſſible and intelligible (to uſe Dr. *Halley*'s Words) is to ſuppoſe it to turn about the Center of the Globe, having its Center of Gravity fixed and immoveable in the ſame common Center of the Earth. This moveable internal Surface muſt likewiſe be looſe, and detached from the external Parts of the Globe; which may be reckoned the Shell, and the other the *Nucleus*, or inner Globe, included within it, with a fluid Medium between. Now from the Variations moving Weſtwards, 'tis plain, that the foreſaid *Nucleus* has not preciſely attained the ſame Degree of Velocity with the exterior Parts in their diurnal Revolution; but ſo nearly equals it, that in 365 Revolves the Difference is ſcarce ſenſible; and muſt probably have ariſen from hence, that the Impulſe, whereby the diurnal Motion was impreſſed on the Earth, was given to the external Parts, and thence communicated to the internal.

XVIII. This internal *Magnet* has one central Pole Northwards, in the nature of the Poles of our common Loadſtones; but its Southern Pole appears not to be central, but rather circular; and that at a great Diſtance from the Southern Pole of the Earth.

XIX. The Northern Magnetic Pole is now ſituate about the Latitude of 76 Deg. ½, *i. e.* 13 Deg. ½ from the North Pole of the Earth, and about 30 Deg. Eaſtward from the Meridian of *London*.

XX. The Southern Magnetic circular Pole has its Center, or central Pole, nearly in the Parallel of 60 Degrees; and in a Meridian paſſing along the Eaſt Coaſt of *Borneo*, about 117 Degrees Eaſtward of *London*: its Radius

dius is alſo an Arc of a great Circle of about 44 Degrees.

XXI. The reſpective Motion of the internal *Magnet*, or the Velocity, *v. g.* of its North-Pole, appears to be 27 Deg. 0 Min. in 144 Degrees, *i. e.* one Degree in five Years; ſo that it makes an entire Revolution in 1920 Years.

Hence as the Number of Degrees in the upper Earth's diurnal Revolution, is to the Number of Days in the Revolution of the internal *Magnet*, *i. e.* as 1 is to 700000, ſo is the reſpective Motion of this *Magnet* from Eaſt to Weſt to the real Motion of the upper Earth from Weſt to Eaſt; or to ſpeak ſtrictly, ſo is the Difference of their Motions from Weſt to Eaſt, to the entire Motion of the upper Earth the ſame way. This external fixed Earth has therefore communicated almoſt all its Motion already to the internal *Magnet*, and can communicate no more than this Difference of their Motion, and that only in an infinite Term of Years; or, in other Words, this real internal Motion can never be the 700000th Part ſwifter than it is at preſent. This internal Motion therefore began with the Commencement of the diurnal Motion of the upper Earth; and has gone on ſtill faſter and faſter by the Communication of that Motion thro' the intermediate Fluid. Since therefore Action and Reaction are equal, and tend to contrary Parts, this internal Loadſtone, thus accelerated by the upper Part, muſt have all along retarded that upper Earth, and made the diurnal Rotation ſtill ſlower and ſlower. This Acceleration on one Side, and Retardation on the other, muſt have been very great at the firſt beginning of the diurnal Motion, when the Difference of their Motion was equal to the entire Motion itſelf, and muſt have been diminiſhing ever ſince. To which Cauſe is probably owing that Acceleration of the Moon's Motion with reſpect to that of the Earth, ſince the time of the old Aſtronomers, firſt taken notice of by Dr. *Halley*, and embraced by Sir *I. Newton*. And the ſame Conſideration ſeems to ſuggeſt a Method for determining the Age of the World; for were the Proportions of the Quantity of Matter in the upper Earth to the internal *Magnet*, with the Tenacity of the intermediate Fluid, *&c.* known, one might go back from the known Difference of their Velocity now, and find thoſe Differences and Quantities of Motion themſelves, *à priori*, in all paſt Ages; or were the Velocity of the firſt diurnal Rotation of the upper Earth known, we might geometrically determine, *à priori*, how long ago that Rotation began, or how antient our Earth is.

XXII. The Variation of Magnetic Needles from the Azimuth of the Meridians of the internal *Magnet*; is derived from the Difference of the Strength of the ſeveral Parts of the internal *Magnet*'s Surface; which as it is only to be known by Experience, that Variation cannot be determined beforehand, unleſs where there are good Accounts how much it had formerly been; it being probable that it returns round, and will be the ſame in any Year of the next Revolution of the internal *Magnet*, that it has been in the like Year of any former Revolution, or will itſelf have a Revolution in about 1920 Years.

XXIII. The two fixed Magnetic Poles, in our upper Earth, firſt introduced by Dr. *Halley*, as neceſſary to ſolve the Irregularity of the Variation of the Horizontal Needle from the Meridians of the moveable internal *Magnet*, ſeem not to have any juſt Foundation in Nature; the like Irregularities being found in the common *Terrellæ* or Spherical Loadſtones; and being beſt accounted for from the Compoſition of the *Magnets*, which are found to have Parts of different Degrees of Purity, Strength, and Perfection; ſo that where the Parts are weaker than ordinary, the ſtronger neighbouring Parts prevail, and draw the Needle that way: not but Dr. *Gilbert*'s Notion of prominent and depreſſed Parts on *Magnets* may have ſome room, and be allowed to contribute ſomewhat to ſuch Variations. See *Needle*.

As to the Cauſes of Magnetiſm, or the Manner in which theſe Phænomena of the *Magnet* are produced, we have yet no Hypotheſis that will ſatisfactorily account for them. *Plutarch* tells us, the *Magnet* attracts Iron, by emitting ſome ſpiritual Effluvia, whereby the contiguous Air being opened and driven on either Side, does again drive that contiguous to it; and thus the Action being communicated round, the Iron is thereby protruded: but this is contradicted by the equally vigorous Action of the Loadſtone *in Vacuo*, and in the open Air. Others of the Antients aſcribe the Action of the *Magnet* to a Soul that animates it; and others to I know not what Sympathy between the Effluvia of the Iron and thoſe of the *Magnet*. The Opinion that principally prevails among the Moderns is that of *Des Cartes*, maintained by *Malebranch*, *Rohault*, *Regis*, &c. and even admitted of and confirmed by Mr. *Boyle*, &c. In this 'tis ſuppoſed there is continually flowing, from the Poles of the World, a ſubtle, impalpable, and inviſible Matter, channel'd or ſtriated; which Matter circulating round the Earth, in the Plains of the Meridians, re-enters at the Pole oppoſite to that from which it iſſued, and paſſes again thro' the Poles parallel to its Axis: That the *Magnet* has two Poles anſwerable to thoſe of the Earth, and that out of theſe there iſſues a Matter like that juſt mentioned: That this Matter, entering in at one of the Poles, gives the Impulſe whereby Iron tends to the *Magnet*, and produces what we call Attraction. Now beſides the Magnetical Matter re-entering the Poles of the *Magnet*, there is always a certain Quantity thereof circulating round the *Magnet*; compoſing a kind of Vortex about it. The Space wherein this Matter moves, is the Sphere of Activity of the *Magnet*, within which its attractive Faculty is confined. As to its directive Faculty, or the Inclination of a Needle touched with it to the Poles of the World, and its Dip to a Point beneath the Horizon, it follows from the ſame Principle; ſince were the *Magnet* or Needle to have any other Situation, the Magnetic Matter would ſtrike on its Surface in vain; and not being able to get Admiſſion, would, by degrees, change its Situation, till ſuch time as its Pores correſponded to the Courſe of the Magnetical Matter; which Situation having once acquired, it would ceaſe to move; the Magnetical Matter then ceaſing to diſturb it. The Form of a *Magnet* therefore is ſuppoſed to conſiſt in its being perforated by an infinite Number of parallel Pores; ſome whereof are diſpoſed to admit the ſtriated Matter from the North Pole of the World, others that of the South; hence the North and South Poles of the *Magnet*.

As to the directive Power of the *Magnet*, Mr. *Whiſton*, from the 1ſt, 2d, 3d, *&c.* Laws of Magnetiſm, inclines to think it mechanical; and aſcribes it to magnetic Effluvia circulating continually round the Loadſtone; of which Circulation, he thinks, there are evident Indications in magnetic Experiments; as Mr. *Boyle* thinks there are of the Magnetiſm or magnetic Effluvia of the Earth; tho' thoſe Effluvia were never yet rendered ſenſible as Electric Effluvia begin to be; but the attractive Power Mr. *Whiſton* thinks entirely immechanical, as the Power of Gravity is; not being able to deviſe any ſuch Motion of a ſubtle Fluid belonging to the Loadſtone, as will account for the attractive Power in the ſeſquiduplicate Proportion of the Diſtances reciprocally; tho' if he could, yet would that be no more than to remove the immediate Power of the Supreme Being one Step further; the laſt Reſort of all mechanical Principles whatever being into the immechanical Power and Efficiency of the Deity.

M. *Hartſoeker* maintains, that the *Magnet* is no more than a common Stone; full of an infinite Number of hollow Priſms, which, by the diurnal Motion of the Earth, are ranged parallel to each other, and nearly parallel to the Axis of the Earth. Theſe Priſms have their Cavities filled with an extremely ſubtle Matter; which, by the diurnal Motion of the Earth, is paſſed from Priſm to Priſm: thus making a Circulation, and returning into the Priſms where it firſt began: From theſe Principles he deduces all the Phænomena of the *Magnet*; and M. *Andry* does the ſame, from the Doctrine of Alkali and Acid.

There are *Magnets* found in moſt of the Provinces of *China*, but the principal Uſe the *Chineſe* make of them is in Medicine. *Le Compte* deſcribes their manner of cutting them by a Machine, which, he ſays, is vaſtly more expeditious than any uſed among us.

The *Magnet* is alſo called *Lapis Heracleus*, from *Heraclea*, a City of *Magneſia*, a Port of the antient *Lydia*, where it is ſuppoſed to have been firſt found. Others derive the word *Magnet* from a Shepherd of that Name, who firſt diſcovered it with the Iron of his Crook on Mount *Ida*. It is alſo called *Lapis Nauticus*, by reaſon of its Uſe in Navigation; and *Siderites*, from its attracting Iron, which the *Greeks* call ἀσηρος.

MAGNETICAL AMPLITUDE, an Arch of the Horizon, contained between the Sun, at his Riſing or Setting, and the Eaſt and Weſt Point of the Compaſs: found by obſerving the Sun at his Riſing and Setting by an Amplitude Compaſs. See *Amplitude*.

MAGNETICAL AZIMUTH. See *Azimuth*.

MAGNETISM, a Term uſed by ſome Chymiſts, to ſignify a certain Virtue, whereby one thing becomes affected at the ſame time with another, either in the ſame or a different manner. This is what they otherwiſe call *Sympathy*.

MAGNIFY, a Term chiefly uſed in reference to Microſcopes, which are ſaid to magnify Objects, or to make them appear bigger than they really are; but, in reality, Microſcopes do not, nor cannot, magnify any Object, but only ſhew it nearer and more of its Parts than before were taken notice of. See *Microſcope*.

MAGNIFYING-GLASS, in Optics, a little Sphere, convex Lens, &c. which, in tranſmitting the Rays of Light, inflects them ſo, as that the parallel ones become converging, and thoſe which were diverging become parallel; by means whereof, Objects view'd thro 'em appear larger than when view'd by the naked Eye. See *Lens*, *Microſcope*, &c.

MAGNITUDE, any thing that has Parts external to Parts, connected together by ſome common Term; *i. e.* any thing locally extended or continued; or that has ſeveral Dimenſions. The Origin of all *Magnitude* is a Point, which tho void of Parts itſelf, yet its Flux forms a Line, the Flux of that a Surface, and of that a Body.

M. *Preſtet* gives the Name *Literal Magnitude* to a *Magnitude* expreſs'd by Letters; and a *Numerical Magnitude* he calls ſuch a one as is expreſs'd by Numbers; a *Broken Magnitude* is a Fraction; a *Complex Magnitude* is that form'd by Multiplication; an *Incommenſurable Magnitude* is a *Magnitude* that has no proportion to Unity.

Among the Writers of Optics, the *Apparent Magnitude* of a Body is that meaſured by the Optic or Viſual Angle, intercepted between Rays drawn from its Extremes into the Centre of the Pupil of each. And 'tis one of their fundamental Maxims, whatever things are ſeen under the ſame or equal Angles, appear equal, and on the contrary.

The *Apparent Magnitudes* of an Object at different Diſtances, are in a Ratio leſs than that of their Diſtances reciprocally.

MAGOPHONIA, the Name of a Feaſt among the antient *Perſians*. The Magus *Smerdis* having uſurped the Throne of the *Perſians* upon the death of *Cambyſes*, 521 Years before J. C. ſeven of the principal Lords of the Court conſpired to drive him out of it. Their Deſign was executed with good ſucceſs; *Smerdis* and his Brother, another Magus, call'd *Pitizithez*, they kill'd. Upon which, the People alſo roſe, and put all the Magi to the ſword; inſomuch that there would not one have eſcaped, had not the Night come upon 'em. *Darius*, Son of *Hyſtaſpes*, was then elected King. In memory of this Maſſacre of the Magi, a Feaſt was inſtituted, ſays *Herodotus*, call'd *Magophonia*; from Μάγος, Magus, and φόνος, Murther.

MAHIM, or *Mayhim*, in Law, a Corporal Hurt, whereby a Man loſeth the Uſe of any Member, that is or may be of any defence to him in Battle; as the Eye, Hand, Foot, Scalp of the Head, Fore-tooth, or, as ſome ſay, any Finger or Toe. *Glanv. Bract. &c.* If any one ſhall of Malice forethought cut out or diſable any Limb or Member of any, with Intention in ſo doing to maim or disfigure him, it is Felony without Benefit of the Clergy; and when the Caſe is difficult to judge, whether it be a *Mahim* or not, the Judges commonly behold the Party wounded, and ſometimes take the Opinion of Chirurgeons. The word comes from the *French Mehaigner*, to mutilate. The Canoniſts call it *Membri Mutilationem*; and all agree, it conſiſts in the Loſs of a Member, or the Uſe thereof.

MAHOMETANISM, the Syſtem of Religion broach'd by *Mahomet*, and ſtill adhered to by his Followers. *Mahometaniſm* is embraced by the *Turks*, *Perſians*, and ſeveral Nations among the *Africans*, and many among the *Eaſt-Indians*. The firſt and chief Article of the *Mahometan* Creed, is, that *there is no other God but God*; which they have from the Alcoran, where theſe Words are repeated inceſſantly: *There is no other God but him. Your God is the only God. I am God, and there is no other God but me.* This grand Axiom of their Theology ſeems to have been taken from the *Jews*, who were continually rehearſing thoſe Words of *Deuteronomy*, *Hear*, Iſrael, *the Lord our God is One.* For this reaſon, the *Mahometans* account all ſuch as own any thing of Number in the Divinity, to be Idolaters: And accordingly, one of the firſt Leſſons they teach their Children, is, That God is neither Male nor Female, and conſequently can have no Children.

The ſecond Fundamental Article of *Mahometaniſm* conſiſts in this, *That* Mahomet *was ſent from God.* By which they exclude all other Religions; under pretence that their Prophet was the laſt and greateſt of all the Prophets that God would ever ſend; and that as the *Jewiſh* Religion ceaſed with the Coming of the *Meſſiah*, ſo likewiſe the Chriſtian Religion was to be abrogated with the Coming of *Mahomet*. Not but that they own *Moſes* and *Jeſus Chriſt* to have been great Prophets; but *Mahomet* they hold to be *The Prophet*, by way of Excellence; and the Paraclete or Comforter ſpoken of in Scripture.

Theſe are the two Fundamentals of *Mahometaniſm*; ſo that when any is to make profeſſion of that Faith, they content themſelves with his ſpeaking theſe words, *There is no other God but God, and* Mahomet *is his Envoy or Prophet.*

To theſe Articles the *Mahometans* have added that of Bathing or Purification, in imitation of the *Jews*. And ſuch an Opinion have they of theſe Purifications, that 'tis purely on that account they ſeem to have retain'd the Practice of Circumciſion. For they pretend, with the *Jews*, that if the leaſt part of the Body remain unwaſh'd, the Bathing is of no effect. Hence they find themſelves under a neceſſity of being circumcis'd; that the Part cover'd by the Prepuce may alſo have its ſhare of the Lotion.

Prayer is alſo one of the Things to which the *Mahometans* are obliged; and they perform it five times a day, to diſtinguiſh themſelves from the *Jews*, who only do it thrice. Some of their Returns of Prayer they hold to be neceſſary and of Divine Obligation; others they eſteem convenient and prudential. That at Nine a-clock in the Morning they don't eſteem neceſſary; but thoſe at Noon and in the Afternoon are held to be *Jure Divino*. They are obliged to obſerve an infinity of things to be heard: If they ſpeak or ſmile in Praying, their Prayers are vain: and 'tis the ſame thing if they weep, unleſs it be with the Thought of Paradiſe or Hell. In many of their Prayers they uſe Beads. They believe with the *Chriſtians* and *Jews* a Reſurrection of the Dead. They hold, that e'er that time an *Anti-Mahomet* will come; and that J. C. will deſcend from Heaven to kill him, and eſtabliſh *Mahometaniſm*. To which they add a great many more Chimæras, relating to *Gog* and *Magog*; and the Beaſt that is to come out of *Mocca*. The Mountains are to fly in the Air like Birds, and at laſt the Heavens will melt and run upon the Earth. They add however, that ſome time after, God will renew and re-eſtabliſh the Earth; that then the Dead will be rais'd, &c. See *Alcoran*.

MAIDEN, an edg'd Inſtrument uſed in ſome Countries, particularly in *Scotland*, for the beheading of Criminals. The *Maiden* is a broad Piece of Iron, a foot ſquare, ſharp on the lower part, and loaded above with Lead, ſo as ſcarce to be lifted. At the time of Execution, it is pull'd up to the top of a narrow wooden Frame ten foot high, with a Groove on each ſide for the *Maiden* to ſlide in. The Priſoner's Neck being faſten'd to a Bar underneath, on a Sign given, the *Maiden* is let looſe, and the Head in an inſtant ſeparated from the Body.

MAJESTY, a Title given to Kings, and which frequently ſerves as a Name to diſtinguiſh them by. The Emperor is call'd, *His Cæſarian* or *Imperial Majeſty*; the King of *Spain*, *His Catholic Majeſty*; the King of *France*, *His moſt Chriſtian Majeſty*; the King of *Great Britain*, *His Britannic Majeſty*, &c. Some have alſo extended this Title to the Popes. *Paſquier* has obſerved, that our Forefathers uſed this Quality exceeding ſparingly; and that the frequent Uſe of the Word which now obtains, had not its beginning before the Reign of their *Henry* II. He inſtances ſeveral Letters of S. *Gregory*, who writing to King *Theodebert* and *Theodoric*, only compliments them with *Excellence*. Till the Time of *Charles* V. the King of *Spain* had no Title but that of *Highneſs*: And before our King *Henry* VIII. the Kings of *England* were only addreſs'd under the Titles of *Grace* and *Highneſs*. At the Peace of *Munſter*, there was a great Conteſt between the Miniſters of the Emperor and thoſe of *France*: The firſt would not allow the Title of *Serenity* to the King of *France*, and the latter would not give that of *Majeſty* to the Emperor. At laſt 'twas agreed, that whenever the *French* King ſhould write with his own Hand to the Emperor, he ſhould give him the Title of *Imperial Majeſty*; and reciprocally when the Emperor ſhould write to the King, he ſhould give him that of *Royal Majeſty*.

Under the *Roman* Republic, the Title of *Majeſty* belonged to the whole Body of the People and to the Principal Magiſtrates; ſo that to diminiſh or wound the *Majeſty* of the Commonwealth, was to be wanting in Reſpect to the State, or its Miniſters. But the Power paſſing into the hands of a ſingle Perſon, the Appellation of *Majeſty* was transfer'd to the Emperor and the Imperial Family. *Pliny* complements *Trajan* on his being contented with the Title of *Greatneſs*; and ſpeaks very invidiouſly on thoſe who affected that of *Majeſty*. And yet *Majeſty* ſeems to be the modeſteſt and juſteſt Title that can be attributed to Sovereigns, ſince it ſignifies no more, at bottom, than the Royalty or Sovereign Power.

The Word ſeems compoſed of the two *Latin* words, *Major*, greater, and *Status*, State.

MAIL, a Coat of *Mail*, ſo call'd from the *French Maille*, a ſquare Figure, or the ſquare Hole of a Net. *Maille* with a double *l* ſignifies a round Ring of Iron, whence the Play of *Pall-Mall*, from *Palla*, a Ball, and *Maille*, the round Ring thro which it is to paſs.

MAILED implies ſomething ſpeckled, or full of Specks; as the Feathers of Hawks, Partridges, &c. or as the Furs of ſome wild Beaſts are.

MAIN MORTE, a Term in ſome antient Cuſtoms ſtill holding in *Burgundy* and other Countries, ſignifying a Right

Right which the Lord has, on the Death of the Chief of a Family *Mainmortable* (*i. e.* ſubject to this Right) of taking the beſt Moveable in the Houſe; or in default of that, they offer'd him the Right Hand of the Deceaſed, in token that he could ſerve him no longer. This Right was not uniform; ſome People were *Main-mortable* in all their Effects Moveable and Hereditary; others in one only.

MAINOUR, *Manour*, or *Meinour*, in Law, ſignifies the thing that a Thief takes away or ſteals. Thus, to be taken with the *Manour*, is to be taken with the Thing ſtolen about him. If the Defendant were taken with the *Manour*, and ſo carried to Court, in antient Times they would arraign him on the *Mainour*, without any Appeal or Indictment. The word comes from the *French Mainier* or *Mainaver*, to hold in the hand.

MAINPRISE, in Law, the taking or receiving a Man into friendly Cuſtody, that otherwiſe is or might be committed to Priſon; upon Security given for his forth-coming at a Day aſſigned. They who thus undertake for any, are call'd *Mainpernors*, becauſe they receive him into their hands; whence alſo comes the word *Mainpernable*, denoting the Perſon who may be thus bailed. See *Bail*.

Manwood makes a great deal of difference between *Bail* and *Mainpriſe*: for he that is *mainpriſed* is already ſaid to be at large after the Day he is ſet to *Mainpriſe* till the Day of his Appearance; but 'tis otherwiſe where a Man is let to *Bail* to four or two Men, by the Lord Juſtice in Eyre of the Foreſt, or any other Judge, until a certain Day; for there he is always accounted by the Law to be in their Ward and Cuſtody for the Time; and they may, if they pleaſe, keep him in Priſon all that time. So that he who is ſo bail'd, ſhall not be ſaid to be at large, or at his own liberty.

Mainpriſe is alſo an Undertaking in a Sum certain: *Bail* anſwers the Condemnation in Civil Cauſes, and in Criminals, Body for Body.

The Author of the *Mirror of Juſtice* ſays, that Pledges are thoſe which bail or redeem any thing but the Body of a Man, and Main-pernors thoſe that free the Body: Pledges therefore belong properly to real and mix'd Actions, and Main-pernors to perſonal. The word *Mainpriſe* is compounded of the *French Main*, Hand, and *prins*, taken.

MAINTENANCE, in Law, is the maintaining or upholding a Cauſe or Suit between others, either by Word, Writing, Countenance or Deed: Metaphorically taken from the ſuccouring a young Child, that learns to go by one's hand; and uſed in the evil part in ſome of our Statutes. When a Man's Act in this kind is eſteem'd *Maintenance*, and when not, ſee *Brooks* and *Kitchin*. There lies a Writ againſt a Maintainer, call'd a *Writ of Maintenance*.

MAJOR, in the Art of War, a Name given to ſeveral Officers of different Qualities and Functions.

Major-General is he who receives the General's Orders, and delivers them out to the Majors of the Brigades, with whom he concerts what Troops are to mount the Guard, what to go on Parties, what to form Detachments, or to be ſent on Convoys, &c. It is his buſineſs alſo to view the Ground to incamp on, and he is next ſubordinate to the General and Lieutenant-General. See *General*.

Major of a Brigade, either of Horſe or Foot, is he who receives Orders, and the Word, from the Major-General, and gives them to the particular Majors of each Regiment. See *Brigade*.

Major of a Regiment of Horſe, is the firſt Captain of the Regiment, and commands in the abſence of the *Maitre de Camp*.

Major of a Regiment, is an Officer, whoſe buſineſs it is, to convey all Orders to the Regiment, to draw it up, and exerciſe it; to ſee it march in good Order, to look to its Quarters, and to rally it, if it happen to be broke in an Engagement, &c. He is the only Officer of a Regiment of Foot, who is allowed to be on horſeback in time of Service; but he rides, that he might ſpeedily get from place to place, as occaſion ſerves. See *Regiment*.

There is alſo in a Gariſon an Officer next to the Deputy-Governour, which is call'd the *Town-Major*: He ought to underſtand Fortification, and hath charge of the Guards, Round, Patrols, and Centinels.

There are alſo *Aids-Major*, *Drums-Major*, and other Officers; ſo call'd by reaſon of ſome Seniority or Prerogative that they have over the reſt.

MAJOR, in Law, is a Perſon who is of Age to manage his own Affairs. By the Civil Law, a Man is not a *Major* till the Age of 25 Years; in *England* he is *Major* at 21, and in *Normandy* at 20.

MAJOR, in Logic, is underſtood of the firſt Propoſition of a regular Syllogiſm. 'Tis call'd *Major*, becauſe it has a more extenſive Senſe than the *Minor* Propoſition, as containing the principal Term. See *Syllogiſm*.

MAJOR and MINOR, in Muſic, are ſpoken of the Concords which differ from each other by a Semi-tone. There are *Major* and *Minor* Thirds, &c. The *Major* Tone is the Difference between the 5th and 4th, and the *Major* Semitone is the Difference between the *Major* 4th and the 3d. The *Major* Tone ſurpaſſes the *Minor* by a Comma. See *Concord*.

MAJOR-DOMO, an *Italian* Term, frequently uſed to ſignify a Steward.

The Title of *Major-Domo* was formerly given in the Courts of Princes to three different kinds of Officers. *1ſt*, To the Officer who took care of what related to the Prince's Table or Eating, otherwiſe call'd *Eleater*, *Præfectus Menſæ*, *Architriclinus*, *Dapifer*, and *Princeps Coquorum*. *2dly*, *Major-Domo* was alſo applied to the Steward of the Houſhold. *3dly*, The Title of *Major-Domo* was alſo given to the Chief Miniſter, to whom the Prince deputed the Adminiſtration of all his Affairs, foreign and domeſtick, relating to War as well as Peace. Inſtances of *Major-Domo's* in the two firſt Senſes are frequent, both in the *Engliſh*, *French*, and *Norman* Affairs.

MAKE, in Law, ſignifies to perform and execute. Thus, *to make his Law*, is to perform that Law to which he had formerly bound himſelf; *i. e.* to clear himſelf of an Action commenc'd againſt him, by his own Oath and the Oath of his Neighbours. To *make Services*, or *Cuſtom*, is nothing elſe but to perform.

MALACIA, a Diſeaſe conſiſting in a depraved Appetite, wherein the Patient covets and longs for ſome particular kind of Food with extraordinary Earneſtneſs, and eats it to Exceſs. As when a Woman with Child is vehemently deſirous of Herrings, or any other uſual Diſh. Many Authors confound this Affection with another call'd *Pica*, conſiſting in a Depravation of Appetite, which leads the Patient to covet things unnatural and abſurd, as Lime, Coals, &c. The *Malacia* ſeems to ariſe from an ill Diſpoſition of the Menſtruum in the Stomach; or from ſome Defect in the Imagination, which determines it to ſome one thing rather than another. The word ſeems derived from the *Greek* μαλακὸς, ſoft: too lax a Tone of the Stomach being generally the Occaſion of Indigeſtion and unuſual Cravings.

MALANDERS, a Diſeaſe in Horſes ſo called from the *Italian Malandare*, to *go ill*. It conſiſts in certain Chops, or Chinks, appearing on the inſide of the Fore-Legs, juſt againſt the bending of the Knee, which void a red, ſharp, and biting Water.

MALE, the Sex which has the Parts of Generation without-wards, and which has ordinarily the Prehemineence over the other.

MALEBRANCHISM, the Doctrine or Sentiments of Father *Malebranch*, a Prieſt of the *Oratory* of *France*. *Malebranchiſm* is in a great meaſure the ſame with *Carteſianiſm*. It muſt be own'd however, that tho F. *Malebranch* thought the ſame with *Des Cartes*, yet he does not ſeem to have follow'd him, but to have met with him. *Malebranchiſm* is contain'd in the *Recherche de la Verité*; and to give a general Notion of it, we need only repeat what M. *Fontenelle* ſays of that Work. The *Enquiry after Truth*, ſays he, is full of God. God is the only Agent, and that too, in the ſtricteſt ſenſe. All Power of Acting, all Actions belong immediately to him. Second Cauſes are no Cauſes. They are only Occaſions that determine the Action of God; Occaſional Cauſes. See *Cauſe*. F. *Malebranch*, however, does not here lay down his Syſtem entire with regard to Religion, or rather the Manner in which he would reconcile Religion to his Syſtem of Philoſophy. That he reſerv'd for his *Chriſtian Converſations*, printed in 1677. where he proves the Exiſtence of a God, the Corruption of Human Nature by Original Sin, the Neceſſity of a Mediator and of Grace. *Malebranchiſm*, notwithſtanding, appears to many Perſons not only ill grounded, but even dangerous and deſtructive to Religion: and has accordingly been vigorouſly oppoſed by many zealous *French* Authors. The firſt was M. *Foucher*. After him came M. *Arnaud*; and in 1715, (the Year F. *Malebranch* died) F. *du Tertre*, a Jeſuit, publiſh'd an ample Confutation (as he imagines) of his whole Syſtem. That part which relates to our ſeeing all things in God, has been anſwer'd by Mr. *Locke*.

MALEDICTION, in Law, a Curſe uſually annex'd to Donations of Lands, &c. to Churches and Religious Houſes; imprecating the moſt direful Puniſhments to thoſe who ſhould infringe them.

MALIGNANT, in Medicine, a Diſeaſe greatly aggravated: The word is generally applied to ſuch Fevers as are Epidemical, or Infectious, and are attended with Spots and Eruptions of various kinds. See *Fever*.

MALLEABLE, ſomething hard and ductile, and that may be beaten, forg'd and extended under the Hammer without breaking. All Metals are *Malleable*, excepting Quickſilver; but Gold in the greateſt degree of all. The Chymiſts have long ſought the Fixation of *Mercury*, to render it *malleable*. 'Tis a popular Error, that ever

the Art of making Glaſs *malleable*, was known; its Nature is incapable of it. For if it were ductile, its Pores would not be oppoſite to each other, and of conſequence it would not be tranſparent; ſo that its principal Quality would be loſt. See *Tranſparency*. This Error is founded on the Credit of antient Hiſtorians.

MALLEOLUS, a Proceſs in the lower part of the Leg juſt above the Foot. There is one internal, and another external. The internal is an Eminence of the *Tibia*, the external of the *Fibula*: the two together form the Ancle.

MALLET, a kind of large Hammer, made of Wood, much uſed by Artificers who work with the Chiſſel, as Sculptors, Maſons and Stone-cutters, whoſe Mallet is ordinarily round; Carpenters, Joiners, *&c.* who uſe it ſquare.

MALLEUS, in Anatomy, is underſtood of one of the Bones of the Ear, from its Reſemblance to a Hammer or Mallet; firſt diſcovered by *Jac. Carpenſis*. See *Ear*.

MALMSEY, or *Malvaſy*, a kind of Wine brought from *Greece* or *Candia*; ſo call'd from *Malvaſia*, a City in *Peloponneſus*, which is the antient *Epidaurus*, whence this celebrated Liquor was firſt brought. That brought from *Candia* is eſteem'd the beſt. See *Wine*.

Malmſey is alſo the Name of a kind of Muſcadine Wine brought from *Provence*.

MALT, a Preparation of Barley, whoſe Uſe is well known. The Proceſs or Manner of making it, Sir *R. Murray* deſcribes as follows. Take good Barley newly threſhed, *&c.* put about ſix *Engliſh* Quarters in a Stone Trough full of Water, where let it ſteep till the Water be of a bright reddiſh colour; which will be in about three days, more or leſs, according to the Moiſtneſs or Dryneſs, Smallneſs or Bigneſs of the Grain, the Seaſon of the Year, or the Temperature of the Weather. In Summer, *Malt* never makes well; in Winter it requires longer ſteeping than in Spring or Autumn. It may be known when it is ſteep'd enough, by other Marks beſides the Colour of the Water; as by the exceſſive Swelling of the Grain if it be over-ſteep'd, and by too much Softneſs: being, when 'tis in a right Temper, like the Barley prepared to make Broth of. When it is ſufficiently ſteep'd, take it out of the Trough, and lay it on heaps, to let the Water drain from it; then after two or three hours turn it over with a Scoop, and lay it in a new heap, about 20 or 24 Inches deep.

This Heap is call'd the *Coming Heap*, and in the right Management of this lies the principal Skill. In this Heap it may lie 40 hours, more or leſs, acoording to the forementioned Qualities of the Grain, *&c.* before it come to the right Temper of *Malt*; which that it may do equally, is mainly deſired. While it lies in this Heap, it muſt be carefully look'd to, after the firſt 15 or 16 Hours; for about that time the Grain begins to put forth the Root: which when they have equally and fully done, the *Malt* muſt within an hour after be turn'd over with a Scoop; otherwiſe the Grains will begin to put forth the Blade or Spire alſo, which muſt by all means be prevented. If all the *Malt* don't come equally, but that which lies in the middle, being warmeſt, come the ſooneſt; turn it, ſo as the outmoſt may lie inmoſt, and thus manage it till 'tis all alike. As ſoon as the *Malt* is ſufficiently come, turn it over, and ſpread it to a depth not exceeding five or ſix Inches; and by that time it is all ſpread out, begin and turn it over and over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the Heap deeper by degrees: and continue ſo to do for the ſpace of 48 hours at leaſt. This frequent turning it over, cools, dries, and deadens the Grain, whereby it becomes mellow, melts eaſily in Brewing, and ſeparates entirely from the Husk. Then throw up the *Malt* into a Heap, as high as you can; where let it lie till it grow as hot as your Hand can endure it, which uſually comes to paſs in about 30 hours ſpace. This perfects the Sweetneſs and Mellowneſs of the *Malt*. After it is ſufficiently heated, throw it abroad to cool, and turn it over again about 6 or 8 hours after, and then lay it on the Kiln with Hair-Cloth or Wire ſpread under it; where after one Fire, which muſt laſt for 24 hours, give it another more ſlow, and afterwards, if need be, a third: for if the *Malt* be not thoroughly dried, it cannot be well ground, neither will it diſſolve well in the Brewing; but the Ale it makes will be red, bitter, and will not keep. The beſt Fewel is Peat or Turf; the next, Charcoal. If there be not enough of one kind, burn the beſt firſt, for that gives the ſtrongeſt Impreſſion. Indeed the beſt and moſt natural Method of drying it, is in the Sun in the Months of *April* and *May*. This yields the paleſt, the moſt wholeſome, and the fineſt Liquor. However this be, take care the *Malt* be not ſmoak'd in the drying. As to the Complexion or Colour of *Malt*, White is accounted the beſt, becauſe the moſt natural.

The Manner of preparing Liquors, of *Malt*; ſee under the word *Brewing*.

Malt Liquors have different Names, as well as different Virtues, Properties and Uſes, both from the different Manners of preparing the *Malt*, (whence they are diſtinguiſh'd into *Pale* and *Brown*;) and from the different Manners of preparing or brewing the Liquors themſelves; whence they are divided into *Beer* and *Ale*, *Strong* and *Small*, *New* and *Old*.

As to the firſt Diviſion, *Malt Drinks* are either *Pale* or *Brown*, as the *Malt* is more or leſs dried on the Kiln; that which is the ſlendereſt dried tinging the Liquor leaſt in brewing, and therefore call'd *Pale*; whereas that higher dried, and as it were roaſted, makes it of a higher colour: a Mixture of both theſe makes an Amber Colour, whence ſeveral of theſe Liquors take their Name. Now 'tis certain the *Pale Malt* has moſt of the natural Grain in it, and is therefore the moſt nouriſhing; but for the ſame reaſon, requires a ſtronger Conſtitution to digeſt it. Thoſe who drink much of it, are uſually fat and ſleek in their Bloom; but are uſually cut off with ſudden Fevers; or if they avoid this, fall early into a diſtemper'd Old Age. The *Brown* makes a Drink much leſs viſcid, and fitter to paſs the ſeveral Strainers of the Body; but if very ſtrong, may lead on to the ſame Inconveniences with the *Pale*; tho a ſingle Debauch wears off much more eaſily in the *Brown*. Dr. *Quincey* obſerves, that the beſt *Pale Liquors* are thoſe brew'd with hard Waters, as thoſe of Springs and Wells: in regard the Mineral Particles wherewith theſe Waters are impregnated, help to prevent the Coheſions of thoſe drawn from the Grain, and enable them to paſs the proper Secretions the better; as the viſcid Particles of the Grain do likewiſe defend theſe from doing the miſchief they might otherwiſe occaſion. But ſofter Waters, as Rain and River Waters, ſeem beſt ſuited to draw out the Subſtance of high-dry'd *Malts*, which retain many fiery Particles in their Contexture, and are therefore beſt loſt in a ſmooth Vehicle.

As to the Difference in Preparation, it conſiſts chiefly in the Uſe of Hops, as in Beer; or in their Omiſſion, as in Ale. Now the Difference made by Hops, is beſt diſcovered from the Nature and Qualities of the Hops themſelves. Theſe are known to be a ſubtile grateful Bitter; in their Compoſition therefore with this Liquor, they add ſomewhat of an Alkaline Nature, *i. e.* Particles that are ſubtile, active and rigid. By which means the ropy, viſcid Parts of the *Malt* are more divided and ſubtiliz'd, and are therefore not only render'd more eaſy of Digeſtion and Secretion in the Body; but alſo, while in the Liquor, prevent it from running into ſuch Coheſions as would make it ropy, vapid and ſour. Now for want of this, in unhopp'd Drinks, that clammy Sweetneſs which they retain after working, ſoon turns them Acid, and unfit for Uſe; which happens ſooner or later, in proportion to the Strength they receive from the *Malt*, and the Comminution it has undergone by Fermentation. 'Tis a common Opinion, that Ale is more Diuretic than Beer, that is, unhopp'd Liquors more than that with Hops in it. Which may hold in ſome particular Conſtitutions, in regard Ale being more ſmooth, ſoftning, and relaxing, where Urine is to be promoted by enlarging the Paſſage, as in thin dry Conſtitutions, this is the moſt likely to effect it. But where the promoting of Urine is to be done by attenuating and breaking the Juices, and rendering them more fluid, 'tis certainly beſt anſwer'd by thoſe Drinks which are well hopp'd. As to the Diſpute, whether or no Hops tend to breed the Stone, 'tis too long to enter upon here. Dr. *Quincey* is of opinion, there is but little reaſon for the Affirmative ſide of the Queſtion; and in the general makes no ſcruple to ſay, that for one Conſtitution damaged by Beer, there are Numbers ſpoil'd by Ale. For this laſt manifeſtly fouls the Glands, ſtuffs the Veſſels with Slime and Viſcidity, makes the Body unwieldy and corpulent, and paves the way for Cachexies, Jaundice, Aſthma's, and at laſt incurable Dropſies. The Urinary Paſſages, alſo, which it is ſuppoſed to clear, it will in time fill with Slough and Matter of as ill conſequence as Gravel.

Again, the different Strengths of theſe Liquors makes their Effects different. The ſtronger they are, the more viſcid Parts they carry into the Blood; and though the Spirituous Parts make theſe imperceptible at firſt, yet when theſe are evaporated, which will be in a few hours, the other will be ſenſibly felt by Pains in the Head, Nauſeouſneſs at the Stomach, and Laſſitude or Liſtleſſneſs to Motion. This, thoſe are the moſt ſenſible of, who have experienced the Extremes of drinking theſe Liquors and Wines; for a Debauch of Wine they find much ſooner wore off, and they are much more lively and brisk afterwards, than after fuddling *Malt Liquors*, whoſe viſcid Remains will be long e'er they are ſhook off. Theſe Liquors therefore are more wholeſome for being ſmall; *i. e.* of ſuch a Strength as is able to carry a ſmall degree of Warmth into the Stomach, but not ſo great as to prevent

vent their being proper Diluters of the neceſſary Food. Indeed in robuſt People, or thoſe who labour hard, the Viſcidities of the Drink may be broke into convenient Nouriſhment; but in Perſons of another Habit and Way of Living, they ſerve rather to promote Obſtructions and ill Humours.

The Age of theſe Liquors is the laſt thing by which they are render'd more or leſs wholeſome. Age ſeems to do nearly the ſame thing as Hops; for thoſe Liquors which are longeſt kept, are certainly leaſt viſcid: Age breaking the viſcid Parts, and by degrees rendering them ſmaller and fitter for Secretion. But this is always determined according to their Strength; in proportion to which they will ſooner or later come to their full Perfection as well as Decay. For when Ale or Beer is kept till its Particles are broke and comminuted as far as they are capable, then 'tis they are the beſt; and beyond this they will be continually on the Decay, till the finer Spirits are entirely eſcaped, and the Remainder becomes vapid and ſour.

We ſhall only add, that thoſe who mix Wine with their common Drink, are leſs ſubject to Coughs, with other Diſtempers of the Breaſt, and to Dropſies; yet are they more affected with Gravel and Pains of the Gout. See *Wine*.

MALTA, Knights of: An Order of Military Religious, who have bore various Names; as, *Hoſpitallers of S.* John *of* Jeruſalem, *Knights of S.* John, *Knights of* Rhodes, *Order of* Malta, *Religion of* Malta, *&c.* About the Year 1048, ſome *Neapolitan* Merchants founded a Church after the *Latin* Rite at *Jeruſalem*, giving it the Name of *Sta Maria della Latina*. They alſo founded a Monaſtery of Religious after the Order of S. *Bennet*, for the Reception of Pilgrims; and afterwards an Hoſpital near the Monaſtery, to take care of the Diſeaſed, under the direction of a Maſter or Rector, to be nominated by the Abbot of *Sta Maria della Latina*. Beſides which, they alſo built a Chappel in honour of S. *John Baptiſt*. In 1099, *Godfrey* of *Bullen* having taken *Jeruſalem*, endow'd this Hoſpital with ſome Demeſnes he had in *France*; and others imitating his Liberality, the Revenues of the Hoſpitals became conſiderably augmented. Upon this, *Gerard Torn* their Rector, in concert with the Hoſpitallers, reſolved to ſeparate from the Abbot and Religious of *Sta Maria*, and to form a diſtinct Congregation, under the Name and Protection of S. *John Baptiſt*: And hence it was, that they had the Name of *Hoſpitallers*, or *Brothers of S.* John *of* Jeruſalem. Pope *Paſchal* II. by a Bull in the Year 1113, confirmed the Donations made to this Hoſpital, which he ſettled under the protection of the Holy See; ordering that the Rectors, after *Gerard*'s death, ſhould be choſen by the *Hoſpitallers*. *Raymond de Puy*, *Gerard*'s Succeſſor, took the Title of *Maſter*: He gave a Rule to the *Hoſpitallers*, which was approved by *Calixtus* II. in 1120.

Such was the firſt Riſe of the *Order of* Malta. Now their firſt Grand Maſter finding the Revenues of the Hoſpital vaſtly exceeded what was neceſſary for the Entertainment of poor Pilgrims and diſeaſed Perſons, reſolved to employ the Surplus againſt the Infidels; and with this View offer'd himſelf to the King of *Jeruſalem*. He divided his *Hoſpitallers* into three Claſſes. The firſt conſiſted of Nobles, whom he deſtined to the Profeſſion of Arms, for the Defence of the Faith, and the Protection of Pilgrims; the ſecond conſiſted of Prieſts or Chaplains, who were to perform the Office; and the third of Servitors, who were not Noble, but were alſo appointed for the War. He alſo regulated the Manner of admitting Knights Brothers; and had the whole confirmed by Pope *Innocent*; who gave them for Arms, a White Croſs in a Field Argent, which continue ſtill the Standard of this Order.

After the Loſs of *Jeruſalem*, they retired firſt to *Margat*, then to *Acre*, which they defended very vigorouſly in 1290. After the entire Loſs of the *Holy Land*, they withdrew to *Cyprus*, where K. *Henry* of *Luſignan*, whom they had follow'd thither, gave 'em the City of *Limiſſon*. Here they continued 18 Years; when taking the Iſland of *Rhodes* from the *Sarazens* in 1308, they ſettled there. And now it was that they firſt took the Name of *Knights*, viz. *Knights of* Rhodes. *Andronicus*, Emperor of *Conſtantinople*, granted to their Grand Maſter *Foulque de Villaret*, the Inveſtiture of this Order; and the Donation was confirm'd by Pope *Clement*. The Year following, with the aſſiſtance of *Amadeus* IV. Duke of *Savoy*, they defended themſelves and their Iſland againſt an Army of *Sarazens*. In 1480, their Grand Maſter *d'Aubuſſon* made a vigorous Defence againſt *Mahomet* II. and preſerved the Iſland, in ſpight of a formidable Army which beſieged it for the ſpace of three Months. But in 1522, it was attack'd by *Soliman* with an Army of three hundred thouſand Men, and taken by him, after having been in the poſſeſſion of the Knights 213 Years. After this Loſs, the Grand Maſter and Knights retired firſt into the Iſle of *Candia*. Some time after Pope *Clement* VII. gave them *Viterbo*. Laſtly, *Charles* V. in 1530, gave them the Iſland of *Malta*, which they ſtill hold; and hence they come by the Appellation of Knights of *Malta*; tho' their proper Name is that of Knights of the Order of St. *John* of *Jeruſalem*; and their Grand Maſter, among his other Titles, ſtill retains that of Maſter of the Hoſpital of St. *John*, and Guardian of the Poor of our Saviour Jeſus Chriſt.

The Order of *Malta* have no other Dominions beſides that of their Iſland, and ſome other little Places in the Neighbourhood, the chief whereof are *Goza* and *Comino*. The Government is both Monarchical and Ariſtocratical, the Grand Maſter being the Sovereign, and the Chapter the Senate. It is Monarchical with regard to the Inhabitants of *Malta*, and the Iſles adjacent, and even with regard to the Knights in every thing relating to the Statutes and Rule of their Order; and Ariſtocratical, with regard to the Deciſion of any important Affairs, which are not to be diſpatched but by the Grand Maſter and the Chapter. There are two Councils, the one ordinary, compoſed of the Grand Maſter, as Chief, and the *Grands Croix*; the other compleat, conſiſting of the Grand Maſter, the *Grands-Croix*, and the two Senior Knights of each Language.

The Languages of *Malta* are the ſeveral Nations whereof the Order is compoſed. Of theſe there are eight, *viz. Provence*, *Auvergne*, *France*, *Italy*, *Arragon*, *Germany*, *Caſtile*, and *England*. The Pillar (as he is called) of the Language of *Provence* is the Grand Commander, he of *Auvergne* the Grand Marſhal, he of *France* the Grand Hoſpitaller, he of *Italy* Grand Admiral, he of *Arragon* Grand Conſervator, or Draper, as he was antiently called; the Pillar of the Language of *Germany* is Grand Bailiff, and he of *Caſtile* Grand Chancellor; the Language of *England*, which has been extinct ſince the Time of the Reformation under King *Henry* VIII. had for its Pillar, or Chief, the Turopolier, or General of the Infantry. The Language of *Provence* is the firſt, on account of *Raimond de Puy*, their firſt Grand Maſter, who was a *Provencial*.

In each Language there are ſeveral Grand Priories and capital Bailiages. To each Language belongs a Hall, where the Knights eat, and hold their ordinary Aſſemblies. Each Grand Prior has a Number of Commandries. The Commandries are either magiſtral, by Right, or by Favour; the magiſtral are thoſe annexed to the Grand Maſterſhip, whereof there is one in each grand Priory. Commandries by Right are thoſe which come by Right of Seniority; their Seniority is computed from the Time of their Admiſſion, but they muſt firſt have lived five Years at *Malta*, and have made four Caravannes, or cruizing Voyages on the *Turks* and *Corſairs*. Commandries by Favour, are thoſe which the Grand Maſter, or the Grand Priors have a Right of conferring; one of theſe they confer every five Years on whom they pleaſe.

The Noble Knights are called Knights by Right; excepting whom, none can be Bailiffs, Grand Priors, or Grand Maſters. The Knights by Favour are thoſe who, not being noble of themſelves, are raiſed, on account of ſome great Exploit, or notable Service, into the Rank of Nobles. The Servitors, or Serving-Brothers, are of two kinds; (1.) The Servitors of War, whoſe Functions are the ſame with thoſe of the Knights. (2.) Servitors of Religion, whoſe whole Buſineſs is to ſing the Praiſes of God in the Conventual Church, and to officiate each in his Turn as Almoners on board the Veſſels and Gallies of the Order. The Brothers of Obedience are Prieſts, who, without being obliged to go to *Malta*, take the Habit of the Order, make the Vows, and attach themſelves to the Service of ſome of the Churches of the Order, under the Authority of a Grand Prior, or Commander, to whom they pay Obedience. The Knights of Majority are thoſe who, according to the Statutes, are admitted at ſixteen Years of Age. The Knights of Minority are thoſe who are admitted from the Time of their Birth; which, however, can't be done without a Diſpenſation from the Pope. The Chaplains can only be admitted regularly from ten to fifteen Years of Age; after fifteen they muſt have a Brief from the Pope; till fifteen the Grand Maſter's Letter is ſufficient. Theſe are called *Diaco's*, and muſt give Proof of their being born of creditable Families.

For the Proofs of Nobility to be made, e'er the Admiſſion of Knights, in the Language of *Germany*, they go back ſix Generations; in the reſt 'tis ſufficient to go back to the Great Grandfather on the Father's or Mother's ſide. All the Knights, after their Profeſſion, are obliged to wear a white Croſs or Star, with eight Points over the Cloak or Coat on the left Side, which is the proper Habit of the Order, the Golden Croſs being only an Ornament.

There

There are alſo Female Hoſpitallers of the Order of St. *John* of *Jeruſalem*, ſometimes alſo called *Chevaliereſſes*, or *She-Knights*, of equal Antiquity with the Knights themſelves; whoſe Buſineſs was to take care of the Women-Pilgrims, in an Hoſpital a-part from that of the Men.

MALTHA, a kind of Cement, formerly in great Uſe, compoſed of Pitch, Wax, Plaiſter, and Greaſe. Beſides this, there was another kind of *Maltha* wherewith the *Romans* plaiſtered and whitened the Inſides of their Aqueducts; this was a very fine Cement, conſiſting of Lime ſlaked in Wine, incorporated with melted Pitch and freſh Figs. The natural *Maltha* is a kind of Bitumen, wherewith the *Aſiaticks* plaiſter their Walls. When this *Maltha* is once ſet on fire, Water won't extinguiſh it, but ſerves rather to make it burn more fiercely. The firſt *Maltha* was antiently uſed in the Dedication of Churches.

MAMMÆ. See *Breaſts*.

MAMMELUKE, the Name of a Dynaſty which reigned a conſiderable Time in *Egypt*. They were originally *Turkiſh* and *Circaſſian* Slaves, bought of the *Tartars* by *Melicſaleh*, to the Number of a thouſand, whom he bred up to Arms, and raiſed ſome to the principal Offices of the Empire. They killed Sultan *Moadam* in 1250, being affronted at his concluding a Treaty with his Priſoner St. *Louis* without their Privity. This *Moadam* was the laſt Sultan of the *Majoubites*; to whom ſucceeded the *Mammelukes*, the firſt of whom was Sultan *Azeddin*, or *Mouz Ibec*, the *Turcoman*.

Others ſay, that the *Mammelukes* were ordinarily choſen from among the Chriſtian Slaves, and that they were the ſame thing, in great meaſure, with the Janizaries among the *Turks*. They never married. The firſt are ſaid to have been brought from *Circaſſia*, and ſome add, that they firſt began to be talked of about the Year 869.

The Word comes from מלך, *regere*, *imperare*, the *Arabic* Participle Paſſive whereof is ممלوك, *Mamluc*, which ſignifies *Subject*, or one under the Dominion of another. *Scaliger* holds, that the Word is *Arabic*, but that it properly ſignifies ſomething bought with Money; but others will have it ſignify any thing acquired, either as Prize or Purchaſe.

MAMMIFORMIS, in Anatomy, a Name given to two Apophyſes of the Bone in the back Part of the Skull, ſo called from their reſembling a Breaſt. See *Maſtoides*.

MAMMILLARIS, in Anatomy, an Epithet given to two little Protuberances, ſomewhat reſembling the Nipples of the Breaſt, found under the Fore-Ventricles of the Brain, and ſuppoſed to be the Organs of Smelling. They are called *Apophyſes Mammillares*. There is alſo a Muſcle called *Mammillaris*, or *Maſtoides*, ſerving to ſtoop the Head.

MANAGE, or *Manege*, a Riding Academy, or Place for riding the Great Horſe, and for breaking Horſes to the proper Motions and Actions. In a *Manage* is a Place deſtined for vaulting round a Pillar, a Courſe or Carrier for running the Ring, and on the Side are Pillars, between which are placed the Horſes deſtined for high Airs. *Manage* is alſo uſed for the Exerciſe itſelf, either of the Horſe or the Rider. The Word is borrowed from the *French Menage*, and that from the *Italian Maneggio*, or, as ſome will have it, *à Manu agendo*.

MANCIPLE, a Caterer; there was antiently an Officer in the *Temple* called by this Name, now called the Steward; and the Name and Office is retained ſtill in our Colleges in both the Univerſities.

MANDAMUS, a Writ that lieth after the Year and Day, whereas, in the mean time, the Writ called *Diem clauſit extremum* hath not been ſent out to the Eſcheator, for the ſame purpoſe to which it ſhould have been ſent. *Mandamus* is alſo a Charge to the Sheriff, to take into the King's hands all the Lands and Tenements of the King's Widow, that, againſt her Oath formerly given, marrieth without the King's Conſent.

MANDARIN, a Name given by the *Portugueſe* to the Nobility of the *Eaſtern* Countries, whom the *Chineſe* call *Quoan*, or rather *Coheri*, *q. d. to ſerve, to be a Miniſter of a Prince*. There are in *China* nine Orders of *Mandarins*; or nine Degrees of Nobility; which have as many different Animals for their Characteriſticks. The firſt is diſtinguiſhed by a Crane, the ſecond by a Lion, the third by an Eagle, the fourth by a Peacock, &c. There are in all thirty-two or thirty-three Thouſand *Mandarins* in *China*. There are *Mandarins* of Letters, and *Mandarins* of Arms; both the one and the other of which paſs ſeveral Examinations. Since the Time that the *Tartars* have rendered themſelves Maſters of *China*, moſt of the Tribunals, or Courts of Juſtice, &c. inſtead of one *Mandarin* for a Preſident, have two; the one a *Tartar*, the other a *Chineſe*. The *Mandarinat* is not hereditary, nor are any raiſed to it but Men of Letters.

Mandarin is alſo the Name which the *Chineſe* give to the learned Language of the Country; for beſides the proper and peculiar Language of each Nation and Province, they have one common to all the learned Men in the Empire; and which is that in *China* which the *Latin* is in *Europe*. This Language they call the *Mandarin*, or the Language of the Court. Their public Officers, as Notaries, Lawyers, Judges, and chief Magiſtrates, write and ſpeak the *Mandarin*.

MANDATE, in the Canon Law, is a Reſcript or Edict of the Pope, by which he commands ſome Ordinary, Collator, or Preſenter, to put the Perſon there nominated in poſſeſſion of the firſt Benefice vacant in his Collation. An Apoſtolical *Mandate* for the Proviſion of Benefices, is a monitorial and comminatory Letter from the Pope to a Biſhop, by which he is enjoined to provide a Subſiſtence for thoſe who have been ordained by him, or his Predeceſſors, from the Tonſure to Sacred Orders incluſively; and to allow them this Subſiſtence till they be provided of a Benefice; which Practice was occaſioned by the Biſhop's laying Hands on great Numbers, and afterwards abandoning them to Miſery and Want. At firſt the Popes only gave monitory *Mandates*, which were no more than ſimple Prayers and Requeſts, that did not bind the Ordinary; afterwards they gave preceptory *Mandates*, which did not annul the Proviſions of the Ordinary; at laſt they ſet up executory *Mandates*, by which the Proviſions made by the Ordinary, in prejudice of the *Mandate*, were declared null, and the Executor of the *Mandate*, in default of the Ordinary, conferred the Benefice on the Mandatory: but the Pope's Power in iſſuing theſe *Mandates* is now very much regulated and reſtrained.

MANDERIL, a kind of wooden Pulley, making a Member of the Turner's Leath. Of theſe there are ſeveral kinds, as *Flat Manderils*, which have three or more little Pegs or Points near the Verge, and are uſed for turning flat Boards on. *Pin Manderils*, which have a long wooden Shank to fit into a round Hole made in the Work to be turned. *Hollow Manderils*, which are hollow of themſelves, and uſed for turning hollow Work. *Screw-Manderils*, for turning Screws, &c. See *Turnery*. See alſo *Leath*.

MANDIBULA, the Jaw. See *Maxilla*. Hence *Mandibulares Muſculi*, and *Manducatorii Muſculi*. See *Maſſeters*.

MANDIL, the Name of a Cap or Turban wore by the *Perſians*. The *Mandil* is formed, by firſt wrapping round the Head a Piece of fine white Linen five or ſix Ells long; over this they wrap, in the ſame manner, a Piece of Silk of the ſame Length, and oftentimes of great Value. To make the *Mandil* genteel, Care muſt be taken, that in wrapping the Silk, it be ſo managed, as that the ſeveral Colours, found in the ſeveral Folds, make a kind of Waves, ſomewhat like what we ſee in marbled Paper. This Dreſs is extremely majeſtic, but at the ſame time very heavy. It ſerves either as a Shelter to the Head from Cold, or as a Skreen from the exceſſive Heat of the Sun; 'tis ſaid the Cutlaſs won't penetrate it. In rainy Weather they cover it up with a kind of Caſe or Hood, made of red Cloth. The Mode of the *Mandil* has been altered of late; during the Time of *Cha Abbas* II. it was round at Top: in the time of *Cha-Soliman*, they brought one End of the Silk out of the middle of the *Mandil* over the Head; and, laſtly, in the Reign of *Cha-Uſſein*, the end of the Silk, in lieu of its being gathered as before, was plaited in manner of a Roſe; and this the *Perſians* find extremely graceful, and uſe it to this day.

MANDRAGORA, *Mandrake*, a Medicinal Plant, which makes a principal Ingredient in the Unguent, called *Populeum*. There are two kinds of Mandrake, Male and Female, each bearing a kind of Apples; thoſe of the Male, as well as the Leaves, Roots, &c. being twice as large as thoſe of the Female; but the Juice of each is a Poiſon, equally violent. Naturaliſts tell ſtrange Stories of this Plant, but ſetting aſide its ſoporiferous Virtue, the modern Botaniſts will ſcarce warrant any of them, not even that human Figure ordinarily aſcribed to its Roots, eſpecially ſince the Diſcovery of the Artifice of Charletan's in preparing it, to ſurprize the Credulity of the People. *Chineſe Mandragora* is the Plant *Ginſeng*, which ſee.

MANDUCATION, the Action of chewing, a Term ſeldom uſed but in ſpeaking of the Euchariſt. The Catholics maintain a real *Manducation* of the Body of Chriſt; the Reformed, on the contrary, take this *Manducation* to be only figurative and by Faith. St. *Auguſtine* calls it a *Spiritual Manducation*.

MANEQUIN, in Painting, is underſtood of a little Statue, or Model, ordinarily made of Wax, and ſometimes of Wood; the Junctures whereof are ſo contrived, as that it may be put into any Attitude one pleaſes, and its Draperies and their Folds be diſpoſed at Diſcretion.

The

The word *Manequin* is a Diminutive of Man, and properly ſignifies a little Man.

MANES; a Poetical Term, ſignifying the Shades or Souls of the Deceaſed. The Heathens uſed a world of Ceremonies and Sacrifices to appeaſe the *Manes* of thoſe who died without Burial.

The *Dii Manes* were the Infernal Gods who tormented Men; and to theſe the Heathens offer'd Sacrifices to aſſuage their Indignation. The Heathen Theology is a little obſcure with regard to theſe Gods *Manes*. Some hold that they were the Souls of the Dead, others that they were the *Genii* of Men; which laſt Opinion ſuits beſt with the Etymology of the Word. The Heathens, 'tis pretty evident, applied all theſe Ideas to the *Manes*; ſo that the Word ſometimes ſignified the Ghoſts of the Departed, and ſometimes the infernal or ſubterraneous Deities, and in general all Divinities that preſided over Tombs. The Invocation of the *Manes* of the Dead, ſeems to have been a thing very frequent among the *Theſſalians*, but was expreſly prohibited by the *Romans*.

MANGANUM, an Engine of War. See *Balliſta*.

MANIA, in Medicine, a Diſeaſe popularly call'd Madneſs: See *Madneſs*. The Word is *Greek*, *μανία*, *Fury*, *Rage*.

MANICHEES; a Set of antient Heretics, ſo call'd from their Author *Manes* or *Manichees*, a *Perſian* by Nation. This Hereſy had its firſt Riſe about the Year 277, and ſpread itſelf principally in *Arabia*, *Egypt*, and *Africa*. St. *Epiphanius*, who treats of it at length, obſerves, that the true Name of this Hereſiarch was *Cubricus*; and that he chang'd it for *Manes*, which in the *Perſian* or *Babyloniſh* Language ſignifies *Veſſel*. A rich Widow, whoſe Servant he had been, dying without Iſſue, left him good ſtore of Wealth; after which, he aſſumed the Title of Apoſtle or Envoy of Jeſus Chriſt. He eſtabliſh'd two Principles, *viz.* a good one and an evil one. The firſt, which he called *Light*, did nothing but good; and the ſecond, which he call'd *Darkneſs*, nothing but evil. This Philoſophy is very antient, and *Plutarch* treats of it at large in his *Iſis* and *Oſiris*. Our Souls, according to *Manes*, were made by the good Principle, and our Bodies by the evil one; thoſe two Principles being co-eternal and independent of each other. He borrow'd many things from the antient *Gnoſtics*; on which account many Authors conſider the *Manicheans* as a Branch of the *Gnoſtics*. In truth, their Doctrine was a Syſtem of Philoſophy, rather than of Religion. They made uſe of Amulets, in imitation of the *Baſilidians*; and are ſaid to have made profeſſion of Aſtronomy and Aſtrology. They denied that Jeſus Chriſt aſſumed a true human Body, and maintain'd it was only imaginary. They pretended that the Law of *Moſes* did not come from God, or the good Principle, but from the evil one; and that for this reaſon it was abrogated. They abſtain'd entirely from eating the Fleſh of any Animal; following herein the Doctrine of the antient *Pythagoreans*. The reſt of their Errors may be ſeen in St. *Epiphanius* and St. *Auguſtine*; which laſt, having been of their Sect, may be preſumed to have been thoroughly acquainted with them.

Tho the *Manichees* profeſs'd to receive the Books of the New Teſtament; yet, in effect, they only took ſo much of them as ſuited with their Opinions: throwing all upon Reaſon, and quite ſetting aſide all Authority. They formed to themſelves a certain Idea of Chriſtianiſm; and to this adjuſted the Writings of the Apoſtles; pretending that whatever was inconſiſtent with this Idea, had been foiſted into the New Teſtament by later Writers, who were half *Jews*. On the other hand, they made Fables and Apochryphal Books paſs for Apoſtolical Writings; and even are ſuſpected to have forged ſeveral others, the better to maintain their Errors. St. *Epiphanius* gives a Catalogue of ſeveral publiſh'd by *Manes*, and adds Extracts of ſome of them. He was not contented with the Quality of Apoſtle of Jeſus Chriſt, but alſo aſſumed that of the Paraclete, whom he had promiſed to ſend. He left ſeveral Diſciples, and among others, *Addas*, *Thomas*, and *Hermeas*. Theſe he ſent, in his lifetime, into ſeveral Provinces to preach his Doctrine. *Manes* having undertaken to cure the King of *Perſia*'s Son, and not ſucceeding, was clapt into Priſon upon the young Prince's Death; whence he made his eſcape, but was apprehended ſoon after, and burnt alive.

Towards the middle of the twelfth Century, the Sect of *Manichees* took a new face, on occaſion of one *Conſtantine*, an *Arminian* and Adherer to it; who took upon him to ſuppreſs the reading of all other Books beſides the Evangeliſts and the Epiſtles of St. *Paul*, which he explain'd in ſuch manner, as to make them contain a new Syſtem of *Manichæiſm*. He entirely diſcarded all the Writings of his Predeceſſors, rejected the Chimera's of the *Valentinians* and their thirty *Eons*; the Fable of *Manes*, with regard to the Origin of Rain, which he made to be the Sweat of a young Man in hot Purſuit after a Maid; and other Dreams, but ſtill retain'd the Impurities of *Baſilides*. In this manner he reformed *Manichæiſm*, inſomuch that his Followers made no ſcruple of anathematizing *Scythian*, *Bouddas*, and even *Manes* himſelf; *Conſtantine* being now their great Apoſtle. After he had ſeduced an infinite number of People, he was at laſt ſtoned by order of the Emperor.

The word *Manichee* comes from the *Latin Manichæus*, which antient Authors maintain to have been formed of the two *Greek* Words, *μάννα*, *Manna*, and *χέω*, *I ſpread*; intimating that the Doctrine of their Maſter was a kind of *Manna*, which he ſpread every where.

MANICORDION, a Muſical Inſtrument, in form of a Spinett: See *Spinett*. Its Strings are cover'd with pieces of Scarlet Cloth, to deaden, as well as ſoften, the Sound; whence it is alſo call'd the *Dumb Spinett*, and is much uſed in Nunneries for the Religious to learn to play on; ſo as not to diſturb the Silence of the Dormitory. *Scaliger* makes the *Manicord* more antient than the Spinett and Harpſichord. *Du Cange* derives the word from *Monochord*, from a ſuppoſition this Inſtrument has but one Cord; but he is miſtaken, it has fifty, or more.

MANIFESTO, an Apology, or public Declaration, in Writing, made by a Prince, ſhewing his Intentions in any Enterprize, the Motives that induced him to it, and the Reaſons on which his Right and Pretenſions are founded.

MANILLE, or *Menille*, in Commerce, one of the principal Commodities carried by the *Europeans* to the Coaſts of *Africa*, to traffic with the *Negroes* in exchange for Slaves; conſiſting of a large Braſs Ring, in form of a Bracelet, either flat or round, plain or engraven; which the Natives uſe to deck themſelves withal, putting them on the Small of the Leg, and the Thick of the Arm above the Elbow. The better ſort among 'em wear Silver and Gold *Manilles*; but theſe are of their own manufacture; moſt of the Money they receive for their other Merchandizes being melted into *Manilles*.

MANIPULATION, a Term uſed in the Mines, to ſignify the manner of digging the Silver, &c. out of the Earth. See *Silver*.

MANIPULE, *Manipulus*, among the *Romans*, was a little Body of Infantry, which, in the Time of *Romulus*, conſiſted of an hundred Men; and, in the Times of the Conſuls and firſt *Cæſars*, of two hundred. Each *Manipule* had two Centurions, or Captains, call'd *Manipularii*, to command it; one whereof was Lieutenant to the other. Each Cohort was divided into three *Manipules*, and each *Manipule* into two Centuries.

'Tis true, *Aulus Gellius* quotes an old Author, one *Cincius*, who lived in the Time of *Hannibal*, (whoſe Priſoner he was) and who, writing on the Art of War, obſerves, that, then, each Legion conſiſted of ſixty Centuries, of thirty *Manipules*, and of thirty Cohorts. And again, *Varro* and *Vegetius* mention it as the leaſt Diviſion in the Army, only conſiſting of the tenth part of a Century; and *Spartian* adds, that it contain'd no more than ten Men, which ſhews that the *Manipule* was not always the ſame thing.

The *Romans* call'd this Company by the Name *Manipule*, or *Manipulus*, as ſignifying the Handful of Hay which they bore at the End of a Pole, to diſtinguiſh themſelves by, e'er the Cuſtom was introduced of bearing an Eagle for their Enſign; and hence came the Phraſe, *an Handful of Men*. *Vegetius*, *Modeſtus*, and *Varro*, give other Etymologies of the Word. The laſt derives it from *Manus*, a little Body of Men following the ſame Standard. According to the former, they were ſo call'd, becauſe they fought hand in hand, or all together. *Contubernium autem Manipulus vocabatur ab eo quod conjunctis Manibus pariter dimicabant*, are their Words.

Manipule is alſo an Eccleſiaſtical Ornament, wore by the Prieſts, Deacons and Subdeacons in the *Romiſh* Church. It conſiſts of a little Fillet in form of a Stole, three or four Inches broad, and made of the ſame Stuff with the Chaſuble; ſignifying and repreſenting an Handkerchief, which the Prieſts in the Primitive Church wore on the Arm, to wipe off the Tears they were continually ſhedding for the Sins of the People. There ſtill remains a Mark of this Uſage in a Prayer ſpoken by thoſe who wear it, *Merear, Domine, portare Manipulum Fletus & Doloris*. The *Greeks* and *Maronites* wear two *Manipules*, one on each Arm.

MANIPULUS, in Phyſic, is uſed for a Meaſure of Herbs, *viz.* an Handful; which is a quantity often uſed in Preſcription amongſt Phyſicians, and is generally marked with *M*.

MANNA, in Pharmacy, a medicinal Drug of great uſe in the modern Practice. *Manna* is a white Juice, or Liquor, very ſweet, Oozing either of it ſelf, or by Inciſion, from the Branches and Leaves of the Aſhe, both wild and ordinary, during the Time of the Dog-days. Others will have it to be a Honey of the Air; or a kind of Dew proceeding from a Vapour rais'd from the Earth, and prepared in the Air, condens'd by the Cold, and gathered in the

hot Countries, before Sun-riſe, both on Plants and Trees, and even on Rocks, and the Earth itſelf. But this muſt be a Miſtake; and 'tis much more rational to rank it amongſt the Number of Gums, which exuding from the Juice of the Tree, and mixing with it ſome ſaline Particles of the Air, is condens'd into thoſe Flakes in which we ſee it.

The *Italians* gather three kinds of *Manna*. The firſt *Manna di Corpo*, which oozes ſpontaneouſly from the Branches of the Tree in the Month of *July*. The ſecond *Manna Forzata*, or *Forzatella*, which is not gather'd 'till *Auguſt*, after an Inciſion of the Tree, when the Flux of the firſt has ceas'd. The third, *Manna di Fronda*, which iſſues of itſelf, in little Drops, like a kind of Sweat from the nervous part of the Leaves of the Aſh, and gathers into Grains about the bigneſs of thoſe of Wheat, which are harden'd by the Sun in *Auguſt*. The Leaves are frequently found ſo loaden with theſe Grains, that they ſeem cover'd with Snow. *Manna* is a gentle and ſafe Purge; and is alſo uſed in Broths. *Altomarus*, a Phyſician of *Naples*, has written a Treatiſe expreſly upon it; and *Donzellus* has ſeconded it. *Manna*, tho' accounted a kind of Honey, purges the Bile; whereas common Honey increaſes it. Formerly the *Syrian* was in the moſt Repute, but now it gives way to the *Calabrian*. *Fuchſius* obſerves, that the Peaſants of Mount *Libanus* eat *Manna* ordinarily as others do Honey. At *Mexico* they are ſaid to have a *Manna* which they eat as we do Cheeſe.

Manna is brought from ſeveral Countries, and in ſeveral Forms. Thus we have *Manna* of *Calabria*, and of *Sicily*; *Manna* in Grains, in Tares, &c. The moſt eſteem'd, is that in Tares; which many take to be factitious, and the Work of the *Jews* of *Legborn*, but 'tis certainly natural: And what gives it this Figure, is, that they put Straws and Slips of Wood in the Inciſions; along which the *Manna* gliding, is condenſed as it comes out, and aſſumes this Form.

MANNA, a Term in Scripture, ſignifying a miraculous kind of Food falling from Heaven, wherewith the *Iſraelites* were ſupported in their Paſſage thro' the Wilderneſs. This *Manna* was in form of *Coriander-Seeds*; its Colour was like that of *Bdellium*, and its Taſte like Honey. They call'd it *Manna*, either from the *Hebrew* Word *Manah*, a Gift, to intimate its being a Gift from Heaven; or from *Minnah*, which ſignifies to prepare, becauſe the *Manna* came to them ready for eating, and needed no Preparation but gathering; or from the *Egyptian* word, *Man, what is it?* This laſt Etymology ſeems the more probable, in regard the Scripture takes notice of the Surprize they were under, when they firſt ſaw this new Food deſcend. *Salmaſius*, however, does not allow of this Derivation. He ſays, that the *Arabs* and *Chaldeans* uſed the word *Man* to ſignify a kind of Dew or Honey that fell on the Trees, and was gathered in great abundance on Mount *Libanus*. So that the *Iſraelites* did not uſe the Term *Mannah* out of Surprize, but becauſe they found this Food fall with the Dew, in the ſame manner as the Honey, ſo well known to them under the Name of *Man*. *Salmaſius* adds, that the *Manna* of the *Iſraelites* was in reality no other than that Honey or Dew condens'd; and that the one and the other were the ſame with the wild Honey wherewith St. *John* was fed in the Wilderneſs. So that the Miracle did not conſiſt in the Formation of any new Subſtance in favour of the *Iſraelites*; but in the punctual Manner in which it was diſpens'd by Providence; ſo that ſo vaſt a Multitude ſhould have wherewithal to ſatisfy themſelves.

MANNER, in Painting, &c. is uſed to expreſs that particular Character obſervable in the Works of Painters, Poets, and other Men of Art, by which their Pencil, Hand, or Style, are diſtinguiſh'd. Thus the Curious in Paintings know the *Manners* of the Painters; and diſtinguiſh readily between the *Manners* of *Rubens*, *Titian*, or *Da Vinci*; between the antient and the new *Manner* of the ſame Painter; the *Flemiſh* and the *Italian Manner*. The *Manner* is uſed with reſpect both to the Invention, the Deſign, and the Colouring. The *Manner* of *Michael Angelo*, or *Raphael*, may alſo be known in their Scholars. Thus we ſay, ſuch a Piece is of *Raphael*'s School, &c.

MANNERS, in Poetry, a Term particularly uſed in Tragedy, Comedy, and the Epopeia; ſignifying the Inclinations, Genius, and Humour, which the Poet gives to his Perſons, or that which diſtinguiſhes his Characters. *Ariſtotle* defines the *Manners* to be that which diſcovers the Inclination of him who ſpeaks, and ſhews what he will reſolve upon, or what reject, before he has actually determin'd: Whence he concludes, that *Manners* are not always, and in all kinds of Diſcourſes: *Non quælibet Oratio eſt Morata*. One Inſtance will make this Definition clear. In the firſt Book of *Virgil*, *Æneas* is repreſented extremely pious, and determined to execute the Will of the Gods at all adventures. In the fourth Book, he has a difficult Choice propoſed; being engaged, on the one hand, out of a Principle of Love, Gratitude, and Honour, not to quit *Dido*; and having, on the other hand, an expreſs Order from the Gods to depart for *Italy*. Now, before it appears on which ſide he has determin'd, what he has before ſaid ſhould ſhew his Will and Inclinations, and which Party he will take. Now thoſe preceding Diſcourſes, which diſcover his future Reſolution, make what we call the *Poetical Manners*. Thoſe make it paſt doubt he will abandon *Dido*, to obey the Gods: This he does in effect; the *Manners* therefore are good, and well conducted. Had he diſobey'd the Orders of *Jupiter*, to ſtay with *Dido*, the *Manners* had been ill; in regard they would have foretold a Reſolution contrary to what he was really to take. But had there been nothing to make us foreſee any Reſolution of *Æneas* at all, neither that which he actually took, nor the contrary, in that Caſe there had been no *Manners* at all.

'Tis the *Manners*, as we have before obſerved, which diſtinguiſh the Characters: And, unleſs the *Manners* be well expreſs'd, we ſhall never be acquainted with the Perſons at all; nor, conſequently, ſhall we be either terrified with foreſeeing their Dangers, nor melted into Pity by ſeeing their Sufferings. See *Character*.

The *Manners* then ſhould have four Qualities; they ſhould be *Good*, *Like*, *Suitable*, and *Equal*. *Good* is when they are well mark'd or expreſs'd; that is, when the Diſcourſe of the Perſons makes us clearly and diſtinctly ſee their Inclinations, and what good or evil Reſolutions they will take. *Like* only relates to known and public Perſons, whoſe Characters are in Hiſtory, with which the poetic Characters muſt agree; that is, the Poet muſt not give a Perſon any Quality contrary to any of thoſe which Hiſtory has given him. And here it may be obſerved, that the evil Qualities given to Princes and great Men, ought to be omitted by the Poets, if they be contrary to the Character of a Prince, &c. but the Virtues oppoſite to thoſe known Vices ought not to be impoſed, by making him generous and liberal in the Poem, who was avaricious in the Hiſtory. The *Manners* muſt likewiſe be *ſuitable*; that is, they muſt be agreeable to the Age, Sex, Rank, Climate and Condition of the Perſon that has them. *Horace* obſerves, *Intererit multum Davuſne loquatur an Heros*. Again, the *Manners* muſt be *equal*; that is, they muſt be conſtant, or conſiſtent through the whole Character; or the Variety or Inequality of the *Manners*, as in Nature, ſo in the *Drama*, muſt be equal. The Fearful muſt never be brave, nor the Brave timorous; the Avaritious muſt never be liberal, nor *vice verſa*. In this part, *Shakeſpear*'s *Manners* are admirable. Beſides theſe four Qualities above-mentioned, there is a fifth eſſential to their Beauty; which is, that they be neceſſary; that is, that no vicious Quality or Inclination be given to any poetic Perſon, unleſs it appear to be abſolutely neceſſary, or requiſite to the carrying on of the Action.

MANOMETER, or *Manoſcope*, an Inſtrument to ſhew or meaſure the Alterations in the Rarity or Denſity of the Air; from the *Greek* μανὸς, *rarus*, and μέτρον, *menſura*, &c. The *Manometer* differs from the *Barometer*, in that the former only meaſures the Weight of the Atmoſphere, or of the Column of the Air over it; but the latter the Denſity of the Air in which 'tis found: which Denſity depends not only on the Weight of the Atmoſphere, but on the Action of Heat and Cold, &c. Authors, however, generally confound the two together; and Mr *Boyle* himſelf gives us a very good *Manometer* of his Contrivance, under the Title of a *Statical Barometer*; the Structure whereof ſee under the Word *Barometer*.

MANOR, is derived *à manendo*; becauſe the Lord did uſually reſide there. For its Original: there was antiently a certain Compaſs of Ground, granted by the King to ſome Man of Worth, for him and his Heirs to dwell upon, and to exerciſe ſome Juriſdiction more or leſs within that Circuit, as he thought good to grant; but performing, withal, ſuch Services, and paying ſuch yearly Rent, as by this Grant was required. Now, the Lord afterwards, parcelling the ſame to other meaner Men, received Rent and Services from them, and by that means, as he became Tenant to the King, the Inferiors became Tenants to him. Indeed the Word is now taken for Juriſdiction, and Royalty incorporeal, rather than for the Land and Suit: For a Man may have a *Manor* in Groſs, *i. e.* the Right and Intereſt of a Court Baron, with the Perquiſites, and another enjoy every Foot of Land belonging to it. A *Manor* may be compounded of divers things, as of an Houſe, Arable Land, Paſture, Meadow, Wood, Rent, Advowſon, Court-Baron, &c. And this ought to be, by long Continuance of Time, beyond Man's Memory. 'Tis held by ſome, that a *Manor* cannot now be made, ſince a Court-Baron cannot be made; and without a Court-Baron, and at leaſt two Suitors, there can be no *Manor*.

MANSE, is a Parſonage or Vicaridge-Houſe, for the Incumbent to live in; this was originally, and is now, an eſſential Part of the Endowment of a Pariſh-Church, together

ther with the Glebe and Tythes. It is ſometimes called the *Presbyterium*. See *Presbytery*.

MANSION, from *manendo*, a Dwelling-Houſe, or Country Habitation; commonly uſed for the Lord's Chief Dwelling-Houſe within his Fee, otherwiſe called the *Capital Meſſuage*, or chief *Manor* Place. *Manſio*, or *Manſus*, were ſometimes uſed in the ſame Senſe with *Hide*; that is, as much Land as one Plow could till in a Year.

MAN-SLAUGHTER, *Homicide*, or the unlawful killing a Man, without prepenſed Malice: As when two, who formerly meant no harm to one another, on ſome ſudden Occaſion falling out, the one kills the other. It differs from Murder, as not being done with fore-going Malice; and from Chance-Medley, becauſe it hath a preſent Intent to kill: It is eſteem'd Felony, but admitted to the Benefit of the Clergy, for the firſt time. By a Law of King *Canutus*, if a Man is kill'd openly and premeditatedly, the Murderer ſhall be committed to the Relations of the Deceaſed: But if, on his Tryal, the Fact is proved, but not wilful, the Biſhop is to judge him.

MANSORII MUSCULI. See *Maſſeters*.

MANTELETS, in War, are a kind of moveable Penthouſes, or Parapets made of Pieces of Timber, ſaw'd into Planks, about three Inches thick, and nailed one over another to the height of almoſt ſix Foot. They are generally caſed with Tin, and ſet upon little Wheels; ſo that in a Siege, they may be driven before the Pioneers, and ſerve as Blinds to ſhelter them from the Enemies ſmall Shot. There are alſo other ſorts of *Mantelets*, covered on the top, whereof the Miners make uſe, to approach the Walls of a Town or Caſtle. It appears from *Vegetius*, that theſe were in uſe among the Antients, but they were built ſlighter, and yet larger than ours, being eight or nine Foot high, as many broad, and ſixteen long: They were defended by a double Covering, the one of Boards, the other of Faggots, with the Ribs of Oſiers, and caſed without with Skins ſteep'd in Water, to prevent Fire.

MANTLE, or *Mantle-Tree*, in Architecture, is the lower-part of a Chimney, or that part laid a-croſs the Jaumbs, and which ſuſtains the Compartiment of the Chimney-piece. See *Jaumb*.

MANTLE, in Heraldry, is that Appearance of the Folding of Cloth, Flouriſhing or Drapery, that is in any Atchievement, drawn about the Coat of Arms: It is ſuppoſed formerly to have been the Repreſentation of a *Mantle* of State in Blazon; it is always ſaid to be doubled, that is, lined throughout with one of the Furs, as Ermin, Pean, Verry, &c. See *Coat*.

Mantle is likewiſe a Term uſed in Falconry; as they ſay, the Hawk *mantles*, that is, ſpreads her Wings after her Legs.

MANUCAPTIO, in Law, a Writ that lies for a Man, who, being taken on Suſpicion of Felony, and offering ſufficient Bail for his Appearance, is refus'd to be admitted thereto by the Sheriff, or other having Power to let to Mainpriſe.

MANUDUCTOR, a Name given to an antient Officer in the Church, who, from the middle of the Choir where he was placed, gave the Signal to the Choriſters to ſing, mark'd the Meaſure, beat Time, and regulated the Muſic. The *Greeks* call'd him *Meſacoros*, becauſe ſeated in the middle of the Choir. But in the *Latin* Church, he was call'd *Manuductor*, from *Manus*, and *duco*, *I lead*; becauſe he led and guided the Choir by the Motions and Geſture of the Hand.

MANUFACTURE, a Place where ſeveral Artiſts and Workmen are employ'd in the ſame kind of Work; or make a Commodity of the ſame kind. The Word is alſo popularly uſed for the Work itſelf; and by Extenſion for the like Work, carried on independently in different parts of a Country. In this ſenſe, we ſay the Woollen *Manufacture*, Silk *Manufacture*, Velvet *Manufacture*, Tapeſtry *Manufacture*, Muſlin *Manufacture*, &c. *Manufacture* of Hats, Stockings, &c. See *Wool*, *Silk*, *Velvet*, *Tapiſtry*, *Muſlin*, &c. The Word comes from the *Latin*, *Manufactus*.

MANUMISSION, an Action by which a Slave is ſet at liberty. Some Authors define Manumiſſion to be an Act by which a Lord enfranchiſes his Tenants, who till that time had been his Vaſſals, and in a State of Slavery, inconſiſtent with the Holineſs of our Faith.

The *Romans* had ſeveral Ceremonies in uſe in the *Manumiſſion* of their Slaves. Their *Manumiſſion* was perform'd three ſeveral Ways. Firſt, When, with his Maſter's Conſent, a Slave had his Name enter'd in the *Cenſus*, or Public Regiſter of the Citizens. Secondly, When the Slave was led before the *Prætor*, and that Magiſtrate laid his Wand on his Head. Thirdly, When the Maſter gave the Slave his Freedom by his Teſtament. *Servius Tullius* is ſaid to have firſt ſet on foot the firſt Manner, and *P. Valerius Publicola* the ſecond. A particular Account is given of the third in the Inſtitutes of *Juſtinian*. It was not neceſſary, that the *Prætor* ſhould be on his Tribunal to perform the Ceremony of *Manumiſſion*. He did it any where indifferently, in his Houſe, in the Street, going to bath, &c. He laid the Rod, call'd *Vindicta*, on the Slave's Head, pronouncing theſe Words, *Dico eum liberum eſſe more* Quiritum; *I declare him a Freeman after the manner of the* Romans. This done, he gave the Rod to the Lictor, who ſtruck the Slave with it on the Head, and afterwards with his Fiſt on his Face and Back. And the Notary, or Scribe, enter'd the Name of the new-free'd Man in the Regiſter, with the Reaſons of his *Manumiſſion*. The Slave had likewiſe his Head ſhaved, and a Cup given him by his Maſter, as a Token of Freedom. *Tertullian* adds, that he had then a third Name given him. If this were ſo, three Names were not a Token of Nobility, but of Freedom. The Emperor *Conſtantine* order'd the *Manumiſſions* at *Rome* to be perform'd in the Churches. The Word comes from the *Latin Manumiſſio*, *quia Servus mittebatur extra Manum*, *ſeu poteſtatem Domini ſui*.

Of *Manumiſſion* there have been various Forms in *England*. In the time of the Conqueror, Servants were *manumitted*, by the Maſter's delivering them by the Right Hand to the Vicount in full Court, ſhewing them the Door, giving them a Launce and a Sword, and proclaiming them free. Some were alſo *manumitted* by Charter. There was alſo an implicit *Manumiſſion*; as when the Lord made an Obligation for Payment of Money to the Bondman at a certain Day; or ſued him, where he might enter without Suit; and the like.

MANURING of Ground, conſiſts in the Application of a Matter proper for meliorating the Soil, and rendring it more fertile. The Matters uſed for *Manure*, are various in various Countries. The moſt ordinary are Lime and Marl, *which ſee under their proper Articles*. In ſome parts of *Ireland*, they uſe Sea-Shells, as thoſe of Cockles, Periwinkles, &c. which are found to agree very well with boggy, heathy, clayey, wet or ſtiff Land. They ſeem to give it a kind of Ferment, as Barm does to Bread, opening and looſening the Clods, and by that means making way for the Roots to penetrate, and the Moiſture to enter into the Fibres of the Roots: This kind of *Manure* continues a long time e'er its Effects are exhauſted, whereas Lime, &c. ſpend themſelves at once. The Shells being hard, melt away very ſlowly, ſo that the Operation needs not be repeated for 20 or 30 Years. In the Weſt of *England*, they *manure* their Land with a brackiſh Sea-Sand; which Dr. *Bury* obſerves, quickens Dead-Land: So that what would otherwiſe be the barreneſt part of that Country, is now the richeſt. The Sea-Salt, he obſerves, is too luſty and active of itſelf, and that it does beſt when mingled with Lime. *Glauber* orders the Mixture to be made up and burnt like Bricks, and then apply'd. In ſome Countries they burn the Surface of their heathy Ground, inſtead of *manuring it*; which is but ill Husbandry, inaſmuch as it impoveriſhes it; and by deſtroying the Sap of the Earth, and Roots of the Graſs, and other Vegetables, it renders it uſeleſs for ſeveral Years after the third, when it is plow'd. Dr. *Jackſon* obſerves, that all the Ground about *Nantwich*, where Salt or Brine is ſpilt, is, when dug up, an excellent *Manure* for grazing Ground; and even Bricks, thoroughly tinged with it, diſſolve and fertilize the Land very conſiderably. Dr. *Beal* ſays, 'tis a common Obſervation of Gardeners and skilful Husbandmen, that Froſt and Snow improve and fertilize the Land both more ſpeedily and more effectually than the Influence and Warmth of the Sun. Dr. *Liſter* tells us, that in ſome parts of the *North-Riding* of *Yorkſhire*, the Soil is ſandy, and the People *manure* it with Clay. The Soil, with any other *Manure*, bears nothing but Rye; but with Clay, bears Oats, Barley, &c. This Clay *Manuring*, will, by certain Experience, laſt 45 Years in the Ground e'er it need be repeated. The Bogs in *Ireland* are beſt improv'd by ſandy, or other gravelly *Manures*.

MANUSCRIPT, a Book, or Paper, written with the Hand; in oppoſition to a printed Book, or Paper. A *Manuſcript* is uſually deſign'd by the two Letters MS, and in the *Plural* by MSS, or MMSS. What makes public Libraries valuable, is the Number of antient MSS repoſited in them.

MANWORTH, in old Law-Books, is the Price or Value of a Man's Head: every Man, according to his degree, being rated at a certain Price; according to which, Satisfaction, in old time, was made to his Lord, if any one kill'd him.

MANZEL. See *Caravanſerail*.

MAP, a plain Figure, repreſenting the ſeveral Parts of the Surface of the Earth, according to the Laws of Perſpective: or a Projection of the Surface of the Globe, or a part thereof, *in plano*. See *Projection*.

Maps are either univerſal, or particular. *Univerſal Maps* are thoſe which exhibit the whole Surface of the Earth, or the two Hemiſpheres. *Particular Maps* are thoſe which exhibit ſome particular Region, or part thereof. Each

kind

kind are frequently call'd Geographical or *Land-Maps*, in contra-diſtinction to Hydrographical or *Sea-Maps*, repreſenting only the Seas and Sea-Coaſts, properly call'd *Charts*. See *Chart*.

There are three Qualifications required in a *Map*. Firſt, That all Places have their juſt Situation with regard to the chief Circles of the Earth, as the *Equator*, *Parallel*, *Meridians*, &c. becauſe on theſe depend many Properties of Regions, as well as Celeſtial *Phænomena*. Secondly, That the Magnitudes of the ſeveral Countries have the ſame Proportion as on the Surface of the Earth. And, Thirdly, That the ſeveral Places have the ſame Diſtance and Situation with regard to each other, as on the Earth itſelf.

For the Foundation of *Maps*, and the Laws of *Projection*, ſee *Perſpective* and *Projection of the Sphere*: The Application thereof, in the Conſtruction of *Maps*, is as follows.

Projection of a Map, the Eye being plac'd in the Axis. Suppoſe, *v. g.* the Northern Hemiſphere to be repreſented with the Eye in a Point of the Axis, *v.g.* the South-Pole; for the Plane, whereon the Repreſentation is to be made, we take the Plane of the Equator, and from all the Points of the Surface of the Northern Hemiſphere, conceive Lines paſſing thro the Plane to the Eye; which Points connected together, conſtitute the *Map* required. Here the Equator will be the Limit of the Projecture; the Pole, the Centre. The Meridians will be Right Lines paſſing from the Pole to the Equator; the Parallels of Latitude, *&c.* Circles concentric with the Equator; and all the other Circles, and Arches of Circles, as the Horizon, Vertical Circles, *&c.* Ecliptic, *&c.* conceived in that Hemiſphere, will be Ellipſes, or Arches of Ellipſes. The better to apprehend the Projecture of the Circles on the Plane, conceive a radiant Cone, whoſe Vertex is the Eye, its Baſe the Circle to be repreſented, and its Sides the Rays paſſing between the Circle and the Eye. Suppoſe this Cone cut by the Plane. 'Tis obvious, that, according to the various Poſition of the Cone, there will be a different Section, and conſequently a different Line or Repreſentation.

For the Application of this Doctrine in Practice. In a Plane, *v. g.* a Paper, take the middle Point *P*. (Plate *Geography*, Fig. 2.) for the Pole, and from this, as a Centre, deſcribe a Circle, of the intended Bigneſs of your *Map*, to repreſent the Equator. Theſe two may be pitch'd on at pleaſure, and from theſe all the other Points and Circles are to be determined. Divide the Equator into 360°, and drawing Right Lines from the Centre to the beginning of each Degree, theſe will be Meridians; whereof that drawn to the beginning of the firſt Degree, we ſuppoſe the firſt Meridian.

Now for the Parallels. There are four Quadrants of the Equator; the firſt, 0,90; the ſecond, 90,180; the third, 180,270; the fourth, 270,0; which, for the better diſtinction, we will note with the Letters AB, BC, CD, DE. Taking one of theſe, *v. g.* BC, from the ſeveral Degrees thereof, as alſo from 23°, 30′, and 66″, 30′. thereof draw occult Right Lines to the Point *D*, marking where theſe Lines cut the Semidiameter *BPC*; and from *P*, as a Centre, deſcribe Arches paſſing thro' the ſeveral Points in *PC*. Theſe Arches will be Parallels of Latitude. The Parallel at 23° 30′, will be the Tropic of *Cancer*, and that at 66° 30′, the *Arctic* Circle. The Meridians and Parallels thus deſcribed, from a Table of Longitudes and Latitudes, lay down the Places; reckoning the Longitude of each Place on the Equator, commencing at the firſt Meridian, and proceeding to the Meridian of the Place; and for the Latitude of the Place, chuſing a Parallel of the ſame Latitude: the Point where this Meridian and Parallel interſect, repreſents the Place: And in the ſame manner all the other Places may be determined 'till the *Map* be compleat.

For the Ecliptic, half of which comes in this Hemiſphere; we have obſerved, that it makes an Ellipſis; ſo that the Points thro' which it paſſes are to be found. The firſt Point, or that wherein the Ecliptic cuts the Equator, is the ſame with that wherein the firſt Meridian cuts the Equator, which is therefore diſtinguiſh'd by the Sign of *Aries*; the laſt Point of this half Ellipſis, or the other Interſection of the Equator and Ecliptic, *viz.* the End of *Virgo*, will be in the oppoſite Point of the Equator, *viz.* at 180°. The middle Point of the Ellipſis is that wherein the Meridian 90 cuts the Tropic of *Cancer*. Thus we have three Points of the Ecliptic determined; for the reſt, *viz.* for 1°, and 15° of *Taurus*, 1° and 15° of *Gemini*, 1° of *Leo*, 1° of *Virgo*, the Declinations of thoſe Points from the Equator muſt be taken from a Table, and ſet off in the *Map*. See *Declination*, &c.

Thus where the Meridian of 13°. cuts the Parallel of 5°, that Point will be 15°. of *Aries*. Where the Meridian 27°. cuts the Parallel, 11 ½ will be the firſt Degree of *Taurus*, and ſo of the reſt. Theſe Points being all join'd by a Curve Line, will be a Portion of an Ellipſis repreſenting the Ecliptic.

Maps of this Projection have the firſt Qualification required; but are defective in the ſecond: the Surface being ſtretch'd further, as it approaches nearer the Equator. For the third, they are ſtill further out. By this Method may almoſt the whole Earth be repreſented in one *Map*, placing the Eye, *v. g.* in the Antarctic Pole, and aſſuming for the Plane of Projection that of ſome Circle near it, *v.g.* the Antarctic Circle. Nothing is here required beſides the former Projection; but to continue the Meridian, draw Parallels on the other ſide of the Equator, and compleat the Ecliptick; but this diſtorts too much for Practice.

This Projection is of all others the eaſieſt; but that, where the Eye is placed in the Plane of the Equator, is preferr'd for uſe. 'Tis, in effect, of the latter kind that *Maps* are ordinarily made. The former are added to 'em, in ſmall, by way of Supplement, to repreſent the intermediate Spaces left between the two Hemiſpheres. Further, as the Situation of the Ecliptic, with regard to the Earth, is continually changing, ſtrictly ſpeaking, it has no Place in the Earth's Surface, but is uſed to be repreſented according to its Situation ſome certain Moment; *viz.* ſo as the beginning of *Aries* and *Libra* may be in the Interſections of the firſt Meridian and Equator.

The Projection of Maps, with the Eye in the Plane of the Equator. This Method of Projection, tho' more difficult, is yet much juſter, more natural and commodious, than the former. To conceive it, we ſuppoſe the Surface of the Earth cut in two Hemiſpheres by the entire Periphery of the firſt Meridian, each of which Hemiſpheres we repreſent in a diſtinct *Map*. The Eye is placed in the Point of the Equator 90° diſtant from the firſt Meridian; and for the tranſparent Plane, wherein the Repreſentation is to be, we take the Plane of the firſt Meridian. In this Projection, the Equator is a Right Line, and the Meridian 90° diſtant from the firſt, is alſo a right Line; but the other Meridians, and all the Parallels of the Equator, are Arches of Circles, and the Ecliptic an Ellipſis.

The Method is thus. From a Point *E*, as a Centre, (Fig. 3.) deſcribe a Circle according to the intended Bigneſs of the *Map*. This repreſents the firſt Meridian, and its oppoſite; for, drawing the Diameter *BD*, there ariſe two Semicircles, the one whereof *BAD* is the firſt Meridian, the other *BCD* its oppoſite, or the Meridian of 180°. This Diameter *BD* repreſents the Meridian of 90 Degrees, whereof the Point *B* is the Arctic Pole, and the Point *D* the Antarctic. The Diameter *AC*, perpendicular to that *BD*, is the Equator. Divide the Quadrants *AB*, *BC*, *CD*, *DA*, each into 90 Degrees; and to find the Arches of the Meridians and Parallels, proceed thus. Divide the Equator into its Degrees, *viz.* 180. (as being indeed only half the Equator;) thro' theſe ſeveral Diviſions, and the two Poles, deſcribe Arches of Circles, repreſenting Meridians, as *B* 1 *D*, *B* 2 *D*, &c. How to find Centres for deſcribing thoſe Arches, ſee under the Word *Circle*. Indeed, the Operation will be both more eaſy and accurate, if performed by a Canon of Tangents. To deſcribe the Parallels, the Meridian *DB* muſt be in like manner divided into 180 Degrees; then thro' each of theſe Diviſions, and the correſponding Diviſions of the Quadrants *AB*, *CB*, deſcribe Arches of Circles. Thus ſhall we have Parallels of all Degrees, with Tropics, Polars and Meridians. As for the Ecliptic, it may be deſign'd two ways. For its Situation over the Earth may either be ſuch, as that its Interſection with the Equator may be over the Place *A*; in which Caſe, the Projection of its Semi-Circles, from the firſt Degree of *Cancer*, to the firſt of *Capricorn*, will be a ſtraight Line, to be determined by numbering 23° 30′ from *A* towards *B*, and from the Extreme of that Numeration, drawing a Diameter thro' *E*; this Line will be half the Ecliptic in this Situation, and may be divided, as before, into Degrees, to which the Numbers, Signs, *&c.* are to be affix'd. But if the Ecliptic be ſo placed, as that its Interſection with the Equator is over the Place *A*, in the firſt Meridian, its Projection in that Caſe will be a Segment of an Ellipſis; whereof two of the Points are *AC*; a third that wherein the Meridian 90 cuts the Tropic of *Cancer*. The other Points muſt be determin'd in the manner laid down above, *viz.* by taking the Declinations and right Aſcenſions of 15° of *Aries*, 1° of *Taurus*, 15° of *Gemini*, &c. For where the Parallels, according to their ſeveral Degrees of Declination, cut the Meridians, taken according to the ſeveral right Aſcenſions, thoſe Points of Interſection are the Points of the 15° of *Aries*, &c. A curve Line therefore being drawn, theſe will give the Projection of the Ecliptic.

Nothing now remains to compleat the *Map*, but to take the Longitudes and Latitudes of Places from a Table; and to ſet them off on the *Map*, as was directed under the former Method. In this Projection the whole Surface of the Earth

may

may be repreſented in one *Map*; if inſtead of the Plane of the firſt Meridian, ſome other Plane parallel to it, but very near the Eye, be taken; for by this means the entire Parallels and Meridians will be deſcribed. But as this diſtorts the Face of the Earth too much, it is ſeldom uſed; and we rather make the two Hemiſpheres in two diſtinct Tables. One great Advantage in this Projection, is, that it repreſents the Longitudes and Latitudes of Places, their Diſtance from the Pole and from the Equator, almoſt the ſame as they are on the Earth. Its Inconveniences are, that it makes the Degrees of the Equator unequal, being the greater as they are nearer the firſt Meridian D A B, or its oppoſite B C D; and for this Reaſon equal Tracts of the Earth are repreſented unequal; which Defect may be in ſome meaſure remedy'd by removing the Eye far from the Earth. Laſtly, the Diſtances of Places, and Situation with regard to each other, cannot be well determined in *Maps* of this Projection.

Projection of Maps on the Plane of the Horizon, or wherein any given Place ſhall be the Centre, or Middle. Suppoſe, for inſtance, 'tis deſired to have *London* the Centre of the *Map*. Its Latitude we'll ſuppoſe to be 51°. 32 Min. The Eye is placed in the Nadir. The tranſparent Table is the Plane of the Horizon, or ſome other Plane, if 'tis deſired to repreſent more than an Hemiſphere. Take then the Point E (*Fig.* 4.) for *London*, and from this, as a Centre, deſcribe the Circle A B C D to repreſent the Horizon, which you are then to divide into four Quadrants, and each of theſe into 90 Degrees. Let the Diameter B D be the Meridian, B the Northern Quarter, D the Southern; the Line of Equinoctial Eaſt and Weſt, ſhews the firſt Vertical, A the Weſt, C the Eaſt, or a Place 90 deg. from the Zenith in the firſt Vertical. All the Verticals are repreſented by right Lines drawn from the Centre E to the ſeveral Degrees of the Horizon. Divide B D into 180 deg. as in the former Methods; the Point in E B repreſenting 51 deg. 32 min. of the Arch B C, will be the Projection of the North Pole, which note with the Letter P. The Point in E D repreſenting 51 deg. 30 min. of the Arch D C, (reckoning from C towards D) will be the Projection of the Interſection of the Equator and Meridian of *London*, which note with the Letter Q, and from this, towards P, write the Numbers of the Degrees, 1, 2, 3, *&c.* As alſo from Q towards D, and from B towards P, *viz.* 51, 52, 53, *&c.*

Then taking the correſponding Points of equal Degrees, *viz.* 99 and 99, 88 and 88, *&c.* about thoſe, as Diameters, deſcribe Circles, which will repreſent Parallels, or Circles of Latitude, with the Equator, Tropics, and Polar Circles. For the Meridians, firſt deſcribe a Circle thro the three Points A, P, C. This will repreſent the Meridian 90 deg. from *London*. Let its Centre be M in B D (continued to the Point N, which repreſents the South Pole) P N being the Diameter, thro M draw a Parallel to A C, *viz.* F H, continued each Way to K and L. Divide the Circle P H N F into 360 deg. and from the Point P draw right Lines to the ſeveral Degrees, cutting K F H L thro the ſeveral Points of Interſection, and the two Poles P, N, as thro three given Points, deſcribe Circles repreſenting all the Meridians. The Centres for deſcribing the Arches will be in the ſame K L, as being the ſame, that are found by the former Interſection; but are to be taken with this Caution, that for the Meridian next B D N towards A, the moſt remote Centre towards L be taken for the 2d, the 2d from this, *&c.* The Circles of Longitude and Latitude thus drawn, inſert the Places from a Table as before directed.

Projection of Maps on the Plane of the Meridian. This Projection is taught by *Ptolemy*, and recommended by him as proper for that part of the Earth then known. In the Equator and Parallels are Arches of Circles, and in the Meridians, Arches of Ellipſes; the Eye hanging over the Plane of that Meridian which paſſes over the middle of the inhabited World. But in regard the Deſcription of theſe Ellipſes is ſomewhat perplexing, and becauſe this Method ſeems only calculated for a part of the Earth; 'tis not now uſed.

There is a ſecond Method ſomething a-kin to it, which repreſents the Circles of Latitude by right Lines, and the Meridians by Arches of Ellipſes; as muſt be the Caſe, if Lines be conceived to fall from the ſeveral Points of each Hemiſphere, perpendicularly on the Plane of the firſt Meridian, and the Eye be ſuppoſed at an infinite diſtance from the Earth; ſo that all the Rays emitted from the Places of the Earth to it, may be accounted Parallels as well as Perpendiculars to the Plane of the firſt Meridian.

Rectilinear Maps, thoſe wherein both the Meridians and Parallels are repreſented by right Lines, which by the Laws of Perſpective is impoſſible; in regard there can no ſuch Poſition be aſſign'd the Eye and the Plane, as that the Circles both of Longitude and Latitude ſhall be right Lines. In the firſt Method laid down, the Meridians are right Lines, but the Parallels are Circles. In the fifth, the Parallels are right Lines, and the Meridians Ellipſes. In all other perſpective Methods, both Kinds of Circles are Curve; one Method indeed muſt be excepted, wherein the Meridians are right Lines, and the Parallels Hyperbola's; as when the Eye is placed in the Centre of the Earth, and the Plane, thro which it is view'd, is parallel to the firſt Meridian: but this Method is rather pretty than uſeful. *Rectilinear Maps* are chiefly uſed in Navigation, to facilitate the Eſtimation of the Ship's Way. See CHART.

Conſtruction of particular or ſpecial Maps.

Particular Maps of large Tracts, as *Europe*, *Aſia*, *Africa*, and *America*, are projected after the ſame Manner as General ones; only let it be obſerved, that for different Parts, different Methods be choſen. *Africa* and *America*, for inſtance, in regard the Equator paſſes thro them, cannot be conveniently projected by the firſt Method, but much better by the ſecond. *Europe* and *Aſia* are moſt conveniently repreſented by the third; and the polar Parts, or the frigid Zones, by the firſt.

To begin then, draw a right Line on your Plane or Paper, for the Meridian of the Place over which the Eye is conceiv'd to hang, and divide it into Degrees, as before, which will be Degrees of Latitude. Then from the Tables take the Latitude of the two Parallels, which terminate each Extreme. The Degrees of theſe Latitudes are to be noted in the Meridian; and thro them draw Perpendiculars, bounding the *Map* towards North and South. This done, Meridians and Parallels are to be drawn to the ſeveral Degrees, and the Places to be inſerted, till the *Map* is compleat.

Particular Maps of leſs Extent. In *Maps* of ſmaller Portions of the Earth, the Geographers take another Method. Firſt, a tranſverſe Line is drawn at the bottom of the Plane, to repreſent the Latitude, wherein the Southermoſt part of the County to be exhibited, terminates. In this Line, ſo many equal Parts are taken, as that Country is extended in Longitude. On the middle of this ſame Line erect a Perpendicular, having ſo many Parts as there are Degrees of Latitude between the Northern and Southern Limits of the Country. How big theſe Parts are to be, may be determin'd by the Proportion of a Degree of a great Circle to a Degree of the Parallel repreſented by the tranſverſe Line at bottom. See DEGREE. Thro' the other Extreme of this Perpendicular, draw another Perpendicular, or a Parallel to the Line at bottom, in which are to be as many Degrees of Longitude, as in the lower Line, and theſe, too, equal to thoſe other, unleſs the Latitudes happen to be remote from each other, or from the Equator. But if the loweſt Parallel be at a conſiderable diſtance from the Equinoctial, or if the Latitude of the Northern Limit go much beyond that of the Southern; the Parts or Degrees of the upper Line muſt not be equal to thoſe of the lower, but leſs, according to the Proportion which a Degree of the more Northern Parallel, has to a Degree of the more Southern: Which ſee, as before, under the word DEGREE.

After Parts have been thus determin'd, both on the upper and lower Line, for the Degrees of Longitude; right Lines muſt be drawn thro' the beginning and end of the ſame Number, which Lines repreſent Meridians: then, thro the ſeveral Degrees of the Perpendicular erected on the middle of the firſt tranſverſe Line, draw Lines parallel to that tranſverſe Line. Theſe will repreſent Parallels of Latitude. Laſtly, at the Points wherein the Meridians of Longitude and the Parallels of Latitude concur, inſert the Places from a Table, as before directed.

For *Maps of Provinces*, or ſmall Tracts, as Pariſhes, Mannors, *&c.* we uſe another Method, more ſure and accurate than any of the former. In this, the Angles of Poſition, or the Bearings of the ſeveral Places, with regard to one another, are determin'd by proper Inſtruments, and tranſferr'd to Paper. This conſtitutes an Art a-part, call'd *Surveying*. See SURVEYING.

The Uſe of Maps is very obvious from their Conſtruction. The Degrees of the Meridians and Parallels ſhew the Longitudes and Latitudes of Places, and the Scale of Miles annex'd, their Diſtance; the Situation of Places, with regard to each other, as well as to the Cardinal Points, appears by Inſpection, the top of the *Map* being always the North, the bottom the South, the right-hand the Eaſt, and the left the Weſt; unleſs the Compaſs uſually annex'd, ſhew the contrary. See MERCATOR's CHART, where theſe Caſes are exemplify'd.

MAPPARIUS, an Officer among the *Romans*, who, in the public Games, as thoſe of the Circus and the Gladiators, gave the Signal for their beginning, by throwing an Handkerchief (*Mappa*) which he had before received from the Emperor, Conſul, or other ſupreme Officer then preſent.

MARASMUS, in Medicine; an extreme Macies or Conſumption of the whole Body. A Hectic Fever uſually produces a *Maraſmus*. The word is *Greek*, being derived from the Verb μαραίνειν, *to waſte*. See CONSUMPTION.

MARAVEDIS, a little *Spaniſh* Copper Coin, worth ſomewhat more than a *French* Denier. The *Spaniards* always count by *Maravedis*, both in Commerce, their Finances, &c. tho the Coin itſelf has but little Courſe among them. 63 *Maravedis* are equivalent to a Real of Silver: ſo that the Piaſter, or Piece of Eight Real, contains 504, and 4 Piſtoles of 4 Pieces of Eight, 2016 *Maravedis*. See COIN and MONEY. This Smallneſs of the Coin produces vaſt Numbers in the *Spaniſh* Accounts and Calculations; inſomuch that a Stranger or Correſpondent would think himſelf indebted ſeveral Millions for a Commodity, that coſts but a few Pounds. In the Laws of *Spain*, we meet with ſeveral Kinds of *Maravedis*; *Alphonſine Maravedis*, *White Maravedis*, *Maravedis of Good Money*, *Maravedis Combrennos*, *Black Maravedis*, *Old Maravedis*. When we find *Maravedis* alone, and without any Addition, it is to be underſtood of thoſe mentioned above. The reſt were different in Value, Fineneſs of Metal, Time, &c. *Mariana* aſſerts, that this Coin is older than the *Moors*, that it came from the *Goths*, and was worth ten *Denarii* in the time of the *Romans*.

The Word is *Arabic*, and took its Riſe from the *Almoravides Moors*, who paſſing out of *Africa* into *Spain*, impoſed their own Name on this Coin, which by Corruption was afterwards changed into *Maravedis*. Mention is made of it in the Decretals, as well as other *Latin* Writers, under the Name of *Marabitini*.

MARBLE, a Kind of Stone, extremely hard, firm and ſolid, dug out of Pits or Quarries: It takes a beautiful Poliſh, cuts very hardly, and is much uſed in Ornaments of fine Buildings, as Columns, Altars, Statues, &c. There are an infinite Number of different Kinds of *Marble*, uſually denominated either from their Colour, their Country, or their Defects; ſome are of one ſimple Colour, as white or black, others ſtreak'd or variegated with Stains, Clouds, Waves, Veins, &c. All *Marbles* are opake, excepting the white, which, when cut into thin Slices, becomes tranſparent. They are alſo different in Weight and Hardneſs, and are to be conſider'd with regard to their Colour, their Country, their Grain, and their Defects.

Under the Genus of *Marble* are comprehended *Porphyry*, which is the hardeſt, and which was antiently brought from *Numidia* in *Africa*; the moſt beautiful is that, whoſe Red is the moſt vivid, and the Stains the whiteſt and the ſmalleſt. See PORPHYRY. The *Serpentine*, which is a greeniſh brown, ſo call'd, becauſe figur'd with little Stains. It is form'd of a great Number of Grains of Sand condens'd; it is of various Kinds, *viz. Egyptian*, *Italian*, *Violet*, and *Green*. See GRANATE and SERPENTINE. *Jaſper*, of which there are various Kinds, the Antient, the Florid, the Black, White, &c. See JASPER. *Alabaſter*, of which there are various Kinds, both White and Variegated. They are all ſoft when taken out of the Quarry, but harden in the Air. *Marbles* again may be conſider'd either as Antient or Modern. By Antient we mean thoſe, whoſe Quarries are loſt or inacceſſible to us, and whereof we have only ſome Pieces remaining. The Modern are thoſe, whoſe Quarries are ſtill open, and out of which Blocks continue to be dug.

Marbles denominated from their Countries.

African Marble is either of a reddiſh Brown, ſtreak'd with Veins of White, or of a Carnation, with Veins of Green. *Engliſh White Marble* is vein'd with Red. *Marble* of *Auvergne* in *France*, is of a pale Red, mingled with Violet, Green, and Yellow. *Marble* of *Brabançon* in *Hainault*, is Black, vein'd with White. *Marble* of *Breſſe* in *Italy*, is Yellow with Spots of White. *Marble Brocatelle*, is mingled with little Shades of *Iſabella*, Yellow, Pale and Gray. It comes from *Tortoſa* in *Spain*, where it is dug out of an antient Quarry: There is alſo another Kind of antient *Brocatelle* dug near *Adrianople*. *Marble* of *Carrara*, on the Coaſts of *Genoa*, is very white, and the fitteſt of all others for Works of Sculpture. *Marble* of *Champagne*, reſembles the *Brocatelle*, being mix'd with blue in round Stains like Partridges Eyes. *Cipollino*, or *Cipollin Marble*, is of a Sea-green Colour, mix'd with large Waves or Clouds of white or pale green. *Scamozzi* takes this to be the ſame with that which the Antients call'd *Auguſtum & Tiberium Marmor*; becauſe diſcover'd in *Egypt* in the Times of the Emperors *Auguſtus* and *Tiberius*. *Marble* of *Dinan*, near *Liege*, is of a pure black, very beautiful, and very common. *Marble* of *Guachenet*, near *Dinan*, is of a reddiſh Brown, with white Spots and Veins. *Marble* of *Languedoc*, is of a vivid red, with large white Veins or Stains, and is very common; there is ſome, whoſe White borders pretty much on the Blue, but this is of leſs Value. *Lumachello Marble*, *Marble* ſo call'd, becauſe mingled with Spots, gray, black, and white, wreath'd ſomewhat like Periwinkle-Shells. This is antient, and its Quarry is loſt. *Marble* of *Margoſſe*, in the *Milaneze*, has a white Ground with browniſh Veins, reſembling the Colour of Iron-Ruſt. This is very common, and extremely hard. *Marble* of *Lavee*, in *Maine*, has a black Ground, with little narrow Veins of white; there is another Kind of it red, with Veins of a dirty white. *Marble* of *Namur* is black, like that of *Dinan*, but leſs beautiful, as inclining a little to the blue, and travers'd with little Streaks of grey. This is very common, and is frequently uſed in Paving. *Parian Marble* is Antique, and much celebrated in Authors; it is of a beautiful White: The greateſt part of the *Grecian* Statues were made of it. *Varro* calls it *Lychnites*, becauſe the Workmen dug it out of the Quarry by Lamp-Light. *Marble* of *Porta Santa*, at *Rome* call'd *Serna*, is mingled with large Clouds and Veins of red, yellow, and grey. *Marble Portor* has a black Ground, with Clouds and Veins of yellow. It is dug out of the foot of the *Alps* towards *Carrara*. *Marble* of *Ratrice*, in *Hainault*, is of a dirty red, mix'd with blue and white Clouds and Veins: this is pretty common, but is different in Beauty. *Marble* of *Savoy*, is a deep red mix'd with other Colours; each Piece whereof ſeems cemented on to the reſt. *Marble* of *Sicily* is a browniſh red, ſtain'd with oblong Squares of White and *Iſabella*, like ſtriped Taffeta's. The Antient has very vivid Colours, and the Modern comes pretty near it. *Marble* of *Signan*, in the *Pyreneans*, is ordinarily of a greeniſh brown, with red Stains; tho this is ſomewhat various in its Colours. *Marble* of *Theu*, near *Namur* in *Liege*, is a pure black, ſoft and eaſy to work, and receives a more beautiful Poliſh than thoſe of *Namur* and *Dinan*.

Marble Bigio Nero, or black-grey, is antique. White-vein'd *Marble* has large Veins, with grey and blue Stains on a white Ground. It comes from *Carrara*. *White Marble*; that dug out of the *Pyreneans* on the ſide of *Bayonne*, is inferior to that of *Carrara*, its Grains being larger, and ſhining, like a kind of Salt. It is ſomething like the antient white *Greek Marble*, whereof their Statues were made, but is not ſo hard or beautiful. *Antient black and white Marble* is now very rare, its Quarries being entirely loſt; it is divided between a pure white and a bright black in Plates. *Blue Turquin Marble*, is mix'd with a dirty kind of white, and comes from the Coaſt of *Genoa*. *Marble Fior di Perſica*, comes from *Italy*, conſiſts of red and white Stains, ſomewhat yelloviſh. *Yellow Marble*, is a kind of yellow *Iſabella* without Veins; it is antique, and now very rare. *Black Attic Marble*, is of a pure black, without Stains, and ſofter than the modern black. There was ſome of it brought from *Greece*, call'd *Marmor Luculleum*; but this was not ſo much prized as that which the *Egyptians* brought from *Æthiopia*, approaching to an Iron Colour, and call'd *Baſaltes*, or Touch-ſtone, becauſe it ſerved them for the Tryal of Metals. *White and black Marble* has a pure black Ground, with ſome very white Veins. *Marble Occhio di Pavone*, or Peacocks Eye, is mingled with red, white and blueiſh Clouds, ſomewhat reſembling the Eyes at the end of a Peacock's Tail. *Green Marble antique*, is a Mixture of Graſs-green and Black, in Clouds of unequal Forms and Bigneſſes, and is very rare, the Quarries being loſt. The *modern Green*, improperly called *Egyptian*, is brought from *Carrara*, on the Coaſt of *Genoa*; it is a deep Green ſpotted with Grey.

Marble denominated from its Defects.

Rigid Marble, that which, being too hard, works with difficulty, and is liable to ſplinter, as the Black of *Namur*. *Thready Marble*, is that full of Threads or Filaments. *Brittle Marble*, is that which crumbles under the Inſtrument, as the white *Greek Marble*, that of the *Pyreneans*, &c. *Terras Marble*, that with ſoft Places in it, which muſt be filled up with Cement, as that of *Languedoc*.

There are two Defects frequent in *Marbles*, which augment the Difficulty of cutting and poliſhing them. The one, what they ſometimes call Nails, anſwering to the Knots in Wood; the other, call'd Emeril, is a Mixture of Copper or other Metals, making black Stains in the *Marble*. The Knots are common to all *Marbles*, the Emeril only in the white.

The Stuck whereof they make Statues, Buſts, Baſſo-Relievos, and other Ornaments of Architecture, is only *Marble* pulveriz'd, mix'd in a certain Proportion with Plaiſter; the whole well ſifted, work'd up with Water, and uſed like common Plaiſter. There is alſo a kind of artificial *Marble*, made of *Gypſum*, or a tranſparent Stone, reſembling Marle; which becomes very hard, receives a tolerable Poliſh, and may deceive the Eye. There is alſo a kind of artificial *Marble* form'd by corroſive Tinctures, which penetrating into white *Marble*, to the depth of a Line, imitates the various Colours of other *Marbles*. Poliſh'd *Marble* is that which, being well rubb'd with Free-ſtone, and afterwards with Pumice-ſtone, is at laſt poliſh'd with Emery, if the *Marble* be of ſeveral Colours, and with Tin, if it be white. In *Italy* they poliſh with a Piece of Lead and Emery.

There

There are various Ways of poliſhing *Marble*. Some lay three or four Blocks in a Row, and with another, fix'd to a broad Beetle, and a Handle fix'd at oblique Angles, with Sand and Water between, work the upper Stone backwards and forwards on the lower ones, till the Strokes of the Ax are wore off; after which, they poliſh them with Emery and Putty. Father *Kircher* ſhews the Manner of applying Colours on *Marble*, ſo as to make them penetrate its whole Subſtance; inſomuch that if the *Marble* be ſlit into ſeveral parallel Tables or Planks, the ſame Image will be found on each, that was painted on the firſt. Spots of Oil penetrate white *Marble*, ſo as they cannot be taken out. The word *Marble* comes from the *Latin Marmor*, and that from the *Greek* μαρμαιρειν, *to ſhine*.

To *marble*, is to paint, or diſpoſe Colours in ſuch a manner, as that they may repreſent *Marble*. Thus we *marble* Paper, Wood, &c.

MARBLED, ſomething reſembling Marble: Thus *marbled* Paper, *v. g.* is a Paper ſtain'd with various Clouds and Shades, reſembling, in ſome meaſure, the various Veins of Marble; the Method whereof, ſee under PAPER.

MARBLING OF BOOKS, among Binders, the ſprinkling over the Cover of a Book with Black, by means of a black Pencil ſtruck gently againſt the Finger, or on a Stick held for the purpoſe. *Marbling* is not uſed, except for Books bound in Calf; after it is finiſh'd, the Cover is glazed over with beaten Whites of Eggs, then ſmooth'd with a poliſhing Iron. They alſo marble Books on the Edges, but in this *Marbling* there is no Black uſed; in lieu thereof, red, blue, &c. See BOOK-BINDING.

MARC, *or* MARK; a Weight uſed in ſeveral States of *Europe*, and for ſeveral Commodities, eſpecially Gold and Silver in *France*. The *Marc* is divided into 8 Ounces, or 64 Drachms, or 192 Deniers or Penny-weights, or 160 Eſterlins, or 300 Mailles, or 640 Felins, or 4608 Grains. In *Holland*, the *Marc* Weight is alſo call'd Troy-Weight, and is equal to that of *France*. When Gold and Silver are ſold by the *Marc*, it is divided into 24 Caracts, the Caract into 8 Penny-weights, the Penny-weight into 24 Grains, and the Grain into 24 Primes. See CARACT.

MARK is alſo uſed among us for a Money of Account; and in ſome other Countries for a Coin: The *Engliſh Mark* is two Thirds of a Pound Sterling, or 13 *s.* 4 *d.* and *Matthew Paris* obſerves, it was of the ſame Value in 1194. The antient *Saxons* call'd the *Mark*, *Mancos*, *Mancuſe*, and *Mearc*; among them it was equivalent to thirty Pence, *i. e.* to ſix Shillings. The *Mark-Lubs*, uſed at *Hambourg*, is alſo a Money of Account, equal to one Third of the Rixdollar, or to the *French Livre Tournois*. Each *Mark* is divided into ſixteen *Sols-Lubs*. *Mark Lubs*, or *Danſch*, is alſo a *Daniſh* Coin, equal to ſixteen *Sols Lubs*, or twenty *French Sols*. See SOL. Laſtly, *Mark* is a Copper-Coin in *Sweden*, equal to two Pence Farthing Sterling; it is divided into eight *Rouſtiqs*, and each *Rouſtiq* into two *Alleveures*. The *Swediſh Silver Mark* is a Money of Account, equal to three *Copper Marks*, tho ſome make it a real Coin.

MARCASSITE; a Metallic Mineral, making, as it were, the Seed or firſt Matter of Metals. On this Principle, there ſhould be as many different *Marcaſſites* as Metals, which is true in effect; the Name being apply'd to every Mineral Body that has Metallic Particles in its Compoſition. There are only three Kinds in the Shops, *viz.* *Marcaſſite* of Gold, of Silver, and of Copper; tho ſome make the Loadſtone *Marcaſſite* of Iron, Tin of Glaſs, *Marcaſſite* of Tin, and Zink or Spelter, that of Lead: but this we leave to the Chymiſts. *Marcaſſite* of Gold is in little Balls about the bigneſs of Nuts, nearly round, heavy, of a brown Colour without. *Marcaſſite* of Silver is like that of Gold, only leſs colour'd: within, the Colour differs much, the one having a Gold Colour, and the other a Colour of Silver, both ſhining and brillant. The *Marcaſſite* of Copper is about the bigneſs of a ſmall Apple, round or oblong, brown without, yellow and cryſtalline within, brillant and ſhining. *Marcaſſites* are found in Mines of Metal; they contain a great deal of Vitriolic Salt, eſpecially that of Copper. Some only uſe the word *Marcaſſite* for *Biſmuth*. The Word is originally *Arabic*.

MARCELLIANISM, the Doctrine and Opinions of the *Marcellians*, a Sect of antient Heretics; ſo call'd from *Marcellus* of *Ancyra*, their Leader, who was accuſed of reviving the Errors of *Sabellius*. Some, however, are of opinion, he was Orthodox, and that it was his Enemies the *Arians*, who father'd their Errors upon him. St. *Epiphanius* obſerves, that there was a great deal of Diſpute with regard to the real Tenets of *Marcellus*; but that as to his Followers, 'tis evident they did not own the three Hypoſtaſes: ſo that *Marcellianiſm* is no imaginary Hereſy.

MARCGRAVE, a kind of Dignity in *Germany*, anſwering to our Marquiſs. The Word is derived from the *German Marche* or *Mark*, which ſignifies a Frontier; the *Marcgraves* being originally Governors of Cities lying on the Frontiers of any State.

MARCH, the third Month of the Year, according to the common way of computing. Among the *Romans* it was the firſt, and in ſome Eccleſiaſtical Computations, that Order is ſtill preſerved; as particularly in reckoning the Number of Years from the Incarnation of our Saviour, that is, from the 25th of *March*. In *England* however, properly ſpeaking, *March* is the firſt Month in Order; the new Year commencing from the 25th, tho, in complaiſance to the Cuſtoms of our Neighbours, we uſually rank it as the third: but in this reſpect, we ſpeak one way, and write another. Till the Year 1564, the *French* reckon'd the beginning of their Year from *Eaſter*; ſo that there were two Months of *March* in one Year, one of which they call'd *March* before *Eaſter*, and the other *March* after *Eaſter*. When *Eaſter* fell within the Month of *March*, the beginning of the Month was in one Year, and the end in another.

It was *Romulus* who divided the Year into twelve Months; to the firſt of which he gave the Name of his ſuppoſed Father *Mars*. *Ovid*, however, obſerves, that the People of *Italy* had the Month of *March* before *Romulus*'s Time; but that they placed it very differently, ſome making it the 3d, ſome the 4th, ſome the 5th, and others the 10th Month in the Year. In this Month it was that the *Romans* ſacrificed to *Anna Perenna*, that they begun their *Comitia*, that they adjudg'd their public Farms and Leaſes; that the Women ſerved the Slaves and Servants at Table, as the Men did in the *Saturnalia*; and that the Veſtals renewed the Sacred Fire. The Month of *March* was under the Protection of *Minerva*, and always conſiſted of 31 Days. The Antients held it an unhappy Month for Marriage, as well as the Month of *May*.

MARCHET; a pecuniary Fine antiently paid by the Tenant to his Lord, for the Marriage of one of the Tenant's Daughters. This Cuſtom obtain'd, with ſome difference, throughout all *England* and *Wales*, as alſo in *Scotland*, and ſtill continues to obtain in ſome places. According to the Cuſtom of the Mannor of *Dinover* in *Carmarthenſhire*, every Tenant, at the Marriage of his Daughter, pays ten Shillings to the Lord; which, in the *Britiſh* Language, is call'd *Gwabr-Merched*, i. e. *Maid's-Fee*.

In *Scotland*, and the North Parts of *England*, the common Cuſtom was, for the Lord to lie the firſt Night with the Bride of his Tenant: But this Cuſtom was abrogated by King *Malcolm* III. at the Inſtance of his Queen; and inſtead thereof, a Mark was paid by the Bridegroom to the Lord. Whence 'tis call'd *Marcheta Mulieris*.

MARCIONITES, the Name of a very antient and popular Sect in the Church. In the Time of St. *Epiphanius*, they were ſpread over *Italy*, *Egypt*, *Paleſtine*, *Syria*, *Arabia*, *Perſia*, and other Countries. *Marcion*, their Author, was of *Pontus*, the Son of a Biſhop, and at firſt made profeſſion of the Monaſtical Life; but having had a criminal Affair with a Maid, was excommunicated by his own Father, who would never admit him again into the Communion of the Church, not even on his Repentance. On this he abandon'd his own Country, and retired to *Rome*, where he began to broach his Doctrines. He laid down two Principles, the one Good, the other Evil. He deny'd the real Birth, Incarnation and Paſſion of Jeſus Chriſt, and held them to be all apparent only. He taught two Chriſts: One, who had been ſent by an unknown God for the Salvation of all the World; Another, whom the Creator would one day ſend to re-eſtabliſh the *Jews*. He deny'd the Reſurrection of the Body, and allow'd none to be baptized, but thoſe who preſerved their Continence; but theſe he granted might be baptized three times. In many things he follow'd the Sentiments of the Heretic *Cerdon*, and rejected the Law and the Prophets. He pretended the Goſpel had been corrupted by falſe Prophets, and allow'd none of the Evangeliſts but St. *Luke*, whom he altered in many places, as well as the Epiſtles of St. *Paul*; a great many things in which he threw out. In his own Copy of St. *Luke*, he threw out the two firſt Chapters entire.

MARCITES, a Sect of Heretics in the ſecond Century, who alſo call'd themſelves the *Perfecti*, and made profeſſion of doing every thing with a great deal of Liberty, and without any Fear. This Doctrine they borrow'd from *Simon Magus*, who, however, was not their Chief; for they they were call'd *Marcites* from one *Marcus*, who conferred the Prieſthood, and the Adminiſtration of the Sacraments, on Women.

MARCOSSIANS, the Name of an antient Sect in Religion, making a Branch of the *Gnoſtics*. St. *Irenæus* ſpeaks at large of the Leader of this Sect, *Marcus*, who, it ſeems, was reputed a great Magician. He relates ſeveral things touching the Prayers and Invocation of the antient *Gnoſtics*, the antient *Jewiſh Cabala* on the Letters of the Alphabet, and

their

their Properties, as well as on the Myſteries of Numbers, which the *Jews* and *Gnoſtics* had borrow'd from the Philoſophy of *Plato* and *Pythagoras*. *Marcus* was an *Egyptian*, and there it was he became acquainted with Magic. To impoſe more eaſily on his Followers, he made uſe of certain *Hebrew*, or rather *Chaldee* Words, much uſed by the Enchanters of thoſe Times. The *Marcoſſians* had a great number of Apocryphal Books, which they held for Canonical, and of the ſame Authority with ours. Out of theſe they pick'd ſeveral idle Fables, touching the Infancy of Jeſus Chriſt, which they put off for true Hiſtories. Many of theſe Fables are ſtill in uſe and credit among the *Greek* Monks.

MARGARITÆ. See PEARLS.

MARK, in Matters of Commerce and Manufacture; a certain Character ſtruck or impreſs'd on various Kinds of Commodities, either to ſhew the Place where they were made, and the Perſons who made 'em; or to ſhew they have been view'd and examin'd by the Officers or Magiſtrates charged with the Inſpection of that Manufacture; or laſtly, to ſhew the Duties impoſed thereon have been regularly acquitted. Thus are Cloths, Leathers, Cutlery-Ware, Paper, Plate, Weights, Meaſures, &c. *mark'd*.

MARK is alſo a particular Sign or Character, known only to the Trader who pitches on it; whereby, being fix'd to any Commodity, he recollects the Price it coſt him. Theſe *Marks*, otherwiſe call'd Numero's, are taken according to the Fancy of thoſe who uſe them; but, ordinarily, are choſen from among the Letters of the Alphabet, each having a relation to ſome particular Number of Figures. They are of ſo much uſe in Trade, that the Reader will not take it amiſs, if we inſert a little Table, to ſerve as a Model for their Conſtruction.

A	B	C	D	E	F	G	H	I	K	L	M
0	1	2	3	4	5	6	7	8	9	10	20

One Example will give the whole Uſe of this Table. Suppoſe, *v. g.* I would put on a Piece of Stuff, that it coſt 37 *s.* 6 *d. per* Ell. I put an M for 20 *s.* an L for 10 *s.* an H for 7 *s.* and a G for 6 *d.* So that the ſeveral Letters wrote after each other (obſerving always to ſeparate Shillings from Pounds and from Pence by Points, will make this *Mark* M.L.H.G equal to 37 *s.* 6 *d.* Note, the *Mark* may be diverſified infinitely, by adding other Figures to the Letters in lieu of theſe.

ST. MARK, a Congregation of Regular Canons, founded at *Mantua* by one *Albert Spinola*, a Prieſt, towards the end of the 12th Century. *Spinola* made a Rule for them, which was approved, corrected and confirmed by ſeveral ſucceeding Popes. About the Year 1450, they were reformed, and followed only the Rule of St. *Auguſtin*. This Congregation, which at firſt conſiſted of 18 or 20 Houſes of Men, and of ſome for Women, ſituate in *Lombardy* and the State of *Venice*; having flouriſhed for the ſpace of 400 Years, declined by little and little, and was at length reduced to two Convents; and in 1584, that of *St. Mark* at *Mantua*, which was the chief, was given with the Conſent of Pope *Gregory* XIII. to the *Camaldules*, and ſo the Congregation became extinct.

Order of ST. MARK; an Order of Knighthood in the Republic of *Venice*, under the Protection of *St. Mark* the Evangeliſt. The Arms of this Order are, a Lion winged Gules, with this Device, *Pax tibi, Marka Evangeliſta*. This Order is never conferred but on thoſe who have done ſignal Services to the Commonwealth.

MARKET, from the *French Marché*, i. e. *Emporium* or *Forum Nundinarium*; and ſignifies the ſame thing with us, as alſo the Liberty or Privileges whereby a Town is enabled to keep a *Market*. *Bracton* obſerves, that one *Market* ought to be diſtant from all others at leaſt ſix Miles and a half, and a Third of a half. In former times it was cuſtomary to have moſt Fairs and *Markets* kept on Sundays, and in the Church-yard; ſo that Matters of Buſineſs and Devotion were tranſacted under one. Which Cuſtom, tho prohibited by ſeveral Kings, was yet held up till the Reign of King *Henry* the Sixth, when it was effectually ſuppreſs'd. In many Places they are ſtill kept in the Church-yard.

MARLE, or *Marne*; a kind of fat, ſoft, foſſile Earth, caſt on Land to make it more fruitful: There are ſeveral Sorts, of ſeveral Colours and Qualities. Too much *Marle* thrown on the Earth, is found to burn it. *Marle* is alſo of uſe in making of Lime, and is burnt like other Stone. The Word comes from the antient *Celtic Marga*, mention'd by *Pliny*. It was afterwards call'd *Margita* and *Marguretta*. *Paliſſi* teaches the Uſe of it.

MARMALADE; a Confection made of the Juice or Pulp of ſeveral Fruits, as Plumbs, Apricocks, Quinces, &c. boiled with Sugar into a Conſiſtence: that made of Quinces is ſub-aſtringent, and grateful to the Stomach.

MARMORA ARUNDELLIANA, or the *Oxford Marbles*, are antient Stones, whereon appear a Chronicle of the City of *Athens*, engraven in Capital Letters in the Iſland of *Paros*, one of the *Cyclades*, 263 Years before Jeſus Chriſt. They took their Name from *Thomas* Earl of *Arundel*, who procured them out of the Eaſt, or from *Henry* his Grandſon, who preſented them to the Univerſity of *Oxford*. An Account of all their Inſcriptions were publiſh'd in 1676, by Dr. *Prideaux*.

MARONITES, a Body of Chriſtians who follow the *Syrian* Rites, and are ſubject to the Pope; their principal Habitation being on Mount *Libanus*. The Learned are divided about their original Father. *Morin* and Cardinal *Bona* take *Maronite* for the Name of a Sect, as well as *Neſtorian* and *Jacobite*. The *Maronites* themſelves pretend, that they are deſcended from one *Maron*, who lived in the beginning of the fifth Century, and whoſe Life is written by *Theodoret*. The Jeſuit *Sacchini* is of the ſame Opinion; he thinks, that they never ſeparated from the Catholic Church; and adds, that what has given occaſion to their being judg'd in a Schiſm, is their Re-union with the *Romiſh* Church, which ſome take for a Return to the Catholic Faith. The former Opinion is founded on the Teſtimonies of *Eutychius*, *James de Vitri*, and ſeveral others, who expreſly aſſert the *Maronites* to have been formerly a part of the *Monothelite Jacobites*: According to their Account, *Maron*, whom the *Maronites* qualify for a Saint, was in truth a Heretic. Towards the Year 1182, *Aimers*, third *Latin* Patriarch of *Conſtantinople*, united the *Maronites* to that Church. From that time they have uſed the Mitre, Ring, Croſier, and other of the *Latin Epiſcopalia*; but their Service is ſtill performed in the *Chaldee* Language.

M. *Fauſtus* has publiſh'd an Apology for *Maron* and the reſt of his Nation. His Opinion is, that they really took their Name from the *Maron* who lived in the 4th Century, and whereof mention is made in *Chryſoſtom*, *Theodoret*, and the Menology of the *Greeks*. He adds, that the Diſciples of this *Maron* ſpread themſelves throughout all *Syria*, that they built ſeveral Monaſteries, and among others, one that bore the Name of their Leader; That all the *Syrians* who were not tainted with Hereſy, took Refuge among 'em; and that for this reaſon, the Hereticks of thoſe Times call'd 'em *Maronites*.

The *Maronites* have a Patriarch who reſides in the Monaſtery of *Cannubia* on Mount *Libanus*, and aſſumes the Title of Patriarch of *Antioch*. He is elected by the Clergy and the People, according to the antient Cuſtom; but ſince their Re-union with the Church of *Rome*, he is obliged to have a Bull of Confirmation from the Pope. He keeps a perpetual Celibate, as well as the reſt of the Biſhops his Suffragans. For the reſt of the Eccleſiaſtics, they are allow'd to marry before Ordination; and yet the Monaſtic Life is in great eſteem among 'em. Their Monks are of the Order of St. *Anthony*, and live in the moſt obſcure Places in Mountains, far from the Commerce of the World.

As to their Faith, they agree in the main with the reſt of the Eaſtern Church. Their Prieſts don't ſay Maſs alone, but all ſay it together, ſtanding round the Altar. They conſecrate Bread without Leaven; and the Laity have hitherto communicated in both Kinds, tho the Practice of communicating in one is introduced by little and little. In *Lent* they eat nothing, unleſs it be two or three hours before Sun-riſing: Their other Faſtings are very numerous. Their Name may either be derived from *Maron* abovementioned, or from μαρω, the Name of a Monaſtery, or from *Maronea*, a City of *Syria*.

MAROTIC STILE; a Term in the *French* Poetry, ſignifying a peculiarly gay, merry, yet ſimple and natural Manner of Writing, introduced by *Marot*, and ſince imitated by their other Authors, but with moſt Succeſs by *Voiture* and *Fontaine*. The Difference between the *Marotic* and the Burleſque Stile, is thus aſſign'd: The *Marotic* makes a choice, the Burleſque admits of all. The firſt is the moſt ſimple, but its Simplicity has its Nobleneſs; and where its own Time won't furniſh natural Expreſſions, it borrows them from former Times. The latter is low and groveling, and borrows falſe and fulſome Ornaments from the Croud, which People of Taſte deſpiſe. The one reſigns itſelf to Nature, but examines firſt of all whether the Objects ſhe preſents be fit for its Paintings, and takes nothing but what carries with it ſomewhat of Delicacy and Mirth; the other runs headlong into Buffoonery, and affects every thing that is extravagant and groteſque.

MARQUE, *Letters of*, are Letters of Repriſal, granted by a King or Parliament, by which Subjects of one Country are licenſed to make Repriſals on thoſe of another; provided Application has been made for Redreſs to the Government, whereto the Aggreſſor belongs, three times without Effect. They are ſo call'd, as being *Jus conceſſum*

conceſſum in alterius Principis Marchas ſeu Limites tranſeundi, ſibique Jus faciendi. See REPRISALS.

MARQUETRY, *in-laid Work*; a Work compoſed of ſeveral Pieces of hard, fine Wood of different Colours, faſten'd, in thin Slices, on a Ground, and ſometimes enrich'd with other Matters, as Tortoiſe-ſhell, Ivory, Tin, and Braſs. There is another kind of *Marquetry* made, inſtead of Wood, of Glaſſes of various Colours; and a third, where nothing but precious Stones, and the richeſt Marbles, are uſed: but theſe are more properly called *Moſaic* Work. See MOSAIC.

The Art of Inlaying is very antient, and is ſuppoſed to have paſs'd from the Eaſt to the Weſt, as one of the Spoils brought by the *Romans* from *Aſia*; indeed it was then but a ſimple thing: nor did it arrive at any tolerable Perfection, till the fifteenth Century, among the *Italians*; it ſeems however to have arrived at its height in the ſeventeenth Century among the *French*. Till *John* of *Verona*, a Cotemporary with *Raphael*, the fineſt Works of this kind were only black and white, which are what we now call *Moreſco's*; but that Religious, who had a Genius for Painting, ſtain'd his Woods with Dyes or boiled Oils, which penetrated them. But he went no further, than the repreſenting Buildings and Perſpectives, which require no great Variety of Colours. Thoſe who ſucceeded him, not only improved on the Invention of dying the Woods, by a Secret which they found of burning them without conſuming, which ſerved exceedingly well for the Shadows; but had alſo the Advantage of a number of fine new Woods of naturally bright Colours, by the Diſcovery of *America*. With theſe Aſſiſtances the Art is now capable of imitating any thing; whence ſome call it the *Art of Painting in Wood*.

The Ground whereon the Pieces are to be arranged and glued, is ordinarily of Oak or Fir well dried; and to prevent warping, is compoſed of ſeveral Pieces glued together. The Wood to be uſed being reduced into Leaves, of the Thickneſs of a Line, is either ſtain'd with ſome Colour, or made black for Shadow; which ſome effect, by putting it in Sand extremely heated over the fire, others by ſteeping it in Lime-Water and Sublimate, and others in Oil of Sulphur. Thus colour'd, the Contours of the Pieces are form'd, according to the Parts of the Deſign they are to repreſent. This laſt is the moſt difficult part of *Marquetry*, and that wherein moſt Patience and Attention are required. The two chief Inſtruments uſed herein, are the Saw and the Vice; the one, to hold the Matters to be form'd; the other, to take off from the Extremes, according to occaſion. The Vice is of Wood, having one of its Chaps fix'd, the other moveable, and is open'd and ſhut by the Foot, by means of a Cord faſten'd to a Treadle. Its Structure is very ingenious, yet ſimple enough, and will be eaſily conceived from the Figure (*Tab. Miſcellany, fig.* 1.) The Leaves to be form'd (for there are frequently three or four of the ſame Kind form'd together) are put within the Chaps of the Vice, after being glued on the outermoſt part of the Deſign, whoſe Profile they are to follow; then the Workman preſſing the Treadle, and thus holding faſt the Piece, with his Saw runs over all the Out-lines of the Deſign. By thus joining and forming three or four Pieces together, they not only gain time, but the Matter is likewiſe the better enabled to ſuſtain the Effort of the Saw; which, how delicate ſoever it may be, and how lightly ſoever the Workman may conduct it, without ſuch a Precaution, would be apt to raiſe Splinters, to ruin the Beauty of the Work.

When the *Marquetry* is to conſiſt of one ſingle kind of Wood, or of Tortoiſe-ſhell, on a Copper or Tin Ground, or *vice verſa*; they only form two Leaves on one another, *i. e.* a Leaf of Metal, and a Leaf of Wood or Shell: this they call ſawing in Counter-parts; for by filling the Vacuities of one of the Leaves by the Pieces coming out of the other, the Metal may ſerve as a Ground to the Wood, and the Wood to the Metal.

All the Pieces thus formed with the Saw, and marked, to know 'em again, and the Shadow given in the manner already mention'd, they vaneer or faſten each in its Place on the common Ground; uſing for that purpoſe the beſt *Engliſh* Glue. The whole is put in a Preſs to dry, planed over, and poliſh'd with the Skin of the Sea-Dog, Wax, and Shave-Graſs, as in ſimple VANEERING, which ſee. With this Difference, however, that in *Marquetry* the fine Branches, and ſeveral of the more delicate Parts of the Figures, are touch'd up and finiſh'd with a Graver. 'Tis the Cabinet-Makers, Joiners, and Toy-Men, among us, who work in *Marquetry*; 'tis the Enamellers and Stone-Cutters, who deal in *Moſaic* Work: the Inſtruments uſed in the former are moſtly the ſame with thoſe uſed by the Eboniſts. See EBONY. See alſo MOSAIC.

MARQUETTE; a Right or Due which the Women formerly paid to the King or Lord, to ranſom themſelves from an infamous Cuſtom, which obliged them to paſs the firſt Night of their Nuptials with their Lords. This Eſtabliſhment is attributed to King *Malcolm* or *Malcolumbe*; and was ſuppreſs'd by *Malcolm* III. Some derive the Word *Marquette* from Marc, becauſe the Fee of *Marquette* was half a Silver Marc.

MARQUISS, properly ſignifies a Title given to a Perſon in poſſeſſion of a conſiderable Demeſne, erected into a *Marquiſate* by Letters Patents; holding a middle Place between the Dignity of a Duke, and that of an Earl or Count. *Marquiſſes* were antiently Governours of Frontier Cities or Provinces, called *Marches*. See NOBILITY, PEER, *&c.*

According to ſome Authors, the Word *Marquiſs* comes from the *Marcomans*, an antient People who inhabited the Marche of *Brandenbourg*. Others derive it from the *German Marck*, Limit; and others from *Marciſia*, which in the *Celtic* Language, ſignify'd a Wing of Cavalry. *Nicod* derives it from the corrupt *Greek* νομίσγια, Province. *Alciat* and *Fauchet* bring it from *Mark*, Horſe, taking a *Marquiſs* to be properly an Officer of Horſe. *Menage* derives it from *Marca*, Frontiere; and *Selden*, *Krantzius* and *Hottoman* do the ſame. Laſtly, *Paſquier* fetches the Etymology of *Marquiſs* from the old *French Marche*, Limit, or from *Marchier*, to confine; the Guard of the Frontiers being committed to them.

The word *Marquiſs* is *French*; the *Romans* were unacquainted with it. In the *Notitia Imperii* they are called *Comites Limitanei*. *Alciat* has ſtarted a Queſtion, whether a *Marquiſs* or Count ſhould have the Precedence. To decide it, he goes back to the antient Function of Counts, and obſerves, that Counts, who are Governours of Provinces, are above *Marquiſſes*, who are only Governours of Frontiers; and that *Marquiſſes*, who are Governours of Frontier-Cities, are above Counts, who are Governours of ſmall Towns. He adds, that in conſequence of this Diſtinction, the Book of Fiefs ſometimes places *Marquiſſes* above Counts, and ſometimes Counts above *Marquiſſes*. *Froiſſart* obſerves, that the *Marquiſat* of *Juliers* was erected into a County. But now-a-days, neither *Marquiſſes* nor Counts are any longer Governours; and as they are mere Titles of Honour, the Counts make no ſcruple of reſigning the Precedency. King *Richard* the Second was the firſt who introduced *Marquiſſes* in *England*; till that time, the Frontiers had been governed by Lords Marches. See COUNT, DUKE, *&c.*

MARRIAGE, a Civil and Religious Contract, by which a Man is join'd and united to a Woman. The Eſſence of *Marriage* conſiſts in the mutual Conſent of the Parties. *Marriage* is part of the Law of Nations, and is in uſe among all People. The *Romaniſts* account it a Sacrament. The Woman, with all her moveable Goods, immediately upon *Marriage*, paſſes wholly *in Poteſtatem Viri*, into the Power and Diſpoſal of the Husband. See WIFE, AFFINITY, DEGREE, *&c.* *Sanchez*, *Bonacina*, and *Bower*, have wrote on the Subject of *Marriage*.

In *Germany* they have a kind of *Marriage* call'd *Marganatic*, wherein, a Man of Quality contracting with a Woman of inferior Rank, he gives her the left Hand in lieu of the right, and ſtipulates in the Contract, that the Wife ſhall continue in her former Rank or Condition, and that the Children born of them, be of the ſame; ſo that they become Baſtards as to Matters of Inheritance, tho legitimate in effect: They cannot bear the Name or Arms of the Family. None but Princes, and great Lords of *Germany*, are allow'd this kind of *Marriage*. The Univerſities of *Leipſic* and *Jena* have declared againſt the Validity of ſuch Contracts, maintaining that they cannot prejudice the Children, eſpecially when the Emperor's Conſent intervenes in the *Marriage*.

The *Turks* have three Kinds of *Marriages*, and three Sorts of Wives; *Legitimate*, *Wives in Kebim*, and *Slaves*. They marry the firſt, hire the ſecond, and buy the third.

Duty of MARRIAGE; a Term uſed in ſome antient Cuſtoms, ſignifying an Obligation to *Marriage*. To underſtand this, it muſt be obſerved, that old Maids, and Widows above ſixty, who held Fees in Body, or were charged with any Perſonal or Military Services, were antiently obliged to marry, to render thoſe Services to the Lord by their Husbands, or to indemnify the Lord, which they could not do in Perſon. And this was call'd, *Duty* or *Service of Marriage*.

The *Roman* Laws ſpeak of ſecond *Marriages* in very hard and odious Terms. *Matre jam ſecundis Nuptiis funeſtata*, *L.* 3. *C. de ſec. Nuptiis*. By theſe Laws it was enacted, that the Effects of the Husband or Wife deceaſed ſhould paſs over to the Children, if the Survivor ſhould marry a ſecond time. By the Law *Hac Edictali Cod. de ſec. Nup.* the Survivor, upon *Marrying* a ſecond time, could not give the Perſon they married, a Portion more than equal to that of each of the Children. In the Primitive Church, the Reſpect to Chaſtity was carry'd ſo high, that a ſecond

Marriage was accounted no more than a lawful Debauch, or a Species of Bigamy. There are ſome antient Canons which forbid the Eccleſiaſtics from being preſent at ſecond *Marriages*.

MARRIAGE, in Law, ſignifies not only the lawful joining of Man and Wife, but alſo the Right of beſtowing a Ward or a Widow in *Marriage*, and the Land given in *Marriage*.

For the Proportions which *Marriages* bear to Births, and Births to Burials in ſeveral Parts of *Europe*, Mr. *Derham* gives us the following Table.

Names of Places.	*Marriages to Births, as*	*Births to Burials, as*
England in General	1 to 4.63	1.12 to 1
London	1 to 4.	1 to 1.1
Hantſhire, from 1569 to 1658	1 to 4.	1.2 to 1
Tiverton in *Devon.* from 1656 to 1664	1 to 3.7.	1.26. to 1
Cranbrook in *Kent*, 1560 to 1649	1 to 3.9.	1.6 to 1
Aynho in *Northamp.* for 118 Years	1 to 6	1.6 to 1
Upminſter in *Eſſex*, for 100 Years	1 to 4.6	1.8 to 1
Frankfort on the *Main* in 1695	1 to 3.7	1.2 to 1
Old, *Middle*, and *Lower Marck*, in 1698	1 to 3.7	1.9 to 1
Dominions of Elect. of *Branden.* 1698	1 to 3.7	1.5 to 1
Breſlaw in *Sileſia*, from 1687 to 91		1.6 to 1
Paris in 1670, 1671, 1672	1 to 4.7	1.6 to 1

From which Table it appears, that *Marriages*, one with another, do each produce about four Births, both in *England* and other Parts of *Europe*. And by Mr. *King*'s Computation, about 1 in 104 Perſons marry; the Number of People in *England* being eſtimated at five Millions and a half, whereof about 41000 annually marry.

Major *Graunt* and Mr. *King* diſagree in the Proportions between Males and Females, the latter making 10 Males to 13 Females in *London*; in other Cities and Towns, and in the Villages and Hamlets, 100 Males to 99 Females. But Major *Graunt*, both from the *London* and Country Bills, computes that there are in *England* 14 Males to 13 Females; whence he juſtly infers, that the Chriſtian Religion, prohibiting Polygamy, is more agreeable to the Law of Nature than *Mahumetiſm*, and others that allow it. This Proportion of Males to Females Mr. *Derham* thinks pretty juſt, being agreeable to what he had obſerved himſelf. In the 100 Years, for inſtance, of his own Pariſh Regiſter of *Upminſter*, tho the Burials of Males and Females were nearly equal, being 633 Males, and 623 Females in all that time; yet there were baptized 709, and but 675 Females, which is 13 Females to 13.7 Males. From which Inequality it appears, that one Man ought to have but one Wife, and yet that every Woman, without Polygamy, may have a Husband; this Surpluſage of Males above Females being ſpent in the Supplies of War, the Seas, &c. from which the Women are exempt. That this is a Work of Providence, and not of Chance, is well made out by the very Laws of Chance, by Dr. *Arbuthnot*: Who ſuppoſes *Thomas* to lay againſt *John*, that for eighty-two Years running, more Males ſhall be born than Females; and giving all Allowances in the Computation to *Thomas*'s Side, he makes the Odds againſt *Thomas*, that it does not ſo happen to be near five Millions of Millions of Millions of Millions to one; but for Ages of Ages, according to this World's Age, to be near an infinute Number to one. See BIRTHS and BURIALS.

MARROQUIN, vulgarly MOROCCO, the Skin of a Goat, or ſome other Animal reſembling it, and call'd *Menon*, frequent in the *Levant*; dreſs'd in Sumac or Galls, and colour'd of any Colour at pleaſure, much uſed in Tapiſtry, Book-Binding, &c. The Name is ordinarily derived from the Kingdom of *Morocco*, whence 'tis ſuppoſed the Manner of preparing them was firſt borrow'd. We have *Morocco* Skins brought from the *Levant*, *Barbary*, *Spain*, *Flanders*, and *France*; red, black, yellow, blue, &c. The various Manners of preparing *Morocco's*, both Black and in Colours, are ſo curious and uſeful, and withal ſo little known among us, that the Publick will not be diſpleaſed to find them here.

Manner of preparing black Morocco. The Skins having been dried in the Hair, are ſteep'd in clear Water three Days and Nights, ſtretch'd on a wooden Horſe or Leg, like that uſed by Tanners, beaten with a large Knife for the purpoſe, and ſteep'd a-freſh in Water, chang'd daily till they be well come again. In this State they are thrown into a large Vat in the Ground, full of Water, wherein Quick-Lime has been ſlaked, where they lie 15 Days; whence, however, they are taken, and again return'd every Night and Morning: They are then thrown into a freſh Vat of Lime and Water, and ſhifted Night and Morning, as before, for 15 Days longer; then rinſed in clear Water, and the Hair taken off, on the Leg, with the Knife; return'd into a third Fat, and ſhifted as before for about 18 Days; ſteep'd 12 Hours in a River, taken out, rinſed, put in Pails, where they are pounded with wooden Peſtles, changing the Water twice: then laid on the Horſe, and the Fleſh taken off, return'd into Pails of new Water, taken out, and the Hair-ſide ſcraped; return'd into freſh Pails, taken out, and thrown into a Pail of a particular Form, having Holes at bottom: here they are beaten the ſpace of an hour, and freſh Water pour'd on from time to time; ſtretch'd on the Leg, and ſcraped on either Side, return'd into Pails of freſh Water; taken out, ſtretch'd up all around in manner of Bags, leaving out the hind Legs, which ſerve as a Mouth for the Conveyance of a Mixture mention'd hereafter. The Skins thus ſew'd, are put in luke-warm Water, where Dogs Excrement has been diſſolved. Here they are ſtirred with long Poles half an hour, left at reſt a dozen, taken out, rinſed in freſh Water, and fill'd by a Tunnel with a Preparation of Water and Sumac, mix'd and heated over the Fire till ready to boil; and as they are fill'd, the hind Legs are ſewed up, to ſtop the Paſſage. In this State they are let down into the Veſſel of Water and Sumac, and kept ſtirring four hours ſucceſſively, taken out, and heap'd on one another; after a little time, their Sides changed: and thus they continue an hour and half, till drain'd. This done, they are looſen'd, and fill'd a ſecond time with the ſame Preparation, ſew'd up again, and kept ſtirring two hours, piled up and drain'd as before. This is again repeated a third time, with this Difference, that they are now only ſtirred a quarter of an hour; after which, they are left till the morrow morning, when they are taken out, drain'd on a Rack, unſewed, the Sumac taken out, folded in two from Head to Tail, the Hair-ſide outwards, laid over each other on the Leg, to perfect their Draining, ſtretch'd out, and dried; then trampled under foot by two and two, ſtretch'd on a wooden Table, what Fleſh and Sumac remains ſcraped off, and the Hair-ſide rubbed over with Oil, and that again with Water. Having thus received their Oil and Water, they are twiſted in the Hands, then ſtretch'd and preſs'd tight on the Table with an Iron Inſtrument like that of the Curriers, the Fleſh-ſide uppermoſt; then turn'd, and the Hair-ſide rubb'd ſtrongly over with a handful of Ruſhes, to ſqueeze out as much of the Oil remaining within as poſſible. The firſt Courſe of Black is now laid on the Hair-Side, by means of a Lock of Hair twiſted and ſteep'd in a kind of black Dye, prepared of ſour Beer, wherein Pieces of old ruſty Iron have been thrown. When half dry by hanging in the Air, they are ſtretch'd on a Table, and rubb'd over every way with a Paumelle, or wooden Inſtrument, with Teeth to raiſe the Grain, over which is paſs'd a light Couche of Water, then ſleek'd, by rubbing them with Ruſhes prepared for the purpoſe. Thus ſleek'd, they have a ſecond Couch of Black, then dried, laid on the Table, rubb'd over with a Paumelle of Cork, to raiſe the Grain again; and after a light Couche of Water, ſleek'd over anew, and to raiſe the Grain a third time, a Paumelle of Wood uſed. After the Hair-ſide has thus received all its Preparations, the Fleſh-ſide is pared with a ſharp Knife for the purpoſe; the Hair-ſide rubb'd ſtrongly over with a woollen Cap, having firſt given it a Luſtre with Barberries, Citron, or Orange. The whole is finiſh'd, by raiſing the Grain lightly for the laſt time with the Paumelle of Cork, which leaves them in a Condition for Sale and Uſe.

Manner

Manner of preparing red Morocco. The Skins are ſteep'd twenty-four hours in a River, taken out, ſtretch'd on the Leg, beat with the Knife, return'd into the Water for twenty-four hours, re-beaten on the Leg, re-ſteep'd; thrown into a Fat, and for three Weeks, taken out and return'd every Morning, to diſpoſe them to peel. Being taken out for the laſt time, they are ſcraped with the Knife, and when the Hair is quite off, thrown in Pails of freſh Water, where they are rinſed; then the Fleſh-ſide ſcraped, thrown into the Pails, and thus alternately from the Leg to the Pails, till they leave the Water quite clean: then they are put in lukewarm Water, with the Experiment as before, and after twelve hours, rinſed in clear Water, and ſcraped on the Leg on both Sides, pounded in Pails, and the Water changed three times; then wrung and ſtretch'd on the Leg, and paſs'd after each other into Water, with Alum diſſolved in it. Thus alum'd, they are left to drain till the Morning, then wrung out, pull'd on the Leg, and folded from Head to Tail, the Fleſh inwards. In this State they receive their firſt Dye, by paſſing them after one another into a red Liquor, prepared with *Lacca*, and ſome other Ingredients, kept ſecret among the *Maroquineers*. This they repeat again and again, till the Skins have got their firſt Colour. They are then rinſed in clear Water, ſtretch'd on the Leg, and left to drain twelve Hours; thrown into Water, into which white Galls pulveriz'd have been paſs'd thro a Sieve, and ſtirred inceſſantly for a day with long Poles, taken out, hung on a Bar a-croſs the Water all night, White againſt Red, and Red againſt White, and in the Morning the Water ſtirred up, and the Skins return'd into it for twenty-four Hours.

MARROW, a delicate Subſtance contain'd in the Cavities of the Bones. All the Bones of the Body, which have any conſiderable Thickneſs, have either a large Cavity, or are ſpongeous, and full of little Cells; in both the one, and the other, is an oleaginous Subſtance, call'd *Marrow*, contain'd in proper Veſicles or Membranes, which open into one another. In the larger Bones, this fine Oil, by the gentle Heat of the Body, is exhaled thro the Pores of its ſmall Bladders, and enters ſome narrow Paſſages, which lead to ſome fine Canals, excavated in the Subſtance of the Bone, according to its Length; and from theſe, other croſs Paſſages (not directly oppoſite to the former, leſt they ſhould weaken the Bone too much in one Place) carry the Marrow ſtill farther into more longitudinal Canals, placed nearer the Surface of the Bone: All this Contrivance is, that the *Marrow* may ſupple the Fibres of the Bones, and render them leſs apt to break. The Antients imagin'd, that *Marrow* ſerv'd for Nouriſhment to the Bones. But later Obſervations have found Blood-Veſſels in the Bones; ſo that it appears the Bones are nouriſh'd in the ſame manner as the other Parts of the Body. Beſides, we find many Bones which grow, and yet have no *Marrow* in them; witneſs the Horns of Deer, Lobſters Claws, &c. See MEDULLA.

MARS, among Chymiſts, ſignifies Iron, becauſe imagin'd under the Influence of that Planet. See IRON. Phyſical Writers prove Iron preferable for all Medicinal Purpoſes to Steel, which is only a more harden'd, compact Iron, made ſo by Art; whereby it is rendred more unfit to yield thoſe Principles or Parts in Preparation, which the Phyſician requires to be drawn out. For the Operation of its Medicinal Properties, ſee CHALYBEAT.

MARS, in Aſtronomy, one of the five Planets, and of the three ſuperior ones; its Place being between the *Sun* and *Jupiter*: See PLANET, and SYSTEM. Its Character is ♂. Its mean Diſtance from the Sun is 1524 of thoſe Parts, whereof the Diſtance of the Sun from the Earth is 1000. Its Excentricity 141. The Inclination of its Orbit, that is, the Angle form'd by the Plane of its Orbit with the Plane of the Ecliptic, 1 Deg. 52 Min. The periodical Time, in which it makes its Revolution round the Sun, 686 Days 23 Hours. Its Revolution about its own Axis is perform'd in 24 Hours 40 Minutes. For the Diameter of *Mars*, ſee DIAMETER, and SEMIDIAMETER. For its Denſity, ſee DENSITY. For the Force of Gravity on its Surface, ſee GRAVITY. Its Parallax, according to Dr. *Hook* and Mr. *Flamſtead*, is ſcarce 30 Seconds.

In the Achronical Riſing of this Planet, that is, when it is in oppoſition to the Sun, it is found twice as near the Earth as the Sun; which is a Phænomenon that has extremely diſcredited the *Ptolemaic* Hypotheſis. Dr. *Hook*, in 1665, obſerv'd ſeveral Spots in *Mars*, which having a Motion, he concluded the Planet to turn round its Centre. In 1666, M. *Caſſini* obſerv'd ſeveral Spots in the two Faces or Hemiſpheres of *Mars*, which, by continuing his different Obſervations very diligently, he found to move by little from Eaſt to Weſt, and to return in the ſpace of 24 Hours 40 Minutes to their former Situation. Whence both the Motion and Period, or natural Day of that Planet, was determin'd. *Mars* always appears with a ruddy, troubled Light; whence we conclude it is encompaſs'd with a thick, cloudy Atmoſphere, which, by diſturbing the Rays of Light in their Paſſage and Re-paſſage thro it, occaſion that Appearance. *Mars* having his Light from the Sun, and revolving round it, has an Increaſe and Decreaſe like the Moon. It may alſo be obſerved almoſt biſſected, when in its Quadratures with the Sun, or in his Perigæon, but never corniculated or falcated, as the inferior Planets. See PHASES.

This Planet's Diſtance from the Sun, is to the Diſtance of the Earth and Sun, as $1\frac{1}{2}$ to 1. So that a Man placed in *Mars*, would ſee the Sun's Diameter leſs by one third than it appears to us, and conſequently the Degree of Light and Heat, which *Mars* receives from the Sun, is leſs by one third than that received by the Earth: This Proportion, however, will admit of a ſenſible Variation, on account of the great Excentricity of this Planet.

Tho the Period or Year of this Planet, as has been already obſerved, is nearly twice as long as ours, and his natural Day, or the Time in which the Sun appears above his Horizon (ſetting aſide the Conſideration of Twilight) is almoſt every where equal to his Night; yet it appears, that in one and the ſame Place on his Surface, there will be but very little Variety of Seaſons, ſcarce any Difference of Summer and Winter. And the reaſon is, that the Axis of his Diurnal Rotation is nearly at right Angles with the Plane of his Orbit. It will be found, notwithſtanding, that Places ſituate in different Latitudes, that is, at different Diſtances from his Equator, will have very different Degrees of Heat, on account of the different Inclination of the Sun's Rays to the Horizon; as 'tis with us, when the Sun is in the Equinoxes. From this Conſideration, Dr. *Gregory* endeavours to account for the Appearance of the *Faſciæ* in *Mars*; which are certain Swathes or Fillets ſeen in this Planet, and poſited parallel to his Equator. For, as among us, the ſame Climate has at different Seaſons very unequal Degrees of Heat; but in *Mars* it is otherwiſe, the ſame Parallel having always a pretty equable Degree of Heat: It follows, that theſe Spots may probably be form'd in *Mars*, or his Atmoſphere, as Snow and Clouds are in ours, *viz.* by the conſtant different Intenſions of Heat and Cold in the different Parallels; and ſo come to be extended in Circles or Belts parallel to his Equator, or the Circle of his Diurnal Revolution. And this ſame Principle may, perhaps, ſolve the Phænomenon of *Jupiter*'s Belts; that Planet, like *Mars*, having a perpetual Equinox. See JUPITER.

Beſides the ruddy Colour of *Mars*, we have another Argument of his being incompaſs'd with an Atmoſphere; and it is this, That when any of the fix'd Stars are ſeen near his Body, they appear extremely obſcured, and almoſt exſtinct. If this be the Caſe, an Eye placed in *Mars* would ſcarce ever ſee *Mercury*, unleſs perhaps in the Sun at the time of Conjunction, when *Mercury* paſſes over his Disk, as he ſometimes appears to us in form of a Spot. A Spectator in *Mars* will ſee *Venus* about the ſame Diſtance from the Sun that *Mercury* appears to us; and the Earth about the ſame Diſtance from the Sun, that to us *Venus* appears. And when the Earth is found in Conjunction with, and very near the Sun, he will ſee in *Mars* what *Caſſini* ſaw on Earth, *viz.* the Earth appear horned or falcated, and its Attendant the Moon of the ſame Figure, and at its utmoſt Diſtance from the Earth, not above 15 Minutes of a Degree.

MARS, among the Aſtrologers, is held a Malific Planet. They call it the *little Unfortunate*; it is maſculine, nocturnal, hot and dry.

Games of MARS, were Combats inſtituted at *Rome* in honour of the God *Mars*. They were held twice in the Year; once in the *Circus*, on the 4th of the Ides of *May*; and a ſecond time on the 1ſt of *Auguſt*. Theſe were eſtabliſh'd, ſome time after the firſt, in memory of the Dedication of the Temple of *Mars* on that Day.

Theſe Games conſiſted in the Courſes of Horſes, and Combats with wild Beaſts. *Germanicus* is ſaid to have kill'd two hundred Lions in the *Circus* on theſe Occaſions.

CROCUS MARTIS, is the Ruſt of Iron; or Iron in an impalpable Powder. The Alchymiſts ſometimes call their Mercury by the Name of *Mars*.

MARSHAL: With us there are ſeveral Officers of this Name, the Chief whereof is the *Earl-Marſhal* of *England*, who is one of the Great Officers of the Crown. He takes Cognizance of all Matters of War and Arms, determines Contracts touching Deeds of Arms out of the Realm upon Land, and Matters concerning War within the Realm, which cannot be determin'd by Common Law, in which he uſually proceeds according to the Civil Law. This Office is Hereditary, having been for many Ages in the Houſe of *Norfolk*.

The *Earl-Marſhal* had antiently ſeveral Courts under him, but hath now only the *Marſhalſea*, where he may ſit

in

in Judgment againſt Criminals offending within the Verge of the Court.

There are other inferior Officers of this Name; as *Marſhal* of the Juſtices in Eyre; *Marſhal* of the King's-Bench, who has Cuſtody of the Priſon, call'd the *King's-Bench*, in *Southwark*. *Knight-Marſhal*, an Officer in the *Marſhalſea*, under whom are the *Marſhal's* Men, who are properly the King's Bayliffs, and arreſt in the Verge of the Court, when a Warrant is back'd by the Board of Green-Cloth. The Court where Cauſes of this kind, between Man and Man, are tried, is call'd the *Marſhalſea*, and is under the *Knight-Marſhal*. In *Fleta* mention is made of a *Marſhal* of the King's Hall; a *Marſhal* of the Exchequer, to whom the Court commits the Cuſtody of the King's Debtors, *&c.*

MARSHAL, or MARECHAL, of *France*; the Name of an Officer of the Crown, who commands the Armies. The Dignity of *Marſhal* is now for Life, tho at its firſt Inſtitution it was otherwiſe. They were then only the King's firſt Ecuyers under the Conſtable, but in Time they became the Conſtables Lieutenants in the Command of the Army, the Conſtable himſelf being then become Captain-General. At firſt they were but two in number, and their Allowance was but 500 Livres *per Annum* in Time of War, and nothing in Time of Peace. In the Reign of *Francis* the Firſt, their Number was increaſed to five; ſince him it has been various: the late King increaſed it at pleaſure; and it is now eleven. Their Office at firſt was to *marſhal* the Army under the Conſtable, and to command in his Abſence. They did then what the *Marſhals de Camp* do now; to which laſt they have given their Title, and the leaſt conſiderable Part of their Authority. The firſt *Marſhal* does the Office of Conſtable in an Aſſembly of the *Marſhals*.

Nicod derives the Word *Marſhal* from *Polemarchus*, Maſter of the Camp: *Matthew Paris* from *Martis Seneſcallus*. In the old *Gauliſh* Language, *March* ſignify'd Horſe, whence *Marechal* might ſignify him who commanded the Cavalry. *Menage* derives it from *Mareſchalus*, which is compoſed of *Marok* or *Marak*, Horſe, and *Schalk*, powerful; or, according to *Cluverius*, Servant: Which makes ſome imagine, the Title was firſt given to Farriers, or thoſe who ſhoe'd and bled Horſes; and that in Succeſſion of Time, it paſſed to thoſe who commanded them. *Paſquier* makes four ſeveral Derivations for the four ſeveral Kinds of *Marſhals*, viz. *Marſhals* of *France*, *Marſhals de Camp*, *Marſhals de Logis*, or Quarter-Maſters, and Farriers, who are call'd by the Name of *Marſhals*. The third he derives from *Marche* or *Marchir*, to mark, limit; and the laſt from *Maire*, Maſter, and *Chal*, Horſe.

MARSHALLING *a Coat of Arms*, in Heraldry, ſignifies the due and proper joining of ſeveral Coats of Arms in one and the ſame Shield or Eſcutcheon, together with their Ornaments, Parts, and Appurtenances. See ARMS.

MARTIAL, is ſometimes uſed to expreſs Preparations of Iron, or ſuch as are impregnated therewith; as the *Martial* Regulus of Antimony, *&c.* See ANTIMONY.

MARTIAL LAW, is the Law of War, depending upon the King's pleaſure, or his Lieutenant in Times of War: For the King, in Time of Peace, never makes any Laws, but by common Conſent in Parliament; yet in War he uſeth abſolute Power: But even this Power hath been inveſted of late Years in the King, or his Generals of the Army, by Act of Parliament, and under particular Reſtrictions too. See LAW.

MARTINGALE; a Thong of Leather faſten'd at one end to the Girths under the Belly of a Horſe, and at the other end to the Muſſroll, to hinder him from rearing.

MARTLET; a Term in Heraldry for a Pigeon, with its Feet eraſed, or torn off: It is uſed for the Difference or Mark of Diſtinction in an Eſcutcheon for the fourth Brother, or Family.

MARTYR, a Perſon who ſuffers Torments, and even Death, in Defence of the Truth of the Goſpel. St. *Stephen* is call'd the *Proto-Martyr*, or firſt *Martyr*. 19700 Perſons are computed to have ſuffer'd *Martyrdom* with St. *Irenæus* at *Lions*, under the Empire of *Severus*. 6666 Soldiers of the *Theban* Legion are ſaid to have been *martyr'd* in *Gaul*. Father *Papebroch* reckons 16000 *Abyſſinian Martyrs*, and 150000 others under *Dioclesian* alone. Antiently thoſe who were baniſh'd for the Faith, were call'd *Martyrs*, as well as thoſe who periſh'd in the Holy Wars. In the Time of St. *Auguſtin*, the Title of *Martyrs* was given to Confeſſors, or thoſe who were tortured for the Faith without loſing their Lives. 'Tis *Tertullian*'s Thought, in his Apologetic; *Plures efficimur, quoties metimur; Semen eſt Sanguis Chriſtianus.*

The Word *Martyr* is *Greek*, μάρτυς, and properly ſignifies a Witneſs. Thus it is apply'd, by way of Eminence, to thoſe who ſuffer in witneſs of the Truth of the Goſpel. In the antient Church, the Acts, Sufferings, and Deaths of the *Martyrs* were preſerved with a world of Care; and yet, maugre all this Diligence, we have but very little left of them. *Euſebius* indeed compoſed a Martyrology, but it never reach'd down to us; and thoſe ſince compiled, are extremely ſuſpected. See MARTYROLOGY. Mr. *Dodwell* endeavours to prove, in a Diſſertation expreſly for that purpoſe, That the Number of *Martyrs* who ſuffer'd under the *Roman* Emperors, was very moderate; alledging, That thoſe we have Accounts of in the Fathers, come in a very ſmall Compaſs; and that, excepting *Nero* and *Domitian*, the reſt of the Emperors made ſcarce any. *T. Ruinard*, on the contrary, endeavours to prove, That the Catalogue of *Martyrs* is not at all ſwelled; That the Carnage was immenſe under the firſt Emperors, and eſpecially in that of *Dioclesian*. F. *Papebroch*, in his *Acta Sanctorum*, makes the Number of *Martyrs* infinite. Scarce any Faith or Religion, but pretends to its *Martyrs*. *Mahometans*, Heathens, Idolaters, *&c.* See SAINTS.

The Æra of MARTYRS is an Æra follow'd in *Egypt* and *Abyſſinia*; and which even the *Mahometans*, ſince their becoming Maſters of *Ægypt*, frequently obſerve. It is fix'd to the beginning of the Perſecution of *Dioclesian*, *A. D.* 302 or 303. The Æra of *Martyrs* is alſo call'd the Æra of *Dioclesian*. See EPOCHA.

MARTYROLOGY, a Catalogue or Liſt of Martyrs. A *Martyrology*, properly ſpeaking, ſhould contain no more than the Name, Place, and Day of Martyrdom of each Saint; but the Term is frequently apply'd to the Hiſtories of Martyrs. The Cuſtom of collecting *Martyrologies*, is borrow'd from the Heathens, who inſerted the Names of their Heroes into their *Faſti*, to preſerve to Poſterity the Memory and Example of their noble Actions. *Baronius* gives Pope *Clement* the Credit of being the firſt who introduced the Cuſtom of collecting the Acts of the Martyrs. The *Martyrology* of *Euſebius* of *Cæſarea* was the moſt celebrated in the antient Church. It was tranſlated into *Latin* by St. *Jerom*; but the Learned agree, that it is not now extant. That attributed to *Beda* in the 8th Century, is of very doubtful Authority; the Names of ſeveral Saints being there found, who did not live till after the Time of *Beda*. The 9th Century was very fertile in *Martyrologies*. Then appear'd that of *Florus*, Sub-Deacon of the Church at *Lions*, who, however, only fill'd up the Chaſms in *Beda*. This was publiſh'd about the Year 830. That of *Wandelbertus*, Monk of the Dioceſe of *Treves*, written in Verſe about the Year 848. That of *Uſuard*, a *French* Monk, who wrote by Command of *Charles the Bald*, in 875; which laſt is the *Martyrology* now ordinarily uſed in the *Romiſh* Church. That of *Rabun*, which is an Improvement on *Beda* and *Florus*, written about the Year 845. That of *Natker*, Monk of St. *Gal*, written about the Year 894. That of *Adon*, Monk of *Ferrieres*, in the Dioceſe of *Treves*, afterwards Archbiſhop of *Vienna*, is a Deſcendant of the *Roman*, if we may ſo call it; for *Du Sollier* gives its Genealogy thus: The *Martyrology* of St. *Jerom* is the great *Roman*, from this was made the little *Roman*, printed by *Roſweyd*. Of this little *Roman*, with that of *Beda* augmented by *Florus*, *Adon* compiled his in the Year 858. The *Martyrology* of *Nevelon*, Monk of *Corbie*, written about the Year 1089, is little more than an Abridgment of that of *Adon*. Father *Kircher* makes mention of a *Coptic Martyrology*, preſerved by the *Maronites* at *Rome*. We have alſo ſeveral Proteſtant *Martyrologies*, containing the Sufferings of the Reformed under the Papiſts, *viz.* an *Engliſh Martyrology*, by *J. Fox*; with others by *Clark*, *Bray*, &c. The Word comes from the *Greek* μάρτυρ, Witneſs, and λέγω, *dico*, I ſpeak, or λεγω, *colligo*, I gather.

MARTYROLOGY, is alſo uſed in the *Romiſh* Church for a Roll or Regiſter kept in the Veſtry, containing the Names of all the Saints and Martyrs, both of the Univerſal Church, and of the Particular Ones of that City or Monaſtery. The Word is alſo apply'd to the painted or written Catalogues in Churches, containing the Foundations, Obits, Prayers, and Maſſes, to be ſaid each Day.

ST. MARY; a Name by which ſeveral Orders of Knighthood, ſeveral Orders of Religious, and ſeveral Feaſts, are diſtinguiſh'd. As *St. Mary of the* THISTLE, a Military Order. See THISTLE. *St. Mary of the Conception*, a Military Order. See CONCEPTION. *St. Mary of the Elephant*, a Military Order. See ELEPHANT. *St. Mary and Jeſus*, a Military Order. See JESUS. *St. Mary of Loretto*, a Military Order. See LORETTO. *St. Mary of Mount Carmel*, a Military Order. See CARMEL. *St. Mary of the Teutonics*. See TEUTONIC, *&c.*

MASBOTHEAN, or MASBUTHEAN: The Name of a Sect, or rather of two Sects; for *Euſebius*, or rather *Hegeſippus*, whom he cites, makes mention of two different Sects of *Masbotheans*. The firſt are one of the ſeven Sects that aroſe out of *Judaiſm*, and proved very troubleſome to the Church. They were ſo call'd from *Maſbotheas*, their Author. The others were one of the ſeven *Jewiſh* Sects before the Coming of Jeſus Chriſt. For

Valeſius won't allow the two to be confounded together: the laſt being a Sect of *Jews* before, or at leaſt cotemporary with Chriſt; and the former a Sect of Heretics deſcended from them. *Ruſinus* diſtinguiſhes them by their Names: The *Jewiſh* Sect he calls *Masbutheans*, and the Heretics *Masbuthanians*. The *Masbutheans* were a Branch of the *Simoneans*.

The Word is derived from the *Hebrew* שבת *Schabet*, to *reſt* or *repoſe*, and ſignifies idle, eaſy, indolent People. *Euſebius* ſpeaks of them, as if they had been ſo call'd from *Masbotheus*, their Chief; but 'tis much more probable that their Name is *Hebrew*, or at leaſt *Chaldaic*, ſignifying the ſame thing with a *Sabbatarian* in our Language, that is, one who makes profeſſion of keeping Sabbath.

MASCLE, is a Term in Heraldry for a Bearing of this Figure: Gules a Chevron Ermin between three *Maſcles* Argent, by the Name of *Bellgrave*. *Guillim* ſaith, that *Maſcle* repreſents the Maſh of a Net, and is an honourable Bearing. A *Maſcle* differs from a Lozenge, only by being voided.

MASCULINE, ſomething belonging to the Male, or the ſtronger of the two Sexes. See MALE.

MASCULINE, is more ordinarily uſed in Grammar to ſignify the firſt and nobleſt of the Genders of Nouns. The *Maſculine* Gender is that which belongs to the Male Kind, or ſomething analogous to it, and which Cuſtom has affix'd to a Word. For Men conſidering themſelves, and obſerving the Difference between the two Sexes, have thought fit to vary the ſame Adjective Names, by giving them different Terminations, as they are differently apply'd to Men or Women. Thus in *Latin* we ſay *bonus Equus*, a good Horſe, in the *Maſculine*; but ſpeaking of a Mare, we change the Termination, not of the Adjective only, but alſo of the Subſtantive, and ſay, *bona Equa*. In *Engliſh*, however, we are more ſtrict; for we generally expreſs the Difference of Sex by different Words, not by the varying the Termination of the ſame, or by varying the Adjective: As *Boar* in the *Maſculine*, *Sow* in the Feminine; *Boy*, *Girl*; *Brother*, *Siſter*; *Buck*, *Doe*; *Bull*, *Cow*, *&c.* Indeed we have about twenty Feminines diſtinguiſh'd from their *Maſculines*, by the Variation of the Termination of the Male into *eſs*; for inſtance, *Abbot*, *Abbeſs*; *Actor*, *Actreſs*; *Count*, *Counteſs*; *Heir*, *Heireſs*; *Maſter*, *Miſtreſs*, *&c.* And this is all that our Language knows of any thing like the Genders, which are only a different way of expreſſing the Male and the Female. But the old Languages, and even ſome of the Moderns, have gone further; for as ſome Adjectives may have Relations to other Things, beſides Men and Women, it has been thought neceſſary to appropriate to them one or other of the Terminations invented for Men and Women. Hence moſt other Subſtantives have been ranged under the Heads of *Maſculine* or Feminine. This, in ſome Caſes, is done with a ſhew of Reaſon, but in others is merely arbitrary; and for that reaſon is found to vary according to the Languages, and even according to the Words introduced from one Language into another. Thus the Names of Trees are generally Feminine in *Latin*, and *Maſculine* in the *French*: Farther, the Genders of the ſame Word are ſometimes varied in the ſame Language. Thus *Alvus*, according to *Priſcian*, was antiently *Maſculine*, but is now become Feminine. And *Navire*, a Ship, in *French*, was antiently Feminine, but is now *Maſculine*. The modern Tongues have no more than two Genders, *viz.* the *Maſculine* and the Feminine; at leaſt, whatever is not Feminine, is accounted *Maſculine*. See GENDER.

The *French*, in their Poetry, have a kind of Rhimes which they call *Maſculine*, to diſtinguiſh them from others, which they call Feminine. The *Maſculine* Rhime is that made with a Word which has a ſtrong, open, and accented Pronunciation; as all Words have, excepting thoſe which have an *e* Feminine in their laſt Syllable: for inſtance, *Amour* and *Jour*, *Mort* and *Sort*, are *Maſculine* Rhimes; and *Pere* and *Mere*, *Gloire* and *Memoire*, are Feminine. Hence Verſes ending with a *Maſuline* Rhime, are call'd *Maſculine* Verſes: and thoſe ending with a Feminine Rhime, Feminine Verſes. 'Tis now a Rule eſtabliſh'd among the *French* Poets, never to uſe above two *Maſculine*, or two Feminine Verſes ſucceſſively, except in the looſer Kinds of Poetry. *Marot* was the firſt who introduced this Mixture of *Maſculine* and Feminine Verſes, and *Ronſard* was the firſt who practiſed it with Succeſs. The *Maſculine* Verſes ſhould always have a Syllable leſs than the Feminine ones. See RHIME.

The Aſtrologers maintain, that the Signs and Planets are really diſtinguiſh'd into *Maſculine* and Feminine; not on account of any Difference of Sex, in their Bodies, or in their Names: but by reaſon of their Qualities, which are either active, hot, or cold, accounted *Maſculine*; or paſſive, dry, and moiſt, which are Feminine. On this Principle they call the *Sun*, *Jupiter*, *Saturn*, and *Mars*, *Maſculine*; and the *Moon* and *Venus*, Feminine. *Mercury*, they ſuppoſe, partakes of the two. Among the Signs, *Aries*, *Libra*, *Gemini*, *Leo*, *Sagittarius*, *Aquarius*, are *Maſculine*; *Cancer*, *Capricornus*, *Taurus*, *Virgo*, *Scorpio*, and *Piſces*, are Feminine.

Plants are likewiſe diſtinguiſh'd into *Maſculine* and Feminine. The *Maſculine* are thoſe which have a greater ſhare of Heat and Virtue.

MASON, a Perſon employ'd under the Direction of an Architect, in the raiſing of a Stone-Building. The chief Buſineſs of a *Maſon*, is to make the Mortar, raiſe the Walls from the Foundation to the Top, with the neceſſary Retreats and Perpendiculars, form the Vaults, and employ the Stones as deliver'd to him. When the Stones are large, the Buſineſs of hewing or cutting them belongs to the Stone-Cutters; tho theſe are frequently confounded with the *Maſons*. The Ornaments of Sculpture are perform'd by Carvers in Stone, or Sculptors. For the Materials whereon *Maſons* work, ſee STONE, MARBLE, *&c.* For the Manner of Working, ſee MASONRY, BUILDING, *&c.* For their Works themſelves, ſee WALL, *&c.* The Tools or Implements principally uſed by them, are, the Square, Level, Plumb-Line, Bevel, Compaſs, Hammer, Chiſſel, Mallet, Saw, Trowel, *&c.* which ſee. Beſides the common Inſtruments uſed in the Hand, they have likewiſe Machines for the raiſing of great Burdens, the conducting of large Stones, *&c.* The principal of theſe are the Lever, Wheel, Pully, *&c.* which ſee. *Maſonry* is ſometimes uſed in a more general and unlimited Senſe; ſo as, beſides proper *Maſonry*, to include the hewing or ſawing of larger Stones, to fit them for Building, properly call'd *Stone-Cutting*; and the carving of the Ornaments, on the Members and Mouldings, properly call'd *Sculpture*: which ſee. *Iſidore* derives the Word from *Machio*, a Machiniſt, as being obliged to uſe Machines in Building. Some derive it from *Machino*. *Du Cange* from *Maceria*, becauſe the long Fence-Walls that incloſe Vineyards, *&c.* in which *Maſons* are ſuppoſed to have been firſt employ'd, were call'd *Maceriæ*. *Maſon eſt Maceriarum Conſtructor*. M. *Huet* derives it from *Mas*, an old Word, ſignifying Houſe; hence *Maſon* is a Perſon who makes *Mas's*, that is, Houſes. In the corrupt *Latin*, a *Maſon* was call'd *Magiſter Comacinus*, which *Lindenbroek* derives from *Comacina*, an Iſland in *Romania*, where, in the Time of the *Lombards*, the beſt Architects were found.

MASONRY, a Branch of Architecture, conſiſting, as ſome define it, in the Art of hewing or ſquaring Stones, and cutting them level and perpendicular, for the Uſes of Building: Tho in the more limited Senſe of the Word, *Maſonry* is the Art of aſſembling and joining Stones together with Mortar. Whence there ariſe as many different Kinds of *Maſonry*, as there are different Forms and Manners of laying or joining the Stones. *Vitruvius* makes mention of ſeven Kinds of *Maſonry* among the Antients; three of hew'd Stone, *viz.* that in form of a *Net*, that in *Binding*, and that call'd the *Greek Maſonry*: And three of unhewed Stones, *viz.* that of an *equal* Courſe, that of an *unequal* Courſe, and that fill'd up in the middle. The ſeventh was a Compoſition of all the reſt.

Net Maſonry, call'd *Reticulation*, from its Reſemblance of the Maſhes of a *Net*, conſiſts of Stones ſquared in their Courſes, and ſo diſpoſed, as that their Joints go obliquely, and the Diagonals are, the one perpendicular, and the other level. This is the moſt agreeable *Maſonry* to the Eye, but it is apt to crack. See *Plate* ARCHITECTURE, *Fig.* 1.

Bound Maſonry, is that wherein the Stones were placed one over another, like Tiles; the Joints of the Beds being level, and the Mounters perpendicular. So that the Joint that mounts and ſeparates two Stones, falls directly over the middle of the Stone below. This is leſs beautiful than the Net-Work, but more ſolid and durable. See *Plate* ARCH. *Fig.* 2.

Greek Maſonry, according to *Vitruvius*, is that where, after we have laid two Stones, each of which makes a Courſe, another is laid at the end, which makes two Courſes; and the ſame Order obſerved throughout the Building. This may be call'd *Double Building*, in regard the Binding is not only of Stones of the ſame Courſe with one another, but likewiſe of one Courſe with another Courſe. See *Plate* ARCH. *Fig.* 3.

Maſonry by Equal Courſes, by the Antients call'd *Iſodomum*, differs in nothing from the *bound Maſonry*, but only in this, that its Stones are not hewn. See *Plate* ARCH. *Fig.* 5.

Maſonry by Unequal Courſes, call'd *Pſeudiſodomum*, is alſo made of unhew'd Stones, and laid in *bound Work*: But then they are not of the ſame Thickneſs, nor is there any Equality obſerved, excepting in the ſeveral Courſes; the Courſes themſelves being unequal to each other. See *Plate* ARCH. *Fig.* 4.

Maſonry fill'd up in the Middle, call'd by the Antients *Empleton*, is likewiſe made of unhew'd Stone, and by

Courſes; but the Stones are only ſet in order as to the Courſes, the Middle being fill'd up with Stones thrown in at random among the Mortar. See *Plate* ARCH. *Fig.* 5.

Compound Maſonry, is of *Vitruvius*'s propoſing; ſo call'd, as being form'd of all the reſt. In this, the Courſes are of hew'd Stone, and the middle Place left void, fill'd up with Mortar and Pebbles thrown in together. After this the Stones of one Courſe are bound to thoſe of another Courſe, with Cramp-Irons faſten'd with melted Lead. See *Plate* ARCH. *Fig.* 6.

All the Kinds of *Maſonry* now in uſe may be reduced to theſe five, *viz. Bound Maſonry*; that of *Brick-Work*, where the Bodies and Projectures of the Stones incloſe ſquare Spaces or Pannels, *&c.* ſet with Bricks: That *de Moilon*, or ſmall Work, where the Courſes are equal, well ſquared, and their Edges or Beds ruſticated: That where the Courſes are unequal; and that fill'd up in the middle with little Stones and Mortar.

FREE, or ACCEPTED MASONS, a very antient Society, or Body of Men, ſo call'd either from ſome extraordinary Knowledge of Maſonry or Building, which they are ſuppoſed to be Maſters of, or becauſe the firſt Founders of the Society were Perſons of that Profeſſion. They are now very conſiderable both for Numbers and Character; being found in every Country in *Europe*, and conſiſting principally of Perſons of Merit and Conſideration. As to Antiquity, they lay claim to a Standing of ſome thouſand Years; and, 'tis ſaid, can trace up their Origin as early as the Building of *Solomon*'s Temple. What the End of their Inſtitution is, ſeems ſtill, in ſome meaſure, a Secret; tho ſo much of it as is known, appears truly good and laudable, as it tends to promote Friendſhip, Society, mutual Aſſiſtance, and Good-Fellowſhip. The Brothers of this Family are ſaid to be poſſeſs'd of a great Number of Secrets, which have been religiouſly obſerv'd from Age to Age: Be their other Virtues therefore what they will, 'tis plain they are Maſters of one in a very great degree, *viz.* Secrecy.

MASQUE, or MASK, a Cover for the Face, contrived with Apertures for the Eyes and Mouth; wore chiefly by Women of Condition, either to preſerve their Complection from the Weather, or out of Modeſty, to prevent their being known. *Poppea*, Wife of *Nero*, is ſaid to be the firſt Inventer of the *Maſque*; which ſhe did to guard her Complection from the Sun and Weather, as being the moſt delicate Woman, with regard to her Perſon, that has been known. *Brantome* obſerves, that the ordinary Uſe of *Maſques* was not introduced till towards the end of the 16th Century. The Word *Maſque* is alſo uſed to ſignify any thing uſed to cover the Eyes, and prevent a Perſon's being known. Thus the Penitents of *Lyons* and *Avignon* hide their Faces with large white Veils, which ſerve 'em for *Maſques*.

MASQUE, in Architecture, is underſtood of certain Pieces of Sculpture, repreſenting ſome hideous Form, Groteſque, or Satyrs Faces, *&c.* uſed to fill up and adorn ſome vacant Places, as in Freezes, the Pannels of Doors, Keys of Arches, *&c.* but particularly in Grotto's.

MASQUERADE, or MASCARADE; an Aſſembly of Perſons mask'd or diſguis'd, meeting to dance and divert themſelves. This is a very common Practice abroad, eſpecially in Carnaval Time. The Word comes from the *Italian Maſcarata*, and that from the *Arabic Maſcâra*, which ſignifies Raillery, Buffoonery.

MASS, in Mechanics, is defined to be the Matter of any Body cohering with it, *i. e.* moving and gravitating along with it; and is diſtinguiſh'd from its Bulk, or Volumn, which is its Expanſion in Length, Breadth, and Thickneſs. The *Maſs* of any Body is rightly eſtimated by its Weight. And the *Maſſes* of two Bodies of the ſame Weight are in a reciprocal Ratio of their Volumes. See MOTION, WEIGHT, MOMENT, *&c.*

MASSALIANS, certain Sectaries, ſo call'd from a *Hebrew* Word ſignifying *Prayer*; it being their diſtinguiſhing Tenet, that a Man is to be continually in Prayer. The *Greeks* call'd them *Euchites*, εὐχῖται, which in their Language ſignified the ſame thing. St. *Epiphanius* diſtinguiſhes two Kinds of *Maſſalians*, the Antient and the New. The firſt, according to him, are neither *Jews*, *Chriſtians*, nor *Samaritans*, but pure *Gentiles*; who owning ſeveral Gods, yet adore only one, whom they call Almighty. They had Oratories like our Churches, where they uſed to meet, to pray and ſing Hymns in honour of God; their Oratories being finely illumined with Lamps and Flambeaux. This Deſcription of St. *Epiphanius* comes ſo near the Practice of the *Eſſeni*, that *Scaliger* thinks the two Sects ought not by any means to be diſtinguiſh'd. The *Maſſalians* have gone by the Names of *Enthuſiaſts*, *Euchites*, *Saccophori*, and ſome of them *Martyrians*.

As to the other *Maſſalians*, who were by Profeſſion Chriſtians, their Riſe was not till about the Time of St. *Epiphanius*. Their Doctrine was, that Prayer alone was ſufficient to Salvation. Many Monks, who loved a Life of Lazineſs, and were averſe to Labour, join'd the *Maſſalians*. See EUCHITES.

MASSATER, from μασάομαι, *manduco*, to chew; the Name of a Muſcle, that helps to pull the Jaw upwards in eating: It is thick and ſhort, ariſing from the *Zygoma*, and from the firſt Bone of the upper Jaw, and is inſerted into the lower Edge of the lower Jaw, from its external Angle to its middle. Its Fibres run in three Directions; thoſe from the *Zygoma* obliquely to the middle of the Jaw, and thoſe from the firſt Bone of the upper Jaw croſs the former, and run to the Angle of the lower Jaw; and the Fibres that are in its middle, run perpendicularly from their Origin to their Inſertion.

MASSES, in Painting, are the large Parts of a Picture, containing the great Lights and Shadows; and thus, when it is almoſt dark, we ſee only the *Maſſes* of a Picture, *i. e.* the Places of the greateſt Lights and Shadows.

MASSIVE, ſomething groſs and ſolid, in oppoſition to Tenderneſs and Delicacy. Thus we ſay, a Wall, or a Building, is too *maſſive*, that is, its Walls are too thick, or the Lights and Openings too little in proportion. A *maſſive* Column is that, which is too ſhort for the Order, whoſe Capital it bears.

MASSORA, a Term in the *Jewiſh* Theology, ſignifying a Performance on the Bible by ſeveral learned Rabbins, to ſecure it from any Alterations that might otherwiſe happen; and to ſerve, according to their Expreſſion, as a *Hedge to the Law*. *Buxtorf* defines it a Critique on the *Hebrew* Text, contrived by the antient *Jewiſh* Doctors, in which they have number'd the Verſes, Words, and Letters of the Text, and mark'd all the Variations of it. For the Text of the Sacred Books was originally written without any Breaks, or Diviſions into Chapters, or Verſes, or even into Words. So that a whole Book, in the antient Manner, was but one continued Word; of which kind we have ſtill ſeveral antient Manuſcripts, both *Greek* and *Latin*. In regard the Sacred Writings had undergone an infinite Number of Alterations, whence various Readings had ariſen, and the Original was become mangled and diſguis'd; the *Jews* had recourſe to a Rule, which they judg'd infallible, to fix and aſcertain the Reading of the *Hebrew* Text: and this Rule they call'd *Maſſora*, Tradition; as if this Critique were nothing but a Tradition, which they had receiv'd from their Fore-Fathers. According to *Elias Levita*, it was the *Jews* of a famous School at *Tiberias* who compoſed, or at leaſt begun the *Maſſora*, whence they are call'd *Maſſoretes*. *Aben Eſra* makes them the Authors of the Points and Accents in the *Hebrew* Text, as we now find it, and which ſerve for Vowels. The *Arabs* have done the ſame thing to their *Alcoran*, that the *Maſſoretes* have done to the Bible: Nor do the *Jews* deny their having borrow'd this Expedient from the *Arabs*, who firſt put it in practice in the 7th Century. There is a great and a little *Maſſora*, printed at *Venice*, and at *Baſil*, with the *Hebrew* Text in a different Character. *Buxtorf* has written a *Maſſoretic* Comment, which he calls *Tiberias*.

MASSORETES, *Jewiſh* Doctors, Authors of the *Maſſora*. See MASSORA.

MAST *of a Foreſt*, the Fruit of a Species of Trees, call'd *Glandiferous*, or Maſt-Bearing; as Beech, Oak, Cheſnut, *&c.*

MAST, a large Tree, or Pole, rais'd in Veſſels, for the Cordage and Sails to be faſten'd to, in order to their receiving the Wind neceſſary for Navigation. In large Veſſels, the Number of *Maſts* is four: Their Names are, the *Main-Maſt*, the *Fore-Maſt*, the *Mizen-Maſt*, and the *Boltſprit*. To which ſome add a fifth, *viz.* a *Counter-Mizen*. The *Main-Maſt*, or Maſter-Maſt, is the chief Maſt in the Ship; its Place is in the middle of the Veſſel, and it bears the ſtrongeſt Cordage, and the largeſt Sails. The *Fore-Maſt* is between the *Main-Maſt* and the Head. The *Mizen-Maſt* is between the *Main-Maſt* and the Stern. The *Boltſprit* lies upon the Beak, in the Prow or Head of the Ship. The *Counter-Mizen*, in large Veſſels and Galleons, is in the Stern.

We alſo uſe the Word *Maſt* to ſignify thoſe Diviſions, or additional Pieces in the *Maſts*, placed over one another. The *Main-Maſt*, and *Main-Top-Maſt*, have each of them two, *viz.* the *Main-Maſt*, *Main-Top-Maſt*, *Main-Gallant-Maſt*; the *Fore-Maſt*, *Fore-Top-Maſt*, *Fore-Top-Gallant-Maſt*. The *Mizen-Maſt* has one, *viz.* the *Mizen-Top-Maſt*. The Word *Maſt* ſignifies the ſame thing in *French*, *High Dutch*, *Flemiſh*, and *Engliſh*. The *Italians* ſay *Maſte*, and the *Spaniards Maſtel*.

For the Proportion of *Maſts*, Sir *H. Manwaring* gives theſe Rules: Whatever the Breadth of a Ship be in Feet, multiply $\frac{3}{4}$ of that Breadth by 30, the Product is the Length of her Main-Maſt in Yards. Thus if a Ship be 30 Foot at the Midſhip-Beam, $\frac{3}{4}$ of 30 is 24; therefore that Ship's Main-Maſt muſt be 24 Yards, or 72 Feet in Length. Then for its Bigneſs, he allows an Inch

to

to every Yard in Length, and therefore this Maſt muſt be 24 Inches thro, or thick. The Fore-Maſt of a Ship muſt be $\frac{4}{5}$ of the Length of the Main-Maſt, that is, in this Caſe, 19 Yards $\frac{1}{2}$ thick, or thro it muſt be near 20 Inches. The Boltſprit is always the ſame Length and Bigneſs with the Fore Maſt; and the Mizen-Maſt muſt be juſt half the Length of the Main-Maſt, and half as thick.

MASTER; a Title given to ſeveral Officers, and Perſons of Authority and Command, and particularly to the Chiefs of the Orders of Knighthood, &c. Thus we ſay, the Grand *Maſter* of *Maltha*, of St. *Lazarus*, of the *Golden Fleece*, of the *Free Maſons*, &c.

The Title *Maſter*, *Magiſter*, was frequent among the *Romans:* They had their *Maſter* of the People, *Magiſter Populi*, who was the Dictator; *Maſter* of the Cavalry, *Magiſter Equitum*, who held the ſecond Poſt in an Army after the Dictator. Under the later Emperors there were alſo *Maſters* of the Infantry, *Magiſtri Peditum*. A *Maſter* of the *Cenſus*, *Magiſter Cenſi*, who had nothing of the Charge of a Cenſor or Sub-Cenſor, as the Name ſeems to intimate; but was the ſame with the Commiſſioner of the Frumentaries, *Præpoſitus Frumentariorum*. *Maſter* of the Militia, *Magiſter Militiæ*, an Officer in the lower Empire, created, as 'tis urged, by *Dioclesian*, who had the Inſpection and Government of all the Forces, with power to puniſh, &c. ſomewhat like a Conſtable of *France*. At firſt there were two of theſe Officers inſtituted, the one for the Infantry, and the other for the Cavalry. But the two were united into one under *Conſtantine*. But as their Power was increaſed, ſo was their Number too; and there was one appointed for the Court, another for *Thrace*, another for the *Eaſt*, and another for *Illyria*. They were afterwards call'd *Comites*, Counts, and *Clariſſimi*. Their Power was only a Branch of that of the *Præfectus Prætorii*, who by that means became a Civil Officer. *Maſter* of Arms, *Magiſter Armorum*, was an Officer or Comptroller under the *Maſter* of the Militia. *Maſter* of the Offices, *Magiſter Officiorum*, had the Superintendance of all the Officers of the Court. He was alſo call'd *Magiſter Officii*, Palatine, ſimply *Magiſter*, and his Poſt *Magiſteria*. This Officer was the ſame in the Weſtern Empire with the *Curopalatii* in the Eaſtern. In fine, *Maſter*, in the *Roman* Hiſtory and Laws, is uſed for every Officer, who is the firſt of his kind, and who has others of the ſame Species, or that have the ſame Functions, under him. In *Latin*, *Magiſter*, and oftentimes *Proximus*.

MASTER *of the Ceremonies*, is an Officer inſtituted by King *James* the Firſt, for the more ſolemn and honourable Reception of Ambaſſadors and Strangers of Quality, whom he introduces into the Preſence. The Badge of his Office is a Gold Chain and Medal, having on one ſide an Emblem of Peace, with King *James*'s Motto, and on the Reverſe the Emblem of War, with *Dieu & mon droit*: He is always ſuppoſed to be a Perſon of good Addreſs, and Maſter of Languages: He is conſtantly attending at Court, and hath under him an Aſſiſtant *Maſter*, or Deputy, who holds his Place during the King's pleaſure. There is alſo a third Officer, call'd *Marſhal of the Ceremonies*, whoſe Buſineſs it is to receive and diſtribute the *Maſter*'s Orders, or the Deputies, for the Service; but without their Order he can do nothing. This is in the King's Gift.

MASTER *of the Houſhold*, is an Officer under the Lord-Steward of the Houſhold, and in the King's Gift: His Buſineſs is to ſurvey the Accounts of the Houſhold. Antiently the Lord-Steward himſelf was call'd *Grand Maſter of the Houſhold*. See HOUSHOLD.

MASTER *of the Horſe*, a great Officer of the Crown, to whom is committed the Charge of ordering and diſpoſing all Matters relating to the King's Stables, Races, and Breed of Horſes, as he had antiently, of all the Poſts in *England*. He hath a Power of commanding the Equerries, and all the other Officers and Tradeſmen employ'd in the King's Stables; to all which he gives, by his Warrant to the Avener, the Oath of Allegiance, &c. for the true and faithful Diſcharge of their Duty. He has the peculiar Privilege of making uſe of any Horſes, Pages, or Footmen, belonging to the King's Stables; ſo that his Coaches, Horſes, and Attendants, are the King's, and have the King's Arms and Liveries.

MASTER *of the Mint:* This, in the ſecond Year of *Henry* the Sixth, was the Title of him, who is now call'd *Warden of the Mint*; whoſe Office it is to receive the Silver and Bullion, which comes to the Mint to be coined, and to take care thereof. See MINT.

MASTER *of the Court of Wards and Liveries*, was the chief Officer, and Judge of that Court, who kept the Seal of it, and was named and aſſigned by the King. But this Court, and all its Officers, Members, Power, and Appurtenances, is taken away by a Statute made the 12 *Car.* 2. *c.* 24.

MASTER *of the Jewel-Houſe*, mention'd in 39 *Eliz. c.* 7 is an Officer of the King's Houſhold of great Credit, being allowed Diet for himſelf, and the Clerks of the Office, and a Lodging in the Court. He hath Charge of all the Gold and Silver Plate uſed at the King's Table, or belonging to any Officer of account attending the Court; and of all Plate remaining in the Tower of *London*, as alſo of Chains and looſe Jewels, not fixed to any Garment.

MASTER *of the Ordnance*, a great Officer, to whoſe Care all the King's Ordnance and Artillery is committed. See ORDNANCE.

MASTER *of the Faculties*, an Officer under the Archbiſhop of *Canterbury*, who grants Licences and Diſpenſations; he is mention'd in the Statute of laying Impoſitions at Law, of 22,23 *Car.* 2. See FACULTY.

MASTER *of the Revels*, an Officer, whoſe Office it is to order all things relating to the Performance of Tragedies, Comedies, Masks, Balls, &c. at Court: He hath likewiſe a Juriſdiction of granting Licences to all who travel to act Plays, Puppet-Shews, or other ſuch like Diverſions; which is very beneficial to him, and increaſeth the Smallneſs of the Salary, which is but 10 *l. per Annum*, to a very conſiderable Income. Neither can any new Play be acted at either of the two Houſes, till it has paſs'd his Peruſal and Licence firſt; and he hath the liberty to caſtrate any thing, which ſhall be offenſive to Religion or Virtue, and for the latter has his Fee.

MASTER *of the Armory*, he that has the Care and Overſight of his Majeſty's Arms and Armory.

MASTER *of the Temple*. The Founder of the Order of the Templars, and all his Succeſſors, were call'd *Magni Templi Magiſtri*; and ever ſince the Diſſolution of the Order, the Spiritual Guide and Director of the Houſe is call'd by that Name. See TEMPLE.

MASTER *of the Ward-Robe*, an Office in the Lord Chamberlain's Diſtrict, who has the Power of managing all the Royal Robes; as thoſe of the Coronation, St. *George*'s Feaſt, the Parliament-Robes: as alſo of the wearing Apparel, Collar of SS's, *George* and Garter, &c. He has the Charge and Cuſtody of all former Kings and Queens Robes, remaining in the *Tower*; all Hangings, Bedding, &c. for the King's Houſe; the Charge and Delivery of Velvet and Scarlet allow'd for Liveries. He has under him a Clerk of the Robes, and Wardrobe-Keeper, a Yeoman, &c. See WARDROBE.

MASTER *of Arts*, the firſt Degree taken up in foreign Univerſities, but the ſecond in ours; Candidates not being admitted to it till they have ſtudied in the Univerſity ſeven Years. See DEGREE.

MASTER *of a Ship*; an Officer, to whom is committed the Direction of a Merchant-Veſſel, who commands it in chief, and is charged with the Merchandizes aboard. In the *Mediterranean*, the *Maſter* is frequently called *Patron*, and in long Voyages *Captain*. 'Tis the Proprietor of the Veſſel that appoints the *Maſter*; and 'tis the *Maſter* provides the Equipage, hires the Pilots, Sailors, &c. The *Maſter* is obliged to keep a Regiſter of the Seamen and Officers, the Terms of their Contract, the Receipts and Payments, and in general, every thing relating to his Commiſſion. See SHIP.

MASTER *of the Rolls*, has his Office by Patent, which is for Life. In the Abſence of the Lord-Chancellor or Keeper, he ſits as Judge in the Court of Chancery, and is, by Sir *Edward Coke*, call'd his *Aſſiſtant*. At other times he hears Cauſes in the Rolls Chappel; he is alſo the firſt of the Maſters in Chancery, and hath their Aſſiſtance at the Rolls: but all Hearings before him are appealable to the Lord Chancellor. He hath alſo his Writ of Summons to Parliament, and ſits next to the Lord Chief Juſtice of *England*, on the ſecond Woolpack. He hath the keeping of the Parliament Rolls, and all the Rolls Houſe for his Habitation; as alſo the Cuſtody of all Charters, Patents, Commiſſions, Deeds, Recognizances, which being made of Rolls of Parchment, gave riſe to the Name. In his Gift are the ſix Clerks in Chancery, the Examiners, three Clerks of the Petty-bag, and the ſix Clerks of the Rolls Chappel, where the Rolls are kept. See ROLLS.

MASTERS *in Chancery*, are uſually choſen out of the Barriſters of the Common Law, and ſit in Chancery, or at the Rolls, as Aſſiſtants to the Lord Chancellor, and *Maſter* of the Rolls, during Term-Time: To them is alſo committed Interlocutory Reports, ſtating of Accounts, taxing Coſts, &c. And ſometimes, by way of Reference, they are empower'd to make a final Determination of Cauſes. They have, time out of mind, had the Honour to ſit in the Lords Houſe, tho they have neither Writs, nor Patent to empower them; but as Aſſiſtants to the Lord Chancellor, and Maſter of the Rolls. They had antiently the Care of inſpecting all Writs of Summons, which is now performed by the Clerk of the Petty-bag. When any Meſſage is ſent from the Lords to the Commons, it is carry'd

carry'd by the *Maſters in Chancery*. Before them, Affidavits are made, and Deeds and Recognizances acknowledged. See CHANCERY.

MASTER-PIECE, an exquiſite, or extraordinary Work or Performance, in any Art or Science.

MASTER-PIECE, or *Chef d'Oeuvre*, is particularly uſed among the *French*, for a particular Work, which thoſe who aſpire to be admitted Maſter in any Art or Trade, are to perform in preſence of the Maſters or Jurands of that Company, by way of Specimen of their Capacity. The *Maſter-Piece* of a Maſon is a Deſcent biaſs'd either in the Head or in Talut, corrected by a full Arch. That of a Carpenter, a Rampant Curve of a Stair-Caſe, the Spiral well adjuſted with the Deſcent. That of a Joiner, a Flat-bottom Cheſt, or a Door-Caſe, or a Mantle-Tree. That of a Tiler, a Luthern well conducted in the *Fourchette*, with a Ridge. That of a Plumber, a little Ciſtern *a Cul de Lampe*. That of a Glazier, a Pair of Compartiments of Glaſſes of ſeveral Colours, hollow'd, incaſtrated, and join'd with Lead of *Chef d'Oeuvre*. That of Paviors, a Roſe in a Free-Stone or Flint-Pavement. That of a Cordwainer, a Turn-up Shoe, &c.

MASTIC, a clear and ſweet reſinous Gum, iſſuing from the Trunk and large Branches of the *Maſtic* or *Lentisk* Tree, either without, or with an Inciſion. It is temperate in Heat, and of a dry, binding Quality; ſo that it ſtrengthens the Stomach, ſtays Vomiting, ſtops Iſſues of Blood, and tickling Coughs and Catarrhs. It ſtrengthens the Reins, and is a good Cleanſer, and is for that reaſon preſcribed in Seminal Weakneſſes. The Goldſmiths mix it with Turpentine and black Ivory, and lay it under their Diamonds, to give them a Luſtre. The *Maſtic* is the Product of *Scio*. The Trees that produce it are cultivated with as much Care as the Vines. It brings in a Revenue of 80000 Ducats *per Annum* to the Grand Signior. There is alſo a kind of black *Maſtic* brought from *Egypt*, which ſerves to ſophiſticate Camphor. The beſt *Maſtic* is brought from the Iſle of *Chio*; it is in larger Tears, and thoſe more balſamic, than that of the *Levant*. The *Maſtic* produced in *Chio* belongs to the Grand Signior, who takes it of this People in lieu of the Tribute he exacts of the other *Grecian* Iſlands. It has its Name *Maſtic*, from its being continually chew'd by the *Turks*, eſpecially the Women.

MASTICATION, in Medicine, the Action of *chewing*, or of agitating the ſolid Parts of our Food between the Teeth, by means of the Motion of the Jaws, the Tongue, and the Lips; whereby it is broke into ſmall Pieces, impregnated with Saliva, and ſo fitted for Deglutition, and a more eaſy Digeſtion in the Stomach. See DIGESTION, CHYLIFICATION, DEGLUTITION, &c.

The Mixture of Saliva with the Food, is of abſolute neceſſity; for the Saliva imbibed within the Parts, diſſolves the Salts hid in them; and by ſo doing, prepares the Food for Fermentation in the Stomach: The Food therefore has the Beginning of its Digeſtion from the Saliva, and its Concluſion from the Ferment in the Stomach. See SALIVA.

MASTICATORIES, in Medicine, are ſuch Remedies as are taken in at the Mouth, and chew'd, in order to promote the Evacuation of the ſalival Humour; as Tobacco, Ginger, Pepper, Sage, Roſemary, Thyme, Maſtic, &c.

MASTOIDES, in Anatomy, the ſame with *Mammillares*. The Word is uſually apply'd to ſuch Proceſſes in the Body, as have the Appearance of Breaſts or Dugs; ariſing from a broad Baſis, and terminating in an obtuſe Top. The Word is ſometimes alſo apply'd to thoſe Muſcles which ſtoop the Head, proceeding from the Neck-Bone, and Breaſt-Bone, and terminating in the Proceſs *Mammiformis*. The Word comes from the *Greek* μαςὸς, Nipple, Dug, and εἰδὸς, *Imago*, Figure.

MATCH, a kind of Cord ſlightly twiſted, and prepared to receive and preſerve Fire, for the Uſes of Artillery, Mines, Fire-Works, &c. It is made of hempen Tow, ſpun on the Wheel like Cord, but very ſlack, and is compoſed of three Twines or Threads, which are afterwards again cover'd with Tow; ſo that the Twines don't appear: laſtly, it is boil'd in Lees of old Wines; whence its Colour. Since Fuſees have been introduced in lieu of Muſkets, the Conſumption of *Match* has been much leſs conſiderable than before.

MATER TENUIS, or PIA MATER. See MENINGES.

MATER DURA. See alſo MENINGES.

MATERIAL, denotes ſomething compoſed of Matter. The *Epicureans*, *Spinoziſts*, &c. own none other but *Material* Subſtances; ſee SUBSTANCE. Among Cauſes, ſome are *material*, others formal: See CAUSE. *Material* Cauſes having no Underſtanding or Liberty, muſt always act in the ſame Manner, when under the ſame Circumſtances. The Philoſophers and Divines diſpute, whether or no there be any *material* Forms really diſtinct from Matter. See FORM.

The *Valentinians* formerly apply'd the Term *Material* to all People, but thoſe of their own Sect; aſſerting, that their Souls periſhed with their Bodies. Thus alſo the *Stoics* maintain'd, that none but the Soul of their Wiſe-Men ſurvived the Body. See STOICKS.

MATERIALISTS, the Name of a Sect in the antient Church, compoſed of Perſons, who, being prepoſſeſs'd with that Maxim in the antient Philoſophy (*ex Nihilo Nihil fit, out of Nothing Nothing can be made*) had recourſe to an Eternal Matter, on which they ſuppoſed God wrought in the Creation; inſtead of admitting God alone as the ſole Cauſe of the Exiſtence of all Things. *Tertullian* vigorouſly oppoſes the Doctrine of the *Materialiſts*, in his Treatiſe againſt *Hermogenes*, one of their Number. See MATTER.

MATERIA SUBTILIS, a fine ſubtile Matter, which the *Carteſians* ſuppoſe to pervade and penetrate, freely, the Parts of all Bodies, and to fill up all their Pores, ſo as not to leave the leaſt Vacuity or Interſtice between them. This Machine they have recourſe to, to ſupport the Doctrine of an abſolute *Plenum*, and to make it conſiſtent with the Phænomena of Motion, &c. and accordingly make it act and move juſt at pleaſure, but in vain; for were there any ſuch Matter, in order for it to be able to fill up the Vacuities of other Bodies, it muſt, itſelf, be entirely void of any, *i. e.* be perfectly ſolid; ſee SOLIDITY: vaſtly more ſolid than Gold, and therefore more ponderous, and reſiſt vaſtly more. See RESISTANCE. Which is inconſiſtent with *Phænomena*. See VACUUM and PLENUM.

Sir *Iſ. Newton*, indeed, allows of the Exiſtence of a *ſubtile Matter*, or Medium, vaſtly finer than Air, penetrating the cloſeſt Bodies, and contributing to the Production of many of the Phænomena of Nature. The Exiſtence of ſuch a Matter he argues from the Experiment of two Thermometers, which being incloſed in Glaſs Veſſels, 'one of them exhauſted of its Air, and both carried from 'a cold to a warm Place, the Thermometer *in vacuo* grows 'warm, and riſes, almoſt as ſoon as that in the Air; and 'if return'd into the cold Place, both cool and fall about 'the ſame. Hence, *ſays he*, is not the Heat of the warm 'Room convey'd thro the Vacuum by the Vibrations of a 'much ſubtiler Medium than Air, which remain'd *in vacuo*, after the Exhauſtion of the Air? And is not this 'Medium the ſame with that whereby Light is refracted 'and reflected, and by whoſe Vibration, Light communicates Heat to Bodies, and is put into Fits of eaſy Reflection, and eaſy Tranſmiſſion? And do not the Vibrations of that Medium in hot Bodies, contribute to the 'Intenſeneſs and Duration of their Heat? And do not 'hot Bodies communicate their Heat to contiguous cold 'ones, by the Vibration of this Medium propagated from 'them into the cold ones? And is not this Medium more 'ſubtile, more elaſtic and active than Air? Does it not 'readily pervade all Bodies? And is it not, by its elaſtic 'Force, expanded thro all the Heavens?' See HEAT, COLD, &c. Again, 'Does not the Refraction of Light 'proceed from the different Denſity of this Matter in different Places; the Light always receding from the denſer 'Parts of the Medium?' See REFRACTION.——Again, 'Is not this Matter much rarer within the denſe Bodies 'of the Sun, Stars, Planets, &c. than in the empty, celeſtial Spaces between them? And in paſſing from them 'to great Diſtances, does it not grow denſer and denſer, 'and thereby occaſion the Gravitation of thoſe Bodies 'towards one another, and of the Parts to the Bodies; 'every Body endeavouring to recede from the denſer Parts 'towards the rarer?' See GRAVITATION.—'Again, Is not 'Viſion performed chiefly by the Vibrations of this Matter, 'excited in the bottom of the Eye by the Rays of Light, 'and propagated thro the ſolid, pellucid, and uniform Capillaments of the Optic Nerves into the Senſory?'——Again, 'Is not animal Motion perform'd by the Vibbrations 'of this Medium, excited in the Brain by the Power of 'the Will, and propagated thence thro the ſolid Capillaments of the Nerves into the Muſcles, to contract and 'dilate them?' See MEDIUM. *Newt. Optic. lib.* 3. *in calce.*

MATHEMATICS, the Science of Quantity; or a Science that conſiders Things as computable, or meaſurable. The Word in its Original, μάθησις, ſignifies *Diſcipline* or *Learning* in the general, and ſeems to have been apply'd to the Doctrine of Quantity, either by way of Eminence, or by reaſon this having the Start of all other Sciences, the reſt took their common Name therefrom. See SCIENCE.

For the Origin of MATHEMATICS, *Joſephus* dates it before the Flood, and makes the Sons of *Seth* Obſervers of the Courſe and Order of the Heavenly Bodies; he adds, that to perpetuate their Diſcoveries, and ſecure 'em from the Injuries either of a Deluge or a Conflagration, they had them engraven on two Pillars, the one of Stone, the other of Brick; the former of which, he ſays, was ſtanding in *Syria* in his days.

The

The firſt who cultivated MATHEMATICS after the Flood, were the *Aſſyrians* and *Chaldeans*; from whom, the ſame *Joſephus* adds, they were carried by *Abraham* to the *Egyptians*; who proved ſuch notable Proficients, that *Ariſtotle* makes no ſcruple to fix the firſt Riſe of *Mathematics* among them. From *Egypt*, 584 Years before Chriſt, they paſs'd into *Greece* thro the hands of *Thales*, who having learnt Geometry of the *Egyptian* Prieſts, taught it in his own Country. After *Thales*, comes *Pythagoras*; who, among other Mathematical Arts, paid a peculiar regard to Arithmetic; fetching the greateſt part of his Philoſophy from Numbers: He was the firſt, as *Laertius* tells us, who abſtracted Geometry from Matter; and to him we owe the Doctrine of *incommenſurable* Magnitudes, and the five *regular* Bodies, beſides the firſt Principles of *Muſic* and *Aſtronomy*. *Pythagoras* was ſucceeded by *Anaxagoras*, *Oenopides*, *Briſo*, *Antypho*, and *Hippocrates* of *Scio*; who all applied themſelves particularly to the *Quadrature* of the Circle, the *Duplicature* of the Cube, &c. but the laſt with moſt Succeſs: This laſt is alſo mention'd by *Proclus* as the firſt who compiled *Elements* of *Mathematics*.

Democritus excelled in *Mathematics* as well as Phyſics; tho none of his Works in either kind are extant: the Deſtruction of which, ſome Authors lay at *Ariſtotle*'s door. The next in order is *Plato*, who not only improved Geometry, but introduced it into Phyſics, and ſo laid the Foundation of a ſolid Philoſophy. Out of his School proceeded a Croud of Mathematicians. *Proclus* mentions thirteen of Note; among whom was *Leodamus*, who improved the *Analyſis* firſt invented by *Plato*; *Thæotetus*, who wrote *Elements*; and *Archytas*, who has the Credit of being the firſt who applied *Mathematics* to Uſe in Life. Theſe were ſucceeded by *Neoclidis* and *Theon*, the laſt of whom contributed to the Elements. *Eudoxus* excelled in *Arithmetic* and *Geometry*, and was the firſt Founder of a Syſtem of *Aſtronomy*. *Menechmus* invented the *Conic* Sections, and *Theodoſius* and *Hermotimus* improved the Elements.

For *Ariſtotle*, his Works are ſo ſtored with *Mathematics*, that *Blancanus* compiled a whole Book of them: Out of his School came *Eudemus* and *Theophraſtus*; the firſt of which wrote of *Numbers*, *Geometry*, and *indiviſible* Lines; the latter a Mathematical *Hiſtory*. To *Ariſteus*, *Iſidorus*, and *Hypſicles*, we owe the Books of *Solids*; which, with the other Books of *Elements*, were improved, collected and methodized by *Euclid*, who died 284 Years before Chriſt. An hundred Years after *Euclid*, came *Eratoſthenes* and *Archimedes*. Cotemporary with the latter was *Conon*, a Geometrician and Aſtronomer. Soon after came *Apollonius Pergæus*; whoſe *Conics* are ſtill extant. To him are likewiſe aſcribed the 14th and 15th Books of *Euclid*, which are ſaid to have been contracted by *Hypſicles*. *Hipparchus* and *Menelaus* wrote on the *Subtenſes* in a Circle, the latter alſo on *Spherical Triangles*; on which Subject, we have a Work of *Theodoſius*: And theſe all, *Menelaus* excepted, lived before Chriſt. *A. D.* 70, *Ptolemy* of *Alexandria* was born; the Prince of Aſtronomers, and no mean Geometrician: He was ſucceeded by the Philoſopher *Plutarch*, of whom we have ſtill extant ſome Mathematical *Problems*. After him came *Eutocius*, who commented on *Archimedes*, and occaſionally mentions the Inventions of *Philo*, *Diocles*, *Nicomedes*, *Sporus*, and *Heron*, on the *Duplicature* of the Cube. To *Cteſebius* of *Alexandria*, we owe our *Pumps*; and *Geminus*, who came ſoon after, is preferred by *Proclus* to *Euclid* himſelf.

Diophantus of *Alexandria* was a great Maſter of Numbers, and the firſt Inventer of *Algebra*: For others of the Antients, *Nicomachus* is celebrated for his Arithmetical, Geometrical, and Muſical Works; *Serenus* for his Books on the *Section* of the Cylinder; *Proclus*, for his Comments on *Euclid*; and *Theon* has the Credit among ſome, of being Author of the Books of *Elements* aſcribed to *Euclid* himſelf. The laſt to be named among the Antients, is *Pappus* of *Alexandria*, who flouriſh'd *A. D.* 400, and is celebrated for his Books of Mathematical *Collections* ſtill extant.

See the Progreſs of each Branch of *Mathematics*, with the Authors who have wrote on it, under the reſpective Heads; as GEOMETRY, MECHANICS, ALGEBRA, ASTRONOMY, &c.

MATHEMATICS are diſtinguiſh'd with regard to their End, into *Speculative*, which reſt in the bare Contemplation of the Properties of Things; and *Practical*, which apply the Knowledge of thoſe Properties to ſome Uſes in Life.

With regard to their Object, *Mathematics* are divided into *pure* or *abſtract*; and *mix'd*. Pure *Mathematics* conſider Quantity, abſtractedly; and without any relation to Matter: Mix'd *Mathematics* conſider Quantity as ſubſiſting in material Beings, and as continually interwove.

Pure MATHEMATICS again, either conſider Quantity as *diſcrete*, and ſo compatible, as *Arithmetic*; or as *concrete*, or *continued*, and ſo meaſurable, as *Geometry* and *Trigonometry*. See ARITHMETIC, GEOMETRY, &c.

Mix'd MATHEMATICS are very extenſive, and are diſtinguiſh'd by various Names, as the Subjects they conſider, and the Views wherein they take them, vary: it being ſufficient to determine an Art to be a Branch of *mix'd Mathematics*, that pure *Mathematics* are applicable thereto, *i. e.* that it may be explain'd and demonſtrated from the Principles of *Arithmetic* and *Geometry*. Such are,

Mechanics, which conſider Motion, or the Laws of moving Bodies. See MOTION.

Hydroſtatics, conſider the Laws of Fluids, or of Bodies gravitating in Fluids. See FLUID.

Pneumatics, the Air, with regard to the Laws and Menſuration thereof. See AIR.

Hydraulics, the Motion of Fluids. See FLUIDS.

Optics, direct Light or Viſion. See VISION.

Catoptrics, reflected Viſion. See REFLECTION.

Dioptrics, refracted Viſion. See REFRACTION.

Perſpective, the Images of Objects, in order to delineate or repreſent them. See PERSPECTIVE.

Aſtronomy, the Univerſe, and the *Phænomena* of the Heavens. See HEAVENLY BODIES.

Geography, the Earth, both as in itſelf, and in its Affections. See EARTH.

Hydrography, the Sea, principally as navigable. See NAVIGATION.

Chronology, Time, with regard to the meaſuring and diſtinguiſhing thereof. See TIME, YEAR, EPOCHA, &c.

Gnomonics, or *Dialling*; Shadows, in order for determining the Hour of the Day. See DIAL and SHADOW.

Pyrotechny, Artificial Fires, with regard both to Diverſion, and to the Uſes of War. See FIRES, ROCKETS, &c.

Military Architecture, the Strength of Places, with regard to their Defence againſt an Enemy. See FORTIFICATION.

Civil Architecture (now become a Branch of *Mathematics*) Buildings. See BUILDING.

Muſic, Sounds, and their Effects on the Ear. See SOUND, TUNE, &c.

For the Elements of each, ſee the reſpective Heads. For an accurate Syſtem of all the Parts above-mention'd (*Muſic* alone excepted) orderly digeſted, and clearly demonſtrated, ſee the excellent *Wolfius*'s *Elementa Matheſeos Univerſæ*.

MATHURINE, ſee TRINITARIAN.

MATINS, the firſt part of the daily Service in the *Romiſh* Church. *Matins* is ſometimes held early in the Morning, ſometimes at Midnight, and ſometimes the Even before. And infirm People, even in Monaſteries, are diſpenſed from attending *Matins*. The Word comes from the *French Matin*, Morning.

MATRASS, or BOLT HEAD, a Veſſel of Glaſs uſed by the Chymiſts in Diſtillation, and other Operations. It is made in form of a Bottle, with a very long narrow Neck. The *Matraſs* is luted with Earth, when it is to be placed on a very hot Fire. When 'tis required it ſhould be ſtopped very cloſe, they ſeal it hermetically. The Word comes originally from the Language of the antient *Gauls*. See BOLT-HEAD.

MATRICE, ſee MATRIX.

MATRICE, *in Dying*, is applied to the five ſimple Colours, whence all the reſt are derived or compoſed. Theſe are the Black, White, Blue, Red, and Fallow or Root Colour. See COLOURS.

MATRICES, uſed by the Letter-Founders, are thoſe little Pieces of Copper or Braſs, at one end whereof are engraven, *dent-wiſe*, or *en creux*, the ſeveral Characters uſed in the Compoſing of Books. Each Character, *Virgula*, and even Point, in a Diſcourſe, has its ſeveral *Matrice*, and of conſequence its ſeveral Puncheon to ſtrike it. 'Tis the Engravers on Metal that cut or grave the *Matrices*: See ENGRAVING. When any Types are to be caſt, the *Matrice* is faſten'd to the End of a Mould, ſo diſpoſed, as that when the Metal is thrown on it, it may fall into the *Creux* or Cavity of the *Matrice*, and take the Figure and Impreſſion thereof. See LETTER FOUNDERY. See alſo TYPE, and PRINTING.

The MATRICES *uſed in Coining*, are Pieces of Steel in form of Dyes; whereon are engraven the ſeveral Figures, Arms, Characters, Legends, &c. wherewith the Species are to be ſtamp'd. The Engraving is perform'd with ſeveral Puncheons, which being form'd *in relievo*, or prominent; when ſtruck on the Metal, make an indented Impreſſion, which the *French* call *en creux*; and for which, I don't know we have any preciſe Name at all. See the Manner hereof under ENGRAVING *on Steel*. See alſo COINING.

MATRICULA, a Regiſter kept of the Admiſſion of Officers, and Perſons enter'd into any Body or Society, whereof a Liſt is made. Among Eccleſiaſtical Authors, we find mention made of two Kinds of *Matricula*'s: the one

containing a List of the Ecclesiastics; the other of the Poor subsisted at the Expence of the Church. The Word *Matricula* was also applied to a kind of Alms-house, where the Poor were provided for. It had certain Revenues appropriated to it, and was usually built near the Church; whence the Name was also frequently given to the Church itself.

MATRIX, or MATRICE, any thing serving for the place of Generation of a Body: whether Organical, as the *Matrix* or Womb of Female Animals, for the Production of the Species; or Inorganical, as those of Vegetables, Metals, and Minerals.

MATRIX, *in Anatomy*, the *Uterus*, or Womb; or that part of the Female of any Kind, wherein the *Fœtus* is conceived and nourished till the Time of its Delivery. In Women, it is situated in the *Pelvis*, or Capacity of the *Hypogastrium*, between the Urinary Bladder and the *Intestinum Rectum*, and reaches as far as the Flanks. It is surrounded and defended by mighty Bones; before, by the *Os Pubis*; behind, by the *Sacrum*; on each side, by the *Ilium* and *Ischium*. It is in figure somewhat like a flat Flask, or dried Pear. In Women with Child, it expands and receives different Forms, according to the different Times and Circumstances of Gestation. It has several Coats, Arteries, Veins, Nerves, and Ligaments, and is interwoven with several different Kinds of Fibres. Anatomists divide it into the *Fundus* and *Cervix*; a broad Part, and a Neck. It is in Extent, from the Extremity of the one to that of the other, about three Inches in Length; its Breadth at the *Fundus* is about two and a half, and its Thickness two. It has but one Cavity, unless we distinguish between the Cavity of the *Uterus*, and that of its Neck. That of the *Cervix* is very small, scarce sufficient to contain a Garden-Bean. At the Bottom or Neck, towards the *Fundus*, it grows very narrow in Virgins; the Extremity of it is call'd the *Osculum Internum*: In pregnant Women it opens, more especially towards the Time of Delivery. The other and lower Orifice of the Neck, towards the *Vagina*, called *Osculum Externum*, is a little prominent, resembling, in some measure, the Glands of the Virile Organ. The Substance of the *Matrix* is membranous and carnous. It consists of three Tunics; or, according to some, who deny that Name to the middle Substance, of two only. The external Tunic, call'd also the *Communis*, is derived from the *Peritonæum*, and consists of two *Lamellæ*; the exterior of which is pretty smooth, the interior rugged and uneven: This Membrane invests the whole *Matrix*, and connects it to the right Intestine, Bladder, &c. The middle Tunic is very thick, and composed of strong Fibres variously disposed. Some think it contributes to the exclusion of the *Fœtus*; tho' others imagine, it serves only to recover the Tone, after any violent Distension. The inner Tunic is nervous. The *Matrix* is connected by its Neck to the *Vagina*; behind, by its outward common Membrane, and before by the same to the Bladder. Its Sides are tied to other Parts; but the *Fundus* is left loose, that it may expand and dilate more freely. Its Ligaments are four, two of which are called *broad*, and two *round*, from their Figure. The broad Ligaments are membranous, loose, and soft; whence they have been compared by some to the Wings of Bats, and called *Alæ Vespertilionum*. The round Ligaments are of a firmer Texture, and consist of a double Membrane, wrapped up in its Arteries, Veins, Nerves, and Lymphæducts. The Blood-Vessels, both in these and the round Ligaments, make a great part of what is called their Substance: These, as well as the others, serve to keep the Womb in its right Position; and are very liable to be injured by unskilful Midwives. On each Side of the *Fundus* of the Womb, arises a Duct, which opens into the Womb with a small Orifice, but in its Progress enlarges, and towards the End is contracted again: At the End next the *Ovaria*, which is at liberty, it expands again into a kind of Foliage fringed round; which Expansion *Fallopius*, the first Discoverer, imagined like the End of a Trumpet; whence he called the whole Duct, *Tuba*. It consists of a double Membrane. Both Veins and Arteries are very numerous here, especially the latter, which, by various Ramifications and Contorsions, make the main Substance of them. Dr. *Wharton* gives them Valves, but the other Anatomists disallow it. See FALLOPIAN TUBE, VESPERTILIONUM ALÆ, &c. &c.

The antient *Greeks* call'd the *Matrix* μήτρα, from μήτηρ, *Mother*: Whence, Disorders of the Womb are frequently call'd *Fits of the Mother*. They also call'd it ὑστέρα, as being the last of the Entrails, by its Situation. They also call'd it φύσις, or *Natura*; and *Vulva*, from *volvo*, *to fold* or *envelop*, or *Valva*, a *Door*. *Plato* and *Pythagoras* took it for a distinct Animal within another. *P. Ægineta* observes, that the *Matrix* may be taken away from a Woman, without her Death; and there have been Instances of People, who have lived a long time after the Loss of the *Matrix*. *Rhasis* and *Paræus* observe, that some Persons have been cured of Diseases, by having the *Matrix* extirpated. In 1669, a Child was produced at the *French* Academy, which had been conceived out of the *Matrix*, and which nevertheless had grown to the Length of six Inches. See EMBRYO, FOETUS, &c

MATRIX's are also used to signify Places proper for the Generation of Vegetables, Minerals, and Metals. Thus the Earth is the *Matrix* wherein Seeds sprout; Marcassites are the *Matrix's* of Metals. See FOSSIL, MINERAL, &c.

MATRIX is also used, tho' figuratively, for several Things, wherein there seems to be effected a kind of Generation; and where certain Things seems to acquire a new Being, or at least a new Manner of Being: of this kind are the Moulds wherein the Printers Types or Letters are cast, and those used in striking Money and Medals, call'd also *Coins*. See MATRICE.

MATRON, among the *Romans*, signify'd a married Woman, and the Mother of a Family. There was, however, some difference between *Matrona* and *Mater-familias*. *Servius* says, that some imagined the Difference to lie in this, That *Matrona* was a Woman who had one Child, and *Mater-familias* she that had several. But others, particularly *Aulus Gellius*, take the Name *Matrona* to belong to a married Woman, whether she had any Children or no; the Hope and Expectation of having them, being enough to warrant the Title of Mother, *Matrona*: and for which reason it is, that Marriage is called *Matrimony*. This Opinion is supported by *Aulus Gellius* and *Nonius*.

MATRONALIA, Feasts of the *Roman* Ladies, or rather *Matronis*, celebrated on the Calends of *March*, in honour of the God *Mars*. No Men living in Celibate, were allow'd to assist at the Feast. The Word comes from the *Latin Matrona*.

MATROSSES, are Soldiers in the Train of Artillery, next below the Gunners; their Duty is to assist the Gunners in traversing, spunging, loading, and firing of Guns, &c. They carry Fire-Locks, and march along with the Store-Waggons.

MATTADORE, see OMBRE.

MATTER, or BODY, an extended, solid, divisible, moveable and passive Substance, the first Principle of all natural Things, from the various Arrangements and Combinations whereof, all natural Things are formed. *Aristotle* makes three Principles, *Matter*, *Form*, and *Privation*: Which last the *Cartesians* throw out of the number; and others, the two last. See PRINCIPLE.

The Properties of *Matter* we are pretty well acquainted with, and can reason about its Divisibility, Solidity, &c. see DIVISIBILITY, &c. But the Essence thereof, or the Subject wherein these Properties reside, or their *Substratum*, is still a Mystery. *Aristotle* speaks very darkly on the Subject, defining *Matter* to be *nec quid*, *nec quantum*, *nec quale*, nor any certain or determinate Thing at all; which many of his Followers interpret so, as to believe, that *Matter* does not at all exist. See BODY.

The *Cartesians* make the Essence of *Matter* to consist in its Extension; arguing, that since the Properties above-mention'd are all that are essential to *Matter*, some of them must constitute its Essence: and since Extension is conceived prior to all the rest, and is that, without which none of the rest can be conceived, Extension is that which constitutes the Essence of *Matter*. But the Conclusion, here, is unjust; for on this Principle, the Existence of *Matter*, according to Dr. *Clark*, would have the fairest Title to constitute its Essence, the τὸ *existere* being conceived prior to all Properties, and even to Extension. Since then the Word *Extension* appears to go further, and to be more general than *Matter*; that impenetrable Solidity, which is essential to all *Matter*, and to *Matter* alone, and from which all its Properties manifestly flow, may, with more Propriety, be call'd the *Essence of Matter*. See ESSENCE.

Again, if Extension were the Essence of *Matter*, and so *Matter* and Space the same thing; it would follow, that *Matter* is infinite and eternal, that it is a necessary Being, and could neither be created nor annihilated; which is absurd. Besides that, it appears both from the Nature of Gravity, the Motions of Comets, the Vibrations of Pendulums, &c. that Space is not *Matter*: and therefore 'tis not Extension; but solid, impenetrable Extension which has a Power of resisting, that constitutes *Matter*. See VACUUM and EXTENSION.

Many among the old Philosophers maintain'd the Eternity of *Matter*, out of which they supposed all things to be formed by the hands of Nature; as being unable to conceive how any thing should be formed out of nothing. *Plato* maintain'd, that *Matter* had existed eternally, and concurred with God in the Production of all things, as a passive Principle, or a kind of collateral Cause. See ETERNITY.

Matter and Form, the two ſimple and original Principiples of all things, according to the Antients, compoſed ſome ſimple Natures, which they called *Elements*; out of the various Combinations whereof, all natural Things were compoſed. See ELEMENT.

Dr. *Woodward* is of an Opinion, not very unlike it; *viz.* That *Matter* is originally and really very different, being at its firſt Creation divided into ſeveral Ranks, Sets, or Kinds of Corpuſcles, differing in Subſtance, Gravity, Hardneſs, Flexibility, Figure, Size, &c. from the various Compoſures and Combinations of which, ariſes all the Varieties in Bodies, as to Colour, Hardneſs, Gravity, Taſtes, &c. But Sir *Iſ. Newton* takes all thoſe Differences to reſult from the various Arrangements of the ſame *Matter*; which he takes to be homogeneous and uniform in all Bodies. See CORPUSCLE.

Beſides the Properties of *Matter* hitherto known, Sir *Iſ. Newton* has diſcover'd a new one, *viz.* 'That of Attraction, or that every Particle of *Matter* has an attractive Power, or a Tendency towards every other Particle: which Power is ſtrongeſt in the Point of Contact, and ſuddenly decreaſes, inſomuch that it acts no more at the leaſt ſenſible Diſtance, and at a greater Diſtance is converted into a repellent Force, whereby the Parts fly from each other. On this Principle of Attraction, he accounts for the Coheſion of the Particles of Bodies, otherwiſe inexplicable.' See COHESION.

For he takes occaſion to obſerve, 'That all Bodies ſeem to be compounded of hard Particles. Even Light itſelf, and all other the moſt volatile of Fluids; inſomuch as Hardneſs may be eſteem'd a Property of all incompounded *Matter*: at leaſt the Hardneſs of *Matter* ſtands on as good a foot as that of its Impenetrability; all the Bodies we know of, being either hard themſelves, or being capable of being harden'd. Now if Compound Bodies be ſo hard, as we find ſome of them, and yet are very porous, and conſiſt of Parts which are only laid together; the ſimple Particles, which are void of Pores, and were never yet divided, muſt be much harder. Now ſuch hard Particles being heaped together, can ſcarce touch one another in more than a few Points, and therefore muſt be ſeparable with much leſs Force than is requiſite to break a ſolid Particle, whoſe Parts touch in all the Space, without any Pores or Interſtices to weaken their Coheſion: How then ſhould ſuch very hard Particles, only laid together, and touching only in a few Points, ſtick together, and that ſo firmly as they do, without the Aſſiſtance of ſomething that cauſes them to be attracted or preſs'd towards each other?'

The ſame great Author obſerves further, 'That the ſmalleſt Particles may cohere by the ſtrongeſt Attractions, and compoſe bigger Particles of weaker Virtue; and many of theſe may cohere, and compoſe bigger Particles, whoſe Virtue is ſtill weaker, and ſo on for divers Succeſſions, until the Progreſſion end in the biggeſt Particles; on which the Operations in Chymiſtry, and the Colours of natural Bodies, depend; and which, by cohering, compoſe Bodies of a ſenſible Magnitude. If the Body is compact, and bends or yields inward to Preſſion; without any ſliding of its Parts; it is *hard*, and *elaſtic*: returning to its Figure with a Force ariſing from the mutual Attraction of its Parts. If the Parts ſlide upon one another, the Body is *malleable* or *ſoft*. If they ſlip eaſily, and are of a fit Size to be agitated by Heat, and the Heat is big enough to keep them in Agitation, the Body is *fluid*; and if it be apt to ſtick to things, it is *humid*. And the Drops of every Fluid affect a round Figure by the mutual Attraction of their Parts, as the Globe of the Earth and Sea affects a round Figure, by the mutual Attraction of its Parts of Gravity.' See ATTRACTION.

Again, 'Since Metals diſſolved in Acids, attract but a ſmall Quantity of the Acid, their attractive Force reaches but to a ſmall diſtance. Now, as in Algebra, where affirmative Quantities ceaſe, there negative ones begin; ſo in Mechanics, where Attraction ceaſes, there a *repulſive* Virtue muſt ſucceed. That there really is ſuch a Virtue, ſeems to follow, from the Reflections and Inflections of the Rays of Light; the Rays being repelled by Bodies in both theſe Caſes, without the immediate Contact of the reflecting or inflecting Body. The ſame thing ſeems alſo to follow from the Emiſſion of Light; a Ray, as ſoon as ſhaken off from a ſhining Body by the vibrating Motion of the Parts of the Body, and got beyond the reach of Attraction, being driven away with exceeding great Velocity: for that Force, which is ſufficient to turn it back in Reflection, may be ſufficient to emit it. It ſeems alſo to follow from the Production of Air and Vapour. The Particles, when they are ſhaken off from the Body by Heat or Fermentation, ſo ſoon as they are beyond the reach of the Attraction of the Body, receding from it, and alſo from one another, with great Strength, and keeping at a diſtance, ſo as ſometimes to take up above a Million of Times more Space, than they did before in the Form of a denſe Body. Which vaſt Contraction and Expanſion ſeems unintelligible, by feigning the Particles of Air to be ſpringy, and ramous, or rolled up like Hoops, or by any other means than a repulſive Power. The Particles of Fluids, which do not cohere too ſtrongly, and are of ſuch a Smallneſs, as renders them moſt ſuſceptible of thoſe Agitations, which keep Liquors in a Fluor, are moſt eaſily ſeparated and rarefied into Vapour, and in the Language of the Chymiſts, they are *volatile*; rarefying with an eaſy Heat, and condenſing with Cold. But thoſe which are groſſer, and ſo leſs ſuſceptible of Agitation, or cohere by a ſtronger Attraction, are not ſeparated without a ſtronger Heat, or perhaps not without Fermentation. And theſe laſt are the Bodies, which Chymiſts call *fixed*, and being rarefied by Fermentation, become true permanent Air; thoſe Particles receding from one another with the greateſt Force, and being moſt difficultly brought together, which upon Contact cohere moſt ſtrongly. And becauſe the Particles of permanent Air are groſſer, and ariſe from denſer Subſtances, than thoſe of Vapours; thence it is that true Air is more ponderous than Vapour; and that a moiſt Atmoſphere is lighter than a dry one, quantity for quantity. From the ſame repelling Power it ſeems to be, that Flies walk upon the Water without wetting their Feet; and that the Object-Glaſſes of long Teleſcopes lie upon one another without touching; and that dry Powders are difficultly made to touch one another ſo as to ſtick together, unleſs by melting them, or wetting them with Water, which by exhaling may bring them together; and that two poliſh'd Marbles, which by immediate Contact ſtick together, are difficultly brought ſo cloſe together, as to ſtick.' See REPELLING POWER.

He further obſerves, 'That all things conſider'd, it ſeems probable God, in the Beginning, formed *Matter* in ſolid, maſſy, hard, impenetrable, moveable Particles, of ſuch Sizes, Figures, and with ſuch other Properties, and in ſuch proportion to Space, as moſt conduced to the End, for which he formed them; and that theſe primitive Particles being Solid, are incomparably harder than any porous Bodies compounded of them; even ſo very hard, as never to wear, and break in pieces: no ordinary Power being able to divide, what God himſelf made one in the firſt Creation. While the Particles continue entire, they may compoſe Bodies of one and the ſame Nature and Texture in all Ages; but ſhould they wear away, or break in pieces, the Nature of Things depending on them, would be changed. Water and Earth, compoſed of old worn Particles and Fragments of Particles, would not be of the ſame Nature and Texture now, with Water and Earth compoſed of entire Particles in the Beginning. And therefore that Nature may be laſting, the Changes of Corporeal Things are to be placed only in the various Separations, and new Aſſociations and Motions of theſe permanent Particles; compound Bodies being apt to break, not in the midſt of ſolid Particles, but where thoſe Particles are laid together, and only touch in a few Points.'

It ſeems farther, 'That theſe Particles have not only a *Vis Inertiæ*, accompany'd with ſuch paſſive Laws of Motion, as naturally reſult from that Force, but alſo that they are moved by certain active Principles, ſuch as is that of Gravity, and that which cauſeth Fermentation, and the Coheſion of Bodies. Theſe Principles are to be conſider'd not as occult Qualities, ſuppoſed to reſult from the ſpecific Forms of Things, but as general Laws of Nature, by which the Things themſelves are form'd; their Truth appearing to us by Phænomena, tho' their Cauſes are not yet diſcover'd.' See PARTICLE; ſee alſo FERMENTATION, FIRMNESS, GRAVITATION, ELASTICITY, HARDNESS, FLUIDITY, SALT, ACID, &c.

Hobbes, *Spinoſa*, &c. maintain all the Beings in the Univerſe to be *material*, and their Differences to ariſe from their different Modifications, Motions, &c. Thus *Matter* extremely ſubtile, and in a briſk Motion, they conceive, may *think*; and ſo exclude all Spirits out of the World. See SPIRIT. Mr. *Berkeley*, on the contrary, argues againſt the Exiſtence of *Matter*; and endeavours to prove, that it is a mere *Ens Rationis*; and has no Exiſtence out of the Mind: 'Thus, ſays he, that neither our Thoughts, Paſſions, nor Ideas, form'd by the Imagination, exiſt without the Mind, is evident; nor is it leſs evident, that the various Senſations or Ideas imprinted on the Senſe, however blended or combined together (that is, whatever Objects they compoſe) cannot exiſt otherwiſe, than as in a Mind perceiving them. This no Man can doubt of, that attends to what is meant by the Term *exiſt*, when applied to ſenſible Things. Thus I ſay, the Table I write on exiſts, *i. e.* I ſee and feel it, and if I were out of my Stu-

dy,

'dy, I ſhould ſay it exiſted; meaning thereby, that if I 'were in my former Situation, I ſhould ſee and feel it 'as before. Again, I ſay there was Odour, *i. e.* I ſmelt 'it; a Sound, *i. e.* it was heard; a Colour or Touch, *i. e.* 'it was perceived by Sight or Touch. This is the utmoſt 'than can be meant by ſuch Expreſſions; for as to the 'abſolute Exiſtence of any unthinking Being, diſtinct 'from its being perceived, 'tis a Chimera. Their *Eſſe* 'is *percipi*; nor is it poſſible they ſhould have any Ex-'iſtence out of the Minds that perceive them. Again, 'what are Hills and Trees, *&c.* but Things perceived by 'Senſe; and what do we perceive, but our own Ideas or 'Senſations: and can any one of theſe, or any Combina-'tion of them exiſt unperceived? What are Light and 'Colours, Heat and Cold, Extenſion and Figure, but ſo 'many Senſations, Ideas, or Impreſſions on the Senſe? 'And is it poſſible, even in Thought, to ſeparate there-'from Perception? 'Tis next to ſelf-evident, therefore 'that all the Choir of Heaven, and Furniture of the 'Earth; in a word, all the Bodies that compoſe the Syſ-'tem of the World, have not any Subſiſtence out of a 'Mind; their *Eſſe* is nothing more than their being per-'ceived: and therefore as long as they don't exiſt in 'me, *i. e.* are not perceived by me, nor any other cre-'ated Spirit; they have no ſhadow of Exiſtence at all, 'unleſs perhaps in the Mind of ſome Eternal Spirit. It 'appears therefore, with the Light of an Axiom, that 'there is not any other Subſtance but Spirit, *&c.*' See *Inquiry into Principles of Human Knowledge.* See EXTERNAL WORLD.

MATTER *in Deed*, and *Matter of Record*, in Law, are thus diſtinguiſh'd: *Matter in Deed* ſignifies nothing elſe but a Truth to be proved, tho not by any Record; and *Matter of Record*, is that which may be proved by ſome Record: For example, If a Man be ſued to an Exigent, during the time he was in the King's Wars, this is *Matter in Deed*, and not *Matter of Record*. And therefore he that will alledge this for himſelf, muſt come before the *Scire Facias*, before Execution be awarded againſt him; for after that, nothing will ſerve but *Matter of Record*; that is, ſome Error in the Proceſs appearing upon Record.

MATURANTIA, in Medicine, *&c.* Ripeners, or ſuch Things as promote Maturation. See RIPENERS.

MATURATION, in Pharmacy, a Preparation of Fruits, or other Remedies, gather'd before their *Maturity*; to fit them to be eaten, or taken.

MAUNCH, is the Figure of an antient Sleeve of a Coat, ſo called by the Heralds; and is borne in many Gentlemen's Eſcutcheons: as in the Earl of *Huntingdon*'s, in thoſe of *Coniers*, &c.

MAUNDAY THURSDAY, the *Thurſday* before *Eaſter*, ſo called from the *French Mande*, i.e. *Sportula*; it being a Cuſtom on that Day to give larger Bounty to certain poor Men, whoſe Feet the King waſh'd.

MAUSOLEUM, a magnificent Tomb, or funeral Monument, conſiſting of Architecture, and Sculpture, with an Epitaph; erected in honour of ſome Prince, or other illuſtrious Perſon: as the *Mauſoleum* of *Auguſtus* at *Rome*. The Word is alſo uſed to ſignify the Decoration of a Tomb, or *Catafalcha*, in a funeral Pomp. The Word comes from *Mauſolus* King of *Caria*, to whom *Artemiſia*, his Widow, erected a moſt ſtately Monument, that has ſince been number'd among the Wonders of the World, calling it from his Name, *Mauſoleum*.

MAXILLÆ, in Anatomy, the *Jaws*, or thoſe Parts of an Animal, wherein the Teeth are ſet, and which ſerve for maſticating of the Food: See TEETH. The *Maxillæ* are two in number, denominated from their Situation, *Superior*, and *Inferior*.

The MAXILLA *Superior*, or Upper Jaw, is immoveable in Man, and all other Animals; excepting Parrots and Crocodiles. It conſiſts of eleven Bones, join'd to each other *per Harmoniam*; five diſpoſed on each ſide, and one in the middle. Their Names are the *Zygoma*, *Os Maxillare*, *Os Unguis*, *Os Naſi*, *Os Palati*, and *Vomer*: See ZYGOMA, *&c.* In this Jaw are Alveoli or Sockets for 16 Teeth.

The MAXILLA *Inferior*, or Lower Jaw, only conſiſts of two Bones, which unite in the middle of the Chin, by the Intervention of a Cartilage, which hardens as the Child grows; and at length, about the Age of ſeven Years, becoming bony, joins the two Bones into a continued one, reſembling the *Greek* υ. It conſiſts of two Tables, betwixt which is a ſpongy Subſtance, in Children medullous. The fore-part is ſhallow, juſt ſufficient to afford Sockets for 16 Teeth. It has two Proceſſes, the *Corone* and *Condyloides*, which ſee; four Holes or *Foramina* for the Paſſage of Veſſels, and five Pair of proper Muſcles, *viz.* the *Crotaphytes* or Temporal, the *Maſſeter*, *Biventer* or *Digaſtricus*, *Pterygoideus Internus*, and *Pterygoideus Externus*. See each in its Place. CROTAPHYTES, MASSETER, *&c.*

MAXILLARIS *Glandula*, a conſiderable Gland of the conglomerate Kind, ſituate on the Inſide, under the lower Jaw-Bone, near the *Muſculus Digaſtricus*. It diſcharges itſelf by ſeveral Branches of Ducts, which form one Trunk that paſſes under the *Mylohyoideus*, and meets with that of the other Side within the fore Teeth of the lower Jaw, having diſtinct Orifices, with a *Papilla* on each Side the *Frænum Linguæ*. See GLAND.

MAXIMIS ET MINIMIS, a Method ſo called, in uſe among the Mathematicians, whereby they arrive at the greateſt or leaſt poſſible Quantity attainable in any Caſe: Or thus, If the Semi-ordinates of any Curve continually increaſe or decreaſe to ſome certain Term, which once paſs'd, they begin again to increaſe or decreaſe, the Method whereby their *Maxima & Minima*, i.e. their greateſt and leaſt State is determined, is called the Method *de Maximis & Minimis*; which, 'tis true, may be uſed to determine other Quantities that increaſe or decreaſe to any certain degree: but then they muſt always be repreſented by the Semi-ordinates of Curves.

The Method *de Maximis & Minimis*, is beſt managed by the *Calculus Differentialis*, or Fluxions. The Rule is: Having put the Equation into Fluxions, let the Fluxion of that Quantity (whoſe extreme Value is ſought) be ſuppoſed $= 0$; by this means all thoſe Members of the Equation, in which it is found, will vaniſh, and the remaining ones will give the Determination of the *Maximum* or *Minimum* deſired. Now the reaſon of the Rule is, that every *Maximum* or *Minimum* is in its own nature a ſtable Quantity: To determine therefore any flowing Quantity to a *Maximum* or *Minimum*, is to make it (inſtead of a flowing) a permanent one; but the Fluxion of a permanent Quantity is equal to nothing. This we ſhall illuſtrate by an Example or two.

Prob. 1. *To determine the greateſt or leaſt Applicate in an Algebraic Curve.* Since in Curves that have a *Maximum* and a *Minimum*, the Tangent T M (*Tab.* ANALYSIS *fig.* 4.) degenerates at length into D E, and becomes parallel to the Axis, and ſo the Perpendicular M H coincides with the greateſt or leaſt Applicate C G; in the Caſe of the *Maximum* and *Minimum*, the Sub-tangent T P becomes infinite, and the Sub-perpendicular equal to nothing, but P H $= y\,dy : dx$. If then $y\,dy : dx = 0$; we ſhall find $dy = 0$, and becauſe of P T $= y\,dx : dy = \infty$ (the Note of Infinity) $dx = \infty$. 'Tis poſſible for the Tangent H G (*fig.* 5.) to lie directly againſt the Semi-ordinate G C; in which Caſe the Sub-tangent P T is equal to nothing, and the Sub-perpendicular infinite. But P T $= y\,dx : dy = 0$; therefore if $y\,dx : dy = 0$, we ſhall have $dx = 0$; or becauſe of P H $= y\,dy : dx = \infty$, we find $dy = \infty$. Both dx and y being, in reſpect of dy, Infiniteſimals. From the Equation of the Curve therefore we are to find the Value of dy, which is to be made equal either to nothing, or to an Infinite, that we may have the Value of the Abſciſſe, to which the greateſt Applicate is co-ordinate.

2. *To cut a right Line* A B (*fig.* 6.) *in ſuch a manner in* D, *that the Rectangle* A D *and* D B *ſhall be greateſt that can poſſibly be thus conſtructed.* Let A B $= a$, A D $= x$, then will D B $= a - x$; conſequently A D. D B $= ax - xx$ any *Maximum*, and hence its Differential will be equal to nothing, as being conceived at a Circle, to which

$$a\,x - x\,x = y\,y$$

Wherefore $a\,dx - 2\,x\,dx = 2\,y\,dy = 0$

$$a - 2\,x = 0$$

$$\tfrac{1}{2}\,a = x.$$

The Line A B therefore is to be cut into two equal Parts; and the Square is the greateſt of all Rectangles, whoſe Altitudes and Baſes, taken together, are equal to each other. See FLUXIONS.

MAXIMS, a kind of Propoſitions, which, under the Name of *Maxims* and Axioms, have paſſed for Principles of Science; and which being ſelf-evident, have been ſuppoſed innate. See AXIOM.

For the Reaſon of the Evidence of Maxims: It may be obſerved, That Knowledge being only the Perception of the Agreement or Diſagreement of Ideas; where that Agreement or Diſagreement is perceived immediately by itſelf, without the Intervention or Help of any other Ideas, there our Knowledge is ſelf-evident: which being ſo, not only *Maxims*, but an infinite number of other Propoſitions, partake equally with them in this Self-Evidence. Thus, that a Circle is a Circle, Blue is not Red, are as ſelf-evident Propoſitions, as thoſe general ones, What is, is; and, It is impoſſible for the ſame thing to be, and not to be. Nor can the Conſideration of theſe Axioms add any thing to the Evidence or Certainty of our Knowledge of them.

As

As to the Agreement or Diſagreement of Co-exiſtence, the Mind has an immediate Perception of this but in very few. And therefore in this Sort we have very little intuitive Knowledge; tho in ſome few Propoſitions we have. Two Bodies cannot be in the ſame Place, is a ſelf-evident Propoſition: the Idea of fitting a Place equal to the Contents of its Superficies, being annexed to our Idea of Body. As to the Relations of Modes, Mathematicians have framed many Axioms concerning that one Relation of Equality; as that Equals being taken from Equals, the Remainder will be equal, *&c.* which however received for Axioms, yet have not a clearer Self-evidence than theſe, That One and One are equal to Two; that if from the five Fingers of one Hand you take two, and from the five Fingers of the other Hand two, the remaining Numbers will be equal. As to real Exiſtence, ſince that has no Connection with any other of our Ideas, but that of ourſelves, and of a firſt Being; we have not ſo much as a demonſtrative, much leſs a ſelf-evident Knowledge concerning the real Exiſtence of other Beings. See EXISTENCE.

For the Influence of MAXIMS *on the other Parts of our Knowledge:* The Rules eſtabliſhed in the Schools, That all Reaſonings are *ex præcognitis & præconceſſis*, ſeem to lay the Foundation of all other Knowledge in theſe *Maxims*, and to ſuppoſe them to be *præcognita*; which implies two Things: *viz.* That theſe Axioms are thoſe Truths firſt known to the Mind; and, That on them the other Parts of our Knowledge depend. But, firſt, That theſe Axioms are not the Truths firſt known to the Mind, is evident from Experience: For who knows not that a Child perceives that a Stranger is not its Mother, long before he knows it impoſſible for the ſame Thing to be, and not to be? And how many Truths are there about Numbers, which the Mind is perfectly acquainted with, and fully convinced of, before it ever thought on theſe general *Maxims*? Hence it follows, That theſe magnified *Maxims* are not the Principles and Foundations of all our other Knowledge; for if there are a great many other Truths, as ſelf-evident as they, and a great many that we know before them, it is impoſſible that they ſhould be the Principles, from which we deduce all other Truths. Thus, That One and Two are equal to Three, is as evident, and eaſier known, than that the Whole is equal to all its Parts. Nor, after the Knowledge of this *Maxim*, do we know that One and Two are equal to Three, better, or more certainly, than we did before. For if there be any odds in theſe Ideas, the Ideas of Whole and Parts are more obſcure, or at leaſt more difficult to be ſettled in the Mind, than thoſe of One, Two, and Three. Either, therefore, all Knowledge does not depend on *Præcognita*, or general *Maxims*, called Principles; or elſe ſuch as theſe (That One and One are Two, that Two and Two are Four, *&c.*) and a great part of Numeration, are *Maxims*. To theſe, if we add all the ſelf-evident Propoſitions that may be made about all our diſtinct Ideas, Principles will be almoſt infinite; and a great many innate Principles, many Men never come to know all their Lives.

General MAXIMS then may be of uſe in Diſputes, to ſtop the Mouths of Wranglers; but are of little in the Diſcovery of unknown Truths. Several general *Maxims* are no more than bare verbal Propoſitions, and teach us nothing but the Reſpect and Import of Names one to another; as, The Whole is equal to all its Parts: What real Truth doth this teach us more, than what the Signification of the word *Totum*, or Whole, does of itſelf import? If rightly conſider'd, we may ſay, that where our Ideas are clear and diſtinct, there is little or no uſe at all of *Maxims*, to prove the Agreement or Diſagreement of any of them. He that needs any Proof to make him certain, and give his Aſſent to this Propoſition, That Two are equal to Two, or that White is not Black; will alſo have need of a Proof to make him admit, That what is, is; or, That it is impoſſible for the ſame Thing to be, and not to be. But as *Maxims* are of little uſe, where we have clear and diſtinct Ideas; ſo they are of dangerous uſe, where our Ideas are confuſed, and where we uſe Words, that are not annexed to clear and diſtinct Ideas. LOCKE.

MAY, the fifth Month in the Year, reckoning from the firſt of *January*; and the third, in counting the Year to begin with *March*, as they antiently did. In this Month the Sun enters *Gemini*, and the Plants of the Earth begin to flower. It was called *Maius* by *Romulus*, in reſpect to the Senators and Nobles of his City, which were named *Majores*; as the following Month was called *Junius*, in honour of the Youth of *Rome*, *in honorem Juniorum*, who ſerved him in the War: Others will have it to have been called thus from *Maia*, the Mother of *Mercury*, to whom they offer'd Sacrifice on that day; *Papias* derives it from *Madius*, *Eo quod tunc terra madeat*. This Month was under the Protection of *Apollo*, and therein alſo they kept the Feſtival of *Bona Dea*, that of *Goblins*, call'd *Lemuria*; and the Ceremony of *Regifugium*, or the Expulſion of the Kings. The Vulgar have a great opinion of *May*-Dew and Butter. See DEW. The Month of *May* has ever been eſteem'd very favourable to Love; and yet the Antients, as well as many of the Moderns, look on it as an unhappy Month for Marriage: The Reaſon may perhaps be refer'd to the Feaſt of the *Lemures*, which was held in it. *Ovid* alludes to this in the 5th of his *Faſti*, when he ſays,

Nec Viduæ tædis eadem, nec Virginis apta
Tempora; quæ nupſit, non diuturna fuit:
Hac quoque de Cauſâ, ſi te proverbia tangunt,
Menſe malus Maio Nubere vulgus erit.

MAYL, in Falconry, is to pinion the Wings of a Hawk.

MAYOR, the Chief Magiſtrate or Governour in the Cities and moſt Corporation-Towns of *England*; choſen annually by his Peers out of the number of the Aldermen. The *Mayor* of the Place is the King's Lieutenant, and with the Aldermen and Common-Council, can make Laws, called *By-Laws*, for the Government of the Place. He has the Authority of a kind of Judge, to determine Matters, and to mitigate the Rigour of the Law. The Word comes from the antient *Britiſh Miret*, *cuſtodire*, *to keep*. King *Richard* I. *A. D.* 1189. firſt changed the Bayliffs of *London* into *Mayors*; by whoſe Example others were afterwards appointed. See PORTREVE and ALDERMAN.

MAYOR's *Court*. To the Lord Mayor and City of *London* belong ſeveral Courts of Judicature. The higheſt and moſt antient is that call'd *The Huſtings*, from the *Daniſh Hus-ding*, i. e. *Domus Judicii*; deſtined to ſecure the Laws, Rights, Franchiſes, and Cuſtoms of the City.

The ſecond is a *Court of Requeſt*, or *of Conſcience*; ſo call'd, as meddling with nothing above 40*s.* Value; or rather, becauſe here the Oath of the Creditor himſelf is accepted.

The third is the *Court of the Lord Mayor and Aldermen*, where alſo the Sheriffs ſit; two *Courts of Sheriffs*; and the *Court of the City-Orphans*, whereof the Lord Mayor and Aldermen have the Cuſtody.

The *Court of Common-Council*, conſiſting of two Houſes; the one for the Lord Mayor and Aldermen, and the other for the Commoners: In which Court are made all By-Laws, which bind the Citizens.

Under him is alſo the *Chamberlain's Court*, where every thing relating to the Rents and Revenues of the City, as alſo the Affairs of Servants, *&c.* are tranſacted. Laſtly, To him belongs the *Courts of Coroner*, and of *Eſcheator*; another Court for the *Conſervation of the River of* Thames; another of *Goal-Delivery*, held uſually eight Times a year, at the *Old-Bayley*, for the Tryal of Criminals, whereof the Lord Mayor is himſelf the chief Judge. There are other Courts call'd *Wardmotes*, or Meetings of the Wards; and *Courts of Helmote*, or Aſſemblies of the ſeveral Guilds and Fraternities.

MEAD, a wholeſome, agreeable Liquor, prepared of Honey and Water. One of the beſt Preparations, is as follows: Into twelve Gallons of Water, ſlip the Whites of ſix Eggs; mixing theſe well together, and to the Mixture adding twenty Pounds of Honey. Let the Liquor boil an hour, and when boiled, add Cinnamon, Ginger, Cloves, Mace, and a little Roſemary. As ſoon as 'tis cold, put a Spoonful of Yeaſt to it, and turn it up, keeping the Veſſel fill'd as it works; when it has done working, ſtop it up cloſe, and when fine, bottle it off for Uſe.

MEAN, the *Middle* between two Extremes. See MIDDLE and EXTREME.

Thus, we ſay, *Mean Motion* of a Planet; its *mean Diſtance*, *&c.* meaning a Motion or Diſtance, which as far exceeds the leaſt Diſtance, or Motion, as it is exceeded by the greateſt. See MOTION, DISTANCE, *&c.*

MEAN, in Logic. See MEDIUM.

MEAN *Proportion*. See EXTREME PROPORTION.

MEAN *Proportional*. See PROPORTIONAL.

MEAN *Time*. See TIME.

MEAN *Axis*, in Optics. See AXIS.

MEAN *Diameter* in Gauging. See DIAMETER.

MEAN, in Law, refers either to Time or Dignity. Thus, in the firſt ſenſe, we ſay, his Action was *mean* betwixt the Diſſeiſin made to him and his Recovery, *i. e.* in the Interim: In the ſecond we ſay, there is Lord *Mean*, i. e. *Meſne*, or Lord of a Mannor, who has Tenants that hold of him, yet himſelf holds of the King.

MEASLES, or MORBILLI, in Medicine, a cutaneous Diſeaſe, conſiſting in a general Appearance of Eruptions, not tending to Suppuration; with a Fever. This Diſtemper ſeems to bear a great Affinity to the Small-Pox, the Symptoms being in many reſpects the ſame, the Cauſe nearly the ſame, and the Regimen and Cure not much different. The Eruptions uſually appear about the fourth

Day, like Flea-Bites, over the whole Body; but thicker and redder, and with greater Inflammation, than thoſe of the Small-Pox, and vaniſh in four or ſix Days after appearance: being, when at the height, not larger than Pins Heads. The *Meaſles* is more ſickly than dangerous; tho it often inclines to Conſumptions, by a Cough which it leaves behind. See VARIOLÆ.

MEASURE, in Geometry, any certain Quantity aſſumed as one, or Unity, to which the Ratio of other homogeneous, or ſimilar Quantities is expreſs'd. This Definition is ſomewhat more agreeable to Practice than that of *Euclid*, who defines *Meaſure* by a Quantity, which being repeated any number of Times, becomes equal to another: This only anſwers to the Idea of an Arithmetical *Meaſure*, or Quota Part. See QUOTA PART.

MEASURE *of a Number*, in Arithmetic, is ſuch a Number as divides another, without leaving any Fraction; thus 9 is a *Meaſure of* 27. See NUMBER.

MEASURE *of a Line*, is any right Line taken at pleaſure: The modern Geometricians uſe a *Decempeda*, or Perch, divided into 10 equal Parts, call'd Feet. The Feet they ſubdivide into 10 Digits, the Digit into 10 Lines, &c. See MEASURES.

This Decimal Diviſion of the *Meaſure* was firſt introduced by *Stevinus*, probably from the Example of *Regiomontanus*: The *Index* or Character of *Decempedæ* he made 0, that of Feet 1, of Digits 2, of Lines 3, &c. which, in regard the *Meaſure* was ſubdivided in a decuple Ratio, were the Logarithms of the Diviſion. *Bayer*, in lieu of theſe, expreſs'd the Logarithms by the *Roman* Characters; *v. g.* 5 Perches, 4 Feet, 3 Digits, and 2 Lines, he expreſs'd thus; $5^{\circ}, 4^{\prime}, 3^{\prime\prime}, 2^{\prime\prime\prime}$. 'Tis, frequently, moſt commodious to ſeparate the Integers, or Perches, from the Fractions by a Point; thus inſtead of $5^{\circ}, 4^{\prime}, 3^{\prime\prime}, 2^{\prime\prime\prime}$; to write 5.432. F. *Noel* obſerves, that among the *Chineſe*, the Decimal Diviſion obtains in their common *Meaſures*, and even in their Weights. See DECIMAL, DEGREE, &c.

MEASURE *of a Figure*, or Plane-Surface, is a Square, whoſe Side is of any determinate Length; among Geometricians 'tis uſually a Perch, call'd a *Square Perch*, divided into ten ſquare Feet, and the ſquare Feet into ſquare Digits: Hence ſquare *Meaſures*. See SQUARE.

MEASURE *of a Solid*, is a Cube, whoſe Sides are of any Length at pleaſure. Among Geometricians, a Perch, call'd a Cubic Perch, divided into Cubic Feet, Digits, &c. Hence *Cubic Meaſures*, or Meaſures of Capacity. See CUBE.

MEASURE *of an Angle*, is an Arch, deſcribed from the *Vertex*, *a* (*Tab.* Geometry, *fig.* 10.) in any Place between its Legs; as at *df*. Hence, Angles are diſtinguiſh'd by the Ratio of the Arches, deſcribed from the Vertex, between the Legs; to the Peripheries. Angles then are diſtinguiſh'd by thoſe Arches; and the Arches are only diſtinguiſh'd by their Ratio to the Periphery. Thus the Angle *laa* is ſaid to be of ſo many Degrees, as is the Arch *fd*. See ANGLE.

MEASURE *of Velocity*, in Mechanics, is the Space paſs'd over by the moving Body in any given Time. To meaſure a Velocity, therefore, the Space muſt be divided into as many equal Parts, as the Time is conceived to be divided into. The Quantity of Space anſwering to ſuch an Article of Time, is the Meaſure of the Velocity. See VELOCITY.

MEASURE *of the Maſs*, or Quantity of Matter in Mechanics, is its Weight; it being apparent, that all the Matter which coheres and moves with a Body, gravitates with it: and it being found by Experiment, that the Gravities of homogeneal Bodies, are in proportion to their Bulks; hence, while the Maſs continues the ſame, the Weight will be the ſame, whatever Figure it put on: its abſolute Weight, we mean; for as to its ſpecific Weight, it varies as the Quantity of Surface varies. See VELOCITY, WEIGHT, GRAVITY, &c.

MEASURES, therefore, are various, according to the various Kinds and Dimenſions of the Things meaſured. Hence ariſe *Lineal* or *Longitudinal Meaſures* for Lines or Lengths; *Square Meaſures* for Area's or Superficies; and *Solid* or *Cubic Meaſures* for Bodies, and their Capacities: All theſe are very different in different Countries, and in different Ages, and even many of 'em for different Commodities. Whence ariſe other Diviſions of *Domeſtic* and *Foreign Meaſures*, *Antient* and *Modern* ones; *Dry* and *Liquid Meaſures*, &c.

The Buſineſs of *Meaſures* has been ſo confuſedly, and withal ſo imperfectly deliver'd by our *Engliſh* Writers, that the Reader will not be diſpleaſed with the pains we have here taken to diſembroil, and ſupply it. Under this Head he will find enumerated the various, general, ſtanding *Meaſures*, *Long*, *Square* and *Cubic*, now or heretofore in uſe, with their Proportions and Reductions: for Particulars, he muſt be contented to be refer'd to the particular Heads; as FOOT, DIGIT, ELL, TUN, GALLON, BUSHEL, PERCH, LEAGUE, FURLONG, &c.

LONG MEASURES, *or* Meaſures of Application.

The Engliſh Standard LONG MEASURE for Commerce, or that whereby the Quantities of Things are ordinarily eſtimated in the way of Trade, is the *Yard*; containing three *Engliſh* Feet: equal to three *Paris* Feet, 1 Inch, $\frac{1}{12}$ of an Inch; or $\frac{7}{9}$ of a *Paris* Ell. Its Diviſions are the *Foot*, *Span*, *Palm*, *Inch*, and *Barley-Corn*, which ſee under their reſpective Heads: FOOT, INCH, &c. Its Multiples are the *Pace*, *Fathom*, *Pole*, *Furlong*, and *Mile*. See MILE, FURLONG, POLE, &c. The Proportions theſe ſeverally bear to each other, will be expreſs'd in a Table for the purpoſe.

The French Standard Meaſure for Commerce is the *Aune* or *Ell*, containing 3 *Paris* Feet, 7 Inches, 8 Lines; or 1 Yard, $\frac{7}{8}$ *Engliſh*; the *Paris* Foot Royal exceeding the *Engliſh* by $\frac{68}{1000}$ Parts, as in one of the following Tables. This Ell is divided two ways; *viz.* into *Halves*, *Thirds*, *Sixths*, and *Twelfths*; and into *Quarters*, *Half-Quarters*, and *Sixteenths*.

This Ell holds throughout the greateſt part of *France*; excepting at *Troyes* in *Campagne*; at *Arc* in the *Barrois*; in ſome parts of *Picardy* and *Burgundy*, where it only contains two Foot, five Inches, one Line; in *Bretagne*, where it contains four Foot, two Inches, eleven Lines; and at *St. Genoux* in *Berry*, where it exceeds the *Paris* Ell by eight Lines. See ELL.

But in *Languedoc*, particularly at *Marſeilles*, *Montpellier*, *Toulouſe*, in *Provence*, *Guienne*, they meaſure by the *Canna*, which at *Toulouſe* and in *Guienne* contains five *Paris* Feet, five Inches, and ſix Lines; or one *Paris* Ell and a half. At *Montpellier*, and throughout the *Lower Languedoc*, as alſo in *Provence* and *Avignon*, and even *Dauphine*, the *Canna* is ſix Foot and nine Lines; or one *Paris* Ell, two Thirds. See CANNA.

Standard Meaſure in Holland, *Flanders*, *Sweden*, a good part of *Germany*, many of the *Hans-Towns*, as *Dantzic* and *Hambourg*; and at *Geneva*, *Francfort*, &c. is likewiſe the Ell: But the Ell in all theſe Places differs from the *Paris* Ell. In *Holland*, it contains one *Paris* Foot, eleven Lines, or four Sevenths of the *Paris* Ell. The *Flanders* Ell contains two Foot, one Inch, five Lines, and half a Line, or ſeven Twelfths of the *Paris* Ell. The Ell of *Germany*, *Brabant*, &c. is equal to that of *Flanders*. See ELL.

The Italian Meaſure is the *Braccio*, Brace, or Fathom; which obtains in the States of *Modena*, *Venice*, *Florence*, *Lucca*, *Milan*, *Mantua*, *Bologna*, &c. but of different Lengths. At *Venice* it contains one *Paris* Foot, eleven Inches, three Lines, or eight Fifteenths of the *Paris* Ell. At *Bologna*, *Modena*, and *Mantua*, the *Brace* is the ſame as at *Venice*; At *Lucca* it contains one *Paris* Foot, nine Inches, ten Lines, or half a *Paris* Ell. At *Florence* it contains one Foot, nine Inches, four Lines; or forty-nine Hundredths of a *Paris* Ell. At *Milan*, the *Brace* for meaſuring of Silks is one *Paris* Foot, ſeven Inches, four Lines, or four Ninths of a *Paris* Ell: That for Woollen Cloths is the ſame with the Ell of *Holland*. Laſtly, at *Bergama* the *Brace* is one Foot, ſeven Inches, ſix Lines, or five Ninths of a *Paris* Ell. See BRACE. The *Meaſure* at *Naples*, however, is the *Canna*, containing ſix Foot, ten Inches, and two Lines, or one *Paris* Ell, and fifteen Seventeenths.

The Spaniſh Meaſure, is the *Virga*, or *Yard*, in ſome Places call'd the *Barra*; containing ſeventeen Twenty-fourths of the *Paris* Ell.——But the *Meaſure* in *Caſtille* and *Valentia* is the *Pan*, *Empan*, or *Palm*; which is uſed, together with the *Canna*, at *Genoa*.——In *Arragon*, the *Varra* is equal to a *Paris* Ell and a half, or five Foot, five Inches, ſix Lines.——The *Portugueſe Meaſure* is the *Cavedos*, containing two Foot, eleven Lines, or four Sevenths of the *Paris* Ell; and the *Veras*, 106 whereof make 100 *Paris* Ells.——The *Piedmonteſe Meaſure* is the *Ras*, containing one *Paris* Foot, nine Inches, ten Lines, or half a *Paris* Ell.——In *Sicily*, their *Meaſure* is the *Canna*; the ſame with that of *Naples*.

Laſtly, the *Muſcovite Meaſures* are the *Cubit*, equal to one *Paris* Foot, four Inches, two Lines; and the *Arcin*, two whereof are equal to three *Cubits*.——The *Turkiſh*, and *Levant Meaſure*, the *Picq*, containing two Foot, two Inches, and two Lines; or three Fifths of the *Paris* Ell.——The *Chineſe Meaſure*, the *Cobre*; ten whereof are equal to three *Paris* Ells.——In *Perſia*, and ſome part of the *Indies*, the *Gueze*, whereof there are two Kinds; the *Royal Gueze*, call'd alſo *Gueze Monkelſer*, containing two *Paris* Foot, ten Inches, eleven Lines, or four Fifths of the *Paris* Ell; and the *Shorter Guege*, call'd ſimply *Gueze*, only two Thirds of the former——At *Goa* and *Ormus*, the *Meaſure* is the *Varra*, the ſame with that of the *Portugueſe*, having been introduced by them.——In *Pegu*, and ſome other Parts of the *Indies*, the *Cando* or *Candi*, equal to the Ell of *Venice*.——At *Goa* and other Parts, they uſe a larger *Cando*, equal to ſeventeen *Dutch* Ells; exceeding that of *Babel* and *Belſora* by $\frac{7}{8}$ *per Cent.* and the *Varra* by 6 and $\frac{1}{2}$ ——In *Siam*, they uſe the *Ken*, ſhort of three *Paris* Feet by one Inch.

The

The *Ken* contains two *Soks*, the *Sok* two *Keubs*, the *Keub* twelve *Nious*, or Inches; the *Niou* to be equal to eight Grains of Rice, *i. e.* to about nine Lines.——At *Camboia*, the *Coiang*; in *Japan*, the *Ikiens*; and the *Pan* on some of the Coasts of *Guinea*.

The Proportions of the Long Measures *of ſeveral Nations to the* Engliſh *Foot, by Mr.* Greaves.

The *Engliſh* Standard Foot being divided into 1000 equal Parts, the other Meaſures will have the Proportions to it, which follow.

The *Engliſh* Foot, *from the Standard in* Guildhall	1000
The *Paris* Royal Foot, *in the* Châtelet	1068
The *Rhinland* Foot, of *Snellius.*	1033
The *Greek* Foot	1007 29/100
The *Roman* Foot, *on the Monument of* Coſſutius	967
The *Roman* Foot, *on the Monument of* Statilius	972
The *Roman* Foot, of *Villalpandus, taken from the* Congius *of* Veſpaſian	986
The *Venetian* Foot	1162
The Ell of *Antwerp*	2283
The Ell of *Amſterdam*	2268
The Ell of *Leyden*	2260
The Canna of *Naples*	687
The Varrà or Vare of *Almeria*, and *Gibraltar* in *Spain*	2760
The Braccio of *Florence*	1913
The Palm of *Genoa*	815
The Common Braccio of *Sienna*	1242
The Braccio of *Sienna, for Linnen*	1974
The Palm of the Architects at *Rome*, whereof X make the Canna of the ſame Architects	732
The Palm of the Braccio of the Merchants and Weavers at *Rome*; *from a Marble in the Capitol, with this Inſcription,* CVRANTE LV POETO	695 1/10
The Large Pique of the *Turks* at *Conſtantinople*	2200
The Small Pique of the *Turks* at *Conſtantinople*, is to the Larger, as 31 to 32.	
The Ariſh of *Perſia*	3197
The Derah or Cubit of the *Egyptians*	1824

The Proportions of ſeveral Long Measures *to each other, by M.* Picard.

The *Rhinland* or *Leyden* Foot (12 *whereof make the* Rhinland *Perch*) *ſuppoſed*	696
The *Engliſh* Foot	675 1/10
The *Paris* Foot	720
The *Amſterdam* Foot, from that of *Leyden*, by *Snellius*	629
The *Daniſh* Foot (*two whereof make the* Daniſh *Ell*)	701 1/10
The *Swediſh* Foot.	658 3/4
The *Bruſſels* Foot	609 3/4
The *Dantzic* Foot, *from* Hevelius's Selenographia	636
The *Lyons* Foot, by M. *Auzout*	757 2/3
The *Bologna* Foot, by the ſame.	843
The Braccio of *Florence*, by the ſame, and Father *Merſenne*	1290
The Palm of the Architects at *Rome*, according to the Obſervation of Meſſ. *Picard* and *Auzout*	494 1/4
The *Roman* Foot in the Capitol, *examin'd by Meſſieurs* Picard *and* Auzout	653 or 653 1/10
The ſame, *from the* Greek *Foot*	652
From the Vineyard Mattei	657
From the Palm	658
From the Pavement of the Pantheon, *ſuppoſed to contain* 10 Roman *Feet*	653
From a Slip of Marble in the ſame Pavement, ſuppoſed to contain 3 Roman *Feet*	650
From the Pyramid of Ceſtius, *ſuppoſed to contain* 3 Roman *Feet*	650 1/2
From the Diameters of the Columns in the Arch of Septimius Severus.	653 1/8
From a Slip of Porphiry in the Pavement of the Pantheon	653 1/8

Square *or* Superficial Measures.

Engliſh Square *or* Superficial Measures, are raiſed from the Yard of 36 Inches, multiplied into itſelf; and this producing 1296 ſquare Inches in the ſquare Yard, the Diviſions of this are Square Feet and Inches; and the Multiples, Poles, Roods, and Acres; as in the Table.

French Square Meaſures, are regulated by 12 ſquare Lines in the Inch ſquare; 12 Inches in the Foot, 22 Feet in the Perch, and 100 Perches in the *Arpent*, or Acre.

Engliſh *Square Meaſures.*

Cubic Meaſures, or Meaſures of Capacity for Things Liquid.

Engliſh Liquid Meaſures, were originally raiſed from Troy-Weight; it being enacted by ſeveral Statutes, That eight Pound Troy of Wheat, gather'd from the middle of the Ear, and well dried, ſhould weigh a Gallon, of *Wine-Meaſure*; the Diviſions and Multiples whereof were to form the other Meaſures: At the ſame time it was order'd, That there ſhould be but one *Liquid Meaſure* in the Kingdom: yet Cuſtom has prevailed, and there having been introduced a new Weight, *viz.* the Avoirdupois, we have now a ſecond Standard Gallon adjuſted thereto, and therefore exceeding the former, in the proportion of the Avoirdupois Weight to Troy Weight. From this latter Standard are raiſed two ſeveral *Meaſures*, the one for Ale, the other for Beer. The ſealed Gallon at *Guildhall*, which is the Standard for Wines, Spirits, Oils, &c. is ſuppoſed to contain 231 Cubic Inches; on which Suppoſition, the other *Meaſures* raiſed therefrom, will contain as in the following Tables; yet, by actual Experiment made in 1688, before the Lord Mayor and the Commiſſioners of Exciſe, it was only found to contain 224 Cubic Inches: It was however agreed to continue the common ſuppoſed Contents of 231 Cubic Inches; ſo that all Computations ſtand on their old footing. Hence, as 12 is to 231, ſo is $14\frac{12}{29}$ to $281\frac{1}{2}$, the Cubic Inches in the Ale Gallon: but in effect the Ale Quart contains $70\frac{1}{2}$ Cubic Inches; on which Principle, the Ale and Beer Gallon will be 282 Cubic Inches. The ſeveral Diviſions and Multiples of theſe *Meaſures*, and their Proportions, are exhibited in the Tables underneath.

French Meaſures. At *Paris*, and in a great part of the Kingdom, the *Meaſures*, to begin with the ſmalleſt, are, the Poſſon, which contains ſix Cubic Inches; two Poſſons make the Demi-ſeptier; two Demi-ſeptiers, the Septier or Chopine; two Chopines, a Pint; two Pints, the Quart or Pot; four Quarts, the Gallon, or Septier of Eſtimation; and thirty-ſix Septiers, the Muid, which is ſub-divided into two Demi-Muids, four Quarter-Muids, and eight Half-Quarter-Muids. See MUID, SEPTIER, QUART, CHOPINE, &c. From the Quart are likewiſe raiſed the *Meaſures* uſed in other Parts, as the Queue uſed in *Orleans*, *Blois*, &c. containing a *Paris* Muid and a half, or 420 Pints; the Tun uſed at *Bayonne* and *Bourdeaux*, conſiſting of four Bariques, and equal to three *Paris* Muids; at *Orleans*, to two: ſo that the firſt Tun contains 864 Pints, and the ſecond 576. See TUN. The Demi-Queue, uſed in *Champagne*, 96 Quarts; the Pipe, uſed in *Anjou* and *Poictou*, containing two Buſſards, equal to two Demi-Queues of *Orleans*, &c. or a Muid and a half of *Paris*, or 432 Pints. See PIPE. The Millerolle uſed in *Provence*, containing 66 *Paris* Pints; and the Poincon uſed at *Nantes*, in *Touraine* and the *Bleſſois*, equal to half the *Orleans* Tun. The Poincon uſed at *Paris*, is the ſame with the Demi-Queue. See QUEUE.

Dutch Liquid Meaſures. At *Amſterdam*, their *Meaſures*, to begin with the Diminutions, are, Mingles, Mingeebles, or Bottles, equal to *French* Quarts, and containing two Pounds, four Ounces, Marc, of an ordinary Liquor. The Mingle is divided into two Pints, four half Pints, eight Muſſies, ſixteen half Muſſies, &c. Seven hundred and ſeventy Mingles make their Tun. The Viertel, or Verge, conſiſts of five Mingles, and one Sixth of a Mingle. The Wine Viertel is juſt ſix Mingles. The Stekan, or Stekamen, contains ſixteen Mingles. The Anker contains two Stekans; and four Ankers, the Aem. For Oils they uſe the Tun, which contains ſix Aems, or Ams; equal to 1600 *Paris* Pints. See TUN.

Spaniſh Liquid Meaſures, are the Botte, containing between thirty-ſix and thirty-ſeven *Dutch* Steekans, holding about a thouſand Weight. The Botte conſiſts of thirty Robes, each weighing twenty-eight Pounds. Each Robe is again divided into eight Sommes, and the Somme into four Quarts. The Pipe conſiſts of eighteen Robes.

Portugueſe Liquid Meaſures, are Bottes, Almudes, Cavadas, Quatas; and for Oil, Alguiers or Cantars. The *Portugueſe* Botte, is ſomewhat ſmaller than the *Spaniſh*; the latter being equal to thirty-ſix or thirty-ſeven Steekans, and the former only to twenty-five or twenty-ſix. The Quatas is one Fourth of the Cavadas. The Cavadas, or Cavado, is the ſame with the *Dutch* Mingle. Six Cavavadas make an Alquier, and two Alquiers one Almude, or Almoud; twenty-ſix Almouds, a Botte.

Italian Liquid Meaſures. At *Rome* are the Boccale, or Bottle, containing a little more than a *Paris* Pint. Seven Boccales and a half make the Rubbia, and thirteen Rubbia and a half, the Brante; ſo that the Brante contains ninety-ſix Boccales.——At *Florence*, the Staro or Staio, containing three Barrils, and the Barril twenty Fiaſco's or Flasks, nearly equal to *Paris* Pints.——At *Verona*, they uſe the Baſſee, ſixteen whereof make a Brente; the Brente contains ninety-ſix Boccales, or thirteen Rubbias and a half.——At *Venice*, the Amphora, containing two Bottes; the Botte, four Bigots; the Bigot, or Bigour, four Quarts; the Quart, four Tiſchaufferas. The *Venetian* Botte is again divided into Muſtaches, ſeventy-ſix whereof make the Amphora.——At *Ferrara*, the Maſtilly, containing eight Sechys.——In *Iſtria*, Sechys; ſix whereof make the Urna.——In *Calabria*, and the *Pouille*, Pignatoli's, equal to *French* Pints; thirty-two Pignatoli's make the Staro, or Staio; and ten Staro's, the Salma.

German Liquid Meaſures. The Feoder is uſed almoſt throughout all *Germany*, but with ſome difference in its Length, as well as its Sub-diviſions. The Feoder is ſuppoſed the Load of a Waggon with two Horſes. Two Feoders and a half make the Reoder; ſix Ames, the Feoder; twenty Fertels, the Ame; and four Maſſems, or Maſſes, the Fertel: ſo that the Roder contains 1200 Maſſes, the Feoder 480, the Ame 80, and the Fertel 41. ——At *Nuremberg*, the Diviſion of the Feoder, is into twelve Heemers, and the Heemer into ſixty-four Maſſes. ——At *Vienna*, they divide the Feoder into thirty-two Heemers, the Heemer into thirty-two Achtelings, and the Achteling into four Seiltins. The Ame, there, is eighty Maſſes; the Fertel, call'd alſo Schreve, four Maſſes; and the Driolinck twenty-four Heemers.——At *Ausbourg*, the Feoder is divided into eight Jez; the Je into two Muids, or twelve Beſons; the Beſon into eight Maſſes, which makes 768 Maſſes in the Feoder, as in that of *Nuremberg*.——At *Heidelberg*, the Feoder is divided into ten Ames; the Ame into twelve Vertels; and the Vertel into four Maſſes.——In *Wirtemberg*, the Feoder is divided into ſix Ames; the Ame into ſixteen Yunes; the Yune into ten Maſſes.

Liquid Meaſures on the Coaſts of Barbary. At *Tripoli*, &c. they uſe the Rotolo, or Rotoli; thirty-two whereof make the Matuli.——At *Tunis*, forty-two of the Rotoli of *Tripoli*, make a Matara, or Mataro; and the other Places on the ſame Coaſt uſe nearly the ſame Meaſures.—— It may be here obſerved, that moſt, if not all the *Eaſtern* Nations, with whom the *Europeans* traffic, have not any ſuch thing as *Meaſures of Capacity*, whether for Things liquid or dry; but that they ſell every thing, even Liquors, by the Weight. We may, however, rank among the Number of *Liquid Meaſures*, the Cocoa and Canan of *Siam*. The firſt are the Cocoa-ſhells cleared of their Kernel. And ſince theſe are not all of the ſame Capacity, they meaſure them with *Cauris*, or little Shells found in the *Maldives*; which alſo ſerve for Money in ſome States of the *Indies*. Some Cocoa's hold a thouſand *Cauris*, and ſome only five hundred. Above the Cocoa's is the Canan, a little Meaſure uſed in the ſame Country, and called by the *Portugueſe*, *Choup*; holding about a *Paris* Quart.

Cubic Meaſures of Capacity for Things Dry.

Engliſh Dry or Common Meaſures, are raiſed from the *Wincheſter* Gallon; which contains 272¾ Solid Inches, to hold of pure Running or Rain-Water, nine Pound, thirteen Ounces. This ſeems to ſtand on the foot of the Old Wine Gallon, of 224 Cubic Inches; 12 being to 14$\frac{12}{20}$, as 224 to 272½. Yet by an Act of Parliament, made 1697, it is decreed, That a round Buſhel, eighteen Inches and a half wide, and eight deep, is a legal *Wincheſter* Buſhel. But ſuch a Veſſel will only hold 250.42 Cubic Inches; conſequently the Gallon will only contain 268$\frac{4}{5}$ Cubic Inches. The Diviſions and Multiples are as in the Table following.

French Dry Meaſures, are the Litron, Buſhel, Minot, Mine, Septier, Muid, and Tun. The Litron is divided into two Demi-litrons, and four Quarter-litrons, and contains 36 Cubic Inches of *Paris*. By Ordonnance, the Litron is to be three Inches and a half high; and three Inches, ten Lines broad. The Litron for Salt is larger, and is divided into two Halves, four Quarters, eight Demi-quarters, and ſixteen Meſurettes.——The Buſhel is different in different Juriſdictions. At *Paris*, it is divided into Demi-buſhels; each Demi-buſhel into two Quarts; the Quart into two Half-quarts; and the Half-quart into two Litrons: ſo that the Buſhel contains ſixteen Litrons. By Ordonnance, the *Paris* Buſhel is to be eight Inches, two Lines and a half high; and ten Inches broad, or in Diameter, within-ſide. The Minot conſiſts of three Buſhels; the Mine of two Minots, or ſix Buſhels; the Septier of two Mines, or twelve Buſhels; and the Muid of twelve Septiers, or a hundred forty-four Buſhels. *The Buſhel for Oats* is eſtimated double that of any other Grain; ſo that there go twenty-four Buſhels to make the Septier, and two hundred eighty-eight to make the Muid. It is divided into four Picotins; the Picotin containing two Quarts, or four Litrons. *The Buſhel for Salt* is divided into two Half-Buſhels, four Quarters, eight Half-Quarters, and ſixteen Litrons; four Buſhels make a Minot, ſixteen a Septier, and a hundred ninety-two a Muid. The *Buſhel for Wood* is divided into Halves, Quarters, and Half-Quarters. Eight Buſhels make the Minot, ſixteen a Mine; twenty Mines, or three hundred and twenty Buſhels, the Muid. For Plaiſter, twelve Buſhels make a Sac, and thirty-ſix Sacs a Muid. For Lime, three Buſhels make a Minot, and forty-eight Minots a Muid. See Bushel.——The Minot is, by Ordonnance, to be eleven Inches, nine Lines high; and fourteen Inches eight Lines in diameter. The Minot is compoſed of three Buſhels, or ſixteen Litrons; four Minots make a Septier, and forty-eight a Muid.——The Mine is no real Veſſel, but an Eſtimation of ſeveral others. At *Paris*, the Mine contains ſix Buſhels, and twenty-four make the Muid. At *Rouen*, the Mine is four Buſhels; and at *Dieppe*, eighteen Mines make a *Paris* Muid. See Muid.——The Septier differs in different Places: At *Paris*, it contains two Mines, or eight Buſhels; and twelve Septiers the Muid. At *Rouen*, the Septier contains two Mines, or twelve Buſhels. Twelve Septiers make a Muid at *Rouen*, as well as *Paris*; but twelve of the latter are equal to fourteen of the former. At *Toulon*, the Septier contains a Mine and half; three of which Mines make the Septier of *Paris*. See Septier.——The Muid, or Muy, of *Paris*, conſiſts of twelve Septiers; and is divided into Mines, Minots, Buſhels, &c. That for Oats is double that for other Grain; *i. e.* contains twice the Number of Buſhels. At *Orleans*, the Muid is divided into Mines; but thoſe Mines only contain two *Paris* Septiers and a half. See Muid. In ſome Places they uſe the Tun in lieu of the Muid; particularly at *Nantes*, where it contains ten Septiers of ſixteen Buſhels each, and weighs about three thouſand three hundred Pounds. Three of theſe Tuns make twenty-eight *Paris* Septiers. At *Rochel*, &c. the Tun contains forty-two Buſhels, and weighs two *per Cent.* leſs than that of *Nantes*. At *Breſt*, it contains twenty Buſhels, is equal to ten *Paris* Septiers, and weighs about two thouſand two hundred and forty Pounds. See Tun.

Dutch, *Swediſh*, *Poliſh*, *Pruſſian*, and *Muſcovite Dry Meaſures*. In theſe Places they eſtimate their Dry Things on the foot of the *Laſt*, *Leſt*, *Leth*, or *Lecht*; ſo called, according to the various Pronunciations of the People who uſe it.——In *Holland*, the Laſt is equal to nineteen *Paris* Septiers, or thirty-eight *Bourdeaux* Buſhels, and weighs about 4560 Pounds; the Laſt they divide into twenty-ſeven Mudes, and the Mude into four Schepels.——In *Poland*, the Laſt is forty *Bourdeaux* Buſhels, and weighs about 4800 *Paris* Pounds.——In *Pruſſia*, the Laſt is 133 *Paris* Septiers.——In *Sweden* and *Muſcovy*, they meaſure by the Great and Little Laſt; the firſt containing twelve Barrils, and the ſecond half as many. See Last.——In *Muſcovy*, they likewiſe uſe the Chefford, which is different in various Places: That of *Archangel* is equal to three *Rouen* Buſhels.

Italian Dry Meaſures. At *Venice*, *Leghorn*, and *Lucca*, they eſtimate their dry Things on the foot of the Staro or Staio; the Staro of *Leghorn* weighs 54 Pounds: 112 Staro's, and ſeven Eighths, are equal to the *Amſterdam* Laſt.——At *Lucca*, 119 Staro's make the Laſt of *Amſterdam*.——The *Venetian* Staro weighs 128 *Paris* Pounds; the Staro is divided into four Quarters. 35 Staro's and $\frac{1}{5}$, or 140 Quarters $\frac{4}{5}$, make the Laſt of *Amſterdam*.——At *Naples*, and other Parts, they uſe the Tomole, or Tomalo, equal to one Third of the *Paris* Septier. 36 Tomols and a half, make the Carro; and a Carro and a half, or 54 Tomols, make the Laſt of *Amſterdam*.——At *Palermo*, 16 Tomoli make the Salma; and four Mondili, the Tomolo. Ten Salma's $\frac{3}{7}$, or 171 Tomoli $\frac{3}{7}$, make the Laſt of *Amſterdam*.

Flemiſh Dry Meaſures. At *Antwerp*, &c. they meaſure by the Vertel; thirty-two and a half whereof, make nineteen *Paris* Septiers.——At *Hambourg*, the Schepel; ninety whereof make nineteen *Paris* Septiers.

Spaniſh and Portugueſe Dry Meaſures. At *Cadiz*, *Bilboa*, and *St. Sebaſtian*, they uſe the Fanequa; twenty-three whereof make the *Nantes*, or *Rochel* Tun; or nine *Paris* Septiers and a half: tho the *Bilboa* Fanequa is ſomewhat larger; inſomuch that twenty one Fanequas make a *Nantes* Tun.——At *Seville*, &c. they uſe the Anagros, containing a little more than the *Paris* Mine; thirty-ſix Anagros make nineteen *Paris* Septiers.——At *Bayonne*, &c. the Conqua; thirty whereof are equal to nine *Paris* Septiers and a half.——At *Lisbon*, the Alquier, a very ſmall Meaſure; 240 whereof make 19 *Paris* Septiers; 60 the *Lisbon* Muid.

Engliſh *Dry or Corn Meaſures.*

Note. *The uſual* MEASURE *of Wood for Firing*, is the Cord; four Foot high, as many broad, and eight long; divided into two half Cords, call'd Ways, and by the *French*, *Membrures*, from the Pieces, ſtuck upright, to bound them; or Voyes, as being ſuppoſed half a Waggon Load. See CORD.

The MEASURE *for Horſes*, is the Hand or Handful; which, by the Statute, contains four Inches. See HAND, *&c.*

MEASURE is alſo uſed to ſignify the Cadence, and Time obſerved in Poetry, Dancing, and Muſic, to render them regular, and agreeable. The different *Meaſures* in Poetry, are the different Manners of ordering and combining the Quantities, or the long and ſhort Syllables. Thus Hexameter, Pentameter, Iambic, Sapphic Verſes, *&c.* conſiſt of different *Meaſures*. See QUANTITY, VERSE, *&c.*

In *Engliſh* Verſes, the *Meaſures* are extremely various and arbitrary, every Poet being at liberty to introduce any new Form he pleaſes. The moſt uſed are, the Heroic, generally conſiſting of five long, and five ſhort Syllables; Verſes of four Feet; and of three Feet, and a Ceſure or ſingle Syllable. The Antients, by variouſly combining and tranſpoſing their Quantities, made a vaſt Variety of different *Meaſures*. Of Words, or rather Feet of two Syllables, they form'd a *Spondee*, conſiſting of two long Syllables; a *Pirrhic*, of two ſhort Syllables; a *Trochee*, of a long and a ſhort Syllable; an *Iambic*, of a long and a ſhort Syllable. Of their Feet of three Syllables, they form'd a *Moloſs*, conſiſting of three long Syllables; a *Tribrach*, of three ſhort Syllables; a *Dactyl*, of one long, and two ſhort Syllables; an *Anapeſt*, of two ſhort and two long Syllables. The *Greek* Poets contrived 124 different Combinations or *Meaſures*, under as many different Names, from Feet of two Syllables to thoſe of ſix. See SPONDEE, DACTYL, RHIME, FOOT, *&c.*

MEASURE, in Muſic, is the Interval, or Space of Time, which the Perſon, who regulates the Muſic, takes between the raiſing and letting fall of his Hand, in order to conduct the Movement ſometimes quicker, and ſometimes ſlower, according to the Kind of Muſic, or the Subject that is ſung or play'd. See TIME. The ordinary or common *Meaſure*, is one Second, or ſixtieth part of a Minute, which is nearly the Space between the Beats of the Pulſe or Heart; the Syſtole, or Contraction of the Heart, anſwering to the Elevation of the Hand, and its Diaſtole, or Dilatation, to the letting it fall. The *Meaſure* uſually takes up the Space that a Pendulum, of two Foot and a half long, employs in making a Swing or Vibration. See VIBRATION.

The *Meaſure* is regulated according to the different Quality or Value of the Notes in the Piece; by which the Time that each Note is to take up, is expreſs'd. The Semi-Breve, for inſtance, holds one Riſe, and one Fall; and this is call'd the whole *Meaſure*: the Minim, one Riſe, or one Fall; and the Crochet, half a Riſe, or half a Fall, there being four Crochets in a full *Meaſure*. See NOTE.

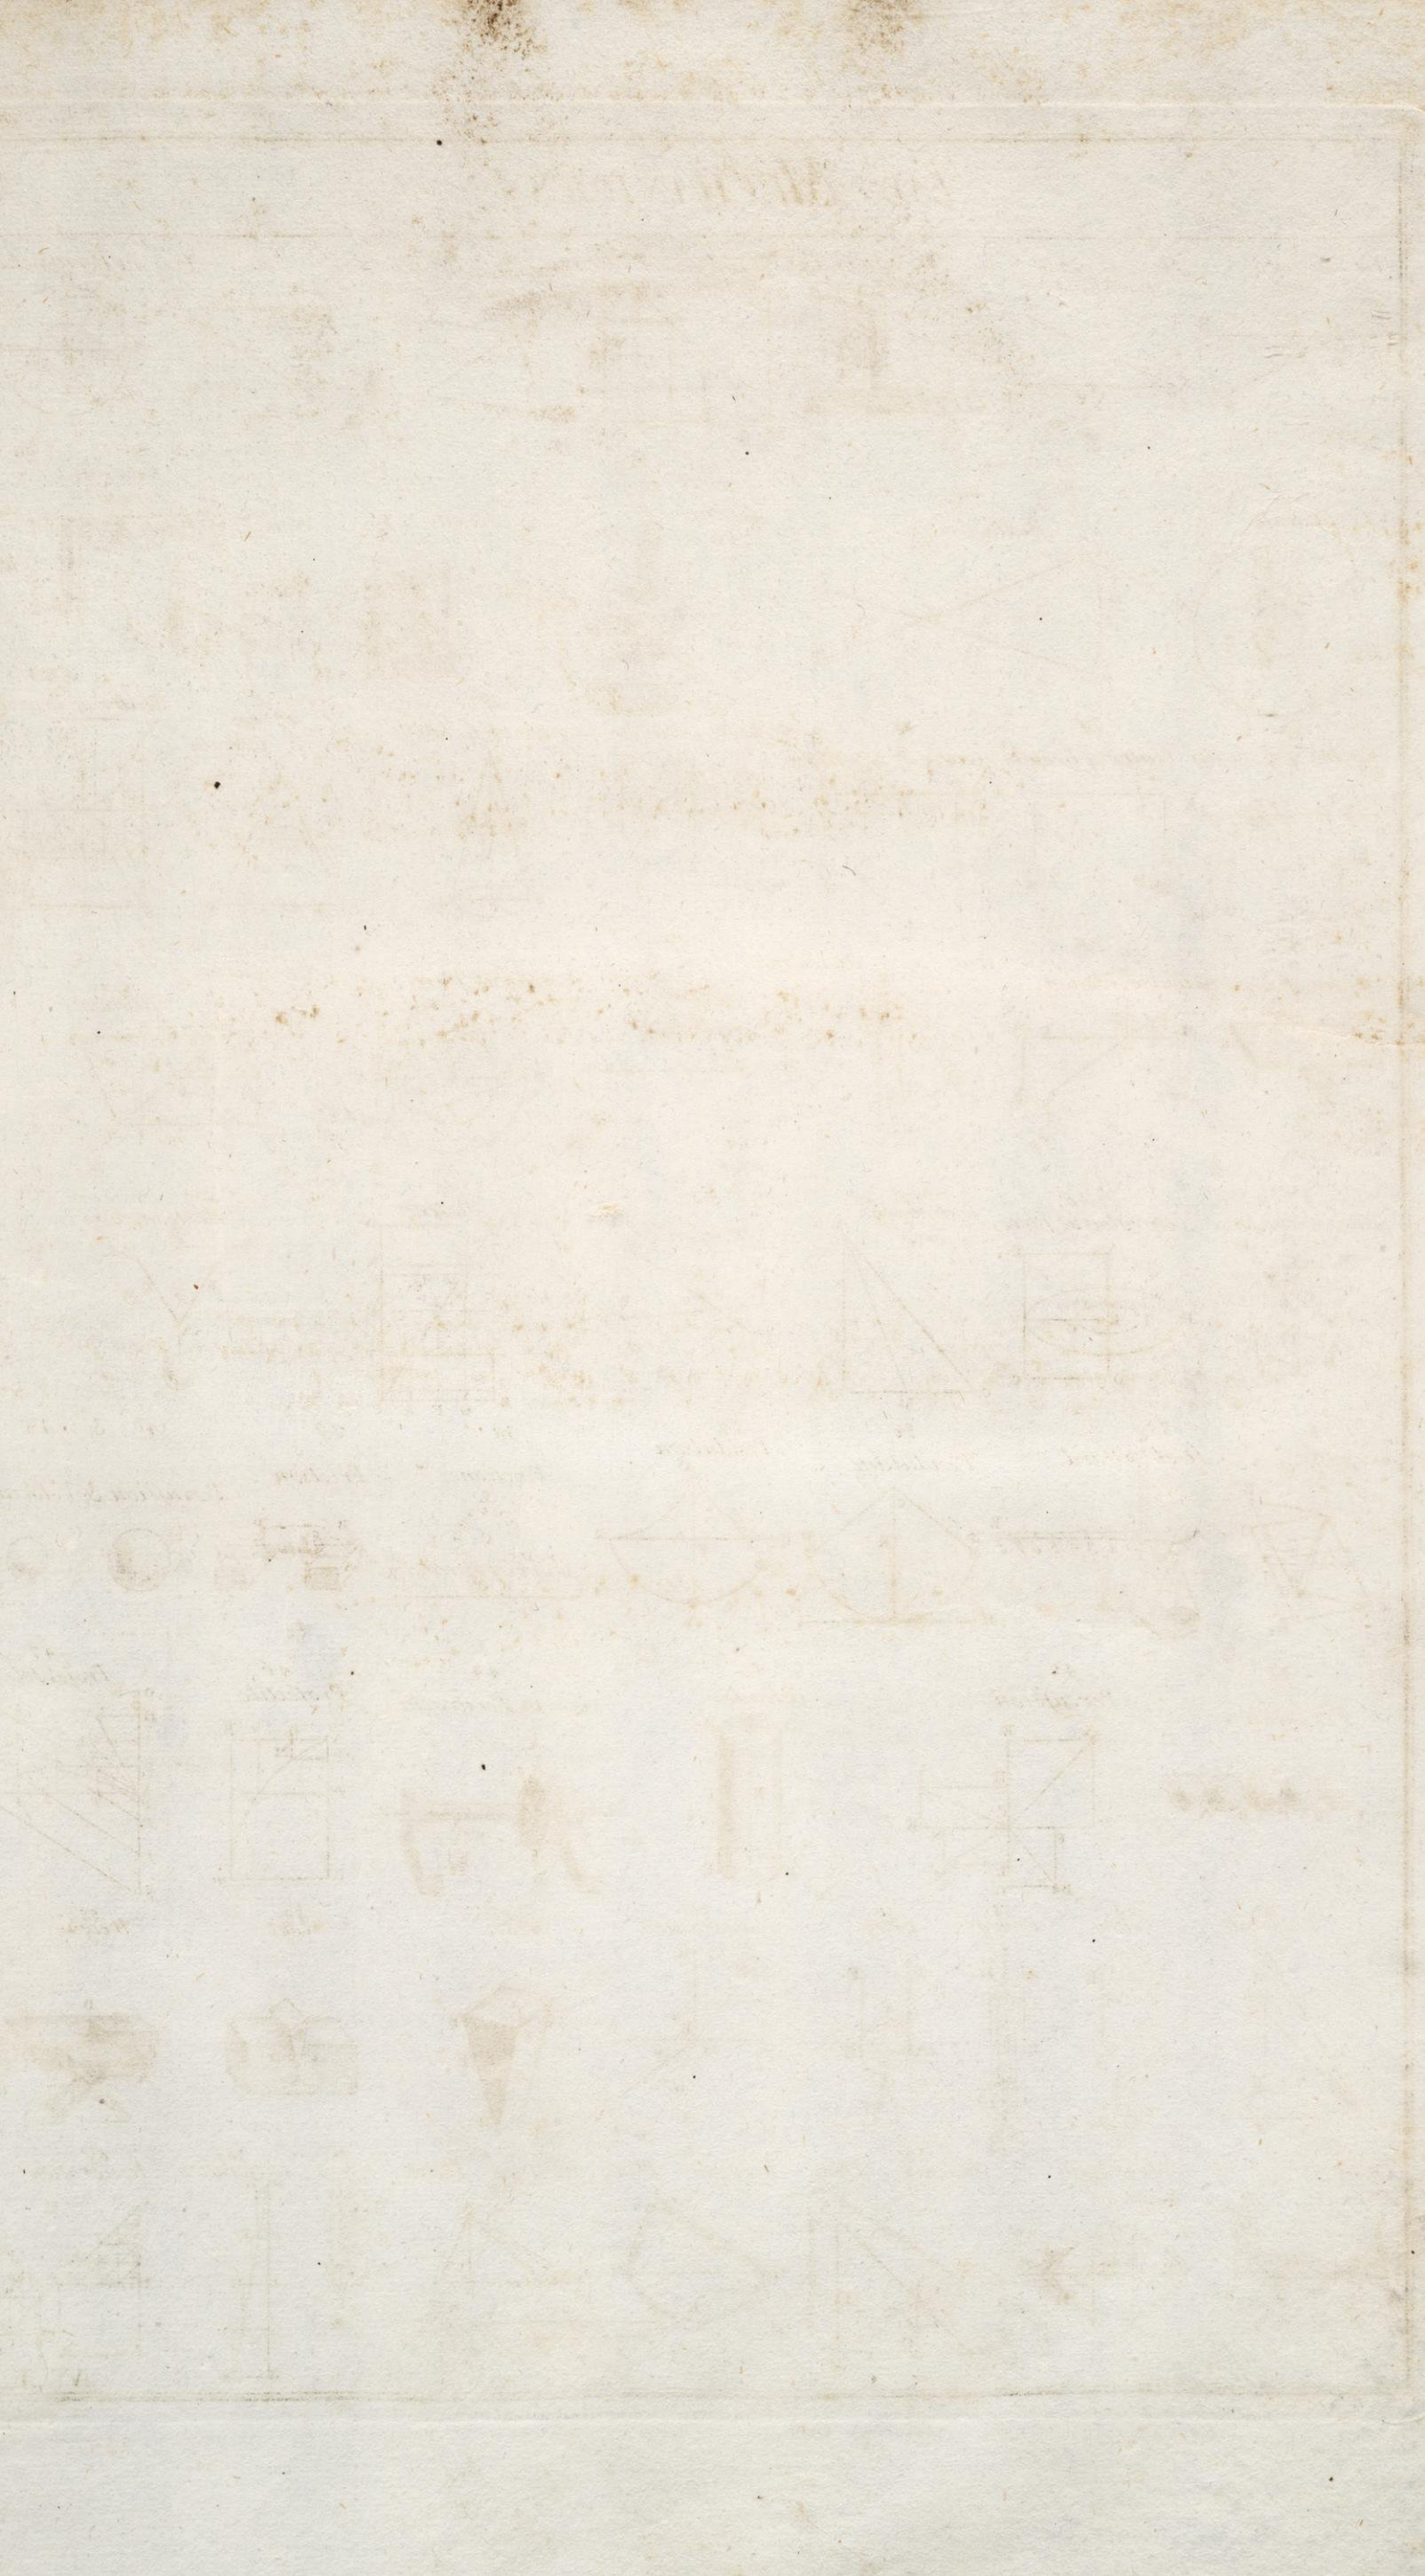
Binary, or *Double* MEASURE, is that wherein the Riſe and Fall of the Hand are equal.

Ternary, or *Triple* MEASURE, is that wherein the Fall is double to the Riſe; or where two Minims are play'd during a Fall, and but one in a Riſe: To this purpoſe, the Number 3 is placed at the beginning of the Lines, when the *Meaſure* is intended to be triple; and a *C*, when the *Meaſure* is to be common or double.

This riſing and falling of the Hands, was call'd by the *Greeks* ἄρσις and θέσις. St. *Auguſtin* calls it *Plauſus*, and the *Spaniards*, *Compaſs*. See BEATING *of Time*.

MEASURING. To define *Meaſuring* Geometrically, it is the aſſuming any certain Quantity, and expreſſing the Proportion of other ſimilar Quantities to the ſame: To define it popularly, *Meaſuring* is the uſing a certain known Meaſure, and determining, thereby, the preciſe Extent, Quantity or Capacity of any thing. See MEASURE.

MEASURING, in the general, makes the practical Part of Geometry; ſee GEOMETRY: From the various Subjects whereon it is employ'd, it acquires various Names, and conſtitutes various Arts. Thus



MEASURING *of Lines*, or Quantities of one Dimenſion, we call *Longimetry*; ſee LONGIMETRY: And when thoſe Lines are not extended parallel to the Horizon, *Altimetry*: ſee ALTIMETRY. When the different Altitudes of the two Extremes of the Line are alone regarded, *Levelling*; ſee LEVELLING.

MEASURING *of Superficies*, or Quantities of two Dimenſions, is variouſly denominated, according to its Subjects; when converſant about Lands, 'tis called *Geodæſia*, or *Surveying*: in other Caſes, ſimply *Meaſuring*. The Inſtruments uſed are the Ten-Foot Rod, Chain, Compaſs, Circumferentor, *&c.* See SUPERFICIES; ſee alſo SURVEYING, *&c*

MEASURING *of Solids*, or Quantities of three Dimenſions, we call *Stereometry*; ſee STEREOMETRY: where 'tis converſant about the Capacities of Veſſels, or the Liquors they contain particularly, *Gauging*. See GAUGING. The Inſtruments are the Gauging-Rod, Sliding-Rule, *&c.* See SOLID; ſee alſo GAUGING-ROD, SLIDING-RULE, *&c.*

From the Definition of *Meaſuring*, where the Meaſure is expreſs'd to be ſimilar or homogeneous, *i. e.* of the ſame kind with the Thing meaſured; 'tis evident that in the firſt Caſe, or in Quantities of one Dimenſion, the Meaſure muſt be a Line; in the ſecond, a Superficies; and in the third, a Solid. For a Line, *v. g.* cannot meaſure a Surface; to meaſure, being no more than to apply the known Quantity to the unknown, till the two become equal. Now a Surface has Breadth, and a Line has none; but if one Line hath no Breadth, two or a hundred have none: A Line, therefore, can never be applied ſo often to a Surface, as to be equal to it, *i. e.* to meaſure it. And from the like Reaſoning it is evident, a Superficies, which has no Depth, cannot be equal to, *i. e.* cannot meaſure a Solid, which has. While a Line continues ſuch, it may be meaſured by any part of itſelf: but when the Line begins to flow, and to generate a new Dimenſion, the Meaſure muſt keep pace, and flow too; *i. e.* as the one commences Superficies, the other muſt do ſo too: Thus we come to have *Square Meaſures*, and *Cubic Meaſures*. See SQUARE and CUBE. Hence we ſee why the *Meaſure of a Circle* is an Arch, or part of the Circle; for a right Line can only touch a Circle in one Point, but the Periphery of a Circle conſiſts of infinite Points: The right Line therefore to meaſure the Circle, muſt be applied infinite Times, which is impoſſible. Again, the right Line only touches the

Circle,

No XI.

Circle in a Mathematical Point; which has no Parts or Dimenſions, conſequently no Magnitude: but a Thing that has no Magnitude or Dimenſions, bears no proportion to another that has; and cannot therefore meaſure it. Hence we ſee the Reaſon of the Diviſion of Circles into 360 Parts or Arches, called *Degrees*. See DEGREE.

MEASURING *of Triangles*, or from three given Sides or Angles, to determine all the reſt, is call'd *Trigonometry*. See TRIGONOMETRY.

MEASURING *of the Air*; its Preſſure, Spring, *&c.* is called *Aerometry* or *Pneumatics:* See AEROMETRY, *&c.*

MEATUS *Cyſticus*, a Bilary Duct, about the Bigneſs of a Gooſe-Quill, which at about two Inches diſtance from the Gall-Bladder, is join'd to the *Meatus Hepaticus*; and theſe together form the *Ductus Communis*. See BILE.

MEATUS *Urinarius*, or *Urinary Paſſage*, in Women, is very ſhort, lined internally with a very thin Membrane; next to which is a Coat of a white Subſtance. Thro this Coat, from ſome *Lacunæ* in it, paſs ſeveral Ducts, which convey a limpid glutinous Matter, ſerving to anoint the Extremity of the *Urethra*. See URINARY.

MEATUS *Auditorius*, the Entrance of the Ear; a cartilaginous Subſtance, irregularly divided with fleſhy membranous Interpoſitions in ſeveral Parts of it, not unlike the *Bronchia* in the Lungs, only its fleſhy Fibres are here thicker. The inner Part, or that next the Brain, is bony. It is lined throughout with a thin Membrane, derived from the Skin, which is continued on the *Membrana Tympani*, where it becomes thinner. See EAR.

From the beginning of the *Meatus*, almoſt half-way, ariſe a great number of ſmall Hairs, at whoſe Roots iſſue the Ear-Wax, which is intangled in thoſe Hairs, the better to break the *Impetus* of the external Air, and prevent its too ſuddenly ruſhing in on the *Membrana Tympani*. See CERUMEN.

MECHANICS, from *μηχανὴ*, *Engine*, is a mix'd Mathematical Science, which conſiders *Motion*, its Nature and Laws, with the Effects thereof, in Machines, *&c.* See MOTION.

That part of *Mechanics* which conſiders the Motion of Bodies ariſing from Gravity, is by ſome call'd *Statics*. See GRAVITY, STATICS, RESISTENCE, *&c.* In diſtinction from that part which conſiders the *Mechanic* Powers, and their Application, properly call'd *Mechanics*. See MECHANIC POWERS, MACHINE, ENGINE, FRICTION, EQUILIBRIUM, *&c.*

MECHANIC *Powers*, are the five ſimple *Machines*; to which all others, how complex ſoever, are reducible, and of the Aſſemblage whereof they are all compounded. See POWER and MACHINE.

Theſe *Mechanic Powers* (as they are call'd) are ſix, *viz.* the *Ballance*, *Lever*, *Wheel*, *Pully*, *Wedge*, and *Screw*; which ſee under their proper Heads: BALLANCE, LEVER, *&c.*

They may, however, be all reduced to one, *viz.* the *Lever*. The Principle whereon they depend, is the ſame in all, and may be conceived from what follows.

The *Momentum*, *Impetus*, or Quantity of Motion of any Body, is the *Factum* of its Velocity, (or the Space it moves in a given Time, ſee MOTION) multiplied into its Maſs. Hence it follows, that two unequal Bodies will have equal Moments, if the Lines they deſcribe be in a reciprocal Ratio of their Maſſes. Thus, if two Bodies, faſten'd to the Extremities of a Ballance or Lever, be in a reciprocal Ratio of their Diſtances from the fixed Point; when they move, the Lines they deſcribe will be in a reciprocal Ratio of their Maſſes. *V. g.* If the Body A (*Tab.* MECHANICS, *fig. 6.*) be triple the Body B, and each of them be ſo fix'd to the Extremities of a Lever AB, whoſe *Fulcrum*, or fix'd Point, is C, as that the Diſtance of BC be triple the Diſtance CA; the Lever cannot be inclined on either ſide: but that the Space BE, paſs'd over by the leſs Body, will be triple the Space AD, paſs'd over by the great one. So that their Motions or Moments will be equal, and the two Bodies in Equilibrio. See MOTION. Hence that noble Challenge of *Archimedes*, *datis Viribus, datum Pondus movere*; for as the Diſtance CB may be increaſed infinitely, the Power or Moment of A may be increaſed infinitely. So that the whole of *Mechanics* is reduced to the following Problem.

Any Body, as A, *with its Velocity* C, *and alſo any other Body, as* B, *being given; to find the Velocity neceſſary to make the Moment, or Quantity of Motion in* B, *equal to the Moment of* A, *the given Body*. Since now the Moment of any Body is equal to the Rectangle under the Velocity, and the Quantity of Matter; as B : A : : C : to a fourth Term, which will be *c*, the Celerity proper to B, to make its Moment equal to that of A. Wherefore in any Machine or Engine, if the Velocity of the Power be made to the Velocity of the Weight : : reciprocally as the Weight is to the Power; then ſhall the Power always ſuſtain, or if the Power be a little increas'd, move the Weight.

Let, for inſtance, A B be a Lever, whoſe *Fulcrum* is at *c*, and let it be moved into the Poſition *a c b*. Here the Velocity of any Point in the Lever, is as the Diſtance from the Centre. For let the Point A deſcribe the Arch A *a*, and the Point B the Arch B *b*; then theſe Arches will be the Spaces deſcribed by the two Motions: but ſince the Motions are both made in the ſame time, the Spaces will be as the Velocities. But it is plain, the Arches A *a* and B *b* will be to one another, as their Radii A C and A B, becauſe the Sectors A C *a*, and B *c b*, are ſimilar: wherefore the Velocities of the Points A and B, are as their Diſtances from the Centre C. Now if any Powers are applied to the Ends of the Lever A and B, in order to raiſe its Arms up and down; their Force will be expounded by the Perpendiculars S *a*, and *b* N; which being as the right Sines of the former Arches, *b* B and *a* A, will be to one another alſo as the Radii A *c*, and *c* B; wherefore the Velocities of the Powers, are alſo as their Diſtances from the Centre. And ſince the Moment of any Body is as its Weight, or gravitating Force, and its Velocity conjunctly; if different Powers or Weights are applied to the Lever, their Moments will always be as the Weights and their Diſtances from the Centre conjunctly. Wherefore if to the ſame Lever, there be two Powers or Weights apply'd reciprocally, proportional to their Diſtances from the Centre, their Moments will be equal; and if they act contrarily, as in the Caſe of a Stilliard, the Lever will remain in an horizontal Poſition, or the Ballance will be in Equilibrio. And thus it is eaſy to conceive how the Weight of one Pound may be made to equi-ballance a thouſand, *&c.* Hence alſo it is plain, that the Force of the Power is not at all increaſed by Engines; only the Velocity of the Weight in either lifting or drawing, is ſo diminiſh'd by the Application of the Inſtrument, as that the Moment of the Weight is not greater than the Force of the Power. Thus, for inſtance; if any Force can elevate a Pound Weight with a given Velocity, it is impoſſible by any Engine to effect, that the ſame Power ſhall raiſe two Pound Weight, with the ſame Velocity: But by an Engine it may be made to raiſe two Pound Weight, with half the Velocity; or 10000 times the Weight with $\frac{1}{10000}$ of the former Velocity. See PERPETUAL MOTION.

MECHANICAL *Curve*, a Term uſed by *Des Cartes* for thoſe Curves, which cannot be defined by any Equation; in oppoſition to Algebraic, which they call Geometric Curves. Theſe Curves, Sir *Iſ. Newton*, M. *Leibnitz*, &c. call tranſcendent Curves; and diſſent from *Cartes*, in excluding them out of Geometry. *Leibnitz* has even found a new kind of tranſcendent Equations, whereby theſe Curves are defined: They are of an indefinite nature; that is, don't continue conſtantly the ſame in all Points of the Curve; in oppoſition to Algebraic Equations, which do. See CURVE.

MECHANICAL *Affections*, are ſuch Properties in Matter, as reſult from their Figure, Bulk, and Motion: MECHANICAL *Cauſes* are thoſe founded on ſuch Affections; and MECHANICAL *Solutions* are Accounts of Things on the ſame Principles.

MECHANICAL *Philoſophy*, is the ſame with the Corpuſcular Philoſophy; *viz.* that which explains the Effects of Nature, and the Operations of Corporeal Things, on the Principles of *Mechanics*; the Figure, Arrangement, Diſpoſition, Motion, Greatneſs or Smallneſs of the Parts which compoſe natural Bodies. See CORPUSCULAR.

The Term MECHANICAL is alſo applied to a kind of *Reaſoning*, which of late has got a great deal of ground both in Phyſics and Medicine; ſo call'd, as being conformable to what is uſed in the Contrivance, and accounting for the Properties and Operations of Machines. This ſeems to have been the Reſult of rightly ſtudying the Powers of a human Mind, and the Ways by which it is only fitted to get acquaintance with material Beings: For conſidering an Animal Body as a Compoſition out of the ſame Matter, from which all other material Beings are formed, and to have all thoſe Properties, which concern a Phyſician's Regard only, by virtue of its peculiar Make and Conſtructure; it naturally leads a Perſon, who truſts to proper Evidences, to conſider the ſeveral Parts, according to their Figures, Contexture, and Uſe; either as Wheels, Pullies, Wedges, Levers, Skrews, Chords, Canals, Ciſterns, Strainers, and the like; and throughout the whole of ſuch Enquiries, to keep the Mind cloſe in view of the Figures, Magnitudes, and mechanical Powers of every Part or Movement; juſt in the ſame manner, as is uſed, to enquire into the Motions and Properties of any other Machine. For which purpoſe it is frequently found helpful to decypher, or picture out in Diagrams, whatſoever is under conſideration, as it is cuſtomary in common Geometrical Demonſtrations; and the Knowledge obtained by this Procedure, is called *Mechanical Knowledge*.

The Term MECHANICAL is alſo uſed in Mathematics, to ſignify a Conſtruction or Proof of ſome Problem, not done in an accurate Geometrical Manner, but coarſely and unartfully, or by the aſſiſtance of Inſtruments, as are moſt Problems relating to the Duplicature of the Cube, and the Quadrature of the Circle.

MECHOACAN, MACADOSSIN, or WHITE JALAP; called alſo *White Rhubarb*, and *American Scammony*; a medicinal Root, taking its Name from a Province of *New Spain*, from whence it is brought. *Mechoacan* was known and uſed as a Purgative before Jalap, tho the latter is now in more general Uſe, as being found more efficacious. Yet *Mechoacan* is the ſweeter and more gentle of the two, and on that account preferable. The Seat of its Action is chiefly in the extreme Parts, for which reaſon it is accounted good in arthritic Pains. It has the advantage of needing no Preparation or Corrective; and purging in its own proper Subſtance, ſuch as it grows. M. *Boulduc* found by analyſing it, that it contains twelve times as much Salt as Reſin; but neither the ſaline nor reſinous Extract purge ſo freely as the Subſtance, even tho taken in larger Doſes; nor do they yet purge ſo gently. In the Choice of *Mechoacan*, prefer thoſe Pieces which are the browneſt within; and whoſe Subſtance is the cloſeſt, and moſt compact.

MECONIUM, in Pharmacy, is the Juice of the Poppy, drawn by Expreſſion, and dried; differing from Opium, in that this laſt ouzes out, after an Inciſion made in the Heads of the Poppies. The Word comes from the *Greek* μηκων, *Poppy*. See OPIUM.

MECONIUM is alſo a black thick Excrement, gather'd in the Inteſtines of a Child during the time of Geſtation. In Colour and Conſiſtence, it reſembles Pulp of *Caſſia*. It is alſo found to reſemble *Meconium*, or Juice of Poppy, whence it takes its Name.

MEDAL, a ſmall Figure, or Piece of Metal, in form of a Coin, deſtined to preſerve to Poſterity the Portrait of ſome great Man, or the Memory of ſome illuſtrious Action.

For the Manner of ſtriking MEDALS, ſee COINING.

Some Authors imagine, that the antient MEDALS were uſed for Money. M. *Patin* has a Chapter expreſs to prove, that they had all a fix'd regular Price in Payments; not excepting even *Medallions*. F. *Joubert* is of the ſame Opinion. Others, on the contrary, maintain, that we have no real Money of the Antients; and that the *Medals* we now have, never had any Courſe as Coins. Between theſe two Extremes, there is a Medium, which appears by much more reaſonable than either of them. See MONEY.

MEDALS are divided into Antient and Modern: The *Antient* are ſuch as were ſtruck between the third and the ſeventh Centuries: The *Modern* are thoſe ſtruck within theſe 300 Years. Among the Anitent, ſome are *Greek*, others *Roman*. The *Greek* are the moſt antient. That People ſtrook *Medals* in all the three Metals with ſuch exquiſite Art, as the *Romans* could never come up to. The *Greek Medals* have a Deſign, Accuracy, Force, and a Delicacy that expreſſes even the Muſcles and Veins, and it muſt be own'd, goes infinitely beyond any thing of the *Romans*. There are alſo *Hebrew Medals*; *Punic*, *Gothic*, and *Arabic Medals*; which make new Claſſes in the antient and modern ones. The Conſular *Medals* are certainly the moſt antient *Medals* of the *Romans*: And yet thoſe of Copper and Silver don't go beyond the 484th Year of *Rome*; nor thoſe of Gold beyond the Year 546. If any are produced of an older Date, they are ſpurious.

Conſular MEDALS are ſo call'd, to diſtinguiſh them from the Imperial; not that they were ſtrook by order of the Conſuls, but becauſe in thoſe Times the Republic was governed by Conſuls. Of theſe, Father *Joubert* reckons about fifty or ſixty of Gold; two hundred and fifty of Copper; and near a thouſand of Silver. *Goltzius* has deſcribed them in a Chronological Order, according to the *Faſti Conſulares*. *Urſinus* has diſpoſed them Genealogically, according to the Order of the *Roman* Families. M. *Patin* has collected an entire Series of them, in the ſame Order with *Urſinus*; and only computes 1037 Conſulars, which relate to 178 *Roman* Families. M. *Vaillant*, and M. *Morel*, each promiſed a new Edition of the *Conſular Medals*; M. *Vaillant* kept his word, and his Book was printed e'er he died, in 3 Vol. *Folio*.

Among the *Imperial* MEDALS, we diſtinguiſh between the Upper and the Lower Empire: The *Upper* Empire commenced under *Julius Cæſar*, and ended about the Year of Jeſus Chriſt 260: The *Lower* Empire comprehends near 1200 Years, *viz.* till the taking of *Conſtantinople*. 'Tis the Cuſtom, however, to account all the *Imperial Medals*, till the Time of the *Paleologi*, among the Antique; and yet we have no *Imperial Medals*, of any conſiderable Beauty, later than the Time of *Heraclius*, who died in 641. After the Time of *Phocas* and *Heraclius*, *Italy* became a Prey to the *Barbarians*; ſo that the Monuments we have remaining of thoſe two Emperors, finiſh the Set or Series of *Imperial Medals*. To theſe are added the *Medals* of the Lower Empire, and the *Greek* Emperors; whereof a Series may be made as low as our time, taking in the Modern ones. M. *Patin* has made an ample Collection of the *Imperial Medals* till the Time of *Heraclius*. The *Gothic Medals* make part of the Imperial ones. They are ſo call'd, as having been ſtruck in the Times of the *Goths*, and in the Declenſion of the Empire; and ſavouring of the Ignorance and Barbarity of the Age.

As to the Modern, they are ſuch as have been ſtruck in *Europe*, ſince the Uſurpation of the *Goths* has been extinct; and Sculpture and Engraving have begun to reflouriſh. The firſt was that of the famous Reformer *John Hus* in 1415; if any pretend to be more antient, they are ſpurious. In *France*, there were none ſtruck with the Prince's Effigy before the Reign of *Charles* VII. The Study of modern *Medals* is ſo much more uſeful, as they afford more light than the antient, and mark the Times and Circumſtances of Events preciſely; whereas the Inſcriptions of the antient *Medals* are very ſhort and ſimple, and generally without any Date. Add to this, that the antient *Medals* are extremely liable to be counterfeited, by reaſon of the exceſſive Price they bear. But in the modern, there is not near that Danger of being impoſed upon.

For the reſt, *Medals* have been ſtruck in three Kinds of Metals, which make three ſeveral Sets or Series in the Cabinets of the Curious. That of Gold is the leaſt numerous, as not conſiſting of above 1000, or 1200 of the Imperial; that of Silver may contain about 3000 Imperial; and that of Copper, of the three ſeveral Sizes, *viz.* the great, the middle, and the ſmall Copper, conſiſts of 6 or 7000, all Imperial. See SERIES.

There are no true *Hebrew Medals*; thoſe which we ſee of the Heads of *Moſes*, and *Jeſus Chriſt*, are ſpurious and modern. We have a few Shekels of Copper and Silver, with *Hebrew* or *Samaritan* Legends; but none of Gold; tho there is mention made of one in the King of *Denmark*'s Cabinet. F. *Souciet* has a Diſſertation on the *Hebrew Medals*, commonly call'd *Samaritan Medals*; where he diſtinguiſhes accurately between the Genuine and Spurious; and ſhews, that they are true *Hebrew* Coins ſtruck by the *Jews*, but on the Model of the Antients; and that they were current before the *Babyloniſh* Captivity. See SAMARITAN.

The Parts of a *Medal*, are the two Sides; one whereof is call'd the *Head*, the other the *Reverſe*. On each Side is the Area or Field, which makes the middle of the *Medal*; the Rim or Border; and the *Exergue*, which is beneath the Ground, whereon the Figures repreſented are placed. On the two Sides are diſtinguiſh'd the Type, and the Inſcription or Legend. The Types are the Figures repreſented; the Legend is the Writing, eſpecially that around the *Medal*; tho in the *Greek Medals*, the Inſcription is frequently in the Area. What we find in the *Exergue*, is frequently no more than ſome Initial Letters, whoſe Meaning we are unacquainted withal; tho, ſometimes too, they contain Epochas, or Words that may be accounted an Inſcription. See EXERGUE and LEGEND.

'Tis not either the Metal, or the Size, which makes a *Medal* valuable; but the Scarcity of the Head, or of the Reverſe, or the Legend. Some *Medals* are common in Gold, which yet are very rare in Copper; and others very rare in Silver, which in Copper and Gold are very common. The Reverſe is ſometimes common, where the Head is ſingular; and ſome Heads are common, whoſe Reverſes are very ſcarce. There are *Medals* very ſcarce in ſome Sets, and yet very common in others. For inſtance, there is no *Antonia* in the Sets of large Copper, and the middle Copper is forced to ſupply its place. The *Otho* is very rare in all the Copper Sets, and yet common in the Silver ones. *Otho's*, of the large Copper, are held at an immenſe Price; and thoſe of the middle Copper, at 40 or 50 Piſtoles. And the *Gordians* are rated full as high. Singular *Medals* are invaluable. Singular *Medals*, in the popular ſenſe, are ſuch as are not found in the Cabinets of the Curious, and are only met with by chance; but in the ſtricter ſenſe are ſuch, whereof there is not above one of a Kind extant. The *Otho* in large Copper is a ſingular *Medal*. When a *Medal* exceeds the Value of ten or twelve Piſtoles, they are worth what the Owner pleaſes. The *Peſcennius Niger*, and *Pertinax*, are very rare in all Metals. The *Didius Julianus* is hardly found any where, but in large Copper. *Carteren*, a *Dutchman*, and ſome others, have made Mills expreſs to ſtrike *Medals* that never were, as thoſe of *Cicero*, *Virgil*, *Priam*, &c. M. *Vaillant* has collected all the *Medals* ſtruck by the *Roman* Colonies; F. *Hardouin* thoſe of the *Greek* and *Latin* Cities. F. *Noris*

thoſe

thoſe of *Syria*. M. *Morel* has undertaken an Univerſal Hiſtory of *Medals*, and promiſes Cuts of twenty-five thouſand. He has ranged them under four Claſſes. The firſt contains the *Medals* of Kings, Cities, and People; which have neither the Name nor Image of the *Roman* Emperors. The ſecond contains the *Conſular Medals*; the third the *Imperial Medals*; and the fourth, the *Hebrew*, *Punic*, *Parthic*, *French*, *Spaniſh*, *Gothic*, and *Arabic*. He begins with the *Imperial*, and brings them down as low as *Heraclius*. He places the *Latin*, in order, before the *Greek*. *Ad. Occo*, a *German* Phyſician, and Count *Mezzabarba*, have endeavoured to range them in a Chronological Order, but that is impracticable. For in moſt of the *Imperial Medals*, there is no Mark either of the Conſulate, or of the Year of the Reign; and ſince *Gallio*, there is none of them that bear the leaſt Footſteps of Chronology. *Greek Medals* are ſuch as have either the Heads of *Greek* Emperors, or *Greek* Inſcriptions.

There are falſe or *ſpurious Medals*, which are thoſe counterfeited, and put off for Antique, when they are not: *Mutilated Medals*, which are thoſe that are not entire, or are defaced: *Redintegrated Medals*, which are thoſe wherein we find the Letters *Reſt.* which ſhew that they have been reſtored by the Emperors: *Dipt Medals*, which are ſtruck of pure Copper, and afterwards ſilver'd. This is a Contrivance that the Curious have frequent recourſe to, in order to compleat their Silver Sets. *Cover'd* or *Plaited Medals*, which have only a thin Silver Leaf over the Copper, but which are ſtruck ſo artfully, that the Cheat does not appear, without cutting them: Theſe are the leaſt ſuſpected. *Grain'd* or *Indented Medals* are thoſe, whoſe Edges are cut like Teeth, which is a ſign of Goodneſs and Antiquity. They are common among the *Conſulars*, but we have none later than *Auguſtus*. There are ſeveral of them, however, among thoſe of the Kings of *Syria*. *Medals countermark'd*, are thoſe that are cut either on the Side of the Head, or of the Reverſe: Theſe Countermarks ſerve to denote the Change of their Value; and this Kind is much enquir'd for by the Curious. There are alſo *Caſt Medals*, which are not ſtruck, but caſt in a Mould; and *Medals* that have no Reverſe.

Scaliger derives the Word from the *Arabic Methalia*, a Coin wherein is impreſs'd the Figure of a human Head. *Menage* and *Voſſius* rather derive it from *Metallum*. *Du Cange* obſerves, that the antient *Oboli* were call'd *Medalia*, *quaſi Medietas Nummi*.

The moſt noted *Medaliſts*, or Authors on *Medals*, are, *Antonius Auguſtinus*, *Wolffius*, *Lazius*, *Ful. Urſinus*, a learned Antiquary, *Æneas Vicus*, *Hubertus*, *Goltzius*, *Oiſelius Seguin*, *Occo*, *Triſtan*, *Sirmond*, *Vaillant*, *Patin*, *Noris*, *Spanheim*, *Hardouin*, *Morel*, *Joubert*, *Mezzabarba*, *Begher*, &c.

MEDALLION, a *Medal* of an extraordinary Bigneſs. It was ordinarily a kind of Medal, which Princes uſed to preſent, as a Token of their Eſteem; for which reaſon the *Romans* call'd them *Miſſilia*. The *Medallions* were never any current Coin, as the Medals were: They were ſtruck purely to ſerve as publick Monuments, or to make Preſents of. There cannot be any Set made of them, even tho' the Metals and Sizes ſhould be join'd promiſcuouſly. The beſt Cabinets do not contain above four or five hundred; tho' M. *Morel* promiſes us Figures of above a thouſand. Authors vary about the Time when they firſt began to be ſtruck. Some Antiquaries will have it under the Empire of *Theodoſius*: but this muſt be a Miſtake; for there were ſome ſtruck even in the Upper Empire: witneſs a *Nero*, a *Trajan*, and an *Alexander Severus*, ſtill extant. *Medallions* of Gold are very rare, as alſo thoſe of large Copper. *Medallions* are diſtinguiſh'd from Medals by the Volume; that is, by the Thickneſs and Compaſs; and the Largeneſs and Relievo of the Head. *Medallions*, in many antient *Latin* Titles, are call'd *Mettalliones*. The *Italians* call them *Medaglioni*.

MEDIANA, the Name of a Vein, or little Veſſel, made by the Union of the Cephalic and Baſilic, in the Bend of the Elbow. 'Tis not a particular Vein, or a third Vein of the Arm, as ſome Authors imagine; but merely a Branch of the Baſilic; which running into the inner Part of the Elbow, unites with the Cephalic, and forms a common Vein, call'd *Mediana*; and by the *Arabs*, the *Black Vein*. *Columnæ Mediana*, in *Vitruvius*, are the two Columns in the middle of a Porch, whoſe inner Column is larger than thoſe of the reſt.

MEDIANA *Linea*, a Line or Seam running down the middle of the Tongue, and dividing it into two equal Parts; tho not ſo effectually, but that the Blood-Veſſels of the one Side communicate with thoſe of the other. See TONGUE.

MEDIASTINE, or MEDIASTINA, the Name of a Vein of the *Mediaſtinum*. See VEIN and MEDIASTINUM.

MEDIASTINUM, in Anatomy, a double Membrane, form'd by a Duplicature of the *Pleura*; ſerving to divide the Thorax, longitudinally. It proceeds from the Sternum, and paſſing ſtrait down thro the middle of the Thorax to the Vertebræ, divides its Cavity into two. It contains, in its Doublings, the Heart, Vena Cava, the Oeſophagus, and the Stomachic Nerves. The Membranes of the *Mediaſtinum* are finer and thinner than the Pleura, and have a little Fat. It receives Branches of Veins and Arteries from the Mammillary, and Diaphragmatic, particularly, one call'd *Mediaſtina*; its Nerves come from the Stomachic: it has alſo ſome Lymphatics, which open into the Thoracic Duct. The *Mediaſtinum* divides the Thorax into two Parts; to the end that one Lobe of the Lungs may officiate, if the other be hinder'd by a Wound on the other Side. Sometimes there is a Matter contain'd betwixt its Membranes, immediately under the Sternum, which may occaſion the trepanning of this Place. The *Mediaſtinum* ſerves to ſuſtain the Viſcera, and prevent their falling from one ſide to the other. See PLEURA, THORAX, &c.

MEDIASTINUM *Cerebri*, is the ſame as *Septum Tranſverſum*. See SEPTUM TRANSVERSUM, &c.

MEDIATE, or INTERMEDIATE, a Term of Relation to two Extremes, applied to a third, which is in the middle; as, to a ſecond Cauſe, which is acted upon by ſome ſuperior or firſt Cauſe, to produce any Effect. Subſtance is a Genus with regard to Man, but between the two there are other *mediate* Genus's, as Body and Animal. *Mediate* is uſed in oppoſition to *immediate*. Thus when we ſay, that God and Man concur to the Production of Man; God is the *mediate* Cauſe, Man the *immediate*. 'Tis a popular Queſtion in Theology, *viz.* Whether the Holy Ghoſt converts a Sinner *mediately* or *immediately*.

MEDICINE, an Art, ordinarily call'd *Phyſic*; defined, by *Boerhave*, to conſiſt in the Knowledge of thoſe Things, by whoſe Application, Life is either preſerv'd ſound and healthy, or when diſorder'd, again reſtor'd to its priſtine Healthineſs. See HEALTH and DISEASE.

Galen defines *Medicine*, the Art of preſerving preſent Health, or of retrieving it when paſt: *Hippocrates*, the Addition of what is wanting, and the Retrenchment of what is redundant: And laſtly, *Hierophilus*, the Knowledge of Things good, indifferent, and ill, with regard to Health.

Phyſic muſt have been nearly coeval with the World. The Injuries and Viciſſitudes of the Air, the Nature and Qualities of Foods, the Violence of external Bodies, the Actions of Life, and laſtly, the Fabric of the Human Compages; muſt have render'd Diſeaſes almoſt as old as Mankind: And the Preſence of a Diſeaſe, as it brings with it a painful Senſation, the Loſs of the Uſe of a Limb, &c. we find, does, by a neceſſary mechanical Impulſe, both in Brutes and Men, compel the Diſeaſed to ſeek for Help, and to apply Remedies, either by mere Experiment, or by Inſtinct, and ſpontaneous Appetite. Hence aroſe the Art of *Medicine*; which, in this ſenſe, has been always, every where, among Mankind. Antient Hiſtories and Fables tell us, that in a little time, from the Flood, it was ſo well cultivated by the *Aſſyrians*, *Babylonians*, *Chaldeans*, and *Magi*, that they were able to remove preſent Diſeaſes, and prevent future ones. Hence it paſs'd into *Egypt*, *Lybia Cyrenaica*, and *Crotone*; and thence into *Greece*, where it flouriſh'd, principally in the Iſlands of *Cnidus*, *Rhodes*, *Cos*, and in *Epidaurus*.

The firſt Foundations of the Art were laid by Chance, natural Inſtinct, and Events unforeſeen: Theſe were improved by the Memory of the Succeſs of former Experiments; by writing down the Diſeaſes, their Remedies, and their Event, on Columns, Paintings, and the Walls of their Temples; by expoſing the Sick in the Markets and public Ways, that thoſe who paſs'd by, might enquire into the Diſeaſe, and communicate a Remedy, if they knew any: and laſtly, by Analogy, or Reaſoning, from a Compariſon of Things already obſerv'd, with Things preſent and to come. The Art at length receiv'd a much greater degree of Perfection, by the appointing of *Phyſicians*; ſome for the Cure of particular Diſeaſes, and others for Diſeaſes in general; by an accurate Obſervation of the Diſeaſe, and its Symptoms; and by an exact Deſcription of the Remedy, and its Uſe: immediately, upon which, it got among the Prieſts, and at length was confined to particular Families; deſcending, by way of Inheritance, from Father to Son: which, again, proved a great Bar to its Progreſs.

The *Extiſpicia*, or inſpecting the Entrails of Beaſts, uſed by the Prieſts; the Cuſtom of Embalming dead Carcaſes, and even Butchery itſelf, promoted the Knowledge of the Human Fabric, and of the Cauſes both of Health, Diſeaſes, and Death. Laſtly, the diſſecting of live Animals for Philoſophical Purpoſes, diſtinct Narratives of the Cauſe, Riſe, Increaſe, Criſis, Declenſion, End, and Effect of Diſeaſes; and the Knowledge of *Medicines*, their Choice, Preparation, Application, Powers, and

and Events, ſeem'd to have almoſt brought the Art to its Perfection.

Hippocrates, who was Cotemporary with *Democritus*, and perfectly acquainted with every thing hitherto laid down, and beſides, furniſh'd with a great number of Obſervations of his own, collecting into one all that was valuable and uſeful; compiled a Body of *Greek Medicine*; and was the firſt who deſerv'd the Title of a true Phyſician: for being a Maſter of the ἐμπειρία, *Experience*, as well as of Analogy and Reaſon, and withal well verſed in a pure Philoſophy; he, firſt, made Phyſic rational; and laid the Foundation of the dogmatical *Medicine*, which has ever ſince obtain'd. See DOGMATICAL, THEORETICAL, &c.

What *Hippocrates* had done, continu'd a long time ſacred and unalter'd, and was the ſtanding Practice of many Ages; at length *Aretæus* the *Cappadocian* digeſted it into a more orderly Body: whence, in various Places, at various Times, and by various Hands, particularly the *Alexandrian* School, it was further alter'd and improv'd; till at length it came to the hands of *Claud. Galen*; who collecting the ſcatter'd Parts, digeſting thoſe that were confus'd, and explaining every thing by the rigid Doctrines of the *Peripatetics*, did both a great deal of ſervice, and a great deal of miſchief, to the noble Art; he being the firſt who introduced the Doctrine of the Elements, the Cardinal Qualities, and their Degrees, the four Humours, &c. into *Medicine:* and on theſe he made the whole Art to depend. See TEMPERAMENT, HUMOUR, QUALITY, GREE, &c.

After the ſixth Century, the Arts were not only extinguiſh'd, but almoſt all Memory of them loſt, till the ninth; from which, to the thirteenth, *Medicine* was vigorouſly cultivated by the *Arabs* in *Aſia*, *Africa*, and *Spain:* who applying themſelves particularly to the Study of the *Materia Medica*, and its Preparations, and to the Operations of Chirurgery, render'd both more juſt and more copious at the ſame time. And yet *Galen*'s Errors became now more predominant than ever.

At length, however, they were purged out and exploded by two different Means; principally indeed by the Reſtoration of the pure Diſcipline of *Hippocrates* in *France*; and then alſo by the Experiments and Diſcoveries of Chymiſts and Anatomiſts: till at length the immortal *Harvey* overturning, by his Demonſtrations, the whole Theory of the Antients, laid a new and certain Baſis of the Science. Since his Time, *Medicine* is become free from the Tyranny of any Sect, and is improv'd by the ſure Diſcoveries in Anatomy, Chymiſtry, Phyſics, Botany, Mechanics, &c.

Hence it appears, that the Art originally conſiſted ſolely in the faithful Collection of Obſervations; and that a long time after, they began to enquire, and diſpute, and form Theories: the firſt part has ever continued the ſame; but the latter always mutable. For the ſeveral Sects that have aroſe among Phyſicians, ſee EMPERIC, DOGMATIC, &c.

MEDICINE is divided into five principal Branches. The firſt conſiders the Human Body, its Parts and Fabric, its Life and Health, and the Effects following from them; and this is call'd *Phyſiology*, the *Animal Oeconomy*, or *Doctrine of the Uſe of the Parts:* and its Objects, now enumerated, are call'd *Res Naturales*, or Things according to Nature. See PHYSIOLOGY, NATURAL THINGS, &c.

The ſecond Branch conſiders the Diſeaſes of the Human Body, their Differences, Cauſes, and Effects; and is call'd *Pathology*, as it conſiders the Diſeaſes; *Ætiology*, as it enquires into their Cauſes; *Noſology*, when it examines their Differences; and laſtly, *Symptomatology*, when it explains their Effects. The Objects of this Part are call'd *Res præter Naturales*, or beyond Nature. See PATHOLOGY, &c.

The third Branch conſiders the Signs or Symptoms, and how to apply them to Uſe; ſo as to judge both in a ſound, and a diſeaſed Body, what, which, is, will be, the Degree, Order, Effect, of the Health, or the Diſeaſe: This is call'd *Semeiotica*. Its Objects are Things both *Natural*, *Non-natural*, and *Præter-natural*. See SEMEIOTICA.

The fourth Branch conſiders the Remedies, and their Uſe, whereby Life may be preſerv'd; whence 'tis call'd *Hygeine*. Its Objects are what we ſtrictly call *Non-naturals*. See HYGEINE and NON-NATURALS.

Laſtly, The fifth furniſhes the *Materia Medica*, its Preparations, and Manner of Exhibition, ſo as to reſtore Health, and remove Diſeaſes; and is call'd *Therapeutica*, comprehending the *Diætetica*, *Pharmaceutica*, *Chirurgica*, and *Jetrica*. See DIÆTETICA, PHARMACEUTICA, CHIRURGICA, and JETRICA.

MEDICINES, or *Medicaments*, Preparations of any natural Subſtances, apply'd to a human Body, in order to anſwer ſome Intention of Cure. *Medicines* are diſtinguiſh'd, with regard to the Manner of Application, into Internal and External. *Internal*, are thoſe taken in at the Mouth: *External*, or *Topical*, are thoſe apply'd to any particular Part. See TOPICAL, &c.

With regard to the different Manner of their Operation, they are diſtinguiſh'd into *Evacuants*, *Aſtringents*, and *Alterants*, or *Specifics*. See EVACUANTS, SPECIFICS, ALTERANTS.

A general Idea of the Manner wherein *Medicines* operate on a human Body, may be conceiv'd from what follows.

A few different ſorts of Particles, variouſly combined, will produce great variety of Fluids; ſome may have one ſort, ſome two, ſome three or more. If we ſuppoſe only five different ſorts of Particles in the Blood, and call them *a*, *b*, *c*, *d*, *e*; their ſeveral Combinations, without varying the Proportions in which they are mix'd, will be theſe following: but whether more or leſs, need not be determin'd.

ab : *ac* : *ad* : *ae* :
bc : *bd* : *be* : *cd* :
ce : *de* : *abc* : *adc* :
abd : *abe* : *ace* : *ade* :
bdc : *bde* : *bec* : *dec* :
abcd : *abce* : *acde* : *abde* : *bcde* : *abcde* :

No Theory of Secretion has hitherto been able to give any tolerable Account of the Operation of ſuch *Medicines*, as promote an Evacuation. For if the Humours are equally mix'd with the Blood, that is, if the Blood is in every part of the Body the ſame, and its Particles are not more apt to form certain Humours, in ſome certain Parts of the Body, than in others; or if they are not forced, by the Power of ſome *Medicine*, to form ſuch Humours: then the Quantities of Humour, ſeparated in equal Times, will always be as the Velocity of the Blood; but the Velocity of the Blood is ſeldom doubled by any *Medicine*, and never tripled by the moſt acute Fever. The Quantity of Humour, however, drawn off by evacuating *Medicines*, is often twenty times greater than the natural Quantity; and therefore, upon ſuppoſition that the Humours are every where equally mix'd with the Blood, the Operation of evacuating *Medicines* can never be accounted for.

Tho this Argument hath the Strength of a Demonſtration, yet there are ſome who explain the Operation of purgative, and other evacuating *Medicines*, by a ſtimulating Faculty; whereby the ſluggiſh Juices are not only forc'd out, but the obſtructed Canals open'd, and the Motion of the Blood quicken'd. But tho ſuch a Power be allow'd, it would remain to be explain'd, why certain *Medicines* do only ſtimulate certain Glands? For it is evident, that evacuating *Medicines* have ſome other Power, beſides the ſqueezing out ſtagnant Juices; becauſe when they are all ſqueez'd out, they ſtill evacuate as much, if they are repeated, as they did before: as is plain, by continuing a Salivation for many days. Secondly, we cannot ſuppoſe, that all Bodies have every where, and at all times, Juices ſtagnating; but theſe *Medicines* conſtantly produce their Effects, more or leſs, at all times. Thirdly, if the Veſſels be ſuppoſed to be obſtructed, an evacuating *Medicine* could but double the Quantity that was evacuated, before it was taken. Fourthly, if theſe *Medicines* operate only theſe ways, then in a healthful Body, where there were no Obſtructions, they would have no effect at all. Fifthly, if the removing Obſtructions were the Cauſe of a greater Quantity evacuated, then the Evacuation ſhould ſtill continue in a greater degree than before the Obſtruction was removed; whereas, in fact, we conſtantly find it leſs, as the *Medicine* works off. Sixthly, tho a *Medicine*, by ſtimulating a Veſſel, may quicken the Motion of the Fluid in that Veſſel; yet it can never increaſe the Quantity of Fluid running thro it, in equal Spaces of Time; becauſe it quickens the Motion of the Fluid, only by contracting the Veſſel: and therefore the faſter the Fluid is made to run thro' the Veſſel, the leſs Fluid the Orifice of the Veſſel admits; and conſequently after the Veſſel is contracted by the ſtimulating *Medicine*, the Secretion will be leſs, inſtead of being greater. That a Stimulus cauſes the part, on which it acts, to contract, is matter of fact; and that purgative *Medicines* do ſtimulate the Bowels; but it may perhaps be likewiſe ſaid, they ſtimulate the Heart and Arteries, and increaſe their Force, being they not only quicken, but raiſe the Pulſe: ſo that a greater Quantity of Blood is ſent to the Glands of the Guts. This may be granted; but not that it is the principal Action of purgative *Medicines*; becauſe that, by the ſame Force, a greater Quantity of Blood is ſent to all the other Glands of the Body, whoſe Fluids are not, however, ſenſibly increaſed; and the Glands of the Inteſtines receive a leſs Quantity, in proportion, than any others, becauſe they cannot be ſo much dilated by the greater Force of the Blood, as others, which are not ſo much ſtimulated by the *Medicine*. There are others, who will have evacuating *Medicines* endued with an attenuating Quality, by which they diſſolve all the Coheſions of the Particles of the Blood, and ſo ſet the ſeveral Humours at liberty, to paſs thro' their proper Glands: but if theſe *Medicines* have a power univerſally to diſſolve all the Coheſions of the Blood, then every evacuating *Medicine* would equally and indif-

indifferently increaſe the Quantity of every Secretion. Mercury would as conſtantly purge as ſalivate, and Nitre promote Perſpiration, as well as Urine; but this is repugnant to Experience. If they have a power to diſſolve certain Coheſions, and not others; this is but ſetting certain Particles at liberty to paſs thro' their proper Glands, which were not ſo before; and is a preparing the Humours, in order to increaſe the Quantity of Secretion. Evacuating *Medicines* muſt therefore have a power to affect ſome Particles, and not others; that is, to repel ſome, and attract, retain, and alter others: and this is what may be affirm'd to be in all *Medicines*, and is what a thouſand Chymical Experiments demonſtrate. The ſeveral Humours then being form'd, by the different Coheſion of the Particles of Blood, the Quantity of Humour ſecerned by any Gland, muſt be in a Proportion compounded of the Proportion, that the Number of the Particles, cohering in ſuch a manner as is proper to conſtitute the Humour which paſſes thro' the Gland, bears to the Maſs of Blood; and of the Proportion of the Quantity of Blood, that arrives at the Gland. And hence it follows, that where there is a determinate Quantity of a certain Humour to be ſeparated, the Number of Particles, that are proper to compoſe the ſecerned Liquor, muſt be reciprocally proportional to the Quantity of the Blood that arrives at the Gland: and therefore, if the Quantity of the Secretion is to be increas'd, the Number of Particles is to be increas'd; if the Secretion is to be leſſen'd, the Number of Particles, proper for ſuch a Secretion, is to be leſſen'd in the ſame Proportion. *Medicines*, therefore, which can alter the Coheſions, and Combinations of the Particles, can either increaſe or diminiſh the Quantity of any Secretion. Thus, ſuppoſe the Humour, which paſſes thro' the Glands of the Inteſtines, to be compoſed of three or four ſeveral ſorts of Particles; that *Medicine*, which will eaſily cohere to thoſe Particles, and cohering, increaſe their mutual Attractions, ſo as they unite in greater Numbers at, or before they arrive at the Inteſtines, than they would have done, if the *Medicine* had not been given, muſt neceſſarily increaſe the Quantity of Humour, which paſſes thro' the Glands of the Inteſtines, if the Quantity of Blood which arrives at the Glands, is not diminiſh'd in the ſame Proportion, as the Number of Particles is increas'd. After the ſame manner do Diuretics, Sudorifics, and *Medicines*, which promote all other Secretions, operate.

Why increaſing the Quantity of ſome Secretions, ſhould diminiſh that of others, is not eaſy to explain on any other foot: for if the Blood be equally mix'd in every part of the Body, with all the Humours which are ſeparated from it; that is, if the Mixture of the Blood is every where alike, ſo that every Humour bears the ſame Proportion to the reſt of the Arterial Blood, in one part of the Body, that it does in another; and if every Humour has its own proper Gland, thro' which it is ſeparated: then what is ſeparated by one Gland, is not ſubſtracted from another; and conſequently doth not diminiſh the Quantity of Humour, which flows to this other, but doth indeed rather increaſe the Quantity of this other Secretion: for the more any one Humour is carry'd off, the greater Proportion any other remaining in the Blood, bears to the remaining Blood: And therefore the more any one Secretion is increaſed, the more all the reſt ſhould be increaſed likewiſe. But if all the Humours are compoſed by a Combination of a few different ſorts of Particles, then the more apt theſe Particles are to run into any one ſort of Combination, the leſs all other Combinations muſt be: and conſequently the increaſing any one Secretion, muſt neceſſarily diminiſh the Quantity of all others; but moſt eſpecially of that, which has the moſt of the ſame ſort of Particles. See SECRETION, HUMOUR, *&c.*

MEDICINAL *Hours*, are thoſe proper to take Medicines in: Of which there are four in the Day, *viz.* in the Morning faſting, about an Hour before Dinner, about four Hours after Dinner, and going to Bed; but in acute Caſes, the Times are to be govern'd by the Symptoms and Aggravation of the Diſtemper.

MEDICINAL *Waters*. See WATER.

MEDIETAS *Linguæ*, an Inqueſt impannel'd, whereof the one half conſiſts of Natives or Denizens, the other Strangers. It is uſed in Pleas, wherein the one Party is a Stranger, and the other a Denizen. *Solomon de Stanford*, a *Jew*, in the Time of *Edward* I. had a Cauſe tried before the Sheriff of *Norwich*, by a Jury of *ſex probos & legales Homines, & ſex legales Judæos de Civitate Norvici.* See JURY.

MEDITATION, an Action by which we conſider any thing cloſely, or wherein the Soul is employ'd in the Search of any Truth. In Religion it is uſed to ſignify a Conſideration of the Myſteries and grand Truths of Faith. The *Myſtics* make a great difference between *Meditation* and Contemplation. *Meditation* conſiſts in diſcurſive Acts of the Soul, conſidering methodically, and with attention, the Myſteries of Faith, and the Precepts of Morality: And is perform'd by Reflections and Reaſonings, which leave behind them manifeſt Impreſſions in the Brain. The pure Contemplative have no need of *Meditation*, as ſeeing all things in God at a Glance, and without any Reflection. When a Man therefore has once quitted *Meditation*, and is arrived at Contemplation, he returns no more; and, according to *Alvarez*, never reſumes the Oar of *Meditation*, except when the Wind of Contemplation is too weak to fill his Sails. See CONTEMPLATION.

MEDITERRANEAN, ſomething incloſed within Land. The Word is particularly uſed to ſignify that large Sea, which flows within the Lands of *Europe* and *Africa*, by the *Streights of Gibraltar*, and reaches into *Aſia*, as far as the *Euxine* Sea, and the *Palus Mœotis*. It was antiently call'd the *Grecian Sea*, and the *Great Sea*. It is now canton'd out into ſeveral Diviſions, which bear ſeveral Names. To the Weſt of *Italy* it is call'd the *Liguſtic*, or *Tuſcan Sea*; near *Venice*, the *Adriatic*; towards *Greece*, *Ionic* and *Ægean*; between the *Helleſpont* and the *Boſphorus*, the *White Sea*, as being very ſafe; and beyond, the *Black Sea*, its Navigation being dangerous. The *Arabs* call the *Mediterranean Sea*, the *Chamber-Pot*, by reaſon, they ſay, of its Figure.

MEDITULLIUM, is that ſpongy Subſtance between the two Plates of the Cranium, and in the Interſtices of all laminated Bodies. See CRANIUM.

MEDIUM, a *Latin* Term, ſignifying *Middle* or *Mean*. See MEAN.

MEDIUM, in Logic, or MEDIUM *of a Syllogiſm*, call'd alſo the *mean* or *middle Term*, and by the *Italians*, *mezzo termino*; is an Argument, Reaſon, or Conſideration, for which we affirm, or deny any thing: Or it is that Cauſe, why the greater Extreme is attributed to, or deny'd of the leſs, in the Concluſion. Thus, in the Syllogiſm, 'Every good thing is to be deſired; but all Virtue is 'good; therefore all Virtue is to be deſired:' The Term *Good* is the *Medium*; *Virtue* the leſs Extreme, and to be deſir'd the greater. See SYLLOGISM, EXTREME, *&c.*

'Tis call'd *Medium*, as being a kind of *Mediator* between the Subject and Predicate; or, by reaſon, the Extremes are diſpoſed to affirm, or deny by *means* hereof. Some call it *Argumentum tertium*, a third Argument, and others ſimply *Argumentum*, as being the Cauſe why we aſſent to the Concluſion. See ARGUMENT.

Mediums, or *Media*, are the Things principally ſought for, in diſcourſing; ſo that the Invention of *Mediums* makes the moſt eſſential Part of Logic. But the Rules commonly given by Logicians for that purpoſe, are mere Impertinencies. In effect, no ſuch Rules can be given: Nor have we any way of coming at ſuch *Mediums* or Reaſons, but by a cloſe Attention to clear Ideas. See DISCOURSE, INVENTION, *&c.*

MEDIUM, in Arithmetic, or an *Arithmetical Medium or Mean*, call'd in the Schools *Medium Rei*, is that which is equally diſtant from each Extreme; or, which exceeds the leſſer Extreme, as much as it is exceeded by the greater; in reſpect of Quantity, not of Proportion. Thus, Nine is a *Medium* between Six and Twelve. See *Arithmetical* PROPORTION.

Geometrical MEDIUM or *Mean*, call'd in the Schools *Medium Perſonæ*, is that where the ſame Ratio is preſerv'd between the firſt and ſecond, and the ſecond and third Terms; or that which exceeds in the ſame Ratio, or Quota of itſelf, as it is exceeded. Thus Six is a geometrical *Medium* between Four and Nine. See *Geometrical* PROPORTION.

This is the *Medium* which Virtue is ſuppos'd to obſerve; whence ſome call it *Medium quoad nos*, as having a View to Circumſtances, Times, Places, Perſons, *&c.* Diſtributive Juſtice obſerves a Geometrical *Medium*; Commutative Juſtice, an Arithmetical one. See JUSTICE.

The Schoolmen diſtinguiſh divers other Kinds of MEDIUMS; as

MEDIUM *Participationis*, in the Schools, is that ſaid to be compounded of the two Extremes: Thus, Man, who is partly Body, partly Mind, is a *Medium* by *Participation*, of the two Extremes; ſo, is Warmth the *Medium* of Heat and Cold, *&c.*

MEDIUM *Negationis* or *Remotionis*, is that, whereof both Extremes are deriv'd; or, it is a Subject, capable of receiving both Extremes, and yet not neceſſarily poſſeſs'd of either. In which latter ſenſe, the Will is a *Mean* with reſpect to Virtue and Vice; and the Underſtanding, with reſpect to Knowledge and Ignorance.

MEDIUM *quod*, or MEDIUM *Suppoſiti*, is ſomewhat between the Agent and Patient, which receives the Action of the one, e'er it arrive at the other. In this ſenſe, Air is a *Medium* between the Fire, and the Hand heated thereby.——MEDIUM *quo*, is the Form, or Faculty,

whereby an Agent produces an Effect; in which ſenſe, Heat is ſaid to be the *Medium* or *Mean*, whereby Fire acts on the Hand.——MEDIUM *ſub quo*, is that which renders the Power to act, compleat, in the general; without determining it to any particular Object: In this ſenſe, Light is the *Medium*, under which the Eye perceives any Colour.——MEDIUM *in quo*, is that, by inſpection whereof, a Power is produced in any thing, of knowing or perceiving another: Such, is a Speculum, as it ſhews an Object; an Image, as it repreſents the Reality, *&c.*

MEDIUM, in Mechanical Philoſophy, is that Space or Region, thro' which a Body paſſes in its Motion towards any Point. Thus *Æther* is ſuppoſed to be the *Medium*, wherein the heavenly Bodies move. See ÆTHER. *Air* the *Medium* wherewith the Earth is encompaſs'd, and Earthy Bodies move. See AIR. *Water* the *Medium* in which Fiſhes live and move. See WATER. Thus, *Glaſs* is alſo a *Medium* of Light, as it affords it a free Paſſage: And that Denſity or Conſiſtence in the Parts of the *Medium*, whereby the Motion of Bodies in it is retarded, is call'd *the Reſiſtance of the Medium*; which, together with the Force of Gravity, is the Cauſe of the Ceſſation of Motion of Projectiles. See RESISTANCE *of the Medium*.

Subtile MEDIUM. Sir *Iſ. Newton* makes it probable, That beſide the particular Aerial *Medium*, wherein we live and breath, there is another more univerſal one, which he calls an *Ætherial Medium*; vaſtly more rare, ſubtile, elaſtic, and active, than Air; and by that means freely permeating the Pores and Interſtices of all other Mediums, and diffuſing itſelf thro' the whole Creation: And by the Intervention hereof he thinks it is, that moſt of the great Phænomena of Nature are effected. This he ſeems to have recourſe to, as the firſt and moſt remote Phyſical Spring; and the Ultimate of all natural Cauſes. By the Vibrations of this *Medium*, he takes Heat to be propagated from lucid Bodies; and the Intenſeneſs of Heat increas'd and preſerv'd in hot Bodies, and from them communicated to cold ones. See HEAT. By this *Medium* he takes Light to be reflected, inflected, refracted, and put alternately in Fits of eaſy Reflection and Tranſmiſſion; which Effects he elſewhere aſcribes to the Power of Attraction: ſo that this *Medium* appears the Source and Cauſe of Attraction. See LIGHT, REFLECTION, REFRACTION, INFLECTION, and ATTRACTION.

Again, this *Medium* being much rarer within the heavenly Bodies, than in the heavenly Spaces; and growing denſer, as it recedes further from them: he propoſes as the Cauſe of the Gravitation of theſe Bodies towards each other, and of the Parts towards the Bodies. See GRAVITATION.

Again, from the Vibrations of this ſame *Medium*, excited in the bottom of the Eye by the Rays of Light, and thence propagated thro the Capillaments of the Optic Nerves into the Senſory, he takes Viſion to be perform'd; ſee VISION: And ſo Hearing, from the Vibrations of thisor ſome other *Medium*, excited in the Auditory Nerves, by the Tremors of the Air, and propagated thro the Capillaments of thoſe Nerves into the Senſory: and thus of the other Senſes. See SENSATION, HEARING, *&c.*

And, again, he conceives Muſcular Motion to be perform'd by the Vibrations of the ſame *Medium*, excited in the Brain at the Command of the Will, and thence propagated thro the Capillaments of the Nerves into the Muſcles; and thus contracting and dilating them. See MUSCLE.

The Elaſtic Force of this *Medium*, he ſhews, muſt be prodigious: Light moves at the rate of 70,000,000 Miles in about ſeven Minutes, yet the Vibrations and Pulſes of this *Medium*, to cauſe the Fits of eaſy Reflection and eaſy Tranſmiſſion, muſt be ſwifter than Light, which yet is 700,000 times ſwifter than Sound. The Elaſtic Force of this *Medium*, therefore, in proportion to its Denſity, muſt be above 490,000,000,000 times greater than the Elaſtic Force of the Air, in proportion to its Denſity: The Velocities and Pulſes of Elaſtic *Mediums* being in a ſub-duplicate Ratio of the Elaſticities, and the Rarities of the *Medium*, taken together. And thus may the Vibrations of this *Medium* be conceiv'd as the Cauſe of Elaſticity of Bodies. See ELASTICITY.

Further, the Particles of this *Medium* being ſuppoſed infinitely ſmall, even ſmaller than thoſe of Light; if they be likewiſe ſuppoſed, like our Air, to have a repelling Power, whereby they recede from each other, the Smallneſs of the Particles may exceedingly contribute to the Increaſe of the repelling Power, and conſequently to that of the Elaſticity and Rarity of the *Medium*; and ſo fit it for the free Tranſmiſſion of Light, and the free Motions of the heavenly Bodies. In this *Medium* may the Planets and Comets roll without any conſiderable Reſiſtance. If it be 700,000 times more elaſtic, and as many times rarer, than Air; its Reſiſtance will be above 600,000,000 times leſs than that of Water: A Reſiſtance that would make no ſenſible Alteration in the Motion of the Planets in ten thouſand Years. And is not ſuch a *Medium* better diſpoſed for the heavenly Motions, than that of the *Carteſians*, which fills all Space adequately, and without leaving Pores; is vaſtly denſer than Gold; and therefore muſt reſiſt more? See PLENUM, *&c.* If any ask how a *Medium* can be ſo rare, let him tell how the Air, in the upper Regions of the Atmoſphere, can be above a hundred thouſand times rarer than Gold. How an electric Body can, by Friction, emit an Exhalation ſo rare and ſubtile, yet ſo potent, as, tho its Emiſſion occaſions no ſenſible Alteration in the Weight of the Body; yet it ſhall be diffuſed thro a Sphere of two Foot in Diameter, and carry up Leaf-Copper, or Leaf-Gold, at the diſtance of a Foot from the electric Body. Or how the Effluvia of a Magnet can be ſo ſubtile, as to paſs a Plate of Glaſs without any Reſiſtance or Diminution of Force; yet ſo potent, as to turn a Magnetic Needle beyond the Glaſs. See ELECTRICITY.

That the Heavens are not fill'd with any other, but ſuch a ſubtile ethereal *Medium*, is evident from Phænomena; whence elſe thoſe laſting and regular Motions of the Planets and Comets, in all manner of Courſes and Directions. And how are ſuch Motions conſiſtent with that Reſiſtance, that muſt reſult from that denſe, fluid *Medium*, wherewith the *Carteſians* fill the Heavens. The Reſiſtance of fluid *Mediums* ariſes partly from the Cohesion of the Parts of the *Medium*, and partly from the *Vis Inertiæ*. The firſt, in a ſpherical Body, is nearly as the Diameter, or, at moſt, as the Factum of the Diameter, and the Velocity of the Body. The latter is as the Square of that Factum. Thus are the two Kinds of Reſiſtance diſtinguiſh'd in any *Medium*; and being diſtinguiſh'd, it will be found that almoſt all the Reſiſtance of Bodies, moving in ordinary Fluids, ariſes from the *Vis Inertiæ*. That Part which ariſes from the Tenacity of the *Medium*, may be diminiſh'd, by dividing the Matter into ſmaller Parts, and making thoſe more ſmooth and ſlippery: But the other will ſtill be proportional to the Denſity of the Matter, and cannot be diminiſh'd any other way, but by a Diminution of the ſame. Thus the Reſiſtance of fluid *Mediums*, is nearly proportional to their Denſities; and thus the Air we breath, being about 900 times lighter than Water, muſt reſiſt about 900 times leſs than Water: As, in effect, the ſame Author has found it does by Experiments on Pendulums. Bodies moving in Quick-Silver, Water, or Air, don't appear to meet with any other Reſiſtance, but what ariſes from the Denſity and Tenacity of thoſe Fluids; which they muſt, were their Pores fill'd with a denſe and ſubtile Fluid. See VACUUM. Heat, 'tis found, diminiſhes the Tenacity of Bodies very much; yet does it not decreaſe the Reſiſtance of Water, ſenſibly. The Reſiſtance of Water, therefore, ariſes chiefly from its *Vis Inertiæ*; conſequently, if the Heavens were as denſe as Water, or as Quick-Silver, they would not reſiſt much leſs: if abſolutely denſe, without any Vacuum, be the Particles never ſo ſubtile and fluid, they would reſiſt much more than Quick-Silver. A ſolid Globe, in ſuch a *Medium*, would loſe above half its Motion, while it moves thrice the Length of its own Diameter; and a Globe not perfectly ſolid, ſuch as the Planets, would loſe more. To make way therefore for the laſting Motions of the Planets and Comets, the Heavens muſt be empty of all Matter, except, perhaps, from ſome very fine Effluvia; from the Atmoſpheres of the Earth, Planets, and Comets; and ſome ſuch Ætherial *Medium* as we have deſcribed. A denſe Fluid can ſerve for no purpoſe, in the Heavens, but to diſturb the Celeſtial Motions, and to make the Frame of Nature languiſh; and in the Pores of Bodies, ſerves only to check the vibrating Motion of their Parts, wherein their Heat and Activity conſiſts. Such a *Medium*, therefore, unleſs we had ſome Evidence of its Exiſtence, muſt be given up; and that given up, the Hypotheſis of Light's conſiſting in a Preſſion, falls to the ground. See LIGHT, PRESSION, CARTESIANISM, *&c.*

MEDIUS *Venter*, in Anatomy, the Breaſt or Thorax. See THORAX; ſee alſo VENTER.

MEDULLA, in natural Hiſtory, *&c.* See MARROW.

MEDULLA *Cerebri* and *Cerebelli*, is the white ſoft Part of the Brain; and *Cerebellum*, cover'd on the Outſide with the Cortical Subſtance, which is of a more dark or aſhy Colour. See the Origin, Structure and Uſe thereof, under BRAIN and CEREBELLUM.

MEDULLA *Oblongata*, is the *Medullary* Part of the Brain and Cerebellum join'd in one; the fore-part of it coming from the Brain, and the hind-part from the Cerebellum. It lies on the Baſis of the Skull, and is continu'd thro' the great Perforation thereof into the Hollow of the Vertebræ of the Neck, Back, and Loins: tho' only ſo much of it retains the Name, as is included within the Skull. After its Exit thence, it is diſtinguiſh'd by the Name of the MEDULLA *Spinalis*.

The

The Subſtance of the *Medulla Oblongata* being only an Aggregate of thoſe of the Brain and Cerebellum, muſt, like them, be purely fibrous or nervous, and only an Aſſemblage of minute Tubes for the Conveyance of the Animal Spirits. It ariſes, as it were, from four Roots; whereof the two largeſt ſpring from the Brain, and are call'd *Crura*: the two leſſer from the Cerebellum, which Dr. *Willis* calls *Pedunculi*. See BRAIN, CEREBELLUM.

There are ſeveral Parts or Members of the *Medulla Oblongata*, particular Deſcriptions whereof will be found under their proper Heads. In the general it may be obſerv'd, that, upon inverting it, the firſt thing that appears upon its Trunk, is a Protuberance ſomewhat like a Ring, for that reaſon call'd *Protuberantia Annularis*. Then follow ten Pair of Nerves, which have their Origin here, and are hence ſent to the ſeveral Parts of the Body. See NERVE. Immediately under the firſt Pair, or Olfactories, appear two ſmall Arteries, or Branches of the *Carotides*. The ſecond Pair, or Optics, being cut off, appears the *Infundibulum*, which ends in the *Glandula Pituitaria*, and on each Side, the Carotid Arteries enter the Skull. In the Lateral Ventricles of the *Medulla* are two Prominences on each Side, the one Pair call'd *Corpora Striata*, from the appearance of Stripes, or nervous Fibres, within them; their outer Subſtance being cortical or glandulous, like the reſt of the Surface of the Brain, tho' not ſo deep. Betwixt the *Corpora Striata* is a broad thin Production of the *Medulla*, call'd *Fornix*; and underneath them lie two other Prominences, call'd *Thalami Nervorum Opticorum*. On either ſide of theſe is a *Plexus* of Blood-Veſſels, called *Plexus Coroides*. And under the *Fornix* a narrow Aperture, call'd the *Rima*, which lets into the *Infundibulum*; which is a Paſſage from the third Ventricle to the *Glandula Pituitaria*, thro the *Medulla* of the Brain; being lined with the *Pia Mater*. Under this, in the *Sinus* call'd *Sella Equina*, or *Turcica*, upon the *Os Cribroſum*, is the *Glandula Pituitaria*; which is ſurrounded with a *Plexus* of Veſſels, call'd *Rete Mirabile*, only viſible in Brutes. On the hind part of the third Ventricle is a ſmall *Foramen*, call'd *Anus*, leading to the fourth Ventricle of the *Cerebellum*: At the Orifice of this is ſeated a ſmall Gland, which, from its fancied Reſemblance to a Pine Apple, is call'd *Conarium*, or *Glandula Pinealis*; where *Des Cartes* and his Followers imagine the Seat of the Soul to be. On the backſide of the *Medulla Oblongata*, near the *Cerebellum*, are four Protuberances, whereof the upper and larger are call'd *Nates*; the under and leſſer *Teſtes*. Between theſe and the Proceſſes of the *Cerebellum*, is the fourth Ventricle, from its Figure call'd *Calamus Scriptorius*. On the *Medulla Oblongata*, near its Extremity, are four other Prominences, two on each Side; call'd *Corpora Pyramidalia* and *Olivaria*. See PYRAMIDALIA, OLIVARIA, CALAMUS, CONARIUM, RETE, &c.

MEDULLA *Spinalis*, or the *Spinal Marrow*, is a Continuation of the *Medulla Oblongata*, or *Medullary* Part of the Brain, without the Skull. It conſiſts, as the Brain does, of two Parts, a White or *Medullary*, and a Cineritious or Glandulous; the former without, and the other within. The Subſtance of the exterior Part is much the ſame with that of the *Corpus Calloſum*, only ſomewhat tougher, and more fibrous: which Difference becomes the more apparent, as it deſcends the lower; by reaſon of the Streightneſs of the Cavity, which growing gradually more narrow, preſſes the *Medullary* Fibres cloſer together, and renders them more compact, and gathers them into more diſtinct *Faſciculi*, till having deſcended the whole Tract of the *Spina*, they end in the *Cauda Equina*. It is the Origin of moſt of the Nerves of the Trunk of the Body: It ſends out thirty Pair on each Side to the Limbs, the great Cavities, and other Parts; which are nothing but *Faſciculi* of *Medullary* Fibres, cover'd with their proper Membranes. See NERVE.

The *Spinal Marrow* is generally ſaid to be cover'd with four Coats: The firſt, or external one, is a ſtrong nervous Ligament, which ties the *Vertebræ* together, to the Inſide of which it firmly adheres. The ſecond is a Production of the *Dura Mater*; it is exceedingly ſtrong, and ſerves to defend the *Spinal Marrow* from any Hurt from the Flexures of the *Vertebræ*. The third is a Production of the *Arytænoides*, and is a thin pellucid Membrane, lying between the *Dura* and *Pia Mater*, or the ſecond and fourth Membranes of the *Medulla*. This Membrane gives a Coat to the Nerves, that go out of the *Spina*, which is the inner Membrane of the Nerves, as the *Dura Mater* gives the outer. The fourth Coat is a Continuation of the *Pia Mater*, and is an extremely thin, fine, tranſparent Membrane; ſtrictly embracing the whole Subſtance of the *Medulla*, dividing it in the middle into two Tracts, and making, as it were, two Columns of it. See SPINE, VERTEBRÆ, &c.

MEDULLA *Oſſium*, or *Marrow of the Bones*, is a ſoft fatty Subſtance, placed in the Cavities or Pores of divers Bones; it is incloſed in a Membrane; and is devoid of Senſe: it is red in the greater Cavities, white in the leſs, and ſoft and ſucculent in ſpungy Bones. See BONE. From this is ſecreted the Medullary Oil. See MEDULLARY OIL.

MEDULLARY *Oil*, is no more than the finer and more ſubtile Parts of the *Medulla*, or Marrow of the Bones, ſo call'd. This, Dr. *Havers* obſerves, paſſes not into the Bones thro Ducts, but by ſmall Pores formed into the Veſſels or Glandules, which are conglomerated into diſtinct Lobules, contained in ſeveral Membranes inveſting the whole Marrow; all which Veſicles or Bags are propagated from the outward Coat of the Arteries; and by theſe it paſſes from one to another, till it arrives at the Sides, or extreme Parts of the Bone. That Part of it, which is ſupply'd to the Interſtices of the Joints, goes into them by Paſſages, penetrating thro the Bone into thoſe Cavities, and form'd for that end. The Uſe of this Oil is either common to all the Bones, whoſe Temper it preſerves, and keeps from being too brittle; or more peculiar for the Joints, where it is very ſerviceable, (1.) To lubricate the Bones at their Extremities, that they may move more eaſily and free. (2.) To keep the Ends of the articulated Bones from growing hot with Motion. (3.) To preſerve the Joints from wearing by Attrition, and rubbing one againſt another: And, (4.) To preſerve the Ligaments of the Joints from Dryneſs and Rigidity; and lubricate thoſe Parts, which ſlide upon the Bones, and keep the Cartilages, which are join'd to them, flexible.

MEETER. See METRE.

MEGALESIA, in Antiquity, a ſolemn Feaſt celebrated among the *Romans* on the 12th of *April*, in honour of the great Mother of the Gods, that is, *Cybele* or *Rhea*; wherein, were Games or Combats held before the Temple of that Goddeſs. They were call'd *Megaleſia*, from the *Greek* μεγαλὴ, *Great*; *Cybele* being accounted the great Goddeſs.

MELA, a Chirurgeon's Inſtrument, call'd alſo *Speculum*, and by the Vulgar, *Tenta*. Its Uſe is to probe Ulcers, draw a Stone out of the Yard: Its Form is various, according to the Uſes it is intended for. See SPECULUM.

MELANAGOGUES, are ſuch Medicines as are ſuppos'd particularly to purge off black Choler; from μέλας, *niger*, black; and ἄγω, *duco*, to lead: but there is no ſuch Diſtinction of Choler now regarded, and conſequently this Diſtinction is but little uſed. See PURGATIVES.

MELANCHOLY, in Medicine, the Name of a Diſeaſe, which conſiſts in a Delirium, without a Fever, and is uſually attended with Fear, Heavineſs and Sorrow, without any apparent Occaſion. The Antients attributed this Diſeaſe to black and cloudy Spirits, ariſing as Vapours from a redundant black Bile. Some of the Moderns aſcribe it to the irregular Motion of the Spirits, and their acid Conſtitution; and others, who know it better, to too heavy and viſcid a Blood, which permits not a Sufficiency of Spirits to be ſeparated in the Brain, to animate and invigorate the Nerves and Muſcles: And others to a Dryneſs of the *Meninges* of the Brain. This Diſeaſe is vary'd an infinite number of Ways, according to the Temperament and Ideas of the Perſon affected with it. It is a Species of Madneſs, and only differs from a downright *Mania* in degree. The Word comes from the *Greek* μέλας, *niger*; and χολὴ, *Bile*. See MADNESS, DELIRIUM, &c.

MELCHISADECHIANS, antient Sectaries, ſo call'd, becauſe they rais'd *Melchiſadech* above all Creatures, and even above Jeſus Chriſt. The Author of this Sect was one *Theodotus*; whence the *Melchiſadecbians* became more commonly known by the Name of *Theodotians*; all the Difference between thoſe, and the ſtrict *Theodotians*, conſiſting in that particular Article relating to *Melchiſadech*; who, according to them, was the great and ſupreme Virtue. See THEODOTIANS.

MELCHITES, the Name of a Religious Sect in the *Levant*, who ſcarce differ from the *Greeks* in any thing relating either to Faith or Worſhip; but yet ſpeak a different Language. The Word, in the *Syriac*, ſignifies *Royaliſts*, and was formerly apply'd to the Catholics by the Heretics, who refus'd to ſubmit to the Deciſions of the Council of *Calcedon*: intimating by this Appellation, that they were of the Religion of the Emperor. Thoſe now call'd *Melchites*, are ſuch People, as, inhabiting among the the *Syrians*, *Cophtæ*, or *Egyptians*, and other *Levantine* Nations, follow the Opinions of the *Greeks*, tho no *Greeks* themſelves: And 'tis for this reaſon that *Gabriel Sionita* calls them indifferently by the Name of *Greeks* and *Melchites*. The ſame Author obſerves, that they are ſpread thro' all the *Levant*; that they deny Purgatory; and are declar'd Enemies to the Pope and his Primacy. For the reſt, they fall in with the *Greeks*, both as to Articles of Faith and Diſcipline. They have tranſlated the *Greek* Euchologue, and other Books of that kind, into *Arabic*; and have the Canons of Councils in the ſame Language. To thoſe of the Council of *Nice*, they have added new Canons, commonly

monly call'd the *Arabic Canons*; which are likewiſe receiv'd by the *Jacobites* and *Maronites*: Tho moſt of the Learned look on them as ſpurious.

MELICERIS, is a Tumour incloſed in a *Cyſtis*, conſiſting of Matter like Honey: it gathers without Pain, and gives way upon Preſſure, but returns again: It is to be cured by warm Diſcutients.

MELITITES, a greyiſh Stone, which, when pulveriz'd, yields a milky Liquor, of a Taſte ſomewhat like Honey; whence it takes its Name. It is found in Mines of Metals, and ſeems to partake pretty much of the Nature of Lead; having a Sweetneſs ſomewhat like the *Sal Saturni*, but much fainter. It only differs from the *Galactites*, in that it is milder to the taſte. The Antients uſed it in Inflammations of the Eyes, and to dry Ulcers.

MELIUS *Inquirendo*, is a Writ that lieth for a ſecond Inquiry of what Lands and Tenements a Man died ſeized; where Partiality is ſuſpected, upon the Writ, call'd, *Diem clauſit extremum*.

MELODY, in Muſic, is the agreeable Effect of different Muſical Sounds, ranged or diſpoſed in Succeſſion. So that Melody is the Effect only of one ſingle Part, Voice, or Inſtrument; by which it is diſtinguiſh'd from *Harmony*; tho' in common Speech, theſe two are frequently confounded. Harmony is the agreeable Reſult of the Union of two or more concording muſical Sounds heard in Conſonance, *i. e.* at one and the ſame time; ſo that Harmony is the Effect of two Parts at leaſt: As therefore a continued Succeſſion of muſical Sounds produces *Melody*, ſo does a continued Combination of theſe produce Harmony. See HARMONY and CONCORD; ſee alſo *Muſic in* PARTS.

Tho' the Term *Melody* be chiefly applicable to the Treble, as the Treble is chiefly diſtinguiſh'd by its Air; yet ſo far as the Baſs may be made airy, and to ſing well, it may be alſo properly ſaid to be *Melodious*. See TREBLE and BASS.

Of the twelve harmonical Intervals of Muſical Sounds, diſtinguiſh'd by the Names of *Second leſſer*, *Second greater*; *Third leſſer*, *Third greater*; *Fourth*; *falſe Fifth*; *Fifth*; *Sixth leſſer*, *Sixth greater*; *Seventh leſſer*, *Seventh greater*; and *Octave*; all *Melody*, as well as Harmony, are compos'd: For the Octaves of each of theſe are but Replications of the ſame Sounds; and whatever is ſaid of any, or all of theſe Sounds, is to be underſtood alſo of their Octaves. See OCTAVE.

For the Rules of *Melody*, ſee COMPOSITION. The Word comes from the *Greek* μελι, *Honey*; and ωδη, *Singing*.

MEMBERS, in Anatomy, the exterior Parts, ariſing from the Trunk, or Body of an Animal, like Boughs from the Trunk of a Tree. See BODY. The Phyſicians divide the Body into three Regions or Venters (the Head, the Breaſt, and the Lower Ventricle;) and their Extremities, which are the *Members*. In *Latin* they are call'd *Artus*, of *Artare*; becauſe they are Parts attach'd to the Trunk.

Each *Member*, and Portion of the Body, was antiently devoted to ſome Divinity. The Head to *Jupiter*, the Breaſt to *Neptune*, the Navel to *Mars*, the Ear to *Memory*, the Forehead to the *Genius*, the Right-Hand to *Faith* or *Fidelity*, the Knees to *Mercy*; the Eye-brows, again, to *Jupiter*, the Eyes to *Cupid*, or, according to others, to *Minerva*; the hind Part of the right Ear to *Nemeſis*, the Back to *Pluto*, the Reins to *Venus*, the Feet to *Mercury*, the Heels and Soal of the Foot to *Thetys*, and the Fingers to *Minerva*.

MEMBERS, in Architecture. See MOULDINGS.

MEMBER, in Grammar, is underſtood of the Parts of a Period or Sentence. See PERIOD and SENTENCE.

MEMBER'D, or MEMBRED, in Heraldry, is where the Leg or Foot of an Eagle, Griffin, or other Bird, is of a different Colour from the reſt of the Body.

MEMBRANA, in Anatomy.
MEMBRANA *Communis Muſculorum.* } See MEMBRANE.
MEMBRANA *propria Muſculorum.* }
MEMBRANA *Communis Voſculorum.* }

MEMBRANA *Adipoſa.* } See ADIPOSA.
MEMBRANA *Carnoſa.* } See CARNOSA.
MEMBRANA *Nictitans.* } See NICTITATING.
MEMBRANA *Tympani.* } See TYMPANUM.
MEMBRANA *Urinaria.* } See ALLANTOIS.

MEMBRANE, in Anatomy, a ſimilar Part of an Animal Body; being a thin, white, flexile, expanded Skin, form'd of ſeveral ſorts of Fibres interwoven together, and ſerving to cover or wrap up ſome certain Parts of the Body. See BODY and PART.

The *Membranes* of the Body are various; and variouſly demonſtrated: Such are the *Perioſtium*, *Pleura*, *Pericardium*, *Peritonæum*, &c. which ſee under their proper Articles; PERIOSTIUM, &c.

Thoſe *Membranes* which ſerve as Integuments, or Covers of Veſſels, are call'd *Coats* or *Tunics*; and thoſe which cover the Brain, are, by a peculiar Name, call'd *Meninges*: See TUNIC and MENINGES.

The Fibres of a *Membrane* give them an Elaſticity, whereby they can contract, and cloſely graſp the Parts they contain; and their nervous Fibres give them an exquiſite Senſe, which is the cauſe of their Contraction: they can therefore ſcarcely ſuffer the Sharpneſs of Medicines, and thoſe are difficultly united, when wounded. In their Texture, there is a number of ſmall Glands, which ſeparate an Humour, fit for moiſtening the Parts they contain. By reaſon of the Thickneſs and Tranſparency of the *Membranes*, the Ramifications of the Blood-Veſſels are more apparently ſeen in them, than in any other Part of the Body: here the innumerable Diviſions, Windings, and Turnings, ſerpentine Progreſſions, and frequent Inoſculations, not only of Veins and Arteries together, but alſo of Veins with Veins, and Arteries with Arteries, make a moſt agreeable Embroidery, and delicate Net-work, covering the whole *Membrane*.

The Uſe of the *Membranes* is to cover and wrap up the Parts, and ſtrengthen them; to ſave them from external Injuries; to preſerve the natural Heat; to join one Part to another; to ſuſtain ſmall Veſſels, and the Nerves which run thro' their Duplicatures; to ſtop the returning of the Humours in their Veſſels, as the Valves ſtop the returning of the Blood in the Veins and Heart; of the Chyle in the Thoracic Duct; and of the Lympha in the Lymphatic Veſſels.

Anatomiſts generally aſſert, that there is a *Membrana Communis Muſculorum*, or *Membrane* common to all the Muſcles; being led into that Miſtake by the *Aponeuroſis* of ſeveral Muſcles; whereas, upon ſtricter Obſervation, there is no ſuch thing to be found. See MUSCLE. The *Membrana propria Muſculorum*, is that which immediately covers all and every one of the Fibres of a Muſcle, and is cloſely tack'd to them. There is another common *Membrane*, call'd *Membrana Communis Vaſculorum*; which is a thin *Membrane*, accompanying almoſt all the Veſſels of the Body. All theſe *Membranes* receive Veins, Arteries, and Nerves from the Parts which are neareſt to them. The Word comes from the *Latin Membranum*, Parchment.

MEMBRANOSUS, in Anatomy, a Muſcle of the Leg, ſo call'd from its large *membranous* Expanſion incloſing all the Muſcles of the *Tibia* and the *Tarſus*; whence it is alſo call'd *Faſcia lata*. It hath a ſharp fleſhy beginning from the fore-part of the Spine of the *Os Ilium*, but ſoon becomes *membranous*, and covers almoſt all the Muſcles of the Thigh and Leg, down to the Foot, where it joins with the *Ligamentum Annulare*; and in its Action turns the Leg outwards.

MEMBRED: In Heraldry, thoſe Birds, which are either whole-footed, or which have no Talons, are blazon'd by the Term, *Membred*.

MEMOIRS, a Term now much in uſe for Hiſtories, compoſed by Perſons who had ſome Share or Concern in the Tranſactions they relate, or who were Eye-witneſſes of them; anſwering to what the *Latins* call'd *Commentarii*. The *French* are great Dealers in this way of Writing, and have an infinite number of Books of *Memoirs*, containing, for the Generality, the Lives and Actions of the Writers.

MEMOIRS are alſo uſed for a Journal of the Acts, and Proceedings of a Society; or a Collection of the Matters debated, tranſacted, &c. therein. Such are the *Memoirs* of the Royal Academy of Sciences, &c. See ACADEMY, &c.

MEMORY, a Power, or Faculty of the Mind, whereby it retains or recollects the ſimple Ideas, or the Images, and Remembrance of Things we have ſeen, imagin'd, underſtood, &c. See SOUL,; ſee alſo POWER, FACULTY, &c.

Of all the Faculties, there is none harder to account for, or that has perplex'd Philoſophers more, than the *Memory*. Some will have it a mere Organ, as the Eye, Ear, &c. Dr. *Hook*, in an *Eſſay towards a mechanical Account of Memory*, makes it to conſiſt in a ſtock of Ideas or Images, form'd occaſionally by the Mind, out of the fine Parts of the Brain, and diſpoſed, or laid by in order. *Des Cartes* and his Followers maintain, That the animal Spirits exciting a Motion in the moſt delicate Fibres of the Brain, leave a kind of Traces or Footſteps, which occaſion our *Remembrance*. Hence it happens, that by paſſing ſeveral times over the ſame things, the Spirits becoming accuſtom'd to the ſame Paſſages, leave them open, and ſo make their way without any Effort or Labour; and in this conſiſts the Eaſe wherewith we recollect ſuch Ideas. Thus Wine is found to ſharpen the *Memory*, in regard the Spirits of the Wine put the animal Spirits in Motion, and agitate the Fibres of the Brain the more briskly. See IDEA, BRAIN, TRACE, REMEMBRANCE, &c.

Father *Malbranche* expreſſes his Notion of *Memory* thus: 'It being granted, that all our different Perceptions are 'owing to Changes happening in the Fibres of the prin- 'cipal Part of the Brain, wherein the Soul more imme-

'diately

diately reſides, the Nature of the *Memory* is obvious: for as the Leaves of a Tree, that have been folded for ſome time, in a certain manner, preſerve a Facility or Diſpoſition to be folded again in the ſame manner; ſo the Fibres of the Brain, having once receiv'd certain Impreſſions by the Courſe of the animal Spirits, and by the Action of Objects, preſerve, for ſome time, a Facility to receive the ſame Diſpoſition. Now 'tis in this Facility that *Memory* conſiſts; for we think on the ſame Things, when the Brain receives the ſame Diſpoſitions. Further, as the animal Spirits act ſometimes more briskly, and ſometimes more languidly on the Subſtance of the Brain; and as ſenſible Objects make much deeper, and more laſting Impreſſions, than the Imagination alone; 'tis eaſy, on this Scheme, to conceive why we don't remember all Things alike: Why a Thing, for inſtance, ſeen twice, is repreſented more vividly to the Mind, than another ſeen but once: Why Things that have been ſeen, are uſually remembred more diſtinctly, than thoſe that have been only imagin'd, *&c.*' See HABITUDE.

'Old Men are defective in *Memory*, and cannot learn any thing without much difficulty; becauſe they want animal Spirits to make new Traces, and becauſe the Fibres of the Brain are become too hard to receive, or too moiſt to retain ſuch Impreſſion. For the ſame reaſon, thoſe who learn with the greateſt Eaſe, forget the ſooneſt; in regard when the Fibres are ſoft and flexible, Objects make a ſlight Impreſſion, which the continual Courſe of animal Spirits eaſily wears off: On the contrary, the Fibres of thoſe who learn ſlowly, being leſs flexible, and leſs ſubject to be ſhaken, the Traces are more deeply engraven, and laſt the longer. From all which Obſervations it follows, that the *Memory* is abſolutely dependant on the Body; being impair'd or ſtrengthen'd, according to the Changes that befall the Body; a Fall, the Tranſports of a Fever, *&c.* being frequently found to eraſe or blot out all the Traces, to bear away all the Ideas, and to cauſe an univerſal Forgetfulneſs.'

The chief Difficulty that clogs this Doctrine of *Memory*, is to conceive how ſuch an infinite number of Things, as the Head is ſtored withal, ſhould be ranged in ſo much order in the *Memory*, as that the one ſhould not efface the other: and how in ſuch a prodigious Aſſemblage of Traces impreſs'd on the Brain, the animal Spirits ſhould awake preciſely thoſe which the Mind has occaſion for. See SPIRITS.

Seneca ſays of himſelf, that by the mere Effort of his natural *Memory*, he was able to repeat two thouſand Words upon once hearing them, each in its order; tho' they had no Dependance or Connection on each other. After which he mentions a Friend of his, *Portius Latro*, who retain'd in his *Memory* all the Declamations he had ever ſpoke, and never had his *Memory* fail him, even in a ſingle Word. He alſo mentions *Cyneas*, Ambaſſador to the *Romans* from King *Pyrrhus*, who in one day had ſo well learnt the Names of his Spectators, that the next he ſaluted the whole Senate, and all the Populace aſſembled, each by his Name. *Pliny* ſays, that *Cyrus* knew every Soldier in his Army by Name; and *L. Scipio*, all the People of *Rome*. *Charmidas*, or rather *Carneades*, when required, would repeat any Volume found in the Libraries; as readily as if he were reading. Dr. *Wallis* tells us, that without the aſſiſtance of Pen and Ink, or any thing equivalent, he was able in the dark, by mere force of *Memory*, to perform Arithmetical Operations, as Multiplication, Diviſion, Extraction of Roots, *&c.* to forty Places. Particularly, that in *February* 167½, at the requeſt of a Foreigner (by Night, in Bed) he propos'd to himſelf a Number of fifty-three Places, and found its ſquare Root to twenty-ſeven Places; and without ever writing down the Number, dictated 'em from his *Memory*, at his next Viſit, twenty Days afterwards.

Local or *Artificial* MEMORY, is an Art or Invention, by means whereof, the *Memory* is ſuppoſed to be aided, ſtrengthen'd, and inlarg'd. This Art ſeems to conſiſt in nothing elſe but a certain Method of coupling or aſſociating Ideas of Things to be remembred; with the Ideas of other Things, already diſpos'd orderly in the Mind, or that are before the Eyes. It is of an old ſtanding, having been practis'd by many of the antient Orators; ſome whereof are ſaid to have made uſe of Paintings, Images, and Emblems, on this occaſion: Tho' others contented themſelves with the Parts, Members, Ornaments, Furniture, and other Circumſtances of the Place where they were to ſpeak. *Muretus* tells us, that a young Man of *Corſica* pretending to do wonders this way, *Muretus* put him to the Tryal; and upon dictating to him two or three thouſand Words, ſome *Greek*, ſome *Latin*, ſome *Barbarous*; all without any relation to each other, and the greateſt part without any Meaning at all: the Artiſt immediately, and without any heſitation, or the leaſt ſtumbling or miſplacing, repeated them all, from firſt to laſt, in the ſame order wherein they had been dictated; and this done, beginning where he ended, he repeated them all backwards, from laſt to firſt. Adding, that this was but a ſlight Eſſay of his *Memory*; and that he would undertake to repeat thirty-ſix thouſand Words in the ſame manner.

The truth is, this Art ſeems better calculated for retaining things without any Coherence or Dependance on one another, as mere Words or Sounds, *&c.* than for things where Reaſon or Judgment are any way required.

Raim. Lully took ſo much pains with it, that it now goes by his Name, being call'd *Lully's Art.*

MEMPHITES, or *Lapis* MEMPHITICUS, a ſort of Stone mentioned by *Dioſcorides*, *Pliny*, and other Natural Hiſtorians. 'Tis ſuppos'd to be found in *Egypt* not far from the City *Cairo*, the antient *Memphis*; whence its Name. The Property it is famed for, is, that being pulverized, and ſmear'd on any part of the Body to be cut off, it deadens it ſo, as that the Patient ſhall perceive no pain from the Operation.

MENANDRIANS, the moſt antient Branch of *Gnoſtics*, thus call'd from *Menander* their Chief, a Diſciple of *Simon Magus*, and himſelf a Magician. See GNOSTICS.

He taught, that no Perſon could be ſaved unleſs he were baptized in his Name: He confer'd a peculiar ſort of Baptiſm, which would render thoſe who receiv'd it immortal in the next World. St. *Irenæus* repreſents him, as pretending to be, That firſt Virtue hitherto unknown to the World, and to have been ſent by the Angels for the Salvation of all Mankind. He took upon him, ſays St. *Epiphanius*, *Hær.* 2. to be greater than his Maſter; which contradicts *Theodoret*, who makes *Menander* a ſubordinate Virtue to *Simon Magus*, the great Virtue of all. See SIMONIANS.

MENDICANTS, *q. d. Beggars*; a Term apply'd to ſeveral Orders of Religious, who live on Alms, and go a begging from Door to Door.

There are four antient Orders which paſs principally by the Name of the *Four Mendicants*: The *Carmelites*, *Jacobines*, *Cordeliers*, and *Auguſtins*. See CARMELITES, JACOBINES, *&c.* each under their proper Articles.

Among the Number of *Mendicants*, are alſo ranked the *Capuchins*, *Recollects*, *Minims*, and others. See CAPUCHINS, RECOLLECTS, *&c.*

The *Mendicants* at the time of their firſt Eſtabliſhment, could not have any Revenues. The Multitudes of *Mendicants*, are now a kind of Tax on the People.

MENINGES in Anatomy, the Coats, or Membranes wherewith the Brain is incloſed. See BRAIN.

The *Arabs* call them *Mothers*; whence we alſo uſually call them in *Latin* the *Pia* and *Dura Mater*. See PIA and DURA *Mater.*

There are two of theſe *Meninges*, the *External* and *Internal.*

The *external* one, being the groſſeſt, is call'd the *Dura*, or *Craſſa Meninx* or *Mater*. It lies immediately under the *Cranium*, and covers the whole Subſtance of the Brain, and the Spinal Marrow, and affords a Coat to the Trunks of the larger Nerves. See NERVE, *&c.* It is connected on the upper part to the *Perioſtium* by means of Fibres, and on the other ſide to the *Pia Mater* by the Branches of the Sinus's, and by the Arteries and Nerves. It conſiſts of two leſſer Coats or Membranes, which ſome have taken for two *Dura Maters*; the exterior, hard: and the inner, more ſmooth, ſoft, and moiſt. It deſcends double between the two Hemiſpheres of the Brain, which it divides as deep as the *Corpus Calloſum*, and by reaſon of its Curvature, occaſion'd by the Convexity of the Brain in that part, is called *Falx*, from its reſemblance to a Sickle. See FALX. It likewiſe inſinuates itſelf between the Brain and *Cerebellum*, and ſo prevents the Brain from lying too hard on the *Cerebellum*. In the Duplicatures thereof, are ſeveral Cavities call'd *Sinus's*, which are a ſort of venous Canals ſerving for the reconveyance of the Blood. Of theſe there are four conſiderable ones, *viz.* the *Longitudinales* and *Laterales*. See SINUS.

Under the *Dura Mater*, immediately upon the Brain, lies the *Meninx tenuis*, or *Pia Mater*, which is a fine thin Membrane adhering ſo cloſely, and inſinuating itſelf into all the Folds and anfractuous parts of the Brain, that it is ſcarce to be ſeparated from it. This Membrane covers the whole Brain, *Cerebellum*, and *Medulla Oblongata*, and ſerves, together with the other, for the Defence of the Brain, and the Support of its Veſſels.

Between the two, lies another fine tranſparent Membrane, call'd *Arachnoides*; but the beſt Anatomiſts take this for no more than the external *Lamina* of the *Pia Mater*. See ARACHNOIDES.

MENIPPEAN, or *Satyra* MENIPPEA, a kind of Satyr compoſed both in Proſe and Verſe. See SATYR.

It is thus call'd from *Menippus*, a Cynic Philoſopher, who delighted in compoſing Satyrical Letters, *&c.* In imitation of him, *Varro* firſt wrote Satyrs under the Title of *Satyræ Menippeæ.*

Among the Moderns, there is a famous Piece under this Title, firſt publiſhed in 1594, againſt the Chiefs of the League, call'd alſo the *Catholicon* of *Spain*. It is eſteem'd a Maſter-piece for the time. See CATHOLICON.

MENISCUS, in Optics, a Glaſs, or Lens, concave on one ſide, and convex on the other; ſometimes alſo call'd *Lunula*. See LENS and OPTIC *Glaſs*.

In a *Meniſcus*, if the Diameter of the Convexity be equal to that of the Concavity, a Ray falling parallel to the Axis, will continue parallel thereto after refraction.

Such a *Meniſcus* therefore, will neither collect, nor diſperſe the Rays; and is therefore of no uſe in Diop r i ks. See REFRACTION.

To find the Focus of a *Meniſcus*, the Rule is, As the difference of the Semi-diameters of the Convexity and Concavity, is to the Semi-diameter of the Convexity: ſo is the Diameter of the Concavity, to the diſtance of the Focus from the *Meniſcus*. Hence,

If the Semi-diameter of the Concavity, be triple the Semi-diameter of the Convexity, the diſtance of the Focus from the *Meniſcus* will be equal to the Semi-diameter: and therefore the *Meniſcus* will be equivalent to a Lens equally convex on either ſide. See CONVEX-*Lens*.

Again; If the Semi-diameter of the Concavity be double that of the Convexity; the diſtance of the Focus will be equal to the Diameter: and therefore the *Meniſmus* will be equivalent to a Plano-Convex Lens. See PLANO-*Convex*.

If the Semi-diameter of the Concavity be quintuple that of the Convexity, the *Meniſcus* will be equivalent to a Sphere. See *Spherical* LENS.

The Semi-diameter therefore of the Convexity being given; that of the Concavity required to remove the Focus to any given diſtance from the *Meniſcus*, is eaſily found. See FOCUS.

MENNONITES, a Sect in the *United Provinces*, in moſt reſpects the ſame with thoſe in other Places called *Anabaptiſts*. See ANABAPTIST.

They had their Riſe in 1496, in a Village in *Friezland*: their Founder was one *Mennon*, who undertook to reform the Religion of the antient Anabaptiſts, and to throw out all Enthuſiaſm touching the new Kingdom of Chriſt, *&c.*

The *Mennonites* hold, that there is no original Sin; that the firſt Man was not created juſt; that in ſpeaking of the Father, Son, and Holy Ghoſt, we muſt not uſe the word *Perſon*, nor that of *Trinity*; that Jeſus Chriſt did not take his Fleſh from the Subſtance of his Mother, but from the Eſſence of the Father; or that the Word of the Father became Man; that he brought it from Heaven; or that we don't know whence he had it: And that the Union of the Divine and Human Nature was ſo effected, as that the Divine was rendered viſible, and liable to Death.

The *Mennonites* teach farther, that Chriſtians are not allow'd to ſwear; to exerciſe any Civil Magiſtrature; to uſe the Sword, not even for the Puniſhment of Criminals. They add, that Miniſters of the Word are not permitted to receive any Wages for their Work: that they muſt not baptize little Children; and that the Souls of Men after Death reſt in an unknown Place till the Day of Judgment.

The *Mennonites* are ſaid to be divided into Sects, whereof there are two Principal. The *Mennonites* of *Friezland*, and thoſe of *Flanders*.

The latter exerciſe a very ſtrict Church-Diſcipline, and Excommunicate for the ſlighteſt Offence; nor do they hold it lawful to have any Society or Communication with thoſe Excommunicated. Thoſe of *Friezland*, on the contrary, receive into their Communion ſuch as are Excommunicated by the others; whence they are call'd *Stercorarii* and *Borbariſtæ*. Their Diſcipline is very remiſs.

They recommend an univerſal Toleration of Religions very earneſtly, and receive all kind of Perſons into their Aſſemblies, provided they be of good Morals, and believe the Scripture to be the Word of God; however divided they may be as to the particular Articles of Faith.

Tho' the *Mennonites* uſually paſs for a Sect of Anabaptiſts, yet M. *Her. Schin*, who has publiſhed their Hiſtory and Apology, maintains that they are not Anabaptiſts, either in Principle, or by Origin: He owns they baptize none but Adults; but then, neither do they re-baptize any who had received it in their Childhood. They ſpeak with a great deal of Prudence and Reſerve as to the extraordinary Operations of the Holy Spirit; and are far from the Fanaticiſm of the old Anabaptiſts. No People are more ſubmiſſive to Magiſtrates, or carry Paſſive Obedience farther than they. Far from Rebellion; they condemn even the moſt juſt War, *&c.*

MENOLOGY in the *Greek* Church, is much the ſame with the *Martyrology*, or *Calendar* in the *Latin*. See MARTYROLOGY and CALENDAR.

It is divided into the ſeveral Months in the Year; and contains an Abridgment of the Lives of the Saints; with a bare Commemoration of the Names of ſuch whoſe Lives were never written. The *Greeks* have various *Menologies*. The *Romans* tax them with inſerting divers Hereticks in their *Menologies* as Saints. *Baillet* treats of them at large.

The Word comes from the *Greek* μην Month, and λογος, Diſcourſe.

MENSALIA, and MENSALES, were ſuch Parſonages, or Livings as were formerly united to the Tables of Religious Houſes; and therefore by Canoniſts call'd *Menſal* Benefices. See PARSONAGE and BENEFICE.

MENSES, *Catamenia* in Medicine, *&c.* The Monthly Evacuations of Women not with Child, nor giving ſuck; ſo call'd from *Menſis*, Month, the Period wherein they return. They are alſo called *Flowers*, *Courſes*, &c.

The *Menſes* make one of the moſt curious and difficult Phænomena in the whole human Body; for the Explanation whereof, many Hypotheſes have been framed: tho' the Matter is yet ſcarcely aſcertained.

'Tis generally agreed by all, that the Neceſſity Women are under for ſome extraordinary Supply to compenſate the Expence, and ſupport them during the time of Geſtation, was the final Reaſon why this Redundance at other times was given them. But this is all they agree in. Some not content with this Occaſion alone, will have the *Menſtruous* Blood offend in Quality more than in Quantity; which they argue from the Pain it gives many Women in the Evacuation. They add, that its Malignity is ſo great, that it excoriates the Parts of Men by mere contact; that the Breath of a *menſtruous* Woman will give a permanent Stain to Ivory, or a Looking-Glaſs; that a little of the Blood drop'd on any Vegetable, blaſts, or renders it ſteril; that if a pregnant Woman be defiled with the *Menſes* of another Woman, ſhe miſcarries; that if a Dog taſte them, he runs Mad, and grows Epileptic: All which, with many more Fables of the ſame kind, tho' related by great Authors, Dr. *Drake* rejects, as too ridiculous to need a Refutation.

Others aſcribe this Effect to an imaginary Dominion of the Moon over the Bodies of Women. This was formerly the prevailing Opinion; tho' the ſmalleſt Reflection would have ſhewn them the weakneſs of it: For had this Purgation been owing to the Influence of the Moon, all Women of the ſame Age and Temperament, would have found it at the ſame Periods and Revolutions of the Moon, *i. e.* at the ſame time; which all Experience ſhews to be falſe.

There are two other Opinions which carry with them a great deal of Probability, and are argued with a great deal of Strength and Reaſon. In both which, the Quality of the Blood is allow'd to be Innocent; but they ſtill differ about the Reaſon of its Iſſue. The former is that of Dr. *Bohn* and Dr. *Friend*, who maintain this Flux to be the reſult of a *Plethora*, or Plenitude; and to be evacuated only for Relief againſt the Quantity.

Dr. *Friend*, who has maintain'd the Cauſe of a *Plethora* with the greateſt Strength and Clearneſs, ſuppoſes that this *Plethora* ariſes from a Coacervation in the Blood-Veſſels of a ſuperfluity of Aliment, which he thinks remains over and above what is expended by the ordinary ways; and that Women have this *Plethora*, and not Men, becauſe their Bodies are more humid, and their Veſſels, eſpecially the Extremities of them, more tender, and their manner of living generally more unactive than that of Man; and that theſe things concurring, are the occaſion that Women do not perſpire ſufficiently to carry off the ſuperfluous alimentary Parts, till it be accumulated in ſuch quantity as to diſtend the Veſſels, and force its way thro' the Capillary Arteries of the *Uterus*. It is ſuppoſed to happen to Women more than the Females of other Species, which have the ſame Parts, becauſe of the erect Poſture of the former; and the *Vagina*, and other Canals, being perpendicular to the Horizon; ſo that the Preſſure of the Blood is directed towards their Orifices: Whereas in Brutes, they are parallel to the Horizon, and the Preſſure wholly on the Sides of thoſe Veſſels. The Diſcharge, he thinks, happen in this Part rather than in any other, as being more favoured by the Structure of the Veſſels; the Arteries being very numerous, and the Veins ſinuous and winding, and therefore more apt to retard the Impetus of the Blood, and conſequently, in a *Plethoric* Caſe, to occaſion the Rupture of the Extremities of the Veſſels, which may laſt, till by a ſufficient diſcharge the Veſſels are eaſed of their Over-load.

This is the Subſtance of that great Man's Theory, from whence he very Mechanically, and very Philoſophically accounts for the Symptoms.

To his Argument, why Women have *Menſes* rather than Men, we may add from *Boerhaave*, that in the former, the *Os Sacrum* is wider, and ſtands farther out, and the *Os Coccygis* farther in; the *Oſſa Innominata* wider, and farther

farther apart, and the loweſt of them, as well as the lower Eminences of the *Os Pubis* farther outwards than in the latter. Hence in Women, the Latitude or Expanſion about theſe Bones, and the Capacity of the *Pelvis*, is vaſtly great in proportion to thoſe of Men; and yet in a Woman not pregnant, there is not much to fill this Expanſe. Again, the fore-ſide of the *Thorax* is ſmoother in Women than in Men, and the Blood-Veſſels, Lymphatics, adipoſe and nervous Veſſels, Membranes and Fibres, are much laxer in Women than in Men: whence all their Cavities, Cells, Veſſels, *&c.* are more eaſily repleted, and the Humours aggregated in them; beſides that, they are found to perſpire leſs than Men, and to arrive much ſooner at their Maturity, or ἀκμην of Increaſe. To which he adds the Conſideration of the ſoft pulpous Texture of the *Uterus*, and the vaſt number of Veins and Arteries it is fill'd withall.

Hence, a healthy Maid, being arrived at her Growth, begins to prepare more Nutriment than is required for the ſupport of the Body; which, as there is not to be any farther accretion, muſt of neceſſity fill the Veſſels, and eſpecially thoſe of the *Uterus*, and Breaſts, as being the leaſt compreſſed. Theſe will be dilated more than the others; whence the lateral *Vaſcules* evacuating their Humour into the Cavity of the *Uterus*, it will be fill'd, and extended: Hence, a Pain, Heat, Heavineſs, will be felt about the Loins, *Pubes*, *&c.* the Veſſels of the *Uterus* at the ſame time will be ſo dilated, as to emit Blood into the Cavity of the *Uterus*, its Mouth will be lubricated and looſened, and Blood iſſue out. As the Quantity of Blood is diminiſhed, the Veſſels will be leſs preſs'd, and will contract themſelves cloſer, ſo as again to retain the Blood, and let paſs the groſſer part of the *Serum*; till at length, only the uſual *Serum* paſſes. Again, there are more Humours prepar'd, which are more eaſily lodged in Veſſels once dilated; hence the *Menſes* go, and return at various Periods in various Perſons.

This Hypotheſis, however plauſible, is oppoſed by Dr. *Drake*, who maintains that there is no ſuch Repletion, or at leaſt that it is not neceſſary to *Menſtruation*. Arguing, That if the *Menſes* were owing to a *Plethora* ſo accumulated, the Symptoms would ariſe gradually, and the Heavineſs, Stiffneſs, and Inactivity, neceſſary Symptoms of a *Plethora*, would be felt long before the Period were compleated, and Women would begin to be heavy, and indiſpoſed ſoon after Evacuation, and the Symptoms increaſe daily: Which is contrary to all Experience; many Women, who have them regularly and eaſily, having no warning, nor other Rule to prevent an indecent Surprize, than the meaſure of the Time; in which, ſome that have ſlip'd, have been put to Confuſion and Shifts, no ways conſiſtent with the notice a *Plethoric* Body would give. He adds, that even in thoſe who are difficultly purged this way, the Symptoms, tho' very vexatious and tedious, do not make ſuch regular Approaches, as a gradual Accumulation neceſſarily requires. If we conſider what violent Symptoms come on in an Hour, we ſhall be extremely puzzled to find the mighty Acceſſion of Matter which ſhould in an Hour or a Day's time make ſuch great Alterations. According to the Hypotheſis, the laſt contributes no more than the firſt, and of Conſequence, the Alteration ſhould not be greater in the one than the other; ſetting aſide the bare Eruption.

This is the ſubſtance of what is argued againſt Dr. *Friend*'s Theory; which, it muſt be own'd, notwithſtanding theſe Objections, is ſtill the moſt rational and conſiſtent that has yet been advanced.

Thoſe who oppoſe it, give into the Doctrine of Fermentation, and maintain the Evacuation of Blood, on thoſe parts, to be the Effect of an Effervеſcence, or Ebullition of the Blood. This Opinion has been maintained by many, particularly Dr. *Charleton*, *Bale*, *De Graaf*, and *Drake*. The two firſt of which ſuppoſe a Ferment peculiar to the Women which produces this Flux, and affects that part only, or at leaſt principally. Dr. *Graaf*, leſs particular in his Notion, only ſuppoſes an Effervеſcence of the Blood raiſed by ſome ferment, without aſſigning how it acts, or what it is. The ſudden Turgeſcence of the Blood, occaſion'd them all to think, that it aroſe from ſomething till then extraneous to the Blood, and led them to the Parts principally affected, to ſeek for an imaginary Ferment, which no Anatomical Enquiry could ever ſhew, or find any Receptacle for, nor any Reaſoning neceſſarily infer. Again, that Heat which frequently accompanies this Turgeſcence, led them to think the Caſe more than a *Plethora*, and that there was ſome extraordinary inteſtine Motion at that time.

Dr. *Drake* improves on the Doctrine of a Ferment; and contends not only that it is neceſſary there ſhould be a Ferment, but a Receptacle alſo for this Ferment: Concluding from the Suddenneſs and Violence of the Symptoms, that a great quantity muſt be convey'd into the Blood in a ſhort time, and conſequently, that it muſt have been ready gather'd in ſome Receptacle, where, while it was lodg'd, its Action was reſtrained. But he goes farther ſtill, and pretends to aſcertain the Place, *&c.* both of the one and the other, making the Gall-Bladder to be the Receptacle, and the Bile the Ferment. This Liquor he thinks well adapted to raiſe a Fermentation in the Blood, when diſcharged into it in a Quantity: And as it is contain'd in a Receptacle that does not admit of a continual Iſſue, may be there reſerved, till in a certain Period of Time, the Bladder becoming turgid and full through the Compreſſion of the incumbent *Viſcera*, it emits the Gall: which, by the way of the *Lacteals*, inſinuating itſelf into the Blood, may raiſe that Effervеſcence which occaſions the Aperture of the Uterine Arteries.

To confirm this, he alledges, that Perſons of a bilious Conſtitution, have the *Menſes* either more plentifully, or more frequently than others; and that Diſtempers manifeſtly bilious, are attended with Symptoms reſembling thoſe of Women labouring under difficult *Menſtruation*. If it be objected, that on this foot, Men ſhould have *Menſes*, as well as Women; he anſwers, that Men don't abound in Bile ſo much as Women; the Pores of the former being more open, and carrying off more of the ſerous part of the Blood, which is the Vehicle of all the other Humours; and, conſequently, a greater part of each is diſcharged thro' them than in Women; wherein the Superfluity muſt either continue to circulate with the Blood, or be gathered in proper Receptacles, which is the Caſe in the Bile. The ſame Reaſon he gives why *Menſtruation* ſhould not be in Brutes; the Pores of theſe being manifeſtly more open than thoſe of Women, as appears from the Crop of Hair which they bear; for the Vegetation whereof, a large Cavity, and a wider Aperture of the Glands is neceſſary, than where no ſuch thing is produced. Yet there is ſome difference between the Males and Females even among theſe, the latter having their *Menſes*, tho' not ſo often, nor in the ſame Form and Quantity, as Women.

He adds, that the ſeveral Phenomena of the *Menſes*, whether in a natural, a regular, or diſeaſed Caſe, flow naturally and readily from this Hypotheſis; and that whatever may be accounted for from a *Plethora*, or from any particular Ferment, may, without any ſtraining, be apply'd to this.

The Root of black *Hellebore* and Steel, are the principal Remedies for Obſtructions of the *Menſes*; the former, is almoſt infallible, and in many Caſes where the latter is not only ineffectual, but improper; as in *Plethoric* Habits, for with ſuch, Steel will ſometimes raiſe *Hyſteric* Commotions, Convulſions, and a kind of Uterine *Furor*; whereas Hellebore thins the Blood, and diſpoſes it for a Diſcharge without making it more impetuous. So that tho' each provoke the *Menſes*, yet they do it by different ways; Steel by increaſing the Blood's Velocity, and giving it a greater Moment againſt the Uterine Arteries; and Hellebore by dividing it, and rendering it more fluid. See HELLEBORE and CHALYBEAT.

MENSIS
MENSIS CHYMICUS } See { MONTH. MENSTRUUM.
MENSIS VETITUS } See { FENCE *Month*.

MENSTRUAL, or MENSTRUOUS, a Term in Medicine, applied to the Blood which flows from Women in their ordinary monthly Purgations. See MENSES.

The *Menſtrual* Blood is the exceſs, or redundance of the Blood in the Body. It may be defined an Excrement ſerving for the Generation, as well as Nutriture of the *Fœtus* in the Womb, and which at other times is evacuated Monthly.

Of all Animals, there is none beſides Women, and perhaps Apes, which have their *Menſtrual* Purgations. *Hippocrates* ſays, that the *Menſtrual* Blood gnaws and tears the Earth like Vinegar. *Pliny* and *Columella* add, that it burns Herbs, kills Plants, tarniſhes Looking-Glaſſes, and that Dogs which taſte it, run mad. But this is all fabulous; it being certain that this Blood is the ſame with that in the Veins and Arteries. By the *Jewiſh* Law, a Woman was unclean while the *Menſtrual* Blood flow'd: and the Man who touched her, or the Moveables ſhe had touched, were declared unclean. *Levit.* Chap. XV.

MENSTRUUM, or DISSOLVENT, in Chymiſtry, any Liquor that will diſſolve, *i. e.* ſeparate the Parts of hard Bodies. See DISSOLVENT and DISSOLUTION.

Thus *Aqua Regalis* is a *Menſtruum* for Gold; *Aqua Fortis*, and Spirit of Nitre, for moſt other Metals; Common Water for Salts, *&c.* See GOLD, SILVER, SALT, *&c.*

In Pharmacy, it is chiefly defined a Body that will extract the Virtues of Ingredients by Infuſion, Decoction or the like. See INFUSION, DECOCTION, *&c.*

The Term *Menſtruum* takes its riſe from this, that ſome Chymiſts pretend the compleat Diſſolution of a mix'd Body can't be effected in leſs than 40 Days, which Period they call a *Philoſophical Month*.

Menſtruum is properly defined a Body, which being applied to, or intermixed with another, does ſo diſſolve it, as that all the diſſolving Parts float among the Parts diſſolved; and ſo divides it into its minuteſt Parts, as that the Parts of the Diſſolvent are intermixed with thoſe of the Body diſſolved. Whence it appears, that every *Menſtruum* in diſſolving a Body, is likewiſe diſſolved itſelf; ſo as with the Body it diſſolves, to make up one Body. A Knife therefore divides Bread, but is not on that account a *Menſtruum*; as it does not conſtitute one Body with the Bread: but Water boil'd with the Bread is a *Menſtruum*, with regard to the Bread, as it only makes up one Body therewith. See DISSOLUTION.

The antient Chymiſts were very careful in all their Proceſſes, that neither the Degree of Fire, nor the *Menſtruum*, might deceive 'em.

All *Menſtruums*, at the time they act as ſuch, that is, at the time they are diſſolving, act as Liquids; whether ſuch *Menſtruum* be a Liquid or a Solid. Thus, *e. gr.* Silver is a *Menſtruum* with regard to Gold; for if you take an Ounce of Silver, melt it at the Fire, and add a Grain of Gold; all the Parts of the Silver will intermix themſelves with the Parts of the Gold: ſo, as that the Gold and Silver, which before were ſeparate, now make one Maſs. But Gold and Silver are only *Menſtruums* as they are diſſolved by the Fire; *i.e.* as they are fluid.

All *Menſtruums* may be divided into two Claſſes; the firſt conſiſts of ſuch as are *fluid*; the ſecond of ſuch as are *ſolid*: that is, they are either actually divided, or they muſt be ſo e'er they act.

Fluid Menſtruums are *Water*, Dew, Oils, Saline and Acid Spirits, *Alkali*, *Salts*, &c. and *Solid Menſtruums*, are ſuch as muſt be made fluid e'er they will diſſolve; ſuch are moſt *Salts*, *Nitre*, *Vitriol*, &c. See WATER, SALT, VITRIOL, &c.

As to the Action of Menſtruums; Sir *Iſaac Newton* accounts for it from the Acids wherein they are impregnated. The Particles of Acids are found to be endued with a ſtrong attractive Force, wherein their Activity conſiſts, and by virtue whereof they diſſolve Bodies. See ATTRACTION. Theſe Acids he ſuppoſes of a middle Nature between Water, and hard Bodies, and to attract both. By this Attraction they gather together about the Particles of Bodies, whether metallick, ſtony, or the like, and adhere to them very cloſe, ſo as ſcarce to be ſeparated from 'em by Diſtillation, or Sublimation. Thus ſtrongly attracted, and gather'd together on all ſides, they raiſe, disjoin, and ſhake aſunder the Particles of Bodies, *i.e.* they diſſolve them; and by the attractive Power whereby they ruſh againſt the Particles of the Bodies, they move the Fluid, and ſo excite Heat, ſhaking ſome of the Particles to that degree, as to convert 'em into Air, and ſo generating Bubbles. See ACID.

Dr. *Keil* gives us the Theory or Foundation of the Action of *Menſtruums*, in the following Propoſitions.

1°. Two Corpuſcles may be placed ſo near each other, without touching, as that the Force wherewith they attract each other, ſhall eaſily exceed that of their Gravity.

2°. If a Corpuſcle placed in a Fluid be every way equally attracted by the ambient Particles, the Corpuſcle will not be put in any Motion; but if it be attracted more by ſome of the Particles than by others, it will then tend towards that Quarter where the Attraction is the ſtrongeſt: and the Motion thus produced will be correſpondent to the Inequality of the Attraction: That is, if the Inequality be great, the Motion will be ſo; and if little, little.

3°. Corpuſcles ſwimming in a Fluid, and attracting each other more than the interpoſed Particles of the Fluid; thoſe Particles of the Fluid will be driven aſide, and the Corpuſcles approach each other with a Force equal to the Exceſs of their mutual Attraction, beyond the Attraction of the Particles of the Fluid.

4°. If a Body be placed in a Fluid whoſe Parts attract the Particles of the Fluid more ſtrongly than thoſe Particles are attracted by one another; and if in the Body there be ſeveral Pores pervious to the Particles of thoſe Fluid, the Fluid will preſently diffuſe itſelf through the Pores; and if the Connection of the Parts in that Body be not ſo ſtrong but that it may be exceeded by the Impetus of the Particles ruſhing together; the immers'd Body will undergo a Diſſolution.

Hence, for a *Menſtruum* to be fit to diſſolve a given Body, there are three things required. 1*ſt*, That the Parts of the Body attract the Particles of the *Menſtruum* more ſtrongly than thoſe are attracted by each other. 2*dly*, That the Body have Pores adequate and pervious to the Particles of the *Menſtruum*. 3*dly*, That the Coheſion of the Parts of the Body be not ſo ſtrong but that it may be torn aſunder by the Impetus of the Particles ruſhing together. Hence alſo it follows, that the Particles which conſtitute Spirit of Wine, are more ſtrongly attracted by each other, than by thoſe of a ſaline Body immerged in it.

Hence we ſee the Reaſons of the different Effects of different *Menſtruums*; why ſome Bodies, for inſtance Metals, diſſolve in a ſaline *Menſtruum*: Others again, as Reſin, in a ſulphureous one, &c. particularly why Silver diſſolves in *Aqua fortis*, and Gold only in *Aqua Regalis*; all the Varieties whereof are accountable for, from the different Degrees of Coheſion, *i.e.* of Attraction in the Parts of the Body to be diſſolved, the different Diameters and Figures of its Pores, the different Degrees of Attraction in the *Menſtruum*, and the different Diameters and Figures of its Parts. See COHESION.

Suppoſe, *e. g.* the Attraction of Gold to that of Silver, to be as A to B; and of Silver to *Aqua fortis* as *b* to *d*; but that of *Aqua fortis* to *Aqua Regia*, as *d* to *e*; let *f* ſignify the Magnitude of Particles in *Aqua fortis*, and *r* thoſe in *Aqua Regia*; *e* the Coheſion of Gold, and *e* the Coheſion of Silver: If the Diameters of the Particles *f*, are greater than the Diameters of the Pores of Gold, they can never diſſolve the Gold, let their attractive Force be ever ſo ſtrong. But if $\frac{b}{exr}$ be greater than *g*, then the Silver will yield to the *Menſtruum* whoſe Particles are *f*, and leſs than the Pores of the Silver; and if $\frac{b}{exr}$ be leſs than *g*, the Silver will never diſſolve in the *Menſtruum*, the Particles whereof are *r*, and the attractive Force *e*. But if $\frac{a}{exr}$ be greater than *c*, the *Menſtruum* made up of the Particles *r*, and whoſe attractive Force is *e*, will be able to penetrate and diſſolve the Gold.

How a *Menſtruum* may ſuſpend Bodies much heavier than itſelf, which very often happens, may be conceiv'd by conſidering, that the Parts of no Fluid can be ſo eaſily ſeparated, but they will a little reſiſt, or retard the Deſcent of any heavy Bodies through them; and that this Reſiſtance is, *cæteris paribus*, ſtill proportionable to the Surface of the deſcending Bodies: But the Surfaces of Bodies do by no means increaſe, or decreaſe, in the ſame Proportion as their Solidities do; for the Solidity increaſeth as the Cube, but the Surface only as the Square of the Diameter. Small Bodies, therefore, will have much larger Surfaces, in proportion to their ſolid Contents, than larger Bodies will; and conſequently when exceedingly diminiſhed, may eaſily be buoyed up in the Liquor. See DESCENT, RESISTANCE, &c.

MENSTRUUM *Peracutum*, a Name Mr. *Boyle* gives to a *Menſtruum* he extracted from Bread only, that would prey on Bodies more compact than many hard Minerals, nay even on Glaſs, and do many things that *Aqua fortis* would not do: With this he drew Tinctures not only from Crude Corals, but alſo from the *Lapis Hæmatites* and Granates, nay from Diamonds and Rubies. See DIGESTION.

MENSURATION, the Act or Art of *Meaſuring*. See MEASURING.

MENTAL, is underſtood of the Conception, or Operation of the Underſtanding: Thus a *Mental* Prayer is ſuch a one as is made merely in the Mind, without pronouncing one word of it. A *Mental* Reſervation, &c. See RESERVATION.

MENTUM, in Anatomy, is the lower Part of the Face, beneath the Mouth; which we otherwiſe diſtinguiſh by the Name of *Chin*.

MENUET, or MINUET, a kind of Dance, the Steps whereof are extremely quick, and ſhort: It conſiſts of a Coupee, a high Step, and a Balance; it begins with a Beat, and its Meaſure, or Motion, is Triple.

MEPHITES, and MEPHITICAL *Exhalations*, any poiſonous and noxious Steams iſſuing out of the Earth, from what Cauſe ſoever. See POISON.

The moſt remarkable Places of this kind is the *Grotta de Cani* near *Puzzoli*, about two Miles from *Naples*, in *Italy*; the Steams of which kill Dogs, or other Animals, when brought within its reach: A very curious Account of which, and the manner of its Efficacy, is given by Dr. *Mead* in his Eſſay on Poiſons. See GROTTO.

MERCERS *Company*. See COMPANY.

MERCERS-*Chapel School*. See SCHOOL.

MERCHANDISE, or, MERCANTILE *Profeſſion*, the Function of a Merchant; or the Art, Method, &c. of exerciſing a Whole-Sale Commerce. See COMMERCE.

The *Mercantile* Profeſſion is eſteemed Noble, and Independent. In *France*, by two Arrets of *Louis* XIV. the one of 1669. the other of 1701. the Nobility are allow'd to trade, both by Land and Sea, without derogating from their Nobility: And we have frequent Inſtances of Merchants ennobled in that Country, in regard of the Utility of their Commerce, and the Manufactures they have ſet up. In *Bretagne*, even a Retail Trade does not derogate from the Nobility. When the Nobles of the Province are diſpoſed for Commerce, they let their Nobility ſleep, that

is,

is, they don't loſe it, but only ceaſe to enjoy the Privileges of their Nobleſſe while their Commerce continues, and reaſſume it, by giving over Trade, without any Letters or Inſtrument of Re-Habilitation. In Republics it is ſtill more valued: but no where more than in *England*, where the younger Sons and Brothers of Peers are frequently bred up to Merchandize. Add to this, that many of the *Italian* Princes are the principal Merchants of their States; and think it no diſcredit to make their Palaces ſerve as Warehouſes: And that many of the Kings of *Aſia*, moſt of thoſe of the Coaſt of *Africa* and *Guinea*, traffick with the *Europeans*, ſometimes by their Miniſters, and ſometimes in Perſon.

The Qualifications requiſite for the Profeſſion of a Merchant, are, 1. To keep Books, ſingle or double, *viz.* Journals, Ledgers, and others. 2. To draw Invoices, Contracts, Charter-Parties, Policies of Aſſurance, Bills of Exchange, Letters Miſſive, *&c.* 3. To know the Relation between the Monies, Weights, and Meaſures of ſeveral Countries. 4. The Places where the ſeveral Kinds of Merchandizes are manufactured, in what manner made, what the Materials compoſed of, and whence; the Preparation the Materials require before they are wrought; and the Merchandizes afterwards. 4. The Lengths and Breadths of Stuffs, as Silks, Wools, Hairs, Linens, *&c.* the Regulations of the Place where they are manufactured, and their different Prices at different Seaſons. 5. The Dying, and the Ingredients for the Formation of the different Colours. 6. The Merchandizes that abound, or are more rare in one Country than another; their Kinds and Qualities; and the manner of Trafficking them to the beſt Advantage, whether by Land, by Sea, or Rivers. 7. The Commodities permitted or prohibited, both for the Import and Export of a State. 8. The Price of Exchange according to the Courſe of ſeveral Places, and what it is that raiſes or lowers it. 9. The Duties to be paid both at the Import and Export of Wares, according to the Uſe of the Places, the Tarifs, Regulations, *&c.* 10. The manner of Packing, Baling, and Tunning *Merchandizes*, to keep them either in Magazines, or in Voyages, *&c.* 11. On what Terms a *Merchant*-Veſſel may be Freighted, and Aſſured. 12. The Goodneſs and Value of every thing requiſite for the Conſtruction or Refitting of Veſſels, the Prices of Woods, Cordage, Maſts, Anchors, Sails, and other Equipage. 13. The Wages ordinarily given Captains, Officers, and Sailors: and the manner of contracting with them. 14. The foreign Languages, which may be reduced to three principal ones, *viz.* the *Spaniſh*, uſed almoſt through all the *Eaſt*, particularly on the Coaſt of *Africa*, from the *Canaries* to the *Cape of Good Hope*; the *Italian*, uſed throughout the Coaſts of the *Mediterranean*, and many Places of the *Levant*; and the *Teutonic* or *German*, uſed throughout moſt Countries of the *North*. Laſtly, the Conſular Juriſprudence, the Laws, Cuſtoms, Companies, Colonies, Chambers of Aſſurances, Conſulates in the ſeveral Countries; and in the general, all the Ordonnances, Regulations, and Policies, relating to Commerce.

MERCHANT, a Perſon who carries on *Merchandize*, or ſuſtains the Mercantile Profeſſion. See MERCHANDIZE.

MERCHANT-*Man*. See SHIP, VESSEL, CAPTAIN, *&c.*

MERCHANT-*Taylors Company* } See { COMPANY.
MERCHANT-*Taylors School* } See { SCHOOL.

MERCHANLAGE, ſee LAW.

MERCATOR's *Chart*, or *Projection*, is a Sea-Chart, wherein the Parallels are repreſented by ſtrait Lines; and the Meridians, likewiſe, by parallel ſtrait Lines, whoſe Degrees, however, are not equal, but are continually enlarged as they approach nearer the Pole, in the ſame Proportion as the parallel Circles decreaſe towards them. See PROJECTION.

For the Conſtruction, Uſe, Advantages, *&c.* hereof, ſee *Mercator's* CHART.

MERCATOR's *Sailing*, is that performed by means of *Mercator's Charts*. See *Mercator's* SAILING.

MERCURY, ☿, in Aſtronomy, the ſmalleſt of the inferior Planets, and the neareſt the Sun. See PLANET and SYSTEM.

The mean Diſtance of this Planet from the Sun is to that of our Earth from the Sun as 387 to 1000; its Excentricity 8 Degrees: The Inclination of its Orbit, that is, the Angle formed by the Plane of its Orbit with the Plane of the Ecliptic, is 6 Degrees 52 Minutes: Its Diameter to that of the Earth as 3 to 4; and therefore the Globe of *Mercury* will be to that of the Earth as 2 to 5. See EXCENTRICITY, INCLINATION, DIAMETER, DISTANCE, *&c.*

According to Sir *Iſ. Newton*, the Heat and Light of the Sun on the Surface of *Mercury* is ſeven times as intenſe as on the Surface of our Earth in the middle of Summer: which, as he found by Experiments made for that purpoſe by a Thermometer, is ſufficient to make Water boil. Such a degree of Heat therefore muſt render *Mercury* uninhabitable to Creatures of our Conſtitution: And if Bodies on its Surface be not inflamed and ſet on fire, it muſt be becauſe their Degree of Denſity is proportionably greater than that of ſuch Bodies with us. See HEAT.

The Revolution of *Mercury* round the Sun, or his Year, is performed in 87 Days, 23 Hours; his diurnal Revolution, or the Length of his Day, is not yet determined; nor is it certain whether he has ſuch a Motion round his own Axis, or not. See PERIOD, REVOLUTION, *&c.*

What variety of Weather or Seaſons it may be liable to, we are ſtill at a loſs; as not knowing the Inclination of his Axis to the Plane of his Orbit. The Force of Gravity on the Surface of *Mercury*, is ſeven times as ſtrong as on the Surface of the Earth. Its Denſity, and, conſequently, the Gravitation of Bodies towards the Centre, cannot be accurately determined; but no doubt it muſt exceed that of our Earth, by reaſon of the Exceſs of Heat there. See GRAVITY, DENSITY, *&c.*

Mercury changes its Phaſes, like the Moon, according to its ſeveral Poſitions with regard to the Sun and Earth. See MOON.

It appears full, in its ſuperior Conjunctions with the Sun, becauſe we can ſee the whole illumined Hemiſphere: But in its lower Conjunction, we only ſee the obſcure, or unillumined Hemiſphere: In his Approach toward the Sun, his Light is falcated or horned. See PHASES.

The Situation of this Planet proves evidently, that the Hypotheſis of *Ptolemy* is falſe: For *Mercury* is ſometimes obſerved betwixt the Earth and Sun; and ſometimes beyond the Sun. But the Earth is never found between *Mercury* and the Sun; which however muſt happen, if the Spheres of all the Planets incompaſs'd the Earth, as a Centre, according to the *Ptolemaic* Scheme. See PTOLEMAIC *Syſtem*.

The Diameter of the Sun view'd from *Mercury*, would appear three times as big as it appears on our Earth; that Planet being thrice as near him as we are; and therefore the Sun's Diſk would appear ſeven times as large as it appears to us.

Its greateſt Diſtance from the Sun, with regard to us, never exceeds 28 Degrees, whence 'tis ſeldom viſible; being commonly either loſt in the Sun's Light, or, when the moſt remote from the Sun, in the Crepuſculum. The beſt Obſervations of this Planet, are thoſe made when it is ſeen on the Sun's Diſk; for in its lower Conjunction, it paſſes before the Sun like a little Spot, eclipſing a ſmall part of his Body, only obſervable with a Teleſcope. The firſt Obſervation of this kind, was that of *Gaſſendi* in 1632. See TRANSIT.

To an Inhabitant of *Mercury*, the ſolar Spots will appear to traverſe his Diſk ſometimes in a right Line from Eaſt to Weſt, and ſometimes Elliptically. As the other five Planets are above *Mercury*, their Phænomena will be nearly the ſame there, as with us. *Venus* and the Earth, when in oppoſition to the Sun, will ſhine with full Orbs, and afford a noble Light to that Planet.

MERCURY, in Natural Hiſtory, a fluid, mineral Matter, perfectly reſembling Silver in fuſion. See MINERAL.

Mercury is known under a great number of Names: The common Name among the Antients was *Hydrargyrum*, *q. d.* Water of Silver. The Moderns commonly call it *Mercury*, from ſome ſuppoſed Relation it bears to the Planet of that Name. In *Engliſh* it is popularly call'd *Quick-Silver*, from its Appearance. Many of the Chymiſts call it *Proteus*, from the variety of Forms, Colours, *&c.* it paſſes thro' in their Preparations.

Naturaliſts are divided what Claſs of Foſſils to range *Mercury* under: Some make it a *Metal*; others a *Semi-metal*; and others an imperfect *Metal*. See FOSSIL and SEMI-METAL.

Boerhaave obſerves, that it is very improperly call'd a *Metal*, inaſmuch as it has not all the Characters of ſuch a Body; nor ſcarce any thing in common with the other Metals, except Weight and Similarity of Parts: Thus, for Example, it is neither diſſolvable by Fire, malleable, nor fix'd: In effect, it ſeems to conſtitute a peculiat Claſs of Foſſils: and is rather the Mother, or Baſis of all Metals, than a Metal itſelf. See METAL.

Perfect Metals, according to M. *Homberg*, *&c.* are nothing but pure *Mercury*, whoſe little Particles are penetrated on all ſides, and fill'd with the Matter of Light, which unites and binds them together into a Maſs, ſo that the Parts of fluid *Mercury*, which are ſuppoſed to be little ſolid Globes, in their Metallification are render'd rough and uneven, being pireced on all ſides, and having their Pores or Perforations fill'd with the Matter of Light. By ſuch means they loſe their firſt Confirmation, and the Politure or Smoothneſs of their Surfaces, which is one of the principal Cauſes of the fluidity of *Mercury*.

The Chymiſts make *Mercury* one of their Hypoſtatical Principles: Not, as M. *Homberg* obſerves, that it anſwers

the Character of a Principle, which is that whoſe Subſtance cannot be Analyzed, or reduced into Matters more ſimple; but becauſe the Analyſis has not yet been diſcovered: Tho' it is poſſible it may hereafter, there being little doubt but that *Mercury* is a Compound. This is the more probable, in regard *Mercury* may be deſtroy'd, which never happens to ſimple Bodies. The manner of deſtroying *Mercury*, is, firſt, by changing it into a perfect Metal, by introducing a ſufficient quantity of Light within its Subſtance; and then expoſing this Metal to a Burning-Glaſs, where, in a little time, it evaporates almoſt wholly into Smoke, leaving nothing behind but a light earthy Duſt.

The Properties of MERCURY.

The Characters, or Properties of *Mercury*, are, 1. That of all Bodies it is the heavieſt, after Gold; and ſtill the purer it is, the heavier: Nay, ſome of the Philoſophers even hold that *Mercury* well purged of all its Sulphur, would be heavier than Gold itſelf. The ordinary Proportion is that of 14 to 19. If any *Mercury* be found to weigh more than according to this *Ratio*, it may be ſafely concluded to have Gold in it. See WEIGHT.

The 2d Character of *Mercury*, is to be of all Bodies the moſt fluid; that is, its Parts ſeparate, and recede from each other by the ſmalleſt Force. Conſequently, of all Bodies it is that whoſe parts cohere the leaſt, or are the leaſt tenacious; and therefore of all others the leaſt ductile and malleable. The parts of Water do not divide ſo readily as thoſe of Quick-Silver; and the parts of Oil much leſs: There is a certain Tenacity even in the parts of Spirit of Wine which reſiſts ſeparation; but there is ſcarce any Coheſion at all in the parts of *Mercury*. See FLUIDITY and FIRMNESS.

The 3d Property of *Mercury*, which, indeed, depends on the 2d, is, That of all Bodies it is diviſible into the minuteſt parts. Thus, being expoſed to the Fire, it reſolves into a Fume ſcarce perceivable to the Eye; but in whatever manner it be divided, it ſtill retains its Nature, and is the ſame ſpecific Fluid. For the Vapours of diſtill'd, or volatilized *Mercury* received in Water, or moiſt Leather, or the like, become pure *Mercury*; and if *Mercury* be mixed with other Bodies, in order to fix it, for it is ſcarce fixable of itſelf, it is eaſily ſeparable from them again by Fire, and reducible into pure *Mercury* as before. See DIVISIBILITY.

The 4th Character is to be extremely Volatile, being convertible into Fume, even by a Sand-heat. In effect, it does not ſuſtain the Fire long enough either to boil, or ignite. Tho' it muſt be added, if the Fire be at firſt very gentle, and increaſe by eaſy degrees, it may be retained therein a pretty long time, and be fixed ſo as at length to become ignited in the Crucible, as we learn from ſome very tedious Experiments made at *Paris*. See VOLATILITY.

The Gilders are but too well acquainted with the Vapours of *Mercury*, which frequently render 'em Epileptic, and Paralytic, and ſometimes ſalivate them; being of ſo penetrating a Nature, as to take away ſcirrhous Tumours, tho' very apt to reach and deſtroy the nobler Parts.

The 5th Property is, that it eaſily enters, and intimately adheres to Gold, leſs eaſily to the other Metals, with difficulty to Copper, and not at all to Iron. See AMALGAMATION.

Indeed we have heard much among the Adepts about making an Amalgama with *Mercury* and Iron; but the Experiment would never ſucceed with that Noble Chymiſt, *Her. Boerhaave*. 'Tis poſſible there may be ſome way of binding thoſe two Bodies together; and no doubt an Amalgama might be made, if a large Quantity of Gold were added to the Iron: But then, if the Compound were beaten into a Duſt, in Water, the Iron would waſh away, and the Gold remain. On this Account it is, that ſuch as have Occaſion to handle Quick-Silver, always make choice of Iron-Inſtruments for that purpoſe. We have known Women, in a Salivation, to have their Ear-Rings grow white and ſoft with the Effluvia of the *Mercury*; and hence the Gilders, to lay Gold on any other Body, diſſolve it in hot *Mercury*, which done, they apply the Solution on the Body to be gilt, ſuppoſe Silver; then ſetting it over the Coals, the *Mercury* flies away, and leaves the Gold adhering like a Cruſt to the Silver. Laſtly, rubbing the Cruſt with *Lapis Hæmatites*, the Silver is gilt. See GILDING.

The 6th Character is, That of all Fluids, it is the coldeſt, and the hotteſt: ſuppoſing the Circumſtances the ſame. *Boerhaave* ſhews, that Fire is equally diffuſed through all Bodies; and that there is in reality the ſame degree thereof in *Mercury*, as in Spirit of Wine; and yet if you try with your Finger, *Mercury* in the Cold, is much colder, and, over the ſame Fire, conſiderably hotter, than the Spirit. This property depends on the great Weight of *Mercury*: for the Heat and Cold of all Bodies is *cæteris paribus* as their Weights. Now, *Mercury* being 14 times heavier than Water; if both of them be expoſed in a Winter's Night to the ſame Cold, the *Mercury* muſt be ſo much colder than Water, as it is heavier. So, alſo, if they be both apply'd to the ſame degree of Heat, while the Water becomes warm, the *Mercury* will be hot enough to burn the Hands. See HEAT and COLD.

The 7th Property is, that it is diſſoluble by almoſt all Acids, and unites itſelf with them; at leaſt with all foſſil Acids. Thus it is diſſolved in Oil of Vitriol; Spirit of Sulphur *per Campanam*, Spirit of Nitre, and *Aqua regia*. It is prepared with Oil of Vitriol, into *Turbith* Mineral; with Spirit of Sulphur, into *Cinnabar*; with *Aqua regia*, or Spirit of Sea-Salt or *Sal gemma*, into corroſive Sublimate. See TURBITH, CINNABAR, SUBLIMATE, &c.

Only Vinegar does not diſſolve it; and hence we are furniſhed with a Method of detecting the Frauds of Druggiſts, &c. who make a practice of ſophiſticating Quick-Silver with Lead. Do but take a Mortar, and pound the *Mercury*, with Vinegar therein; if the Vinegar grow ſweetiſh, it is a Proof there is a Mixture of Lead: If Copper have been mix'd with it, the *Mercury* will turn greeniſh, or bluiſh; if there be no Adulteration, the *Mercury* and Vinegar will both remain as before.

The 8th Property is, that it is the moſt Simple of all Bodies, next after Gold: Accordingly, we find it the ſame in all its parts, ſo far as our Obſervation goes. If a ſingle Grain of *Mercury* be diſſolved in Spirit of Nitre, a proportionable part of the Grain will be diſtributed into every minute Particle thereof; and by diluting the whole with an Ounce of *Aqua Stygia*, the whole Grain of *Mercury* will be revived. Had we the *Mercury* of the Philoſophers called alſo *Vital Mercury*, *Mercury of Metals*, &c. ſo much talked of; it is aſſerted it would be ſtill vaſtly ſimpler than Gold: For, from Gold, we can ſometimes ſeparate *Mercury*, and ſometimes Sulphur; but from pure *Mercury* nothing beſide itſelf can be ſeparated.

The 9th Property of *Mercury* is, not to be in any meaſure *Sharp*, for it ſhews no Acrimony in the Taſte, nor does it corrode any Body; and if a Carcaſe were to be buried in Quick-Silver, it would there remain without being any way hurt. The extraordinary Effects, however, it produces in the Body, have given People a Notion of its being Acrid. But the Caſe is, that when received into the Blood, it acts by its Weight and Velocity; whence it tears and deſtroys the Veſſels, and thus occaſions thoſe great Alterations, which lead the Chymiſts into their Miſtakes.

In effect, all its medicinal Operations are to be accounted for from the Properties already enumerated.

Mines of MERCURY.

The Chief Quick-Silver *Mines*, are thoſe of *Hungary*, *Spain*, *Friuli*, and *Peru*. The greateſt part of our Quick-Silver is brought us from *Friuli*, where there are abundance of *Mines* belonging to the Emperor, tho' now mortgaged to the *Dutch*. It is found under three ſeveral Forms. 1. In ruddy Glebes or Clods, call'd *Cinnabar*. 2. In hard ſtony Glebes, or a mineral Subſtance of a ſaffron, and ſometimes a blackiſh Colour. 3. It is alſo found pure: For upon opening Holes in the Beds of Stones, &c. there ſometimes guſhes a Vein or Stream of pure *Mercury*, call'd *Virgin-Mercury*. This laſt ſort is moſt valued: *Paracelſus* and *Baſil Valentine* prefer it far to any other ſort, for Chymical Operations. Dr. *Brown* aſſures us in his Travels, that enquiring of one of the Directors of the Quick-Silver *Mines*, wherein the Difference between this and common *Mercury* conſiſted; he was anſwered, That *Virgin-Mercury*, mix'd, and amalgamated with Gold, render'd the Sulphur of the Gold volatile: but this has been ſeveral times try'd without ſucceſs.

Method of procuring or ſeparating MERCURY *from the Ore, or Earth.*

They firſt grind the mineral Glebe into Powder; this done, they pour a great Quantity of Water upon it, ſtirring and working the whole briskly about till the Water becomes exceeding thick, and turbid. This Water having ſtood till it be ſettled, they pour it off, and ſupply its place with freſh, which they ſtir, and work as before. This they repeat, and continue to do, till the Water at length comes away perfectly clear; then, all remaining at the bottom of the Veſſel, is *Mercury*, and other metalline Matter.

To this *Mercury*, &c. they add the *Scoria* of Iron, putting the whole in large Iron Retorts, and ſo diſtilling it; by which means all the heterogeneous, metallic and ſtony Part, is ſeparated therefrom; and the *Mercury* left pure.

As to the *Mercury* in *Cinnabar*, they don't find it worth while to diſtil, and get it out; *Cinnabar* ſelling for a better Price than *Mercury* itſelf. See CINNABAR.

The miſerable People condemn'd or hir'd to work in thoſe *Mines*, all die in a little time. They are firſt affected with Tremors, and proceed to ſalivate; then their Teeth drop

drop out, and they are ſeized with Pains all over, eſpecially in their Bones, which the *Mercury* penetrates, and thus die.

In *Spain*, the melting or exhalation of the Mineral is performed with more Care, and with an Engine contrived for that purpoſe. As to the earthy Matter wherewith the *Mercury* is mixed, that of *Spain* is red, and ſpeckled with black and white; and ſo hard, that 'tis not to be broken up with Gun-powder. In *Hungary* 'tis frequently a hard Stone, but ordinarily a reddiſh Earth. In *Friuli* there is a ſoft Earth where the Virgin Quick-Silver is found, and a hard Stone which yields the common *Mercury*. The Mine of *Idica*, one of thoſe belonging to *Friuli*, is ſo rich, that it yields always half Quick-Silver, ſometimes two thirds. The *Mine* of *Juan Cabelaca*, or *Guan Cabilica* in *Peru*, is ſtill more conſiderable, the Earth is of a whitiſh red, like Bricks half burnt; 'tis firſt broke, then expoſed to the Fire, by ſpreading it on a Lay of common Earth, wherewith the Grate of an Earthen-Furnace is cover'd; under which is lighted a little Fire of an Herb call'd by the *Spaniards*, *Icho*: which is of that neceſſity in theſe Works, that the cutting it is prohibited for the ſpace of 20 Leagues round. In proportion as the Mineral heats, the *Mercury* riſes volatiliz'd into Smoke; which Smoke finding no vent thro' the Capital of the Furnace, which is exactly luted, eſcapes thro' a Hole made for the purpoſe, communicating with ſeveral Earthen Cucurbites fitted within one another. The Water at the bottom of each Cucurbite condenſing it to Smoke, the Quick-Silver precipitates, and is taken up, when the Operation is over. In this Proceſs, there are three things remarkable. The firſt, That the further the Cucurbites are from the Furnace, the more they are fill'd with Quick-Silver. The ſecond, That at laſt they all grow ſo hot, that they would break, were they not ſprinkled from time to time with Water. Thirdly, It is obſerved that the Workmen employ'd in the Preparation of *Mercury*, never hold it long, but become paralytic, and die hectic. A Precaution they uſe, is to hold a piece of Gold in the Mouth, to imbibe the Effluvia, and intercept their Paſſage into the Body. Dr. *Pope* tells us of one he ſaw in the *Mines* of *Friuli*, who in half a Year's time was ſo impregnated with the Metal, that putting a piece of Braſs in his Mouth, or even rubbing it in his Fingers, it would turn white as Silver.

The *Method of purifying* MERCURY, is, by waſhing it ſeveral times in Vinegar, wherein common Salt has been diſſolved; or by paſſing, and repaſſing it frequently over a *Chamois* Skin. *Am. Paræus* tells us, that the beſt way is to make a Dog ſwallow a Pound at a time, and afterwards to ſeparate it from the Excrements, and waſh it in Vinegar.

The *Uſes of* MERCURY are very conſiderable in Gilding, making Looking-Glaſſes, in refining Gold, *&c.* See each under its head, GILDING, REFINING, MIRROR, LOOKING-GLASS, *&c.*

But eſpecially in Medicine, and particularly for the Cure of the Venereal-Diſeaſe, raiſing Salivations, and on other Occaſions. See VENEREAL-DISEASE and SALIVATION. See alſo MERCURIALS.

The *Preparations of* MERCURY are very various; this Metal making one of the moſt conſiderable Articles in the Chymical Pharmacy. The moſt common Preparations are,

Sweet Precipitate of MERCURY, or MERCURIUS *Dulces*, is compounded of crude *Mercury* drove over from Sea-Salt in a Retort, or revived from common Cinnabar, and diſſolved in *Aqua fortis*; then a Brine prepared of Spring-Water and Sea-Salt is filtred thro' a Cap-Paper, and the Solution of *Mercury* drop'd gradually into this Brine, whence there is a white Powder precipitated, which is to be waſh'd from all its Acrimony with ſome ſimple diſtill'd Water, or warm Spring-Water, and the whole dried.

This is the common Precipitate of the Shops, uſually call'd *White Precipitate*. Its Operation is moſtly by Stool, ſometimes by Vomit, and will ſalivate, if ordered accordingly. It is frequently mix'd with Pomatums for the Itch, and other Foulneſſes of the Skin; for which purpoſe, 'tis neceſſary to keep the Body laxative, and to take ſomething inwardly to take hold of the Mercurial Principles, and prevent their raiſing a Salivation, which they may otherwiſe do. See PRECIPITATE.

Corroſive Sublimate of MERCURY, is a Compoſition of Vitriol calcined to a redneſs, common Salt, and purify'd Nitre, with crude *Mercury*, cleans'd by ſtraining thro' a Leather, all rubb'd together in a Mortar, till the Salts are reduced into Powder, and not the leaſt Globule of *Mercury* appears. The Mixture is then put into a Matraſs, and that ſet in a Furnace with a Sand-heat, under which a Fire being kept to its greateſt height for 12 or 15 Hours, the *Mercury* will be ſublimed, and ſtick to the Top of the Veſſel.

This Sublimate is a violent Eſcharotic, and eats away proud Fleſh; half a Dram of it diſſolved in a Pound of Lime-Water, turns it yellow, which is then call'd *Phagadenic* Water; it is uſed to waſh Ulcers, and tetterous Eruptions. See SUBLIMATE.

Sweet Sublimate of MERCURY, is a Compoſition of the preceding corroſive Sublimate with crude *Mercury*, ground together till no *Mercury* appear, and then put into a Bolt-head, well ſtop'd, and ſet in a Sand-heat, with a gentle Fire, for the Space of two Hours; which Heat is to be then increas'd for three Hours longer, and, laſtly, made very ſtrong, for as much more. When this is cold, the Glaſs is broke, and the Sublimate ſeparated from the light Flowers at top, and the Duſt at bottom. This is then powder'd a-freſh, and the Operation repeated in the ſame manner three times. If it be further repeated a ſixth time, it is call'd *Calomel*. See CALOMEL.

Fixing of MERCURY. See FIXATION and PHILOSOPHER'S *Stone*.

MERCURY *in Chymiſtry*, or MERCURY *of Bodies*, is the third of the Principles, or Elements of natural Bodies; call'd alſo *Spirit*. See PRINCIPLE.

In this Senſe, *Mercury* is defined the moſt ſubtle, light, volatile, penetrating, and active part of all Bodies. See SPIRIT.

MERCURY *of Metals*, or *of the Philoſophers*, is a pure, fluid Subſtance in form of common running *Mercury*, ſaid to be found in all Metals, and capable of being extracted from the ſame. See METAL.

The Notion of *Mercury* of Metals, is founded on the common Syſtem of the Chymiſts, That *Mercury*, or Quick-Silver, is the Baſis, or Matter of all Metals; and that Metals are only *Mercury* fix'd by a certain Sulphur. See SULPHUR, *&c.*

Mr. *Boyle* aſſures us, he had a way of drawing a true, running *Mercury*, or Quick-Silver from Antimony. See ANTIMONY.

MERCURY alſo ſerves as a general Title for Books, and Papers of News; ſo call'd from the Heathen Deity *Mercury*, ſuppoſed the Meſſenger of the Gods. See JOURNAL.

Thus we have *Mercuries Galant*, *Monthly Mercuries*, &c. See GALANT, *&c.*

In this Senſe, *Mercury* is alſo figuratively apply'd to Perſons who make it their Buſineſs to collect News, or to run about and diſtribute it.

MERCURY, in Heraldry, is ſometimes the Term, or Blazon for the Purple Colour in the Coats of Sovereign Princes. See PURPLE.

MERCURY is ſometimes uſed for the *Torricellian* Experiment, or Barometer. See BAROMETER.

Tho' *Mercury* is not ordinarily ſuſtain'd in a Tube above the diſtance of 28 or 29 Inches, yet M. *Huygens* has found, that *Mercury* well purged, and in a cloſe ſtill Place, will be ſuſtain'd to the height of 72 Inches; which is a Phænomenon the Philoſophers are all at a loſs to account for. See TORRICELLIAN *Experiment*.

MERCURIAL, ſomething that conſiſts of, or bears relation to *Mercury*, of one kind or another. See MERCURY.

Thus we ſay a *Mercurial Perſon*, to denote a Perſon of a brisk, volatile Complexion; ſuch Perſons being ſuppoſed by the Aſtrologers to be under the more immediate Dominion of the Planet *Mercury*.

So, alſo, we ſay *Mercurial* Fumes, *Mercurial* Spirits, &c. with reference to the Mineral *Mercury*.

MERCURIAL *Phoſphorus*, ſee PHOSPHORUS.

MERCURIAL *Unguents*, *Frictions*, &c. ſee SALIVATION.

MERCURIAL *Medicines*, ſee MERCURIALS.

MERCURIALS, Medicines compoſed, or prepared of *Mercury* or Quick-Silver. See MERCURY.

The principal of the Claſs of *Mercurials*, are *Mercurius dulcis*, or *white Precipitate of Mercury*; *ſweet and corroſive Sublimate of Mercury*; *Calomel*; *Artificial Cinnabar*; *Turbith Mineral*; *Prince's Powder*; *Æthiops Mineral*, &c. See each under its proper Article, *Sublimate of* MERCURY, *Precipitate of* MERCURY, CINNABAR, TURBITH, CALOMEL, *&c.*

The Medicinal Efficacy of *Mercury* depends on its extreme Diviſibility, and Fineneſs of its Particles, and on their Gravity or Weight: by means of the firſt, it finds a Paſſage into the inmoſt Receſſes of the Animal Structure, and, when properly guarded, does not exert itſelf till it comes in the remoteſt Scenes of Action; where moſt other Medicines either don't arrive, or at leaſt not till their Force is rebated. This Property it has in common with Camphor. See CAMPHOR. By the latter, it is enabled to make ſtill more conſiderable Alterations in the Animal OEconomy, by rendering the Fluids thinner, and breaking open the ſecretory Paſſages: But this Effect it has in common with *Chalybeats*. See CHALYBEATS. It may be here added, that the ſame Property whereby it becomes ſo powerful a Deobſtruent, indicates, that 'tis to be avoided in Hectics, and all Caſes where the Conſtitution is drawn

low

low by too profuſe Evacuations; in regard *Mercurials* tend to keep up or increaſe the Exceſs of Impetus in the Fluids, and that Over-Capacity in the ſecretory Orifices, wherein the Defect of ſuch a Conſtitution ſeems to conſiſt. See HECTIC.

MERIDIAN, in Aſtronomy, a great Circle of the Sphere, paſſing thro' the Zenith, Nadir, and Poles of the World; and dividing the Sphere into two Hemiſpheres, the one Eaſtern, and the other Weſtern. See CIRCLE, and SPHERE.

Or, the *Meridian* is a Vertical Circle, as A Z B N, (Tab. *Aſtronomy*. Fig. 6.) paſſing thro' the Poles of the World, P and Q. See VERTICAL *Circle*.

It is call'd *Meridian*, from the *Latin*, *Meridies*, Noon, or Mid-day, by reaſon when the Sun is in this Circle, it is Noon in that Place.

MERIDIAN, in Geography, is a great Circle, as P A Q D, (Tab. *Geography*, Fig. 7.) paſſing thro' the Poles of the Earth P and Q; and any given Place, as Z. So that the Plane of the Terreſtrial *Meridian*, is in the Plane of the Celeſtial one.

Hence, 1. As the *Meridian* inveſts the whole Earth, there are ſeveral Places ſituated under the ſame *Meridian*. And, 2. As it is Noon-Tide whenever the Centre of the Sun is in the *Meridian* of the Heavens; and as the *Meridian* of the Earth in the Plane of the former: it follows, that it is Noon, at the ſame time, in all Places ſituate under the ſame *Meridian*. 3. There are ſo many *Meridians* on the Earth, as there are Points conceived in the Æquator. In effect, the *Meridians* always change, as you change the Longitude of the Place; and may be ſaid to be infinite: Each ſeveral Place from Eaſt to Weſt having its ſeveral *Meridian*. See LONGITUDE.

Firſt MERIDIAN, is that from which the reſt are accounted, reckoning from Weſt to Eaſt. The firſt *Meridian* is the beginning of Longitude. See LONGITUDE.

The fixing of a firſt *Meridian* is a matter merely arbitrary; and hence different Perſons, Nations, and Ages, have fix'd it differently; whence ſome confuſion has aroſe in Geography. The Rule among the Antients was to make it paſs thro' the Place furtheſt to the Weſt that was known. But the Moderns knowing, that there is no ſuch Place in the Earth as can be eſteemed the moſt Weſterly; the way of computing the Longitudes of Places from one fix'd Point is much laid aſide.

Ptolemy aſſumed the *Meridian* that paſſes thro' the furtheſt of the *Canary* Iſlands as his firſt *Meridian*; that being the moſt Weſtern Place of the World then known. After him, as more Countries were diſcovered in that Quarter, the firſt *Meridian* was removed further off. Some fix'd it to the Iſland of St. *Nicholas*; *Hondius* to the Iſle of St. *James*; others to the Iſland *Del Corvo* one of the *Azores*. The lateſt Geographers, particularly the *Dutch*, have pitch'd on the *Pike of Teneriff*; others to the Iſle of *Palm*, another of the *Canaries*; and, laſtly, the *French*, by Command of their King, to the Iſland of *Fero*, another of the *Canaries*.

But, without much regard to any of theſe Rules, our Geographers, and Map-Makers, frequently aſſume the *Meridian* of the Place where they live, or the Capital of their Country for a firſt *Meridian*, and thence reckon the Longitudes of their Places.

The Aſtronomers in their Calculations uſually chuſe the *Meridians* of the Place where their Obſervations were made, for their firſt *Meridian*, as *Ptolemy* at *Alexandria*; *Tycho Brahe* at *Uranibourg*; *Riccioli* at *Boulogne*; Mr. *Flamſteed* at the Royal Obſervatory at *Greenwich*; the *French* at the Obſervatory at *Paris*.

In the *Philoſophical Tranſactions*, there is a Suggeſtion, that *Meridians* vary, in Time. This ſeems very probable from the old *Meridian-Line* in the Church of St. *Petronio* in *Bononia*, which is found to vary no leſs than 8 Degrees from the true *Meridian* of the Place at this time; and from that of *Tycho* at *Uranibourg*, which M. *Picart* obſerves, varies 18′ from the modern *Meridian*. If there be any thing of Truth in this Hint, Dr. *Wallis* ſays, the Change muſt ariſe from a change of the Terreſtrial Poles (here on Earth, of the Earth's diurnal Motion) not of their pointing to this or that of the fixed Stars: For if the Poles of the diurnal Motion remain fixed to the ſame Place on the Earth, the *Meridians* which paſs through theſe Poles muſt remain the ſame.

But the Notion of the Changes of the *Meridian* is overthrown by an Obſervation of M. *Chazelles* of the *French* Academy of Sciences, who, when in *Egypt*, found that the four ſides of a Pyramid built 3000 Years ago, ſtill look'd very exactly to the four Cardinal Points. A Poſition which can never be look'd on as fortuitous.

MERIDIAN *of a Globe*, or *Sphere*, is the Brazen Circle, in which the Globe hangs and turns. See GLOBE.

It is divided into four 90's, or 360 Degrees, beginning at the Equinoctial: On it, each way, from the Equinoctial, on the Celeſtial Globes, is counted the South and North Declination of the Sun or Stars: And on the Terreſtrial Globe, the Latitude of Places North or South. There are two Points on this Circle, call'd the *Poles*: and a Diameter continued from thence through the Centre of either Globe, is call'd the *Axis*, of the Earth or Heavens on which they are ſuppoſed to turn round. See POLE and AXIS.

On the Terreſtrial Globes there are uſually 36 *Meridians* drawn; one through every tenth Degree of the Equator, or through every tenth Degree of Longitude.

The Uſes of this Circle are, to ſet the Globes to any particular Latitude; to ſhew the Sun's or a Star's Declination, Right Aſcenſion, greateſt Altitude, &c. See GLOBE.

MERIDIAN *Line*, an Arch, or part of the *Meridian* of a Place; terminated, each way, by the Horizon: Or a *Meridian* is the Interſection of the Plane of the *Meridian* of the Place, with the Plane of the Horizon; vulgarly call'd a *North and South Line*; becauſe its Direction is from one Pole towards the other. See MERIDIAN.

The Uſe of *Meridian* Lines in Aſtronomy, Geography, Dialling, &c. is very great; and on its Exactneſs all depends: Whence infinite Pains have been taken by divers Aſtronomers to have it to the laſt Preciſion. M. *Caſſini* has diſtinguiſh'd himſelf by a *Meridian* Line drawn on the Pavement in the Church of St. *Petronia* at *Boulogne*, the largeſt and moſt accurate in the World. In the Roof of the Church, 1000 Inches above the Pavement, is a little Hole through which the Sun's Image, when in the *Meridian*, falling upon the Line, marks his Progreſs all the Year. When finiſhed, M. *Caſſini*, by a public Writing, inform'd the Mathematicians of *Europe*, of a new Oracle of *Apollo* or the Sun eſtabliſhed in a Temple, which might be conſulted with entire Confidence as to all Difficulties in Aſtronomy. See SOLSTICE.

To draw a Meridian Line.

Knowing the South Quarter pretty nearly, obſerve the Altitude F E (Tab. *Aſtronomy*, Fig. 8.) of ſome Star on the Eaſtern ſide thereof not far from the *Meridian*, HZ R N. Then, keeping the Quadrant firm on its Axis, ſo as the Plummet may ſtill cut the ſame Degree, only directing it to the Weſtern-ſide of the *Meridian*, wait till you find the Star has the ſame Altitude as before, *f e*. Laſtly, Biſſect the Angle E C *e* form'd by the Interſection of the two Planes wherein the Quadrant is placed at the time of the two Obſervations, by the right Line H R. This H R is a *Meridian Line*.

Or thus;

On a Horizontal Plane, from the ſame Centre C, (Fig. 9.) deſcribe ſeveral Arches of Circles B A, *b a*, &c. And on the ſame Centre C, erect a Style or Gnomon perpendicular to the Plane A C B, a foot, or half a foot long. About the 21ſt of *June*, between the Hours of 9 and 11 in the Morning, and between 1 and 3 after Noon, obſerve the Points B *b*, &c. A *a*, &c. wherein the Shadow of the Style terminates. Biſſect the Arches A B, *ab*, &c. in D, *d*, &c. If then the ſame right Line D E biſſect all the Arches A B, *a b*, &c. it will be the *Meridian* Line ſought. In regard the Extremity of the Shadow is ſomewhat hard to determine, 'tis beſt to have the Style flat a-top, and to drill a little Hole, noting the lucid Spot projected by it on the Arches A B and *a b*, inſtead of the Extremity of the Shadow. Otherwiſe the Circles may be made with yellow, inſtead of black, &c.

Several Authors have invented particular Inſtruments and Methods for the deſcribing of *Meridian* Lines, or rather for the determining equal Altitudes of the Sun in the Eaſtern and Weſtern Parts of the Heavens; as Mr. *Grey*, Mr. *Derham*, &c. in the *Philoſ. Tranſ.* But as the former of the Methods above delivered, ſuffices for Aſtronomical Obſervations, and the latter for more ordinary Occaſions, we ſhall forbear to give any Deſcriptions thereof.

From what has been ſhewn, it is evident that whenever the Shadow of the Style covers the *Meridian* Line, the Centre of the Sun is in the *Meridian*; and therefore it is then Noon. And hence the Uſe of a *Meridian* Line in adjuſting the Motion of Clocks, &c. to the Sun. Hence, alſo, if the *Meridian* Line be biſſected by a right Line O V, drawn perpendicularly through the Point C; O V will be the Interſection of the *Meridian*, and firſt Vertical; and, conſequently, O will ſhew the Eaſt Point, and V the Weſt. Laſtly, if a Style be erected perpendicularly in any other horizontal Plane, and a Signal be given when the Shadow of the Style covers the *Meridian* Line drawn in another Plane, noting the Apex or Extremity of the Shadow projected by the Style, a Line drawn from that Point thro' that wherein the Style is rais'd will be a *Meridian* Line. See MERIDIAN *Altitude*.

MERIDIAN Line on a Dial, is a right Line ariſing from an Interſection of the *Meridian* of the Place with the Plane of the Dial. See DIAL.

This

This is the Line of twelve a-clock; and from hence the Diviſion of the Hour-Lines begins.

MERIDIAN *Magnetical*, is a great Circle paſſing thro' or by the Magnetical-Poles; to which *Meridian* the Compaſs (if not otherwiſe hindred) hath reſpect. See MAGNET and COMPASS.

MERIDIAN *Altitude* of the Sun or Stars, is, their Altitude when in the *Meridian* of the Place where they are obſerved. See ALTITUDE.

The *Meridian* Altitude may be defined an Arch of a great Circle perpendicular to the Horizon, and terminated between the Horizon and the Star then in the *Meridian* of the place. See SUN, STAR, PLANET, &c.

To take the MERIDIAN *Altitude of the Stars.*

Aſtronomers make two principal kinds of Obſervations of Stars; the one when they are in the *Meridian*, and the other when in Vertical Circles. See OBSERVATION.

For *Meridian Obſervations*; there are two Inſtruments principally uſed, the *Quadrant* and *Gnomon*. See QUADRANT and GNOMON.

To take the Meridian Altitude with a Quadrant; if the Poſition of the *Meridian* be known, and the Plane of an Aſtronomical Quadrant be placed in the *Meridian* Line by means of the Plumb-Line ſuſpended at the Centre: The *Meridian* Altitudes of the Stars, which are the principal Obſervations whereon the whole Art of Aſtronomy is founded, may eaſily be determined.

The *Meridian* Altitude of a Star may likewiſe be had by means of a Pendulum-Clock, if the exact time of the Star's Paſſage by the *Meridian* be known. Now it muſt be obſerved, that Stars have the ſame Altitude for a Minute before and after their Paſſages by the *Meridian*, if they be not in or near the Zenith: But if they be, their Altitudes muſt be taken every Minute when they are near the *Meridian*; and then their greateſt or leaſt Altitudes will be the *Meridian* Altitudes ſought.

As to the manner of Obſerving, it is found very difficult to place the Vane of the Quadrant in the *Meridian* exactly enough to take the *Meridian* Altitude of a Star; for unleſs there be a convenient Place, and a Wall where the Quadrant may be firmly faſtned in the Plane of the *Meridian*, which is not eaſily had, we ſhall not have the true Poſition of the *Meridian* proper to obſerve the Stars.

'Twill be much eaſier therefore on ſeveral Accounts, to uſe the portable Quadrant, by which the Altitude of the Star may be obſerved a little before its Paſſage over the *Meridian* every Minute till its greateſt or leaſt Altitude be found. Here tho' we have not the true Poſition of the *Meridian* by this means, yet we have the apparent *Meridian* Altitude of the Star.

Tho' this Method, in the general, be very good, and free of any ſenſible Error, yet in caſe a Star paſſes by the *Meridian* near the Zenith, it proves ſomewhat defective: For in theſe kind of Obſervations, the inconvenient Situation of the Obſerver; the Variation of the Star's Azimuth ſeveral Degrees in a little time; the Alteration of the Inſtrument, and the difficulty of replacing it vertically, will prevent the Obſervations from being oftner than in every four Minutes. But in each Minute, the Altitude varies about fifteen Minutes of a Degree, ſo that there will be the difference of a Degree in the Star's Altitude between each Obſervation. In ſuch Caſes, therefore, it will be better to have the true Poſition of the *Meridian*, or the exact time wherein the Star paſſes the *Meridian*, in order either to place the Inſtrument in the *Meridian*, or to obſerve the Altitude of the Star the Moment it paſſes the *Meridian*. See ALTITUDE and QUADRANT.

To find the MERIDIAN *Altitude of the Sun*, &c. *by a Gnomon*. See GNOMON.

MERIDIONAL Diſtance in Navigation, is the ſame with the Departure; Eaſting or Weſting; or the Difference of Longitude between the *Meridian*, under which the Ship now is, and any other *Meridian* ſhe was under before. See DEPARTHRE.

MERIDIONAL *Parts*, *Miles*, or *Minutes*, in Navigation, are the Parts, by which the *Meridians* in *Mercator*'s Chart do increaſe, as the Parallels of Latitude decreaſe. See CHART.

The Co-ſine of the Latitude of any Place being equal to the Radius, or Semi-diameter of that Parallel, therefore in the true Sea-Chart, or Nautical Planiſphere, this Radius being the Radius of the Equinoctial, or whole Sine of 90 Degrees, the *Meridian* Parts at each Degree of Latitude muſt increaſe, as the Secants of the Ark contain'd between that Latitude and the Equinoctial do decreaſe.

The Tables therefore of Meridional Parts in Books of Navigation, are made by a continual addition of Secants, calculated in ſome Books (as in Sir *Jonas Moor*'s Tables) for every Degree and Minute of Latitude; and theſe will ſerve, either to make or graduate a *Mercator*'s Chart, or to work the *Mercator*'s Sailing.

To uſe them, you muſt enter the Table, with the Degree of Latitude at the head, and with the Minute on the firſt Column towards the Left-hand; and in the Angle of meeting, you will have the Meridional Parts.

Having the Latitudes of two Places, to find the *Meridional Miles*, or *Minutes* between them: conſider whether the Places be, one under the Equinoctial, and the other wide thereof; or the one on the one ſide the Equinoctial, and the other on the other; or whether they both lie on the ſame ſide.

If one Place lie under the Equator, the *Meridional Minutes* next under the Degree of Latitude of the other Place, is the *Meridional* difference of Latitude, or Latitude enlarged.

If one be in North, and the other in South Latitude; the *Meridional Minutes* correſponding to the two Latitudes added together, give the *Meridional Minutes* between them.

Both Places lying towards the ſame Pole; ſubſtract the *Meridional* Parts anſwering to the leſs Latitude from thoſe of the greater; the remainder gives the *Meridional Minutes*.

MERIDIANS, or MERIDIANI, a Name which the antient *Romans* gave to a kind of Gladiators, who enter'd the *Arena* about *Noon*; after the *Beſtiarii*, who fought in the Morning againſt Beaſts, had finiſh'd. See GLADIATOR.

The *Meridiani* fought Man with Man, Sword in hand: Hence *Seneca* takes occaſion to obſerve, that the Combats of the Morning were full of Humanity, compared with thoſe which follow'd.

The *Meridians* took their Name from *Meridies*, *i. e.* Noon, the time when they exhibited their Shews.

MERIT, in Theology, is uſed to ſignify the Moral Goodneſs of the Actions of Men, and the Reward due to them.

The Romiſh Schoolmen diſtinguiſh two kinds of *Merit* towards God: The one of *Congruity*, and the other of *Condignity*.

The *Merit of Congruity*, is, when there is no juſt Proportion between the Action, and the Reward; but he who beſtows the Reward ſupplies by his Goodneſs or Liberality, what was wanting in the Action: Such is the *Merit* of a Son towards his Father; but this is only *Merit* in an improper ſenſe.

The *Merit of Condignity*, is, when there is an abſolute Equality, and a juſt Eſtimation between the Action and the Reward, as in the Wages of a Workman.

Thoſe of the Reformed Religion diſclaim all *Merit* towards God. Even their beſt Works don't *Merit* any thing at his hands. The Doctrine of *Merits* makes one of the great Articles of Controverſy between the Romiſh and Reformed Churches.

MERLON, in Fortification, that part of the Parapet which lies betwixt two Embraſures. See PARAPET and EMBRASURE.

It is from 8 to 9 Foot long on the ſide of the Cannon, and 6 on the ſide of the Field; about 6 Foot high, and 18 thick.

The Word comes from *Merula*, or *Merla*, which in the corrupt *Latin* was uſed for a Battlement.

MERMAID, or MERMAN, a Sea-Creature frequently talk'd of, as being ſuppoſed half human, and half a Fiſh. See MONSTER.

However Naturaliſts may doubt of the Reality of *Mermen*, or *Mermaids*, yet we have Teſtimony enough to eſtabliſh it beyond all contradiction. In the Year 1187, as *Larrey* informs us, ſuch a Monſter was fiſh'd up in the County of *Suffolk*, and kept by the Governour for ſix Months. It bore ſo near a Conformity with Man, that nothing ſeem'd wanting to it beſides Speech. One day it took the Opportunity of making its Eſcape, and plunging into the Sea, was never more heard of. *Hiſt. d'Angleterre*, P. I. p. 403.

In the Year 1430, after a huge Tempeſt, which broke down the Dykes in *Holland*, and made way for the Sea into the Meadows, &c. ſome Girls of the Town of *Edam* in *Weſt-Friezland*, going in a Boat to milk their Cows, perceiv'd a *Mermaid* embarraſs'd in the Mud, with a very little Water. They took it into their Boat, and brought it with them to *Edam*, dreſs'd it in Women's Apparel, and taught it to ſpin. It fed like one of them, but could never be brought to ſpeak. Some time afterwards it was brought to *Haerlem*, where it liv'd for ſome Years, tho' ſtill ſhewing an Inclination to the Water. *Parival* relates, that they had given it ſome Notion of a Deity, and that it made its Reverences very devoutly when ever it paſs'd by a Crucifix. *Delices d' Hollande*.

In the Year 1560, near the Iſland of *Manar*, on the Weſtern Coaſt of the Iſland of *Ceylon*, ſome Fiſhers brought up at one Draught of a Net, ſeven *Mer-men* and *-Maids*; of which, ſeveral *Jeſuits*, and among the reſt,

F. *Hen. Henriques*, and *Dimas Boſquez*, Phyſician to the Vice-Roy of *Goa*, were Witneſſes. The Phyſician, who examined them with a great deal of Care, and made Diſſections thereof, aſſerts, that all the Parts, both internal and external, were found perfectly conformable to thoſe of Men. See the *Hiſt. de la Compagne de Jeſus*, P. II. T. IV. N°. 276. where the Relation is given at length.

We have another Relation well atteſted of a *Merman*, near the great Rock call'd *Diamond*, on the Coaſt of *Martinico*. The Perſons who ſaw it, gave in a preciſe Deſcription of it before a Notary. They affirmed that they ſaw it wipe its Hand over its Face, and even heard it blow its Noſe.

Another Creature of the ſame Species was caught in the *Baltic* in the Year 1531, and ſent as a Preſent to *Sigiſmond* King of *Poland*, with whom it liv'd three Days, and was ſeen by all the Court. Another very young one was taken near *Rocca de Sintra*, as related by *Damian Gaes*.

The King of *Portugal* and the Grand Maſter of the Order of St. *James*, had antiently a Suit at Law to determine which Party theſe Monſters belonged to.

MESARÆUM in Anatomy, the ſame with *Meſenterium*. See MESENTERY.

MESARÆUM is alſo uſed in a more reſtrained Senſe for a Part, or Diviſion of the *Meſentery*; being that faſtned to the thick Guts. See MESENTERY.

MESARAIC *Veſſels*, in the general Senſe, are the ſame with *Meſenteric*. See MESENTERIC.

In common uſe, *Meſaraic* is more frequently applied to the Veins; and *Meſenteric* to the Arteries of the *Meſentery*.

MESENTERY, or MESARÆUM, in Anatomy a fat membranous Body; thus call'd, becauſe placed in the middle of the Inteſtines, which it connects to one another. See INTESTINES.

The *Meſentery* is almoſt of a circular Figure, with a narrow Production, to which the end of the *Colon*, and beginning of the *Rectum*, are tied.

'Tis about four fingers and a half in Diameter: Its Circumference, being full of Plaits and Foldings, is about three Ells in length. The Inteſtines are tied like a Border on this Circumference of the *Meſentery:* There are three Inches of the Inteſtines faſtned. See INTESTINES.

The *Meſentery* itſelf is ſtrongly tied to the three firſt *Vertebræ* of the Loins. It is compoſed of three *Laminæ*; the inner, upon which the Glands and Fat lie, and the Veins and Arteries run, is its own proper Membrane; and the other two which cover each ſide of the proper Membrane come from the *Peritonæum*. Between the two external *Laminæ* of the *Meſentery*, run the Branches of *Arteria Meſenteriaca*, ſuperior and inferior, which bring the Blood to the Inteſtines; and the *Venæ Meſeraicæ*, which being Branches of the *Portæ*, carry the Blood back to the Liver. Here the large Branches of both Arteries and Veins communicating with one another, march directly to the Guts; where, with the Nerves from the *Plexus Meſentericus*, they divide into an infinite Number of ſmall Branches, which ſpread themſelves extremely finely upon the Coats of the Inteſtines. The *Venæ Lacteæ*, and Lymphatic Veſſels, run likewiſe upon the *Meſentery*, in which there are alſo ſeveral Veſicular Glands; the biggeſt of which in the middle of the *Meſentery*, is call'd *Pancreas Aſellii*; theſe Glands receive the Lympha and Chyle from the Lacteal Veins. See PANCREAS ASELLII.

The *Meſentery* has been ordinarily divided into two Parts, the *Meſaræum* and *Meſocolon*. The firſt appended to the *Inteſtina Tenuia*; and the latter to the *Craſſa*: But this is a Diviſion of no great moment.

The Uſe of the *Meſentery*, is, firſt, to gather the Inteſtines into a narrow Compaſs, that the Courſe of the Chiliferous Veſſels towards their common Receptacle may be but ſhort; to cover and protect them and the Blood-Veſſels; and to connect and diſpoſe the Inteſtines, ſo as to ſecure them from any Entanglement that might hinder their periſtaltic Motion.

The Word comes from the *Greek* μεσον, middle, and ἔντερον, Inteſtine, Gut; as being in the middle of the Inteſtines.

MESENTERIC, or MESARAIC, an Epithet given to two Arteries ariſing from the deſcending *Aorta*, and proceeding to the *Meſentery*.

There is an Upper, or *Superior Meſenteric*, which goes to the upper part of the Meſentery; and a Lower, or *Inferior Meſenteric*, which diſtributes itſelf through the lower part. See ARTERY.

We have alſo a *Meſenteric Vein*, compoſed of an infinity of Veins proceeding from the Meſentery; which, with the *Vena Splenica* ariſing from the Spleen, form the *Vena Porta*.

Anatomiſts alſo reckon a *Meſenteric* Nerve which ariſes from the Intercoſtal, and ſends ſeveral Branches to the Meſentery. See NERVE.

MESENTERIC *Plexus*, a Plexus, or piece of Net-Work form'd by the Branches or Ramifications of the *Par Vagum*. The *Plexus Meſentericus Magnus*, or *great Meſenteric Plexus*, is form'd out of the concurrent Branches of ſeveral other Plexus's, and ſends its nervous Fibres through the whole Meſentery along with the *Meſeraic* Veſſels, which, with various Circumligations, they accompany to the Inteſtines. See PLEXUS.

MESN, or MEASNE, a Term in Law ſignifying him who is Lord of a Manor, and ſo hath Tenants holding of him; yet he himſelf holds of a ſuperior Lord. See LORD.

MESN is alſo a Writ, which lieth where there is Lord *Meſn* and Tenant.; and the Tenant is diſtrained for Services due from the *Meſn* to the ſuperior Lord. The Word is properly derived from *Maiſn*, *minor natu*, becauſe his Tenure is derived from another, from whom he holds.

MESOCOLON, in Anatomy, that part of the Meſentery continued in the great Guts. See MESENTERY.

The *Meſocolon* lies in the midſt of the Colon, to which it is join'd. Its lower part ſticks to a part of the *Rectum*.

MESOLABE, MESOLABIUM, a Mathematical Inſtrument invented by the Antients for finding two mean Proportionals Mechanically, which they could not come at Geometrically. See PROPORTIONAL.

It conſiſts of three Parallelograms moving in a Groove to certain Interſections. Its Figure is deſcribed by *Eutochius* in his Commentary on *Archimedes*.

MESO-LOGARITHM, a Term uſed by *Kepler* to ſignify the Logarithms of the Co-Sines, and Co-Tangents: The former of which my Lord *Neper* calls *Anti-Logarithms*, and the latter *Differentiales*.

Theſe are alſo call'd Artificial Sines and Tangents. See LOGARITHM, CO-SINE, CO-TANGENT, ANTI-LOGARITHM, &c.

MESO-PLEURII in Anatomy, the Intercoſtal Muſcles. See INTERCOSTAL,

The Word is derived from μεσον *Medium*, Middle; and πλευρα *Latus*, the Side.

MESO-PLEURII is ſometimes alſo uſed for the intermediate Spaces between the *Coſtæ*, or Ribs. See RIBS.

MESSE, or MASSE, or MISSA, the Office, or public Prayers made in the *Romiſh* Church, at the Celebration of the Euchariſt. See EUCHARIST.

The *Romiſh* Divines define the *Maſs*, an Oblation made to God, wherein, by the change of a ſenſible Object by virtue of a divine Inſtitution, the ſovereign Dominion of God over all Things is acknowledged. This they eſteem the greateſt and moſt auguſt Ceremony in uſe in the Church, as being the Sacrifice of the new Law, wherein the Body and Blood of Jeſus Chriſt are offered up to God.

They are divided about the Queſtion, Whether or no it be proper or allowable for the ſame Perſon to celebrate *Maſs* ſeveral times in one day; having the Authority of Pope *Leo* in his Letter to *Dioſcurus* for the Affirmative Side of the Queſtion, and that of ſeveral of the Councils for the Negative.

Nicod, after *Baronius*, obſerves that the Word *Maſs* comes from the *Hebrew*, *Miſſach*, *Oblatum*; or from *Miſſa*, *Miſſorum*; becauſe in the former Times, the Catechumens and Excommunicated were ſent out of the Church when the Deacon ſaid *Ite*, *miſſa eſt*, after Sermon, and the reading of the Epiſtle and Goſpel; they not being allow'd to aſſiſt at the Conſecration. See CATECHUMEN.

Menage derives it from *Miſſio*, diſmiſſing. Others again, derive it from the *Latin*, *Miſſa*, Envoy; becauſe in the *Maſs*, the Prayers of Men on Earth are ſent up to Heaven.

There are a vaſt Variety of *Maſſes* in the *Romiſh* Church; the thing acquiring new Titles and Appellations according to the different Rites, Intentions, and Manners in which it is performed, as well as other Circumſtances.

Thus they have an *Ambroſian Maſs*, celebrated according to the Rite of St. *Ambroſe*, particularly uſed in *Milan*.

The *Engliſh Maſs* was the Form which antiently obtain'd in *England*.

Gallican Maſs is the Rite that formerly obtain'd in the Churches of *France*.

Greek Maſs is that rehearſed according to the *Greek* Rites in the *Greek* Language, and by *Greek* Prieſts. *Latin Maſs* is that uſed in the *Latin* Church in the *Latin* Tongue, and according to the Rites of the *Latin* Church.

High Maſs, called alſo *Grand Maſs*, is that ſung by the Choriſters, and celebrated with the Aſſiſtance of a Deacon and Subdeacon.

Low-Maſs is that wherein the Prayers are all barely rehearſed without any Singing, and performed without much Ceremony, or the Aſſiſtance of any Deacon or Subdeacon.

The *Maſs of the Beatæ*, or our Lady, is that offer'd to God by the Means and thro' the Interceſſion of the Virgin.

The *Beau-Maſs* is a *Maſs* rehearſed every day, at which the

the Ladies and *Beau-Monde* of the Place attend. This is alſo call'd the perfumed *Maſs*.

Common Maſs, or *Maſs* of the Community in a Monaſtery, is that celebrated at certain Hours, whereat the whole Body aſſiſts.

Maſs of the Holy Ghoſt, is that celebrated at the beginning of any Solemnity or Church-Aſſembly, commencing with an Invocationof the Holy Ghoſt.

Holy-day-Maſs, is that wherein certain Prayers or Lectures are read ſuitable to the Day.

Maſs of Judgment, was that wherein a Perſon clear'd himſelf of any Calumny by ſome Proof agreed upon.

Maſs for the Death of our Enemies, was a Form of *Maſs* that obtained a long time in *Spain*, but was at length aboliſhed as inconſiſtent with Chriſtian Charity.

Maſs of the Dead, or *Requiem*, is that performed at the Requeſt of the Deceaſed: The Introit whereof begins with *Requiem*. In the 13th Century, it was the Cuſtom e'er Criminals were carried out to Execution, to make them attend at a *Maſs* of the Dead, rehearſed for the Repoſe of their Souls.

Pariſh Maſs, or *Great Maſs*, is that which the Parſon is obliged to rehearſe to his Pariſhioners on Sundays and Holydays. *Little Maſs* is that ſaid at private Altars with leſs Ceremony. The firſt *Maſs* is that ſaid at Break of Day.

Maſs of a Saint, is that wherein God is invoked by the Interceſſion of ſome Saint. Thus there are alſo *Maſſes* of Apoſtles, Martyrs, Pontiffs, Virgins, &c.

Maſs of Scrutiny, was formerly rehearſed at the Examination of Catechumens, when Enquiry was made as to their Diſpoſition for Baptiſm.

Dry Maſs, is that where there is no Conſecration; as thoſe, according to *Durandus*, where the Prieſt cannot conſecrate, by reaſon of his having ſaid *Maſs* before on the ſame day; or that uſed by the Candidates of the Prieſthood, in order to their becoming acquainted with the Ceremonies; as *Eckius* will have it.

Votive Maſs, is an extraordinary Maſs beſides that of the Day, rehearſed on ſome extraordinary Occaſion.

MESSENGERS, in the *Engliſh* Polity, are Officers chiefly under the Direction of the Secretaries of State; being always ready to be ſent with all manner of Diſpatches, Foreign and Domeſtic.

They are alſo employ'd, with the Secretaries Warrants, to take up Perſons for High Treaſon, or other Offences againſt the State, which do not ſo properly fall under the Cognizance of the Common Law, and, perhaps, are not proper to be divulged in the ordinary Courſe of Juſtice.

The Priſoners they apprehend are uſually kept at their own Houſes, for which they are allow'd by the Government 6 *s.* 8 *d. per* day. When they are diſpatch'd abroad, they have an Allowance for their Journey, as ſtated, *viz.* to *Paris*, 30 *l.* to *Holland*, 25 *l.* to *Edinburgh*, 30 *l.* to *Ireland*, 30 *l.* and ſo to other Places in proportion. Part of which Money is advanced to them for their Journey.

They wait twenty at a time, monthly, diſtributed as follows, *viz.* four at Court, five at one Secretary's Office, five at the other, and two at the third Office for *North Britain*, three at the Council-Office, and one at the Lord Chamberlain's of the Houſhold. Their Poſts, if purchaſed, are eſteemed worth 300 *l.* Their Salary is 45 *l. per Annum* each.

MESSENGERS *of the Exchequer*: The four Purſuivants in that Court are called by this Name. Their Duty and Office is to attend the Lord Treaſurer, and to carry his Letters, Precepts, &c. See PURSUIVANT.

MESSENGER *of the Preſs*, a Perſon who by order of the Court ſearches Printing-Houſes, Bookſellers Shops, &c. in order to find out, or diſcover ſeditious Books, &c.

MESSIAH, a Term ſignifying *Anointed*, or *Sacred*; and in that Senſe applied to Kings and Prieſts: But, by way of Eminence to Jeſus Chriſt, the Saviour promis'd by the Prophets of the Old Law. See CHRIST.

The *Jews* ſtill wait for the coming of the *Meſſiah*; being infatuated with the Notion of a temporal *Meſſiah* that is to be a mighty Conqueror, and to ſubdue all the World. See PROPHECY, &c.

Jeſus Chriſt aſſerts himſelf the *Meſſiah*. In St. *John* iv. 25. the *Samaritan* Woman ſays to Jeſus, *I know that when the* Meſſiah *comes* (*who is called the* Chriſt) *he will tell us all things. Jeſus anſwered her, I that ſpeak to thee, am he.*

There are ſeveral Impoſtors that have endeavour'd to paſs for *Meſſiahs*. *J. Lent*, a *Dutchman*, has written a Hiſtory of falſe *Meſſiahs*, *De Pſeudomeſſiis*. The firſt he mentions was one *Barcochal*, who appeared under the Empire of *Adrian*. The laſt is Rabbi *Mardochai*, who began to be talk'd of in 1682. A little before him, *viz.* in 1666, appear'd *Sabbethai Sebi*, who was taken by the *Turks*, and turned *Mahometan*.

The Word comes from the *Hebrew*, *Maſchuach*, Anointed, of the Verb *Maſchach*, to anoint: whence Jeſus Chriſt claims the Title on a manifold Account; 1ſt, as having been anointed King of Kings from all Ages. 2dly, As Chief of the Prophets. 3dly, As High-Prieſt of the Law of Grace, or Prieſt for ever according to the Order of *Melchiſedech*.

The Son of God is variouſly denominated according to his various Qualities and Attributes. He is call'd the *Word*, as being the Eternal Son of the Father, and Conſubſtantial with him. *Chriſt*, Χριστος, a *Greek* Term, ſignifying *Anointed*, of the ſame import with the *Hebrew Meſſiah*; Jeſus, *i. e. Saviour*, of the *Hebrew*, *Jehoſua*, by reaſon he ſaves his People from their Sins. He is called *Word*, as being the Son of God; *Jeſus*, as Man; *Chriſt*, as being Anointed; and *Meſſiah*, as being both God and Man.

MESSIEURS, a *French* Title of Honour or Civility, lately introduced into our Language. The Word is the Plural of *Monſieur*, and is equivalent to the Engliſh, *Sirs*. See MONSIEUR and SIR.

The Lawyers always begin their Pleadings and Harangues with *Meſſieurs*; which Word is alſo frequently repeated in the Courſe of the Speech; on which occaſion it anſwers to our *Engliſh* Word *Gentlemen*.

The *French* ſay, *Meſſieurs du Parlement*; *du Conſeil*; *des Comptes*; &c.

MESSUAGE in Law, a Dwelling-Houſe with ſome Land aſſigned for its uſe, &c.

By this Name may a Garden, Shop, Mill, Chamber, or Cellar be called.

In *Scotland*, *Meſſuage* is what we call the *Manor-Houſe*, *viz.* Principal Dwelling-Houſe within any Barony. See MANOR.

MESYMNICUM, a Name the Antients gave to a certain part of their Tragedy; or to certain Verſes in their Tragedies. See TRAGEDY.

The *Meſymnicum* was a kind of Burden, as *Io Pæan*; *O Dithyrambe*; *Hymen*, *O Hymenæe*, or the like; which when placed at the end of a *Strophe*, was called *Ephymnium*; and when inſerted in the middle of a *Strophe*, *Meſymnicum*. See STROPHE and CHORUS.

METACARPUS, or METACARPIUM, in Anatomy, that part of the Hand between the Wriſt and the Fingers. See HAND.

The *Metacarpus* conſiſts of four Bones, which anſwer to the four Fingers; whereof that which ſuſtains the Fore-finger is the biggeſt and longeſt. They are all round and long, a little convex towards the back of the Hand, and concave and plain towards the Palm: They are hollow in the middle, and full of Marrow; they touch one another only at their Extremities, leaving Spaces in their middle, in which lie the *Muſculi Interoſſei*. See INTEROSSEI.

In their upper end there is a Sinus, which receives the Bones of the Wriſt; their lower Extremity is round, and is received into the Sinus of the firſt Bones of the Fingers. See FINGER.

The inner part of the *Metacarpus* is called the *Palm*, and the outer the back of the Hand. See PALM, &c.

The Word comes from the *Greek* μετα, *poſt*; and καρπος, *Manus*. See CARPUS.

METACISM, in Grammar, a Defect in the Pronunciation of the Letter *M*.

Iſidore ſays it's a final *m*, followed by a Vowel, as *bonum aurum*, &c.

METACHRONISM, in Chronology, an Error in Computation of Time, either on the ſide of Defect, or Exceſs. See CHRONOLOGY and TIME.

METACONDYLI, is uſed by ſome Authors for the out-moſt Bones of the Fingers. See FINGER and CONDYLUS.

METAL, in Natural Hiſtory, a ſimple, foſſil Body, that fuſes, and becomes fluid, by Fire, and by Cold coagulates and hardens into a ſolid Maſs, capable of diſtending under the Hammer. See FOSSIL.

Metal is ſaid to be *Simple*, as it may be affirm'd of every the minuteſt Particle of a *Metal*, *e. gr.* a Grain of Gold, that it is Gold, or has all the Properties of Gold. See GOLD.

Fuſible by Fire, that is, when expoſed to a great Fire, it diſſolves into parts which are eaſily moveable among themſelves, or are in actual motion. See FUSION.

Fixed, *i. e.* bearing the Fire without flying off in Vapours. Tho' it is only to a certain degree that *Metals* are fixed; for by the large Burning-Glaſſes of Meſſ. *Tſchirnhauſen* and *Villette*, all *Metals* readily evaporate. See FIXITY.

Such is the proper Idea of *Metals*, which is no ways applicable to any other Body in Nature: For a Diamond, or other Stone, tho' a ſimple Body, is not fuſible in the Fire, nor capable of being ſtretched under the Hammer. See DIAMOND. And Salt, tho' diſſolvable by Fire, is not malleable, but breaks under the Hammer. See SALT, &c.

There are indeed certain Woods which yield in ſome meaſure

meaſure to the Hammer; but then they fall to Duſt in the Fire: And ſo of the reſt. See MALLEABILITY, &c.

We find but ſix *Metals* in all Nature, *viz. Gold*, *Lead*, *Silver*, *Copper*, *Iron*, and *Tin*. See the Nature, Characters, Production, Uſes, &c. of each thereof, under its proper Article; GOLD, LEAD, SILVER, COPPER, IRON, and TIN.

To theſe, a ſeventh *Metal* is uſually added, *viz. Mercury*, or *Quick-Silver*; but improperly, as it has not all the Characters of a *Metal*, nor ſcarce any thing in common with the other *Metals*, except Weight and Similarity of parts. See MERCURY, &c.

Thus, for Example, it is neither diſſolvable by Fire, malleable, nor fix'd: In effect, it ſeems to conſtitute a peculiar Claſs of Foſſils, and is rather the Mother, or Baſis of all *Metals*, than a *Metal* itſelf. However, as it is uſually reckoned among them, and as it wants nothing to render it a *Metal*, but an additional Sulphur to fix and connect its parts together, it may without any great harm be conſider'd under that Claſs.

The common radical Character of *Metals* is, that of all known Bodies, they are the heavieſt. By Dr. *Halley*'s Experiments, the Weight of Gold to that of Glaſs is determined to be as 7 to 1; and the Weight of Tin, the lighteſt of all *Metals*, to that of Gold, as 7 to 19; which conſiderably ſurpaſſes the Weight of all Stones, Marbles, Gems, and other the moſt ſolid Bodies, as appears from the Tables of ſpecific Gravities. Nor is there any Body in Nature but a *Metal*, that is one third of the Weight of Gold. See SPECIFIC *Gravity*.

The *Royal Society* furniſh us with various Experiments of this kind. The Weights of the ſeveral *Metals*, and other Solids, they have examined Hydroſtatically, by weighing them in Air and in Water; and the Weights of the Fluids by weighing an equal Portion of each. By ſuch Experiments they find, that taking the ſame Weights of Water and Gold, the Bulk or Magnitude of the former is to the latter as 19636 to 1000; conſequently that the Weight of Gold is to Water nearly as 19 to 1.

The Specific Weight of the ſeveral *Metals* by this Means determined, ſtand thus:

Gold	19635	Iron	7852
Quick-Silver	14019	Tin	7321
Lead	11341	Stone	2000
Silver	105135	Water	1000
Copper	8843	Air	$\frac{1}{17}$

The Cubic Inch of	Weighs	*Ounces.*	*Drams.*	*Grains.*
Gold		12	2	52
Quick-Silver		8	6	8
Lead		7	3	30
Silver		6	5	28
Copper		5	6	36
Iron		5	1	24
Tin		4	6	17

As to the Origin and Formation of *Metals*, various are the Sentiments of Philoſophers Antient and Modern.

Plato will have the Cauſe of *Metals* to be a humid Vapour, incloſed in the Bowels of the Earth, which being variouſly intermix'd with Parts of the Earth, produce various *Metals*. *Plotin* will have Sulphur to be the Father of *Metals*; and an oleaginous viſcous Humour the Mother. *Lidyat* endeavours to prove all *Metals* generated by a ſubterranean Fire; urging, among other Reaſons, that many *Metals*, when taken out of the Earth, are exceedingly hot. *Du Hamel* ſhews, that *Metals* don't take their Riſe either from any vaporous Exhalation, or from Water, or from Earth; but are generated of Mercury, Sulphur and Salt. He adds, that *Metals* take their Matter and Weight from the Mercury, and their Tincture and Form from Sulphur.

The ſame Author owns the firſt Rudiment of a *Metal* to be a ſaline Subſtance ſwimming in Water, which is by little and little carry'd off. By how much the Terreſtrial Parts are more exquiſitely mix'd with the aqueous or humid, by ſo much is the *Metal* more heavy and firm, as having fewer and ſmaller Pores. Hence its Ductility; for its Parts being extremely ſmall, denſe, and complicated, may be drawn out into a very ſpacious Surface. On which account it is, that Gold exceeds all other *Metals* both in Weight and Ductility; hence alſo its Fixity, its Parts being too cloſe and denſe to be exhaled. The Water defends the Earth from being burnt, and the Earth the Water from flying off; neither forſakes the other, but each is bound in an undiſſolvable Knot. The Moiſture gives Ductility, the Earth Solidity. Where the Mixture is leſs perfect, whether the Earth or the Water prevail, the *Metal* will neither have ſo much Weight, as having larger Pores; nor will it bear the Fire ſo well. For if the Earth prevail, as in Iron, or the Water, as in Lead; Heat will ſet the one at liberty from the other; the Moiſture evaporates, and the Earth is reduc'd into Scoria's, &c.

Dr. *Woodward* accounts for the Production of *Metals* found in the Earth, in the following manner.

All *Metals* now found in the *Strata* owe their preſent Condition to the Deluge; when, alſo he imagines the *Strata* of Stone, Earth, Marble, &c. were form'd. See DELUGE.

The *Metallic* and Mineral Matter now found in the perpendicular Intervals or Fiſſures of the ſeveral *Strata*, whereof the Body of the Earth is compos'd, was, according to him, at the time of the Deluge lodg'd in the Bodies of thoſe *Strata*, and brought thence, and tranſmitted into theſe Intervals ſince that time; the Intervals themſelves not exiſting, till the *Strata* were form'd and broke again, to let the Water from the Earth.

Now the Water which, he imagines, is conſtantly aſcending from the Abyſs (ſee ABYSS) towards the Surface of the Earth, continually pervading the *Strata*, detaches out of their Pores and Interſtices ſuch *Metallic* and Mineral Corpuſcles as it finds looſe in its way, carrying them along with it to the perpendicular Intervals, where having a freer Paſſage than before, it deſerts them, and leaves them in thoſe Intervals. And this he takes to be the way in which all *Metals*, now found in thoſe Places, were brought thither, and ſtill grow.

Thoſe in the *Strata*, however, he obſerves do not, nor cannot grow; but, on the contrary, are continually leſſen'd and diminiſh'd, by ſo much as has been convey'd into the perpendicular Intervals, and brought forth of the Surface of the Earth by Springs and Exhalations from the Abyſs, &c. See FOSSIL.

The ſame ingenious Author complains of the great Uncertainty and Inconſtancy in the Mineral and *Metallic* Kingdom; neither Colour, Figure, nor Situation in the Earth, being to be depended on, ſo as to make any poſitive Judgment from them. A Pyrites or Marchaſite, for inſtance, ſhall have the Colour and Brightneſs of Gold and Silver, and yet afford nothing but a little Vitriol and Sulphur; while a Pebble in appearance ſhall have a Mixture of a valuable *Metal* in it. 'Tis common too to find the ſame *Metal* ſhot into a great number of different Forms, as well as to find different Kinds of *Metal* of the ſame Form. And as to their Place in the Earth, there is the ſame Uncertainty, being ſometimes found in the perpendicular Fiſſures or Intervals of the *Strata*, ſometimes interſperſed in the Bodies of the *Strata*, and ſometimes in both. The ſame *Metals* are alſo placed indifferently in all kind of terreſtrial *Metal*, or in *Strata* of very different natures. They are frequently intermix'd with each other, ſo that 'tis a rare thing to find any of them pure and ſimple; but Copper and Iron ſhall be in the ſame Maſs, Gold and Copper, Silver and Lead, Tin and Lead; nay, ſometimes all ſix together in the ſame Lump. See MINERAL.

M. *Tournefort* is of opinion, that all *Metals* have their Origin from Seeds, like Plants,; that they have Veſſels, with Juices circulating in them, &c.

The *French* Chymiſts have been very curious in their Inquiries into the Nature and Production of *Metals*.

M. *Geoffroy*, from a Mixture of Sulphur with a vitriolic Salt, and an argillous Earth, brought an Iron, which he maintain'd to be a new Production, or a Compoſition reſulting from the Aſſemblage of certain Principles, which exiſted ſeparately in the Ingredients that formed the *Metal*; in a word, that it was an artificial Iron. And obſerving that there were Parcels of this *Metal* in the colour'd Aſhes of Plants, and of moſt other inflammable Subſtances, he concluded that it might be form'd there alſo by the Union of the ſame three Principles.

This was oppos'd by M. *Lemery* the younger, who maintain'd that the Iron contain'd in the Aſhes of Plants, was not form'd there by Calcination, but was really exiſtent in the Plants themſelves, being rais'd in their Veſſels along with the Juices of the Earth; and further, that all the Ingredients whereof M. *Geoffroy*'s artificial Iron were form'd, do really contain Iron in themſelves, either in ſmaller or larger Quantities: Not the Argilla only, where the Iron is eaſily diſcover'd by an animated Knife; nor the Oil of Vitriol, which is drawn from a Mineral, the Ground whereof is Iron; but alſo Linſeed Oil, whereof M. *Geoffroy*'s Sulphur was made; and even that of Turpentine, ſweet Almonds, &c. relating withal the Operations whereby each of thoſe Oils might be reduc'd to an Earth wherein was Iron.

To this it is anſwer'd, that in what manner ſoever Iron be drawn from the ſeveral Ingredients ſeparately, there will be ſtill found infinitely leſs in 'em, than when mix'd, and that of conſequence the Mixture produces Iron. That as for Oils, 'tis evident they are not ſimple Subſtances, but are compos'd of an Earth, an acid and a ſulphurous or inflammable Part; which are the three preciſe

cile Principles requir'd for the Formation of Iron: ſo that, according to all Appearances, 'tis an Aſſemblage of thoſe Sulphurs, Salts and Earth in the Oil, that the Iron is form'd by Calcination; and therefore that the Means uſed to the Iron in the Ingredients, are the very ſame with thoſe by which it is compos'd.

Hence it appears, that vegetable Matters contain the Principles of Minerals. But M. *Geoffroy* goes further: and to ſupport his Doctrine of the Production of *Metals*, undertakes to prove, that the Principles of Vegetables, and thoſe of Minerals, are eſſentially the ſame; and that one may readily, and with eaſe, decompound Minerals, by ſeparating their Principles, and compound 'em again, by ſubſtituting Principles taken from Vegetables in lieu of thoſe taken away.

To clear this Point, he examines and compares the Principles of Mineral and Vegetable Salts. The Principal in the Mineral Claſs, are Nitre, Sea-Salt, and Vitriol: All which Salts we find in Plants. On the other hand, the eſſential Salt of the *Parietaria* is wholly nitrous, and melts on the Coals like Salt-Petre. The fix'd Salts of the *Carduus Benedictus*, *Abſinthium*, *Kali*, &c. contain a great deal of Sea-Salt, which cryſtallizes in Cubes, and precipitates on the Coals. Add, that the greateſt part of the fix'd Salts of Plants calcin'd to a certain degree, yield a ſtrong Smell of Sulphur, which can proceed from nothing but a vitriolic Salt, rarify'd and volatiliz'd by the Oil of the Plant. By theſe Salts we may be able to judge of all the other Salts of Plants; for the volatile Salts are nothing elſe but fix'd Salts diſengag'd from the groſſeſt part of their Earth, and join'd with parts of Oil. See SALT.

Further, there is ſcarce any reaſon to doubt, that the acid Juices drawn from Vegetables, are of the ſame nature with the mineral Acids; with this only difference, that the Acids of Plants have been extremely rarify'd by Fermentation, and united ſo cloſely with Sulphurs, that 'tis not without a great deal of difficulty that they are ſeparated.

Thus, diſtill'd Vinegar, which we make no ſcruple of ranking among the vitriolic Acids; does only differ from Spirit of Sulphur, Spirit of Vitriol, or even the Cauſtic Oil of Vitriol, in that the Acids in the Vinegar are diffuſed among a great deal of Phlegm, and ſtrongly united to a great deal of Oil, which yet may be ſeparated. By diſſolving Copper in the Acid of Vinegar, ſeparated, as much as poſſible from its Oil, there are form'd Cryſtals, like in figure to thoſe of blue Vitriol. From all which it appears, that the Salts of Plants do not differ eſſentially from thoſe of Minerals.

For Sulphurs, the inflammable or ſulphureous Principle is the ſame in Vegetables as in Minerals. And M. *Geoffroy* even ſhews, that the Principle of Inflammability in common Sulphur, is the ſame with that which renders the Fat of Animals, the Oils and Reſins of Plants, and the Bitumens of the Earth, inflammable. To which he adds, that this ſame ſulphureous Principle is not only likewiſe found in metallic Subſtances, but that 'tis this which gives them their Fuſibility, Ductility, and metallic Forms. Thus Antimony, which is a Subſtance approaching the neareſt of any to a *Metal*, is little elſe but a burning Sulphur. By exhaling this, it loſes its metallick Form, and becomes a kind of grey Aſhes, which being melted, inſtead of Metal becomes Glaſs. By melting this over again, and adding to it ſome inflammable Matter, as Tartar, it returns into a Regulus.

As to the Species of METALS, there are four which the Chymiſts call *Imperfect*, becauſe their Principles are not bound ſo faſt together, but that the Force of a common Fire deſtroys them; theſe are, Iron, Copper, Lead and Tin: the others, which are Proof againſt common Fire, are Gold and Silver. In the four firſt 'tis eaſy to ſee the Principle of Inflammability. They become all fuſible by the Addition of Salt-Petre, either in a greater or leſs degree. Iron is that wherein this is the moſt viſible; next, Tin; then Copper and Lead. But the Principle is more conſpicuous ſtill, in the Duſt or ſmall Filings of the *Metals*, let fall in the Flame of a Candle, than in the Lump. For Gold and Silver, the ſulphurous Principle is not ſo obvious. No Heat but that of the Sun collected into a Focus, is capable to decompound them. But no doubt they have the ſame Principles with the other *Metals*, tho' not ſo eaſily ſeen. In Gold, as well as in the imperfect *Metals*, the Ground is an Earth capable of Vitrification, as appears by the Glaſs remaining after the Calcination of Gold in a Burning-Glaſs; and there is reaſon to believe, that the greateſt part of what is exhaled in Smoak during the Operation, is the ſulphurous Principle mix'd with Salts. As to Silver, there is ſomething in it extremely various. When purify'd with Antimony, it vitrifies in the Sun; but if purify'd with Lead, it leaves nothing behind it but grey Aſhes. The Ground of this *Metal* is doubtleſs an Earth capable of Vitrification; and what exhales in Smoak, is apparently a Mixture of Sulphur, Salts, and a little Earth volatilized by the Fire. See SULPHUR.

From all which, and many more Obſervations of the ſame kind, M. *Geoffroy* ventures to draw the following Concluſions. That the Subſtances whereof *Metals* are compoſed, don't differ eſſentially from thoſe which compoſe Vegetables. That the imperfect *Metals* are compoſed of a Sulphur, vitriolic Salt, and a vitrifiable Earth. That this ſulphurous Principle is more or leſs ſtrongly join'd with the other Principles; very ſtrongly in Gold and in Silver, leſs in Antimony, and very little in mineral Sulphur. That the Principle of Inflammability may be ſeparated from metallick Subſtances, either by culinary Fire, or by the Sun. That the *Metal* thus deſpoiled of its Principle, is converted into Aſhes. That theſe Aſhes, purſued farther with a violent Fire, vitrify; and that theſe Aſhes, or rather Glaſſes, by the Application of ſome inflammable Matter, reſume the *metallic* Form they had loſt. That 'tis by this means Linſeed-Oil turns Argilla into Iron. That if we knew all the other *metallic* Earths, they might likewiſe be immediately converted into *Metals*, by the Projection of ſome inflammable Matter. That 'tis the ſaline and earthy Parts, found in Oil of Vitriol, that furniſh the Earth capable of Vitrification, which makes the Baſe or Ground of Iron, and receives the *metallic* Form from the ſulphurous Principle of the Oil. That the Iron found in the Aſhes of Plants, was produced there in the ſame manner: And, That 'tis a Compoſition of the vitrifiable Earth of the Plants, the Acid of thoſe Plants, and their oily or inflammable Principle.

The ſame Author, the better to aſcertain the conſtituent Parts of *Metals*, made a great number of Experiments on them with the Duke of *Orleans*'s large Burning-Glaſs; the Reſult whereof falls in with, and confirms the Doctrine laid down above.

From thoſe Experiments, he ſays, it appears, That the four *Metals* which we call *imperfect*, *viz.* Iron, Copper, Tin and Lead, are compoſed of a Sulphur or oily Subſtance, capable of Inflammation, and a metallic Earth, capable of Vitrification. That from this Sulphur proceed the Opacity, Brightneſs and Malleability of a *Metal*. That this metallic Sulphur does not appear at all different from the Oil or Sulphur of Vegetables, or even Animals; and that it is the ſame in Mercury as in the four imperfect *Metals*. That theſe four *Metals* have for their Baſis an Earth ſuſceptible of Vitrification; that this Earth is different in each of the four *Metals*, in that it vitrifies differently in each; and that on this Difference in vitrifying, depends the Difference of *Metals*. See VITRIFICATION.

The excellent *Boerhaave*, after an accurate Survey of the ſeveral *Metals*, their Characters, Properties, Preparations, Uſes, &c. draws the following Corollaries concerning the general Nature of *Metals*.

1. That which diſtinguiſhes *Metals* from all other Bodies, as well as from each other, is their Heavineſs: Tho, every *Metal* has its peculiar Weight; which no Art is able to imitate, and which depends, as *Helmont* and the Chymiſts expreſs it, on the Anatic Homogeneity of the Parts. Now, the later Philoſophers have proved, that all corporeal Magnitude has juſt ſo much reality in it, as Weight; and therefore if you have found the Heavineſs of any *Metal*, you have at the ſame time found its Corporeity. Sir *Iſ. Newton* treating of Gravity, and *Huygens* of the Pendulum, ſhew that Weight and Reality are correſpondent. See WEIGHT and GRAVITY.

2. The *Metals* appear to be Simple, yet are really Compounds. Their component Principles, according to the Antients, are Sulphur and Mercury; to which ſome of the Moderns have added Salt: but 'tis certain Salt is no conſtituent Part, or Ingredient of *Metals*, but rather ſomething external adhering to them. All *Metals* conſiſt of two Parts, or Principles; Mercury as the Baſis or Matter; and Sulphur as the Binder or Cement: the firſt, the Subſtratum, or *metallic* Matter; and the ſecond, that which renders it fix'd and malleable. The Mercury, it is to be noted, is the ſame with our Quickſilver, only defæcate, and clear of any heterogeneous Matter; whereas the common Quickſilver is always mix'd. As to the Sulphur, it is not the vulgar foſſil Sulphur, but a peculiar ſort of Matter ſpecifically denominated *Sulphur of Metals*, concluded by ſome of our lateſt, and beſt Chymiſts, particularly Monſ. *Homberg*, to be Fire; which being mix'd with the Mercury, fixes it, and according to the different degrees of its Union and Coheſion therewith, produces different *Metals*. See MERCURY, SULPHUR, FIRE, &c.

This Doctrine of the Compoſition of *Metals* is confirm'd by an Experiment of Mr. *Boyle*, who after having retain'd Mercury a long time in a moderate Fire, took a piece of Gold out of it, which 'twas apparent was not in the Mercury before it was expoſed to the Fire. Monſ. *Homberg*'s Experiment is to the ſame effect; from which he con-

cludes, that Gold consists of a sulphurous ignious Part, and a heavy mercurial Part fixed thereby; and that upon taking away the sulphurous or fiery Part, the Gold is converted into fluid Mercury. See MERCURY.

3. All *Metals* must first be Mercury, e'er they be Gold; and the thing superadded to common Mercury, whereby it is prevented from becoming Gold, is a sharp volatile Body, which, when heated, becomes corrosive, and emits Fumes; which are the Properties of the fossil Sulphur.

4. If any *Metal*, or other Body, could be found that only differ'd from Gold in its wanting Weight, it were impossible ever to make Gold of it; and, on the contrary, if a Body could be had that is as heavy as Gold, all the other Properties, as Colour, Fixity, Ductility, &c. might easily be added. And hence the more knowing among the Alchymists hold the primary Matter of Gold to be Quicksilver; which, say they, is Gold, at heart, as coming neareſt to Gold in the point of specific Gravity. Only there is a corrosive Body, *i. e.* Sulphur, adhering to it, which, if it were separated, you would have Gold; or if it were only inverted, Silver.

And accordingly on such Principles whoever would make Gold out of any other foreign Matter, must remember, that the more his Matter differs from Mercury in Weight, &c. the less Gold it will make. See PHILOSOPHER'S *Stone*.

5. Therefore *Metals* are transmutable into one another: for if Mercury be the common Matter of all *Metals*, and if all the difference lie in the fixing Spirit or Sulphur, which, as it is less or more subtile and pure, constitutes this or that *Metal*; it is no way improbable they should be transmuted by a purer fixing Sulphur, taking place of a corrosive one, and fixing the Matter into a more perfect *Metal*.

6. The purest *Metals* result of the purest and most defæcate Mercury, and the smallest quantity of the subtilest Sulphur. Hence, Mercury of Gold is heavier than common Mercury, and has always some impure part that is lighter than Gold; and could that be taken away, and the fixing Spirit be added, it would become heavier than Gold.

7. The imperfect *Metals* consist of impure Mercury and imperfect Sulphur, with some other variable heterogeneous Matter in it: Thus, fused by the Fire, it emits a Fume which whitens Copper, after which the Sulphur exhales yet further. The reality of such a third Matter is evinced hence, that all these baser *Metals* are resolvable not only into Mercury and Sulphur, but also into *Scoria* or *Sordes*, which are lighter and more earthy than either of the other, and accordingly swim therein.

8. Upon the whole it appears, that in the three nobler *Metals*, Gold, Mercury, and Silver, it is principally the greater or less proportion of the Sulphur to the Mercury, that determines them to be Gold, Mercury, or Silver: That it is by this Proportion those several *Metals* are defined and denominated; and that from this difference of Proportion, flow all the specific differences of Colour, Weight, Fixity, Ductility, Volatility, Fusibility, Solubility, Salubrity, &c.

9. That in the other baser *Metals*, besides this different Proportion of the two Principals, there intervenes another Cause of Diversity, *viz.* a third Principle, or Matter of an earthy kind, and very distant from either of the rest; which adhering to the pure elemental Sulphur, corrupts and adulterates, and variously modifies it: And from the different Circumstances of this third Principle, consider'd along with those of the Sulphur itself, result the specific differences of the more imperfect *Metals* as to Weight, Colour, &c.

Bath METAL, call'd also *Princes* METAL, is a kind of factitious *Metal*, composed of the finest and purest Brass mix'd with Tin, or rather with some Mineral; whereby it becomes more disposed to receive a Polish, Lustre, &c. as also fitter to be gilt. See GILDING.

'Tis said to have been invented by Prince *Rupert*, whence its Name.

Bell METAL, is a Composition of Copper and Tin melted together. See BELL.

The ordinary Proportion is 22 or 23 Pounds of Tin to an hundred Weight of the former. See BRASS.

Line of METALS. On *Gunter's* Sector, are sometimes two Lines thus call'd, and noted with the Characters of the seven Metals, ☉, ☽, ☿, ♄, ♀, ♂, and ♃; and their Use is to give the proportions between the several *Metals* as to their Magnitudes and Weights. See their Use under the Word SECTOR.

To be laid under METAL, in Gunnery, is when the Mouth of a Gun lies lower than her Breech.

METALS *in Heraldry*. There are two *Metals* used in Heraldry, by way of Colours, *viz.* *Gold* and *Silver*; the first called *Or*, and the second *Argent*. See OR and ARGENT.

In the common painting of Arms, these *Metals* are represented by *White* and *Yellow*, which are the natural Colours of those *Metals*. See COLOUR.

In Engraving, *Gold* is expressed by dotting the Coat, &c. all over; *Silver*, by leaving it quite blank.

It is a general Rule in Heraldry never to place *Metal* upon *Metal*, nor Colour on Colour: So that if the Field be of one of the *Metals*, the Bearing must be of some Colour, and *vice versa*; otherwise the Arms are false: Tho this Rule admits of some Exceptions.

METALLIC, or METALLINE, an Adjective applied to something bearing a relation to *Metals*.

Thus we say, painting in Enamel is only to be performed with *metallic Colours*, that is, with such as come from *Metals*, or are made with *Metals*; no other being able to endure the Fire. See ENAMEL.

F. *Romani* has published a *Metallic History* of the Popes. *La France Metallique*, is a Book of Medals mostly imaginary, pretended to be taken from the Cabinets of the Curious, where they never were, by *Jaques de Bie*. *M. Bizot* has published the *Metallic History* of *Holland*.

METALLURGIA, the Art of *Metals*, that is of preparing and working Metals, from the Glebe or Mineral, to the Utensil. See METAL.

The *Metallurgia* includes what relates to the finding of the Metallic Glebe, or Ore in the Mine; the judging of its Kind, Richness, &c. the Proportion of Metal therein; the digging and separating it from the Earth, and other matters; and the purifying and disposing it into a compleat, pure, malleable Metal. See MINE and MINERAL.

Boerhaave divides the *Metallurgia* into four parts. The first teaches how Metals grow in the Mine, how they are discovered, and how procured out of the same. The second how to separate the Metallic from the other Matter of the Ore. The third, how to reduce the separated Matter to its simplicity and ductility. The fourth, to work, gild, polish, and imitate the finer Metals in rhe coarser.

METAMORPHOSIS, the Transformation of a Person; or a Change into another Form. See TRANSFORMATION.

The Antients held two kinds of *Metamorphoses*: The one real, the other apparent. The *Metamorphosis* of *Jupiter* into a Bull, and of *Minerva* into an old Woman, were only apparent. That of *Lycaon* into a Wolf, and of *Arachne* into a Spider, were of the number of the real.

Most of the antient *Metamorphoses* include some Allegorical meaning, relating either to Physics or Morality.

Ovid's Metamorphoses is a Collection of such Transformations.

Some Authors are of Opinion, that a great part of the antient Philosophy is couched under them; and Dr. *Hooke* has made an attempt to unriddle, and lay open several of them.

The Word comes from the *Greak* μετα, Change, or Removal from one place or state to another; and μορφη, Form, Figure.

METAMORPHISTS, a Sect of Heretics in the XVIth Century, whose distinguishing Tenet was, That the Body of Jesus Christ was, upon his Ascension into Heaven, changed, and *Metamorphosed* into God.

The *Metamorphists* were a Branch of the *Sacramentarians*. See SACRAMENTARIAN.

METAPHORA, or METAPHOR, in Rhetoric, a Figure of Speech whereby a Word is transfer'd from its proper Signification, to another: or, whereby the proper Name of one thing is translated and applied to some other thing; which other thing is more elegantly explained by this tralatitious or foreign Name, than by that which properly belongs to it. As when we say, the Light of the Understanding; to burn with Zeal; to float between Hope and Despair, &c. See TROPE.

The *Metaphor* is the most common of all the Figures of Speech; and is that usually meant when we say a thing is spoken *Figuratively*. See FIGURE.

The *Metaphor* is a short Simile; an Image being thereby call'd from its proper Subject to give the resemblance of another. See SIMILE.

An Allegory is no more than a continued *Metaphor*. See ALLEGORY.

The Sources or Places whence *Metaphors* are drawn, are innumerable: They may be fetch'd from Divine Matters; thus *Cicero* calls *Plato* our *God*, *Deus ille noster Plato*. From the Elements; as a *Torrent* of Eloquence. From Plants; as where Virtue has taken *Root*. From Artificial things; as where *Appian* is call'd the *Cymbal* of the World; *Longinus*, a living *Library*; *Pertinax*, Fortune's *Foot-Ball*, &c.

Quintilian distinguishes *Metaphors* into four kinds: The first, when the Word is transfer'd from one Animal to another; as when *Livy* says that *Cato* used to *bark* at *Scipio*: or, when our Saviour calls *Herod*, *Fox*. The second, when the Word is transfer'd from one Inanimate to another; as *Bridle*, for *Laws*. The third, when Inanimates are apply'd to Animates; as the *Flower* of Youth. And the last, when Animates are apply'd to Inanimates; as the River *disdain'd* its Bounds.

As the *Metaphor* is intended to ſet things before the Eyes; it becomes ſo much the more perfect, as it ſhews them the more vividly, by repreſenting them in Motion and Action. A *Metaphor* ſhould have nothing in it coarſe or ſhocking; nothing that may raiſe it above the Simplicity of Nature: Nor ſhould it appear a *Metaphor* to any but thoſe who view it very cloſely. A *Metaphor* ſhould never be carried too far; for in that Caſe, it degenerates into Puerility. *Metaphors* ſhould always be follow'd in the ſame kind; they become unnatural, when different Images are introduced. In all *Metaphorical* Dictions, there ſhould be a kind of Unity, ſo that the different Words uſed, may have a kind of Suitableneſs to each other. Different Ideas are always abſurd: As in this Inſtance; The Church was beſieged with a Deluge of Troubles: Where the two Images, *Siege* and *Deluge*, have no relation.

There is nothing young Writers are more faulty in, than the indiſcrete uſe of *Metaphors*. Thoſe who affect the *Merveilleux*, are eternally on the *Metaphorical* ſtrain; nor know any bounds or reſtraint. They who underſtand them beſt, uſe them with the greateſt reſerve. Mr. *Addiſon* propoſes it as a Rule for Writers, to imagine their *Metaphors* actually painted before them, and to view and examine the Juſtneſs of their Application and Aſſemblages: under thoſe Circumſtances; throwing every thing out of the Writing, but what might be retained in the Picture. Card. *Perron* preſcribes this general Rule for *Metaphors*; that they muſt always deſcend from the Genus to the Species; and never go backwards from the Species to the Genus: Thus we ſay figuratively, the *Bonds of Society*; and not the *human Cords* which tie us together: *Bond* being a Genus, and Cord a Species.

The Word comes from the *Greek* μεταφορα, Tranſlation, or diſplacing; of μετα, *trans*, and φερω, I bear, or carry.

METAPHRASTES, or METAPHRAST, a literal Tranſlator; or a Perſon who renders an Author into ſome other Language Word for Word. See TRANSLATION.

A *Metaphraſis* uſually ſignifies ſomething more than a Paraphraſe, or a Tranſlation; in which ſenſe, *Metaphraſt* implies a Tranſlator, Gloſſographer, and Interpolator, all at once. See PARAPHRASE, &c.

METAPHYSICS, a Branch of Science, about whoſe Nature and Idea, there is ſome difference among Authors. See SCIENCE.

Some define it that part of Science which conſiders Spirits and immaterial Beings; which others chuſe to diſtinguiſh by the Name of *Pneumatics*. See SPIRIT and PNEUMATICS.

Others, keeping cloſer to the Etymology of the Word, explain *Metaphyſics* by *trans-natural*, or *præternatural*, or even *poſt-natural Philoſophy*. In this ſenſe the Word is form'd of the Prepoſition μετα, trans, *beyond*, or *above*; and φυσις Nature, or φυσιχη, Natural.

Others, with more Propriety, conceive *Metaphyſics* to be what ſome others call *Ontology*, or *Ontoſophy*, *i. e.* the Doctrine *de Ente*, or of Being, in the general, *i. e.* of Being *quatenus* Being, or Being in the Abſtract. See ONTOLOGY and ABSTRACTION.

In the ſame view, ſome Philoſophers call this Science by the Name *Philoſophia* or *Scientia generalis*, as being the Foundation, or, as it were, the Stamen or Root from whence all the other parts of Philoſophy ariſe, and wherein they all meet; its Object being *Being* in the Abſtract, or general, not reſtrain'd to this or that Denomination of them; not to Spirit any more than Body: So that the Doctrines of *Metaphyſics*, are applicable to all Beings whatever, See ENS.

The Philoſophers again, are divided as to the Notion of a Science *de Ente*, in general. Some hold it real, preciſe, and ſolid enough to be demonſtrated; others judge it too obſcure, faint, and confuſed to be admitted into Philoſophy.

Being, abſtracted from every Sort or Species of Being, is certainly a very vague Term; and does not ſeem to give footing enough for a Science: We do not ſee how it comes to affect the Mind as an Object. Add, that the common *Metaphyſics* cannot demonſtrate any part of its Subject, but aſſumes the whole: There are no Principles, or Axioms whereon to demonſtrate *Metaphyſics* which contain the Principles of all other Sciences. See MATHEMATICS.

The firſt who wrote profeſſedly on the Subject of *Metaphyſics* is *Ariſtotle*. Indeed he is the firſt who uſes the Word: μετα τα φυσικα, is the Title of one of his Books, which ſome of his Commentators will have to ſignify no more than *after the Books of Phyſics*. M. *du Hamel*, taking the Prepoſition μετα in the ſenſe of *poſt*, is even of Opinion that the Word was coin'd by *Ariſtotle*'s Followers; and that it was utterly unknown to *Ariſtotle*.

Ariſtotle's *Metaphyſics* ſeem to have been intended for a kind of Natural Theology. F. *Malebranch* and Mr. *Locke* have wrote much more clearly and conſiſtently of *Metaphyſics*, than any of the Antients. See UNITY, MODE, TRUTH, DURATION, &c.

METAPHYSICAL, ſomething belonging to *Metaphyſics*. See METAPHYSICS.

The Word is alſo uſed to denote ſomething too ſubtle, abſtract, and refined. In this ſenſe we ſay, ſuch a Reaſoning, ſuch a Proof, is too *Metaphyſical*, &c.

A *Metaphyſical* Caſe, is an imaginary or chimerical Caſe, which can ſcarce ever happen, or not without much difficulty; and which ought not to be laid down as a Rule for common Occaſions.

METAPLASM, METAPLASMUS, in Grammar, a Tranſmutation, or Change made in a Word, by adding, retrenching, or changing a Letter or Syllable thereof.

The Word comes from the *Greek* μεταπλασμος.

METASTASIS, in Medicine, from μεταϛαω, *tranſfero*, I change, or remove; ſignifies the Removal of a Humour from one part, to another, which is moſt commonly known in nervous Caſes: ſometimes alſo in the groſſer Humours; the refluent Blood taking up digeſted Matter from one part, and diſpoſing it upon another. See FLUXION.

METATARSUS, in Anatomy, that part of the human Sceleton, containing the middle of the Foot. See FOOT.

The *Metatarſus* conſiſts of five Bones, reaching from the Heel to the Toes; whereof that which ſuſtains the great Toe, is the thickeſt; and that which ſuſtains the next Toe, the longeſt. The reſt grow, each ſhorter than other. They are longer than the Bones of the *Metacarpus*; in other things they are like them, and are articulated to the Toes, as theſe are to the Fingers. See METACARPUS.

The Word comes from μετα, *trans*, and ταρσος, *pes*, foot.

METATHESIS, *Tranſpoſition*, a Grammatical Figure, whereby the Letters of a Word, or the Words of a Sentence, are tranſpoſed, or ſhifted out of their natural Situation. See TRANSPOSITION.

The Word comes from the *Greek* μετα-θεσις, *trans-poſitio*.

METEMPSYCHI, antient Heretics, who, in imitation of *Pythagoras*, held the *Metempſychoſis* or Tranſmigration of Souls. See METEMPSYCHOSIS.

METEMPSYCHOSIS, in the antient Philoſophy, the Paſſage, or Tranſmigration of the Soul of a Man, after Death, into the Body of ſome other Animal. See TRANSMIGRATION.

Pythagoras and his Followers held, That after Death Men's Souls paſſed into other Bodies, of this or that kind, according to the manner of Life they had led. If they had been vicious, they were impriſon'd in the Bodies of *Hachan*, miſerable Beaſts, there to do Penance for ſeveral Ages; at the Expiration whereof, they returned afreſh to animate Men: If they had lived virtuouſly, ſome happier Brute, or even a human Creature, was to be their Lot. See PYTHAGOREANS.

What led *Pythagoras* into this Opinion, was, the Perſuaſion he had, that the Soul was not of a periſhable nature: whence he concluded, that it muſt remove into ſome other Body, upon its abandoning this. *Lucan* treats this Doctrine as a kind of officious Lye, contrived to mitigate the Apprehenſion of Death, by perſuading Men that they only changed their Lodging; and ceaſed to live, to begin a new Life.

Reuchlin denies this Doctrine; and maintains, that the *Metempſychoſis* of *Pythagoras* imply'd nothing more than a Similitude of Manners, Deſires, and Studies formerly exiſting in ſome Perſon deceaſed, and now revived in another alive. Thus, when it was ſaid that *Euphorbus* was revived in *Pythagoras*, no more was meant than that the martial Virtue, which had ſhone in *Euphorbus* at the time of the *Trojan* War, was now in ſome meaſure revived in *Pythagoras*, by reaſon of the great reſpect he bore to the *Athletæ*. For thoſe People wondring how a Philoſopher ſhould be ſo much taken with Men of the Sword, he palliated the Matter, by ſaying that the Soul of *Euphorbus*, *i. e.* his Genius, Diſpoſition and Inclination, were revived in him. And this gave occaſion to the Report that *Euphorbus*'s Soul, who periſhed in the *Trojan* War, had tranſmigrated into *Pythagoras*.

Ficinus aſſerts, That what *Plato* ſpeaks of the Migration of a human Soul into a Brute, is intended allegorically; and relates meerly to the Manners, Affections, and Habits of its degenerating into a beaſtly Nature by the Impurities of Vice. *Serranus*, tho' he allows ſome force to this Interpretation, yet inclines rather to refer the *Metempſychoſis* to the Reſurrection. See RESURRECTION.

Pythagoras is ſaid to have borrowed the Notion of a *Metempſychoſis* from the *Egyptians*, others ſay from the antient *Brachmans*. It is ſtill retained among the *Banians* and other Idolaters of *India* and *China*; and makes the principal Foundation of their Religion. So extremely are they bigotted to it, that they not only forbear eating any thing that has Life, but many of them even refuſe to defend

fend themſelves from wild Beaſts. They burn no Wood, leſt ſome little Animalcule ſhould be in it; and are ſo very charitable, that they will redeem from the hands of Strangers, any Animals that they find ready to be killed. See BRACHMANS, BANIANS, &c.

The Word is *Greek*, form'd of μετὰ, ἐν, and Ψυχὴ, *Soul*.

METEMPTOSIS, a Term in Mathematics, particularly uſed in Chronology, expreſſing the ſolar Equation, neceſſary to prevent the new Moon from happening a Day too late; as, on the contrary, *Proemptoſis* ſignifies the lunar Equation, neceſſary to prevent the new Moon from happening a Day too ſoon. See PROEMPTOSIS.

The new Moons running a little backwards, that is, coming a Day too ſoon at the end of 312 Years and a half; by the *Proemptoſis*, a Day is added every 300 Years, and another every 2400 Years: On the other hand, by the *Metemptoſis*, a Biſſextile is ſuppreſſed each 134 Years, that is, three times in 400 Years. Theſe Alterations are never made, but at the end of each Century; that Period being very remarkable, and rendring the Practice of the Calendar eaſy.

There are three Rules for making this Addition, or Suppreſſion of the Biſſextile-Day, and by conſequence for changing the Index of the Epacts. 1. When there is a *Metemptoſis* without a *Proemptoſis*, the next following, or lower Index, muſt be taken. 2. When there is a *Proemptoſis* without a *Metemptoſis*, the next preceding, or ſuperior Index, is to be taken. 3. When there is both a *Metemptoſis* and a *Proemptoſis*, or when there is neither the one nor the other, the ſame Index is preſerved. Thus in 1600 we had D; in 1700, by reaſon of the *Metemptoſis*, C was taken; in 1800 there will be both a *Proemptoſis* and a *Metemptoſis*; ſo the ſame Index will be retained. In 1900 there will be a *Metemptoſis* again, when B will be taken, which will be preſerved in 2000; becauſe there will then be neither the one nor the other. This is as far as we ſhall need it. *Clavius* has calculated a Cycle of 301800 Years; at the end of which Period, the ſame Indices return in the ſame Order. See EPACT.

The Word comes from the *Greek* μετα, *poſt*, and πίπτω, *cado*, I fall.

METEOR, in Phyſiology, a mixed, moveable, crude, inconſtant, imperfect Body, or Semblance of a Body, appearing in the Atmoſphere, and formed out of the Matter of the common Elements, altered a little, but not tranſformed.

METEORS are of three Kinds: Ignious, or fiery *Meteors*, conſiſt of a fat ſulphurous Smoke ſet on Fire; ſuch are *Lightning*, *Thunder*, *Ignis Fatuus*, *Draco Volans*, *Falling Stars*, and other fiery Phænomena appearing in the Air. See THUNDER, LIGHTNING, IGNIS FATUUS, &c.

Aerial or *Airy* METEORS, conſiſt of flatulent and ſpirituous Exhalations; ſuch are *Winds*, *Whirlwinds*, and *Hurricanes*. See WIND, HURRICANE, &c..

Aqueous or *Watery* METEORS, are compoſed of Vapours, or watery Particles variouſly ſeparated and condenſed by Heat and Cold; ſuch are *Clouds*, *Rainbows*, *Hail*, *Snow*, *Rain*, *Dew*, and the like. See CLOUD, RAINBOW, HAIL, SNOW, RAIN, DEW, &c.

The Formation of METEORS is explained pretty largely by *Des Cartes*, in a Treatiſe expreſs. *Ariſtotle* and *Gaſſendus* have alſo handled the ſame Subject. Dr. *Woodward*'s Opinion is, That the Matter of *Meteors* is in great meaſure of a mineral nature; That the mineral Particles contained in the Strata of the Earth, are raiſed by the ſubterraneous Heat, together with the Vapours aſcending from the Abyſs, and pervading thoſe Strata; eſpecially at ſuch times as the Sun's Heat is ſufficient to penetrate the exterior Parts of the Earth, and to make room for their Eſcape into the Atmoſphere. Thus ſulphurous, nitrous, and other active and volatile mineral Particles, form various *Meteors*, according to the various Fate they meet with in the Air. See VAPOUR, EXHALATION, MINERAL, AIR, &c.

The *Greeks* call them μετέωρα, q. d. *Sublimes*, or high-raiſed; the *Latins*, *Impreſſiones*, as making Signs or Impreſſions in the Air.

METEOROLOGY, the Doctrine of *Meteors*; explaining their Origin, Formation, Kinds, Phænomena, &c. See METEOR.

METEOROSCOPE, a Name the antient Mathematicians gave to ſuch Inſtruments as they uſed for obſerving, and determining the Diſtances, Magnitudes and Places of the heavenly Bodies.

From the *Greek* μετέωρος, *high*; and σκέπτομαι, *I view*, *obſerve*.

METHEGLIN, a Liquor, or Drink prepared of Honey; one of the moſt pleaſant and general Drinks the Northern part of *Europe* affords; and much uſed among the antient Inhabitants. See DRINK.

There are divers ways of making it: One of the beſt whereof follows. Put as much live Honey naturally running from the Comb, into Spring-Water, as that when the Honey is thoroughly diſſolved, an Egg will not ſink to the bottom, but be juſt ſuſpended in it: This Liquor boil for an Hour, or more, till ſuch time as the Egg ſwims above the Liquor about the breadth of a Groat; when very cool, next Morning, it may be barrel'd up; adding to each fifteen Gallons an Ounce of Ginger, as much of Mace and of Cloves, and half as much Cinnamon, all groſly pounded: a Spoonful of Yeſt may be alſo added at the Bung-Hole, to promote the working. When it has done working, it may be cloſely ſtop'd up, and after it has ſtood a Month, may be drawn off into Bottles. The Word is *Welch*, *Meddyglyn*.

METHOD, the Art, or Rule of diſpoſing things in ſuch a manner, as they may be eaſily comprehended; either in order to diſcover the Truth, which we ourſelves are ignorant of; or to prove and demonſtrate it to others when known. See TRUTH and ERROR.

METHOD is twofold. The one of *Reſolution*, which is that we generally uſe in our Enquiry after Truth. See RESOLUTION. The other of *Compoſition*, by which the Truth once found, is taught or imparted to others. See COMPOSITION.

In the METHOD of Reſolution, call'd alſo by Geometers the *Analytic Method*, we proceed from ſome general, known Truth, to others which belong to ſome particular or ſingular Thing. See ANALYSIS.

In the METHOD of Compoſition, called alſo the *Synthetic Method*, we propoſe ſome certain, general Truths, from which we deduce particular Truths. See SYNTHESIS.

If in the *Method* of Reſolution we propoſe any Maxims; 'tis not immediately in the beginning, and all together; but as they are found neceſſary in the Diſquiſition: On the contrary, in the *Method* of Compoſition, they are propoſed all together in the beginning, before there is any abſolute need of them.

Theſe two *Methods* differ from each other, as the *Methods* of ſearching out a Genealogy, either by deſcending from the Anceſtors to their Poſterity, or by aſcending from the Poſterity to the Anceſtors: both of them have this in common, That their Progreſſion is from a Thing known, to another unknown. Thoſe Things that are known, in each, are ſet in the front, or firſt place; that by them we may be able to arrive at thoſe which are not known. The following Things are required in both, that Error may be avoided.

1. That no Propoſition be admitted as true, to which a Man can, with a good Conſcience, deny his Aſſent; or which is not evident. 2. That the Connection of the following Propoſition, with the foregoing in every ſtep of the Progreſſion, be likewiſe evident or neceſſary. To theſe may be added two other prudential Maxims, that hold good in each *Method*: As, that we ought to reaſon on thoſe Things only, of which we have clear and perſpicuous Ideas; or of obſcure Things only, ſo far as we know them; and that we ſhould always begin from the ſimple and eaſy, and dwell on them a-while, before we proceed to Things compounded, and more difficult.

As to the Laws peculiar to *Reſolution*, they are, 1. That we muſt clearly and perfectly underſtand the State of the Queſtion propoſed. 2. That with ſome Energy or Effort of the Mind, one or more intermediate Ideas be diſcovered; which are to be a common Meaſure or Standard, by whoſe help the relations between the Ideas to be compared are to be found out. 3. That we cut off all that has no neceſſary relation to the Truth ſought after from the thing which is to be the Subject of our Conſideration. 4. That the compounded Queſtion be divided into parts, and thoſe ſeparately conſider'd in ſuch Order, as that we begin with thoſe which conſiſt of the more ſimple Ideas, and never proceed to the more compounded, till we diſtinctly know the more ſimple, and by reflection have render'd them obvious to the Underſtanding. 5. That certain Signs of our Ideas comprehended in obvious and eſtabliſh'd Figures, or in the feweſt Words poſſible, be imprinted in the Memory, or mark'd on Paper, leſt the Mind have any further trouble about them. 6. Theſe things done, that the Ideas (according to the ſecond Law) be then compared with each other, either by reflection alone, or by expreſs Words. 7. If after we have compared all the Ideas, we cannot find out what we ſeek, we are then, by the third Law, to cut off all the Propoſitions, which, after a full Examination, we find of no uſe to the Solution of the Queſtion, and begin a-freſh. If, after this Method has been repeated as often as is neceſſary, nothing of what we have obſerved ſeems to conduce to the Solution of the Queſtion, we ought to give it over as out of our reach.

The *Synthetic Method*, or *Method* of Compoſition, is only practicable in things, whoſe Principles we perfectly know; as in Geometry, which is wholly employ'd in the Conſi-

deration

deration of abſtract Modes; of which our Mind has clear and adequate Ideas: But when the Enquiry is into Subſtances, as in Phyſics, we cannot make uſe of the *Method of Compoſition*, their Kinds, and intimate Eſſences being unknown to us.

This *Method* has not been by any ſo juſtly and accurately obſerved, as by the Mathematicians, whoſe Principles are perfectly known: Its Laws therefore will be beſt drawn from their Practice. Now, as they deſigned to propoſe nothing that could be contradicted; they pitch'd on theſe three Rules: 1. To offer nothing but what was couch'd in Words or Terms perfectly underſtood; for which reaſon they always define the Words they make uſe of. 2. To build only on evident and clear Principles, ſuch as could not be contradicted by any who underſtood them; for which reaſon they firſt of all propound their Maxims or Axioms, which they demand to be granted them, as being ſelf-evident, and needing no Proof. 3. To prove demonſtratively all their Conſequences; for which reaſon they uſe nothing in their Arguments or Proofs, but Definitions that have been laid down, Axioms that have been granted, and Propoſitions that have been already proved; which become Principles to things that follow them.

The Word *Method* comes from the *Greek* μέθοδος, which ſignifies the ſame thing. The Schools have a long time diſputed, whether Logic be an Art, a Science, or a *Method*. See LOGIC.

Gaſſendus diſtributes *Method* into three Kinds or Branches, *viz. Methodus Inventionis*, *Method of Invention*, or diſcovering a Truth unknown. See INVENTION.

Methodus Judicii, of *Judging*, or determining of a Truth, or Propoſition propoſed. See JUDGMENT.

And *Methodus Demonſtrationis*, or of *Demonſtration*; that is, of exhibiting it to another. See DEMONSTRATION.

METHOD, *Methodus*, is peculiarly uſed in Mathematics for divers particular Proceſſes. In this ſenſe we ſay

METHOD *of Fluxions.*	See	FLUXIONS.
METHOD *de Maximis & Minimis, &c.*		MAXIMIS.
METHOD *of Tangents.*		TANGENTS.
DIFFERENTIAL *Method*, &c.		DIFFERENTIAL
EXPONENTIAL *Method*, &c.		EXPONENTIAL.

METHODICA *Medicina*. See MEDICINE and PHYSIC.

METHODISTS, METHODICI, an Appellation given to thoſe Phyſicians who adhere to the Doctrine of *Galen*, and the Schools; and who cure with Bleedings, Purges, &c. duly apply'd according to Symptoms, Circumſtances, &c. in oppoſition to *Emperics* and *Chymiſts*, who uſe violent Medicines, and pretended Secrets or Noſtrums. See EMPERIC, CHYMIST, &c.

METOCHE, in the antient Architecture, a Term uſed by *Vitruvius* to ſignify the Space or Interval between the Dentils. See DENTICLE.

Baldus obſerves, that in an antient MS. Copy of that Author, the Word *Metatome* is found for *Metoche*. Hence *Daviler* takes occaſion to ſuſpect that the common Text of *Vitruvius* is corrupted; and concludes, that it ſhould not be *Metoche*, but *Metatome*, *q. d.* Section.

METONIC *Cycle*, in Chronology, the Lunar Cycle, or Period of 19 Years; thus call'd from its Inventor *Meton*, an antient *Athenian*. See CYCLE and PERIOD.

When the *Metonic* Cycle is compleated, the Lunations, or the New and Full Moons return on the ſame Day of the Month; ſo that on whatever days the New and Full Moons happens this Year, 19 Years hence they will fall preciſely on the very ſame Day of the Month, as *Meton* and the Primitive Fathers thought. See LUNATION.

For this reaſon, at the Time of the Council of *Nice*, when the manner of ſettling the Time for obſerving *Eaſter* was eſtabliſhed, the Numbers of the *Metonic* Cycle were inſerted in the Calendar in Letters of Gold, on account of their great Uſe; and the Year of the Cycle for that Year was call'd the *Golden Number* of that Year. See GOLDEN NUMBER.

This is ſometimes alſo call'd the *Lunar Cycle*, or *Period*. See LUNAR *Cycle*.

METONYMY, a Figure in Rhetoric, call'd alſo *Hypallage* and *Tranſnominatio*. It conſiſts in a tranſmutation or change of Names, or putting of one Name for another. See FIGURE.

The *Metonymy* is the moſt extenſive of all the Tropes. See TROPE.

There are four principal Kinds of *Metonymies*: The firſt, when we put the Inventor for the thing invented; as *Bacchus* for Wine, *Ceres* for Bread. The ſecond, when we put the Containing for the thing contained; as a Glaſs for the Wine within it. The third, when the Effect is put for the Cauſe; as the Captain for his Soldiers, *Greece* for the *Greeks*, the Author for his Works. The fourth, when the Sign is put for the thing ſignified; as the Gown for the Prieſthood, &c.

The Word comes from the *Greek* μετα, *trans*, and ὀνομα, *Nomen*.

METOPE, or METOPA, in Architecture, the Interval, or ſquare Space between the Triglyphs, in the Frieze of the *Doric* Order. See TRIGLYPH and FRIEZE.

The Antients uſed to adorn theſe Parts with carved Works, or Paintings, repreſenting the Heads of Oxen, Veſſels, Baſons, and other Utenſils of the Heathen Sacrifices.

As there is found ſome difficulty in diſpoſing the Triglyphs and *Metopes* in that juſt Symmetry which the *Doric* Order requires; ſome Architects make it a Rule, never to uſe this Order but in Temples.

Semi METOPE is a Space ſomewhat leſs than half a *Metope*, in the Corner of the *Doric* Frieze.

The Word *Metope*, in the original *Greek*, ſignifies the diſtance between one Aperture or Hole and another, or between one Triglyph and another; the Triglyphs being ſuppoſed to be Solives or Joiſts that fill the Apertures: from μετα *inter*, between, and οπη *foramen*.

METOPOSCOPY, the Art of diſcovering the Temperament, Inclinations, and Manners of Perſons by Inſpecting the Lines in their Faces.

Metopoſcopy is no more than a Branch of Phyſiognomy; the latter taking its Conjectures from all parts of the Body: But both the Body, and the Branch are extremely precarious, not to ſay vain. See PHYSIOGNOMY.

Ciro Spontoni, who has wrote on the Subject of *Metopoſcopy*, obſerves, that there are ſeven principal Laws conſider'd in the Forehead; each of which has its peculiar Planet. The firſt is the Law of *Saturn*. The ſecond of *Jupiter*, &c.

The Word comes from the *Greek* μετωπον, *Vultus*, Face, and σκεπτομαι, *inſpicio*, I view.

METRE, or METER, a Term in Poetry; form'd of the *Greek* μέτρον, *Menſura*, and ſignifying *Verſe*, or *Meaſure*. See VERSE and MEASURE.

Metrical Verſes are thoſe conſiſting of a determinate Number of long and ſhort Syllables; as thoſe of the *Greek* and *Latin*. See QUANTITY.

Capellus obſerves, that the Genius of the *Hebrew* Language is incompatible with *Metrical* Poetry. See HEBREW.

METRICE, among the Antients, was that part of their Muſic employ'd about the Quantities of Syllables; or which conſider'd them as long, or ſhort. See QUANTITY and MUSIC.

METROCOMIA, a Term in the antient Church Hiſtory, ſignifying a Town that had other Towns under its Juriſdiction.

What a Metropolis was among Cities, that a *Metrocomia* was among Country-Towns. The antient *Metrocomies* had each its *Chorepiſcopus*, or Rural-Dean, and here was his See or Reſidence. See METROPOLIS and CHOREPISCOPUS.

The Word comes from the *Greek* μητηρ, Mother, and κώμη, Town, Village.

METROPOLIS, the Capital of a Country, or Province; or the principal City, and, as it were, the *Mother* of all the reſt. See CITY.

The Name is alſo apply'd to Archiepiſcopal Churches; and ſometimes to the principal Church of a City. See CHURCH.

Father *Monet* gives a compleat Liſt of all the *Metropoles*. See METROPOLITAN.

The Word comes from the *Greek* μήτηρ, *Mater*, Mother; and πολις, *Urbs*, City; as who ſhould ſay, the Mother-City, &c.

METROPOLITAN, is indifferently applied to an Archbiſhop, and to his Cathedral Church. See ARCHBISHOP and CATHEDRAL.

The *Roman* Empire having been divided into thirteen Dioceſes, and 120 Provinces; each Dioceſe and each Province had its *Metropolis*, or Capital City, where the Proconſul, or the Vicar of the Empire had his Reſidence. See DIOCESE and PROCONSUL.

By this Civil Diviſion, the Eccleſiaſtical was afterwards adjuſted; and the Biſhop of the Capital City, had the direction of Affairs, and the Pre-eminence over all the Biſhops of the Province. His Reſidence in the Metropolis, gave him the Title of *Metropolitan*. This erection of *Metropolitans* is refer'd to the end of the third Century, and was confirmed by the Council of *Nice*.

Archbiſhop *Uſher* and *de Marca*, however, maintain it to be an Eſtabliſhment of the Apoſtles; but in vain: For 'tis next to certain, that the Eccleſiaſtical Government was regulated on the foot of the Civil, and that it was hence the Name and Authority of *Metropolitans* was given to the Biſhops of the Capital Cities of the Empire, or the Provinces that compoſed it. This is ſo true, that in the Conteſt between the Biſhop of *Arles*, and the Biſhop of *Vienne*, each of whom laid claim to the *Metropolitanſhip* of the Province of *Vienne*; the Council of *Turin* appointed, that which e'er of them could prove his City to be the Civil Metropolis, ſhould enjoy the Title, and Rights of Eccleſiaſtical *Metropolitan*.

Tho the Eccleſiaſtical Government was modell'd on the foot of the Political; yet in *Gaul*, and ſome other Countries, the diſtinctions of *Metropolitan* and *Primate* were not obſerved till very late. As the *Præfectus Galliæ* reſided by turns at *Treves*, *Vienne*, *Arles*, and *Lyons*, he communicated the Rank and Dignity of *Metropolitan* and Primate to each of them in their turn; and yet none of the *Gallican* Biſhops aſſumed to themſelves the Rights, nor even the Precedence of *Metropolitans*. The *Epiſcopate* level'd them all; and as to Order, they had no regard, but to the Privileges of Seniority. This Equality laſted till the fifth Century, when the Conteſt between the Biſhops of *Vienne* and *Arles* was ſet on foot.

M. *du Pin* obſerves, that in the Provinces of *Africa*, excepting thoſe whereof *Carthage* was the Metropolis, the place where the moſt aged Biſhop reſided became the Metropolis. The Reaſon of which without doubt was this, that neither the Proconſul, nor Præfectus ever fix'd their Reſidence.

The ſame Author obſerves, that in *Aſia* there were Metropolis's merely nominal, that is, which had no Suffragan, nor any Rights of *Metropolitans*. The Biſhops of *Nice*, *Chalcedon*, and *Berytus*, had the Precedence of the other Biſhops, and the Title of *Metropolitans*, without any other Right or Prerogative beſides the Honour of the Appellation; they themſelves being ſubject to their *Metropolitans*.

A *Metropolitan* has the Privilege of Ordaining his Suffragans; and Appeals from Sentences paſs'd by the Suffragans, are prefer'd to the *Metropolitan*. See BISHOP and PRIMATE.

The Jeſuit *Cantel* had began a Hiſtory of *Metropoles*; but dy'd e'er the ſecond Volume was finiſhed.

MEZZANINE, a Term uſed by ſome Architects to ſignify an Entreſole. See ENTRESOLE.

The Word is borrowed from the *Italians*, who call *Mezzanini* thoſe little Windows, leſs in height than breadth, which ſerve to illuminate an Attic, or Entreſole.

MEZZO-TINTO, in Sculpture, a particular manner of Engraving Figures on Copper. See ENGRAVING.

Mezzo-Tinto is ſaid to have been firſt invented by Prince *Rupert*; and Mr. *Evelyn*, in his Hiſtory of *Chalcography*, gives us a Head perform'd by that Prince in this way.

'Tis pretty different from the common way of Engraving. To perform it, they rake, hatch, or punch the Surface of the Plate all over with a Knife, or Inſtrument for the purpoſe; firſt one way, then a-croſs, &c. till the face of the Plate be thus entirely furrow'd with Lines or Furrows cloſe and as it were contiguous to each other; ſo that if an Impreſſion were then taken from it, it would be one uniform blot or ſmut.

This done, the Deſign is drawn, or marked on the ſame Face: after which, they proceed with Burniſhers, Scrapers, &c. to expunge and take out the Dents or Furrows in all the parts where the Lights of the Piece are to be; and that more or leſs, as the Lights are to be ſtronger or fainter: leaving thoſe parts black which are to repreſent the Shadows or Deepnings of the Draught.

MIASMA, from *μιαίνω*, *inquino*, I infect; is made uſe of to ſignify ſuch Particles, or Atoms, as are ſuppoſed to ariſe from diſtemper'd, putrifying, or poiſonous Bodies, and to affect People at a diſtance. See CONTAGION.

MICHAELMAS, the Feaſt of St. *Michael* the Archangel, held on the 29th of *September*. See QUARTER-DAY.

MICROCOSM, a *Greek* Term literally ſignifying *Little World*; chiefly underſtood of *Man*, who is ſo called by way of Eminency, as being an Epitome of all that is wonderful in the great World, or Macrocoſm. See MACROCOSM.

The Word is formed from the *Greek* *μικρος*, *parvus*, little; and *κοσμος*, *Mundus*, World.

MICROGRAPHIA, MICROGRAPHY, a Deſcription of the Parts, and Proportions of Objects, that are too ſmall to be viewed without the Aſſiſtance of a Microſcope. See MICROSCOPE. Dr. *Hook*'s *Micrographia* is in much eſteem among the Curious.

The Word is compounded of *μικρος*, *parvus*, and *γραφη*, *ſcriptio*, *deſcriptio*.

MICROMETER, an Aſtronomical Machine, which by means of a very fine Skrew, ſerves to meaſure extremely ſmall Diſtances in the Heavens; as the apparent Diameters of the Planets, &c. to a great degree of Accuracy. See DISTANCE.

The Word comes from the *Greek* *μικρος*, *parvus*, and *μετρον*, *Menſura*; in regard a ſmall Length, e.g. an Inch, is hereby divided into a vaſt number of Parts, e.g. in ſome, 2800; and in others more.

There is ſome Controverſy about the Invention of the *Micrometer*. Meſſ. *Auzout* and *Picard* have the Credit of it in common Fame; as being the firſt who publiſhed it, in the Year 1665. But Mr. *Townley*, in the *Philoſophical Tranſactions*, reclaims it for one of our own Countrymen, Mr. *Gaſcoyne*. He relates, that from ſome ſcatter'd Papers and Letters of this Gentleman, he had learnt, that before our Civil Wars he had invented a *Micrometer*, of as much effect as that ſince made by M. *Auzout*, and had made uſe of it for ſome Years, not only in taking the Diameters of the Planets, and Diſtances upon Land, but in determining other Matters of nice Importance in the Heavens; as the Moon's Diſtance, &c.

Monſ. *de la Hire*, in a Diſcourſe on the Æra of the Inventions of the *Micrometer*, Pendulum Clock, and Teleſcope, read before the Royal Academy of Sciences, in 1717, makes M. *Huygens* the Inventor of the *Micrometer*. That Author, he obſerves, in his *Obſervations on Saturn's Ring*, &c. publiſhed in 1659, gives a Method of finding the Diameters of the Planets by means of a Teleſcope, *viz.* by putting an Object, which he calls *Virgula*, of a proper Bigneſs to take in the Diſtance to be meaſured, in the Focus of the Convex Object-Glaſs: In this Caſe, ſays he, the ſmalleſt Object will be ſeen very diſtinctly, in that place of the Glaſs. By ſuch means, he adds, he meaſured the Diameters of the Planets, as he there delivers them.

This *Micrometer*, M. *de la Hire* obſerves, is ſo very little different from that publiſhed by the Marquiſs *de Malvaſia*, in his *Ephemerides*, three Years after, that they ought to be eſteemed the ſame; and the *Micrometer* of the Marquiſs differ'd yet leſs from that publiſhed four years after his by *Auzout* and *Picard*. Hence M. *de la Hire* concludes, that 'tis to M. *Huygens* the World is indebted for the Invention of the *Micrometer*: without taking any notice of the Claim of our Countryman, Mr. *Gaſcoyne*, which is prior by many Years to any of them.

Conſtruction and Uſe of the MICROMETER.

1. *Wolfius* deſcribes a *Micrometer* of a very eaſy and ſimple Structure; firſt contrived by *Kirchius*.

In the Focus of a Teleſcope fit a Braſs or Iron Ring A B, (Tab. ASTRONOMY, fig. 11.) with Female Screws diametrically oppoſite to each other. Into theſe inſert Male Screws C E and F B, of ſuch Length, as that they may be turned in the Tube, ſo as to touch each other. And with this Inſtrument very ſmall Spaces in the Heavens may be accurately meaſured.

For when any Objects, viewed thro' a Tube, appear contiguous to the Screws; if theſe be turned till they juſt touch two oppoſite Points, whoſe Diſtance is to be meaſured, it will be evident how many Threads of the Screw they are apart. To determine how many Seconds anſwer to each Thread; applying the Tube towards the Heavens, turn the Screws, till they touch two Points, whoſe Diſtance is already accurately known; and obſerve the Number of Threads correſponding to that Interval. Thus, by the Rule of Three, a Table may be made of the Seconds correſponding to the ſeveral Threads; by means whereof, without more ado, the Diſtances of any Points may be determined.

2. The Structure of the *Micrometer* now chiefly in Uſe, with the Manner of fitting it to a Teleſcope, and applying it, is as follows:

A B C g (Plate ASTRONOMY, fig. 12.) is a Rectangular BraſsFrame; the Side A B being about three Inches long, and the Side B C, as likewiſe the oppoſite Side A g, about ſix Inches; and each of the three Sides about $\frac{8}{10}$ of an Inch deep. The two oppoſite Sides of this Frame are ſcrewed to the Circular Plate, to be mentioned hereafter.

The Screw P, which has exactly forty Threads in an Inch, being turned round, moves the Plate G D E F along two Grooves made near the Tops of the two oppoſite Sides of the Frame; and the Screw Q having the ſame number of Threads in an Inch as P, moves the Plate R N M Y along two Grooves, made near the bottom of the ſaid Frame, in the ſame Direction as the former Plate moves, but with only half the Velocity of that other. Theſe Screws are turned both at once, and ſo the Plates are moved along the ſame way, by means of a Handle turning the endleſs Screw S, whoſe Threads fall in between the Teeth of the Pinions on the Screws P and Q. And note, that two half Revolutions of the endleſs Screw S, carry the Screw P exactly once round.

The Screw P turns the Hand *a* faſten'd thereto, over a hundred equal Diviſions, made round the Limb of a circular Plate, to which the above named two oppoſite Sides of the Frame are ſcrew'd at right Angles. The Teeth of the Pinion on the Screw P, whoſe Number is 5, take into the Teeth of a Wheel on the back-ſide of the circular Plate, whoſe Number is 25. Again, on the Axis of this Wheel is a Pinion of two, which takes into the Teeth of another Wheel, moving about the Center of the circular Plate, on the out-ſide thereof; having 50 Teeth. This laſt Wheel moves the leſſer Hand *b* once round the above mention'd circular Plate, in the $\frac{1}{100}$ part of the Time the Hand *a* is moving round: For becauſe the Number of Teeth in the Pinion on the Screw P, are 5, and the Number of Teeth of the Wheel this Pinion moves, are 20; therefore the

Screw

Screw P moves four times round, in the time that Wheel is moving once round. Further, ſince there is a Pinion of two which takes into the Teeth of a Wheel, whoſe Number is 50; therefore this Wheel with 50 Teeth, will move once round in the time that the Wheel of 20 Teeth moves 25 times round; and conſequently the Screw P, or Hand A, muſt move a hundred times round, in the ſame time as the Wheel of fifty Teeth on the Hand *b*, has moved once round.

Hence it follows, that if the circular Plate W, which is faſten'd at right Angles to the other circular Plate, be divided into two hundred equal Parts, the Index *x*, to which the Handle is faſten'd, will move five of thoſe Parts in the ſame time, in which the Hand *a* moves one of the hundred Diviſions round the Limb of the other circular Plate. Thus by means of an Index, and Plate W, every fifth part of each of the Diviſions round the other Plate, may be known.

Farther, ſince each of the Screws P and Q, have exactly forty Threads in an Inch; therefore the upper Plate G D E F, will move one Inch, while the Hand *a* moves forty times round; the four thouſandth Part of an Inch, while the Hand moves over one of the Diviſions round the Limb; and the twenty thouſandth Part of an Inch, while the Index *x* moves one Part of the two hundred round the Limb of the circular Plate W: And the under Plate R N M Y will move half an Inch, the two thouſandth Part of an Inch, and the ten thouſandth Part of an Inch, the ſame way, in the ſaid reſpective Times.

Hence, if the under Plate, having a large round Hole therein, be fixed to a Teleſcope, ſo that the Frame is moveable, together with the whole Inſtrument, except the ſaid lower Plate; and the ſtrait ſmooth Edge H I, of the fixed Plate A B I H, as likewiſe the ſtrait ſmooth Edge D E of the moveable Plate G D E F, be perceivable thro' the round Hole in the under Plate, in the Focus of the Object-Glaſs; then, when the Handle of the *Micrometer* is turned, the Edge H I of the narrow Plate A B I H fixed to the Frame, and D E of the moveable Plate, will appear thro' the Teleſcope equally to approach to, or recede from each other.

By theſe Edges we ſhall be able to meaſure the apparent Diameters of the Sun, Moon, &c. the Manner of doing which take as follows:

Suppoſe in looking at the Moon thro' the Teleſcope, you have turned the Handle till the two Edges D E and H I, are open'd, ſo as juſt to touch or claſp the Moon's Edges; and that there was twenty one Revolutions of the Hand *a*, to compleat that opening. Firſt ſay, As the focal Length of the Object-Glaſs, which ſuppoſe ten Feet, is to Radius, ſo is 1 Inch to the Tangent of an Angle ſubtended by 1 Inch in the Focus of the Object-Glaſs; which will be found 28 Min. 30 Sec. Again, becauſe there are exactly 40 Threads of the Screws in 1 Inch; ſay, if 40 Revolutions of the Hand *a*, give an Angle of 28′ 30″, what Angle will 21 Revolutions give? The Anſwer will be, 15 Min. 8 Sec. And ſuch was the Moon's apparent Diameter; and ſo may the apparent Diameters of any other Objects be taken.

It muſt be here obſerved, that the Diviſions on the Top of the Plate G D E F, are diagonal Diviſions of the Revolutions of the Screws, with diagonal Diviſions of Inches againſt them. Thus as the ſaid Plate ſlides along, theſe Diagonals are cut by Diviſions made on the Edge of the narrow Plate K L, fixed to the oppoſite ſides of the Frame by means of two Screws. Theſe diagonal Diviſions ſerve for a Regiſter to count the Revolutions of the Screws, and to ſhew how many there are in an Inch, or the parts of an Inch.

Mr. *Derham* tells us, that his *Micrometer* is not, as uſually, to be put into a Tube, but to meaſure the Spectres of the Sun on Paper, (of any Radius) or to meaſure any part of it. By this means he can eaſily, and very exactly, with the help of a fine Thread, take the Declination of a ſolar Spot at any time of the Day; and by his half-Seconds Watch, meaſure the diſtance of the Spot from the Sun's Eaſtern or Weſtern Limb.

MICROSCOPE, or ENGYSCOPE, a Dioptrical Inſtrument, by means whereof very minute Objects are repreſented exceedingly large, and view'd very diſtinctly; according to the Laws of Refraction. See REFRACTION.

Microſcopes are properly diſtinguiſhed into ſimple, or *ſingle*; and compound, or *double*.

The *Simple* are thoſe which conſiſt of a ſingle Lens, or a ſingle Spherule: The Compound conſiſt of ſeveral duly combined. See LENS.

As Optics have been improved, other Varieties have been contrived, in the ſorts of *Microſcopes:* Hence *Reflecting-Microſcopes*, *Water-Microſcopes*, &c. See REFLECTING, &c.

When, and by whom *Microſcopes* were firſt invented, is not certainly known. *Huygens* tells us, that one *Drebbel*, a *Dutchman*, had the firſt *Microſcope*, in the Year 1621; and that he was reputed the Inventor of it: tho' F. *Fontana* a *Neapolitan*, claims the Invention to himſelf, but dates it from the ſame Year. As a Teleſcope inverted is a *Microſcope*; the Diſcovery might eaſily enough have aroſe from thence. See TELESCOPE.

Foundation and Theory of Single MICROSCOPES.

If an Object A B (Tab. OPTICS, Fig. 21.) be placed in the Focus of a ſmall convex Lens, or a ſimple *Microſcope* D E, and the Eye be applied cloſe to the other ſide of the Microſcope, *the Object will be ſeen diſtinct, in an erect Situation, and magnified in the Ratio of the diſtance of the Focus to the diſtance wherein Objects are to be placed to be ſeen diſtinctly with the naked Eye.*

Dem. For the Object A B being placed in the Focus of the convex Lens D E, the Rays iſſuing from the ſeveral Points thereof, after Refraction, will be parallel to each other. See LENS and REFRACTION. Conſequently the Eye will ſee it *diſtinctly*, by virtue of what is proved under the Word TELESCOPE.

Further, ſince one of the Rays A F proceeding from the Point A, after Refraction, becomes parallel to the incident Ray; and therefore, ſetting aſide the thickneſs of the Lens, is found directly againſt it; and the ſame holds of all the other Rays carried to the Eye: the Rays A F, and B F, to which the reſt coming from A and B are parallel, will enter the Eye in the ſame manner as if they enter'd without paſſing through the Lens; and will therefore appear *erect*; as if the Lens were away. See VISION.

Laſtly, it is manifeſt that the Object A B will be ſeen under the ſame Angle as if view'd by the naked Eye: But ſince it appears very diſtinct, whereas to the naked Eye, at the ſame diſtance, it would appear extremely confuſed, 'tis the ſame thing as if the Object ſhould ſeem removed to the diſtance F H, wherein it is viewed with equal diſtinctneſs, and under the ſame Angle. The Diameter of the Object A B, therefore, will be to the apparent Diameter I K, as F C to F H, *i. e.* as the diſtance of the Focus of the Lens to the diſtance wherein an Object is to be placed in order to view it diſtinctly. See MAGNITUDE and ANGLE.

Huygens takes it for granted, that an Object ſeen with the naked Eye, is then in its utmoſt diſtinctneſs, when ſeen at the diſtance of 8 Digits, or tenths of a Foot; which agrees pretty near with the Obſervations of others.

Laws of Single MICROSCOPES.

1. Simple *Microſcopes* magnify the Diameter of the Object A B in the Ratio of the diſtance of the Focus F C to an interval of 8 Digits, *v. g.* If the Semi diameter of a Lens convex on both ſides be half a Digit A B : I K $= \frac{1}{2} : 8 = 1 : 16$, that is, the Diameter of the Object will be increaſed in a ſedecuple Proportion, or as ſixteen to one.

2. Since the diſtance F H is conſtant, *viz.* 8 Digits, by how much the diſtance of the Focus, F C is ſmaller, ſo much the ſmaller Ratio will it have to F H; conſequently the Diameter of the Object will be ſo much the more magnified.

3. Since in Plano-convex Lens's, the diſtance of the Focus is equal to the Diameter; and in Lens's convex on both ſides, to the Semi-diameter; ſimple *Microſcopes* will enlarge the Diameter ſo much the more, as they are Segments of ſmaller Spheres.

4. If the Diameter of the Convexities of a Plano-convex Lens, and a Lens convex on both ſides, be the ſame, *viz.* $= 1$; the Diſtance of the Focus of the firſt will be 1; of the ſecond $\frac{1}{2}$. Conſequently, the Semi-diameter of the Object A B will be to the apparent one in the firſt Caſe as 1 to 8, in the latter as $\frac{1}{2}$ to 8, *i. e.* as 1 to 16. A Lens, therefore, convex on both ſides, magnifies twice as much as a Plano-convex.

As the whole depends on the juſt and ſteady ſituation of Objects with regard to the Lens, various Methods have been contrived to that end: Whence we have ſeveral different kinds of ſingle *Microſcopes*. The moſt ſimple is as follows.

1. A B, *Fig.* 22. is a little Tube, to one of whoſe Baſes B C, is fitted a plain Glaſs, to which an Object, *viz.* a Gnat, Wing of an Inſect, Down, or the like, is applied: To the other Baſe, A D, at a proper diſtance from the Object is applied a Lens convex on both ſides, whoſe Semi-diameter is about half an Inch. The plain Glaſs is turn'd to the Sun, or the Light of a Candle, and the Object is ſeen magnified. And if the Tube be made to draw out, Lens's of different Spheres may be uſed.

Again, a Lens, convex on both ſides, is incloſed in a Cell A C, and by a Screw H there faſtened a-croſs; thro' the Pedeſtal C D paſſes a long Screw, by means whereof, and the female Screw I, a Style or Needle fix'd perpendicular to its extreme, is kept firm at any diſtance from the Lens. In E is a little Tube, on which, and on the Point G, the various Objects are to be diſpoſed:

Thu-

Thus there may be Lens's of various Spheres applied.

2. But the *Microſcope* which is found to anſwer the end beſt, is as follows: A B, *Fig.* 23. is a round Braſs Tube, whoſe exterior Surface is form'd into a Skrew of a length ſomewhat leſs than the diſtance of the Focus of a Glaſs convex on both ſides, uſed here for illuminating the Object, and fitted to its Baſe A C, by a Ring with a Skrew in it D E.

F G is another Braſs Tube, ſomewhat wider than the firſt, and open each way for an Object to be apply'd to the *Microſcope*. To its upper Baſe G H is faſtned a Spring of Steel-Wire, twiſted into a ſpiral I; whereby an Object placed between two round Plates, or Slices K and L, in the manner hereafter mentioned, is by means of the Skrew B C, brought to the *Microſcopical* Lens, (or magnifying Glaſs, whereof there are ſeveral) and kept firm in its place. To the Baſis H G, which has a female Skrew M, are fitted Cells N, with a male Skrew O, wherein Lens's of various Spheres, guarded by Ferrils, are included. In P is a female Skrew, by which an Ivory Handle P Q is faſtned to the *Microſcope*.

In the Ivory Slice T are round Holes, in which are fitted little Circles of *Muſcovy* Glaſs, for Objects, eſpecially ſmall and pellucid ones, as little Inſects, or the Wings, Scales, &c. of larger, to be faſtned to.

When live Inſects are to be view'd, they are cover'd with the Braſs Slice Y, which is put in a little ſquare Braſs-bed, perforated with Holes X: And the ſame Slice, whether alone, or incloſed in the bed, being laid between the round Plates K and L, is brought to the Lens by means of the Screw A B, till the Object may be diſtinctly view'd.

If other pellucid oblong Objects are to be view'd, as Down, Cuticle, &c. inſtead of the Slice above, is uſed the Inſtrument mentioned above, for viewing Wings of Flies; whoſe Structure is manifeſt from inſpection.

There are other Inſtruments in the Apparatus of the *Microſcope*, as little Tongs, &c. for taking up ſmall Objects, a Glaſs-Tube for viewing the Circulation of the Blood in Fiſhes, &c. which need no deſcription.

What has been ſaid hitherto, is to be underſtood of *Lenticular Microſcopes*; for *Spherical* ones, their Doctrine will be underſtood from what follows.

If an Object A B be placed in the Focus of a Glaſs Spherule F, and the Eye be behind it, *v. g.* in the Focus G; the Object will be ſeen diſtinct, in an erect Situation, and magnified, as to its Diameter, in a Ratio of $\frac{3}{4}$ of the Diameter E I, to the diſtance at which Objects are to be placed to be ſeen diſtinctly with the naked Eye.

The firſt part of the Propoſition is proved in the ſame manner of Spheres, as of Lens's: As, then, a good Eye ſees an Object diſtinctly at the diſtance of 8 Digits, a Glaſs Spherule will inlarge the Diameter of an Object in a Ratio of $\frac{3}{4}$ of the Diameter to 88 Digits. Suppoſe then the Diameter of the Spherule E I $\frac{1}{10}$ of a Digit, C E will be $= \frac{1}{20}$, and F E $= \frac{1}{40}$; and therefore F C $= \frac{1}{20} + \frac{1}{40} = \frac{3}{40}$. Conſequently, the true Diameter of an Object to its apparent one is in the Ratio of $\frac{3}{40}$ to 80; *i. e.* as 3 to 320, or 1 to 107 nearly.

Now a Lens convex on both ſides, increaſes the Diameter in a Ratio of the Semi-diameter to the ſpace of 8 Digits; wherefore $\frac{1}{2}$ having a leſs Ratio to 8 than $\frac{3}{4}$; of a Lens and a Sphere that have the ſame Diameter, the former will magnify more than the latter: And pretty much after the ſame manner it may be ſhewn that a Sphere of a leſs Diameter, magnifies more than another of a large one.

For the *Methods of caſting little glaſs Spherules for* MICROSCOPES; there are various. *Wolfius* deſcribes one as follows: A ſmall piece of very fine Glaſs, ſticking to the wet Point of a Steel-Needle, is to be apply'd to the extreme bluiſh part of the Flame of a Torch; or, which is better, to the Flame of Spirit of Wine, to prevent its being blacken'd. Being there melted, and run into a little round drop, it is to be removed from the Flame; upon which it inſtantly ceaſes to be fluid: folding, then, a thin Plate of Braſs, and making a very ſmall ſmooth perforation, ſo as not to leave any Roughneſs on the Surfaces; and further, ſmoothing them over to prevent any glaring: fit the Spherule between the Plates againſt the Apertures, and the whole in a Frame, with Objects convenient for Obſervation.

Dr. *Adams* tells us another Method, thus: Take a piece of fine Window-Glaſs, and raſe it with a Diamond into as many lengths as you think needful, not exceeding an eighth of an Inch in breadth; then holding one of thoſe lengths between the Fore-finger and Thumb of each Hand over a very fine Flame till the Glaſs begins to ſoften, draw it out till it be as fine as an Hair, and break; then, applying each of the ends into the pureſt part of the Flame, you have two Spheres preſently, which you may make larger or leſs at pleaſure. If they ſtay long in the Flame, they'll have Spots; ſo they muſt be drawn out immediately after they are turn'd round. As to the Stem, break it off as near the Ball as poſſible; and lodging the remainder of the Stem between the Plates; by drilling the Hole exactly round, all the Protuberances are buried between the Plates; and the *Microſcope* performs to admiration.

After theſe manners may Spheres be made much ſmaller than any Lens; ſo that the beſt *Microſcopes*, or thoſe which magnify the moſt, are made thereof. For ſuppoſe the Diameter of a Spherule to be $\frac{1}{18}$ of a Digit, the diſtance of its Focus will be $\frac{1}{24}$; and therefore its real Diameter to its apparent one, as $\frac{1}{18} + \frac{1}{24}$; that is, as $\frac{3}{24}$ to 8, or as 3 to 512; or laſtly, as 1 to 170. Its Surface therefore will be increaſed in the Proportion of 1 to 28900, and its Bulk in a Ratio of 1 to 4913000.

M. *Leewenhoeck* and M. *Muſſchenbroeck* have ſucceeded very well in ſpherical *Microſcopes*; and the Apparatus of the latter is much commended: But we forbear any Deſcriptions thereof; it being eaſy for any who conſiders the Structure of thoſe conſiſting of Lens's, to conceive how thoſe of Spheres may be contrived.

Water MICROSCOPE. Mr. *S. Gray*, and after him, *Wolfius* and others, have contrived *Water-Microſcopes*, conſiſting of Spherules, or Lens's of Water inſtead of Glaſs, fitted up ſomewhat after the manner of thoſe above-mentioned; (as Spheres of Water may be likewiſe uſed inſtead of Glaſs in any of the common *Microſcopes*) But ſince the diſtance of the Focus of a Lens or Sphere of Water, is greater then in one of Glaſs, (the Spheres, whereof they are Segments being the ſame) *Water-Microſcopes* magnify leſs, and are therefore leſs eſteemed than thoſe of Glaſs.

The ſame Mr. *Gray* firſt obſerved that a ſmall Drop or Hemiſpherule of Water held to the Eye by Candle-Light or Moon-Light, without any other Apparatus, magnified the Animalcule contain'd in it, vaſtly more than any other *Microſcope*. The Reaſon is, that the Rays coming from the interior Surface of the firſt Hemiſphere, are reflected ſo as to fall under the ſame Angle on the Surface of the hind Hemiſphere, to which the Eye is applied, as if they came from the Focus of the Spherule; whence they are propagated to the Eye in the ſame manner as if the Objects were placed without the Spherule in its Focus.

Hollow Glaſs Spheres, of the Diameter of about half a Digit, fill'd with Spirit of Wine, are frequently uſed for *Microſcopes*; but they don't magnify near ſo much.

Theory of Compound, or double MICROSCOPES.

Suppoſe an Object-Glaſs E D, *Fig.* 24. the Segment of a very ſmall Sphere, and the Object A B placed without the Focus F.

Suppoſe an Eye-Glaſs G H, convex on both ſides, and the Segment of a Sphere greater (tho' not too great) than that of D E, and let it be ſo diſpoſed behind the Object, as that if C E : C L : : C L : C K, the Focus of the Eye-Glaſs may be in K.

Laſtly, ſuppoſe L K : L M : : L M : L I.

If then O be the place wherein an Object is ſeen diſtinct with the naked Eye; the Eye in this Caſe being placed in I, will ſee the Object A B diſtinctly in an inverted ſituation, and magnified in a compound Ratio of M K to L H and L C to C O; as is proved from the Laws of Dioptrics.

Laws of double MICROSCOPES.

1. The more an Object is magnified by the *Microſcope*, the leſs is its *field*, *i. e.* the leſs it takes in at one view.

2. To the ſame Eye-Glaſs, may be ſucceſſively apply'd Object-Glaſſes of various Spheres; ſo as that both the entire Objects, but leſs magnified, and their ſeveral parts, much more magnified, may be viewed thro' the ſame *Microſcope*. In which Caſe, by reaſon of the different diſtance of the Image, the Tube L K, in which the Lens's are fitted, ſhould be made to draw out.

For the Proportion of the Object-Glaſs to the Eye-Glaſs, ſome commend the ſubduple Ratio, and ſome the ſubſeſquiſextile. *De-Chales* will have the Semi-diameter of the Convexity of the Object-Glaſs to be $\frac{1}{3}$ of a Digit; or at moſt $\frac{1}{2}$; in the Eye-Glaſs an entire Digit, or even 1 $\frac{1}{2}$. *Cherubin* makes the Semi-diameter of the Object-Glaſs $\frac{1}{4}$, $\frac{1}{3}$, or $\frac{1}{2}$ of a Digit; the Semi-diameter of the Eye-Glaſs 1 $\frac{1}{4}$, or 1 $\frac{1}{2}$ of a Digit.

Since 'tis proved, that the diſtance of the Image L K from the Object-Glaſs D E will be greater, if another Lens, concave on both ſides, be placed before its Focus; it follows, that the Object will be magnified the more if ſuch a Lens be here placed between the Object-Glaſs D E, and the Eye-Glaſs G H. Such a *Microſcope* is much commended by *Conrade*, who uſed an Object-Lens, convex on both ſides, whoſe Semi-diameter was two Digits, its Aperture equal to a Muſtard-Seed; a Lens concave on both ſides 12, or at moſt 16 Digits; and an Eye-Glaſs convex on both ſides, of 6 Digits.

4. Since the Image is projected to the greater distance, the nearer another Lens of a Segment of a larger Sphere, is brought to the Object-Glass; a *Microscope* may be composed of three Lens's, which will magnify prodigiously.

5. From these Considerations it follows, that the Object will be magnified the more, as the Eye-Glass is the Segment of a smaller Sphere; but the Field of Vision will be the greater, as the same is a Segment of a larger Sphere: If then two Eye-Glasses, the one a Segment of a larger, the other of a smaller Sphere, be so combin'd, as that the Object appearing very near thro' them, *i. e.* not farther distant than the Focus of the first, be yet distinct; the Object at the same time will be exceedingly magnified, and the Field of Vision much greater than if only one Lens were used: And the Object will be still more magnified, and the Field enlarged, if both the Object and Eye-Glass be double. But in regard an Object appears dim, when view'd through so many Glasses, part of the Rays being reflected in passing through each; the multiplying of Lens's is not adviseable: And the best among compound *Microscopes*, are those which consist of one Object-Glass, and two Eye-Glasses.

For a *Microscope* of three Lens's, *De-Chales* commends an Object-Glass of $\frac{1}{3}$ or $\frac{1}{4}$ of a Digit; and the first Eye-Glass he makes 2, or $2\frac{1}{2}$ Digits; the distance between the Object-Glass and Eye-Glass about 20 Lines. *Conradi* had an excellent *Microscope*, the Object-Glass whereof was half a Digit, and the two Eye-Glasses (which were placed very near) 4 Digits: But it answer'd best when in lieu of the Object-Glass, he used two Glasses, convex on both sides, their Sphere about a Digit and half, or at most two, and their Convexities touching each other within the Space of half a Line. *Eustachius de Divinis*, instead of an Object-Glass, convex on both sides, used two Plano-Convex Lens's, whose Convexities touched. *Grindelius* did the same; only that the Convexities did not quite touch. *Zahnius* made a a Binocular *Microscope*, wherein both Eyes were used.

Structure or Mechanism of a Double MICROSCOPE.

The Industry and Address of our Country-man, Mr. *Marshall*, here deserves to be remember'd: The most commodious *Double Microscope* is of his Contrivance. In this, the Eye-Glasses are placed in the Tube at A and B, *Fig.* 25. and the Object-Glass at C. The little Pillar D E is turned by means of a Ball E, moveable in the Socket F; and thus the *Microscope* is accommodated to any Situation. The same Pillar is divided into as many parts, 1, 2, 3, 4, 5, &c. as there are Lens's of different Spheres to be used in viewing different Objects; so that the distance of the Object from the Object-Glass may be found without any trouble. But as it is scarce exactly enough determined this way, the Tube may be brought nearer the Object at discretion, by means of the Screw G H.

The Objects are either laid on the Circle I; or fitted to proper Instruments, having their Points or Stiles passing through the little Tube L M.

Lastly, to illumine the Object, a Lens convex on both sides, N O, is disposed in a convenient Situation. The rest appears from the Figure.

Reflecting MICROSCOPE, is that which magnifies by Reflection, as the above-mentioned ones do by Refraction. See REFLECTION.

The Structure of such a *Microscope* may be conceiv'd thus: Near the Focus of a concave Speculum A B, place a minute Object C, that its Image may be form'd larger than it self in D. To the Speculum join a Lens convex on both sides E F, so as the Image D may be in its Focus.

The Eye will here see the Image inverted, but distinct, and enlarged; consequently the Object will be larger than if viewed through the Lens alone. See MIRROUR.

The Inventor of this *Microscope* is the great Sir *I. Newton*; but it is somewhat to be feared lest the Objects appear dim.

Any Telescope is converted into a *Microscope*, by removing the Object Glass to a greater distance from the Eye-Glass. And since the distance of the Image is various, according to the distance of the Object from the Focus; and it is magnified the more, as its distance from the Object-Glass is greater; the same Telescope may be successively converted into *Microscopes* which magnify the Object in different degrees. See TELESCOPE.

MID, or MIDDLE, in Philosophy, and Mathematics. See MEAN and MEDIUM.

MIDDLE LATITUDE, in Navigation, is half the Sum of two given *Latitudes*. See LATITUDE.

MIDDLE LATITUDE is also used for a Method of working the several Cases in Sailing, nearly agreeing with *Mercator*'s way, but without the help of Meridional Parts. See SAILING. See MERIDIONAL *Parts*, MERCATOR, &c.

MIDHAVEN, *Medium Cœli*, in Astronomy, is that Point of the Ecliptic which culminates, or is in the Meridian. See CULMINATION, &c.

MIDRIFF, in Anatomy. See DIAPHRAGM.

MIDSHIP-*Men*, are Officers aboard a Ship, whose Station, when they are on Duty, is, some on the Quarter-Deck, others on the Poops, &c. Their Business is to mind the Braces, to look out, and to give about the Word of Command from the Captain, and other superior Officers. They also assist on all occasions both in sailing the Ship, and in stowing and rummaging the Hold.

They are usually Gentlemen, who, having served their time as Volunteers, and are now upon their preferment.

MIDSUMMER-DAY, is the Festival of St. *John* the Baptist, held on the 24th Day of *June*. See QUARTER-DAY.

MIGRATION, or *Transmigration*, the Passage or Removal of any thing out of one State, or Place into another; particularly of Colonies of People, Birds, &c. into other Countries. See TRANSMIGRATION.

The MIGRATION *of the Souls of Men* into other Animals after Death, is the great Doctrine of the *Pythagoreans*, call'd the *Metempsychosis*. See METEMPSYCHOSIS.

The MIGRATION *of Birds*, as the Swallow, Quail, Stork, Crane, Fieldfare, Woodcock, Nightingale, and other Birds of *Passage*, is a very curious Article in Natural History, and furnishes a notable Instance of the powerful Instinct impress'd by the Creator. See INSTINCT.

Mr. *Derham* observes two things very remarkable therein; the *first*, That these untaught, unthinking Creatures should know the proper Times for their Passage, when to come, and when to go; as also, that some should come when others go. No doubt, the Temperature of the Air as to heat and cold, and their natural Propensity to breed their Young, are the great Incentives to those Creatures to change their Habitation: But it is an odd Instinct they should at all shift their Habitation; that some certain Place is not to be found in all the Terraqueous-Globe affording 'em convenient Food and Habitation all the Year round.

The *second*, That they should know what way to steer their Course, and whither to go. What Instinct is it, that moves a poor foolish Bird to venture over vast Tracts of Lands and Sea? If it be said, that by their high Ascents up into the Air, they can see cross the Seas, yet what should teach or persuade them that that Land is more proper for the purpose than this? That *Britain*, for instance, should afford them better Accommodation than *Egypt*? than the *Canaries*? than *Spain*? or any other of the intermediate Countries? *Physico-Theol.* p. 349.

Lud. de Beaufort remarks, that Birds in their Passage observe a wonderful Order and Polity: They fly in Troops, and steer their Course through huge unknown Regions, without the Compass. *Cosmol. Divin.* It is to be added, that the Birds of Passage are all peculiarly accommodated by the Structure of their Parts for long flights. See PASSAGE.

Naturalists are divided as to the Places whither Birds of Passage retire when they leave us. Mr. *Willoughby* thinks the Swallows fly into *Egypt* and *Æthiopia*. *Ornith. Lib.* 2. *c.* 3. *Olaus Magnus* says, they lurk in Holes, or under Water; which is confirmed by *Etmuller*, who assures us, that he saw a Bushel of them taken out of a frozen Fish-Pond, all hanging together head to head, feet to feet, &c. in one Cluster. *Dissert.* 2. *c.* 10. *Olaus* adds, that this is a common thing in the Northern Countries; and that such a Cluster being carried accidentally by some Boys into a Stove, the Swallows, after thawing, began to fly about, but weakly, and for a very little time. A further Confirmation of this Account was given by Dr. *Colas*, a Person very curious in such things, to the *Royal Society*. Speaking of the way of Fishing in the Northern Parts, by breaking Holes, and drawing their Nets under the Ice, he related, that he saw sixteen Swallows so drawn out of the Lake of *Samrodt*, and about thirty out of the King's great Pond in *Rosineilen*; and that at *Schlebitten*, near a House of the Earl of *Dohna*, he saw two Swallows just come out of the Waters that could scarce stand; being very wet and weak, with their Wings hanging on the Ground. He added, that he had often observed the Swallows to be weak for some days after their Appearance.

MILDEW. See MILLDEW.

MILE, in Geography, a long Measure, whereby we use to express the distance between Places. See MEASURE, DISTANCE, &c.

The *Mile* is of different extent in different Countries. The Geographical or *Italian Mile* contains a thousand Geometrical Paces, *Mille Passus*, whence the Term *Mile* is derived. See PACE, LEAGUE, &c.

Casimir has made a curious Reduction of the *Miles*, or Leagues, of the several Countries in *Europe* into *Roman* Feet, which are equal to the *Rhinland* Feet generally used throughout the North. See FOOT.

	Feet.
The *Mile* of *Italy*	5000
Of *England*	5454

	Feet.
The *Mile* of *Scotland.*	6000
Of *Sweden*	30000
Of *Muſcovy*	3750
Of *Lithuania*	18500
Of *Poland*	19850
Of *Germany*, the Small	20000
The Middle	22500
The Largeſt	25000
Of *France*	5250
Of *Spain*	7090
Of *Burgundy*	6000
Of *Flanders*	6666
Of *Holland*	8000
Of *Perſia*, called alſo *Paraſanga*	18750
Of *Egypt*	25000

MILES, a *Latin* Term, which, in its general import, ſignifies *Soldier*. See SOLDIER and MILITIA.

In our *Engliſh* Laws, and Cuſtoms, *Miles* is peculiarly appropriated to a Knight, called alſo *Eques*. See KNIGHT and EQUES.

MILIARY *Glands*, *Glandulæ Miliares*, in Anatomy, a great number of ſmall Glands interſperſed throughout the Subſtance of the *Cutis*, or Skin. See GLAND and CUTIS.

The *Miliary Glands* are the Organs whereby the Matter of Sweat, and inſenſible Perſpiration, is ſecreted from the Blood. See PERSPIRATION and SWEAT.

They are interwove with the pyramidal *Papillæ* of the Skin; and are each ſerved with a Branch of an Artery, Vein, and Nerve; as alſo with a proper excretory Duct, through which the fluid Matter ſecreted from the Blood in the Subſtance of the Gland, is excreted, and ſent forth at the Pores, or Perforations of the Cuticle. See PORE and CUTICLE.

MILIARY *Fever*, is a malignant Fever wherein the Skin is ſprinkled over with little purple Spots, or Puſtles, in form of Grains of *Millet*.

It is alſo call'd a *purple Fever*, from the colour of the Spots. See PURPLE and FEVER.

MILITANT, a Term underſtood of the Aſſembly of Chriſtians, while here on Earth.

The *Romaniſts* divide the Church into *Militant*, Patient, and Triumphant: The *Militant* is on Earth; the Patient, or Paſſive, they place in Purgatory; and the Triumphant in Heaven. See CHURCH.

MILITARY, ſomething belonging to the *Militia*, or Soldiery. Thus,

The MILITARY *Art* is the Science of War. See WAR.

MILITARY *Government* is the ſupreme Government, Direction, Command, and Diſpoſition of all the *Military* Power of a Nation by Land and Sea. See GOVERNMENT.

The *Military* Government of *England* is wholly under the King; and neither one, nor both Houſes of Parliament have any Right to levy any Forces, or make any War Offenſive or Defenſive. See KING, ARMY, MILITIA, GUARDS, *&c.*

MILITARY *Exerciſes*, are the Evolutions, or various manners of Ranging and Exerciſing Soldiers. See EVOLUTION.

MILITARY *Architecture*, is the Art of Fortification. See ARCHITECTURE and FORTIFICATION.

MILITARY *Execution*, is the delivery of a City or Country up to be ravaged and deſtroy'd by the Soldiers, upon its refuſing to pay Contribution-Money. See EXECUTION.

MILITARY *Teſtament* among the *Romans*, was what we call a Nuncupative-Will; or a Teſtament made only by Word of Mouth, in the Preſence of two Witneſſes. See TESTAMENT.

This was a Privilege peculiar to the Soldiery, and to them only when in the Campaign; for at other times they were ſubject to the common Laws.

MILITARY *Column* among the *Romans*, was a Column on which was engraved a Liſt of the Troops of an Army; or the Number of Soldiers employ'd in any Expedition. See COLUMN.

MILITARY *Order*, ſee ORDER.

MILITARY *Law*, ſee LAW.

MILITARY *Fever*, is a kind of malignant Fever frequent in Armies, by reaſon of the ill Food, *&c.* of the Soldiers. See FEVER.

MILITARY *Ways*, *Viæ Militares*, are the large *Roman* Roads, which *Agrippa* procured to be made through the Empire, in the time of *Auguſtus*, for the more convenient marching of Troops, and conveyance of Carriages. See ROAD.

N. Bergier has wrote the Hiſtory of the Origin, Progreſs, and amazing Extent of theſe *Military* Roads; which were paved from the Gates of *Rome* to the extreme Parts of the Empire. See VIÆ.

MILITIA, a collective Term, underſtood of Perſons who make Profeſſion of Arms.

The Word comes from the *Latin*, *Miles*, a Soldier; and *Miles*, from *Mille*, which was antiently wrote *Mile*: For in levying Soldiers at *Rome*, as each Tribe furniſhed a Thouſand, *Mille* or *Mile*, Men, whoever was of that Number, was called *Miles*. See TRIBE.

MILITIA in its proper, and more reſtrained ſenſe, is uſed to ſignify the Inhabitants, or, as we call them, the *Trained-Bands* of a Town, or Country; who arm themſelves, on a ſhort warning, for their own Defence. In which ſenſe, *Militia* is oppoſed to regular, ſtated Forces.

The ſtanding *Militia* of *England* is now computed to be about 200000 Horſe and Foot; but may be increaſed at the pleaſure of the King.

For the Direction and Command of theſe, the King conſtitutes *Lords Lieutenants* of each County, with Power to Arm, Array, and Form into Companies, Troops, and Regiments, to Conduct, (upon Occaſion of Rebellion, and Invaſion) and Employ the Men ſo Arm'd within their reſpective Counties, and other Places where the King commands; to give Commiſſions to Colonels, and other Officers; to charge any Perſon with Horſe, Horſe-man, Arms, *&c.* proportionable to his Eſtate, *&c.* See *Lord* LIEUTENANT.

No Perſon to be charged with a Horſe unleſs he have 500 Pounds yearly Revenue, or 6000 Pounds Perſonal Eſtate; nor with a Foot-Soldier, unleſs he have 50 Pounds yearly, or 600 Pounds Perſonal Eſtate.

MILK, *Lac*, a white Juice, or Humour, which Nature prepares in the Breaſts of Women, and the Udders of other Animals; for the Nouriſhment of their Young. See BREASTS.

Milk is thicker, ſweeter, and whiter, than the Chyle itſelf, from which it is derived, and that probably, without much more Artifice or Alteration than the leaving behind ſome of its aqueous Parts. The Antients held it form'd from the Blood; but the Moderns are of Opinion, it comes from the pure Chyle convey'd by the Arteries to the Breaſts, and without any other Coction filtrated through the Glands whereof they are compos'd, like Urine through the Reins; without undergoing any conſiderable change.

According to M. *Leewenhoeck*'s Obſervations, *Milk* conſiſts of little Globules ſwimming in a clear tranſparent Liquor, call'd *Serum* or *Whey*.

Milk is a Compoſition of three different Kinds of Parts, Butirous, Caſeous, and Serous. The *Butirous* Parts are the Cream and Oil that ſwim a-top. See BUTTER. The *Caſeous* are the groſſer Parts, and thoſe that coagulate, and are made into Cheeſe. See CHEESE. The *Serous* are properly a Lympha, and make what we call *Whey*.

Dr. *Drake* ſays, that *Milk* is nothing but Oil and Water united by the Artifice of Nature, perhaps by the Intervention of ſome peculiar Salts, which, *Milk* itſelf, however ſweet at firſt, does, after a little ſtanding, diſcover to be pretty plentifully therein.

Milk is firſt found in the Breaſts of Women after they have been pregnant about four Months. The Fermentation of the *Milk* in the Breaſts, the firſt days after a Woman is delivered, occaſions a Fever, which takes its Name therefrom.

Ariſtotle ſays, there are ſome Men who have *Milk* in their Breaſts. *Cardan* tells us he ſaw one that had enough to ſuckle a Child.

In the *Philoſophical Tranſactions*, we have an Account of a Wether brought to *Milk* by the ſucking of a Lamb; which Lamb was maintain'd by it all the Summer, till it was weaned.

Milk corrupted in the Stomachs of Children, occaſions the ſeveral Diſeaſes incident to that Age. *Dobel*, a *Daniſh* Phyſician, who has wrote expreſly on this Subject, tells us, an excellent Remedy in ſuch Caſe, is a Glaſs of Water with a little Salt diſſolved in it: This acts as an Emetic, and throws up the Corruption that occaſion'd the Diſorder. *Celſus* mentions this Remedy, L. 1. c. 3. See CHILDREN.

Galen obſerves, that in Animals fed with *Milk*, the greateſt part of the Food of the Mother is converted into that Humor.

There are ſeveral kinds of *Milk*, uſed not only as Food, but as Phyſic: As Cows *Milk*, Aſſes *Milk*, Sheeps *Milk*, and Goats *Milk*. Theſe are preſcribed as proper to alter a ſharp thin Blood into a Craſis more ſoft, balſamic, and nutritive; and in Conſtitutions where they fit the firſt Paſſages, muſt be very good for that End, as being already prepared into Nutriment, ſo far as is required for their admiſſion into the Blood. But where the Juices of the Stomach are ſharp, theſe Liquors are apt to be turn'd into Curd. Whenever *Milk*, therefore, of what kind ſoever, is order'd in Conſumptions, and as a Reſtorative, it is with good reaſon join'd with the teſtaceous Powders, and ſuch things as are proper to deſtroy thoſe Acidities.

Aſſes *Milk* is ſaid to be a great Beautifier and Preſerver of the Skin. *Poppea*, Wife of the Emperor *Nero*, uſed it for that purpoſe; having four or five hundred Aſſes conſtantly in her Retinue, to furniſh her every Morning with a freſh Bath.

We have ſeveral artificial *Milks*, ſo call'd from their reſemblance of natural ones. As,

Milk *of Sulphur*, a Preparation of Flowers of Sulphur, and Salt of Tartar; preſcribed by the Phyſicians, as a Sudorific. See Sulphur.

Virgin's Milk, *Lac Virginale*, compoſed of Rock Alum, Spring Water, Litharge, and Vinegar; uſed as a Coſmetic, to drive in Pimples, and check any cutaneous Eruptions, by its cooling, reſtringent Quality.

Milk *of the Moon*, *Lac Lunæ*, is a Name given by the Naturaliſts to a kind of foſſil Agaric. See Agaric.

Milk *of the Moon*, or of *Silver*, is alſo the Name of a white, porous, friable, inſipid Earth, extracted by ſublimation from a Matter frequently found in Silver-Mines: Whence alſo it has the Name of *Flowers of Silver*. See Silver.

MILKY WAY, *Via Lactea*, or *Galaxy*. See Galaxy.

MILL, in propriety, is a Machine uſed for *Grinding*: But the Word in its general Signification is uſed for all Machines whoſe Action depends on a circular Motion. See Grinding, Machine, &c.

Of theſe there are various kinds, which acquire various Names according to the various manners in which the moving Power is apply'd; but they may all be reduced to three heads, *viz. Wind-Mills*, *Water-Mills*, and *Hand-Mills*; under which laſt, are alſo comprehended thoſe worked by Horſes, &c.

Water-Mills are thoſe turned by the force or fall of a River, &c. Of which, again, there are two kinds; thoſe where the force of the Water is apply'd above the Wheel, call'd *Over-Shot*; and thoſe where it is apply'd below the Wheel, call'd *Under-Shot Mills*. See Water-*Mill*.

Wind-Mills, are thoſe turned by the force of Wind gathered in their Sails. Of theſe, ſome are call'd *Vertical*, others *Horizontal*, according to the poſition of the Sails; or rather according to the direction of their Motion with regard to the Horizon. See Vertical and Horizontal.

For the beſt Form of Horizontal Sails, as alſo for determining the Poſition of the Axis of Wind-Mills, ſee Wind-*Mill*.

Portative, or *Hand*-Mills, are thoſe kept in Motion by the Hand; or whoſe Mill-Stones are turn'd, or Piſtons driven by the force of Horſes, or other Beaſts.

The Uſe of *Mills* and Mill-ſtones, according to *Pauſanias*, was firſt invented by *Miletus*, Son of *Meleges*, firſt King of *Sparta*. Tho *Pliny* attributes the Invention of every thing belonging to Bread and Baking, to *Ceres*. *Polydore Virgil* was not able to diſcover the Author of ſo uſeful a Machine. 'Tis doubted whether or no Water-Mills were known to the *Romans*; there being no mention made in the Digeſt but of *Mills* turned by Slaves and Aſſes.

Salmaſius, however, and *Gothofrid*, will not allow *Water-Mills* to have been unknown to the antient *Romans*, though they were not in ordinary uſe.

Wind-Mills are of much more modern Invention: The firſt Model of theſe was brought from *Aſia* into *Europe*, in the time of the Holy-Wars.

Mill is alſo uſed, in the general, for all Machines, which being moved by ſome external Force, ſerve to give a violent Impreſſion on things apply'd thereto.

Mills in this ſenſe, are Machines of vaſt uſe in the Manufactures, Arts, and Trades; for the making and preparing divers kinds of Merchandizes. The principal are thoſe which follow.

Paper-Mill, a Water-Mill furniſh'd with ſeveral Hammers, which beat, or pound the Rags or Cloth in a kind of Wooden-Trough: and thus by reducing them to little pieces, turn them into a kind of Pulp, by means of Water convey'd into the Troughs by a Pipe for the purpoſe. See Paper.

Fulling-Mill, is a Water-Mill which raiſes and beats down large wooden Piſtons in proper Veſſels, call'd Peels or Troughs; in order to full, ſcower, and cleanſe Woollen Stuffs. See Fulling.

Linen-Mills don't differ much from Fulling-Mills. Their Uſe is to ſcower Linens, after having been firſt cleans'd when taken out of the Lixivium, or Lye. See Bleaching.

Some of theſe go by Water, the generality by Horſes.

Mill in Coinage, is a Machine uſed to prepare the *Laminæ* or Plates of Metal, and to give them the proper thickneſs, hardneſs, and conſiſtence before they be ſtruck or ſtamped. See Coining.

This Machine has not been long known among us; but is of ſome ſtanding in *Germany*. It conſiſts of ſeveral Wheels dented like thoſe of Clocks, &c. which move two Cylinders of Steel, between which the Metal is paſſed to be brought to its proper thickneſs. It was firſt turned in order with Water, afterwards with Cattel, &c.

Mill, among the Gold Wire-Drawers, is a little Machine conſiſting of two Cylinders of Steel, ſerving to flatten the Gold, or Silver Wire, and reduce it into *Laminæ*, or Plates. See Gold-Wire.

They have alſo *Mills* to wind the Gold Wire or Thread on the Silk; compoſed of ſeveral rows of Bobins all turned at the ſame time. See Ductility.

Sugar-Mills, is a Machine that ſerves to bruiſe the Sugar-Canes, and expreſs the Liquor or Juice contain'd therein. See Sugar.

The *Sugar-Mills* are very curious Contrivances. Of theſe there are four kinds; being turned either by Water, Wind, Men, or Horſes.

Thoſe turned by the hand were firſt in uſe; but are now laid aſide, as being an intolerable Hardſhip on the poor Negroes, who were doom'd thereto; beſides the ſlowneſs of their Progreſs.

Wind-Mills are the moſt Modern, but they are yet ſomewhat rare: excepting in *St. Chriſtopher's* and *Barbadoes*, and among the *Portugueze*. Theſe make good diſpatch, but have this Inconvenience, that they are not eaſily ſtop'd; which proves frequently fatal to the Negroes who feed them.

Oil-Mills, whether turned by Men, Water, Hand, or Horſe, ſerve to bruiſe or break the Nuts, Olives, and other Fruits and Grains, whoſe Juice is to be taken by Expreſſion to make Oil. See Oil, Olive, &c.

Tan, or *Bark*-Mills, wrought by Water or Horſes, ſerve to cut certain Barks into a coarſe ſort of Powder, proper for the Tanning of Hides, &c. See Bark and Tanning.

Sawing-Mill is a Water-Mill, ſerving to ſaw ſeveral Planks or Boards at the ſame time. See Sawing.

Theſe are frequent in *France*, eſpecially in *Dauphine*. They were lately prohibited in *England*, where they were begun to be introduced, from a view to the Ruin of the Sawyers, which muſt have enſued.

Forge-Mills, turn'd by Water, ſerve to raiſe and let fall one or more huge Hammers, to beat and form the Iron into Bars, Anchors, or other maſſive Works. See Forge.

Mills *for Sword-Blades*, are likewiſe moved by Water. They are frequent at *Vienne* in *Dauphine*. By working heavy Hammers, they forge thoſe excellent Sword-Blades, call'd *Blades of Vienne*.

Leather-Mills, are uſed to full, and prepare with Oil, the Skins of Stags, Buffalo's, Elks, Bullocks, &c. to make what they call *Buff-Leather*, for the uſe of Military-Men.

This is effected by means of ſeveral large Piſtons riſing and falling on the Skins in large Wooden-Troughs, by means of a Wheel without-ſide, turn'd by the force of the Water. See Buff.

Gun-Powder Mill, is that uſed to pound, and beat together the Ingredients whereof Gun-Powder is compoſed.

This is done in a kind of Iron or Braſs Mortar by means of Iron Peſtles wrought by a Wheel without the *Mill*, turn'd by the Water falling on it. See Gun-Powder.

There are alſo *Silk*-Mills, for ſpinning, throwing, and twiſting Silks; which are large round Machines in form of Turrets, five or ſix Foot high, and ſix Yards in diameter; which being turn'd either by the force of Water, or that of Men, work at the ſame time an infinity of Bobins faſtned thereto, whereon the Silk had been wound to be here ſpun, and twiſted. See Silk and Throwster.

There are abundance of *Mills* of this kind in *France*, eſpecially about *Lyons* and *Tours*, ſome of which are ſo diſpoſed, as that three of them will go at the ſame time, and by the ſame Wheel wrought by Water, or by ſtrength of Hand. That in the Hôpital *de la Charite* at *Lyons*, is wonderful, a ſingle Man working no leſs than forty-eight of theſe *Mills*. See Milling.

MILLDEW, *Rubigo*, a Diſeaſe happening to Plants, cauſed by a dewy Moiſture, which falling on them, and continuing, for want of the Sun's heat, to draw it up; by its Acrimony corrodes, gnaws, and ſpoils the inmoſt Subſtance of the Plant, and hinders the Circulation of the nutritive Sap; upon which the Leaves begin to fade, and the Bloſſoms and Fruit are much prejudiced.

According to Meſſ. *Cook* and *Mortimer*, *Milldew* is a thick, clammy Vapour exhaled in the Spring and Summer from Plants, Bloſſoms, and even the Earth itſelf, in cloſe ſtill Weather, when there is neither Sun enough to draw it on high, nor Wind enough to diſperſe it. Hanging thus in the lower Regions, when the Evening's Cold comes on, it condenſes and falls on the Plants; with its thick clammy Subſtance ſtops up their Pores, and thus prevents Perſpiration, and hinders the Sap from aſcending to nouriſh its Flowers, Shoots, &c. See Dew.

'Tis added, this Dew falling on the top of the Shoot of a Cherry-Tree about Midſummer, has been found to ſtop the Shoot; ſo as the Tree has ſhot forth in other places.

Blights and *Milldews* are commonly taken for the ſame thing; yet are they very different. See BLIGHT.

On Plants which have ſmooth Leaves, as the Oak, &c. the Dew hangs, and may be ſeen, taſted, &c. Others, whoſe Leaves are rougher, imbibe it. When it falls on Wheat, &c. it beſpots the Stems with a Colour different from the natural one.

Theſe Dews, Mr. *Mortimer* takes to be the principal Food of Bees; being ſweet, and eaſily convertible into Honey. See HONEY.

MILLENARIES, MILLENARIANS, a Sect among Chriſtians, chiefly in the primitive Church, who hold that Jeſus Chriſt is to come and reign on Earth for the ſpace of a thouſand Years; during which time, the Faithful are to enjoy all manner of temporal Bleſſings, and at the Expiration of this Term, the Day of Judgment is to take place. See MILLENNIUM.

The *Millenaries* are alſo call'd *Chiliaſts* from the *Greek* χίλιοι, *mille*, a Thouſand. See CHILIAST.

This Opinion of the *Millenaries* is very antient; and may be traced back almoſt as far as the time of the Apoſtles. It had its Origin from a Paſſage in the *Apocalypſe* too literally underſtood, wherein mention is made of Chriſt's Reign on Earth, &c.

The Opinion of *S. Papias*, ſays Mr. *Launoy*, touching the new Kingdom of Jeſus Chriſt on Earth, after the Reſurrection, was held for near three Centuries, e'er it was charged as erroneous; as appears from Eccleſiaſtical Hiſtory. It was allow'd of, and follow'd by the greateſt Men among the Primitive Fathers; as *Irenæus*, *Juſtin Martyr*, *Tertullian*, &c. *Dionyſius* of *Alexandria* and St. *Jerom*, oppoſed this imaginary *Millenary* Reign very ſtrongly.

MILLENNIUM, a Term literally ſignifying a *thouſand Years*; chiefly uſed for the time of our Saviour's ſecond Appearance, and Reign on Earth. See MILLENARIES.

Mr. *Whiſton*, in ſeveral of his Writings, has endeavoured to ſupport the Notion of the *Millennium*. According to his Computation, it was to have commenced about the Year 1720.

The Word is *Latin*, compounded of *mille*, a Thouſand, and *annus*, Year.

MILLEPEDES, *Wood-Lice*, little Animals of conſiderable Uſe in Medicine. Thus call'd from the great number of their Feet.

Millepedes are ſo much in the Acquaintance of the People, that they ſeem to be Maſters of their medicinal Uſes, and take them in many Caſes without any other Direction. They are, by all Experience, found to be very Diuretic and Abſterſive; which makes them not only frequent in Preſcriptions for Diſorders in the Reins, but alſo in Obſtructions of the Viſcera, and particularly in the Jaundice.

They abound with a nitrous Salt, which they ſeem to derive from the earthy Diet they live on. It is ſomewhat volatilized by its Digeſtion and Circulation in the Inſect; as ſuch Salt always is more or leſs, in proportion to the digeſtive Powers of the Animal, into whoſe Blood it enters; yet not ſo much, but that it is brackiſh and pungent upon the Palate. This makes their deterſive Qualities extend further, than the larger Glands, and enables them to ſcour even the minuteſt Paſſages, and keep the Nerves clear from Viſcidities, and ſuch things as would clog their Springs; whereby they are good in Palſies, Epilepſies, and all nervous Diſtempers.

As they open and cleanſe away Viſcoſities, and by their Minuteneſs and Aſperities cut their way through any Obſtructions, they are good in Struma's, and all inveterate Tumours or Ulcers.

Remarkable Cures have been performed in each way by a long uſe of them. They are beſt taken in Subſtance; or bruiſed in white Wine, the Liquor being taken without ſettling.

There are ſeveral Chymical Preparations of *Millepedes*, as Spirit, volatile Salt, Oil, and Wine of *Millepedes*.

MILL-REE, or MILLE-RAY, a *Portugueze* Coin, current for ſomewhat more than the *Spaniſh* Piſtole. See COIN.

The *Mill-ree* is thus call'd, as conſiſting of a thouſand *Rees*. See REE.

It is alſo called a St. *Stephen*, from the Figure of that Martyr impreſs'd thereon.

MILLIARIUM, among the *Romans*, was a *Mile*, or League; conſiſting of a thouſand Paces, *mille paſſus*; whence the Name. See MILE and LEAGUE.

In the *Roman* Empire, the *Milliaria*, in all the great Roads, were all mark'd with Stones or Columns, erected for that purpoſe; commencing from a Column in the heart of the City. See ROAD.

Thoſe Columns were hence denominated *Milliary Columns*. See COLUMN.

MILLING, in the Manufactories, an Operation call'd alſo *Fulling*. See FULLING.

MILLING, or *Throwing of Silk*, is the laſt preparation of Silk before dying; ſerving to twiſt it, more or leſs according to the Work it is intended for. See SILK.

To prepare the Silks for *Milling*, they firſt put it in boiling Water, incloſed between two linen Cloths. The *Mill* is a ſquare Machine, compoſed of ſeveral pieces of Wood mortaiſed in each other ſo as to form a kind of large Cage, in the Centre whereof are two Wheels placed parallel over each other, whoſe Axis bears on two Poſts. When the Machine is Simple, a ſingle Man turns theſe Wheels by means of a little Cogg in which they catch, and a large Handle.

The Wheels put in motion by the Handle, communicate their Motion to eight Windles, or Reels, or even more, according to the largeneſs of the Machine; on the Wings, or Arms whereof the Silk is wound from off two Rows of Bobins placed on each ſide the Machine, each Row at the height of one of the two Wheels in the Centre. Theſe Bobins have their Motion by means of leathern Thongs, which bear on the little Cylinders of Wood that ſupport them, and turn at length on the two Wheels at the Centre; ſo that the Silk on each Bobin twiſts, as it winds, and forms its ſeparate Skain.

The ſmalleſt Wheel moves two hundred of theſe Bobins, over which a ſingle Perſon is ſufficient to inſpect, to put new Bobins or Spools in lieu of thoſe diſcharged of their Silk, and to knot the Ends when they break.

MILLION, in Arithmetic, the Number of ten hundred thouſand; or a thouſand times a thouſand. See NUMERATION.

The Revenues of Princes are now only computed in *Millions*. See REVENUE and POLITICAL *Arithmetic*.

A MILLION *of Gold*, or MILLION *of Money*, is ſometimes underſtood of a *Million* of Pounds; and ſometimes a *Million* of Crowns. See CROWN, &c.

MILT, in Anatomy, is a popular Name for the Spleen. See SPLEEN.

MILT, in Natural Hiſtory, the ſoft Row in Fiſhes; thus call'd by reaſon it yields, by expreſſion, a whitiſh Juice reſembling Milk. See ROW.

The *Milt* is properly the Seed, or the Spermatic part of the Male Fiſh. The *Milt* of a Carp is reckon'd a choice Bit.

Lewenhoeck, examining the *Milt* of a ſingle Cod-fiſh with an excellent Microſcope, found it to contain more living Animals than there are Men on the Face of the Earth. See ANIMALCULE.

MIME, MIMUS, a Term in the antient Comedy, ſignifying a *Buffoon*, or *Mimic*, who acted Poſtures ſuitable to the Perſon or Subject he repreſented.

The Word comes from the *Greek* μίμος, Imitator.

The ſame Comedians were alſo ſometimes call'd *Pantomimes*, becauſe of their counterfeiting all manner of Poſtures and Geſtures. See PANTOMIME.

MIMESIS, *Imitation*, in Rhetoric, &c. a Figure, wherein the Words, Actions, &c. of another Perſon are imitated. See MIME and PANTOMIME.

MIND, *Mens*, a thinking Being. See THINKING.

Philoſophers generally allow of three Kinds of *Minds*, viz. *God*, *Angels*, and the human *Soul*. For a thinking Being muſt either be finite, or infinite: If infinite, it is *God*; and if finite, it is either join'd with a human Body, or not; if the latter, it is an *Angel*; if the former, a *Soul*. See GOD, ANGEL, and SOUL.

The *human Mind* is properly defined a thinking, rational Subſtance: By *Thinking*, it is diſtinguiſhed from Body; and by *Reaſoning*, from God, and Angels, which are ſuppoſed to ſee and know things intuitively, without the help of Deduction, and Diſcourſe. See DISCOURSE, REASONING, and KNOWLEDGE.

MINE, in Natural Hiſtory, a place under ground where Metals, Minerals, or even precious Stones, are found. See METAL, MINERAL, PRECIOUS STONE, &c.

As, therefore, the Matter dug out of *Mines* is various; the *Mines* themſelves acquire various denominations: as *Gold-Mines*, *Silver-Mines*, *Copper-Mines*, *Iron-Mines*, *Diamond-Mines*, *Salt-Mines*, *Mines of Antimony*, *of Alum*, &c.

For *Gold* and *Silver* MINES, the richeſt and moſt celebrated are thoſe of *Peru* and *Chili* in *America*. See GOLD and SILVER.

Iron-MINES are more abundant in *France* than elſewhere. See IRON.

Copper-MINES are chiefly in *Sweden* and *Denmark*. See COPPER.

Tin-MINES abound in *England*. See TIN.

Quickſilver-MINES in *Hungary* and *Spain*; *Diamond*-MINES in *Golconda*; *Salt*-MINES in *Poland*, &c. See QUICKSILVER, DIAMOND, SALT, &c.

Metallic MINES are chiefly found in Mountains; tho the reaſon thereof does not appear. It is probable, Plains may abound as much therewith, would People dig deep enough. But Plains are commonly cultivated; and beſide, the Water will ſcarce allow 'em to be dug. Add, that the Metallic Vein

always

always run either horizontal or oblique; and for that Reason, are eaſieſt found on the ſides of Eminences.

The Metallic Veins are commonly encompaſſed with a ſort of Stone peculiar to the *Mine*, and are accompanied with ſeveral Strata of different Matters, as Clay, Gravel, Rock, &c. They who work in *Mines*, know by the Size, and Colour of the Stones, when they approach the Vein. See STRATA and VEIN.

They diſcover that there is a *Mine* in a Mountain by the Marcaſites, or Mineral Stones falling from it; by the Mineral Taſte of the Waters; by the Quality of the Exhalations rais'd from it; and by the difference between the Earth over the *Mines*, and that of the neighbouring parts in the cold time of Spring and Autumn, the Froſt lying on the adjacent Places, when it thaws about the *Mines*. Add, that the Grounds producing but little Graſs, and that little, pale and colourleſs, is an indication of a *Mine*.

Some pretend to diſcover *Mines* by the ſole virtue of the Hazle-Tree, out of which they form a forked Stick, call'd *Virgula divinatoria*, which, they ſay, turns of itſelf, in their hands, but differently, according to the different nature of the Metals or Minerals underneath. This Artifice made a great noiſe in *France* towards the end of the 17th Century; and the *Corpuſcular* Philoſophy was call'd to account for it. But it is now in little Credit. See VIRGULA DIVINATORIA.

There are ſome *Mines*, wherein the Metals are found at their firſt openings very crude and imperfect; which yet, in time, grow ripe and rich. *Alonſo Barba* relates, that in *Potoſi*, Stones have frequently been thrown aſide, as not containing any thing conſiderable of Metal; and yet have been found many Years afterwards exceeding full thereof. *Cæſalpinus* aſſures us, that Earths which yield no Metal at all, ſometimes become very fertile Veins. In an Iſland of the *Tyrrhene-Sea*, after the Iron *Mines* have been exhauſted, they ſtop 'em up about ten Years, at the end whereof, they find 'em as rich as before.

For the Formation of Mineral and Metallic Matters in Mines, ſee MINERAL.

MINE, in the Art of War, is a ſubterraneous Canal, or Paſſage dug under the Wall, or Rampart of a Fortification intended to be blown up by Gun-powder.

The *Alley*, or Paſſage of a *Mine*, is uſually about four foot ſquare; at the end of this is the *Chamber* of the *Mine*, which is a Cavity about five foot in width and in length, and about ſix in height; and here the Gun-Powder is beſtow'd.

The *Saucidge* of the *Mine* is the Train; for which there is always a little Aperture left. See SAUCIDGE.

There are various kinds of *Mines*, which acquire various Names; as Royal *Mines*, Serpentine *Mines*, Forked *Mines*, according as their Paſſages are ſtrait, oblique, winding, &c.

There are alſo *Mines* made in the Field, which are call'd *Fougades*. See FOUGADE.

Mines are either dug within the Body of the Earth, as thoſe made by the Beſieged to blow up the Works of the Beſiegers, before they make a Lodgment on the Cover'd Way: Or in Eminences and Riſing Grounds, as to make a Breach in the Ramparts, &c. Or to blow up Walls: Or, laſtly, to tear up Rocks.

M. *Chevalier*, in the Memoirs of the *Royal Academy of Sciences*, has handled the Subject of *Mines* with a great deal of Accuracy. He has calculated the Force of Gun-Powder, the Effort it makes, and the Reſiſtance it meets with in heaving up the Ground. He ſhews, that a Cubic Foot of Air incloſed in two Cubic Feet of Gun-Powder, is capable of ſuſtaining a Weight of near 290000 Pounds. But obſerves withal, that this is vaſtly greater than what it is found by Experience to have; and that in fact, 140 Pounds of Powder don't raiſe above 30000 Pound of Earth. The Reaſon of which difference he aſcribes to ſeveral Cauſes; as, that the Powder does not take fire all at once, ſo that its force is divided; that part of the Shock is loſt in the Canal or Paſſage of the *Mine*, and in the Pores of the Bodies incompaſſing the *Mine*; that the tenacity of the parts of the Earth reſiſt a ſeparation; that it is not enough that the Earth be ſupported, but it muſt be carry'd upwards with a certain Velocity; and that the Weight of the Atmoſphere, is a very conſiderable obſtacle, to which no regard is had in the Calculation. See GUN-POWDER.

From a great number of Experiments it appears, 1. That the Effect of a *Mine* is always towards the weakeſt ſide; ſo that the diſpoſition of the Chamber of a *Mine* does not at all contribute to determine this Effect either one way or another, as the Miners miſtakenly imagine. 2. That the Quantity of the Powder muſt be greater or leſs, in proportion to the greater or leſs Weight of the Bodies to be rais'd, and to their greater or leſs Coheſion; and the reſult of all the Experiments that have been made for determining the different Quantity of Powder to be uſed for different Bodies, is to allow for each Cubic Fathom

Of looſe Earth,	9 or 10 Pounds of Powder.
Of firm ſolid Earth, and ſtrong Sand,	11 or 12
Of Argil, or fat clayey Earth,	15 or 16
Of new Maſonry, not very ſtrongly bound,	15 or 16
Of old Maſonry well bound,	25 or 30

3. That the Aperture, or Funnel of a *Mine* that has been play'd, if it had been rightly charg'd, is a Cone, the Diameter of whoſe Baſe is double the height taken from the Center of the *Mine*. 4. That when the *Mine* has been over-charg'd, its Aperture is nearly Cylindrical, the upper Extremity not being much wider than the Chamber at bottom, where the Powder was lodg'd. 5. That, beſide the ſhock of the Powder againſt the Bodies it takes up, it likewiſe cruſhes all the Earth that borders upon it, both underneath and ſide-ways, which Cruſh extends itſelf the further as the Matters make the leſs Reſiſtance.

To account for all the Effects reſulting from theſe Experiments, and to determine the Quantity of Powder required for the charge of a *Mine*, and the moſt advantageous Diſpoſition for anſwering the Intent: Let us conceive, 1. A *Mine*, whereof all the parts wherewith it is incompaſſed are incapable of being compreſs'd, and make an equable Reſiſtance, ſuch as that of a Bomb equally thick throughout, ſuſpended in the Air; where it muſt be obſerved, that beſides the Reſiſtance of the Body, the Effort of the Powder muſt likewiſe ſurmount the Weight of the ambient Air; in which Caſe the Body will be beaten into Duſt, or at leaſt into very ſmall pieces.

2. Conceive a *Mine* incompaſs'd wholly by ſuch Bodies as are equally compreſſible, and that reſiſt every way with equal force. In this Caſe, the firſt Effect of the Powder will be to compreſs all thoſe Bodies equally, and they will not be ſeparated, till by the Violence of their Compreſſion, they are all incapable, any longer, to reſiſt its Effort; ſo that unleſs the Powder be in a great Quantity, all its Effect may end in the mere compreſſion of the adjacent Bodies. For this reaſon, they ſometimes block up the Chamber of the *Mine* with large Beams, and ſometimes wall it up with Stones, that the adjacent Bodies may reſiſt the more.

Laſtly, ſuppoſe a *Mine* where all the Bodies that incompaſs it, are equally compreſſible, but where there is leſs Reſiſtance on one ſide than another; in this Caſe, there will be a Sphere of Compreſſion, whoſe Diameter will be ſo much the greater, as the weak Side reſiſts the more. With regard to which, there are three things to be conſider'd.

Firſt, if the Effort of the Powder be very great with regard to the Reſiſtance of the weak Side, the Compreſſion will but reach a little way, that Side being tore off too ſuddenly for the neighbouring parts to receive their Shock. In which Caſe, the Aperture or Funnel will be almoſt Cylindrical, the Diameter of the upper Extreme not much exceeding that of the Chamber; and the Earth will be thrown to a great diſtance, which the Enemy may make an advantage of, by making Lodgments in the Cavity, as was done at the Siege of *Verue*. Secondly, If the *Mine* be under-charged, it only makes a ſimple Compreſſion on the weakeſt Side, as it hapned at *Cividad Rodrigo*. Thirdly, If the *Mine* be charged with a Quantity of Powder between the two Extremes, it will raiſe a Cone of Earth, the Diameter of whoſe Baſe will have a greater or leſs Ratio to its height from the Centre of the *Mine*, as the Effort of the Powder is greater or leſs. The moſt advantageous Effect is when the Diameter of the Baſe of the Cone is double its height: In which caſe, the Earth blown up, falls almoſt all back again into the Aperture of the *Mine*; ſo that the Enemy cannot make any Lodgment.

To charge a *Mine*, therefore, ſo as it may have the moſt advantageous Effect poſſible, the Weight of the Matter to be carried up muſt be known, *i. e.* the Solidity of a right Cone, whoſe Baſe is double the height of the Earth over the Centre of the *Mine*, which is eaſily found from the Rules of Geometry. Having found the Solidity of the Cone in cubic Fathoms, multiply the number of Fathoms by the number of Pounds of Powder neceſſary for raiſing the Matter it contains, according to the Proportion already laid down; and if the Cone contains Matters of different Weights, take a mean Weight between 'em all; having always a regard to their degree of Coheſion.

As to the Diſpoſition of *Mines*, we have but one general Rule to lay down; which is, that the Side towards which one would determine the Effect, be the weakeſt. But this varies according to Occaſions and Circumſtances.

Knight of the MINE, is a Military Honour, antiently confer'd on Perſons who had diſtinguiſh'd themſelves in Engagements in *Mines*.

MINE *Ships*, are Ships fill'd with Gun-Powder, incloſed

in ſtrong Vaults of Brick or Stone, to be fired in the midſt of an Enemy's Fleet.

MINE is alſo a *French* Meaſure. See MEASURE.

MINERA, in Medicine and Anatomy, a Term apply'd to thoſe Parts of the Body wherein there are collections and coacervations of Humours made; which hardning, form Obſtructions, and produce Diſeaſes. In this ſenſe we ſay, the *Minera morbi*, &c.

MINERAL, in Natural Hiſtory, is ſometimes uſed in the general for *Foſſil*, and applied to any Body, ſimple, or compound, dug out of a *Mine*; from which it takes the Denomination. See MINE.

In this ſenſe, the Metals, Sulphurs, foſſil Salts, Semimetals, &c. are *Minerals*. See FOSSIL.

On this Principle, they divide *Minerals* into two Claſſes; the one *fuſible*, and *malleable*; *i.e.* which melt with Fire, and ſtretch on the Anvil; which are what we properly call *Metals*. The others want thoſe two Properties; and are what in the ſtrict ſenſe we call *Minerals*.

Some divide *Minerals* into *Simple* and *Compound*: To the firſt belong *Stones*; *Salts*, as Alum, Nitre, &c. *Inflammable Minerals*, as Sulphur and Bi tumen; and *Metals*, as Gold, &c.

Others of the more accurate Writers, reſtrain the Word *Mineral* to what we otherwiſe call *Semi-metal*. See SEMIMETAL.

In this ſenſe, a *Mineral* may be defined a compound Foſſil, wherein there is ſomething diſcovered, in all reſpects like Metal, only that it is not malleable; join'd, or compounded with ſome other Foſſil, as Salt, Sulphur, Stone, or Earth. Such are *Antimony*, *Cinnabar*, *Biſmuth*, *Calaminaris*, *Vitriol*, *Pyrites*, *Marcaſſites*, *Cobalt*, *Oker*, the *Magnet*, *Lapis Hæmatites*, *Armenus*, and *Stellatus*. See each under its proper Article, ANTIMONY, CINNABAR, BISMUTH, VITRIOL, CALAMINARIS, &c.

Some attribute the Formation of *Minerals* to the Action of the Sun without; ſome to the central Fire within; and ſome think the Cold does all by uniting condenſing, and congealing certain Juices.

Des Cartes takes Metals to have been form'd from the beginning of the World; and to have ranged themſelves, by the Laws of Gravity, about the Centre. In proceſs of time, he ſuppoſes them to have been corroded by the acid Salts, &c. and abundance of the parts thereof carried up along with thoſe Salts by the ſubterranean Heat, and depoſited in divers parts of the Earth.

Monſ. *Tournefort* ſuppoſes Seeds of *Minerals*, as of Animals, and Vegetables. Every thing, according to him, comes from Eggs, even Stones; and the largeſt Rocks were originally no more than Grains of Sand. See his Syſtem more at length under the Articles METAL and STONE.

Others, as M. *Geoffroy*, contend that Metals, &c. may be the reſult of a mixture of certain Matters, which had nothing metallic in them. Thus, in the Aſhes of all Vegetables we find a ferruginous Matter which the Load-ſtone attracts; and yet it will hardly be ſaid that Iron exiſted in the Plants. We ſee no ſigns of Iron in Argilla, work it in what manner you will; and yet add Linſeed-Oil, and by Fire you will procure Iron. And the like may be ſaid of divers other Matters.

Hence it is probable, Metals may be form'd by a mere combination of different Ingredients; much like Sulphur, which we all know is made by adding an inflammable Principle to a vitriolic Salt. The Earth may every where abound with thoſe Matters, which are continually circulating through its Pores and Canals, and which meeting with an Earth homogeneous to them, fix thereto; and commence *Minerals*.

The *Minerals*, Metals, and Stones lie in Beds; and have done ſo ever ſince the Flood, if not from the Creation; yet 'tis highly probable they have a faculty of growing in their reſpective Beds; that, as their Beds are robb'd and emptied by Miners, ſo after a while they recruit again. Thus Vitriol, Mr. *Boyle* thinks, may grow by the help of the Air, and Alum does the ſame. We are aſſured (ſays that Author) by the experienced *Agricola*, that the Earth, or Oil of Alum, being robb'd of its Salts, will, in tract of time, recover it by being expoſed to the Air.

As for Metals, there is good reaſon to believe they grow likewiſe; from what has been alledged by Mr. *Boyle*, in his Obſervations about the growth of Metals, and particularly as to the growth of Iron. To the Inſtances he brings from *Pliny*, *Fallopius*, *Cæſalpinus*, and others, we may add, that in the Foreſt of *Dean* in *Glouceſterſhire*, the beſt Iron, and in the greateſt Quantities, are found in the old Cinders which they melt over again. This ſome impute to the Negligence of the former Melters in not exhauſting the Ore. But Mr. *Derham* thinks it rather owing to the new Impregnations of the old Ore, or Cinders from the Air; than to any ſeminal Principle in the Ore itſelf.

The Chymiſts generally take *Minerals* to be nothing elſe but imperfect Metals, which not having arriv'd at Maturity, may be perfected by Chymical Operations, and raiſed to red Metals. This agreeable, but fatal Deluſion, has given riſe to the Sect of Philoſophers, who ſtudy the Philoſopher's Stone. See METAL, GOLD, PHILOSOPHER'S STONE, &c.

Cryſtal MINERAL, ſee CRYSTAL *Mineral*.

MINERAL-WATERS, are thoſe, which at their ſpringing forth from under Ground, are found impregnated with ſome *Mineral* Matter; as Salt, Sulphur, Vitriol, &c. See WATER.

Such are hot *Baths*, *Spaws*, purging, &c. Springs. See BATH, SPAW, SPRING, &c.

MINIATURE, or MIGNATURE, a delicate kind of Painting, conſiſting of little Points or Dots, inſtead of Lines; uſually done on Velom, with very thin, ſimple Water-Colours. See PAINTING.

Miniature is diſtinguiſhed from other kinds of Painting by the ſmallneſs and delicacy of its Figures, the weakneſs of their Colours, and faintneſs of the Colouring, and in that it requires to be view'd very near.

Thoſe Colours that have the leaſt Body, are the beſt and moſt commodious for painting in *Miniature*; as *Carmine*, *Ultramarine*, fine Lakes, and Green made of the Juices of ſeveral kinds of Herbs and Flowers.

Painting in *Miniature* is the niceſt and moſt tedious of all others; being performed wholly with the Point of the Pencil.

There are ſome Painters who never uſe any white Colour in *Miniature*, but make the ground of the Velom ſerve to raiſe their Figures; in which Caſe, the Lights appear bright in proportion to the depth and ſtrength of the Colours of the Figures. Others, before they go to work, give the Velom a light waſh with white Lead, well prepared and purified.

When the Colours are laid on flat without dotting, tho' the Figures be ſmall, and the ground either Velom or Paper, it is not call'd *Miniature*, but *Waſking*.

The Colours for *Miniature* may be mix'd up with Water of Gum Arabic, or Gum Tragacanth.

The Word comes from the *Latin Minium*, Red Lead, that being a Colour much uſed in this kind of Painting. The *French* frequently call it Mignature, from *Mignon*, fine, pretty, on account of its ſmallneſs and delicacy.

MINIM, in Muſic, a Note, or Character of Time; equal to two Crochets, or half a Semibreve. See TIME, and CHARACTERS *of Muſic*.

MINIMA *Naturæ*, or MINIMA *Naturalia*, among Philoſophers, are the primary Particles, whereof Bodies conſiſt; call'd alſo *Corpuſcles* and *Atoms*. See CORPUSCLE, ATOM, MATTER, &c.

MINIMA *and Maxima*, in the higher Geometry. See MAXIMA and *Minima*.

MINIMENTS, or MUNIMENTS. See MUNIMENTS.

MINIMS, or MINIMI, an Order of Religious, inſtituted about the Year 1440, by S. *Francis de Paulo*.

Theſe have improved on the Humility of the *Minors*, by terming themſelves *Minimi*, or *Minimes*, *q. d.* Leaſt, or Smalleſt. See MINORS.

MINION, a ſort of Cannon, or piece of Ordnance, whereof there are two kinds: large and ordinary. See CANNON and ORDNANCE.

The *large Minion*, or one of the largeſt Size, has its Bore $3\frac{1}{4}$ Inch Diameter, and is 1000 Pounds Weight; its Load is $3\frac{1}{4}$ Pounds of Powder; its Shot 3 Inches in Diameter, and $3\frac{1}{4}$ Pound Weight; its Length is 8 Foot, and its level Range 125 Paces.

The *ordinary Minion* is three Inches Bore, in Diameter, and weighs about 800 or 750 Pounds Weight. It is ſeven Foot long; its Load $2\frac{1}{2}$ Pounds of Powder; its Shot near three Inches Diameter, and weighs 3 Pounds 4 Ounces; and ſhoots point-blank 120 Paces.

MINISTER, *Servant*, one that ſerves God, the Public, or a private Perſon. See SERVANT.

In the Reformed Church, Prieſts, or thoſe ordain'd to preach, and do the other Functions of the Prieſthood, are call'd abſolutely and ſimply *Miniſters*.

In this ſenſe, Biſhops, &c. are ſaid to be *Miniſters* of God; *Miniſters* of the Word; of the Goſpel, &c. In ſome Churches they are alſo called Paſtors. See BISHOP, PRIEST, PASTOR, &c.

MINISTERS *of the Altar*, are properly thoſe who attend, and aſſiſt the Prieſt at the Adminiſtration of the Euchariſt. Deacon, and Subdeacon are Titles that properly ſignify *Miniſters*; Διακονος, *Miniſter*. See DEACON and SUBDEACON.

Officers of State, &c. are call'd the King's *Miniſters*; as adminiſtring the Affairs of Juſtice, Policy, &c. for him. See OFFICER.

MINISTER *of State*, is he with whom a Prince entruſts the Adminiſtration of his State; or to whom he commits the Care, and Direction of the principal Affairs thereof. See STATE and GOVERNMENT.

Boetius is propoſed as a Model for *Miniſters* of State. The Grand Vizir is the Prime *Miniſter* of the *Ottoman* Empire, See VIZIR.

Foreign Miniſters, or the *Miniſters of Foreign Princes*, are their Embaſſadors, Envoys, Agents, or Reſidents in the Courts of other Princes.

There are two kinds of Foreign *Miniſters*: *Miniſters* of the firſt Rank, who are alſo call'd Embaſſadors, and Envoys in Extraordinary. See EMBASSADOR and ENVOY.

And *Miniſters* of the ſecond Rank, who are the ordinary Reſidents. See RESIDENT.

Thoſe of the firſt Rank have a Repreſentative Character, which the others have not; tho' theſe laſt are ſometimes inveſted with fuller Powers than the former.

MINISTER is alſo the Title certain Religious Orders give to their Superior. See SUPERIOR.

In this ſenſe we ſay the *Miniſter* of the *Mathurins*; the *Miniſter* of the *Trinitarians*. See MATHURIN, *&c.*

Among the *Jeſuits*, the ſecond Superior, or Deputy of each Houſe is call'd *Miniſter*: as being an Aſſiſtant to the Superior, or Rector. See JESUITS.

The General of the *Cordeliers* Order is call'd the *Miniſter* General. See GENERAL.

MINISTRY, or MINISTERY, a Profeſſion, Office, or Employment which a Perſon diſcharges for the Service of God, the Public, or ſome particular Perſon. See MINISTER.

In this ſenſe we ſay, a Biſhop muſt give account to God of his *Miniſtry*, &c.

MINISTRY is alſo uſed for the Government of a State, by ſome great Miniſter under the Sovereign Authority. In this ſenſe we ſay, the *Miniſtry* of the Cardinal *de Richelieu*, &c.

MINISTRY is alſo frequently uſed as a collective Word, ſignifying the Miniſters or Officers of State. Thus we ſay, the *Miniſtry* oppoſed a Thing; meaning, the Miniſters oppoſed it.

MINIUM, a Mineral Colour, call'd alſo *red Lead*, uſed by Painters, Illuminers, *&c.* See LEAD.

Minium is a preparation of Lead, performed by Fire. There are two ways of making it. The firſt, of burnt Lead; the ſecond of Ceruſs, or white Lead further urged by Fire. See CERUSS, *&c.*

Beſide the uſe of *Minium* as a Colour; it is alſo an Ingredient in an Officinal Compoſition, call'd *Emplaſtrum de Minio*, uſed as a Deſiccative and Cicatrizer.

Some Authors will have the *Minium* of the Antients to be what we now call *Vermillion*. See VERMILLION.

MINOR, a *Latin* Term, literally denoting *leſs*, uſed in oppoſition to *major*, greater. See MAJOR.

Thus we ſay St. *James minor*: *Aſia minor*: The *Minor* Excommunication, *&c.*

The four *Minor Orders*, are the four leſſer Orders confer'd, in the *Romiſh* Church, between the Tonſure and Subdeaconate. Theſe are that of *Porter*, or Door-Keeper; that of *Reader*; that of *Exorciſt*; and that of *Acolyte*. See EXORCIST, ACOLYTE, *&c.*

MINOR, in Law, is uſed in the like ſignification, to denote a Perſon yet under Age, or who by the Laws of the Country, is not yet arrived to the Power of Adminiſtring his own Affairs, or coming to the Inheritance of an Eſtate. See AGE.

Among us, a Perſon is a *Minor* till the Age of twenty one: Till this Time his Acts are invalid. See MAJOR.

Yet if a Patron, *&c.* have a Right of Advowſon, by the Common Law he may preſent at the Age of fourteen Years; and may of himſelf, and without his Father, or Guardian, conſent to any Proceſs relating to beneficiary Matters. See PATRON.

Hence, in the Canon Law, there is no Title *de Minoribus*; and the reaſon is, that the ſeveral Ages whereat the Common Law declares a Perſon capable of a Benefice, or of Sacred Orders, are ſo many Species of Canonical Majorities.

MINOR, in Logic, is the ſecond Propoſition of a formal, or regular Syllogiſm, call'd alſo the *Aſſumption*. See SYLLOGISM, PROPOSITION, and ASSUMPTION.

I grant the Major, but deny the *Minor*. See TERM.

MINOR, in Muſic, is apply'd to certain Concords, which yet differ from others of the ſame Denomination by a half Tone. See SEMI TONE.

Thus we ſay, a third *Minor*, or leſſer third: A ſixth Major, and *Minor*. See THIRD, SIXTH, *&c.*

Concords that admit of Major and *Minor*, *i. e.* greater, and leſs, are ſaid to be *Imperfect Concords*. See CONCORD.

MINORS, or *Friars* MINORS, an Appellation which the Cordeliers aſſume, out of ſhew of Humility; calling themſelves *Fratres Minores*, i. e. *Leſſer Brothers*; and ſometimes *Minorites*. See CORDELIERS.

The Title of *Minors*, however, is not abſolutely reſtrain'd to the Cordeliers, but alſo given, in the general, to all the Mendicants, or begging Religious, founded by St. *Francis d'Aſſiſe*. See FRANCISCANS.

There is alſo an Order of *Regular Minors* at *Naples*, eſtabliſhed in the Year 1588, and confirmed by *Sixtus* V.

MINOT, a *French* Meaſure. See MEASURE.

MINOTAUR, in Antiquity, a fabulous Monſter, much talk'd of by the Poets; feign'd to be half Man, and half Bull.

The *Minotaur* was brought forth by *Paſiphae*, Wife of *Minos* King of *Crete*. It was ſhut up in the Labyrinth of that Iſland; and at laſt kill'd by *Theſeus*. See LABYRINTH.

Servius gives the Explication of this Fable. He ſays, that a Secretary of King *Minos*, named *Taurus*, Bull, had an Intrigue with the Queen, *Paſiphae*, in the Chamber of *Dedalus*; and that ſhe was at length delivered of Twins, one of which reſembled *Minos*, and the other *Taurus*. This occaſion'd the Production to be reputed Monſtrous.

MINOVERY, a Treſpaſs committed in the Foreſt, by ſomething that is a Man's Handy-Work; as an Engine to catch Deer, *&c.* See FOREST.

The Word is form'd of the *French Main-oeuvre*, Hand-Work.

MINSTER, antiently ſignified the Church of a Monaſtery, or Convent. See CHURCH.

The Word is *Saxon*, *Mynſter*.

MINSTREL, an antient Term for a *Fidler*, or a Player on any other kind of Muſical Inſtrument.

The Word *Minſtrel* in its Original, was uſed for People who ſung and ſerenaded their Miſtreſſes. Afterwards it became a Name for all kinds of Muſicians: and at length paſs'd to Buffoons and Country Scrapers.

Borel derives the Word from *Manus* and *Hiſtrio*, one who diverts with the Hand; or from *Minor Hiſtrio*, little Buffoon. *Du Cange* derives it from *Minſtrellus*, a diminutive of Miniſter, by reaſon the *Minſtrels* were antiently ranked among the lower Officers, *Miniſters*, or Servants.

MINT, the Place where the King's Coin is form'd. See COIN.

Antiently there were *Mints* in moſt Cities of *England*. See MONEY.

The chief *Mint* at preſent is in the Tower of *London*. See TOWER.

The *Officers of the Mint* are, 1. The *Warden*, who is the Chief, and is to receive the Bullion, and over-ſee all the other Officers. 2. The *Maſter Worker*, who receives the Bullion from the Warden, cauſes it to be melted, and deliver'd to the Moniers, and takes it from them again when coin'd. 3. *Comptroller*, who is to ſee that the Money be made to the juſt Aſſize, and to over-ſee the Officers. 4. The *Aſſay-Maſter*, who weighs the Silver and Gold, and ſees whether it be Standard. 5. The *Auditor*, who takes all the Accounts. 6. The *Surveyor of the Melting*, who is to ſee the Silver caſt out, and that it be not alter'd after it is deliver'd to the Melter, *i. e.* after the Aſſay-Maſter has made Trial of it. 7. The *Clerk of the Irons*, who is to ſee that the Iron be clean, and fit to work with. 8. The *Graver*, who engraves the Dies and Stamps for the Coinage of the Money. 9. The *Melters*, who melt the Bullion before it comes to Coining. 10. The *Blanchers*, who boil and cleanſe the Money. 11. The *Porters*, who keep the Gate of the *Mint*. 12. The *Provoſt* of the *Mint*, who provides for all the Moneyers, and over-ſees them. And, Laſtly, the *Moniers*, ſome of which ſhear the Money; ſome forge it; and ſome ſtamp or coin it; and ſome round and mill it. See COINAGE.

MINT-*Water*, the diſtill'd Water of the Plant of that Name. See WATER.

MINTERS, or *Moneyers*. See MONEYERS and MINT.

MINTING, is ſometimes uſed for the *Coining* of Money. See COINING.

MINUSCULE, or MINUSCULÆ, in Printing, are the ſmall, or running Letters; as contradiſtinguiſh'd from *Majuſculæ*, or Capitals. See LETTER, MAJUSCULÆ, *&c.*

MINUTE, in Geography, and Aſtronomy, is the 60th part of a *Degree*; which is the 360th part of a Circle. See DEGREE.

Thus we ſay, the Diameter of the Sun is ſeen under an Angle of 39 *Minutes* in Winter; and 31 in Summer. See DIAMETER and SUN.

In this ſenſe, a *Minute* is alſo call'd a *Prime*, or *Prime Minute*. See PRIME.

The Diviſions of Degrees are Fractions, whoſe Denominators increaſe in a Sexagecuple Ratio; that is, a *Minute* or Prime is $= \frac{1}{60}$; a Second, or ſecond *Minute* $= \frac{1}{3600}$, *&c.* See SEXAGESIMAL.

In Aſtronomical Tables, *&c.* *Minutes* are expreſſed by acute Accents, thus, $'$; Seconds by two, $''$; Thirds by three, $'''$. See SECOND, THIRD, *&c.*

MINUTE, in computation of Time, is uſed for the 60th part of an Hour. See HOUR.

MINUTE, in Architecture, is a 30th Part, or Diviſion of a Module. See MODULE.

MINUTE,

MINUTE, in ſpeaking of Weights, is the 24th part of a Grain. See GRAIN.

MINUTE is alſo uſed to ſignify a ſhort Memoir, or Sketch of any thing taken haſtily in writing.

In this ſenſe we ſay, the *Minutes* of the Proceedings of the Houſe of Lords, *&c.*

The Word comes from the *Latin Minutus*, ſmall.

MIQUELETS, a kind of foot Soldiers, inhabiting the *Pyrenean* Mountains; arm'd with Piſtols under their Belts, a Carbine, and a Dagger.

The *Miquelets* are dangerous People for Travellers to meet.

MIRABOLANS, or MIROBOLANS, in Pharmacy. See MYROBOLANS.

MIRACLE, in the popular ſenſe of the Word, is a *Prodigy*, or an extraordinary Event that ſurprizes us by its Novelty.

In the more Accurate and Philoſophical Senſe, a *Miracle* is an Effect that does not follow from any of the known Laws of Nature; or which is inconſiſtent with ſome known Laws thereof. See NATURE.

A *Miracle*, therefore, being a ſuſpenſion of ſome Law, can't come from any hand leſs than his who fix'd that Law. See GOD, LAW, *&c.*

Spinoſa denies that any Power can ſuperſede that of Nature; or that any thing can diſturb or interrupt the Order of Things; and accordingly defines a *Miracle* to be a rare Event, happening in conſequence of ſome Laws that are unknown to us. See SPINOSISM.

The Divines define a *Miracle* to be an extraordinary and wonderful Effect, above the Power of Nature, wrought by God, to manifeſt his Power or Providence; or to give Credit to ſome Meſſenger ſent from himſelf. Thus Jeſus Chriſt evinced the Truth of his Miſſion, and his Doctrine by *Miracles*; and thus alſo did *Moſes*.

It is ſtill a diſpute in the World, how far it may be in the power of the Devil to work *Miracles*; or wherein the ſpecific difference lies between the *Miracles* of *Moſes*, and thoſe of *Pharaoh*'s Magicians; thoſe of Jeſus Chriſt and the Apoſtles, and thoſe of *Simon Magus* and *Apollonius Tyanæus*: Whether the latter were any more than mere Deluſions of the Senſes; or whether any ſupernatural and diabolical Power concurred with them. See MAGIC.

The Church of *Rome* abounds in *Miracles*; if we believe their Writers, ſome of their Monks have wrought more *Miracles* than all the Apoſtles; and that without any viſible Neceſſity for them.

As full as that Church pretends to be of Saints, it is a Rule with them, that none are ever Canonized till there be good Proof of his having wrought *Miracles*. So that were all thoſe allowed good *Miracles*, and to have happened out of the common Order of Nature, they are ſo numerous, one would be tempted to think there were no Order or Law of Nature at all. See SAINT.

There are thoſe however, who ſet aſide the Authority of all *Miracles*; thinking it unbecoming the Wiſdom of God to eſtabliſh ſuch Laws, as that he ſhould find it frequently neceſſary to ſuperſede. And as the former, from the avowed Authority of ſome *Miracles*, fetch an Argument for the Truth of all; pleading thoſe which are allow'd as well as thoſe which are queſtion'd; ſo theſe alledge the falſe ones as concluſions againſt them all.

The *Romans* attribute *Miracles* to their Emperors *Adrian* and *Veſpaſian*.

St. *Auguſtine* is a ſtrong Advocate for *Miracles*. He mentions ſeveral whereof he was an Eye-Witneſs, and others whereof he was informed by thoſe that were. In the ſingle City of *Hippo*, he tells us there were ſeventy *Miracles* wrought in the ſpace of two Years, on the building a Chappel in honour of St. *Stephen*.

Tho *Miracles* may prove the Superintendency of a voluntary Agent; and that the Univerſe is not guided by Neceſſity or Fate; yet that Mind muſt be weak and inadvertent, which needs them to confirm the Belief of a Wiſe and Good Deity: Since the Deviation from general Laws, unleſs upon very extraordinary Occaſions, muſt be a Preſumption of Inconſtancy and Weakneſs, rather than of a ſteady Wiſdom and Power; and muſt weaken the beſt Arguments we have for the Sagacity and Power of the Univerſal Mind. *Inquiry into the Original of the Ideas of Beauty*, &c.

MIRROR, or MIRROUR, or *Speculum*, Body which exhibits the Images of Objects preſented thereto, by Reflexion. See REFLEXION.

The Uſe of *Mirrours* is very antient. Mention is made of a *Brazen Mirrour*, or Looking-Glaſs in *Exodus* xxxviii. 8. where *Moſes* is ſaid to have made *a Brazen Laver, or Baſon, of the Looking-Glaſſes of the Women continually aſſembled at the Door of the Tabernacle*. 'Tis true, ſome modern Commentators will not allow the *Mirrours* themſelves to have been Braſs; but of Glaſs, only ſet, or framed in Braſs. But the moſt learned among the Rabbins do all allow, that in thoſe times, the *Mirrours* made uſe of by the *Hebrew* Women in dreſſing their Heads, were of Metal; and that the devout Women mention'd in this Paſſage, made Preſents to *Moſes* of all their *Mirrours* to make the Brazen Laver. See the Jeſuit *Bonfrezius*'s Comment on this Text.

It might likewiſe be proved, that the Antient *Greeks* made uſe of Brazen *Mirrours*; from divers Paſſages among the antient Poets. See BURNING-*Mirrour*.

MIRROUR, in Catoptrics, is any poliſh'd Body impervious to the Rays of Light, and which of conſequence reflects it equally. See LIGHT.

Thus Water in a deep Well or River, and ſmooth polite Metals, are rank'd among the number of *Mirrours*.

In this ſenſe, the Doctrine of *Mirrours* makes the Subject of *Catoptrics*. See CATOPTRICS.

MIRROUR, however, in the more confined Senſe of the Word, is peculiarly uſed to ſignify a ſmooth Surface of Glaſs, tinn'd or quick-ſilver'd on the back-ſide, which exhibits the Images of Objects oppoſed thereto.

The Doctrine of MIRROURS *is built on the following general Principles.*

1. *Light reflected from any* Mirrour, *or Speculum, makes the Angle of Incidence equal to that of Reflexion*; which ſee demonſtrated under the Word REFLEXION.

Hence, a Ray of Light, as A B (Tab. OPTICS, *Fig* 26.) falling perpendicularly on the Surface of a Speculum, will be reflected back upon itſelf: which we find by Experience it actually does.

From the ſame Point of a *Mirrour*, therefore, there can't be ſeveral Rays reflected to the ſame Point; ſince in that Caſe, all the Angles of Incidence muſt be equal to the ſame Angle of Reflexion C B G, and therefore to each other; which is abſurd. Nor can the Ray A B be reflected into two or more Points; ſince, in that Caſe, all the Angles of Reflexion would be equal to the ſame Angle of Incidence A B F: which is likewiſe abſurd.

2. *From every Point of a* Mirrour, *are reflected Rays thrown on it from every Point of a radiant Object.*

Since then Rays coming from different parts of the ſame Object, and ſtriking on the ſame Point of the Object, cannot be reflected back to the ſame Point; the Rays which flow from different Points of the ſame radiating Object, are again ſeparated after reflexion: ſo that each Point ſhews whence it came. See RADIANT.

Hence it is, that the Rays reflected from *Mirrours* exhibit the Objects to view. Hence, alſo, it appears, that rough uneven Bodies muſt reflect the Light in ſuch manner, as that Rays coming from different Points, will be blended or thrown confuſedly together.

MIRROURS are either *Plane*, *Concave*, *Convex*, *Cylindrical*, *Conical*, *Parabolical*, or *Elliptical*.

Plane MIRROURS, or *Specula*, are thoſe which have a plain or flat Surface. See PLANE.

Theſe, by a popular Word, we call *Looking-Glaſſes*.

For the Manner of making plain Mirrours, *or Specula*, ſee LOOKING-GLASS.

Laws and Phænomena of Plain MIRROURS.

I. *In a plain* Mirrour, *every Point of an Object, as* A, (Tab. OPTICS, *Fig.* 27.) *is ſeen in the Interſection of the Cathetus of Incidence*, A B, *with the reflected Ray* C B.

Hence, 1. As all the reflected Rays meet with the Cathetus of Incidence in B; by whatever reflected Rays the Point A be ſeen, it will ſtill appear in the ſame Place. Conſequently, any number of Perſons viewing the ſame Object in the ſame *Mirrour*; will all ſee it in the ſame place behind the *Mirrour*. And hence it is, that the ſame Object has only one Image, and that we don't ſee it double with both Eyes. See VISION.

2. The diſtance of the Image B, from the Eye C, is compounded of the Ray of Incidence A D, and the reflected Ray C D: And the Object A radiates reflectedly, in the ſame manner as it would do directly, were it removed into the place of the Image.

II. *The Image of a radiant Point*, B, *appears juſt ſo far behind a plain* Mirrour, *as the radiant Point is before it.*

Hence, 1. If the *Mirrour* A G be placed horizontal; the Point A will ſeem ſo much below the Horizon, as it is really elevated above it: Conſequently, erect Objects will appear as if inverted; and therefore Men ſtanding on their Feet, as if on their Heads. Or if the *Mirrour* be faſtned to the Ceiling of a Room, parallel to the Horizon, Objects on the Floor will appear above the Ceiling as much as they really are below it; and that upſide down.

III. *In a plain* Mirrour, *the Images are perfectly Similar, and equal to the Objects.* And hence their Uſe as Looking-Glaſſes.

IV. *In a plain* Mirrour, *things on the right Hand, appear as on the left; and* vice verſa.

Hence alſo, *we have a Method of Meaſuring any inacceſſible Altitude by means of a plain* Mirrour.

Thus, the *Mirrour* being placed horizontally in C, *Fig.* 28. retire from it till ſuch time as the Top of the Tree be ſeen therein.

therein. Meaſure the height of the Eye D E; the diſtance of the Station from the Point of Reflexion E C, and the diſtance of the Foot of the Tree from the ſame. Then to E C, C B, and E D, find a fourth Proportional A B. This is the Altitude ſought.

V. *If a plain Mirrour be inclined to the Horizon in an Angle of* 45 *Degrees; an Object perpendicular to it will appear parallel, and an horizontal Object perpendicular.*

And hence, the Eye being placed beneath the *Mirrour*, the Earth will appear perpendicularly over it; or if placed over it, the Earth will appear perpendicularly under it. Hence alſo, a Globe deſcending down a Plane a little inclined, may, by means of a *Mirrour*, be exhibited as mounting up a Vertical Plain, to the great ſurprize of ſuch as are unacquainted with Catoptrics.

And hence we have a Method of repreſenting ourſelves as if flying.

For a *Mirrour* inclined to the Horizon under an Angle of 45°, we have obſerved, will repreſent Vertical Objects as if Horizontal. Conſequently, a large *Mirrour* being ſo diſpoſed; as you advance toward it, you will ſeem to move horizontally; and nothing will be wanting to the Appearance of flying, but to ſtrike out the Arms and Legs. It muſt be added, however, that as the Floor is elevated along with you, your Feet will ſtill be ſeen to walk as along a vertical Plane. To deceive the Eye intirely, therefore, it muſt be kept from the Feet.

VI. If the Object A B (*Fig.* 29.) be parallel to the Speculum C D, and be equally diſtant from it, with the Eye; the reflecting Line C D will be half the length of the Object A B.

And hence, to be able to ſee the whole Body in a plain *Mirrour*; its height and breadth muſt be half your height, and breadth. Conſequently, the height and breadth of any Object to be ſeen in a *Mirrour*, being given; we have alſo the height and breadth of the *Mirrour* wherein the whole Object will appear, at the ſame diſtance with the Eye.

Hence alſo, as the length and breadth of the reflecting part of the Speculum, are ſubduple of thoſe of the Object to be reflected; the reflecting part of the *Mirrour*, is to the Surface reflected in a ſubquadruple Ratio. Conſequently, the reflecting Portion being a conſtant Quantity; if in any place you ſee the whole Body in a *Mirrour*, you will ſee it in every other place, whether you approach nearer, or recede farther from it.

VII. If ſeveral *Mirrours*, or ſeveral Fragments, or Pieces of a *Mirrour*, be all diſpoſed in the ſame Plane; they will only exhibit an Object once.

VIII. *If two plain* Mirrours, *as* X Y, *and* Z X, (Fig. 30.) *be join'd at an Angle* X; *the Eye* O, *placed within that Angle, will ſee the Image of an Object* A *placed within the ſame, as often repeated as there may be Catheti drawn determining the places of the Images, and terminated without the Angle* Y X Z.

Hence, as the more Catheti terminated without the Angle, may be drawn as the Angle is more acute; the acuter the Angle, the more numerous the Images. Thus *Z. Traber* found at an Angle of one third of a Circle, the Image was repreſented twice or thrice, at $\frac{1}{4}$ thrice, at $\frac{1}{5}$ five times, at $\frac{1}{12}$ twelve times.

Further, if the *Mirrours* be placed upright, and ſo contracted; or if you retire from them, or approach to them, till the Images reflected by them coaleſce, or run into one, they will appear monſtrouſly diſtorted: Thus if they be at an Angle ſomewhat greater than a right one, you will ſee it with only one Eye; if the Angle be leſs than a right one, you will ſee three Eyes, two Noſes, two Mouths, &c. At an Angle ſtill leſs, the Body will have two Heads. At an Angle ſomewhat greater than a right one, at the diſtance of four Feet, the Body will be headleſs, &c. Again, if the *Mirrours* be placed the one parallel to the Horizon, the other inclined to it, or declined from it, it is eaſy to perceive that the Images will be ſtill more Romantic. Thus, one being declined from the Horizon to an Angle of 144 Degrees, and the other inclined to it; a Man ſees himſelf ſtanding with his Head to another's Feet.

Hence it appears how *Mirrours* may be manag'd in Gardens, &c. ſo as to convert the Images of thoſe near 'em into Monſters of various kinds: And ſince glaſs *Mirrours* will reflect the Image of a lucid Object twice or thrice; if a Candle, &c. be placed between the *Mirrours*, it will be multiply'd an infinite number of times.

On theſe Principles are founded various Catoptric Machines, ſome of which repreſent Objects infinitely multiply'd and diſtorted; others infinitely magnify'd, and ſet at vaſt diſtances. See CATOPTRIC, CISTULA, &c.

Convex MIRROURS are thoſe whoſe Surface is convex. See CONVEX.

Note, by *Convex* Surfaces, Authors generally mean ſuch as are ſpherically Convex. See CONVEXITY.

Manner of preparing or making Convex Specula, or MIRROURS.

There are divers Methods uſed by divers Artiſts; particularly as to the Matter, or Compoſition. One of the beſt that is known, is given us by *Wolfius* thus;

Melt one part of Tin, and another of Marcaſite together, and to the melted Maſs add two parts of Mercury; as ſoon as the Mercury begins to evaporate into Smoak (which it preſently does) the whole Compoſt is to be thrown into cold Water, and when well cool'd, the Water decanted off. The Mixture is then to be ſtrain'd through a linen Cloth two or three fold; and what is thus ſecerned, pour'd into the Cavity of a glaſs Sphere: this Sphere is to be turn'd gently round its Axis till the whole Surface is cover'd; the reſt being reſerved for future uſe.

If the Sphere were of colour'd Glaſs, the *Mirrour* will be ſo too.

And in the ſame manner may Conic, Elliptic, Cylindric, and other *Mirrours* be made.

How they may be made of Metal, ſee under *Concave* MIRROUR.

Laws, or Phænomena of Convex MIRROURS.

I. In a ſpherical convex *Mirrour*, the Image of a radiant Point appears between the Centre, and the Tangent; but nearer to the Tangent than the Centre.

Hence, the diſtance of the Object from the Tangent is greater than that of the Image. And, conſequently, the Object is further diſtant from the Speculum than the Image.

II. If the Arch B D, (*Fig.* 31.) intercepted between the Point of Incidence D, and the Cathetus A B; or the Angle C form'd in the Centre of the *Mirrour* by the Cathetus of Incidence A C, and that of Obliquation F C, be double the Angle of Incidence; the Image G will appear on the Surface of the Speculum.

III. If the Arch intercepted between the Point of Incidence, and the Cathetus; or the Angle C form'd in the Centre of the *Mirrour* by the Cathetus of Incidence, and the Cathetus of Obliquation, be more than double the Angle of Incidence; the Image will be without the *Mirrour*.

IV. If the Arch intercepted between the Point of Incidence, and the Cathetus; or the Angle form'd in the Centre of the *Mirrour*, by the Cathetus of Incidence, and that of Obliquation be leſs than double the Angle of Incidence; the Image will appear within the Speculum.

V. In a convex *Mirrour*, a remoter Point, A, (*Fig.* 32.) is reflected from a Point F, nearer the Eye O, than any nearer Point B in the ſame Cathetus of Incidence.

Hence, if the Point of the Object A, be reflected from the Point of the *Mirrour* F; and the Point of the Object B from the Point of the *Mirrour* E: all the intermediate Points between A and B will be reflected from the intermediate Points of the Speculum between F and E. Conſequently F E will be the Line that reflects A B.

Hence alſo, a Point of the Cathetus B, ſeems at a greater diſtance C *b* from the Centre C; than a more remote one, A.

VI. A nearer Point B (*Fig.* 33.) not in the ſame Cathetus with a remoter, H; is reflected to the Eye O, from a nearer Point of the Speculum, than the remoter H.

Hence, if the Point of an Object A, be reflected from the Point of a *Mirrour* C; and the Point of the Object B, from the Point of the Speculum D, all upon the ſame Point O: All the intermediate Points between A and B will be reflected from all the intermediate Points between C and D. Conſequently, the Image F G, of the Object B A, is contain'd between the Cathetus B E, and A E.

VII. In a ſpherical convex *Mirrour*, the Image is leſs than the Object.

And hence the Uſe of ſuch *Mirrours* in the Art of Painting, where Objects are to be repreſented leſs than the Life.

VIII. In a convex *Mirrour*, the more remote the Object; the leſs its Image: And again, the ſmaller the *Mirrour*, the leſs the Image.

IX. In a convex *Mirrour*, the right hand is turn'd to the left; and the left to the right: And Magnitudes perpendicular to the *Mirrour*, appear topſy turvey.

X. The Image of a right Line perpendicular to the *Mirrour*, is a right Line; but that of a right Line either oblique to the *Mirrour*, or parallel thereto, is convex.

XI. Rays reflected from a convex *Mirrour*, diverge more than if reflected from a plane *Mirrour*.

Hence Light, by being reflected from a ſpherical *Mirrour*, is weakned; and, conſequently, the Effects of the reflected Light are weaker than thoſe of the direct. Hence alſo, Myopes ſee remote Objects more diſtinctly in a convex *Mirrour*, than they do directly.

Rays reflected from a convex *Mirrour* of a ſmaller Sphere, diverge more than if reflected from a larger. Conſequent

ly, the Light is more weaken'd, and its Effects are leſs conſiderable in the former Caſe than the latter.

Concave MIRROURS are thoſe whoſe Surface is concave. See CONCAVE.

Note, by *Concave*, Authors commonly mean *Spherically Concave*.

The Manner of preparing or making Concave MIRROURS.

Firſt, a Mould is to be provided for caſting them. In order to this, take Clay well dry'd, pulverize, and ſift it; mix it up with Water, and then ſtrain or filter it; with this, work up Horſe-Dung and Hair ſhred ſmall, till the Maſs be ſufficiently tough; to which, on occaſion, may be added Charcoal-Duſt, or Brick-Duſt, well ſifted.

Two coarſe Molds are then prepared of a gritty Stone, the one concave, the other convex, which are to be ground on one another with wet Sand between, till ſuch time as the one perfectly fits the other. By this means a perfect ſpherical Figure is acquir'd.

The Maſs prepared before, is now to be extended on the Table by means of a wooden Roller, till it be of Thickneſs proper for the *Mirrour*; and then being ſtrew'd with Brick-Duſt to prevent its ſticking, it is laid over the convex Mould, and ſo gets the figure of the *Mirrour*. When this is dry, it is cover'd with another Lay of the ſame Maſs; which once dry'd, each Cover, or Segment of the hollow Sphere made of Clay, is taken off. The innermoſt of the two being laid aſide, the ſtone Mould is anointed with greaſe prepared from Chalk and Milk, and the outer Cover again put over it.

Laſtly, the Joining being cover'd over with the ſame Clay whereof the Cover is form'd; the whole Mould is bound together with Iron-Wire; and two Holes cut through the Cover, the one for the melted Matter of the *Mirrour* to be poured thro', the other for the Air to eſcape at, to prevent the *Mirrour*'s being ſpoil'd with Bubbles.

The Mould thus prepared; eight parts of Copper, one of *Engliſh* Tin, and five of Marchaſite, are melted together; a little of the mixture is taken out with a Ladle, and if it be too red, when cold, more Tin is put in; if too white, more Copper: The Maſs is then poured into the Mould before prepared; and ſo aſſumes the figure of a *Mirrour*.

Some with ten parts of Copper mix four of *Engliſh* Tin, a little Antimony and Sal Armoniac, ſtirring the Maſs about as long as any Fumes ariſe from it. Others have other Compoſitions; many of which are deſcribed by *Schottus* and *Zahnius*.

The *Mirrour* being thus caſt, is cemented to a Wooden Frame, and thus work'd to and fro over the convex Stone-Mould, firſt with Water and Sand; and, laſtly, without Sand, till it be fit for poliſhing. The Stone-Mould is then cover'd with Paper, and that ſmear'd over with Tripoly Duſt and Calx of Tin: over which the *Mirrour* is work'd to and fro till it have got a perfect Poliſh. And in the ſame manner are Glaſs *Mirrours* poliſh'd, excepting that the convex Surface is there work'd in the concave Mould.

When the *Mirrours* are very large, they are fix'd on a Table, and firſt ground with a gritty Stone, then with Pumice, then with fine Sand, by means of a Glaſs cemented to a wooden Frame; and laſtly rubb'd with Calx of Tin and Tripoly-Duſt by a wet Leather.

For concave *Mirrours* of Glaſs; the Mould is made of Alabaſter: The reſt, as in Metal *Mirrours*.

Laws and Phænomena of Concave MIRROURS.

I. If a Ray, as K I, (*Fig.* 34.) fall on a concave *Mirrour* L I, under an Inclination of 60 Degrees, and parallel to the Axis A B; the reflected Ray I B will concur with the Axis A B in the Pole of the Glaſs B. If the Inclination of the incident Ray be leſs than 60 Degrees, as that of E, the reflected Ray E F will concur with the Axis at the diſtance B F, which is leſs than a fourth part of the Diameter. And univerſally, the diſtance of the Point F, wherein the Ray H E concurs with the Axis, from the Centre C, is to half the Radius C D in the Ratio of the whole Sine, to the Coſine of Inclination.

Hence it is gathered by Calculation, that in a concave ſpherical *Mirrour*, whoſe breadth ſubtends an Angle of 6 Degrees, parallel Rays meet after Reflection in a part of the Axis leſs than the one thouſand four hundred fifty ſeventh part of the Radius: if the breadth of the concave *Mirrour* be 12, 18, 24, 30, or 36 Degrees; the part of the Axis wherein the parallel Rays meet after Reflexion is leſs than $\frac{1}{3683}$, $\frac{1}{1830}$, $\frac{1}{914}$, $\frac{1}{550}$, $\frac{1}{366}$ of the Radius.

And on this Principle it is, that *Burning-Glaſſes* are built.

For ſince the Rays diffuſed thro' the whole Surface of the concave *Mirrour*, after reflection are contracted into a very ſmall compaſs; the Light and Heat of the parallel Rays muſt be prodigiouſly increaſed thereby, *viz.* in a duplicate Ratio of the breadth of the *Mirrour*, and the Diameter of the Circle wherein all the Rays are collected: And ſince the Sun's Rays are, as to any purpoſes on Earth, parallel, (ſee LIGHT) no wonder concave *Mirrours* ſhould burn with ſo much violence. See BURNING-*Glaſs*.

From this ſame Principle is likewiſe deduced a Method of repreſenting the Images of Objects in a dark Room; which ſee under CAMERA *Obſcura*.

II. A lucid Body being placed in the Focus F, of a concave *Mirrour*, H B C; the Rays after reflexion become parallel.

Hence an intenſe Light may be projected to a vaſt diſtance, by a lighted Candle, *&c.* placed in the Focus of a concave *Mirrour*. Hence alſo, if the parallel Rays be received by another concave *Mirrour*, they will again concur in its Focus, and burn.

Zahnius mentions an Experiment of this kind made at *Vienna*, where two concave *Mirrours*, the one ſix, the other three Foot diameter, being placed about 24 Feet apart, with a Live-Coal in the Focus of the one, and a Match and Tinder in the other, the Rays of the Coal lighted the Candle.

III. If a lucid Body be placed between the Focus F, and the *Mirrour* H C B, the Rays after reflexion will diverge from the Axis B G. Whence it follows that Light is weakned by reflexion.

IV. If a lucid Body be placed between the Focus F, and the Centre I, the Rays after reflexion will meet in the Axis beyond the Centre.

Hence if a Candle be placed in G, its Image will be in K; if it be placed in K, its Image will be in G; in the intermediate Points between G and K the Section of Light will be a Circle, and that ſo much the greater, as it is nearer the Point of Concourſe.

V. If a luminous Body be placed in the Centre of the *Mirrour*, all the Rays will be reflected back upon themſelves.

Hence if the Eye be placed in the Centre of a concave *Mirrour*, it will ſee nothing but itſelf, and that confuſedly through the whole *Mirrour*.

VI. If a Ray falling from the Point of the Cathetus *h*, (*Fig.* 35.) on the convex *Mirrour h* F, be together with its reflex I F, continued within the Concavity of the *Mirrour*; F H will be the Incident Ray from the Point of the Cathetus H and F O its reflex.

Hence, 1. Since the Point of the Cathetus H is the Image of the Point *h* in the convex *Mirrour*; but the Point *h* the Image of H in the concave: if the Image of an Object reflected by a convex Speculum, be ſeen by a Reflection made in its Concavity, it will appear like the Object itſelf.

2. Since the Image of an infinite Cathetus is leſs in a convex Glaſs by one fourth of its Diameter; a Portion of the Cathetus leſs than a fourth part of the Diameter, may appear of any magnitude required in a concave one.

3. A Point therefore diſtant from a concave Speculum, leſs than $\frac{1}{4}$ of the Diameter muſt appear behind the *Mirrour* at any diſtance, how great ſoever.

4. Since the Image of any Object how broad ſoever, is contain'd, in a convex Speculum, between the two Lines of Incidence of its extreme Points; if an Object be placed between the two Lines at a diſtance leſs than $\frac{1}{4}$ of its Diameter, the breadth of the Image, how great ſoever, may all appear.

4. Since then the Image of an Object included between two Lines, at a diſtance leſs than one fourth of the Diameter, may exceed the juſt height and breadth of the Object; nay, may be made of any magnitude, how big ſoever: Objects placed between the Focus and *Mirrour*, muſt appear of enormous magnitudes in concave *Mirrours*; the Image being ſo much the greater in the concave *Mirrour*, as it is leſs in the convex.

5. In a convex *Mirrour*, the Image of a remote Object appears nearer the Centre than that of a nearer Object: therefore in a concave *Mirrour*, the Image of an Object remote from the *Mirrour*, appears at a greater diſtance than that of a nearer Object, provided the diſtance of the Object from the Centre be leſs than a fourth part of the Diameter.

6. In a convex Speculum, the Image of a remote Object is leſs than that of a near one; therefore in a concave one, the Image of an Object placed between the Focus and the *Mirrour*, is nearer the Focus than the Speculum.

7. The Image therefore of an Object receding continually from a concave Speculum, becomes continually greater, provided it don't recede beyond the Focus, where it becomes confuſed; and as it approaches, it grows continually leſs.

8. In a convex Speculum, if the Sphere, whereof it is a Segment, be ſmaller, the Image is ſmaller than in another of a larger Sphere; therefore in a concave, if the Sphere whereof it is a Segment, be ſmaller, the Image will be larger than in another, whoſe Sphere is larger; whence concave *Mirrours*, if they be Segments of very ſmall Spheres, will do the Office of Microſcopes.

VII. If an Object be placed between a concave *Mirrour* and its Focus, its Image will appear behind the *Mirrour*, in an erect but inverted Situation.

VIII. If an Object A B, (*Fig.* 36.) be placed between the Focus and the Centre, its Image E F will appear inverted, and in the open Air, beyond the Centre, the Eye being placed beyond the Centre.

IX. If an Object E F be placed beyond the Centre C, and the Eye likewiſe beyond the Centre, the Image will appear inverted in the open Air between the Centre and the Focus.

Hence, the inverted Images of Objects placed beyond the Centre, are reflected by a concave *Mirrour*, erect, and may be received on a Paper apply'd between the Centre and the Focus, eſpecially if the Room be dark: if the Object E F be further diſtant from the Centre than is the Focus, the Image will be leſs than the Object.

On this Principle, concave *Mirrours*, eſpecially thoſe which are Segments of large Spheres, and are capable of reflecting intire Objects, exhibit many pleaſing Phænomena. Thus, if a Man flouriſh a Sword againſt the *Mirrour*, another comes out thereof, and meets him with the ſame Motions; and the Image of his Head coming out of the *Mirrour*, if he ſtrike it with his real Sword, the imaginary Sword will ſtrike his real Head. If he ſtretch out his Hand, another Hand will be ſtretch'd out of the *Mirrour*, and meet it at a great diſtance in the open Air, *&c.*

And on the ſame Principle are built Catoptric Ciſtulæ, which when look'd into, exhibit Images vaſtly bigger than the Cheſt. See CATOPTRIC *Ciſtula*.

X. The Image of a right Line perpendicular to a concave *Mirrour*, is a right Line; but all oblique or parallel Lines are concave.

Cylindrical, *Conical*, *Parabolical*, and *Elliptical* MIRROURS, or *Specula*, are thoſe terminated by a Surface reſpectively Cylindrical, Conical, Parabolical, and Sphæroidical. See CYLINDER, CONE, PARABOLA, *&c.*

To prepare, or make Cylindrical, Conical, Parabolical, Elliptical, and Hyperbolical MIRROURS.

For *Cylindrical* and *Conical Mirrours*, if they are to be of Glaſs, the Method of preparing 'em is the ſame as that already laid down for convex *Mirrours*.

If of Metal, they are to be made after the manner of *Concave Mirrours*, only that the clay Moulds there deſcribed, require other Wooden ones of the Figure of the *Mirrour*.

For *Elliptical*, *Parabolical*, and *Hyperbolical Mirrours*, the Mould is to be thus prepared. On a Wooden or Brazen Plane or Table, deſcribe the Figure of an *Ellipſis*, A B, (*Fig.* 37.) a *Parabola*, or an *Hyperbola* C D, (*Fig.* 38.) after the manner taught under thoſe heads; which done, cut out the Figure from the Plane with all the Accuracy imaginable.

To the Elliptic Figure, fit an Axis, as E F, with two Fulcra to ſuſtain it, *&c.* and to move it. Lay a Quantity of the Lay above deſcribed under it; and turn about the Axis by the Handle, till the Plane A B have turn'd, or impreſs'd the Elliptical Figure exactly thereon.

The Axis of the Parabolical, or Hyperbolical Figure C D, is to be fix'd at the Vertex in ſuch manner as it may always remain Erect. This to be turn'd about as above, till it have given its own Figure to the Clay apply'd about it.

The part of the Mould thus form'd, is to be dry'd, and either ſmear'd over with Fat, or ſprinkled with Brick-Duſt. Then a convex Mould to be made, by putting a Quantity of the ſame Clay into the Cavity thus form'd. This latter is call'd the *Male*, as the former the *Female* Mould.

The Male Mould being well dried, is to be apply'd within the Female; in ſuch manner as only to leave the intended Thickneſs of the *Mirrour* between them. The reſt as for concave *Mirrours*.

Theſe *Mirrours* are not made without the utmoſt difficulty; by reaſon, be the Moulds ever ſo juſt, the Figure of the *Mirrour* is apt to be damaged in the Grinding.

Phænomena, or Properties of Cylindrical MIRROURS.

I. The Dimenſions of Objects correſponding length-wiſe to the *Mirrour*, are not much chang'd; but thoſe correſponding breadth-wiſe, have their Figures alter'd, and their Dimenſions leſſen'd ſo much the more, as they are further from the *Mirrour*: Whence ariſes a very great Diſtortion.

II. If the Plane of Reflexion cut the cylindric *Mirrour* thro' the Axis, the Reflexion is performed in the ſame manner, as in a plain *Mirrour*; if it cut it parallel to the Baſe, the Reflexion happens in the ſame manner as in a ſpherical *Mirrour*; if, laſtly, it cut it obliquely, or be oblique to its Baſe, the Reflexion is the ſame as in an Elliptic *Mirrour*.

Hence, as the Plane of Reflexion never paſſes through the Axis of the *Mirrour*, except when the Eye and Objective-Line are in the ſame plane; nor parallel to the Baſe, except when the radiant Point and the Eye are at the ſame height: The Reflexion in a Cylindrical *Mirrour* is uſually the ſame as in an Elliptic one.

III. If a hollow cylindric *Mirrour* be oppoſed directly to the Sun, inſtead of a Focus of a Point, the Rays will be reflected into a lucid Line parallel to its Axis, at a diſtance ſomewhat leſs than a fourth part of its Diameter.

Hence ariſes a Method of Drawing *Anamorphoſes*, *i. e.* wild deformed Figures on a Plane, which appear beautiful and well-proportion'd when view'd in a cylindrical *Mirrour*. See ANAMORPHOSIS.

For *Elliptic*, *Parabolic*, *Conic*, and *Pyramidal Mirrours*, we are not much acquainted with their Properties: Only that,

In the Firſt, if a Ray ſtrike on it from one of its Focus's, it is reflected into the other: So that a lighted Candle being placed in one, its Light will be collected in the other.

That the Second, inaſmuch as all the Rays they reflect meet in one Point, make the beſt Burning-Glaſſes of all others.

And, Laſtly, that wild irregular Figures may be ſo drawn on a Plane, as that the Eye being placed over the Axis of the two laſt, they ſhall appear beautiful and well-proportion'd. See ANAMORPHOSIS.

MIS, a Particle prefix'd to divers Terms, particularly Law-Terms; denoting ſome Fault, or Defect.

As in *Miſpriſion*; *Miſdicere*, to ſcandalize one; *Miſdocere*, to teach amiſs, *&c.* See MISPRISION, *&c.*

MISANTHROPY, a general Hatred to Man, and Mankind: In oppoſition to *Philanthropy*. See PHILANTHROPY.

The Word comes from the *Greek* μῖσος, *Odium*, Hatred; and ἄνθρωπος, *Homo*, Man.

MISAVENTURE, or MISADVENTURE, in Law, is uſed by *Britton*, *&c.* in an eſpecial Signification, for the killing a Man partly by Negligence, and partly by Chance: As if a Perſon, thinking no harm, careleſly throws a Stone, or ſhoots an Arrow, wherewith he kills another; in this caſe he commits no *Felony*, but only loſes his Goods, and has a Pardon of courſe for his Life. See HOMICIDE.

Staunford diſtinguiſhes between *Aventure* and *Miſaventure*. The firſt he makes to be meer Chance; as if a Man being upon, or near the Water, be taken with ſome ſudden Sickneſs, and ſo fall in, and be drown'd; or into the Fire, and be burnt.

Miſaventure, according to him, is when a Man comes to his Death by ſome outward Violence, as the Fall of a Tree; the Running of a Cart-Wheel; the Stroke of a Horſe, *&c.*

Weſt diſtinguiſhes Homicide into caſual and mix'd. The firſt, when a Man is ſlain by mere Accident, againſt the mind of the Killer; as if the Ax fly off the Helve, and kill a Man: Which is the ſame with *Britton*'s *Miſaventure*.

MISCONTINUANCE, in Law, the ſame with *Diſcontinuance*. See DISCONTINUANCE.

MISDEMEANOUR, an Offence, or Fault, particularly in the Execution of an Office.

High Crimes and MISDEMEANOURS, are Offences of a heinous nature, next to High Treaſon.

MISE, a *French* Term, literally denoting Expence, or Diſburſement, wrote in *Latin Miſum* or *Miſa*; and uſed in our Law-Books in divers Acceptations.

Firſt, as an honorary Gift, or cuſtomary Preſent, wherewith the People of *Wales* uſed to ſalute every new King and Prince of *Wales* at their Entrance upon the Principality. Antiently it was given in Cattle, Wine, Corn, *&c.* for the Support of the Prince's Family; but when that Dominion was annex'd to the *Engliſh* Crown, the Gift was chang'd into Money. The County of *Flint* pays 2000 Marks, *&c.* for their *Miſe*.

The County of *Cheſter* alſo pays a *Miſe* or Tribute of 5000 Marks at the Change of every Owner of the ſaid Earldom, for the enjoying of the Privileges of that Palatinate. At *Cheſter* they have a *Miſe*-Book, wherein every Town and Village in the County is rated what to pay toward the *Miſe*.

Miſes are alſo taken for the Profits of Lands; ſometimes for Taxes or Taillages; and ſometimes for Expences or Coſts: As *pro Miſis & Cuſtagiis*, for Coſts and Charges in the Entries of Judgments, *&c.*

Miſe is alſo a Term uſed in ſpeaking of a Writ of Right. What in other Actions is call'd an *Iſſue*, in a Writ of Right is call'd a *Miſe* or *Me*: ſo that *to join the Miſe upon the Meer*, is as much as to ſay, to *join Iſſue* on the meer Right, *i. e.* to join upon this Point, whether has the more Right, the Tenant or Demandant. See ISSUE, *&c.*

Yet

Yet even in a Writ of Right, if a Collateral Point be try'd, it is there call'd an *Iſſue*, not a *Miſe*. See RIGHT.

MISE is alſo uſed as a Participle, for *caſt* or *put upon*. Sometimes corruptly for *Meaſe*, a Meſſuage or Tenement. In ſome Manors, a *meaſe Place* is taken for ſuch a Meſſuage or Tenement, as yields the Lord a Herriot at the Death of the Tenant.

MISERERE, *have mercy*, the Name, and firſt Word of one of the Penitential Pſalms; being that commonly given by the Ordinary to ſuch condemn'd Malefactors, as are allow'd the Benefit of the Clergy. Whence it is alſo call'd the *Pſalm of Mercy*. See CLERGY.

MISERERE *mei*, is a kind of Colic, or Diſorder of the Inteſtines, wherein the Excrements, inſtead of paſſing off the common way, are thrown up by the Mouth. See COLIC.

The *Miſerere mei* is the ſame with what we otherwiſe call *Volvulus* and *Iliac Paſſion*. See ILIAC *Paſſion*.

It takes its Name from the intolerable Pain and Anguiſh it occaſions the Patient; which is ſuch, as claims Pity from the Beholders: *Miſerere mei* being a *Latin* Phraſe, which literally ſignifies, *Have pity on me*.

MISERICORDIA, *Mercy*, in Law, is an arbitrary Amerciament or Puniſhment impoſed on any Perſon for an Offence. See AMERCIAMENT.

Where the Plaintiff or Defendant in any Action is amerced, the Entry is always *Ideo in Miſericordia*. It is thus call'd, according to *Fitzherbert*, by reaſon it ought to be but ſmall; and leſs than the Offence, according to the Tenor of *Magna Charta*.

Hence, if a Man be unreaſonably amerced in a Court not of Record, as a Court-Baron, &c. there is a Writ call'd *Moderata Miſericordia*, directed to the Lord, or his Bailiff, commanding them to take moderate Amerciaments. See MODERATA, &c.

Multa lenior ſic dicta, quod leniſſima imponitur Miſericordia; *Graviores enim multas* Fines *vocant*; *Atrociſſimas*, Redemptiones. See FINE and REDEMPTION.

Miſericordia Communis, is when a Fine is ſet on the whole County or Hundred.

MISFEASANCE, in Law, Miſdoings or Treſpaſſes. Whence alſo *Miſfeaſor*, a Treſpaſſer. See TRESPASS.

MISNA, or MISCHNA, a part of the *Jewiſh* Talmud. See TALMUD.

The *Miſna* contains the Text; and the Gemara, which is the ſecond part of the Talmud, contains the Commentaries: ſo that the Gemara is, as it were, a Gloſſary on the *Miſna*.

The *Miſna* conſiſts of various Traditions of the *Jews*, and of Explanations of ſeveral Paſſages in Scripture. The *Jews* maintain, that it was compleated, and reduc'd into a Body, by Rabbi *Juda*, in the ſecond Century, to prevent the Memory of their Traditions from periſhing. But the Generality of the Learned ſcarce allow it of ſo much Antiquity, and bring it ſeveral Centuries lower.

It is written in a much purer Stile, and is not near ſo full of Dreams and Viſions as the Gemara. See GEMARA.

MISNOMER, a Term in Law, compounded of the *French Mes*, which in Compoſition ſignifies *amiſs*; and *nommer*, to name: It denotes the uſing of one Name for another; a miſterming or miſnaming. See NAME.

MISPRISION, a Term in Law, ſignifying *Neglect*, or *Overſight*.

MISPRISION *of Treaſon*, or *Felony*, is a Neglect or light Account ſhew'd of Treaſon or Felony by not revealing it, when we know it to be committed; or by letting any Perſon, &c. on Suſpicion of Treaſon, to go, before he is indicted. See TREASON.

It is the Concealment, or not diſcloſing of known Treaſon; for which the Offenders are to ſuffer Impriſonment during the King's Pleaſure, and to loſe their Goods, and Profit of their Lands, during their Lives.

Miſpriſion of Felony is only fineable by the Juſtices, before whom the Party is attainted; but Juſtices of the Common Pleas have a power to aſſeſs any Amerciaments upon Perſons offending by *Miſpriſions*, Contempts or Neglects, for not doing, or miſdoing any thing in or concerning Fines.

MISPRISION *of Clerks*, is a Neglect of Clerks in writing or keeping Records. By the *Miſpriſion* of Clerks, no Proceſs ſhall be annull'd or diſcontinu'd. And Juſtices of Aſſize ſhall amend the Defaults of Clerks miſ-ſpelling of a Syllable or Letter in Writing.

MISSAL, MISSALE, a Maſs-Book, containing the ſeveral Maſſes to be uſed for the ſeveral Days, Feaſts, &c. See MASS.

The *Miſſal* was firſt compil'd by Pope *Zachary*, and afterwards reduc'd into better Order by Pope *Gregory* the Great, who call'd it the Book of *Sacraments*.

Each Dioceſe, and each Order of Religious, have their particular *Miſſal*, accommodated to the Feaſt of the Province, or of the Order.

MISSELTOE, MISSLETOE, or MISLETOE, in Natural Hiſtory, a Plant of the Paraſite Kind; growing, not on the Ground, but on other Trees, as the Oak, Apple-Tree, Pear-Tree, Plumb-Tree, Acacia Americana, Beech, Cheſnut, &c. See PARASITE.

Miſſeltoe, by Phyſicians, &c. call'd *Viſcum*, grows to the height of about two Feet. It conſiſts of ſeveral Stems, which are uſually cover'd with a greeniſh, ſometimes a yellowiſh Bark, about the Thickneſs of the Finger, hard, woody, and divided by Knots; from which ſpring the Leaves, which grow by two and two oppoſite to each other, oblong, thick, of a greeniſh, or yellowiſh Colour, vein'd their whole Length, and rounded at the End. Its Flowers grow by three and three, Trefoil-wiſe, at the Extremes of the Branches: each Flower is a yellow Calyx, one third of an Inch in Diameter, divided into four Parts. The Fruit likewiſe grows by three and three, at the Extremes of the Branches. They are a kind of oval Berries, not unlike little Pearls, fill'd with a flattiſh Seed in form of a Heart; cover'd with a fine ſilver'd Membrane, and enclos'd with a viſcid, glutinous Humour, of a whitiſh Colour, wherein the Seed naturally buds or germinates, and puts forth two Eyes. From this Juice it is, that the *Latins* denominate the Plant *Viſcum*. The Fruit grows on different Branches from the Flowers.

That uncommon Soil, whereon the *Miſſeltoe* grows, has occaſion'd abundance of fabulous Notions both as to its Production and Virtues.

Pliny and moſt Naturaliſts relate, that Thruſhes being exceedingly fond of the Berries of the Miſſeltoe; they ſwallow 'em, and caſt 'em out again on the Branches of Trees where they uſe to perch; and by this means give Occaſion to a new Production of *Miſſeltoe*. By cracking the Berries with their Bills, or Claws, they are ſuppoſed to let out the Viſcous Juice, which facilitates their Sticking: And hence that Proverb, *Turdus ſibi cacat Malum*; the *Viſcum* being ſometimes uſed as Bird-Lime.

Mr. *Bradley* endeavours to refute the popular Opinion of the Antients, that the Seeds of the *Miſſeltoe* could not vegetate. Their endeavouring to propagate it in the Earth without ſucceſs, he takes to have led them into the Error: And aſſerts, that it may be propagated by Seed on any Tree whatever. The Method too is very eaſy. About *Chriſtmas*, when the Berries are full ripe, you need only apply them on the ſmooth Bark of any Tree; the viſcid Juices they are encompaſs'd withal, will make them ſtick; and, provided the Birds do not devour the Seed, you may, without any further Trouble, expect a young Plant the following Year.

Others rather chuſe to account for the Propagation of *Miſſeltoe* from the Syſtem hereafter advanced for that of *Muſhrooms*. See MUSHROOM.

For the Virtues of *Miſſeltoe*, it ſeems of the moſt Efficacy in the Epilepſy; againſt which ſome will have it a Specific. Dr. *Colbatch* has wrote expreſly to prove it ſuch. It is alſo preſcribed in Apoplexies, Lethargies, and Vertigos; and wore about the Necks of Children to prevent Convulſions, and eaſe the cutting of their Teeth.

The beſt is the *Miſſeltoe of the Oak*; tho' it is not this which is commonly uſed, but that of the Apple or Pear-Tree. Mr. *Bradley* obſerves, that there is no Variety in this Plant, but that the Leaves, Flowers, Fruit, &c. are all alike on whatever kind of Tree it grows: But others pretend to diſtinguiſh that of the Oak by ſeveral particulars.

The Virtues aſcribed to the *Miſſeltoe*, may perhaps be the Remains of the Religious Honours paid it by the antient *Gauls*; among whom the Druids, aſſembled conſtantly on the firſt Day of the Year, went in queſt thereof with Hymns, and other Ceremonies and Rejoycings, diſtributing it again among the People, as a Thing ſacred, after having firſt conſecrated it, crying *Au guy l'An neuf*, to proclaim the new Year. See DRUIDS.

The Cry is ſtill kept up at *Picardy*, where they add *Plantez*, to wiſh a plentiful new Year.

M. *Perrault* obſerves, that the *Miſſeltoe* is full of a poiſonous Juice, which weakens the Tree whereon it grows; and that the Fruit has always a diſagreeable Taſte while it ſticks on it.

MISSEN-*Maſt* of a Ship, is a *Maſt*, or round long piece of Timber, ſtanding in the ſternmoſt part. See MAST.

Some great Ships require two *Miſſens*.

Next the Main-Maſt, is the *Main-Miſſen*; and that next the Poop, is call'd the *Bonaventure-Miſſen*. When at Sea they uſe the Word *Miſſen* alone, they always mean the *Sail*, and not the *Maſt*.

To change the *Miſſen*, is to bring the *Miſſen-Yard* over to the other ſide the Maſt. To peck the *Miſſen*, is to put the *Miſſen* right up and down the Maſt. To ſpell the *Miſſen*, &c.

MISSION, a Term in Theology uſed to ſignify a Power or Commiſſion to preach the Goſpel. See GOSPEL.

Jeſus Chriſt gave his Diſciples their *Miſſion* in theſe Words, *Go, and teach all Nations*, &c.

The *Romaniſts* reproach the *Proteſtants*, that their Miniſters have no *Miſſion*; as not being authorized in the Exerciſe of their Miniſtry, either by an uninterrupted Succeſſion from the Apoſtles, or by Miracles; or by any extraordinary Proof of a Vocation.

The *Anabaptiſts* deny any other *Miſſion* neceſſary for the Miniſtry than the Talents neceſſary to diſcharge it.

MISSION is alſo uſed for divers Eſtabliſhments of People zealous for the Glory of God, and the Salvation of Souls, who go and preach the Goſpel in remote Countries, and among Infidels. See MISSIONARY.

There are *Miſſions* in the *Eaſt*, as well as the *Weſt-Indies*.

Among the *Romaniſts*, the Religious Orders of St. *Dominic*, St. *Francis*, St. *Auguſtin*, and the *Jeſuits*, have *Miſſions* in the *Levant*, *America*, &c.

The *Jeſuits* have *Miſſions* in *China*, and all other parts of the Globe, where they have been able to penetrate.

The Mendicants abound in *Miſſions*.

MISSION is alſo the Name of a Congregation of Prieſts, and Laymen, inſtituted by *Vincent de Paul*, and confirmed in 1626 by Pope *Urban* VIII. under the Title of *Prieſts of the Congregation of the* Miſſion.

Theſe profeſs to make it their whole Buſineſs to aſſiſt the poor People in the Country; and to this purpoſe oblige themſelves never to preach, or adminiſter any of the Sacraments in any Town where there is an Archbiſhop, Biſhop, or Provincial reſiding.

They are ſettled in moſt Provinces of *France*, *Italy*, *Germany*, and in *Poland*.

At *Paris* they have a Seminary which they call the *Foreign Miſſion*, where Youth are bred up and qualify'd for foreign *Miſſions*.

MISSIONARY, an Eccleſiaſtic who devotes himſelf and his Labours to ſome *Miſſion*, either for the Inſtruction of the Orthodox, the Conviction of Heretics, or the Converſion of Infidels.

MISSIVE, ſomething *ſent* to another. The Word is form'd from the *Latin Mitto*, I ſend.

In this ſenſe we ſay *Miſſive* Letters, or Letters *Miſſive*, *i. e.* Letters ſent from one to another. See LETTER.

In propriety, *Letters Miſſive* are Letters of Buſineſs; but not Buſineſs of great concern; in contradiſtinction from Letters of Gallantry, Letters on Points of Learning, Diſpatches, &c.

MIST, a Meteor, call'd alſo *Fog*. See FOG.

MISY, in Natural Hiſtory, ſee CHALCITIS.

MITE, a ſmall Coin, formerly current; equal to about one third part of a Farthing. See MONEY and COIN.

MITE is alſo a ſmall Weight uſed by the Moneyers. It is equal to the twentieth part of a Grain, and is divided into 24 *Doits*. See WEIGHT.

MITHRIDATE, in Pharmacy, an Antidote, or Compoſition ſerving either as a Remedy or a Preſervative againſt Poiſons.

Mithridate is one of the capital Medicines in the Apothecaries Shops; being compoſed of a vaſt Number of Drugs, as *Opium*, *Myrrh*, *Agaric*, *Saffron*, *Ginger*, *Cinnamon*, *Spikenard*, *Frankincenſe*, *Caſtor*, *Pepper*, *Gentian*, &c.

It is accounted a Cordial, Opiate, Sudorific and Alexipharmic.

Matthiolus ſays it is more effectual againſt Poiſons than *Venice-Treacle*; tho' eaſier to be made. See POISON.

It takes its Name from its Inventor, *Mithridates* King of *Pontus*, who is ſaid to have ſo fortify'd his Body againſt Poiſons with Antidotes and Preſervatives, that when he had a mind to diſpatch himſelf, he could not have any Poiſon that would have effect.

The Receipt of it was found in his Cabinet, written with his own Hand, and was carried to *Rome* by *Pompey*. It was tranſlated into Verſe by *Damocrates*, a famous Phyſician, and was afterwards tranſlated by *Galen*, from whom we have it: Tho there is room to imagine it has undergone conſiderable Alterations ſince the time of its Royal Preſcriber.

MITRALES *Valvulæ*, MITRAL *Valves*, in Anatomy, two Valves in the Heart; thus call'd from their reſembling a Mitre. See VALVE and Heart.

They are placed at the Orifice of the Pulmonary Vein, in the left Ventricle of the Heart. Their Office is to cloſe the Orifice thereof, and prevent the return of the Blood through the Pulmonary Vein into the Lungs again. See PULMONARY *Vein*, CIRCULATION, &c.

MITRE, a Pontifical Ornament, wore on the Head by Biſhops, and certain Abbots, on Solemn Occaſions. See BISHOP, ABBOT, &c.

The *Mitre* is a round Cap, pointed, and cleft a-top with two Fannels hanging down the Shoulders.

The Abbots wear the *Mitre* turned in Profile; and bear the Croſier inwards, to ſhew that they have no ſpiritual Juriſdiction without their own Cloiſters.

The Pope has granted to ſome Canons of Cathedrals the Privilege of wearing the *Mitre*. The Counts of *Lyons* are ſaid to have aſſiſted at Church in *Mitres*.

In *Germany*, ſeveral great Families bear the *Mitre* for their Creſt; to ſhew that they are Advocates, or Feudatories of antient Abbies, or Officers of Biſhops, &c.

The Pope has four *Mitres*, which are more or leſs rich according to the Solemnity of the Feaſt-Days they are to be worn on.

The *Mitre* was originally the Women's Head-Dreſs, as the Hat was that of the Men. This appears from *Servius*, who reproaches the *Trojans*, or *Phrygians*, that were dreſs'd like Women, and wore *Mitres*;

Et Tunicæ Manicas, & habent redimicula Mitræ.

The Cardinals antiently wore *Mitres*, before the Hat which was firſt granted them by the Council of *Lyons* in 1245.

Authors make no mention of the *Mitre* as an Epiſcopal Ornament before the Year 1000.

The Word comes from the *Latin Mitra*, of the *Greek* μίτρα.

MITRE, in Architecture, is the Work-men's Term for an Angle, that is juſt 45 Degrees; or half a right one.

If the Angle be a quarter of a right Angle, they call it a *Half Mitre*.

To deſcribe ſuch Angles, they have an Inſtrument call'd the *Mitre Square*; with this they ſtrike *Mitre-Lines* on their Quarters, or Battens: And for diſpatch, have a *Mitre-Box*, as they call it, which is made of two pieces of Wood, each about an Inch thick, one nailed upright on the Edge of the other; the upper piece hath the *Mitre-Lines* ſtruck upon it on both ſides, and a Kerf to direct the Saw in cutting the *Mitre* Joints readily, by only applying the Piece into this Box.

MITRED *Abbots*, ſee ABBOT.

MITTIMUS, in Law, a Writ, by which Records are tranſfer'd from one Court to another; ſometimes immediately, as out of the King's Bench into the Exchequer; and ſometimes by a *Certiorari* into the Chancery, and from thence by a *Mittimus* into another Court.

The Word is alſo uſed for a Precept directed by a Juſtice of Peace to a Goaler, for the receiving and ſafe keeping a Felon, or other Offender, by him committed to the Goal.

MIXT, or MIXT *Body*, in Philoſophy, is that which is compounded of divers Elements, or Principles; in contradiſtinction to thoſe which the Chymiſts ſuppoſe to be *Elementary*, or conſiſting of one Principle only; as they take Sulphur, Salt, &c. to be. See ELEMENT.

The Schoolmen define a *Mixt Body* to be a Whole, reſulting from ſeveral Ingredients, alter'd, or new modified by the Mixture. On which Principle, the ſeveral Ingredients don't actually exiſt in the *Mixt*, but are all changed, ſo as to conſpire to a new Body of a different Form, from the Forms of the Ingredients. But the modern Philoſophers rarely conceive the Term in ſo much ſtrictneſs.

The Buſineſs of Chymiſtry, we ſay, is to reſolve *Mixt Bodies* into their Principles, or component Parts. See PRINCIPLE, CHYMISTRY, &c.

The School-Philoſophers diſtinguiſh *Mixt Bodies* into *Perfect* and *Imperfect*. *Perfect Mixts* are the Claſs of Vital or Animated Bodies, where the Elements or Ingredients they are compoſed of, are changed or transformed by a perfect Mixture. Such are Plants, Beaſts, and Men.

Imperfect Mixts are inanimate Bodies, the Forms whereof remain ſtill the ſame as of the Ingredients that conſtitute them: Such are Meteors, Minerals, Metals, &c.

MIXT *Figure*, in Geometry, is that which conſiſts partly of right Lines, and partly of curve Lines. See FIGURE.

MIXT *Number*, in Arithmetic, that which is partly an Integer, and partly a Fraction; as $4\frac{1}{2}$ or $\frac{9}{2}$. See FRACTION.

MIXT *Action*, in Law, is an Action of two different Natures; being partly real, and partly perſonal. See ACTION, *real*, *perſonal*.

A *Mixt Action* is that which lies both for the *Thing* detained; and againſt the *Perſon* of the Detainer.

Or a *Mixt Action* is that which ſeeks both the Recovery of a thing we are unjuſtly deprived of; and Damages, or a Penalty for the unjuſt detainment thereof. Such are Actions of *Waſte*, and *Quare Impedit*; Actions for Tithes on the Statute 2 & 3 *Edw. 6.* &c.

MIXT *Tithes*, are thoſe of Cheeſe, Milk, &c. and of the Young of Beaſts. See TITHES.

MIXT *Mode*, according to Mr. *Lock*, is a Combination of ſeveral ſimple Ideas of different Kinds. See IDEA and MODE.

Thus, *Beauty*, as it conſiſts in a certain Compoſition of Colour, Figure, Proportion, &c. of different Parts, cauſing Delight to the Beholder, is a *Mixt Mode*. Such alſo is Theft, Murder, &c. See MODE.

The Mind, that Author obſerves, being once furniſhed with ſimple Ideas, can put them together in ſeveral Compoſitions, without examining whether they exiſt ſo in Na-

ture together. And hence it is that these Ideas are call'd Notions; as if they had their Original and constant Existence more in the Thoughts of Men, than in the Reality of Things; and that to form such Ideas, it sufficed that the Mind put the Parts of them together; and that they were consistent in the Understanding, without considering whether they had any real Being.

There are three ways whereby we get these complex Ideas of *Mixt Modes*. First, By Experience and Observation of Things themselves: Thus by seeing two Men wrestle, we get the Idea of Wrestling. Secondly, By Invention, or voluntary putting together of several simple Ideas in our own Mind: So he that first invented Printing, had an Idea of it first in his Mind before ever it existed. Thirdly, By explaining the Names of Actions we never saw, or Notions we cannot see; and by enumerating all those Ideas which go to the making them up.

Thus the mixt *Mode* which the Word *Lie* stands for, is made up of these simple Ideas; First, Articulate Sounds. Secondly, Certain Ideas in the Mind of the Speaker. Thirdly, Those Words, the Signs of these Ideas; Fourthly, Those Signs put together by Affirmation, or Negation, otherwise than the Ideas they stand for are in the Mind of the Speaker, since the Language was made.

Complex Ideas are usually got by the Explication of those Terms that stand for them. For since they consist of simple Ideas combined, they may by Words standing for those simple Ideas be represented to the Mind of one who understands those Words, tho' that Combination of simple Ideas was never offer'd to his Mind by the real Existence of Things.

MIXT *Ratio*, or *Proportion*, is when the Sum of the Antecedent and Consequent is compared with the difference between Antecedent and Consequent; as if $\overset{3}{a} : \overset{4}{b} :: \overset{12}{c} : \overset{16}{d}$ $a \times b \overset{7}{\circ\!\circ} b :: c \times d \overset{1}{\circ\!\circ} \overset{28}{c} \overset{4}{\circ\!\circ} d$. See RATIO.

MIXTION, the Act of *Mixing*; or the Union and Coalition of divers Corpuscles into one Body. See MIXT.

The *Peripatetics*, who hold an Alteration essential to *Mixtion*, define it the Union of several alter'd Ingredients, or Miscibles.

Mixtion makes a considerable Operation in the Chymical and *Galenical* Pharmacy.

MIXTURE, in a Philosophical sense, is an Assemblage, or Union of several Bodies of different Properties, in the same Mass.

To determine the Ratio of the Ingredients of a *Mixture*, is that celebrated Problem proposed by *Hiero* King of *Syracuse* to *Archimedes*, on occasion of a Crown of Gold wherein the Workman had fraudulently mix'd Silver; the Solution whereof was matter of so much Transport to that divine Mechanic.

It may be determined thus:

Weigh the *Mixture*, immerge it in some Fluid; and find the Weight it loses therein. (See SPECIFIC *Gravity*.) Then find what Weight any determinate Quantity of either Ingredient loses in the same Fluid: And by the Rule of Three find what Weight each ought to lose therein, were its Weight equal to that of the *Mixture*. Substract the less Loss from the greater, which will give the Excess wherewith the Loss of the lighter exceeds that of the heavier. Then substract the Weight lost by the heavier, from that lost by the whole *Mixture*, to find the Excess of the Weight lost by the *Mixture* beyond that lost by the heavier.

MIXTURE, in Matters of Drapery, the Union, or rather Confusion of several Wools of different Colours, not yet spun.

Hence a *Mixture*, or mix'd Stuff, is that whose Woof and Warp are of Wools of different Colours dy'd and mix'd before they were spun.

MOAT, in Fortification, call'd also *Foss* and *Ditch*, a hollow Space or Ditch dug round a Town, or Fortress to be defended, on the outside the Wall or Rampart. See RAMPART.

The Length and Breadth of the *Moat* often depends on the nature of the Soil; according as it is Marshy or Rocky.

A *Dry* MOAT is that which is destitute of Water, and ought to be deeper than one which is full of Water.

A *Lined* MOAT is that whose Scarp and Counterscarp are cased with a Wall of Mason's Work lying a-slope.

A *Flat-bottom'd* MOAT is that which hath no sloping, its Corners being somewhat rounded.

The Brink of the *Moat* next the Rampart in any Fortification is call'd the *Scarp*, and the opposite one the *Counterscarp*. See SCARP and COUNTERSCARP.

MOATAZALITES, a Religious Sect among the *Turks*.

There are two Opinions among the *Turkish* Divines concerning God. The first admit Metaphysical Forms, or Attributes; as that God has a Wisdom by which he is Wise; a Power by which he is Powerful; an Eternity by which he is Eternal, &c.

The Second allow God to be Wise, Powerful, Eternal; but will not allow any Form in God, for fear of admitting a multiplicity.

Those who follow this latter Opinion are call'd *Moatazilites*: They who follow the former, *Sephalites*.

MOBILE, Moveable; any thing susceptible of Motion, or that is disposed to be moved either by itself, or by some other prior *Mobile*, or Mover.

Primum MOBILE in the antient Astronomy, was a ninth Heaven, or Sphere, imagined above those of the Planets and fixed Stars. See SPHERE.

This was supposed to be the first Mover, and to carry all the lower Spheres round along with it; by its Rapidity communicating to 'em a Motion whereby they revolved in twenty-four Hours. But the diurnal Revolution of the Planets is now accounted for without the Assistance of any such *Primum Mobile*.

Perpetuum MOBILE, see PERPETUAL *Motion*.

MOBILIA *Bona*, in the Civil Law, are what in Common Law, &c. we call *Moveables*, or *Moveable Goods*. See MOVEABLES.

MOBILITY, in the Schools, &c. an Aptitude, or Facility to be moved.

The *Mobility* of Mercury is owing to the smallness and sphericity of its Particles; and is that which renders its Fixation so difficult. See MERCURY and FIXATION.

The Hypothesis of the *Mobility* of the Earth is the most plausible; and is that commonly admitted, by the latter Astronomers. See EARTH.

Pope *Paul* V. appointed Commissioners to examine the Opinion of *Copernicus* touching the *Mobility* of the Earth. The Result of their Enquiry, was, a Prohibition to assert, not that the *Mobility* was possible, but that it was actually true. That is, they allow'd the *Mobility* of the Earth to be held as an Hypothesis which gives an easy and sensible Solution of the Phænomena of the heavenly Motions; but forbad the *Mobility* of the Earth to be maintain'd as a Thesis, or a real effective thing; by reason they conceiv'd it contrary to Scripture.

MODAL, in Logic, &c. a Term apply'd to Propositions containing certain Conditions, or Restrictions. See CONDITIONAL.

MODE, or MOOD, in Philosophy, a *Manner* of Being; or a Quality, or Attribute of a Substance, or Subject, which we conceive as necessarily depending on the Subject, and incapable of subsisting without it. See SUBSTANCE.

Mr. *Lock* defines *Modes* to be those Ideas (he should have said *Things*) which don't imply any supposition of subsisting by themselves, but are consider'd as mere dependences and affections of Substances.

Our Ideas of things may be reduced to two Kinds: The one of Things which we conceive separately, and by themselves, call'd *Substances*; and the other of Things which we conceive as existing in others, in such manner as that we cannot allow them existence without 'em; and these we call *Modes*, or Accidents. See ACCIDENT.

Thus, when we reflect on Wax, and Roundness; we consider the Wax as a thing which may subsist without the Roundness; *Wax* therefore we denominate a *Substance*: on the contrary, we consider *Roundness* so dependant on the Wax, that it can't subsist without it, there being no conceiving of Roundness distinct and separate from a round Body: This therefore we call a *Mode*, or Accident. See IDEA.

It is the Characteristic, then, of a true *Mode*, to have such a relation to some Subject, as not to be clearly and distinctly conceivable without conceiving the Subject, whereof it is a *Mode*, at the same time: When, on the other hand, the conception of the Subject does not at all infer or require that of the *Mode*. See SUBSTANCE.

Thus, what gives us to know that Thought is not a *Mode* of extended Substance, or Matter, is, that Extension, and the other Properties of Matter may be divided from Thought, without ceasing to conceive Thought all the while. See THINKING, EXTENSION, &c.

We always consider Things as clothed with certain *Modes*; except when we reflect on the Abstract, or General: And it is the Variety of *Modes*, and Relations, that occasions the great Variety of Denominations of the same thing. It is the various *Modes* of Matter, *e. gr.* that make all the Diversity of Bodies, or corporeal Beings in Nature. See RELATION, MATTER, &c.

There are various Divisions and Kinds of *Modes*: One of the most common, is into *Internal* and *External*.

Internal MODES are those inherent in the Substance, as Roundness in the Bowl; Flatness in the Nose; Crookedness in the Finger, &c.

These, we have observ'd, cannot exist, nor even be conceiv'd without the Subject, as being only Circumstances thereof, or even, according to some, only the Subject itself consider'd, not simply, but as such. Thus the Roundness of the Bowl, is only the Bowl itself consider'd as round, &c.

Ex-

External MODES are thoſe extraneous to the Subject; as when we ſay a thing is deſir'd, lov'd, beheld, &c. Theſe coincide with what we call *Relations*.

Add, that there are *Modes* which are likewiſe Subſtances, as Apparel, Hair, &c. which may ſubſiſt without the Subject.

Mr. *Lock* divides *Modes* into *Simple* and *Compound*.

Simple MODES are Combinations of ſimple Ideas of the ſame Kind, or even of the ſame ſimple Ideas divers times repeated; as a Dozen, a Score, &c. which are only the Ideas of ſo many diſtinct Units put together.

Mixed MODES are Combinations of ſimple Ideas of ſeveral Kinds; as in *Beauty*, which conſiſts in a certain Compoſition of Colour, Figure, &c. *Theft*, which is the conceal'd Change of the Poſſeſſion of any thing without conſent of the Proprietor, &c.

With regard to *Simple Modes*; that Author obſerves, that the Modifications of any ſimple Idea are as perfectly different and diſtinct Ideas in the Mind as thoſe the moſt remote and inconſiſtent. Thus *two* is as diſtinct from *three*, as Blindneſs from *Heat*. With this View he examines the *Simple Modes* of Space.

Space is a ſimple Idea, which we get both by Sight and Touch: When we conſider it barely in Length between two Bodies, it is call'd *Diſtance*: When in Length, Breadth, and Thickneſs, it may be call'd *Capacity*: When conſider'd between the Extremities of Matter, which fills the Capacity of Space with ſomething ſolid, tangible, and moveable, it is call'd *Extenſion*; and thus Extenſion will be an Idea belonging to Body: But Space may be conceived without it. Each different Diſtance is a different Modification of Space; and each Idea of any different Space, is a ſimple *Mode* of this Idea. Such are an Inch, Foot, Yard, &c. which are the Ideas of certain ſtated Lengths, which Men ſettle in their Minds for the Uſe, and by the Cuſtom of Meaſuring. When theſe Ideas are made familiar to Men's Thoughts, they can in their Minds repeat them as often as they will, without joining to them the Idea of Body, and frame to themſelves the Ideas of Feet, Yards, and Fathoms, beyond the utmoſt Bounds of all Bodies, and by adding theſe ſtill to one another, inlarge their Idea of Space, as much as they pleaſe.

From this Power of repeating any Idea of Diſtance, without being ever able to come to an end, we come by the Idea of Immenſity. See EXTENSION, DISTANCE, MEASURE, &c.

Another *Mode*, or Modification of Space, is taken from the relation of the Parts of the Termination of Extenſion, or circumſcrib'd Space amongſt themſelves; and this is what we call *Figure*. This, the Touch diſcovers in ſenſible Bodies, whoſe Extremities come within our reach; and the Eye takes, both from Bodies and Colours whoſe Boundaries are within its view; where, obſerving how the Extremities terminate, either in ſtreight Lines, which meet at diſcernible Angles; or in crooked Lines, wherein no Angles can be perceived; by conſidering theſe as they relate to one another in all parts of the Extremities of any Body or Space, it has the Idea we call Figure: Which affords to the Mind infinite Variety. See FIGURE.

Another *Mode* belonging to this Head, is that of *Place*. Our Idea of Place is nothing but the relative Poſition of any thing, with reference to its diſtance from ſome fixed and certain Points: Whence we ſay, that a thing has, or has not changed Place, when its diſtance either is, or is not alter'd with reſpect to thoſe Bodies, with which we have occaſion to compare it. That this is ſo, we may eaſily gather from hence; that we can have no Idea of the Place of the Univerſe: tho we can of all its Parts. See PLACE.

Another *Mode* of Space, is the Idea which we get from the fleeting, and perpetually periſhing Parts of Succeſſion, which we call *Duration*. The *Simple Modes* of it are any different Lengths of it, whereof we have diſtinct Ideas, as Hours, Days, Years, &c. Time, and Eternity. The Idea of *Succeſſion* is got by reflecting on that train of Ideas, which conſtantly follow one another in our Minds, as long as we are awake. See SUCCESSION.

The diſtance between any Parts of this Succeſſion is what we call *Duration*: And the Continuation of the Exiſtence of ourſelves, or any thing elſe commenſurate to the Succeſſion of any Ideas in our Minds, is what we call our own Duration, or that of another thing co-exiſting with our thinking.

A Man having once got this Idea of Duration, can apply it to things which exiſt, while he doth not think: And thus we meaſure the time of our Sleep, as well as that wherein we are awake. See DURATION.

In regard to ſome other *Simple Modes*, Mr. *Lock* obſerves, That the Mind has ſeveral diſtinct Ideas of Sliding, Rolling, Walking, Creeping, &c. which are all but the different Modifications of Motion. Swift and Slow are two different Ideas of Motion, the Meaſures whereof are made out of the Diſtances of Time and Space put together. The like Variety we have in Sounds; every articulate Word is a different Modification of Sound, as are all Notes of different length put together, which make that complex Idea call'd Time. See TIME.

The *Modes* of Colours might be alſo very various; ſome of which we take notice of as the different Degrees, or as they are termed, Shades of the ſame Colour. But ſince we ſeldom make Aſſemblages of Colours without taking in Figure alſo, as in Painting, &c. thoſe which are taken notice of, do moſt commonly belong to mix'd *Modes*, as Beauty, Rainbow, &c. All compounded Taſtes and Smells are alſo *Modes* made up of the ſimple Ideas of thoſe Senſes.

As to the *Modes of Thinking*; when the Mind turns its view inward upon itſelf, Thinking is the firſt Idea that occurs, wherein it obſerves a great Variety of Modifications; and therefore frames to itſelf diſtinct Ideas.

Thus the Perception annex'd to any Impreſſion on the Body made by an external Object, is call'd *Senſation*. Where an Idea recurs without the preſence of the Object, it is call'd *Remembrance*. When ſought after by the Mind, and brought again in view, it is call'd *Recollection*. When held there long under attentive Conſiderations, it is call'd *Contemplation*. When Ideas float in the Mind without regard or reflection, it is call'd in *French*, *Reſvery*. When the Ideas are taken notice of, and, as it were, regiſter'd in the Memory, it is *Attention*. When the Mind fixes its view on any one Idea, and conſiders it on all ſides, it is *Intention* and *Study*.

Of theſe various *Modes* of Thinking, the Mind forms as diſtinct Ideas, as it does of White and Red, a Square, or a Circle.

For *Mix'd* MODES, there are three ways whereby we get the complex Ideas thereof. 1. By Experience and Obſervation of things themſelves; thus by ſeeing two Men wreſtle, we get the Idea of Wreſtling. 2. By Invention, or voluntary putting together of ſeveral ſimple Ideas in our own Minds; ſo he that firſt invented Printing, had an Idea of it firſt in his Mind, before ever it exiſted. 3. By explaining the Names of Actions we never ſaw, or Notions we cannot ſee; and by enumerating all thoſe Ideas, which go to the making them up: Thus the mix'd *Mode* which the Word *Lie* ſtands for, is made up of theſe ſimple Ideas: (1.) Articulate Sounds. (2.) Certain Ideas in the Mind of the Speaker. (3.) Thoſe Words, the Signs of theſe Ideas. (4.) Thoſe Signs put together by Affirmation, or Negation, otherwiſe than the Ideas they ſtand for are in the Mind of the Speaker.

Mixt Modes have their Unity from an Act of the Mind, combining thoſe ſeveral ſimple Ideas together, and conſidering them as one complex one: The Mark of this Union is one Name given to that Combination. Men ſeldom reckon any number of Ideas to make one complex one, but ſuch Collections, as there be names for. Thus, the Killing of an old Man is as fit to be united in one complex Idea, as that of a Father; yet there being no Name for it, it is not taken for a particular complex Idea; nor a diſtinct Species of Action from that of Killing any other Man: Thoſe Collections of Ideas have Names generally affixed, which are of frequent uſe in Converſation; in which Caſes Men endeavour to communicate their Thoughts to one another, with all poſſible diſpatch. Thoſe others, which they have ſeldom occaſion to mention, they lay not together, nor give them Names.

This gives the Reaſon, why there are Words in every Language, which cannot be rendred by any one ſingle Word of another. For the Faſhions and Cuſtoms of one Nation make ſeveral Combinations of Ideas familiar in one, which another had never any occaſion to make. Such were, Ὀστρακισμὸς, among the *Greeks*; and *Proſcriptio* among the *Romans*. This alſo occaſions the conſtant Change of Languages; becauſe the Change of Cuſtom and Opinion brings with it new Combinations of Ideas, which, to avoid long Deſcriptions, have new Names annexed to them, and ſo they become new Species of *Mixed Modes*.

Of all our ſimple Ideas, thoſe which have had moſt mixed *Modes* made out of them, are Thinking, and Motion, (which comprehend in them all Action) and Power, from whence theſe Actions are conceived to flow. For Actions being the great Buſineſs of Mankind, it is no wonder that the ſeveral *Modes* of Thinking and Motion, ſhould be taken notice of; and the Ideas of them obſerved, and laid up in Memory, and have Names aſſigned them. For without ſuch complex Ideas with Names to them, Men could not eaſily hold any Communication about them.

Of this kind are the *Modes* of Actions diſtinguiſh'd by their Cauſes, Means, Objects, Ends, Inſtruments, Time, Place, and other Circumſtances; as alſo of the Powers fitted for thoſe Actions. Thus Boldneſs is the Power to do or ſpeak what we intend, without Fear or Diſorder; which Power of doing any thing, when it hath been acquir'd by frequent doing the ſame thing, is that Idea we call *Habit*;

bit; and when forward and ready upon every Occaſion, to break into Action, we call it *Diſpoſition*: Thus Teſtineſs is a Diſpoſition or Aptneſs to be angry. Power being the Source of all Action, the Subſtances, wherein thoſe Powers are, when they exert this Power, are call'd *Cauſes*: And the Subſtances thereupon produced, or the ſimple Ideas introduced into any Subject, *Effects*. The Efficacy whereby the new Subſtance or Idea is produced, is call'd in the Subject exerting that Power, *Action*; in the Subject wherein any ſimple Idea is changed, or produced, *Paſſion*. Which Efficacy in intellectual Agents, we can conceive to be nothing elſe, but *Modes* of Thinking and Willing: In corporeal Agents, nothing elſe but Modifications or Motions.

Whatever ſort of Action, beſides theſe, produces any Effect, we have no Notion or Idea of. And, therefore, many Words which ſeem to expreſs ſome Action, ſignify nothing of the Action, but barely the Effect, with ſome Circumſtances of the Subject wrought on, or Cauſe operating: Thus Creation, and Annihilation, contain in them no Idea of the Action, or Manner whereby they are produced, but barely of the Cauſe, and the Thing done. And when a Country-man ſays, the Cold freezes Water, though the word, Freezing, ſeem to import ſome Action, yet it truly ſignifies nothing but the Effect, *viz.* that the Water that was before fluid, is become hard and conſiſtent; without intimating any Idea of the Action whereby it is done.

In *Mixed Modes*, it is the Name that ſeems to preſerve their Eſſences, and to give them their laſting Duration. The Collection of Ideas is made by the Mind; but the Name is, as it were, the Knot which ties them faſt together: Hence we ſeldom take any other for diſtinct Species of *mixed Modes*, but ſuch as are ſet out by Names. We muſt obſerve, that the Names of *mixed Modes* always ſignify the real Eſſences of their Species; which being nothing but the abſtract complex Ideas, and not refer'd to the real Exiſtence of Things, there is no ſuppoſition of any thing more ſignified by any Name of a *mixed Mode*, but barely that complex Idea, the Mind itſelf has form'd; which when the Mind has form'd, is all it would expreſs by it, and is that on which all the Properties of the Species depend, and from which alone they flow; and ſo, in theſe, the real and nominal Eſſence is the ſame.

This alſo ſhews the Reaſon, why the Names of *mixed Modes* are commonly got, before the Ideas they ſtand for are perfectly known; becauſe there being no Species of theſe ordinarily taken notice of, but ſuch as have Names, and thoſe Species being complex Ideas made arbitrarily by the Mind, it is convenient, if not neceſſary, to know the Names, before we learn the complex Ideas; unleſs a Man will fill his Head with a company of abſtract complex Ideas, which others having no Names for, he has nothing to do with, but to lay by, and forget again. In the beginning of Languages, it was neceſſary to have the Idea, before one gave it the Name; and ſo it is ſtill, where a new complex Idea is to be made, and a Name given it. In ſimple Ideas, and Subſtances, it is otherwiſe; which being ſuch Ideas, as have real Exiſtence and Union in Nature, the Ideas or Names are got, one before the other, as it happens.

The Schoolmen make numerous other Diviſions of *Modes*; as into *Immediate* and *Mediate*: *Eſſential* and *Non-Eſſential*: *Poſitive* and *Privative*: Of *Spirit* and of *Body*: Of *Thinking*, and of *Having*.

Immediate MODES are thoſe immediately attributed to their Subjects or Subſtances.

Mediate MODES are thoſe attributed to Subjects by the intervention of ſome other *Mode*.

Thus, *e. gr.* Motion is an immediate *Mode* of the Body; Knowledge of the Mind, *&c.*

But Swiftneſs and Slowneſs are not immediately attributable to the Body; but only to the Body inreſpect of the Motion.

Eſſential, or *Inſeparable* MODES, are Attributes without which the Subſtance cannot exiſt; as Wiſdom, Goodneſs, Power, *&c.* in God: Figure, Place, Quantity, Extenſion, *&c.* of Body. See ATTRIBUTE.

Non-Eſſential, or *Separable* MODES, are Attributes affecting created Subſtances, and remaining affix'd thereto ſo long as it is neceſſary; ſuch are Coldneſs, of Water: Hardneſs, of Stone: Whiteneſs, of Milk, *&c.*

Poſitive MODES, are thoſe which give ſomething real, poſitive, and abſolute to their Subſtances. Thus Roundneſs is a poſitive *Mode* of a Globe, *&c.*

Privative MODES are attributed to Subjects, when the Mind perceiving ſome Attributes wanting therein, frames a Word, which at firſt ſight ſeems to note ſomething poſitive, but which in reality only notes the want of ſome Property, or *Mode*. Thus a Privation of Light is attributed to a blind Man, *&c.*

MODES *of Spirit* are two, *viz.* Cognition, or *Knowledge*; and *Willing*. See KNOWLEDGE and WILLING.

MODES *of Body* are three, *viz. Figure*, *Reſt*, and *Motion*. See FIGURE, REST, and MOTION.

MODES *of Thinking* are the ſame with Eſſential Attributes or *Modes*. See *Eſſential* MODE.

MODES *of Having*, are thoſe whereby any thing may be had by another.

Ariſtotle enumerates ſeven of theſe: A thing, for inſtance, may be had either by the *Mode* of Quality, as Knowledge; by that of Magnitude, as Circumference; by the *Mode* of Part, as the Hand, *&c.*

MODE is alſo uſed in Logic, for the Modification of a Propoſition; or that which renders it *Modal* and *Conditional*. See CONDITIONAL.

MODE in Grammar, } See MOOD.
MODE in Logic, }

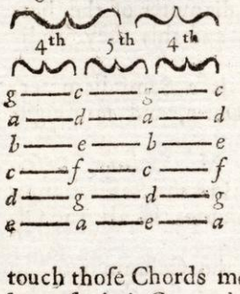
MODE in Muſic, is defined by ſome Authors, the particular Manner of conſtituting the Octave; or the melodious Conſtitution of the Octave, as it conſiſts of ſeven Eſſential, or Natural Notes beſides the Key, or Fundamental. See OCTAVE.

A *Mode*, then, is not any ſingle Note, or Sound; but the particular Order of the concinnous Degrees of an Octave: The fundamental Note whereof may, in another ſenſe, be call'd the *Key*, as it ſignifies that principal Note which regulates the reſt.

The proper difference between a *Mode* and a Key, conſiſts in this, that an Octave with all its natural and concinnous Degrees, is call'd a *Mode*, with reſpect to the Conſtitution, or the manner and way of dividing it; and with reſpect to the place of it in the Scale of Muſic, that is, the Degree or Pitch of Tune, it is call'd a *Key*: that is, an Octave of Sounds may be rais'd in the ſame Order, and Kind of Degrees which makes the ſame *Mode*, and yet be begun higher or lower; that is, be taken at different Degrees with reſpect to the whole, which makes different Keys: and from the ſame Definition it follows, that the ſame Key may be found with different *Modes*; that is, the Extremes of two Octaves may be in the ſame Degree of Tune, and the Diviſion of 'em different. See KEY.

Now it may be further obſerved, that of the natural Notes of every *Mode*, or Octave, three go under the Name of the eſſential Notes in a peculiar manner, *viz.* the Fundamental, the Third, and Fifth; their Octaves being reckon'd the ſame, and mark'd with the ſame Letters in the Scale: the reſt are particularly call'd Dependents. Again, the Fundamental is alſo call'd the final; the Fifth the Dominante; and the Third, as being between the other two, the Mediante. See KEY.

The Doctrine of the Antients with regard to *Modes*, which they ſometimes alſo call Tones, is ſomewhat obſcure; there being an unaccountable Difference among their Authors as to the Definitions, Diviſions, and Names of their *Modes*. They agree indeed, that a *Mode* is a certain Syſtem or Conſtitution of Sounds; and that an Octave, with all its intermediate Sounds, is ſuch a Conſtitution: but the ſpecific differences of Tones, ſome place in the manner of Diviſion, or Order of its concinnous parts; and others merely in the different Tenſion of the Whole, *i. e.* as the whole Notes are acuter or graver, or ſtand higher or lower in the Scale of Muſic.



Boethius is very dark on this head; and defines a *Mode* to be, as it were, an intire Body of Modulation, conſiſting of a Conjunction of Conſonances, as the Diapaſon.

Ptolemy makes the *Modes* the ſame with the Species of the Diapaſon; but at the ſame time ſpeaks of their being at ſome diſtance from each other. Some contended for thirteen, ſome for fifteen *Modes*, which they placed at a Semitone's diſtance from each other; but it is plain, thoſe underſtood the differences to be only in their place or diſtances from each other; and that there is one certain harmonious Species of Octave apply'd to all, *viz.* that Order which proceeds from the *Proſlambanomenos* of the *Syſtema Immutatum*, or the A of the modern Syſtem. *Ptolemy* argues, that if this be all, they may be infinite, tho' they muſt be limited for Uſe and Practice. But, indeed, much the greater part define them by the Species *Diapaſon*; and therefore only make ſeven *Modes*; but as to their Uſe, we are left intirely in the dark.

If the *Modes* be nothing but the ſeven Species of Octaves, the Uſe of 'em can only be, that the *Proſlambanomenos* of any *Mode* being made the principal Note of any Song, there may be different Species of Melody anſwering to thoſe different Conſtitutions. But then we are not to conceive that the *Proſlambanomenos*, or Fundamental of any *Mode* is fixed to any particular Chord of the Syſtem, *v. g.* the *Phrygian* to g; ſo that we muſt always begin there, when we would have a piece of Melody of that Species. When we ſay in general, that ſuch a *Mode* begins in g, it is no more than to ſignify the Species of Octave as they appear in a certain fix'd Syſtem; but we may begin in any Chord of the Syſtem, and make it the *Proſlam.* of any *Mode*, by

by adding new Chords, or altering the tuning of the old. If this were the true nature, and uſe of the Tones, moſt of theſe *Modes* muſt be imperfect, and incapable of good Melody, as wanting ſome of thoſe which we reckon the eſſential and natural Notes of a true *Mode*. Again, if the eſſential difference of the *Modes* conſiſt only in the Gravity or Acuteneſs of the whole Octave, then we may ſuppoſe one Species or concinnous Diviſion of the Octave, which being apply'd to all the Chords of the Syſtem, makes them true Fundamentals for a certain Series of ſucceſſive Notes, by changing, as above, the Tone of certain Chords in ſome caſes, or by adding new Chords to the Syſtem. But that muſt have been a ſimple kind of Melody, produced by admitting only one concinnous Series, and that too wanting ſome uſeful and neceſſary Chords.

Muſic was conſiderably improved in the XIth Century, by *Guido Aretinus*; who, among other Innovations, reformed the Doctrine of *Modes*. It is true, they were ſtill defined by the Species of the Octave, in *Ptolemy*'s manner, and their number was fix'd to ſeven; but afterwards taking occaſion to conſider the Harmonical and Arithmetical Diviſions of the Octave, whereby it reſolves into a 4th above a 5th, or a 5th above a 4th, they hence conſtituted 12 *Modes*, making of each Octave two different *Modes*, according to this different Diviſion; but becauſe there are two of them that cannot be divided both ways, there are but 12 *Modes*. Of theſe, ſuch as were divided harmonically, that is, with the 5ths loweſt (which were ſix) were call'd *Authentic*; and the other ſix which had the 5ths higheſt, were call'd *Plagal Modes*. See the Scheme annex'd.

To theſe *Modes*, they gave the Names of the antient *Greek* Tones, as *Dorian*, *Phrygian*, *Lydian*: But the ſeveral Authors differ in the Application and Order of theſe Names. So that we are ſtill in great meaſure at a loſs what they meant by thoſe diſtinctions, and what their real uſe was. The beſt Account we can give is this; They conſider'd that an Octave which wants a 4th or 5th, is imperfect; theſe being the Concords next to Octave, the Song ought to touch thoſe Chords moſt frequently and remarkably; and becauſe their Concord is different, which makes the Melody different, they eſtabliſhed by this two *Modes* in every natural Octave that had a true 4th and 5th: Then, if the Song was carried as far as this Octave above, it was call'd a *perfect Mode*; if leſs, as to the 4th or 5th, it wac *imperfect*; if it moved both above and below, it was call'd a *mix'd Mode*. Thus it is ſome Authors ſpeak about theſe *Modes*. Others, conſidering how indiſpenſible a Chord the 5th is in every *Mode*, they took for the Final, or Key-Note in the Arithmetically divided Octaves, not the loweſt Chord of that Octave, but that very 4th. The only difference then in this Method between the Authentic and Plagal *Modes is*, that the Authentic goes above its Final to the Octave; the other aſcends a 5th, and deſcends a 4th; which will indeed be attended with different Effects, but the *Mode* is eſſentially the ſame, having the ſame Final to which all the Notes refer. We are now to conſider wherein the *Modes* of one Species, as Authentic, or Plagal, differ among themſelves. This muſt either be by ſtanding higher or lower in the Scale, *i. e.* by the different Tenſion of the whole Octave, or rather by the different Subdiviſion of the Octave into its concinnous Degrees; there can be no other. We are to conſider then, whether theſe Differences are ſufficient to produce ſuch very different Effects as are aſcribed to the ſeveral *Modes*; for inſtance, that the one produces Mirth, another Sadneſs, a third is proper for Religion, a fourth for Love, &c. That theſe Effects are owing merely to the Conſtitution of the Octave, ſcarce any body will affirm. The differences in the Conſtitution will, indeed, have ſome influence, but it will be ſo little, as that by the various Combinations of other Cauſes, one of theſe *Modes* may be uſed to different purpoſes. The greateſt difference is that of thoſe Octaves which have the 3d *f*, or 3d *g*, making what on other occaſions we call the *Sharp* and *Flat* Key.

However, if the *Modes* depend upon the Species of Octaves, how can they be more than ſeven? And as to the diſtinction between Authentic and Plagal, we have already obſerved, that it is imaginary with reſpect to any eſſential Difference conſtituted thereby in the Kind of the Melody; for tho' the carrying the Song above or below the Final, may have different Effects, yet this is to be aſcribed to other Cauſes beſides the Conſtitution of the Octaves. It is particularly obſervable, that thoſe Authors who give us Examples in actual Compoſition of their twelve *Modes*, frequently take in the Artificial Notes ♯ and ♭, to perfect the Melody of their Key; and by this means depart from the Conſtitution of the Octave, as it ſtands fix'd in the natural Syſtem. There is nothing certain or conſiſtent therefore in their way of ſpeaking; but the *Modes* are all really reducible to two, *viz.* the Sharp and Flat; the other differences reſpecting only the Place of the Scale where the Fundamental is taken.

The antient *Modes*, beſides their general Diviſion into Authentic and Plagal, had alſo their reſpective Names from the ſeveral *Greek* Provinces where they are ſuppoſed to have been invented. Originally, indeed, there were but three, *viz. Doric*, *Lydian*, and *Phrygian*; which were particularly call'd Tones, becauſe at a Tone's diſtance from one another. The reſt were added afterwards, and were ſome of them named from the relations they bore to the former, particularly the *Hypo-Doric*, as being below the *Doric*.

The *Doric* MODE was a mixture of Gravity and Mirth, invented by *Thamiras* of *Thrace*. See DORIC.

The *Phrygian* MODE was adapted to the kindling of Rage; invented by *Marſyas* the *Phrygian*. See PHRYGIAN.

The *Lydian* MODE was proper for Funeral Songs; invented, according to *Pliny*, by *Amphion*. See LYDIAN.

The *Myxolodian* was invented by *Sappho*.

The *Æolic*, *Ionic*, and *Hypo-Doric* were invented by *Philoxenus*.

The *Hypo-Lydian* by *Polymneſtes*.

Beſides theſe *Modes of Tune*, old Authors have alſo introduced *Modes of Time*, or Meaſures of Notes.

Theſe at firſt were diſtinguiſhed into Greater and Leſs, and each of theſe again into *Perfect* and *Imperfect*. But afterwards they reduced all into four *Modes*, which included the whole Buſineſs of Times. As thoſe *Modes* are now diſuſed, they are hardly worth the reciting.

The common *Mode* now in uſe, is much more Simple and Natural than any of thoſe; the Proportion, which in theirs varied, being in ours fix'd, *viz.* 2 : 1. A Large equal to two Long; a Long to two Breves; a Breve to two Semibreves, &c. proceeding in the ſame Proportion to the laſt or loweſt Notes. And if on ſome Occaſions the Proportion of 3 : 1 betwixt two ſucceſſive Notes is required, it is eaſily expreſs'd by annexing a Point (.). See TIME, NOTE, &c.

The Antients had likewiſe their *Modi* MELOPOEIÆ, of which *Ariſtides* names theſe, *Dithyrambic*, *Nomic*, and *Tragic*, call'd *Modes* from their expreſſing the ſeveral Motions and Affections of the Mind. See MELOPOEIA.

MODEL, an Original, or Pattern propoſed for any one to copy or imitate.

St. *Paul*'s Church is ſaid to be built on the *Model* of St. *Peter*'s at *Rome*.

MODEL is particularly uſed in Building for an Artificial Pattern, made of Wood, Stone, Plaiſter, or other Matter, with all its Parts and Proportions; in order for the better Conducting and Executing of ſome great Work, and to give an Idea of the Effect it will have in Large.

In all large Buildings, it is much the ſureſt way to make a *Model* in *Relievo*; and not to truſt to a bare Deſign, or Draught. See DESIGN.

There are alſo *Models* for the Building of Ships, &c. for extraordinary Stair-Caſes, &c.

MODEL, in Painting and Sculpture, is any thing propoſed to be imitated.

Hence in the Academies they give the Term *Model* to a naked Man, diſpoſed in ſeveral Poſtures, to give an Opportunity for the Scholars to deſign him in various Views and Attitudes.

The Sculptors have little *Models* of Clay or Wax to aſſiſt them in their Deſigns of others that are larger in Marble, &c. and to judge of the Attitude and Correctneſs of a Figure. See FIGURE.

The Statuaries likewiſe give the Name *Model* to certain Figures of Clay or Wax, which are but juſt faſhion'd, to ſerve by way of Guide for the making of larger, whether of Marble, or other Matter. See STATUE.

MODERATOR, in the Schools, the Perſon who preſides at a Diſpute, or at a public Aſſembly. See PRESIDENT.

Such a Doctor was the *Moderator*, the Preſident at ſuch a Diſputation; in ſuch an Aſſembly, &c.

MODERN, ſomething new, or of our Time; in oppoſition to any thing Antique, or *Antient*.

MODERN *Authors*, according to *Nauda*, are all thoſe that have wrote ſince *Boetius*. The *Modern* Philoſophy commences with *Galilæus*. The *Modern* Aſtronomy with *Copernicus*. See PHILOSOPHY and ASTRONOMY.

MODERN *Medals* are all thoſe that have been ſtruck within theſe 300 Years. See MEDAL.

MODERN in *Architecture*, is improperly apply'd to the preſent, or *Italian* Manner of Building; as being according to the Rules of the *Antique*. See ANTIQUE. Nor is the Term leſs abuſed, when attributed to Architecture purely *Gothic*. See GOTHIC.

Modern Architecture, in ſtrictneſs, is only applicable to that which partakes partly of the Antique, retaining ſome-

what of its Delicacy and Solidity; and partly of the Gothic, whence it borrows Members and Ornaments, without Proportion or Judgment. See ARCHITECTURE.

MODIFICATION, or MODE, in Philoſophy, that which *modifies* a thing; that is, gives it this or that manner of Being. See MODE.

Quantity and Quality are Accidents that make the *Modification* of all Bodies. See QUANTITY and QUALITY.

According to *Spinoza*'s Syſtem, all the Beings that compoſe the Univerſe, are only ſo many different *Modifications* of one and the ſame Subſtance. 'Tis the different Arrangement and Situation of their Parts, that make all the difference between them. See SPINOSISM.

MODIFICATIVE, ſomething that *modifies*, or gives a thing a certain Manner of being.

Father *Buffier* eſtabliſhes a new Part of Speech, which he calls *Modificative*. Nouns, and Verbs, he obſerves, are ſuſceptible of divers Circumſtances or *Modifications*: In the Phraſe *Zeal acts*, we have a Noun and Verb without any Modification; but in that, *Zeal without Diſcretion acts raſhly*, the Noun and the Verb are each attended with a Modification or Circumſtance.

This laſt Kind of Words, which ſerve to modify Nouns and Verbs, ſince it has no general Name in the common Grammars, he chuſes to call *Modificatives*. It includes what Grammarians commonly call *Adverb*, *Conjunction*, and *Preposition*. See CONJUNCTION, PREPOSITION, &c.

MODILLIONS, in Architecture, Ornaments in the Corniſh of the Ionic, Corinthian, and Compoſite Columns. See CORNISH.

The *Modillions* are little Conſoles or Brackets under the Soffit of the Corniſh, ſeeming to ſupport the Lamier, tho in reality they are no more than Ornaments. See CONSOLE.

They ought always to be placed over the middle of the Column. They are particularly affected in the Corinthian Order, where they are uſually enrich'd with Sculpture.

The *Modillion* is uſually in form of an S inverted, and fitted to the Soffit of the Corniſh. See CORNISH.

The Proportions of *Modillions* muſt be ſo adjuſted, as to produce a Regularity in the Parts of the Soffits.

The *Inter-Modillions*, *i. e.* the Diſtances between them, depend on the Inter-Columns, which oblige the *Modillions* to be made of a certain Length and Breadth, in order to make the Intervals perfect Squares, which are always found to have better effect than Parallelograms. To this it muſt be added, that in adjuſting the *Modillions*, Care ſhould be taken that they have ſuch a Proportion, as that when the Orders are placed over one another, there be the ſame Number in the upper Order as in the lower, and that they fall perpendicularly over each other.

Modillions are alſo uſed under the Corniſhes of Pediments; tho *Vitruvius* obſerves that they were not allow'd of in his time, in regard *Modillions* were intended to repreſent the Ends of Rafters, which could not be ſuppos'd to be uſed in a Pediment. See PEDIMENT.

Some will have the *Modillions* of a Pediment to repreſent Purlins; and thoſe at the Eaves to repreſent Rafters. *Daviler* rather takes them for a kind of inverted Conſoles or Corbels.

The *Modillion* is ſometimes alſo call'd *Mutule*, tho Uſe has introduc'd a little difference between the Idea of a *Modillion* and a Mutule; the Mutule being peculiar to the Doric Order; and the *Modillions* to the higher Orders. See MUTULE.

The Word comes from the *Italian Modiglione*, a little Meaſure.

MODIOLUS, a Chirurgeon's Inſtrument, the ſame with *Abaptiſton* and *Trepanum*. See TREPANUM.

MODIUS, in Antiquity, a Kind of Buſhel, or Meaſure in uſe among the *Romans* for ſeveral Sorts of Grain. See MEASURE.

It contain'd about nine *Engliſh* Quarts.

MODO & *Forma*, in Law, a Phraſe uſed in Proceſſes and Pleadings, whereby the Defendant abſolutely denies the thing charg'd on him by the Plaintiff, *Modo & Forma declaratâ*.

The Civilians in the like ſenſe ſay, *Negat allegata prout allegantur, eſſe vera*.

MODULATION, in Muſic, is the Art of keeping in, or changing the *Mode* or Key. See MODE.

Under this Term is comprehended the regular Progreſſion of the ſeveral Parts thro the Sounds that are in the Harmony of any particular Key, as well as the proceeding naturally and regularly from one Key to another.

The Rules of *Modulation* in the firſt ſenſe belong to Harmony and Melody. See HARMONY and MELODY.

We ſhall here only add a word with regard to the Rules of *Modulation* in the latter ſenſe.

As every Piece muſt have a principal Key; and ſince the Variety ſo neceſſary in Muſic to pleaſe and entertain, forbids the being confined to one Key; and that therefore it is not only allowable, but neceſſary, to *modulate* into, and make Cadences on ſeveral other Keys, having a Relation and Connection with the principal Key: It muſt be conſider'd what it is that conſtitutes a Connection between the Harmony of one Key and that of another, that it may be hence determin'd into what Keys the Harmony may be conducted with Propriety. See KEY.

As to the Manner in which the *Modulation* from one Key to another is to be perform'd, ſo that the Tranſition may be eaſy and natural; 'tis not eaſy to fix any preciſe Rules: for tho it is chiefly perform'd by the help of the 7th *g* of the Key, into which the Harmony is to be changed, whether it be flat or ſharp; yet the Manner of doing it is ſo various and extenſive, as no Rules can eaſily circumſcribe. A general Notion of it may be conceiv'd under the following Terms.

The 7th *g* in either ſharp or flat Key, is the 3d *g* to the 5th *f* of the Key, by which the Cadence in the Key is chiefly perform'd; and by being only a Semi-tone under the Key, is thereby the moſt proper Note to lead into it, which it does in the moſt natural manner imaginable. Inſomuch that the 7th *g* is never heard in any of the Parts, but the Ear expects the Key ſhould ſucceed it; for whether it be uſed as a 3d, or as a 6th, it always affects us with ſo imperfect a Senſation, that we naturally expect ſomething more perfect to follow, which cannot be more eaſily and ſmoothly accompliſh'd, than by the ſmall Interval of a Semi-tone, to paſs into the perfect Harmony of the Key. Hence it is, that the Tranſition into one Key is beſt effected, by introducing its 7th *g*, which ſo naturally leads to it.

MODULE, in Architecture, a certain Meaſure, or Bigneſs taken at pleaſure, for regulating the Proportions of Columns, and the Symmetry or Diſtribution of the whole Building. See COLUMN.

Architects uſually chuſe the Semi-diameter of the bottom of the Column for their *Module*; and this they ſubdivide into Parts, or *Minutes*.

Vignola divides his *Module*, which is a Semi-diameter, into twelve Parts in the Tuſcan and Doric, and into eighteen for the other Orders.

The *Module* of *Palladio*, *Scamozzi*, M. *Cambray*, *Deſgodetz*, *Le Clerc*, &c. which is alſo equal to the Semi-diameter, is divided into thirty Parts or Minutes in all the Orders. See MINUTE.

Some divide the whole height of the Column into 20 Parts for the Doric, 22½ for the Ionic, 25 for the Roman, &c. and one of theſe Parts they make a *Module*, to regulate the reſt of the Building by.

There are two Ways of determining the Meaſures, or Proportions of Buildings; the firſt by a fix'd Standard Meaſure, which is uſually the Diameter of the lower part of the Column, call'd a *Module*, ſubdivided into 60th Parts, call'd *Minutes*. In the ſecond, there are no Minutes, nor any certain and ſtated Diviſion of the *Module*; but it is divided occaſionally into as many Parts as are judg'd neceſſary. Thus, the height of the Attic Baſe, which is half the *Module*, is divided either into three, to have the height of the Plinth; or into four, for that of the greater Torus; or into ſix, for that of the leſſer. Both theſe Manners have been practiſed by the antient, as well as the modern Architects: But the ſecond, which was that chiefly uſed among the Antients, is in my Opinion preferable. *Perrault*.

As *Vitruvius*, in the Doric Order, has leſſen'd his *Module*, which in the other Orders is the Diameter of the lower part of the Column; and has reduc'd that great *Module* to a mean one, which is the Semidiameter: I here reduce the *Module* to a third part for the ſame reaſon, *viz.* to determine the ſeveral Meaſures without a Fraction. For in the Doric Order, beſide that the height of the Baſe, as in the other Orders, is determin'd by one of theſe *mean Modules*; the ſame *Module* gives likewiſe the heights of the Capital, Architrave, Triglyphs, and Metopes. But our little *Module*, taken from the third of the Diameter of the lower part of the Column, has Uſes much more extenſive; for, by this the heights of Pedeſtals, of Columns, and Entablatures, in all the Orders, are determin'd without a Fraction.

As then the *great Module*, or Diameter of the Column, has 60 Minutes; and the *mean Module*, or half the Diameter, 30 Minutes; our *little Module* has 20. *Id.*

MODUS *Decimandi*, is when Land, a Sum of Money, or a yearly Penſion, belongs to the Parſon, either by Compoſition or Cuſtom, in Satisfaction for Tithes in Kind.

MOHAIR, MOUAIRE, or MOIRE, a kind of Stuff, ordinarily of Silk, both Weft and Warp; having its Grain wove very cloſe.

There are two kinds of *Mohairs*, the one ſmooth and plain; the other water'd like Tabbys: The Difference between the two only conſiſts in this, that the latter is calander'd, the other not.

There are alſo *Mohairs* both plain, and water'd, the Woof whereof is Woollen, Cotton, or Thread.

MOIDORE, MOEDORE, or MOEDA, a Gold Coin, ſtruck and current in *Portugal*. See COIN.

The

The *Moidore* is properly their *Piſtole*; and is equivalent to two Mille-Rees. See PISTOLE, &c.

There are alſo *Doppio-Moedas*, or double Piſtoles, and Demi-Piſtoles.

MOIETY, a *French* Word, *Moitie*; ſignifying the *half* of any thing.

MOINEAU, in Fortification, is a flat Baſtion raiſed in the middle of a Curtain when it is too long, and the Baſtions of the Angles too remote to be able to defend one another. See BASTION.

Here Muſqueteers are placed, to fire each way.

MOLA, in Medicine, ſee MOLE.

The Word is *Latin*, and literally ſignifies a *Mill-ſtone*.

MOLA, in Anatomy, a Bone of the Knee, call'd alſo *Patella*, *Rotulo*, &c. See PATELLA.

MOLARES, in Anatomy, the *Grinders*, an Epithet given to the large Teeth; as ſerving, like Mill-ſtones, to grind the Food. See TEETH.

The Number of *Molares* is not always the ſame. Some Perſons have twenty; and others only ſixteen, *viz.* four, or five on each ſide of either Jaw. They are very large, hard, and ſtrong; being faſtned into their Alveoli or Sockets by ſeveral Roots.

MOLASSES, MOLOSSES, or MELASSES, that groſs, yet fluid Matter, remaining of Sugar, after refining, and which no boiling will bring to a conſiſtence more ſolid than that of Syrup; hence alſo call'd *Syrup of Sugar*. See SUGAR and REFINING.

Properly, *Moloſſes* are only the Sediment of one kind of Sugar call'd *Chypre*, or brown Sugar, which is the Refuſe of other Sugars not to be whiten'd, or reduced into Loaves.

Molaſſes are much uſed in *Holland* among poor People, for the Preparation of Tobacco, and inſtead of Sugar.

There is alſo a kind of Brandy, or Spirit made of it; but exceedingly unwholeſome, and therefore much diſcouraged. See BRANDY.

MOLE, MOLA, or MOLA *Carnea*, in Medicine, a miſhapen Maſs of hard Fleſh, ſometimes generated in the Wombs of Women, inſtead of a *Fœtus*; call'd alſo a *falſe Conception*.

The *Mole* is the Chaos of an Embryo; and would have grown to an Infant, had not the Proceſs of Conception been diſturbed. Tho' it be without regular Bones, Viſcera, &c. yet the Lineaments frequently are not ſo far effaced, but that there are ſome Remains of a Child; ſometimes a Hand, and ſometimes a Foot, have been ſpied; but commonly the Secundines.

It is rare that more than one *Mole* is excluded; though *Sennertus* obſerves that there are Inſtances of two, three, or even more. He adds, that tho' they uſually come alone, yet they have been known to come with a *Fœtus*, ſometimes before it, and ſometimes after it. See CONCEPTION.

The *Mole* is diſtinguiſhed from an Embryo, in that it has no Placenta whereby to receive its Nouriſhment from the Mother. Inſtead of that, it grows immediately to the Womb; and is nouriſhed thence. It has a kind of Vegetative Life, and continues growing in bulk till the time of excluſion. Sometimes it has been born in the Womb for two or three Years.

This Production is ſuppoſed to ariſe from ſome Defect or Indiſpoſition of the *Ovum*, or Egg; or, perhaps, from the Male Seed's wanting force to penetrate it ſufficiently in order to open, and expand the Parts. Or the Effect may be accounted for, by ſuppoſing an *Ovum* to drop into the Womb, without being impregnated by the Seed of the Male: In all which caſes, the Egg continuing to grow, and yet wanting ſomething neceſſary to organize and form it into an Embryo, becomes a ſhapeleſs Lump. See EMBRYO.

Authors are divided whether or no the Women ever bring forth *Moles* without any intercourſe with Men. Some ſay there are *Moles* which derive their Origin from the Menſtruous Blood detain'd, coagulated, and harden'd; through which the Blood and Spirits have made themſelves Paſſages, &c. See MENSES.

The *Mole* is diſtinguiſhed from a true Conception, by its tremulous palpitating Motion; by its rolling from ſide to ſide; and by the Belly's ſwelling equally every way. The Breaſts ſwell as in caſe of a juſt Embryo; but the Humour generated therein is not true Milk, but a crude Matter, form'd of the ſuppreſſed Menſes.

To bring the *Mola* out of the Womb, Bleeding and violent Purging are uſed, and at laſt ſtrong Emmenagogues. If theſe fail, recourſe is to be had to manual Operation.

The *Latins* give it the Name *Mola*, which literally ſignifies *Mill-ſtone*, from its reſemblance thereto in Form and Hardneſs.

MOLE, *Moles*, a Peer, or Maſſive Work of Maſonry, conſiſting of large Stones thrown into the Sea, in manner of a Bank, with deſign to ſhut up a Port, and defend the Veſſels in it from the Impetuoſity of the Waves, and to prevent the Paſſage of any Veſſel without leave. Thus we ſay the *Mole* of the Harbour of *Meſſina*. See PILE.

The Word *Mole* is ſometimes alſo uſed to ſignify the Harbour itſelf. See HARBOUR.

Among the *Romans*, *Mole*, *Moles*, was alſo uſed for a kind of Mauſoleum built in manner of a round Tower on a ſquare Baſe, inſulate, incompaſs'd with Columns, and cover'd with a Dome. See MAUSOLEUM.

The *Mole* of the Emperor *Adrian*, now the Caſtle of St. *Angelo*, was the greateſt, and moſt ſtately of all the *Moles*. It was crown'd with a Brazen Pine-Apple, wherein was a golden Urn containing the Aſhes of the Emperor.

MOLECULE, MOLECULA, in Phyſics, a little Maſs, or part of any thing. See MASS, &c.

Thus we ſay the Air, by Reſpiration, inſinuating itſelf into the Veins and Arteries, endeavours by its elaſtic Power to divide and break the *Molecules* of the Blood, which on their ſide reſiſt ſuch diviſion.

MOLINE, in Heraldry. A *Croſs*-MOLINE is that which turns round both ways at all its Extremities, tho' not ſo wide or ſharp as that ſaid to be *Anchored*. See CROSS.

In *Upton*, the Points are all cut off, which makes it very different from the Croſs Anchored. See FER *de Moulin*.

MOLINISTS, a Sect among the *Romaniſts*, who follow the Doctrine and Sentiments of the Jeſuit *Molina*, relating to ſufficient and efficacious Grace. See GRACE, &c.

Their great Antagoniſts are the *Janſeniſts*. See JANSENISTS.

MOLINOSISTS, a Sect among the *Romaniſts*, who adhere to the Doctrine of *Molinos*.

Theſe are likewiſe call'd *Quietiſts*. See QUIETISTS.

MOLMUTIN, or MOLMUTIAN *Laws*, the Laws of *Dunwallo Molmutius*, XVIth King of the *Britons*, who began his Reign 440 Years before the Incarnation. See LAW.

He was the firſt who publiſhed any Laws in this Land; and they continued famous therein till the time of *William* the Conqueror.

MOLOSSUS, in the *Greek* and *Latin* Poetry, the Name of a Foot conſiſting of three long Syllables: As *Auderi*, *cantabant*, *Virtutem*. See FOOT.

It takes its Name either from a Dance in uſe among the People call'd *Moloſſi*, or *Epirotes*; or from the Temple of *Jupiter Moloſſus*, where Odes were ſung, in which this Foot had a Share; or becauſe the March of the *Moloſſi* when they went to the Combate, was compoſed of theſe Feet, or had their Cadence.

MOLTA, or MOLTURA, a Duty, or Toll paid by Vaſſals to the Lord for grinding their Corn at his Mill.

MOLTING, or MOULTING, the falling off or change of Hair, Feathers, Skin, Horns, Voice, and other Diſpoſitions of the Body of Animals, happening in ſome, annually, in others at certain Stages of their Life.

The generality of Beaſts *Molt* in the Spring.

The *Molting* of a Deer is the quitting of his Horns in *February* or *March*; the *Molting* of a Serpent is the putting off his Skin. See EXUVIÆ.

MOMENT, in Time, is the moſt minute, and inſenſible Diviſion of Time; or what we otherwiſe call an *Inſtant*. See TIME.

MOMENTS, in the new Doctrine of Infinites, are the infinite ſmall Parts of Quantity. See INFINITE.

Moments are the ſame with what we otherwiſe call *Infiniteſimals*, *Differentials*, and *Fluxions*; being the *Momentary* Increments, or Decrements of Quantity conſider'd as in a continual Flux. See DIFFERENTIAL and FLUXION.

Moments are the generative Principles of Magnitude: They have no determined Magnitude of their own; but are only inceptive thereof. See INCEPTIVE.

Hence, as it is the ſame thing if in lieu of theſe *Moments*, the Velocities of their Increaſes and Decreaſes be made uſe of, or the finite Quantities proportionable to ſuch Velocities; the Method of Proceeding which conſiders the Motions, Changes, or Fluxions of Quantities, is denominated by Sir *Iſ. Newton* the Method of *Fluxions*. See FLUXIONS.

Leibnitz, and moſt of the Foreigners, conſidering theſe infinitely ſmall parts or Infiniteſimals as the differences of two Quantities; and thereby endeavouring to find the differences of Quantities, *i.e.* ſome *Moment* or Quantity infinitely ſmall, which being taken an infinite Number of Times, ſhall equal a given Quantity, call theſe *Moments Differentials*; and the Method of Proceedure, the *Differential Calculus*. See CALCULUS *Differentialis*.

MOMENT, in Mechanics, is the ſame with *Impetus*, or Quantity of Motion in any moving Body; and ſometimes it is uſed ſimply for the Motion itſelf. See IMPETUS.

Moment is frequently defined by the *Vis inſita*, or the Power by which moving Bodies continually change Place. See VIS.

In

In comparing the Motions of Bodies, the Ratio of their *Moments* is always compounded of the Quantity of Matter, and the Celerity of the moving Body; ſo that the *Moment* of any ſuch Body may be conſider'd as a Rectangle under the Quantity of Matter, and the Celerity. And ſince it is certain that all equal Rectangles have their ſides reciprocally proportionable; therefore if the *Moments* of any moving Bodies are equal, the Quantity of Matter in one to that of the other will be reciprocally as the Celerity of the latter to the Celerity of the former; and, on the contrary, if the Quantities of Matter are reciprocally proportionable to the Celerities, the *Moments*, or Quantities in each, will be equal.

The *Moment* alſo of any moving Body may be conſider'd as the Aggregate or Sum of all the *Moments* of the Parts of that Body; and therefore where the Magnitudes and Number of Particles are the ſame, and where they are moved with the ſame Celerity, there will be the ſame *Moments* of the Wholes. See MOTION.

MONARCHY, a large State govern'd by one; or a State where the ſupreme Power is lodged in the hands of a ſingle Perſon. See GOVERNMENT.

The moſt antient *Monarchy* was that of the *Aſſyrians*, which was founded ſoon after the Deluge.

We uſually reckon four Grand or Univerſal *Monarchies*, the *Aſſyrian*, *Perſian*, *Grecian*, and *Roman*. But St. *Auguſtin* makes them but two, *viz.* thoſe of *Babylon* and *Rome*. There is no neceſſity to make the *Medes*, *Perſians* and *Greeks* ſucceed to the whole Power of the *Aſſyrians*, to multiply the number of the *Monarchies*. It was the ſame Empire ſtill, and the ſeveral Changes that hapned in it, did not conſtitute different *Monarchies*. Thus the *Roman* Empire was ſucceſſively govern'd by Princes of different Nations, yet without any new *Monarchy* being formed thereby. *Rome* therefore may be ſaid to have immediately ſucceeded *Babylon* in the Empire of the World. See EMPIRE.

Of *Monarchies* ſome are Abſolute and Deſpotic, where the Will of the Monarch is uncontrollable; as *France*, &c. others limited, where the Prince's Authority is reſtrained by Laws, and part of the ſupreme Power lodged in other hands; as in *England*. Some again are Hereditary, where Succeſſion devolves immediately from Father to Son; and others Elective, where, on the Death of the *Monarch*, his Succeſſor is appointed by Election, as *Poland*.

The Word comes from the *Greek* μοναρχης, one who governs alone; form'd of μονος *ſolus*, and αρχη *Imperium*, Government.

According to *Hobbes*, *Monarchy*, as well as Ariſtocracy, derives all its Authority from the People, who transfer all their Right, *v. g.* the ſupreme Power, by a Plurality of Suffrages, &c. to ſome one Perſon call'd a *Monarch*; ſo that whatever the People could have done before this Tranſlation, may be now rightfully done by him, to whom the Tranſlation is made. This done, the People are no longer to be look'd on as a Perſon, but a diſſolv'd Multitude; in regard they were only one by virtue of the ſupreme Power, which they have now transferred to another.

Nor can the *Monarch*, ſays he, oblige himſelf by any Covenants, to any Perſon, for the Authority he has receiv'd; in regard he receives the Power from the People, which, as ſoon as that is done, ceaſes to be a Perſon; and the Perſon ceaſing, the Obligation to the Perſon ceaſes of courſe. The People therefore are oblig'd to pay Obedience to the *Monarch*, by virtue of thoſe Covenants, whereby they mutually oblige themſelves to what the People, as a Perſon, injoins to be done.

He argues further, that as a *Monarch* cannot be oblig'd by any Covenants; ſo neither can he do any injury to his Subjects: an Injury being nothing elſe but a Breach of Covenant; and where there is no Covenant, there can be no Breach. *De Cive*, *cap.* 8.

MONASTERY, a *Convent*, or Houſe built for the Reception of Religious, whether it be *Abbey*, *Priory*, *Nunnery*, or the like. See ABBEY, PRIORY, &c.

Monaſtery is in a more immediate ſenſe apply'd to the Houſes of Mendicant Friars, and Nuns. The reſt are more properly call'd *Convents*. See CONVENT.

MONASTIC, ſomething belonging to the *Monks*, or the *Monkiſh* Life. See MONK.

The *Monaſtic* Profeſſion is a kind of civil Death, which has the ſame Effects with the natural Death. The Council of *Trent*, &c. fix ſixteen Years for the Age at which a Perſon may be admitted into the *Monaſtical* Life.

St. *Anthony* is the Perſon who in the fourth Century firſt inſtituted the *Monaſtic* Life; as St. *Pacome*, in the ſame Century, is ſaid to have firſt ſet on foot the Cœnobitic life, *i. e.* Regular Communities of Religious. See COENOBITE.

In a ſhort time, the Deſarts of *Egypt* became inhabited with a Set of Solitaries, who took upon them the *Monaſtic* Profeſſion. See SOLITARY. St. *Baſil* carry'd the Monkiſh Humour into the *Eaſt*, where he compos'd a Rule, which afterwards obtain'd thro a great part of the *Weſt*. In the eleventh Century, the *Monaſtic* Diſcipline was grown very remiſs. St. *Odo* firſt began to retrieve it in the Monaſtery of *Cluny*.

That Monaſtery, by the Conditions of its Erection, was put under the immediate Protection of the Holy See; with a Prohibition to all Powers, both Secular and Eccleſiaſtical, to diſturb the Monks in the Poſſeſſion of their Effects, or the Election of their Abbot. In virtue hereof, they pleaded an Exemption from the Juriſdiction of the Biſhop; and extended this Privilege to all the Houſes dependent on *Cluny*. This made the firſt Congregation of ſeveral Houſes under one Chief immediately ſubject to the Pope, ſo as to conſtitute one Body, or, as they now call it, one *Religious Order*. Till then, each Monaſtery was independent of other, and ſubject to the Biſhop. See ORDER, ABBOT, RELIGIOUS, &c.

MONETAGIUM, MONETAGE, was antiently the Right, or Privilege of Coining Money. See MINT, COINING, &c.

MONK, was antiently a Perſon who retir'd from the World, to give himſelf up wholly to God, and to live in Solitude, and Abſtinence. See RELIGIOUS.

Such were the *Hermites* and *Anchorites*, who withdrew into Deſarts, and lived remote from all Commerce of Mankind. See HERMITE and ANCHORITE.

The Word is deriv'd from the *Latin Monachus*, and that from the *Greek* μοναχος, which ſignifies *alone*; by reaſon the antient *Monks* liv'd in Solitude, as the true *Monks* ſtill do.

Some Writers, as Father *Helyot*, *Diſſert. Prelim.* trace the Original of *Monks* up as early as the time of the *Therapeutæ*, and maintain that there had been an uninterrupted Succeſſion of *Monks* from the *Therapeutæ* to St. *Anthony*. Others, on the contrary, are contented with going back as far as St. *Paul*, the firſt Hermite. See THERAPEUTÆ.

The *Monks*, at leaſt the antient ones, were diſtinguiſh'd into *Solitary* and *Cœnobites*.

The *Solitary* are thoſe who live alone, in Places remote from all Towns, or Habitations of Men, as do ſtill ſome of the Hermites. See SOLITARY.

The *Cœnobites* are thoſe who live in Community with ſeveral others in the ſame Houſe, and under the ſame Superiors. See COENOBITE.

Thoſe Houſes again were of two kinds, *viz.* *Monaſteries* and *Lauri*. See MONASTERY and LAURUS.

Thoſe we call *Monks* now-a-days, are *Cœnobites*, who live together in a Convent or Monaſtery, who make Vows of living according to a certain Rule eſtabliſh'd by the Founder, and wear a Habit which diſtinguiſhes their Order.

Thoſe that are endow'd, or have a fix'd Revenue, are properly call'd *Monks*, as the *Chartreux*, *Benedictines*, *Bernardines*, &c. The *Mendicants*, or thoſe that beg, as the *Carthuſians*, and *Franciſcans*, are properly call'd *Religious*, tho the Names are frequently confounded. See RELIGIOUS.

The firſt *Monks* were thoſe of St. *Anthony*; of St. *Baſil*, call'd in the *Eaſt Calogers*, from καλος γερων, *Good old Man*; and thoſe of St. *Jerom*; the Hermites of St. *Auguſtine*, and afterwards thoſe of St. *Benedict* and St. *Bernard*; at length came thoſe of St. *Francis*, St. *Dominic*, with a Legion of others; which ſee under their proper Heads. BENEDICTINS, &c.

Monks are diſtinguiſh'd by the Colour of their Habits into *Black*, *White*, *Grey*, &c.

Among the *Monks*, ſome are call'd *Monks of the Choir*, others *Profeſſed Monks*, and others *Lay Monks*; which laſt are deſtin'd for the Service of the Convent, and have neither Clericature nor Literature. See LAY.

Cloiſter'd MONKS, are thoſe who actually reſide in the Houſe, in oppoſition to *Extra-Monks*, who have Benefices depending on the Monaſtery. They are diſtinguiſh'd further into *Reformed*, whom the Civil and Eccleſiaſtical Authority have made Maſters of antient Convents, and put it in their power to retrieve the antient Diſcipline, which had been relax'd; and *Antient*, who enter the Convent, to live in it according to its Eſtabliſhment at the time when they make their Vows, without obliging themſelves to any new Reform.

Antiently, the *Monks* were all Laymen, and were only diſtinguiſh'd from the reſt by a particular Habit, and an extraordinary Devotion. Not only the *Monks* were prohibited the Prieſthood; but even Prieſts were expreſly prohibited from becoming *Monks*, as appears from the Letters of St. *Gregory*. Pope *Syricius* was the firſt who call'd them to the Clericature, on occaſion of ſome great Scarcity of Prieſts, that the Church was then ſuppos'd to labour under. And ſince that time, the Prieſthood has been uſually united to the Monaſtical Profeſſion. See FATHER, &c.

MONKS *Rhubarb*, ſee RHUBARB.

MONKS *Seam*, among Sailors, is, when the Selved ges of Sails are laid a little over one another, and ſewed on both ſides.

MONETARIUS, a Name Antiquaries and Medaliſts give to thoſe who ſtruck the antient Coins, or Moneys.

All the old *Roman*, &c. Coins, have the Name of the *Monetarius*, either written at length, or at leaſt the initial Letters of it.

MONEY, or MONY, *Moneta*, a Piece of Metal mark'd for Coin, with the Arms of a Prince, or State, who make it circulate or paſs, at a common rate, for things of different Value; to facilitate the Buſineſs of Commerce. See COMMERCE.

Paulus the Lawyer, defines *Money* a thing ſtamp'd with a public Coin, and deriving its Uſe and Value from its Impreſſion rather than its Subſtance. *ff. de Contr. Empt.*

Monſ. *Boizard* defines it a piece of Matter to which public Authority has affixed a certain Value and Weight to ſerve as a Medium in Commerce.

The *Æra* of the Invention of *Money* is not eaſy to be ſettled. There is no room to doubt but that in the earlieſt Ages, the ordinary way of Traffick among Men was by trucking or exchanging Commodity for Commodity. Thus in *Homer*, *Glaucus*'s golden Armour was valued at one hundred Cows; and *Diomedes*'s Armour at ten. See EXCHANGE.

But in courſe of time, it was found neceſſary in the way of commutative Juſtice, to have ſome common Meaſure or Standard, according to which all other things ſhould be eſtimated. This, as the *Jews* gather from *Joſephus*, was firſt invented by *Cain*: Tho the firſt tidings we hear of it, is in the time of *Abraham*, who paid 400 Shekels for a Burying-Place.

The *Greeks* refer the Invention of *Money* to *Hermodice*, Wife of King *Midas*: And the *Latins* to *Janus*.

This being a common Meaſure for reducing Wares to a Balance, it was call'd by the *Greeks Nomiſma*; not from King *Numa*, but from *Nomos*, as being eſtabliſhed by Law. By the *Latins* it was call'd *Pecunia*; either becauſe the Wealth of thoſe Days conſiſted in their Cattel; or, as *Pliny* will have it, becauſe their firſt Coin was ſtamp'd with the Figure of a Cow. They alſo call'd it *Moneta*, *à monendo*, as *Suidas* obſerves, becauſe when the *Romans* were at a want of *Money*, *Juno* admoniſhed them to uſe Juſtice, and there ſhould be no want of *Money*. The Effect whereof when they had found, ſhe was ſur-named *Juno Moneta*, and *Money* was coin'd in her Temple. In proceſs of time, *Money* herſelf was made a Goddeſs, and inſhrined by the Name of *Dea Pecunia*, in the Figure of a Woman holding a Balance in one hand, and a *Cornucopia* in the other.

On the foot *Money* now ſtands, it may be divided into *Real*, or *Effective*; and *Imaginary*, or *Money of Account*.

Under *Real* MONEY come all Coins or Species, of Gold, Silver, Copper, *&c.* which have courſe in Commerce, and do really exiſt: Such are *Guineas*, *Crowns*, *Piſtoles*, *Louis's*, *Pieces of Eight*, *Ducats*, &c. Which ſee under their proper heads; as alſo under COIN.

Imaginary MONEY, or *Money of Account*, is that which has never exiſted, or at leaſt which does not exiſt in real Species, but has been invented and retained to facilitate the Stating of Accounts, by keeping them ſtill on a fixed footing, not to be changed like current Coins, which the Authority of the Sovereign raiſes or lowers according to the Exigencies of State. Of this kind are *Pounds*, *Livres*, *Maravedies*, *&c.*

This *Money of Account*, M. *Boiſſart* obſerves, is a Sum of Money, or a certain number of Species which may change in Subſtance and Quantity, but never in Quality. Thus fifty Pounds conſiſts of fifty Pieces call'd Pounds, which are not real, but may be paid in ſeveral real Species, as in Guineas, Crowns, Shillings, *&c.* which are changeable, as Guineas, *v.g.* which are ſometimes higher, ſometimes lower.

Real Money, as the Civilians obſerve, has three eſſential Qualities, *viz. Matter*, *Form*, and *Weight* or *Value*.

For *Matter*, Copper is that thought to have been firſt coin'd; afterwards Silver, and, laſtly, Gold; as being the moſt beautiful, ſcarce, cleanly, diviſible, and pure of all Meta's.

The Degrees of Goodneſs are expreſs'd in Gold by Caracts; and in Silver by Penny-weights. See CARACTS, *&c.*

For there are ſeveral reaſons for not coining 'em pure, and without alloy, *viz.* the great Loſs and Expence in refining them, the neceſſity of hardening them to make 'em more durable, and the ſcarcity of Gold and Silver in moſt Countries. See ALLOY.

Among the antient *Britons*, Iron Rings, or, as ſome ſay, Iron Plates, were uſed for *Money*. Among the *Lacedemonians* Iron Lingets quench'd with Vinegar, that they might not ſerve for any other uſe. *Seneca* obſerves, that there was antiently ſtamp'd *Money* of Leather; *Corium forma publica Impreſſum*. And the ſame thing was put in practice by *Frederic* II. at the Siege of *Milan*; to ſay nothing of an old Tradition among ourſelves, that in the confuſed times of the Barons Wars, the like was done in *England*: But the *Hollanders*, we know, coin'd great Quantities of Paſteboard in the Year 1574. *Numa Pompilius* made *Money* of Wood and Leather. Nor does it appear that the *Romans* were much acquainted with the Art of ſtriking *Money* in Metal in the Time of their Kings. The firſt Silver *Money* they coin'd was in the Year of *Rome* 484; and their firſt Gold *Money* in 546. See COINING.

As to the *Form of Money*, it has been more various than than the Matter.

Under the *Form* are comprehended the Weight, Figure, Impreſſion, and Value.

For the *Impreſſion*, the *Jews*, tho they deteſted Images, yet ſtamp'd on one ſide their Shekel, the golden Pot which had the Manna; and on the other, *Aaron*'s Rod. The *Dardans*, two Cocks fighting. *Alexander* his Horſe *Bucephalus*. The *Athenians* an Owl, or an Ox; whence the Proverb on bribed Lawyers, *Bos in Lingua*. They of *Ægina*, a Snail; whence that other ſaying, *Virtutem & Sapientiam vincunt teſtudines*. For the *Romans*, as they impreſs'd the Image and Inſcription of the Conſul on their Coins while the Common-wealth flouriſh'd, and afterwards that of the Emperor on one ſide; ſo they always varied the Reverſe upon new Events or Exploits. Some think that the great Ounce Medals both of Braſs and Gold were ſtruck chiefly to do honour, and preſerve the Memories of great Men; but it is pretty plain they were current as well as the ſmaller. See MEDAL and MEDALLION.

This Practice of ſtamping the Prince's Image on Coins, has obtain'd among all civiliz'd Nations; the *Turks* and other *Mahometans* alone excepted, who, in deteſtation of Images, inſcribe only the Prince's Name, with the Year of the tranſmigration of their Prophet.

As to the *Figure*, it is either round, as in *England*; multangular or irregular, as in *Spain*; ſquare, as in ſome parts of the *Indies*; or nearly globular, as in moſt of the reſt.

After the Arrival of the *Romans* in this Iſland, the *Britons* imitated them, coining both Gold and Silver with the Images of their Kings ſtamp'd on 'em. When the *Romans* had ſubdued the Kings of the *Britons*, they alſo ſuppreſs'd their Coins, and brought in their own; which were current here from the time of *Claudius* to that of *Valentinian* the Younger, about the ſpace of 500 Years.

Mr. *Camden* obſerves, that the moſt antient *Engliſh* Coin he had known was that of *Ethelbert* King of *Kent*, the firſt Chriſtian King in the Iſland; in whoſe time all *Money* Accounts began to paſs by the Names of *Pounds*, *Shillings*, *Pence*, and *Mancuſes*.

Pence ſeems borrow'd from the *Latin Pecunia*, or rather from *Pendo*, on account of its juſt Weight, which was about three Pence of our *Money*. Theſe were coarſely ſtamp'd with the King's Image on the one ſide, and either the Mint-Maſter's, or the City's where it was coin'd, on the other. Five of theſe Pence made their Scilling, probably ſo call'd from *Scilingas*, which the *Romans* uſed for the fourth part of an Ounce. Forty of theſe Scillings made their Pound, and 400 of theſe Pounds were a Legacy, or a Portion for a King's Daughter; as appears by the laſt Will of King *Alfred*. See PENNY, *&c.*

By theſe Names they tranſlated all Sums of *Money* in their old *Engliſh* Teſtament; Talents by Pundes; *Judas*'s thirty pieces of Silver by thirty Scillinga; Tribute *Money*, by Penining; the Mite by Feorthling.

But it muſt be obſerved, they had no other real *Money*, but Pence only; the reſt being imaginary *Moneys*, *i. e.* Names of Numbers, or Weights. Thirty of theſe Pence made a Mancus, which ſome take to be the ſame with a Mark; Manca, as appears by an old MS. was *quinta pars Unciæ*. See MANCUS.

Theſe Mancas or Mancus's, were reckon'd both in Gold and Silver. For in the Year 680, we read that *Ina* King of the *Weſt-Saxons*, obliged the *Kentiſhmen* to buy their Peace at the price of thirty thouſand Manca's of Gold. In the Notes on King *Canute*'s Laws, we find this diſtinction, that Mancuſa was as much as a Mark of Silver; and Manca a ſquare piece of Gold, valued at thirty Pence.

The *Danes* introduced a way of reckoning *Money* by Ores, mentioned in *Dooms-Day* Book; but whether they were a ſeveral Coin, or a certain Sum, does not plainly appear. This, however, may be gathered from the Abby-Book of *Burton*, that twenty Ores were equivalent to two Marks. They had alſo a Gold Coin call'd Bizantines, or Beſants, as being coin'd at *Conſtantinople*, then call'd *Bizantium*. The value of which Coin is not only now loſt, but was ſo entirely forgot even in the time of King *Edward* the Third; that whereas the Biſhop of *Norwich* was fin'd a Bezantine of Gold to be paid the Abbot of St. *Edmond's Bury*, for infringing his Liberties (as it had been enacted by Parliament in the time of the Conqueror) no Man then living could tell how much it was; ſo it was refer'd to the King to rate how much he ſhould pay. Which is the

more unaccountable, becauſe but an hundred Years before, two hundred thouſand Beſants were exacted by the *Soldan* for the Ranſom of St. *Lewis* of *France*; which were then valued at one hundred thouſand Livres.

Tho' the Coining of *Money* be a ſpecial Prerogative of the King, yet the antient *Saxon* Princes communicated it to their Subjects; inſomuch that in every good Town there was at leaſt one Coiner; but at *London* eight, at *Canterbury* four for the King, two for the Arch-biſhop, one for the Abbot at *Wincheſter*, ſix at *Rocheſter*, at *Haſtings* two, *&c.* See MINT.

The *Norman* Kings continu'd the ſame Cuſtom of Coining only Pence, with the Prince's Image on one ſide, and on the other the Name of the City where it was coin'd, with a Croſs ſo deeply impreſs'd, that it might be eaſily parted, and broken into two Halves, which ſo broken, they call'd Half-pence; or into four Parts, which they call'd Fourthings, or Farthings. See FARTHING.

In the time of King *Richard* the Firſt, Money coin'd in the Eaſt Parts of *Germany*, came in ſpecial requeſt in *England*, on account of its Purity, and was call'd *Eaſterling Money*, as all the Inhabitants of thoſe Parts were call'd *Eaſterlings*. And ſhortly after, ſome of thoſe People ſkilled in Coining were ſent for hither, to bring the Coin to Perfection; which ſince has been call'd *Sterling* for *Eaſterling*. See STERLING.

King *Edward* the Firſt, who firſt adjuſted the Meaſure of an Ell by the Length of his Arm, herein imitating *Charles the Great*, was the firſt alſo who eſtabliſh'd a certain Standard for the Coin, which is expreſs'd to this effect by *Greg. Rockley*, Mayor of *London*, and Mint-Maſter. A Pound of *Money* containeth twelve Ounces: In a Pound there ought to be eleven Ounces, two Eaſterlings, and one Farthing; the reſt Allay. The ſaid Pound ought to weigh twenty Shillings and three Pence in Account and Weight. The Ounce ought to weigh twenty Pence, and a Penny twenty four Grains and a half. Note, that eleven Ounces two Pence Sterling ought to be of pure Silver, call'd *Leaf Silver*, and the Minter muſt add of other Weight ſeventeen Pence Half-penny Farthing, if the Silver be ſo pure.

About the Year 1320. the States of *Europe* firſt began to coin Gold, and among the reſt, our King *Edward* the Third. The firſt Pieces he coin'd were call'd *Florences*, as being coin'd by *Florentines*; afterwards he coin'd Nobles; then Roſe-Nobles, current at ſix Shillings and eight Pence; Half-Nobles, call'd *Half-Pennys*, at three Shillings and four Pence of Gold; and Quarters at twenty Pence, call'd *Farthings of Gold*. The ſucceeding Kings coin'd Roſe-Nobles, and double Roſe-Nobles, great Sovereigns, and half *Henry* Nobles, Angels, and Shillings.

King *James* the Firſt coin'd Unites, double Crowns, *Britannic* Crowns. Then the Crowns, Half Crowns, *&c.*

There are various Kinds of *falſe* or baſe *Money*, *viz.* either that ſtruck by an unqualify'd Perſon, and of unſtatutable Metals; or that which has loſt of its Weight, either by being clipped on the Corners, or filed on the Edges, or laſtly, by having ſome of its Surface peel'd off; if Gold, by *Aqua Regalis*; if Silver, by *Aqua Fortis*. Another Kind of baſe *Money* is that made by Pieces of Iron, Copper, or other Metal, cover'd on each ſide with a thin Plate or Leaf of Gold or Silver, nearly ſoder'd and join'd around the Edges, and ſtruck, like other Coin, with Figures, Legends, *&c.* only to be diſtinguiſh'd from them by the Bulk, and Weight, and Sound.

The Word *Money* comes from the old *Anglo-Saxon Munet*, and that from *Moneta a Mundo*, as before obſerv'd. From the ſame *Moneta* the *Germans* have borrow'd their *Muntz*, the *French Monnoye*, the *Spaniards Moneda*, and the *Italians Moneta*.

MONEYS *of Account, or Manners of reckoning* MONEY *in* Europe *and* Aſia.

We here confine ourſelves to the *Moneys* of Account of thoſe two Parts of the World: *America* having none; the reſpective *Moneys* of Account of the *Europeans*, who have there made Settlements, being eſtabliſh'd with 'em. As to *Africa*, the Cities of *Barbary* and *Egypt*, whither the *Europeans* traffick, reckon much after the ſame manner as in the *Levant*, and in the Dominions of the Grand Signior: For the reſt, throughout that vaſt Extent of Coaſts, where we trade for Negroes, Gold-Duſt, Elephants Teeth, Wax, Leathers, *&c.* either the miſerable Inhabitants do not know what *Money* of Account is; or if they have any, 'tis only what Strangers, ſettled among them, have introduc'd. The *Macoute*, however, and the *Piece*, which are Manners of accounting among theſe *Barbarians*, will be deliver'd in their place.

Engliſh MONEY *of Account* is the Pound, Shilling, and Penny Sterling: The Pound containing 20 Shillings, and the Shilling 12 Pence. See POUND, *&c.* See alſo COIN, and STERLING.

French MONEY *of Account*, was antiently the Pariſis, Tournois, and the Ecu, or Crown: but ſince the Ordonnance of 1667, they only reckon by Livres, *i. e.* Pounds; Sols, *i. e.* Shillings; and Deniers Tournois, *i. e.* Pence. The Livre, 20 Sols, or $\frac{1}{3}$ of the Ecu, or Crown; the Sol, 12 Deniers. See LIVRE, DENIER, *&c.*

The Maille, Obole, or Half-penny Tournois, is alſo now a *Money* of Account, tho antiently a real Coin. The Maille is divided into two Pites, and each Pite into two Semi-pites; all *Moneys* of Account. To which muſt be added the Franc, of the ſame Value with the Livre, *viz.* 20 Sols Tournois; and the Blanc, 5 Deniers Tournois; and the Carolus, Ten: All three antiently real Coins. See FRANC, *&c.*

Dutch and Flemiſh MONEYS *of Account*. In *Holland*, *Zeland*, *Brabant*, and *Cologne*, they uſe the Pundt, or Livre de Gros; Schelling, or Sol de Gros; and Penning, or Deniers Gros. The Pundt, containing 20 Schelling; and the Schelling, 12 Pennings. The Pundt equal to 7 Livres, 4 Sols *French*, or 10 Shillings $\frac{5}{10}$ Sterling. They alſo account by Florins or Guilders, Patards and Pennings: The Florin is equal to $\frac{1}{4}$ of the Pound, or 20 Patards; and the Patard, 12 Pennings. The Merchants uſe each Method of Accounting indifferently.

Spaniſh MONEY *of Account*, is the Peſo, Ducat of Silver and Vellon, Rial of Vellon, and Cornados and Maravedis of Silver and Vellon. The Peſo is to the Ducat as 12 to 10. The Ducat of Silver contains 11 Rials of Silver; and that of Vellon, 11 Rials of Vellon; which makes a difference of near one half. The Silver Rial being current for 7 Shillings Sterling, and that of Vellon only at 3 : 8 *d.* Sterling. 34 Maravedis make the Rial of Vellon, and 63 that of Silver. The Maravedis is divided into 4 Cornaros.

German and Swiſs MONEYS *of Account*. In *Switzerland*, and many of the chief Cities of *Germany*, particularly *Francfort*, they account by Florins (but on a footing different from that of *Holland*) by Creux's or Creuxers, and Pennins. The Florin equal to 3 Shillings Sterling, and divided into 60 Creux or Kreux, and the Creux into 8 Pennins. In others, as *Nuremberg*, *&c.* they account by Rixdollars, Florins, and Creux. The Rixdollar equal to 4. 8 *d.* Sterling, divided into 100 Creux, and the Creux into 8 Pennins. In others, as *Hambourg*, *Berlin*, *&c.* by Rixdollars, Marks Lubs, Schellings Lubs, and Deniers Lubs. The Rixdollar and Dollar on the foot of the *French* Crown, or 4 : 6 Sterling, divided into 3 Marks, and the Mark into 16 Schellings, and the Schelling into 12 Pennins. At *Hambourg* they alſo uſe the Livre, Schelling, and Denier de Gros. At *Ausbourg* and *Bolzamont*, they account by Tallers and Creux's; the Taller equal to 4 : 6 Sterling, divided into 90 Creux's. At *Nambourg*, by Rixdollars Gros and Fenins; the Rixdollar equal to 4 : 6 Sterling, divided into 36 Gros, and the Gros into 12 Fenins. At *Strasbourg* by Florins, Creux, and Penins. The Florin equal to 1 : 6 Sterling, divided into 60 Creux, and the Creux into 8 Pennins.

Italian MONEYS *of Account*. In *Italy*, the *Moneys* of Account are various, almoſt as the Cities of Commerce. At *Rome*, they account by Pounds, Shillings, and Pence of Gold *di Stampa*. At *Venice*, by Ducats, and Gros *di Banco*. The Ducat divided into 24 Gros, each Gros equal to 2 Pence $\frac{1}{2}$ Sterling. And by Ducats Currant, call'd alſo Sequins, equal to 9 : 2 Sterling; and by Pounds, Shillings, and Pence. At *Lucca* and *Bergamo*, they uſe the four laſt; and only the three laſt at *Boulogna*, *Mantua*, and *Savoy*: In *Geneva*, beſides Pounds, Shillings, and Pence, they account alſo by Florins, containing 6 Soldis, or 6 Pence $\frac{1}{2}$ Sterling. At *Leghorn* and *Genoa*, beſides Pounds, Shillings, and Pence, they account by Piaſtres, equal to 4 : 6 Sterling. At *Nova*, their *Moneys* of Account are Crowns, Shillings, and Pence of Gold *de Marc*. At *Ranconis*, Pounds, Florins, and Gros. At *Ancona*, Crowns, Shillings, and Pence. At *Naples*, Ducats, Tarins, and Grains, equal to one Shilling Sterling, divided into 20 Grains.

Sicilian and Malteſe MONEYS *of Account*. At *Meſſina*, *Palermo*, and throughout *Sicily*, they account by Pounds, Ounces, Tarins, Grains, and Piccoli's; which are ſumm'd by 30, 20, and 6: the Ounce being 30 Tarins, the Tarin 20 Grains, and the Grain 6 Piccoli's. At *Malta*, they account by Pounds, Ounces, Carlins, and Grains. The Ounce 30 Tarins, or 60 Carlins, or 600 Grains; the Carlin equal to 6 $\frac{1}{4}$ Sterling.

Poliſh MONEYS *of Account*. Throughout *Poland*, moſt of the Dominions of the King of *Pruſſia*, and *Dantzic*, they account by Rixdollars, Roups, and Grochs. The Rixdollar equal to 4 : 6 Pence Sterling, and divided into 32 Roups; and again, in the *Pruſſian* Territories, into 24 Grochs: In *Poland*, into 90 Grochs. Sometimes they uſe the Florin, Groch, and Penny.

Swediſh, Daniſh, and Muſcovite MONEYS *of Account*. In *Sweden*, they account by Dalles, equal to 32 Sols Lubs, or

3 Shil-

3 Shillings Sterling. In *Denmark*, by Rixdollars, Hors, and Schellings; the Rixdollar divided into 4 Hors, and the Hor into 2 Schellings. In *Muſcovy*, they account by Roubles, Altins, and Grifs or Grives. The Rouble equal to 100 Copecs, or 2 Rixdollars, or 9 Shillings Sterling; divided into 10 Grifs; 3 Altins ½ make the Grif, or 10 Copecs; the Copec at 13 Pence ¾ Sterling.

Turkiſh MONEYS *of Account*. The *Turks*, both in *Europe*, *Aſia*, and *Africa*, account by Bourſes or Purſes; either of Silver or Gold (the laſt only uſed in the Seraglio) with half Purſes of Gold, call'd alſo Rizers. The Purſe of Silver equal to 1500 *French* Livres, or 112 *l.* 10 *s.* Sterling. The half Purſe in proportion. The Purſe of Gold 15000 Sequins, equal to 30000 *French* Crowns, or 6750 Pounds Sterling; ſeldom uſed but for Preſents to Favourites: So that a Purſe, ſimply, ſignifies a Purſe of Silver, or 1500 Livres. They are call'd Purſes, becauſe all the *Money* in the Treaſury of the Seraglio is kept in Leathern Bags or Purſes, of thoſe Contents. The Merchants alſo uſe *Dutch* Dallers, call'd Aſlani or Abouquels, with Meideins and Aſpres. The Daller equal to 33 Meideins, and the Meidein to 3 Aſpres; the Aſpre to ½ Penny Sterling.

Perſian MONEYS *of Account*. In *Perſia*, they account by the Toman (call'd alſo Man, and Tumein) and the Dinarbiſti. The Toman is compoſed of 50 Abaſſi's, or 100 Mamoudi's, or 200 Chapes, or 10000 Dinars; which accounting the Abaſſi on the foot of 18 *French* Sols, or the Dinar on that of a Denier, amounts to 3 *l.* 12 *s.* 6 *d.* Sterling the Toman. They alſo account by Larins, eſpecially at *Ormus*, and on the Coaſts of the *Perſian* Gulph. The Larin equivalent to 11 Pence Sterling; and on that footing uſed alſo in *Arabia*, and a great part of the *Eaſt Indies*.

Chineſe MONEYS *of Account*, are the Pic, Picol, and Tael; which tho in effect Weights, do likewiſe ſerve as *Moneys of Account*; obtaining in *Tunquin* as well as *China*. The Pic is divided into an hundred Cati's, ſome ſay 125. The Cati into 16 Taels; each Tael equal to 1 Ounce 2 Drachms. See *Chineſe* COINS. The Picol contains 66 Cati's ¾; the Tael equivalent to 6 *s.* 8 *d.* Sterling.

Japoneſe MONEYS *of Account*, are the Schuites, Cockiens, Oebans or Oubans, and Taels. Two hundred Schuites are equal to five hundred *Dutch* Livres, or Pounds; the Cockien equal to ten *Low-Countrey* Livres; 1000 Oebans make 45000 Taels.

Mogul MONEYS *of Account*. At *Surat*, *Agra*, and the reſt of the Eſtates of the *Great Mogul*, they uſe Lacres, Acres, or Leeths; implying a hundred thouſand: Thus a Lacre of Roupias is a hundred thouſand Roupias; the Lacre being nearly on the footing of the Tun of Gold in *Holland*, and the Million of *France*.

MONEYS *of Account of other Iſlands and Coaſts of India*. Throughout *Malabar*, and at *Goa*, they uſe Tanga's, Ventins, and Pardoa's Xeraphin. The Tanga is of two kinds, *viz.* of good, and bad Alloy. Hence their Cuſtom is to count by good or bad *Money*. The Tanga of good Alloy is ⅕ better than the bad; ſo that 4 Tanga's good being allow'd the Pardoa Xeraphin, there will be required 5 of the bad; four Vintins good make a Tanga likewiſe good; 15 Barucos a Vintin. The good Baruco is equal to a *Portugueſe* Rey, a *French* Denier, or $\frac{1}{15}$ of a Penny Sterling. In the Iſland of *Java*, they uſe the Santa, Sapacou, Fardo's, and Cati's; which laſt *Money*, together with the Leeth, or Lacre, is much uſed throughout all the *Eaſt-Indies*. The Santa is 200 Caxas, or little Pieces of that Country hung on a String; and is equal to $\frac{10}{12}$ of a Penny Sterling. Five Santa's make the Sapacou. The Fardo equal to 2 *s.* 8 *d.* Sterling. The Cati contains 20 Taels; the Tael 6 *s.* 8 *d.* Sterling.

There are Iſlands, Cities, and States of the *Eaſt-Indies*, whoſe *Moneys of Account* are not here expreſs'd; partly becauſe reducible to ſome of thoſe above-mentioned; and partly becauſe we find no certain conſiſtent account of 'em in any of the Authors, or Memoirs herein conſulted.

African MONEYS *of Account*. From *Cape Verd*, to the *Cape of Good Hope*, all Exchanges and Valuations of Merchandizes are made on the foot of the Macoute and Piece: which tho no *Moneys of Account*, for thoſe Barbarians having no real *Moneys*, need no imaginary ones to value them by, yet ſerve in lieu thereof. At *Loango de Boirie*, and other Places on the Coaſt of *Angola*, the Eſtimations are made by Macoutes; and at *Malimbo*, and *Cabindo*, on the ſame Coaſt, the Negroes reckon by Pieces. Among the firſt, the Macoute is equivalent to ten: Ten Macoutes make an hundred; which likewiſe leaves us a kind of imaginary *Money*. To eſtimate any Purchaſe, Exchange, &c. they fix on the one ſide the number of Macoutes required, *e. g.* for a Negro; on the other for how many Macoutes they agree to receive each kind of Merchandize required for the Negro; ſo that there are ſeveral Bargains made for one. Suppoſe, *v. g.* the Slave be fix'd at 3500; this amounts to 350 Macoutes. To make up this number of Macoutes in Merchandizes, they fix the Price of each in Macoutes. Two *Flemiſh* Knives, *e. g.* are accounted one Macoute; a Copper-Baſon two Pounds Weight, three; a Barrel of Gun-Powder, three, &c. For the Piece, it ſerves in like manner to eſtimate the Value of Goods Duties, &c. on either ſide. Thus the Natives require ten Pieces for a Slave; and the *Europeans* put, *v. g.* a Fuſee at 1 Piece; a piece of Salampoures blue, at 4 pieces, &c.

MONEYS *of Account among the Antients*.

Grecian MONEYS *of Account*. The *Grecians* reckon'd their Sums of *Money* by Drachmæ, Minæ, and Talenta. The Drachma equal to 7 ¾ *d.* Sterling; 100 Drachmæ made the Mina, equal to 3 *l.* 4 *s.* 7 *d.* Sterling; 60 Minæ made the Talent, equal to 193 *l.* 15 *s.* Sterling: Hence 100 Talents amounted to 19375 *l.* Sterling.

The Mina and Talentum indeed, were different in different Provinces: Their Proportions in *Attic* Drachms are as follow. The *Syrian* Mina contain'd 25 *Attic* Drachms; the *Ptolemaic* 33 ⅓; the *Antiochic* and *Eubœan* 100; the *Babylonic* 116; the greater *Attic* and *Tyrian* 133 ⅓; the *Æginean* and *Rhodian* 160 ⅔.

The *Syrian* Talent contain'd 15 *Attic* Minæ; the *Ptolemaic* 20; the *Antiochic* 60; the *Eubœan* 60; the *Babylonic* 70; the greater *Attic* and *Tyrian* 80; the *Æginean* and *Rhodian* 100.

Roman MONEYS *of Account*, were the Seſtertii Nummi, Seſtertia, and Decies Seſtertium. The Seſtertius equal to 1 *d.* 3 *q.* Sterling. One thouſand of theſe made the Seſtertium, equal to 8 *l.* 1 *s.* 5 *d.* 2 *q.* Sterling. One thouſand of theſe Seſtertia made the Decies Seſtertium (the Adverb Centies being always underſtood) equal to 8072 *l.* 18 *s.* 4 *d.* Sterling. The Decies Seſtertium they alſo call'd Decies Centena millia Nummum. Centies Seſtertium, or Centies H S were equal 807291 *l.* 3 *s.* 4 *d.* Millies H S to 807291 *l.* 13 *s.* 4 *d.* Millies Centies H S 8880201 *l.* 16 *s.* 8 *d.*

MONEYERS, MONEYORS, or MONIERS, Officers of the Mint, who work, and coin Gold and Silver Money; and anſwer all the Waſte, and Charges. See MINT and COINING.

MONEYERS are alſo taken for *Bankers*; or thoſe who make a Trade of turning, and returning Money. See BANKER.

MONITORY *Letters*, are Letters of Admonition, or Warning, ſent from an Eccleſiaſtical Judge upon Information of Scandals and Abuſes within Cognizance of his Court.

MONOCHORD, a muſical Inſtrument wherewith to try the Variety and Proportion of muſical Sounds. See TUNE.

It is compos'd of a Rule, divided and ſubdivided into divers Parts, whereon there is a String pretty well ſtretch'd upon two Bridges, at each Extreme thereof. In the middle between both is a moveable Bridge, by whoſe means, in applying it to the different Diviſions of the Lnei, you find that the Sounds are in the ſame Proportion to one another, as the Diviſions of the Line cut by the Bridge were.

The *Monochord* is alſo call'd the *Harmonical Canon*, or *Canonical Rule*; becauſe ſerving to meaſure the Degrees of Gravity, and Acuteneſs of Sounds. See GRAVITY, &c.

There are alſo *Monochords* with 48 fix'd Bridges; the Uſe of all which may be ſupply'd by one ſingle moveable Bridge; which are placed in the middle, by only ſhifting it under new Chords or Strings, always repreſenting the entire Sound, or the open Note.

Pythagoras is held to have been the Inventor of the *Monochord*. *Ptolemy* examined his Harmonical Intervals with the *Monochord*. See CANON.

When the Chord was divided into equal parts, ſo that the Terms were as 1 and 1, they call'd them *Uniſons*; if they were as 2 to 1, *Octaves*, or *Diapaſons*; when they were as 8 to 2, *Fifths*, or *Diapentes*; if they were as 4 to 3, they called them *Fourths*, or *Diateſſerons*; if the Terms were as 5 to 4, *Diton*, or a *Tierce Major*; if as 6 to 5, a *Demi-Diton*, or a *Tierce Minor*; laſtly, if as 24 to 25, *Demi-diton* or *Dieze*. See UNISON, OCTAVE, DIAPASON, DIAPENTE, DIATESSERON, &c.

The *Monochord* being thus divided, was properly what they call'd a Syſtem, of which there were many kinds, according to the different Diviſions of the *Monochord*. See SYSTEM.

Dr. *Wallis* has taught the Diviſion of the *Monochord* in the *Philoſophical Tranſactions*; but thet Inſtrument is now diſuſed, the modern Muſic not requiring ſuch Diviſion.

MONOCHORD, is alſo uſed for any muſical Inſtrument, conſiſting of only one Chord, or String. See CHORD.

The Trumpet Marine is a *Monochord*. See TRUMPET.

The Word is *Greek*, form'd of μόνος *ſolus*, ſingle, and χορδὴ Chord.

MONOCHROMA, a Picture all of one Colour. See CAMIEUX, CLAIR OBSCURE, &c.

The Word is compounded of the *Greek* μόνος, ſingle; and χρωμα, Colour.

MONODY, Monodia, in the antient Poetry, a kind of mournful Song, or Ditty, ſung by a Perſon all alone; to utter his Grief.

The Word is compounded of μονος *ſolus*, and ωδη, Song.

MONOGAMY, the State or Condition of thoſe who have only married once. See Marriage, Bigamy, &c.

The Word is compouned of μόνος *ſolus*, and γάμος Marriage.

MONOGRAM, or Monogrammon, a Cypher, or Character compoſed of one or more Letters interwoven; being a kind of Abbreviation of a Name; antiently much uſed as a Badge, Seal, Arms, &c. See Seal, Cypher, &c.

Under the Eaſtern Empire, it is uſual to find M I K, which are the *Monogram* of *Maria*, *Jeſus*, *Conſtantine*.

The uſe of *Monograms* is of an antient ſtanding, as appears from *Plutarch*, and from ſome *Greek* Medals of the time of *Philip* of *Macedon*, *Alexander* his Son, &c.

The *Roman Labarum* bore the *Monogram* of Jeſus Chriſt, conſiſting of two Letters, a P placed perpendicular over the middle of a X, as we find it in ſeveral Medals of the time of *Conſtantine*; thoſe being the two firſt Letters of the Word ΧΡΙΣΤΟΣ, Chriſt. See Labarum.

The Kings formerly marked their Coins with their *Monogram*: Of this we have inſtances in *Charlemain*'s Coins. That Prince alſo uſed the *Monogram* for his Signature. *Eginard* gives us this reaſon for it, *viz.* that *Charlemain* could not write; and that having attempted in vain to learn in his grown Age, he was reduced to the neceſſity of Signing with a *Monogram*.

The Antients uſed *Monograms* as Notes or Abbreviations of Inſcriptions; for the underſtanding whereof we have expreſs Treatiſes of *Valerius Probus*, *Paulus Diaconus*, &c. See Character.

MONOLOGUE, a Dramatic Scene, wherein a Perſon appears alone on the Stage, and ſpeaks to himſelf. See Soliloquy.

The Word *Monologue* is derived from the *Greek* μονος *ſolus*, and λογος, Diſcourſe, Speech.

MONOMACHIA, a *Duel*, or ſingle Combat of Man againſt Man. See Duel.

Monomachia was antiently allow'd by Law for the Trial or Proof of Crimes. It was even permitted in pecuniary Cauſes, as appears by antient Records. It is now forbid both by the Civil and Canon Laws. See Combat.

Alciat has wrote a Treatiſe *de Monomachia*.

The Word comes from the *Greek* μονος *ſolus*, and μαχη Combate.

MONOME, in Algebra, a Quantity that has but one Denomination, or Name; as *ab*, *aab*, *aaabb*. See Quantity.

The *Monome* may be either Rational, or Irrational. See Rational, &c.

MONOPETALOUS, in Botany, a Term apply'd to Flowers which have only one undivided Petalum, or Leaf. See Flower, Petala, &c.

MONOPHYSITES, a general Name given to all thoſe Sectaries in the *Levant* who only own one Nature in Jeſus Chriſt.

The *Monophyſites* however, properly ſo call'd, are the Followers of *Severus*, and *Petrus Fullenſis*.

The Word comes from the *Greek* μόνος *ſolus*, and φυσις *Natura*.

MONOPOLY, an unlawful kind of Traffick, when one or more Perſons make themſelves ſole Maſters of any Commodity, with deſign to enhance its price; thoſe who have occaſion for it being obliged to purchaſe it at their hands, and on their own terms.

There are two kinds of *Monopolies*: The one, when a Merchant buys up, for inſtance, all the Corn of a Province, to retail it at an advanced Rate to the People.

The other when a Letter, or Patent is procured from the Prince, prohibiting any other Perſon to ſell any Commodity beſides the Patentee.

The Word is pure *Greek*, form'd of μονος and πωλεῖ, ſignifying to ſell alone.

Among the *Romans*, the Term was ſo odious, that *Tiberius*, as *Suetonius* relates, having occaſion to make uſe of it, begg'd leave of the Senate for it, as being borrow'd from the *Greek*.

MONOPTERE, a kind of Temple among the Antients, round, and without Walls; having a Dome ſupported with Columns. See Temple.

MONOPTOTE, Monoptoton, in Grammar, a Noun which has only one Caſe. See Case.

MONOPYRENEOUS *Fruits*, are ſuch as only contain one Kernel, or Seed. See Fruit.

MONORYME, a Poetical Compoſition, all the Verſes whereof end with the ſame Ryme.

Monorymes are ſaid to have been invented by the old *French* Poet *Leonin*, who addreſſed ſome *Latin* Verſes of this kind to Pope *Alexander* III. Whence they are alſo call'd *Leonine Verſes*. See Leonine.

They are but little uſed in *Engliſh*; more in *French*.

The Word comes from the *Greek* μόνος *ſolus*, and ῥυθμος Ryme. See Ryme.

MONOSTICH, Monosticon, an Epigram conſiſting of one ſingle Verſe.

MONOSYLLABLE, a Word of a ſingle Syllable; or, conſiſting of one, or more Letters pronounced all together. See Word and Syllable.
