In the *Rumen*, or firſt Ventricle of Camels, are found divers Sacculi, which contain a conſiderable Quantity of Water: Which is an admirable Contrivance for the Neceſſities of that Animal, which living in dry Countries, and feeding on dry hard Food, wou'd be in danger of periſhing, but for theſe reſervoirs of Water. See DRINK, THIRST, *&c.*

RUMINANT, in natural Hiſtory, an Animal which chews over again what it has eat before; popularly call'd *chewing the Cud*. See RUMINATION.

Joan. Con. Peyer has an expreſs Treatiſe *de Ruminantibus & Ruminatione*, where he ſhews, that there are ſome Animals which do really *ruminate*; ſuch are Oxen, Sheep, Deer, Goats, Camels, Hares, and Squirrels: Whereas others only appear to *Ruminate*; which he calls *Ruminantia ſpuria*; of which Number are Moles, Crickets, Bees, Beetles, Crabs, Mullets, and ſeveral other Fiſhes.

This latter Claſs, he adds, have their Stomachs compoſed of muſcular Fibres, by means whereof the Food is groun'd up and down, much as in real *Ruminants*.

Ruminants, Mr. *Ray* obſerves, are all Quadrupedal, Hairy, and Viviparous; ſome with hollow and perpetual Horns, others with deciduous ones. See QUADRUPED, HAIR, HORN, *&c.*

The horned *Ruminants* have all four Stomachs, appropriated to the Office; *viz.* the Κοιλία Μεγάλη of *Ariſtotle*, the *Venter Magnus*, or what we call the *Paunch* or *Inward*, which receives the Meat ſlightly chewed, retains it a-while, and then delivers it back again into the Mouth, which is what we call the *Cud*, to be re-chewed.—2°. The Κεκρύφαλος, or *Reticulum*, which we call the *Honey-Comb*, from its internal Coat being divided ſo into Cells, like *Honey-Combs*.—3°. The Ἔχῖνος, which Mr. *Ray* thinks hath been wrong tranſlated, *Omaſus*; and which he chuſes to call the *Echinus:* This being difficult to clear, our People throw it away, and call it the *Manifold*.—4°. The Ὑπυξον of *Ariſtotle*, by *Gaza* call'd the *Abomaſus*. See OMASUS, ABOMASUS, *&c.*

Again, all horned *Ruminant* Animals want the *Dentes Primores*, or broad Teeth in the upper Jaw; and have that kind of Fat, call'd *Suet*, *Sebum*, Στεαρ, which is harder and firmer, and leſs aquifiable in them, than the Adeps of other Animals. See FAT, SERUM, ADEPS, *&c.*

RUMINATION, an Action peculiar to a Claſs of Animals call'd *Ruminants*; whereby they return the Food they have formerly ſwallow'd, to be chew'd over again, and render'd more fit for Chyle. See RUMINANT.

Peyer defines *Rumination* a natural Motion of the Stomach, Mouth, and other Parts; By means of which the

Food

Food eaten, at firſt, haſtily, is return'd back again to the Mouth; where 'tis re-chew'd and ſwallowed a ſecond time; and that much to the Benefit of the Animal. See FOOD, CHYLE, MASTICATION, *&c.*

Burnet, in his *Theſaur. Med.* gives ſeveral Inſtances of Men that *ruminated*, from *Salmuthius*, *Rhodius*, &c.—Dr. *Slare* in the *Philoſ. Tranſact.* gives us a freſher Inſtance in one of our own Countrymen, living at *Briſtol*. His account, as 'tis curious, and may let us ſee a little how it fares with *ruminating* Animals; we ſhall here add.

" He begins to chew his Meat over again within a Quarter of " an Hour after Meals, if he drink with it; if not, ſomewhat " later. His chewing after a full Meal laſts about an Hour and " a half: And if he go to Bed preſently after Meals, he cannot " ſleep till the uſual time of chewing be over. The Victuals, " upon the return, taſte ſomewhat more pleaſantly than at firſt. " Bread, Meat, Cheeſe, and Drink, return much of ſuch Co- " lours as they wou'd be of were they mix'd together in a Mor- " tar. Liquids, as Spoon-Meat, return to his Mouth all one as " dry and ſolid Food. The Victuals ſeem to him to lye heavy " till they have paſs'd the ſecond chewing; after that it paſſes " clean away. If he eat variety of things, that which paſſes " down firſt comes up again firſt. If the *ruminating* Faculty " chance to leave him, it ſignifies Sickneſs; and 'tis never well " with him till it returns. He is about twenty Years of Age, " and was always thus ſince he can remember. His Father " does the like, ſometimes; but in ſmall Quantities.

RUMMAGE, in the Sea Language, ſignifies to clear a Ship's Hold, or remove Goods or Luggage from one Place to another. See HOLD.

The Word is probably derived from the *Saxon raum*, Room, or Space.

RUN *of a Ship*, ſo much of her Hull as is always under Water; growing thinner and lanker by Degrees, from the Floor-Timbers to the Stern-Poſts. See SHIP.

This is alſo call'd her *Way afterward on.*—A Ship is ſaid to have a *good Run*, when it is long, and the Water paſſes cleverly to her Rudder, her Tuck not lying too low, which is of great Importance to her Sailing. If the Water do not come ſtrongly to her Rudder, by reaſon of her being built too broad below, ſhe cannot ſteer well; and a Ship that can't ſteer well, cannot keep a good Wind, nor will have any freſh Way through the Sea, but will ſtill be falling to Leeward. See RUDDER, STEERING, *&c.*

And yet a Ship with a large and good *Run*, loſes much Stowage, becauſe made narrow below. See HOLD, BURTHEN, *&c.*

RUNDLES, or ROUNDELS, in Heraldry, the ſame as *Balls* or *Pellets*. See BALL and PELLET.

RUNDLET, or ROUNDLET, a ſmall Veſſel, containing an uncertain Quantity of any Liquor, from three to twenty Gallons. See MEASURE, *&c.*

RUNIC, a Term applied to the Language and Letters of the antient *Goths*, *Danes*, and other Northern Nations.

Some have been of Opinion that *Gulphilas*, or *Ulphilas*, a *Daniſh* Biſhop about the Year 370 was the firſt Inventor of the *Runic Character*: But *Olaus Wormius* ſhews at large that *Ulphilas* could only be the firſt who taught them to Foreigners; for that the Characters themſelves were older than he. See CHARACTER.

'Tis ſuppoſed they were called *Runic*, as being myſterious and ſcientifical, like the *Egyptian* Hieroglyphicks.

The *Runic* Language is more frequently call'd *Sclavonic*. See SCLAVONIC. See alſo *Wormius de Literatura Runica*; and *Hicks's Theſaurus* of the antient Northern Languages.

There are ſome *Runic Medals* in the Cloſets of the Curious; and ſome more Modern *Daniſh* and *Engliſh* Medals, the Inſcriptions whereof are *Latin*, and the Character *Runic*. See TALISMAN.

RUNNER, in the Sea Language, a Rope with a Block or Pulley at one End, and a Hook at the other; for hoiſting of Goods. See ROPE.

To *overhale the Runner*, is to pull down the hooked End, and hitch it into the Sling.

RUNNET, or RENNET, an acid Juice, found in the Stomachs of Calves that have fed on nothing but Milk, and are kill'd before the Digeſtion be perfected. See MILK.

'Tis this *Runnet* is chiefly uſed to curdle or turn Milk for Cheeſe. See CURDLING, CHEESE, *&c.*

Its proper Place is the *Abomaſus*.—The like Matter is alſo ſaid to be found in Goats and Hares. See ABOMASUS.

The longer the *Runnet* is kept, the better it is.—Though it readily coagulates Milk; yet if put into it when already coagulated, it diſſolves it. See COAGULATION and DISSOLUTION.

If Salt be put in the Milk, e're the *Runnet* be applied, it prevents its Coagulation.—If Salt be put in afterwards, it hardens the Coagulum. See SALT.

Ariſtotle will have the *Runnet* to be the proper Subſtance of the Milk; but he is miſtaken when he ſays 'tis found in all Animals which give Milk, eſpecially all Ruminants. See RUMINANT.

RUNNING *of Goods*, a clandeſtine landing of Goods without paying the legal Cuſtoms or Duties for the ſame. See SMUGLING, OWLER, DUTY, CUSTOM, *&c.*

RUPEE, or ROUPIA. See ROUPIA.

RUPTURE, in Medicine, call'd alſo *Hernia*, and popularly *Burſtneſs*; is when the Rim or thin Film or Caul, which holds up the Inteſtines, is broken or over-ſtrained or ſtretch'd, ſo as the Guts fall down either into the Groin, Cod, or Flank. See HERNIA.

According as the *Rupture* happens in the *Abdomen*, *Inguen*, or *Scrotum*, it is call'd *Exomphalus*, *Hernia Inguinalis*, or *Hernia Scroti*. See EXOMPHALUS, *&c.*

RURAL, or RUSTIC, ſomething that relates to the Country. See RUSTIC.

The Word is form'd of the *Latin Rus*, *Ruris*, Country.

RURAL *Dean*, in the antient Church, was a Temporary Dean, appointed by the Biſhop or Archbiſhop, for ſome particular Miniſtry, without Canonical Inſtitution. See DEAN.

The *Rural* Dean is the ſame with what in the Laws of *Edward* the Confeſſor, was call'd *Decanus Epiſcopi*, the *Biſhop's Dean*.

Heylin obſerves that each Dioceſe has in it one or more Archdeaconries for diſpatch of Eccleſiaſtical Buſineſs; and each Archdeaconry is ſubdivided into *Rural Deaneries*, fewer or more according to the extent thereof; the Deans whereof were alſo call'd *Archipresbyteri*, and *Decani Chriſtianitatis*. See ARCHIPRESBYTERI, *&c.*

The *Rural* Deans ſeem to have been the ſame with what in other Parts were call'd *Choreſpiſcopi*. See CHORESPISCOPUS, *&c.*

RUST *of a Metal*, the Flowers or Calx thereof; procured by corroding and diſſolving its ſuperficial Parts by ſome menſtruous Fluid. See METAL, CALX, FLOWER, MENSTRUUM, *&c.*

Water is the great Inſtrument or Agent in producing *Ruſt*; the Air apparently *ruſts* Bodies, but 'tis only in Virtue of the Water it contains. See AIR.

Hence, in a dry Air, Metals remain a long time without contracting *Ruſt*; and hence Oils and other fatty Bodies ſecure Metals from *Ruſt*; Water being no Menſtruum to Oil, *&c.* And therefore not able to make its Way through it. See WATER, *&c.*

All Metals are liable to *Ruſt*; even Gold it ſelf, though generally held incapable thereof, grows *Ruſty* if expoſed to the Fumes of Sea-Salt. See GOLD.

The reaſon why it is ſo rarely found to *ruſt*, is that Sea-Salt, which is the only Salt that will prey upon it, is of a very fix'd Nature, and therefore little of its Effluvia or Exhalations are found floating in the Air. See GOLD, *Aqua* REGIA, VOLATILISATION, *&c.*

Ruſt is uſually ſuppoſed a Corruption of the Metal, but without much Foundation: 'Tis the very Metal itſelf, only under another Form; and accordingly we find that *Ruſt* of Copper may be again turned into Copper.

The *Ruſt* of Copper, call'd *Ærugo*, makes what we call *Verdigreaſe*. See VERDIGREASE.

Ceruſs is made of Lead converted into *Ruſt* by Vinager. See CERUSS.—Iron, in time, turns wholly into *Ruſt*, unleſs preſerv'd from the Air by Paint or Varniſh. See IRON, PAINTING, *&c.*

RUSTIC *Gods*, in Antiquity, *Dii Ruſtici*, were the Gods of the Country; or thoſe who preſided over Agriculture, *&c.* See GOD, *&c.*

Varro invokes the twelve *Dii Conſentes*, as the principal among the *Ruſtic* Gods; *viz. Jupiter*, *Tellus*, the *Sun*, *Moon*, *Ceres*, *Bacchus*, *Rubigus*, *Flora*, *Minerva*, *Venus*, *Lympha*, and *Good Luck*.—Beſides theſe twelve Arch-*Ruſtic* Gods, there were an Infinity of leſſer ones. As *Pales*, *Vertumnus*, *Tutelina*, *Fulgor*, *Sterculius*, *Mellona*, *Jugatinus*, *Collinus*, *Vallonia*, *Terminus*, *Sylvanus*, and *Priapus*.—*Striuvius* adds, the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the Empire over all the *Ruſtic* Gods to the God *Pan*. See SATYR, FAUN, SYLVAN, NYMPH, DRYADES, PANES, *&c.*

RUSTIC, in Artichitecture, a Manner of building in Imitation of Nature, rather than according to the Rules of Art. See BUILDING and ARCHITECTURE.

RUSTIC *Work*, is where the Stones in the Face, *&c.* of a Building, inſtead of being ſmooth, are hatch'd or pick'd with the Point of a Hammer.

RUSTIC-*Quoins*, by *Vitruvius* call'd *Lapides Minentes*; See *Ruſtic*-QUOIN.

RUSTIC *Order*, is an Order with *Ruſtic* Quoins, *Ruſtic* Work, *&c.* See ORDER.—*Felibien* ſays, 'tis properly where the ſeveral Parts of the five Orders are not exactly obſerv'd; but this confounds *Ruſtic* with *Gothic*. See GOTHIC.

RUT, in Hunting, *&c.* a Term uſed for the Venery, or Copulation of Deer.—*For the Terms which obtain in reſpect of other Beaſts of Game, with the Noiſe they make during the Act*, ſee HUNTING.

The *Rutting*-time with the Hart begins about the middle of *September*, and holds two Months; the older they are, the better, and the more beloved by the Hinds; and the earlier do they go to *Rut*.—At this Time they will turn Head, and furiouſly make at any living Creature. 'Tis eaſy killing them now; their whole Buſineſs being to ſcent and purſue the Track of the Females; ſcarce feeding at all. The young Herd are forced to fly with great Precipitancy when the Hart comes in Sight of his Mate. If there be any other of Bulk, they will diſpute it very hotly with their Horns.—As the Seaſon expires, they withdraw and dig themſelves Holes wherein to lye to aſſwage the ſtrong Savour of their Luſt: When become a little ſweet, they return to ther Paſture, and live in Herds. See *Hart*-HUNTING.

The *Rutting* or Tourning-time of the Roe-buck begins in *October*, and only laſts 12 or 15 Days. This over, he caſts his Horns. See HEAD.—After the Hind is fill'd, ſhe keeps no more Company with the Male 'till ſhe be deliver'd.—But the Doe always accompanies her Paramour 'till her time approaches, when ſhe retires, for the ſafety of her young, which he wou'd otherwiſe kill. See *Roe-buck* HUNTING.

RYPTICKS, in Medicine, detergent Remedies. See DETERGENT.—The Word is form'd of the *Greek* ῥυπτειν, to wipe, cleanſe.

S.

S, A Conſonant, and the Eighteenth Letter of the Alphabet. 'Tis accounted one of the four hiſſing Conſonants; the other three being Z, J, and CH. 'Tis alſo held a Semi-vowel, as forming a kind of imperfect Sound without the Aſſiſtance of any Vowel. Some of the Ancients avoided all Uſe of the S very ſtudiouſly; particularly *Pindar*, who ſcarce has it once in all his Verſes. And hence alſo in *Plautus*, and ſome others of the *Latin* Poets, we find it cut abruptly off, as in *dignu'*, *omnibu'*, &c. Others, on the contrary, affected the Uſe of it every where, inſerting it where 'twas not wanted; as *Caſmenæ* for *Camenæ*, *duſmoſæ* for *dumoſæ*, *cæſna* for *cæna*, &c. Of all others, 'tis the neareſt a-kin to the *r*; whence it was frequently changed, by reaſon of its diſagreeable Sound, into *r*. Thus the *Valerii*, *Furii*, &c. were at firſt call'd *Valeſii*, *Fuſii*, &c. and what we now call *ara*, *arena*, *carmen*, *feriæ*, *lares*, &c. were anciently wrote *aſa*, *aſena*, *caſmen*, *feſiæ*, *laſes*. Add to this, that the Latin Nouns now terminated in *or*, as *arbor*, *labor*, &c. anciently ended in *s*, as *arbos*, *labos*, &c. In the Inflections, 'tis variouſly changed: Sometimes into *rs*, as *flos*, *floris*, ſometimes into *n*, as *ſanguis ſanguinis*, ſometimes into *d*, as *pes pedis*; ſometimes into *t*, as *Nepos Nepotis*. On the contrary, in Verbs, 'tis frequently put for other Letters, for *b*, as in *jubeo juſſi*; for *c*, as in *parco parſi*; for *d*, as in *ludo luſi*; for *g*, as in *ſpargo ſparſi*, &c. The *Latins* frequently changed the *Greek s* into *l*, as Ἀννίβας *Annibal*; into *d*, as μεσον *medium*, &c. The double *s* was frequently changed into *x*, as πισσα *pix*; and ſometimes even the ſingle one, as Αἰας *Ajax*. The old and the new Orthography of the *French*, differ chiefly on the Uſe of the *s*; the latter omitting it in writing where 'tis not heard in the Pronunciation, and the former retaining it; thus the Followers of the one, particularly the Academy in their Dictionary, write *tempeſte*, *huiſtre*, *fluſte*; thoſe of the other, *tempête*, *huître*, *flûte*, &c.

The S was a Numerical Letter among the Ancients, ſignifying Seven: according to the Verſe,

S Verò ſeptenos numeratos ſignificabit.

In Books of Navigation, &c. S. ſignifies *South*, S. E. *South-Eaſt*, S. W. *South-Weſt*, S. S. E. *South South-Eaſt*, &c. *See* WIND. S. A. is frequently uſed in Medicinal Preſcription as an Abbrevation of *Secundum Artem*, According to the Rules of Art. Sometimes it alſo ſtands for *Socius*, Fellow, Member, and ſometimes for *Societas*, as R. S. S. *Regiæ Societatis Socius*, Fellow of the Royal Society.

SABÆANS, a Sect of Idolaters, much ancienter than *Moſes* and the *Jewiſh* Law, call'd alſo *Sabians*, *Sabaites*, *Zabæans*, *Tſabæans*, &c. See SABAISM. The *Sabæans* were very numerous throughout the Eaſt. In later Times they have mixed ſomething of Chriſtianity with their Superſtition. They ſet a great Value on the Baptiſm of St. *John*; whence they have been alſo denominated *Chriſtians of St.* John. Some, indeed, doubt whether the *Sabæans* be the ſame with the Chriſtians of St. *John*; but *Father Angelo de St. Joſeph*, a *Carmelite* Miſſionary, and *Maraci*, in his Notes on the *Alcoran*, aſſert it expreſly. Be this as it will, *Mahomet*, in his *Alcoran*, and the *Arabian* Authors ſince him, make frequent mention of them. *Beidavius*, in his Comment on the *Alcoran*, makes them a kind of Mean between the Chriſtians and the Maguſians, who are the Followers of the Magi, among the *Perſians*. He adds, That they pretend to be of the Religion of *Noah*, and *Keſſæus*: That they pretend to be in Poſſeſſion of the Books of *Seth* and *Enoch*; though they own none of the Books of Scripture. Some charge them with worſhipping the Stars, and others the Angels, or *Demons*. *Maimonides* attributes both to them; as is obſerved under the Article *Sabaiſm*.

Abu Joſeph Aſcheus, and *Keſſæus* place the *Sabæans* about *Charan*, or *Charres*, and *Ghezira* in *Meſopotamia*; which Opinion is confirmed by this that their Books are in the *Chaldee* Tongue, tho' in a Character very different from the *Chaldee*. *Hottinger* ſets aſide the common Derivation of *Sabæan* from צבא *Militia*, *Hoſt*; and will not have it the Name of a Sect of Religion, but of a People in *Arabia Felix*, the Deſcendants of *Saba*, Grand-ſon of *Cham*. But the Criticks, to a Man, cenſpire againſt this Opinion.

SABAISM, a Kind of Idolatry very ancient; the firſt that ever entered into the World. *Sabaiſm* conſiſted in the Worſhip and Adoration of the Stars, as the Scriptures call צבא שמים *Tſeba Schamaim*, or *Seba Schamaim*, Hoſt or Militia of the Heavens; whence ſome of the Moderns have formed the Word *Sabaiſm* for the Worſhip of the heavenly Bodies, and *Sabæans* for the Worſhippers. But as the *Hebrew* Word, whence theſe are form'd, is wrote with a צ *Tzade*, which ſome expreſs in the modern Tongues by an *s*, ſome by a *z*, others by *ts*, and others by *tz*; hence ariſes a great many different Manners of writing the Word, among different Authors. Some writing it *Sabæans*, others *Zabiens*, or *Zabæans*, or *Zabæiſts*, as *Buxtorf*; others *Tſabians*, and others *Tſabæans*. *Maimonides* makes frequent mention of this Idolatry in his *More Nebuihim:* 'twas very general, he obſerves, in the Time of *Moſes*. The Retainers hereto taught, That God was the Spirit of the Sphere, that is the Soul of the World; *Abraham*, he adds, was brought up in the Doctrine of the *Sabæans*, who admitted no other Gods but the Stars, and who in their Books, many of which have been tranſlated into *Arabic*, maintain expreſly, That the fixed Stars and Planets, are inferior Gods, and the Sun and Moon the ſuperior ones. *Abraham* at length, he tells us, oppoſing theſe Errors, firſt aſſerted the Exiſtence of a Creator diſtinct from the Sun. The King of the *Cuthæans* clapt him up in Priſon; but he ſtill perſiſting, that Prince, from an Apprehenſion of his diſturbing the State by teaching a new Religion, confiſcated his Goods, and baniſhed him to the Extremities of the Eaſt. This Relation, he tells us, is found in a Book intitled, חעכורה חנכטיה, *The Religion of the* Nabathæans. And adds further, That the *Sabæans*, to the Adoration of the Stars, joined a great Reſpect for Agriculture; ſet a great Value on Cattle and Sheep; and taught, That it was unlawful to kill them. He even adds, That they worſhipp'd *Demons*, under the Form of Goats, and eat the Blood of Animals, (tho' they judged it unclean,) merely becauſe they imagined it was the Food of *Demons*. This is an Abridgment of what that *Rabbin* gives us of *Sabaiſm*; from whence, 'tis eaſy judging of what ſome People tell us, that *Sabaiſm* is a Mixture of *Judaiſm*, *Chriſtianity*, *Mahometaniſm*, and *Paganiſm*. The Truth is, The Worſhip of the Stars was eſtabliſhed long before not only Chriſtianity, but even before the Law of *Moſes*. Indeed ſome of the latter *Sabæans* have given into ſome Articles of almoſt all Religions. See SABÆANS.

SABATHIANS, a Sect of Hereticks thus called from *Sabathius*, their Leader, who lived under *Diocleſian*, was firſt a *Jew*, then converted, and made a Prieſt by *Marcian*; but afterwards left the Sect of *Marcianites*, on Account of the Celebration of *Eaſter*, which he would have on the Fourteenth Day of the Moon; whence he, and his Adherents were called *Quartodecimans:* Which ſee. The *Sabathians* are recorded by Eccleſiaſtical Hiſtorians, as having a great Abhorrence of the Left hand; ſo as to make it a Point of Religion, not to receive any Thing therewith. This Cuſtom, which is now become a Piece of Manners among us, was then eſteemed ſo ſingular, that the *Sabathians* were thence denominated *Ariſteri*, *q. d. Iniſtri*, left-handed.

SABBATARIANS, a Sect of Anabaptiſts, in the XVIth Century; thus called, becauſe they held the *Jewiſh* or *Saturday*-Sabbath; from a Perſuaſion that it was never abrogated in the New Teſtament by the Inſtitution of any other. See ANABAPTIST.

SABBATH, the Seventh Day of the Week, held as a Feaſt among the *Jews*, in Memory of God's reſting on the Seventh Day of the Creation. See WEEK. The Word is pure *Hebrew*, and ſignifies *Ceſſation* or *Reſt*. *Philo* calls it, Τὸ κοσμου γενεσιον, The World's Birth-day. 'Twas appointed from the Beginning by God himſelf, *Gen.* ii. 2, 3. and by him ſet apart for the Commemoration of the great Work of the Creation; and when it had fallen into Neglect after the Flood, was re-eſtabliſhed by him, upon his ſettling the *Jewiſh* Polity after the Return out of *Egypt*. The Chriſtians alſo apply it, by Extenſion, to the firſt Day of the Week, popularly called *Sunday*, or *Lord's-Day*; as inſtituted by the Apoſtles to take Place of the *Jewiſh Sabbath*, and by us obſerved in Remembrance, not of the Creation, but of the Work of Redemption, being compleated by our Saviour's Reſurrection on that Day. The *Jews* had alſo their *Sabatick-Year*, which was every Seventh Year; Wherein they were obliged to ſet their Slaves at Liberty, and to let their Lands lie idle.

Thoſe who diſpute the Divine Appointment of a Chriſtian *Sabbath*, yet allow the Moral Neceſſity thereof, as a wiſe Deſignation of Time for the recruiting of our Bodies, and at the ſame Time, keeping up a Senſe of the great

 Benefits

Benefits we have received from God, and a ſpiritual Temper of Mind. By allowing Six Days to labour, the Poor hath Time to earn his Bread, and the Man of Buſineſs Time to diſpatch his Affairs. Had more Time been allotted to Labour and Buſineſs, and none to Reſt; our Bodies would have been too much fatigued and waſted, and our Minds too long engaged about worldly Matters, ſo as to have forgotten Divine Things. Greedy People, without ſuch an Injunction, would ſcarce have favoured their own Bodies, much leſs their Servants, Slaves, Cattle, &c. The Creation therefore, would have ſuffered, had it not been provided for by the Inſtitution of a *Sabbath*. See SUNDAY.

SABBATH, is alſo uſed for a nocturnal Aſſembly Witches are ſuppoſed to hold on *Saturdays*, where the Devil appears in Form of a Goat, around whom they make ſeveral Dances, and magick Ceremonies, amply deſcribed in their Books of *Demonomania*. To prepare themſelves for this Meeting, they take certain ſoporific Drugs; after which they are fancied to fly up the Chimney, and to be ſpirited through the Air to the *Sabbath* on a Switch.

SABBATH-*days-journey*, is fixed by the Criticks, to a Space of 729 *Engliſh* Paces and 3 Feet; or of 2000 Cubits, or 3648 Feet. See MEASURE.

SABELLIANS, a Sect of ancient Hereticks in the Eaſt, who reduced the Three Perſons in the Trinity, to Three States or Relations; or rather reduced the whole Trinity to the One Perſon of the Father; making the Word and the Holy Spirit to be Virtues, Emanations, or Functions thereof. *Sabellius*, their Chief, firſt broached this Doctrine, in the Third Century, in a City of *Lybia*, called *Ptolemais*. He taught, That he, who in Heaven is the *Father* of all Things, deſcended into the Virgin, became a Child, and was born of her as a *Son*; and that having accompliſhed the Myſtery of our Salvation, he diffuſed himſelf on the Apoſtles, in Tongues of Fire; and was then denominated the *Holy Ghoſt*. *Epiphanius* tells us, That the God of the *Sabellians*, whom they called the *Father*, reſembled the *Sun*, and was a mere *Subſtratum*; whereof the *Son* was the illuminative Virtue or Quality, and the Holy Spirit the warming Virtue. The *Word*, they taught, was darted, like a Divine Ray, to accompliſh the Work of Redemption; and that, being re-aſcended to Heaven, as the Ray returns to its Source, the Warmth of the Father was communicated, after a like Manner, to the Apoſtles. The Council of *Antioch*, held by the *Euſebians* in 345, tells us, That, at *Rome*, they were called *Patripaſſians*, who, in the Eaſt, were called *Sabellians*. See PATRIPASSIAN.

SABLE, in Heraldry, a black Colour, in the Arms of Gentlemen; In thoſe of Nobility, it is called *Diamond*; and in the Coats of Sovereign Princes, *Saturn*. It is expreſſed in Engraving by Strokes drawn perpendicularly acroſs each other, as in the adjoyning Figure. The Name is borrowed from the little Animal called *Sable*, becauſe of its black Colour.

SABRE, a Kind of Cutting-ſword, or Cimetarre, having a very broad, heavy Blade; thick at the Back, and a little crooked towards the Point. See SWORD. The *Turks* are very expert in the Uſe of the *Sabre*, which is the Weapon they ordinarily wear by their Side, &c. With this, 'tis ſaid, they'll cleave a Man quite down, at a ſingle Stroke. The Word is formed from the *German Sabel*, of the *Sclavonic Sabla Cuttelas*.

SAC, or *Sacha*, in Law, a royal Privilege which a Lord of a Manor claims to have in his Court, of holding Plea in Cauſes of Debate ariſing among his Tenants and Vaſſals, and of impoſing and levying Fines and Amercements touching the ſame. *Raſtal* and ſome others, define *Sac* to be a Forfeiture or Amercement itſelf, pay'd him who denies that which is proved againſt him, to be true, or affirms that to be true which is not ſo. The Word is *Saxon*, and literally ſignifies, Cauſe, Conteſt, &c.

SACÆA, in Antiquity, a Feaſt which the ancient *Babylonians*, and other *Orientals*, held annually in Honour of the God *Anaitides*. The *Sacæa* were in the Eaſt what the *Saturnalia* were at *Rome*, *viz.* a Feaſt for the Slaves. One of the Ceremonies hereof, was to chuſe a Priſoner condemned to Death, and allow him all the Pleaſures and Gratifications he would wiſh, e'er he were carried to Execution. See SATURNALIA.

SACCADE, in the Manage, a violent Check the Cavalier gives his Horſe, by drawing both the Reins very ſuddenly; uſed when the Horſe bears too heavy on the Hand. The *Saccade* is a kind of Correction rarely to be uſed; for fear of ſpoiling the Horſe's Mouth.

SACCHARUM. See SUGAR.

SACCOPHORI, a Sect of ancient Hereticks, thus called from the *Greek*, σακκος a Sack, and φέρω I bear, becauſe they cloathed themſelves continually in Sackcloth, and affected a world of Auſterity and Penance. We know but little of their Tenets: In all Probability they were the ſame with the *Maſſalians*; Which ſee. The Emperor *Theodoſius*, made a Law againſt the *Saccophori* and *Manichees*.

SACCO BENEDITTO, or *Sac-beni*, a Kind of linnen Garment given to Perſons condemned by the Inquiſition, to be wore at their Execution. 'Tis in Form of a Scapulary, of a yellow Colour, with two Croſſes on it; and painted over with Devils and Flames. The *Latins* call it *Habitello*, and the *Spaniards*, *Sacribenito*, and *Zamaretta*. 'Twas likewiſe in Uſe for public Penitents in the primitive Church, and called alſo *Samarra*, *San benito*, &c.

SACCULUS, a Diminutive of *Saccus*, a Bag; uſed in Anatomy, to expreſs ſeveral Parts of the Body, bearing ſome Reſemblance thereto; as *Sacculus Chyliferus*, or *Roriferus*, a Paſſage which makes the beginning of the *Thoracic Duct*. See THORAX.

SACCULUS *Cordis*, the *Pericardium*. Which ſee.

SACCULUS *Lacrymalis*, a little membranous Bag, into which the *Puncta Lacrymalia* of the Eye open; and which is, itſelf, the Entrance of a Canal, by which the Liquor ſeparated in the *Glandula Lacrymalis*, is diſcharged into the Cavity of the Noſe. 'Tis the Ulceration of this *Saccus*, that makes the *Fiſtula Lacrymalis*. See FISTULA.

SACCULI *Adipoſi*, little Cells or Veſicles, in the *Membrana adipoſa*, wherein the Fat of the Body is contained. See FAT.

SACCULUS *Medicinalis*, a topical Medicine, applied to ſome painful Part; conſiſting of Herbs or Drugs incloſed in a Linnen-Bag.

SACCULI *Medicinales*, are alſo Bags of Ingredients, ſuſpended in Liquors, in making Diet-drinks.

SACER, in Anatomy, a Muſcle ariſing from the Hind-Part of the *Os Sacrum*, and running along under the *Longiſſimus Dorſi*. With its ſeveral Tendons, it lays hold on the Spine, and every Tranſverſe Proceſs of the Loins, and the loweſt of the Back. It aſſiſts in erecting the Trunk. See MUSCLE.

SACER *Ignis*, SACER *Morbus*, } See { HERPES *Excedens*. EPILEPSY.

SACERDOTAL, ſomething belonging to the Prieſthood. See PRIEST. *Sacerdotal* Benefices are ſuch as cann't be legally held by any but Perſons in Holy Orders: ſuch are all Cures of Souls, Biſhopricks, &c. The *ſacerdotal* Ornaments, are thoſe wherewith the Prieſts are cloathed, when they officiate, &c. The Word is formed from the *Latin*, *Sacerdos* Prieſt, of *Sacer* Holy.

SACK OF WOOL, is a determinate Quantity, containing juſt 26 Stone, and every Stone is 14 Pounds, by 14 *E.* 3. Stat. 1. c. 2. But in *Scotland*, a *Sack* is 24 Stone, and each Stone contains 16 Pounds. A *Sack of Cotton Wool*, is a Quantity from an hundred and half to 400 Weight. See WOOL.

SACKS *of Earth*, uſed in Fortification, are large Bags full of Earth, made of coarſe Cloth, the largeſt of about a Cubick-foot wide, and the leſſer ſomewhat more than half a Foot. They are uſed on ſeveral Occaſions; particularly for making Retrenchments in haſte, to place on Parapets, or the Head of the Breaches, &c. or to repair them when beaten down. They are of good Uſe alſo, when the Ground is rocky, and affords not Earth to carry on the Approaches, becauſe they can eaſily be brought on, and carried off; the ſame Bags, on Occaſion, are uſed to carry Powder in, of which, they hold about Fifty Pounds a piece.

SACKBUT, a muſical Inſtrument of the Wind Kind; being a kind of Trumpet, tho' different from the common Trumpet both in Form and Size. 'Tis very fit to play Baſs, and is contrived ſo as to be drawn out or ſhorten'd according to the Gravity or Acuteneſs of the Tones. The *Italians* call it *Trombone*, the *Latins*, *Tuba Ductilis*. It takes aſunder into Four Pieces, or Branches; and hath frequently a Wreath in the middle; which is the ſame Tube, only twiſted twice, or making two Circles in the middle of the Inſtrument; by which Means, it is brought down one fourth lower than its natural Tone. It has alſo two Pieces or Branches on the Inſide, which don't appear, except when drawn out by means of an Iron Bar, and which, lengthen it to the Degree requiſite to hit the Tone required. The *Sackbut* is uſually Eight Foot long, without being drawn out, or without reckoning the Circles. When extended to its full Length, 'tis uſually Fifteen Foot. The Wreath is Two Foot Nine Inches in Circumference. It ſerves as Baſs in all Conſorts of Wind Muſic.

There are *Sackbuts* of different Sizes, ſerving to execute different Parts; particularly a ſmall one, called by the *Italians*, *Trombone picciolo*, and the *Germans*, *Cleine alt-*

alt-poſaune, proper for a Counter-Tenor. The Part aſſigned it, is uſually called *Trombone primo*, or I°. There is another larger, called *Trombone maggiore*, which may ſerve as a Tenor: Its Part is uſually called *Trombone ſecondo*, or II°. or 2°. There is a third ſtill bigger, called *Trombone groſſo*; its Part is called *Trombone terzo*, or III°. or 3°. Laſtly, there is another which exceeds all the reſt, and which is much heard in the Muſic, eſpecially in the Baſs; its Part is called *Trombone quarto*, or IV°. or 4°. or ſimply *Trombone*. It has uſually the Key of *Fa*, *ut fa* on the fourth Line; tho' frequently alſo on the fifth Line from the Top, by Reaſon of the Gravity or Depth of the Sounds.

SACRAMENT, in Theology, is defined, in the general, A Sign of a holy or ſacred Thing. In which Senſe, the Word includes both the Sacraments of the Law of Nature, as ſound Morality, the Manner of offering the Bread and Wine practiſed by *Melchiſedech*, &c. and thoſe of the Law of *Moſes*, as the *Circumciſion*, the *Paſchal Lamb*, *Purifications*, *Order of Prieſthood*, &c. But with Regard to the Chriſtian Church *Sacrament* is defined, A viſible Sign of a ſpiritual Grace annexed to the Uſe thereof. There are Two Objects in a *Sacrament*; the one a material Sign, the Object of the Senſes; the other the Thing ſignified, which is the Object of Faith. Thus it has pleaſed God to give a Body or Subſtance to ſpiritual Myſteries, that our Faith might have the Aſſiſtance of ſenſible Signs. The *Roman Catholicks* own Seven *Sacraments*, viz. *Baptiſm*, *Confirmation*, the *Euchariſt*, *Penance*, *Extreme Unction*, *Ordination* and *Marriage*. See each under its proper Article. The *Proteſtants* admit of only Two, *viz. Baptiſm* and the *Euchariſt*.

The *Romaniſts*, however, call the *Euchariſt*, by way of Eminence, *H. Sacrament*, the *Holy Sacrament*. Thus to expoſe the *H. Sacrament*, is to lay a conſecrated Hoſt on the Altar to be adored. The Proceſſion of the *H. Sacrament*, that wherein 'tis carried about the Church, or the Town. See PROCESSION. The *Feaſt of the H. Sacrament*; the *Congregation of the Sacrament*, &c.

The Word is formed from the *Latin*, *Sacramentum*, which ſignified an *Oath*, particularly that which the Soldiers took to be true to their Commanders. The Words whereof, according to *Polybius*, were, *Obtemperaturus ſum & facturus quicquid mandabitur ab Imperatoribus, juxta Vires.*

SACRAMENT, was alſo uſed in the *Roman* Law, for a Pledge or Gage of Money, which both the Plaintiff and Defendant, in any real Action, laid down in Court, to be forfeited by him who ſhould loſe the Cauſe.

SACRAMENTARIANS, a general Name given to all ſuch as have publiſhed, or held erroneous Doctrines of the *Sacrament* of the Supper. The Term is chiefly applied by the *Roman Catholicks*, by Way of Reproach, to the *Lutherans*, *Calviniſts*, and other *Proteſtants*. --- *Sacramentarium*, was an antient Church-Book, comprehending all the Prayers and Ceremonies practiſed at the Celebration of the *Sacraments*. Pope *Gelaſius* was the firſt Author of the *Sacramentarium*. It was afterwards reviſed, corrected and abridged by St. *Gregory*. It was the ſame with what the *Greeks* now call *Euchology*; Which ſee.

SACRED, ſomething *holy*, or, that is ſolemnly offered, and conſecrated to God with Ceremonies, Benedictions, Unctions, &c. See CONSECRATION. Kings, Prelates, and Prieſts are held *ſacred Perſons*, Abbots are only *bleſſed*. The Deaconhood, Sub-deaconhood, and Prieſthood, are *ſacred Orders*, and impreſs a *ſacred*, indelible Character. The Cuſtom of *conſecrating* Kings with Holy Oil, is derived, according to *Guthingius*, from the *Hebrews*; among whom, he agrees with *Grotius*, it was never uſed but to Kings who had not an evident Right by Succeſſion. He adds, That the Chriſtian Emperors never uſed it before *Juſtin* the younger; from whom he takes it to have paſſed to the *Goths*, &c.

SACRED, is alſo applied to Things belonging to God and the Church: Church Lands, Ornaments, &c. are held *ſacred*. —— The *Sacred College* is that of the Cardinals. See CARDINAL. *Sacred Majeſty*, is applied to the Emperor and the King of *England*; yet *Loueay* ſays 'tis Blaſphemy.

The Ancients held a Place ſtruck with a Thunder-bolt, as a *ſacred* Thing. In the Civil-Law, a *Sacred Place* is that, where a Perſon deceaſed, has been interr'd.

SACRIFICE, an Offering made to God on an Altar, by Means of a regular Miniſter, as an Acknowledgement of his Power, and a Payment of Homage. *Sacrifices* differ from mere *Oblations*, in that in a *Sacrifice* there is a real Deſtruction or Change of the Thing offered; whereas an Oblation is only a ſimple Offering or Gift, without any ſuch Change at all. See OBLATION. Divines divide *Sacrifices* into *Bloody*, ſuch as thoſe of the Old Law; and *Bloodleſs*, ſuch as thoſe of the New Law. They divide them again into *Impetratory*, which are thoſe offered, to obtain ſome Favour of God, or to thank him for ſome already received; and *Propitiatory*, which are thoſe offered to obtain Forgiveneſs of Sins.

The *Phœnicians* are uſually held the firſt Authors of *Sacrifices*. *Porphyry*, indeed, attributes the Invention to the *Egyptians*; who, he ſays, firſt offered the Firſt Fruits of their Grounds, to the Gods; burning them upon an Altar of Turfe. At length they came to burn Perfumes, and at laſt ſacrificed Animals; obſerving that they firſt eat ſome Herbs, or Fruits, regularly offered on the Altars. He adds, that *Libations* were very frequent e'er *Sacrifices* of Beaſts got Footing. See LIBATION. *Ovid* obſerves, That the very Names *Victim* and *Hoſtia* import, that they were not ſlain, till ſuch Time as Victories were obtained over Enemies. Indeed, while Men lived on Herbs and Pulſe, 'tis no Wonder they abſtained from *Sacrifices* of Beaſts; ſince the Law of Sacrifices required, that they eat ſome Part thereof. In Effect, 'tis ſuppoſed to be this that firſt introduced Fleſh as a Food, and made Man a carnivorous Animal. See CARNIVOROUS. The Truth is, in all Antiquity, both ſacred and profane, *Sacrifices* were ordinarily nothing elſe but Holy Banquets.

The Scriptures furniſh us with a ſomewhat different Account. *Noah* certainly ſacrificed Animals at his coming out of the Ark, and 'tis even ſuggeſted, that *Abel* himſelf ſacrificed the beſt and fatteſt of his Flocks: But *Grotius* ſhews, 'tis much more probable, he contented himſelf with making a mere *Oblation* of his Lambs, &c. to God without ſacrificing them.

Macrobius tells us, That the *Egyptians*, long accuſtomed to bloodleſs *Sacrifices*, being at length obliged to admit the Worſhip of *Serapis* and *Saturn*, to whom *Victims* were to be ſacrificed; would not allow their Temples to be built in the Cities. Theſe *Victims*, however, or *bloody Sacrifices*, at length obtained, in Excluſion of almoſt all the reſt. The moſt uſual *Victims* among the Ancients, were Bulls, Oxen, Cows, Sheep and Lambs, in regard theſe were the moſt ordinary Food of Man.

The Manner of *Sacrificing* among the ancient *Hebrews*, is amply deſcribed in the Books of *Moſes*. That in Uſe among the *Romans*, is as follows: In the Choice of the *Victims*, Care was taken it were without Blemiſh or Imperfection, his Tail not too ſmall at the End; the Tongue not black, nor Ears cleft, and the Bulls ſuch as had never been yoked. The *Victim* pitched upon, they gilt his Forehead and Horns, eſpecially if a Bull, Heifer, or Cow. The Head they alſo adorned with a woollen *Infula*, whence hung two Rows of *Chaplets* with twiſted Ribbons; and in the middle of the Body a kind of *Stole*, pretty large, hung down on both Sides: The leſs *Victims* were only adorned with Bundles of Flowers and Garlands, together with white Tufts or Garlands. The *Victims* thus made ready, were brought before the Altar; the leſſer were not led in a String, but driven to the Place; the greater were conducted in an Halter; if they made any Struggle, or refuſed to go, the Reſiſtance was taken for an ill Augury, and the *Sacrifice* ſet aſide. The *Victim* thus brought before the Altar, was examined very circumſpectly, to ſee if there were no Defect in it. Then the Prieſt, being clad in his *ſacerdotal* Habit, and accompanied with the Sacrificers and other Attendants, and being waſhed and purified according to the Ceremonies preſcribed, began the *Sacrifice*, with making a loud Confeſſion of his Unworthineſs, acknowledging himſelf guilty of divers Sins; for which he begged Pardon of the Gods, hoping they would be pleaſed to grant his Requeſts.

Theſe Confeſſions were like thoſe of the *Hebrews*: with this Difference, that the *Pagans* confeſs'd the Frailty of Mankind, and owned their Faults; the *Jews* confeſſed chiefly the Greatneſs of God, accompanying it with Hymns and muſical Inſtruments. The Confeſſion over, the Prieſt cry'd aloud, *Compoſe your ſelves, and mind your* Sacrifice; and preſently an Uſher, holding a Rod in his Hand, called *Commentaculum*, went through the Temple, and made all thoſe withdraw, who were not inſtructed in the Myſteries of Religion, or ſuch as were excommunicated. The Cuſtom of the *Greeks*, from whom the *Romans* borrowed theirs, was, That the Prieſt coming to the Altar, ſhould ask aloud Τίς τελεῖ? Who is here? The People anſwered, Πολλοὶ καὶ ἀγαθοί, Many good Perſons: Then the Uſher went through the Temple, crying, Ἐκτὸς, ἐκτὸς, ἔστε βέβηλοι; that is, Away with the Wicked. The *Romans* commonly uſed the Words, *Nocentes*, *Profani abſcedite*. All thoſe who were driven out of the Temples among the *Greeks*, were comprehended under theſe general Words, βέβηλοι, ἀμύητοι, ἀκάθαρτοι. The Prophane withdrawn, they cry'd, *Favete linguis*, or *animis*, and *Paſcite linguam*, to require Silence, and Attention during the *Sacrifice*. Theſe Ceremonies ended, the chief Sacrificer being ſet down, and the reſt of them ſtanding, the Magiſtrates or private Perſons, who offered *Sacrifice*, came before him, and preſented him with the Firſt Fruits

and

and *Victim*, and ſometimes made a ſhort Diſcourſe, by Way of Complement; as we find *Homer* makes *Ulyſſes* do, when he preſented the High-Prieſt with *Iphigenia* to be ſacrificed. As any Perſon came to preſent his Offering, he waſhed his Hands in a Place appointed in the Temple for that Purpoſe. Laſtly, when the Offering was made, the Prieſt that officiated, perfumed the *Victims* with Incenſe, and ſprinkled them with luſtral Water; and having waſhed his Hands, and got up again to the Altar, he prayed to the God to whom he preſented the *Sacrifice*, with a loud Voice, That he would accept of thoſe Offerings, and be pleaſed with the *Victims* he ſacrificed to him for the publick Good, and for ſuch and ſuch Things in particular. In the Cloſe of the Offertory and Prayer, made by the Prieſt to the Gods, he came down the Steps of the Altar, and from the Hand of one of his Aſſiſtants, received the Sacred Paſte, called *Mola ſalſa*, made of Barley or Wheat Flower, mixed with Salt and Water, which he threw upon the Head of the *Victim*, ſprinkling a little Wine upon it, which was called *Immolatio*. *Servius* ſays, The Prieſt ſcattered little bits of this Paſte upon the Head of the *Victim*, the Altar, where the ſacred Fire burned, and the Knives, by Way of Conſecration. He then took Wine in a Veſſel called *Simpulum*, and having taſted it himſelf firſt, and made his Aſſiſtants do all the ſame, to ſhew that they partook of the *Sacrifice*, he poured it between the Horns of the *Victim*, pronouncing theſe Words of the Conſecration, *Mactus hoc vino inferis eſto*; Let this *Victim* be improved and honoured by this Wine. This done, he pulled off the Hairs from between the Horns, and threw them into the Fire; and commanded the Sacrificer, (who asked him, *Agon*' Shall I ſtrike?) To knock down the *Victim* with a Blow on the Head with an Hammer or Ax; upon which, another Aſſiſtant, named *Popa*, preſently thruſt a Knife into his Throat, whilſt a third received the Blood, wherewith the Prieſt ſprinkled the Altar.

When the *Victim* was ſlain, they flead him, if it was not a Burnt Offering; (for then they burn'd Skin and all,) took the Fleſh off the Head, and adorning it with Garlands and Flowers, faſtened it to Pillars of the Temples, as well as the Skins, as Enſigns of Religion, carrying them about in Proceſſion in publick Calamities; not but that the Prieſts oft wore the Skins, and others went to ſleep upon them in the Temples of *Æſculapius* and *Faunus*, that they might receive favourable Reſponſes in their Dreams, or be cured of their Maladies. They then opened the *Victim*'s Entrails, and after circumſpectly viewing them, to draw Preſages therefrom, according to the Art of the *Aruſpices*, they flowered them with Meal, and ſprinkled them with Wine, and made a Preſent of them to the Gods, *reddebant exta Diis*, by throwing them into the Fire in ſmall bits, boiled or parboiled; and hence the Entrails were called *Porricæ*. The Entrails being burned, and the other Ceremonies finiſhed, they believed the Gods to be ſatisfied; and that they could not fail to find their Vows accompliſhed, which they expreſſed by the Word *Litare*, *q. d.* All is finiſhed, and well done; whereas *Non Litare*, on the contrary, intimated there was ſomething wanting for the Perfection of the *Sacrifice*, and that the Gods were not appeaſed. The Prieſt afterwards diſmiſſed the People with theſe Words, *I licet*. Hence it may be obſerved, that the *Sacrifices* conſiſted of four principal Parts, the firſt called *Libatio*, or the pouring a little Wine upon the *Victim*; the ſecond *Immolatio*, when, after they had ſcattered the Crumbs of ſalted Paſte thereon, they killed it; the third *Redditio*, when they offered the Entrails to the Gods; and the fourth *Litatio*, when the *Sacrifice* was perfected, and accompliſhed without any Fault.

SACRILEGE, the Crime of profaning ſacred Things, or Things devoted to God, or alienating to Laymen, or common Purpoſes, what was given to Religious Perſons, and pious Uſes. Our Fore-fathers were very tender in this Caſe; and therefore, when the Order of the Knights Templers was diſſolved, their Lands, *&c.* were all given to the Knights Hoſpitallers of *Jeruſalem*, for this Reaſon, *Ne in pios uſus ergata, contra donatorum voluntatem, in alios uſus diſtraherentur*.

SACRISTAN, a Church Officer, otherwiſe called *Sexton*. See SEXTON.

SACRISTY, or *Sextry*, the Place where the Veſſels and other Utenſils, and the Ornaments of the Church, were anciently preſerved, called alſo in ancient Authors, *Secretarum*. The like with what we call *Veſtry*. See VESTRY.

SACROLUMBARIS, or *Sacrolumbus*, in Anatomy, a Muſcle, that ariſeth fleſhy from the ſuperior Part of the *Os Sacrum*, poſterior Part of the *Ilium*, and from all the Spines and tranſverſe Proceſſes of the *Vertebræ* of the Loins. It gives a ſmall Tendon to the poſterior Part of each Rib near its Root, where a ſmall Bundle of fleſhy Fibres ariſes and unites with each aſcending Tendon, to the third, fourth, fifth, and ſixth *Vertebræ* of the Neck. This with the *Serratus Poſticus inferior*, and *Triangularis*, help to contract the Ribs in Expiration. But they are but of ſmall Force, and ſeem only to accelerate the Motion of the Ribs, which fall down chiefly by their own Gravity, and the Elaſticity of the Ligaments, by which they are tied to the *Vertebræ*. See MUSCLE.

SACRUM OS, in Anatomy, is the lower Extremity of the *Spina Dorſi*, being that whereon we ſit. See Os SACRUM and SPINA. 'Tis doubted whence this Name ſhould ariſe: Some think 'tis becauſe the Ancients offered it in Sacrifice to the Gods; others, becauſe 'tis very large, and others, becauſe it incloſes the Natural Parts. Its Figure is triangular. 'Tis hollow within-ſide, and by that Means, contributes to the forming of the Cavity at the Bottom of the *Hypogaſtrium*, called the *Pelvis*. Its Fore-part is ſmooth, by which Means, the Parts it contains are ſecured from being wounded: Its Hind-part rough, that the Muſcles may faſten the better to it. It has Three different *Articulations*. The firſt is with the laſt of the *Vertebræ* of the Loins, and is like that of the other *Vertebræ*. The ſecond, with the *Os Coccigis*, by *Synchondroſis*: The third, with the Bones of the Hips. The *Os Sacrum* is uſually divided into five Parts, which are ranked among the Number of *Vertebræ*. The higheſt is the greateſt; the reſt growing leſs as they go lower. Theſe *Vertebræ* are eaſily ſeparated in Children, by Reaſon the *Cartilages* which joyn them, are not yet *oſſified*. But in Adults, they are ſo firm, that they only make one Bone. 'Tis in the *Os Sacrum*, that the Cavity which contains the Spinal Marrow, terminates. See VERTEBRÆ. —— *Sacra Vena* is a Vein ariſing from the *Os Sacrum*, and terminating, uſually in the *Iliac* Vein; ſometimes in the Place where the two *Iliacs* meet with the aſcending *Aorta*. —— *Arterica Sacra*, is a Branch of the *Iliacus Internus*. See VEIN. *&c.*

SADDLE, in the Manage, a Kind of ſtuffed Seat, laid on the Back of a Horſe for the Convenience of the Rider. The Origin of the *Saddle* is not well known. *Goropius Becanus* attributes its Invention to the *Salii*, a People among the ancient *Franks*; and hence, ſays he, came the *Latin Sella*, *Saddle*. 'Tis certain, the ancient *Romans* were unacquainted with the Uſe either of *Saddle* or *Stirrups*: Whence *Galen* obſerves, in ſeveral Places, that the *Roman* Cavalry, in his Time, were ſubject to ſeveral Diſeaſes of the Hips and Legs, for want of having their Feet ſuſtained on Horſe-back. And long before him, *Hippocrates* had obſerved, that the *Scythians*, who were much on Horſe-back, were troubled with Defluxions in their Legs, becauſe of their hanging down. The firſt Time we hear of *Saddles* among the *Romans*, was *Anno.* 340; when *Conſtans*, endeavouring to deprive his Brother *Conſtantine* of the Empire, made Head againſt his Army, and entring the Squadron where he himſelf was, threw him off his *Saddle*, as we are informed by the Hiſtorian *Zonaras*. Before, they made Uſe of ſquare Pannels; ſuch as we ſee in the Statue of *Antoninus* in the Capitol. The Uſe of *Saddles* was firſt eſtabliſhed in *England*, by a Law of *Henry* VII. whereby the Nobility were obliged to ride on *Saddles*. 'Tis but very lately that the *Iriſh* have taken to it.

There are various Kinds of *Saddles*; as the *running Saddle*, a very ſmall one, with round Skirts. The *Burford Saddle*, which has the Seat and Skirts plain. The *Pad Saddle*, of which there are two Kinds, the one made with Burrs before the Seat, the other with Bolſters under the Thighs. The *French Pad-ſaddle*, the Burrs whereof, came all round the Seat. *Portmantua Saddle* furniſhed with a Cantle behind the Seat, to keep a Carriage off the Rider's Back. *War Saddle*, furniſhed with a Cantle, *&c.* Bolſter both behind and before.

SADDLE-*gall'd*, is when a Horſe's Back is hurt or fretted with the *Saddle*; 'tis cured by bathing the Part with Urine, or warm Wine. When the Sore is large, 'tis cured by *Aqua Secunda*, ſtrewing over it the Powder of an old Rope or Flax, and conſuming the Proud-fleſh with *Vitriol* or *Colcothar*.

SADUCEES, a Sect among the ancient *Jews*, eſteemed as Deiſts, or Free-Thinkers, rather than real *Jews*; tho' they aſſiſted at all the Ceremonies of the Worſhip in the Temple. St. *Epiphanius* will have them to have taken their Riſe from *Doſitheus*, a *Samaritan* Sectary; and *Tertullian* is of the ſame Opinion. St. *Jerom*, and other Writers add, That the *Saducees* came near the *Samaritans* in many Things; particularly in this, that they allowed no Books of Scripture, but the five Books of *Moſes*. The Jeſuit *Serrarius*, has alſo embraced this Opinion; as ſeeming to be ſupported by the Authority of *Joſephus*. But all *Joſephus* ſays, is, That they admitted all that was written, *i. e.* all the Books of Scripture; intimating by that, they diſowned the unwritten Traditions of the *Phariſees*; and, in Effect, St. *Epiphanius* is forced to own, that

that the *Saducees* were *Jews*; inasmuch, as they assisted at the Worship and Sacrifices of the Temple at *Jerusalem*: Whereas the *Samaritans* sacrificed on *Mount Gerizaim*. See SAMARITANS.

Some Authors ascribe the Original of this Sect, to one *Sadoc*, a Disciple of *Antigonus Sochæus*, who frequently inculcated it on his Scholars, That God is to be served for himself, and not out of View to any Reward to be received from him in the next World, as Slaves serve their Masters merely for Recompence. *Sadoc*, add they, putting a false Interpretation on these Words of his Master, published, That there was no Reward to befall good Actions done in this World. And hence arose the Sect of *Saducees*, thus denominated from their Leader *Sadoc*. St. *Epiphanius*, and some modern Writers after him, take the *Saducees* to have been thus called from the *Hebrew*, *Sadic* Just, or *Sedec* Justice, in Regard of the great Justice they shewed in all their Actions.

'Tis observ'd, *Acts* xxiii. 8. that the *Saducees* say, There is no Resurrection, neither any Angel or Spirit; but that the *Pharisees* believe both the one and the other. These Words, *The one and the other*, seem to insinuate, That Angel and Spirit are one and the same Thing. But as the Apostles, observes *Oecumenius* on that Passage, don't always use the exactest Terms, one may understand by *Spirit*, all spiritual Substances; as if the *Saducees* had believed that God himself was a Body. This, however, is not *Oecumenius*'s Opinion. He asks, Why the Scripture says, *The one and the other*, tho' it spoke of Three Things, *Resurrection*, *Angel*, and *Spirit*? And he answers, That 'tis either because *Angel* and *Spirit* are the same thing; or that *one and the other*, which is only properly understood of Two Things, is, perhaps, here spoke of Three: Exact Propriety of Words not being to be required in Books wrote by simple illiterate Fishermen. 'Tis true, in explaining what goes before, he observes, That the *Saducees*, being very ignorant, might possibly disbelieve the Existence of a God, and on that Account, might be represented as denying a Resurrection, &c. But he does not say, that by Spirit, they might mean all spiritual Substance. 'Tis probable, all meant by it, is the Immortality of the Soul; it being the Opinion of the *Saducees*, That there is nothing immortal in Man. 'Tis certain, they denied all Resurrection, and allowed of no Happiness but what is enjoyed in this Life; believing, that every Thing told of the other World, had been invented by the *Pharisees*. Hence, also, they denied a Divine Providence, and attributed all Things to Free Will; in which, they opposed the Opinion of the *Pharisees*, who admitted a kind of Destiny or Fatality in all our Actions. See PHARISEES.

SÆPHÆNA, in Anatomy, a Vein, which arising over the *Maleolus internus*, up along the Leg, and the Inner Part of the Thigh, discharges itself near the Groin, into the *Crural* Vein. 'Tis this Vein they usually open when they bleed in the Foot. It has its Name probably from σαφὴς, *Manifestus*, as lying plain in Sight.

SAFE-CONDUCT, a Security given by the Prince under his Great Seal, to a Stranger for his quiet coming in and passing out of the Realm. The *Safe-Conduct* is granted to Enemies, the Passport to Friends. Judges sometimes give *Safe Conducts* to Delinquents, or Prisoners, to enable them to act in their Affairs.

SAFE GUARD, *Salva guardia*, a Protection given by the King to a Person fearing the Violence of some other Person, for seeking his Right by Course of Law.

SAFE-GUARD, at Sea, is a Rope which saves and secures any Thing: For Instance, that whereby Persons walk securely over the Bolt sprit. The *Safe guard of the Helm*, is a Rope which goes through the Helm, and is fastened to the Buttocks of the Ship. See ROPE.

SAFE-PLEDGE, in Law, a Security given for a Man's Appearance against a Day assigned.

SAFFRON, or *Saffran*, a Plant which produces a Flower of the same Name; whence, also, a Drug called *Saffron* or *Crocus* is gathered. See CROCUS. The Root which produces the *Saffron*, is a kind of Onion, covered with several bulbous Cartilages. Its Leaves are long, narrow, thick and soft to the Hand. Its Flower, which appears a long Time before the Leaves, is a faint Blue, tinged with a little Yellow at the Extreme towards the Stalk. From the Middle of the Flower arise three reddish Filaments or Chives, which are properly the *Saffron*; the rest of the Flower being of no Use. Assoon as the Flower is gathered, they separate the Chives, and lay them on Hurdles, or in large Sieves, or on a little Kiln for that Purpose, with a little Coal-fire underneath to dry them. When dry, the *Saffron* is in its Perfection, and fit for Use. 'Tis observed, that five Pounds of fresh Chives only make one Pound of dry *Saffron*. The good Qualities of *Saffron* are, That its Chives be long and broad, that they be velveted over with a fine Red, of an agreeable Smell, free of yellow Threads, and very dry. The best *Saffron* in *Europe* is that of *England*. That brought from *Spain* is good for nothing; because of the Oil the *Spaniards* mix with it to keep it. 'Tis used both in Foods and Medicines, to chear, fortify, and resolve. 'Tis also used by Illuminors, to make a golden yellow Colour. The Word is formed from the *Arabic*, *Zaphe-ran*, which signifies the same Thing.

SAFFRON is also a Name given to several Chymical Preparations, from the Resemblance of their Colour to that of *Saffron*, but more usually called *Croci*: Such is *Saffron of Venus*. See COPPER.

SAFFRON *of Mars*. See CROCUS MARTIS. *Saffron of Gold*. See AURUM *Fulminans*

SAGAPENUM, or *Serapinum*, a Gum whose Smell comes very near that of the Pine, whence its Name. It flows by Incision, from the Trunk of a ferulaceous Plant growing in *Persia*. The best is in bright transparent Tears, of a strong Smell; and the whiter and freer of Dirt, the better. Sometimes 'tis found as white, both within and without Side, as Milk; tho' this is very rare. 'Tis esteemed operative and purgative, proper in the Epilepsy, Asthma and Palsy, and is also used externally to assuage Pains, and resolve Tumors.

SAGATHEE, in Commerce, a slight woollen Stuff, being a kind of Serge or Rateen; sometimes mixed with a little Silk. 'Tis manufactured chiefly at *Amiens*; tho' we have our Share in *England*. The Word is formed from the *French Sayette*, a Diminutive of *Saye*; which see. The *French* Name *Sayette*, is derived from that of the Thread used herein, which is chiefly prepared and spun in *Flanders*, about *Turcoing*, &c. and called *Fil de Sayette*.

SAGE, *Salvia*, a Medicinal Herb of an agreeable, aromatic Taste; esteemed an excellent Cephalic of the detergent Kind; and on that Score likewise used as a Vulnerary and Diuretic. There are several Kinds of *Sage*; those used and cultivated by us are the *Tea-Sage*, or *Sage of Virtue*, the *Red Sage*, and the *Wormwood Sage*. The first has the most agreeable Flower; and on that Score is cut when young and full of Sap, dried, and kept for Tea. The *Dutch* dry and prepare their *Sage* like other Teas, and carry it to the *Indies* as a very precious Thing. They there find a good Market for it; the *Chinese* preferring it to the best of their *Indian* Teas; and for every Pound of *Sage* Tea, giving, in Exchange, Four Pounds of theirs, which they sell again very dear in *Europe*. But the Wormwood Sage is esteemed of the most Efficacy in Medicine, and is that alone used in the Shops. It makes an excellent Gargarism, especially if sharpened with a little Acid. Its Decoction is very grateful and cooling, with the Addition of a little Lemon-juice. 'Tis both detergent and absorbent, and as such, finds Place in Diet-drinks, and medicated Ales, intended for Sweetners and Cleansers of the Blood. The School of *Salernum* recommend *Sage* as a Remedy in all Diseases. Hence the Verse,

Cur moritur homo cui salvia crescit in horto?

Sage, when viewed with a Microscope, appears covered all over with little Spiders, which are seen to walk, &c. about. It yields, by Distillation, a very agreeable, aromatic Oil, of some Use in the Shops.

SAGITTA, in Astronomy, the *Arrow*, a Constellation of the Northern Hemisphere. See CONSTELLATION. The Stars in the Constellation *Sagitta*, in *Tycho*'s Catalogue, are Five, and as many in *Ptolomy*'s. In Mr. *Flamstead*'s Catalogue they are Twenty Three; The Longitudes, Latitudes, &c. whereof are as follow.

Stars in the Constellation SAGITTA.

SAGITTA, in Botany, signifies the Upper Part of any small Twig, Cyon, or Graft of a Tree.

SAGITTA, in Mathematicks, is the same as the versed Sine of any Arch, and is so called by some Writers, because it is like a Dart, or Arrow, standing on the Chord of the Arch. See SINE.

SAGITTA, in Geometry, a Term some Writers use for the *Abscisse* of a Curve. See ABSCISSE.

SAGITTAL SUTURE, in Anatomy, the second of the genuine *Sutures* of the *Cranium*. See SUTURE. It reaches the whole Length of the Head; and has its Name from the *Latin Sagitta*, as being streight, like an Arrow. 'Tis sometimes also called *Rhabdoides*.

SAGITTARIUS, in Astronomy, the *Archer*, one of the Signs of the Zodiac; the Ninth in Number. See SIGN.

The *Stars in the Constellation Sagittarius*, in *Ptolomy*'s Catalogue are Thirty One; in *Tycho*'s Sixteen; In the *Britannic* Catalogue Fifty. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

SAGUM, in Antiquity, a military Garment wore by the *Greeks*, *Romans* and *Gauls*, in Manner of a Cassock; covering the Thighs, and sustaining the Sword. 'Twas made of Wool, and square. They had one for the Winter, and another lighter for Summer.

SAICK, or *Saique*, a *Turkish* Vessel, very proper for the Carriage of Merchandizes. It has square Sails on the Middle-mast; without either Mizzen, Top-gallant, or Shrouds: Only a Main-mast, with a Main top-mast, both very high; with a Bolt-sprit, and a little Mizzen Mast. The Height of the Main mast makes the *Saick* be seen at a great Distance. Their Make renders it impossible for them to go with a Side-wind; but when they have the Wind behind them, nothing can out-go them. The generality of them carry no Guns.

SAIGNER, in Fortification, a *French* Term, signifying to *bleed* or *drain*. Hence to *saigner* a Moat, is to empty or draw out the Water by Conveyances under Ground, that it may be passed over the more easily, after laying Hurdles or Rushes on the Mud remaining.

SAIL, in Navigation, an Assemblage of several Breadths of Canvas, or Cloth of raw Hemp, sewed together by the Lists, and edg'd around with a Cord; fastened to the Yards and Stays of a Vessel, to make it drive before the Wind which bears thereupon. There are two Kinds of *Sails*, the one square, generally used in high bottom'd Vessels: This has various Names, according to the various Masts 'tis fastened to, as the *Main-sail*, the *Mizzen-sail*, the *Top sail*, &c. The other are triangular, called *Smack-sails*, and by some *Latin-sails*, because chiefly used in *Italy*, and in flat-bottom'd Vessels; tho' they are also used on the Mizzen-Masts and Stays of other Vessels. They need but few Ropes, and little Wind; but are dangerous, and not to be used in foul Weather. There are ordinarily Ten *Sails* in large Vessels; which Number is increased at Bottom by the Addition of Bonnets, and at the Sides by *Case-sails*.

A Vessel is said to set *Sail*, to go with full *Sail*, to make all her *Sail*, that is, to open all her *Sails*. To be under *Sail*, that is, ready to set *Sail*, &c.

SAILS, are also the *Vanes* of Windmills, or the Arms or Flights, whereby the Wind has its Effect on Windmills. These are either *Horizontal* or *Perpendicular*. See WINDMILL.

SAILS, in Falconry, the Wings of an Hawk are so termed.

SAILING, in a general Sense, is used for the Art, or Act of *Navigation*; or of determining all the Cases of a Ship's Motion, by Means of *Sea-Charts*. See NAVIGATION. Of this there are Three Kinds, *Plain*, *Mercator's*, and *Circular*.

Plain SAILING, is that performed by Means of Rhumbs drawn on a plain Chart. See PLAIN CHART.

Mercator's SAILING, is that performed by Rhumbs drawn on a *Mercator*'s *Chart*. See MERCATOR'S *Chart*.

Circular SAILING, is that performed by the Arch of a great Circle; which, of all others, where practicable, is the shortest. See CIRCULAR.

Doctrine of PLAIN *and* MERCATOR'S-SAILING.

Case I. *The Longitude and Latitude of Two Places given; To find the Departure, or Miles of Longitude.*

In Plain Sailing. 1°. If both Places be more Easterly than the first Meridian, subtract the less Longitude from the greater, the Remainder is the Difference of Meridians. If one of the Places be more Easterly, and the other more Westerly than the first Meridian, add the Longitude of the more Easterly to the Complement of the Longitude of the more Westerly to a whole Circle; the Sum is the Difference of Meridians. 2°. Divide the Difference of Meridians into so many Parts as there are Degrees in the Difference of Latitude: Or, if the Difference of Latitude be greater than that of the Meridians, into so many fewer. 3°. Reduce the Minutes of Longitude answering to one Part, into Miles of the several Parallels, in the former Case; or into Miles of the Parallel, which is an arithmetically mean Proportional between the Two, in the latter Case. 4°. The Aggregates of these Parts collected into one Sum, exhibit the Departure or Miles of Longitude.

E. gr. Suppose the Longitude of the one Place 35°. and that of the other 47°. the Difference of Meridians is 12°. Suppose the Latitude of the first 4°. and that of the latter 8°. the Difference will be 4°, consequently we have *sailed* from the 4th to the 8th Parallel. Therefore divide 12 by 4, and reduce the Quotient 3°. into Miles in the several Parallels 4, 5, 6, and 7. (See DEGREE) the several Quotients will be 43°. 71′. 43°. 68′. 43°. 65′. 43°. 59′. the Sum of which is 174, the *Departure* or *Miles of Longitude* required.

In

In Mercator's Sailing. The Reduction is much more commodiously performed in *Mercator's Charts*; wherein the Arch intercepted between the Two Meridians, is applied to an Arch of the Meridian intercepted between the Two Parallels; and the Distance it there measures, gives the *Departure*, or *Miles of Longitude* required. See DEPARTURE and LONGITUDE.

Case II. *The Longitude and Latitude of Two Places, to and from which, a Ship is to sail, being given; To find the Rhumb to be sailed on, and the Distance to be run.*

In plain Sailing. 1. Find the *Departure* by the last Case. 2. From the *Departure*, and Difference of Latitudes, find the Loxodromic Angle or Rhumb-line; which is done by this Proportion: as the Difference of Latitude is to the Departure, so is the whole Sine to the Tangent of the Angle of the Rhumb-line. The Distance then, to be run on this Rhumb, is to the Departure, as the whole Sine to the Sine of the Angle of the Rhumb. See RHUMB.

In Mercator's Sailing. 1. Apply the Center of the Mariners Compass on the Place sailed from, on the *Mercator's Chart*, as *a*, (*Tab. Navigation* Fig. 7.) and so as that the North or South Line thereof be parallel to some of the Meridians. 2. Mark the Rhumb of the Compass, wherein the Place sailed to, as *b*, is placed. For this is the Rhumb to be sailed on. 3. The same Rhumb is likewise found by drawing a right Line from *a* to *b*; and with a Protractor, finding the Angle the Rhumb makes with any Meridian it cuts. 4. The Quantity or Distance *a b* is found by applying the Part *a* 1 to 1 K, 1 *a* to *k l*, 2 *b* to *l m*.

Note, the Rhumb and Distance may also be found after the same Manner on a plain *Chart*.

The same may likewise be found by *Loxodromic* Tables; thus, 1. Chuse a Rhumb at Pleasure, and under the same, in the Tables, find the Longitudes corresponding to the given Latitudes. The Difference whereof, if it coincide with the Difference of the given Longitudes, the Rhumb is well chosen; otherwise another must be pitched on, either more or less oblique, 'till the Tabular Difference agree with the given Difference. 2. The Rhumb thus found, the Distances answering to the given Latitudes, must be taken from the Tables, and the less subtracted from the greater; the Remainder is the Distance sought.

Case III. *The Rhumb and Distance sailed being given; To find the Longitude and Latitude of the Place arrived at.*

In Plain Sailing. 1. From the *Data*, find the Difference of Latitude of the the Two Places: (by the Proportion delivered under the Article RHUMB-*line.*) This Difference added to the Latitude of the Place sailed from, or subtracted from the same, the Sum, or the Remainder, leaves the Latitude of the Place sailed to. 2. From the same, find the Departure; and thence the Latitudes of the Place sailed to (as directed under RHUMB *line.*)

In Mercator's Sailing. 1. Place the Mariners Compass on the *Chart*, with the Center over the Place *a*; and the Meridian, or North or South Line, parallel to the Meridian thereof. 2. From the Point *a*, draw a right Line, as *a b*, for the Ship's Course. Take the Distance by Parts, in Parts of the Meridian IK, KL, *&c.* and set it off upon the right Line *a b*; *E. gr.* from *a* to *c*; Then will *c* be the Place the Ship is arrived at; the Longitude and Latitude whereof are given by the *Chart*. See CHART.

By the Loxodromic Tables. 1. Under the given Rhumb, seek the Distance answering to the Latitude of the Place sailed from; and either add it to, or subtract it from the given Distance; as the Latitude of the Place sailed to is greater, or less than that sailed from. 2. Under the same Rhumb, ascend or descend further, till you meet with the Distance corrected. 3. The Latitude answering thereto in the first Column, is the Latitude of the Place sailed to. 4. From the second Column of the Table take the Longitude corresponding to the Latitudes of the Places sailed to and from. Their Difference is the Difference of Longitudes of the Places sailed to and from.

Case IV. *The Latitudes of the Places sailed to and from, together with the Rhumb sailed in, being given; To find the Distance and Difference of Latitudes.*

In Plain Sailing. From the Difference of Latitude and the Rhumb given, find the Distance; and from the same *Data*, the Departure. See RHUMB. This converted into Degrees of a great Circle (See DEGREE) exhibits the Difference of Longitudes sought.

In Mercator's Sailing. 1. Place the Compass on the *Chart*, as in the preceding Case. From the Place sailed from, *a*, draw the Rhumb-line *a b*, sailed in; till it cut the Parallel of the given Latitude. 2. The Point of Intersection will be the Place arrived in. 3. Hence its Longitude is easily found; and the Distances. See RHUMB.

By the Tables. Take both the Longitudes and the Distances answering to the Latitude of the given Places, out of the Tables; then subtract both the Longitudes and the Distances from each other. The first Remainder is the Difference of Longitude, the latter the Distance of the Places.

Case V. *The Latitudes of the Places sailed from, and to, with the Distance given; To find the Rhumb and the Difference of Longitude.*

In Plain Sailing. From the Difference of Latitude, and the Distance, find the Rhumb, and from the same *Data* find the Departure; which may be also determined from the Rhumb now found, and the Differences of Latitude, or from the Rhumb and the Distance run. Lastly, from the Departure find the Difference of Longitude. See RHUMB.

In Mercator's Sailing. On the Map draw the Parallel the Ship arrives at, C D. Reduce the Distance run into Parts proportional to the Degrees of the Map. The Distance reduced, being *a* 2; from *a* describe an Arch cutting the Parallel C D in 2: Then will 2 be the Place in the Map; whose Longitude accordingly is easily found.

By the Tables. Subtract the given Latitudes from each other; and in the Tables seek the Rhumb; under which, the Distance run answers to the given Difference of Latitude. Subtract the Longitude under the Rhumb, answering to the Latitude of the Place sailed to; and that under the same Rhumb against the Latitude of the Term sailed to, from each other, the Remainder is the Difference of Longitude sought.

Case VI. *The Difference of Longitudes of the Places sailed to, and from, with the Latitude of one of the Places, and the Distance run, being given; To find the Rhumb, and the Latitude of the other.*

In Plain Sailing. Convert the Difference of Longitudes into Miles of Longitude or the Departure; from the given Departure and Distance run, seek the Rhumb: And from the same, and the Rhumb, seek the Difference of Latitude; which, and the Latitude of one Place being had, the Latitude of the other readily follows. See RHUMB.

In Mercator's Sailing. Through the given Place *a* in the Map, draw a right Line E F parallel to the Meridian 1H; and make F L equal to the Difference of Longitudes. From F draw L M parallel to E F, which will be the Meridian the Ship is arrived at. Then from *a*, with the Interval of the Distance run, *a c*, describe an Arch intersecting the Meridian M L; the Place sought will be in *c*. If then a Compass be placed on the Map, as before directed, the Rhumb-line will fall in with *a c*; and consequently the Rhumb will be known. Lastly, If through *c* be drawn N O, parallel to A B; N A will be the Latitude of the Place required.

By the Tables. Take a Rhumb at Pleasure, and under the same in the Tables, find the Longitude, and the Distance answering to the given Latitude. Add the given Distance to the Distance found in the Tables, if the Vessel sailed from the Equator; or subtract it therefrom, if it sailed towards the same. With the same Sum, or the Difference, enter the Tables; and the Longitudes found against it, subtract or add from that just found. If the Remainder be found the given Difference of Longitudes, the Rhumb is well taken. Otherwise, it must be changed for a more or less oblique one, till the same Operation being repeated, the Remainder be found the Difference of Longitudes; then the Latitude in the first Column, corresponding to the Distance, will be the Latitude of the other Place.

Case VII. *The Difference of Longitude, and the Latitude of one of the Places, being given, together with the Rhumb; To find the Distance run, and the Latitude of the other Place.*

In Plain Sailing. Reduce the Difference of Longitude into Miles of Longitude, or Departure, as under the first Case. From the Departure and the Rhumb, find the Distance run. (See RHUMB.) And from these, or from the Rhumb, and the Distance run, find the Difference

ference of Latitude. This done, as the Latitude of the one is already had, that of the other is ſo too.

In Mercator's Sailing. Place the Compaſs on the *Chart* as before; and by the given Rhumb, draw the Rhumb-line, *a b*. Draw a Meridian E F through the given Place *a*; and with the Interval of the Difference of Longitude F L, draw another, L M, for that the Veſſel is arrived at. Where this interſects the Rhumb-line, is the Place *c* that the Veſſel is arrived at. Wherefore, if through *c* be drawn N O parallel to A B; N A will be the Latitude of the Place. The Diſtance run *a c* is eaſily reduced into Miles by the Scale.

By the Tables. Under the given Rhumb, ſeek the Diſtance run, and the Difference of Longitude anſwering to the given Latitude. If the Veſſel have ſailed towards the Pole, the Difference of Longitude is to be added to the given Difference of Longitude; if towards the Equator, 'tis to be ſubtracted from the ſame. In the former Caſe, deſcend in the Table, and in the latter, aſcend; 'till in the firſt, the Aggregate, in the latter, the Difference be ſeen in the Column of Longitude. The Latitude anſwering hereto in the firſt Column, is that ſought. And from the Diſtance anſwering to this Latitude in the firſt Caſe, the Tabular Diſtance is to be ſubtracted; or in the latter Caſe, that Diſtance to be ſubtracted from the Tabular Diſtance. What remains, is the Diſtance run.

From the Solution of theſe Caſes in *Sailing*, 'tis evident, ſome are more eaſily performed by the Charts than the Tables; and that the *Mercator's Charts* are preferable to the Plain ones; ſince in the latter, the Diſtance is not reduced by the Map, but by a particular Scale for that Purpoſe.

Doctrine of CIRCULAR SAILING.

I. *The Latitude and Longitude of the Places ſailed to and from, being given; to find the Angle* M (Fig. 8.) *which a Ship's Way* MO *proceeding in a Circular Courſe, includes, with the Meridian* P. M. *of the Place ſailed from.*

Since in the Triangle P M N, we have P M and P N, the Complements of the given Latitudes H M, and I N, together with the Angle M P N, meaſured by the Arch H I, the Difference of the given Longitudes H and I; the Angle P M N is found by *Spherical Trigonometry*. See TRIANGLE.

II. *The Latitude* H M, *and the Longitude* H, *of the Place ſailed from,* M, *with the Diſtance run, and the Latitude of the Place* L S *the Ship in a Circular Voyage arrives at, being given; to find the Longitude of the Place* L, *and the Angle* P L M *comprehended between the Ship's Way* M L, *and the Meridian* P S.

In the Triangle P M L, we have given P M the Complement of the Latitude H M, and P L the Complement of the Latitude L S. Wherefore, if the Ship's Way M L be turned into Degrees of the Equator; we ſhall find the Angle M P L, which is meaſured by the Difference of Longitudes H S; and likewiſe the Angle P L M by Spherical Trigonometry. See *Spherical* TRIANGLE.

After the like Manner may other Problems be ſolved; but as 'tis eaſier and better *Sailing* by Rhumbs, than by Circles, and as this latter Way is but very little in Uſe; we chuſe to paſs them over. See GLOBULAR SAILING.

SAILING, in a more confined Senſe, is the Art of conducting a Veſſel from Place to Place, by the working or handling of her *Sails* and *Rudder*; though what is done by Means of this latter, is more properly called *Steering*. See STEERING.

To bring *Sailing* to certain Rules, a late Author computes the Force of the Water, againſt the Ship's Rudder, Stem or Side; and that of the Wind againſt her *Sails*: in order to this, he conſiders all Fluid Bodies, as the Air or Water, *&c.* as being compoſed of little Particles, which, when they act upon, or move againſt any Surface, do all move parallel one to another, or ſtrike againſt the Surface after the ſame Manner. He conſiders, 2, That the Motion of any Body, with regard to a Surface, on which it is to ſtrike, muſt be either Perpendicular, Parallel, or Oblique. In the firſt Caſe, the Body ſtrikes with all its Force, which will be greater or leſs, according as the Body moves ſwifter or ſlower. In the ſecond Caſe, the Line of Motion *a b*, (*Tab. Navigation Fig.* 3.) will not affect the Surface at all, becauſe it is no way oppoſed to it; nor can the moving Body ſtrike upon it, or touch it. In the third, If the Line of Motion, A D, be oblique to the Surface D C, ſo that the Angle of Incidence be A D C, then the Motion of the Body in the Line A D may be reſolved into Two Directions, *viz.* into A E, or D B, and into A B. But the Direction or Line of Motion A E being *parallel* to the Surface D C, cannot affect it at all; ſo that the whole Motion of the Body A in that oblique Manner of ſtriking on the Surface, will be expounded by the *Perpendicular* Line, A B. And if D A be made the Radius of a Circle, whoſe Center is at D, B A will be the Line of the Angle of Incidence, A D C. Hence we deduce, That the Force of a Particle of Air or Water, as A, ſtriking againſt the Surface D C, which may repreſent, either a Sail or the Rudder of a Ship, in the oblique Direction A D, will be to the Perpendicular Force there, as B A is to D A: that is, as the Line of the Angle of Incidence is to the Radius. And ſince what is thus true of one Particle, ſingly conſidered, will be true of all the Particles of any Fluid Body collectively, it will follow, That the Force of the Air or Water ſtriking perpendicularly upon a Sail or Rudder, to the Force of the ſame, in any oblique Impingency, will be, as the Square of the Radius, to the Square of the Sine of the Angle of Incidence: and conſequently, that all oblique Forces of the Wind againſt the Sails, or of the Water againſt the Rudder, will be to one another, as the Squares of the Lines of the Angles of Incidence. If the different Degrees of Velocities be conſidered, it will be found, that the Forces will then be as the Squares of the Velocities of the moving Air or Water; that is, That a Wind that blows thrice as ſtrong, or moves thrice as ſwift as another, will have nine Times the Force upon the Sail. And it being alſo indifferent, whether you conſider the Motion of a Solid in a Fluid, whoſe Particles are at reſt; or of thoſe Particles moving all parallel againſt a Solid that is at reſt, the reciprocal Impreſſions being always the ſame: If a Solid be moved with different Velocities in the ſame Fluid Matter (as ſuppoſe Water) the different Reſiſtances which it will receive from that Water, will be in the ſame Proportion, as the Squares of the Velocities of that Body.

Let H M (Fig. 4) repreſent a Ship, C D the Poſition of the Sail, and A B the Courſe of the Wind blowing towards B. Draw B G perpendicular to the Sail, and G K perpendicular to the Line of the Keel produced H M K. By what is ſaid above, the Sail C D, will be driven by the Wind A B, according to the Direction of the Line B G. So that if ſhe could divide the Water every Way with the ſame Facility, as ſhe doth with her Head, the Ship would go directly to the Point G, along the Line B G. And if H K repreſent her direct Courſe, ſhe would have got forward the Length B K, and Sideways ſhe would have gone the Quantity G K. But as her Length is much greater than her Breadth, ſo ſhe will divide the Water, or make her Way in it with more Difficulty with her Side, than with her Head or Stern; on which Account, ſhe will not run Sideways ſo far as K G, but fall ſhort of it in Proportion to the ſaid Difficulty of dividing the Water with her Side; that is, If the Reſiſtance ſhe finds in her paſſing thro' the Water Sideways, be to that of paſſing Lengthways, ſuppoſe, as ten to one, then will not the Ship get Sideways above a tenth Part of the Line G K. Wherefore if K G be found to G L, in the *Ratio* of the Reſiſtance of the Side to that of the Stern, and the Line B L, be drawn; the Ship will go to the Point L, along the Line B L, in the ſame Time as it would have gone to G, if it could have divided the Water every Way equally. This Part, K L, is called the *Drift* or *Lee-way* of a Ship, and the Angle K B L is her Degrees of *Lee-way*; as the Angle A B K, expreſſes how near the Wind ſhe lies. After this, he proceeds to demonſtrate, That the beſt Poſition or Situation of a Ship, ſo as ſhe may make the beſt *Lee-way*, but go to *Wind-ward* as much as is poſſible, is this: That, let the Sail have what Situation it will, *the Ship be always in a Line biſſecting the Complement of the Winds Angle of Incidence upon the Sail*; that is, Suppoſing the Sail in the Poſition B C (Fig. 4.) the Wind blowing from A to B, and conſequently, the Angle of the Wind's Incidence on the Sail A B C, and its Complement C B E; then muſt the Ship be put into the Poſition B K, or move in the Line B K, biſſecting the Angle B G E. He ſhews farther, That *the Angle which the Sail ought to make with the Wind, i. e.* the Angle A B C, *ought to be but* 24 *Degrees*; that being the moſt advantageous Situation to go to Wind-ward, the moſt that is poſſible. And in order to bring this to bear in Practice, he directs to put Marks to the Sheets, Braces, and Bow lines of the lower Sails, to know when they are in their beſt Situation; and then, even in the Night, when the Marks of a Brace or of a Sheet ſhall come to the Cleat, one may be pretty well aſſured, that the Sail trims well. To this may be added, many curious Things from *Borelli de V. Percuſſionis* concerning the different Direction given to a Veſſel from the Rudder, when *Sailing* with a Wind, or floating without Sails in a Current; in

the former Caſe, the Head of the Ship always coming to the Rudder, and in the latter always flying off from it.

SAILORS, the elder Seamen, who are employed in managing the Sails, the Tackle, Steering, &c.

SAINTS, in the *Romiſh* Church, Holy Perſons deceaſed; and ſince their Deceaſe, Canonized by the Pope, after ſeveral Informations and Ceremonies. See CANONIZATION. One of the Points wherein the *Roman Catholicks* and *Proteſtants* differ, is, That the former addreſs, invoke, ſupplicate Saints, &c. to interceed for them; whereas the latter hold it ſufficient to propoſe their good Examples. The Number of *Saints*, allowed as ſuch, in the *Romiſh* Church, is prodigious. Father *Papebroch* reckons Seventeen or Eighteen Hundred to have died on the Firſt of *June*, only. Indeed, the Croud of *Saints* wherewith their Martyrologies are ſtocked, is ſcandalous, even to the more ſober of their own Communion. Father *Mabillon*, in an expreſs Diſſertation on the *Worſhip of unknown Saints*, obſerves, That Honours are given to *Saints*, who, perhaps, were not *Chriſtians*; and whoſe Names were never known. Hence, being under a Neceſſity of giving them Names, they are therefore called *Baptized Saints*. He adds, That they every Day beſeech *Saints* to interceed for them with God; when, 'tis much doubted, whether they themſelves be in Heaven. Father *Papebroch* was a long Time employed in writing the Lives of the *Saints*. He ranged them each on the Day of the Year wherein they died. For the firſt Six Months he publiſhed Twenty Four Volumes in Folio; and ſince his Death, in 1714, his Succeſſors have publiſhed Two more.

SAKER, is a Sort of *Cannon*; and is either extraordinary, ordinary, or leaſt Size: *Saker* Extraordinary, is Four Inches Diameter at the Bore, 1800 Pound Weight, 10 Foot long; its Load 5 Pounds, Shot 3 Inches and Half Diameter, and ſomething more than 7 Pound and a Quarter Weight; its Level Range is 163 Paces. *Saker* Ordinary, is a Size leſs, 3 Inches 3 Quarters Bore, 9 Foot long, 1500 Weight; its Charge, 4 Pounds of Powder; Bullets Diameter 3 Inches and a Half, Weight 6 Pounds, its Level Range 160 Paces. *Saker* of the leaſt Size, is 3 Inches and a Half Diameter at the Bore, 1400 Pound Weight, 8 Foot long, its Load near 3 Pounds and a Half; Shot 4 Pounds 3 Quarters Weight, and 3 Inches and a Quarter Diameter. See CANNON.

SAL, in Chymiſtry, &c.	See	SALT.
SAL *Armoniac*, or *Ammoniac*,		AMMONIAC.
SAL *Petræ*, or *Nitri*,		SALT-PETRE.
SAL *Prunellæ*,		PRUNELLÆ.
SAL *Tartari*,		TARTAR.
SAL *Polychreſtum*,		POLYCHREST.
SAL *Gemmæ*,		GEMMA.

SAL *Volatile Oleoſum*, an Aromatic *Volatile Salt*, firſt prepared by *Sylvius de la Boe*, and found a very notable Medicine, chiefly as a Cephalic and Cordial. 'Tis made thus: To an Ounce of *Volatile Salt* of *Sal Ammoniac*, diſtill'd with *Salt* of *Tartar*, and dulcified with Spirit of Wine, put a Dram and Half of ſome Aromatic Oil, or Eſſence, drawn from ſome generous Aromatic Vegetable, as Cinnamon, Cloves, Roſemary, Balm, &c. And when the Spirit and Oil are well ſtirred and incorporated together; draw off the Volatile *Salt* and Spirit in a Cucurbit. Some, inſtead of this, mix all the Ingredients together at firſt, *viz.* the *Sal Ammoniac*, *Sal Tartari*, Spirit of Wine and Powder of Cinnamon or Cloves, &c. and diſtill off the Volatile Spirit and *Salt* at once; but the former Way is preferred. See VOLATILE.

SALADE, in War, a light Covering, or Armour for the Head, anciently wore by the light Horſe; only differing from the Cask, in that it had no Creſt, and was little more than a bare Pot. That of the Foot-men was called *Morion*. *Nicod* derives the Word from *Sila*, which had the ſame Signification among the *Latins*. Others from *Saladinus*; adding, That it was borrowed from the Orientals: others from the *Italian Celeta*, as if the Head were hid hereby. Others from the *Spaniſh Celada*, a little Cask, &c.

SALADINE, a Tax, impoſed in *England* and *France*, in the Year 1188, to raiſe a Fund for the *Cruzade*, undertook by *Richard* I. of *England*, and *Philip Auguſtus* of *France*, againſt *Saladin* Sultan of *Egypt*, then going to beſiege *Jeruſalem*. The *Saladine-Tax* was thus laid; That every Perſon who did not enter himſelf a *Croiſe*, was obliged to pay a Tenth of his yearly Revenue, and the Value of all his Moveables, excepting his wearing Apparel, Books, and Arms. The *Carthuſians*, *Bernardines*, and ſome other Religions, were exempted from it.

SALAMANDER's BLOOD, a Term the Chymiſts give to Red Vapours, which in Diſtillation of Spirit of Nitre, towards the latter End do fill the Receiver with Red Clouds; they are the moſt fixed, and ſtrongeſt Part of the Spirit; and nothing but Nitre yields a Red Vapour in Diſtillation.

SALARY, *Salarium*, in old Law Books, a Toll, or Duty paid for Salt. Alſo a Stipend, or Wages for any Service done.

SALIANT, in Fortification. There are Two Kinds of Angles; the one *Saliant*, which are thoſe that preſent their Point outwards: The other *Re-entring*, which have their Points inward. Inſtances of both Kinds, we have in *Tenailles*, and Works in Form of Stars. See ANGLE. The Word is formed from the *French Saillant*, which ſignifies the ſame Thing; of *Sailler*, to project, advance outwards, and that, of the *Latin Salire*, to leap. See ANGLE.

SALIENT, in Heraldry, is applied to a Lyon, &c. when its Fore-legs are raiſed in a leaping Poſture; ſtanding ſo as that his right Fore-foot, is in the Dexter chief Point, and his hinder Left-Foot, in the Sinifter baſe Point of the Eſcutcheon; by which it is diſtinguiſhed from *Rampant*. See RAMPANT.

SALIC LAW, an ancient and fundamental Law of the Kingdom of *France*; ſuppoſed to have been made by *Pharamond*, or at leaſt by *Clovis*. *Du Haillan*, after a critical Examination of the *Salic Law*, declares it to have been an Expedient of *Philip the Long*, in 1316, for the Excluſion of the Daughter of *Louis Hutin*, from inheriting the Crown. Father *Daniel*, on the other Hand, maintains, That 'tis quoted by Authors more ancient than *Philip the Long*; and that *Clovis* is the real Author of it. The Stile, which is ſcarce intelligible, and which is in a *latinized* Dialect, is a Mark of its Antiquity. This *Law* has not particular Regard to the Kingdom of *France*. It only imports in the general, That *in Salic Land, no Part of the Inheritance ſhall fall to any Female; but the whole to the Male Sex*. So that 'tis a popular Error to ſuppoſe, That the *Salic Law* was eſtabliſhed purely on Account of the Succeſſion to the Crown: Since it extends to private Perſons as much as thoſe of the Royal Family. Part of it ſeems to have been borrowed by our *Henry* I. in compiling his Laws, *Cap.* 89. *Qui hoc fecerit ſecundum legem Salicam moriatur*. By *Salic Lands* or *Inheritances* was anciently expreſſed all Lands by whatever Tenure held, whether Noble or Baſe, from the Succeſſion whereto, Women were excluded by the *Salic Law*; and admitted to inherit nothing but Moveables, and Purchaſes, whenever there were any Males. Indeed, M. *Fenelon* obſerves, That there were originally *Salic Lands*, diſtinguiſhed from all others, and deſtined for the Military People of the Nation; and to theſe, 'tis ſuppoſed, the *Law* was originally intended to be confined. M. *Eccard*, a *Hanoverian*, is ſaid to have recovered an antient M S. of this famous *Law*, containing a third Part thereof, much more amply than any yet known, with a very curious Chronology of the ſame *Law*, hitherto unknown.

Some, as *Poſtellus*, will have this *Law* called *Salic*, *q. d. Gallic*, becauſe peculiar to the *Gauls*. *Cenal* takes the Reaſon to be, That the *Law* was only ordained for the Royal *Salles* or Palaces. *Claud. Seiſſel* ſays, 'Twas thus called, becauſe of the *Salt* and the *Prudence* it abounds withal. *Fer. Montanus* ſays, 'Twas becauſe *Pharamond* was at firſt called *Salic*. Others, with the Abbot *Uſperg*, derive its Name from *Salogaſt* his Principal Miniſter. And others from the frequent Repetition of the Words *Si aliqua*, at the beginning of the Articles. *Genebrand* ſays, 'Tis called *Salic* for *Salomonic*, by Reaſon *Solomon* ſet the firſt Example of it. *Daviſon* derives it from the *German* Words, *Salts* and *Lik*, *q. d.* like to Salt. The moſt probable Opinion is, That the Word is derived from the ancient *Franks*, called *Sali*, *Salici*, and *Salingi*, from the River *Sala*, a River of ancient *Germany*: This is the Sentiment of *Rhenanus* and *Emilius*, who are followed by ſeveral others; among the reſt, *Menage*, *Paſquier*, *Borel*, and *Juncker*. *Bouteroue* gives another plauſible Origin of the Word: He ſays, it comes from the Word *Salich*, which, in the Old *Teutonic* Language, ſignified *Salutary*; and that the *French* in this *Law* imitated the Policy of the ancient *Romans*, who made *Salutary Laws*, which the Magiſtrates were to have before them when they adminiſtred Juſtice. This he proves from a curious Figure taken out of the *Notitia Imperii*, wherein the Book is repreſented covered with Gold, with this Inſcription; *Leges Salutares*.

SALII, in Antiquity, Prieſts of *Mars*, whereof there were Twelve, inſtituted by *Numa*. They were painted with Parti-coloured Garments and high Bonnets, with a Steel Cuiraſſe, or Breaſt-plate on the Breaſt. They had their Name

Salii from *Saltare*, to dance; becauſe, after aſſiſting at Sacrifices, they went dancing about the Streets with *Ancyles* or Bucklers in the Left-Hand, and a Rod in the Right, ſtriking muſically on one another's Bucklers with their Rods, and ſinging Hymns in Honour of the Gods. There were Two Companies or Colleges of *Salii*: The ancient eſtabliſhed by *Numa*, called *Palatini*; the latter by *Tullus Hoſtilius*, called *Collini*, and *Agonales*. *Servius*, indeed, tell us, That there were Two Kinds inſtituted by *Numa*, the *Collini* and *Quirinales*; and Two other Kinds by *Tullus*, the *Pavorii* and *Pallorii*. In Singing, they uſed a Song called *Saliare Carmen*; and after the Ceremony, were entertained with a Feaſt: Whence *Saliares Epulæ*, and *Saliares Dapes*, paſſed into a Proverb for good Eating. Their Chief, called *Præſul*, and *Magiſter Saliorum*, was one of their Number. 'Twas he led the Band, and begun the Dance; the reſt imitating all his Steps and Motions. The whole Company was called *Collegium Saliorum*.

Sex. Pompeius makes mention of *Salian Maids*, *Virgines Saliares*, hired for the Purpoſe, and joyned with the *Salii*, wearing a Kind of Military Garb, called *Paludamentum*, with high round Bonnets like the *Salii*, and, like them, performing Sacrifice with the *Pontifices* in the Palaces of Kings. M. *Patin* takes it, there is a Figure of one of the *Salii* on a Medal of the *Sagninian* Family; who, beſides the Buckler in one Hand, holds the *Caduceus* in the other. But his Look is very grave and ſedate; and beſides, the Buckler he holds, does not ſeem to be an *Ancyle*, as being quite round, and not indented any where. And again, why ſhould a Prieſt of *Mars*, the God of War, be repreſented with a *Caduceus*, the Emblem of Peace? 'Tis probable therefore, this is no Figure of any *Salius*, as *Patin* imagines.

SALIVA, *Spittle*, a thin pellucid Humour, ſeparated by the Glands about the Mouth and Fauces; and conveyed by proper *Salival Ducts* into the Mouth, for ſeveral Uſes. See SALIVAL *Ducts*. It conſiſts of a great deal of Water or Phlegm, and a Volatile Salt; ſome add, a ſulphurous Spirit. The *Saliva*, *Boerhaave* obſerves, is void both of Taſte and Smell; does not harden by Heat; is more copious, fluid, ſharp, penetrating, and detergent, as a Perſon has faſted longer; and is ſeparated from the pure Arterial Blood. The Glands wherein the *Saliva* is ſeparated from the Blood, are the *Parotides*; the *Maxillary Glands*; the *Sublinguales*, or thoſe under the Tongue; the *Amygdalæ*, or Almonds of the Ears, and the *Palatinæ*, or Glands of the Palate: See each under its proper Article. The great Uſe of the *Saliva*, is in maſticating and diluting the Food, and making the firſt Digeſtion thereof. The other Uſes are to moiſten the Tongue, to render its Motion more quick and eaſy; to lubricate the Throat and *Oeſophagus*, in order to facilitate Deglutition, to prevent Thirſt, and to aſſiſt in the Senſation of Taſtes, by diſſolving the Salts. Some imagine it to do the Office of a *Menſtruum* to mix the oily and aqueous Parts of the Food more intimately, to diſſolve the Saline Parts, and to procure a Fermentation in the Stomach. But Dr. *Drake* will not allow it fit for that Purpoſe. Were the *Saliva*, ſays he, acrimonious enough for this, 'twould be impoſſible but it muſt offend the Stomach; eſpecially, conſidering the Quantities of it that many ſwallow, even upon an empty Stomach. See DIGESTION.

M. *Gaſtaldy*, who has a Medicinal Theſis on the Subject of the *Saliva*, obſerves, That it takes its Name from the *Salt* it contains; which Salt he will have to be partly a Volatile Acid, and partly Alcalious. He adds, That it contains ſome Oleaginous Parts, and a little Earth. By being compounded of ſo many different Kinds of Parts, it becomes a Diſſolvent proper for all the different Kinds of Foods whereof we live. Its natural and laudable State, is to be a little more Viſcid than common Water, and much leſs ſo than Milk. 'Tis preſerved in this State by the Application of the Spirits, and of the Particles of Air which inſinuate into it. According to all Appearance, the *Saliva* is derived from the Blood of the Arteries. Part of the Arterial Blood brought to the *Salival Glands*, ſerves to feed them; another Part is returned into the Veins, and continues the Circulation, and a third Part, which is the *Serum*, receiving a ſub-acid Quality from them, is converted into *Saliva*. Some Authors have imagined, that the Nervous Juice contributed to the Compoſition of the *Saliva*; the rather becauſe larger and more numerous Twigs of Nerves are communicated to theſe Glands, than to moſt other Parts, which yet have a more exquiſite Feeling than theſe. But Dr. *Nuck* has refuted this Opinion by ſeveral Experiments.

Too great an Excretion of *Saliva*, *Boerhaave* obſerves, diſorders the firſt Digeſtion; and hence cauſes Thirſt, Dryneſs, a black Bile, Conſumption, Atrophy: On the contrary, if no *Saliva* be diſcharged into the Mouth, or leſs than ordinary, it ſpoils both the Manducation of the Food, and its Taſte, Swallowing, and Digeſtion; and withal, occaſions Thirſt.

SALIVAL, or *Salivary Ducts*, in Anatomy, certain little Canals lately diſcovered; whereby the *Saliva* falls into the Mouth. The *Lower Salival Duct* comes from the *Maxillary* Glands, ſituate under the lower Jaw, and terminated behind the *Dentes Inciſores*. It was firſt deſcribed by our Dr. *Wharton*, in his Treatiſe of the *Glands*, in 1656. The *Upper Salival Duct* was diſcovered by *Nicolas Steno*, in 1660. It comes from the Parotid Glands; whence perforating the *Buccinator*, it terminates near the third Upper Grinder. *Caſp. Bartholine*, in 1682, diſcovered another *Salival Duct*, coming from the Glands ſituate on the Side of the Tongue; tho' *Rivinus*, a Phyſician of *Leipſic*, had mentioned it before, in a Diſſertation printed in 1679. *Auth. Nuck*, Profeſſor at *Leiden*, diſcovered a fourth *Salival Duct*, ariſing from a Gland ſituate in the Orbit of the Eye, between the *Muſculus Obductor*, and the Upper Part of the *Os Jugale*. Theſe Ducts are all double, there being one of each Kind on either Side. But 'tis pretended, the Two laſt are only found in ſome Brutes, and not in Man.

As the Demand of *Saliva* is greateſt in Maſtication, Deglutition, Talking, *&c.* ſo, Dr. *Drake* obſerves the Diſpoſition of the *Salival Ducts*, to favour the Diſcharge on thoſe Occaſions, is very remarkable: Thus the Ducts of the *Parotides* paſs cloſe over the *Muſculi Maſſeteres*, and thro' the *Buccinatores*. The *Salival Ducts* of the *Maxillary* Glands paſs cloſe under the *Mylohyoideus*, where the *ſublingual* Glands are placed; by Means whereof, the Intumeſcence of the *Maſſeters*, in Chewing, accelerate the Spittle in the *Parotid Salival Ducts*; as the *Mylohyoideus* does in the Action of Deglutition, in drawing the *Hyoides* upwards. The Agitation of the Cheeks and Lips, is ſufficient to promote the Diſcharge from the Glands of the Lips, *&c.*

SALIVATION, in Medicine, a promoting of the Flux of *Saliva*, by Means of Medicines; chiefly *Mercury*. See MERCURIALS. The chief Uſe of *Salivation* is in Diſeaſes adhering to the Glands, and the *Membrana Adipoſa*; principally in the Cure of the Venereal Diſeaſe. 'Tis ſometimes alſo uſed in Epidemic Diſeaſes. The Body is prepared for *Salivation* by a copious and continued Uſe of attenuating, diluting, ſoftening Decoctions; as of Scabious, Pellitory, China, Sarſaparilla, Saſſafras, and Santal. *Salivation* is either *Partial* or *Univerſal*. By the firſt, only, the Humours of ſome Part of the Body are to be diſcharged; as in *Catarrhs*, *Tooth-ach*, &c. By the ſecond, the whole Maſs of Blood is to be purged. The firſt is raiſed by a ſlow continued Chewing of ſome tenacious Matter, as Maſtich, Wax, Myrrh; eſpecially if other ſharp Things be mixed with them, as Pyrethrum or Bartram, Ginger, or Pepper. Or by drawing in ſharp irritating Vapours, as thoſe of Tobacco, Roſemary, Thyme, Marjoram, *&c.* The latter is effected by the Action of ſuch Medicines as create ſome ſlight but conſtant *Nauſea*; as *Stibium* not quite fixed, nor yet quite emetic; a little common Vitriol, *&c.* but chiefly ſuch as diſſolve all the Parts of the Maſs of Blood, turn them into *Lympha*, and thus cauſe a *Ptyaliſm*. Such is crude Quickſilver, Cinnabar, a Solution of Quickſilver in *Aqua-fortis*, White and Red Precipitate, Turbith Minerale, ſweet Sublimate of Mercury, *&c.*

MERCURIAL SALIVATION, is now a very uſual Method of Cure; eſpecially in Venereal Scrophulous, and Hypochondriac Caſes. In Effect, it proves the ſureſt Remedy yet diſcovered for the *Lues*; tho' the Diſcovery hereof, as that of moſt other Remedies, is owing to Chance. *Jac. Carpi*, a Phyſician of *Boulogne*, having read in *Avicenne* and *Meſve*, Two *Arab*-Authors, that Mercury applied externally, was proper for the *Lepra*, and ſome Kinds of Puſtules, particularly the *Scabies* or the Itch; had a Mind to try it in a Pocky Itch: A *Salivation* was hereupon unexpectedly raiſed, and the Patient was cured not only of his Itch, but of his Pox. The ſame Method he afterwards uſed for the Pox itſelf; and meeting with great Succeſs therein, others were induced to follow him; and thus did it arrive at its preſent Height.

There are Two Manners of applying Mercury to raiſe a *Salivation*: The one *external*, by mixing it up with ſome Unguent, Plaiſter, or Perfume, and then rubbing it on the Joints, *&c.* The other *internal*, where 'tis taken at the Mouth. In each Caſe the Mercury inſinuates it ſelf into the Maſs of Blood, and mixing with the Venereal Poiſon, the Two Bodies thus locked together, are drawn, with the Seroſity, into the *Salival* Glands, where they are ſeparated and diſcharged, as finding the Pores of the Glands proportioned to their Figures, and proper to receive them. But, for the Manner wherein the Mercury acts to raiſe the *Salivation*, ſee MERCURIALS. Dr. *Quincy*, will have the *internal* to be much the ſafer

and

and better Method. The Mineral Globules, he thinks, being intimately combined with Salts, in the Preparations given inwardly, will, by the Irritation thereof, be eaſily and fully thrown off by the Secretory Organs, 'till the Blood is quite diſcharged of its Load: Whereas, in Mercurial Frictions, 'tis poſſible, ſome of the heavy Particles may be left lodged in the Interſtices of the Fibres, or Cells of the Bones. Add to this, that by computing the Proportion of Mercury in all the Doſes neceſſary to promote a Spitting, internally; and the Weight of the ſame Mineral uſed when 'tis done by Unction; the Quantity uſed in the latter Caſe, far exceeds that in the former; conſequently, the ill Effects apprehended from that dangerous Medicine, muſt be vaſtly more ſenſible in the one Caſe than the other. The external Application, therefore, is only to be allowed of, where either the Caſe will bear the Violence of ſuch a Management, or outward Ulcers and Tumours, require a particular Cure by Linements.

Indeed, a great *French* Phyſician, M. *Chicoyneau*, Chancellor of the Univerſity of *Montpellier*, has lately done ſome Diſcredit to the Practice of *Salivating* in any Manner; And that, in a little Treatiſe lately publiſhed, where he endeavours to prove, That the *Salivation* it ſelf contributes nothing to the Cure, but is rather prejudicial thereto: That the Salutary Effects of the Mercury are independant of any Evacuation at all; and that it acts purely as a Specific. 'Tis without Reaſon, therefore, he urges, that Venereal Patients are put to the Torture of a *Salivation*, ſince the full Effect of the Medicine is had without carrying Matters to that Extremity. The *Salivation* is only an Accident to the Cure; which is effectually obtained by a Mercurial Unguent rubbed on the Joints in ſuch Quantities, and at ſuch Intervals, as not to raiſe any *Salivation*. He ſupports the whole by the Experience of Forty or Fifty Cures wrought in one Year, by the New Method. This Method, it ſeems, has been lately, too, tried in *England*, and with Succeſs; as appears from a Tranſlation of *Chicoyneau*'s Piece juſt publiſhed with Notes.

SALLET, or *Salade*, a Diſh of eatable Herbs ordinarily accompanying Roaſt-meat, compoſed chiefly of crude, freſh Herbs, ſeaſoned with Salt, Oil, and Vinegar. Some add Muſtard, hard Eggs, and Sugar; others, Pepper, and other Spices, with Orange-Peel, Saffron, *&c.* Some define *Sallet* more generally, A Compoſition of Plants and Roots, of ſeveral Kinds, to be eaten raw or green, blanched or candied, by themſelves, or mixed with others; and even, occaſionally, boiled, pickled, or otherwiſe prepared and diſguiſed, to render them more grateful to the Palate. But this Definition includes *Pot-herbs*, &c. which the Generality of Authors deny to be any proper Salleting, though others ſtiffly maintain it. *Menage* derives the Word from the *Latin*, *Salate*, of *Sal*, Salt; others from *Salcedo*. *Du Cangſe* from *Salgama*; which is uſed in *Auſonius*, and *Columella* in the ſame Senſe.

Compoſition of SALLETS.

The principal *Sallet-herbs*, and thoſe which ordinarily make the Baſis of our *Engliſh Sallets*, are Lettice, Sellery, Endive, Creſſes, Radiſh, and Rape, *&c.* Along with which, by way of Furniture, or Additionals, are uſed Purſlane, Spinage, Sorrel, Taragon, Burnet, Corn-Sallet, and Chervil. The different Taſtes of Mankind will not allow any certain Mixture of theſe to be preſcribed as moſt agreeable; but ſtill, in mixing them, the Reliſh of the ſeveral Herbs is to be conſider'd: Thoſe, for Inſtance, which are moſt hot and biting; as Creſſes, Muſtard, Sellery, Taragon, Chervil, *&c* with thoſe that are more cool and inſipid to the Taſte; as Turnips, Rape, Spinage, Lettice, Corn-Sallet, Purſlane, *&c.* by this Means the Herbs may be ſo judiciouſly mixed, that the too ſtrong Taſte of one Kind may not over power all the reſt; and the inſipid Kinds be diſcretely uſed to moderate and qualify the Heat and Pungency of the others, as the Seaſon of the Year is more hot or cold; ſo as every *Sallet* may not only be agreeable to the Taſte, but alſo Phyſic to the Body.

Culture of SALLETS.

The Gardeners call *Small-herbs*, in *Sallets*, thoſe which ſhould always be cut while in the Seed Leaf; as Creſſes, Muſtard, Radiſh, Turnip, Spinage, and Lettice; all which are raiſed from Seeds ſown in Drills or Lines, from Mid-*February* to the End of *March*, under Glaſſes or Frames, and thence to the Middle of *May*, upon natural Beds, warmly expoſed; and during the Summer Heats in more ſhady Places; and afterwards, in *September*, &c. as in *March*, &c. and laſtly, in the Rigour of the Winter, in hot Beds. If they chance to be frozen in very froſty Weather, putting them in Spring-Water two Hours, e'er they be uſed, recovers them. In gathering *Small-herbs*, the beſt Way is to pull them up by the Roots from the hot Beds. If the Roots be left, and a ſecond Crop of *Salleting* ſown on the ſame Bed, it will not proſper. In ſowing ſecond Crops, 'tis alſo to be obſerved, that Seeds of the ſame Kind be not ſown in the ſame Place; but the Ground is to be eaſed by varying its Burthen, putting hot Seeds where cold ones grew before, *&c.* Another Rule is, that no Plant be placed in the ſame Spot where the ſame Kinds have been growing.—— *Winter-Sallets* are greatly improved by blanch'd Sellery, which is a hot Herb, of a very rich Flavour; raiſed from Seed ſown in *March*, and *April*, in a well expoſed Place, and tranſplanted, ſix Weeks after its firſt Appearance, into Beds, where it remains till the Middle of *June*, and then planted in Trenches 8 or 10 Inches wide, and as many deep, firſt pruning off the Tops and Roots. As they grow large, they are earthed up within 4 or 5 Inches of the Top, which is repeated ſeveral times, till they be fit for Uſe.—— *Endive* blanch'd is much uſed in *Winter Sallets*, though it have neither Taſte nor Flavour; 'tis cultivated much after the ſame Manner as Sellery.—— Of Lettice there are various Kinds, the beſt are the *Roman*, *Dutch brown*, *Imperial*, and *Sileſia-Kinds*, all which cabbage well. They are all commonly ſown with other Crops in *March*, for *Summer-Sallets*, and in *Auguſt*, to be tranſplanted, or *September*, to ſtand the Winter, either to be cut for *Winter Sallets*, or to cabbage early next Spring for *Seeds*. See SEEDS. Indeed the *Roman* will ſcarce bear the Froſt.

For the Additional, or Secondary *Sallet-herbs*: *Burnet* is a cool perennial Herb, whoſe tender Leaves, mixed with other Herbs in Winter, give the agreeable Flavour of a Cucumber: 'Tis propagated by Seed ſown in *March*. *Corn-Sallet*, raiſed at the ſame Time, and in the ſame Manner, makes a good *Winter-Sallet* Furniture; *Purſlane*, an inſipid, yet cooling Herb, is admired by ſome in *Summer-Sallets*: 'Tis raiſed by Seeds ſown in *March* in a warm Place. *Sorrel* is chiefly uſed in the Spring, when the young Leaves are very agreeable. 'Tis raiſed from Seeds ſown in *March*, uſually in Rows or Drills. *Spinage* is a neceſſary Ingredient in raw *Sallets*, to be cut in the Ear-leaf; but 'tis better for boiled *Sallets* in the Winter and Spring. 'Tis ſown in *March*, *April*, and *May*; and again in *Auguſt*, in a Place well expoſed to the Sun, that the Leaves may be large enough for boiling in the Winter. *Taragon*, of all others, ſhould never be wanting; 'tis a Cordial Herb, though not the moſt agreeably taſted: Yet a few Leaves, or three or four of the tender Tops, give a *Sallet* a good Reliſh. 'Tis propagated from Slips, taken from the Root, and planted in *March*.—— *Note*, in the Spring, *Dandelion* blanch'd, which is gather'd in almoſt every plough'd Field, makes an excellent Sallet mixed with other Herbs. Some likewiſe gather Violet Flowers, Cowſlips, and Bloſſoms of Burrage, as part of the *Sallet* Furniture; others, *Fennel*, and *Parſley*. See POT-HERBS.

Preparation and Dreſſing of SALLETS.

The *Sellery* and *Endive*, have their hollow, green Stem, or Stalk, ſtripp'd of all its outſide Leaves, and ſliced in the blanch'd Part, cutting the Root into four Parts. The other ingredient Herbs being exquiſitely culled and cleanſed, of all faulty Leaves, *&c.* are waſh'd rather by ſprinkling, than ſobbing them in Spring-water; laid to drain of all ſuperfluous Moiſture, then ſhook and ſqueezed together gently, in a coarſe Cloth, to diſpoſe them to receive the Seaſonings, *viz.* the Salt, Vinegar, Oil, *&c.* The Oil not to be yellow, or high colour'd, but of a pale Olive Green, without either Taſte or Smell. See OIL. The Vinegar perfectly clear, neither ſour nor pall'd. See VINEGAR. The Salt to be the beſt ordinary Bay-Salt, clean, bright, and dry. Some indeed recommend the Eſſential Salts and Spirits of Vegetables, or thoſe of the Alcalizate and Fix'd Kind, extracted from the Calcination of Balm, Roſemary, Wormwood, *&c.* and affirm, That, without eating the groſs *Sallet-herbs* themſelves, we might have healing, cooling, generous *Sallets*, wholly out of the *Salt-Setler*. See SALT. *Note*, In the Proportion of the Salt, Pepper, and Vinegar, Regard is to be had to the Seaſon, Conſtitution, *&c.* the two firſt being beſt for cold, the ſecond for hot Stomachs and Seaſons. For a moderate *Oxalme*, or *Sallet-Vehicle*, to three Parts of Oil, put one of Vinegar, or Lemon, or Orange Juice, and in the Mixture, ſteep Slices of Horſe-radiſh with a little Salt; occaſionally, add a little *Guinea* Pepper, and Muſtard, with the Yolks of two Eggs boiled, ſqueezed, and bruiſed into a Maſh therein. Pour the Whole on the Herbs, ſtirring and mingling them till they be thoroughly imbibed.

SALLY, in Architecture, from the *French Sallie*, is what we more uſually call *Projecture*. See PROJECTURE.

SALLY, in the Military Art, the iſſuing out of the Beſieged from their Town or Fort, and falling upon the Beſiegers to cut them off, nail their Cannon, hinder the Progreſs of their Approaches, deſtroy their Works, &c. To *Cut off a Sally*, is to get between thoſe who made it and the Town.

SALON, or *Saloon*, in Architecture, a very lofty, ſpacious Hall, vaulted at Top, and ſometimes comprehending two Stories, or Ranges, of Windows: As that at *Blenheim*-Houſe. The *Salon* is a Grand Room in the Middle of a Building, or at the Head of a Gallery, &c. Its Faces, or Sides, are all to have a Symmetry with each other; and as it uſually takes up the Height of two Stories, its Ceiling, *Daviler* obſerves, ſhould be with a moderate Sweep. The *Salon* is a State Room. 'Tis much uſed in the Palaces in *Italy*; and from thence the Mode came to us. Embaſſadors, and other Great Viſitors, are uſually received in the *Salon*: 'Tis frequently built Square, ſometimes Octogonal, as at *Marly*, and ſometimes in other Forms.

SALT, *Sal*, in Chymiſtry, a ſimple, acid Subſtance which enters the Compoſition of all Bodies, and is held one of the Five *Principles*, or Elements thereof; only to be extracted by Fire. See PRINCIPLE. *Salt*, M. *Homberg* obſerves, is an Ingredient in all Animal, Vegetable, and Mineral Bodies, excepting perhaps ſome Metals, and Stones. In Vegetables and Mineral Bodies, that have undergone a Fermentation, the *Salt* riſes firſt in the Alembic, then the Phlegm: If the Mixt have undergone a Fermentation, the *Salt* riſes after the Phlegm.

SALTS are diſtinguiſhed, with Regard to the Manner of extracting them, &c. into *Volatile*, *Fixed*, and *Eſſential*. *Volatile Salts*, are thoſe light, ſubtle ones, which riſe eaſily upon Diſtillation, or are even exhaled by the Noſe, and rendered ſenſible to the Smell. See VOLATILE SALT. *Fixed Salts* are ſuch as, being more Groſs and Material, reſiſt and ſuſtain the Fire; and are not raiſed by it, but remain, after Calcination, or Diſtillation, in the Earthy Part, at the Bottom. For the Manner of Extracting them, &c. ſee FIXED SALT. *Eſſential Salts* are thoſe drawn from Vegetables, without the Uſe of Fire, as by Cryſtallization, and other eaſy, natural Means. See ESSENTIAL SALTS. *Volatile Salts* become diſtinguiſhable to the Noſe, Tongue, and Brain, by their Tenuity and Briskneſs; *Fixed Salts* by their Bitterneſs, and Heat in the Mouth. To theſe may be added an intermediate Kind of *Salt*, under the Title of *Mixed Salts*; which are thoſe reſulting from a Mixture of a *Volatile* with *Fixed Salt*.

SALTS are of different Kinds, according to the different Matters wherewith they are found mixed: Some are mix'd Bodies themſelves, and their Mixture ſeparable by Fire, and Lixivation; ſuch are all *Eſſential Salts* of Plants, and all *Foſſile Salts*, &c. but theſe are no proper Chymical Principles. There are others which we are ſenſible are mixed, and whoſe Mixture we know pretty nearly, though we are not yet able to decompound them: 'Tis theſe make the Chymical Principle *Salt*; for our Analyſes will not render them more Simple, which is the Character of a Principle: And in this Senſe *Salt* is defined, *A Matter diſſoluable by Water, and unchangeable by Fire*; to which ſome add, *Of a pungent Taſte*.

There are Three Kinds, or Claſſes, of *Salts*, which come under this Definition; Two whereof are *Volatile*, and the Third *Fixed*. The *Volatile* ones, are *Acid Salts*, and *Urinous Salts*; the *Fixed*, are thoſe drawn by a Lixivium after Calcination, and called *Lixivious Salts*. Nature produces none of theſe *Salts* ſimple and unmixed, but we eaſily extract them by Art, from the Mixts wherein ſhe has placed them. The Principal Natural Salts may be reduced to *Salt-petre*, *Sea-Salt*, and *Vitriol*. Each whereof has its different Kinds; of the various Combination whereof, with different Oily Matters, all the Natural *Salts*, we know of, are compounded. Theſe *Salts* are found, by Chymical Analyſes, to conſiſt of Aqueous, Earthy, Oily, or Sulphurous, and Acid Particles. The Acid Matter is the *Pure Salt*, or the *Salt-Principle*, and is the Baſe of all the reſt. This M. *Homberg* obſerves, is pretty uniform, and nearly the ſame in all *Salts*, before the particular Determination to form this or that *Salt*, by the particular Admixture of the Sulphur, &c. *Salt petre*, *Sea-Salt*, &c. therefore are not Principles, but the *Acid Salts* diſtilled from them are, and the Water wherein theſe *Salts* ſwim, and the Earth, or *Fixed Salt*, remaining in the Retort after Diſtillation, are other Chymical Principles. See PHLEGM, and EARTH.

The Principle *Salt* is held a *Mean* between the *Active* and *Paſſive* Principles. The pure *Acid*, though accompanied with its ſulphurous determinating Matter, never becomes ſenſible but when lodged either in ſome earthy Matter, or artificially in ſome ſimple aqueous Matter. In the firſt Caſe, it appears under the Form of a cryſtallized *Salt*, as *Salt petre*, &c. See SALT, &c. In the ſecond Caſe, it appears in the Form of an Acid Spirit, which, according to the Determination of the Sulphur that accompanies it, is either Spirit of Nitre, or Spirit of *Common-Salt*, or Spirit of Vitriol; and what we have here obſerved of the three Simple, or *Foſſile Salts*, may be applied to all other more Compound *Salts* of Plants, Animals, &c. with this Difference, That when, in Form of a *Concrete Salt*, theſe laſt always take a greater Quantity of earthy Matter, and when in Form of an Acid Spirit, a greater Quantity of aqueous Matter, than the Simple ones. Whence it follows, that the Acid Spirits of Compound *Salts* are always weaker, lighter, and leſs penetrating than thoſe of *Foſſile Salts*; and after Diſtillation leave a greater Quantity of earthy Matter behind them.

We don't know preciſely what Figures the three *Salt-Principles*, *Acid*, *Urinal*, and *Lixivial*, muſt have. But to judge by their Effects, one would conclude, the *Acids* to be pointed, only the Points ſheathed in ſome ſulphurous Matter. The *Urinous Salts* to be Spunges, containing ſome of the *Acid*, and ſome of the fœtid Oil of the Animal or Plant: And the *Lixivious Salts* to be Spunges, only containing the Remainder of the Acid, which the calcining Fire could not expel.

Acid Spirits may be conceived as pure, and without any Mixture; in which Caſe all Acids will be found of the ſame Nature: But if we conſider them as Diſtillation gives them, we ſhall always find them accompanied with ſome ſulphurous Matter, which we cannot ſeparate from them, and which gives the Degree of Activity to the Acid Spirits. 'Tis this ſulphurous Matter which characterizes them, and makes all the Difference we find between Acid Spirits. M. *Homberg* ranges all the Kinds of Acid Spirits under Three different Claſſes, according to the different ſulphurous Matters which accompany them. The Firſt Claſs is of thoſe which contained Animal or Vegetable Sulphur; under which come all Acids, diſtilled from Plants, Fruits, Woods, &c. as alſo Spirit of Nitre. 'Tis eaſy to conceive, that the Acids of Plants may have retained a Part of the Oil of the Plant, which is their Sulphur; ſince in reducing theſe Acids into *Salts*, we always find a little Oil therein; which can be nothing elſe but that of the Plants themſelves. And for *Salt-petre*, as this is always drawn from Earths moiſtened with the Excrements of Animals, or from old Walls, Plaiſter, &c. full of the ſulphurous Matters of the Animals that lived within them, the Soot, &c. 'tis thence, doubtleſs, *Salt-petre* borrows its Sulphur. See SALT-PETRE. The Second Claſs is of thoſe which contain a bituminous Sulphur: Under which come the Acids of Vitriol, Common Sulphur, and Alum. For thoſe are all uſually drawn from the ſame Mineral Stone, wherein the bituminous Matter, which makes one of the Principal Parts of *Common Sulphur*, predominates. See SULPHUR. The Third Claſs is of thoſe which contain a more fixed mineral, ſulphurous Matter; approaching nearer the Properties of Metaline Sulphur: Under which Claſs come the Acids drawn from ſeveral Kinds of *Sea Salts*, *Rock-Salts*, &c. For the *Rock Salt*, or *Sal-Gemmæ*, is always found in Places near Metalic Mines; and *Sea-Salt*, in all Appearance, is nothing but *Rock-Salt*, the Quarries whereof have been penetrated by the Sea-Water, which has extracted all the Saltneſs therefrom. See SEA-SALT.

The ſulphurous Matters of the Firſt Claſs of Acids being very light, and taking up a deal of Place, muſt augment the Bulk of the Points of the Acids to which they are joined. And hence theſe Acids become diſabled from penetrating very compact Bodies; but their Surface being increaſed from the ſame Cauſe, the Flame will have the greater Hold to drive them: And hence the Acids of this Claſs act more ſwiftly than any of the reſt. The bituminous Sulphur is the leaſt active of all the Sulphurs we know, as being loaden with a great Quantity of earthy Matter, which ſerves it as a Matrix. Hence it unites more difficultly with Saline Matters than any of the other Sulphurs; ſo that a leſs Quantity of it may be conceived to adhere to the Acids of this, than of either of the other Claſſes. Accordingly we find, that the Acids of this Claſs, uſed alone, ſcarce diſſolve any Metals; but mixed with the others, partake of their Sulphur, and thereby become enabled to diſſolve all Metals. The Metalick-Sulphur is of all others the moſt fixed; that is, its Parts are the ſmalleſt, and moſt compact. See FIXITY. Hence the Points of this Claſs of Acids will not be much ſwelled by it, and of Conſequence will be able to inſinuate themſelves into the moſt compact Bodies, or thoſe whoſe Pores are the ſmalleſt. And for the ſame Reaſon they will not give much hold to the Flame that agitates them, and will

therefore

therefore act with leſs Violence than thoſe of the Firſt Claſs of *Salts*. Acids joined to *Fixed Salts*, compoſe *Mixed Salts*. Thus Spirit of *Nitre*, with *Salt* of *Tartar*, make *Salt-petre*; and Spirit of *Salt*, with *Salt* of *Tartar*, make a true *Common Salt*; and Spirit of *Vitriol*, with *Salt* of *Tartar*, a true *Vitriol*. However, the two ingredient *Salts* ſtill remain, the one *Fixed*, the other *Volatile*: Acids joined with *Urinous Salts*, compoſe another Kind of *Salts*, called *Sales Ammoniaci*, which are always *Volatile*.

Lixivial and *Urinous Salts*, are called *Alcalies*; the firſt a *Fixed Alcali*, the ſecond a *Volatile Alcali*. Theſe *Alcalies* are uſually eſteemed Antagoniſts to the *Acid Salts*, becauſe their Mixture always occaſions a ſudden Ebullition. But 'tis more probable this Ebullition is not the Effect of a Combat, but rather a proper Junction and Union of two Matters which had been naturally united together, and only ſeparated by the Fire, and now re-place themſelves in the ſame Parts whence the Flame had tore them off. Hence, the one are compared to Sheaths, and the other to Points fit to be ſheathed therein. Now, the Precipitation wherewith the Points of the *Acids* enter the Pores of the *Alkalies*, tears aſunder their Contexture, and reduces them into minute Parts inviſible to the Eye; and thus is the Buſineſs of *Diſſolution* accounted for. See Dissolution.

Thus far will the mere Doctrine of *Alkali* and *Acid* go towards accounting for ſome of the great Phænomena of Nature. But the Theory is made vaſtly more compleat and adequate, by Sir *Iſaac Newton*'s Principle of *Attraction*, for which we refer the Reader to the Articles Acid, Menstruum, &c. where the Operation of *Salts*, or *Acid Spirits*, are perhaps more ſatisfactorily accounted for.

The Principal *Chymical Salts* of Uſe in Medicine are; Salt of *Urine*, of *Lavander*, of *Viper*, of *Human Blood*, of *Wormwood*, of *Guayac*, of *Quinquina*, of *Tobacco*, of *Rhubarb*, of *Roſemary*, of *Calaureum*, of *Sage*, of *Juniper*, of *Vitriol*, of *Amber*, of *Saturn*, &c. moſt of which, with many others, are explained under the Articles of the reſpective Drugs, *&c.* whence they are drawn: To which the Reader may have recourſe.

Salt, in the popular Uſe of the Word, is uſed for a Kind of *Saline* Cryſtallization; or a ſharp, pungent, detergent and aſtringent Subſtance, uſed to Seaſon Fleſh, Fiſh, Butter, Hides, and other Things that are to be kept: As alſo to give a Reliſh to Meats, *&c.* This *Salt* we uſually call *Common-Salt*, in Contra-diſtinction to the *Chymical Salt*. M. *Guglielmeni*, in an expreſs Diſſertation *de Salibus*, lays it down as a Fundamental, that the firſt Principles of *Common-Salt*, *Salt-petre*, *Vitriol*, &c. have their Figures unalterably fixed at their firſt Creation, and are indiviſible as to any created Force. That of *Common-Salt*, he maintains to be a little Cube; that of *Salt* of *Vitriol*, a Parallelipiped; that of *Salt-petre* a Priſm, whoſe Baſe is an equilateral Triangle, *&c.* *Common-Salt* is of three Kinds, *viz.* *Sea-Salt*, *Foſſile*, or *Rock-Salt*, and *Salt* drawn out of *Salt* Springs and Wells.

For *Sea-Salt*, the greateſt and beſt Part is made in *France*; little in *England*. *Foſſile*, or *Rock-Salts*, are chiefly found in *Poland*, *Hungary*, and *Catalonia*. For *Salt* Fountains, they are conſiderable in *Cheſhire*, *Worceſterſhire*, *Hampſhire*, *Northumberland*, *Franche Comte*, *Lorrain*, *Tirol*, and ſome other Places.

The Uſe of *Salt* is ſo univerſal, and the Commerce thereof ſo very conſiderable in the Places where Nature has produced the different *Salts*, and ſo neceſſary for thoſe which have not that Advantage; that a Detail of the Preparation, Commerce, *&c.* of the ſeveral Kinds, cannot fail of being acceptable.

Manner of Making Sea-Salt.

This *Salt* is made of *Sea* Water, thicken'd by frequent Evaporations, and at length Cryſtallized. Of *Sea-Salt* there are two Kinds: That which requires the Sun's Rays to give it its Conſiſtence, called, from its brown Colour, *Bay-Salt*: And that which receives its Conſiſtence from the Heat of a Fire, called *White Salt*. They uſe either this or that Manner of Preparation, according to the Diſpoſition of the Coaſts, where 'tis made. If the Coaſts riſe in Downs or Hills of Sand, the *Salt* is made by Fire, in Copper or Leaden Veſſels. If the Coaſts be flat, and low; eſpecially, if the Bottom be a little Clayey, the *Salt* is Cryſtallized wholly by the Action of the Sun. We have nothing very conſiderable of either Kind in *England*. Some indeed we have of the latter, at *Shields* in *Northumberland*; and of the former in the Iſle of *May*. *France* is the principal Place for theſe *Salts*; more being made there than in all *Europe*, perhaps in all the World beſide, and 'tis hence that we are chiefly furniſhed therewith. We ſhall therefore deliver the Method of making it, as it is practiſed there. The chief Coaſts for *Bay Salt* are thoſe of *Bretagne*, *Saintonge*, and the *Pays d' Aunis*. The chief *Salt-Works*, in the two latter Places, are *Brouage*, *Maran*, and the Iſle of *Rhe*. Thoſe in *Bretagne* are in the Bay of *Borneuf*, *Guerand*, and *Croiſil*: For *White-Salt* is chiefly made on the Coaſts of *Normandy*. In the Bay of *Borneuf* alone, are computed above Twenty Thouſand conſiderable *Salt-Works*.

Manner of Making Bay-Salt.

Low Marſhy Grounds, diſpoſed by Nature for the Reception of the Sea-waters when the Tide ſwells, and provided with Banks and Sluices to retain the ſame, are called a *Salt-marſh*. Theſe *Salt-marſhes*, the Bottoms whereof they ram with a deal of Care, are divided into ſeveral ſquare Pits or Baſons, ſome greater, others leſs, ſeparated by little Dikes 13 or 14 Inches broad: And into theſe Baſons, when the Seaſon is at hand, they let in the Sea-water. The *Salt Seaſon* is from the Middle of *May* to the End of *Auguſt*; in which Time the Days being long, and the Sun's Rays ſtrongeſt, the Salt is raiſed and cryſtallized better than in any other Seaſon. E'er they let in the Water, they take Care the Baſons be well cleared of what had been left in them during the Winter to keep them in Order. The Water is admitted to the Heighth of about ſix Inches, after having firſt let it reſt, and warm two or three Days in huge Reſervoirs, without the Works; that it may come in luke-warm. The Water admitted, the Sluices are ſhut, and the reſt of the Work left to the Wind and the Sun.

The Surface of the Water being ſtruck, and agitated by the direct Rays of the Luminary, thickens, at firſt, imperceptibly, and becomes, at length, cover'd over with a ſlight Cruſt, which hardening by the Continuance of the Heat, is wholly converted into *Salt*. The Water, in this Condition, is ſo hot, that the Hand can't be put into it without burning it. When the *Salt* has received its full Coction, they break it with a Pole, upon which it ſinks to the Bottom, whence being dragg'd out again, they leave it ſometimes in little Heaps, about the Edge of the Pit, to compleat the Drying; and at length in greater Heaps, containing ſeveral Thouſand Muids, which they cover over with Straw, or Ruſhes, to ſecure them from the Rain.

Eight, Ten, or at moſt Fifteen Days, having thus perfected the Cryſtallization of the *Salt*, they open the Sluices, when the Tide is riſing, for a freſh Stock of Water; and thus they continue alternately, taking in Water, and gathering the *Salt*, till the Seaſon be over. Rainy Weather is very pernicious to the Work; for Rain Water, mixing in any Quantity with the *Sea* Water, renders it uſeleſs, ſo that new Water muſt be called in. The *Salt* is brown when taken out of the Pits, and is uſually thus ſold, without farther Preparation. Indeed in ſome Places they make it into *White-Salt* by refining. They refine it by boiling it in large flat Caldrons, which not only takes away its Acrimony, but is found to increaſe the Quantity.

Method of Making White Sea-Salt.

The *White-Salt* of *Normandy* is not made by refining the *Bay-Salt*, but has this Colour naturally when taken out of the Pits. To make it, they gather a muddy Sand on the Flats of the Shoar, which the riſing Tide has covered and impregnated with its Waters for ſeven or eight Days. This Sand being removed into Pits for the Purpoſe, diſcharges itſelf by degrees of all its Water, which filtrates through ſome Straw wherewith the Bottom of the Pit is filled, and trickles into Veſſels ſet on purpoſe to receive it. Of this Water it is that they make their Salt.

Their Furnaces are of Earth, and their Boilers of Lead: Each Furnace boils four Leads. When the Water wherewith they have filled the Leads begins to boil, they take off the Skim, which ariſes in abundance, and in Proportion as it diminiſhes, throw in freſh Water, which they continue to skim, as before. When it thickens, they keep it continually ſtirring, with a crooked Stick, or Ladle; and when the Grain is form'd, take it off the Fire to purify it.

The Purifying is performed by letting it ſtand in large Oſier Baskets; where it drains itſelf of certain Humidities that remained. When dry, it is laid in Heaps, and thence carried into the Magazines. The Commerce of *White-Salt* brings an immenſe Profit to *France*, though more to the King than to the Makers and Sellers: The Duty is one Fourth Part of the Price the *Salt* is ſold at. The *Engliſh* and *Dutch*, and (when they are at War with *France*) the *Swedes* and *Danes*, take off moſt of the *Salts* of the *Compte Nantois*; paying for it, *communibus Annis*, from 20 to 35 Livres the Load. That of *Gue-*

*

rande is preferred, by the *Engliſh* and *Iriſh*, to all the reſt, as the beſt and whiteſt. Yet that of *Borneuf*, though browner and heavier, is moſtly uſed in *France*, as alſo throughout the *Baltic*; particularly in *Poland*, where, beſides the ordinary Uſes, it ſerves in tilling the Ground; being found to warm it, and to prevent little Vermin from gnawing the Grain.

The *Engliſh* and *Dutch* have oft ſtrove hard, in Times of War, to do without the *French Salts*; and to that End, have endeavoured to take *Salts* from the *Spaniſh* and *Portugueze*; but there is a diſagreeable Sharpneſs and Seroſity natural to them, which renders them very unfit for the Salting of Fleſh, Fiſh, &c. To remove this, they boil them with *Sea*-Water, and a little *French Salt*, which they procure by Means of Neutral Nations; which not only ſoftens them, but increaſes their Quantity by one Third. But it ſhould ſeem their Refining does not ſucceed to their Wiſh, by the Eagerneſs wherewith they return to the Salts of *Bretagne*, &c. aſſoon as any Treaty has opened the Commerce.

Fossile, or Rock-Salt, call'd alſo Sal-Gemmæ.

The *Foſſile-Salt* is called *Sal-Gemmæ*, from a certain Brightneſs it has, which gives it ſome Reſemblance to Gems. Indeed, it ſhould have ſomething of the Gem in its Nature; if there be nothing exaggerated in the Account Dr. *Ed. Brown*, (who went down into the *Salt-Mines* in *Hungary*) gives us thereof in his Travels. This *Salt* was intirely unknown to the Ancients. *Pliny*, however, gives us ſome curious Things about *Salts* in *Nat. Hiſt. Lib.* 30. which we ſhould have tranſcribed hither, could we believe them as true as they are pretty. We ſhall here content ourſelves with what well warranted Relations we could get of the *Salt-Mines* of *Wiliſce* in *Poland*; thoſe in the *Upper Hungary*, and thoſe in the Mountains of *Catalonia*, which make a very conſiderable Article of Commerce in thoſe Three States; *Salt* being tranſported hence to the ſeveral Neighbouring Nations, who can't be conveniently ſupplied with *Sea-Salt*.

Salt-Mines of *Poland*, *Hungary*, &c.

The *Poliſh-Mines*, in the Village *Wiliſce*, five Leagues from *Cracow*, were firſt diſcovered in 1251. Their Depth and Capacity are ſurprizing. Within them is found a kind of ſubterraneous Republick, which has its Polity, Laws, Families, &c. and even publick Roads, and Cartiages, Horſes, &c. being kept here to draw the *Salt* to the Mouth of the Quarry, where 'tis taken up by Engines. Theſe Horſes, when once they are down never ſee the Light again; but the Men take frequent Occaſions of breathing the Village Air. When a Traveller is arrived at the Bottom of this ſtrange Abyſs, where ſo many People are interr'd alive, and where ſo many are even born, and have never ſtirred out, he is ſurprized with a long Series of lofty Vaults, ſuſtained by huge Pilaſters cut with the Chiſſel, and which, being themſelves *Rock-Salt*, appear, by the Light of Flambeaux which are inceſſantly burning, as ſo many Cryſtals, or precious Stones, of various Colours, caſting a Luſtre, which the Eye has much ado to bear.

The Rocks of *Salt* are hewn in Form of huge Cylinders; the Workmen uſing Hammers, Pinchers, and Chiſels, much as in our Stone Quarries, to ſeparate the ſeveral Banks of Stone. Aſſoon as the maſſive Pieces are got out of the Quarry, they break them into Fragments fit to be thrown into the Mill, where they are ground, and reduced into a coarſe Farina or Flower, which ſerves all the Uſes of *Sea Salt*.

In the *Salt-Mines* of *Wiliſce*, there are two Kinds of *Sal Gemmæ*; the one harder and more tranſparent, and the Cryſtallization whereof appears more perfect than that of the other: This is the real *Sal-Gemmæ* of the Druggiſts and Dyers. It cuts like Cryſtal, and is frequently uſed for Toys, Chapelets, little Veſſels, &c. the other is leſs compact, and only fit for Kitchen Uſes. One of the chief Wonders of the Place is, that through theſe Mountains of *Salt*, and along the Middle of the Mine, there runs a Rivulet of freſh Water ſufficient to ſupply the Inhabitants.

The *Salt-Mines* in the *Upper Hungary* are every whit as extraordinary. They are found in the Mountains, two Miles from *Eperies*, a City in the County of *Sarax*, on the River *Tarbz*. The Depth is 180 Fathoms. The Mineral runs in huge Veins, ſo that Pieces are ſometimes dug not leſs than an Hundred Thouſand Weight; which however, are afterwards reduced into Square Pieces two Foot long, and a Foot thick, for the Conveniency of drawing them out of the Mine. When out, they are broke farther, and put to the Mill to be ground. The Colour of the Stone is a little browniſh, and yet when ground, becomes as white as if it had been refined. Some of the Stones are found as hard and tranſparent as Cryſtal, ſome White, Yellow, Blue, &c. fit for various Works, whereon they engrave as on precious Stones. The Mine is cold and moiſt, whence there ariſes ſome Difficulty in reducing the *Salt* into Powder. Of the Water drawn out of it and boiled, is made a blackiſh *Salt*, which fattens Cattle.

The *Salt Mines* of *Catalonia* are found in the Mountains of the Dutchy of *Cardonna*, and belong to the Grandees of that Name. 'Tis the Opinion of the Country People, that the *Salt* grows again, and is re-produced, after ſeveral Years, in the ſame Places whence it had been dug. But the Naturaliſts will ſcarce allow of ſuch a Re-production. There is no Doubt, however, but it vegetates, or grows ſometimes: M. *Tournefirt*, and the Specimens he had of it in his Cabinet, make it plain. The *Salt* is of four Kinds, White, Bay, Red, and Brilliant. The Firſt, is almoſt like our *Sea-Salt*, only that it is not granulated. The Second, of an Iron and Slate Colour, has moſt of the Qualities of the White. The Third, of a Conſerve Roſe Colour, only differing from the reſt by the Mixture of ſome Bole, or Earth, which gives it this Colour. The Fourth is a *Brilliant-Salt*, yet tranſparent as Cryſtal, which is the proper *Sal Gemmæ* of the Druggiſts. Of this Kind there is ſome Blue, others Green, Orange, Red, &c. but they all become white by grinding. Theſe four Kinds of *Salts* are found over each other in diſtinct Strata or Beds. The Commerce hereof is very conſiderable. The *Engliſh*, &c. when Commerce is prohibited with *France*, furniſh themſelves hence.

Sal-Gemmæ is to be choſen in large, bright, tranſparent Pieces, eaſy to break, and dividing into little ſquare Grains. It grows red-hot in the Fire, like Iron, but diſſolves eaſily in Air: Yet the Druggiſts waſh it, to give it the greater Luſtre, but they take Care to wipe it dry again ſpeedily.

Salt *drawn from Saline Fountains and Springs.*

Our Method in *England* is thus. Near the Springs, or Place of the Brine, is built a *Saltern*, or Boiling-houſe, with a Convenience for the Conveyance of the Brine within it. The *Saltern* is uſually large enough to contain ſeveral huge flat Pans, or Boilers, each furniſhed with its Grate and Furnace. The Brine being in the Pan, the Fire is kindled; and after Two Hours Time, the Liquor begins to be ready to granulate, which is known by a thin Skin riſing at the top; this they skim off into Brine Tubs, that the Brine that goes with it may not be loſt: And whereas all Brines contain, or yield Sand, which is ſuppoſed to petrify in boiling; and upon boiling this Sand, if the Liquor be before hand ſtrained, will ariſe; and the Pan boiling violently in the Middle, the Sand is caſt towards the Corners, where it falls to the Bottom of the Pan, before the *Salt* precipitates; therefore, they rake it to one Corner of the Pan, with a broad Rake, and then take it out with Ladles, and put it into Wooden Veſſels, open at one End, placed on Stands. The Sand being removed, that the *Salt* floating in the Liquor may precipitate, they ſhut up the Vent-holes, and Door, and let the Fire go out, and in Twelve Hours Time the *Salt* falls to the Bottom, and grows hard; a Liquor called the *Bittern*, remaining at Top, which being again boiled away, yields more *Salt*. To make the *Salt* precipitate more readily, after the Liquor is ſcummed, &c. they frequently uſe ſome Beef-Suet, and Wine-Lees, of each a like Weight, melting and mixing them together; and putting an Ounce of this Mixture on the End of a Slice, turn it round in the Liquor till it be ſpent; then after two Hours, at moſt, open the Vent-holes and Door, quicken the Fire, and lade away the Liquor in a good meaſure, and ſo is the *Salt* found lying at the Bottom, fit to be removed. 'Tis now raked up to one Side, taken out and put into Cribs, or Sepels, like Hay-racks, with looſe Ribs on each Side, ſo cloſe to one another, that an Half-Crown will ſcarce go between: Here, after eight Hours draining, it is found an hard granulated *Salt*, and may be taken away; but yet continues dripping three Weeks, and afterwards, if not often moved, will become Rocky: The Liquor in the Pan, called *Bittern*, is to be all taken out, except a little to keep the Pan from burning; drained from the *Salt*, and caſt away, or reſerved for *Salt-Petre* Makers, and the Pan immediately filled with freſh Brine, for another Boiling. A Pan of Brine, of moderate Strength, in eight Hours Time will be compleatly made into *Salt*, with the Expence of about a Buſhel and Half of Coals, which will make a Pan of *Salt* from two Buſhels and Half to four Buſhels of *Salt*, or more, according as the Liquor is in Strength. This *Salt* they ſometimes mould into the Form of Sugar-Loaves, in which State it will keep dry without Fire,

and

and that for a long Time. At *Nantwich*, they bake the Loaves twice, or thrice, in an Oven, and keep them in a Stove, or the Chimney-corner.

SALT *from Brine raiſed by the Sun.*

In ſome Parts of *England*, as at *Limington*, *Port-ſea*, &c. they uſe Water raiſed by the Sun, and then boiled, which they find preferrable to the natural Brines of Springs; thoſe being always found either too weak, or too ſtrong. To this End, they have ſeveral Ponds, or Ciſterns, called *Sun-Ponds*, built with Mud, and well expoſed to the Sun, with little Channels, to convey the Brine from them all to a large ſhallow Reſervoir, called the *Common-Sun-Pan*, not exceeding ſeven or eight Inches in Heighth. Here the Liquor is left to mellow, from twelve to twenty-four Hours, or till the Liquor will bear an Hen's Egg new laid; and when it has attained a ſufficient Strength, it is from thence derived by Channels into the Ciſterns, where the Rain and Sun breed Red Worms, which cleanſe and purify the Liquor, which ripens by Age, and is rendered fitter for boiling, which is perform'd after the ſame Manner as is already deſcribed.

Properties of SALT.

The great Property of *Salt* is, that it is incapable of Corruption, and that it even preſerves Meats, *&c.* ſeaſoned therewith, or ſteeped in Solutions thereof. It endures the Fire, and even comes out purified thereby, as being thereby freed of its Humidity. In very hot Fires it fuſes, and is converted into corroſive Waters. It gives Fertility to Lands, and promotes the Fuſion of all Metals; yet, we read of Princes, who, as a Mark of their Indignation, ſowed Grounds with *Salt* to render them barren. *Plutarch* obſerves, That the *Egyptians* believed *Salt* to be the Spittle, or Foam, of the Giant *Typhon*, the great Enemy of their Gods: And hence, adds he, they held it in the greateſt Horror.—— *Salt* is found to have two oppoſite Qualities: By its ſubtle, penetrating Acidity, it breaks and diſſolves the hardeſt and moſt compact Minerals and Metals; and by a contrary Property coagulates Liquid Bodies, as Milk, Blood, *&c.* Some of its Spirits, mixed in a certain Proportion with Water, produce an exceſſive Heat, yet, when mixed in a leſs Quantity augment its Coldneſs, as *Salt-petre* in Snow, *&c.* Though all *Salts* diſſolve by Moiſture, yet Water only diſſolves, *&c.* a certain Quantity. However, when impregnated with any *Salt* as much as it can bear, it will ſtill diſſolve a Quantity of another *Salt*, whoſe Particles are of different Figures, proper to inſinuate into the remaining Vacuities of the Water: Thus, after *Common-Salt* will no longer diſſolve in it, Alum will, and after Alum, *Salt-petre*, then *Sal-Armoniac*, &c.

BAY-SALT, ROCK-SALT. } See the preceeding Article SALT.

SALT of *Steel*, SALT of *Glaſs*, SALT of *Saturn*, SALT of *Tin*, SALT of *Sulphur*, SALT of *Tartar*, VEGETABLE SALT, or *Soluble Tartar*, } See { VITRIOL OF MARS. GLASS. SASCHARUM SATURNI. TIN. SULPHUR. TARTAR. TARTAR.

SALT-PETRE, called alſo *Nitre*, and by the Chymiſts *Dragon*, *Cerberus*, and *Salt of Hell*, a Kind of *Salt* either natural or fictitious; of very great Uſe both in Chymical Preparations, in the Compoſition of Gun-powder, and in Dying, in the Glaſs-Manufacture, and in the making of *Aqua Fortis* for the Diſſolution of Metals. Its minute Parts, or Cryſtals, are in Form of Needles; though ſome will have them Triangular, as thoſe of Alum are Triangular, and thoſe of *Common Salt* Cubical. When perfect they are ſaid to be fiſtulous, or hollow, like *Capulæ*.

Of Natural *Salt petre* there are two Kinds: The Firſt formed by a natural Cryſtallization of ſaline ſulphurous Juices diſtilling in Caverns, or along old Walls. This is what they call *Salt-petre of the Rocks*; the ſame with the *Aphronitre* of the Ancients.

The Second Kind of *Natural Salt-petre* is furniſhed by the Water of a dead Lake in the Territory of *Terrane* in *Egypt*, called the *Nitrian Waters*, exalted and concocted by the Heat of the Sun, much after the Manner of our *Bay-Salt*. This is the *Natrum*, or *Anatrum* of the Ancients, which our Druggiſts call *Natron*; now little uſed but in the bleaching of Linnens. See NATRUM.

Artificial, or *Factitious Salt-petre*, is alſo principally of two Kinds. The firſt, called, by ſome, *Mineral Salt-Petre*, is found in ſeveral Places in the Kingdom of *Pegu*, and about *Agra*, in Villages anciently populous, but now Deſart. 'Tis alſo found in ſome Places along the Banks of the *Wolga*, that famous River, which after watering a good Part of *Muſcovy*, empties itſelf into the *Caſpian* Sea. The Natural *Salt-petre* is drawn from three different Kinds of Mineral Earths, Black, Yellow, and White. The beſt is that drawn from the Black, as being pureſt from *Common-Salt*, and needing no purifying after it come to us, to fit it for making of Gun-powder; as the reſt do. See GUN POWDER.

The Method of Working it is thus: Two flat Pits are dug; one of which they fill up with the Mineral Earth, turning Water upon it for ſome Time, and then tread it with their Feet into the Conſiſtence of Pap, letting it ſtand two Days for the Water to imbibe, and extract all the *Salt* therein. They then paſs the Water into another Pit, where ſtanding ſome Time, it ſhoots and cryſtallizes into *Salt-Petre*. This they boil once, or twice, as they would have it more or leſs white and pure, ſcumming it continually, and filling it out into Pots, holding 25 or 30 Pounds each, and expoſing theſe to the Air in clear Nights; by which Means if there be any Impurity, it ſinks to the Bottom: They then break the Pots, and dry the *Salt* in the Sun.

All the *Salt-petre* we now have, M. *Homberg* obſerves, is drawn either from Earths moiſtened, and manured with the Excrements of Animals, or from old Walls, and the Plaiſter of ruin'd Buildings, which have been filled with ſulphurous Matters as well from the Animals which inhabited them, as the Soot penetrating them, and the Air incompaſſing them. See SALT. However, we uſually make a Diviſion of *Salt-petre* into *Natural* and *Factitious*.

The ſecond Kind of *Artificial* or *Factitious Salt-petre*, is that prepared from Nitrous Matters collected in old Buildings, Dove-houſes, the Middle of ancient Ruins, *&c.* by means of *Lixiviums*, or Lyes made of Wood Aſhes, and ſometimes of thoſe of Herbs. Of this there are great Quantities made in *France*, particularly in the Arſenal at *Paris*, where there is a Corporation of *Salt-petre* Makers appointed for the Purpoſe. The *Salt-petre* gained thus, they refine, by boiling it three or four times, and paſſing it ſucceſſively through ſeveral Lyes.

Some Naturaliſts pretend, that the Earths, which have already ſerv'd for *Salt petre*, may be re-animated, and made fit to ſerve again, by keeping covered for Twelve or Fourteen Years, and watering them with the Scum, *&c.* of the *Salt-petre*, and even with Brine.

Good common *Salt-Petre* ſhould be well clean'd, white, dry, and as free of *Salt* as poſſible. The beſt refined *Salt-Petre*, is that whoſe Cryſtals are the longeſt, largeſt, and fineſt.

There are abundance of Chymical Preparations made with *Salt-petre*, as Spirit of *Nitre*. See NITRE: *Aqua Regulis*, *Aqua-fortis*, *Cryſtal-Mineral*, *Sal-polychreſt*, Butter of *Nitre*, &c. each of which ſee under its proper Article.

The Philoſophers generally allow the Air to be impregnated with a Volatile Nitre, or *Salt-petre*, which is thence communicated to Plaiſter, Mortar, *&c.* 'Tis probable it may derive it from Soot and Smoak, which are actually found to abound with Volatile *Salt* of a Nitrous Nature. Dew and Rain are ſuppoſed to fertilize the Ground principally by their bringing down this Nitre. See AIR.

Salt petre has a Property of rarifying, or expanding itſelf to a prodigious Degree. 'Tis hence Gun-powder derives its Force, whereof *Salt-petre* is the Principal Ingredient. 'Tis computed, that when inflamed, it takes up above Ten Thouſand Times the Space it poſſeſſed before. See GUN-POWDER.

SALTIER, or *Salteer*, in Heraldry, an Ordinary in Form of a St. *Andrew's Croſs*; anciently called *Croſs of Burgundy*. See CROSS. Its ordinary Breadth, when alone, is one Third of the Eſcutcheon. 'Tis ſometimes bore *alaiſé*, and ſometimes *in Number*, placed in different Parts of the Field. Sometimes charged, countercharged with the Field, accompanied, engrailed, indented, quarterly-quartered, *&c.* The *Saltier* was anciently a Piece of the Knight's Harneſs; being faſtened to the Saddle, and ſerving him for a Stirrup to mount upon; and 'twas hence it had its Name *Saltier* from the *French Sauter*, to leap. It was made of a Silk Cord, or of ſome other Kind of Cord, covered with ſome rich Stuff. Others will have it, that the original *Saltier* was a Kind of *Paliſade*, ſerving to fence Parks, Woods, *&c.* where wild Beaſts were incloſed. Tho' *Spelman* ſays, 'Twas an Inſtrument for the taking them, thus called, *Quod ſit in uſu in Saltu.* Laſtly, others aſſure us, That *Saltier* was anciently the Figure of an Engine, which being full of Pins, was uſed in the Scaling of the Walls

of a beſieged Place. Pearl a *Saltier* Ruby, the Coat of Lord *Macclesfield*.

SALTNESS, the Quality of ſomething impregnated with *Salt*.—— The *Saltneſs of the Sea*, *Lakes*, &c. is a Thing that has long perplexed the Philoſophers to account for. Some take it to be the Effect of the dry, aduſt, and even ſaline Exhalations, which the Sun raiſes from the Earth, and the Winds, and Rains diſcharge into the Sea. And hence, ſay they, it is, that the Sea is found more *brackiſh* near the Surface, than towards the Bottom. Others contend, that the Sun being continually extracting the pureſt and ſubtileſt Parts from the Water; the coarſer Parts remaining, being exalted and concocted by this Heat, acquire by little and little, their Degree of *Saltneſs*. Others, as Father *Bouhours*, will have it, That the Creator gave the Waters of the Ocean their *Saltneſs* at the Beginning, not only to prevent their Corruption, but alſo to enable them to bear greater Burthens. *Bernier* ſeems to be nearer the Matter, when he aſcribes the *Saltneſs* of the Ocean, to the *Foſſile* or *Mineral Salts* brought into it by the Rivers, and diſſolved in the Water.

Dr. *Halley*, in an expreſs Diſcourſe *of the Saltneſs of the Ocean*, in the *Philoſophical Tranſactions*, obſerves, That all the Lakes in the World are *Salt*, ſome more, ſome leſs than the Ocean; which, in this Caſe, may be eſteemed a great Lake it ſelf. And that all the Vapours exhaled by the Sun from Lakes, are perfectly freſh; ſo that all the ſaline Particles brought in by the Rivers remain behind, while the freſh evaporate. Hence 'tis evident, their *Saltneſs* muſt be continually augmented. Now if this be the true Reaſon of the *Saltneſs* of Lakes, 'tis probable the *Saltneſs* of the Ocean it ſelf ariſes from the ſame Cauſe: Hence we are furniſhed with a Method of eſtimating the Age of the World, by obſerving the Increaſe of *Saltneſs* in the Waters of Lakes; and computing in how long Time the Ocean might, at that Rate, arrive at its preſent *Saltneſs*. See LAKE.

The Count *de Marſigli* obſerves, That in *Provence*, the Bottom of the Sea is wholly ſtony, and nothing but a Continuation of the Mountains of the *Cevennes*; being even found to conſiſt of ſeveral *Strata*; among which, are *Salt* and Pitcoal: And hence he derives the *Saltneſs* and *Bitterneſs* of the Sea-Water.

SALTS, or *Sauts*, in the Manage, the Leaps or Vaults of a Horſe; from the *French Saut*, of the *Latin Saltus*, a Leap, Dance, &c. A *Step* and a *Salt* is a high Air, wherein the Horſe riſing, makes a *Curvet* between Two *Salts*, or *Cabrioles*; ſo as to mount before, and fling back with his hind Feet. Two *Steps* and a *Salt* is a Motion compoſed of Two Curvets, ending with a Capriole.

SALTUARIUS, in Antiquity, an Officer, Servant or Slave among the *Romans*, &c. who had the Care and Cuſtody of a Country Houſe, with Lands and Woods, and who was to look to the Fruit, the Fences, &c. In *Nehemiah*, cap. ii. v. 8. mention is made of an Officer of this Kind; *Cuſtos Saltus Regis*, which *Saci* interprets, Keeper of the King's Foreſt; but he was more; having not only the keeping of a Foreſt, but of a Houſe with a Foreſt. *Saltus* being here uſed as *Horti* for a Houſe of Pleaſure; becauſe Gardens are the principal Part. —— In the Laws of the *Lombards*, *Saltuarius* is an Officer who has the Guard of the Frontiers.

SALTUM, as, *Ordination per* SALTUM. See ORDINATION.

SALTUS, in Law-Books, a high Wood. See BOSCUS.

SALTZ, or *Sultz*, a Pickle made of Salt, diſſolved by the Coldneſs or Moiſture of a Cellar.

SALVAGE-MONEY, is a Recompence allowed by the Statute and Civil Law, to ſuch Perſons as have aſſiſted in ſaving Merchandizes, Ships, &c. periſhing in Wrecks, or by Pyrates or Enemies. This uſually was a Tenth Part of the Value of the Things ſaved. See WRECK.

SALVATELLA, in Anatomy, a famous Branch of the Cephalic Vein, paſſing over the Metacarpus, between the Ring Finger, and the little Finger. Several Phyſicians, in Imitation of the *Arabs*, recommend Bleeding in the *Salvatella*, as proper in Tertian and Quartan Agues, and moſt Hypochondriac Diſeaſes.

SALVE, among the *Romaniſts*, the firſt Word of a *Latin* Prayer, or Sequence adreſſed to the Virgin, and ſung after Complines; as alſo upon the Point of executing a Criminal. *Durandus* ſays, 'Twas compoſed by *Peter* Biſhop of *Compoſtella*. The Cuſtom of Singing the *Salve Regina*, at the Cloſe of the Office, was begun by Order of St. *Dominic*; and firſt, by the Congregation of *Dominicans* at *Bologne*, about 1237. *Gregory* IX. firſt appointed it to be general. S. *Bernard* added the Concluſion, *O dulcis! O pia*, &c.

SALVER, a flat Diſh, uſually of Silver or other rich Metal, uſed to ſet Glaſſes on to ſerve Wines and other Liquors. The *French* call it *Sous-couppe*, *under-cup*. The *Italians* uſe to preſent a *Salver*, with ſeveral Kinds of Wines, with this Complement, *Si non e buono fatte lo*.

SALUTATION, the Action or Ceremony of Saluting, Greeting, or paying Reſpect, or Reverence to any one. There is a great Variety in the Forms of *Salutation*: We *ſalute* God by Adorations, Prayers, &c. Kings, by Genuflexion, &c. In *England*, &c. we *ſalute* one another by uncovering the Head, inclining the Body, &c. The Orientals by uncovering their Feet, laying their Hands on the Breaſt, &c. The Pope makes no Reverence to any Mortal but the Emperor of *Germany*, to whom he ſtoops a very little, when he admits him to kiſs his Mouth. —— In the Army, the Officers *ſalute* by certain orderly, ſtudied Motions of the Pike, &c. 'Twas held by the Ancients, That the Statue of *Memnon*, one of the Horſes of the Sun, in a Temple in *Egypt*, *ſaluted* that Luminary every Morning at his Riſing. The Deceit conſiſted in this, That the Statue being hollow, when the Warmth of the Morning began to rariſy the included Air, it was driven out thro' a narrow Duct in the Mouth: Thus making a gentle Murmur, which the Prieſts interpreted a Neighing.

At Sea, they *ſalute* by a Diſcharge of Cannon, which is greater or leſs, with Ball or without, according to the Degree of Reſpect they would ſhew. Ships always *ſalute* with an odd Number of Guns; Galleys with an even one. A Veſſel under the Wind of another, is always obliged to *ſalute* firſt. To *ſalute* with Muſquets, is to fire One, Two or Three Volleys; which is a Method of *Salutation* that ſometimes precedes that of the Cannon; and is chiefly uſed on Occaſion of Feaſts. After the Cannon, they ſometimes alſo *ſalute* with the Voice; which *Salutation* alſo occaſionally obtains where they carry no Guns, or don't care to diſcharge any. *Saluting with the Flag*, is performed Two Ways; either by holding it cloſe to the Staff, ſo as it can't flutter; or by ſtriking it ſo as it can't be ſeen at all, which is the moſt reſpectful *Salutation*. *Saluting with the Sails*, is performed by hovering the Top-ſails half Way of the Maſts. Only thoſe Veſſels which carry no Guns, *ſalute* with the Sails. When there are ſeveral Ships of War together, the Commander alone *ſalutes*. Father *Fournier* has an expreſs Treatiſe of *Sea-Salutes* and Signals. See SIGNAL.

The *Angelical Salutation*, is an Addreſs which the *Romaniſts* make to the Virgin; containing the Form wherein the Angel *ſaluted* her, when he acquainted her with the Myſtery of the Incarnation. See AVE MARY.

SAMARITANS, an ancient Sect among the *Jews*; ſtill ſubſiſting in ſome Parts of the *Levant*, under the ſame Name. Its Origin was in the Time of *Rehoboam*; under whoſe Reign, a Diviſion was made of the People of *Iſrael* into Two diſtinct Kingdoms. One of theſe Kingdoms, called *Judah*, conſiſted of ſuch as adher'd to *Rehoboam*, and the Houſe of *David*; The other retain'd the ancient Name of *Iſraelites*, under the Command of *Jeroboam*. The Capital of their State was *Samaria*; and hence it was they were denominated *Samaritans*. *Salmanazar*, King of *Aſſyria*, having conquered *Samaria*, led the whole People Captive into the remoteſt Parts of his Empire; and filled their Place with Colonies of *Babylonians*, *Cutheans*, and other Idolaters. Theſe finding themſelves daily deſtroyed by wild Beaſts, deſired an *Iſraelitiſh* Prieſt to inſtruct them in the ancient Laws and Cuſtoms of the Land they inhabited. This was granted them; and they thence-forth ceaſed to be incommoded with any Beaſts. However, with the Law of *Moſes*, they ſtill retained ſomewhat of their ancient Idolatry. The *Rabbins* ſay, They adored the Figure of a Dove on *Mount Gerizim*. See Father *Souciet*. Be this as it will, 'tis certain, the modern *Samaritans* are far from all Idolatry. Some of the moſt learned among the *Jewiſh* Doctors own, That they obſerve the Law of *Moſes* more rigidly than the *Jews* themſelves. They have a *Hebrew* Copy of the *Pentateuch*, differing in ſome Reſpects from that of the *Jews*; and written in different Characters, commonly called *Samaritan* Characters; which *Origen*, *Jerom*, and other Fathers and Criticks, ancient and modern, take to be the primitive Characters of the ancient *Hebrews*; tho' others maintain the contrary. The Point of Preference, as to Purity, Antiquity, &c. of the Two *Pentateuch*'s, is alſo diſputed by the modern Criticks. See PENTATEUCH.

The *Samaritans* are now very few in Number; tho' 'tis not very long, ſince they pretended to have Prieſts deſcended directly from *Abraham*. They were chiefly found at *Gaza*, *Neapolis* (the ancient *Sichem*) *Damaſcus*, *Cairo*, &c. They had a Temple or Chapel on *Mount Gerizim*, where they performed their Sacrifices. *Joſeph Scaliger*, being curious to know their Uſages, wrote to the

Sama-

Samaritans of *Egypt*, and to the High Prieſt of the whole Sect, who reſided at *Neapolis*. They returned Two Anſwers to *Scaliger*, dated in the Year 998 of the *Hegira* of *Mahomet*. Theſe Anſwers never came to the Hands of *Scaliger*. They are now in the *French* King's Library, and have been tranſlated into *Latin* by Father *Morin*, Prieſt of the Oratory; and printed in the Collection of Letters of that Father in *England*, 1682, under the Title of *Antiquitates Eccleſiæ Orientalis*. M. *Simon* has inſerted a *French* Tranſlation in the firſt Edition, of *Ceremonies & Coutumes des Juifs*, by Way of Supplement to *Leon de Modena*. In the Firſt of theſe Anſwers, wrote in the Name of the Aſſembly of *Iſrael* in *Egypt*, they declare, That they celebrate the Paſſover every Year, on the Fourteenth Day of the firſt Month, on Mount *Gerizim*; and that he who then did the Office of High Prieſt, was called *Eleazar*, Son of *Phineas*, Son of *Aaron*. At preſent they have no High Prieſt. In the ſecond Anſwer, which is in the Name of the High Prieſt *Eleazar* and the Synagogue of *Sichem*, they declare, That they keep the Sabbath in all the Rigor wherewith 'tis enjoyned in the Book of *Exodus*; none among them ſtirring out of Doors, but to the Synagogue. They add, That on that Night they don't lie with their Wives; That they begin the Feaſt of the Paſſover, with the Sacrifice appointed for that Purpoſe in *Exodus*; That they ſacrifice no where elſe but on Mount *Gerizim*; That they obſerve the Feaſts of Harveſt, the Expiation, the Tabernacles, *&c.* They add further, That they never defer Circumciſion beyond the eighth Day; never marry their Nieces, as the *Jews* do; have but one Wife; and, in fine, do nothing but what is commanded in the Law: Whereas the *Jews* frequently abandon the Law to follow the Inventions of their Rabbins. At the Time when they wrote to *Scaliger*, they reckoned 122 High Prieſts; affirmed that the *Jews* had no High Prieſts of the Race of *Phineas*; and, That the *Jews* belyed them, in calling them *Cutheans*, whenas they are deſcended from the Tribe of *Joſeph*, by *Ephraim*. The Truth is, The *Jews* impoſe abundance of Things on the *Samaritans*: They frequently confound them with the Saducees, as if they were infected with their Errors. Rabbi *Benjamin*, who lived in the XIIth Century, confirms the beſt Part of what we have obſerved of the *Samaritans*. He obſerves, They had Prieſts of the Tribe of *Aaron*, and who never married with any but thoſe of the ſame Tribe: That they ſacrificed on Mount *Gerizim*, where they had an Altar of Stone raiſed by the *Iſraelites* after paſſing over *Jordan*. He adds, That they are of the Tribe of *Ephraim*; That they change their Habit to go to the Synagogue, and waſh e'er they take it.

SAMARITAN *Characters*, or *Letters*. See LETTER.

SAMARITAN *Pentateuch*. See PENTATEUCH.

SAMARITAN *Medals*. In the Cabinets, we find ſome *Medals*, uſually called *Samaritan Medals*. The Inſcriptions and Legends of theſe are *Hebrew*; but the Character different from the *Hebrew* of our Bibles, which is the ſquare *Hebrew* or *Chaldee*; and 'tis hence, *viz.* from the Character, not from being ſtruck by the *Samaritans*, that they are denominated *Samaritan*. Theſe *Medals* have been infinitely canvaſſed by the Criticks, both *Jewiſh* and *Chriſtian*; particularly *Rabbi Alaſcher*, *R. Bartenora*, *Rabbi Azarias*, *Rabbi Moſes*, Father *Kircher*, *Villalpandus Waſerus*, *Conringius*, *Hottinger*, Father *Morin*, *Walton*, *Hardouin*, *Spanheim*, &c. The learned Jeſuit *Souciet*, in an expreſs Diſſertation on the *Samaritan Medals*, rejects all *Hebrew Medals*, whoſe Inſcriptions are in *Chaldee* Characters, as ſpurious; and allows of none to be genuine but the *Samaritan*. Of theſe there are Four Kinds. The firſt bear expreſsly the Name of *Simon*, and the Subject for which they were ſtruck, *viz.* the Deliverance of *Jeruſalem*. The Second Kind have not the Name *Simon*, but only the Deliverance of *Sion*, or *Jeruſalem*. The Third Kind have neither *Simon*, nor the Deliverance of *Sion*; but only the *Epochas*, firſt Year, ſecond Year, *&c.* The Fourth Claſs have neither any Inſcriptions, nor any Thing whence one may judge of the Time when they were ſtruck. The Three firſt Kinds were certainly ſtruck after the Return from the *Babyloniſh* Captivity, and in the Time of *Simon Maccabeus*, after *Jeruſalem* had been freed from the Yoke of the *Greeks*. But tho' ſtruck after the Captivity, Father *Souciet* obſerves, their Character ſhews it ſelf to be that of the ancient *Hebrew*, which was uſed before the Captivity, and the Uſe whereof was loſt by the People, during their Sojourn in *Babylon* and *Chaldea*; but reſtored after their Return, on the ſame Footing as before. He adds, That the Inſcriptions are pure *Hebrew*, ſuch as it was ſpoke before the Captivity; That the Character, therefore, is the true ancient Character of the *Hebrew*: That it was the Cuſtom to write each Language in its proper Character: That if they had departed from this Rule, they had doubtleſs uſed the New Character they brought with them from *Babylon*: That there could be no other Reaſon but that of ſettling all Things on the ſame Foundation they were on before the Deſtruction of *Jeruſalem*, that could have induced them to uſe this Character on their Coins. And, laſtly, That theſe *Medals* were not ſtruck by the *Samaritans*, but by the *Jews*, and in *Jeruſalem*. He is very full on all theſe Points, and; to the Proofs drawn from *Medals*, adds Two others foreign thereto. The firſt drawn from the Reſemblance of the *Greek* Letters, introduced by *Cadmus* the *Phœnician*, with this *Hebrew* Character; which was the ſame with that of the *Phœnicians*, as the Language of thoſe People was the ſame with that of the *Hebrews*. The ſecond drawn from ſeveral various Readings in the Scriptures, which cannot be well accounted for otherwiſe, than by ſuppoſing, That the Books wrote before the Captivity, were in the ſame Character with theſe *Medals*, and which ſhew, that 'tis the Conformity which certain Letters have in that Character, that has deceived the Copiſts. From the whole, he concludes, That this Character of the *Medals* is the true ancient *Hebrew* Character; and, That to judge of the various Readings of the *Hebrew* Text, and the Differences of the ancient *Greek* and *Latin* Tranſlations, either with themſelves, or with the *Hebrew* Text, Recourſe muſt be had to this Character.

SAMBUCUS, an ancient muſical Inſtrument of the Wind Kind, and reſembling a Kind of Flute; probably thus called becauſe made of Elder, which the *Latins* call *Sambucus*. —— *Sambucus* was alſo an ancient Engine of War, uſed by *Marcellus* in beſieging the City of *Syracuſe*. 'Twas ſo big, that *Plutarch*, in the Life of that General, obſerves, Two Ships were required to carry it.

SAMIAN EARTH, an Earth brought from the Iſle of *Samos*, in the *Ægean* Sea. The beſt is called by *Dioſcorides*, *Collyrium*, becauſe uſed in the Medicines of that Name. 'Tis white, very light, ſoft, friable, well-taſted, and a little glutinous on the Tongue. There is another Kind, harder and fouler, called *Ater-Samius*, in Regard little ſhining Straws are frequently found in it, diſpoſed like little Stars. Each Kind is eſteemed very aſtringent, proper to dry, and draw Wounds.

There is alſo a *Samian Stone*, taken out of the Mines in the ſame Iſland. 'Tis white, and ſticks to the Tongue when applied to it. 'Tis aſtringent and cooling, and is alſo uſed by the Goldſmiths to burniſh their Gold, and give it a greater Luſtre.

SAMOSATENI, or *Samoſatenians*, a Sect of ancient *Antitrinitarians*, thus called from their Leader, *Paulus Samoſatenus*, Biſhop of *Antioch*, under the Emperors *Aurelian* and *Probus*. He renewed the Hereſy of *Artemon*, and had ſeveral Sentiments in common with *Sabellius*, &c. tho' he differed from them in the Manner of explaining them. He owned, That the Father, Son, and Holy Ghoſt were but one God, but denied that the Son and Holy Spirit had any real Subſiſtance. According to him, they only ſubſiſted in the Father, as the Word of Man ſubſiſts in his Underſtanding. St. *Epiphanius* will have the *Samoſatenians* to be real *Jews*, without any Thing more than the Name of Chriſtians; adding, That they uſe the ſame Arguments againſt the Myſtery of the Trinity that the *Jews* do; pleading againſt it, with them, on Pretence of maintaining the Unity of the Godhead, tho' they don't obſerve the Ceremonies of the Law. Their Chieftain was condemned by a Council held at *Antioch*, whereat aſſiſted above Seventy Biſhops; and was depoſed from his Biſhoprick.

SAMPSÆI, or *Sampſæians*, ancient Sectaries, the ſame, according to St. *Epiphanius*, with the ELCESAITES, which ſee. The *Sampſæans* were not properly either *Jews*, *Chriſtians*, or *Gentiles*. They took their Name from the *Hebrew Semes*, Sun; as if they adored the Sun. They acknowledged one only God; waſhed themſelves often, and were attached, in almoſt every Thing, to the Religion of the *Jews*. Many among them abſtained from eating of Fleſh. *Scaliger*, after *Epiphanius*, will have the *Sampſæi* to be the ſame with the *Eſſeni*. In effect, the *Elceſaites*, *Sampſæans*, *Maſſalians*, and *Eſſeni*, appear to be no more than ſo many different Names for the ſame Thing; unleſs, perhaps, the firſt added ſomething to the Opinions of the laſt. See ESSENI.

SAN BENITTO. See SACCO *Beneditto*.

SANCTIFICATION, the Action of *Sanctifying*, or making a Thing Holy, and ſeparate to God. See SACRED. The reformed Divines define *Sanctification* an Act of God's Grace, whereby a Man is renewed inwardly, his Deſires and Affections alienated from the World, and the Man put in a Courſe of dying to Sin, and living to Righteouſneſs. The *Sanctifying of the Sabbath*, among the *Jews*, is of Divine Right. By *Sanctifying* the Sab-

bath, is meant, the ſpending it in Prayer, Praiſe, &c. not in worldly Concerns. The firſt Petition in the Lord's Prayer is, *Hallowed*, or *ſanctified, be thy Name*: By which is meant, Let thy Name be ever accompanied with Bleſſing and Praiſe.

SANCTION, the Authority given to ſome judicial Act; or that, whereby it becomes legal and current. The Royal Aſſent gives the *Sanction* of Statutes, to all Bills in Parliament that have paſſed each Houſe Thrice. See PARLIAMENT. The Word is form'd from the *Latin Sancire*, to eſtabliſh.

PRAGMATICAL SANCTION. See PRAGMATICAL.

SANCTI VITI CHOREA. See SANCTI VITI.

SANCTUARY, among the *Jews*, the holieſt and moſt retired Part of the Temple of *Jeruſalem*; wherein was preſerved the Ark of the Covenant; and into which No-body was allowed to enter but the High Prieſt, and that only once a Year, to intercede for the People. The *Sanctuary*, called alſo *Sanctum Sanctorum*, or Holy of Holies, is ſuppoſed to be a Type or Figure of Heaven and of *Jeſus Chriſt* the true High Prieſt, who is aſcended thither to make Interceſſion for us. Some will have it, That the whole Temple was called the *Sanctuary*; and that the *Sanctum Sanctorum*, where the Ark was kept, was only a little Chapel or Oratory therein. See TEMPLE.

Weight of the SANCTUARY, to examine a Thing by the Weight of the *Sanctuary*, is to examine it by a juſt and equal Scale; in Regard among the *Jews*, 'twas the Cuſtom for the Prieſts to keep Weights of Stone, to ſerve as Standards for the regulating of all Weights by; tho' theſe did not differ from the royal or profane Weights. See WEIGHT, SHEKLE, &c.

SANCTUARY, in our ancient Cuſtoms, an *Aſylum*, or place privileged by the Prince for the Safeguard of Mens Lives, who were guilty of Capital Crimes. See ASYLUM. 'Till *Henry* the VIIIth, all our Churches and Church-yards were *Sanctuaries*; and protected Traytors, Murderers, &c. if within Forty Days they acknowledged their Fault, and ſubmitted themſelves to Baniſhment; and during that Time, if any Lay-man expelled them, he was excommunicated; if a Clerk, he was made irregular: After Forty Days no Man might relieve them. St. *John's* of *Beverly*, had an eminent *Sanctuary*, called by the *Saxons*, A Seat of Peace: So had St. *Martin's le Grand*, in *London*. *Rippon* had the like granted by *Whitlafe*, King of the *Mercians*: So had St. *Buriens* in *Cornwal*, granted by King *Athelſtan*, *Anno* 936; and *Weſtminſter* the like, granted by *Edward* the Confeſſor. In *Scotland* they call the *Sanctuary*, *Girthole*, or *Grithol*. The *Saxons* alſo called it *Frodmortel*. See ABJURATION.

SANCTUARY, is alſo uſed in the *Romiſh* Church for the Chancel, or that Part of the Church wherein the Altar is placed, incompaſſed with a Rail or Balluſtrade. See CHANCEL.

SANCTUM SANCTORUM. See SANCTUARY.

SAND, a fine, hard gravelly Earth, of great Uſe in Building, and many other Arts and Manufactures, as in the making of Glaſs, in Plumbery, Foundery, &c. There are Three Kinds of Sands, diſtinguiſhed by the Places whence they are drawn: *viz. Pit-Sand*, *River-Sand*, and *Sea-Sand*. See EARTH.

The Uſe of *Sand* in Building, is as an Ingredient in Mortar: See MORTAR. For this Uſe, *Pit-Sand* is of all others the beſt; and of *Pit-Sand*, the whiteſt is always the worſt. Of *River-Sand*, that found in the Falls of Waters is beſt, becauſe moſt purged. *Sea-Sand* is the worſt. *Pit Sand*, as being fat and tough, is moſt uſed in Walls and Vaults. *River-Sand* ſerves for rough caſting. All *Sand* is good in its Kind, if when ſqueezed and handled it crackles; and if being put on a white Cloth, it neither ſtains nor makes it foul. That *Sand* is naught, which, mixed with Water, makes it dirty and muddy, and which has been long in the Air; for ſuch will retain much Earth and rotten Humour. Hence ſome Maſons waſh their *Sand* e'er they uſe it. The *Sand* of *Puzzuolo*, *De Lorme* obſerves, is the beſt in the World; eſpecially for Maritime Building. See PUZZUOL. Some diſtinguiſh a *Male Sand*, which is of a deeper Colour than another Sort in the ſame Bank or Bed, called *Female Sand*.

The *Sand* whereof Glaſs is made, is white and gritty, full of little ſparkling Grains. See GLASS.

The *Sand* uſed by Founders, is Foſſile. 'Tis properly a yellow fat Earth, whereof they make their Moulds, for the Caſting of little Works; whence it is they ſay, *Caſting in Sand*. See FOUNDERY. The Plumbers alſo uſe *Sand* to mould ſeveral of their Works, particularly large Sheets. To prepare the *Sand* for theſe Sheets, they wet it lightly, ſtir and work it with a Stick, then beat and plane it. See PLUMBERY.

SAND, in Agriculture, is one of the Three great Kinds of Soil; which are *Sand*, *Clay* and *Earth* or *Loam*. The Properties, &c. whereof ſee under the Article SOIL.

M. *de la Quintine* attributes all the Difference we find in Soils, to the different Quality of *Sands* mixed in them. *Soft Sands*, according to him, make a ſoft, gentle Earth. *Unctuous Sands*, a ſtiff Earth. *Coarſe Sands* a rough untractable Earth, &c.

SAND is alſo applied to dry, crumbling Earths, which, wanting any Fatneſs to bind them together, the Wind eaſily breaks into Duſt, and carries them away. In this Senſe it is that Travellers tell us, the Caravans in *Africa* are frequently loſt, and buried under Clouds of *Sand*, tore up by Whirl-winds; and ſometimes heaped up into Mountains. The Deſarts of *Lybia* are mere *Sands*; and hence their Sterility.

A TABLE *of* SANDS.

- Sharp, or *Rag Sand*, compoſed of ſmall Tranſparent Pebbles, naturally found upon the Mountains, not Calcinable.
- Fine
  - White.
    - *Stitneham-Moor*, in the Road waſhed up very white Pebble.
    - *Flamborough Head*, of which the Light-Houſe there is cemented.
  - Grey.
    - *Calais Sand*, burns reddiſh, but falls not in Water.
    - *Seaton-Banks*, near *Hartlepool*, on the *Tee*'s Mouth; *Eſcrick* in the Gravel-pit there, a Vein of exceeding fine *Sand*.
  - Reddiſh.
    - The *Pillow Sand* in the *Baltick*.
  - Brown.
    - In a Spring at *Heſlington*.
    - *Acome* near *York*, drifted *Sand*.
- Coarſe
  - Grieſly.
    - *Hutton-Moor*, waſht.
    - *Throp* Fells.
    - *Ouze* at *York*.
    - *Nid* at *Mountain*.
    - Dug up at *Rawcliff* near *Snath*.
    - Wharf at *Ickly* and *Denton*.
    - *Air* at *Carleton* in *Craven*.
    - *Eure* at *Craven*.
  - Brown.
    - *Gauton*.
    - *Santon* in *Lincolnſhire*.
    - *Bromly-Common*.
    - *Skipwith-Common*.
- Soft or ſmooth, with flat Particles
  - From *Limeſtone*, with *Mica* of Glittering Particles,
    - At —— in *Yorkſhire*.
    - A Vein at *Oſwell-Beacon*, in *Lincolnſhire*.
- Of *Weſtmoreland*
  - Silver-like
    - *Sea-Sand*, about the *Scilly* Iſlands.
    - In *Cleveland*, and about *Scarborough*.
    - *Ouze Duct*, or *Sediment* at *Rawcliff*.
    - A Vein of *Mica* in *Heſlington* Gravel-pit.
    - *Mica Argentea* in *Red-Sand* Rock, near *Rippon*, plentifully.
  - Gold-like
    - *Mica Aurea* of *Cleveland*.

SANDAL, in Antiquity, a rich kind of Shoe or Wear for the Feet, made of Gold, Silk, or other precious Stuff, uſed by the *Roman* and *Greek* Ladies; conſiſting of a Sole, with a Hollow at one Extreme to embrace the Ancle. *Terence* ſpeaks of this *Sandal*, *Utinam tibi committigari videam* Sandalio *caput:* I wiſh ſhe wou'd break your Head with her *Sandal*. *Apollo* was ſometimes called *Sandalarius*, the Reaſon of which Appellation has given great Perplexity to the Criticks; ſome derive it from a Street called *Sandalarius*, becauſe chiefly inhabited by *Sandal*-Makers, wherein that God had a Temple: But others, with more Probability, derive the Name of the Street from that of the God, and take *Apollo* to have been thus called from his effeminate Dreſs, as if he wore Womens *Sandals*.

The Shoe anciently wore by the Pope, Biſhops, Prieſts, &c. when they officiated, was alſo called *Sandal*; being ſuch as was ſuppoſed to have been wore by St. *Bartholomew*. *Alcuin* obſerves, That there was ſome Difference between the *Sandals* of Biſhops, Prieſts, and Deacons. Monks were not allowed to wear *Sandals*, except in Travelling, as is obſerved by *Du Cange*, *Salmaſius*, &c.

Sandal is alſo a Shoe wore by ſeveral Congregations of reformed Monks. It conſiſts of no more than a mere Leathern Sole, faſten'd with Latches or Buckles, all the reſt of the Foot being left bare: The Capuchins wear *Sandals*, the Recollects, Socks: The former are of Leather, the latter of Wood.

SANDARAC, in Natural Hſtory, &c. Some divide this *Sandaracha* into *Natural* and *Factitious*: The *Natural* is found in Gold, Silver, and Copper Mines, and is the ſame with the red Arſenic: The *Factitious* is only Ceruſs exalted by the Fire, and burnt into a kind of Minium. Both the one and the other is a violent Poiſon. See REALGAL, CERUSS, &c.

SANDARAC or *Sandarach*, in Pharmacy, *Red Arſenic*, called alſo *Realgal* and *Red Orpiment*; 'tis ſometimes alſo called *Sandaracha Græcorum*, in Oppoſition to the Gum.

SANDARACH, or *Gum-Sandarach*, called alſo *Sandaracha Arabum*, is a white Gum oozing out of the Trunk, and thick Branches of the great Juniper-Tree, by Inciſions made in the Heats of the Summer. The little or common Juniper yields very little *Sandarach*: Its Fruit yields Oils, Waters, Salts, Spirits and Extracts of ſome Repute in Medicine. The *Gum Sandarach* is an Ingredient in Varniſh. See VARNISH. 'Tis alſo reduced into an impalpable Powder, and uſed to prevent Paper from imbibing Ink. The beſt is in fine white Tears, free of Duſt: The *Engliſh*, *Swedes*, &c. drive a conſiderable Trade therewith. Some will have it, that the *Sandarach* of the Juniper is not the right, but only that of *Oxycedron*, which ſee.

SAND-BAGS, in Fortification, are Bags holding about a Cubic Foot of Earth or Sand. They are uſed for raiſing Parapets in haſte, or to repair what is beaten down; they are alſo of Uſe when the Ground is Rocky, and affords not Earth to carry on their Approaches, becauſe they can be eaſily brought on and off at Pleaſure. There are a leſſer Sort, which hold half what the former do, and which are placed upon the upper Talus of the Parapet, to cover thoſe who are behind, and who Fire through the Embraſures, or Intervals, that are between them.

SANDEVER, the Droſs of Glaſs, or the Scum that ariſes from the Aſhes of the Herb *Kali*, uſed in the Making of Glaſs. See GLASS.

SANDIX, a kind of Minium, or rather of red Maſticot made of Ceruſs calcined and rubified, called alſo a *Factitious Sandarach*. 'Tis of little Uſe in Painting, the real Minium or Vermilion, to which it is ſubſtituted, making a much better, brighter, and more durable Colour. See MASTICOT, and VERMILION.

SAND-HEAT, or *Sand-Bath*, in Chymiſtry, one of the Chymiſts Fires, conſiſting of hot Sand, wherein Herbs, Flowers, &c. are infuſed in a Cucurbit. See BALNEUM ARENOSUM. The *Sand-Heat* is eſteemed gentle, digeſtive, and alterative.

SANGUIFICATION, in the Animal Oeconomy, the Action whereby Chyle is converted into Blood. *Sanguification* ſucceeds to *Chylification*. See CHYLIFICATION. Alſo ſee BLOOD and CHYLE.

SANGUIFICATION is thus effected. The Chyle having paſſed the Lacteals of the ſeveral Kinds, is delivered into the Blood at the Subclavian; whence the two Humours paſs together to the right Ventricle of the Heart, where being yet more intimately mixed, they circulate together through the whole Body; 'till, after ſeveral Circulations and Depurations at the ſeveral Colatures and Strainers of the Body, they become aſſimulated, or, as the Chymiſts call it, *cohobated*, ſo as only to make one uniform compound Maſs, which appears to be nothing elſe but Chyle alter'd by the Artifice of Nature, and exalted into Blood. In Effect, it does not appear that any Thing extraneous is mixed with the circulating Liquor but Chyle, excepting what was before ſeparated from it for particular Occaſions; unleſs perhaps it ſhould receive ſome Portion of Air in the Lungs, which is a Point long diſputed, and yet ſcarce aſcertained. Indeed, that there is a Quantity of Air mixed with the Blood and circulating with it, is granted; but whether this be any more than was at firſt contained in the Bodies whereof the Chyle was form'd, is much doubted: The principal Arguments for it, are, The Neceſſity of Reſpiration, and the florid Colour the Blood receives in the Lungs, and firſt ſhews itſelf in the Pulmonary Vein; but the firſt is ſatisfactorily accounted for another Way. See RESPIRATION. The latter is chiefly ſupported by this Experiment, That Blood drawn by Veniſection, and ſuffered to coagulate, upon turning up the Bottom, which before was blackiſh, being now expoſed to the Air, acquires a florid Colour, like that we obſerve in the Blood of the Pulmonary Vein. The Action of *Sanguification* is ſucceeded by that of *Nutrition*. See NUTRITION.

The Antients were in great Perplexity about the Seat of *Sanguification*, or the Place where, and the Inſtrument whereby it is effected: Whether in the Heart, or the Liver, or the Lungs: But, according to the Doctrine of the Moderns, the Heart, Liver, Veſſels, &c. contribute no otherwiſe to the changing of the Chyle into Blood, than the Sun does to the changing of the Muſt into Wine. See HEART, LIVER, &c.

The Antients accounted for *Sanguification* from a plaſtic Power. In the laſt Century, when Chymiſtry was introduced, *Sanguification*, and almoſt every thing elſe, was to be effected by a Ferment; and the Phyſicians of thoſe Times, were very ſollicitous as to the particular *Officina* where this Ferment was prepared and kept. Some would have it the Liver, others the Spleen, &c. but the very Notion is now exploded.

Of *Sanguification* we may admit two Degrees; the firſt amounting to no more than a Confuſion, or ſuch an intimate Mixture of Parts, as ſuffices ſo to confound the different coloured Liquors, as that the Whiteneſs of the Chyle ſhall be loſt or drowned in the Redneſs of the Blood, ſo as never more to appear in its own Shape and Colour. This we ſuppoſe may be effected by repeated Circulations alone: How many Circulations are neceſſary thereto, 'tis difficult to determine.

The Second Degree of *Sanguification*, is, when the Parts of the Chyle are ſo exalted or communuted and ſubtilized, as to loſe all Tendency to a coagulatory Separation, ſuch as they have in Chyle and Milk. To theſe two Degrees may be added a third, wherein the Fibres and Filaments of the crude Blood are ſo broken and blended with the Serum, as not to be again ſeperable from them. This is a *Morbid Sanguification*, ſuch as happens in Fevers, &c. attended with a bloody Sweat, Spots, &c.

All theſe Degrees of *Sanguification*, Dr. *Drake* makes no doubt are procured by reiterated Circulations, wherein as well the Inteſtine, as the Progreſſive Motion, conſpire to the mixing and comminuting of the adventitious Parts. Doubtleſs they have their ſtated Period, wherein they are in Perfection; though where preciſely to fix it, we do not know.

SANGUINE, ſomething abounding in Blood; hence *Sanguine Temperament*, or Conſtitution, is that where Blood and Heat predominate. *Sanguine* Conſtitutions require a frequent Uſe of Phlebotomy. *Sanguine* People are uſually obſerved to be brisk, bold, daring, and even preſumptuous: Hence *Sanguine* Hopes, ſtrong, aſſured, &c. Hopes.

SANGUINE, in Heraldry, the Colour uſually called *Murry*, being made of Lake, with a little *Spaniſh* Brown: It is repreſented in Engraving, by Hatches like Purpure: It is moſtly uſed in the Coats of Knights of the *Bath*; when it is borne by Nobles, it is called *Sardonyx*, and in the Coats of Sovereign Princes they call it *Dragons-Tail*.

SANGUINE-STONE, *Lapis Sanguinalis*, or *Blood-Stone*, a kind of Jaſper brought from *New-Spain*, of a dark brown Colour, marked with Spots of a Blood-red; the *Indians* cut it in Form of a Heart, and uſe it in Hæmorrhagies, immoderate Menſes, and other Fluxes of Blood. The Patient applies it by graſping it in his Right Hand, having firſt dipt it in Water 'Tis ſometimes alſo hung on the Part whence the Blood flows. See JASPER.

SANGUIS, in Medicine, &c. See BLOOD.

SANGUIS, in our antient Cuſtoms, a Right, or Power, which the chief Lord of the Fee had to determine in Cauſes where Blood was ſhed. *De Murderia & Raptu, de Igne, de* Sanguine, &c. Monaſt. —— *Sanguinem Emere* was an Obligation the Inhabitants of ſome Manors, as that of *Grendon*, were under, to buy and redeem their Villain Blood or Tenure, and make themſelves Freemen.

SANGUIS CAPRINUS, or *Hircinus*, the Blood of the He Goat, either wild or tame, which is prepared, with great Precaution, to be uſed in Medicine, and ſuppoſed to have very extraordinary Qualities. The principal Precautions are theſe: The Goat is not to exceed four or five Years of Age; 'tis to be fed a conſiderable Time with Aromatic Herbs, and eſpecially thoſe of the Saxafrage Kind; to be drawn out of the Throat, or the Teſticles, by cutting them; but neither what comes firſt, nor laſt to be uſed, the former being too full of Humidity, and the latter too thick; and that the Operation be only performed in *July*, and the Blood put into Earthen Veſſels, and dried either in the Sun or the Shade, and, laſtly, bottled up to be uſed occaſionally.

Among other Specific Virtues attributed to Goats-blood, the two moſt conſiderable ones are, that it cures

the Pleuriſy without bleeding; and that it diſſolves the Stone in the Bladder, by taking it in Vehicles proper for thoſe Diſeaſes. To be good, 'tis to be extremely hard and difficult to pulverize.

SANGUIS-DRACONIS, in Pharmacy. See DRAGONS-BLOOD.

SANHEDRIN, or *Synedrin*, among the Ancient *Jews*, the Supreme Council, or Court of Judicature of their Republic; wherein were diſpatch'd all the great Affairs both of Religion, and Policy. Many of the Learned agree, That it was inſtituted by *Moſes*, and conſiſted at firſt of Seventy Perſons, all inſpired of the Holy Ghoſt, who judged finally of all Cauſes and Affairs; and that it ſubſiſted, without Intermiſſion, from *Moſes* to *Eſdras*. Others will have it, That the Council of Seventy Elders, eſtabliſhed by *Moſes*, *Numb. Cap.* xi. was Temporary, and did not hold after his Death; adding, That we find no Sign of any ſuch perpetual and infallible Tribunal throughout the whole *Old Teſtament*. The *Jews*, however, contend ſtrenuouſly for the Antiquity of their Great *Sanhedrin*; M. *Simon* backs and defends their Proofs, and M. *le Clerc* attacks them. Be the Origine and Eſtabliſhment of the *Sanhedrin* how it will, 'tis certain it was ſubſiſting in the Time of our Saviour; that it was held at *Jeruſalem*; and that the Deciſion of all the moſt important Affairs belonged to it. The Preſident of this Aſſembly was called *Naſi*: There were ſeveral inferior *Sanhedrins* in *Paleſtine*, all depending on the Great *Sanhedrin* at *Jeruſalem*. The inferior *Sanhedrins* conſiſted each of Twenty-three Perſons; and there was one in each City and Town. Some ſay, That to have a Right to hold a *Sanhedrin*, 'twas requiſite there were One Hundred and Twenty Inhabitants in the Place. Where the Inhabitants came ſhort of the Number of One Hundred and Twenty, they only eſtabliſh'd Three Judges. Into the great as well as the inferior *Sanhedrins* were admitted Prieſts, Levites, and Laymen, of all the Tribes, provided they were of noble Extraction, Rich, Prudent, without any Blemiſh of Body, and expert in Magick; which laſt was eſteemed a neceſſary Qualification, to enable them to obviate and deſtroy it: Very old People and Eunuchs were excluded. In each *Sanhedrin* there were two Scribes; the one to write down the Suffrages of thoſe who condemned; the other to take down the Suffrages of thoſe who acquitted.

Selden has a very Learned Work on the Subject of the *Jewiſh Sanhedrins*, *de Synedriis*, Printed at *London* in 1635, in three Volumes *Quarto*. The Word is derived from the *Greek* Συνέδριον a Council, Aſſembly, or Company of People ſitting together, from σὺν *con* together, and ἕδρα Seat, of ἕζω, I place.

SANIES in Medicine, a thin, ſerous Matter, iſſuing out of Wounds and Ulcers. *Galen* compares it to Whey. It differs from *Pus*, which is thicker and whiter: The *Greeks* call it ἰχὼρ crude Blood.

SANTALUM, *Santal*, *Sandal* or *Saunders*, a hard, heavy, odoriferous, medicinal Wood, brought from the *Eaſt-Indies*. There are of three different Colours, Citron, White, and Red. The Trees whence they are taken are all of the ſame Kind; and 'tis ſuppoſed their different Colours only ariſe from the Difference of Climates where they grow. 'Tis about the Height of the *European* Walnut-tree. Its Leaves reſemble thoſe of the *Lentisk*, its Flowers Blue, bordering on Black; its Fruit of the ſize of our Cherry, green at firſt, but blackening as it ripens, and of a faint Taſte. The Citron *Santal* is eſteemed the beſt. 'Tis brought from *China*, and *Siam*: Is yellow, heavy, and of a good Smell; 'tis uſed in Medicine, as alſo by the Perfumers. The *White-Santal* is leſs odoriferous; 'tis brought from the Iſle of *Timor*. The *Red-Santal* has the leaſt Smell of the Three: 'Tis brought from the Iſland *Tamaſſarin*, and the Coaſt of *Coromondel*. The *Santals* are all held to be a little Aſtringent, to ſtrengthen the Heart and Brain, and to ſtop Vomiting; and are frequently uſed in Diet-drinks, and medicated Ales, againſt Scorbutick Complaints.

SAP, or *Sapp*; to *Sap* a Wall, &c. is to dig or open a Hole in the Ground at the Foot of a Wall, &c. to bring it down all at once for want of Support. To *Sap*, according to *Daviler*, is to undermine a Work with Hammers, Clubs, Pickaxes, Mattocks, &c. *viz.* A Bank, or Hillock, by propping it up, digging underneath it, and then burning the Props, or Stays; or a Rock, by digging a Mine underneath it. To demoliſh the thick, firm Walls of old Caſtles, &c. *Sapping* is much the readieſt Way. See SAPPING.

SAPHÆNA, in Anatomy, a Vein which ariſing over the *Malleolus Internus*, up along the Leg, and the inner Part of the Thigh, diſcharges it ſelf, near the Groin, into the Crural Vein. 'Tis the Vein they uſually open when they bleed in the Foot. It has its Name, probably, from σαφὴς *manifeſtus*, as lying plain in Sight.

SAPHETA, in Architecture, is the Board over the Top of a Window, placed parallel and oppoſite to the Window-Board at the Bottom.

SAPHIC, in Poetry, a kind of Verſe much uſed by the *Greeks*, and *Latins*; denominated from the Inventreſs *Sapho*. The *Saphic* Verſe conſiſts of Eleven Syllables, or Five Feet, whereof the Firſt, Fourth, and Fifth, are Trochees, the Second a Spondee, and the Third a Dactyl, as in

Integer Vitæ ſceleriſq; purus.

Three Verſes of this Kind, cloſed with an Adonick Verſe, conſiſting of a Dactyl and Spondee, uſually make a Strophe. Though we have ſome Chorus's in the Ancient Tragic Poets, containing a much greater Number of *Saphicks* ſucceſſively. They generally run rough, unleſs they have a Cæſure after the Second Foot.

SAPIENTAL, an Epithet applied to certain Books of Scripture, calculated for our Inſtruction and Improvement in Prudence, or Moral Wiſdom; thus called, in Contra-diſtinction to *Hiſtorical* and *Prophetical* Books. The *Sapiental* Books are *Proverbs*, *Canticles*, *Eccleſiaſtes*, *Eccleſiaſticus* the *Pſalms*, and *Job*; though ſome reckon this laſt among the *Hiſtorical* Books.

SAPIENTIÆ DENTES, Teeth, thus called becauſe they appear not till Perſons are grown. See TEETH.

SAPPHIRE, or *Saphir*, a precious Stone of a beautiful Azure, or Sky-blue Colour. The *Saphir* is tranſparent, yet exceedingly hard, ſo as ſcarce to bear being Engraven. Different Colours conſtitute different Kinds thereof; the deepeſt Blues being eſteemed *Males*, and the whiteſt *Females*. The *Saphirs* of *Pegu* are the moſt eſteem'd. They are found in the ſame Mines with the Rubies. There are ſome alſo brought from the Kingdom of *Calecut*, *Cananor*, and *Ceylon*; from which laſt Place we ſhould be furniſhed with abundance, if the King of the Iſland did not prohibit all Commerce thereof with Foreigners. The ſoft *Water-Saphirs* of *Bohemia* and *Sileſia* are of ſome Account, though far inferior to the Oriental ones. Many People value the *Saphir* beyond the Ruby and give it the ſecond Place among precious Stones, *viz.* that next the Diamond: Others give that Place to the Ruby. Some Authors affirm, That a *Saphir* being heated to a certain Degree, between two Crucibles luted together, loſes all its Colour, and becomes perfectly White; ſo as to deceive even the Jewellers themſelves, and make it paſs for a Diamond.

The Chymiſts make ſeveral Preparations of *Saphir*; as a Salt, a Tincture, an Eſſence, a Water, an Oil, &c. and there are few Diſeaſes but they pretend themſelves able to cure by Remedies compoſed thereof. The Superſtitious attribute ſtill more ſtrange Virtues to it; as, that it grows foul, and loſes its Beauty, when wore by a Perſon that is letcherous, &c. The Rabbins hold, That *Moſes*'s Rod, and the Tables he received on Mount *Sinai*, were of *Saphir*. The Word is derived hence, that in the *Hebrew* the fineſt Things are all called *Saphirs*; whence, in Scripture, the Throne of God is ſaid to reſemble a *Saphir*.

Our Druggiſts ſell two Kinds of *Saphirs* uſed in the Confection of Hyacinth: The one red, the other blackiſh. The laſt, by reaſon of the deep Tincture they give that Medicine, are very improperly uſed there: The former are little reddiſh Stones, of the Size of Pins-heads, very hard, and difficult to pulverize.

There is a particular Kind of *Saphir*, called, by the *Latins*, *Oculus Felis*, *Cats-Eye*, remarkable for a fine Diverſity of Colours, as well as for its Hardneſs, which bears a Poliſh equal with that of the true *Saphir*.

SAPHIR-RUBIES are certain precious Stones, between blue and red, which, in effect, are nothing but Rubies, whoſe Colour is not yet perfectly form'd. See RUBY.

SAPPING, in War, a Working under Ground, to gain the Deſcent of a Ditch, Counterſcarp, &c. and the Attacking of a Place. 'Tis performed by digging a deep Trench, deſcending by Steps from Top to Bottom, under a Corridor, carrying it as far as the Bottom of the Ditch, when that is dry, or the Surface of the Water when wet. When the Cover'd-way is well defended by Musketeers, the Beſiegers make their Way down into it by *Sapping*. When they are got near the Foot of the Glacis, the Trench is carried on directly forwards; the Workmen covering themſelves with Blinds, Wool-packs, Sand-bags, and Mantelets upon Wheels. They alſo make Epaulements, or Traverſes, on each Side to lodge a good Body of Men: The *Sap* is made five or ſix Fathom from the Saliant Angle of the Glacis, where the Men are only covered ſide-ways, wherefore they lay Planks overhead with Hurdles, and Earth above them. When they have forced the Enemy to quit the Covered-way, the Pioneers immediately make a Lodgment, and cover themſelves

themſelves as well as they can, from the Fire of the oppoſite Baſtion.

SARABAIT, a Name anciently given to vagabond Monks. St. *Benedict* gives a frightful Idea of theſe *Sarabaites* in the Firſt Chapter of his Rule. *Caſſian* does not ſpeak a whit more favourably of them in his Fourteenth Conference; nor S. *Jerom* in his Letter to *Euſtochius*. *Caſſian* calls them, *Renuitæ, quia jugum regularis diſciplinæ renuunt*. The Word *Sarabaitæ* is derived from the *Hebrew* סרב *Sareb*, to be a Rebel.

SARABAND, a Muſical Compoſition in Triple Time; being, in reality, no more than a Minuet, whoſe Motions are ſlow, and ſerious. *Saraband* is alſo a Dance to the ſame Meaſure, uſually terminating when the Hand riſes, whereby 'tis diſtinguiſhed from the Courant, which Ends when the Hand that beats Time, falls. The *Saraband* is ſaid to be derived originally from the *Sarazens*, as well as the *Chacone*: It had its Name, according to ſome Authors, from a Comedian called *Sarabande*, who firſt danc'd it in *France*. Others derive it from the *Spaniſh Sarao* Ball: 'Tis uſually danced to the Sound of the Guitarre, or Caſtanettes.

SARCASM, in Rhetorick, a keen, bitter Irony, whereby the Orator ſcoffs and inſults his Adverſary. Such was that of the *Jews* to our Saviour: *Thou who deſtroyeſt the Temple, and raiſeſt it in three Days, ſave thy ſelf*, &c. and again, *He ſaved others, himſelf he cannot ſave*. Or that of *Tamus* to a *Trojan* ſlain by him in *Virgil*.

En agros, & quam bello, Trojane, *petiſti*
Heſperiam metere jacens. Hæc præmia qui me
Ferro auſi tentare ferunt: Sic Mœnia condunt.

SARCOCELE, in Medicine, a fleſhy Excreſcence, very hard, yet indolent, riſing up by little and little about the Teſticle, or on the inner Membrane of the *Scrotum*. Sometimes indeed it is painful, in which Caſe there is Danger of its degenerating into a Cancer: It uſually owes its Origine to ſome external Cauſe, as a Blow, a Bruiſe, or Contuſion. Such Accidents occaſion the nutritious Juices to ſtop, and to be collected in great Quantities in the relaxed or compreſſed Pores of thoſe Parts, by which Means is form'd that kind of Fleſh called *Sarcocele*. 'Tis a very troubleſome and obſtinate Diſeaſe, and is frequently incurable by any other Means than cutting off the Teſticle. The Word is formed from the *Greek* σὰρξ *Caro*, Fleſh, and κήλη Tumor.

SARCOCOLLA, a Gum oozing out of a thorny Tree, either with or without Inciſions. Neither Authors nor Merchants are agreed as to the Place where it grows: Some ſay 'tis in *Perſia*, others, in *Arabia Deſerta*. It comes either in Grains, or in Tears of different Colours; ſometimes White, ſometimes Yellow, and ſometimes Red, but all equally good, provided they be very dry. Their Taſte is bitter, accompanied with ſomewhat of a diſagreeable Sweetneſs. 'Tis eſteemed warm and drying; very good to conſolidate and heal Wounds, whence its Name, which is from the *Greek*, σὰρξ Fleſh, and κόλλα Glue. 'Tis ſometimes alſo uſed in Collyria to ſtop Defluxions, and take off Specks on the Eye.

SARCOLOGY, in Anatomy, a Diſcourſe on the Fleſh, or the ſoft Parts of the Human Body. Anatomy is divided into Two principal Parts; Oſteology and *Sarcology*. The firſt whereof treats of the Bones and Cartilages; the ſecond of the Fleſh and ſoft Parts. See FLESH.

SARCOMA, in Medicine, a fleſhy Excreſcence ariſing from the proper Nutriment of the Part where it grows, without any Defluxion, or Diſcharge of Humours from other Parts. If the Fleſh be not repreſs'd and kept under, it frequently produces Pipes like Veins and Arteries, whereby it receives Nouriſhment, as we ſee in Wens. It yields a very fetid Sanies, and ariſes chiefly about the Fundament, the Neck of the Womb, Fractures of the Cranium, &c. The *Latins* call it *Fungus*.

SARCOMPHALUM, in Medicine, &c. a fleſhy Excreſcence of the Navel, from the *Greek* σὰρξ Fleſh, and ὄμφαλος Navel.

SARCOPHAGUS, or *Sarcophagum*, in Antiquity, a Tomb-ſtone, wherein the Antients laid thoſe they had not a mind to burn: The Word, derived from the *Greek*, literally ſignifies, one that eats Fleſh; becauſe at firſt, they uſed a Sort of Stones for the making of Tombs, which quickly conſumed the Bodies: The Quarries from whence they dug them were in a City of *Troas*, named *Aſſum*: They had the Virtue to waſte away a Body to nothing, ſave the Teeth, in Forty Days: This Stone reſembled a Reddiſh Pumice Stone, and had a ſaltiſh Taſte; they made Veſſels of it to cure the Gout, into which they put their Feet, not ſuffering them to continue there too long.

SARCOTICKS, in Medicine, Remedies proper to fill up Wounds and Ulcers with new Fleſh; the ſame as *Incarnatives*. *Sarcoticks* ſhould be deterſive and moderately hot. Such are *Sarcocolla*, *Dragon's-Blood*, *Incenſe*, &c. The Word is form'd from the *Greek* σὰρξ Fleſh.

SARDOIN, or *Sardonian-Stone*, a precious Stone of a Blood Colour, half tranſparent; the ſame with what we otherwiſe call a *Cornelian*. See CORNELIAN. The moſt beautiful *Sardoins*, are thoſe brought from about *Babylon*: Thoſe of *Sardinia*, whence they take their Name, are in the ſecond Claſs. There are others, and thoſe no contemptible ones, found near St. *Mauro* in *Albania*; and other, very ſmall ones, about the *Rhine*, in *Bohemia*, *Sileſia*, &c. To give them the greater Luſtre, 'tis uſual in ſetting them, to lay Silver-leaf underneath. The *Sardoin* is moſt uſed for Seals, as graving eaſily, yet taking a fine Poliſh. The Author of the Book falſely aſcribed to *Albertus Magnus*, attributes ſeveral wonderful Virtues to this Stone. See AGATE.

SARDONIAN LAUGHTER. See RISUS *Sardonius*.

SARDONYX, a precious Stone, partaking partly of the *Sardoin*, and partly of the Agate or *Onyx*. 'Tis reddiſh, bordering on White, like the Nail of the Hand. In ſome, the Red inclines to a Yellow. 'Tis brought from the *Eaſt Indies*, *Arabia*, and *Bohemia*. It was anciently much uſed for fine Veſſels. See AGATE and SARDOIN.

SARPLAR OF WOOL, otherwiſe called a *Pocket*, is half a *Sack*. See SACK. In *Scotland*, it is called *Serpliathe*.

SARRASIN, in Fortification, is a Kind of Portcullice, otherwiſe called an Herſe, which is hung with a Cord over the Gate of a Town, or Fortreſs, and let fall in Caſe of a Surprize.

SARSAPARILLA, or *Salſaparilla*, a Medicinal Plant, growing in *New Spain*, *Peru*, and the *Eaſt Indies*. Its chief Uſe is in Decoctions and Potions in the Venereal Diſeaſe, being eſteemed a great Obſervant and Sweetner; and, on that Score, ſometimes uſed as a Tea. Its Root, which is the Part in Uſe, divides its ſelf into a great Number of Filaments, Six or Seven Foot long; of the Thickneſs of a Quill. 'Tis Grey without Side, and White within, only mark'd with Two Red Streaks. Its Branches creep on the Earth, or along the Trunks of other Trees, &c. as the Ivy does. To be good, it muſt be very dry, its Filaments long, eaſy to cleave; and, in cleaving, muſt not yield any Duſt: When boiled in Water, it muſt give it a Red Tincture. Some of the Modern Phyſicians doubt the Medicinal Virtue of this Root, as it does not diſcover much, either in Taſte, Smell or Tincture. There is another Kind, the Filaments of whoſe Root are thicker, growing in the Iſland *Maregnan*, on the Coaſt of *Braſil*. This is not eſteemed ſo good as the former. There is a third Kind brought from *Muſcovy*, the Roots whereof are ſtill bigger, but good for nothing but to burn.

SARTORIUS, in Anatomy, the *Taylor's Muſcle*, a *Muſcle* thus called, becauſe ſerving to throw one Leg a-croſs the other. 'Tis alſo called *Poplitæus*. See POPLITÆUS.

SASSAFRAS or *Saxafras*, a Yellow odoriferous Wood, of a briſk aromatic Scent, ſomewhat reſembling Fennel. 'Tis the Wood of a Tree growing in *Florida*, whereof there are whole Foreſts. The Natives call it *Pavama*, the *Spaniards* and *French* alſo, *Cinnamon-Wood*; becauſe, at the Conqueſt of that Country, under *Ferdinand Soto*, in 1558, they imagined this to have been the true *Cinnamon* Tree. The Wood of *Saſſafras*, chiefly its Bark, wherein its principal Virtue is ſuppoſed to reſide, was formerly ſold at an incredible Price, to be uſed with Sarſaparilla and Eſquilina, in the Cure of the Venereal Diſeaſe. 'Tis very drying and hot, tho' not quite ſo much as the Guaiacum: It is ſomewhat come into Faſhion in Families, as the common Tea, which the Shavings of it make agreeably enough; but the Scandal of being good in Venereal Caſes, is a Detriment to it, and prevents a deal of Good being done by it: Indeed, with ſome, it doth not agree, eſpecially at firſt, and in a Morning, as it affects the Head, like ſome Perfumes, and occaſions Pains, Drowſineſs and Vapours: But Uſe and drinking it, in the Beginning, in the Afternoon, will, with moſt Conſtitutions, wear out theſe Inconveniencies. 'Tis eſteemed in the Gout, Sciatica, and Green Sickneſs. Chuſe that covered with a thick Bark, reddiſh, and rough, of a ſharp Taſte, and a ſtrong aromatic Smell.

SASSE, in ſome of our Statutes, is a Kind of *Wear* with Flood-gates, commonly in Navigable Rivers for the damming and looſing the Stream of Water, as Occaſion requires, for the better paſſing of Boats and Barges to and from. This, in the Weſt of *England*, is called a *Lock*; in the River *Lee*, a *Turn-pike*, and in other Places a *Sluice*.

SATELLIT *Guard*, a Perſon attending on another, either for his Safety, or to be ready to execute his Pleaſure. Among the *Eaſtern* Emperors, *Satellite* expreſs'd the Dignity or Office of Captain of the Life-Guard. The Term was afterwards uſed for the Vaſſals of Lords, and afterwards for ſuch as held Fees, called SERGEANTIES: Which ſee.

SATELLITES, in Aſtronomy, certain ſecundary Planets, moving round the other Planets, as the *Moon* does round the Earth; thus called, becauſe always found attending them from Riſing to Setting, and making the Tour of the Sun together with them. See PLANET.

The *Satellites* move round their primary Planets, as their Centres, by the ſame Laws as thoſe primary ones do round their Centre, the Sun. For the Phyſical Cauſe of their Motions, ſee GRAVITY; ſee alſo SYSTEM.

The Words *Moon* and *Satellit*, are ſometimes uſed indifferently; and thus we ſay, either *Jupiter's Moons*, or *Jupiter's Satellites*: But ordinarily we diſtinguiſh, reſtraining the Term *Moon* to the Earth's *Satellit*; and *Satellit* to the little *Moons* lately diſcovered about *Jupiter* and *Saturn*. See MOON.

The *Satellites* were unknown till our Time, as needing the Aſſiſtance of the Teleſcope to render them viſible. We don't know of any *Satellites*, beſides thoſe juſt mentioned; nor is there any great Foundation to hope that more ſhall be diſcovered hereafter, as the longeſt, and the moſt exquiſite Teleſcopes have already been applied.

SATELLITES of *Jupiter* are Four little ſecundary Planets, performing their Revolutions about *Jupiter*, as that Planet does round about the Sun. See JUPITER. *Simon Marius*, Mathematician of the Elector of *Brandenburgh*, about the End of *November* in 1609, diſcerned Three little Stars moving round *Jupiter's* Body, and proceeding along with him; and in *January* 1610, found a Fourth. In *January* 1610, *Gallilæo* obſerved the ſame in *Italy*; and the ſame Year publiſhed his Obſervations; from which time commenced the Obſervation of the *Circumjovial Satellites*. *Gallilæo*, in Honour of his Patron, firſt called them *Aſtra Medicæa*, Medicæan Stars. *Marius*, the firſt Diſcoverer, called that next *Jupiter*, *Mercurius Jovialis*, *Jupiter's Mercury*. The ſecond, *Venus Jovialis*, *Jupiter's Venus*; the third *Jupiter Jovialis*, and the fourth *Saturnus Jovialis*, *Jupiter's Saturn*.

Indeed, *Anthony Maria Schyrlæus de Rheita*, a Capuchin of *Cologne*, imagined, That, beſides the Four known *Satellites* of *Jupiter*, he had diſcovered Five more, the 29th of *December*, *Anno* 1642, and in Honour of *Urban* VIII, the Pope then reigning, denominated them *Sidera Urbanotaviana*. But upon *Naudæ's* communicating the Obſervation to *Gaſſendus*, who had obſerved *Jupiter* on the ſame Day, he ſoon perceived that the Monk had miſtaken Five fixed Stars, in the pouring out of the Water of *Aquarius*, mark'd in *Tycho's* Catalogue 24, 25, 26, 27 and 28, for *Satellites* of *Jupiter*: Whence 'tis no Wonder they ſhould appear to the Diſcoverer to move a contrary Way to that of the reſt, *viz.* from Weſt to Eaſt. See *Epiſt. Gaſſend. ad Gab. Naud. de Novem Stellis. circa Jovem viſis.*

Phænomena, Nature, Properties, &c. of Jupiter's SATELLITES.

1°. The *Satellites* of *Jupiter* all diſappear in a clear Sky, when *Jupiter* interpoſes between them and the Sun; that is, are eclipſed by him.

Hence it follows, That they are deſtitute of Light, when the Sun's Rays, which are propagated in right Lines, are intercepted by *Jupiter*: And hence it follows, That they are opaque Bodies like our Moon, and are illumined by the Sun. And hence, ſince *Jupiter* does not illumine his *Satellites* when placed behind him; he himſelf, in that Side oppoſite to the Sun, is deſtitute of all Light.

2°. When the *Satellites* are interpoſed between *Jupiter* and the Sun, a round Macula or Spot is obſerved in *Jupiter's* Disk; which is ſometimes found bigger even than the *Satellit* itſelf.

Hence, ſince the *Satellites* are opaque Bodies, and are illumined by the Sun, and muſt therefore project a Shadow, oppoſite to the Sun; the round Spots ſeen in *Jupiter*, are the Shadows of the *Satellites*. Hence alſo, ſince the Interſection of the Shadow is a Circle, the Shadow itſelf is Conical: And hence it follows, That the Figure of the *Satellites*, at leaſt, as to Senſe, is Spherical.

3°. If, when the Earth is between *Jupiter* and the Sun, any of the *Satellites* happen to be between the ſame, its Light diſappears, and is loſt in *Jupiter's* Light. Thus M. *Maraldi* tells us, That on the 26th of *March* 1707, thro' a Teleſcope of Thirty Four Foot, he obſerved the Fourth of *Jupiter's* Moons paſſing over his Body, in Form of a dark Spot; but it had no ſooner got off of the Disk, than it reſumed its uſual Brightneſs. A like Spot he obſerved on the 4th of *April*, from an Immerſion of the third *Satellit*; but, on the 11th of *April*, upon watching an Immerſion of the ſame *Satellit*, he found it appeared wholly, without leaving any Spot at all. The ſame Phænomenon was alſo obſerv'd at other Times by M. *Caſſini*: And both *Caſſini* and *Maraldi*, have frequently obſerved very ſurprizing Changes in the apparent Magnitudes of the *Satellites*, when there was nothing in their Diſtance, either from Earth, the Sun, or *Jupiter*, to occaſion ſuch Variations. *E. gr.* The fourth *Satellit*, which is frequently the leaſt of all, ſometimes appears the biggeſt: And the third, which is ordinarily the biggeſt, ſometimes only appears equal, and ſometimes leſs, than any of the reſt.

Hence, ſince *Jupiter's Satellites* are illumined by the Sun, even when immerged in the Light of *Jupiter*, and yet, notwithſtanding this, ſometimes appear dark, and ſometimes diſappear; there muſt be ſome Changes in their Atmoſpheres, to prevent the equable Reflection of the Sun's Rays, from the ſeveral Parts of the Atmoſphere. To the ſame Cauſe 'tis owing that their Shadows are ſometimes ſeen bigger than themſelves.

Periodical Times of the SATELLITES *of* Jupiter.

The Periods, or Revolutions of the *Satellites*, are found from their Conjunctions with *Jupiter*, after the ſame Manner as thoſe of the primary Planets are found from their Oppoſitions to the Sun. See PERIOD, *&c.*

Note, By this Method *Caſſini* determined the Periods of

The Firſt *Satellit*	1 Day	18 Hours	28 Min.	36 Sec.
Second *Satellit*	3	13	18	52
Third *Satellit*	7	3	59	40
Fourth *Satellit*	16	18	05	06

Diſtances of Jupiter's SATELLITES *from* Jupiter.

As in the primary Planets, with regard to the Sun, ſo in the *Satellites*, with regard to their Primaries, the Squares of the Periodical Times, are in a *Triplicate Ratio* of their Diſtances therefrom. To determine the Diſtance by Obſervation, they meaſure them with a Micrometer, in Semi-Diameters of *Jupiter*. Theſe Diſtances, according to *Caſſini*, are as follow.

The Firſt *Satellit* diſtant from *Jupiter's* Center,	5 and two 3ds. Semi-diam.
The Second *Satellit*	9 Semi-diam.
The Third *Satellit*	14
The Fourth *Satellit*	25 and one 3d.

Hence, as the Semi-diameter of *Jupiter* is equal to 27 8 11ths Semi-diameters of the Earth, the Diſtance of the firſt *Satellit* from the Centre of *Saturn* is 166 Semi-diameters of the Earth: That of the ſecond 249 and a Half. That of the third 388; and that of the fourth 884.

Eclipſes of Jupiter's SATELLITES. See ECLIPSE.

SATELLITES of *Saturn*, are Five little Stars revolving about *Saturn*. See SATURN. The firſt was diſcovered by M. *Huygens*, *Anno* 1655, *March* the 25th, by means of a Teleſcope Twelve Foot long. The other Four, at different Times, by M. *Caſſini*, viz. Thoſe Two next *Saturn*, in *March* 1684, by Help of *Campani's* Glaſſes, of One Hundred, and One Hundred and Thirty-ſix Foot long. The third in *December* 1672, by a Teleſcope of *Campani's*, of Thirty-five Foot; and the fifth (that of *Huygens* being the fourth) in *October* 1671, by a Teleſcope of Seventeen Foot.

Moſt, perhaps all, of the Phænomena obſerved of *Jupiter's Satellites*, are alſo found exhibited by thoſe of *Saturn*: Thus, they are found ſometimes bigger, and ſometimes leſs: The fifth is ſometimes, alſo, found eclipſed, *&c.* And hence, there is no doubt, but they are of the ſame Nature, *&c.* See SATELLITES *of Jupiter*.

The Periodical Times of the SATELLITES *of* Saturn, *according to M.* Caſſini, *are as follow.*

That of the

Firſt *Satellit*	1 Day	21 Hours	18 Min.	31 Seconds
Second *Satellit*	2	17	41	27
Third *Satellit*	4	13	47	16
Fourth *Satellit*	15	22	41	11
Fifth *Satellit*	74	7	53	57

The Distances of Saturn's SATELLITES *from his Centre, according to the same M.* Cassini, *are as follow.*

First *Satellit*	4 3 8ths	Semi-diam. of *Saturn*, or	1		Diameter of *Saturn*'s *Ring*.
Second *Satellit*	5 3 5ths		1 1 4th		
Third *Satellit*	8		1 2 $\frac{1}{2}$ds		
Fourth *Satellit*	18		4		
Fifth *Satellit*	54		5		

The great Distance between the fourth and fifth *Satellit*, gave Occasion to *Huygens* to suspect that there might be some intermediate one; or else, that the fifth might have some other *Satellit* moving round it, as its Centre.

Dr. *Halley*, in the *Philosophical Transactions*, gives us a Correction of the Theory of the Motion of the fourth or *Huygenean Satellit*. Its true Period he makes 15 Days, 22 Hours, 41 Minutes, 6 Seconds. Its diurnal Motion, 22° 34′ 38″ 18‴. Its Distance from the Centre of *Saturn*, 4 Diam. of the Ring; and its Orbit to be little or nothing distant from that of the Ring, intersecting the Orbit of *Saturn* under an Angle of 23 $\frac{1}{2}$ Degrees.

SATIR. See SATYR.

SATIRE. See SATYRA.

SATRAPA, or *Satrapes*, in Antiquity, the Governor of a Province among the ancient *Persians*. King *Darius* usually walked attended by his principal Lords, and *Satrepæ*. *Q. Curtius*. The Kingdom was divided into *Satrapies*, or Jurisdictions of *Satrapæ*. The Word is originally *Persian*, signifying, strictly, *Admiral* or *Commander* of a *Naval Army*, but was afterwards used indifferently for all Governors of Provinces; in which Sense it was borrowed by the *Greeks*, who used σατράπης in the same Signification. We also find the Word used in some ancient *English* Charters of King *Etheldred*, where the Lords, who sign next after the Dukes, take the Title of *Satrapes* of the King. *Du Cange* takes the Word here to signify *Ministers* of the King.

SATTIN, or *Satten*, a kind of Silken Stuff very smooth, and shining, the Warp whereof is very fine, and stands out; the Woof coarser, and hid underneath: Whence it is it receives that Gloss, which is its Beauty, and which gives it its Price. There are *Sattins* quite plain, others wrought; some flowered with Gold, or Silk, others striped, &c. All the Changes in the Fashions of *Sattins* are made by adding new Warps or Woofs.

The finest *Sattins* are those of *Florence* and *Genoa*; yet, the *French* will not allow those of *Lyons* any thing inferior thereto.—— The *Sattins* of *Bruges* have their Warp of Silk, and their Woof of Thread. *Indian Sattins*, or *Sattins* of *China*, are Silken Stuffs, much like those manufactured in *Europe*. Of these, some are plain, either white, or of other Colours, others worked, either with Gold, or Silk, flowered, damasked, striped, &c. They are mostly valued, because of their Cleaning, and Bleaching easily, without losing any thing of their Lustre. In other Respects they are inferior to those of *Europe*. F. *le Compte* observes, That the *Chinese* prepare their *Sattins* in Oil, to give them the greater Lustre; but this makes the Dust liable to hang to them. *Menage* derives the Word from the *Latin Seta*, as who should say, *Setinam*, or from the *Hebrew Sadin*, signifying the same thing; or from the old *French Sade* and *Sadinet*, handsome, gentile.

SATTINET, or SATTINADE, a very slight, thin Sattin, chiefly used by the Ladies for *Summer* Night-gowns, &c. and ordinarily striped. The Word is a Diminutive of *Satten*.

SATURANTIA, is sometimes used in the same Sense as *Absorbent*: Which see.

SATURDAY-STOP, a Space of Time, in which of old it was not lawful to take *Salmons*, in the North, *viz.* From Even song on *Saturday*, till Sun-rising on *Monday*.

SATURN, in Astronomy, one of the primary Planets, being the furthest from the Earth, and the Sun, and that whose Motion is the slowest: Thus characteriz'd ♄. It shines but with a feeble Light, by reason of its Distance, on which Account, though the biggest of all the Planets, it appears the least. See PLANET.

The Period of *Saturn*, or the Space of Time wherein he revolves round the Sun, which makes his Year, according to *Kepler*, is 29 Years, 174 Days, 4 Hours, 58 Minutes, 25 Seconds, and 30 Thirds, whence his Diurnal Motion must be 2 Minutes, 0 Seconds, 36 Thirds. Tho' *de la Hire* makes his Diurnal Motion 2 Minutes 1 Second. See REVOLUTION. The Inclination of his Plane to that of the Ecliptick, *Kepler* makes 2°. 32′, *De la Hire*, 2°. 33′. See INCLINATION. Its mean Distance from the Sun is 326925 Semi-diameters of the Earth; and from the Earth 210000 of the same: See DISTANCE. Its smallest Diameter, according to *Huygens*, is 30 Seconds. The Proportion of its Diameter to that of the Earth, as 20 to 1; of its Surface to that of the Earth, as 400 to 1; of its Solidity to that of the Earth, as 1 to 8000. See DIAMETER. Dr. *Halley* observes, in the Preface to his Catalogue of the Southern Stars, That he has found *Saturn* to have a slower Motion than is assigned him in the Tables: This Irregularity, we may hope, is abundantly rectified in his own Tables now in the Press. 'Tis doubted whether or no *Saturn*, like the other Planets, revolves on his *Axis*: It does not appear from any Astronomical Observations that he does; and there is one Circumstance that should seem to argue the contrary, *viz.* That whereas the Earth, and other Planets, which we know do revolve on their Axes, have their Equatorial Diameter greater than their Polar, nothing like this is observed in *Saturn*. See EARTH.

The Distance of *Saturn* from the Sun being ten times greater than that of the Earth from the same, 'tis found, that the apparent Diameter of the Sun seen from him, will not exceed 3 Minutes, which is but little more than twice the Diameter of *Venus*. The Sun's Disk, therefore, to an Inhabitant of *Saturn*, will appear 100 times less than it does to us, and both its Light and Heat be diminished in the same Proportion. See SUN.

The Phases of *Saturn* are very various and extraordinary, and long perplexed the Astronomers, who could not divine the Meaning of such Irregularity: Thus *Hevelius* observed him to be sometimes Monospherical, sometimes Trispherical, Spherico-ansated, Elliptico-ansated, and Spherico-cuspidated. But *Huygens* plainly shews, That all these monstrous Appearances are owing to the Imperfection of the Telescopes that Author had used. *Huygens*, upon observing him very attentively with much better Glasses, reduced all his Phases to three Principal ones, *viz.* Round, Brachiated, and Ansated. See PHASES.

One Thing *Saturn* has peculiar to himself, *viz.* A Ring which surrounds his middle like an Arch, or like the Horizon of a Globe, without touching him any where; the Diameter thereof more than double that of the Planet which it surrounds; The former containing 45 Diameters of the Earth, the latter only 20. When raised enough to be out of the Shadow of the Body of *Saturn*, it reflects the Light of the Sun very strongly. The Thickness of the Ring, Dr. *Keill* observes, takes up one half of the Space between its outer or convex Surface, and the Surface of the Planet. This Ring is found to be an opaque, solid, but smooth, and even Body 'Twas *Galilæo* first discovered that the Figure of *Saturn* was not round; But 'twas *Huygens* first found that its Inequality was in Form of a Ring; the Discovery of which he published in 1659, in his *Systema Saturnianum*. 'Tis doubted whether or no the Ring revolves round the Planet: Its Use and Design are still a Mystery. For its Phænomena, &c. see RING.

Saturn performs his Course round the Sun, attended with five *Satellites*, or Secondary Planets; the Periods, Distances, &c. whereof, see under SATELLITES.

SATURN, in Chymistry, signifies Lead, in regard that Metal is supposed to lie immediately under the Influence of this Planet. See LEAD; Where the several Preparations thereof are described

SATURN, in Heraldry, the Black Colour in the Coats of Arms of Soveraign Princes: answering to *Diamond* in the Coats of Noblemen; and *Sable* in those of Gentlemen. See SABLE.

SATURNALIA, in Antiquity, Feasts celebrated among the *Romans*, in Honour of the God *Saturn*: They held three Days, beginning on the 16th, others say, the 17th, and others the 18th Day of *December*. During the Solemnity the Slaves were reputed Masters; they were allowed to say any thing; and, in fine, were served at Table by the Masters themselves. Every thing run into Debauchery and Dissoluteness, and nothing was heard or seen in the City of *Rome*, but the Din, Riot, and Disorder, of a People wholly abandoned to Joy and Pleasure. M. *Dacier* observes, That the *Saturnalia* were not only celebrated in Honour of *Saturn*, but also to keep up the Remembrance of the Golden Age, when all the World was on a Level. 'Twas a Piece of Religion not to begin any War, or execute any Criminal during this Feast. The *Saturnalia* were not only held at *Rome*, but also in *Greece*; and were, in reality, much older than *Rome* it self. Some ascribe their Institution to the *Pelasgi*, who were cast upon the Island of *Delos*; others to *Hercules*, and others to *Janus*. *Goropius Becanus* makes *Noah* the Author of them. *Orig. lib.* 4. That Patriarch, he tells us, in the *Ark*, instituted a Feast to be held in the Tenth Month, in Memory of this, That in that Month, the Tops of the Mountains began to appear above the Water; and this he makes the Origine of the *Saturnalia*: But 'tis very

very probable the Year then begun in *Autumn*, and of conſequence *December* could not be the Tenth Month. *Voſſius* goes ſtill higher, and will have it, that the *Saturn*, in Honour of whom this Feaſt was inſtituted, was *Adam*.

SATURNINE, a Term applied to Perſons of dark, ſullen, melancholic Complections; as being ſuppoſed under the Predominancy of *Saturn*, or at whoſe Births *Saturn* was the Aſcendant.

SATURNINIANS, or *Saturnilians*, a Sect of ancient *Gnoſticks*, thus called from their Chief *Saturnil* or *Saturnin*, a Diſciple of *Menander*, a famous Gnoſtic. *Saturnil* taught the ſame Errors with his Maſter, in *Syria*. See MENANDRIANS.

SATYR, in the Heathen Theology, a fabulous Demi-God, who with the *Fauns*, and *Sylvans*, preſided over Groves, and Foreſts, under the Direction of *Pan*. The *Satyrs* were painted half Men, half Goats. The upper Part was Human, excepting for Horns on the Head: The lower Brutal, with the Tail and Legs of a Goat: The Whole cover'd with Hair. The Word is uſually derived from *Sathin*, which, in the antient *Greek*, ſignified the virile Member; theſe Deities being ſuppoſed much addicted to Laſciviouſneſs.

The Poets uſually confound the *Satyrs*, *Sylvans*, *Fauns*, and *Panes:* See each under its proper Article. *Nonnus* in his *Dionyſiaca*, makes the Satyrs the Offspring of *Mercury*, and a Doric Nymph, call'd *Iptitime*, and gives us the Names of ſeveral, *viz. Pæminius*, *Thyeſus*, *Hypſichorus*, *Oriſtas*, *Apæus*, *Phlegræus*, *Lycon*, &c. *Memnon*, in his Book againſt the Tyrants of *Heraclea*, derives the *Satyrs* from *Bacchus*, and a *Naiad*, called *Nicæa*.

SATYRA, or rather *Satira*, a Satyr: It is a Word that ſignifies all manner of Diſcourſe, wherein any Perſon is reprehended. But a *Satyr* is commonly meant of a Poem, that wittily reproves Men's Vices: *Caſaubon* makes a Diſtinction between the Satyrical Poetry of the *Greeks*, and the *Satyr* of the *Romans*, which was peculiar to themſelves only, and this is juſtified by *Quintilian*, l. 1. c. 10. *Satira quidem tota noſtra eſt*, for which Reaſon *Horace* calls it, *Græcis intactum Carmen*; a ſort of Poetry unknown to the *Greeks:* See *Caſaubon* on the Word. A *Satyr* ought to be lively, pleaſant, moral, and full of Variety, wherein *Juvenal* and *Horace* excelled, though their *Satyrs* ought to be read with Caution.

SATYRION, a Root called by this Name, becauſe of its fancied Promotion of Luſt: *Dioſcorides* diſtinguiſheth this from the *Orchis*, but Mr. *Dale* ranks it under that Tribe. It paſſeth for a great Cordial and Reſtorer; but its Shape, reſembling an Human *Penis*, ſeems to be the only Foundation for the Whimſey of making it a Provoker to Venery, and to forward Conception.

SAVAGES, or *Salvages*, wild, barbarous People, without any fix'd Habitation, Religion, Law or Policy: A great Part of *America* is peopled with *Savages*. Many, ſome ſay moſt, of the *Savages* are *Anthropophagi*. The Word is form'd from the *Italian Salvagio*, of *Salveticus* or *Silvaticus*, which we find uſed in the barbarous *Latin* for *Silveſtris*.

SAUCISSON, in Fortification, a kind of Faggot made of thick Branches of Trees, or of the Trunks of Shrubs bound together; the Uſe whereof is to cover the Men, and to ſerve as Epaulements. It differs from a Faſcine, which is only made of the ſmall Branches, and by its being bound at both Ends, and in the Middle. Anciently they made it 46 Foot long, and 15 Foot thick; ſince, 'tis uſually 23 Foot long, and 12 thick; bound ſtrongly together with three Bands furniſh'd with Iron. The Word is *French*, and ſignifies literally, a big Sauſage.

SAVER-DE-FAULT, in Law, to excuſe a Fault; which is properly when a Man having made Default in Court, comes afterwards, and alledges good Cauſe why he did it; as Impriſonment at the Time, or the like.

SAVIOUR. *Order of St. Saviour*, is a religious Order founded by St. *Bridget*, about the Year 1344, thus called from an Opinion, that Chriſt himſelf, the *Saviour of the World*, preſcribed the Rules and Conſtitutions thereof. They are alſo called, from their Foundreſs, *Bridgetins*. Their Origine was thus: *Wilphon* Prince of *Nericia*, to whom St. *Bridget* had been married, being dead at *Arras*, in his Return from *Galicia*, the Widow thought of nothing but devoting herſelf to a religious Life, and accordingly, ſoon after, built the Monaſtery of *Weſtern* in the Dioceſe of *Lincopen* in *Sweden*, where ſhe entred herſelf. By the Conſtitutions of this Order, 'tis to be principally appointed for Women, who are to pay a particular Honour and Service to the Virgin. The Monks are only to afford them the Spiritual Aſſiſtances they may need, to adminiſter them the Sacraments, &c. The Number of Nuns is fixed to Sixty in each Monaſtery, and that of Monks to Thirteen, according to the Number of Apoſtles, whereof St. *Paul* makes the Thirteenth. Four of them were to be Deacons, to repreſent the Four Doctors of the Church, and Eight Converts; the whole Number making Seventy-two, the Number of the Diſciples of our Saviour. Setting aſide theſe Circumſtances, and the Habit, this Order is under the Rule of St. *Auguſtine*. It was approved of by *Urban* V. and ſeveral ſucceeding Popes. In 1603, *Clement* VIII. made ſome Alterations in it, on account of the double Monaſteries which then began to be built in *Flanders*, &c.

SAVOR. See FAST.

SAUSAGE, or *Sauciage*, a Term of ſome Significancy in Commerce. The *Sauſage* is a popular Food prepared of ſome crude Meat, uſually either Pork or Veal ſhred ſmall, ſeaſoned, and put up in a Skin, in manner of a Pudding. The moſt eſteemed Confection of this Kind, is the *Bologna Sauſage*, which is much thicker than the common one, and is made with moſt Succeſs in ſome Cities in *Italy*, particularly *Bologna*, *Venice*, &c. whence great Quantities are exported to other Places. 'Tis made of raw Pork, well beaten in a Mortar, with a Quantity of Garlic, Pepper in the Grain, and other Spices. The *Italians* are furniſh'd with a great Part of the Skins or Guts for their *Sauſages* from *England*. The Quantities of that Commodity yearly exported, are greater than one would imagine. *Menage* derives the Word from *Salcicia* for *Salcicium*.

SAUSAGE, in War, a little long Linnen-Bag, in Form of a Gut, two Inches in Diameter, dipt in Pitch and Tar, and filled with Powder, having a ſlow Fuſee faſten'd thereto, to ſerve as a Train to ſet Fire to Mines, Fougades, or Bomb-Cheſts, being made to reach into the Chamber of the Mine. Two of theſe *Sauſages* are commonly applied to every Mine, to the End, that if one ſhould fail, the other may take Effect. See MINE.

SAUT, in the Manage. See SALTS.

SAW, an Inſtrument ſerving to cleave, or divide into Pieces, divers ſolid Matters, as Wood, Stone, Marble, Ivory, &c. The *Saw* is one of the moſt uſeful Machines, in the Mechanic Arts, ever invented. The Fable, which is perhaps founded on ſome ſurer Tradition, attributes the Invention thereof to *Icarus*, who, vying with his Father *Dedalus*, enrich'd the riſing Arts with ſeveral Diſcoveries. 'Tis added, he firſt contrived it on the Model of the Spine or Backbone of a fiat Fiſh, ſuch as the Soal. The *Saw* is made of Steel with Teeth, but thoſe differently filed, and turned, according to the Uſe it is deſigned for. There are alſo Saws without Teeth, uſed in the ſawing of Marbles and other Stones.

The beſt *Saws* are of Steel, ground bright and ſmooth; thoſe of Iron are only Hammer-hardned: Hence, the firſt, beſides their being ſtiffer, are likewiſe found ſmoother than the laſt. They are known to be well hammer'd by the ſtiff bending of the Blade; and well or evenly ground, by bending equally into a Bow. The Edge, wherein the Teeth are, is always thicker than the Back, in regard the Back is to follow the Edge. The Teeth are cut and ſharpened by a Triangular File, firſt fixing the Blade of the *Saw* in a Whetting-block. When filed, the Teeth are to be *ſet*, that is, to be turned a-skew, or out of the right Line, to make the wider Kerf or Fiſſure, that the Back may follow the better: This is done by putting an Inſtrument, called a *Saw wreſt*, between every other two Teeth, and giving it a little Wrench, which turns one of the Teeth a little towards you, and the other a little from you. The Teeth are always ſet ranker for coarſe cheap Stuff, than for hard and fine, in regard the ranker the Tooth is ſet, the more Stuff is loſt in the Kerf; and if the Stuff be hard, the greater the Labour of ſawing it.

The Workmen who make the greateſt Uſe of the *Saw*, are, The Sawyers, Carpenters, Joiners, Eboniſts, Stone-Cutters, Carvers, Sculptors, &c. The Lapidaries too have their *Saw*, as well as the Workers in *Moſaick*, but theſe bear little Reſemblance to the common *Saws*. See LAPIDARY and MOSAICK Work.

But of all Mechanicks, there are none have ſo many as the Joiners, nor ſo many different Kinds. The chief are as follow. The *Pit-Saw*, a large two-handed *Saw*, uſed to ſaw Timber in Pits. 'Tis ſet rank for coarſe Stuff, ſo as to make a Kerf or Fiſſure of almoſt a Quarter of an Inch; but for finer Stuff, finer. The *Whip-Saw*, which is likewiſe two handed, uſed to ſaw ſuch large Pieces of Stuff as the *Hand-Saw* will not eaſily reach.—— The *Hand-Saw* is made for a ſingle Man's Uſe. Of theſe are various Kinds; as, The *Bow*, or *Frame-Saw*, furniſhed with Cheeks; by the twiſted Cord and Tongue in the Middle thereof, the upper Ends are occaſionally drawn cloſe together, and the lower ſet the further apart.—— The *Tenant-Saw*, which being very thin, has a Back to keep it from bending.—— The *Compaſs-Saw*, which

which is very ſmall, and its Teeth, uſually, not ſet; its Uſe is to cut a round, or any other Compaſs-Kerf: Hence, the Edge is made broad, and the Back thin, that it may have a Compaſs to turn in.

The Chirurgeons likewiſe uſe a *Saw*, to cut off Bones: 'Tis to be very ſmall, and light, in order to be managed with the more Eaſe and Freedom. The Blade exceedingly fine, and the Teeth exquiſitely ſharpened, to make its Way more gently, and yet with more Expedition in Amputations of Legs, Arms, &c.

The *Saw* is alſo a Gardener's Inſtrument, uſed in the pruning of Trees, &c. 'Tis chiefly applied in the cutting of old, dry, and, conſequently, hard Woods, whether Roots or Branches, which might ſpoil the Pruning-Knife; and big Branches, &c. which the Knife could not well take off at one Stroke. Except on theſe Occaſions, *Quinteney* will have us always uſe the Knife.

SAWING, the Application of the *Saw*, in the dividing of Timber, &c. into Boards, &c. See SAW. There are Wind-mills, and Water-mills, which do the Office of *Sawing* Wood, with infinitely more Expedition and Eaſe than 'tis done by the Hand: They conſiſt of ſeveral parallel Saws, which riſe and fall perpendicularly, by means of one of the grand Principles of Motion. But a very few Hands are here needed, *viz.* only to puſh along the Timber, which are laid on Rollers, or ſuſpended by Ropes, in Proportion as the *Sawing* advances. Theſe are frequently found abroad, and were lately begun to be introduced in *England*; but the Parliament, in Conſideration of this, that they would ſpoil the Sawyers Trade, and ruin great Numbers of Families, thought fit to prohibit them.

M. *Felibien*, in his Principles of Architecture, &c. mentions a Kind of long *Saws*, invented by one *Miſſon* Inſpector of the Marble Quarries in the *Pyreneans*, by means whereof Stones are ſawed even in the Rock itſelf whence they are taken. He adds, That ſome of them are twenty-three Foot long, but does not deſcribe either their Form or Application: He only ſays, They are of Iron, without Teeth.

SAXIFRAGE, a Medicinal Plant thus called from its ſuppoſed Virtue in diſſolving the Stone in the Bladder, from the *Latin Saxum, & Frango*, I break. Its Leaves are almoſt round, indented, fat and ſhining, like thoſe of Ivy. In the Middle of the Leaves riſe Stalks, about a Foot high, which, at their Extremities, bear little white Flowers, conſiſting of five Leaves, diſpoſed in Form of a Roſe. Its Seed, which is very ſmall, is incloſed in the *Capſula* of a roundiſh Pod. Its Root divides itſelf into ſeveral Fibres, at the Bottom whereof are found little reddiſh Tubercles, like *Coriander* Seed. 'Tis theſe Grains are commonly called the Seed of the *Saxifrage*, and are uſed in Medicine. The beſt manner of uſing them is to take them infuſed in White-Wine, or in a Decoction in common Water. Some uſe the Decoction of the Root itſelf: 'Tis held a great Diuretick. Dr. *Quincy* obſerves, That its Lithontriptic Vertue is but little ſeen in Practice. He adds, That the Simple Water thereof, ſold in the Shops, is good for nothing; the Virtue of the Plant, if it have any, conſiſting in ſomething too groſs to riſe over the Helm. Some take it to derive its Name from its growing in the Clefts of Rocks, which it ſeems to pierce through.

SAXON LANGUAGE. See ENGLISH.

SAY, or *Saye*, in Commerce, a kind of Serge, or a very light, croſs'd Stuff, all Wooll, much uſed abroad for Linings, and by the Religious for Shirts; and with us, by the Quakers, for Aprons, for which Purpoſe 'tis uſually green. There are very conſiderable Manufactures hereof at *Sedbury*, near *Colcheſter*; at *Ypres*, *Houdſcot*, &c. in *Flanders*, &c. Thoſe made in *England*, are chiefly exported to *Portugal*, and *Leghorn*.

SAYETTE. See SAGATHEE.

SCABELLUM, in the ancient Architecture, a kind of Pedeſtal, uſually ſquare, ſometimes polygonous, very high and ſlender, commonly terminating in a kind of Sheath or Scabbard, or profiled in manner of a Balluſter. Its Uſe is to bear *Buſto's*, *Relivo's*, &c.

SCABIES, in Medicine. See ITCH.

SCABIOUS, a Medicinal Plant, very common in the Fields, and flowers in *July*. It has a great Character amongſt many Diſpenſatory Writers, but ſeems to grow much out of uſe to what it has been: It paſſes for a very great Pectoral, and to do great Things in Aſthma's and Pleuriſies, and *Etmuller* gives it the Pre-eminence in inward Abſceſſes. It hath a Place alſo amongſt the *Alexipharmicks*. But hardly any thing is in better Eſteem for the Itch, and other cutaneous Foulneſſes; whence it has its Name, *viz.* from *Scabies*, Itch, and upon which Account it is often met with in Decoctions, and ſometimes in a Syrup, among ſuch as are called Sweetners. Some call it the *Widow's Flower*.

SCAFFOLD, a Timber-Work, raiſed in manner of an Amphitheatre to place Spectators upon for the commodious viewing of ſome Shew or Ceremony.—— The Word is alſo uſed for a little Stage, or Theatre, raiſed in ſome publick Place, to execute Criminals upon, either by beheading or breaking upon the Wheel.—— Alſo for an Aſſemblage of Planks and Boards ſuſtained by Treſſels, or by Pieces of Wood fixed in the Wall, whereon Maſons, Sculptors, Painters, &c. ſtand to work in high Places, Wells, Ceilings, &c. *Menage* derives the Word from the *German Schawhauſzch*, and *Guyet* derives it from the *Italian Catafalco*, which ſignifies the ſame thing. *Du Cange*, from *Eſchafaudus*, a Word in the corrupt *Latin*, ſignifying a Tribunal or Pulpit. He adds, That it might come from *Cata*, a Wooden Machine uſed to carry Earth to fill up Ditches, and carry over the Soldiers to the Attack; whence the *Italians* formed their *Catafalco*, the old *French* their *Chafaut*, and the *Engliſh* their *Scaffold*.

SCALA, in Anatomy, the Canal or Cochlea of the Ear is divided by a Septum into two Canals called *Scalæ*; whereof the one, looking towards the Tympanum, is called the *Scala Tympani*; the other, having a Communication with the Veſtibulum, is called the *Scala Veſtibuli*. See EAR.

SCALA, in the Ancient Architecture, is what in the Modern we call a Stair-caſe. See STAIR-CASE.

SCALADO, or *Scalade*, an Aſſault made on a City, to be ſurprized, by mounting the Walls thereof with Scaling-Ladders. Cities are now no longer taken by *Scalade*, ſince the Walls have been flank'd.

SCALE, in Muſick, a Series of Sounds riſing or falling towards Acuteneſs or Gravity, from any given Pitch of Tune to the greateſt Diſtance that is fit or practicable, through ſuch intermediate Degrees as makes the Succeſſion moſt agreeable and perfect, and in which we have all the harmonical Intervals moſt commodiouſly divided. This *Scale* is otherwiſe called an *Univerſal Syſtem*, as including all the particular Syſtems belonging to Muſick. See SYSTEM.

Origin and Conſtruction of the SCALE *of Muſick.*

Every Concord or harmonical Interval, is reſolvable into a certain Number of Degrees or Parts; the Octave, for Inſtance, into three greater Tones, two leſs Tones, and two Semi-Tones; the greater Sixth, into two greater Tones, one leſs Tones, and two Semi-Tones; the leſs Sixth, into two greater Tones, one leſs Tone, and two Semi-Tones; the Fifth, into two greater Tones, one leſs Tone, and one Semi-Tone; the Fourth, into one greater Tone, one leſs Tone, and one Semi-Tone; the greater Third, into one greater Tone, and one leſs Tone; and the leſs Third, into one greater Tone, and one leſs Tone. 'Tis true, there are Variety of other Intervals or Degrees, beſides greater Tones, leſs Tones, and Semi-Tones, into which the Concords may be divided; but theſe three are preferred to all the reſt, and theſe alone are in Uſe: For the Reaſon whereof, ſee TONE. Further, 'Tis not any Order, or Progreſſion, of theſe Degrees, that will produce Melody: A Number, for Inſtance, of greater Tones will make no Muſick, becauſe no Number of them is equal to any Concord, and the ſame is true of the other Degrees: There is a Neceſſity, therefore, of mixing the Degrees to make Muſic, and the Mixture muſt be ſuch, as that no Two of the ſame Kind be ever next each other A natural and agreeable Order of theſe Degrees Mr. *Malcolm* gives us in the following Diviſion of the Interval of an Octave; wherein, (as all the leſſer Concords are contained in the greater) the Diviſions of all the other ſimple Concords are contained. Under the Series are the Degrees between each Term, and the next. In the firſt Series, the Progreſſion is by the leſs Third; in the latter, by the greater Third.

Now, the Syſtem of Octave, containing all the Original Concords; and the Compound Concords being only

the Sum of Octave and ſome leſs Concord; 'tis evident, That if we would have the Series of Degrees continued beyond Octave, they are to be continued in the ſame Order through a Second as through the Firſt Octave, and ſo on through a Third and Fourth Octave, &c. and ſuch a Series is what we call the *Scale of Muſick*. Whereof there are two different Species; according as the leſs or greater 3d. or the leſs or greater 6th. are taken in; for both can never ſtand together in relation to the ſame Key or Fundamental, ſo as to make a harmonical Scale. But if, either of theſe Ways, we aſcend from a Fundamental or given Sound, to an Octave, the Succeſſion will be melodious; tho' the Two make two different Species of Melody. Indeed, every Note is Diſcord with regard to the next; but each of them is Concord to the Fundamental, except the 2d and 7th. In continuing the Series, there are two Ways of compounding the Names of the ſimple Interval with the Octave. Thus: A greater or leſſer Tone or Semi-tone above an Octave, or two Octaves, &c. or to call them by the Number of Degrees from the Fundamental, as 9th, 10th, &c. In the two *Scales* above, the ſeveral Terms of the *Scale* are expreſſed by the proportionable Sections of a Line, repreſented by 1, the Key or Fundamental of the Series: If we would have the Series expreſſed in the whole Numbers; they will ſtand as follows; in each whereof, the greateſt Number expreſſes the longeſt Chord, and the other Numbers the reſt in Order: So that if any Number of Chords be in theſe Proportions of Length, they will expreſs the true Degrees and Intervals of the *Scale* of Muſick, as contained in an Octave concinnouſly divided in the Two different Species abovementioned.

This *Scale* the Ancients called the *Diatonic* Scale, becauſe proceeding by Tones and Semi-tones. See DIATONIC. The Moderns call it, ſimply, *The Scale*, as being the only one now in Uſe; and ſometimes *The natural Scale*, becauſe its Degrees and their Order are the moſt agreeable and concinnous, and preferable, by the Conſent both of Senſe and Reaſon, to all other Diviſions ever inſtituted. Thoſe others, are the *Chromatic* and *Enharmonic Scales*, which, with the *Diatonic*, made the Three *Scales* or *Genera* of Melody of the Ancients. See GENERA: See alſo ENHARMONIC and CHROMATIC.

Office and Uſe of the SCALE *of Muſick.*

The Deſign of the *Scale* of Muſick, is, To ſhew how a Voice may riſe and fall, leſs than any harmonical Interval, and thereby move from the one Extreme of any Interval to the other, in the moſt agreeable Succeſſion of Sounds. The *Scale* therefore, is a Syſtem, exhibiting the whole Principles of Muſick; which are either harmonical Intervals (commonly called *Concords*) or *Concinnous Intervals*; the firſt are the eſſential Principles, the others, ſubſervient to them, to make the greater Variety. See CONCORD and INTERVALS. Accordingly, in the *Scale*, we have all the Concords, with their concinnous Degrees, ſo placed, as to make the moſt perfect Succeſſion of Sounds from any given Fundamental or Key, which is ſuppoſed to be repreſented by 1. 'Tis not to be ſuppoſed, that the Voice is never to move up and down by any other more immediate Diſtances than thoſe of the concinnous Degrees: For though that be the moſt uſual Movement, yet to move by harmonical Diſtances, as Concords at once, is not excluded, but is even abſolutely neceſſary. In effect, the Degrees were only invented for Variety ſake, and that we might not always move up and down by harmonic Intervals, though thoſe are the moſt perfect; the others deriving all their Agreeableneſs from their Subſerviency to them. See DIASTEM. And that, beſides the harmonical and concinnous Intervals, which are the immediate Principles of Muſick, and are directly applied in Practice; there are other diſcord Relations, which happen unavoidably in Muſick, in a kind of accidental and indirect Manner: For, in the Succeſſion of the ſeveral Notes of the *Scale*, there are to be conſidered not only the Relations of thoſe that ſucceed others immediately; but alſo of thoſe betwixt which other Notes intervene. Now the immediate Succeſſion may be conducted ſo, as to produce good Melody; and yet among the diſtant Notes there may be very groſs Diſcords, that would not be allowed in immediate Succeſſion, much leſs in Conſonance. Thus in the firſt Series, or *Scale* above-delivered, though the Progreſſion be melodious, as the Terms refer to one common Fundamental, yet are there ſeveral Diſcords among the mutual Relations of the Terms; *e.gr.* from 4th to 7th is 32 : 45, and from the greater 2d to the greater 6th is 27 : 40, and from the greater 2d to 4th is 27 : 32, which are all Diſcords; and the ſame will happen in the ſecond Series. See DISCORD.

From what we have obſerved here, and under the Article KEY, it appears, That the *Scale* ſuppoſes no determinate Pitch of Tune; but that being aſſign'd to any Key, it marks out the Tune of all the reſt, with relation to it, ſhews what Notes can be naturally joyned to any Key, and thereby teaches the juſt and natural Limitations of Melody: And when the Song is arrived through ſeveral Keys, yet 'tis ſtill the ſame natural *Scale*, only applied to different Fundamentals. If a Series of Sounds be fixed to the Relations of the *Scale*, 'twill be found exceedingly defective; but this Imperfection is not any Defect in the *Scale*, but follows accidentally from its being confined to this Condition, which is foreign to the Nature and Office of the *Scale* of Muſick.

This is the Caſe in muſical Inſtruments; and in this conſiſts their great Deficiency. For, ſuppoſe a Series of Sounds, as thoſe of an Organ or Harpſicord, fixed in the Order of this *Scale*, and the loweſt taken at any Pitch of Tune; 'tis evident, 1°. that we can proceed from any Note, only by one particular Order of Degrees: Since from every Note of the *Scale* to its Octave, is contained a different Order of the Tones and Semi-tones. Hence, 2°. we cannot find any Interval required from any Note upwards or downwards; ſince the Intervals from every Note to every other, are alſo limited. And hence, 3°. a Song may be ſo contrived, that, beginning at a particular Note of the Inſtrument, all the Intervals, or other Notes, ſhall be found exactly on the Inſtrument or in the fixed Series; yet were the Song, though perfectly *Diatonic*, begun in any other Note, it would not proceed. In effect, 'tis demonſtrable, there can be no ſuch thing as a perfect *Scale* fixed on Inſtruments, *i. e.* no ſuch *Scale* as from any Note upwards or downwards, ſhall contain any harmonical or concinnous Interval required. The only Remedy for this Defect of Inſtruments whoſe Notes are fixed, muſt be by inſerting other Notes and Degrees betwixt thoſe of the *Diatonic* Series. Hence ſome Authors ſpeak of dividing the Octave into 16, 18, 20, 24, 26, 31, and other Number of Degrees; but 'tis eaſy to conceive, how hard it muſt be to perform on ſuch an Inſtrument. The beſt on't is, we have a Remedy on eaſier Terms: For a *Scale* proceeding by Twelve Degrees, that is, Thirteen Notes, including the Extremes, to an Octave, makes our Inſtruments ſo perfect, that we have little Reaſon to complain. This, then, is the preſent *Scale* for Inſtruments, *viz.* Between the Extremes of every Tone of the natural *Scale* is put a Note, which divides it into two unequal Parts, called Semi-tones; whence the whole may be called the *Semitonic Scale*; as containing Twelve Semi-tones betwixt Thirteen Notes, within the Compaſs of an Octave. And to preſerve the *Diatonic* Series diſtinct, theſe inſerted Notes take either the Name of the natural Note next below, with the Mark ♯ called a *Sharp*; or the Name of the natural Note next above, with this Mark ♭ called a *Flat*. See FLAT and SHARP: See alſo SEMI-TONE.

For the *Scale* of *Semi-tones* — See — SEMITONIC SCALE.
For *Guido*'s *Scale*, commonly called the *Gamut* — See — GAMUT.
For the *Scale* of the Ancients, commonly called the *Diagram* — See — DIAGRAM.

SCALE, a Mathematical Inſtrument, conſiſting of one or more Lines drawn on Wood, Metal or other Matter, divided into equal or unequal Parts, of great Uſe in laying down Diſtances in Proportion; or in meaſuring Diſtances already laid down.

There are *Scales* of ſeveral Kinds, accommodated to the ſeveral Uſes: The principal are the *Plain Scale*, the *Diagonal Scale*, *Gunter*'s *Scale*, and the *Plotting Scale*.

Plain Scale, is made, by dividing a Line, as A B (Tab. Geometry Fig.) into any Number of equal Parts, *e. gr.* 5 or 10, and then ſubdividing one of them, as *a b*, into 10 leſs Parts. This done, if one of the larger Diviſions repreſent 10 of any Meaſure; *e. g.* 10 Miles, 10 Chains, 10 Poles, 10 Feet or 10 Inches; each of the leſſer will repreſent One Mile, or One Chain, Pole, Foot or Inch. The Uſe of this *Scale* is very obvious, *exemp. gr.* To lay down a Diſtance by it of 32 Miles or 32 Poles, &c. I take in my Compaſſes the Interval of three of the larger Diviſions, which contain 30, and two of the ſmaller,

ſmaller, for the two odd Ones: This Diſtance drawn on Paper, will contain 32 by the *Scale*. Again, Were I required to meaſure any Line by a given *Scale*: Taking the Length of the Line in my Compaſſes, I apply one Foot in one of the great Diviſions of the *Scale*, ſo as the other may reach over among the leſſer; then the Number of great and ſmall Diviſions intercepted between the Points, give the Number of Miles, &c. See the Uſe hereof further illuſtrated under the Article PLOTTING SCALE.

Diagonal Scale - - - - -
Gunter's Scale - - - - - } See { DIAGONAL. GUNTER.
Plotting Scale - - - - - { PLOTTING SCALE.

SCALE, in Geography and Architecture, a Line divided into equal Parts, placed at the Bottom of a Map or Draught, to ſerve as a common Meaſure to all the Parts of the Building, or all the Diſtances and Places of the Map. In Maps of large Tracts, as Kingdoms and Provinces, &c. the *Scale* uſually conſiſts of Miles; whence it becomes denominated A *Scale of Miles*. In more particular Maps, as thoſe of Manors, &c. the *Scale* is uſually of Chains ſub-divided into Poles or Links. The *Scales* uſed in Draughts of Buildings, uſually conſiſt of Modules, Feet, Inches, Palms, Fathoms or the like. To find the Diſtance between two Towns, &c. in a Map, the Interval is taken in the Compaſſes, and ſet off in the *Scale*, and the Number of Diviſions it includes, gives the Diſtance. See MAP. To find the Height of a Story in a Deſign, the ſame Method is uſed. See DESIGN.

A *Front Scale* in Perſpective, is a right Line in the Draught, parallel to the Horizontal Line; divided into equal Parts, repreſenting Feet, Inches, &c. A *Flying Scale* is a right Line in the Draught, tending to the Point of View, and divided into unequal Parts, repreſenting Feet, Inches, &c.

SCALENUM, or *Scalenous* Triangle, in Geometry, a Triangle, whoſe Sides and Angles are all unequal. See TRIANGLE. A Cylinder, whoſe Axis is inclined, is alſo ſaid to be *Scalenous*. The Word is form'd from the *Greek* σκαληνὸς, which ſignifies the ſame Thing; and which *Hermol* tranſlates *Scalarium*.

SCALENUS, in Anatomy, a Name given to three Pair of Muſcles, from their Form; all of them ſerving to draw the Ribs upwards, in conjunction with the *Serratis ſuperiores poſtici*, &c.

SCALENUS *Primus* ſprings, Fleſhy, from the tranſverſe Proceſſes of the Second, Third and Fourth Vertebræ of the Neck, where deſcending laterally, it is inſerted into the firſt Rib, which it helps to draw upwards.

SCALENUS *Secundus*, ariſes from the ſame Proceſſes, as likewiſe from thoſe of the Fifth Vertebra of the Neck; and is inſerted into the Second Rib, and ſometimes into the Third.

SCALENUS *Tertius*, ariſes from the ſame Proceſſes with the former, and from thoſe of the Sixth Vertebra of the Neck; and is inſerted into the Firſt Rib.

SCALPEL, in Chirurgery, a kind of Knife chiefly uſed in Diſſections; but which may be occaſionally uſed in many other Operations, as in Amputations, and to cut off the Fleſh and Membranes that are between the Two Bones of an Arm or Leg, before the Limb be ſawed off: There are two Kinds of *Scalpels*; the firſt cuts on both Sides, and is fixed in an Ebony or Ivory Handle, which being very flat and thin at the Extremity, ſerves to part the membranous and fibrous Parts in Anatomical Preparations. The other has a Back, that is, it only cuts on one Side; 'tis crooked, and very commodious for ſtripping the Fleſh off the Bones in Embalming, making Skeletons, &c. *Scultetus*, in his *Arſenal*, deſcribes ſeveral other Kinds of *Scalpels*; as, A deceitful *Scalpel*, thus called, becauſe it deceives the Patient by hiding its Blade. 'Twas much uſed by the Ancients, in opening and dilating of Sinews; but as 'tis apt to deceive the Chirurgeon himſelf, and is beſides very ſlow, 'tis better uſing a Syringotomus: A *Scalpel*, ſharp on both Sides for Setons. A little crooked *Scalpel* for ſeparating the Coherence of the Eyelids. A ſharp, double-cutting *Scalpel*, with a Bone-Handle, for the cutting off an Ægilops. *Scalpels* like Scolopomachairions, &c. even the Scolopomachairion itſelf is a kind of *Scalpel*. See SCOLOPOMACHAIRIONS.

SCALPER, *Scalprum*, or Scalping-Iron, a Surgeon's Inſtrument uſed to raſp, and ſcrape foul, carious Bones.

SCALPTOR ANI, in Anatomy. See LATISSIMUS DORSI.

SCAMILLI IMPARES, in the Ancient Architecture, a Term much contended about among the Criticks; though, in effect, it ſignify no more than certain Benches, Zocco's or Blocks, ſerving to raiſe the reſt of the Members of an Order, Column, Statue or the like, and prevent their being loſt to the Eye, which may chance to be placed below their Level; or below the Projecture of ſome of the Ornaments thereof. Theſe *Scamilli* are well repreſented by the Pedeſtals of Statues.

SCAMMONY, in Pharmacy, the inſpiſſated Juice of the Root of a Plant of the ſame Name, growing in the *Levant*, particularly about *Aleppo* and St. *John de Acre*. The Juice flows from an Inciſion made in the Root; and is afterwards thickened by the Sun, as 'twas pretended, but in reality by the Fire. The Tree is much like an Ivy, its Leaves in Form of Hearts, its Flowers White, and it creeps on the Ground, or mounts on other Trees, Walls, &c. The good, genuine *Scammony* of *Aleppo*, is to be grey, tender, friable and reſinous; the Taſte bitter, and the Smell faintiſh and diſagreeable. The *Scammony* of *Smyrna* and that of the *Eaſt Indies* are leſs valued. The firſt as being more heavy, hard and black; the latter, though light, friable, &c. is in reality only a Compoſition of common Roſin with ſome other violent Purgers. *Pomet* ſhews, that both Kinds are rather Poiſons than Remedies. The true *Scammony* is one of the ſureſt Purgatives; but, at the ſame time, one of the moſt violent we have: Hence 'tis ſeldom uſed without Correcting it by ſome Preparation. From the Juice is drawn a Roſin of more Virtue than the *Scammony* itſelf. They alſo make a Syrup of it, which is found a very gentle Purgative. *Scammony* now in Uſe, muſt be very different from that of the Ancients, at leaſt in the Preparation; by reaſon the Ancients gave it in much greater Doſes: Hence *Fallopius* conjectures, the modern *Scammony* to be adulterated with Spurge. Some give the Name of *American Scammony* to *Mechoacam*. See MECHOACAM.

SCANDAL, in the Scripture Language, is any thing that may draw us aſide, or ſollicit us to Sin. In which Senſe 'tis uſed indifferently with Offence, and Stumbling-block. *Scandal* is either Active or Paſſive. An active *Scandal* is a real Induction to Sin; a paſſive *Scandal* is the Impreſſion an active *Scandal* makes on the Perſon induced to Sin. In the popular Language, *Scandal* is ſome Action or Opinion contrary to good Manners, or to the general Senſe of a People. The Word is form'd from the *Latin*, *Scandalum*, which, according to *Papeas*, was originally uſed for a ſudden, extemporary Quarrel, *quæ ſubito inter aliquos Scandit vel oritur*.

SCANDAL is alſo a diſadvantagious Rumor or Report; or an Action whereby any one is affronted in publick. Hence Stone of *Scandal*, *Lapis Scandali*, or *Vituperi*; a Stone raiſed in the great Portal of the Capitol in Old *Rome*; wherein was Engraven the Figure of a Lion; upon which the Ceſſionary or Bankrupt being ſeated bare-breech'd, cried with a loud Voice, *Cedo bonis*, I ſurrender my Effects; when, ſquatting his Breech violently, three Times on the Stone, he was acquitted. 'Twas called the *Stone of Scandal*, becauſe thence-forward the Ceſſionary became inteſtable, and incapable of giving any Evidence. *Julius Cæſar* introduced this Form of Surrender, after abrogating that Article of the Laws of the Twelve Tables, which allow'd the Creditors to diſmember their Inſolvent Debtors, and to take each his Member, or at leaſt to make a Slave of him.

SCANDALUM MAGNATUM, in Law, a ſpecial Name, for a Scandal or Wrong done to any high Perſonage of the Land, as Prelates, Dukes, Earls, Barons, &c. as alſo of the Chancellor, Treaſurer, Clerk of the Privy Seal, Steward of the Houſe, Juſtice of the Bench, or other great Officers of the Realm, by falſe News or Meſſages, whereby Debates and Diſcords between them and the Commons, or any Scandal to their Perſons, might ariſe; and hath given Name to a Writ granted to recover Damages thereupon.

SCANNING, in Poetry, the meaſuring of a Verſe, to ſee the Number of Feet and Syllables it contains, and whether or no the Quantities, that is the long and ſhort Syllables, be duly obſerved. The Term is chiefly uſed with regard to *Greek* and *Latin* Verſes; the Quantities not being well ſettled and obſerved in the Verſes of the Modern Languages. See QUANTITY. Hexameters are *Scanned* one Way, Jambic another, Saphics another. See HEXAMETER, &c. The Word is form'd from the *Latin*, *Scandere*, to climb.

SCANTLING, a Meaſure, Size, or Standard, whereby the Dimenſions, &c. of Things are to be determined. The Word is form'd from the *French Eſchantillon*, a Pattern or Specimen. See STANDARD.

SCAPHISM, in Antiquity, a kind of Torture or Puniſhment formerly in Uſe among the *Perſians*. It conſiſted in locking the Criminal cloſe up in the Trunk of a Tree bored to the Dimenſions of his Body, only with Five holes for his Head, Arms and Legs to come through. In this State he was expoſed to the Sun, and the Parts thus appearing anointed with Honey and Milk, to invite the Waſps and Flies. They forced him to eat abundantly, till his Excrements, cloſe pent up in the Wood, rotted his Body.

Body. Some Authors obſerve, that they ordinarily lived Forty Days in this Torment. The Invention is aſcribed to *Pariſatis* Queen of *Perſia*, and Mother of *Artaxerxes*, *Mnemon*, and the young *Cyrus*. 'Tis added, ſhe firſt ordered it to be practiſed on the Perſon who brought the Tidings of the Death of *Cyrus*. The Word is form'd from the *Greek* σκαφος of σκαφω, I hollow or dig.

SCAPHOIDES, in Anatomy, a Bone, called alſo *Naviculare*, which ſee. The Word is formed of the *Greek* σκαφη, a Boat or Bark; of σκαπτω, I hollow; becauſe Boats were originally made of Trunks of Trees hollowed, as are ſtill the Canoes of ſeveral Savages; and ειδος, Form.

SCAPULA, in Anatomy, called alſo *Omoplate* and *Blade*; a large and broad Bone, repreſenting a ſcalenous Triangle, ſituate on each Side of the upper and back Part of the *Thorax*: The Subſtance of the *Scapula* is thin, but ſolid and firm; its Outſide is ſomewhat Convex, and its Inſide Concave; its upper Edge is called *Coſta ſuperior*, and its lower, *Coſta inferior*; its broad End is called its Baſis, which, with the two Edges, make the upper and lower Angles. They have each three Proceſſes, of which the firſt runs all along the Middle of their Outſide, and it is called their *Spine*: That End of the *Spine*, which receives the Extremity of the Clavicula, is called *Acromium*. The ſecond Proceſs is a little lower than the *Acromium*; it is ſhort and ſharp, like a *Crow*'s Bill, therefore called *Coracoides*; theſe two Proceſſes are tied to one another by a ſtrong Ligament, which ſerves to keep the Head of the Humerus in the Cavity of the third Proceſs, which is called *Cervix*. This Proceſs is the Extremity of the *Scapula*, which is oppoſite to its Baſis. It has a round Sinus, tipp'd about its Brim, with a Cartilage, which receives the Head of the Humerus. The Uſe of the *Scapula* is to receive the Extremities of the Clavicula and Humerus, for the eaſier Motion of the Arm, and to give Riſe to the Muſcles, which move the Arm.

SCAPULAR, *Scapularis*, in Anatomy, an Epithet given to two Arteries, and as many Veins of the Body. The *Scapularis interna & externa*, or the inner and outer *Scapular* Arteries, ariſe out of the Subclavian, and are ſpread over the *Scapulæ*: The *Inner* and *Outer Scapular* Veins diſcharge themſelves into the Axillary, or Vein of the Arm-pits.

SCAPULARY, Part of the Habit of ſeveral Orders of Religious, wore over the Gowns, as a Badge of peculiar Veneration for the Virgin. It conſiſts of two narrow Breadths or Slips of Cloth, covering the Back and the Breaſts, and hanging down to the Feet of the profeſſed Religious, and to the Knees of the Lay-brothers, &c. The common Opinion of the Introduction of the *Scapular* is, That it was firſt given by the Virgin herſelf, in an Apparition ſhe made to *B. Stock*, General of the *Carmelites*, in the Thirteenth Century: Which Account of its Origine is aſſerted, or at leaſt ſuppoſed, in ſeveral Bulls of the Popes. *M. de Launy*, however, maintains, in an expreſs Treatiſe on the Subject, That the Apparition was falſe, and the Sabbaten Bull, which approves of the *Scapulary*, a Counterfeit. In effect, the *Carmelites* themſelves did not begin to wear the *Scapulary* till ſeveral Years after 'tis pretended the Virgin gave it to *B. Stock*. The Word is formed from *Scapula*, the Shoulder-Blade. There is alſo a Friery, or Fraternity of the *Scapulary*, conſiſting of Lay-Brothers, who profeſs a particular Devotion to the Virgin, and who, in Honour of her, wear a little *Scapulary*, in manner of a Bracelet, or otherwiſe, repreſenting the great One. They are obliged to certain Prayers, and to obſerve certain Rules in their Manner of Life.

SCAPUS, in Architecture, the Fuſt or Shaft of a Column. See FUST.

SCAPUS; in *Botany*, the ſtrait Stalk, or Stem of a Plant, ſtanding upright like a Pillar, or Column.

SCAR. See ESCHAR.

SCARIFICATION, in Chirurgery, an Operation whereby ſeveral Inciſions are made in the Skin, with an Inſtrument proper for that Purpoſe. See SCARIFICATOR. *Scarification* is chiefly practiſed in Cupping. See CUPPING. It acts by ſtimulating and evacuating. *Salmaſius* will have us write *Scarifatio*, not *Scarificatio*, in regard the Word is derived from the *Greek* σκαρφος. See his Notes on *Solinus*, where he thus corrects the reading of *Plin. Lib.* XVII. *F. Hardouin* lets the old Reading *Scarificatio* ſtand; though he owns the M.SS. have it *Scarifatio*; but adds, That *Theod. Priſcian* writes *Scarrificatio*.

SCARIFICATOR, a Chirurgical Inſtrument uſed in *Scarification*; which ſee. The *Scarificator* is made in Form of a Box, wherein are fitted 10, 12, or 15 Lancets, all perfectly in the ſame Plane; which being, as it were, *cock'd*, by means of a Spring, are all diſcharged at the ſame Time, by pulling a kind of Trigger, and driven equally within the Skin. 'Till of late, they uſed little ſharp cutting Wheels inſtead of Lancets. The Uſe of the *Scarificator* is to evacuate the Blood, and other Humours, ſpread under the Skin, by making a great Number of Apertures, or Outlets, therein; which being thus all ſtruck at once, gives much leſs Pain than when ſtruck ſucceſſively.

SCARLET, in Dying, one of the Seven Kinds of good Reds. There are two Kinds of *Scarlets*; the One given with *Scarlet Grain*, particularly called *Scarlet in Grain*, the other with *Cochineel*. See RED. See alſo COCHINEEL, &c.

SCARLET-GRAIN, a Matter uſed to dye a *Scarlet* Colour, uſually taken for the Grain of a Plant. This imaginary Grain, called by the *Arabs*, *Kermes*, is found on a kind of Holm, growing in great Plenty in the uncultivated Parts of *Provence*, *Languedoc*, *Spain* and *Portugal*. That of *Languedoc*, paſſes for the beſt, being big, and of a very bright Red; that of *Spain* is the worſt, being very thin, and of a blackiſh Red; tis to be gathered when ripe, and is only good while new, that is, within the Compaſs of the Year, after which Time a kind of Inſect is found in it, that eats out the Heart thereof. *F. Plumier* has made ſome particular Diſcoveries on the Subject of *Scarlet-Grain*. The *Arabic* Term *Kermes*, which ſignifies little Worms, he obſerves, agrees perfectly to the Nature of this Drug; which is the Work of a Worm, and not the Grain or Seed of a Tree, as is generally ſuppoſed. The Shrub 'tis found on, is the *Hexaculeate Cocci Glandifera*; on the Leaves, and little Shoots whereof, are ſeen, in the Spring Time, a kind of little Veſicle, which is at firſt no bigger than a Grain of Millet, and is occaſioned by the Puncture of an Inſect, which depoſites its Eggs therein. In Proportion as it grows, it becomes covered with a kind of Aſh-coloured Down, which hides the red Colour underneath. And when 'tis arrived at Maturity, which thoſe who gather them know very well, 'tis taken from the Tree, in Form of a little Gall. The Pod, or Skin, is very light and brittle, covered with a fine membranous Pellicle all around, except at the Place where it grows to the Leaf. A ſecond Skin, under the firſt, is full of a kind of Duſt, partly Red, and partly White. Aſſoon as the Gall is gathered, the Juice or Pulp is expreſſed from it; 'tis waſhed in Vinegar to deſtroy the little Inſect withinſide, which, without ſuch Precaution, would grow, feed on the Duſt, and, at laſt, be hatch'd, and leave no more than an empty Shell.

The *Scarlet-Grain* is alſo of conſiderable Uſe in Medicine, where 'tis better known under its *Arabic* Name of *Kermes*. See KERMES. *Menage* derives the Word from the *German Scarlak*, or the *Flemiſh Scharlaken*: Whence the *Engliſh* have form'd the *Scarlet*, the *Italians* their *Scarlato*, and the *French* their *Eſcarlate*. Others derive it from the *Celtic Squarlera*. *Dalechampius* will have it called *Scarlatum*, by Corruption, for *Caſculiatum*, a barbarous Word introduced into *Spain*; others fetch it from the *Arabic Txquer late*.

SCARLETINA FEBRIS; or Scarlet-Fever; the ſame as Purple-Fever. See PURPLE and FEVER.

SCARP, in Fortification, is the Foot of the Rampart-Wall, or the Sloping of the Wall from the Bottom of the Work to the Cordon on the Side of the Moat.

SCARPE, is a Term in Heraldry, probably derived from the *French Eſcharpe*, ſignifying the Scarf which Military Commanders wear for Ornament. It is borne ſomething like a Battoon Siniſter, but is broader, and is continued out to the Edges of the Field, whereas the Battoon is cut off at each End. He beareth Argent, a *Scarpe* Azure.

SCAVAGE, in our ancient Cuſtoms, called alſo *Schevage*, *Schewage*, and *Scheawing*, a kind of Toll or Cuſtom, exacted by Mayors, Sheriffs, &c. of Merchants-Strangers, for Wares ſhewed or offered to Sale within their Liberties. This Cuſtom is prohibited by *Stat.* 19. *Hen.* VII.

SCAVANT, or *Savant*, a Term purely *French*, ſignifying Learned; little uſed in our Language, except in the Phraſe *Journal des Scavans*, a Journal of the Works of the Learned, publiſhed Monthly at *Paris*, being the firſt Thing of that Kind, and that whereon all the reſt are founded. See JOURNAL. *Menage* derives the Word from *Sapere*, to be Wiſe, and on that Footing will have it wrote *Savant*; others from *Scire*, to know, and for that Reaſon write it *Scavant*. The latter Etymology, and Orthography, are followed by the Academy; though all the ancient M.S.S. have it *Savant*, *Savoir*, &c.

SCAVENGERS,

SCAVENGERS, two Officers chose yearly in each Parish in *London*, and the Suburbs, whose Business it is to hire Persons called *Rakers*, and Carts to cleanse the Streets, and carry away the Dirt and Filth thereof. The Word is derived from the *Dutch Schaven*, to scrape or shave away. The *Germans* call them *Dreck-simons*, from one *Simon* a famed *Scavenger* of *Marpurg*. The *Scavengers* are much the same with what were anciently called *Street-wards*.

SCENE, in the ancient Drama, in its general Sense, was the Theatre whereon Dramatic Pieces, and other publick Shews, were represented. See THEATRE. In its proper Sense, the ancient *Scene* was the Decoration of the Theatre. In the Extremity of the Theatre, were three large Gates or Openings, wherein appeared several perspective Decorations, *viz.* A Palace for Tragedies, Houses and Streets for Comedies, and Forests for Pastorals. These Decorations were all versatile, *i. e.* either they turn'd on Pivots, as described by *Vitruvius*, or trusile, *i. e.* slided along Grooves, as those in our Theatres; and as this or that Side, or Representation, was turned towards the Spectators, the *Scene* was called a *Tragic*, a *Comic*, or a *Pastoral Scene*. See STAGE. *Vitruvius* observes, That the *Scene* was properly a large Face or Front of Building, adorned with Columns and Statues, among which were three large Apertures for perspective Representations. See several curious Remarks on the ancient *Scene* in M. *Perrault*'s Notes on *Vitruvius*, lib. 5. cap. 6. According to *Rosinus*, the *Scene*, in its proper and original Sense, is a Series of Trees disposed against each other, so as to form a continued Arch, and Shade, σκια, to defend those underneath it from the Injuries of the Weather: For in such Places it was, that, in ancient Times, e'er Theatres were built, they acted their Plays. Thus also *Cassiodorus* derives the Word *Scene*, from the close Shade of the Grove, where, in the Spring Time, the ancient Shepherds used to Sing and Play.

SCENE is also used for the Place thus represented, or that where the Action is conceived to have passed. See ACTION. One of the grand Laws of the Drama, is, To observe the Unity of the *Scene*, which we more usually call the *Unity of Place*. See UNITY. In Effect, to keep close to Nature and Probability, the *Scene* should never be shifted from Place to Place, in the Course of the Play. The Ancients were pretty severe in this Respect, particularly *Terence*: In some of his Plays, the *Scene* never shifts at all, but the Whole is transacted before the Door of an old Man's House, whither, with inimitable Art, he brings all his Actors, occasionally. The *French* too are very strict in this Respect: But the *English* plead for a Dispensation from the Rule, which they think confines them to too narrow Bounds, and precludes them from that Variety of Adventures and Intrigues, which our *English* Audiences will never be satisfied without. However, the more judicious and accurate of our Writers are very moderate in the Use of this Licence, and take Care not to deviate too far from Probability, by shifting the *Scene*, between the Acts, much farther than the Persons concerned may be supposed to have passed in the Interval. Hence they seldom carry the *Scene* out of the same Town: But others, who own no Subjection to the ancient Rules, take otherguise Liberties. With some of these 'tis nothing to skip at once from *Covent-Garden* to *Peru*. The great *Shakespear* is exceedingly faulty in this Respect, in almost all his Plays.

SCENE is also a Part or Division, of a Dramatick Poem, determined by a new Actor's entering. Plays are divided into Acts, and Acts sub-divided into *Scenes*. See ACT. In most of our printed Plays, a new *Scene* is never expressed to begin, but when the Place is supposed to be changed by shifting, or drawing, the moveable *Scene*; but this must be esteemed as an Oversight. On our Stage, the *Scene* is, properly, the Persons present to, or concern'd in the Action on the Stage at such Time. Whenever, therefore, a new Actor appears, or an old one disappears, the Action is changed into other Hands, and therefore a new *Scene* then commences.

'Tis one of the Laws of the Stage, That the *Scenes be well connected*: that is, that one succeed another, in such Manner, as that the *Scene* is never quite empty till the End of the Act. The Ancients did not allow of above Three Persons on the Stage at the same Time, excepting in the *Chorus*'s, where the Number was not limited. The Moderns have but little regard to this Restriction.

SCENIC GAMES, or *Representations*. *Ludi Scenici*, among the Ancients, were Entertainments exhibited on the *Scene*, or Theatres, including what we now call *Plays*, of all Kinds, with Dancing, and other Theatrical Performances. The *Romans* were 400 Years without any *Scenic Games* at all. *Livy* observes, That they were first instituted in the Year of *Rome* 392, under the Consulate of *C. Sulpitius Pœticus*, and *C. Licinius Stolon*. But the Criticks have observed a Trip here in *Livy*; the Consulate of those Persons falling in the Year 389, which, therefore, is held the *Æra* of the Introduction of *Scenic Games*. For at the Beginning, some Actors were sent for out of *Hetruria*; who, without reciting any Thing, danced about to the Sound of Instruments; so that thus far was no more than a Ball, or rather what the *French* call a *Ballet*. At length they began to rehearse Verse: thus, by degrees, growing more and more perfect, they were at last represented with a Justness, and Magnificence, beyond any Thing the World ever saw. See THEATRE. The Fathers, in their Writings, cry out loudly against these Games.

SCENOGRAPHY, in Perspective, a Representation of a Body on a perspective Plane; or, a Description thereof in all its Dimensions; such as it appears to the Eye. See PERSPECTIVE. The *Ichnography* of a Building, &c. represents the Plan, or Ground-work of the Building. See ICHNOGRAPHY. The *Orthography*, the Front, or Upright, thereof. See ORTHOGRAPHY. And the *Scenography*, the whole Building, Front, Sides, the Height and all. The Word is formed from the *Greek* σκηνη Scene, and γραφια Description.

To exhibit the SCENOGRAPHY *of any Body.*

1°. Lay down the Basis, Ground-plot, or Plan of the Body, in the perspective *Ichnography*, according to the Method laid down under the Article PERSPECTIVE. 2°. Upon the several Points of the Plan raise the Perspective Heights: Thus will the *Scenography* of the Body be compleated; excepting that a proper Shade is to be added. The Method of raising the Heights is as follows.

On any Point given as C, (Tab. Perspect. Fig. 1.) *to raise a Perspective Altitude, answerable to an Objective Altitude* P Q. On the Terrestrial Line raise a Perpendicular P Q, equal to the given objective Altitude. From P and Q, to any Point, as T, draw right Lines P T and Q T. From the given Point C draw a right Line C K, parallel to the Terrestrial Line D E, meeting the right Line Q T in K. In the Point K, upon the Line K C, erect a Perpendicular I K. This I K is the *Scenographic* Altitude required. The Application of this general Method of drawing the *Scenography* of a Body, is not so obvious, in every Case, but that it may be necessary to illustrate it a little by a few Examples.

To exhibit the SCENOGRAPHY *of a Cube, viewed by an Angle.*

1°. As the Basis of a Cube viewed by an Angle, standing on a Geometrical Plane, is a Square viewed by an Angle; Draw a Square, viewed Angular wise, on the Perspective Table, or Plane. 2° Raise the Side H I (Fig. 2.) of the Square perpendicularly on each Point of the Terrestrial Line D E; and to any Point, as V, of the Horizontal Line H R, draw the right Line V I and V H. 3°. From the Angles d, b and c, draw c 1, d 2, &c. Parallel to the Terrestrial Line D E. 4°. From the Points 1 and 2, raise L 1, and M 2. perpendicular to the same. Lastly, Since H I is the Height to be raised in a, L 1 in c and b, and M 2 in d: In a raise the Line f a perpendicular to f a; in b and c, raise b g and c e perpendicular to b c 1; and Lastly, Raise d h, perpendicular to d 2: And make a f = H I, b g = e c = L 1, and h d = M. 2: If then the Parts g h, e f be connected by right Lines, the *Scenography* will be compleat.

To exhibit the SCENOGRAPHY *of a Hollow* Quinquangular Prism.

1°. Since the Base of a hollow *Quinquangular Prism*, standing on a Geometrical Plane, is a Pentagon, with a Limb or Breadth of a certain Dimension; find the Appearance of this Pentagon on a Table, or Plane. See PERSPECTIVE. 2°. On any Point, as H, of the Terrestrial Line D E (Fig. 3.) raise a perpendicular H I, equal to the objective Altitude; and to any Point, as V, of the Horizontal Line H R, draw the Lines H V and I V. 3°. From the several Angles, a, b, d, e, c, of the Perspective *Ichnography*, both the Internal and External ones, draw right Lines, as b 2, d 3, &c. parallel to the Terrestrial Line; and from the Points 1, 2, 3, raise Perpendiculars to the same, as L 1, M 2 m 2, N 3 n 3. If these, then, be raised in the correspondent Points of the *Ichnography*, as in the preceding Article, the *Scenography* will be compleat.

To exhibit the SCENOGRAPHY *of a Cylinder.*

1°. Since the Base of a Cylinder, standing on a Geometrical Plane, is a Circle; seek the Appearance of a Circle. In the Points, a, b, d, f, h, g, e, c, (Fig. 4.) raise

the apparent Altitudes, as in the preceding Articles. If now their upper Lines be connected by curve Lines, as in the Base, a, b, d, f, c, h, e, c, the *Scenography* of the Circle will be compleat.

'Tis evident that those Lines are to be omitted, both in the Plan and in the Elevation, which are not exposed to the Eye; though they are not to be disregarded, from the Beginning, as being necessary for the finding of other Lines. *E. gr.* In the *Scenography* of the Cube, viewed Angle wise, the Lines b d and d c, (Fig. 2.) in the Base, and the d h in the Elevation, are hid from the Eye, and are therefore omitted in the Description. But since the Point h is not to be found unless the Point d be had in the *Ichnography*; nor the Lines g h and d e be drawn without the Height d h; the Appearance of the Point d is as necessary to be determined in the Operation, as the Height h d.

To exhibit the SCENOGRAPHY *of a Pyramid, standing on its Base.*

Suppose, *e. gr.* it were required to delineate a Quadrangular Pyramid, viewed by an Angle: 1°. Since the Base of such Pyramid is a Square seen by an Angle, draw such a Square. 2°. To find the Vertex of the Pyramid, *i. e.* a Perpendicular let fall from the Vertex to the Base, draw Diagonals mutually intersecting each other in e (Fig. 5.) 3°. On any Point, as H, of the Terrestrial Line D E, raise the Altitude of the Pyramid H I; and drawing the right Lines H V, and I V to each Point of the Horizontal Line H R; produce the Diagonal a b, till it meet the Line V H in h. Lastly, From h draw h i parallel to H I. This being raised on the Point e, will give the Vertex of the Pyramid c d; consequently, the Lines d k, k a, and k b, will be determined at the same Time.—— After the like Manner is the *Scenography* of a Cone delineated.

To exhibit the SCENOGRAPHY *of a Truncated Pyramid.*

Suppose the Truncated, Pyramid Quadrangular; 1°. then, If from the several Angles of the upper Base be conceiv'd Perpendiculars let fall to the lower Base, we shall have a Pentagon, with another inscribed therein, whose Sides are parallel to those of the former. This coincides with a Pentagon, furnished with a Rim or Breadth, *&c.* and may therefore be delineated in the same manner.— 2°. Raising the Altitude of the Truncated Pyramid (I H, Fig. 6.) determine the *Scenographic* Altitudes, to be raised in the Points a, b, c, d. If now the Points f, g, h, i, k, be connected by right Lines, and the Lines l k, f m, g n, h o, be drawn, the *Scenography* will be compleat.——By drawing two concentric Circles in a Geometrical Plan, and doing every Thing else, as in this Problem, the *Scenography* of a Truncated Pyramid will be drawn.

To exhibit the SCENOGRAPHY *of Walls, Columns, &c. or to raise them on the Pavement.*

1o. Suppose a Pavement A F H I (Fig. 7.) represented in a Plan, together with the Bases of the Columns, *&c.* if there be any. 2°. Upon the Terrestrial Line set off the Thickness of the Wall B A and 1, 3. 3°. Upon A and B, as also upon 3 and 1, raise Perpendiculars A D and B C, as also 3, 6, and 1, 7. 4°. Connect the Points D and 6 with the Principal Point V, by the right Lines D V and 6 V. 5°. Upon I and H raise Perpendiculars H G and E F. Thus will all the Walls be delineated. Now to raise the Pillars, *&c.* there needs nothing but, from their several Bases (whether Square, or Circular) projected on the Perspective Plan, to raise indefinite Perpendiculars; and on the Fundamental Line, where intersected by the Radius F a passing through the Base, raise the true Altitude A D: for D V, being drawn as before, the *Scenographical* Altitudes will be determined.

To exhibit the SCENOGRAPHY *of a Door in a Building.*

Suppose a Door required to be delineated in a Wall D E F A (Fig. 7.) 1°. Upon the Fundamental Line set off its Distance A N from the Angle A, together with the Breadths of the Posts N I and L M, and the Breadth of the Gate itself L I. 2°. To the Point of Distance K, from the several Points N, I, L, M, draw right Lines K N, K I, K L, K M, which will determine the Breadth of the Door l i, and the Breadths of the Posts c n and m l. 3°. From A to O, set off the Height of the Gate A O, and from A to P, the Height of the Posts A P, 4°. Joyn O and P with the Principal Point, by the right Lines P V and O V. 5°. Then, from n, i, l, m, raise Perpendiculars, the Middle ones whereof are cut by the right Line O V in o, and the Extremes, by the right Line V P in p. Thus will the Door be delineated, with its Posts. If the Door were to have been exhibited in the Wall E F G H, the Method were nearly the same. For, 1°. Upon the Terrestrial Line, set off the Distance of the Door from the Angle, and thence also the Breadth of the Door R T. 2°. From R and T, draw right Lines to the Principal Point V, to have the Breadth r t in the perspective Plan. 3°. From r and t, raise indefinite Perpendiculars to F H. 4°. From A to O, set off the true Height A O. Lastly, From O, to the principal Point V, draw the right Line O V, intersecting E F in Z, and make r r and t t equal to T Z. Thus is the Door r r, t t, drawn, and the Posts are easily added, as before.

To exhibit the SCENOGRAPHY *of Windows in a Wall.*

When you know how to represent Doors, you'll find no Difficulty in adding Windows; all that is here further required, being to set off the Height of the Window from the Bottom of the Ground. The Whole Operation is as follows. 1°. From 1 to 2, set of the Thickness of the Wall at the Window; from 3 to 4, its Distance from the Angle 3; and from 4 to 5 its Breadth. 2°. From 4 and 5, to the Point of Distance L, draw the right Lines E 5 and L 4, which will give the Perspective Breadth 10, 9 of the Window. 3°. From 10 and 9 raise Lines perpendicular to the Pavement; *i. e.* draw the parallel Lines 6, 3. 4°. From 3 to 11 set off the Distance of the Window from the Pavement 3, 11; and, from 11 to 12, its Height 11, 12. Lastly, From 11 and 12, to the principal Point V, draw Lines V 11 and V 12; which intersecting the Perpendiculars 10, 13, and 9, 14, in 13 and 14, as also in 15 and 16, will exhibit the Appearance of the Window.

From these Examples, which are all no more than Applications of the first grand general Rule, it will be easily perceived what Method to take to delineate any other Thing, and at any Height from the Pavement.

A Mechanical Method of exhibiting the Scenography *of any Object*; See under the Article DESIGNING.

SCENOPEGIA, a Feast among the *Jews*, more usually called, *The Feast of Tabernacles*, instituted after the People of *Israel* were in Possession of the Land of *Canaan*, in Memory of their having dwelt under Tents in the Wilderness. 'Twas held for 8 Days successively, commencing on the Fifteenth of *September*. The last Day was much the most solemn, both on Account of the Conflux of Persons, and of the extraordinary Tokens they gave of their Joy. 'Tis of this Eighth Day, St. *John* must be understood to speak, when he tells us, our Saviour was at the Feast of Tabernacles, on the last and great Day. When the Holy Scripture says absolutely, *the Feast*, 'tis to be usually understood of the *Scenopegia*. The Word is *Greek*, form'd of σκηνη Scene, Tabernacle, Tent; and πηγνυμι *Figo*, I fix.

SCEPTER, a Royal Staff, or Battoon, born, on solemn Occasions, by Kings, as a Badge of their Command and Authority. See REGALIA. The *Scepter* is an Ensign of Royalty of greater Antiquity than the Crown. The *Greek* Tragic, and other Poets, put *Scepters* in the Hands of the most ancient Kings they ever introduce. *Justin* observes, That the *Scepter*, in its Original, was a *Hasta* or *Spear:* He adds, That in the most remote Antiquity, Men adored the *Hastæ*, or *Scepters*, as immortal Gods; and, that it was upon this Account, that even, in his Time, they still furnished the Gods with *Scepters*. *Neptune's Scepter* is his Trident, See TRIDENT. *Tarquin*, the Elder, was the first who assumed the *Scepter* among the *Romans*. *Le Gendre* tells us, That in the first Race of the *French* Kings, the *Scepter* was a Golden Rod, almost always of the same Heighth with the King who bore it, and crooked at one End like a Crozier. Frequently, instead of a *Scepter*, they are seen on Medals with a Palm in their Hand. *Nicod* derives the Word from the *Greek* σκηπτεσθαι, which he says, originally signified a Javelin, which the antient Kings usually bore as a Badge of their Authority, in regard that Instrument was in very great Veneration among the Heathens. But, in Effect, σκηπτρον does not properly signify a Javelin, but as a Staff, to rest upon, from σκηπτω, *Innitor*, I lean.

SCEPTER, *Sceptrum*, in Anatomy, one of the Six new Constellations of the Southern Hemisphere, consisting of 17 Stars; one of the 4th Magnitude, 8 of the 5th, and as many of the 6th.

SCEPTICISM, the Doctrine and Opinions of the *Scepticks*; called also *Pyrrhonism*, from the Name of its Author. See PYRRHONISM. The Ancient *Scepticism* consisted

ſiſted in doubting of every Thing, in affirming nothing at all, and in keeping the Judgment in Suſpenſe on every Thing. *Sextus Empiricus* makes *Scepticiſm* to conſiſt in a Faculty of oppoſing all Appearances, of making all, even contrary Things, equally probable, and of proceeding firſt to an ἐποχὴ, Suſpenſe of Mind, and then to an intire Undiſturbedneſs or Tranquillity. Hence theſe great Maxims of theirs, Οὐ μᾶλλον τοῦτο ἢ ἐκεῖνο, *This is no more than that.* Παντὶ λόγῳ λόγος, *&c. Every Reaſon has ſome Reaſon againſt it*; and Οὐδὲν ὁρίζω, *I determine nothing.* The proper Character then of *Scepticiſm* is an ἀκαταληψία, *Neutrality*, or ſuch a Diſpoſition of Mind as does not, upon any Occaſion, incline to any thing more than the contrary thing. This Heſitancy of the *Scepticks* is well deſcribed by *Ariſtocles* in *Euſeb. de præpar. Evan.* All Things are equally indifferent, uncertain and undeterminate; neither our Senſes, nor our Opinions give us either Truth or Falſehood: Therefore, neither the one, nor the other are to be credited; but all Things to be left on a Level, without having any Opinion, Inclination or Motion of the Mind at all. 'Tis added, that the *Scepticks* carried this Suſpenſe of theirs ſo far, as to deny, that any thing is either good or evil, juſt or unjuſt, true or falſe; or that any thing is this, more than that. See SCEPTICKS.

'Tis from this *Acatalepſia* of the *Scepticks*, that *Des Cartes* ſeems to have borrowed his great Principle of *doubting of all Things*; as is own'd by many of his Followers. It muſt be own'd, there is ſome Difference between the Doubting of the *Scepticks*, and that of the *Carteſians*. In Phyſical Matters, 'tis true, there does not ſeem a great deal of Difference; and *Des Cartes*, in that Reſpect, may, without much Injuſtice, be deem'd a *Sceptic:* But this may be ſaid in his Favour, That the great *Socrates* was ſo far a *Sceptic* himſelf; phyſical and ſenſible Things, he held, were all dubious, and, at beſt, but probable. See CARTESIANISM.

The Origin of *Scepticiſm* is ſomewhat obſcure; *Pyrrho*, who lived under *Alexander the Great*, and made the Tour of *India* in his Retinue, is uſually reputed the Author; whence *Pyrrhonians* and *Scepticks* are ordinarily uſed indifferently. See PYRRHONIAN. It muſt be own'd, however, that the great Dogma of the *Scepticks* had been countenanced, and even cultivated before *Pyrrho* by *Democritus*, *Heraclitus*, *&c. Sextus Empiricus* ſays, expreſly, That all that *Pyrrho* did, was to improve, illuſtrate and inforce the Dogma; and form the Retainers thereto into a Sect. *Democritus*'s Philoſophy was near akin to *Scepticiſm*; for that, upon his obſerving, that Honey ſeemed ſweet to ſome, and bitter to others, he concluded, that 'twas neither ſweet nor bitter; and thereupon pronounced ἐ μᾶλλον, *non magis*, which is pure *Scepticiſm*. Yet the ſame *Sextus* adds, That *Democritus* was no *Sceptic*. Though *Plato* argue very ſtrenuouſly againſt the Acatalepſy of the *Scepticks*; yet 'tis certain that Dogma received a great Part of its Encouragement from *Socrates*'s School, and *Plato*'s Academy. Nay, 'twas a great Controverſy among the Ancients, whether *Plato* himſelf were a *Sceptic* or *Dogmatiſt*. Indeed *Plato*'s deciſive Way of ſpeaking, in many caſes, ſeems to leave no great room for ſuch a Doubt; but 'tis certain, his Followers of the New Academy founded by *Arceſilas*, gave much into this Way; and *Nihil Scitu*, was held by them, a Principle. *Sextus Empiricus* obſerves, That *Socrates* himſelf had a Tincture of *Scepticiſm*; ſome even make him the Author of it, from that cuſtomary Saying of his, *I know nothing but this, that I know nothing.* If this were the Origin of *Scepticiſm*, it muſt be owned, it was mightily improved afterwards, e'er *Metrodorus* ſaid, *I know nothing, not even this, that I know nothing.* The ſame *Sextus* however adds, That *Plato*, introducing his Maſter in his *Gymnaſtic* Dialogues, diſputing with the Sophiſts, makes him act the Part of a *Sceptic*. Some have even charged *Job* and *Solomon* with *Scepticiſm*; from their propoſing a great Number of Queſtions, without deciding any of them. The Philoſopher of *Kiel*, who has publiſhed a Diſſertation on *Scepticiſm*, fetches its Origin ſtill higher: He will have the Devil the Author thereof, who made our firſt Parents doubt of the Word of God himſelf; and drew them in, the firſt Proſelytes to *Scepticiſm*.

SCEPTICKS, a Sect of Ancient Philoſophers, founded by *Pyrrho*, whoſe diſtinguiſhing Tenet was, That all Things are uncertain and incomprehenſible; Contraries equally true; that the Mind is never to aſſent to any thing; but to keep up an abſolute Heſitancy or Indifference. See SCEPTICISM.

Plato refutes the great Principle of the *Scepticks* thus: When you ſay, that all Things are incomprehenſible, do you comprehend or conceive that they are thus incomprehenſible, or do you not? If you do, then ſomething is comprehenſible; if you don't, there is no Reaſon we ſhould believe you, ſince you don't comprehend your own Aſſertion.

The Term *Sceptic*, in its Original *Greek*, Σκεπτικὸς, properly ſignifies *Conſiderative*, or, A Man who is ever weighing the Reaſons on one Side and the other, without ever deciding between them. 'Tis form'd from the Verb σκέπτεσθαι, to conſider, weigh, deliberate. *Laertius* adds, That the Followers of *Pyrrho*, had various Denominations; from their Maſter, they were called *Pyrrhonians*; from their Dogma *Aporetici*, that is Doubters, of ἀπορεῖν, to doubt. From their Suſpenſion and Heſitation, *Ephectici*, of ἐπέχειν to ſtay, to keep back; and from their never getting beyond the Search of Truth, *Zetetici*.

SCELOTYRBE; from Σκελὸς, *Crus*, the Leg, and Τύρβη, *Tumultus*, Uproar, ſignifieth thoſe Pains in the Legs, that generally attend Scorbutick Habits; whence it is alſo frequently uſed for the Scurvy itſelf, and applied to ſome Medicines contrived againſt ſuch Diſorders.

SCHAR-PENNY, *Scharn-Penny*; and ſometimes *Schorn-Penny*. It appears from our old Books, that ſome cuſtomary Tenants were obliged to pen up their Cattle at Night in the Pound or Yard of their Lord, for the Benefit of their Dung or *Sceam*, as is the *Saxon* Word. And if they did not do this, they were obliged to pay a ſmall Compenſation, which therefore was called by this Name of *Schar-Penny*.

SCHEAT or SEAT, in Aſtronomy, a fixed Star of the Second Magnitude in the Juncture of the Leg, with the Left Shoulder of *Pegaſus*. Some call it *Seat Alphorus*, and ſome *Scheat Pegaſi*. Its Longitude, according to Mr. *Flamſtead*, is 25° 2′ 13″ its Latitude 31° 8′ 6″ *North*.

SCHEDULE, or *Cedula*, a Scroll of Paper, or Parchment, annex'd or appended to a Will, Leaſe, Deed or other Inſtrument, containing an Inventory of Goods, or ſome other Matter, omitted in the Body of the Inſtrument. See CEDULA.

SCHEMATISM. See FIGURE.

SCHEME, a Model, Draught, *&c.* or the Repreſentation of any Geometrical or Aſtronomical Figure, or Problem by Lines ſenſible to the Eye: Or of the Cœleſtial Bodies in their proper Places for any Moment. See DIAGRAM. The Word is form'd from the *Greek* σχῆμα.

SCHERIF. See CHERIF.

SCHIRE MOTE, was anciently a ſolemn Meeting of all the free Tenants and Knights in any County, to do Fealty to the King, and elect an Annual Sheriff. See SHERIFF.

SCHIRRUS, in Medicine, called alſo *Schirrome* and *Schirroſis*, a hard, indolent Tumor, form'd gradually, in the ſoft, glandulous Parts of the Body; ſometimes internal, and ſometimes external. There are two Kinds of *Schirrus*'s; the one only beginning, and frequently painful when preſs'd by the Fingers; the other, confirm'd and ſenſeleſs. The *Schirrus* ariſes from a thick, viſcid, probably, gritty Matter, detained and indurated in the Pores and other minute Paſſages of the Parts affected. There are ſome *Schirrus*'s as hard as Stones; ſome are even painful in their confirm'd State, and partake of the Nature of a Cancer. The Word is form'd from the *Greek* σκιῤῥὸς, hardneſs.

SCHISM, a Term, which, in the general, ſignifies *Diviſion*, or *Separation*; but chiefly uſed in ſpeaking of Separations happening through Diverſity of Opinions among People of the ſame Religion and Faith: Thus we ſay, The *Schiſm* of the Ten Tribes of *Iſrael*, from the Two Tribes of *Juda* and *Benjamin*. See SAMARITANS. The *Schiſm* of the *Perſians* from the *Turks* and other *Mahometans*. Among Eccleſiaſtical Authors, the *Great Schiſm of the Weſt*, is that which happened in the Times of *Clement* VII. and *Urban* VI. which divided the Church for Forty or Fifty Years, and was at length ended by the Election of *Martin* V. at the Council of *Conſtans*. The *Romaniſts* number Thirty-four *Schiſms* in their Church: They beſtow the Name of the *Engliſh Schiſm* on the Reformation of Religion in that Kingdom; thoſe of the Church of *England* again apply the Term *Schiſm* to the Separation of the *Nonconformiſts*, *viz.* the *Presbyterians* and *Anabaptiſts*, who are earneſt for a further Reformation. Some call the Separation of the Proteſtants from the Church of *Rome*, a *Paſſive Schiſm*, becauſe that Church cut them off from her Communion. The Word is form'd from the *Greek* σχισμὰ, cleft, fiſſure.

SCHOENOBATES, a Name the *Greeks* gave to their Rope-dancers. The *Romans* call them, *Funambuli*. The *Schœnobates* were Slaves, whoſe Maſters made Money of them, by entertaining the People with their Feats of Activity. *Mercurialis de Arte Gymnaſtica, Lib.* III. gives us five Figures of *Schœnobates* Engraven after ancient Stones. The Word is form'd from the *Greek* σχοινὸς, a Rope; and βαίνω, I walk.

SCHOLASTIC, ſomething belonging to the Schools, or that is taught in the Schools. See SCHOOL.

The Title *Scholaſticus*, was a long time a Title of Honour. At firſt it was only given to ſuch as diſtinguiſhed themſelves by their Eloquence, in Declaiming,

ing, &c. After *Nero*, 'twas alſo apply'd to the *Advocati*, and among others, to *Socrates* and *Euſebius*, the Eccleſiaſtical Hiſtorians, who were Advocates at *Conſtantinople*. *Conſtant. Hiermenopulus* alſo bore it in the twelfth Century, with ſeveral others. Afterwards it became reſtrained to ſuch as had the Government of the Eccleſiaſtical Schools, eſtabliſhed under the firſt Race of *French* Kings, who inſtructed the Clerks of each Church, firſt in the Humanities, then in Theology and the Liturgy. Theſe were alſo called *Primiciers Eſcolaſtres* and *Theologaux*. If the Church were ſituated in a City, the *Scholaſticus* was called the *Chancellor*. *Genebrand* obſerves, That among the *Greeks*, *Scholaſticus* was the Name of an Office or Dignity anſwering to our *Divine* or *Theologue*. Indeed, he adds, 'twas only properly applied to People of general Learning, and fine Parts, and who were well known to the World in that Character. This St. *Jerom* obſerves, That *Serapion* was ſurnamed *Scholaſticus*, by reaſon of the Delicacy of his Wit. *Walafrid Strabo*, calls the Poet *Prudentius*, *Scholaſticus*: *Fortunatus* was called *Scholaſticiſſimus*.

SCHOLASTIC, or SCHOOL *Divinity*, is that Part of *Divinity* which clears and diſcuſſes Queſtions, by means of Reaſon, and Arguments: In which Senſe, it ſtands, in good meaſure, oppoſed to poſitive *Divinity*, which is founded on the Authority of Fathers, Councils, &c. The *School Divinity*, like *Plato*'s School, has had its three ſeveral Ages or Periods: The *Ancient*, the *Mean* and the *New*. The Ancient began under *Lanfrank*, Archbiſhop of *Canterbury*, or, more properly, under *Peter Lombard*, the Maſter of the Sentences; and held about 200 Years; ending under *Albertus Magnus*. 'Twas ſucceeded by the *Mean School Divinity*, which laſted about 300 Years, to the Time of *Thomas Aquinas*; during which Time, the *Peripatetic* Philoſophy was raiſed to its utmoſt Reputation. The third Age began under *Durandus*, who ſet himſelf up againſt *Thomas*, the Chief of the *mean* Age. From him Peoples Wits began to be more and more ſubtile; and the *School* began to be wholly taken up in frivolous Queſtions. They diſputed, with great Heat, about mere Formalities; and even raiſed Phantoms on purpoſe to combat withal. 'Tis now fallen into the laſt Contempt; and is ſcarce regarded any where, but in ſome of the Univerſities, where they are obliged by their Charters to teach it.

SCHOLIAST, a Commentator, particularly a Perſon who writes *Scholia*, that is, Notes, Gloſſes, &c. upon the Ancient *Greek* Authors. See SCHOLIUM.

SCHOLIUM, a Note, Annotation, or Remark occaſionally made on ſome Paſſage, Propoſition, &c. 'Tis much uſed in Geometry, and other Parts of Mathematicks; where, after demonſtrating a Propoſition, 'tis frequent to point out where it might be done ſome other Way; give ſome Advice, or Precaution to prevent Miſtakes; or add ſome particular Uſe or Application thereof. *Wolfius* has given us abundance of curious and uſeful Arts and Methods, a good part of the Modern Philoſophy, the Deſcription of Mathematical Inſtruments, &c. all by way of *Scholia*, to the reſpective Propoſitions in his *Elementa Matheſeos*. The Word in the Original *Greek*, σχόλιον, ſignifies the ſame Thing.

SCHOOL, a publick Place, wherein the Languages, Humanities or other Sciences are taught. Thus we ſay, a *Grammar School*, the *School* of Medicine, of Natural Philoſophy, &c. The Word is alſo uſed for a whole Faculty, Univerſity, or Sect: as, *Plato*'s *School*: The *School* of *Epicurus*, the *School* of *Paris*, &c. The *School* of the *Tiberiad* has been famous among the Ancient Jews; and 'tis to this we owe the *Maſſora* and *Maſſoretes*. See MASSORETES. The Word is form'd from the *Latin*, *Schola*, which *Du Cange* derives from *Schola*, which ſignifies *Diſcipline* and *Correction*; and adds, That it was anciently, in the general, uſed for all Places, where ſeveral Perſons met, either to ſtudy, to converſe, or do any other Matter. Accordingly, there were the *Scholæ Palatinæ*, being the ſeveral Poſts wherein the Emperor's Guards were placed; the *Schola Scutariorum*, *Schola Gentilium*, &c. At length the Term paſſed to Civil Magiſtrates; and accordingly in the Code, we meet with *Schola Chartulariorum*, *Agentium*, &c. and even to Eccleſiaſticks, as, *Schola Cantorum*, *Sacerdotum*, &c.

SCHOOL, in Painting, is a Term uſed to diſtinguiſh the different Manners of Places, and Perſons: As, the *Roman School*, the *Venetian School*, the *Flemiſh School*, &c. *Raphael's School*, *Titian's School*, *da Vinci's School*, &c. meaning their Diſciples, Pupils, &c. See PAINTING.

SCHOOL of *Athens*, in Painting, is a celebrated Piece of *Raphael*, now in the *Vatican*. It contains a great Number of Figures, repreſenting Philoſophers, Mathematicians, and other Perſons, engaged in the Arts and the Sciences. Several Authors have wrote of this Painting, and given different Explications thereof. *Vaſari* will have it to be, The Agreement of Philoſophy, and Aſtronomy, with Theology. The Engravers, by the Inſcription they add at the Bottom of the Print thereof, ſhew, That they take it for a Painting of St. *Paul* preaching at *Athens*. An *Auguſtin* of *Venice*, takes the Philoſopher who is writing, for a St. *Mark*; and he at his Knees, for the Angel *Gabriel*. M. *de Piles* rejects all theſe Explications of the *School* of *Athens*, and eſpecially the laſt: His Opinion is, That 'tis nothing more than the mere Image or Repreſentation of Philoſophy, which *Raphael* here deſigns under all the Philoſophers he has painted. In Behalf of the *Venetian* Engravers it may be ſaid, that they do not pretend to explain the Painting, but have only copied ſuch of the Figures as they thought proper to repreſent St. *Mark*, St. *Gabriel*, &c.

SCHOOL PHILOSOPHY, Theology, &c. See SCHOLASTIC.

SCHOONBIAH, a Sect among the Muſſulmans. The diſtinguiſhing Tenet of thoſe of this Sect is, That the *Sunnites* are not a whit preferable to the *Schaia* or *Rafadhites*, *i. e.* the Orthodox to the Heteredox; but that both the one and the other are equally good Muſſulmans. The *Schoonbiah*, therefore, ſhould be properly the *Latitudinarians* of *Muſſulmaniſm*. Yet are not they regarded by either Party, as much better than Gentiles or Heathens, as their Name imports. There are abundance among the Muſſulmans, who give into this Sect, only ſecretly; *Mahometiſm*, like all other falſe Religions, being an avowed Enemy to Toleration.

SCIATICA, in Medicine, the Gout in the Hip. See GOUT.

SCIENCE, in Philoſophy, a clear and certain Knowledge of any Thing, founded on ſelf-evident Principles, or Demonſtration. See KNOWLEDGE. In this Senſe, *Doubting* is oppos'd to *Science*; and *Opinion* is the middle between the Two. See OPINION. The *Scepticks* profeſs to deny, that we have any ſuch thing as *Science*; that is, any clear, certain Notices of any thing, capable of producing abſolute Conviction. See SCEPTICISM. The Word is form'd of the *Latin*, *Scire*, to know.

Divines ſuppoſe three Kinds of *Science* in God: The firſt, *Science* of mere Knowledge, whereby God knows himſelf, and all Things poſſible. The ſecond, a *Science* of Viſion, whereby he knows all Things he has reſolved to do, or to permit, in the ſame Order wherein he has reſolved to do, and to permit them. The third an intermediate *Science*, whereby he knows what Angels and Men will do, in certain Caſes and certain Circumſtances, if he reſolve to bring them about. 'Tis greatly diſputed among the School Divines, whether or no there be ſuch an intermediate *Science* in God; the Reaſon why ſome call it in queſtion is, becauſe it does not conſiſt well with their particular Schemes.

SCIENCE, is particularly uſed for a form'd Syſtem of any Branch of Knowledge; comprehending the Doctrine, Reaſon and Theory, of the Thing, without any immediate Application thereof to any Uſes or Offices of Life; in which Senſe, the Word is uſed in Oppoſition to *Art*. Indeed, the preciſe Notion of an *Art* and *Science*, and their juſt, adequate Diſtinction, are not yet well fixed. See the PREFACE to this Work.

As to the Number and Diviſion of the *Sciences*, Mr. *Lock* fixes them thus: All that can fall within the Compaſs of human Underſtanding, is, Firſt, Either the Nature of Things, their Relations, and their Manner of Operation: or, Secondly, That which Man himſelf ought to do as a voluntary and rational Agent, for the Attainment of any End, eſpecially Happineſs; or, Thirdly, the Ways and Means, whereby the Knowledge of both of theſe are attained and communicated: Whereupon, *Science*, may be properly divided into theſe Three Sorts. Firſt, the Knowledge of Things, their Conſtitutions, Properties and Operations, whether material or immaterial: This, in a little more inlarged Senſe of the Word, may be called Φυσικὴ, or *Natural Philoſophy*. The End of this is bare ſpeculative Truth, and whatſoever can afford the Mind of Man any ſuch, falls under this Branch; whether it be God himſelf, Angels, Spirits, Bodies, or any of their Affections, as Number, Figure, &c. Secondly, Πραϰτιϰὴ, the Skill of right applying our own Powers and Actions for the Attainment of Things good and uſeful. The moſt conſiderable under this Head, is *Ethicks*, which is the ſeeking out thoſe Rules and Meaſures of Human Actions, which lead to Happineſs, and the Means to practiſe them. The End of this is not bare Speculation; but Right, and a Conduct ſuitable thereto. Thirdly, Σημειωτιϰὴ, or the Doctrine of *Signs*: The moſt uſual being Words; it is aptly enough termed *Logick*: The Buſineſs whereof is to conſider the Nature of *Signs*, which the Mind makes uſe of for the underſtanding of Things, or conveying its Knowledge to others. Things are repreſented to the Mind by Ideas; and Mens Ideas are communicated to one another by articulate Sounds or Words. The Conſideration then of Ideas or Words, as the great Inſtruments of

Know-

Knowledge, makes no deſpicable Part of their Contemplation, who wou'd take a View of Human Knowledge in the whole Extent of it. This ſeems the firſt, and moſt general, as well as natural Diviſion of the Objects of our Underſtanding. For a Man can employ his Thoughts about nothing, but either the Contemplation of Things themſelves for the Diſcovery of Truth; or about the Things in his own Power, which are his Actions, for the Attainment of his own Ends; or the Signs the Mind makes uſe of, both in the one and the other, and the right ordering of them, for its clearer Information. All which Three, *viz. Things*, as they are in themſelves knowable; *Actions*, as they depend on us in order to Happineſs, and the right uſe of *Signs*, in order to Knowledge, being *toto Cœlo*, different, they ſeem to be the Three great Provinces of the Intellectual World, wholly ſeparate and diſtinct one from another.

SCIENTIFIC, ſomething relating to the pure, ſublimer *Sciences*; or, that abounds in *Science* or *Knowledge*. A Work, a Method, *&c.* is ſaid to be *Scientifical*, when 'tis founded on the pure Reaſon of Things, *&c.* conducted wholly on Principles thereof. In which Senſe, the Word ſtands oppoſed to *Narrative*, *Arbitrary*, *Opinionative*, &c.

SCILLA, or *Squill*, a Medicinal Plant, of the Onion-kind, but very large; chiefly brought from *Spain*: Uſed only in Infuſion, and that generally in Vinegar, which it renders Emetic. There are two Kinds, *Male* and *Female*; the Male are whitiſh, and the Female reddiſh. Their Infuſion, when boiled into the Conſiſtence of a Syrup, with Honey, called *Oximel Sylliticum* in the Shops, retains the ſame Properties. They wonderfully deterge and ſcour off the viſcid Adheſions in the Bowels, and gently irritate the Stomach to Ejection. They are alſo, as all of the Onion Kind are, very Diuretick, and therefore in great Eſteem, with ſome, in Dropſies: For if their Infuſion be mixed with Cinnamon-Water, they will ſeldom vomit, but work downwards, and very forcibly, by Urine: In Aſthmas, and all Obſtructions, or Infractions of the Lungs, which are to be removed by Deterſives and Expectoration, there is ſcarce any thing more effectual. They are alſo eſteemed *Alexipharmicks*, and upon that Account have a Place in the *Theriaca Andromachi*.

SCIOGRAPHY, the Profile, or Section of a Building, to ſhew the Inſide thereof. See SECTION and PROFILE.

SCIOGRAPHY, in Aſtronomy, *&c.* is a Term ſome Authors uſe for the Art of finding the Hour of the Day or Night, by the Shadow of the Sun, Moon, Stars, *&c.* See DIAL.

SCIOMANTIA, or *Sciomancy*, a kind of Divination, otherwiſe called *Pſychomancy*. *Sciomancy*, among the Ancients, was the Art of raiſing and calling up the Manes or Souls of deceaſed Perſons, to inſtruct them in Things to come. The Witch who conjured up the Soul of *Samuel*, to foretel *Saul* the Event of the Battle he was about to give, did it by *Sciomancy*. The Word is form'd from the *Greek*, σκία, Shadow, uſed metaphorically for the *Soul*, and μαντεία, Divination. See DIVINATION.

SCIOPTRICK, a Sphere or Globe of Wood, with a circular Hole or Perforation wherein a Lens is placed: 'Tis ſo fitted, that, like the Eye of an Animal, it may be turn'd round every Way; to be uſed in making Experiments of the darken'd Room. See CAMERA OBSCURA.

SCIRE-FACIAS, is a judicial Writ, moſt commonly to call a Man to ſhew Cauſe to the Court whence it iſſues, why Execution of a Judgment paſſed, ſhould not be made out. This Writ is not granted, until a Year and a Day be elapſed after a Judgment given: *Scire-facias*, upon a Fine, lies not but within the ſame Time after the Fine levied, otherwiſe it is the ſame with the Writ of *Habere facias ſeiſinam*.

SCLAVONIC, the Language of the *Sclavi*, an Ancient People of *Scythia Europæa*; who, about the Year 518, quitting their native Country, ravaged *Greece*, and eſtabliſhed the Kingdoms of *Poland* and *Moravia*, and at laſt ſettled in *Illyria*; which thence took the Name of *Sclavonia*. But the Modern *Sclavonia* is much narrower, being only a Province in *Hungary*. The *Sclavonic* is held, after the *Arabic*, the moſt extenſive Language in the World: 'Tis ſpoke from the *Adriatic* to the *North* Sea, and from the *Caſpian* to *Saxony*, by a great Variety of People, all, the Deſcendants of the Ancient *Sclavi*, *viz.* the *Poles*, *Muſcovites*, *Bulgarians*, *Carinthians*, *Bohemians*, *Hungarians*, *Pruſſians*, *Suabians*, *&c.* each of whom, however, have their particular Dialect; only the *Sclavonic* is the common Mother of their ſeveral Languages, *viz.* the *Poliſh*, *Ruſſian*, *Hungarian*, *&c.* By a *Latin* Chronicle of the *Sclavi*, compoſed by *Helmold*, a Prieſt of *Buda*, and *Arnoul* Abbot of *Lubec*, and corrected by *M. Leibnitz*, it appears, That the *Sclavi* anciently inhabited the Coaſts of the *Baltic* Sea, and were divided into *Eaſtern* and *Weſtern*: In the latter whereof, were the *Ruſſians*, *Poles*, *Bohemians*, *&c.* And in the former, the *Vandals*. *Dom. Maur. Orbini Rauſer*, Abbot of the Order of *Malta*, in an *Italian* Hiſtory of the *Sclavi*, intitled, *Il Regno de gli Slavi*, printed in 1601, will have them to be originally of *Finland* in *Scandinavia*. *Laur. Privero*, a *Dalmatian*, in an expreſs Diſcourſe on the Origin of the *Sclavi*, maintains them to be originally of *Thracia*, and the ſame with the *Thracians*, the Poſterity of *Thiras*, Seventh Son of *Japhet*. *Theod. Polycarpowitz*, in a *Greek*, *Latin* and *Sclavonic* Dictionary, printed at *Moſcow* in 1704, obſerves, That the Word *Sclava*, whence *Sclavonic* is form'd, ſignifies in their Language, *Glory*.

SCLEROPHTHALMIA, a kind of Ophthalmia, wherein the Eye is dry, hard, red and painful; and the Eyebrows likewiſe; ſo as not to be opened after Sleep, without great Pain, by reaſon of their exceſſive Dryneſs. See OPHTHALMIA.

SCLEROTICA, in Anatomy, *&c.* one of the common Membranes of the Eye, ſituate between the Adnata and the Uvea: 'Tis very firm and opaque behind; but tranſparent before. In Strictneſs, 'tis only the hind-part is call'd *Sclerotica*; the fore-part being properly called the *Cornea*; See CORNEA. The *Sclerotica* is a Segment of a larger Sphæroid than the Cornea. See EYE. The Word is form'd from the *Greek* σκληρὸς, hard.

SCLEROTICKS, Medicines, proper to *harden* and conſolidate the Fleſh, *&c.* of Parts they are applied to. Such are Purſlain, Jubarb or Houſe-leek, Pſyllium, Morel or Garden-night-ſhade, *&c.*

SCOLDING: The Puniſhment allotted by our Laws for *Scolding* Women, is, To be ſet in a Trebuchet, commonly called a *Cucking-Stool* (probably from the *French Coquine*, *Queau*, and the *German Stull*, *Chair*) placed over ſome deep Water, into which they are to be let down, and plunged thrice, under Water, to cool their Heat and Choler.

SCOLOPOMACHAIRION, in Chirurgery, a Kind of Scalpel, thus called, by the *Greeks*, from its reſembling a *Woodcock's Bill*. Its Uſe is to open, and dilate, narrow Wounds of the Breaſt, Abſceſſes, *&c.* *Aquapendente* recommends it for Tapping in Dropſies. 'Tis uſually furniſhed with a little Button at the Point, that it may be uſed to open Wounds of the Breaſt, without Danger of wounding the Lungs.

SCONCES are ſmall Forts, built for Defence of ſome Paſs, River, or other Place: Sometimes they are made regular of four, five, or ſix Baſtions; others of ſmaller Dimenſions, fit for Paſſes, or Rivers, and likewiſe for the Field: Such are (1.) Triangles with half Baſtions; which may be all of equal Sides, or they may be ſomething unequal. However it be, divide the Sides of the Triangle into three equal Parts, one of theſe three Parts will ſet off the Capitals and the Gorges; and the Flanks, being at Right Angles with the Sides, make half of the Gorge. (2.) Square, with half Baſtions; whoſe Sides may be betwixt 100 and 200 Feet, and let one Third of the Side ſet off the Capital and the Gorges, but the Flank (which raiſe at Right Angles to the Side) muſt be but one half of the Gorge or Capital, that is on the Sixth Part of the Side of the Square. (3.) Square with half Baſtions and Long. (4.) Long Squares. (5.) Star Redoubt of four Points. (6.) Star Redoubt of five or ſix Points. (7.) Plain Redoubts, which are either ſmall or great. The ſmall are fit for Court of Guards in the Trenches, and may be a Square of 20 Feet to 30. The middle Sorts of Redoubts may have their Sides from 30 to 50 Feet; the great ones from 60 to 80 Feet Square. The Profiles (that is the Thickneſs and Height of the Breaſt-works) to be ſet on theſe ſeveral Works, and the Ditches, are alterable, and uncertain; for ſometimes they are uſed in Approaches, and then the Wideneſs of the Breaſt-work, at the Bottom, may be 7 or 8 Feet, inward Height 6, and outward 5 Foot; the Ditch may be 8 or 10 Feet, and ſometimes 12; and for the Slopes, to be wrought according to the Nature of the Earth, they may ſometimes be made 14 or 20 Feet wide at the Bottom, and the Height of 7, 8, or 9 Feet, and to have 2 or 3 Aſcents to raiſe to the Parapet; the Ditch may be 16 or 24 Feet wide, and 5 or 6 deep; and ſometimes they may come near the ſmalleſt ſort of Ramparts, and have a Breaſt-work Cannon Proof, with a Ditch of 50 or 60 Feet wide, and are thus made to ſet upon Paſſes or Rivers to endure. See REDOUBT.

SCOPER-HOLES in a Ship, are Holes made through the Sides cloſe to the Deck, to carry off the Water that comes from the Pump, or any other Way. Theſe Holes in the Covert Deck, have round Leathers nailed over them, to keep the Sea Water from coming up into the Ship, which are called *Scoper-Leathers*; and the ſhort Nails, with broad Heads, which faſten theſe Leathers down, are called *Scoper Nails*.

SCORBUTUS, *Scurvy*, in Medicine, a Diſeaſe very frequent in the *Northern* Countries, particularly in fenny, wet, humid Places, open to the North, &c. 'Tis accompanied with a great Variety of Symptoms attacking the ſeveral Parts of the Body all at once. Hence *Willis* ſays, 'tis not any particular Diſeaſe, but a Legion of Diſeaſes. The moſt uſual are Bleeding, Coughing, Vomiting, Difficulty of Breathing, Looſeneſs, a Relaxation of the Parts, Swetting, a fœtid Smell of the Gums, a falling of the Teeth, ſtinking Breath, reddiſh or yellow livid Spots, Pains of the Arms and Legs, Wearineſs, Faintings, Head-ach, &c. Some diſtinguiſh it into *Hot* and *Cold*; but there is little Foundation for ſuch a Diſtinction, as the Cauſe is the ſame in all, *viz.* according to *Barbette* and *Decker*, a too thick Pituitous Lymph; whence various Symptoms in various Temperaments. *Charleton* obſerves, That it ariſes chiefly from ſharp, ſaline Particles, taken in by Inſpiration, from Salt and corrupted Meats eaten, from bad Waters drank, from Naſtineſs, deep Chagrins, &c. He adds, That 'tis contagious. Dr. *Quincy* will have it to conſiſt in ſuch a Conſtitution, wherein the Blood is unequally Fluid. And hence he obſerves, 'tis beſt remedied by Stimuli, Exerciſe, and ſuch means as promote Sanguification: 'Tis now become ſo frequent, that there is ſcarce any Diſeaſe appears, but 'tis judged to partake of the *Scorbutus*. The Cure is very difficult; and when the Diſeaſe is rooted, next to impoſſible. It ſometimes goes off in a Flux by Stool, ſometimes by the Hæmorrhoids, and ſometimes by Urine; but more often degenerates into a Dropſy, Atrophy, Apoplexy, Epilepſy or Convulſions. A very exact Diet is held of more Effect than the beſt Medicines; without this, it becomes incurable. Bleeding does not avail; ſtrong Purgatives are hurtful: So is Sugar, and all ſugar'd Things, *Mercurius Dulcis* uſed internally, ſo as not to Salivate, but only raiſe a Sweating, is found excellent. *Dolæus* undertakes to cure any *Scorbutus* in Twelve Days time, by the Uſe of this alone; only the Patient to drink nothing all that Time, but a proper Decoction, and to abſtain from Acids, and Hog's Fleſh. *Charleton* recommends a continued Uſe of Milk, particularly Milk Emulſions of Sweet Almonds, Decoctions of China, Broths and other Anti-acids and Analepticks. *Etmuller* makes the Baſis of the Cure of the *Scorbutus* and Hypochondriacal Diſeaſes the ſame, *viz.* copious Vomiting. Strong Catharticks, he obſerves, are prejudicial; but gentle ones good; for the Body is to be ſtill kept open. He adds, That Vinegar is hurtful, and yet the Acid Juices of Fruits and Vegetables, wholeſome. Accordingly the Uſe of Lemon Juice is much recommended by *Liſter*. Milk, and all milky Things, while the Stomach is yet able to digeſt, are excellent. So are Martials. *Etmuller*, inſtead of Mercurials, recommends Antimonials. Thus much in the general; for the particular Symptoms, particular Medicines adapted thereto, are to be uſed; only mixing Antiſcorbuticks with them all.

The chief ſimple Antiſcorbuticks are, Horſe-radiſh, ſowre Sorrel, Butter-bur, Scorzonera, Sow-thiſtle, Zedoary, Polypody, Elecampane, Guiacum, Saſſafras, Muſtard-Seed, Naſturtium Aquaticum, Trifolium Paludoſum, Oranges, Lemons, Juniper-Berries, Cream of Tartar, Tartartum Vitriolum, &c.

SCORE, in Muſick, *Partition*, or the Original Draught of the whole Compoſition, wherein the ſeveral Parts, *viz.* Treble, Second Treble, Baſe, &c. are diſtinctly *ſcored* and marked. See PARTITION.

SCORPIO, in Aſtronomy, the Eighth Sign of the *Zodiac*. See SIGN.

The Stars in *Scorpio*, in *Ptolomy*'s Catalogue are 20; in that of *Tycho* 10; in that of Mr. *Flamſtead* 49: The Longitude, Latitudes, Magnitudes, &c. whereof, are as follow;

Stars in the Conſtellation SCORPIO.

Names and Situations of the Stars.	Signs.	Longitude ° ′ ″	Latitude. ° ′ ″	Magn.

That foll. Ophiu. Foot, N.	♐	20 46 23	1 28 55B	6

SCORPION, an ancient, military Engine, uſed chiefly in the Defence of Walls, &c. called alſo *Scorpio*. *Marcellinus* deſcribes the *Scorpio*, as conſiſting of two Beams bound together by Ropes. From the Middle of the Two, roſe a Third Beam; ſo diſpoſed, as to be pull'd up and let down at Pleaſure; and on the Top of this, were faſten'd Iron Hooks, where was hung a Sling, either of Iron or Hemp. Under the Third Beam lay a Piece of Hair-cloth full of Chaff, tied with Cords. To uſe the Engine, a round Stone was put into the Sling, and Four Perſons on each Side, looſening the Beams bound by the Ropes, drew back the erect Beam to the Hook: When, the Engineer ſtanding on an Eminence, giving a Stroke with a Hammer on the Cord to which the Beam was faſtned with its Hook, ſet it at liberty; ſo that hitting again the ſoft Hair-cloth, it ſtruck out the Stone with a vaſt Force. It had its Name *Scorpio*, becauſe when the long Beam or Tillar was erected, it had a ſharp Top, in manner of a Sting. The more modern Times have given it the Name *Onagar*, Wild Aſs, becauſe that Animal, when hunted, flings back Stones.

SCORIA, the Recrement or Droſs of any Metal, remaining after melting, or refining the ſame. The *Scoria* of Iron, is the Scum taken from that Metal in Forges where 'tis melted. See SCUM. *Scoria of Iron*, is alſo the ſulphurous Part of the Iron; which uniting with the ſulphurous Part of the Charcoal, makes together, thoſe porous Maſſes, reſembling Spunges, frequently ſeen in the Smiths Forges.

SCOT or *Scoth*, from the *Saxon Sceas*, a Part or Portion; is a certain Cuſtom or common Tallage, according to *Raſtal*, made to the Uſe of the Sheriff or his Bailiffs; but now ſignifies a cuſtomary Contribution laid upon all Subjects, according to their Ability; for whoever are aſſeſſed to any Contribution, are generally ſaid to pay *Scot and Lot*.

SCOTIA, in Architecture, a Semicircular Cavity or Channel between the Tores, in the Baſes of Columns. See BASE. The *Scotia* has an Effect juſt oppoſite to that of the Quarter-round. Our Workmen frequently call it the *Caſement*. The *Scotia* is a concave, dark Moulding; whence its Name, *viz.* from Σκότος, *Obſcurity*, *Darkneſs*. 'Tis alſo called *Trochilus*, partly from its Form. In the *Corinthian* Baſe, there are Two *Scotias*, the upper whereof is the ſmaller. According to *Filibien*, the *Cavetto* is a fourth Part of the *Scotia*. See CAVETTO.

SCOTISTS, a Sect of School Divines and Philoſophers, thus called from their Founder, *J. Duns Scotus*, an *Iriſh* Cordelier; who maintained the immaculate Conception of the Virgin; or, that ſhe was born without Original Sin; in Oppoſition to *Thomas Aquinas* and the *Thomiſts*. See THOMIST. As to Philoſophy, the *Scotiſts*

tists were, like the *Thomists*, Peripateticks; only distinguish'd by this, That in each Being, as many different Qualities as it had, so many different Formalities did they distinguish; all distinct from the Body itself; and making, as it were, so many different Entities: Only those Metaphysical, and, as it were, superadded to the Being. See PERIPATETICKS.

SCOTOMY, in Medicine, a Dizziness, or Swimming in the Head, wherein the Animal Spirits are so whirl'd about, that external Objects seem to turn round. See VERTIGO.

SCRATCHES, among Farriers, a Distemper incident to Horses, consisting of dry Scabs, Chops or Rifts, that breed between the Heel and the pastern Joint. There are various kinds of *Scratches*, distinguish'd by various Names, as *Crepances*, *Rats-Tails*, *Mules*, *Kibes*, *Pains*, &c. which are all so many Species of *Scratches*; Engender'd from some dry Humour falling on the Legs, or from the Fumes of his own Dung lying under his Heels, or near them; or for Want of rubbing his Heels, especially after a Journey, from over hard-riding, &c. It begins first, with dry Scabs in the pastern Joint, in several Forms. 'Tis known by the staring, dividing and curling of the Hair on the Spot.

SCRATCH-WORK, in *Italian*, *Sgrafitti*, was a Way of Painting in Fresco, by preparing a black Ground, on which was laid a white Plaister; which White being taken off with an Iron Bodkin, the Black appear'd through the Holes, and serv'd for Shadows: This kind of Work is lasting; but being very rough, is unpleasant to the Sight.

SCREW, *Cochlea*, in Mechanicks, one of the Five mechanical Powers: Chiefly used in pressing or squeezing Bodies close, though sometimes also in raising Weights. The *Screw* is a right Cylinder, as A B, (Tab. Mechanicks Fig. 11.) furrow'd Spiral-wise. 'Tis generated by the equable Motion of a right Line F G, around the Surface of a Cylinder; while, at the same Time, the Point I, descends equably from F towards G. If the furrow'd Surface be convex, the *Screw* is said to be *Male*; if concave, 'tis *Female*. Where Motion is to be generated, the *Male* and *Female Screw* are always joined; that is, whenever the *Screw* is to be used, as a simple Engine, or mechanical Power. When joyned with an Axis in Peritrochio, there is no Occasion for a *Female*; but in that Case, it becomes part of a compound Engine.

Doctrine of the SCREW.

1° If, as the Compass described by the Power in one Turn of the *Screw*, is to the Interval or Distance between any two immediate Threads or spiral Windings, as B I (measured according to the Length of the *Screw*) so is the Weight or Resistance to the Power; then the Power and the Resistance will be equivalent one to the other, and, consequently, the Power being a little increased, will move the Resistance.

For 'tis evident, that in one Turn of the *Screw*, the Weight is so much lifted up, or the Resistance so much removed, or the Thing to be press'd, is squeezed so much closer together, as is the Distance between two immediate Spirals; and in the same Time, the Power to be moved is so much, as is the Compass, describ'd by the said Power in one Turn of the *Screw*. Wherefore the Velocity of the Weight (or whatsoever answers thereto) will be to the Velocity of the Power, as is the said Distance between the Spirals to the Compass described by the Power, in one Revolution or turning round of the *Screw*: So that the gaining in Power, is here recompensed by the Loss in Time.

2° As the Distance between two Threads, B I, is less; the Power required to overcome the said Resistance is less; therefore the finer the Thread, the easier the Motion.

3° If the *Male Screw* be turned in the *Female*, at rest, a less Power will be required to overcome the Resistance, as the Lever or Scytala, B D (Fig 12) is the longer.

4° The Distance of the Power from the Centre of the *Screw*, C D; the Distance of two Threads I K, and the Power to be applied in K, being given, to determine the Resistance it will overcome: Or, the Resistance being given to find the Power necessary to overcome it;

Find the Periphery of a Circle described by the Radius C D: Then to the Distance between the two Threads, the Periphery just found, and the given Power: Or, to the Periphery found, the Distance of the two Threads and the given Resistance, find a Fourth proportional. This in the former Case, will be the Resistance that will be overcome by the given Power; and in the latter, the Power necessary to overcome the given Resistance.

E. gr. Suppose the Distance between the two Threads, 3, the Distance of the Power from the Centre of the *Screw* C D, 25, and the Power 30 Pounds; The Periphery of the Circle to be described by the Power, will be found 157. Therefore, as 3, 157, 30, 1570, the Weight to which the Resistance is equal.

5° The Resistance to be overcome by a given Power, being given; to determine the Diameter of the *Screw*, the Distance of the two Threads I K, and the Length of the Scytala or Handle: The Distance of the Threads, and the Diameter of the *Screw* may be assumed at pleasure, if the *Male* be to be turned in the *Female* by a Handle. Then, as the given Power is to the Resistance it is to overcome, so is the Distance of the Threads to a fourth Number, which will be the Periphery to be described by the Handle C D, in a Turn of the *Screw*. The Semi-diameter of this Periphery, therefore being sought, we have the Length of the Handle C D. But if the *Female Screw* be to be turn'd about the *Male*, without any Handle; then the Periphery and Semi-diameter found, will be very nearly those of the *Screw* required.

E. gr. Suppose the Weight 6000, the Power 100, and the Distance of the Threads 2 Lines; for the Periphery to be passed over by the Power, say, As, 100, 6000: 2, 120; The Semi-diameter of which Periphery being ⅓ of 120 = 40 Lines will be the Length of the Handle, if any be used; otherwise the Side of the *Female Screw* must be 40 Lines.

Endless SCREW. If a *Screw* be so fitted as to turn a Wheel D F (Fig. 13) it is called an *Endless*, or *perpetual Screw*; in regard it may be turned for ever, without coming at any End. From the Scheme, 'tis evident enough, that while the *Screw* turns once round, the Wheel only advances the Distance of one Tooth.

Doctrine of the Endless SCREW.

1° If the Power applied to the Lever, or Handle of an *Endless Screw* A B, be to the Weight, in a *Ratio* compounded of the Periphery of the Axis of the Wheel E H, to the Periphery described by the Power, by turning the Handle; and of the Revolutions of the Wheel D F, to the Revolutions of the *Screw* C B; the Power will be equivalent to the Weight.

Hence, 1° as the Motion of the Wheel is exceedingly slow; a small Power may raise a vast Weight, by means of an *Endless Screw*: For this Reason, the great Use of the *Endless Screw*, is either where a great Weight is to be raised through a little Space; or, where a very slow, gentle Motion is required. On which Account 'tis very useful in Clocks and Watches.

2° The Number of Teeth; the Distance of the Power from the Centre of the *Screw* A B, the Radius of the Axis H F, and the Power, being given; To find the Weight it will raise;

Multiply the Distance of the Power from the Centre of the *Screw* A B, into the Number of Teeth: The Product is the Space of the Power past'd through, in the Time the Weight passes through a Space equal to the Periphery of the Axis. Find a Fourth proportional to the Radius of the Axis; the Space of the Power now found, and the Power. This will be the Weight the Power is able to sustain. Thus, if A B = 3, the Radius of the Axis H F = 1; the Power 100 Pounds; Number of Teeth of the Wheel D F 48; the Weight will be found 14400; whence it appears, that the *Endless Screw* exceeds all others, in increasing the Force of Powers.

Archimedes's SCREW, or the *Spiral Pump*, a Machine for the Raising of Water, invented by *Archimedes*. Its Structure is as follows; A leaden Tube is wound round a Cylinder A B (Tab. Hydraulicks Fig. 1.) after the same Manner as the spiral Thread is drawn in the common *Screw* above described. This Cylinder is inclined to the Horizon, in an Angle of about 45 Degrees, and the Orifice of the Tube B immerged under Water. If then, the *Screw* be turned about by the Handle I, against the Water; the Water will rise up the Spiral, and at length be discharged in A.

This Machine, with a very little Force, is able to raise a great Quantity of Water: Whence 'tis found of good Use, in the emptying of Lakes, &c. If the Water be to be raised to any considerable Height, one *Screw* will not suffice; but the Water drawn up by one, is to be taken by another, and so successively.

SCRIBE, a principal Officer in the *Jewish* Law, whose Business was to write and interpret Scripture. We find no mention of *Scribes*, in the *Old Testament*, before *Esdras*; whence some Learned Men have construed, That the Office was brought from *Chaldea*, and *Assyria*, and first established by the *Jews* after their Return from the *Babylonish* Captivity. The *Scribes* were in great Credit and Esteem among the *Jews*, and had even the Precedency of the Priests, and Sacrificers: Indeed, there were three Kinds of *Scribes*, whereof those just mention'd, properly called *Scribes of the Law*, were the first, and most con-

conſiderable. The Deciſions of theſe were received with the ſame Reſpect as the Law of God itſelf. The ſecond Kind, properly called *Scribes of the People*, were a Kind of Magiſtrates, among the *Greeks*, as well as among the *Jews*. The third Kind were publick Notaries, or Secretaries of the Council: Theſe were the leaſt conſiderable.

SCRIBE, *Scriba*, was alſo an Officer, among the *Romans*, who wrote Decrees, or Acts, and gave out Diſpatches. Every Magiſtrate had his *Scriba* or Secretary, ſo that there were *Scribæ Edilitii*, *Prætorii*, *Quæſtorii*, &c. They were not admitted to the Management of the principal Offices of the Republick, unleſs they relinquiſhed their Profeſſion. In the Time of the Emperors, they were alſo called *Notarii*, becauſe they made uſe of Abbreviations, and ſhort Notes in Writing. See NOTARY.

SCRIBING, in Joinery, &c. A Term uſed, when one Side of a Piece of Stuff being to be fitted to the Side of ſome other Piece, which laſt is not regular; to make the Two, then, join cloſe together all the Way, they *Scribe* it, thus: That is, they lay the Piece of Stuff to be *Scribed* cloſe to the other Piece they intend to *Scribe* to, and open their Compaſſes to the greateſt Diſtance the two Pieces any where ſtand from each other; then, bearing one of the Legs againſt the Side to be *Scribed* to, with the other Point they draw a Line on the Stuff to be *Scribed*: Thus have they a Line on the irregular Piece parallel to the Edge of the regular One; and if the Stuff be wrought away exactly to the Line, when the two Pieces are put together, they will ſeem a Joint.

SCRIPTUARY, among the *Jews*. See CARAITES.

SCRIPTURE, or *Scriptures*. See BIBLE.

SCROBICULUS CORDIS, the ſame as ANTICARDIUM; which ſee.

SCROPHULÆ, in Medicine, Schirrhous Tumours, ariſing uſually about the Neck, and ſometimes on other glandulous Parts, called alſo *Strumæ*, and popularly the *King's Evil*, or ſimply, the *Evil*. See EVIL. The Word is *Latin*, formed by Diminution, from *Scropha*, Sow.

SCROTUM, or *Scroton*, in Anatomy, the common *Capſula* or Membrane, wherein the Teſticles are contained; thus called from its reſembling a Pouch or Purſe of Leather, called by the Ancients *Scortea*. The *Scrotum* conſiſts of two Membranes; the Exterior whereof is only a Production of the Cuticula or Cutis, which is here very thin, and without any Fat underneath it. The Inner, called *Dartos*, is only an Expanſion of the *Panniculus Carnoſus*, which, together with the Cutis, is drawn into the Figure of a Purſe, externally. 'Tis divided longitudinally into two Parts, right and left, by a Line, called the *Seam* of the *Scrotum*; anſwering to which inwardly is a Membrane, called the *Septum*, which divides the Cavity into two Parts, being only a Production of the *Dartos*. 'Tis diviſible into Lamellæ, and the Teſticles are on each Side looſely connected to it by means of their outer proper Tunic. Its Uſe is to ſuſtain them, prevent their Colliſion, as alſo their falling too low, and to promote the *Corrugation* of the *Scrotum*. See TESTICLE.

SCROTUM CORDIS, the ſame as PERICARDIUM; which ſee.

SCROWLS, in Architecture. See VOLUTES.

SCRUPLE in Chronology. The *Chaldee Scrupule* is $\frac{1}{1080}$ Part of an Hour; called, by the *Hebrews*, *Helakim*. Theſe *Scruples* are much uſed by the *Jews*, *Arabs*, and other Eaſtern People.

SCRUPLES, in Aſtronomy. *Scruples* eclipſed are that Part of the Moons Diameters which enters the Shadow, expreſſed in the ſame Meaſure wherein the apparent Diameter of the Moon is expreſſed. See DIGIT.

SCRUPLES of half Duration, are an Arch of the Moon's Orbit, which the Moon's Centre deſcribes from the Beginning of the Eclipſe to its Middle. See ECLIPSE.

SCRUPLES of Immerſion, or Incidence, are an Arch of the Moon's Orbit, which her Centre deſcribes from the Beginning of the Eclipſe, to the Time when its Centre falls into the Shadow. See IMMERSION.

SCRUPLES of Emerſion, are an Arch of the Moon's Orbit, which her Centre deſcribes in the Time from the firſt Emerſion of the Moon's Limb, to the End of the Eclipſe. See EMERSION.

SCRUPULUS, *Scruple*; the leaſt of the Weights uſed by the Ancients; and amongſt the *Romans* was the Twenty-fourth Part of an Ounce. See OUNCE.

SCRUPLE is ſtill a Weight among us, containing the Third Part of a Dram, or 20 Grains. See GRAIN. Among Goldſmiths, the *Scruple* is 24 Grains. See WEIGHT.

SCRUTOIR, *Scritory*, from the *French Eſcritore*, a kind of long Cabinet, with a Door or Lid opening downwards, for the Conveniency of Writing on, &c.

SCRUTINY, in Antiquity, an Examination, or Probation, performed in the laſt Week of *Lent*, with regard to the Catechumens who were to receive Baptiſm on *Eaſter* Day. The *Scrutiny* was practiſed with a great many Ceremonies. Exorciſms and Prayers were made over the Heads of the Catechumens. Palms were given them on the *Sunday*, with the Lord's Prayer, and the Creed; which they were afterwards made to rehearſe. The Proceſs was called *Scrutinium*, *Scrutiny*; becauſe hereby the Hearts of the Catechumens were *ſcrutinized*, or ſearched, that the Prieſts might underſtand who were fit to be admitted to Baptiſm. This Cuſtom was more in Uſe in the Church of *Rome* than any where elſe: Though it appears, by ſome Miſſals, to have been likewiſe uſed, though much later, in the *Gallican* Church. 'Tis ſuppoſed to have ceaſed about the Year 860.

SCRUTINY is alſo uſed, in the Canon Law, for a Ticket, or little Paper Billet, wherein, at Elections, the Electors write their Notes privately, ſo as it may not be known for whom they vote.

Among us, *Scrutiny* is chiefly uſed for a ſtrict Peruſal, and Examination of the ſeveral Votes haſtily taken at an Election; in order to find out any Irregularities committed therein, by unqualified Voters, &c.

SCULK, (amongſt Hunters) is a Company; as, A *Sculk* of Foxes.

SCULPTURE, the Art of Cutting, or Carving Wood, Stone, or other Matter, to form various Figures for Repreſentations; as alſo of faſhioning Wax, Earth, Plaiſter, &c. to ſerve as Models, or Moulds, for the Caſting of Metal Figures. *Sculpture*, in its Latitude, includes both the Art of working in Creux, properly called *Engraving*, and of working in Relievo, which is what we ſtrictly call *Sculpture*. See ENGRAVING.

The Antiquity of this Art is paſt Doubt; as the Sacred Writings, the moſt ancient and authentic Monuments we have of the earlieſt Ages, mention it in ſeveral Places: Witneſs *Laban*'s Idols ſtollen away by *Rachel*, and the Golden Calf which the *Iſraelites* ſet up in the Deſart, &c. But 'tis very difficult to fix the Original of the Art, and the firſt Artiſts, from prophane Authors; what we read thereof, being intermixed with Fables, after the Manner and Taſte of thoſe Ages: Some make a Porter of *Sicyon*, named *Dibutades*, the firſt Sculptor. Others ſay, The Art had its Origin in the Iſle of *Samos*, where one *Ideocus* and *Theodorus*, perform'd Works of this Kind, long before *Dibutades*'s Time. 'Tis added, That *Demuratus*, Father of *Tarquin the Elder*, firſt brought it into *Italy* upon his retiring thither; and that by Means of *Enciropus* and *Entygramma*, Two excellent Workmen herein, who communicated it chiefly to the *Tuſcans*; among whom it was afterwards cultivated with great Succeſs. They add, That *Tarquin* ſent for *Tauranius*, one of the moſt eminent among them, to *Rome*, to make a Statue of *Jupiter*, &c. of baked Earth; for the Frontiſpiece of the Temple of that Deity. About this Time, there were many *Sculptors*, both in *Greece* and *Italy*, who wrought altogether in Earth. Some of the moſt noted, are, *Caliſthenes*, an *Athenian*, who made himſelf and his Houſe famous, by the great Number of Earthen Figures he adorned it withal. *Demophilus* and *Gorſanus*, two Painters, who inrich'd the Temple of *Ceres* with great Variety of Painting and Earthen Images. In effect, all the firſt Statues of the Heathen Deities, were either of Earth or Wood; and 'twas not ſo much any Frailty of the Matter, or Unfitneſs for the Purpoſe, as the Riches and Luxury of the People, that firſt induced them to make them of Marble, and other more precious Stones. Indeed, how rich ſoever the Matter were, whereon they wrought, yet they ſtill uſed Earth, to form Models thereof. And to this Day, whether they be for cutting Marble Statues with the Chiſſel, or for caſting them in Metal, they never undertake the one or the other, without firſt making a perfect Model thereof in Earth. Whence, doubtleſs, aroſe the Obſervation of *Praxiteles*, That the Art of Moulding Earthen Figures, was the natural Mother of that of making Marble and Metal Figures; which laſt never appeared in Perfection, till about 300 Years after the Building of *Rome*; though the Firſt was at its Height long before.

Phidias of *Athens*, who came next, ſurpaſs'd all his Predeceſſors, both in Marble, in Ivory and Metals: And about the ſame Time, appeared ſeveral others, who carried *Sculpture* to the higheſt Perfection it ever arrived at; particularly *Policletes* at *Sicyon*; then *Myron*; *Lyſippus*, who alone was allowed the Honour of caſting *Alexander*'s Image in Braſs. *Praxiteles* and *Scopas*, who made thoſe excellent Figures, now before the *Pope*'s Palace at *Montecavallo*: *Briaxis*, *Timotheus* and *Leochares*, who, with *Scopas*, wrought at the famous Tomb of *Mauſolus* King of *Caria*; *Ceſiſodorus*, *Canachus*, *Dedalus*, *Burbieus*, *Nyceratus*, *Euphanor*, *Theodorus*, *Xenocrates*,

crates, *Phiromachus*, *Stratonicus*, *Antigonus*, who wrote on the Subject of his Art; the famous Authors of the *Laocoon*, viz. *Ageſander*, *Polydore*, and *Athenodorus*, and infinite others, the Names of ſome whereof have paſſed to Poſterity; thoſe of others have periſhed with their Works: For though the Number of Statues in *Aſia*, *Greece*, and *Italy*, were ſo immenſe, that in *Rome* alone, as we are informed, there were more than there were living Perſons, yet we have but very few now left, at leaſt very few of the fineſt. When *Marcus Scaurus* was Ædile, his Office obliging him to provide what was requiſite towards the Publick Rejoycings, he adorned the ſtately Theatre, which he erected, with 3000 Brazen Statues; and though *L. Mummius*, and *Lucullus*, brought away a great Number out of *Aſia* and *Greece*, yet, there were ſtill above 3000 remaining in *Rhodes*, as many at *Athens*, and more at *Delphi*: but what is moſt extraordinary, is the Bigneſs of the Figures, which thoſe ancient Artiſts had the Courage to undertake. Amongſt thoſe *Lucullus* brought to *Rome*, there was one of *Apollo*, 30 Cubits high; the *Coloſſus* of *Rhodes*, made by *Cares* of *Lyndos*, the Diſciple of *Lycippus*, far exceeded it; *Nero*'s Statue, made by *Xenodorus*, after that of *Mercury*, was alſo of an extraordinary Size, being 110 Feet high: *Sculpture*, however, did not continue above 150 Years, after *Phidias*'s Time, till it began inſenſibly to decline; not, but that there were ſtill ſome fine Pieces of Workmanſhip both in *Greece* and *Italy*, though not performed with ſo good a Fancy, and ſuch exquiſite Beauty.

Beſides that the *Greek* Statues are moſt eſteemed for the Work; there is a ſpecial Difference between them, and thoſe of the *Romans*: in that the greateſt Part of the firſt are naked, like thoſe who wreſtle or perform ſome other bodily Exerciſe, wherein the Youth of thoſe Times placed all their Glory; whereas, the others are clad or armed, and particularly have the *Toga* on, which was the greateſt Mark of Honour amongſt the *Romans*.

To perform any thing in the Way of *Sculpture*, they begin with making a Model of Earth, or Wax. For Earthen Models, they uſe but few Inſtruments: Their Hands and Fingers do almoſt the Whole For Waxen Models, to a Pound of Wax they put half a Pound of Colophony; ſome add Turpentine, melting the Whole with Oil of Olive: Some add a little Vermillion, or other Matter, to give it a Colour. 'Tis wrought and molded with the Fingers, like Earthen Models.

Sculpture *in Wood.*

For *Sculpture* in Wood, which we properly call *Carving*, the firſt Thing required, is, to chuſe a Wood proper for the particular Kind of Work. If it be any thing large, and require a deal of Strength and Solidity, the hardeſt and moſt durable Wood is to be choſen, as Oak or Cheſnut. For ſmaller Works they uſe Pear-tree, and Service-tree; but as theſe Woods are very hard, for little delicate Works they uſe ſofter Woods, only cloſe, and of a fine Grain: Such is the Linden-tree, which the Chiſſel is found to cut more eaſily, and cleanly, than any other Wood.

As to Statues, we find the Ancients have made them of almoſt all Kinds of Wood. At *Sicyon* was an Image of *Apollo* in Box; at *Epheſus*, that of *Diana* was in Cedar. As theſe two Kinds of Wood are very hard, and even held incorruptible, eſpecially Cedar; *Pliny* obſerves, they were judged particularly expedient for Repreſentations of the Deities. In a Temple, on Mount *Cyllenus*, dedicated to *Mercury*, was an Image of that God form'd of the Wood of the Lemon-Tree: Others there were of the Palm-Tree, Olive-Tree, Ebony, and even of the Vine.

For large Works, if it be only ſingle Figures, 'tis better they conſiſt of ſeveral Pieces, than of a ſingle one, by reaſon of the Liableneſs of the latter to warp; for every large Piece may probably not be dried to the Heart, however it may appear without Side. Obſerve, that the Wood will not be fit for working, till after it have been cut at leaſt ten Years.

Sculpture *in Marble, and other Stones.*

The firſt Thing they do, is out of a great Block of Marble to ſaw another of the Size required, which is performed with a ſmooth Steel Saw without Teeth, caſting Water and Sand thereon, from Time to Time: Then they faſhion it, by taking off what is ſuperfluous with a ſtubbed Point, and a heavy Mallet; after this, bringing it near the Meaſures required, they bring it ſtill nearer with another finer Point. They now uſe a flat cutting Inſtrument, having two Notches in its Edge, or three Teeth; then a Chiſſel to take off the Scratches the former has left. This laſt Inſtrument they uſe with a deal of Delicacy, giving thereby a Softneſs, and Tenderneſs to their Figure; till, at length, taking Raſps of different Degrees of Fineneſs, by degrees they bring their Work into a Condition for Poliſhing. To Poliſh, or make the Parts ſmooth and ſleek, they uſe Pumice-Stone, and Smalt; then Tripoli, and when a ſtill greater Luſtre is required, a Skin and burnt Straw.

When any conſiderable Work is undertaken, as a Statue, Baſſo Relievo, or the like, they always make a Model, before-hand, of Clay; but as this ſhrinks in drying, and eaſily cracks and breaks, they only uſe it to make a Mould of Plaiſter, or Stucco, wherein they make a Figure of the ſame Matter, which ſerves them thenceforth for a Model, and by which they adjuſt all their Meaſures and Proportions. To proceed the more regularly, on the Head of the Model they place an immoveable Circle, divided into Degrees, with a moveable Ruler, or Index, faſtened in the Centre of the Circle, and divided likewiſe into equal Parts. From the End of the Ruler hangs a Thread with a Plummet, which ſerves to take all the Points to be transferr'd thence to the Block of Marble, from whoſe Top hangs another Plummet like that of the Model. Indeed there are ſome excellent *Sculptors* who diſapprove of this Method, urging, That he ſmalleſt Motion of the Model changes their Meaſures, for which Reaſon they rather chooſe to take all their Meaſures with the Compaſſes.

For the Caſting of Statues, or Figures, of Metal; and the Moulding of Statues, &c. of Stucco, Plaiſter, &c. *See* Statue.

SCUM, a light Excrement, ariſing from Liquors when briskly ſtirred, called *Foam*, or *Froth*: See Froth. The Word is alſo uſed for the Impurities which a Liquor by boiling caſts up to the Surface; and alſo, for thoſe taken from off Metals when infuſed; called alſo *Droſs*.

Scum *of Lead* is a Kind of Smalt of various Colours, produced from the Smoak of Lead. See Lead.

Scum *of Silver* is what we commonly call *Litharge* of Silver. See Litharge.

Scum of *Nitre*, Scum of *Salt*, } See { Salt-Petre. Salt.

SCURVY, in Medicine, a Diſeaſe called by the Phyſicians *Scorbutus*. See Scorbutus.

M. *Poupart*, in the Memoirs of the *French* Academy, gives us a very accurate Hiſtory of a particular Kind of *Scurvy*, very frequent in *Paris* in the Year 1699. The Symptoms, and Conſequences, of this new *Scurvy* were very extraordinary; and ſoon determined M. *Poupart* to conclude it ſomewhat of that cruel Plague wherewith the *Athenians* were ſo long and ſo dreadfully harraſſed; Yet was it a true *Scurvy*, and the Perſons attacked with it had all the uſual Scorbutic Symptoms.

SCUTAGE, in ancient Cuſtoms; All Tenants who held from the King by Military Service, were either bound to attend perſonally in Wars and Expeditions, or, for Default of ſuch Service, to pay a *Scutage*, or Compoſition in Money, which was levied on every *Scutum Militare*, or Knights Fee, and the proportional Parts for the King's Uſe; and the Barons, and Knights, who then paid a *Scutage* to the King, had a Power to levy the ſame Tax on thoſe Tenants who held from them in Military Service. The *Scutage* was at one, two, or three Marks for each Knight's Fee. See Escuage.

SCUTCHEON. See Escutcheon.

SCUTIFORME OS, in Anatomy, the chief Bone of the Knee, called alſo *Patella*, *Mola*, &c. See Patella.

SCUTIFORMIS CARTILAGO, in Anatomy, one of the *Cartilages* of the *Larynx*, the broadeſt, and biggeſt of them all: Thus called, becauſe in Form of a Shield, or ſquare Buckler, called by the *Greeks* θυρεὸς, whence 'tis alſo called by us *Thyorides*. 'Tis alſo called the *Anterior*, becauſe ſituate in the fore Parts. Tis gibbous without Side, and hollow within: Sometimes double, chiefly in Women, in whom it does not advance ſo far forward as in Men. The People call it *Adam*'s *Apple*, or, *Pomum Adami*. See Pomum, &c.

SCUTTLES in a Ship, are ſquare Holes cut in the Deck, big enough to let in the Body of a Man; to let People down into any Room below, upon Occaſion. They are generally before the Main-maſt, before the Knight in the Fore-caſtle: In the Gun-Room to go down to the Stern-Sheets: In the Round-houſe to go down into the Captain's Cabin, when forced by the Enemy in a Fight aloft. There are alſo ſome ſmaller *Scuttles*, which have Gratings over them, and all of them have Covers

to them, that Men may not tumble in, in the Night. Alſo, thoſe little Windows, and long Holes, which are cut out in Cabins to let in Light, are called *Scuttles*.

SYCRE GEMOT, in ancient Cuſtoms, a Court held twice every Year (as the Sheriffs Turn is at this Day) by the Biſhop of the Dioceſs, and the *Earldorman* (in Shires committed to *Eldormen*) or Sheriff in thoſe committed to Sheriffs, that were immediately under the King. In this Court both the Eccleſiaſtical and Temporal Laws were given in Charge to the County: At firſt it was held thrice every Year. *Edward* the Confeſſor, appointed it to be held twelve Times in the Year. See CONSISTORY.

SCYTALA, in Mechanicks, a Term ſome Writers uſe for a Kind of Radius, or Spoke, ſtanding out from the Axis of a Machine, as a Handle or Lever, to turn it round and work it by. See AXIS in *Peritrochio*.

SCYTALA LACONICA, in Antiquity, a Stratagem, or Invention, of the *Lacedæmonians*, for the ſecret writing of Letters to their Correſpondents, that if they ſhould chance to be intercepted, no Body might be able to read them. To this End they had two Wooden Rollers, or Cylinders, perfectly alike, and equal; one whereof was kept in the City, the other by the Perſon to whom the Letter was directed. For the Letter, a Skin of very thin Parchment was wrapped round the Roller, and thereon was the Matter wrote; which done, 'twas taken off, and ſent away to the Party, who, upon putting it in the ſame manner upon his Roller, found the Lines and Words in the very ſame Diſpoſition, as when they were firſt wrote: This Expedient they ſet a very high Value on, though, in Truth, artleſs, and groſs enough: The Moderns have improved vaſtly on this Method of Writing. See CYPHER.

SEA, in Geography, is frequently uſed for that vaſt Tract of Water incompaſſing the whole Earth, more properly called *Ocean*. See OCEAN.

For the Cauſe of the Saltneſs of the Sea. See SALTNESS.

SEA is more properly uſed for a particular Part or Diviſion of the *Ocean*, denominated from the Countries it waſhes, or other Circumſtances: As, The *Iriſh Sea*, The *Mediterranean Sea*, The *Baltic Sea*, The *Red Sea*, &c.

Till the Time of the Emperor *Juſtinian*, the *Sea* was common, and open, to all Men: Whence it is, that the *Roman* Laws give an Action againſt a Perſon who ſhall prevent, or moleſt, another in the free Navigation, or Fiſhing therein. The Emperor *Leo*, in his 56 Novel, firſt allowed ſuch as were in Poſſeſſion of the Lands, the ſole Privilege of Fiſhing before their reſpective Territories, excluſive of all others: He even gave a particular Commiſſion to certain Perſons, to divide the *Thracian Boſphorus* among them. From that Time the Soveraign Princes have been endeavouring to appropriate the *Sea*, and to withdraw it from the Public Uſe. The Republic of *Venice* pretends to be ſo far Miſtreſs in her Gulf, that there is a formal Marriage, every Year, between that Seignory and the *Adriatic*. In theſe laſt Ages, the *Engliſh* have particularly affected the Empire of the *Sea* in the Channel, and even that of all the *Seas* incompaſſing the Three Kingdoms of *England*, *Scotland*, and *Ireland*, and that as far as the Shores of the neighbouring States. In Conſequence of which Pretenſion it is, that Children born on theſe *Seas* are declared natural *Engliſhmen*, as much as if born on *Engliſh* Ground. The *Juſtice* of this Pretenſion is ſtrenuouſly argued between *Grotius* and *Selden*, in the *Mare Liberum*, and *Marum Clauſum*.

SEA-*Aſtrolabe*, SEA-*Chart*, SEA-*Compaſs*, SEA-*Laws*, SEA-*Quadrant*, See ASTROLABE. CHART. COMPASS. OLERON. BACK-STAFF.

SEA-DRAGS, among Mariners, are ſuch Things as hang over the Ship at Sea, as the Boat, &c. when towed.

SEA-WATER. To make *Sea-water* ſweet, or freſh, is a Thing long and much wanted, for the Advantage of Navigation and Commerce: A Method of doing which has been invented by Mr. *Hauton*, and the Secret publiſhed in the *Philoſophical Tranſactions*. 'Tis perform'd by precipitating the Water with the Oil of *Tartar*, and then diſtilling it: The Oil of *Tartar* he can draw very cheap, and the Diſtillation he performs very compendiouſly, ſo as to gain 24 *French* Quarts of freſh Water in a Day; for the Cooling of which, inſtead of making the Worm paſs through a Veſſel of Water, as uſual, he makes it paſs through a Hole in the Ship into the Sea, and enter in again through another. To the Precipitation, and Diſtillation, he adds a third Operation, *viz.* Filtration, to correct intirely the Malignity of the Water. The Filtration is performed by a peculiar Earth, mixed and ſtirred with the diſtilled Water, and at length ſuffered to ſettle to the Bottom. The Water thus manag'd, is found perfectly wholſom both to Man and Beaſt.

Dr. *Liſter* obſerves, That the *Sea-water* is made freſh by the Breath of Plants growing in it. This he found by putting a Quantity of *Sea-weed* in a Veſſel of *Sea-water*; and fitting the Hole with a head Beek and Receiver, he diſtilled daily, from the Plants, a ſmall Quantity of freſh, ſweet, potable Water: This he takes to be the moſt natural, ſafe, and ſpeedy Way of having freſh Water from the Sea. See WATER.

Mr. *Boyle* relates, from ſome Experiments he procured to be made of the Gravity of *Sea-water*, in different Climates, that ſtill, as you approach nearer the Equator, the *Sea-water* is heavier and heavier, as far as within 30 Degrees thereof, after which it continues much at one.

SEA-YOKE, when the Sea is ſo rough, that the Helm cannot be governed by the Hands, the Seamen make a *Yoke* to ſteer by; that is, they fix two Blocks to the End of the Helm, and reeving two ſmall Ropes through them, which they call *Falls*, by having ſome Men at each Tackle, they govern the Helm by Direction: They have other Ways of making *Sea-Yokes*.

SEAL, *Sigillum*, a Punchion, or Piece of Metal, or other Matter, uſually either round or oval; whereon is engraven the Arms, Device, &c. of ſome Prince, State, Community, Magiſtrate, or private Perſon, with a Legend or Inſcription: The Impreſſion whereof in Wax ſerves to make Acts, Inſtruments, &c. authentic.— The King's *Great-Seal* is that whereby all Patents, Commiſſions, Warrants, &c. coming from the King, are Sealed. The Keeping hereof is in the Hands of the Lord High-Chancellor, who is hence alſo denominated Lord Keeper. Indeed, there is ſome Difference between the Lord Chancellor and Lord Keeper; not in Office, but in the Manner of Creation, the latter being made by the Delivery of the *Great-Seal* to him by the King; but the former having likewiſe a Patent. See CHANCELLOR.——The King's *Privy-Seal* is a *Seal* uſually firſt ſet to Grants that are to paſs the *Great-Seal*. See PRIVY-SEAL.

The Uſe of *Seals* is very ancient. In *Daniel*, *cap.* xiv. we read that *Darius* ſet his Seal on the Temple of *Bel*: But *Seals* are ſtill more ancient; for *Jezabel*, in *Kings*, *cap.* xxi. ſeals the Orders ſhe ſent for *Naboth*'s Death with the King's Ring. In Effect, as the ancient *Seals* were all Engraven on the Collets, Stones, &c. of Rings, and as the Original Uſe of Rings, 'tis aſſerted, was only to be in a Readineſs for the Sealing of Acts, Inſtruments, &c. *Seals* ſhould be as ancient as Rings themſelves. See RING. Theſe Sealing Rings, called *Annuli Signatorii*, *Sigillaricii*, *Cirographi* or *Cerographi*, 'tis ſaid, in ancient Authors, were firſt invented by the *Lacedæmonians*, who, not content to ſhut their Cheſts, Armories, &c. with Keys, added *Seals* to them: And to this End, at firſt, made uſe of Worm-eaten Wood, the Impreſſions whereof they took on Wax, or ſoft Earth: But they at length found the Art of Engraving Figures, or Rings, the Impreſſions of which they took in the ſame Manner. This, however, muſt be granted, that even in *Moſes*'s Time, the Art was known of Engraving, not only on Metals, but alſo on precious Stones. See ENGRAVING. Indeed, it does not appear that the Ring had any other Uſe among the Primitive *Jews* beſides Ornament: At length they were uſed to ſeal Inſtruments, Contracts, Diplomas, Letters, &c. Inſtances whereof we have in the Third Book of *Kings* xxi. 8. *Heſter* viii. 10. *Xenophon. Hellen.* lib. I. *Quint. Curt.* lib. vi. *Juſt.* lib. xliii. cap. iii. where we learn, the Keeping of the Emperor's Seal was become a particular Office. *Lucian* adds, That *Alexander* gave his to *Perdiccas*, thereby appointing him his Succeſſor. *Pliny* obſerves, That in his Time there were no *Seals* uſed any where but in the *Roman* Empire. At *Rome*, he tells us, they were become of abſolute Neceſſity, inſomuch, that a Teſtament was null without the Teſtator's *Seal*, and the *Seals* of Seven Witneſſes: But it does not appear that the *Romans* had any ſuch Things as publick *Seals*; nor that their Edicts, and Contracts, were ſealed, not even in the Times of the Emperors. In *France*, the Cuſtom anciently was, inſtead of ſigning their Inſtruments, &c. only to ſeal them, as appears from an Infinity of ancient Charters, which are not ſigned at all: The Reaſon whereof was, That in thoſe Days very few People were then able to write; no Body could read and write but Clerks. In *England*, the firſt ſealed Charter we find extant, is that of *Edward* the Confeſſor, upon his Founding of *Weſtminſter* Abbey: Yet, we read of *Seals* in the MS. Hiſtory of King *Offa*. Before the Time of *William* the Conqueror, the *Engliſh* did not ſeal with Wax, but only made a Golden Croſs on the Parchment, and ſometimes

times an Impreſſion on a Piece of Lead, which hung to the Grant with a Silken String, and was deemed an abundant Authorizing of the Grant itſelf, without either Signing or Witneſſes. The Colour of the Wax wherewith the King's Grants were ſealed, was uſually Green, to ſignify that the Act continued for ever freſh, and of Force. The uſual Impreſſion on all Laymens *Seals*, till the Year 1218, was a Man on Horſe back, with a Sword in his Hand; afterwards, they began to Engrave their Coats of Arms on their *Seals*: Only the Archbiſhops, and Biſhops, by a Decree of Cardinal *Otto*, who was Legate here in 1237, were to bear in their *Seals*, their Title, Office, Dignity, and even their proper Names. *Du Cheſne* obſerves, that none below the Dignity of a Knight had any Right to a pendant *Seal*, called *Authentic*.

The Emperors long ſealed all their Acts of Importance with a Golden *Seal*; and the *Golden Bull* of *Charles* IV, for the Election of an Emperor, takes its Name from the Gold *Seal* hanging to it, which is called *Bull*. See BULL. The Pope has two Kinds of *Seals*: The firſt uſed in Apoſtolical Briefs, and private Letters, &c. called, the *Fiſherman's Ring*. This is a very large Ring, wherein is repreſented St. *Peter*, drawing his Nets full of Fiſhes. The other is uſed in Bulls, repreſenting St. *Peter*'s Head on the Right, that of St. *Paul* on the Left, with a Croſs between the two: On the Reverſe is ſometimes the Pope's Name, and Arms: The Impreſſions of the firſt *Seal* are taken in red Wax, thoſe of the ſecond, in Lead.

Theod. Hopkingk, a *German* Lawyer, has furniſhed the World with a very learned and curious Work on the Subject of *Seals*: It conſiſts of Sixteen Chapters, the 1ſt. whereof treats of the Name *Seal*, *Sigillum*. 2d. Of the Antiquity of the *Sealing-Rings*, mentioned in *Geneſis*, their Inventors, the Reaſons of bearing them, their Kinds, and Differences, Forms, Ornaments, Hieroglyphicks, Ends, Uſes, Effects, and Abuſes. 3°. Of *Bulls*, in the ſame Method, and under the ſame Circumſtances. 4°. Of different Kinds of *Seals*, which he divides into public and private, proper and foreign, formed and informed, ordinary and extraordinary, known and unknown, true and falſe; and, laſtly, ratificative, and confirmative, of Authority, Solemnity, Teſtimony, and Conſent. 5°. Of ſuch as have a Right to bear *Seals*. 6°. Of the Keeping of *Seals*. 7°. Of Things *Seals* are put to. 8°. Of the Images, Figures, Arms, &c. the Characters, Inſcriptions, and of the Places where the *Seals* are to be ſet, and the Order to be obſerved therein. 9°. Of the Number and Multitude of *Seals*, and the Advantage they bring. 10. Of their Uſe, End, Effects, Force, &c. 11°. Of the Proof of the *Seals* in general and particular, publick and private. 12°. Of the Verifying of *Seals*. 13°. Of the Manner of Cenſuring and Attaching *Seals*. 14°. Of Subſcriptions that have any Regard to *Seals*. 15°. Of other Particulars that have any Regard thereto; as the Signature of Emperors, Kings, Chancellors, Secretaries, and Notaries, all in the ſame Order and Method. The Book was Printed in 1642. at *Nurembergh*, in 4*to*, under the Title of *De Sigillorum Primo & Novo Jure, Tractatus Practicus*, &c. We have another Work of the like Kind, by *Heincujus*, in *Folio*, Printed at *Francfort*, and *Leipſic*, in 1709, under the Title, *De Veteribus Germanorum aliorumq; Nationum Sigillis, eorumq; uſu & præſtantia Syntagma Hiſtoricum*.

Engraving of Seals. See ENGRAVING.

L. Keeper of the *Great-Seal*, } See { CHANCELLOR.
L. Keeper of the *Privy-Seal*, } See { PRIVY-SEAL.
Hermetical-Seal, - - - - - - } See { HERMETICAL.

SEAL is alſo uſed for the Wax or Lead, and the Impreſſion affixed to the Thing ſealed. The Manufacturers *Seal* frequently apply'd to their Stuffs, &c. is of Lead. That of Knights enjoyn'd to be of hard Wax; that of Commiſſioners, of ſoft Wax. Some *Seals* are fixed on by way of Placard, others hung by Silken Strings. The *French* ſeal their Edicts in Green Wax, Arrets in Yellow Wax; Expeditions for *Dauphine* in Red Wax. The Letters of the *French* Academy are ſealed in Blue Wax. See WAX.

SEALER, an Officer in Chancery, appointed by the Lord Chanceller, or Keeper of the Great-Seal, to ſeal the Writs and Inſtruments there made.

SEALING, in Architecture, the fixing a Piece of Wood or Iron in a Wall, with Plaiſter, Mortar, Cement, Lead, or other ſolid Bindings. For Staples, Hinges and Joints, Plaiſter is very proper.

SEAM *of Corn*; is a Meaſure of Eight Buſhels: Of Glaſs, the Quantity of 120 Pounds, or 24 Stone, each Five pound Weight: Of Wood, an Horſe-load.

SEARCE. See SIEVE.

SEARCHER. See ALNEGAR.

SEAR-CLOTH, or *Cere-cloth*, in Chirurgery, an external Remedy ſomewhat harder then an Unguent, yet ſofter than an Emplaſter; though 'tis frequently uſed, both for the one and the other. The *Sear-cloth* is ſuppoſed to have Wax in its Compoſition, which diſtinguiſhes and even denominates it. In effect, when a Liniment or Unguent has Wax in it, it does not differ from a *Sear-cloth*. *Sear-cloths* are a kind of Subſtitutes to Friction, for the raiſing a Salivation. They are uſually compounded of reſolutive Drugs, as Saffron, Myrrh and Aloes, incorporated with Wax and Gums, as Galbanum, Gum Ammoniac, and Sagapenum. The whole temper'd with Wine. The Word *Sear-cloth* is ſuppoſed to be a Corruption of *Cere-cloth*, and to be derived originally from the *Greek* κηρὸς, *Wax*.

SEASONING *of Timber*. See TIMBER.

SEASONINGS, in the *Weſt Indies*, a kind of aguiſh Diſtemper, which Foreigners are much ſubject to at their firſt coming.

SEASONS, in Coſmography, certain Portions or Quarters of the Year, diſtinguiſh'd by the Signs the Sun enters, or by the meridian Altitudes of the Sun; conſequent on which, are different Temperatures of the Air, different Works in Tilling the Ground, &c. The Year is divided into Four *Seaſons*, *Spring*, *Summer*, *Autumn*, and *Winter*. The Beginnings and Endings of each whereof, ſee under its proper Article. 'Tis to be obſerved, the Seaſons anciently began differently from what they now do: Witneſs the old Verſes,

Dat Clemens Hyemem; dat Petrus Ver Cathedratus;
Æſtuat Urbanus; Autumnat Bartholomæus.

The Word is form'd on the *French*, *Saiſon*, which *Menage* derives from the *Latin*, *Statio*, whence the *Italians* have form'd *Stagione*. *Nicod* derives it from *Satio*, *Tempus Sationis*, *Sowing Time*.

SEAT, in Medicine. See ANUS or FUNDAMENT.

SEBARAI, or *Sebaraen*, a Name the *Jews* gave to ſuch of their Rabbins or Doctors, as lived and taught ſome time after the finiſhing of the Thalmud. The Word is derived from סבר, *Sabar*, I think, whence סבבא, *Sebara*, Opinion, Sentiment; and thence סברא, *Sebari*, or *Sebaraen*, Opinionative. The Reaſon of this Appellation, ſay the Rabbins, is, That the Thalmud being finiſh'd, publiſh'd and receiv'd in all the Schools and Synagogues, theſe Doctors had nothing to do, but diſpute for and againſt the Thalmud and its Deciſions. Others ſay, 'twas becauſe their Sentiments were not received as Laws, or Deciſions; as thoſe of the *Miſchnic* and *Gemaric* Doctors were; but were held as mere Opinions. Others, as the Author of *Schalſcheleth Hakkabala*, Chain of Tradition, tell us, That the Perſecution, the *Jews* underwent in thoſe Times, not allowing them to teach quietly in their Academies, they only propoſed their Opinion on the Compoſition of the Miſchna. The firſt and Chief of the *Sebarai*, was *R. Joſi*, who began to teach in the Year 787 of the Æra of Contracts; which, according to *R. David Gautz*, falls on the Year of the World 4236; and who, according to *R. Abraham*, was 38 Years Preſident of the *Jewiſh* Academy. This Æra of Contracts is the ſame with that of the *Seleucides*, the 787th Year whereof, falls on the Year of *Chriſt* 476, which of conſequence, is the Æra of the Origin of the *Sebardi*; whoſe Reign did not hold long: *Buxtorf* ſays, not above 60 Years; but *R. Abraham* and others, not 50. The laſt of them was *R. Simona*. They were ſucceeded by the *Gaons* or *Geonim*.

SEBESTUM, or *Sebeſtens*, in Pharmacy, &c. a Fruit reſembling a little Plumb; which when ripe, is of a deep red Colour, bordering on Black; very ſweet, and the Fleſh, or Pulp, glutinous, or ſticky. The *Syrians* make a kind of Glue or Birdlime, of the *Sebeſtum*, called *Glue of Alexandria*. The Fruit is eſteem'd Pectoral; but is little uſed in Medicine. The Stone within it is Triangular. It brought its Name from *Arabia*, whence *Pliny* obſerves it came in his Time into *Italy*.

SEBUÆI, a Sect among the ancient *Samaritans*. St. *Epiphanius* accuſes them of changing the Time expreſs'd in the Law, for the Celebration of the great annual Feaſts of the *Jews*. *Serrarius* conjectures, That they were thus call'd, from their celebrating the Feaſt of the Paſſover on the Seventh Month, called by the *Hebrews*, *Seba*, Seventh. *Douſius* rather takes them to have been denominated from *Sebaia*, the Leader of a Sect among the *Samaritans*; as the Followers of *Doſitheus*, were denominated *Doſithæi*; which two Sects, ſome *Jewiſh* Doctors ſuppoſe, to have ſubſiſted at the ſame Time. *Scaliger* derives the Name from the *Hebrew*, *Sebua*, Week; as, who ſhould ſay, *Hebdomadites*, becauſe of their celebrating every Second Day of the Seven Weeks, between *Eaſter* and

and *Whitſuntide*. Yet *Scaliger*, in his Anſwer to *Serrarius*, gives a different Explication. In effect, all that has hitherto been advanced on this Point, is mere Conjecture.

SECANT, in Geometry, a Line that *cuts* another, or divides it into Two Parts: Thus the Line A M (Tab. Geometry Fig. 12) is a *Secant* of the Circle A E D, &c. as it cuts the Circle B. 'Tis demonſtrated by Geometers; 1° That if ſeveral *Secants* M A, M N, M E, &c. be drawn from the ſame Point M, that paſſing through the Centre M A, is the greateſt, and the reſt are all ſo much the leſs, as they are more remote from the Centre. On the contrary, the Portions thereof without the Circle M D, M O, M B, are ſo much the greater, as they are further from the Centre. The leaſt, is that of M A, which paſſes through the Centre. 2° That if Two *Secants* M A and M E, be drawn from the ſame Point M; the *Secant* M A, will be to M E as M D to M B. See TANGENT.

SECANT, in Trigonometry, a right Line, drawn from the Centre of a Circle, which *cutting* the Circumference, proceeds, till it meets with a Tangent, to the ſame Circle. Thus the Line F C (Tab. Trigonometry Fig. 1.) drawn from the Centre C, till it meet the Tangent E F, is call'd a *Secant*, and particularly the *Secant of the Arch* A E, to which F E is a Tangent. The *Secant* of the Arch A H, which is the Complement of the former Arch to a Quadrant, is call'd the *Co-Secant*, or *Secant of the Complement*.

The Sine of an Arch A D, being given; To find the *Secant* thereof F C, the Rule is, As the Co-ſine A D C is to the Sine A D, ſo is the whole Sine E C, to the *Secant* C F.

To find the Logarithm of the *Secant* of any Arch: The Sine of the Complement of the Arch being given; multiply the whole Sine of the Logarithm by Two, and from the Product ſubtract the Logarithm of the Sine Complement, the Remainder is the Logarithm of the *Secant*. See LOGARITHM.

Line of SECANTS. See SECTOR.

SECOND *in Anatomy*. See SECUNDI GENERIS.

SECOND *in Geometry, Aſtronomy*, &c. the Sixtieth Part of a Prime or Minute; either in the Diviſion of Circles, or in the Meaſure of Time. A Degree, or an Hour, are each divided into 60 Minutes, marked thus ': A Minute is ſubdivided into 60 *Seconds*, marked thus "; a *Second* into 60 Thirds, marked thus "', &c. See DEGREE. We ſometimes ſay a *Second Minute*, a *Third Minute*, &c. but more uſually, ſimply *Second, Third*, &c. A Pendulum Three Feet Three Inches, and two Tenths of an Inch long, vibrate's *Seconds*: According to Sir *Jonas Moor*'s Reduction of *Huygen*'s Three Feet Eight Lines and an Half of *Paris* Meaſure, to *Engliſh* Meaſure. See PENDULUM.

SECOND *in Muſick*, one of the muſical Intervals; being only the Diſtance between any Sound, and the next neareſt Sound; whether higher or lower. See INTERVAL. As in the Compaſs of a Tone, there are reckoned Nine ſenſible, different Sounds, which form thoſe little Intervals, call'd *Commas*; one might, in ſtrictneſs, ſay, there are Eight kinds of Seconds. But as theſe minute Intervals, though ſenſible, are not yet ſo far ſo, as to contribute much to the Harmony, they uſually only diſtinguiſh four Sorts. The Firſt called, *The diminiſh'd Second*, containing Four Commas, and is the Difference, for Inſtance of a natural *ut*, and an *ut* raiſed four Commas higher. The Second, call'd *Second Minor*, contains Five Commas, and is made either naturally, as from *mi* to *fa*, or from *ſi* to *ut*; or accidentally, by means of *b*, as from *ta* to *ſi*, *b flat*; or from *fa dieſis* to *ſol*; otherwiſe called a *Major Semitone*, or *imperfect Second*, or *Italian Semitone*. The Third is the *Major Second*, containing the Nine Commas, which compoſe the Tone. This the *Italians* call *Tono* or *perfect Second*. The Fourth is the *Second Redundant*, compoſed of a whole Tone and a minor Semitone.

SECOND *Terms*, in Algebra, thoſe where the unknown Quantity has a Degree leſs than it has in the Term where 'tis rais'd to the higheſt. The Art of throwing theſe *Second* Terms out of an Equation; that is, of forming a new Equation, where they have no Place, is one of the moſt ingenious and uſeful Inventions in all Algebra. See REDUCTION *of Equations*.

SECOND *Captain*, is a reform'd Captain, who acts as Lieutenant of another, into whoſe Company he is Incorporated. See CAPTAIN.

SECOND *Cauſe*. See CAUSE; and EFFICIENT.

SECOND *Sight*, an odd Qualification, many of the Inhabitants of the Weſtern Iſlands of *Scotland* are ſaid to be poſſeſs'd of. We have the Thing ſo well attested by ſo many credible Authors (the lateſt of whom is Mr *Martin*, the Ingenious Author of the natural Hiſtory of theſe Iſlands, and a Member of the *Royal Society*) that, notwithſtanding the Quaintneſs of the Thing, there is ſcarce Room to call it in Queſtion. The *Second Sight*, is a Faculty of ſeeing Things to come, or Things doing at a great Diſtance, repreſented to the Imagination as if actually viſible and preſent. Thus if a Man be dying, or about to die, his Image ſhall appear diſtinctly in its natural Shape, in a Shroud, and with other funeral Apparatus, to a *Second Sighted* Perſon, who, perhaps, never ſaw his Face before: Immediately after which, the Perſon ſo ſeen, certainly dies. This Quality of *Second Sightedneſs*, is not hereditary: The Perſon who has it, cannot exert it at pleaſure; nor can he prevent it, or communicate it to another; but it comes on him involuntarily, and exerciſes itſelf on him arbitrarily. And often, eſpecially in the younger *Second Seers*, to their great Trouble and Terror. There are a great Number of Circumſtances attend theſe Viſions, by Obſervation whereof, the particular Circumſtances as to Time, Place, &c. of the Death of the Perſon, are learnt. The Method of judging of them, or interpreting them, grows into a kind of Art; which is very different in different Perſons. *Second Sightedneſs*, is held a Diſcredit among them; ſo that none will counterfeit it; many conceal and diſſemble it.

SECONDARY *Circles*, in reference to the Ecliptick, or Circles of Longitude of the Stars, are ſuch, as paſſing through the Poles of the Ecliptick, are at right Angles to the Ecliptick (as the Meridian and Hour Circles are to the Equinoctial). By the Help of theſe, all Points in the Heavens are referred to the Ecliptick; that is, any Star, Planet or other Phænomenon, is underſtood to be in that Point of the Ecliptick, which is cut by the *Secondary* Semicircle, which paſſes through ſuch Star or Phænomenon. And if two Stars are thus referr'd to the ſame Point of the Ecliptick, they are ſaid to be in Conjunction; if in oppoſite Points, they are ſaid to be in Oppoſition: If they are referred to two Points at a Quadrant's Diſtance, they are ſaid to be in a Quartile Aſpect; if the Points differ a ſixth Part of the Ecliptick, they are ſaid to be in a Sextile Aſpect. And in general, all Circles which interſect one of the Six greater Circles of the Sphere at Right Angles, may be called *Secondary Circles*; as the Azimuth or Vertical Circles in reſpect of the Horizon, &c.

SECONDARY *Fever*, is that which ariſes after a Criſis, or the Diſcharge of ſome morbid Matter, as after the Declenſion of the Small Pox, or Meaſles; and ſuch a *Fever* is frequently dangerous. See FEVER.

SECONDARY *Planets*, thoſe moving round other *Planets*, as the Centres of their Motion, and along with them round the Sun. See PLANET.

Saturn, *Jupiter*, and the *Earth*, are each attended with *Secondary Planets*: *Jupiter* with four, and *Saturn* with five, called the *Satellites* of thoſe two *Planets*. See SATELLITES. The *Earth* with one called the *Moon*. See MOON.

The Motion of the *Primary Planets*, is very ſimple and uniform, as being compounded only of a Projectile Motion, forward in a right Line, which is a Tangent to the Orbit, and a Gravitation towards the Sun at the Centre. Add, That being at ſuch vaſt Diſtances from each other, the Effects of their mutual Gravitation towards one another are inſenſible: But the Matter is far otherwiſe, in reſpect of the *Secondary Planets*; for every one of theſe, though it chiefly gravitate towards its reſpective Primary One, as towards its Centre, yet at equal Diſtances from the Sun, is attracted towards him with equally accelerated Gravity, as the primary One is towards him, but at a greater Diſtance with leſs, at a nearer Diſtance with greater; from which double Tendency towards the Sun, and towards its own Primary Planet, the Motion of the *Satellites*, or *Secondary Planets*, comes to be mightily compounded, and affected, with many Inequalities: As for Inſtance, (1.) The *Satellite* ſhall be continually accelerated in its Motion, from the Time of its Quadrature with the Sun, to the next following Conjunction or Oppoſition; but contrary-wiſe from the Syzygies to the Quadratures, it ſhall be retarded, and therefore will not always move ſwifter in or near the Syzygies, and ſlower near the Quadratures. From whence will follow, (2.) That the Orbits of theſe *Secondary Planets*, will be of a Figure more Circular in the Quadratures than in the Syzygies, where the Swiftneſs of the Motion will make the Figure of the Orbit more Rectilinear, and therefore the *Satellite* will run farther from its Primary Planet at the Quadratures, than at the Syzygies, ſo that the Orbit will be a little elliptical, having the primary Planet for its Centre, and the longer Diameter will coincide with the Line of the Quadratures, and the ſhorter with that of the Syzygies. Which Irregularities will ariſe, if the Sun's Power of perturbing the Motion of the *Satellite* be excluded, and the Orbit be concentrick with that of the

Primary

Primary Planets. For if the Orbit be eccentrical, it may happen that the *Satellite* ſhall be farther off from the Primary One in the Syzygies, and ſo move ſlower than it does at the Quadratures: And when this is the Caſe, that the *Satellite's* Orbit is not a Circle concentrick to the Primary Orbit, but an Ellipſis, in one of whoſe Focus's the Primary Orbit is placed, then, the Motion of the *Satellite* will be ſo diſturbed by the Sun, that as it runs into its Orbit, the Apſes of the Orbit ſhall be moved ſometimes *in Conſequentia*, and ſometimes *in Antecedentia* (whereas the Nodes and Apſes of the primary Planets are at reſt). (3.) When the Plane of the *Satellite's* Orbit is inclined to the Plane of the Primary Orbit, the Line of the Nodes of the Secondary Orbit will be moved *in Antecedentia*, with an Angular Motion, and an unequal Velocity, for it will recede moſt ſwiftly, when the Nodes are in Quadrature to the Sun; after which, it will move ſlower, and at the Time of the Nodes being in the Syzygies, will be perfectly at reſt. (4.) The Inclination alſo of the Plane of the ſecondary Orbit, to the primary One, will be continually varying, and will be greateſt, when the Nodes are in the Syzygies with the Sun, and leſs (*cæteris paribus*) when they are in the Quadratures; and from the Time of the Nodes being in the Syzygies, to the Quadratures, it will be always decreaſing, and from the Time of their being in the Quadratures to the Syzygies, it will be always increaſing, and all thoſe Irregularities, whether in any eccentrick or concentrick Orbit, will always be ſomething greater, when the *Satellite* is in Conjunction with the Sun, than when he is in Oppoſition to him. See PLANET.

SECONDINE. See SECUNDINE.

SECRETARY, an Officer, who, by Order of his Maſter, writes Letters, Diſpatches, and other Inſtruments, which he renders Authentic by his Signature. Of theſe there are ſeveral Kinds; as, *Secretary of the King*, or of *State*; *Secretary of the Lord Chancellor*; *Secretary of War*, &c. The King's *Secretaries* were anciently call'd the *King's Clerks* and *Notaries*. As for the Name of *Secretary*, it was at firſt applied to ſuch as being always near the King's Perſon, received his Commands, and were call'd *Clerks of the Secret*; whence was afterwards form'd, the Word *Secretary*; *Regi a ſecretis*: And as the great Lords gave to their Clerks the Quality of Secretaries; thoſe who attended the King, were call'd, by way of Diſtinction, *Secretaries of the Commands*; *Regi a Mandatis*. This continued till the Reign of our *Henry* VIII. 1659, when, at a Treaty of Peace between the *French* and *Spaniards*, the former obſerv'd, that the *Spaniſh* Miniſters, who treated for *Philip* II. called themſelves *Secretaries of State*. Upon which the *French Secretaries des Commandements*, out of Emulation, aſſumed the ſame Title; which thence paſſed into *England*.

SECRETARIES *of State*, Officers attending the King, for the Receipt and Diſpatch of Letters, Grants, Petitions, and many of the moſt important Affairs of the Kingdom, both Foreign and Domeſtick.

Till the Reign of King *Henry* VIII. there was only one *Secretary of State*; but then Buſineſs increaſing, that Prince appointed a Second *Secretary*; both of equal Power and Authority, and both ſtiled *Principal Secretaries of State*: Before Queen *Elizabeth*'s Time, they did not ſit at the Council-Board; but that Princeſs admitted them to the Places of Privy Counſellors; which Honour they have held ever ſince, and a Council is never, or at leaſt very ſeldom, held without one of them. On the Union of *England* and *Scotland*, Queen *Anne* added a Third *Secretary*, on account of the great Increaſe of Buſineſs, which, as to *Britain*, is equally and diſtinctly managed by all the Three, although the latter is frequently ſtil'd *Secretary of State for North Britain*: They have under their Management and Direction, the moſt conſiderable Affiairs of the Nation, and are obliged to a conſtant Attendance on the King: They receive and diſpatch whatever comes to their Hands, be it for the Crown, the Church, the Militia, Private Grants, Pardons, Diſpenſations, &c. as likewiſe Petitions to the Sovereign, which, when read, are returned to the *Secretaries* for Anſwer, all which they diſpatch according to the King's Command and Direction. As to Foreign Affairs, they are divided into Two Provinces comprehending all the Kingdoms and Nations which have any Intercourſe or Buſineſs with *Great Britain*; each *Secretary* receiving all Letters and Addreſſes from and making all Diſpatches to the ſeveral Princes and States comprehended in his Province: Which Diviſion ſtill ſubſiſts, notwithſtanding the Addition of a Third *Secretary*. *Ireland* and the Plantations are under the Direction of the Elder *Secretary*, who has the *Southern* Province. Of theſe Three Principal *Secretaries*, the Two for *South Britain*, have each Two Under-*Secretaries*, and one chief Clerk; and the other for *North Britain* one Under-*Secretary*, and one chief Clerk, with an uncertain Number of other Clerks and Tranſlators, all wholly depending of them.

The SECRETARIES *of State* have the Cuſtody of that Seal, properly called the *Signet* (See SIGNET) and the Direction of the *Signet Office*; wherein are Four Clerks employ'd, who prepare ſuch Things as are to paſs the *Signet*, in order to the Privy or Great Seal. All Grants ſigned by the King are returned hither, which, tranſcrib'd, are carried to one of the Principal *Secretaries of State*, and ſeal'd, and then called *Signets*, which being directed to the Lord Privy Seal, are his Warrant. On the *Secretaries of State*, is likewiſe dependant another Office, call'd *The Paper Office*, wherein all Public Writings, Papers, Matters of State, &c. are preſerved. See PAPER OFFICE. All the Under *Secretaries* and Clerks are in the Choice of the *Secretary of State*, without Reſerve to any Perſon; the former of which receives Orders and Directions from them, for writing Diſpatches, Foreign and Domeſtick, which they give to the Chief Clerk, who diſtributes them to the Under-Clerks.

SECRETARY *of an Embaſſy*, is a Perſon attending an Embaſſador, for the writing of Diſpatches relating to the Negotiation. There is a deal of Difference between the *Secretary of the Embaſſy*, and the Ambaſſador's *Secretary*; the laſt is a Domeſtick or Menial of the Ambaſſador; the firſt a Servant or Miniſter of the Prince. See EMBASSADOR.

SECRETION, in Medicine, the Act, whereby the ſeveral Juices, or Humours in the Animal Body, are ſeparated from the Blood, by means of the Glands.

In the Bodies of Animals, we obſerve a great Number of Juices of different Natures, *viz.* the Blood, Lympha, Saliva, Stomach-liquor, inteſtinal Juices, Panchreatic Juice, the Bile, Urine, &c. Now, the Blood is the general Source of all; and from it they are all *Secerned* by particular Organs, called *Glands*. The Manner, wherein this *Secretion* is effected, has been greatly enquired into in theſe laſt Ages; though not with the greateſt Succeſs. The Ancient Phyſicians, indeed, contented themſelves to aſſert certain particular Virtues or Faculties inherent in the ſeveral Viſcera; whereby they were determined to ſeparate one Liquor rather than another: without troubling themſelves much about the Manner wherein it was done. But the Moderns, according to the Genius of their Philoſophy, muſt have this Point clear'd, and the Modus of *Secretion* rendered intelligible. Hence, as the exceeding Smallneſs of theſe Organs prevented any regular Search, they have imagined various Manners of explaining them.

Some, full of the Effects they have obſerved from Fermentations, maintain, that there are *Ferments* in the ſeveral Parts; by Aid whereof, certain Kinds of Particles mix'd in the Blood, are ſeparated therefrom; after the ſame Manner as we ſee in *Muſt*, or new Wine, from which, while fermenting, certain Parts are detach'd in form of Scum. But this Opinion has ſo many Inconveniencies to grapple withal, that'tis almoſt univerſally abandoned. See FERMENT.

Others conſider the Glands as kinds of Sieves, whoſe Holes having different Figures, will only let paſs certain Particles or Molecules, whoſe Figures reſemble thoſe of the Holes: but the Falſity of this Hypotheſis was ſoon found out; and it was thought ſufficient to fix ſome Proportion between the Diameters of the Pores and of the Molecules that were to paſs through them, to account why very ſubtile Parts ſhould paſs through the Glands, through which the Coarſer could not paſs. Yet this Opinion was not found perfectly ſatisfactory: For on this Suppoſition, the moſt ſubtile Parts of the Blood muſt paſs in ſuch Quantity through the largeſt Pores, that there would not be enough left to furniſh the little ones with what they needed: And for the ſame Reaſon, thoſe Parts whoſe Pores are biggeſt, ought to furniſh Liquors much fuller of ſubtile Parts than thoſe whoſe Pores are ſmaller, which yet is contrary to Experience. For the Seroſity ſeparated in the Kidneys, under the Name of *Urine*, conſiſts of Parts much ſubtiler and ſmaller than the Bile ſeparated in the Liver: Why then don't this Seroſity eſcape in the Liver? the Pores whereof muſt be much greater than thoſe of the Kidneys. See BILE.

This Inconvenience, many Naturaliſts being aware of, has made them have recourſe to *Imbibition* (if the Word may be allowed us for want of a better). They maintain, then, That beſides the different Diameters of the Pores, 'tis required that the ſeveral Parts be already imbued or moiſten'd with a Liquor like to that they are to filter. This Opinion is rather the Reſult of Reaſon than of Experiment, and the Maintainers hereof, well pleas'd they had ſomething to ſatisfy their Reaſon withal, never troubled themſelves whether it were true: Till M. *Winſlow* fell into it.

Dr. *Keil*, whoſe Theory prevails moſt in *England*, accounts for *Secretion*, from the different Diameters of the Veſſels, the different Velocity of the Blood, the different Angles the Ducts make with the Arteries, and the different Attraction of the different Parts, under all theſe different Circumſtances. His *Theory* ſee at length, under the Article ANIMAL SECRETION. But even in this, there is ſomething Arbitrary and Conjectural. Beſides, the Reaſoning is carried ſuch a Length; that, in a Thing the Principles whereof are ſo obſcure, the Parts or Organs ſo imperfectly known, and the whole Proceſs carried on out of Sight, the Mind can ſcarce ſafely acquieſce in it.

Monſ. *Winſlow*, of the *Royal Academy* of *Sciences*, has taken a better Courſe for the Diſcovery of this important Action of *Secretion*. He does not take up with conjectural Principles, nor draw a plauſible Scheme of Reaſoning therefrom through the Dark; but applies himſelf to Experiment, and inveſtigates, in Nature herſelf, and the Structure of the Parts, the Manner *Secretion* is perform'd in. From a ſtrict Examination of the ſeveral Kinds of Glands, both in Men and other Animals, he finds, with ſome other Anatomiſts, that the Glands are only Pelotoons or Plexus's of Veſſels: but the Veſſels proper to the Gland, and which conſtitute the principal Part thereof, M. *Winſlow* firſt diſcovered to be Tubes, furniſhed, on the Inſide, with a kind of Down or Tuft, or rather a very fine, ſpongeous Tiſſue, which fills the whole Cavity of thoſe Veſſels like a Pith or Marrow. This he finds in all Glands, of all Animals: In different Glands, 'tis found of different Colours, and this different Colour is even found in the different Glands of Fœtus's themſelves.

The Gland, then, is, at leaſt its main Part, a Compound of theſe downy or ſpongeous Veſſels, which, from their Office, we will call *Secretory Veſſels* or *Ducts*, and which frequently do, almoſt of themſelves, form what we call a *Gland* or *glandulous Body*: Tho' beſide theſe Veſſels, we uſually remark Four other Kinds, *viz.* Arteries, Veins, Excretory Ducts and Nerves. The *Secretory* Ducts we diſtinguiſh from the *Excretory* Ones; in that the former, by the peculiar Texture of their Down, ſerve to ſeparate a particular Liquor; and that the latter only ſerve to receive the Liquor thus *Secreted*, and to carry it to the Place 'tis deſtined for. For a more particular Account of the Structure and Organization of the Glands, See GLAND.

For the Manner wherein the Glands act, in ſeparating the ſeveral Liquors from the Body, M. *Winſlow* lays it down thus: 'Tis a Thing well known by Phyſicians and Chymiſts, that a Piece of brown Paper, which is only an Aſſemblage of ſmall Filaments drawn cloſe to each other, having once imbibed Oil or Water, will never let any other Liquor paſs through it, but of the ſame Kind with what 'tis impregnated withal. All others it ſtops. And the like is obſerved of a Wick of Cotton or other Matter, which having firſt imbibed its Fill of Oil or Water, and being then dipp'd at one End, in a Veſſel full of Oil and Water together; the Wick that had imbibed the Oil, will only raiſe and diſtil Oil, and that with Water, only Water. Now, in the *Secretory Ducts* of the Glands, we find a Parallel Structure; an Aſſemblage or Tiſſue of fine Threads or Filaments bound cloſe together, much as in brown Paper, or a Cotton-wick; only differently diſpoſed. This Tiſſue, then, having once imbibed a certain Juice, will not let paſs any of the Liquors which arrive at the Orifices of theſe Ducts, but that it had firſt imbibed. The Cauſe of this Phænomenon, is doubtleſs, to be referr'd to the great Principle of Attraction, which is found ſtronger between the Homogeneous than the Heterogeneous Parts of the ſame Fluid. But this is an Enquiry that belongs to another Place. See ATTRACTION and REPULSION.

As the Blood, now, is not a Homogeneous Liquor; but a Compound of an Infinity of different Parts or Molecules, ſome Oily, others Mucilaginous, Aqueous, Saline, Subtile, Groſs, &c. in its Motion along the Arteries of the Gland, it becomes divided into all the little Ramifications thereof; by which Means its Velocity is exceedingly abated, and its Molecules obliged to go off one by one, through the narrow Paſſage of the Artery into the Vein, and of conſequence to paſs over the Orifices of the *Secretory Ducts* of the Glands, whoſe Down is already tinged with a Juice of a certain Nature. Such of the Molecules therefore, as are found of the ſame Nature with the Juice they meet withal at the Entrance of the *Secretory Duct*, joyn themſelves to them, and enter the Ducts, driven on by others that follow them. Thus they paſs, ſucceſſively, through the whole Veſſel, and at length go out of it into the Excretory Duct, while the reſt, which are of a different Kind, run over the Orifice of the *Secretory* Veſſel, without ever mixing with the Juice thereof, and thus arriving in the Vein, are carried back to the Heart.

All that remains, is, to explain how theſe Parts ſhould have firſt imbibed the particular Juices neceſſary for their reſpective *Secretions*; How, for Inſtance, the Bile ſhould come to be ſeparated in the Liver, for the firſt Time, preferably to any other Liquor? To this M. *Winſlow* anſwers, That having obſerv'd the Glands of the ſmalleſt Fœtus's to be colour'd, much as in Adults; it appears highly probable they had been imbued with the Juices they were to filtrate, at the firſt Formation of the Animal; or at the ſame time when the ſolid Parts of the Organ themſelves were framed.

SECT, a collective Term, comprehending all ſuch as follow the Doctrines or Opinions of ſome famous Divine or Philoſopher, &c. The Sects of Philoſophers among the Ancients, particularly in ancient *Greece*, were various; as, *Pyrrhonians*, *Platoniſts*, *Epicureans*, *Stoicks*, *Peripateticks*, *Academicks*, &c. See each under its proper Article. At preſent the Sects of Philoſophy are chiefly reduceable to Three, *viz.* the *Carteſians*, the *Peripateticks*, and the *Newtonians*. In Theology, the *Sects* are much more numerous; yet the Ancients had Legions now extant, as, *Manichees*, *Gnoſticks*, *Montaniſts*, &c. The principal now on Foot, are the *Lutherans*, *Calviniſts*, *Anabaptiſts*, *Arians*, *Socinians*, *Arminians*, &c. The Riſe, Progreſs, and Fate, with the diſtinguiſhing Characters and Opinions of each; See under its reſpective Head.

SECTA, in Law. See SUIT.

SECTIO, or *Operatio Cæſarea*. See CÆSARIAN SECTION.

SECTION, a Part of a Thing divided; or the Diviſion itſelf: Such, particularly, are the Sub-diviſions of Chapters, by others called *Articles*. The Mark of a *Section* is §. The Ancients diſregarded the Dividing of their Books into Chapters and *Sections*; that was a Task left for future Editors, and Criticks. The Word is form'd from the *Latin*, *ſeco*, I cut.

SECTION *of a Building*, is its *Profile*; or a Delineation of its Heights and Depths raiſed on the Plan; as if the Fabrick was cut aſunder, to diſcover the Inſide. See PROFILE.

Horizontal SECTION. See ICHNOGRAPHY.

SECTION, in Geometry, a Side or Surface appearing of a Body, or Figure cut by another; or the Place wherein Lines, Planes, &c. cut each other. The common *Section* of two Planes is always a right Line, being the Line ſuppoſed to be drawn by the one Plane in its cutting or entering the other. See PLANE. If a Sphere be cut in any manner, the Plane of the Section will be a Circle, whoſe Centre is in the Diameter of the Sphere. See SPHERE. The *Sections* of the Cone are Four, *viz.* a *Circle*, *Parabole*, *Hyperbole* and *Ellipſis*. See each under its proper Article. See alſo CONE.

Conic SECTIONS. See CONIC SECTION.

SECTIONES SEQUENTES, in Conics, a Term, whoſe Import may be thus conceiv'd: Suppoſe Two Right Lines, as A B, C D (Tab. Conicks Fig. 5.) mutually interſecting one another in E, which Point E, is ſuppoſed to be the common Centre of the oppoſite Hyperbolic Sections, F G, H I, and whoſe common Aſymptotes, the propoſed Lines A B, C D alſo are. In this particular Caſe, the *Sections* G F and H I, are called *Sectiones Sequentes*, becauſe they are placed following one another in the contiguous Angles of Two interſecting Right Lines: And if the determinate Diameter H G, of one of the *Sectiones Sequentes* (which is coincident with the ſuppoſed indeterminate Diameter of its oppoſite) be equal to the vertical Tangent K L, applied between the Aſymptotes in the Point G, of the Diameter G F, then, *Apollonius* calls ſuch *Sections*, *Conjugate Sections*.

SECTOR, in Geometry, a Part of a Circle comprehended between two Radii, and the Arch. Thus the mix'd Triangle A C D (Tab. Geometry Fig. 13.) comprehended between the Radii A C and D and the Arch A D, is a *Sector of the Circle*.

'Tis demonſtrated by Geometricians, that the *Sector* of a Circle, as A C D, is equal to a Triangle, whoſe Baſe is the Arch A D, and its Altitude the Radius A C.

If from the common Centre of Two Concentric Circles, be drawn Two Radii, to the Periphery of the Outer, the Two Arches included between the Radii, will have the ſame *Ratio* to the Peripheries; and the Two *Sectors*, the ſame *Ratio* to the Areas of their Circles.

To find the Area of a *Sector* D C E; the Radius of the Circle C D, and the Area D E being given: To 100, 314 and the Radius A C, find a Fourth propotional Number; this will be the Semi-periphery. Then to 180°, the given Arch D E, and the Semi-periphery juſt found, find another fourth Proportional; this will give the Arch A B in the ſame Meaſure in which the Radius A C is given. Laſtly, multiply the Arch D E into the Semi-radius, the Product is the Area of the *Sector*.

SECTOR is alſo a Mathematical Inſtrument, of great Uſe in finding the Proportion between Quantities of the ſame Kind, as between Lines and Lines, Surfaces and Surfaces, &c. whence the *French* call it the *Compaſs of Proportion*.

The great Advantage of the *Sector* above the common Scales, &c. is, that 'tis made to fit all Radius's and Scales. For, by the Lines of Chords, Sines, &c. on the *Sector*, we have Lines of Chords, Sines, &c. to any Radius betwixt the Length and Breadth of the *Sector* when opened.

The *Sector* is founded on the Fourth Propoſition of the 6th Book of *Euclid*; where 'tis demonſtrated, That ſimilar Triangles have their homologous Sides proportional: An Idea of its Foundation may be conceived thus; Let the Lines AB, AC (Fig. 14.) repreſent the Leg of the *Sector*, and AD, AE two equal Sections from the Centre. If now the Points CB and DE be connected, the Lines CB and DE will be Parallel; therefore the Triangles ADE, ACB Similar, and conſequently the Sides AD, DE, AB and BC proportional: That is, as AD : DE : AB : BC; whence if AD be the Half, Third or Fourth Part of AB; DE will be a Half, Third or Fourth Part of CB, and the ſame holds of all the reſt. If, therefore, AD be the Chord, Sine, or Tangent of any Number of Degrees to the Radius AB; DE will be the ſame to the Radius BC.

Deſcription of the Sector.

The *Sector* conſiſts of two equal Rules or Legs of Braſs or other Matter, rivetted together; but ſo as to move eaſy on the Rivet. See its Figure, Tab. Geometry Fig. 15. On the Faces of the Inſtrument are placed ſeveral Lines; the principal are the Line of equal Parts, Line of Chords, Line of Sines, Line of Tangents, Line of Secants, and Line of Polygons.

The *Line of Equal Parts*, called alſo *Line of Lines*, marked L, is a Line divided into 100 equal Parts; and, where the Length of the Leg will allow it, each is ſub-divided into Halves, and Quarters. 'Tis found on each Leg, on the ſame Side; and the Diviſions numbred 1, 2, 3, 4, &c. to 10, which is near the Extremity of each Leg. Note, in Practice, 1 is taken for 10, or 100, or 1000, or 10000, &c. as Occaſion requires; in which Caſes 2 is taken for 20 or 200, or 2000, &c. and ſo of the reſt. *The Line of Chords*, marked C on each Leg, is divided after the uſual Manner, and numbred 10, 20, 30, &c. to 60. See Chord. The *Line of Sines*, denoted on each Leg by the Letter S, is a Line of Natural Sines, numbred 10, 20, 30, &c. to 90. See Sines. *Line of Tangents*, denoted on each Leg by the Letter T, is a Line of natural Tangents, numbred 10, 20, 30, &c. to 45: beſides which, is another little Line of Tangents on each Leg, commencing at 45° and extending to 75° denoted by the Letter *t*. See Tangent. *Line of Secants*, denoted on each Leg by the Letter S, is a Line of natural Secants, number'd 10, 20, 30, &c. to 75, and commencing, not from the Centre of the Inſtrument, but at Two Inches Diſtance therefrom. See Secant. *Line of Polygons*, denoted by the Letter P on each Leg, is number'd 4, 5, 6, &c. to 12, which falls 3 Inches ſhort of the Centre of the Inſtrument. See Polygon.

Beſide theſe Lines, which are eſſential to the *Sector*; there are others placed near the outward Edges on both Faces, and parallel thereto, which are, in all reſpects, the ſame as in *Gunter*'s Scale, and uſed after the ſame Manner. Such are the Line of *Artificial Sines* marked S; The Line of *Artificial Tangents*; A Line of 12 *Inches*, mark'd *In*; and *Gunter*'s *Line of Numbers*, mark'd N. For the Uſes of all which, See *Gunter*'s Scale. There are ſometimes, other Lines placed, to fill the vacant Spaces, as the Lines of *Hours*, *Latitudes* and *Inclinations of Meridians*, which are uſed the ſame as on the common Scales. See Scale.

The Lines found by the *Sector* are of two Kinds, lateral and parallel. The Firſt are ſuch as are found by the Sides of the *Sector* as AB, AC. The latter, ſuch as go acroſs from one Leg to the other, as DE, CB. Note, the Order of the Lines in the newer *Sectors*, is different from what it is in the old ones; for the ſame Line is not now put at the ſame Diſtance from the Edge on both Legs; but the Line of Chords, *e. gr.* is innermoſt upon the one, and the Line of Tangents on the other. The Advantage hereof is, that when the Inſtrument is ſet to a Radius for the Chords, it ſerves alſo for the Sines and Tangents without ſtirring it; for the Parallel betwixt 60 and 60 of the Chords, 90 and 90 of the Sines, and 45 and 45 of the Tangents, are all equal.

Uſe of the Line of Equal Parts on the Sector.

1° *To Divide a given Line into any Number of equal Parts, e. gr.* Seven: Take the given Line in your Compaſſes, and ſetting one Foot in a Diviſion of the Line of equal Parts, that may eaſily be divided by 7, *e. gr.* 70; whoſe Seventh Part is 10: Open the Sector till the other Point fall exactly on 70 in the ſame Line, in the other Leg. In this Diſpoſition, applying one Point of the Compaſſes to 10 in the ſame Line; ſhut them till the other fall in 10 in the ſame Line of the other Leg. This Aperture will be the 7th Part of the given Line. Note, if the Line to be divided be too long to be applied to the Legs of the *Sector*, only divide one Half, or one Fourth by 7, and the Double or Quadruple thereof will be the 7th Part of the whole.

2° *To meaſure the Lines of the Perimeter of a Polygon*, one of which contains a given Number of equal Parts: Take the given Line in your Compaſſes, and ſet it over, upon the Line of equal Parts, to the Number of Parts on each Side, expreſſing its Length. The *Sector* remaining thus, ſet off the Length of each of the other Lines parallel to the former; and the Numbers each of them falls on will expreſs their Lengths.

3° *A Right Line being given, and the Number of Parts it contains, e. gr.* 120, *to take from it a leſs Line, containing any Number of the ſame Parts, e. gr.* 25: Taking the given Line in your Compaſſes, open the *Sector* till the two Feet fall on 120 on each Leg; then, the Diſtance from 25 to 25 gives the Line required.

4° *To find a Third Proportional to Two given Lines, and a Fourth to Three.* For the Firſt, take the Length of the firſt given Line in your Compaſſes, and lay it off on the Line of equal Parts from the Centre, to find the Number where it terminates: Then open the *Sector*, till the Length of the Second Line be included in the Aperture of the Extreme of the firſt: The *Sector* remaining thus, lay off the Length of the Second Line on one of the Legs, from the Centre; and note the Number where it terminates; the Diſtance between that Number on the Two Legs, gives the Third Proportional. In the Second Caſe, take the Second Line in your Compaſſes, and opening the *Sector*, apply this Extent to the Ends of the Firſt, laid off from the Centre on both Legs. The *Sector* thus open'd, lay off the Third Line from the Centre, and the Extent between the Number whereon it terminates on both Legs, is the Fourth Proportional.

5° *To divide a Line in any given Proportion, e. gr.* into Two Parts, which ſhall be to each other as 40 to 70: Add the Two Numbers together, their Sum is 110. Then, between your Compaſſes take the Line propoſed, which ſuppoſe 165, and open the *Sector* till this Diſtance reach from 110, to 110 on both Legs. The *Sector* thus open'd, take the Extent from 40 to 40, as alſo from 70 to 70; the firſt will give 60, the laſt 105, which will be the Parts propoſed, for 40 : 70 : 60 : 105.

6° *To open the Sector, ſo as the Two Lines of equal Parts may make a Right Angle*: Find Three Numbers that may expreſs the Sides of a Right-angled Triangle, as 3, 4 and 5, or their Equimultiples, as 60, 80 and 100. Take, then, in your Compaſſes the Diſtance from the Centre to 100; and open the *Sector*, till, one Point ſet upon 80, the other full upon 60 in the other Leg; then do the Two Lines of equal Parts, include a Right Angle.

7° *To find a Right Line equal to the Circumference of a Circle*: The Diameter of a Circle being to the Circumference, nearly as 50 to 157, take the Diameter in your Compaſſes, and ſet it over on the Legs of the *Sector*, from 50 to 50. The *Sector* thus open'd, take the Diſtance from 157 to 157 in your Compaſſes. This will be your Circumference required.

Uſe of the Line of Chords on the Sector.

1°. *To open the* Sector, *ſo as the two Lines of Chords may make an Angle of any Number of Degrees, e. gr.* 40: Take the Diſtance from the Joint to 40, the Number of Degrees propoſed, on the Line of Chords; open the *Sector*, till the Diſtance from 60 to 60, on each Leg, be equal to the foreſaid Diſtance of 40; then does the Line of Chords make the Angle required.

2°. *The Sector being opened, to find the Degrees of its Aperture*: Take the Extent from 60 to 60, and lay it off on the Line of Chords, from the Centre: The Number, whereon it terminates, ſhews the Degrees of its Opening — By applying Sights on the Line of Chords, the *Sector* may be uſed to take Angles, as a Surveying Inſtrument.

3°. *To make an Angle of any given Number of Degrees, with a given Line*: On the given Line deſcribe a Circular Arch, the Centre whereof is the Point whereon the Angle is to be made. Set off the Radius from 60 to 60; and the *Sector* remaining thus, take the Diſtance of the two Numbers on each Leg, expreſſing the propoſed Degrees, and lay it from the Line upon the Arch deſcribed. Laſtly, drawing a Line from the Centre, through the End of the Arch, it will make the Angle propoſed.

4°. *To find the Degrees a given Angle contains*: About the Vertex deſcribe an Arch, and open the *Sector*, till the Diſtance from 60 to 60 on each Leg, be equal to the Radius of the Circle: Then taking the Chord of the Arch between the Compaſſes, and carrying it on the Legs of the *Sector*, ſee what equal Number, on each Leg,

the Points of the Compaſſes fall on: This is the Quantity of Degrees, the given Angle contains.

5. *To take an Arch, of any Quantity, from off the Circumference of a Circle.* Open the *Sector*, till the Diſtance from 60 to 60 be equal to the Radius of the given Circle: Then take the Extent of the Chord, of the Number of Degrees, on each Leg of the SECTOR, and lay it off, on the Circumference of the given Circle. By this Uſe may any regular Polygon be inſcribed in a given Circle, as well as by the Line of Polygons.

Uſe of the Line of Polygons on the SECTOR.

1°. *To inſcribe a regular Polygon, in a given Circle.* Take the Semi-diameter of a given Circle, in the Compaſſes, and adjuſt it to the Number 6, on the Line of Polygons, on each Leg of the *Sector*: Then the *Sector* remaining thus opened, take the Diſtance of the two equal Numbers, expreſſing the Number of Sides the Polygons is to have. *E. gr.* The Diſtance from 5 to 5 for a Pentagon, from 7 to 7 for a Heptagon, *&c.* Theſe Diſtances carried about the Circumference of the Circle, will divide it into ſo many equal Parts.

2°. *To deſcribe a regular Polygon*, e. gr. *a Pentagon on a given right Line:* Take the Length of the Line in the Compaſſes, and apply it to the Extent of the Number 5, 5, on the Lines of Polygons. The *Sector* thus opened, upon the ſame Lines take the Extent, from 6 to 6, this will be the Semi-diameter of the Circle the Polygon is to be inſcribed in. If, then, with this Diſtance, from the Ends of the given Line, you deſcribe two Arches of a Circle, their Interſection will be the Center of the Circle.

3°. *On a right Line, to deſcribe an Iſoſceles Triangle:* Having the Angles at the Baſe, double thoſe at the Vertex: Open the *Sector*, till the Ends of the given Line fall on 10 and 10 on each Leg; Then take the Diſtance from 6 to 6. This will be the Length of the two equal Sides of the Triangle.

Uſe of the Lines of Sines, Tangents, and Secants, on the SECTOR.

By the ſeveral Lines diſpoſed on the *Sector*, we have Scales to ſeveral Radius's; So that having a Length, or Radius given, not exceeding the Length of the *Sector* when opened; we find the Chord, Sine, *&c.* thereto. *E. gr.* Suppoſe the Chord, Sine, or Tangent, of 10 Degrees, to a Radius of 3 Inches, required: Make 3 Inches the Aperture, between 60 and 60, on the Lines of Chords of the two Legs; then will the ſame Extent reach from 45, to 45 on the Line of Tangents, and from 90 to 90 on the Line of Sines on the other Side; ſo that to whatever Radius the Line of Chords is ſet, to the ſame are all the other ſet. In this Diſpoſition therefore, if the Aperture between 10 and 10, on the Lines of Chords, be taken with the Compaſſes, it will give the Chord of 10 Degrees. If the Aperture of 10 and 10 be in like manner taken on the Lines of Sines, it will be the Sine of 10 Degrees. Laſtly, If the Aperture of 10 and 10 be in like manner taken on the Lines of Tangents, it gives the Tangent of 10 Degrees.

If the Chord, or Tangent, of 70 Degrees were required; for the Chord, the Aperture of half the Arch, *viz.* 35. muſt be taken as before; which Diſtance, repeated twice, gives the Chord of 70°. To find the Tangent of 70° to the ſame Radius, the ſmall Line of Tangents muſt be uſed, the other only reaching to 45: Making therefore, 3 Inches the Aperture between 45 and 45 on the ſmall Line; the Extent between 70 and 70 Degrees, on the ſame, will be the Tangent of 70°. to 3 Inches Radius.

To find the Secant of an Arch, make the given Radius the Aperture between 0 and 0 on the Line of Secants: Then will the Aperture of 10 and 10, or 70 and 70, on the ſaid Lines, give the Tangent of 10° or 70°.

If the Converſe of any of theſe Things were required; that is, if the Radius be required, to which a given Line, is the Sine, Tangent, or Secant, 'tis but making the given Line, if a Chord, the Aperture on the Line of Chords, between 10 and 10, and then the *Sector* will ſtand at the Radius required; that is, the Aperture between 60 and 60, on the ſaid Line, is the Radius. If the given Line were a Sine, Tangent or Secant, 'tis but making it the Aperture of the given Number of Degrees, then will the Diſtance of 90 and 90 on the Sines, of 45 and 45 on the Tangents, of 0 and 0 on the Secants, be the Radius.

Uſe of the SECTOR *in Trigonometry.*

1°. *The Baſe and Perpendicular of a rectangled Triangle being given, to find the Hypothenuſe:* Suppoſe the Baſe A C (Plate Trigonom. Fig. 2.) 40 Miles, and the Perpendicular A B 30; open the *Sector* till the two Lines of Lines make a right Angle: Then for the Baſe, take 40 Parts on the Line of Lines on one Leg; and for the Perpendicular 30 on the ſame Line on the other Leg: Then the Extent from 40 on the one, to 30 on the other, taken in the Compaſſes, will be the Length of the Hypothenuſe, which Line will be found 50 Miles.

2°. *The Perpendicular* A B *of a right-angled Triangle* A B C, *being given* 30, *and the Angle* B C A 37°, *to find the Hypothenuſe* B C: Take the given Side A B, and ſet it over, on each Side, upon the Sine of the given Angle A C B; then the Parallel Diſtance of Radius, or of 90 and 90, will be the Hypothenuſe B C; which will meaſure 50 on the Line of Sines.

3°. *The Hypothenuſe and Baſe being given, to find the Perpendicular:* Open the *Sector*, till the two Lines of Lines be at right Angles; then lay off the given Baſe on one of thoſe Lines from the Centre: Take the Hypothenuſe in your Compaſſes, and ſetting one Foot in the Point of the given Baſe, let the other fall on the Line of Lines, on the other Leg: The Diſtance from the Centre to the Point where the Compaſſes fall, will be the Length of the Perpendicular.

4°. *The Hypothenuſe being given, and the Angle* A C B, *to find the Perpendicular:* Make the given Hypothenuſe a Parallel Radius; *i. e.* make it the Extent from 90 to 90 on the Lines of Sines; then will the Parallel Sine of the Angle A C B be the Length of the Side A B.

5°. *The Baſe and Perpendicular* A B *given, to find the Angle* B C A: Lay off the Baſe A C on both Sides the *Sector*, from the Centre, and note its Extent: Then take the given Perpendicular, and to it open the *Sector*, in the Terms of the Baſe; the Parallel Radius will be the Tangent of B C A.

6°. *In any right-angled Triangle, two Sides being given, with the included Angle, to find the third Side:* Suppoſe the Side A C 20, the Side B C 30, and the included Angle A C B 110°; Open the *Sector*, till the two Lines of Lines make an Angle equal to the given Angle, *viz.* 110°. Lay off the given Sides of the Triangle from the Center of the *Sector*, on each of the Lines of Lines; the Extent between their Extremes is the Length of the Side A B ſought, *viz.* 412.

7°. *The Angles* C A B *and* A C B *given, and the Side* C B, *to find the Baſe* A B: Take the given Side C B, and turn it into the Parallel Sine of its oppoſite Angle C A B; and the Parallel Sine of the Angle A C B will be the Length of the Baſe A B.

8°. *The three Angles of a Triangle being given, to find the Proportion of the Sides:* Take the lateral Sines of the ſeveral Angles, and meaſure them in the Line of Lines; the Numbers anſwering thereto, give the Proportion of the Sides.

9°. *The three Sides being given, to find the Angle* A C B: Lay the Sides A C, C B, along the Line of Sines, from the Centre, and ſet over the Side A B in their Terms: So is the *Sector* opened, in theſe Lines, to the Quantity of the Angle A C B.

10°. *The Hypothenuſe* A C (*Fig.* 3.) *of a right-angled Spherical* A B C *given, e. gr.* 43°; *and the Angle* C A B 20°. *to find the Side* C B. The Rule is: As Radius is to the Sine of the given Hypothenuſe 43°, ſo is the Sine of the given Angle 20° to the Sine of the Perpendicular C B. Take, then, 20° from the Centre, along the Line of Sines, in your Compaſſes, and ſet the Extent, from 90 to 90, on the two Legs, and the Parallel Sine of 43°, the given Hypothenuſe, will, when meaſured from the Centre on the Line of Sines, give 13° 30′ the Side required.

11°. *The Perpendicular* B C, *and the Hppothenuſe* A C *given, to find the Baſe* A B: As the Sine Complement of the Perpendicular B C is to Radius, ſo is the Sine Complement of the Hypothenuſe, to the Sine Complement of the Baſe —— Therefore, make the Radius a Parallel Sine of the given Perpendicular, *e. gr.* 76° 30′; Then the Parallel Sine of the Complement of the Hypothenuſe, *e. gr.* 47° meaſured along the Line of Sines, will be found 49° 25′, the Complement of the Baſe required: Conſequently the Baſe itſelf will be 40° 35′.

Particular Uſes of the SECTOR *in Geometry, &c.*

1°. *To make a regular Polygon, whoſe Area ſhall be of any given Magnitude:* Let the Figure required be a Polygon, whoſe ſuperficial Area is 125 Feet: Extract the Square Root of $\frac{5}{8}$ of 125, it will be found 5. Make a Square, whoſe

whose Side is 5 Feet; and, by the Line of Polygons, as already directed, make the Isosceles Triangle C G D so, as that C G being the Semi-diameter of a Circle, C D may be the Side of a regular Pentagon inscribed therein, and let fall the Perpendicular G E. Then continuing the Lines E G and E C, make E F equal to the Side of the Square before made: And from the Point F, draw the right Line F H parallel to G C; then a mean Proportional between G E and E F will be equal to half the Side of the Polygon sought, which doubled, will give the whole Side. The Side of the Pentagon thus had, the Pentagon itself may be described, as above directed.

2°. *A Circle being given, to find a Square equal thereto.* Divide the Diameter into 14 equal Parts, by the Line of Lines, as above directed: Then will 12. 4 of those Parts found by the same Line, be the Side of the Square sought.

3o. *A Square being given, to find the Diameter of a Circle equal thereto.* Divide the Side of the Square into 11 equal Parts, by means of the Line of Lines; and continue that Side to 12. 4 Parts; this will be the Diameter of the Circle required.

4°. *To find the Side of a Square equal to an Ellipsis, whose transverse and conjugate Diameters are given.* Find a mean Proportional between the transverse and conjugate Diameters; which, being divided into 14 equal Parts; $12\frac{4}{7}$ thereof, will be the Side of the Square required.

5°. *To describe an Ellipsis in any given Ratio of its Diameter; the Area whereof shall be equal to a given Square.* Suppose the Proportion of the transverse and conjugate Diameters be required, as 2 to 1; divide the Side of the given Square into 11 equal Parts: Then as 2 is to 1, so is 11 X 14 = 154 to a 4th Number; the Square whereof is the conjugate Diameter sought. Then, as 1 to 2, so is the conjugate Diameter to the transverse. Now,

6°. *To describe an Ellipsis, by having the transverse and conjugate Diameters given.* Suppose A B and E D (Fig. 4.) to be the given Diameters; take A C in your Compasses, and to the Extent thereof open the *Sector*, till the Distance from 90 to 90, on the Lines of Sines, be equal thereto. Then may the Line A C be divided into a Line of Lines, by taking the parallel Extents of the Sine of each Degree, on the Legs of the *Sector*, in your Compasses, and laying them off from the Centre C. The Line thus divided into Sines, (in the Figure 'tis only done into every 10th Sine) from each raise Perpendiculars both Ways; then, find Points in those Perpendiculars through which the Ellipsis must pass, thus: Take the Extent of the Semi-conjugate Diameter C E between your Compasses, and open the *Sector*, till the Aperture of 90 and 90 on the Lines of Sines be equal thereto: Then take the parallel Sines of each Degree of the Line of Sines of the *Sector*, and lay them off on those Perpendiculars drawn through their Complements in the Line of Sines A C; thus will you have two Points in each Perpendicular, through which the Ellipsis must pass. *E. gr.* The *Sector* still remaining the same, take the Distance from 80 to 80 on the Lines of Sines, in your Compasses, and setting one Foot in the Point 10, on the Line A C, with the other, make the Points *a* and *b* in the Perpendiculars passing through that Point: Then will *a* and *b* be the two Points in the Perpendicular, through which the Ellipsis must pass. All the other Points, found after the same Manner, being connected, will give the Semi-Ellipsis D A E; and the other Half will be drawn after the same Manner.

Use of the SECTOR *in Surveying.*

The Bearings of three Places, as A, B, C, (*Fig.* 5.) *to each other*; i. e. *The Angles* A B C, B C A *and* C A B, *being given: And the Distance of each, from a Fourth standing among them: as*, D, *i. e.* B D, D C, and A D *being given: To find the Distances of the several Places* A, B, C, *from each other*; i. e. *The Lengths of the Sides* A B, B C, A C. Having drawn the Triangle E F G (Fig. 6) similar to A B C, divide the Side E G in H, so as that E H may be to H G, as A D to D C, after the Manner already directed: And, after the like Manner must E F be divided in I, so as E I may be to I F, as A D to D B. Then continuing the Sides E G, E F, say, As E H — H G is to H G, so is E H + H G to G H, and as E I — I F is to I F, so let E I + I F be to F M; which Proportions are easily wrought by your Line of Lines on the *Sector*. This done, bisect H K and I M, in the Points L N; and about the said Points as Centres, with the Distances L H, and I N, describe two Circles intersecting each other, in the Point O; to which, from the Angles E F G, draw the right Line E O, F O, and O G, which will have the same Proportion to each other, as the Lines A D, B D, D C: Now, if the Lines E O, F O, and G O, be equal to the given Lines A D, B D, D C, the Distances E F, F G, and E G, will be the Distances of the Places required. But if E O, O F, O G, be less than A D, D B, D C, continue them, till P O, O R, and O Q be equal to them: Then the Points P, Q, R, being joined, the Distances P R, R Q, and P Q, will be the Distances of the Places sought. Lastly, if the Lines E O, O F, O G, be greater than A D, D B, D C, cut off from them Lines equal to A D, B D, D C, and join the Points of *Section* by three right Lines; the Lengths of the said three right Lines will be the Distances of the three Places sought. *Note*, If E H be equal to H G, or E I to I F, the Centres L and N, will be infinitely distant from H and I; that is, in the Points H and I, there must be Perpendiculars raised to the Sides E F, E G, instead of Circles, till they intersect each other; but if E H be less than H G, the Centre L will fall on the other Side of the Base continued, and the same is to be understood of E I, I F.

Use of the Sector *in the Projection of the Sphere, both Orthographic and Stereographic*; See ORTHOGRAPHIC and STEREOGRAPHIC.

SECULAR, something Temporal, in which Sense the Word is used in Opposition to *Ecclesiastical*. Thus we say, *Secular Power*, *Secular Arm*, &c.

SECULAR is also used for a Person who lives at liberty in the World, not shut up in a Monastery, not bound by Vows, nor subjected to the particular Rules of any Religious Community: In which Sense the Word stands in Opposition to *Regular*. The *Romish* Clergy is divided into *Regular* and *Secular*. The *Regulars* pretend their State is much more perfect than that of the *Seculars*. *Secular* Priests may hold Abbies and Priories both simple and Conventual, though not regularly but only in *Commendam*. 'Tis a Maxim, in their Canon Law, *Secularia Secularibus*, and *Secular* Benefices are only to be given to *Secular* Persons; Regular to Regular. See REGULAR.

SECULARE CARMEN, *Secular Poem*; A Poem sung, or re-hearsed, at the *Secular* Games. Of this Kind we have a very fine Piece among the Works of *Horace*: 'Tis a Saphic Ode, which usually comes at the End of his Epodes. In some Editions, the Twenty-first Ode of the first Book, is called *Carmen Seculare*.

SECULAR GAMES, *Seculares Ludi*: In Antiquity, solemn Games, held among the *Romans*, once in an *Age*; or, in a Period, deemed the Extent of the longest Life of Man, called by the *Greeks* αἰών, and the *Latins*, *Seculum*. They lasted three Days, and as many Nights, during which, Sacrifices were performed, Theatrical Shews exhibited, with Combats, Games, &c. in the Circus. Their Origine, and Institution, is delivered at Length by *Val. Maximus*: The Occasion thereof was, to stop the Progress of a Plague. The first who had them celebrated at *Rome*, was *Valerius Publicola*, the first Consul created after the Expulsion of the Kings, in the Year of *Rome* 245. The Ceremonies to be observed therein were found in one of the Books of the *Sibyls*. At the Time of their Celebration, Heralds were sent to invite all the World to a Feast no body had ever yet seen, nor was ever to see again.

Authors are not agreed of the Number of Years wherein these Games returned; partly, because the Quantity of an Age or *Seculum* among the Antients is not known; and partly on other Accounts: Some will have it, that they were held once every hundred Years, and that the *Seculum*, or Age, was our Century. This *Varro* and *Livy* seem to express in very plain Terms; yet others will have it, that *Seculum* comprehended 110 Years, and that the *Secular Games* only returned in that Period, that is, at the Beginning of every 111th Year; which Opinion is countenanced by *Horace*, in his *Secular Poem*, v. 21. Be this as it will, it is certain they sometimes did not stay for the 111th, nor even for the 100th Year, for the Celebration of these Games. *Augustus*, for Instance, held them in the Year of *Rome* 736; and *Caligula* again in the Year of *Rome* 814, and of Christ 38, *viz.* 64 Years after the former; and *Domitian*, again, in still less Time, *viz.* in the Year of Christ 87, at which *Tacitus* assisted in Quality of *Decemvir*, as he himself tells us, *Annal. Lib.* xi. *c.* ii. This was the Seventh Time that *Rome* had seen them from their first Institution. The Emperor *Severus* exhibited them the Eighth Time 110 Years after those of *Domitian*: *Zozimus* says, these were the last; but he is mistaken, for in the Year of *Rome* 1000, Fifty Years after those of *Severus*, the Emperor *Philip* had them celebrated with greater Magnificence than had ever been known. We find them represented on Medals.

The *Ludi Seculares* were also called *Ludi Tarentini*, from *Manius Valerius Tarentinus*, who gave Occasion

to their Inſtitution: for having been warned, in a Dream, to dig in the Ground in a Place near the *Campus Martius*, called *Tarentum*, he there found an Altar inſcribed to *Dis*, or *Pluto*, and *Proſerpine*: Upon which, as had been foretold him in his Dream, three of his Children born Blind, recovered their Sight, and he, in Gratitude, performed Sacrifices, on the ſame Altar, for three Days and three Nights ſucceſſively. Some ſay the Place it ſelf was called *Tarentum*, becauſe the Water of the *Tyber terram terreret*, eat into the Ground in this Place.

SECULAR YEAR. See JUBILEE.

SECULARIZATION, the Action of *Secularizing*, or of converting a regular Perſon, Place, or Benefice, into a Secular one: Almoſt all the Cathedral Churches were antiently Regular, *i. e.* the Canons were to be Religious, but they have been moſt of them *Secularized*: For the *Secularization* of a regular Church there is required the Authority of the Pope, that of the Prince, the Biſhop of the Place, the Patron, and even the Conſent of the People. In *France* all this muſt be confirmed by Parliament. Religious, that want to be releaſed from their Vows, obtain Briefs of *Secularization* from the Pope.

SECUNDA AQUA, among Chymiſts, *&c.* is *Aqua-Fortis*, which has been already uſed to diſſolve ſome Metal, *&c.* See AQUA FORTIS.

SECUNDARY, an Officer who acts as *Second*, or next to the chief Officer: Such are the *Secundaries* of the Fine Office; the *Secundaries* of the Compters, who are next the Sheriffs of *London* in each of the two Compters: *Secundary* of the Office of the Privy Seal; two *Secundaries* of the Pipe; *Secundary* to the Remembrancers, which are two Officers in the *Exchequer*, &c.

SECUNDI GENERIS, in Anatomy, a Diſtinction among the Lacteal Veſſels. There are two Kinds of Lacteals, *viz. Primary*, or thoſe of the firſt Kind, *Primi Generis*; and *Secundi Generis*, *Secondary*, or of the ſecond Kind. The Firſt carry the Chyle from the Inteſtines into Glands, diſperſed in great Numbers throughout the Meſentery. The Second carry it from theſe Glands, after its being diluted there with Lympha, into the common Receptacle. See LACTEALS.

SECUNDINE, in Medicine, the ſeveral Coats or Membranes wherein the *Fœtus* is wrap'd up, in the Mother's Womb, as the Chorion, Amnios, the Placenta, *&c.* thus call'd, becauſe they come out in the ſecond Place, *i. e.* after the Child, in Delivery. The Matrons or Midwives call the *Secundine*, The *After-birth*, as being eſteem'd a ſecond Burthen, whereof the Mother is freed. Others call it, The *Delivery*, becauſe when this is out, the Woman is reckon'd to be perfectly deliver'd. See FOETUS. The *Secundine* muſt never be left in the Matrix; 'tis a foreign Body, which wou'd deſtroy the Mother: 'Tis dangerous even to have a Piece of it left behind. *Hippocrates* obſerves, That Twins have always the ſame *Secundine*.

Dr. *Grew*, in his Anatomy of Plants, applies the Term *Secundine* to the Fourth and laſt Coat or Cover of Seeds; by reaſon this performs nearly the ſame Office in Plants, that the Membranes inveſting the *Fœtus* do in Animals. Indeed *Pliny*, *Columella*, *Apuleus*, *&c.* have uſed *Secundine* in the ſame Senſe.

SECURITATE PACIS, a Writ, which lies for one who is threaten'd with Death, or Danger; againſt the Perſon who ſo threatens him. It is taken out of *Chancery*, directed to the Sheriff. See PEACE.

SECUTOR, in Antiquity, a Kind of Gladiator among the *Romans*. The *Secutores* are thoſe who fought againſt the *Retiarii*. They were armed with a Sword, and a Buckler, to keep off the Net, or Nooſe, of their Antagoniſt, and wore a Cask on the Head. Some confound the *Secutores* with the *Mirmillones*, becauſe both had nearly the ſame Weapons. The Word is formed from the Verb *Sequi*, to follow; becauſe the *Secutores* uſe to purſue the *Retiarii*. See RETIARII—— *Secutor* was alſo a Name given to ſuch Gladiators, as took the Place of thoſe killed in the Combat; or, who fought the Conqueror. This Poſt was taken by Lot—— In Ancient Inſcriptions we alſo meet with *Secutor Tribuni*, *Secutor Ducis*, *Secutor Cæſaris*, &c. who were Officers attending the Tribunes, and Generals; perhaps like our *Aids de Camp*.

SE-DEFENDENDO; a Plea for him who is charged with the Death of another, ſaying, He was forced to do what he did, *in his own Defenſe*, the other ſo aſſaulting him, that had he not done as he did, he muſt have been in Danger of his own Life. To have this Plea admitted, the Danger muſt appear inevitable. But though the Party juſtify its being done *Se-Defendendo*, yet he is driven to procure his Pardon of Courſe from the Lord Chancellor, and forfeits his Goods to the King.

SEDER OLAM, in Philology, a *Hebrew* Term, literally ſignifying, *Order of the World*; being the Title of two Books of Chronology in that Language. They are both very ſhort, though the one more ſo than the other; for which Reaſon the one is called *Seder Olam Rabba*, that is, the *great Seder Olam*; and the other, *Sedar Olam Zuta*, i. e. *little Sedar Olam*. The firſt commences at the Creation of the World, and comes down as low as the War of the Pſeudo Meſſiah *Bar Cochbah*, under *Adrian*, 52 Years after the Deſtruction of the Temple of *Jeruſalem*, and, of Conſequence, to the 122d Year of Chriſt: 'Tis almoſt all taken from the Scripture, excepting the End. 'Tis the Work of *R. Jeſa*, Son of *Hhelpeta* of *Iſippora*, who lived in the ſecond Century, about the Year 130, and was Maſter of the famous *R. Juda Hakkadſoch*, the Compiler of the *Miſchna*. The *Seder Olam Zuta* is an Abridgment of the former, brought down as far as *Mar Sutra*, who lived 450 Years after the Deſtruction of the Temple, or 522 Years after Chriſt. *F. Morin*, continually bent upon diminiſhing the Antiquity of the Principal Books of the *Jews*, endeavours to prove it to have been wrote about the Year of Chriſt 1124, as indeed it is expreſſed at the Beginning; but *R. Dav. Gantz* has overthrown this Opinion in his *Teſmah David*, and ſhewn, that the Date, in the Beginning, is an Interpolation. The two Chronologies were firſt Printed at *Mantua* in 1514, *Quarto*; again, at *Baſil*, by *Froben*, in 1580, *Octavo*: At *Venice* in 1545 *Quarto*: At *Paris*, with a *Latin* Verſion of *Genebrard*, in *Twelves*. They have been ſince Printed at *Amſterdam*, in 1711.

SEDIMENT, the Settlement, or Dregs, of any Thing; or that groſs, heavy Part of a fluid Body, which, upon reſting, ſinks to the Bottom of the Veſſel. Some Phyſicians pretend to diſcover much of the Nature of the Diſeaſe, from the Sediment of the Urine. The Word is formed from the *Latin Sedimentum*, which *Mathæus Sylvaticus* derives *à diuturna Sede*. Dr. *Woodward* maintains, That at the Deluge, the whole Terreſtrial Globe was diſſolved into one uniform Maſs, and that the New World ariſing thence was perfectly Spherical, and without any Inequalities, conſiſting of ſeveral Strata, which the Earthy Sediment gradually produced, as it drained. See DELUGE.

SEDRA, the High-Prieſt of the Sect of *Ali*, among the *Perſians*. The *Sedra* is appointed by the Emperor of *Perſia*, who uſually confers the Dignity on his neareſt Relation. The Juriſdiction of the *Sedra* extends over all Effects deſtined for pious Purpoſes, over all Moſques, Hoſpitals, Colleges, Sepulchres, and Monaſteries. He diſpoſes of all Eccleſiaſtical Employments, and nominates all the Superiors of religious Houſes. His Deciſions, in Matters of Religion, are all received as ſo many infallible Oracles: He judges of all Criminal Matters, in his own Houſe, without Appeal, and is, without Contradiction, the ſecond Perſon in the Empire. He has not, however, any indelible Character, but frequently quits his Poſt for another purely Secular one: His Authority is balanced by that of the *Moudtehitehid*, or firſt Divine of the Empire.

SEED, a Matter prepared by Nature, for the Re-production and Conſervation of the Species, both in Men, Animals, and Plants: Some Naturaliſts add, That even Stones, Minerals, and Metals themſelves have each their proper Seed in their Mines, and are produced and perpetuated thereby. See MINERAL, STONE, &c.

SEED, *Semen*, in the Animal OEconomy, is a white, Liquid Matter, or Humour, the thickeſt of any in the Body, ſeparated from the Blood in the Teſticles, and reſerved in proper Veſſels, to be the Means of Generation. By Chymical Analyſis it is found to conſiſt almoſt intirely of Oil, and Volatile Salts, blended together by the Mediation of a little Phlegm. Its Activity Dr. *Drake* takes to be derived from the Salts, wherewith it abounds, far more than any other Animal Liquor. See HUMOUR.

The Parts concerned in the Preparation of the *Seed* are the *Spermatic Arteries*, which bring the Blood to be ſecreted into the *Teſticles*; The *Teſticles*, and *Paraſtatæ*, where the Secretion it ſelf is chiefly effected; The *Vaſa Deferentia*, which convey the ſecreted Matter out of the Teſticles; and the *Veſiculæ Seminales*, which receive and preſerve it to be emitted in Coition. See each of theſe Parts deſcribed under its proper Article TESTICLE, *&c.*

The Blood received, in ſmall Quantities, into the *Spermatic Arteries*, and there, by the particular Structures of the Parts, much diminiſhed of its Velocity, is yet farther retarded about the *Corpus Pyramidale*, or *Varicoſum*, and its redder, and thicker Parts, carried off by Canals opening into the Veins. Thus rendered paler, and ſlower, it is received into the winding Receſſes of the *Teſticles*, where, almoſt ſtagnating, it aſſumes an Aſh Colour, and is further prepared, thickened, *&c.* in the *Ductus Highmorianus*, whence, ſlowly driven into the *Epididymidæ*, or *Paraſtatæ*, it is further prepared and elaborated in the Folds and Complications thereof, and, at length, creeps ſlowly into the

the *Vasa Deferentia*, or *Ejaculatoria*, which consist, at first, of a thick, fungous Matter, very narrow, but growing sensibly wider, and then again narrower; in the winding Meanders whereof it is collected, its Motion abated, further elaborated, and concocted, and at last driven into the *Vesiculæ Seminales*, in the various Cells and Meatus's whereof it is receiv'd, laid up, fix'd, thicken'd, whiten'd, and raised to its last Perfection: in which State it is called *Seed*.

It is observed, that no Humour in the Body is generated so slowly, meets with so many Means to retard it, or to elaborate, and concoct it, when at rest, as the *Seed*. Some imagine that, in its whole retarded Progress, besides what is apparent, there is something still added to it from the minute nervous Vesicles; and something taken away, by the various Lymphatics, and discharg'd thereby into the Venous Vesicles of the *Corpus Pyramidale*, and the little Veins of the *Vesiculæ Seminales*, and thence into the Humours of the whole Body: *Boerhaave* takes both the one and the other to be very probable.

The *Seed*, or Humour, thus form'd in the Testicles, *Parastatæ*, *Vasa Deferentia*, and *Vesicula Seminales*, being, when new, diluted with a little warm Water, and view'd with a good Microscope, is seen to consist of innumerable, little, oblong, living, Eel-like Animalcula floating in the other Part of this Humour. This is always observ'd in the Seed of all Men, Quadrupedes, Birds, Fishes, amphibious Animals, and Insects. Upon comparing this with the Bulk, Figure, Place, Change, &c. of the Carina of the Chick described by *Malpighi*, and with the known Law of Nature observ'd in the Generation of Frogs; it appears highly probable, that the Animalcula of the Male Seed, contain the Rudiments, or Stamina, of the future Human Body; and the more so, since, whenever the Testicles, or this Humour is wanting, there is always Sterility on the Side of the Male. M. *Leewenhoeck*, the first Discoverer of these Animalcula, and many after him, make no Scruple to call them true *Fœtus*'s, little *Men*; and some have even pretended to discover somewhat of the Human Figure therein. But *Verheyen*, and others after him, deny the Existence of any such Animalcula, maintaining, That 'tis only the intestine Motion of the Parts of the Seed kept on Foot by the Warmth thereof, that exhibits this Appearance, which fanciful Persons have improv'd into frisking Animalcula; and urging, in Confirmation hereof, That no sooner is the Warmth gone, than all Appearance of Animals ceases: But this, notwithstanding the Doctrine of the *Animalcula in Semine*, is now generally received. See ANIMALCULA.

Some admit of four several Kinds of *Seed*: The Seed of the *Testicles*, that of the *Vesicula Seminales*, that of the *Prostates*, and that of the Glands of the *Penis*. The two first, which we have described as one and the same Humour, only in different Stages, those Authors take to be different, as not being able to find any strict Communication between the *Deferentia* and the *Vesiculæ*; but that Communication is fully shewn, by Dr. *Drake*, so that nothing needs further, to shew the *Seeds* the same. The Liquor of the *Prostates*, and that of the Glands of the *Penis* are generally allow'd not to be any true *Seed*, no more than that emitted by Women: Nor is there any good Reason why either of them should be called so, as their Appearance is very different, and as other sufficient Uses are assign'd for them, *viz.* To line and lubricate the Parts, that the Seed, Urine, &c. may pass more freely, and without adhering. See PROSTATES.

The Seminal Liquor, however, such as emitted for Use, is a Mixture of several Liquors, pour'd at the same Time into the common Canal of the Urethra, either from the Glands that have secreted them, or the Reservoirs that have kept them. M. *Du Verney* observes, That in different Species, the Number and Structure of these Organs is different. In Man, the Principal are the *Vesiculæ Seminales*, and the *Prostates*, besides what was discovered by Mr. *Cowper*, *viz.* A Number of new glandulous Bodies on each Side the Urethra, whose excretory Ducts open into the Urethra, towards the Root of the Yard. *M. du Verney* has found, that the same are likewise in most other Animals, and placed in the same Manner. 'Tis controverted, whether or no the Liquor filtrated hereby, be necessary to Generation. *M. de Verney* thinks it is, and his chief Reason is, That in Animals that have been castrated, these Glands, as well as all the other Sources of Generation, are found dried up, and decay'd. M. *Littre* opposes to this, that the *Vesiculæ Seminales*, and *Prostates*, having little Cells, where their filtrated Liquor is deposited, 'tis easily conceiv'd that their Humours may wait some Time, for an Occasion of being emitted; but that these new *Prostates*, or Glands, of Mr. *Cowper*, having no such Reservoirs, their Liquor must ooze out into the Cavity of the Urethra, in Proportion, as it is separated, and be destined for some continual, not a momentary, or occasional Use. He adds, That as the excretory Ducts of these Glands traverse the spongeous Body of the Urethra, for two Inches e'er they penetrate into its Cavity, and that in the sole Moments when the Liquor should be discharg'd, to assist in Generation, that spongeous Body is extremely dilated, and its Sides in a State of Compression, the Liquor must be then less disposed to a Discharge than ever. See ERECTION.

For the Fate of the Seed *when lodged in the Uterus*: *See* CONCEPTION, GENERATION, &c.

SEED in Botany, a Product of a Plant, whereby the Species is propagated. See PLANT. The *Seed* is frequently the Fruit of the Plant, as is the Case in most Herbs: See FRUIT. Sometimes it is only a Part inclosed in the Fruit, and that in Form, either of Grain, Pippin, Kernel, or Berry. See GRAIN, PIPPIN, &c.

The *Seed* is the natural Off-spring of the Flower, and that for whose Production all the Parts of the Flower are intended; So that when this is once well form'd, these several Parts of the Flower dwindle, and disappear. See FLOWER.

'Tis produced from the Farina of the Apices, let fall on the Head of the Pistil, and thence forwarded to an Uterus, at the Bottom thereof, divided into several Cells; where, coming to receive the nutritious Juice of the Plant, it is first soften'd, then swell'd, increased both in Matter and Bulk, and at length comes to its State or Maturity. For more particular Account of the Manner of the Generation of the *Seed*, see GENERATION.

That the whole Plant is contained in the *Seed*, is an Opinion as old as *Empedocles*, and is still the prevailing Doctrine among the Generality of Naturalists. Experience, the Microscope, and the Modern Philosophy, give it great Countenance. In effect, by the Use of good Microscopes, we discover, in the Seed, several of the Parts of the future Tree, only in Miniature; particularly a little Root, called the *Radicle*, and the Stem called the *Plumule*. See RADICLE, and PLUMULE.

In *Malpighi*'s Life, we have a Debate between him and Seignior *Triumphetti*, Provost of the Garden at *Rome*, Whether the whole Plant be actually contained in the Seed: The Affirmative is maintained by *Malpighi*, with cogent Arguments; among which this is one, That in a Kidney Bean e'er sown, the Eye, assisted with a Microscope, easily discovers Leaves, a Bud, and even the Knots, or Implantations of the Leaves on the Stem. The Stem itself is very conspicuous, and plainly consists of Woody Fibres, and Series's of little Utricles. And whereas Seignior *Triumphetti* had objected, That by Poverty, Transplantation, &c. several Plants degenerate into others, particularly Wheat into Tares, and Tares again into Wheat: In Answer to this, which is one of the strongest Objections against that Opinion, *Malpighi* replies, That he is not fully satisfied as to the Truth of the Objection, for that both himself, and his Friends, making the Experiment, no Metamorphosis of the Wheat succeeded: But granting the Metamorphosis, 'tis the Soil, or the Air, or the Culture, is in the Fault. Now, from a morbid, and monstrous Condition of Nature, there is no inferring her genuine and permanent State. See DEGENERATION.

To the same Effect, Mr. *Leewenhoeck*, after a nice Observation of an Orange Kernel he had made to germinate in his Pocket, &c. concludes, "Thus we see "how small a Particle, no bigger than a coarse Sand, "is increas'd, &c." A plain Demonstration, that the Plant, and all that belongs to it, was actually in the *Seed*, *viz.* The Body, Root, &c. Mr. *Derham* adds, That of all the *Seeds* he has viewed, except the Maple, the Plant appears the plainest to the naked Eye in the Nux Vomica.

The Fecundity of Plants, in the Production of *Seeds*, is very surprizing. M. *Dodart*, in the Memoirs of the *French* Academy of Sciences, computes, That an Elm, living 100 Years, ordinarily produces of it self 33000000 Grains; and adds, That had its Crown, or Head, been cut off, it would have put forth as many Branches, within half an Inch of the Place where it was cut, as it had before; and that at whatever Height it were cut off, the Effect would have been still the same. Hence he concludes, That the whole Trunk, from the Ground to the Rise of the Branches, is full of the Principles, or little Embryo's of Branches, which, it is true, cannot all appear at once, but which being conceiv'd, as separated by Circular Rims, half an Inch high, compose so many Sets of Branches, each whereof is ready to appear, and will really appear if the Head be lopp'd off just over it. Now these invisible Branches exist as really as those which appear. For whence else should they come? The

Trunk

Trunk cannot produce them, as being it ſelf no more than a Packet of Fibres, deſtitute of all Action: Nor can the Sap, which, like the Blood, is fit to nouriſh the Parts, but not to form any new ones. The Branches thereof exiſted before the Tree was lopped, and if they had appeared, would have bore an equal Number of Grains as thoſe which did. Theſe Grains, therefore, they muſt already contain in little. On this Footing, the Tree may be ſaid actually to contain in itſelf 15840000000 *Seeds*, wherewith to multiply itſelf as many times: But what ſhall we ſay, if each *Seed*, or Grain of a Tree, contain in itſelf another Tree, containing the ſame Number of *Seeds*? And, if we can never come either at a *Seed* which does not contain Trees, nor at a Tree which does not contain *Seed*? By this Means we ſhall have an increaſing Geometrical Progreſſion, the firſt Term whereof is 1. the ſecond 15840000000, the third, the Square of 15840000000; the fourth, its Cube, *&c.* to Infinity.

Several Species of Plants have been always ſuppoſed to be deſtitute of *Seed*, in regard, no Obſervation, no Microſcope, no Anatomy, diſcovered any Thing like them: Such are the *Capillaries*, the ſeveral Kinds of *Fuci*, Sea-plants, Moſſes, *&c.* But the happy Induſtry of the preſent Age has diſcover'd the *Seeds* of ſome of them; and has left us out of all Doubt, that the reſt are not without the ſame. The *Seeds* of Fern, and the Capillary-Plants, were firſt diſcovered by *Cæſius*; and ſince, more fully and critically by M. *W. Cole*. The Seeds of ſome Sea-Plants, were diſcover'd by the Count de *Marſigli*, and thoſe of others, by M. *Reaumur*, the firſt mentioned in the Hiſtory of the *French* Academy, for the Year 1712, and the latter for the Year 1711. The *Seeds* of ſome Kind of Fuci have been diſcovered by Mr. *Samuel Doody*; thoſe of Coralloid Shrubs, by Dr. *Tanc. Robinſon*, as alſo, thoſe of ſeveral Fungi, particularly Truffles, and *Crepitus Lupi's*, or Puff-balls; and thoſe of ſome other by Dr. *Liſter*. See MUSHROOM. *Under which Article, a new Theory of a Propagation of theſe apparently Seedleſs Plants is laid down.*

SEEDS, in Gardening, and Agriculture. Mr. *Bradley* obſerves, That the *Seeds* of Plants, though exceedingly good, will degenerate from the Mother-Plant, if they be ſown on the ſame Ground, whence they were gathered; ſo that there is a great Neceſſity for a yearly Change for Seeds of Foreſt Trees, as Acorns, Maſt, *&c.* If the Place be too cold to ſow them when gathered in *Auguſt*, they may be kept barrelled or potted up, in moiſt Sand or Earth, *ſtratum ſuper ſtratum*, during the Winter, at the End of which they are found ſprouted, and if gently ſown, will be as forward as if ſown in *Autumn*, beſides their miſſing the Vermine to which the Winter *Seed* is much expoſed. The *Seed* not to be choſen from the moſt fruitful Trees, ſo much as from the moſt ſolid and fair; nor covet the largeſt Acorns, but the moſt weighty, clean, and bright. Porous, inſipid, mild Sorts of *Seeds*, to be ſown as ſoon as ripe. Hot, bitter Seeds to be kept a Year before ſown. The Shape and Weight of *Seeds*, direct how they are to be ſet. Moſt of them, when they fall, lie on one Side, with the ſmall End towards the Earth, which ſhews that Poſture to be beſt to ſet any Stone or Nut in: If they be heavy, ſow them the deeper. Acorns, Peaches, *&c.* to be ſown 2 or 3 Inches deep. See SEMINARY and SEMINATION.

SEEDS, in Pharmacy, *&c.* The *Seeds* uſed in Medicine, *&c.* eſpecially thoſe imported from the *Indies*, *Levant*, *&c.* are ſeverally deſcribed under their reſpective Articles, which ſee. Among thoſe cultivated at Home, the Principal are the Four *hot*, and the Four *cold Seeds*, as they are called. The firſt are thoſe of Annis, Fennel, Cummin, and Caraway; the latter, thoſe of Gourd, Pumpkin, Melon, and Cucumber. The Uſe of the four cold *Seeds* is for the making of Emulſions, cool, refreſhing Drinks, Paſts for the Hands, and Oils uſed by the Ladies for the Complection.

SEED of Pearls, - - - - - } See { PEARL.
SEMEN *Sanctum*, or *Santonicum*, } See { WORMSEED.

SEEDLINGS, are ſuch Roots of Gilliflowers, as come from Seed ſown; alſo the young tender Shoots of any Plants, that are newly ſowed.

SEEING, the Act of perceiving Objects by the Organ of *Sight*; or the Senſe we have of external Objects, by means of the Eye. See SIGHT.

For the Apparatus, or Diſpoſition of the Parts neceſſary to Seeing; *See* EYE.

For the Manner wherein Seeing *is perform'd, and the Laws thereof*; *See* VISION.

Our beſt Anatomiſts differ greatly as to the Cauſe why we don't *ſee* double with the Eyes. *Galen*, and others after him, aſcribe it to a Coalition or Decuſſation of the Optic Nerve behind the *Os Sphenoides*. But whether they decuſſate or coaleſce, or only barely touch one another, is not ſo well agreed. The *Bartholines* and *Veſalius*, ſay expreſly, they are united by a perfect Confuſion of their Subſtance: Dr. *Gibſon* allows them to be united by the cloſeſt Conjunction, but not Confuſion of their Fibres. *Des Cartes* and others, account for the Effect another Way, *viz.* by ſuppoſing that the *Fibrillæ* conſtituting the medullary Part of thoſe Nerves, being ſpread in the Retina of each Eye, have each of them correſponding Parts in the Brain; ſo that when any of thoſe *Fibrillæ* are ſtruck by any Part of an Image, the correſponding Parts of the Brain are affected thereby. Somewhat like which is the Opinion of Dr. *Briggs*; who takes the Optic Nerves of each Eye to conſiſt of homologous Fibres, having their Riſe in the *Thalamus nervorum Opticorum*, and thence continued to both the *Retinæ* which are compoſed of them: And farther, that thoſe *Fibrillæ* have the ſame Paralleliſm, Tenſion, *&c.* on both Eyes: Conſequently, when an Image is painted on the ſame correſponding, ſympathizing Parts of each *Retina*, the ſame Effects are produced, the ſame Notice carried to the Thalamus, and ſo imparted to the Soul. Hence that double Viſion enſuing upon an Interruption of the Paralleliſm of the Eyes, as when one Eye is depreſſed by the Finger, or their Symphony interrupted by Diſeaſe. But Dr. *Briggs* maintains, that 'tis but in few Subjects, there is any Decuſſation; in none, any Conjunction more than mere Contact.

Whence it is that we ſee Objects erect, when, as 'tis certain, the Images thereof are painted invertedly on the Retina, is another Difficulty in the Theory of *Seeing*. *Des Cartes* accounts for it hence; That the Notice the Soul takes of the Object, does not depend on any Image, nor of any Action coming from the Object, but merely from the Situation of the minute Parts of the Brain; whence the Nerves ariſe. *E.gr.* the Situation of a Capillament of the Optic Nerve, correſponds to a certain Part of the Brain; which occaſions the Soul to ſee all thoſe Places lying in a right Line therewith. But Mr. *Molyneux* gives us another Account: The Eye, he obſerves, is only the Organ, or Inſtrument: 'Tis the Soul that ſees. To enquire, then, how the Soul perceives the Object erect by an inverted Image, is to enquire into the Soul's Faculties. Again, imagine that the Eye receives an Impulſe on its lower Part, by a Ray from the upper Part of an Object; muſt not the viſive Faculty be hereby directed to conſider this Stroke as coming from the Top rather than the Bottom of the Object, and conſequently, be determined to conclude it the Repreſentation of the Top?

SEELING. A Horſe is ſaid to *Seel*, when upon his Eye-brows, there grows about the Breadth of a Farthing of white Hairs, mixed with thoſe of his natural Colour; which is a Mark of Old Age: An Horſe never *Seels* till he is Fourteen Years old, and always before he is Sixteen at fartheſt: The light Sorrel and Black, ſooner *Seel* than any other. Horſe-Jockeys uſually pull out thoſe Hairs with Pincers; but if there be ſo many, that it cannot be done, without making the Horſe look bald and ugly, then they colour their Eye-brows, that they may not appear old.

SEGMENT *of a Circle*, in Geometry, a Part of a Circle comprehended between an Arch and the Chord thereof. Thus the Portion A F B A (Tab. Geometry Fig. 23) comprehended between the Arch A F B, and the Chord A B, is a *Segment* of the Circle A B E D, *&c.* a *Segment* of ſo many Degrees. The Term *Segment* is alſo applied by Extenſion, to Ellipſes and other Curvilinear Figures. As 'tis evident every *Segment* of a Circle muſt either be greater or leſs than a Semi-circle; the greater Part of the Circle cut off by a Chord, *i. e.* the Part greater than a Semi-circle, is call'd the *greater Segment*, as A D E B; and the leſſer part, the Part leſs than a Semi-circle, the *leſſer Segment*, as A F B, *&c.* The Angle which the Chord A B, makes with a Tangent L B, is called the *Angle of a Segment*. Some, indeed, call the Two mixt Angles comprehended between the Two Extremes of the Chord, made with the Arch, *Angles of the Segment*.

The Height of a Segment F a, *and half its Baſe or Chord* B a, *being given, to find the Area of the Segment*: Find the Diameter of the Circle. (See DIAMETER.) On this deſcribe a Circle, and draw the Baſe of the *Segment* A a B; draw R, A C, B C; and find the Number of Degrees of the Arch A F B. From the Diameter had, and its *Ratio* to the Periphery, find the Periphery itſelf; and from the *Ratio* of the Periphery to the Arch A D B, and the Periphery itſelf, find the Length of the Arch A D B. This done, find the Area of the Sector A F B C A. See SECTOR. And that of the Triangle A B. See TRIANGLE. Laſtly, ſubtract the Triangle from the Sector, the Remainder is the Area of the *Segment*.

If the Area of the greater *Segment* A D E B were required, the Triangle A C B muſt be added to the Sector A D E B

ADE BC. SEGMENT *of a Sphere*, is a part of a Sphere terminated by a Portion of its Surface, and a Plane which cuts it off; passing somewhere out of the Centre: This is more properly called a *Section of a Sphere*. See SECTION. The Base of such a *Segment*, 'tis evident, is always a Circle whose Centre is in the Centre of the Sphere. See SPHERE.

The solid Content is found, by multiplying the Surface of the whole Sphere by the Altitude of the *Segment*, and then dividing the Product by the Diameter of the Sphere, and to the Quotient adding the Area of the Base of the *Segment*; or, if it be less than a Hemisphere, thus; Take the Altitude of the *Segment* from the Radius of the Sphere, and by the Difference multiply the Area of the Base of the *Segment*; and subtract this Product, from that which will arise by multiplying the Semi-Axis of the Sphere into the convex Surface of the *Segment*; then divide the Remainder by 3, and the Quotient is the Solidity sought. This latter Method supposes the Axis of the Sphere to be given; if not, it may be found thus: Let the Altitude of the *Segment* be called a, and its Semi-diameter s, then will $a. s :: s. \frac{ss}{a}$; add $\frac{ss}{a}$ to a, and that shall give the Axis sought.

Line of SEGMENTS. On *Gunter's* Sector there are usually Two Lines, called *Lines of Segments*; they are numbered with 5, 6, 7, 8, 9, 10, and lie between the *Lines of Sines*, and those of Superficies. They represent the Diameter of a Circle, so divided into 100 Parts, as that a Right Line drawn through those Parts, and normal to the Diameter, shall cut the Circle into Two *Segments*, of which the greater shall have that Proportion to the whole Circle, as the Parts cut are to 100. See SECTOR.

SEGMENT-LEAVES; thus Botanists call those Leaves, that are cut and divided into many Shreds or Slices, as Fennel, &c.

SEGMOIDAL VALVES, in Anatomy, are little *Valves* of the Pulmonary Artery; thus call'd from their resembling Segments of Circles; but more usually *Semilunar Valves*. See SEMILUNAR.

SEGREIANT, is the Herald's Word for Griffins, when drawn in a leaping, or salient Posture.

SEJANT, is a Term used in Heraldry, when a Lyon, or other Beast, is drawn in an Escutcheon, sitting like a Cat, with his Fore-feet streight.

SEIGNOURAGE, a Right or Due belonging to a *Seigneur*, or *Lord*. The Term is particularly used for a Duty belonging to the Prince for the Coining of Money, called also *Coinage*; in the baser *Latin*, *Monetagium*. This Duty is not always the same; but changes according to the Pleasure of the Prince, and the Occasions of State. 'Tis in some measure for the Discharge of this Duty that *Alloy* was invented; that is, the Mixture of other Metals with Gold and Silver.

Under our ancient Kings, for every Pound of Gold brought in the Mass to be Coined, the King's Duty was Five Shillings; one Shilling, and sometimes Eighteen Pence whereof went to the Master of the Mint. Under *Edward* the Third, the *Seignourage* of every Pound Weight of Silver, was Eighteen-penny Weight, which was then equivalent to a Shilling. Under *Henry* V. the King's *Seignourage* for every Pound of Silver was Fifteen-pence. At present, the King claims no *Seignourage* at all, but the Subject has his Money coined at the public Expence: Nor has the King any Advantage therefrom, but what he has by the Alloy. In *France*, under *Philip Augustus*, the *Seignourage* was one Third of the Profit made by the Coining. St. *Louis* fix'd it at one Fifteenth Part of the Value of the Money Coined. King *John* at Three Livres the Mark of Gold. *Charles* VII. by reason of the distress'd State of the Finances, rais'd it to Three Fourths of the Value. *Louis* XIII. fix'd it at Six Livres the Mark or Eight Ounces of Gold, and Ten Sols, the Mark of Silver. *Louis* the XIV. took away the Right of *Seignourage* in 1679, tho' 'twas re-established in 1689 on the Foot of Seven Livres, Ten Sols the Mark of Gold, and Twelve Sols, Six Deniers the Mark of Silver.

It must be observed, that for the levying of this Duty of *Seignourage*, the just Value of the Money is augmented by the Value of the Duty.

SEISIN, in Law, from the *French Seisine*, signifies Possession; so *primier Seisin* is the first Possession. *Seisin*, according to the common Law, is Two-fold; *Seisin in Fact*, and *Seisin in Law*. *Seisin in Fact*, is, when a Corporal Possession is taken. *Seisin in Law*, is, when something is done, which the Law accounteth a *Seisin*; as an Inrollment: and this in Law, is as much as a Right to Lands and Tenements, tho' the Owner be by Wrong Disseised of them; and he, who hath had an Hour's Possession quietly taken, hath *Seisin de Droit*, & *de Claime*, whereof, no Man may *disseise* him by his own Force or Subtlety, and it is called by *Coke*, *Seisin in Law*, or actual *Seisin*. The Civilians call the one *Civilem Possessionem*, the other *Naturalem*. See POSSESSION.

SEIZE or SEASE, in the Sea Language, is to make fast or bind; particularly to fasten Two Ropes together, with Rope-Yarn. The *Seizing* of a Boat is a Rope tied to a Ring, or little Chain in the Fore-ship of the Boat, by which means it is fastened to the Side of the Ship.

SEIZING, (in Falconry) is when an Hawk gripes her Prey, or any thing, fast within her Claws.

SEIZURE, in Commerce, an Arrest made of some Merchandize, Moveable, or other Matter, either in consequence of some Law, or of some express Order of the King. Contraband Goods, those fraudulently Entered, or landed without Entering at all, or landed at wrong Places, are subject to *Seizure*. See CONTRABAND. In *Seizures*, among us, one half goes to the *Seizor* or Informer, and the other Half to the King. In *France*, Half the painted Linnens, &c. *Seiz'd*, used to be burnt, and the other Half sent Abroad: But in 1715, by an Arret of Council, it was appointed the Whole should be burnt.

SELENITES, in Natural History, *Moon-Stone*, said to be a Stone still found in *China*, which has this remarkable Property, That it increases and decreases, as the Moon waxes and wains. There are some of these *Selenites* preserved in the Palace of *Peking*, valued at an incredible Rate. *Martinius*. The Word is form'd from the *Greek* Σελήνη Moon. Some give the same Appellation to *Muscovy-Talc*, from an Opinion, that its Brightness increases and diminishes with the Moon.

SELENOGRAPHY, a Branch of Cosmography, which describes the *Moon* and all the Parts and Appearances thereof; as Geography does those of the Earth: from Σελήνη Moon, and γραφὴ, Description. Since the Invention of the Telescope, *Selenography* is vastly improved. We have now distinct Names for most of the Regions, Seas, Lakes, Mountains, &c. visible in the Moon's Body. *Hevelius*, a celebrated Astronomer and Bourgue-master of *Dantzick*, who published the first *Selenography*, named the several Places of the Moon from those of the Earth: *Ricciolus*, from the Names of the celebrated Astronomers and Philosophers. Thus what the one calls *Mons Porphyrites*, the other calls *Aristarchus*. What the one calls *Etna*, *Sinai*, *Athos*, *Apermius*, &c. the other calls *Copernicus*, *Possidonius*, *Tycho*, *Gassendus*, &c. See MOON. At the Royal Observatory at *Paris*, they continue to make *Selenographic* Maps. M. *Cassini* has publish'd a Work call'd *Instructions Seleniques*.

SELEUCIANS, a Sect of ancient Hereticks, call'd also *Hermians*. *Seleucus* and *Hermias* joyning Forces, and dogmatizing together, taught, That God was Corporeal; that the Elementary Matter was Coeternal with him; and that the Human Soul was form'd by the Angels, of Fire and Air: They denied that *Jesus Christ* sate at the Right Hand of God; asserting, That he had quitted that Right, and had removed his Throne into the Sun. See PHILASTRIUS, S. AUGUSTIN, &c.

SELEUCIDES, in Chronology. The *Æra of the Seleucides*, or the *Syro-Macedonian Æra*, is a Computation of Time, commencing from the Establishment of the *Seleucides*, a Race of *Greek* Kings, who Reign'd as Successors of *Alexander the Great* in *Syria*; as the *Ptolomy's* did in *Egypt*. This *Æra* we find express'd in the Book of *Maccabees*, and on a great Number of *Greek* Medals struck by the Cities of *Syria*, &c. The Rabbins and *Jews* call it, The *Æra of Contracts*, because being then subject to the Kings of *Syria*, they were obliged to follow their Method of computing in all Contracts. The *Arabs* call it *Therick Dilkarnain*, Æra of two Horns, which some say signifies the Æra of *Alexander the Great*; by reason that Prince bore Two Rams Horns on Medals, in Imitation of *Jupiter Ammon*, whose Son he would needs be. But others understand it much better of the Two Kingdoms of *Syria* and *Egypt*, which were now cloven or divided; and of one single Empire parted into two Monarchies. The grand Point, is to know the Year wherein the Separation was made; or, which is the same Thing, when *Seleucus*, one of *Alexander's* Captains, and the first of the *Seleucides*, established his Throne in *Syria*. Without detailing the various Sentiments of various Authors, it may suffice to observe, That, according to the best Accounts, the first Year of this Æra falls in the Year 311 before *Christ*, which was 12 Years after *Alexander's* Death. See EPOCHA.

SELLA, in Anatomy, *Sella Equina*, *Sella Turcica*, and *Sella Sphænoides*; A Name given the Four Apophyses of the *Os Sphænoides*, and *Os Cuneiforme* in the Brain, in regard of their forming a Resemblance of a Saddle, which the *Latins* call *Sella*. See BRAIN. They are sometimes also called by the *Greek* Name *Clinoides*. Herein are contained the pituitary Glands, and in some Beasts, the *Rete Mirabile*. See SPHÆNOIDES.

SELL, in Building, is of Two kinds, *viz. Ground-Sell*, which is the loweſt Piece of Timber in a Timber Building, and that whereon the whole Superſtructure is raiſed; and *Window-Sell*, called alſo *Window-Soil*, the bottom Piece in a Window-Frame. See WINDOW.

SEMBIANS, a Sect of ancient Hereticks, denominated from their Leader, *Sembius* or *Sembianus*, who condemn'd all Uſe of Wine, as Evil of itſelf; perſuaded his Followers, that the Vine was a Production of Satan and the Earth; denied the Reſurrection of the Dead, and rejected moſt of the Books of the *Old Teſtament*. *Jovet.*

SEMBRADOR, an Engine, invented by *Don Joſ. de Lucatello*, for the evenly Sowing of Seeds; deſcribed in the *Philoſophical Tranſactions*, under the Title of the *Spaniſh Sembrador*. The Perfection of Agriculture is allowed to conſiſt in ſetting the Plants in proportionable Spaces, and giving ſufficient Depth to the Roots, that they may ſpread, and receive their neceſſary Nouriſhment: yet is very little Care taken in the Practice of this important Part of Husbandry; but all ſorts of Grains ſown by Handfuls, caſt at Random; by which means Four Parts in Five of the Seed are loſt. To remedy this Inconvenience, the *Sembrador* or *Sower*, is invented, which being faſtened to the Plough, the whole Buſineſs of Plowing, Sowing and Harrowing is done at once, the Seeds-man's Trouble ſaved, and the Grain ſpread at equal Diſtances, and equally deep at the bottom of the Furrow. An Experiment hereof was made before the Emperor *Leopold* in the Fields of *Luxemburg* in *Auſtria*, where the Land uſually yields four or five fold; but the Crop from the Ground ſowed by this Inſtrument, was Sixty fold, as appears by a Certificate of the Emperor's Officer, appointed to ſee the Experiment: Sign'd *Vienna, Auguſt* 1. 1663. A Figure of the *Sembrador*, we have in the *Tranſactions*, by the Earl of *Caſtlemain*.

SEMEIOSIS, in Medicine. See DIAGNOSIS.

SEMEIOTICA, that Part of Medicine, which conſiders the Signs or Indications of Health and Diſeaſes; and enables the Phyſician to judge what is, was, or will be the State, Degree, Order and Effect of Health or Sickneſs. See SIGN and INDICATION; ſee alſo MEDICINE. The Word is form'd from the *Greek* Σημειοτικη, of Σημεῖον, *Sign*.

SEMENTINÆ FERIÆ, in Antiquity, Feaſts held annually among the *Romans*, to obtain of the Gods a plentiful Harveſt. They were held in the Temple of *Terra*, or the Earth; where ſolemn Sacrifices were offered to *Terra* and *Ceres*. The Time of the Celebration was about Seed-Time, uſually in the Month of *January*; for *Macrobius* obſerves, they were moveable Feaſts. They had their Name from *Semen*, Seed.

SEMETS, in Botany; Dr. *Grew* uſes the Word for the Apices of the Attire of Plants. See APICES.

SEMI, a Word borrow'd from the *Latin*, ſignifying *Half*; but only uſed in Compoſition with other Words, as in the following Examples. The *French*, inſtead of *Semi*, frequently uſe *Demi*.

In Muſic, *Semi* has three ſeveral Uſages: Firſt, when added to a Note, it expreſſes a Diminution of Half its Value, as *Semi-breve*, &c. which See. Secondly, when added to the Name of an *Interval*, it expreſſes a Diminution, not of Half, but of a minor Half-tone, or four Commas in the whole Compaſs. Thirdly, it ſometimes ſignifies an Imperfection. Thus *Semicircolo* or *Circolo-mezzo*, ſignifies an imperfect Circle, which is the Mark of imperfect Time, that is, of double Time; whereas, the Circle, being a Character of Perfection, marks triple Time.

SEMI-ARIANS, a Branch of the Ancient *Arians*; conſiſting of ſuch as, in Appearance, condemned the Errors of that Hereſiarch, but yet acquieſced in the Principles thereof; only palliating and hiding them under ſofter, and more moderate Terms. 'Tis true, they ſeparated from the *Arian* Faction; but yet could never be brought to acknowledge, that the Son was *Homoouſios*, that is, conſubſtantial, or of the ſame Subſtance with the Father. They would only allow him to be *Homoiouſios*, that is, of a Subſtance like the Father. Though, as to Expreſſion, they only differ'd from the Orthodox by a ſingle Letter; yet were they, in Effect, in the Error of the *Arians*; as they placed the Son in the Rank of Creatures. It did not avail the teaching, that there was no other Creature of the ſame Claſs with him; ſince by denying him conſubſtantial with God, they effectually precluded him from being truly God. Yet ſome, even among the Orthodox, uſe the Word *Homoiouſios*, in ſpeaking of the Son; applying ſuch an Idea to it, as, it ſeems, is conſiſtent with Orthodoxy. See ARIANS.

SEMI-BREVE, in Muſic, a Note, or Meaſure of Time, comprehending the Space of Two Minims, or Four Crotchets, or Half a *Breve*. The *Semi-breve* is accounted one Meaſure or Time; or the Integer, in Fractions and Multiples whereof the Time of the other Notes is expreſſed. Thus the Minim is expreſs'd by $\frac{1}{2}$; a Crotchet by $\frac{1}{4}$, &c. *i. e.* by $\frac{1}{4}$ of a Meaſure or *Semi-breve*. A *Breve* by 2; a *Long* by 4, that is, by 4 Meaſures or *Semi breves*. The Character of the *Semi-breve* is O.

SEMI-CIRCLE, in Geometry, a Figure comprehended between the Diameter of a Circle, and Half the Circumference. See CIRCLE. Two *Semi-Circles* can only cut each other in one Point.

Semi-Circle, is alſo an Inſtrument in Surveying, call'd alſo *Graphometer*. It conſiſts of a *Semi-circular* Limb, as F I G (Tab. Surveying Fig. 16.) divided into 180 Degrees and ſometimes ſubdivided, Diagonally or otherwiſe, into Minutes. This Limb is ſubtended by a Diameter F G, at the Extremities whereof are Erected two Sights. In the Centre of the *Semi-circle*, or the Middle of the Diameter, is fix'd a Box and Needle. On the ſame Centre is fitted an Alidade or moveable Index, carrying two other Sights, as H I. The whole is mounted on a Staff with a Ball and Socket.

In Effect, the *Semi-circle* is nothing elſe but Half a *Theodolite*; with this only Difference, that whereas the Limb of the *Theodolite*, being an intire Circle, takes in all the 360° ſucceſſively; in the *Semi circle*, the Degrees only going from 1 to 180, 'tis uſual to have the remaining 180°, or thoſe from 180° to 360°, graduated in another Line on the Limb, within the former.

To take an Angle with a SEMI-CIRCLE.

Place the Inſtrument in ſuch Manner, as that the Radius C G may hang over one Leg of the Angle, to be meaſur'd, and the Centre C over the Vertex of the ſame. The firſt is done by looking through the Sights F and G at the Extremities of the Diameter, to a Mark fixed up in one Extremity of the Leg: The latter is had by letting fall a Plummet from the Centre of the Inſtrument. This done, turn the moveable Index H I on its Centre towards the other Leg of the *Semi-circle*, till through the Sights fixed on it, you ſee a Mark in the Extremity of the Leg. Then, the Degree which the Index cuts on the Limb, is the Quantity of the Angle.

For further Uſes of the Semi-circle, *they are the ſame with thoſe of the Theodolite.* See THEODOLITE.

SEMI-CUPIUM, a Half Bath, wherein the Patient is only up to the Navel. See BATH.

SEMI-DIAMETER, a Right Line drawn from the Centre of a Circle or Sphere, to its Circumference; the ſame with what we otherwiſe call *Radius*. See RADIUS. The Diſtances, Diameters, &c. of the Heavenly Bodies, are uſually eſtimated by Aſtronomers in *Semi diameters* of our Earth. See EARTH; See alſo SUN, PLANET, &c.

To find the Semi-diameters *of the Primary Planets in* Semi-diameters *of the Earth.*

Since the Sun's true *Semi-diameter* is 152 *Semi-diameters* of the Earth; and we have the *Ratio* of the *Diameters* of the Primary Planets to that of the Sun (See DIAMETER; their *Semi-diameters* are eaſily found by the Rule of Three: Thus, the *Semi-diameter* of *Saturn* will be found $20\frac{2}{37}$; that of his Ring $45\frac{7}{17}$; that of *Jupiter* $27\frac{8}{11}$; that of *Mars* $\frac{76}{63}$; that of *Venus* $\frac{4}{7}$; and that of *Mercury* $\frac{1}{3}$. See PLANET.

SEMI-COLON, in *Grammar*, one of the Points or Stops, uſed to diſtinguiſh the ſeveral Members of Sentences from each other. See SENTENCE and POINT. The Mark or Character of the *Semi-colon* is (;) It has its Name, as having a ſomewhat leſs Effect than a Colon, or as demanding a ſhorter Pauſe. The Uſe of the *Semi-colon*, the Grammarians generally ſay, is, To mark a Senſe leſs compleat than the Colon, and more compleat than the Comma; but this only conveys a very obſcure Idea. In effect, the preciſe Uſe of the *Semi-colon*, or what it is diſtinguiſhes it from the Colon, is a Thing very little known in the World. Our beſt Authors ſeem to uſe them promiſcuouſly. See COLON.

Mr. *Ward*, we believe, is the firſt (and he in the preſent Year 1724) who ever ſettled the preciſe Uſe of the *Semi-colon*. His Obſervation is, *That the Semi-colon is properly uſed to diſtinguiſh the conjunct Members of Sentences:* Now, by a *conjunct Member of a Sentence*, he means, ſuch a one as contains at leaſt two ſimple Members. See SENTENCE. Whenever, then, a Sentence can be divided into ſeveral Members of the ſame Degree; which are again diviſible into other ſimple Members, the former are to be ſeparated by a *Semi-colon*. For an Inſtance: If Fortune bear a great Sway over him, who has nicely ſtated and concerted every Circumſtance of an Affair; we muſt not commit every Thing, without Reſerve to Fortune, leſt ſhe have too great a hold of us. Again, *Si quantum in agro Icciſque deſertis audacia poteſt, tantum in Foro atque*

Judiciis

Judicis imprudentia valeret; non minus in Causa, cederet Aulus Cæcinna Sexti Alburni imprudentia quam tum in vi faciendâ cessit audaciæ. An Instance in a more complex Sentence we have in *Cicero*. *Res familiaris primum bene parta sit, nulloque turpi quæstu; tum quam plurimis, modo dignis, se utilem præbeat; deinde augeatur ratione, diligentia, parsimonia; Nec lividini potius luxuriæque, quam liberalitati & beneficentiæ pareat.* But though the proper Use of the *Semi-colon*, be to distinguish conjunct Members; 'tis not necessary that all the Members divided hereby, be conjunct. For upon dividing a Sentence into great and equal Parts, if one of them be conjunct, all those other Parts of the same Degree are to be distinguished by a *Semi-colon*. Thus: Whoever is overtaken with Poverty; the same will find, that Coldness, Contempt, Injuries, &c. are not far behind. Or thus: *Nihil est tam molle, tam rerum, tam aut fragile, aut flexibile; quam voluntas civium.* Sometimes also it happens, that Members that are opposite to each other; but relate to the same Verb, are separated by a *Semi-colon*: Thus *Cicero*. *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; tunc pietas, illinc scelus*, &c. Hither likewise may be referred such Sentences, where the whole going before, the Parts follow: as, The Parts of *Rhetorick* are Four; Invention, Disposition, Elocution and Pronunciation.

Semi-Diapason, in Music, a defective Octave; or an Octave diminished, of a minor *Semi-tone*, or four Commas. See Diapason.

Semi-Diapante, in Music, a defective Fifth, call'd usually by the *Italians*, *Falsa quinta*, and by us a *false Fifth*. See Fifth.

Semi-Diatessaron, in Music, a defective Fourth, call'd, properly, a *false Fourth*. See Fourth.

Semi-Double, in the *Romish* Breviary, a Term used for such Offices and Feasts as are celebrated with less Solemnity than the *double* ones; but yet with more than the single ones. The *Semi-double* Office has double Vespers, and Nine Lessons at *Mattins*; but the Anthems are not redoubled. 'Tis perform'd on *Sundays*, in the Octaves, and in Feasts mark'd for *Semi-double* in the Calendar.

Semi-Lunar *Valves*, in Anatomy, are little *Valves* or Membranes of a *Semilunar* Figure, placed in the Orifice of the Pulmonary Artery, to prevent the Relapse of the Blood into the Heart at the time of its Dilatation. See Valve.

Semi-Ordinates, in Geometry, the Halves of the *Ordinates* or Applicates. See Ordinate.

Semi-Parabola, in Geometry, a Curve defined by the Equation $ax^{m-1} = y^m$; as $ax^2 = y^3$, $ax^3 = y^4$. See Parabola.

In *Semi-parabolas* $y^m : v^m :: ax^{m-1} : az^{m-1} = x^{m-1} : z^{m-1}$ or the Powers of the *Semi-ordinates*, are as the Powers of the Abscisses one Degree lower; *E. gr.* in Cubical *Semi-parabolas*, the Cubes of the Ordinates y^3 and v^3 are as the Squares of the Abscisses x^2 and z^2.

Semi-Pelagians, a Name anciently, and even at this Day, given to such as retain some Tincture of *Pelagianism*. See Pelagians. S. *Prosper*, in a Letter to St. *Augustin*, calls them *Reliquias Pelagii*.

Many learned Men, principally among the *Gauls*, who cou'd not come into St. *Augustin*'s Doctrine of Grace, &c. were accused of *Semi-pelagianism*: They were also call'd *Priests of Marseilles*; in regard their Errors had their first Rise in that City. *Cassian*, who had been a Deacon of *Constantinople*, and was afterwards a Priest at *Marseilles*, was the Chief of these *Semi-pelagians*. S. *Prosper*, who was Co-temporary with him, and who attack'd him very vigorously, tells us, That *Cassian* endeavouring to keep I know not what Medium between the *Pelagians* and the Orthodox, did not agree either with the one or the other. The *Semi-pelagians*, with the Orthodox, allowed of Original Sin; but denied, that Man's free Agency could be so wounded by this Sin, that he could not of himself do something which might induce God to afford his Grace to one more than another. They taught, That the Grace which saves Men, was not given them from the mere Will of God, but according to his eternal Prescience, whereby he foresaw who they were that would believe in him. They own'd, that the Vocation or Call to the Gospel, was gratuitous; but added, at the same Time, That it was common to all, inasmuch as God desired all should be saved. As to Election, they held, that it depended on our Perseverance; God only chusing such to Eternal Life, as should persevere in the Faith.

Semi-Proof, an imperfect Proof. The Depositions of a single Evidence only make a *Semi-proof*. See Witness. The Testament of a Person deceased, is deemed a *Semi-proof*. In *France*, in enormous Cases, the *Semi proof* frequently determines them to try the Torture.

Semi-Quartile, is an Aspect of the Planets, when distant from each other 45 Degrees, or one Sign and an Half.

Semi-Quaver, in Music. See Quaver.

Semi-Quintile; is an Aspect of the Planets, when at the Distance of 36 Degrees from one another. See Aspect.

Semi-Sextile, or *Semi-sixth*, or *S. S.* an Aspect of two Planets, wherein they are distant from each other, one Twelfth Part of a Circle, or 30 Degrees. See Aspect. The *Semi-sixth* was added to the ancient Aspects by *Kepler*; and, as he says, from Meteorological Observations.

Semi-Spinatus, in Anatomy. See Transversatis Dorsi.

Semi-Tone, in Music, one of the Degrees, or concinnous Intervals, of Concords: See Degree. There are three Degrees, or lesser Intervals, by which a Sound can move upwards and downwards successively from one Extreme of any Concord to the other, and yet produce true Melody; and, by means whereof, several Voices, and Instruments are capable of the necessary Variety in passing from Concord to Concord. These Degrees, are the greater and lesser Tone, and the *Semi-tone*. The *Ratio* of the First is 8 : 9; that of the Second 9 : 10. See Tone. The *Ratio* of the *Semi-tone* is 15 : 16. which Interval is called a *Semi-tone*, not that 'tis geometrically the Half of either of the Tones, for 'tis greater; but because it comes somewhat near it. 'Tis also call'd the *Natural Semi-tone*, and the *Greater Semi-tone*, because greater than the Part it leaves behind, or its Complement to a *Tone*, which is 15 : 16 in the *Less Tone*, and 128 : 135 in the Lesser. The *Semi-tone* is the Difference of the greater Third and Fourth, or of a Fifth, and lesser Sixth.

Every *Tone* of the Diatonic Scale is divided into a *Greater* and *Less*, or a *Natural and Artificial Semi-tone*. Mr. *Malcolm* observes, 'Twas very natural to think of a Division of each Tone, where 15 : 16 should be one Part in each Division, in regard this being an unavoidable and necessary Part of the Natural Scale, wou'd readily occur as a fit Degree, and the more, as 'tis not far from an exact *Half Tone*. In effect, the *Semi-tones* are so near equal, that, in Practice, at least, on most Instruments, they are accounted equal, so that no Distinction is made into *Greater* or *Less*. These *Semi-tones* are called *Fictitious Notes*, and, with respect to the Natural ones, are express'd by Characters called *Flats* and *Sharps*. See Flat and Sharp. Their Use is to Remedy the Defects of Instruments, which having their Sounds fixed, cannot be always made to answer to the Diatonic Scale: See Scale. By means of these we have a new Kind of Scale, called the *Semi-tonic-Scale*.

Semi-Tonic-*Scale*, or the Scale of *Semi-tones*; A Scale or System of Music, consisting of 12 Degrees, or 13 Notes, in the *Octave*; being an Improvement on the Natural or Diatonic Scale, by inserting between each two Notes thereof, another Note, which divides the Interval or Tone into two unequal Parts, called *Semi tones*. See Semitone. The Use of this Scale is for Instruments that have fixed Sounds, as the Organ, Harpsichord, &c. which are exceedingly defective on the Foot of the *Natural*, or *Diatonic*, Scale. For the Degrees of the Scale being unequal, from every Note to its *Octave* there is a different Order of Degrees; so that from any Note we cannot find any Interval in a Series of fix'd Sounds: Which yet is necessary, that all the Notes of a Piece of Music carried through several Keys, may be found in their just Tune, or that the same Song may be begun indifferently at any Note, as may be necessary for accommodating some Instruments to others, or to the Human Voice, when they are to accompany each other in Unison.

The *Diatonic* Scale, beginning at the lowest Note, being first settled on an Instrument, and the Notes thereof distinguished by their Names *a . b . c . d . e . f . g*; the inserted Notes, or *Semi-tones*, are called *Fictitious Notes*, and take the Name or Letter below with a ♯ as *c* ♯ called *c Sharp*; signifying, that it is a *Semi-tone* higher than the Sound of *c* in the natural Series, or this Mark ♭ (called a *Flat*) with the Name of the Note above, signifying it to be a *Semi-tone* lower. Now $\frac{15}{16}$ and $\frac{128}{135}$ being the two *Semi-tones* the greater *Tone* is divided into; and $\frac{15}{16}$ and $\frac{24}{25}$, the *Semi-tones* the less *Tone* is divided into; the whole *Octave* will stand as in the following Scheme, where the *Ratio's* of each Term to the next, are wrote Fraction wise between them below.

Scale of Semi tones.

c	♯	*d*	♯	*e*	*f*	♯	*g*	♯	*a*	*b*	*b*	*cc*
$\frac{15}{16}$	$\frac{128}{135}$	$\frac{11}{16}$	$\frac{24}{25}$	$\frac{15}{16}$	$\frac{128}{135}$		$\frac{15}{16}$	$\frac{15}{16}$	$\frac{24}{25}$	$\frac{15}{16}$	$\frac{8}{15}$	$\frac{15}{16}$

For the Names of the Intervals in this Scale it may be considered, that as the Notes added to the natural Scale are not design'd to alter the Species of Melody, but leave it still *Diatonic*, and only correct some Defects arising from something foreign to the Office of the Scale

of

of Muſic, *viz.* the fixing and limiting the Sounds: We ſee the Reaſon why the Names of the *Natural* Scale are continued; only making a Diſtinction of each into a *Greater* and *Leſs*. Thus an Interval of one *Semi-tone* is called a *Leſſer Second*; of two *Semi-tones*, a *Greater Second*; of three *Semi-tones*, a *Leſs Third*; of four, a *Greater Third*, &c.

A ſecond Kind of *Semitonic Scale* we have from another Diviſion of the *Octave* into *Semi-tones*; which is performed by taking an Harmonical Mean between the Extremes of the *Greater* and *Leſs Tone* of the Natural Scale, which divides it into two *Semi-tones* nearly equal: Thus the *Greater Tone* 8 : 9 is divided into 16 : 17, and 17 : 18; where 17 is an Arithmetical Diviſion, the Numbers repreſenting the Lengths of Chords; but if they repreſent the Vibrations, the Lengths of the Chords are reciprocal, *viz.* As 1 : 16 : $\frac{8}{9}$, which puts the *Greater Semi-tone* $\frac{16}{17}$, next the lower Part of the *Tone*, and the Leſſer $\frac{17}{18}$ next the Upper, which is the Property of the Harmonical Diviſion. After the ſame Manner the *Leſſer Tone* 9 : 10 is divided into the two *Semi-tones* 18 : 19 and 19 : 20, and the whole *Octave* ſtands thus:

c . c ♯ . d . d ♯ . e . f . f ♯ . g . g . ♯ . a . b . b . c

16 17 18 19 15 16 17 18 19 20 16 17 18 15 16

This Scale, Mr. *Salmon* tells us, in the *Philoſoph. Tranſact.* he made an Experiment of, before the Royal Society, on Chords, exactly in theſe Proportions, which yielded a perfect Conſort with other Inſtruments, touch'd by the beſt Hands. Mr. *Malcolm* adds, That having calculated the *Ratios* thereof, for his own Satisfaction, he found more of them falſe than in the preceding Scale; but their Errors were conſiderably leſs, which made Amends.

SEMINAL, in Medicine, &c. *Spermatic*, or ſomething belonging to the *Semen* or *Seed*. See SEED.

SEMINALIS CAPSULA, or *Seed-Bag*, is the Husk, that contains the Seed of any Plant.

SEMINALES *Veſiculæ*. See VESICULÆ *Seminales*.

SEMINAL *Leaves*: Much the greateſt Part of all Seeds, ſown in the Earth, come up, or ſhoot forth at firſt with little, plain, ſoft, and undivided Leaves; which, becauſe they are uſually very different from the Leaves of the ſucceeding Plant in Magnitude, Figure, Surface, and Poſition, are called *Seminal Leaves*: As the little embrionated Plant, which lies in Miniature in every Seed, is called the *Plantula Seminalis*. See PLANT and LEAF.

SEMINARY, a Place appointed for the Inſtruction of young Perſons, deſtined for the Sacred Miniſtry, in the Duties, Ceremonies, and Offices thereof; firſt inſtituted, as *Thomaſin* tells us, by St. *Auguſtin*. Of theſe *Seminaries* there are many abroad, furniſh'd with Halls for the Aſſemblies of the Exercitants, and little Chambers, or Cells, where each Perſon retires, ſtudies, and prays apart: Such is the *Seminary* of St. *Sulpitius* at *Paris*. The Council of *Trent* decrees, That Children exceeding 12 Years of Age, be taken, brought up, and inſtructed in common, to qualify them for the Eccleſiaſtical State; and that there be a *Seminary* of ſuch belonging to each Cathedral, under the Direction of the Biſhop. In *France*, the Eſtabliſhment of *Seminaries* is ſomewhat different from the Decree of the Council. None are taken in but young People ready to ſtudy Theology, and be ordained: So that the *Seminaries* are a Kind of Houſes of Probation, where the Vocation of Clerks is examined, and they prepared to receive Orders. For the Subſiſtance of theſe *Seminaries*, there are ſeveral Unions of Benefices, or elſe the Clergy of the Dioceſe are obliged to contribute to maintain them. Pope *Pius* IV. having eſtabliſhed a *Seminary* at *Rome*, in Conſequence of the Decree of the Council of *Trent*; by Advice of the Cardinals, it was given to the Jeſuits, who have made good Uſe thereof——Among the Canons of S. *Auguſtine*, *Seminary* is uſed for a Kind of College, or School, where Penſionaries are kept, and inſtructed in the Claſſical and other Learning.

The Houſes of the Society *de propaganda Fide*, eſtabliſhed for the preparing of Eccleſiaſticks for Miſſions among Infidels and Hereticks, are alſo called *Seminaries*: The Principal whereof is that at *Rome*, called, The *Apoſtolical College*, *Apoſtolical Seminary*, *Paſtoral Seminary*, *Seminary* of the *Propaganda*, &c.

SEMINATION, in Natural Hiſtory, &c. the Act of ſowing or ſhedding *Seed*; particularly, that of Vegetables. See SEED.

Aſſoon as the Seed is ripe, Dr. *Grew* obſerves, Nature takes ſeveral Methods for its being duly *Sown*: Not only by the Opening of the Uterus, but in the Make of the Seed it ſelf. Thus, the Seeds of many Plants, which affect a peculiar Soil or Seat, as *Arum*, Poppy, &c. are heavy and ſmall enough, without farther Care, to fall directly down to the Ground. Others, that are large, and light enough to be expoſed to the Wind, are often furniſhed with one or more Hooks to ſtay them from ſtraying too far from their proper Place: Thus, the Seeds of Avens have a ſingle Hook; thoſe of Agrimony and Gooſe-graſs, many; both the former loving a warm Bank, and the laſt a Hedge for its Support. On the contrary, many Seeds are furniſhed with Wings, or Feathers; partly with the Help of the Wind to carry them, when ripe, off the Plant, as thoſe of Aſh, &c. and partly, to enable them to make their Flight more or leſs abroad, that they may not, by falling together, come up too thick; and, that if one ſhould miſs a good Soil or Bed, another may hit. So the Kernels of Pines have Wings, though ſhort ones, whereby they don't fly in the Air, but only flutter on the Ground. But thoſe of Typha, Dandelion, and moſt of the pappous Kind, have numerous long Feathers, by which they are wafted every Way. Others are ſown by being laid in ſpringy elaſtic Caſes, which, when they crack and burſt, dart their Seed at convenient Diſtances: Thus, Wood-Sorrel having a running Root, Nature ſees fit to ſow the Seed at ſome Diſtance, the doing of which is effected by a white, ſturdy, tendinous Cover, which beginning to dry, burſts open on one Side in an Inſtant, and is violently turn'd Inſide outwards. The Seed of Harts-tongue, and codded Arſmart, is flung, or ſhot away, by means of a Spring, wound, or girt round the Seed-caſe. When the Spring is become ſtark and tenſe enough, it ſuddenly breaks the Caſe into two Halves, like little Cups, and ſo flings the Seed.

Other notable Means of *Semination* are obſerved by other Authors: A Quantity of Fern-Seed, Mr. *Ray* tells us, laid in a Lump, on a Paper, the *Seminal Veſiculæ* are heard to crackle, burſt, and, by a Microſcope, the Seeds are ſeen to be projected to a conſiderable Diſtance from each other. Dr. *Sloane* obſerves, That the *Gentianella flore Cœruleo*, or Spirit Leaf, requiring wet Weather to be ſown in, aſſoon as the leaſt Drop of Rain touches the End of the Seed-Veſſels, with a ſmart Noiſe, and a ſudden Leap, it opens it ſelf, and, with a Spring, ſcatters its Seed. The Plants of the Cardamine-Family, throw their Cods open, and dart out their Seed upon a ſlight Touch of the Hand. Nay, Mr. *Ray* adds, That the Pods of the *Cardamine Impatiens* not only burſt upon the ſlighteſt Touch, but even by an Approach of the Hand to touch them, without any real Contact.——

Other Plants ſow their Seeds by inviting Birds, by their agreeable Taſte and Smell, to feed of them, ſwallow them, and carry them about; thereby alſo fertilizing them, by paſſing through their Bodies. In ſuch Manner are Nutmegs, and Miſſeltoe, ſown and propagated. See NUTMEG and MISSELTOE.

SEMITA LUMINOSA, is a Name given to a Kind of Lucid Tract in the Heavens, which, a little before the Vernal Equinox, may be ſeen about Six a Clock at Night, extending from the Weſtern Edge of the Horizon, up towards the Pleiades. The Phænomenon hath been taken Notice of by *Caſſini* and *Fatio*, who both evince, That this Light comes diffuſed from both Sides of the Sun: Its Brightneſs is much the ſame with that of the *Via Lactea*, or the Tail of a Comet: It is ſeen plaineſt with us about the Beginning of *October*, or the latter End of *February*. *Fatio* conjectures, That the Bodies, or rather the Congeries or Aggregate of thoſe Bodies, which occaſion a Light, doth conform to the Sun like a Lens, and takes it to have ever been the ſame; but, *Caſſini* thinks it ariſes from a vaſt Number of ſmall Planets, which encompaſs the Sun, and give this Light by Reflexion, eſteeming it alſo not to have exiſted long before he obſerved it.

SENA, or *Senna*, in Medicine, a purgative Leaf, much uſed in Compoſitions of that Kind: The Shrub which bears it, is cultivated in ſeveral Parts of the *Levant*, and grows five or ſix Foot high. It puts forth woody Branches, furniſhed with Leaves on one Side: Its Flowers are yellow, and yield a Fruit in Manner of a greeniſh flat Pod, containing ſeveral Lodges or Cells of Seeds, reſembling Grape-ſtones. Theſe Pods ſome Phyſicians prefer to the Leaves themſelves. There is alſo a Kind of *Sena* cultivated about *Florence*, but 'tis inferior to that of the *Levant*, as is owned by the *Italians* themſelves. Father *Plumier* mentions a Third Kind growing in the *Antilles* Iſlands. M. *Lemery* diſtinguiſhes three Kinds of *Sena* of the *Levant*. The firſt brought from *Seyda*, called *Sena of Appalto*, that is *Cuſtom Sena*, by reaſon of the Cuſtom paid the Grand Seignior, for the Privilege

of

of exporting it. The ſecond comes from *Tripoli*: The third is called *Sena of Mocha*. The beſt of theſe Kinds is the firſt, which *Pomet* directs us to chuſe, in narrow Leaves, of a moderate Size, ſhaped like the End of a Pike, of a pale green Colour, a penetrating Smell, ſoft to the Touch, &c. The *Sena* of *Tripoli* holds the ſecond Rank in Goodneſs. Its Difference from that of *Seyda*, conſiſts in its Colour, which is green; its Smell which is very weak; and in a certain Harſhneſs, or Roughneſs, which it diſcovers upon the Touch. Beſides theſe three Kinds of *Sena*, and their Pods; the Druggiſts ſell the Duſt found at the Bottom of the Bales; which is a very poor Commodity; and yet much better than what they call the *Small Sena*, which comes with it in the Bales, by way of Package, and which many hold to be a Plant of no Virtue, put in by Chance, or, at beſt, to increaſe the Weight.

The beſt *Sena*, ordinarily found in our Shops, Dr. *Quincy* obſerves, is that which is ſharpeſt leaved, and which ſmells freſheſt. The Brightneſs of its Colour, and Quickneſs of its Flavour, are the Indications of its Goodneſs; for when it has loſt its Scent, and grows dusky, it is good for little: This Drug, at firſt taking, is apt to nauſeate the Stomach; and therefore, if a little Cinnamon, or a Dram or two of its diſtilled Water, be added, it paſſeth thro' with leſs Sickneſs. This is exactly conformable to the Sentiments of *Ludovicus*, who ſays, That the purgative Quality of this Herb reſides in its mucilaginous or gummy Juice; which, the more it is divided, gripes the leſs in its Operation. *Rulandus* imagined a Sudorifick Quality to be in it; and accordingly order'd it in ſome Compoſitions of that Intention. This is ſo ancient in Medicine, that *Schroder* ſays, *Serapion* firſt preſcribed it.

SENATE, an Aſſembly or Council of *Senators*; that is, of the principal Inhabitants of a State, who have a Share in the Government. See SENATOR. As, the *Senate* of *Rome*, of *Carthage*, &c. among the Ancients; the *Senate* of *Venice*, of *Genoa*, &c. among the Moderns. The *Senate of Ancient Rome*, was, of all others, the moſt celebrated, during the Splendor of the Republic. The *Roman Senate* exercis'd no contentious Juriſdiction. It appointed Judges, either out of the *Senate*, or among the Knights; but never ſtoop'd to judge any Proceſſes, in a Body. The *Senate* concerted Matters of War; appointed who ſhould command the Armies; ſent Governors into the Provinces; took Order, and diſpoſed of the Revenues of the Empire. Yet did not the whole Soveraign Power reſide in the *Senate*. It cou'd not elect Magiſtrates, make Laws, nor decide of War and Peace: But in all theſe Caſes they were to conſult the People. Under the Emperors, when the *Senate* became diſpoil'd of moſt of its other Offices; they began to judge Cauſes. For Cauſes of leſs Conſequence they appointed particular Judges; the reſt, principally Criminal Cauſes, they reſerv'd for their own Cognizance, to be judg'd by them in a Body, and that frequently in the Emperor's Preſence. This was to keep their Heads from State Affairs. *Nero* further committed to the *Senate*, the Judgment of all Appeals: But this did not hold long; nor do we find any Footſteps thereof any where but in the 62d Novel. The *Senate* aſſembled on certain ſtated Days, *viz.* ordinarily on the Calends, Nones and Ides of each Month. Their extraordinary Meetings were on any other Days; when the Conſul, Dictator, or Tribune, thought fit to call them. Their Place of Meeting, was either the Temple of *Concord*, at the Gate of *Capua*, or in the Temple of *Bellona*: The Conſul preſided at the *Senate*. Till *Auguſtus*'s Time, the *Senate* was always open'd with a Sacrifice. But that Prince, in Lieu thereof, appointed, That each *Senator*, e'er he took his Place, ſhou'd offer Wine and Incenſe on the Altar of the God, in whoſe Temple they were met; and take an Oath, That he would give his Vote according to his Conſcience.

Halicarnaſſæus, and other Authors, mention it as a great Defect in the Authority of the *Roman Senate*, That they had none under their Command, to execute their Orders. Hence the leaſt Tribune had it in his Power to obſtruct their Decrees; and hence it is, that when they gave their Orders to the Conſuls, and Prætors, they did it with a kind of Submiſſion, *Si eis ita videtur*; If they think fit.

SENATOR, a Member of a *Senate*. There were Two Orders, or Degrees, among the *Roman* Nobility; that of the *Senators*, and that of the *Knights*: After the Two, came the *People*. The firſt hundred *Senators* were appointed by *Romulus*, called *Patres*. Upon the Union with the *Sabines*, *Romulus*, or, as others ſay, *Tullius*, added a ſecond Hundred, called *Patres majorum Gentium*, to diſtinguiſh them from a third Hundred added by the elder *Tarquin*, and called *Patres minorum Gentium*. The Number of *Senators* was not fix'd. In the Time of *Gracchus* they were 600; during the Civil Wars, they were reduced to 300. *Julius Cæſar* augmented that Number to 800 or 900; and *Auguſtus* brought them back again to 600. The Choice of *Senators* belong'd at firſt to the Kings, then to the Conſuls, then to the Cenſors; who, in their Cenſus or Survey, every five Years, appointed new *Senators* in lieu of thoſe dead or degraded: At length it fell to the Emperors. Though, for a long Time, none were raiſed to the Dignity of *Senators*, but thoſe moſt conſpicuous for their Prudence, &c. yet ſome Regard was afterwards had to their Eſtate, leſt the Dignity ſhould become debaſed by Poverty. To hold the Dignity, a yearly Revenue of 800 Thouſand Seſterces was required, which amounts to nearly 6000 Pounds of our Money. Half as much was required for the Knights. The *Senators* who ſunk below this Revenue, were diſcarded, and expunged out of the Liſt by the Cenſor. The *Senators*; were ordinarily choſe from among the Knights, or among ſuch as had bore the Principal Magiſtratures. At firſt the Magiſtrates were taken wholly from among the *Senators*; whence *Tacitus* calls the *Senate*, The *Seminary of all Dignities*: But after the People had been admitted to Magiſtratures; *Senators* were taken from among ſuch as had diſcharged thoſe Offices, though, before, Plebeians. The *Senators* carried their Children with them to the *Senate*, to inform them betimes of Affairs of State: Their Children, however, had not Admittance till 17 Years of Age.

Some make a Diſtinction among the *Senators*. Beſides the *Senators* who were allow'd to ſpeak, and were ask'd their Sentiments, there were others, who, without ſpeaking, or being ever asked their Opinion, were only to follow the Opinion of thoſe they thought the moſt reaſonable, and were hence called *Pediarii*. *A. Gellius* gives us another Notion of the *Pediarii*, and ſays, Thoſe were thus called, who having never bore the Office of Curule Magiſtrate, were obliged to go to the *Senate* on foot.

The *Senators* alone were allowed to wear the Habit call'd *Laticlavium*: (which See) Had a Right to ſit, and be carried in Curule Chairs; to aſſiſt at Plays, and Shews, in the *Orcheſtra*; at Feaſts of the Gods, &c. All which Privileges were reſerved to ſuch as *Auguſtus*, (in the Reform he made of the too numerous *Senate* of *Julius Cæſar*) ſet aſide. They had the Names *Senators*, q. d. *old Men*, given them in Imitation of the *Greeks*, who called their Senate γερουσίαν. So when the *Athenians* aſſembled the People to conſult about the Affairs of the Public; the Officers ſummoned none but ſuch as were Fifty Years Old. The *Ægyptians* and *Perſians* followed the ſame Example, after the *Hebrews*. The *Lacedæmonians*, and *Carthaginians* received none but ſuch as were Sixty Years of Age.

SENATUS CONSULTUM, a Vote or Reſolution of the *Roman Senate*, pronounced on ſome Queſtion, or ſome Point of Law propoſed to it. The *Senatus conſulta* made a Part of the *Roman* Law, when paſs'd. They were depoſited in the Temple of *Ceres*, under the Cuſtody of the *Ædiles*, and at laſt carried, by the Cenſor, to the Temple of *Liberty*, and put up in an Armory called *Tabularia*. See LAW.

SENESCHAL, a Name anciently uſed for a *Steward*; form'd from the *Saxon Sein*, Houſe or Place, and *Schalc*, Governor. Thus the *Seneſchal* of a Baron is his Steward or Bailiff, who holds his Courts, and manages his Demeſne Lands: Sub-*Seneſchal*, his Under-Steward. High *Seneſchal* of *England*, is the High-Steward of *England*: High *Seneſchal del Hotel du Roi*, the Steward of the King's Houſhold. The Ancients uſed the Term *Seneſchallus* indifferently with that of *Dapifer*, whence we are ſure it ſignifies *Steward*. See STEWARD.

SENSATION, the Action of perceiving external Objects, by Means of the Organs of *Senſe*. See SENSE.

To conceive the Manner wherein *Senſation* is effected: Obſerve by the way, That all the Organs conſiſt of little Threads, or Nerves; which have their Origine in the Middle of the Brain, are diffuſed thence throughout all the Members which have any Senſe, and terminate in the exterior Parts of the Body: That when we are in Health, and awake, one End of theſe Nerves cannot be agitated, or ſhaken, without ſhaking the other; by reaſon they are always a little ſtretch'd, as is the Caſe of a ſtretch'd Cord, one Part of which cannot be ſtirr'd without a like Motion of all the reſt. Obſerve, again, That theſe Nerves may be agitated two ways; either by the End out of the Brain, or that in the Brain. If they be agitated from without, by the Action of Objects, and their Agitation be not communicated as far as the Brain; as frequently happens in

Sleep, when the Nerves are in a State of Relaxation; the Soul does not then receive any new *Senſation*. But if the Nerves happen to be agitated in the Brain, by the Courſe of the Animal Spirits, or any other Cauſe; the Soul perceives ſomething, though the Parts of thoſe Nerves, that are out of the Brain, diffuſed through the ſeveral Parts of the Body, remain at perfect Reſt: as likewiſe is frequently the Caſe in Sleep. Laſtly, obſerve, by the way, that Experience tells us, we may ſometimes *feel* Pain in Parts of the Body that have been entirely cut off; by reaſon the Fibres in the Brain correſponding to them, being agitated in the ſame Manner as if they were really hurt; the Soul feels a real Pain in thoſe imaginary Parts. All theſe Things ſhew evidently, that the Soul reſides immediately in that Part of the Brain wherein the Nerves of all the Organs of Senſe terminate: we mean, 'tis there it perceives all the Changes that happen with regard to the Objects that cauſe them, or that have been uſed to cauſe them; and, that it only perceives what paſſes out of this Part, by the Mediation of the Fibres terminating in it. See NERVE, FIBRE, &c.

Theſe Things premiſed, 'twill not be difficult to explain how *Senſation* is perform'd; the Manner whereof may be conceiv'd from what follows. When the Point of a Needle, for Inſtance, is preſſed againſt the Hand, that Point ſtirs and ſeparates the Fibres of the Fleſh; which Fibres are extended from that Place to the Brain, and when we are awake, are in ſuch a Degree of Tenſion as that they cannot be ſtirr'd without ſhaking thoſe of the Brain. If then, the Motion of the Fibres of the Hand be gentle, that of the Fibres of the Brain will be ſo too; and if the firſt be violent enough to break any thing in the Hand, the laſt will be ſtronger and more violent in Proportion. In like Manner, if the Hand be held to the Fire; the little Particles of the Wood it throws off in great Numbers, and with a great deal of Violence, ſtriking againſt theſe Fibres, and communicating a Part of their Agitation thereto; if the Action be moderate, that of the Extremities of the Fibres of the Brain correſponding to thoſe of the Hand, will be moderate likewiſe: If it be violent enough to ſeparate any of the Parts of the Hand, as it happens in Burning; the Motion of the Fibres in the Brain will be proportionably more violent. This is what befals the Body, when Objects ſtrike upon it. We are now to conſider how the Mind is affected.

The Mind, we have obſerv'd, reſides principally, if we may be allow'd to ſay ſo, in that Part of the Brain where all the Fibres of the Nerves terminate. It attends here, as its Senſory, or Office, to look to the Preſervation of all the Parts of the Body; and, of conſequence, muſt be here advertiſed of all the Changes that happen, and muſt be able to diſtinguiſh between thoſe agreeable to the Conſtitution of the Body, and thoſe hurtful thereto. Any other, abſolute Knowledge, without a Relation to the Body, were uſeleſs. Thus, though all the Changes in our Fibres, do, in Reality, conſiſt in Motions, which ordinarily only differ as to more and leſs; 'tis neceſſary the Soul ſhould look on them as Changes eſſentially different; for though in themſelves they differ but very little, yet, with regard to Preſervation of the Body, they are to be look'd on as eſſentially different.

The Motion, for Inſtance, which cauſes Pain, frequently differs exceedingly little from that which occaſions Titillation: 'Tis not neceſſary there ſhould be an Eſſential Difference between thoſe two Motions, but 'tis neceſſary there be an Eſſential Difference between the Pain and the Tickling thoſe two Motions occaſion in the Soul; for the Agitation of the Fibres, which accompanies the Titillation, informs the Soul of the good State of the Body, that it is able to reſiſt the Impreſſion of the Objects, and that it need not apprehend its being hurt: But the Motion, which occaſions Pain, being ſomewhat more violent, is capable of breaking ſome of the Fibres of the Body; wherefore 'tis neceſſary the Soul be advertized hereof by ſome diſagreeable *Senſation*, that it may provide againſt it. Thus, though all the Motions which paſs in the Body only differ in themſelves, as to more or leſs, yet, when conſidered, with regard to the Preſervation of Life, they may be ſaid to be eſſentially different: For this Reaſon it is, that the Soul does not perceive the Shakes, or Motions themſelves, which Objects excite in the Fibres of the Fleſh: It would be uſeleſs to perceive them; and ſhe would never be able, thence, to learn whether the Objects were capable of doing Hurt or Good. But ſhe perceives herſelf affected with *Senſations*, which differ eſſentially, and which ſhewing preciſely the Qualities of the Objects, as they regard the Body, make her perceive, diſtinctly, whether or no thoſe Objects are capable of hurting it.

In Effect, from a ſtrict Examination of the ſeveral Senſes, it appears, that ſenſible Objects act no otherwiſe upon the Body, for the producing of *Senſation*, than by exciting a Change in the extreme Surface of the Fibres of the Nerves. The Quality of which Change depends on the Figure, Bulk, Hardneſs, and Motion of the Object; ſo that according to all Appearances, the moſt different Objects, which ſhould agree in theſe Four Circumſtances, would produce the ſame *Senſation*. From the various Texture of the Object; the Diverſity of the Nerve affected; the different Fabric of the Organ of Senſe; the different Place in the *Medulla* of the Brain, where the Nerve ariſes; and the different Degree of Motion, wherewith the Action of the Object is applied, ariſe various *Senſations*, and Ideas, in the Mind: none of which repreſent any thing in the Action of the Object, or in the Paſſion of the Organ. And yet the ſame Action of the ſame Object, on the ſame Organ, always produce the ſame *Senſation* or Idea: And the ſame Ideas neceſſarily follow the ſame Diſpoſition of the ſame ſenſible Organ, in the ſame manner as if the Idea perceiv'd, were the natural and neceſſary Effect of the Action on the Organ. See IDEA.

SENSE, a Faculty of the Soul, whereby it perceives external Objects, by means of ſome Action or Impreſſion made on certain Parts of the Body, called *Organs of Senſe*, and propagated by them to the *Senſory*.

Some uſe the Word *Senſe* in a greater Latitude; and define it a Faculty whereby the Soul perceives Ideas or Images of Objects, either convey'd to it from without, by the Impreſſion of Objects themſelves, or excited within by ſome Effort of the Soul on the Senſory it ſelf: Under this Notion, *Senſe* becomes diſtinguiſhible into two Kinds, *External* and *Internal*; correſponding to the two ſeveral Manners wherein the Images of the Objects perceiv'd, either are occaſion'd, and preſented to the Mind, *viz.* immediately from without, or from within; that is, either by what we commonly call the *Five External Senſes*, *Hearing*, *Seeing*, &c. or by the Internal ones, *Imagination*, *Memory*, and *Attention*; to which ſome add *Hunger* and *Thirſt*. But as theſe *Internal Senſes* are not ordinarily conſider'd in the Notion of *Senſes*, nor implied under the Word *Senſe*; but are thus only denominated from Analogy; we ſhall wave them to be further conſider'd, under their reſpective Articles IMAGINATION, MEMORY, &c.

External Senſes, or, ſimply, *The Senſes*, in their general Signification, are the Means whereby the Soul apprehends, or takes Cognizance of External Objects; the Means, we mean, both on the Part of the Mind, and of the Body. The Means, on the Part of the Mind, are always the ſame; it being one and the ſame Faculty, whereby we *See*, *Hear*, &c. The Means, on the Part of the Body, are different; as different as are the Objects we are concern'd to perceive: For the Being, and Well-being of the Animal, being the End, Nature had in View in giving him any Perception of external Bodies; by this, the Meaſure and Manner of that Perception is regulated; and we have ſo many Ways of perceiving, and of perceiving ſo many Things, as the Relation we bear to external Bodies renders neceſſary for the Preſervation, &c. of our Being. Hence thoſe ſeveral Organs of *Senſe*, call'd *Eye*, *Ear*, *Noſe*, *Palate*, and the univerſal one *Cutis*; each of which is ſo diſpoſed as to give it ſome Repreſentation and Report to the Mind, of the State of external Things, the Nearneſs, Convenience, Hurtfulneſs, and other Habitudes; and each of them a different one, according to the Degree, and Immediateneſs, &c. of the Danger, or Conveniency. And hence the ſeveral Exerciſes of thoſe Organs, *Hearing*, *Seeing*, *Smelling*, *Taſting*, and *Feeling*.

For the general Manner wherein our *Senſes* act; or, more properly, the Manner wherein we become *Senſible*, that is, perceive external Objects; See SENSATION.

For the particular *Senſes*, or, more properly, the particular Manners, wherein we become *ſenſible*, by the particular Organs of *Senſe*; See HEARING, SEEING, SMELLING, &c.

For the ſeveral Organs of *Senſe*, miniſtring to the ſeveral Manners of *Senſation*; See EYE, EAR, NOSE, &c.

Pliny obſerves, That of all the *Senſes*, Feeling and Taſting are what Man has in the greateſt Perfection: As to Seeing he is excelled by the Eagle, &c. as to Smelling, by the Vulture, &c. and as to Hearing, by the Mole, even when hid under Ground. *Nat. Hiſt. Lib.* 10. The *Senſes* have been ſometimes found greatly ſharpened and improved by Diſeaſes. Mr. *Boyle* mentions a Gentleman, who, during a Diſtemper he had in his Eyes, had his Organs of Sight brought to be ſo tender, that when he waked in the Night, he could, for a while, plainly ſee and diſtinguiſh Colours, and other Objects; and the ſame Author gives an Inſtance of another Perſon, who, after getting half-fuddled with Claret, if he waked in the

the Night, could ſee, for ſome Time, to read a moderate Print. In the *Philoſoph. Tranſ.* N°. 312. we have an Account of *Dan. Fraſer*, who continued Deaf and Dumb, from his Birth to the 17th Year of his Age; when, upon recovering from a Fever, he perceived an uneaſy Motion in his Brain, after which he began to hear, and, by degrees, to ſpeak. *Grimaldi* affirms, That ſome Women of *Megara* were able, by their Eyes alone, to diſtinguiſh between Eggs lay'd by black Hens, and thoſe by white ones, *Grimald. de Lum. & Col.*

SENSES. A late excellent Author, gives us a more Juſt, Extenſive, and Philoſophical Notion of *Senſe*. On his Principle, *Senſe* is defined, A *Power of Perception*; or, A *Power of receiving Ideas*; If what is abſolutely Paſſive may be properly called a Power. On ſome Occaſions, inſtead of *Power*, he chuſes to call it, A *Determination* of the Mind, to receive Ideas. See IDEA. The Ideas thus perceived, or raiſed in the Mind, he calls *Senſations*.

SENSE, he conſiders, either as *Natural*, or *Moral*: and the Natural, either as *External*, or *Internal*; though the Diſtribution is chiefly founded on the common Ways of conceiving; for, in Reality, they appear to be all *Natural*, and neceſſary: Some Reaſons, however, for the Diſtinction, will be ſhewn under the ſeveral Articles thereof.

External SENSES, are Powers of perceiving Ideas, upon the Preſence of external Objects. On ſuch Occaſions, we find the Mind is merely Paſſive, and has not Power directly to prevent the Perception, or Idea, or to vary it at its Reception; as long as the Body is continued in a State fit to be acted upon by the external Object. When two Perceptions are entirely different from each other, or agree in nothing but the general Idea of Senſation; the Power of receiving thoſe different Perceptions, are called *different Senſes*. Thus *Seeing* and *Hearing* denote the different Powers of receiving the Ideas of *Colours*, and *Sounds*. And though Colours, as well as Sounds, have vaſt Differences amongſt themſelves; yet is there a greater Agreement among the moſt oppoſite Colours, than betwen any Colour and a Sound: And hence all Colours are deemed Perceptions of the ſame *Senſe*. All the ſeveral *Senſes* ſeem to have their diſtinct Organs, except *Feeling*, which is, in ſome Degree, diffuſed over the whole Body.

Internal SENSES, are Powers, or Determinations of the Mind, to be pleaſed with certain Forms, and Ideas, which occur to our Obſervation, in Objects perceived by the external *Senſes*. Of theſe there are two different Species, diſtinguiſh'd by the different Objects of Pleaſure, *viz.* Pleaſurable or Beautiful Forms of natural Things, and Pleaſurable or Beautiful Actions, or Characters of rational Agents: Whence the Internal *Senſes* become diviſible into *Natural* and *Moral*; though what we call the *Internal Natural Senſe*, our Author calls ſimply, and by way of Eminence, *the Internal Senſe*.

In reflecting on our external *Senſes*, we plainly ſee, that our Perceptions of Pleaſure, or Pain, do not depend directly on our Will. Objects do not pleaſe us according as we incline they ſhould: The Preſence of ſome Objects neceſſarily pleaſe us, and the Preſence of others as neceſſarily diſpleaſes us; nor can we, by our Will, any otherwiſe procure Pleaſure, or avoid Pain, than by procuring the former Kind of Objects, and avoiding the latter. By the very Frame of our Nature, the one is made the Occaſion of Delight, and the other of Diſſatisfaction. In Effect, our ſenſitive Perceptions are pleaſant, and painful, immediately, and without any Knowledge of the Cauſe of this Pleaſure and Pain, or of the Manner how they excite it, or are Occaſions of it, or without ſeeing to what further Advantage, or Detriment, the Uſe of ſuch Objects might tend. Nor would the moſt accurate Knowledge of theſe Things vary either the Pleaſure, or the Pain, of the Perception; however it might give a rational Pleaſure diſtinct from the ſenſible; or might raiſe a diſtinct Joy, from Proſpect of further Advantage in the Object, or Averſion, from Apprehenſion of Evil. There is ſcarce any Object, which our Minds are employed about, but is conſtituted the neceſſary Occaſion of ſome Pleaſure or Pain. Thus we ſhall find our ſelves pleaſed with a regular Form, a Piece of Architecture, or Painting, a Compoſition of Notes, a Theorem, an Action, an Affection, a Character; and we are conſcious that this Pleaſure naturally ariſes from the Contemplation of the Idea then preſent to the Mind, with all its Circumſtances, though ſome of thoſe Ideas have nothing of what we call ſenſible Perception in them; And in thoſe which have, the Pleaſure ariſes from ſome Uniformity, Order, Arrangement, Imitation, and not from the ſimple Ideas of Colour, or Sound, or Mode of Extenſion ſeparately conſider'd.

It ſeems hence to follow, that when Inſtruction, Education, or Prejudice, of any Kind, raiſe any Deſire or Averſion toward an Object; this Deſire, or Averſion, is founded on an Opinion of ſome Perfection, or Deficiency, in thoſe Qualities, for Perception whereof we have the proper *Senſes*. Thus, if Beauty be deſired by one who has not the *Senſe* of Sight; the Deſire muſt be raiſed by ſome apprehended Regularity of Figure, Sweetneſs of Voice, Smoothneſs, Softneſs, or ſome other Quality perceivable by the other *Senſes*; without relation to the Ideas of Colour.

The only Pleaſure of *Senſe*, which our Philoſophers ſeem to conſider, is that which accompanies the ſimple Ideas of *Senſation*; but there are vaſtly greater Pleaſures in thoſe complex Ideas of Objects, which obtain the Names of *Beautiful* and *Harmonious*. The Power, then, whereby we receive Ideas of Beauty, and Harmony, has all the Characters of a *Senſe*. 'Tis no Matter, whether we call theſe Ideas of Beauty, and Harmony, Perceptions of the external *Senſes* of Seeing, and Hearing, or not; we ſhould rather chuſe to call theſe Ideas an *internal Senſe*, were it only for the Convenience of diſtinguiſhing them from other *Senſations* of Seeing and Hearing, which Men may have without Perception of Beauty and Harmony. See PLEASURE, BEAUTY, and HARMONY.

Moral SENSE, is a Determination of the Mind, to be pleas'd with the Contemplation of thoſe Affections, Actions, or Characters of rational Agents, which we call *Virtuous*.

This Moral *Senſe* of Beauty, in Actions, and Affections, may appear ſtrange at firſt View: Some of our Moraliſts themſelves are offended at it in my Lord *Shaftsbury*, as being accuſtomed to deduce every Approbation, or Averſion, from rational Views of Intereſt. Our Gentlemen of good Taſte can tell us of a great many *Senſes*, Taſtes, and Reliſhes, for Beauty, Harmony, Imitation in Painting and Poetry; and may we not find, too, in Mankind, a Reliſh for a Beauty in Characters, in Manners? The Truth is, Human Nature does not ſeem to have been left quite indifferent in the Affairs of Virtue, to form to it ſelf Obſervations concerning the Advantage or Diſadvantage of Actions, and accordingly to regulate its Conduct. The Weakneſs of our Reaſon, and the Avocations ariſing from the Infirmity and Neceſſities of our Nature, are ſo great, that very few of Mankind could have found thoſe long Deductions of Reaſon, which may ſhew ſome Actions to be, in the whole, advantageous, and their Contraries pernicious. The Author of Nature has much better furniſhed us for a Virtuous Conduct than our Moraliſts ſeem to imagine; by almoſt as quick and powerful Inſtructions, as we have for the Preſervation of our Bodies: He has made Virtue a lovely Form, to excite our Purſuit of it, and has given us ſtrong Affections, to be the Springs of each virtuous Action. See VIRTUE.

SENSIBLE *Horizon*, SENSIBLE *Point* } See { HORIZON. POINT.

SENSITIVE or SENSIBLE *Soul*, the Soul of Brutes, or that which Man is ſuppoſed to have in common with Brutes. See SOUL. 'Tis thus call'd, as intimating its utmoſt Faculty, to be that of *Senſation*; or, perhaps, becauſe it is ſuppoſed to be material, and to come under our *Senſes*. My Lord *Bacon* aſſerts, That the *Senſible* or *Brute Soul*, is plainly no more than a Corporeal Subſtance, attenuated by Heat, and thus render'd Inviſible; or a kind of Aura or Vapour partly of an aërial, and partly a fiery Nature; endued with the Softneſs of Air, to be fit to receive Impreſſions, and with the Vigor of Fire, to communicate its Action; fed partly with oily Matters, and partly with aqueous ones; incloſed in the Body, and in the more perfect Animals; principally in the Head, moving along the Nerves; and reſtored and repaired by the Spirituous Blood of the Arteries. *Bac. de Augment. Scient. Lib.* IV.

SENSITIVE-PLANTS, a Species of *Plants*, call'd by the Ancients *Æſchynomenous*, and by us *Senſitive*, *Living* or *Mimic Plants*, as giving ſome Tokens of *Senſe*. Theſe are ſuch whoſe Frame and Conſtitution is ſo nice and tender, that at the Touch, or leaſt Preſſure of one's Hand, they will contract their Leaves and Flowers, as if *ſenſible* of the Contact. Botanick Writers mention many Kinds hereof; ſome of which contract with the Hand or a Stick; others with Heat, others with Cold. The Truth is, many, if not moſt, Vegetables expand their Flowers, Down, &c. in warm, Sun-ſhiny Weather, and again cloſe them towards Evening or in Rain, &c. eſpecially at the beginning of Flowering, whilſt the Seed is yet young and tender: As is very evident in the Down of *Dandelion*, &c. and in the Flower of the *Pimpernel*, the opening and ſhutting whereof are the Country-man's Weather-wiſer; whereby, *Gerard* ſays, he foretells what Weather ſhall

follow

follow next Day; for if the Flowers be close shut up, it betokens Rain and foul Weather; if they be spread abroad, fair Weather. *Ger. Herb. Lib.* 2.

SENSORY, or *Sensorium Commune*, the Seat of the *Common Sense*; or that Part where the sensible Soul is supposed more immediately to reside. The *Sensory* is allow'd to be that Part of the Brain wherein the Nerves from all the Organs of Sense, terminate. This is generally allowed to be about the Beginning of the *Medulla Oblongata*: *Des Cartes* will have it in the *Conarion*, or Pineal Gland. See CONARION. Sir *Isaac Newton* describes the *Sensory* of Animals as the Place to which the sensible Species of Things are carry'd through the Nerves and Brain; that they may be there perceiv'd by their immediate Presence to the Soul. The Organs of Sense, the same great Author observes, are not for enabling the Soul to perceive the Species of Things, in its *Sensory*; but only for conveying them thither. See SENSE. The Universe, he makes the *Sensory* of the Godhead. See GOD.

SENTENCE, in Law, a Judgment pass'd in Court, by the Judge, upon some Process either Civil or Criminal. *Sentences* are either Definitive, Interlocutory, Contradictory, *&c.* of Absolution, Excommunication, *&c.* Superior Judges either confirm or annul those of Inferior ones. See APPEAL. —*Three conformable Sentences*, Tres Sententiæ Conformes: In the *Romish* Ecclesiastical Law, 'tis allowed to Appeal Three Times; so that there must be Three conformable *Sentences* e'er the *Sentences* of the Judges can take effect. The first Degree of Jurisdiction is the Bishop's Official: From him an Appeal lies to the Metropolitan; and from the Metropolitan to the Primate, or immediately to the Pope. If the Appeal come from the Metropolitan to the Pope, the Pope is obliged to delegate Judges *in Partibus*; and then if the Three *Sentences* pass'd in these Three Stages be conformable, there is no further Appeal: but if one of them annul another, new Judges are to be required of the Pope for a Fourth *Sentence*; and thus they sometimes proceed to a Sixth, or Seventh *Sentence*. Such a Number of Jurisdictions, is found infinitely prejudicial to the Public, and vexatious to private Persons.

SENTENCE, in Grammar, *&c.* a Period; or a Set of Words comprehending some perfect Sense, or Sentiment of the Mind. Every *Sentence* comprehends at least Three Words. The Business of Pointing, is to distinguish the several Parts and Members of *Sentences*; so as to render the Sense thereof the clearest, aptest and fullest possible. See PUNCTUATION.

In every *Sentence* there are two Parts necessarily required; a Noun for the Subject, and a definite Verb: Whatever is found more than these Two, affects one of them, either immediately, or by the Intervention of some other, whereby the first is affected. Again, every *Sentence* is either Simple or Conjunct. A *Simple Sentence* is that consisting of one single Subject, and one finite Verb: A *Conjunct Sentence* contains several Subjects and finite Verbs; either expressly or implicitely. A *Simple Sentence* needs no Point or Distinction; only a Period to close it: as, *A good Man loves Virtue for itself.* In a *Simple Sentence*, the several Adjuncts affect either the Subject or the Verb in a different Manner. Thus the Word *good*, expresses the Quality of the Subject, *Virtue* the Object of the Action, and, *for itself*, the End thereof. Now none of these Adjuncts can be separated from the rest of the *Sentence*: For if one be, why should not all the rest? And if all be, the *Sentence* will be minced into almost as many Parts as there are Words. But if several Adjuncts be attributed in the same manner either to the Subject or the Verb; the *Sentence* becomes *Conjunct*, and is to be divided into Parts.

In every *Conjunct Sentence*, as many Subjects, or as many finite Verbs as there are, either expressly, or implied, so many Distinctions may there be. Thus, *My Hopes, Fears, Joys, Pains, all center in you:* And thus, *Cicero, Catalina abiit, excessit, evasit, erupit.* The Reason of which Pointing is obvious; for as many Subjects or finite Verbs as there are in a *Sentence*, so many Members does it really contain. Whenever, therefore, there occur more Nouns than Verbs, or contrarywise; they are to be conceived as equal. Since, as every Subject requires its Verb; so every Verb requires its Subject, wherewith it may agree: Excepting, perhaps, in some figurative Dictions.

Indeed, there are some other Kinds of *Sentences* which may be rank'd amongst the Conjunct Kind, particularly the absolute *Ablative*, as 'tis call'd: Thus, *Physicians, the Disease once discovered, think the Cure half wrought:* Where the Words *Disease once discovered*, are equivalent to, *when the Cause of the Disease is discovered.* So also in Nouns added by Apposition; as, *The Scots, a hardy People, endured it all*; so also in Vocative Cases, and Interjections; as, *This, my Friend, you must allow me:* And, *What, for Heaven's Sake! would he be at?*

The Case is much the same, when several Adjuncts affect either the Subject of the *Sentence*, in the Verb, in the same Manner; or at least something, whereby one of them is affected: as, *A good, wise, learned Man, is an Ornament to the Commonwealth*: Where the several Adjectives denoting so many Qualities of the Subject, are to be separated from one another. Again, when I say, *Your Voice, Countenance, Gesture terrified him:* The several Nominative Cases denote so many Modes of the Verb, which are likewise to be distinguished from each other. The Case is the same in Adverbs; as, *He behav'd himself modestly, prudently, virtuously.* In the first Example, the Adjuncts immediately affect the Subject; in the Third, the Verb, in the following one, another Adjunct: as, *I saw a Man loaden with Age, Sickness, Wounds.* Now, as many such Adjuncts as there are, so many several Members does the *Sentence* contain; which are to be distinguished from each other, as much as several Subjects, or finite Verbs. And that this is the Case in all Conjunct *Sentences*, appears hence; that all these Adjuncts, whether they be Verbs or Nouns, *&c.* will admit of a Conjunction Copulative, whereby they may be joyn'd together. But where-ever there is a Copulative, or Room for it, there a new Member of a *Sentence* begins. For the other Partitions, *&c.* of *Sentences*; See COLON, SEMICOLON, PERIOD.

SENTENCE, is also used in Poetry, *&c.* for a short, pithy Remark or Reflection, containing some Sentiment of use in the Conduct of Life. As, *Discite Justitiam moniti, & non temnere divos*; or, *A teneris assuescere multum est*, &c. *Sentences*, Father *Bossu* observes, render Poems useful; And, besides, add, I know not what Lustre and Spirit, which pleases. But there is no Virtue which is not accompanied with some dangerous Vice. Too many *Sentences* give a Poem too Philosophical an Air; and sink it into a kind of Gravity, that is less fit for the Majesty of a Poem, than the Study of a learned Man, and the Quaintness of a Dogmatist. Such Thoughts not only contain, but inspire, a certain calm Wisdom, which is directly opposite to the Passions: It cools them, both in the Hearers and in the Speaker. Lastly, the Affectation of speaking in *Sentences*, leads a Person to trifling and impertinent Ones; Instances whereof we have, in Abundance, in *Seneca*'s Tragedies. *Petronius* recommends it to Authors, to disguise their *Sentences*, that they mayn't stand glaring above the Thread or Ground of the Discourse. See ELLIPSIS.

SENTIMENTS, in Poetry, and particularly Tragedy, are the Thoughts which the Poet makes his Persons express; whether they relate to Matters of Opinion, Passions, Business or the like. The *Manners* form the Tragic Action, and the *Sentiments* explain it; discovering its Causes, Motives, &c. The *Sentiments* are to the *Manners*, what those are to the *Fable*. See MANNERS. In the *Sentiments*, Regard is to be had to Nature and Probability; a Madman, for Instance, must speak as a Madman; a Lover as a Lover; a Hero as a Hero. The *Sentiments*, in great measure, are to sustain the Character. See CHARACTER, DICTION, *&c.*

SENTINEL, or SENTRY, in War, a Soldier taken out of a *Corps de Gard* of Foot, and placed in some Post to watch any Approach of the Enemy, to prevent Surprizes; and to stop such as would pass without Orders, or without discovering who they are. *Sentinel Perdue*, is a *Sentinel* plac'd at some very advanced and dangerous Post, whence 'tis odds he never returns. The *Sentinel*'s Word is, *Who is there? Qui va la?* Stand, *Demeure la.* The Word is Modern: 'Tis not long since they said, *To be on the Scout*, in the same Sense as we now say, *To stand Sentry*, &c. *Menage* derives the Word *a Sentiendo*, from perceiving.

SEPARATION, in Navigation, the same with what we more usually call *Departure*. See DEPARTURE.

SEPARATION *of Man and Wife*. See MULIER.

SEPARATISTS, a Religious Sect in *England*, denominated from their setting up a separate Church, in Opposition to that Established by Law. At present, *Separatists*, is rather the Name of a Collection of Sects, than of any particular one; but nearer their Original, there was that Agreement among them, that one Name served them all. Their Division into *Presbyterians, Anabaptists, Independents*, &c. is a Modern Thing. *Hornius* tells us, *Hist. Eccl.* they are such as under *Edward* VI. *Elizabeth* and *James* I. refused to conform to the Church of *England*: And who were first call'd *Puritans*, then *Separatists* and *Nonconformists*. The first Leader of the *Separatists*, was *Bolton*; who, upon quitting the Party he had form'd, was succeeded by *Robert Brown*, from whom the *Separatists* were call'd *Brownists*, a Name they long retain'd: tho' *Brown* himself deserted the Sect, and, in Imitation of *Bolton*, abjured his Errors. He was succeeded by *Barrow*, who was hang'd at the Instigation of the Bishops. Their Fourth Chief was *Johnson*, who set up a Church at *Amsterdam*; which afterwards divided into several Sects, at the Head of one whereof was *Johnson*'s Brother, who Excommuni-

communicated him, and was reciprocally Excommunicated by him. Soon afterwards, a Fifth, named *Smith*, erected a like Church at *Leyden*, but it dwindled away after his Death: And *Separatiſm* was brought very low, when *Robinſon* appeared, and rais'd its Head. He ſoften'd the Dogma's of *Brown*, and ſet on foot a good Underſtanding among them; but was not able to unite the whole Sect. Part of them ſtill adhered to the rigid Opinions of their old Maſter *Brown*, and part of them followed *Robinſon*. The firſt retained the Old Name of *Separatiſts*, the latter aſſumed that of *Semi-Separatiſts*, and at length degenerated into *Independants*, which is the Name whereby they are now uſually call'd, both in New and Old *England*. See INDEPENDANTS.

Hornius mentions another Claſs of *Separatiſts*, call'd *Seſqui-Separatiſts*, that is, *Separatiſts* and an Half. Some will have theſe to be a diſtinct Sect; others, the ſame with the *Semi-Separatiſts*: For 'tis added, that the *Semi-Separatiſts*, under pretence of taking a Medium between the *Browniſts* and the Church of *England*, went further even than the *Browniſts* themſelves, and under the Name of *Separatiſts* degenerated into *Separatiſts and a Half*.

SEPIÆ OS, Skuttleſiſh Bone: This is white and Spongy, and ſeems almoſt to be calcined by the Sun. It is rough and abſterſive, and chiefly uſed in Medicine as a Dentrifice.

SEPTA, in Antiquity, were Incloſures, or Rails, made of Boards; through which they went in, to give their Votes, in the Aſſemblies of the *Romans*.

SEPTEMBER, the Ninth Month of the Year, reckoning from *January*; and the Seventh, from the *Vernal Equinox*; whence its Name, viz. from *Septimus*, Seventh. The *Roman* Senate would have given this Month the Name of *Tiberius*; but that Emperor oppos'd it. The Emperor *Domitian* gave it his own Name *Germanicus*; the Senate under *Antoninus Pius* gave it that of *Anthoninus*. *Commodus* gave it his Sirname *Herculeus*; and the Emperor *Tacitus*, his own Name, *Tacitus*; but theſe Appellations have all gone into Diſuſe.

SEPTEMVIR, in Antiquity. See EPULO. The *Germans* ſometimes uſe the Word *Septemvirate*, for the Seven Electors of the Empire. See ELECTOR.

SEPTENTRIO, in Aſtronomy, a Northern Conſtellation, more uſually call'd *Urſa minor*, or the *little Bear*, and by the People, *Charles's Wain*. See URSA MINOR. The Word is form'd from the Latin, *Septem*, as conſiſting of Seven Stars, and *Triones* the *Bullocks*, which, in the Ancient Conſtellation, were yoak'd to the Chariot.

SEPTENTRIO, in Coſmography, the ſame with *North*; thus call'd from the ancient Conſtellation *Septentrio*, one of whoſe Stars, is the *Pole Star*. See NORTH, POLE-STAR, &c. Hence alſo *Septentrional*, ſomething belonging to the *North*; as *Septentrional Signs*; *Septentrional Parallels*, &c. thoſe on the Northern Side of the Equator.

SEPTIER or SETIER, a *French* Meaſure, differing according to the Species of the Things meaſured. For Liquors, the *Septier* is the ſame Thing with the *Chopine* or *Half-pint*. See CHOPINE. For dry Meaſure, the *Septier* is very different, in different Places and different Commodities; as not being any Veſſel of Meaſure, but only an Eſtimation of ſeveral other Meaſures. At *Paris*, the *Septier* of Wheat conſiſts of Two Mines, the Mine of Two Minots, and the Minot of Three Buſhels. See BUSHEL. Twelve *Septiers* make the *Mine*. See MINE. The *Septier* of Oats is double that of Wheat. See MEASURE.

SEPTIZON, in the Ancient Architecture, a Term almoſt appropriated to a famous Mauſoleum, of the Family of the *Anthonins*; which *Aur. Victor* tells us, was built in the Tenth Region of the City of *Rome*: being a very large inſulated Building, with Seven Stages or Stories of Columns. The Plan was ſquare; and the Upper Stories of Columns, falling back much, render'd the Pile of a Pyramidal Form; terminated a-top, with the Statue of the Emperor *Septimus Severus*, who built it. It had its Name *Septizon*, *Septizonium*, from *Septem* and *Zona*, *q. d.* Seven Zones or Girdles, by reaſon of its being girt with Seven Rows of Columns. Hiſtorians make mention of another *Septizon*, more Ancient than that of *Severus*, built near the *Thermæ* of *Anthoninus*.

SEPTUAGESIMA, the Firſt Sunday in Lent, or the Fourth Sunday before *Quadrageſima*; as *Quinquageſima* is the next before *Quadrageſima*, then *Sexageſima*, and *Septuageſima*: Being all Days appropriated by the Church to Acts of Penance and Mortification, by Way of Preparation for the Devotion of the *Lent* enſuing. The Laws of King *Canutus* ordained a Vacation from Judicature, from *Septuageſima* to *Quindena Paſchæ*. See QUINQUAGESIMA. From *Septuageſima* to the Octaves after *Eaſter*, Marriage is forbidden by the Canon-Law. It takes its Name from its being about 70 Days before *Eaſter*. Pope *Teleſphorus* firſt made it a Feaſt Day, and appointed Lent to commence from it. See LENT.

SEPTUAGINT, LXX, or the *Seventy*, a Term famous among Divines and Criticks, for a Verſion of the *Old Teſtament*, out of *Hebrew* into *Greek*, perform'd by Seventy-two *Jewiſh* Interpreters, in Obedience to an Order of *Ptolomy Philadelphus*. The Ancients, till *Jerom*'s Time, univerſally believed, that the *Seventy* were Inſpired Perſons, not mere Tranſlators; grounding their Belief on a fabulous Hiſtory of this Verſion, given by *Ariſtæus*: Who tells us, That the High-Prieſt *Eleazer*, choſe Six Doctors out of each Tribe for this Office, which made the Number of Seventy Two; and that theſe being ſhut up, each in his ſeveral Cell, each tranſlated the whole; and without ſeeing what any of the reſt had done, they were all found to agree, to a Letter. The Word is form'd from the *Latin*, *Septuaginta*, Seventy.

The *Chronology of the Seventy*, is an Account of the Years of the World, very different from what is found in the *Hebrew* Text, and the Vulgate; making the World 1466 Years older than 'tis found in theſe latter. The Criticks are much divided, as to the Point of Preference. *Baronius* prefers the Account of the *Seventy*: And *Iſ. Voſſius* makes an Apology for it. The Two lateſt and moſt ſtrenuous Advocates, are Father *Pezron*, a *Bernardine*, and Father *le Quien*, a *Dominican*, the firſt of which defends the Chronology of the *Septuagint*, and the latter that of the *Hebrew* Text.

SEPTUM, in Anatomy, a Term literally ſignifying an *Incloſure* or *Partition*; applied to ſeveral Parts of the Body, which ſerve to ſeparate one Part from another. The *Septum Lucidum*, is a Partition ſeparating the Two upper Ventricles of the Brain; thus call'd, as being Tranſparent. See BRAIN.

Septum Medium, or *Cordis*, is a Separation between the Two Ventricles of the Heart. 'Tis about a Finger thick, fleſhy, and of the ſame Subſtance with the Heart itſelf; conſiſting of muſcular Fibres, which aſſiſt it in its Motions. Some have imagined it to be perforated with a great Number of Holes; but miſtakenly. See HEART. *Septum Tranſverſum*, is the Separation of the Two Bellies, or Venters, call'd alſo *Diaphragm*. See DIAPHRAGMA. *Septum Narium*. See NOSE. *Septum Bulbi*, divides the Bulb of the Urethra lengthwiſe. See URETHRA. *Septum Gallinaginis*. See CAPUT GALLINAGINIS. *Septum Clitoridis*, a membranous Partition running all along between the Two *Corpora Cavernoſa*, from the Glans to its Divarication at the *Os pubis*. See CLITORIS. *Septum Auris*. See EAR. *Septum Teſtium*. See TESTICLE.

SEPULCHER, a Tomb, or Funeral Monument; or a Place deſtined for the Interment of the Deceas'd. The Term is chiefly uſed with regard to the Burying-Places of the Ancients: Thoſe of the Moderns we uſually call *Tombs*. See TOMB. Beſides, the uſual *Sepulchers* for the Interment, either of the whole Body, or of the Aſhes of the Body burnt; the Ancients had a peculiar Kind, call'd *Cenotaphium*; being an empty *Sepulcher*, made in Honour of ſome Perſon, who, perhaps, had no Burial at all; from a Superſtitious Opinion, That the Souls of thoſe who wanted Burial, wandered an Hundred Years, e'er they were admitted to paſs into the *Elyſian* Fields. See BURIAL, FUNERAL, &c. The Pyramids are built to ſerve as *Sepulchers* for the Kings of *Egypt*. See PYRAMID. And the *Obelisks* had generally the ſame Intention. See OBELISK. *Sepulchers* were held Sacred and Inviolable; and the Care taken thereof, deem'd a Religious Duty, grounded on the Fear of God, and the Belief of the Soul's Immortality. Thoſe who ſearch'd or violated them, were odious to all Nations, and ſeverely puniſhed. The *Egyptians* call'd their *Sepulchers*, *Eternal Houſes*, in Contradiſtinction to their Houſes and Palaces, which they call'd *Inns*; by reaſon of the ſhort Sojourn we have in the one, in Compariſon of the long Stay in the other. The *Eaſtern* Pilgrimages are all made with Deſign to viſit the *Holy Sepulcher*, that is, the Tomb of *Jeſus Chriſt*. No Body enters here but bare-footed, and with a World of Ceremonies. The *Turks* exact 24 Crowns of each Pilgrim, whom Devotion carries to the *Holy Sepulcher*.

St. SEPULCHER, or the *Holy Sepulcher*, an Order of Regular Canons, anciently inſtituted in *Jeruſalem*, in Honour of the *Holy Sepulcher*. They aſcribe their Inſtitution to *Godfrey* of *Boulogne*; who, they ſay, upon his taking *Jeruſalem* in the Year 1099, placed Canons in the Patriarchal Church of the *Holy Sepulcher*, which, indeed, is true; but then they were not Regulars. In effect, 'twas *Arnoul*, who, of Archdeacon of the Church of *Jeruſalem*, got himſelf elected Patriarch thereof; that in 1114, firſt obliged his Canons to live in Community, and to follow the Rule of St. *Auguſtin*. From the Holy Land, Numbers of theſe Canons were brought into *Europe*, particularly into *France* by *Louis the Younger*; into *England* by King *Henry*; into *Poland* by *Jaxa*, a *Poliſh* Gentleman; into *Flanders* by the Counts thereof. But the Order was afterwards ſuppreſs'd by *Innocent* VIII. and its Effects

added to that of our Lady of *Bethlehem*, which itſelf, ceaſing, they were beſtowed in 1484, on that of the Knights of St. *John* of *Jeruſalem*. But the Suppreſſion did not take Place in *Poland*, nor in ſeveral Provinces of *Germany*, where they ſtill ſubſiſt: Their General is in *Poland*. Their Habit, Father *Helyot* obſerves, was different in different Places.

St. SEPULCHER, or the *Holy Sepulcher*, is alſo the Name of a Military Order, Eſtabliſh'd in *Paleſtine*. Moſt Writers who mention this Order, carry its Inſtitution as far back as the Time of the Apoſtle St. *James*, Biſhop of *Jeruſalem*; or at leaſt to that of *Conſtantine*; pretending that *Godfrey* of *Boulogne*, and *Baldwin*, were only the Reſtorers thereof: But this Antiquity is Chimerical. 'Tis not even certain, that 'twas founded ſo early as *Godfrey* of *Boulogne*, or his Succeſſor *Baldwin*; though *Favyn* and *de Belloy*, attribute it to this latter. 'Tis certain, there was nothing but Canons in the Church of St. *Sepulchers*, till the Year 1114; and 'tis more than probable, the Knights were only inſtituted upon the Ruins of the Canons 400 Years after, and that by Pope *Alexander* VI. in order to excite Rich and Noble Perſons to viſit the Holy Places, by giving them the Title of *Knights of the Holy Sepulcher*, and to this End, inſtituting an Order under that Name, whereof he took the Quality of Maſter for himſelf and his Succeſſors. *Leo* X. and *Clement* VII. granted to the Guardian of the Religious of St. *Francis*, in the *Holy Land*, the Power of making theſe Knights; which Power, firſt granted *Vive voce*, was afterwards confirm'd by Bull of *Pius* IV. In 1558, the Knights of this Order in *Flanders*, choſe *Philip* II. King of *Spain*, their Maſter; and afterwards his Son: But the Grand Maſter of the Order of *Malta* prevail'd on him to reſign; and when afterwards the Duke of *Nevers* aſſumed the ſame Quality in *France*, the ſame Grand Maſter, by his Intereſt and Credit, procured a like Renunciation of him, and a Confirmation of the Union of this Order to that of *Malta*. See MALTA.

SEPULCHRAL, ſomething belonging to *Sepulchers* or Tombs. See SEPULCHER. *Sepulchral* Inſcriptions are the ſureſt Monuments we have of Antiquity. See INSCRIPTION. *Sepulchral Lamps*, are thoſe ſaid to have been found burning in the Tombs of ſeveral Martyrs and others. See LAMP. *Sepulchral Column*, is a Column erected on a Tomb, with an Inſcription on its Shaft. See COLUMN.

SEPULCHRAL, is alſo the Appellation of a Sect. — *Sepulchral Hereticks*, were thus call'd, from their principal Error, which was, That by the Word *Hell*, whither the Scripture tells us *Jeſus Chriſt* deſcended after his Death, they underſtood his *Sepulcher*. They maintained, That *Jeſus Chriſt* only deſcended into Hell according to the Fleſh; that this Hell was nothing elſe but the Grave where he was laid, and wherein his Soul could not reſt. See *Prateolus*.

SEQUEL, SEQUELA, in Logic, a Conſequence drawn from ſome preceding Propoſition: As if I ſay, *The Human Soul is immaterial; and therefore Immortal*: The laſt Member of the Sentence is a *Sequel* from the firſt.

SEQUENCE, in Gaming, a Series or Set of Cards following in the ſame Suit or Colour. A *Sequence* of Four Cards, of Five, &c. At *Piquet*, theſe are call'd Fourths, Fifths, &c. Quarts, Quints, &c.

SEQUESTRATION, in Common-Law, is the ſeparating of a Thing in Controverſy, from the Poſſeſſion of both Parties, till the Right be determined by Courſe of Law. This is of Two Sorts; *Voluntary*, or *Neceſſary*: *Voluntary*, is that which is done by Conſent of each Party. *Neceſſary*, is that, which the Judge doth by his Authority, whether the Parties will or not. *Sequeſtration*, in the Civil Law, is the Act of the Ordinary, diſpoſing of the Goods and Chattles of one Deceaſed, whoſe Eſtate no Man will meddle with. A Widow is particularly ſaid to *Sequeſter*, when ſhe diſclaims having any thing to do with the Eſtate of her deceaſed Husband.

Among the *Romaniſts*, in Queſtions of Marriage, where the Wife complains of Impotency in the Husband; ſhe is *Sequeſter'd* into a Convent, or the Hands of Matrons, till the Proceſs be determined.

SEQUESTRATION is alſo uſed, for the gathering the Fruits of a Benefice void, to the Uſe of the next Incumbent. In the Time of the Civil Wars, *Sequeſtration* was uſed for a Seizing of the Eſtates of Delinquents, for the Uſe of the Commonwealth.

SEQUIN, or CECHIN, a Gold Coin ſtruck at *Venice*, and in ſeveral Parts of the Grand Seignior's States, particularly *Cairo*; which laſt are call'd *Turkiſh Sequins*, or *Cherifs*. At *Conſtantinople*, the Ducats ſtruck in ſeveral Parts of *Germany*, are call'd *Hungarian Sequins*.

The Value of theſe *Sequins* is different; thoſe of *Venice* exceeding thoſe of *Turkey* and *Germany*, by one Fifteenth. In the *Eaſt-Indies* the Difference is ſtill more ſenſible: The *Venetian Sequin* being current for Four Roupies, and Six Peſſas, or 9 *s.* 4 *d. Sterling*, and the *Turkiſh Sequin*, only for four Roupies, or 9 *s.* See DUCAT. *Ablancourt* derives the Word from *Cziquin* or *Cizicenique*, as ſuppoſing the *Sequin* firſt ſtruck at *Cizicum*. *Menage*, from the *Italian Zecchino*, of *Zecca*, a Town belonging to *Venice*. See COINS.

SERAGLIO, among the *Levantines*, the Palace of a Prince or Lord. At *Conſtantinople* they ſay, The *Seraglio* of the Embaſſador of *England*, of *France*, &c. The Word is originally *Perſian*, where it has the ſame Signification. *The Seraglio* is uſed by way of Excellence for the Palace of the Grand Seignior at *Conſtantinople*, where he keeps his Court, and where his Concubines are lodg'd, and where the Youth are train'd up for the chief Poſts of the Empire. 'Tis a little Triangle about Two Miles round, wholly within the City, at the End of the Promontory *Chryſoceras*, now call'd the *Seraglio* Point. The Buildings run back to the Top of the Hill, from whence are Gardens that reach to the Edge of the Sea. The outward Appearance, *du Loir* tells us, is not beautiful, in regard the Architecture is irregular, being canton'd out into ſeparate Edifices and Apartments, in manner of Pavillions and Domes. No Stranger has ever yet been admitted to the inmoſt Parts of the *Seraglio*. The old *Seraglio* is the Place where the Emperor's old Miſtreſſes are kept. *Balſac* obſerves, That the *Seraglio* at *Conſtantinople*, is only a Copy of that which *Solomon* anciently built at *Jeruſalem*.

SERAPH, in the Hierarchy of Angels, a Spirit of the firſt, or higheſt Rank. The *Seraphs*, or rather *Seraphims*, make that Claſs of Angels, ſuppoſed to be the moſt inflamed with Divine Love, by their nearer and more immediate Attendance on the Throne; and communicate the Heat to the inferior and remoter Orders: Hence their Name, which is form'd from the *Hebrew* Root, שרף, to *burn*, *inflame*. See HIERARCHY.

SERAPHICK, ſomething belonging to the *Seraphim*. See SERAPH. Mr. *Boyle* has a Treatiſe of *Seraphic Love*, *i. e.* of the Love of God. St. *Francis*, the Founder of the *Cordeliers* and *Franciſcans*, is call'd the *Seraphic Father*, in Memory of a Viſion he ſaw on Mount *Alverna*, after a Faſt of Forty Days, accompanied with many other Severities; when, falling into an Extaſy, he ſaw a *Seraph* glide rapidly from Heaven upon him; which impreſs'd on him certain Stigmata or Marks, repreſenting the Wounds which the Nails and the Spear made in our Saviour's Body, at his Crucifixion. In the Schools, St. *Bonaventure* is call'd *The Seraphic Doctor*, from his abundant Zeal and Fervour.

SERENADE, a kind of Concert given in the Night-Time by a Gallant, at his Miſtreſs's Door, or under her Window. Sometimes it conſiſts wholly of Inſtrumental Muſic; ſometimes Voices are added; and the Pieces compos'd or play'd on theſe Occaſions, are alſo call'd *Serenades*. We don't know whence the Word ſhould derive, unleſs from the *French*, *Serein*, the Dew falling in the Night-Time.

SERENA GUTTA, in Medicine, a Diſeaſe, the ſame as *Amauroſis*. See AMAUROSIS.

SERENE, a Quality or Title of Honour given to certain Princes, and chief Magiſtrates of Republicks. The King of *England* is ſtil'd, *The moſt Serene*. The Term is alſo applied to the Doge of *Venice*. The Pope, and the Sacred College writing to the Emperor, to Kings, or the Doge, give no other Title but that of *Moſt Serene*. The *Venetians* ſet the Title of *Serenity* above that of Highneſs. In 1646, *Wicquefort* obſerves, there was a Claſhing between the Courts of *France* and *Vienna*; becauſe the Emperor refuſed the King of *France* any other Title than that of *Serene*. Biſhops anciently, were addreſs'd under the Title of *Serene*. The Kings of *France* of the Firſt and Second Race, ſpeaking of themſelves; uſe no other Quality, but *Nôtre Serenité*. The Emperor gives no other Title to the King of *England*, nor even to any other King, excepting the King of *France*. The King of *Poland*, and other Kings, give it to the Electors. The Emperor, writing to the Electors or other Princes of the Empire, only uſes the Term *Dilection*; but in treating with them, uſes *Electoral Sereneneſs* or *Serenity* to the Electors; and *Ducal Sereneneſs* to the other Princes.

SERGE, in Commerce, a Woollen croſs'd Stuff, manufactured on a Loom with four Treddles, after the Manner of Rateens, and other croſs'd Stuffs. The Goodneſs of *Serges* is known by the Croſſing, as that of Cloths by the Spinning.

Of *Serges* there are various Kinds, denominated either from the different Qualities thereof, or from the Places where they are wrought. The moſt conſiderable is the *London Serge*, now highly valued Abroad, particularly in *France*, where the Manufacture is carried on with good Succeſs, under the Title of *Serge Facon de Londres*.

Manu-

Manufacture of London SERGES.

For Wooll, the longeſt is choſen for the Warp; and the ſhorteſt for the Woof. E'er either Kind is uſed, 'tis firſt ſcour'd, by putting it in a Copper of Liquor, ſomewhat more than luke-warm, compoſed of three Quarters of fair Water, and one of Urine. After having ſtay'd long enough therein to diſſolve, and take off the Greaſe, *&c.* 'tis ſtirred briskly about with a Wooden Peel; taken out of the Liquor; drain'd, and waſh'd in a running Water; dried in the Shade; beaten with Sticks on a Wooden Rack, to drive out the coarſer Duſt and Filth; and then picked clean with the Hands. Thus far prepared, 'tis greaſed with Oil of Olives, and the longeſt Part, deſtined for the Warp, combed with large Combs, heated in a little Furnace for the Purpoſe. To clear off the Oil again, the Wooll is put in a Liquor compoſed of hot Water, with Soap melted therein: Whence being taken out, wrung, and dried, 'tis ſpun on the Wheel. As to the ſhorter Wooll, intended for the Woof, 'tis only carded on the Knee, with ſmall fine Cards, then ſpun on the Wheel, without being ſcoured of its Oil. *Note*, The Thread for the Warp is always to be ſpun much finer, and better twiſted, than that of the Woof.

The Wooll, both for the Warp, and the Woof, being ſpun, and the Thread divided into Skains; that of the Woof is put on Spools (unleſs it have been ſpun upon them) fit for the Cavity or Eye of the Shuttle; and that for the Warp wound on a Kind of Wooden Bobins, to fit it for Warping. When warp'd, 'tis ſtiffen'd with a Kind of Size, whereof, that made of the Shreds of Parchment is held the beſt; and when dry, is put on the Loom.

When mounted on the Loom; the Workman raiſing and falling the Threads (which are paſs'd through a Reed) by means of four Steps placed underneath the Loom, which he makes to act tranſverſly, equally, and alternately, one after another, with his Feet, in Proportion as the Threads are raiſed and lowered, throws the Shuttle acroſs from one Side to the other; and each Time that the Shuttle is thrown, and the Thread of the Woof croſs'd between thoſe of the Warp, ſtrikes it with the Frame to which the Reed is faſtened through whoſe Teeth the Threads of the Warp paſs; and this Stroke he repeats twice, or thrice, or even more, till he judges the Croſſing of the *Serge* ſufficiently cloſe: Thus he proceeds, till the Warp is all filled with Woof.

The *Serge* now taken off the Loom is carried to the Fuller, who fulls, or ſcours it, in the Trough of his Mill, with a Kind of fat Earth, for the Purpoſe, firſt purged of all Stones and Filth. After three or four Hours ſcouring, the Fuller's Earth is waſhed out in fair Water, brought, by little and little, into the Trough, out of which it is taken when all the Earth is cleared: Then, with a Kind of Iron Pinchers, or Plyers, they pull off all the Knots, Ends, Straws, *&c.* ſticking out on the Surface, on either Side: Then return it into the Fulling Trough, where 'tis work'd with Water ſomewhat more than luke-warm, with Soap diſſolved therein; for near two Hours. 'Tis then waſh'd out, till ſuch Time as the Water becomes quite clear, and there be no Signs of Soap left: Then 'tis taken out of the Trough, the Knots, *&c.* pull'd off, and then put on the Tenter to dry, taking Care, as faſt as it dries, to ſtretch it out both in Length and Breadth, till it be brought to its juſt Dimenſions. When well dried, 'tis taken off the Tenter, Died, Shorn, and Preſſed. See DYING, PRESSSING, and SHEERING.

SERGEANT, a Term in our Law, applied to ſundry Offices. As a *Sergeant at Law*, or *of the Coif*, is the greateſt Degree taken in that Profeſſion; as that of a Doctor is in the Civil Law. As they are the moſt Learned and Experienced, there is one Court appropriated to plead in by themſelves, which is the *Common-Pleas*, where the Common Law of *England* is moſt ſtrictly obſerv'd; but they are not prohibited pleading in other Courts, where the Judges (who muſt firſt be *Sergeants*) call them *Brothers*. They are called by the King's Mandate, or Writ, directed to them; commanding them, under a great Penalty, to take upon them that Degree, by a Day aſſigned. Out of theſe, one is made the King's *Sergeant* (more may be) to plead for him in all Cauſes, eſpecially Treaſon.

The *Sergeants* were anciently called *Servientes ad Legem*, and *Servientes Narratores*: Mr. *Selden* adds, That they were alſo called *Doctores Legis*; though others are of Opinion, that the Judges are, more properly, the *Doctores Legis*, and the *Sergeants*, Batchelors of Law. *Spelman* obſerves, That however a *Sergeant* may be richer than all the Doctors of the *Commons*, yet a Doctor is ſuperior in Degree to a *Sergeant*; for the very Name of a Doctor is *Magiſterial*, but that of a *Sergeant Miniſterial*. Hence the Doctors are ſeated and cover'd when they plead; but the *Sergeants* ſtand uncovered at the Bar, excepting for their Coif.

SERGEANT *at Arms*, is an Officer appointed to attend the Perſon of a King, *An.* 7. *H.* 8. *c.* 3. To Arreſt Traitors, *&c.* and Perſons of Quality offending, and to attend the Lord High-Steward, when he ſits in Judgment on any Traitor. There are now Eight at Court, at 100 *l. per Ann.* Salary each: They are called the King's *Sergeants at Arms*, to diſtinguiſh them from others: They are created with great Ceremony; the Perſon kneeling before the King, his Majeſty lays the Mace on his Right Shoulder, and ſays, *Riſe up, Sergeant at Arms, and Eſquire, for ever.* They have, beſides, a Patent for the Office, which they hold for Life. They have their Attendance in the Preſence-Chamber, where the Band of Gentlemen Penſioners wait, and receiving the King at the Door, carry the Maces before him to the Chapel-Door, whilſt the Band of Penſioners ſtand foremoſt, and make a Lane for the King, as they alſo do when the King goes to the Houſe of Lords. There are likewiſe Four others created in the ſame Manner; One, who attends the Lord Chancellor; a Second, the Lord Treaſurer; a Third, the Speaker of the Houſe of Commons, and a Fourth, attending the City of *London*. They have a conſiderable Share of the Fees of Honour, and travelling Charges allowed them, when in waiting, *viz.* Five Shillings *per* Day, when the Court is within Ten Miles of *London*, and Ten Shillings when Twenty Miles off *London*: They are in the Lord Chamberlain's Gift.

SERGEANT, in War, an inferior Officer of Foot, in each Company, arm'd with a Hallbard, and appointed to ſee Diſcipline kept, to form Ranks, and Files, *&c.*

SERGEANTY, a Service antiently due to the King for the Tenure or Holding of Lands; and which could not be due to any other Lord. 'Tis divided into *Grand* and *Petty Sergeanty*. *Grand Sergeanty*, is where one holds Land of the King by Service, which he ought to do in his own Perſon; as to bear the King's Banner, Spear, *&c.* *Petty Sergeanty* is where a Man holds Land of the King, to yield him yearly ſome ſmall Thing toward his Wars; as a Sword, Dagger, Bow, Spurs, *&c.*

Coke, on *Littleton*, tells us, That Sir *Richard Rockeſly* held Lands at *Seaton*, by *Sergeanty*; to be *Vantrarius Regis*, *i. e.* The King's Fore-footman, when he went into *Gaſcoign*, till he had worn out a Pair of Shooes of the Price of Four-Pence. By the Statute, 12 *Car.* II. all Tenures of any Honours, Manors, Lands, *&c.* are turn'd into Free and Common Soccage; but the Honorary Services of *Grand Sergeanty* are thereby continued.

SERIES, a continued Rank or Succeſſion of Things, in the ſame Order, and which have ſome Relation or Connection with each other.—— Medals are formed into *Series*, both with Regard to the Metal, and to the Subject. The different Metals of Medals, form three different *Series*, in the Cabinets of the Curious; we mean, as to the Order, and Arrangement, of the ſeveral Medals. The Gold *Series*, for Inſtance, of Imperials, amounts to about 1000 or 1200; that of Silver may amount to 3000; and that of Copper, in all the three Sizes, Great, Mean, and Little, to 6 or 7000. Of theſe, the *Series* of Middle Copper is the moſt compleat and eaſily found, as it may be brought down to the Fall of the Empire in the Weſt, and the Time of the *Paleogi* in the Eaſt. As to the Antique, the *Series* of Medals are uſually formed from the Side called the *Head*. In the Firſt Claſs, is diſpoſed the *Series* of Kings; in the Second, that of *Greek* and *Latin* Cities; in the Third, the *Roman* Conſular Families; in the Fourth, the Imperial; in the Fifth, the Deities: To which may be added a Sixth *Series*, conſiſting of Medals of illuſtrious Perſons. There are alſo *Series* of Modern Medals; That of the Popes only commences from *Martin* V. in 1430. From that Time we have a *Series* of Papal Medals, tolerably compleat, to the Number of 5 or 600. One might likewiſe have a *Series* of Emperors from *Charlemain*; provided one took in the current Coins: But, in Strictneſs, we commonly commence with *Frederick* II. in 1463. The *Series* of the Kings of *France* is the moſt numerous and moſt conſiderable of all the Modern Kings.

SERIES, in Algebra, a Rank or Progreſſion of Quantities, increaſing or decreaſing in ſome conſtant *Ratio*; which, in its Progreſs, approaching ſtill nearer and nearer ſome ſought Value, is called a *Converging Series*, and if infinitely continued, becomes equal to that Quantity; whence its uſual Appellation of *Infinite Series*: Thus $\frac{1}{2}$ $\frac{1}{4}$ $\frac{1}{8}$ $\frac{1}{16}$ $\frac{1}{32}$ $\frac{1}{64}$, *&c.* make a *Series*, which always converges, or approaches, to the Value of 1, and infinitely continued, becomes equal thereto. See INFINITE.

The

The Doctrine and Uſe of *Infinite Series*, one of the greateſt Improvements of the preſent Age, we owe to *Nic. Mercator* of *Holſtein*, who, however, firſt took it from Dr. *Wallis*'s Arithmetick of *Infinites*. It takes Place principally in the Quadrature of Curves: Where, as we frequently fall upon Quantities, which cannot be expreſſed by any preciſe definite Numbers, ſuch as is the *Ratio* of the Diameter of a Circle to the Circumference, we are glad to expreſs them by a *Series*, which, infinitely continued, is the Value of the Quantity requir'd: An Idea of the Nature, Uſe, &c. of *Infinite Series*, may be conceived from what follows.

Though Arithmetic furniſh us with very adequate and intelligible Expreſſions for all rational Numbers, yet it is very defective as to irrational Ones; which are infinitely more numerous than the other; there being, for Inſtance, an Infinity of them between 1 and 2. Were it now required to find a Mean, proportional between 1 and 2, in rational Numbers, which alone are clearly intelligible, (the Root of 2 being certainly a very obſcure Idea) we could ſtill approach nearer and nearer to the juſt Value of the Quantity required, but without ever arriving at it: Thus, if for the mean Proportional between 1 and 2, or the Root of 2, we firſt put 1, 'tis evident we have not put enough; if we add $\frac{1}{2}$ we put too much, for the Square of $1 + \frac{1}{2}$ is greater than 2. If then we take away $\frac{1}{8}$, we ſhall find we have taken away too much, and if we return $\frac{1}{16}$, the Whole will be too great: Thus may we proceed, without ever coming at the juſt Quantity ſought. Theſe Numbers thus found, and thoſe found after the ſame Manner to Infinity, being diſpoſed in their natural Order, make what we call an *Infinite Series*.

Sometimes the *Series* do not proceed by alternate Additions and Subtractions, but by ſimple Additions, or an Infinity of Subtractions; according to the Poſition of the firſt Term. In all theſe *Infinite Series*, 'tis viſible, that as all the Terms are only equal to a finite Magnitude, they muſt be ſtill decreaſing; and 'tis even convenient that they be ſo, as much as poſſible, that one may take only a certain Number of the firſt Terms for the Magnitude ſought, and neglect all the reſt.

But 'tis not irrational Numbers only, that are expreſſed in rational Ones, by *Infinite Series*. Rational Numbers themſelves may be expreſſed in the ſame Manner: 1, for Inſtance, being equal to the *Series* $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, &c. but, there is this Difference between them, that whereas irrational Numbers can only be expreſſed in rational Numbers, by ſuch *Series*; rational Ones need no ſuch Expreſſion.

Among *Infinite Series*, there are ſome whoſe Terms only make a finite Sum, ſuch is the Geometrical Progreſſion $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, &c. and in general, all Geometrical, decreaſing Progreſſions: In others, the Terms make an infinite Sum; ſuch is the Harmonical Progreſſion $\frac{1}{1}\ \frac{1}{2}\ \frac{1}{3}\ \frac{1}{4}\ \frac{1}{5}$, &c. 'Tis not that there are more Terms in the Harmonical, than in the Geometrical Progreſſion, tho' the latter has no Term which is not in the former, and wants ſeveral the former has: Such a Difference would only render the two infinite Sums unequal, and that of the Harmonical Progreſſion the greateſt; the Cauſe lies deeper. From the received Notion of infinite Diviſibility, it follows, that any finite Thing, *e. gr.* A Foot is a Compound both of Finite and Infinite: Finite, as it is a Foot; Infinite, as it contains an Infinity of Parts, into which it is diviſible. If theſe Infinite Parts be conceiv'd, as ſeparated from one another, they will make an *Infinite Series*, and yet their Sum only be a Foot; only, no Terms are to be here put, but ſuch as may, diſtinct from each other, be Parts of the ſame Finite Whole: Now this is the Caſe in the Geometrical, decreaſing *Series* $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, &c. for 'tis evident, that if you firſt take $\frac{1}{2}$ of a Foot, then $\frac{1}{2}$ of what remains, or $\frac{1}{4}$ of a Foot, then $\frac{1}{2}$ of what remains, or $\frac{1}{8}$ of a Foot; you may proceed to Infinity, ſtill taking new decreaſing Halves, all diſtinct from each other, and which all together only make a Foot. In this Example, we not only take no Parts but what were, in the Whole, diſtinct from each other; but we take all that were there; whence it comes to paſs, that their Sum make the preciſe Whole again: But, were we to follow the Geometrical Progreſſion $\frac{1}{3}\ \frac{1}{9}\ \frac{1}{27}$, &c. that is, at firſt take $\frac{1}{3}$ of a Foot, and from what remains $\frac{1}{9}$ of a Foot, and from what ſtill remains $\frac{1}{27}$ of a Foot, &c. 'tis true, we ſhould take no Parts but what were diſtinct from each other in the Foot; but we ſhould not take all the Parts that were there, ſince we only take the ſeveral Thirds, which are leſs than the Halves; Of Conſequence, all theſe decreaſing Thirds, though Infinite in Number, could not make the Whole, and 'tis even demonſtrated, that they would only make Half: In like Manner, all the Fourths decreaſing to Infinity, would only make one Third, and all the Hundredths, only the Ninety-ninth Part; ſo that the Sum of the Terms of an *Infinite Series* decreaſing geometrically, is not only always finite, but may even be leſs than any finite Quantity that can be aſſigned. If an Infinite decreaſing *Series* expreſs Parts which cannot ſubſiſt in the Whole, diſtinctly from each other; but ſuch, as to take their Values, we muſt ſuppoſe the ſame Quantity taken ſeveral Times, in the ſame Whole; then will the Sum of theſe Parts make more than a Whole, nay, infinitely more; that is, the *Series* will be Infinite, if the ſame Quantity be taken, an Infinity of Times: Thus, in the Harmonical Progreſſion $\frac{1}{2}\ \frac{1}{3}\ \frac{1}{4}$, &c. if we take $\frac{1}{2}$ of a Foot, or 6 Inches, then $\frac{1}{3}$ 4 Inches, 'tis evident we cannot take further $\frac{1}{4}$ of a Foot, or 3 Inches, without taking 1 Inch more than was left in the Foot. Since then the Whole is already exhauſted by the Three firſt Terms, we can take no more of the following Terms, without taking ſomething already taken: And, ſince thoſe Terms are infinite in Number, 'tis very poſſible that the ſame finite Quantity may be repeated an infinite Number of Times, which will make the Sum of the *Series* infinite. We ſay *poſſible*; for though of two *Infinite Series*, the one may make a finite Sum, and the other an Infinite; 'tis true, that there may be ſuch a *Series*, where the Finites, having exhauſted the Whole, the following ones, though infinite in Number, ſhall only make a finite Sum: And, in Effect, ſince 'tis demonſtrated, by Geometrical Progreſſions, that there are *Series*, whoſe Sums are leſs than the Whole, nay, infinitely leſs; it follows, that there muſt likewiſe be *Series* which make infinitely more.

There are two further Remarks neceſſary to be made on *Series* in general. 1°. That there are ſome, wherein, after a certain Number of Terms, all the other Terms, though infinite in Number, become each a Cypher. Now, 'tis evident, that the Sum of theſe *Series* is finite, and eaſily found; they having only an Appearance of Infinity. 2°. That the ſame Magnitude may be expreſſed by different *Series*; and may be expreſſed both by a *Series*, whoſe Sum may be found, and by another, whoſe Sum cannot be found.

Geometry does not labour under the ſame Difficulty as Arithmetic. It expreſſes irrational Numbers exactly in Lines, and needs not have Recourſe to *Infinite Series*. Thus the Diagonal of a Square, whoſe Side is 1, is known to be the Root of 2. But, in ſome other Caſes, Geometry it ſelf is under the like Embarraſs; there being ſome Right Lines, which cannot be expreſſed otherwiſe than by an *Infinite Series* of ſmaller Lines, whoſe Sum cannot be found: Of which Kind are the Right Lines equal to Curves; ſo that in ſeeking, for Inſtance, a Right Line equal to the Circumference of a Circle, we find, that the Diameter being 1, the Line ſought will be $\frac{4}{1}$ Minus, $\frac{4}{3}$ Plus, $\frac{4}{5}$ Minus, $\frac{4}{7}$ Plus, $\frac{4}{9}$, &c.

As to the finding of *Infinite Series*, to expreſs Quantities ſought; *Mercator*, the firſt Inventor of the Method, did it by Diviſion: But Sir *I. Newton* and M. *Leibnitz*, have improved the Doctrine very conſiderably; The Firſt finding his *Series* by the Extraction of Roots, and the Second by another *Series* preſuppoſed.

To find a Series *expreſſing a Quantity ſought, by Diviſion.*

Suppoſe a *Series* required to expreſs the Quotient of b divided by $a + c$. Divide the Dividend by the Diviſor, as in common Arithmetic; continuing the Diviſion till the Quotient ſhew the Order of the Progreſſion, or the Law, according to which the Terms proceed to Infinity: Still obſerving the Rules of Subtraction, Multiplication, and Diviſion about the changing of the Signs. The Proceſs carried on, the Quotient will be found $\frac{b}{a} - \frac{bc}{a^2} + \frac{bc^2}{a^3} - \frac{bc^3}{a^4}$ &c. in *Infinitum*. Theſe Four or Five Terms thus found, both the Quotient and Manner of the Diviſion ſhew, That the Quotient conſiſts of an Infinite *Series* of Terms, whoſe Numerators are the Powers of c, whoſe Exponents differ from the Number of the Order by Unity, whoſe Denominators, are the Powers of a, and their Denominators equal to the Number of the Order of the Terms. *E. gr.* In the Third Term, the Power of c is the Second in the Numerator; and the Power of a the Third in the Denominator.

Hence, 1°. If $b=1$ and $a=1$ ſubſtituting this Value for that, we have, in that Quotient $1-c+c^2-c^3$, &c. to Infinity. Wherefore $\frac{1}{1+2} = 1-c+c^2-c^3$, &c. In

infinite——

infinite —— 1. If then, 2dly, that Term in the Quotient continually decreaſe; the *Series* will give a Quotient as near the Truth as poſſible. *E. gr.* If $b=1$, $c=1$ and $a=2$; theſe Values ſubſtituted in the general *Series*, or the Diviſion performed as in the general Example; we ſhall find $\frac{1}{3}=\frac{1}{2+1}=\frac{1}{2}-\frac{1}{4}+\frac{1}{8}-\frac{1}{16}+\frac{1}{32}-\frac{1}{64}+\frac{1}{128}$, &c. Suppoſe then, the *Series* to be broke off in the Fourth Term; there will be a Deficiency: but 'twill be leſs than $\frac{1}{32}$. If it be broke off in the Sixth, there will be a Deficiency, but that leſs than $\frac{1}{128}$. The further therefore the *Series* is continued, the nearer it approaches to Truth, but never arrives at it.

After the like Manner we find $\frac{1}{4}=\frac{1}{3+1}=\frac{1}{3}-\frac{1}{9}+\frac{1}{27}-\frac{1}{81}+\frac{1}{243}$, &c. In infinit. $\frac{1}{5}=\frac{1}{4+1}=\frac{1}{4}-\frac{1}{16}+\frac{1}{64}-\frac{1}{256}$, &c. *In Infinitum* $\frac{1}{6}=\frac{1}{5+1}=\frac{1}{5}-\frac{1}{25}+\frac{1}{125}-\frac{1}{625}$, &c. *in Infinitum.* This is a conſtant Law, whereby all Fractions, whoſe Numerator is Unity, may be expreſſed by *infinite Series*: Thoſe *Series* being all Geometrical Progreſſions, decreaſing in ſuch Manner as that the Numerator is always Unity; and the Denominator of the firſt Term, which is alſo the Exponent of the *Ratio*, differs by Unity from the Denominator of the Fraction to be reſolved.

If the Terms of the Quotient be continually increaſing, the *Series* recedes ſo much the farther from the Quotient as it is continued longer; nor does it ever become equal to the Quotient, unleſs it be terminated; and the laſt Remainder be added under its Sign. *E. gr.* Suppoſe $\frac{1}{3}=\frac{1}{1+2}$; the Quotient will be found $1-2+4-8+16-64+128$, &c. One Term, 1 exceeds $\frac{1}{3}$ by an Exceſs of $\frac{2}{3}$; Two Terms come ſhort by $\frac{4}{3}$. Three Terms exceed by $\frac{9}{3}$; Four fall ſhort by $\frac{15}{3}$, &c. If the *Series* be ſuppoſed to terminate in -8; then will $\frac{1}{1+2}=1-2+4-8+\frac{16}{3}$. But $1-2+4-8=-5=\frac{15}{3}$. Therefore, $\frac{1}{1+2}=\frac{16}{3}-\frac{15}{3}=\frac{1}{3}$. Suppoſe the General *Series* to terminate in $-c^3$; then will $\frac{1}{1+c}=1-c+c^2-c^2+\frac{c^3}{1+c}=\frac{1+c-c^2+c^2+c^3-c^3-c^4+c^4}{1+c}=\frac{1}{1+c}$

To find an *Infinite Series* by extracting of Roots -- } See { Quadrature *of the* Circle.

SERMOLOGIES, in Church Hiſtory, Books of Sermons, or Homilies of Popes and other Perſons of Eminence and Sanctity, read at the Feaſts of the Confeſſors, the Purification, All Saints, and on every Day from *Chriſtmas* to the Octave of the Epiphany. See Homily.

SERMONES, the Title *Horace* gives his Satyrs. The Criticks are divided about the Reaſon of the Name. The Opinion of Father *Boſſu* ſeems well grounded. A mere Obſervation of Feet, and Meaſure, ſuch as we find in *Terence*, *Plautus*, and in *Horace*'s Satyrs, he thinks, is not ſufficient to conſtitute Verſe; to determine the Work to be Poetical; or to diſtinguiſh it from Proſe: unleſs it have ſome further Air, or Character of Poetry; ſomewhat of the Fable, or the Sublime. See Poetry. Hence it is, that *Horace* calls his Satyrs, *Proſe*, *Sermones*. His Odes have quite another Air, and are therefore called, *Poems*, *Carmina*. See Poem, Prose, and Versification.

SERMONIUM, in Old Records, a kind of Interlude or Hiſtorical Play, which the Inferior Orders of Clergy, aſſiſted by Boys, &c. uſed to act in the Body of the Church, ſuitable to the Solemnity of ſome Feſtival or high Proceſſion Day. This is ſuppoſed to have been the Origin of the Modern Drama. See Comedy.

SERON OF ALMONDS, is the Quantity of Two Hundred Weight; of Aniſe-ſeeds from 3 to 400; of Caſtle Soap, from 200 and a Half, to 300 and 3 Quarters.

SEROSITY, in Medicine, an aqueous Liquor, mixed with the Blood and other Humours. *Degori* defines it, a ſharp, bilious Juice, approaching nearly the Nature of Blood; but which, being extravaſated, does not coagulate like the Blood. See Serum. Diſorders of the Spleen are attended with *Seroſities*. The Kidneys help to purge off *Seroſities*.

SERPENS, in Aſtronomy, a Conſtellation in the Northern Hemiſphere, called *Serpens Ophiuchi*.

The Stars in the Conſtellation *Serpens*, in *Ptolomy*'s Catalogue are 17; in *Tycho*'s 19; in the *Britannic* Catalogue 59. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

Stars in the Conſtellation Serpens Ophiuchi.

SERPENT, a Muſical Inſtrument, ſerving as a Baſſe to the Cornet, or ſmall Shawm, to ſuſtain a Chorus of Singers in a large Veſſel. It has its Name *Serpent*, from its Figure; as conſiſting of ſeveral Folds or Wreaths, ſerving to take off its Length, which would otherwiſe be Six or Seven Feet. 'Tis uſually covered with Leather; and conſiſts of Three Parts; a Mouth-piece, a Neck, and a Tail. It has Six Holes, by means whereof, they give it the Compaſs of Two Octaves.

SERPENTARIUS, in Aſtronomy, a Conſtellation of the Northern Hemiſphere, called alſo *Ophiuchus*, and anciently *Æſculapius*. See Constellation.

The Stars in the Conſtellation *Serpentarius* in *Ptolomy*'s Catalogue are 29; in *Tycho*'s 25; in the *Britannic* Catalogue 69. The Longitudes, Latitudes, Magnitudes, &c. whereof, are as follow.

Stars in the Conſtellation SERPENTARIUS, or OPHIUCHUS.

SERPENTARY, a Medicinal Plant, called by the Ancients *Piſtolochia*, and *Dracunculus*, and now by the People, *Snake Root*, and *Dragons Wort*. The Ancients were only acquainted with Two Kinds of this Plant; the *Great* and the *Small*: But ſince the Diſcovery of *America*, the Botaniſts have added ſeveral others; as, The *Serpentary*, or *Snake Root*, of *Virginia*, that of *Canada*, and that of *Braſil*. They are all ſuppoſed to be Alexipharmicks, or Counter-Poiſons; and as ſuch are Ingredients in Treacle. The Great *Serpentary*, called by the Antients *Dracunculus Major*, has its Stem very ſtreight, ſmooth, and mark'd with red Spots, like the Skin of a Serpent; whence, probably, as much as from its Virtues, it is, that it take its Name. Its Root is big, round and white, covered with a thin Skin. The ſmaller *Serpentary* has its Stalk much like that of the larger, only its Leaves are like thoſe of Ivy; whereas thoſe of the larger are folded in one another, after the Manner of Baſtard Rhubarb. Its Root is round and bulbous. The *Serpentary* of *Virginia*, called alſo *Viperia*, *Dittany*, *Snake Root*, and *Contrayerva* of *Virginia*, has its Leaves green and large, almoſt in Figure of a Heart; its Fruit round, and its Root, which is of a very ſtrong Aromatick Smell, has, at Bottom, an infinite Number of long ſmall Filaments, repreſenting a Kind of Beard. 'Twas firſt brought into *Europe* from *Virginia* by the *Engliſh*, where 'tis eſteemed a ſovereign Antidote againſt the Bite of the Rattle Snake. We are told by Travellers, That this *Serpentary* does not only cure the Bite of the Rattle Snake, but that that Animal flies the Smell thereof: For which Reaſon the *Indian*, and other Travellers, always carry it with them on the End of a Staff, to preſent towards the Snake, when, by Chance, they meet it.

SERPENTINE VERSES, are ſuch as begin and end with the ſame Word; as,

Ambo florentes ætatibus, Arcades Ambo.

SERPENTINE, in Chymiſtry, a *Worm*, or Pipe of Copper, or Pewter, twiſted into a Spiral, and aſcending from the Bottom of the Alembick to the Capital, and ſerving as a Refrigeratory in the Diſtillation of Brandy and other Liquors. See REFRIGERATORY.

SERPENTINE MARBLE, or *Stone*, a Kind of Marble called by the Ancients *Ophites*, from the *Greek* Ὄφις, *Serpent*, as being ſpeckled like a Serpent's Skin. The Ground is blackiſh, but covered with green and yelloviſh Stains, Streaks, &c. exceeding hard, precious and antique. The Scarceneſs of the *Serpentine* makes, that 'tis only uſed by Way of Incruſtation. The largeſt Pieces we know of, are ſome Tables in the Compartiments of the Attic of the Pantheon; and Two Columns in the Church St. *Laurence* in *Lucina* at *Rome*. There is alſo a ſoft Kind of *Serpentine* brought from *Germany*, uſed to make Veſſels of, but not in Building.

SERPIGO, in Medicine, a kind of Herpes, popularly call'd a *Tetter* or *Ring-worm*. It conſiſts of a Number of very ſmall Puſtules, riſing cloſe to each other, ſometimes in a circular Form, with great Pain and Itching. It never comes to Digeſtion, and is not cur'd without Difficulty. For after it appears to have been quite extinguiſh'd, it frequently breaks forth again at certain Seaſons of the Year. The common People uſe to anoint it with Ink: But where the Diſeaſe is fix'd, ſome Univerſals ſhould be firſt applied. See LICHEN.

SERRATUS, in Anatomy, a Name given to ſeveral Muſcles, from their Reſemblance in Shape, to a *Saw*. Such are the

SERRATUS *Anticus Minor*, which ariſeth thin and fleſhy from the Second, Third, Fourth, and Fifth ſuperior Ribs, and aſcending obliquely, is inſerted Fleſhy into the *Proceſſus Coracoides* of the *Scapula*, which it draws forward. It alſo helps in Reſpiration.

SERRATUS *Anticus Major*, comes from the whole Baſis of the *Scapula*, and is inſerted into the ſeven true Ribs, and firſt of the falſe Ribs, by ſo many diſtinct Portions, repreſenting the Teeth of a Saw.

SERRATUS *Poſticus Superior*, ariſeth by a broad and thin Tendon, from the Two inferior Spines of the *Vertebræ* of the Neck, and the Three ſuperior of the Back, and growing fleſhy, is inſerted into the Second, Third, and Fourth Ribs, by ſo many diſtinct Indentations. Theſe Two help to draw the Ribs upwards, and bring them to Right Angles with the *Vertebræ*; and, conſequently, make the Cavity of the *Thorax* wider and ſhorter.

SERRATUS *Poſticus Inferior*, ariſes by a broad and thin Tendon, from the Three inferior Spines of the *Vertebræ* of the Back, and from the two Superior of the Loins; its Fibres, aſcending obliquely, grow fleſhy, and are inſerted by four Indentations, into the Four laſt Ribs.

SERVANT, a Term of Relation, ſignifying a Perſon who owes and pays a limitted Obedience for a certain Time, to another, in Quality of Maſter. See SLAVE. The *Romans*, beſides their *Slaves*, whom they alſo call'd *Servi*; had another kind of *Servants*, whom they call'd *Nexi* & *Addicti*, who were ſuch as being in Debt, were delivered up to their Creditors by the Prætor, to work out their Debt; after which they were again at Liberty. The Pope, out of his wonderful Humility, calls himſelf in his Bulls, *The Servant of the Servants of God*. *Servus Servorum Dei*. The firſt who uſed the Appellation, as *Diaconus* tells us, were

Pope

Pope *Damasus* and *Gregory the Great*; which last is said to have used it to check, by his Modesty, the Arrogance of *John*, Patriarch of *Constantinople*, who took the Title of *Oecumenical*. *Du Cange* adds, That the Title *Servant* has been taken by some Bishops, some Kings, and some Monk.

SERVITIUM, in Law. See SERVICE.

SERVETISTS, the Disciples or Followers of *Michael Servet*, the Ringleader of the *Antitrinitarians* of these last Ages. In Reality, however, *Servet* had not any Disciples; as being burnt, together with his Books, at *Geneva*, in 1553; But the Name *Servetists* is given to the Modern *Antitrinitarians*, because they have follow'd his Foot-steps. *Sextus Senensis* calls the *Anabaptists*, *Servetists*, and seems to use the Two Terms Indifferently. The Truth is, in many Things, the ancient *Anabaptists* of *Switzerland*, &c. chimed in with *Servet*. As the Books that he wrote against the Trinity, are very rare, his real Sentiments are but little known. M. *Simon*, who had a Copy of the first Edition, lays them down at length in his Critical History. Tho' *Servet* uses many of the same Arguments against the Trinity, as the *Arians*, yet he professes himself very far from their Sentiments. He also opposes the *Socinians* in some Things; and declares his Dissent from the Opinions of *Paulus Samosatenus*, though *Sandius* mistakenly charges him with having the same Sentiments. In effect, he does not seem to have had any fix'd regular System of Religion, at least not in the first Edition of his Book against the Trinity, publish'd in 1531, under the Title of *De Trinitatis Erroribus, Libri Septem, per Michaelem Servetum, alias Reves, ab Arragonia Hispanum.* The Year following he publish'd his Dialogues on the Mystery of the Trinity. In the Preface to which last Work, he declares himself dissatisfied therewith. 'Twas on this Account he undertook another on the same Subject, of much greater Extent; which did not appear till the Year 1553, a little before his Death. Those of *Geneva* having seiz'd the Copies of this Edition, had it burnt; nor were there above Two or Three that escaped; one of which was kept at *Basil*, where the Book was printed, but is now in the Library at *Dublin*. It was lately put to the Press, secretly, in *England*; but being discovered, the Impression was seiz'd, and destroy'd.

SERVICE, SERVITUM, in Law, a Duty which the Tenant, by reason of his Fee, owes to the Lord. See FEE. It is sometimes also call'd *Servage*. Our ancient Law-Books make divers Divisions of *Service*, *viz.* into *Personal*, *Real* and *Mixt*; *Military*, and *Base*; *Intrinsec* and *Extrinsec*, &c. But since the Statute 12 *Car.* II. whereby all Tenures are turn'd into free and common Soccage; much of that Learning is set aside: Yet may it not be amiss to mention how the several Kinds of *Service* are described in our ancient Law-Books.

Personal SERVICE, is that to be perform'd by the *Person*; such is that due from a Slave to his Master.

Mixt SERVICE, is that due from the Person, by reason of the Thing, as an Usu-fruit, &c. Our ancient Law-Books tell us of Lands held of the King, by the Tenant's letting a Fart before the King on *New-Years-Day*; others, by furnishing the King with Whores whenever he travelled that Way; others, by bringing the King a Mess of Pottage at his Coronation Feast, &c.

Real SERVICE, is either *Urbane* or *Rustic*; which two Kinds differ, not in the Place, but the Thing. The first is that due from a Building or House, in whatever Place situate, whether City or Country, as the keeping a Drain, a Vista or the like. *Rustic Services*, are those due for Grounds where there is no Building; such is the Right of Passage through Ways, &c. There are also *Natural Services*: For Instance, if a Man can't gather the Produce of his Lands without passing through his Neighbour's Grounds, the Neighbour is obliged to allow a Passage, as a *Natural Service*. By the *Lex Scribonia*, a *Servitude* can't be acquir'd by Custom and Prescription.

Military SERVICE, *Base* SERVICE } See { KNIGHTS SERVICE. VILLENAGE.

Forinsec, or *Extrinsec*, or *Regal* SERVICE, was a *Service* which did not belong to the chief Lord, but to the King. 'Twas call'd *Forinsec* and *Extrinsec*, because done *foris*, out of Doors; and *extra Servitium*. We read several Grants in the *Monasticon*, of all Liberties, with the Appurtenances, *Salvo forensi Servitio*.

Intrinsec SERVICE, that due to the Chief Lord from his Vassals.

Frank SERVICE, a Service done by the Feudatory Tenants, who were call'd *Liberi homines*, and distinct from Vassals: As likewise was their *Service*; for they were not bound to any of those *Services*, as to Plough the Lord's Lands, &c. But only to find a Man and Horse to attend the Lord into the Army or Court. This was sometimes call'd *Liberum Servitium Armorum*.

SERVITES, an Order of Religious, denominated from a peculiar Attachment to the Service of the Virgin. The Order was founded by Seven *Florentine* Merchants, who, about the Year 1233, began to live in Community on Mount *Senar*, Two Leagues from *Florence*. In 1239, they received from the Bishop, the Rule of St. *Augustine*; with a Black Habit, in lieu of a Grey one which they had wore before. In 1251 *Bonfilio*, one of the Seven, of simple Prior of Mount *Senar*, was named General. The Order was approved of by the Council of the *Lateran*, notwithstanding the Decree it had pass'd to prevent the Multiplication of Religious Orders. And it was again approved by Cardinal *Raynerius*, Legat of Pope *Innocent* IV; who put it under the Protection of the Holy See. The succeeding Popes have granted it a great many Favours, particularly *Alexander* IV. and *Innocent* VIII. It has had some Reform. At present it has Twenty-seven Provinces. 'Tis become famous in *Italy*, by the History of the Council of *Trent*, of *Fra. Paolo*, a *Venetian*, who was a Religious *Servite*. *M. Hermant*, gives this Order the Name of the *Annunciate*, doubtless from this Mistake, that in some Cities of *Italy*, they are call'd *Religious of the Annunciate*, because in those Cities, their Church is dedicated under that Name. *F. Archan Giani*, derives the Name *Servites*, *Servants* of the Holy Virgin, from hence; That when they appeared for the first Time in the Black Habit given them by the Bishop, the Sucking Children cried out; *See the Servants of the Virgin.* —— There are also Nuns of this Order.

SERVITOR, in our Universities, a Scholar who attends or waits on another for his Maintenance there.

SERVITORS of Bills; are such Servants or Messengers, of the Marshal of the *King's-Bench*, as were sent Abroad with Bills or Writs, to Summon Men to that Court. They are now commonly called *Tip-staves*.

SERVITUDE, the Condition of a Servant, or Slave; See SERVICE. Under the Declension of the *Roman* Empire; a new kind of *Servitude*, was introduced, different from that of the ancient *Romans*: It consisted in leaving the Lands of subjugated Nations to the first Owners, upon Condition of certain Rents, and servile Offices, to be paid in Acknowledgement. Hence the Names of *Servi censiti*, *ad scriptitii & addicti Glebæ*: Some whereof were taxable at the reasonable Discretion of the Lord; others at a certain Rate agreed on; and others were mainmortable, who, having no legitimate Children, could not make a Will to above the Value of Five-Pence, the Lord being Heir of all the rest: Others were prohibited marrying, or going to live out of the Lordship. Most of which Services still subsist in one Province or other of *France*; though all abolish'd in *England*. Such was the Original of our Tenures, &c. See TENURE.

SERUM, a thin, transparent, watry Liquor, somewhat saltish, which makes a considerable Part in the Mass of Blood. The Blood consists of Two Kinds or Parts; the *Cruor*, or red Part; and the *Serum*, or wheyish, limpid Part. See BLOOD. Mr. *Boyle*, and some others, have taken the *Serum* to be more ponderous than the *Cruor*; but Dr. *Jurin*, in the *Philosophical Transactions*, from repeated Experiments, assures us of the contrary. See CRUOR. The *Serum* is, in Reality, the same with the *Lympha*: 'Tis carried by the Arteries throughout the several Parts of the Body; whence it returns partly in the Veins, and partly in the Lymphatick Vessels. See LYMPHA. The Use of the *Serum* is to nourish the Parts of the Body; and to render the Chyle and Blood more Fluid. See NUTRITION. Urine and Sweat, are nothing but *Serum* drained of their Nutritious Parts, by repeated Circulations, and Secreted from the Blood in the Glands of the Kidneys and Skin. The Redundancy, and other Vices in the *Serum*, are the Cause of various Diseases. See DISEASE.

SESAMOIDEA OSSA, in Anatomy, several very small Bones, placed between the Joints of the Fingers, to fortify them; and prevent Dislocations. See FINGER. They have their Name from their Resemblance to a Grain of *Sesamum*, from *Sesamum*, and εἶδος, *form*.

SESQUI, a *Latin* Particle, signifying a Whole and a Half; which, joined with *Altera*, *Terza*, *Quarta*, &c. is much used in the *Italian* Music, to express a Kind of *Ratio*'s; particularly, several Species of Triples. The *Ratio* express'd by *Sesqui*, is the Second *Ratio* of Inequality, called also *Super-particular Ratio*; and is, when the greater Term contains the Less, once, and some certain Part, over: As 3 : 2; where the First Term contains the Second once, and Unity over; which is a Quota Part of Two. Now, if this Part remaining, be just Half the less Term, the *Ratio* is called *Sesqui-altera*: If the remaining Part be a Third Part of the lesser Term, as 4 : 3, the *Ratio* is called *Sesqui-tertia*, or *Sesqui-terza*. If a Fourth Part, as 5 : 4, the *Ratio* is called *Sesqui-quarta*; and thus to Infinity, still adding to *Sesqui* the ordinal Number of the smaller Term. In

English,

Engliſh, we may ſay *Seſqui-alteral*, *Seſqui-third*, *Seſqui-fourth*, &c.

As to the Kinds of Triples expreſſed by the Particle *Seſqui*, they are theſe: The *Greater Perfect Seſqui-alteral*, which is a Triple, where the Breve is three Meaſures, or Minims, and that without having any Point. The *Greater Imperfect Seſqui-alteral*, which is where the Breve, when pointed, contains three Meaſures, and without any Point, two. The *Leſs Perfect Seſqui-alteral*, which is where the Semi-breve contains three Meaſures, and that without any Point. The *Leſs Imperfect Seſqui-alteral*, a Triple, mark'd C $\frac{1}{2}$, where the Semi-breve, with a Point, contains three Meaſures, and two without. According to *Bontempi*, one may likewiſe call the Triples $\frac{6}{4}$ and $\frac{12}{8}$, *Seſqui-alteral*.

The *Seſqui-octave*, is a Kind of Triple, mark'd C $\frac{8}{9}$, called by the *Italians Nonupla di Crome*, where there are 9 Quavers in every Meaſure or Bar, in Lieu of 8. The *Double Seſqui-quarta* is a Kind of Triple mark'd C $\frac{9}{4}$, called by the *Italians Nonupladi Semi-minime*, where there are 9 Crotchets in each Meaſure, inſtead of 4.

SESQUI-*alteral*, in Geometry, and Arithmetic, is a *Ratio* between two Lines, two Numbers, *&c.* where one of them contains the other once, with the Addition of an Half. Thus 6 and 9 are in a *Seſqui-alteral Ratio*, ſince 9 contains 6 once, and 3, which is Half of 6, over: And 20 and 30 are in the ſame; as 9 contains 20, and half of 20 or 10. See RATIO.

SESQUI-*duplicate Ratio*, is, when of two Terms, the greater contains the leſs twice, with half another over: As 15 and 6; 50 and 20. See RATIO.

SESQUI-*alteral*,
SESQUI-*octave*,
SESQUI-*quartan*,
SESQUI-*tertian*,
} In Muſic See } SESQUI.

SESQUIDITONUS, in Muſic, a Concord reſulting from the Sounds of two Strings, whoſe Vibrations, in equal Times, are to each other in the *Ratio* of 5 to 6. See DITONUS.

SESQUIQUADRATE, is an Aſpect, or Poſition, of the Planets, when at the Diſtance of four Signs and an Half; or 135 Degrees from each other.

SESQUIQUINTILE, is an Aſpect of the Planets, when 108 Degrees diſtant from each other.

SESSION, in the Schools, each Sitting, or Aſſembly, of a Council. In quoting Councils, we ſay, In ſuch a *Seſſion*, ſuch a Canon, *&c.* *Seſſion of Parliament*; is the Seaſon, or Space, from its Meeting to its Prorogation, or Diſſolution. See PROROGATION.

SESSIONS, a Sitting of Juſtices in Court, upon Commiſſions; as the *Seſſions of Oyer and Terminer*; *Quarter-Seſſions*, called *General Seſſions*, or *Open Seſſions*, oppoſite whereto are *Eſpecial*, otherwiſe called *Privy-Seſſions*, which are procured upon ſome ſpecial Occaſion, for the more ſpeedy Diſpatch of Juſtice. See QUARTER-SESSIONS. *Petit Seſſions*, or *Statute Seſſions*, are kept by the High-Conſtable of every Hundred, for the placing of Servants.

SESTERCE, *Seſtertius*, a Silver Coin, in Uſe among the Ancient *Romans*, called alſo *Nummus*, and ſometimes *Nummus Seſtertius*. The *Seſterce* was the Fourth Part of the *Denarius*, and contained Two *As*'s, and an Half; eſtimated in *Engliſh* Money, at One Penny Half-penny Farthing. The *Seſterce* was at firſt mark'd with L L S, the two L's ſignifying two *Libræ*, and the S Half. But the *Librarii*, afterwards, converting the two L's into an H, expreſſed the *Seſterce* by H S. The Word *Seſtertius* was uſed by way of Abbreviation for *Semiſtertius*, which ſignifies Two, and a Half of a Third; or, literally, only Half a Third: For in expreſſing Half of a Third, 'twas underſtood, that there were Two before. Some Authors make two Kinds of *Seſterces*; the *Leſs*, called *Seſtertius*, in the Maſculine Gender; and the *Great* one, called *Seſtertium* in the Neuter. The Firſt, that we have already deſcribed: The Latter containing a Thouſand of the other, or 7 *l.* 16 *s.* 3 *d.* of our Money. Others will have any ſuch Diſtinction of great and little *Seſterces*, unknown to the *Romans*. *Seſtertius*, ſay they, was an Adjective, and ſignified *As Seſtertius* or two *As*'s and a Half: And when uſed plurally, as in *Quadraginta Seſtertium*, or *Seſtertia*, 'twas only by Way of Abbreviation, and there was always underſtood *Millia*, Thouſands: This laſt is the more probable Opinion. To be qualified for a *Roman* Knight, an Eſtate of Four Hundred Thouſand *Seſterces* was required; and, for a Senator, Eight Hundred Thouſand. Authors mention a Copper *Seſterce*, worth about $\frac{1}{3}$ of a Penny *Engliſh*.

SESTERCE, *Seſtertius*, was alſo uſed in Antiquity, for a Thing containing Two Wholes and a Half of a Thing: As *As* was taken for any Whole, or Integer. See AS.

SESTUPLE SEXTUPLE, in Muſic, a Kind of mix'd Triple-time. M. *Broſſart* thinks, 'tis improperly thus called, and ought rather to be called *Binary-Triple*. We only find three Kinds of it in Authors; but one may add two others; the Firſt, the Seſtuple of the Semi-breve, or Triple, of 6 for 1, or Six-one. The Second, the Seſtuple of Minims, or Triple of 6 for 2, or Six-two. The Third, the Triple of Semi-minim, or Triple of 6 for 4, or Six-four. The Fourth, the Sextuple of the Croma, or Triple of 6 for 8, or Six-eight. The Fifth, the Sextuple of Semi-croma, or Triple of 6 for 16, or Six-ſixteen. See TRIPLE.

SETHIANS, or SETHINIANS, a Branch of the Antient Gnoſticks; thus called, becauſe of their pretending to fetch their Origin from *Seth*, the Son of *Adam*, whom they called *Jeſus*, and *Chriſt*; from an Opinion, that *Seth* and *Jeſus* were the ſame Perſon, who came down from Heaven two ſeveral Times. As they had the ſame Philoſophy with the other Gnoſticks, they had numerous other Fables in their Syſtem. See GNOSTICKS. They pretended to have ſeveral Books of the Antient Patriarchs; particularly, Seven of their great Maſter *Seth*, and one of *Abraham*, full of manifeſt Falſities; which yet they call *Apocalypſe*, or *Revelation*. The Book called the *Little Geneſis*, anciently very common in the Churches of the Eaſt, was borrow'd from them. From this Book they learn'd the Name of *Seth*'s Wife, who, they ſay, was called *Horæa*. Some imagine, they borrowed a great many of their Fictions from the *Helleniſt Jews*.

SETON, *Setaceum*, in Chirurgery, *&c.* a Kind of topical Remedy, uſed, like a Cautery, or an Iſſue, to divert Defluxions from the Eyes; by making a Wound in the Skin of the Hind Part of the Neck, which is kept ſuppurating, by Means of a little Skain of Silk, or Cotton, paſſed through it. 'Tis alſo applied to ſuch as are apt to fall into Epileptic Fits: 'Tis of more Efficacy than a common Iſſue, but is preſcribed with much the ſame Intention. See ISSUE. The Operation is frequently practiſed on Horſes, *&c.* and called, by the Farriers, *Rowelling*: See ROWEL. *Setons* evacuate with a gentle Pain; ſhake the nervous Kind; evacuate *Serum*, and give Vent to Repletions.

SETTER, among Farmers. To *Setter*, is to cut the Dew-Lap of an Ox or Cow, and into the Wound to put Helleboraſter, whereby an Iſſue is made, for all Humours to vent themſelves. See ISSUE, and SETON.

SETTING, in Aſtronomy, the Occultation of a Star or Planet; or its ſinking below the Horizon. Aſtronomers make three different Kinds of *Setting* of the Stars: Coſmical, Acronical, and Heliacal. The Firſt, when the Star ſets with the Sun: See COSMICAL. The Second, when it ſets at the Time the Sun riſes: See ACRONICAL. The Third, when it is immerged, and hid, in the Sun's Rays: See HELIACAL.

To find the Times of the *Setting* of the Sun and Stars; See GLOBE.

SETTING, in Sea Language. To *ſet the Ship by the Compaſs*, is to obſerve how the Land bears on any Point of the Compaſs; or, on what Point of the Compaſs the Sun is: Alſo, when two Ships ſail in Sight of one another, to mark on what Point the Chaſed bears, is termed, *Setting the Chaſe by the Compaſs*.

SEVENTH, in Muſic, an Interval, called by the *Greeks Heptachordon*; whereof there are four Kinds: The Firſt, The defective *Seventh*, conſiſting of three Tones, and 3 greater Semi-tones. The Second, called by *Zarlin*, and the *Italians*, *Semi-ditano condiapente*, or *Settimo Minore*; is compoſed Diatonically of ſeven Degrees, and ſix Intervals, four whereof are Tones, and the reſt greater Semi-tones, as from *de* to *ut*; and Cromatically of ten Semi-tones, ſix whereof are greater, and four leſs: It takes its Form from the *Ratio Quadripartiens Quintas*, as 9 to 5. The Third, called by the *Italians*, *Il Ditono con Diapentes*, or *Settimo Maggiore*, is compoſed Diatonically, like the former, of ſeven Degrees, and ſix Intervals, ſix whereof are full Tones, and a ſingle one a greater Semi-tone; ſo that only one major Semi-tone is wanting of the Octave: As from *ut* to *ſi*, and Cromatically of twelve Semi-tones, ſix whereof are greater, and five leſſer. It takes its Form, or Origin, from the *Ratio* of 15 to 8. The Fourth, is the redundant *Seventh*, compoſed of five Tones, a greater Semi-tone, and a leſſer; as from *ſi b* to *la*: So that it only wants a Comma of an Octave; that is, ſo much as it wants to render its ſecond Semi-tone greater. Hence many confound it with the Octave itſelf; maintaining, with good Reaſon, That only the three firſt *Sevenths* can be of any Uſe.

SEVERAL-TAIL, in Law, is that whereby Land is given, and *Entailed ſeverally* to two. *E. gr.* Land is given to two Men and their Wives, and the Heirs of their Bodies begotten. The Donees, here, have joint Eſtate for their two Lives yet they have *ſeveral* Inheritance

tance; for the Iſſue of the one ſhall have his Moiety, and that of the other, the other.

SEVERANCE, in Law, the *Singling*, or *Severing*, two or more that joyn, or are joyn'd, in the ſame Writ. As if two join in a Writ, *De Libertate Probandâ*, and the one be afterwards Non-ſuited; here, *Severance* is permitted, ſo, as notwithſtanding the Non-ſuit of the one, the other may ſeverally proceed. There is alſo *Severance of the Tenants* in an Aſſize; when one, two, or more Diſſeiſins appear upon the Writ, and not the other. And *Severance in Debt*, where two Executors are named Plaintiffs, and the one refuſes to Proſecute. *Severance of Coin*; *Severance of Summons*; *Severance in Attaints*, &c.

SEVERIANS. There were Two Sects of Hereticks thus call'd: The Firſt, who are as old as the beginning of the Third Century, were a Branch of impure Gnoſticks; thus call'd from their Chief, *Severus*. The Second, were a Sect of *Acephali* or *Eutychians*. Their Leader, *Severus*, was preferred to the See of *Antioch* in 513, where he did his utmoſt to ſet aſide the Council of *Chalcedon*. See MONOTHELITES. *Hoffman* calls theſe laſt *Severites*.

SEWER, in the Houſhold, an Officer who comes in before the Meat of a King or Nobleman, to place and range it on the Table. The Word is form'd from the *French*, *Eſcuyer*, Eſquire, Gentleman or Uſher.

SEWERS, in Building, are Shores or Conduits, or Conveyances for the Suillage and Filth of a Houſe. Sir *Henry Wotton* adviſes, that Art imitate Nature in theſe Ignoble Conveyances, and ſeparate them from Sight, (where there wants a running Water) into the moſt remote, loweſt and thickeſt part of the Foundation, with ſecret Vents paſſing up through the Walls, to the wide Air, like Tunnels; which all the *Italian* Architects commend for the Diſcharge of noiſom Vapours, though elſewhere little practiſed.

SEX, ſomething in the Body, which diſtinguiſhes *Male* from *Female*. See MALE and FEMALE. The Number of Perſons, of the two Sexes, are exceedingly well balanc'd; ſo that every Man may have his Wife, and every Woman her Husband. See MARRIAGE. Hermaphrodites have both the *Sexes* in one. See HERMAPHRODITE. 'Tis expreſly forbid by the Law of *Moſes*, to diſguiſe the *Sex*.

SEXAGENARY; ſomething relating to the Number Sixty: Particularly, a Perſon arrived at the Age of Sixty Years. Some Caſuiſts diſpenſe with *Sexagenaries* for not Faſting. The *Papian* Law prohibits *Sexagenaries* from Marriage; becauſe, at that Age, the Blood and Humours are frozen. The Word is formed from the *Latin*, *Sexagenarius*.

SEXAGENARY TABLES, are Tables of proportional Parts, ſhewing the Product of Two *Sexagenaries*, or *Sexagena's*, that are to be multiplied; or the Quotient of Two, to be divided.

SEXAGESIMA, the Second *Sunday* before *Lent*, or the next to *Shrove-Sunday*: So called, as being about the Sixtieth Day before *Eaſter*. *Sexageſima* is that which follows *Septuageſima*, and preceding *Quinquageſima*. See SEPTUAGESIMA.

SEXAGESIMAL, or *Sexagenary Arithmetic*, a Method of Computation, proceeding by Sixties: As in the Diviſion of a Degree into 60 Minutes; of the Minute, into 60 Seconds; of the Second, into 60 Thirds, &c.

SEXAGESIMALS, are Fractions, whoſe Denominators proceed in a *Sexagecuple Ratio*; that is, the Firſt Minute $= \frac{1}{60}$, a Second $= \frac{1}{3600}$, a Third, $\frac{1}{216000}$. See DEGREE. Antiently there were no other than *Sexageſimals*, uſed in Aſtronomical Operations, and they are ſtill retained in many Caſes; though Decimal Arithmetick begins to grow in Uſe now in Aſtronomical Calculations. In theſe Fractions, (which ſome call Aſtronomicals) the Denominator is uſually omitted, and the Numerator only written down; thus, $4^{\circ}, 59', 32'', 50''', 16''''$, is to be read, 4 Degrees, 59 Minutes, 32 Seconds of a Degree, or 60th Part of a Minute, 50 Thirds, 16 Fourths, &c. See FRACTIONS.

SEXTANS: The *Romans* divided their As, which was a Pound of Braſs, into 12 Ounces: The Ounce was called *Uncia*, from *Unum*; and two Ounces *Sextans*, being the ſixth Part of the Pound. *Sextans* was alſo a Meaſure, which contained two Ounces of Liquor: Thus, *Sextantes*, *Calliſte*, *duos infunde Falerni*.

SEXTANT, in Mathematicks, is the Sixth Part of a Circle; or an Arch, comprehending 60 Degrees. *Sextant* is particularly uſed for an Aſtronomical Inſtrument, made like a Quadrant; excepting, that its Limb only comprehends 60 Degrees: The Uſe and Application of the *Sextant*, is the ſame with that of the Quadrant. See QUADRANT. In the Obſervatories of *Greenwich*, and *Pekin*, are very large and extraordinary *Sextants*. See OBSERVATORY.

SEXTARIUS, an ancient *Roman* Meaſure. See MEASURE.

SEXTILE, is the Poſition, or Aſpect, of the Planets, when at 60 Degrees diſtant; or at the Diſtance of two Signs from one another. It is marked thus (⚹).

SEXTON, A Church Officer, thus call'd by Corruption of *Sacriſtan*, *Sagerſon*, and *Sagiſtan*. His Office is to take Care of the Veſſels, Veſtments, &c. belonging to the Church; and to ſerve and aſſiſt the Miniſter, Church-Wardens, &c. at Church: He is uſually choſe by the Parſon only. The Office of *Sexton of the Pope's Chapel* is particularly affixed to the Order of the Hermits of Saint *Auguſtin*: He is generally a Biſhop, though ſometimes the Pope only gives a Biſhoprick, *in partibus*, to him he confers the Poſt on. He takes the Title of *Prefect of the Pope's Sacriſty*; has the keeping of the Veſſels of Gold and Silver, the Relicks, &c. When the Pope ſays Maſs, the *Sexton* always taſtes the Bread and Wine firſt. If it be in Private he ſays Maſs; his Holineſs, of two Wafers gives him one to eat; and if in Publick, the Cardinal, who aſſiſts the Pope in Quality of Deacon, of three Wafers, gives him two to eat. When the Pope dies, he adminiſters to him the Sacraments of Extreme Unction, &c. and enters the Conclave, in Quality of firſt Conclaviſt.

SEXTRY. See SACRISTY.

SEXTUS, *Sixth*, in the Canon Law, is a Collection of Decretals, made by Pope *Boniface* the VIIIth; uſually thus called from the Title, which is *Liber Sextus*; as if it were a Sixth Book added to the Five Books of Decretals, collected by *Gregory* IX. The *Sextus* is a Collection of Papal Conſtitutions, publiſhed after the Collection of *Gregory* IX. containing thoſe of the ſame *Gregory*, *Innocent* the IVth, *Alexander* the IVth, *Urban* the IVth, *Clement* the IVth, *Gregory* X. *Nicholas* III. and *Boniface* VIII. by whoſe Order the Compilation was made. The Perſons employ'd in making of it were *Will. de Mandegot*, Archbiſhop of *Ambrun*; and *Berenger* Biſhop of *Beziers*, and *Richard* of *Vienna*.

SGRAFIT, in Painting, a Term derived either from the *Italian Sgrafficiata*, Scratch-work, or the *Greek* γραφω; ſignifying a Method of Painting in Black and White only, not in Freſco, yet ſuch as will bear the Weather. *Sgrafit* is both the Deſign, and the Painting, all in one: 'Tis chiefly uſed, to embelliſh the Fronts of Palaces, and other magnificent Buildings. See SCRATCH-WORK.

SHACK, in our Cuſtoms, a Liberty of Winter-Paſturage. In the Counties of *Norfolk*, and *Suffolk*, the Lord of the Manor has *Shack*, *i. e.* A Liberty of feeding his Sheep at Pleaſure upon his Tenant's Lands, during the Six Winter Months. In *Norfolk*, *Shack* alſo extends to the Common for Hogs, in all Mens Grounds, from the End of Harveſt, till Seed-time: Whence, to go *a-Shack*, is to feed at large.

SHADOW, SHADE, a Plan where the Light is weakened by the Interpoſition of ſome opake Body before the Luminary. The *Shadow* of Yew, Cypreſs, and Wall-nut-tree, are held dangerous to Men: The *Shadow* of Aſh is deadly to Serpents; for which Reaſon Serpents are never found under its Shade. The Doctrine of *Shadows* makes a conſiderable Article in Opticks, and Geography, and is the Foundation of Dialling.

SHADOW, in Opticks, is a Privation of Light, by the Interpoſition of an opake Body. But as nothing is ſeen but by Light; a mere *Shadow* is inviſible. When therefore we ſay, We ſee a *Shadow*; 'tis partly, that we ſee Bodies placed in the *Shadow*, and illuminated by Light, reflected from collateral Bodies; and partly, that we ſee the Confines of the Light. See LIGHT.

If the opake Body, that projects the *Shadow*, be perpendicular to the Horizon, and the Place 'tis projected on, be Horizontal; the *Shadow* is called a *Right Shadow*: Such are the *Shadows* of Men, Trees, Buildings, Mountains, &c. If the opake Body be placed parallel to the Horizon, the *Shadow* is called a *Verſed Shadow*; as the Arms of a Man ſtretched out, &c.

Laws of the Projection of SHADOWS *from Opake Bodies.*

1°. Every opake Body projects a *Shadow* in the ſame Direction with its Rays; that is, towards the Part oppoſite to the Light. Hence, as either the Luminary, or the Body changes Place, the *Shadow* likewiſe changes.

2°. Every opake Body projects as many *Shadows*, as there are Luminaries to inlighten it.

3°. As the Light of the Luminary is more intenſe, the *Shadow* is the deeper. Hence the Intenſity of the *Shadow* is meaſured by the Degrees of Light that Space is deprived of.

4°. If a luminous Sphere be equal to an opake one it illumines; the *Shadow* this latter projects, will be a Cylinder; and, of Conſequence, will be propagated ſtill equal to it ſelf, to whatever Diſtance the Luminary is capable of acting: So that, if it be cut in any Place, the Plane of the Section will be a Circle equal to a great Circle of the opake Sphere.

5°. If the Luminous Sphere be greater than the opake one; the *Shadow* will be conical. If therefore the *Sha-*

dow be cut by a Plane parallel to the Baſe, the Plane of the Section will be a Circle, and that ſo much the leſs, as it is a greater Diſtance from the Baſe.

6°. If the Luminous Sphere be leſs than the opake one, the *Shadow* will be a truncated Cone: Conſequently, it grows ſtill wider and wider; and therefore, if cut by a Plane parallel to the Section, that Plane will be a Circle ſo much the greater as 'tis further from the Baſe.

7°. To find the Length of the *Shadow*, or the Axis of the Shady Cone, projected by a leſs opake Sphere, illumined by a larger; the Diameters of the Two, as C D, and I N; Tab. Opticks, Fig. 12. and the Diſtances between their Centers G M being given.

Draw F M parallel to C H; then will I M = C F; and therefore F G will be the Difference of the Semi-Diameters G C and I M. Conſequently, as F G, the Difference of the Semi-Diameters is to G M, the Diſtance of the Centers; ſo is C F, the Semi-Diameter of the opake Sphere, to M H, the Diſtance of the Vertex of the ſhady Cone, from the Centre of the opake Sphere. If then, the Ratio of P M to M H be very ſmall; ſo that M H and P H do not differ very notably, M H may be taken for the Axis of the *Shadow* Cone: Otherwiſe the Part P M muſt be ſubtracted from it; which to find, ſeek the Arch L K: For, this ſubtracted from a Quadrant, leaves the Arch I Q; which is the Meaſure of the Angle I M P. Since then, in the Triangle M I P, which is rectangular at P; beſides the Angle I M Q, we have the Side I M; the Side M P is eaſily found by plain Trigonometry.

E. gr. If the Semi-Diameter of the Earth M I = 1; the Semi-Diameter of the Sun, according to *Riccioli*, will be = 33; and therefore G F = 32; and of Conſequence M H = 228$\frac{1}{2}$: Since then, M P is found by Calculation to bear a very ſmall Ratio to M H; P H is found to be 288$\frac{1}{2}$ Semi-Diameters of the Earth.

Hence, as the Ratio of the Diſtance of the opake Body, from the Luminous Body G M; to the Length of the *Shadow* M H, is conſtant; if the Diſtance be diminiſhed, the Length of the *Shadow* muſt be diminiſhed likewiſe. Conſequently, the *Shadow* continually decreaſes as the opake Body approaches the Luminary.

8°. To find the Length of the *Shadow* projected by an opake Body, T S, Fig. 13, the Altitude of the Luminary; *E. gr.* of the Sun above the Horizon, *viz.* the Angle S V T, and that of the Body being given. Since, in the Rectangle Triangle S T V, we have given the Angle V, and the Side T S; the Length of the *Shadow* T V is had Trigonometry. See TRIANGLE.

Thus, Suppoſe the Altitude of the Sun 37° 40', and the Altitude of a Tower 187 Feet; T V will be found 241$\frac{1}{2}$ Feet.

9°. The Length of the *Shadow* T V, and the Height of the opake Body T S, being given; to find the Altitude of the Sun above the Horizon.

Since, in the Rectangle Triangle S T V, the Sides T V and T S, are given; the Angle V is found thus: As the Length of the *Shadow* T V, is to the Altitude of the opake Body T S, ſo is the whole Sine to the Tangent of the Sun's Altitude above the Horizon. Thus, if T S be 30 Foot, and T V 45'; T V S will be found 33°. 41'.

10°. If the Altitude of the Luminary, *E. gr.* The Sun above the Horizon T V S, be 45°. the Length of the *Shadow* T V is equal to the Height of the opake Body.

11°. The Lengths of the *Shadows* T Z and T V of the ſame opake Body T S, in different Altitudes of the Luminary, are as the Co-tangents of thoſe Altitudes.

Hence, as the Co-tangent of a greater Angle is leſs than that of a leſs Angle; as the Luminary riſes higher, the *Shadow* decreaſes: Whence it is, that the Meridian *Shadows* are longer in Winter than in Summer.

12o. To meaſure the Altitude of any Object, *E. gr.* A Tower A B, (Fig. 14.) by means of its *Shadow* projected on a Horizontal Plane.

At the Extremity of the *Shadow* of the Tower C, fix a Stick, and meaſure the Length of the *Shadow* A C; Fix another Stick in the Ground of a known Altitude D E, and meaſure the Length of the *Shadow* thereof E F. Then, as E F is to A C; ſo is D E to A B. If, therefore, A C be 45 Yards, and E D 5 Yards; A B will be 327 Yards.

13°. The *Shadows* of equal opake Bodies have their Length proportionable to their Diſtances from the ſame Luminaries equally high. Hence, as the Opake approaches to the Luminary; or the Luminary to the Opake Body, the Length of the *Shadow* is increaſed; and as either of them recedes, is diminiſhed. Hence, from the different Lengths of *Shadows* of the ſame opake Bodies at the ſame Height of the *Sun*, *Moon*, *Jupiter*, *Venus*, &c. we may gather their different Diſtances from the Earth; tho' not accurately enough for Aſtronomical Purpoſes. See DISTANCES.

14°. The *Right Shadow* is to the Height of the opake Body, as the Co-ſine of the Luminary, to the Sine.

15°. The Altitude of the Luminary being the ſame in both Caſes, the opake Body A C, (Fig. 15.) will be to the *verſed Shadow* A D, as the *right Shadow* E B, to its opake Body D B.

Hence, 1°. The opake Body is to its *verſed Shadow*, as the Co-ſine of the Altitude of the Luminary to its Sine; Conſequently, the verſed A D is to its opake Body A C, as the Sine of the Altitude of the Luminary to its Co-ſine. 2°. If D B = A C; then will D B be a mean Proportional between E B, and A D; that is, the Length of the opake Body is a mean Proportional between its *right Shadow* and *verſed Shadow*, under the ſame Altitude of the Luminary. —— 3°. When the Angle C is 45°; the Sine, and Co-ſine are equal; and therefore the *verſed Shadow* equal to the Length of the opake Body.

15°. A *right Sine* is to a *verſed Sine* of the ſame opake Body, under the ſame Altitude of the Luminary, in a Duplicate Ratio of the Co-ſine, to the Sine of the Altitude of the Luminary.

Right and *verſed Shadows*, are of conſiderable Uſe in Meaſuring; as by their Means we can commodiouſly enough meaſure Altitudes, both acceſſible and inacceſſible, and that too when the Body does not project any *Shadow*. The *right Shadows*, we uſe when the *Shadow* does not exceed the Altitude; and the *verſed Shadows*, when the *Shadow* is greater than the Altitude. On this Footing, is made an Inſtrument call'd the *Quadrat* or *Line of Shadows*, by means whereof the Ratios of the *right* and *verſed Shadow* of any Object, at any Altitude, are determined. This Inſtrument is uſually added on the Face of the Quadrant. Its Deſcription and Uſe, ſee under the Article QUADRAT.

SHADOW, in Geography. The Inhabitants of the Globe are divided, with Reſpect to their *Shadows*, into *Aſcii*, *Amphiſcii*, *Heteroſcii*, and *Periſcii*. The firſt are ſuch as at a certain Seaſon of the Year have no *Shadows* at all, while the Sun is in the Meridian. See ASCII. The ſecond are ſuch, whoſe Meridian *Shadow*, at one Seaſon of the Year looks to the North, and at another to the South. See AMPHISCII. The third are ſuch, whoſe *Shadows* conſtantly tend either to the North or South. See HETEROSCII. The laſt are thoſe, whoſe *Shadows*, in one and the ſame Day, ſucceſſively tend to all the Points. See PERISCII.

SHADOW, in Painting, an Imitation of a real *Shadow*, effected by gradually heightening, and darkening the Colours of ſuch Figures as by their Diſpoſitions cannot receive any direct Rays from the Luminary, ſuppoſed to enlighten the Piece. The Management of the *Shadows* and Lights, makes what the Painters call the *Clair obſcure*: The Laws whereof ſee under the Article CLAIR-OBSCURE.

SHADOW, in Perſpective. The Appearance of an opake Body, and a luminous one, whoſe Rays diverge, (*E. gr.* as Candle, Lamp, &c.) being given; To find the juſt Appearance of the *Shadow* according to the Laws of Perſpective: The Method is this. From the Luminous Body, which is here conſidered as a Point, let fall a Perpendicular to the Perſpective Plane or Table; *i. e.* Find the Appearance of a Point upon which a Perpendicular drawn from the Middle of the Luminary, falls on the Perſpective Plane; and from the ſeveral Angles, or rais'd Points of the Body let fall perpendicular to the Plane. Theſe Points whereon theſe Perpendiculars fall, connect by right Lines, with the Point upon which the Perpendicular let fall from the Luminary, falls. And continue the Lines to the Side oppoſite to the Luminary. Laſtly, thro' the raiſed Points, draw Lines thro' the Centre of the Luminary, interſecting the former; the Points of Interſection are the Terms or Bounds of the *Shadow*.

E. gr. Suppoſe it required to project the Appearance of the *Shadow* of a Priſm, A B C F E D (*Tab. Perſpective Fig.* 8.) Scenographically delineated: Since A D, B E, and C F, are perpendicular to the Plane, and L M is likewiſe perpendicular to the ſame; (for the Luminary is given, if its Altitude L M be given) Draw the right Lines G M and H M, thro' the Points D and E. Thro' the raiſed Points A and B, draw the right Line G L and H L, interſecting the former on G and H. Since the *Shadow* of the right Line A D terminates in G; and the *Shadow* of the right Line B E in H; and the *Shadows* of all the other right Lines conceived in the given Priſm are comprehended within theſe Terms; G D E M will be the Appearance of the *Shadow* projected by the Priſm.

SHAFT, in Building: the *Shaft of a Column*, is the Body thereof; thus call'd from its Streightneſs: but by Architects more frequently the *Fuſt*. See FUST. *Shaft*, is alſo uſed for the Spire of a Church Steeple. See SPIRE. And for the Tunnel of a Chimney. See CHIMNEY.

SHAFT *of a Mine*, is the hollow Entrance into a Mine, which is ſunk or dug to come at the Ore. In the Tin-Mines, after this is ſunk about a Fathom, they leave a little, long, ſquare Place, which is called a *Shamble*.

SHAGREEN. See CHAGREEN.

SHALLOP or SLOOP, is a ſmall light Veſſel, with only a ſmall Main-maſt, and Fore-maſt, and Lug-Sails, to hale up, and

and let down, on Occaſion: They are commonly good Sailers; and are often uſed as Tenders upon a Man of War.

SHAMADE. See CHAMADE.

SHAMOY, or SHAMMY. See CHAMOIS.

SHANKER, in Medicine, a malignant Ulcer, which gnaws and eats the Fleſh; uſually occaſioned by ſome Venereal Diſorder. See CARCINOMA.

SHARP, in Muſic, a kind of artificial Note or Character, (thus form'd ♯) which being prefix'd to a Note, ſhews that it is to be ſung or play'd a Semi-tone, or half a Note higher than the natural Note would have been without. When the Semi-tone takes the Name of the natural Note next above it, 'tis mark'd with a Character call'd a *Flat*. See FLAT. 'Tis indifferent, in the Main, which of the Two be uſed, tho' there are ſometimes particular Reaſons for the one rather than the other. See SEMITONE. The Uſe of *Flats* and *Sharps*, is by way of Remedy to the Deficiencies of the fixed *Scales* of Inſtruments. See SCALE.

SHARPING CORN, is a cuſtomary Preſent of Corn, which at every *Chriſtmas*, the Farmers, in ſome Parts of *England*, make to their Smith, for ſharpening their Plough-Irons, Harrow tines, &c.

SHEADING, is a Riding, Tything, or Diviſion in the *Iſle of Man*; the whole Iſland being divided into Six *Sheadings*, in every one of which, is a Coroner or chief Conſtable.

SHEATHING *of a Ship* is the caſing that Part of her Hull, which is to be under Water, with ſomething to keep the Worms from eating into her Planks. It is uſually done with laying Tar and Hair mix'd together all over the old Plank, and then nailing on thin new Boards: But this hinders a Ship's ſailing, and therefore of late ſome have been ſheathed with mill'd Lead, which is much ſmoother, and conſequently better for ſailing, and alſo more cheap and durable than the other Way. It was firſt Invented by Sir *Philip Howard*, and Major *Watſon*.

SHEERING, in the Woollen Manufactures, the *Sheerman's Craft* or Office; or the cutting off, with large *Sheers*, the too long and ſuperfluous Nap, or Shag found on the Surface of Worſted Stuffs, Fuſtians, Cottons, &c. in order to make them more ſmooth and even. Stuffs are *Shorn* more or fewer Times, according to their Quality and Fineneſs. See CLOTH.

Some uſe the Phraſe *Sheering of Hats*, for the paſſing of Hats made of Wooll, over the Flame of a clear Fire made of Straw, or Spray, to take off the long Hairs. Others call this *Flaming* and others *Singing*. Other Hats, as Caſtors, Semi caſtors, &c. are *Shorn*, by rubbing them over with Pumice-ſtone. See HAT.

SHEERING, is alſo the Sea Term for the Motion of a Ship, when ſhe is not ſteer'd ſteadily; in which caſe ſhe is ſaid to *Sheer* or go *Sheering*. When ſhe lies at Anchor, near Port, &c. by reaſon of the ſwift running of a Tide Gate, &c. ſhe is ſaid to be in danger of *Sheering home her Anchor*, or *Sheering a-ſhore*.— *Sheer-hooks*, are large Iron Hooks, uſed when a Ship deſigns to Board another.— *Sheer-ſhanks*, is a kind of Knot, by which they tie up and ſhorten a Runner when it is too long.

SHEKEL, an ancient *Hebrew* Coin, equal to Four *Attick Drachmas*, or Four *Roman Denarii*; amounting to 2 *s.* 6 *d. Sterling*. In the Bible, the *Shekel* is ſometimes alſo render'd *Solidus*, and ſometimes *Stater*. The *Jewiſh* Doctors are in great doubt of the Weight of the *Shekel*, and 'tis only by Conjecture, and by the Weight of the Modern *Shekel*, that the Ancient one is judg'd equal to Four *Attick Drachmas*. See BUDEUS. Father *Souciet*, has deſcribed ſeveral of theſe *Shekels*, in his Diſſertation on the *Hebrew* Medals. By the Way he obſerves, that the Third and Fourth Parts of a *Shekel*, deſcribed by *Waſerus de Ant. Num. Heb.* are Counterfeits of that Author.

The *Hebrew Shekel*, according to F. *Merſenne*, weighs 268 Grains, and is compoſed of 20 Oboli, each Obolus weighing 16 Grains of Wheat. This, he ſays, is the juſt Weight, as he found by Weighing one in the *French* King's Cabinet. He adds, that ſuch as come ſhort of this Weight, have been filed or clip'd. Biſhop *Cumberland* tells us, he has weigh'd ſeveral, and always found them near the Weight of a *Roman* Half-ounce. Some are of Opinion, that the *Hebrews* had two Kinds of *Shekels*. The Common, or Prophane *Shekel*, call'd *Didrachma*; and the *Shekel of the Sanctuary*, which laſt they will have double the former. By this Expedient they think we may get clear of ſome Difficulties occurring in Scripture, where Things are mentioned as of Incredible Weight; particularly that Paſſage where 'tis ſaid, That every Time *Abſalom* cut off his Hair, the Weight whereof uſed to incommode him; he cut off the Weight of 200 *Shekels*. But *Villalpandius* will not hear of it; nor does Biſhop *Cumberland*, *M. Morin*, &c. take the Opinion to have any Foundation. The Profane *Shekel*, or *Shekel* of Four *Drachmas*, they agree, was the ſame with the *Sacred Shekel*; and 'twas only ſo call'd, becauſe the Standard thereof was kept in the Sanctuary, by the Prieſts. 'Tis pretended by others, that the *Jews* had a Gold *Shekel* of the ſame Weight with the Silver one. The *Shekel* is ſuppoſed to have been firſt ſtruck in the Deſart, at the Rate of 100 to the *Attick* Mina, weighing 160 Grains of Wheat, and currant for 10 Gerahs or Oboli. But afterwards they were ſtruck of double that Weight. Some will have the *Shekel* the oldeſt Piece of Money in the World, as being in Uſe in *Abraham*'s Time; but this was not Coin'd, or Stamp'd; nor had any other Value beſides its Intrinſic Worth. See MONEY. *Xenophon* mentions *Shekels*, as current in *Arabia*: *Du Cange* ſays the ſame of *England* and *Germany*. The Word is form'd from a *Hebrew* Word, ſignifying *to Weigh*.

SHELF, is what the Miners (eſpecially in Tin Mines) call the *Faſt-Country*; by which they mean, an imaginary Surface of the Earth, which, at the Concuſſion of Waters at the Deluge, was never moved; and to the *Shelf*, they think, all the Loads or Mineral Veins at firſt lay even, and parallel; tho' after the Flood, ſome were elevated, ſome depreſſed. And by *Shelf* now, they mean that hard Surface or Coat of the Earth which lies under the Mould, uſually about a Foot deep; for they ſuppoſe, that ſince the Flood, the Earth hath gotten a new Coat of Vegetable Earth, or ſuch as is made by the Corruption of Vegetables and Animals. See DELUGE and STRATA.

SHELL, in Natural Hiſtory, a hard Cruſt, ſerving to cover and incloſe a kind of Animals, hence call'd *Teſtaceous*.

Naturaliſts have been generally miſtaken in the Manner of the Formation of *Shells*. The Animal and its *Shell* have been always ſuppoſed to ariſe from the ſame Egg. But M. *Reaumur* has ſhewn the Suppoſition to be falſe. He has found, by ſure Experiments, that the *Shells* of Garden Snails are form'd of a Matter which perſpires from their Bodies, and hardens and condenſes in the Air. 'Tis certain, that all Animals perſpire, and are encompaſs'd with a kind of Cloud or Atmoſphere, which exhales from them, and, in all Probability, aſſumes pretty nearly their external Figure. Snails have nothing peculiar in this reſpect; unleſs that the Atmoſphere of their Perſpiration, condenſes and hardens about them, and forms a viſible Cover, whereof the Body is the Mould or Model; whereas that of other Animals is evaporated and loſt in Air. This Difference ariſes from the different Subſtance perſpired; That coming from Snails, is viſcous and ſtony. This is no Suppoſition; but a Matter of Fact, which M. *Reaumur* has well proved by Experiments.

On this Principle, tho' the *Shell* ſerve the Animal as an univerſal Bone, yet it does not grow like a Bone, nor like any of the other Parts, by Vegetation; that is, by a Juice circulating within itſelf; but by an external Addition of Parts laid one over another; as is commonly ſuppoſed of Stones. But, to conſider the Thing more particularly; It is to be remembred, that the Snail's Head is always at the Aperture of the *Shell*, and its Tail in the Tip or Point of the *Shell*; and that its Body is naturally turn'd into a Spiral Form, the different Folds whereof are in different Planes. This ſuppoſed: Take the Snail juſt hatch'd; As the Matter it perſpires petrifies around it, there muſt be firſt form'd a little Cover, proportion'd to the Bigneſs of its Body; And as its Body is yet too little to make a Fold of a Spiral, at leaſt a whole Fold; this Cover will only be the Centre, or, at moſt, the firſt Beginning of a little Circle of a Spiral. But the Animal grows: If, then, it ceas'd to perſpire, 'tis evident, all that is added to its Body, would remain naked; but as it continues to perſpire, it makes itſelf a Cover in proportion as it needs it. Thus is an intire Fold of a Spiral found; and thus is a Second and a Third; and ſtill every new Fold is bigger than the laſt, in regard the Animal grows in Thickneſs, at the ſame Time as it grows in Length. When the Animal ceaſes to grow, yet it does not ceaſe to perſpire; Accordingly, the *Shell* continues to grow thicker, though not longer.

SHELLS make a conſiderable Article in the Cabinets of the Curious: The fineſt and rareſt are theſe that follow; *viz.* The *Papal Crown*, which takes its Name from its Form, and which is all ſtreak'd with Red on a White Ground. The *Feather*, *Pluma*, whoſe Whiteneſs, with its Carnation Stains, have an admirable Effect. The *Hebraica*, which, on a Ground as white as Snow, has Spots as black as Jet, much reſembling *Hebrew* Characters. The *Chineſe Snail*, which has a Green and Black Embroidery, on a dark Brown Ground. The *Cloth of Gold*, remarkable for an admirable Texture of Yellow, Brown and Black. The *Cloth of Silver*, which does not come behind that of Gold in Beauty. The *Leopard*, which is all ſpeckled. The *Tyger*, whoſe Spots exceed thoſe of the *Leopard*. The *Hart's-horn*, which has black Stains on a white Ground. The *Purſe*, thus call'd from its Figure; it is embroider'd with Three or Four Colours. The *Dial*: The *Caterpillar*, both denominated from their Forms. The *Nerites*, *White Nautilus*, *Lepaſia*, *Apperays*, *Tuba*, *Galea*, &c.

In *Aldrovand*, *Geſner* and *Fabius Columna*, we have all that the Ancients have ſaid on the Subject of *Shells*. In 1692, Dr. *Liſter* publiſh'd a Natural Hiſtory of *Shells*, in Folio, full of Cuts, repreſenting the various Kinds of *Shells*. Under the firſt Claſs, he ranges the Terreſtrial or Land *Shells*; In the Second, the Freſh-water *Shells*, both thoſe call'd *Turbinata*, and thoſe *Bivalvia*. In the Third he diſpoſes all the Sea *Shells*, the *Bivalvia* and *Multivalvia*; and in the Fourth, he divides, into ſeveral Claſſes, the Sea *Shells*, call'd *Turbinata*.

SHELLS are frequently found under the Ground, in Places far remote from the Sea, in Mines, and even in the Tops of Mountains: but how they ſhould come there, is a Thing the Naturaliſts are greatly divided about. The moſt uſual and eaſy Opinion is, That thoſe Parts have been formerly Sea, or at leaſt have been over-flown thereby; and many even go as high as the grand Deluge. See DELUGE. But others take theſe to be the natural Places of their Birth or Formation; ſome of them being found no other than raw Clay; others of the ſame Texture with the Rock whereto they grow; and others of as abſolute a *Shelly* Subſtance, as any in the Sea. In effect, theſe may be only ſo many different Gradations of Nature, which can as well produce *Shells* in Mines, as in the Sea; there being no want of Saline or Earthy Particles for the Purpoſe: nor is there any great Difference between ſome Sorts of *Spars*, and Sea *Shells*. See SPAR.

Dr. *Liſter* judges, that *Shells* found in Stone-Quarries, were never any Part of an Animal; and gives this Reaſon for it; That Quarries of different Stone, yield quite different Species of *Shells*; different not only from one another, but from any Thing in Nature beſides, which either Sea or Land does yield. See FOSSILE.

SHELL-FISH, a collective Name for all Fiſhes naturally incloſed in *Shells*. See TESTACEOUS. *Bonetus* obſerves, That *Shell Animals* have no Diverſity of Sex; that they lay no Eggs, as having no Blood; and that if they have any thing that appears analogous to Eggs, 'tis rather ſomething that ſerves for Nutrition, than for Generation.

SHERIF, or *Sherife*, or *Shire-reeve*, an Officer in each County of *England*, whoſe Buſineſs is to ſee to the Execution of the King's Orders, and all Writs directed to him out of the King's Courts; To impannel Juries; to bring Cauſes and Criminals to Tryal; to take Care of the Diſpatch of Affairs both Civil and Criminal; to collect the Revenues, Impoſts, Fines, Confiſcations, &c. ariſing in his County, for which he accounts to the Exchequer; and to attend and aſſiſt the itinerant Judges. The *Sherif* is, as it were, the Soul of the Policy of the County; and the Preſerver of the Peace thereof. His Office only laſts one Year. The *Sherif* was anciently thoſe by the People in the County Court, as Knights now are for Parliament; but he is now nominated by the King. In order to which, the itinerant Judges every Year nominate Six Perſons for each County; whereof, the Lord Chancellor, Treaſurer, Privy Council, &c. aſſembled in the Exchequer Chamber, make Choice of Three; out of which Number, the King chuſes One. Only the County of *Middleſex* has Two *Sherifs*; choſe, as anciently, by the Citizens of *London*: And *Durham*, *Weſtmoreland*, and *Cumberland*, none.

The *Sherif*, beſides his Miniſterial Office, of executing Proceſſes and Precepts of the Courts, and making Returns of the ſame; has a judicial Office, whereby he holds Two ſeveral Kinds of Courts; the one called the *Sherif's Turn*, held in divers Places of the County, to enquire of all Offences againſt Common Law not prohibited by any Statute. The other called the *County Court*, wherein he hears and determines all Civil Cauſes of the County, under Forty Shillings. See COURT, and TURN.

The Word is formed from the *Saxon*, *Scire Gereſa*, Prefect of a Town or County; or rather from *Scyrian*, to divide; the *Sherif* being denominated from the firſt Diviſion of the Kingdom into Counties. In *Latin* he is called *Vice-comes*.

SHIELD, an ancient Weapon of Defence, made in Manner of a light Buckler, and bore on the Arm to fend off Lances, Darts, &c. The Form of the *Shield* is repreſented by the Eſcutcheon in Coats of Arms. See BUCKLER.

SHIELD, in Heraldry, the Eſcutheon or Field whereon the Bearings of an Armory are placed. See ESCUTCHEON.

SHILLING, an *Engliſh* Silver Coin, equal to Twelve Pence, or the 20th Part of a Pound: See POUND and PENNY. 'Tis obſerv'd, there were no *Shillings* or Twelve-penny-Pieces coin'd in *England* till the Year 1504; and theſe, *Stow* calls *Groats*, though *Fabian* mentions them under the Name of *Shillings*, 34 *Hen.* VIII. The *Dutch*, *Flemiſh*, and *Germans* have likewiſe their *Shilling*; call'd *Schelin*, *Schilling*, *Schelling*, *Scalin*, &c. But theſe not being of the ſame Weight or Fineneſs with the *Engliſh Shilling*, are not Current on the ſame Foot. The *Engliſh Shilling* is worth about Fifteen *French* Sols: thoſe of *Holland* and *Germany* about Seven Sols and a Half, or Six Deniers. Thoſe of *Flanders* about Six. The *Dutch Shillings* are alſo call'd *Sols de Groſs*, becauſe equal to 12 Groſs. The *Danes* have Copper *Shillings*, worth about $\frac{1}{4}$ of a Farthing *Sterling*. *Freherus* derives the Word from a Corruption of *Siliqua*; proving the Derivation by ſeveral Texts of Law, and among others by the XXI. Law, *De Annuis legatis*. See COIN.

SHINGLES, in Building, ſmall Pieces of Wood, or quarter'd oaken Boards, ſaw'd to a certain Scantling; or more uſually cleft to about an Inch thick at one End, and made like Wedges, Four or Five Inches broad, and Eight or Nine Inches long. They are uſed in Covering, eſpecially Churches and Steeples, inſtead of Tiles, or Slates. This Covering is dear; yet where Tiles, &c. are very ſcarce, and a light Cover required, is preferable to Thatch. If made of good Oak, and cleft, not ſawed, and well ſeaſon'd, they make a ſure, light, and durable Covering. The Building is firſt to be cover'd all over with Boards, and the *Shingles* nail'd thereon. See COVERING.

SHINGLES, in Medicine, a kind of Herpes, call'd alſo the *Milliary Herpes*. It conſiſts of innumerable little Puſtules breaking out in various Parts of the Body, *viz.* the Neck, Breaſt, Loins, Thighs, &c. The Place affected is ſomewhat Inflamed, and the Patient a little Feveriſh. White Puſtules ariſe and ſuppurate, and are ſucceeded by little round Scabs reſembling Millet Seeds. It is to be attack'd with Diſcutients; and the higher Puſtules cut off with Sciſſars, and a Cerate of Oil and Wax to be applied. *Wiſeman* obſerves, the *Shingles* come near the Nature of a Pſora, and are therefore to be cured with Mercurial Catharticks.

SHIP, a general Name for all great Veſſels with Sails, fit for Navigation on the Sea; excepting Galleys, which go with Oars and Smack-Sails. See GALLEY. The Sieur *Aubin*, defines a Ship, A Timber-building, conſiſting of various Parts and Pieces, nail'd and pinn'd together with Iron and Wood, in ſuch Form as to be fit to float, and to be conducted by Wind and Sails, from Sea to Sea.

For the moſt convenient Form of SHIPS; *or that wherein they ſhall meet with the leaſt Reſiſtance from the Water*; *See* VESSEL.

The Invention of *Ships* is very Ancient, and, at the ſame time, very uncertain. The Mythologiſts attribute it to *Dedalus*; and pretend, that the Wings he invented to ſave himſelf withal from the Labyrinth of *Crete*, were nothing but Sails, which he firſt gave to Veſſels, and wherewith he eluded the Vigilance and Purſuit of *Minos*. Others gave the Honour to *Janus*; on the Credit of ſome ancient *Greek* and *Latin* Coins, on one Side whereof, is repreſented his double Face, and on the Reverſe a *Ship*. Laſtly, others, and thoſe who go on the beſt Grounds, look on *Noah* as the Firſt *Ship-builder*. See ARK; See alſo NAVIGATION.

SHIPS are uſually divided into Three Claſſes, *Ships* of War, Merchant *Ships*, and an intermediate Kind, half War, half Merchant; being ſuch, as, tho' built for Merchandiſe, yet take Commiſſions for War. *Ships* of War are again divided into ſeveral Orders, call'd *Rates*. See RATE. Merchant *Ships* are eſtimated by their Burthen, that is, by the Number of Tuns they bear, each Tun reckon'd at Two thouſand Pounds Weight. The Eſtimate is made by Gauging the Bottom of the Keel, which is the proper Place of Loading. See BURTHEN.

The moſt celebrated *Ships* of Antiquity are, that of *Ptolomy Philopater*, which was 280 Cubits long, 38 broad and 48 high. It carried 400 Rowers, 400 Sailors, and 3000 Soldiers. That he made to Sail on the *Nile*, we are told, was Half a Stadium long. Yet theſe were nothing in Compariſon with *Hiero's Ship*, built under the Direction of *Archimedes*; on the Structure whereof, *Moſchion*, as we are told by *Snellius*, wrote a whole Volume. There was Wood enough employ'd in it to make Fifty Gallies. It had all the Variety of Apartments of a Palace; Banqueting Rooms, Galleries, Gardens, Fiſh-ponds, Equerries, Mills, Baths, a Temple of *Venus*, &c. It was incompaſs'd with an Iron Rampart, Eight Tours, with Walls and Baſtions, furniſh'd with Machines of War; particularly one, which threw a Stone of 300 Pounds, or a Dart of 12 Cubits, the Space of Half a Mile; with many other Particulars related by *Athenæus*. Among Modern *Ships*, one of the moſt conſiderable is a Firſt Rate *Ship* of War, built at *Woolwich* in 1701; The Dimenſions whereof, whence thoſe of other Rates may be deduced, are as follow: The Length 210 Foot; Number of Guns 110: Number of Men 1250: Number of Tuns 2300: Draught of Water 22 Foot; the Main-ſail in Length 54 Yards, Depth 19: Main-maſt in Length 39 Foot; in Diameter 38 Inches: Weight of the Anchor 82 Hundred 1 Quarter 14 Pound: Cable in Length 200 Yards: Diameter of the Cable 22 Inches. The Expence of building a common Firſt Rate *Ship*, with Guns, Tackling and Rigging, is computed at 60000 *l. Sterling*. See NAVY, FREIGHT, CHARTER-PARTY, POLICY *of Aſſurance*, &c.

To give the Reader an Idea of the ſeveral Parts and Members of a Ship, both Internal and External, with their reſpective Denominations in the Sea Language (the Principal

A SHIP *of War, of the third Rate, With Rigging &c. at Anchor.*

Section *of a* SHIP *of War, of ye First Rate, Shewing ye Inside.*

Afore. — Midships — Abaft.

Fore Mast — Main Mast. — Mizzen Mast

whereof are explained in the reſpective Places of this *Dictionary*) we here give him Two Draughts; the one, a Section of the Body of a Firſt Rate, to ſhew its Conſtruction, the Diſpoſition of its Inſide, &c. The other, the ſame *Ship* entire, with the Sails, Rigging, &c.

SHIPPER, or *Scipper*, a *Dutch* Term, ſignifying the Maſter of a Ship. We alſo uſe the Word for any common Seamen.

SHIP-MONEY, an Impoſition anciently charged upon the Ports, Towns, Cities, Boroughs, and Counties of the Realm; by Writs commonly called *Ship-writs*, under the Great Seal of *England*. This Impoſition was revived by King *Charles* the Firſt, in the Years 1635 and 1636, for the providing and furniſhing certain *Ships* for the King's Service: But by Stat. 17 *Car.* I. it was declared to be contrary to the Laws and Statutes of the Realm, Claim of Right, Liberty of the Subject, &c.

SHIPWRACK. See WRECK.

SHIRE, (from the *Saxon Scir*, or *Scyre*, to divide) is a Part or Portion of the Land, call'd alſo *County*. See COUNTY. King *Alfred* firſt divided the Land into *Satrapias*, which we now call *Shires*, and thoſe into *Centurias*, which we now call *Hundreds*; ſee HUNDRED: And thoſe again into *Decanias*, which we call *Tythings*: See TYTHING. The antient *Latin* Word for *Shire*, was *Scyra*: The Aſſizes of the *Shire*, or Aſſembly of the People of a County, was call'd, by the *Saxons*, *Scirgemot*.

SHOAL, in the Sea Phraſe, is the ſame as *Shallow*, and is uſed for Flats in the Water: They ſay, It is good *Shoaling*, when a Ship ſailing towards Shore, they find by her Sounding, it grows ſhallower and ſhallower by degrees, and not too ſuddenly; for then the Ship goes in Safety. It is alſo uſed for a Company of Fiſh.

SHOALED, is the Miner's Term in the Tin Mines, for ſuch Fragments of Ore, which by Rains, Currents of Water, &c. are torn off from the Load or Veins of Ore. They are waſh'd down from the Mountains, and by finding of them, they gueſs where to look for a Load of Ore. Sometimes it is called *Squad*, and *Squod*.

SHOARS, Props, or Counterforts, ſet up to ſupport any Thing of Weight, which leans on one Side. See BUTTRESS.

SHOE, a Covering of Leather for the Foot: Its Structure, though the Object of a particular Art, is too popular to need explaining: (See CORD-WAINER). Its Hiſtory is more obſcure. *Bened. Baudoin*, a Shoe-maker, has an expreſs Treatiſe of the *Antient Shoes*; *De Solea Veterum*: Where the Origine, Matter, Form, &c. thereof, are particularly inquired into.

Baudoin maintains, that God, in giving *Adam* Skins of Beaſts to cloath him, did not leave him to go bare-footed; but gave him *Shoes* of the ſame Matter. That after raw Skins, Men came to make their *Shoes* of Ruſhes, Broom, Paper, Line, Silk, Wood, Iron, Silver, Gold; ſo different has their Matter been; nor was their Form more ſtable, with regard either to the Shape, Colour, or Ornaments. They have been ſquare, high, low, long, and quite even, cut, carved, &c. *Pliny*, *Lib.* 7. *c.* 56. tells us, That one *Tibus* of *Bœotia* was the firſt who uſed *Shoes*. M. *Nilant*, in his Remarks on *Baudoin*, obſerves, That he quotes *Xenophon* to little Purpoſe, to ſhew, that even in his Time they ſtill wore *Shoes* of raw Skins. *Xenophon* relates, That the Ten Thouſand *Greeks*, who had follow'd the young *Cyrus*, wanting *Shoes*, in their Retreat, were forced to cover their Feet with raw Skins, which occaſioned them great Inconveniencies. He will not even allow, that the *Shoes* of the Country People, call'd *Carbatinæ*, and *Peroneæ*, were of crude Skin, without any Preparation. The Patricians among the *Romans*, wore an Ivory Creſcent on their *Shoes*. *Heliogabalus* had his *Shoes* covered over with a very white Linnen; in Conformity to the Prieſts of the Sun, for whom he profeſſed a very high Veneration. This kind of *Shoe* was called ὐδλὸν, *Udo*, or *Odo*. *Caligula* wore *Shoes* enrich'd with precious Stones. The *Indians*, like the *Egyptians*, wore *Shoes* made of the Bark of the Papyrus. The *Turks* put off their *Shoes*, and leave them at the Doors of the *Moſques*.

SHOOTING, } See { GUNNERY and PROJECTILE.
SHOOTING of Bombs, } See { BOMB.
SHOOTING by the Air, } See { WIND-GUN.

SHOP-LIFTER, a Perſon, who cheapening Wares, on Pretence of Buying, takes the Opportunity of ſtealing them.

SHORE, or *Common-Sewer*, a Corruption of *Sewer*. See SEWERS and CLOACA.

SHORT ACCENT, in *Grammar*, a Mark which ſhews, that the Time of pronouncing, ought to be ſhort; It is wrote thus (˘). See ACCENT.

SHORT-SAILS, in a Man of War, are the ſame with the *Fighting Sails*; being the *Fore-ſail*, *Main-ſail*, and *Foretop-ſail*, which are all that are uſed in Fight, leſt the reſt ſhould be fired, and ſpoiled; beſides the Trouble of managing them when a Ship gives Chaſe to another. If the Chaſe have a Mind to fight, they ſay, The Chaſe *ſtrips into her* Short-Sails, *i. e.* puts out her Colours in the Poop, her Flag at the Main-top, and her Streamers, or Pendants, at the Yard's Arms; Furls her *Sprit-ſail*, Peeks her Mizzen, and ſlings her Main-Yard.

SHORT-SIGHTEDNESS, a Fault in the Conformation of the Eye, wherein the Cryſtallin, &c. being too Convex, the Rays reflected from diſtant Objects are refracted too much, and made to converge too ſaſt, ſo as to unite e'er they reach the *Retina*; by which Means the Viſion is render'd dim and confus'd. See MYOPIA.

The ordinary Remedy, for *Short-ſightedneſs*, is a Concave Lens, held before the Eye; which making the Rays diverge, or at leaſt, diminiſhing much of their Convergency, makes Amends for the too great Convexity of the Cryſtallin. See LENS.

Dr. *Hook* ſuggeſts another Remedy. Finding, that many *Short-ſighted* Perſons are but little helped by Concaves; he recommends a Convex Glaſs, placed between the Image and the Eye; by Means whereof the Object may be made to appear at any Diſtance from the Eye, and conſequently, all Objects may be thereby made to appear at any required Diſtance from the Eye; ſo that the *Short-ſighted* Eye ſhall contemplate the Picture of the Object, in the ſame Manner, as if the Object it ſelf were in the Place. 'Tis true, the Image will appear inverted; but we have Expedients to remedy this too: For, in Reading, there needs nothing but to hold the Book upſide down. To write, the beſt will be for the Perſon to learn to read upſide down. For diſtant Objects, the Doctor aſſerts, from his own Experience, that, with a little Practice in contemplating inverted Objects, one gets as good an Idea of them, as if ſeen in their natural Poſture.

SHOT, for Ordnance, are of ſeveral Sorts; as *Round-ſhot*, or Bullets fitted to the Bore of the Piece. *Croſs-bar-ſhot*, Round-ſhot, with a long Spike of Iron caſt in it, as if it went through the Middle of it. *Trundle-ſhot*, being only a Bolt of Iron, 16 or 18 Inches long, ſharp-pointed at both Ends, and about an Hand's-breadth from each End, having a round broad Bowl of Lead caſt upon it, according to the Bore of the Piece. *Langrel-ſhot*, which runs looſe with a Shackle, to be ſhortened, when put into the Piece, and when it flies out it ſpreads it ſelf; at each End of the Bar, it hath half a Bullet, either of Lead or Iron. *Chain-ſhot*, is two Bullets, with a Chain betwixt them; ſome being contrived round, yet ſo, that they will ſpread in flying their full Length and Breadth. *Caſe-ſhot*, is any thing of ſmall Bullets, Nails, old Iron, and the like, to put into the Caſe, to ſhoot out of Ordnance.

SHOT, for Fowling. The Method of Caſting it is as follows. The Lead being melted, ſtirr'd, and skimm'd, a Quantity of powder'd yellow Orpiment is ſtrew'd in it; as much as will lie on a Shilling, to 12 or 15 Pounds of Lead. The Whole being well ſtirr'd, the Orpiment will flame. To judge whether there be Orpiment enough in, a little of the Lead is dropped into a Glaſs of Water, and if the Drops prove round, and without Tails, there is Orpiment enough, and the Degree of Heat is as it ſhould be. This done, a Copper Plate, Hollow in the Middle, and Three Inches in Diameter, bored through, with 30 or 40 ſmall Holes, according to the Size of the Shot, is placed on an Iron Frame, over a Tub of Water, four Inches above the Water: The Hollow Part is to be very thin. On this Plate are laid burning Coals, to keep the melted Lead in Fuſion. The Lead is now poured gently, with a Ladle, in the Middle of the Plate, and it will make its Way through the Holes in the Bottom of the Plate into the Water, in round Drops. Great Care is taken to keep the Lead on the Plate in its proper Degree of Heat: If too cold, it will ſtop the Holes; and if too hot, the Drops will crack and fly. The *Shot*, thus made, are dried over a gentle Fire, always ſtirring them that they do not melt: This done, the greater are ſeparated from the ſmaller, by paſſing them through Sieves for that Purpoſe.

SHOT-FLAGON, a *Flagon* ſomewhat bigger than ordinary; which in ſome Counties, particularly *Derbyſhire*, it is the Cuſtom for the Hoſt to ſerve his Gueſts in, after they have drank above a Shilling.

SHOULDER, among Farriers. *Shoulder-pitcht*, is a Diſeaſe in a Horſe, when the Pitch or Point of the Shoulder is diſplaced; which makes the Horſe halt downright.—*Shoulder-ſplaiting*, or *Shoulder torn*, is a Hurt which befals a Horſe by ſome dangerous Slip, by which the *Shoulder* is parted form the Breaſt.

SHOULDER-BLADE, a Bone of the *Shoulder*, of a Triangular Figure, covering the Hind-part of the Ribs; call'd by the Anatomiſts *Scapula* and *Omoplata*. See SCAPULA.

SHOULDER-BONE. See HUMERUS.

SHOULDERING, in Fortification, is a Retrenchment, oppoſed to the Enemies; or a Work caſt up for a Defence on one Side: whether made of Heaps of Earth caſt up, or of Gabions, and Faſcines. A *Shouldring* alſo is a Square Orillon, ſometimes made in the Baſtions, on the Flank near the *Shoulder*, to cover the Cannon of a Caſement. It is alſo taken for a Demi-Baſtion, or Work, conſiſting of one Face, and one Flank, which ends in a Point, at the Head of an Horn-work, or Crown-work: Neither is it to be underſtood only of a ſmall Flank added to the Sides of the Horn-work to defend them, when they are too long; but alſo of the Redents which are raiſed on a ſtreight Line.

SHOULDERING-PIECE, in Building. See BRACKET.

SHOULDER-WRENCH is a Strain in the *Shoulder*.

SHOWER, a Cloud reſolved into Rain, and diſcharged on a certain Tract of Ground. See RAIN.

In Natural Hiſtory we meet with abundance of Inſtances of extraordinary and præternatural *Showers*: As, *Showers of Blood*, mention'd by *Gaſſendus*, and others; A *Brimſtone Shower*, mentioned by *Wormius*; *Showers of Frogs*, mentioned by *Pliny*, and even Dr. *Plot*; A *Shower of Millet-Seed*, in *Sileſia*, mentioned in the *Ephem. German. An.* 3°. *Showers of Aſhes*, frequent in the *Archipelago*. A *Shower of Wheat*, in *Wiltſhire*. *A Shower of Whitings*, mention'd in the *Philoſ. Tranſact.* The natural Reaſons of many whereof may be ſeen under the Article RAIN.

SHRINE, a Caſe to hold the Relicks of ſome Saint: See RELICKS. The Word is formed from the *Latin Scrinium*, a *Desk* or *Cabinet*.

SHROVE-TIDE, the Time immediately before *Lent*; thus call'd by our Anceſtors, becauſe employed in *Shriving*, that is, in confeſſing their Sins to the Prieſt; in order to a more devout keeping the enſuing *Lent* Faſt.——*Shrove Tueſday* is the Day next before the firſt of *Lent*.

SHROWDING *of Trees*, the cutting or lopping off the Top-Branches thereof; which is only practiſed to Trees that are not fit for Timber, but deſigned for Fuel, or ſome other preſent Uſe. Such Trees the Husbandmen find much preferable to Copſe; as they need no Fence to ſecure them, becauſe ſtanding in no Danger of the Browzings and Rubbings of Cattle, which too, have the Benefit of Grazing under them.——For the Time of *Shrowding*, 'tis not to be practiſed till the Trees have ſtood three or four Years; either at the Beginning of the Spring, or the End of the Fall. The harder ſort not to be lopped above once in ten or twelve Years, and that at any Time in the Winter. The pithy and ſofter Woods are beſt *ſhrowded* in the Spring. The Stumps left, ſhould always be cut aſlope, and ſmooth, in order to caſt the Water off; and prevent its ſinking in, and rotting the Tree.

SHROWDS, are great Ropes in a Ship, which come from either Sides of all Maſts: They are faſtened below by Chains to the Ship's Sides, and aloft, over the Head of the Maſt; their Pendants, Fore-tackle, and Swifters, being firſt put under them. They are alſo ſewed there, to prevent their galling the Maſt. The Top-maſt *Shrowds* are faſtened to the Puttocks, by Plates of Iron, and by Dead-Mens-Eyes, and Lanniers alſo, as the others are: The Terms are, *Eaſe the Shrowds*; that is, Slacken them: *Set taught the Shrowds*; that is, Set them faſter: The Bolt-Sprit hath no *Shrowds*.

SHRUB, a little low Tree, or Dwarf; or a Woody Plant, of a Size leſs than a Tree; which, beſides its principal Stem, and Branches, frequently, from the ſame Root, puts forth ſeveral other conſiderable Sets or Stems: Such are *Privet*, *Phillyrea*, &c. Shrubs and Trees put forth in *Autumn*, a kind of Buttons, or Gems, in the Axes of the Leaves: Theſe Buttons are as ſo many little Eggs, which coming to expand by the Warmth of the following Spring, open into Leaves, and Flowers. By this, together with the Heighth, ſome diſtinguiſh *Shrubs* from *under Shrubs*; which are low Buſhes, that do not put forth any of theſe Buttons; as Roſemary, Thyme, &c.

SHUTTLE, in the Manufactures, a kind of Inſtrument uſed by the Weavers, which, with a Thread it contains either of Wooll, Silk, Line, or other Matter, ſerves to form the Woof of their Stuffs, Linnens, Ribbands, &c. by throwing the *Shuttle* alternately from Left to Right, and from Right to Left, a-croſs; between the Threads of the Warp, which are ſtretched out lengthwiſe on the Loom. In the Middle of the *Shuttle* is a Kind of Cavity, called *the Eye* or *Chamber* of the *Shuttle*, wherein is incloſed the Spoul, which is a Part of the Thread deſtined for the Woof; and is wound on a little Tube of Paper, Ruſh, or other Matter.

The Ribband-Weaver's *Shuttle* is very different from that of moſt other Weavers, though it ſerve for the ſame Purpoſe: 'Tis of Box, ſix or ſeven Inches long, one broad, and as much deep: Shod with Iron at both Ends, which terminate in Points, and are a little crooked, the one towards the Right, and the other towards the Left, repreſenting the Figure of an ∽ horizontally placed.

SI, in Muſic, a Seventh Note, added within this Sixty Years, by one *le Maire*, to the Six ancient Notes; invented by *Guido Aretin*, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*; by Means whereof, the Embarraſs of the ancient Gamut is avoided. So buſy a Thing is Jealouſy, that, for a matter of Thirty Years, that *le Maire* kept preaching to the Muſicians of his Time, in Behalf of the new Note; not a Man would allow it: But he was no ſooner dead, than all the World came into it. See NOTE.

SIBYLS, SIBYLLÆ, in Antiquity, Virgin Propheteſſes, or Maids ſuppoſed to be divinely inſpired; and who, in the Height of their Enthuſiaſm, gave Oracles, and foretold Things to come. See PROPHESY. The Word is ſuppoſed formed of an Aſſemblage of the Two *Greek* Words, Σειω, to agitate, and Βυλλω, full, by Reaſon of the exceſſive Fury they were agitated withal, when they delivered their Oracles. Authors do not agree about the Number of the *Sibyls*. *Capella* reckons but Two, *viz. Europhile* of *Troy*, called *Sibylla Phrygia*, and *Sinuachia* of *Eritbræa*, called, *Sibylla Erithræa*. *Solinus* mentions Three, *viz. Cumea*, *Delphica*, and *Erithræa*. *Ælian* makes their Number Four; and *Varro* increaſes it to Ten, denominating them from the Places of their Birth; the *Perſian*, *Lybian*, *Delphic*, Two *Cumeans*, *Erithræan*, *Samian*, *Helleſpontic* or *Trojan*, *Phrygian*, and *Tiburtin*. Of theſe, the moſt celebrated are, the *Erithræan*, *Delphic*, and *Cumean Sibyls*. See ORACLE.

The *Sibylline-Oracles*, were held in great Veneration by the more credulous among the Antients; but were much ſuſpected by many of the more knowing. The Books wherein they were written, were kept by the *Romans* with infinite Care, and nothing of Moment undertaken without conſulting them. *Tarquin* firſt committed them to the Cuſtody of Two Patrician Prieſts, inſtituted for that Purpoſe.

SICILIAN, in Muſic, &c. a Kind of gay ſprightly Air, or Dance; ſomewhat of the Nature of an *Engliſh* Jig: uſually marked with the Characters $\frac{6}{8}$ or $\frac{12}{8}$.

SICKNESS, *Green*-SICKNESS, *Sweating*-SICKNESS, *Falling*-SICKNESS, } See { DISEASE. CHLOROSIS. SUDOR ANGLICANUS. EPILEPSY.

SICUT ALIAS, a Writ ſent out in the Second Place, where the firſt was not executed. It is thus called from its Beginning, which is in this Form: *Georgius D. G.* &c. *Vicecomiti Heref. Salutem. Præcipimus tibi* (Sicut Alias) *præcepimus quod non omittas*, &c.

SIDE, *Latus*, in Geometry. The *Side of* a *Figure*, is a Line making Part of the Periphery of any Superficial Figure. See FIGURE. In Triangles, the *Sides* are alſo called *Legs*. In a Rectangle Triangle, the Two *Sides*, including the right Angle, are called *Catheti*; and the Third the *Hypothenuſe*. See CATHETUS and HYPOTHENUSE.

SIDE *of a Polygonal Number*, is the Number of the Terms of the Arithmetical Progreſſion, that are ſummed up. See POLYGONAL *Number*.

SIDE *of a Power*, is what we otherwiſe call the *Root*, or *Radix*. See ROOT.

Right SIDE, *Tranſverſe* SIDE, } See { LATUS *Rectum*. LATUS *Tranſverſum*.

SIDE-LAYS, is a Term made Uſe of by Huntſmen, when Dogs are ſet in the Way, to be let ſlip at a Deer, as he paſſes by.

SIDERATION, in Chirurgery, a Mortification of ſome Part of the Body; called alſo *Sphacelus* and *Necroſis*; which ſee.

SIDERATION, the blaſting or blighting of Trees, Plants, &c. by Eaſtern Winds, exceſſive Heat, Draught, or the like. See BLIGHT.

SIDERATION, is alſo uſed for a being ſuddenly benumb'd, and deprived of the Uſe of one's Limbs, Senſes, &c. which the People call being *Planet-ſtruck*.

SIDERIAL YEAR. See YEAR.

SIDERITES, a Name ſome Authors gives the Load-ſtone. See MAGNET.

SIDES *of Hornworks*, &c. in Fortification, are the Ramparts and Breaſt-works, which incloſe them on the Right and Left from the Gorge to the Head.

SIDES-MEN, properly called *Synods-Men*, or *Queſt-Men*, Perſons, who in larger Pariſhes are appointed to aſſiſt the Church-Wardens, in enquiring into the Manners of inordinate Livers, and in preſenting Offenders at Viſitations.

SIEGE, in War, the Incampment of an Army around a Place, with Deſign to take it, either in the Way of Diſtreſs and Famine; or by making Lines all around it, to prevent any Relief from without; or by main Force, as by digging Trenches, and making formal Attacks. The moſt celebrated

celebrated *Sieges* of Antiquity, are thoſe of *Troy*, *Tyre*, *Alexandria*, *Numantium*, &c. Thoſe of the Moderns are that of *Oſtend*, *Candia*, *Graves*, &c. The Word is *French*, and ſignifies, literally, *Seat*.

SIERRA, a *Spaniſh* Term ſignifying *Mountain*; applied to Mountains, and Mountainous Countries.

SIEVE, or *Search*, an Inſtrument ſerving to ſeparate the Fine from the Coarſe Parts of Powders, Liquors, &c. or to cleanſe the Pulſe from Duſt, light Grains, &c. 'Tis made of a Rim of Wood; the Circle, or Space whereof is filled with a Tiſſue of Silk, Tiffany, Hair, Line, Wire, or even thin Slices of Wood. The *Sieves* which have large Holes, are uſually called *Riddles*; ſuch is the *Coal* or *Lime Sieve*, *Garden Sieve*, &c. When Drugs, apt to evaporate, are to be paſſed thro' the *Sieve*, 'tis uſual to have it covered with a Lid.

SIEUR, a Kind of Title of Honour, or Quality among the *French*; chiefly uſed among the Lawyers, and in publick Acts and other Writings of that Kind: As I plead for the *Sieur* Marquis, &c. The Title *Sieur* is properly given by a Superior to an Inferior, in his Letters, and other particular Writings: As, Tell the *Sieur* ſuch a one, that he proceed, &c. In this Senſe, Authors ſometimes uſe it, by Way of Modeſty, in ſpeaking of themſelves. Thus, at the Heads of Books, we ſee, *Traduction du Sieur d' Ablancourt*, *OEuvres du Sieur d' Deſpreaux*, &c.

SIEUR, is alſo a Term expreſſing *Seigneury* or Lordſhip: As *Ecuyer* or *Sieur* of ſuch a Place.

SIGHT, the Exerciſe, or Action of the Senſe of Seeing. See SEEING.

Our *Sight*, the nobleſt and moſt uſeful of all our Senſes, Father *Mallebranch* ſhews, deceives us in abundance of Inſtances; Nay, almoſt in all: Particularly with Regard to the Magnitude, and Extent of Things; their Figures, Motions, &c. Our Eyes do not ſhew us any Thing leſs than a Mite: Half a Mite is nothing, if we believe their Report. A Mite is only a Mathematical Point, with Regard thereto; and we cannot divide it without annihilating it. In effect, our *Sight* does not repreſent Extenſion, ſuch as it is in it ſelf; but only the Relation and Proportion it has to our Body. Hence, as Half a Mite has no Relation to our Bodies, and that it cannot either preſerve or deſtroy, our *Sight* hides it intirely. Were our Eyes made like Microſcopes, or were we our ſelves as ſmall as Mites, we ſhould judge very differently of the Magnitude of Bodies. It may be added, That our own Eyes are really no other than a kind of natural Spectacles; that their Humours do the ſame Office as the Lens's in Spectacles; and that, according to the Figure of the Cryſtallin, and its Diſtance from the Retina, Objects are ſeen very differently; inſomuch, as we are not ſure, that there are any Two Perſons in the World, who ſee them equally big. 'Tis even very rare, that the ſame Perſon ſees the ſame Object equally big with both Eyes; as both Eyes are very ſeldom perfectly alike: on the contrary, we generally ſee Things bigger with the left than the right Eye; Of which we have ſome very good Obſervations in the Journal of the Learned at *Rome*, for the Year 1669. See VISION.

Short-SIGHT, *Second* SIGHT, *Point of* SIGHT, } See { MYOPIA, SECOND *Sight*. VIEW.

SIGHTS, in Mathematicks, are Two thin Pieces of Braſs raiſed perpendicularly on the Two Extremes of an Alidade or Index of a Theodolite, Circumferentor, or other like Inſtrument: Each whereof has an Aperture or Slit up the Middle, thro' which the uſual Rays paſs to the Eye, and diſtant Objects are ſeen. Their Uſe is for the juſt Direction of the Index to the Line of the Object. See TELESCOPE, CIRCUMFERENTOR, ALIDADE, &c.

Plain SIGHT, *Teleſcopic*-SIGHTS, } See { SIGHTS. TELESCOPIC SIGHTS.

Mr. *Flamſtead* and Dr. *Hook*, abſolutely explode the Uſe of *Plain Sights* in Aſtronomical Obſervations. The Errors in *Tycho*'s Latitudes of the Stars, Mr. *Flamſtead* aſcribes wholly to his uſing *Plain Sights*; and ſuſpects, that *Hevelius* uſing the ſame Kind of *Sights*, will fall into the like Errors. *Hevelius*, on the contrary, in a Paper in the *Philoſophical Tranſactions*, vindicates the Uſe of *Plain Sights*, and prefers them to *Teleſcopic* ones. The main Objection he makes to the latter, is, That no Obſervation can be ſafely taken with them, without firſt examining and rectifying them: In which Examination, many and groſs Miſtakes are liable to be committed. To which he adds, That in Sextants, Octants, Azimuth Quadrants, &c. he does not ſee how ſuch Examination can be made, at all times, without much Loſs of Time.

SIGILLARIA, a ſolemn Feaſt held among the ancient *Romans*; thus called from a Cuſtom which obtained therein, of ſending little Preſents from one to another; conſiſting of Seals, little Gravings, Sculptures, &c. The *Sigillaria* followed immediately after the *Saturnalia*, and held Four Days; which, with the Three Days of the *Saturnalia*, made a Solemnity of Seven Days. The Inſtitution of the *Sigillaria* is referred, by ſome, to *Hercules*; who, upon his Return from *Spain*, after killing *Geryon*, led his Flocks into *Italy*, where he built a Bridge over the *Tiber*, at a Place, where was ſince the *Pons Sublicius* in *Rome*. Others aſcribe it to the *Pelagian*; who conceiving, that by the Words *Head* and *φώς*, the Oracle did not require living Men to be ſacrificed to it, but Statues, or Figures of Men by the Firſt, and Lights by the Second; began to offer Torches to *Saturn*, and human Figures to *Pluto*.

SIGILLATA TERRA, a Kind of Earth or Clay, dug in the Iſle of *Lemnos*, thence alſo called *Lemnian* Earth; of conſiderable Uſe in Painting, and Medicine. 'Tis of different Colours, but moſt commonly Red; heavy, ſoft, and friable; held very aſtringent, and, as ſuch, uſed in Hæmorrhages; as alſo againſt the Plague and Poiſons. *Pliny* attributes ſeveral other Virtues, which Experience does not juſtify; nor is it in that Eſteem it anciently was; yet is ſtill an Ingredient in Treacle. 'Twas anciently found in a Mountain, in the Neighbourhood of the City *Hephæſtia*; where *Diana*'s Prieſts went at certain Times, with great Ceremony, to dig it up. After a little Preparation, they made it up into Troches, and ſeal'd them with *Diana*'s Seal; whence the Appellation of *Sigillata*, *Seal'd*. 'Tis now brought from *Conſtantinople* in little Cakes orbicular, on one Side flat, on the other ſealed. See TERRA.

SIGILLUM, a *Seal* or *Signet*. See SEAL and SIGNET.

SIGN, a ſenſible Mark or Character, denoting ſomething abſent, or inviſible. See CHARACTER and MARK. Antiently, the Monks, in all Religious Houſes, were not allowed to ſpeak; nor to expreſs their Minds otherwiſe than by *Signs*, which they learned in their Novitiate. *C. Rhodiginus* and *Porta* have wrote of the ancient *Signs* and Cyphers uſed in Speaking and Writing.

SIGN, in Medicine, ſome Appearance in the Body, diſtinguiſhable by the Senſes: Whence, by juſt Reaſoning, is inferred the Preſence, Nature, State, Event, of Health, a Diſeaſe, or Death. Thoſe which denote the preſent Condition of a Body, whether ſick or well, dying or the like, are called *Diagnoſtic Signs*. See DIAGNOSTIC. Thoſe which foretel the future State thereof, are called *Prognoſtic Signs*. See PROGNOSTIC. That *Sign* which is proper to the Diſeaſe, and inſeparable from it, as ariſing from the Nature thereof, is called a *Pathognomic Sign*. See PATHOGNOMIC. As all theſe are Effects produced by the Cauſe of the Diſeaſe, the Diſeaſe it ſelf, and its Symptoms; they uſually note the preſent Condition of the Matter which firſt produced the Diſeaſe, and even of that produced by the Diſeaſe: On which Footing, the *Signs* are all reducible to theſe Three Claſſes, *viz.* *Signs* of the Crudity and Digeſtion of the Diſeaſe; of its Event, whether in Health, a Diſeaſe or Death; and of its Secretion and Excretion: Which laſt *Signs* are called *Critical* ones. See CRUDITY, DIGESTION, &c. each under its proper Article. See alſo HEALTH and DISEASE.

SIGN, in Aſtronomy, a Twelfth Part of the Ecliptic, or Zodiac; or a Portion containing Thirty Degrees thereof. The Zodiac was divided by the Antients into Twelve Segments, called *Signs*; commencing from the Point of Interſection of the Ecliptic and Equinoctial: Which *Signs* they denominated from the Twelve Conſtellations, which, in *Hipparchus*'s Time, poſſeſſed thoſe Segments; But the Conſtellations have ſince ſo changed their Places, by the Præceſſion of the Equinox, that *Aries* is now got out of the *Sign* called *Aries*, into *Taurus*, *Taurus* into *Gemini*, &c.

The Names of the Twelve *Signs*, and their Order, are as follow; *Aries*, *Taurus*, *Gemini*, *Cancer*, *Leo*, *Virgo*, *Libra*, *Scorpio*, *Sagittarius*, *Capricornus*, *Aquarius*, *Piſces*: Each of which, with the Stars thereof, ſee under its proper Article.

The *Signs* are diſtinguiſhed with Regard to the Seaſon of the Year when the Sun is in them, into *Vernal*, *Eſtival*, *Autumnal*, and *Brumal*. The *Vernal*, or *Spring-Signs*, are *Aries*, *Taurus*, *Gemini*: The *Eſtival*, or *Summer-Signs*, *Cancer*, *Leo*, and *Virgo*: The *Autumnal-Signs*, *Libra*, *Scorpio*, and *Sagittarius*; and the *Brumal*, or *Winter-Signs*, *Capricornus*, *Aquarius*, *Piſces*. The *Vernal* and *Summer Signs*, are alſo called *Northern Signs*, and the *Autumnal* and *Brumal Signs*, *Southern Signs*.

For the Motion of the *Signs*. See PRÆCESSION *of the Equinox*.

SIGN *Manual*, the ſetting one's Hand and Seal to a Writing. See SIGNATURE. Among the *Saxons*, before the Invention of *Seals*, a + was a common *Sign* or *Signum*, prefixed to the Names of moſt ſubſcribing Witneſſes in Charters and other Deeds, as + *Signum Roberti Epiſcop. Lond.* &c.

SIGNAL, a certain Sign agreed upon for the conveying of Intelligence whither the Voice cannot reach. *Signals* are given for the beginning of a Battle, or an Attack: Sometimes

times with Drums and Trumpets. At Sea, *Signals* are given by Canon or Musket Shot, by Lights, Sails, Flags, &c.

SIGNALS have been in Uſe in all Ages. The Ancients who had no regular Couriers or Poſts, made Uſe thereof to convey Intelligence of what paſs'd at a great Diſtance. For which Purpoſe they placed Sentinels on the Heights, from Space to Space; ſome Mention whereof, we find made by *Homer* himſelf. *Iliad* Θ. *v.* 553, &c. *Odyſſ.* Ξ. *v.* 261. Thoſe People thus diſpoſed; lighted Fires, or Flambeaux in the Night-time. In the *Agamemnon* of *OEſchilus*, that Prince at his Departure for *Troy*, promiſes *Clytemneſtra*, that the very Day the City ſhould be taken, he would apprize her of his Victory by Fires lighted Expreſs. He keeps his Word, and Tidings are brought the Princeſs, that *Troy* is taken, and that *Agamemnon*'s *Signals* are ſeen. *Frontinus* obſerves, they were in Uſe among the *Arabs*; and *Bonaventura Vulcanius*, in his *Scholia* on *Ariſtotle*'s Book *de Mundo*, adds, That while the *Moors* were Maſters of the greateſt Part of *Spain*, they built on the Tops of the Mountains, an Infinity of Turrets, or Watch-houſes, call'd in the *Arabic*, *Atalayas*, a Word the *Spaniards* ſtill retain; whence, by Fires, they could immediately alarm the whole Kingdom. Indeed the Cuſtom was much more Ancient than the *Moors* in *Spain*. Q. *Curtius* obſerves, 'twas very frequent among the *Aſiaticks*, in the Time of *Alexander*. *Livy* and *Cæſar* both mention it as uſed among the *Romans*. *Polydore Virgil* ſhews it of great Antiquity in *England*; and *Boethius* adds, that in ſeveral Places in *England*, there are the Remains of huge Poles that have ſerved for this Purpoſe. See BEACON.

SIGNALS *at Sea*, are Signs made at Sea, by the Admiral or Commander in Chief of a Squadron of Ships, either in the Day or by Night, either for Sailing or Fighting, or for the better Security of the Merchant Ships, under the Convoy of Men of War: Theſe *Signals* are very Numerous and very Important; all appointed and determined by Order of the Lord High Admiral, or Lords of the Admiralty.

SIGNALS *by Day*.

When the Commander in Chief would have them prepare for Sailing, he firſt looſes his Fore-top-ſail, and then the whole Fleet are to do the ſame. When he would have them Unmoor, he looſes his Main-top ſail, and fires a Gun, which in the Royal Navy is to be anſwered by every Flag-ſhip. When he would have them Weigh, he looſes his Fore-top-ſail, and fires a Gun, and ſometimes hawls home his Sheets: The Gun is to be anſwered by every Flag-ſhip, and every Ship to get to Sail as ſoon as it can. If with the Leeward-ſide, the Stern-moſt Ship is to weigh firſt. When he would have the Weather-moſt, and Head-moſt Ships to Tack firſt, he hoiſts the Union-Flag at the Fore-top-maſt-head, and fires a Gun, which each Flag-ſhip anſwers; but if he would have the Stern-moſt, and Leeward-moſt Ships to Tack firſt, he hoiſts the Union Flag at the Mizen-top-maſt-head, and fires a Gun; and when he would have all the whole Fleet Tack, he hoiſts an Union, both on the Fore, and Mizen-top-maſt-heads, and fires a Gun. When in bad Weather, he would have them Wear, and bring to the other Tack, he hoiſts a Pendant on the Enſign-ſtaff, and fires a Gun: And then the Leeward-moſt and Stern-moſt Ships are to Wear firſt, and bring on the other Tack, and lie by, or go on with an eaſy Sail, till he comes a-head: Every Flag is to anſwer with the ſame *Signal*. If they are lying by, or Sailing by a Wind, and the Admiral would have them bear up and Sail before the Wind, he hoiſts his Enſign, and fires a Gun, which the Flags are to anſwer: And then the Leeward-moſt Ships are to bear up firſt, and to give Room for the Weather-moſt to Wear, and ſail before the Wind with an eaſy Sail, till the Admiral comes a-head. But if it ſhould happen when the Admiral hath Occaſion to Wear and Sail before the Wind, that both Jack and Enſign be abroad, he will haul down the Jack, before he fires the Gun to Wear, and keeps it down, till the Fleet is before the Wind. When they are ſailing before the Wind, and he would have them bring to, with the Star-board Tacks Aboard, he hoiſts a Red Flag at the Flag-ſtaff, on the Mizen-top-maſt-head, and fires a Gun. But if they are to bring to, with the Larboard Tack, he hoiſts a Blue Flag at the ſame Place, and fires a Gun, and every Ship to anſwer the Gun. When any Ship diſcovers Land, he is to hoiſt his Jack and Enſign, and keep it abroad, till the Admiral or Commander in Chief anſwer him, by hoiſting his; on Sight of which, he is to hawl down his Enſign. If any diſcovers Danger, he is to Tack and bear up from it, and to aw Jack abroad from the Main-top-maſt Croſs-trees, and fire two Guns; but if he ſhould ſtrike or ſtick faſt, then, beſides the ſame *Signal* with his Jack, he is to keep firing, till he ſees all the Fleet obſerve him, and endeavour to avoid the Danger. When any ſees a Ship or Ships more than the Fleet, he is to put abroad his Enſign, and there keep it, till the Admiral's is out, and then to lower it, as often as he ſees Ships, and ſtand in with them, that ſo the Admiral may know which Way they are, and how many; but if he be at ſuch a Diſtance, that the Enſign can't well be diſcovered, he is then to lay his Head towards the Ship or Ships ſo deſcry'd, and to brail up his low Sails, and continue hoiſting, and lowering his Top-ſails, and making a Weſt with his Top-gallant Sails, till he is perceived by the Admiral. When the Admiral would have the Vice-Admiral, or he that commands in the Second Poſt of the Fleet, to ſend out Ships to Chaſe, he hoiſts a Flag, ſtriped White and Red, on the Flag-ſtaff, at the Fore-top-maſt-head, and fires a Gun. But if he would have the Rear-Admiral do ſo, he then hoiſts the ſame *Signal* on the Flag-ſtaff, at the Mizen-top-maſt-head, and fires a Gun. When the Admiral would have any Ship to Chaſe to Windward, he makes a *Signal* for ſpeaking with the Captain, and he hoiſts a Red Flag in the Mizen-ſhrouds, and fires a Gun: But if to Chaſe to Leeward, a Blue Flag; and the ſame *Signal* is made by the Flag, in whoſe Diviſion that Ship is. When he would have them give over Chaſe, he hoiſts a White Flag on his Flag-ſtaff at the Fore-top-maſt-head, and fires a Gun: Which *Signal* is to be made alſo, by that Flag-ſhip, which is neareſt the Ship that gives Chaſe, till the chaſing Ship ſees the *Signal*. In caſe of ſpringing a Leak, or any other Diſaſter, that diſables their Ship from keeping Company, they are to hawl up their Courſes, and fire two Guns. When any Ship would ſpeak with the Admiral, he muſt ſpread an *Engliſh* Enſign, from the Head of his Main, or Fore, Top-maſt, downwards on the Shrowds, lowering his Main, or Fore, Top ſail, and firing Guns, till the Admiral obſerve him; and if any Ship perceive this, and judgeth the Admiral doth not, that Ship muſt make the ſame *Signal*, and make the beſt of his Way to acquaint the Admiral therewith, who will anſwer by firing one Gun. When the Admiral would have the Fleet to prepare to Anchor, he hoiſts an Enſign, ſtriped Red, Blue and White on the Enſign-ſtaff, and fires a Gun, and every Flag-ſhip makes the ſame *Signal*. If he would have the Fleet Moor, he hoiſts his Mizen-top-ſail, with the Clew-lines hawled up, and fires a Gun. If he would have the Fleet cut or ſlip, he looſeth both his Top-ſails, and fires two Guns; and then the Leeward Ships are to cut or ſlip firſt, to give Room to the Weathermoſt to come to Sail. So if he would have any particular Ship to cut or ſlip, and to Chaſe to Windward, he makes the *Signal* for ſpeaking with that Ship, hoiſts a Red Flag in the Mizen-ſhrowds, and fires a Gun: But if the Ship is to Chaſe to Leeward, he hoiſts a Blue Flag as before. If he would have the Fleet exerciſe their Small Arms, he hoiſts a Red Flag on the Enſign-ſtaff, and fires a Gun; but if the great Guns, then he puts up a Pendant over the Red Flag.

SIGNALS *by Night*;

To be obſerved at an Anchor, weighing Anchor, and Sailing, are as follow. When the Admiral would have the Fleet to Unmoor, and ride ſhort, he hangs out three Lights, one over another in the Main-top-maſt Shrowds, over the conſtant Light in the Main-top, and fires two Guns, which are to be anſwered by Flag-Ships; and each private Ship hangs out a Light in the Mizen Shrowds. *Note*, That all Guns, fired for Signals in the Night, muſt be fired on the ſame Side, that they may make no Alteration in the Sound. When he would have them Weigh, he hangs a Light in the Main-top-maſt Shrowds, and fires a Gun, which is to be anſwered by all the Flags, and every private Ship muſt hang out a Light in his Mizen-Shrowd. When he would have them Tack, he hoiſts two Flags on the Enſign-Staff, one over another, above the conſtant Light in his Poop, and fires a Gun, which is to be anſwered by all the Flags; and every private Ship is to hang out a Light extraordinary, which is not to be taken in, till the Admiral takes in his. After the *Signal* is made, the Leeward-moſt, and Stern-moſt Ships muſt Tack as faſt as they can, and the Stern-moſt Flag-ſhip, after he is about on the other Tack, is to lead the Fleet, and him they are to follow, to avoid running through one another in the Dark. When he is upon a Wind, and would have the Fleet Veer, and bring to on the other Tack, he hoiſts up one Light at the Mizen-peek, and fires three Guns, which is to be anſwer'd by the Flag-ſhips, and every private Ship muſt anſwer, with one Light at the Mizen-peek. The Stern-moſt, and Leeward-moſt Ships, are to bear up ſo ſoon as the *Signal* is made. When he would have them, in blowing Weather, to lie a Try, Short, or a Hull, or with the Head-ſails brac'd to the Maſt, he will form Lights of equal Height, and fire five Guns, which are to be anſwer'd by the Flag-ſhips, and then every private Ship muſt ſhew four Lights: And after this, if he would have them to make Sail, he then fires ten Guns, which are to be anſwered by all the Flags, and then the Head-moſt, and Weathermoſt Ships, are to make ſail firſt. When the Fleet is ſailing large, or before the Wind, and the Admiral would have them bring to, and lie by with their Star-board

Tacks

Tacks aboard, he puts out four Lights in the Fore-Shrowds, and fires ſix Guns; but, if with the Lar-board Tacks aboard, he fires eight Guns, which are to be anſwered by the Flag-ſhips; and every private Ship muſt ſhew four Lights. The Wind-moſt Ships muſt bring to firſt. Whenever the Admiral alters his Courſe, he fires one Gun, (without altering his Lights) which is to be anſwered by all the Flag-ſhips. If any Ship hath Occaſion to lie ſhort, or by, after the Fleet hath made Sail, he is to fire one Gun, and ſhew three Lights in his Mizen-ſhrowds. When any one firſt diſcovers Land, or Danger, he is to ſhew as many Lights as he can, to fire one Gun, and to tack, or bear away, from it: And, if any one happen to ſpring a Leak, or any be diſabled from keeping Company with the Fleet, he hangs out two Lights of equal Height, and fires Guns till he is relieved by ſome Ship of the Fleet. If any one diſcovers a Fleet, he is to fire Guns, make falſe Fires, put one Light out on the Main-top, three on the Poop, to ſteer after them, and to continue firing of Guns, unleſs the Admiral call him off, by ſteering another Courſe, and fire two or three Guns; for then he muſt follow the Admiral. When the Admiral Anchors, he fires two Guns, a ſmall Space of Time one from the other, which are to be anſwered by the Flag-Ships; and every private Ship muſt ſhew two Lights. When the Admiral would have the Fleet to moor, he puts a Light on each Top-maſt-head, and fires a Gun, which is to be anſwered by the Flag-ſhips, and every private Ship is to ſhew one Light. If he would have them lower their Yards and Top-maſts, he hoiſts one Light upon his Enſign-ſtaff, and fires one Gun; which is to be anſwered by the Flag-ſhips; and every private Ship muſt ſhew one Light. And when he would have them hoiſt their Yards and Top maſts, he puts out two Lights, one under the other, in the Mizen-top-maſt Shrowds, and fires one Gun; which is to be anſwered by the Flag-ſhips; and each private Ship muſt ſhew one Light in the Mizen-ſhrowds. If any ſtrange Ship be diſcovered coming into the Fleet, the next Ship is to endeavour to ſpeak with her, and bring her to an Anchor, and not ſuffer her to paſs through the Fleet. And if any one diſcovers a Fleet, and it blow ſo hard that he cannot come to give the Admiral Notice timely, he is to hang out a great Number of Lights, and to continue firing Gun after Gun, till the Admiral anſwers him with one. When the Admiral would have the Fleet to Cut or Slip, he hangs out four Lights, one at each Main-yard-arm, and at each Fore-yard-arm, and fires two Guns, which are to be anſwered by the Flag-ſhips, and every private Ship is to ſhew one Light.

Signals *uſed, when a Fleet ſails in a Fog.*

If the Admiral would have them Weigh, he fires ten Guns; which every Flag-ſhip is to Anſwer. To make them Tack, he fires four Guns, which are to be anſwered by the Flag-ſhips; and then the Leeward-moſt, and Stern-moſt Ships muſt tack firſt, and after they are about, to go with the ſame Sail they tacked with, and not to lie by, expecting the Admiral to come a-head: And this is to avoid the Danger of running thro' one another in thick Weather.

When the Admiral brings to, and lies with his Head-ſails to the Maſt; if with the Star-board Tack aboard, he fires ſix Guns; but if with the Lar-board Tack, he fires eight Guns, which the Flag-ſhips are to anſwer. And after this, if he makes Sail, he fires ten Guns, which the Flag-ſhips muſt anſwer, and then the Head-moſt, and Weather-moſt Ships are to make Sail firſt. If it grow thick and foggy Weather, the Admiral will continue ſailing, with the ſame Sail ſet, that he had before it grew foggy, and will fire a Gun every Hour, which the Flag-ſhips muſt anſwer, and the private Ships muſt anſwer, by firing of Muskets, beating of Drums, and ringing of Bells. But if he be forced to make either more or leſs Sail than he had, when the Fog began, he will fire a Gun every half Hour, that the Fleet may diſcern, whether they come up with the Admiral, or fall a-ſtern of him; and the Flags, and private Ships are to anſwer as before. If any one diſcovers Danger, which he can avoid, by Tacking and Standing from it, he is to make the Signal for Tacking in a Fog; but if he ſhould chance to ſtrike and ſtick faſt; he is to fire Gun after Gun, till he thinks the reſt have avoided the Danger. When the Admiral would have the Fleet to Anchor, he fires two Guns, which the Flags are to anſwer; and after he hath been Half an Hour at an Anchor, he will fire two Guns more, to be anſwered by the Flags, as before; that all the Fleet may know it.

Signals *for calling Officers on Board the Admiral.*

When the Admiral puts aboard an Union Flag in the Mizen-ſhrowds, and fires a Gun, all the Captains are to come aboard him: And if, with the ſame *Signal*, there be alſo a Weſt made with the Enſign, then the Lieutenant of each Ship is to come on board. If an Enſign be put aboard in the ſame Place, all the Maſters of the Ships of War are to come on board the Admiral. If a Standard on the Flag-ſtaff be hoiſted at the Mizen-top-maſt-head, and a Gun fired, then all the Flag-Officers are to come aboard the Admiral. If the *Engliſh* Flags only; then a Standard in the Mizen-ſhrowds; and fire a Gun: If the Flags, and Land General Officers; then the Admiral puts aboard a Standard at Mizen-top-maſt-head, and a Pendant at Mizen-peek, and fires a Gun. If a Red Flag be hoiſted in the Mizen-ſhrowds, and a Gun fired; then the Captains of his own Squadron are to come aboard the Admiral; and if, with the ſame Signal, there be alſo a Weſt with the Enſign, the Lieutneant of each Ship muſt come aboard. If he hoiſts a White Flag, as before, then the Vice-Admiral, or he that commands in the Second Poſt, and all the Captains of his Squadron, are to go on board the Admiral: If a Blue Flag, *&c.* then the Rear-Admiral, and the Captains of his Squadron, muſt come on board; and if a Weſt, as before, the Lieutenants. When a Standard is hoiſted on the Enſign-Staff, and a Gun fired, the Vice and Rear Admirals muſt come on board the Admiral's Ship. When the Admiral would ſpeak with Captains of his own Diviſion, he will hoiſt a Pendant on the Mizen-peek, and fire a Gun; and if with the Lieutenants; a Weſt is made with the Enſign, and the ſame *Signal*: For whenever he would ſpeak with the Lieutenants of any particular Ship, he makes the *Signal* for the Captain, and a Weſt alſo with the Enſign. When the Admiral would have all the Tenders in the Fleet come under his Stern, and ſpeak with him; he hoiſts a Flag, Yellow and White, at the Mizen-peek, and fires a Gun. But if he would ſpeak with any particular Ship's Tender, he makes a Signal for ſpeaking with the Captain ſhe tends upon, and a Weſt with the Jack. If all the Pinnaces and Barges are to come on Board, manned and armed, the *Signal* is a Pendant on the Flag-ſtaff, hoiſted on the Fore-top-maſt-head, and a Gun fired; and if he would have them chaſe any Ship, Veſſel, or Boat, in View, he hoiſts the Pendant, and fires two Guns. The *Signal* for the Long-boats to come on board him, manned and armed, is the Pendant hoiſted on the Flag-ſtaff, and the Mizen-top-maſt-head, and a Gun fired; and if he would have them chaſe any Ship, Veſſel, or Boat, in open View, without coming on board him, he hoiſts the Pendant, as aforeſaid, and fires two Guns. When the Admiral would have all the Boats in the Fleet come on board him, manned and armed, he hoiſts a Pendant on the Flag-Staff, both on the Fore-top-maſt, and Mizen-top-maſt head, and fires one Gun; but if he would have them chaſe, he hoiſts his Pendants, as before, and fires two Guns. When the Admiral would ſpeak with the Victualler, or his Agent, he puts an *Engliſh* Enſign in the Mizen top-maſt-ſhrowds; and when with him that hath the Charge of the Gunner's Stores, he will ſpread an Enſign at his Main-top-ſail-yard-arm.

Signals *for managing a Sea-Fight.*

When the Admiral would have the Fleet form a Line of Battle, one Ship a-head of another; he hoiſts an Union Flag at the Mizen-peek, and fires a Gun; and every Flag-Ship does the like. But when they are to form a Line of Battle, one a-breaſt of another, he hoiſts a Pendant with the Union-Flag, *&c.* When he would have the Admiral of the White, or he that commands in the ſecond Poſt, to Tack, and endeavour to gain the Wind of the Enemy, he ſpreads a White Flag under the Flag at the Main-top-maſt-head, and fires a Gun; and when he would have the Vice-Admiral of the Blue do ſo, he doth the ſame with the Blue Flag. If he would have the Vice-Admiral of the Red do ſo, he ſpreads a Red Flag from the Cap, on the Fore top-maſt-head, downward on the Back-ſtay: If the Vice-Admiral of the Blue, he ſpreads a Blue Flag, *&c.* and fires a Gun. If he would have the Rear-Admiral of the Red do ſo, he hoiſts a Red Flag at the Flag-ſtaff, at the Mizen-top-maſt-head; if the Rear Admiral of the White, a White Flag; if the Rear-Admiral of the Blue, a Blue Flag, and under it a Pendant of the ſame Colour, with a Gun. If he be to Leeward of the Fleet, or any Part of it, and he would have them bear down into his Wake or Grain, he hoiſts a Blue Flag at the Mizen-peek, and fires a Gun. If he would be to Leeward of the Enemy and his Fleet, or any Part of it be to Leeward of him; in order to bring theſe Ships into the Line, he bears down with a Blue Flag at the Mizen-peek, under the Union Flag (which is the *Signal* for Battle) and fires a Gun; and then thoſe Ships, that are to Leeward of him, muſt endeavour to get into his Wake or Grain, according to their Station in the Line of Battle. When the Fleet is ſailing before the Wind, and he would have him, who commands in the Second Poſt, and the Ship of the Star-board Quarter, to clap by the Wind, and come to the Star-board Tack, he hoiſts a Red Flag on the Mizen-top-maſt-head: But a Blue one, if he would have Ships of the Lar-

board Quarter, come to the Lar-board Tack, with a Gun. If the Van are to tack firſt, he ſpreads the Union Flag at the Flag-ſtaff, on the Fore-top-maſt-head, and fires a Gun, if the Red Flag be not Abroad; but if it be, then he lowers the Fore-top Sails a little; and the Union Flag is ſpread from the Cap of the Fore-top-maſt downwards; and every Flag-ſhip doth the ſame. If the Rear be to Tack firſt, he hoiſts the Union Flag on the Flag-ſtaff, at the Mizen-top-maſt-head, and fires a Gun; which all the Flag-ſhips are to anſwer. If all the Flag-ſhips are to come into his Wake or Grain, he hoiſts a Red Flag at his Mizen-peek, and fires a Gun; and all the Flag-ſhips muſt do the ſame. If he would have him that commands in the Second Poſt of his Squadron to make more Sail (though he himſelf ſhorten Sail) he hoiſts a White Flag on the Enſign-ſtaff. But if he that Commands in the Third Poſt be to do ſo, he hoiſts a Blue Flag, and fires a Gun, and all the Flag-ſhips muſt make the ſame *Signal*. Whenever he hoiſts a Red Flag on the Flag-ſtaff at the Fore-top-maſt-head, and fires a Gun; every Ship in the Fleet muſt uſe their utmoſt Endeavour to engage the Enemy, in the Order preſcribed them. When he hoiſts a White Flag at his Mizen-peek, and fires a Gun; then all the ſmall Frigates of his Squadron, that are not of the Line of Battle, are to come under the Stern. If the Fleet be ſailing by a Wind in the Line of Battle; and the Admiral would have them brace their Head-ſails to the Maſt, he hoiſts up a Yellow Flag, on the Flag-ſtaff, at the Mizen-top-maſt-head, and fires a Gun; which the Flag-ſhips are to anſwer: and then the Ships in the Rear muſt Brace firſt. After this, if he would have them fall their Head Sails, and ſtand on, he hoiſts a Yellow Flag on the Flag-ſtaff of the Fore-top-maſt-head, and fires a Gun, which the Flag-ſhips muſt anſwer, and then the Ships in the Van, muſt fall firſt, and ſtand on. If when this *Signal* is made, the Red Flag at the Fore-top-maſt-head be abroad, he ſpreads the Yellow Flag under the Red. If the Fleets being near one another, the Admiral would have all the Ships to tack together, the ſooner to lie in a Poſture to engage the Enemy; he hoiſts an Union Flag on the Flag-ſtaves at the Fore and Mizen-top-maſt-heads, and fires a Gun; and all the Flag-ſhips are to do the ſame. The Fleet being in a Line of Battle, if he would have the Ship that leads the Van, hoiſt, lower, ſet, or hawl up any of his Sails, he ſpreads a Yellow Flag, under that at his Main-top-maſt-head, and fires a Gun, which *Signal* the Flag-ſhips are to anſwer; and then the Admiral will hoiſt, lower, ſet, or hawl up the Sail, which he would have the Ship, that leads the Van, do; which is to be anſwered by the Flag-ſhips of the Fleet. When the Enemies run, and he would have the whole Fleet follow them, he makes all the Sail he can after them himſelf, takes down the *Signal* for the Line of Battle, and fires two Guns out of his Fore-chaſe, which the Flag-ſhips anſwer, and then every Ship is to endeavour to come up with, and Board the Enemy. When he would have the Chaſe given over, he hoiſts a White Flag at the Fore-top-maſt-head, and fires a Gun. If he would have the Red Squadron draw into a Line of Battle, one a-breaſt of another, he puts abroad a Flag, ſtriped Red and White, on the Flag-ſtaff at the Main, top-maſt-head, with a Pendant under it; and fires a Gun: If the White or Second Squadron is to do ſo, the Flag is ſtriped Red, White and Blue: If the Blue or Third Squadron is to do ſo, the Flag is a Genoeſe Enſign and Pendant: But if they are to draw into a Line of Battle, one a-head of another, the ſame Signals are made without a Pendant. If they are to draw into the Line of Battle one a-Stern of another, with a large Wind, and he would have the Leaders go with the Star-board Tacks, a-board by the Wind; he hoiſts a Red and White Flag at the Mizen-peek, and fires a Gun: But if they ſhould go with the Larboard-tacks Aboard, by the Wind, he hoiſts a Genoeſe Flag at the ſame Place; which Signals, like others, muſt be anſwered by the Flag-ſhips.

SIGNATURE, *Signing*, a Subſcription or putting of one's Name at the Bottom of an Act or Deed, in one's own Hand Writing. Anciently, when very few People could write, they diſpenſed with the Uſe of *Signatures*; and contented themſelves with the Party's *Seal*: See SEAL.—*Signature of the Court of Rome*, is a Supplication anſwered by the Pope, whereby he grants a Favour, Diſpenſation, or Collation, to a Benefice, by putting the *Fiat* at the Bottom thereof, in his own Hand; or the *Conceſſum eſt* wrote in his Preſence. The *Signature*, at the Bottom of the Supplication, gives the Name to the whole Inſtrument. The *Signature* contains the Clauſes, Derogations, and Diſpenſations, wherewith the Pope grants the Favour, or the Benefice; with a Commiſſion for the Execution thereof, either in *Forma dignum*, or in gracious Form. A *Signature* of the Pope's own Hand, whereby he anſwers, *Fiat ut petitur*, is preferred to another, anſwered by the Prefect, in his Preſence, in theſe Words, *Conceſſum uti petitur in præſentia D. N. Papæ*. Sometimes, in *Signatures* with the *Fiat*, the Pope adds, *Proprio Motu*; which Clauſe gives them ſtill further Force. See PROVISION. There are three Kinds of *Signatures*; one in *Forma Gratioſa*, diſpatch'd on an Atteſtation of the Ordinary; another in *Forma dignum Antiqua*, diſpatch'd for Canonicates; the third in *Forma dignum Noviſſima*, which is a Kind of Second *Signature*, or Executorial Letter granted, where upon the Ordinary's failing to execute the firſt within Thirty Days, the neareſt other Ordinary is enjoyn'd to execute it.

SIGNATURE, in Printing, a Mark at the Bottom of each Sheet, to facilitate the Gathering and Binding of the Book; and to ſhew the Order, and Number, of the Quires and Sheets. The *Signatures* conſiſt of the Capital Letters of the Alphabet; and change in every Quire. If there be more Quires than Letters in the Alphabet; to the Capital Letter, they add a ſmall one of the ſame ſort, *i. e.* a little *a* after a great A, *&c.* which they repeat, as often as is neceſſary.

SIGNATURE is alſo uſed by ſome Naturaliſts for the Reſemblance a Vegetable or Mineral bears to any Part of the Human Body.

SIGNET, one of the King's *Seals*, uſed in ſealing his private Letters, and in ſigning all Grants, which paſs his Majeſty's Hand by Bill. The *Signet* is always in the Cuſtody of the King's Secretaries: On whom attend Four Clerks of the *Signet-Office*. See SECRETARY.

SIGNIFICAVIT, is a Writ which iſſues out of Chancery, upon a Certificate given by the Ordinary, of a Man that ſtands obſtinately Excommunicate for the Space of Forty Days, for the laying him up in Priſon, without Bail, or Mainprize, till he ſubmit himſelf to the Authority of the Church.

SIGNIFICATION, the Senſe of a Sign, Word, Phraſe, Emblem, *&c.* or the Thing meant or denoted by the Sign, Word, Figure, *&c.* We are perfectly at a loſs as to the *Signification* of the Hieroglyphic Characters of the Antients.

SIGNIFICATION, in Law, is the Notification of an Act, *&c.* made to the oppoſite Party, by a Copy, *&c.* thereof, given and atteſted by a proper Officer. Some *Significations* are to be made to the Perſon himſelf; or, at leaſt, at his Houſe: For others, 'tis enough they be made to the Party's Attorney, or Agent.

SILENCIARCY, *Silenciarius*, an Officer among the antient *Roman* Slaves. The *Silenciary*, according to ſome Authors, was a Slave placed over the reſt, to prevent any Noiſe and Din, and keep them ſilent. *Seneca*, in his Epiſtles, mentioning the great Care taken to keep the Slaves mute, has given Occaſion to *Lipſius*, *Popma*, and ſome others, to ſuppoſe, That the *Silenciary* was eſtabliſhed in his Time: But others, as *Pignorius*, think no ſuch Concluſion can be drawn from *Seneca*'s Words; nor any Thing, but that they were, even then, very ſevere in preventing any Noiſe among the Slaves. As to the Name and Office of the *Silenciary*, 'twas not eſtabliſhed till about the Time of *Salvian*; who is the firſt Author that mentions it. —— There were alſo *Silenciaries* eſtabliſhed in the Emperor's Court; called *Quietis Miniſtri*, and *Silenciarii Palatii*; and honoured with the Title of *Clariſſimi*, *Spectabiles*, *Devotiſſimi*, and in *Greek*, Θαυμασιώτατοι, *q. d.* Moſt admirable. There was a great Number of them; but only Thirty ordinarily officiated; who were divided into Three Bands, each whereof had its *Decurio*. The Council of *Chalcedon*, call the Body of *Silenciaries*, *Schola devotiſſimorum Silenciariorum*.

SILENI, in Antiquity, Heathen Demi-Gods; the ſame with the *Satyrs*, which were called *Sileni* when they came to be advanced in Age. Yet was there one principal *Silenus*, elder than any of the reſt. *Diod. Siculus* ſays, He was the Maſter, or Tutor of *Bacchus*, whom he diſciplined nobly, and followed him to the Wars. He quotes an ancient Poet named *Thymætas*, who relates, That the *Sileni* aſſiſted *Bacchus* in the War he waged againſt the *Titans*; adding, That the firſt *Silenus* reigned in an Iſland made by the River *Triton* in *Lybia*. He is repreſented, as having a long Tail hanging behind; which is likewiſe an Attribute of all his Poſterity. The Poets always mount him on an Aſs. *Nonnus* makes *Silenus* a Son of *Tellus*; and gives him Three Children; *Aſtræus*, *Maron*, and *Lenæus*. *Servius*, on *Virgil*'s Eclogue, makes *Silenus* the Son of *Mercury*; others, the Son of *Pan*, and a Nymph: Others will have him born of the Drops of the Blood of *Cœlus*, Father of *Saturn*.

Bochart, in his *Canaan*, will have *Silenus* to take his Name from שלח, *Silo*, or שול, and רעל, *Silan*, the Name of the *Meſſiah*. He adds, That whatever is attributed to this imaginary God, is all taken from what the Prophets have foretold of the *Jeſus Chriſt*: Thus, whereas 'tis ſaid, The *Meſſiah* ſhall be the Inſtructor of the People; *Silenus* is made Preceptor of *Bacchus*. Becauſe 'tis ſaid, That our Saviour ſhall bind his Aſs to the Vine, and his Colt to the young Vine; *Silenus* is made to ride an Aſs. Becauſe our Saviour waſhed his Garments in Blood, as thoſe who trod the Wine-preſs; *Silenus* was made to preſide over thoſe who preſs'd the Vintage. Becauſe, 'tis added, his Eyes were red by Reaſon of Wine; *Silenus* was made always fuddled. *Bochart* advances all this with a deal

deal of Diſtruſt, as he has Reaſon; it having no Warrant: He adds, That the Devil invented the Fable of *Silenus*, to turn the Myſteries of our Religon into Ridicule. But it muſt be a very ignorant Devil, to take *Rubent illi oculi ex vino, & dentes ejus ex lacte albeſcent*, in the Senſe he has done; as if the Words ſignified any Thing more, in the Propriety of the *Hebrew* Tongue, than, His Eyes are redder than Wine; His Teeth whiter than Milk. We may add, That no Body, before *Bochart*, neither Chriſtian nor Idolater, ever ſaw any Thing of *Jeſus Chriſt* in the Fable of *Silenus*.

SILIQUA, in Botany, is the Seed-Veſſel, Husk, Pod, or Shell of Plants, of the leguminous Kind. Whence *Siliquous Seeds*, &c.

SILK, a very ſoft, fine, bright, delicate Thread; the Work of an Inſect, called the *Silk Worm*. The Antients were but little acquainted with the Uſe and Manufacture of *Silk*. They took it for the Work of a Kind of Spider, or Beetle, who ſpun it out of its Entrails, and wound it with its Feet about the little Branches of Trees. This Inſect they called *Ser*, from *Seres*, a People in *Scythia*, who kept it; whence, the *Silk* it ſelf they called *Sericum*. But the *Ser* has very little Affinity with our *Silk-Worm*, *Bombyx*: The former living Five Years; but the latter dying annually, envelop'd in a yellowiſh Cover, or Ball; which, wound out into little Threads, makes what we call *Silk*. 'Twas in the Iſle of *Cos*, that the Art of manufacturing *Silk*, was firſt invented; and *Pamphila*, Daughter of *Platis*, the Inventor. The Diſcovery was not long unknown to the *Romans*. *Silk* was brought them from *Seres*, where the *Worm* was a Native. But ſo far were they from profiting by the Diſcovery, that they could not be induced to believe ſo fine a Thread ſhould be the Work of a Worm; and thereupon formed a Thouſand Chymerical Conjectures of their own.

This Temper rendered *Silk* a very ſcarce Commodity among them for many Ages: 'Twas even ſold Weight for Weight againſt Gold; inſomuch, that *Vopiſcus* tells us, The Emperor *Aurelian*, refuſed the Empreſs, his Spouſe, a Suit of *Silk*, which ſhe ſolicited of him with much Earneſtneſs; merely for its Dearneſs. At length, Two Monks, coming from the *Indies* to *Conſtantinople*, in 555; brought with them great Quantities of *Silk Worms*, with Inſtructions for the hatching of their Eggs, rearing and feeding the Worms, drawing out the *Silk*, ſpinning and working it. Upon this, Manufactures were ſet up at *Athens*, *Thebes*, and *Corinth*.

About the Year 1130, *Roger* King of *Sicily*, eſtabliſhed a *Silk* Manufactory at *Palermo*, and another in *Calabria*; managed by Workmen, who were Part of the Plunder brought from *Athens*, *Corinth*, &c. whereof that Prince made a Conqueſt in his Expedition to the Holy Land. By Degrees, *Mezeray* adds, the reſt of *Italy* and *Spain* learned from the *Sicilians*, and *Calabrians*, the Management of the *Silk-Worms*; and the working of the *Silk*: And at length the *French*, by Right of Neighbourhood, a little before the Reign of *Francis* I. began to imitate them. The great Advantage the New Manufacture turned to, made our King *James* I. very earneſt for its being introduced into *England*. Accordingly, it was recommended ſeveral Times from the Throne, and in the moſt earneſt Terms, to plant Mulberry-Trees, &c. for the Propagation of *Silk-Worms*; but, unhappily, without Effect: Tho' from the various Experiments we meet withal in the *Philoſophical Tranſactions*, and other Places, it appears, That the *Silk-Worm* thrives and works as well, in all Reſpects, in *England*, as in any Part of *Europe*.

The *Silk-worm* is an Inſect, not more remarkable for the precious Matter it furniſhes for divers Stuffs; than for the many Forms it aſſumes, before and after its being invelop'd in the rich Cod or Ball it weaves it ſelf. From a Grain, or Seed, which is its firſt State, it becomes a pretty big *Worm*, of a whitiſh Colour, bordering on a yellow. When a *Worm*, it ſhuts its ſelf up in its Cod, and aſſumes the Form of a kind of greeniſh Bean, without any Signs of Life or Motion. At length it awakes to become a Butter-Fly; after making it ſelf a Paſſage out of its *Silken* Sepulcher. And, at laſt, dying indeed, it prepares it ſelf, by a Grain, or Seed it caſts, for a New Life; which the Warmth of the Summer Weather aſſiſts it in reſuming.

Aſſoon as the *Silk-Worm* is arrived at the Size and Strength neceſſary for the beginning his Cod; he makes his Web: For 'tis thus they call that ſlight Tiſſue, which makes the Beginning, and Ground of this admirable Work. This is his firſt Day's Employment. On the Second, he forms his Cod, and covers himſelf almoſt over with *Silk*. The Third Day, he is quite hid; and the following Days, employs himſelf in thickening and ſtrengthening his Cod: Always working from one ſingle End, which he never breaks thro' his own Fault; and which is ſo fine, and ſo long, that thoſe who have examined it attentively, think they ſpeak within Compaſs, when they affirm, that each Cod contains *Silk* enough to reach the Length of Six *Engliſh* Miles In Ten Days time, the Cod is in its Perfection; and is now to be taken down from the Branches of the Mulberry Tree, where the *Worms* have hung it. But this Point requires a deal of Attention; for there are ſome *Worms* more lazy than others; and 'tis very dangerous waiting till they make themſelves a Paſſage, which uſually happens about the Fifteenth Day of the Month.

The firſt, fineſt and ſtrongeſt Cods or Balls, are kept for the Grain; the reſt are carefully wound: or, if 'tis deſired to keep them all, or if there be more than can be well wound at once; they lay them for ſome Time in an Oven moderately hot, or elſe expoſe them, for ſeveral Days ſucceſſively, to the greateſt Heats of the Sun, in order to kill the Bean or Maggot; which, without this Precaution, would not fail to open it ſelf a Way to go and uſe thoſe New Wings abroad, it has acquired within. Ordinarily, they only wind the more perfect Cods. Thoſe that are double, or too weak, or too coarſe, are laid aſide; not as altogether uſeleſs, but that, being improper for winding, they are reſerved to be drawn out into Skains. The Cods are of different Colours; the moſt common are Yellow, Orange-Colour, Iſabella, and Fleſh-Colour.

There are ſome alſo of a Sea-green; others of a Sulphur Colour, and others White: But there is no Neceſſity for ſeparating the Colours and Shades to wind them apart; as all the Colours are to be loſt in the future Scouring and Preparing of the *Silk*.

To wind the Silk from off the Cods, Two Machines are neceſſary; the one a Furnace, with its Copper; the other a Reel, or Frame, to draw the *Silk*. The Winder, then, ſeated near the Furnace, throws into the Copper of Water over the Furnace (firſt heated and boiled to a certain Degree which Cuſtom alone can teach) a Handful or Two of Cods, which have been firſt well purged of all their looſe furry Subſtance. He then ſtirs the whole very briskly about with Birchen Rods, bound and cut like Bruſhes; and when the Heat, and Agitation have detach'd the Ends of the *Silks* of the Pods, which are apt to catch on the Rods, he draws them forth; and joining Ten or Twelve, or even Fourteen of them together, he forms them into Threads, according to the Bigneſs required to the Works they are deſtined for: Eight Ends ſufficing for Ribbonds; and Velvets, &c. requiring no leſs than Fourteen. The Ends thus joyned into Two or Three Threads, are firſt paſſed into the Holes of Three Iron Rods, in the Fore-part of the Reel, then upon the Bobbins, or Pullies, and at laſt are drawn out to the Reel it ſelf, and there faſtened, each to an End of an Arm or Branch of the Reel. Thus diſpoſed, the Workman, giving Motion to the Reel, by turning the Handle; guides his Threads; ſubſtitutes new ones, when any of them break, or any of the Cods are wound out; ſtrengthens them where neceſſary, by adding others; and takes away the Cods wound out, or that, having been pierced, are full of Water. In this Manner, Two Workmen will ſpin and reel Three Pounds of *Silk* in a Day; which is an otherguiſe Diſpatch than is made by the Spinning Wheel, or Diſtaff. Indeed, all *Silks* cannot be ſpun, and reeled after this Manner: Either, by Reaſon the Cods have been perforated by the *Silk-Worms* themſelves, or becauſe they are double, or too weak to bear the Water; or becauſe they are coarſe, &c. Of all theſe together, they make a particular Kind of *Silk* called *Fleuret*: Which being carded, or even ſpun on the Diſtaff, or the Wheel in the Condition it comes from the Cod, makes a tolerable *Silk*.

As to the Cods, after opening them with Sciſſars, and taking out the Beans (which are of ſome Uſe for the feeding of Fowl) they are ſteeped Three or Four Days in Troughs, the Water whereof is changed every Day to prevent their ſtinking. When they are well ſoftened by this Scowring and cleared of that gummy Matter; the *Worm* had lined the Inſide withal, and which renders it impenetrable to the Water, and even to Air it ſelf; they boil them Half an Hour in a Lie of Aſhes, very clear and well ſtrained: and after waſhing them out in the River, and drying them in the Sun, they card and ſpin them on the Wheel, &c. and thus make another Kind of *Fleuret*, ſomewhat inferior to the former.

The ſeveral Preparations which *Silks* undergo, to fit them to be uſed in the Manufacture of *Silken Stuffs*, are the *Spinning*, *Reeling*, *Milling*, and *Dying*. The Two firſt we have already ſpoke of, as they are concerned in drawing the *Silk* from off the Cods. As to the Spinning and Reeling of *Raw Silks*, already off the Cods, ſuch as they are brought hither from *Italy*, the *Levant*, &c. the firſt is chiefly performed on the *Spinning-wheel*; and the latter, either on *Hand Reels*, or on Reels mounted on Machines, which ſerve to reel ſeveral Skains at the ſame Time. As to the *Milling*, they uſe a Mill compoſed of ſeveral Pieces, which may Mill Two or Three Hundred Bobbins at once, and make them into as many Skains. See SPINNING, REELING, MILLING, and DYING, each under its proper Article.

Raw SILK, is that taken from the Cod, without Fire, and wound without boiling; ſuch is moſt, if not all, that is brought into *England* from the *Levant*. In the *French Silk-works*, the greateſt Part of this *Silk* paſſes for little better than a Kind of very fine Fleuret; yet, when ſpun, it makes a bright Thread, and ſerves for the Manufacture of Stuffs of moderate Value, and Luſtre: But the *Raw Silks* of the *Levant*, whence moſt of ours come, are exceeding fine and beautiful. This Difference ariſes hence, That in *France* the beſt Cods are ſpun and wound in boiling Water, and only the Refuſe made into *Raw Silk*: Whereas, in the *Levant*, there is no ſuch thing as Spinning or Winding in the Fire; but the *Silks* are all ſent in Balls or Maſſes, as they are drawn from off the Cods: So that they are only diſtinguiſhed by their Quality of Fine, Middling, and Coarſe.

Boil'd SILK, is that boiled in Water, to facilitate the Spinning and Winding. This is the fineſt of all the *Silks* manufactured in *France*, and is ſeldom uſed, but in the richeſt Stuffs, as Velvets, Taffeta's, Damasks, Brocades, *&c.* There is alſo another Kind of *Boiled Silk*, which is prepared by boiling, to be milled; and which cannot receive that Preparation, without being firſt paſſed through boiling Water. By the Laws of *France*, 'tis prohibited to mix Raw with *Boil'd Silk*; both as ſuch a Practice ſpoils the Dying, and as the raw *Silk* corrupts and cuts the boiled.

Thrown or Twiſted SILKS are ſuch, as, beſide their Spinning and Winding, have had their Milling or *Throwing* This they have in a different Degree, as they are paſſed oftener, or ſeldomer, over the Mill. Properly, however, *Thrown Silks*, are thoſe wherein the Threads are pretty thick *thrown*, and are twiſted ſeveral times.—*Slack Silks* are ſuch as are not twiſted, but are prepared, and died, for Tapeſtry, and other Works, with the Needle. See THROWSTER.

Eaſtern SILK: That particularly thus called, is not the Work of the *Silk-Worms*, but comes from a Plant that produces it, in Pods, much like thoſe of the Cotton-Tree. The Matter this Pod contains is extremely white, fine, and moderately bright: It ſpins eaſily, and is made into a Kind of *Silk*, that enters the Manufacture of ſeveral *Indian* and *Chineſe* Stuffs.

SPIDER-SILK. Within a few Years the Secret has been found in *France*, of procuring and preparing *Silk* of the Webs of *Spiders*; and uſing it in ſeveral Manufactures. This Diſcovery is owing to M. *Bon*, in 1710. who publiſhed a Diſſertation on the Subject; whence what follows is extracted. See SPIDER-WEB.

Spiders are uſually diſtinguiſhed, either with regard to their Colour; as, into Black, Brown, Yellow, White, *&c.* or, with regard to the Number, or Arrangement, of their Eyes; ſome having 6, others 8, others 10. But with regard to the *Silk-Spider*, M. *Bon* reduces them all to two Kinds, thoſe with long Legs, and thoſe with ſhort; which laſt, are thoſe which furniſh the *Raw Silk*.

The *Silk-Spider* make a *Silk*, every whit as beauiful, ſtrong, and ſhining, as the *Silk-worm*: It ſpins it out of the *Anus*, around which are Five Papillæ, or ſmall Nipples, and behind theſe, two others; all muſculous, and furniſhed with Sphincters. Theſe Nipples ſerve, as ſo many wire-drawing-Irons, to form and mould a Liquor, which, when dried in the Air, after being drawn through them, is to be the *Silk*. Each of theſe Nipples, M. *Reaumur* obſerves, conſiſts of a Number of leſſer and inſenſible ones; which one may be convinced of, by preſſing a *Spider*'s Belly between the Fingers, to oblige the Liquor to flow into the Nipples; for by this Means, applying the Finger againſt the *Anus*, ſeveral diſtinct Threads will be drawn out through the ſeveral Perforations of the Nipples. The Threads are too fine to be told with any Certainty; but M. *Reaumur* reckons, each larger Nipple may ſend forth ſix or ſeven. Hence we ſee, how the *Spiders* make their Threads bigger, or ſmaller: For as, before they begin to Spin, they always apply more or fewer of theſe ſix Nipples, againſt the Body whence the Web is begun; or as they apply each more or leſs ſtrongly, ſo as more or fewer of the inſenſible Nipples come to take; the Thread thus ſpun, will be a Compound of more or fewer of the ſingle Threads. Indeed, as the Threads come from the *Anus*, all joined together, they appear to be ſingle; but M. *Bon* has diſtinguiſhed one of the ſingle ones to conſiſt of 15 or 20 diſtinct Threads.

The Threads are of two Kinds: The Firſt is weak, and only ſerves for that kind of Web wherewith they catch Flies. The Second is much ſtronger, and ſerves to wrap up their Eggs in; which, by this means, are ſheltered from the Cold, as well as from Inſects, which might otherways gnaw and ſpoil them. Theſe Threads they wind very looſely round the Eggs, reſembling the Cods or Bags of *Silk-Worms*, that have been prepared and looſened for the Diſtaff. The *Spider-Bags* are of a Grey Colour when new; but turn blackiſh when long expoſed to the Air: Indeed, one might find other *Spider-bags* of other Colours, and which would afford a better *Silk*, but their Scarcity would render the Experiment difficult; for which Reaſon we confine our ſelves to the Bags of the commoneſt *Spiders*, which are the ſhort-legg'd Kind. Theſe always find out ſome Place ſecure from the Wind and Rain, to make their Bags; as, hollow Trees, the Corners of Windows, or Vaults, or under the Eaves of Houſes. By collecting a Quantity of theſe Bags, a new *Silk* is made, inferior in nothing to the common *Silk*. It takes all Kinds of Dyes, and may be made into all Kinds of Stuffs. M. *Bon* had Stockings, and Gloves, made of it, which he preſented to the Academy; and others to the Royal Society.

For the Manner of preparing the Bags to get the *Silk*, 'tis thus: After having gather'd 12 or 13 Ounces of theſe Bags, M. *Bon* had them well beaten for ſome Time, with the Hand, and a Stick, to get out all the Duſt: He then waſhed them, in luke-warm Water, till they left the Water very clean: After this, he laid them to ſteep, in a large Veſſel, with Soap and Salt-petre, and Gum Arabic. The Whole was left to boil over a gentle Fire, for three Hours. The Bags were next waſh'd, in warm Water, to get out the Soap; and, after all, laid to dry ſome Days, to fit them for Carding; which was perform'd by the common *Silk-Carders*, but with Cards much finer than ordinary. By this Means, he had a *Silk*, of a very particular Aſh-colour, which was eaſily ſpun, and the Thread ſpun from it, both ſtronger and finer, than that of common *Silk*; which ſhews, that all ſorts of Work may be made of it: Nor is there any Reaſon to fear, but it will ſtand any Trials of the Loom, after having paſs'd that of the *Stocking-Weavers*.

The only Difficulty, now, is in procuring a ſufficient Quantity of Spider's Bags to make any conſiderable Work of it: Which M. *Bon* obſerves, would be no Difficulty at all, had we but the Art of Breeding them as they do *Silk-Worms*. For they multiply much more; every Spider laying 6 or 700 Eggs, whereas the *Silk-Worms* don't lay above 100; yet are theſe laſt, ſo tender, *&c.* that one Half die without making any Bags, or are hinder'd by ſome little Accident, from making their Bags: Whereas the Spiders hatch of themſelves, without any Care, in the Months of *Auguſt* and *September*, in Fifteen or Sixteen Days after they are laid; the Old Spiders that lay them, dying ſoon after. The young Ones thus bred, live Ten or Twelve Months without eating, and continue in their Bags without growing, till the hot Weather putting their viſcid Juices in Motion, forces them to come forth, ſpin, and run about to ſeek Food. Were a Way, therefore, found of breeding young Spiders in Rooms, they would, doubtleſs, furniſh a much greater quantity of Bags than *Silk-Worms* do. For of Seven or Eight hundred young Spiders, which M. *Bon* kept, ſcarce one died in a Year; whereas of One hundred *Silk-Worms*, not Forty lived to make their Bags. M. *Bon* having order'd all the ſhort-legg'd Spiders that could be found in the Months of *Auguſt* and *September*, to be brought to him, ſhut them up in Paper Coffins, and Pots; covering the Pots with Papers, which he pricked full of Pin-holes, as well as the Coffins, to give them Air. He fed them with Flies, and found ſometime afterwards the greateſt part of them had made their Bags. The ſame Excellent Perſon found that Spiders Bags, with regard to their Weight, afford much more *Silk* than thoſe of the *Silk-Worms*. As a Proof hereof, he obſerves, That Thirteen Ounces yield near Four Ounces of clear *Silk*, Two Ounces whereof, will make a Pair of Stockings; whereas Stockings of common *Silk* weigh Seven or Eight Ounces: Nor is there any Venom in the *Silk*, or even in the Spider, as many have imagined. M. *Bon* has been bit by them ſeveral times, without any manner of harm; and as for the *Silk*, 'tis uſed with very good Succeſs, to ſtop Bleeding and cure Wounds, the natural Gluten thereof acting as a kind of Balſom. It likewiſe yields, by Diſtillation, ſeveral Specific Medicines, particularly great Quantities of Spirit, and Volatile Salt, which being prepared after the ſame Manner as that drawn from the Bags of *Silk-Worms*, in making the *Engliſh Drops*, ſo famous over all *Europe*; may ſerve to make other Drops of greater Efficacy, which M. *Bon* calls *Drops of Montpellier*, to be uſed in all ſleepy Diſeaſes.

M. *Reaumur* being appointed by the *Royal Academy*, to make a further Enquiry into this New *Silk-work*, has rais'd ſeveral Objections and Difficulties againſt it; which are found in the Memoirs of the *Academy* for the Year 1710. The Sum of what he has urged, amounts to this: The Natural Fierceneſs of the Spiders, renders them unfit to be bred and kept together, Four or Five thouſand being diſtributed into Cells, 50 in ſome, 100 or 200 in others; the big Ones kill'd and eat the leſs, ſo that in ſhort time, there were ſcarce left one or two in each Cell: And to this Inclination of mutually eating one another, M. *Reaumur* aſcribes the Scarcity of Spiders, conſidering the vaſt Number of Eggs they lay. But this is not all: He even affirms, That the Spider's Bag is inferior to that of the *Silk-worm*, both in Luſtre and Strength; and that it produces leſs Matter to be manufactured. The Thread of the Spider's Web only bears a Weight of Two Grains without breaking; that of the

the Bag bears 36. The latter, therefore, in all Probability, is Eighteen Times thicker than the former; yet is it weaker than that of the *Silk-worm*, which bears a Weight of Two Drams and a Half. So that Five Threads of the Spider's Bag muſt be put together to equal one Thread of the *Silk-worm*'s Bag. Now, 'tis impoſſible theſe ſhould be applied ſo juſtly over one another, as not to leave little vacant Spaces between them, whence the Light will not be reflected; And of Conſequence, a Thread thus compounded, muſt fall ſhort of the Luſtre of a ſolid Thread. Add to this, that the Spider's Thread cannot be wound off, as that of the *Silk-Worm* may; but muſt, of neceſſity, be Carded; by which means being torn in Pieces, its Evenneſs, which contributes much to its Luſtre, is deſtroy'd. In effect, this want of Luſtre was taken Notice of by M. *de la Hire*, when the Stockings were preſented to the *Academy*. Again, Spiders furniſh much leſs *Silk*, than the Worms. The largeſt Bags of theſe latter, weigh Four Grains; the ſmaller Three Grains; ſo that 2304 Worms, produce a Pound of *Silk*. The Spider's Bags don't weigh above one Grain: Yet, when clear'd of their Duſt and Filth, loſe Two thirds of their Weight. The Work of 12 Spiders, therefore, only equal that of one *Silk Worm*; and a Pound of *Silk* will require at leaſt 27648 Spiders. But, as the Bags are wholly the Work of the Females, who ſpin them to depoſit their Eggs in; there muſt be kept 55296 Spiders, to yield a Pound of *Silk*. Yet will this only hold of the beſt Spiders; thoſe large ones ordinarily ſeen in Gardens, &c. ſcarce yielding a Twelfth Part of the *Silk* of the others. 280 of theſe, he ſhews, would not do more than one *Silk-Worm*; and 663552 of them would ſcarce yield a Pound.

Commerce of Silks.

French Silks. 'Tis only in the moſt Southern Provinces of *France*, that *Silk* is cultivated, Mulberry Trees planted, and Worms bred. The principal, are thoſe of *Languedoc*, *Dauphine*, *Provence*, *Avignon*, *Savoy* and *Lyons*. This laſt Place, indeed, furniſhes very few *Silks* of its own Growth; but is the great Staple whence the Merchants of *Paris* and the other Cities are to fetch them: at leaſt, they are obliged to have them paſs through *Lyons*, if they bring them from elſewhere, either by Land or Sea. There are computed to enter *Lyons*, *Communibus Annis*, 6000 Bales; the Bale valued at 160 Pound Weight: Of which 6000 Bales, there are 1400 from the *Levant*, 1600 from *Sicily*, 1500 from *Italy*, 300 from *Spain*, and 1200 from *Languedoc*, *Provence* and *Dauphine*. At the Time when the Manufactures of *Lyons* were in their Proſperity, there were reckoned 18000 Looms employ'd in the *Silk* Manufacture; but they are ſo fallen, that even in 1698, there were not reckon'd 4000 The Decay is not leſs notable at *Tours*. They had formerly 700 Mills for winding and preparing the Silks; 8000 Looms to weave them, and 40000 Perſons employ'd in the Preparation and Manufacturing thereof; which are now reduced to 70 Mills, 1200 Looms, and 4000 Perſons.

Sicilian Silks. The Commerce of the *Silks* of *Sicily*, is very conſiderable; and the *Florentines*, *Genoeſe* and *Lucceſe*, are the People who chiefly make it. Great Quantities are Yearly brought thence, eſpecially from *Meſſina*; part whereof they uſe in their own Manufactures, and ſell the reſt to their Neighbours, the *French*, &c. with Profit. The *Italians* have this Advantage, eſpecially the *Genoeſe*, over other People, That having large Eſtabliſhments in the Iſland, they are reputed as Natives, and pay no Duty for the Export. Part of the *Sicilian Silks* are Raw; the reſt Spun and Mill'd; of which laſt Kind, thoſe of St. *Lucia* and *Meſſina*, are the moſt valued. The raw, unwrought *Silks* are always ſold for ready Money; the others, ſometimes, in Exchange for other Goods.

Italian Silks. The *Silks* brought from *Italy* are partly Wrought, and partly Raw, and Un-wrought. *Milan*, *Parma*, *Lucca* and *Modena*, furniſh none but the latter Kind; *Genoa* moſt of the former; *Boulogne* affords both Kinds.

Spaniſh Silks, are all Raw, and are Spun, Mill'd, &c. in *England*, according to the ſeveral Works they are to be uſed in.

Silks *of the Levant*, are all Raw. One Advantage we have in the Commerce of the *Levant*, in *Silks*, wanting in thoſe of *Sicily*, is, That the latter are confined to a particular Seaſon of the Year; whereas the former are bought at all Times. They are brought from *Aleppo*, *Tripoli*, *Seyda*, from the Iſle of *Cyprus*, *Candia*, &c. but the principal Place of Commerce, eſpecially for the *Silks* of *Perſia*, is *Smyrna*. The *Silks* are brought hither in Caravans, from the Month of *January* to *September*. The Caravans in *January*, are loaden with the fineſt *Silks*; thoſe of *February* and *March* bring indifferent ones; the reſt, the coarſeſt. They all come from the ſeveral Provinces of *Perſia*, chiefly thoſe of *Quilan* and *Schiruvan*, and the City of *Schamachia*, ſituate near the Edge of the *Caſpian* Sea; from which three Places, a *Dutch* Author aſſures us, there don't come leſs than 30000 Bales of *Silk* in a Year. *Ardeuil* or *Ardebil*, another City of *Perſia*, not far diſtant from theſe *Silk* Countries, is the Place where the *Silks* are laid up, and whence the Caravans ſet out for *Smyrna*, *Aleppo*, and *Conſtantinople*; and 'tis this City, with *Schamachia*, that have always been eſteem'd the Centre of the *Silk* Trade; which has been ſeveral Times attempted to be removed from *Smyrna* and the *Mediterranean*, in favour of *Archangel* and the *White* Sea, by carrying them acroſs *Muſcovy*, by the *Volga* and *Dwina*, two Rivers that traverſe the principal Provinces of that vaſt Empire. This new Courſe of the *Perſian Silks* into *Europe*, was firſt propos'd by *Paolo Centurio*, a *Genoeſe*, to Czar *Baſil*, under the Pontificate of *Leo* X. The *French* had the ſame Deſign in 1626. The Duke of *Holſtein*, in 1633, ſent Embaſſadors to the Court of *Perſia* purely with the ſame View: And in 1668, the Czar *Alexis Michael* attempted the thing himſelf; but was diſappointed by the Rebellion of the Coſſacks, and the ſurprize of *Aſtracan*. In 1688, the Commerce of *Perſian Silks* had like to have been removed from *Smyrna* by an Earthquake, which almoſt overturn'd the whole City: And, doubtleſs, the Removal had been effected, but for the vigorous Means uſed by the *Turks* to prevent it. *Smyrna*, however, ſtill remains in her ancient Poſſeſſion; and the ſeveral Nations of *Europe* continue every Year to ſend their Fleets, to fetch away the *Silks*; and Matters are like to remain ſo, unleſs the Conqueſts made by the late Czar, along the *Caſpian Sea*, enable his Succeſſors, as 'tis certain he himſelf had ſuch a Thing in View, to put this great Deſign in Execution.

Chineſe, *Japaneſe* and *Indian* Silks. Several Provinces of *China* are ſo fertile in Mulberry-trees, and their Climate ſo agreeable to the Nature of *Silk-Worms*, that the Quantity of *Silk* here produced is incredible: The ſingle Province of *Tchekiam* might ſupply all *China*, and even a great Part of *Europe*, with this Commodity. The *Silks* of this Province are the moſt eſteem'd, though thoſe of *Nanquin* and *Canton* be excellent. The *Silk* Trade is the Principal in *China*, and that which employs the moſt Hands. But the *European* Merchants, who meddle in it, eſpecially in Work'd *Silks*, are to be careful of the Spinning, &c. the Waſte being uſually very great, as the *French Eaſt-India* Company lately found to their Coſt. —*Japan* would not afford fewer *Silks* than *China*; but that the *Japaneſe*, a barbarous and diſtruſtful People, have interdicted all Commerce with Strangers, eſpecially *Europeans*; excepting with the *Dutch*; who are ſaid to be admitted on certain Terms, related by *Tavernier*, but which we muſt own we can't credit, ſo much Horror they raiſe. Accordingly, the *Dutch* have endeavour'd to vindicate themſelves by the Pens of ſeveral famous Writers. — The *Silks* of the States of the Great Mogul, are brought almoſt wholly from *Kaſem-bazar*, a Mediterranean Place, whence they are convey'd by a Canal of Fifteen Leagues into the *Ganges*, by which, they are forwarded Fifteen Leagues further, to the Mouth of the famous River of *Indoſtan*. The *Silk* of *Kaſem-bazar* is Yelloviſh; as are alſo thoſe of *Perſia* and *Sicily*; there being none, that we know of, naturally White, but that of *Paleſtine*. The *Indians*, however, whiten it with a Lye made of the Aſhes of a Tree, call'd *Adam's Fig-tree*; but as the Tree is pretty ſcarce, the *Europeans* are forced to take the greateſt Part of their *Silks* in the native Yellow. *Kaſem-bazar* alone, is computed to furniſh every Year Twenty-two thouſand Bales of *Silk*, each Bale weighing 100 Pounds. The *Dutch* buy it almoſt all up; not to bring into *Europe*, no more than they do that of *Japan*; but to exchange it for other rich Merchandizes; particularly Bars of Silver, &c.

SILLON, in Fortification, is an Elevation of Earth made in the Middle of the Moat, to fortify it, when too broad: It is otherwiſe called *Envelope*, which is the more common Name. See Envelope.

SILVER, a white Metal, holding the ſecond Place among Metals; being of all others, after Gold, the fineſt, pureſt, moſt ductile, and moſt precious. See Metal.

There are *Silver* Mines in all the Four Quarters of the World. *Europe* has its Share; nor is our own Iſland quite deſtitute thereof, tho' it has none of much Value.

The Mines of *Peru*, and ſome other Parts of *America*, are much the richeſt, and moſt abundant. They appear almoſt inexhauſtible: Particularly thoſe of *Potoſi*, which continue to be dug with equal Advantage as when firſt diſcovered; with this only Difference, That the Veins which were then almoſt in the Surface of that famous Mountain, are now ſunk to prodigious Depths, the Workmen going into them by a painful Deſcent of Four or Five Hundred Steps. Many Millions of *Indians* have periſhed in them; and prodigious Numbers continue to be deſtroyed yearly.

The Ores, or Mineral Stones they dig, are not all of the ſame Quality, Conſiſtence, or Colour; ſome are white, or aſh-coloured, ſpotted with red, or blue; and called *Plata blanca*. Others are black, and called *Plomo-ronco*. Theſe laſt are the richeſt and the eaſieſt wrought: No *Mercury*

being here needed; nor any Thing, but to put them in the Fire; Where the Lead evaporating, leaves the *Silver* pure. The *Indians*, who, till the Arrival of the *Spaniards*, knew nothing of the Uſe of *Mercury*, melted none but of this Kind of Mineral. The *Roſficler*, is another black Mineral diſtinguiſhed by whetting and rubbing it againſt Iron, which turns it red. 'Tis very rich, and the Metal it yields, of the beſt Sort. The *Loroche* burns like Talc, and looks as if ſilvered; tho' it does not yield much. The *Paco* is a yellow red, very ſoft, and found almoſt broke in Pieces; 'tis not rich. The *Cobriſſo* is green, and half friable. Tho' the *Silver* be viſible, yet 'tis exceedingly difficultly drawn from it, by Reaſon of the Copper wherewith 'tis intermixed. Laſtly, the *Arannear*, which is only found in *Potoſi*, and that only in the Mine of *Cotamito*, conſiſts of Threads of pure *Silver*, interwove like a *Silver* Galoon, that has been burnt to get out the Silk.

The *Silver-Veins*, of what Quality ſoever, are uſually richer in the Middle than towards the Extremes. But the richeſt Places are thoſe where the Veins interſect. 'Tis reckoned a great Addition to the Richneſs of a Mine to be near a River, for the Advantage of Mills to grind Oar. At *Lipes* and *Potoſi*, for Inſtance, the *Caxon* of Oar muſt yield Ten Marks to defray Expences; whereas, at *Tanava*, there need not above Five.

The moſt uſual Way of ſeparating the *Silver* from the Oar, is by what they call *Pignes*. See PIGNES. Sometimes, however, they uſe nothing but Fire frequently repeated; or *Aqua Fortis*.

What renders the Working of the Mines exceedingly dangerous, is the Exhalations ariſing from them; which are even felt on the Out-ſide; and make an Impreſſion on Animals grazing in the Neighbourhood; but in the In-ſide, ſtupify the Miners, none of whom can bear ſo poiſonous an Air above a Day together. Sometimes 'tis ſo fatal, that it kills on the Spot; and obliges them to ſtop up the Veins again, whence it exhales. The Mines of *Potoſi*, are much the leaſt ſubject to them; and yet, without the Herb *Paraguay*, the Infuſion whereof is taken by the Miners, as we do that of Tea, thoſe Mines muſt be ſoon abandoned. Tho' the Mines of *Potoſi* and *Lipes*, ſtill keep up their Reputation, yet are there ſeveral diſcovered within theſe few Years, that exceed them much in Richneſs: Such are the Mines of *Oruro*, Eighty Leagues from *Arica*, and thoſe of *Ollackea*, near *Cuſco*, opened in 1712. 'Tis remarkakle, that moſt of the Mines in *America* are found in cold and barren Places.

The Method of ſeparating *Silver* from the Ore, in *Europe*, is the ſame as that of Gold: That is, by Means of *Quick-Silver*; with this Difference, that for *Silver*, to every Fifty Hundred Weight of Ore, is added One Hundred Weight of Rock-Salt, or ſome other natural Salt. That curious Operation may be ſeen at length under the Article GOLD.

To ſeparate the *Silver* from the *Mercury*, wherewith 'tis amalgamated; they have a Furnace open a-top; and the Aperture covered with a kind of Capital made of Earth, of a Cylindrical Form; that may be clapp'd on, or taken off at Pleaſure. The Maſs of *Silver*, and *Quick-ſilver*, being laid in the Furnace, the Capital applied, and the Fire lighted underneath; by this Means, the *Quick-ſilver* rais'd by the Action of the Fire, in Form of Vapour, is caught in the Capital, and taken thence, to be uſed in the Second Operation.

The Standard of fine *Silver* is 12 Penny-weights, each conſiſting of 24 Grains. When 'tis below this, it muſt be raiſed to it by Refining; which is uſually performed by means of Lead. In order to this, a Coppel is fill'd with a Mixture of Brick-aſhes, and Aſhes of a Bullock's and other Bones. 'Tis ſet on the Fire, and heated red hot; in which State the *Silver* and Lead are put in together, in the Proportion of a Pound of Lead to Eight Ounces of *Silver*, and even ſomewhat more Lead, if the *Silver* be very coarſe. As theſe Two Metals melt together, the Copper, before mixed with the *Silver*, diſſipates in Smoak, or goes away with the Scum; and ſo does the Lead it ſelf; leaving the *Silver* alone in the Coppel, in its proper Degree of Fineneſs. In this Method of Refining, wherein 6 or 7000 Pounds may be refined at once; the Metal is drawn out of the Coppel Two ways; the one by plunging in it, while ſtill liquid, a thick Bar of Iron, round which, the *Silver* ſticks in Form of a Shell, or Cruſt; repeating this again and again: The other, is by letting the Coppel ſtand till 'tis cold; in the Bottom whereof, the *Silver* fixes in Form of a Cake.

Beſides the Refining of *Silver* with Lead, there is another Manner of doing it with *Salt-Petre*; the Manner whereof, ſee deſcribed under the Article REFINING.

But both the one and the other are tedious and troubleſome; when performed on large Quantities. This occaſioned M. *Homberg* to endeavour to ſhorten the Operation; which he effected with good Succeſs. His Method is; To calcine the *Silver* with Half its Weight of common Sulphur; and after melting the whole together, to caſt a Quantity of Steel Filings upon it, at ſeveral Times: Upon this, the Sulphur quits the *Silver*, and joins it ſelf to the Iron, and both are converted into Scoria, which ſwim on the *Silver*; and the Metal it ſelf is found pure at the Bottom of the Crucible.

The Eſſay of *Silver* is alſo made by the Coppel, in the ſame Manner as the refining by Lead. If the *Silver*, after this Eſſay, preſerve its Weight, 'tis Standard; if it loſe, the Grains, or even Penny-weights of its Diminution, are accounted. See ESSAY: See alſo STANDARD.

SILVER-*Wire*, is *Silver* drawn thro' the Holes of a Wire-drawing-Iron, and by this Means reduced to the Fineneſs of a Thread or Hair. The Manner of drawing it, ſee under the Article GOLD-WIRE.

SILVER-*Leaf*, is that the Gold-beaters have reduced into fine, thin Leaves, to be uſed by Gilders, *&c.* See GOLD-LEAF.

Shell-SILVER, is made of the Shreads of *Silver* Leaves, or of the Leaves themſelves: Uſed in Painting and *Silvering* certain Works. *Shell-Silver* is prepared after the ſame Manner as *Shell-Gold*. See GOLD.

SILVER, in Chymiſtry, is called *Luna*, Moon; and ſeveral Preparations are made from it: Particularly, a *Tincture of Silver*, by diſſolving thin *Silver* Plates, or *Silver* Shot in Spirit of Nitre; and pouring the Diſſolution in another Veſſel full of Salt-water. By this Means, the *Silver* is immediately precipitated in a very white Powder, which they waſh ſeveral Times in Spring-Water. This Powder they put in a Matraſs; and pour rectified Spirit of Wine, and Volatile Salt of Urine upon it. The whole is left to digeſt in a moderate Heat for Fifteen Days; during which, the Spirit of Wine aſſumes a beautiful Sky-blue Colour, and becomes an Ingredient in ſeveral Medicines. This is alſo called *Potable Silver*, or *Argentum Potabile*. *Silver* is likewiſe converted into Cryſtals, by means of the ſame Spirit of Nitre; and 'tis this is called *Vitriol of Silver*. The *Lapis Infernalis* is nothing but *Silver* diſſolved in *Aqua Fortis*, and left to cryſtallize.

Quick-SILVER. See MERCURY.

SILVERING, the Covering of any Work with *Silver*-Leaf. 'Tis uſual to *Silver* Metals, Wood, Paper, *&c.* Which is performed either by Fire, by Oil, or by Glue. Metal-Gilders *ſilver* by the Fire: Painter-Gilders, all the other Ways. See GILDING.

SILVESTRIS, a red Grain uſed to Dye in Scarlet. The Tree that produces it, is peculiar to the Province of *Guatimala* in *New Spain*. 'Tis not unlike the Tree that produces the Cochineel, only in this, that the Fruit containing the Grain *Silveſtris*, is ſomewhat longer than that of the Cochineel-Tree: When the Fruit of the former is ripe, it opens of it ſelf, and caſts out its Seed upon a gentle ſhaking; and the *Indians* gather it in Earthen Plates ſet under the Tree for the Purpoſe. Eight or Ten of theſe Fruits do not yield above an Ounce of Seed; whereas Four of the Cochineel Fruits, yield an Ounce of Inſects. The two Drugs are much like one another, as to the Eye, but prove very different; the Tincture of Cochineel being infinitely more beautiful than that of *Silveſtris*: See COCHINEEL.

SIMA, in Architecture, a Term uſed by *Wolfius*, and ſome other Writers, for what we otherwiſe call *Cymatium* or *Simatium*. See CYMATIUM.

SIMATIUM or SIMAISE, in Architecture: See CYMATIUM. *Simatium* and *Cymatium*, are generally confounded together; yet, in effect, they ought to be diſtinguiſhed: the latter being the Genus, and the former the Species. *Simatium* of *Sima*, camous, according to *Felibien*, is the laſt and uppermoſt Member of grand Corniches, called particularly the great *Doucine* or *Gula recta*; and by the *Greeks*, *Epithides*. In the Antique Buildings, the *Simatium*, a-top of the Doric Corniche, is generally in Form of a Cavetto, or Semi-Scotia; as we ſee particularly in the Theatre of *Marcellus*: This, ſome modern Architects have imitated; but in the *Ionic* Order, the *Simatium* is always a *Doucine*. The *Simatium*, or *Doucine*, then, is diſtinguiſhed from the other Kinds of *Cymatia*, by its being camous.

SIMELIUM, a Term purely *Latin*, ſignifying a little Table, with Ranges of little Cavities therein, for the diſpoſing of Medals in Chronological Order. The Word is but ill wrote: It ſhould rather be *Cymelium*, as being formed of the *Greek* Κειμηλιον, Curioſities, or a Cabinet of precious Things. We more uſually ſay, A Cabinet of Medals, than a *Simelium*.

SIMILAR, in Arithmetic and Geometry. Thoſe Things are ſaid to be *Similar*, or *alike*, which cannot be diſtinguiſh'd but by their Com-preſence; that is, either by immediately applying the one to the other, or ſome other Third to them both. There is nothing, therefore, found in one of the *Similar* Things, but is equally found in the other; that is, if you note all the Things in A, which may be diſcerned and conceiv'd, without aſſuming any other; and, in like Manner, note all the Things in B, which may be

be thus conceived: and A be *Similar* to B; all Things in A will be the ſame with thoſe in B.

Since a Quantity cannot be underſtood, otherwiſe, than by aſſuming ſome other Quantity to refer it to; *Similar* Things, notwithſtanding their Similitude, may differ in Quantity: And ſince, in *Similar* Things, there is nothing wherein they differ, beſide the Quantity; Quantity itſelf is the Internal Difference of *Similar* Things. See SIMILITUDE.

SIMILAR *Parts*, as A a, have the *ſame* Ratio to their Wholes B b; and if the Wholes have the *ſame* Ratio to the Parts, the Parts are *Similar*. *Similar Parts* A a, are to each other as their Wholes B b. See PART.

SIMILAR *Rectangles*, are thoſe which have their Sides about the equal *Angles*, proportional. See RECTANGLE.

Hence 1°. All Squares muſt be *Similar Rectangles*. See SQUARE.— 2°. All *Similar Rectangles* are, to each other, as the Square of their homologous Sides.

SIMILAR *Triangles*, are ſuch as have all their three Angles reſpectively equal to each other. See TRIANGLE.

Hence 1°. All *Similar Triangles* have their Sides about the equal Angles, proportional.— 2°. All *Similar Triangles* are, to each other, as the Squares of their homologous Sides.

SIMILAR *Polygons* are thoſe, whoſe Angles are equal, and their Sides proportional.

And the like of other *ſimilar* rectilinear Figures. See POLYGON, and RECTILINEAL *Figure*.

Hence, all *Similar Polygons* are, to each other, as the Squares of the homologous Sides.

SIMILAR *Arches*, are ſuch as are *Similar*, or equal Parts of their reſpective Circumferences.

SIMILAR *Segments* of Circles, are ſuch as contain equal Angles. See SEGMENT.

SIMILAR *Conic-Sections*, are thoſe whoſe Diameters make Angles equal to thoſe of their Ordinates; *i. e.* thoſe which are equilateral and equiangular.

SIMILAR *Plain Numbers*, are thoſe which may be ranged into *Similar Rect-angles*; *i. e.* into Rectangles, whoſe Sides are proportional: As 6 multiplied by 2, and 12 by 4; the Product of one whereof is 12, and the other 48, are *Similar Numbers*.

SIMILAR *Solid Numbers*, are thoſe whoſe little Cubes may be ſo ranged as to make *Similar* and Rectangular Parallelipipeds.

In all SIMILAR *Figures*, the homologous Angles are equal; and the homologous Sides proportional. All regular Figures, and *Similar* irregular ones, are in a duplicate Ratio of their homologous Sides. Circles, and *Similar Figures*, inſcribed in them, are, to each other, as the Squares of the Diameter. See FIGURE.

SIMILAR *Angles*, are alſo equal *Angles*. In ſolid *Angles*, when the Planes, under which they are contained, are equal both in Number and Magnitude, and are diſpoſed in the ſame Order; they are *Similar*, and conſequently equal. See ANGLE.

In SIMILAR *Triangles*, and *Parallelograms*, the Altitudes are proportional to the homologous Sides; and the Baſes are cut proportionably by thoſe Sides. See TRIANGLE, *&c.*

SIMILAR *Diſeaſe*, a Diſeaſe of ſome ſimple, ſolid Part of the Body; as of a Fibre, with regard to its Tenſion or Flaccidity; of a Membrane; a nervous Canal, *&c.* See DISEASE.

SIMILAR *Parts*, in Anatomy, thoſe Parts of the Body which, at firſt Sight, appear to conſiſt of like Parts, or Parts of the ſame Nature: Of theſe we uſually reckon Ten, *viz.* The Bones, Cartilages, Ligaments, Membranes, Fibres, Nerves, Arteries, Veins, Fleſh, and Skin: Each of which ſee under its proper Article. Dr. *Grew*, in his Anatomy of Plants, obſerves, that theſe have, likewiſe, their *Similar*, and Organical Parts. See PARTS.

SIMILE, or SIMILITUDE, in Rhetoric, *&c.* a Compariſon of two Things, which, though different in other Reſpects, yet agree in ſome one: As, He ſhall be *like* a Tree planted by the Water-ſide, *&c.* The Difference between a *Simile*, and a *Compariſon*, conſiſts in this; That the *Simile* properly belongs to what we call the *Quality* of the Thing, and the *Compariſon* to the *Quantity*. See COMPARISON.

SIMILITUDE, in Arithmetic, Geometry, *&c.* the Relation of two Things *ſimilar* to each other; or which are only diſtinguiſhable by Com-preſence. See SIMILE. The Notion of *Similitude*, which now makes ſome Figure in Geometry, *&c.* is owing to M. *Leibnitz*: 'Twill be rendered eaſy by the following Inſtance. Suppoſe two Watches perfectly alike; the one belonging to *Caius*, the other to *Gracchus*. If, now, *Caius* pull out his Watch in Preſence of *Gracchus*; the latter will be ſurprized, and fancy it his own; but he will perceive it different from his own, upon pulling out his own: that is, *Gracchus* diſtinguiſhes *Caius*'s Watch from his own, by their Com-preſence; or, by applying the one immediately to the other.

Euclid, and after him moſt other Authors, demonſtrated all Things from the ſole Principle of Congruity: *Wolfius*, in lieu hereof, ſubſtitutes that of *Similitude*; which, he tells us, was communicated to him by M. *Leibnitz*, and which he finds of very notable Uſe in Geometry, as ſerving to demonſtrate many Things directly, which are only demonſtrable from the Principle of Congruity, by an Ambages.

SIMONIACAL is applied to a Perſon guilty of *Simony*; or of purchaſing a Benefice, or other ſacred Matter, with Money. See SIMONY. A *Simoniacal* Perſon convict, is infamous, and incapable of holding any Benefice.

SIMONIANS, a Sect of ancient Hereticks, the firſt that ever diſturb'd Chriſtianity; if they might be ſaid to do ſo, who were little more than mere Philoſophers, and made Profeſſion of Magic. *Simon Magus*, ſo often mentioned in the *Acts*, was their Leader, and died under the Emperor *Nero*; St. *Peter* ſtill ſurviving: So that *Clemens Alexandrinus* is miſtaken, when he makes *Simon* poſterior to *Marcion*. St. *Epiphanius* ſays expreſly, That the firſt Hereſy was ſet on foot by *Simon* the *Magician*, born in a little City of *Samaria*, who pretended to be the great Virtue and Power of God, ſent from Heaven to Earth. Among the *Samaritans* he made himſelf paſs for God the Father, and among the *Jews*, for the Son. He patch'd up a Kind of medly Syſtem, out of the Philoſophy of *Plato*, the religious Fables of the Heathens, and Chriſtianity: Particularly, from the *Platoniſts* he borrow'd abundance of Things relating to the Worſhip of Angels, which he perverted to Uſes of Magic; pretending, there was no Salvation, but by the Invocation of Angels, who were, as it were, the Mediators between God and Man: To which ſuperſtitious Worſhip of Angels it is that St. *Paul* ſeems to refer in his Epiſtle to the *Coloſſians*. The *Gnoſticks*, whereof the ſame *Simon* was the Father, adopted the ſame Practice of worſhipping Angels, and even improved on it. See GNOSTICKS.

SIMONY, the Crime of trading with ſacred Things, particularly of purchaſing a Benefice with Money. By the *Engliſh* Canons, *Anno* 1229, *Simony* is not only committed by an Agreement for Money in Hand, or to be paid yearly; but for any other Profit or Emolument; any Reward, Gift, or Benefit, directly or indirectly; or by Reaſon of any Promiſe, Grant, Bond, *&c.* and this, either in Acceptance of a Living, or in an Exchange or Reſignation. The Penalty, by our Laws, is, That the corrupt Patron ſhall forfeit the next Preſentation to the King, and two Years Value of the Living; and the corrupt Incumbent, be for ever diſabled to hold the Living.

SIMONY is committed by the Buying or Selling the Sacrament, Baptiſm, Ordination, Abſolution, as well as of the Nomination and Collation to Benefices, a Place in a Monaſtery, or the like. Some have pretended it to be ſufficient, that the Ordination were gratuitous; and that for the reſt, the Revenues might be bought and ſold as a Temporal Thing: But the Canons of ſeveral Councils have condemned this ſubtle Diſtinction; ſince the Revenues are attach'd to an Eccleſiaſtical Office purely Spiritual. The Caſuiſts diſtinguiſh three Kinds of *Simony*. *Mental Simony*, is that which ſticks in the mere Will, and Inclination, without ever breaking forth into Act: As when a Preſent is made to a Collator, without taking any Notice that we expect a Benefice from him. This Kind of *Simony* is only puniſhable *in foro Conſcientiæ*. *Conventional Simony* is where there is an expreſs Act, and a formal Bargain, though it never come to an Execution. *Real Simony*, is where the Convention is executed on both Sides, which laſt is the moſt criminal of them all. The Penalty of *Simony* is Depoſition in a Clerk, and Excommunication in a Layman. 'Tis a Maxim among the Romiſh Canoniſts, That there is no *Simony* in the Court of *Rome*; in Regard, the Pope acts there as an abſolute Soveraign. They alſo ſay, That Reſignations, *in favorem*, are not to be admitted but by the Pope, as favouring a little of *Simony*. On theſe Occaſions, however, they ſwear, That there has been no Deceit, Colluſion, or *Simony*, or other illegal Covenant. *Peter Damianus* diſtinguiſhes three Kinds of *Simony*; that of Money, that of the Tongue, and that of Services. *Simony of Money*, or *per munus a manu*, is where Money is really paid down for a Benefice: He adds, That 'tis likewiſe committed, by expending Money to live at Court to obtain a Benefice. *Simony of the Tongue*, or *per munus a lingua*, conſiſts in flattering the Collator, or making one's ſelf agreeable by Complaiſance and Commendation. *Simony of Services*, or *per munus ab obſequio*, conſiſts in the doing them good Offices to obtain a Benefice. The Word is borrow'd from *Simon Magus*, who is mention'd in the *Acts* of the Apoſtles, as offering to buy the Power of working Miracles with Money.

It was agreed, by all the Juſtices, *Trin. Oct. Jac. Primi*, That if the Patron preſented any Perſon to a Benefice with Cure,

Cure, for Money, that ſuch Preſentation, &c. is void, though the Preſentee were not privy to it; and the Statute gives Preſentation to the King; but this is now repealed.

SIMPLARY, *Simplaris*, in Antiquity, a *Roman* Soldier, who had only ſingle Pay; thus call'd, in Oppoſition to the *Duplaries*, or ſuch as had double Pay.

SIMPLE, ſomething not mixed or compounded; in which Senſe it ſtands in Oppoſition to *Compound*. The Elements are *Simple* Bodies; from the Compoſition whereof all mix'd Bodies reſult. In Geometry we ſay, the moſt *Simple* Demonſtrations are the beſt: The *Simpleſt* Machines are the moſt eſteemed. In Pharmacy there are *Simple Remedies* and Compounds. In *Grammar* we have *Simple Verbs*, or Primitives; and Compounds, which have ſome Particle added to them. In Juriſ-prudence we have a *Simple* Donation, in oppoſition to a mutual or reciprocal one. A *Simple Sale*, in Oppoſition to that made with a Reſervation of the Faculty of Redemption. *Simple Homage*, in Oppoſition to Liege Homage.

SIMPLE, in Muſic, is chiefly uſed in Oppoſition to *Double*; ſometimes to a *Compound* of ſeveral Parts, or Figures of different Values, &c. *Simple Cadence*, is that where the Notes are all equal through all the Parts. *Simple Concords* are thoſe, wherein we hear at leaſt two Notes in Conſonance; as a Third, and a Fifth; and, of conſequence, at leaſt three Parts: Which is either done immediately, and called the *Harmonical Triad*; or in a more remote Manner; that is, when the Sounds, that are not in the Baſe, are one or two Octaves higher. This Diſtance has no ill Effect in the Third; but in the Fifth it has; and, generally ſpeaking, the nearer, or more immediate the Concords are, the better. We alſo ſay, C *Simple*, in Oppoſition to *c* Accented.—— *Simple Counter-point*, is a Harmonical Compoſition, wherein Note is ſet againſt Note; in Oppoſition to a figurative Counter-point. *Simple Fugue*, or *Simple Imitation*, is, when one Part imitates the Singing of another for ſome Meaſures. *Simple Interval:* See INTERVAL. *Simple Triple:* See TRIPLE.

SIMPLE Equation, in Algebra, is an Equation where the unknown Quantity is only of one Dimenſion. *E.gr.* if $x = (a + b) : 2$. See EQUATION.

SIMPLE, in Botany, is a general Name given to all Herbs, and Plants; as having each its particular Virtue, whereby it becomes a *Simple Remedy*. The *Simples* brought from the *Levant*, and the *Eaſt-Indies*, were not known among us till about the Year 1200.

SIMPLEFYING, in Eccleſiaſtical Matters, is the taking away of a Cure of Souls from a Benefice, and diſpenſing the Beneficiary from Reſidence. Several Benefices, which have been *Simplefied*, now require Reſidence; and, an Infinity of others, which required Reſidence, have been *Simplefied*. Some uſe the Word in a more extenſive Signification, *viz.* for the ſhortning a Relation, &c. or retrenching every Thing not preciſely neceſſary: When the Matter of Fact ſhall be *Simplefied*, and ſtripp'd of its vain Circumſtances, the Court will ſee, &c.

SIMPLE QUANTITIES, are ſuch as have but one Sign, as $2a$, and $-2b$; whereas $a+b$, and $+d-c+b$, are compound *Quantities*. Theſe are only uſed in Algebraical Calculations.

SIMPLUDIARIA, in Antiquity, a kind of funeral Honours paid to the Deceas'd. Some will have the *Simpludiaria* to be Funerals, at which Games were exhibited: Such is the Sentiment of *Paulus Diaconus*. *Feſtus* ſays, They were thoſe, in the Games whereof nothing were ſeen but Dancers and Leapers, called, according to *Scaliger*, *Corvitores*; but who, according to M. *Dacier*, were only a kind of Dancers, who run along the Maſts and Yards of Veſſels or Boats, call'd *Corbes*. In other reſpects, thoſe Two Authors agree as to the kind of Funeral, *viz.* That it was oppoſite to thoſe call'd *Indictivæ*; wherein, beſides the Dancers and Leapers, obſerv'd in the *Simpludiaria*, there were *Deſultores*, or People who vaulted on Horſes; or, perhaps, Horſe-races, wherein the Cavaliers leap'd from Horſe to Horſe at ſpeed. The Word is form'd from the *Latin*, *Simplex* and *Ludus*, *Simpludaria* or *Simpliludaria*, Simple Games.

SIN, a Breach, or Tranſgreſſion of ſome divine Law or Command. *Plato* defines *Sin* to be ſomething devoid, both of Number and Meaſure; by way of Contradiction to Virtue, which he makes to conſiſt in muſical Numbers, &c. Hence *Suarez* obſerves, That an Action becomes *Sinful*, by its wanting a due Commenſuration; for as every thing meaſured refers to ſome Rule, from which if it deviate, it becomes incommenſurate; and as the Rule of Man's Will is the Law of God: So, &c. *Suarez* adds, That all evil Actions are prohibited by ſome divine Law; and that this is required to the Perfection of the divine Providence. *Simplicius*, and, after him, the Schoolmen aſſert, That Evil is not any poſitive Thing, contrary to Good; but a mere Defect and Accident. See EVIL.

SINS are diſtinguiſh'd into *Original* and *Actual*. The *Romiſh* Caſuiſts again diſtinguiſh *Actual Sins* into *Mortal*, which are ſuch as make us loſe the Grace of God; and *Venial*, which alone are pardon'd, as being only *Sins* of Infirmity, not of Malice. The Divines are not yet agreed, what the *Sin* againſt the Holy Ghoſt is. See ORIGINAL SIN.

SINAPISM, in Pharmacy, &c. an external Medicine, in form of a Cataplaſm; compoſed chiefly of Muſtard-ſeed, pulveriz'd, and mix'd up with the Pulp or Fleſh of Figs, or with Briony, Garlic, Onion, Naſturtium, Euphorbium, Ranunculi or the like. The *Sinapiſm* excites a Redneſs, Heat, itching Tumour, and ſometimes a Bliſter on the Place 'tis applied to. 'Twas anciently in great Requeſt; and ſtill continues in Uſe for inveterate Diſeaſes of the Head; long, continued Defluxions, &c. The Word is form'd from the *Latin*, *Sinapis*, Muſtard-Seed.

SINCIPUT, is the Fore-part of the Head, reaching from the Fore-head to the Coronal Suture. See CRANIUM.

SINDON, in Chirurgery, a little round Piece of Linnen or Lint, uſed in dreſſing a Wound after trepanning. The firſt thing done after the Operation of Trepanning, is to pour a few Drops of white Balm on the Dura Mater: then a Spoonful of Mel-Roſatum, being warm'd with a little Balm, Two *Sindons* are dipt in it, the one of linnen Cloth, the other of Lint: The firſt of them is immediately applied upon the Dura-Mater; and, being greater than the Hole in the Skull, its Circumference is thruſt all round between the Cranium and the Membrane: Then the ſecond *Sindon* is applied, and the Hole quite ſtopp'd with Lint. The next Morning, when the Apparel is taken off, the Brain is never left bare; but aſſoon as the former *Sindons* are removed, new ones are clapp'd in their Room.

SINE, or right *Sine*, in Trigonometry, a right Line drawn from one Extremity of an Arch, perpendicularly upon the Radius drawn from the other Extremity: or, the *Sine* is half the Chord of twice the Arch; thus the Line A D (Tab. *Trigonom.* Fig. 6.) which is half the Chord A B, of double the Arch A E B, is the right *Sine*; or, ſimply, the *Sine* of the Arch A E.

The *Whole* SINE, *Sinus totus*, is the *Sine* of the Quadrant H E, that is, the whole *Sine* is the ſame with the Radius H C.

The *Verſed* SINE, is a Part E D of the *Whole Sine* or Radius, intercepted between the right *Sine* A D, and the Arch A E.

1° The right *Sine* A D, being perpendicular to the Radius E C; all *Sines* drawn to the ſame Radius, are parallel to each other. 2° Since the Arch A E is the Meaſure of the Angle A C E, and A I the Meaſure of the contiguous Angle A C I; and the Quadrant H E the Meaſure of the right Angle; A D is alſo the right *Sine*, and E D the verſed *Sine* of the Angles A C E and A C I; and the *Whole Sine* is the *Sine* of the right Angle. 3° Two Angles contiguous, as A C E and A C I, have the ſame *Sine*. 4° The *Sines* of obtuſe Angles are the ſame with thoſe of their Complements to Two right Angles. 5° All *Sines* of Similar Arches have the ſame *Ratio* to their Radii.

The SINE-*Complement* or *Co-Sine*, is the *Sine* of an Arch A E, which is the Complement of another Arch A E, to a Quadrant. Thus the *Sine* of the Arch A H, is call'd the *Sine-Complement* of the Arch A E.

In eſtimating the Quantity of *Sines*, &c. we aſſume Radius for Unity; and determine the Quantity of the *Sines*, Tangents and Secants in Fractions thereof. From *Ptolomy*'s Almageſt, we learn, That the Ancients divided the Radius into 60 Parts, which they call'd Degrees, and thence determined the Chords in Minutes, Seconds and Thirds; that is, in Sexageſimal Fractions of the Radius, which they likewiſe uſed in the Reſolution of Triangles. The *Sines*, or Half-Chords, for ought appears, were firſt uſed by the *Saracens*. *Regiomontanus*, at firſt, with the Ancients, divided the Radius into 60 Degrees; and determined the *Sines* of the ſeveral Degrees in Decimal Fractions thereof. But he afterwards found 'twould be more commodious to aſſume Radius for 1; and thus introduced the preſent Method into Trigonometry. In the common Tables of *Sines* and Tangents, the Radius is conceiv'd, divided into 10000000 Parts; beyond which we never go in determining the Quantity of the *Sines* and Tangents. Hence, as the *Sine* of a Hexagon ſubtends the Sixth Part of a Circle, and is equal to the Radius; the *Sine* of 30° is 5000000.

1° *The* SINE A D *being given; to find the* Sine-Complement.

From the Square of the Radius A C ſubtract the Square of the *Sine* A D: The Remainder will be the Square of the *Sine-Complement* A G: Whence, the Square Root being extracted, gives the *Sine Complement*. *E.gr.* Suppoſing A C, 10000000, A G will be found 8660254, the *Sine* of 60°.

2° *The*

2° *The* SINE A D *of the Arch* A E *being given; to find the* Sine *of the Half-Arch, or Half of* A E.

Find the Chord of the Arch A E (See CHORD): for Half of this is its *Sine*. Thus, ſuppoſing D G and A D, as in the preceding Problem; we ſhall find the *Sine* of the Arch Half A E, or the *Sine* of 15°. = 2588190.

3° *The* SINE D G, *of the Arch* D F *being given; to find the* Sine D E, *of the double Arch* D B, *Fig.* 7.

Since the Angles at E and G are right Angles; and the Angle B is common to each Triangle B C G and D E B; we ſhall have B C : C G : : B D : D E : wherefore C G being found by the Second Problem, and B D being double of D G; D E is found by the Rule of Proportion.

4° *The* SINES F G *and* D E (*Fig.* 8.) *of the Arches* F A *and* D A, *whoſe Difference* D F *is greater than* 45 *Minutes, being given; to find any intermediate* Sine, *as* I L.

To the Difference F D of the Arches, whoſe *Sines* are given; the Difference of the Arch I F, whoſe *Sine* is required, and the Difference of the given *Sines* D H; find a fourth Proportional: This added to the leſs given *Sine* F G; the Aggregate will be the *Sine* required.

5° *To find the* SINE *of* 45 *Degrees.*

Let H I (Fig. 6.) be a Quadrant of the Circle; then will H C I be a right Angle: conſequently the Triangle, rectangular; therefore $HI^2 = HC^2 + CI^2 = 2HC^2$; wherefore, ſince H C the whole *Sine*, is 10000000; if from $2HC^2$ ſquared, 200000000000000, be extracted the ſquare Root 14142136; we ſhall have the Chord H I, whoſe Half 7071068 is the *Sine* of 45° required.

6° *The* SINE *of a Minute or* 60″ F G, (*Fig.* 8.) *being given; to find the* Sine *of one or more Seconds* M N.

Since the Arches A M and A F are very ſmall; A M F may be taken for a right Line, without any ſenſible Error in the Decimal Fractions of the Radius wherein the *Sine* is expreſs'd; that is, the Arches A M and A F may be taken proportional to their Chords. Wherefore, ſince M N is parallel to F G; we ſhall have A F : F G : : A M : M N: Therefore A F, F G and A M being given, M N is eaſily had.

To Conſtruct a Canon of SINES.

The *Sines* of 30° 15° 45° and 36° (which we have already ſhewn how to find,) being had; we can thence conſtruct a Canon of all the *Sines* to every Minute, or even Second. For from the *Sine* of 36° we find thoſe of 18° 9° 4° 30′ and 2° 15′, by the Second Problem: The *Sines* of 54° 72° 81° 85° 30′ and 87° 45′, &c. by the firſt Problem. Again, for the *Sine* of 45°, find the *Sine* of 22° 30′ 11° 15′, &c. From the *Sines* of 30° and the *Sines* of 54°, find the *Sine* of 12°. From the *Sine* of 12°, find the *Sines* of 6° 3° 1 30′ 35′ 78°, &c. From the *Sine* of 15°, find the *Sine* of 7° 30′, 30° 45′, &c. 'till you have 120 *Sines* ſucceeding each other orderly, at an Interval of 45 Minutes. Between theſe, find the intermediate *Sines* by the Fifth Problem: Thus will the Canon be compleat.

From the *Sine* of an Arch given; to find the Tangent and Secant. See TANGENT and SECANT.

To find the Logarithm of a given *Sine*; See LOGARITHM. *Note*, the Logarithm of a *Sine*, is call'd an *Artificial Sine*.

In every Triangle, the Sides are as the *Sines* of the oppoſite Angles. See TRIANGLE.

The Sine B C (*Fig.* 9.) *and the Verſed* Sine A B, *being given in common Meaſure, not in Parts of the Radius; to find the Arch* E F C *in Degrees.* Find the Semi-diameter A D, (See SEMI-DIAMETER.) Then in the Triangle D B C, beſides the Right Angle B, by the Sides A C and D C, we find the Angle A D C, which ſhews the Number of Degrees in the Arch, the Double whereof is the Arch F C; the uſe of which Problem is in finding the Segment of a Circle. See SEGMENT.

Line of SINES, a Line on the Sector, *Gunter's* Scale, &c. the Deſcription and Uſe whereof ſee under the Articles SECTOR and GUNTER'S *Scale.*

SINE CURES are Eccleſiaſtical Benefices without Cure of Souls. See BENEFICE, and CURE.

No Church, where there is but one Incumbent, can properly be a *Sine-Cure:* And though the Church being down, or the Pariſh being become deſtitute of Pariſhioners, the Incumbent may be thereby neceſſarily acquitted from the actual Performance of publick Duty, yet he is ſtill under an Obligation to do it, whenever a Church ſhall be built, and there are a competent Number of Inhabitants: And in the mean while, if the Church be Preſentative, as moſt ſuch Churches are, the Incumbent is inſtituted into the Cure of Souls; and ſuch Benefices are rather Depopulations than *Sine-Cures*, and it will be proper for the new Incumbent to read the 39 Articles, and the Liturgy in the Church-yard, &c. and to do what other Incumbents uſually do.

But a Rectory, or a Portion of it, may properly be a *Sine-Cure*, if there be a Vicar endowed, and then it doth not come within the Statute of Pluralities, 21 *H.* VIII. *c.* 13. which declareth, That no Parſonage that hath a Vicar endowed, ſhall be comprehended, &c. ſo that here no Diſpenſation is neceſſary to hold this *Sine-Cure* with a former Living: Nor need he read the Articles or Divine Service, as required by 13 *Eliz. c.* 12. which extends only to a Benefice with Cure. ---A *Sine-Cure* Donative wants no Inſtitution and Induction: but one Preſentative muſt have both; eſpecially if it conſiſt in Glebe and Tythes, and not in a Portion of Money: But the Inſtitution muſt not run in *Curam Animarum*, but in *Rectoriam, ſive portionem Rectoriæ de* A B, &c. ---By the above-mention'd Statute 21 *H.* VIII. not only Prebends and Rectories, with Vicarages endowed, but Deaneries and Archdeaconries, are declared to be Benefices without Cure.

SINE-DIE, in Law, when Judgment is given againſt the Plaintiff; he is then ſaid to be in *miſericordia pro falſo clamore ſuo*: But when for the Defendant, then it is ſaid, *Eat inde ſine die, i. e.* he is diſmiſſed the Court. ---The Phraſe is alſo uſed in Parliament, for the Adjournment of any Debate, without fixing the Day when it ſhall come on again, and is looked upon as a genteeler Diſmiſſion of the Thing required.

SINEW, in Anatomy, &c. is what we otherwiſe call a *Nerve*. See NERVE.

SINGING, the Action of making divers Inflexions of the Voice, agreeable to the Ear, and even anſwering to the Notes of a Song or Piece of Melody. See SONG.

The firſt thing done in learning to *ſing*, is to raiſe a Scale of Notes by Tones and Semi-tones, to an Octave, and deſcend again by the ſame Notes; and then to riſe and fall by greater Intervals, as a 3d, 4th, and 5th; and to do all this by Notes of different Pitch. Then theſe Notes are repreſented by Lines and Spaces, to which the Syllables *fa, ſol, la, mi*, are applied, and the Pupil taught to name each Line and Space thereby; whence this Practice is uſually call'd *Sol-fa-ing*. The Nature, Reaſon, Defects, &c. whereof, ſee under the Article SOL-FA-ING.

SINGULAR *Number*, in Grammar, the firſt manner of declining Nouns, and conjugating Verbs; uſed when we only ſpeak of a ſingle Perſon or Thing. See NUMBER.

The *Latins, French, Engliſh*, &c. have no Numbers but the *Singular* and *Plural*; the *Greeks* and *Hebrews* have likewiſe a *Dual*. See PLURAL, DUAL, &c.

SINGULTUS, in Medicine, a convulſive Motion of the Midriff, commonly call'd *Hiccoup*. See HICCOUP.

SINICAL *Quadrant*, a Kind of *Quadrant* furniſh'd with an Index, and two Sights, to take Altitudes, &c. by; and, beſides, its Side, or Face, covered over with *Sines*, drawn from each Side, interſecting each other; whereby the Seamen can ſolve, by Inſpection, any Problem in Plain Sailing. See SAILING.

Its Conſtruction and Uſe; ſee under the Article QUADRANT.

SINISTER, ſomething on, or towards the left Hand. Hence *Siniſter* is ordinarily uſed among us for unlucky; tho' in the Holy Rites of Divining, the *Romans* uſed it in an oppoſite Senſe. Thus *Avis Siniſtra*, or a Bird on the left Hand, was eſteem'd a happy Omen: Whence in the Law of the Twelve Tables, *Ave Siniſtra populi magiſter eſt.* And hence the *Greeks*, according to *Lipſius*, call the left Hand, ἀειστερὰ, beſt.

Some derive the Word *Siniſter, a Sinendo*; becauſe the Gods, by ſuch Auguries, permit us to proceed in our Deſigns.

SINISTER, in Heraldry. The *Siniſter* Side of an Eſcutcheon is the left Side. *Siniſter chief Point*, is the next middle Chief, on the left Side. *Siniſter baſe Point*, is next the baſe Point, at the bottom of the Eſcutcheon. See POINT, ESCUTCHEON, &c.

SINISTER *Aſpect*, among Aſtrologers, is an Appearance of two Planets, happening according to the Succeſſion of the Signs; as *Saturn* in *Aries*, and *Mars* in the ſame Degree of *Gemini*. See ASPECT.

SINISTRI, a Sect of ancient Hereticks, thus call'd; becauſe they held the left Hand, *Siniſtram manum*, in Abhorrence, and made it a Point of Religion, not to receive any thing therewith. What in us, is a Piece of Civility; in them was a Superſtition. *Balſamon* obſerves, that they were likewiſe called *Sabbathians* and *Novatians*. See NOVATIANS, &c.

SI *non omnes*, a Writ of Aſſociation, whereby, if all in Commiſſion cannot meet at the Day aſſign'd, it is permitted, that two or more of them may finiſh the Buſineſs. See ASSOCIATION.

SINOPER, in Natural Hiſtory. See RUDDLE.

SINOPLE or SENOPLE, in Heraldry, the Green Colour in Armories; thus called by the ancient Heralds, tho' *Pliny* and *Iſidore*, by *Color Praſinus*, or *Sinople*, mean a

brownish Red, such as that of our Ruddle. *Sinople* signifies Love, Youth, Beauty, Rejoicing and Liberty; whence it is, that Letters of Grace, Abolition, Legitimation, &c. are used to be seal'd with Green Wax. See GREEN. *F. Menestrier* derives it from the *Greek*, *Prasina hopla*, Green Armories; by corruptedly retrenching the first Syllable, *pra*; which is no new Thing among Oriental Words, witness *Salonica* for *Thessalonica*.

SINUOSITY, a Series of Bends and Turns in Arches, or other irregular Figures; sometimes jetting out, and sometimes falling in. Such is the Motion of a Serpent, &c. 'Tis the *Sinuosity* of the Sea Coasts that forms Bays, Ports, Capes, &c. *Du Loir* observes, that the Course of the River *Meander*, creeping in a thousand agreeable *Sinuosities*, served *Dedalus* as a Model to form his Labyrinth by. See LABYRINTH.

SINUS, in Chirurgery, a little Bag or Sacculus, form'd by the Side of a Wound, or Ulcer; wherein *Pus* is collected. See PUS.

Sinus's that slope downwards, *Scultet* observes, are difficult to heal: Yet that Surgeon undertakes to cure any *Sinus* in a Week, by the Medicaments he describes Page 338, and an agglutinative Bandage. He adds, that he never comes to make an Incision, till he finds that the Pharmaceutic Applications are ineffectual; and that for the Dilatation of *Sinus*'s, he does not use the deceitful Scalpel; as being more apt to deceive the Operator than the Patient.

SINUS, in Anatomy, a kind of Cavity in certain Bones, and other Parts, the Entrance whereof is very narrow, and the bottom wider and more spacious. See BONE. Of these *Sinus*'s, we find several in the several Parts of the Body; particularly in the Basis of the Skull, on the *Ossa petrosa*, where the Ancients imagined their Use was to render the Bones more light: In several of the Joints of the Body, they serve to receive the Apophyses of the other Bones. In the Duplicatures of the *Dura Mater*, are several *Sinus*'s, which Doctor *Drake* observes to be venous Channels, form'd for the Reconveyance of the Blood. Of these, Four only are considerable, *viz.* the *Sinus Longitudinalis*, which running along the middle of the convex Part of the Brain, sends out a Branch on each Side, between the Brain and Cerebellum, call'd the *Lateral Sinus*'s: And the *Torcular Herophili*, form'd out of a Concourse of the *Lateral Sinus*'s, and Pineal Gland. They are all form'd of the several Venous Branches, which return the Blood from the Brain and Cerebellum, and deliver their Contents into the Jugular Veins; whereof they are, as it were, the Roots. The Coats of these *Sinus*'s, are furnished with strong Fibres, by means whereof, they are dilated by the Influx of the Venal Blood, and again contracted with a reciprocal Motion, like the Pulse of an Artery. See DURA MATER

SION COLLEGE. See COLLEGE.

SIPHON or SYPHON, in Hydraulicks, a crooked Tube, one Leg or Branch whereof is longer than the other; used in the raising of Fluids, emptying of Vessels, and in various Hydrostatical Experiments. ---The Word in the original *Greek*, σίφων, signifies, simply, *Tube*, whence some apply the Term to common Tubes or Pipes: *Wolfius*, particularly describes two Vessels under the Name of *Siphons*; the one Cylindrical in the Middle, and Conical at the two Extremes; the other Globular in the Middle, with two narrow Tubes fitted to it, Axis-wise; both serving to take up a Quantity of Water, &c. and to retain it when up.

But the most useful and celebrated *Siphon* is as follows: A crooked Tube A B C, (Tab. Hydraulicks Fig. 2.) is provided, of such a Length, and with such an Angle, as that when the Orifice A, is placed on an horizontal Plane, the Height of A B, may not exceed 30 Foot. (For common Uses, a Foot, or half a Foot high, suffices. If, now, the less Arm A B, be immerg'd in Water, or any other Liquid, and the Air be suck'd out of it by the Aperture C, till the Liquor follow; the Liquor will continue to flow out of the Vessel, through the Tube B C; as long as the Aperture A is under the Surface of the Liquor. Note, instead of sucking out the Air; the Event will be the same, if the *Siphon* be at first filled with the Fluid, and the Aperture C stopp'd with the Finger, till the Aperture A be immerg'd.

The Truth of the Phænomenon is known by abundance of Experiments. Nor is the Reason of part of it far to seek. In sucking, the Air in the Tube is rarified, and the Equilibrium destroyed, consequently the Water must be raised into the lesser Leg A B, by the preponderating Pressure of the Atmosphere.

The *Siphon* being thus filled, the Atmosphere presses equally on each Extremity thereof; so as to sustain an equal Quantity of Water in each Leg: But the Air not being able to sustain all the Water in the longer Leg, unless it exceed 32 Feet in Height; it will be more than able to sustain that in the shorter Leg; with the Excess of Force, therefore, will raise new Water into the shorter Leg; which new Water cannot make its way, but by protruding the first before it. By this means is the Water continually driven out at the longer End, as 'tis continually raised at the shorter.

But *Wolfius*, and some other Authors assert, that the Water continues to flow through the *Siphon*, even when removed under a Receiver, and the Air exhausted from it. The Reason of this, if it be true, is very difficult to account for.

Some will have it, that there is still Air enough left in the evacuated Receiver, to raise the Water to an Inch or two. But as both Mercury and Water are found to fall entirely out of the Torricellian Tube, *in Vacuo*; the Pressure of the thin remaining Air, can never be the Cause of the Ascent, both of Mercury and Water, in the less Leg of the *Siphon*.

Hence, as the Height of the *Siphon* is limited to 31 Foot; for this only Reason, that Air cannot raise Water higher; It does not appear, whether or no we are in the Right in rejecting *Hero*'s Method of carrying Water, by means of a *Siphon*, over the Tops of Mountains, into an opposite Valley. For *Hero* only orders the Apertures of the *Siphon* to be stopp'd, and Water to be pour'd through a Funnel into the Angle or Meeting of the Legs, till the *Siphon* were full; when, shutting the Aperture in the Angle, and opening the other two, the Water will continue to flow. Now, if there only need Air for the first Rise of the Water into the less Leg, not for the Continuation of the Motion; it were possible to raise the Water much higher than the Height of the Atmosphere would carry it. ---The real Cause, therefore, of this extraordinary, tho' well-known Phænomenon; needs some further Disquisition. This is certain, that a *Siphon* once set a running, will persist in its Motion, tho' removed into the most perfect Vacuum our Air-Pumps will make: Or, if the lower Orifice of a full *Siphon* be shut, and the whole be thus placed in a Receiver, with a Contrivance for opening the Orifice when the Air is exhausted; the Water will be all emptied out of the Vessel, as if it had been in open Air.

This, too, is remarkable enough, that the Figure of the *Siphon* may be varied at pleasure, (see Fig. 3. &c.) provided only the Orifice C be below the Level of the Surface of the Water to be drawn up; but, still, the further 'tis distant from it, the faster will the Fluid be carried off. And if, in the Course of the Flux, the Orifice A be drawn out of the Fluid; all the Liquor in the *Siphon* will go out at the lower Orifice C: That in the Leg C B, dragging, as it were, that in the shorter Leg A B after it. If a fill'd *Siphon* be so disposed, as that both Orifices A and C be in the same horizontal Line; the Fluid will remain pendant in each Leg; how unequal soever the Length of the Legs may be. Fluids, therefore, in *Siphons*, seem, as it were, to form one continued Body; so that the heavier Part descending, like a Chain, pulls the lighter after it.

Lastly, it must be observed, that the Water will flow out, even through a *Siphon* that is interrupted, by having the Legs A D and F C joyned (Fig. 4.) together by a much bigger Tube full of Air.

The SIPHO *Wurtembergicus*, is a very extraordinary Machine of this Kind, performing most of the Things the common *Siphon* will not reach, *E.gr.* In this, though the Legs be in the same Level, yet the Water rises up the one, and descends through the other: The Water rises, even tho' the Aperture of the less Leg be only half immerg'd in Water: the *Siphon* has its Effect after continuing dry a long time: either of the Apertures being opened, the other remaining shut for a whole Day, and then open'd, the Water flows out as usually. Lastly, The Water rises and falls indifferently through either Leg. ---The Project of this *Siphon*, was laid by *Jordanus Pelletier*, and executed at the Expence of Prince *Frederic Charles* Administrator of *Wirtemberg*, by his Mathematician, *Schahackard*, who made each Branch 20 Feet long, and 18 Feet apart; the Description thereof was published by *Reiselius* his Physician, which gave Occasion to M. *Papin* to invent another, that did the same Things, described in the *Philosophical Transactions*; and which *Reiselius*, in another Paper in the *Transactions*, ingenuously owns to be the very same with that of *Wirtemberg*. Its Structure will appear from its Figure; which is represented, Tab. *Hydraulicks*, Fig. 5.

SIRE, a Title of Honour in *France*; now given to the King only, as a Mark of Soveraignty. In all Placets and Requests, Epistles, Discourses, &c. to the King, he is address'd under the Title of *Sire*. Some derive the Word from the *Latin*, *Herus*, Master: Of which Opinion seems *Will. Budeus*, who, in speaking to King *Francis* I. always calls him *Here*, *q. d.* Master, or *Sire*. Others derive the Word from the *Greek*, κυρὸς, *Lord*; of which Opinion is *Pasquier*, who adds, that the ancient *Franks* gave the Title to God, calling him *Beau sire Diex*. Others derive the Word from the *Syrian*, and maintain, it was first given to the Merchants who traded to *Syria*. *Menage* will have it come from *Senior* Elder; whence *Seigneur*, then *Seignor*, and *Sire*.

SIRE was likewise anciently used in the same Sense with Sieur and Seigneur, and applied to Barons, Gentlemen and Citizens. The *Sire de Joinville* has wrote the History of St. *Louis*.

SIRIUS,

SIRIUS, in Aſtronomy, the *Dog-Star*; a very bright Star of the firſt Magnitude in the Mouth of the Conſtellation *Canis Major*, or the *Great Dog*. See CANIS. The *Arabs* call it *Aſchere*, *Eſchecre*, *Scera*; the *Greeks*, *Sirius*; and the *Latins*, *Canis candens*. Its Longitude, according to Mr. *Flamſtead*, is 9° 49′ 1″, its Latitude 39° 32′ 8″ *South*.

SISTRUM or CISTRUM, an ancient muſical Inſtrument, uſed by the Prieſts of *Iſis* and *Oſiris*. *Spon* deſcribes it as of an oval Form, in manner of a Racket, with three Sticks traverſing it breadth-wiſe, which playing freely, by the Agitation or Beating of the Inſtrument, made a kind of Sound, which to the Ancients ſeem'd melodious. Mr. *Malcolm* takes the *Siſtrum* to have been no better than a kind of a Rattle. *Jer. Boſius* has an expreſs Treatiſe on the *Siſtrum*, intitled, *Iſiacus de Siſtro*. *Oiſelius* obſerves, that the *Siſtrum* is found repreſented on ſeveral Medals; and alſo on *Taliſmans*. *Oſiris* on ſome Medals, is painted with a Dog's Head and a *Siſtrum* in his Hand.

SITE or SCITE, the Situation of a Houſe, *&c.* and ſometimes the Ground-Plot, or the Spot of Earth it ſtands on.

SITE, in Logic, one of the Predicaments, declaring a Subject to be ſo and ſo placed. See PLACE.

SITOPHYLAX, in Antiquity, an *Athenian* Magiſtrate, who had the Intendance of the Corn, and was to take Care that no Body bought more than was neceſſary for the Proviſion of his Family. By the *Attic* Laws, particular Perſons were prohibited buying more than fifty Meaſures of Wheat a Man; of thoſe Meaſures, we mean, called φόρμαι: And the *Sitophylax* was to look to the Obſervation of this Law. 'Twas a Capital Crime to prevaricate in it. There were Fifteen of theſe *Sitophylax*'s, Ten for the City, and Five for the *Pireum*. The Word is form'd from the *Greek*, Σῖτος *Corn*, and φυλαξ, *Keeper*.

SITUS, in Geometry and Algebra, the Situation of Lines, Surfaces, *&c.* *Wolfius* gives us ſome Things in Geometry, which are not deduced from the common Analyſis; particularly things depending on the *Situs* of Lines and Figures. In effect, M. *Leibnitz* has invented a particular Kind of Analyſis, call'd *Analyſis Situs*, and built a peculiar kind of Calculus thereon, call'd *Calculus Situs*.

SIXAIN, SIXTH, SEXAGENA, in War, an Order of Battle wherein Six Batallions having been ranged in a Line, the Second and Fifth are made to advance, to form the Van-guard; the Firſt and Sixth to retire, to form the Rear-guard; the Third and the Fourth remaining on the Spot, to form the Corps, or Body of the Battle. The Word is *French*, where it ſignifies the ſame thing.

SIX *Clerks*, Officers in *Chancery* of great Account, next in Degree below the Twelve Maſters; whoſe Buſineſs is to enroll Commiſſions, Pardons, Patents, Warrants, *&c.* which paſs the Great Seal. They were anciently *Clerici*, and forfeited their Places if they married: They are alſo Attornies for Parties in Suits depending in the Court of *Chancery*. Under them were formerly 60 Clerks, who, with the Under-Clerks, did the Buſineſs of the Office; which Number was afterwards increaſed to 90. At preſent the Number is indefinite; an Order having been made, for the reducing them to their ancient Number of 60; by not filling up the Vacancies that may happen by Death, *&c.* till they are fallen to that Standard.

SIXTH, in Muſic, one of the Simple Original Concords, or Harmonical Intervals. See CONCORD. The *Sixth* is of two Kinds; *greater* and *leſſer*; and hence is eſteem'd one of the Imperfect Concords; though each of them ariſe from a Diviſion of the Octave. See OCTAVE. The greater *Sixth* is the Concord reſulting from a Mixture of the Sounds of two Strings, that are to each other as 3 to 5. The leſſer *Sixth* reſults from two Strings, which are to each other as 5 to 8. See SCALE. The leſſer *Sixth* is compoſed Diatonically of Six Degrees, whence its Name; and of Five Intervals, Three whereof are Tones, and Two Semi-tones; Chromatically of Eight Semi-tones; Five whereof are greater, and Three leſs. It has its Form or Origin from the *Ratio*, *Super-tri-partiens quintas*, as of 8 to 5. The greater is compoſed Diatonically like the leſs, of Six Degrees and Five Intervals; among which are Four Tones, and a Semi-tone: And Chromatically of Nine Semi-tones; Five whereof are greater, and Four leſs; of Conſequence it has a leſs Semi-tone more than the former. It has its Origin from the *Ratio Super-bi-partiens tertius*, as of 5 to 3. Anciently the *Sixth* had only one Reply, which was the 13th; but in the modern Syſtem, it has ſeveral, as the 20th, 27th, *&c.* all marked indifferently in the thorough Baſe, by the Figure 6. And even the *Sixth* itſelf, both greater and leſſer, when uſed naturally, is not expreſſed any otherwiſe than by a Simple *Sixth*. But when 'tis greater or leſs accidentally, to the 6 is added ſome other Mark, as may be ſeen in M. *Broſſet*.

Beſides the two kinds of *Sixth*'s here deſcribed, which are both good Concords; there are two others that are vitious and diſſonant. The firſt is the *Defective Sixth*, compoſed of two Tones and three Semi-tones, or of Seven Semi-tones, five whereof are greater, and two leſs. The ſecond is the *Redundant Sixth*, compoſed of Four Tones, a greater Semi-tone, and a leſs. Whence ſome call it *Pentatonon*, as comprehending Four Tones. Theſe two being both diſſonant, ſhould never be uſed in Melody, and very rarely in Harmony.

As to the two Conſonant *Sixth*'s, they were anciently to be uſed very ſparingly; but at preſent we make them as often as we pleaſe, as we do with Thirds; the *Sixths* being in reality, no other than inverted Thirds; but Care is uſually taken, that the firſt *Sixth* that occurrs be leſs, and the laſt greater; and that from the greater, we riſe to the Octave, and from the leſs, fall to the Fifth.

SIZE, an Inſtrument uſed to find the Weight of fine round Pearls withal. See PEARL. It conſiſts of five thin Pieces or Leaves, about two Inches long, and half an Inch broad; faſtned together at one End by a Rivet. In each of theſe, are ſeveral round Holes drill'd, of different Diameters. Thoſe in the firſt Leaf ſerve for weighing Pearls from ¼ a Grain to Seven Grains. Thoſe of the Second, for Pearls from Eight Grains or two Carats, to five Carats, *&c.* and thoſe of the Fifth, for Pearls from 6 ¼ to 8 ½.

SKELETON, in Anatomy, an Aſſemblage or Arrangement of all the Bones of a dead Animal, diſpoſed in their natural Situation, and kept in that Diſpoſition by means of Wiars, *&c.* *Skeletons* ſerve to good Purpoſe, in learning the Oſteology. See OSTEOLOGY.

For the ſeveral Bones a *Skeleton* conſiſts of; See BONE.

The Word is form'd from the *Greek* σκέλλω, I dry.

SKIFF or SQUIFF, a Shaloop, or the leſs of two Ship-boats. See BOAT.

SKIN, in Anatomy, a large thick Membrane, ſpread over the whole Body, ſerving as the external Organ of Feeling, and as a Cover and Ornament of the Parts underneath. The *Skin* conſiſts of Three Parts; the external one, called the *Cuticle*, *Epidermis*, or *Skarf Skin*. See CUTICLE. The middle-moſt is called the *Corpus Reticulare*, becauſe pierced through with a great Number of Holes, like a Net or Sieve. See RETICULARE CORPUS. The innermoſt, called the *Cutis*, is a Fibrous Subſtance, wove out of the Extremities of Arteries, Veins, Nerves, Tendons, *&c.* Whence ariſe abundance of little Eminences, call'd *Papillæ Pyramidales*. See CUTES and PAPILLÆ.

It is likewiſe ſet with an Infinity of Glands, called *Milliary Glands*, each whereof has its excretory Duct, paſſing along with the Pyramidal *Papillæ*, through the Holes of the *Corpus Reticulare*, and terminating at the Cuticle. The *Papillæ* are held by the Moderns to be the Organ of Feeling, and the Excretory Veſſels ſerve to carry off the Matter of Perſpiration, which is ſeparated from the Blood in the Milliary Glands. See MILLIARY GLANDS, PERSPIRATION and FEELING.

Nutrition, M. *Perrault* obſerves, is ſometimes taken in throughout the whole Body of Animals, at the Pores of the *Skin*. The ſubtile Subſtances of nutritious Matters applied externally to thoſe Bodies, are found to penetrate them, to mix with the Blood and Juices, and are there aſſimilated. On this Account, he adds, it is, that Butchers Dogs, Turnſpit-Dogs, *&c.* are generally very Fat, and even Butchers, Cooks, *&c.* themſelves. M. *Dodart* takes it, that Plants receive a great Part of their Food by the external Bark, not all by the Root. See ROOT.

SKIN, in Commerce, is particularly uſed for this Membrane ſtripped off the Animal, to be prepared by the Tanner, Skinner, Currier, Parchment-Maker, *&c.* and converted into Leather, *&c.* See LEATHER.

The Uſe of *Skins* is very ancient; the firſt Garment in the World being made thereof. The *Danes* and other Northern Nations, have a long Time dreſs'd in *Skins*.

Morocco's are made of the *Skins* of a kind of Goats. See MOROCCO.

Parchment is uſually made of Sheeps *Skins*; ſometimes of Goat *Skins*. See PARCHMENT.

Velom is a kind of Parchment made of the *Skin* of an abortive Calf, or at leaſt of a ſucking Calf. See VELOM.

The True Chamois or Shammy, is made of the *Skin* of an Animal of the ſame Name; though frequently counterfeited with Goats and Sheeps *Skins*. See CHAMOIS.

Shagreen is prepared at *Conſtantinople*, of the hind Part of the *Skin* of a Horſe, Mule or Aſs of the Country, prepared and tanned, and when ſoft and manageable, ſtretch'd on a Frame, and expoſed to the Sun. This done, they ſprinkle Muſtard-Seed on the *Skin*; taking Care to rub it ſeveral Times over with the Hand. By means hereof, and the Heat of the Sun, the Grain of the Leather is rais'd up, and there hardned. See CHAGRIN.

For the ſeveral Preparations of *Skins*; See TANNING, CURRYING, CHAMOISING, *&c.*

SKINKER, a Cup-bearer, or Butler. See BUTLER.

SKIRMISH, in War, a Combat, in Preſence of two Armies, between Perſons who advance from the Body for that Purpoſe, and introduce, or invite to a general, regular Fight. The Word ſeems form'd from the *French*, *Eſcarmouche*, which ſignifies the ſame thing, and which *Nicod* derives from the *Greek*, χαρμὴ.

χαρὰ, which ſignifies at the ſame time, both *Light Combat* and *Joy*. *Menage* derives it from the *German*, *Schirmen* or *Skermen*, to Fence. *De Cange*, from *Scaramuccia*, a light Engagement, of *Scara* and *Muccia*, a Body of Soldiers hid in Ambuſh; in regard moſt *Skirmiſhes* are performed by Perſons in Ambuſcade.

SKULL, in Anatomy. See CRANIUM.

SKY, the blue Air or Atmoſphere. See ATMOSPHERE.

The Azure Colour of the *Sky*, Sir *Iſaac Newton* attributes to Vapours beginning to condenſe therein, which have got Conſiſtence enough to reflect the moſt reflexible Rays, *viz.* the Violet ones; but not enough to reflect any of the leſs reflexible ones. See REFLEXIBILITY.

M. *de la Hire* attributes it to our viewing a black Object, *viz.* The dark Space beyond the Regions of the Atmoſphere, thro' a white or lucid one, *viz.* the Air illumined by the Sun: A Mixture of Black and White always appearing Blue. See BLUE.

This Account is not his; 'tis as old as *Leonardo da Vinci*.

SLAB, the Outſide ſappy Plank or Board ſaw'd off from the Sides of a Timber Tree.

SLAUGHTER. See MAN-SLAUGHTER.

SLATE, a blue foſſile Stone, very ſoft when dug out of the Quarry, and on that Account eaſily cut or ſaw'd into thin long Squares or Eſcallops, to ſerve in Lieu of Tiles for the Covering of Houſes. See COVERING. 'Tis ſometimes alſo uſed to make Tables of; to Pave withal, &c. The Ancients were unacquainted with the Uſe of *Slate*, and inſtead thereof cover'd their Houſes with Shingle, as we read in *Pliny*. Beſides the *Blue Slate*, we have in *England* a *Greyiſh Slate*, call'd alſo *Horſham Stone*, from a Town in *Suſſex* of that Name, where the greateſt Quantities of it are found.

The *Blue Slate*, is a very light, laſting, and beautiful Covering but chargeable withal, in regard the Roof muſt be firſt Boarded over, the *Slates* hung on Tacks, and laid with finer Mortar than Tiles. The *Grey Slate* is chiefly uſed in the Covering of Churches, Chappels, Chancels, &c.

'Tis dearer than Tiles, but far more durable. The Timber of the Roof needs to be very ſtrong for theſe *Grey Slates*, it being almoſt double the Weight of Tiles. See TILE.

To judge of the Goodneſs of *Slate*, Mr. *Colepreſs*, in the *Philoſophical Tranſactions*, orders it to be knock'd againſt any hard Body, to make it yield a Sound: If the Sound be good and clear, the Stone is firm and good; otherwiſe, 'tis crazy.

Another Method of proving its Goodneſs, is, by weighing it exactly, then letting it lie 6 or 8 Hours under Water, and wiping it very clean, if it weighs more now than it did before, 'tis of that Kind that ſoaks in Water, and therefore will not long endure, without rotting the Lath or Timber. Another Method of Trial is, by placing a *Slate* half a Day perpendicularly in a Veſſel of Water, ſo as to reach a conſiderable Height above the Level thereof: If the *Slate* be firm and cloſe, then it will not draw Water, that is, the Water will not have aſcended above half an Inch above the Level of that in the Veſſel, nor that perhaps any where but at the Edges, the Texture whereof might be looſened by hewing; but a bad Stone will have drawn the Water to the very Top, be it as high as it will. There are *Slates* in ſeveral Places, which the moſt experienced *Slaters*, or Coverers, conjecture to have continued on Houſes ſeveral Hundreds of Years, and are yet as firm as when firſt put up.

M. *Leibnitz* informs us, in the Hiſtory of the *French* Academy, that in ſeveral Parts of the Dutchy of *Brunſwick*, particularly about *Oſteroda*, &c. there are Horizontal Veins of *Slate*, wherein are found very exact and finiſh'd Repreſentations of various Kinds of Fiſhes and Plants, appearing in their natural Breadth and Length, but without any Thickneſs The ſame Impreſſions are alſo frequently found even in a Mixture of Copper and Silver. M. *Leibnitz* accounts for this Appearance, by ſuppoſing the Lakes and Meadows of the Places to have been cover'd over with a Kind of Earth, which has buried the Fiſhes and Plants; or that ſome very muddy Water, much impregnated with Earth, has covered them up, or carried them away. This Earth he takes to have ſince hardned into *Slate*; and length of Time, or ſome other Cauſe, to have conſumed the delicate Matter of the Fiſh, &c. Much as the Bodies of Flies or Ants, which are found encloſed in Amber, are quite diſſipated, and nothing left but a mere Delineation. The Matter of the Fiſh, or Plant, thus conſumed, has left its Form impreſſed in the *Slate*, by means of the Cavity remaining therein; which Cavity has been at length filled up with a Metallic Matter. Whether that the Subterranean Fire, in baking the Earth into *Slate*, has ſeparated the Metal therefrom; or whether a Metallic Vapour penetrating the *Slate*, has become fix'd in theſe Cavities.

SLAVE, a Perſon in the abſolute Power of a Maſter, either by War or Conqueſt. See SERVANT.

We find no mention of *Slaves* before the Deluge; but immediately after, *viz.* in the Curſe of *Cain*, *Gen.* ix. 25. whence 'tis eaſily inferred, that Servitude commenced ſoon after that Time: For in *Abraham*'s Time we find it generally eſtabliſhed. Some will have it to have commenced under *Nimrod*, becauſe it was he who firſt began to make War, and of conſequence to make Captives; and to bring ſuch as he took either in his Battles, or Irruptions, into Slavery.

The *Romans* called their *Slaves Servi*, from *Servare* to *keep*, *ſave*; as being ſuch as were not killed, but ſaved, to yield Money either by Sale, or by their Work. Other Authors are of Opinion, that the *Roman* Name *Servi* might come from that of *Serbi*; as that of *Slaves* from *Sclavi*, a People. *Slavery* is abſolutely aboliſhed in *England*, and *France*, as to Perſonal Servitude: Our Servants are not *Slaves*, but only ſubject to certain determinate Services. The Moment a *Slave* ſteps on *Engliſh* Ground, he becomes Free.

SLAVES make a very conſiderable Article of the Traffick in *America*. The *Engliſh South-Sea* Company have the ſole Privilege of furniſhing the *Spaniſh Weſt-Indies* with *Slaves*, by Treaty. See NEGRO. *Menage* and *Voſſius* derive the Word from *Sclavus*, which is the Name of a *Scythian* People, according to the latter, whom *Charlemagne* condemned to perpetual Impriſonment, whence the *Italians* have made their *Schiavo*, the *Germans* their *Slaef*, and we *Slave*: But the former will have it the Name of a People whom the *Italians*, and other Nations, uſed to buy to make Drudges of; whence the proper Name of a Nation, in Time, became the Name of a State or Condition.

Among the *Romans*, when a *Slave* was ſet at Liberty, he changed his Name into a Surname; took the *Nomen* or *Præ-nomen* of his Maſter; to which he added the *Cognomen* or Nick-name he had been called by when a *Slave* See LIBERTIN. By the Civil Law, the Power of making *Slaves* is eſteem'd a Right of Nations, and follows as a natural Conſequence of War. The *Lacedæmonians*, ſay ſome, or as others ſay, the *Aſſyrians*, firſt introduced the Practice; which the *Romans* not only approved of, but even invented new Manners of making of *Slaves*: For Inſtance, a Man born Free, among them, might ſell his Freedom, and become a *Slave*. This voluntary *Slavery* was firſt introduced by a Decree of the Senate, in the Time of the Emperor *Claudius*, and at length abrogated by *Leo*. The *Romans* had Power of Life and Death over their *Slaves*, which no other Nations had; and even this Severity was moderated by the Laws of the Emperors; and by one of *Adrian*, it was made Capital to kill a *Slave* without a Cauſe. The *Slaves* were eſteemed the proper Goods of their Maſters, and all they got belong'd to them: But, if the Maſter were too cruel in his Domeſtic Corrections, he was obliged to ſell his *Slave* at a moderate Price. As *Slavery* was not aboliſhed by the Goſpel, the Cuſtom of having *Slaves* laſted a long Time in *Chriſtendom*. In the Time of *Louis the Groſs*, they were ſo numerous in *Egypt*, that 'twas found a difficult Matter to quell a Body of them who had made Head againſt their Maſters: Yet *Bartholus*, who lived in 1300, obſerves, there were none left in his Time.

SLEASY *Holland*, a Kind of *Holland* thus call'd, becauſe made in *Sileſia* in *Germany*; and which, from its Slightneſs, occaſions all thin, ſlight, ill-wrought *Hollands* to be called *Sleaſy*. See HOLLAND.

SLEDGE, a Kind of Machine, or Carriage, without Wheels, for the Conveyance of very weighty Things, as huge Stones, Bells, &c. The *Dutch* have a Kind of *Sledge*, whereon they can carry a Veſſel of any Burthen by Land. It conſiſts of a Plank a Foot and a Half broad, and the Length of the Keel of a moderate Ship, raiſed a little behind, and hollow in the Middle; ſo that the Sides go a little aſlope, and are furniſh'd with Holes to receive Pins, &c. The reſt is quite even.

SLEEP, that State wherein the Body appearing perfectly at Reſt, external Objects move the Organs of Senſe as uſually, without exciting the uſual Senſations. See WAKING.

SLEEP, according to *Rohault*, conſiſts in a Scarcity of Spirits; which occaſions that the Orifices or Pores of the Nerves in the Brain, whereby the Spirits uſed to flow into the Nerves, being no longer kept open by the Frequency of the Spirits, ſhut of themſelves. For this being ſuppoſed, as ſoon as the Spirits, now in the Nerves, ſhall be diſſipated, the Capillaments of thoſe Nerves, having no Supplement of new Spirits, will become lax, and cohere as if cemented together; and ſo be unfit to convey any Impreſſion to the Brain; beſides, the Muſcles being now void of Spirits, will be unable to move, or even ſuſtain the Members: Thus will Senſation, and Motion, be both deſtroyed. See SENSATION, MUSCULAR MOTION, SPIRITS, &c.

Sleep is broke off unnaturally, when any of the Organs of Senſe are ſo briskly acted on, that the Action is propagated to the Brain: For upon this, the few Spirits remaining in the Brain, are all called together, and unite their Forces to unlock the Pores of the Nerves, &c. But if no Object ſhould thus affect the Organ, yet *Sleep* would in ſome Time be broke off naturally; for the Quantity of Spirits generated in *Sleep*, would at length be ſo great,

great, that, ſtretching out the Entrances of the Nerves, they would open themſelves a Paſſage.

With regard to Medicine, *Sleep* is defined, by *Boerhaave*, to be that State of the *Medulla* of the Brain, wherein the Nerves do not receive ſo copious, nor ſo forcible an Influx of Spirits from the Brain as is required to enable the Organs of Senſe, and voluntary Motion, to perform their Offices.

The immediate Cauſe hereof appears to be the Scarcity of Animal Spirits, which being ſpent, and requiring ſome Time to be recruited, the minute Veſſels, before inflated, become flaccid and fall: Or elſe, 'tis owing to ſuch a Preſſure of the thicker Blood againſt the Cortex of the Brain, as that the Medulla, becoming likewiſe compreſſed by its Contiguity with the Cortex, the Paſſage of the Spirits is obſtructed. The natural Cauſe of *Sleep* is any Thing that may contribute to theſe two. ---And hence its Effects are underſtood: For in *Sleep* ſeveral Functions are ſuſpended, their Organs and Muſcles are at Reſt; the Spirits ſcarce flow through them, therefore there is a leſs Conſumption of them; but the ſolid *Villi* and Fibres of the Nerves are but little chang'd, but an Equilibrium obtains throughout; there is no Difference of Preſſure on the Veſſels, nor of Velocity in the Humours. The Motion of the Heart, Lungs, Arteries, Viſcera, *&c.* is increaſed; nor is it chang'd or abated by the Action of the Senſes, or of voluntary Motions: The Effects of which are, that the Vital Humours circulate more ſtrongly and equably thro' the Canals, which are now freer, laxer, and opener, as not being compreſſed by the Muſcles. Hence the Blood is driven leſs forcibly, indeed, into the Lateral Veſſels, but more equably; thro' the greater Veſſels, both more ſtrongly, and more equably. Thus are the Lateral Fibres ſenſibly filled, as being leſs traverſed, and at length remain at reſt, with the Juices they have collected: Hence the lateral adipoſe Cells become filled and diſtended with an Oily Matter. By this means the Circulation, being almoſt wholly perform'd in the larger Blood Veſſels, becomes gradually ſlower, and at length ſcarce ſenſible, if the *Sleep* be too long continued: Thus, in moderate *Sleep*, is the Matter of the Chyle beſt converted into *Serum*; that, into thinner Humours; and thoſe, into Nouriſhment. The Attrition of the ſolid Parts is leſs conſiderable; the cutaneous Secretion is increaſed, and all the reſt diminiſh'd. The Parts wore off are now beſt ſupplied, as an equable, continual Repletion, reſtores the Humours, and repairs the Solids, the preventing and diſturbing Cauſes being then at reſt. In the mean Time, that the nutritious Matter is beſt prepared; there is an Aptitude in the Veſſels to receive, and in the Humours to enter, and the Means of Application, and Conſolidation, are at liberty: Hence, a new Production, and Accumulation, of Animal Spirits, in all the Humours, as to Matter, and in the minuteſt Veſſels as to Repletion: The Conſequence of which is, an Aptitude for *Waking*, and an In-aptitude for *Sleep*; ſo that upon the firſt Occaſion the Man awakes. See NUTRITION, *&c.*

Some of the more extraordinary Phænomena of *Sleep*, yet to be accounted for, are; That when the Head is hot, and the Feet cold, *Sleep* is impracticable: That ſpirituous Liquors firſt bring on Drunkenneſs, then *Sleep*: That Perſpiration, during the Time of *Sleep*, is twice as great as at other Times: That upon *Sleeping* too long, the Head grows heavy, the Senſes dull, the Memory weak, with Coldneſs, Pituitouſneſs, an Indiſpoſition of the Muſcles for Motion, and a want of Perſpiration. That much *Sleeping* will ſuſtain Life a long Time, without either Meat or Drink: That upon a laudable *Sleep*, there always follows an Expanſion of all the Muſcles, a repeated Yawning, and the Muſcles and Nerves acquire a new Agility: That *Fœtus*'s always *ſleep*; Children often, Youth more than grown Perſons, and they more than old Men; and that People, riſing from violent Diſtempers, *ſleep* much more than when perfectly at Health.

SLIDING, in Mechanicks, called, by ſome Authors, *Superinceſſus Radens*, is, when the ſame Point of a Body, moving along a Surface, deſcribes a Line on that Surface: Such is the Motion of a Parallelepiped, protruded along a Plane.

SLIDING RULE, a Mathematical Inſtrument, ſerving to work Queſtions in Gauging, Meaſuring, *&c.* without the Uſe of Compaſſes; merely by the *ſliding* of the Parts of the Inſtrument one by another, the Lines and Diviſions whereof give the Anſwer, by Inſpection. See RULE.

This Inſtrument is variouſly contrived, and applied by various Authors; particularly *Everard*, *Coggeſhal*, *Gunter*, *Hunt*, and *Partridge*; but the moſt uſual and uſeful ones, are thoſe of *Everard* and *Coggeſhal*; the Deſcription, and Uſes whereof, are as follow.

Everard's SLIDING-RULE is principally uſed in Gauging. See GAUGING.

'Tis ordinarily made of Box, a Foot long, an Inch broad, and $\frac{6}{10}$ thick. It conſiſts of three Parts: A Rule, on each Side whereof *a b* and *c d*, Tab. Surveying, Fig. 17. is a Groove; and two ſmall Scales, or *Sliding-Pieces*, *m*, *n*, to *ſlide* in the Grooves. When both theſe Pieces are drawn out to their full Extent, the Inſtrument is three Foot long.

On the *firſt broad Face* of the Inſtrument *a b*, are four Lines of Numbers; for the Properties, *&c.* whereof ſee LINE of NUMBERS. The firſt mark'd A, conſiſting of two Radius's number'd 1, 2, 3, 4, 5, 6, 7, 8, 9, 1; and then 2, 3, 4, 5, *&c.* to 10. On this Line are four Braſs Centre-Pins, two in each Radius; one in each whereof is mark'd M B, to ſignify that the Numbers 'tis ſet againſt, 2150.40 are the Cubic Inches in a Malt-Buſhel; the other two are marked with A, to ſignify that the Numbers they are ſet againſt, *viz.* 282, are the Cubic Inches in an Ale-Gallon. The ſecond and third Lines of Numbers, are on the *Sliding-Pieces*, and are exactly the ſame with the firſt. Cloſe to the Figure 7, in the firſt Radius, is a Dot mark'd *S i*, ſet directly over 707, denoting 707 to be the Side of a Square inſcribed in a Circle, whoſe Diameter is Unity. Cloſe to 9 is another Dot, mark'd *S e*, ſet over 886, which is the Side of a Square, equal to the Area of a Circle, whoſe Diameter is Unity. Another Dot, nigh W, is ſet over 231, the Number of Cubic Inches in a Wine-Gallon; and another near C, is ſet over 3.14 the Circumference of a Circle, whoſe Diameter is Unity. The fourth Line of Numbers, mark'd M D, to ſignify Malt Depth, is a broken Line of two Radius's number'd 2, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, 9, 8, 7, *&c.* the Numbers being ſet directly againſt M B on the firſt Radius.

On the *ſecond broad Face*, mark'd *c d*, are 1°. A Line of Numbers of one Radius, number'd 1, 2, 3, and to 10, noted by the Letter D. On this are four Centre-Pins, the firſt, mark'd W G, is the Gauge-Point for a Wine-Gallon, *i. e.* the Diameter of a Cylinder, whoſe Height is an Inch, and Content 231 Cubic Inches, or a Wine-Gallon, which is 17.15 Inches: The ſecond Centre-pin A G ſtands at the Gauge-Point for an Ale-Gallon, which is 18.95 Inches. The third M S ſtands at 86.3 the Side of a Square, whoſe Content is equal to the Inches in a ſolid Buſhel. The fourth M R. is the Gauge-point for a Malt-buſhel, which is 52.32 Inches. 2°. Two Lines of Numbers on the *Sliding-Piece*, which are exactly the ſame as thoſe on the *Sliding-Piece* on the other Side. Cloſe to the Diviſion 8 is a Dot mark'd *c*, which is ſet to 795. the Area of a Circle, whoſe Diameter is Unity; and another mark'd *d*, ſtands at 785, the Area of a Circle, whoſe Diameter is Unity. 3°. Two Lines of Segments, each number'd 1, 2, 3, to 100; the firſt, for finding the Ulage of a Cask taken, as the Middle Fruſtum of a Spheroid, lying with its Axis parallel to the Horizon; and the other, for finding the Ulage of a Cask ſtanding.

Again, on one *of the narrow Sides*, noted *e*, are 1°. A Line of Inches, number'd 1, 2, 3, *&c.* to 12, each ſubdivided into 10 equal Parts. 2°. A Line, by which, with that of Inches, we find a mean Diameter for a Cask, in the Figure of a Middle Fruſtum of a Spheroid: 'Tis number'd 1, 2, 3, *&c.* to 7, and mark'd *Spheroid*. 3°. A Line for finding the mean Diameter of a Cask, in the Figure of the Middle Fruſtum of a Parabolic Spindle, which Gaugers call, the *Second Variety* of *Casks*; 'Tis number'd 1, 2, 3, *&c.* and noted *Second Variety*. 4°. A Line, by which we find the mean Diameter of a Cask of the *Third Variety*, *i. e.* of a Cask in the Figure of two Parabolic Conoids, abutting on a common Baſe; 'tis number'd 1, 2, 3, *&c.* and noted *Third Variety*.

On the *other narrow Face*, mark'd *f*, are, 1°. A Foot divided into 100 equal Parts, mark'd F M. 2°. A Line of Inches, like that before-mention'd, noted I M. 3°. A Line for finding the mean Diameter for the fourth Variety of Casks, which is the Middle Fruſtum of two Cones, abutting on a common Baſe. It is number'd 1, 2, 3, *&c.* and noted F C, ſignifying Fruſtum of a Cone.

Note, on the Backſide of the two *Sliding-Pieces* are a Line of Inches, from 13 to 36, when the two Pieces are put Endwiſe; and againſt that, the correſpondent Gallons, or Hundred Parts, that any ſmall Tub, or the like open Veſſel (from 13 to 36 Inches Diameter) will contain at one Inch deep.

Uſe of Everard's SLIDING-RULE.

1°. *To multiply one Number by another.* Suppoſe 4 required to be multiplied by 6: Set 1 on the Line of Number S B, to 4 on the Line A; then, againſt 6 upon B is 24, the Product ſought upon A. Again, to multiply 26 by 68, ſet 1 on B to 26 on A; then, againſt 68 on B is 1768 on A, the Product ſought.

2°. *To divide one Number by another.* Suppoſe 24 to be divided by 4: Set 4 on B to 1 on A; then againſt 24 on B is 6 on A, which is the Quotient. Again, to divide 952 by 14; ſet 14 on A to 1 on B, and againſt 952 on A you have on B, 68, which is the Quotient.

3°. *To work the Rule of Three.* If 8 give 20, what will 22 give? Set 8 on B to 20 on A, then againſt 22 on B ſtands 55 on A; the Number ſought.

4°. *To find a mean Proportional between two Numbers*; Suppoſe between 50 and 72: Set 50 on C to 72 on D; then againſt 72 on C you have 60 on D, which is the Mean required.

5°. *To extract the Square Root of a Number.* Apply the Lines C and D to one another, ſo as 10 at the End of D be even with 10 at the End of C; then are theſe two Lines a Table, ſhewing the Square Root of any Number leſs than 1000000 by Inſpection: For againſt any Number on C, the Number anſwering to it on D, is the Square Root thereof. *Note*, If the given Number conſiſt of 1, 3, 5, or 7 Places, ſeek it on the firſt Radius, on the Line C, and againſt it is the Root required at D.

6°. *Either the Diameter, or Circumference of a Circle, being given; to find the other:* Set 1 on the Line A againſt 3, 141 (to which is writ C) on the Line B; and againſt any Diameter on the Line A, you have the Circumference on B; and contrariwiſe: thus, The Diameter being 20 Inches, the Circumference will be 62.831 Inches; and the Circumference being 94, 237, the Diameter will be 30.

7°. *The Diameter of a Circle given, to find the Area in Inches, or in Ale or Wine-Gallons.* Suppoſe the Diameter 20 Inches, what is the Area? Set 1 upon D, to 785 (noted *d*) on C; then againſt 20 on D is 314.159 the Area required. Now to find that Circle's Area in Ale-Gallons, ſet 18.25 (mark'd A G) upon D, to 1 on C; then againſt the Diameter 20 upon D, is the Number of Ale-Gallons on C, *viz.* 1.11. The ſame may ſerve for Wine-Gallons, Regard only had to the proper Gauge-Point.

8°. *The two Diameters of an Ellipſis being given, to find the Area in Ale-Gallons:* Suppoſe the Tranſverſe Diameter 72 Inches, and the Conjugate 50: Set 359.05 the Square of the Gauge-point on B, to one of the Diameters (ſuppoſe 50) on A; then againſt the other Diameter 72 on B, you will have the Area on A, *viz.* 10.02 Gallons, the Content of this Ellipſis at one Inch deep. The like may be done for Wine-Gallons, if inſtead of 359.05 you uſe 249.11 the Square of the Gauge-Point for Wine-Gallons.

9°. *To find the Area of a Triangular Surface in Ale-Gallons:* Suppoſe the Baſe of the Triangle 260 Inches, and the Perpendicular let fall from the oppoſite Angle 110 Inches; Set 282 (mark'd A) upon B to 130, half the Baſe on A: Then againſt 110 on B is 50.7 Gallons on A.

10°. *To find the Content of an Oblong in Ale-Gallons:* Suppoſe one Side 130 Inches, and the other 180; ſet 282 on B to 180 on A; then againſt 130 upon B is 82.97 Ale-Gallons, the Area required.

11°. *To find the Content of a regular Polygon in Ale-Gallons, one of the Sides being given:* Find the Length of the Perpendicular let fall from the Centre to one of the Sides: This multiplied by half the Sum of the Sides, gives the Area. For an Inſtance: Suppoſe a Pentagon, whoſe Side is 1 Inch; here, the Perpendicular will be found 837, by ſaying, As the Sine of half the Angle at the Centre, which in this Polygon is 36°, is to half the given Side 5, ſo is the Sine of the Complement of 36°, *viz.* 54° to the Perpendicular aforeſaid. Whence the Area of a Pentagon, whoſe Side is Unity, will be found 1.72 Inches, which divided by 282, give 1.0061, the Ale-Gallons in that Polygon.

12°. *To find the Content of a Cylinder in Ale-Gallons:* Suppoſe the Diameter of the Baſe of the Cylinder 120 Inches, the Perpendicular Height will be 36 Inches: Set therefore the Gauge-Point (A G) to the Height, 36 on C; then againſt 120, the Diameter on D, is found 1443.6, the Content in Ale-Gallons.

13°. *The Bung, and Head-Diameters, of any Cask, together with its Length, being given; to find its Content in Ale, or Wine-Gallons.*

1°. Suppoſe the Length of a Cask taken, (as the Middle Fruſtum of a Spheroid which is the firſt Caſe or *Variety*) be 40 Inches, its Head-diameter 24 Inches, and Bung-diameter 32 Inches; ſubtract the Head-diameter from that of the Bung; the Difference is 8. Look, then, for 8 Inches on the Line of Inches, on the firſt narrow Face of the Rule; and againſt it, on the Line Spheroid ſtands 5.6 Inches, which added to the Head-Diameter 24, gives 29.6 Inches for that Cask's Mean-Diameter: Set therefore the Gauge-Point for Ale (mark'd A G) on D, to 40 on C; and againſt 29.6 on D, is 97.45, the Content of the Cask in Ale-Gallons. If the Gauge-Point for Wine (mark'd W G) be uſed inſtead of that for Ale; you will have the Veſſel's Content in Wine-Gallons.

2°. If a Cask, of the ſame Dimenſions as the former be taken (as the Middle Fruſtum of a parabolic Spindle, which is the *Second Variety*) ſee what Inches, and Parts, on the Line mark'd *Second Variety*, ſtand againſt the Difference of the Bung and Head-Diameters, which in this Example is 8; and you will find 5.1 Inches, which added to 24, the Head-Diameter makes 29.1 Inches, the Mean-Diameter of the Cask: Set therefore the Rule, as before, and againſt 29.1 Inches, you will have 94.12 Ale-Gallons, for the Content of the Cask.

3°. If the Cask taken be the Middle-Fruſtum of two parabolic Conoids, which is the *Third Variety*; againſt 8 Inches, the Difference of the Head and Bung-Diameters, on the Line of Inches, you will find 4.57 Inches on the Line called *Third Variety*; this added as before to 24, gives 28.57 for the Cask's Mean-Diameter: Proceeding as before, you will find the Content 90.8 Gallons.

4°. If the Cask taken be the Fruſtums of two Cones, which is the *Fourth Variety*, againſt 8 Inches on the Line of Inches, you will find on the Line mark'd F C, 4.1 Inches to be added to 24 Inches: The reſt, carried on as before, gives the Content of the Cask 87.93 Ale-Gallons.

14°. *A Cask partly empty, lying with its Axis parallel to the Horizon; to find the Quantity of Liquor therein:* Find its whole Content, as above; which ſuppoſe 97.455 Gallons; and ſuppoſe the Inches, left dry, 8, and the Bung-Diameter 32: Then, as the Bung-Diameter on C is to 100 on the Line of Segments L, ſo are the dry Inches on C to a fourth Number on the Line of Segments: And as 100 upon B is to the Cask's whole Content on A, ſo is that fourth Number to the Liquor wanting to fill up the Cask; which, ſubtracted from the whole Contents of the Cask, gives the Liquor remaining therein. *E. Gr.* Set 32, the Bung-Diameter on C, to 100 on the Segment Line L; then againſt 8, the dry Inches on C, ſtands 17.6 on the Segment Line: Set therefore 100 on B, to the Casks whole Content on A; and againſt 17.6 on B, you have 16.5 Gallons on A; ſubtracting therefore the ſaid Gallons from 97.45, the Veſſel's whole Content; the Liquor in the Cask will be 80.95 Gallons.

15°. *A Cask partly ſtanding upright, or with its Axis perpendicular to the Horizon, to find the Liquor therein.* Suppoſe the Length of the Cask 40 Inches, and 10 of them dry; ſet 40 Inches, on the Line C, to 100 on the Segment Line S; and againſt 10, the dry Inches on the Line C, ſtands 24.2 on H the Segment Line. Set, then, 140 on B, to 97.455, the Cask's whole Content on A; and againſt 24.2 on B, you will have 23.5 Gallons, which is what is wanting to fill up the Cask: This, therefore, ſubtracted from the whole Content 97.455, gives 73.955 Gallons, for the Quantity of Liquor remaining in the Cask.

16°. *To find the Content of any right-angled Parallelepiped* (E. gr. *a Ciſtern, Uting-Fat, or the like*) *in Malt-Buſhels.* Suppoſe the Length of the Baſe 80 Inches, the Breadth 50, and Depth 9 Inches: Set the Breadth 50 on B, to the Depth 9 on C; then againſt the Length 80 on A, ſtands 16.8 Buſhels on B, the Number required.

Coggeſhal's Sliding-Rule, is principally uſed in meaſuring of the Superficies, the Solidity of Timber, &c. See Measuring, &c.

It conſiſts of two Rulers, each a Foot long, which are framed, or put together, various ways; ſometimes they are made to ſlide by one another, like Glaziers *Rules:* Sometimes a Groove is made in the Side of a common two-foot *Joint-Rule*, and a thin *Sliding-Piece* put in, and *Coggeſhal's* Lines added on that Side: But the moſt uſual and commodious way, is to have one of the Rulers *ſlide* along a Groove made along the Middle of the other, as 'tis repreſented in Table Surveying, Fig. 18.

On the *Sliding*-Side of the Rule are four Lines of Numbers, three whereof are double, that is, are Lines to two Radius's, and one, a ſingle broken Line of Numbers: The three firſt, mark'd A, B, C, are figured 1, 2, 3, &c. to 9; then 1, 2, 3, &c. to 10. Their Conſtruction, Uſe, &c. are the ſame as thoſe on *Everard's Sliding-Rule*. The ſingle Line, called the *Girt-Line*, and noted D, whoſe Radius is equal to the two Radius's of any of the other Lines, is broke for the eaſier meaſuring of Timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. 4 to 5. It is divided into 10 Parts, and each 10th ſubdivided into 4, and ſo on to 10, &c.

On the back-ſide of the *Rule*, are, 1°. A Line of Inch-Meaſure, from 1 to 12; each Inch being divided and ſubdivided. 2°. A Line of Foot-Meaſure; conſiſting of one Foot, divided into 100 equal Parts, and figured 10, 20, 30, &c. The Back-ſide of the *Sliding-Piece* is divided into Inches, Halfs, &c. and figured from 12 to 24; ſo that when ſlid out, there may be a Meaſure of two Foot.

Uſe of Coggeſhal's Sliding-Rule, *in Meaſuring Plain Superficies.*

1. *To meaſure a Square.* Suppoſe, *E. gr.* the Sides be each 5 Feet: Set 1 on the Line B, to 5 on the Line A; then againſt 5 on the Line B, is 25 Feet; the Content of the Square on the Line A.

2. *To meaſure a long Square.* Suppoſe the longeſt Side 18 Foot, and the ſhorteſt 10: Set 1 on the Line B, to 10 on the Line A; then againſt 18 Foot, on the Line B, is 180 Feet, the Contents on the Line A.

3. *To*

3. *To measure a Rhombus.* Suppose the Side 12 Feet, and the Length of a Perpendicular let fall from one of the obtuse Angles, to the opposite Side, 9 Feet: Set 1, on the Line B, to 12, the Length of the Side, on the Line A; then against 9, the Length of the Perpendicular on the Line B, is 108 Feet, the Content.

4. *To measure a Triangle.* Suppose the Base Seven Feet, and the Length of the Perpendicular let fall from the opposite Angle to the Base, 4 Feet: Set 1 on the Line B, to 7 on the Line A; then against half the Perpendicular, which is 2, on the Line B, is 14 on the Line A, for the Content of the Triangle.

5. *To find the Content of a Circle, its Diameter being given.* Suppose the Diameter 3.5 Feet: Set 11 on the Girt-Line D, to 95 on the Line C; then against 3.5 Feet on D is 9.6 on C, which is the Content of the Circle in Feet.

6. *To find the Content of an Oval or Ellipsis.* Suppose the longest Diameter 9 Feet, and the shortest 4. Find a mean Proportional between the two, by setting the greater 9 on the Girt-Line, to 9 on the Line C; then, against the less Number 4, on the Line C, is 6; the mean Proportional sought. This done, find the Content of a Circle, whose Diameter is 6 Feet; this, when found, by the last Article, will be equal to the Content of the Ellipsis sought.

Use of Coggeshal's SLIDING-RULE, *in the Measuring of Timber.*

1°. *To measure Timber the usual Way.* Take the Length in Feet, Half-Feet, and, if required, Quarters; Then measure half way back again; there girt the Tree with a small Cord or Line; double this Line twice, very evenly, and measure this fourth Part of the Girt or Perimeter, in Inches, Halves, and Quarters. The Dimensions thus taken, the Timber is to be measured as if Square, and the Fourth of the Girt taken for the Side of the Square, thus; Set 12 on the Girt-Line D, to the Length in Feet on the Line C, then against the Side of the Square, on the Girt-Line D, taken in Inches, you have, on the Line C, the Content of the Tree in Feet.

For an Instance: Suppose the Girt of a Tree, in the Middle, be 60 Inches, and the Length 30 Feet, to find the Content, set 12 on the Girt Line D, and 30 Feet on the Line C; then against 15, one Fourth of 60, on the Girt-Line D, is 46.8 Feet; the Content on the Line C. If the Length should be 9 Inches, and the Quarter of the Girt 35 Inches; here, as the Length is beneath a Foot, measure it on the Line of Foot-measure, and see what decimal Part of a Foot it makes, which you will find 75. Set 12, therefore, on the Girt Line to 75 on the first Radius of the Line C, and against 35 on the Girt Line is 64 Feet on C, for the Content.

2° *To measure round Timber the true Way.* The former Method, though that generally in Use, is not quite just. To measure Timber accurately, instead of the Point 12 on the Girt Line, use another, *viz.* 10.635; at which there should be placed a Centre-pin. This 10.635 is the Side of a Square equal to a Circle, whose Diameter is 12 Inches. For an Instance: Suppose the Length 15 Feet, and $\frac{1}{4}$ of the Girt 42 Inches: Set the Point 10.635 to 15 the Length; then against 42 on the Girt Line is 233 Feet for the Content sought; whereas by the common Way, there arises only 184 Feet. In effect, the common Measure is only to the true Measure, as 11 to 14. See TIMBER.

3° *To measure a Cube*: Suppose the Sides to be 6 Feet each; set 12 on the Girt Line D, to 6 on C; then against 72 Inches (the Inches in 6 Feet) on the Girt Line, is 216 Feet on C, which is the Content required.

4° *To measure unequally-squared Timber*; that is, where the Breadth and Depth are not equal. Measure the Length of the Piece, and the Breadth and Depth (at the End) in Inches: Then find a mean Proportional between the Breadth and Depth of the Piece. This mean Proportional is the Side of a Square, equal to the End of the Piece; which found, the Piece may be measur'd as Square Timber. For an Instance: Let the Length of the Piece of Timber be 13 Feet; the Breadth 23 Inches, and the Depth 13 Inches: Set 23 on the Girt Line D, to 23 on C; then against 13 on C is 17.35 on the Girt Line D, for the mean Proportional. Again, setting 12 on the Girt Line D, to 13 Feet, the Length on the Line C; against 17.35 on the Girt Line, is 27 Feet, the Content.

5° *To measure taper Timber*: The Length being measured in Feet, Note, one third of it; which is found thus: Set 3 on the Line A, to the Length on the Line B; then against 1 on A, is the third Part on B: Then if the Solid be round, measure the Diameter at each End in Inches, and subtract the less Diameter from the greater; add half the difference to the lesser Diameter; the Sum is the Diameter in the middle of the Piece. Then set 13.54 on the Girt to the Length of the Line C, and against the Diameter in the middle, on the Girt Line, is a Fourth Number on the Line C. Again, set 13.54 on the Girt Line to the third Part of the Length on the Line C; then against half the Difference on the Girt Line, is another fourth Number on the Line C, these two fourth Numbers added together, give the Content. For an Instance; Let the Length be 27 Feet (one Third whereof is 9) the greater Diameter 22 Inches, and the lesser 18; the Sum of the Two will be 40, their Difference 4, and half the Difference 2, which added to the less Diameter, gives 20 Inches for the Diameter in the middle of the Piece. Now set 13.54 on the Girt Line, to 27 on the Line C, and against 20 on D, is 58.9 Feet. Again, set 13.54 of the Girt Line to 9 on the Line C; and against 2 on the Girt Line (represented by 20) is 196 Parts; therefore, by adding 59.9 Feet to 126 Feet, the Sum is 59 096 Feet the Content.

If the Timber be Square, and have the same Dimensions; that is, the Length 27 Feet, the Side of the greater End 22 Inches, and that of the lesser 18 Inches, to find the Content: Set 12 on the Girt Line to 27 the Length on the Line C, and against 20 Inches, the Side of the mean Square on the Girt Line, is 75.4 Feet. Again, set 12 on the Girt Line to 9 Feet, one Third of the Length, on the Line C, and against 2 Inches, half the Difference of the Squares of the Ends on the Girt Line, is 25 Parts of a Foot, both together make 75.65 Feet, the Content of the Solid.

The Girt or Circumference of a Tree, or round Piece of Timber given; to find the Side of a Square within, or the Number of Inches of a Side, when the round Timber is Squar'd. Set 10 on A to 9 on B, then against the Girt on A, are the Inches for the Side of the Square on the Line B.

SLING, *Fundus*, a String-Instrument, serving for the casting Stones with the greater Violence. ---*Pliny, L.* 7. *C.* 56. attributes the Invention of the *Sling* to the *Phœnicians*. *Vegetius* attributes it to the Inhabitants of the *Balearic* Islands; who were famous in Antiquity, for the dextrous Management thereof. *Florus* and *Strabo* say they had three Kinds of *Slings*; some longer, others shorter, which they used according as their Enemies were nearer or more remote. *Diodorus* adds, that the first served them for a Head-band, the second for a Girdle, and that the Third they constantly carried with them in the Hand.

SLINGING, is used variously at Sea; but chiefly for the hoisting up Casks or other heavy Things, with *Slings* or Contrivances of Ropes, spliced into themselves at either End, with an Eye big enough to hold the Thing to be Slung.

SLIPPING (among Gardeners) is the pulling off a Sprig from a Branch, or a Branch from an Arm of the Tree: and so a *Slip* may have its Rents double and treble *Slipped*, or its Stalk ragged.

SLOOP, is a floating Vessel of the Shallop-kind. See FLOATING VESSEL.

In our Navy, they are Attenders on the Men of War; and are usually about 60 Ton, and carry about 30 Men. See NAVY.

SLOUGH, a deep and muddy Place; also the cast Skin of a Snake, the Damp of a Coal-pit, and the Scar of a Wound, are so called. The *Slough* of a Wild Boar is the Bed, Soil, or Mire, wherein he wallows, or in which he lies in the Day-time: *Slough* (in Hunting) is used for a Company of some Sorts of Wild-Beasts.

SLUICE, a Frame of Timber, Stone, or other Matter, serving to retain and raise the Water of a River, *&c.* and, on Occasion, to let it pass: Such is the *Sluice* of a Mill, which stops and collects the Water of a Rivulet, *&c.* to let it fall, at length, in the greater Plenty upon the Mill-wheel: such also are those used as Vents or Drains to discharge Water off Land: And such are the *Sluices* of *Flanders*, *&c.* which serve to prevent the Waters of the Sea overflowing the lower Lands, except when there is Occasion to drown them.

Sometimes there is a kind of Canal inclosed between two Gates or *Sluices*, in artificial Navigations, to save the Water, and render the Passage of Boats equally easy, and safe, upwards and downwards; as in the *Sluices* of *Briare* in *France*, which are a kind of massive Walls, built Parallel to each other at the Distance of 20 or 24 Feet, closed with strong Gates, at each End, between which is a kind of Canal or Chamber, considerably longer than broad, wherein a Vessel being inclosed, the Water is let out at the first Gate, by which the Vessel is raised 15 or 16 Foot, and pass'd out of this Canal into another much higher. By such means a Boat is convey'd out of the *Louvre* into the *Seyne*, though the Ground between them be raised above 150 Feet higher than either of those Rivers. ---The Word is form'd of the *French*, *Escluse*, which *Menage* derives from the *Latin*, *Excluſa*, found in the *Salic* Law in the same Sense. But this is to be restrained to the *Sluices* of Mills, *&c.* for as to those serving to raise Vessels, they were unknown to the Ancients.

SMACK,

SMACK, is a ſmall Veſſel with but one Maſt. See MAST. Sometimes, ſuch are employed as Tenders on a Man of War, and they are alſo uſed for Fiſhing upon the Coaſts.

SMALL-POX, *Variolæ*. See Pox and VARIOLÆ.

SMALT, a kind of Mineral Matter, prepared and purified Abroad, and brought hither, ſometimes in Form of a blue Powder, and ſometimes in Cakes; chiefly uſed along with Starch, to give Linens the finer and clearer Caſt; and beſt known by the Name of *Stone-blue*. See BLUE.

The Preparation of *Smalt*, as practiſed in *Hermanduria*, we have deſcribed in the *Philoſophical Tranſactions* by Dr. *Krieg*; Who tells us, that the Matter 'tis made of, is the Mineral Stone, called *Cobalt* or *Cadmia*, which being pulveriz'd, and the lighter Stuff waſh'd away, the Remainder is laid on a Furnace, and by a Fire, underneath and aſide it, the Flames whereof are reverberated over it, a Matter is ſeperated from it in Form of a Smoak, which ſticking to the Walls, makes what we call *Arſenic*. See ARSENIC.

When the Cobalt has done ſmoaking, 'tis cool'd, mix'd with Pot-aſhes and Powder of white Flint-ſtones, the Mixture put in Pots, and melted for five or ſix Hours in a Furnace. By this means, the Matter is form'd into a blue Glaſs, which being put in cold Water, cracks and grows tender, and is at length powder'd by an Engine, the fineſt part ſeparated by a Sieve, put into a Mill, and ground in Water, into the fineſt Powder, which by waſhing is ſtill further ſeparated from the coarſer, then dried in warm Chambers, barrell'd up, and ſent away.

SMARAGD, a precious Stone of a green Colour, very Beautiful and Brilliant. See PRECIOUS STONE.

The Oriental *Smaragds* are the moſt in Eſteem, as being the hardeſt, and their Splendor the moſt vigorous; ſo as even to tinge the ambient Air with their Greenneſs. Great Virtues are aſcribed to the *Smaragd*. *Cardan* and others ſay, it reſiſts Plagues, Poiſons and Dyſſenteries; that it refreſhes the Spirits, &c.

The Word is form'd from the *Greek*, σμάραγδος.

SMECTYMNUUS, a Term that made ſome Figure in the Time of the Civil Wars, and during the *Inter-regnum*. It was form'd of the initial Letters of the Names of Five eminent Presbyterian Miniſters of that Time, *viz. Stephen Marſhal*, *Edmund Calamy*, *Thomas Young*, *Matthew Newcomen*, and *William Spurſto*, who, together, wrote a Book againſt Epiſcopacy, in the Year 1641, whence they and their Retainers, were called *Smectymnuans*.

SMELL, Odor, with regard to the Organ, is an Impreſſion made on the Noſe, by little Particles continually exhaling from odorous Bodies. See NOSE, &c.

Smell, with regard to the Object, is the Figure and Diſpoſition of Odorous Effluvia, which ſticking on the Organ, excite the Senſe of *Smelling*. See SMELLING.

With regard to the Soul, *Smell* is the Perception of the Impreſſion of the Object on the Organ, or the Affection in the Soul reſulting therefrom. See SENSE.

The Chymiſts teach, that Sulphur is the Principle of all *Smells*, and that theſe are more or leſs ſtrong, as the Sulphur in the odorous Body, is more or leſs dried and exalted. Sulphur, they ſay, is the Foundation of Odors, as Salt is of Savors, and Mercury of Colours. See SMELLING.

Smell, like Taſte, conſiſts altogether in the Arrangement, Compoſition and Figure of the Parts; as appears from the following Experiments of Mr. *Boyle*;

1° From a Mixture of Two Bodies, each whereof, is, of itſelf, void of all *Smell*; a very urinous *Smell* may be drawn: That is, by the Grinding of Quick-lime with Sal-Ammoniac. 2° By the Admixture of common Water, which of itſelf, is void of *Smell*, or inodorous; another inodorous Body may be made to emit a very rank *Smell*. Thus Camphor diſſolved in Oil of Vitriol, is inodorous; yet mix'd with Water, immediately exhales a very ſtrong *Smell*. 3° Compound Bodies may emit *Smells*, which have no Similitude to the *Smells* of the Simples they conſiſt of. Thus Oil of Turpentine, mixt with a double Quantity of Oil of Vitriol, and Diſtilled; after Diſtillation, there is no *Smell* but of Sulphur; and what is left behind in the Retort, being again urged by a more violent Fire, yields a *Smell* like Oil of Wax. 4° Several *Smells* are only to be drawn by Motion and Agitation. Thus Glaſs, Stones, &c. which even when heated, yield no *Smell*, yet when rubbed and agitated in a peculiar Manner, emit a ſtrong *Smell*; particularly Beech-wood in turning, yields a kind of Roſy *Smell*. 5° A Body that has a ſtrong *Smell*, by being mix'd with an Inodorous one, may ceaſe to have any *Smell* at all: Thus if Aqua-fortis, not well dephlegmated, be poured on Salt of Tartar, till it ceaſe to ferment; the Liquor, when evaporated, will yield inodorous Cryſtals, much reſembling Salt of Nitre. Yet when burnt, will yield a moſt noiſom *Smell*. 6° From a Mixture of Two Bodies, the one whereof *ſmells* extremely ill, and the other not well; a very pleaſant aromatic Odor may be gain'd, *viz.* by a Mixture of Aqua-fortis, or Spirit of Nitre, with an inflammable Spirit of Wine. 7° Spirits of Wine, by mixing with an almoſt inodorous Body, may gain a very pleaſant, aromatic *Smell*. Thus inflammable Spirits of Wine, and Oil of *Dantzic* Vitriol, mix'd in equal Portions, then digeſted, and at laſt diſtill'd, yield a Spirit of a very fragrant *Smell*. 8° A moſt fragrant Body may degenerate into a fœtid one, without the Admixture of any other Body. Thus if the Spirit, mentioned in the former Experiment, be kept in a well cloſed Receiver, it will ſoon turn to the Rankneſs of Garlic. 9° From two Bodies, one whereof is inodorous, and the other fœtid; a very pleaſant *Smell* may ariſe, much reſembling Musk, *viz.* by putting Pearls into Spirit of Vitriol: For when diſſolved, they yield a very agreeable *Smell*.

SMELLING, the Act whereby we perceive *Smells*; (See SMELL) or the Act, whereby we become ſenſible of odorous Bodies, by means of certain Effluvia thereof, which ſticking on the Olfactory Organ, and briskly enough to have their Impulſe propagated to the Brain, excite a Senſation in the Soul. See SENSATION.

The principal Organs of *Smelling*, are the Noſtrils, and the Olfactory Nerves; the minute Ramifications of which latter are diſtributed throughout the whole Concave of the former: Their Deſcription, ſee under their proper Heads.

Smelling is performed by the odorous Effluvia floating in the Air, being drawn into the Noſtrils, in Inſpiration, and ſtruck with ſuch Force againſt the Fibrillæ of the Olfactory Nerves which the Figure of the Noſe, and the Situation of the little Bones, render oppoſite thereto, as to ſhake them, and give them a vibratory Motion; which Action being communicated thence to the common Senſory, occaſion an Idea of a ſweet, or fœtid, or ſour, or an aromatic, or a putrified Object, &c.

The Matter in Animals, Vegetables, Foſſils, &c. which chiefly affects the Senſe of *Smelling*, *Boerhaave* obſerves, is that ſubtile Subſtance inherent in the oily Parts thereof, call'd *Spirit*: For that when this is taken away from the moſt fragrant Bodies; what remains, has ſcarce any *Smell* at all; but this pour'd on the moſt ſmell-leſs Bodies, gives them a Fragrancy. *Inſtit. cap. de Olfac.*

Willis obſerves, That Brutes have, generally, the Senſe of *Smelling* in much greater Perfection than Man; as by this, alone, they diſtinguiſh the Virtues and Qualities of Bodies unknown before; hunt out their Food at a great Diſtance, as Hounds, and Birds of Prey, or hid among other Matters, as Ducks, &c. Man having other means of judging of his Food, &c. did not need ſo much Sagacity in his Noſe: Yet have we Inſtances of a great deal, even in Man.

In the *Hiſtoire des Antilles*, we are aſſured, there are Negroes who, by the *Smelling*, alone, can diſtinguiſh between the Foot-ſteps of a *Frenchman* and a Negro. 'Tis found that the Laminæ, wherewith the Upper Part of the Noſtrils is fenc'd, and which ſerve to receive the Divarications of the olfactory Nerves, are always longer, and folded up together in greater Number, as the Animal has this Senſe more accurate. The various Windings and Turnings of theſe Laminæ, detain and fetter the more of the odoriferous Particles.

SMELTING, among Refiners, the melting of Metal in the Ore in a *Smelting* Furnace; in order to ſeparate the metallic from the earthy Parts. See METAL.

SMINTHEAN, SMINTHEUS, in Antiquity, an Epithet given to *Apollo*, from the *Greek* σμίνθος, a *Rat*. —There are two different Accounts of the Origin of this Appellation: The firſt, that in the City of *Chryſa* in *Miſia*, was a Prieſt of *Apollo*, call'd *Crines*, with whom that God being offended, ſent a Herd of Rats to ſpoil all his Lands. But *Crines* appeaſing the Deity, he came in Perſon to his Aſſiſtance, took his Lodgings with *Crines*'s Shepherd, told him who he was, and deſtroyed all the Rats with his Arrows: In Memory whereof, *Crines* built a Temple to his Deliverer, under the Name of *Apollo Smintheus*. —*Clemens Alexandrinus*, in his Exhortation to the *Greeks*, gives us a different Story. The *Cretans*, ſays he, intending to ſend out a Colony, conſulted the Oracle of *Apollo* as to the Place; the Anſwer was, That they ſhould place their Colony where thoſe, born of the Earth, ſhould oppoſe them. Upon their Arrival in the *Helleſpont*, the Rats, in the Night-time, gnawed aſunder all the Strings of their Bows: This they deem'd an Accompliſhment of the Oracle, and built a City call'd *Sminthia*.

SMOAK, a humid Matter, exhaled in Form of Vapour, by the Action of Heat, either external or internal. See FIRE.

Smoak, Sir *Iſaac Newton* obſerves, aſcends in the Chimney by the Impulſe of the Air it floats in: For that Air being rarified by the Fire underneath, has its ſpecific Gravity diminiſhed; thus, being determined to aſcend, itſelf, it carries up the *Smoak* along with it. The Tail of a Comet, that great Author takes to aſcend from the Sun after the ſame manner. See COMET.

SMOAK of fat unctuous Woods, as Fir, Beech, &c. makes what we call *Lamp-black*. See BLACK.

There are various Inventions for preventing and curing *Smoaking* Chimneys; as the Oeolipiles of *Vitruvius*, the Ventiducts of *Cardan*, the Wind-mills of *Bernard*, the Capitals of *Serlio*, the little Drums of *Paduanus*, and ſeveral Artifices of *de Lorme*, &c. See CHIMNEY.

In

In the *Philoſophical Tranſactions*, we have the Deſcription of an Engine invented by Monſieur *Daleſme*, which conſumes the *Smoak* of all Sorts of Wood, and that ſo totally as the moſt curious Eye cannot diſcover it in the Room, nor the niceſt Noſe ſmell it, though the Fire be made in the middle of the Room. It conſiſts of ſeveral Iron Hoops, four or five Inches Diameter, which ſhut into one another; and is placed on a Trevet. A Brand taken out of the Fire *ſmoaks* inſtantly; but ceaſes as ſoon as returned. The moſt fœtid Things, as a Coal ſteep'd in Cat's-piſs, which ſtinks abominably when taken out of the Fire, yet in it makes not the leaſt ill Scent; no more than Red Herrings broil'd, *&c.*

SMOKE *Farthings*, were the pentecoſtal or cuſtomary Oblations, offered by the Inhabitants within any Dioceſs, when they made their Proceſſions to the Cathedral Church; which came by degrees into an annual, ſtanding Rent, called *Smoke-Farthings*.

SMUGGLING, a Cant Term for the Running of Goods; or the ſtealing them aſhore without paying Cuſtom. See CUSTOM.

SMUT, a Diſeaſe in Corn, whereby the Pulp or Meal thereof is damaged, and its natural Taſte, Colour, *&c.* alter'd.

The *Smut* is uſually aſcribed by the Husbandmen to the exceſſive Fatneſs and Rankneſs of the Soil; to the manuring the Land with rotten Vegetables, as Straw, Hawm and Fern; and to the ſowing *ſmutty* Seed.

Mr. *Bradley* makes no doubt to call the *Smut* a *Blight*, and to account for it on the ſame Principle as the Blights befalling other Plants, particularly Fruit Trees, *viz.* from innumerable little Inſects, brought, or at leaſt hatch'd by the eaſtern Winds, which prey on and devour the native Juices of the Corn, and poiſon them with a Mixture of their own. See BLIGHT.

An approved Method to prevent the *Smut*, the ſame Mr. *Bradley* gives us, as follows: The Wheat, for Seed, to be waſhed in three or four Waters, ſtirring it well round, and with great force, each time, and skimming off all the light Wheat ſwimming a-top. This done, 'tis to be ſteep'd in a Liquor thus prepared: Into a ſufficient Quantity of Water, put as much Salt, as, when ſtirred about, will make an Egg ſwim; and to this add as much more Salt; ſtir the whole well, and to the Brine, put two or three pound of Alum beaten fine. In this Mixture, lay the Wheat to ſteep, at leaſt, thirty or forty Hours. Take it out the Night before 'tis to be ſown, and ſift ſome ſlack'd Lime on it; this dries and fits it for ſowing.

Note, many ſteep their Wheat in Brine, yet have plenty of *ſmutty* Corn: The Reaſon is, that they don't either make their Brine ſtrong enough, or don't let the Wheat ſtay long enough therein. 'Tis a common Notion among them, that ſteeping it ſo long, rots the Grain; but Experience ſhews the contrary.

SNAKE *Root*. See SERPENTARIA *Radix*.

SNEEZING, a convulſive Motion of the Muſcles of the Breaſt uſed in Expiration; wherein, after ſuſpending the Inſpiration begun, the Air is repelled from the Mouth and Noſe with a momentary Violence. See RESPIRATION.

The Cauſe is an Irritation of the Upper Membrane of the Noſe, which communicates with the Intercoſtal Nerve by means of the Twigs that it detaches to it. This Irritation is performed either externally by ſtrong Smells; as Marjoram, Roſes, *&c.* or by Duſt floating in the Air, and taken in by Inſpiration; or by ſharp, pungent Medicines, as Creſſes and other Sternutatories, which vellicate the Membrane of the Noſe; or internally by the Acrimony of the Lympha or Mucus, which naturally moiſtens that Membrane.

The Matters caſt forth in *Sneezing*, come primarily from the Noſe and Throat, the pituitary Membrane continually exuding a Mucus thither; and, ſecondarily, from the Breaſt, the Trachea and the Bronchia of the Lungs.

F. Strada, in an expreſs Treatiſe on *Sneezing*, has diſcovered the Original of the Cuſtom of ſaluting thoſe who *Sneeze*. He ſhews it to be a Remain of Paganiſm; tho' he owns 'twas in uſe among the *Jews* as well as among the *Romans*. From an Epigram in the Anthology, it appears, that among the Ancients, a Perſon after *Sneezing*, made a ſhort Prayer to the Gods; as Ζεῦ σῶζον, *Jupiter ſave me*.

SNOW, a Meteor form'd in the middle Region of the Air, of Vapour raiſed by the Action of the Sun or ſubterraneous Fire, there congeal'd, its Parts conſtipated, its ſpecifick Gravity increaſed, and thus returned to the Earth in form of little Villi or Flakes. See METEOR and VAPOUR.

The *Snow* we receive, may properly enough be aſcribed to the Coldneſs of the Atmoſphere through which it falls. When the Atmoſphere is warm enough to diſſolve the *Snow* before it arrives at us; we call it *Rain*: If it preſerve itſelf undiſſolved, it makes what we call *Snow*. See RAIN.

The Uſes of *Snow* muſt be very great, if all be true *Bartholin* has ſaid in its behalf, in an expreſs Treatiſe, *de Nivis uſu medico*: He there ſhews that it fructifies the Earth, (which, indeed, is a very old and general Opinion) preſerves from the Plague, cures Fevers, Colicks, Tooth-Aches, Sore-Eyes, and Pleuriſies (for which laſt Uſe, his Countrymen of *Denmark* uſe to keep *Snow*-Water gathered in *March*) He adds, that it contributes to the prolongation of Life; giving Inſtances of People in the *Alpine* Mountains that live to great Ages: And to the preſerving of dead Bodies: Inſtances whereof, he gives in Perſons buried under *Snow* in paſſing the *Alps*, which are found uncorrupted in the Summer when the *Snow* is melted.

He obſerves, that in *Norway*, *Snow*-water is not only their ſole Drink in the Winter; but *Snow* even ſerves for Food; People having been known to live ſeveral Days, without any other Suſtenance.

Indeed the Generality of theſe medicinal Effects of *Snow*, are not to be aſcribed to any ſpecific Virtue in *Snow*; but to other Cauſes. It fructifies the Ground, for Inſtance, by guarding the Corn, or other Vegetables, from the intenſer Cold of the Air, eſpecially the cold, piercing Winds. And it preſerves dead Bodies, by conſtipating and binding up the Parts, and thus preventing all ſuch Fermentations or internal Conflicts of their Particles, as would produce Corruption. See COLD.

'Tis a popular Error, that the firſt *Snow* that falls in the Year, has particular Virtues. In *Italy*, they cool their Wines all the Summer with *Snow*-water.

Dr. *Grew*, in a Diſcourſe of the Nature of *Snow*, obſerves, that many Parts thereof are of a regular Figure, for the moſt part ſo many little Rowels or Stars of Six Points, and are perfect and tranſparent Ice, as any we ſee on a Pond, *&c.* Upon each of theſe Points are other collateral Points, ſet at the ſame Angles, as the main Points themſelves: Among which there are divers others irregular, which are chiefly broken Points, and Fragments of the regular Ones. Others alſo by various Winds, ſeem to have been thaw'd, and froze again into irregular Cluſters; ſo that it ſeems as if the whole Body of *Snow* were an infinite Maſs of Icicles irregularly figured. That is, a Cloud of Vapours being gathered into Drops, the ſaid Drops forthwith deſcend; upon which Deſcent, meeting with a freezing Air as they paſs through a colder Region, each Drop is immediately froze into an Icicle, ſhooting itſelf forth into ſeveral Points; but theſe ſtill continuing their Deſcent, and meeting with ſome intermitting Gales of warmer Air, or in their continual Waftage to and fro, touching upon each other, ſome of 'em are a little thaw'd, blunted, and again froze into Cluſters, or intangled ſo as to fall down in what we call Flakes. The Lightneſs of *Snow*, although it is firm Ice, is owing to the Exceſs of its Surface, in Compariſon to the Matter contained under it; as Gold itſelf may be extended in Surface, till it will ride upon the leaſt Breath of Air. See ICE and FREEZING.

Signior *Sarotti*, in the *Philoſophical Tranſactions*, mentions a *red* or *bloody Snow*, which fell on the Mountains *le Langhe*, near *Genoa* on S. *Joſeph*'s Day. This *Snow* when ſqueez'd, yielded a Liquor of the ſame Colour.

SNUFF, a Preparation of Tobacco, made by reducing it into a Powder, fit to be taken at the Noſe; in order to purge or clear the Head of Pituita. See TOBACCO.

Ordinarily, Tobacco is only the Baſis of *Snuff*; other Matters being added to give it a more agreeable Scent, *&c.*

The kinds of *Snuff*, and their ſeveral Names, are infinite; and new ones are daily invented; ſo that it would be as impertinent as 'tis impoſſible, to give a Detail of them. We ſhall only ſay, that there are Three grand Sorts; the Firſt granulated; the Second an impalpable Powder; and the Third the Bran or the coarſe Part remaining after ſifting the ſecond Sort.

SOAP, a kind of Paſt, ſometimes hard and dry, and ſometimes ſoft and liquid; much uſed in waſhing, and whitening Linens, and for various other Purpoſes, by the Dyers, Perfumers, Hatters, Fullers, *&c.* See DYING, HAT, FULLING, *&c.*

The principal *Soaps* of our Manufacture, are the *Soft*, the *Hard*, and the *Ball Soap*. The *Soft Soap*, again, is either White or Green: The Proceſs of making each kind, is as follows;

Method of making the ſeveral Kinds of SOAP.

1° *Green, Soft-Soap*. The chief Ingredients uſed in making of *Green Soap*, are Lyes drawn from Pot-aſh and Lime, boil'd up with Tallow and Oil. Firſt, the Lye and Tallow are put into the Copper together, and when melted, the Oil is put to it, and the Copper made to boil; then the Fire is dampt or ſtopt up, while the Ingredients lie in the Copper to knit or incorporate; which done, the Copper is ſet on boiling, being fed or filled with Lyes as it boils, 'till there be a ſufficient Quantity put therein: Then it is boil'd off with all convenient ſpeed, and put to Casks.

2° *White Soft Soap*. One ſort of *White Soap* is made after the ſame manner as *Green Soft Soap* is, Oil excepted, which is not uſed in White. The other ſort of *White Soft Soap*, is made from Lyes of Aſhes of Lime boil'd up at twice with Tallow. Firſt, a quantity of Lyes and Tallow are put into the Copper together, and kept boiling; being

ſed with Lyes as it boils, until it grains, or is boiled enough; then the Lyes are ſeparated or diſcharged from the tallowiſh Part, which Part is removed into a Tub, and the Lyes thrown away: This is called the Firſt *half Boil*. Then the Copper is charged again with freſh Tallow and Lyes, and the firſt half Boil put out of the Tub into the Copper a ſecond Time; where it is kept boiling with freſh Lyes and Tallow, till it comes to Perfection. It is then put out of the Copper into the ſame ſort of Casks as are uſed in Green ſoft *Soap*.

3° *Hard Soap* is made with Lyes from Aſhes and Tallow, and moſt commonly boil'd at Twice: The Firſt, called a *Half-boiling*, hath the ſame Operation as the firſt Half-boil of ſoft White *Soap*. Then the Copper is charged with freſh Lyes again, and the firſt Half-boil put into it, where it is kept boiling, and fed with Lyes as it boils, till it grains, or is boiled enough; then the Lye is diſcharged from it, and the *Soap* put into a Frame to cool and harden.

Note, There is no certain Time for bringing off a Boiling of any of theſe Sorts of *Soap*. It frequently takes up part of two Days.

4° *Ball-Soap*, commonly uſed in the *North*, is made with Lyes from Aſhes and Tallow; the Lyes are put into the Copper, and boil'd 'till the watery Part is quite gone, and there remains nothing in the Copper but a ſort of Nitrous Matter (the very Strength or Eſſence of the Lye) to this the Tallow is put, and the Copper kept boiling and ſtirring for above half an Hour, in which time the *Soap* is made; and then it is put out of the Copper into Tubs or Baskets with Sheets in them, and immediately (whilſt ſoft) made into Balls.

Note, it requires near Twenty-four Hours to boil away the watery Part of the Lye.

Soaps, both dry and liquid, are held of ſome Uſe in Medicine: The Liquid againſt Fevers; to be applied by rubbing the Soals of the Patient's Feet therewith: And the Dry, diſſolved with Spirit of Wine, in the Cure of cold Humours: Beſides its being uſed in Suppoſitories, and in the Compoſition of a kind of Plaſter, commonly called *Emplaſt de Sapone*.

SOAP *Earth*, a kind of Earth found in the *Levant*, and uſed as a *Soap*. See Earth.

The *Soap-Earth*, Dr. *Smith* tells us, is only had in two Places near *Duraclea*, Six Leagues to the Eaſt of *Smyrna*. 'Tis, in effect, of itſelf, a fine *Soap*, boiling and ſhooting up out of the Earth.

'Tis gathered always before Sun-riſe, and in Mornings when there falls no Dew; ſo that a Stock muſt be laid up in the Summer Months, to ſerve all the Year.

In ſome Places, it comes up an Inch or two above the Surface of the Ground: But the Sun riſing on it, makes it fall again. Every Morning there returns a freſh Crop.

SOC, in Law, a Power, Authority, or Privilege to miniſter Juſtice, and execute Laws: Alſo the Shire, Circuit, or Territory wherein ſuch Power is exerciſed by him indued with ſuch Juriſdiction.

And hence the Law *Latin* Word *Soca* for a Seignory or Lordſhip, infranchiſed by the King, with Liberty of holding a Court of his *Sock-men* or *Sockagers*, that is, his Tenants, whoſe Tenure is hence called *Socage*. See Socage.

This kind of Liberty ſtill ſubſiſts in ſeveral Parts of *England*, under the Name of *Soke* or *Soken*. *Skene* defines *Sok*, to be *Secta de hominibus ſuis in curia ſecundum conſuetudinem Regni*. *Brady* makes mention of theſe Liberties: *Soc*, *Sac*, *Sol*, *Team*, *Infangthef* and *Utfangthef*.

In the Laws of *Henry* I. *Soca* is uſed as ſynonymous with Franchiſe, or a privileged Place, Refuge, Aſylum, Sanctuary, &c. From the *Saxon*, Socn and Socne.

SOCAGE or SOCCAGE, a Tenure, by which Men held their Lands on condition of ploughing thoſe of their reſpective Lords, with their own Ploughs, and at their own Charges. See Service, Vassal, Tenure, &c.

This ſlaviſh Tenure was afterwards, by the mutual Agreement of Lord and Tenant, turned into the Payment of a certain Sum of Money, which is hence called *Liberum Socagium*, *free* or *common Socage*. Whereas the other was *Villanum Socagium*, or *baſe Socage*: Inaſmuch as thoſe who held Lands by this Tenure, were not only bound to plough their Lords Lands; but took the Oath of Fealty to them, *Sicut de Villanis*. See Fealty.

Socage was a Tenure of that Extent, that *Littleton* tells us, all the Lands in *England*, which were not held by Knight's Service, were held in *Socage*: So that it ſeems the Land was divided between the two Tenures, which, as they were of different Natures, ſo the Deſcent of the Land was in a different Manner. For the Lands held in Knight's-Service, deſcended to the eldeſt Son; but thoſe held in *Villano Socagio*, equally among all the Sons. Yet if there was but one Meſſuage, the eldeſt Son was to have it; ſo, as the reſt had the Value of the Meſſuage equally divided between them.

Skene defines *Socage*, a Tenure of Lands, whereby a Man is Infeoffed freely, without Wardſhip and Marriage, paying to his Lord ſome ſmall Rents, &c. which is called *Free Socage*, &c.

Bracton thus deſcribes it, *Dici poterit* Socagium *a* Socco *& inde tenentes* Sockmanni, *eo quod deputati ſunt ut videtur tantum modo ad Culturam, & quorum Cuſtodia & Maritagia ad propinquiores parentes jure ſanguinis pertinebunt*, &c.

Several Diviſions of *Socage* we meet withal in Law-writers, as *Socage in Capite*, &c. But by *Stat.* 12. *Car.* II. all Tenures from and after the 24th of *February*, 1645, ſhall be adjudg'd and taken for ever, to be turn'd into *free* and *common Socage*.

SOCCUS, SOCK, in Antiquity, a kind of high Shoe, reaching above the Ankle, wore by the Actors in the ancient Drama, in repreſenting of Comic Perſons. See Comedy.

The *Soccus* was much lower than the Cothurnus; and was the diſtinguiſhing Wear of the Comedians; as the Cothurnus was of the Tragedians: Hence *Soccus* is frequently uſed for Comedy itſelf. Comedy, ſays M. *Fenelon*, muſt talk in an humbler Stile than Tragedy; the *Sock* is lower than the Buskin. See Buskin.

SOCIETY, an Aſſemblage, or Union of ſeveral Perſons in the ſame Place, for their mutual Aſſiſtance, Security and Intereſt.

Of *Societies* we have a great many Kinds, diſtinguiſhed by the different Ends propoſed by them: *Civil Societies*, *Trading Societies*, *Religious Societies*, &c.

Civil Society. See Government.

Society, in Trade, is a Contract or Agreement between two or more Perſons, whereby they bind 'emſelves together for a certain Time, and agree to ſhare equally in the Profits or Loſſes which ſhall accrue in the Affairs for which the *Society* or Co-partnerſhip is contracted. See Co-partner.

We have ſeveral very conſiderable *Societies* of this Kind; as the *Merchant Adventurers*, the *Turkey*, *Eaſt India*, *Muſcovy*, *Eaſtland*, *Greenland*, *Spaniſh*, *African*, *South-Sea* and *Hudſon's Bay Companies*. The Inſtitutions, Policies, &c. whereof, ſee under the Article Company.

By the *Roman* Law, the *Social* Contract needs no other Solemnity, but the ſole Conſent of Parties, without any Writing at all: But among us, Articles of Co-partnerſhip are required. There is no Contract wherein Probity is more required than in *Society*; inaſmuch as the Laws pronounce thoſe Null, that are made contrary to Equity, and with deſign to deceive.

The *French* diſtinguiſh three Kinds of Mercantile *Society*: *Ordinary Society*, called alſo *Collective* and *General*; *Society* in *Commendam* or *Commandity*; and *Anonymous Society*, called alſo *Momentary* and *Inconnue*. The firſt is, where ſeveral Merchants act alike in the Affairs of the *Society*, and do all under their collective Names, which are public and known to every Body. — *Society* in *Commendam*, &c. is that between two Perſons, one of whom only puts his Money into Stock, without doing any other Office of a Co-partner; the other, who is called the *Complimentary* of the *Society*, diſpatching all the Buſineſs under his own Name. This *Society* is very uſeful to the State; inaſmuch as all kinds of Perſons, even Nobles and Men of the Robe, may contract it; and thus make their Money of Service to the Publick: And thoſe who have no Fortune of their own to trade withal, hereby find means of eſtabliſhing themſelves in the World, and of making their Induſtry and Addreſs ſerviceable. *Anonymous Society*, is that, where all the Members are employ'd, each particularly, in the common Intereſt, and each accountable for Profits, &c. to the reſt; but without the Publick's being informed thereof; ſo that the Seller has only an Action againſt the particular Buyer, no other Name appearing. 'Tis alſo called *Momentary*, becauſe frequently made on particular Occaſions, and ceaſing with them; as in the making a Purchaſe, the ſelling any Commodity, &c. Of this they diſtinguiſh four Kinds: *Society* by Participation, which is uſually form'd by Letters from one City to another, where a Merchandiſe is to be bought or ſold. The Second is, when two or three Perſons go together to Fairs to buy Goods. The Third, when two or three Perſons agree to buy up the Whole of ſome Commodity, in any Country; to ſell it again at their own Price. And the Fourth is, when three or four Perſons make a Journey together, to buy and ſell the ſame Commodity. Beſide Merchants, People of Quality, &c. are admitted into theſe Anonymous *Societies*.

Religious Societies, are Parties of Perſons formed, either to live regularly together; or to promote the Intereſt of Religion; or to cultivate it in themſelves.

Of the *firſt* Kind, are all Congregations of Religious; particularly the *Jeſuits*, who are called the *Society of Jeſus*; though they more uſually call themſelves the *Company of Jeſus*. See Jesuites. — The *Society* of the *Sorbonne*. See Sorbonne. — The *Society* of S. *Thomas de Villenuve*, inſtituted in 1660, by *F. Ange le Prouſt*. — The *Society* of S. *Joſeph*, inſtituted in 1638. — The *Society* of *Bretagne*, a Reform of Benedictins in 1606. And the *Society* of *Jeſus*, a religious military Order, inſtituted by *Pius* II.

Of the *ſecond* Kind are; the Society for *Reformation of Manners*; and putting in Execution the Laws againſt Immorality and Prophaneneſs. It was ſet on foot about 30 Years ago, by five or ſix private Perſons in *London*; but is ſince exceedingly increaſed, by Numbers of Members of all Denomina-

tions. A particular Body of the moſt conſiderable hereof, bear the Expences of Proſecutions, &c. without any Contribution from the reſt: Theſe chiefly apply themſelves to the Proſecuting Perſons for Swearing, Drunkenneſs, and Prophaning the *Sabbath*. Another Body of about 50 Perſons, apply themſelves to the ſuppreſſing Lewdneſs; and by them above 500 lewd Houſes have been actually ſuppreſs'd. A third Body conſiſts of Conſtables. A fourth, of Informers. Beſides theſe, are Eight other regular, mix'd Bodies of Houſe-keepers, and Officers, who inſpect the Behaviour of Conſtables and other Officers, aſſiſt in ſearching diſorderly Houſes, &c. ſeizing Offenders, giving Information, &c.

There are ſeveral other *Societies* of this kind at *Briſtol*, *Canterbury*, *Nottingham*, &c.

The SOCIETY *for propagating the Goſpel in foreign Parts*, was inſtituted by King *William*, in 1701, for ſecuring a Maintenance for an Orthodox Clergy, and making other Proviſions for the Propagation of the Goſpel in the Plantations, Colonies, Factories, &c. ----To that end, He Incorporated the Archbiſhops, ſeveral Biſhops, and other of the Nobility, Gentry and Clergy, to the number of 90, into a Body, with Privilege to purchaſe Two thouſand Pounds a Year, Inheritance and Eſtates for Lives or Years, with other Goods, to any Value. They meet yearly on the third *Friday* in *February*, to chuſe a Preſident, Vice-Preſident and other Officers; and the third *Friday* in every Month to tranſact Buſineſs, depute fit Perſons to take Subſcriptions for the ſaid Uſes; and of all Monies ſo received, to give account to the Lord Chancellor, &c. They have a ſtanding Committee at the *Chapter-houſe*, to prepare Matters for the monthly Meeting, which is held at St. *Martin*'s Library.

The SOCIETY *for Propagating Chriſtian Knowledge*, was begun in 1699 by ſome Perſons of Worth, &c. Its original Deſign was to propagate Religion in the Plantations, to ſecure the pious Education of the Poor at Home, and to reclaim thoſe that err in the Fundamentals of Chriſtianity.

In the Year 1701, they had procured conſiderable Charities, and had tranſmitted the ſame to the Plantations, in Libraries, Bibles, Catechiſms, &c. with a voluntary Maintenance for ſeveral Miniſters, to be employ'd in the Plantations. But the *Society* for Propagating the Goſpel in foreign Parts, being then inſtituted, they were Incorporated, by Charter, into the ſame; and thus diſcharged, as a particular *Society*, from the further Purſuit of that Branch of their original Deſign: Whereupon they wholly turned themſelves to the other; and are now very conſiderable, by great Acceſſions from among the Clergy and Laity.

They meet weekly, to concert Meaſures for raiſing Charity for Education of poor Children, and ſetting up Schools for that Purpoſe; as alſo for the more regular Diſpoſal of pious Books and Catechiſms; for Inſtruction of the Ignorant, Erroneous, &c. By the Aſſiſtance of Members of other religious *Societies*, they have procured Subſcriptions for the Education of above Three thouſand Children, who are placed out in Schools about *London*, and taught Reading, Writing, Pſalmody, &c. They have diſperſed great Numbers of good Books among the Poor, in the Fleet, Army, &c. and have procured ſeveral to be tranſlated into *Welſh* and other foreign Languages, and diſpers'd accordingly. See CHARITY *School*.

Of the *third* Kind, are divers religious *Societies*, properly thus called; firſt ſet on foot in *London* about the Year 1678, by a few young Men, who agreed to meet weekly, for Prayer, Pſalmody and ſpiritual Conference. They are now increaſed to Forty diſtinct Bodies, who have ſet up public Prayers in many Churches where it was not, procured frequent Adminiſtrations of the Sacrament; and maintain Lectures on that Subject, in one Church or another almoſt on every Sunday-evening.

Royal SOCIETY. See ROYAL *Society*.

SOCINIANS, a late Sect of Antitrinitarians, who, in theſe Ages, have revived ſome of the Errors of *Paulus Samoſatenus*, *Photinus* and *Arius*; whence they are alſo occaſionally call'd *Arians*, *Photinians*, &c. tho' in many reſpects different from any of them. See ARIAN, PHOTINIAN, &c.

Fauſtus Socinus, a Gentleman of *Sienna*, whence they take their Name, was not the firſt Author of the Sect; for he ſays himſelf, in his Letter to *Martin Vadau*, wrote in 1548, that he advances no Dogma but what had been publiſhed by others before him, even in *Poland*, e'er he came to ſettle there. The Truth is, he may be rather ſaid to have refined, by his Subtilties, on the Notions that already prevailed there in his Time, than to have invented a new Syſtem.

In his Life, wrote by a *Poliſh* Knight, we read, that he had not applied himſelf to the Study of Theology and Divinity, nor had ſtudied any thing but Logic; till 35 Years of Age; but had ſpent the greateſt part of his Life at the Court of the Great Duke of *Tuſcany*. Upon his retiring thence, he began to think of Religion: and, prepoſſeſſed as he was with the Writings of his Unkle *Lælius Socinus*, he form'd a Syſtem thereon. *Lælius* had explained the firſt Words in the Goſpel of S. *John*, *Inprincipio erat Sermo*; by theſe, *In principio Evangelii erat Sermo*; as if the *Beginning*, there ſpoke of, were only the *beginning of the Goſpel*.

This Interpretation, never heard of in all Antiquity, is followed by *Fauſtus*, in his Comment on the Fourteen firſt Verſes of that Goſpel. He adds, that he who is called *Word*, had not been from all Eternity, nor even before the Creation of the World; but that by *Word*, muſt be meant the Man *Jeſus Chriſt*, God born of the Virgin, under the Emperor *Auguſtus*. But this is a Paradox, which all his Followers do not equally come into. However, they all deny, not only the Divinity of *Jeſus Chriſt*, but the Exiſtence of the Holy Ghoſt, the Myſtery of the Incarnation, Original Sin, and Grace.

Their Sentiments are explain'd at length, in their Catechiſm printed ſeveral Times, under the Title of *Catecheſis Eccleſiarum Polonicarum unum Deum Patrem illiuſque filium Unigenitum, una cum Sancto Spiritu ex ſacra ſcriptura conſtentum*. Still, they are divided on ſeveral Articles. Some of them leave *Socinus*, as to what regards the Worſhip offered to *Jeſus Chriſt*; not being able to conceive how divine Worſhip ſhould be given a mere Man.

The Hereſy of the *Socinians* ſpread exceedingly in *Poland*, *Lithuania*, *Tranſilvania*, and the neighbouring Places. *Racow* was their chief School; and there all their firſt Books were publiſhed. But they were exterminated out of *Poland* in 1655; ſince which time they have chiefly ſhelter'd in *Holland*; where, however, their public Meetings have been prohibited: But they find means to conceal themſelves under the Name of *Arminians* and *Anabaptiſts*. See UNITARIAN.

SOCLE or ZOCLE, in Architecture, a flat, ſquare Member under the Baſes of Pedeſtals, of Statues, Vaſes, &c. which it ſerves as a Foot, or Stand. See PEDESTAL, STATUE, &c.

The Word is *French*, form'd from the *Italian Zoccola*, or the *Latin Soccus*, the Shoe of the ancient Actors. *Vitruvius* calls it *Quadra*.

A *continued* SOCLE, is a kind of continued Stand, or Pedeſtal, without either Baſe, or Cornice ranging round the whole Building; called by *Vitruvius*, *Stereobata*, and the *French*, *Soubaiſſement*. See STEREOBATA.

SOCOME, in our Law-Books, &c. a Cuſtom of grinding at the Lord's Mill. There is *Bond Socome*, where the Tenants are bound to it, and *Love Socome*, where they do it freely, out of Love to the Lord.

SOCRATIC-*Philoſophy*, the Doctrines and Opinions, with regard to Morality and Religion, maintained, and taught by *Socrates*. See PHILOSOPHY.

By the Character of *Socrates*, left us by the Ancients, particularly his Scholar *Plato*, *Laertius*, &c. He appears to have been one of the beſt, and the wiſeſt Perſons in all the Heathen World.

To him is aſcribed the firſt introducing of Moral Philoſophy; which is what is meant by that popular Saying, *Socrates firſt called Philoſophy down from Heaven to Earth*; that is, from the Contemplation of the Heavens and heavenly Bodies, he led Men to conſider themſelves, their own Paſſions, Opinions, Faculties, Duties, Actions, &c.

While young, he was exceedingly fond of natural Knowledge, as he witneſſes of himſelf in *Plato*: But in his older Age, he caſt aſide this part of Philoſophy as obſcure, uncertain, impracticable, and even uſeleſs and impertinent; and applied himſelf wholly to moral or active *Philoſophy*.

'Twas he, firſt, who when all the other *Philoſophers* boaſted they knew all Things, own'd, ingenuouſly, he knew nothing; but this, that he knew nothing. Which *Pyrrho*, the Father of the *Sceptic Philoſophy*, improved on, when he ſaid he knew nothing; not even this, that he knew nothing. Yet in an Anſwer of the Oracle, it was pronounced; Ἀνδρῶν ἁπάντων Σωκράτης σοφώτατος. That *Socrates* was the Wiſeſt of all Men. See PYRRHONIAN.

He was accuſed by *Anytus*, *Melitus* and *Lycon*, three Perſons, whoſe Hatred he had incurred, by his ſevere Declamations againſt the Poets, of which Number two of the firſt were, and the Third an Actor. His Accuſation was, That he corrupted the *Athenian* Youth, and broached new Superſtitions. He was condemned to drink Cicuta, by 281 Votes, as we are told by *Quintilian*.

After his Death, his Fellow-citizens repented to that degree, that the *Gymnaſia*, Courts of Juſtice, &c. were all ſhut up; *Melitus* put to Death, *Anytus* baniſh'd, and a Statue erected to *Socrates*. He wrote nothing himſelf; yet almoſt all the Sects of Philoſophers refer their Origin to his Diſcipline; particularly the *Platoniſts*, *Peripateticks*, *Academicks*, *Cyrenaicks*, *Stoicks*, &c. But the greateſt Part of his *Philoſophy*, we have in the Works of *Plato*. See PLATONIC *Philoſophy*; ſee alſo ACADEMIC, PERIPATETIC, STOIC, &c.

SODOMY, an unnatural Crime, thus called from the City of *Sodom*, which was deſtroy'd by Fire for the ſame. See BUGGERY.

The

The *Levitical* Laws adjudged thoſe guilty of this execrable Evil to the Fire, *Lev. c.* 18 and 20. And the Civil Law aſſigns the ſame Puniſhment. Our Laws make it Felony.

SOFA, in the *Eaſt*, is a kind of Alcove, raiſed half a Foot above the Floor of a Chamber or other Apartment, and eſteem'd the Place of State, where Viſitors of Diſtinction are received.

Among the *Turks*, the whole Floor of their State-Rooms is cover'd with a kind of Tapiſtry, and on the Window-ſide is raiſed a *Sofa* or *Sopha*, laid with a kind of Matraſs, cover'd with a Tapiſtry much richer than the other. On this Tapiſtry the *Turks* are ſeated, both Men and Women, like the Taylors in *England*, croſs-legg'd, leaning againſt the Wall which is bolſter'd with Velvet, Sattin or other Stuff ſuitable to the Seaſon. Here they eat their Meals, only laying a Skin over the Tapiſtry, to ſerve as a Table-cloath, and a round wooden Board over all, cover'd with Plates, *&c.*

The Embaſſadors of *France* ſtood out a long while, and refuſed to viſit the Grand Vizier, unleſs he'd receive them on the *Sofa*: At length he granted them the *Sofa*.

SOFFITO or SOFIT, in Architecture, any Plafond or Ceiling, form'd of croſs Beams, or flying Cornices, the ſquare Compartiments or Pannels whereof are inrich'd with Sculptures, Painting, or Gilding. Such are thoſe we ſee in the Baſilics and Palaces of *Italy*, in the Apartments at *Luxembourg*, at *Paris*, *&c.* See CEILING.

The Word is *Italian*, and ſignifies the ſame with the *Latin*, *Lacunar* and *Laquear*; with this Difference, that *Lacunar* is uſed for any Ceiling, with ſquare, hollow Pannels, called *Lacus*; and *Laquear* for Compartiments interlaced with Plat-bands, after the manner of Knots or *Laquei*.

SOFFITO or *Soffit*, is particularly uſed for the under Side or Face of an Architrave; and for that of the Corona or Larmier, which the Ancients called *Lacunar*, and we uſually, *Plafond*. See PLAFOND.

It is enrich'd with Compartiments of Roſes; and in the *Doric* Order has 18 Drops, diſpoſed in three Ranks, Six in each, placed to the Right of the Guttæ, at the Bottom of the Triglyphs. See GUTTÆ, DORIC, ARCHITRAVE, *&c.*

SOFI, *&c.* See SOPHI.

SOFTENING, in Painting, the mixing and diluting of Colours with the Bruſh or Pencil.

They alſo ſay, *ſoften* Deſigns in Black and White, made with the Pen, *&c.* to weaken the Teint. To *ſoften* a Portrait, according to *Felibien*, is to change ſome of the Stroaks, and give a greater Degree of Sweetneſs and *Softneſs* to the Air thereof, which before had ſomething rough and harſh in it.

SOIL, in Agriculture, Gardening, *&c.* denotes Earth or Ground conſider'd, with regard to the Quality of its Mould, for the Production and Growth of Vegetables. See EARTH, MOULD, VEGETABLES, *&c.*

M. *Bradley* reduces all *Soils* to three Heads, *viz. Sand*, *Loam* or *Mother-Earth*, and *Clay*. See SAND, LOAM and CLAY.

Gravels and all the open *Soils*, till we come at Loam, are of the *ſandy* Race; and the binding Earths, from Loam down to the Stiffneſs of Chalk, may be ranged under the *Clay*-kind.

Loam or Mother-Earth, is the Medium between the Two, and includes all the intermediate Kinds.

Each of theſe *Soils* tends alike to Vegetation; and each has its Salts proper thereto; but in different Proportions: A Peck of Clay having twice as much Salts in it as the ſame Quantity of Loam; and four Times as much as Sand.

Now, 'tis found to be the Salts or Juices of the *Soil*, not the Earth itſelf, that Plants are fed and ſubſiſted by. (For in many Experiments of Vegetation, where Plants of Fifteen or Twenty pound Weight have been produced, there has been no ſenſible Diminution in the Weight of the Earth). See VEGETATION.

Hence, at firſt Sight, it might ſeem, that Clay were the moſt proper, and Sand the leaſt proper *Soil* to promote the Growth of Plants; which is contrary to Experience. The Reaſon is, that the Parts of Clay being cloſe wrought together, do not ſo eaſily give out their Salts; nor can the tender Fibres of many Plants make their Way through it, in ſearch of their Food. But if its Parts be well open'd, by digging and breaking it into very ſmall Pieces, and thoſe Parts be kept open by a Mixture of ſome ſharp Sand, or other like Matter, that Author adds, we ſhall ſee the Effects of its Vigour. Sand, on the other hand, giving its Salts readily, puts forth its Plants very early, and will make them germinate a full Month ſooner than Clay; but as it is haſty, 'tis ſoon ſpent. The Sun's Warmth calls up all its Salts early in the Spring, and there is but little left for them to ſubſiſt long on, if the Heat continue.

Each Kind has its peculiar Plants, which will not grow on the other; but the peculiar Plants of both the other two will grow in Loam, as partaking equally of the Qualities of both. Loam, then, muſt be allowed the beſt and moſt beneficial *Soil*, where it can be had: And where it cannot, if, by a Mixture of other Earths, we can make a Compoſt to reſemble it; we have more to expect from it, eſpecially in Plantations of durable Trees, than from a Compoſition of Dung or other forcing Ingredients, which, like Exceſs of high intemperate Foods and Liquors, though they give a haſty Growth, yet make the Thing ſhort-lived. The Compoſition or *Soil* here meant, is equal Quantities of Sand and Clay well mix'd. See TIMBER; ſee alſo HOT-BED.

Generally, a Mixture of two or three *Soils*, is better than any ſimple *Soil*; eſpecially where the Hot and Dry are mix'd with the Cold and Moiſt. Clay laid on Sand or Gravel, or Sand on Clay, is the beſt Manure. See MANURE.

But 'tis not the Nature of the *Soil* alone; but its Depth is alſo to be regarded, and what *Soil* is underneath. For the beſt *Soil*, if it be not above a Foot deep, and lie on a ſtiff Clay, or hard cold Stone, is not ſo fertile as a leaner *Soil* of greater Depth, or lying on a warm Lime-ſtone, Sand or Gravel, through which the ſuperfluous Moiſture may deſcend, and not ſtagnate on the Clay or Stone, to chill the Roots of Plants.

Indeed, Regard is to be had to the Climate; for even in *England*, cold, moiſt Clays are more fruitful in the South than the North.

Some general Rules with reſpect to *Soils*, are as follow. 1° All Land that moulders to Duſt with Froſt, with all ſorts of warm Lands, black Mould, yellow Clay, (if not too wet) and that turns Black after Rain, are good for Corn. 2° Lands bringing forth large Trees and Weeds, Black-Thorn, Thiſtles, rank Graſs, *&c.* generally prove fruitful. 3° Straw-berries, Betony, Thyme, *&c.* give Indication to Wood, and Camomile to a Mould diſpoſed for Corn. 4° All Land that binds after Froſt and Rain, that turns White and full of Worms, that is extremely moiſt, bears Holly, Yew, Box, Broom, Heath, Moſs, *&c.* is of a cold Temperature. 5° Black, Dun and Yellow Sand, and hot, ſtony Gravel, are generally unfruitful. See GARDEN, ORCHARD, BILL, PARLIAMENT, *&c.*

SOIT *fait comme il eſt deſire*, Be it done as 'tis deſired; a Form uſed when the King gives the Royal Aſſent to a private Bill preferr'd in Parliament.

SOKA, *Soke*, *Soc*, in ancient Cuſtoms, the Privilege of Tenants excuſed from cuſtomary Impoſitions. See SOC.

It alſo denotes the Territory wherein the chief Lord exerciſed his Liberty of keeping Courts within his own Domains.

Alſo a Quit-Rent, or Payment made to the Lord by his Tenant, for acting in Quality of a *Soc-man* or Freeholder. See SOCAGE.

The Rent-gatherer in the *Soka*, was called *Soke Reeve*.

SOL, in Muſic, the Fifth Note of the Gamut: Ut, Re, Mi, Fa, Sol. See NOTE and GAMUT; ſee alſo MUSIC.

SOL or *Sou*, Shilling, a *French* Coin, of Billon, *i. e.* Copper with a little Silver mix'd; equal to Twelve Deniers or Pence; and the 20th Part of the Livre or Pound. See SHILLING; ſee alſo DENIER and LIVRE.

The *French Sol* is rated at one Tenth Part leſs than the *Engliſh* Penny. See COIN, PENNY, *&c.*

The Word is form'd from the *Latin Solidus*, Shilling. *Bodin* is miſtaken, when he derives it *à Sole*, by reaſon of the Sun ſtruck on it.

The *Sol* was firſt ſtruck on the Foot of 12 Deniers Tournois, whence it was alſo called *Douzain*, a Name it ſtill retains, tho' its ancient Value be changed; the *Sol* having been ſince augmented by Three Deniers, and ſtruck with a Punchion of a *Flower de Lys*, to make it Current for 15 Deniers. Soon after, the old *Sols* were coin'd over again, and both Old and New indifferently Current for 15 Deniers. In 1709, the Value of the ſame *Sols* was raiſed to 18 Deniers. Towards the latter End of the Reign of *Louis* the Fourteenth, the *Sols* of 18 Deniers were again lowered to 15, where they now ſtand.

The *Dutch* have alſo two Kinds of *Sols*: The one of Silver, called *Sols de gros*, and likewiſe *Schelling*. See SCHELLING. The other of Copper, called alſo *Stuyver*. See STUYVER.

In old Authors we read of Gold *Sols*, which were different at different Times. In the Time of the *Salic* Law, the *Sol* was Forty Deniers; and thus it continued till the Time of King *Pepin*, when it was reduced to Twelve. Some have imagined, that the *French* had anciently Silver *Sols*.

SOL, in Aſtrology, *&c.* ſignifies the Sun. *Sol* in Aries, *&c.* See SUN.

SOL, in the Hermetical Philoſophy ſignifies Sulphur. See SULPHUR.

SOL, *Sun*, in Chymiſtry, is Gold; thus called from an Opinion, that this Metal is, in a particular Manner, under the Influence of that Luminary. See GOLD.

What ſhould have been the principal Inducement of torturing this Metal, with ſo much Violence to obtain from it ſome medicinal Virtues, Dr. *Quincy* obſerves, is not eaſy to be gueſs'd; unleſs it was to keep up the Authority of an ill-deſerved Regard, and a Jealouſy, that they could not be well

well in the common Opinion for Phyſicians, who could not do extraordinary Things in their Profeſſion with a Metal, which had ſuch a prodigious Influence on other Accounts. Many, indeed, there have been, who have honeſtly oppoſed this Artifice; but the contrary Sides have a long Time prevailed, and to ſuch a Degree, that this Metal itſelf has not only been transformed into all the Shapes imaginable for medicinal Purpoſes; but even its Name has been transferr'd to do Honour to, and enhance the Price of many other worthleſs Preparations, that bore any Reſemblance to its ſenſible Qualities.

Hence many Tinctures of a yellow Colour, are preſently the *Golden Tincture* of ſomething or other.

Moſt, indeed, acknowledge, that Gold in Subſtance, or reduced into the ſmalleſt Particles by the Hammer, as in the Leaf-Gold, is not digeſtible in the Stomach, ſo as to be tranſmitted into the Blood, and be of any Efficacy there. But there are, nevertheleſs, many, who are confident of its doing extraordinary Matters, if reduced into a Powder, by Amalgamation with Mercury, and by evaporating the Mercury afterwards.

Zacutus Luſitanus, is one of the ſmarteſt Pleaders on this ſide the Controverſy, againſt *Muſa*, *Picus Mirandola* and *Platerus*; who, beſides many Inſtances of its Efficacy, urges the Authority of *Avicen*, *Serapion*, *Geber* and many of the *Arabian* Phyſicians, with thoſe of other Countries, and of later Date. *Quercetan*, *Schroder*, *Zwelfer* and *Etmuller*, with many other more modern, practical Phyſicians, fell into the ſame Opinion. But which ſide ſoever is in the right, the preſent Practice rejects all Pretenſions to Medicine from it.

SOL, in Heraldry, the Gold Colour in the Arms of Sovereign Princes. See METAL.

SOLAR, ſomething belonging to the Sun. See SUN.

Thus we ſay, SOLAR *Fire*, in contradiſtinction to *Culinary Fire*. See FIRE.

The SOLAR *Year*, which conſiſts of 365 Days, 5 Hours, 49 Minutes; in Oppoſition to the *Lunar Year*, which only conſiſts of 354 Days. See YEAR.

The *Solar Year*, is either *Tropical*, or *Siderial*.

Tropical Year, is that Space of Time, wherein the Sun returns again to the ſame equinoctial or ſolſtitial Point; which is always equal to 365 Days, 5 Hours, and about 49 Minutes. The *Siderial* Year, is the Space wherein the Sun comes back to any particular, fixed Star; which is about 365 Days, 8 Hours, and 9 Minutes. See SIDERIAL, *&c.*

SOLAR *Syſtem*, the Order and Diſpoſition of the ſeveral heavenly Bodies, which revolve round the Sun as the Centre of their Motion, *viz.* the *Planets*, Primary and Secundary, and the *Comets*. For a Scheme of the Solar Syſtem, ſee SYSTEM.

SOLAR *Eclipſe*, is a Privation of the Light of the Sun, by the Interpoſition of the opake Body of the Moon. See ECLIPSE.

SOLAR *Spots*, SOLAR *Cycle*, SOLAR *Month*, } See { SPOTS. CYCLE. MONTH.

SOLDER, popularly called *Sodder*, a metallic or mineral Compoſition, uſed in *Soldering* or joyning together other Metals.

Solders are made of Gold, Silver, Copper, Tin, Glaſs of Tin, and Lead; always obſerving, that in the Compoſition, there be ſome of the Metal to be *Solder'd*, mix'd with ſome higher and finer Metals.

Goldſmiths make four Kinds of *Solder*, *viz.* *Solder* of Eight; where, to ſeven Parts of Silver there is one of Braſs or Copper. *Solder* of Six, where only a ſixth Part is Copper. *Solder* of Four: and *Solder* of Three. 'Tis the Mixture of Copper in the *Solder* that makes raiſed Plate always come cheaper than flat.

The *Solder* uſed by Plumbers, is made of two Pounds of Lead to one of Tin. Its Goodneſs is tried by melting it, and pouring the bigneſs of a Crown-piece on a Table; for, if good, there will ariſe little, bright, ſhining Stars therein. See PLUMBERY.

The *Solder* for Copper is made like that of the Plumbers; only, with Copper and Tin: For very nice Works, inſtead of Tin, they ſometimes uſe a Quantity of Silver. See COPPER.

Solder for Tin, is made of two Thirds of Tin, and one of Lead; but where the Work is any thing delicate, as in Organ-pipes, where the Juncture is ſcarce deſcernible, 'tis made of one Part of Tin of Glaſs, and three Parts of Pewter. See TIN.

The Duke of *Florence*'s Nail, anciently ſo much admired, as being half Iron and half Gold, when as thoſe Two Metals were deem'd irreconcileable; was joyn'd by a kind of *Solder*, made by *Turneiſſer*, an ingenious Chymiſt of *Venice*: The Secret whereof, was never diſcover'd till publiſh'd by *Tachenius*. The *Solder* is nothing but a little Copper or Cyprus Vitriol put between the Gold and the Iron. For, naturally, the great Acidity of the Gold, reduces the Iron into a Scoria or Ruſt, when the Two are applied immediately over one another; but this Difficulty is removed, by the Interpoſition of a little Copper, be it in the ſmalleſt Quantity imaginable.

The Word is form'd from the *Latin*, *Solidare*, to ſtrengthen.

SOLDERING, or *Soddering*, among Mechanicks, the joyning and faſtening together of two Pieces of the ſame Metal, or of two different Metals, by the Fuſion and Application of ſome metallic Compoſition on the Extremities of the Metals to be joyn'd. See SOLDER.

Goldſmiths *Solder* with Gold, Silver and Copper mix'd together: Plumbers with Lead and Tin. See PLUMBERY, *&c.*

Copper is uſually *Solder'd* with Tin; ſometimes, according to the Work, with a Mixture of Copper and Silver. In the *Soldering* of all theſe Metals, they generally uſe Borax in Powder, and ſometimes Roſin. As to Iron, 'tis ſufficient that it be heated red-hot; and the two Extremities, in this State, hammer'd together. By this means they become incorporated together. See BRAZING.

SOLDIER, a military Man, ſerving a Prince in War, in Conſideration of a certain *Solde* or daily Pay. See MILITARY.

The *Soldier* is he who takes Pay; the Vaſſal he who ſerves at his own Expences. See VASSAL and SERVICE.

Du Cange obſerves, that the ancient *Soldiers* were not to be ſhort of Five Foot and a Half; and that this Meaſure was called *Incoma*.

The Word is form'd from the *Italian*, *Soldato* of the *Latin Solida* or *Solidus*, the Solde or Pay. *Paſquier* derives it from the old *Gauliſh* Soal doyer. And *Nicod* from *Soldurius*. See SOLDURII.

SOLDURII, in Antiquity, a kind of Clients or Retainers to the great Men in *Gaul*, particularly *Aquitania*; mentioned by *Cæſar*.

The *Soldurii* were People, who ſhared all the good and all the ill Fortune of their Patrons; To whom, if any Diſaſter happened, they either underwent the very ſame, or kill'd themſelves; and *Cæſar* aſſures us, that no one had ever been known to refuſe the Alternative, *Lib.* III. *de Bel. Gal.* *Vigenerius* takes them to have been more than common Soldiers, and even Gentlemen in Penſion, or Appointment. *Atheneus* calls them Συναποθνήσκοντες, *q. d.* who die with their Maſters.

SOLECISM, or *Solœciſm*, in Grammar, a groſs Impropriety in Speech, contrary to the Uſe of the Language, and the Rules of Grammar, either in reſpect of Declenſion, Conjugation or Syntax.

An Actor on the *Roman* Theatre having made a wrong Geſture; the Audience immediately cried out he had committed a *Soleciſm* with his Hand. Ablanc.

SOLECISMS, on ſome Occaſions, are pardonable. *Impetratum eſt a ratione ut peccare ſuavitatis cauſa liceret.* *Vargelas* is frequently repeating that of *Quintillian*: *Aliud eſt Latinè, aliud Grammaticè loqui.* *Baltaſar Stolberg* has a *Latin* Treatiſe of the *Soleciſms* and Barbariſms falſely attributed to the *New Teſtament*. See BARBARISM.

The Word is *Greek*, σολοικισμὸς, derived from the *Soli*, a People of *Attica*, who being tranſplanted to *Cilicia*, loſt the Purity of their ancient Tongue, and became ridiculous to the *Athenians* for their Improprieties therein.

SOLEMN, ſomething perform'd with much Pomp, Ceremony and Expence.

Thus we ſay, *Solemn Feaſts*, *Solemn Funerals*, *Solemn Games*, &c. See FEAST, GAME, *&c.*

SOLEMN, in Law, ſignifies ſomething Authentic, or that is cloath'd in all its Formalities. A *Solemn Teſtament*, in the Civil Law, is to be atteſted by ſeven Perſons, and ſeal'd with their Seals.

A *Solemn Marriage*, is that perform'd in one's own Pariſh Church, after Publication of the Bans, and in Preſence of Witneſſes.

SOLET *and Debet*. See DEBET *and Solet*.

SOLE-*Tenant*, in Law, is he or ſhe, who holds only in his or her own Right, without any other Perſon joyn'd. See TENANT.

E. gr. If a Man and his Wife hold Land for their Lives, the Remainder to their Son; Here, the Man dying, the Lord ſhall not have Heriot, becauſe he dies not *Sole Tenant*.

SOLEUS, in Anatomy, a Muſcle called alſo *Gaſtrocnemius Internus*. See GASTROCNEMIUS.

SOL-FA-ING, in Muſic, the naming and pronouncing of the ſeveral Notes of a Song, by the Syllables *Sol*, *Fa*, *La*, *&c*, in learning to ſing it. See NOTE.

Of the Seven Notes in the Scale, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*; only Four are in Uſe among us, *viz.* *fa*, *ſol*, *la*, *mi*. Their Office is principally in Singing: that by applying them to every Note of the Scale, it may not only be pronounced more eaſily; but chiefly, that by them, the Tones and Semi-tones of the natural Scale, may be better mark'd out and diſtinguiſh'd.

This Deſign is obtained by the Four Syllables, *fa*, *ſol*, *la*, *mi*; thus, from *fa* to *ſol* is a Tone; alſo from *ſol* to *la*, and from *la* to *mi*, without diſtinguiſhing the greater or leſſer Tone; but from *la* to *fa*, alſo from *mi* to *fa*, is a Semi-tone.

If, then, these be applied in this Order, *fa*, *sol*, *la*, *fa*, *sol*, *la*, *mi*, *fa*, &c. They express the Natural Series from *c*; and if that be to be repeated to a Second or Third Octave, we see by them how to express all the different Orders of Tones and Semi-tones in the Diatonic Scale; and still above *mi*, will stand *fa*, *sol*, *la*; and below it, the same reversed, *la*, *sol*, *fa*; And one *mi* is always distant from another by an Octave; which cannot be said of any of the rest because after *mi* ascending, comes always *fa*, *sol*, *la*, *fa*, which are repeated invertedly, descending.

To conceive the Use of this: it is to be remember'd, that the first Thing in teaching to sing, is to make one raise a Scale of Notes by Tones and Semi-tones to an Octave, and descend again by the same Notes, and then to rise and fall by greater Intervals, at a Leap, as a Third, Fourth and Fifth, &c. And to do all this, by beginning at Notes of different Pitch. Then, these Notes are represented by Lines and Spaces, to which those Syllables are applied, and the Learner taught to name each Line and Space, by its respective Syllable; which makes what we call *Sol-fa-ing*: The Use whereof is, that while they are learning to tune the Degrees and Intervals of Sound, express'd by Notes set on Lines and Spaces; or learning a Song, to which no Words are applied; they may do it the better, by means of an articulate Sound: but, chiefly, that by knowing the Degrees and Intervals express'd by these Syllables, they may more readily know the true Distance of Notes. See SINGING.

Mr. *Malcolm* observes, that the Practice of *Sol-fa-ing*, common as it is, is very useless and insignificant, either as to the Understanding or Practising of Music; yet exceedingly perplexing: The various Application of the several Names, according to the various Signatures of the Clef, are enough to perplex any Learner; There being no less than 72 various Ways of applying the Names *sol*, *fa*, &c. to the Lines and Spaces of a particular System. See SCALE.

SOLID, in Physicks, a Body whose minute Parts are connected together, so, as not to give Way, or slip from each other upon the smallest Impression. See SOLIDITY.

The Word is used in this Sense, in Contradistinction to Fluid. See FLUID and FIRMNESS.

For the Laws of Gravitation of SOLIDS *immerged in Fluids Specifically lighter than the Solids* - - - - - - - - }
The Laws of Gravitation of SOLIDS *immerg'd in Fluids Specifically heavier* - - - } See GRAVITY.

To find the Specific Gravity of SOLIDS - - - - - - }
To find the Ratio of the Specific Gravity of SOLIDS *to Fluids.* } See SPECIFIC *Gravity*.

The Laws of the Resistance of SOLIDS *moving in Fluids* - }
SOLID *of the least Resistance* - - } See RESISTANCE.

SOLID, in Geometry, is a Magnitude indued with Three Dimensions; or extended in Length, Breadth and Depth. See DIMENSION.

Hence, as all Bodies have these Three Dimensions, and nothing but Bodies; *Solid* and *Body* are frequently used indiscriminately. See BODY.

A *Solid* is terminated, or contained under one or more Planes or Surfaces; as a Surface is under one or more Lines. See SURFACE and LINE.

From the Circumstances of the terminating Lines, *Solids* become divided into Regular and Irregular.

Regular SOLIDS, are those terminated by regular and equal Planes. See REGULAR.

Under this Class come the *Tetraëdron*, *Hexaedron* or *Cube*, *Octaëdron*, *Dodecaëdron* and *Icosiëdron*. See TETRAEDRON, CUBE, &c. each under its proper Article.

Irregular SOLIDS, are all such as do not come under the Definition of *Regular Solids*; such are the *Sphere*, *Cylinder*, *Cone*, *Parallelogram*, *Prism*, *Pyramid*, *Parallelopipid*, &c. See SPHERE, CYLINDER, CONE, &c. each under its proper Article.

The Geneses, Properties, Ratio's, Constructions, Dimensions, &c. of the several *Solids*, Regular and Irregular, Spherical, Elliptical, Conical, &c. See under each respective Heads.

Cubature or *Cubing of a* SOLID, is the measuring of the Space comprehended under a *Solid*, *i. e.* the *Solidity* or *Solid Content* thereof. See SOLIDITY.

SOLID *Angle*, is that form'd by three or more plain Angles meeting in a Point: Or, more strictly, a *Solid Angle*, as B, (Tab. Geometry, Fig. 30.) is the Inclination of more than two Lines, A B, B C, B F, which concur in the same Point B, and are in the different Planes.

Hence, for *Solid* Angles to be equal, 'tis necessary they be contained under an equal Number, of equal Planes, disposed in the same manner.

And as *Solid* Angles are only distinguishable by the Planes under which they are contained; and as Planes thus equal, are only distinguishable by Compræsence, they are Similar; and consequently Similar *Solid* Angles, are equal, & *vice versa*. See SIMILAR.

The Sum of all the Plane Angles constituting a *Solid* Angle, is always less than 360°; otherwise they would constitute the Plane of a Circle, and not a *Solid*. See ANGLE.

For the Method of Cubing the several Kinds of Solids; See CUBATURE.

SOLID *Bastion* } See { BASTION.
SOLID *Place* } { LOCUS.

SOLID *Numbers*, are those which arise from the Multiplication of a Plain Number, by any other whatsoever. Thus 18 is a *Solid* Number, made of 6 (which is Plain) multiplied by 3; or of 9 multiplied by 2. See NUMBER.

SOLID *Problem*, in Mathematicks, is one which cannot be Geometrically solved, but by the Intersection of a Circle, and a Conic Section; or by the Intersection of two other Conic Sections, besides the Circle.

Thus, to describe an Isosceles Triangle on a given Right Line, whose Angle at the Base, shall be triple to that at the Vertex, is a *Solid* Problem. See PROBLEM.

SOLIDITY, in Physicks, a Property of Matter or Body, whereby it excludes every other Body from the Place itself possesses.

Solidity is a Property common to all Bodies, whether Solid or Fluid. See BODY.

The Idea of *Solidity*, Mr. *Lock* observes, arises from the Resistance we find one Body make to the Entrance of another into its own Place. 'Tis usually called *Impenetrability*; but *Solidity* expresses it best; as carrying somewhat more of positive with it than the other, which is negative.

Solidity, he adds, seems the most extensive Property of Body; as being that whereby we conceive it to fill Space: 'Tis distinguish'd from meer Space, by this latter not being capable of Resistance or Motion. See SPACE.

'Tis distinguish'd from *Hardness*, which is only a firm Cohesion of the Solid Parts, so as they mayn't easily change their Situation. See HARDNESS.

The Difficulty of changing Situation, gives no more *Solidity* to the hardest Body than the softest; nor is a Diamond a Jot more *Solid* than Water. By this we distinguish the Idea of the Extension of Body, from that of the Extension of Space: That of Body, is the Continuity or Cohesion of solid, separable, moveable Parts; that of Space, the Continuity of unsolid, inseparable, immoveable Parts. See EXTENSION.

The *Cartesians*, however, will, by all means, deduce *Solidity*, or, as they call it, *Impenetrability*, from the Nature of Extension; and contend, that the Idea of the former, is contain'd in that of the latter; and hence argue against a *Vacuum*. Thus, say they, one Cubic Foot of Extension cannot be added to another, without having two Cubic Feet of Extension; for each has in itself, all that is required to constitute that Magnitude. And hence they conclude, that every Part of Space is Solid, or Impenetrable; inasmuch as of its own Nature it excludes all others. But the Conclusion is false, and the Instance they give follows from this, that the Parts of Space are immoveable; not that they are Impenetrable or Solid. See IMPENETRABILITY.

SOLIDITY, in Geometry, the Quantity of Space contain'd in a Solid Body; call'd also the *Solid Content*, and the *Cube* thereof. See CUBATURE.

The *Solidity* of a Cube, Prism, Cylinder, or Parallelopipid, is had by multiplying its Basis into its Height. See CUBE, PRISM, CYLINDER, &c.

The *Solidity* of a Pyramid or Cone, is had by multiplying either the whole Base into a Third Part of the Height; or the whole Height into a third Part of the Base. See PYRAMID and CONE.

To find the SOLIDITY *of any Irregular Body.*

Put the Body in a hollow Parallelopipid, and pour Water or Sand upon it, and Note the Height of the Water or Sand A B (Tab. Geometry, Fig. 32.) then, taking out the Body, observe at what Height the Water (or Sand when level'd) stands, as A C. Subtract A C from A B; the Remainder will be B C. Thus is the irregular Body reduced to a Parallelopipid, whose Base is F C G F; and Altitude B C. To find the *Solidity* whereof, see PARALLELOPIPID.

Suppose, *E. gr.* A B 8, A C 5; then will B C be 3: Suppose, again, D B 12, D E 4; then will the *Solidity* of the irregular Body be found 144.

If the Body be such, as that it can't be well laid in such a kind of Channel; *E. gr.* if it be required to measure the

Solidity

Solidity of a Statue, as it ſtands; a quadrangular Priſm or Parallelopipid is to be framed over it: the reſt as before.

To find the SOLIDITY *of a hollow Body.*

If the Body be not comprized in the Number of regular Bodies; its *Solidity* is found as in the preceding Problem. If it be a Parallelopipid, Priſm, Cylinder, Sphere, Pyramid or Cone; the *Solidity*, firſt of the whole Body, including the Cavity, then that of the Cavity, which is ſuppoſed to have the ſame Figure with the Body itſelf, is to be found, according to the reſpective Methods delivered under PARALLELOPIPID, PRISM, *&c.* For the latter being ſubtracted out of the former, the Remainder is the *Solidity* of the hollow Body required.

SOLIDITY, in Architecture, is applied both to the Conſiſtence of the Ground whereon the Foundation of a Building is laid; and to a Maſſive of Maſonry, of extraordinary Thickneſs, without any Cavity within.

The *Solidity* of the *Egyptian* Pyramids is inconceivable. See PYRAMID.

SOLIDS, in Anatomy, *&c.* all the continuous and continent Parts of the Body are thus call'd, in Oppoſition to the Fluids or the Parts contained therein. See BODY.

Of the *Solid* kind, are the Bones, Cartilages, Ligaments, Membranes, Fibres, Muſcles, Tendons, Arteries, Veins, Nerves, Glands, Lymphæducts and Lacteals. See BONE, CARTILAGE, LIGAMENT, *&c.* under their reſpective Articles.

Notwithſtanding the great Number and Appearance of the *Solids* of the Body; we find from the Microſcope, Injections, Veſicatories, Atrophies, *&c.* that the *Solid* Parts are exceedingly ſmall and inconſiderable, in compariſon of the Fluids. Nay, 'tis almoſt demonſtrable, from a Conſideration of the Riſe and Generation of the Veſſels, and the Reſolution of the greateſt Veſſels into their ſmalleſt conſtituent ones, that the whole Maſs of *Solids* in the Body, conſiſts merely of Fibres, as their common Elements. See FIBRE.

In, effect, the whole Maſs of *Solids*, as well as Fluids, a minute Stamen or Animalcule, only excepted, aroſe from a very ſubtile fluid Colliquament, not unlike the Nervous Juice; as is ſhewn by *Malpighi*, in his Treatiſe *de Ovo Incubato*. See EGG.

The White of the Egg never nouriſhes, till, from its natural Thickneſs, it have been brought, by Incubation, through innumerable Degrees of Fluidity, to become ſubtile enough to enter the minute Veſicles of the Stamen or Seed. The firſt, ſoft, tender *Solids* ariſing from this ſubtile Humor paſs through infinite, intermediate Degrees, e'er they arrive at their utmoſt *Solidity*. See GENERATION.

All the *Solids* therefore in our Bodies (unleſs any one will be ſo nice as to except the firſt Stamen) only differ from the Fluids, out of which they ariſe, by their Reſt, Coheſion and Figure; and a fluid Particle will become fit to form a Part of a *Solid*, as ſoon as there is a Force ſufficient to effect its Coheſion with the other *Solid* Parts. See NUTRITION.

SOLILOQY, a Reaſoning or Diſcourſe, which a Man holds with himſelf. See MONOLOGUE.

Papias ſays, that *Soliloquy* is properly a Diſcourſe by Way of Anſwer, to a Queſtion that a Man has propoſed to himſelf.

Soliloquies are become mighty common Things on the modern Stage; yet can nothing be more inartificial or more unnatural, than an Actor's making long Speeches to himſelf, to convey his Intentions, *&c.* to the Audience.

Where ſuch Diſcoveries are to be made, the Poet ſhould rather take Care to give the Dramatic Perſons ſuch Confidants, as may neceſſarily ſhare their inmoſt Thoughts; By which means, they will be more naturally convey'd to the Audience. Yet is even this a Shift, an accurate Poet would not be found to have Occaſion for. The Uſe and Abuſe of *Soliloquies*, is well delivered by the Duke of *Buckingham*, in the following Lines:

Soliloquies *had need be very few,*
Extremely ſhort, and ſpoke in Paſſion too.
Our Lovers talking to themſelves, for want
Of others, make the Pit their Confidant:
Nor is the Matter mended yet, if thus
They truſt a Friend, only to tell it us.——

SOLITARY, ſomething retired, or in private; remote from the Company, or Commerce of others of the ſame Species.

A *Solitary* COLUMN, is a Column that ſtands alone in any public Place; as the *Trajan* Column. See COLUMN.

A *Solitary* WORM, is a Worm ſometimes found in the Inteſtines, and which is always the only one of the Kind; as being placed in the Pylorus, and extending thence, the whole Length of the Inteſtines; ſo that there is no Room for another. See WORM.

SOLITARIES, is alſo the Title of the Nuns of S. *Peter* of *Alcantara*, inſtituted in 1676, by Cardinal *Barberin*, when Abbot of *Notre Dame de Farſa*, in that City.

They propoſe to imitate the ſevere, penitent Life of St. *Peter* of *Alcantara*; keep a continual Silence, never open their Mouths to any Body but themſelves; employ their Time wholly in ſpiritual Exerciſes, and leave the Temporal Concerns to a Number of Maids, who have a particular Superior in a ſeparate Part of the Monaſtery. They always go Bare-footed, without Sandals, gird themſelves with a thick Cord, and wear no Linnen.

SOLITAURILIA, in Antiquity. See SUOVETAURILIA.

SOLLICITOR, a Perſon employ'd to follow, and take care of Suits depending in Courts of Law, or Equity; formerly allowed only to Nobility, whoſe menial Servants they were; but now frequently uſed to others, to the great Increaſe of Champarty and Maintenance. See ATTORNEY.

SOLLICITOR *General*, hath his Office by Patent, during the King's Pleaſure.

The Attorney General, and he, had anciently a Right to their Writs of Summons, to ſit in the Lords Houſe on ſpecial Occaſions, till the 13th *Car.* II. ſince which, they have almoſt conſtantly been choſen Members of the Houſe of Commons. He has the Care and Concern of managing the King's Affairs, and hath Fees for Pleading, beſides other Fees ariſing by Patents, *&c.* He hath his Attendance on the Privy Council; and the Attorney General, and he, were anciently reckoned among the Officers of the Exchequer: They have Audience, and come within the Bar in all other Courts.

SOLSTICE, in Aſtronomy, the Time when the Sun is in one of the *Solſtitial Points*, that is, when he is at his greateſt Diſtance from the Equator; which is 23 Degrees and a Half; thus called, becauſe he then appears to *ſtand* ſtill, and not to change his Place in the Degrees of the Zodiac, any Way: An Appearance owing to the Obliquity of our Sphere, and which thoſe who live under the Equator are Strangers to. See SOLSTITIAL POINTS.

The *Solſtices* are Two, in each Year; the *Eſtival* or *Summer Solſtice*, and the *Hyemal* or *Winter Solſtice*.

The *Summer Solſtice*, is when the Sun is in the Tropic of *Cancer*; which is on the 11th of *June*; when he makes the longeſt Day. See TROPIC and DAY.

The *Winter Solſtice*, is when he enters the firſt Degree of *Capricorn*; which is on the 11th of *December*; when he begins to return towards us, and makes the ſhorteſt Day.

This is to be underſtood, as in our Northern Hemiſphere; for in the Southern, the Sun's Entrance into *Capricorn*, makes the *Summer Solſtice*, and that into *Cancer*, the *Winter Solſtice*. See ECLIPTIC, SUMMER, WINTER, *&c.*

SOLSTITIAL *Points*, are thoſe Points of the Ecliptic, wherein the Sun's Aſcent above the Ecliptic, and his Deſcent below it, are terminated. See POINT.

The firſt Point, which is in the beginning of the firſt Degree of *Cancer*, is called the *Eſtival* or *Summer Point*; and the latter, which is in the beginning of the firſt Point of *Capricorn*, the *Winter Point*. See SOLSTICE.

The *Solſtitial Points* are Diametrically oppoſite to each other.

SOLSTITIAL *Colure*, is that paſſing through the *Solſtitial Points*. See COLURE.

SOLUBLE, in Medicine, *Looſe*, or apt to go to Stool. See LAXATIVE, STOOL, *&c.*

Soluble Tartar, is a kind of Salt, chymically prepared, by boiling Eight Ounces of Cream of Tartar, with Four of Fix'd Salt of Tartar. See TARTAR.

SOLVENT, the ſame with Diſſolvent. See DISSOLVENT.

SOLUTIO *Continui*, or *Solution of Continuity*, a Term uſed by Phyſicians, *&c.* to expreſs a Diſeaſe common to the ſolid Parts of the Body, wherein their natural Coheſion is ſeparated.

If this happen to a ſimple, ſimilar Part of the Body; 'tis called, ſimply, *Solutio Continui*.

If on a compound, or organical Part, it acquires a particular Denomination, from the Nature of the Part, the Difference of the Cauſe, or the Manner of the Application; as, a *Wound*, *Rupture*, *Fracture*, *Puncture*, *Fiſſure*, *Contuſion*, *Ulcer*, *Corroſion*, *Dilaceration*, *Exfoliation*, *Caries*, &c. See WOUND, RUPTURE, FRACTURE, *&c.*

SOLUTION, in Algebra and Geometry, is the anſwering of a Queſtion; or reſolving any Problem propoſed. See RESOLUTION.

The *Solution* of the Problem of the Quadrature of the Circle, and that of the Duplicature of the Cube, by Right Lines, are held impoſſible. See QUADRATURE and DUPLICATURE.

SOLUTION *of Continuity*, in Chirurgery; See SOLUTIO *Continui*.

SOLUTION, in Phyſicks, the Reduction of a Solid, or firm Body, into a fluid State, by means of ſome Menſtruum. See MENSTRUUM.

Solution, is frequently confounded with what we otherwiſe call *Diſſolution*; but there is a Difference. See DISSOLUTION.

SOLUTION, in Chymiſtry, is ſometimes uſed for the Analyſis, or Reduction of a natural Body into its chymical Principles. See PRINCIPLE and ANALYSIS.

In this Senſe, *Solution* is the ſame with what we otherwiſe call *Reſolution*. See RESOLUTION.

SOLUTIVE. See LAXATIVE.

SOMNAMBULI, an Appellation given to People, who walk in their Sleep; more uſually called *Noctambuli*. See NOCTAMBULI.

The Word is form'd from the *Latin*, *Somnus*, Sleep, and *Ambulo*, I walk.

SOMNIFEROUS. See SOPORIFEROUS.

SON, a relative Term, applied to a Male Child, conſider'd in the Relation he bears to his Parents. See FATHER.

The Children of the King of *England*, are called *Sons* and *Daughters* of *England*. See KING. The Eldeſt *Son* is born Duke of *Cornwal*, and created Prince of *Wales*. See PRINCE.

The younger *Sons* are called *Cadets*. See CADET.

The King of *France*'s Children were anciently call'd *Fils*, and *Filles de France*, *Sons* and *Daughters* of *France*; and the Grand-children, *Petits Fils*, and *Petites Filles de France*. At preſent, the Daughters are called *Mes-dames*, and the Grand-daughters, *Mes-demoiſelles de France*.

Natural SON, *Adoptive* SON } See { BASTARD. ADOPTIVE.

SON *of God*, a Term uſed in various Senſes, in the Holy Scriptures; as, 1°. For the *Word*, or the Second Perſon in the Bleſſed Trinity: who is thus called, with reſpect to the Manner of his Generation; as being begotten of the Father.

Him, the Orthodox believe to be Co-eternal, and Co-equal with the Father; and to have been with him, the eternal Principle and Source of the Holy Spirit. See TRINITY.

The Term *Son*, is applied to him, both before and after his Incarnation. Thus we ſay, The *Son* of God Created the World; the *Son* of God was Incarnate, and lived 33 Years on Earth, &c.

2° Several Creatures are alſo called *Sons of God*; not as being ſo by Nature and Generation; but on divers other Accounts. Thus the Angels are called *Sons of God* by *Job*; in reſpect of their Creation, Adoption, &c. And great Men are called *Sons of God* in the *Pſalms*; as being his Lieutenants; or, the Depoſitaries of his Authority. Good Men, and particularly the Elect, are alſo called *Sons of God*, in various Places of the Sacred Writings.

SON *of Man*, is frequently uſed in Scripture, to ſignify *Man*; as expreſſing not only the Nature of Man; but his Frailneſs.

The Expreſſion is very uſual among the *Hebrews* and *Chaldeans*. *Daniel*, *Ezekiel*, and *Jeſus Chriſt*, are particularly thus called; the Firſt once, and the Two latter, frequently.

Sometimes, the Word is alſo uſed for the Wicked and Reprobate; in contradiſtinction to thoſe call'd *Sons of God*.

SONATA, in Muſic, a Term called by the *Italians*, *Suonata*, of *Suono*, Sound, as ſignifying a Piece or Compoſition of Muſic, wholly executed by Inſtruments; and which is, with regard to the ſeveral Kinds of Inſtruments, what the *Cantata* is, with regard to Voices. See CANTATA.

The *Sonata*, then, is properly a grand, free, humorous Compoſition, diverſified with a great Variety of Motions and Expreſſions, extraordinary and bold Strokes, Figures, &c. And all this purely according to the Fancy of the Compoſer; who, without confining himſelf to any general Rules of Counter-Point, or to any fix'd Number or Meaſure, gives a Looſe to his Genius, runs from one Mode, Meaſure, &c. to another, as he thinks fit.

We have Cantata's of 1, 2, 3, 4, 5, 6, 7, and even 8 Parts; but uſually they are performed by a ſingle Violin, or with two Violins and a thorough Baſs for the Harpſichord, and frequently a more figured Baſs for the Baſs-Viol, &c.

There are a Thouſand different Species of *Sonata's*; but the *Italians* uſually reduce them to three Kinds: *Suonate de Chieſa*; that is, *Sonata's* proper for Church-Muſic, which uſually begin with a grave, ſolemn Motion, ſuitable to the Dignity and Sanctity of the Place and the Service; after which they ſtrike into a briſker, gayer and richer Manner. Theſe are what they properly call *Sonata's*.

The ſecond Kind comprehends the *Suonate de Camera*, or *Sonata's* proper for the Chamber, &c. Theſe are properly Series's of ſeveral little Pieces, proper for Dancing; only compoſed to the ſame Tune. They uſually begin with a Prelude or little *Sonata*, ſerving as an Introduction to all the reſt: Afterwards come the *Alleman*, *Pavan*, *Courant*, and other ſerious Dances; then *Gigues*, *Gavots*, *Minuets*, *Chacons*, *Paſſecailles* and other gayer Airs: The whole compoſed in the ſame Tone or Mode.

SONG, in Poetry, a little Compoſition, conſiſting of ſimple, eaſy, natural Verſes, ſet to a Tune, in order to be ſung. See SINGING.

Each Stanza of a *Song*, is called a *Couplet*. See STANZA and COUPLET.

The *Song* bears a deal of Reſemblance to the *Madrigal*; and more to the *Ode*, which is nothing but a *Song* according to the ancient Rules. See MADRIGAL and ODE.

Its Object is uſually either Wine or Love; whence M. *le Brun* defines a modern *Song*, to be either a ſoft and amorous, or a brisk and bacchic Thought, expreſs'd in a few Words.

Indeed, this is to reſtrain it to too narrow Bounds; for we have devout *Songs*, ſatyrical *Songs*, and panegyrical *Songs*.

But, be the *Song* what it will, the Verſes are to be eaſy, natural, flowing, and to contain a certain Harmony, which neither ſhocks the Reaſon nor the Ear; and which unites Poetry and Muſic agreeably together.

Anciently, the only Way of preſerving the Memory of great and noble Actions, was, by recording them in *Songs*; and in *America* there are ſtill People, who keep their whole Hiſtory in *Songs*. See DRUID.

SONG, in Muſic, is applied in the General, to any ſingle Piece of Muſic, whether contrived for a Voice or Inſtrument. See MUSIC and COMPOSITION.

A *Song*, Mr. *Malcolm* obſerves, may be compared to an Oration: For, as in this latter, there is a Subject, *viz.* ſome Perſon or Thing the Diſcourſe is referr'd to, and which is always to be kept in View throughout the whole; ſo, in every truly regular and melodious *Song*, there is one Note which regulates all the reſt; wherein the *Song* begins, and at laſt ends, and which is, as it were, the principal Matter, or muſical Subject, to be regarded in the whole Courſe of the *Song*. And, as in the Oration, there may be ſeveral diſtinct Parts, which refer to particular Subjects, yet muſt they have an evident Connection with the principal Subject, which regulates the whole; ſo in Melody, there may be ſeveral ſub-principal Subjects, to which the different Parts of the *Song* may belong: But theſe are, themſelves, under the Influence of the principal Subject, and muſt have a ſenſible Connection with it. This principal or fundamental Note, is called the *Key of the Song*. See KEY.

SONNA, a Book of Mahometan Traditions, wherein all the Orthodox Muſſulmans are required to believe. See MAHOMETISM.

The Word ſignifies, in *Arabic*, the ſame with *Miſna* in the *Hebrew*, that is, *Second Law*, or, as the *Jews* call it, *Oral Law*. See MISCHNA.

The Adherents to the *Sonna* are called *Sonnites*: and as among the *Jews*, there is a Sect of *Caraites*, who reject the Traditions as Fables, invented by the Rabbins; there are alſo Sectaries among the *Mahometans*, called *Sciaites*, who reject the Traditions of the *Sonnites*; as being only founded on the Authority of an apocryphal Book, and not derived to them from their Legiſlator.

There is the ſame Enmity between the *Sonnites* and *Sciaites*, as between the rabbiniſt *Jews* and the *Caraites*. The *Sciaites* reproach the *Sonnites* with obtruding the Dreams of their Doctors, for the Word of God: And the *Sonnites*, in their Turn, treat the *Sciaites* as Hereticks, who refuſe to admit the divine Precepts, have corrupted the *Alcoran*, &c.

SONNET or *Sonetto*, in Poetry, a kind of Compoſition, contained in Fourteen Verſes, *viz.* two Stanza's or Meaſures of four Verſes each, and two of Three: The Eight firſt Verſes to be all in two Rhimes.

The *Sonnet* is of *Italian* Origin, and *Petrarch* is allowed to be the Father. 'Tis held the moſt difficult and artful of all poetical Compoſitions; as requiring the laſt Accuracy and Exactneſs. 'Tis to end with ſome pretty, ingenious Thought: The Cloſe to be particularly Beautiful.

In *Malherb*, and ſome other Poets, we meet with *Sonnets*, where the two firſt Stanza's are not in the ſame Rhime; but they are held irregular; and, in effect, great Part of the Merit of theſe Pieces, conſiſts in a ſcrupulous Obſervation of the Rules.

Ronſard, *Malherb*, *Maynard* and *Gombaut*, have compoſed abundance of *Sonnets*; but among two or three Thouſand, there are ſcarce Two or Three to be much admired.

Paſquier obſerves, that *du Bellai* was the Firſt who introduced *Sonnets* into *France*. But *du Bellai* himſelf ſays, That *Melin de S. Gelais*, firſt converted the *Italian Sonnets* into *French*.

SOOT, an earthy, volatile Matter, ariſing from Wood, Coals and other Fuel, along with the Smoak, by the Action of Fire; or, rather, it is the Smoak itſelf, fixed and gathered on the Sides of the Chimney. See SMOAK and FIRE.

Soot, is found an excellent Manure for Corn Lands, eſpecially where the Soil is cold. See MANURE.

The Dyers make conſiderable Uſe of *Soot*, for a kind of Dun Colour; which, 'tis true, has no agreeable Smell; but in Return has the Property of ſaving Cloaths and other Stuffs, from Moths.

Soot of Frankinſence, is the ſmalleſt and fineſt Part of the Incenſe, called *Olibanum*, or *Male Incenſe*; burnt after the manner of Roſin to make Lamp-black.

Dioſcorides.

Dioſcorides ſhews how to make a *Soot* of Butter, which has ſeveral Uſes in Medicine.

The *Soot* found in the Furnaces of Glaſs-houſes, is uſed by Painters.

SOPHI or SOFI, a Title or Quality given the Emperor of *Perſia*.

The *Sophi*'s value themſelves, and with ſome Reaſon, of their illuſtrious Extraction; The Race being Second to none in the *Eaſt*. They are deſcended in a right Line from *Houſſein*, ſecond Son of *Ali*, *Mahomet*'s Couſin, and *Fatima*, *Mahomet*'s Daughter. There is no Prince in the World, whoſe Authority is more abſolute than that of the *Sophi* of *Perſia*. His Power is not even limited by any Laws he himſelf can make; but he ſuſpends, changes, and annuls them at Pleaſure.

The Title is ſaid to have taken its Riſe from a young Shepherd thus named, who attained to the Crown of *Perſia* in 1370. Others derive *Sophi*, from the *Sophi's* or Sages, anciently called *Magi*.

Voſſius gives us a different Account of the Word. *Sophi*, in *Arabic*, he obſerves, ſignifies *Wool*, and adds, That it was applied by the *Turks* out of Deriſion to the Kings of *Perſia*, ever ſince *Iſhmael*'s Time, becauſe, according to the Scheme of Religion, he is to wear no other Covering on his Head, but an ordinary, red, woollen Stuff; whence the *Perſians* are alſo called *Kiſſelbais*, *q. d. Red-heads*. But *Bochart* ſays, That *Sophi*, in the original *Perſian* Language, ſignifies One that is pure in his Religion, and who prefers the Service of God in all Things; and derives it from

SOFI's or SOFEES, a kind of Order of Religious among the *Mahometans* in *Perſia*; thus called, from a kind of coarſe Camelot which they wear, called *Souf*, from the City *Souf* in *Syria*, where 'tis principally manufactured.

Scheik Sofi, who laid the firſt Foundation of the Grandeur of the Royal Houſe of *Perſia*, was the Founder, or rather the Reſtorer of this Order. *Iſhmael*, who conquered *Perſia*, was, himſelf, a *Sofi*, and valued himſelf on his being ſo. He choſe all the Guards of his Perſon from among the Religious of this Order; and would have all the great Lords of his Court *Sofi*'s. The King of *Perſia* is ſtill Grand Maſter of the Order; and the Lords continue to enter into it, tho' it be now fallen into great Contempt.

The vulgar *Sofi*'s are now chiefly employ'd as Uſhers, and Attendants of the Court; and even as Executioners of Juſtice; and the Emperor laſt reigning, would not allow them, according to Cuſtom, to gird the Sword on him. This Neglect, into which the *Sofi's* are fallen, has occaſioned the late Emperors to diſuſe the Title of *Sofi* or *Sophi*: However, *M. de la Croix* is miſtaken, when he ſays, That they never bore it. The more eminent of thoſe *Sofi*'s are called *Scheick*, *q. d.* Reverend.

SOPHISM, in Logic, a captious, fallacious Reaſoning; or an Argument, which with ſome Subtilty, carries much Appearance of Truth; but little Solidity. See FALLACY.

A *Sophiſm* is, properly an Argument falſe at bottom, and only invented to amuſe and embarraſs the Perſon to whom it is uſed. See SOPHIST.

SOPHISM's, or *Sophiſtical Arguments*, among Logicians, are particularly ſuch as are not in Form, or are founded on Equivocals; as, *You have every Thing you have not loſt; but you have not loſt Horns: Therefore you have Horns.*

SOPHIST, a Perſon who frames *Sophiſms*; that is, uſes ſubtile Arguments, with deſign to deceive thoſe he would perſuade or convince. See SOPHISM.

The Term *Sophiſt*, which is now reproachful, was anciently honourable; and carried a very innocent Idea. St. *Auguſtin* obſerves, it ſignified, ſimply, a Rhetor or Profeſſor of Eloquence; ſuch as were *Lucian*, *Athenæus*, *Libanius*, &c.

Suidas, and after him, *Olareus Celſius* in an expreſs Diſſertation on the *Greek Sophiſts*, tell us, That the Word was applied indifferently to all, who excelled in any Art or Science; whether Divines, Lawyers, Phyſicians, Poets, Orators or Muſicians. But this ſeems to be ſtretching the Senſe of the Word without all Meaſure. 'Tis poſſible a Rhetor might have made Verſes, &c. but that it was on account of his poetical Talent, that he was denominated *Sophiſt*, is what we ſee no Reaſon to apprehend. However, *Solon* is the Firſt who appears to have ever bore the Appellation; which is given him by *Iſocrates*: Afterwards, it was ſcarce ever given, but to Philoſophers and Declaimers.

The Title was in great Credit among the *Latins* in the XIIth Century, and in the Time of St. *Bernard*; but it began to loſe Ground in *Greece*, as early as *Plato*'s Time; on account of *Protagoras* and *Gorgias*, who made a ſordid Traffic thereof, by ſelling Eloquence for Money. Hence *Seneca* calls the *Sophiſts Charletans* or *Emperics*.

Cicero ſays, That the Title *Sophiſta* was given to ſuch as profeſs'd Philoſophy with too much Oſtentation, to make a Trade of it, by running from Town to Town, to retail their deceitful Science. A *Sophiſt*, therefore, was then, as now, a Rhetor, or Logician, who makes it his Buſineſs to enſnare and perplex People, by frivolous Diſtinctions, vain Reaſonings and captious Diſcourſes. Nothing has conduced more to the Increaſing of the Number of *Sophiſts*, than the contentious School Philoſophy. People are there taught to puzzle and obſcure the Truth, by barbarous, unintelligible Terms, as *Antipredicaments*, great and little *Logicals*, *Quiddities*, &c.

The Title of *Sophiſt* was given to *Rabanus Maurus*, by way of Eminence. *John Hincton*, an *Engliſh* Scholaſtic Writer, endeavoured to get, and bear, as a Credit to him, the Title of *Sophiſt*.

The Word is form'd from the *Greek* σοφὸς, Wiſe; or rather from σοφιστὴς, Impoſtor, Deceiver.

SOPHISTICATION, in Chymiſtry, Alchymy, &c. a Term particularly applied to the Counterfeit Works of fraudulent Alchymiſts, who uſe indirect Means of whitening Copper, gilding Silver, and giving other ſuperficial Tinctures; as alſo of making Augmentations, by divers Mixtures, and other illegal Operations, to delude thoſe, at whoſe Expence they are employ'd.

Hence the Term is alſo applied to Merchandizes, and other Goods adulterated, mix'd or alter'd by the Deceit of the Seller.

Muſc, at preſent, is almoſt all *Sophiſticated*, as well as Bezoard, Balm of *Gilead*, Lapis Lazuli, and other valuable Drugs. *Canary* Wines are *Sophiſticated* on the Place, before ever they come near our Ports.

SOPORIFIC, *Soporiferous* or *Soporative*, a Medicine that has the Faculty of procuring Sleep. See SLEEP.

Such are Opium, Laudanum, &c. See OPIATE.

The Word is form'd from the *Latin*, *Soper*, Sleep: The *Greeks*, in lieu hereof, uſe the Word *Hypnotic*; which ſee.

SOPOROUS or *ſleepy* Diſeaſes, are the *Coma* or *Catephora*, *Lethargy* and *Carus*, which rather appear to differ as to more or leſs, than as to Eſſence.

In this they all agree, That they induce a morbific Sweat. See COMA, &c.

SORBONNE, the Houſe or College of the Faculty of Theology, eſtabliſhed in the Univerſity of *Paris*. See COLLEGE.

It was founded in 1252, by St. *Louis*, or rather by *Robert de Sorbon* his Confeſſor and Almoner; firſt, Canon of *Cambray*, and afterwards of the Church of *Paris*. He gave his new Houſe his own Name; which he himſelf took from the Village of *Sorbon*, or *Serbon*, near *Sens*, where he was born. The Foundation was laid in 1250: Queen *Blanche*, in the Abſence of her Husband, furniſhing him with a Houſe before the Palace of *Julian* the Apoſtate, whereof ſome of the Remains are ſtill ſeen. Afterwards, the King gave him all the Houſes he had in the ſame Place, in exchange for ſome others in another.

The College has been, ſince, magnificently rebuilt by the Cardinal *de Richelieu*. The Deſign of its Inſtitution, was for the Uſe of poor Students in Divinity.

There are Lodgings in it for 36 Doctors, who are ſaid to be of the *Society of the Sorbonne*. Thoſe admitted into it without being Doctors, are ſaid to be of the *Hoſpitality of the Sorbonne*. Six Regent Doctors hold Lectures every Day, for an Hour and Half each: Three in the Morning, and Three in the Afternoon. See DOCTOR.

SORBONNE is alſo uſed in the General, for the whole Faculty of Theology at *Paris*: In regard the Aſſemblies of the whole Body are held in the Houſe of the *Sorbonne*; and that the Bachelors of the other Houſes of the Faculty, as the Houſe of *Navarre*, &c. come here to hold their *Sorbonnique* or Act, for being admitted Doctor in Divinity. See FACULTY.

SORCERY, the Crime of Witchcraft, or Divination by the Aſſiſtance of the Devil. See MAGIC, WITCHCRAFT and DIVINATION.

Some hold *Sorcery* to be properly what the Ancients call *Sortilegium*, or Divination by means of *Sortes* or *Lots*. See SORTES.

My Lord *Coke*, 3d *Inſt. Fol.* 44. deſcribes a *Sorcerer*, *Qui utitur Sortibus in cantationibus Dæmonum*. *Sorcery* is Felony, by *Stat.* 1° *Jac.* In the Mirror, *Sorcery* is ſaid to be a Branch of Hereſy; and by *Stat.* 12. *Car.* II. it is excepted out of the general Pardons.

Sorcery was a Thing formerly very common; at leaſt the Credulity of thoſe Ages made it paſs for ſuch; and People ſuffered frequently for it. In a more knowing and leſs believing Age, 'tis out of Doors.

In effect, the moſt probable Opinion is, That the ſeveral glaring Inſtances of *Sorcery* we meet withal, in our old Law-Books and Hiſtorians, if well enquired into, would be found, at Bottom, no other than artful Poiſonings.

SORITES, in Rhetoric, &c. a kind of Argument, wherein a Number of Propoſitions are gradually and minutely laid together; and ſomething inferred from the whole: Whence *Cicero* calls it *Syllogiſmus acervatus*, a Syllogiſm heaped up or accumulated.

Such was that merry Way *Themiſtocles* uſed of proving, That his little Son, under Ten Years old, commanded the whole World; thus: My Son commands his Mother; his Mother me; I the *Athenians*; the *Athenians* the *Greeks*;

Greece commands *Europe*: *Europe* the whole World: Therefore my Son commands the whole World.

This Method of Diſputing, prevailed much among the Stoicks; eſpecially with *Zeno* and *Chryſippus*. But 'tis very captious and ſophiſtical.

The Word is formed from the *Greek* σωρὸς, cumulus, Heap.

SORRANCES, among Farriers, is uſed to ſignify two Things, *viz.* either an ill State or Habit of a Horſe's Body, ariſing from ſome Part diſeaſed; or a Looſening and Solution of the Continuity of the Parts, which according to the various Circumſtances thereof, acquires various Names, as *Fracture*, *Wound*, *Ulcer*, *Rupture*, *Convulſion*, *Cramp*, *Excoriation*.

SORTES, in Antiquity, *Lots*, a Method of deciding dubious Caſes, where there appears no ground for a Preference, by referring the Thing to the Conduct of Chance; as in caſting of Dice, drawing of Tickets, &c. See CHANCE.

The ancient *Sortes* or *Lots*, were inſtituted by God himſelf; and in the Books of the *Old Teſtament*, we meet with divers ſtanding and perpetual Laws, and divers particular Commands, preſcribing and regulating the Uſe thereof. Thus the Scripture informs us, That the *Lot* fell on St. *Matthias*, when a Succeſſor to *Judas* in the Apoſtolate was to be choſen. And our Saviour's Garment itſelf, was caſt *Lots* for. *Sortiti ſunt Chriſti Veſtem.*

The SORTES *Præneſtinæ*, were famous among the *Greeks*. The Method of theſe, was to put an Infinity of Letters, or even whole Words into an Urn; to ſhake them together, and throw them out; and whatever ſhould chance to be made out in the Arrangement of the Letters, &c. compoſed the Anſwer of this Oracle.

In what Repute ſoever, this Method of Divination might, anciently, have been, M. *Dacier* obſerves, That in *Cicero*'s Time its Credit was low; inſomuch that none but the credulous Populace had recourſe to it.

In lieu of this, another kind of *Sortes* was introduced into *Greece* and *Italy*, which was to take ſome celebrated Poet, as *Homer*, or *Euripides*, or *Virgil*, to open the Book, and whatever firſt preſented itſelf to the Eye upon opening, was taken for the Ordinance of Heaven. This made what they call'd *Sortes Homericæ*, and *Sortes Virgilianæ*, which ſucceeded to the Uſe of the *Sortes Præneſtinæ*.

This Superſtition paſs'd hence into Chriſtianity; and the Chriſtians took their *Sortes* out of the Books of the *Old* and *New Teſtament*. The firſt Paſſage that it preſented, upon opening a Book of Scripture, was eſteem'd the Anſwer of God himſelf.

If the firſt Paſſage did not happen to be any Thing to the Purpoſe for which the *Sortes* were conſulted; another Book was opened, till a Paſſage were met withal, that might be taken for an Anſwer. This was called *Sortes Sanctorum*.

St. *Auguſtin* does not diſapprove of this Method of learning Futurity, provided it be not uſed for worldly Things; and owns he has practiſed it himſelf.

Gregory of *Tours* adds, That the Cuſtom was, to lay the Bible on the Altar, and to pray the Lord, that he'd diſcover what was to come to paſs.

Inſtances of the Uſe of the *Sortes Sanctorum* are very frequent in Hiſtory. *Heraclius*, Mr. *Fleury* tells us, in his War againſt *Cozroe*, to learn where he ſhould take up his Winter Quarters, purified his Army for three Days, and then opened the Goſpels, and found the Place appointed for his Winter Quarters, was in *Albania*.

Gilbert of *Nogent*, informs us, That in his Time, that is, about the beginning of the XIIth Century, the Cuſtom was at the Conſecration of Biſhops, to conſult the *Sortes Sanctorum*, to learn the Succeſs, Fate, &c. of their Epiſcopate.

The Practice is founded on a Suppoſition, that God preſides over the *Sortes*; and on the 33d Verſe of the 16th Chapter of *Proverbs*; *The Lot is caſt in the Boſom, and its Deciſion is from the Almighty.*

In effect, many Divines hold, that the *Lot* is conducted in a particular Manner by Providence; that 'tis an extraordinary Manner wherein God declares his Will by a kind of immediate Revelation. The *Sortes Sanctorum*, however, were condemn'd by the Council of *Agda* in 506, at the Time they were beginning to take footing in *France*, &c.

SORTILEGE, a kind of Divination by *Sortes* or *Lots*. See SORTES.

SOTERIA, in Antiquity, Sacrifices offered to the Gods, in Gratitude for their having delivered from Danger. See SACRIFICE.

The Term is alſo applied to poetical Compoſitions made for the ſame End. *Orpheus* is the firſt, who appears to have compoſed *Soteria*.

Our *Latin* Poets give the ſame Name to Poems in *Latin* Verſe, wrote to give Thanks to God or the Saints, for having preſerved them on any Occaſion: *F. Petavius* being delivered from a dangerous Diſeaſe, by the Interceſſion, as he ſuppoſed, of St. *Genevieve*, compoſed that fine Piece in Honour of that Saint, ſtill extant under the Title of *Soteria*.

The Word is form'd from the *Greek*, σωτὴς, *Saviour*.

SOVERAIGN, the firſt Being; the Supreme, or the Almighty: A Term, in Strictneſs, only applicable to God.

Paſquier derives it from the *Latin*, *Superior*, the Firſt in any Thing, or he who is ſuperior to the reſt.

Whence, in the ancient *French* Cuſtoms, we meet with *Soveraign* Maſter of the Houſhold; *Soveraign* Maſter of the Foreſts; *Soveraign* Maſter of the Treaſury: and hence, under *Charles* VI. the Title *Soveraign* is given to Bailiffs and Seneſchals, with regard to their Superiority over *Prevots* and *Chatelains*.

SOVERAIGN, with regard to Men, is applied to Kings, and Princes, who are Supreme and Independant, and hold of no Body but God and their Sword. See KING, PRINCE, &c.

The Authority of a *Soveraign* is only bounded by the Laws of God, of Nature, and the fundamental Laws of the State.

The Title is alſo given to ſuch as are inveſted with certain Rights, which only belong to *Soveraigns*: As the Right of Coining Money; ſending Agents to Diets, to treat of War and Peace: In which Senſe, the Feudatories of the Empire, and the Tributaries of the Grand Signor, are called *Soveraigns*.

Soveraign is alſo applied to Judges, who have a Power from a Prince, to decide the Proceſſes of his Subjects without Appeal or in the laſt Reſſort. At *Paris* there are five *Soveraign* Companies; the Parliament, the Chamber of Accompts, the Court of Aids, the Grand Council, and the Court of Monies. In *England*, we have but one *Soveraign* Court; the Houſe of Lords.

SOUL, a Spirit incloſed in an organiz'd Body. See SPIRIT and BODY.

Many of the ancient Philoſophers aſſerted an *Anima Mundi*, a *Soul* which moved and animated the Machine of the Univerſe, and gave Action to all natural Cauſes. This Doctrine, *Plato* handles very fully in his *Timæus*. See ANIMA MUNDI.

Others have given particular *Souls* to all the heavenly Bodies, the Sun, Stars, Earth, &c. to regulate their Motions.

The Philoſophers, many of them, allow of two, and others of three kinds of *Souls*.

A *Rational Soul*, which they hold to be Divine, and infuſed by the Breath of God.

An *Irrational* or *Senſitive Soul*, which Man has in common with Brutes, and which is form'd out of the Elements.

To which ſome add a *Vegetative Soul*; which we have in common with Plants; and which, as the Firſt is the Principle of Reaſon and Underſtanding, or that in us which thinks and underſtands; and the Second, the Principle of Life; ſo this Third is the Principle of Growth, Nutrition and Vegetation. See VEGETATIVE, &c.

The *Epicureans* took the Subſtance of the *Soul*, we mean of the rational *Soul*, to be a ſubtil Air, compoſed of their Atoms, or primitive Corpuſcles. See ATOM.

The Stoicks held it to be a Flame or Portion of heavenly Light.

Spinoſa and his Followers, allowing of only one kind of Subſtance, *viz.* Matter, maintain the *Soul* to be of the ſame Subſtance with the Body, *viz.* Material. See SUBSTANTIAL.

The *Carteſians* make Thought the Eſſence of the *Soul*, and from this Principle, deduce its Immateriality and Immortality. See THINKING.

But the Principle is Falſe; nor is there any need to define the *Soul* a Subſtance that thinks, to prove it Immortal. 'Tis enough, that the *Soul* be capable of Thinking; and that it produce its own Thoughts, without having Thought its Eſſence. 'Tis no more eſſential to the *Soul* to Think than to Will: For a Thing I can conceive the *Soul* without, cannot be its Eſſence.

Again, if Thought be the Eſſence of the *Soul*; as a Thing cannot produce itſelf, its own Being, or Eſſence; the *Soul* does not produce its own Thoughts, nor its own Will: And thus is it brought to the Condition of Brutes, or even of inanimate Bodies without any Action, any Liberty, &c.

If the *Carteſians* only mean this of the Faculty of Thinking; they do wrong even to call this the Eſſence of the *Soul*. 'Tis no more its Eſſence, than the Faculty of Willing is. And we conceive ſomething in the *Soul*, prior to both thoſe Faculties.

The *Soul* is a ſpiritual Subſtance, proper to inform, or animate a human Body, and by its Union with this Body, to conſtitute a reaſonable Animal or Man. This is its Eſſence; and this its Definition.

It muſt be owned, the *Carteſians* prove the Spirituality and Immortality of the *Soul*, from its Thinking, exceedingly well: But they are not to have the Honour of this Proof, as their own Invention. All the great Philoſophers uſed it before them, and uſe it ſtill. See IMMORTALITY.

The Philoſophers are not at all agreed, as to the Manner wherein the *Soul* reſides in the Body. Some hold it equally diffuſed throughout every Part thereof. Others ſay it influences

fluences, and acts on every Part of the Body, though it has its principal Residence in some particular Part, call'd the *Sensory*. See SENSORY.

This principal Part, *Des Cartes* maintains, is the Pineal Gland of the Brain, where all the Nerves terminate, &c. See PINEAL *Gland*.

Borry, a Northern Physician, in a Letter to *Bartholin*, asserts, That in the Brain is found a certain, very subtile, fragrant Juice, which is the principal Seat or Residence of the reasonable Soul; and adds, That the Subtilty and Fineness of the *Soul*, depends on the Temperament of this Liquor, rather than on the Structure of the Brain, to which 'tis usually ascribed. This Liquor, we conceive, must be the same with what we usually call the *Nervous Juice*, or *Animal Spirits*. The Constitution whereof, is, doubtless, of great Importance, with regard to the Faculties of the *Soul*. See SPIRIT.

Mr. *Lock* distinguishes Two principal Faculties for Powers of the *rational* or *human Soul*, *viz. Perception* and *Willing*. See POWER.

To these, other Philosophers add others; as *Sensation*, *Liberty*, *Memory*, *Imagination* and *Habit*. See UNDERSTANDING, WILL, SENSATION, LIBERTY, &c.

The Mystic Divines distinguish Two principal Parts in the *Soul*: The *Upper-part*, which comprehends the Understanding and the Will; and the *inferior Part*, which comprehends Imagination and Sensation. Thus, say they, *Jesus Christ* was happy on the Cross in his *upper Part*, and suffered in his *lower Part*. The lower Part did not communicate to the Upper, either its Troubles or its Failings; nor the Upper to the Lower, its Peace or Beatitude. From this Distinction, the Quietists take in hand to maintain, That whatever passes contrary to good Morals, in the lower Part of the *Soul*, is not contrary to the Purity of the upper Part, inasmuch as the Will has no Share therein.

As to the *Soul* of Brutes, the *Cartesians*, and some others, deny its Existence, in the common Sense of the Word *Soul*; that is, they strip off all the Properties or Faculties of the *Human Soul*: And the *Peripateticks*, on the contrary, invest it with the greatest Part of them.

In Man, a particular Agitation of the Fibres of the Brain is accompanied with a Sensation of Heat; and a certain Flux of animal Spirits towards the Heart, and Viscera, is followed by Love or Hatred.

Now the Peripateticks maintain, That the Brutes feel the same Heat and the same Passions, on the same Occasions: That they have the same Aversion for what incommodes them, and, in the general, are capable of all the Passions, and all the Sensations we feel.

The *Cartesians* deny they have any Perceptions or Notices at all; that they feel any Pain or Pleasure; or love or hate any thing. The Ground of their Opinion is, That they allow of nothing in Brutes, but what is material, and that they deny Sensations and Passions, to be any Properties of Matter. Some of the Peripateticks, on the other hand, maintain Matter, when subtilized, framed, ranged and moved in a certain Manner, to be capable of Sensation and Passion; that Beasts may feel and perceive, by means of the animal Spirits, which are a Matter thus modified; and that the *human Soul* itself, only becomes capable of Sensation and Passion, by means thereof.

But we must own it very difficult, to reconcile the Idea we have of Matter, with that we have of Thought; to conceive that Matter figured in any manner, whether in a Square, a Sphere, or an Oval, should be Pleasure, Pain, Heat, Colour or Smell; to conceive that Matter, however, agitated, whether in a Circle, a Spiral, Parabola or Ellipsis, should be Love, Hatred or Joy.

The Maintainers of the contrary Opinion, urge that Appearance of Sense, of Fear, Caution, Love for their Young, infinite Sagacity, both for their own Preservation and that of their Species, visible through the whole Brute Creation. And 'tis true, all the Actions of Beasts plainly express an Understanding; for every thing that is regular, expresses it; even a Machine or Watch expresses it: and a Plant much more; the Radicle of the Seed turning downwards, and the Stem upwards, whatever Situation the Seed is sown in: the young Plants knitting from Space to Space, to strengthen it; its putting forth Prickles, &c. to defend it, &c. mark a great Understanding. All the Motions of Plants and Brutes plainly discover an Intelligence; but the Intelligence does not reside in the Matter thereof: 'Tis as distinct from the Beast or Plant, as is that which ranged the Wheels of the Watch, is distinct from the Watch itself.

For, in effect, this Intelligence appears infinitely Great, infinitely Wise, infinitely Powerful; and the same which form'd us in our Mother's Womb, which gives our Growth, &c.

Thus, in Brutes, there is not either Understanding or *Soul*, in the Sense we generally use the Word: They eat without Pleasure, cry without Pain, grow without knowing it. They fear nothing; know nothing; and if they act in such manner, as shews Understanding; 'tis because God having made them, to preserve them, has formed their Bodies, so as to avoid whatever might hurt them, mechanically.

Otherwise, it might be said, That there is more Understanding in the vilest Insect, nay, in the smallest Grain, than in the most knowing of Men; for 'tis evident, either of them contains more Parts, and produces more regular Motions and Actions, than we are capable of understanding. Thus does the great F. *Mallebranch*, argue against the *Souls* of Brutes. *Recherche de la Verite, liv. 6.*

SOUL'S *Cheat*, a Legacy anciently bequeathed at their Deaths, by our scrupulously pious Ancestors, to the Parish Priest, to compensate for any Tythes that might have been forgot in their Lives. See TYTHE.

SOUND, a Perception of the *Soul*, communicated by means of the Ear; or, the Effect of a Collision of Bodies, and a tremulous Motion consequent therein, communicated thence to the circumambient Fluid, and propagated through it to the Organs of Hearing. See EAR and HEARING.

To illustrate the Cause of *Sound*; we observe; first, That a Motion is necessary in the sonorous Body, for the Production of *Sound*. Secondly, That this Motion exists, first, in the small and insensible Parts of the sonorous Bodies, and is excited in them by their mutual Collision, and Percussion against each other, which produces that tremulous Motion, so observable in Bodies, that have a clear *Sound*, as Bells, musical Chords, &c. Thirdly, That this Motion is communicated to, or produces a like Motion in the Air, or such Parts of it, as are apt to receive and propagate it; inasmuch as no Motion of Bodies, at a Distance, can affect our Senses without the Mediation of other Bodies, which receive those Motions from the Body, and communicate them immediately to the Organ. Lastly, That this Motion must be communicated to those Parts, that are the proper and immediate Instruments of Hearing.

Further, That Motion of a sonorous Body, which is the immediate Cause of *Sound*, may be owing to two different Causes; either the Percussion between it and other hard Bodies, as in Drums, Bells, Chords, &c. or the beating and dashing of the sonorous Body and the Air, immediately against each other, as in Wind Instruments, as Flutes, Trumpets, &c.

But in both Cases, the Motion, which is the Consequence of the mutual Action, and the Immediate of the sonorous Motion which the Air conveys to the Ear; is an invisible, tremulous or undulating Motion in the small and insensible Parts of the Body.

To explain this; all sensible Bodies are supposed to consist of a Number of small and insensible Parts or Corpuscles, which are of the same Nature in all Bodies, perfectly hard and incompressible. See CORPUSCLE.

Of these, are composed others, somewhat greater, but still insensible; and these different, according to the different Figures and Union of their component Parts. These, again, constitute other Masses bigger and more different than the former, and of the various Combinations of these last, are those gross Bodies composed, that are visible, touchable, &c. The first and smallest Parts, we have observed, are absolutely hard; the others are compressible, and united in such manner, that being compress'd by an external Impulse, they have an elastic or restitutive Power, whereby they restore themselves to their natural State. See ELASTICITY.

A Shock, then, being made by one Body upon another, the small Particles, by their elastic Principle, move to and again with a very great Velocity, in a tremulous, undulating Manner, somewhat like the visible Motions of grosser Springs; as we easily observe in the Chords of musical Instruments. And this is what we may call the *Sonorous Motion*, which is propagated to the Ear: But observe, that 'tis the insensible Motion of those Particles next the smallest, which is supposed to be the immediate Cause of *Sound*; and of these, only those next the Surface, communicate with the Air: The Motion of the whole, or of the greater Parts, being no further concerned, than as they contribute to the other.

To apply this Theory; strike a Bell with any hard Body, and you easily perceive a sensible Tremor in the Surface, spreading itself over the whole; and that more sensibly, as the Shock is greater. Upon touching it in any other Part, the Motion and the *Sound* too, are stopp'd. Now this is apparently a Motion of the small and insensible Parts, changing their Situations, with respect to one another, which being so many, and so closely united, we cannot perceive their Motions separately and distinctly; but only a Trembling, which we reckon to be the Effect of the Confusion of an infinite Number of little Particles, closely joyn'd, and only moving in infinitely little Lines.

Mr. *Perrault* adds, That this visible Motion of the Parts, contributes no otherwise to *Sound*, than as it causes the invisible Motion of the smaller Parts, which he calls *Particles*, to distinguish them from the sensible ones, which he calls *Parts*, and from the smallest of all, which we call *Corpuscles*.

This he ſupports from the Inſtance of a Chord, which being ſtruck, and the *Sound*, and ſenſible Undulations at Reſt again, if you approach the Chord ſoftly with the Finger, you'll find a ſmall tremulous Motion, which is the Remains of the Vibrations of the whole Chord, and the Parts. Now, the Parts vibrate without any *Sound*; but no ſooner is the Vibration felt by the Finger, than the *Sound* is heard again; which he aſcribes to this, That the Motion of the Parts being inſufficient to move the Particles, whoſe Motion is the firſt that ceaſes, requires ſome Aſſiſtance from daſhing againſt the Finger, whereby to become enabled to give the Particles the Motion neceſſary for the producing of *Sound*. He finiſhes his Proof, by the Inſtance of Flutes; which when made of different Matters, as Wood, Metal, &c. whoſe Parts are very different, but their Particles nearly the ſame, if their Lengths and Bores be the ſame; there is very little ſenſible Difference in their *Sounds*.

The ſonorous Body having made its Impreſſion on the contiguous Air, that Impreſſion is propagated, from one Particle to another, according to the Laws of Pneumaticks.

A few Particles, for inſtance, driven from the Surface of the Body, drive the neighbouring Particles into a leſs Space; and the Medium, as it is thus rarified in one Place, becomes condenſed in the other: But the Air thus compreſs'd in the ſecond Place, is, by its Elaſticity, returned back again, both to its former Place, and its former State; and the Air, contiguous to that, is compreſs'd: and the like obtains, when the Air leſs compreſs'd expanding itſelf, a new Compreſſion is generated. From each Agitation of the Air, therefore, there ariſes a Motion of the Air, analogous to the Motion of a Wave on the Surface of Water; which we call a *Wave* or *Undulation* of Air. See UNDULATION.

In each Wave, the Particles go and return back again, through very ſhort, but equal Spaces; the Motion of each Particle is analogous to the Motion of a vibrating Pendulum, while it performs two Oſcillations; and moſt of the Laws of the Pendulum, with very little Alteration, are applicable thereto. See PENDULUM.

Sounds are as various, as are the Means that concur to their Production.

The principal Varieties are reducible to the Figure, Conſtitution, Quantity, &c. of the ſonorous Body, the Manner of Percuſſion, with the Velocity, &c. of the Vibrations conſequent thereon; the State and Conſtitution of the Medium; the Diſpoſition, Diſtance, &c. of the Organ; the Obſtacles between the Organ and the ſonorous Object, and the adjacent Bodies: The moſt notable Diſtinctions of *Sounds*, ariſing from the various Degrees and Combinations of the Conditions mentioned, are into *loud* and *low* (or ſtrong or weak) into *grave* and *acute* (or ſharp and flat, or high and low) and into *long* and *ſhort*. The Management whereof, makes the Office of Muſic. See SOUND *in Muſic*.

The Velocity of *Sound* is the ſame, with that of the Waves; which does not differ much, whether it go with the Wind or againſt it. By the Wind, indeed, a certain Quantity of Air is carried from one Place to another; and the *Sound* is accelerated, while its Waves move through that Part of the Air, if their Direction be the ſame as that of the Wind. But as *Sound* moves vaſtly ſwifter than Wind, the Acceleration it will hereby receive, is inconſiderable. In effect, the moſt violent Winds we know of, have their Celerity to that of *Sound*, only as 1 to 33; and all the Effect we can perceive from the Wind, is, that it increaſes and diminiſhes the Space of the Waves; ſo that the *Sound* may be heard to a greater Diſtance than otherwiſe it would.

That the Air is the ordinary Medium of *Sound*, appears from various Experiments, in rarified and condenſed Air.

In an exhauſted Receiver, a ſmall Bell may be heard ſome Diſtance; but when exhauſted, it can ſcarce be heard at the ſmalleſt Diſtance. If the Air be condenſed, the *Sound* will be louder, proportionably to the Condenſation, or Quantity of Air crouded in: Of which we have many Inſtances in Mr. *Haukſbee*'s Experiments; and this does not only ſucceed in forced Rarefactions, &c. but in ſuch alſo, as are Natural; as is evident from *Fredlicius*'s Story of his Journey to the Top of Mount *Carpathus* in *Hungary*.

But 'tis not the Air alone, that is capable of the Impreſſions of *Sound*; but Water alſo: as is manifeſt, by ſtriking a Bell under Water, the *Sound* of which may plainly enough be heard, only not ſo loud, and alſo a Fourth deeper, by the Ear of ſome good Judges in muſical Notes. Indeed *Merſenne* ſays, a *Sound* made under Water, is of the ſame Tone or Note, as if made in Air, and heard under Water.

The *Velocity of Sound* is variouſly reported by various Authors.

Sir *Iſaac Newton* makes its Progreſs, in a Second of Time, to be 968 Feet; the Honourable Mr. *Francis Roberts* 1300 Feet; Mr. *Boyle* 1200 Feet; Dr. *Walker* 1338 Feet; *Merſenne* 1474 Feet; Mr. *Flamſtead* and Dr. *Halley* 1142 Feet; the *Florentine* Academy 1148 Feet; the *French* Obſervers, *Hiſt. Acad. Reg.* 1172. The Reaſon of which Variety, Mr. *Derham* aſcribes partly to thoſe Gentlemen uſing Strings and Plummets inſtead of regular Pendulums; partly to there not being Diſtance enough between the ſonorous Body and the Place of Obſervation; and partly, to there being no Regard had to the Winds.

Some of the moſt conſiderable Queries, relating to the Laws of *Sounds*, the ſame Author propoſes; and anſwers ſeveral of them accurately, from Experiments made for that Purpoſe by himſelf, as follows;

How far a *Sound* moves in a Second of Time? *Sound* moves 1142 Seconds in a Second, which is juſt an *Engliſh* Mile in $9\frac{1}{4}$ or 9.25 half Seconds; two Miles in $18\frac{1}{2}$; three Miles in $27\frac{3}{4}$, &c.

Does the Report of a Gun, diſcharged with its Mouth towards us, come ſooner than when the Muzzle is from the Obſerver? By repeated Experiments, it appears, there is no Difference in the *Sound*, from this different Direction.

Do *Sounds* move in the ſame Time, the ſame Spaces, in all States of the Atmoſphere, and Heights of the Barometer, by Day and by Night, in Summer and in Winter, in ſnowy and in clear Weather, in this or that Climate? By repeated Experiments, it does not appear there ariſes any Difference from any of theſe different Circumſtances.

Do the Winds affect the Motion of *Sounds*? By repeated Experiments, it appears, there is ſome, though a very ſmall Difference in the Velocity of *Sounds*, with or againſt the Wind; which is alſo augmented, or diminiſhed, by the Strength or Weakneſs of the Wind.

Do a great and intenſe *Sound*, and a ſmall or languid one, move with the ſame Velocity? It appears that they do.

Does the *Sound* of a Gun move equally ſwift at all Elevations of the Gun? They do.

Do different Quantities or Strengths of Gun-powder, occaſion any Difference, as to the Velocity of the *Sound*? None.

Does *Sound* move in a right Line, the neareſt Way; or does it ſweep along the Earth's Surface? And is there any Difference in the Time, if the Piece be diſcharged in an acclive and a declive Poſition? *Sound* moves the neareſt Way; and the Velocity appears to be the ſame in Acclivities and Declivities.

Have all kinds of *Sounds*, as thoſe of Guns, Bells, &c. the ſame Velocity? And are *Sounds* equally ſwift in the Beginning of their Motion, and in the End? There appears no Inequality in either of theſe reſpects.

For the Reflection of SOUND, *For the Refraction of* SOUND, } See { ECCHO. REFRACTION.

SOUND, in Muſic, the Quality and Diſtinction of the ſeveral Agitations of the Air, conſider'd as their Diſpoſition, Meaſure, &c. may make Muſic. See MUSIC.

Sound is the Object of Muſic, which is nothing but the Art of applying *Sounds*, under ſuch Circumſtances of Tone and Tune, as to raiſe agreeable Senſations.

The principal Affection of *Sound*, whereby it becomes fitted to have this End; is that, whereby it is diſtinguiſhed into *Acute* and *Grave*. See GRAVITY, &c.

This Difference depends on the Nature of the ſonorous Body, the particular Figure and Quantity thereof; and even, in ſome Caſes, on the Part of the Body where it is ſtruck; and is that which conſtitutes what we call different Tones. See TONE.

The Cauſe of this Difference appears to be no other than the different Velocities of the Vibrations of the *ſounding* Body. In effect, the Tone of a *Sound*, is found, by abundance of Experiments, to depend on the Nature of thoſe Vibrations, whoſe Differences we can conceive no otherwiſe, than as having different Velocities: And ſince 'tis proved, That the ſmall Vibrations of the ſame Chord, are all performed in equal Time; and that the Tone of a *Sound*, which continues for ſome Time after the Stroak, is the ſame from firſt to laſt: It follows, that the Tone is neceſſarily connected with a certain Quantity of Time in making each Vibration, or each Wave; or that a certain Number of Vibrations or Waves, accompliſhed in a given Time, conſtitute a certain and determinate Tone.

From this Principle, are all the Phænomena of Tune deduced. See TUNE.

From the ſame Principle, ariſe what we call *Concords*, &c. which are nothing but the Reſults of frequent Unions and Coincidences of the Vibrations of two ſonorous Bodies, and conſequently of the Waves and undulating Motions of the Air, occaſioned thereby. See CONCORD.

On the contrary, the Reſult of leſs frequent Coincidences of thoſe Vibrations, is what we call a *Diſcord*. See DISCORD.

Another conſiderable Diſtinction of *Sounds*, with regard to Muſic, is that, whereby they are denominated *long* and *ſhort*; not with regard to the ſonorous Body's retaining a Motion once received, a longer or a leſs Time, though gradually growing weaker; but to the Continuation of the Impulſe of the efficient Cauſe of the ſonorous Body, for a *longer* or a *ſhorter* Time, as in the Notes of a Violin, &c. which are made

made longer or ſhorter, by Strokes of different Length or Quickneſs.

This Continuity, is, properly, a Succeſſion of ſeveral *Sounds*, or the Effect of ſeveral diſtinct Strokes, or repeated Impulſes on the ſonorous Body, ſo quick, that we judge it one continued *Sound*; eſpecially if it be continued in the ſame degree of Strength: And hence ariſes the Doctrine of *Meaſure* and *Time*. See TIME.

Sounds, again, are diſtinguiſhed, with regard to Muſic, into *Simple* and *Compound*; and that two Ways:

In the Firſt, a *Sound* is ſaid to be *Compound*, when a Number of ſucceſſive Vibrations of the ſonorous Body and the Air, come ſo faſt upon the Ear, that we judge them the ſame continued *Sound*; as in the Phænomenon of the Circle of Fire, cauſed by putting the fir'd End of a Stick in a quick, circular Motion; where, ſuppoſing the End of the Stick in any Point of the Circle, the Idea we receive of it there, continues till the Impreſſion is renewed by a ſudden Return.

A *ſimple Sound*, then, with regard to this Compoſition, ſhould be the Effect of a ſingle Vibration, or of ſo many Vibrations as are neceſſary to raiſe in us the Idea of *Sound*. In the Second Senſe of Compoſition, a *ſimple Sound* is the Product of one Voice, or one Inſtrument, &c.

A *compound Sound*, conſiſts of the *Sounds* of ſeveral diſtinct Voices or Inſtruments all united in the ſame individual Time and Meaſure of Duration, that is, all ſtriking the Ear together, whatever their other Differences may be: But in this Senſe, again, there is a two-fold Compoſition; a *Natural* and *Artificial* one.

The natural Compoſition, is that proceeding from the manifold Reflexions of the firſt *Sound* from adjacent Bodies, where the Reflexions are not ſo ſudden, as to occaſion Eccho's; but are all in the ſame Tune with the firſt Note. See RESONANCE.

The artificial Compoſition, which alone comes under the Muſicians Province, is, that Mixture of ſeveral *Sounds*, which being made by Art, the Ingredient *Sounds* are ſeparable, and diſtinguiſhable from one another. In this Senſe, the diſtinct *Sounds* of ſeveral Voices or Inſtruments, or ſeveral Notes of the ſame Inſtrument, are called *Simple Sounds*; in contradiſtinction to the *Compound* ones, wherein, to anſwer the End of Muſic, the Simples muſt have ſuch an Agreement in all relations, chiefly as to Acuteneſs and Gravity, as that the Ear may receive the Mixture with Pleaſure. See COMPOSITION.

Another Diſtinction of *Sounds*, with regard to Muſic, is that, whereby they are ſaid to be *ſmooth* and *even*, or *rough* and *harſh*, alſo *clear* and *hoarſe*; the Cauſe of which Differences, depends on the Diſpoſition and State of the ſonorous Body, or the Circumſtances of the Place; but the Ideas of the Differences muſt be ſought from Obſervation.

Smooth and *rough Sounds* depend, principally, on the *ſounding* Body; Of theſe we have a notable Inſtance in Strings that are uneven, and not of the ſame Dimenſion or Conſtitution throughout.

M. *Perrault*, to account for *Roughneſs* and *Smoothneſs*, maintains, there is no ſuch thing as a ſimple *Sound*; but that the *Sound* of the ſame Chord or Bell, is a Compound of *Sounds* of the ſeveral Parts of it; ſo that where the Parts are homogeneous, and the Dimenſions, or Figure uniform, there is always ſuch a perfect Mixture and Union of all the *Sounds*, as makes one uniform and ſmooth *Sound*: Contrary Conditions, produce *Harſhneſs*. In effect, a Likeneſs of Parts and Figure, makes an Uniformity of Vibrations, whereby a great Number of ſimilar and coincident Motions conſpire to fortify and improve each other, and unite, for the more effectual producing of the ſame Effect.

This Account he confirms, from the Phænomena of a Bell, which differs in Tone, according to the Part 'tis ſtruck in; and yet ſtrike it any where, there is a Motion over all the Parts. Hence, he conſiders the Bell as compoſed of an infinite Number of Rings, which, according to their different Dimenſions, have different Tones; as Chords of different Lengths have; and when ſtruck, the Vibrations of the Parts immediately ſtruck, ſpecify the Tone, being ſupported by a ſufficient Number of Conſonant Tones in other Parts. This muſt be allowed, that every Note of a ſtring'd Inſtrument, is the Effect of ſeveral ſimple *Sounds*: For there is not only the *Sound* reſulting from the Motion of the String; but that from the Motion of the Parts of the Inſtrument, which has a conſiderable Effect in the total *Sound*, as is evident from hence, that the ſame String on different Violins, *ſounds* very differently.

But *Perrault* affirms the ſame of every String in itſelf, and without conſidering the Inſtrument. Every Part of the String, he ſays, has its particular Vibrations, different from the groſs and ſenſible Vibrations of the whole; and theſe are the Cauſes of different Motions and *Sounds* in the Particles, which uniting, compoſe the whole *Sound* of the String, and make an uniform Compoſition, wherein the Tone of the particular Part ſtruck, prevails; and all the others mix under a due Subordination with it, ſo as to make the Compoſition ſmooth and agreeable. If the Parts be unevenly, or irregularly conſtituted, the *Sound* is harſh; which is the Caſe in what we call *falſe Strings*, and various other Bodies; which, for this Reaſon, have no certain and diſtinct Tone; but a Compoſition of ſeveral Tones, which don't unite and mix, ſo as to have one predominant, to ſpecify the total Tone.

As to *clear* and *hoarſe Sounds*, they depend on Circumſtances that are accidental to the ſonorous Body: Thus a Voice or Inſtrument will be hollow and hoarſe, if raiſed within an empty Hogſhead, that yet is clear and bright out of it: The Effect is owing to the Mixture of other and different *Sounds*, raiſed by Reflexion, which corrupt and change the Species of the primitive *Sound*.

For *Sounds* to be fit to obtain the End of Muſic, they ought to be *ſmooth* and *clear*, eſpecially the firſt; ſince without this, they cannot have one certain and diſcernable Tone, capable of being compared to others, in a certain relation of Acuteneſs, of which the Ear may judge; and of Conſequence can be no Part of the Object of Muſic. Upon the whole, then, with Mr. *Malcolm*, we call that a *harmonic* or *muſical Sound*, which being *clear* and *even*, is agreeable to the Ear, and gives a certain and diſcernable Tune; (hence called *tunable Sound*) which is the Subject of the whole Theory of Harmony. See HARMONY.

SOUND, in Geography, a Streight, or Inlet of the Sea, between two Capes or Head-lands. See STREIGHT.

The Word is particularly uſed, by way of Eminence, for that famous Streight, which joins the *German* Sea to the *Baltic*.

It is ſituate between the Iſland of *Zeland* and the Coaſt of *Schonen*. 'Tis about ſixteen Leagues long, and generally five broad, excepting againſt the Caſtle of *Cronenbourg*, where 'tis but one: So that there is no Paſſage for Veſſels, but under the Cannon of the Fortreſs.

This has given occaſion to the *Danes* to ſettle a Toll on all Veſſels, which is one of the beſt Revenues of the Crown of *Denmark*; and to forbid all Pilots from paſſing through the great and little Belt, which are two other Inlets into the *Baltic*, though ſomewhat leſs commodious than the former. The *Swediſh* Veſſels are exempted from paying this Toll, by the Treaty of 1658, whereby the *Danes* yielded *South-Gothland* to the *Swedes*. See TOLL.

SOUND-*Board*, the principal Part of an Organ, and that which makes the whole Machine play. See ORGAN.

The *Sound-board* or *Summer*, is a Reſervoir, into which the Wind drawn in by the Bellows, is conducted by a Port-vent, and hence diſtributed into the Pipes placed over the Holes of its upper Part. This Wind enters them by Valves, which open by preſſing upon the Stops or Keys, after drawing the Regiſters, which prevent the Air from going into any of the other Pipes, but thoſe 'tis required in.

Organs, whoſe longeſt blind Pipes are four Foot, have their *Sound-Board* from five to ſix Feet. Organs of 16 Feet have two *Sound-Boards*, which communicate the Wind from one to the other, by a Pewter Port-vent.

SOUNDING, in Navigation, the trying of the Depth of the Water, and the Quality of the Bottom, by a Line and Plummet, or other Artifice.

There are two Kinds of Lines occaſionally uſed in *Sounding* the Sea; the *Sounding Line* and the *deep Sea Line*.

The firſt, is the thickeſt and ſhorteſt, as not exceeding 20 Fathom in Length; and marked at two, three and four Fathoms, with a Piece of black Leather between the Strands; and at Five, with a Piece of white Leather.

The *Sounding* Line may be uſed when the Ship is under Sail, which the deep Sea-Line cannot. The Plummet is uſually in form of a Nine-pin, and weighs 18 Pounds; the End is frequently greaſed, to try whether the Ground be Sandy or Rocky, &c. Near Banks, Shores, &c. they are *Sounding* continually.

Dr. *Hook* has invented a manner of *Sounding* the Depth of the deepeſt Sea, without any Line; only by a wooden Globe, lighter than Water, to which, at a little Diſtance is a piece of Lead or Stone fix'd, by means of a ſpringing Wire in the Firſt, fitted into a Staple in the Second. The whole being let gently down, with the Stone or Lead foremoſt, aſſoon as that arrives at the Botom, it will ſtop; but the Ball, by the Impetus it has acquired in deſcending, will be carried a little lower after the Weight is ſtopp'd; by which means the ſpringing Wire will be inabled to fly back, and diſingaging itſelf, will reaſcend.

By obſerving, then, the Time of the Ball's ſtay under Water by a Watch or Pendulum, and the Help of ſome Tables; the Depth of the Sea is found.

In ſome Experiments made in the *Thames* with a maple Globe, 5 $\frac{13}{16}$ Inches in Diameter, and weighing 4 Pound and a Half, lined with Pitch; and a conical Weight 11 Inches long, the ſharp End downwards; at the Depth of 19 Feet, there paſſed ſix Seconds; and at the Depth of 10 Feet 3 $\frac{1}{2}$ Seconds between the Immerſion and Emerſion of the Ball. From theſe Numbers given, the Depths, at any other ſtays, may be computed by the Rule of Three.

SOUP, a kind of Potage made of Bread, and Broth or

the Juice of Fleſh, or other Matters; uſually ſerved at the beginning of a Meal.

Soup is eſteem'd eſſential to a *French* Meal. Occaſionally, they improve the Reliſh by the Addition of Onions or Leaks, or Cabbage or Turnips, &c. The Word is *French*, form'd from the *Italian*, *Zuppa* or *Suppa*, of the *Latin*, *Sapa*, Wine boil'd away to a Third Part. Others derive it from the *German*, *Soupp*, or the *Celtic*, *Souben*, which ſignify the ſame Thing.

SOURCE. See SPRING.

SOUTH *direct Dials*, SOUTHERN *Signs*, } See { DIAL. SIGN.

SOWING. See SEMINATION and SEMBRADOR.

SOWNE, a Term uſed in the *Exchequer*; ſeeming to be a Corruption from the *French Souvenu*; that is, remembred. For the Statute, 4 *H.* 5. *c.* 7. in the Original *French*, hath *Des Eſtreats oriens Souvenu*. And ſuch Eſtreats and Caſualties, as are not to be remembred, run not in Demand, that is, are not Leviable. So now in the *Exchequer*, they ſay, ſuch Eſtreats, as the Sheriff by his Induſtry cannot get, are Eſtreats that *Sowne* not; and Eſtreats that *Sowne*, are ſuch as he may gather. See ESTREAT.

SPACE, a ſimple Idea. The Modes, whereof, are Diſtance, Capacity, Extenſion, Duration, &c. See MODE, EXTENSION, DURATION, &c.

SPACE, in Philoſophy, conſidered barely in Length between any two Bodies; is the ſame Idea which we have of Diſtance. See DISTANCE.

If it be conſidered in Length, Breadth and Thickneſs, it is properly called *Capacity*. See CAPACITY.

When conſidered between the Extremities of Matter, which fills the Capacity of *Space*, with ſomething Solid, Tangible and Moveable, it is then called EXTENSION. So that Extenſion is an Idea belonging to Body only; but *Space*, it is plain, may be conſidered without it. See BODY.

Space, therefore, in the general Signification, is the ſame thing with Diſtance, conſidered every Way, whether there be any ſolid Matter in it or not.

Accordingly, *Space*, is either *Abſolute* or *Relative*.

Abſolute Space, is that conſidered in its own Nature, without regard to any thing External; which always remains the ſame; and is infinite and immoveable.

Relative Space, is that moveable Dimenſion, or Meaſure of the former, which our Senſes define by its Poſitions to Bodies within it; and this the Vulgar uſe for immoveable *Space*.

Relative *Space*, in Magnitude and Figure, is always the ſame with Abſolute; but it is not neceſſary it ſhould be ſo numerically; as if you ſuppoſe a Ship to be, indeed, in abſolute Reſt, then the Places of all Things within her, will be the ſame Abſolutely and Relatively, and nothing will change its Place: But, ſuppoſe the Ship under Sail, or in Motion, and ſhe will continually paſs through new Parts of abſolute *Space*: But all Things on Board, conſidered relatively, in reſpect to the Ship, may be, notwithſtanding, in the ſame Places, or have the ſame Situation and Poſition, in regard to one another.

Proper and abſolute Motion, is defined to be the Application of a Body to different Parts of *Abſolute*, that is, of *infinite* and *immoveable Space*. See PLACE, MOTION and REST.

The *Carteſians*, who make Extenſion the Eſſence of Matter, aſſert, That the *Space* any Body takes up, is the ſame thing with the Body itſelf; and that there is no ſuch Thing as mere *Space*, void of all Matter, in the Univerſe: But this ſee diſproved under the Article VACUUM.

SPACE, in Geometry, is the Area of any Figure; or that which fills the Intervals or Diſtance between the Lines that terminate it. See AREA and FIGURE.

The *Parabolic Space*, is that included in the whole Parabola. See PARABOLA.

The *Conchoidal Space*, and the *Ciſſoidal Space*, are what are included within the Cavity of the Conchoid and Ciſſoid.

By the new Methods now introduced, of applying Algebra to Geometry, 'tis demonſtrated, That the *Conchoidal* and *Ciſſoidal Spaces*, though infinitely extended, are yet finite Magnitudes. See CONCHOID and CISSOID.

SPACE, in Mechanicks, the Line a moveable Body, conſider'd as a Point, is conceived to deſcribe by its Motion. See MOTION.

SPHÆNOPHARYNGÆUS, in Anatomy, a Pair of Muſcles, called alſo *Pterygopharyngæus*, *Cephalopharyngæus*, &c. See PTERYGOPHARYNGÆUS.

SPAGYRIC, an Epithet given to Chymiſtry; which is called the *Spagyric Art*, or *Medicina Spagyrica*; and to Chymical Phyſicians, who are alſo called *Spagyriſts*. See CHYMISTRY.

Voſſius derives the Word from the *Greek*, σπᾶν, to *extract*, and ἀγείρειν, *congregare* to *collect*; which are the two principal Offices of Chymiſts. *Paracelſus* firſt introduced the Word.

SPAHI, a Horſe-man in the Ottoman Army, chiefly raiſed in *Aſia*.

The chief Strength of the Grand Signor's Army conſiſts in the Janiſaries, who are the Foot, and the *Spahi*'s, who are the Horſe. See JANISARY, &c.

The Aga or Commander of the *Spahi*'s, is alſo called *Spahi Agaſi*.

SPALT, or SPELT, a white, ſcaly, ſhining Stone, frequently uſed to promote the Fuſion of Metals. 'Tis found pretty frequently in *England* and *Germany*; and ſometimes brought from the *Levant*. The beſt is in long Scales, very ſoft, and eaſily pulveriz'd. The *Engliſh Spalt* is generally very hard.

SPAN, a Meaſure taken from the Space between the Thumb's End, and the Top of the little Finger, when both are ſtretch'd out. The *Span* is eſtimated at three Hands-breadth's, or nine Inches. See MEASURE.

SPANISH, or the SPANISH *Language*. See LANGUAGE.

SPANISH-*Flies*. See CANTHARIDES.

SPANISH-*Inquiſition*, &c. See INQUISITION.

SPAR, in Natural Hiſtory, a ſhining, ſtony Subſtance, frequently found in Caves and Grotto's, in the Clefts of Rocks, Lead-Mines, &c. See STONE, GROTTO, &c.

Mr. *Beaumont*, in the *Philoſophical Tranſactions*, endeavours to account for the Origin and Growth of *Spar*; which he makes to be a kind of *Rock Plant*.

Spar, he obſerves, may be form'd three Ways; either from Steams alone, or from Steams coagulating Dew, as it falls on the Ground, or Waters iſſuing from the Joints of Rocks: Or, it may grow from Earths and Clays. To ſay nothing of the Account we have from *Switzerland*, *viz.* That Snow, by long lying and continual Froſts, becomes hardened into *Spar*.

We have Inſtances of the firſt Kind in many Grotto's where *Spars* produced from Steams, hang like Icicles; Lead Ore being often found to grow in the ſame Manner. And as this *Spar* grows downwards; ſo in many Places, from the Sides of it, iſſue little Plants of *Spar*, ſhooting upwards, contrary to the Tendency of the others. An Inſtance of the Second, we have in a certain Place in *Italy*, where Cryſtals (which are a ſort of *Spars*) are produced in clear Evenings, from a Coagulation of Dew falling on Nitrous Stones. But hereof we have Inſtances enough nearer Home. See STALACTITES.

For the third Kind of Generation of *Spar*, never before taken Notice of by Naturaliſts; Mr. *Beaumont* gives us Inſtances of it in *Mendip* Hills, and other Mines, wherein are Subterraneous Vaults or Grotto's. In the Bottoms of ſome of theſe, is a Steam incumbent thereon. From this Earth, ſhoots up Spires of various Heights, &c. from the firſt Buddings out of it, till it is come as high as a Man's Finger; the biggeſt ordinarily an Inch in Diameter. Theſe Spires have all irregular Ridges and Furrows; and ſome ſooner, ſome later, begin on the Tops to be congealed into *Spar*; and ſo gathering a Cruſt downwards by degrees, are all at laſt, turned into an abſolute *white Spar* or Stone. See PETRIFACTION.

SPARADRAP, in Pharmacy, &c. an ancient Name for a Sear-cloth, or Cere-cloth; or a Cloth ſmear'd on each Side with a kind of Plaiſter. See CERE-CLOTH.

'Tis prepared by melting a ſufficient Quantity of ſome Plaiſter or Unguent, and dipping a linnen Cloth therein, till ſuch time as it have imbibed its fill. 'Tis then taken out, cool'd and poliſh'd on a Marble.

There are as many different Kinds of *Sparadrap*, as there are of Plaiſters for the Cloth to be dipp'd in. 'Tis ſometimes alſo called *Tela Gualteriana*.

SPARRING, among Cock-fighters, is the fighting a Cock with another to breathe him. In *ſparring*, they put Hotts on their Spurs, that they may not hurt one another. To *ſparr the Cock*, imports in general, to breathe him, to embolden him to Fight.

SPASMA or SPASMUS, in Medicine, a *Greek* Term, σπασμα, of equal Import with the *Latin*, *Convulſio*, and the *Engliſh*, *Convulſion*. See CONVULSION.

A *Spaſmus* happening after the taking of Hellebore, or any other violent Purgative, is mortal.

There are *Spaſma*'s peculiar to certain Members, and diſtinguiſhed by particular Names: That of the Mouth is called *Spaſmus Cynicus*; that of the Penis, *Satyriaſis*, &c. See SATYRIASIS, CYNICUS, &c.

Cardan diſtinguiſhes two Kinds of *Spaſma*'s: The firſt conſiſting in a conſtant Contraction of the Muſcles, which renders the Members rigid, and inflexible. The Second, in ſudden, unnatural Motions and Palpitations, frequently intermitting and beginning again.

Accidental *Spaſmi*, are of little Continuance: There are ſome ariſing from Flatulencies; from Bites of venomous Beaſts, from the Puncture of a Nerve, the Acrimony of the Humours vellicating the Stomach, Vapours of the Matrix, exceſſive Cold, &c.

SPASMODIC, ſomething belonging to a *Spaſma*, or Convulſion;

vulſion; as a *Spaſmodic Medicine*, *Spaſmodic Diſeaſe*, &c. See SPASMA.

Hunger, according to M. *Hecquet*, is a *Spaſmodic Affection* of the Fibres of the Stomach; unleſs it ariſes from the Fibres being too much moiſten'd by the Liquor thereof, ſo as to incapacitate them for their Office. See HUNGER.

SPATULA, an Inſtrument uſed by Surgeons and Apothecaries; made flat at one end, and round at the other. The Surgeons have little Silver or Steel *Spatulas*, to ſpread their Plaiſters and Unguents withal.

The Apothecaries have large ones of Wood, to ſtir their Drugs in diluting, tempering or boiling them. The Word is form'd from the *Latin*, *Spathus*, of the *Greek* σπάθιον.

SPAVIN, a Diſeaſe in a Horſe; being a Swelling or Stiffneſs in the Ham, that cauſes him to halt.

There are two Kinds of *Spavins*, *viz.* the *Ox-Spavin*, which is a callous Tumour, at the Bottom of the Ham, on the Inſide, hard as a Bone, and very painful. While 'tis yet young, ſome Horſes only halt with it, at the firſt coming out of the Stable.

The *dry Spavin* is more eaſily perceived, by the Horſe's raiſing one of his hind Legs, with a Twitch, higher than the other. Sometimes 'tis found on both Legs. This Kind frequently degenerates into the *Ox-Spavin*, for which there is no Remedy, but to apply the Fire; which, however, is not always ſucceſsful.

The Word is form'd from the *French*, *Eſparvin*, which ſignifies the ſame thing.

There are two other Kinds of *Spavin*, which have their Seat in the Hoof, *viz.* the *Blood Spavin*, and *Bone Spavin*; which ſee under their proper Articles.

SPAWS, are Springs of Water, ariſing out of Minerals in the Earth, or from Mines of Nitre, Sulphur, Allum, Bitumen, Copperas, &c. See MINERAL and WATER.

Spaws are phyſical Waters, ſome purging by Urine, others by Vomit, and Stool.

That in *Yorkſhire* is the moſt noted of this Kind in *England*. See BATH.

SPAYING, the Operation of Caſtrating the Females of ſeveral Kinds of Animals, as Sows, Bitches, &c. to prevent any further Conception, and promote their fattening. See CASTRATION.

'Tis perform'd, by cutting them in the mid Flank, on the left Side, with a ſharp Knife or Lancet, taking out the Birth-Bag and cutting it off, and ſo ſtitching up the Wound, anointing the Sore with Tar, and keeping the Animal warm for two or three Days.

The uſual Way, is to make the Inciſion a-ſlope, two Inches and a Half long, that the Fore-finger may be put in towards the Back, to feel for Two Kernels, as big as Acorns on both Sides the Birth, one of which is drawn to the Wound, the String thereof cut, and thus both taken out.

SPEAKER, a Member of the Houſe of Commons, elected by a Majority of the Votes thereof, to act as Chair-man, or Preſident, in putting Queſtions, reading Briefs or Bills, keeping Order, reprimanding the Refractory, adjourning the Houſe, &c.

The firſt Thing done upon the firſt Meeting of a Parliament, is to chuſe a *Speaker*; who is to be approved of by the King; and who upon his Admiſſion, begs his Majeſty, That the Commons, during their Sitting, may have *free Acceſs to his Majeſty*; *Freedom of Speech in their own Houſe*, and *Security from Arreſts*.

The *Speaker* is not allowed to perſuade or diſſuade, in paſſing of a Bill; but only to make a ſhort and plain Narrative; nor to Vote, unleſs the Houſe be equally divided. See PARLIAMENT.

The Lord Chancellor is uſually *Speaker of the Houſe of Lords*. See CHANCELLOR.

The *Speaker of the Convocation*, is called the *Prolocutor*. See PROLOCUTOR.

SPEAKING, the Art or Act of expreſſing one's Thoughts in articulate Sounds or Words. See WORD and VOICE; ſee alſo SPEECH and GRAMMAR.

Pliny, *Ælian*, *Plutarch* and other Authors, make mention of ſeveral Beaſts that have *Spoke*: And *Pliny* himſelf, ſpeaks with Aſſurance, in his Hiſtory, of an Ox that *Spoke*. *Philoſtrates*, in his Life of *Apollonius*, gives the like Privilege to an Elm, and even to Ships. *Homer* makes *Xanthos*, one of *Achilles*'s Horſes, ſpeak; wherein he has been followed by *Oppian*. But theſe are all fabulous: We have much better Authority for a Serpent, and an Aſs's ſpeaking. See LANGUAGE.

SPEAKING-*Trumpet*. See TRUMPET.

SPECIAL, ſomething that has a particular Deſignation; from the *Latin*, *Species*; in Oppoſition to *general*, of *Genus*. See SPECIES and GENUS.

The King in his Letters, frequently ſays, of our *Special Grace*, full Power and royal Authority.

SPECIAL *Matter*, in Evidence, in Law. See GENERAL *Iſſue*.

SPECIAL *Verdict*, &c. See VERDICT, &c.

SPECIALTY, in Law, is moſt commonly taken for a Bond, Bill, or ſuch like Inſtrument. Sometimes it is alſo uſed for *Special* or particular Acquaintance.

SPECIES, an Idea, which relates to ſome other more general one; or is compriz'd under a more univerſal Diviſion of a Genus. See GENUS.

Species is a mere Term of Relation: And the ſame Idea may be a *Species*, when compared to another more general one; and a *Genus*, with regard to a more particular one. Thus Body is a *Genus*, with regard to an animate and inanimate Body; and a *Species*, with regard to Subſtance.

The laſt *Species*, is that which can only be divided into Individuals. See INDIVIDUAL.

Animal is a *Species*, with regard to Body; and Man is a *Species* with regard to Animal. God deſtroy'd Mankind by the Deluge; but he preſerv'd the *Species*. See DELUGE.

SPECIES, in Logic, is one of the Five Words, call'd by *Porphyry*, *Univerſals*. See UNIVERSAL.

The Word is *Latin*, form'd from the ancient Verb, *Specio*, I ſee; as if a *Species* of Things were a Collection of all the Things ſeen at one View.

SPECIES, in Rhetoric, is a particular Thing, contained under a more univerſal one.

The Orators alſo call it *Hypotheſis*, *E. gr.* Virtue is to be loved, is the *Genus* or *Theſis*. Temperance is to be preſerved here, at this Time, is the *Species* or *Hypotheſis*. See THESIS.

SPECIES, in the ancient Muſic, a Sub-diviſion of one of the Genera.

The Genera of Muſic were Three, the *Enharmonic*, *Chromatic* and *Diatonic*; the two laſt of which were variouſly ſub-divided into *Species*; nor was the Firſt without *Species*, though thoſe had not particular Names as the *Species* of the other Two had.

Theſe *Species* were alſo called the *Chroai*, Colours of the Genera: The Conſtitution whereof, ſee under the Article GENERA.

SPECIES, in Opticks, the Image painted on the Retina by the Rays of Light reflected from the ſeveral Points of the Surface of Objects, received in at the Pupilla, and collected, in their Paſſage through the Cryſtallin, &c. See VISION.

The Philoſophers have been in great Doubt, whether the *Species* of Objects, which give the Soul an Occaſion of *Seeing*, are an Effuſion of the Subſtance of the Body; or a mere Impreſſion which they make on all ambient Bodies, and which they all reflect, when in a proper Diſtance and Diſpoſition; or, laſtly, whether they are not ſome other more ſubtile Body, as Light, which receives all theſe Impreſſions from Bodies, and is continually ſent and returned from one to other, with the different Figures and Impreſſions it had taken on all Sides: But the Moderns have decided this Point by their Invention of artificial Eyes, wherein the *Species* of Objects are received on a Paper or Linnen-cloth in the ſame manner as they are received in the natural Eye. See EYE.

The Ancients have diſtinguiſhed the *Species*, whereby Objects become viſible, into *Impreſſæ* and *Expreſſæ*.

Impreſs'd Species are ſuch, as come from without; or are ſent from the Object to the Organ; ſuch are thoſe we have already been ſpeaking of.

Expreſs'd Species, are thoſe, on the contrary, from within; or that are ſent from the Organ to the Object.

Le Clerc, in his Syſtem of Viſion, by one of thoſe Revolutions very frequent in philoſophical Opinions, has call'd upon the Stage again the *Species expreſſæ*, of the ancient Philoſophers. For, according to him, 'tis not by *Species* or Images impreſs'd on the Optic Nerve, that the Soul ſees Objects; but by Rays, which ſhe herſelf directs to them, and which ſhe uſes as a Blind Man does his Staff, to grope out Objects.

The Peripateticks account for Viſion, from a kind of *Intentional Species*, thus: Every Object, ſay they, expreſſes a perfect Image of itſelf on the Air next to it. This expreſſes another leſſer one on the Air next to that; and this a Third ſtill leſs. Thus are the Images continued from the Object to the Cryſtallin, which theſe Philoſophers hold the principal Organ of Seeing. Theſe they call *Species Intentionales*; and to account the better for their Generation, affirm, That Objects exhibit them in the ſame Manner, as Mirrors do a Man's Face.

SPECIES, in Theology, the Appearances of the Bread and Wine in the Sacrament, after Conſecration: Or, as the *Romaniſts* call them, the Accidents remaining in the Bread, &c. whereby they become ſenſible to us, after their Subſtance is deſtroy'd.

The *Species* of the Bread, &c. are its Whiteneſs, Quantity, Figure, Friableneſs, &c. Of Wine, its Flavour, Quickneſs, ſpecific Gravity, &c.

The Generality of the *Romiſh* Divines, hold, That the *Species* are abſolute Accidents: And the *Carteſians*, who are bound to deny any ſuch Things as abſolute Accidents, are greatly puzzled to explain the *Species*, without incurring the Cenſure of Hereſy. F. *Magnan* is forced to aſſert, That the

the *Species* are mere Deluſions and Appearances, which God impreſſes on our Senſes. See ABSOLUTE *Accident*.

SPECIES, in Commerce, are the ſeveral *Pieces* of Gold, Silver, Copper, &c. which having paſs'd their full Preparation, and Coinage, are currant in Public. See COIN.

Species decried, or *cried down*, are ſuch as the Prince has forbidden to be received in Payment.

Light Species, are thoſe that fall ſhort of the Weight preſcribed by Law.

Falſe Species, are thoſe of different Metal from what they ſhould be, &c.

SPECIES, in Algebra, are the Symbols, or Characters, whereby the Quantities are repreſented. See CHARACTER.

SPECIFIC, in Philoſophy, that which is proper, or peculiar to any thing; that characterizes it, and diſtinguiſhes it from every other Thing.

Thus the attracting of Iron is *Specific* to the Load-ſtone, or a *Specific* Property of the Load-ſtone.

A juſt Definition ſhould contain the *ſpecific Notion* of the Thing defined, or that which *ſpecifies* and diſtinguiſhes it from every thing elſe. See DEFINITION.

SPECIFIC, in Medicine, a Remedy, whoſe Virtue and Effect is peculiarly adapted to ſome certain Diſeaſe; is adequate thereto; and exerts its whole Force immediately thereon.

Thus Quinquina, or the Jeſuits Bark, is held a *Specific* for intermitting Fevers or Agues; Mercury for the Venereal Diſeaſe, &c. See QUINQUINA.

Authors make mention of three Kinds of *Specific Medicines*.

1° Such as are eminently and particularly friendly to this or that Part, as the Heart, the Lungs, the Brain, the Stomach, &c.

2° Such as ſeem to attract, expell, or evacuate ſome determinate Humour, by a kind of *Specific* Power they are endowed withal; as Jalap is ſuppoſed to purge watery Humors, Rhubarb, Bile, &c.

And, 3°, Such as remove the Cauſe of a Diſeaſe, by ſome ſudden Property, without our knowing how or why; or the Manner of whoſe Operations we are entirely ignorant of, and have only learnt their Effects by Experience.

In the Uſe of theſe laſt, there is no Enquiry into the Nature of the Diſeaſe; no regard had to the Symptoms or Phænomena: Nor is the Medicine to be at all adapted to the particular Circumſtances thereof. All that we regard, is the Name of the Diſeaſe, and that of the Remedy: As, immediately, upon finding an intermitting Fever, we preſcribe the Bark; to aſſuage Pain, Opium; to expel Poiſon, ſome particular Antidote.

A *Specific* Medicine, therefore, ſtands in Oppoſition to a *Scientific* or *Methodic* Medicine. See MEDICINE.

SPECIFIC *Gravity*, in Hydroſtaticks, that Gravity, or Weight peculiar to each *Species*, or Kind of natural Body; and whereby it is diſtinguiſhed from all other Kinds. See WEIGHT.

In this Senſe, a Body is ſaid to be *ſpecifically Heavier* than another, when under the ſame Bulk it contains a greater Weight than that other; and that other, is ſaid to be *ſpecifically Lighter* than the Firſt. Thus, if there be two equal Spheres, each a Foot in Diameter; only the one Wood, the other Lead: Since the Leaden one is found heavier than the Wooden one, it is ſaid to be *ſpecifically* or in *Specie*, *Heavier*, and the Wooden one *ſpecifically Lighter*.

This kind of Gravity, ſome call *relative Gravity*; in oppoſition to *abſolute Gravity*, which increaſes in Proportion to the Quantity or Maſs of the Body. See GRAVITY.

Laws of the SPECIFIC *Gravity and Levity of Bodies.*

1. If two Bodies be equal in Bulk, their *ſpecific Gravities* are, to each other, as their abſolute Gravities. Thus a Body is ſaid to be twice as heavy, *ſpecifically*, as another, if it have twice its Gravity under the ſame Bulk

Hence, the *ſpecific* Gravities of equal Bodies, are as their Denſities. See DENSITY.

2. The *ſpecific* Gravities of Bodies of the ſame Weight, are in a reciprocal *Ratio* of their Bulks. Hence, the Maſſes of two Bodies of the ſame Weight, are in a reciprocal *Ratio* of their Bulks.

3. The *ſpecific* Gravities of two Bodies are, in a *Ratio*, compounded of the direct *Ratio* of the abſolute Gravities, and the reciprocal one of their Bulks.

Hence, again, the *ſpecific* Gravities are as the Denſities.

4. A Body *ſpecifically* heavier than a Fluid, loſes ſo much of its Weight therein, as is equal to a Quantity of the Fluid of the ſame Bulk.

For, ſuppoſe a Cubic Inch of Lead immerged in Water: a Cubic Inch of Water will, thereby, be expell'd from its Place: But the Weight of this Water was ſuſtained by the Reſiſtance of the ambient Water. Therefore, ſuch a Part of the Weight of the leaden Cube, muſt be ſuſtained by the Reſiſtance of the ambient Water, as is equal to the Weight of the Water expell'd. The Gravity of the Body immerg'd, therefore, muſt be diminiſhed by ſo much.

Hence, 1°, Since a Fluid *ſpecifically* heavier, has a greater Weight, in the ſame Bulk, than a lighter; the ſame Body will loſe a greater Part of its Weight in a Fluid, *ſpecifically* heavier than in a lighter; and therefore it weighs more in a lighter than a heavier.

2° Equal homogeneous Bodies weighing equally in Air, loſe their Equilibrium, if one of them be immerg'd in a heavier Fluid; the other in a lighter.

3° Since the *ſpecific* Gravities are as the abſolute Gravities under the ſame Bulk; the *ſpecific* Gravity of the Fluid, will be to the Gravity of the Body immerged; as the Part of the Weight loſt by the Solid, to the whole Weight.

4° Two Solids equal in Bulk, loſe the ſame Weight in the ſame Fluid; but the Weight of the *ſpecifically* heavier Body, is greater than that of the *ſpecifically* lighter; therefore, the *ſpecifically* lighter, loſes a greater Part of its Weight, than the *ſpecifically* heavier.

4. Since the Bulks of Bodies equal in Weight, are reciprocally as the *ſpecific* Gravities; the *ſpecifically* lighter, loſes more Weight in the ſame Fluid than the heavier; wherefore, if they be in *Equilibrio* in one Fluid; they will not be ſo in another; but the *ſpecifically* heavier, will preponderate, and that the more as the Fluid is denſer.

5. The *Specific* Gravities of Fluids, are as the Weights loſt by the ſame Solid immerged in the ſame.

To find the SPECIFIC *Gravity of any Fluids.*

On one Arm of a Balance ſuſpend a leaden Globe; and to the other, faſten a Weight, which is in *Equilibrium* therewith in the Air. Immerge the Globe ſucceſſively in the ſeveral Fluids, whoſe *ſpecific* Gravities are to be determined, and obſerve the Weight which balances it in each. Theſe ſeveral Weights, ſubtracted, ſeverally, from the firſt Weight, the Remainders are the Parts of the Weight loſt in each Fluid. Whence the *Ratio* of the *ſpecific* Gravity of the Fluids is ſeen. See HYDROSTATICAL *Balance*.

Hence, as the Denſities are as the *ſpecific* Gravities; we find the *Ratio* of the Denſities of the Fluids at the ſame time.

This Problem is of the utmoſt Uſe; as by it, the Degree of Purity or Goodneſs of Fluids, is eaſily found; a Thing, not only of Service in Natural Philoſophy; but alſo in common Life, and in the Practice of Phyſic.

At different Seaſons of the Year, the *ſpecific* Gravities of the ſame Fluids, are found different. *Joan. Caſp. Eiſenchmidius*, in his *Diſquiſitio Nova de Ponderibus*, &c. gives us Variety of Experiments relating hereto: The principal whereof, to ſave the Trouble of too frequent Experiments, we ſhall here ſubjoin.

Table of SPECIFIC *Gravities of ſeveral Fluids.*

A Cubic Inch *Paris* Meaſure.	In Summer O. D. G.	In Winter O. D. G.
Of Mercury	7 1 66	7 2 14
Oil of Vitriol	7 59	7 71
Spirit of Vitriol	5 33	5 38
Spirit of Nitre	6 24	6 44
Spirit of Salt	5 49	5 55
Aquafortis	6 23	6 35
Vinegar	5 15	5 21
Diſtill'd Vinegar	5 11	5 15
Burgundy Wine	4 67	4 75
Spirit of Wine	4 32	4 42
Pale Ale	5 1	5 9
Brown Ale	5 2	5 7
Cows Milk	5 20	5 25
Goats Milk	5 24	5 28
Urine	5 14	5 19
Spirit of Urine	5 45	5 53
Oil of Tartar	7 27	7 43
Oil of Olives	4 53	Is froze in Winter
Oil of Turpentine	4 39	4 46
Sea Water	6 12	6 18
River Water	5 10	5 13
Spring Water	5 11	5 14
Diſtill'd Water	5 8	5 11

That the *ſpecific* Gravity may be found the more accurately; the Weight of the Thread not immerged in the Fluid, is to be ſubtracted from the Weight of the Solid in Air; and the Force neceſſary to make the Thread ſubſide (if it be *ſpecifically* lighter) is be to added to the Weight loſt. But if the Thread that ſuſtains the Solid be heavier than the Fluid; the whole Weight of the Thread in the Air is to be ſubtracted from the Weight of the Solid in Air; and the Weight the Thread loſes from the Weight loſt in the Fluid. Indeed, this Precaution may be ſpared, if in examining the *ſpecific* Gravity of ſeveral Fluids, Care be taken that the ſame Thread be immerged to the ſame Depth in each.

6. To determine the *Ratio* which the *ſpecific* Gravity of a Fluid has to the *ſpecific* Gravity of a Solid, that is *ſpecifically* heavier than the Fluid.

Weigh any Maſs of the Solid in the Fluid, and note the juſt Weight therein: The *ſpecific* Gravity of the Fluid will be to that of the Solid, as the Part of the Weight loſt by the Solid, is to its whole Weight.

7. The *ſpecific* Gravities of equally heavy Bodies, are reciprocally as the Quantities of Weight loſt in the ſame Fluid. Hence we find the *Ratio* of the *ſpecific* Gravities of Solids, by weighing Maſſes thereof, that are equal in Air, in the ſame Fluid; and noting the Weights loſt by each.

The *ſpecific* Gravities of various Solids, have been determined by many Authors. *Marin Ghetaldus*, particularly tried the *ſpecific* Gravities various Bodies had, eſpecially metallic Ones; which were borrowed thence by *Oughtred*. In the *Philoſophical Tranſactions*, we have very prolix Tables of *ſpecific* Gravities, by various Authors.

'Twill be ſufficient for us to give thoſe of ſome of the more uſual Bodies, as determined with great Care and Accuracy by M. *Petit*; and publiſh'd by *F. Merſenne*; and from him by ſeveral others.

Table of the SPECIFIC *Gravities of ſeveral Solids.*

An Hundred pound Weight of Gold, is equal in bulk to

71 ½	of Mercury	38 ¼	of fine Tin
60 ½	of Lead	26	of Load-ſtone
54 ½	of Silver	21	of Marble
47 ⅓	of Copper	14	of Stone
45	of Braſs	12 ½	of Sulphur
42	of Iron	5	of Wax
39	of Tin	5 ⅓	of Water.

8. A Body *ſpecifically* heavier, deſcends in a Fluid *ſpecifically* lighter, with a Force equal to the Exceſs of its Weight, over that of an equal Quantity of the Fluid.

Hence, 1°, The Force which ſuſtains a *ſpecifically* heavier Body in a Fluid, is equal to the Exceſs of the abſolute Gravity of the Body above that of the Fluid, under the ſame Bulk; *E. gr.* 47 ⅓ Pound of Copper loſes 5 ⅓ Pounds of its Weight in Water; therefore a Power of 42 Pounds is able to ſuſtain it.

2° Since the Exceſs of the Weight of a Solid over the Weight of a Fluid *ſpecifically* heavier, is leſs than that over the Weight of a *ſpecifically* lighter Fluid under the ſame Bulk; it will deſcend with leſs Force in a *ſpecifically* heavier Fluid than in a lighter; and, conſequently, will deſcend more ſlowly in the former than in the latter.

9. A *ſpecifically* lighter Body, ſinks in a heavier Fluid, till the Weight of a Quantity of the Fluid, equal in Bulk, to the Part immerſed, is equal to the Weight of the whole Body.

Hence, 1°, Since the *Specific* Gravities of Bodies of the ſame Weight, are reciprocally as their Bulks; and the Bulks of Fluids equal in Weight, are as the Parts of the ſame Solid immerged therein; the *ſpecific* Gravities of Fluids are reciprocally as the Parts of the ſame Body immerged therein.

2° A Solid, therefore, immerges deeper in a lighter Fluid than a heavier; and deeper as the Proportion of the *ſpecific* Gravity of the Solid to that of the Fluid is greater.

3° If a Body be of the ſame *ſpecific* Gravity with a Fluid; the whole Body will be immerged; and it will remain in any given Place of the Fluid.

4° If a *ſpecifically* lighter Body be wholly immerged in a Fluid; it will be urged by the collateral Columns of the Fluid, to aſcend with a Force equal to the Exceſs of the Weight of the Fluid, Bulk for Bulk, over the Weight of the Solid.

5° A Body, therefore, *ſpecifically* lighter, lying on the Bottom of a Veſſel, will not be raiſed up, unleſs the heavier Fluid riſe above ſuch a Part, as is equal in Bulk to a Quantity of the Fluid of the ſame Weight with the whole Solid.

10. The *ſpecific* Gravity of a Solid, is to the *ſpecific* Gravity of a lighter Fluid, wherein 'tis immerged, as the Bulk of the Part immerged, is to the whole Bulk.

11. The *ſpecific* Gravities of equal Solids, are as their Parts immerged in the ſame Fluid.

12. The Weight and Bulk of a *ſpecifically* lighter Body, and the Weight of the *ſpecifically* heavier Fluid, being given, to find the Force required, to keep the Solid wholly immerged under the Fluid.

As this Force is equal to the Exceſs of the Weight of the Fluid, beyond that of an equal Bulk of the Fluid; from the given Bulk of the Solid, and the Weight of a Cubic Foot of Water, find, by the Rule of Three, the Weight of a Bulk of Water, equal to that of the Body. From this, ſubtract the Weight of the Solid; the Remainder is the Force required. *E. gr.* Suppoſe the Force neceſſary to detain a Solid Eight Feet in Bulk, and 100 Pounds in Weight, under Water, required: Since a Cubic Foot of Water is found to weigh 70 Pound, the Weight of Water under the Bulk of Eight Feet, is 560; whence, 100 Pound, the Weight of the Solid, being ſubtracted; the Remainder 460 Pound, is the Force neceſſary to detain the Solid under Water.

Hence, ſince a *ſpecifically* lighter Body aſcends in a heavier Fluid, with the ſame Force that would prevent its Aſcent: by the preſent Problem, we can likewiſe find the Force wherewith a *ſpecifically* lighter Body aſcends in a heavier.

13. The Weight of a Veſſel, to be made of a *ſpecifically* heavier Matter; and that of a *ſpecifically* lighter Fluid, being given: to determine the Cavity the Veſſel muſt have, to ſwim on the Fluid.

The Weight of a Cubic Foot of the Fluid being given; the Bulk of the Fluid equal to the Weight of the Veſſel, is found by the Rule of Three. If, then, the Cavity be made a little bigger than this, the Veſſel will have leſs Weight under the ſame Bulk, than the Fluid, and will therefore be *ſpecifically* lighter than the ſame, and conſequently, will ſwim. *E. gr.* Suppoſe it required to make an Iron Ball of 30 Pounds Weight, ſo as it ſhall ſwim upon Water. Since the Weight of a Cubic Foot of Water is 70 Pound, the Quantity of Water equal to 30 Pounds, will be found 728 571‴; and therefore the Cube of the Diameter of the Sphere 1392174‴, whence the Cube Root being extracted 1′ 1″ 1‴ is the Diameter of a Sphere of Water of 30 Pounds. If, therefore, the Diameter of the Cavity be made a little bigger, *e. gr.* 1 ½ or 2 Feet; ſo much leſs of the Ball will be immerged as the Diameter is increaſed.

14. The Force employ'd to retain a *ſpecifically* lighter Solid, under a heavier Fluid; and the Weight loſt by a heavier Solid in a lighter Fluid; are each added to the Weight of the Fluid, and weigh together with it.

The ſeveral Theorems here delivered, are not only all demonſtrable from the Principles of Mechanicks; but are conformable to Experiment. In effect, Experience is here found to anſwer exactly to Calculation, as is abundantly evident from the Courſes of philoſophical Experiments, now frequently exhibited; where the Laws of *ſpecific Gravitation* are well illuſtrated.

SPECILLUM, is an Inſtrument, wherewith Surgeons ſearch Wounds; in manner of a Probe.

SPECIOUS *Arithmetic*, is that converſant in Quantities, deſign'd by *Species*, that is by the Letters of the Alphabet; in contradiſtinction to that, where the Quantities are expreſs'd by Numbers, which is call'd *Numerous Arithmetic*. See ARITHMETIC; ſee alſo SPECIES.

Specious Arithmetic, is what we more uſually call *Algebra*. See ALGEBRA.

SPECTACLE, *Shew*; ſome extraordinary Object, which draws the View and Attention; and is not beheld without ſome Emotion.

The Term is chiefly uſed by the Ancients, for theatrical and amphitheatrical Performances: For Comedies, Combats of Gladiators, of Beaſts, and even for ſolemn Proceſſions, as thoſe of the *Circus*, &c.

The People of *Rome* were extremely fond of *Spectacles*; and the *Roman* Hiſtorians obſerve, There was no ſurer Way of gaining their Affections, and making Parties to introduce Tyranny and Oppreſſion, than by the Uſe of *Spectacles*.

SPECTACLES, an Optic Machine, conſiſting of two Lens's ſet in Horn, or other Matter; and applied on the Noſe; to aſſiſt in Defects of the Organ of Sight. See LENS.

Old People and all Presbytæ, uſe *Spectacles* of convex Lens's, to make Amends for the Flatneſs of the Eye, which does not make the Rays converge enough to have them meet in the Retina. See PRESBYTÆ.

Short-ſighted People, or Myopes, uſe concave Lens's, to keep the Rays from converging ſo faſt, through the great Roundneſs of the Eye, as to make them meet e'er they reach the Retina. See MYOPES.

In *Spain*, and at *Venice* eſpecially, *Spectacles* are uſed with a different View: All the People of Note and Faſhion there, have them continually on their Noſes; a Folly, that has its Source in the natural Pride of thoſe People, who value themſelves on a profound Wiſdom; and affect to ſtare very near at every Thing; as if their Eyes were weakned, and wore out with Exceſs of Attention. *Vign. de Marv.*

F. Cherubin, a Capuchin, deſcribes a kind of *Spectacle-Teleſcopes*, for the viewing of remote Objects with both Eyes; hence called *Binoculi*. Though *F. Rheita* had mentioned the ſame before him, in his *Oculus Enoch* and *Eliæ*. See TELESCOPE.

The ſame Author invented a kind of *Spectacles*, with three or four Glaſſes, which perform'd extraordinarily.

Spectacles were certainly unknown to the Ancients; yet are they not of ſo late a Date as the Teleſcope. *Franciſco Redi*, in a very learned Treatiſe on *Spectacles*, will have them to have been invented in the 13th Century, between the Years 1280 and 1311; and adds, that *Alexander Deſpina*, a Monk of the Order of *Predicants* of St. *Catherine* at *Piſa*, firſt communicated the Secret, which was of his own Invention; upon learning, that another Perſon had it as

well as himſelf. This Hiſtory is wrote in the Chronicles of that Convent.

The ſame Author tells us, That in an old Manuſcript ſtill preſerv'd in his Library, compoſed in 1299, *Spectacles* are mentioned as a Thing invented about that Time: And that a famous Jacobin, one *Jourdon de Rivalto*, in a Treatiſe compoſed in 1305, ſays, expreſly, That 'twas not yet 20 Years, ſince the Invention of *Spectacles*. He likewiſe quotes *Bernard Gordon* in his *Lilium Medicinæ*, wrote the ſame Year, where he ſpeaks of a Collyrium, good to enable an Old Man to read without *Spectacles*.

Du Cange, however, carries the Invention of *Spectacles* farther back; aſſuring us, That there is a *Greek* Poem in Manuſcript in the *French* King's Library, which ſhews, That *Spectacles* were in Uſe in the Year 1150: ſtill, the Dictionary of the Academy *Della Cruſca*, under the Word *Occhiale*, inclines to *Redi*'s Side; and quotes a Paſſage from *Jourdon*'s Sermons, which ſays, That *Spectacles* had not been 20 Years in Uſe: Now *Salviati* has obſerved, that thoſe Sermons were made between the Years 1330 and 1336.

SPECTATOR, a Perſon preſent at a *Spectacle*.

Among the *Romans*, *Spectators*, *Spectatores*, were a kind of Gladiators, who had had their Diſcharge; and were frequently hired to be preſent, as *Spectators*, at the Combats of Gladiators, &c. the People were entertained withal. See GLADIATOR.

SPECULARIA, the Art of preparing, and making *Specula* or Mirrors: Or, the Laws of Mirrors, their Phænomena, Cauſes, &c. call'd alſo *Catoptricks*. See CATOPTRICKS.

SPECULARIS *Lapis*, in natural Hiſtory, is a kind of Stone, clear as Glaſs, uſed in ſeveral Countries where 'tis found, for Window-lights, &c. 'Tis a kind of Talc, ſplits eaſily into thin Laminæ or Plates; and is ſometimes calcined to make a fine Plaiſter. See TALC.

SPECULUM, *Mirror*, in Opticks, any poliſh'd Body, impervious to the Rays of Light: Such as Water in Wells and deep Rivers, poliſh'd Metals, and Glaſſes lined with Mercury, or other opake Matter, popularly call'd *Looking-Glaſſes*. See LOOKING-*Glaſs*.

The ſeveral Kinds and Forms of *Specula*, *plain*, *concave* and *convex*
The Theory and Phænomena of the ſeveral Kinds of *Specula* - -
The Method of preparing, grinding, &c. Glaſs or Metal *Specula* of various Forms - - - -
} See under MIRROR.

The Laws and Effect of the *Specula* of various Forms - } See particularly under { REFLECTION.
The Theory of concave *Specula* } See particularly under { BURNING-*Glaſs*.

SPECULUM *Ani*, an Inſtrument, wherewith Surgeons dilate the Fundament, examine Sores, extract Bones, or let out any peccant Matter that may be there lodged.

SPECULUM *Matricis*, is an Inſtrument uſed by Surgeons, to examine and dreſs corrupted Places in the natural Parts of Women. Its Form is the ſame with that of the *Speculum Ani*.

SPECULUM *Oris*, is an Inſtrument ſerving to examine Diſorders in the Mouth.

There are two Kinds: the one common; the other bigger and ſtronger, fit not only to keep down the Tongue; but alſo the lower Jaw; while the Mouth is ſurveyed, to the very Extremity of the Throat, and the neceſſary Remedies applied.

SPEECH, the Act, or Art of expreſſing a Man's Thoughts, by certain Signs invented for that Purpoſe.

Theſe Signs are principally *Sounds*, made by the *Voice* and *Letters*. See VOICE and LETTER.

SPEECH, in Grammar, an Aſſemblage of ſeveral Words ranged in Order. See LANGUAGE.

The Grammarians generally make *Eight Parts of Speech*; *i. e.* Eight kinds of Words uſed in Diſcourſe, *viz. Noun*, *Pronoun*, *Verb*, *Participle*, *Adverb*, *Conjunction*, *Preposition* and *Interjection*; each of which ſee under its proper Article ADVERB, NOUN, PRONOUN, &c.

F. Buffier, one of the laſt and beſt Writers of Grammar, only admits of three Parts of Speech, *viz. Noun*, *Verb* and *Modificative*; which laſt includes the *Adverb*, *Conjunction* and *Preposition*. See MODIFICATIVE.

SPELL, a kind of Charm, to drive away a Diſeaſe, by hanging a Word or Sentence on a Paper about the Neck. See CHARM and PHYLACTERY.

SPELL, in the Sea Language. *To Spell*, is to let go the Sheets and Bowlings of a Sail, and brace the Weather Brace, that the Sail may lie looſe in the Wind. *To do a Spell*, is to do any thing by Turns, for a ſhort Time, and then leave it. *To give a Spell*, is to be ready to work in ſuch a one's Room. *Freſh Spell*, is when freſh Men come to work; eſpecially when the Rowers are relieved, with another Gang.

SPELLING, that Part of Grammar properly called *Orthography*. See ORTHOGRAPHY.

Dr. *Jones* gives the following Rules or Maxims of *Spelling*. 1°. That all Words were originally writ as *ſpelt*. 2° That in all Words, whoſe Sounds have been ſince alter'd (the Origin of the Difficulty of *Spelling*) the Alteration was made for the ſake of Eaſe and Pleaſure: And hence, 3° All Words that can be written ſeveral Ways, muſt be *ſpelt* according to the hardeſt, harſheſt and moſt unuſual Sound.

SPELTER, or *Zinck*, a kind of imperfect Metal, which ſome confound with *Biſmuth*, and others with *Spalt*; others making it a female Antimony. See ZINK.

The *Spelter* is a kind of mineral Lead, very hard, white and brilliant; which though not perfectly malleable, yet ſtretches a little under the Hammer.

'Tis found in greateſt Quantity in the Mines of *Goſſelar* in *Saxony*; and is ordinarily ſold in large, ſquare, thick Cakes, whence one would judge it to have been melted as it came out of the Mines, and caſt into that Figure.

'Tis uſed to clear and whiten Tin, in making of Pewter, much as Lead is uſed to purify Gold and Silver.

Thoſe who imagine that the *Spelter* is put in to increaſe the Weight, are miſtaken; ſince in melting Five or Six hundred Weight of Tin, they ſcarce put in a Pound of *Spelter*, and that mix'd with Turmaric. 'Tis alſo uſed in the making of Solder, and with Curcuma, in the melting of Copper, to give that Metal a gold Colour; which, however, is not permanent. See SOLDER.

The Beſt is white, in fine Scales, difficult to break, &c.

SPERM or *Sperma*, the Seed whereof an Animal is form'd. See SEED.

The Word is *Greek*, σπέρμα.

SPERMA-*Ceti*, in Pharmacy, uſually call'd *Parmaſity*, is a Preparation made from the Brain, and Cerebel of a kind of Animal, call'd by ſome, the *Male Whale*, and by the *Latins*, *Orca*; only diſtinguiſh'd from the common Whale, by its having Teeth, in lieu whereof, the Whale has a kind of Tufts in the Throat. See WHALE.

The Ancients were great Strangers to the Nature of this Preparation; inſomuch, that *Schroder* ſeems in doubt, whether to reckon it an animal or mineral Subſtance.

It had its Name *Sperma Ceti*, Seed or Sperm of a Whale, given it, no doubt, to raiſe the Value, by a Notion of its Scarcity.

The Method of preparing it, is a Secret in the Hands of a very few: The Proceſs is thus;

The Brain being taken out of the Animal, is melted over a gentle Fire, and put into Moulds, like thoſe wherein Sugar-Loaves are form'd. When cold and drain'd of its Oil, 'tis taken out and melted over again; and this they continue to do till it be well purified, and become white. 'Tis then cut with a Knife for the Purpoſe, and reduced into Flakes, ſuch as we have it from the Druggiſts.

It muſt be choſen white, clear and tranſparent, of a rankiſh Smell, which ſome fancy to partake of that of the Violet: ſome ſophiſticate it with Wax; but the Deceit is diſcovered, either by the Smell of the Wax, or by the Dulneſs of the Colour.

Some alſo ſell a Preparation made from the Tail of the Whale, inſtead of that from the Brain; which laſt kind turns Yellow, aſſoon as opened to the Air. In the General, there is no Merchandiſe that ſhould be kept cloſer from the Air than *Sperma Ceti*.

'Tis of ſome Uſe in Medicine. Dr. *Quincy*, ſays, 'tis a noble Remedy in many Caſes, as the Aſthma, &c. though chiefly uſed in Bruiſes, inward Hurts, and after Delivery. But 'tis certain, its greateſt Property, and that which makes it ſo much in Vogue, is its ſoftning the Skin, and reſolving Tumours of the Breaſt. Whence it comes to be uſed by the Ladies in Paſtes, Waſhes, &c.

SPERMATIC, in Anatomy, ſomething belonging to the *Sperm* or *Seed*.

The Ancients made a general Diviſion of the Parts of the Animal Body into *Spermatic* and *Fleſhy*.

The *ſpermatic* Parts, were thoſe, which by their Colour, &c. bore ſome Reſemblance to Seed, and were ſuppoſed to be form'd thereof; ſuch are the Nerves, Membranes, Bones, &c.

The *Fleſhy*, were thoſe ſuppoſed to be form'd of the Blood, after Conception. But the Moderns, with much better Reaſon, hold all the Parts to be *Spermatic* in this Senſe, and either form'd of the Ovum of the Female, or of the Semen of the Male. See GENERATION.

M. *Andry* mentions *ſpermatic Worms* in the human Body. See WORMS.

SPERMATIC *Veſſels*, called alſo *Vaſa præparantia*, are certain Veſſels appointed for the bringing of the Blood to the Teſticles, &c. to be ſecreted and prepared into Seed; and for the carrying back again the Blood, remaining after the Secretion is effected. See SEED.

The *ſpermatic Veſſels* are two Arteries and two Veins.

Spermatic Arteries ariſe from the fore Part of the Trunk of the Aorta, below the Emulgents. Their Structure is very ſingular, in that, contrary to the Fabric of all other Arteries, which are largeſt at their Exit from the Trunk, theſe are ſmalleſt at their Origin, and grow bigger in their Progreſs to-

wards

wards the Teſtes. By this means, the Blood receives a Check at its firſt going off for thoſe Parts, which diſpoſes it for the future Changes, &c. it is to paſs. The ſame End is anſwered in Quadrupeds, by having theſe Arteries curl'd and contorted in their Paſſage like a Screw.

The Reaſon why Nature has taken another Method in Man; Mr. *Cowper* obſerves, is, that in that Caſe, the Abdominal Muſcles muſt have been much larger than they are; by which means, the Inteſtines would have been frequently let down into the Scrotum; an Inconvenience Quadrupeds are ſecured from, by the horizontal Poſition of their Bodies.

The *ſpermatic Arteries*, in their Progreſs, meeting with the *ſpermatic Veins*, enter together with them the inner Lamella of the Peritonæum, where, inſinuating into the Duplicature of the Proceſs, and being cloathed therewith, they paſs on to within three or four Fingers Breadth of the Teſticles, where they divide into Two unequal Branches; the biggeſt of which, goes to the Teſticle, and is diſtributed therein (See TESTICLE.) And the leſs in the *Paraſtata* or *Epididymis*. See PARASTATA.

The *ſpermatic Veins* take the ſame Courſe with the Arteries; only a little above the Teſticles, they ſplit into ſeveral Branches, which uniting, form a Plexus, called *Corpus Varicoſum Pampiniforme* or *Pyramidale*. The Blood returned by the *ſpermatic Veins*, is delivered on the right Side to the Cava, and on the Left, into the emulgent Vein.

SPERMATOCELE, in Medicine, a Rupture occaſioned by a Contraction of the ſeminal Veſſels, whereby they are let fall into the Scrotum. *Harris*.

SPHACELUS, in Medicine, a total Mortification of any Part, occaſioned by an Interception of the Blood and Spirits. See MORTIFICATION.

The Word is *Greek*, σφάκελος, form'd, perhaps, of σφάττω, *I kill*.

The *Sphacelus* is diſtinguiſhed from the Gangrene; which is only a Mortification begun, and, as it were, the Road to a *Sphacelus*, which is the State and Perfection thereof. See GANGRENE.

The *Sphacelus* is diſtinguiſhed by the Lividneſs or Blackneſs of the Part affected; its Softneſs, Inſenſibility and cadaverous Smell.

The other Cauſes of the *Sphacelus*, are cloſe Ligatures, exceſſive Colds, great Inflammations, Bites of Mad Dogs. 'Tis ſometimes, alſo, called *Necroſis*, and ſometimes *Sideratio*. See NECROSIS and SIDERATIO.

A *Sphacelous* Foot, according to *Aquapendente*, ought to be cut off in the mortified Part, near the live Part. When the Foot is off, the dead Fleſh left behind, is to be conſumed by the Application of an actual Cautery, repeated ſeveral Times, till the Patient feel the Heat of the Fire. *Scultet*.

SPHÆRISTERIUM, in Antiquity, the ſeventh Part of the ancient Gymnaſium; being that wherein the Youth practiſed Tennis-Playing. See GYMNASIUM.

The *Sphæriſterium* or Tennis-Court, was between the Place, named *Palæſtra*, and that where they run Races, which was between the Portico's and the outer Wall: Though *Vitruvius* does not make mention of it in the Deſcription he gives of the ancient Gymnaſium.

The Exerciſe here perform'd was called *Sphæriſtica* and *Sphæromachia*, which ſome will have to have differ'd from the modern Tennis; but 'tis not known wherein the Difference conſiſted.

The *Mileſians* were particularly averſe to this Exerciſe; and the *Athenians* as remarkably fond of it.

They frequently gave the Right of Citizens to the *Sphæriſtes*, or Maſters in this Art, by way of Reſpect.

SPHENOIDAL *Suture*, in Anatomy, a *Suture* thus call'd, from its encompaſſing the *Os Sphenoides*, which it ſeparates from the *Os frontis*, the *Os petroſum* and *Os occipitis*. See SUTURE.

SPHENOIDES, in Anatomy, a Bone of the Head, common to the Cranium and upper Jaw. See CRANIUM, &c.

It is ſituate in the lower Part of the Skull, whereof it is, as it were, the Baſis, and is connected to all the other Members thereof, by the *Sphenoidal Suture*. Its Form, is irregular, and not eaſy to be deſcribed; whence ſome have call'd it *Multiforme*. It has its Name *Sphenoides* from the *Greek*, σφὴν, *Cuneus*, Wedge, from the Form of its Inſertion into the other Bones of the Skull.

In Adults, 'tis one continued Bone; but in young Children, ſometimes conſiſts of Three, and ſometimes of Four diſtinct Pieces.

SPHENOSTAPHYLINUS, in Anatomy, a Muſcle of the Larynx. It deſcends from a round, fleſhy Origination, near the Root of a Proceſs of the *Os Sphenoides*, and is implanted into the poſterior Part of the Uvula, where it joins its Partner. It ſerves to draw the Uvula upwards and backwards; and hinders the maſticated Aliment from paſſing into the Foramina Narium in Deglutition.

SPHERE, in Geometry, a Solid Body contained under one ſingle Surface, and having a Point in the middle, call'd the *Centre*, whence all the Lines drawn to the Surface, are equal. See SOLID, &c.

The *Sphere* is ſuppoſed to be generated by the Revolution of a Semi-circle, as K, (Tab. Geometry Fig. 34.) about its Diameter A B, which is alſo called the *Axis of the Sphere*, and the extreme Points of the Axis, A and C the *Poles of the Sphere*. See CENTRE, CIRCUMFERENCE, AXIS, POLE, &c.

Properties of the SPHERE.

1° A *Sphere* is equal to a Pyramid, whoſe Baſe is equal to the Surface, and its Height to the Radius of the *Sphere*.

Hence a *Sphere* being eſteem'd ſuch a Pyramid, its Cube or Solid Content, is found like that of a Pyramid. See PYRAMID.

2° A *Sphere* is to a Cylinder, ſtanding on an equal Baſis, and of the ſame Height, as 2 to 3. Hence, alſo, may the Cube or Content of the *Sphere* be found. See CYLINDER.

3° The Cube of the Diameter of a *Sphere*, is to the Solid Content of the *Sphere*, nearly as 300 to 157: And thus, alſo, may the Content of the *Sphere* be meaſured.

4° The Surface of a *Sphere* is quadruple that of a Circle deſcribed with the Radius of the *Sphere*. For ſince a *Sphere* is equal to a Pyramid, whoſe Baſe is the Surface, and its Altitude, the Radius of the *Sphere*: The Surface of the *Sphere* is had, by dividing its Solidity by a third Part of its Semi-diameter.

If, now, the Diameter of the Circle be 100, the Area will be 7850; conſequently, the Solidity 1570000, which divided by a Third of the Semi-diameter, 100; the Quotient is the Surface of the *Sphere* 31400; which is manifeſtly quadruple the Area of the Circle.

The Diameter of a SPHERE *being given, to find its Surface and Solidity.*

Find the Periphery of the Circle deſcribed by the Radius of the *Sphere*. See PERIPHERY.

Multiply this, found, into the Diameter; the Product is the Surface of the *Sphere*. Multiply the Surface by a ſixth Part of the Diameter, the Product is the Solidity of the *Sphere*.

Thus, ſuppoſing the Diameter of the *Sphere* 56, the Periphery will be found 175; which multiplied by the Diameter, the Product 9800 is the Surface of the *Sphere*; which multiplied by one ſixth Part of the Diameter, gives the Solidity 919057. Or, thus;

Find the Cube of the Diameter 175616; then to 300157, and the Cube found, find a Fourth proportional, 919057. See PROPORTIONAL. This is the Solidity of the *Sphere* required.

For Segments and Sectors of Spheres; ſee SEGMENT and SECTOR.

Doctrine of the SPHERE } See { SPHERICKS.
Projection of the SPHERE } See { PROJECTION.

SPHERE *of Activity* of any Body; is that determinate Space or Extent, all round about it, to which, and no farther, the Effluvia continually emitted from that Body, do reach, and where they operate according to their Nature. See EFFLUVIA.

Thus we ſee the magnetical Effluvia have certain Bounds and Limits, beyond which they will have no Influence to turn, or attract the Needle: But where-ever a Needle is placed, ſo as it may be moved by a Load-ſtone, it may be ſaid to be within the *Sphere* of Activity of the Stone. See MAGNET.

SPHERE, in Aſtronomy, that concave Orb or Expanſe, which inveſts our Globe, and in which the heavenly Bodies, Sun, Stars, Planets and Comets, appear to be fix'd, at equal Diſtances from the Eye. See HEAVENS.

This is alſo call'd the *Sphere of the World*; and is the Subject of the *Spherical* Aſtronomy. See SPHERICAL *Aſtronomy*.

This *Sphere*, as it includes the fix'd Stars, whence we alſo occaſionally call it, the *Sphere of the fix'd Stars*, is vaſtly great. The Diameter of the Earth's Orbit is ſo ſmall, in reſpect of the Diameter hereof, that the Centre of the *Sphere* is not ſenſibly changed by any Alteration of the Spectator's Place in the ſeveral Parts of the Orbit: But ſtill, in all the Points of the Earth's Surface, and at all Times, the Inhabitants have the ſame Appearance of the *Sphere*; that is, the fix'd Stars ſeem to poſſeſs the ſame Points in the Surface of the *Sphere*. For our Way of judging of the Places, &c. of the Stars, is to conceive right Lines drawn from the Eye or the Centre of the Earth, through the Centres of the Stars, and continued thence, till they cut the foreſaid *Sphere*; the Points where theſe Lines terminate therein, are the apparent Places of thoſe Stars. See PLACE and PARALLAX.

The better to determine the Places of the heavenly Bodies in the *Sphere*; ſeveral Circles are imagined to be deſcribed in the Surface thereof; hence called *Circles of the Sphere*. See CIRCLE *of the Sphere*.

Of these, some are said to be *greater*, as the Ecliptic, Meridian, Equator, &c. others *less*, as the Tropicks, Parallels, &c. See GREATER and LESSER.

Of these, again, some are *moveable*, or owe their Origin, to the Motion of the Earth, &c. such is the Ecliptic, Secondaries of the Ecliptic, &c. See each Circle under its proper Head; as EQUATOR, ECLIPTIC, HORIZON, &c.

SPHERE, in Geography, &c. a certain Disposition of the Circles on the Surface of the Earth, with regard to one another; which varies in various Parts thereof. See EARTH.

The Circles originally conceived on the Surface of the *Sphere* of the World, are almost all transferred, by Analogy, to the Surface of the Earth; where they are conceived to be drawn directly underneath those in the *Sphere*, or in the same Planes therewith; so that were the Planes of those of the Earth continued to the *Sphere*, they would coincide with the respective Circles thereon.

Thus we have a Horizon, Meridian, Equator, &c. on the Earth.

As the Equator in the Heavens divides the *Sphere* into two equal Parts; the one *North* and the other *South*; so does the Equator on the Surface of the Earth, divide the Globe in the same Manner. See EQUATOR.

And as the Meridians in the Heavens, pass through the Poles of the Horizon; so those on the Earth, &c. See MERIDIAN.

With regard, then, to the Position of some of these Circles in respect of others, we have a *Right*, a *Parallel*, and an *oblique Sphere*.

A *right* SPHERE, is that where the Equator cuts the Horizon of the Place at right Angles: For the particular Phænomena, &c. whereof; see RIGHT *Sphere*.

A *parallel* SPHERE, is where the Equator is parallel to the sensible Horizon, and in the Plane of the Rational. See PARALLEL *Sphere*.

An *oblique* SPHERE, is where the Equator cuts the Horizon obliqually. See OBLIQUE *Sphere*.

Armillary, or *artificial* SPHERE, is an astronomical Instrument, representing the several Circles of the *Sphere*, in their natural Order; serving to give an Idea of the Office and Position of each thereof, and to solve various Problems relating thereto.

'Tis thus called, as consisting of a Number of Fasciæ or Rims of Brass, or other Matter, called by the *Latins*, *Armillæ*, from their resembling of Bracelets, or Rings for the Arm.

By this, 'tis distinguished from the *Globe*, which, though it have all the Circles of the *Sphere* on its Surface; yet is not cut into *Armillæ* or *Rings*, to represent the Circles, simply and alone; but exhibits also the intermediate Spaces, between the Circles. See GLOBE.

Armillary Spheres, are of different Kinds, with regard to the Position of the Earth therein; whence they become distinguished into *Ptolomaic* and *Copernican Spheres*. In the First whereof, the Earth is in the Centre; and in the latter near the Circumference, according to the Position that Planet has in those Systems. See SYSTEM.

The *Ptolomaic* SPHERE, is that commonly in Use, and is represented (Tab. Astronomy, Fig. 21.) with the Names of the several Circles, Lines, &c. of the *Sphere*, inscribed thereon. See PTOLOMAIC.

In the Middle, upon the Axis of the *Sphere*, is a Ball, representing the Earth; on whose Surface are the Circles, &c. of the Earth. The *Sphere* is made to revolve about the said Axis, which remains at rest: By which Means, the Sun's Diurnal and Annual Course about the Earth, are represented according to the *Ptolomaic* Hypothesis: And even by Means hereof, all Problems relating to the Phænomena of the Sun and Earth, are solved, as upon the Cœlestial Globe; and after the same Manner; which see described under the Article GLOBE.

The *Copernican* SPHERE, represented (Fig. 22.) is very different from the *Ptolemaic*, both in its Constitution and Use; and more intricate in both. Indeed the Instrument is in the Hands of so few People, and its Use so inconsiderable, except what we have in the other more common Instruments, particularly the Globe and *Ptolomaic Sphere*, that we shall be easily excused the not filling up Room, with any Description thereof.

SPHERICAL *Angle*, is the mutual Inclination of Two Planes, whereby a Sphere is cut: Thus the Inclination of the two Planes, C A F and C E F (Tab. Trigon. Fig. 9.) forms the *Spherical Angle* A C E. See SPHERE and ANGLE.

The Measure of a *Spherical Angle*, A C E, is an Arch of a great Circle A E, described from the Vertex C, as from a Pole, and intercepted between the Legs C A and C E.

Hence, 1°, Since the Inclination of the Plane C E F, to the Plane C A F, is every where the same; the Angles in the opposite Intersections G and F, are equal.

2° Hence the Measure of a *Spherical Angle* A C E, is described with the Interval of a Quadrant A C or E C, from the Vertex C between the Legs C A, C E.

If a Circle of the *Sphere*, A E B F (Fig. 8.) cut another C E D F, the adjacent Angles, A E C and A E D are equal to two Right ones; and the vertical Angles A E C and D E B equal to one another. The former likewise, holds of several Angles form'd on the same Arch C E D, at the same Point E.

Hence, any Number of *Spherical Angles*, as A E C, A E D, D E B, B E C, &c. made on the same Point E, are equal to four right Angles. See SPHERICAL *Triangle*.

SPHERICAL *Triangle*, a Triangle comprehended between three Arches of *great Circles of a Sphere*, intersecting each other in the Surface thereof. See TRIANGLE.

Properties of the SPHERICAL *Triangles.*

1. If in two *Spherical* Triangles, (Tab. Trigon. Fig. 10.) A B C and a b c A=*a*, B A=*b a* and C A=*c a*: Then will B and the Sides, including the Angles, be respectively equal, the whole Triangles are equal: That is, B C=*bc*, B=*b* and C=*c*.

Again, if in two *Spherical Triangles* A=*a*, C=*c* and A C=*ac*; then will B=*b*, A B=*ab* and *bc*=B C. Lastly, if in two *Spherical* Triangles A B=*a b*, A C=*ac*, and B C=*bc*, then will A=*a*; B=*b* and C=*c*; the Demonstrations whereof, coincide with those of the like Properties in plain Triangles. The Theorems of the Congruency of rectilinear Triangles, extending to all other curvilinear, circular, parabolical, &c. provided their Sides be Similar. See TRIANGLE.

2. In an equilateral Triangle A B C (Fig. 11.) the Angles at the Base, B and C, are equal; and if in any Triangle, the Angles B and C, at the Base B C, are equal; the Triangle is equilateral.

3. In every *Spherical Triangle*, each Side is less than a Semi-circle: Any two Sides taken together are greater than the Third; and all the three Sides together are less than the Periphery of a great Circle: And a greater Side is always opposed to a greater Angle, and a less Side to a less Angle.

4. If in a *Spherical Triangle* B A C (Fig. 12.) two Legs A B and B C taken together, be equal to a Semi-circle; the Base A C being continued to D; the external Angle B C D will be equal to the internal opposite one B A C.

If the two Legs together, be less than a Semi-circle, the external Angle B C D, will be greater than the internal opposite one A: And if the Legs be greater than a Semi-circle, the external Angle B C D, will be less than the internal opposite one A; and the Converse of all these holds, *viz.* If the Angle B C D be equal to, greater, or lesser than A; the Sides A B and B C are equal to, greater, or lesser than a Semi-circle.

5. If in a *Spherical Triangle* A B C, two Sides A B and B C, be equal to a Semi-circle; the Angles at the Base A and C, are equal to two Right ones: If the Sides be greater than a Semi-circle, the Angles are greater than two Right ones; and if less, less. And, conversely.

6. In every *Spherical Triangle*, each Angle is less than two Right ones; and the Three together, less than Six right Angles, and greater than two.

7. If in a *Spherical Triangle* B A C (Fig. 13.) the Sides A B and A C be Quadrants; the Angles at the Base, B and C, will be right Angles. And, conversely, If the intersected Angle A be a right Angle, B C will be a Quadrant: If A be obtuse, B C will be greater than a Quadrant; and if acute, less. And, conversely.

8. If a *Spherical* rectangular Triangle, the Side B C (Fig. 14.) adjacent to the right Angle B, be a Quadrant; the Angle A will be a right Angle; if B E be greater than a Quadrant, the Angle A will be obtuse; and if B D be less than a Quadrant, the Angle A will be acute. And, conversely.

9. If in a *Spherical* rectangular Triangle, each Leg be either greater or lesser than a Quadrant; the Hypothenuse will be less than a Quadrant. And, conversely.

10. If in a *Spherical Triangle* A B C (Fig. 15.) rectangular only at B, one Side C B be greater than a Quadrant, and the other Side A B less; the Hypothenuse A C will be greater than a Quadrant. And, conversely.

11. If in a *Spherical* obliquangular Triangle A C B (Fig. 16.) both Angles at the Base, A and B, be either obtuse or acute; the Perpendicular C D let fall from the Third Angle C to the opposite Side A B, falls within the Triangle: if one of them, A, be obtuse; and the other, B, acute; the Perpendicular falls without the Triangle.

12. If in a *Spherical Triangle* A C B, all the Angles A, B and C be acute; the Sides are each less than a Quadrant. Hence, if in an obliquangular *Spherical Triangle*, one Side be greater than a Quadrant, one Angle is obtuse, *viz.* that opposite to this Side.

13. If in a *Spherical Triangle* A C B, two Angles A and B, be obtuse, and the third C acute; the Sides A C and C B opposite to the obtuse Sides, are greater than a Quadrant; and that opposite to the acute Side A B, less than a

Quadrant. Hence, if the two Sides be leſs than a Quadrant, the two Angles are acute.

14. If in a *Spherical Triangle*, the ſeveral Sides be each greater than a Quadrant; or only two of them greater, and the Third equal to a Quadrant; the ſeveral Angles are obtuſe.

15. If in an obliquangular *Spherical Triangle*, two Sides be leſs than a Quadrant, and the Third greater; the Angle oppoſite to the greateſt will be obtuſe, and the reſt acute.

Reſolution of SPHERICAL *Triangles*. See TRIANGLE.

SPHERICAL *Geometry*, the Doctrine of the Sphere; particularly of the Circles deſcribed on the Surface thereof, with the Method of projecting the ſame on a Plane. See SPHERICKS.

SPHERICAL *Trigonometry*, the Art of reſolving *Spherical Triangles*; *i. e.* from three Parts of a *Spherical* Triangle given, to find the reſt. *E. gr.* From two Sides of one Angle; to find the other two Angles, and the third Side. See SPHERICAL *Triangle* and TRIGONOMETRY.

SPHERICAL *Aſtronomy*, that Part of Aſtronomy which conſiders the Univerſe, ſuch as it appears to the Eye. See ASTRONOMY.

Under *Spherical Aſtronomy*, then, come all the Phænomena and Appearances of the Heavens and heavenly Bodies, ſuch as we perceive them; without any Inquiry into the Reaſon, the Theory, or the Truth thereof: by which it is diſtinguiſhed from *Theorical Aſtronomy*, which conſiders the real Structure of the Univerſe, and the Cauſe of thoſe Phænomena.

In the *Spherical Aſtronomy*, the World is conceived to be a concave, *ſpherical* Surface, in whoſe Centre is the Earth, or rather the Eye, about which the viſible Frame revolves, with Stars and Planets fix'd in the Circumference thereof. And on this Suppoſition all the other Phænomena are determined.

The *Theorical Aſtronomy* teaches us, from the Laws of Opticks, &c. to correct this Scheme, and reduce the whole to a juſter Syſtem. See SYSTEM.

SPHERICITY, the Quality of a *Sphere*; or that whereby a thing becoms *Spherical*, or round. See SPHERE.

The *Sphericity* of Pebbles, Fruits, Berries, &c. of Drops of Water, Quick-ſilver, &c. of Bubbles of Air under Water, &c. Dr. *Hook* takes to ariſe from the Incongruity of their Particles with thoſe of the ambient Fluid, which prevents their Coaleſcing; and by preſſing on them, and encompaſſing them all around equally, turns them into a round Form. See DROP.

This, he thinks, appears evidently, from the Manner of making ſmall round Shot of ſeveral Sizes, without caſting the Lead into any Moulds; from Drops of Rain being form'd, in their fall, into round Hail-ſtones; and from Drops of Water falling on ſmall Duſt, Sand, &c. which ſtrait produce an artificial round Stone; and from the ſmall, round, red-hot Balls, form'd by the Colliſion or Fuſion of Flint and Steel, in ſtriking Fire.

But all theſe Caſes of *Sphericity* ſeem better accounted for, from the great Principle of Attraction; whereby the Parts of the ſame Fluid drop, &c. are all naturally ranged as near the Centre as poſſible, which neceſſarily induces a *ſpherical* Figure: and, perhaps, a repelling Force between the Particles of the Drop, and of the Medium, contribute not a little thereto. See ATTRACTION.

SPHERICKS, the *Doctrine of the Sphere*, particularly of the ſeveral Circles deſcribed on the Surface thereof; with the Method of projecting the ſame in Plano. See SPHERE.

The principal Matters ſhewn herein, are as follow:

1. If a Sphere be cut in any Manner, the Plane of the Section will be a Circle, whoſe Centre is in the Diameter of the Sphere.

Hence, 1°, The Diameter H I (Tab. Trigon. Fig. 17.) of a Circle, paſſing through the Centre C, is equal to the Diameter A B of the generating Circle; and the Diameter of a Circle, as F E, that does not paſs through the Centre, is equal to ſome Chord of the generating Circle.

Hence, 2°, As the Diameter is the greateſt of all Chords; a Circle paſſing through the Centre, is the *greateſt Circle of the Sphere*; and all the reſt are *leſſer* than the ſame.

3° Hence, alſo, all *great Circles of the Sphere* are equal to one another.

4° Hence, alſo, if a *great Circle of the Sphere* paſs through any given Point of the Sphere, as A; it muſt alſo paſs through the Point diametrically oppoſite thereto, as B.

5° If Two great Circles mutually interſect each other, the Line of the Section is the Diameter of the Sphere, and therefore two great Circles interſect each other in Points diametrically oppoſite.

6° A *great Circle of the Sphere*, divides it into two equal Parts or Hemiſpheres.

2. All great Circles of the Sphere, cut each other into two Parts; and, converſely, all Circles that thus cut each other, are *great Circles of the Sphere*.

3. An Arch of a great Circle of the Sphere, intercepted between another Arch H I L (Fig. 18.) and its Poles A and B, is a Quadrant.

That intercepted between a *leſs Circle* D E F, and one of its Poles A, is greater than a Quadrant; and that between the ſame and the other Pole B, leſs than a Quadrant; and, converſely.

4. If a *great Circle of the Sphere* paſs through the Poles of another, that other paſſes through the Poles of this. And if a great Circle paſs through the Poles of another, the Two cut each other at right Angles, and converſely.

5. If a great Circle, as A F B D, paſs through the Poles A and B of a leſſer Circle D E F, it cuts it into equal Parts; and at right Angles.

6. If two great Circles A E B F and C E D F (Fig. 19.) interſect each other in the Poles E and F of another great Circle A C B D; that other will paſs through the Poles H and h, I and i of the Circles A E B F and C E D F.

7. If two great Circles A E B F and C E D F, cut each other mutually; the Angle of Obliquity A E C, will be equal to the Diſtance of the Poles H I.

8. All *Circles of the Sphere*, as G F and L K (Fig. 20.) equally diſtant from its Centre C, are equal; and the further they are removed from the Centre, the leſs they are. Hence, ſince of all parallel Chords, only two, D E and E K are equally diſtant from the Centre; of all the Circles parallel to the ſame great Circle, only two are equal.

9. If the Arches F H and K H, and G I and I L, intercepted between a great Circle I M H and the leſſer Circles G N F and L O K; be equal, the Circles are equal.

10. If the Arches F H and G I of the ſame great Circle A I B H, intercepted between two Circles G N F and I M H, be equal, the Circles are parallel.

11. An Arch of a parallel Circle I G (Fig. 21.) is ſimilar to an Arch of a great Circle A E; if each be intercepted between the ſame great Circles C A F and C E F.

Hence the Arches A E and I G, have the ſame *Ratio* to their Peripheries; and, conſequently, contain the ſame Number of Degrees. And hence the Arch I G is leſs than the Arch A E.

12. The Arch of a great Circle, is the ſhorteſt Line which can be drawn from one Point of the Surface of the Sphere to another: And the Lines between any two Points on the ſame Surface, are the greater, as the Circles whereof they are Arches, are the leſs.

Hence, the proper Meaſure, or Diſtance of two Places on the Surface of the Sphere, is an Arch of a great Circle intercepted between the ſame.

SPHEROID, in Geometry, a Solid approaching to the Figure of a Sphere, but not exactly round, but oblong; as having one of its Diameters bigger than the other; and generated by the Revolution of a Semi-ellipſis about its Axis.

When 'tis generated by the relation of the Semi-ellipſis about its greater Axis, 'tis call'd an *Oblong Spheroid*; and when generated by the Revolution of an Ellipſis about its leſs Axis, an *oblate Spheroid*. See OBLATE.

The Contour of a Dome, *Daviler* obſerves, ſhould be Half a *Spheroid*. Half a Sphere, he ſays, is too low to have a good Effect below. See DOME.

For the Solid Dimenſions of a *Spheroid*, 'tis $\frac{2}{3}$ of its Circumſcribing Cylinder: Or it is equal to a Cone, whoſe Altitude is equal to the greatet Axis, and the Diameter of the Baſe to four Times the leſs Axis of the generating Ellipſis.

Or a *Spheroid* is to a Sphere deſcribed on its greater Axis, as the Square of the leſs Axis to the Square of the greater: Or 'tis to a Sphere deſcribed on the leſſer Axis, as the greater Axis to the Leſs. The Word is form'd from *Sphæra*, and εἶδος, *Shape*.

SPHINCTER, in Anatomy, a Term applied to a kind of circular Muſcles, or Muſcles in Form of Rings, which ſerve to cloſe and draw up ſeveral Orifices in the Body, and prevent the Excretion of the Contents. See MUSCLE.

The Word is form'd from the *Greek* σφιγκτὴρ, *Strictor*, *i. e.* ſomething that binds and conſtringes a Thing very cloſely; theſe Muſcles having an Effect much like that of a Purſe-ſtring.

SPHINCTER *Ani*, is a circular Muſcle, ſerving to ſhut the *Anus*, and keep the Excrements from coming away involuntarily. See ANUS and EXCREMENTS.

'Tis near two Inches broad, and hangs down below the *Rectum*, near an Inch. It is faſten'd on the Sides to the Bones of the *Coxendix*, and behind to the *Os ſacrum*: Before, in Men, to the *Accelerator Urinæ*, and in Women, to the *Vagina Uteri*. See RECTUM.

Some would have it Two Muſcles, and ſome Three; but without much Reaſon.

SPHINCTER *Veſicæ*, is a Muſcle conſiſting of circular Fibres, placed at the Exit of the Bladder, to prevent the perpetual dripping of the Urine. See URINE and BLADDER.

It keeps the Bladder conſtantly ſhut; and is only opened, when by the Contraction of the Abdominal Muſcles, the Bladder is compreſs'd, and the Urine forced out.

SPHINCTER *Vaginæ*, a conſtrictory Muſcle, ſerving to hinder the Reflux of the Blood from the *Clitoris*, &c. in Coition. See VAGINA.

SPHINCTER *Gulæ* } See { OESOPHAGÆUS.
SPHINCTER *Labiorum* } See { CONSTRICTOR.

SPHINX, in Sculpture, &c. a Figure or Repreſentation of a Monſter of that Name, famed among the Ancients; now moſtly uſed as an Ornament in Gardens, Terraſſes, &c.

'Tis repreſented with the Head and Breaſts of a Woman, the Wings of a Bird, the Claws of a Lion, and the reſt of the Body like a Dog.

It is ſuppoſed to have been engender'd by *Typhon*, and ſent by *Juno*, to be revenged on the *Thebans*. Its Office was to propoſe dark, enigmatical Queſtions to all Paſſers-by, and if they did not give the Explication thereof, to devour them.

It made horrible Ravages on Mount *Sphingion*, and could not by any means be deſtroyed, till after *Oedipus* had ſolved the following Riddle; What Animal is it, that in the Morning walks on four Legs; at Noon on Two, and at Night on Three?

Among the *Egyptians*, the *Sphinx* was the Symbol of Religion, by reaſon of the Obſcurity of its Myſteries. And on the ſame account, the *Romans* placed a *Sphinx* in the *Pronaos* or Porch of their Temples.

SPICA-*Nardi*, Spike-nard, a kind of Ear growing even with the Ground, and ſometimes in the Ground; uſed in the Compoſition of Treacle. See TREACLE.

It likewiſe ſhould be uſed in the Compound-Syrop of Chicory, in lieu of Cinnamon, which the Apothecaries generally put for it, becauſe cheaper.

The Ear or *Spica*, is about the Length and Thickneſs of a Finger; very light, covered with long, reddiſh Hairs, of a ſtrong Smell, and a bitteriſh, ſharp Taſte. There riſe ſeveral of theſe Ears from the ſame Root. The Stem is ſmall, and the Root the Thickneſs of a Quill.

The *Spica-Nardi*, is uſually reckon'd in the Number of Roots. 'Tis alſo call'd *Nardus Indicus*; becauſe brought from the *Eaſt-Indies*.

'Tis accounted a *Stomachic* and *Nephritic*, proper to ſtrengthen the Stomach, and promote the Diſcharge of Urine.

There is alſo another Kind, call'd *Spica-Celtica*, growing in the *Pyreneans*, and the Mountains of *Tirol*.

SPICA *Virginis*, a Star of the firſt Magnitude in the Conſtellation *Virgo*. See VIRGO.

Its Place is in the more ſoutherly Hand. Its Longitude, according to Mr. *Flamſtead*, is 19° 31′ 22″; its Latitude 2° 1′ 59″ South.

SPICE, any kind of aromatic Drug, that has hot and pungent Qualities; ſuch are *Pepper*, *Nutmeg*, *Ginger*, *Cinnamon* and *Cloves*. See PEPPER, NUTMEG, &c.

Some alſo apply the Word to medicinal Drugs brought from the *Eaſt*, as *Senna*, *Caſſia*, *Frankincenſe*, &c. See each under its proper Article, SENNA, CASSIA, &c.

SPIDERS-*Silk*. See SILK.

SPIKING *up the Ordnance*; a Sea Phraſe, for the faſtening a Quoin with *Spikes* to the Deck, cloſe to the Breech of the Carriages of great Guns; that they may keep cloſe and firm to the Ship's Sides, and not get looſe when the Ship rolls, and by that means endanger the breaking out of the Butt-head of a Plank.

SPINA *Ventoſa*, in Medicine, &c. an Ulceration, wherein the Bones are eaten by a malignant Tumour, without any Pain of the *Perioſteum*, or Membrane that covers the Bone. After which, an indolent Swelling being riſen, the Part affected is quite eat out with the Ulcer; whence frequently follows a neceſſity of Amputation.

SPINAL *Marrow* } See { MEDULLA *Spinalis*.
SPINAL *Nerves* } See { NERVE.

In the Hiſtory of the *French* Academy of Sciences, for the Year 1714, we have an Inſtance of a Fœtus born without either Brain, Cerebel, or *Spinal Marrow*, though perfectly well form'd in other reſpects. It had gone its natural Time; lived two Hours; and even gave Signs of Life, upon ſprinkling the Baptiſmal Water on its Head.

Inſtances of this Kind, as this is not the only one we meet withal, furniſh a terrible Objection againſt the Exiſtence of the animal Spirits, which ſhould be generated in the Brain, or at leaſt in the Cerebel or *Spinal Marrow*; and which are generally allowed of ſuch abſolute Neceſſity in the Animal Oeconomy. See SPIRIT.

SPINALIS, in Anatomy, a Muſcle on the Side of the Neck, ariſing from the Five ſuperior Proceſſes of the Vertebræ of the Thorax, and inferior of the Neck; and in its Aſcent, becomes more fleſhy, and is laſtly inſerted into the inferior Part of the Vertebræ of the Neck, laterally. It ſerves to draw the Neck backwards.

SPINDLE, in the Sea Language, is the ſmalleſt Part of a Ship's Capſtan, which is betwixt the two Decks: The *Spindle* of the Jeer Capſtan hath Whelps to heave the Viol. Alſo the Axis of the Wheel of a Watch or Clock, is called the *Spindle*, and its Ends the Pevets. See CLOCK, &c.

SPINE, or SPINA *Dorſi*, in Anatomy, the Series or Aſſemblage of Vertebræ, or Bones of the Back, which ſuſtain the reſt of the Body, and to which are connected the Ribs. See VERTEBRÆ.

The *Spine* is uſually divided into four Parts; the Neck, which contains Seven Vertebræ; the Back, Twelve; the Loins Five; and the *Os ſacrum*, Four. The *Spine* includes a kind of Medulla, much reſembling that of the Brain, hence call'd *Medulla Spinalis*, or *Spinal Marrow*; which ſee.

It has its Name *Spine*, by reaſon the hind Part thereof is Edg'd, or *Spiny*. Some call it the *Canalis Sacer*.

SPINET, a Muſical Inſtrument, rank'd in the Second or Third Place among harmonious Inſtruments. See MUSIC.

It conſiſts of a Cheſt or Belly, made of the moſt porous and reſinous Wood to be found; and a Table of Firr faſten'd on Rods, call'd *Sound-boards*, which bear on the Sides. On the Table is raiſed a little Prominence, wherein are placed as many Pins as there are Chords to the Inſtrument.

The Inſtrument is played by two Ranges of continued Keys, the foremoſt Range being in the Order of the Diatonick Scale; and the other Range ſet backwards in the Order of the Artificial Notes or Semi-tones. See SCALE.

The Keys are ſo many long, flat Pieces of Wood, which when touched and preſs'd down at one End, make the other raiſe a Jack, which ſounds the Strings by means of the End of a Crow's Quill, wherewith 'tis armed. The 30 firſt Strings are of Braſs, the other more delicate ones of Steel or Iron Wiar. They are all ſtretch'd over Two Bridges glued to the Table.

The Figure of the *Spinet* is a long Square, or Parallelogram a Foot and Half broad; ſome call it a *Harp Couch'd*, and the Harp, an *Inverted Spinet*.

The *Spinet* is generally tuned by the Ear; which Method of the practical Muſicians, is founded on this Suppoſition, That the Ear is a perfect Judge of an Octave and Fifth. The general Rule, is to begin at a certain Note, as *c*, taken towards the middle of the Inſtrument, and tuning all the Octaves up and down, and alſo the Fifth's, reckoning Seven Semi-tones to each Fifth, by which means the whole is tuned.

Sometimes to the common or fundamental Play of the *Spinet*, is added another ſimilar one in Uniſon, and a Third in Octave to the firſt; to make the Harmony the fuller. They are played either ſeparately or together, which is call'd the *double* or *triple Spinet*. Sometimes a Play of Violins is added, by means of a Bow, or a few Wheels parallel to the Keys, which preſs the Strings, and make the Sounds laſt as long as the Muſician pleaſes; and heighten and ſoften them, as they are more or leſs preſs'd. The Harpſichord is a kind of *Spinet*, only with another Diſpoſition of the Keys. See HARPSICHORD.

The Inſtrument takes its Name from the little Quills Ends, wherewith the Strings are drawn, which are ſuppoſed to reſemble *Spinæ*, Thorns.

SPINNING, in Commerce, the reducing of Silk, Line, Hemp, Wooll, Hair or other Matters into Thread. See THREAD.

Spinning, is either perform'd on the Wheel, or with a Diſtaff or Spindle, or with other Machines proper for the ſeveral kinds of Working. Hemp, Line, Nettles and other like Plants are to be wet in *Spinning*: Silks, Woolls, Cottons, &c. are *ſpun* dry, and don't need Water; yet there is a Way of *Spinning* Silk as it comes off the Caſes or Balls, where hot, and even boiling Water is to be uſed. See SILK; ſee alſo WHEEL, DISTAFF, &c.

SPINOSISM, the Doctrine of *Spinoſa*; or, Atheiſm propoſed after the Manner of *Spinoſa*. The Retainers whereto, are called *Spinoſiſts*.

The great Principle of *Spinoſiſm* is, That there is nothing properly and abſolutely exiſting, but Matter, and the Modifications of Matter; among which are even comprehended, Thought, abſtract and general Ideas, Compariſons, Relations, Combinations of Relations, Properties, &c. See MATTER, SUBSTANCE, &c.

Spinoſa or *Eſpinoſa*, was a Man well known in *Holland*. He was born a *Jew*; but did not make Profeſſion of any Religion, either the Jewiſh or Chriſtian. He compoſed ſeveral Books in *Latin*, the moſt celebrated whereof, is his *Tractatus Theologico Politicus*, wherein he overturns the Foundation of all Religion: The Book, accordingly, was condemn'd by a publick Decree of the States; though it has ſince been ſold publickly, and even reprinted, both in *Latin* and *French*, in that Country.

Spinoſa, here, maintains, That all Religions are only political Engines, calculated for the publick Good; to render the People obedient to Magiſtrates, and to make them practiſe Virtue and Morality.

He does not here lay down his Notion of the Deity openly; but contents himſelf with inſinuating it.

In his Converſations, he uſed to be more expreſs; and maintained, That God is not, as we imagine him, an infinite, intelligent, happy and perfect Being; nor any thing, but that natural Virtue, or Faculty, which is diffuſed throughout all Creatures. See NATURE.

There have been abundance of Anſwers made to this Work of *Spinoſa*; but all exceedingly weak, except what we have in *Clark*'s Sermons at *Boyle*'s Lecture.

Spinoſa, in the ſaid Treatiſe, is very full on the Subject of the Authors of the Scriptures; and endeavours to ſhew, That the Pentateuch is not the Work of *Moſes*; contrary to the common Opinion, both of the *Jews* and Chriſtians. He has alſo his particular Sentiments, as to the Authors of the other Books. This Part of the Treatiſe has been anſwered by M. *Huet*, in his *Demonſtration Evangelique*; and by M. *Simon*, in his *Hiſt. Crit. du vieux Teſt.* See PENTATEUCH.

SPINSTER, in Law, an Addition uſually given to all unmarried Women, from the Viſcount's Daughter downwards.

Yet Sir *Edward Coke* ſays, *Generoſa* is a good Addition for a Gentlewoman; and that if ſhe be named *Spinſter* in any Original Writ, Appeal or Indictment, ſhe may abate and quaſh the ſame.

Spelman ſays, That anciently, even the Queens uſed the Diſtaff and Spindle; whence *Spinſter* became a common Appellation for all Women.

SPIRAL, in Geometry, a curve Line, of the circular Kind, which in its Progreſs, recedes from its Centre; as in winding from the Vertex down to the Baſe of a Cone. See SPIRE.

'Tis called from its Inventor, *Archimedes*'s *Spire*, or *Helix*; and is thus deſcribed:

Divide the Periphery of a Circle A P p A (Tab. Geometry Fig. 39.) into any Number of equal Parts, by a continual Biſſection in the Points p. Into the ſame Number of Parts divide the Radius C A, and make C M equal to one Part, C *m* to two Parts, &c. Then will the Points M *m*, *m*, &c. be Points in the *Spiral*, which connected, will give the *Spiral* itſelf. This now, is called the *firſt Spiral*, and the Space included between its Centre, and the Point A, the *Spiral Space*.

This firſt *Spiral* may be continued to a *ſecond Spiral*, by deſcribing another Circle with double the Radius of the Firſt; and the Second may be continued a Third, by a third Circle, &c.

Hence, 1°, A P is to the Periphery, as C *m* to the Radius. Wherefore, if the Periphery be called *p*, the Radius A C=*r*, A P=*x*, P M=*y*; then will C M=*r*--*y*: Conſequently as *p* : *mr* : : *x* : *r*--*y*, we ſhall have *pr*--*py*=*rx*.

2° If C M=*y*; then will *rx*=*py*. Which Equation the *Spiral* has in common with the Quadratrix of *Dinoſtrates*, and that of *Tſchirnhauſen*; and therefore $r^n x^m = p^n y^m$ will ſerve for infinite *Spirals* and Quadratrices. See QUADRATRIX.

3° The Lines M *m*, M *m*, &c. are to one another as the Arches of the Circle, intercepted between M A and thoſe Lines: And, when continued, making equal Angles with the firſt and ſecond *Spiral*, are in arithmetical Proportion.

4° Lines drawn from M to the ſecond *Spiral*, are to each other as the ſaid Arches, together with the whole Periphery added on both Sides.

Quadrature of SPIRALS, *Logiſtic* SPIRAL } See { QUADRATURE. LOGISTIC.

SPIRAL, in Architecture, Sculpture, &c. is a Curve that aſcends, winding about a Cone or *Spire*; ſo as all the Points thereof continually approach the Axis: By this it is diſtinguiſhed from the *Helix*, which winds after the ſame Manner, around a Cylinder. See HELIX.

Ignorant Architects confound the Two: But the more knowing diſtinguiſh them carefully.

The *Spiral* Line is conceived to be thus generated.

If a Right Line as A B, (Tab. Geometry Fig. 40.) having one End fix'd at B, be equally moved round, ſo as with the other End B, to deſcribe the Periphery of a Circle; and at the ſame Time, a Point be conceived to move forward, equally from B towards A in the Right Line A B, ſo as that the Point deſcribes that Line, while the Line generates the Circle:

Then will the Point, with its two Motions, deſcribe the curve B, 1, 2, 3, 4, 5, &c. which is called a *Spiral Line*, and the plain Space contained between the *Spiral Line*, and the Right Line B A, is called the *Spiral Space*.

Again, if the Point B be conceived to move twice as ſlow as the Line A B; ſo that it ſhall get but Half way along B A, when that Line ſhall have formed the Circle; and if then, you imagine a new Revolution to be made of the Line carrying the Point, ſo that they ſhall end their Motion, at leaſt, together; there ſhall be formed a double *Spiral Line*; as in the Figure: From the Manner of which, may be eaſily drawn theſe Corollaries.

1. That the Lines B 12, B 11, B 10, &c. making equal Angles with the firſt and ſecond *Spiral* (as alſo B 12, B 10, B 8, &c.) are in an arithmetical Proportion.

2. The Lines B 7, B 10, &c. drawn any how to the firſt *Spiral*, are to one another as the Arches of the Circle intercepted betwixt B A, and thoſe Lines: Becauſe whatever Parts of the Circumference the Point A deſcribes, as ſuppoſe 7, the Point B will alſo have run over 7 Parts of the Line A B.

3. Any Line drawn from B to the ſecond *Spiral*, as B 18, B 22, &c. are to each other, as the aforeſaid Arches, together with the whole Periphery added on both Sides: For at the ſame time that the Point A runs over 12, or the whole Periphery, or perhaps 7 Parts more, ſhall the Point B have run over 12, and 7 Parts of the Line A B, which is now ſuppoſed to be divided into 24 equal Parts.

Proportional SPIRALS, are ſuch *Spiral* Lines, as the Rumb Lines on the Terreſtrial Globe, which, becauſe they make equal Angles with every Meridian, muſt alſo make equal Angles with the Meridians in the Stereographick Projection on the Plane of the Equator; and therefore will be, (as Dr. *Halley* obſerves) proportional *Spirals* about the Polar Point. From whence he demonſtrates, that the Meridian Line, is a Scale of Log-Tangents of the Half Meridian-Complements of the Latitudes.

SPIRAL *Stairs*, in Building. See STAIRS.

SPIRE, SPIRA, in the ancient Architecture, is ſometimes uſed for the Baſe of a Column; and ſometimes for the *Aſtragal* or *Tore*. See BASE.

From the *Latin*, *Spiræ*, the Folds of a Serpent, which when laid, bears ſome Reſemblance thereto; or from the *Greek*, σπεῖρα, the Coils of a Rope.

SPIRIT, in Theology, is uſed by way of Eminence, for the Third Perſon in the Holy Trinity; called *The Spirit*, or *The Holy Spirit*. See TRINITY and PERSON.

The *Macedonians*, &c. deny the Divinity of the *Spirit*. See MACEDONIANS.

The *Arians*, &c. deny his Co-equality with the Father. See ARIANS.

Divines expreſs the Manner wherein the *Spirit* was produced by the active *Spiration* or Breathing of the Father and the Son; whence the Name *Spiritus*, Breath.

Order of the Holy SPIRIT. See *Holy* GHOST.

SPIRIT, is alſo uſed among Divines, for the divine Power and Virtue; and the Communication thereof to Men.

In this Senſe, the *Spirit* is ſaid to have gone out on the Face of the Deep, *Geneſis*, *c.* i. *v.* 2. And the Prophets to have been poſſeſs'd of the *Spirit* of God.

Providence, in this Senſe, is that univerſal *Spirit*, whereby God makes all Nature to act. Thus the Holy Virgin is ſaid to have conceived of the *Spirit*, 1. *Cor.* vii. 40.

SPIRIT, is alſo uſed for any Incorporal Being, or Intelligence.

In this Senſe, God is ſaid to be a *Spirit*: Angels, *Spirits*; and the Devil an *Evil Spirit*. See GOD, ANGEL, DEVIL, &c.

In this Senſe, the Human Soul is alſo call'd *Spirit*, from its thinking and reflecting Powers, which cannot be conceived to reſide in any thing Material. See SOUL.

F. *Mallebranch* obſerves, 'tis extremely difficult to conceive what it is, ſhould make the Communication between the Body and the *Spirit*; for if the *Spirit* have no material Parts, it can't move the Body: But the Argument muſt be falſe ſome how or other; for we believe that God can move Bodies, and yet don't attribute any material Parts to him.

Private SPIRIT, is a Term that made a great Figure in the Controverſies of the two laſt Centuries. It ſignifies the particular View or Notion each Perſon has of the Dogmata of Faith, and the Truths of Religion, as ſuggeſted by his own Thought, and the Perſuaſion he is under with regard thereto.

The firſt Reformers denying ſtrenuouſly any infallible Interpreter of the Scripture, or any ſettled Judge of Controverſies; maintained, that every Perſon was to interpret and judge of revealed Truths, by his own Light, aſſiſted by the Grace of God; and this was what they call'd *private Spirit* or *Judgment*.

Againſt this, the Arguments uſed by the Romaniſts are, That revealed Truths being one and the ſame for all Believers; the Rule God has given us for the judging of them, ought to repreſent them to us uniformly and the ſame; but the *private Spirit* informs *Luther* one way, and *Zuinglius* another. It divides *Oecolompadius*, *Bucer*, *Oſiander*, &c. And the Doctrine it diſcovers to the *Confeſſionites*, is quite different from that it ſhews the *Anabaptiſts* and *Mennonites*, in the very ſame Paſſage of Scripture.

SPIRIT, in Chymiſtry, is one of the Principles of natural Bodies, called alſo *Mercury*. See PRINCIPLE and MERCURY.

The chymical Principle *Spirit*, is a fine, ſubtile, volatile, penetrating, pungent Liquor, which ariſes ordinarily before the Phlegm or Water, and ſometimes after it.

The great Properties of this Liquor are, that it penetrates and opens ſolid Bodies, corrodes, breaks, diſſolves, and even diſſolves certain mix'd Bodies; coagulates others, and produces an Infinity of Effects; and thoſe even contrary to one another.

In the general, the Chymiſts call *Spirits*, all the fine ſubtile, and not aqueous Particles, raiſed from Bodies by Heat, and reduced into Liquors by Diſtillation; ſuch are *Spirit* of *Vitriol*, of *Salt-petre*, of *Salt*, &c.

They alſo call *Spirits*, thoſe aqueous Liquors drawn by Liquidation, when they are impregnated with Salts, or other active Principles, raiſed, together with them, by the Violence of the Fire.

Theſe, when they excite any Senſation of Heat on the Tongue, are particularly called *Acid*, or *Sharp Spirits*.

When they make any Eroſion on the Tongue, they are call'd *Corroſive Spirits*. See CORROSIVE.

Such as Taſte ſomewhat like common Salt, are call'd *Saline Spirits*. See SALT.

Such as partake of the Taſte of common Sulphur, *Sulphurous Spirits*. See SULPHUR.

And when this Taſte is very ſtrong, *Urinous Spirits*. See URINOUS.

Such as take Fire readily, *Inflamable* or *Ardent Spirits*. See INFLAMABLE.

Such where the Acid predominates, though qualified with a little Sulphur, &c. are called *Mix'd Spirits*.

In this Senſe, the Chymiſts are ſaid to draw a *Spirit* from Sulphur, Salt and other Bodies, when they extract the Eſſence, or the ſubtileſt Part thereof, by Diſtillation or otherwiſe. See DISTILLATION, &c.

SPIRITS is alſo a general Name among Diſtillers, for all diſtill'd Liquors that are neither Oil nor Phlegm.

SPIRIT *of Wine*, is only Brandy rectified once or more Times, by repeated Diſtillations. See BRANDY.

One may likewiſe make a perfect Rectification of *Brandy* into *Spirit of Wine*, at one ſingle Diſtillation, by uſing a chymical Inſtrument, conſiſting of ſeveral Cucurbites, deſcribed by *Glaſer*. See RECTIFICATION.

Spirit of Wine is uſed in Dying, as a non-colouring Drug, and giving no Colour itſelf, but ſerving to prepare the Stuffs to receive the Colours. See DYING.

The Conſumption of *Spirit of Wine* is very conſiderable in ſeveral other Works and Manufactures, particularly the making of Varniſh. See VARNISH.

SPIRIT *of Sulphur*, is a *Spirit* drawn from *Sulphur* melted and inflamed; the moſt ſubtile Part whereof, is converted into a Liquor, by ſticking to a Glaſs Bell ſuſpended over it, whence it falls Drop by Drop, into a Trough, in the Middle whereof, is placed the Stone Pot wherein the Sulphur is burnt. See SULPHUR.

This *Spirit* is held Specific for the ſame Diſeaſes as *Spirit of Vitriol*. See SPIRIT *of Vitriol*.

SPIRIT *of Salt*, a yellow Liquor drawn, by Chymiſtry, from Sea Salt. See SALT.

The beſt, is that prepared in *England*. 'Tis much uſed in Medicine; but has not, perhaps, all the Virtues aſcribed to it. The common *Spirit of Salt*, being very corroſive, may be dulcified, by letting it digeſt three Days on a gentle Sand heat, with an equal Quantity of *Spirit of Wine* mix'd therewith. See DULCIFYING, FRESH-*water*, &c.

SPIRIT *of Vitriol*, is *Vitriol* dried in the Sun, or in Defect thereof, by the Fire, and then diſtill'd by chymical Operations ſeveral Times repeated; firſt by a reverberatory Fire, and then in *Balneo Mariæ*. See VITRIOL.

'Tis held excellent againſt the Epilepſy, as well as againſt burning and malignant Fevers.

The laſt *Spirit* drawn from Vitriol, and which is improperly called *Oil of Vitriol*, is uſed in the Diſſolution of Metals and Minerals.

SPIRIT *of Tartar*	See	TARTAR.
SPIRIT *of Sugar*		SUGAR.
SPIRIT *of Turpentine*		TURPENTINE.
SPIRIT *of Venus*		VENUS.

SPIRIT, in Phyſicks. Sir *Iſaac Newton* cloſes his immortal *Principia*, with obſerving, That he might "there "have added ſome Things, concerning a moſt ſubtile *Spirit* "which pervades all, even the denſeſt Bodies, and lies hid "therein; by the Force and Action whereof, the Particles "attract each other, at very ſmall Diſtances, and when con- "tiguous, cohere: And electric Bodies act at greater Di- "ſtances, both attracting and repelling the neighbouring "Corpuſcles; and Light is emitted, reflected, and in- "flected and warms Bodies; and all Senſation is excited; "and the Members of Animals moved at the Inſtance of the "Will, *viz.* by Vibrations of this *Spirit*, propagated through "the ſolid Capillaments of the Nerves, from the external "Organs of Senſe to the Brain, and from the Brain to the "Muſcles."

But he chuſes to poſt-pone them; "as not having a ſufficient "Number of Experiments, whereby the Laws of the Action "of this *Spirit* might be preciſely determined." See NEWTONIAN *Philoſophy*; ſee alſo MEDIUM, VACUUM, &c.

SPIRITS, in Medicine, are the moſt ſubtile and volatile Parts, or Juices of the Body; by means whereof, all the Functions and Operations thereof are performed.

The *Spirits* are uſually diſtinguiſhed into *Vital* and *Animal*.

The Ancients, indeed, made a four-fold Diſtinction of *Spirits*; into *Vital*, *Animal*, *Natural* and *Genital*: Whereof the Firſt they placed in the Heart; the Second in the Brain; the Third in the Stomach and Liver; and the laſt in the Teſticles: But as this Diviſion is founded on a falſe Hypotheſis; 'tis now deſervedly ſet aſide.

Vital SPIRITS, are only the fineſt, and moſt agitated Part of the Blood; whereon its Motion, and Heat depend. See BLOOD.

Animal SPIRITS, are an exceedingly thin, ſubtile, moveable Fluid, Juice or Humour ſeparated from the Blood in the Cortex of the Brain, hence received into the minute Fibres of the Medulla, and by them diſcharged into the Nerves, by which it is convey'd through every Part of the Body, to be the Inſtruments of Senſation, muſcular Motion, &c. See SENSATION, MUSCULAR *Motion*, &c.

The *Animal Spirits*, call'd alſo *Nervous Spirits* and *Nervous Juice*, only differ from the *Vital Spirits*, in that theſe laſt are ſtill mix'd and blended with the groſſer Parts of the Blood, and circulate along with it: Whereas, the *Animal Spirits* are ſecreted thence by the Glands whereof the cortical Subſtance is compoſed; and have a Motion, Circulation, &c. peculiar to themſelves. See CIRCULATION.

Dr. *Willis* conceives, that the *Animal Spirits* are prepared by a proper Diſtillation of the ſubtileſt Part of the arterial Blood, brought by the Carotides into the Cortex of the Brain; and ſhews, that the Blood contained in the Sinus's of the Dura Mater, acts in this Diſtillation in the ſame Manner as Fire does in the chymical Diſtillations perform'd by Defluxion, where being placed over the Matter to be diſtill'd, it makes the ſubtileſt Parts thereof deſcend.

The Exiſtence of the *Animal Spirits* is controverted: But the infinite Uſe they are of in the Animal Oeconomy, and the exceedingly lame Account we ſhould have of any of the Animal Functions without them, will ſtill keep the greateſt Part of the World on their Side. And, in effect, the learned *Boerhave* had gone a good way towards a Demonſtration of their Reality.

The Blood brought to the Brain by the Carotides, and Vertebral Arteries, he ſhews, is infinitely prepared, ſecreted elaborated and changed from its natural State, e'er it arrives there, inſomuch as, contrary to the Nature of the reſt, inſtead of cohering by the Fire, it immediately reſolves wholly into a thin Vapour, without any Fæces behind. And is thus exceedingly well fitted for the Formation of ſo extraordinary a Fluid.

He ſhews, further, That the *Animal Spirits* are not form'd from the Cruor, but the Serum of the Blood, which *Malpighi*'s Hiſtory of the Growth of the Fætus in an incubated Egg, ſhews to be diviſible into Parts or Corpuſcles, inconceivably ſmaller than the Cruor.

He adds, That the Nature of the Juice is ſuch, as that no Salts or Oils in the Body can contribute any thing to it; and that in all appearance, 'tis only a moſt ſubtile, pure Water; which Liquor is found to reſemble theſe *Spirits* in its extraordinary Miſcibility, Mobility, Solidity, Softneſs, Simplicity and want of Elaſticity.

The ſame Author ſhews, further, from the Magnitude of the Carotids and Vertebrals, their ſtraight uninterrupted Courſe, the great Quantity of Blood they bring, the Bulk of the Cortex, &c. that there muſt be a very great Quantity of this Liquor; that there is freſh prepared every Moment of Life; and that it is driven, every Moment, by the Action of Heat, &c. from the Brain and Cerebel, to all the Parts of the Body furniſhed with Nerves; which Motion, he ſhews from the exceeding Fineneſs, Crookedneſs, &c. of the Ramifications muſt be very gentle, equable and conſtant, one Part continually driving before it another. Upon the whole, 'tis no Wonder it eſcapes the Notice of our Senſes; and that no Ligatures, Wounds, Punctures, Injections or the like, make either it or the Apertures of the Nerves through which it flows, viſible: Nor does it avail, what ſome, who allow the Exiſtence of the *Animal Spirits*, urge againſt their being any coherent Juice or Liquor, *viz.* That we ſhould find it ooze out and wet the adjacent Parts, upon cutting a Nerve, as we do in cutting a Lymphatic, &c. that upon binding a Nerve, the upper Part would ſwell; that the Agitations which Objects make on the Filaments, would deaden, &c. that 'tis impoſſible a Liquor ſhould have two oppoſite Motions at the ſame Time; and that the Velocity of Senſations, and the Rapidity of the Motions of Man, prove, that the *Animal Spirits* are rather Light than a Liquor. *Mem. de Trev.*

For the Secretion of the Animal SPIRITS *from the Blood, and the Apparatus in order thereto* - - - - - - - See BRAIN and SECRETION.

For the Courſe of the Animal SPIRITS, *and the Veſſels thro' which they are carried* - - - See NERVE and SECRETION.

For the Office of the Animal SPIRITS *in muſcular Motion and Senſation* - - - - - - See MUSCLE and SENSATION.

SPIRITUALITIES of a Biſhop, are ſuch Profits, as ariſe to him from the Benefit of his Juriſdiction in his Dioceſs, and not as a Baron of the Parliament. See BISHOP.

Such are thoſe of his Viſitations, Inſtitutions, Ordinations, Preſentation-Money, *&c.* See VISITATION, *&c.*

SPIRITUALIZATION, in Chymiſtry, the Action of extracting *Spirits* from natural Bodies. See SPIRIT.

Spiritualization, is an Operation that belongs principally to fermented Salts; then to fermented Juices and Liquors; the Fermentation rendring the *Spirits* Volatile and Inflammable. See FERMENTATION.

Spirit of Wine, is ſometimes *Spiritualiz'd* to that degree, that upon throwing a Quantity into the Air, not a Drop ſhall fall down; but the whole evaporate and be loſt.

SPITTLE. See SALIVA and SPUTUM.

SPITTLE-*Houſe*, a Corruption of the Word *Hoſpital*. See HOSPITAL.

SPLANCHNOLOGY, in Anatomy, a Diſcourſe, or Explication of the Viſcera. See VISCERA.

Sarcology is divided into three Parts, *viz. Splanchnology*, *Myology* and *Angeology*. See SARCOLOGY.

Splanchnology, is that which treats of the Internal Parts, and particularly the Viſcera. The Word is form'd from the *Greek* σπλάγχνον *Viſcus*, *Inteſtin*, and λόγος, *Diſcourſe*.

SPLEEN, *Lien*, in Anatomy, a ſoft, ſpungy Viſcus, of a darkiſh Red, or rather Livid, Colour, ordinarily reſembling the Figure of a Tongue, though ſometimes triangular, and ſometimes roundiſh.

The *Spleen* is uſually ſingle, though ſometimes there are Two, and ſometimes Three found. 'Tis ſituate in the Left Hypochondrium, between the ſpurious Ribs and the Stomach; is ſomewhat convex on the Side, towards the former, and concave towards the latter. Its ordinary Length is Six Inches; Breadth Three, and Thickneſs One. It is connected to the Omentum, and by Means of that and the Blood Veſſels, to the Stomach and Left Kidney, and ſometimes to the Diaphragm.

It is covered with two Tunics; the External derived from the Peritonæum and connected to the Internal only, by the Intervention of the Blood Veſſels. The inner conſiſts of Fibres very curiouſly interwoven. From this, probably, are derived thoſe innumerable Cells or little Bladders, which make up the main Bulk of the *Spleen*: Though *Malipighi* rather takes them to ariſe from the Venous Duct. The Cells communicate with each other, and diſcharge themſelves into the Trunk of the Vein. Their Inſide, according to *Malpighi*, is furniſhed with various minute Glands adhering together; Six, Seven or Eight whereof, form a kind of ſmall conglomerate Glands, wherein the Arteries and Veins ſeem to terminate.

Its Blood-Veſſels are the *Splenic* Artery, which furniſhes it with Blood, from the Cœliac; and the *Splenic Vein*, which carries it thence, by the Porta, to the Liver. See SPLENIC.

Its Nerves come from the *Plexus Lienaris*, near the Bottom of the Stomach. The Veſſels are all, as ſoon as they enter the *Spleen*, wrapt up in one common Capſula or Membrane, and plentifully diſtributed together throughout the Subſtance of the *Spleen*. Beſides theſe, are Lymphaticks in great Abundance.

The Anaſtomoſes between the Arteries and Veins of the *Spleen*, are more apparent than in any other Part of the Body. And this Viſcus is obſerved to be furniſhed with a greater Proportion of Blood than any other Parts. See ANASTOMOSIS.

The Uſe of the *Spleen* has been diſputed in all Ages; both, as no immediate Uſe thereof appears from Diſſection, and as we find, that Animals from whom it has been cut, live very well without it. All the Effects, *e. gr.* following the cutting it from a Dog, are, that the Animal grows more Salacious than uſual; that it urines more frequently; is more hungry than ordinary; and for the firſt Days is troubled with a Vomiting and Nauſea. 'Tis added, That 'tis neceſſary the Part be taken away to make a good Runner.

Hence ſome have imagined that the *Spleen* only ſerved to make a Balance in the Weight of the Body; others, that it was only intended for the ſake of Symmetry; others, an uſeleſs Load, and one of Natures Redundances; others a Pit or Common-Shore to diſcharge the Fœces of the Blood into; others a Fire, by the Heat whereof, the Action of the Ventricles is animated.

Many of the Ancients took it to be the Receptacle of the Atra Bilis or Melancholic Humour; for which Reaſon, ſome of them call it the *Organ of Laughter*.

Mr. *Cowper*, from the great Quantity of Blood, and the apparant Inoſculations of the *Spleen*, draws a very natural Conjecture of the Uſe thereof; at leaſt of the peculiar Mechaniſm. He takes, then, the *Spleen* to be only a ſubordinate Organ, miniſtring to the Circulation; and thinks, that by this Congreſs of the Arterial and Venal Blood, an Impetus is communicated to the latter, by which its Progreſs through the Ramifications of the Porta to the Cava, is promoted, which would otherwiſe be ſo broke by the double Ramifications of the Porta, as to want Strength ſufficient to carry it to the Heart. See CIRCULATION.

The Action or Effect of the *Spleen*, according to Dr. *Boerhaave*, is to receive the freſh arterial Blood, prepare it in its Glands, and pour it into its Cells; to return what Blood is left from this Action, to the little Veins, and thence to the *Splenic* Vein; to mix the Humour thus prepared, with the nervous Juice, and to prepare, attenuate, and more intimately unite them together into one Humour.

Malpighi, and afterwards Dr. *Keil*, and ſome others, take the *Spleen* to be a viſcous Aſſiſtant to the Liver, in the Secretion, *&c.* of the Bile. We have obſerved, that by reaſon of the Nearneſs of the Liver and Heart, and the ſwift Motion of the Blood in the Aorta, a Humour conſiſting of Particles that combine ſo ſlowly as thoſe of the Bile do, could not be prepared but by bringing the Blood round about through the Stomach, Inteſtines and Omentum, *&c.* to the Liver, to abate its Velocity.

Now Dr *Keil* conjectures, that thoſe Part were not ſufficient to receive all the Blood neceſſary to be ſent to the Liver; therefore Nature framed the *Spleen*, into whoſe Cavities the Blood being poured from a ſmall Artery, moves at leaſt as ſlowly as any that paſſes otherwiſe to the Liver; by which Means the Particles that compoſe the Bile in the Blood, which paſſes through the *Ramus Splenicus*, by ſo long and ſlow a Circulation, have more Chances for uniting than otherwiſe they would, had they been carried by the Branches of the Cœliac directly to the Liver; conſequently without the *Spleen*, ſuch a Quantity of Bile as is now ſecerned, that is, as Nature requires, could not have been ſecerned by the Liver. See BILE; ſee alſo LIVER.

SPLEEN, is alſo uſed for a Diſeaſe; by Phyſicians more uſually called the *Hypochondriac Diſeaſe*. See HYPOCHONDRIAC and VAPOURS.

SPLENETIC, a Perſon affected with Oppilations and Obſtructions of the *Spleen*.

In *Splenetic* People, the *Spleen* is ſwell'd beyond the natural Bulk, or harden'd, ſo as to ſhew a Schirrous Tumour thereon. *Splenetic* People are diſtinguiſhed by a Livid, Lead-coloured Complexion; their Character is to be very prone to Laughter; which is an Expedient Nature is ſuppoſed to make uſe of, to evacuate the too redundant Humour the *Spleen* is charged withal, whence it is that the Ancients made the *Spleen* the Organ of Laughter; and hence that popular Saying of a Perſon laughing heartily, *That he vents his Spleen*.

SPLENIC *Veſſels*, a large Artery, and a Vein of the *Spleen*. See SPLEEN.

The *Splenic Artery*, is a Trunk of the left Cœliac, ſerving to bring the Blood from that Artery to the *Spleen*, to be there ſecreted, prepared, *&c.* its Progreſs is very much contorted; and after its Arrival at the Surface of the *Spleen*, it is diffuſed through the Subſtance thereof in ſmall Branches, which ſeem to terminate in the Cells.

The *Splenic Vein* is form'd out of the ſeveral minute Veins of the *Spleen*, uniting as they quit the Surface thereof. It carries the Blood ſecreted, *&c.* in the *Spleen*, to the Left Branch of the *Vena Porta*, to be thence convey'd to the Liver, there to be further prepared and converted into Bile.

The *Splenic* Vein and Artery manifeſtly communicate with each other: For Water being poured into one of them, preſently diſcharges itſelf by the other. See SPLEEN.

SPLENII, in Anatomy, a Pair of Muſcles, called alſo from their Form *Triangulares*.

They ariſe from the four upper Spines of the Vertebræ of the Back, and from the two lower of the Neck, and aſcending obliquely, adhere to the upper tranſverſe Proceſſes of the Vertebræ of the Neck, and are inſerted into the upper Part of the Occiput. They pull the Head backwards to one Side. They are call'd *Splenii*, from a ſuppoſed Reſemblance to an Ox's *Spleen*.

SPLENT, or SPLINT, among Farriers, a callous, inſenſible Excreſcence; or kind of hard Griſtle, that ſometimes ſticks to an Horſe's Shank-Bone, and generally comes upon the Inſide: If there be one oppoſite thereto on the Outſide, it is called a *Pegg'd* or *Pinn'd Splent*, becauſe it doth, as it were, pierce the Bone, and is extremely dangerous.

SPLENTS, in Surgery, Pieces of Wood uſed in binding up broken Limbs. See FERULA.

The Word is alſo uſed for the Pieces of a fractured Bone.

SPLICE; at Sea they ſay, a Cable or Rope is *Spliced*, when the Ends of two Pieces being untwiſted, the ſeveral Strands are wrought into one another by a Fidd. Alſo when an Eye is to be made at the End of a Rope, the Ends of the Strands, are, by a Fidd, drawn into the Ends of the other Ropes Strands; and this is call'd a *Splice*.

To *Splice* among Gardeners, is to graft the Top of one Tree into the Stock of another, by cutting them ſloping, and faſtening them together. See ENGRAFTING.

SPODIUM, in Pharmacy, a kind of Calx or Aſhes, eſteem'd an excellent Cardiac, and held to have the ſame Virtues with Coral.

The *Spodium* of the ancient *Greeks*, was a kind of Aſhes found on the Hearths of Furnaces wherein Braſs was made; call'd by them σποδιον, *q. d. Cinis*.

That of the *Arabian* Phyſicians, as *Avicenna* and others, was made of the burnt Roots of Ruſhes and Reeds.

The Moderns make their *Spodium* of Ivory burnt and calcined to a Whiteneſs. 'Tis ſometimes counterfeited, by burning Bullocks or Dogs-bones; but theſe are of no Value.

The *Anti-Spodium*, which the Ancients ſubſtituted for their *Spodium*, was made of Myrtle-Leaves, Galls and ſome other Ingredients, calcined.

SPOILS, whatever is taken from an Enemy in War.

Among the *Greeks*, the *Spoils* were divided in common among the whole Army; only the Generals Quota was the biggeſt.

By the Military Diſcipline of the *Romans*, the *Spoils* belong'd to the Republick; particular Perſons had no Title to them; and each of the Generals, as valuing themſelves on their Probity, always carried them to the Publick Treaſury. Sometimes, indeed, the Pillage was diſtributed by the General among the Soldiery, to encourage them, or to reward them: But this was not done without a world of Prudence and Reſervedneſs, otherwiſe it came under the Crime of *Peculatus*.

The Conſuls *Romulus* and *Veturius*, were condemn'd for having ſold the *Spoils* taken from the *Æqui*. *Livy*, *lib.* 8.

SPONDAULES, in Antiquity, a Player of the Flute, or other Wind Inſtrument of that Kind, who, during the Offering of Sacrifice, performed ſome ſuitable Air in the Prieſt's Ear to prevent the hearing of any Thing that might diſtract him, or leſſen his Attention. See SACRIFICE.

The Word is form'd from the *Greek* σπονδη, *Libation*, and αυλη, *Flute*.

SPONDEE, SPONDÆUS, in the *Greek* and *Latin* Proſody, a Foot of a Verſe conſiſting of two long Syllables; as *Vertunt*. See FOOT and QUANTITY.

The *Spondee* is a grave Meaſure: All *Greek* and *Latin* Hexameters end with a *Spondee*. See VERSE and MEASURE.

There are alſo *Spondee* or *Spondaic Verſes*; that is, Verſes compoſed wholly of *Spondees*, or at leaſt that end with Two *Spondees*, as,

Conſtitit atque oculis Phrygia agmina circumſpexit.

SPONDYLUS, a Term anciently uſed for a Vertebra of the *Spina Dorſi*. See VERTEBRA, &c.

SPONGE. See SPUNGE.

SPONGIOSA, in Anatomy, an Epithet given to ſeveral Parts of the Body, from their Texture, which is Porous and Cavernous, like that of the *Spunge*; as

Corpora Spongioſa Penis, call'd alſo *Corpora Cavernoſa* and *Nervoſa*. See CAVERNOSA CORPORA.

Oſſa Spongioſa of the Noſe, called alſo *Oſſa Turbinata*, and *Cribriformia Oſſa*. See TURBINATA *Oſſa* and CRIBRIFORME.

SPONTANEOUS, in the Schools, a Term applied to ſuch Motions of the Body and Mind as we perform of our ſelves, without any Conſtraint.

Thus, in Morality, thoſe Actions preform'd from an inward and natural Principle, conformable to the Inclination of Nature, excluding all Conſtraint, but not excluding Neceſſity, are called *Spontaneous Actions*. See NECESSITY.

In Medicine, an Evacuation effected without any Application for that purpoſe, is call'd a *Spontaneous Evacuation*. And a Laſſitude or Wearineſs, not occaſioned by any preceding Fatigue, is call'd a *Spontaneous Wearineſs*.

The Word is form'd from the *Latin* Adverb, *Sponte*, of one's own accord.

'Tis held a grievous and dangerous Error, with regard both to Religion and Morality, to hold that human Liberty only conſiſts in a *Spontaneity*: *M. le Clerc* has been very harſhly treated, for making St. *Auguſtin* of this Opinion. See LIBERTY.

SPONTANEOUS *Generation*. See EQUIVOCAL *Generation*.

SPOONING: In the Sea Language, when a Ship being under Sail, in a Storm at Sea, cannot bear it; but is forced to put right before the Wind; then the Seamen ſay, ſhe *Spoons*; and when in ſuch a Caſe, there is Danger leſt ſhe ſhould bring her Maſts by the Board, with her rolling about, or feel under Water, and ſo founder, they uſually ſet up the Fore-ſail to make her go the ſteadier, eſpecially if there be Sea-room enough; and this they call *Spooning with the Fore-ſail*.

SPORADES, in Aſtronomy, a Name the Ancients gave to ſuch Stars as were not included in any Conſtellation. See STAR.

Theſe, the Moderns more uſually call *Informes*. See INFORMES.

Many of the *Sporades* of the Ancients have been ſince form'd into new Conſtellations, *E. gr.* Of thoſe between *Leo* and *Urſa Major*, *Hevelius* has form'd a Conſtellation, call'd *Leo Minor*; of thoſe between *Urſa Minor* and *Auriga*, another Conſtellation called *Lynx*; of thoſe under the Tail of *Urſa Major*, another call'd *Canis venatics*, &c. See CONSTELLATION.

SPORADIC, in Medicine, an Epithet given to ſuch Diſeaſes as have ſome ſpecial or particular Cauſe, and are diſperſed here and there, regarding particular Conſtitutions, Ages, or other Circumſtances. See DISEASE.

Sporadic ſtand in Oppoſition to *Epidemic* Diſeaſes, which are thoſe ariſing from a general Cauſe, and that are common to all Kinds of Perſons, of what Complexion and Quality ſoever. See EPIDEMIC.

The Word is form'd from the *Greek* σπορας, diſperſed, ſpread, &c.

SPORTULA, in Antiquity, a Dole, or Largeſs, either of Meat or Money, given by Princes or great Men, to the People, or the Poor.

The *Sportula* was properly the Panier, or Basket wherein the Meat was brought, or wherewith the Poor went to beg it; thence the Word was transferred to the Meat itſelf; and thence to Money ſometimes given in lieu of it.

Sportula was frequently uſed in Oppoſition to *Recta cœna*, a plentiful Meal; as in *Martial*,

Promiſſa eſt nobis Sportula *recta data.*

St. *Cyprian* calls *Sportulantes Fratres*, ſuch Clergymen as then received Gifts for their Maintenance, like our Prebends.

SPOTS, in Aſtronomy, dark Places, obſerved on the Disks or Faces of the Sun and Moon. See SUN and MOON.

The *Spots* in the Sun are only viſible through a Teleſcope: Some diſtinguiſh them into *Maculæ* or dark *Spots*, and *Faculæ* or bright *Spots*; but there ſeems little Foundation for any ſuch Diviſion. See MACULÆ and FACULÆ.

The *Solar* SPOTS have not been long obſerved. They are very changeable, as to Number, Form, &c. are ſometimes in a Multitude, and ſometimes none at all.

Some imagine they may become ſo numerous, as to hide the whole Face of the Sun; at leaſt the greateſt part of it; And to this, aſcribe what *Plutarch* tells us, *viz.* That in the Firſt Year of the Reign of *Auguſtus*, the Sun's Light was ſo faint and obſcure, that one might look ſteadily at it with the naked Eye. See ECLIPSE.

To which *Kepler* adds, That in 1547, the Sun appeared reddiſh, as when viewed through a thick Miſt; and hence conjectures, That the *Spots* in the Sun are a kind of dark Smoaks or Clouds floating on the Surface thereof. Others will have them Stars or Planets tranſiting the Body of the Sun. But 'tis much more probable they are opake Bodies, in manner of Cruſts, form'd like the Scums on the Surface of Liquors. See SUN.

The *Lunar* SPOTS are fix'd. Some will have them the Shadows of the Mountains, or uneven Places of the Moon's Body; but their Conſtancy diſcredits this Opinion. The more general and probable Opinion is, That the *Spots* in the Moon, are Seas, Lakes, Moraſſes, &c. which abſorbing Part of the Sun's Rays reflect the fewer to us; ſo as to appear in form of dark *Spots*: Whereas the earthy Parts, by reaſon of their Solidity, reflect all their Light, and thus appear perfectly bright. M. *Hartſoeker* has another Opinion, and takes the *Spots* in the Moon, many of them at leaſt, for Foreſts, Groves, &c. the Leaves and Branches whereof, intercept the Rays reflected from the Ground, and ſend them elſewhere.

The Aſtronomers reckon about 48 *Spots* on the Moon's Face; to each whereof, they have given Names. The 21ſt is one of the moſt conſiderable, and is called *Tycho*.

Planetary SPOTS: Aſtronomers find that the Planets are not without their *Spots*. *Jupiter*, *Mars* and *Venus*, when viewed through a Teleſcope, ſhew ſeveral very remarkable ones; and it is by the Motion of theſe *Spots*, that we conclude the Rotation of the Planets round their Axes, in the ſame Manner as that of the Sun is deduced from the Motion of his *Maculæ*. See PLANET, SUN, &c.

SPOUT, or *Water*-SPOUT, in Natural Hiſtory, an extraordinary Meteor, or Appearance, at Sea, and ſometimes at Land, very dangerous to Ships, &c. oftenеſt obſerved in hot, dry Weather; call'd by the *Latins*, *Typho*, and *Sipho*, by the *French*, *Trompe*, &c. See METEOR.

Its firſt Appearance is in form of a deep Cloud, the upper Part whereof is White, and the lower Black. From the

lower

lower Part of this Cloud hangs, or rather falls down, what we properly call the *Spout*, in manner of a Conical Tube, biggeſt a-top. Under this Tube is always a great boiling, and flying up of the Water of the Sea, as in a *Jet d'Eau*. For ſome Yards above the Surface of the Sea, the Water ſtands as a Column or Pillar; from the Extremity whereof, it ſpreads and goes off, as in a kind of Smoak. Frequently, the Cone deſcends ſo low, as to touch the Middle of this Column, and continue for ſome time contiguous to it; though ſometimes it only points to it, at ſome Diſtance, either in a perpendicular or oblique Line.

Frequently 'tis ſcarce diſtinguiſhable, whether the Cone or the Column appear the firſt, both appearing all of a ſudden againſt each other. But ſometimes the Water boils up from the Sea to a great Height, without any Appearance of a *Spout* pointing to it, either perpendicularly or obliquely. Indeed, generally, the boiling or flying up of the Water, has the Priority, this always preceding its being form'd into a Column.

Generally, the Cone does not appear hollow, till towards the End; when the Sea-water is violently thrown up along its Middle, as Smoak up a Chimney. Soon after this, the *Spout* or Canal breaks and diſappears; the boiling up of the Water, and even the Pillar, continuing to the laſt, and for ſome time afterwards; ſometimes till the *Spout* form itſelf again and appear anew; which it ſometimes does, ſeveral times in a Quarter of an Hour.

M. *de la Pyme*, from a near Obſervation of two or three *Spouts* in *Yorkſhire*, deſcribed in the *Philoſophical Tranſactions*, gathers, that the *Water-Spout*, is nothing but a Gyration of Clouds by contrary Winds, meeting in a Point or Centre; and there, where the greateſt Condenſation and Gravitation is, falling down into a Pipe or great Tube, ſomewhat like *Archimedes*'s Spiral Screw; and in its working and whirling Motion, abſorbing and raiſing the Water in the ſame Manner as the Spiral Screw does; and thus deſtroys Ships, *&c.*

Thus, *June* the 21ſt, he obſerved the Clouds mightily agitated above, and driven together; upon which they became very black, and were hurried round, whence proceeded a moſt audible whirling Noiſe, like that ordinarily heard in a Mill. Soon after, iſſued a long Tube or *Spout*, from the Centre of the congregated Clouds, wherein he obſerved a ſpiral Motion, like that of a Screw; by which the Water was raiſed up. Again, *Auguſt* 15, 1687, the Wind blowing at the ſame Time out of ſeveral Quarters, created a great Vortex and Whirling among the Clouds; the Centre whereof, every now and then, dropt down, in Shape of a long, thin, black Pipe, wherein he could diſtinctly behold a Motion like that of a Screw, continually drawing upwards and ſcrewing up, as it were, where-ever it touch'd. In its Progreſs it moved ſlowly over a Grove of Trees, which bent under it like Wands in a circular Motion. Proceeding, it tore off the Thatch from a Barn, bent a huge Oak Tree, broke one of its greateſt Branches, and threw it to a great Diſtance. He adds, That whereas 'tis commonly ſaid, the Water works and riſes in a Column, e'er the Tube comes to touch it; this is certainly a Miſtake, owing to the Fineneſs and Tranſparency of the Tubes, which do moſt certainly touch the Surface of the Sea, e'er any conſiderable Motion can be raiſed therein; but which do not become opake and viſible, till after they have imbibed a conſiderable Quantity of Water.

The Diſſolution of *Spouts*, he aſcribes to the great Quantity of Water they have glutted; which by its Weight impeding their Motion, whereon their Force, and even Exiſtence, depends, they break and let go their Contents; which uſed to prove fatal to whatever is found underneath.

A notable Inſtance hereof, we have in the *Philoſophical Tranſactions*, related by Dr. *Richardſon*. A *Spout* in 1718, breaking on *Emott-moor* nigh *Coln* in *Lancaſhire*, the Champaign was immediately overflow'd, a Brook, in a few Minutes, roſe Six Feet perpendicularly high; and the Ground whereon the *Spout* fell, which was Sixty-ſix Feet over, was tore up to the very Rock, which was no leſs than Seven Feet deep; and a deep Gulf made for above half a Mile; the Earth being raiſed on either ſide in vaſt Heaps.

In *Pliny*'s Time, the Seamen uſed to pour Vinegar into the Sea, to aſſuage and lay the *Spout*, when it approached them: Our Modern Seamen think to keep it off, by making a Noiſe with filing and ſcratching violently on the Deck; or, by diſcharging great Guns to diſperſe it.

SPRING, in Natural Hiſtory, a *Fountain* or Source of Living Water ariſing out of the Ground. See WATER.

The Origin of *Springs* or Fountains, is a Thing much controverted among our lateſt Naturaliſts.

Meſſieurs *Mariotte* and *Perrault* aſcribe it to Rains. Their Doctrine is, That the Rain-water penetrates the Earth till ſuch time as it meets a Clayey Soil or Stratum; which proving a ſufficient ſolid Bottom, to ſuſtain and ſtop their Deſcent, they glide along it that way to which the Earth declines, till they meet with a Place or Aperture in the Surface of the Earth, through which they may eſcape, and make the Head of a River. See STRATUM.

Now, that the Rain is ſufficient for this Effect, appears hence; that upon calculating the Quantity of Rain and Snow that falls yearly on the Tract of Ground, that is to furniſh, for Inſtance, the Water of the *Seine*; 'tis found, that River does not take up above one ſixth Part of it. *Springs* ordinarily ariſe at the Feet of Mountains: The Reaſon, ſay they, is, That Mountains collect the moſt Waters, and give them the greateſt Deſcent towards the ſame Side: and that if we ſometimes ſee Springs on high Grounds, and even on the Tops of Mountains; they muſt be brought from other remoter Places, conſiderably higher, along on Beds of Clay or clammy Ground, as in their natural Channels. If then, there happen to be a Valley between a Mountain, on whoſe Top is a *Spring*, and the Mountain that is to furniſh it with Water, the *Spring* muſt be look'd on as a Water conducted from a Reſervoir of a certain Height through a ſubterraneous Channel, to make a Jet of an equal or ſomewhat leſs Height. See RAIN.

This Theory M. *de la Hire* has taken under Examination, in its moſt eſſential Article, and that where the Authors ſeem to have been the leaſt diſtruſtful.

He has endeavour'd to find, by Experiment, whether Rain or Snow-water could penetrate the Earth as low as the clayey Stratum: The Reſult of his Inquiry, is, That they don't penetrate even 16 Inches deep, in a Quantity ſufficient to form the ſmalleſt Collection of Water on a Solid Bottom. Nay, this he found when the Earth he made his Experiment on, was quite naked of all Herbs and Plants; but aſſoon as ever any of theſe came up, and were grown to any Bulk, ſo far was the Rain that fell, from being able to gather itſelf at the Depth of 16 Inches, that it was not ſufficient even to feed the Plants, but there was a Neceſſity for watering them. For the Quantity of Water expended in the ordinary Support of Plants, ſee VEGETATION.

Dr. *Halley* refers the Origin of *Springs* meerly to Vapours, rais'd by the Heat of the Sun, or of Subterraneous Fires from the Sea, Lakes, Rivers, *&c.* Theſe Vapours, thus rais'd, he ſuppoſes, are by the Winds, carried over the Low-lands, to the ſeveral Mountains and Ridges of Mountains, and are there compell'd, by the Stream of Air, to mount with it to the Tops, where the Atmoſphere being very rare and cold, retains but a ſmall Part of them; the reſt is condenſed into Dew, which preſently precipitates, gleeting down by the Crannies of the Stones, and part of it entering the Caverns of the Hills, is gather'd therein, as in an Alembic, which being once full, the Overplus muſt run down at the loweſt Part of the Reſervoir, and breaking out by the Side of the Hills, forms *ſingle Springs*, many of which running down by the Vallies or Guts between the Ridges of the Hills, and at length uniting, form *Rivulets*, and many of theſe meeting in a common Channel, form Rivers. See RIVER.

Now, to ſhew that Vapour is a ſufficient Fund, to ſupply all our *Springs*, Rivers, *&c.* The ſame excellent Author makes an Eſtimate of the Quantity of Vapour raiſed from the Sun, by the Action of the Sun: The Reſult of an Experiment he made to that Purpoſe was, That the Thickneſs of Water evaporated from the Surface of the Sea, in the Space of Two Hours, in Summer-time, is one Fifty-third Part of an Inch; which for the Eaſe of Calculation, being only ſuppoſed to be $\frac{1}{40}$; the Quantity of $\frac{1}{1}$. of an Inch will be found exhaled in 12 Hours. On this Principle, every Mile ſquare will be found to evaporate, in 12 Hours, 6914 Tuns of Water, and every ſquare Degree, Thirty-three Millions of Tuns. The Area of the *Mediterranean* then being eſtimated at 160 Square Degrees, it will loſe in Vapour, in a Summer's Day 5280 Millions of Tuns.

Yet the Quantity of Vapour thus raiſed, great as it is, is only the Remains of what is rais'd another Way, *viz.* by the Winds, which ſometimes ſweep the Water off, faſter than the Sun takes it up.

To find now, the Quantity of Water the *Mediterranean* receives, allow the moſt conſiderable Rivers it receives, *viz.* the *Iberus*, *Rhone*, *Tyber*, *Po*, *Danube*, *Neiſter*, *Boriſthenes*, *Tanais* and the *Nile*, each to furniſh Ten Times as much Water as the *Thames*; not that any of them are, in reality, ſo great, but ſo to allow for the leſſer Rivulets: But the *Thames* is found, by Calculation, to evacuate 20300000 Tuns of Water daily. All the Nine Rivers abovementioned, therefore, will only evacuate 1827 Millions of Tuns in a Day, which is little more than a Third of what is rais'd in that Time in Vapour. See VAPOUR.

After all that can be ſaid in Favour, both of Rain and Vapour, it muſt be owned, they are both ſtill preſs'd with great Difficulties; and there is ſtill Room to look out for a better Theory.

The Perennity of divers *Springs*, always yielding the ſame Quantity of Water, when the leaſt Rain or Vapour is afforded, as well as when the greateſt, is a ſtrong Objection to both. Mr. *Derham* mentions one in his own Pariſh of *Upminſter*, which he could never perceive by his Eye to be diminiſh'd in the greateſt Droughts, even when all the Ponds in the Country, as well as an adjoining Brook, have been dry for ſeveral Months together; nor ever to be increaſed in the moſt rainy Seaſons, excepting perhaps, for a few Hours, or at moſt

for

for a Day, from ſudden and violent Rains. Had this *Spring* its Origin from Rain or Vapour, there would be found an Increaſe and Decreaſe of its Water, correſponding to thoſe of its Cauſes; as we actually find in ſuch temporary *Springs*, as have undoubtedly their Riſe from Rain and Vapour: Add to this, another conſiderable Thing in this *Upminſter Spring*, and Thouſands of others, *viz.* That it breaks out of ſo inconſiderable a Hillock or Eminence, as can have no more Influence in the Condenſation of the Vapours or ſtopping the Clouds, than the lower Lands about it have. The very higheſt Ground in the County, he finds is not above 133 Yards above the Level of the Sea; and what is ſuch an inconſiderable Riſe of Land, to a Perennial Condenſation of Vapours, fit to maintain ſo inconſiderable a *Spring*? Or the high Lands of the whole County, to the maintaining all its Fountains and Rivulets?

Other Naturaliſts, therefore, have Recourſe to the Sea, and derive the Origin of *Springs* immediately thence; but how the Sea-water ſhould be rais'd up to the Surface of our Earth, and even to the Tops of the Mountains, is a Difficulty they can't agree upon.

Some fancy a kind of hollow, ſubterranean Rocks to receive the watery Vapours from the Bottom of the Earth, and to act the Part of Alembics, in condenſing and converting them into Waters. Others, as M. *de la Hire*, &c. ſet aſide the Neceſſity of Alembicks, and think it enough that there be large ſubterranean Reſervoirs of Water at the Height of the Sea, whence the Warmth of the Bottom of the Earth, or even the central Fire (if there be ſuch a Thing) may raiſe Vapours, which pervading not only the Intervals and Fiſſures of the Strata, but the Bodies of the Strata themſelves, at length arrive near the Surface; where, being condenſed by the Cold, they glide along on the firſt Bed of Clay they meet withal, 'till an Aperture in the Ground lets them out. M. *de la Hire* adds, That the Salts of Stones and Minerals may contribute to the detaining and fixing the Vapours, and the converting them into Water.

But we have a ſtill more natural and eaſy Way of exhibiting the Riſe of the Sea-water up into Mountains, &c. by putting a little Heap of Sand, Aſhes, a Loaf of Bread, or the like, in a Baſon of Water: In which Caſe, the Sand, &c. will repreſent the dry Land, or an Iſland; and the Baſon of Water the Sea about it. Here, the Water in the Baſon will riſe to, or near, the Top of the Heap, in the ſame Manner, and from the ſame Principle, as the Water of the Sea, Lakes, &c. riſe in the Hills. The Principle of Aſcent in both, is, doubtleſs, the ſame with that of the Aſcent of Liquids in Capillary Tubes, or between contiguous Planes, or in a Tube fill'd with Aſhes; all which are now generally accounted for from the Doctrine of *Attraction*; ſee ASCENT, CAPILLARY, ATTRACTION, &c.

SPRING, in Coſmography, one of the Seaſons of the Year; commencing, in the Northern Parts of the World, on the Day the Sun enters the Firſt Degree of *Aries*, which is about the 10th Day of *March*, and ending when the Sun leaves *Gemini*. See SEASON.

Or, more ſtrictly, and generally, the *Spring* begins on the Day, when the Diſtance of the Sun's Meridian Altitude from the Zenith, being on the Increaſing Hand, is at a Medium between the greateſt and leaſt. The End of the *Spring* coincides with the Beginning of *Summer*. See SUMMER.

SPRING, in Phyſicks, a natural Faculty, or Endeavour, Bodies have of returning to their firſt State, after having been violently put out of the ſame, by compreſſing, bending them, or the like: This Faculty the Philoſophers uſually call the *Elaſtic Force*, or *Elaſticity*. See ELASTIC.

Fleas only jump to thoſe exceſſive Heights, by means of a *Springy* Membrane, eaſily viſible by a Microſcope, and whereof we have a curious Figure in Dr. *Hook*'s Micrography. By the elaſtic Force of this *Spring*, they are enabled to leap 200 times the Height of their own Body. See FLEA.

Nature has provided for the regular ſowing of the Seeds of ſeveral Kinds of Plants, by furniſhing them with a *Spring*, which is wound ſometimes round the Outſide, and ſometimes round the Inſide of the Caſe wherein the Seeds are contained. This *Spring*, when ſtretch'd to a certain Pitch, by the full Growth and Maturity of the Seed, ſuddenly, either breaks in two, as when on the Outſide, and tears the Caſe along with it; or elſe, by its vehement Effort to unbend itſelf, as when in the Inſide, it burſts the Caſe into Two Parts like Cups, and diſperſes the Seed. See SEMINATION.

SPRING, is particularly uſed for a Piece of temper'd Steel put in ſeveral Machines to give them Motion, by the Endeavour it makes to unbend itſelf.

In Watches, 'tis a fine Piece of well-beaten Steel, coil'd up in a cylindrical Caſe or Frame, which by ſtretching itſelf forth, puts the Wheels and the whole Movement in Motion. See WATCH

The *Spring* of a Lock, Piſtol or the like, is a Piece of Steel violently bent, which beats back the Bolt, or ſtrikes down the Cock, when ſet at Liberty. See LOCK.

SPRING *of the Air*, or its Elaſtick Force. See AIR and ELASTICITY.

SPRING *a Maſt*; ſo the Sea-men call it, when a Maſt is crack'd, but not quite broken in any Part.

SPRING-*Tide*, is the increaſing of a *Tide* after a dead Neip. See TIDE.

The *Spring-Tides* happen about Three Days before the Full or Change of the Moon; but the Top or Higheſt of the *Spring-Tides*, is three Days after the Full or Change: then the Water runs higheſt with the Flood, and loweſt with the Ebb, and the *Tides* run more ſtrong and ſwift, than in the Neips. See NEIP, FLUX, EBB, &c.

SPRINGE, a Snare or Device made of twiſted Wire, to catch Birds or ſmall Beaſts.

SPRINGY, or *elaſtic* Bodies, are ſuch, as having had their Figure changed by the Stroke or Percuſſion of another Body, can recover again their former Figure; which Bodies, that are not Elaſtic, will not do. Thus if a Piece of Steel be bent any way, it will recover again its former Straitneſs; but a Piece of Lead will ſtand bent in any Form. See ELASTIC *Bodies*.

SPUNGE or SPONGE, a kind of Sea-Fungus or Muſhroom found adhering to Rocks, Shells, &c. on the Sea-ſhore. See MUSHROOM.

The Ancients diſtinguiſh'd two Kinds, *Male* and *Female*: But the Moderns make only one Kind; which, however, they diſtinguiſh with regard to to its Texture, into *Coarſe* and *Fine*.

The Naturaliſts have been embaraſs'd in all Ages, whether to range *Spunges* in the Animal, Mineral or Vegetable Family. Some wou'd have it a Concretion form'd of the Sea-mud; and others an Animal, from its Motion of Contraction and Dilatation.

The greateſt Part of our *Spunges* are brought from the *Mediterranean*; though there are conſiderable Quantities from *Vicaria*, an Iſland on the Coaſt of *Aſia*.

The Diving or Fiſhing for *Spunges* is there reckoned the top Qualification in the Youth, who all get the better Wives as they excel more herein. To this Proof, the Maids refer the Preference among ſeveral Suitors; placing themſelves on the Brink of the Sea, to be Witneſſes of the Addreſs of each; and giving themſelves as a Prize to the Conqueror. See DIVING.

The fine or ſmall *Spunges* are the moſt eſteem'd; and uſually come to us from *Conſtantinople*. Their Goodneſs conſiſts in their being very white, light, and the Holes ſmall and cloſe; the larger and coarſer come from the Coaſts of *Barbary*, particularly *Tunis* and *Algier*.

The *Spunge* is a very uſeful Matter in the Arts. In Phyſic it ſerves to foment Parts inflamed. By Analyſis, it yields a deal of volatile, ſharp Salts, like other Sea-Plants. Taken inwardly it choaks; and is for that Reaſon cut ſmall, and fried or dipt in Honey, and given to Quadrupeds to kill them, which it ſeldom fails to do, by ſwelling and preventing the Paſſage of the Food into the Inteſtines.

In *Spunges* are found a kind of Stones call'd *Cyſthoelithres*, held good for the Worms in young Children, and taken in Powder.

Pyrotechnical SPUNGES, are made of the large Muſhrooms or fungous Excreſcences growing on old Oaks, Aſhes, Firs, &c. which being boil'd in common Water, then dried and well beaten, are put in a ſtrong Lye, prepared with Salt-peter, and again dried in an Oven.

Theſe make the black Match or Tinder brought from *Germany*, uſed to receive and ſuſtain the Fire ſtruck from a Flint and Steel, &c.

SPUNGE, in Gunnery, a Rammer or Staff, with a Piece of Sheep or Lamb-skin about its End; to ſerve for ſcouring of great Guns when diſcharged, e'er they be charged with freſh Powder. See CHARGE.

SPUNGING, in Gunnery, the clearing a Gun's Inſide with a *Spunge*, in order to prevent any Parts of Fire from remaining in her; which would endanger the Life of him, who ſhould load her again. See GUN.

SPUN-*Yarn*, among Sailors, the *Yarn* of untwiſted Ropes, whoſe Ends are ſcraped and beaten thin, in order to be let into the Ends of other Ropes, and ſo made long as Occaſion ſhall require.

SPUR, was anciently a Piece of the Armour of a Cavalier, faſten'd to the Talary, that is, the hind of that Part of the compleat Armour which cover'd the Legs and Feet.

At preſent, the *Spur* is a Piece of Iron or other Metal, conſiſting of two Branches incompaſſing the Cavalier's Heel, and a Rowel in form of a Star, advancing out behind to prick the Horſe.

Louis le Debonnaire forbad Eccleſiaſticks the profane Faſhion of wearing *Spurs*.

Anciently the Difference between the Knight and Eſquire was, that the Knight wore gilt *Spurs*, whence the Appellation of *Eques Auratus*, and the 'Squire ſilver'd ones. See KNIGHT and ESQUIRE.

The Word is derived from the *German*, *Sporen* or *Sporn*.

SPURIOUS-

SPURIOUS *Diſeaſes*, are ſuch as in ſome Symptoms cannot be brought under any diſtinct Head, and therefore are call'd by the Name of ſome, with which they moſt agree; and hence, alſo, they are often denominated Baſtards, *Nothi*; as a *ſpurious* or *baſtard Pleuriſy*, a *baſtard Quinſy*, and the like. See PLEURISY, *&c.*

SPURIOUS *Fleſh*, among Anatomiſts, that which is of a Conſtitution quite different from all the reſt; as the *Fleſh* of the Lips, Gums, Glans, *&c.* See FLESH, GUMS, GLANS, *&c.*

SPUR-*Way*, a Horſe-way through a Man's Grounds, through which one may ride, by Right of Cuſtom.

SPUTUM, in Medicine, *&c.* the Spittle, or Excrement voided at the Mouth. See SALIVA.

An Examen of the *Sputum*, is of great Conſequence in Phthiſical Caſes; and *Bennet*, in his *Theatrum Tabidorum*, applies himſelf in a particular Manner thereto. See PHTHISIS.

The *Sputum Sanguinis*, is a very dangerous Symptom in that Diſeaſe.

SPY, a Perſon paid to watch the Actions, Motions, *&c.* of another; particularly as to what paſſes in an Army.

When a *Spy* is found in a Camp, he is immediately hanged. *Wicquefort* ſays, an Embaſſador is an Honourable *Spy*, under Protection of the Law of Nations. See EMBASSADOR.

SQUADRON *of Ships*, a Diviſion, or Part, of a Fleet, commanded by a Vice or Rear Admiral, or ſome other Commander or Commadore. See FLEET, ADMIRAL, *&c.*

The Number of Ships in the *Squadron* is not fix'd: A ſmall Number of Veſſels, if they be in a Body, and have the ſame Commander, may make a *Squadron*.

If there be a great Number, they are uſually divided into Three *Squadrons*. And if the *Squadrons* be numerous, each *Squadron* is divided into Three Diviſions.

The Word is form'd from the *Italian Squadrone* of the *Latin*, *Squadro*, uſed by Corruption for *Quadro*: In regard, at firſt, the *Squadrons* were always Square, and called alſo by the *Latins*, *Agmina Quadrata*.

SQUADRON is alſo a Body of Horſe, whoſe Number is not fixed; but is uſually from One hundred to Two hundred Men, according to the General's Pleaſure, the Strength of the Army, or as Occaſion ſerves.

It uſually conſiſts of Three Troops, each of Fifty Men, and it never exceeds Two hundred; becauſe a greater Number can't be advantageouſly poſted, nor have Room to act in narrow Grounds, Woods, Marſhes, Defiles, *&c.* See TROOP.

The Eldeſt Troop takes the Right of the *Squadron*, and the Second the Left, the Youngeſt being in the Centre.

A *Squadron* is always drawn up Three deep, or in Three Ranks, with the Length of an Horſe between each Rank.

The Standard is always in the Centre of the firſt Rank.

SQUAMMOUS, in Anatomy, an Epithet given to the Spurious or falſe Sutures of the Skull; becauſe compoſed of *Squammæ* or Scales like thoſe of Fiſhes, or like Tyles laid ſo as to reach over one another. See SUTURE.

The *Suturæ Squammoſæ*, are alſo call'd *Temporales*, from their terminating the Temples, or *Oſſa Temporis*

SQUARE, in Geometry, a quadrilateral Figure, both Equilateral and Equiangular. See FIGURE, QUADRILATERAL, EQUIANGULAR, *&c.*

To find the Area of a Square: Seek the Length of one Side; multiply this by itſelf; the Product is the Area of the *Square*.

Thus, if the Length of a Side be 345, the Area will be 119025: And if the Side of a *Square* be 10; the Area will be 100.

Since, then, a Decempeda contains 10 Feet, a Foot 10 Digits, *&c.* a *ſquare* Decempeda contains 100 *ſquare* Feet, a *ſquare* Foot 100 *ſquare* Digits, *&c.*

The Properties of a Square, are, that its Angles are all Right, and, conſequently, its Sides Perpendicular; that it is divided into two equal Parts, by a Diagonal; that the Diagonal of a *Square*, is incommenſurable to the Side. See DIAGONAL, *&c.*

For the Ratio of Squares; they are to each other in a duplicate *Ratio* of their Sides. *E. gr.* a *Square* whoſe Side is double another, is quadruple the *Square* of the ſingle Side.

SQUARE *of the Cube*
SQUARE *of the Surdeſolid* } See POWER.

SQUARE *Number*, the Product of a Number multiplied by itſelf: Thus 4, the Product of 2 multiplied by 2; or 16 the Product of 4 multiplied by 4, are *Square* Numbers. See NUMBER.

Such Number is called a *Square Number*, becauſe it may be ranged into the Form of a *Square*, by making the Root, or Factor the Side of the *Square*. See ROOT.

The Difference of Two *Square* Numbers, whoſe Roots are not Unity, is an uneven Number, equal to double the Root of the leſs, increas'd by Unity.

Hence we have an eaſy Method of conſtructing *Square* Numbers for a Number of Roots proceeding in the natural Series; the double of the Root of the Antecedent increas'd by Unity, being continually to be added to the preceding *Square*.

Thus, if $n=1$; $2n+1=3$: If $n=2$; then will $2n+1=5$: If $n=3$; then will $2n+1=7$: If $n=4$; then will $2n+1=9$, *&c.* Thus by a continual Addition of the uneven Numbers, ariſe the *Square* Numbers.

SQUARE *Root*, a Number conſider'd as the Root of a Second Power or *Square* Number; or a Number by whoſe Multiplication into itſelf, a *Square* Number is generated. See ROOT.

Thus the Number 2, being that by whoſe Multiplication into itſelf, the *Square* Number 4 is produced; is, in reſpect hereof, call'd a *Square Root*, or the *Square Root of* 4.

Since, as Unity is to the *Square* Root, ſo is the Root to the *Square* Number; the Root is a mean Proportional between Unity and the *Square* Number.

A *Square* Root conſiſting of 2 Parts, is call'd a *Binomial*; as $20+4$. See BINOMIAL.

If it conſiſts of Three, a *Trinomial*, as $6+2-1$. See TRINOMIAL.

Now, every *Square* Number of a Binomial Root, is demonſtrated to be compounded of the *Square* of the firſt Part, the Product of double the firſt into the ſecond, and of the *Square* of the other Part.

To extract the SQUARE *Root out of any given Number*; ſee EXTRACTION *of Roots*.

SQUARE, is alſo an Inſtrument made of Wood or Metal, ſerving to deſcribe and meaſure Right Angles withal; ſuch is AEF, (Tab. Geometry Fig. 42.).

It conſiſts of two Rules or Branches faſten'd perpendicularly at one of their Extremes. When the two Branches are moveable on a Joint, it is call'd a *Bevel*. See BEVEL.

To examine whether or no a *Square* be exact, deſcribe a Semi-circle AEF, of any Length, at Pleaſure; and therein, from each Extreme of the Diameter A and F, draw Right Lines to a Point taken at Pleaſure in the Periphery, as E: To the Sides of the Angle AEF, apply the *Square*, ſo as its Vertex may fall on F. If this be poſſible, that *Square* is juſt.

Geometrical SQUARE, a Compartiment frequently added on the Face of the Quadrant, called alſo *Line of Shadows* and *Quadrat*. See QUADRAT.

Magic SQUARES. See MAGIC *Square*.

SQUARE *Battle*, or *Battalion* of Men, is one that hath an equal Number of Men in Rank and File. See BATTALION.

To form any Number of Men into a *Square Battle*, as ſuppoſe 500, extract the neareſt *Square* Root of 500, which is in Integers 22, and that will give the Number of Men for Rank and File. There will be a Remainder of 16 Men, who may be diſpoſed of, as the Commander thinks beſt.

SQUARE *Hollow*, or *hollow* SQUARE, in the Military Art; is a Body of Foot drawn up with an empty Space in the Middle, for the Colours, Drums and Baggage; faced and covered by the Pikes every way, to keep off Horſe.

SQUARING. See QUADRATURE.

SQUILLITIC. See SCILLITIC.

SQUILLÆ. See SCILLÆ.

SQUINANCY or *Eſquinancy*, by the *Latins*, *&c.* call'd *Angina*, and by us, popularly *Quinzy*, a Diſeaſe which ſtops the Freedom of Reſpiration and Deglutition. See RESPIRATION.

The *Squinancy* conſiſts in an Inflammation of the Throat; and particularly of the Muſcles of the Larynx or Pharynx, which exactly cloſing the Chinks thereof, prevent the Air from paſſing in and out of the Trachea, and the Food from being ſwallowed and convey'd into the Stomach.

The *Squinancy* is divided into *true* and *ſpurious*; the *true Squinancy* is always accompanied with a Fever; the *baſtard* or *ſpurious Squinancy* is free from it.

They are cauſed by a Defluxion of Blood, either pure or bilious, from the Branches of the Carotid Arteries; and there cauſing a Phlegmon, either a Simple or an Ereſypetalous one. See ANGINA.

The Word is form'd from the *Greek* συνάγχειν, to *Suffocate*.

The *Squinancy* is of all others the moſt dangerous, when the Tumour is neither perceivable on the inſide nor the out. That appearing on the outſide is the moſt curable. In violent *Squinancies*, recourſe ſhould be had to Laryngotomy or Bronchotomy, which though rarely practiſed, may yet be uſed with Safety. See LARYNGOTOMY, *&c.*

SQUINTING. See STRABISMUS.

ST, an indeclinable Term, chiefly uſed to command Silence. See SILENCE.

The *Romans* had theſe two Characters wrote over the Doors of their Eating Rooms, as who ſhould ſay *Sed tace*, or *Silentium tene*.

Porphyry obſerves, the Ancients made a Point of Religion of it, not to ſpeak a ſingle Word in paſſing in or out of the Doors.

STABLE-*Stand*, in the Foreſt Law, is when a Perſon is found at his *Stand* in the Foreſt, with a Croſs-Bow, or Long-Bow, ready to ſhoot at a Deer, or elſe ſtanding cloſe by a Tree with Grey-hounds ready to ſlip: It is one of the Four

Evidences or Presumptions, by which a Man is convicted of intending to steal the King's Deer; the other Three being Back-berond, Bloody-hand, and Dog-draw. See FOREST.

STACK *of Wood*, among Husbandmen, is a Pile of Wood three Foot long, as many broad, and twelve Foot high.

STACTE, in Pharmacy, a fatty Matter drawn from fresh Myrrh, pounded or press'd with a little Water. See MYRRH.

This Liquor is very Odoriferous, and held mighty precious; making, alone, the Perfume, called by *Dioscorides*, *Stacte*, and which smells finely, though very bitter to the Taste.

We have none of it now, but what is sophisticated; and what the Apothecaries call *Stacte*, is no more than liquid Storax. See STORAX.

STADHOUDER, STADTHOLDER, STADHOLDER, or STATHOLDER, a Governor or Lieutenant of a Province, in the *United Netherlands*; particularly that of *Holland*; where the Word is most used, by reason of the superior Importance of the Government of that Province.

The *Stadtholder*, *i. e.* the *Stadtholder* of *Holland*, is the first Member of the Republick: He is chief of all the Courts of Justice; and may preside therein when he pleases. All Sentences, Judgments, &c. are dispatch'd in his Name. When an Office becomes vacant in any of the Courts, the States propose three Persons to the *Stadtholder*, who is to chuse one of them. He can even pardon Criminals, which is a Right of Soveraignty; and has the Choice of Sheriffs, or chief Magistrates in each City; to which end the Council of the City present him two Persons, one of which he appoints.

In several Cities, he has the same Right, with regard to the Bourgher-masters and Counsellors; as at *Rotterdam*, *Dort*, &c. He has also a Right to Cassheer the Magistrates, and put others in their Room, when he finds it necessary for the public Good; upon giving a Reason for the same.

By Article VI. of the Union of *Utrecht*, the States constitute him Arbiter of all the Differences that may arise between the States of the several Provinces; or between the Cities and the Members of the States of the Province. To the Dignity of *Stadtholder*, is inseperably annex'd, that of Captain and Admiral General of the Province; in which Quality, he names all the Officers, and disposes of all the Military Charges. 'Tis he, takes care of the Execution of the Ordinances of the States; and his Authority gives him a Right to receive and hear Embassadors from foreign Princes, and even to send Embassadors on his own private Affairs.

The Office of *Stadtholder* is very Ancient: The Counts not being able to reside in *Holland*, appointed *Stadtholders* to command in their Absence, in the several Provinces; besides a Governor General of all the Seventeen Provinces of the *Netherlands*.

William I. Prince of *Orange*, was *Stadtholder* of *Holland* and *Zeeland*, at the Time when the *Dutch* shook off the *Spanish* Yoak; which enabled him to contribute greatly to that happen Event.

In 1567, the States thought fit to suppress the Office of *Stadtholder*, by Edict; and resolved it should never be confer'd on any Person for the future; but in 1672, *William* III. Prince of *Orange*, afterwards King of *England*, being elected Captain and Admiral General by the States; some Months afterwards, they revoked the Edict of Suppression in favour of that Prince, who was declared *Hereditary Stadtholder*; an Honour never confer'd before.

Menage derives the Word from *Stat*, State, and *houder*, holding, *q. d.* Lieutenant of the States; but he is mistaken in the Etymology: The Word being compounded of *Stad* or *Stede*, Place, and *houder*, holding, in regard the Governor held the Place of the Counts, and represented them in their Absence.

STADIUM, an ancient *Greek* long Measure, containing 125 Geometrical Paces, or 625 Feet; corresponding to our Furlong. See FURLONG.

Eight of them make a Geometrical or *Italian* Mile; and 20, according to M. *Dacier*, a *French* League; according to others 24 make the League.

Guilletiere computes that the *Stadium* was only 600 *Athenian* Feet, which amount to 566 *French* Royal Feet, or 604 *English* Feet; so that the *Stadium* should only have been 113 Geometrical Paces.

It must be observed however, That the *Stadium* was different in different Times and Places. See MEASURE.

The Word is form'd from the *Greek*, στάσις, *Station*; and, 'tis said, on this Occasion, that *Hercules*, after running so far at one Breath, stood still.

The *Greeks* measured all their Distances by *Stadia*, which they call'd σταδιαξειν.

STADIUM was also the Course or Career, wherein the *Greeks* run their Races. See GYMNASIUM.

Vitruvius describes it as an open Space 125 Paces long, terminated at the two Extremes with two Posts, called *Carcer* and *Meta*.

Along it was an Amphitheatre, where the Spectators were placed to see the *Athletæ* Exercise, Running, Wrestling, &c.

There were *Stada* likewise, covered over, and encompassed with Colonnades and Porticoes, serving for the same Exercises in ill Weather. Captive Children used to run the *Stadium*. Ablanc.

A more natural Derivation of the Word *Stadium*, from στάσις, or *Statio*, than that popular one mentioned in the last Article, is drawn from the *Athletæ* stopping and resting, when at the End of this Course: Whence the Name might be applied to the same Distance, measured in any other Place.

STAFF, an Instrument ordinarily used to rest on, in walking.

Cardinal *Bona* observes, in his Treatise of *Liturgies*, that anciently, those who used a *Staff* in the Church to lean on, were obliged to lay it by, and to stand alone, firm and upright, while the Gospel was a reading; to testify their respect, by their Posture, and to shew they were ready to obey *Jesus Christ*, and to go whereso'ever he should command them.

The *Staff* is also frequently used, as a kind of natural Weapon, both of Offence and Defence. The *Lacedemonians* never wore any Swords in Time of Peace; but contented themselves with a thick, crooked *Staff*, which was peculiar to them. Among the *Romans*, Mr. *St. Evremond* observes, Blows with a *Staff* were the gentlest Correction they gave their Slaves; inasmuch as they received them over their Cloaths.

Among the Masters of Honour and Arms, 'tis held a greater Affront to be beaten with a *Staff* than with a Sword; because the Sword is the Instrument of War, the *Staff* the Instrument of Outrage.

Blows with a *Staff* are very severely punished by the *French* Laws: By a Regulation of the Marshals of *France*, in 1653, for Reparations and Satisfactions of Honour, 'tis adjudged, That a Person who shall strike another with a *Staff*, shall be Imprison'd a whole Year; unless Six Months be moderated, upon paying 3000 Livres, applicable to the nearest Hospital: Beside which, the Offender is to ask Pardon of the Offended on his Knees, &c. ready to receive a like Number of Blows with a *Staff*; which on some Occasions one may oblige him to give; if he have too much Generosity, not to do it of himself. By another Regulation of the Marshals in 1679, he who strikes with a *Staff*, after receiving Blows with the Fist, in the Heat of a Fray, is condemn'd to Four Years Imprisonment; and to Four, if he even struck first with the Fist.

Pastoral STAFF, *Augural* STAFF, *Jacob's* STAFF } See { CROSIER. LITUUS. RADIUS *Astronomicus*.

STAFF, in Music, five Lines, on which, with the intermediate Spaces, the Notes of any Song or Piece of Music are mark'd. See MUSIC.

Guido Aretin, the great Author of the Modern Music, is said to be the first who introduced the *Staff*; marking his Notes, by setting Points (.) up and down them, to denote the Rise and Fall of the Voice; and each Line and Space he mark'd at the beginning of the *Staff* with *Gregory*'s Seven Letters, *a*, *b*, *c*, *d*, *e*, *f*, *g*. See NOTE.

But others will have the Artifice of an older Date; and *Kircher* particularly affirms, That in the *Jesuites* Library at *Messina*, he found an old *Greek* MS. Book of Hymns, above 700 Years old; wherein some Hymns were written on a *Staff* of eight Lines, mark'd at the beginning with Eight *Greek* Letters. The Notes or Points were on the Lines, but no use made of the Spaces. See SCALE, GAMUT, SOLFAING, &c.

STAFF, in Heraldry. See BATTOON.

STAFF, in Surveying, a kind of Stand, whereon to mount a Theodolite, Circumferentor, plain Table, or the like, for Use. It consists of Three Legs of Wood, joyned together at one End, whereon the Instrument is placed; and made peeked at the other, to enter the Ground. Its upper End is usually filled with a Ball and Socket. See BALL and SOCKET.

STAGE, in the Modern Drama, the Place of Action and Representation; included between the Pit and the Scenes.

The *Stage* answers to the *Proscenium* or *Pulpitum* of the ancient Theatre. See THEATRE, PULPITUM, PROSCENIUM.

Laws of the STAGE, are the Rules and Decorums to be observed, with regard to the Oeconomy and Conduct of a Dramatic Performance to be exhibited on the *Stage*. These relate, principally, to the Unities, the Disposition of the Acts and Scenes, the Unravelling, &c. See UNITY, ACT, SCENE, CATASTROPHE, &c.

STAGGERS, or *Stavers*, in the Manage. See STAVERS.

STAIRS, in Building, the Steps whereby we ascend and descend, from one Story of a House to another. See STORY.

The

The Dimenſions of *Stairs* are differently aſſigned by different Authors: In this however they agree, that they muſt not be more than Six, nor leſs than Four Inches high; not more than 18, nor leſs than 12 Inches broad; not more than 16, nor leſs than 6 Foot long, each Stair. But theſe Meaſures have only regard to fine Buildings; ordinary Houſes are excepted: Yet even in theſe, the *Stairs* are not to exceed Eight Inches in Height; nor leſs than Nine Inches in Breadth; nor Three in Length.

To reduce the Dimenſions of *Stairs* to ſome natural, or at leaſt geometrical Standard, *Vitruvius* borrows the Proportions of the Sides of a rectangle Triangle, which the ancient School expreſs'd by the Numbers 3, 4 and 5. The firſt for the perpendicular Height; the ſecond for the horizontal Breadth; and the third for the whole Slope or Inclination, from the Edge of one *Stair* to that of another.

But this Rule is ſet aſide, and with good Reaſon, by the modern Builders. For, on this Principle, the lower the *Stairs*, the narrower they muſt be; and *Stairs*, for Inſtance, Four Inches high (ſuch as we find mentioned in ancient Architects) muſt be but $5\frac{1}{3}$ Inches broad.

One Rule to be regarded in the making of *Stairs*, is, That they be laid according to the *Italian* Phraſe, *Con un tantino da Scarpa*, i. e. *ſomewhat ſloping*, or a little higheſt behind, that the Foot may, as it were, both aſcend and deſcend at once; which, though obſerved by few, is found a ſecret and delicate Deception of the Pains in mounting.

STAIR-*Caſe*, an Aſcent incloſed between Walls, or a Balluſtrade, conſiſting of *Stairs* or Steps, with Landing-places and Rails; ſerving to make a Communication between the ſeveral Stories of a Houſe. See STAIR.

The Conſtruction of a compleat *Stair-Caſe*, is one of the moſt curious Works in Architecture. The common Rules to be obſerved therein, are as follow;

1° That it have a full, free Light, to prevent Accidents of ſlipping, falling, &c. 2° That the Space over Head be large and airy, which the *Italians* call *un bel Sfogolo*, good Ventilation, in regard a Man ſpends much Breath in mounting. 3° That the Half-paces, or Landing-places, be conveniently diſtributed for repoſing in the Way. 4° That to prevent Rencounters, &c. the *Stair-Caſe* ben't too narrow; but this laſt is to be regulated by the Quality of the Building. 5° That Care be taken in placing the *Stair-Caſe*, ſo as the *Stairs* may be diſtributed, without Prejudice to the reſt of the Building.

The Kinds of *Stair-Caſes* are various: In ſome, the *Stairs* are ſtraight, others winding; in others both Ways.

Again, of *ſtraight Stairs*, called alſo *Flyers*, ſome fly directly forwards, others are Square, others Triangular, others call'd *French Flights*. Of *winding Stairs*, call'd alſo *ſpiral* or *cockle Stairs*, ſome are Square, ſome Circular, or ſome Elliptical.

And theſe again, are various; ſome winding round a ſolid and others an open Newel.

Laſtly, of *mix'd Stairs*, ſome are call'd *Dog-leg'd*: Others both wind about a ſolid Newel, and fly about a ſquare, open Newel.

Stair-Caſes are of that Importance in Building, that we can't excuſe the not giving a more particular Account of each kind.

Straight STAIRS, then, are ſuch as always *fly*, that is, proceed in a Right Line, and never wind, whence their Denomination. See FLYERS.

Of theſe there are ſeveral Kinds; as ——*Direct Flyers* or *Plain Flyers*, which proceed directly from one Floor to another, without turning either to the Right or Left; ſeldom uſed, except for Garret or Cellar *Stairs*.—— *Square Flyers*, which fly round the Sides of a Square Newel, either ſolid or open; having at every Corner of the Newel, a ſquare, half Step, taking up $\frac{1}{4}$ of a Circle. So that they fly from one half Step to another, and the Length of the *Stairs* is perpendicular to the Side of the Newel. ——*Triangular Flyers*, which fly round by the Sides of a triangular Newel, either ſolid or open, having at each Corner of the Newel a Trapezial Half-ſtep, taking up $\frac{1}{3}$ of a Circle: So they fly from one Half-ſtep to another; and their Length is Perpendicular to the Side of the Newel.—— *French Flyers*, which fly, firſt directly forwards, till they come within the Length of a *Stair* of the Wall; and then have a ſquare half Pace, from which you immediately aſcend to another half Pace, from which the *Stairs* fly directly back again, parallel to their firſt Flight.

Winding STAIRS, are ſuch as always *wind*, and never fly: Of theſe there is great Variety; as, ——*Circular winding Stairs*, whereof there are four Kinds, *viz.* ſuch as wind about a ſolid Newel, the fore Edge of each being in a Right Line, pointing to the Centre of the Newel; commonly uſed in Church Steeples and great old Houſes. Such as wind round an open Newel, the Fore-ſide of each being in a right Line, pointing to the Centre of the Newel, as thoſe in the *Monument*, *London*. Such as wind round a ſolid Newel, only the Fore-ſide of each, an Arch of a Circle, either concave or convex, pointing near to the Circumference of the Newel. And ſuch as reſemble the laſt, in all other reſpects, ſave that they have an open Newel. Any of theſe *winding Stairs* take up leſs Room than any other Kind. In *Stairs* that wind round a ſolid Newel, Architects make the Diameter of the Newel either $\frac{1}{2}$ or $\frac{1}{4}$, $\frac{1}{5}$ or $\frac{1}{7}$ of that of the *Stair-caſe*, according as that is in Bigneſs. If very ſmall, the Newel is but $\frac{1}{8}$, and if large $\frac{1}{9}$, &c.

In *Stairs* that wind round an open Newel, *Palladio* orders the Newel to be $\frac{1}{2}$ the Diameter of the *Stair-caſe*; though there does not appear any Reaſon why the Newel here ſhould not be proportion'd to the *Stair-caſe*, as in the former. As to the Number of *Stairs* in each Revolution; *Palladio* orders, that in a *Stair-caſe* of 6 or 7 Foot Diameter, the *Stairs* in each Revolution be 12; if the Diameter be 8, the *Stairs* to be 16; if 9 or 10, the *Stairs* to be 20; and if 18, to be 24. ——*Elliptical winding Stairs*, whereof there are two Kinds; the one winding round a Solid, the other round an open Newel. They are much of the ſame Nature as *circular Stairs*, excepting that in the one, the Newel is a Circle, and in the other an Ellipſis. —— *Square winding Stairs*, are ſuch as wind round a ſquare Newel, either Solid or open; the Fore-ſide of each *Stair* being a right Line, pointing to the Centre of the Newel. —— *Triangular winding Stairs*, are ſuch as wind round a triangular Newel; the Fore-ſide of each being a right Line, pointing to the Centre of the Newel. —— *Columnated window Stairs*: *Palladio* mentions a *Stair-caſe* in *Pompey*'s Portico at *Rome*, ſet on Columns, ſo, as that the Light they received from above, might diſtribute itſelf to all Parts alike. ——*Double winding Stairs*, *Scamozzi* mentions a *Stair-caſe* of this Form, made by *Piedro del Bergo*, and *Jean Coſſin*, at *Sciamberg* in *France*, in the King's Palace. They are ſo contrived, as that two Perſons, the one aſcending and the other deſcending, ſhall never meet. Dr *Grew* deſcribes a Model of this kind of *Stair-caſe*, kept in the *Muſæum* of the *Royal Society*. The Foot of one of the *Stair-caſes*, he ſays, is oppoſite to that of the other, and both make a parallel Aſcent, and within the ſame Cylinder. The Newel in the Middle is hollow, and built with long Apertures, to convey Light from Candles placed at the Bottom and on the Sides of the Newel, into both Caſes. —— *Quadruple winding Stairs*, *Palladio* mentions a *Stair-caſe* of this Form, in the Caſtle of *Chambor* near *Bloys*. It conſiſts of four *Stair-caſes*, carried up together, having each its ſeveral Entrance, and going up one over another, in ſuch Manner, as that being in the middle of the Building, the Four ſerve for four Apartments; ſo that the People of the one need not go up and down the *Stairs* of the other; yet being open in the Middle, they all ſee each other paſs.

Mixt STAIRS, are ſuch as partly fly, and partly wind; whence ſome call them *Flyers* and *Winders*. Of theſe there are ſeveral Kinds, as, —— *Dog-leg'd Stairs*, which firſt fly directly forwards, then wind a Semi-circle, and then fly directly backwards, parallel to that.—— *Square Flyers and Winders*, have a ſquare Newel, either Solid or open, and fly by the Sides of the Newel, winding a Quadrant of a Circle at each Corner. —— *Solid and open Newel'd Flyers and Winders*, are of two Kinds; the one winds a Quadrant of a Circle about a Solid Newel, then flies by the Side of a ſquare open Newel; then winds again, by the Side of a ſolid Newel, then flies again, and ſo alternately. The other flies firſt, then winds, and then flies again, alternately.

STALACTITÆ, or STAGONITÆ, in natural Hiſtory, a ſort of ſtony, ſparry Iſicles, which hang down from the Tops or Arches of Grotto's, Caves or ſubterranean Caverns; and from the Roof of the Buildings, and Capitals of the Pillars of ſuch Places, as are built over Thermæ or Hot Springs, &c. See STONE and SPAR.

Of this Kind, are the *Sal Alumen*, and *Vitriolum Stalacticum*; the *Minera Ferri-ſtalactica*, the *Vitriolum Capillare*, the *Alumen Capillare*, &c.

The *Stalactitæ*, which incruſtate or line the Tops and Sides of Caves, &c. are manifeſtly form'd of Exſudations or Extillations of petrifying Juices out of the neighbouring rocky Grounds. Thoſe in the Cave on the Top of *Breedon* Hill, Mr. *Derham* fancies, might be form'd by the Rains ſoaking through, and carrying with it Impregnations from the Stones; the Hill, there, being all rocky.

STALE, the Urine of Cattle. — A *Stale* is alſo a living Fowl, put in any Place to allure other Fowl, where they may be taken: For want of theſe, a Lark or any other Bird ſhot, his Entrails taken out, and dried in an Oven, in his Feathers, with a Stick thruſt through to keep him in a convenient Poſture, may ſerve as well as a live one.

STALK, in Botany. See STEM.

The *Stalk* is diſtinguiſh'd into ſeveral Kinds, *viz.* the *Naked Stalk*; which has no Leaves on: *Creſted Stalk*, that has Furrows or Ridges: *Winged Stalk*, which has Leaves on both Sides. *Striped Stalk*, which is of two or more Colours, &c.

STALKING,

STALKING, a Term of conſiderable Import in Fowling; applied to a kind of Screen or Device to hide the Fowler, and amuſe the Game, while he gets within Shot.

Of ſuch Devices there are ſeveral Kinds, *viz.* —— A *Stalking Hedge*, which is an artificial Hedge, two or three Yards long, and a Yard and half high, made with ſmall Wands, to be light and portable, yet buſh'd out like a real Hedge, with Stakes to ſupport it, while the Fowler takes his Aim.

Stalking Horſe, is an old Jade train'd up for the Purpoſe, which will gently walk up and down as you would have him, in Water, *&c.* beneath whoſe Fore-ſhoulder, the Sportſman ſhelters himſelf and Gun. When thus got within Shot, he takes Aim from before the Fore-part of the Horſe; which is much better than ſhooting under his Belly.

To ſupply the Defect of a real *Stalking Horſe*, an Artificial one is frequently made, of old Canvas, ſhaped in form of a Horſe, with his Head bent down, as if grazing; ſtuff'd with any light Matter, and painted. In the Middle it is fix'd to a Staff ſhod at the Foot, to ſtick into the Ground while Aim is taken.

For Change, when the Fowls begin to be uſed to the *Stalking Horſe*, and to know it, ſome *Stalk* with an Ox, Cow, Deer or the like. Others uſe a *Stalking Tree*, and others a *Stalking Buſh*.

STAMINA, in the Animal Body, are thoſe ſimple, original Parts, which exiſted firſt in the Embryo, or even in the Seed; and by whoſe Diſtinction, Augmentation and Accretion, by additional Juices, the human Body, at its utmoſt Bulk is ſuppoſed to be form'd. See EMBRYO, BODY, *&c.*

All that is eſſential to the Animal, are the *Stamina*, which exiſt, *in ovo*; the reſt being foreign, additional and even accidental.

The *Stamina* ſeem to coincide with the *Solids*, which are ſurprizingly ſmall in Quantity. See SOLID.

The Word is *Latin*, and ſignifies *Threads*.

STAMINA, in Botany, thoſe fine Threads or Capillaments growing up within the Flowers of Tulips, Lillies and moſt other Flowers, around the Style or Piſtil. See FLOWER and PISTIL.

On the Tops of the *Stamina*, grow thoſe little Capſulæ or Knots, call'd *Apices*, which M. *Tournefort* makes eſſential to the *Stamina*; whence M. *Reaumur*, who aſſures us in the Memoirs of the *French* Academy, that he could never diſcover any Apices on the Threads of the *Fucus Marinus*, refuſes to call them *Stamina*; though he adds, one may ſuppoſe that the Apices fall aſſoon as the Threads or *Stamina* begin to be unfolded. See APICES.

In ſome tubular Flowers, as the *Narciſſus*, *Digitalis*, *&c.* M. *Geoffroy* obſerves the *Stamina* are exceedingly ſhort; and in ſome Flowers there are no *Stamina* at all, as in the long *Ariſtolochia*, wherein the Apices are immediately faſten'd on the Capſula, which incloſes the Fruit. In ſome other Flowers, as thoſe of Thiſtles, Lettice, Chicory, *&c.* the Apices are incloſed in the *Stamina*; ſeveral of which uniting, form a little Tube in Manner of a Scabbard, in the Inſide whereof are the Apices, furniſhed with their Farina: The reſt of the Cavity being taken up by the Piſtil, which is a little Thread placed on the Embryo of the Seed.

M. *Tournefort* takes the Uſe of the *Stamina* to be, as it were, ſo many excretory Canals, for diſcharging the growing Embryo of its redundant Juices; and of theſe Excrements of the Fruit, he takes that *Farina* or Duſt, found in the Apices, to be form'd. See FARINA.

But M. *Geoffroy*, Mr. *Bradley*, and other late Writers on Plants, as well as ſome former, aſſign the *Stamina* a nobler Uſe.

Theſe Authors, explaining the Generation of Plants, in a Manner, analogous to that of Animals, maintain the Uſe of the *Stamina* to be to ſecrete, in their fine capillary Canals, a Juice, which being collected, harden'd and form'd into a Farina or Duſt, in the Tips or Apices, is thence, when the Plant arrives at Maturity, diſcharged, by the burſting of the Apices, upon the Top of the Piſtil; whence is a Paſſage for it to deſcend into the *Uterus*, where being received, it impregnates and fecundifies the Plant.

On this Principle, it may be ſaid, that the ſame Flower contains both Sexes, which contribute each their Part to the Generation: That the *Stamina* are the Male-part; and the *Farina*, which is always found of an oily, glutinous Nature, the ſeminal Liquor; and that the Piſtil is the Female Part, which conducts the Semen to the *Ova* or Embryo's. See GENERATION *of Plants*.

STAMINEOUS *Flowers*, among Botaniſts, are ſuch as are ſo far imperfect, as to want thoſe colour'd Leaves, we call *Petalæ*; and which only conſiſt of the *Stylus* and the *Stamina*. See FLOWER.

Such Plants as bear theſe *Stamineous Flowers*, Mr. *Ray* makes to conſtitute a large Genus of Plants, which he calls *Herbæ flore imperfecto, ſive apetalo, Stamineove*. And theſe he divides into ſuch as,

1. Have their Fruit or Seed totally divided from the Flower; which are ſuch Plants as are ſaid to be of different Sexes: The Reaſon of which is, that from the ſame Seed, ſome Plants ſhall ariſe with Flowers, and no Fruit; and others, with Fruit, and no Flowers: As Hops, Hemp, Stinging-nettles, Spinach, Mercurialis and Phyllon.

2. Such as have their Fruit only a little diſjoined from their Flowers; as the Ambroſia Bardana Minor, Ricinus, and the Heliotropium Tricoccon.

3. Such as have their Fruit immediately contiguous, or adhering to their Flower: And the Seed of theſe is either, 1. Triangular; and of this Sort, ſome are lucid and ſhining, as the Lapathum, Rhabarbarum, and Biſtorta, to which alſo may be added the Perſicaria: Others are rough and not ſhining, as the Helleborus Albus, Fegopyrum, Convolvulus Niger, and the Polygonum. 2. Such as have a roundiſh Seed, a little flatted or compreſſed, or of any other Figure but the former Triquetrous or Triangular one; and theſe have their Flower, or the Calyx of the Flower, adhering to the Bottom or Baſis of the Seed or Fruit; as the Potamogiton, Blitum Sylveſtre, Parietaria, Atriplex, Blitum Sativum, Amuranthes, Hoclocerieus, and the Saxifraga Aurea. 3. Such whoſe Flowers adhere to the Top of the Seed; as the Beta, Aſarum, Archimilla. And to theſe kind of Plants, Mr. *Ray* reduces alſo the Kaligeniculatum, Sedum Fruticoſum, the Scoparia or Belvidere of the *Italians*.

STAMP. See PRINT.

STAMPING-*Mill*, or *Knocking-Mill*, an Engine uſed in the Tin-works, to bruiſe the Ore ſmall. See TIN.

STANCHEONS, in Building. See PUNCHINS.

STANDARD, in War, a Banner or Flag, bore as a Signal for the joyning together of the ſeveral Troops belonging to the ſame Body. See BANNER.

The *Standard* is uſed for any Enſign of Horſe; but more uſually for that of the General. See FLAG and ENSIGN.

The ancient Kings of *France* bore St. *Martin*'s Hood for their *Standard*. The *Turks* preſerve a *Green Standard* bore by *Mahomet*, with a world of Devotion; as believing it to have been brought down by the Angel *Gabriel*. Every time 'tis diſplay'd, all who profeſs the Mahometan Faith, are obliged to take Arms; thoſe who refuſe, are to be deem'd as Infidels. *Du Cange* derives the Word from *Standarum* or *Stantarum*, *Standardum* or *Standale*, Words uſed in the corrupt *Latin*, to ſignify the principal *Standard* of an Army. *Menage* derives it from the *German*, *Stander*, or the *Engliſh*, *Stand*.

STANDARD, in Commerce, the Original of a Weight, Meaſure or Coin, committed to the keeping of the Magiſtrate, or depoſited in ſome publick Place, to regulate, adjuſt, and try the Weights uſed by particular Perſons in Traffick. See MEASURE, WEIGHT, *&c.*

The Juſtneſs of Weights and Meaſures, is of that Conſequence to the Security and good Order of Trade, that there is no civiliz'd Nation but makes it a Part of their Policy to preſerve the Equality thereof by means of *Standards*. The *Romans* and *Jews* even ſeem to have affix'd a kind of religious Worſhip to theſe *Standards*, by laying them up in their Temples, as it were under the Eye of their Deities.

The *Standards* of Weights and Meaſures in *England*, are appointed by *Magna Charta*, to be kept in the *Exchequer*, by a ſpecial Officer, called the *Clerk* or *Comptroller of the Market*.

For Coins; the *Standard* of Gold Coin is 22 Carrats of fine Gold and 2 Carrats of Alloy in the Pound weight Troy; and the *French*, *Spaniſh* and *Flemiſh* Gold, are nearly of the ſame Fineneſs. The Pound Weight is cut into Forty-four Parts and a Half, each current for 21 Shillings. See GUINEA.

The *Standard* of Silver is 11 Ounces and two Penny-weight of Silver, and 18 Penny-weight of Alloy of Copper. Whether Gold or Silver be above or below *Standard*, is found by aſſaying. See ASSAY.

STANDARDS, or *Standils*, in Husbandry, are Trees, reſerved at the felling of Woods, for Growth for Timber.

STANNARIES; are the Mines and Works, were Tin is dug and purified; as in *Cornwall*, and elſewhere. See TIN.

There are four Courts of the *Stannaries* in *Devonſhire*, and as many in *Cornwall*; and there are ſeveral Laws about, and Liberties granted to theſe Courts in ſeveral Acts of Parliament, as in the Time of *Edward* I. and as abridged by *Edward* III. and in 17 *Car.* I. *c.* 15.

STANZA, in Poetry, a certain regulated Number of grave Verſes, containing ſome perfect Senſe, terminated with a Reſt.

The Word is *Italian*, and literally ſignifies a *Stand* or *Station*, becauſe of the Pauſe to be made at the end of each *Stanza* or compleat Senſe.

What the *Couplet* is in Songs, and the *Strophe* in Odes, the *Stanza* is in the greater and graver Pieces, as Epic Poems, *&c.* See COUPLET and STROPHE.

Indeed the *Italians* ſcarce write any Poems, but they divide them into *Stanzas*. There are *Stanza*'s of 4, 6, 8, 10, 12 Verſes, and ſometimes of an uneven Number of Verſes, as

as 5, 7, &c. but these last are somewhat more difficult to execute, by reason of the three Verses to one Rhime.

The *French* lay it down as a Rule, That if the first *Stanza* begin with a Masculine or a Feminine Verse, the Second is to begin and end with the same. Every *Stanza* ought not only to contain a perfect Sense, but to be terminated with some lively and ingenious Thought, or some just and pertinent Reflexion.

Stanzas were first introduced from the *Italian* into the *French* Poetry, about the Year 1580, and thence transfer'd into the *English*.

The Use of *Stanza*'s in Tragedy or Comedy, is condemn'd by all the best Criticks: For though we speak Verse on the Stage, 'tis still presumed we are speaking Prose. *Stanza*'s shew a kind of Ingenuity, on the Part of the Poet, which has nothing of Nature in it on the Part of the Actor. Add to this, That *Stanza*'s are not fit to express every thing. Wrath, Threatening, &c. sit very ill on a regular *Stanza*: Though Irresolution, Reveries, and every Thing that leads the Actor to think on what he is to resolve, agrees well enough with the unequal Cadence of the *Stanza*.

STAPES, in Anatomy, a little Bone situate in a Cavity of the *Fenestra ovalis*; thus call'd from its resembling a *Stirrop*. See EAR.

The *Stapes*, is one of the Four little Bones fastened to the Tympanum of the Ear; first discovered and published, as *Fallopius* tells us, by *John Philab Ingrassia*, a Physician of *Sicily*. Its Use is in stretching or relaxing the *Membrana Tympani*. See TYMPANUM; see also HEARING and EAR.

STAPLE, primarily, signifies a publick Place or Market, whither Merchants, &c. are obliged to bring their Commodities to be bought by the People; such as the *Greve*, or rather the *Places* along the *Seine*, for the Wines and Corns at *Paris*; whither the Merchants of other Parts are obliged to bring those Commodities.

Menage derives the Word from *Staplus*, which is found in the Ripuary Laws, to signify a Place where Justice is administred. Others derive it from the *German*, *Stapel*, or rather *Stapula*, which *Boxhornius* derives further, from the *German*, *Stapelen*, to put in a Heap.

STAPLE also signifies a City or Town, where Merchants jointly agree to carry certain Commodities, as Wooll, Cloth, Lead, Tin, &c. in order to their being commodiously sold by the Great.

In *England*, *Staples* were settled and appointed, to be constantly kept at *York*, *Lincoln*, *Newcastle upon Tine*, *Norwich*, *Westminster*, *Canterbury*, *Chichester*, *Winchester*, *Exeter* and *Bristol*; to which Places Merchants and Traders were to carry Goods to sell in those Parts.

The *Staple Commodities* of *England*, were chiefly Wooll, Leather, Cloth, Tin, Lead, &c. though by *Staple Goods*, is now generally meant, any proper saleable Commodities, not easily subject to perish. See WOOLL, &c.

The Principal *Staples* now existing, are *Amsterdam* for all Goods from the *East-Indies*, *Spain*, the *Mediterranean*, and the *Baltick*: *Flushing* for those of the *West-Indies*; *Middlebourg* for *French* Wines; *Dort* for *Rhenish* Wines and *English* Cloth; *Verre* in *Zeland* for *Scotch* Merchandizes, &c.

The *Staples* in the *Levant*, call'd by the *French*, *Eschelles Scales*, are such Cities where the *English*, *French*, *Dutch*, *Italians*, &c. have Consuls, Factors and Magazines; and whither they send Vessels regularly each Year. The principal of these are *Smyrna*, *Alexandretta*, *Aleppo*, *Seyda*, *Cyprus*, *Sallee*, *Alexandria*, *Cairo*, *Tunis*, *Algiers*, *Tripoli*, the *Morea*, *Candia* and the Islands of the *Archipelago*. See FACTORY.

STAR, in Astronomy, a general Name for all the heavenly Bodies. See HEAVENLY *Body*.

The *Stars* are distinguish'd, from the Phænomena of their Motion, &c. into *Fix'd* and *Erratic*.

Erratic or *wandering* STARS, are those whose Distances and Places, with regard to each other, are continually changing. These are what we properly call *Planets*. See PLANET.

Though, to the same Class, may likewise be refer'd, what we popularly call *Blazing Stars* or *Comets*. See COMET.

Fix'd STARS, call'd also, by way of Eminence, simply, *Stars*, are those which continually keep the same Distance, with regard to each other.

Concerning the fix'd STARS.

The principal Points that have come under the Consideration of Astronomers, are their *Distance*, *Magnitude*, *Number*, *Nature* and *Motion*.

Distance of the fix'd STARS.

The *Fix'd Stars*, are Bodies exceedingly remote from us; so remote, that we have no Distances in the Planetary System to compare to them. See DISTANCE.

Their immense Distance is argued hence, That they have no sensible Parallax: that is, that the Diameter of the Earth's Orbit bears no sensible Proportion thereto; but they are seen the very same, in all the Points thereof. Mr. *Flamstead*, indeed, seems to have discovered a small Parallax: *Sirius*, *e. gr.* he finds to have a Parallax of 20 Seconds. Admitting this, we have Data enough to determine their Distance, a thing hitherto despair'd of.

For thus, the Sun's Parallax being had, and his mean Distance being 34377 Semi-diameters of the Earth, the Distance of *Sirius* from the Earth will be found to be 35477064 Semi-diameters of the Earth. See PARALLAX.

Mr. *Huygens* attempts the Distance of the *Stars* by another Method, *viz.* by making the Aperture of a Telescope so small, as that the Sun through it appears no bigger than *Sirius*. In this State he found the Sun's Diameter only $\frac{1}{27664}$ of his Diameter when seen with the naked Eye. Were the Sun's Distance, then, 27664 times as great as it is, it would be seen of the same Diameter with *Sirius*; so that allowing *Sirius* to be equal in Magnitude with the Sun (which is a very reasonable Supposition) the Distance of *Sirius* from the Earth, will be found to be to that of the Sun from the Earth, as 27664 to 1. On which Principle, *Sirius* will be 951005328 Semi-diameters distant from the Earth.

If it be urged, that these Methods are too precarious, to conclude any thing from them, yet this we can demonstrate, that the *Stars* are remoter than *Saturn*; nay, that they are vastly more remote than *Saturn*, as *Saturn* has a great Parallax, and the *Stars* scarce any at all.

Magnitude of the fix'd STARS.

The Magnitudes of the *fix'd Stars*, appear to be very different; which Difference arises, not from any diversity in their real Magnitudes, but from their Distances, which are different. From this Difference, the *Stars* become distributed into Seven several Classes, call'd *Magnitudes*. See MAGNITUDE.

The first Class, or those of the first Magnitude, are those nearest us, and whose Diameters are, therefore, biggest. Next these, are those of the second Magnitude, and so on to the Sixth, which comprehends the smallest *Stars* visible to the naked Eye. All beyond, are called *Telescopic Stars*: Not that all the *Stars* of each Class appear justly of the same Magnitude; there is a great Latitude in this respect; and those of the first Magnitude, appear almost all different in Lustre and Size. Other *Stars* there are, of intermediate Magnitudes, which Astronomers cannot refer to this, rather than the next Class, and therefore place them between the Two.

Procyon, for Instance, which *Ptolomy* makes of the first Magnitude, and *Tycho* of the Second, Mr. *Flamstead* lays down as between the First and Second.

Thus, instead of Six several Magnitudes, we have really Six times Six.

Some Authors lay it down, that the *Stars* of the first Magnitude, are seen under an Angle of at least a Minute; but the Earth's Orbit seen from the *fix'd Stars*, we have observed only subtends an Angle of 20 Seconds; and hence they conclude, That the Diameter of the *Stars* is vastly greater than that of the Earth's whole Orbit.

Now a Sphere, whose Semi-diameter only equals the Distance between the Sun and Earth, is Ten Millions of times greater than the Sun; consequently, the *fix'd Stars* must be much more than Ten Millions of times greater than the Sun.

But here is a Mistake; for the Diameters, even of the largest *Stars* viewed through a Telescope, which magnify, *e. gr.* 100 Times, subtend no sensible Angle at all, but are mere lucid Points.

The *Stars* are likewise distinguished, with regard to their Situation, into *Asterisms* or *Constellations*, which are nothing but Assemblages of several neighbouring *Stars*, consider'd as constituting some determinate Figure, as of an Animal, &c. and denominated therefrom: A Division as ancient as the Book of *Job*; wherein we find mention of *Orion* and the *Pleiades*, &c. See CONSTELLATION.

Beside the *Stars* thus distinguished into *Magnitudes* and *Constellations*, there are others not reduced to either. Those not reduced into Constellations, are called *Informes*, or *unform'd Stars*; of which Kind, several so reputed by the Ancients, have been since form'd into New Constellations by the Modern Astronomers; as *Cor Caroli* by Dr. *Halley*, *Scutum Sobiesci*, by *Hevelius*, &c. See INFORMES.

Those not reduced to Classes or Magnitudes, are call'd *Nebulous Stars*, being such as only appear faintly, in Form of little lucid Nebulæ or Clouds. See *Nebulous*.

Number of the STARS.

The Number of *Stars* is vastly great, almost infinite; yet have Astronomers long ago, ascertain'd the Number of those visible to the Eye; which are found vastly fewer than one would imagine. *Hipparchus*, 125 Years before the Incarnation, on occasion of a new *Star* then appearing, made a Catalogue of the *Stars*, *i. e.* an Enumeration thereof, with an exact Description of their Magnitudes, Situations, Longitude, Latitude, &c. that it might be known, if any the like Change should be made for the future in the Heavens. *Hipparchus*, made the Number of visible *Stars* 1022. These

were reduced into 48 Conſtellations, and he laid it down, that if there ſometimes appeared more in Winter Nights, 'twas owing to a Deception of the Senſe.

Ptolomy added Four *Stars* to *Hipparchus*'s Catalogue, and made the Number 1026.

In the Year 1437, *Uleig Beigh*, Grandſon of *Tamerlane*, in a New Catalogue he made, only gives 1017.

But in the 17th Century, when Aſtronomy began to be retrieved, their Number was found to be much greater.

To the 48 Conſtellations of the Ancients, were added 12 New ones, diſcovered towards the South Pole, and two towards the North: Beſides ſeveral others not univerſally admitted, as the *Flower de Lys*, the *Royal Oak*, &c.

Tycho Brahe publiſhed a Catalogue of 777 *Stars*, from his own Obſervations; which *Kepler*, from *Ptolomy* and others, increaſed to 1163, *Ricciolus* to 1468, and *Bayer* to 1725: Dr. *Halley* added 373 obſerv'd by him, within the Antarctic Circle. *Hevelius*, from his own Obſervations, and thoſe of Dr. *Halley*, made a Catalogue of 1888 *Stars*: And Mr. *Flamſtead* has ſince made a Catalogue of no leſs than 3000 *Stars*, all from his own moſt accurate Obſervations. See CATALOGUE.

Of theſe 3000, 'tis true, there are many only viſible through a Teleſcope; nor does a good Eye ſcarce ever ſee more than an Hundred together in the cleareſt Heaven: The Appearance of innumerable more, frequent in clear winter Nights, ariſes from our Sight's being deceived by their Twinkling, and from our viewing them confuſedly, and not reducing them to any Order.

Yet for all this, the *Stars* are really almoſt infinite. *Riccioli*, makes no Scruple to affirm, in his new *Almageſt*, That a Man who ſhould ſay there are above Twenty thouſand times Twenty thouſand, would ſay nothing improbable.

For a good Teleſcope directed almoſt to any Point of the Heavens, diſcovers Numbers that are loſt to the naked Sight; particularly in the Milky Way, which is nothing but an Aſſemblage of *Stars*, too remote to be ſingly ſeen, but ſo cloſely diſpoſed, as to give a luminous Appearance to that Part of the Heavens where they are. See GALAXY.

In the ſingle Conſtellation of the *Pleiades*, inſtead of 6 or 7 *Stars* ſeen by the beſt Eye, Dr. *Hook*, with a Teleſcope 12 Foot long, told 78; and with larger Glaſſes, many more of different Magnitudes. F. *de Rheita*, a Capuchin, affirms, That he has obſerved above 2000 *Stars* in the ſingle Conſtellation of *Orion*.

The ſame Author found above 188 in the *Pleiades*. And *Huygens* looking at the *Star* in the Middle of *Orion*'s Sword; inſtead of one, found it to be 12. *Gallilæi* found 80 in *Orion*'s Sword; 21 in the *Nebulous Star* of his Head; and 36 in the *Nebulous Star*, *Præſepe*.

Changes in the STARS.

The Changes that have happened in the *Stars*, are very conſiderable; contrary to the Opinion of the Ancients, who held, that the Heavens and heavenly Bodies, were incapable of any Change, the Matter thereof being Permanent and Eternal, infinitely exceeding the Hardneſs of Diamonds, and not ſuſceptible of any different Form. And, in Effect, till the Time of *Ariſtotle*, and even 200 Years afterwards, there had no Change been obſerved.

The firſt, was in the Year 125, before the Incarnation; when *Hipparchus* diſcovering a new *Star* to appear, was firſt induced to make a Catalogue of the *Stars*, that Poſterity, as we have obſerved, might perceive any future Changes of the like Kind.

In the Year 1572, *Tycho Brahe*, obſerved another new *Star* in the Conſtellation *Caſſiopœia*, which was, likewiſe, the Occaſion of his making a new Catalogue. Its Magnitude, at firſt, exceeded that of the biggeſt of our *Stars*, *Sirius* and *Lyra*; it even equalled that of *Venus*, when neareſt the Earth; and was ſeen in fair Day-light. It continued Sixteen Months; towards the latter Part whereof, it began to dwindle, and at laſt totally diſappeared, without any Change of Place in all that Time.

Leovicius tells us of another *Star* appearing in the ſame Conſtellation, about the Year 905, which reſembled that of 1572; and quotes another ancient Obſervation, whereby it appears, that a new *Star* was ſeen about the ſame Place in 1264.

Dr. *Keill* takes thoſe to have been all the ſame *Star*; and does not know but it may make its Appearance a-new 150 Years hence.

Fabricius diſcovered another new *Star* in the Neck of the *Whale*, which appeared and diſappeared ſeveral times in the Years 1648 and 1662. Its Courſe and Motion, are deſcribed by M. *Bouilland*.

Simon Marius diſcovered another in *Andromedas*'s Girdle; in 1612 and 1613, though M. *Bouilland* ſays, it had been ſeen before, in the XVth Century. Another was obſerved by *Kepler* in *Serpentarius*. Another of the Third Magnitude in the Conſtellation *Cygnus*, near the Bill, in the Year 1601, which diſappeared in 1626, and was obſerved again by *Hevelius* in 1659, till the Year 1561, and again in 1666 and 1671, as a *Star* of the Sixth Magnitude.

'Tis certain, from the ancient Catalogues, that many of the ancient *Stars* are now inviſible. This is particularly notorious in the *Pleiades*, or Seven *Stars*, whereof only Six are now viſible to the Eye; a Thing long ago obſerved by *Ovid*: Witneſs the Verſe, *Quæ Septem dici, ſex tamen eſſe ſolent.*

M. *Montanere*, in his Letter to the *Royal Society* in 1670, obſerves, that there are now wanting in the Heavens, two *Stars* of the ſecond Magnitude, in the Stern of the Ship *Argo* and its Yard; which had been ſeen till the Year 1664. When they firſt diſappeared 'tis not known; but he aſſures us, there was not the leaſt Glimpſe of them in 1668. He adds, he has obſerved many more Changes in the *fix'd Stars*, even to the Number of an Hundred.

Nature of the fix'd STARS.

For the Nature of the *fix'd Stars*, their immenſe Diſtance leaves us greatly at a loſs about it. What we can gather for certain from their Phænomena, is as follows;

1° *That the fix'd Stars are greater than our Earth.* This is demonſtrable thus: Suppoſe two *Stars* C and D (Tab. Aſtronomy Fig. 31.) the one in the Eaſtern Horizon, and the other in the Weſtern. As ſoon as D arrives in C; C will appear in D. But ſince both move with the ſame Velocity, while C deſcribes the Arch CHD; the *Star* C deſcribing an equal Arch CDH, will appear in F: Wherefore, if the *Stars* C and D be leſs than the Earth, the *Star* C will not be ſeen in the Eaſtern Horizon, when the other, C, is arrived at the Weſtern: But as this is contrary to Experience, it follows, that the *Stars* being in L and S, and there ſeen at the ſame time by Spectators in A and B, are greater than the Earth AB.

2° The *fix'd Stars are farther diſtant from the Earth*, than the *fartheſt of the Planets*. For we frequently find the *fix'd Stars*, hid behind *Saturn*'s Body; the higheſt of the Planets. See OCCULTATION.

3° *The fix'd Stars ſhine with their own Light*: For they are much further from the Sun than *Saturn*, and appear much leſs than *Saturn*; but ſince, notwithſtanding this, they are found to ſhine much brighter than *Saturn*, 'tis evident they cannot borrow their Light from the ſame Source as *Saturn* does, *viz.* the Sun: But ſince we know of no other luminous Body beſide the Sun, whence they might derive their Light; it follows, that they ſhine with their own native Light.

Hence 1°, we deduce, that the *fix'd Stars* are ſo many Suns; for they have all the Characters of Suns. See SUN.

2° That in all probability, the *Stars* are not leſs than our Sun.

3° That 'tis highly probable, each *Star* is the Centre of a Syſtem, and has Planets or Earths revolving round it, in the ſame Manner as round our Sun; *i. e.* has opake Bodies illuminated, warm'd and cheriſh'd by its Light. See SYSTEM.

How immenſe, then, does the Univerſe appear! Indeed, it muſt either be Infinite, or infinitely near it. See UNIVERSE.

Kepler, 'tis true, denies that each *Star* can have its Syſtem of Planets as ours has; and takes them all to be fix'd in the ſame Surface or Sphere; urging, that were there one twice or thrice as remote as the other, it would appear twice or thrice as ſmall, ſuppoſing their real Magnitudes equal; whereas there is no Difference in their apparent Magnitudes, juſtly obſerved, at all. But to this we oppoſe, that *Huygens* has not only ſhewn, that Fires and Flames are ſeen at ſuch Diſtances, where other Bodies, comprehended under equal Angles, diſappear; but it ſhould likewiſe ſeem, that the Optic Theorem about the apparent Diameters of Objects being reciprocally proportional to their Diſtances from the Eye, does only hold while the Diameter of the Object has ſome ſenſible *Ratio* to its Diſtance.

4° *The Stars which appear and diſappear by turns*, being always found to increaſe in Magnitude at their firſt Appearance, and to decreaſe as they begin to diſappear, and being likewiſe ſtill viſible through Teleſcopes, for ſome Time after they are loſt to the naked Eye (of which we have various Inſtances in the *Philoſophical Tranſactions*) *ſeem to be no other than Planets performing their Periods about* the *fix'd Stars*, as *their reſpective Suns*; unleſs any Perſon ſhould rather incline to Dr. *Keill*'s Opinion, *viz.* That the *Stars* loſe their Brightneſs, and diſappear, by their becoming cover'd with *Maculæ* or Spots, ſuch as are frequently found to over-ſpread the Sun. See SPOTS.

5° Thoſe temporary *Stars*, which, upon their diſappearing, have never been found to return again; are probably conjectured to be of the Number of Comets, which make long Excurſions from their Suns, or the Centers of the upper planetary Syſtems, *i. e.* from the *fix'd Stars*; returning too ſeldom to have their Returns perceived. See COMET.

Motions of the STARS.

The *fix'd Stars* have two kinds of Motions; one called the *Firſt*, *common* or *diurnal Motion*, or the Motion of the *Primum*

mum Mobile: By this they are carried along with the Sphere or Firmament wherein they appear fix'd, round the Earth, from East to West, in the Space of 24 Hours.

The other, call'd the *Second* or *proper Motion*, is that whereby they go backwards from West to East round the Poles of the Ecliptic, with an exceeding Slowness, as not describing above a Degree of their Circle in the Space of 71 or 72 Years, or 551 Seconds in a Year.

Some have imagin'd, I don't know on what Grounds, that when they are got round to the Points, whence they first departed, Nature will have finish'd her Course, and the *Stars* having perform'd their Career, the Heavens will remain at rest, unless the Being, who first gave them Motion, appoint them to begin another Circuit.

On the footing of this Calculation, the World should last about Thirty thousand Years, according to *Ptolomy*; 25816 according to *Tycho*; 25930 according to *Riccioli*, and 24800 according to *Cassini*. See PRÆCESSION *of the Equinox*.

In effect, the Latitudes of the *fix'd Stars*, we find, by comparing the Observations of the ancient Astronomers with those of the Moderns, continues still the same; but their Longitude is by this Second Motion always increasing.

Thus, *e. gr.* the Longitude of *Cor Leonis*, was found by *Ptolomy*, *A. D.* 138, to be 2° 30'; in 1115 'twas observ'd by the *Persians* to be 17° 30'; in 1364, by *Alphonsus*, 20° 40'; in 1586 by the Prince of *Hesse* 24° 11'; in 1601 by *Tycho* 24° 17'; and in 1690 by Mr. *Flamstead* 25° 31' 20"; whence the proper Motion of the *Stars*, according to the Order of the Signs in the Circles, parallel to the Ecliptic, is easily inferred.

'Twas *Hipparchus* first suspected this Motion, upon comparing the Observations of *Tymocharus* and *Aristillus* with his own. *Ptolomy*, who lived Three Centuries after *Hipparchus*, demonstrated the same by undeniable Arguments. See LONGITUDE.

Some, 'tis true, have imagined a Change in the Latitudes of the *Stars*; but such an Opinion has little Countenance from Observation. See LATITUDE.

Tycho Brahe makes the Increase of Longitude in a Century 1° 23' 40" 12"'; *Flamstead* and *Ricciolus* 1° 23' 20"; *Bullialdus* 1° 24' 54"; *Hevelius* 1° 24' 46" 50"'; whence, with *Flamstead*, the Annual Increase of the Longitudes of the *fix'd Stars* may be well fix'd at 50".

From these Data, the Increase of the Longitude of a *Star* for any given Time, is easily had; and hence the Longitude of a *Star* for any given Year, being given, its Longitude for any other Year, is readily found: *E. gr.* the Longitude of *Sirius* in Mr. *Flamstead*'s Tables for the Year 1690 being 9° 49' 1"; its Longitude for the Year 1724 is found, by multiplying the Interval of Time, *viz.* 34 Years by 50", the Product 1700" or 28' 2" added to the given Longitude, will give the Longitude required, 10° 17' 3".

The principal Phænomena of the fix'd STARS, *arising from their common and proper Motion, besides their Longitude, are their* Altitudes, Right Ascentions, Declinations, Occultations, Culminations, Risings *and* Settings; *which see under their proper Articles*, ALTITUDE, ASCENTION, DECLINATION, OCCULTATION, *&c.*

The several Stars *in each Constellation*, e. gr. *in* Taurus, Bootes, Hercules, *&c. their Longitudes, Latitudes, Magnitudes, Names, Places, &c. as fix'd by Mr.* Flamstead *in the* Britannic Catalogue; *see under the proper Article of each Constellation*, TAURUS, BOOTES, HERCULES, *&c.*

To learn to know the several fix'd Stars *by the Globe*; *see* GLOBE.

The Parallax and Distance of the fix'd Stars; *see under* PARALLAX and DISTANCE.

STAR, in Fortification, a little Hexagonal Fort, with Six Points, or Salliant and Re-entring Angles flanking one another, and their Faces 90 or 100 Foot long. See FORT.

They are frequently made in Lines of Circumvallation, after two or three Redoubts. See REDOUBT.

STAR, in Pyrotechny, a Composition of combustible Matters, which being borne or thrown aloft into the Air, exhibits the Appearance of a real *Star*.

Stars are chiefly used as Appendages to Rockets, a Number of them being usually inclosed in a Conical Cap or Cover at the Head of the Rocket, and carried up with it to its utmost Altitude, where the *Stars* taking Fire, are spread around, and exhibit an agreeable Spectacle. See ROCKET.

To make Stars; Mix 3 Pounds of Salt-petre, 11 Ounces of Sulphur, one of Antimony and three of Gunpowder Dust: Or 11 Ounces of Sulphur, 6 of Salt-petre, 5½ of Gunpowder Dust, 4 Ounces of Olibanum, one of Mastic, Camphir, Sublimate of Mercury, and Half a one of Antimony and Orpiment.

Moisten the Mass with Gum-water, and make it into little Balls, of the Size of a Chesnut, which dry either in the Sun or the Oven. These set on fire in the Air, will represent *Stars*.

STAR, in Heraldry, a Term frequently used, as signifying a Moveable or Charge, frequently borne on the Shield, and the honourable Ordinaries.

It differs from the *Mullet*, or Spur-rowel, in that it is not pierced as this last is. See MULLET.

It usually consists of five Rays or Spokes. When it has Six or Eight, as among the *Germans* and *Italians*, particular Mention must be made thereof in Blazoning.

On Medals, *Stars* are Marks of Consecration and Deification, being intended as Symbols of Eternity. *F. Joubert* says, they sometimes express the Children of Princes reigning; and sometimes the Children dead, and placed in the Rank of Deities. See DEIFICATION.

STAR, a Badge of the Honourable Order of the Garter. See GARTER.

Order of the STAR, or our *Lady of the* STAR, an Order of Knighthood instituted by King *John* of *France* in the Year 1352, denominated from a *Star* they wore on the Stomach.

At first there were but 30 Knights; but the Order in time became depreciated, by the Multitude of Persons admitted, without any Distinction. For which Reason, *Charles* VII. when Grand-master thereof, quitted it, and gave it the Chevalier *du Guet*, Knight of the Watch at *Paris*, and his Archers, who still wear a *Star* on their Cassock. But this Account is contradicted by others; who will have the Order instituted by King *Robert* in 1022 in Honour of the Holy Virgin, and to have fallen into Disregard during the Wars of *Philip de Valois*.

Justiniani mentions another Order of the *Star*, at *Messina* in *Sicily*, call'd also the *Order of the Crescent*. It was Instituted in the Year 1268, by *Charles* of *Anjou*, Brother of St. *Louis*, King of the Two *Sicilies*.

Others will have it Instituted in 1464, by *Renatus* Duke of *Anjou*, who took the Title of King of *Sicily*. At least, it appears from the Arms of this Prince, that he made some Alteration in the Collar of the Order; for instead of *Flower-de-Luces* and *Stars*, he only bore Two Chains, whence hung a Crescent, with the old *French* Word *Loz*, which in the Language of *Rebus*, signified *Loz in a Crescent*.

The Order being dropt into Obscurity, was raised again by the People of *Messina*, under the Name of the *Noble Academy of the Knights of the Star*, reducing the ancient Collar to a single *Star* placed on a forked Cross, and the Number of Knights to Sixty-two. Their Device was, *Monstrant Regibus Astra Viam*, which they express'd by the Four Initial Letters $\frac{M}{A}*\frac{R}{V}$ with the *Star* in the Middle.

STAR, in the Manage. White *Stars in the Forehead*, are esteem'd good Marks in all Horses, except White and Grey ones: where Nature fails to produce this good Criterion, our Jockies have frequent Recourse to Art.

The Method of making *Stars*, practised among the *Dutch*, is to roast a large Onion in hot Ashes, and when near thoroughly done, to divide it in two, and dip it in scalding hot Wallnut Oil. This done, they immediately apply the flat Side thereof to the Place the *Star* is to be on, and keep it there Half an Hour. After taking it off, they anoint the Scalded Place with Ointment of Roses: In a short Time, the Scarf Skin falls off, and White Hair grows up in their Room; but the Middle always continues bare of Hair, which is the certain Characteristic of an *Artificial Star*.

The Method most used among us, is to shave the Hair from the Place 'tis to be made on; then to apply a little Oil of Vitriol with a Feather, or the like, passing it lightly over the bald Place. This eats away the Roots of the former Hair, which will be succeeded by White. The Sore is heal'd up with Copperas and green Ointment.

To make a *black Star*, on a White or other colour'd Horse; Wash the Place to be changed, frequently, with Fern Roots and Sage boil'd in Lye; and it will breed black Hairs. The same may be done, by beating four Milk, Galls and Rust together, and anointing the Part therewith.

A *Red Star* is made with an Ounce of Aqua-fortis, a pennyworth of Aqua-vitæ, and Silver to the Value of Eighteenpence, all heated together in a Glass, and the Place anointed therewith. This immediately turns the Hair to a perfect Red; but it lasts no longer than till the Horse cast his Coat; when it is to be renewed.

STAR-BOARD, is the Right-hand Side of a Ship, as Larboard is the Left:

Thus they say, *Starboard the Helm*, or *Helm a Starboard*, when the Man at the Helm should put the Helm to the Right Side of the Ship.

STARCH, a Fecula or Sediment found at the Bottom of Vessels, wherein the waste or refuse Wheat has been steep'd in Water: Of which Fecula, after separating the Bran from it, they form a kind of Loaves, which being dried in the Sun, or on a Furnace, is reduced into little Pieces, and so sold for *Starch*.

The best is white, soft and friable, easily broke into Powder. Such as require very fine *Starch*, don't content themselves, like the *Starch-men*, with the Refuse of Wheat, but use the finest Grain. The Process is as follows;

Method

Method of making STARCH *of Wheat.*

The Grain being well cleaned, is put to ferment in Veſſels full of Water, which they expoſe to the Sun, when in its greateſt Heat; changing the Water twice a Day, for the Space of 8 or 12 Days, according to the Seaſon. When the Grain burſts eaſily under the Finger, they judge it ſufficiently fermented. The Fermentation perfected, and the Grain thus ſoften'd; 'tis put, handful by handful, in a canvas Bag, to ſeparate the Flower from the Husks, which is done by rubbing and beating it on a Plank, laid acroſs the Mouth of the empty Veſſel that is to receive the Flower.

As the Veſſels are filled with this liquid Flower, there is ſeen ſwimming a top, a reddiſh Water, which is to be carefully ſcum'd off from time to time, and clean Water put in its Place; which, after ſtirring the whole together, is all to be ſtrained through a Cloth or Sieve, and what is left behind, put into the Veſſel with new Water, and expoſed to the Sun for ſome time; and as the Sediment thickens at the Bottom, they drain off the Water four or five Times, by inclining the Veſſel, but without paſſing it through the Sieve. What remains at bottom, is the *Starch*, which they cut in Pieces to get out, and leave it to dry in the Sun. When dry, 'tis laid up for Uſe.

To uſe *Starch*, they take as much as is needed, and ſteep in Water over Night, changing the Water four or five Times.

The *Starch-men* uſing the Refuſe of Wheat, only obſerve a Part of all theſe Things in their Proceſs; but their *Starch* falls far ſhort of this.

Starch is uſed along with Smalt or Stone-blue, to ſtiffen and clear Linnen. The Powder thereof is alſo uſed to whiten and powder the Hair. 'Tis alſo uſed by the Dyers to diſpoſe their Stuffs to take Colours the better.

STAR-*Chamber*; was a Chamber at *Weſtminſter*, formerly ſo called, from its Roof being painted with *Stars*. See CHAMBER.

Henry the VIIth and VIIIth, ordered, by ſeveral Statutes, that the Chancellor, aſſiſted by others there named, ſhould have Power to puniſh Routs, Riots, Forgeries, Embraceries, Perjuries, and ſuch other Miſdemeanors, as were not ſufficiently provided for by the common Law, and for which the inferior Judges were not ſo proper to give Correction. But this Court, by 17 *Car* I. *c.* 10. was intirely diſſolv'd, and ſo continues to this Day.

STAR-*Fort*, in Fortification, is a Work with ſeveral Faces, generally compoſed of from 5 to 8 Points, with Saliant and Re-entring Angles flanking one another; every one of its Sides containing from 12 to 25 Fathoms.

STARTING, among Brewers, is the putting of new Beer or Ale to that which is decayed, to revive it again.

STATERA *Romana*, or Steelyard, a Name given to the *Roman* Balance. See STEELYARD.

STATERA was alſo an ancient Silver Coin, weighing four *Attic* Drachms, or Half a *Roman* Ounce. It was worth about two Shillings or two Shillings and Two-pence *Sterling*. See COIN.

STATE, or *Eſtate*, an Empire, Kingdom, Province or Extent of Country under the ſame Government. See EMPIRE, KINGDOM, *&c.*

The *State*, or *States* of the King of *England*, include the *Britiſh* Iſlands and the *Weſt India* Plantations, as *Virginia*, *Carolina*, *Mary-land*, *&c.* to which may be added, the Dutchies of *Brunſwic-Lunenbourg*, *Bremen*, *&c.*

STATE is alſo uſed for the Policy or Form of Government of a Nation. Hence, *Miniſters of State*; *Reaſons of State*, *&c.* See RATIO *Status*, *&c.*

Politicians make ſeveral *Forms of State*, *viz.* the *Monarchic*, as that of *England*; ſee MONARCHY: The *Democratic*, as that of *Rome* and *Athens*; ſee DEMOCRACY: The *Oligarchic*, as that of *Venice*; ſee OLIGARCHY: And the *Ariſtocratic*, as that of *Sparta*; ſee ARISTOCRACY, *&c.*

STATE *of a Diſeaſe*. See ACME.

STATES, a Term applied to the ſeveral Orders, or Claſſes of a People, aſſembled to conſult of Matters for the publick Good. See ESTATES.

STATES-*General*, the Name of an Aſſembly, conſiſting of the Deputies of the Seven United Provinces.

In this Aſſembly, the Deputies of each Province, what Number ſoever they be, have only one Voice, and are eſteem'd as but one Perſon; the Votes being given by Provinces. Each Province preſides at the Aſſembly in its Turn, according to the Order ſettled among them; *Guelderland* preſides firſt, then *Holland*, *&c.* This Aſſembly is the Repreſentative of the Soveraignty of the Union, which reſides principally in the General Aſſembly of the *States* themſelves of all the Provinces: But as the Aſſembly ordinarily conſiſts of 7 or 800 Perſons, it was reſolved, after the Departure of the Earl of *Leiceſter*, in order to avoid Expence, and the Confuſion of ſo numerous a Body, that the Provincial Eſtates ſhould, for the future, be ordinarily repreſented by their Deputies, under the Name of the *States-General*, who were always to reſide at the *Hague*, and who alone are now called *States General*.

Since that new Regulation, there have been two General Aſſemblies of the *States* of the Provinces; the former held in 1600 at *Berg-op-Zoom*, to confirm the Truce agreed on with the Arch-duke *Albert*, with the greater Solemnity; and the latter in 1651.

STATES *of Holland*, an Aſſembly conſiſting of the Deputies of the Councils of each City; wherein reſides the Soveraignty of that Province.

Originally, none but the Nobility and the Six principal Cities had Seats or Voices in the *States*. At preſent there are the Deputies of 18 Cities.

The Nobility have the firſt Voice. The other Provinces of the Union have likewiſe their *States*, repreſenting their Soveraignty.

STATICAL *Baroſcope*. See BAROSCOPE.

STATICKS, STATICE, a Branch of Mathematicks, which conſiders *Weight* or *Gravity*, and the Motion of Bodies ariſing therefrom.

Thoſe who define Mechanicks, the Science of Motion, make *Staticks* a Member thereof, *viz.* that Part which conſiders the Motion of Bodies ariſing from Gravity. See GRAVITY.

Others make them two diſtinct Doctrines; reſtraining Mechanicks to the Doctrine of Motion, and Weight, in reference to the Structure and Power of Machines; and *Staticks* to the Doctrine of Motion, conſider'd merely as ariſing from the Weight of Bodies, without any immediate reſpect to Machines: On which footing, *Staticks* ſhould be the Doctrine or Theory of Motion; and Mechanicks the Application thereof to Machines. See MECHANICKS.

For the Laws of STATICKS } See { GRAVITY, DESCENT, *&c.*
STATICAL *Barometer* } See { BAROMETER.

STATICKS, *Statici*, in Medicine, a kind of Epilepticks, or Perſons ſeiz'd with Epilepſies. See EPILEPSY.

The *Staticks* differ from the Catalepticks, in that, theſe laſt have no Senſe of external Objects, nor remember any thing that paſſes at the Time of the Paroxyſm: Whereas the *Statici* are all the while taken up with ſome very ſtrong lively Idea, which they remember well enough, out of the Fit. See EPILEPSY.

STATION, in Geometry, *&c.* a Place pitch'd upon to make an Obſervation, take an Angle, *&c.*

An inacceſſible Height or Diſtance is only to be taken, by making two *Stations*, from two Places, whoſe Diſtances are known. In making Maps of Provinces, *&c.* *Stations* are fix'd on all the Eminences, *&c.* of the Country, and Angles taken thence to the ſeveral Towns, Villages, *&c.*

In Surveying, the Inſtrument is to be adjuſted by the Needle, to anſwer the Points of the Horizon; at every *Station*, the Diſtance from the laſt *Station* to be meaſured, and an Angle to be taken to the next *Station*; which includes the whole Buſineſs of Surveying. See SURVEYING.

In Levelling, the Inſtrument is *rectified*, that is placed level, at each *Station*, and Obſervations made forwards and backwards. See LEVELLING.

STATION, in Aſtronomy, the Poſition or Appearance of a Planet in the ſame Point of the Zodiac for ſeveral Days. See PLANET.

As the Earth, whence we view the Motions of the Planets, is out of the Centre of their Orbits, the Planets appear to proceed irregularly; being ſometimes ſeen to go forwards, that is from Weſt to Eaſt, which is called their *Direction*; ſometimes to go backwards, or from Eaſt to Weſt, which is call'd their *Retrogradation*. See DIRECTION and RETROGRADATION.

Now between theſe two States, there muſt be an intermediate one, wherein the Planet neither appears to go backwards nor forwards, but to ſtand ſtill and keep the ſame Place in her Orbit, which is call'd her *Station*. See STATIONARY.

STATION, in Church Hiſtory, is uſed for the Faſts of the 4th and 6th Day of the Week; that is, thoſe of *Wedneſday* and *Friday*, which many among the Ancients obſerved with much Devotion.

Theſe Faſts only held to 3 o'Clock in the Afternoon. See FAST.

S. *Peter* of *Alexandria*, in his *Canonical Epiſtle*, *Can.* 15. obſerves, that it was appointed in conformity with the ancient Tradition, to faſt weekly on thoſe Days: On *Wedneſday*, in Memory of the Counſel the *Jews* took to put our Saviour to Death; and on *Friday*, on account of his Paſſion; ſome regard to which is ſtill had by many in the Church of *England*.

STATION is alſo uſed in the Church of *Rome*, for certain Churches where Indulgences are to be had on certain Days. See INDULGENCE.

'Twas St. *Gregory* that fix'd the *Stations* at *Rome*, *i. e.* the Churches where the Office was to be perform'd each Day of *Lent*, and on Solemn Feaſt Days. Theſe *Stations* he mark'd

mark'd down in his *Sacramentary*, as they now ſtand in the *Roman* Miſſal; attaching them chiefly to the Patriarchal and Titular Churches: But though the *Stations* were fix'd, the Archdeacon did not fail, at each *Station*, to publiſh to the People the following *Station*.

STATION is alſo a Ceremony in the *Romiſh* Church, wherein the Prieſts or Canons go out of the Choir to ſing an Anthem before the Crucifix, or the Image of our Lady. This Ceremony is aſcribed to S. *Cyril*.

STATIONARY, in Aſtronomy, the State of a Planet when it ſeems to remain immoveable in the ſame Point of the Zodiac. See STATION.

The Planets having ſometimes a progreſſive and ſometimes a retrograde Motion; there will be ſome Point wherein they appear *Stationary*. Now a Planet will be ſeen *Stationary*, when the Line that joins the Earth's and Planet's Centre, is conſtantly directed to the ſame Point in the Heavens; that is, when it keeps parallel to itſelf. For all right Lines drawn from any Point of the Earth's Orbit, parallel to one another, do all point to the ſame Star; the Diſtance of thoſe Lines being inſenſible, in compariſon of that of the fix'd Stars.

Saturn is ſeen *Stationary*, at the Diſtance of ſomewhat more than a Quadrant from the Sun; *Jupiter* at the Diſtance of 52°, and *Mars* at a much greater Diſtance. *Saturn* is *Stationary* 8 Days, *Jupiter* 4, *Mars* 2, *Venus* 1½ and *Mercury* ½; though the ſeveral *Stations* are not always equal. See SATURN, *&c.*

STATOCELE, in Medicine, a Rupture, or Tumour in the Scrotum, conſiſting of a fatty Subſtance reſembling Suet. See HERNIA.

STATUARY, a Branch of Sculpture, employ'd in the making of *Statues*. See STATUE.

Statuary is one of thoſe Arts wherein the Ancients ſurpaſs'd the Moderns: Indeed 'twas much more popular, and more cultivated among the former than the latter. See SCULPTURE.

'Tis diſputed between *Statuary* and *Painting*, which of the two is the moſt difficult and the moſt artful. See PAINTING.

The Invention of *Statuary* was at firſt very coarſe. *Leon Batiſt Alberti*, who has an expreſs Treatiſe on *Statues*, imagines that it took its Riſe from ſomething caſually obſerved in the Productions of Nature, that, with a little Help, might ſeem diſpoſed to repreſent the Figure of ſome Animal. The common Story is, That a Maid, full of the Idea of her Lover, made the firſt Eſſay, by the Aſſiſtance of her Father's Implements, who was a Potter. This at leaſt, is pretty certain, that Earth is the firſt Matter *Statuary* was practiſed upon.

STATUARY is alſo uſed for the Artificer, who makes *Statues*. In this Senſe we ſay, *Phidias* was the greateſt *Statuary* among the Ancients, and *Michael Angelo* among the Moderns.

STATUE, a Piece of Sculpture in full Relievo, repreſenting a human Figure. See FIGURE.

Daviler, more Scientifically defines *Statue* a Repreſentation in high Relievo and Inſulate, of ſome Perſon diſtinguiſh'd by his Birth, Merit or great Actions; placed as an Ornament in a fine Building, or expoſed in a publick Place to preſerve the Memory thereof.

Statues are form'd with the Chiſſel, of ſeveral Matters, as Stone, Marble, Plaiſter, *&c.* See STONE, MARBLE, CHISSEL, *&c.*

They are alſo caſt of various Kinds of Metals, particularly Gold, Silver, Braſs and Lead.

For the Method of caſting STATUES; ſee FOUNDERY *of Statues*.

Dedalus, the Son of *Eupalamus*, who lived not only before the Siege of *Troy*, but even before the Expedition of the *Argonauts*, among many other notable Contrivances aſcribed to him, is ſaid to have been the Inventor of *Statues*. And yet 'tis certain, there were *Statuaries* before him; only he 'twas firſt found how to give them Action and Motion, and to make them appear as if alive. Before him, they made them with the Feet joined together, never intending to expreſs any Action. He firſt looſened the Feet of his, and gave them the Attitudes of People walking and acting.

The *Phœnicians* are ſaid to have been the firſt who erected *Statues* to the Gods.

The *Greeks* ſucceeded in their *Statues* beyond the *Romans*; both the Workmanſhip and the Fancy of the *Roman Statues*, were inferior to the *Grecian*. Indeed we have very few remaining, that have eſcaped the Injuries of Time.

In Strictneſs, the Term *Statue* is only applied to Figures on Foot; the Word being form'd from the *Latin*, *Statura*, the Size of the Body; or from *Stare*, to ſtand.

Statues are uſually diſtinguiſh'd into four Kinds; the Firſt, are thoſe leſs than the Life; of which Kind we have ſeveral *Statues* of Men, of Kings, and Gods themſelves.

The Second, of thoſe equal with the Life; in which Manner it was, that the Ancients, at the publick Expence, uſed to make *Statues* of Perſons eminent for Virtue, Learning, or the Services they had done.

The Third, of thoſe that exceed the Life; among which, thoſe which ſurpaſs'd the Life once and a half, were for Kings and Emperors; and thoſe double the Life, for Heroes.

The Fourth Kind, were of thoſe that exceeded the Life twice or thrice, or even more, and were called *Coloſſus*'s. See COLOSSUS.

Every *Statue* reſembling the Perſon it repreſents, is called *Statua Iconica*.

Greek STATUE, is uſed for a Figure that is Naked and Antique; it being in this Manner the *Greeks* repreſented their Deities, *Athletæ* of the Olympic Games, and Heroes. The Reaſon of this Nudity, whereby the *Greek Statues* are diſtinguiſhed, is, that thoſe who exerciſed Wreſtling, wherein the *Greek* Youth placed their chief Glory, always perform'd naked.

The *Statues* of Heroes were particularly called *Achillean Statues*, by reaſon of the great Number of Figures of that Prince, in moſt of the Cities of *Greece*.

Roman STATUES. This Appellation was given to ſuch as were cloath'd, and which receive various Names from their various Dreſſes. Thoſe of Emperors with long Gowns over their Armour, were called *Statuæ Paludatæ*; thoſe of Captains and Cavaliers, with Coats of Arms, *Thoracatæ*; Thoſe of Soldiers, with Cuiraſſes, *Loricatæ*; thoſe of Senators and Augurs, *Trabeatæ*; thoſe of Magiſtrates with long Robes, *Togatæ*; thoſe of the People with a plain Tunica, *Tunicatæ*; and laſtly, thoſe of Women with long Trains, *Stolatæ*.

The *Romans* had another Diviſion of *Statues*, into *Divine*, which were thoſe conſecrated to the Gods, as *Jupiter*, *Mars*, *Apollo*, *&c.* *Heroes*, which were thoſe of the Demi-Gods, as *Hercules*, *&c.* and *Auguſt*, which were thoſe of the Emperors; as thoſe two of *Cæſar* and *Auguſtus*, under the Portico of the Capitol.

Pedeſtrian STATUE, a *Statue* ſtanding on foot; as that of King *Charles* II. in the *Royal Exchange*, and that of King *James* II. in the *Privy Gardens*.

Equeſtrian STATUE, that repreſenting ſome illuſtrious Perſon on Horſeback; as that famous one of *Marcus Aurelius* at *Rome*, and thoſe of King *Charles* I. and II. at *Charing-Croſs* and in *Stocks-Market*, *London*.

Curule STATUE. Thoſe are thus called, which are repreſented in Chariots drawn by *Bigæ* or *Quadrigæ*, that is, by two or four Horſes; of which Kind there were ſeveral in the *Circus*'s *Hippodromes*, *&c.* or in Cars, as we ſee on triumphal Arches in antique Medals. See CURULE.

Allegorical STATUE, that which, under a human Figure, or other Symbol, repreſents ſomething of another Kind, as a Part of the Earth, a Seaſon, Age, Element, Temperament, Hour, *&c.*

Hydraulick STATUE, any Figure placed as an Ornament to a Fountain or Grotto; or that does the Office of a *Jet d'Eau*, a Cock, Pipe or the like, by any of its Parts, or by an Attribute it holds. The ſame is to be underſtood of any Animal ſerving for the ſame Uſe.

Coloſſal STATUE, *Perſian* STATUE, *Caryatic* STATUE } See { COLOSSUS. PERSIAN *Order*. CARYATIDES.

STATURE, the Size or Height of a Man; from the *Latin*, *Statura*, of *Stare*, to ſtand.

The *Stature*, or Pitch of Man, is found admirably well adapted to the Circumſtances of his Exiſtence. Had Man, obſerves Dr. *Grew*, been a Dwarf; he could ſcarce have been a reaſonable Creature: For, to that End, he muſt have had a Jolt-head; and then he would not have had Body and Blood to ſupply his Brain with Spirits; or if he had had a ſmall proportional Head, there would not have been Brain enough for his Buſineſs. Again, had Man been a Gyant, he could not have been ſo commodiouſly ſupplied with Food: For there would not have been Fleſh enough of the beſt edible Beaſts to ſupply his Turn; or if the Beaſts had been made proportionably bigger, there would not have been Graſs enough, *&c.* See DWARF, GIANT, *&c.*

'Tis a common Opinion, however, and has been ſo, ever ſince *Homer*'s Time, that People in the earlieſt Ages of the World, much ſurpaſs'd the Moderns in *Stature*; and 'tis true, we read of Men, both in ſacred and profane Hiſtory, whoſe Pitch appears ſurprizing; but then 'tis true, they were eſteemed Giants.

The ordinary *Stature* of Men, Mr. *Derham* obſerves, is in all probability the ſame now, as at the beginning; as may be gathered from the Monuments, Mummies, *&c.* ſtill remaining. The oldeſt Monument in the World, is that of *Cheops*, in the firſt Pyramid of *Egypt*, which Mr. *Greaves* obſerves, ſcarce exceeds the Meaſure of our ordinary Coffins. The Cavity, he ſays, is only 6,488 Feet long, 2,218 Feet wide, and 2,160 deep: From which Dimenſions, and thoſe of ſeveral Embalmed Bodies, taken by him in *Egypt*, that accurate Writer concludes, there is no Decay in Nature; but that the Men of this Age are of the ſame *Stature* as thoſe 3000 Years ago.

To these we have other and later Instances to add from *Hakewill*: The Tombs at *Pisa*, which are some Thousands of Years old, are no longer than ours: So is *Athelstan*'s in *Malmsbury* Church; *Sheva*'s in *Paul*'s, of the Year 693, &c.

The like Evidence, we have from the ancient Armour, Shields, Vessels, &c. dug up at this Day, *E. gr.* the Brass Helmet dug up at *Metaurum*, fits one of our Men; yet 'tis allowed to have been left there at the Overthrow of *Asdrubal*. Add, that *Augustus* was Five Foot Nine Inches, which was the Measure of our Queen *Elizabeth*; only the Queen exceeded the Emperor by Two Inches, Allowance being made for the Difference between the *Roman* and our Foot.

STATUS *de Manerio*, in ancient Records, all the Tenants and legal Men within the Lands of a Manor, assembled in their Lord's Court, to do their customary Suit, and enjoy their Rights and Privileges.

STATUTE, in its general Sense, signifies a Law, Ordinance, Decree, &c. See LAW, DECREE, &c.

In our Laws and Customs, *Statute* more immediately signifies an Act of Parliament, made by the Three Estates of the Realm; in which Sense, *Statute* is either general or special, public or private, &c. See PARLIAMENT.

STATUTES, or *Statute Sessions*, called also *Petit Sessions*, are Meetings in every Hundred, to which Constables repair, and others, both Masters and Servants, for deciding Differences between Masters and Servants, rating of Wages, bestowing People in Service who being fit to serve, either refuse to seek or cannot get Masters. See SESSIONS.

STATUTE *Merchant*, is a Bond acknowledged before one of the Clerks of the *Statutes* Merchant and Mayor or chief Warden of the City of *London*, or Two Merchants of the said City for that Purpose assigned, or before the Mayor, chief Warden, or Master of other Cities or Towns, or other sufficient Men for that Purpose appointed; sealed with the Seal of the Debtor and of the King, which is of two Pieces, the greater to be kept by the Mayor, chief Warden, &c. and the lesser by the said Clerks. See BONDS.

STATUTE *Staple*, is so called, either properly or improperly: Properly, it is a Bond of Record, acknowledged before the Mayor of the Staple, in the Presence of the Two Constables of the same Staple; for which Seal, the Fee of every Pound, if the Sum exceed not 100 *l.* is an Half-penny, and if it exceed 100 *l.* a Farthing; by Virtue of which *Statute Staple*, the Creditor may forthwith have Execution of the Body, Lands and Goods of the Debtor.

Improperly, it is a Bond of Record, founded upon the *Statute* 23 *H.* VIII. *c.* 6. of the Nature of a proper *Statute Staple* as to the Force and Execution of it, and acknowledged before one of the chief Justices, and in their Absence, before the Mayor of the *Staple*, and Recorder of *London*.

STAVERS, or STAGGERS, among Farriers, a Giddiness in a Horse's Head, which ends in Madness. 'Tis frequently occasion'd, by turning out a Horse to Grass too soon, e'er well cold; where, by hanging down his Head to feed, ill Vapours and Humours are generated, which oppressing the Brain, are the next Cause of this Disease. Sometimes it comes by over Exercise in hot Weather, which inflames the Blood, &c. and sometimes by noisome Smells in the Stable, excessive Eating, &c. The Signs of it, are Dimness of Sight, Reeling and *Staggering*, watery Eyes, &c. At length, for very Pain, he beats his Head against the Wall, thrusts it into the Litter, rises and lies down with Fury, &c. The Methods of Cure are various; but they all begin with Bleeding.

STAY, in the Sea Language, a big, strong Rope, fasten'd to the Top of one Mast, and the Foot of that next before it, towards the Prow, serving to keep it firm, and prevent its falling backwards.

All Masts, Top-masts and Flag-staves, have their *Stays*; except the Sprit-sail and Top-mast. That of the Main-mast, is called the *Main-stay*. The Main-mast, Fore-mast, and those belonging to them, have also *Back-stays*, to prevent their pitching forwards or over-board; as going on either side her. See BACK-*Stays*.

Hence, to *Stay a Ship*, or *bring her on the Stay*, is to manage her Tackle and Sails, so as that she cannot make any Way forwards, which is done in order to her Tacking about.

STEADY, is a Word of Command at Sea, for the Man at the Helm to keep the Ship *Steady* in her Course, and not to make Angles (or *Yaws* as they call them) in and out. See HELM.

STEATOMA; from στέαρ, Sevum, Suet; is a Swelling, consisting of a Matter much like Suet, soft, without Pain, and without discolouring the Skin; contained in a Cystis; and easily turned out upon Incision.

STEEL, a kind of Iron refined and purified by the Fire, with other Ingredients; which renders it whiter, and its Grain closer and finer. See IRON.

Steel, of all other Metals, is that susceptible of the greatest degree of Hardness, when well temper'd; whence its great Use in the making of Tools and Instruments of all Kinds.

The true Method of making *Steel* has been greatly conceal'd, and the Publick long abused by counterfeit ones.

The following Method we have from *Agricola*; and is affirmed by *Kircher* to be that practised in the Island of *Ilva*; a Place famous in all Ages for the Manufacture of good *Steel*, from the Time of the *Romans*, to Ours.

Heat a Quantity of Iron red-hot, cut it into small Pieces, mix it with a sort of Stone that easily melts. This Mixture put by little and little into a Crucible, first fill'd with Charcoal-dust, and heated red-hot; when melted off, three, four or more Pieces of Iron are to be put into the middle of it; there boil them five or six Hours with a strong Fire. The Workman is to stir the melted Matter often, that the Pieces of Iron may soak in the smaller Particles of the melted Iron; which Particles consume, and thin the grosser ones of the Iron Pieces, and are, as it were, a Ferment to them, and make them tender. One of the Pieces is now taken out of the Fire, and put under the great Hammer, to be drawn out into Bars and wrought; and hot as it is, plunged into cold Water. Thus temper'd, 'tis again worked upon the Anvil; then breaking it, 'tis consider'd, whether in any Part it looks like Iron; or whether it be wholly condensed and turned into *Steel*.

STEEL, in Medicine. See CHALYBEAT.

STEELYARD, in Mechanicks, a kind of Balance, call'd *Statera Romana*, or the *Roman Balance*; by means whereof, the Gravity of different Bodies are found by the Use of one single Weight. See BALANCE.

Construction of the STEELYARD.

It consists of an Iron Beam A B (Tab. Mechanicks, Fig. 35.) wherein a Point is assumed at Pleasure, as C, and on this a Perpendicular raised C D. On the less Arm A C, is hung a Scale or Bason to receive the Bodies weighed: The Weight I is shifted this and that Way on the Beam, till it be a Counter-balance to one, two, three, four, &c. Pounds placed in the Scale; and the Points are noted wherein I weighs as one, two, three, four, &c. Pounds.

From this Construction of the *Steelyard*, the Manner of using it is apparent. But the Instrument being very liable to Deceit, is therefore not to be countenanced in Commerce.

Spring STEELYARD, a kind of portable Balance, serving to weigh any Matter, from about one to forty Pounds.

It is composed of a Brass Tube, into which goes a Rod, and about that is wound a Spring of temper'd Steel in a spiral Form. On this Rod are the Divisions of Pounds and Parts of Pounds, which are made by successively hanging on to a Hook fasten'd to the other End, 1, 2, 3, 4, &c. Pounds. Now the *Spring* being fasten'd by a Screw, to the bottom of the Rod, the greater Weight is hung on the Hook, the more will the *Spring* be contracted, and, consequently, a greater Part of the Rod will come out of the Tube; the Proportions of which greater Weights are indicated by the Figures appearing against the Extremity of the Tube.

STEEPLE, an Appendage, raised on the western End of a Church, to hold the Bells. See CHURCH and BELL.

Steeples are denominated from their Form, either *Spires* or *Towers*.

The first, are such as ascend continually diminishing either Conically or Pyramidically. The latter are mere Parallelipipeds, and are cover'd atop, Plat-form-like. In each Kind, there is usually a sort of Windows or Apertures to let out the Sounds, and so contrived, at the same time, to drive it down.

Masius, in his Treatise of Bells, treats likewise of *Steeples*. The most remarkable in the World, is that at *Pisa*, which leans all on one Side, and appears every Moment ready to fall; yet without any Danger. This odd Disposition, he observes, is not owing to a Shock of an Earthquake, as is generally imagined; but it was contrived so at first by the Architect; as is evident from the Ceilings, Windows, Doors, &c. which are all in the Level.

STEERAGE, the Act of Steering. See STEERING.

The Word is also used for a Place in a Ship before the Bulk-head of the great Cabin, where the Steers-man stands and lodges.

STEERING, in Navigation, the directing of a Vessel from one Place to another, by means of the Helm and Rudder. See HELM and RUDDER.

He is held the best *Steers-man*, who uses the least Motion in putting the Helm over to and again, and that keeps the Ship best from making Yaws; that is, from running in and out.

There are three Methods of *Steering*. 1° By any Mark on the Land, so as to keep the Ship even by it. 2° By the Compass, which is by keeping the Ship's Head on such a Rhumb or Point of the Compass, as best leads to Port. 3° To *Steer* as one is bidden or conn'd; which in a great Ship, is the Duty of him that is taking his Turn at the Helm. See CONDER.

For the Theory and Effect of Steering; *ſee* SAILING.

STEGANOGRAPHY; the Art of *ſecret Writing*; or of writing in Cyphers, known only to the Perſons correſponding. See CYPHER.

One *Æneas Tacticus*, Two thouſand Years ago, as we are told by *Polybius*, had invented 20 different Manners of writing ſo as no Body but thoſe let into the Secret, could underſtand any thing of the Matter.

But now-a-days, hardly any thing can be written by this Art, but what may be Decyphered, and the Meaning diſcovered. And to this Art of Decyphering, that excellent Mathematician, Dr. *Wallis*, hath contributed much.

STEGNOSIS, from στέγω, *conſtipo*, I fix, or harden; is an Obſtruction of the Pores; whence *Stegnoticks* are the ſame as *Aſtringents*. See ASTRINGENT.

STEGNOTICKS, in Medicine, Remedies proper to cloſe and ſtop the Orifices of the Veſſels, when ſtretch'd, lacerated, &c. See STYPTICK.

Such are Pomgranate Leaves, red Roſes, Plantain Leaves, Tormentil Root, &c.

Stegnoticks are proper in the Hæmorrhoids, and other Fluxes of Blood.

The Word is form'd from the *Greek* στέγω, *impedro, conſtipio*, I hinder, cloſe.

STELLATE *Plants*, ſuch as have their Leaves growing on the Stalks, at certain Diſtances, in the Form of a Star with Beams; or ſuch Flowers as are Star-like or full of Eyes, reſembling Stars, in the Thrum or Pendants. See PLANT.

Mr. *Ray* makes this the Tenth Genus of *Engliſh Plants*; of this Kind is Croſs-Wort, Mollugo, wild Madder, Aſperula, or Woodruff, Gallium or Ladies Bed-ſtraw, Aparine or Cleavers, Rubia Tinctorum or Dyers Madder.

To which he adds, as akin to this Genus, the Naſturtium Indicum, *Indian* Creſſe, or yellow Lark-Spur.

STELLIONATE, STELLIONATUS, in the Civil Law, a kind of Crime committed by a fraudulent Bargain, where one of the Parties ſells a thing for what it is not.

As if I ſell an Eſtate for my own, which belongs to another; or convey a thing as free and pure, which is already engaged to another; or put off Copper for Gold, &c.

Cujas ſays, the Word comes from *Stellio*, a very ſubtile kind of Lizzard. We find mention hereof in the *Code, lib. 9. Tit.* 34.

The *Romans* frequently uſed *Stellionatus* to expreſs all Kinds of Crimes that had no proper Names.

STEM, in Botany, that Part of a Plant ariſing out of the Root, and which ſuſtains the Leaves, Flowers and Fruits. See PLANT.

In Trees, the *Stem* is called the *Trunk* or *Stock*; in *Latin*, *Caudex* and *Truncus*. See STOCK, &c.

In Herbs, 'tis ordinarily call'd the *Stalk*; by the *Latins*, *Caulis* and *Scapus*, when ſtreight like a Column.

When ſlender, and creeping on the Ground, as that of Nummulary, ſome Authors call it *Viticulus*.

In the ſeveral Kinds of Corn and Plants of that Kind, 'tis call'd *Culmus*.

The *Stem* of the Plant, according to Dr. *Grew*, is no more than the *Cutis* or Skin which at firſt covers the two Lobes, and the Plume of the Seed, and which is further dilated as the Plant grows. See PLUME, SEED, &c.

STEM *of a Ship*, is that main Piece of Timber which comes bending from the Keel below where it is Scarfed as they call it; that is pieced in, right before the Fore-caſtle. This *Stem* it is, that guides the Rake of the Ship, and all the Butt-ends of the Planks forwards, are fixed into it. This in the Section of a Firſt Rate Ship, is called the *Main Stem*.

STENTOROPHONIC *Tube*, a *ſpeaking Trumpet*; thus call'd from *Stentor*, (a Perſon mentioned in the Fifth Book of the *Iliad*, who could call louder than Fifty Men) and φώνη, *Voice*.

The *Stentorophonic Horn* of *Alexander the Great* is famous; with this he could give Orders to his Army at the Diſtance of 100 *Stadia*; which is above 12 *Engliſh* Miles. See SPEAKING *Trumpet*.

STEP. See PACE and STAIR.

STEP and *Leap*, in the Manage, one of the Seven Airs or artificial Motions of a Horſe; conſiſting, as it were, of three Airs; *viz.* the Pace or *Step* which is *terra a terra*; the raiſing a Curvet; and the whole finiſhed with a *Salt* or *Leap*.

The *Step*, properly, puts a Horſe on the Hand, and gives him a Riſe to Leap; like one that runs e'er he leaps, that he may go the higher.

For Leaps of all kinds, the Rider is not to give any Aids or Helps with his Legs; only to hold him well up with the Bridle-hand when he riſes before, that he may riſe the higher behind: when he begins to riſe behind, he is to put the Bridle-hand a little forwards to hold him before, and ſtay him there on the Hand, as if he hung in the Air; timing the Motion of the Bridle-hand ſo, as to take him like a Ball on the bound; which is the great Secret in Leaping.

STERCORARIANS, or STERCORANISTS, a Name thoſe of the *Romiſh* Church have anciently given to ſuch as held that the Euchariſt was liable to Digeſtion, and all its Conſequences, like other Foods. See SACRAMENT.

The Word is form'd from the *Latin*, *Stercus*, Dung. Card. *Humber* in his Anſwer to *Nicet Pectorat*, treats him as a *Stercoraniſt*, merely for holding, that the Euchariſt breaks the Faſt; which Opinion he imagined led directly into *Stercoraniſm*.

STEREOBATA, in the ancient Architecture, the Baſis or Foundation whereon a Wall or other Building is rais'd. See BASE.

This anſwers pretty well to the *continued Socle* or Baſement of the Moderns: Some confound it with the ancient *Stylobata*, or Pedeſtal; but in effect, the *Stereobata* is that to the *Stylobata*, which the *Stylobata* is to the *Spira* or Baſe. See STYLOBATA.

The Word is form'd from the *Greek*, στερεοβάτης, ſolid Prop.

STEREOGRAPHIC *Projection of the Sphere*, is that wherein the Eye is ſuppoſed to be placed, in the Surface of the Sphere. See PROJECTION *of the Sphere*.

The Method and Practice of this Projection, in all the principal Caſes, *viz.* on the Planes of the Meridian, Equinoctial and Horizon, is as follows;

1° *Stereographic Projection on the Plane of the Meridian.*

Let ZQNE (Fig. 23.) be the Meridian, Z and N the Poles, as alſo the Zenith and Nadir; E Q the Equinoctial and Horizon; Z N the equinoctial Colure, and prime vertical Circle: Z 15 N, Z 30 N, Z 45 N, &c. are Hour-circles or Meridians, and alſo Azimuths, becauſe the Pole is in the Zenith; and to deſcribe theſe Circles, find the Points, 15, 30, 45, 60, &c. in the Equinoctial, by ſetting the Half-tangent of their Diſtance from ♈; and then their Centres are found by ſetting their Co-ſecants, both ways, from their Points of Interſection with the Equator; ♋, ♋, and ♑, ♑, are the Northern and Southern Tropics, which are deſcribed by ſetting the Half-tangent of 23 Degrees 30 Minutes from ♈ each Way; then the Tangent of its Complement, *viz.* 66 Degrees 30 Minutes, each way from thence on the Colure produced, gives their Centres; by this Method, all Parallels of Declinations may be drawn. Or you might have ſet the Co-ſecant of the Parallel from the Centre of the Primitive, which would alſo have found the ſame Point for the Centre of the Parallel, whoſe Radius is equal to the Tangent of its Diſtance from its Pole. Theſe Parallels in this Projection, are alſo Almicanters, or Parallels of Altitude; ♋, ♑ is the Ecliptick, which muſt be divided from the Diviſion on the Scale of Half-tangents; but denominated according to the Signs of the Zodiac, reckoning 30 Degrees to each Sign.

2° *Stereographic Projection on the Plane of the Equinoctial.*

Let S C (Fig. 24.) be the Meridian, and ſolſtitial Colure; E N the equinoctial Colure, and Hour-circle of 6; P the North Pole; ♋ ♋, the Northern Tropick; E ♋ N the Northern Half of the Ecliptick (whoſe Centre is found, by ſetting off the Secant of 23 Degrees 30 Minutes from ♋) and its Pole is at *a* the Interſection of the Polar Circle and Meridian, being the Place through which all Circles of Longitude muſt paſs; and E Z N the Horizon of *London*, which is deſcribed thus: Set the Half-tangent of the Co-latitude, from P to Z; then the Tangent of the ſame, ſet from P to O, or its Secant from Z to O, gives its Centre; and its Pole will be at *h* 38 Degrees 30 Minutes, (in the Half-tangents) diſtant from F, where *h* is at the Zenith. To draw any other Circles in this Projection; 1. For Circles of Longitude, which muſt all paſs through *a*, and the ſeveral Degrees of the Ecliptick; ſet the Tangent of 66 Degrees, 30 Minutes, from *a* downwards, on the Meridian produced; which will find a Point, through which a Perpendicular, drawn to the Meridian, ſhall contain in it the Centres of all the Circles of Longitude, whoſe Diſtances ſet off to the Radius P *x*, ſhall be the Tangents of the Degrees of their Diſtances from the Meridian, S P C (which is that belonging to 180 Degrees. 2. All Parallels of Declination are drawn by ſetting the Half-tangents of their Diſtances from P. 3. All Azimuths, or Vertical Circles muſt paſs through *h d*, the Zenith: Since, therefore, the Zenith is 38 Degrees 30 Minutes diſtant from P, ſet the Co-ſecant of that (or the Secant of 51 Degrees 30 Minutes) from *h* on the Meridian extended below, and that ſhall find the Point *x*, the Centre of the Azimuth of Eaſt and Weſt, *viz.* E *h* N; and the Centres of all the reſt are in a Line that is perpendicular to the Meridian, and drawn through *x*. 4. Circles of Altitude or Almicanters, are leſſer Circles, whoſe Poles are not in the Plane of the Projection; thus the Circle O *e*, is a Parallel of Altitude 50 Degrees above the Horizon. 5. All Hour-circles are ſtrait Lines from the Centre to the Limb.

3° *Stereographick Projection on the Plane of the Horizon.*

Firſt draw a Circle repreſenting the Horizon, and quarter it with two Diameters; then will ♑ be the Zenith of the Place,

12 z 12 the Meridian; 6 z 6 the prime Vertical, or Azimuth of East and West; (Fig. 25.) make z P = Half-tangent of 38° 30′ (or Tangent of 19° 15′) P shall be the Pole of the World. Make Z E = Half-tangent of 51° 30′ (or Tangent of 25° 45′) and E o = Secant, z o = Tangent } of 38 Degrees 30 Minutes; then shall o be the Centre of the Equinoctial 6 E 6. In this Projection Almicanters, are all parallel to the primitive Circle: And Azimuths are all right Lines passing through z the Centre of the Primitive, to the equal Divisions in the Limb. Parallels of Declination are all lesser Circles, and parallel to the Equinoctial, and their Intersections with the Meridian are found, by setting the Half-tangent of their Distance from the Zenith, Southward or Northward, or both Ways from z. Their Centres are found, by bissecting the Distance between those two Points; for the Middle shall be the Centre of the Parallel. Thus z ♋ = Half-tangent of 20° 00′ = Distance of the Tropick of ♋ from the Zenith - - - - - - - - - } to the Southward, And ♈ = Half-tangent of 75° = Distance of the Tropick of ♈ from the Zenith - - - - - - - - } or downward from z, and the Intersection again with the North of the Meridian, is at 105° 30′, 152° 30′ } for { ♈ ♈ } to the Northwards or upward from z. For the Hour-circles make z c = Tangent of 51° 30′, or P C equal Secant of 51° 30′, draw G C T perpendicular to the produced Meridian: Then, if from c with the Radius z c, you set off the Tangents of 15° 30° 45°, &c. both ways, you will have the Centres of the several Hour-circles, 7 and 5, 8 and 4, &c. *Note*, In all *Stereographick Projections*, all Diameters are measured on the Scale of Half-tangents; and this is the Ground of all Dialling, or the true Projection of the Hour-Circles of the Sphere on any given Plane. See Spherick *Geometry*, Dialling, &c.

STEREOGRAPHY, the Art of drawing the Forms of Solids upon a Plane. See Solid.

The Word is form'd from the *Greek*, στερεὸς, Solid, and γράφω, I describe.

STEREOMETRY, that Part of Geometry, which teaches how to measure Solid Bodies, *i. e.* to find the Solidity or solid Content of Bodies; as Globes, Cylinders, Cubes, Vessels, Ships, &c. See Solid and Solidity.

The Methods hereof, see under the respective Bodies, as Globe, Sphere, Cylinder, &c.

The Word is form'd from the *Greek*, στερεὸς, *Solid*, and μέτρον, *Measure*. See Cubature.

STEREOTOMY, the Art or Science of cutting Solids, or making Sections thereof; as in Profiles of Architecture, in Walls and other Solids to be cut. See Section.

The Word is form'd from στερεὸς, and τομὴ, Section.

STERILITY, the Quality of something *Barren*; in opposition to *Fecundity* See Barrenness and Fecundity.

Sterility was held a grievous Affliction by the Wives of the ancient Patriarchs. Nature has annex'd *Sterility* to all monstrous Productions, that the Creation might not degenerate. Hence the *Sterility* of Mules, &c. See Monster, Mule, &c.

The *Sterility* of Mercury, says the Alchymists, resembles that of Women who are too cold and moist; and who, by being purged and heated, wou'd be raised from their *Sterility*, as Mercury is when purged according to the Rules of Art.

The Word is form'd from the *Latin Sterilitas*, of *Sterilis*, Barren.

STERLING, a Term frequent in the *English* Commerce. A Pound, Shilling, or Penny *Sterling*, signifies as much as a Pound, Shilling or Penny of lawful Money of *England*, as settled by public Authority. See Pound, Shilling, &c.

Our Antiquaries and Criticks are greatly divided, as to the Origin of the Word *Sterling*. *Buchanan* fetches it from the Castle of *Striveling* or *Sterling* in *Scotland*, where a small Coin was anciently struck, that in time came to give Name to all the rest.

Cambden and *Spelman* derive the Word from *Easterling*; observing, That in the Reign of King *Richard* I. Money coin'd in the East Parts of *Germany*, began to be of especial Request in *England*, by reason of the Purity thereof, and was called *Easterling Money*; as all the Inhabitants of those Parts were called *Easterlings*; some of whom, skill'd in Coinage, were soon after sent for over to perfect the *English* Money, which was thenceforwards denominated from them, *Sterling* for *Easterling*; not, says *Cambden* from *Striveling* in *Scotland*, nor from a Star which some dream to have been coined thereon; for in old Deeds, the *English Species* are always call'd *Nummi Easterlingi*, which implied as much as good and lawful Money, &c.

Somner, again, derives the Word from the *Saxon*, *Steore*, a Rule or Standard; intimating, that this, as to Weight and Fineness, was to be the common Standard of all current Money.

In *Stow*, and some other of our ancient Writers, *Easterling* is used for a certain Coin, amounting nearly to our Silver-penny; and on some Occasions we find the same Word *Sterling* used in the general for any Piece of Money; it being observable, that, for a good while together, there was no other Coin but *Pennies*, with which *Sterlings* or *Esterlings* were become synonymous: Much as among the Ancients, the Words *Denarius* and *Nummus* were used. See Penny, Denarius, Nummus, &c.

STERN *of a Ship*, is all the hindermost Part of her, generally speaking; but properly, it is only the outmost Part of her, abaft. See Ship, Abaft, &c.

Stern, among Hunters, is the Tail of a Grey-hound or a Wolf.

STERNOHYOIDEUS, in Anatomy, a Pair of Muscles arising from the upper and internal Part of the Bone of the Sternum, and part of the Clavicle, and adjoining Part of the first Rib, with a broad Origin; and which running from the Aspera Arteria, Glandulæ Thyroideæ, and Cartilago Scutiformis, terminates in the Base of the Os Hyoides. It draws the Bone straight upwards.

STERNOTHYROIDES, in Anatomy, a Pair of Muscles of the Larynx; arising in the Sternum, or Breast Bone, and terminating in the Cartilago Thyroides. They serve to draw down that Cartilage.

STERNUM, *Breast-bone*, in Anatomy, a Bone that makes the Fore-part of the Breast, and is situated in the middle of the Ribs. See Bone.

In Adults, it consists of one single Piece; but in Infants, of several, according to the Diversity of Age. *Kerkringius* tells us, he has never seen more than Six. They continue Cartilaginous 'till Seven Years of Age; and are not very Solid afterwards, but Spongeous.

At the lower Extremity of the *Sternum*, is a Cartilage, called *Xiphoides* or *Ensiformis*, because resembling the Point of a Sword. See Xiphoides, &c.

The Use of the *Sternum* is to defend the Heart, and to receive the Extremities of the true Ribs. See Rib.

The Word is form'd from the *Latin*, *Sterno*; the Breast being, as it were, couch'd upon it.

STERNUTATIVE, or STERNUTATORY, a Medicine proper to occasion *Sternutation*, or Sneezing.

Sternutatories are of two Kinds, gentle and violent: Of the first Kind, are Betony, Sage, Marjoram, Tobacco, &c.

Of the latter, are Euphorbium, white Hellibore, Pellitory, &c.

Sternutatories have their Effect by their sharp, pungent Parts vellicating the inner Membrane of the Nose, which is exceedingly sensible, and occasioning the Serous Matter contained in the Glands of the Nose, and in several Sinus's situate in the Base of the Cranium, and the Os Frontis, to be expell'd. See Nose.

STEW, a kind of small Fish-pond, the peculiar Service whereof is, to maintain Fish, and keep them in Readiness, for the daily Uses of a Family, &c. See Fish.

The Fish bred in the large Ponds, are drawn and put in here. For two large Ponds of three or four Acres apiece, 'tis advisable to have four *Stews*, each two Rods wide, and three long. The *Stews* are usually in Gardens, or at least near the House, to be more handy, and the better look'd to.

The Method of making them, is to carry the Bottom in a continual Decline from one End, with a Mouth to favour the drawing with a Net. See Pond.

Stews or *Stues*, are Places anciently permitted in *England*, to Women of profess'd Incontinency, for the Proffer of their Bodies to all Comers.

These were under particular Rules, and Laws of Discipline appointed by the Lord of the Manor.

The Word is probably borrowed from the *French*, *Estuves*, hot Baths, in regard Wantons are wont to prepare themselves for venereal Acts, by Bathing; and that this is not new, *Homer* shews in the Eighth Book of his *Odyssey*.

STEWARD, or *Seneschal*, an Officer, whereof there are various Kinds; thus call'd from the *Steda*, Stead, Place or Room, and *Weard*, Ward, or Keeper, *q. d.* a Lieutenant; or Person appointed in Place of another.

Lord High Steward *of England*, is the first and highest Officer of the Crown; as having the Power of what We call a *Vice Roy*, the *Danes*, &c. *Stadtholder*, and the *Swedes*, *Reichs drosset*, *q. d. Vice Rex*.

The common Lawyers call him *Magnus Angliæ Seneschallus*. His Office, as express'd in an ancient Record, was to supervise and regulate the whole Kingdom, both in Time of Peace and War, immediately under the King and after him; an Authority so very great, that it was not judged safe, to trust it any longer in the Hands of any Subject.

The Office was Hereditary and Permanent, till the Time of *Henry* IV. since whom it has only been made *Pro hac vice*, occasionally; as to officiate at a Coronation; at the Arraignment and Trial of some Nobleman for Treason, or other great Crime. During his *Stewardship*, he bears a white Staff

in

in his Hand; and the Trial, &c. ended, he breaks his Staff, and with it, his Commiſſion expires.

Lord STEWARD *of the Houſhold*, is an Officer to whom the State of the King's Houſe is committed; to be ruled and guided at his Diſcretion. He has Authority over all Officers and Servants of the King's Houſe, except thoſe of the Chapel, Chamber and Stable; which are under the Lord Chamberlain, Maſter of the Horſe, and Dean of the Chapel. See CHAMBERLAIN, &c.

The *Lord Steward*, by Virtue of his Office, judges of all Enormities, as Treaſons, Murders, Felons, Bloodſheds, &c. committed in the Court, or within the Verge thereof; which is Ten Miles all around the chief Tunnel of the Court (*London*, only, by Charter, exempted).

The ſame Officer miniſters the Oath to the Members of the Houſe of Commons, at the beginning of each Parliament; and at the end of the Parliament, adjuſts the parliamentary Expences.

The Badge of his Commiſſion is a white Staff, which he bears in the King's Preſence; but which at other Times is carried by a Footman bare-headed.

STEWARD *of a Ship*, is he who receives all the Victuals from the Purſer; and is to ſee it well ſtowed in the Hold: all Things of that Nature belonging to the Ship's Uſe, are in his Cuſtody: He looks after the Bread, and diſtributes out the ſeveral Meſſes of Victuals in the Ship. He hath an Appartment for himſelf in the Hold, which is called the *Steward's Room*.

STIGMATA, in Antiquity, certain Marks impreſs'd on the Left Shoulder of the Soldiers, when liſted.

STIGMATA were alſo a kind of Notes or Abbreviations, conſiſting only of Points diſpoſed various Ways, as in Triangles, Squares, Croſſes, &c.

STIGMATA, is alſo a Term introduced by the *Franciſcans*, to expreſs the Marks or Prints of our Saviour's Wounds, impreſs'd by him on the Body of their Seraphic Father, St. *Francis*. See FRANCISCAN.

'Twas one Morning, about the Feaſt of the Exaltation, in the Year 1224, that St. *Francis*, being at Prayers on Mount *Alvernus*, whither he had retired to paſs the *Michaelmas Lent*; ſaw a Seraph with Six burning Wings, in other reſpects like a Man; with his Hands and his Feet ſtretch'd upon a Croſs. With two of the Wings he covered his Body, two were raiſed over his Head, and with two he flew ſwiftly down. Five Rays proceeded from the Five Wounds of the Perſon crucified, and were directed to the ſame Five Parts of the Body of the Saint.

Upon the Viſion's diſappearing, he ſaw the Marks of the Nails, &c. on his Hands and Feet; the ſame as he had ſeen them in the Image of the Crucifix. His Hands and Feet were found pierced with Nails in the Middle; the Heads of the Nails were plainly ſeen within the Fleſh on one Side, and the Points clench'd on the other. On his right Side, appeared a red Scar, as from a Wound of a Spear, which frequently run with Blood, that ſtain'd his Gown, &c.

The good Man, we are told, took a World of Pains to hide the *Stigmata*; but thoſe of his Hands and Feet were ſeen in his Life-time, maugre all his Endeavours, by ſeveral of the Brotherhood, who affirmed it upon Oath, and by ſome Cardinals, ſays St. *Bonaventure*, who atteſted the Miracle both by Word and Writing, and expreſs'd it in the Hymns, Anthems, &c. compoſed in Honour of St. *Francis*.

After his Death, they were ſeen by Fifty of his Religious, as well as by St. *Clara* and her Nuns, and an infinite Number of Seculars; many of whom felt them with their Hands, to be the more certain.

A ſolemn Feaſt was hereupon appointed to be annually celebrated, in Memory of the Miracle, called *The Feaſt of the* Stigmata *of St.* Francis; and a peculiar Maſs or Office compoſed for the ſame.

An Archiconfraternity was erected on the ſame Occaſion, by *Frid. Pizzi*, a *Roman* Chirurgeon in the Year 1594.

STIGMATA, in Natural Hiſtory, are Points, or Specks uſually ſeen on the Sides of the Bellies of Inſects; particularly the Sphondilium, where they are very apparent.

They are nothing but the Extremities of certain Veſſels faſten'd to the Sides in each Knot, and ſerving them for Lungs.

STIBIUM, an ancient Name for Antimony, now ſeldom uſed. See ANTIMONY.

STILE and *Stilus*. See STYLE.

STILES, in Carpentry, &c. are the upright Pieces, which go from the bottom to the top in any Wainſcot.

STILLATITIOUS *Oils*; are ſuch as are procured by Diſtillation, in oppoſition to thoſe got by Infuſion, Expreſſion, &c. See OIL and DISTILLATION.

STILLYARD, in Commerce. The *Company of the* STILLYARD was a Community, or Corporation of foreign Merchants, eſtabliſh'd at *London*; thus call'd, from the Place where they had their Reſidence, called the *Still-yard*, near the Bridge, which was aſſigned them by Act of Parliament; and which, in ſome Records, is called *Guilhalda Teutonicorum*; being, as ſome write, a broad Place or *Yard* where much *Steel* had uſed to have been ſold.

This Company was created in the Year 1215, under *Henry* III. in favour of the free Cities of *Germany*, who had been aſſiſtant to him in his Wars againſt *France*. See COMMERCE.

It had render'd itſelf Miſtreſs of all the *Engliſh* Manufactures, particularly thoſe of Cloth; which it was allowed not only to ſell throughout the Kingdom, but alſo to tranſport Abroad. The Prejudice theſe Privileges did, by which they frequently abuſed the Nation, occaſioned the Company's being broke, by Sentence of the Judges, under *Edward* IV. But it redeem'd its Rights, and laſted to the Year 1552, when it was ſuppreſs'd by *Edward* VI. See HANSE.

STIMULATING, a Property in angular or ſharp Bodies, whereby they cauſe Vibrations and Inflections of the Fibres of the Nerves, and a greater Derivation of nervous Fluid into the Part affected.

Stimulants produce Pain, Heat, Redneſs, &c. They may be reduced to violent penetrating *Depilatories*; gentle *Sinapiſms*, *Veſicatories* and *Cauſticks*. See SINAPISM, VESICATORY, &c.

STING, an Apparatus in the Body of certain Inſects, in manner of a little Spear; ſerving them as a Weapon of Offence.

The *Sting* of a Bee or Waſp, is a curious Piece of Mechaniſm: It conſiſts of an hollow Tube, at the Root whereof, is a Bag full of ſharp, penetrating Juice, which in *Stinging*, is injected into the Fleſh through the Tube.

Within the Tube, Mr. *Derham* has obſerved, there lie two ſmall ſharp-bearded Spears: In the *Sting* of a Waſp, he told Eight Beards on the Side of each Spear, ſomewhat like the Beards of Fiſh-hooks.

One of theſe Spears in the *Sting* or Sheath, lies with its Point a little before the other; to be ready, as ſhou'd ſeem, to be firſt darted into the Fleſh: which once fix'd, by means of its foremoſt Beard, the other then ſtrikes in too; and ſo they alternately pierce deeper and deeper, their Beards taking more and more hold in the Fleſh; after which, the Sheath or *Sting* follows, to convey the Poiſon into the Wound; which, that it may pierce the better, is drawn into a Point, with a ſmall Slit below that Point, for the two Spears to come out at.

By means of theſe Beards it is, that the Animal is forced to leave its *Sting* behind it, when diſturb'd, e'er it can have Time to withdraw the Spears into their Scabbard.

STINK or STENCH, a diſagreeable Smell exhaling from a corrupted or other Body; and which is prejudicial to the Noſe and Brain. See SMELL.

A *ſtinking* Breath, is uſually the Reſult either of diſeaſed Lungs, or of ſcorbutick Gums, &c.

A *ſtinking* Noſe, *Fœtor Naris*, is the Reſult of a deep Ulcer within the Noſe, whence ariſe fetid Scabs, &c. Its Cauſe, according to *Galen*, is a ſharp, putrid Humour falling from the Brain, or the *Proceſſus Mamillares*.

A *ſtinking* Noſe is reckoned by the Civilians, one of the legal Cauſes of annulling Marriage.

STIPEND, *Stipendium*, among the *Romans*, ſignified the ſame with *Tribute*; and hence *Stipendiarii* were the ſame with *Tributarii*. See TRIBUTE.

STIPULATION, in the Civil Law, the Act of *Stipulating*; that is, of treating and concluding of Clauſes and Conditions to be inſerted in a Contract. See TREATY and CONTRACT.

Stipulations were anciently performed at *Rome*, with abundance of Ceremonies; the firſt whereof was, that one Party ſhould interrogate, and the other anſwer, to give his Conſent and oblige himſelf.

By the ancient *Roman* Law, no Body could *Stipulate*, but for himſelf; but as the *Tabelliones* were publick Servants, they were allowed to *Stipulate* for their Maſters; and the Notaries ſucceeding the *Tabelliones*, have inherited the ſame Privilege.

The Word is form'd from the *Latin*, *Stipula*, a Straw; becauſe in making a Sale, a Straw was given the Purchaſer, in ſign of a real Delivery.

Which Cuſtom is ſtill retain'd in ſome Parts of *France*, particularly at *Verdun*: The Cuſtom always has been on this Occaſion, for the two Parties to break a Straw between them, and each take his Moiety; which they afterwards join'd again, to recognize their Promiſe.

The *Stipulation* had its Origin in the *Lex Aquilia*, and another Law of the Emperor *Arcadius*.

STIRROP, a Reſt or Support for the Horſe-man's Foot; ſerving to keep him firm in his Seat, and enable him to mount. See SADDLE.

The great Art of a Cavalier in a Tournament, was to make his Antagoniſt loſe his *Stirrop*.

For Combating, 'tis a Rule to have the Right Foot *Stirrop* ſomewhat ſhorter than the other.

Mattkiolus obſerves, that the *Turks* have a knack of poiſoning their *Stirrops*, with ſo ſubtile and penetrating a Poiſon, that it makes its Way through the Boots, and kills the Rider. F. *le Compte* tells us, that the *Tartars* ride croſs-leg'd, and with their *Stirrops* exceedingly ſhort.

Stirrops are allowed a modern Invention. *Menage* obſerves, that St. *Jerom* is the firſt Author who mentions them.

STOCK, in Gardening, *&c.* the Stem or Trunk of a Tree. See STEM.

For *Stocks of Fruit-trees*; the beſt to *Graft* on; are thoſe rais'd of Kernels of Wildings and Crabs of the moſt thriving Trees.

Though the Fruit always take after the Graft; yet the *Stock* has ſome Influence. A wild *Stock* is always found to enliven a dull Apple. See ENGRAFTING.

To have a Quantity of *Stocks* to graft on; old Trees are to be cut down within two Inches of the Ground, which will cauſe a multitude of Suckers to riſe from the Roots. When theſe are riſen Half a Yard, they are to be covered up with good Earth a Foot thick, and aſſoon as they have put forth Roots, in Winter are to be conveyed into the Nurſery, where, in a Year or two, they will be ready to Graft. *Cherry Stocks*, *Plumb Stocks* and *Pear Stocks* may be thus raiſed from Suckers, as well as Stones or Seeds; but thoſe raiſed this latter way are prefer'd. See FRUIT-*Tree*, *&c.*

STOCK-FISH or STOCKFISCH, in Commerce, a kind of dried, ſalted Fiſh; of a greyiſh Aſh-colour, only the Belly ſomewhat whiter. See FISH.

The Commerce of *Stock-fiſh* is very conſiderable in *Holland*, both from the great Conſumption thereof in the Country, and from their Victualling their Veſſels therewith. 'Tis ſaid to take its Name, from being as hard as a *Stock*, or from its needing to be beaten with a Stick, to fit it for Eating. See FISHERY.

STOCKING, that Part of the Cloathing of the Leg and Foot, which immediately covers their Nudity, and ſkreens them from the Rigor of the Cold. Anciently, the only *Stockings* in Uſe, were made of Cloth or mill'd Stuffs ſew'd together; but ſince the Invention of knitting and weaving *Stockings* of Silk, Wooll, Cotton, Thread, *&c.* the Uſe of *cloth Stockings*, is quite out of Doors.

The modern *Stockings*, whether wove or knit, are a kind of Tiſſues form'd of an infinite Number of little Knots, call'd *Stitches*, *Loops* or *Maſhes*, intermingled in one another.

Knit STOCKINGS are wrought with Needles made of poliſh'd Iron or Braſs Wire, which interweave the Threads, and form the Maſhes the *Stocking* conſiſts of. This Operation is call'd *Knitting*; the Invention whereof it were difficult to fix preciſely; though its commonly attributed to the *Scotch*, on this ground, that the firſt Works of this Kind came from thence. 'Tis added, that it was on this Account, that the Company of *Stocking-knitters* eſtabliſh'd at *Paris* in 1527, took for their Patron St. *Fiacre*; who is ſaid to have been the Son of a King of *Scotland*.

Wove STOCKINGS, are ordinarily very fine: They are manufactured on a Frame Machine made of poliſh'd Iron; the Structure whereof is exceedingly ingenious, but withal exceedingly complex, ſo that 'twere very difficult to deſcribe it well, by reaſon of the Diverſity and Number of its Parts; nor is it even conceived, without a deal of Difficulty, when working before the Face.

The *Engliſh* and *French* have greatly conteſted the Honour of the Invention of the *Stocking-loom*; but the Matter of Fact, waving all national Prejudices, ſeems to be this; That 'twas a *Frenchman* firſt invented this uſeful and ſurprizing Machine; who, finding ſome Difficulties in procuring an excluſive Privilege, which he required, to ſettle himſelf at *Paris*, went over into *England*, where his Machine was admired, and the Workman rewarded according to his Merit.

The Invention thus imparted to the *Engliſh*; they became ſo jealous hereof, that for a long Time it was forbid, under Pain of Death, to carry any of the Machines out of the Iſland, or communicate a Model thereof to Foreigners. But as 'twas a *Frenchman* firſt inrich'd our Nation with it, ſo a *Frenchman* firſt carried it Abroad; and by an extraordinary Effort of Memory and Imagination, made a Loom at *Paris*, on the Idea he had form'd thereof, in a Voyage he made to *England*. This Loom firſt ſet up in the Year 1656, has ſerved for the Model of all thoſe ſince made in *France*, *Holland*, *&c.*

STOCKS, in Ship-Carpentry, a Frame of Timber, and great Poſts, made aſhore, to build Pinnaces, Ketches, Boats and ſuch ſmall Craft, and ſometimes ſmall Frigates upon. See SHIP and VESSEL.

Hence we ſay, a Ship is on the *Stocks*, when ſhe is a building.

STOICISM, the Doctrines and Opinions of *Zeno*'s Followers, call'd *Stoicks*. See STOICKS.

STOICKS, a Sect of ancient Philoſophers, the Followers of *Zeno*; thus call'd from the *Greek*, στοα, *Portico*, in regard *Zeno* uſed to teach under a Portico or Piazza. See PHILOSOPHY.

The Author of this Sect, *Zeno*, was of *Cittium*, a Town in *Cyprus*, inhabited by a Colony of *Phœnicians*; whence he is ſuppoſed to have borrowed many of his Dogmata from the *Phœnician* Philoſophy, which many learned Men have ſhewn was, itſelf, borrowed from the *Jewiſh* or *Moſaic* Philoſophy; though it muſt be allowed, there appear as many Things in the *Stoick* Philoſophy, borrowed from *Plato*'s and *Socrates*'s School, as from that of *Moſes*.

Zeno making a trading Voyage from *Cittium* to *Athens*, richly loaden with *Tyrian* Purple, was Shipwreck'd not far from Port; upon which, we are told, conſulting the Oracle how he ſhou'd beſt ſpend the reſt of his Life, he was anſwer'd, εἰ ζυγχρωτιζοιτο τοῖς νεκροις, By becoming of like Colour with the Dead; upon which he applied himſelf to the Study of the ancient Philoſophers; became a Hearer of *Crates* the *Cynic*; but *Laertius* tells us, he had too much natural Modeſty to give in to the *Cynic* Impudence.

From *Crates*, he had recourſe to *Xenocrates*, then to *Polemon*; and at length began to think of inſtituting a new Sect.

To this Purpoſe, a στοὰ, *Portico*, call'd from the Pictures of *Polignotus* therein, the *painted Portico*, was pitch'd on. Here uſing to walk and philoſophize; he was ſoon attended by a great Number of Diſciples, hence call'd Στωϊκοὶ, *Stoici*.

He became exceedingly reverenc'd at *Athens*, for the Probity and Severity of his Life and Manners, and the Conſiſtency thereof with his Doctrine; inſomuch that the *Athenians* decreed him, when living, a golden Crown, and uſed in dubious Times to depoſite the Keys of the City with him; and after his Death, conſecrated an Altar to him.

One of his chief Followers was *Cleanthes*, who was ſucceeded by *Chryſippus*, and he by *Diogenes Babylonius*, *Antipater*, *Panætius* and *Poſſidonius*, among the *Greeks*; and by *Cato*, *Varro*, *Cicero*, *Seneca*, the Emperor *Antoninus*, *&c.* among the *Romans*; and by *Pantænus*, and *Clemens Alexandrinus*, among the Chriſtians.

The *Stoicks* cultivated Logicks, Phyſicks, Metaphyſicks, *&c.* but principally Ethicks. The principal of their Dogmata of the former Kinds, are as follows.

That there are certain καταλήψεις, Comprehenſions; which others call κοιναὶ ἐννοίαι, common Notices or innate Ideas or Principles; and *Cicero*, *Inchoatæ Intelligentiæ*, Beginnings of Underſtanding; naturally found in the Mind: That God is the ſeminal Cauſe of the Univerſe: That the World is an Animal; which Opinion the *Stoicks* maintain'd in common with the *Platoniſts*, by reaſon of God's inhabiting and informing every Part thereof, in quality of an *Animi Mundi*. See ANIMA. That Nature is an artificial Fire, tending to Generation: And, that the World is to be deſtroy'd at laſt by a Conflagration.

For the Morality of the *Stoicks*; 'twas couch'd much in Paradoxes: as, That a wiſe Man is void of all Paſſion or Perturbation of Mind: That Pain is no real Evil; but that a wiſe Man is happy in the midſt of the ſevereſt Torture: That a wiſe Man is always the ſame, and always joyful; That none but a wiſe Man is free; all others are Servants; That none but a wiſe Man is Rich; That none but a wiſe Man ought to be eſteem'd a King, Magiſtrate, Poet or Philoſopher; That all wiſe Men are great; That all Things are a wiſe Man's, who is contented with himſelf; That wiſe Men are the only Friends, and the only Lovers; That nothing ever happens to a wiſe Man beyond Expectation; That all Virtues are inſenſibly connected together; That all good Things are equal, and equally to be deſired; and that Goodneſs admits of no Increaſe or Diminution. Whether Virtue might be loſt or no, was hotly diſputed among them; *Chryſippus* held it might, by Drunkenneſs and Atrabilis; *Cleanthes*, that it could not, by reaſon of the firm καταλήψεις, Comprehenſions.

They own'd but one God; whom, however, they call'd by various Names, as *Mind*, *Fate*, *Jupiter*, *&c.* by which they did not mean various Things; but various Powers and Relations of the ſame Things. Providence, they expreſs'd under the Name of *Fate*, which *Chryſippus* defines to be a natural Series or Compoſition of Things mutually following each other by an immutable Nexus or Tie fix'd from all Eternity. Laſtly, they held, That the human Soul ſurvived after Death. See FATE, *&c.*

STOLE, STOLA, a ſacerdotal Ornament, wore by the *Romiſh* Pariſh Prieſts over the Surplice, as a Mark of Superiority in their reſpective Churches; and by other Prieſts over the Alb, at celebrating of Maſs; in which Caſe, it goes acroſs the Stomach; and by Deacons over the Left Shoulder, Scarf-wiſe. When the Prieſt reads the Goſpel for any one, he lays the Bottom of his *Stole* on his Head.

The *Stola* is a broad Swath or Slip of Stuff, hanging from the Neck to the Feet, with Three Croſſes thereon.

The Biſhops anciently pretended, that the Pariſh Prieſts were never to appear before them, but in their *Stoles*. In *Flanders*

Flanders and *Italy*, they always preach in *Stoles*. 'Tis ſuppoſed to be a Repreſentation of the Extremities of the long Robe wore by the ancient High Prieſts. The Word is *Greek*, στολὴ, ſignifying a long Robe or Veſtment.

The *Stola* of the ancient *Romans*, *&c.* was very different from that now in Uſe; that being a kind of Robe fitter for Women than Men; tho' 'twas held a Robe of Honour among all Nations. Kings themſelves ſometimes uſed it, and ſometimes beſtowed it as a Reward of Virtue.

Groom of the STOLE, the eldeſt Gentleman of his Majeſty's Bed-chamber; whoſe Office and Honour it is, to preſent and put on his Majeſty's firſt Garment or Shirt every Morning; and to order the Things in the Chamber. See BED-*Chamber*.

Order of the STOLE, an Order of Knights inſtituted by the Kings of *Arragon*; though as to the particular Author, or Time of the Inſtitution, we are in the Dark. The firſt Time we hear of it, is under *Alphonſus* V. who mounted the Throne in 1416. *Juſtiniani* takes it to have been inſtituted about the Year 1332.

Order of the Golden STOLE, a military Order at *Venice*; thus called from a golden *Stole* which the Knights wear over the Left Shoulder, reaching to the Knee, both before and behind, a Palm and a Half broad. None are raiſed to this Order but the *Patricians* or noble *Venetians*. *Juſtiniani* obſerves, That the Time of the Inſtitution of this Order is unknown.

STOMACH, *Ventricle*, in Anatomy, *&c.* a hollow, membranous Organ, deſtined to receive the Food, and convert it into Chyle. See FOOD, DIGESTION, CHYLE, *&c.*

Its Form is longiſh, compared by ſome to a Gourd; by others to a Bag-pipe. 'Tis ſituate in the Epigaſtrium, declining a little further to the Left than the Right. Its upper Part is connected to the Diaphragm, the bottom to the Cawl; the right Side to the Duodenum, and the Left to the Spleen.

It has two Orifices, one at each end. The Left Orifice is called στομαχὸς, from στομα, Mouth; and alſo καρδια: This is join'd to the OEſophagus, of which it ſeems to be only a Continuation: By this Orifice, the Aliments enter the Stomach; where being digeſted, they aſcend obliquely to the *Pylorus*, or right Orifice, which is united to the firſt of the Inteſtines. See PYLORUS.

The *Stomach* conſiſts of four Membranes or Coats; the firſt and inmoſt is form'd of ſhort Fibres, which ſtand perpendicularly upon the Fibres of the next Coat; they are to be ſeen plainly towards the Pylorus: when the *Stomach* is diſtended with Meat, theſe Fibres become thick and ſhort. Whilſt they endeavour to reſtore themſelves by their natural Elaſticity, they contract the Cavity of the *Stomach* for the Attrition and Expulſion of the Aliments. This Coat is much larger than the reſt, being full of Plaits and Wrinkles, and chiefly about the Pylorus: Theſe Plaits retard the Chyle, that it run not out of the *Stomach* before it be ſufficiently digeſted. In this Coat, there are alſo a great Number of ſmall Glands which ſeparate a Liquor, which beſmears all the Cavity of the *Stomach*, and helps the Concoction of the Aliments; for which Reaſon this Coat is called the *Tunica Glanduloſa*.

The Second is much finer and thinner; it is altogether Nervous; is of an exquiſite Senſe, and is called *Nervoſa*.

The Third is Muſcular, being made of ſtreight and circular Fibres; the ſtreight run upon the upper Part of the *Stomach*, between its ſuperior and inferior Orifices, and the circular run obliquely from the upper Part of the *Stomach* to the Bottom. Of theſe, the innermoſt deſcends towards the right Side, and the outermoſt towards the Left; ſo that by their Action, both Ends of the *Stomach* are drawn towards its Middle, and the whole is equally contracted; by their Contraction and continual Motion, the Attrition and Digeſtion of the Aliments, is in great meaſure performed.

The fourth Tunic is common; it comes from the Peritonæum. The *Stomach* ſends Veins to the Portæ, and Branches to the Gaſtroepiplois, accompanied with others of the Cœliac; all lying immediately under the fourth Coat.

The Eighth Pair of Nerves gives two conſiderable Branches to the *Stomach*, which are ſpread much about the upper Orifice; by which it is render'd very ſenſible; whence alſo, proceeds the great Sympathy betwixt the *Stomach*, Head and Heart; on account whereof, *Van Helmont* thought, that the Soul had its Seat in the upper Orifice of the *Stomach*.

For the Motion of the STOMACH; Dr. *Pitt* in the *Philoſophical Tranſactions*, acquaints us, that in diſſecting a Dog, he found the periſtaltic Motion of the Guts continued through the *Stomach*; the Pylorus, which is uſually found as high as the Diaphragma, being, in every Undulation, brought below the very bottom of the *Stomach*; ſo that he could manifeſtly obſerve a Conſtriction in the middle of the *Stomach*, at every Motion downwards, paſſing it in, ſo as to be able to compreſs whatever was contained in its Cavity. Theſe Motions, he obſerves, were as regular as any he ever obſerved in the Guts; and adds, That he has ſince obſerved the ſame in three others; whence one may ſafely enough conclude it holds of all. See PERISTALTIC.

Hence, we eaſily ſee the Reaſon of the quick Diſtribution of the Nouriſhment; the Food being no ſooner opened by the Drink and Spittle, *&c.* than it has a free Motion through the Pylorus into the Inteſtines, from this Compreſſion in the middle of the *Stomach*. See INTESTINES.

Ruminating Animals have four *Stomachs*; yet 'tis obſerved that ſome of theſe, which have four in *Europe*, have only two in *Africa*, probably by reaſon the Herbs in *Africa* are more nouriſhing. See RUMINANT.

Birds that live ordinarily of Seeds, cover'd with a tough Rind, have a kind of *Stomach* call'd the *Crop* or *Gizzern*, conſiſting of four large Muſcles without-ſide, and a hard callous Membrane within. See GIZZERN.

Such as live on Fleſh, as Eagles, Vulturs, *&c.* have only one. See CARNIVOROUS, GRANIVOROUS, *&c.*

STOMACHIC, a Medicine that ſtrengthens the *Stomach*; and promotes the Office of Digeſtion. See STOMACH.

Of this Kind are Wormwood, Rhubarb, Mint, Maſtic, Aloes, Pepper, Cinnamon, Aromatick Bitters, *&c.* good Wine is alſo a *Stomachic*.

STOMACHIC, in Anatomy, is applied to the Arteries, Veins, *&c.* of the *Stomach*; call'd alſo *Gaſtric*. See GASTRIC.

The *Stomachic Veins* terminate in the Trunk of the Vena Porta, and the Splenic Vein.

The *Stomachic Arteries* ariſe from the Cœliac.

The *Stomachic Nerves* come from the Eighth Pair.

STONE, in Natural Hiſtory, a hard, ſolid, mineral Body, neither fuſible nor malleable, form'd, in Succeſſion of Time, in the Body of the Earth. See FOSSIL.

Origin and Formation of STONES.

For the Origin and Formation of *Stones*, M. *Tournefort*, on his Return from the *Eaſt*, in the Year 1702, propoſed to the *Royal Academy*, a new Theory.

On a curious Survey of the famous Labyrinth of *Crete*, he obſerved, that ſeveral People had Engraven their Names in the living Rock, whereof its Walls are form'd; and, what was very extraordinary, the Letters whereof they conſiſted, inſtead of being hollow, as they muſt have been at firſt (being all cut with Knife-points) were prominent, and ſtood out from the Surface of the Rock, like ſo many Baſſo-Relievo's. See LABYRINTH.

This is a Phænomenon no otherwiſe accountable for, than by ſuppoſing the Cavities of the Letters fill'd inſenſibly, with a Matter iſſuing from out of the Subſtance of the Rock; and which even iſſued in greater Abundance than was neceſſary for filling the Cavity. Thus is the Wound made by the Knife healed up, much as the Fracture of a broken Bone is conſolidated by a Callus, form'd of the extravaſated nutritious Juice, which riſes above the Surface of the Bone: And this Reſemblance is the more juſt; as the Matter of the Letters was found whitiſh, and the Rock itſelf greyiſh.

Something very like it, is obſerved in the Barks of Trees, wherein Letters have been cut with the Knife; ſo that the Poet had Reaſon to ſay, That the Characters grew as the Trees themſelves grew: *Creſcent illæ, creſcetis amores.*

M. *Tournefort* ſupports his Opinion by ſimilar Calus's apparently form'd in ſeveral other *Stones*, which re-unite them, after, by Accident, they have been broken.

From theſe Obſervations, it follows, that there are *Stones* which grow in the Quarries, and of Conſequence that are fed; that the ſame Juice which nouriſhes them, ſerves to rejoyn their Parts when broken; juſt as in the Bones of Animals, and the Branches of Trees, when kept up by Bandages; and in a Word, that they vegetate.

There is, then, no room to doubt but that they are organized; or that they draw their nutritious Juice from the Earth. This Juice muſt be firſt filtrated and prepared in their Surface; which may be here eſteem'd as a kind of Bark, and hence it muſt be convey'd to all the other Parts.

'Tis highly probable, the Juice which fill'd the Cavities of the Letters, was brought thither from the bottom of its Roots; nor is there any more Difficulty in conceiving this, than in comprehending how the Sap ſhould paſs from the Roots of our largeſt Oaks, to the very Extremities of their higheſt Branches.

It muſt be owned, the Heart of theſe Trees is exceedingly hard; and yet thoſe of *Braſil*, call'd *Iron Wood*, Guiacum and Ebony, are much harder. Coral is as hard in the Sea as out of it; and Sea Muſhrooms, which every Body allows to grow, are true *Stones*, and ſo, like the common *Stones*, are uſed in *America* to make Lime of.

None, we believe, ever doubted that Shells grow by means of a nutritious Juice; and yet this Juice is convey'd along

along the narrow Canals of theſe exceſſively hard Bodies, as well as through thoſe of Plants, which are much leſs hard. See SHELL.

Some *Stones*, then, muſt be allow'd to vegetate and grow like Plants: But this is not all; probably they are generated in the ſame Manner; at leaſt there are abundance of *Stones*, whoſe Generation is inconceivable, without ſuppoſing they come from a kind of Seed, wherein the organical Parts of the *Stones* are wrapped up in little; as thoſe of the largeſt Plants are in their Grains.

The *Stones*, call'd *Cornu Ammonis*, *Lapis Judaicus*, *Aſtroites*, thoſe of *Bologne* and *Florence*, the ſeveral kinds of Pyrites, Sea Muſhrooms, Cryſtals of the Rock, and an Infinity of other *Stones*, ſuppoſe their ſeveral Seeds; as much as Muſhrooms, Truffles, and various Kinds of Moſſes, whoſe Seeds were never yet diſcovered. See MUSHROOM, CRYSTAL, CORAL, &c.

How ſhould the *Cornu Ammonis*, which is conſtantly in Figure of a Volute, be form'd without a Seed, containing that ſame Structure in little? Who moulded it ſo artfully? And where are the Moulds? Far from this, theſe Kinds of *Stones* are found in the Earth, like common Flints. Nor were either Moulds or any thing like them, ever diſcover'd. See CORNU *Ammonis*.

M. *Tournefort* examines the ſeveral Kinds of *Stones* above-mentioned, and finds them under the ſame Neceſſity of Seed. Again, that immenſe Quantity of Flints, wherewith the *Crau of Arles* is cover'd, is a ſtrong Argument in behalf of this Theory.

The Country there, for 20 Miles round, is full of roundiſh Flints; which are ſtill found in equal abundance, to whatever Depth you dig. M. *Pereiſc*, who firſt propoſed the Generation of *Stones* by means of Seeds (though he took the Word *Seed* in a very different Senſe from M. *Tournefort*) firſt brought this extraordinary Campagne as a Proof thereof. In effect, how could ſo many ſimilar Flints be form'd? There is no ſaying they are coeval with the World, without aſſerting at the ſame time, That all the *Stones* in the Earth were produced at once; which were to go directly contrary to the Obſervations above-mentioned.

Among the Seeds of *Stones*, M. *Tournefort* obſerves, there are ſome, which don't only grow ſoft by the Juices of the Earth, but even become liquid. Theſe, then, if they penetrate the Pores of certain Bodies, grow hard, petrify and aſſume the Figure or Impreſſion of the Body: Thus what we call *Pectinites*, *Conchites*, *Mytulites*, *Oſtracites*, *Nautilites*, *Echinites*, &c. are real *Stones*, the liquid Seeds whereof have inſinuated into the Cavities of the Shells, call'd *Pecten*, *Concha*, *Mytulus*, *Oſtrea*, *Nautilus*, *Echinus*.

On the contrary, if thoſe liquid Seeds fall on Flints, on Shells, Sand, &c. they incloſe thoſe ſeveral Bodies, and fixing between them, form a kind of Cement, which yet grows like other *Stones*. 'Tis highly probable that ſuch Rocks as are only an Aſſemblage of mafticated Flints have been form'd by a Number of theſe liquid Seeds; in like Manner as the Quarries full of Shells; unleſs the Rocks have envellop'd theſe Bodies in their Growth.

He adds, that there are Seeds of real *Stones* incloſed in the Spawn of certain Shell-fiſh; as well as that hard ſolid Matter deſtin'd to the forming their Shells.

There is a particular Kind of Shell-fiſh, call'd *Pholas*, which is never found any where but in Cavities of Flints, which are always found exactly fitted to receive them. Now, 'tis highly improbable the Fiſh ſhould come and dig ſuch a Nitch to ſpawn in; 'tis much more likely, the *Stones* they are found incloſed in, were at firſt ſoft; and that the Matter they are form'd of, was originally found in the Spawn, in like Manner as the Matter which forms the Egg-ſhell, is really found in the Seed thereof.

From the whole, he concludes, that the Seed of *Stones*, and even of Metals, is a kind of Duſt, which probably falls from them while they are alive, *i. e.* while they continue to vegetate as above. This Duſt may be compared to the Seeds of ſeveral Plants, as thoſe of Ferns, Capillaries, Moſſes, Truffles, &c. which no Microſcope e'er yet diſcover'd; though their Exiſtence is not at all doubted.

Probably Flints and Pebbles are among *Stones*, what Truffles are among Plants: Nor is this Opinion new; *Pliny* aſſures us, That *Theophraſtus* and *Mutianus* believed, that *Stones* produced *Stones*: And *Gregory Nazianzen* adds, that there were Authors who even believed that *Stones* made Love, Ἐστι καὶ ἀψύχοισι γάμος καὶ δεσμὸς ἔρωτος, *Poem. de Virgin.*

M. *Geoffroy* accounts for the Origin and Formation of *Stones*, in a different Manner.

He lays it down as a Principle, that all *Stones*, without Exception, have been Fluid; or at leaſt a ſoft Paſte, now dried and harden'd; witneſs the *Stones* wherein are found foreign Bodies; witneſs, alſo, figured *Stones*, &c.

On this Principle, he examines the Formation of the different Kinds of *Stones*; and ſhews, that the Earth alone ſuffices for the ſame, independent of all Salts, Sulphurs, &c. The metallic Particles contain'd in Flints, give them their Colour; but theſe are only Accidents; for Proof of which, he inſtances the Saphirs and Emeralds of *Auvergne*, which loſe all their Colour by a moderate Fire conſuming their metallic Parts; but without any Damage to their Tranſparence; they being hereby render'd mere Cryſtals.

To view Rock Cryſtal, indeed, one would not take it for Earth; and yet Earth it muſt be, not Water congeal'd, as the Ancients imagin'd. See CRYSTAL.

Mr. *Geoffroy* conceives two Kinds of little primitive Parts in the Earth: Thoſe of the firſt Kind, are exceedingly fine, thin Lamellæ, equal to each other, or nearly ſo. Now, when theſe meet together, from any Cauſe whatever, in a ſufficient Quantity; the Regularity and Equality of their Figures determines them to range themſelves equally and regularly; and thus to form a homogeneous Compound, which is very hard, from the immediate Contact of the Parts, and very tranſparent, by reaſon of their regular Diſpoſition which leaves a free Paſſage to the Rays of Light every Way; and this is Cryſtal. See CRYSTAL.

The Parts of the ſecond Kind have all kinds of irregular Figures; and muſt accordingly form Aſſemblages that are much opaker and leſs hard. Now Cryſtal is form'd wholly of Parts of the firſt Kind; and all other *Stones* of a Mixture of the two kinds of Parts together: This Mixture is abſolutely neceſſary, in order to unite and bind together the Parts of the ſecond Kind, and give them a Hardneſs and Conſiſtence, without which they would only make a Sand or Duſt. Water, now appears the fitteſt Vehicle, to carry the Parts of the firſt Kind. This is ſeen from ſeveral petrifying Springs, which incruſtate the Pipes through which their Waters are convey'd, or even ſolid Bodies laid in them for ſome time. The Water does not diſſolve thoſe earthy Parts; it only keeps them in Fuſion, as it does the Juices wherewith Plants are fed.

This Water, thus charged with earthy Particles of the firſt Kind, M. *Geoffroy* calls the *Stony* or *Cryſtalline Juice*, whereof thoſe Bodies are primarily form'd.

STONES are of various Kinds, with regard to the Places they are produced in: the moſt ordinary are under Ground; others in the Bodies of Men and other Animals; others ſeem to be generated by the Sea, as Pumice, &c. and others, the Effect of a petrifying Virtue in certain Waters.

Of theſe, ſome ſerve ſimply for Magnificence and Ornament; as all thoſe called

Precious STONES; which make the Commerce of Lapidaries and Jewellers. See PRECIOUS *Stone*.

Others, much uſefuller, if one might credit all the Virtues attributed to them, are uſed in Medicine, ſuch as *Bezoards*, *Jews Stone*, *Eagles Stone*, &c. See BEZOARD, &c.

Others, again, are uſed in Painting; either to prepare Colours from, by calcining and grinding them, or to be uſed as Crayons or Pencils for Deſigning; of which Number are the *Armenian Stone*, *Black Lead*, *Ruddle*, &c.

Laſtly, much the greateſt Quantity, and thoſe too of the moſt immediate and common Uſe, are thoſe employ'd in Building; ſuch as *Free-ſtone*, *Marble*, *Lime-ſtone*, *Fire-ſtone*, &c. each of which ſee under their proper Articles.

A Scheme of the ſeveral Kinds of STONES *from Biſhop* Wilkins.

Stones are either *Vulgar*, *Middle-priced*, or *Precious*.

1. *Vulgar* STONES, or ſuch as are of little Price, are diſtinguiſhable by their different Magnitudes, Uſes, and Conſiſtence, into the

- Greater Magnitudes of *Stone*, uſed either about Buildings, whether of
  - Walls; chiefly being of a
    - ſofter Conſiſtence, whether Natural or Factitious.
      1. *Free Stone*
      1. Brick
    - Harder Conſiſtence; not eaſily yielding to the Tool of the Workman, growing either in
      2. Great Maſſes.
      2. Ragg
      2. Leſſer Maſſes; whether ſuch as are for their Figure,
  - More knobbed, and unequal; uſed for the ſtriking of Fire, either the more common, which is leſs heavy; or the leſs common, which is more heavy, as having ſomething in it of a metalline Mixture.
    3. Flint.
    3. Marchaſite, *Fire-ſtone*.
  - More round and even.
    4. Pebble.
  - Roof, or Pavement, being of a laminated Figure, either Natural or Factitious.
    5. Slate
    5. Tile
- Metals, either for the

Sharpening

Sharpening, or trying of them
6 { *Whet-ſtone.* / *Touch-ſtone.*
Poliſhing, or cutting of them; being either of a more ſpongy and ſoft, or of a more hard Conſiſtence.
7 { Pumice. / Emery.
Leſſer Magnitudes, either more, leſs or minute.
8 { Sand. / Gravel.

2. *Middle priced* STONES, are either of a

Shining Politure, or capable of it; whether of a
Simple white Colour, and more ſoft Conſiſtence,
1. Alabaſter.
Sometimes White, ſometimes Black or Green, and ſometimes variegated with Veins, growing in greater or leſſer Maſſes.
2 { Marble, Porphyry, / Agat.
Spotted with Red, upon a greeniſh Colour, or with Spots of Gold-colour upon Blue.
3 { Jaſpis, Heliotrope. / Lazul, Azure *Stone.*
Tranſparency, either
Brittle; whether Natural or Factitious
4 { Cryſtaline / Glaſs,
Fiſſil into Flakes, either greater or leſſer.
5 { Selenite, *Muſcovia* Glaſs, Iſing Glaſs, Spar. / Talk.
Relation to Metals, attracting Iron, or making of Braſs.
6 { Load-*ſtone* / Cadmia, Calaminaris.
Incombuſtible Nature.
7 Amiantus.
Strange Original; not being properly Minerals, though uſually reckoned amongſt them; but either a ſubmarine Plant, or ſuppoſed to proceed from a liquid Bitumen.
8 { Coraline. / Ambet.

3°. *Precious* STONES; which ſee under the Article PRECIOUS *Stone.*

STONE is alſo a certain Quantity or Weight of ſome Commodities:

A *Stone* of Beef at *London*, is the Quantity of Eight Pounds: In *Herefordſhire*, Twelve Pounds; in the *North*, Sixteen Pounds. A *Stone* of Glaſs is Five Pounds; of Wax, Eight Pounds.

A *Stone* of Wooll (according to the Statute 11. *H.* 7.) ought to weigh Fourteen Pounds, yet in ſome Places it is more, in others leſs; as in *Glouceſterſhire*, Fifteen Pounds; in *Herefordſhire* Twelve Pounds.

Among Horſe-Courſers, a *Stone* is the Weight of Fourteen Pounds.

Building STONE: Of this there are ſeveral Kinds; the principal among us, are *Marble*, *Fire-ſtone*, *Purbec-ſtone*, *Rag-ſtone*, *Alabaſter*, *Free-ſtone* and *common Stone*; of all which, except the two laſt, we have ſpoke under their proper Article; which ſee.

For *Free-ſtone*, that dug in the Peninſula of *Portland*, and thence call'd *Portland ſtone*, is much uſed; being ſofter and whiter than *Purbec-ſtone*, and is commonly raiſed out of the Quarries in bigger Blocks than that. Some alſo call *Rigate* or *Fire-ſtone*, *Free-ſtone*.

Mr. *Boyle* obſerves, That a competent Knowledge of the Manner of the Sap or Juice found in *Stones* uſed in Building, is of the laſt Importance; the ſame *Stone* dug out of the ſame Quarry at one Seaſon, being found to moulder away in a few Winters, which dug at another Seaſon, will brave the Weather for many Ages; and that there are others, which though dug at the proper Seaſon, yet make but ruinous Buildings, if uſed at an improper Seaſon.

The ſame Author adds, That as there are ſome ſort of *Stones* which will decay in a few Years, there are others will not have attain'd their full Hardneſs in 30 or 40 Years, or even much more. See PORPHYRY.

For the drawing of STONE *out of the Quarry.* See QUARRY.

Precious STONE, *Bolonian* STONE, *Eagles* STONE, *Jewiſh* STONE, *Pumice* STONE, *Touch* STONE, *Emery* STONE, *Infernal* STONE, *Calamine* STONE, *Philoſophers* STONE } See { PRECIOUS. BOLONIAN. ÆTITES. JUDAICUS. PUMICE. TOUCH. EMERY. LAPIS. CALAMINARIS. PHILOSOPHERS.

STONE, in Medicine, a Diſeaſe call'd alſo *Calculus*, and *Lithiaſis*; and, occaſionally, the *Gravel*. See CALCULUS, LITHIASIS and GRAVEL.

It conſiſts of a *ſtony* Concretion, form'd either in the Bladder or Kidneys; which prevents the Diſcharge of Urine, and occaſions violent Pains. See BLADDER and KIDNEYS.

The *Stone* is generated, according to ſome Authors, of the earthy viſcid Parts of the Blood, harden'd, in courſe of Time, by the Heat of the Kidneys; much after the manner as Brick is baked in a Furnace.

Dr. *Quincy* ſuppoſes the *Stone* generated of the harder Parts of the Urine, pent up by the Straightneſs of the Ducts, and brought into Contact and Coheſion.

Etmuller aſcribes the *Stone*, ſometimes to the *ſtony* and metallic Particles of our Foods and Drinks, which the Reins, through Weakneſs and Relaxation thereof, cannot eject; but more uſually to the unequal Strength of the Kidneys: Whence it is that we ſee one Kidney breed *Stones*, and the other ſound.

The *Stone* in the Bladder, is firſt form'd in the Pelvis of the Kidneys, whence falling into the Bladder, it becomes augmented by new Lamellæ or Coats. See PELVIS.

The Diagnoſtic Signs of the *Stone in the Kidneys*, are, 1° A fix'd, obtuſe Pain in the Region of the Loins, appearing like a Weight loading the Reins. As the *Stone* falls out of the Pelvis into the Ureter, the Pain is exceedingly acute and racking, which holds till either the *Stone* be got into the Bladder, or returned again to the Pelvis. 2° An Inflexibility of the Spina Dorſi, from the Extenſion and Compreſſion of the Nerves. 3° A Stupor of the Thigh and Leg of that Side, from the Conſent of Parts. 4° A Retraction of the Teſticle. 5° A very ſmall Quantity of Urine, either thin and limpid, or bloody. But aſſoon as the *Stone* is got into the Bladder, the Urine becomes thick, turbid, blackiſh and in great Quantity.

The Diagnoſtics of the *Stone in the Bladder*, are a Senſe of Heavineſs in the Perinæum and inguinal Region, a perpetual and troubleſome Deſire of making Water, which is followed with a ſharp Pain, principally in the Glans of the Penis, whence a Prolapſus of the Anus. But the ſureſt Way of finding it, is by the Touch, *viz.* by thruſting the Finger or a Catheter up the Anus.

The Cure of the *Stone*, is either by a Liquor that will diſſolve or break the concrete *Stone*; ſo as it may be evacuated Piece-meal; which is call'd a *Lithontriptic*; or by enlarging the Capacities of the Veſſels; or by the Operation of Cutting, call'd *Lithotomy*.

We have yet no aſſured Lithontriptic known, how many ſoever may pretend to it; the moſt noted, are *Daffey*'s Elixir, *Tipping*'s Liquor, and *Rogers*'s Powder. See LITHONTRIPTIC.

The moſt uſual Cure is by Cutting; the various Manners whereof, ſee under LITHOTOMY.

In ſome deſperate Caſes, the *Stone* has been known to make itſelf a Way through the Spinal Muſcles.

Dr. *Liſter* obſerves, that *Stones* are found, not only in the Bladder and Kidneys, but alſo in the pituitary Ducts, the Brain, Liver, Lungs, Ventricle, Inteſtines and Joints of the Hands and Feet; to which may be added, that in the *Philoſophical Tranſactions*, we have likewiſe Accounts of *Stones* in the Pineal Gland, the Heart, Gall, Bladder, &c.

The *Stone*, *Etmuller* ſays, is not a Diſeaſe, but the Product of a Diſeaſe: The Diſeaſe, properly, is the *Lithiaſis*, or the Diſpoſition of the Kidneys and Bladder to generate *Stones*.

Stones are diſtinguiſh'd into three Kinds, White, Red and Yellow; which laſt are the moſt uſual. *Deckers* recommends calcin'd Egg-ſhells as excellent in all Suppreſſions of Urine: *Hamilton*, Linſeed Oil, and Mr. *Boyle*, the Herb Arſemart.

STONE-*Blue*, a mineral Preparation, properly call'd *Smalt*. See SMALT.

STONE-*Henge*, in Antiquity, a fam'd Pile or Monument, on *Salisbury* Plain, ſix Miles diſtant from that City.

It conſiſts of three Ranks of huge rough *Stones*, ranged one within another, ſome of them Twenty-eight Feet high, and Seven broad; ſuſtaining others, laid acroſs their Heads, and faſten'd by Mortaiſes; ſo that the whole muſt have anciently hung together.

Antiquaries are ſtrangely at a loſs, as to the Origin, Uſe, Structure, &c. of this wonderful Fabrick. Moſt of them allow the *Stones* to be artificial, and to have been made on the Spot; which is the more probable, as we are pretty well aſſured the Ancients had the Art of making *Stones* with Sand and a ſtrong Lime or Cement; and as the *Stones* are too big for any Land Carriage; and yet are in a Plain, which for ſome Miles round, ſcarce affords any *Stones* at all.

The Legends give us various other Accounts; ſome will have them brought miraculouſly by St. *Patrick* from *Ireland*; others, &c.

As to its Uſe, ſome Antiquaries take it to have been an ancient Temple of the *Druids*, others of the *Romans*, de-

dicated to *Cœlus*; in which they are confirm'd by its having been open atop. Others, reading it *Stone Hengiſt*, maintain it to have been a Monument erected in Memory of *Hengiſt*, the firſt General of the *Saxons* in *England*: And others, to name no more, will have it a Funeral Monument, raiſed to that brave *Romano-Briton*, *Aurelius Ambroſius*; to which Opinion, ſome Circumſtances of his Actions, and ſtill remaining *Latin* Name of the Place (*Mons Ambroſii*) and that very ancient *Welſh* Proverb, *Mal givaiſh Emrys*, Like the Work of *Ambroſius*, give ſome Countenance.

STOOL, in Medicine. A Thing is ſaid to be *voided by Stool*, when it is diſcharged by the Anus or Fundament. See ANUS.

In the *Philoſophical Tranſactions*, we have Inſtances of ſick Perſons voiding factitious Stones, Balls, &c. by *Stool*. See EXCREMENT.

STOOMING *of Wine*; is a putting Bags of Herbs, or other Ingredients into it. See WINE.

STOOPING, in Falconry, is when an Hawk being upon her Wings, at the Height of her Pitch, bends down violently to take the Fowl.

STOPS } in Grammar. See { POINTS.
STOPPING } { PUNCTUATION.

STORAX or STYRAX, a reſinous odoriferous Gum, brought from *Syria*; whereof there are three Kinds, *viz.* the *red Storax*, *Storax Calamita*, and *liquid Storax*.

The *red Storax*, call'd alſo *Jews Incenſe*, is a Gum or Reſin oozing out at an Inciſion made in the Trunk and biggeſt Branches of a Tree, call'd *Storax*, not unlike our Quince Tree. Its Fruit is of the Size of a Filberd, and contains a white, oily Kernel, of a Smell perfectly like *Storax*.

It muſt be choſen in a Maſs, of a reddiſh Colour, ſoft and fat, and of an agreeable Smell, bearing no Reſemblance to *liquid Storax*.

That in Cakes, in Balls, &c. is all ſophiſticated; and only a wretched Compoſition of *liquid Storax*, and the Impurities of the true *red Storax* and other Drugs. That in Powder is ſtill worſe.

Red Storax is of ſome Uſe in Medicine; and is alſo uſed by the Perfumers, and often ſubſtituted for Incenſe.

The *Storax Calamita*, thus call'd from the Ruſhes or Quills, in *Latin*, *Calami*, it was anciently brought in, is, in reality, only a Compoſition of ſeveral excellent Drugs, and among the reſt, of *red Storax*, whence its Name; though Authors have hitherto taken it for a natural Gum, different from the *red Storax*.

It muſt be choſen in fine white Tears, very dry, and not bitter; ſometimes 'tis in reddiſh Maſſes, full of theſe whitiſh Tears, only mix'd with a ruddy Subſtance. Theſe two Kinds are eſteem'd excellent Pectorals, Stomachicks and Cephalicks.

Liquid Storax, is a kind of factitious Roſin, of a greyiſh Colour, compoſed of true *Storax*, common Roſin of the Pine, Oil and Wine, beaten with Water, into the Conſiſtence of an Unguent. The Druggiſts alſo call it *Stacte*, to diſtinguiſh it, and ſell it for the better Price. See STACTE.

The beſt is that of *Holland*. 'Tis eaſily kept in a Cellar, by pouring Water on it from Time to Time. 'Tis an Ingredient in an Unguent which Experience has ſhewn to be excellent againſt the Scorbutus and Gangrene.

STORGE, a *Greek* Term, Στοργὴ, frequently uſed by Naturaliſts, to ſignify that Parental Inſtinct, or natural Affection, which all, or moſt Animals bear their Young. See INSTINCT.

This *Storge* is an admirable Principle implanted by the All-wiſe Creator throughout the Animal World, for the Preſervation thereof; and is govern'd by ſuch Rules as make it beſt contribute thereto. By means of this, with what Care and Alacrity do they nurſe their Young? and what Dangers will they avoid for their Security? Even the moſt timorous Animals, which at other times fly the Face of Men, Dogs, &c. will, for the ſake of their Young, expoſe themſelves.

Thus Hens inſtead of flying from, will aſſault ſuch as meddle with their Brood; and Partridges, e'er their Young can fly, will frequently drop down before the Dogs, firſt at leſs, then at greater Diſtances, to dodge and draw them off, from purſuing their Young. With what Concern do others lead about their Young in Places of Safety? and ſome even admit them for Shelter into their Bowels.

Thus the Opoſſum, Dr. *Tyſon* obſerves, has a curious Bag on purpoſe for the ſecuring and carrying about her Young; and ſome ſay, the Teats lie in it. The ſame Author adds, from *Oppian*, that the Dog-fiſh upon any Storm or Danger, receives her Young into her Belly, which come out again when the Fright is over. The Squatina and Glaucus do the like.

With what Tenderneſs do others ſeek and prepare the Food for their Young, teach them to ſuck, cheriſh or lull them to Reſt, &c. like ſo many Nurſes, deputed by the Creator to take Care of his Creatures? And ſtill in Proportion, as they grow up and become fit to look to themſelves, this *Storge* abates; and at length, when no longer needed, becomes extinct. Mr. *Ray* obſerves, that young Doves are fed with Meat firſt eat by the Dam, and ſodden a-while in her Prolobe. And *Cluſius* obſerves, that the old Female *Ethiopian* takes no Food but from the Male, after this Manner.

The Returns made by the Young to the Parent Animal, when grown old, are not leſs conſiderable. *Pliny* ſays of Rats, that they nouriſh their aged Parents with eminent Piety.

St. *Ambroſe*, and after him *Olaus Magnus*, obſerve of the Crane, that when their Parents, through old Age, are bereft of their Feathers, and left half naked, their Offspring ſtand around them, and cheriſh them with their own Feathers; that they ſeek Food for them; and when Nature, as it often happens, repairs their Decays, and reſtores them to Strength again, they take them up by Turns, on their Wings, and habituate their unpractiſed Limbs to their ancient Art of Flying.

STOVE, in Building, a Hot-houſe or Room. See FIRE, CHIMNEY, &c.

Palladio obſerves, that the Ancients uſed to warm their Rooms with certain ſecret Pipes, which came through the Walls, conveying Heat to ſeveral Parts of the Houſe, from one common Furnace. Whether this were a common Cuſtom, ſays Sir *Henry Wotton*, or a Curioſity, we cannot determine; but it was certainly, both for Profit and Uſe, far beyond the *German Stoves*.

STOVE, among Confectioners, a little Cloſet well cloſed on all Sides, wherein are ſeveral Stories or Rows of Shelves made of Wiars one above another, for the drying of Sweetmeats.

STOWAGE, is a Place where Goods are ſtow'd or laid up; or the Money paid for ſuch a Place.

STRABISMUS, an ill Diſpoſition of the Eye, which makes it look a-ſquint.

This Indiſpoſition conſiſts in a Retraction of the Ball of the Eye, towards one Side; occaſion'd by a Convulſion, or a Palſie of one of its Muſcles.

Children are apt to acquire it through the Careleſneſs of their Nurſes, in placing them always on the ſame Side the Light, or of any other remarkable Object that occaſions them to turn their Eyes that Way.

To remedy it, Care is to be taken, that the Light, or other notable Body, be placed on the other ſide of them; or elſe a Mask put on them, the Holes whereof are ſo diſpoſed, as that to ſee through them, the Child be obliged to turn his Eyes the oppoſite Way. The Word is form'd from the *Greek* στραβισμός, which ſignifies the ſame.

STRAIGHT, or, as ſome chuſe to write it, *Streight*, or, as others, *Strait*, in Hydrography, a narrow Sea, or Gut ſhut up between Lands on either Side, and affording a Paſſage out of one great Sea into another.

The moſt celebrated *Streight* in the World, is that of *Gibraltar*, which is about 130 Miles long and 12 broad, joining the *Mediterranean* Sea, with the *Atlantic* Ocean.

The *Streight of Magellan*, diſcover'd in 1520 by *F. Magellan*. It was uſed ſome time, as a Paſſage out of the *North* into the *South* Sea; but ſince the Year 1616, that the *Streight of le Maire* has been diſcovered, the former has been diſuſed; both becauſe of its Length, which is full 300 Miles, and becauſe the Navigation thereof is very dangerous, from the Waves of the *North* and *South* Seas meeting herein, and claſhing.

The *Streight* at the Entrance of the *Baltic*, is call'd the *Sound*. See SOUND.

That between *England* and *France*, *Le Pas de Calais*, or the *Channel*. The *Streights* of *Babalmanda*, of *Weigats*, of *Jeſſo*, of *Anian*, of *Davis* and *Hudſon*, &c.

STRAIGHT is alſo uſed in Geography, for an Iſthmus or Neck of Land between two Seas; preventing the Communication thereof. See ISTHMUS.

STRAIN or *Sprain*, a violent Extenſion of the Sinews or Tendons of ſome Muſcle. See TENDON.

STRAND and *Stream*, in ancient Cuſtoms, a Freedom from all Impoſitions upon Goods or Veſſels by Land or Water.

STRANDED, (from the *Saxon Strand*, *i. e.* a Shore or Bank of the Sea or a great River) is when a Ship is by Tempeſt or ill Steerage, run on Ground, and ſo periſhes.

STRANGER, in Law, has a ſpecial Signification, for a Perſon who is not Privy or Party to an Act: As, a *Stranger* to a Judgment, is he to whom a Judgment does not belong; in which Senſe it ſtands directly contrary to *Party* or *Privy*.

STRANGURY, in Medicine, a Diſeaſe occaſioning a very frequent and involuntary Emiſſion of Urine, in very ſmall Quantities, and, as it were, Drop by Drop; with an intenſe Pain. See URINE.

It ariſes from the too great Acrimony of the Urine, which vellicating the Nervous Parts of the Bladder, occaſions a continual Inclination to urine.

New

New Beer, and other Liquors not well fermented, are uſed to occaſion the *Strangury*.

The extreme Sharpneſs of the Urine, ſometimes produces an Ulcer in the Bladder.

The Word is form'd from the *Greek* στράγξ, Gutta, Drop, and οὖρον, Urine.

Some Authors confound the *Strangury*, which the *Latins* call *Urinæ Stillicidium*, with the *Urinæ Incontinentia*.

The Difference between them, conſiſts in this, that in the former, the Urine comes away with Pain, in the latter, without. The former proceeds from the Acrimony of the Urine; and the latter from a Relaxation or Palſy of the Sphincter of the Bladder, which cannot keep the Neck thereof cloſe ſhut. See URINE.

STRAP, among Surgeons, a Sort of Band to ſtretch out Members in the ſetting of broken, or disjointed Bones. See BANDAGE.

STRAPADO, a kind of Military Puniſhment, wherein the Criminal's Hands being tied behind him, he is hoiſted up with a Rope, to the Top of a long Piece of Wood, and let fall again almoſt to the Ground; ſo that by the Weight of his Body in the Shock, his Arms are diſlocated.

Sometimes he is to undergo three *Strapado*'s, or more.

The Word is form'd from the *French*, *Eſtrapade*, which ſignifies the ſame Thing, and which is ſuppoſed to come from the old Verb *Eſtreper*, to break, extirpate.

STRATA, in Natural Hiſtory, the ſeveral Beds or Layers of different Matter, whereof the Body of the Earth is compoſed. See EARTH.

The *Strata*, include all the Layers of Earths, Minerals, Metals, Stones, &c. lying under that upper Tegument or *Stratum*, the Turf or Mould. See FOSSIL.

The Time when thoſe ſeveral *Strata* were laid, was, doubtleſs, at the Creation; unleſs, with ſome great Naturaliſts, as *Steno*, Dr. *Woodward*, &c. we ſuppoſe the Globe of Earth to have been diſſolved by the Flood. See DELUGE.

At that Time, ſays Mr. *Derham*, whenever it was that the Terraqueous Globe was in a Chaotic State, and the earthy Particles ſubſided, then theſe ſeveral Beds were repoſited in that commodious Order, wherein they are now found; and that, as is aſſerted, according to the Laws of Gravity; the lower ſtill heavier than the upper.

But Dr. *Leigh*, in his Natural Hiſtory of *Lancaſhire*, ſpeaking of the Coal-pits, denies the *Strata* to lie according to the Laws of Gravitation; obſerving that the *Strata* there, are firſt a Bed of Marle, then Free-ſtone, next Iron-ſtone, then Coal or Channel Mire, then ſome other *Strata*, then Coal again, &c.

This determined Mr. *Derham* to make a nicer Enquiry into the Matter; accordingly, in 1712, he cauſed divers Places to be bored, laying the ſeveral *Strata* by themſelves; and afterwards determined very carefully their ſpecific Gravity. The Reſult was, that in his Yard, the *Strata* were gradually ſpecifically heavier and heavier, the lower and lower they went; but in another Place in his Fields, he could not perceive any Difference in the ſpecific Gravities.

Acquainting the *Royal Society* therewith, their Operator Mr. *Hauksbee*, was order'd to try the *Strata* of a Coal-pit, which he did to the Depth of 30 *Strata*: The Thickneſs and ſpecific Gravity of each whereof, he gives us in a Table in the *Philoſophical Tranſactions*; and from the whole make this Inference, that it evidently appears, the Gravities of the ſeveral *Strata* are in no manner of Order; but purely Caſual, as if mix'd by Chance. See VEIN and COAL-*Pit*.

STRATAGEM, a Military Wile; or a Device in War, for the ſurprizing or deceiving an Enemy.

The Ancients dealt mightily in *Stratagems*; the Moderns wage War more openly, and on the Square.

Frontinus has made a Collection of the ancient *Stratagems* of War.

The Word is form'd from the *Greek* στρατηγεω, I lead an Army.

STRATARITHMETRY, in War, &c. the Art of drawing up an Army or any Part of it, in any given Geometrical Figure; and of expreſſing the Number of Men contain'd in ſuch a Figure, as they ſtand in Array, either near at Hand, or at any Diſtance aſſign'd. *Harris*.

The Word is form'd from the *Greek*, στρατὸς, Army, ἀριθμὸς, Number, and μέτρον, Meaſure.

STRATEGUS, in Antiquity, an Office among the *Athenians*, whereof there were two choſen yearly, to command the Troops of the State.

Plutarch ſays, there was one choſe from out of each Tribe; but *Pollux* ſeems to ſay, they were choſe indifferently out of the People. 'Twas the People themſelves made the Choice; and that on the laſt Day of the Year, in a Place call'd *Pnyce*.

The two *Strategi* did not command together; but took their Turns, Day by Day; as we find from *Herodotus* and *Cornelius Nepos*. Some times, indeed, as when a Perſon was found of Merit vaſtly ſuperior, and exceedingly fam'd in War, the Command was given to him alone: But it was ever a Rule, never to put any Perſon in the Office, but who had his Lands in *Attica*, and who had Children, that there might be ſome Hoſtages, and Securities for his Conduct and Fidelity.

STRATIFICATION, in Chymiſtry, an Arrangement of different Matters, in ſeveral *Strata* or Layers, alternately; call'd by the *Latins*, *Stratum ſuper Stratum*; and mark'd in Books of Chymiſtry with S S S.

This Operation is uſed in calcining of Minerals or Metals with Salts or other Matters. See CALCINATION.

To purify Gold by Cementation, they *Stratify* Laminæ, or Plates of Gold in a Crucible, with a dry Paſte call'd *Cement*. See GOLD and PURIFICATION.

STRAY. See ESTRAY.

STREAM-*Anchor*, is a ſmall one, made faſt to a *Stream* Cable; for a Ship to ride by in gentle *Streams*, and in fair Weather. See ANCHOR.

STREAM-*Works*, are certain Works in the Tin-Mines, when the Miners follow the Veins of Metal, by cutting Trenches, &c.

STRENÆ, in Antiquity, Preſents made, out of Reſpect, on New-year's Day; and as a happy Augury for the enſuing Year.

The ancient Lawyers derive the Origin of the Word hence, That theſe Preſents were only given *viris ſtrenuis*, as *Symmachus* obſerv'd; who adds further, That the Uſe hereof was firſt introduced by King *Tatius*, *Romulus*'s Collegue, upon his giving, firſt together the happy Branches, which were the Preſages of a New Year, in the ſacred Grove of the Goddeſs *Strenia*.

Anciently, a Pound of Gold was given to the Emperors every New-year's Day, by way of *Strena*. *Du Cange* obſerves, that *Strina* or *Strinna* was uſed for a kind of Tribute the People of *Dalmatia* and *Croatia* pay'd to the *Venetians*, or to the Kings of *Hungary*, whom they obey'd voluntarily.

STRENGTH, as it concerns the Animal Oeconomy. The *Strengths* of different Animals of the ſame Species, or of the ſame Animal at different Times, are demonſtrated to be in a triplicate Proportion of the Quantities of the Maſs of their Blood: The whole *Strength* of an Animal, is the Force of all the Muſcles taken together; therefore, whatſoever increaſeth *Strength*, increaſes the Force of all the Muſcles, and of thoſe ſerving Digeſtion, as well as others. See MUSCLE.

Yet notwithſtanding the Truth of this, the Quantity of Blood may be increaſed in ſuch Circumſtances, as to abate the *Strength*. The Equilibrium between the Blood and Veſſels being deſtroy'd, wonderfully leſſens the *Strength*. The ſudden Suppreſſion of Perſpiration, though it increaſes the Quantity of the Blood, as it muſt conſiderably do, by *Sanctorius*'s Calculation, yet it leſſens the *Strength*; becauſe the retained Matter, being what ought to be evacuated, ſo alters the Texture of the Blood, as to make it unfit for muſcular Motion. Suppoſe the increaſed Quantity to be joined by an extraordinary Viſcidity, the Quantity of ſmall ſeparable Parts decreaſing, as the Viſcidity increaſes, the Quantity of animal Spirits ſeparated in the Brain, will be leſs; and the Tenſity of the Fibres being in Proportion to the animal Spirits forced into them, they will not be able to counterpoiſe the great Weight of the Blood, and ſo the *Strength* will be diminiſhed.

Bellini proves, that if the Blood be ſo vitiated, as to increaſe or diminiſh *Strength*; it amounts to the ſame as if the Blood were in a natural State, but its Quantity increaſed or diminiſhed in the ſame Proportion: So that the Blood, when vitiated, may ſo impair the *Strength* of the Muſcles, as even to ſpoil Digeſtion; and yet in ſome Caſes, it may be ſo vitiated, as to help Digeſtion, and increaſe *Strength*.

M. *de la Hire*, in a Calculation of the *Strength* of a Man in drawing and bearing, ſhews, that an ordinary Man walking in a horizontal Direction, and with his Body inclining forwards, is only equal to Twenty-ſeven Pounds; which is much leſs than one would have imagined.

He adds, That this Force would be much greater, if the Man were to walk backwards; and that 'tis for this Reaſon, the Watermen fetch their Oars from before, backwards: And though he obſerves, the Gondoliers of *Venice* fetch them the contrary Way, yet this is, becauſe they chuſe to loſe the Advantage of *Strength*, to have that of ſeeing the Place they are going to, in the numerous Turns and Canals they there meet withal.

'Tis known by Experience, that a Horſe draws, horizontally, as much as Seven Men; conſequently, his *Strength* will be 189 Pounds. A Horſe, as to puſhing forwards, has a great advantage over a Man, both in the *Strength* of its Muſcles, and the Diſpoſition of the whole Body; but the Man has the Advantage over the Horſe in aſcending. M. *de la Hire* ſhews, that three Men loaden with 100 Pounds apiece, will aſcend a pretty ſteep Hill with more Eaſe and Expedition, than a Horſe loaden with 300 Pounds.

Hakewill furniſhes us with abundance of Inſtances of extraordinary *Strength*: *Klunker*, Provoſt of the great Church of *Meſnia* in 1529, carried a Pipe of Wine out of the Cellar, and laid it in the Cart. ---- *Mayolus* ſaw one hold a marble Pillar in his Hand three Foot long, and one in Diameter,

ameter, which he toſs'd in the Air, and catch'd again like a Ball. ---- A little Man of *Mantua*, call'd *Rodamas*, could break a Cable. ---- *Ernando Burgh* fetch'd up Stairs, an Aſs loaden with Wood, and threw both into the Fire. At *Conſtantinople*, in 1581, one lifted a Piece of Wood which Twelve Men could ſcarce raiſe; then lying all along, bore a Stone which Ten Men could but juſt roll on him. ---- *G.* of *Fronsbergh*, Baron of *Mindlehaim*, cou'd raiſe a Man off his Seat with his middle Finger, and ſhove a Cannon out of its Place.— *Cardan* ſaw a Man dance with two Men in his Arms, two on his Shoulders and one on his Neck. *Patacona*, Captain of the Coſſacks, could tear an Horſe-ſhoe; and the ſame is reported of the preſent *Auguſtus* King of *Poland*. ---- On *Putney* Common, is a Stone with an Inſcription, mentioning a Man, who in that Place out-drew Five Horſes in his own Team. ---- A gigantic Woman of the *Netherlands*, could lift a Barrel of *Hamburgh* Beer. Mr. *Carew* had a Tenant that could carry Six Buſhels of Wheat in Meal (of Fifteen Gallons Meaſure) with the Lubber a-top of it. And *J. Roman* of the ſame County, could carry the Carcaſs of an Ox. See *Hakewill's Apology*, *p.* 238.

STRENGTHENERS, ſuch Medicines as add to the Bulk and Firmneſs of the Solids. See SOLIDS and STRENGTH.

Strengtheners differ from Cordials, as a Bandage doth from a Fleſh-bruſh: The latter are ſuch as facilitate and drive on the vital Actions; but the former, ſuch as confirm the Stamina, and maintain the Solids in ſuch a Condition, as to exert themſelves into Action on all proper Occaſions, with the greateſt Force and Vigour.

The continual Waſte, which conſtant Motion makes in the Conſtitution, were it not for frequent and proper Supplies, would ſoon wear the Body quite out. The Attritions and Abraſions of the circulating Fluids, would quickly carry away the Canals in which they circulate, were not ſomewhat furniſhed in their Compoſition, which is ſuited to fall into, adhere with, and recruit that which is waſhed off. And thoſe Particles muſt be much more diſpoſed ſo to do, whoſe Adheſions are greateſt, when once they come into Contact; ſuch are thoſe of Bodies we call Glutinous, and which eaſily form themſelves into Jellies, and ſuch-like Conſiſtences; for the Parts of ſuch Bodies are very light, by the over-proportion of their Surfaces to their Solidities, whereby their Motions are both more languid, when in Circulation; and when they ſtop, their Coheſions will be much the ſtronger, with whatſoever they happen to fall into Contact.

Medicines of this Tribe, are therefore of great Service in Hectics; where the ſwift Motion of a thin, ſharp Blood, wears away the Subſtance of the Body, inſtead of nouriſhing it; for they not only retard the inordinate Motion; but give ſuch a Weight and Conſiſtence to the Juices, as fits them alſo for Nouriſhment. There are likewiſe other Cauſes, which may weaken the Solids, by admitting, or occaſioning them to relax too much. Whatſoever therefore acts as a Stimulus, and criſps and corrugates the Fibres into a more compacted Tone, which moſt auſtere and pointed Bodies do, will remove ſuch Weakneſs, and increaſe Strength: And as alſo, too much Moiſture may contribute to ſuch a Relaxation, what has no other Quality but abſorbing, and drying up ſuch ſuperfluous Humidities, may deſerve, though accidentally, to come under this Denomination.

STRETCH: When at Sea, they are going to hoiſt the Yard, or hale the Sheet; they ſay, *Stretch forward the Sheets*, meaning, that the Part which the Men are to hale by, ſhould be put into their Hands, in order to their Haling.

STRIÆ, in the ancient Architecture, the Liſts, Fillets or Rays which ſeparate the Striges or Flutings of Columns. See LIST and FLUTING.

STRIÆ, among Naturaliſts, the ſmall Hollows or Channels in the Shells of Cockles, Scollops, *&c.*

STRICTOR, in Anatomy, the ſame as *Sphincter*. See SPHINCTER.

STRIGES, in the ancient Architecture, are what in the Modern we call *Flutings*. See FLUTING.

They are thus call'd, as ſuppoſed to have been originally intended to imitate the Folds or Plaits in Womens Robes; which the *Latins* call *Striges*.

The Fillets or Spaces between them, were call *Striæ*.

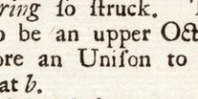
STRIKE, is a Meaſure, containing four Buſhels; two of which make a Quarter. A *Strike* of Flax, is as much as can be heckled at one Handful.

STRIKE, is a Sea Word variouſly uſed. When a Ship in a Fight, or upon meeting with a Man of War, lets down, or lowers her Top-ſails, at leaſt half-Maſt high; they ſay, *She Strikes*, meaning, ſhe yields or ſubmits, or pays her Devoir to that Man of War, as ſhe paſſes by. When a Ship touches Ground in a Shoal-water, they ſay, *She Strikes*.

When any Top-maſt is to be taken down, they ſay, *Strike the Top-maſt*. And when any Thing is let down or lowered into the Hold, they call it *Striking down into the Hold*.

STRIKING. The Puniſhment appointed by our Laws, for *Striking within the King's Court*, whereby Blood is drawn, is, that the Criminal ſhall have his Right Hand ſtruck off, in a moſt ſad and ſolemn Manner.

For *Striking in Weſtminſter-Hall*, while the Courts of Juſtice are ſitting, the Puniſhment is Impriſonment for Life, and Forfeiture of one's Eſtate.



STRING, in Muſic. See CHORD.

If two *Strings* or Chords of a muſical Inſtrument only differ in Length; their Tones, that is, the Number of Vibrations they make in the ſame Time, are in an inverted *Ratio* of their Lengths.

If they only differ in Thickneſs, their Tones are in an inverted *Ratio* of their Diameters. As to the Tenſion of *Strings*, to meaſure it regularly, they muſt be conceived ſtretch'd or drawn by Weights; and then, *cæteris paribus*, the Tones of two *Strings* are in a direct *Ratio* of the Square Roots of the Weights which ſtretch them, that is, *e. gr.* the Tone of a *String* ſtretch'd by a Weight 4, is an Octave above the Tone of a *String* ſtretch'd by the Weight 1.

'Tis an Obſervation of an old ſtanding, that if a Viol or Lute-*ſtring* be touch'd with the Bow, or Hand, another *String*, on the ſame, or another Inſtrument, not far from it, if in Uniſon to it, or in Octave, or the like, will at the ſame Time tremble of its own accord. See UNISON.

But it is now found, that not the whole of that other *String* doth thus tremble; but the ſeveral Parts, ſeverally, according as they are Uniſons to the whole, or the Parts of the *String* ſo ſtruck. Thus ſuppoſing A B to be an upper Octave to *ac*, and therefore an Uniſon to each half of it ſtop'd at *b*.

If while *ab* is open, A B be ſtruck, the two Halves of this other, that is *ab* and *bc* will both tremble; but the middle Point will be at reſt; as will be eaſily perceived, by wrapping a bit of Paper lightly about the *String ac*, and removing it ſucceſſively from one End of the *String* to the other. In like manner, if A B were an upper Twelfth to *ac*, and, conſequently, an Uniſon to its three Parts *a* 1, 1 2 and 2 *c*; if *ac* being open, A B be ſtruck, its three Parts *a* 1, 1 2 and 2 *c* will ſeverally tremble; but the Points 1 and 2 remain at Reſt.

This, Dr. *Wallis* tells us, was firſt diſcover'd by Mr. *William Noble* of *Merton* College; and after him by Mr. *T. Pigot* of *Wadham* College, without knowing that Mr. *Noble* had obſerved it before. To which we may add, that M. *Sauveur*, long afterwards, propoſed it in the *Royal Academy* at *Paris*, as his own Diſcovery, as 'tis like enough it might: But upon his being inform'd, by ſome of the Members then preſent, that Dr. *Wallis* had publiſh'd it before, he immediately reſign'd all the Honour thereof.

STRING-*Halt*, is a ſudden twitching or ſnatching up of an Horſe's hinder Leg, much higher than the other, as if he trod on Needles; generally befalling the beſt mettled Horſes.

It frequently happens upon taking Cold, after hard Riding, or ſore Labour; eſpecially by waſhing them when too hot, which chills the Blood, and ſo benumbs the Sinews, as to take away the Senſe and Feeling of the Member.

To Cure it, the middle Vein is taken up above and underneath the Thigh; under which is found a *String*, which is to be cut away, and the Part anointed with Butter and Salt.

STROAKING, a Method of Cure ſome People have given into, in certain Diſeaſes; conſiſting in a mere Application of the Hand to the Part affected, in the way of Friction or Rubbing.

That Friction has very conſiderable Uſes in many Diſeaſes, is allow'd. See FRICTION.

But, as to the particular Efficacy of the *Stroak* of particular Perſons; we ſee little Foundation for it in Nature. Experience, indeed, affords ſome; to which we don't know what to object.

Mr. *Thoresby*, in the *Philoſophical Tranſactions*, gives ſeveral remarkable Inſtances of Cures perform'd by that famous *Stroaker*, Mr. *Greatrix*. Mr. *Thoresby*'s own Brother being ſeiz'd with a violent Pain in his Head and Neck; Mr. *Greatrix* coming accidentally thither, gave immediate Eaſe to his Head, by only *Stroaking* it with his Hand: He then fell to *ſtroak* his Back; whence the Pain immediately fled to his Right Thigh: Then he purſued it with his Hand to the Knee, from thence to the Leg, Ancle, Foot, and at laſt to the great Toe, where it grew more violent; but upon rubbing there, it vaniſh'd.

Another Relation of the ſame Author having a great Pain and Weakneſs in her Knees, which occaſion'd a white Swelling, that had hung to her ſeveral Years, in ſpight of all Means; the ſame *Stroaker* rubbing both her Knees, gave her preſent Eaſe, the Pain flying downwards from his Hand, till he drove it out of the Toes, after which the Swelling ſoon went abſolutely away.

Mr. *Thoresby*

Mr. *Thoresby* gives various other like Inſtances, all among his Acquaintance; and adds, That when Mr. *Greatrix ſtroaks* only for Pains, he uſes nothing but his Hand; but that for Ulcers, or running Sores, he uſes Spittle on his Hand or Fingers. See TOUCHING.

STROPHE, in the *Greek* and *Latin* Poetry, a Stanza, or certain Number of Verſes including a perfect Senſe; ſucceeded by another, conſiſting of the ſame Number and Meaſure of Verſes, in the ſame Diſpoſition and Rythmus, call'd the *Antiſtrophe*.

What the *Couplet* is in Songs, and the *Stanza* in Epic Poetry; *Strophe* is in Odes. See COUPLET.

The Word is *Greek*, στροφὴ of στρέφω, I turn; becauſe at the End of the *Strophe*, the ſame Meaſures returned again; or rather, as the Term related, principally, to the Muſic or Dancing, becauſe at firſt coming in, the Chorus or the Dancers turn'd to the Left, and that Meaſure ended, they turn'd back again to the Right.

STRUCTURE, in Architecture. See BUILDING.

STRUMÆ, in Medicine, Tumours ariſing moſt uſually on the Neck; call'd alſo *Scrophulæ*, and, popularly the *Evil*, or *King's Evil*. See EVIL.

The Word is *Latin*, form'd, as ſome will have it, *a ſtruendo*; becauſe they grow inſenſibly, *Structim aſſurgunt*.

The *Greeks* call them χοιράδες, Sores.

STUC, in Maſonry, from the *Italian Stucco*, &c. a Compoſition of Lime and the Duſt of white Marble, pounded together and ſifted; whereof Figures and other Ornaments of Sculpture are made.

This is what *Pliny* means by *Marmoratum Opus*; and *Albarium Opus*. See PLAISTER and MOSAIC.

STUFF, in Commerce, a general Name for all Kinds of Works made of Gold, Silver, Silk, Wooll, Hair, Cotton or Thread, manufactured on the Loom; of which Number are *Velvets*, *Brocades*, *Mohairs*, *Sattins*, *Taffeta's*, *Cloths*, *Serges*, *Rateens*, and various other Kinds; explain'd under their reſpective Articles of this *Dictionary*.

STUFF is particularly uſed, for certain Kinds of ſlight woollen *Stuffs*, uſed principally for Linings and Womens wear, as *Linſeys*, *Rateens*, &c.

STUM, is the Flower of Wine, ſet a working. See WINE, MUST, &c.

Hence to *Stum*, is to put certain Ingredients into ſick and decay'd Wine, in order to revive it, and make it briſk.

STUMBLING, in the Manage, &c. a Vice in a Horſe, either natural or accidental.

The *Natural* ariſes from the Sinews of the fore Legs being ſomewhat too ſtraight, which cramps the Horſe, and prevents his uſing his Legs with the neceſſary Freedom and Nimbleneſs.

The Way to cure him, is to cut him of the Cords, *i. e.* to make a Slit on the Top of his Noſe, and with a Cornet, to raiſe up the great Sinews, to cut them aſunder, and heal them up again with a proper Salve. The *Accidental* ariſes from a Splint, Wind-gall, being founder'd, prick'd, ſtubbed, gravel'd, &c.

STUPIFIERS, in Medicine, the ſame as Narcoticks and Opiates. See OPIATES.

STUPHA, or STUPE, the ſame as Fomentation. See FOMENTATION.

STUPOR, a Numbneſs, occaſioned by any accidental Bandage that ſtops the Motion of the Blood and nervous Fluids, or by a Decay in the Nerves, as in a Palſy, &c.

STYGIAN *Liquors*, a Term ſome Chymiſts apply to acid Spirits, from their Efficacy in deſtroying or diſſolving mixt Bodies. See SPIRIT.

STYLE, a kind of Point, or Bodkin, wherewith the Ancients wrote on Plates of Lead, or on Wax, &c. and which is ſtill uſed to write on Ivory Leaves, and Paper prepared for that Purpoſe, &c. See WRITING.

This is the Origin of all the other Significations of the ſame Word in *Engliſh*.

STYLE, in Chirurgery, is a long Steel Inſtrument, that goes diminiſhing towards one End, ſo as to be of a conical Form.

'Tis uſed to be thruſt in red-hot, in *Canulæ*, and to be pull'd out again, immediately: 'Tis put in and drawn out ſucceſſively, as often as is neceſſary. In order to do this, 'tis good to have two *Styles*, to be put in alternately. See CANULA.

STYLE, in Dialling, the Gnomon or Cock of a Dial, rais'd on the Plane thereof, to project a Shadow. See GNOMON.

STYLE, in Botany, the Part riſing up the middle of a Flower, and bearing, by its lower Part, on the Seed.

This we more uſually call the *Piſtil*. See PISTIL.

STYLE, in Matters of Language, is a particular manner of delivering a Man's Thoughts in Writing, agreeably to the Rules of *Syntax*; or, as *F. Buffier* more accurately defines it, the Manner where the Words conſtructed according to the Laws of *Syntax*, are arranged among themſelves, ſuitably to the Genius of the Language. See LANGUAGE.

This Definition fixes the Notion of *Style* to ſomething determinate, which before was very vague and arbitrary, whence many Authors, even of Note, confounded it with *Syntax* itſelf. See SYNTAX.

From the Definition, it appears, that *Style* ſuppoſes or includes the *Syntax*; and that *Syntax* does not extend ſo far as *Style*: For the *Syntax* may be very juſt, where the *Style* is wretched, were it only in this Example; *God always rewards with great Fidelity, and greater Liberality, the Juſt*: Or this, *There is no Body, who more than I honour you.*

The Regimens and Terminations of each Word, are perfectly juſt in each of theſe Phraſes: There is no Fault then, in the *Syntax*; but there is ſomething wanting in the Arrangement of the Words, to make them in the Genius of the Language; there is a Fault then, in the *Style*.

Indeed, againſt what particular Rule of Grammar the Fault is committed, 'tis ſcarce poſſible to determine preciſely; the Taſte and Uſe of a Language being ſo exceedingly delicate and precarious. 'Tis true, a Fault in *Style*, is not leſs a Fault againſt Grammar, than is a Fault in *Syntax*; Only the former is leſs preciſe and palpable than the latter.

A very common Error in Grammarians, *F. Buffier* adds, is to confound two Kinds of *Styles* in one: The *Grammatical Style*; or that directed by the Rules of Grammar; and the *Perſonal Style*, which depends leſs on the Grammar, than on the Perſon that writes; whether with regard to his particular Taſte and Genius, or with regard to his Matter, or the Kind or Character of his Work.

There are a great many Differences between the Two; the moſt eſſential is, that the one may be diverſified an infinite Number of Ways, and the other cannot.

In effect, the *Perſonal Style* is naturally variable, according to the different Genius's, Humours, and Complexions.

'Tis the Imagination that acts, that conceives, that propoſes, and that expreſſes Things, according to its Character, which is different in all Men, and which is to be varied, according to the particular Kind of the Work.

Hence ariſes the *Gay*, the *Grave*, the *Florid*, the *Jejune*, the *Copious*, the *Conciſe*, the *Poetical*, the *Epiſtolary*, the *Burleſque Styles*.

Theſe *Perſonal Styles* are all Independant on the *Grammatical*; and we have Authors, who excel in the one, yet are miſerably defective in the other. The *Perſonal Style* is not under the Direction of Grammar; but of the Imagination, or rather of Rhetoric, that Art having to do directly with our Thoughts, as Grammar with our Words.

This, however, may be ſaid, That Grammar is far from being able to vary the ſame Words of a Phraſe with equal Perfection; and that generally there is but one Way of delivering them in the Taſte and Genius of the Language. Thus, the *Grammatical Style*, is invariable in the following Phraſe, and proportionably in others. *Death is a Law, which all Men are to undergo:* For you cannot well range the Words otherwiſe than they here are, without going out of the Bounds of Grammar. Would you ſay, *a Law is Death, which all Men*, &c. or, *a Law is Death, which*, &c.

But in the *Perſonal Style*, where the Imagination comes to be concern'd, this Sentence might be varied infinite Ways, according to the Kind of the Writing, whether Oratorial, Poetical, &c. As, *Death neither ſpares the Prince nor the Peaſant. Death knocks equally at the Monarch's Palace and the Beggar's Hut*, &c.

STYLE, in Oratory and Poetry, is reſtrain'd wholly to what *F. Buffier* calls the *Perſonal Style*.

Language refers principally to the Matter of the Diſcourſe, *viz.* the *Words*; *Elocution* to the particular Members or Parts thereof; and *Style*, to the whole Compoſition.

The Maſters of the Art, reduce the Kinds of *Style* to Three, the *Sublime*, the *Low*, and the *Intermediate* or *equable Style*.

The *Sublime*, is that conſiſting in magnificent Words and Sentences; which, by its noble Boldneſs, raviſhes the Hearers, and extorts Admiration even from the Unwilling. See SUBLIME.

The *low* or *ſimple Style*, is that ordinarily uſed in ſmaller and humbler Works, as Epiſtles, Dialogues and common Diſcourſe. The chief Virtues hereof are Perſpicuity, Smoothneſs, Eaſineſs and Cleanneſs; it muſt be very ſparing in the Uſe of Tropes and Figures, eſpecially the more violent ones, as the *Proſopœia*, *Apoſtrophe*, &c.

The *intermediate*, *equable Style*, partakes of the Magnificence of the *Sublime*, and the Simplicity of the *Low*. It neither riſes to the Majeſty of the one in Words or Sentences; nor yet is ſmartly pointed like the other: But, as *Tully* excellently expreſſes it, *Eſt Stylus quidam interjectus, intermedius, & quaſi temperatus; nec acumine inferioris, nec fulmine utens ſuperioris, vicinus amborum, in neutro excellens utriuſque particeps.*

The ſame Author calls it the *Florid* and *Poliſh'd Style*; it being in this that all the Graces and Beauties of Language are principally to be uſed.

For the Choice of *Style*, in the General, 'tis the Matter is to determine it. Such *Style*, says *Cicero*, is to be chosen, as expresses great Things magnificently, middle Things moderately, and low Things subtly: But more particularly as there are three Branches of the Duty of an Orator, to teach, to delight, and to move; the *simple Style* is used to teach, the Middle to delight, and the Sublime to move.

Again, the *simple* or *low Style* is fit for Comedy, the Sublime for Tragedy, and the Middle for History.

Cæsar, 'tis true, rather used the *Simple* than the *Intermediate Style*; but then he wrote Commentaries, not a History, as is observed by *Tully*.

Again, the *simple Style* is fit for Bucolicks and Eclogues, the *intermediate Style* for Georgicks, and the *Sublime* for Epicks; which triple Difference we easily descry in *Virgil*, though he sometimes mixes them all in the *Æneid* itself, using the *simple Style* in the Fifth Book, where he describes Games, and the *Intermediate* in the Beginning of the Poem. Care is still to be taken, that the *Style* be not *flat* and *dull*, on pretence of being *simple*.

M. *Boileau* observes, that in all Languages a mean Thought express'd in Noble Terms, is better liked than the noblest Thought express'd in mean Terms: The Reason he gives, is, that every Body can't judge of the Force and Justness of a Thought; but scarce any Body but perceives the Meanness of the Words. The latter we find by our Senses, the former by our Reason.

He adds, That the Words in different Languages don't always answer justly to one another; and that a noble *Greek* Term can't frequently be express'd in another Language, but by a very mean one.

This we see in the Words *Asinus* in *Latin*, *Ane* in *French*, and *Ass* in *English*, which are the meanest imaginable, in those three Languages; yet the Word expressing that Animal, has nothing mean in it, either in *Greek* or *Hebrew*, but is used in the finest and noblest Passages.

Add to this, that Languages are exceedingly capricious on this Head: A Bull, a Heifer, a Goat, a Boar, &c. may be used in the sublimest Passages, without debasing the *Style*; but a Cow, a Sheep, a Hog, a Sow, &c. would be intolerable. Shepherd and Herdsman, are fine Words; Hog-keeper and Cow-ward, which carry the same Ideas, vitious to the last Degree.

The chief Faults in *Style*, are, its being *tumid* and *swollen*; or *cold* and *puerile*; or *stiff* or *loose*; or *dry* and *jejune*. A *swollen Style*, is that immediately stuff'd with big Words and Sentences; such are those Verses of the Emperor *Nero*, ridiculed by *Persius*.

Torva mimalloneis implerunt Cornua Bombis
Et raptum Vitulo caput ablatura superbo
Bassaris, & lyncem mœnas flexura Corymbis, &c.

A *cold* or *puerile Style*, is that which affects certain trifling Ornaments, cold Jests, remote and strain'd Allusions, redundant Descriptions, &c. Such, *e. gr.* as, *A Centaur's riding himself*: *More golden than Gold*, &c. Of this Vice, that Passage of *Virgil* seems guilty.

Num Capti potueri capi? Num incensa cremavit
Troja Viros?

And that in *Plutarch*, and *Dion Cassius*; *'Twas no wonder* Diana's *Temple should be burnt the Night* Alexander *was born*; *as that Goddess, attending at so great a Birth, could not be in the Way to extinguish the Flames.* And that in *Plautus*, where a Person is represented so exceedingly covetous, that he would invoke *Heaven and Earth, if he saw but a Grain of Smoak escape out of his Cottage.*

A *loose Style*, is that which wanting Articles, Numbers, &c. fluctuates here and there, not connected or hung together. This is a Fault so frequent, especially in young Writers, that we shall spare giving Instances of it.

A *dry jejune Style*, is that destitute of Ornament, Spirit, &c.

The Ancients made a notable Distinction of *Styles*, into *Laconic* and *Asiatic*.

Asiatic Style, is that which is very diffusive and prolix; or where abundance of Words are used to express a little Matter: Thus call'd, by the *Greeks*, from the People of *Asia*, who affected such Redundancies, in Opposition to the

Laconic Style, which is distinguish'd by its exceeding Conciseness; and by comprehending a deal of Matter under a few Words. See LACONIC.

Such, *e. gr.* is that Answer returned by the *Lacedæmonians*, to a long Epistle of an Enemy, threatning to destroy them with Fire and Sword; ἤν, *si*, *if*; that is, Do *if* you can: Or, that return'd by the same to King *Philip*, demanding some extravagant Thing of them, οὐ, *non*, *no*. Or that of *Cleomenes* the *Spartan* General to the Ambassador of *Samos*; *As to what you have said, the first Part I don't remember, the middle I don't understand; the last I don't approve.* Or that Epistle of *Archidamus* to the *Elei*, who were preparing War against him; *Archidamus to the Elei*: *'Tis good to be quiet.* Or that of *Cæsar* to the *Roman* Senate, after his conquering *Pharnaces*, King of *Pontus*: *Veni, vidi, vici*; I came, I saw, I conquer'd.

STYLE, in *Jurisprudence*, the particular Form, or Manner of Proceeding in each Court or Jurisdiction, agreeably to the Rules and Orders establish'd herein. Thus we say, the *Style* of the Court of *Rome*, of the Court of *Chancery*, of Parliament, of the Privy Council. See CHANCERY, &c.

STYLE, in Music, the manner of Singing and Composing.

The *Style* is, properly, the manner each Person has, either of Composing, of Performing or Teaching; which is very different, both in respect of the different Genius's of Countries and Nations, and of the different Matters, Places, Times, Subjects, Expressions, &c.

Thus we say, the *Style* of the *Charissimi*, of *Lully*, of *Lambert*; the *Style* of the *Italians*, the *French*, the *Spaniards*, &c. The *Style* of gay Pieces of Music, is very different from that of serious Pieces: The *Style* of Church Music, very different from Theatrical Music. The *Style* of the *Italian* Compositions, is poignant, florid, expressive; that of the *French* Compositions, natural, flowing, tender, &c.

Hence, the various Epithets, given to distinguish these various Characters; as, the ancient and modern *Style*, the *Italian* and *German Style*, the Ecclesiastical and Dramatic *Style*, the gay, grave, majestic, natural, soft, familiar, gallant, low, sublime *Styles*, &c.

The *Stylo Recitativo* or *Dramatico*, in the *Italian* Music, is a *Style* fit to express the Passions. The *Stylo Ecclesiastico* is full of Majesty, very grave, and fit to inspire Devotion.

Stylo Motectico, is a various, rich, florid *Style*, capable of all Kinds of Ornaments, and, of consequence, fit to express various Passions, particularly Admiration, Grief, &c.

Stylo Madrigalesco, is a *Style* proper for Love, and the other softer Passions.

Stylo Hyperchematico, is a *Style* proper to excite Mirth, Joy, Dancing, &c. and, of consequence, full of brisk, gay Motions.

Stylo Symphoniaco, is a *Style* fit for Instrumental Music: But as each Instrument has its particular Effect, there are as many different *Symphonical Styles*. The *Style* of Violins, for Instance, is usually Gay; that of Flutes Melancholy and Languishing, and that of Trumpets, Sprightly and Animated.

Stylo Melismatico, is a natural, artless *Style*, which any Body, almost, may sing.

Stylo Phantastico, is a free, easy, humorous Manner of Composition, far from all Constraint, &c.

Stylo Choraico, is the *Style* proper for Dancing; and is divided into as many different Kinds, as there are Dances; as the *Style* of Sarabands, of Minuets, of Gavots, of Rigadoons, &c.

STYLE, in Chronology, a particular Manner of accounting Time, with regard to the Retrenchment of Ten Days from the Calendar, in the Reformation made thereof under Pope *Gregory* XIII.

Style is either *Old* or *New*.

The *old Style*, is the *Julian* Manner of Computing, which obtains in *England* and some other Protestant States, who refused to admit of the Reformation. See JULIAN.

The *new Style* is the *Gregorian* Manner, followed by the Catholicks, in consequence of that Reformation. See GREGORIAN.

Hence, there arose a Difference of Ten Days, between the *Old Style* and the *New*, the latter being so much before-hand with the former: So that when the Catholicks, *e. gr.* reckon'd the 21st of *May*, we only reckon'd the 11th.

This Difference of Ten Days, was increased in the Year 1707, to 11 Days, by reason that Year was not the *Bissextile* in the *Old Style*, but was, in the *New*: So that the 10th Day of the one, corresponded to the 21st of the other.

There are several Places, however, where the *new Style* has begun to obtain, even among Protestants; and 'tis not unlikely, that the *old Style* may, in Time, dwindle quite away. At the Diet of *Ratisbon* in 1700, it was decreed, by the Body of Protestants of the Empire, that Eleven Days should be retrenched from the *old Style*, to accommodate it for the future to the *New*. And the same Regulation has since pass'd in *Sweden* and *Denmark*. *England* holds out, almost alone, for the *old Style*. See CALENDAR.

STYLET, STILETTO, a little, dangerous Poniard, which is hid in the Hand, and chiefly used in treacherous Assassinations.

The Blade is usually Triangular, and so slender, that the Wound it makes, is almost imperceptible.

The *Stylet* is strictly prohibited in all well Policy'd States.

STYLITES, an Appellation given to a kind of Solitaries, who spend their Life, seated on the Tops of Columns, to be the better disposed for Meditation, &c. See SOLITARY.

Of these, we find several mention'd in ancient Writers, and even as low as the IXth Century. The Founder of the Order

Order was St. *Simon Stylites*, a famous Anchorite in the Vth Century; who firſt took up his Abode on a Column Six Cubits high; then on a Second of 12 Cubits; a third of 22; and at laſt on another of 36, where he lived ſeveral Years.

The Extremities of theſe Columns were only three Foot in Diameter, with a kind of Rail or Ledge about that reach'd almoſt to the Girdle, ſomewhat reſembling a Pulpit. There was no lying down in it.

The Faquiers or devout People of the *Eaſt*, imitate this extraordinary kind of Life to this Day. See FAQUIER.

STYLOIDES, in Anatomy, an Apophyſis of the *Os petroſum*, thus call'd from its reſembling a *Style* or *Stylet*. See PETROSUM *Os*.

STYLOGLOSSUS, in Anatomy, a pair of Muſcles, running off ſharp and fleſhy, from the *Proceſſus Styloides*; whence deſcending obliquely forwards, it is inſerted into the Root of the Tongue. It ſerves to pull the Tongue up in the Action of Deglutition.

STYLOHYOIDEUS, in Anatomy, a pair of Muſcles ſpringing from the *Proceſſus Styloides*, and inſerted into the Baſis and Horns of the *Os Hyoides*; which it draws, laterally, upwards.

STYLOPHARYNGÆUS, in Anatomy, a pair of Muſcles, ariſing round and fleſhy, from the *Proceſſus Styloides*; and which in its oblique Deſcent, becomes thicker, and is afterwards expanded on the back Parts of the Fauces. It ſerves to draw up and dilate the Pharynx.

STYPTIC, in Medicine, a Remedy that has the Virtue of ſtopping Blood, or of binding up the Aperture of a wounded Veſſel. See BLOOD.

The Service, Nettle, *Solomon's* Seal, *&c.* are *Stypticks*.

There are various *Styptic* Waters and Powders of ſurprizing Efficacy, in moſt of which, Vitriol is the principal Ingredient.

The uſual *Styptic Water* is made of Colcothar calcined, or Vitriol diſſolved with burnt Allum, Sugar-candy, the Urine of a young Man, *&c.*

Dr. *Colbatch's Styptic Powder* has been famed; though Mr. *Cowper*, in the *Philoſophical Tranſactions*, gives us a Number of Inſtances, wherein it was applied with very little, or ill Succeſs in human Subjects; though he gives us others made in Dogs where it anſwer'd well.

M. *Tournefort* obſerves, from the Analyſis he has made of *Styptic* and Aſtringent Plants, that Acids and Earths prevail therein; though ſome of them yield an urinous Spirit. On this Principle, he aſſerts, That their Salt is analogous to Allum, and that there is ſomewhat of Sal Ammoniac in their Texture. *Chomel* obſerves, that this does not hold univerſally.

STYRAX, in Medicine. See STORAX.

SUB, a *Latin* Prepoſition, ſignifying *under*; frequently uſed, in Compoſition, in our Language.

Sub-Brigadier, is an Officer in the Cavalry, who commands under the Brigadier; aſſiſting him in the Diſcharge of his Functions. See BRIGADIER.

Sub-Chantor, an Officer in the Choir, who officiates in the Abſence of the Chantor, *&c.* See CHANTOR.

Sub-Dean, a Dignity in certain Chapters beneath the Dean. See DEAN.

Sub-Prior, a Clauſtral Officer, who aſſiſts the Prior, *&c.*

Sub-Deacon, an inferior Miniſter, who anciently attended at the Altar, prepared the Sacred Veſſels, *&c.* and was inveſted with the firſt of the Holy Orders.

According to the Canons, a Perſon muſt be 22 Years of Age, to be promoted to the Order of *Sub-Deacon*.

'Tis diſputed among the *Romaniſts*, whether the *Sub-deaconhood* be a Sacrament or not; in regard *Sub-Deacons* are ordain'd without Impoſition of Hands, and that there is no mention made of them in Scripture. Yet *Bellarmin* holds the affirmative Side of the Queſtion. By the Papal Canons, a married Man may be ordain'd *Sub-Deacon*; upon Condition his Wife conſent to it, make a Vow of Continence, and ſhut herſelf up in a Monaſtery. See DEACON.

SUBALTERN, a *ſubordinate* Officer, or one who diſcharges his Poſt under the Command and Direction of another.

Such are Lieutenants, Sub-lieutenants, Cornets and Enſigns, who ſerve under the Captain.

We alſo ſay *Subaltern* Courts, Juriſdictions, *&c.* Such are thoſe of inferior Lords, with regard to the Lord Paramount, Hundred Courts, to County Courts, *&c.*

For the *Subaltern* Perſons in an Epic Poem, *F. Boſſu* obſerves, there is no Neceſſity to be very ſtrict in preſerving every one's Character. See CHARACTER.

The Patriarchs, M. *St. Evremond* tells us, had ſeveral Wives, who did not all hold the ſame Rank; but there were ſeveral *ſubaltern* to the principal Wife. Grammar we alſo ſay is *ſubaltern* to Rhetoric. The Word is form'd from the *Latin*, *ſub*, and *alter*, another.

SUBCLAVIAN, is applied to any thing under the Armpit or Shoulder; whether Artery, Nerve, Vein or Muſcle.

SUBCLAVIUS, in Anatomy, is a Muſcle that ariſeth from the lower Side of the Clavicula, near the Acromium; and deſcends obliquely to be inſerted into the upper Part of the firſt Rib, near the Sternum.

SUBCONTRARY *Poſition*, in Geometry, is when two ſimilar Triangles are ſo placed, as to have one common Angle, V, (Tab. Geometry Fig. 44.) at the Vertex, and yet their Baſe not parallel.

Thus, if the ſcalenous Cone B V D be ſo cut by the Plane C A, as that the Angle at C=D; the Cone is then ſaid to be cut *Subcontrarily* to its Baſe B A.

SUBCUTANEUS, in Anatomy, a thin membranous Muſcle, running under the Skin, call'd alſo *Quadratus*. It ariſes with a pretty broad Origin, from the hind Part of the Neck, and from the Pectoral Muſcle below the Clavicle. It adheres firmly to the Panniculus Carnoſus; from which it is not ſeparated without Difficulty, and therefore was not anciently diſtinguiſh'd from it; and is inſerted, obliquely, on each Side, into the lower Jaw-bone near the Skin, Lips, and ſometimes the bottom of the Noſe; all which Parts it draws downwards and a-wry.

A Convulſion herein is call'd a *Spaſmus Cynicus*. In ſome Perſons, it reaches to the Ears; and in others not; which is the Reaſon ſome Folks have a Faculty of moving the Ears, which others want.

SUBDUCTION, in Arithmetick, the ſame as Subſtraction. See SUBSTRACTION.

SUBDUPLE *Ratio*, is when any Number or Quantity is contained in another, Twice; thus Three is ſaid to be *Subduple* of 6, as 6 is duple of 3. See RATIO.

SUBJECT, a Perſon under the Rule and Dominion of a Soveraign Prince or State.

Of *Subjects*, ſome are ſo by Birth, others by Acts of Naturalization. Anciently, the Lords call'd, abuſively, thoſe who held Lands or Fees of them, or ow'd them any Homage, *Subjects*.

SUBJECT is alſo uſed for the Matter of an Art or Science; or that which it conſiders, or whereon it is employ'd: Thus the human Body is the *Subject* of Medicine; and in this Senſe, Anatomiſts call the Body they are Diſſecting, and whereon they read Lectures, their *Subject*. See OBJECT.

The *Subject* of Logic, is Thinking or Reaſoning; but more particularly, in a Syllogiſm, one of the Terms of a Propoſition is call'd the *Subject*, and the other the *Attribute*. See PROPOSITION.

In Poetry, the *Subject* is the Matter treated of; the Event related, or ſet in a fine View, and inrich'd with Ornaments.

SUBJECT is alſo the Subſtance or Matter to which an Accident is added. See ACCIDENT.

'Tis a Maxim, That two Contraries can never ſubſiſt in the ſame *Subject*.

SUBJUNCTIVE, in Grammar, the fourth Mood, or Manner of conjugating Verbs; thus call'd, becauſe uſually ſubjoin'd to ſome other Verb, or at leaſt to ſome other Particle, as, *I ſee what you aim at. Though this be true*, *&c.* See MOOD.

The *Greek* is almoſt the only Language that properly has any *Subjunctive* Mood, though the *French*, *Spaniſh* and *Italian* have ſome Shew thereof. In all other Languages, the ſame Inflexions ſerve for the Optative and the *Subjunctive* Moods: For which Reaſon, the *Subjunctive* Mood might be retrench'd from the *Latin* and thoſe other Grammars; it not being the different Ways of ſignifying, which may be very much multiplied, but the different Inflections, that conſtitute the different Moods. See OPTATIVE, *&c.*

SUBLAPSARY, in Theology; or *Infralapſary*; a Term applied to ſuch as hold, that God having foreſeen the Fall of *Adam*, and in conſequence thereof, the Loſs of Mankind; reſolved to give a Grace ſufficient to Salvation to ſome, and to refuſe it to others. See GRACE.

Sublapſary is uſed in Oppoſition to *Infralapſary*. See INFRALAPSARY.

SUBLIMATE, a chymical Preparation, the Baſis whereof is Mercury, or Quick-ſilver. See MERCURY.

There are two Kinds of *Sublimate*, *Corroſive* and *Sweet*.

Corroſive Sublimate, is prepared of Mercury, either crude or revived from Cinnabar, together with Spirit of Nitre, Vitriol lixiviated to a Whiteneſs, and Sea Salt decripitated; the whole reduced into a white brilliant Maſs by *Sublimation*.

Sweet Sublimate, is the ſame with Corroſive, only temper'd and ſweeten'd by the Addition of *Mercurius Dulcis*, and thus reduced into a white Maſs full of hard glittering Pieces, like little Needles, by being paſs'd ſeveral times over the Fire, and through ſeveral Mattraſſes.

To take away all its Malignity, it ſhould be dulcified at leaſt Thrice.

Corroſive *Sublimate* is White, and full of ſhining, cryſtallin Veins. It cannot act, unleſs it find ſome Humidity to act on; and is then a violent Poiſon, which corrodes and deſtroys the Parts of the Body with much Violence. Oil of Tartar *per Deliquium*, is held the beſt Antidote againſt it.

Sweet *Sublimate*, is thus call'd, in Oppoſition to the Corroſive. 'Tis given internally, in the Cure of ſeveral Diſeaſes, particularly Venereal ones. See VENEREAL.

SUBLIMATION, in Chymiſtry, an Operation which differs very little from Diſtillation, excepting, that in Diſtilla-

tion,

tion, only the Fluid Parts of Bodies are raiſed; but in this, the Solid and Dry; and that the Matter to be diſtilled may be either Solid or Fluid; but *Sublimation* is concerned only about ſolid Subſtances. See DISTILLATION.

There is alſo another Difference, namely, that Rarefaction, which is of very great Uſe in Diſtillation, has hardly any Room in *Sublimation*; for the Subſtances which are to be *Sublimed*, being Solid, are incapable of Rarefaction; and ſo it is only Impulſe can raiſe them.

However, it may not be improper to inquire a little more nicely into the Reaſon of ſuch a Diverſity in the Elevation of Bodies; why ſome do aſcend with a gentle Heat, and others are not to be raiſed by the moſt vehement Fire: And ſuch an Enquiry will more properly come in here, becauſe this Head contains all the Buſineſs of Volatility and Fixation. See VOLATILITY and FIXITY.

The Cauſe of this Elevation, and Aſcent in the Particles of Bodies, is to be aſcribed to the Fire; not only on the account of Impulſe, but of another Property the Fire has; namely, to inſinuate itſelf into all the Interſtices of theſe Bodies, and thereby break the Coheſion of their Parts, ſo that at laſt they become divided into very ſmall Parts, if not into the ſmalleſt that Art can reduce them into.

Particles thus ſeparated and divided, loſe much of their Gravity. For the Gravity of the ſame Particle decreaſes in the ſame Proportion as the Cube of the Diameter is leſſened. Suppoſe, therefore, a Body, whoſe Diameter is 12: If, then, its Diameter be made leſs by 1, *viz.* 11, the Gravity of that Body will be only 9 ¼, or thereabouts: A Body, therefore, by being divided into very minute Corpuſcles, is very eaſily *ſublimed*.

Add, that the Surface of a Body decreaſes in a very different Manner from Gravity only as the Square of the Diameter is leſſened. Where the Gravity decreaſes, in ſuch a Series, as is expreſs'd by the Numbers 1728, 1331, 1000, the Diminution of the Surface will obſerve this Proportion, *viz.* 144, 121, 100; and when, upon reducing the Diameter to 6, the Gravity becomes leſs than 2, the Surface will ſtill amount to 36.

How much this contributes to a quick Aſcent, will appear from the *Sublimation* of Camphire, Benzoin and Arſenick; whoſe Particles, as they cohere but looſely, are, for that Reaſon, diffuſed into a larger Surface; upon which account they are the eaſieſt to be *ſublimed* of any; nay, theſe ſolid Particles, upon account of their Surface, will ſooner aſcend than ſome Fluids.

So Flower of Sulphur riſes ſooner than Oil, not only than that of Vitriol, but any other, though ever ſo light.

By this Contrivance of Nature, *viz.* that the Gravity of Bodies decreaſes in a triplicate, but their Surface in a duplicate Proportion of their Diameters; it comes to paſs, that Bodies, which have a very different Gravity, may be raiſed with the ſame Force. Thus the Salts of Animals, as of Harts-horn, human Blood, of Vipers, *&c.* being compoſed of very minute Corpuſcles, as is found by Experience, in diſtilling them, do eaſily aſcend; becauſe the Surface in them, is not leſſened ſo much as the Gravity is; and the Salts of Vegetables, as of Tartar, Balſam, *&c.* which are of a more cloſe Texture, by reaſon of their larger Surfaces, are without much difficulty raiſed.

The Corpuſcles alſo of Minerals and Metals, though very compact and heavy, do, in ſome meaſure, give way to the Fire, and are capable of being *Sublimed*. In all theſe Inſtances, the Breadth of the Surface, which expoſeth the Particles more to the Impetus of the Fire, is the Reaſon why they are raiſed with as much Eaſe, as if their Gravity had been leſſened, by diminiſhing their Surface: So that Particles though ever ſo different in Weight, may be equally raiſed by the ſame Degree of Heat, if the Propoſition of their Gravity be reciprocal to that of their Surfaces.

SUBLIME, in Diſcourſe, ſomething extraordinary and ſurprizing, which ſtrikes the Soul, and makes a Work raviſh and tranſport.

This is what *Longinus*, who has wrote expreſsly on the Subject, means by *Sublime*. The Definition, indeed, is not his, but M. *Boileau*'s; for the Author writing his Book after another of *Cecilius*, on the ſame Subject, employ'd almoſt wholly in ſhewing what the *Sublime* is, declined defining it, as ſuppoſing it well known.

By the Definition, it may appear, that the *Sublime* is a very different Thing from what the Orators call the *ſublime Style*. See STYLE.

The *ſublime* Style neceſſarily requires big and magnificent Words; but the *Sublime* may be found in a ſingle Thought, a ſingle Figure, a ſingle Turn of Words. A thing may be in the *ſublime* Style, and yet not be *Sublime*, *i. e.* have nothing extraordinary and ſurprizing.

For Inſtance: *The Almighty Author of the Univerſe, with a ſingle Word, created Light.* This, now, is in the *ſublime* Style, yet it is not *Sublime*, there being nothing extraordinary in it, which another Perſon might not eaſily hit on. But as *God ſaid, Let there be Light, and there was Light*; ſo extraordinary a Turn of Expreſſion, which ſhews the Obedience of the Creature to the Orders of his Creator, is truly *Sublime*, and has ſomething more than Human.

Longinus makes five Sources of the *Sublime*: The Firſt, a certain Elevation of Mind, which makes us think happily. The Second, in the Pathetic, or that natural Vehemence and Enthuſiaſm, which ſtrikes and moves us: Theſe Two are owing almoſt wholly to Nature, and muſt be born with us; whereas the reſt depend, partly, on Art. The Third is, the turning of Figures in a certain Manner, both thoſe of Thought and of Speech. The Fourth, Nobleneſs of Expreſſion, which conſiſts of two Parts, the Choice of the Words, and the elegant, figurative Diction. The Fifth, which includes all the reſt, is the Compoſition and Arrangement of the Words in all their Magnificence and Dignity. See PATHETIC, *&c.*

SUBLIMING *Pots*. See ALUDELS.

SUBLINGUAL *Glands*, in Anatomy, two Glands under the Tongue, placed on each Side thereof. See TONGUE.

Theſe with the Sipoglottides filtrate a ſerous Humour, of the Nature of Saliva, which they diſcharge by little Ducts nea rthe Gums, into the Mouth.

SUBMULTIPLE, in Geometry, *&c.* a *Submultiple Quantity*, is that which is contained in a certain Number of times in another, and which therefore repeated a certain Number of times, becomes equal thereto. Thus 3 is a *Submultiple* of 21.

In which Senſe, a *Submultiple* coincides with a *Quota Part*. See QUOTA *Part*.

Submultiple Ratio, is that between the Quantity contain'd, and that containing: Thus the *Ratio* of 3 to 21 is *Submultiple*. See RATIO.

In both Caſes, *Submultiple* is the Reverſe of *Multiple*: 21, *e. gr.* being a *Multiple* of 3, and the *Ratio* of 21 to 3 a *multiple Ratio*. See MULTIPLE.

SUBMULTIPLE - - - - -
SUBMULTIPLE *Subſuperparticular*
SUBMULTIPLE *Subſuperbipartiens*
} See RATIO.

SUBNORMAL, in Geometry, a Line which determines the Point in the Axis of a Curve, where a Normal or Perpendicular, rais'd from the Point of Contact of a Tangent to the Curve, cuts the Axis. See CURVE.

Or, the *Subnormal* is a Line, which determines the Point wherein the Axis is cut by a Line falling perpendicularly on the Tangent in the Point of the Contact.

Thus T M (Plate Conicks, Fig. 19.) being a Tangent to a Curve in M; And M R a Normal or Perpendicular to the Tangent; the Line P R intercepted between the Semiordinate P M and the Normal M R, is call'd the *Subnormal*.

Hence, 1°, In a Parabola, as A M, *&c.* the *Subnormal* P R is to the Semiordinate P M, as P M is to P T, and M R to T M.

2° In the Parabola, the *Subnormal* P R is Subduple the Parameter; and, conſequently, an invariable Quantity.

SUBORDINATION, a relative Term, expreſſing the Degree of Superiority or Inferiority, between one thing and another.

There is a Series of *Subordinations* running throughout all Nature. In the Church, there are ſeveral Degrees of *Subordination*, as of Deacons to Prieſts; Prieſts to Prelates, *&c.*

The like are obſervable in the ſecular State; In Offices of War, Juſtice, *&c.* and even

In the Sciences, Trigonometry is *ſubordinate* to Geometry; and in the Virtues, Abſtinence and Chaſtity are *ſubordinate* to Temperance. In Muſic, ſome call the plagal Tones, *ſubordinate Tones*. See TONE.

SUBORNATION, is a ſecret or under-hand preparing, inſtructing or bringing in, a falſe Witneſs, or corrupting or alluring a Perſon to do ſuch a falſe Act.

Hence the *Subornation* of Perjury, mention'd in the Act of General Pardon, 12 *Car.* II. *c.* 8. is the alluring to Perjury. See PERJURY.

SUBPOENA, is a Writ, whereby all Perſons under the Degree of Peerage, are call'd into *Chancery*, in ſuch Caſes, where the Common Law hath made no Proviſion, ſo that the Party can have no Remedy by the ordinary Courſe of Common Law.

The Peers, in ſuch Caſes, are called by the Lord Chancellor's Letter, giving Notice of the Suit intended againſt them, and requiring them to appear.

There is alſo a *Subpœna ad teſtificandum*, for ſummoning of Witneſſes, as well in *Chancery*, as in other Courts.

There is alſo a *Subpœna* in the *Exchequer*, as well in the Court of Equity there, as in the Office of Pleas.

The Name is taken from the Words in the Writ, which charge the Party ſummoned to appear at the Day and Place aſſigned; *Sub pœna centum librarum.*

SUBPOPLITÆUS, in Anatomy. See POPLITÆUS.

SUBREPTION, the Action of obtaining a Favour from a Superior by Surprize, or by a falſe Repreſentation.

Subreption

Subreption differs from *Obreption*, in that *Obreption* is a falſe Expreſſion of the Quality of a Thing or Fact, &c. And *Subreption*, a want of Expreſſion; or a fraudulent Reticency or Concealment of a Thing, which would have render'd the obtaining of the Favour more difficult.

The Word is form'd from the *Latin*, *ſub*, under, and *repo*, I creep.

SUBREPTITIOUS or SURREPTITIOUS, a Term applied to a Letter, Licence, Patent or other Act, fraudulently obtain'd of a Superior, by concealing ſome Truth, which had it been known, would have prevented the Conceſſion or Grant.

The Benefit of Letters, Licences, &c. is forfeited, when they are found contrary to the Informations given; they being then reputed *Subreptitious*.

Papal Bulls and Signatures are Null and *Subreptitious*, when the true State of the Benefice, the Manner of the Vacancy, and other neceſſary Matters, are not juſtly ſignified to the Pope.

Subreptitious differs from *Obreptitious*. See SUBREPTION.

SUBROGATION, in the Civil Law, the Action of ſubſtituting a Perſon in the Place, and intitling him to the Right, of another.

In its general Senſe, *Subrogation* implies a Succeſſion of any Kind; whether of a Perſon to a Perſon, or of a Perſon to a Thing.

There are two Kinds of *Subrogations*, the one *Conventional*, the other *Legal*.

The *Conventional*, is a Contract, whereby a Creditor tranſfers his Debt, with all Appurtenances thereof, to the Profit of a third Perſon.

Legal Subrogation, is that which the Law makes in favour of a Perſon, who diſcharges an antecedent Creditor; in which Caſe there is a legal Tranſlation of all Rights of the ancient Creditor to the Perſon of the new one.

This the Civilians more uſually call *Succeſſion*, as being wholly the Work of the Law, and to diſtinguiſh it from the *conventional Subrogation*, which they alſo call *Ceſſion*. See CESSION.

The Word is form'd from the *Latin*, *Subrogatio*, of the Verb *Rogare*, which, among the ancient *Romans*, ſignified to ask, to interrogate; whence it was, that they call'd the Laws themſelves *Rogationes*, in regard the People made them, upon being *ask'd* by the Magiſtrates. And as Laws made by the People could not be changed without their Conſent, and without being ask'd a-new, if they thought good to have the Law wholly aboliſh'd, *Lex abrogabatur*; if only a Part of it were to be aboliſh'd, *Lex derogabatur*; and if any Clauſe or Amendment were added to it, *Lex ſubrogabatur*.

The new Magiſtrates were alſo *Subrogated* in the Place of the old ones; for during the Time of the Republic, no Magiſtrate could be, but by Conſent of the People, nor, of conſequence, but by Law; ſince whatever the People thought good, was Law. This is what occaſion'd *Salmaſius* to ſay, That *Subrogare* and *Subſtituere per Legem*, were Reciprocals.

SUBSCAPULARIS, in Anatomy, a Muſcle ariſing from the Baſis and Side of the Scapula; and, ſpreading itſelf under the whole Convex, or Under-ſide of it, is inſerted by a Semicircular Tendon, into the Neck of the *Os Humeri*, and draws it down to the Side of the Trunk.

SUBSCRIPTION, the Signature put at the bottom of a Letter, Writing, or Inſtrument. See SIGNATURE.

In Church Hiſtory, we meet with Inſtances of *Subſcriptions*, wrote in the Blood of *Jeſus Chriſt*. *Nicetas*, in the Life of *Ignatius*, ſpeaking of the *Subſcriptions* made at the Council, wherein that Father was depoſed, ſays, They *Subſcribed*, not with common Ink, but, what ſtrikes a Man with Horror, with a Pen dipp'd in the Blood of *Chriſt*. The Hiſtorian *Theophanes*, tells us, That Pope *Theodore* mix'd the Blood of *Chriſt* with the Ink, wherein he wrote the Depoſition of *Pyrrhus*.

SUBSCRIPTION, in the *Engliſh* Commerce, is uſed for the Share or Intereſt, particular Perſons take in a publick Stock, or a Trading Company, by writing their Names, and the Shares they require, in the Regiſter thereof. Half the Commerce in *England* is carried on in *Subſcription*. See COMPANY, BUBBLE, FUND, &c.

The *French* have likewiſe adopted the Word *Subſcription*, uſing it in ſpeaking of the Actions of the *India* Company.

A *Subſcription* differs from an Action; in that the firſt is properly only an Action begun, or an Engagement, by making the firſt Payment, to acquit the reſt in the Time limited; and that the other is the whole Action, preform'd in all its Parts. See ACTION.

SUBSCRIPTION, in the Commerce of Books, particularly ſignifies an Engagement a Perſon enters, to take a certain Number of Copies of a Book going to be printed; and the reciprocal Obligation of the Bookſeller or Publiſher, to deliver the ſaid Copies on certain Terms.

The uſual Conditions of theſe *Subſcriptions*, are, on the Part of the Bookſeller, to afford the Books cheaper to a Subſcriber than to another, by one Third or one Fourth of the Price; and on the Part of this latter, to advance half the Money in Hand, and to pay the reſt on the Delivery of the Copies: An Agreement equally advantageous to the one and the other; as the Bookſeller is hereby furniſhed with Money to carry on Works, which would otherwiſe be above his Stock; and the Subſcriber, as it were, receives Intereſt for his Money, by the moderate Price the Book ſtands him in.

Subſcriptions had their Riſe in *England*, and 'tis but very lately that they are got into other Countries. They were firſt ſet on Foot, in the middle of the laſt Century, for the printing of *Walton*'s Polyglot Bible, which is the firſt Book ever printed *by Way of Subſcription*.

From *England*, they paſs'd a few Years ago into *Holland*, and are juſt now introduced into *France*. F. *Montfaucon*'s Collection of Antiquities, is the firſt Book there publiſh'd by *Subſcriptions*, which were ſo very numerous, that great Numbers were refuſed. The ſame Method has been ſince propoſed, for the Publication of S. *Chryſoſtom* by the Benedictins; but not with equal Succeſs.

All the other Books ſince printed by *Subſcription*, are M. *Dacier*'s Tranſlation of *Plutarch*'s Lives; the Deſcription of *Verſailles*, and F. *Daniel*'s Hiſtory of the *French* Militia.

In *England*, they are become exceedingly frequent; and their Frequency has render'd them liable to ſome Abuſes, which begin to diſcredit them.

SUBSEQUENT, ſomething that comes after another, particularly with regard to the Order of Time. When two Feſtivals happen on the ſame Day, the principal One is celebrated; and the other transferr'd to the *Subſequent* Day, *i. e.* to the Morrow.

SUBSESQUIALTERATE, SUBSUPERPARTICULAR, SUBSUPERPARTIENS } See RATIO.

SUBSIDY, in Law, any Aid, Tax or Tribute granted by Authority of Parliament to the King; on preſſing Occaſions of the State; levied either on Perſons, Lands or Goods. See DUTY.

Such are the Land Tax, as 'tis call'd; which is uſually at the Rate of three or four Shillings in the Pound, for Lands, and of two Shillings and eight Pence for Goods, &c. See TAX.

In the Liſt of *Engliſh* Duties, or Impoſitions, are divers Kinds of *Subſidies*: Old *Subſidy*, Additional Impoſition to the old *Subſidy*. New *Subſidy*, third *Subſidy*; Two-thirds *Subſidy*. See DUTY, CUSTOM, &c.

The ancient *Saxon* Kings had no *Subſidies* collected after the Manner of ours; but in lieu thereof, had ſeveral *Cuſtoms*, whereby they levied Money or perſonal Service on the People, for the Repairing of Cities, Caſtles, Bridges, military Expeditions, &c. which they call'd *Burgbote*, *Brigbote*, *Herefare*, *Heregeld*, &c.

But upon the Lands becoming oppreſs'd by the *Danes*, King *Egelredus* in the Year 1007, agreed to pay them yearly 10000 Pounds for Redemption of Peace, which Sum was afterwards increaſed to 36000 Pounds, and at length to 48000 Pounds, which was call'd *Danegeld*, and was levied on Land; each Hide, or Plough-land, that of the Church only excepted, being ceſs'd 12 Pence. See DANEGELD.

Hence the Tribute came to be call'd *Hydagium*, a Name that afterwards became common to all Taxes and *Subſidies* impoſed on Lands; as thoſe on Cattle, being call'd *Hornegeld*. See HIDAGE.

Both theſe the *Normans* ſometimes call'd from the *Greek*, *Taxes*, and ſometimes from their own Language, *Taillage*, and ſometimes, according to the Cuſtom beyond-Sea, *Subſidia* and *Auxilia*.

After the Conqueſt, theſe *Subſidies* ſeem to have been granted differently from what they now are; as every Ninth Lamb, every Ninth Fleece, every Ninth Sheep, &c. Sometimes the Rate was every Tenth, and ſometimes every Fifteenth, &c. See TENTH, FIFTEENTH, &c. See alſo BENEVOLENCE.

In *France*, the King alone, by his own Authority, impoſes *Subſidies* on his People, at his own Diſcretion. What *Grotius* ſays, that thoſe who pay *Subſidies* to other Soveraigns, to engage them in their Defence againſt powerful Enemies, by ſo doing, acknowledge their own Weakneſs, and that ſuch an Acknowledgment diminiſhes ſomewhat of their Dignity; muſt be underſtood of ſuch States as are too weak to defend themſelves, and who, in reſpect hereof, render themſelves, in ſome meaſure, Tributary; not of ſuch as ſubſiſting by their own Strength, give *Subſidies* to their weaker Neighbours, to prevent their being over-run by others.

Such, *e. gr.* as the King of *France* is, with regard to *Sweden*, and ſeveral other Princes; to whom he generally grants *Subſidies* in the Treaties he concludes with them.

SUBSTANCE, in Phyſicks, ſomething that we conceive to ſubſiſt of itſelf, independantly of any created Being, or any particular Mode or Accident.

Thus a Piece of Wax is a *Subſtance*; becauſe we can conceive it as ſubſiſting of itſelf, and of its own Nature, without any Dependance on any other created Nature, or without any particular Mode, Form, Colour, &c. See MODE.

Spinoſa maintains, that there is but one only *Subſtance* in Nature, whereof all the Creatures are ſo many different Modifications; and thus he makes the Soul of the ſame *Subſtance* with the Body. The whole Univerſe, according to him, is but one *Subſtance*; which *Subſtance*, he holds endow'd with an Infinity of Attributes, in the Number of which are *Thought* and *Extenſion*. All Bodies are Modifications of this *Subſtance*, conſider'd as extended; and all Spirits Modifications of the ſame *Subſtance*, conſider'd as Thought. See BODY and THINKING.

But Mr. *Lock*'s Philoſophy of *Subſtances*, is much more Orthodox: Our Ideas of *Subſtances*, that great Author obſerves, are only ſuch Combinations of ſimple Ideas, as are taken to repreſent diſtinct Things, ſubſiſting by themſelves; in which the confuſed Idea of *Subſtance*, is always the Chief. Thus the Combination of the Ideas of a certain Figure, with the Powers of Motion, Thought and Reaſoning, joined to *Subſtance*, make the ordinary Idea of Man; and thus the Mind obſerving ſeveral ſimple Ideas to go conſtantly together, which being preſumed to belong to one Thing, are call'd, and united in one Subject, by one Name; which we are apt, afterward, to talk of and conſider as one ſimple Idea. See IDEA.

We imagine not theſe ſimple Ideas to ſubſiſt by themſelves; but ſuppoſe ſome *Subſtratum*, wherein they ſubſiſt, which we call *Subſtance*. See SUBSTRATUM.

The Idea of pure *Subſtance*, is nothing but the ſuppoſed, yet unknown Support of theſe Qualities, which are capable of producing ſimple Ideas in us. See QUALITY.

The Ideas of particular *Subſtances* are compoſed out of this obſcure and general Idea of Subſtance, together with ſuch Combinations of ſimple Ideas, as are obſerved to exiſt together, and ſuppoſed to flow from the internal Conſtitution, and unknown Eſſence of that *Subſtance*.

Thus we come by the Ideas of Man, Horſe, Gold, &c. Thus the ſenſible Qualities of Iron, or a Diamond, make the complex Idea of thoſe *Subſtances*, which a Smith, or a Jeweller commonly knows better than a Philoſopher. See DEFINITION.

The ſame happens concerning the Operations of the Mind, *viz.* Thinking, Reaſoning, &c. which we concluding not to ſubſiſt by themſelves, nor apprehending how they can belong to Body, or be produc'd by it; we think them the Actions of ſome other *Subſtance*, which we call Spirit; of whoſe *Subſtance* or Nature we have as clear a Notion, as of that of Body; the one being but the ſuppos'd *Subſtratum* of the ſimple Ideas we have from without; as the other of thoſe Operations, which we experiment in ourſelves within: So that the Idea of *Corporeal Subſtance* in Matter, is as remote from our Conceptions, as that of *Spiritual Subſtance*.

Hence we may conclude, that he has the perfect Idea of any particular *Subſtance*, who has collected moſt of thoſe ſimple Ideas which do exiſt in it; among which, we are to reckon its active Powers and paſſive Capacities, though not ſtrictly ſimple Ideas.

Subſtances are generally diſtinguiſh'd by ſecondary Qualities; for our Senſes fail us in the Diſcovery of primary ones, as the Bulk, Figure, Texture, &c. of the minute Parts of Bodies, on which their real Conſtitutions and Differences depend. See PARTICLE.

But ſecondary Qualities are nothing but Powers, with relation to our Senſes.

The Ideas that make our Complex ones of Corporeal *Subſtances*, are of three Sorts: Firſt, the Ideas of primary Qualities of Things, which are diſcovered by our Senſes; ſuch as Bulk, Figure, Motion, &c. Secondly, the Senſible ſecondary Qualities, which are nothing but Powers to produce ſeveral Ideas in us, by our Senſes. Thirdly, the Aptneſs we conſider in any *Subſtance*, to cauſe or receive ſuch Alterations of primary Qualities, as that the *Subſtance* ſo alter'd, ſhould produce in us different Ideas from what it did before.

Beſides the complex Ideas we have of material *Subſtances*, by the ſimple Ideas taken from the Operations of our own Minds which we experiment in ourſelves as Thinking, Underſtanding, Willing, Knowing, &c. co-exiſting in the ſame *Subſtance*, we are able to frame the complex Idea of a Spirit: And this Idea of an immaterial *Subſtance*, is as clear, as that we have of a Material.

By joining theſe with *Subſtance*, of which we have no diſtinct Idea, we have the Idea of Spirit: And by putting together the Ideas of coherent, ſolid Parts, and Power of being mov'd joined with *Subſtance*, of which likewiſe we have no poſitive Idea; we have the Idea of Matter.

Further, there are other Ideas of *Subſtances*, which may be called *Collective*, which are made up of any particular *Subſtances*; conſidered as united into one Idea, as a Troop, Army, &c. which the Mind does by its Power of Compoſition. Theſe collective Ideas, are but the artificial Draughts of the Mind, bringing Things remote, and independant, into one View, the better to contemplate and diſcourſe of them united into one Conception, and ſignified by one Name. For there are no Things ſo remote, which the Mind cannot, by this Art of Compoſition, bring into one Idea; as is viſible, in that ſignified by the Name Univerſe. See COMPOSITION.

SUBSTANTIAL, or SUBSTANCIAL, in the Schools, ſomething belonging to the Nature of *Subſtance*.

'Tis generally diſputed, whether or no, there be ſuch Things as *ſubſtantial Forms*, *i. e.* Forms independant of all Matter; or Forms that are *Subſtances* themſelves. See FORM.

Subſtantial, is alſo uſed in the ſame Senſe with *Eſſential*, in oppoſition to *Accidental*; in which relation, it gives room for abundance of Diſtinguo's. See ESSENTIAL.

SUBSTANTIVE, in Grammar, a Quality aſcribed to a Noun or Name, when the Object it deſigns, is conſider'd, ſimply, in itſelf, and without any regard to its Qualities. See NOUN.

When the Object is conſider'd, as cloath'd with certain Qualities, the Noun is ſaid to be *Adjective*.

For a more palpable Criterion; All Nouns, to which one cannot add the Word *Thing*, are *Subſtantives*; and all thoſe to which *Thing* may be added, are Adjectives. See ADJECTIVE.

F. Buffier obſerves, 'tis a common Miſtake in Grammarians, to define a Noun *Subſtantive*, to be that which denotes or expreſſes a *Subſtance*.

The Miſtake ariſes hence, that finding all Subſtances expreſs'd by *Subſtantives*, they have call'd all Kinds of Nouns, *Subſtantives*. But it does not follow, that all Nouns deſign Subſtances; witneſs the Nouns *Accident*, *Lightneſs*, &c. which are far from expreſſing Subſtances, and yet are true Nouns *Subſtantives*. Perhaps Grammarians mean nothing here by *Subſtance*, but the Subject ſpoke of: If ſo, the Definition is laudable.

Nouns *Subſtantives* ſometimes, become Adjectives; and Nouns Adjectives become *Subſtantives*. In effect, the Nature of the Adjective being to expreſs the Quality of an Object; if that Quality be the Object itſelf ſpoke of, then, on the Foot of our Definition, it becomes a *Subſtantive*. If, I ſay, a *good Prince*, the Word *good* is apparently an Adjective, becauſe it repreſents the Prince, as cloath'd with the Quality of Goodneſs. But if I ſay, *The Good ought to be prefer'd to the Bad*; 'tis evident, *Good* is the Subject ſpoke of, and, conſequently, a *Subſtantive*.

Indeed, Cuſtom does not allow us to uſe all Adjectives indifferently, as *Subſtantives*; nor all *Subſtantives*, as Adjectives. The Laws regarded herein are as follow;

All Nouns either ſignify an Individual, as *Socrates*, *Alexander*, &c. or a Species, as Man, Horſe, &c. or an eſſential Quality, as Rational, Material; or an accidental one, as Black, White, Good, Fair, &c. or a Dignity, Office, Art, &c. as King, Preſident, Philoſopher, &c.

Thus have we four Kinds of Nouns; whereof the 1° is very rarely taken adjectively; for as they ſignify Individuals or particular Beings, they can ſcarce be applied to any thing but the Thing they properly ſignify: yet we have ſometimes known the Name of *Cato* taken Adjectively; as, *This is to be Cato, indeed.* Nor does *Malherbe* ſcruple to ſay in *French*, *Plus Mars que le Mars de la Thrace.*

2° Proper Names are ſometimes converted into the Name of Dignities, &c. as *Cæſar*, *Auguſtus*, &c. In which Caſe, they may be conſider'd, in the ſame Light, as Nouns of the fourth Kind.

3° Thoſe of the ſecond Kind, are alſo ſometimes taken Adjectively, as, He is much a Man, &c. The third Kind are Adjectives themſelves: For the fourth Kind, all Grammarians rank them among *Subſtantives*; excepting F. *Buffier*, who will have them to be Adjectives; or, to uſe his own Term, *Modificatives*. Be this as it will, they are frequently uſed adjectively; He is more a King, and more a Philoſopher than any of his Predeceſſors.

Now for Adjectives taken *ſubſtantively*, 1° Participles Paſſive, are very rarely thus taken; though we ſometimes ſay, *The Loved are leſs happy than the Lovers: The Taught have the Advantage of the Untaught: The Beſieged made a Salley*, &c. And, 2° Participles Active are taken ſtill more rarely for *Subſtantives*. We ſcarce ever, *e. gr.* ſay the Loving, the Reading; but the Lover, the Reader; yet we ſay Student, the Proteſtant, the Tenant, the Appellant, the Opponent, &c.

3° For Nouns Adjectives, thoſe applied to Men, are not only uſed *Subſtantively*, but are even become *Subſtantives* by Uſe; whether they be ſuch as regard Religion; as Chriſtian, Pagan, Mahometan, &c. Or Opinion; as Stoic, Peripatetic, Carteſian, &c. Or Country; as the *Engliſh*, *French*, *Italians*: Or the Temperament; as the Melancholic, Phlegmatic, Choleric, &c. Under the ſame Rule, are likewiſe comprehended

hended abundance of Adjectives, ſignifying a Number of People agreeing in ſome common Attribute; as, the Learned, the Great, the Devout, the Brave, the Diſſolute, &c. But Uſe is here to be regarded; for we don't ſay the Eloquent, as we ſay the Learned; but Elegant Writers, &c. 'Tis Cuſtom, and the Ear alone, that are to decide about theſe Differences.

Again, Adjectives taken *ſubſtantively*, for other Things beſide Men, are either ſo uſed, to ſignify a Number or Set of Things that have ſome common Quality; or to expreſs an abſtract Quality. In both which, as in thoſe of Men, there are ſome authorized by Cuſtom, and others form'd every Day on their Model.

With regard to which laſt, Uſe, again, and the Ear, are to decide. Here All the Adjectives of Colours, are uſed *ſubſtantively*; as the White, Black, Green, &c. Some of thoſe of Qualities; as the Cold, &c. Thoſe of Time; as the Paſt, Preſent, Future: And many of other Matters; as the Agreeable, the Sublime, the Principal, &c. Nor is it only in the Poſitive, but alſo in the Comparative and Superlative Degrees, that Adjectives are uſed *ſubſtantively*; as, The *better of the two*: *The beſt of it*, &c.

SUBSTITUTE, a Perſon appointed to officiate for another, in caſe of Abſence, or other legal Impediment.

In the *French* Law, the *Procureurs*, or Proctors, are obliged to name two of their Brethren for *Subſtitutes*, whoſe Names are wrote after theirs in the Liſt; to receive Significations and Summons's made in their Abſence.

The Word is form'd from the *Latin*, *ſub*, under, and *ſtatuo*, I appoint, eſtabliſh.

SUBSTITUTE, in Medicine, a Drug, or Remedy that may be uſed in lieu of another; or that ſupplies the Place of another of like Virtue, which is not to be had; call'd alſo a *Succedaneum*. See SUCCEDANEUM.

The Root of the great Centaureum, and ſometimes Monk's Rhubarb, are uſed as *Subſtitutes* to Rhapontic.

SUBSTITUTION, in Grammar, the uſing of one Word for another; or a Mode, State, Manner, Perſon or Number of a Word for that of another. This the Grammarians otherwiſe call *Syllepſis*. See SYLLEPSIS.

SUBSTITUTION, in the Civil Law, a Diſpoſition of a Teſtator, whereby he *Subſtitutes* one Heir to another, who has only the Uſu-fruit, and not the Property of the Thing left him.

Subſtitution is a kind of Inheritance, call'd *Fiduciary*, or *Fidei-commiſſio*, in regard the immediate Inheritor has only the Uſe or Fruit of the Thing; the Body thereof being ſubſtituted and affected to certain Perſons, who are likewiſe to have the Uſu-fruit in their Times, but never the Property. In ſome Countries, the *Subſtitution* is perpetual; in *France*, it only holds to the fourth Generation.

Subſtitution anſwers to *Remainder*, in our common Law. See REMAINDER.

Among the *Romans*, there were abundance of theſe Fiduciary Heirs; who enjoy'd Inheritances, till they returned them into the Hands of the right Heir; and the Reaſon why they did not likewiſe reſtore the Fruits, or that the Fruits were not deem'd to make a Part of the Inheritance, but only of the Thing, was, that the Fiduciary was obliged to run the Risks, and to ſtand the Charge of the Culture of the Land.

SUBSTITUTION, in Algebra, Fractions, &c. is the putting in the Room of any Quantity in an Equation, ſome other Quantity, which is equal, but expreſs'd after another Manner. See QUANTITY.

SUBSTRACTION, in Arithmetic, the ſecond Rule, or rather Operation, in Arithmetic; whereby we deduct a leſs Number from a greater, to learn the preciſe Difference:

Or, more juſtly, *Subtraction* is the finding of a certain Number from two Homogeneous ones given; which, with one of the given Numbers, is equal to the other. See ARITHMETIC.

The Doctrine of *Subſtraction* is as follows;

To ſubſtract a leſs Number from a greater.

1° Write the leſs Number under the greater, in ſuch Manner, as that homogeneous anſwer to homogeneous Figures, *i.e.* Unites to Unites, Tens to Ten, &c. as we have directed under ADDITION. 2° Under the two Numbers, draw a Line. 3° *Subſtract*, ſeverally, Unites from Unites, Tens from Tens, Hundreds from Hundreds; beginning at the right Hand, and proceeding to the Left; and write the ſeveral Remainders in their correſpondent Places, under the Line. 4° If a greater Figure come to be *ſubtracted* from a leſs; borrow an Unite from the next Left-hand Place; this is equivalent to 10, and added to the leſs Number, the *Subſtraction* is to be made from the Sum: Or if a Cypher chance to be in the next Left-hand Place, borrow the Unite from the next further Place. By theſe Rules, any Number may be *ſubtracted* out of another greater. For Example;

If it be required, from	9800403459
To *Subtract*	4743865263
The Remainder will be found	5056538196

For, beginning with the right Hand Figure, and taking 3 from 9, there remains 6 Unites, to be wrote underneath the Line: Going then to the next Place, 6 I find, can't be taken from 5; wherefore, from the Place of Hundreds 4, I borrow one, which is equivalent to Ten, in the Place of Tens; and from the Sum of this 10 and 5, *viz.* 15, *ſubtracting* 6, I find 9 Tens remaining, to be put down under the Line. Proceeding to the Place of Hundreds, 2 with the 1 borrowed at the laſt Place, make 3, which *ſubtracted* from 4, leave 1. Again, 5 in the Place of Thouſands, cannot be *ſubtracted* from 3; for which Reaſon, taking one from 4, in the Place of Hundreds of Thouſands, into the empty Place of Tens of Thouſands, the Cypher is converted into Ten Tens of Thouſands, whence one Ten being borrowed, and added to the 3, and from the Sum 13 Thouſand, 8 Thouſand being *ſubtracted*, we ſhall have 8 Thouſand to enter under the Line: Then *ſubtracting* 6 Tens of Thouſands from 9, there remain 3. Coming now to take 8 from 4; from the 8 further on the Left, I borrow one, by means whereof, the two Cyphers will be turned each into 9. And after the like Manner, is the reſt of the *Subſtraction* eaſily perform'd.

If heterogeneous Numbers be to be *ſubſtracted* from each other; the Unites borrow'd, are not to be equal to Ten; but to ſo many as there go of Unites of the leſs Kind, to conſtitute an Unite of the Greater. For Example;

l.	*s.*	*d.*
45	16	6
27	19	9
17	16	9

For ſince 9 Pence cannot be *ſubſtracted* from 6 Pence; of the 16 Shillings, one is converted into 12 Pence; by which means, for 6 we have 18 Pence; whence 9 being *ſubtracted*, there remains 9. In like Manner, as 19 Shillings cannot be *ſubtracted* from the remaining 15; one of the 45 Pounds is converted into 20 Shillings, from which, added to the 15, 19 being *ſubtracted*; the Remainder is 16 Shillings. Laſtly, 27 Pounds *ſubtracted* from 44 Pounds, there remains 17.

If a greater Number be required to be *ſubtracted* from a leſs, 'tis evident the Thing is impoſſible. The leſs Number, therefore, in that Caſe, is to be *ſubtracted* from the greater; and the Defect to be noted by the negative Character. *E. gr.* If I am requir'd to pay 8 Pounds, and am only Maſter of 3; when the Three are paid, there will ſtill remain 5 behind; which are to be noted, 5.

Subſtraction is prov'd, by adding the Remainder to the *Subtrahend*, or Number to be *ſubſtracted*: For if the Sum be equal to the Number whence the other is to be *ſubtracted*, the *Subſtraction* is juſtly perform'd: For Example;

		l.	*s.*	*d.* *q.*	
9800403459		156	11	3 ¼	
4743865263	Subtrahend	21	17	2 ½	Subtrahend
5056538196	Remainder	134	14	0 ¾	
9800403459		156	11	3 ¼	

SUBSTRACTION, in Algebra, is perform'd by connecting the Quantities with all the Signs of the Subtrahend changed; and at the ſame time uniting ſuch as may be united; as is done in Addition. Thus $+7a$ *ſubſtracted* from $+9a$, makes $+9a - 7a$ or $2a$.

In the *Subſtraction* of Compound algebraic Quantities; the Characters of the Subtrahend, are to be changed into the contrary ones, *viz.* $+$ into $-$; and $-$ into $+$. See QUANTITY.

To Subſtract ſpecious Numbers, or Quantities from one another; both thoſe affected with the ſame, and thoſe with contrary Characters.

1° If the Quantities deſign'd by the ſame Letter, have the ſame Signs; and the leſs be to be *ſubſtracted* from the greater; the *Subſtraction* is perform'd as in common Arithmetic, *e. gr.*

$5b$	$+4d$	$-f$	$=5ſh.+4p.-¼$
$2b$	$+d$	$-f$	$=2ſh.+1p.-¼$
$3b$	$3d$	-0	$3-+3p.\ 0$

2° If a greater Quantity be to be *ſubſtracted* out of a leſs; the leſs muſt be *ſubſtracted* out of the greater, and to the Remainder, muſt be prefix'd the Sign $-$, if the Quantities be affected with the Sign $+$; or the Sign $+$, if they be affected with $-$.

$$\begin{array}{rrrr} 16a+bb-9d & =16\,lib. & +2\,ſh. & -9\,d. \\ 19a+3b-11d & 19 & +3 & -11 \\ \hline -3a-1b+2 & -3 & -1 & +2 \end{array}$$

3° If the Quantities have different Signs; the *Subſtraction* is converted into Addition, and to the Aggregate is prefix'd the Sign of the Quantity, whence the *Subſtraction* is to be made: For Example;

$$\begin{array}{rr} 8a-5c+9d & =8\,lib.-5+9\,d \\ 6a-8c-7d & =6\quad -8-7 \\ \hline 2a+3c+16d & =2\,lib.+3+16 \end{array}$$

4° If the Quantities be expreſs'd in different Letters; they muſt be connected; only the Characters of the *Subtrahend* muſt be changed into the contrary ones: For Example;

$$\begin{array}{rr} a+b-c & a+d \\ d-e+f & c-e-g \\ \hline a+b-c-d+e-f & a+d-c+e+g \end{array}$$

SUBSTRACTION *of Logarithms*, SUBSTRACTION *of Vulgar Fractions*, SUBSTRACTION *of Decimals* } See { LOGARITHM. FRACTIONS. DECIMALS.

SUBSTRUCTION, in Building. See FOUNDATION.

SUBSTYLAR *Line*, in Dialling, a right Line, whereon the Style or Gnomon of a Dial is erected. See GNOMON.

In Polar, Horizontal, Meridional and Northern Dials, the *Subſtylar* Line is the Meridian Line, or Line of 12 a Clock; or the Interſection of the Plane, whereon the Dial is delineated, with that of the Meridian. See MERIDIAN.

In Eaſterly and Weſterly Dials, the *Subſtylar* Line, is the Line of Six a Clock; or the Interſection of the Plane, whereon the Dial is delineated, with the prime Vertical. See DIAL.

SUB-TANGENT, of a Curve, is the Line that determines the Interſection of the Tangent with the Axis; or, that determines the Point wherein the Tangent cuts the Axis, prolonged. See CURVE.

Thus, in the Curve A M, &c. (Tab. Analyticks, Fig. 10.) the Line T P intercepted between the Semiordinate P M, and the Tangent T M, is the *Sub-tangent*. And P R is to P M, as P M to P T; and P M to P T, as M R to T M.

'Tis a Rule in all Equations, that if the Value of the *Sub-tangent* come out poſitive, the Point of Interſection of the Tangent and Axis, falls on that Side of the Ordinate, where the Vertex of the Curve lies; as in the Parabola and Paraboloides.

If it come out Negative, the Point of Interſection will fall on the contrary Side of the Ordinate, in reſpect of the Vertex or beginning of the Abſciſſe; as in the Hyperbola, and Hyperboliform Figures.

And, univerſally, in all Paraboliform, and Hyperboliform Figures, the *Sub-tangent* is equal to the Exponent of the Power of the Ordinate, multiplied into the Abſciſs. Thus in the common Parabola, whoſe Property is $px=yy$. The *Subtangent* is in Length, equal to x, the Abſciſs multiplied by 2, the Exponent of the Power of yy, the Square of the Ordinate; that is, it is equal to twice the Abſciſs; and by the former Rule for Paraboliform Figures, it muſt be taken above the Ordinate, in the Axis produced.

Thus, alſo, in one of the cubical Paraboloids, where $pxx=yyy$. The Length of the *Sub-tangent* will be $\frac{3}{2}$ of the Abſciſs. Thus in the Figure, you will ſee that the *Subtangent* in any Curve is a Line, which determines the Interſection of the Tangent in the Axis.

SUBTENSE, in Geometry, a right Line, oppoſite to an Angle, and preſumed to be drawn between the two Extremities of the Arch, which meaſures that Angle. See ARCH.

The *Subtenſe* of the Angle coincides with the Chord of the Arch. See CHORD.

In every rectangle Triangle, the Square of the *Subtenſe* of the right Angle, is equal to the Squares of the *Subtenſes* of both the other Angles; by the 47th *Prop.* of *Euclid*. This wonderful Property of that Triangle, was firſt diſcover'd by *Pythagoras*, who in the Tranſport of Joy, hereby occaſion'd, ſacrificed a Hecatomb. See TRIANGLE.

The Word is form'd from the *Latin*, *ſub*, under, and *tendo*, I ſtretch.

SUBTERRANEOUS, ſomething under Ground. See FOSSIL.

Naturaliſts talk much of *Subterranean Fires*, as the Cauſe of Volcano's. See FIRE and VOLCANO.

Subterranean Winds, as the Cauſe of Earthquakes. See EARTHQUAKE.

Mr. *Boyle* gives us an Inſtance, from the Diſſertation *de Admirand. Hungar. Aquis*, of a huge *Subterraneous* Oak dug out of a Salt Mine in *Tranſylvania*, ſo hard, that it could not eaſily be wrought on by Iron Tools; which yet, being expoſed to the Air out of the Mine, became ſo rotten, that in four Days, it was eaſy to be broken and crumbled between one's Fingers.

Mr. *Derham* adds, That the Trees turned out of the Earth, by the Breaches at *Weſt Thurrock* and *Dagenham*, though probably no other than Alder, and interred many Ages ago, in a rotten, oozy Mould, were ſo exceedingly tough, hard and ſound at firſt, that he could make but little Impreſſions on them with the Strokes of an Ax; yet being expoſed to the Air and Water, ſoon became ſo rotten, as to be crumbled between the Fingers.

SUBTILE, in Phyſicks, intimates a Thing exceedingly ſmall, fine, and delicate; ſuch as the Animal Spirits, &c. the Effluvia of odorous Bodies, &c. are ſuppoſed to be. See EFFLUVIA.

One kind of Matter is only more *ſubtile* than another, in that being divided into ſmaller Parts, and thoſe, too, more agitated; on the one hand, it makes leſs Reſiſtance to other Bodies; and on the other, inſinuates itſelf more eaſily into their Pores.

The *Carteſians* ſuppoſe a *ſubtile Matter* for their firſt Element. See CARTESIANISM and ELEMENT.

This they lay down as ſo exceedingly Fine, that it penetrates the minute Pores of Glaſs and other ſolid Bodies; and from this they account for moſt of the Phænomena of Nature. See VACUUM, PLENUM, SUCTION, &c.

Yet they don't pretend to prove the Exiſtence of this Matter, otherwiſe than by Conſequence. See MATERIA *Subtilis*.

SUBTILE *Matter*. See MATTER.

SUBTILIZATION, the Act of *ſubtilizing*, or rendering any thing ſmaller and *ſubtiler*; particularly, the diſſolving or changing a mixt Body into a pure Liquor, or a fine Powder.

SUBTRIPLE *Ratio*, is when one Number or Quantity is contain'd in another three times; thus 2 is ſaid to be *Subtriple* of 6, as 6 is Triple of 2. See RATIO.

SUBURBICARY, an Epithet given to thoſe Provinces of *Italy*, &c. which compoſed the ancient Dioceſe or Patriarchate of *Rome*. See PROVINCE.

The Term is form'd from the *Latin*, *ſub*, under, and *urbs*, City. They were alſo ſometimes call'd *Urbicary* Provinces.

Authors uſually reckon Ten of theſe *Suburbicary* Provinces; whereof *Italy*, from the *Po* to the *Heel* made Seven, and the Iſles of *Sicily*, *Sardinia*, and *Corſica*, the other Three.

Yet *Salmaſius* will have the *Suburbicary* Provinces confined to thoſe Four in the Neighbourhood of *Rome*, to which the Authority of the Præfect of *Rome* extended; and theſe he makes the Limits of the Dioceſe of ancient *Rome*. See DIOCESE.

F. *Sirmond* takes the other Extreme, and comprehends all the *Weſt* under the Name of *Suburbicary* Provinces. *Rufinus*, who lived in the Age of the Council of *Nice*, explains the Power aſcribed to the Pope, in the Sixth Canon of that Council, by ſaying, That he had the Care and Intendance of the *Suburbicary* Provinces. Hence, the different Sentiments of Authors, with regard to the *Suburbicary* Provinces; ſome only conſidering the Pope as Biſhop of *Rome*; others, as Patriarch of the *Weſt*, &c.

SUCCEDANEUM, in Pharmacy, a Remedy ſubſtituted in the Place of another firſt preſcribed, when the Ingredients are wanting, neceſſary for the Compoſition of that other. See SUBSTITUTE.

Subſtitute and *Succedaneum*, are of equal Import, unleſs, with ſome Authors, we chuſe to uſe *Subſtitute*, where a Simple of like Virtue is put for another; and *Succedaneum*, where a Compound is uſed with the ſame Intention.

The Word is form'd from the *Latin*, *Succedo*, to ſucceed, to come after.

SUCCENTURIATÆ, in Anatomy. See RENES *Succenturiatæ*.

SUCCENTURIATION, the Act of Subſtituting. See SUBSTITUTION.

SUCCENTURIATUS, in Anatomy, a Muſcle, call'd alſo *Pyramidalis*. See PYRAMIDALIS.

SUCCESSION, in Philoſophy, an Idea we get, by reflecting on that Train of Ideas conſtantly following one another in our Minds when awake. See IDEA and MODE.

The Diſtance between any Parts of this *Succeſſion*, is what we call *Duration*. When this *Succeſſion* of Ideas ceaſes, we have no Perception of Time or Duration thereof; but the Moment we fall aſleep, and that wherein we awake, ſeem connected. See DURATION.

They, who think we get the Idea of *Succeſſion* from our Obſervation of Motion by our Senſes, will come into Mr. *Lock*'s Sentiment, above, when they conſider that Motion produces an Idea of *Succeſſion* no otherwiſe, than by producing a continued Train of diſtinguiſhable Ideas.

A Man that looks on a Body moving, perceives no Motion, unleſs that Motion produce a conſtant Train of *ſucceſſive* Ideas. But where-ever a Man is, though all Things be at

at reſt about him, if he Thinks, he will be conſcious of *Succeſſion*.

SUCCESSION, in Aſtronomy. The *Succeſſion of the Signs*, is the Order wherein they follow each other, and according to which, the Sun enters, ſucceſſively, into one, then into another, call'd, alſo, *Conſequence*. This Order is expreſs'd in the two following Technical Verſes;

Sunt Aries, Taurus, Gemini, Cancer, Leo, Virgo
Libraque, Scorpius, Arcitenens, Caper, Amphora, Piſces.

When a Planet is direct, it is ſaid to go according to the Order and *Succeſſion of the Signs*, that is, from *Aries* to *Taurus*, &c. when Retrograde, it is ſaid to go contrary to the *Succeſſion of the Signs*, *viz.* from *Gemini* to *Taurus*, then to *Aries*, &c. See SIGN.

SUCCESSION, in Law, implies a Right to the Univerſality of the Effects left by a Defunct.

Of this, there are ſeveral Kinds, *ab-inteſtate*, *inteſtate*, &c.

A *Succeſſion*, *ab-inteſtate*, is that, a Perſon has a Right to by being next of Kin, which is, what we call, being next Heir at Law. See AB-INTESTATE.

A *teſtamentary Succeſſion*, is that, a Perſon comes to by Virtue of a Will.

Succeſſion in the direct Line, is that, coming from Aſcendants or Deſcendants. *Collateral Succeſſion*, is that, coming by Unkles, Aunts, or other Collaterals.

A *jacent* or *abandon'd Succeſſion*, is a burthenſome or vexatious One, which no Body will accept of. There is no real *Succeſſion* in Benefices; for here, no Body Inherits. *Succeſſions* were anciently divided into Noble and Baſe.

In Effects, that cannot be divided, as Kingdoms, &c. the *Succeſſion* falls on a ſingle Head, which is uſually the eldeſt Son of the Deceaſed, as being ſuppoſed an indiviſible Repreſentative of his Father. In Effects, that are divided, all the Children repreſent their Father. 'Twas on this Principle, M. *Courtin* obſerves, that each of the Sons of *Jacob* had his Share aſſign'd him in the Land of *Promiſe*. 'Tis true, *Manaſſah* and *Ephraim*, the two Sons of *Joſeph*, had likewiſe their Shares; but this was becauſe a double Portion had been allotted their Father, wherein he was treated as elder Brother, in conſideration of the great Services he had done his Father and Brethren.

SUCCESSOR, a Perſon who has a Right to hold the Place another held before him; whether he arrive at it by Election, Collation, Inheritance, or otherwiſe.

Our Hiſtorians tell us, that Queen *Elizabeth* could never bear to hear of a *Succeſſor*. The King of the *Romans* is Preſumptive *Succeſſor* to the Empire. The Canoniſts ſay, a Coadjutor is a neceſſary *Succeſſor* to a Prelature; a Reſignatary to the Reſignant.

The Civilians ſay, a Titular Uſu-fructuary, can do nothing to the Prejudice of his *Succeſſor*.

SUCCINUM, in Pharmacy, *Karabe* or *Amber*; a bituminous Juice or Reſin, which from a Fluor grows hard and brittle. See AMBER.

The Whiteſt, and moſt Tranſparent, is accounted beſt; it is of no great Uſe in Medicine, *per ſe*, as its Texture ſeems too compact to open and yield to the natural Elaborations; though ſome have a great Opinion of it, as a Balſamick, and gave it in Gonorrhœa's particularly.

But it is certain, that what Pharmacy extorts from it, is of wonderfull Efficacy, eſpecially in nervous Caſes.

SUCCISA, a medicinal Herb, call'd alſo *Morſus Diaboli*, or the *Devil's Bit*.

'Tis a powerful Sudorific, inſomuch that Sir *Theodore Mayerne* obſerves, in the *Philoſophical Tranſactions*, laying a Perſon ſick of a Plague, or other malignant Fever, on a Bed thereof, moderately hot; he ſhall ſweat 'till they take him off; and much more, if he drink of the Decoction or Juice of the Herb. The *Succiſa* is now little uſed.

SUCCOTRINE *Aloes*. See ALOES.

SUCCUBUS or SUCCUBA, a Term uſed to ſignify a *Dæmon*, who aſſumes the Shape of a Woman, and, as ſuch, lies with a Man.

Some Authors uſe *Incubus* and *Succubus*, indiſcriminately; but they ought to be diſtinguiſh'd; *Incubus* being only properly uſed, where the Dæmon is ſuppoſed to be in Form of a Man, and, as ſuch, lies with a Woman. See INCUBUS.

SUCCULA, in Mechanicks, a bare Axis, or Cylinder, with Staves in it to move it round, without any Tympanum. See AXIS.

SUCCUS *Pancreaticus* } See { PANCREATIC *Juice*.
SUCCUS *Nervoſus* } See { NERVOUS *Juice*.

SUCKERS or Off-ſets, in Agriculture, Gardening, &c. are young Shoots, that proceed from the Root of a Tree, and are of the ſame Kind and Nature with the Tree from which they ſpring; for ſuch as grow from Trees raiſed by Grafting or Inoculation, follow the Nature of the *Stock*. See ENGRAFTING.

They ſometimes put forth near the Body of the Mother-Plant; but other *Suckers* at more Diſtance are beſt; yet the former removed when there is leaſt Sap in the Top, and preſerving what Fibrous Roots are upon them, often proſper well. When they are taken up, the Ground is to be well opened, and if they grow from the Body of the Tree, or great Roots, they muſt be cut off cloſe to the Stem, and ſet preſently. See STOCK.

It forwards much the ſpringing out of *Suckers*, to bear the Roots of Trees, and ſlit them in ſome Places.

SUCKING-*Pump*. See PUMP.

SUCTION, the Act of *Sucking*, or of drawing up a Fluid, as Air, Water, &c. by the Mouth and Lungs.

Air is *ſuck'd* in by the Muſcles of the Thorax, and Abdomen, diſtending the Cavity of the Lungs and Abdomen, by which means the Air included therein, is rarified, and ceaſes to be a Counterbalance to the external Air, which, of conſequence, is driven in by the Preſſure of the Atmoſphere through the Mouth and Noſtrils. See RESPIRATION.

Air is ſuck'd through a Pipe, in the ſame Manner as with the naked Mouth: It being here all one as if the Mouth were extended the Length of the Pipe.

The *Suction* of heavier Liquors is perform'd after the ſame Manner, *e.gr.* in lying prone to drink out of a Spring, &c. the Lips are applied cloſe to the Surface of the Water, ſo as to prevent any Paſſage of the Air between them; then the Cavity of the Abdomen, &c. being diſtended as before, the Preſſure of Air incumbent on the Surface of the Water without the Circumference of the Mouth, prevailing over that upon the Water within the ſame, the Fluid is raiſed, from the ſame Principle as Water in a Pump. See PUMP.

In ſucking a heavy Liquor, as Water, through a Pipe, the longer the Pipe is, the greater Difficulty is found in the *Suction*; but the Bigneſs or Diameter of the Pipe, makes no Alteration therein. The Reaſon of this, ariſes from the great Principle in Hydroſtaticks, that Fluids preſs according to their perpendicular Altitudes. See FLUID.

For, as the external Air raiſes Columns of the Fluid with greater or leſs Difficulty, as their Altitudes are leſs, not as their Thickneſſes are ſo; if two ſuch Columns be conceived, the one twice as high as the other, and that other twice as thick as this firſt; though the very ſame Quantity of Water is to be ſuck'd through the Pipe, and the Force of the Air to raiſe it be exactly the ſame, in both Caſes; yet there will be required a greater Diſtenſion of the Breaſt, and a greater Niſus of the Muſcles, to raiſe and ſuck the former than the latter.

From what we have ſaid, it evidently enough appears, that what we call *Suction*, is not perform'd by any active Faculty in the Mouth, Lungs, &c. but is perform'd by the mere Impulſe and Preſſure of the Atmoſphere. See AIR.

SUCULA or SUCCULA, is a Term in Mechanicks, for a bare Axis or Cylinder, with Staves in it, to move it round; but without any Tympanum or Peritrochium.

SUDAMINA, little Pimples in the Skin, like Millet Grains, frequent in Youth, eſpecially thoſe of a hot Temperament, and that uſe much Exerciſe.

SUDATORY, a Name given by the ancient *Romans*, to their Sweating-houſes; ſometimes alſo call'd *Laconica*.

The *Sudatory* was a Species of their *Hypocauſta*. See HYPOCAUSTUM.

SUDOR, in Medicine. See SWEAT.

SUDOR *Anglicanus*, or the *Engliſh Sweat*, is an Epidemic Diſeaſe, firſt perceived in *England*, in 1485.

'Twas, properly, a ſort of Plague; thus call'd, becauſe attended with an extraordinary kind of Sweat.

It made its Return four Times in the Space of 66 Years, *viz.* in 1506, 1517, 1528 and 1551.

It began with a Sweat, which never ended, but either with the Death of the Patient, or his Recovery. If he ſurvived 24 Hours, he was ſafe. Few People eſcaped of it at firſt; too much Care, and too little, were found equally deſtructive.

The Patient was to wait, without ſtirring, either in his Bed, or in his Cloaths, according to the Condition Nature was ſurprized in; without burthening him either with Remedies or with Foods; without cloathing either too much or too little; and, if poſſible, without either eating or drinking. The Sweat to be kept up, without either promoting it, by any extraordinary Heat, or checking it by the leaſt Cold.

This was what was found by Experience; and which was at length practiſed, with happy Succeſs. The Diſeaſe was firſt felt on the 21ſt of *September*, and in the ſame Day, ſpread itſelf all over *England*; where, after a great Mortality, it ſtopp'd all at once, towards the End of *October*.

Its Ravages were ſo great, that in ſome Parts, it took off a Third Part of the People, in a very little Time.

At its Return under *Henry* VIII. in 1516, it was as general, and as dangerous as before, and again diſappeared all at once.

At the third Attack, in 1528, 'twas leſs fatal; inſomuch that *Bellay*, Biſhop of *Bayonne*, then Ambaſſador in

England, who Sweat like the reſt, tells us, that of Forty thouſand Souls, ſeiz'd with it in *London*, only Two thouſand died. In 1534, it paſs'd over into *Ireland*, where it kill'd great Numbers.

SUDORIFIC, in Medicine, a Remedy that cauſes, or promotes Sweat. See SWEAT.

Sudorificks only differ from *Diaphoreticks*, in the Degree of their Action; the one promoting ſenſible Perſpiration, the other inſenſible. See DIAPHORETICKS.

To the Claſs of *Sudorificks*, belong, 1°, all Things that moving violently through the Body, attenuate the Humours, and accelerate their Motion.

2° Such Things, as at the ſame Time diminiſh the Reſiſtance in the Sudatory Veſſels about the Cutis.

To which ſome add a third Kind, *viz.* ſuch as abſorb the Acidities of the Blood, and thus ſet at liberty the Matter of the Sweat.

The firſt Intention is chiefly effected, by a copious drinking of very hot Waters; by Acids drawn from Vegetables by Fermentation and Diſtillation; or thoſe of Foſſils, attenuated by repeated Diſtillations; eſpecially if theſe be drunk mix'd with hot Water; by *Alcali*'s, both volatile and fix'd, diluted with hot Water; by all compound *Salts*, diſſolved in Water; by Sapa's, metallic Cryſtals, or the attenuated Parts of Metals themſelves, as *Stibium Diaphoreticum*, *fix'd Sulphur* of Tachenius; *Bezoardic Mineral*, *Diaphoretic Mercury*, *Diaphoretic Gold*, *&c.* by ſharp, ſubtile, acrimonious Aromaticks, as *Abſynthium*, *Abrotonum*, *Opium*, *Aſparagus*, *Anis*, *Aſclepias*, *Ariſtolochia*, *Gum Ammoniac*, *Carduus Benedictus*, *Caraways*, *Cinnamon*, *Camomile*, *Saffron*, *Capillus Veneris*, *China*, *Dittany*, *Eupatorium*, *Gentian*, *Hyſſop*, *Laurel*, *Mint*, *Leek*, *Roſemary*, *Sage*, *Savin*, *Saſſafras*, *Scordium*, *Thyme*, *Veronica*, *Nettle*, and other Medicines compounded hereof, as *Treacle*, *Mithridate*, *Diaſcordium*, *Orvietan*, *&c.*

The Second is chiefly effected, by cleanſing the Skin, by *vaporous Lotions*, *Baths*, and *Frictions*; by relaxing the Cutaneous and Subcutaneous Veſſels, which is beſt done by hot Water ſprinkled all over the Body, the Head excepted; by increaſing the external Heat about the naked Body, as by the Warmth of a Bed, a Vapour-bath, *&c.*

The Third is effected by Abſorbents, as *Corals*, *Crabs-Eyes*, *Diaphoretic Antimony*, *Bezoard*, *&c.* See each under its proper Article.

SUET, a kind of Fat, found in Sheep, Oxen, Hogs, *&c.* which melted down and clarified, makes what we call *Tallow*, uſed in the making of Candles. See FAT and TALLOW.

Anatomiſts, *&c.* diſtinguiſh four Kinds of Fat in the Body of an Animal. The firſt, which fixes itſelf, and after melting, cools into a very firm Conſiſtence, they call *Suet*.

'Tis found in greateſt Abundance in the lower Belly, and about the Kidneys. The Word is form'd from the *Latin*, *Suedum*, *a Sue*.

F. *le Compte* mentions a Tree in *China*, that bears *Suet* or Tallow. 'Tis much about the Height of our Cherry Tree: Its Fruit is cover'd with a Rind, which divides into 3 Segments of a Sphere, which when ripe, open in the middle like a Cheſnut, and ſhew Three white Grains, of the Size of our Small-nuts. The Fleſh, or Pulp of theſe Grains, which include a little Stone, has all the Qualities of our *Suet*, the Colour, Smell, Conſiſtence, *&c.* and accordingly they make Candles of it; after firſt melting it down with a little Oil of Olives, to make the Paſte the ſofter and more manageable.

SUFFICIENT, in the School Theology. *Sufficient Grace*, is a Help or Aſſiſtance God gives to Man, to enable him to act and perform his Duty. See GRACE.

'Tis allowed an Article of Faith, that Grace is neceſſary, and that without Grace, nothing that is Good, or that can any way intitle to Heaven, can be done: Tis allow'd too, that God does not refuſe the neceſſary Aſſiſtances; and 'tis allow'd, that Man, frequently, either does not act, when he ſhould, or acts what he ſhould not.

From theſe Principles, which are generally admitted by all Sects, however different in other reſpects, it follows, that there is ſome Aſſiſtance of God which Man reſiſts; ſome, wherewith Man does not act, wherewith yet he might act; or ſome, whereby he does Evil, by which he might do well. 'Tis this Aſſiſtance that is call'd *Sufficient Grace*; becauſe *ſufficing* to make us act, though we don't act with it.

SUFFITUS, or SUFFIMENTUM, in Medicine, a thickiſh Powder, *&c.* prepared of odoriferous Plants, Gums, *&c.* which being thrown on Coals, the Vapours or Steam thereof, are received by Smelling. See FUMIGATION.

SUFFOCATION, in Medicine, *&c.* a Loſs or Obſtruction of Reſpiration.

Suffocations ſometimes ariſe from a too great Abundance of Blood thrown on the Lungs, or the Muſcles of the Larynx, and preventing the Ingreſs of the Air; as is the Caſe in Squinancies, *ſuffocating* Catarrhs, Peripneumonies, *&c.* See SQUINANCY, *&c.*

The Fumes of Wines, or ſtrong Beers, when boiling, cauſe *Suffocation*, by interrupting the Circulation of the Blood. And the ſame may be obſerved of the Fumes of Lime, wherewith Walls are whitened; and thoſe of Charcoal, Antimony, Sulphur, Vitriol and Spirit of Nitre.

The *Suffocation* under Water, is owing partly to the Paſſage of the Air being ſtopp'd up, and partly to the Irruption of the Water into the Breaſt. See DROWNING.

The *Suffocation of the Womb or Matrix*, is a Diſeaſe pretty frequent in Women, call'd alſo, *Fits of the Mother*.

In this, the Patient imagines a malignant Vapour riſing from the Matrix, and ſo preſſing againſt the Lungs and the Diaphragm, as to prevent the free Motion neceſſary to Reſpiration.

Its true Cauſe, is a Convulſion of the Muſcles of the Larynx, which ſtraighten the Wind-pipe, and prevent the Air's paſſing into the Lungs. Hence it is, that Hyſteric Women feel Conſtrictions in the Throat, as if one were ſtrangling them with a Cord. See HYSTERIC.

In *France*, they diſpatch their People that are raving Mad, by *ſuffocating* them between two Pillows.

SUFFRAGAN, in the Eccleſiaſtical Polity, a Term applied to a Biſhop, with reſpect to his Arch-Biſhop, on whom he depends, and to whom Appeals are made from the Biſhop's Official. See BISHOP.

In this Senſe, the Archbiſhop of *Canterbury* has Twenty-one *Suffragans*; and the Archbiſhop of *York* Four.

The Term was never heard of before the VIIIth Century.

Some diſtinguiſh between *Biſhop* and *Suffragan* thus: *Dicuntur Epiſcopi qui Archiepiſcopo* Suffragari *& aſſiſtere tenentur*: *Et* Suffraganei *dicuntur quia eorum* Suffragiis *cauſæ Eccleſiaſticæ judicantur*. *Spelman*. Others ſay, they are call'd *Suffragans*, becauſe when call'd by the Metropolitan to a Synod, they have a Right of *Suffrage* or of Voting; or becauſe they could not be conſecrated without his *Suffrage* and Conſent.

SUFFRAGAN is alſo uſed for a *Chorepiſcopus*, or an Aſſiſtant-Biſhop, or a Coadjutor, who has a Title, *in partibus infidelium*, and aſſiſts another in the Diſcharge of his Function, or diſcharges it himſelf in the Abſence of that other. Theſe ſome call *Subſidiary Biſhops*.

By Statute 36 *Henry* VIII. every Biſhop and Archbiſhop is allowed to appoint, ſome one, ſome two, and ſome three *Biſhops-Suffragans*; the Seats or Reſidences whereof, are fix'd by the ſame Statute.

The *Suffragan-Biſhop* for the Dioceſe of *Canterbury*, to be at *Dover* only; for *York*, at *Nottingham* and *Hull*; for *London*, at *Colcheſter*; for *Winchester*, at *Guilford*, *Southampton*, and in the Iſle of *Wight*, *&c.*

Du Cange obſerves, that the Title *Suffragan* has alſo been given to ſuch Prieſts as are ſubject to the Viſitation of the Arch-deacon: And *Suffragans of the Pope*, to the Biſhops of ſuch Dioceſes, as are immediately ſubject to the Pope.

SUFFRAGE, a Voice or Vote, given in an Aſſembly, where ſomething is deliberated on, or where a Perſon is elected to an Office or Benefice. See VOTE.

Suffrages are ſometimes given by Word of Mouth; and ſometimes in Writing, as at Elections lyable to a Scrutiny. See SCRUTINY.

The Preſident of the Aſſembly uſually collects the *Suffrages*.

The Word is form'd from the *Latin*, *Suffragium*, which anciently ſignified *Silver*, as appears in the VIIIth Novel of *Juſtinian*: *Ut Judices ſine* Suffragio *fiant*; and the VIth Novel: *Qui emerit præſulatum per* Suffragium, *Epiſcopatu & Ordine Eccleſiaſtico excidat*.

Suffrages of the Saints, in the *Romiſh* Church, are the Prayers and Interceſſions they are ſuppoſed to make to God, in behalf of the Faithful.

SUFFERANCE, in ancient Cuſtoms, was a Delay, or Reſpite of Time the Lord granted his Vaſſal, for the Performance of Fealty and Homage; ſo as to ſecure him from any feodal Seizure. See SERVICE, VASSAL, FEE, *&c.*

Sufferance, ſay the Cuſtoms, is equivalent to Fealty and Homage, while it holds.

The Word is alſo uſed for a Delay which the Lord grants his Vaſſals, to free their Hands of Fees or Inheritances they have acquired, till they have pay'd the Due of Indemnity, *&c.*

SUFFRUTEX, among Botaniſts, a Name given to a low, woody, perennial Species of Plants, ſending out no Leaves from its Root, and beginning to be branched from the very bottom of the Stalk; ſuch as Lavender, Rue, Sage, *&c.* See PLANT, TREE, *&c.*

SUFFUMIGATION, in Medicine, a Term applied to all Remedies that are received into the Body in form of Fumes, *i. e.* of Smoak or Perfumes. See SMOAK.

Theſe are compoſed of different Matters, according to the Nature of the Diſeaſe.

Suffumigations are intended to ſoften ſharp, ſerous Humours, to provoke or check the Courſe of the Menſes, to raiſe a Salivation in venereal Evils, *&c.*

The Word is form'd from the *Latin*, *ſub*, under, and *fumus*, Smoak.

SUFFUSION,

SUFFUSION, in Medicine, an overflowing of ſome Humour, ſhewing itſelf in the Skin; particularly that of the Blood or Bile. See BLUSHING.

That Redneſs ordinarily ariſing from Shame, is only a *Suffuſion* of Blood appearing in the Cheeks.

The Jaundice is a *Suffuſion* of Bile over the whole Body. See JAUNDICE.

SUFFUSION is alſo uſed for a little Film or Pellicle, form'd in the aqueous Humour of the Eye, before the Pupil; call'd, alſo, *Cataract*. See CATARACT.

SUGAR, *Saccharum*, a very ſweet, agreeable Juice, expreſs'd from a kind of Canes, growing in great Plenty in the *Eaſt* and *Weſt Indies*; particularly in *Madera*, *Braſil* and the *Caribbee* Iſlands.

'Tis a Queſtion not yet decided among the Botaniſts, *&c.* whether the Ancients were acquainted with this Cane, and whether they knew how to expreſs the Juice from the ſame? What we can gather from the Opinions and Arguments of the one Party and the other; is, That if they knew the Cane and the Juice, they did not know the Art of Condenſing, Hardening and Whitening it, and, of conſequence, knew nothing of our *Sugar*.

Some ancient Authors ſeem to mention *Sugar*, under the Name of *Indian Salt*; but they add, that it ooz'd out of the Cane of itſelf; and there harden'd like a Gum; and was even friable between the Teeth, like our common Salt; whereas, ours is expreſs'd by a Machine on purpoſe, and coagulated by the Fire.

Theirs, *Salmaſius* tells us, was refreſhning and looſening, whereas ours is hot, and excites Thirſt. Hence, ſome have imagined, that the ancient and modern *Sugar*-Plant were different: But *Matthiolus*, on *Dioſcorides*, *C.* 75. makes no doubt they were the ſame; and others are even of Opinion, that ours has a laxative Virtue, as well as that of the Ancients, and that it purges Pituita.

The Generality of Authors, however, agree, that the ancient *Sugar* was much better than the Modern; as conſiſting of only the fineſt and matureſt Parts, which made themſelves a Paſſage, and were condenſed in the Air.

The Interpreters of *Avicenna* and *Serapion*, call *Sugar*, *Spodium*; the *Perſians*, *Tabatis*, and the *Indians*, *Mambuc*.

Salmaſius aſſures us, that the *Arabs* have had the Art of making *Sugar*, ſuch as we now have it, above 800 Years. Others produce the following Verſes of *P. Terentius Varro Atacinus*, to prove that it was known before *Jeſus Chriſt*.

Indica non magna nimis Arbore creſcit arundo,
Illius extentis premitur radicibus humor,
Dulcia cui nequeunt ſucco contendere mella.

Another Queſtion among Naturaliſts is, Whether the *Sugar* Canes be originally of the *Weſt Indies*; or whether they have been tranſlated thither from the *Eaſt*?

The Learned of theſe laſt Ages, have been much divided on the Point: But ſince the Diſſertation of F. *Labat*, a Dominican Miſſionary, publiſh'd in 1722, there is no longer room to doubt, but that the *Sugar*-Cane is as natural to *America* as *India*; all that can be ſaid in favour of the latter, is, That the *Spaniards* and *Portugueſe* learnt from the Orientals, the Art of expreſſing its Juice, boiling it, and reducing it into *Sugar*.

Culture of the SUGAR-*Cane.*

The Reed or Ruſh, whence this uſeful Juice is drawn, reſembles thoſe others we ſee in Moraſſes, and on the Edges of Lakes; excepting that the Skin of theſe latter is hard and dry, and their Pulp void of Juice; whereas the Skin of the *Sugar*-Reed is ſoft, and the ſpongeous Matter or Pith it contains, very juicy, though that in a greater or leſs Degree, according to the Goodneſs of the Soil, its Expoſure to the Sun, the Seaſon 'tis cut in, and its Age; which four Circumſtances contribute equally to its Goodneſs and its Bulk.

The *Sugar*-Cane uſually grows five or ſix Foot high, and about half an Inch in Diameter; though F. *Labat* mentions ſome extraordinary ones in the Iſle of *Tobago*, Twenty-four Foot high. The Stem or Stalk is divided by Knots, a Foot and Half apart. At the Top it puts forth a Number of long, green, tufted Leaves, from the Middle whereof, ariſe the Flower and the Seed. There are likewiſe Leaves ſpringing out from each Knot; but theſe uſually fall as the Cane riſes; and 'tis a Sign, either that the Cane is naught, or that 'tis far from its Maturity, when the Knots are ſeen beſet with Leaves.

The Ground fit for *Sugar*-Canes, is that which is light, ſoft and ſpongy; lying on a Deſcent, proper to carry off the Water, and well turn'd to the Sun. They uſually plant them in Pieces, cut a Foot and Half below from the Top of the Flower. Theſe are ordinarily ripe in Ten Months, though ſometimes not till Fifteen; at which Time, they are found quite full of a white, ſucculent Marrow, whence is expreſs'd the Liquor whereof *Sugar* is made. When ripe, they are cut, their Leaves cleared off, and they are carried in Bundles to the Mills. The Mills conſiſt of Three wooden Rollers, cover'd with Steel Plates; and have their Motion either from the Water, the Wind, Cattle, or even the Hands of Slaves. See SUGAR-*Mill*.

Two Rules belonging hereto are, That no Canes above four Foot, or under two Foot and a Half long, be ſent to the Mills; and, That no more Canes be cut than can be conveniently preſs'd in 24 Hours; in regard they will heat, ferment and grow ſour.

The Juice coming out of the Canes, when preſs'd and broke between the Rollers, runs through a little Canal into the *Sugar*-Houſe; which is near the Mill; where it falls into a Veſſel, whence it is convey'd into the firſt Copper or Cauldron, to receive its firſt Preparation, only heated by a ſlow Fire to make it ſimmer. With the Liquor, is here mix'd a Quantity of Aſhes or beaten Lime; the Effect of which Mixture, aſſiſted by the Action of the Fire, is, that the unctuous Parts are ſeparated from the reſt, and raiſed to the Top, in form of a thick Scum, which is kept conſtantly ſcumming off; and ſerves to feed the Poultry, *&c.* withal.

Preparation of SUGAR.

The Juice, in the next Place, is purified in a ſecond Copper; where a briſker Fire makes it boil; and all the Time the caſting up of its Scum is promoted by means of a ſtrong Lye, compoſed of Lime-water and other Ingredients.

This done, 'tis purified and ſcum'd in a third Boiler, wherein is caſt a kind of Lye, that aſſiſts in purging it; collects together its Impurities, and makes them riſe to the Surface; whence they are taken with a Skimmer.

From the Third, 'tis removed to a Fourth Boiler, where the Juice is further purified by a more violent Fire: and hence to a Fifth; where it takes the Conſiſtence of a Syrop.

In a Sixth Boiler, the Syrop receives its full Coction; and here all the Impurities left from the former Lyes, are taken away by a new Lye, and a Water of Lime and Allom caſt into it. In this laſt Cauldron, there is ſcarce found one Third of what was in the Firſt; the reſt being waſted in Scum.

By thus paſſing, ſucceſſively, a Number of Coppers, the *Sugar* Juice is purified, thicken'd, and rendred fit to be converted into any of the Kinds of *Sugar* hereafter mention'd. The Size of the ſeveral Coppers always diminiſhes, from the firſt to the laſt; each being furniſhed with a Furnace, to give a Heat proportionable to the Degree of Coction the Juice has received. In ſome large *Sugar*-Works, there are alſo particular Coppers, for the boiling and preparing the Scums.

The ſeveral Kinds of SUGAR *made in the* Caribbee *Iſlands.*

F. *Labat* mentions Seven different kinds of *Sugars* prepared in the *Caribbees*, *viz.*

Crude SUGAR, or *Muſcouade*	*Royal* SUGAR
Strain'd or *Brown* SUGAR	*Candied* SUGAR
Earth'd or *White* SUGAR in Powder	SUGAR *of fine Syrop*
Refined SUGAR, either in Powder or Loaves.	SUGAR *of coarſe Syrop*
	SUGAR *of the Scum.*

Crude SUGAR, or *Moſcouade*, is that firſt drawn from the Juice of the Cane, and whereof all the reſt are compoſed.

The Method of making it, is that already deſcribed as for *Sugar* in the General.

We need only add, That when taken out of the ſixth Copper, 'tis put in a Cooler, where ſtirring it briskly together, 'tis let ſtand to ſettle, till a Cruſt, of the Thickneſs of a Crown-piece, be form'd thereon. The Cruſt form'd, they ſtir it up again, then put it into Veſſels, where it ſtands to ſettle, till it be fit to Barrel.

Strain'd or *Brown* SUGAR, though whiter and harder, does not differ much from the *crude Sugar*. Though 'tis held a Medium between this laſt and the *Earth'd Sugar*; which is the white *Powder Sugar*. The Preparation of this *Sugar*, is the ſame as that of the raw *Sugar*, with this Difference, that to Whiten it, they ſtrain the Liquor through Blankets, as it comes out of the firſt Copper.

The Invention of *Strain'd Sugar* is owing to the *Engliſh*, who are more careful than their Neighbours, in the Preparation hereof; for they not only ſtrain it, but when boil'd, put it in ſquare wooden Forms, of a pyramidal Figure; and when it has purified itſelf well, they cut it in Pieces, dry it in the Sun, and barrel it up.

Earth'd SUGAR, is that which is whiten'd by means of Earth laid on the Top of the Forms 'tis put in, to purge itſelf.

The making of this *Sugar*, is begun after the ſame manner as that of raw *Sugar*; except that they only uſe the beſt Canes in it;

that

that they work with more Care and Nicety; that when the Liquor is in the firſt Copper, the Aſhes they put in, are little or nothing mix'd with Lime, for fear of reddening it; and that they ſtrain it through a Blanket, from the firſt to the ſecond Copper.

When it has paſs'd all the Six Coppers, 'tis laden out into a Cooler; whence 'tis put into conical Moulds or Forms, the Tips whereof are perforated, but now ſtopp'd with Linnen or other Stuff; and theſe ranged evenly before the Furnace. When it has been a Quarter of an Hour in the Forms, 'tis cut with a *Sugar*-Knife, that is, 'tis ſtirred briſkly this way and that, for Half an Hour.

This ſerves, not only to promote the forming of the Grain, and the diffuſing it equally throughout; but alſo to determine the unctuous Parts of the *Sugar* to mount to the Top that they may be ſcum'd off.

The Forms being left to ſtand 15 Hours in this State, the Holes at the bottom are then unſtopp'd, to give a Paſſage to the Syrop, and to determine it to take that Way. When enough of theſe Forms are fill'd, to fill a Stove, which uſually contains Five or Six hundred Forms; they viſit the *Sugar* in all the Forms, to examin the Quality thereof, and to ſee if it quit the Form eaſily; that it may either have the Earth given it, as the Refiner, who viſits it, judges proper; or be melted over again, if it don't prove well.

This done, the Forms are planted, each on its Pot, with the Tip of the Cone downwards; the Top is taken off, and in lieu thereof, they put in ſome *Sugar* in Grain, to within an Inch of the Edge; which Space is left for the Earth prepared for it.

The Earths here uſed, are of various Kinds; the good Qualities of each whereof, are, that they don't tinge the Water, that they let it filtrate eaſily through, and that they don't imbibe the fatty Part of the *Sugar*. E'er put in the Forms, 'tis ſteep'd in Water 24 Hours; and at length applied, in the Conſiſtence of a Pulp.

Aſſoon as the Earth is on the *Sugar*, all the Windows of the Refining Room are ſhut, that the Air and Heat may not dry the Earth. When 'tis quite dry, which uſually happens in nine or ten Days Time, 'tis taken off; and after cleaning the Surface of the *Sugar* with Bruſhes, and raking it up an Inch deep, and again laying it Level as before; they give it a ſecond Earth.

The Whiteneſs of the *Sugar* of each Form, is ſeen from the firſt Earth; Experience ſhewing, that a Second or Third Earth don't make the *Sugar* any thing whiter, but only whitens the Head of the Loaf. When the ſecond Earth is taken off, they clean the Surface of the *Sugar* with a Bruſh, and with a Knife looſen the Edge of the *Sugar*, where it ſticks to the Form, that neither the Form nor the *Sugar*-Loaf be damaged in taking out the latter. The Windows are now open'd, and the Forms left to ſtand Eight or Ten Days to dry. While the *Sugar* is draining in its Forms, a Stove is prepared to receive them.

The Stove being ſufficiently heated, by Means of the Furnace therein, Loaves are taken out of the Forms one after another; and ſuch as are white from one End to t'other, are carry'd to the Stove, as are, alſo, the reſt, after cutting off what is not white, to be farther refin'd.

When the Loaves are all rang'd in the Stove, a moderate Fire is made for about two Days, during which Time, they viſit every Part of the Stove very carefully, to ſee that every Thing is in good Order, and to repair any Thing that may go amiſs.

After theſe two Days, they ſhut the Trap-Door a-top of the Building, and increaſe the Fire. Eight or ten Days and Nights continu'd violent Fire uſually ſuffice to dry a Stove of *Sugar*.

When they judge it ſufficiently done, they open the Trap-Door, and chuſe a hot dry Day to pound the *Sugar*, which is perform'd with huge, hard, heavy Wooden Peſtles; when pounded, 'tis put up in Barrels, and well trodden down as 'tis put in, that the Barrels may hold the more.

SUGAR *of the Scum*. This is all made of the Scums of the two laſt Coppers; thoſe of the former being reſerv'd for the making of Rum.

The Scum deſtin'd to make *Sugar*, is kept in a Veſſel for that Purpoſe, and boil'd every Morning in a Copper ſet apart for that Uſe. With the Scum, is put into the Copper a fourth Part of Water, to retard the boiling, and give Time for its purging: When it begins to boil, the uſual Lye is put in, and 'tis carefully ſcum'd: When almoſt enough boil'd, Lime and Allom-Water are thrown in; and when 'tis ready to be taken out, they ſprinkle it with a little powder'd Allom.

SUGAR of *Syrop*. There are three Kinds of Syrops that run from Sugar. The firſt from the Barrels of raw Sugar, which is the coarſeſt of all: The ſecond, from the Forms or Moulds after they are perforated, and e'er they receive their Earth: The third, that coming from the Forms after they have had their Earth; which laſt is the beſt.

The coarſe Syrops ſhould only be uſed for Rum; but Sugar being grown dear, Endeavours have been uſed to make ſome hereof, and that with tolerable Succeſs. They are firſt clarify'd with Lime-Water, and, when boil'd, are put up in Barrels, with a *Sugar*-Cane in the Middle, to make them purify themſelves. After twenty Days, a Quantity of coarſe Earth is thrown in, to make 'em caſt the Remainder of their Syrop, and fit 'em to be return'd into raw Sugar. The *Dutch* and *German* Refiners, firſt taught the Iſlanders how to turn their Syrop into crude *Sugar*.

The ſecond Syrop is wrought ſomewhat differently: After the Copper 'tis to be boil'd in is half full, eight or ten Quarts of Lime-Water are caſt in: 'Tis then boil'd with a briſk Fire, and carefully ſcum'd: Some add a Lye, and others none. F. *Labat* takes the former Method to be the better, tho' it requires more Trouble and Attention. This *Sugar* may be Earth'd alone, or, at leaſt, with the Heads of Loaves, the dry'd Tops, and ſuch other Kinds of *Sugars* as may not be mix'd with the proper earth'd *Sugar*, nor yet with the raw *Sugar*.

For the third Syrop, after boiling and ſcumming it as the former, they put it inſtantly into Coolers, the Bottoms whereof are cover'd half an Inch thick with white *Sugar*, very dry, and well pounded; and the whole is well ſtir'd, to incorporate the two together. This done, they ſtrew the Surface over with the ſame pounded *Sugar*, to the Thickneſs of one Fifth of an Inch; this aſſiſting the *Sugar* in forming its Grain. When ſettled, and the Cruſt gather'd at the Top, a Hole is made in the Cruſt five or ſix Inches Diameter.

By this Aperture, they fill the Cooler with a new Syrop, pour'd gently in, which inſenſibly raiſes up the former Cruſt. When all the Syrops are boil'd, and the Cooler is full, they break all the Cruſts; and after mixing them well, put it up in Forms or Moulds.

The reſt is perform'd in the ſame manner as in the earth'd *Sugar*, from which it only differs in that it falls ſhort of its Luſtre and Brilliant; being, in reality, ſometimes whiter and finer, tho' of a flatter and duller white.

Refined SUGAR. *Crude Sugar*, ſtrain'd *Sugar*, and the Heads or Tops of Loaves that have not whiten'd well, are the Matter of this *Sugar*.

In a Refinery are uſually two Coppers, the one ſerving to clarify, the other to boil the clarify'd Liquor; tho' they ſometimes clarify in both, and boil afterwards. For the Operation of Refining, the ſame Weight of Lime-Water and of *Sugar* are put in the Copper; and as the Scum is rais'd by the Heat, 'tis taken off, and when it ceaſes to riſe any more, the Syrop is ſtrain'd through a Cloth.

After this, 'tis clarify'd; that is, a Dozen of Eggs is thrown, White, Yolk, Shell and all; after having firſt broke and beaten them well in Lime-Water. When the fat, and other Impurities of the *Sugar*, which this Compoſition gathers together on the Surface of the Syrop, have been ſcum'd off; a few more Eggs are thrown in, and 'tis ſcum'd afreſh. This they repeat 'till the Sugar is ſufficiently clarify'd; which done, 'tis again ſtrain'd through the Cloth.

When taken out of this Copper, 'tis boil'd in the ſecond; which done, 'tis put out into Coolers, the Bottoms whereof are firſt cover'd half an Inch thick with fine white powder'd *Sugar*. As ſoon as 'tis there, 'tis briskly ſtirred about, and the Surface ſtrew'd over with pounded *Sugar*. The reſt is perform'd as in *Sugars* of fine Syrops, or in earth'd *Sugar*; only more Care and Exactneſs is uſed.

Royal SUGAR. The Matter of this *Sugar* ought to be the fineſt refined *Sugar* to be found. This they melt with a weak Chalk-Water; and ſometimes, to make it the whiter, and prevent the Lime from reddening it, they uſe Allom-Water.

This they clarify three Times, and paſs as often thro' a cloſe Cloth, uſing the very beſt Earth. When prepared with theſe Precautions, 'tis whiter than Snow, and ſo tranſparent, that we ſee a Finger touching it, even thro' the thickeſt Part of the Loaf.

SUGAR-*Candy*. This is better made of earth'd *Sugar*, than refin'd *Sugar*, in regard the former is ſweeter.

The *Sugar* to be uſed herein, is firſt diſſolved in a weak Lime-Water, then clarify'd, ſcum'd, ſtrain'd through a Cloth, and boil'd, and put in Forms or Moulds that are travers'd with little Rods, to retain the *Sugar* as it Cryſtallizes. Theſe Forms are ſuſpended in a hot Stove, with a Pot underneath, to receive the Syrop that drops out at the Hole in the Bottom, which is half ſtopped, that the Filtration may be the gentler. When the Forms are full, the Stove is ſhut up, and the Fire made very vehement.

Upon this the *Sugar* faſtens to the Sticks that croſs the Forms, and there hangs in little Splinters of Cryſtal. When the *Sugar* is quite dry, the Forms are broke, and the *Sugar* taken out, *candied*. *Red Sugar-Candy* they make, by caſting into the Veſſel, where the *Sugar* is boiling, a little Juice of the Indian Fig; and if 'tis deſir'd to have it perfumed, they

they caſt a Drop of ſome Eſſence in, when the *Sugar* is putting into the Forms.

This Method of making *Sugar-Candy* is that of F. *Labat*, practis'd in the *Caribbees*: The Method in *Europe*, deſcrib'd by *Pomet*, is ſomewhat different.

White Sugar-Candy they make of white refin'd *Sugar*, boil'd with Water into a thick Syrop, in a large Peel. Tis candied in a Stove, whither 'tis carry'd, inclos'd in braſs Peels, croſs'd with little Rods, about which the Cryſtals faſten as they are form'd.

The Fire of the Stove is kept equable for fifteen Days; after which, the *Sugar* is taken out of the Peels to be dry'd. *Red* or *brown Sugar Candy* is made like the white, except that they only uſe brown *Sugars* and earthen Pots.

Barley SUGAR, is a *Sugar* boil'd till it be brittle, and then caſt on a Stone anointed with Oil of ſweet Almonds, and form'd into twiſted Sticks, about the Length of the Hand, and the Thickneſs of a Finger.

It ſhould be boil'd up with a Decoction of Barley, whence it takes its Name; but in Lieu thereof, they now generally uſe common Water, to make the *Sugar* the finer. To give it the brighter Amber Colour, they ſometimes caſt Saffron into it. Tis found very good for the Cure of Colds and Rheums.

SUGAR *of Roſes*, is white *Sugar* clarify'd, and boil'd into a Conſiſtence, in Roſe-Water; when boil'd, they form it into Lozenges, ſometimes into little Hail, of the Size of Peas, by keeping it ſtirring till it be cold and dry. Tis reputed good to ſoften and allay Acrimonies, *&c.* of the Breaſt.

SUGAR *of Saturn* } See SATURN.
SUGAR *of Lead* }

SUGGESTION, the Act of furniſhing one with a Thought, or Deſign, or of inſinuating it artfully into his Mind.

In the Civil Law a Teſtament is ſaid to be made *by Suggeſtion*, when 'tis made by Surprize, and contrary to the Intention of the Teſtator. See TESTAMENT.

If *Suggeſtion* be prov'd, the Teſtament becomes null. Articles and Legacies of *Suggeſtion* are not admittable againſt a Teſtament wrote with the Teſtator's own Hand, which is never ſuſpected.

SUIT, or SUTE, *Secta*, in Law, (from the *French Suite*, a following one another) is uſed in divers Senſes.

As, 1°, *Suit in Law*; which is of two Kinds, *Real* and *Perſonal*: The ſame with what we call *Real* and *Perſonal Actions*. See ACTION.

2°. *Suit of Court*, or *Suit of Service*; an Attendance which the Tenant owes the Court of his Lord. See SERVICE.

3°. *Suit Covenant*; is when your Anceſtor hath covenanted with mine to *ſue* to his Court.

4°. *Suit Cuſtom*; when I and my Anceſtors owe Suit time out of Mind.

5°. *Suit Real*, or *Regal*; when Men come to the Sheriff's Turn or Leet.

6°. *Suit* ſignifies the following one in *Chaſe*, as *Freſh Suit*.

Laſtly, *Suit* ſignifies a Petition made to the King, or any Great Perſon.

SULPHUR, in Natural Hiſtory, a fat unctuous Mineral Subſtance, fuſible and inflammable by Fire, and not diſſoluble or miſcible in Water. See FOSSIL.

It is particularly call'd *Foſſil*, or *Mineral Sulphur*, to diſtinguiſh it from the *Sulphur of Metals*, or *of the Philoſophers*. See METAL.

Sulphurs make a particular Claſs of Foſſils, divided into *Solid* and *Fluid*.

The *Solid Sulphurs* are, *common Sulphur*, or *Sulphur* properly ſo call'd, *Arſenic* and *Ambar*. See ARSENIC and AMBAR.

The *Liquid Sulphurs* are, *Aſphaltum*, or *Piſaſphaltum*, *Bitumen*, *Petroleum*, *Naptha*, and *Oleum Terræ*, &c. See BITUMEN, PISASPHALTUM, PETROLEUM, NAPTHA, *&c.*

SULPHUR, properly ſo call'd, or *Brimſtone*, is of three Kinds, *viz. Vivum*, *Mineral*, and *Common Sulphur*.

Sulphur Vivum is thus called, as being ſuch as it is taken out of the Mine: It is a kind of greyiſh argillous Clay, which eaſily takes Fire, and, in burning, caſts a ſtrong ſulphurous Smell. Its Colour occaſions its being ſometimes call'd *Grey Sulphur*.

'Tis chiefly brought from *Sicily*; and is but little uſed, except in ſome Galenical Compoſitions, and to *ſulphur* Wine, to make it keep in Carriage.

The beſt is ſoft, ſmooth, friable, and ſhining, of a Mouſe-Colour, and not too full of Smell.

Mineral Sulphur, call'd alſo *Yellow Sulphur*; is a Kind of hard, earthy Bitumen, of a ſhining yellow Colour, a ſtrong ſtinking Smell, eaſily taking Fire, and diſſolving.

'Tis found in great Quantities in the Neighbourhood of Vulcanos or burning Mountains, as *Veſuvius*, *Ætna*, *&c.* yet is it likewiſe found in its particular Mines; and we have very good from ſeveral Parts of *Italy* and *Switzerland*, tho' the beſt is that of *Quitto* and *Nicaragua* in *America*.

'Tis from this *Sulphur*, that the *Common Sulphur* uſed in Gunpowder, and on divers other Occaſions, is drawn, by Means of Fire and Whale Oil, which diſſolving it, 'tis pour'd into Moulds; and thus form'd into thoſe Cylinders we find it in.

This *Common Sulphur* is either better or worſe, according to the Refinery it comes from. That of *Holland* has a long Time had the Vogue; the ſecond Place has been given to that of *Venice*, and the third to that of *Marſeilles*; but the Order ſeems to have been ſince chang'd, and that from *Marſeilles* is now in the firſt Place.

It is choſen in large thick Cylinders, of a golden yellow Colour, very brittle, and when broke, appearing all brilliant, as if Cryſtallized.

Beſide the Uſe of *Sulphur* in the Compoſition of Gunpowder, whereof it is one of the three Ingredients, and that which makes it take Fire ſo readily, (See GUNPOWDER) 'tis of ſome Uſe in Medicine, and more in Chymiſtry. 'Tis alſo uſed in whitening Silken and Woollen Stuffs; to which End, the Vapour thereof is contriv'd to be receiv'd by them. See BLEACHING.

Its Vapour alſo whitens red Roſes, and even young Rooks, taken out of the Neſt, and expos'd thereto, become perfectly white. It has the ſame Effect on Gold; which is to be reſtored to its Colour by boiling it in Water with Tartar.

The Chymical Analyſis of *Sulphur* is very difficult; its Principles being ſo volatile, and withal ſo faſt bound together, that they either riſe all together, or are diſſipated and loſt in being ſeparated.

M. *Homberg*, however, has at length found the Secret of ſeparating the Principles, and of ſaving them at the ſame Time. He finds it conſiſts of an Acid Salt, an Earth, an oily, bituminous, and inflammable Matter, and uſually a little Metal.

The three firſt he finds, by a long Series of Operations, are in pretty equal Quantities; but the laſt, which he finds to be Copper, inconſiderable. The Acid, he adds, is exactly the ſame with that of Vitriol; the Oil thick and red as Blood, appears to be the inflammable Part, and that which conſtitutes the Chymical Principle *Sulphur*, but that it retains ſome heterogeneous Matter in the Operation. The Earth is extremely fix'd, and unalterable by the ſtrongeſt Fire.

M. *Geoffroy* tried the Recompoſition of *Sulphur* on M. *Homberg*'s Principles, and with Succeſs. The pure Acid Salt of *Sulphur*, being mix'd with an equal Quantity of the oily Matter, and earthy Alcali, and a little Oil of Tartar, and the Operation conducted according to the Rules of Art, the Mixture was converted into a pure burning Sulphur.

This done, he attempted the Compoſition of *Sulphur*, not by recompounding it out of the ſame Matters it had been reſolv'd into, but by uſing Matters judged of the ſame Nature. Thus, by ſubſtituting Oil of Vitriol for the Acid Salt, and Oil of Turpentine for the inflammable Part, he ſucceeded as before.

Again, he found that fixed Salts, as they are Acids abſorb'd in Earth, ſerve for two Principles at once, and need nothing but an inflammable Oil to make *Sulphur*: And even in Lieu of this Oil, M. *Geoffroy* imploy'd, with equal Succeſs, Charcoal, Pit-coal, and other Solids.

Indeed, Mr. *Boyle* and *Glauber* had before made common *Sulphur*, and that by Mixtures, ſuch as M. *Geoffroy* deſcribes; but they were both miſtaken as to the Reaſon thereof; the one concluding, that the *Sulphur* he thus got, had been contain'd in the fix'd Salts, and the other in the Coal; neither of them dreamed, that 'twas the Mixture of the three Principles that produced the Mixt.

Flowers of SULPHUR, are the pureſt and fineſt Part of *Sulphur*, gain'd by evaporating *Sulphur*, by Sublimation, or burning it in Pots made for that Purpoſe; and gathered in the Capital of the Cucurbit, where the Vapour ſticks. See FLOWER.

This Preparation, as, indeed, *Sulphur* in moſt of its Forms, is found excellent for the Lungs. The beſt Flower of *Sulphur* is that of *Holland*, which is in Cakes, or Pieces, light, ſoft, friable, and rather white than yellow. If it be in Powder, it muſt be very fine, of a yellow Colour, that is both whitiſh and gilt at the ſame Time.

Inſtead of this, we have frequently put upon us a vile Mixture of *Sulphur*, exalted by Fire, and mix'd with Starch, or Wheat Flower; and ſometimes only *Sulphur*-Duſt well ſifted.

By adding fix'd Nitre, or Sal Polychreſt, to the Flowers of *Sulphur*, we have the white Flowers of *Sulphur*.

Magiſtery, or *Balm*, or *Milk* of SULPHUR, is *Sulphur* diſſolved in a ſufficient Quantity of Water, with Salt of Tartar; and precipitated by Means of a Spirit of Vinegar, or ſome other Acid. See MAGISTERY.

'Tis called *Milk of Sulphur* from its Whiteneſs; and *Balm of Sulphur*, or *of the Lungs*, from its excellent Uſe in Diſeaſes of the Lungs and Breaſt. See BALSOM, *&c.*

Salt of SULPHUR, is a Chymical Preparation, very improperly thus called, as being no other than the Sal Polychreſton, impregnated with Spirit of *Sulphur*, and reduced to an Acid Salt, by evaporating the Humidity thereof. Some hold it a powerful Febrituge. See SALT.

SULPHUR *of Antimony*, is a ſulphurous Matter drawn from Antimony by divers Operations. See ANTIMONY.

That drawn from the Fæces of the Crocus Metallorum, is by ſome called, *Golden Sulphur*.

SULPHUR *Metallorum*, or *Sulphur of Metals*, called alſo, *Sulphur Figens*, is uſed among the Chymiſts and Alchymiſts for a peculiar Matter, which enters the Compoſition of all Metals. See METAL.

Metals are ſuppos'd to conſiſt of two eſſential Parts, or Principles; Mercury as the Baſis, or Metallic Matter; and *Sulphur* as the Binder or Cement, which fixes the fluid Mercury into a coherent malleable Maſs. See METAL and MERCURY.

Some of the lateſt and beſt Chymiſts, particularly Monſ. *Homberg*, will have this *Sulphur* to be no other than Fire. See FIRE, GOLD, BURNING-GLASS.

SULTAN, or SOLDAN, a Title, or Appellation given the *Turkiſh* Emperor.

It had its Riſe under *Mahmoud*, Son of *Sebectteghin*, the firſt Emperor of the Dynaſty of the *Gaznerides*, towards the Cloſe of the IVth Century of the Æra of the *Hegira*: When that Prince going to *Segeſtan* to reduce *Kalaf*, the Governor of that Province, who affected the Sovereignty; *Kalaf* was no ſooner advertis'd of his coming, than he went out before him, delivered the Keys of his Fortreſs, and own'd him his *Sultan*, that is, his *Lord* or *Commander*.

The Title pleaſed *Mahmoud* ſo well, that he aſſumed it ever afterwards; and from him it paſs'd to his Deſcendants, and to other Mahometan Princes.

Vatier will have the Word *Turkiſh*, and to ſignify *King of Kings*; adding, that it was firſt given the Princes *Angrolipex* and *Maſgud*, about the Year 1055; others will have it originally *Perſian*, alledging, in Proof hereof, an ancient Medal of *Coſroe's*; others derive it from *Soldan quaſi ſolus dominus*; others from the *Hebrew* שלש, Schalat, to rule, reign: From the *Hebrew* it paſs'd into the *Arabic*, and thence to the *Turks*.

In the *Roman* Ceremonial, we find mention made of a *Soldan*, or Marſhal, who is to attend the Pope when he marches in State.

SULTANA, the Wife of a Sultan. The Favourite *Sultana* is called *Hhaſeki-Sultan*, *i. e.* private *Sultana*.

The *Sultana* Queen is the Emperor's chief Wife. The old *Sultana*, Mother of the Emperor reigning, is called the *Sultana Valide*. *Sultana* is alſo a *Turkiſh* Veſſel.

SUM, in Mathematicks, ſignifies the Quantity that ariſes from the Addition of two or more Magnitudes, Numbers, or Quantities together. See ADDITION.

This is ſometimes called the *Aggregate*; and, in Algebra, it is uſually denoted by the Letter Z, which ſtands for *Zuma*, or *Suma*; and ſometimes by the Letter S.

SUM of an Equation, is when the abſolute Number being brought over to the other Side, with a contrary Sign, the whole becomes equal to O: This *Des Cartes* calls the *Sum* of the Equation propos'd. See EQUATION.

SUMAC, a Drug uſed to die in Green; as alſo in the Preparation of Black Morocco, and other Leather. See MOROCCO.

It conſiſts of the Leaves and young Branches of a Shrub, not unlike the little Service-Tree: The Leaves are longiſh, pointed, and hairy: The Flowers grow in Cluſters, and are red, like our Roſes. Its Fruit is a Kind of Grape, of a very aſtringent Quality; and its Seed almoſt oval, and incloſed in Capſulæ of the like Figure.

The Antients uſed them, inſtead of Salts, to ſeaſon their Meats withal; whence the *Latins* call the Tree *Rhus Obſoniorum*, from its Uſe in the Dreſſing of Leather: 'Tis alſo called *Rhus Coriaria*. 'Tis the *Arabs* call it *Sumac*.

SUMMARY, an Abridgment, containing the Sum and Subſtance of a Thing in a few Words.

The *Summary* placed at the Head of a Book, a Chapter, a Law, or the like, is very uſeful to the Reader, to facilitate the Underſtanding thereof.

A Recapitulation, is to contain a *Summary* of the whole preceding Diſcourſe. See RECAPITULATION.

SUMMATORIUS *Calculus*, the Method of ſumming differential Quantities; that is, from any Differential given, to find the Quantity from whoſe Differencing the given Differential reſults.

This Method we more uſually call, *The inverſe Method of Fluxions*; and Foreigners, *Integralis Calculis*. See CALCULUS *Integralis*, and FLUXIONS.

SUMMER, one of the Seaſons of the Year, commencing, in theſe Northern Regions, on the Day the Sun enters *Cancer*; and ending when he quits *Virgo*. See SEASON.

Or, more ſtrictly, and univerſally, the *Summer* begins on the Day when the Sun's Meridian Diſtance from the Zenith is the leaſt. It ends on the Day when its Diſtance is a Mean betwixt the greateſt and ſmalleſt.

The End of *Summer* coincides with the Beginning of Winter. See WINTER.

SUMMER, in Architecture, is a large Stone, the firſt that is laid over Columns and Pilaſters, in beginning to make a croſs Vault; or 'tis the Stone which being laid over a Piedroit or Column, is hollowed, to receive the firſt Haunce of a Plat-band.

The Word is form'd from the *French*, *Sommier*, which ſignifies the ſame Thing.

SUMMER, in Carpentry, is a large Piece of Timber, which being ſupported on two Stone Peers, or Poſts, ſerves as a Lintel to a Door, Window, *&c.*

There are alſo *Summers* uſed in various Engines, *&c.* ſerving to ſuſtain the Weight, *&c.*

SUMMERS, in Building. See BRESS-SUMMERS and GIRDERS.

SUMMET, the Vertex, or Point of any Body; as of a Triangle, a Pyramid, a Pediment, *&c.* See VERTEX.

The Word is formed from the *French*, *Summet*, which ſignifies the ſame Thing.

SUMMONER, or SUMMONITOR, an Apparitor, who is to cite Offenders to appear at a certain Time and Place, to anſwer to the Charge exhibited againſt them.

SUMMONS, in Law, a citing or calling a Perſon to any Court, to anſwer any Complaint, or even to give in his Evidence, *&c.*

This is the ſame with the *Vocatio in Jus*, or the *Citatio* of the Civilians: Hence our old Word *Sumner*, or *Summoner*.

Summons in Terra Petita, is that made on the Land which the Party, at whoſe Suit the *Summons* is ſent out, ſeeks to have.

Summons ad Warrantizandum, is a Proceſs, whereby a Vouchee is called. See VOUCHEE.

SUMMONS, in War. To *ſummons* a Place, is to ſend a Drum, or Trumpet, to command the Governor to ſurrender; or, in Defect thereof, to proteſt to make an Aſſault, and to lay all in Fire and Blood.

SUMMUM *Bonum*, in Ethicks, the chief Good of Human Nature; or that, which, by its Enjoyment, renders truly and compleatly happy.

The Schools diſtinguiſh this chief Good of Man, into that which is ſimply and adequately ſo, and beyond which there can be no other; and into a leſſer and ſubordinate one, which is in ſome meaſure attainable in this imperfect State.

This laſt they call *Fœlicitas Viatorum*; and the former, *Fœlicitas Comprehenſorum*.

SUMPTER-*Horſe*, is an Horſe that carries Proviſions and Neceſſaries for a Journey.

SUMPTUARY Laws, are Laws made to reſtrain Exceſs in Apparel, Furniture, Eating, *&c.*

Moſt Ages and Nations have had their *Sumptuary* Laws; and ſome retain them ſtill, as the *Venetians*, *French*, *&c.* 'Tis obſerved, that no Laws are ever worſe executed than *Sumptuary* Laws.

The *Sumptuary* Laws of that ancient *Locrian* Legiſlator *Zaleucus*, are famous: By theſe it was ordained, That no Woman ſhould go attended with more than one Maid in the Street, except ſhe were drunk: That ſhe ſhould not go out of the City in the Night, unleſs ſhe went to commit Fornication: That ſhe ſhould not wear any Gold or Embroider'd Apparel, unleſs ſhe purpoſed to be a common Strumpet. That Men ſhould not wear Rings or Tiſſues, except when they went a Whoring, *&c.*

The *Engliſh* have had their Share of *Sumptuary* Laws, tho' all repealed by a Statute 1° *Jac.* I. or obſolete.

Under King *Henry* IV. *Cambden* tells us, Pride was got ſo much into the Foot, that it was proclaim'd, *That no Man ſhould wear Shoes above ſix Inches broad at the Toes.* And their other Garments were ſo ſhort, that it was enacted, 25 *Ed.* IV. That no Perſon under the Condition of a Lord, ſhould, from that Time, wear any Mantle or Gown, *unleſs of ſuch Length, that, ſtanding upright, it ſhould cover his Privy Members and Buttocks.*

Among the *Romans*, the *Sumptuary* and *Cibary* Laws were very numerous: By the *Lex Orchia*, the Number of Gueſts at Feaſts was limited, tho' without Limitation of the Charges thereof. By the *Fannian* Law, made Twenty-two Years afterwards, it was enacted, That more than ten As's ſhould not be ſpent at any ordinary Feaſt: For the ſolemn Feaſts, as the *Saturnalia*, *&c.* an hundred As's were allowed; Ten of which, *Gellius* informs us, was the Price of a Sheep, and an hundred of an Ox.

By the *Didian* Law, which was preferr'd eighteen Years after, it was decreed, That the former *Sumptuary* Laws ſhould be of Force, not only in *Rome*, but alſo in *Italy*: And that for every Tranſgreſſion, not only the Maſter of the Feaſt,

Feaſt, but all the Gueſts too, ſhould be liable to the Penalty.

SUN, *Sol*, in Aſtronomy, the great Luminary which enlightens the World, and by his Preſence, conſtitutes Day. See DAY.

The *Sun* is uſually reckon'd among the Number of *Planets*; but that he ought rather to be numbred among the *fix'd Stars*, will be ſhewn in its Place. See STAR and PLANET.

According to the Copernican Hypotheſis, which is now generally received, and which has even Demonſtration on its Side, the *Sun* is the Centre of the planetary and cometary Syſtem; round which all the Planets and Comets, and our Earth among the reſt, revolve, in different Periods, according to their different Diſtances from the *Sun*. *See this Motion Illuſtrated and Demonſtrated under the Article* PLANET.

But the *Sun*, though thus eas'd of that prodigious Motion, whereby the Ancients imagined him to revolve daily round our Earth; yet is he not a perfectly quieſcent Body.

From the Phænomena of his Maculæ or Spots, it evidently appears, that he has a Rotation round his Axis; like that of the Earth whereby the natural Day is meaſured; only ſlower. Some of theſe Spots have made their firſt Appearance near the Edge or Margin of the *Sun*, and have been ſeen ſome time after on the oppoſite Edge; whence, after a Stay of about 14 Days, they have re-appeared in their firſt Place, and taken the ſame Courſe over again; finiſhing their entire Circuit in 27 Days time; which is hence deduced to be the Period of the *Sun*'s Rotation round his Axis. This Motion of the Spots, is from *Eaſt* to *Weſt*, whence we conclude that of the *Sun*, to which the other is owing, to be from *Weſt* to *Eaſt*.

For the various Appearances of the Solar Spots, their Cauſe, &c. ſee MACULÆ and SPOTS.

For the annual Motion of the Sun *round the Earth*; 'Tis eaſily ſhewn by Aſtronomers, That the annual Motion of the Earth will occaſion ſuch an Appearance, though it be demonſtrated that there is no ſuch Thing.

A Spectator in the *Sun*, would ſee the Earth move from *Weſt* to *Eaſt*, for the ſame Reaſon as we ſee the *Sun* move from *Eaſt* to *Weſt*. And all the Phænomena reſulting from this annual Motion, in whichſoever of the Bodies it be, will appear the ſame from either. Let S, for Inſtance (Tab. Aſtronomy, Fig. 39.) repreſent the *Sun*, ABCD the Earth's Orbit, which it paſſes through from *Weſt* to *Eaſt*, in the Space of a Year.

Now, a Spectator in S, viewing the Earth at A, will refer it to the Point of the Sphere of the Stars, ♈: When arrived in B, the Spectator will ſee it, as in the Point ♎; when in C, as in the Point ♑, &c. till after its whole Circuit, it will be again ſeen in ♈. Thus will the Earth appear to deſcribe the whole Ecliptic, and to paſs, ſucceſſively, from Sign to Sign.

Suppoſe, now, the Spectator removed from the *Sun* to the Earth, which imagine in C; the Diſtance of the fix'd Stars, we have ſhewn, is ſo vaſt, that that of the *Sun* is but a Point to it. The Spectator, therefore, now ſituate on the Earth, will ſee the ſame Face of the Heavens, the ſame Stars, &c. as before; the only Difference will be, that as before he imagined the Earth in the Heavens, and the *Sun* in the Centre; he will now ſuppoſe the Sun in the Heavens, and the Earth in the Centre.

The Earth, therefore, being in C, the Spectator will ſee the *Sun* in ♈; and the Spectator being carried along with the Earth, and partaking of his annual Motion, will not perceive either his own Motion, or that of the Earth; but obſerving the *Sun*, when the Earth is arrived at D, the *Sun* will be ſeen at ♎. Again, while the Earth proceeds to A, the *Sun* will ſeem to have moved through the Signs ♎, ♏, and ♐: And while the Earth deſcribes the Semi-circle ABC, the *Sun* will appear to have moved in the concave Surface of the Heavens, through the Six Signs, ♎, ♏, ♐, ♑, ♒, ♓. So that an Inhabitant of the Earth will ſee the *Sun* go through the ſame Orbit or Circle in the Heavens, and in the ſame Space of Time, as a *Spectator* in the *Sun* would ſee the Earth deſcribe the ſame.

Hence ariſes that apparent Motion of the *Sun*, whereby he is ſeen to advance, inſenſibly, toward the eaſtern Stars: Inſomuch, that if any Star near the Ecliptic, riſe any Time with the *Sun*; after a few Days, the *Sun* will be got more to the *Eaſt* of the Star, and the Star will riſe and ſet before him.

For the ſeveral Phænomena reſulting from the Sun's *apparent Motion, or the Earth's real Motion, as the Diverſity of Day and Night, of Seaſons, &c.*; See EARTH.

Nature, Properties, Figure, &c. of the SUN.

1° As the Solar Spots are ſometimes found to ſtay Three Days longer behind the *Sun*, than they ſpend in paſſing over the Hemiſphere viſible to us; we eaſily deduce, that they don't adhere to the Surface of the *Sun*, but are at ſome Diſtance therefrom.

2° As the Spots frequently riſe and vaniſh, even in the midſt of the *Sun*'s Diſk; and undergo ſeveral Changes, both with regard to Bulk, and Figure, and Denſity; it follows, that they frequently riſe, *de novo*, about the *Sun*, and are again diſſipated.

3° Hence it ſhould follow, that they are form'd out of the Exhalations of the *Sun*; and are no other than Solar Clouds. See VAPOUR, CLOUD, &c.

4° Since, then, Exhalations proceeding from the *Sun*, riſe above him, and ſtop at a certain Altitude; 'tis evident there is ſome Fluid incompaſſing the *Sun*, to urge the Exhalations to riſe; and this Fluid muſt be denſer at bottom, and rarer a top, like our Atmoſphere. See ATMOSPHERE.

5° Since the Spots frequently diſſolve and diſappear in the middle of the *Sun*'s Diſk; the Matter of the Spots, that is, the Solar Exhalations, fall back again to the *Sun*: Whence it follows, that there muſt ariſe various Alterations in the *Sun*'s Atmoſphere, and the *Sun* himſelf. See RAIN, HAIL, METEOR, &c.

6° Since the Revolution of the Spots round the *Sun* is found very regular, and the Spots very near the *Sun*; it follows, That the Spots do not revolve round the *Sun*; but that the *Sun*, together with his Atmoſphere, wherein the Maculæ are, move round their common Axis, in an Interval of about 27 Days; and hence it is, that the Spots near the Limb, being viewed obliquely, appear narrow and oblong.

7° Since the *Sun*, in every Situation, appears like a circular Disk; its Figure, as to Senſe, muſt be Spherical; though we ſhall hereafter ſhew, That it is really Spheroidical.

Beſides the Maculæ or dark Spots, ſeveral Authors make mention of Faculæ or Spots brighter than the reſt of the *Sun*'s Disk; and thoſe generally larger, and very different from the Maculæ, both in Figure, Duration, &c.

Theſe Faculæ, *Kircher*, *Scheiner*, &c. take to be Eruptions of Flames; and hence take Occaſion to repreſent the Face of the *Sun* as full of Volcano's, &c. But *Huygens*, uſing the beſt Teleſcopes, could never find any ſuch Things, though he has ſometimes ſpied certain Places in the Maculæ themſelves, more lucid than the reſt. But theſe do not ſeem owing to any kindled Matter, which were ſcarce conſiſtent with their Duration, and their frequent Change into Maculæ; but to the Refraction of the *Sun*'s Rays through the thinner Exhalations, when as the Groſſer, in their Neighbourhood, intercept the ſame. See FACULÆ.

8° That the Subſtance of the *Sun*, is Fire, we thus prove: The *Sun* ſhines, and his Rays, collected by concave Mirrors, or convex Lens's, burn, conſume, and melt the moſt ſolid Bodies, or elſe convert them into Aſhes, or Glaſs. Wherefore, as the Force of the ſolar Rays is diminiſhed by their Divergency, in a duplicate *Ratio* of the Diſtances reciprocally taken; 'tis evident, their Force and Effect is the ſame, when collected by a burning Lens or Mirror, as if we were at ſuch Diſtance from the *Sun*, where they were equally denſe. The *Sun*'s Rays, therefore, in the Neighbourhood of the *Sun*, produce the ſame Effects, as might be expected from the moſt vehement Fire; conſequently, the *Sun* is of a fiery Subſtance. See FIRE.

Hence it follows, That its Surface is every where Fluid; that being the Condition of Flame. See FLAME.

Indeed, whether the whole Body of the *Sun* be Fluid, as ſome think, or Solid, as others; we don't determine: But as there are no other Marks, whereby to diſtinguiſh Fire from other Bodies, but Light, Heat, a Power of Burning, Conſuming, Melting, Calcining and Vitrifying; we don't ſee what ſhould hinder, but that the *Sun* may be a Globe of Fire like ours, inveſted with Flame.

9° Since the Maculæ are form'd out of the ſolar Exhalations; it appears, that the *Sun* is not pure Fire, but that there are Heterogeneous Particles mix'd along with it.

10° The Figure of the *Sun* is a Spheroid, higher under the Equator than about the Poles. This we prove thus: The *Sun* has a Motion about his own Axis, and therefore the ſolar Matter will have an Endeavour to recede from the Centres of the Circles wherein it moves; and that, with the greater Force, as the Peripheries of the Circles are greater. But the Equator is the greateſt Circle, and the reſt, towards the Poles, continually decreaſe; therefore the ſolar Matter, though at firſt in a ſpherical Form, will endeavour to recede from the Centre of the Equator, further than from the Centres of the Parallels.

Conſequently, ſince the Gravity whereby it is retain'd in its Space, is ſuppoſed to be uniform throughout the whole *Sun*; it will really recede from the Centre, more under the Equator than under any of the Parallels. And hence the *Sun*'s Diameter, drawn through the Equator, will be greater than that paſſing through the Pole, *i. e.* the *Sun*'s Figure is not perfectly Spherical, but Spheroidical. See SPHEROID.

For the Parallax of the Sun; ſee PARALLAX.

For the Sun's *Diſtance*: As the Determination thereof depends on that of the Parallax; and as the *Sun*'s Parallax is not found without a long, operoſe Calculus; So, Aſtronomers don't agree much about either of them.

The mean Diſtance of the *Sun* from the Earth, ſome make 7490 Diameters of the Earth, others 10000, others 12000; others

others 15000; but allowing M. *de la Hire*'s Parallax of 6", the *Sun*'s mean Diſtance will be 17188 Diameters of the Earth; and allowing that of *Caſſini*, only 14182. See DISTANCE.

The apparent Diameter of the *Sun*, is not found always the ſame. *Ptolomy* makes it, when greateſt, 33' 20", *Tycho* 32', *Kepler* 31' 4", *Ricciolus* 32' 8", *Caſſini* 32' 20", *De la Hire* 32' 43". Its mean, apparent Diameter, according to *Ptolomy*, is 32' 18"; according to *Tycho* 31'; according to *Kepler* 30' 30"; according to *Ricciolus* 31' 40"; according to *Caſſini* 31' 40"; according to *De la Hire* 32' 10". Its leaſt Diameter, *Ptolomy* makes 31' 20"; *Tycho* 30'; *Kepler* 30'; *Ricciolus* 31'; *Caſſini* 31' 8"; *De la Hire* 31' 38".

The true Diameter of the *Sun* to that of the Earth, is computed to be, as 10000 to 208. See DIAMETER.

For the Eclipſes of the Sun; ſee ECLIPSE.

Cycle of the SUN. See CYCLE.

Meridian Altitude of the SUN, *&c.* See MERIDIAN *Altitude.*

SUNDAY, the Firſt Day of the Week; thus call'd by our Idolatrous Anceſtors, becauſe ſet apart for the Worſhip of the *Sun*.

'Tis now alſo call'd the *Lord's Day*, becauſe kept a Feaſt in Memory of our Lord's Reſurrection on this Day; and *Sabbath Day*, becauſe ſubſtituted, under the new Law, in the Place of the *Sabbath*, in the old Law. See SABBATH.

In the Breviary, and other Offices, we meet with *Sundays* of the firſt and ſecond Claſs: Thoſe of the firſt Claſs, are *Palm*, *Eaſter*, *Advent* and *Whit-Sunday*, thoſe of *Quaſimodo* and *Quadrigeſimo*; each whereof, ſee under its proper Article.

Thoſe of the ſecond Claſs, are the common *Sundays*. Anciently, each *Sunday* in the Year had its particular Name, which was taken from the Introit of the Day; which Cuſtom has only been continued to ſome few in *Lent*; as *Reminiſcere*, *Oculi*, *Lætare*, *Judica*.

It was *Conſtantine the Great*, that firſt made a Law for the Obſervation of *Sunday*; and that, according to *Euſebius*, appointed it ſhould be regularly celebrated throughout the *Roman* Empire.

Before him, and even in his Time, they obſerved both the *Jewiſh Sabbath* and *Sunday*, at the ſame Time; both to ſatisfy the Law of *Moſes*, and to imitate the Apoſtles, who uſed to meet together on the firſt Day.

Indeed, ſome are of Opinion, that the *Lord's Day*, mention'd in the *Apocalypſe*, is our *Sunday*; which they will have to have been ſo early inſtituted by the Apoſtles. Be this as it will, 'tis certain, a Regard was had to this Day, even in the earlieſt Ages of the Church; as appears from the firſt Apology of *Juſtin Martyr*, where he deſcribes the Exerciſe of the Day, not much unlike to ours.

By *Conſtantine*'s Laws, made in 321; it was decreed, That for the future, the *Sunday* ſhould be kept a Day of Reſt in all Cities and Towns; but he allowed the Country People to follow their Work. In 538, the Council of *Orleans* prohibited this Country-labour; but in regard there were ſtill abundance of *Jews* in the *Gauls*, and that the People gave into a good many Superſtitious Uſages, in the Celebration of the New *Sabbath*, like thoſe of the *Jews* in that of the Old; the Council declares, That to believe it unlawful to travel with Horſes, Cattle and Carriages, to prepare Foods, or to do any thing relating to the Cleanneſs and Decency of Houſes or Perſons, ſavours more of Judaiſm than Chriſtianity.

SUNDAY *Letter*. See DOMINICAL *Letter*.

SUN-*Flower*. See TOURNSOLE.

SUOVETAURILIA, or SOLITAURILIA, a Sacrifice among the ancient *Romans*; wherein they offer'd Three Victims, of Three different Kinds, *viz.* a Bull, a Ram and a Boar.

Livy deſcribing it, calls it *Suovetaurilia*, as compoſed of *Sus*, *Ovis* and *Taurus*, the Names of the Three Victims ſacrificed. *Dion. Halicarnaſſæus* deſcribing the ſame, calls it *Solitaurilia*, in regard 'twas required, that the Victims were intire, and without any Defect; *Sollus*, or *ſolus*, in the Language of the *Oſci*, ſignifying *Integer*.

SUPERBIPARTIENS
SUPERPARTICULARIS
SUPERPARTIENS
SUPERQUADRIPARTIENS
SUPERTRIPARTIENS
} See RATIO.

SUPERCARGO, a Perſon imploy'd by the Owners of Ships, to go a Voyage, to overſee the Cargo or Lading, and to diſpoſe of it to their beſt Advantage, for which Service he is allowed good Proviſion, becauſe the Truſt repoſed in him, is very conſiderable.

SUPERCILIUM, in Anatomy, the Eye-brow. See EYE.

SUPERCILIUM, in the ancient Architecture, the uppermoſt Member of the Cornice, call'd by the Moderns, *Corona*, *Crown*, or *Larmier*.

Mr. *Evelyn* conceives, it ſhould rather have been call'd *Stillicidium*, *Drip*, to denote its Office of Sheltering the Order from Rain, *&c.* See CORONA and LARMIER.

SUPERCILIUM, is alſo uſed for a ſquare Member under the upper Tore in ſome Pedeſtals. Some Authors confound it with the Tore itſelf.

SUPEREROGATION, in Theology, what a Man does beyond his Duty, or beyond what he is commanded to do.

The *Romaniſts* ſtands up ſtrenuouſly for Works of *Supererogation*; and maintain, that Evangelical Councils are ſuch. By means hereof, a Stock of Merit is laid up; which the Church has the Diſpoſal of, and which ſhe diſtributes in Indulgences to ſuch as need. See INDULGENCE.

The Reformed Church don't allow of any Work of *Supererogation*; but held, with the Apoſtle, *That when we have done our beſt, we are but unprofitable Servants.* See MERIT.

SUPERFETATION, in Medicine, an After-Conception; or a ſecond Generation, happening when the Mother, already pregnant, conceives, of a later Coition; ſo that ſhe bears at once Two Fætus's of unequal Age and Bulk, and is delivered of them at different Times. See BIRTH, CONCEPTION, FÆTUS, *&c.*

We meet with Inſtances of *Superfetations* of Women, in *Hippocrates*, *Ariſtotle*, *Pliny*, *du Laurens*, *&c.* But they are much more frequent in Hares and Sows.

An Inſtance of an extraordinary Kind of *Superfetation*, we have in *Bartholin*; who tells us, That a *Daniſh* Girl was born big with Child.

Menzelius, a *German* Phyſician, adds, That in 1672, the Wife of a Phyſician, in *Thuringia*, was delivered of a Girl big with another; whereof ſhe was delivered in Eight Days Time; and which was Baptized, and died a Day after her Mother.

The Naturaliſts hold, That Female Rats are frequently born with young Rats in their Wombs.

In the King of *Denmark*'s Cabinet, is ſeen an Egg, in the middle whereof is another Egg perfectly form'd. See EGG.

We meet with ſomething like a *Superfetation* in Plants too; there being a kind of Lemon found to grow incloſed in the Body of another.

In the Hiſtory of the Royal Academy of Sciences, for the Year 1709, mention is made of a Letter from a very conſiderable Magiſtrate, to the Academy, containing a very remarkable Inſtance of a *Superfetation*; a Butcher's Wife of *Aix* being delivered in that Year of Nine Children, each about Two Days after other, all well form'd and alive.

The Word is form'd from the *Latin*, *Super*, over, and *fætus*, Embryo.

SUPERFICIAL *Content*. See SUPERFICIES, AREA and MEASURING.

SUPERFICIES, or SURFACE, in Geometry, a Magnitude, conſidered as having Two Dimenſions; or extended in Length and Breadth; but without Thickneſs or Depth. See DIMENSION.

In Bodies, the *Superficies* is all that preſents itſelf to the Eye. See BODY.

A *Superficies* is chiefly conſider'd, as the external Part of a Solid; when we ſpeak of a *Surface* ſimply, and without any regard to Body, we uſually call it *Figure*. See FIGURE.

A *Rectilinear* SUPERFICIES, is that comprehended between Right Lines.

A *Curvilinear* SUPERFICIES, that comprehended between Curve Lines. See CURVE.

A *Plane* SUPERFICIES, is that which has no Inequality, but lies evenly between its boundary Lines. See PLANE.

A *Convex* SUPERFICIES, is the exterior Part of a ſpherical Body. See CONVEX.

A *Concave Surface*, is the internal Part of an orbicular Body. See CONCAVE.

The Meaſure or Quantity of a Surface, is call'd the *Area* thereof. See AREA.

The finding of this Meaſure or Area, is call'd the *Quadrature* thereof. See QUADRATURE.

To Meaſure the Surfaces of the ſeveral Kinds of Bodies, as Spheres, Cubes, Parallelepipids, Pyramids, Priſms, Cones, &c. See SPHERE, CUBE, PARALLELEPIPID, *&c.*

Line of SUPERFICIES, a Line uſually found on the Sector, and *Gunter*'s Scale. See SCALE.

The Deſcription and Uſe hereof, ſee under the Articles SECTOR and GUNTER'S *Scale*.

SUPERFINE, in the Manufactures, a Term uſed to expreſs the ſuperlative Fineneſs of a Stuff.

Thus a Cloth, a Camlet, *&c.* are ſaid to be *Superfine*, when made of the fineſt Wool, Silk, *&c.* or when they are the fineſt that can be made.

The Term is particularly uſed among Gold Wiar-drawers, for the Gold or Silver-wiar, which after being drawn through an infinite Number of Holes, each leſs and leſs, is, at length, brought not to be bigger than a Hair. See GOLD-*Wiar*.

SUPERINCESSUS *radens*
SUPERINCESSUS *volvens*
} See { SLIDING. ROLLING.

SUPER-

SUPER-*Inſtitution*; is one Inſtitution upon another; as if A be admitted and inſtituted to a Benefice upon one Title, and B admitted, inſtituted, &c. by the Preſentation of another.

SUPERINTENDANT, in the *French* Cuſtoms, an Officer who has the prime Management and Direction of the Finances or Revenues of the *French* King.

The Term is alſo uſed for the firſt Officer in the Queen's Family, who has the chief Adminiſtration of the Houſhold.

They have alſo a *Superintendant* of the Buildings, anſwering to the Surveyor of the Works among us.

The Cardinal *de Richelieu* made himſelf *Superintendant* of Commerce.

SUPERINTENDANT, is alſo an Eccleſiaſtical Superior in ſeveral Reform'd Churches where Epiſcopacy is not admitted; particularly among the *Lutherans* in *Germany*, and the *Calviniſts* in ſome other Places.

The *Superintendant* is, in Effect, little elſe but a Biſhop; only his Power is ſomewhat more reſtrain'd than that of our Biſhops.

He is the chief Paſtor, and has the Direction of all the inferior Paſtors within his Diſtrict or Dioceſe.

In *Germany* they had formerly *Superintendants General*, who were ſuperior to the ordinary *Superintendants*. Theſe, in reality, were Archbiſhops; but the Dignity is ſunk into Diſuſe; and, at preſent, none but the *Superintendant* of *Wirtemberg* aſſumes the Quality of *Superintendant General*.

SUPERIOR, ſomething rais'd above another, or that has a Right to command another.

Thus an Abbot is call'd the *Superior* of an Abbey; and a Prior the *Superior* of a Convent. See ABBOT, &c.

The Canoniſts hold, that a perpetual *Superiority* forms a Title: But a *Superior* may be continued by thoſe who conſtituted him ſuch, yet without the *Superiority*'s being render'd, by that Means, perpetual. The Church of *France* allow the *Superiority* of the Pope; not his *Infallibility*, as all the other *Romiſh* Churches do.

SUPERJURARE: Antiently, when a Criminal endeavour'd, &c. to excuſe himſelf by his own Oath, or by that of one or more Witneſſes; and yet the Crime ſo notorious, that he was convicted by the Oaths of many more Witneſſes; this was call'd *Superjurare*.

SUPERLATIVE, in Grammar, an Inflexion of Nouns Adjectives, ſerving to augment and heighten their Signification, and to ſhew the Quality of the Thing to be in the higheſt Degree. See DEGREE.

In *Engliſh*, the *Superlative* is uſually form'd by the Addition of *eſt*; as Richeſt, Holieſt, &c. Rarely by the Addition of *iſſimo*, as Generaliſſimo; more frequently by the prefixing of *moſt*, as Moſt Honourable, Moſt Amiable, &c.

The *French* are generally forc'd to form their *Superlatives*, by prefixing of *le plus*, ſometimes of *tres*, and ſometimes of *fort*.

The *Italians* and *Spaniards* have great Advantages over them in this Reſpect; their Language abounding with magnificent Words to exaggerate Things withal: yet the *Hebrews* are more poor than the *French* in this Reſpect, as having neither *Comparatives* nor *Superlatives*.

They uſe to expreſs theſe Degrees by the Particles *joter* and *meod*, ſometimes by the Prepoſition *min*, and ſometimes by re-doubling the Words; which is what we frequently find in the Vulgate.

SUPERNUMERARY, ſomething over and above a fix'd Number.

In ſeveral of the Offices are *Supernumerary* Clerks, &c. to be ready on extraordinary Occaſions, &c.

There are alſo *Supernumerary* Surveyors of the Exciſe, to be ready to ſupply Vacancies when they fall. They have but half Pay.

In Muſic, the *Supernumerary*, call'd by the *Greeks Proſlambanomenos*, is the loweſt of the Chords of their Syſtem; anſwering to *a*, *mi*, *la*, of the loweſt Octave of the Moderns. See PROSLAMBANOMENOS and DIAGRAM.

SUPER-*purgation*, in Medicine, an exceſſive, over-violent Purging. See PURGATION.

A Man who had taken Powder of Diacarthamus inwardly, was ſent by it to Stool an hundred times; and was cured of the *Super-purgation* by a Pound of Capon-Broth, an Ounce of Saccharum Roſatum, five Grains of Laudanum, and the Yolk of an Egg.

In lieu of Laudanum, they ſometimes uſe a Drachm and a half of new Treacle. *Burnet*.

SUPERSCAPULARIS *inferior*; call'd alſo *Infraſpinatus*; a Muſcle that helps to draw the Arm backwards. It covers all the Space that is between the Spine, and the Teres minor; and is inſerted into the Neck of the Humerus.

SUPERSCAPULARIS *ſuperior*, in Anatomy, a Muſcle call'd alſo *Supraſpinatus*. See SUPRASPINATUS.

SUPERSEDEAS, is a Writ iſſued in divers Caſes, importing, in general, a Command to ſtay or forbear the doing of that which ought not to be done, but which, in Appearance of Law, ought to be done; were it not for that Cauſe, whereon the Writ is granted. Thus, a Man, regularly, is to have Surety of Peace, againſt him of whom he will ſwear he is afraid; and the Juſtice requir'd hereunto can't deny it him: yet, if the Party be formerly bound to the Peace, either in Chancery, or elſewhere, this Writ lies, to ſtay the Juſtice from doing that, which otherwiſe he ought not to deny.

SUPERSTITION, an extravagant Devotion, or a Religion ill directed, and ill conducted. See RELIGION.

'Twas a Piece of *Superſtition* in the ancient *Romans*, to obſerve the Flight of Birds, the Entrails of Victims, &c.

The *Romiſh* Prieſts make a fine Penny of the *Superſtition* of the People: Monſ. *Thiers* has an expreſs Treatiſe *des Superſtitions Populaires*. Women, he obſerves, are naturally more inclin'd to *Superſtition* than Impiety. *Plutarch* has endeavour'd to ſhew, that *Superſtition* is worſe than Atheiſm. The Puniſhment allotted by ſeveral Councils for the *Superſtitious*, was to faſt a Month in Priſon.

SUPERVISOR, ſignifies a *Surveyor*, or *Overſeer*.

It was formerly, and is ſtill amongſt ſome, a Cuſtom, eſpecially of the better Sort, to make a *Superviſor* of a Will, but it is to little Purpoſe; as being now ſo careleſly executed. However, the firſt Intendment might be good, that he ſhould ſuperviſe the Executors, and ſee the Will truly perform'd.

SUPINATION, in Anatomy, the Action of a *Supinator* Muſcle; or the Motion whereby it turns the Hand, ſo, as that the Palm is lifted upwards towards Heaven. See SUPINATOR.

SUPINATORES, in Anatomy, two Muſcles of the Arm; the one call'd *Supinator longus*, the other *Supinator brevis*.

The firſt ariſes by a fleſhy Beginning, three or four Fingers Breadth above the external Extuberance of the Humerus. It lies along all the Radius, to whoſe inferior and external Part it is inſerted by a pretty broad Tendon.

The laſt comes from the external and upper Part of the Ulna, and paſſing round the Radius, is inſerted into its upper and fore Part, below the Tendon of the Biceps. Theſe turn the Palm of the Hand upwards.

SUPINE, in the *Latin* Grammar, a Part of the Conjugation of a Verb, of like Effect with the Infinitive Mood. See VERB, MOOD, &c.

There are two Kinds of *Supines*, the one in *um*, whoſe Signification is active, and marks a Motion, as *dare nuptum*; the other in *u*, having a paſſive Signification, as *horrendum Auditu*, &c. The *Supines* have neither Number nor Perſon.

They have their Name, ſays *Probus*, and after him *Voſſius*, *quod ad inſtar* Supinorum *& otioſorum hominum omnia habent confuſa*. Or, according to *Priſcian*, *quod naſcantur a participiis paſſivis quæ* ſupina *appellata ſunt, quia in infimo loco ſita totam conjugationis molem ſuſcipiant*

SUPPLANTALIA, among Phyſicians, Plaiſters apply'd to the Soles of the Feet, generally made of Leaven, Muſtard, wild Radiſh, Salt, Soap, Gunpowder, &c.

SUPPLEMENT of an Ark in Geometry, or Trigonometry, is the Number of Degrees that it wants of being an intire Semicircle; as Complement ſignifies what an Ark wants of being a Quadrant. See QUADRANT, COMPLEMENT, &c.

SUPPLEMENT, in Matters of Literature, an Appendage to a Book, to ſupply what is wanting therein. See PARERGON.

Frenſhemius has wrote divers *Supplements*, to reſtore the Books of ſeveral ancient Authors, Part whereof had been loſt.

The *French* alſo uſe the Word *Supplement* for a Kind of Tax, or After-payment charg'd on Lands, Offices, &c. that are pretended to have been ſold beneath their Value.

SUPPLICAVIT, a Writ iſſuing out of Chancery, for taking the Surety of Peace againſt a Man. It is directed to the Juſtices of the Peace, and Sheriff of the County; and is grounded on the Statute 1 *Ed.* 3. which appoints, that certain Perſons ſhall be aſſign'd by the Lord Chancellor to take Care of the Peace.

SUPPORTED, in Heraldry, a Term apply'd to the uppermoſt Quarters of a Shield, when divided into ſeveral Quarters; theſe ſeeming, as it were, *ſupported* or ſuſtain'd by thoſe below. See QUARTER'D.

The Chief is alſo ſaid to be *ſupported* when it is of two Colours, and the upper Colour takes up two Thirds of it: In this Caſe it is *ſupported* by the Colour underneath.

SUPPORTERS, in Heraldry, Figures in an Atchievement, plac'd by the Side of the Shield, and ſeeming to *ſupport*, or hold up the ſame. See ATCHIEVEMENT, SHIELD, &c.

The *Supporters* of the *Engliſh* Arms are a Lion and an Unicorn; ſome of the former Kings had a Leopard and an Unicorn; others Griffons; others Eagles. See ARMS.

The *Supporters* of the *French* Arms are Angels; which are ſaid to have been firſt introduc'd by *Philip* VI; his De-

vice being an Angel over-throwing a Dragon: The Dragon being at that Time the Device of the King of *England*.

Thoſe of the Prince of *Monaco*, are Auguſtin Monks: Thoſe of the Family of the *Urſini*, Bears, in Alluſion to their Names.

In *England*, none below the Degree of a Banneret are allow'd *Supporters*.

Some make a Difference between *Tenant* and *Supporter*: When the Shield is bore by a ſingle Animal, 'tis call'd *Tenant*; when by two, they are call'd *Supporters*. See TENANT.

SUPPOSITION, in Muſic, the uſing of two ſucceſſive Notes, of the ſame Value, as to Time; the one whereof being a Diſcord, *ſuppoſes* the other a Concord. See HARMONY.

The Harmony, Mr. *Malcolm* obſerves, is always to be full on the accented Parts of the Bar, or Meaſure, but on the unaccented, Diſcords may tranſiently paſs, without any Offence to the Ear. This tranſient Uſe of Diſcords, follow'd by Concords, makes what we from the *French* call *Suppoſition*. See CONCORD and DISCORD.

There are ſeveral Kinds of *Suppoſition*: The firſt is, when the Parts proceed gradually from Concord to Diſcord; and Diſcord to Concord; the intervening Diſcord ſerving only as a Tranſition to the following Concord.

Another Kind is, when the Parts do not proceed gradually from the Diſcord to the Concord, but deſcend to it by the Diſtance of a Third.

A third Kind, like the ſecond, is, when the riſing to the Diſcord is gradual, but the deſcending from it to the following Concord, is by the Diſtance of a fourth.

A fourth Kind, very different from all the reſt, is, when the Diſcord falls on the accented Parts of the Meaſure, and the Riſing to it is by the Diſtance of a fourth. In which Caſe 'tis abſolutely neceſſary to follow it immediately, by a gradual Deſcent into a Concord, that has juſt been heard before the Harmony; to make the preceding Diſcord paſs without Offence, and only ſeem a Tranſition into the Concord.

SUPPOSITION, in Arithmetick. See POSITION.

SUPPOSITORY, in Pharmacy, a ſolid Medicine thruſt up the Fundament, in lieu of a Liquid one, or Clyſter, where that would not be ſo convenient. See CLYSTER.

'Tis compos'd of common Honey, mix'd up with either Soap, or Oil, and form'd into Pieces of the Length and Thickneſs of the little Finger, only Pyramidal.

The *Suppoſitory* was invented for the Convenience of ſuch as have an Averſion to the taking of Clyſters; or to be uſed where the Diſeaſe does not allow thereof.

The *Latins* call it *Balanus*, becauſe anciently made in Figure of an Acorn.

To the Compoſition is ſometimes added Powder of Scammony, Euphorbium, Colocynthis, &c.

On ſome Occaſions 'tis made ſimply of a Cut of Bacon, the Stem of a Leek, or the like Matter, thruſt, like a Tent, up the Anus, to irritate the Sphincter Muſcle, and oblige it to extrude the Excrements.

SUPPRESSION, in the Cuſtoms, the Extinction or Annihilation of an Office, Right, Rent, &c.

From the *Latin ſub* and *premo*, *I preſs under*.

SUPPRESSION, in Grammar, an Omiſſion of certain Words in a Sentence, which yet are neceſſary to a full and perfect Conſtruction: As, I come from my Father's; that is, from my Father's Houſe.

Suppreſſion is a Figure of Speech very frequent in our Language; chiefly uſed for Brevity and Elegance. Some Rules relating hereto, are as follow:

1°. Whenever a Word comes to be repeated in a Sentence oftner than once, 'tis to be *ſuppreſs'd*: Thus we ſay, This is my Maſter's Horſe; not, This Horſe is my Maſter's Horſe.

2°. Words that are neceſſarily imply'd, may be *ſuppreſs'd*.

And 3°. All Words that Uſe and Cuſtom *ſuppreſs* in other Languages, are to be *ſuppreſs'd* in *Engliſh*; unleſs there be particular Reaſons for the contrary.

SUPPRESSION, in Medicine, is apply'd to the Humours that are retain'd in the Body by ſome Obſtruction or Stoppage of the uſual Out-lets. As, a *Suppreſſion* of Urine, of the Menſes, &c. See URINE, MENSES, &c.

SUPPURATION, in Medicine, the Action whereby extravaſated Blood, or other Humours, are chang'd, in the Body, into *Pus*. See PUS.

The Change is begun by a Diſſipation of the moſt ſubtle and ſpirituous Parts of the Blood: What is left behind, thickens and purifies by little and little; that is, its Salts and Sulphurs diſengage themſelves from the groſſer Parts wherein they were embarraſs'd. Theſe Parts thus diſengaged, and acting on one another, bruiſe and break each other, and thus excite a Fermentation, which increaſes the Heat of the Part; whereby the Matter is further digeſted, and a Pain and Tenſion produc'd. At length the Blood loſes its Colour, and becomes quite white, by the Mixture of its Acid, ſulphurous and acrimonious Particles; as we ſee happens to ſulphurous Alcalies, when mix'd with Acids. See DIGESTION.

The Word is form'd from the *Latin*, *ſub*, under, and *pus*, *puris*.

SUPPURATIVE, a Medicine that promotes *Suppuration*. See SUPPURATION.

Suppuratives are all hot; by which Means, increaſing the Heat of the Part, they reſolve the Humour into a *Pus*. See DIGESTIVE.

Such are Mallows, Lilly-Roots, Drachylon, &c.

SUPPUTATION. See COMPUTATION.

SUPRALAPSARY, in Theology, a Perſon who holds, that God, without any Regard to the good or evil Works of Men, has reſolv'd, by an eternal Decree, to ſave ſome, and damn others.

Such are alſo call'd *Antelapſaries*; and are oppos'd to *Sublapſaries* and *Infralapſaries*. See SUBLAPSARIES.

According to the *Supralapſaries*, the Object of Predeſtination is *Homo creabilis & labilis*; and according to the *Sublapſaries*, *Homo creatus & lapſus*.

The *Supralapſaries* ſeem, in one ſingle abſolute Decree, to confound two ſeveral ones which ought to be diſtinguiſh'd: The one, the Conditional Decree preceding the Fore-ſight of the Man's Obedience, or Diſobedience to the Grace of God; The other, the Abſolute Decree following this Fore-ſight. See DECREE.

The Predeterminants alſo, admit an Abſolute Decree prior to the Foreſight of Original Sin, in common with the *Supralapſaries*; but diſtinguiſh themſelves from them, as alſo from the *Infralapſaries* and *Janſeniſts*; in that their Abſolute Decree includes the offering of ſufficient Means of Salvation to the Reprobate; ſo that, as to the Point of Power, nothing hinders but they might be ſav'd. See GRACE.

SUPRASPINATUS, in Anatomy, a Muſcle thus call'd from its fleſhy Origination, at the upper End of the Baſis of the Scapula, above the Spine, to the upper Part whereof it is connected, as alſo to the ſuperior Rib of the Scapula; whence marching along the upper Interſcapulum, or thin Part of the Scapula, which it fills, it paſſes under the Acromium and Articulation of the Humerus. It helps to lift the Arm upwards.

SUPREMACY, in the *Engliſh* Cuſtoms, the Superiority of the King over the Church of *England*, whereof he is eſtabliſh'd Head. See KING.

The King's *Supremacy* was firſt eſtabliſh'd by King *Henry* VIII. in 1534, after breaking with the Pope. It is ſince confirm'd by ſeveral Canons, as well as by the Articles of the Church of *England*; and is paſs'd into an Oath, which is requir'd as a neceſſary Qualification for all Offices and Employments both in Church and State, from Perſons to be ordain'd, from the Members of both Houſes of Parliament, &c. See OATH.

This Right of *Supremacy* chiefly conſiſts in the following Articles, 1. That the Archbiſhops of either Province cannot ſummon the Biſhop and Clergy to Convocation, nor enact any Canons without the King's expreſs Conſent, by 25 *H.* 8. *c.* 19. Whereas before that Act, the Convocation was often call'd, and Laws made by it for governing the Church, without any Authority from the Crown. 2. In that there lies now an Appeal from the Archbiſhop to the King in Chancery; and on ſuch an Appeal, a Commiſſion under the Great Seal is to be directed to certain Perſons, whereof commonly half are Laymen, and half Clergymen, which is call'd the Court of Delegates, and which finally determine all Eccleſiaſtical Cauſes, by 25 *H.* 8. *c.* 19. tho' ſometimes a Review is granted. Before this Statute, the Appeal from the Archbiſhop's Court lay to the People only. 3. The King can grant Commiſſions for viſiting ſuch Places, as are exempt from the Juriſdiction of the Biſhops or Archbiſhops; and Appeal lies from thence to the King in Chancery: Whereas before 25 *H.* 8. the Pope only could viſit them, and receive Appeals from thoſe Courts. 4. Perſons in holy Orders, are not, as formerly, exempt from the King's Temporal Laws, any more than Laymen. 5. The Biſhops and Clergy do not ſwear, or pay any Obedience to the Pope; but muſt take the Oaths of Allegiance and Supremacy to the King.

SURA, in Anatomy, the Shin-Bone; the ſame as Fibula. See FIBULA.

SURBATING, among Farriers, is when the Sole of a Horſe's Foot is wore, bruis'd, or ſpoil'd, by beating the Hoof againſt the Ground in travelling without Shoes, or going in hot, ſandy Lands, or with a Shoe that hurts the Sole, lies too flat to it, &c.

Sometimes, it happens by over-riding a Horſe, while young, e'er his Feet are harden'd; and ſometimes by the Hardneſs of the Ground, and high lifting his Feet.

The Signs hereof, are his halting on both Fore-legs, and going ſtiffly, and creeping as if half founder'd.

In the general, there is nothing better for *Surbated* Feet than Tar melted into the Foot; or Vinegar boil'd with Soot to the Conſiſtence of a Broth, and put into the Foot boiling hot, with Hards over it, and Splints to keep it in.

SURCHARGE,

SURCHARGE of the Foreſt, is when a Commoner puts more Beaſts in the Foreſt than he has a Right to. See FOREST.

SURCINGLE, a Girdle, wherewith the Clergy of the Church of *England* uſually tye their Caſſocks.

SURCOAT, a Coat of Arms, to be wore over other Armour. See COAT *of Arms*.

SURD, in Arithmetick, an irrational Number, or Quantity; or a Number, &c. that is incommenſurate to Unity. See *Irrational* NUMBER.

When any Number or Quantity hath its Root propos'd to be extracted, and yet is not a true figurate Number of that Kind; that is, if its ſquare Root being demanded, it is not a true Square: If its Cube Root being requir'd, itſelf be not a true Cube, &c. then it is impoſſible to aſſign, either in whole Numbers or Fractions, any exact Root of ſuch Number propos'd.

And whenever this happens, it is uſual in Mathematicks, to mark the requir'd Root of ſuch Numbers or Quantities, by prefixing before it the proper Mark of Radicality, which is $\surd$: Thus $\surd : 2$ ſignifies the Square Root of 2, and $\sqrt[3]{} : 16$, or $\surd : (3)\ 16$, ſignifies the Cubic Root of 16: Which Roots, becauſe they are impoſſible to be expreſs'd in Numbers exactly, (for no aſſable Number, either Integer or Fraction, multiply'd into itſelf, can ever produce 2; or being multiply'd Cubically, can ever produce 16) are very properly call'd *Surd* Roots.

There is alſo another Way of Notation now much in Uſe, whereby Roots are expreſs'd without the Radical Sign, by their Indexes: Thus, as x^2, x^3, x^5, &c. ſignify the Square Cube, and 5th Power of x; ſo $x^{\frac{1}{2}}$, $x^{\frac{1}{3}}$, $x^{\frac{1}{5}}$, ſignify the Square Root, Cube, &c. of x.

The Reaſon of which is plain enough; for Since $\surd : x$ is a Geometrical mean Proportional between 1 and x, ſo $\frac{1}{2}$ is an Arithmetical mean Proportional between 0 and 1; and therefore as 2 is the Index of the Square of x, $\frac{1}{2}$ will be the proper Index of its Square Root, &c.

Obſerve alſo, that for Convenience, or Brevity's Sake, Quantities or Numbers, which are not *Surds*, are often expreſs'd in the Form of *Surd* Roots. Thus, $\surd : 4$ $\surd : \frac{9}{4}$ $\sqrt[3]{} : 27$, &c. ſignify, $2\frac{3}{2}3$, &c.

But tho' theſe *Surd* Roots (when truly ſuch) are inexpreſſible in Numbers, they are yet capable of Arithmetical Operations, (ſuch as Addition, Subſtraction, Multiplication, Diviſion, &c.) which how readily to perform, the Algebraiſt ought not to be ignorant.

Surds are either *Simple*, which are expreſs'd by one ſingle Term; or *Compound*, which are form'd by the Addition or Subſtraction of ſimple *Surds*: As $\surd : 5 + \surd : 2$: $\surd : 5 - \surd : 2$, or $\sqrt[3]{\surd : 7 + \surd : 2}$: Which laſt is call'd an univerſal Root, and ſignifies the Cubic Root of that Number, which is the Reſult of adding 7 to the Square Root of 2.

To reduce rational Quantities to the Form of any Surd Roots aſſign'd; involve the rational Quantity according to the Index of the Power of the *Surd*, and then prefix before it the Radical Sign of the *Surd* propos'd. Thus to reduce $a = 10$, to the Form of $\surd : 15 = : b$, you muſt ſquare $a = 10$; and prefixing the Sign, it will ſtand thus, $\surd : aa = \surd : 100$, which is the Form of the *Surd* deſir'd.

So alſo, if 3 were to be brought to the Form of $\sqrt[4]{} : 12$, you muſt raiſe 3 up to its fourth Power, and then prefixing the Note of Radicality to it, it will be $\sqrt[4]{} : 81$, or $81^{\frac{1}{4}}$, which is in the ſame Form with $\sqrt[4]{} : 12$.

And this Way may a ſimple *Surd* Fraction, whoſe Radical Sign refers only to one of its Terms, be changed into another, which ſhall reſpect both Numerator and Denominator. Thus $\frac{\surd : 2}{25}$ is reduc'd to $\surd : \frac{2}{25}$ and $\frac{5}{\sqrt[3]{} : 4}$, to $\sqrt[3]{} : \frac{125}{4}$; where the Radical Sign affects both Numerator and Denominator.

To reduce ſimple Surds, *having different Radical Signs*, (which are call'd Heterogeneal *Surds*) to others that may have one common Radical Sign, or which are Homogeneal; divide the Indexes of the Powers by their greateſt common Diviſor, and ſet the Quotients under the Dividends; then multiply thoſe Indexes croſs-ways by each other's Quotients, and before the Product ſet the common Radical Sign $\surd$: with its proper Index: Then involve the Powers of the given Roots alternately, according to the Index of each other's Quotient; and before thoſe Products, prefix the common Radical Sign before found.

To Reduce $\sqrt[2]{} : aa$ and $\sqrt[4]{} : bb$

2) $\surd : aa$ 2) $\sqrt[4]{} : bb$

1 X 2

$\sqrt[4]{} : bb$ $\sqrt[4]{} : aaaa$.

To reduce Surds *to the loweſt Terms poſſible*: Divide the *Surd* by the greateſt Square, Cube, Biquadrate, &c. or any other higher Power, which you can diſcover is contain'd in it, and will meaſure it without any Remainder; and then prefix the Root of that Power before the Quotient, or *Surd*, ſo divided, and this will produce a new *Surd* of the ſame Value with the former, but in more ſimple Terms. Thus, $\surd : 16\,aab$, by dividing by $16\,aa$, and prefixing the Root $4\,a$, will be reduc'd to this, $4\,a \surd : b$, and $\surd : 12$, will be depreſs'd to $2 \surd : 3$. Alſo $\sqrt[3]{} : cb^3r$ will be brought down to $b \sqrt[3]{} : cr$.

This Reduction is of great Uſe whenever it can be perform'd: But if no ſuch Square, Cube, Biquadrate, &c. can be found for a Diviſor, then you muſt find out all the Diviſors of the Power of the *Surd* propos'd; and then ſee whether any of them be a Square, Cube, &c. or ſuch a Power as the Radical Sign denotes; and if any ſuch can be found, let that be uſed in the ſame Manner as is aboveſaid, to free the *Surd* Quantity in Part from the Radical Sign. Thus, if $\surd : 288$ be propos'd; among its Diviſors will be found the Squares, 4, 9, 16, 36, and 144; by which, if 288 be divided, there will ariſe the Quotients 72, 32, 18, 8, and 2; wherefore inſtead of $\surd : 288$, you may put $2 \surd : 72$, or $3 \surd : 32$, or $4 \surd : 18$, or $6 \surd : 8$, or laſtly, $12 \surd : 2$, and the ſame may be done in Species. But for the whole Arithmetic of *Surds*, ſee *Kerſey*'s Algebra, and others on the ſame Subject.

SURETY of the Peace, (ſo call'd, becauſe the Party that was in fear, is thereby ſecur'd) is the acknowledging a Bond to the Prince, taken by a competent Judge of Record, for the keeping the Peace. See PEACE.

This Peace, a Juſtice of the Peace may command, either as a Miniſter, when commanded thereto by higher Authority; or as a Judge, when he doth it of his own Power, deriv'd from his Commiſſion.

Surety of the good abearing, differs from this; that whereas the Peace is not broken without an Affray, or ſuch like; the *Surety de bono geſtu* may be broken by the Number of a Man's Company, or by his or their Weapon, or Harneſs.

SURFACE, in Geometry. See SUPERFICIES.

SURFEIT, an Indiſpoſition caus'd by Exceſs in Eating or Drinking, that is, by over-charging the Stomach. It is uſually attended with Eruptions, and ſometimes with a Fever. See PLENITUDE.

SURFEIT-*Water*, is a Water diſtill'd from Poppies, and other Herbs, proper to cure Indigeſtions.

SURGE: The Sailors call a Wave or Billow of the Sea a *Surge*: Alſo, when they are heaving at the Capſtan, if the Cable happen to ſlip back a little, they ſay, The Cable *ſurges*.

SURGERY. See CHIRURGERY.

SURMOUNTED, is the Herald's Term for the Bearing of one Ordinary upon another: thus in the adjoining Figure, a Pile is *ſurmounted* of a Chevron. *Harris*.

SURNAME, a Name added to the Proper or Baptiſmal-Name, to denominate the Perſon of ſuch a Family. See NAME.

'Twas the *Romans* firſt introduced the Uſe of Hereditary Names; and that on Occaſions of their League with the *Sabines*; for the Confirmation whereof, it was agreed, That the *Romans* ſhould prefix *Sabine* Names, and the *Sabines*, *Roman* Names, to their own.

Theſe new Names became Family Names, or *Surnames*, and the old Ones continued perſonal Names. The former they call'd *Cognomina*, and the latter *Prænomina*. See PRÆNOMEN and COGNOMEN.

When they came to be uſed among the *French* and *Engliſh*, they were call'd *Sur-names* or *Sir-names*, not becauſe they are the Names of the *Sire* or Father; but, according to *Cambden*, becauſe they are ſuper-added to the perſonal Name; or, rather, with *Du Cange*, becauſe at firſt, this Family-name was wrote over (*Sur*) the other Name thus: *de Bourbon* / *Louis*.

In lieu of *Surnames*, the *Hebrews*, to keep up the Memory of their Tribes, uſed the Name of their Father, with the Addition of *Ben*, Son; as *Melchi Ben-Addi*, *Addi-Ben Coſam*, &c. ſo the *Greek*, Ἴκαρος τὸ Δαιδάλου; Icarus, *the Son of* Dedalus, Dedalus *the Son of* Eupalmus, &c.

So, alſo, the ancient *Britons*, *Ceonred*, *Ceolwalding*, *Ceolwald Cuthing*, that is, *Ceonred* Son of *Ceolwald*, Son of *Cuth*; and in the ſame Senſe, the later *Welſh* uſe *Ap* for *Map*, Son,

as,

as, *ap Owen*, *Owen ap Harry*, *Harry ap Rheſe*; and the *Iriſh*, *Mac*, as *Donald Mac Neal*, *Neal Mac Con*, &c. and the old *Normans*, *Fitz*, as *John Fitz Robert*, *Robert Fitz Ralph*, &c.

Scaliger, adds, That the *Arabs* uſed their Father's Name, or *Surname*, without their perſonal Name; as, *Aven-Pace*, *Aven-Zoar*, &c. *q. d.* Son of *Pace*, Son of *Zoar*, &c.; as if *Pace* had a Son at his Circumciſion, call'd *Haly*, he would be call'd *Aven-Pace*, concealing *Haly*; but his Son, however he were nam'd, would be call'd *Aven-Haly*, &c.

The *Romans*, in Time, multiplied their *Sur-names*: Beſides the general Name of the Race or Family, call'd, alſo, *Gentilitium*; they took a particular one, to diſtinguiſh the Branch of the Family, call'd *Cognomen*; and ſometimes a Third, on account of ſome perſonal Diſtinction; as that of *Africanus*, by *Scipio*; of *Torquatus* by *Manlius*.

Theſe Three different Kinds of *Sur-names*, had alſo their different Names, *viz.* *Nomen*, *Cognomen*, *Agnomen*; but theſe laſt were not Hereditary; being, in effect, a kind of *Nick-names*, if that Word be indifferent with reſpect to Good and Evil.

In theſe, too, they have been imitated by later Times: Thus, in our *Engliſh* Hiſtory, we find that *Edgar* was call'd the *Peaceable*; *Ethelred*, the *Unready*; *Edmond*, *Iron-ſide*; *Harold*, *Hare-foot*; *William*, *the Baſtard*; *Henry* I. *Beauclerk*; *John*, *Lack-land*, &c. But as theſe Names were never bore by the Sons, *Cambden* thinks it ſtrange, that *Plantagenet* ſhould be accounted the *Sur-name* of the Royal Family of *England*, till *Henry* VII.; or *Tydur* or *Tudor*, that from *Henry* VII. to King *James* I.; or that of *Steward* from *James* I. to King *George*; or, that *Valoys* ſhould be eſteem'd the *Sur-name* of the late Family of *French* Kings; or *Bourbon* of the preſent; or *Oldenburg* of the Kings of *Denmark*; or *Hapſbourg* of the Emperors. See PLATAGENET.

Du Cheſne obſerves, that *Sur-names* were known in *France* before the Year 987; when the Lords began to aſſume the Names of their Demaines. *Cambden* relates, That they were firſt taken up in *England*, a little before the Conqueſt, under King *Edward the Confeſſor*: But he adds, they were never fully eſtabliſh'd among the common People, till the Time of King *Edward* II. till then they varied with the Father's Name; if the Father, *E. gr.* were call'd *Richard* or *Roger*, the Son was call'd *Richardſon* or *Hodgſon*; but from that Time they were ſettled, ſome ſay, by Act of Parliament.

The oldeſt *Sur-names*, are thoſe we find in Domeſday-Book, moſt of them taken from Places, with the Addition of *de*, as *Godefridus de Mannevilla*, *Walterus de Vernon*, *Robert de Oily*, &c.; others from their Fathers, with *Filius*, as *Guielmus Filius Osberni*; others from their Offices, as *Eudo Dapifer*, *Gulielmus Camerarius*, *Giſlebertus Cocus*, &c. But the inferior People are noted, ſimply, by their Chriſtian Names; without any *Sur-names* at all.

In *Sweden*, 'till the Year 1514, no Body ever took any *Sur-name*; and the common People there, have none to this Day; nor even the native *Iriſh*, *Poles* and *Bohemians*, &c. 'Tis very late that the *Welſh* have had any; and thoſe they have, are generally only form'd, by leaving out the *a* in *ap*, and annexing the *p* to their Father's Name, as in lieu of *Evan ap Rice*, they now ſay, *Evan Price*; for *ap Howel*, *Powel*, &c.

Du Tillet maintains, That all *Sur-names* were given by way of *Sobriquets*, or Nick-names; and adds, That they are all ſignificant and intelligible, to thoſe who underſtand the ancient Dialects of the ſeveral Countries. The greateſt Part of our *Sur-names*, and thoſe of greateſt Account, *Cambden* ſhews, are local, and borrowed from the Places in *Normandy*, &c. where the reſpective Perſons, who came over with the Conqueror, and firſt bore them, had their Poſſeſſions, or their Birth; ſuch as *Mortimer*, *Warren*, *Albigny*, *Percy*, *Devereux*, *Tankervil*, *Nevil*, *Tracy*, *Montfort*, &c. He adds, That there is not a Village in *Normandy*, but gives Name to ſome Family in *England*. Others were taken from Places in *England*, as *Aſton*, *Sutton*, *Wotton*, &c.

The *Saxon* common People generally took their Father's or Mother's Chriſtian Name, with the Addition of Son: Though many were *Sur-named* from their Trade, as *Smith*, *Carpenter*, *Taylor*, *Weaver*, *Fuller*, &c. others from their Offices, as *Porter*, *Shepherd*, *Carter*, *Cook*, *Butler*, &c. others from their Complexion, as *Fair*, *fax*, *Pigot*, *Blunt* or *Blind*; others from Birds, as *Wren*, *Finch*, &c. others from Beaſts, as *Lamb*, *Hare*, *Hart*, &c. others from the Winds; others from Saints, &c.

SURPLUSAGE, in common Law, ſignifies a Superfluity, or Addition, more than needeth; which ſometimes is the Cauſe that a Writ abateth.

It is ſometimes alſo applied to Matter of Account, and denotes a greater Diſburſement than the Charge of the Accomptant amounteth to.

SURREBUTTER, in Law, a ſecond Rebutter, or a Rebutting more than once. See REBUTTER.

SURREJOYNDER, is a ſecond Defence of the Plaintiff's Action, oppoſite to the Defendant's Rejoynder. See REJOYNDER.

SURRENDER, an Inſtrument in Writing, teſtifying, That the particular Tenant of Lands and Tenements for Life or Years, doth ſufficiently conſent and agree, That he, who has the next or immediate Remainder or Reverſion thereof, ſhall have the preſent Eſtate of the ſame in Poſſeſſion; and that he yields and gives up the ſame to him; for every *Surrender* ought, forthwith, to give Poſſeſſion of the Things *ſurrender'd*.

There may alſo be a *Surrender* without Writing, whence, a *Surrender* is divided into that in *Deed*, and that in *Law*.

Surrender-in-Deed, is that which is really and ſenſibly perform'd.

Surrender-in-Law, is in the Intendment of Law, by way of Conſequent, and not Actual. As if a Man have a Leaſe of a Farm, and during the Term, he accepts of a new Leaſe; this Act is in Law, a *Surrender* of the former.

There is alſo a cuſtomary *Surrender* of the Copy-hold, as may be ſeen in *Coke ſup. Littlet.* Sect. 74.

SURROGATE, a Perſon ſubſtituted or appointed in Room of another; moſt commonly of a Biſhop, or Biſhop's Chancellor. See BISHOP, SUFFRAGAN, &c.

SURSOLID, or SURDESOLID, in Arithmetic, the Fifth Power of a Number, or the Fourth Multiplication of any Number, conſider'd as a Root. See POWER.

The Number 2, for Inſtance, conſider'd as a Root, and multiplied by itſelf, produces Four, which is the Square, or ſecond Power of 2; and 4 multiplied by 2, produces 8, the third Power, or the Cube or ſolid Number of 2; 8, again, multiplied by 2, produces 16, the fourth Power, or *Quadrato-quadratum* of 2; and 16 multiplied once more by 2, produces 32, the fifth Power, or *Surſolid*, or *Surdeſolid* Number of 2.

SURSOLID *Problem*, is that which cannot be reſolved, but by Curves of an higher Kind, than the Conic Sections. See PROBLEM.

E. gr. To deſcribe a regular Endecagon, or Figure of Eleven Sides in a Circle, it is required to deſcribe an Iſoſceles Triangle on a Right Line given, whoſe Angles at the Baſe, ſhall be quintuple to that at the Vertex; which may eaſily be done by the Interſection of a Quadratrix, or any other Curve of the ſecond Gender, as they are by ſome called, but not by any lower Curve. See CURVE.

SURVEYING, the Art or Act of meaſuring Lands; *i. e.* of taking the Dimenſions of any Track of Ground, laying down the ſame in a Map or Draught; and finding the Content or Area thereof. See MEASURING, MAP, &c.

Surveying, call'd alſo *Geodeſia*, is a very ancient Art; 'tis even held to have been the Firſt, or primitive Part of Geometry, and that which gave Occaſion to, and laid the Foundation of, all the reſt. See GEOMETRY.

Surveying conſiſts of Three Parts or Members; the Firſt, is the taking of the neceſſary Meaſures, and making the neceſſary Obſervations on the Ground itſelf: The Second, is the laying down of theſe Meaſures and Obſervations on Paper; and the Third, the finding the Area or Quantity of the Ground thus laid down.

The Firſt is what we properly call *Surveying*. The Second we call *Plotting* or *Protracting*, or *Mapping*: And the Third, *Caſting up*.

The Firſt, again, conſiſts of Two Parts, *viz.* the making of Obſervations for the Angles, and the taking of Meaſures for the Diſtances.

The former of theſe is performed by ſome one or other of the following Inſtruments, *viz.* the *Theodolite*, *Circumferentor*, *Semi-circle*, *Plane Table* or *Compaſs*: The Deſcription and Manner of uſing each whereof; ſee under its reſpective Article, THEODOLITE, CIRCUMFERENTOR, PLANE TABLE, COMPASS, &c.

The latter is performed, by means either of the Chain or the Perambulator: The Deſcription and Manner of applying each whereof; ſee under its reſpective Article, CHAIN and PERAMBULATOR.

The ſecond Branch of *Surveying*, is perform'd by means of the *Protractor* and *Plotting Scale*: The Uſe, &c. whereof; ſee under PROTRACTOR, PLOTTING SCALE, &c. See alſo MAP.

The Third is perform'd, by reducing the ſeveral Diviſions, Incloſures, &c. into *Triangles*, *Squares*, *Trapeziums*, *Parallelograms*, &c. but eſpecially *Triangles*; and finding the Areas or Contents of theſe ſeveral Figures, by the Rules delivered under the Articles AREA, TRIANGLE, SQUARE, &c.

SURVEYING *Croſs*, is an Inſtrument little known, and leſs uſed in *England*; though in *France*, &c. it ſerves in lieu of a Theodolite or the like Inſtrument: It conſiſts of a braſs Circle, or rather a circular Limb, graduated, and again divided into Four equal Parts, by two Right Lines cutting each other at right Angles in the Centre. At each of the Four Extremities of the Lines, and in the Centre are fix'd Sights. The whole is mounted on a Staff.

SURVEYING *Wheel*. See PERAMBULATOR or WAY-WISER.

SURVEYOR, one that hath the Over-ſight and Care of conſiderable Works, Lands, &c.

As,

As, the *Surveyor General of the King's Manors*; *Surveyor of the King's Exchange*; *Surveyor General of the Works*; *Surveyors of the Highways*, &c.

SURVEYOR *of the Melting*, is an Officer of the Mint, whſe Buſineſs is to ſee the Bullion caſt out; and that it be not alter'd after the Delivery of it to the Melter. See MINT and COINAGE.

SURVEYOR *of the Navy*, is an Officer, whoſe Buſineſs is to know the State of all Stores, and ſee the Wants ſupplied; to *Survey* the Hulls, Maſts and Yards of Ships; to Audit the Boatſwain's and Carpenter's Accounts. See NAVY.

SURVEYOR *of the Ordnance*, is an Officer, whoſe Charge is to *Survey* all the King's Ordnance, Stores and Proviſions of War, in the Cuſtody of the Store-keeper of the *Tower* of *London*; to allow all Bills of Debts, to keep Checks on Labourers and Artificers Works, &c. See ORDNANCE.

Surveyor is alſo uſed for a Gauger; and alſo for a Perſon who meaſures Lands. See SURVEYING and GAUGING.

SURVIVOR, in Law, ſignifies the longer Liver of two joint Tenants; or any Two joined in the Right of any Thing.

SUSPENSION or SUSPENSE, in Common Law, is a Temporal Stop of a Man's Right.

As, when a Seigniory, Rent, &c. by reaſon of the Unity of Poſſeſſion thereof, and of the Land out of which they iſſue, are not *in eſſe* for a certain Time, and *tunc dormiunt*; but may be revived: and thus it differs from Extinguiſhment, which dies for ever. See EXTINGUISHMENT.

SUSPENSION, in the Common Law, is what we otherwiſe call the *minor Excommunication*, *viz.* a Cenſure inflicted by way of Puniſhment, on an Eccleſiaſtic, for ſome conſiderable Fault. See CENSURE and EXCOMMUNICATION.

'Tis of two Kinds, *viz. ab Officio*, and *a Beneficio*.

Suſpenſion ab Officio, is that whereby a Miniſter is, for a Time, declared unfit to execute the Office of a Miniſter. See OFFICIO.

Suſpenſion a Beneficio, is when a Miniſter is, for a Time, deprived of the Profits of his Benefices. See BENEFICIO.

Where the Fault is more Notorious, the two Kinds of *Suſpenſions* are ſometimes joined; and the Perſon *ſuſpended ab Officio*, and *a Beneficio* likewiſe. See DEPRIVATION, &c.

SUSPENSION, the Act of preventing the Effect, or Courſe of any thing, for a certain Time.

The principal Point urged in the Philoſophy of the *Sceptricks* and *Pyrrhonians*, is a *Suſpenſion* of Mind. See SCEPTICKS, PYRRHONIANS, &c.

A *Suſpenſion of Arms*, in War, is a ſhort Truce the contending Parties agree on, for the Burial of their Dead, the waiting for Succours, or the Orders of their Maſters, &c.

In Rhetorick, *Suſpenſion* is a keeping the Hearer attentive and doubtful; in expectation of what the Speaker will conclude in: as, *O God! Darkneſs is not more oppoſite to Light; Tempeſts to Calms; Pain to Pleaſure; or Death to Life; than Sin to thee.*

SUSPENSION, in Mechanicks. *Points of Suſpenſion* in a Ballance, are thoſe Points in the Axis or Beam wherein the Weights are apply'd; or from which they are *ſuſpended*. See BALLANCE.

SUSPENSOR *Teſticuli*, in Anatomy, a Muſcle call'd alſo *Cremaſter*. See CREMASTER.

SUSPIRAL, a Spring of Water, paſſing under Ground towards a Conduit or Ciſtern; alſo a Breathing-Hole, or Ventiduct. See VENTIDUCT.

SUTE. See SUITE.

SUTH-*Dure*, in ancient Cuſtoms, the South Door of a Church. The *Suth-dure* is mentioned in old Authors, as the uſual Place where canonical Purgation was perform'd: that is, when the Fact could not be proved by ſufficient Evidence, the Party accuſed, came to the South Door of the Church; and there, in the Preſence of the People, made Oath, that he was Innocent. See PURGATION.

This was called *Judicium Dei*. 'Tis for this Reaſon, that Porches are built at the South Doors of Churches. See PORCH.

SUTURE, SUTURA, in Anatomy, a particular Kind of Juncture, or Articulation, of certain Bones in the Animal Body; thus call'd, as reſembling a Seam. See ARTICULATION.

There are two Kinds of *Sutures*; the one call'd the *true* or genuine *Suture*; wherein the Bones are indented like Saws, and reciprocally receiv'd into each other.

The other, call'd the *falſe*, or *ſpurious*, or *ſquammous Sutures*; wherein the Bones are laid over each other, like the Scales of Fiſhes.

The Bones of the Cranium are uſually join'd by three genuine *Sutures*; the *Coronal*, reaching acroſs from one Temple to t'other. See CORONAL.

The *Sagittal*, joining the Oſſa Parietalia. See SAGITTAL.

And the *Lambdoidal*; thus call'd from its reſembling the *Greek* Λ, Lambda.

Beſides theſe, is a fourth *Suture*, of the ſpurious or ſquammous Kind, ſuppos'd, tho' falſely, to have no Indentures: It joins the Oſſa Temporum to the Os Sphænoides, Occipitis, &c. and is alſo call'd the *Temporal Suture*. See SQUAMMOUS.

Natural Hiſtorians tell us, That in *Perſia* 'tis frequent to have People without any *Sutures* at all in the Skull; but the whole one ſolid Bone; yet without any apparent Inconvenience: And M. *Flechier*, in his Life of Cardinal *Ximenes*, affirms the ſame of that Cardinal; yet it ſhould ſeem that great Diſorders ſhould ariſe therefrom; as the Perſpiration could be but very imperfectly effected; whence Heavineſs and Swimming in the Head. See CRANIUM.

SUTURE, in Chirurgery, a Seam made to cloſe the Lips of a Wound, in order to its healing. See WOUND.

The Ancients invented a great Variety of *Sutures*, which they reduced to three Kinds; *Incarnatives*, *Reſtrictives* and *Conſervatives*.

Incarnative SUTURE, is thus call'd, becauſe, by rejoining the Edges of a Wound, and keeping them together by the means of a Thread run acroſs them with a Needle; they grow together, and incarnate as before. See INCARNATIVE.

This, they ſub-divided into five Kinds, *viz.* the *Interrupted*, *Intertwiſted*, *Pinn'd* or *Feather'd*, *with Claſps*, and the *Dry Suture*.

Of theſe Five, two are perfectly diſuſed, *viz.* the *feather'd Suture* and the *Suture with Claſps*, as being too barbarous, and at the ſame Time unneceſſary. The Firſt was call'd *Pinn'd*, when little Pins were made uſe of; and *feather'd*, when the Barrels of Feathers or Quills.

To perform it, two or three Needles, threaded with a double Thread, were paſs'd through the Lips of the Wound, at a Finger's breadth from each other, and a Pin or Feather put in the Stitch; and another Pin or Feather bound with the Ends of the ſame Thread; that the Feathers might keep the Lips of the Wound cloſe together.

To perform the Second, they had large, crooked Claſps, pointed at each End; one of which they thruſt into the upper Part of the Wound, the other into the lower, to bring the Lips together.

Theſe *Sutures*, cruel as they were, are yet known to be uſeleſs; for in the only Caſes where they ſhould ſeem ſerviceable, *viz.* in deep Wounds, where the Contraction of the fleſhy Parts keeps the Lips far aſunder, and in Wounds of Tendons; they expoſe the Patient to terrible Convulſions and Shudderings, which are avoided, by diminiſhing the Dilatation of the Wounds, by moderate Compreſſions, and waiting till the Fibres relax.

Reſtrictive SUTURES, were thoſe wherewith they endeavour'd to ſtop the Flux of Blood from large Wounds, where any conſiderable Veſſels were cut.

To this End they invented ſeveral Kinds, in the Number whereof, were the *Shoe-maker's*, *Taylor's*, *Skinner's* and other Seams; all more impertinent than each other. 'Tis evident, the very Deſign of ſuch a *Suture* is blameable: For ſuppoſing the Wound ſo exactly ſew'd up, that no Blood could eſcape through the Lips thereof; yet will it ſtill flow out of the Veſſels; and will thus be forced to make its Way within the Inteſtines of the Muſcles, by which means the Part will ſwell, rot and gangrene. Yet the *Skinners Suture*, *Sutura Pellionum*, is ſtill preſerved for Wounds of the Inteſtines: 'Tis thus call'd, becauſe the Skinners uſe the ſame, in ſewing up the Holes made by the Butchers, in fleaing off the Skin.

Conſervative SUTURE, is that kind of ancient *Suture*, whereby the Lips of large Wounds, wherein there was a Loſs of Subſtance, were prevented from receding too far. But a Bandage, now, ſuffices.

The *Intertwiſted* SUTURE, is thus call'd, becauſe the Needles being left ſticking in the Wound, the Thread is wound around them; much after the ſame Manner as the Taylors do the threaded Needles they keep in their Sleeves, &c. This *Suture* is perform'd two Ways; for either the Needles are paſs'd acroſs the Wound, or they are ſtuck on the Sides thereof.

All the *Sutures* hitherto mention'd, are made with Needle and Thread: Beſide which, there is another Kind, call'd *dry Sutures*, which are perform'd with Glue or Size; or other proper viſcous Matter.

The *dry Suture* is ordinarily made with ſmall Pieces of Leather, or Linnen Cloth, indented like a Saw, ſo that the Teeth may fall between each other, and the whole Row may be clos'd. The Cloth, before it is cut into this Form, is ſpread with ſome proper Emplaiſter, in order to its firm Adheſion.

The Plaiſters thus prepar'd, being cut into the proper Form, are apply'd on the firm Fleſh, according to the Length of the Wound, reaching from it to the Diſtance of ſome Inches; and after they are dry'd, or well faſten'd to the Part, the Lips of the Wound being approach'd, they may conveniently be held together by the *Suture* in that Poſture.

This kind of *Suture* is principally uſed to Wounds in the Face, to prevent unſightly Scars: 'Tis likewiſe convenient when the Fibres of the Muſcles are cut a-croſs; and where 'tis difficult or impoſſible to apply a Bandage.

In the other Kinds of *Sutures*, the Stitches ought always to be taken at a Depth proportionable to that of the Wound; Care being had to avoid the Nerves as much as poſſible. In long Wounds they are beſt begun at the Ends; but in ſhort ones at the Middle.

SWABBER, the Title of an inferior Officer on Board a Man of War, whoſe Office is to ſee, that the Ship be kept neat and clean.

In order to this, he is to ſee her waſh'd well once or twice a Week at leaſt; eſpecially about the Gun-Walls and Chains. He ought to burn Pitch, or ſome ſuch Thing, now and then between Decks, to prevent Infection; and to acquaint the Captain of ſuch as are naſty and offenſive.

SWALLOWING. See DEGLUTITION.

" Some People," (ſays Dr. *Sloan*, from an Inſtance of an unhappy Perſon who had *ſwallow'd* great Quantities of Pebbles to eaſe him of the Wind, and which remaining in his Stomach to the Number of 200, had brought him into a very ſad Condition,) " from their ſeeing Birds lan-" guiſh, unleſs they *ſwallow* Gravel, or ſmall Stones, take " up an Opinion, that the *ſwallowing* of Stones helps the " Stomach to digeſt its Food; but I have been always " againſt that Practice: For tho' the Stomachs, or Gizzards " of Birds (they wanting Teeth to grind their Food) are " made very ſtrong, muſculous, and defended on the Inſide " with a Coat, by the Help whereof, and theſe Stones, their " Victuals are ground; yet the Stomachs of Men being " very different, 'tis not reaſonable to think they ſhould be " of Uſe (or even inoffenſive) to them.

" I knew, adds he, one Mr. *K*——, who for many " Years *ſwallow'd* nine or ten every Day, nearly as large as " Wallnuts, and without any apparent Harm, as they al-" ways paſs'd; but he afterwards dy'd ſuddenly." —— A Lady, mention'd by Mr. *Greenhill* in the *Philoſophical Tranſactions*, got a large and painful Tumor in the Umbilicus, with *ſwallowing* Prune-Stones; which, upon the Tumor's breaking of itſelf, came out in great Quantity: Notwithſtanding all imaginable Care ſhe dy'd of it. —— A Lad, 16 Years of Age, near *Hall* in *Saxony*, playing with a Knife ſix Inches and half long, accidentally *ſwallow'd* it. The Curioſity of the Caſe led *Wolfgang Chriſt. Weſenon*, Phyſician of the Elector of *Brandenbourg*, to take Care of him. The Knife was felt to have chang'd its Poſition ſeveral Times, and in a few Months ceas'd to be very troubleſome; and in a Year was ſo much diminiſh'd, as ſcarce to be felt from without. At length it was drawn out (exceedingly diminiſh'd every way) thro' an Abſceſs which its Point occaſion'd, three Fingers Breadth below the Pit of the Stomach, and the Boy was perfectly well; *Philoſophical Tranſactions*, N° 219. Among the Rarities in the Anatomy Hall at *Leyden*, is preſerv'd a Knife ten Inches long, *ſwallow'd* by a Peaſant, and cut out of his Stomach; after which he liv'd Eight Years.

SWALLOW-*tail*, in Fortification, is a ſingle Tenaille, narrower towards the fortify'd Place, than towards the Country. See QUEVE d' HIRONDE.

SWALLOW-*tail*, in Joinery and Carpentry, a particular Way of faſtening together two Pieces of Timber; ſo as that they can't fall aſunder. See DOVE-*tail*.

SWAN-*herd*. See KING's *Swan-herd*.

SWANIMOTE, or SWAINMOTE, (from the *Saxon Swang*, Swain, Ruſtic, and *Gemote*, Meeting) a Court touching Matters of the Foreſt; kept by the Charter of the Foreſt thrice in every Year, before the Verdurors, as Judges. See FOREST.

This Court is as incident to a Foreſt, as a Court of Piepowder to a Fair. See COURT.

SWATH, among Surgeons, a long and broad Band to bind up any diſeas'd Member, or Part. See BANDAGE.

SWEAT, a Moiſture iſſuing out of the Pores of the Skins of Animals; thro' too much Heat, Exerciſe, or Weakneſs; or through the Action of certain Medicines call'd *Sudorificks*.

Sweat is either the Conſequence of an Acceleration of the Blood's Motion, by Stimuli, or Exerciſe; or of a Relaxation of the Pores of the Cutis; by means of either whereof, the Matter which before perſpir'd inſenſibly, is now render'd ſenſible. See PERSPIRATION.

The former is the Caſe in Natural and Medicinal *Sweats*, and the latter in morbid, fainting, and cold *Sweats*.

The principal Organ of *Sweat* are the milliary Glands; which are ſpread over the whole Ambit of the Body; and furniſh'd, each, with a Vein, Artery, and Nerve, beſides an excretory Duct, thro' the Orifice whereof the *Sweat* is caſt out under the Cuticle. This Duct is cover'd with a little round Valve, lying immediately under the Cuticle, whereby the *Sweat* is occaſionally either retain'd or tranſmitted. See MILLIARY *Gland*.

The *Sweat* thus ſecreted, is various, according to the Variety of the Weather, Soil, Sex, Age, Temperament, Emunctories, Diet, Time of Digeſtion, &c. as in the Urine. See URINE.

In a ſound Body, *Sweat* is ſcarce ever found, but from a Fault in ſome of the ſix Non-naturals: Its immediate Effect is always hurtful; By Accident it ſometimes does good.

The Phyſicians order *Sweats* in cold and inveterate Diſeaſes, as the Palſy, Rheumatiſm, Sciatica, and many other Diſeaſes. Diſeaſes frequently have their Criſes in *Sweats*.

Sweating is indicated by the Beginning of a critical *Sweat*, to carry off the Diſeaſe; by the Tenuity of the morbid Matter diſpers'd thro' all the Veſſels, as in the Plague, a venomous Bite, the *French* Diſeaſe, e'er yet fix'd; by the particular Temperature of the Patient, and by various Obſtructions to be remov'd in the ſeveral Parts of the Body; particularly in ſubcutaneous Diſeaſes, the Itch, Pſora, Leproſy, &c.

Matthiolus tells us, That the *Sweat* of all Quadrupeds, as Horſes, Aſſes, &c. is venomous; and that that of other Beaſts is unwholſome. *Tachenius* adds, that the *Sweat* of Horſes, particularly, is ſo acid, that it pierces the ſtrongeſt and firmeſt Boots, that are Proof againſt all Water. Some Naturaliſts affirm, that Dogs and Cats never *ſweat*, how hot ſoever they be, becauſe they are not found to have any Pores in the Cuticle. See PORE.

Engliſh SWEAT. See SUDOR *Anglicanus*.

SWEEP, among Refiners, the Almond Furnace. See FURNACE.

SWEEP: The Seamen call the Mold of a Ship, when ſhe begins to compaſs in at the Rungheads, the *Sweep* of her, or the *Sweep* of the Futtock.

Sweeping at Sea, ſignifies dragging along the Ground, at the Bottom of the Sea, or Channel, with a Tree-fluk'd Grapnel, to find ſome Hawſer or Cable which is ſlipped from an Anchor.

SWIMMING, the Act or Art of ſuſtaining the Body in Water, and of advancing therein by the Motion of the Arms, Legs, &c.

Man alone learns to *ſwim*; all other Animals have it naturally.

Among the ancient *Greeks* and *Romans*, *Swimming* made ſo eſſential a Part of the Diſcipline of their Youth, that to repreſent a Man perfectly rude and uneducated, they uſed to ſay proverbially, he had neither learned to read nor to *ſwim*.

In Fiſhes, 'tis the Tail is the grand Inſtrument of *Swimming*, not the Fins, as is generally imagin'd: For this Reaſon Fiſhes are more ſtrong and muſculous in that Part, than in all the reſt of the Body; according as we find it in all other Animals; the motive Parts whereof are ſtill the ſtrongeſt, as the Thighs of Men for walking, the Pectoral Muſcles of Birds for Flight, &c. See FLYING, &c.

The Manner wherein Fiſhes row themſelves forwards by the Tail, is well explain'd by *Borelli de Motu Animal.* Pars 1. cap. 23. The Fins of Fiſhes only ſerve to keep the Body well pois'd and ballanc'd, and prevent Vacillation. See FIN.

M. *Thevenot* has publiſh'd a curious Piece in *French*, call'd *L'Art de Nager*, the Art of *Swimming*, demonſtrated by Figures. Before him, *Everard Digby*, an *Engliſhman*, and *Nicholas Winman*, had laid down the Rules of this Art: *Thevenot* has done little more than copy from them.

Indeed, had he but read, with half that Application, *Borelli*'s Treatiſe *de Motu Animalium*, he would ſcarce have maintain'd, as he has done, that Men would *ſwim* naturally, like other Animals, were they not prevented by Fear, which magnifies their Danger.

We have abundant Experience againſt this: Throw any Brute, newly born, into a River, and it *ſwims*: Throw an Infant in, e'er yet capable of Fear, and it *ſwims* not, but is drown'd.

The Reaſon is, that the human Machine differs very notably in its Structure and Configuration from that of Brutes; and particularly, which is very extraordinary, in the Situation of its Centre of Gravity. In Man, the Head is exceedingly heavy, with regard to the Weight of the reſt of the Body; by reaſon the Head is furniſh'd with a very great Quantity of Brain, and has, beſides, a deal of Fleſh and Bones, and no Cavities to be fill'd with Air; ſo that the Head immerging under Water by its own Gravity, the Noſe and Ears are ſoon fill'd: Thus the Strong carrying down the Weak, the Man ſoon drowns, and is loſt.

But in Brutes 'tis otherwiſe: For the Head having but little Brain, and there being abundance of Sinus's therein; its Weight, with Regard to the reſt of the Body, is much leſs conſiderable; ſo that they are eaſily able to keep their Noſe up in the Air, and thus reſpiring freely, are out of Danger of drowning, on the Principles of Staticks.

In effect, the Art of *Swimming*, which is no otherwiſe to be acquir'd but by Exerciſe, conſiſts principally in keeping the Head above Water, ſo, that the Noſe and Mouth being at Liberty, Reſpiration may be carry'd on: For, as to the Feet and

and Hands, 'tis enough to ſtir them, and to uſe them as Oars to conduct the Veſſel.

SWIMMING *Bladder*, a Veſicle of Air, inclos'd in the Bodies of Fiſhes, by means whereof they are enabled to ſuſtain themſelves at any Depth of Water. See FISHES.

For the Air in that Bladder being more or leſs compreſs'd, according to the Depth the Fiſh *ſwims* at; takes up more or leſs Space; and conſequently the Body of the Fiſh, Part of whoſe Bulk this Bladder is, is greater or leſſer, according to the ſeveral Depths; and yet retains the ſame abſolute Weight. Now the Rule *de Inſidentibus humido*, is, that a Body heavier than ſo much Water as is equal in Quantity to the Bulk of it, will neceſſarily ſink; a Body that is lighter, will *ſwim*; and a Body of equal Weight, will reſt in any Part of the Water.

By this Rule, if the Fiſh in the middle Region of the Water be of equal Weight with Water, Bulk for Bulk; the Fiſh will reſt there without any natural Tendency upwards or downwards.

And if the Fiſh be deeper in the Water, its Bulk becoming leſs by the greater Compreſſion of the *Bladder*; it will ſtill remain commenſurate to the Gravity of the Water in that Part.

If the Fiſh be higher than the middle Region; the Air dilating itſelf, and the Bulk of the Fiſh conſequently increaſing, but not the Weight; the Fiſh will riſe upwards, and reſt a-top of the Water.

'Tis probable the Fiſh, by ſome Action, can emit Air out of its *Bladder*, and take freſh in: Mr. *Ray* obſerves, that in moſt Fiſhes, there is a manifeſt Channel leading from the Gullet to the *ſwimming Bladder*, which doubtleſs ſerves for the Conveyance; and that there is a muſculous Power in the Coat of the *Bladder*, whereby the Fiſh can contract it when it liſts. The ſame Author adds, in Confirmation of this Doctrine, that 'tis found, if the *ſwimming Bladder* of any Fiſh be prick'd or broke, the Fiſh immediately ſinks to the Bottom, and can neither ſupport nor raiſe itſelf. And that in flat Fiſhes, as Soles, Plaiſe, *&c.* which lie always groveling at the Bottom, there is no *ſwimming Bladder* at all.

SWINE-*Pox*. See POX.

SWOONING, a Kind of Syncope, or Fainting, wherein the Patient loſes all his Strength, and his Underſtanding.

Swooning may be occaſion'd by any thing that alters, corrupts, or diſſipates the Vital Spirits; as, long Watching, violent Pains, great and ſudden Evacuations, putrid Vapours ariſing from Abſceſſes in the noble Parts. See SYNCOPE.

SWORD, an offenſive Weapon, wore at the Side, ſerving either to prick, or cut, or both. See FENCING.

Its Parts are the *Blade*, *Guard*, *Hand* or *Graſp*, and *Pummel*; to which may be added, the *Bow* and *Scabbard*. The Maſters of Defence divide the *Sword* into the upper, middle, and lower Part; or the ſtrong, middle, and ſmall or weak Part.

Anciently there were a kind of two-handed *Swords*, call'd *Spado*'s, which were to be manag'd with both Hands; which in thoſe Days they could brandiſh ſo nimbly, as to cover the whole Body therewith.

The Savages of *Mexico*, when firſt viſited by the *Spaniards*, had a kind of Wooden *Swords*, which would do as much Execution as ours. In *Spain*, *Swords* are only allow'd of ſuch a Length, determin'd by Authority. The ancient Cavaliers gave Names to their *Swords*; *Joyeuſe* was that of *Charlemain*; *Durandal* that of *Orlando*, &c.

SWORD-*Blade Company*. See COMPANY.

SYCOPHANT, a *Greek* Term, originally uſed at *Athens*, for Perſons who made it their Buſineſs to inform againſt thoſe who ſtole Figs, to the Owners; or againſt thoſe, who, contrary to the Law, which prohibited the Exportation of Figs, yet practiſed the Thing; and deceiv'd the Officers, the Inſpectors of the Ports, *&c.*

At length, the Term became uſed in the general for all Informers, Tale-bearers, Paraſites, *&c.* eſpecially thoſe in the Courts of Princes: And, at laſt, for a Lyer, Impoſter, *&c.*

The Word is form'd from *συκη*, a Fig, and *φημὶ*, I ſay.

SYCOPHANTIC Plants. See PARASITES.

SYLLABIC, in the *Greek* Grammar. There are two Kinds of Augmentations in the *Greek*: The firſt call'd *Syllabic*, which is when the Word is increas'd by a Syllable; and the other *Temporal*, which is when a ſhort Syllable becomes long. See AUGMENTATIVE.

SYLLABLE, in Grammar, a Part of a Word, conſiſting of one or more Letters pronounc'd together. See LETTER.

Or, a Syllable is a compleat Sound, utter'd in one Breath, conſiſting either of a Vowel alone, or of a Vowel and one or more Conſonants, not exceeding ſeven. See VOWEL, CONSONANT, *&c.*

Scaliger defines a *Syllable* to be an Element under one Accent; that is, what can be pronounc'd at once.

Priſcian, more intelligibly, calls it a Comprehenſion of ſeveral Letters falling under one Accent, and produc'd at one Motion of the Breath: But ſome Grammarians reject this Definition, as excluding all *Syllables* of one Letter.

Another defines *Syllable* a literal, or articulate Voice, of an individual Sound. See VOICE.

In every Word, therefore, there are as many *Syllables* as there are vocal Sounds; and as many vocal Sounds, as there are ſimple or compound Vowels; each whereof requires a diſtinct Motion of the pectoral Muſcles: Thus, *a*, *a*, *a*, make three *Syllables*, form'd by ſo many Motions, diſtinguiſh'd by ſmall Stops betwixt each Expiration.

In the *Hebrew*, all the *Syllables* begin with Conſonants; allowing *Aleph* to be one; nor has any *Syllable* more than a ſingle Vowel. See VOWEL.

From the Number of *Syllables* in Words they become denominated *Monoſyllables*, *Biſſyllables*, *Triſſyllables*, and *Poly-ſyllables*, *q. d.* Words of one *Syllable*, two *Syllables*, three *Syllables*, and many *Syllables*. See WORD, MONOSYLLABLE, *&c.*

The Word is deriv'd from the *Greek* *συλλαβὴ*, Aſſemblage.

As 'tis the Number of *Syllables* that makes the Meaſure of *Engliſh* Verſe; it were to be wiſh'd, we had fix'd and ſettled Rules to determine the preciſe Number of *Syllables* in each Word: for we have Words very dubious in that reſpect: And there are even ſome which have more *Syllables* in Verſe, than in Proſe. Many of the Words ending in *cious*, give a deal of Embarraſs to ſuch as pique themſelves on Exactneſs; as *odious*, *precious*, &c. See FOOT, QUALITY, MEASURE, *&c.*

SYLLABUB, a kind of compound Drink, moſt affected in the Summer Seaſon; ordinarily made of White-Wine and Sugar, into which is ſquirted new Milk with a Syringe, or Wooden Cow.

Sometimes 'tis made of Canary, in lieu of White Wine; in which Caſe the Sugar is ſpar'd, and a little Lemon and Nutmeg uſed in lieu of it.

To prepare it the beſt Way, the Wine and other Ingredients, excepting the Milk, are mix'd over Night, and the Milk or Cream added in the Morning. The Proportion is, a Pint of Wine to three of Milk. For

Whipt Syllabub, to half a Pint of White Wine, or Rheniſh, is put a Pint of Cream, with the Whites of three Eggs. This they ſeaſon with Sugar, and beat with Birchen Rods. The Froth is taken off as it riſes, and put into a Pot; where, after ſtanding to ſettle two or three Hours, 'tis fit to eat.

SYLLEPSIS, in Grammar, call'd alſo *Conceptio*, is a Figure whereby we conceive the Senſe otherwiſe than the Words import; and thus make our Conſtruction, not according to the Words, but to the Senſe. See CONCEPTIO.

The *Syllepſis*, ſays an ingenious Author, is a Figurative Conſtruction, which agrees more with our Ideas, than with the Words; and which expreſſes more of the Senſe or Ideas in the Mind, than the Terms themſelves.

Other Authors make it a Diſproportion, or Unſuitableneſs in the Parts of the Diſcourſe.

Voſſius will have it the Agreement of a Verb, or Adjective, not with that Word next it, but with the moſt worthy in the Sentence; as *Rex & Regina beati*.

Some Authors call the *Syllepſis*, *Syntheſis*. See SYNTHESIS.

'Tis a Figure of very conſiderable Uſe for the well underſtanding of Authors: Accordingly, *Scioppius* divides it into two Kinds, ſimple and relative. The *ſimple Syllepſis* is when the Words of a Diſcourſe either differ in Gender, or Number, or both: The *relative Syllepſis*, is when the Relative is referr'd to an Antecedent, which is not expreſs'd; but which we conceive by the Senſe of the whole Period.

SYLLOGISM, in Logic, an Argument, or Form of Reaſoning, conſiſting of three Propoſitions; having this Property, that the Concluſion neceſſarily follows from the two Premiſes; ſo that if the firſt and ſecond Propoſition be granted, the Concluſion muſt be granted in like Manner; and the whole allow'd Demonſtration.

If the Premiſes be only probable, or contingent, the *Syllogiſm* is ſaid to be *Dialectical*; if they be certain, *Apodictical*; if falſe, under an Appearance of Truth, *Sophiſtic*, or *Paralogiſtic*. See DIALECTICAL, APODICTICAL, and SOPHISTICAL.

As often as the Mind obſerves any two Notions to agree to a third; which is done in two Propoſitions; it immediately concludes that they agree to each other: Or if it find that one of them agrees, and the other diſagrees; which is likewiſe done in two Propoſitions; it immediately pronounces that they diſagree to each other. And ſuch is a *Syllogiſm*; which, it hence appears, is nothing but an inward Diſcourſe, or Thought, whereby, from any two Propoſitions granted, a third is neceſſarily deduc'd. See PROPOSITION.

Hence, as the *Greeks* call it *Syllogiſm*, the *Latins* call it *Collectio*, or *Ratiocinatio*, as being a kind of Computation, which, either by adding or ſubſtracting, gathers either the Sum or the Remainder: For, as if we add two to three, we thence collect five; ſo, if to this Propoſition, *Man is an Animal*, you add this, *every Animal thinks*; you thence deduce this, *therefore Man thinks*.

Of the three Propoſitions whereof a *Syllogiſm* conſiſts; the firſt is by way of Eminence, call'd the *Propoſition*, as being propos'd for the Baſis of the whole Argument; the ſecond is call'd the *Aſſumption*, as being aſſum'd to aſſiſt in inferring

inferring the third: Tho' they are both call'd *Sumptiones*, becauſe aſſum'd for the Sake of the third; and both *Premiſes*, as being premis'd to it; and for the ſame Reaſon both are call'd *Antecedents*, only the firſt the *Major*, and the latter the *Minor*. See ASSUMPTION, PREMISES, MAJOR, MINOR, &c.

The third is call'd the *Concluſion*, as being the Cloſe of the whole Argumentation; and ſometimes *Complexio*, as including the two Notions, before ſeparately compar'd; and *Conſequens*, becauſe it follows from the Antecedents; and laſtly, *Illatio*, becauſe inferr'd from the Premiſes by Means of the illative Particle *Ergo*, therefore, &c. See CONCLUSION, COMPLEXIO, &c.

As the Concluſion is the principal Part of a *Syllogiſm*, it thence ariſes, that tho' both the Propoſition and Aſſumption conſiſt each of its Subject and Attribute; yet the Subject and Attribute of a *Syllogiſm*, are properly underſtood of thoſe of the Concluſion. See SUBJECT and ATTRIBUTE.

Again, in the Inſtance above mention'd, *Animal* being uſed both as Subject and Attribute, 'tis held a kind of Intermediate between the Two, and frequently call'd *Medium*; in reſpect to which, both the Subject and Attribute, *Man* and *Thinks*, are call'd *Extremes*, or *Terms*; only the Subject the *greater Extreme*, and the Attribute *the leſs*. See MEDIUM and EXTREME.

A *Syllogiſm*, whether Simple or Compound; may either be *Categorical*, as that already inſtanced; wherein both Premiſes are Poſitive. See CATEGORICAL.

Or, *Hypothetical*, wherein one or both of the Premiſes are ſuppoſed; as, *As if the Sun ſhines, 'tis Day, but the Sun does ſhine; therefore 'tis Day.* See HYPOTHETICAL.

Or, *Analogical*, as, *As the Baſe is to the Column; ſo is Juſtice to the Commonwealth; but if the Baſe be withdrawn, the Column is overturn'd; therefore if Juſtice be taken away, the Commonwealth is over-turn'd.* See ANALOGICAL.

Or *Diezeutic*, or *Disjunctive*; as, *Either they mean to Pleaſe or to Profit; but they don't aim to Pleaſe; therefore they don't aim to Profit.* See DIEZEUTIC.

The moſt convenient Form of a perfect *Syllogiſm*, is to have the Medium in the Middle, placed between the Subject and the Attribute; as in the Inſtance above-mentioned.

Of this Form, there are two Figures; the one *Coherent*, or *Conjunct* and *Affirmative*, founded on this Canon, That what agrees with any thing, likewiſe agrees with that, wherewith this neceſſarily agrees.

The other *Incoherent* or *Disjunct* and *Negative*, founded on this Canon, That what agrees with any thing, diſagrees with that wherewith this diſagrees. Of each of theſe Figures there are three Modes, *viz. General*, *Particular* and *Mix'd*. See MOOD and FIGURE.

A *Syllogiſm*, wherein one of the Premiſes is ſuppreſs'd; but ſo as to be underſtood, is call'd an *Enthymeme*; *e. gr. Every Animal Thinks, therefore Man Thinks*; wherein the Propoſition, *Man is an Animal*, is underſtood. See ENTHYMEME.

The Demonſtrations of Mathematicians, 'tis obſerved, are only certain Series's of Enthymemes; ſo that every thing in Mathematicks, is concluded by *Syllogiſm*; only omitting ſuch Premiſes as occur of their own accord, or as are referr'd to by the Citations. See DEMONSTRATION.

For the Uſe *Syllogiſm* is of to Reaſon, Mr. *Lock* obſerves, That of four Things, which Reaſon is employ'd about, *viz.* the finding out of Proofs; the regular Diſpoſition of them, ſo as their Connexion may appear; the perceiving their Connexion; and the making a right Concluſion: *Syllogiſm* only aſſiſts in one, *viz.* the ſhewing the Connexion of the Proofs of any Inſtance.

Nor is it of any great Uſe even here; ſince the Mind can perceive ſuch Connexion, where it really is, as eaſily, nay, perhaps, better, without. We ſee Men reaſon very ſtrongly, who don't know how to make a *Syllogiſm*.

Indeed, *Syllogiſm*, the ſame Author adds, may ſerve to diſcover a Fallacy in a rhetorical Flouriſh; or, by ſtripping an Abſurdity of the Cover of Wit and good Language, ſhew it in its natural Deformity. But it only ſhews the Weakneſs or Fallacy of ſuch a Diſcourſe, by the artificial Form it is put into, to thoſe who have thoroughly ſtudied Mode, and Figure, and have ſo examined the many Ways three Propoſitions may be put together in, as to know which of them does certainly conclude right, and which not, and upon what Grounds they do ſo.

The Mind is not taught to reaſon by theſe Rules: It has a native Faculty, of perceiving the Coherence or Incoherence of its Ideas, and can range them right, without ſuch perplexing Repetitions. Add, that to ſhew the Weakneſs of an Argument, there needs no more, than to ſtrip it of the ſuperfluous Ideas, which, blended and confounded with thoſe on which the Inference depends, ſeems to ſhew a Connexion where there is none; or at leaſt hinders the Diſcovery of the Want of it: And then to lay the naked Ideas, on which the Force of the Argumentation depends, in their due Order. In this Poſition, the Mind taking a View of them, ſees what Connexion they have, and ſo is able to judge of their Inference, without any need of *Syllogiſm* at all. Nor muſt it be omitted, that *Syllogiſms* are as liable to Fallacies, as the plainer Ways of Argumentation; for which one might appeal to common Obſervation, which has always eſteem'd theſe artificial Methods of Reaſoning, more adapted to catch and intangle the Mind, than to inſtruct and inform the Underſtanding. And if it be certain that Fallacy can be couch'd in a *Syllogiſm*, as no Body will deny but it may; it muſt be ſomething elſe, and not a *Syllogiſm*, that muſt diſcover it.

The ſame Author proceeds to ſhew, that this Way of Reaſoning, diſcovers no new Proofs, nor makes any Diſcoveries; but is wholly converſant in the Marſhalling and Ranging thoſe we already have: A Man muſt know, e'er he be able to prove *ſyllogiſtically*; ſo that the *Syllogiſm* comes after Knowledge, when we have but little need of it. See REASON.

SYLVA, in Poetry, a poetical Piece; compoſed, as it were, at a Start; in a kind of Rapture or Tranſport, without much Thought or Meditation.

Such are the *Sylvæ* of *Statius*, which, he aſſures us, were all compoſed after this Manner.

Quintilian extends the Uſe of the Word to any Writing done in haſte, and on the Spot.

The Word is *Latin*, and literally ſignifies *Foreſt*; whence its chief Uſe, in our Language is, metaphorically, to expreſs certain Collections of poetical Pieces, of various Kinds, and on various Subjects; as a Foreſt is an Aſſemblage of Trees of different Kinds.

SYMBOL, a Sign, Type, Emblem or Repreſentation of any moral Thing, by the Images or Properties of natural Things. See SIGN, TYPE, &c.

Thus we ſay, the Lion is the *Symbol* of Courage; the Pellican of paternal Love, &c.

Symbols were in great Repute among the ancient *Hebrews*, and eſpecially among the *Egyptians*; and ſerved to cover a great Part of their moral Myſteries; being uſed not only to repreſent Moral Things by Natural; but even Natural by Natural.

Symbols are of various Kinds; as *Types*, *Ænigma's*, *Parables*, *Fables*, *Allegories*, *Emblems*, *Hieroglyphicks*, &c. each whereof ſee under its reſpective Article ENIGMA, PARABLE, FABLE, &c.

The Word is form'd from the *Greek*, σύμβολον, a Mark, Sign, or Badge, and that from the Verb συμβάλλειν, *Conjicere*.

The *Chineſe* Letters are moſt of them *Symbols*, or Significative. See LETTER.

The *Symbols* in Algebra, &c. are various. See CHARACTER.

Medalliſts apply the Term *Symbol* to certain Marks or Attributes peculiar to certain Perſons, or certain Deities. The Thunder-bolt, for Inſtance, accompanying the Heads of certain Emperors, is a Sign or *Symbol* of the Soveraign Authority, and of a Power equal to that of the Gods. The Trident is the *Symbol* of *Jupiter*; the Peacocks of *Juno*; a Figure ſeated on an Urn, of a River.

SYMBOL, among Chriſtians, is particularly uſed for the *Creed*, or the Articles every Chriſtian is to know, and believe. See CREED.

Fleury obſerves, That till the Time of St. *Gregory*, the *Symbol* was never uſed to be rehearſed in the Office of the *Roman* Church; in regard that Church, having never been infected with any Hereſy, did not need to make any Profeſſion of Faith.

Suicer notes, That ſeveral Words and Points have been occaſionally added to the *Symbols*, upon the riſing of new Hereſies.

Though it be a common Opinion, that the *Symbol* is the Work of the Apoſtles; and though, on the footing of ſuch Opinion, we call it the *Apoſtles Creed*; yet, *du Pin* obſerves, there are ſeveral very cogent Arguments to render the Opinion highly improbable.

In the Emperor's Library, is a *Greek* MS of the *Symbol of the Apoſtles*, divided into 12 Articles, with the Names of the reſpective Apoſtles, who are ſaid to have compoſed each Article: The Firſt is attributed to St. *Peter*, and the reſt ſucceſſively to *Andrew*, *James* Major, *John*, *Thomas*, *James* Minor, *Philip*, *Bartholomew*, *Matthew*, *Simon*, *Thadeus* and *Matthias*.

But the Teſtimony of that MS, does not much confirm the Opinion, that each Apoſtle compoſed an Article of the *Symbol*; yet the Opinion is, at leaſt, as old as St. *Leo*, who ſeems to have believed it.

Authors are in doubt, why the Name *Symbol* ſhould be given this Compendium of the Articles of the Chriſtian Faith: Some ſay, 'tis thus call'd, as being the Mark or Characteriſtic of a Chriſtian. Others derive it from an Aſſembly or Conference of the Apoſtles, where each expreſſing his Senſe of the Faith, and what each had chiefly preach'd, the Creed was fram'd, and call'd by the *Greek* Word σύμβολον, which ſignifies Collation or Conference. 'Tis added, that St. *Cyprian* is the firſt who appears to have uſed the Word *Symbol* in this Senſe.

SYMBOLICAL *Column* } See { COLUMN
SYMBOLICAL *Philoſophy* } See { HIEROGLYPHIC.

Clemens Alexandrinus, *Euſebius*, &c. obſerve, that the *Ægyptians* had two Ways of deſigning their *Symbolical Myſteries*: One by the Virtues of Animals, Herbs, &c. the other by Geometrical Figures: Thus, the *Sun* and *Moon* were repreſented, in the firſt Manner, by the *Beetle* and *Ibis*; and in the latter, by their own Figure. Again, the four Elements they repreſented, after the firſt Manner, by four Animals which had Qualities correſponding thereto; and after the ſecond Manner by +. See HIEROGLYPHIC.

SYMMETRY, the Relation of Equality, in the Height, Length and Breadth of the Parts neceſſary to compoſe a beautiful Whole.

Symmetry, according to *Vitruvius*, conſiſts in the Union and Conformity of Relation, of the Members of a Work, to their Whole, and of each of the ſeparate Parts to the Beauty of the entire Work; Regard being had to ſome certain Meaſure: ſo that the Body is framed with *Symmetry*, by the Relation the Arm, Elbow, Hand, Fingers, &c. have to each other, and to their Whole.

Symmetry, ariſes from that Proportion, which the *Greeks* call *Analogy*, which is the Relation of Conformity of all the Parts of a Building, and of their Whole, to ſome certain Meaſure; whereon depends the Nature of *Symmetry*.

In Architecture, we call *Uniform Symmetry*, that where the Ordonnance reigns in the ſame Manner, throughout the whole Pourtour; and *Reſpective Symmetry*, that where only the oppoſite Sides are equal to each other.

The Word is form'd from the *Greek*, συν, with, and μετρον, Meaſure.

SYMPATHETIC, ſomething that has a *Sympathy*, or that acts by *Sympathy*. See SYMPATHY.

SYMPATHETIC, is particularly applied to all Diſeaſes which have two Cauſes; the one remote, the other near.

In which Senſe, the Word is oppoſed to *Idiopathetic*. See IDIOPATHETIC.

Thus, an Epilepſy is ſaid to be *Sympathetic*, when produced by a remote Cauſe; *i. e.* when the Diſorder in the Brain, embarraſs'd, and, as it were, mired with Blood, is preceded and produced by ſome other Diſeaſe.

There is a *Sympathetic* Palpitation of the Heart, and an *Idiopathetic* one. There is but one Idiopathetic Cauſe of the Palpitation; but there are ſeveral *Sympathetic* ones. See PALPITATION.

Among Chymiſts and Alchymiſts, the Term *Sympathetic* is principally applied to a kind of *Powder*, and a Sort of *Ink*.

SYMPATHETIC *Inks*, are ſuch as can be made to appear and diſappear very ſuddenly, by the Application of ſomething which ſeems to work by *Sympathy*. See INK.

Of theſe, we have ſome very curious Inſtances and Experiments, given us by *Lemery* and Mr. *Boyle*; to the following Effect.

1° To two or three Parts of unſlak'd Lime, put one of yellow Orpiment; powder and mix the Two, adding 15 or 16 times as much Water as there was Orpiment; ſtop up the Viol with a Cork and Bladder, and ſet it in warm Embers. Shake the Viol now and then for five Hours, and warily decant the clear Part, or rather filtrate it. In the mean Time, burn a Piece of Cork thoroughly, and when well inflamed, quench it in common Water, or rather in Brandy. Being thus reduced into a friable Coal, grind it with fair Water, wherein Gum Arabic has been diſſolved; and it will make a Liquor as black as the common *Ink*.

While theſe are doing, diſſolve in three Times as much diſtill'd or ſtrong Vinegar, over warm Embers, a Quantity of Red Lead; or of Saccharum Saturni, in Thrice the Quantity of Water, for three or four Hours; or 'till the Liquor have a ſweet Taſte. This Liquor will be as clear as common Water.

The *Inks* thus prepared: Write any thing on Paper with this laſt Liquor, dry it, and nothing will appear. Over the Place, write what you pleaſe with the Second Liquor; it will appear as if written with common *Ink*: When dry, dip a ſmall Piece of Rag or Spunge in the firſt Liquor, rub it over the written Place, and the black Writing will vaniſh; and that wrote with the inviſible *Ink*, appear black and legible.

Again, take a Book four or five Inches thick, and on the firſt Leaf, write any thing with the laſt Liquor: Turn to the other End of the Book, and rub there with a Rag, dipt in the firſt Liquor, on that Part, as near as you can gueſs, oppoſite to the Writing; and leave alſo the Rag there, clapping a Paper over it; then nimbly ſhutting the Book, ſtrike four or five ſmart Strokes thereon with your Hand, and turning the other Side uppermoſt, clap it into a Preſs, or lay it under a good Weight, for a Quarter of an Hour, or even half that Time: Then will the Writing done with the inviſible *Ink* be found white and legible.

2° Diſſolve white or green Vitriol in Water, and writing with the Solution, nothing will appear. Boil Galls in Water, and dip a Linnen Rag in the Decoction, and with it rub the Place before writ, and it will appear black and legible. Rub it over again with Spirit of Vitriol, or its Oil, and the Writing will diſappear again: Rub it over again with Oil of Tartar *per Deliquium*; the Letters will appear again, but of a yellow Colour.

SYMPATHETIC *Powder*, a Powder once very much fam'd; ſuppoſed to have this wonderful Property, That if ſpread on a Cloth dipt in the Blood of a Wound, the Wound would be cured, though the Patient were any Number of Miles off.

This Powder, M. *Lemery* tells us, is nothing but *Roman* Vitriol, open'd by the Sun-beams penetrating it, and imperfectly calcining it, in the middle of Summer.

But it is now generally allowed a mere Piece of Charletanery, whatever Sir. *Kenelm Digby* and others before him and after, plead in its Favour.

Sir *Kenelm*, in an expreſs Treatiſe on the Subject, where he gives Inſtances of Cures perform'd by it, accounts for the Manner of its Operation thus: The Sun's Rays, ſays he, attract and draw the Spirits of the Blood, at a great Diſtance; by which means the Atoms thereof, are driven and diſperſed far and near in the Air. Now, the Spirits of Vitriol, incorporated with the Blood, fly along with them, and the Two together form a kind of Train of Corpuſcles. On the other Side, there is continually iſſuing and exhaling from the Wound, abundance of fiery Spirits, which attract the neighbouring Air, and this Air, by a continued Concatenation, attracting, ſtill, the next Air, at length, meets the Atoms, with the Spirits of the Blood and Vitriol. Thus the Spirits of the Blood finding their Source again, re-enter into their primitive Seat, and being joined with the vitriolic Spirits, the Wound is comforted and healed, imperceptibly.

But to the Confuſion of all this fine Reaſoning; 'tis found by Experience, that the Powder is ſo far from this Effect at a great Diſtance, that 'tis ſcarce perceived, if done in the ſame Room with the Patient. Though 'tis poſſible, as the Parts of the Vitriol are in continual Motion, if the Cloth be applied juſt by the Patient, ſome of the Effluvia thereof, may enter the Wound, and help to ſtop the Bleeding. See VITRIOL.

SYMPATHY, an Agreement of Affections and Inclinations; or a Conformity of natural Qualities, Humours, Temperaments, &c. which make two Perſons pleas'd and delighted with each other.

The Word is form'd from the *Greek* σὺν, with, and πάθος, Paſſion, *q. d.* Com-paſſion, Fellow-feeling.

Sympathy is alſo uſed with regard to inanimate Things; intimating ſome Propenſion they have to unite, or to act on one another.

In this Senſe, Naturaliſts ſay, there is a *Sympathy* between the Vine and the Elm; between the Load-Stone and Iron; the two Poles of a Load-Stone, &c.

Several Authors have wrote on the *Sympathies* and Antipathies between Animals; but the greateſt Part of what they ſay is fabulous: Such, *e. gr.* is that Antipathy between Chords made of Sheeps and Wolfs Guts; A Lute, they ſay, being ſtrung with theſe two Kinds of Chords, they can never be brought into Tune with each other: Such alſo is that of Eagles Feathers, which mix'd with thoſe of other Birds, devour and conſume them. See ANTIPATHY.

The Alchymiſts talk much of the *Powder of Sympathy*. See SYMPATHETIC *Powder*.

SYMPATHY, in Medicine, an Indiſpoſition befalling one Part of the Body, thro' the Diſorder or Faultineſs of another; whether it be thro' the Affluence of ſome Humour, or Vapour ſent from elſewhere; or thro' the Want of the Influence of ſome Matter neceſſary to its Action. See CONSENT *of Parts*.

For the Force and Effect of Sympathy, *in the Production of Monſters*. See MONSTER.

SYMPHISIS, in Medicine, one of the Manners of articulating or jointing the Bones. See ARTICULATION.

Symphiſis is a natural Union, whereby two ſeparate Bones are render'd contiguous, and become one, ſo, as neither has any proper, diſtinct Motion.

Such are moſt of the Junctures of the Epiphyſes, and many others of Bones which in Children are ſeparate, but with Age grow together; as the Os Ethmoides, the Bones of the Cranium, Os Sacrum, &c. See BONE.

The *Symphiſis*, or *Natural Union* of Bones, is of two Kinds; either with a Medium, or without.

The *Symphiſis* without Medium, is where two Bones unite, and grow together of themſelves without the Intervention of any third Thing: Such are the *Symphiſes* of *Epiphyſes* with the principal Bones; and ſuch thoſe of the lower Jaw. This Union is effected much after the ſame Manner as that of a Graft and a Tree.

The *Symphiſis* with a Medium is of three Kinds, call'd *Syneuroſis*, *Syſarchoſis*, and *Synchondroſis*. Each whereof ſee under its proper Article, SYNEUROSIS, &c.

The Word is *Greek*, σύμφυσις, and ſignifies a natural Coherence or Connection.

SYMPHONY, in Muſic, a Conſonance, or Conſort of ſeveral Sounds agreeable to the Ear; whether they be Vocal or Inſtrumental, or both; call'd alſo *Harmony*. See HARMONY and CONSONANCE.

Some Authors reſtrain *Symphony* to the ſole Muſic of Inſtruments: In this Senſe, ſay they, the Recitativo's in ſuch an Opera were intolerable, but the *Symphonies* excellent. See SONG.

The *Symphony* of the Ancients went no further than to two or more Voices or Inſtruments ſet to Uniſon; for they had no ſuch Thing as Muſic in Parts; as is very well prov'd by M. *Perrault*; at leaſt, if ever they knew ſuch a Thing, it muſt be allow'd to have been loſt. See SYNAULIA.

'Tis to *Guido Aretine* we owe the Invention of Compoſition: 'Twas he firſt join'd in one Harmony ſeveral diſtinct Melodies; and brought it even the Length of four Parts, *viz.* Baſs, Tenor, Counter, and Treble. See HARMONY and MELODY.

The Word is form'd from the *Greek* συν, with, and φώνη, Sound.

SYMPOSIAC, an Entertainment, or Converſation of Philoſophers at a Banquet. See BANQUET.

Plutarch has ſeveral Treatiſes which he calls *Sympoſiaca*; or, The Banquet of the ſeven Sages, *&c.*

The Word is form'd from the *Greek*, συμπόσιον, Convivium, Feaſt.

SYMPTOM, in Medicine, is ordinarily confounded with *Sign*, and defin'd an Appearance, or Conjunction of Appearances, in a Diſeaſe, which ſhew or indicate its Nature and Quality, and whence one may judge of the Event thereof. See SIGN.

In this Senſe, a Delirium is held a *Symptom* of a Fever; and Pain, Waking, Drowſineſs, Convulſions, Suppreſſion of Urine, Difficulties of Breathing and Swallowing, Coughs, Diſguſts, Nauſeas, Thirſt, Swoonings, Faintings, Looſeneſs, Coſtiveneſs, Dryneſs and Blackneſs of the Tongue, are held the principal *Symptoms* of Diſeaſes.

But *Boerhaave* gives us a much more juſt and accurate Notion of a *Symptom*: Every præternatural Thing, ſays he, ariſing from a Diſeaſe, as its Cauſe, in ſuch Manner, however, as that it may be diſtinguiſh'd from the Diſeaſe itſelf, and from its next Cauſe, is call'd a *Symptom* of the Diſeaſe. See DISEASE.

If it ariſe, after the ſame Manner, from the Cauſe of the Diſeaſe, it is call'd a *Symptom of the Cauſe*. See CAUSE.

If it ariſe from ſome former *Symptom* as its Cauſe, it is call'd a *Symptom of a Symptom*.

Whatever happens to a Diſeaſe, from any other Cauſes than thoſe mention'd, is more properly call'd an *Epigenema*.

Hence it appears, that theſe former *Symptoms* are really Diſeaſes themſelves, very different as to Number, Effect, *&c.* Tho', after the Ancients, they may be conveniently enough reduc'd to Faults in the *Functions*, *Excretions*, and *Retentions*.

Under the firſt come all Diminutions, Abolitions, Increaſes, and Depravations of Animal Actions, particularly with regard to *Hunger* and *Thirſt*, *Sleeping* and *Waking*. See HUNGER, THIRST, *&c.*

Under the ſecond come, *Nauſea's*, *Vomitings*, *Lienteries*, *Cœliac Affections*, *Diarrheas*, *Diſenteries*, *Iliac Paſſions*, &c.

Under the third, come the *Jaundice*, *Stone*, *Dropſy*, *Fever*, *Iſchuria*, *Strangury*, *Aſthma*, *Catarrh*, &c. Each whereof ſee under its reſpective Article, HUNGER, NAUSEA, LIENTERY, DIARRHÆA, JAUNDICE, DROPSY, STONE, FEVER, *&c.*

SYMPTOMATICAL, in Medicine, is a Term often uſed to denote the Difference between the primary and ſecondary Cauſes in Diſeaſes; as, a Fever from Pain is ſaid to be *Symptomatical*, becauſe it ariſes from Pain only; and therefore the ordinary Means in Fevers are not, in ſuch Caſes, to be had recourſe to; but to what will remove the Pain; for when that ceaſes, the Fever will ceaſe, without any direct Means taken for that.

SYNÆRESIS, in Grammar, a Figure, whereby two Syllables are united in one; as *vemens* for *Vehemens*.

SYNAGOGUE, a particular Aſſembly of *Jews*, met to perform the Offices of their Religion; alſo the Place wherein they meet. See JEWS.

Some Authors take the Uſe of *Synagogues* to be of no old ſtanding among the *Jews*; and maintain, that 'twas not till after their Return from the *Babyloniſh* Captivity, that the Opinion firſt got footing, that the Worſhip of God was not ſo reſtrain'd to the Temple at *Jeruſalem*, that it could not be held any where elſe. The Conſequence of which new Opinion was, that the *Jews* began to build them *Synagogues* in all their Cities.

Others hold, that there were *Synagogues* even in the Time of *David*.

Be this as it will, no Aſſemblies of the *Jews* appear to have been call'd *Synagogues* till a little before the Coming of *Jeſus Chriſt*; who is ſaid to have preach'd in the Middle of the *Synagogue*.

There were reckon'd 480 *Synagogues* in the ſingle City of *Jeruſalem*.

There are ſtill *Synagogues* ſubſiſting at *London*, *Amſterdam*, *Rotterdam*, *Avignon*, *Metz*, &c.

The Word is *Greek*, συναγωγὴ, Aſſembly.

SYNALÆPHA, in Grammar, a Contraction, or ſhortening of a Syllable, in a *Latin* Verſe. See VERSE.

It is perform'd various Ways; principally, by the ſmothering ſome Vowel or Diphthong at the End of a Word, by Reaſon of another Vowel or Diphthong at the Beginning of the next; as *Ill' ego*, &c.

SYNAUCHE, in Medicine, a kind of Squinancy, wherein the internal Muſcles of the Fauces, or Pharynx, are attack'd. See SQUINANCY.

When the external Muſcles of the ſame are ſeiz'd, it is call'd a *Paraſynanche*. See PARASYNANCHE.

The Word is form'd from the *Greek*, σὺν, with, and ἀγχειν, to preſs, ſuffocate.

SYNARTHROSIS, in Anatomy, a kind of Articulation, or Jointure of the Bones of the Body. See ARTICULATION.

The *Synarthroſis* is when the Bones are bound ſo faſt together, that they are render'd immoveable with regard to each other.

'Tis divided into three Kinds: The firſt, *Sutura*; which is ſometimes in Form of two Combs or Saws, the Teeth whereof enter within one another; and ſometimes in Form of Scales, one Edge lapping over the other. See SUTURE.

The ſecond Kind is call'd *Harmonia*; which is when the Bones meet in an even Line, whether it be right or circular. See HARMONIA.

The third, call'd a *Gomphoſis*, is when one Bone is fixed into another like a Nail or Peg into a Hole. See GOMPHOSIS.

To theſe three Kinds of *Synarthroſis*, ſome add ſeveral others, as *Symphiſis*, *Syntenoſis*, and *Synemenſis*. See SYMPHISIS, *&c.*

The Word is form'd from the *Greek*, σὺν, with, and ἄρθρος, Articulus, Joint.

SYNAULIA, in the ancient Muſic, a Conteſt of Pipes, performing alternately, without Singing.

Mr. *Malcolm*, who doubts whether the Ancients had properly any ſuch Thing as Inſtrumental Muſic, that is, Muſic compoſed wholly for Inſtruments, without any Singing; yet quotes the Practice of the *Synaulia* from *Athenæus*. See SYMPHONY, HARMONY, MUSIC, *&c.*

SYNCATEGOREGMA, in Logic, is uſed for a Word, which ſignifying little or nothing of itſelf, yet when joined with others, adds Force thereto; as *all*, *none*, *certain*, &c.

SYNCELLUS, an ancient Officer in the Family of the Patriarchs, and other Prelates of the Eaſtern Church.

The *Syncellus* was an Eccleſiaſtic, who liv'd with the Patriarch of *Conſtantinople*, to be a Witneſs of his Conduct; whence it is, that the *Syncellus* was call'd the *Patriarch's Eye*, becauſe his Buſineſs was to obſerve and watch.

The Word, in the corrupt *Greek*, ſignifies a Perſon who lies in the ſame Chamber with another.

The other Prelates had alſo their *Syncelli*, who were Clerks living in the Houſe with them, and even lying in the ſame Chamber; to be Witneſſes of the Purity of their Manners.

At length the Office degenerated into a mere Dignity; and there were made *Syncelli* of Churches. At laſt it became a Title, and was beſtow'd by the Emperor on the Prelates themſelves; whom they call'd *Pontifical Syncelli*, and *Syncelli Auguſtales*.

There were alſo *Syncelli* in the Weſtern Church, particularly in *France*. The VIth Council of *Paris* ſpeaks with a deal of Indignation of ſome Biſhops who aboliſh'd the Office of *Syncelli*, and lay alone; and ſtrictly enjoins them, that, for the future, to take away all Occaſion of Scandal, they make the Office of *Syncelli* inſeparable from that of Biſhops.

SYNCHONDROSIS, in Anatomy, a kind of Articulation of the Bones of the Body; being a Species of *Symphiſis*. See SYMPHISIS.

The *Synchondroſis* ſignifies the Union of two Bones by Means of a Cartilage; in which Manner the Ribs are join'd to the Sternum, and the Parts of the Os Pubis to one another.

The Word is form'd from the *Greek*, σὺν, with, and χονδρος, Cartilage.

SYNCHRONISM, the being or happening of ſeveral Things at the ſame Time.

The Word is form'd from the *Greek*, σὺν and χρονος, Time.

The happening or performing of ſeveral Things in equal Times, as, the Vibrations of Pendulums, *&c.* is properly call'd

call'd *Iſochroniſm*, tho' ſome Authors confound the two. See ISOCHRONISM.

SYNCOPE, in Medicine, a deep and ſudden Swooning; wherein the Patient continues without any ſenſible Heat, Motion, Senſe, or Reſpiration; is ſeiz'd with a cold Sweat over the whole Body, and all the Parts turn pale and cold, as if dead.

There are ſeveral Cauſes of *Syncope*'s: 1°. Too great an Exhauſtion of Spirits; as after long Diets, exceſſive Evacuations, violent Exerciſes, long Bathings, &c.

2°. The irregular Motion of the Spirits preventing their due Influx into the Parts; as ſometimes happens in Fear, Wrath, and other violent Paſſions.

3°. Immoderate Hæmorrhagies.

4°. An ill Conſtitution of Blood; as in Cacochymies, or in Perſons who have taken ſomething that either diſſolves or coagulates the Blood.

5°. Secret Diſeaſes, as Abſceſſes, or Polypus's of the Heart, Worms, &c.

In very numerous crouded Aſſemblies, People ſometimes fall into *Syncopes*, thro' the hot, thick, impure Air they breathe.

Some Women are liable to them upon the Smell of Musk, Civet, &c.

For *Syncopes*, give volatile Spirits and Aromatics. *Heurnius* recommends Treacle Water, and Cinnamon Water; and *Etmuller* the Volatile Salt of Vipers, Spirit of Sal Ammoniac, Oil of Ambar, and ſometimes Bleeding.

The Word is form'd from the *Greek*, συν, with, and κόπτειν, to cut.

SYNCOPE, in Grammar, is an Eliſion, or Retrenchment of one or more Letters, or Syllables from a Word.

As when we ſay *Virum* for *Virorum*; and *manet alta, mente, repoſtum*, for *repoſitum*.

SYNCOPE, in Muſic, ſignifies the Diviſion of a Note; uſed when two or more Notes of one Part anſwer to a ſingle Note of the other Part: as when a Semibreve of the one anſwers to two or three Crotchets of the other.

A Note is ſaid to be *Syncope'd* when it has a Point added on the Side of it; which increaſes its Value by one half.

SYNDESMUS, in Anatomy, is ſometimes us'd for a Ligament. See LIGAMENT.

In Grammar, it is uſed for a Conjunction. See CONJUNCTION.

The Word in the original *Greek*, συνδεσμός, ſignifies a joining together.

SYNDIC, in Government and Commerce, an Officer in *France*, intruſted with the Affairs of a City, or other Community; who calls Meetings, makes Repreſentations and Solicitations to the Miniſtry, Magiſtracy, &c. according to the Exigency of the Caſe.

The *Syndic* is appointed to anſwer and account for the Conduct of the Body; makes and receives Propoſals for the Advantage thereof; controuls and corrects the Failings of particular Perſons of the Body, or, at leaſt, procures their Correction at a publick Meeting.

In effect, the *Syndic* is, at the ſame Time, both the Agent and Cenſor of the Community.

Almoſt all the Companies in *Paris*, &c. as the Univerſity, Companies of Arts and Trades, &c. have their *Syndics*; and ſo have moſt of the Cities of *Provence* and *Languedoc*.

SYNDIC is alſo us'd for a Perſon appointed to ſolicit ſome common Affair, wherein he himſelf has a Share; as happens particularly among ſeveral Creditors of the ſame Debtor, who fails, or dies inſolvent.

The chief Magiſtrate of *Geneva* is alſo call'd *Syndic*. There are four *Syndics* choſe every Year; the eldeſt of which preſides in the Council of Twenty-five, which is the chief Council of the City, wherein all Affairs are diſpatch'd both Civil and Political: Thus the other three elect cannot all come at the Office till the four Years end; ſo that the *Syndicate* comes by Turn to ſixteen Perſons, all choſen out of the Council of Twenty-five.

The Word is form'd from the *Latin*, *Syndicus*, and that from the *Greek*, σύνδικος, which ſignifies the ſame Thing.

SYNDROME, from συνδρομή, Concurſus, a Combination of Diſeaſes.

SYNECDOCHE, in Rhetoric, a Figure very frequent among Orators and Poets. See FIGURE.

There are three Kinds of *Synecdoches*: By the firſt, a Part is taken for the Whole; as the *Point* for the *Sword*; the *Roof* for the *Houſe*; the *Sails* for the *Ship*, &c.

By the ſecond, the Whole is uſed for a Part: And by the third, the Matter whereof the Thing is made, is uſed for the Thing itſelf; as *Steel* for *Sword*, *Silver* for *Money*, &c.

To which may be added another Kind, where the Species is uſed for the Genus, or the Genus for the Species.

The Word is *Greek*, form'd of συνεκδέχομαι, I take together.

SYNEDRIN, or SYNEDRION. See SANHEDRIN.

SYNERPHONESIS, in Grammar, an Union, or Colliſion of Vowels, whereby two Syllables are pronounc'd as one. See SYLLABLE.

'Tis much the ſame Thing as *Synalæpha*, or *Synereſis*. See SYNALÆPHA, &c.

SYNEUROSIS, in Anatomy, a kind of Articulation, or Jointure of the Bones. See ARTICULATION.

The *Syneuroſis* is reckon'd a Branch of the *Symphiſis*; and is, when the Bones are connected together by a Ligament: as is that of the Os Femoris to the Os Iſchium; that of the Patella to the Tibia. See SYMPHISIS.

The Word is form'd from the *Greek*, σὺν, with, and νεῦρον, Nerve.

SYNOCHA, and *Synochos*, in Medicine, are Terms borrowed from συνόχω, *Juſtineo*, I ſupport, or hold up; or συνέχω, *continuo*, I continue. The Practice of Authors, with regard to theſe two Words, is whimſical enough: Literally they both ſignify the ſame Thing; yet is the former uſed to ſignify an intermitting, and the latter a continu'd Fever. See FEVER.

SYNOD, in Aſtronomy, a Conjunction, or Concourſe of two Stars, or Planets in the ſame optical Place of the Heavens. See CONJUNCTION.

SYNOD, in Church Hiſtory, a *Council*, or Meeting, or Aſſembly of Eccleſiaſticks, to conſult Matters of Religion. See COUNCIL.

Of theſe there are four Kinds, *viz. General*, or *Oecumenical*, where Biſhops, &c. meet from all Nations. See OECUMENICAL.

National; where thoſe of one Nation only come together.

Provincial; where they of one only Province meet. And

Dioceſan; where thoſe of but one Dioceſe meet. See CONVOCATION.

The Word is form'd from the *Greek*, συνοδός, Aſſembly.

SYNODALS, or SYNODIES, were Pecuniary Rents (commonly of two Shillings) paid to the Biſhop, at the Time of the Annual Synod, by every Parochial Prieſt.

For the Biſhops uſed to hold their Dioceſan Synods, and to viſit all at once; from whence theſe *Synodals* are accounted amongſt the Biſhop's Procurations at this Time.

SYNODALES *Teſtes*; the urban and rural Deans were at firſt ſo call'd, from their informing againſt, and atteſting the Diſorders of the Clergy and People in the Epiſcopal Synod. But when they ſunk in their Authority, in their ſtead roſe *Synodical* Witneſſes, who were a Sort of impannel'd Jury, conſiſting of a Prieſt, and two or three Laymen for every Pariſh; though at length two for every Dioceſe were annually choſen; till at laſt the Office came to be devolv'd on the Church-Wardens. Some think our Queſt-men, who are Aſſiſtants to the Church-Wardens, were call'd Sides-men, *quaſi* Synod-men. See SIDES-*Men*.

SYNODALE *Inſtrumentum*; was the ſolemn Oath that theſe *Synodical* Witneſſes took; as our Church-Wardens now are ſworn to make their juſt Preſentments.

SYNODICAL, ſomething belonging to a *Synod*.

Thus *Synodical Letters*, are Circular Letters wrote by *Synods* to the abſent Prelates and Churches; or even thoſe general ones directed to all the Faithful, to inform them of what had paſs'd in the *Synod*.

In the Collection of Councils are abundance of theſe *Synodical Letters*.

SYNODICAL *Month*, is the Period or Interval of Time, wherein the Moon, departing from the Sun at a Synod or Conjunction, returns to him again. See MOON.

Kepler found the Quantity of the mean *Synodical Month*, 29 Days, 12 Hours, 44 Minutes, 3 Seconds, 11 Thirds. See MONTH.

This Period is alſo call'd a *Lunation*; in Regard, in the Courſe hereof, the Moon puts on all her Phaſes or Appearances. See LUNATION.

SYNOD's-*Men*, or *Teſtes Synodales*. See SIDES-MEN.

SYNOESIA, in Antiquity, a Feaſt celebrated at *Athens*, in Memory of *Theſeus*'s having united all the petty Communities of *Attica*, into one ſingle Commonwealth; the Seat whereof was *Athens*; where all the Aſſemblies were to be held.

The Feaſt was dedicated to *Minerva*; and, according to the Scholiaſt of *Thucydides*, was held in the Month Metagitnion.

SYNONYMOUS, an Epithet apply'd to a Word or Term that has the ſame Import, or Signification with another; call'd alſo *Synonyma*. Some ſevere Criticks condemn all Uſe of *Synonymous* Terms in the ſame Period; but this is to condemn all Antiquity. So far is the Uſe thereof from being vicious, that 'tis frequently neceſſary; as they contribute both to the Force and Clearneſs of the Expreſſion. If the firſt sketch out the Reſemblance of the Thing it repreſents, the *Synonyma* that follows, is, as it were, a ſecond Touch of the Pencil, and finiſhes the Image.

Indeed they muſt be uſed with a deal of Diſcretion and Oeconomy. The Stile muſt be rais'd and brighten'd, not ſtuff'd or loaded with *Synonymous* Terms. They muſt be uſed as Ornaments, and to render the Expreſſion the more forcible, without

without making a Shew of the Riches thereof, or heaping *Synonyma's* on *Synonyma's*.

But, tho' *Synonymous* Words be laudable, *Synonymous* Phraſes are inexcuſable: The Reaſon is, that two *Synonymous* Phraſes keep the Mind at Reſt, and let it flag and languiſh.

SYNONYMY, in Rhetoric, a Figure whereby *Synonyma's*, or *Synonymous* Terms, that is, various Words of the ſame Signification, are made Uſe of to amplify the Diſcourſe.

As *abiit*, *evaſit*, *effugit*, he went off, he eſcap'd, he run away.

The Word is form'd from the *Greek*, σὺν, with, and ονομ, Name.

SYNOVIA, in Medicine, a Term uſed by ſome Authors for the nutritious Juice proper to each Part. See NUTRITION.

Others uſe it for the Gout, and other Diſeaſes ariſing from a Vice in the nutritious Juice.

Others reſtrain it to the oozing out of the nutritious Juice thro' the wounded Parts.

Van Helmont defines it a kind of tranſparent Mucilage, like Seed, ſuch as iſſues from the Legs of a Calf upon cutting off the Feet.

SYNTAGMA, a diſpoſing, or placing of Things in an orderly Manner.

The Word is *Greek*, σύνταγμα.

SYNTAX, in Grammar, the Conſtruction or Connection of the Words of a Language into Sentences, or Phraſes. See WORD, SENTENCE, PHRASE, *&c.*

Or, as F. *Bouffier* more accurately defines it, *Syntax* is the Manner of conſtructing one Word with another, with regard to the different Terminations thereof, preſcrib'd by the Rules of Grammar. See CONSTRUCTION and GRAMMAR.

Some Authors, as M. *Vaugelas*, *&c.* confound it with Style; but there is a real Difference. See STYLE.

The Office of *Syntax*, is to conſider the natural Suitableneſs of Words with reſpect to one another; in order to make them agree in Gender, Number, Perſon, Mood, *&c.*

To offend in any of theſe Points, is call'd to offend againſt *Syntax*: and ſuch kind of Offence, when groſs, is call'd a *Soleciſm*; and when more ſlight, a *Barbariſm*. See SOLECISM and BARBARISM.

The ſeveral Parts of Speech, are, with regard to Language, what Materials are with regard to a Building. How well prepar'd ſoever they may be, they will never make a Houſe, unleſs they be plac'd conformably to the Rules of Architecture. 'Tis the *Syntax*, then, that properly gives the Form to the Language; and 'tis this makes the moſt eſſential Part of Grammar.

There are two Kinds of *Syntax*; the one of *Concord*, wherein the Words are to agree in Gender, Number, Caſe, and Perſon. See CONCORD.

The other, of *Regimen* or *Government*, wherein one Word governs another, and occaſions ſome Variation therein. See REGIMEN.

The firſt, generally ſpeaking, is the ſame in all Languages, as being the natural Series of what is in Uſe almoſt every where, the better to diſtinguiſh Diſcourſe. Thus, the Diſtinction of two Numbers, Singular and Plural, has render'd it neceſſary to make the Subſtantive agree with the Adjective in Number; that is, to make the one ſingular or plural, when the other is ſo: For, as the Subſtantive is the Subject confuſedly, tho' directly, mark'd by the Adjective; if the Subſtantive expreſs ſeveral, there are ſeveral Subjects to be expreſs'd in that Form by the Adjective: And by Conſequence it ought to be in the Plural; as *Homines Docti*, learned Men: But there being no Termination in the Adjective in *Engliſh* to diſtinguiſh the Number, it is only imply'd. See NUMBER.

The Diſtinction of Maſculine and Feminine Gender, obliges the Languages, which have diſtinct Terminations, to have a Concordance or Agreement between the Subſtantive and Adjective, in Gender as well as Number: And for the ſame Reaſon, the Verbs are to agree with the Nouns and Pronouns in Number and Perſon. If at any Time we meet with any thing that ſeems to contradict theſe Rules, 'tis by a Figure of Speech, *i. e.* by having ſome Word underſtood, or by conſidering the Thoughts rather than the Words themſelves. See GENDER.

The *Syntax* of *Government*, on the contrary, is generally arbitrary; and, on that Account, differs in moſt Languages. One Language, for Inſtance, forms their Regimen by *Caſes*; as the *Latin* and *Greek*: others uſe *Particles* in lieu thereof; as the *Engliſh*, *French*, *Italian*, *Spaniſh*, &c. See CASE and PARTICLE.

One or two general Rules, however, may be here noted, which are of Uſe in all Languages. 1°. That there is no Nominative Caſe, but has a Relation to ſome Verb, either expreſs'd or underſtood; ſince we never ſpeak merely to expreſs what we conceive, but to expreſs what we think of what we conceive, which is done by the Verb. See NOMINATIVE.

2°. That there is no Verb but has its Nominative Caſe either expreſs'd or underſtood; for the Office of the Verb being to affirm, there muſt be ſomething to affirm of; which is the Subject or Nominative Caſe of the Verb; tho' before an Infinitive 'tis an Accuſative; as *Scio Petrum eſſe doctum*. I know *Peter* to be learned. See VERB.

3°. That there is no Adjective but has a Relation to ſome Subſtantive; in regard the Adjective marks confuſedly the Subſtantive, which is the Subject of the Form or Quality diſtinctly mark'd by the Adjective. See ADJECTIVE.

4°. That there never comes any Genitive Caſe but is govern'd by ſome other Noun. See GENITIVE.

5°. The Government of Verbs is frequently taken from various Sorts of References, included in the Caſes, according to the Caprice of Cuſtom or Uſage; which yet does not change the ſpecific Relation of each Caſe, but only ſhews that Cuſtom has made Choice of this or that. Thus, the *Latins* ſay, *Juvare aliquem & opitulari alicui*; the *French*, *Servire quelqu un & ſervir a quelque choſe*; and in the *Spaniſh*, the Generality of Verbs govern indifferently a Dative and an Accuſative Caſe.

SYNTECTOE, in Medicine, a kind of Colliquation of the Solids of the Body; ſuch as frequently happens in Inflammations of the Bowels, Colliquative Fevers, *&c.* wherein a fatty Uliginous is voided with the Excrements by Stool. See COLLIQUATION.

SYNTHESIS, the *Compoſition* or putting of ſeveral Things together; as the making a compound Medicine of ſeveral ſimple Ingredients, *&c.*

The Word is form'd from the *Greek* σὺν, with, and θέσις, *poſitio*.

SYNTHESIS, in Logic, *&c.* a Branch of *Method*, oppoſite to *Analyſis*. See METHOD.

In the *Syntheſis*, or *Synthetic Method*, we purſue the Truth by Reaſons drawn from Principles before eſtabliſh'd or aſſum'd, and Propoſitions formerly proved; thus proceeding by a regular Chain, till we come to the Concluſion.

Such is the Method in *Euclid*'s Elements, and moſt Demonſtrations of the ancient Mathematicians; which proceed from Definitions and Axioms, to prove Propoſitions, *&c.* and from thoſe Propoſitions proved, to prove others.

This Method we alſo call *Compoſition*, in oppoſition to *Analyſis*, which we call *Reſolution*. See COMPOSITION.

SYNTHESIS, in Grammar. See SYLLEPSIS.

SYNTHESIS, in Chirurgery, an Operation, whereby divided Parts are re-united; as in Wounds, Fractures, *&c.*

SYNUSIASTS, or SYNOSIASTS, a Sect of Hereticks, who maintain'd, that there was but one ſingle Nature, and one ſingle Subſtance in *Jeſus Chriſt*.

The *Synuſiaſts* denied, that the Word had taken a Body in the Womb of the Virgin; but held, that a Part of the divine Word being detach'd from the reſt, was there changed into Fleſh and Blood. Thus they taught, that *Jeſus Chriſt* was conſubſtantial to the Father, not only as to his Divinity, but even as to his Humanity and his Body.

The Word is form'd from the *Greek*, σὺν, with, and ὐσία, Subſtance.

SYPHILIS, is a Term uſed for the *Lues Venerea*. See VENEREAL.

Some will have it from σὺν, *cum*, with, and φιλία, *Amor*, or *Amicitia*, Love or Friendſhip; becauſe it proceeds from the infectious Intercourſes of Lovers in Coition. Others will have it from the Name of a Shepherd ſo called, who was remarkably afflicted with it.

However, ſome Authors of Note uſe the Term; and *Fracaſtorius* a famous *Italian* Phyſician, gives it for the Title of a fine Poem, which he wrote upon that Diſtemper.

SYPHON. See SIPHON.

SYRENS, SIRENES, in Antiquity, *Mermaids*, or certain fabulous Beings, repreſented by *Ovid*, *&c.* as Sea-monſters, with Womens Faces and Fiſhes Tails; by others, deck'd with a Plumage of the gayeſt Colours.

They are ſuppoſed to have been the Three Daughters of the River *Achelous*; and call'd *Parthenope*, *Ligea*, and *Leucoſia*.

Homer only makes mention of Two *Syrens*; but others reckon Five. *Virgil* places them on Rocks, where Veſſels are in danger of ſplitting. *Pliny* makes them inhabit the Promontory of *Minerva*, near the Iſland *Caprea*. Others fix them in *Sicily*, near *Cape Pelorus*. *Claudian* ſays, they inhabited harmonious Rocks; that they were charming Monſters; and that Sailors were wreck'd on their Rocks without Regret, and even expir'd in Raptures: *Dulce malum Pelago Siren*.

This Deſcription is, doubtleſs, founded on a literal Explication of the Fable, that they were Women who inhabited the Shores of *Sicily*, and who, by all the Allurements of Pleaſure, ſtopp'd Paſſengers, and made them forget their Courſe. Some Explainers of the ancient Fables, will have the Number and the Names of the Three *Syrens*, to have been form'd on the Triple Pleaſure of the Senſes, Wine, Love

Love and Muſic; which are the three moſt powerful Means of ſeducing Men; and hence ſo many Exhortations to avoid the fatal *Syrens* Song.

Probably 'twas hence, that the *Greeks* fetch'd their Etymology of *Syren, viz.* from σειρὰ, a Chain, as if there was no getting free of their Enticement.

Others, who don't look for ſo much Myſtery in the Fable, maintain, that the *Syrens* were nothing but certain cloſe Places in the Sea, where the Waves whirling furiouſly around, ſeiz'd and ſwallow'd up Veſſels that approach'd them too near.

Laſtly, others allow them to have been certain Shores and Promontories, where the Winds, by the various Reverberations and Echo's, cauſe a kind of Harmony, that ſurprizes and ſtops Paſſengers. This, probably, might be the Origin of the *Syrens* Song, and of the giving the Name of *Syrens* to theſe Rocks. The *Sculptors* and Painters uſually follow *Ovid*'s Deſcription; but on ſome Medals, we find them repreſented with the upper Parts of Women, and the lower, of Birds.

SYRINGE, an Inſtrument ſerving to imbibe or ſuck up a Quantity of any Fluid, and to expel the ſame with violence.

The *Syringe* is made of a hollow Cylinder, as ABCD (Tab. Hydroſtaticks, Fig. 26.) furniſhed with a little Tube at bottom, E F. In this Cylinder, is an Embolus, K, made or at leaſt cover'd with Leather, or other Matter, that eaſily takes Moiſture; and ſo filling the Cavity of the Cylinder, as that no Air or Water may paſs between the one and the other.

If, then, the little Tube F be put in Water, and the Embolus drawn out; the Water will aſcend into the Cavity left by the Embolus: And upon thruſting back the Embolus, it will be violently expell'd again through the Tube E F: And ſtill, the greater Impetus will the Water be expell'd withal, and to the greater Diſtance, as the Embolus is thruſt down with the greater Force, or the greater Velocity.

This Aſcent of the Water, the Ancients, who ſuppoſed a Plenum, attributed to Nature's Abhorrence of a Vacuum: But the Moderns, more reaſonably, as well as more intelligibly, attribute it to the Preſſure of the Atmoſphere on the Surface of the Fluid. See AIR and VACUUM.

For, by drawing up the Embolus, the Air left in the Cavity of the Cylinder muſt be exceedingly rarified; ſo that being no longer a Counter-balance to the Air incumbent on the Surface of the Fluid; that prevails, and forces the Water through the little Tube, up into the Body of the *Syringe*.

In effect, a *Syringe* is only a ſimple Pump, and the Water aſcends in it on the ſame Principle, as in the common ſucking Pump; whence it follows, that Water will not be raiſed in a *Syringe*, to a Height exceeding 31 Feet. See PUMP and SUCTION.

SYRINGES are of conſiderable Uſe in Medicine and Chirurgery. By them Clyſters are adminiſtred: Injections of medicinal Waters, &c. made into Wounds, &c. They alſo ſerve to inject colour'd Liquors, melted Wax, &c. into the dried Veſſels of the Parts of Animals, to ſhew the Diſpoſition, Texture, Ramifications, &c. thereof. See INJECTION.

The Word is form'd from the *Latin, Syrinx*, Pipe.

SYROP, in Pharmacy, an agreeable Liquor, or Compoſition, of a moderately thick Conſiſtence, extracted from Juices, Tinctures, or Waters of Fruits, Flowers, or Herbs boil'd, and ſeaſon'd with Sugar, or Honey; and taken either for Health or Pleaſure.

There are various Kinds of *Syrops*, denominated from the various Fruits, &c. they are extracted from; as *Syrop* of Violets, of Elder, of Wormwood, of Poppies, &c. *Emetic Syrops, Lienteric* and *Antinephritic Syrops*, &c. *Chologogue, Phlegmagogue Syrops*, &c.

The *Syrop of Sapor* is a *Syrop*, the Baſe whereof is Apples, with Juices of Bugles, Annis, Saffron, &c. thus call'd from *Sapor* King of *Perſia*, who overcame the Emperor *Valerian*, ſuppos'd to be the Inventer thereof.

The Word, *Menage* derives from the *Latin Syropus*, of the *Arab Schirab*, which ſignifies *Potion*. Others derive it from the *Greek*, σύρω, I draw, and ὀπὸς, Juice. *Skinner* thinks the Word might come from the *Greek* Συρία, *Syria*, in regard theſe Kinds of Liquors were much in Uſe among the *Syrians*, a very delicate People; tho' he thinks it ſhould rather be deriv'd from the *Arabic Siruph*, which ſignifies the ſame Thing as *Syrop*, or from *Sark* or *Sirab*, a Potion, or Medicinal Drink.

D. Herbelot obſerves, that the Words *Syrop*, and *Sherbet*, or *Sorbet*, all come from the *Arabic, Scharab*, which ſignifies any Kind of Drink in the general. See SHERBET.

SYROP *of Alkemes*	See	SCARLET.
SYROP *of Diacodium*		DIACODIUM.
SYROP *of Capillaries*		CAPILLARIES.
SYROP *of Lemon*		CITRON.
SYROP *of Sugar*		MOLOSSES.
SYROP *of Violets*		VIOLETS.

SYSSARCOSIS, in Anatomy, a particular Species of the Kind of Articulation call'd *Symphiſis*. See SYMPHISIS.

The *Syſſarcoſis* is a natural Union of two Bones, by Means of Fleſh or Muſcles: Such is that of the Os Hyoides, and Omoplata.

The Word is *Greek*, compounded of σὺν, with, and σὰρξ, Fleſh.

SYSTEM, in the general, a certain Aſſemblage, or Chain of Principles and Concluſions: Or the Whole of any Doctrine, the ſeveral Parts whereof are bound together, and follow or depend on each other.

The Word is form'd of the *Greek*, Σύστημα, Compoſition.

In this Senſe, we ſay, a *Syſtem of Philoſophy*; a *Syſtem of Motion*; a *Syſtem of Fevers*, &c. The Divines have framed abundance of *Syſtems of Grace*: The *Syſtems* of *intermediate Science*, and *Prædetermination*, are invented to explain that of Grace. See GRACE, &c.

Among Phyſicians, ſome follow the *Syſtem of Alcali* and *Acid*; others that of the four Qualities, &c. Dr. *Woodward* accounts for moſt Things on his *Syſtem* of the Bile.

Des Cartes's *Syſtem* is held very deſtructive to Religion. See CARTESIANISM, CAUSE, &c.

Gaſſendi renewed the ancient *Syſtem of Atoms*; which was that of *Democritus*, followed by *Epicurus, Lucretius*, &c. See CORPUSCULAR.

Sir *Iſaac Newton*'s Doctrine of Colours; M. *Leibniz*'s *Protogæa*, and ſome Diſcourſes of M. *Juſſieu*, to the Academy of Sciences, to ſhew that there are Bodies, whoſe Parts are not to be deſtroy'd by any natural Agents; are very favourable to the *Syſtem* of *Gaſſendi*. See ATOM.

Experiments are the Materials of *Syſtems*: An Infinity are required to build one. See EXPERIMENT.

SYSTEM, in Aſtronomy, an Hypotheſis or Suppoſition of a certain Order, and Arrangement of the ſeveral Parts of the Univerſe; whereby Aſtronomers explain all the Phænomena, or Appearances of the heavenly Bodies, their Motions, Changes, &c. call'd, alſo, the *Syſtem of the World*, and the *Solar Syſtem*. See WORLD.

Syſtem and *Hypotheſis*, have the ſame Signification; unleſs, perhaps, *Hypotheſis* be a more particular *Syſtem*; and *Syſtem* a more general *Hypotheſis*. See HYPOTHESIS.

Some late Authors, indeed, furniſh a freſher Diſtinction: An Hypotheſis, ſay they, is a mere Suppoſition, or Fiction; founded rather on Imagination, than Reaſon: A *Syſtem* is only built on the firmeſt Ground, and raiſed by the ſevereſt Rules: 'Tis founded on Aſtronomical Obſervations, and Phyſical Cauſes, and confirm'd by Geometrical Demonſtrations.

The moſt celebrated *Syſtems of the World*, are the *Ptolomaic*, and the *Copernican*; to which may be added, the *Tychonic*: The Oeconomy of each whereof, is as follows;

Ptolomaic SYSTEM places the Earth at Reſt, in the Centre of the Univerſe; and makes the Heavens revolve round the ſame from *Eaſt* to *Weſt*, and carry all the heavenly Bodies, Stars and Planets along with them. See PTOLOMAIC.

For the Order, Diſtances, &c. of the ſeveral Bodies in this Syſtem, *ſee Plate Aſtronomy, Fig.* 43.

The principal Aſſerters of this *Syſtem*, are *Ariſtotle, Hipparchus, Ptolomy*, and many of the old Philoſophers, followed by the whole World, for a great Number of Ages; and ſtill adhered to in ſome of our Univerſities, and other Places, where free Philoſophizing is excluded: But the late Improvements have put it out of all Countenance; and we don't even want Demonſtration againſt it. See EARTH, &c.

Copernican SYSTEM, places the Sun at reſt, nearly in the Centre of the *Syſtem*; excepting for a vertiginous Motion about his own Axis. See SUN.

Around him, move from *Weſt* to *Eaſt*, in ſeveral Orbits, firſt *Mercury*, then *Venus*, the *Earth*, *Mars*, *Jupiter* and *Saturn*. See PLANET.

About the Earth, in a peculiar Orbit, moves the Moon; accompanying the Earth, in its whole Progreſs round the Sun. See MOON.

And after the ſame Manner, do four Satellites move round *Jupiter*; and Five round *Saturn*. See SATELLITES.

Athwart the planetary Space do the Comets move round the Sun; only in very excentrick Orbits, probably Parabola's, in one of whoſe *Foci* is the Sun. See COMET.

At an immenſe Diſtance beyond the Planetary and Cometary Spaces, are the fix'd Stars, which have all a proper Motion from *Weſt* to *Eaſt*. See STAR.

The *Solar* or *Planetary Syſtem*, is uſually confined to narrower Bounds: The Stars, by their immenſe Diſtance, and the little Relation they appear to bear to us, being reputed no Part thereof. 'Tis highly probable, that each Star, is, itſelf, a Sun; and the Centre of a particular *Syſtem*, ſurrounded with a Company of Planets, &c. which, in different Periods, and at different Diſtances, perform their Courſes round their reſpective Sun; and are enlighten'd, warm'd and cheriſh'd, &c. thereby: Hence we have a very magnificent Idea of the

World, and the Immenſity thereof: Hence ariſes a *Syſtem* of *Syſtems*. See UNIVERSE.

The *planetary Syſtem*, here deſcribed, is the moſt ancient in the World. 'Twas the firſt that we know of, introduced into *Greece* and *Italy* by *Pythagoras*; whence, for many Ages, it was call'd the *Pythagorian Syſtem*. It was followed by *Plato*, *Archimedes*, &c. but loſt under the Reign of the *Peripatetic Philoſophy*; till happily retrieved above 200 Years ago by *Nic. Copernicus*; whence its new Appellation, of *Copernican Syſtem*. See COPERNICAN.

For the Oeconomy of the Copernican Syſtem; ſee the Scheme thereof, Tab. Aſtronomy, Fig. 44.

Tychonic SYSTEM, in moſt reſpects, coincides with the *Copernican*; except in this, that, ſuppoſing the Earth to be fix'd, its Orbit is omitted, and in lieu thereof, the Sun's Orbit is drawn round the Earth, and made to interſect the Orbit of *Mars*; that *Mars* may be nearer the Earth than the Sun. But as there is not any Reaſon, or Foundation in Nature, for ſuch a manifeſt Shift; and as the Author was only led thereto, from a ſuperſtitious Perſuaſion, that to ſuppoſe the Sun at Reſt, and the Earth to move, is contrary to Scripture; the true *Syſtem* is not much prejudiced hereby. See EARTH.

For the Order and Oeconomy of the Tychonic Syſtem; ſee the Scheme in Tab. Aſtronomy, Fig. 45.

SYSTEM, in Poetry, is a certain Hypotheſis, from which the Poet is never to recede; *e.gr.* Having made his Choice either in the Fables of the Heathens, or in Chriſtianity; he muſt always diſtinguiſh between the Two; and never mix ſuch different Ideas in the ſame Poem. Thus, after invoking *Apollo* and the Muſes, he muſt bid adieu to the Language of Chriſtianity, and not confound the two *Syſtems*. The Fabulous Stile, indeed, is the Gayer and more Figurative; but a Pagan God makes but a miſerable Figure in a Chriſtian Poem. The *Syſtem* of Poetry, *Bouhours* obſerves, is, itſelf, wholly Fabulous and Pagan.

SYSTEM, in Muſic, a compound Interval; or an Interval compoſed, or conceived to be compoſed, of ſeveral leſſer; ſuch is the Octave, &c. See INTERVAL.

The Word is borrowed from the Ancients, who call a ſimple Interval, *Diaſtem*, and a Compound one *Syſtem*.

As there is not any Interval in the Nature of Things; ſo we can conceive any given Interval, as compoſed of, or equal to the Sum of ſeveral others. This Diviſion of Intervals, therefore, only relates to Practice; ſo that a *Syſtem* is properly an Interval, which is actually divided in Practice, and where, along with the Extremes, we conceive always ſome intermediate Terms. The Nature of a *Syſtem* will be very plain, by conceiving it an Interval, whoſe Terms are in Practice, taken either in immediate Succeſſion; or the Sound is made to riſe and fall, from the one to the other, by touching ſome intermediate Degrees; ſo that the whole is a *Syſtem* or Compoſition of all the Intervals, between one Extreme and the other. *Syſtems* of the ſame Magnitude, and conſequently of the ſame Degree of Concord and Diſcord, may yet differ in reſpect of their Compoſition; as containing and being actually divided into more or fewer Intervals: And when they are equal in that reſpect, the Parts may differ in Magnitude. Laſtly, when they conſiſt of the ſame Parts, or leſſer Intervals, they may differ as to the Order and Diſpoſition thereof between the two Extremes.

There are ſeveral Diſtinctions of *Syſtems*; the moſt remarkable is, into *Concinnous* and *Inconcinnous*.

Concinnous Syſtems, are thoſe conſiſting of ſuch Parts, as are fit for Muſic, and thoſe Parts, placed in ſuch an Order between the Extremes, as that the Succeſſion of Sounds, from one Extreme to the other, may have a good Effect. See CONCINNOUS.

Inconcinnous Syſtems, are thoſe, where the ſimple Intervals are *Inconcinnous*, or ill diſpoſed betwixt the Extremes.

A *Syſtem*, again, is either *Particular* or *Univerſal*. An *univerſal Syſtem*, is that which contains all the particular *Syſtems* belonging to Muſic; and makes what the Ancients call the *Diagramma*, and we the *Scale of Muſic*. See SCALE.

The Ancients alſo diſtinguiſh *Syſtems* into *Perfect* and *Imperfect*. The Diſdiapaſon, or double Octave, was reckon'd the *perfect Syſtem*, becauſe within its Extremes, are contained Examples of all the ſimple and original Concords, and in all the Variety of Order wherein their concinnous Part ought to be taken; which Variety conſtitutes what they call the *Species* or *Figures of Conſonances*.

All the *Syſtems*, leſs than the *Diſdiapaſon*, were reckoned *Imperfect*.

The double Octave was alſo called the *Syſtema Maximum*, and *Immutatum*; becauſe they took it to be the greateſt Extent or Difference of Time that we could go in making Melody; though ſome added a Fifth to it, for the greateſt *Syſtem*: But the Diapaſon, or ſimple Octave, was reckon'd the moſt perfect, with reſpect to the Agreement of its Extremes; ſo that how many Octaves ſoever were put into the greateſt *Syſtem*, they were all to be conſtituted or ſub-divided the ſame Way as the Firſt: So that when we know how the Octave is divided, we know the Nature of the *Diagramma* or *Scale*: The Varieties whereof, conſtituted the *Genera Melodiæ*, which were ſub-divided into Species. See GENERA and SPECIES.

SYSTOLE, in Medicine, the Contraction of the Heart and Arteries of an Animal. See HEART and ARTERY.

The *Syſtole of the Heart* is well accounted for by Dr. *Lower*, who ſhews, that the Heart is a true Muſcle, the Fibres whereof are acted on like thoſe of other Muſcles, by Means of certain Branches of the eight Pair of Nerves inſerted into it, which bring the Animal Spirits from the Brain hither. By a Flux of theſe Spirits, the Muſcular Fibres of the Heart are inflated, and thus ſhorten'd; the Length of the Heart diminiſh'd, its Breadth or Thickneſs increas'd, the Capacity of the Ventricles clos'd, the tendonous Mouths of the Arteries dilated, thoſe of the Veins ſhut up by means of their Valves, and the contain'd Juices forcibly expreſs'd into the Orifices of the Arteries. See MUSCLE.

And this we call the Συſολὴ, or Contraction of the Heart; the oppoſite State to which is call'd the *Diaſtole*, or Dilatation of the Heart. See DIASTOLE.

Dr. *Drake* adds to Dr. *Lower*'s Account, that the intercoſtal Muſcles and Diaphragm, contribute to the *Syſtole*, by opening the Blood a Paſſage from the right Ventricle of the Heart, to the left thro' the Lungs, to which it could not otherwiſe paſs: By which Means, the Oppoſition the Blood contain'd in that Ventricle muſt neceſſarily have made to its Conſtruction, is taken off. See CONTRACTION.

Lower and *Drake* make the *Syſtole* the natural State or Action of the Heart, and the *Diaſtole* the violent one: *Boerhaave*, on the contrary, makes the *Syſtole* the violent, and the *Diaſtole* the natural State.

SYXHINDEMEN, a Term purely *Saxon*, literally ſignifying 600 Men, or Men worth 600 Shillings.

In the Time of our *Saxon* Anceſtors, all Men were rank'd into three Claſſes; the *loweſt*, the *middle*, and the *higheſt*; and were valu'd according to their Claſs: that if any Injury were done, Satisfaction might be made to the Value or Worth of the Man it was done to.

The *loweſt* were call'd *Twyhindemen*, *q. d.* valued at 200 Shillings; the *middle*, *Syxhindemen*, *q. d.* valued at 600 Shillings; and the *higheſt*, *Twelfhindemen*, *i. e.* valued at 1200 Shillings.

SYZYGY, in Aſtronomy, a Term equally uſed for the Conjunction and Oppoſition of a Planet with the Sun. See CONJUNCTION and OPPOSITION.

The Word is form'd from the *Greek*, συζυγία, *Conjunctio*.

On the Phænomena and Circumſtances of the *Syzygies*, a great Part of the Lunar Theory depends. See MOON.

For, 1°. It is ſhewn in the Phyſical Aſtronomy, that the Force which diminiſhes the Gravity of the Moon in the *Syzygies*, is double that which increaſes it in the Quadrature: So that in the *Syzygies* the Gravity of the Moon from the Action of the Sun is diminiſh'd by a Part, which is to the whole Gravity as 1 to 89,36; for in the Quadratures, the Addition of Gravity is to the whole Gravity as 1 to 178,73. See QUADRATURE.

2°. In the *Syzygies*, the diſturbing Force is directly as the Diſtance of the Moon from the Earth, and inverſely as the Cube of the Diſtance of the Earth from the Sun. And at the *Syzygies*, the Gravity of the Moon towards the Earth, receding from its Centre, is more diminiſh'd, than according to the inverſe Ratio of the Square of the Diſtance from that Centre. Hence, in the Motion of the Moon from the *Syzygy* to the Quadrature, the Gravity of the Moon towards the Earth is continually increas'd, and the Moon is continually retarded in its Motion; and in the Motion from the Quadratures to the *Syzygies*, the Moon's Gravity is continually diminiſh'd, and its Motion in its Orbit accelerated. See GRAVITY.

3°. Further, in the *Syzygies* the Moon's Orbit or Circle round the Earth, is more convex than in the Quadratures; for which Reaſon the Moon is leſs diſtant from the Earth at the former than the latter. When the Moon is in the *Syzygies*, her Apſides go backwards, or are retrograde. See ORBIT, APSIDES and RETROGRADATION.

When the Moon is in the *Syzygies*, the Nodes move in Antecedentia faſteſt; then ſlower and ſlower, till they become at reſt when the Moon is in the Quadratures. See NODE.

Laſtly, When the Nodes are come to the *Syzygies*, the Inclination of the Plane of the Orbit is leaſt of all. See INCLINATION.

Add, that theſe ſeveral Irregularities are not equal in each *Syzygy*, but all ſomewhat greater in the Conjunction than the Oppoſition. See DISTURBING *Force*, &c.

T.

T.

T A Conſonant, and the nineteenth Letter in the Alphabet. See LETTER.

The *T*, in Sound, bears a near Reſemblance to the D, for which Reaſon they are often put for each other; and *Quintilian* even rallies thoſe who ſcrupled to write the one indifferently for the other; as *at* for *ad*, *ſet* for *ſed*, *haut* for *haud*, &c.

The *T* is one of the five Conſonants which the Abbot *de Dangeau* calls *Palatal*, and which are *D-T*, *G-K*, and *N*: The four firſt whereof have the ſame Relation to each other, as the Labials *B-P* and *V-F* have. *D*, for Inſtance, having the ſame Relation to *T*, that *B* has to *P*, or *V* to *F*. See PALATAL.

The *T*, the ſame Author obſerves, is a Letter of a ſtrong Sound; ſo that a feeble one cannot be pronounc'd before it: Thus to form the Supine of *rego*, the *T* of *tum* changes the *b*, and ſtrengthens it to the Sound of a *c*; ſo that we ſay *rectum*; as in the preterperfect Tenſe *rexi*, which we pronounce *rekſi*.

T among the Ancients was uſed as a Numeral Letter, ſignifying 160; according to the Verſe,

T quoque centenos & Sexaginta tenebit.

When a Daſh was added a-top, thus, T, it ſignify'd 160,000.

When the Tribunes approv'd of the Decrees of the Senate, they teſtify'd their Conſent by ſubſcribing a *T*.

T, in Muſic, is ſometimes uſed to mark the Tenor. See TENOR.

T is alſo a Mark, or Brand, which by Statute 4 *Hen.* 7. every Perſon convicted of any Felony, ſave Murther, and admitted to the Benefit of the Clergy, ſhall be mark'd withal, on the Brawn of the left Thumb. See STIGMA.

T, or TAU, in Heraldry, is a kind of Croſs potent, or truncated; found in all the Armories of the Commanders of the Order of St. *Anthony*. See CROSS.

The *T*, *Tau*, azure, is ſeen in Arms above 400 Years old: Its Origin, according to ſome Authors, is taken from the Apocalypſe; where the ſame is a Mark that the Angel impreſſes on the Foreheads of the Elect. Others take it to repreſent a Crutch; a Symbol proper enough for this Order, which was ſworn to Hoſpitality. But the Truth, F. *Meneſtrier* obſerves, is, that 'tis the Top of a *Greek* Croſs.

The Biſhops and Abbots of the *Greek* Church wear it ſtill; and if it be found on the Habit of St. *Anthony*, 'tis only to ſhew that he was an Abbot.

TABACCO. See TOBACCO.

TABBY, in Commerce, a kind of coarſe Taffaty, water'd.

It is manufactured like the common Taffaty, excepting that 'tis ſtronger and thicker both in the Woof and Warp. See TAFFATY.

The Watering is given it by means of a Calender, the Rolls whereof are of Iron or Copper, variouſly engraven, which bearing unequally on the Stuff, render the Surface thereof unequal, ſo as to reflect the Rays of Light differently. See CALENDER.

TABBYING, the paſſing a Stuff under the Calender, to make a Repreſentation of Waves thereon, as on a Tabby. See CALENDER.

'Tis uſual to *tabby* Mohairs, Ribbonds, &c.

Tabbying is perform'd without the Addition of any Water or Dye; and furniſhes the modern Philoſophers with a ſtrong Proof, that Colours are only Appearances. See COLOUR.

TABELLA, or TABLETTE, in Pharmacy, a ſolid Electuary, or Compoſition of ſeveral Drugs, made up dry, and form'd into little Squares; more uſually call'd *Lozenges*. See LOZENGE.

Powders, Confections, Fruits, Salts, &c. are diſſolv'd, in Sugar, and made into *Tabulæ*; as thoſe of the Juice of Liquorice for Colds, &c.

We have Cordial, Stomachic, Aperitive, Hepatic, &c. *Tablettes*. Jellies and Broths are ſometimes reduc'd into *Tablettes*, to be carry'd in the Pocket. There are *Tablettes* of *Manus Chriſti*, or Sugar of Roſes pearled. *Tabellæ Magnanimitatis*, are thoſe taken by feeble old Men, when match'd with young Wives, to aſſiſt and bear them out in the Affair of Generation.

TABELLION, TABELLIO, TABULARIUS, in the *Roman* Law, a kind of Officer often confounded with *Notary*, *Notarius*.

Yet did the two differ in this; that the Notaries only drew up, and kept the Minutes of Acts and Inſtruments on Paper, and in Notes, or Short-hand; whereas the *Tabellions* deliver'd them engroſs'd on Parchment, in full executory Form. The ſame put the Seals to Contracts, and render'd them authentic.

The Domeſtic Clerks of theſe *Tabelliones*, who, at firſt, wrote under them, in Proceſs of Time came to be call'd Notaries. See NOTARY.

Paſquier obſerves, that the *Tabelliones* at *Rome* were publick Slaves, appointed for the keeping of Contracts made between private Perſons. According to *Loyſeau*, a Contract wrote by a Notary, was not perfect or obligatory, till the *Tabellio* had wrote it fair; after which the Parties ſubſcrib'd it, *i. e.* they wrote at Bottom that they approv'd the Contents; for Signatures were not then in Uſe. See SIGNATURE.

— *Quoniam* Tabellionum *uſus in regno Angliæ non habetur, propter quod magis ad Sigilla Authentica credi eſt neceſſi, ut eorum Copia facilius habeatur, ſtatuimus ut Sigillum habeant non ſolum Archiepiſcopi, & epiſcopi ſed eorum Officinales*. See SEAL.

TABERNACLE, among the *Jews*, the Place wherein the Ark of the Covenant was lodg'd; both while they were in Tents, during their Journey from *Ægypt*; and when fix'd in *Jeruſalem*, and the Ark kept in the Temple.

Philo deſcribes the *Jewiſh Tabernacle* thus: It was a Building compos'd of 48 Cedar Boards, lined with maſſive Gold; under each whereof was a Silver Stand, or Foot, and at the Top a Capital of Gold: It was encompaſs'd with ten Pieces of rich Tapiſtry, of different Colours, Purple, Scarlet, Hyacinth, &c. The Length of the *Tabernacle* was 30 Cubits; its Breadth 10, *Joſephus* ſays 12. See ARK.

The Ark was placed in a ſecret Oratory, in the Middle of this *Tabernacle*; and was gilt both within-ſide and without: the Top whereof, being a Kind of Lid, was call'd *Propitiatory*, becauſe it appeas'd the Wrath of God.

It was encompaſs'd with ſeveral Veils, ſtretch'd over it, with Hooks, and Buckles of Gold.

The Word is form'd from the *Latin Tabernaculum*, a Tent.

Feaſt of TABERNACLES. See SCENOPEGIA.

TABERNACLE has alſo been uſed of late for a ſort of temporary Church, or Chapel, contriv'd to ſerve the immediate Purpoſes of the Pariſhioners, &c. while their proper Church is Repairing, Rebuilding, or the like.

TABES, in Medicine, a general Name for Conſumptions of all Kinds. See CONSUMPTION, PHTHISIS, ATROPHY, &c.

TABES *Dorſalis*, is a kind, or rather a Degree of Conſumption: proceeding ſometimes from an exceſſive Application to Venery.

The Patient has neither a Fever, nor Loſs of Appetite; but a Senſation, as if there were a Number of Piſmires running from the Head, down the Spinal Marrow; and when he evacuates, either by Urine, or Stool, there flows a liquid Matter like Semen.

After any violent Exerciſe his Head is heavy, and his Ears tingle; and at length he dies of a Lipyria, *i. e.* a Fever, where the external Parts are cold, and the internal burn at the ſame time. See LIPYRIA.

TABLATURE, in Anatomy, a Diviſion or parting of the Scull into two Tables. See CRANIUM.

TABLATURE, in Muſic, in the general, is, when, to expreſs the Sounds, or Notes of a Compoſition, we uſe Letters of the Alphabet, or Cyphers, or any other Characters, not uſual in the modern Muſic. See SCORE.

But in its ſtricter Senſe, *Tablature* is the Manner of Writing a Piece for a Lute, Theorba, Guitarre, Baſs-Viol, or the like; which is done by Writing on ſeveral parallel Lines (each whereof repreſents a String of the Inſtrument) certain Letters of the Alphabet; whereof, A marks that the String is to be ſtruck open, *i. e.* without putting the Finger of the left Hand on the Head; B ſhews, that one of the Fingers is to be put on the firſt Stop; C on the ſecond; D on the third, &c. See WRITING of Muſic.

The *Tablature* of the Lute is wrote in Letters of the Alphabet; that of the Harpſichord in the common Notes. See LUTE, HARPSICHORD, &c.

TABLE, *Tabula*, a Moveable, uſually made of Wood, or Stone, ſupported on Pillars, or the like; for the commodious Reception of Things placed thereon.

Moſes made a *Table* in the Tabernacle for the laying of the Shew-Bread upon; deſcrib'd by *Philo Judæus* as two Cubits long, one broad, and one and half high. Among Chriſtians, the *Table*, or *Lord's Table*, ſignifies the Sacrament of the Euchariſt. See EUCHARIST.

Round TABLE: Knights of the *Round Table*, a military Order, ſuppos'd to have been inſtituted by *Arthur* firſt King of the *Britons*, in the Year 516. See KNIGHT.

They are ſaid to have been 24 in Number; all pick'd from among the braveſt of the Nation.

The *Round Table*, which gave them their Title, was an Invention of that Prince, to avoid Diſputes about the upper and lower End; and to take away all Emulation as to Places.

Leſſy

Leſly aſſures us, he has ſeen the *Table* at *Wincheſter*; At leaſt, ſays he, if we may believe the Keepers thereof, who ſtill ſhew it with a deal of Solemnity. He adds, that the Names of a great Number of Knights wrote around it, ſeem to confirm the Truth of the Tradition.

Larrey, and ſeveral other Authors, make no Scruple to relate this Fable, as Matter of Hiſtory: but that 'tis Fable is certain; F. *Papebroch* having ſhewn, that there was no ſuch Thing as an Order of Knights before the VIth Century.

Cambden obſerves, that the *Table* at *Wincheſter* is of a Structure much more modern than the VIth Century. 'Tis added, that *Arthur* himſelf is no more than a fabulous Prince.

In effect, the *Round Table* does not appear to have been any military Order, but rather a kind of Juſt, or military Exerciſe, between two Perſons, arm'd with Lances. Several Authors ſay, that *Arthur*, Duke of *Bretagne*, renew'd it. See *Matthew Paris*, the Abbot *Juſtiniani*, and F. *Helyot*.

Paulus Jovius ſays, 'twas under the Empire of *Frederic Barberoſa*, that the Knights of the *Round Table* firſt began to be talk'd of: Others attribute their Origin to the Factions of the *Guelphs* and *Gibellins*. K. *Edward* built a Houſe call'd the *Round Table*, the Court whereof was 200 Foot in Diameter.

TABLE, *in Architecture*, a ſmooth ſimple Member, or Ornament, of various Forms; but moſt uſually in that of a long Square.

A *Projecting Table*, is ſuch a one as ſtands out from the Naked of the Wall, Pedeſtal, or other Matter it adorns. ------ *Raked Table*, is that which is hollow'd in the Die of a Pedeſtal, or elſewhere, and which is uſually encompaſs'd with a Moulding. ------ *Razed Table*, an Emboſſment in a Frontiſpiece, for the putting an Inſcription or other Ornament in Sculpture. This is what M. *Perrault* underſtands by *Abacus* in *Vitruvius*. ------ *Crown'd Table*, that cover'd with a Cornice, and wherein is cut a Baſſo Relievo, or a Piece of black Marble incruſtated for an Inſcription. ------ *Ruſticated Table*, that which is pick'd, and whoſe Surface ſeems rough, as in Grotto's, *&c.*

Plain TABLE, a Surveying Inſtrument. See PLAIN *Table*.

TABLE, *in Perſpective*, is a plain Surface, ſuppos'd to be tranſparent, and perpendicular to the Horizon. See PERSPECTIVE.

'Tis always imagin'd to be plac'd at a certain Diſtance between the Eye and Objects, for the Objects to be repreſented thereon by means of viſual Rays paſſing from every Point thereof, thro' the Table to the Eye.

Whence it is alſo call'd *Perſpective Plane*. See PLANE.

TABLE, *in Anatomy*. The Cranium is ſaid to be compos'd of two *Tables*, or Laminæ, *i. e.* 'tis double; as if it conſiſted of two Bones, laid one over another. See CRANIUM.

TABLE of *Pythagoras*, call'd alſo *Multiplication* TABLE, is a Square, form'd of an hundred leſſer Squares, or Cells, containing the Products of the ſeveral Digits, or ſimple Numbers, multiply'd by each other. See MULTIPLICATION.

As 'tis abſolutely neceſſary, thoſe who learn Arithmetic have the ſeveral Multiplications contain'd in this Table, off by Heart; we have thought fit to ſubjoin it here: with an Example, to ſhew the Manner of uſing it.

TABLE *of* Pythagoras, *or* Multiplication TABLE.

1	2	3	4	5	6	7	8	9	10
2	4	6	8	10	12	14	16	18	20
3	6	9	12	15	18	21	24	27	30
4	8	12	16	20	24	28	32	36	40
5	10	15	20	25	30	35	40	45	50
6	12	18	24	30	36	42	48	54	60
7	14	21	28	35	42	49	56	63	70
8	16	24	32	40	48	56	64	72	80
9	18	27	36	45	54	63	72	81	90
10	20	30	40	50	60	70	80	90	100

Example: Suppoſe it were requir'd to know the Product of 6 multiply'd by 8: Look for 6 in the firſt horizontal Column, beginning with 1; then look for 8 in the firſt perpendicular Column, beginning likewiſe with 1; the Square or Cell wherein the perpendicular Column from 6, meets with the horizontal one from 8, contains the Product requir'd, *viz.* 48.

Laws of the Twelve TABLES, were the firſt Set of Laws of the *Romans*; thus call'd, either by reaſon the *Romans* then wrote with a Style on thin, wooden *Tables*, cover'd with Wax; or rather, becauſe they were engraven on *Tables* or Plates of Copper, to be expoſed in the moſt noted Part of the public Forum. See LAW.

After the Expulſion of the Kings, as the *Romans* were then without any fix'd, certain Syſtem of Law; at leaſt had none ample enough to take in the various Caſes that might fall between particular Perſons; 'twas reſolved to adopt the beſt and wiſeſt Laws of the *Greeks*.

One *Hermodorus* was firſt appointed to Tranſlate them; and the *Decemviri* afterwards compiled and reduced them into Ten *Tables*. After a world of Care and Application, they were at length enacted and confirm'd by the Senate, and an Aſſembly of the People, in the Year of *Rome* 303.

The following Year, they found ſome Things wanting therein, which they ſupplied from the Laws of the former Kings of *Rome*, and from certain Cuſtoms, which long Uſe had authoriz'd; theſe being engraven on Two other *Tables*, made the *Law of the Twelve Tables*, ſo famous in the *Roman Juriſprudence*; the Source and Foundation of the Civil or *Roman* Law. See CIVIL *Law*.

The Laws of the Twelve *Tables*, were alſo call'd *Decemviral Laws*, from the Officers entruſted with the Compoſing them. See DECEMVIR.

'Tis great Pity, this Syſtem of Law ſhould have periſhed thro' the Injuries of Time: We have, now, nothing of it, but a few Fragments diſperſed in divers Authors. *J. Gothefrid* has collected them together, and we have them in *Roſinus* and ſome other Authors. The *Latin* is very old and barbarous, and remarkably obſcure.

New TABLES, *Tabulæ Novæ*, an Edict occaſionally publiſh'd in the *Roman* Commonwealth, for the aboliſhing all Kinds of Debts, and annulling all Obligations.

It was thus call'd, in regard all antecedent Acts being deſtroy'd, there were nothing but new ones to take Place.

TABLE, *among Jewellers*. A *Table Diamond*, or other precious Stone, is that whoſe upper Surface is quite flat; and only the Sides cut in Angles: In which Senſe, a Diamond cut *Table-wiſe* is uſed in oppoſition to a Diamond cut *Facetwiſe*. See DIAMOND.

TABLE *of Glaſs*. See CASE *of Glaſs*.

TABLE is alſo an Index or Repertory, put at the Beginning or End of a Book, to direct the Reader to any Paſſages he may have occaſion for. See INDEX.

Thus we ſay, *Table of Matters*: *Table of Authors quoted*; *Table of Chapters*, &c. *Tables*, of themſelves, ſometimes, make large Volumes; as that of *Daoiz* on the Civil and Canon Laws. *Tables of the Bible*, are call'd *Concordances*. See CONCORDANCE.

TABLE *Rents*. See BORD *Lands*.

TABLE *of Houſes*, among Aſtrologers, are certain *Tables* ready drawn up for the Aſſiſtance of Practitioners in that Art, for the erecting or drawing of Figures or Schemes.

TABLES, *in Mathematicks*, are certain Syſtems of Numbers, calculated to be ready at Hand for the expediting Aſtronomical, Geometrical, *&c.* Operations.

Aſtronomical TABLES, are Computations of the Motions, Places and other Phænomena of the Planets, both Primary and Secundary. See PLANET, SATELLITE and MOON.

The oldeſt *Aſtronomical Tables*, are the *Ptolemaic*, found in *Ptolomy*'s *Almageſt*; but theſe no longer agree with the Heavens. See ALMAGEST.

In 1252, *Alphonſus* XI. King of *Caſtile*, undertook the Correcting them, chiefly by the Aſſiſtance of *Iſaac Hazan*, a *Jew*; and ſpent 400000 Crowns therein. Thus aroſe the *Alphonſine Tables*, to which that Prince himſelf prefix'd a Preface.

But the Deficiency of theſe was ſoon perceiv'd by *Purbachius* and *Regiomontanus*; upon which *Regiomontanus*, and after him *Waltherus* and *Warnerus*, applied themſelves to cœleſtial Obſervation, for the further amending them; but Death prevented any Progreſs therein.

Copernicus, in his Books of the Cœleſtial Revolutions, inſtead of the *Alphonſine Tables*, gives others of his own Calculation from the later, and partly from his own, Obſervations.

From *Copernicus*'s Obſervations, and Theories, *Eraſ. Reinholdus* afterwards compiled the *Prutenic Tables*, which have been printed ſeveral Times, and in ſeveral Places.

Tycho de Brahe, even in his Youth, became ſenſible of the Deficiency of the *Prutenic Tables*; which was what determined him to apply himſelf with ſo much Vigour to Cœleſtial Obſervation. Yet all he did thereby, was to adjuſt the Motions of the Sun and Moon; though *Longomontanus*, from the ſame, to the Theories of the ſeveral Planets publiſh'd in his *Aſtronomia Danica*, added *Tables* of their Motions; now call'd the *Daniſh Tables*; and *Kepler*, likewiſe, from the ſame, in 1627, publiſh'd the *Rudolphine Tables*, which are now much eſteem'd.

Theſe

Theſe were afterwards, *Anno* 1650, turned into another Form, by *Maria Cunitia*, whoſe Aſtronomical *Tables*, comprehending the Effect of *Kepler*'s Phyſical Hypotheſis, are exceedingly eaſy, and ſatisfy all the Phænomena, without any Trouble of Calculation, or any Mention of Logarithms; ſo that the *Rudolphin Calculus* is here greatly improved.

Mercator made a like Attempt in his Aſtronomical Inſtitution, publiſh'd in 1676; and the like did *J. Bap. Morini*, whoſe Abridgment of the *Rudolphin Tables* was prefix'd to a *Latin* Verſion of *Street's Aſtronomia Carolina*, publiſh'd in 1705.

Lansbergius, indeed, endeavour'd to diſcredit the *Rudolphin Tables*, and fram'd *perpetual Tables*, as he calls them, of the heavenly Motions; but his Attempt was never much regarded by the Aſtronomers; and our Country-man *Horrox*, gave an abundant Check to his Arrogance, in his Defence of the *Keplerian Aſtronomy*.

Nor was the Authority of the *Rudolphin Tables* impaired by the *Philolaic Tables* of *Bullialdus*, the *Britannic Tables* of *Vincent Wing*, calculated on *Bullialdus*'s Hypotheſis; or the *Britannic Tables* of *Newton*; or the *French* ones of the Count *de Pagan*, or the *Caroline Tables* of *Street*, all calculated on Dr. *Ward*'s Hypotheſis; or the *Novalmagiſtic Tables* of *Ricciolus*.

Among theſe, however, the *Philolaic* and *Caroline Tables* are eſteem'd the beſt; inſomuch that Mr. *Whiſton*, by the Advice of Mr. *Flamſteed* (a Perſon of undoubted Authority in ſuch Caſes) thought fit to ſubjoyn the *Caroline Tables* to his Aſtronomical Lectures.

The lateſt *Tables*, are the *Ludovician*, publiſh'd in 1702, by M. *de la Hire*, wholly from his own Obſervations, and without the Aſſiſtance of any Hypotheſis; which before the Invention of the Micrometer, Teleſcope, and the Pendulum Clock, was held impoſſible.

Another Set of *Tables*, the Aſtronomical World is in daily Expectation of from Dr. *Halley*, Aſtronomer Royal, &c. 'Twere needleſs to prepoſſeſs the Public in their Favour: The Author's Name, and the preſent State of Aſtronomy, will leave no Doubt on any Body but that they will have the laſt Degree of Juſtneſs and Preciſion; and ſuch as Poſterity itſelf ſhall ſcarce be able to amend. They have been in the Preſs ſeveral Years, and what it is retards their Publication, is not known, unleſs it be the rendring them more ample.

For TABLES *of the fix'd Stars*; ſee CATALOGUE.

TABLES *of Sines, Tangents, Secants*, &c. uſed in Trigonometrical Operations, are uſually call'd *Canons*. See CANON. See alſo SINE, TANGENT, &c.

TABLES *of Logarithms, Rhumbs*, &c. uſed in Geometry, Navigation, &c. See LOGARITHM, RHUMB, SAILING, &c.

Loxodromick TABLES, *Tables* of Traverſes, uſed in Navigation for the eaſy and ready Solution of Problems, and Caſes therein. See TRAVERSE.

TABLE, in Heraldry. Coats, or Eſcutcheons, containing nothing but the mere Colour of the Field, and not charged with any Bearing, Figure, Moveable, &c. are call'd *Tables d'Attente*: *Tables of Expectation*, or *Tabulæ raſæ*.

TABLET, in Pharmacy, &c. See TABELLA.

TABLING *of Fines*, is the making a Table for every County, where his Majeſty's Writs run; containing the Contents of every Fine paſs'd each Term. See FINE.

'Tis to be done by the Chirographer of the Fines of the Common Pleas, who every Day of the next Term, after engroſſing any ſuch Fine, fixes each of the ſaid *Tables* in ſome open Place of the ſaid Court, during its Sitting; and likewiſe delivers to the Sheriff of each County, a Content of the ſaid *Tables*, made for that reſpective County, the Term before the Aſſizes, to be affix'd in ſome Place in the open Court, while the Juſtices ſit, &c.

TABOR, *Tabourin*, a ſmall Drum. See DRUM.

Privilege of the Tabouret, in *France*, is a Privilege ſome great Ladies enjoy, to ſit or have a Stool in the Queen's Preſence.

TACAMACHA or TACAMAHACA, a kind of reſinous Gum, diſtilling from the Trunk of a very large Tree, growing in *New Spain*; but, in greateſt Abundance, in the Iſland of *Madagaſcar*. See GUM.

'Tis not unlike our Poplar Tree, only bigger and taller, its Leaves ſmall and green, its Fruit red, of the Size of our Wallnuts, exceedingly Reſinous, and containing a Stone like our Peaches.

The Wood of the Tree makes good Timber for Ships, and the Gum it yields, ſerves for their Caulking; though its chief Uſe is in Medicine.

There are three Kinds of *Tacamacha*; the *Sublime*, call'd alſo *Tacamacha* in the Pod; *Tacamacha* in the Maſs; and *Tacamacha* in Tears.

The Firſt, is the natural Reſin, as it falls of itſelf, without any Inciſion made in the Tree: The Good is dry, reddiſh, tranſparent, of a bitter Taſte and a ſtrong Smell, reſembling that of Lavender. The Iſlanders gather it in little Gourds cut in two, and cover'd with a Palm Leaf.

The *Tacamachas* in *Tears*, and in the *Maſs*, are thoſe which flow from the Tree through Inciſions: They muſt be choſen dry and clear, and their Smell reſembling that of the firſt Kind.

Gum *Tacamacha* is found good for digeſting and reſolving of Tumors, and aſſuaging Pains. Burnt upon Coals, 'tis reckon'd good for Hyſteric Fits in Women, and likewiſe applied to the Belly in form of a Plaiſter. Some apply it to the Temples in the ſame Manner, and to the Nape of the Neck for Pains in the Head, Defluctions of Rheum upon the Throat, and Inflammations of the Eyes, as alſo in the Tooth-ach. It is of ſo ſubtle and penetrating a Nature, that it is greatly uſed in external Applications, to ſuppurate and diſperſe Tumours; and is accounted effectual, even in thoſe which are Scrophulous.

It is likewiſe uſed externally in Arthritical Pains, with Succeſs; in effect, the *Indians* uſe it for all Kinds of Pains. *Schroder* affirms, That he has ſeen intolerable Pains in the Leg removed by it.

TACHEOGRAPHY, or TACHYGRAPHY, the Art of faſt or ſhort writing.

There have been various Kinds of *Tacheography* invented: Among the *Romans*, there were certain Notes uſed, each whereof ſignified a Word. See NOTE.

The Rabbins have a kind of *Tacheography* form'd by Abbreviations, which make a kind of Technical Words; wherein each Conſonant ſtands for a whole Word, as רמבם *Ramban*, which expreſſes *Rabbi Moſes, Son of Maiemon*; רשי *Raſchi*, *Rabbi, Schelomoh, Jarchi*. See ABBREVIATION.

In *France*, &c. the only *Tacheography* uſed is the retrenching of Letters, or even whole Syllables of Words; as in *ſdm* for *ſecundam*, *aut* for *autem*, *d* for *ſed*, *o* for *non*, *Particip aon* for *Participation*, &c.

The firſt Printers imitated theſe Abbreviations: At preſent they are almoſt laid aſide, except among Scriveners, &c.

In *England* we have great Variety of Methods of *Tachygraphy*, or Short-hand; more by far, and thoſe too, much better, eaſier, ſpeedier, and more commodious, than are known in any other Part of the World. Witneſs *Wilkins*'s, *Shelton*'s, *Wallis*'s, *Webſter*'s and *Weſton*'s Short-hands.

The Word is form'd from the *Greek*, ταχὺς, ſwift, and γραφία, writing.

TACK *about*, in Navigation, a Term uſed at Sea when a Ship's Head is brought about, ſo as to lie the contrary Way.

To effect this, they firſt make her *ſtay*; which done, ſhe is ſaid to be *paid*. They then let *riſe* and *hale*, *i. e.* let the Lee-Tack riſe, and hale aft the Sheets, and ſo trim all the Sails by a Wind as they were before.

TACKLE, or TACKLING, in Navigation, includes all the Ropes or Cordage of a Ship, with their Furniture, whereby the Sails are manag'd. See CORDAGE and ROPE.

TACKLES *in a Ship*, are ſmall Ropes running in three Parts, having at one End a Pendant, with a Block faſten'd to them, or elſe a Lannier; and at the other End, a Block and an Hook to hang Goods upon, that are to be heav'd into the Ship, or out of it.

There are ſeveral Kinds of theſe *Tackles*, as the *Boat Tackles*, ſerving to hoiſt the Boat, &c. in and out: The *Tackles* belonging to the Maſts, ſerving as Shrouds to keep the Maſts from ſtraining: The *Gunner's Tackles*, with which the Ordnance are hoiſted in and out: For the *Winding Tackle*, and the *Burnett*. See BURNETT.

TACTICKS, the Art of diſpoſing Forces in Form of Battle, and of performing the military Motions and Evolutions. See EVOLUTION.

The *Greeks* were very skilful in this Part of the military Art, having publick Profeſſors of it, call'd *Tactici*, who taught and inſtructed their Youth therein. *Ælian* hath a particular Book on this Subject; and there is a great deal of it in *Arrian*, in his Hiſtory of *Alex. M.* and in *Mauritius*, and *Leo Imperator*.

Voſſius de ſcient. Mathemat. mentions 24 ancient Authors on the Subject of *Tacticks*.

The Word is form'd from the *Greek* τάξις, Order.

TACTICKS is alſo uſed for the Art of inventing and making the Machines of the Ancients for throwing of Darts, Arrows, Stones, Fire-balls, &c. by means of Slings, Bows, and Counter-poiſes. See MACHINE.

Vegetius, *Hero*, &c. have wrote on theſe Machines; and we have them deſcrib'd and deſign'd by *Lipſius*.

TACTIL, or TANGIBLE, in the Schools, ſomething that may fall under the Senſe of Feeling. See FEELING.

Tho' Atoms be corporeal, yet are they not either *tactil* or viſible, by reaſon of their Smallneſs. See CORPUSCLE.

The principal *tactil* Qualities are Heat, Cold, Dryneſs, Hardneſs, and Humidity. See each under its proper Article, HEAT, COLD, HARDNESS.

TACTION in the Schools } See { FEELING.
TACTION in Geometry } See { TOUCHING.

TÆNIA, or TENIA, in Architecture (from the *Greek* ταινια, a Bandelet, or little Band, call'd by the *Latins Vitta*, *Faſcia*, *Zona*, and *Corona*,) a Member of the Doric Architrave, reſembling a ſquare Fillet, or Ruler, and ſerving in lieu of a Cymatium. See DORIC and CYMATIUM.

Barbaro calls it *Liſtel*; but *Palladio* uſes the old Name *Tænia*. See LISTEL.

Philander ſays, there are two Kinds, *viz.* the abovemention'd, which he calls the *lower*; and another, which ſerves as a Capital to the Triglyphs. *Leon Baptiſt. Alberti* calls the *Tæniæ*, *Regulæ* and *Faſciolæ*; and *Daviler*, *Bandelettes*. See each under its proper Article.

TAFFAREL, in a Ship, the uppermoſt Part, Frame, or Rail, abaft, near the Poop. See SHIP.

TAFFETY, or TAFFETAS, in Commerce, a kind of fine, ſmooth Silk Stuff; having, uſually, a remarkable Luſtre. See SILK and STUFF.

There are *Taffeties* of all Colours; and ſtriped with all Kinds of Stuffs, as Gold, Silver, Silk, *&c.* others checquer'd, others flower'd, others in the *Chineſe* Point, others the *Hungarian*; with various others, to which the Mode, or the Caprice of the Workmen give ſuch whimſical Names, that it would be as difficult, as 'tis uſeleſs, to rehearſe them: beſides that, they ſeldom hold beyond the Year wherein they firſt roſe.

The old Names of *Taffeties*, and which ſtill ſubſiſt, are *Taffeties* of *Lyons*, of *Spain*, of *England*, of *Florence*, of *Avignon*, &c.

The chief Conſumption of *Taffeties* is in Summer Dreſſes for Women, in Linings, Scarves, Coifs, Window-Curtains, *&c.*

There are three Things which contribute chiefly to the Perfection of *Taffeties*, *viz.* the Silk, the Water, and the Fire.

The Silk is not only to be of the fineſt Kind, but it muſt be work'd a long time, and very much, e'er it be uſed. The Watering, beſide that it is only to be given very lightly, ſeems only intended to give that fine Luſtre, by a peculiar Property not found in all Waters. Laſtly, the Fire, which is paſs'd under it to dry the Water, has its particular Manner of Application, whereon the Perfection of the Stuff depends very much.

Octavio May, of *Lyons*, is held the firſt Author of the Manufacture of gloſſy *Taffeties*; and Tradition tells us the Occaſion of it. *Octavio*, it ſeems, going backwards in the World, and not able to retrieve himſelf by the Manufacture of *Taffeties*, ſuch as were then made, was one Day muſing on his Misfortunes, and, in muſing, chanced to chew a few Hairs of Silk which he had in his Mouth. His Reverie being over the Silk he ſpit out, ſeem'd to ſhine, and on that Account engag'd his Attention. He was ſoon led to reflect on the Reaſon; and, after a good deal of Thought, concluded, that the Luſtre of that Silk muſt come, 1°. From his having preſs'd it between his Teeth. 2°. From his having wet it with his Saliva, which had ſomething glutinous in it: And 3°. From its having been heated by the natural Warmth of his Mouth. All this he executed upon the next *Taffeties* he made; and immediately acquir'd immenſe Riches to himſelf; and to the City of *Lyons* the Reputation it ſtill maintains, of giving the Gloſs to *Taffeties* better than any other City in the World.

'Twill not, we conceive, be leſs uſeful than curious, to give here the Deſcription of the Engine contriv'd by *Octavio* to give the Gloſs to *Taffety*; to add the Manner of applying it, and the Compoſition of the Water uſed therein.

The Machine is much like a Silk Loom, except that inſtead of Iron-Points, here are uſed a kind of crooked Needles, to prevent the *Taffety* from ſlipping: At the two Extremities, are two Beams; on one of which is roll'd the *Taffety* to take the Gloſs; and on the other, the ſame *Taffety* as faſt as it has receiv'd it. The firſt Beam is kept firm by a Weight of about 200 Pounds; and the other turn'd by means of a little Lever paſſing thro' Mortoiſes at each End. The more the *Taffety* is ſtretch'd, the greater Luſtre it takes; Care, however, is to be uſed it be not over-ſtretch'd.

Beſides this Inſtrument for keeping the Stuff ſtretch'd, there is another to give it the Fire: This is a kind of Carriage, in Form of a long Square, and the Breadth of the *Taffeties*. It moves on Trundles, and carries a Charcoal Fire under the *Taffety*, at the Diſtance of about half a Foot.

The two Machines prepar'd, and the *Taffety* mounted, the Luſtre is given it by rubbing it gently with a Pelotoon, or Handful of Liſts of fine Cloth, as it rolls from one Beam to t'other; the Fire, at the ſame Time, being carry'd underneath it to dry it. As ſoon as the Piece has its Luſtre, 'tis put on new Beams to be ſtretch'd, a Day or two; and the oftner this laſt Preparation is repeated, the more it increaſes the Luſtre.

For black *Taffeties*, the Luſtre is given with double Beer, and Orange or Lemon Juice; but this laſt is the leaſt proper, as being apt to whiten. The Proportion of the two Liquors, is a Gallon of Orange Juice to a Pint of Beer, to be boil'd together to the Conſiſtence of a Broth. For colour'd *Taffeties*, they uſe Gourd-Water, diſtill'd in an Alembic.

TAFTOLOGY. See TAUTOLOGY.

TAIL, that Part of an Animal which terminates its Body behind.

The *Tail* is different both in Figure and Uſe in the various Species: In Land Animals, it ſerves to rid them of Flies, and is uſually cover'd with Hair, and ſtrengthen'd with Bones: In Fiſhes it is Cartilaginous, and ſerves them as a Helm to ſteer their Courſe withal in ſwimming. See SWIMMING.

In Birds it is cover'd with Feathers, and greatly aſſiſts in all Aſcents, and Deſcents in the Air; as alſo to render their Flight ſteady, by keeping the Body upright in that ſubtile and yielding Medium, by its readily turning and anſwering to every Vacillation of the Body. See FLYING.

In Anatomy, TAIL is uſed for that Tendon of a Muſcle, which is fix'd to the moveable Part: In Oppoſition to which, the Tendon fix'd to the immoveable Part is call'd the *Head*. See MUSCLE.

Among Botaniſts, the *Pedicle* is ſometimes call'd the *Tail*. The Way to preſerve Fruits in Winter, is to ſeal up their *Tails* or Pedicles with Wax. See PEDICLE.

Dove-TAIL, or *Swallows*-TAIL, among Carpenters, is one of the ſtrongeſt Manners of Jointing; wherein, a Piece of Wood that grows larger towards the End, is inſerted into another Piece; ſo that it cannot ſtir out, by Reaſon the Hole in the one, is narrower than the lower End of the other. As in the Figure of a *Dove's Tail*. See QUEUE *d'Aronde*, and SWALLOWS-*Tail*.

Peacock's-TAIL, a Term apply'd to all circular Compartments, which go enlarging from the Centre to the Circumference; imitating, in ſome meaſure, the Feathers of a Peacock's *Tail*.

Dragon's TAIL, *Cauda Draconis*, in Aſtronomy, the deſcending Node of a Planet; thus characterized ☋. See NODE.

The Aſtrologers take Care to put it in all their Horoſcopes. See HOROSCOPE.

Horſe's TAIL, among the *Tartars* and *Chineſe*, is the Enſign or Flag under which they make War. See ENSIGN.

Among the *Turks*, it is the Standard bore before the Grand Vizier, the Baſhaws, and Sangiacs; in order to which, it is fitted on the End of a half Pike, with a Gold Button, and is call'd *Toug*.

There are Viziers of one, others of two, others of three *Horſes Tails*. The *Horſe's Tail* plac'd on a General's Tent, is a Signal of Battel.

For the Original of this Cuſtom, it is related, that in a certain Battel, the Standard being taken by the Enemy, the General of the Army, or, as others ſay, a private Horſeman, cut off the *Tail* of his Horſe, and faſtening it to the End of a half Pike, encourag'd the Troops, and gain'd the Victory. In Memory of which noble Action, the Grand Signor appointed that Standard to be bore for the future, as a Symbol of Honour. *Ricaut*.

TAIL *of a Comet*. When a Comet darts his Rays forwards, or towards that Part of the Heavens, whither his proper Motion ſeems to be carrying him; thoſe Rays are call'd its *Beard*: On the contrary, when its Rays are ſhot behind, towards that Part from whence it appears to move, the Rays are call'd the *Tail of the Comet*.

The various Phænomena whereof, with their Phyſical Cauſes, ſee under the Article COMET.

TAIL *of the Trenches*, in the military Art, is the firſt Work which the Beſiegers make at the Opening of the Trenches, as the Head of the Attack is carry'd on toward the Place. See TRENCH.

TAIL, or TAILE, *Sectura*, in Common Law, ſignifies two ſeveral Things; both grounded upon one Reaſon.

Firſt, It is uſed for that Kind of Fee, which is oppoſite to the Fee-ſimple; ſuch Fee being ſo minced, or parted, as it were, that it is not in the Owners free Power to diſpoſe of; but is by the firſt Giver *cut*, *taille*, and divided from all others, and tied to the Iſſue of the Donee. See FEE.

This Limitation of *Taile* is either General or Special.

Taile General, is that whereby Lands and Tenements are limited to a Man, and to the Heirs of his Body begotten: It is call'd *General*, becauſe how many Wives ſoever the Tenant holding by this Title ſhall have, one after another, in lawful Marriage, his Iſſue by them all have a Poſſibility to inherit one after another.

Taile Special, is when Lands or Tenements are limited to a Man and his Wife, and the Heirs of their two Bodies begotten: It is call'd *Special*, becauſe if the Man bury his Wife before Iſſue, and take another; the Iſſue by his ſecond Wife cannot inherit the Land, *&c.*

Alſo, if the Land be given to a Man and his Wife, and their Son *R*, for ever; this is *Taile Special*.

Taile,

Taile, after Poſſibility of Iſſue, extinct; is where Land being given to a Man, and his Wife, and the Heirs of their two Bodies; the one over-lives the other, without Iſſue between them begotten; upon which the Survivor ſhall hold the Land for Term of his own Life in quality of Tenant in *Taile, after the Poſſibility of Iſſue, extinct*; and notwithſtanding that he does Waſte, he ſhall never be impeached of it: And when he dies, he in the Reverſion ſhall not have a Writ of Entry, *in Conſimili Caſu*, but may enter, and his Entry is lawful.

Secondly, Tail, or *Taile* is uſed for what we vulgarly call a *Talley, une Taille de Bois*, for a Cloven Piece of Wood to nick up an Account on. See TALLY.

TAILLOIR, in Architecture, a Term ſome of our Writers, after the *French*, uſe for *Abacus*. See ABACUS.

TAINT, in Law, ſignifies, either, ſubſtantively, a Conviction; or, adjectively, a Perſon convicted of Felony, Treaſon, *&c.* See ATTAINT.

TAKE *and Leave*, in the Sea Language. The Sailors ſay, a Ship can *take and leave upon her when ſhe will*; when ſhe ſails ſo well that ſhe can come up with another, or outſail her at Pleaſure.

TALBOT, a Sort of Dog, frequent in Coat Armour, noted for its quick Scent, finding out the Tracks, Lodgings, and Forms of Beaſts, and purſuing them with open Mouth, and continual Cry, with ſuch Eagerneſs, that if not taken off by the Huntſmen, they are often ſpoil'd.

TALC, or TALK, in Natural Hiſtory, a ſhining, ſquammous, fiſſile Stone, eaſily ſeparable into thin tranſparent Scales, or Leaves. See STONE.

Anciently, *Talc* was only found in *Spain*; but ſince, Mines thereof have been found in *Cyprus, Cappadocia*, and ſince that, in *Arabia* and *Africa*; at preſent, they dig it in the *Alps* and *Apennines*, ſeveral Mountains in *Germany*, and even in *England*, particularly in *Northamptonſhire*.

We uſually diſtinguiſh two Kinds of *Talc, viz. White Talc of Venice*, and *Red of Muſcovy*.

That from *Venice* is the moſt eſteem'd: 'Tis brought in large ſhining greeniſh Stones; but becomes white, and exceedingly tranſparent when wrought. It appears fatty to the Touch, tho' there is ſcarce any Stone dryer; yet in Spight of its Dryneſs, it pulverizes with Difficulty; nor is it eaſily calcined.

Its chief Uſe is as a Screen or Cover for Paintings in Miniature and Craions; to which Purpoſe thin Slices thereof are uſed: 'Tis ſometimes alſo uſed for a Fucus; in order to which, by Reaſon of the Difficulty of pulverizing it, *&c.* they content themſelves to raſp it with the Skin of a Sea-Dog, and to paſs the Raſping thro' a Sieve.

Pliny, in his Natural Hiſtory, *lib. 36. cap. 22.* obſerves, that the *Romans* built Temples, and Places therewith, and paved the Coliſæum of the ſame.

The *Talc* brought from *Muſcovy* is reddiſh when in the Stone; but it ſeldom comes to us otherwiſe than in Leaves, which are very hard, ſmooth, poliſh'd, and exceedingly tranſparent: 'Tis found in Quarries in *Muſcovy* and *Perſia*, and is uſed to make Lanthorns, to cover Paintings, *&c.*

The Word is *German*, where it ſignifies the ſame Thing.

Some Chymiſts, and other Empiricks, have held, that *Talc* might be uſed for many more important Purpoſes; and pretend to draw from it that precious Oil, ſo much boaſted of by the Ancients, particularly the *Arabs*, call'd *Oil of Talc*, which is ſuppos'd a wonderful Coſmetic, and Preſerver of the Complexion: But the Truth is, the Word *Talc*, among them, ſignify'd no more than an equal Diſpoſition of the Humours, which kept the Body in good Temperament, and perfect Health. Now, as nothing contributes more than Health to the preſerving of Beauty, this has given Occaſion to the Chymiſts to ſearch this *Oil of Talc*, which is to maintain the Body in this Diſpoſition, and to engage the Ladies to be at the Expence of the Search.

Some have alſo pretended, that yellow or ruddy *Talc* contain'd the Seeds of Gold; and that a Menſtruum might be drawn from it, to tranſmute Metals into Gold and Silver, to fix Mercury, *&c.*; but this is mere Charletanery.

TALENT, *Talentum*, a Weight and a Coin, both very famous among the Antients; but very different in different Countries. See COIN and WEIGHT.

The Value of the *Talent* is very hard to aſſign in *Engliſh* Money; as being uſed among all the People throughout the Eaſt; and its Value, and the Manner of Computation, different among each. A Difficulty abundantly ſhewn by *Budæus*, in his learned Treatiſe *de Aſſe*.

There were various Kinds of *Talents*, both with regard to Weight, and to Species; the Value of theſe laſt ſtill increaſing, as the Metal whereof it conſiſted was higher: tho' the *Talent Weights* did all contain the ſame Number of Pounds and Drachms.

For as the *French* have a Pound *Pariſis*, and a Pound *Tournois*, each whereof contains alike 20 Sols; yet theſe compar'd together, the *Paris* Pound contains 25 Sols of the *Tournois* Pound, the *Paris* Sol exceeding that of *Tours* by one quarter; ſo all *Talent* Weights were equally 60 Minæ, and the Mina 100 Drachmæ; but the Drachma of one Place exceeding that of another, there hence aroſe a Difference in the *Talents*. See MINA.

The *Attic* Drachma, for Inſtance, was 6 *Attic* Oboli, and that of *Ægina* 10 of the ſame Oboli; whence the *Æginian Talent*, computed on the Foot of the *Attic* Weight, was 100 Minæ; whereas reckon'd on the Foot of its own Drachma, it was no more than 60. See DRACHMA.

The *common Attic Talent* then (the *Talent* Weight we mean) contain'd 60 *Attic* Minæ, or 62 and half *Attic* Pounds, or 6000 *Attic* Drachmæ; equal, according to Dr. *Arbuthnot*'s Reduction, to 56 Pounds 11 Ounces *Engliſh* Troy Weight. Some Authors, as *Priſcian*, mention another *Attic Talant* of 100 Minæ; but this is to be underſtood of ancient Minæ, as they ſtood before *Solon*; each only worth 75 Drachmæ.

The *Syrian Talent* contained 15 *Attic* Minæ; That of *Alexandria* 96 *Attic* Minæ, or 91 Lib. Troy. The *Babylonic, Perſian* and *Antiochic Talents* were the ſame with the *Ægyptian*.

Among the *Romans*, there were two Kinds of *Talents*, the *little* and the *great Talent*: The *little* was the common *Talent*; and whenever they ſay, ſimply, *Talent*, they are to be underſtood of this: The *little Talent* was 60 Minæ or *Roman* Pounds, the Mina or Pound eſtimated at 100 Drachmæ or Denarii: It was alſo eſtimated at 24 great Seſterces, which amounted to 60 Pounds.

The *great Talent* exceeded the leſs by one third Part. *Budæus* computes, that the little *Talent* of Silver was worth 75 Pounds Sterling; and the greater 99 *l.* 6 *s.* 8 *d.* Sterling. The greater *Talent* of Silver he makes worth 75 Pounds Sterling; the greater of Gold worth 1125 Lib. Sterling.

Talent, as a Species, or Money, among the *Hebrews*, was a Gold Coin, the ſame with the Shekel of Gold, call'd alſo *Stater*, and weigh'd only 4 Drachms. See SHEKEL.

In the Scripture it is alſo call'd *Solidus*, Shilling. The *Hebrews* reckon'd by theſe *Talents* as we do by Pounds, *&c.* Thus a Million of Gold, or Million of *Talents* of Gold, among them, was a Million of Shekels, or Nummi; the Nummus of Gold being the ſame Weight with the Shekel, *viz.* 4 Drachms.

TALES, in Law, a Supply or Addition of Men impannel'd on a Jury of Inqueſt, and not appearing, or at their Appearance, challeng'd by either Party as not indifferent. See JURY.

In ſuch Caſe, the Judge, upon Motion, grants a Supply to be made by the Sheriff, of one, or more *Tales*, ſuch there preſent, equal in Reputation to thoſe impannell'd.

This Act of ſupplying is call'd a *Tales de Circumſtantibus*.

He that has had one ſuch *Tales*, either upon Default, or Challenge, may not have another containing ſo many as the former: For the firſt *Tales* muſt be leſs than the principal Pannel, except in a Cauſe of Appeal; and ſo every *Tales* leſs than other, till the Number be made up of ſuch as are unexceptionable.

Theſe, call'd *Tales*, or *Taleſmen*, and corruptly *Tallymen*, are, on ſome Occaſions, call'd *Meliores*.

TALIO, *Lex Talionis*, or *Pœna Talionis*, a Retribution, or Puniſhment, whereby an Evil is return'd perfectly like that committed againſt us, by another; which is what we uſually expreſs by the Words *Eye for Eye, Tooth for Tooth*.

The *Pœna Talionis* was enjoyn'd by the Law of *Moſes*, juſt as 'tis in the Goſpel: It was eſteem'd a natural Piece of Juſtice; and yet the *Romans* ſet it aſide; inaſmuch as ſuch a Parity or Equality of Puniſhment could not always be obſerved. For this Reaſon, the Prætor allowed ſuch as had ſuffer'd any Injury, to make an Eſtimate thereof in Money, that Juſtice might be done him that way; only reſerving to himſelf the Power of moderating the ſame.

And this was what was conſtantly practiſed, and thus the *Pœna Talionis*, became quite diſuſed.

The *Lex Talionis*, is never obſerved in the Civil Juſtice, but with regard to falſe Witneſſes.

TALISMANS, certain Figures engraven, or cut, under ſeveral ſuperſtitious Obſervations of the Characters and Diſpoſitions of the Heavens; to which ſome Aſtrologers, hermetical Philoſophers, and other Adepts, attribute marvellous Virtues, particularly that of calling down Cœleſtial Influences.

The Author of a Book, intitled, *Taliſmans Juſtifiez*, ſays, a *Taliſman* is the Seal, Figure, Character or Image of a heavenly Sign, Conſtellation or Planet, engraven on a Sympathetic Stone, or on a Metal correſponding to the Star, *&c.* in order to receive its Influences. The *Taliſmans* of the *Samothracians*, ſo famous of old, were Pieces of Iron, form'd into certain Images, and ſet in Rings, *&c.*

They were held Preſervatives againſt all Kinds of Evils; there were other *Taliſmans* taken from Vegetables, and others from Minerals. In the general, we uſe to diſtinguiſh three

Kinds

Kinds of *Taliſmans*. The *Aſtronomical*, which are known by the Signs, or Conſtellations of the Heavens engraven thereon, with other Figures, and ſome unintelligible Characters. The *Magical*, which bear very extraordinary Figures, with ſuperſtitious Words and Names of Angels unheard of. And the *Mixt*, which conſiſt of Signs and barbarous Words, but have no ſuperſtitious ones, or Names of Angels.

Some Rabbins have maintained, that the Brazen Serpent, rais'd by *Moſes* in the *Wilderneſs*, for the Deſtruction of the Serpents that annoy'd the *Iſraelites*, was a *Taliſman*.

All the miraculous Things wrought by *Apollonius Tyanæus*, are attributed to the Virtue and Influence of *Taliſmans*: That Wizard is even ſaid to have been the Inventor of *Taliſmans*.

Some Authors take ſeveral *Runic* Medals, at leaſt Medals whoſe Inſcriptions are in *Runic* Characters, for *Taliſmans*; it being notorious, that the Northern Nations, in their heathen State, were much devoted thereto.

M. *Keder*, however, has ſhewn, that the Medals here ſpoke of are quite otherguiſe Things than *Taliſmans*. See RUNIC.

The Word is pure *Arabic*; though *Menage* thinks it may come from the *Greek* τελεσμα, Conſervation: *Borel* ſays, 'tis *Perſian*, and ſignifies, literally an engraven Conſtellation. *Du Cange* derives it a *Talamacis literis*, which are myſterious Characters, or Cyphers uſed by Sorcerers; thus call'd from *Talamaſca*, a Fantom, or Illuſion.

TALKING. See SPEAKING, SPEECH and VOICE.

TALLAGE, a certain Rate, according to which, Barons and Knights were anciently tax'd by the King towards the Expences of the State; and inferior Tenants by their Lords, on certain Occaſions. See TAX.

This latter *Tallage* of the cuſtomary Tenants, was ſometimes fix'd, and certain; and ſometimes at the Pleaſure of the Lord; and was alſo ſometimes compounded for. See SUBSIDY.

Tallages were anciently call'd *Cuttings*; which Name is ſtill retain'd in *Ireland*, tho' in a different Signification.

Tallage, ſays Sir *Ed. Coke*, is a general Name including all Taxes. See TAX.

TALLY, or TAIL, (from the *French*, *tailler*, to cut,) a Piece of Wood, whereon retail Traders uſe to ſcore or mark, by Notches or Inciſions, the ſeveral Quantities of Goods they deliver out on Credit; to ſave the Trouble of Writing down ſo many little Articles in Books. See TAIL.

Each Score conſiſts of two Pieces of Wood, or rather of a ſingle Piece cleft length-wiſe, the Parts whereof falling in with one another, the Things deliver'd are ſcored on both at the ſame time; the Seller keeping one, and the Buyer the other. *Tallies* are taken as Evidences in Courts of Juſtice, as much as Books.

The ancient Way of keeping all Accounts was by *Tallies*; the Debtor ſtill keeping one Part, and the Creditor the other.

There are three Kinds of *Tallies*, mention'd in our Statutes, and long uſed in the *Exchequer*.

The firſt, TALLIES *of Loans*; one Part whereof is kept in the *Exchequer*, and the other Part given to particular Perſons, in lieu of an Obligation for the Monies they have lent to the Government on Acts of Parliament. See LOAN.

This laſt Part is call'd the *Stock*, and the former the *Counter-ſtock*, or Counter-tail.

The *Tallies* are number'd, bear the Perſon's Name, and the Sum lent: Thus we ſay, The *Tallies*, N° have been paid, diſcharg'd: *Tallies* are riſen, fallen 4, 5, &c.

The ſecond are, TALLIES, or TAILES *of Debt*; which are a kind of Acquittances for Debts paid the King.

E. gr. the Univerſity of *Cambridge* pays yearly 10 Lib. for ſuch Things as are by Charter granted them in Fee-Farm. He that pays this, receives a *Tail*, or *Tally* for his Diſcharge, with which, or a Note of it, he repairs to the Clerk of the Pipe; and there for the *Tally* receives a full Diſcharge on Parchment.

The other are, TALLIES *of Reward*, or Allowance, made to Sheriffs, for ſuch Matters as (to their Charge) they have perform'd in their Office, or ſuch Money as is by Courſe caſt on them in their Accounts, but which they cannot levy.

TALLOW, a Sort of Fat of Animals, melted down, and clarify'd. See FAT.

There are ſcarce any Animals, but a Sort of *Tallow* may be prepar'd from; but thoſe which yield the moſt, and whereof the moſt Uſe is made, are the Horſe, Bullock, Sheep, Hog, Goat, Deer, Bear, and Viper. Some of which *Tallows*, or Fats, are only uſed in Medicine. See AXUNGIA.

Moſt of the reſt are uſed in the making of Soap; the dreſſing of Leather; but chiefly in the making of Candles. See SOAP, CURRYING, &c.

For Candles, the beſt Compoſition is half Sheeps *Tallow*, and half Cows or Bullocks *Tallow*, without any Mixture of other kinds of Fat, which only ſerve to turn the Candles yellow, make them run, and ſpoil the Clearneſs of their Light. See CANDLE.

TALLOW-*tree*, in *China*, is a Tree growing in great Plenty in that Country, which produces a Subſtance like our *Tallow*, and ſerving for the ſame Purpoſe.

'Tis about the Height of a Cherry-Tree; its Leaves in Form of a Heart, of a deep, ſhining, red Colour, and its Bark very ſmooth. Its Fruit is incloſ'd in a kind of Pod, or Cover, like a Cheſnut, and conſiſts of three round white Grains, of the Size and Form of a ſmall Nut, each having its peculiar Capſula, and within, a little Stone.

This Stone is encompaſs'd with a white Pulp, which has all the Properties of true *Tallow*, both as to Conſiſtence, Colour, and even Smell: And accordingly the *Chineſe* make their Candles of it; which would, doubtleſs, be as good as thoſe in *Europe*, if they knew how to purify their *Vegetable Tallow*, as well as we do our *Animal Tallow*.

All the Preparation they give it, is to mix a little Oil with it, to make it ſofter, and more pliant. 'Tis true their Candles made of it yield a thicker Smoak, and a dimmer Light, than ours; but thoſe Defects are owing, in great meaſure, to the Wicks, which are not of Cotton, but only a little Rod, or Switch of dry light Wood, cover'd with the Pith of a Ruſh, wound round it; which being very porous, ſerves to filtrate the inſenſible Parts of the *Tallow*, attracted by the burning Stick, which by this Means is kept alive.

TALMUD, or, rather, THALMUD, a Book, wherein the *Jews* have collected what relates to the Explication of their Law.

The *Thalmud*, is the Body of the *Hebrew* Law, and of Expoſitions of the Duties impoſ'd on that People, either in Scripture, or by Tradition, or by Authority of their Doctors, or by Cuſtom, or even by Superſtition; and, to ſpeak more plainly ſtill, the Courſe of Caſes of Conſcience, or of moral Theology, wherein the Duties are explain'd, and the Doubts clear'd, not by Reaſoning, but generally by Authority, by the Cuſtom of the Nation, and by the Deciſions of the moſt approv'd of ancient Doctors.

This *Thalmud* conſiſts of two general Parts; the one call'd the *Miſchna*, the other the *Gemara*; which ſecond Part is alſo frequently call'd abſolutely the *Thalmud*, the general Name of the whole Work. See MISCHNA and GEMARA.

The *Jews* divide their Law into *Written*, which is that contain'd in the Books of *Moſes*; and *Unwritten*, which is that convey'd by Tradition. This latter is, in Effect, no other than a Gloſs or Interpretation of the former, given by the ancient Rabbins. See TRADITION and RABBIN.

The *Thalmud*, then, contains the Traditions of the *Jews*, their Polity, their Doctrine, and their Ceremonies; which they obſerve as religiouſly as the Law of God itſelf: They would never put it in Writing till they were compell'd to it by the Deſtruction of *Jeruſalem*, and till they ſaw themſelves diſpers'd throughout the World.

They had two famous Schools; the one at *Babylon*, and the other at *Jeruſalem*: In theſe they made two ſeveral Collections of thoſe Traditions, the firſt at *Jeruſalem*, the latter at *Babylon*; but both call'd *Thalmud*, and both exceedingly reverenc'd, eſpecially the *Babylonian*, tho' full of Extravagances.

It was compiled by the *Jews* of *Meſopotamia*, about 500 Years after *Chriſt*.

The *Thalmud* of *Jeruſalem* is the leaſt eſteem'd. It was compiled by the *Jews* of that City 300 Years after *Chriſt*.

The *Babylonian Thalmud* conſiſts of two Parts, the one the Text, the other the Comment: The Comment, call'd the *Gemara*, contains the Deciſions of the *Jewiſh* Doctors, and their Expoſitions of the Text. This we find ſtuffed with Dreams and Chimæra's; a deal of Ignorance, and a world of impertinent Diſputations: The Stile very coarſe. On the contrary, the Text, call'd the *Miſchna*, is wrote in a pretty pure Style, and the Reaſonings generally much more ſolid.

The *Jews* pretend it was compos'd by *Rabbi Juda*, ſurnam'd the *Saint*; and that God reveal'd to him the Doctrine and the chief Myſteries thereof. But this is only to be underſtood of the *Miſchna*, not of the *Gemara*, the Compilation whereof was not begun till the VIth Century after the Deſtruction of the ſecond Temple.

Rabbi Juda is ſaid to have compos'd the *Miſchna* under the Empire of *Antoninus*, in the IId Century; but they don't all agree about this Antiquity, ſome carrying it back much further.

'Tis the *Thalmud of Babylon* that is uſually read, and that is the moſt conſulted among the *Jews*; ſo that when they ſay ſimply the *Thalmud*, they always mean this; never quoting the other without the Addition of *Jeruſalem*.

Rabbi Moſes, *Son of Maiemon*, has made an Abridgement of the *Thalmud*, which *Scaliger* prefers to the *Thalmud* itſelf; as being purg'd of many of the Fables wherewith the other is full. 'Tis a Syſtem of the Laws and Cuſtoms of the *Jews*, both their Civil and their Canon Law, and the beſt of their Traditions.

About

About the Year 1236, a *Jew* of *Rochel*, well vers'd in the *Hebrew*, becoming Chriſtian, made a Journey to Pope *Gregory* IX. and diſcover'd to him a Number of Errors in the *Thalmud*: Theſe the Pope ſends, in 39 Articles, to the Archbiſhops of *France*, with a Letter, appointing them to ſeize the Books of the *Jews*, and to burn all ſuch as ſhould contain thoſe Errors; in Conſequence of which Order, above 20 Cart Loads of *Hebrew* Books were burnt. He wrote to the ſame Effect to the Kings of *England*, *France*, *Arragon*, *Caſtile*, &c.

His Succeſſor, *Innocent* IV. giving Commiſſion to his Legate *Eudes de Chateauroux*, to examine the *Thalmud*, and other *Jewiſh* Books more carefully, and to tolerate ſuch Errors as were not contrary to the Chriſtian Religion; the Legate wrote to the Pope, that to tolerate them was to approve them; and the 15th of *May*, 1248, he condemn'd them Juridically.

TALON, in Architecture, a kind of Aſtragal; or Moulding conſiſting of a ſquare Fillet, crowning a Cymatium; frequently found to terminate Ornaments of Joyners-Work, as thoſe of Doors, &c. See CYMATIUM.

The *Talon* is a Moulding concave at the Bottom, and convex a-top; having an Effect juſt oppoſite to the Doucine. See DOUCINE.

When the concave Part is a-top, 'tis call'd an *Inverted Talon*. The *Talon* is uſually call'd by our *Engliſh* Workmen *Ogee*, or *O. G*; and by Authors an *upright* or *inverted Cymatium*. See OGEE.

The Word is *French*, and literally ſignifies *Heel*.

TALPA, in Medicine and Chirurgery, a Tumour thus call'd, of the Oedematous Kind. See OEDEMATOUS.

The *Talpa*, and Nates, chiefly ariſe about the Head, as the Conſequence of ſome Venereal Diſorder. See NATES.

The *Talpæ* elevate the Skin from the Pericranium; and generally denote a Foulneſs in the ſubjacent Bone of the Skull.

TALUS, in Anatomy, a Bone, call'd alſo *Aſtragalus*. See ASTRAGAL.

In its upper Part, it has a Convex Head, which is articulated with the two Fociles of the Leg, by Ginglymus, it being divided by a little Sinus, which receives the ſmall Protuberance in the Middle of the Sinus of the Tibia: Without this Articulation, we muſt always, in going, have trod on the Heel with our Fore-foot, and our Toes with the Hind-foot. See TIBIA.

The fore Part of the *Talus*, which is alſo convex, is receiv'd into the Sinus of the Os Naviculare. See NAVICULARE.

Below, towards the hind Part of its under Side, it has a pretty large Sinus, which receives the upper and hind Part of the Os Calcis: And towards the fore Part of the ſame Side it has a Protuberance, which is receiv'd into the upper and fore Part of the ſame Bone. Betwixt this Sinus, and this Protuberance, there is a Cavity, which anſwers to another in the Os Calcis; in which is contain'd an oily and mucous Sort of Subſtance, for moiſtening the Ligaments, and facilitating the obſcure Motion of theſe Bones when we go.

TALUS, or TALUT, in Architecture, the ſenſible Inclination or Slope of a Work; as of the Outſide of a Wall, when its Thickneſs is diminiſh'd by Degrees, as it riſes in Height, to make it the firmer. See WALL.

TALUS, in Fortification: The *Talus of a Baſtion*, or *Rampart*, is the Slope allow'd to ſuch a Work, whether it be of Earth or Stone, the better to ſupport its Weight. See RAMPART.

The *Talus exterior* of a Work, is its Steepneſs on the Side of the Field, which is always made as little as poſſible, to prevent the Enemies Scalado; unleſs the Earth be bad, and then it is abſolutely neceſſary to allow a conſiderable *Talus* for its Parapet.

The *Talus interior* of a Work, is its Steepneſs on the Inſide towards the Place.

TAMARINS, or TAMARINDS, a kind of Medicinal Fruit, of a tart, agreeable Taſte; brought from the *Eaſt Indies*, and call'd by ſome *Indian Dates*, and by others the *Indian Acacia*.

The Tree which yields it, call'd by the *Indians Tamarinds*, and the *Portugueſe Tamarindos*, is not unlike our Aſh, or Walnut Tree; its Leaves reſemble thoſe of Female Fern; its Flowers are join'd eight or ten together, like thoſe of the Orange Tree.

Its Fruit is in a Pod, the Length of a Finger, and the Thickneſs of the Thumb; cover'd at firſt with a green Rind, which afterwards becomes brown, and contains a blackiſh Pulp, among which are found Seeds reſembling Lupines: 'Tis this Pulp alone that is brought to us, and us'd in Medicines.

The *Tamarinds* muſt be choſen big, of a Jet Colour, a brisk Taſte, not too dry, and ſuch as have not been laid in the Cellar, nor falſify'd with Molaſſes of Sugar and Vinegar. They are found laxative, cooling, and good to quench Thirſt. In burning Fevers they are preſcrib'd to moiſten and cool the Mouth.

TAMBAC, or TAMBAQUA, a Mixture of Gold and Copper, which the People of *Siam* hold more beautiful, and ſet a greater Value on, than Gold itſelf.

Some Travellers ſpeak of it as a Metal found in its peculiar Mines; but upon what Authority we don't know. The Abbe *de Choiſy*, in his *Journal of Siam*, doubts whether it mayn't be the Electrum, Amber, of *Solomon*.

The Embaſſadors of *Siam* brought ſeveral Works in *Tambac* to *Paris*, in the Reign of *Louis* XIV; which were not found ſo beautiful as was expected.

TAMBOUR, in Architecture, a Term apply'd to the *Corinthian* and Compoſite Capitals; as bearing ſome Reſemblance to a Drum; which the *French* call *Tambour*. See CAPITAL.

Some chuſe to call it the *Vaſe*, and others the *Campana*, Bell. See VASE, &c.

TAMBOUR is alſo us'd for a little Box of Timber-Work, cover'd with a Ceiling, within-ſide the Porch of certain Churches; both to prevent the View of Perſons paſſing by, and to keep off the Wind, &c. by means of folding Doors, &c.

TAMBOUR is alſo a round Stone, or Courſe of Stones, ſeveral whereof form a Section of the Shaft of a Column, not ſo high as a Diameter.

TAMPION, TAMKIN or TOMKIN, a kind of Plug or Stopple, ſerving to cloſe a Veſſel; particularly to keep down the Powder in a Fire-Arm, &c.

In charging a Mortar, or the like, over the Powder is uſually put a thin round Piece of Wood to keep the Shot, Ball, Shell, or the like from the Gun-powder. This Piece is call'd a *Tampion*, and by means hereof, the Shot is exploded with the greater Vehemence. See CHARGE, &c.

The Word is form'd from the *French*, *Tampon*, a Bung, Stopple, &c. Some derive it from the *Engliſh* Tap.

TAN, the Bark of the Oak; chopp'd, and ground, by a *Tanning* Mill, into a coarſe Powder; to be uſed in the *Tanning* or Dreſſing of Skins. See BARK and TANNING.

New Tan is the moſt eſteem'd; when Old and Stale, it loſes a deal of its Effect, which conſiſts in the condenſing or cloſing the Pores of the Skins; ſo that the longer the Skins are kept in *Tan*, the greater Force and Firmneſs they acquire.

In effect, not only the Bark, but every Part of the Oak Tree, of what Age or Growth ſoever, all oaken Coppice, &c. cut in Barking Time, makes good *Tan*; as good at leaſt, as the beſt Bark.

This, when got, is to be well dried in the Sun, houſed dry, and kept ſo. To uſe it, the greater Wood may be ſhaved ſmall, or cleft, fit to be cut ſmall by a *Tanning* Engine for the Purpoſe; which done, 'tis well dried again on a Kiln, and then ground by the Mill.

Where Oak is ſcarce, Thorns may ſupply the Defect.

TANGENT, in Geometry, a right Line, which touches a Circle, that is, which meets it in ſuch Manner, as that though infinitely produced, it would never cut the ſame; that is, never come within the Circumference. See CIRCLE, &c.

Thus the Line AD (Tab. Geometry Fig. 50) is a *Tangent* to the Circle, in D.

'Tis demonſtrated in Geometry, 1° That if a *Tangent* AD, and a Secant AB, be both drawn from the ſame Point A; the Square of the *Tangent* will be equal to the Rectangle, under the whole Secant AB, and that Portion thereof AC, which falls without the Circle. See SECANT.

2° That if two *Tangents*, as AD AE be drawn to the ſame Circle from the ſame Point A, they will be equal to each other.

TANGENT, in Trigonometry. A TANGENT *of an Arch*, is a right Line, raiſed perpendicularly on the Extreme of the Diameter, and continued to a Point, where it is cut by a *Secant*, that is by a Line, drawn from the Centre through the Extremity of the Arch whereof it is a *Tangent*.

Or thus; A *Tangent of an Arch* EA (Tab. Trigonometry Fig. 26) is a Part of a *Tangent* of a Circle (that is, of a right Line which touches a Circle without cutting it) intercepted between two right Lines, drawn from the Centre C, through the Extremes of the Arch E and A. See ARCH.

Hence, the *Tangent* FE is perpendicular to the Radius EC.

And hence the *Tangent* FE is the *Tangent of the Circle* ACE, as alſo of that ACI; ſo that Two adjacent Angles have only the ſame common *Tangent*.

Co-TANGENT, or TANGENT *of a Complement*, is the *Tangent* of an Arch which is the Complement of another Arch to a Quadrant. See COMPLEMENT.

Thus, a *Tangent* of the Arch AH, is the *Co-tangent* of the Arch AE, or the *Tangent* of the Complement of the Arch AE.

To find the Length of the TANGENT *of any Arch*; The Sine of the Arch being given: Suppoſe the Arch, AE;

the given Sine, A D; and the *Tangent* required, E F. Since both the Sine and *Tangent* are perpendicular to the Radius E C, they are parallel to each other. Wherefore, as the Cosine D C is to the Sine A D, so is the whole Sine, to the *Tangent* E F. See SINE.

Hence, a Canon of Sines being had; a *Canon of Tangents* is eaſily conſtructed therefrom. See CANON.

Artificial TANGENTS, are the Logarithms of the *Tangents* of Arches. See LOGARITHM.

Line of TANGENTS, is a Line uſually placed on the Sector and *Gunter's* Scale; the Deſcription and Uſes whereof, ſee under the Articles SECTOR and GUNTER'S *Scale*.

TANGENT *of a Conic Section*, as of a Parabola, or other algebraic Curve, is a right Line, drawn, cutting the Axis. See CURVE, CONIC, *&c.*

Method of TANGENTS, a Method of determining the Quantity of the *Tangent* of any algebraic Curve; the Equation defining that Curve, being given.

This Method is one of the great Reſults of the *Calculus Differentialis*. See DIFFERENTIAL.

Its Uſe is very great in Geometry; becauſe in determining the *Tangents* of Curves, we determine at the ſame Time, the Quadratures of the Curvilinear Spaces: on which account it well deſerves to be here particularly inſiſted on. See QUADRATURE.

To find the Sub-tangent *in any Algebraic Curve.*

Let the Semiordinate pm be infinitely near another P M (Tab. Analyſis Fig. 13) then will P p be the Differential of the Abſciſs; and letting fall the Perpendicular M R = P p; R m will be the Differential of the Semiordinate. Draw, therefore, the *Tangent* T M: The infinitely little Arch M m, will not differ from a Right Line; and therefore M m R will be a right-lined, right-angled Triangle, uſually call'd the *Characteriſtic Triangle of the Curve*, in regard Curve Lines are diſtinguiſh'd from each other hereby. See CHARACTERISTIC.

Now, by reaſon of the Paralleliſm of the Right Lines P M and pm; the Angle M m R = T M P. Wherefore the Triangle M m R is Similar to the Triangle T M P. Let, therefore A P = x, P M = y, then will P p = M R = dx, and R m = dy. Conſequently,

R m : M R :: P M : P T
dy : dx :: y : $\frac{ydx}{dy}$

If, then, from the given Equation of any Curve, you ſubſtitute the Value of dx to $ydx : dy$, in the general Expreſſion of the *Sub-tangent*, P T; the differential Quantities will vaniſh, and the Value of the *Sub-tangent* come out in common Quantities; whence the *Tangent* itſelf is eaſily determined. This we ſhall illuſtrate in a few Examples:

1° The Equation defining the common Parabola, is,

$$\frac{ax = y^2}{\frac{adx = 2ydy}{dx = 2ydy : a}}$$

Hence,

P T = $ydx : dy = 2y^2dy : ady = 2y^2 : a = 2ax : a = 2x$. That is, the *Sub-tangent* is double the Abſciſſe.

2° The Equation defining a Circle is,

$$\frac{\frac{ax - xx = yy}{adx - 2xdx = 2ydy}}{dx = 2ydy : (a - 2x)}$$

P T = $dx : ydy = 2y^2dy : (a - 2x)\,dy = 2y^2 : (a - 2x) = (2ax - 2xx) : (a - 2x) = (ax - xx) : (\frac{1}{2}a - x)$ that is, P C : P B :: A P : P T.

Therefore A T = $(ax - xx) : (\frac{1}{2}a - x) - x = (ax - xx - \frac{1}{2}ax + xx) : (\frac{1}{2}a - x) = \frac{1}{2}ax : (\frac{1}{2}a - x)$ that is, P C : P A :: C A : A T.

3° The Equation defining an Ellipſis, is;

$$\frac{ay^2 = abx - bx^2}{\frac{2aydy = abdx - 2bxdx}{2aydy : (ab - 2bx) = dx}}$$

Hence

P T = $ydx : dy = 2ay^2 : (ab - 2bx) = (2abx - 2bx^2) : (ab - 2bx) = (2ax - 2ax^2) : (a - 2x)$ that is, as the Diſtance of the Semiordinate from the Centre, is to the Half Axis, ſo is the Abſciſs to the Portion of the *Sub-tangent* intercepted between the Vertex of the Ellipſis and the *Tangent*.

Laſtly, for all Algebraic Curves, the Equation is,

$$\frac{\frac{\frac{ay^m + bx^n + cy^rx^s + df = 0}{may^{m-1}dy + nbx^{n-1}dx + scy^rx^{s-1}dx + rcy^{r-1}x^sdy = 0}}{nbx^{n-1}dx + scy^rx^{s-1}dx = -may^{m-1}dy - rcy^{r-1}x^sdy}}{dx = \frac{-may^{m-1}dy - rcy^{r-1}x^sdy}{nbx^{n-1} + scy^rx^{s-1}}}$$

$$\text{P T} = \frac{ydx}{dy} = \frac{-may^{m-1} - rcy^{r-1}x^s}{nbx^{n-1} + scy^rx^{s-1}}$$

Suppoſe, *e. gr.* $y^2 - ax = 0$; then, by comparing with the general Formula;

$$\frac{ay^m = y^2}{\frac{a = 1\ m = 2}{cy^rx^s = 0}} \qquad \frac{bx^n = -ax}{\frac{b = -a\ n = 1}{f = 0}}$$

$$c = 0\ r = 0\ s = 0$$

Theſe Values being ſubſtituted in the moſt general Formula of the *Sub-tangent*; we have the *Sub-tangent* of the Parabola of the firſt Kind, $(-2.1y^{2-1}.0.0y^0x^0) : (1 - ax1 - 1 + 0.0y^0x^0) = -2y^2 : a = 2y^2 : a$,

Suppoſe $y^3 - x^3\ axy = 0$, then will

$$\frac{ay^m = y^3\ bx^n = -x^3}{\frac{a = 1\ m = 3\ b = 1\ n = 3}{cyrx^s = -axy \qquad f = 0}}$$

$$c = -a\ r = 1\ \ s = 1$$

Theſe Values being ſubſtituted in the general Formula of the *Sub-tangent*; we have the *Sub-tangent* of the Curve, whoſe Equation is given, P T = $(-3.1y^3 - 1.-ayx) : (3.-1x^3 - 1 + 1.-ayx^{1-1}) = (-3y^3 + ayx) : (-3x^2 - ay) = (3y^3 - axy) : (3x + ay)$ Conſequently, A T = $(3y^3 - axy) : (3x^2 + ay) - x = (3y^3 - axy) - (3x^3 - axy) : (3x^2 + ay) = (3axy - 2axy) : 3x^2 + ay$. The Value of $y^3 - x^3$, that is, $axy : (3x^2 + ay)$ being ſubſtituted from the Equation to the Curve.

In the *Philoſophical Tranſactions*, we have the following Method of drawing *Tangents* to all Geometrical Curves, without any Labour, or Calculation, by M. *Sluſius*.

Suppoſe a Curve, as D Q (Fig. 14) whoſe Points are all referable to any Right Line given, as E A B, whether the Right Line be the Diameter or not; or whether there be more given Right Lines than one, provided their Powers do but come into the Equation. In all his Equations he puts v for the Line D A, y for B A; and for E B, and the other given Lines, he puts $b\,d$, *&c.* that is, always Conſonants.

Then, ſuppoſing D C to be drawn touching the Curve in D, and meeting with E B produced in C; he calls the ſought Line C A, by the Name of a.

To find which, he gives this general Method: 1. Reject out of the Equation all Members, which have not either v or y with them: Then put all thoſe that have y, on one Side; and all thoſe which have v, on the other; with their Signs + or −; and the latter, for Diſtinction and Eaſe ſake, he calls the Right, the former, the Left Side. 2. On the Right Side, let there be prefix'd to each Member, the Exponent of the Power, which v hath there; or, which is all one, let that Exponent be multiplied into all the Members. 3. Let the ſame be done alſo on the Left Side, multiplying each Member there by the Power of the Exponent of y. Adding this moreover, that one y muſt, in each Member, be always changed into a. This done, the Equation thus reform'd, will ſhew the Method of drawing the required *Tangent* to the Point D: For, that being given; as alſo y, v, and the other Quantities expreſſed by Conſonants, a cannot be unknown. Suppoſe an Equation $by - yy = vv$, in which E B is called b; B A = y, D A = v, and let a, or A C be required ſo as to find the Point C, from whence C D being drawn, ſhall be a true *Tangent* to that Curve Q D in D. In this Example, nothing is to be rejected out of the Equation, becauſe y or v are in each Member: It is alſo diſpoſed, as required by the Rule 1; to each Part therefore, there muſt be prefix'd the Exponent of the Powers of y or v, as in Rule 2; and on the Left Side, let one y be changed into a, and then the Equation will be in this Form, $ba - 2ya = 2vv$, which Equation reduced, gives eaſily the Value of $a = \frac{2vv}{b - 2y}$ = A C. And ſo the Point C is found, from whence the *Tangent* D C may be drawn.

To determine which Way the *Tangent* is to be drawn, whether towards B or E, he directs to conſider the Numerator and Denominator of the Fraction. For, 1. If in both Parts of the Fraction, all the Signs are Affirmative; or if the Affirmative ones are more in Number; then the *Tangent* is to run towards B. 2. If the Affirmative Quantities are greater than the Negative in the Numerator; but equal to them in the Denominator; the Right Line drawn through D, and touching the Curve in that Point, will be parallel to A B: For in this Caſe, a is of an infinite Length. 3. If in both Parts of the Fraction, the Affirmative Quantities, are leſs than the Negative, changing all the Signs, the *Tangent* muſt be drawn now alſo towards B: For this Caſe, after the Change, comes to be the ſame as the Firſt. 4. If the Affirmative Quantities are greater than the Negative in the Denominator; but in the Numerator are leſs; or *vice verſa*; then changing the Signs in that Part of the Fraction where they are leſs, the *Tangent* muſt be drawn a contrary Way; that

that is, A C muſt be taken towards E. 5. But whenever the Affirmative and Negative Quantities are equal in the Numerator, let them be how they will in the Denominator, a will vaniſh into nothing: And, conſequently, the *Tangent* is either A D itſelf, or E A, or parallel thereto; as will eaſily be found by the Data. This he gives plain Examples of, in reference to the Circle; thus: Let there be a Semicircle, whoſe Diameter is E B; in which there is given any Point; as D, (Fig. 15.) from which the Perpendicular D A is let fall to the Diameter. Let $DA=v$, $BA=y$, $BE=b$: Then the Equation will be $by-yy=vv$, and drawing the *Tangent* D C, A C, or $a=\frac{2vv}{b-2y}$. Now, if b be greater than $2y$, the *Tangent* muſt be drawn towards B; if leſs, towards E; if it be equal to it, it will be parallel to E B, as was ſaid in the firſt, ſecond and fourth Rules.

Let there be another Semi-circle inverted; as N D D, (Fig. 16.) the Points of whoſe Periphery, are referr'd to the Right Line B B, parallel and = to the Diameter. Let N B be called d; and all Things elſe as before; then the Equation will be $by-yy=dd+vv-2dv$; which being managed according to his Rules, you have $a=\frac{2vv-2dv}{b-2y}$. Now ſince v here is ſuppoſed to be always leſs than d; if b be greater than $2y$, then the *Tangent* muſt be drawn towards E; if equal, it will be parallel to B B; if leſs, changing all the Sines, the *Tangent* muſt be drawn towards B, as by Rules Fourth, Fifth and Third. But there could be no *Tangent* drawn, or at leaſt, E B would be it, if N B had been taken equal to the Diameter. Let there be another Semicircle, whoſe Diameter N B, (Fig. 17.) is perpendicular to E B, and to which its Points are ſuppoſed to be referr'd. Let N B be called B, and all Things elſe as above; the Equation will be $yy=bv-vv$, and $a=\frac{bv-2vv}{2y}$. If, now, b be greater than $2v$, the *Tangent* muſt be drawn towards B, if leſſer, towards E, if equal, D A will be the Tangent, as by Rules 1, 4 and 5, appears.

Inverſe Method of TANGENTS, is a Method of finding the Equation, or the Conſtruction, of any Curve; from the *Tangent* or any other Line whoſe Determination depends on the *Tangent*, given.

This Method is one of the great Reſults of the New *Calculus Integralis*. See CALCULUS.

Its Application we ſhall give in what follows.

The differential Expreſſions of the *Tangent*, *Sub-tangent*, &c. being delivered under the laſt Article: If you make the given Value equal to the differential Expreſſion, and either ſum up the differential Equation, or, if that can't be, conſtruct it, the Curve required, is had. For Example:

1° *To find the Curve Line, whoſe* Sub-tangent $= 2yy:a$

Since the *Sub-tangent* of an algebraic Line is $=ydx$, we have

$$\frac{ydx:dy=2yy:a}{aydx=2y^2dy}$$
$$\frac{adx=2ydy}{ax=y^2}$$

The Curve ſought, therefore, is a Parabola; whoſe Conſtruction is ſhewn under the Article PARABOLA.

2° *To find the Curve, whoſe* Sub-tangent *is a Third Proportional to* $r-x$ *and* y.

Since $r-x:y=y:\frac{ydx}{dy}$

We have
$$\frac{r-x:y=dy:dx}{rdx-xdx=ydy}$$
$$\frac{rx-2^1x^2=2^1y^2}{2rx-xx=y^2}$$

The Curve ſought therefore, is a Circle.

3° *To find the Line wherein the* Sub-tangent *is equal to the Semiordinate.*

Since,
$$\frac{ydx:dy=y}{ydx=ydy}$$
$$\frac{dx=dy}{x=y}$$

Hence it appears, that the Line ſought, is a right Line, that referrs to the Cathetus of an Equicrural Triangle, as to an Axis or the Hypothenuſe of an Equicrural, rectangled Triangle. If x had been taken for the Arch of a Circle, the ſought Line had been a Cycloid. See CYCLOID.

TANGIBLE. See TACTILE.

TANISTRY, or TANISTRI, in our ancient Cuſtoms, an Heir preſumptive, or ſecond Poſſeſſor. See HEIR, &c.

Hence the Law, or Tenure, *Taniſtry*, or *Taniſtria*, an ancient municipal Law, or Tenure of *England*, which allotted the Inheritance of Lands, Caſtles, &c. held by this Tenure, to the oldeſt and moſt worthy and capable Perſon of the Deceaſed's Name and Blood; without any Regard to Proximity.

This, in reality, was giving it to the ſtrongeſt; which naturally occaſion'd bloody Wars in Families: for which Reaſon it was aboliſh'd under K. *James* I. Sir *John Davis* deſcribes it thus; *Quant aſcun Perſon moruſt ſeiſie des Aſcuns Caſtles, Manors, Terres ou Tenements del* Nature & Tenure de Taniſtry; *que donques meſme les Caſtles*, &c. *doent deſcender, & de temps dont Memory ne Court ont uſe de deſcender* Seniori & digniſſimo Viro Sanguinis & Cognominis *de tiel Perſon*, &c. The Word is ſuppos'd form'd from *Thanis*.

TANNING, the preparing of Skins or Hides in a Pit, with *Tan* and Water, after having firſt taken off the Hair, by ſteeping them in Lime Water. See TAN and LEATHER.

Method of TANNING *Cows, Calves, and Horſes Hides.*

The Skin being ſtead off the Carcaſs, if 'tis intended to be kept, 'tis ſalted with Sea Salt and Alum, or with a kind of Saltpetre, call'd *Natron*; if 'tis not for keeping, the Salting is ſav'd, as being of no uſe, but to prevent the Hide from corrupting e'er it can be conveniently carry'd to the *Tan-houſe*.

Whether the Hide have been ſalted or not, the *Tanner* begins with taking off the Horns, the Ears, and the Tail; after which 'tis thrown into a running Water for about 30 Hours, to waſh off the Blood, and other Impurities adhering to the Inſide.

This done, 'tis laid over Night in a Lime Pit, already uſed; whence it is taken, and left to drain three or four Days on the Edge of the Pit.

This firſt and ſlighteſt Preparation over, it is return'd into a ſtrong Lime-Pit for two Days; then taken out for four more; and thus for ſix Weeks alternately, taken out and put in, twice a Week.

At the ſix Weeks End, it is put into a freſh Pit, where it continues eight Days, and is taken out for ſo many; and this alternately for a Year or eighteen Months, according to the Strength of the Leather, or the Weather: for in great Heats, they put in freſh Lime twice a Week; and in Froſt they ſometimes don't touch them for three Months. Every freſh Lime-Pit they throw them into, is ſtronger and ſtronger.

At four, five, or ſix Weeks end, the *Tanner* ſcrapes off the Hair, on a Wooden Leg, or Horſe, with a kind of Kniſe for that Purpoſe. And after a Year or eighteen Months, when the Hair is perfectly gone, he carries it to a River to waſh, pares off the Fleſh on the Leg, with a kind of cutting Knife, and rubs it briskly with a kind of Whet-ſtone, to take off any Remains of Fleſh or Filth on the Side of the Hair.

The Skin is now put into *Tan*; that is, cover'd over with *Tan*, as 'tis ſtretch'd in the Pit, and Water let in upon it: If the Skin be ſtrong, five Coverings of *Tan* will be requir'd; for weaker, three or four may ſuffice. When the Skin has not been kept long enough in Lime, or the *Tan*-Pit; upon cleaving it, in the Middle is ſeen a whitiſh Streak, call'd the Horn, or Crudity of the Skin; and 'tis this is the Reaſon why the Soals of Shoes, Boots, &c. ſtretch ſo eaſily, and take Water.

When the Hides are ſufficiently *tann'd*, they are taken out of the Pit, to be dry'd, by hanging in the Air: Then the *Tan* is clean'd off them, and they are put in a Place neither too dry, nor too moiſt; they are well ſtretch'd over one another, with Weights a-top, to keep them tight and ſtraight; and in this Condition are ſold, under the Denomination of *Bend Leather*. This is the Method of *tanning* Bullocks or Oxes Hides.

Cows, Calves, and Horſes Skins are *tann'd* much after the ſame Manner as thoſe of Oxen, except that the former are only kept four Months, in the Lime-Pit; and that before they be put in the *Tan*, there is a Preparation requir'd, thus: Cold Water is pour'd into a Wooden Fat or Tub, wherein the Skins are put, which are kept ſtirring while ſome other Water is warming in a Kettle; and as ſoon as that Water is a little more than lukewarm, 'tis pour'd gently into the Fat, and upon this is caſt a Basket of *Tan*; during which Time, the Skins are ſtill kept turning, that the Water and *Tan* mayn't burn them.

After an Hour, they are taken out, and caſt for a Day in cold Water, then return'd into the former Fat, and the

ſame Water they had been in before; and here they are left eight Days; which expir'd, they are put in the *Tan*-Pit, and three Coverings of *Tan* given them, the firſt of which laſts five Weeks, the 2d ſix, and the 3d two Months.

The reſt of the Proceſs is in all reſpects the ſame as that above deliver'd. In ſome Countries, as in *Champagne*, &c. the *Tanners* give the firſt Preparation with Barley inſtead of Lime.

TANTAMOUNT, (of the *French tant* and *Montant*, or *Monter*,) ſomething that amounts to, or is equivalent to ſo much.

TAP, among Hunters: A Hair is ſaid to *tap*, or beat, when ſhe makes a Noiſe.

TAPASSANT, denotes *lurking* or *ſquatting*, and is a Term us'd in Hunting: Hence, to *tappy*, is to be hid, as a Deer may be.

TAPER, *Tapering*, is underſtood of a Piece of Timber, or the like, when broad beneath, and ſharp towards the Top; as is the Caſe in Pyramids, Cones, &c. See PYRAMID.

To meaſure *taper* Timber, &c. See TIMBER, SLIDING-*Rule*, &c.

TAPER-*bored*, is apply'd to a Piece of Ordnance, when it is wider at the Mouth than towards the Breech. See ORDNANCE.

TAPER, a kind of tall waxen Candle, placed in a Candleſtick, and burnt at Funeral Proceſſions, and in other Church Solemnities. See CANDLE.

They are made of different Sizes: In ſome Places, as *Italy*, &c. they are Cylindrical; but in moſt other Countries, as *England*, *France*, &c. they are Conical, or *taper*, whence the Name.

Both Kinds are pierced at Bottom, for a Pin in the Candleſtick to enter.

The Uſe of Lights in religious Ceremonies, is of a long ſtanding: The Ancients, we know, uſed Flambeaux in their Sacrifices, and particularly in the Myſteries of *Ceres*; and they had *Tapers* placed before the Statues of their Gods.

Some ſuppoſe, that it was in Imitation of this Heathen Ceremony, that Lights were firſt introduc'd into the Chriſtian Church; others take it, that the Chriſtians borrow'd the Practice from the *Jews*: But Recourſe need not be had to the one or the other.

Doubtleſs, as in the firſt Days of Chriſtianity they had their Meetings in obſcure ſubterraneous Vaults, there was a Neceſſity for *Tapers*, &c. and there was even Occaſion for them after they had the Liberty of building Churches; thoſe being contriv'd in ſuch Manner, as only to receive very little Light, that they might inſpire the greater Awe and Reſpect by the Obſcurity.

This Original of *Tapers* in Churches is the moſt natural; but 'tis now a long Time ſince the Uſe of *Tapers*, which Neceſſity at firſt introduc'd, is become a mere Ceremony. S. *Paulinus*, who liv'd at the Beginning of the Vth Century, obſerves, that the Chriſtians of his Days were ſo fond of *Tapers*, that they even painted them in their Churches. See LUMINARY.

Manner of making TAPERS.

There are two ways of making *Tapers*: The firſt with the *Ladle*, the ſecond by *Hand*.

In the firſt, after the Wicks (which are uſually half Cotton half Flax) have been well twiſted, and cut of the due Length; a Dozen of them are hung, at equal Diſtances, around an Iron Hoop, directly over a large Copper Baſon full of melted Wax.

Then taking an Iron Ladle-full of the Wax, they pour it gently over the Wicks, a little below the Tops thereof, one after another; ſo that the Wax running down them, they become quite cover'd therewith, and the Surplus returns into the Baſon, under which is a Pan of Coals to keep it in Fuſion.

Thus they continue to caſt on more and more Wax for ten or twelve times, till the *Tapers* be brought to the requir'd Dimenſions. The firſt Caſt only ſoaks the Wick, the ſecond begins to cover it, and the reſt give it the Form and Thickneſs; in order to which, they take Care that every Caſt, after the fourth, be made lower and lower below the Wicks, to make them *taper*.

The *Tapers* thus form'd, are laid, while yet hot, one againſt another, in a Feather Bed, folded double to preſerve them ſoft; and taken out thence, one after another, to be rolled on a long ſmooth Table, with an oblong Inſtrument of Box, poliſh'd at Bottom, and furniſh'd with a Handle above.

The *Taper* thus roll'd and poliſh'd, a Piece of its big End is cut off, and a Conical Hole bored therein, with a Boxen Inſtrument, into which the Pin, or Point of the Candleſtick is to be receiv'd.

While the Broach is yet in the Hole, they uſe to ſtamp the Maker's Name, and the Weight of the *Taper*, with a Boxen Ruler, whereon the Characters are cut. The *Taper* is then hung up to dry and harden; after which it is fit for Uſe.

Making of TAPERS *by Hand.*

The Wicks being diſpos'd, as in the former Manner; they begin to ſoften the Wax by working it in hot Water, in a narrow, deep Copper Veſſel. They then take a Quantity of this Wax out with the Hand, and lay it gradually on the Wick, which is faſten'd to a Hook in the Wall by the End oppoſite to the Wick; ſo that they begin to form the *Taper* by the big End; and proceed, ſtill leſſening the Thickneſs, to the Neck or Collet.

The reſt is perform'd after the ſame Manner as in *Tapers* made with the Ladle, except that they don't lay them in the Feather-Bed, but roll them on the Table as faſt as form'd.

Two Things there are to be obſerv'd in the two Kinds of *Tapers*: The firſt, that in the whole Proceſs of *Tapers* with the Ladle, they uſe Water to moiſten the Table, and other Inſtruments uſed therein, that the Wax may not ſtick; and that in the other, they uſe Oil of Olives or Lard for the ſame End.

Paſchal TAPER, among the *Romaniſts*, is a large *Taper*, whereon the Deacon applies five Grains of Frankincenſe, in Holes made for the Purpoſe, in Form of a Croſs; and which he lights with new Fire in the Ceremony of *Eaſter* Saturday.

The Pontifical makes Pope *Zoſimus* the Author thereof; but *Baronius* will have the Uſage more ancient, and quotes a Hymn of *Prudentius* to prove it.

The Pope he ſuppoſes to have only eſtabliſh'd the Uſe thereof in Pariſh Churches; which, till that Time, had been reſtrain'd to the greater Churches. F. *Papebroch* explains the Origin of the Paſchal Torch more diſtinctly in his *Conatus Chronico Hiſtoricus*, &c. It ſeems, tho' the Council of *Nice* regulated the Day whereon *Eaſter* was to be celebrated, it laid it on the Patriarch of *Alexandria* to make a yearly Canon thereof, and to ſend it to the Pope. As all the other moveable Feaſts were to be regulated on that of *Eaſter*, a Catalogue of them was made every Year, and wrote on a *Taper*, *Cereus*, which was bleſs'd in the Church with much Solemnity.

This *Taper*, according to the Abbot *Chaſtelain*, was not a Wax Candle, made to be burnt: It had no Wick; nor was it any thing more than a kind of Column of Wax, made on purpoſe to write the Liſt of moveable Feaſts on, and which would ſuffice to hold it for the Space of a Year.

For among the Ancients, when any thing was to be wrote to laſt for ever, they engrav'd it on Marble or Steel; when it was to laſt a long while, they wrote it on *Ægyptian* Paper; and when it was only to laſt a ſhort Time, they contented themſelves to write it on Wax.

In Proceſs of Time, they came to write the Liſt of moveable Feaſts on Paper, but they ſtill faſten'd it to the Paſchal *Taper*; which Practice is obſerv'd to this Day at *Notre Dame* in *Rouen*, and throughout the Order of *China*.

Such is the Original of the Benediction of the *Paſchal Taper*.

TAPESTRY, or TAPISTRY, a curious Kind of Manufacture, ſerving to adorn a Chamber, or other Apartment, by hanging, or covering the Walls thereof. See HANGING.

Some uſe *Tapeſtry* as a general Name for all Kinds of *Hangings*, whether wove, or wrought with the Needle, and whether Silken, Woollen, Linnen, Leather, or Paper; (in which they are countenanc'd by the Etymology of the Word, form'd from the *French Tapiſſer*, to line, of the *Latin Tapes*, a Cover of a Bed, &c.) But in the common Uſe of our Language, the Term is now appropriated to a Kind of woven Hangings, of Wooll and Silk, frequently rais'd, and enrich'd with Gold and Silver, repreſenting Figures of Men, Animals, Landskips, &c.

The Invention of *Tapeſtry* ſeems to have come from the *Levant*; and what makes this the more probable is, that formerly the Workmen concern'd herein, were call'd, at leaſt in *France*, *Sarrazins*, or *Sarraſinois*.

'Tis ſuppos'd that the *Engliſh* and *Flemiſh*, who were the firſt that excell'd therein, might bring the Art with them from ſome of the Croiſades, or Expeditions againſt the *Sarazens*. See CROISADE.

Be this as it will, tis certain thoſe two Nations, particularly the *Engliſh*, were the firſt who ſet on Foot this noble and rich Manufacture in *Europe*; now one of the fineſt Ornaments of Palaces, Baſilicks, Churches, &c.

Hence, if they ben't allow'd the Inventors, they have, at leaſt, the Glory of being the Reſtorers of ſo curious and admirable an Art, as gives a kind of Life to Woolls and Silks, in no Reſpect inferior to the Paintings of the beſt Maſters.

'Twas

'Twas late e'er the *French* apply'd themſelves to *Tapiſtry*: The firſt Eſtabliſhment of that Kind, was under *Henry* IV. in the Year 1607, in the *Fauxbourg*, *S. Michael*. But this fell with the Death of that Prince. Under *Lewis* XIV. the Manufacture was retriev'd by the Care and Addreſs of the great M. *Colbert*, to whom the Eſtabliſhment of the Gobelins is owing, a Royal *Tapiſtry* Manufacture, which has produc'd Works in this Kind, ſcarce inferior to the fineſt *Engliſh* or *Flemiſh Tapiſtry*, either with regard to the Deſigns, the Colours, or the Firmneſs. See GOBELIN.

The *Tapiſtry-men* diſtinguiſh two Kinds of Work, *viz.* *Tapiſtry* of the *high* and *low Warp*; tho' the Difference is rather in the Manner of working, than in the Work itſelf, which is, in effect, the ſame in both; only the Looms, and conſequently the Warps, are differently ſituate: Thoſe of the *low Warp* being placed flat, and parallel to the Horizon; and thoſe, on the contrary, of the *high Warp*, erected perpendicularly.

The *Engliſh* anciently excell'd all the World in their *Tapiſtry of the high Warp*; and they ſtill retain their former Reputation, tho' with ſome little Change: Their *low Warps* are ſtill admir'd; but as for the *high ones*, they are quite laid aſide in our Nation. See COMMERCE, WOOLLEN *Manufacture*, &c.

The *French* have three conſiderable *Tapiſtry* Manufactures beſides that of the Gobelins; the firſt at *Aubuſſon* in *Auvergne*, the ſecond at *Felletin* in the *Upper Marche*, and the third at *Beauvois*: They were all equally eſtabliſh'd for the high and the low Warp, but have all laid aſide the former, excepting the Gobelins.

There are admirable low Warps in *Flanders*, generally exceeding thoſe of *France*; the chief, and almoſt only *Flemiſh* Manufactories, are at *Bruſſels*, *Antwerp*, *Oudenard*, *Liſle*, *Tournay*, *Bruges*, and *Valenciennes*.

At *Bruſſels* and *Antwerp* they ſucceed both in human Figures, in Animals, and Landskips; and that both with regard to the Deſigns and the Workmanſhip. At *Oudenard* their Landskips and Animals are good, but their human Figures naught. *Liſle*, and the other Cities nam'd, come behind *Oudenard*. The *French* Manufacture of *Felletin* does tolerably well in Landskips, *Aubuſſon* in Figures, and *Beauvois* in both.

The uſual Widths of *Tapiſtries*, are from two Ells to three Ells and half, *Paris* Meaſure.

The Manufacture of *Tapiſtry* of each Kind, is too curious to be here paſs'd over, without a ſhort Deſcription. We ſhall give each under its ſeparate Article.

Manufacture of TAPISTRY *of the high Warp.*

The Loom whereon tis wrought, is placed perpendicularly: It conſiſts of four principal Pieces; two long Planks or Cheeks of Wood, and two thick Rollers or Beams. The Planks are ſet upright, and the Beams acroſs them, one atop, and t'other at Bottom, a Foot's Diſtance from the Ground. They have each their Trunnions, by which they are ſuſpended on the Planks, and are turn'd with Bars. In each Roller is a Groove, from one End to t'other, capable of containing a long round Piece of Wood, faſten'd therein with Hooks. Its Uſe is to tye the Ends of the Warp to. The Warp, which is a kind of worſted, or twiſted Woollen Thread, is wound on the upper Roller; and the Work, as faſt as wove, is wound on the lower.

Within-ſide the Planks, which are ſeven or eight Foot high, fourteen or fifteen Inches broad, and three or four thick, are Holes pierc'd, from Top to Bottom, in which are put thick Pieces of Iron, with Hooks at one End, ſerving to ſuſtain the Coat-ſtave: Theſe Pieces of Iron have alſo Holes pierced; by putting a Pin in which, the Stave is drawn nearer, or ſet further off; and thus the Coats, or Threads, are ſtretch'd or looſen'd at Pleaſure.

The Coat-ſtave is about three Inches Diameter, and runs all the Length of the Loom: On this are fix'd the Coats, or Threads, which make the Threads of the Warp croſs each other. It has much the ſame Effect here, as the Spring-ſtave and Treddles have in the common Looms. The Coats are little Threads faſten'd to each Thread of the Warp, with a kind of ſliding Knot, which forms a Sort of Maſh, or Ring. They ſerve to keep the Warp open, for the Paſſage of Broaches wound with Silks, Woollens, or other Matters uſed in the Piece of *Tapiſtry*.

Laſtly, there are a Number of little Sticks, of different Lengths, but all about an Inch Diameter, which the Workman keeps by him in Baskets, to ſerve to make the Threads of the Warp croſs each other, by paſſing them acroſs: And that the Threads thus croſs'd may retain their proper Situation, a Packthread is run among the Threads, above the Stick.

The Loom thus form'd, and mounted with its Warp, the firſt Thing the Workman does, is to draw, on the Threads of this Warp, the principal Lines and Strokes of the Deſign to be repreſented on the Piece of *Tapiſtry*, which is done by applying Cartoons made from the Painting he intends to copy, to the Side that is to be the wrong Side of the Piece; and then with a Black-lead Pencil following and tracing out the Contours thereof on the Thread of the right Side; ſo that the Strokes appear equally both before and behind. As to the original Deſign the Work is to be finiſh'd by, tis hung up behind the Workman, and wound on a long Staff; from which a Piece is unroll'd from Time to Time, as the Work proceeds.

Beſides the Loom, *&c.* here deſcribed; there are Three other principal Inſtruments required for the working the Silk, or Wooll of the Woof within the Threads of the Warp. Theſe are a Broach, a Reed, and an Iron Needle.

The Broach is of hard Wood, 7 or 8 Inches long, and two Thirds of an Inch thick, ending in a Point with a little Handle. It ſerves as a Shuttle, the Silks, Woollens, Gold or Silver to be uſed in the Work, being wound on it. The Reed or Comb is alſo of Wood, Eight or Nine Inches long, and an Inch thick at the Back; whence it uſually grows leſs and leſs, to the Extremity of the Teeth, which are more or leſs apart, according to the greater or leſs Degree of Fineneſs of the intended Work. Laſtly, the Needle is in Form of the common Needle, only bigger and longer. Its Uſe is to preſs cloſe the Wooll and Silks, when there is any Line or Colour that does not ſit well.

All Things being prepared for the Work; and the Workman ready to begin, he places himſelf on the wrong Side the Piece, with his Back towards the Deſign; ſo that he works, as it were, blind-fold, ſeeing nothing of what he does, and being obliged to quit his Poſt, and go to the other Side the Loom, whenever he would view and examine the Piece, to correct it with his Preſſing Needle.

To put any Silk, *&c.* in the Warp, he firſt turns, and looks at his Deſign: Then taking a Broach full of the proper Colour, he places it among the Threads of the Warp, which he brings acroſs each other with his Fingers, by means of the Coats or Threads faſten'd to the Staff: This he repeats every time he is to change his Colour.

The Silk or Wooll being placed, he beats it with his Reed or Comb; and when he has thus wrought in ſeveral Rows over each other, he goes to ſee the Effect they have; in order to reform the Contours with his Needle, if there be occaſion.

As the Work advances, they roll it up on the lower Beam, and unroll as much Warp from the upper Beam, as ſuffices them to continue the Piece: The like they do to the Deſign behind them.

When the Pieces are wide, ſeveral Workmen may be employ'd at once.

We have but two Things to add: The firſt, that this *high Warp Tapiſtry* goes on much more ſlowly than the *low Warp*, and takes almoſt double the Time and Trouble. The ſecond, that all the Difference the Eye can obſerve between the two Kinds, conſiſts in this, that in the low Warp there is a red Fillet, about one Twelfth of an Inch broad, running on each Side, from Top to Bottom; which is wanting in the high Warp.

Manufacture of TAPISTRY *of the low Warp.*

The Loom or Frame wherein the low Warp is wrought, is much like that of the Weavers: The principal Parts thereof are two ſtrong Pieces of Wood forming the Sides of the Loom, and bearing a Beam or Roller at each End: They are ſuſtain'd at Bottom with other ſtrong Pieces of Wood in Manner of Treſtles; and, to keep them the firmer, are likewiſe faſten'd to the Floor with a kind of Buttreſſes, which prevent any ſhaking, tho' there are ſometimes four or five Workmen leaning on the fore Beam at once.

The Rollers have each their Trunnions, by which they are ſuſtain'd: They are turn'd by large Iron Pins, three Foot long. Along each Beam runs a Groove, wherein is placed the *Wich*, a Piece of Wood of above two Inches Diameter, and almoſt the Length of the Roller: This Piece fills the Groove entirely, and is faſten'd therein, from Space to Space, by wooden Pins. To the two Wiches are faſten'd the two Extremities of the Warp, which is wound on the further Roller; and the Work, as it advances, on the nearer.

A-croſs the two Sides, almoſt in the Middle of the Loom, paſſes a wooden Bar, which ſuſtains little Pieces of Wood, not unlike the Beam of a Balance: To theſe Pieces are faſten'd Strings, which bear certain Spring-ſtaves, wherewith the Workman, by means of two Treadles under the Loom whereon he ſets his Feet, gives a Motion to the Coats, and makes the Threads of the Warp riſe and fall alternately. Each Loom has more or fewer of theſe Spring-ſtaves, and each Stave more or fewer Coats, as the *Tapiſtry* conſiſts of more or fewer Threads. See LOOM.

The Deſign or Painting the *Tapiſtry-man* is to follow, is placed underneath the Warp; where it is ſuſtain'd from Space to Space with Strings, by which the Deſign is brought nearer the Warp.

The Loom being mounted, there are two Inſtruments uſed in working of it, *viz.* the Reed and the Flute. The Flute does the Office of the Weavers Shuttle: 'Tis made of a hard, poliſh'd Wood, three or four Lines thick at the Ends, and ſomewhat more in the Middle, and three or four Inches long. On it are wound the Silks, or other Matters to be uſed as the Woof of the *Tapiſtry*. The Comb or Reed is of Wood, or Ivory; it has uſually Teeth on both Sides; 'tis about an Inch thick in the Middle, but diminiſhes each Way to the Extremity of the Teeth: It ſerves to beat the Threads of the Woof cloſe to each other, as faſt as the Workman has paſs'd and placed them with his Flute among the Threads of the Warp.

The Workman is ſeated on a Bench before the Loom, with his Breaſt againſt the Beam, only a Cuſhion or Pillow between them; and in this Poſture, ſeparating, with his Fingers, the Threads of the Warp, that he may ſee the Deſign underneath, and taking a Flute, wound with the proper Colour, he paſſes it among the Threads; after having rais'd or lower'd them, by means of the Treadles moving the Spring-ſtaves and Coats.

Laſtly, to preſs and cloſe the Threads of the Silk or Yarn, *&c.* thus placed, he ſtrikes each Courſe (*i. e.* what the Flute leaves in its paſſing and coming back again) with the Reed.

What is very remarkable in the Manufacture of the low Warp, and which is common to it with the high, is, that 'tis all wrought on the wrong Side; ſo that the Workman cannot ſee the right Side of his *Tapiſtry*, till the Piece be finiſh'd and taken off the Loom.

TAPPING, the Act of piercing a Hole in a Veſſel, and applying a Tube or Cannula in the Aperture, for the commodious drawing off the Liquors contain'd therein.

TAPPING, in Agriculture, is the making an Inciſion in the Bark of a Tree, and letting out the Juice. See BARK.

To *Tap* a Tree at the Root, is to open it round about the Root.

Ratray, the learned *Scot*, affirms, that he has found by Experiment, that the Liquor which may be drawn from the Birch in the Spring-time, is equal to the whole Weight of the Tree, Branches, Roots and all together.

In the *Tapping* of Trees, the Juice certainly aſcends from the Root, and after it is Concocted and Aſſimulated in the Branches, *&c.* deſcends like a Liquor in an Alembic, to the Orifice or Inciſion where it iſſues out.

One of the moſt effectual Ways of *Tapping*, ſo as to obtain the greateſt Store of Sap in the ſhorteſt Time, is, not only to pierce the Bark, nor yet to cut the Body of the Tree almoſt to the Pith, with a Chiſſel (as ſome have directed) but quite through all the Circles, and the inner Rind itſelf, on both Sides the Pith; leaving only the Outermoſt Circle, and the Bark on the North-Eaſt Side unpierced.

But this Hole is to be bored ſloping upwards, as large as the largeſt Augre you can get, will make; and that alſo through and under a large Arm, near the Ground. So will it not need any Stone to keep open the Orifice, nor Tap to direct the Sap into the Receiver.

This Way, the Tree will, in ſhort Time, afford Liquor enough to Brew withal; and with ſome of this ſweet Sap, one Buſhel of Malt, will make as good Ale as Four Buſhels of Malt with ordinary Water. Sycamore I take to yield the beſt brewing Sap, being very ſweet and wholeſome.

To preſerve the Sap for Brewing.

Inſolate it by a conſtant Expoſure to the Sun in Glaſſes or other Veſſels, till the reſt be gather'd and ready; otherwiſe it will contract an Acidity: when you have enough, put into it as much very thin cut, and hard toaſted Rye-bread, as will ſerve to ferment it; and when it works, take out the Bread, and bottle up the Liquor. A few Cloves in each Veſſel that receives the Sap, as it oozes from the Tree, will certainly preſerve it a Twelve-month. Dr. *Tonge* in the *Philoſophical Tranſactions.*

TAPPING, in Chirurgery. See PARENTHESIS, DROPSY, *&c.*

TAPPING, in Heraldry. See BEATING.

TAR, a groſs, fatty Liquor, iſſuing from the Trunks of old Pines.

When theſe Trees are on the Return, and only fit for burning, they cut off the Bark all around towards the Root, and through theſe Inciſions, there continues flowing, for a conſiderable Time, a blackiſh Liquor, which is the *Tar*. When this ceaſes, 'tis a ſure Indication the Pine is quite dead, and only fit for the Fire.

The chief Uſe of *Tar*, is for the Coating and Caulking of Ships. See CAULKING, *&c.*

Of *Tar*, boil'd to a ſufficient Conſiſtence, Pitch is made. See PITCH.

TARANTISMUS, in Medicine, the Diſeaſe or Affection of thoſe bit by the *Tarantula*. See TARANTULA.

Dr. *Cornelio*, in the *Philoſophical Tranſactions* repreſents this as an imaginary Diſeaſe; and tells us, that all thoſe who think themſelves ſeized with it (excepting ſuch as for particular Ends feign themſelves ſo) are moſt of them young wanton Girls, whom the *Italian* Writers call *Donne di ſale*, who falling, from ſome particular Indiſpoſition, into a melancholy Madneſs, perſuade themſelves, according to the vulgar Prejudice, that they have been ſtung by a Tarantula.

But the Evidence on the other Side the Queſtion, is too ſtrong to be thus overturned; as will appear from the following Article.

TARANTULA, or TARENTULA, in Natural Hiſtory, a venomous Inſect, whoſe Bite gives Name to a new Diſeaſe. See TARANTISMUS.

The *Tarentula* is a kind of Spider, denominated from the City *Tarentum*, in *Apulia*, where it is chiefly found: 'Tis about the Size of an Acorn; and is furniſh'd with eight Feet, and as many Eyes; its Colour various; but it is ſtill hairy: From its Mouth ariſe two Sorts of Horns, or Trunks, made a little hooked, with the Tips exceedingly ſharp; thro' which it conveys its Poiſon.

Theſe Horns, M. *Geoffroy* obſerves, are in continual Motion, eſpecially when the Animal is ſeeking for Food; whence he conjectures they may be a kind of moveable Noſtrils.

The *Tarantula* is found in ſeveral other Parts of *Italy*, and even in the Iſle of *Corſica*; but thoſe of *Apulia* alone are dangerous: Even theſe, when remov'd thence, are ſaid to become harmleſs: 'Tis added, that even in *Apulia*, none but thoſe found on the Plains are much to be fear'd; the Air being hotter there, than on the Mountains.

M. *Geoffroy* adds it as an Opinion of ſome, that the *Tarantula* is never venomous but in the coupling Seaſon; and *Baglivi*, that 'tis never ſo, but in the Heat of Summer, particularly in the Dog-Days, when, becoming enrag'd, it flies on all that paſs by.

The Bite occaſions a Pain, which at firſt appears much like that felt on the Stinging of a Bee, or an Ant: In a few Hours, the Patient feels a kind of Numbneſs; and the Part affected becomes mark'd with a little livid Circle, which ſoon after riſes into a very painful Tumour: A little longer, and he falls into a profound Sadneſs, breathes with much Difficulty, his Pulſe grows feeble, his Sight fails; at length he loſes all Senſe and Motion, and dies, unleſs reliev'd. But theſe Symptoms come ſomewhat differently, according to the Nature of the *Tarantulæ*, and the Diſpoſition of the Patient. An Averſion for Black and Blue; and, on the contrary, an Affection for White, Red, and Green, are other unaccountable Symptoms of this Diſeaſe.

All the Aſſiſtance Medicine has been able to diſcover by Reaſoning, conſiſts in ſome chirurgical Applications on the Wound, in Cordials and Sudorificks; but theſe are of little Efficacy: A Thing that avails infinitely more, is, what Reaſon could never have thought of, Muſic. See MUSIC.

As ſoon as the Patient has loſt his Senſe, and Motion, a Muſician tries ſeveral Tunes on an Inſtrument; and when he has hit on that, the Tones and Modulation whereof agree to the Patient, he is immediately ſeen to make a faint Motion: His Fingers firſt begin to move in Cadence, then his Arms, then his Legs; by Degrees his whole Body: at length he riſes on his Feet, and begins to dance; his Strength and Activity ſtill increaſing. Some will continue the Dance for ſix Hours without Intermiſſion

After this, he is put to Bed; and when he is judg'd ſufficiently recruited of his firſt Dance, he is call'd out of Bed, by the ſame Tune, for a Second.

This Exerciſe is continu'd for ſeveral Days, ſix or ſeven at moſt; in which time the Patient finds himſelf exceedingly fatigu'd, and unable to dance any longer; which is the Characteriſtic of his being cured: For as long as the Poiſon acts on him, he would dance, if one pleas'd, without any Diſcontinuation, till he died of the mere Loſs of Strength.

The Patient perceiving himſelf weary, begins to come to himſelf; and awakes, as out of a profound Sleep, without any Remembrance of what had paſs'd in his Paroxyſm, not even of his Dance.

Sometimes the Patient, thus recovering from his firſt Acceſs, is quite cured; if he ben't, he finds a melancholy Gloom hanging on him; he ſhuns the Sight of Men, and ſeeks Water; and if he ben't carefully look'd to, throws himſelf into ſome River. If he don't die, the Fit returns at that Time Twelvemonth, and he is driven to dancing again. Some have had theſe Returns regularly for 20 or 30 Years.

Every *Tarantatus*, or Patient in this Diſeaſe, has his particular and ſpecific Tune; but, in the general, they are all very briſk, ſprightly Tunes. See TUNE.

This Account was given into the Royal Academy of Sciences, by M. *Geoffroy*, at his Return from *Italy*, in 1702; and confirm'd by Letters from F. *Gouye*. The like Hiſtory

is given us by *Baglivi*, in an expreſs Diſſertation on the *Tarantula*, publiſh'd in 1696.

To ſuch extraordinary Facts, 'tis no Wonder a few Fables ſhould be added; as, for Inſtance, that the Patient is no longer affected than while the Inſect lives; and that the *Tarantula* itſelf dances, all the while, the ſame Air with the Perſon bitten.

Theory of the Effects of the Tarantula's *Bite, by M.* Geoffroy.

The poiſonous Juice injected by the *Tarantula*, M. *Geoffroy* conceives, may give the Nerves a Degree of Tenſion, greater than is natural to them, or than is proportionate to their Functions: And hence ariſes a Privation of Knowledge and Motion. But, at the ſame time, this Tenſion, equal to that of ſome Strings of an Inſtrument, puts the Nerves in Uniſon to certain Tones, and obliges them to ſhake, after being agitated by the Undulations, and Vibrations of the Air proper to thoſe Tones. And hence this wonderful Cure by Muſic: The Nerves thus reſtor'd to their Motion, call back the Spirits thither, which before had abandon'd them. See UNISON.

It may be added, with ſome Probability, and on the ſame Principles, that the Patient's Averſion for ſome Colours ariſes hence, that the Tenſion of his Nerves, even out of the Paroxyſm, being ſtill different from what it is in the natural State, the Vibrations thoſe Colours occaſion in the Fibres of the Brain, are contrary to their Diſpoſition, and occaſion a kind of Diſſonance, which is Pain.

Theory of the Effects of the Tarantula's *Bite, by Dr.* Mead.

The Malignity of the Poiſon of the *Tarantula* ſeems to conſiſt in its great Force and Energy, whereby it immediately raiſes an extraordinary Fermentation in the whole Arterial Fluid; by which its Texture and Craſis is conſiderably alter'd: The Conſequence of which Alteration, when the Ebullition is over, muſt neceſſarily be a Change in the Coheſion of its Parts, by which the Globules, which did before with equal Force preſs each other, have now a very differing and irregular Niſus, or Action; ſo that ſome of them do ſo firmly cohere together, as to compoſe Moleculæ, or ſmall Cluſters: Upon this Account, as there is now a greater Number of Globules contain'd in the ſame Space, than before, and the Impulſe of many of theſe, when united together, differing according to the Conditions of their Coheſion, as to Magnitude, Figure, *&c.* the Impetus, with which this Fluid is drove towards the Parts, will not only be at ſome Strokes greater than ordinary, but the Preſſure upon the Blood-Veſſels muſt be very unequal, and irregular; and this will be particularly felt in thoſe which are moſt eaſily diſtended, as thoſe of the Brain, *&c.*

Upon this the nervous Fluid muſt neceſſarily be put into various undulatory Motions, ſome of which will be like thoſe, which different Objects acting upon the Organs or Paſſions of the Mind do naturally excite in it; whereupon ſuch Actions muſt follow in the Body, as are uſually the Conſequences of the ſeveral Species of Sadneſs, Joy, Deſpair, or the like Determinations of Thought.

This, in ſome Degree, is a Coagulation of the Blood, which will the more certainly, when attended with uncommon Heat, as is the Caſe in thoſe Countries where theſe Creatures abound, produce ſuch like Effects as theſe; becauſe the Spirits ſeparated from the Blood thus inflamed, and compounded of hard, fixed and dry Particles, muſt unavoidably ſhare in this Alteration; that is, whereas their Fluid conſiſts of two Parts, one more active and volatile, the other more viſcid and glutinous, which is a kind of Vehicle to the former; their active Part will bear too great a Proportion to the Viſcid; conſequently they muſt have more than ordinary Volatility and Force, and will therefore, upon the leaſt Occaſion imaginable, be irregularly determined to every Part.

Whereupon will follow, Tumblings, Anger or Fear upon a light Cauſe, extreme Pleaſure at what is trivial, as particular Colours, or the like: And on the other hand, Sadneſs at what is not agreeable to the Sight; nay, Laughter, obſcene Talk and Actions, and ſuch like Symptoms as attend Perſons bit; becauſe in this Conſtitution of the nervous Fluid, the moſt light Occaſion will make as real a Reflux and Undulation of it to the Brain, and preſent as lively Species there, as the ſtrongeſt Cauſe and Impreſſion can produce in its natural State and Condition; nay, in ſuch a Confuſion, the Spirits cannot but ſometimes, without any manifeſt Cauſe at all, be hurried towards thoſe Organs, to which at other Times they have been moſt frequently determined; and every one knows which theſe are in hot Countries.

The Effects of Muſic on Perſons touch'd with this Poiſon, confirms the Doctrine above delivered.

For muſcular Motion, we know, is no other than a Contraction of the Fibres, from the arterial Fluid's making an Effervеſcence with the nervous Juice, which, by the light Vibration and Tremor of the Nerve, is derived into the Muſcle.

Thus there is a two-fold Effect and Operation of the Muſic, that is, upon the Body and the Mind: A brisk Harmony excites lively Species of Joy and Gladneſs, which are always accompanied with a more frequent and ſtronger Pulſe, or an increaſed Influx of the Liquor of the Nerves into the Muſcles; upon which ſuitable Actions muſt immediately follow.

As for the Body, ſince it was ſufficient to put the Muſcles into Action, to cauſe thoſe Tremors of the Nerves by which their Fluid is alternately dropp'd into the moving Fibres, it is all one whether it be done by the Determination of the Will, or the outward Impreſſions of an Elaſtick Fluid.

Such is the Air; and that Sounds are the Vibrations of it, is beyond Diſpute: Theſe, therefore, rightly modulated, may ſhake the Nerves as really, as the *Imperium Voluntatis* can do, and conſequently, produce the like Effects.

The Benefit of Muſic ariſes not only from their dancing to it, and ſo evacuating, by Sweat, a great Part of the inflammatory Fluid; but beſides this, the repeated Percuſſions of the Air hereby made, by immediate Contact ſhaking the contractile Fibres of the Membranes of the Body, eſpecially thoſe of the Ear which being continuous to the Brain, communicate their Tremblings to its Membranes and Veſſels; by theſe continued Succuſſions and Vibrations, the Coheſion of the Parts of the Blood is perfectly broken, and the Coagulation prevented: So that the Heat being removed by Sweating, and the Coagulation by the Contraction of the muſcular Fibrillæ, the wounded Perſon is reſtored to his former Condition.

If any one doubts of this Force in the Air, he may conſider, that it is demonſtrated in Mechanicks, that the ſmalleſt Percuſſion of the ſmalleſt Body, may overcome the Reſiſtance of any the greateſt Weight, which is at reſt; and that the languid Tremor of the Air, which is made by the Sound of a Drum, may ſhake the vaſteſt Edifices.

But beſides this, we muſt allow a great deal to the determinate Force, and particular Modulation of the trembling Percuſſions; for contractile Bodies may be acted upon by one certain Degree of Motion in the ambient Fluid, though a greater Degree of it differently qualified, may produce nothing at all of the like Effect: This is not only apparent in two common-ſtringed muſical Inſtruments tuned both to the ſame Height; but alſo in the Trick which many have of finding the Tone or Note peculiarly belonging to any Wine-Glaſs, and, by accommodating their Voice exactly to that Tone, and yet making it loud and laſting, make the Veſſel, though not touched, firſt to tremble, and then to burſt; which it will not do, if the Voice be too low, or too high. See SOUND.

This makes it no difficult Matter to conceive, why different Perſons infected with this ſort of Venom, do require a different Sort of Muſic, in order to their Cure; inaſmuch as the Nerves and diſtractile Membranes have different Tenſions, and conſequently are not in like Manner to be acted upon by the ſame Vibrations.

TARE, in Commerce, any Defect, Waſte or Diminution in the Weight, the Quantity, or the Quality of Goods. The Seller is uſually to account to the Buyer for the *Tare* and Tret. See TRET.

TARE is particularly uſed for an Abatement, or Deduction in the Price of a Commodity, on account of the Weight of Cheſts, Casks, Bags, Frails, *&c.*

The *Tare* is very different, in different Merchandizes; in ſome, there is none at all allowed.

'Tis a Thing much more regarded in *Holland* than in *England* or elſewhere: A Modern Author, M. *Ricard*, treating of the Commerce of *Amſterdam* obſerves, that the *Tares* are one of the moſt conſiderable Articles a Merchant is to be acquainted withal, if he would trade with Security.

Sometimes, the *Tare* is, as it were, regulated by Cuſtom; but generally, to avoid all Diſpute, the Buyer and Seller make a particular Agreement about it. We ſhall here add, from the fore-mentioned Author, ſome Inſtances of *Tares* allowed at *Amſterdam*, referring the Reader for a more ample Account to his *Negoce d'Amſterdam*, *Edit.* 1722.

Spaniſh Woolls are ſubject to a kind of double *Tare*: For, Firſt, they deduct the *Tare* mark'd on the Bales; and after that, 24 Pounds *Tare* for every 175 Pound weight, beſides the Rebate for prompt Payment. Indeed, for the common Woolls, the Seller will ſeldom allow above 14 *per Cent.* for the whole *Tare*; for which Reaſon, the Bargain is to be agreed on before.

TARE of *Roman* Alum is 4 *lib. per* Sack.
of *Iriſh*, *&c.* Butter, 20 *per Cent.*
of crude Borax, 15 *lib. per Cent.*
of Cinnamon 17 *lib.* the Burthen.
of Capers 32 *per Cent.*
of White Pepper 40 *lib. per* Barrel.
of Black Pepper 5 *lib. &c.*

TARGET, a *Shield*; thus call'd from the *Latin*, *Tergum*, Back, becauſe originally made of Leather, wrought out of the Back of an Ox's Hide. See SHIELD and BUCKLER.

TARGUM, in the ſacred Literature, a Name the *Jews* give their *Chaldee* Gloſſes, and Paraphraſes on the Scripture. See PARAPHRASE.

As the *Jews*, during their long Captivity in *Babylon*, had forgot their ancient Language, the *Hebrew*; and now underſtood nothing but the Language of their Maſters, the *Chaldeans*: There was a Neceſſity of explaining the Prophets in that Language; and to this Neceſſity, is owing the firſt beginning of the *Chaldee* Paraphraſe to make the Senſe of the Text underſtood. See CHALDEE.

Each Doctor made a Paraphraſe of ſome Part thereof in the vulgar Tongue; and as theſe ſeveral Interpretations in Time, became very Voluminous, certain Rabbins undertook to collect them together; and this Collection they call'd the *Targum*.

The *Jewiſh* Doctors don't agree about the Antiquity of the *Targum*; for the more modern *Jews* having blended their own Comments with thoſe of the Ancients; no certain Age or Æra can be fix'd for the whole Work.

'Tis commonly believed, that *R. Jonathan*, who lived under the Reign of *Herod the Great*, made the firſt *Chaldee* Verſion of the Prophets; and with this Verſion mix'd the Interpretations of Tradition. *Onkelos*, 'tis certain, tranſlated the Pentateuch almoſt Word for Word; and without any Paraphraſe; and another Verſion of the Pentateuch is aſcrib'd to *Jonathan*, but without much Certainty. See PENTATEUCH.

For the *Targum* or Paraphraſe on the other Books; we know little of the Authors, no more than of thoſe of the *Targum of Jeruſalem*, which is another imperfect Paraphraſe on the Five Books of *Moſes*: So that in Strictneſs, the *Targum* of *Jonathan* and *Onkelos*, is the only Paraphraſe of any Authority. See PARAPHRASE.

The Account aſcribed to *Scaliger*, is this: The *Hebrew* was tranſlated under the Reign of *Tiberius* into *Chaldee*, by *Jonathan*; the Prophets by *Onkelos*; and the Book of *Moſes* into good old Hieroſolymitan, which was then uſed at *Jeruſalem*, much as *Latin* is among us.

'Tis certain, there was a *Targum Hieroſolymitanum* ſtill extant: It was wrote in the vulgar Tongue; but that being then greatly corrupted, we have now much ado to underſtand it.

Thoſe *Targumiſts* might have ſeen *Jeſus Chriſt*; 'tis ſure they lived long before the taking of *Jeruſalem*. *Scaligerana*.

TARIF or TARIFF, a Book of Rates; a Table, or Catalogue, drawn, uſually, in Alphabetical Order, containing the Names of ſeveral Kinds of Merchandize, with the Duties or Cuſtoms to be paid for the ſame, as ſettled by Authority, and agreed on between the ſeveral Princes and States, that hold Commerce together. See DUTIES.

TARNISHING, a Diminution of the natural Luſtre of any Thing, eſpecially a Metal. See LUSTRE.

Gold and Silver, when *Tarniſh'd*, reſume their Brightneſs, by ſetting them over the Fire with certain Lies. Copper, Pewter, &c. that are *Tarniſh'd*, recover their Luſtre with Tripoli and Pot-aſhes.

The Breath of Women, under their monthly Purgations, *Ariſtotle* aſſerts, tarniſhes all Mirrors, &c. See MENSES.

TAR-PAWLING, of the *Saxon*, *Tare*, and the *Latin*, *Pallium*, Cloak, *q. d.* a tarred Garment; is a Piece of Canvaſs, well tarred over, to keep off the Rain from any Place.

The Term is alſo uſed in Deriſion for a Perſon bred at Sea, and educated in the Mariner's Art. See MARINER.

TARPEIAN, in Antiquity, an Epithet given to a Rock in ancient *Rome*, of ſurprizing Height; whence, by the Law of the Twelve Tables, thoſe guilty of certain Crimes, were precipitated.

'Twas on this Rock the Capitol was built. See CAPITOL.

It took its Name from a Veſtal, call'd *Tarpeia*, who betray'd the Capitol, whereof her Father was Governor, to the *Sabines*; on Condition they would give her all they bore on their Left Arms, meaning their Bracelets. But inſtead of Bracelets, they threw their Bucklers (which were likewiſe borne on their Left Arm) upon her Head, and cruſh'd her to Death.

Others aſcribe the Delivery of the Capitol to her Father *Spurius Tarpeius*; and add, That he was precipitated down this Rock by *Romulus*'s Order; and that this, henceforward, became the Puniſhment of all Criminals of the like Kind.

The *Tarpeian Games*, were Games inſtituted by *Romulus*, in Honour of *Jupiter Feretrius*; call'd alſo *Capitolini Ludi*. See CAPITOLINI.

TARRASS, or TERRASS, a Sort of Plaiſter, or ſtrong Mortar, chiefly uſed to line Baſons, Ciſterns, Wells and other Reſervoirs of Water. See MORTAR, CISTERN, &c.

TARSUS, in Anatomy, is what we vulgarly call the *Inſtep*; being the Beginning of the Foot, or the Space between the Ankle and the Body of the Foot which is call'd *Metatarſus*. See FOOT.

The *Tarſus* conſiſts of ſeven Bones: The firſt whereof is call'd *Aſtragalus*, and by the *Latins Talus*, and *Os Baliſtæ*. See ASTRAGALUS.

The ſecond call'd the *Calx*, or *Calcar pedis*, or *Calcaneum*; the third *Naviculare*, and by the *Greeks Scaphoeides*; the fourth, fifth, and ſixth are generally call'd *Innominata*, but by *Fallopius*, from their Figure, *Cuneiformia*: Laſtly, the 7th, the *Cuboeides*. See each deſcrib'd under its proper Article, CALX, NAVICULARE, INNOMINATA, &c.

TARSUS is alſo a Name given by ſome Anatomiſts to the Cartilages which terminate the Palpebræ or Eye-lids. See PALPEBRA.

They are exceedingly thin and fine, which makes them light and flexible.

Their Form is Semicircular: That of the upper Eye-lid, is ſomewhat longer than that of the under: They ſerve alike to cloſe the Eyes. See CILIA.

TARTANE, a kind of Bark uſed for Fiſhing and Carriage; having neither a rais'd Poop, nor Prow; and alſo uſing Oars.

Tartanes are common in the *Mediterranean*: They have only a Main-maſt, and a Mizzen: Their Sails are triangular. When they put up a ſquare Sail, 'tis call'd a *Sail of Fortune*.

TARTAR, in Chymiſtry, &c. a Kind of Salt, which riſes from fumous Wines, and ſticking to the Top and Sides of the Casks, forms a greyiſh Cruſt, which hardens to the Conſiſtence of a Stone. See SALT.

Tartar, ſays an ingenious Author, has the Juice of the Grape for its Father, Fermentation for its Mother, and the Cask for its Matrix. See WINE, &c.

Its Goodneſs rather depends on the Number of repeated Fermentations, which a Succeſſion of new Wines in the ſame Cask for ſeveral Years, makes, than on the Soil or Climate where the Wine is produc'd.

Tartar is either *white*, or *red*, according to the Colour of the Wine it is rais'd from.

That brought from *Germany* is the beſt, as being taken out of thoſe monſtrous Tuns, ſome whereof hold a thouſand Pipes of Wine; ſo that the Salt has Time to come to its Conſiſtence, one of the chief Qualities to be regarded in *Tartar*.

That of *Montpellier* is the next in Order; then that of *Lyons*, *Paris*, &c.

White Tartar is preferr'd to red, and is really better: The Marks of good *Tartar* of either Kind, are, its being thick, brittle, brilliant, and very little Earthy.

Tartar is of conſiderable Uſe among the Dyers; as ſerving to diſpoſe the Stuffs to take the Colours the better. See DYING.

The Chymiſts make abundance of Preparations from *Tartar*; as *Cream*, or *Cryſtal of Tartar*, which is nothing but *Tartar* powder'd, and reduc'd by means of boiling Water, a ſtraining Bag, and a Cellar, into little Cryſtals. See CREAM *of Tartar*.

Salt of TARTAR is made of *Tartar* waſh'd, ground, purify'd, and calcin'd in Paper, by a reverberatory Fire; or 'tis made by pulverizing what remains in the Retort after the Diſtillation of *Tartar*. On the one or the other of theſe Preparations, they pour a great Quantity of hot Water, to make a Lye of it; this they filtrate, and evaporate the Liquor by a Sand Heat, till the fix'd Salt be found at the Bottom of the Veſſel. This is the Alkali, or fix'd Salt of *Tartar*. See SALT.

Oil of TARTAR, is the Salt of *Tartar* expos'd to the Air for ſome Days, in an open Veſſel, in a moiſt Place, till it diſſolve into an Oil; tho' 'tis improperly ſo call'd, being no more than a diſſolv'd Oil. See DELIQUIUM.

Oil of *Tartar per deliquium*, is held the beſt Remedy againſt corroſive Sublimate.

TARTAR *Vitriolated*, which ſome call *Magiſtery of Tartar*, is Oil of *Tartar* mix'd with rectify'd Spirit of Vitriol: Upon mixing the two, there ariſes a great Ebullition; by means whereof, of Liquids they become Solids.

TARTAR *foliated*, is a Preparation of *Tartar* with diſtill'd Vinegar, which reduces it into white Leaves.

TARTAR *Emetic*, TARTAR *Soluble* } See { EMETIC. SOLUBLE.

TARTARIZING, a Term uſed by ſome Writers, for the Act of Refining or Purifying, by means of Salt of *Tartar*. See TARTAR.

TASSEL, a Sort of pendant Handle, hanging down from a Cuſhion, or ſuch like Thing: Alſo a ſmall Ribbon or Silk ſew'd to a Book, to be put between the Leaves.

TASSELS, in a Building, are thoſe Pieces of Boards that lie under the Ends of the Mantle-Trees. See MANTLE.

TASSEL, or TIERCELET, is alſo us'd in Falconry for a *Male Hawk*. See HAWK and FALCON.

TASSELS are alſo a kind of hard Burr, uſed by Clothworkers in dreſſing Cloth.

TASTE,

TASTE, or *Savour*, a Senſation, excited in the Soul by means of the Organ of *Taſte*; *viz.* the Papillæ of the Tongue, *&c.* See SENSATION and TASTING.

Dr. *Grew*, in a Lecture on the Diverſity of *Taſtes*, before the Royal Society, diſtinguiſhes them into *Simple* and *Compound*.

By the former, he underſtands ſuch as are Simple Modes of *Taſte*, although mingled with others in the ſame; thus the *Taſte* of a Pippin is Aci-dulcis; of Rhubarb, Amara-ſtringent, and therefore compounded, in both; but yet in the Pippin the Acid is one ſimple *Taſte*, and the Sweet another; as diſtinct as the Bitter and Aſtringent are in the Rhubarb.

Two Faults, he obſerves, have here been committed: The firſt, a defective enumerating of ſimple *Taſtes*, and reckoning them, indiſtinctly, among ſuch as are compounded.

Simple Taſtes, of which we uſually only reckon ſix or ſeven Sorts, are at leaſt ſixteen; 1. *Bitter*, as in Wormwood; whoſe contrary is, 2. *Sweet*, as in Sugar. 3. *Sour*, as in Vinegar; whoſe contrary is, 4. *Salt*. 5. *Hot*, as in Cloves; to which is oppoſite, 6. *Cold*, as in Sal Prunella; for we may as properly ſay a cold *Taſte*, as an hot one, ſince there are ſome Bodies which do manifeſtly impreſs the Senſe of Cold upon the Tongue, tho' not to the Touch. 7. *Aromatick*; to which is contrary, 8. *Nauſeous*, or malignant.

He thinks alſo that *Taſtes* may be diſtinguiſh'd into ſuch as are, 9. *ſoft*, which are either Vappid, as in Water, Starch, Whites of Eggs, *&c.* or *Unctuous*, as in Oils, Fat, *&c.* 10. Or ſuch as are *hard*; of which he reckons four Kinds, as, 11. *Penetrant*, which worketh itſelf into the Tongue without any Pungency; as is found in the Root and Leaves of wild Cucumber. 12. *Stupefacient*, as in the Root of black Hellebore; which being chew'd, and for ſome time retain'd upon the Tongue, affects that Organ with a Numbneſs, or Paralytic Stupor. 13. *Aſtringent*, as in Galls: And, 14. *Pungent*, as in Spirit of Sal Armoniac; which two laſt *Taſtes* he makes contrary to the Unctuous, as Penetrant and Stupefacient are contrary to the Vappid one.

The *Compound Taſtes* are very numerous; but we have Words to expreſs but ſix of them, 1. *Auſtere*, which is aſtringent and bitter, as in the green and ſoft Stones of Grapes. 2. *Acerb*, properly ſo call'd, which is aſtringent and acid, as in the Juice of unripe Grapes. 3. *Acrid*, which is pungent and hot. 4. *Muriatick*, which is ſalt and pungent, as in common Salt. 5. *Lixivious*, which is Saltneſs join'd with ſome Pungency and Heat. 6. *Nitrous*, which is Saltneſs join'd with Pungency and Cold.

TASTE, in a Figurative Senſe, is apply'd to the Judgment and Diſcernment of the Mind.

We talk, and we hear Talk, every Day, of *Taſte*, of *good Taſte*, and of *bad Taſte*; and yet without well underſtanding what we mean by the Word: In Effect, a *good Taſte* ſeems to be little elſe but right Reaſon, which we otherwiſe expreſs by the Word *Judgment*. See REASON.

To have a *Taſte*, is to give Things their real Value, to be touch'd with the Good, to be ſhock'd with the Ill; not to be dazzled with falſe Luſtres; but, in ſpight of all Colours, and of every Thing that might deceive or amuſe, to judge ſoundly.

Taſte and Judgment then ſhould be the ſame Thing; and yet 'tis eaſy to diſcern a Difference: The Judgment forms its Opinions from Reflection; The Reaſon, on this Occaſion, fetches a kind of Circuit to arrive at its End: It ſuppoſes Principles; it draws Conſequences; and it judges; but not without a thorough Knowledge of the Caſe: So that after it has pronounc'd, it is ready to render a Reaſon of its Decrees. *Good Taſte* obſerves none of theſe Formalities; e'er it has time to conſult, it has taken its Side: As ſoon as ever an Object is preſented it, the Impreſſion is made; the Sentiment form'd; ask no more of it.

As the Ear is wounded with a harſh Sound; as the Smell is ſooth'd with an agreeable Odor, before ever the Reaſon have meddled with thoſe Objects, to judge of them; ſo the *Taſte* opens itſelf at once, and prevents all Reflection.

They may come afterwards to confirm it, and diſcover the ſecret Reaſons of its Conduct; but it was not in its Power to wait for them. Frequently, it happens not to know them at all; and what Pains ſoever it uſe, cannot diſcover what it was determin'd it to think as it did.

This Conduct is very different from that the Judgment obſerves in its Deciſions; unleſs we chuſe to ſay that *Good Taſte* is, as it were, a firſt Motion, or a kind of Inſtinct of right Reaſon, which hurries us on with Rapidity, and conducts more ſecurely than all the Reaſonings ſhe could make. 'Tis a firſt Glance of the Eye, which diſcovers to us the Nature and Relations of Things in a Moment.

In Effect, *Taſte* and Judgment are one and the ſame Thing, one and the ſame Diſpoſition, and Habitude of the Soul, which we call by different Names, according to the different Manners wherein it acts: When it acts by Senſation, by the firſt Impreſſion of Objects, we call it *Taſte*; and when by Reaſoning, after having examin'd the Thing by all the Rules of Art, *&c.* we call it Judgment: So that one may ſay, *Taſte* is the Judgment of Nature, and Judgment the *Taſte* of Reaſon. See JUDGMENT.

Good Taſte, as defin'd by Mad. *Scudery*, and Mad. *Dacier*, in an expreſs Treatiſe *of the Corruption of Taſte*, is a Harmony between the Mind and Reaſon; and a Perſon has more or leſs of this *Taſte*, as that Harmony is more or leſs juſt.

One might perhaps improve on this Idea; and ſay, that *Good Taſte* is nothing elſe but a certain Relation between the Mind, and the Objects preſented to it.

A right Reaſon cannot but be mov'd and affected with Things conformable thereto, and wounded by thoſe contrary: There is, then, a kind of Sympathy which unites them as ſoon as ever they meet; and their Union, their good Underſtanding, diſcover each other. Make a fine Diſcourſe; uſe only the richeſt and nobleſt Expreſſions; if they contain an unhappy Thought, or an incoherent Reaſoning; that Thought, this Reaſoning, will immediately be felt by a Perſon of *Taſte*: The Antipathy ſhews itſelf by a Movement of Averſion, as ſudden, as lively, and as natural, as that which Nature inſpires us withal for Toads or Spiders. See BEAUTY.

TASTING, the Senſe whereby we diſtinguiſh Savours; or the Perception the Soul has of external Objects, by means of the Organ of *Taſte*. See SENSE and TASTE.

Authors have differ'd much as to the *Organ of Taſting*. *Bauhin*, *Bartholin*, *Veſlingius*, &c. place it in the laxer fleſhy Parts of the Tongue: Dr. *Wharton* in the Gland at the Root of the Tongue: *Laurentius*, in the thin Tunic covering the Tongue; others in the Palate, *&c.* But the great *Malpighi*, and, after him, all the lateſt Writers, place it in the Papillæ, chiefly lying about the Tip and Sides of the Tongue. See TONGUE.

Theſe Papillæ ariſe from the Corpus Nervoſum that covers the muſcular Fleſh of the Tongue; whence, paſſing thro' the Corpus Reticulare, they ſtand up under the external Membrane of the Tongue, erect, cover'd with Vaginæ, or Sheaths of the ſaid Membrane, to defend them from Objects too violent. See PAPILLA.

Theſe Vaginæ are porous; and ſtick out ſo far, that when the Aliment is ſqueez'd, they enter within the ſame, to receive the Object, or the Matter of *Taſte*.

Theſe Papillæ, *Boerhaave* conjectures, to ariſe from the ninth Pair of Nerves: And theſe he aſſerts, are the only Organ of *Taſte*: Thoſe others of the Tongue, Palate, Jaws, *&c.* he obſerves, contribute nothing thereto, tho' probably thoſe of the Cheeks, next the Dentes Molares, may. See PAPILLÆ, PALATE, *&c.*

The *Object of Taſting*, is any Thing either in Animals, Vegetables, or Minerals, from which Salt or Oil may be extracted. See SALT.

Taſting, then, is perform'd by the Objects being attenuated, and mix'd with Saliva, warm'd in the Mouth, and apply'd to the Tongue; where, inſinuating into the Pores of the membranous Vaginæ of the nervous Papillæ, and penetrating to the Surface of the Papillæ themſelves, it affects and moves them; by which Means a Motion is communicated along the Capillament of the Nerve to the common Senſory, and an Idea excited in the Mind, of Salt, Acid, Sweet, Bitter, Hot, Aromatic, Auſtere, or the like; according to the Figure of the Particles that ſtrike the Papillæ, or the Diſpoſition of the Papillæ to receive the Impulſe. See SENSATION.

TATIANITES, a Sect of ancient Hereticks; thus call'd from *Tatian*, a Diſciple of *Juſtin Martyr*.

This *Tatian*, who has the Character of one of the moſt learned Men of all Antiquity, was perfectly Orthodox during the Life of his Maſter. He was, like him, a *Samaritan*, by Nation, not by Religion, as *Epiphanius* ſeems to inſinuate. They both belong'd to thoſe *Greek* Colonies ſpread throughout the Country of the *Samaritans*.

Juſtin being dead, *Tatian* gave into the Errors of the *Valentinians*; and form'd a Sect call'd ſometimes *Tatianites*, and ſometimes *Encratites*. See ENCRATITES.

TATH, in old Law, a Privilege which ſome Lords of a Manor have, of having their Tenants Sheep folded at Night upon their own Ground.

TAT-*too*, *q. d. tap-to*, a Beat of a Drum, at Night, to adverti ſe the Soldiers to repair to their Quarters in a Garriſon, or to their Tents in a Camp. See DRUM.

TAU, in our ancient Cuſtoms, ſignifies a Croſs: — *Tradendo dicto Comiti* Thau *eboreum*. So Mr. *Selden*, in his Notes upon *Eadmerus*, *p.* 159. *Ego Eadgiſa prædicti Regis Ava hoc opus egregium Crucis Taumate conſolidavi*. See Mon. 3. Tom. pag. 121.

TAU, or TAW, in Heraldry, an Ordinary, in Figure of a T, ſuppos'd to repreſent a Croſs potence, the top Part cut off. It is thus call'd from the Name of the *T*, *tau*. See T.

TAUGHT, *Tight*, in the Sea Language, is the ſame as ſetting a Rope ſtiff, or faſt.

Thus they ſay, *Set taught the Shrouds, the Stays, or any other Ropes*, when they are too ſlack and looſe.

TAUNT, a Sea Term: When the Maſts of a Ship are too tall for her, the Sailors ſay, ſhe is *taunt-maſted*.

TAURI *liberi Libertas*: In ſome ancient Charters, *Taurus liber* ſignifies a common Bull to all Tenants within ſuch a Manor or Liberty, *Cum libertate faldiæ, liberi* Tauri *& liberi Apri*, &c.

TAURUS, in Aſtronomy, the *Bull*; one of the Twelve Signs of the Zodiac, and the ſecond in Order. See SIGN and CONSTELLATION.

The Stars in the Conſtellation *Taurus*, in *Ptolomy*'s Catalogue are 44; in *Tycho*'s Catalogue 41; in the *Britannic* Catalogue 135. The Longitudes, Latitudes, Magnitudes, *&c.* whereof, are as follow:

Stars in the Conſtellation TAURUS.

TAURUS, in our ancient Cuſtoms, ſignifies a Husband.

In leg. H. I. cap. 7. *Videtur autem Matris eſſe, cujuſcunque* Taurus *alluſerit.*

TAUTOLOGY, in Grammar, a needleſs Repetition of the ſame Thing in different Words.

Some People, particularly the Jeſuits, write and pronounce it *Taftology*. The Difference ariſes from the different Pronunciation of the *Greek upſilon* in ταυτολόγια. The modern *Greeks*, 'tis true, pronounce the υ as *f*; and 'tis argued the Ancients did the like: But as Cuſtom is the Standard of a Language, this Plea avails but little with Regard to the *Engliſh*.

TAUTOLOGICAL

TAUTOLOGICAL *Echo*'s, are ſuch Echo's as repeat the ſame Sound or Syllable many Times. See ECHO.

TAWING, call'd alſo by ſome *Skimming*, the Art or Manner of preparing or dreſſing Skins in white; to fit them for Uſe in divers Manufactures, particularly Gloves, Purſes, *&c.* See LEATHER, *&c.*

All Kinds of Skins may be *taw'd*; but 'tis chiefly thoſe of Sheep, Lambs, Kids, and Goats, that are uſed to be dreſs'd this Way; as being thoſe fitteſt for Gloves.

Method of TAWING, *or of dreſſing Skins in white.*

The Wooll or Hair being well got off the Skins, by means of Lime, *&c.* (as deſcrib'd under the Article CHAMOIS) they are laid in a large Vat of Wood or Stone ſet in the Ground, full of Water, wherein quick Lime has been ſlaked; where they continue a Month or ſix Weeks, as the Weather is more or leſs hot, or as the Skins are requir'd to be more or leſs ſoft and pliant.

While in the Vat, the Water and Lime is chang'd twice, and they are taken out and put in again every Day. When taken out for the laſt Time, they are laid all Night to ſoak in a running Water, to get out the greateſt Part of the Lime; and, in the Morning, are laid, ſix together, on the wooden Leg, to get off the Fleſh, by ſcraping them ſtoutly, one after another, on the Fleſh Side, with a cutting two-handed Inſtrument, call'd a Knife; and while this is in Hand, they cut off the Legs, and other ſuperfluous Parts about the Extremes.

This done, they are laid in a Vat or Pit with a little Water; where being well full'd with wooden Peſtles for a quarter of an Hour, the Vat is fill'd up with Water, and the Skins rinced therein.

They are next thrown on a clean Pavement to drain; which done, they are caſt into a freſh Pit of Water, where being well rinced, they are taken out, and laid on the wooden Leg, fix at once, with the Hair Side outermoſt, over which they rub a kind of Whetſtone very briskly, to ſoften, and fit them to receive four or five more Preparations given them on the Leg, both on the Fleſh Side and the Hair Side, with the Knife, after the Manner above mention'd.

Theſe over, they are put in a Pit with Water and Wheat Bran, and ſtirr'd about therein, with wooden Poles, till the Bran is perceiv'd to ſtick to them; and then they are left: As they riſe of themſelves to the Top of the Water by a kind of Fermentation, they are plung'd down again to the Bottom; and, at the ſame Time, Fire is ſet to the Liquor, which takes as eaſily as if it were Brandy, but goes out the Moment the Skins are all cover'd.

This Operation is repeated as often as the Skins riſe above Water; and when they riſe no more, they are taken out; laid on the wooden Leg, the Fleſh Side outermoſt; and the Knife paſs'd over it to ſcrape off the Bran. The Bran thus clear'd, the Skins are laid in a large Basket, where they are loaden with huge Stones to promote their draining; and when ſufficiently drain'd, their Feeding is given them, which is perform'd after the following Manner.

For a hundred large Sheep Skins, and for ſmaller in Proportion, they take eight Pounds of Alum, and three of Sea Salt, and melt the whole with Water in a Veſſel over the Fire; pouring the Diſſolution out while yet lukewarm into a kind of Trough, wherein is twenty Pounds of the fineſt Wheat Flower, with eight Dozen Yolks of Eggs; of all which is form'd a kind of Paſte, a little thicker than Childrens Pap; which, when done, is put into another Veſſel, to be uſed in Manner following.

A Quantity of hot Water being pour'd into the Trough wherein the Paſte was prepar'd; two Spoonfuls of the Paſte is mix'd therewith; in order to which, they uſe a wooden Spoon, which contains juſt what is requir'd for a Dozen Skins: And when the whole is well diluted, two Dozen of the Skins are plung'd therein: Care being taken, by the Way, that the Water ben't too hot, which would ſpoil the Paſte, and burn the Skins.

Having ſtaid ſome time in the Trough, they are taken out, one after another, with the Hand; and ſtretch'd out; which is repeated twice: When they have all had their Paſte, they are put in Tubs, where they are full'd afreſh with wooden Peſtles.

Then they are put in a Vat, where they remain five or ſix Days, or more; and are at laſt taken out in fair Weather, and hung out to dry on Cords or Racks: The quicker they dry the better; for if they be too long a drying, the Salt and Alum within them, are apt to make them riſe in a Grain, which is an eſſential Fault in this Kind of Dreſſing.

When the Skins are dry, they are put up in Bundles, and juſt dipt in fair Water; from which being taken out and drain'd, they are thrown into an empty Tub; and, after ſome Time, are taken out, and trampled under Foot.

They are then drawn over a flat Iron Inſtrument, the Top whereof is round like a Battledore, and the Bottom fix'd into a wooden Block; to ſtretch and open them: When open'd, they are hung in the Air upon Cords to dry; and when dry, are open'd a ſecond Time by repaſſing them over the ſame Inſtrument.

Laſtly, they are laid on a Table, pull'd out, and laid ſmooth; and are thus in a Condition for Sale and Uſe.

After the ſame Manner are dreſs'd Horſes, Cows, Calves Skins, *&c.* for the Sadlers, Harneſs-makers, *&c.* as alſo Dogs, Wolves, Bears Skins, *&c.* excepting that in theſe the Uſe of the Paſte is omitted, Salt and Alum Water being ſufficient.

TAWNY, in Heraldry. See TENNE.

TAX, a Tribute ſettled on every Town, after a certain Rate; and paid yearly towards the Expences of the Government. See TRIBUTE and IMPOST.

The ancient *Tax* was what the *Subſidy* now is; excepting that the *Tax* was fix'd to a certain Sum, *viz.* the *Fifteenth* Part of what the Place was anciently valu'd at, whereas the Subſidy is variable according to Occaſion; and that the *Tax* was levy'd on Cities and Towns, but the Subſidy on Perſons. See SUBSIDY.

Anciently, the *Tax* was impos'd by the King at his Pleaſure; but *Edward* I. bound himſelf, and his Succeſſors, from that Time forward, not to levy it but by Conſent of the Realm. See FIFTEENTH; ſee alſo GILD and WITERDEN.

The Word *Tax* is form'd from the *Greek* ταξις, Order. See TAXIS.

The Rate, *&c.* of the *Tax* was anciently call'd *Tallage*, from the *French taille*, *Tax*. See TAILLE.

The People of *France* were Strangers to *Tailles*, or *Taxes*, till the Time of *S. Louis*, when they were firſt impos'd in Form of Subſidies, neceſſary for the Support of the War in the Holy Land.

They were then extraordinary Levies, and were rais'd by Capitation; but were afterwards made perpetual under *Charles* VII. *Philip the Fair*, to raiſe Money without diſturbing the People, call'd the People, as a third Eſtate, into the general Councils of the Realm. See ESTATE.

The Name *Taille* is deriv'd from the Tally of petty Tradeſmen; in regard the Country People appointed to collect it, not being able to write, ſcored down what they receiv'd on Tallies. See TALLY.

TAX is alſo the Tribute which Tenants were occaſionally to pay their Lord. See LORD and TENANT.

Moſt Lords had a Right of *taxing* on four Occaſions, *viz.* when the Lord was taken Priſoner in a juſt War; when he made his eldeſt Son a Knight; when he marry'd his eldeſt Daughter to a Gentleman; and when he made the Voyage of the Holy Land. See CROISADE.

Nauda ſhews the extravagant Riſe of this Kind of *Taxes*: Thoſe, he obſerves, which under *Charles* VI. only amounted to the Sum of 40000 Livres, were increas'd, under *Charles* VII. to the Sum of 1800000 Livres; under *Louis* XI. to 4740000 Livres; under *Charles* VIII. to 6000000; under *Louis* XII. to 7640000 Livres.

Taxes were diſtinguiſh'd into *free*, which were thoſe due, in the four Caſes, by Freemen, or thoſe who held free Lands; and *ſervile* and *baſe*, which were thoſe due from Perſons of baſe Condition.

They were alſo diſtinguiſh'd into *real* and *perſonal*. The *perſonal* were impos'd on the Head of the Servant or Man in Main-morte, and ſo follow'd him where-ever he went.

TAXERS, two Officers yearly choſen in *Cambridge*, to ſee the true Gauge of all Weights and Meaſures.

The Name took beginning from Taxing and Rating the Rents of Houſes, which was anciently the Duty of their Office.

TAXIS, in the ancient Architecture, the ſame with *Ordonnance* in the new, is deſcrib'd by *Vitruvius* to be that which gives every Part of a Building its juſt Dimenſions, with regard to its Uſes. See ORDONNANCE.

TAYL, in Heraldry, *&c.* is particularly uſed for the Tail of an Hart; thoſe of ſeveral other Creatures having peculiar and diſtinct Names.

As that of a Buck, Roe, or any other Deer, is call'd the *Single*; of a Boar, the *Wreath*; of a Fox, the *Buſh*; of a Wolf, the *Stern*; and of a Hare and Coney, the *Scut*.

TCHELMINAR, or TCHILMINAR, or, as we pronounce it, *Chelminar*, one of the moſt celebrated Ruins in the World. See RUINS.

Tchelminar is the Remains of a Palace, ſuppos'd by ſome to have ſtood in the Middle of the City *Eſtekhar*, built by Queen *Homœi*; others will have it the Palace of the Kings of *Perſia* in the ancient *Perſepolis*, the Capital of that Kingdom.

The Word in the *Perſian* ſignifies 40 Towers, or 40 Columns. See CHILMINAR.

TEA, or, as the *Chineſe* call it, TCHA, the Leaf of a Tree or Shrub, growing in ſeveral Provinces of *China*, *Japan*, and *Siam*.

The *Tea* Plant affects Valleys, and the Feet of Mountains, and a ſtony Soil. Its Seed is uſually ſown in Places expos'd to the South; and bears three Years after ſown. The Root reſembles

reſembles that of the Peach Tree: The Leaves are green, longiſh at the Point, and pretty narrow, an Inch and half long, and jagged all around. The Flower is much like that of the wild Roſe. The Fruit is of different Forms, ſometimes round, ſometimes long, ſometimes triangular; of the ordinary Size of a Bean; containing two or three Peas, of a Mouſe Colour, including each a Kernel. Theſe Peas are the Seeds by which the Plant is propagated.

The Tree is of various Heights, from one Foot to an hundred: Some there are which two Men can't fathom, while others ſcarce exceed the feebleſt Shrub in a Garden.

The beſt Time to gather the Leaves of *Tea*, is while they are yet ſmall, young, and juicy: When gather'd, they are paſs'd over the Smoak of boiling Water to moiſten them; then they are laid on Copper Plates, which are heated; and thus, the Leaves drying, they curl up in the Manner they are brought to us.

'Tis very rare to find *Tea* perfectly pure; the *Chineſe* always mixing other Herbs with it, to increaſe the Quantity. Indeed, the Price 'tis ſold for among them is moderate enough; uſually 'tis about Three-Pence a Pound Sterling, never more than Nine-Pence.

The *Chineſe* know nothing of *Imperial Tea*, *Flower of Tea*, and many other Names, which in *Europe* ſerve to diſtinguiſh the Goodneſs, and the Price of this faſhionable Commodity; and yet beſide the common *Tea*, they diſtinguiſh two other Kinds, *viz.* the *Voui* and *Soumlo*, which are reſerv'd for People of the firſt Quality, and ſick Folks.

We have three Kinds of *Tea* in *Europe*, *viz.* *Green Tea*; which is the common *Tea* of the *Chineſe*, *&c.* F. *le Compte* calls it *Bing Tea*, and ſays 'tis gather'd from the Plant in *April*.

'Tis held very digeſtive, and a little corroſive: It gives a pale greeniſh Tincture to Water; and its Leaves are much twiſted.

The ſecond is *Bohea Tea*, which is the *Voui Tea*, or *Bou Tea* of the *Chineſe*. F. *le Compte* makes this only to differ from the *Green Tea*, by its being gather'd a Month before it, *viz.* in *March*, while in the Bud; and hence the Smallneſs of the Leaves, as well as the Depth of the Tincture it gives Water. But 'tis much more probably the *Tea* of ſome particular Province; the Soil being found to make an Alteration in the Properties of the *Tea*, as much as the Seaſon of gathering it.

'Tis all bought at *Nanquin*; and it is but lately that the *Dutch* have introduced it into *Europe*, where it begins to be much in Vogue.

The third is *Red Tea*, or *Tartar Tea*, or *Honan Tcha*, which tinges the Water with a pale Red, and which is ſaid to be extremely digeſtive: By means hereof, it is that the *Tartars* are ſaid to be able to feed on raw Fleſh. Its Taſte is Earthy; and much the leaſt agreeable of them all; but little known in *England*.

Tea is to be choſen Green, of the briskeſt Smell, as whole as poſſible; and the greateſt Care taken that it han't been expos'd to the Air to pall, and evaporate.

The Drink, *Tea*, is made in *China*, and throughout the greateſt Part of the Eaſt, after the ſame Manner as in *Europe*; *viz.* by infuſing the Leaves in boiling Water, and drinking the Infuſion hot. Indeed, among us, 'tis uſual to temper its Bitterneſs with Sugar, which the Orientals uſe little or none of.

However, the *Japaneſe* are ſaid to prepare their Liquor a ſomewhat different Way, *viz.* by pulverizing it; ſtirring the Powder in hot Water, and drinking it as we do Coffee.

The *Chineſe* are always taking *Tea*, eſpecially at Meals: 'Tis the chief Treat wherewith they regale their Friends. The moſt moderate take it at leaſt thrice a Day; others, ten times, or more: And yet 'tis computed, the Conſumption of *Tea* among the *Engliſh* and *Dutch* is as great in Proportion as among the Orientals. In *France*, the Uſe of *Tea* is much declin'd, and Coffee is now become the prevailing Liquor. See COFFEE.

As to the Properties of *Tea*, they are ſtrangely controverted: The Eaſtern Nations are at leaſt as much poſſeſs'd with them as the *Europeans*; but 'tis, perhaps, becauſe Imagination bears as great a Sway there as here. The Reaſon why the Gout and Stone are unknown in *China*, is aſcrib'd to the Uſe of this Plant; which is ſaid further to cure Indigeſtions of the Stomach, to carry off a Debauch, and to give new Strength for Drinking, to diſpel Wind, to cure the Vapours, *&c.*

Sim. Paulli, Phyſician of the King of *Denmark*, in an expreſs Treatiſe on this Plant, endeavours to ſhew, that theſe Virtues aſcrib'd to it in the Eaſt, are local, and don't hold with the Inhabitants of *Europe*. He holds, that thoſe paſt their 40th Year ſhould never uſe it, as being too deſiccative: That *Tea* has no other Virtues but thoſe of Betony: And adds, with *Bauhin*, that 'tis only a Species of Myrtle found in *Europe* as well as the *Indies*.

But this Opinion is refuted by *Pechlin*, in a Treatiſe of *Tea*, intitled, *Theophilus Bibaculus, ſive de Potu* Theæ *Dialogus*; Where he maintains, That 'tis good to prevent Scorbutic Diſeaſes; that its gentle aſtringent Virtues ſtrengthens the Tonic Motion of the Inteſtines, *&c.* But he blames the Drinking it with Milk; and eſpecially after a full Meal, or after much Wine.

TEAM and THEAME, or TEM and THEME, in our ancient Cuſtoms, ſignifies a Royalty granted by the King's Charter to the Lord of a Manor, for the having, reſtraining, and judging Bondmen, Neifs, and Villains, with their Children, Goods, and Chattels, in his Court.

TEARS, *Lachrymæ*, a watry Humour, iſſuing out at the Corner of the Eye, by the Compreſſion of the Muſcles; ſerving to moiſten the Cornea, to expreſs our Grief, and even to alleviate it. See LACHRYMÆ and LACRYMALIA PUNCTA.

The Ancients had an Opinion, that the *Tears* of the Living were of uſe, at leaſt of Pleaſure, to the Dead; for which Reaſon they took great Care to procure them abundance at their Funerals; ſo much, as to inſtitute a Profeſſion or Trade of Weepers, as judging thoſe of their own Families inſufficient. See LACHRYMATORY and FUNERAL.

Deer, when at Bay, are commonly ſaid to ſhed *Tears*: Indeed, they ordinarily do yield a Sort of *Tears*, which oozing into the two Clefts underneath, call'd Lachrymatories, are there condens'd into a kind of yellow Liquor, or Gum; which diluted in white Wine or Carduus Water, is reputed a Sovereign Remedy for Fits of the Mother, and the Falling Sickneſs.

Virgil makes the Horſe of *Pallas* ſhed *Tears* at the Funeral Pomp of his Maſter: This is one of the Paſſages which the modern Criticks cenſure as a Breach of Probability. See PROBABILITY.

TEAZEL, or TEASEL, the *Fullers Thiſtle*, a kind of Plant much uſed by the Fullers, Cloth-workers, and Stocking-Weavers, to card, or draw out the Wooll or Nap from the Thread or Ground of ſeveral Kinds of Cloths, Stuffs, Stockings, *&c.* in order to render them cloſer and warmer. See FULLING, *&c.*

This Plant is cultivated with great Care in ſeveral Parts of *France*, particularly *Normandy*; and the Exportation thereof prohibited, by Reaſon of the vaſt Uſe thereof in the Woollen Manufacture. See CARDUUS.

The Stem of the Plant is very high; and its Extremity, as alſo thoſe of its Branches, bear a little round prickly yellowiſh Ball or Bur, which is the Part uſed.

The largeſt Burs, and thoſe moſt pointed, are eſteem'd the beſt; and are now call'd *Male Teazles*, moſtly uſed in the dreſſing and preparing of Stockings and Coverlets; the ſmaller Kind, properly call'd the *Fullers* or *Drapers*, and ſometimes the *Female Teazle*, are us'd in the Preparation of the finer Stuffs, as Cloths, Rateens, *&c.*

The ſmalleſt Kind ſometimes, call'd *Linnots Heads*, are us'd to draw out the Nap from the coarſer Stuffs, as Bays, *&c.*

TECHNICAL, ſomething that relates to an Art. See ART.

In this Senſe we ſee *Technical Words*, *Technical Verſes*, *&c.* And in this Senſe Dr. *Harris* intitles his Dictionary of Arts and Sciences, *Lexicon Technicum*.

The Word is form'd of the *Greek*, τεχνικὸς, Artificial, of τέχνη, Art.

TECHNICAL, is a Term particularly apply'd to a kind of Verſes, wherein are contain'd the Rules or Precepts of any Art; thus digeſted to help the Memory to retain them.

Technical Verſes are uſual in Chronology, *&c.* Such. *e. gr.* are thoſe expreſſing the Order and Meaſures of the Calends, Nones, *&c.* See CALENDS.

Thoſe expreſſing the Seaſons; See under AUGUST.

Thoſe expreſſing the Order, *&c.* of the Signs; See under SIGN.

F. *Labbe* has compos'd *Latin* Verſes, including all the Epochas in Chronology; and *F. Buffier*, after his Example, has put both Chronology and Hiſtory in *French* Verſe; and ſince, Geography too.

Technical Verſes are commonly compos'd in *Latin*: They are generally wretched ones, and often barbarous; but 'tis Utility is all aim'd at. To give ſome Idea hereof, we will here add a few Inſtances. The Caſuiſts include all the Circumſtances which make us ſhare with another in a Theft, or other Crime, in theſe two *Technical Verſes*.

Juſſio, Concilium, Conſenſus, Palpo, Recurſus,
Participans, Mutus, non Obſtans, non Manifeſtans.

The firſt of Father *Buffier*'s *Technical Verſes* of the Hiſtory of *France*, are theſe:

Ses Loix en quatre Cents Pharamond Introduit,
Clodion Chevelu, qu Aetius vanquit,
Merovee, avec lui Combatit Attila;
Childeric fat chaſſee, mais on le rapalla.

TECHNICAL *Words*, are what we otherwiſe call *Terms of Art*. See TERM.

TE DEUM, a kind of Hymn, or Song of Thankſgiving, uſed in the Church, beginning with the Words *Te Deum laudamus, We praiſe thee, O God.*

'Tis uſed to be ſung in the *Romiſh* Church with extraordinary Pomp and Solemnity, upon the gaining a Battle, or other happy Event. The *Te Deum* is uſually aſcrib'd to St. *Ambroſe*, and St. *Auguſtin*.

TEETH, *Dentes*, in Anatomy, little hard ſmooth Bones, ſet in the Gums, and ſerving to maſticate or chew the Food, to bite, &c. See FOOD, MASTICATION, &c.

Men, and moſt terreſtrial Animals, as alſo ſome Fiſhes, have two Rows of Teeth, the one in the upper Jaw, and the other in the lower. See GUM and JAW.

In Men, the ordinary Number of *Teeth* is 32, ſixteen in each Jaw; all fix'd in peculiar Sockets, call'd *Alveoli*; by the Juncture or Articulation, call'd *Gomphoſis*, and by the Joyners, *Pegging*. See GOMPHOSIS.

They are of three Sorts: Thoſe in the fore Part of each Jaw are call'd *Inciſores*, *Cutters*; and are four in Number in each Jaw, broad, thin, and flat: Some call them the *Primores*, becauſe they appear the firſt; others the *Adverſi*; and others the *Ridentes*, *Laughers*, becauſe they ſhew themſelves firſt in Laughing. See INCISORES.

Behind theſe, on each Side of each Jaw, ſtand two which are a little more prominent, and pointed, call'd *Canini*, by the People *Eye-Teeth*, becauſe Part of the Nerve which moves the Eyes is inſerted into them; whence the Danger of pulling them out. See CANINI.

Behind theſe are five in each Jaw, call'd the *Molares* or *Grinders*, being thoſe which in Men ſerve chiefly for Maſtication. See MOLARES.

The *Inciſores* have generally only a ſingle Root, or Twang; the *Canini* ſometimes two; and the *Molares* three or four, eſpecially the hind ones, which are put to the greateſt Streſs.

The *Teeth*, according to *Peyer*, are form'd of convolv'd Skins, harden'd and bound together by a viſcid Mucus: And if we view the Grinders of Deer, Horſes, and Sheep, &c. we ſhall find great Reaſon to be of his Mind.

Others ſpeak of their Formation otherwiſe. The Sockets, Dr. *Quincy* obſerves, are lin'd with a thin Membrane, upon which are ſeveral Veſſels, thro' which there paſſes a thick tranſparent Humour, that, as it increaſes, hardens in form of Teeth; and about the ſeventh or eighth Month after Birth, they begin to pierce the Edge of the Jaw, tear the Perioſteum and Gums, which being very ſenſible, create a violent Pain, and other Symptoms incident to Children in the Time of Dentition. See DENTITION.

The *Teeth* begin not to appear all at a Time; but firſt the *Dentes inciſivi* of the upper, and then thoſe of the lower Jaw appear, becauſe the thinneſt and ſharpeſt; after them come out the *Canini*, becauſe they are ſharper than the *Molares*, but thicker than the *Inciſivi*; and laſt of all the *Molares*, becauſe they are thickeſt and bluntеſt.

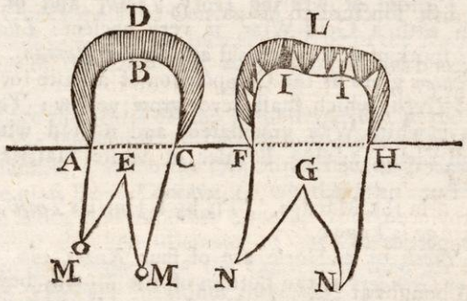
Of this viſcous tranſparent Liquor, which is indurated into the Subſtance of the *Teeth*, there are two Lays, one below the other, divided by the ſame Membrane which covers all the Cavity of the Jaw: The uppermoſt Lay forms the *Teeth* which come out firſt; but about the ſeventh Year of Age they are thruſt out by the *Teeth* made of the undermoſt Lay, which then begin to ſprout; and if theſe *Teeth* be loſt, they never grow again.

If ſome have been obſerv'd to ſhed their *Teeth* twice, they have had three Lays of this viſcous Humour, which hardly ever happens.

About the one and twentieth Year, the two laſt of the *Molares* ſpring up, and are call'd *Dentes Sapientiæ*, becauſe they ariſe when the Perſon is at Years of Diſcretion.

The *Teeth*, M. *de la Hire* the younger, has found to have all that Part which ſtands out beyond the Jaw, cover'd with a peculiar Subſtance quite different from the Bone, which he calls *Email*, or Poliſh.

This Email, by ſome others call'd the *Perioſteum*, is compos'd of an Infinity of little Fibres, which grow to the Bone by their Roots, much like Nails or Horns. See NAIL.



This Compoſition is very diſcernable in a broken Tooth, where the Origin and Situation of the Fibres are apparent. M. *de la Hire* is perſwaded, that the Growth of theſe Fibres is perform'd much like that of Nails. If by any Accident a little Part of this Email be broke off, ſo that the Bone is left bare, that is, if the very Roots of the Fibres be taken away, the Bone, in that Part, will grow carious, and the *Tooth* inevitably periſh; there being no Bone in the Body that can bear the Air. See BONE.

Indeed, in ſome Perſons the Email is very much wore and ſhatter'd, by rubbing them much with Dentrifices, &c. ſo that the Bone appears thro', and yet the *Tooth* keeps ſound; but the Reaſon is, that the Bone is not quite bare, but there is ſtill a thin Lay of the Email which preſerves it; but this Lay being thin enough to be tranſparent, the yellow Bone is ſeen thro' it.

Sometimes alſo a *Tooth* breaks, and the Bone is left bare, yet the Perſon does not find any Pain or aking from it: The Reaſon is, that the Hole in the Root or Twang of the *Tooth* thro' which a little Branch of a Nerve enters that renders the *Tooth* ſenſible, being quite ſtopp'd up by Age, or the like, has pinch'd off the Nerve, and taken away all Communication between the *Tooth* and the Origin of the Nerves, and, by Conſequence, all Senſibility.

It alſo happens in ſome *Teeth*, that the Fibres are only in little Sheaves or Bundles, whoſe upper Extremities meet, but not their lower; as is the Caſe in moſt of the Grinders, where the Separation of the Bundles is apparent. Here, if the upper Extreme of the Fibres chance to be broken, or wore off, the Separation between two of the Bundles often enlarges itſelf, ſo as to admit ſome hard Particle of the Food, by which Means a little Aperture being made thro' the Email, the Bone is laid bare, and the *Tooth* ſoon rots. This Inconvenience is remedy'd a little by ſtopping up the Hole with Lead, which prevents the ſharp pungent Parts of the Food from penetrating to the Bone, and there occaſioning Pain. See ODONTALGY.

What we have ſaid is illuſtrated by the adjoining Figures, where A C F H expreſſes the Extremity of the Jaw the *Teeth* are ſet in; A F C and F G H the Roots or Twangs of the *Teeth* inclos'd in the Jaw; A D C B and F L H I L the *Email*, compos'd of little Fibres ranged aſide of each other, which cover all that Part of the *Tooth* without Side the Jaw; I I ſeveral Threads join'd at the upper Extremity, but apart at the lower; M M Holes thro' which the Nerves enter the Roots of the *Teeth*; N N a *Tooth* cloſed up.

The *Teeth*, Mr. *Derham* obſerves, furniſh us with a notable Inſtance of the Wiſdom and Goodneſs of the Creator: Their peculiar Hardneſs is very remarkable, conſidering the tender Subſtance they are form'd of. See BONE.

The Ancients, and even *Riolanus*, among the Moderns, have held them to be incombuſtible, and the only Part of the Body that was ſo; on which Account they were placed with great Care in the Urns among the Aſhes of the Deceas'd: But the Opinion is falſe, there having only been two found in the Tombs of *Weſtphalia*, one of which was half calcin'd.

Another popular Error is, that the *Teeth* continue growing for ever, even in old People, to the Hour of their Death. M. *de la Hire* obſerves, 'tis only the Email or Poliſh that grows, which is a Subſtance very different from the *Teeth*.

The Form, Diſpoſition, and Order of the *Teeth* are admirable: The foremoſt weak and far from the Centre, as being only Preparers to the reſt; the others being to grind and mince, are accordingly ſtronger, and placed near the Centre of Motion.

Galen puts the Caſe, that the Order of the *Teeth* ſhould have been inverted, and the Grinders, *e. gr.* put in the Place of the Inciſors; and asks, what Uſe the *Teeth* had then been of, and what Confuſion would not there have aroſe by ſuch a ſlight Overſight in the Diſpoſal only? Upon which he argues, that if any Perſon ſhould diſpoſe a Company of 32 Men, the Number of the *Teeth*, in a juſt Order, we ſhould judge him an intelligent Perſon: Why then ſhould we not judge the ſame of the Creator, &c.? *De uſu Partium.*

Again, their various Forms in various Animals is no leſs conſiderable, being all curiouſly adapted to the peculiar Food and Occaſions of the ſeveral Species of Animals: Thus in the Rapacious they are fitted for the catching, holding, and tearing the Prey; in Herbaceous for the Gathering and Communition of Vegetables; and in ſuch as have no *Teeth*, as Birds, the Bill ſupplies the Defect. See BILL.

Add, that the temporary Defect of them is no leſs obſervable in ſome: That Children, for Inſtance, ſhould have none while they are not able to uſe them, but to hurt themſelves, or the Mother; and that at the very Age when they can take in the more ſubſtantial Food, and live without the Breaſt, and begin to need *Teeth* for the Sake of Speech; that then, we ſay, their *Teeth* ſhould begin to

appear, and gradually grow as they more and more ſtand in need of them.

Some Perſons are born with all their *Teeth*, as *Marcus Curius Dentatus*, and *Cneius Pampirius Carbo*: Others have only had one continu'd *Tooth*, reaching the whole Length of the Jaw, as *Pyrrhus*, King of *Epirus*, and *Pruſias*, Son of the King of *Bithynia*: Others are ſaid to have had two or three Rows on the ſame Jaw, as *Hercules*.

Mentzelius, a *German* Phyſician, aſſures us, that he ſaw an old Man at *Cleves*, in 1666, aged 120 Years, who had a new Set of *Teeth* two Years before, which cut with great Pain; and he ſaw an *Engliſhman* at the *Hague*, who cut a new Set of *Teeth* in his 118th Year.

A *Daniſh* Phyſician, named *Hageruſ*, maintains in certain Theſes, that one may hear with the *Teeth*. See HEARING.

As to Animals, there are ſome Fiſhes have *Teeth* on their Tongues, as Trouts; others have them at the Bottom of the Gullet, as the Cod Fiſh; ſome, as the great Sea-Dog, call'd *Canis Carcharius*, have three, four, or five Rows of *Teeth* on the ſame Jaw; the Requiem and Crocodile have each three, and thoſe all Inciſors; Vipers and Sea Frogs have two large crooked Canine *Teeth*, which are moveable, and ordinarily lie flat, only rais'd when they would bite. See VIPER, &c.

The Toad and Cuttle Fiſh have no *Teeth*, and yet bite. See BITE.

Artificial TEETH, are thoſe ſet in lieu of natural ones which are wanting.

They are uſually made of Ivory; but in regard Ivory, in a little Time, grows yellow in the Mouth, *Fabricius* adviſes them to be made of the Shin-bone of a Bullock, which preſerves its Colour.

The Cuſtom of wearing Ivory *Teeth*, and of binding them in with a Gold Wiar, is very ancient: *Lucian* and *Martial* ſpeak of it as practis'd among the *Romans*.

Guilleman gives us the Compoſition of a Paſte for making *artificial Teeth*, which ſhall never grow yellow: The Compoſition is white Wax granulated, and melted with a little Gum Elemi, adding Powder of white Maſtick, Coral, and Pearl.

TEETH in the Manage. 'Tis by a Horſe's *Teeth*, chiefly, that his Age is known.

The *Teeth* of a Horſe are of four *Kinds*, *viz.* 24 *Jaw Teeth*, or *Grinders* at the Bottom of the Mouth, beyond the Bars; 12 on each Side the Canal, ranged 6 above, and as many below: Theſe never fall, nor are they uſed for the Diſtinction of Age.

12 *Foal-Teeth*, which come in the fore Part of the Mouth at three Months old, and are uſually caſt at two Years and half.

4 *Tuſhes* placed alone in the Bars between the fore *Teeth* and Grinders, one on each Side below, and as many above. Mares ſeldom have Tuſhes, and when they have, they are ſmall, and are reckon'd an Imperfection.

12 *Gatherers* growing before in the Place of the *Foal-Teeth* and Grinders, and with which Horſes draw their Fother, cut Graſs, &c. Theſe are divided into

Nippers, which are the two foremoſt *Teeth* above and below, which a Horſe firſt changes.

Middle Teeth, or *Separaters*, parting the Nippers from the Corner *Teeth*, are the two next the Nippers, one on each Side of 'em both above and below, and are thoſe which change next.

Outward or *Corner Teeth*, are thoſe next the Tuſhes above and below, and which are caſt laſt. 'Tis by theſe that the Horſe's Age is known. They ſhoot forth from the Gum at five Years of Age, and have a Hollow, wherein is a black Speck, reſembling a Bean, call'd the *Mark*, which continues till ſeven or eight Years of Age, and then begins to fill up. See MARK.

TEGUMENT. See INTEGUMENT.

TEINTS, and *Semi*-TEINTS, in Painting, the ſeveral Colours us'd in a Picture, conſider'd as more or leſs high, or bright, or deep, or thin, or weaken'd, or diminiſh'd, &c. to give the proper Relievo, or Softneſs, or Diſtance, &c. of the ſeveral Objects. See COLOURING.

The Word is pure *French*, where it ſignifies the ſame Thing.

TEIRS, the third Part of a Pipe, or the Meaſure of forty-two Gallons. See TIERCE, MEASURE, &c.

TEKUPHÆ, in the *Jewiſh* Chronology, are the Times wherein the Sun proceeds from one Cardinal Point to the next. See CARDINAL *Point*.

The Term is alſo apply'd to the Moments wherein the Sun enters a Cardinal Point: Theſe four Terms, or *Tekuphæ*, are obſerv'd among the *Jews* with a World of Ceremony: The Reaſon, as we are inform'd by *Munſter*, is this:

That People have a Notion, that in each *Tekupha* the Sun has a ſeveral Angel appointed to guard and direct it; and that in the very Point wherein the Sun finiſhes one *Tekupha*, and enters upon another, before the one Director has taken Place of the other, the Devils have a Power to exerciſe all Kinds of Tyranny in the Water.

And hence, they ſay, that if any body drinks the ſmalleſt Quantity of Water at that Time, he'll infallibly have a Dropſy, or ſome other grievous Diſtemper.

TELAMONES: The *Romans* call'd by this Name, what the *Greeks* named *Atlantes*; *viz.* the Figures of Men ſupporting the Out-jettings of Cornices, &c. in Architecture. See ATLANTES.

A late Author thinks, that the Word *Telemon*, which in *Greek* is τλήμων, a Wretch that bears Misfortunes with Patience, does not diſagree with thoſe Statues, which, in Architecture, ſuſtain ſuch Loads.

TELESCOPE, an Optical Inſtrument, conſiſting of ſeveral Glaſſes or Lens's, fitted into a Tube; thro' which remote Subjects are ſeen as if nigh at Hand. See LENS and OPTIC *Glaſs*.

In *Teleſcopes*, the Lens or Glaſs turn'd towards the Object, is call'd the *Object Glaſs*; and that next the Eye, the *Eye-glaſs*; and if the *Teleſcope* conſiſts of more than two Lens's, all but that next the Objects, are call'd *Eye-glaſſes*. See OBJECT-*glaſs*, &c.

The Invention of the *Teleſcope* is one of the nobleſt, and moſt uſeful theſe Ages have to boaſt of: By means hereof, the Wonders of the Heavens are diſcover'd to us, and Aſtronomy brought to a Degree of Perfection, which former Ages could have no Notion of. See ASTRONOMY.

Indeed, the Diſcovery is owing rather to Chance, than to Thought; ſo that 'tis the good Fortune of the Diſcoverer, not his Skill or Ability, we are indebted to: On this Account it concerns us the leſs to know, who it was firſt hit on this admirable Invention. 'Tis certain it muſt be caſual, ſince the Theory it depends on was not then known.

Johannes Baptiſta Porta, a noble *Neapolitan*, is aſſerted by *Wolffius* to be undoubtedly the firſt that made a *Teleſcope*; from this Paſſage in his *Magia Naturalis*, printed in 1549: "If you do but know how to join the two (*viz.* the Concave and Convex Glaſſes) rightly together, you will ſee both remote and near Objects, much larger than they otherwiſe appear, and withal very diſtinct. In this Way we have been of good Help to many of our Friends, who either ſaw remote Things dimly, or near ones confuſedly; and have made them ſee every thing perfectly.

But 'tis certain *Porta* did not underſtand his own Invention, and therefore neither troubled himſelf to bring it to greater Perfection, nor ever apply'd it to Cœleſtial Obſervation. What is more, the Account *Porta* gives of his Concave and Convex Lens's is ſo dark and indiſtinct, that *Kepler*, who examin'd it, by particular Command of the Emperor *Rudolphus*, declar'd to that Prince, that it was perfectly unintelligible.

Fifty Years afterwards, a *Teleſcope*, 12 Inches long, was made and preſented to Prince *Maurice* of *Naſſau*, by a Spectacle-maker of *Middlebourg*; but Authors are divided about his Name. *Sirturus*, in a Treatiſe of the *Teleſcope*, printed Anno 1618, will have it to be *John Lipperſein*: And *Borel*, in an expreſs Volume on the Inventor of the *Teleſcope*, publiſh'd in 1655, ſhews it to be *Zacharias Janſen*, or, as *Wolffius* has it, *Hanſen*.

Joh. Lapreius, another Workman of the ſame Town, paſſes for a third Inventor; having made one in 1610, on the mere Relation given him of that of *Zachary*.

In 1620, *James Metius*, Brother of *Adrian Metius*, Profeſſor of Mathematicks at *Franeker*, came with *Drebel* to *Middlebourg*, and there bought *Teleſcopes* of *Zachary*'s Children, who had made them publick; and yet *Hadr. Metius* has given his Brother the Honour of the Invention; in which he is miſtakenly follow'd by *Des Cartes*.

But none of theſe Artificers made *Teleſcopes* of above a Foot and half: *Simon Marius* in *Germany*, and *Galileo* in *Italy*, firſt made long ones, fit for Cœleſtial Obſervations.

Le Roſſi relates, that *Galileo* being then at *Venice*, was told of a Sort of Optic Glaſs made in *Holland*, which brought Objects nearer: Upon which, ſetting himſelf to think how it ſhould be, he ground two Pieces of Glaſs into Form as well as he could, and fitted them to the two Ends of an Organ Pipe, and ſhew'd, at once, all the Wonders of the Invention to the *Venetian* Nobleſſe on the Top of the Tower of St. *Mark*. That Author adds, that from this Time *Galileo* devoted himſelf wholly to the improving and perfecting of the *Teleſcope*; and that he thereby almoſt deſerv'd all the Honour uſually done him, of being reputed the Inventor of the Inſtrument, and of its being denominated from him *Galileo*'s *Tube*.

F. *Mabillon*, indeed, relates, in his Travels thro' *Italy*, that in a Monaſtery of his own Order, he ſaw a Manuſcript Copy of the Works of *Commeſtor*, written by one *Coradus*, who liv'd in the 13th Century; in the third Page whereof, was ſeen a Portrait of *Ptolomy* viewing the Stars thro' a Tube of four Draws: But that Father does not ſay that the Tube had Glaſſes in it. In effect, 'tis more than probable, that ſuch Tubes were then uſed for no other Purpoſe but to

preſerve

preserve and direct the Sight, or to render it more distinct, by singling out the particular Object look'd at, and shutting out all the foreign Rays reflected from others, whose Proximity might have render'd the Image less precise.

This Conjecture is verify'd by Experience; we having often observ'd, that without a Tube, by only looking thro' the Hand, or even the Fingers, or a Pin-Hole in a Paper, Objects shall appear more clear and distinct than otherwise.

Be this as it will, 'tis certain the Optic Principles, whereon *Telescopes* are founded, are contain'd in *Euclid*, and were well known to the ancient Geometricians; and 'tis for want of Attention thereto, that the World was so long without that admirable Invention; as, no doubt, there are numerous others lying hid in the same Principles, only waiting for Reflection or Accident to bring them forth.

Telescopes are of several Kinds, distinguish'd by the Number and Form of their Lens's or Glasses, and denominated from their particular Uses, *&c.* such are the *Terrestrial* or *Land Telescope*, the *Cœlestial* or *Astronomical Telescope*: To which may be added, the *Galilean* or *Dutch Telescope*, the *Reflecting Telescope*, and the *Aerial Telescope*.

Galileo's, or the Dutch TELESCOPE, is a *Telescope* consisting of a Convex Object-glass, and a Concave Eye-glass. See CONCAVE and CONVEX.

This, of all others, is the most ancient Form, being the only Kind made by the Inventors, *Galileo*, *&c.* or known, before *Huygens*: Whence its Name. Its Construction, Perfections, Imperfections, *&c.* are deliver'd in what follows.

Construction of Galileo's *or the* Dutch TELESCOPE.

In a Tube prepar'd for the Purpose, (the Structure whereof see under the Article TUBE) at one End is fitted a Convex Object Lens, either a plain Convex, or Convex on both Sides, but a Segment of a very large Sphere: At the other End is fitted an Eye-glass, concave on both Sides, and the Segment of a less Sphere; so dispos'd, as to be the Distance of the Virtual Focus before the Image of the Convex Lens. See FOCUS.

Theory of Galileo's TELESCOPE.

Now, in an Instrument thus framed, *all People, except Myopes*, or those short-sighted, *must see Objects distinctly, in an erect Situation; and increased in the Ratio of the Distance of the Virtual Focus of the Eye Glass, to the Distance of the Focus of the Object Glass.*

But, for Myopes to see Objects distinctly thro' such an Instrument, the Eye-glass must be set nearer the Object-glass. The Reason of these Effects will appear from what follows:

For, 1°, Since 'tis far distant Objects that are to be viewed with a *Telescope*, the Rays proceeding from the same Point of the Object, will fall on the Object-glass, parallel; and, consequently, by their Refraction thro the Convexity will be thrown Converging on the Eye-glass. But by their Refraction thro' the Concavity hereof, they will be again render'd parallel; and in such Disposition will enter the Eye. See RAY, CONCAVITY, CONVEXITY, and CONVERGING.

But all, excepting Myopes, see Objects *distinctly* by parallel Rays. See VISION and PARALLEL. *Therefore the first Point is clear.*

2° Suppose A (Tab. Opticks, Fig. 41.) to be the Focus of the Object-glass; and suppose A C the furthest Ray on the Right Hand of the Object that passes through the Tube: After Refraction, it will become parallel to the Axis B I, and, consequently, after a second Refraction through the concave Lens, will diverge from the virtual Focus. Wherefore, since all the Rays coming from the same Extreme to the Eye placed behind the concave Lens, are parallel to L E; and those from the middle of the Object, parallel to F G (as shewn under the former Article) the middle Point of the Object will be seen in the Axis G A; and the right Extreme, on the right Side, *viz.* in the Line L N, or parallel thereto: that is, the Object will be *erect*; *Which is the second Point.*

3° Since all Right Lines parallel to L E cut the Axis under the same Angle; the Semi-diameter of the Object will be seen through the *Telescope*, under the Angle E F I; the Rays L E and G I entring the Eye in the same Manner, as if the Pupil were placed in F. If, now, the naked Eye were in A, it would see the Semi-diameter of the Object under the Angle c A b or C A B. But since the Object is supposed very remote, the Distance A F in respect hereto is nothing, and therefore the naked Eye, even in F, would see the Semi-diameter of the Object under an Angle, equal to A.

The Semi-diameter of the Object, therefore, seen with the naked Eye, is to that seen through the *Telescope* as I M to I E. But 'tis demonstrated, that I M : I E :: I F : A B; that is, the Semi-diameter seen with the naked Eye, is to that viewed through the *Telescope*; *in the Ratio of the Distance of the Virtual Focus of the Eye-glass* F I, *to the Distance of the Focus of the Object-glass*, A B; *Which was the third Point.*

Lastly, Myopes have their Retina too far from the crystallin Humour; and diverging Rays, concur at a greater Distance than parallel ones; and those that were parallel become diverging by bringing the Eye-glass nearer the Object-glass; by means of such Approach, *Myopes will see Objects distinctly* through a *Telescope*; *Which is the fourth Point.*

Hence, 1°, To have the whole Object visible, the Semi-diameter of the Pupil must not be less than the Distance of the Rays L E and G I; and, therefore, the more the Pupil is dilated, the greater *Field* or Compass will be taken in by the *Telescope*, and *vice versa*; so that coming out of a dark Place, or shutting the Eye for some time e'er you apply it to the Glass, you will take in a greater Field at first Glance, than afterwards, when the Pupil is again contracted by the Increase of Light. See PUPIL.

2° Since the Distance of the Rays E L and I K is greater, at a greater Distance from the Lens; the Compass taken in by the Eye at one View, will be greater as the Eye is nearer the Concave Lens.

3° Since the Focus of a Plano Convex Object Lens, and the Focus of a Plano Concave Eye Lens, is at the Distance of the Diameter; and the Focus of an Object-glass, convex on both Sides, and the virtual Focus of an Eye-glass concave on both Sides, is at the Distance of a Semi-diameter; if the Object-glass be Plano Convex, and the Eye-glass Plano Concave, the *Telescope* will increase the Diameter of the Object, in the *Ratio* of the Diameter of the Concavity to that of the Convexity: If the Object-glass be Convex on both Sides, and the Eye-glass Concave on both Sides, it will magnify in the *Ratio* of the Semi-diameter of the Concavity to that of the Convexity; if the Object-glass be Plano Convex, and the Eye-glass Concave on both Sides, the Semi-diameter of the Object will be increased in the *Ratio* of the Diameter of the Convexity to the Semi diameter of the Concavity: And, Lastly, if the Object-glass be Convex on both Sides, and the Eye-glass Plano Concave, the Increase will be in the *Ratio* of the Diameter of the Concavity, to the Semi-diameter of the Convexity.

4° Since the *Ratio* of the Semi-diameters is the same as that of the Diameters: *Telescopes* magnify the Object in the same Manner, whether the Object-glass be Plano Convex, and the Eye-glass Plano Concave, or whether the one be Convex on both Sides, and the other Concave on both.

5° Since the Semi-diameter of the Concavity, has a less *Ratio* to the Diameter of the Convexity, than its Diameter has; a *Telescope* magnifies more, if the Object-glass be Plano Convex, than if it be Convex on both Sides.

6° The greater the Diameter of the Object-glass, and the less that of the Eye-glass; the less *Ratio* has the Diameter of the Object viewed with the naked Eye, to its Semi-diameter viewed with a *Telescope*; and, consequently, the more is the Object magnified by the *Telescope*.

7° Since the Semi-diameter of the Object is increased in the *Ratio* of the Angle E F I; and the greater the Angle E F I is, the less Part of the Object does it take in at one View; the *Telescope* exhibits so much a less Part of the Object, as it increases its Diameter more.

And this is the Reason that determined the Mathematicians to look out for another *Telescope*, after having clearly found the Imperfection of the first, discover'd by Chance. Nor were their Endeavours vain; as appears from the Astronomical *Telescope* hereafter to be described.

If the Semi-diameter of the Eye-glass, have too small a *Ratio* to that of the Object-glass, an Object through the *Telescope*, will not appear sufficiently clear, by reason the great Divergency of the Rays will occasion the several Pencils representing the several Points of the Object on the Retina, to consist of too few Rays. This, too, is found, that equal Object Lens's won't bear the same Eye Lens, if they be differently transparent, or there be a Difference in their Polish. A less transparent Object-glass, or one less accurately ground, requires a more spherical Eye-glass, than another more transparent, *&c.*

Hence, though it be found by Experience, that a *Telescope* is good, if the Distance of the Focus of the Object-glass be six Inches, and the Diameter of the Plano Concave Eye-glass be one Inch and one Line, or of one equally Concave on both Sides, one Inch and a Half; yet is it by no means expedient to recommend to the Artificer, either this or any particular Combination; but to try several Eye-glasses, both greater and smaller, with the same Object-glass; and take that through which Objects appear most clear and distinct.

Hevelius recommends an Object-glass Convex on both Sides, whose Diameter is four *Dantzic* Feet; and an Eye-glass Concave on both Sides, whose Diameter is 4 $\frac{1}{2}$ Digits or Tenths of a Foot. An Object-glass, equally Convex on both Sides, whose Diameter is five Feet, he observes, will require an Eye-glass of 5 $\frac{1}{2}$ Digits; and adds, that the same Eye-glass will also serve an Object-glass of eight or ten Feet.

Hence, as the Distance of the Object-glass and Eye-glass is the Difference between the Distance of the virtual Focus of the

Eye-

Eye-glaſs, and the Diſtance of the Focus of the Object-glaſs; the Length of the *Teleſcope* is had by ſubſtracting that from this. That is, the Length of the *Teleſcope* is the Difference between the Diameters of the Object-glaſs and Eye-glaſs, if that be Plano Convex and this Plano Concave; or the Difference between the Semi-diameters of the Object-glaſs, and Eye-glaſs, if that be Convex on both Sides, and this Concave on both; or the Difference between the Semi-diameter of the Object-glaſs and Eye-glaſs, if that be Convex on both Sides, and this Concave on both; or the Difference between the Semi-diameter of the Object-glaſs, and the Diameter of the Eye-glaſs, if that be Convex on both Sides, and this, Plano Concave; or the Difference between the Diameter of the Object-glaſs, and the Semi-diameter of the Eye-glaſs if that be Plano Convex, and this Concave on both Sides.

Thus, *e. gr.* If the Diameter of an Object-glaſs on both Sides, be four Foot, and that of an Eye-glaſs Concave on both Sides, be Four and a Half Digits or Tenths of a Foot; the Length of the *Teleſcope* will be one Foot eight Digits.

Aſtronomical TELESCOPE, is a *Teleſcope* conſiſting of an Object-glaſs and an Eye-glaſs, both Convex. See CONVEXITY.

It has its Name, from its being wholly uſed in Aſtronomical Obſervations.

Conſtruction of the Aſtronomical TELESCOPE.

The Tube being prepared, an Object-glaſs, either Plano Convex, or Convex on both Sides, but to be a Segment of a large Sphere, is fitted in at one End. At the other End, an Eye-glaſs Convex on both Sides, which is the Segment of a ſmall Sphere, is fitted into the other End, at the common Diſtance of the Foci.

Theory of the Aſtronomical TELESCOPE.

Now, *an Eye placed near the Focus of the Eye-glaſs, will ſee Objects diſtinctly, but inverted; and magnify'd in the Ratio of the Diſtance of the Focus of the Eye-glaſs to the Diſtance of the Focus of the Object-glaſs.*

For 1° Since 'tis very remote Objects are viewed through *Teleſcopes*, the Rays from any Point of the Object, fall parallel on the Object-glaſs; and, conſequently, after Refraction, will meet in a Point behind the Glaſs, which Point is the Focus of the Eye-glaſs. From this Point they begin to diverge, and fall diverging on the Eye-glaſs, where being refracted, they enter the Eye parallel.

Hence, as all but Myopes ſee diſtinctly by parallel Rays, a *Teleſcope*, thus diſpos'd, will exhibit remote Objects *diſtinctly*.

Suppoſe the common Focus of the Lens's in F, (Fig. 42.) and make AB = BF. Since one of the Rays AC, proceeding from the Right Side of the Object, paſſes thro' A; the Ray CE will be parallel to the Axis AI, and therefore after Refraction in the Eye-glaſs, will fall in with it in its Focus G. Since then, the Eye is placed near it; and all the other Rays proceeding from the ſame Point of the Object with EG, are refracted parallel thereto; the Point in the Right Side of the Object, will be ſeen in the Right Line EG.

After the like Manner it appears, that the middle Point of the Object is ſeen in the Axis GB ſo that the Object appears *Inverted.*

3° From what has been already ſhewn, it appears that the Semi-diameter of the Object will be ſeen through the *Teleſcope*, under the Angle EGI, which to the naked Eye placed in A, is ſeen under the Angle bAc. Suppoſe, now, IF equal to the Diſtance of the Focus IG; ſince the Right Angles at I are equal; EGF = EFI. Therefore drawing FM parallel to AC, we ſhall have IFM = BAC. The Semi-diameter, therefore, viewed with the naked Eye, is to that viewed through the *Teleſcope*, as IM to IE. Draw KE parallel to FM; we ſhall have IM : IE :: IF : IK. But by reaſono fthe Paralleliſm of the Lens's; CE = BI = BF + FI = AB + FI; and by reaſon of the Paralleliſm of the Right Lines CA, and EK; CE = AK, therefore BI = AK, conſequently, AB = IK. And, therefore, IM : IE :: IF : AB; that is, the *Semi-diameter ſeen with the naked Eye, is to the Semi-diameter view'd through the* Teleſcope, *in the* Ratio *of the Diſtance of the Focus of the Eye-Lens* IF, *to the Diſtance of the Focus of the Object-glaſs* AB. Q. e. d.

Hence, 1°, As the *Aſtronomical Teleſcope* exhibits Objects Inverted; it ſerves, commodiouſly enough for obſerving the Stars (it mattering little, whether they be ſeen Erect or Inverted) but for Terreſtrial Objects, 'tis much leſs proper, as the Inverting mutually prevents their being known.

2° If between the Eye-glaſs, and its Focus G, be a plain well-poliſh'd Metal Speculum LN, of the Length of an Inch, and of an Oval Figure, inclined to the Axis under an Angle of 45°, the Rays EP and MQ will be reflected in ſuch Manner, as that concurring in g, they make an Angle PgQ, equal to PGQ: And therefore the Eye being placed in *g*, will ſee the Object of the ſame Magnitude as before, only in an erect Situation. By the Addition, therefore, of ſuch a Speculum, the *Aſtronomical Teleſcope*, is render'd fit to obſerve Terreſtrial Objects. See MIRROR.

3° Since the Focus of a Glaſs Convex on both Sides, is diſtant from the Glaſs itſelf, a Semi-diameter; and that of a Plano Convex Glaſs, a Diameter; if the Object-glaſs be Convex on both Sides, the *Teleſcope* will magnify the Semi-diameter of the Object, in the *Ratio* of the Semi-diameter of the Eye-glaſs to the Semi-diameter of the Object-glaſs; but if the Object-glaſs be a Plano Convex, in the *Ratio* of the Semi-diameter of the Eye-glaſs, to that of the Object-glaſs.

4° Wherefore, ſince the Semi-diameter of the Eye-glaſs has a greater *Ratio* to the Semi-diameter of the Object-glaſs, than to its Diameter; a *Teleſcope* magnifies the Semi-diameter of the Object more, if the Object-glaſs be a Plano Convex, than if Convex on both Sides.

5° The *Ratio* of the Semi-diameter of the Eye-glaſs, to the Diameter or Semi-diameter of the Object-glaſs, is the leſs, as the Eye-glaſs is a Segment of a leſs Sphere, and the Object-glaſs of a greater. A *Teleſcope*, therefore, magnifies the Diameter of the Object more, as the Object-glaſs is a Segment of a greater, and the Eye-glaſs of a leſſer Sphere. And yet the *Ratio* of the Semi-diameter of the Eye glaſs to the Object-glaſs muſt not be too ſmall: If it be, it will not refract Rays enough to the Eye from each Point of the Object; nor will it ſeparate thoſe coming from different Points ſufficiently: by which means the Viſion will be render'd obſcure, and confuſed. To this may be added, what we have ſhewn, of the *Ratio* of the Object-glaſs to the Eye-glaſs in the *Dutch Teleſcope.*

De Chales obſerves, that an Object Lens of 2 $\frac{1}{4}$ Feet will require an Eye-glaſs of 1 $\frac{1}{2}$ Digit or Tenth of a Foot; and an Object-glaſs of eight or ten Feet, an Eye-glaſs of four Digits; in which he is confirm'd by *Euſtachio de Divinis.*

Huygens's great *Teleſcope*, wherewith *Saturn*'s true Face, and one of his *Satellites* were firſt diſcovered, conſiſts of an Object-glaſs of 12 Feet, and an Eye-glaſs of a little more than Three Digits. Though he frequently uſed a *Teleſcope* 23 Feet long, with two Eye-glaſſes joined together, each in Diameter 1 $\frac{1}{2}$ a Digit; ſo that the Two were equal to One of Three Digits. The ſame Author obſerves, that an Object-glaſs of 30 Feet, requires an Eye-glaſs of 3 $\frac{3}{10}$ Digits; and gives us a Table of Proportions, for the Conſtructing of *Aſtronomical Teleſcopes*; an Abridgment whereof, we ſhall here give the Reader.

Diſt. of Foc. of Obj. Glaſs.	Diam. of Aperture	Diſt. of F. of E. Glaſs	Magn. Diam.	Diſt. of Foc. of Obj. Glaſs	Diam. of Aperture.	Diſt. of F. of E. Glaſs	Magn. Diam.
Rhinland Feet.	Digits & Dec.	Digit and Dec.					
1	0 55	0 61	20	15	2 12	2 33	72
2	0 77	0 85	28	20	2 45	2 70	89
3	0 95	1 05	34	25	2 74	3 01	100

				100	5 48	9 03	199

If in Two or more *Teleſcopes*, the *Ratio* between the Object and Eye-glaſs be the ſame; the Object will be magnified the ſame in both.

Hence ſome may conclude, the making of large *Teleſcopes* a needleſs Trouble. But it muſt be remembered, what we have already laid down: An Eye-glaſs may be in a leſs *Ratio* to a greater Object-glaſs, than to a ſmaller: Thus, *e. gr.* in *Huygens*'s *Teleſcope* of 25 Feet, the Eye glaſs is Three Digits. Now, keeping this Proportion, in a *Teleſcope* of 50 Feet, the Eye-glaſs ſhould be Six Digits; but the Table ſhews, Four and a Half are ſufficient. Hence, from the ſame Table it appears, that a *Teleſcope* of 50 Feet magnifies in the *Ratio* of 1 : 141; whereas that of 25 Feet, only magnifies in the *Ratio* of 1 : 100.

Since the Diſtance of the Lens's is equal to the Aggregate of the Diſtance of the Foci of the Object and Eye-glaſſes; and the Focus of a Glaſs Convex on each Side is a Semi-diameter's Diſtance, and that of a Plano Convex, a Diameter's Diſtance from the Lens; the Length of a *Teleſcope* is equal to the Aggregate of the Semi-diameters of the Lens's, if the Object-glaſs be Convex on both Sides; and to the Sum of the Semi-diameter of the Eye-glaſs, and of the Diameter of the Object-glaſs, if the Object-glaſs be a Plano Convex.

But as the Semi-diameter of the Eye-glaſs is very ſmall, in reſpect of that of the Object-glaſs, the Length of the *Teleſcope* is uſually eſtimated from the Diſtance of the Object-glaſs, *i. e.* from its Semi-diameter, if it be a Convex on both Sides; or its Diameter if Plano Convex. Thus, a

Teleſcope

Teleſcope is ſaid to be 12 Feet, if the Semi-diameter of the Object-glaſs, Convex on both Sides, be 12 Feet, &c.

Since Myopes ſee near Objects beſt; for them the Eye-glaſs is to be remov'd nearer the Object-glaſs, that the Rays refracted thro' it may be the more diverging.

To take in the larger Field at one View, ſome uſe two Eye-glaſſes; the formoſt whereof is a Segment of a larger Sphere than that behind: To this it muſt be added, that if two Lens's be join'd immediately together, ſo as one touch the other, the Focus is remov'd to double the Diſtance which that of one of them would reach to.

To ſhorten the Aſtronomical Teleſcope, i. e. *to conſtruct a* Teleſcope *ſo, as that tho' ſhorter than the common one, it ſhall magnify as much.*

1°. Having provided a drawing Tube, fit in an Object Lens EG (Fig. 43.) which is a Segment of a moderate Sphere; let the firſt Eye-glaſs BD be Concave on both Sides; and ſo placed in the Tube, as that the Focus of the Object-glaſs A may be behind it, but nearer than the Centre of the Concavity G. Then will the Image be thrown in Q, ſo that GA : GI :: AB : QI. Laſtly, fit in another Object-glaſs, Convex on both Sides, and a Segment of a leſſer Sphere, ſo as that its Focus may be in Q.

This *Teleſcope* will magnify the Diameter of the Object, more than if the Object-glaſs were to repreſent its Image at the ſame Diſtance EQ; and conſequently a ſhorter *Teleſcope* conſtructed this Way, is equivalent to a longer in the common Way. The Demonſtration may be ſeen in *Wolfius*.

Sir *Iſ. Newton* furniſhes us with another Method of contracting the *Teleſcope*, in his Caloptrical or Reflecting *Teleſcope*; the Conſtruction whereof ſee hereafter.

Land Telescope, or *Day* Telescope; a *Teleſcope* conſiſting of more than two Lens's, commonly of a Convex Object-glaſs, and three Convex Eye-glaſſes: or, a *Teleſcope* that exhibits Objects erect, yet different from that of *Galileo*.

It has its Name from its being uſed to view Objects in the Day-time, or on the Earth, or from its being uſed by Day.

To conſtruct a Land or Day Telescope.

A Tube being provided, fit in an Object-glaſs, which is either Convex on both Sides, or Plano Convex, and a Segment of a large Sphere: To this add three Eye-glaſſes, all Convex on both Sides, and Segments of equal Spheres; diſpoſing them in ſuch Manner, as that the Diſtance of any two may be the Aggregate of the Diſtance of their Foci.

Theory of a Land Telescope.

Then will an Eye apply'd to the laſt Lens, at the Diſtance of its Focus, *ſee Objects very diſtinctly, erect, and magnify'd in the Ratio of the Diſtance of the Focus of one Eye-glaſs* LK (*Fig.* 44.) *to the Diſtance of the Focus of the Object-glaſs* AB.

For, 1°. the Rays, from what has been already ſaid, falling on the Object parallel; the Image of the Object will be repreſented invertedly at the Diſtance of the principal Focus: Wherefore, ſince this Image is in the Focus of the firſt Eye-glaſs, the Rays after a ſecond Refraction will become parallel, and thus falling on the third Lens, after a third Refraction they exhibit the inverted Image invertedly; that is, a direct Image of the Object. Since then this Image is in the Focus of the third Eye-glaſs, the Rays after a fourth Refraction will become parallel: And in this Diſpoſition the Eye will receive them, and conſequently there will be diſtinct Viſion, and the *Object will appear erect*.

2°. If IQ = IK, that is, equal to the Diſtance of the Focus of the Object-glaſs; the Eye placed in M, will ſee the Semi-diameter of the Object increas'd in the Ratio of LM to KI; but the Ray AQ, proceeding from the Focus Q of the Object Lens AB, after Refraction becomes parallel to the Axis IL; conſequently the firſt Eye Lens CD joins it to the Axis in M, the Diſtance of a Semi-diameter.

And ſince the Focus of the ſecond Eye-glaſs EF, is alſo in M; the Ray FH, after Refraction, will be parallel to the Axis NO; and therefore the third Eye-glaſs will join it at the Axis in P; but the Semi-diameters of the Lens's GH and CD are ſuppos'd equal; therefore PO = LM. Wherefore ſince the right Angles at O and L are equal, as alſo HO = CL, the Angle OPH is equal to CML. The Semi-diameter of the Object, therefore, appears the ſame in P as in M; and is conſequently *magnify'd in the Ratio of* LM, *or* PO *to* KI.

Hence, 1°. An Aſtronomical *Teleſcope* is eaſily converted into a Land *Teleſcope*, by uſing three Eye-glaſſes for one; and the Land *Teleſcope*, on the contrary, into an Aſtronomical one, by taking away two Eye-glaſſes; the Faculty of magnifying ſtill remaining the ſame.

2°. Since the Diſtance of the Eye-glaſſes is very ſmall, the Length of the *Teleſcope* is much the ſame as if you only uſed one.

3°. From the Conſtruction, 'tis evident that the Length of the *Teleſcope* is had by adding five times the Semi-diameter of the Eye-glaſſes to the Diameter of the Object-glaſs, if a Plano Convex; or its Semi-diameter, if Convex on both Sides.

Huygens firſt obſerv'd, both in the *Aſtronomical* and *Land Teleſcope*, that it contributes conſiderably to the Perfection of the Inſtrument, to have a Ring of Wood or Metal, with an Aperture, a little leſs than the Breadth of the Eye-glaſs, fix'd in the Place where the Image is found to radiate upon the Lens next the Eye: By Means hereof the Colours, which are apt to diſturb the Clearneſs and Diſtinctneſs of the Object, are prevented, and the whole Compaſs taken in at a View, perfectly defin'd.

Some make *Land Teleſcopes* of three Lens's, which yet repreſent Objects erect and magnify'd as much as the former. But ſuch *Teleſcopes* labour under very great Inconveniencies, both as the Objects herein are tinged with falſe Colours, and as they are diſtorted about the Margin.

Some again uſe four Lens's, and even more; but ſince ſome Part of the Rays is intercepted in paſſing every Lens, Objects are hereby exhibited dim and feeble.

Reflecting, or *Catoptric*, or *Cata-dioptric* Telescope, is a *Teleſcope*, which, inſtead of Lens's, conſiſts chiefly of Mirrors, and exhibits remote Objects by Reflection, inſtead of Refraction. See Catoptricks, &c.

This Inſtrument is the Invention of the great Sir *Iſ. Newton*: What determin'd him to apply his Thoughts this Way, was the different Refrangibility, which in his new Doctrine of Light and Colours, he found the Rays of Light were of. In effect, as he found the Ratio between the greateſt and leaſt Refractions of the different Rays, to be nearly as 28 to 27, it eaſily follow'd, that the Rays could never be all refracted parallel from any Lens, but would ſome of them divaricate more, ſome leſs; beſide that, the Foci would be diſturb'd; the Focus of the moſt refrangible Rays, being nearer the Lens than that of the leaſt refrangible ones, by a Diſtance which is the 27th Part of the Diſtance between the Object-glaſs, and the Focus of the leaſt refrangible ones. See Ray and Refrangibility.

Hence he concluded, that Refraction was too unequal a Principle; and that Lens's, of whatever Figures, whether Spherical, Parabolical, or any of the other Conic Sections, and how truly ſoever ground, would never ſuffice for the Perfection of *Teleſcopes*.

Upon this he had Recourſe to another more equable Principle, *viz. Reflection*; and made a *Teleſcope*, conſiſting of Specula, or Mirrors: The firſt Hint whereof he owns he took from Dr. *Gregory*'s Opticks.

Conſtruction of a Reflecting Telescope.

Provide a Tube ABCD, (Fig. 45.) open in AD, and clos'd in BC, well black'd within-ſide, and of a Length equal to the Diſtance of the Focus from the Concave Speculum EF. To the Bottom BC, is to be fitted a Concave metallic Speculum *ab*, poliſh'd to the greateſt poſſible Perfection; or rather, to have the Objects clearer, and more diſtinct, let it be a Glaſs Speculum, Concave on its fore Side, and equally Convex on the hind Side; for unleſs it be of the ſame Thickneſs every where, it will reflect the Images of Objects tinged with a ſpurious Colour, and indiſtinct. Towards the other End of the Tube is fix'd an Iron Piece HL, to which is cemented a plain metallic Speculum; or, which is better, a triangular Priſm of Glaſs or Cryſtal G, whoſe upper Angle G is a right Angle, the two others half right. The Faces or Planes that meet in the Angle G, to be ſquare, and the third a Parallelogram. This Priſm is to be ſo diſpos'd, as that a Ray reflected from the Speculum, paſſing thro' the Middle of the Face GM, may cut it at right Angles; but be inclin'd to the Rectangle MN in an Angle of 45°. Its Diſtance from the Concave Speculum EF, is to be ſuch, as that the Rays *ac* and *bd* reflected from the Concave Speculum, may, after a ſecond Reflection from the Baſe of the Priſm, concur in the Point *e*; that is, the Diſtance of the Focus *e* from the reflecting Surface of the Priſm, and the Diſtance of that from the Concave Speculum, is to be equal to the Diſtance of the Focus from the Concave Speculum. In I is placed a Plano Convex Lens, whoſe Focus is in *e*, that the reflected Rays may enter the Eye parallel. Laſtly, this Lens is cover'd with a thin Braſs or Leaden Plate, having a little round Perforation therein, for the Eye to look thro', by which means all foreign Rays are excluded, which would otherwiſe occaſion Confuſion.

In the firſt *Teleſcope* of this Kind which the Inventor made, the Semi-diameter of the Concave Metallic Speculum was 12 $\frac{1}{2}$ Digits, or Tenths of an Inch; from which, therefore, the Focus was 6 $\frac{1}{4}$ Digits diſtant. The Diameter of the Eye-glaſs was $\frac{1}{6}$ of a Digit; ſo that it magnify'd the Diameter of the Object in the Ratio of 1 to 38: But he found that Objects were ſhewn ſomewhat obſcure hereby; on which Account, he afterwards recommended Glaſs Specula inſtead

of Metallic ones; adding, that there is nothing more requir'd to the Perfection of this *Teleſcope*, but that the Art of poliſhing Glaſs be brought to greater Perfection; for that ſome Inequalities which don't hurt Lens's, are found to affect Specula, and prevent Objects being ſeen diſtinctly.

The ſame Author obſerves, that if the Length of the Inſtrument be 6 Feet, and conſequently the Semi-diameter of the Concave Speculum 12, the Aperture of the Speculum is to be 6 Inches; by which Means the Object will be increas'd in the Ratio of 1 to 200 or 300.

If it be longer, or ſhorter, the Aperture muſt be as the Cube of the Quadrato-quadrate Root of the Length, and its magnifying Power as its Aperture. The Speculum he orders to be an Inch or two broader than the Aperture.

Aerial TELESCOPE, a kind of *Aſtronomical Teleſcope*, the Lens's whereof are us'd without a Tube.

In Strictneſs, however, the *Aerial Teleſcope*, is rather a particular Manner of mounting and managing long *Teleſcopes*, for Cœleſtial Obſervations in the Night Time, whereby the Trouble of long unweildy Tubes is ſav'd, than a particular Kind of *Teleſcope*. The Contrivance we owe to the noble *Huygens*.

Conſtruction of the Aerial TELESCOPE.

1° A tall Pole or Maſt, A B (Fig. 46.) the Length the Tube ſhould be of, is fix'd perpendicularly in the Ground. Before the erecting it, one Side is planed ſmooth, and upon it two Rulers fix'd parallel to each other, an Inch and Half apart, including a kind of Groove or Channel between them, reaching from top almoſt to bottom. At the Top of the Pole is fitted a little Truckle A, moveable on its Axis, and over it is drawn a Cord G g, double the Length of the Pole, and the Thickneſs of the little Finger, returning into itſelf, and furniſh'd with a piece of Lead, H, equal in Weight to the Lens and a moveable Arm to be ſuſtained thereby.

Then, a wooden Lath, C D, two Foot long, is framed ſo as that it may ſlide freely in the Channel; and in the Middle thereof, is affix'd a wooden Arm E, ſtanding out a Foot from the Pole, and on its Extremity bearing another, F f, a Foot and Half long, fix'd to it at Right Angles; both of them parallel to the Horizon.

2° An Object-glaſs is included in a hollow Cylinder I K, three Inches long: To this Cylinder is fix'd a Staff, K L, near an Inch thick, and a Foot long, which reſts on a braſs Ball M, that moves freely in its Cup or Socket underneath: Only, on Occaſion, the Ball and Socket are fix'd by a Screw. That the Lens thus equally balanced, may be moved with a ſmall Force, a Weight N I of about a Pound, is ſuſpended, by a ſtrong Wiar N F, by bending which, the common Centre of Gravity of the Weight, the Lens is eaſily made to coincide with that of the Ball. To the Staff K L, is fix'd a braſs Style L, which is bent downwards, till its Point be as much below the Centre of the Staff, as the Centre of the Ball is. To the Point is tied a fine ſilken Thread L V, which, of Conſequence, will be parallel to the Staff K L.

3° An Eye-glaſs O, is included in a ſhort Cylinder; and the Staff P V, fix'd to the ſame. To this is hung a little Weight S, ſufficient to make a Balance. In Q is fix'd a Handle, R, which carries a tranſverſe Axis, to be held in the Obſerver's Hand, and the Staff P V directed towards the Object-glaſs, is tied to the Thread L V. The Thread paſs'd through a Hole, V, is wound about a little, Peg T, fix'd in the middle of the Staff; by the turning whereof, the Length of the Thread is ſhorten'd or prolong'd at Pleaſure.

4° That the Obſerver may be able to hold the Eye-glaſs ſteady; he has a Fulcrum or Prop under his Arm, the Structure whereof appears from Inſpection of the Figure. Laſtly, to keep off the feeble Light flowing from the Air upon the Eye, it is conveniently cover'd with a Circle, Y, perforated in the Middle, fitted on to a moveable and flexible Arm.

TELESCOPICAL *Stars*, are ſuch as are not viſible to the naked Eye; but diſcoverable only by the Help of a *Teleſcope*. See STAR.

All Stars leſs than the 6th Magnitude, are *Teleſcopic* to a moderate Eye.

TELLER, an Officer in the Exchequer, of which there are Four. See EXCHEQUER.

Their Buſineſs is to receive all Monies due to the Crown, and thereupon to throw down a Bill through a Pipe, into the Tally-Court, where it is received by the Auditor's Clerks, who attend there to write the Words of the ſaid Bill upon a Tally; and then deliver it to be enter'd by the Clerk of the Pells, or his Clerk. See TALLY and PELL.

The Tally is then ſplit or cloven by the two Deputy Chamberlains, who have their Seals, and whilſt the Senior Deputy reads the one Part, the Junior examins the other Part, with the other two Clerks.

Their Places are in the King's Gift, and they have, beſides their chief Clerk or Deputy, four other Clerks, for the Diſpatch of Buſineſs.

TELLUS, *Terra*, ♁, in Aſtronomy. See EARTH.

TEMPER in a { Phyſical / Muſical / Mechanical } Senſe. See { TEMPERAMENT / TEMPERAMENT *in Muſic.* / TEMPERING. }

TEMPERAMENT, TEMPERAMENTUM, TEMPERATURE, in Phyſicks, that Habitude or Diſpoſition of a Body ariſing from the Proportion of the ſeveral prime or elementary Qualities it is compoſed of. See QUALITY and ELEMENT.

The Notion of *Temperament*, ariſes from that of Mixture; where different Elements, as Earth, Water, Air and Fire (or, to ſpeak more juſtly, in the Peripatetic Way, hot, cold, moiſt and dry) are blended together; by their Oppoſition, they tend mutually to weaken and incroach on each other: and from the whole, ariſes a ſort of temperate Craſis, or Coalition of them all, in this, or that Proportion; whence, according to the Quality that prevails or predominates, we ſay a *hot* or *cold*, a *moiſt* or *dry Temperament*.

It is controverted among the School-men, Whether the *Temperament* properly comprehends all the Four primary Qualities? or, Whether thoſe do not all ceaſe, and a new one, a Fifth, ſimple Quality, reſult from the total Alteration made in the other Four, by their mutual Action on each other?

Authors diſtinguiſh two Kinds of *Temperaments*, *viz. Uniform* and *Difform*: The Firſt, wherein all the Qualities are mix'd in an equal Degree: The Second, where in an unequal one.

The Uniform *Temperament*, can only be one; the Difform admits of Eight different Combinations, ſince either any one, or any two of the Qualities may prevail; whence *hot* and *moiſt*, *cold* and *moiſt*, &c. Further, ſome conſidering that the Qualities which do prevail, may not be in equal Degree; and the like of thoſe which do not prevail; make ſeveral other Combinations or *Temperaments*; and add 12 more to the Number. In effect, as there are infinite Degrees between the higheſt and loweſt Pitch of any one of the Elements, the different *Temperatures* may be ſaid to be Infinite.

TEMPERAMENT, in Medicine, is particularly underſtood of the natural Habitude and Conſtitution of the Body of Man; or the Diſpoſition of the Animal Humours. See CONSTITUTION and HUMOUR.

The Notion of this *Temperament* ariſes hence, that the Blood flowing in the Veins and Arteries, is not conceived to be a ſimple Fluid; but a ſort of imperfect Mixt, or an Aſſemblage of ſeveral other Fluids. For it does not only conſiſt of the Four ſimple, or primary Qualities; but of Four other ſecondary Ingredients compounded thereof, into which it is ſuppoſed to be reſolvable, *viz. Choler*, *Phlegm*, *Melancholly* and *Blood*, properly ſo called. See BLOOD, CHOLER, BILE, PHLEGM, &c.

Hence, as this, or that Ingredient Humour prevails in a Perſon, he is ſaid to be of a Choleric, Phlegmatic, Melancholic, Sanguine, &c. *Temperament*. See SANGUINE, MELANCHOLLY, CHOLERIC, &c.

The ancient Phyſicians brought theſe Animal *Temperaments* to correſpond with the univerſal *Temperaments* above deſcribed: Thus the *Sanguine Temperament* was ſuppoſed to coincide with *hot* and *moiſt*; the *Phlegmatic* with *cold* and *moiſt*, the *Melancholic* with *dry* and *cold*, &c.

Galen introduced the Doctrine of *Temperaments* into Phyſic, from the Peripatetic School; and made it, as it were, the Baſis of all Medicine. The whole of curing Diſeaſes, conſiſted in *tempering* the Degrees of the Qualities, Humours, &c. See GALENICAL, DEGREE, &c.

On the Footing Medicine now ſtands, the *Temperaments* are much leſs conſider'd. Dr. *Quincy* and other Mechanical Writers, pare away the greateſt Part of the Galenic Notion, as uſeleſs and uncertain; and conſider the *Temperaments* as no other but thoſe Diverſities in the Blood of different Perſons, whereby it becomes more apt to fall into certain Combinations in one Body than another, whether into Choler, Phlegm, &c. whence, according to them, People are denominated *Choleric*, *Phlegmatic*, &c.

The Ancients diſtinguiſh'd two Kinds of *Temperaments* in the ſame Body; the one *ad Pondus*, in Weight; the other, *ad Juſtitiam*.

The *Temperamentum ad Pondus*, is, where the elementary Qualities are found in equal Quantities, and in equal Proportions; ſuch is ſuppoſed to be in the Skin of the Fingers; without which they would want Power of diſtinguiſhing Objects, with ſufficient Accuracy.

The *Temperamentum ad Juſtitiam*, is that which contains unequal Portions of thoſe Qualities, but yet in ſuch Proportion as is neceſſary for the Diſcharge of the Functions proper to the Part: Such is the *Temperament* in a Bone, which contains more earthy than aqueous Parts, to make it more hard and ſolid, for its Office of ſuſtaining.

Galen obſerves, that the *Temperament ad Pondus*, is only imaginary; and that though it were real, it could not ſubſiſt above one Moment.

Dr. *Pitcairn* looks on the *Temperaments* or Conſtitutions, as native Diſeaſes; According to him, any one indued with whatever *Temperament*, hath the Seeds of a real Diſeaſe within him: A particular *Temperament*, ſuppoſing that ſome Secretions are in greater Proportion than is proper for Life Indefinitely long.

As the Diverſities of *Temperaments* are no other than Diverſities of Proportions in the Liquids, which may be diverſified infinite Ways; ſo there may be an infinite Number of *Temperaments*; though Authors have only ſuppos'd Four. The *Sanguin*, which is reckon'd a *Temperament*, *Pitcairn* ſays, is no other than a Plethora. See PLETHORA.

TEMPERAMENT, or *tempering*, in Muſick, a rectifying or mending the falſe or imperfect Concords, by transferring to them part of the Beauty of the perfect ones. See CONCORD.

The Degrees of the Octave, which may be call'd its *Elements*, as being the ſmalleſt Intervals it is reſolvable into; are two greater Semitones, two leſſer Tones, and three greater Tones. See TONE and OCTAVE.

Now the different Situation of theſe Elements, with reſpect to each other, occaſions that Intervals or Concords of the ſame Name, as *Thirds*, *Fourths*, &c. don't conſiſt of the ſame Degrees or Elements, tho' there be always the ſame Number of them; but one Fourth, for Inſtance, is agreeable and perfect, and another not.

To mend theſe imperfect Concords, the Muſicians have bethought themſelves to *temper*, *i. e.* give them part of the Agreeableneſs of perfect ones. In order to this, they take a Medium between the two, and this they call a *Temperament*, which neceſſarily produces a new Diviſion of the Octave, or which amounts to the ſame new Elements.

For Inſtance, whereas naturally its Elements are the greater Semitone, and the greater and leſſer Tone; they take a middle Tone form'd of the greater and the leſs: And the only Elements now, are the greater Semitone, and this mean Tone, which renders the five Intervals that are Tones equal, and thoſe that are Semitones leſs unequal to theſe.

One might alſo divide each of the five Tones of the Octave into Semitones, which, join'd to the two it naturally has, make twelve: In which Caſe, the whole Octave would be divided into twelve equal Parts, which would be mean Semitones.

'Tis eaſy to form various other Kinds of *Temperaments*: All the Difficulty is to find ſuch as are free from two great Inconveniencies, *i. e.* which don't alter either all the Concords too much, or, at leaſt, ſome of them.

All ſuch Diviſions of the Octave are call'd *temper'd*, or *temperative Syſtems*. See SYSTEM and SCALE *of Muſick*.

TEMPERATE *Zone*. See ZONE.

TEMPERING, in the Mechanic Arts, the preparing of Steel and Iron, ſo as to render them more compact, hard, and firm; or even more ſoft and pliant; according to the reſpective Occaſions. See IRON and STEEL.

Theſe Metals are *temper'd* by plunging them, while red hot, in ſome Liquor prepar'd for the Purpoſe: Sometimes pure Water is us'd for that Purpoſe; and, in effect, Lockſmiths, &c. ſcarce uſe any other.

Sometimes a Compoſition of divers Juices, Liquors, &c. is us'd; which is various, according to the Manner and Experience of the Workman; as Vinegar, Mouſe-Ear-Water, the Water oozing from broken Glaſſes, Soot, Salt, Oil, &c.

To harden and *temper Engliſh*, *Flemiſh*, and *Swediſh* Steel, you muſt give them a pretty high Heat, then ſuddenly quench them in Water to make them hard: But *Spaniſh* and *Venice* Steel will need but a Blood-red Heat e'er it be quench'd. See HEAT.

If the Steel be too hard, or brittle for an Edge Tool, &c. let it down by rubbing a Piece of Grindſtone or Whetſtone hard upon the Work, to take off the black Scurf: Then brighten, or heat it in the Fire; and as it grows hotter, you will ſee the Colour change by Degrees, coming firſt to a Straw, or light goldiſh Colour, then to a darker Goldiſh Colour, and at laſt to a Blue Colour. Chuſe ſuch of theſe Colours as the Work requires, then quench it ſuddenly in Water.

The light Gold Colour is for Files, cold Chiſſels, and Punches, that punch Iron and Steel: The dark Goldiſh Colour for Punches to uſe on Braſs, &c. The Blue Colour gives the *Temper* for Springs, &c.

The *Tempering* of Files and Needles is perform'd in a peculiar Manner. See FILE and NEEDLE.

The Ancients appear to have had ſome better Method of *Tempering*, than any of the Moderns are acquainted with; witneſs their Works in Porphyry; a Stone ſo hard, that none of our Tools make any Impreſſion upon it. See PORPHYRY.

TEMPEST, a Storm, or violent Commotion of the Air, with or without Rain, Hail, Snow, &c. See WIND, HURRICANE, WHIRLWIND, WATER-*ſpout*, EARTHQUAKE, &c.

TEMPLARS, or *Knights*-TEMPLARS, or Knights of the TEMPLE, a Religious-Military Order, firſt eſtabliſh'd at *Jeruſalem*, in Favour of Pilgrims travelling to the Holy Land. See KNIGHT.

The Original of this Order, the firſt Military Order in the World, is this: In 1118, ſome pious noble Perſons devoted themſelves to the Service of God, in the Preſence of the Patriarch of *Jeruſalem*; promiſing to live in perpetual Chaſtity, Obedience, and Poverty, after the manner of Canons.

The two principal Perſons were *Hugo de Paganis*, and *Geoffroy* of S. *Omers*. *Baldwin* II. then King of *Jeruſalem*, gave them an Appartment in his Palace, near the Temple, at *Jeruſalem*, not far from the Sepulchre of our Saviour; whence their Denomination *Templars*.

Soon afterwards, the Canons of the Temple gave them a Piece of Ground hard by the ſaid Temple, to build them regular Houſes on; and the King, the Lords, the Patriarch, and the Prelates, each gave them ſomewhat out of their Revenue, for Food and Cloaths. Their firſt Undertaking, and what they had firſt in View at their Inſtitution, was to guard the Highways againſt Robbers, &c. chiefly for the Safety of Pilgrims and Croiſes. See CROISE.

The principal Articles of their Rule, were: That they ſhould hear the holy Office throughout every Day; or, that when their Military Duties ſhould prevent this, they would ſupply it by a certain Number of Pater Noſters: That they would abſtain from Fleſh four Days in the Week; and on *Fridays* from Eggs and Milk-meats: That each Knight might have three Horſes, and one Eſquire; and that they ſhould neither hunt, nor fowl.

Their firſt Rule was that of St. *Bernard*. Nine Years after their Foundation, a particular Rule was preſcrib'd them in the Council of *Troyes*.

In every Nation they had a particular Governor, call'd *Maſter of the Temple*, or of the *Militia of the Temple*. Their *Grand Maſter* had his Reſidence at *Paris*.

The Order of *Templars* was aboliſh'd at the Beginning of the XIVth Century, under *Clement* V, *Edward* II. of *England*, and *Philip* the Fair of *France*. In 1607 thoſe in *England* were all arreſted, and ſeven burnt alive. And in 1312, the Order was quite ſuppreſs'd in the Council of *Vienna*, and 50 burnt alive.

The Crimes they were charg'd withal, were apoſtatizing to the *Sarazens*, and holding Correſpondence with them. Some Authors will have it, theſe Crimes were only pretended; and that the true Reaſon of the Suppreſſion of the Order, was the immenſe Riches they were poſſeſs'd of. But tho' this might be ſome Reaſon for their Suppreſſion, it could be none for burning them alive: Add to this, that their Effects were given to the Hoſpitallers, or Knights of St. *John*. What then did the Kings of *England*, &c. get by their Suppreſſion? And what was it to them, which of thoſe Orders had the Effects?

TEMPLE, a publick Building, erected in Honour of ſome Deity, either true, or falſe; and wherein the People meet to pay religious Worſhip to the ſame. See GOD.

Clemens Alexandrinus and *Euſebius*, refer the Origin of *Temples* to the Sepulchres built for the Dead. *Herodotus* and *Strabo* will have the *Ægyptians* to be the firſt who built *Temples* to the Gods. The firſt, built in *Greece*, is aſcrib'd to *Deucalion*, by *Apollonius*, *Argonaut.* Lib. III.

In Antiquity we meet with many People who would not build any *Temples* to their Gods, for fear of confining them to too narrow Bounds. They perform'd their Sacrifices in all Places indifferently, from a Perſuaſion, that the whole World is the *Temple* of God, and that he requires no other. This was the Doctrine of the *Magi*, follow'd by the *Perſians*, the *Scythians*, the *Numidians*, and many other Nations mention'd by *Herodotus*, Lib. I. *Strabo* Lib. XV. and *Cicero* in his 2d Oration againſt *Verres*.

The *Perſians*, who worſhipp'd the Sun, believ'd it would wrong his Power, to incloſe Him in the Walls of a *Temple*, who had the whole World for his Habitation: And hence, when *Xerxes* ravag'd *Greece*, the *Magi* exhorted him to deſtroy all the *Temples* he met with.

The *Sicyonians* would build no *Temple* to their Goddeſs *Coronis*: Nor the *Athenians*, for the like Reaſon, erect any Statue to Clemency, who, they ſaid, was to live in the Hearts of Men, not within Walls.

The *Bithynians* had no *Temples*, but the Mountains to worſhip on; nor the ancient *Germans* any other but the Woods.

Even ſome Philoſophers have blamed the Uſe and Building of *Temples*, particularly *Diogenes*, *Zeno*, and his Followers the Stoicks: But, it may be ſaid, That if God have no Need of *Temples*, Men have Need of Places to meet in for the publick Offices of Religion: Accordingly, *Temples* may be traced

traced back even into the remoteſt Antiquity. See *Hoſpinianus de Origine Templorum.*

The *Romans* had ſeveral Kinds of *Temples*; whereof thoſe built by the Kings, *&c.* conſecrated by the Augurs, and wherein the Exerciſe of Religion was regularly perform'd, were call'd, by Way of Eminence, *Templa, Temples.*

Thoſe that were not conſecrated, were call'd *Ædes.*

The little *Temples*, that were cover'd or roof'd, they call'd *Ædiculæ.*

Thoſe open, *Sacella.*

Some other Edifices conſecrated to particular Myſteries of Religion, they call'd *Fana* and *Delubra.*

All which Kinds of *Temples*, *Vitruvius* tells us, had other particular Denominations, according to the Form and Manner of their Conſtruction; as hereafter related.

Indeed, the *Romans* out-did all Nations in the Point of *Temples*; they not only built *Temples* to their Gods, to their Virtues, to their Diſeaſes, *&c.* but alſo to their Emperors, and that in their Life-time; Inſtances whereof we meet withal in Medals, Inſcriptions, and other Monuments. *Horace* compliments *Auguſtus* hereupon, and ſets him above *Hercules*, and all the Hero's of Fable; in that thoſe were only admitted into *Temples* after their Death, whereas *Auguſtus* had his *Temples* and Altars while living.

Viventi tibi maturos largimur honores;
Jurandaſq; tuum per nomen ponimus Aras. Epiſt. ad Auguſt.

TEMPLE, in Architecture. The ancient *Temples* were diſtinguiſh'd, with regard to their Conſtruction, into various Kinds; as,

TEMPLES of *Antæ*, or ſimply *Antæ*: Theſe, according to *Vitruvius*, were the moſt ſimple of all *Temples*; having only angular Pilaſters, call'd *Antæ*, or *Paraſtatæ*, at the Corners, and two Tuſcan Columns on each Side the Doors. See ANTA.

Tetraſtyle-TEMPLE, or ſimply *Tetraſtyle*, was a *Temple* that had four Columns in Front and as many behind; as that of *Fortuna Virilis* at *Rome*. Se TETRASTYLE.

Proſtyle-TEMPLE, that which had only Columns in its Front, or Fore-ſide; as that of *Ceres* in *Eleuſis*, in *Greece*. See PROSTYLE.

Amphiproſtyle, or *double Proſtyle*, that which had Columns both before and behind, and which was alſo Tetraſtyle. See AMPHIPROSTYLE.

Periptere-TEMPLE, that which had four Rows of inſolated Columns around, and was Hexaſtyle, *i. e.* had ſix Columns in Front; as the *Temple* of Honour at *Rome*. See PERIPTERE.

Diptere-TEMPLE, that which had eight Rows of Columns around, and was alſo Octoſtyle: Or had eight Columns in Front; as that of *Diana* at *Epheſus*. See DIPTERE.

PSEUDO *diptere*, or *imperfect diptere*	See	PSEUDO *diptere*.
HYPETRE - - - - - - - -		HYPETRE.
MONOPTERE - - - - - - -		MONOPTERE.

The Word *Temple* is form'd from the *Latin Templum*, which ſome derive from the *Greek* τέμενος, ſignifying the ſame Thing; and others from τέμνω, *abſcindo*, I cut off, I ſeparate, in Regard a *Temple* is a Place ſeparated from common Uſes; others derive it from the old *Latin* Word *templare*, to contemplate.

The ancient Augurs gave the Name *Temples* to thoſe Parts of the Heavens, which they mark'd out for the obſerving of the Flight of Birds. Their Formula was this: *Templa teſqua ſunto.*

TEMPLES, among us, are two Inns of Court; thus call'd, becauſe anciently the Dwelling-Houſe of the Knights *Templars*. See TEMPLAR.

At the Suppreſſion of that Order, they were purchas'd by ſome Profeſſors of the Common Law, and converted into Hoſpitia, or Inns. See INN.

They are call'd the *Inner* and *Middle Temple*, in relation to *Eſſex* Houſe, which was alſo a Part of the Houſe of the *Templars*, and call'd the *Outer Temple*, becauſe ſituate without *Temple Bar.*

In the *Middle Temple*, during the Time of the *Templars*, the King's Treaſure was kept: As was alſo that of the Kings of *France* in the Houſe of the *Templars* at *Paris.*

The chief Officer was the *Maſter of the Temple*, who was ſummon'd to Parliament in 49 *Hen.* 3. And from him, the chief Miniſter of the *Temple Church* is ſtill call'd *Maſter of the Temple.* See MASTER.

TEMPLES, *Tempora*, in Anatomy, a double Part of the Head, reaching from the Forehead and Eyes, to both Ears. See HEAD.

The *Temples* are form'd of two Bones, call'd *Oſſa Temporis.* See TEMPORIS *Oſſa.*

Menage will have the Word deriv'd from the old *Latin*, *Tempra*, whence *Tempora*, and *Temples.* But the Phyſicians give another Origin. Theſe Parts, they ſay, were call'd *Tempora*, from their ſhewing the Age or Time of Man, by the Colour of the Hair, which turns white in this Part before any other; Which *Homer* ſeems to have been aware of, by his calling Men *Poliocrotaphos*, *q. d.* Grey-templed.

TEMPORAL, *Temporalis*, a Term frequently us'd for *Secular*; in which Senſe it ſtands in Oppoſition to *Eccleſiaſtical.* See SECULAR.

Pope *Boniface* wrote to *Philip* the Fair of *France*, that he was ſubject to him both in Spirituals and *Temporals.* At preſent all the Doctors on this Side the *Alps* own the Supremacy of Kings in Temporals. See SUPREMACY.

TEMPORALIS, in Anatomy, a Muſcle, which ariſes by a Semi-circular fleſhy Beginning, from a Part of the Os Frontis, the lower Part of the Parietale, and upper Part of the *Temporale*; from whence going under the Zygoma, and gathering together, as in a Centre, it is inſerted, by a ſhort and ſtrong Tendon, into the Proceſſus Coronæ of the lower Jaw, which it pulls upward.

This Muſcle is alſo call'd *Crotaphites*, and is cover'd with a ſtrong tendonous Faſcia. See CROTAPHITES.

TEMPORALITIES, the Temporal Revenues of an Eccleſiaſtic; particularly, ſuch Revenues, Lands, Tenements, or Lay-fees, as have been annexed to Biſhops Sees by our Kings, or other Perſons of high Rank in the Kingdom. See BISHOP.

The Canoniſts on the other ſide the *Alps*, anciently gave the Pope a Power over the *Temporalities* of Kings. Yet Pope *Clement* V. owned frankly, that his Predeceſſor *Boniface* VIII. had exceeded the juſt Bounds of his Authority, in meddling with the *Temporalities* of the King of *France. Fevret.*

TEMPORIS *Os*, *Bone of the Temple*, a Bone on each Side the Head. See TEMPLES.

The Figure of the *Os Temporis* is nearly Circular. The fore and upper Parts are very thin, conſiſting only of one Table. The lower and hind Parts are thick, hard, and uneven.

It is joined to the Os Sincipitis, by the Squammous Suture; whence, in that Part, it is call'd *Os Squammoſum.* Its lower Part is joined to the Os Occipitis, and Sphenoides: To which latter, as likewiſe to the Bones of the upper Jaw, it is joined by means of certain Proceſſes, and in that Part, is call'd *Os Petroſum.* See PETROSUM.

Each of the *Oſſa Temporum* has two Sinus's; the Exterior whereof, is lined with a Cartilage, and receives the Proceſs of the lower Jaw; the Interior receives the lower Part of the Sinus Laterales of the Dura Mater. Each likewiſe has four Proceſſes; the *Os Jugale*, *Proceſſus Mamillaris*, *Styloides*, and *Os Petroſum.* See each deſcribed under its proper Article JUGALE, MAMILLARIS, *&c.*

TEMPTATION, in Theology, an Induction, or Sollicitation to Evil; whether from the World, the Fleſh or the Devil.

Among the Myſtic Divines, *profitable Temptations*, are thoſe Trials the Soul is to paſs through, e'er it arrive at the unitive Life, and the Peace within.

When it ſurmounts that Dryneſs and Darkneſs it falls into, through a Suſpenſion of the Effects of divine Love, and that it reſiſts the World, and all the Allurements it preſents; thoſe *Temptations* are called *Tentationes Utiles*, and *Fructuoſæ.*

In our ancient Law Books, *Temptation*, *Tentatio*, is uſed for a Trial, Proof or Aſſay. *Tentatio Panis fiat bis, in Anno Chart. Edw.* I.

TENABLE, in the military Art, ſomething that may be defended, kept and held againſt Aſſailants.

The Word is little uſed, but with a Negative: When a Place is open on all Sides, and its Defences all beaten down, It is no longer *Tenable.* When the Enemy has gain'd ſuch an Eminence, This Poſt is not *Tenable.*

The Word is *French*, form'd from *Tenir*; as that from the *Latin*, *Tenere*, to hold.

TENAILLE, in Fortification, a kind of Out-Work, conſiſting of Two Parallel Sides, with a Front, wherein is a re-entering Angle,

In Strictneſs, that Angle, and the Faces that compoſe it, are the *Tenaille.*

The Word is *French*, and ſignifies, literally, Pincers or Nippers.

The *Tenaille* is of two Kinds: *Simple* and *Double.*

Simple or *ſingle Tenaille*, is a large Out-work, as D A B C E (Tab. Fortification, Fig. 8.) conſiſting of two Faces or Sides A B and C B, including a re-entring Angle B.

The great Defects of the *Tenaille* are, that it takes up too much Room, and on that Account is advantageous to the Enemy; that its Angle B is undefended; the Height of the Parapet hindering the ſeeing down into it, ſo that the Enemy can lodge there under Covert: and that the Sides A C and C D are not ſufficiently defended.

For these Reasons, the *Tenaille* is now excluded out of Fortification by the best Engineers; and never made, but where there wants Time to form a Horn-work.

Double or Flank'd TENAILLE, is a large Out-work, consisting of two simple *Tenailles*, or two re-entring Angles FGH and HIK (Fig. 9). This is now, also, excluded out of Fortification for the same Reasons as the former.

TENAILLE *of the Place*, is the Face of the Place, comprehended between the Points of Two neighbouring Bastions; including the Curtain, the two Flanks raised on the Curtain, and the two Sides of the Bastions which face one another. See BASTION, CURTAIN, &c.

So that the *Tenaille* is the same with what is otherwise call'd, the *Face of a Fortress*. See FORTIFIED *Place*.

TENAILLE *of the Ditch*, is a low Work raised before the Curtain, in the Middle of the Foss or Ditch. It is of three Sorts: The First is composed of a Curtain, two Flanks and two Faces. The Rampart of the Curtain, including the Parapet and Talus, is but five Fathom thick, but the Rampart of the Flanks and Faces Seven.

The Second, which *Vauban* saith, he found to be of very good Defence, is composed only of two Faces, made on the Lines of Defence, whose Rampart and Faces are parallel.

The third Sort differs from the Second, only in this, that its Rampart is parallel to the Curtain of the Place.

All three Sorts are good Defences for the Ditch, and lie so low, that they cannot be hurt by the Besiegers Cannon, till they are Masters of the Covert-way, and have planted their Cannon there.

TENANCY, a Habitation or House to live in, or a Tenement, or Possession held of another. See TENEMENT.

TENANT or TENENT, in Law, one that holds or possesses Lands and Tenements, by any kind of Right, either in Fee, for Life, Years, or at Will. See POSSESSION, TENURE, &c.

The Term *Tenant*, is used in Law with divers Additions: Thus, *Tenant in Dower*, is she that possesses Lands by Virtue of her Dower. See DOWER.

Tenant per Statute-Merchant, holds Land by Virtue of a Statute, forfeited to him. See STATUTE-*Merchant*.

Tenant in Frank Marriage, is he that holds Lands or Tenements by Virtue of a Gift thereof made to him upon Marriage between him and his Wife. See FRANK-*Marriage*.

Tenant by Courtesy, holds for his Life, by reason of a Child begotten by him of his Wife, being an Inheritrix and born alive. See COURTESY.

Tenant by Elegit, holds by Virtue of the Writ call'd an *Elegit*. See ELEGIT.

Tenant in Mortgage, holds by means of a Mortgage. See MORTGAGE.

Tenant by Verge, in ancient Demesne, is he who is admitted by the Rod in the Court of an ancient Demesne. See VERGE and DEMESNE.

Tenant by Copy of Court Roll, is one admitted *Tenant* of any Lands, &c. within a Manor, which Time out of Mind, have been Demisable according to the Custom of the Manor. See COPYHOLD.

Tenant paravail. See PARAVAIL.

Tenant by Charter, is he that holdeth by Feoffment in Writing or other Deed. See CHARTER.

Tenant in Capite or Chief, holdeth of the King in Right of his Crown. See CAPITE.

Tenant of the King, is he that holdeth of the Person of the King.

Joint Tenants have equal Right in Lands or Tenements by Virtue of one Title.

Tenants in common, have equal Right; but hold by divers Titles. A *Particular Tenant* holds only for this Term. A *Sole Tenant*, is he, who hath no other joined with him; and a *Tenant by Execution*, is he who holds by Virtue of an Execution upon any Statute, Recognizance, &c.

Anciently, there was also *Tenant by Knight-Service*, *Tenant in Burgage*, *Tenant in Socage*, *Tenant in Frank-Fee*, *Tenant in Villenage*; and there is still *Tenant in Fee-simple*, *Tenant in Fee tail*, *Tenant upon Sufferance*, &c. See KNIGHTS *Service*, BURGAGE, SOCAGE, VILLENAGE, FEE-*Simple*, TAIL, SUFFERANCE, &c.

TENENT, in Heraldry, is used for something that sustains, or holds up the Shield, or Armory; and is generally synonymous with *Supporter*.

The Difference which some Authors make between them, is, that *Tenents* are single, and *Supporters* double; one placed on each Side the Shield. But the proper Distinction seems to consist in this, that *Tenents* are human Figures, and Supporters, Figures of Beasts.

There are various Forms of *Tenents*, as well as of Supporters, *viz.* Angels, Maids, Religious, Savages, Moors, &c.

The first *Tenents*, F. *Menestier* observes, were Trunks or Branches of Trees; to which the Escutcheons were fasten'd by Straps and Buckles. Afterwards, the Knights were represented as holding their own 'Scutcheons, which were either tied to their Neck, or else they leant on them.

The Origin of *Tenents* and *Supporters* is referr'd to the ancient Tournament, wherein the Cavaliers had their Arms bore by Servants disguis'd like Savages, Moors, fabulous Deities, Bears, Lions, &c. See SUPPORTER.

TENAR, in Anatomy, a Muscle, whose Office is to draw the Thumb from the Fore-finger. See FINGER.

Its Antagonist is call'd *Antitenar*. See ANTITENAR.

TENCH-*Fishing*. See *Tench*-FISHING.

TENDER, in a legal Sense, signifies as much, as carefully to offer, or circumspectly to endeavour the Performance of any Thing: Thus, to *Tender Rents*, is to offer it at the Time and Place, where and when it ought to be paid. To *tender a Person's* Law of Summons, is to offer himself ready to make his Law, whereby to prove that he was not summoned.

TENDER, in the Sea Language, is a Vessel, attending on some other larger, and more considerable one.

TENDING-*Penny*. See TITHING-*Penny*.

TENDON, in Anatomy, a hard, white Part of a Muscle, whereby it is fasten'd to the Bone. See MUSCLE.

Most Muscles have, at least, two *Tendons*, one at each Extreme: that fasten'd to the Part toward which the Motion is to be perform'd, is call'd the *Head of the Muscle*; and that fasten'd to the Part drawn towards the other, the *Tail of the Muscle*. See HEAD and TAIL.

The Fibres, whereof the *Tendons* consist, have been supposed to be Nervous; but they are now found to be no other than Productions of the same Fibres, which make the *Belly or Body of the Muscle*. All the Difference between them is, that in the Belly of the Muscle they are lax, and at a Distance from each other; whereas in the *Tendon*, they are more closely and firmly connected.

Their Whiteness proceeds wholly from the Blood's being excluded, by the Tightness of their Contexture: In effect, there is the same Difference between them, that there is between a Skein of Thread, and a Cord made of the same Thread.

The Fibres of the *Tendons* undergo no Contraction, or Dilatation, as those of the Belly of the Muscle do; they act as mere Cords, to draw the Parts towards each other.

The *Suture of a Tendon*, is a very delicate Operation in Chirurgery. It had been abandon'd a long Time, and was not re-established till the last Century by *J. Bienaise*. See SUTURE.

The *Puncture of a Tendon* is very dangerous. See PUNCTURE.

Mr. *Cowper* in the *Philosophical Transactions*, gives us an Account of a Cure of the *great Tendon* above the Heel, after an intire Division, by Stitching.

TENEBRES, TENEBRÆ, in the *Romish* Church, a Service perform'd on the *Wednesday*, *Thursday* and *Friday* before *Easter*, in Commemoration of the Agony of our Saviour in the Garden. See PASSION, &c.

TENEMENT, TENANCY, in Law, a House or Lands, depending of a Manor or Lordship; or a Fee or Farm, held of a Superior Lord, and which he may re-call, when the Term or Condition is expired. See LORD and TENANT.

Frank Tenement, is any Lands, Houses, Offices or the like, wherein a Man has Estate for Life, or in Fee. ---- *Base Tenement*, is where a Man holds Lands, &c. at the Will of the Lord.

Kitchin, *Briton*, &c. make *Frank Tenement* and *Base Tenement*, Opposites; so that *Frank Tenement* should be where the Tenant is at liberty to quit it when he pleases.

TENEMENTARY *Lands*, among our Ancestors, were such Lands as the *Saxon* Thanes or Nobles let out to Tenants under arbitrary Rents and Services. See TENANT.

TENEMENTIS *Legatis*, in Law, a Writ which lies in *London* and other Places, where the Custom is to devise *Tenements* by last Will, as well as personal Goods and Chattels; for the Hearing of any Cause relating hereto.

TENENTIBUS *in Assisa non Onerandis*, a Writ which lies for him to whom a Disseisor has made over Land, whereof he has disseis'd of another; that he be not disturb'd for the Damages awarded.

TENESMUS, in Medicine, a continual Inclination to go to Stool; yet without voiding any Thing, unless, sometimes, a little purulent bloody Slime.

The Cause of the *Tenesmus*, is a sharp, pungent Humour, irritating the Intestinum Rectum, and exciting those troublesome Endeavours to evacuate. Those affected with the Stone, are also subject to the *Tenesmus*, from the Communication, or Consent between the Bladder and the Rectum.

The Word is form'd from the *Greek*, τείνειν, *tendere*, to bend, in regard those attack'd with this Disease, feel a continual Tension in the Fundament.

The Cure of a *Tenesmus* depends on proper Evacuations and Astringents; the former always preceding the latter; such are Bleeding, if Plethoric, gentle Cathartics, especially of the Powder of Rhubarb, &c. An Emetic of the *Indian* Root, *Ipecacuanha*, has been found of great Service in a long standing *Tenesmus*; for the augmenting one Evacuation, is

the leſſening of another, and it becomes ſo much the more ſervicable, as they happen to be Contraries.

The Reſtringents are ſuch as are of uſe in other Fluxes. See DIARRHEA, DYSENTERY, &c.

TENET, a particular Opinion, Dogma, or Doctrine, profeſſedly held by ſome Divine, Philoſopher, &c. See DOGMA.

The diſtinguiſhing *Tenets* of the ſeveral Sects in Religion and Philoſophy, ſee under the Names of the Sects themſelves. See alſo PHILOSOPHER, SECT, &c.

TENMENTALE, or TEMANTALE, in our ancient Cuſtoms, originally ſignifies the Number of Ten Men; which Number, in the Time of the *Engliſh Saxons*, was call'd a *Decennary*; and ten Decennaries made what we call a Hundred. See DECENNA and HUNDRED.

Theſe ten Men were bound for each other to preſerve the publick Peace; and if any of them was found guilty of a Breach thereof, the other nine were to make Satisfaction, or to bring the Criminal before the King. See FRIBURG.

The Word was alſo us'd for a Duty, or Tribute paid to the King, conſiſting of two Shillings for each Ploughland; which was probably thus call'd, by Reaſon each Perſon of the Decennary was bound to ſee it paid.

TENNY, or TAWNY, in Heraldry, a bright Colour, made of Red and Yellow mix'd; ſometimes alſo call'd *Brusk*, and expreſs'd in Engraving by thwart or diagonal Strokes or Hatches, like Purpure, and mark'd with the Letter T. See PURPURE.

In the Coats of all below the Degree of Nobles, it is call'd *Tenny*; but in thoſe of Nobles, it is call'd *Hyacinth*; and in Princes Coats, the *Dragons Head*.

TENON, in Building, &c. the End of a Piece of Wood, or Metal, diminiſh'd by one Third of its Thickneſs, to be receiv'd into a Hole in another Piece, call'd the *Mortiſe*, for the jointing or faſtening the two together. See MORTISE.

Among Joiners, &c. the *Tenon* is made in various Forms, ſquare, Dove-tail'd, for double Mortiſes, &c.

Vitruvius calls the *Tenons*, *Cardines*; Dove-tail'd *Tenons* he calls *Subſcudes*, or *Securiclæ*. See DOVE-*tail*.

TENOR, TENOUR, the Purport or Content of a Writing or Inſtrument in Law, &c. Warrants iſſu'd for the Confirmation of Sentences, expreſs, that they ſhall be executed according to their Form and *Tenor*.

It was impoſſible to retain ſo long a Speech Word for Word, but the Subſtance, the *Tenor* is this.

TENOR *in Muſick*, the firſt mean or middle Part; or that which is the ordinary Pitch or *Tenor* of the Voice, when not either rais'd to the Treble, or lower'd to the Baſe. See PART and MUSIC.

The *Tenor* is frequently mark'd on thorough Baſſes with the Letter T.

The *Tenor* is a Part which almoſt all grown Perſons can ſing. But as ſome have a greater Compaſs of Voice upwards, others downwards, others are confin'd to a kind of Medium, and others can go equally either higher or lower; hence many Muſicians make a Variety of *Tenors*, as a *low Tenor*, a *mean Tenor*, a *high Tenor*, a *natural Tenor*; to which is alſo added, a *reacting Tenor*, *Violin Tenor*, &c.

The *Italians* uſually diſtinguiſh no more than two Kinds of *Tenors*, *viz. Tenore primo*, or P° or I°, which anſwers to our upper *Tenor*; and *Tenore ſecundo*, or 2° or II°, which is our natural *Tenor*; confounding the others under the Word *Baritono*.

TENOR is alſo us'd for a Perſon who ſings that Part in Concert; or for an Inſtrument proper to play it.

TENORE *Indictamenti mittendo*, is a Writ whereby the Record of an Indictment is call'd out of another Court into *Chancery*.

TENSE, *Time*, in Grammar, an Inflexion of Verbs, whereby they are made to ſignify or diſtinguiſh the Circumſtance of Time of the Thing they affirm, or attribute. See VERB.

The Affirmations made by Verbs, are different as to Point of Time; ſince we may affirm a Thing *is*, or *was*, or *will be*: Hence, a Neceſſity of a Set of Inflections, to denote thoſe ſeveral Times; which Inflections, our *Engliſh* Grammarians call by a barbarous Word *Tenſes*, from the *French temps*; moſt other Languages call them ſimple *Times*.

There are but three ſimple *Tenſes*, the *Preſent*; as, *I love*, *Amo*: the *Preter*, or *Preterit*, or *Paſt*; as, *I have lov'd*, *Amavi*: and the *Future*; as, *I will love*, *Amabo*. See PRESENT, &c.

But in regard, in the Preter one may either expreſs the Thing as juſt done, or paſt, or indefinitely and barely that it was done: Hence, in moſt Languages, ariſe two Kinds of Preterits; the one *definite*, marking the Thing to be preciſely done; as, *I have written*, *I have ſaid*: And the other *indefinite* or *aoriſt*, denoting a Thing done indeterminately; as, *I wrote*, *I went*. See PRETER.

The future *Tenſe* admits of the ſame Variety. See FUTURE.

Beſide the three ſimple *Tenſes*, others have been invented, call'd *compound Tenſes*; expreſſing the Relation of the ſimple ones to each other: The firſt expreſſes the Relation of the paſt to the preſent, and is call'd the *preterimperfect Tenſe*, becauſe it does not mark the Thing ſimply, and properly as done, but as imperfect and preſent with reſpect to another Thing paſt; as, *I was at Supper when he enter'd*; *Cum intravit cænabam*.

The ſecond compound Time marks the paſt doubly, and is therefore call'd the *pluſquamperfect Tenſe*; as, *I had ſupp'd*, *Cænaveram*.

The third compound *Tenſe* denotes the Future with reſpect to the Paſt; as, *I ſhall have ſupp'd*, *Cænavero*.

The ſeveral *Tenſes* or Times, it is to be obſerv'd, are properly denoted in the *Greek* and *Latin* by particular Inflections; in the *Engliſh*, *French*, and other modern Tongues, the auxiliary Verbs *to be* and *to have*, *etre* and *avoir*, are call'd in.

As to the Oriental Languages, they have only two ſimple *Tenſes*, the Paſs'd and Future, without any Diſtinctions of imperfect, more than perfect, &c. which renders thoſe Languages ſubject to abundance of Ambiguities which others are free from.

TENSION, the State of a Thing bent, or the Effort made to bend it.

Animals only ſuſtain and move themſelves by the *Tenſion* of their Muſcles, and Nerves. A Chord or String gives an acuter or a deeper Sound, as it is in a greater or leſs Degree of *Tenſion*. See CHORD.

TENSOR, in Anatomy. See EXTENSOR.

TENT, *Tabernacle*, a Pavillion, or portable Lodge, under which to ſhelter in a Campagne, &c. from the Injuries of the Weather. See TABERNACLE.

Armies encamp under *Tents*: Moſt of the *Tartars* and *Arabs* are wandring People, that lodge under *Tents*. The *Hebrews* lodg'd forty Years under *Tents* in the Deſart; which gave Occaſion to the Scenopegy or Feaſt of Tabernacles. See SCENOPEGY.

The Word is form'd from the *Latin tentorium*, of *tendo*, I ſtretch; in regard *Tents* are uſually made of Canvas ſtretch'd out, and ſuſtain'd by Poles.

TENT, in Chirurgery, is a Roll of Lint, made in a particular Form, put into Wounds whoſe Suppuration is not perfect; or where there is a Quantity of Matter contain'd in the Tumor, more than what comes out at the firſt Dreſſing, &c. See WOUND, &c.

Tents are us'd in order to hinder the cloſing too ſoon. But ſeveral Chirurgical Writers, and particularly the Author of the Hoſpital Surgeon, gives us numerous Inſtances, wherein the Uſe, eſpecially of hard *Tents*, has prov'd prejudicial in protracting the Cure, bringing on Inflammations, Sinus's, Mortifications, &c. in Wounds and Ulcers. To remedy this, he propoſes, that the Liniments, &c. be made of a liquid Conſiſtence, either naturally, or by warming them; and that where *Tents* may ſeem indiſpenſably neceſſary, as in large Cavities, the Orifice may be enlarg'd, and ſoft Doſils put in inſtead of them, which will prevent the Miſchiefs commonly attending *Tents*. See ULCER.

TENTATIVE, is ſometimes uſed Adjectively; thus we ſay, a *Tentative Method*, meaning a kind of unartful or indirect Method, which only proceeds by *trying*.

Tentative is alſo uſed Subſtantively, for an Eſſay, or Effort, whereby we try our Strength, or ſound an Affair, &c. to ſee whether or no it will ſucceed.

In the *French* Univerſities, a *Tentative* is the firſt Theſis or Act, which a Student in the Theology School, holds to ſhew his Capacity; if he anſwers well, the Degree of Bachelor is conferr'd on him.

TENTER, called alſo *Tryer* and *Prover*, a Machine uſed in the Cloth Manufactory, to ſtretch out the Cloths, Stuffs, &c. or only to make them even, and ſet them ſquare. See CLOTH.

'Tis uſually about Four Feet and a Half high, and for Length, exceeds that of the longeſt Piece of Cloth.

It conſiſts of ſeveral long ſquare Pieces of Wood, placed like thoſe which form the Barriers of a Manage, ſo, however, as that the lower Croſs-piece of Wood may be rais'd or lower'd, as is found requiſite, to be fix'd at any Height, by means of Pins. Along the Croſs-pieces, both the upper and under one, are hooked Nails, call'd *Tenter-hooks*, placed from Space to Space.

To put a Piece of Cloth on the Tenter: While the Piece is yet quite wet, one End is faſten'd to one of the Ends of the *Tenter*, then 'tis pull'd by Force of Arms towards the other End, to bring it to the Length required: That other End being faſten'd, the upper Liſt is hook'd on to the upper Croſs-piece, and the loweſt Liſt to the lower Croſs-piece, which is afterwards lower'd by Force, 'till the Piece have its deſired Length. Being thus well ſtretch'd, both as to Length and Breadth; they bruſh it with a ſtiff Hair-bruſh, and thus let it dry. Then they take it off; and till they wet it again, it will ſtill retain the Width and Breadth the *Tenter* gave it.

TENTH,

TENTH, *Decima*. See TITH.

The *Babylonians* and *Egyptians* gave their Kings a *Tenth* of their Revenues: See *Ariſtotle* in his *Oeconomicks*, *lib.* 2. *Diodorus Siculus*, *lib.* 5. and *Strabo*, *lib.* 15.

Afterwards, the *Romans* exacted of the *Sicilians* a *Tenth* of the Corn they reap'd; and *Appian* tells us, that thoſe who broke up, or till'd any new Grounds, were obliged to carry a *Tenth* of their Produce to the Treaſury.

The *Romans* offer'd a *Tenth* of all they took from their Enemies to the Gods, whence the Name of *Jupiter Prædator*: The *Gauls* in like Manner, gave a *Tenth* to their God *Mars*, as we learn in the Commentaries of *Cæſar*.

Authors have been ſtrangely perplex'd, to find the Original of a Cuſtom, eſtabliſh'd among ſo many People of different Manners and Religion, to give a *Tenth* to their Kings, or their Miniſters of Religion. *Grotius* takes it to ariſe hence, That the Number Ten is the moſt known and the moſt common among all Nations; by reaſon of the Number of Fingers which is Ten. On this Account he thinks it is, that the Commandments of God were reduced to *Ten*, for People to retain them with greater Eaſe; that the Philoſophers eſtabliſh'd *Ten* Categories, &c.

TENURE, in Law, the Manner or Condition wherein a Tenant holds Lands or Tenements of his Lord; or the Services perform'd to the Lord, in Conſideration of the Uſe and Occupancy of his Lands. See TENANT, LORD, &c.

The Kinds of Service, and conſequently of *Tenures*, are almoſt infinite. See SERVICE.

Thoſe for Lands held of the King, are either *great* or *petty Sergeanty*, in *Capite*, *Knights-Service*, &c. See SERGEANTY, CAPITE, &c.

Thoſe held of other Lords were very various, *Baſe*, *Frank*, &c. by *Homage*, by *Soccage*, &c. But by Stat. 12 *Car.* II. all *Tenures*, both of the King and other Lords, are turn'd into free and common Soccage. See SOCCAGE.

TERES, in Anatomy, a Name given two Muſcles of the Arms, call'd alſo *Rotundi*; diſtinguiſh'd by *major* and *minor*.

The *Teres*, or *Rotundus major*, ariſes from the lower Angle of the Baſis of the Scapula, and aſcending obliquely upwards, in a round ſmooth Body, under the Head of the Longus, is inſerted with a ſhort flat Tendon into the Neck of the Os Humeri.

The *Teres*, or *Rotundus minor*, call'd alſo *Tranſverſalis*, is frequently wanting, or, at leaſt, ſo confounded with the Infraſpinatus, that it is loſt therein. It ariſes from the inferior Angle of the Scapula, and aſcending obliquely in a round fleſhy Body, paſſes over the upper Head of the Longus, and is inſerted by a ſhort flat Tendon below the Os Humeri.

TERGIFÆTOUS *Plants*, are ſuch as bear their Seeds on the Backſides of their Leaves. See PLANT and SEED.

Such are the Capillaries. See CAPILLARY.

TEREBINTHINA, in Medicine, Natural Hiſtory, &c. See TURPENTINE.

TERM, *Terminus*, the Extreme of any thing, or that which bounds and limits its Extent. See EXTREME.

TERM, *in Geometry*, is ſometimes us'd for a Point, ſometimes for a Line, &c. A Line is the *Term* of a Superficies; and a Superficies of a Solid.

This is what the Schools call *Terminus Quantitatis*.

TERM, *in Law*, ſignifies a Boundary or Limitation of Time. In this Senſe we ſay, A Leaſe for Term of Life, For Term of Years, &c.

TERM, TERMINUS, in Architecture, is a kind of Statue, or Column adorn'd a-top with the Figure of a Man's, Woman's, or Satyr's Head, as a Capital; and the lower Part ending in a kind of Sheath or Scabbord.

Terms are ſometimes us'd as Conſoles, and ſuſtain Entablatures, and ſometimes as Statues to adorn Gardens.

Some write the Word *Thermes*, from *Hermes*, a Name the *Greeks* gave the God *Mercury*; whoſe Statue, made after this Manner, was placed in ſeveral of the Croſs-ways in the City of *Athens*, &c.

Others bring the Etymology of the Word from the *Roman* God *Terminus*, the Protector of Land-marks, whoſe Statue (made without Hands or Feet, that he might not change his Place) was uſed to be planted at the Bounds of Lands to ſeparate them.

Of theſe *Termini*, the Architects make great Variety, *viz.* *Angelic*, *Ruſtic*, *Marine*, *Double*, in *Buſt*, &c.

Milliary TERMS, or *Termini Milliares*, among the ancient *Greeks*, were the Heads of certain Divinities, placed on ſquare Land-marks of Stone, or on a kind of Sheath, to mark the ſeveral Stadia, &c. in the Roads. Theſe are what *Plautus* calls *Lares Viales*. See LARES.

They were uſually dedicated to *Mercury*, whom the *Greeks* believed to preſide over the High-ways. Some of them were repreſented with four Heads; ſuch as we ſtill ſee in *Rome*, at the End of the Fabrician Bridge, which is hence call'd *Ponte de quattro Capi*.

Mercury was thus repreſented, and alſo call'd by the *Latins*, *Mercurius Quadriformis*, as being ſuppoſed the Firſt, who taught Men the Uſe of Letters, Muſic, Wreſtling and Geometry. See HERMES.

TERMS are alſo us'd for the ſeveral Times or Seaſons of the Year, wherein the Tribunals, or Courts of Judicature, are open to all who think fit to complain of Wrong, or to ſeek their own by due Courſe of Law or Action. See COURT, DAY, LAW, FASTUS, &c.

In Contra-diſtinction to theſe, the reſt of the Year is call'd *Vacation*. See VACATION.

Of theſe *Terms* there are four in every Year, during which Time Matters of Juſtice are diſpatch'd, *viz.* *Hillary Term*, which, at *London*, begins the 23d Day of *January*; or if it be *Sunday*, the next Day after, and ends the 12th of *February* following. *Eaſter Term*, which begins the *Wedneſday* Fortnight after *Eaſter-Day*, and ends the *Monday* next after *Aſcenſion-Day*. *Trinity-Term*, beginning the *Friday* next after *Trinity Sunday*, and ending the *Wedneſday* Fortnight after. And *Michaelmas Term*, which begins the 23d of *October*, and ends the 28th of *November* following. Each of theſe *Terms* have their *Returns*. See RETURNS.

Oxford TERMS. *Hillary* or *Lent Term* begins *January* 14, and ends the *Saturday* before *Palm Sunday*. ---- *Eaſter Term* begins the 10th Day after *Eaſter*, and ends the *Thurſday* before *Whitſunday*. *Trinity Term* begins the *Wedneſday* after *Trinity Sunday*, and ends after the Act, ſooner or later, as the Vice Chancellor and Convocation pleaſe. *Michaelmas Term* begins *October* the 10th, and ends *December* the 17th.

Cambridge TERMS. *Lent Term* begins *January* the 13th, and ends the *Friday* before *Palm Sunday*. *Eaſter Term* begins the *Wedneſday* after *Eaſter*-week, and ends the Week before *Whitſunday*. *Trinity Term* begins the *Wedneſday* after *Trinity Sunday*; and ends the *Friday* after the Commencement. *Michaelmas Term* begins *October* the 10th, and ends *December* the 16th.

Iriſh and Scotch TERMS. In *Scotland*, *Candlemas Term* begins *January* the 23d, and ends *February* the 12th. *Whitſuntide Term* begins *May* the 25th, and ends *June* the 15th. *Lammas Term* begins *July* the 20th, and ends *Auguſt* the 8th. *Martinmas Term* begins *November* the 3d, and ends *November* the 29th. --- In *Ireland* the *Terms* are the ſame as at *London*, except the *Michaelmas Term*, which begins *October* the 13th, and adjourns to *November* the 3d, and thence to the 6th.

TERM, in Grammar, a particular Word, Diction, or Expreſſion in a Language. See WORD.

The Word *Term*, *Terminus*, is borrow'd, metaphorically, by the Grammarians and Philoſophers, from the Meaſurers or Surveyors of Lands: As a Field is defin'd and diſtinguiſh'd by its *Termini*, or Limits, ſo is the Thing or Matter ſpoke of by the Word or *Term* it is denoted by.

Some of our Philoſophers complain loudly of the great Uſe, or rather Abuſe of vague and general *Terms*, which have no preciſe, definitive Signification.

To diſtinguiſh theſe, F. *Mallebranch* obſerves, that every thing that is (whether it have actual Exiſtence, or not) and of conſequence every thing that is intelligible, is either a Being, or a Mode, or Manner of Being: Where, by Being, is meant whatever is abſolute, or which may be conceiv'd alone, and without Relation to any other Thing; and by manner of Being, whatever is relative, or which cannot be conceiv'd alone.

Now, there are two Kinds of Manner of Being; the one conſiſting in the Relation of the Parts of a Whole, to ſome Part of the ſame Whole; the other in the Relation of one thing to another: Of the firſt Kind is the Roundneſs of a Piece of Wax; and of the ſecond, the Motion or Situation of that ſame Wax. If then, every thing that is intelligible, be reducible either to Beings, or Manner of Beings, 'tis evident, every *Term* which does not ſignify either of thoſe Things, ſignifies nothing; and that every *Term* which does not ſignify either a Being, or a Manner of Being, is an obſcure and confus'd *Term*.

In Metaphyſicks, the Uſe of ſuch *Terms* is ſometimes neceſſary and allowable, as in ſpeaking of the Divine Perfections, &c. But in Phyſicks 'tis always miſchievous, and yet nothing more common; *e. gr.* when we ſay, that Bodies tend to their *Centre*, that they fall by their *Weight*, that they riſe by their *Levity*, that they move by their *Nature*, that they change ſucceſſively their *Forms*, that they act by their *Virtues*, *Qualities*, *Faculties*, &c. we uſe *Terms* which ſignify nothing; and all theſe Propoſitions are abſolutely falſe in the Senſe moſt Philoſophers underſtand them.

There is no Centre in the Senſe commonly meant; and the *Terms Weight*, *Form*, *Nature*, *Quality*, and the like, don't awaken any Idea either of a Being, or a Manner of Being: They are *Terms* void of Senſe, and which Perſons of Underſtanding ſhould always avoid.

Scientia inſenſati inenarrabilia verba.

TERM, *in the Arts*, or TERM *of Art*, is a Word, which, beſides the literal and popular Meaning which it has, or may have, in common Language, bears a further and peculiar Meaning in ſome Art or Science. See ART.

Or, a *Term* is a Word which has one or more Meanings beſide its Grammatical one; or which has a peculiar Force or Import in the Language of ſome particular Science, or Art.

A Word then becomes a *Term*, when its Idea is render'd more complex, conſiſts of more Parts, and includes more ſpecial Circumſtances on ſome Occaſions than on others.

'Tis this greater Complexneſs, this Exceſs of conſtituent Parts in the Idea, that denominates it a *Term* in the general.

Further, as the Parts of the Idea ſignify'd by any Word are arbitrary; and as one may not only add new Parts to thoſe contain'd in the literal Meaning, but alſo ſuper-add others to them, alter them, extend them, and otherwiſe modify them, at Pleaſure: Hence, the ſame Word becomes a *Term* of this, or that Art, or both, as the Inventors and Improvers of thoſe Arts, have thought fit to adopt it for the common Baſis of certain Ideas, and to modify and circumſtantiate its Meaning to the Uſe of their reſpective Arts.

See the Nature and Office of a *Term* further illuſtrated in the Preface to this Work. See alſo the Article DEFINITION.

TERM, *in Logic*. A Propoſition is ſaid to conſiſt of two *Terms*, *i. e.* two principal and eſſential Words, the *Subject* and the *Attribute*. See PROPOSITION.

A Syllogiſm conſiſts of three *Terms*, the *Major*, *Minor*, and *Concluſion*. A Syllogiſm containing four *Terms*, is vicious. See SYLLOGISM.

TERMS *of an Equation*, in Algebra, are the ſeveral Names or Members of which it is compos'd, and ſuch as have the ſame unknown Letter, but in different Powers and Degrees; for if the ſame unknown Letter be found in ſeveral Members in the ſame Degree or Power, they all paſs but for one *Term*. See EQUATION.

Thus in this Equation $aa+ab=R$, the three *Terms* are aa, ab, and R: And in this, $aa+ab+ac=Rd+dc$, the *Terms* are, aa, $ab+ac$, and $Rd+dc$; which are but three, becauſe $ab+ac$, having a in the ſame Dimenſion in both Parts, is taken but for one *Term*.

Hence, the *firſt Term* in any Equation, muſt be that where the unknown Root hath the higheſt Dimenſions; and that *Term* which hath the Root in it of one Dimenſion of Power lower, is call'd the *ſecond Term*; and ſo on.

TERMS *of Proportion* in Mathematicks, are ſuch Numbers, Letters, or Quantities, as are compar'd one with another. See PROPORTION.

Thus, if $\begin{matrix}4\cdot 8::6\cdot 12\\ a\cdot b::c\cdot d\end{matrix}$ then a, b, c, d, or 4, 8, 6, 12, are call'd the *Terms*; of which a is call'd the firſt *Term*, b the ſecond *Term*, *&c.* a and c are call'd the two *Antecedents*, and b and d the two *Conſequents*. See ANTECEDENT and CONSEQUENT.

TERMS, or Courſes in Medicine, the Menſes or Woman's monthly Purgations. See MENSES.

TERMINALIA, in Antiquity, Feaſts celebrated by the *Romans*, in Honour of the God *Terminus*. See FEAST.

In Reality, the *Terminalia*, or Feaſt of Land-Marks, was held in Honour of *Jupiter*, conſider'd in the Capacity of Conſervator of Land-Marks or Bounds. *Dionyſius Halicarnaſſæus* tells us, that it was *Numa Pompilius* who firſt conſecrated Land-Marks to *Jupiter*; and adds, that the ſame Prince appointed an Anniverſary Day, wherein the Country People aſſembling together on the Bounds of the Lands, ſhould offer Sacrifices in Honour of the Tutelary Gods thereof.

The *Terminalia* were held on the 7th, or, as *Struvius* will have it, on the 10th of the Calends of *March*. No Animal was to be ſacrific'd herein, it being deem'd unlawful to ſtain the Land-Marks with Blood. They only offer'd Sacrifices of the Firſt-Fruits of the Earth; and this in the open Air, and on the Spot where the Land-Marks were.

Varro is of Opinion this Feaſt took its Name from the End of the Year: But *Feſtus* is of a different Sentiment, and derives it from the Name of the Deity in whoſe Honour it was held.

TERMINATION, in Grammar, the ending of a Word; or the laſt Syllables thereof.

'Tis the different *Terminations* of one, and the ſame Word, on different Occaſions, that make the different Caſes, Numbers, Tenſes and Moods, *&c.* See CASE, NUMBER, TENSE, *&c.*

TERMINISTS, a Sect or Party among the Calviniſts, whoſe particular Tenets are reducible to Five Points.

1° That there are ſeveral Perſons, both in and out of the Church, to whom God has fix'd a certain *Term* before their Death, after which he no longer wills their Salvation, how long ſoever they live afterwards. 2° That God has fix'd this fatal Term of Grace, by a ſecret Decree. 3° That this Term once elapſed, he makes them no further Offer of Repentance or Salvation; but takes away from his Word, all the Power it might have to convert them. 4° That *Pharoah*, *Saul*, *Judas*, moſt of the *Jews*, and many of the Gentiles were of this Number. 5° That God ſtill bears with ſeveral of theſe Sort of People, and even confers Benefits on them after the Term expired; but that he does not do it with any Intention they ſhould be converted.

All the other Proteſtants, and particularly the Lutherans, look on theſe Articles with Abhorrence, as repugnant to the Goodneſs of God, as deſtructive to all Chriſtian Virtue, and as contrary to Scripture, particularly the following Texts; *Ezek.* xviii. 23, 30, 31, 32. xxxiii. 11. 1 *Tim.* ii. 1, 16. 2. *Pet.* iii. 9. *Acts* xvii. 30, 31. *Mat.* xi. 28. *Iſa.* lxv. 2. *Heb.* iii. 7, 13. *Rom.* iv. 5, *&c.*

TERRA, in Geography
TERRA, in Chymiſtry
TERRA, in natural Hiſtory } See EARTH.

TERRA *Damnata*
TERRA *Lemnia*
TERRA *Japonica*
TERRA *Sigillata*
TERRA *Merita* } See CAPUT MORTUUM.
LEMNIAM.
JAPON *Earth.*
SIGILLATA.
TURMERIC.

TERRA, *a Terra*, Galleys, and other Veſſels, are ſaid to go *Terra*, *a Terra* when they never go far from the Coaſts. See COASTING.

The Phraſe is alſo apply'd in the Manage, to Horſes, which neither make Curvets nor Balotades, but run ſmoothly on the Ground, on a preſs'd Gallop; only making little Leaps or Riſings ſomething with the fore Feet.

The *Terra*, *a Terra*, is a Series of very low, eaſy Leaps, which a Horſe makes forward, bearing ſidewiſe, and working on two Treads. In this Motion he lifts both Legs at once; and when thoſe are on the Point of deſcending, they are accompany'd by the hind Legs, with a ſhort and quick Cadence, always bearing and ſtaying on the Haunches, ſo that the Motions of the hind Quarters are very ſhort and quick.

The *Term* is alſo apply'd to Dancers who cut no Capers, nor ſcarce quit the Ground. Hence it is alſo figuratively apply'd to Authors, whoſe Stile and Diction is low and creeping.

TERRACE, or TERRAS, a Bank of Earth, raiſed in a Garden, Court, *&c.* above the Level of the Ground.

The *Terras* is an Earth-work uſually lined and breaſted with a ſtrong Wall, in Compliance with the natural Inequality of the Ground. Sometimes it is made in Talus, or a-ſlope, and cover'd with Turf. A *Counter-terrace*, is a *Terrace* raiſed over another, for the joining of the Ground, or the raiſing a Parterre.

TERRACE is alſo applied to the Roofs of Houſes that are flat, and whereon one may walk; as alſo to Balconies that project. See ROOF.

The *Terrace* is properly the Covering of a Building, which is in Plat-form; as that of the Periſtyle of the *Louvre*; or that of the Obſervatory, paved with Flint and Mortar. All the Buildings of the Oriental Nations, are cover'd with *Terraſſes*, to take the freſh Air on, and even to lie on. See PLAT-*Form*.

TERRA-*Firma*, in Geography, is ſometimes uſed for a *Continent*; in Contradiſtinction to Iſlands. See CONTINENT.

Thus *Aſia*, the *Indies* and *South America* are uſually diſtinguiſh'd into *Terra-firma*'s and Iſlands. See ISLAND.

In our ancient Law-Books, we meet with *Terra* in the Senſe of *Land* or *Ground*; joined with divers Additions; as, *Terra Normanorum*, the Lands of ſuch *Norman* Noblemen, as were forfeited to the Crown, by the Owners taking Part with the *French* King, againſt King *Henry* III.---- *Terra Fruſca*, ſuch Land as has not been lately plough'd. ---- *Terra Gilliflorata*, Land held by the Tenure of paying a Gilliflower yearly. See SERVICE. ----- *Terra Veſtita*, Land ſown with Corn, and the Crop ſtill remaining thereon. ----- *Terra Teſtamentalis*, Land held free from feodal Services, and deviſable by Will. ------ *Terra culta*, Land that is Till'd and Manur'd, in Contradiſtinction to *Terra Inculta*. ----- *Terra Affirmata*, Land let out to Farm. ----- *Terra Dominica*, or *Indominitata*, Demain Land of a Manor. See DEMAIN. ----- *Terra Hydata*, was Land ſubject to the Payment of Hydage. See HYDAGE. ----- *Terra Lucrabilis*, Land that may be gain'd from the Sea, or incloſed out of a Waſte or Common, to particular Uſes. ----- *Terra Wainabilis*, Tillage Land. ----- *Terra Warecta*, Fallow Land. ----- *Terra Boſcalis*, Wood Land, *&c.*

TERRA *extendenda*, is a Writ directed to the Eſcheator, *&c.* willing him to inquire and find out the true yearly Value of any Land, *&c.* by the Oath of 12 Men, and certify the Extent into *Chancery*. See ESCHEATOR.

TERRAGE, TERRAGIUM, anciently ſignified a Service, in which a Tenant or Vaſſal was bound to his Lord, to plough and reap the Ground for him. See PRECARIOUS.

Others

Others will have it Money paid for digging or breaking the Earth in Fairs and Markets.

Quieti ſint de Theolonio, Pavagio, Paſſagio, Laſtagio, Tallagio, Carvagio, Priſagio & Terragio.

TERRAQUEOUS, an Epithet given to our Globe or Earth, conſider'd as conſiſting of Land and Water; which, together, conſtitute one globular Maſs. See GLOBE and EARTH.

The Word, like the Thing, is a Compound of *Terra* and *Aqua*, *Earth* and *Water*.

Some Philoſophers, particularly Dr. *Burnet* in his *Theory*, tax the Frame and Faſhion of the *Terraqueous Globe* as rude, unartful and diſorderly; and conclude it highly abſurd to ſuppoſe it came thus out of the Hands of the Creator, and therefore have Recourſe to a Deluge to make it thus. See DELUGE.

But others can perceive a world of Art and Conveniency, even in this apparent Diſorder: Mr. *Derham* particularly obſerves, That the Diſtribution of Land and Water is admirable; the one being laid over the other ſo skilfully all the World over, that there is a juſt Equipoiſe or Ballance of the whole Globe.

Thus the Northern Ocean balances the Southern; and the *American* Continent, is a Counterpoiſe to the *European*, *African* and *Aſiatic*. See OCEAN, *&c.*

And what ſome object, that the Waters occupy too great a Part of the Globe, which they imagine would be of more Uſe were it dry Land; he obviates, by ſhewing that this would deprive the World of a due Quantity of Vapours and Rain: For if the Cavities which contain the Sea, and other Waters, were deeper; tho' the Quantity of Water were the ſame, and only the Surface leſſer and narrower, the Evaporations would be ſo much the leſs, inaſmuch as they are made from the Surfaces, and, conſequently, are in proportion thereto. See VAPOUR, CLOUD, RAIN, *&c.* See alſo MOUNTAIN, VALLEY, *&c.*

TERRÆ-*Filius*, q. d. *Son of the Earth*. A Student in the Univerſity of *Oxford*, appointed on certain Occaſions to make Jeſting and Satyrical Speeches againſt the Members thereof; to tax them with any growing Corruptions, *&c.*

TERRE-*Plain*, in Fortification, the Top, Plat-form, or Horizontal Surface of the Rampart, whereon the Cannon are placed, and the Defenders perform their Office. See RAMPART.

It is thus call'd, as lying level; having only a little Slope outwardly, to bear the Recoil of the Cannon.

It is terminated by the Parapet on that Side towards the Campaign; and by the inner Talus, on the Side towards the Place. Its Breadth is from 24 to 30 Feet. See PARAPET, *&c.*

TERRE-*Tenant*, is he who hath the actual Poſſeſſion of the Land, otherwiſe call'd the *Occupation*. See TENANT and OCCUPATION.

Thus a Lord of a Manor hath a Freeholder, who letteth out his Freehold to another to be occupied: And this Occupier, having the actual Poſſeſſion, is called the *Terre-Tenant*.

TERRELLA, *μικρογη, little Earth*; is a Magnet, turn'd of a juſt ſpherical Figure, and placed ſo as that its Poles, Equator, *&c.* do exactly correſpond to thoſe of the World. See MAGNET.

'Twas thus firſt call'd by *Gilbert*, as being a juſt Repreſentation of the great magnetic Globe we inhabit. See GLOBE.

Such a *Terrella*, if nicely pois'd, and placed in a Meridian like a Globe, it was ſuppoſed, would be turn'd round like the Earth in 24 Hours by the Magnetic Particles pervading it; but Experience has ſhewn this to be a Miſtake. See MAGNETISM.

TERRESTRIAL *Globe*, TERRESTRIAL *Paradiſe*, TERRESTRIAL *Line* } See { GLOBE. PARADISE. LINE *Terreſtrial.*

TERRIER, or TERRAR, in our ancient Cuſtoms, a Collection of Acknowledgments of Vaſſals or Tenants of a Lordſhip, containing the Rents, Services, *&c.* they owe their Lord; and ſerving as a Title, or Claim for demanding and executing the Payments thereof.

At preſent, by *Terrier* we mean no more than a Book, or Roll, wherein the ſeveral Lands, either of a private Perſon, or of a Town, College, Church, *&c.* are deſcrib'd. It ſhould contain the Number of Acres, the Scite, Boundaries, Tenants Names, *&c.*

TERRIER is alſo the Lodge or Hole which Foxes, Badgers, Rabbets, *&c.* dig themſelves under Ground; and wherein they ſave themſelves from the Purſuit of the Hunters.

Hence *Terrier* is alſo uſed for a kind of little Hound to hunt thoſe Animals, which, like a Ferret, creeps into the Ground, and by that Means affrights and bites them; either tearing them with his Teeth, or elſe haling them by Force out of their Holes.

TERRIS *Bonis & Catallis rehabendis poſt purgationem*, a Writ which lies for a Clerk to recover his Lands, Goods or Chattels formerly ſeiz'd; after having clear'd himſelf of a Felony, upon Suſpicion whereof he was convict, and deliver'd to his Ordinary to be purged.

TERRIS *& Catallis tentis ultra debitum levatum*; a Writ Judicial, for the reſtoring Lands or Goods to a Debtor, that is diſtrained beyond the Quantity of the Debt. See DISTRESS.

TERRIS *Liberandis*, a Writ lying for a Man convicted by Attaint, to bring the Record and Proceſs before the King, and take a Fine for his Impriſonment, and deliver him Lands and Tenements again, and releaſe him of a Strip and Waſte.

TERRITORY, *Diſtrict*, the Extent or Compaſs of Land within the Bounds, or belonging to the Juriſdiction, of any State, City or other Diviſion.

'Tis a Maxim, that the Church has no *Territory*, *i. e.* it has no Temporal Juriſdiction; ſo that an Eccleſiaſtical Judge cannot arreſt any Body, not even a Prieſt.

Much in this Senſe, *Cujas* ſays, the Church has an Auditory, but no *Territory*.

TERSION, the Act of wiping or rubbing a Thing. See ATTRITION.

The Word comes of *tero*, I wear.

TERTIAN, a Fever or Ague intermitting but one Day; ſo that there are two Fits in three Days. See FEVER.

The Method of curing *Tertians*, as well as other Agues, is by the Cortex, either given in Subſtance or Decoction. This laſt is beſt in weak Conſtitutions, and where the Fits are not ſo regular; but the Subſtance more to be depended on as to Certainty in other Caſes. See AGUE, *&c.*

TERTIATE, in Gunnery: To *Tertiate a great Gun*, is to find the Thickneſs of the Metal at the Touch-hole, the Trunnions, and at the Muzzle; whereby to judge of the Strength of the Piece, and whether it be well fortified or not. See GUN, CANNON, ORDNANCE, *&c.*

This is uſually done with a Pair of Calliper Compaſſes; and if the Piece be Home-bored, the Diameter leſs by the Height, divided by 2, is the Thickneſs at any Place. See CALLIPER.

TERUNCIUS, in Antiquity, a very ſmall Silver Coin, in uſe among the *Romans*. See COIN.

The Inconvenience of ſuch very ſmall Pieces being ſoon found, the *Teruncius* became diſuſed; but its Name was ſtill retain'd in reckoning; and thus it became a Money of Account. See MONEY.

The *Teruntius* at firſt, was a Quarter of the *As*, or *Libra*: Hence, as the *As* contained 12 Ounces, the *Teruncius* contained Three; whence the Name, which is form'd of the *Latin*, *tres unciæ*.

The *Teruncius* was alſo a Quarter of the Denarius; ſo that when the Denarius was at ten As's, the *Teruncius* was worth Two and a Half, and when the Denarius was riſen to 16 the *Teruncius* was worth Four. See DENARIUS.

TESSELATED *Pavement*, *Pavementum Teſſelatum*, a rich Pavement of *Moſaick* Work, made of curious ſmall ſquare Marbles, Bricks or Tyles, call'd *Teſſelæ*, from the Form of Dies. See MOSAIC *Work*.

Theſe *Pavements* were much uſed in the Tents of the *Roman* Generals.

TESSERA-COSTE, in our ancient Writers, the 40 Days between *Eaſter* and *Holy Thurſday*. See LENT.

TEST, or *Teſt Oath*, in our Cuſtoms, a Form of Oath, whereby the Doctrine of Tranſubſtantiation, the Sacrifice of the Maſs, the Invocation of Saints, *&c.* are abjured. See OATH.

This Oath was firſt introduced by Authority of Parliament in 1672; and they who refuſed to take it, were excluded the Privilege of holding any public Offices.

The Word ſignifies *Proof* or *Trial*, being form'd of the *Latin*, *Teſtis*, Witneſs; this Oath being a Mark or Evidence, that the Perſon is not a *Roman* Catholic.

TEST, among Chymiſts and Refiners, the ſame as the *Coupel*, *Cuppel* or *Coppel*, an Inſtrument uſed in the purifying Gold and Silver. See COUPEL.

TESTACEOUS, in natural Hiſtory, an Epithet given to a Species of Fiſh, which are covered with a ſtrong, thick Shell; as Tortoiſes, Oyſters, Pearl Fiſh, *&c.* See FISH.

In Strictneſs, however, *Teſtaceous* is only applied to ſuch Fiſh, whoſe ſtrong and thick Shells are intire and of a Piece: Thoſe which are ſoft, thin, and conſiſt of ſeveral Pieces jointed, as the Lobſter, *&c.* being called *Cruſtaceous*. See SHELL.

In Medicine, all Preparations of Shells, and Subſtances of the like Kind, are called *Teſtaceous Powders*.

Such are Powders of Crabs Claws and Eyes, Harts-horn, Pearl, *&c.*

Dr. *Quincy*, and others, ſuppoſe the Virtue of all *Teſtaceous* Medicines to be alike; that they ſeldom or never enter the Lacteals; but that the chief of their Action is in the firſt Paſſages; in which Caſe, they are of great Uſe in abſorbing Acidities. See ABSORBENT.

Hence they become of Uſe in Fevers, and eſpecially in rectifying the many Diſtempers in Children, which generally owe their Origin to ſuch Acidities. See *Diſeaſes of* CHILDREN.

TESTAMENT, in Law, a ſolemn and authentic Act, whereby a Perſon declares his Will, as to the Diſpoſal of his Eſtate, Effects, Burial, *&c.* See WILL.

A *Teſtament* has no Effect till after Death; and 'tis always revocable till then. As *Teſtaments* are Acts, of all others the moſt ſubject to Deceits, Surprize, *&c.* it was neceſſary to uſe all kinds of Precautions to prevent the Wills of the Deceaſed from being eluded; and the Weakneſs of dying Perſons from being abuſed.

The moſt ancient *Teſtaments* among the *Romans*, were made *viva voce*; the Teſtator declaring his Will in the Preſence of Seven Witneſſes: Theſe they call'd *Nuncupative Teſtaments*; but the Danger of truſting the Will of the Dead to the Memory of the Living, ſoon aboliſh'd them; and all *Teſtaments* were order'd to be in Writing. See NUNCUPATIVE.

The *French* Legiſlators, thought *Holographic Teſtaments*, *i. e. Teſtaments* wrote wholly with the Teſtator's Hand, an abundant Security; but the *Roman* Law, more ſevere, did not admit of *Teſtaments* without further Solemnity.

The eaſieſt and moſt favourable, is the 21ſt Law in the *Code de Teſtamentis*, which permits ſuch as are unwilling to truſt the Secret of their *Teſtaments* to others, to write it with their own Hand, and to cloſe it in the Preſence of Seven Witneſſes, declaring to them, that it is their *Teſtament*; after which it is to be Sign'd by all the Seven Witneſſes.

Otherwiſe, to make a Solemn *Teſtament*, it was required to be atteſted by Seven Witneſſes, and ſealed with their Seals.

Yet the *Military Teſtament* was not ſubject to ſo many Formalities: The Soldier was ſuppoſed too much employ'd in defending the Laws, to be ſubject to the Trouble of knowing them. His tumultuary Profeſſion excuſed him from obſerving all the Rules.

Add, that *Teſtaments*, wherein Fathers diſpoſed of their Eſtates among their Children, had particular Privileges, and were diſpens'd from moſt of the ordinary Formalities.

The Word is form'd from the *Latin*, *Teſtamentum*, which the *Latin* Lawyers derive from *Teſtatio Mentis*.

TESTATOR, or TESTATRIX, the Perſon who makes his or her Will and Teſtament. See TESTAMENT.

M. *Gillet*, ſhews, that a Perſon incapable of a Legacy, cannot demand any Sum, which the *Teſtator* in his Teſtament declares himſelf indebted to him in; in regard ſuch a Declaration of Debt is preſumed a Fraud, againſt the Intention of the Law.

TESTA NEVELLI, or TESTA de NEVIL, an ancient Record kept by the King's Remembrancer in the *Exchequer*; containing the King's Fees throughout the greateſt Part of *England*, with Inquiſitions of Lands Eſcheated, and Serjeanties.

It was denominated from its Compiler, *Johan. de Nevil*, one of the Itinerant Juſtices under K. *Henry* III.

TESTATUM, in Law, a Writ in perſonal Actions. If the Defendant cannot be arreſted on a Capias in the County where the Action is laid, but is return'd *non eſt Inventus* by the Sheriff; this Writ ſhall be ſent into any other County, where this Perſon is thought to have wherewithal to ſatisfy the Demand.

It is call'd *Teſtatum*, becauſe the Sheriff has before teſtify'd, that the Defendant was not to be found in his Bailiwic.

TESTE, a Term commonly us'd in the Cloſe of every Writ, where the Date is contain'd, which begins with *Teſte meipſo*, if it be an original Writ; or if Judicial, *Teſte Matheo Hale*, *Mil.* or *Franciſco North*, *Mil. &c.* according to the Court whence it comes.

In ſome ancient Formula's, we read *Teſte Cuſtode Angliæ*.

TESTES, in Anatomy, two white, ſoft, oval Bodies ſerving for Generation; uſually call'd, diminutively, *Teſticles*. See TESTICLE.

TESTES, *of the Brain*, are two little, round, hard Bodies, between the third and fourth Ventricle, near the pineal Gland. See BRAIN.

TESTICLE, *Teſtis*, a double Part in an Animal, ſerving for the Office of Generation. See GENERATION.

In Man, and moſt Animals, they are exterior; in ſome, as Fowls, interior.

Some have only one, ordinarily they have two, and ſome have naturally had three; nay, Anatomiſts aſſure us they have known four.

The *Teſticles* are ſoft white Bodies, of an oval Figure, and about the Size of a Pidgeon's Egg: They have been thought to be of a glandulous Subſtance, and, according to the preſent Doctrine of Glands, they may be allow'd to be ſo ſtill. See GLAND.

They are form'd of a Convolution of divers Kinds of Veſſels, particularly the Spermatic Veins and Arteries; the latter of which bring the Blood whence the Seed is to be ſecreted in the Meanders of the *Teſticles*; and the former return it back again after the Secretion made. See SEED.

The reſt of the *Teſticle* is made up of Seed-Veſſels, which, indeed, are but one continu'd Series or Rope, intricately convoluted and wound up as it were into a Bottom, but adhering ſo laxly, that they are eaſily drawn out into Length, and in Rats ſhaken from their cloſe Contexture.

Theſe Seminal Veſicles terminate in the Paraſtatæ. See PARASTATA.

The *Teſticles*, with the Paraſtatæ, are ſaid to be incloſ'd in three proper Coats; the firſt the *Muſculoſa*, deriv'd from the Cremaſter Muſcle; the ſecond the *Elythroides*, or *Vaginalis*, which is a Continuation of the external Lamina of the Peritonæum; the third, the *Abuginea*. See each under its proper Article, MUSCULOSA, ELYTHROIDES, *&c.*

The common Capſula or Membrane including both *Teſticles*, is the *Scrotum*; which ſee deſcrib'd under the Article SCROTUM.

For the Uſe of the *Teſticles*, in preparing and ſecreting the Seed; See SEED.

They are call'd *Teſticles*, by Diminution, of *Teſtes*, Witneſſes; as giving Teſtimony of Virility. They are what we properly call *Genitors*, *Genitalia*.

The *Greeks* call them *Didymi* or Twins. See DIDYMI.

TESTIMONIAL, a kind of Certificate, ſign'd either by the Maſter and Fellows of the College where a Perſon laſt reſided; or by three, at leaſt, Reverend Divines, who knew him well for three Years laſt paſt; giving an Account of the Virtues, Uniformity, and Learning of the Perſon. See CERTIFICATE.

Such a *Teſtimonial* is always requir'd before Holy Orders are conferr'd; and the Biſhop even ordinarily demands one of a Prieſt before he admits him to a Benefice. See ORDINATION, *&c.*

TESTIMONIAL is alſo a Certificate under the Hand of a Juſtice of Peace, teſtifying the Place and Time when and where a Soldier landed, and the Place of his Dwelling, *&c.* whither he is to paſs.

TESTIMONY. See EVIDENCE and WITNESS.

For the Credibility of *human Teſtimony*; See CREDIBILITY.

TESTUDO, in Natural Hiſtory. See TORTOISE.

TESTUDO, *in Antiquity*, was particularly us'd among the Poets, *&c.* for the ancient Lyre; by Reaſon it was originally made, by its Inventor *Mercury*, of the Back or hollow Shell of a *Teſtudo Aquatica*, or Sea Tortoiſe, which he accidentally found on the Banks of the River *Nile*. See LYRE.

Dr. *Molyneux* has an expreſs Diſcourſe, in the *Philoſophical Tranſactions*, to ſhew that the Tortoiſe-ſhell was the Baſis of the ancient Lyre, and that the whole Inſtrument had thence the Denomination *Teſtudo*; which Account lets ſome Light into an obſcure Paſſage in *Horace*, Ode 3. lib. 4. miſtaken by all the Commentators.

O Teſtudinis *Aureæ*
Dulcem quæ ſtrepitum, Pieri, temperas;
O Mutis quoque piſcibus,
Donatura Cygni, ſi libeat, ſonum.

TESTUDO, *Tortoiſe*, in the military Art of the Ancients, was a Kind of Cover or Screen which the Soldiers, *e. gr.* a whole Company, made themſelves of their Bucklers, by holding them up over their Heads, and ſtanding cloſe to each other.

This Expedient ſerv'd to ſhelter them from Darts, Stones, *&c.* thrown upon them; eſpecially thoſe thrown from above when they went to the Aſſault.

TESTUDO was alſo a kind of large Wooden Tower which mov'd on ſeveral Wheels, and was cover'd with Bullocks Hides newly flead; ſerving to ſhelter the Soldiers when they approach'd the Walls to mine them, or to batter them with Rams.

They were call'd *Tortoiſes* from the Strength of their Roof, which cover'd the Workmen as the Shell does the Tortoiſe.

TESTUDO, *in Medicine*, a ſoft broad Tumour, or gathering of impure Humours between the Scull and the Skin, call'd alſo *Talpa*, as reſembling the Form of a Tortoiſe or a Mole. See TALPA.

TESTUDO *Veliformis quadrabilis*, a Hemiſpherical Vault, or Ceiling of a Church, *&c.* wherein four Windows are ſo contriv'd, as that the reſt of the Vault is quadrable, or may be ſquar'd. See VAULT, QUADRATURE, *&c.*

The determining of theſe Windows, was a Problem propos'd to the great Mathematicians of *Europe*, particularly the Cultivators of the new *Calculus Differentialis*, in the *Acta Eruditorum Lipſiæ*, by Sig. *Viviani*, under the fictitious Name of *A. D. Pia Liſci puſillo Geometra*, which was the Anagram of *Poſtremo Galilæi Diſcipulo*.

It was ſolv'd by ſeveral Perſons, particularly M. *Leibnitz*, the very Day he ſaw it: And he gave it in the *Leipſic* Acts in an Infinity of Manners; as alſo did M. *Bernoulli*, the Marquis *del Hoſpital*, Dr. *Wallis*, and Dr. *Gregory*.

TETANOS, in Medicine, a Term purely *Greek*, and ſignifying a kind of Tonic Spaſmus, or Convulſion, wherein the fore and hind Muſcles of the Head are render'd rigid and inflexible; ſo that it can neither bend one Way nor t'other. See CONVULSION.

The Word is form'd from the *Greek*, τείνειν, to ſtretch.

Some Authors alſo uſe *Tetanos*, or *Tetanus* in a more general Senſe. When a Convulſion is univerſal, they denominate it *Tetanus*; which they ſub-divide into *Emproſthotonus* and *Opiſthotonus*. See EMPROSTHOTONOS and EPISTHOTONOS.

TETRACHORD, in the ancient Muſic, a Concord conſiſting of three Degrees, Tones, or Intervals, or four Sounds or Terms; call'd alſo by the Ancients διατέσσαρον, and by the Moderns a *Fourth*. See FOURTH.

This Interval had the Name *Tetrachord* given it with reſpect to the Lyra, and its Chords or Strings. See CHORD. See alſo DIATESSARON.

Ancient Authors make frequent Mention of the Synaphe, or Conjunction; and Dieſeuſis, or Disjunction of *Tetrachords*. To conceive their Meaning, it muſt be obſerv'd, that two *Tetrachords* were ſaid to be join'd, when the ſame Chord was the higheſt of the firſt, or loweſt Inſtrument, and the loweſt of the ſecond; as was the Caſe in the two *Tetrachords* that compoſe the ancient Heptachord or Seventh. But when two *Tetrachords* had no common Chord; but, on the contrary, had each their different ones to begin and end withal, ſo that between the two there were two Intervals of a Tone, then the *Tetrachords* were ſaid to be disjoin'd; which was the Caſe in the two *Tetrachords* that compoſe the Octachord or Octave. See OCTAVE.

The Word is form'd of the *Greek*, τέτρα, four times, and χορδὴ, a Chord or String.

TETRACTYS, in the ancient Geometry. The *Pythagoric Tetractys* is a Point, a Line, a Surface, and a Solid.

TETRADIAPASON, a *Quadruple Diapaſon*; a Muſical Chord, otherwiſe call'd a quadruple eight or nine and twentieth. See DIAPASON.

TETRADITES, in Antiquity, a Name given to ſeveral different Sects of Hereticks, out of ſome particular Reſpect they bore to the Number *four*, τέτρα.

The Sabbathians were call'd *Tetradites*, from their faſting on *Eaſter-Day*, as on the fourth Day, or *Wedneſday*. See SABBATHIAN.

The Manichees, and others, who admitted a Quaternity inſtead of a Trinity in the Godhead, or four Perſons in lieu of three, were alſo call'd *Tetradites*. See MANICHEE.

The Followers of *Petrus Fullenſis* bore the ſame Appellation of *Tetradites*, by Reaſon of the Addition they made to the *Triſagion*, to countenance an Error they held, that in our Saviour's Paſſion, 'twas not any particular Perſon of the Godhead, *e. gr.* the Son, that ſuffer'd; but the whole Deity. See TRISAGION.

The Ancients alſo gave the Name *Tetradites* to Children born under the fourth Moon; and theſe they believ'd unhappy.

The Word is form'd from the *Greek*, τέτλαρες or τέσσαρες, four.

TETRAEDRON, TETRAHEDRON, in Geometry, one of the five regular or Platonic Bodies, or Solids; comprehended under four equilateral and equal Triangles. See SOLID.

The *Tetraedron* may be conceiv'd as a triangular Pyramid of four equal Faces. See PYRAMID.

Such is that repreſented (Tab. Geometry, Fig. 59.) See REGULAR *Body*.

'Tis demonſtrated by Mathematicians, that the Square of the Side of a *Tetraedron*, is to the Square of the Diameter of a Sphere wherein it may be inſcrib'd, in a ſubſeſquialteral Ratio: Whence it follows, that the Side of a *Tetraedron* is to the Diameter of a Sphere it is inſcrib'd in, as $\sqrt{2}$ to the $\sqrt{3}$, conſequently they are incommenſurable.

TETRAGON, in Geometry, a *Quadrangle*; or a Figure with four Angles. See QUADRANGLE.

Thus a Square, Parallelogram, Rhombus, Trapezium, are *Tetragonal* Figures, See SQUARE, &c.

The Word is form'd from the *Greek*, τέτρες, four, and γωνία, Angle.

TETRAGON, in Aſtrology, &c. an Aſpect of two Planets with Regard to the Earth, when they are diſtant from each other a fourth Part of a Circle, or 90°; as A D Tab. Aſtronomy, Fig. 3.

The *Tetragon* is expreſs'd by the Character, □. See ASPECT.

TETRAGONIAS, a Name given to a Comet, whoſe Head is of a Quadrangular Figure, and its Tail or Train long, thick, and uniform; not much different from the Meteor call'd *Trabs*. See COMET and TRABS.

TETRAGONISM, a Term ſome Authors uſe to expreſs the Quadrature of the Circle. See QUADRATURE.

TETRAGONUS, in Anatomy, a Muſcle, call'd alſo *Quadratus Genæ*. See QUADRATUS.

TETRAGRAMMATON, a Denomination given by the *Greeks* to the Name of God, becauſe conſiſting of four Letters in moſt Languages. See GOD.

TETRAMETER, in the ancient Poetry, an Iambic Verſe conſiſting of eight Feet. See IAMBIC.

We meet with none of theſe but in the Comic Poets, as *Terence*.

The Word is form'd from the *Greek*, τέτρες, four, and μέτρον, Meaſure, *q. d.* four Meaſures.

TETRAPASTUS, in Mechanicks, a Machine wherein are four Pullies. See PULLY.

The Word is form'd from the *Greek*, τετράπαστον. See POLYPASTUS.

TETRAPETALOUS, in Botany, an Epithet given to Flowers that conſiſt of four *Petala*, or Leaves, plac'd around the Piſtil. See PETALA.

Theſe, M. *Juſſieu* calls *Polypetalous* Flowers. See POLYPETALOUS.

Mr. *Ray*, who calls them *Tretapetalous*, makes them conſtitute a diſtinct Kind, which he divides into

1°. Such as have an uniform *Tetrapetalous* Flower, and their Seed-Veſſels a little oblongiſh, which he therefore calls *Siliquoſæ*; as the Keiri or Leucoium Luteum, and the other common Leucoium, the Dentaria, the Leucoium Siliquoſum, Alyſſon, Viola Lunaris, Paronychia, Heſperis, Alliaria, Rapa, Napus, Sinapis, Rapiſtrum, Eruca Spuria, Eriſimum, Cardamine, Turritis, Piloſella Siliquoſa, and the Raphanus Ruſticanus and Aquaticus.

2°. Such as have their Seed Caſe or Veſſel ſhorter, which therefore, for Diſtinction Sake, he calls *Capſulatæ*, and *Siliculoſæ*; as the Myagrum, Draba, Leucoium Siliqua ſubrotunda, Cochlearia, Naſturtium, Lepidium vulgare, Thlaſpi, Braſica marina, Glaſtum, Eruca marina, &c.

3. Such as have a ſeeming *Tetrapetalous* Flower, that is, a Monopetalous one, divided deeply into four Partitions; which he particularly calls *Anomalous*; as the Papaver, Agremony, Veronica, Tithymallus, Plantago, Coronopus, Pſyllium, Lyſimachia Siliquoſa, Alſine ſpuria, &c.

TETRAPHARMACUM, from τέτρα, *quater*, four, and φάρμακον, *Medicamentum*, is any Remedy conſiſting of four Ingredients.

TETRAPLA, in Church Hiſtory, a Bible diſpos'd by *Origen* under *four Columns*, in each whereof was a different *Greek* Verſion, *viz.* that of *Aquila*, that of *Symmachus*, that of the *Seventy*, and that of *Theodoſian*. See BIBLE.

Sixtus of *Sienna* confounds the *Tetrapla* with the *Hexapla*; but the *Tetrapla* is a different Work, compos'd after the *Hexapla*, in Favour of ſuch as could not have the *Hexapla*. See HEXAPLA.

Some Authors are of Opinion, that the Order wherein the four Verſions of the *Tetrapla* were rang'd, was different from that wherein we have rehears'd them; and particularly that the Septuagint was in the firſt Column: But S. *Epiphanius* ſays expreſsly to the contrary, and places it in the third. He even gives us *Origen*'s Reaſon for putting it there; which was, ſays he, that the beſt Verſion might be in the Middle, that the others might be the more eaſily confronted therewith, and corrected from it.

Baronius, however, in his Annals for the Year 231, takes the Septuagint to have been in the third Place in the *Hexapla*, but the firſt in the *Tetrapla*; yet *Epiphanius* gives it the ſame Place in both.

The Word is form'd from the *Greek* τετραπλοῦς, *quadruplex*, four-fold.

TETRAPTOTE, TETRAPTOTON, in Grammar, ſuch defective Nouns as have only four Caſes; as *Plus*, which wants the Dative and Vocative ſingular. See CASE, APTOTE, &c.

TETRARCH, TETRARCHA, a Prince who holds and governs a fourth Part of a Kingdom; thus call'd from the *Greek* τέτρες, fourth, and ἀρχὴ, Rule, Dominion.

Such, originally, was the Import of the Title *Tetrarch*; but it was afterwards apply'd to any petty King, or Sovereign, and became ſynonymous with *Ethnarch*; as appears from the following Conſideration: 1°. That *Pliny* makes mention of ſix *Tetrarchies* within the Cities of *Decapolis*. 2°. That *Herod*'s Kingdom was only divided into three Parts, which yet were call'd *Tetrarchies*, and the Sovereigns thereof, *Luke* iii. 1. *Tetrarchs*. 3°. *Joſephus*, Antiq. Jud. lib. xiv. c. 23. tells us, that after the Battle of *Philippi*, *Anthony* going into *Syria*, conſtituted *Herod*, *Tetrarch*; and on Medals the ſame *Herod* is call'd *Ethnarch*. See ETHNARCHA.

TETRASTICH, a Stanza, Epigram, or Poem, conſiſting of four Verſes. See DISTICH.

TETRASTYLE, in the ancient Architecture, a Building, and particularly a Temple, with four Columns both before and behind, *i. e.* in Front and Rear. See TEMPLE.

The

The Word is form'd from τετραες, four, and στλΘ, Columns.

TETRASYLLABICAL, a Word conſiſting of four Syllables. See WORD and SYLLABLE.

TEUTONIC, ſomething belonging to the *Teutones*, an ancient People of *Germany*, inhabiting chiefly along the Coaſts of the *German* Ocean.

The TEUTONIC *Language* is the ancient Language of *Germany*, the ſame with the *Celtic*. See LANGUAGE, CELTIC, &c.

The *Teutonic*, or *German*, is rank'd among the Mother Tongues. See MOTHER *Tongue*.

It is now diſtinguiſh'd into *Upper* and *Lower*.

The *Upper* has two notable Dialects, *viz.* 1°. the *Scandian*, *Daniſh*, or perhaps, *Gothic*; to which belong the Languages ſpoke in *Denmark*, *Norway*, *Sweden*, and *Ireland*. 2°. The *Saxon*; to which belong the ſeveral Languages of the *Engliſh*, *Scots*, *Friſian*, and thoſe on the North of the *Elbe*. See ENGLISH, &c.

To the *Lower* belong the *Low Dutch*, *Flemiſh*, &c. ſpoke thro' the *Netherlands*, the more Southerly Parts of *Germany*, &c.

TEUTONIC *Order*, a Military-Religious Order of Knights, eſtabliſh'd towards the Cloſe of the XIIth Century; and thus call'd, becauſe conſiſting principally of *Germans*. See KNIGHT and ORDER.

The Origin, &c. of this Order was thus: The Chriſtians under *Guy* of *Luſignan*, laying Siege to *Aca*, or *Acra*, a City of *Syria*, on the Borders of the Holy Land; at which Siege were preſent, *Richard* King of *England*, *Philip Auguſte* of *France*, &c. ſome *Germans* of *Bremen* and *Lubec*, touch'd with Compaſſion for the Sick and Wounded of the Army, who wanted common Neceſſaries, ſet on Foot a kind of Hoſpital under a Tent, which they made of a Ship's Sail; and here betook themſelves to a charitable Attendance of the Sick.

This ſtarted a Thought of eſtabliſhing a third Military Order, in Imitation of the Templars and the Hoſpitallers.

The Deſign was approv'd by the Patriarch of *Jeruſalem*, the Archbiſhops and Biſhops of the neighbouring Places, the King of *Jeruſalem*, the Maſters of the Temple and the Hoſpital, and the *German* Lords and Prelates then in the Holy Land, &c. And by common Conſent, *Frederic*, Duke of *Suabia*, who was then at their Head, ſent Embaſſadors to his Brother, *Henry*, King of the *Romans*, to ſolicit the Pope to confirm the new Order.

Calixtus III. who then govern'd the Church, granted it by a Bull of the 23d of *February*, 1192; and the new Order was call'd, *The Order of* Teutonic *Knights of the Houſe of St.* Mary *of* Jeruſalem.

The Pope granted them all the Privileges of the Templars, and the Hoſpitallers of St. *John*; excepting that they were to be ſubject to the Patriarchs, and other Prelates, and that they ſhould pay a Tenth of what they poſſeſs'd.

The firſt Maſter of the Order, *Henry Valpot*, elected during the Time of the Siege of *Aca*; after the taking of that City, purchas'd a Garden, wherein he built a Church and an Hoſpital, which was the firſt Houſe of the *Teutonic Order*. Such is the Account given by *Peter* of *Dusbourg*, a Prieſt of this Order.

Jacques de Vitry differs a little herefrom; and relates, that the *Teutonic Order* was eſtabliſh'd at *Jeruſalem* before the City of *Aca* was beſieg'd.

Theſe two Opinions *Hartknok*, in his Notes on *Dusbourg*, reconciles, by ſaying, that the Order was firſt inſtituted by a private Perſon, a *German*, at *Jeruſalem*; that it was confirm'd by the Pope, the Emperor, and the Princes at the Siege of *Aca*; and that after the taking that City, it was become ſo conſiderable, that it was known all over the World.

If it be true that it was a private Perſon who firſt ſet on Foot the Order, and that thoſe People of *Bremen* and *Lubec* only join'd with them; as ſome Authors aſſert; we don't know the preciſe Year of its Eſtabliſhment.

The Order made no great Progreſſes under the three firſt Grand Maſters; but under the fourth, *Herman de Salza*, it became very powerful; inſomuch, that *Conrade*, Duke of *Mazovia* and *Cujavia*, about the Year 1230, ſent an Embaſſy to him, to ſolicit his Friendſhip and Aſſiſtance, offering him and his Order, the Provinces of *Culmes* and *Livonia*, with all the Lands they could recover from the Idolatrous *Pruſſians*, who harraſs'd him exceedingly with their continual Incurſions, and againſt whom he intended this new Militia; his own Knights of the Order of *Chriſt*, or of *Dobrin*, inſtituted for the like Purpoſe, being found too weak.

De Salza accepted the Donation; and *Gregory* IX. confirm'd it; and to aid the Knights in reducing the *Pruſſians*, *Innocent* IV. publiſh'd a Croiſade.

With this Help, in a Year's Time, they ſubdu'd the Provinces of *Warmia*, *Notangerland*, and *Barthia*; the Inhabitants whereof renounc'd the Worſhip of Idols; and in the Courſe of fifty Years more, they reduc'd all *Pruſſia*, *Livonia*, *Samogitia*, *Pomerania*, &c.

In 1204, Duke *Albert* had founded the Order of Sword-bearers, *Port-Glaives*, which now became united to the *Teutonic* Knights, and the Union approv'd by Pope *Gregory* IX. See PORT-GLAIVE.

Waldemar III. King of *Denmark*, ſold the Order the Province of *Eſtein*, the Cities of *Nerva* and *Weſſemberg*, and ſome other Provinces.

A new Union ſome time afterwards occaſion'd great Diviſions and Troubles in the Order: It was with the Biſhops and Canons of *Pruſſia* and *Livonia*; who hereupon took the Habit of the *Teutonic* Order, and ſhar'd the Sovereignty with the Knights, in their reſpective Dioceſes.

The Order, thus Maſter of all *Pruſſia*, built the Cities of *Elbing*, *Marienbourg*, *Thorn*, *Dantzic*, *Koningsberg*, and ſome others: The Emperor *Frederic* II. permitted them to add to the Arms of the Order, the Imperial Eagle; and S. *Louis*, in 1250, allow'd them to Quarter the *Flower-de-Luce*.

After the City *Aca*, or *Acra*, had been recover'd by the Infidels, the Grand Maſter of the *Teutonic* Order remov'd his Seat from that City to *Marienbourg*. As the Order grew in Power, the Knights took more State on them; and, at length, inſtead of *Friars*, Brothers, as at firſt, would be call'd *Lords*. And tho' the Grand Maſter *Conrade Zolnera*, of *Rotenſteine*, oppos'd this Innovation, his Succeſſor *Conrade Wallerod* not only approv'd it, but even procur'd himſelf to be treated with Honours only render'd to the greateſt Princes.

Diviſions being got into the Order, the Kings of *Poland* made their Advantage of them: The *Pruſſians* revolted to them; and after ſeveral Wars between the Knights and the *Poles*, the former yielded to King *Caſimir* the upper *Pruſſia*, and did Homage to him for the lower.

Laſtly, at the Time of the Reformation, *Albert*, Marquis of *Brandenbourgh*, then Grand Maſter, becoming Lutheran, renounc'd the Dignity of Grand Maſter, diſſolv'd the Commanderies, and drove the Knights out of *Pruſſia*.

Moſt of the Knights follow'd his Example, and embrac'd the Reformation: The reſt transferr'd the Seat of their Order to *Margentheim*, or *Mariendal* in *Franconia*, which they ſtill retain.

They there elected *Walter* of *Cromberg* their Grand Maſter; form'd a Proceſs againſt *Albert*; and the Emperor put him to the Ban of the Empire. The Order, however, could never recover their Domains; but are now little more than the Shadow of what they formerly were, having only three or four Commanderies, ſcarce ſufficient for the ordinary Subſiſtence of the Grand Maſter and his Knights.

The Officers of the *Teutonic* Order, when in its Splendor, were the *Grand Maſter*, who reſided at *Marienbourg*; under him were the *Grand Commander*; the *Grand Marſhal*, who had his Reſidence at *Koningsberg*; the *Grand Hoſpitaller*, who reſided at *Elbing*; the *Draper*, who took Care to furniſh the Habits; the *Treaſurer*, who lived at the Court of the Grand Maſter; and ſeveral *Commanders*, as thoſe of *Thorn*, *Culme*, *Brandenbourg*, *Koningsberg*, *Elbing*, &c.

They had alſo their Commanders of particular Caſtles and Fortreſſes; Advocates, Proveditors, Intendants of Mills, Proviſions, &c.

Waiſſelius in his Annals ſays, they had 28 Commanders of Cities, 46 of Caſtles, 81 Hoſpitallers, 35 Maſters of Convents, 40 Stewards, 37 Proveditors, 93 Maſters of Mills, 700 Bothers or Knights to take the Field, 162 Brothers of the Choir, or Prieſts, 6200 Servitors or Domeſticks, &c.

TEXT, a relative Term, contra-diſtinguiſh'd to Commentary. It ſignifies an original Diſcourſe, excluſive of any Note, or Interpretation.

Infinite Pains have been taken by the Criticks to reſtore, reconcile, ſettle, explain, &c. the *Text* of the Bible, and the Claſſicks.

Mr. *Whiſton* accounts for all thoſe Miſunderſtandings between the New and Old Teſtament, particularly as to the Propheſies in the Old, cited as fulfill'd in the New, to the Corruption of the *Text* of the Old Teſtament; and to obviate Objections made againſt Chriſtianity on that Head, has publiſh'd an *Eſſay towards reſtoring the true* Text *of the Old Teſtament*, &c.

This Reſtoration he is to effect from the *Samaritan* Pentateuch, the *Roman* Pſalter, the Apoſtolical Conſtitutions, &c. But all our Criticks take this Corruption of the *Text* to be imaginary, and look out for other Ways of ſolving thoſe Difficulties. See PROPHESY.

TEXT, is particularly uſed for a certain Paſſage choſe by a Preacher to be the Subject of his Sermon.

Anciently, the Lawyers began all their Pleadings with like *Texts* of Scripture.

A *Text-book*, in ſeveral Univerſities, is a Claſſic Author wrote very wide, by the Students, to give Room for an Interpretation dictated by the Maſter or Regent, to be inſerted in the Inter-lines.

In

In this Sense, the *French* say, proverbially, *Glose d'Orleans plus obscure que le Texte.*

The *Spaniards* give the Name *Text* to a kind of little Poem or Set of Verses, placed at the Head of a Gloss, and making the Subject thereof; each Verse being explain'd, one after another in the Course of the Gloss. See GLOSS.

In ancient Authors, *Text* is appropriated to the *New Testament*, by way of Eminence: it was written in gold Letters, and carefully preserved in the Churches.

Codex aurato conseptus Grammate, Scriptus
Auctus Evangelicum conservat corpore Textum.

TEXTUARIES, TEXTUARII, a Name given the Sect of the Caraites, among the *Jews*. See CARAITES.

Hittel shone among the Traditionaries; and *Schammai* among the *Textuaries*. See TRADITIONARY.

The Civil and Canon Lawyers, sometimes also call a Book containing the bare Text, without any Gloss or Commentary, a *Textuary*.

TEXTUS *Roffensis*, is an ancient Manuscript, containing the Laws of *Ethelbert*, *Flothere*, *Eadric* and *Withred* Kings of *Kent*, collected by *Eardulf*, the venerable Bishop of *Rochester*, about the Year 760. See LAW.

TEXTURE, TEXTURA, properly denotes the Arrangement and Cohesion of several slender Bodies or Threads, interwove, or intangled among each other; as in the Webs of Spiders, or in Cloths, Stuffs, &c. See WEB and WEAVING.

The Word is *Latin*, form'd of *Texo*, I weave.

The Word is also used not only of Threads, but for any Union or Cohesion of the constituent Particles of a concrete Body; whether by weaving, hooking, knitting, tying, chaining, indenting, intruding, compressing, attracting, or any other way. See COHESION, PARTICLE, BODY, &c.

In this Sense, we say a close, compact *Texture*; a lax, porous *Texture*; a regular, or irregular *Texture*, &c. See PORE, RAREFACTION, CONDENSATION, &c.

A great deal depends on the *Texture* of the Component Parts of a Body; hence most of its particular Properties, its specific Gravity, Colour, &c. See COLOUR, &c.

THABORITES, or TABORITES, a Branch of the ancient *Hussites*. See HUSSITE.

The *Hussites*, towards the Close of the XVth Century, dividing into several Parties; one of them retired to a little Mountain or Rock, situate in *Bohemia*, 15 Leagues from *Prague*, and there put themselves under the Conduct of *Zisca*: Building themselves a Fort or Castle, which they call'd *Thabor*, either from the general Word *Thabor*, which in the *Sclavonic* Language signifies Castle; or from the Mountain *Thabor*, mention'd in Scripture: And hence they became denominated *Thaborites*.

These carried the Point of the Reformation further than *Hus* has done; rejected Purgatory, Auricular Confession, the Unction at Baptism, Transubstantiation, &c.

They reduced the Seven Sacraments of the *Romanists* to Four, *viz.* Baptism, the Eucharist, Marriage and Ordination.

They maintain'd a stout War with the Emperor *Sigismund*. Pope *Martin* V. was obliged to publish a Croisade against them. Nor did this succeed: At length, however, in 1544, their Castle of *Thabor* was taken, and they dispersed.

THALAMI *Nervorum Opticorum*, in Anatomy, two oblong Prominences, of the lateral Ventricles of the Brain; Medullary without, but a little Cineritious within. See BRAIN.

They are thus call'd, because the Optic Nerves rise out of them. See OPTIC.

THANE or THAIN, THANUS, the Name of an ancient Dignity among the *English*, or *Anglo-Saxons*. See NOBILITY.

Skene makes *Thane* to be a Dignity equal with that of the Son of an Earl; *Cambden* will have it, that *Thanes* were only dignify'd by some Offices which they bore.

There were two Kinds or Orders of *Thanes*: The *King*'s *Thanes*, and the *Ordinary Thanes*.

The First, were those who attended our *English-Saxon* Kings in their Courts; and who held Lands immediately of the King; whence, in *Doomsday-Book*, they are promiscuously call'd *Thani* and *Servientes Regis*.

Soon after the Conquest, the Name was disused; and instead thereof they were call'd the *King's Barons*, *Barones Regis*. See BARON.

As to Dignity, they took Place next after Knights.

Their Origin is referr'd to King *Canutus*, who, taking the chief of the *Danish* Nobility, to the Number of 3000, for his Guard; and arming them with Battle Axes and Sabres with gilt Handles, call'd them *Thing-lith*, from the Two *Danish* Words *Theing* or *Thein* or *Tein*, Body of Nobility, and *Lith*, Order of Battel.

The ordinary *Thanes* or *Thanii Minores*, were the Lords of Manors, who had particular Jurisdiction within their Limits, and over their own Tenants. See LORD and MANOR.

These, too, changed their Name for that of Barons; and hence their Courts are call'd *Courts Baron*, to this Day. See COURT and BARON.

In old Authors, Charters, &c. we meet with *Thane*, as signifying a *Nobleman*; sometimes, a *Freeman*, and sometimes a *Magistrate*.

THANE *Lands*, were Lands granted by Charter of the *Saxon* Kings to their *Thanes*.

THAUMATURGUS, *q. d. Worker of Miracles*; an Appellation which the *Romanists* give to several of their Saints. See SAINT.

St. *Gregory Thaumaturgus*, or *Gregory* of *Neocæsarea*, was a Disciple of *Origen*, about the Year 223; and afterwards Bishop of *Cæsarea* in *Pontus*; and in that Capacity assisted at the First Council of *Antioch*, and at that of *Ephesus* against *Paulus Samosatanus*.

St. *Leo* of *Catanea*, is also usually call'd S. *Leo Thaumaturgus*: He lived in the VIIIth Century; and his Body is still honour'd at *Rome* in the Church of S. *Martin de Tours*.

St. *Francis Paul*, and St. *Francis Xavier*, are the great *Thaumaturgi* of these last Ages. See MIRACLE.

The Word is form'd from the *Greek*, θαυμα, *wonderful thing*, and ἔργον, *work*.

THAWING, the Resolution of Ice into its former fluid State, by the Warmth of the Air, &c. See ICE; see also FREEZING.

THEANDRIC, a Term signifying Divine and Human under one; or God-Man; form'd from θεὸς, God, and ἀνὴρ, Man.

S. *Dionysius* Bishop of *Athens*, first used the Word *Theandric*, to express the two Kinds of Operations in *Jesus Christ*; the one divine, the other human: The *Monothelites* afterwards abused it, to signify the one only Operation which they admitted in *Jesus Christ*; in whom they believed there was a Mixture of the divine and human Nature, whence resulted a third Nature, which was a Compound of the one and the other, whose Operations follow'd the Essence and Qualities of the Mixture, and were neither divine nor human; but both at once, or, in one Word, *Theandric*. See OPERATION and MONOTHELITE.

The Term *Theandric*, and the Dogma of *Theandric Operations* were examined with great Care and Attention, at the Council of the *Lateran*, held in 649; where Pope *Martin* solidly refuted the Notion of *Theandric Operations*, and shew'd, That the Sense wherein S. *Dionysius* first used the Word, was Catholic, and quite remote from that of the *Monothelites*.

THEANTHROPOS, a Term sometimes used in the Schools, to signify the Person of *Jesus Christ*, who is really *Theanthropos*, *i. e.* God-Man; from the *Greek*, θεὸς, *Deus*, and ἀνθρωπος, *Homo*, Man.

THEATER or THEATRE, THEATRUM, among the Ancients, a Public Edifice, for the exhibiting of Spectacles or Shews to the People. See SPECTACLE.

Under the Word *Theater* was comprehended, not only the Eminence whereon the Actors appear'd, and the Action pass'd; but also the whole Area, or Extent of the Place, common to the Actors and Spectators.

In this Sense, the *Theater* was a Building encompass'd with Portico's, and furnished with Seats of Stone, disposed in a Semi-circle, and ascending by degrees over one another; which encompass'd a Space, call'd the *Orchestra*, in the Front whereof, was the *Proscenium*, or *Pulpitum*, whereon the Actors perform'd, and which is what we properly call the *Theater* or *Stage*. See ORCHESTRA and PROSCENIUM.

On the *Proscenium* stood the *Scena*, a large Front, adorn'd with Orders of Architecture, behind which was the *Postcenium*, or Place where the Actors made themselves ready, retired, &c. So that the Scena, in its full Extent, comprehended all the Part belonging to the Actors. See SCENA, POSTCENIUM, &c.

In the *Greek Theaters*, the Orchestra made a Part of the Scena; but in the *Roman Theaters*, none of the Actors ever descended into the Orchestra; which was taken up by the Seats of the Senators.

The most celebrated *Theaters* remaining of Antiquity, are the *Theater* of *Marcellus*, and that of *Pompey*; which are also call'd *Amphitheaters*. See AMPHITHEATER.

At *Athens*, are still seen, the Remains of the Temple of *Bacchus*, which was the first *Theater* in the World, and a Master-piece in Architecture. All *Theaters* were consecrated to *Venus* and *Bacchus*.

The Word is form'd from the *Greek*, θέατρον, Spectacle, Shew, of θεαομαι, *specto*, *video*, *I see*

THEATER, among the Moderns, is the Stage, or Place whereon the Drama, or Play is exhibited; answering to the *Scena* of the Ancients. See DRAMA.

In its full Latitude, however, the *Theater* includes the whole Play-House; in which Sense, it is a spacious Room, or Hall, part whereof is taken up by the *Scena*, which comprehends the Stage, the Decorations and the Machines; and the rest distributed into a Space, call'd the *Pit*, or *Parterre*,

which is cover'd with Seats, Boxes, &c. and terminated with an Elevation of one, or two Galleries, diſpoſed into Benches aſcending over one another. See STAGE; ſee alſo COMEDY, TRAGEDY, &c.

THEATER is alſo uſed in Architecture, chiefly among the *Italians*, for an Aſſemblage of ſeveral Buildings, which, by a happy Diſpoſition and Elevation, repreſents an agreeable Scene to the Eye.

Such as are moſt of the Vineyards at *Rome*; but particularly that of *Monte Dragone*, at *Freſcati*; and in *France*, the new Caſtle of St. *Germain en Laye*.

Anatomical THEATER, in a School of Medicine and Chirurgery, is a Hall, with ſeveral Rows of Seats, diſpoſed in the Sweep of an Amphitheatre; having a Table, bearing on a Pivot, in the middle; for the Diſſection of Bodies.

Such is the *Anatomical Theater* of the Royal Garden of Plants at *Paris*, &c.

The *Theater* at *Oxford* is a beautiful Building erected by Archbiſhop *Sheldon*, for the Uſe of Scholaſtic Exerciſes.

THEATINS, a Religious Order of Regular Prieſts; thus call'd from Don *John Pietro Caraffa*, Archbiſhop of *Chieſi*, in the Kingdom of *Naples*, which was anciently call'd *Theate*.

The ſame Archbiſhop was afterwards Pope, by the Name of *Paul* IV. after having been a Companion of *Caetan*, a *Venetian* Gentleman, the firſt Founder of this Order, at *Rome* in 1524.

The *Theatins* were the firſt that aſſum'd the Title of *Regular Clerks*. They have not only no Lands or fix'd Revenues either in common or in particular; but they don't even ask or beg any thing, but wait for what Providence ſhall ſend them for their Subſiſtance.

They employ themſelves much in Foreign Miſſions; and in 1627 enter'd upon *Mingrelia*, where they have an Eſtabliſhment: They have had the like in *Tartary*, *Circaſſia*, and *Georgia*, which they have ſince abandon'd, by Reaſon of the little Fruit they perceiv'd thereof.

Their firſt Congregation appear'd at *Rome* in 1524, and was confirm'd the ſame Year by *Clement* VII. Their Conſtitutions were drawn up at a General Chapter in 1604, and approv'd by *Clement* VIII. They wear Prieſts Habit.

THEATINES, are Congregations of Nuns, under the Direction of the *Theatins*.

There are two Kinds of *Theatines*, under the Title of Siſters of the *immaculate Conception*, who form two different Congregations, the one engag'd by ſolemn Vows, and the other only by ſimple Vows. Their common Foundreſs was *Urſula Benincaſa*.

Thoſe who make the ſimple Vows, are the moſt ancient; and are call'd ſimply *Theatines* of the Congregation: They had their Riſe at *Naples* in 1583.

The others are call'd *Theatines of the Hermitage*: The whole Buſineſs of theſe is Praying in Retirement; and an auſtere Solitude, to which they engage themſelves by ſolemn Vows.

The *Theatines* of the firſt Congregation take Care of the Temporal Concerns of theſe laſt. Their Houſes ſtand together, and communicate by a large Hall. Their Foundreſs drew up their Conſtitutions, and laid the Foundation of their Houſe at *Naples*; but dy'd e'er it was finiſh'd.

Gregory the XVth, who confirm'd the new Inſtitute under the Rule of S. *Auguſtin*, appointed that they ſhould be under the Direction of the *Theatins*. *Urban* VIII. revok'd this Article by a Brief in 1624, and ſubjected them to the Nuncio of *Naples*; but *Clement* IX. annull'd this Brief, and ſubmitted them anew to the *Theatins* by a Brief in 1668.

THEBAID, THEBAIS, a famous heroic Poem of *Statius*, the Subject whereof is the Civil War of *Thebes* between the two Brothers *Eteocles* and *Polynices*; or *Thebes* taken by *Theſeus*. See HEROIC and POEM.

Statius was twelve Years in compoſing his *Thebaid*, which conſiſts of XII Books: He wrote under *Domitian*.

He is cenſur'd by the beſt Criticks, as *Boſſu*, &c. for a vicious Multiplication of Fables and Actions, for too much Heat and Extravagance, and for going beyond the Bounds of Probability. See FABLE and PROBABILITY.

Several *Greek* Poets had compos'd *Thebaids* before him; the principal were, *Antagoras*, *Antiphanes* of *Colophon*, *Menelaus* the *Ægean*, and an anonymous Author mention'd by *Pauſanias*, lib. ix.

Ariſtotle, praiſing *Homer* for the Simplicity of his Fable, oppoſes to him the Ignorance of certain Poets, who imagin'd that the Unity of Fable or Action was abundantly provided for by the Unity of the Hero, and who compos'd *Theſeids*, *Herculeids*, &c. in each whereof they collected every thing that had ever happen'd to their principal Perſon. See FABLE.

THEFT, *Larceny*, *Furtum*, in Law, a felonious taking away another Man's moveable and perſonal Goods, againſt the Owner's Will, with an Intent to ſteal them. See LARCENY.

It is divided into *Theft* or *Larceny*, properly ſo call'd, and *petit Theft* or *Larceny*; the former whereof is of Goods above the Value of 12 *d.* and is deem'd Felony: The other, which is of Goods under that Value, is not Felony. See FELONY.

Theft from the Perſon, or in Preſence of the Owner, is properly call'd *Robbery*. See ROBBERY.

THEFTHOLE, the receiving Goods from a Thief, to favour and maintain him, the Puniſhment whereof is Impriſonment, and not Loſs of Life or Member. See THEFT.

THELONIUM, TELONIUM, or *Breve eſſendi quietum de* THELONIO, is a Writ lying for the Citizens of a City, or Burgeſſes of a Town, that have a Charter or Preſcription to free them from Toll; againſt the Officers of any Town or Market, who would conſtrain them to pay it, contrary to the ſaid Grant or Preſcription.

THEME, THEMA, a Subject or Topic, to write or compoſe on.

Theme, among Aſtrologers, is the Figure they conſtruct when they draw the *Horoſcope*: It repreſents the State of the Heavens for a certain Point or Moment requir'd, *i. e.* the Places of the Stars and Planets for that Moment. See HOROSCOPE.

It conſiſts of 12 Triangles, inclos'd within two Squares, and call'd the *Twelve Houſes*.

THENAR, in Anatomy, a Muſcle, call'd alſo *Abductor Pollicis manus*. See ABDUCTOR.

THNETOPSYCHITES, a Sect in the ancient Church, who believ'd the Soul of Man perfectly like that of Brutes; and taught that it dy'd with the Body. See SOUL.

We meet with no Account of theſe Hereticks any where, but in *J. Damaſcenus*, *Hæreſ.* 90. unleſs they be the ſame with thoſe *Euſebius* ſpeaks of, *Hiſt. Eccleſ.* lib. ix. c. 38. who relates, that in *Origen*'s Time, there were Hereticks in *Arabia*, who taught that the Soul of Man dy'd with the Body; but that it ſhould riſe again with it at the End of the World. He adds, that *Origen* refuted them in a numerous Council, and reclaim'd them from their Errors. S. *Auguſtin* and *Iſidore*, calls them *Arabian* Hereticks.

Marſhal, in his Tables, has diſfigur'd the Word, for want of underſtanding it; he writes it *Thenopſychites*, inſtead of *Thnetopſychites*: He likewiſe places them in the VIth Century; on what Grounds we can't imagine.

The Word is compos'd of the *Greek*, θνητὸς, Mortal, and ψυχὴ, Soul.

THEOCATAGNOSTES, a Sect of Hereticks, or rather Blaſphemers, who dar'd to find fault with certain Words and Actions of God, and to blame many Things in the Scriptures.

Marſhal, in his Tables, places theſe Hereticks in the VIIth Century; for what Reaſon we know not; *Damaſcenus* being the only Author that mentions them, but without taking any Notice of the Time of their Appearance.

Add to this, that in *Damaſcenus*'s Treatiſe of Hereſies, we meet with Hereticks that were not ſo much the Authors of Sects ſubſiſting at any certain Time, as wicked Perſons, ſuch as are found in all Times, and all Ages.

The Word is form'd from the *Greek*, θεὸς, God, and καταγνώσκω, I condemn.

THEOCRACY, a State govern'd by the immediate Direction of God alone. See GOVERNMENT.

According to *Joſephus*, the ancient Government of the *Jews* was *Theocratic*; God himſelf ordering and directing every thing belonging to the Sovereign Authority. See JUDGE.

This *Theocracy* laſted till the Time of *Saul*; when the *Iſraelites*, weary thereof, deſir'd they might have a King like other Nations; and thence-forward the State became Monarchic.

There was alſo a kind of imaginary *Theocracy* at *Athens*: While the Sons of *Codrus* were diſputing the Succeſſion; the *Athenians*, weary'd out with the Miſeries of an inteſtine War, aboliſh'd the Royalty, and declar'd *Jupiter the only King of the People of Athens*.

The Word is form'd from θεὸς, God, and κράτος, Power, Empire.

THEODOLITE, a Mathematical Inſtrument, much us'd in Surveying, for the taking of Angles, Diſtances, Altitudes, &c. See ANGLE, &c.

'Tis made variouſly; ſeveral Perſons having their ſeveral Ways of contriving it each more ſimple, and portable, more accurate and expeditious, than other. The following one is not inferior to any we have ſeen: It conſiſts of a Braſs Circle, about a Foot Diameter, cut in Form of Fig. 25. Plate Surveying; having its Limb divided into 360 Degrees, and each Degree ſub-divided either diagonally, or otherwiſe, into Minutes.

Underneath, at *cc*, are fix'd two little Pillars *bb* (Fig 26.) which ſupport an Axis, whereon is fix'd a *Teleſcope*, conſiſting of two Glaſſes, in a ſquare Braſs Tube; for the viewing of remote Objects.

On

On the Centre of the Circle B, moves the Index C; which is a circular Plate, having a Compaſs in the Middle, whoſe Meridian Line anſwers to the Fiducial Line *aa*: at *bb* are fix'd two Pillars to ſupport an Axis, which bears a *Teleſcope* like the former, whoſe Line of Collimation anſwers to the Fiducial Line *aa*.

At each End of either *Teleſcope*, is fix'd a plain Sight for the viewing nearer Objects. See SIGHT.

The Ends of the Index *aa* are cut circularly, to fit the Diviſions of the Limb B; and when that Limb is diagonally divided, the Fiducial Line at one End of the Index ſhews the Degrees and Minutes upon the Limb. The whole Inſtrument is mounted with a Ball and Socket, upon a three-leg'd Staff.

Moſt *Theodolites* have no Teleſcopes, but only four plain Sights, two of them faſten'd on the Limb, and two on the Ends of the Index.

The *Uſe of the Theodolite* is abundantly ſhewn in that of the *Semicircle*; which is only half a *Theodolite*. See SEMICIRCLE.

And in that of the *plain Table*, which is occaſionally made to be us'd as a *Theodolite*. See PLAIN *Table*.

Note, the Index and Compaſs of the *Theodolite*, likewiſe ſerve for a Circumferentor, and are us'd as ſuch. See CIRCUMFERENTOR.

THEOGONY, that Branch of the Heathen Theology, which taught the Genealogy of their Gods. See GOD.

Heſiod gives us the ancient *Theogony*, in a Poem under that Title. Among the ancient Writers, Dr. *Burnet* obſerves, *Theogony* and *Coſmogony*, ſignify'd the ſame Thing. In effect, the Generation of the Gods of the ancient *Perſians*, Fire, Water, and Earth, is apparently no other than that of the primary Elements. See COSMOGENY; ſee alſo CHAOS.

The Word is form'd from θεὸς, God, and γονὴ, Geniture, Seed, Offspring.

THEOLOGY, call'd alſo *Divinity*, a Science which inſtructs us in the Knowledge of God, and divine Things; or which has God, and the Things he has reveal'd, for its Object. See GOD and DIVINITY.

Theology is a Doctrine which ſhews us what we are to think of God, and of the Manner wherein he would be ſerv'd. It is divided into two Branches, *Natural*, and *Reveal'd* or *Supernatural*.

Natural Theology, is the Knowledge we have of God from his Works, by the mere Light of Nature and Reaſon. See NATURE and REASON.

Supernatural Theology, is that which we learn from Revelation. See REVELATION.

Poſitive THEOLOGY, is the Knowledge of the holy Scriptures, and of the Signification thereof, agreeable to the Opinions of the Fathers and Councils; without the Aſſiſtance of any Argumentation. Some will have it, that this ought to be call'd *expoſitive*, not *poſitive*. See POSITIVE.

Moral THEOLOGY, is that which teaches us the divine Laws relating to our Manners. See MORAL.

Scholaſtic, or *School* THEOLOGY, is that which proceeds by Reaſoning; or that derives the Knowledge of ſeveral divine Things from ſome eſtabliſh'd Principles of Faith. See SCHOLASTIC.

The Ancients had a three-fold *Theology*; the firſt μυθικὴν, *Mythic*, fabulous, which flouriſh'd among the Poets; and was chiefly employ'd in the Theogony, or Genealogy of the Gods. See FABLE and FABULOUS; ſee alſo THEOGONY.

The ſecond, πολιτικὴν, *Political*, which was that chiefly embrac'd by the Politicians, Prieſts, and People, as moſt ſuitable and expedient to the Safety, Quiet, and Intereſt of the State.

The third, φυσικὴν, *Natural*, chiefly cultivated by the Philoſophers, as moſt agreeable to Nature.

The Phyſical or Natural *Theology* acknowledg'd one only ſupreme God; to which it added Dæmons, as Mediators between him and Man. See DÆMON.

The Word is compounded of θεὸς, God, and λογος, Diſcourſe.

THEOLOGIUM, in the ancient Theater, was a Place, or little Stage, above that whereon the ordinary Actors appear'd.

The *Theologium* was the Place where the Gods appear'd; it alſo included the Machines whereon they deſcended, and from which they ſpoke. See MACHINE.

There was a *Theologium* requir'd for the Repreſentation of the *Ajax* of *Sophocles*, the *Hippolitus* of *Euripides*, &c. Scal. Poet. lib. 1. cap. 1.

The Word is *Latin*, form'd from θεὸς, and λογος, Speech, Diſcourſe.

THEOPASCHITES, a Sect of Hereticks, in the Vth Century, the Followers of *Petrus Fullenſis*, or *Peter* the *Fuller*.

Their diſtinguiſhing Doctrine was, That the whole Trinity ſuffer'd in the Paſſion of *Jeſus Chriſt*. See PATRIPASSIANS.

This Hereſy was embrac'd by the *Eutychean* Monks of *Scythia*; who uſing their utmoſt Efforts to make it obtain, rais'd great Diſorders toward the Beginning of the following Century.

It was condemn'd at its firſt Riſe, in the Councils of *Rome* and *Conſtantinople*, held in 483: It was reviv'd in the IXth Century, and again condemn'd in a Council at *Rome*, held in 862 under Pope *Nicholas* I.

F. *Quien*, in his Notes on *Damaſcenus*, ſays, that the ſame Error had been taught before *Fullenſis*, by *Apollinarius*, whoſe Diſciples were the firſt that were call'd *Theopatites*, or *Theopaſchites*.

THEORBO, THEOREA, a Muſical Inſtrument, made in Form of a Lute; except that it has two Necks, or Juga, the ſecond and longer whereof ſuſtains the four laſt Rows of Chords, which are to give the deepeſt Sounds. See LUTE.

The *Theorbo* is an Inſtrument, which for theſe laſt ſixty or ſeventy Years, has ſucceeded to the Lute, in the playing of thorough Baſſes: 'Tis ſaid to have been invented in *France* by the Sieur *Hotteman*, and thence introduc'd into *Italy*, &c.

The only Difference between the *Theorbo* and the Lute, is, that the former has eight Baſs or thick Strings, twice as long as thoſe of the Lute; which Exceſs of Length renders their Sound ſo exceedingly ſoft, and keeps it up ſo long a Time, that 'tis no Wonder many prefer it to the Harpſichord itſelf. At leaſt it has this Advantage, that it is eaſily remov'd from Place to Place, &c.

All its Strings are uſually ſingle; tho' there are ſome who double the Baſs Strings with a little Octave, and the ſmall Strings with an Uniſon; in which Caſe, bearing more Reſemblance to the Lute than the common *Theorbo*, the *Italians* call it the *Archiluto* or *Arch-Lute*.

The Word *Theorbo* is form'd from the *French Theorbe*, of the *Italian Tiorba*, which ſignifies the ſame Thing, and which ſome will have the Name of the Inventor.

THEOREM, in the Mathematical Method, a Propoſition which terminates in Theory, and which conſiders the Properties of Things already made, or done. See THEORY and PROPOSITION.

Or, ſtrictly, a *Theorem* is a *Theoretical* Propoſition, deduc'd from ſeveral Definitions compar'd together. Thus, if a Triangle be compar'd with a Parallelogram ſtanding on the ſame Baſe, and of the ſame Altitude; and, partly, from their immediate Definitions, and, partly, from other of their Properties already determin'd, 'tis inferr'd, that the Parallelogram is double the Triangle; that Propoſition is a *Theorem*. See DEFINITION, &c.

There are two Things to be chiefly regarded in every *Theorem*, *viz.* the Propoſition and the Demonſtration: In the firſt is expreſs'd what agrees to ſome certain Thing under certain Conditions, and what does not. See PROPOSITION.

In the latter, the Reaſons are laid down, by which the Underſtanding comes to conceive that it does or does not agree thereto. See DEMONSTRATION.

Theorems are of various Kinds: *Univerſal Theorem*, is that which extends to any Quantity without Reſtriction, univerſally; as this, *That the Rectangle of the Sum and Difference of any two Quantities, is equal to the Difference of their Squares.*

Particular Theorem, is that which extends only to a particular Quantity.

Negative, is that which expreſſes the Impoſſibility of any Aſſertion; as, *That the Sum of two Biquadrate Numbers cannot make a Square.*

Local Theorem, is that which relates to a Surface; as, *That Triangles of the ſame Baſe and Altitude are equal.* See LOCAL.

A *plane Theorem*, is that which either relates to a Rectilinear Surface, or to one terminated by the Circumference of a Circle; as, *That all Angles in the ſame Segment are equal.* See PLANE.

A *Solid Theorem*, is that which conſiders a Space terminated by a ſolid Line; that is, by any of the three Conic Sections; *e.gr.* this, *That if a right Line cut two Aſymptotick Parabola's, its two Parts terminated by them ſhall be equal.* See SOLID.

A *Reciprocal Theorem*, is one whoſe Converſe is true; as, That if *a Triangle have two equal Sides, it muſt have two equal Angles*: The Converſe of which is true, *That if it have two equal Angles, it muſt have two equal Sides.* See RECIPROCAL.

THEORETIC, THEORETICAL, or THEORIC, ſomething relating to *Theory*, or that terminates in Speculation; in which Senſe the Word ſtands in Oppoſition to *Practical*.

'Tis form'd from the *Greek*, θεωρεω, I ſee, I contemplate.

The Sciences are ordinarily divided into *Theoretical*, as Theology, Philoſophy, &c. and Practical, as Medicine, Law, &c. See SCIENCES.

In ancient Authors, *Theoric Money* was what was rais'd by Way of Tax on the People, to defray the Expences of Theatrical Repreſentations, and other Spectacles.

There were particular Questors or Treasurers of the *Theoric Money*. By a Law of *Eubulus*, it was made a capital Crime to pervert the *Theoric Money* to any other Use, even to employ it in the Occasions of War.

THERORETICKS, or THEORETICI, a peculiar Appellation given to an ancient Sect of Physicians. See PHYSICIAN.

The *Theoretic Physicians* were such as apply'd themselves to a careful Study and Consideration of what relates to Health and Diseases; the Principles of the human Body, its Structure and Parts, with their Actions and Uses; whatever befalls it either naturally, or preternaturally; the Differences of Diseases, their Nature, Causes, Signs, Indications, &c. the Textures, Properties, &c. of Plants, and other Medicines, &c. In a Word, the *Theoretic* Physicians were such as went on the Foot of Reason; in Opposition to the *Empirical Physicians*, who went wholly on Experience. See MEDICINE.

The Word is form'd from the *Greek*, θεωρέω, I see.

THEORICAL *Astronomy*, is that Part of Astronomy which considers the true Structure and Disposition of the Heavens, and heavenly Bodies; and accounts for their various Phænomena therefrom. See ASTRONOMY.

It is thus call'd in Opposition to that Part which considers their apparent Structure, or their Disposition as view'd by the Eye, which is call'd *Spherical Astronomy*. See SPHERICAL.

The several Parts of *Theorical Astronomy*, see under SYSTEM, SUN, STAR, PLANET, EARTH, MOON, SATELLITE, COMET, &c.

THEORY, a Doctrine which terminates in the sole Speculation or Consideration of its Subject, without any View to the Practice, or Application thereof.

To be learn'd in an Art, &c. the *Theory* suffices; To be a Master of it, both the *Theory* and Practice are requir'd.

Machines, many times, promise well in the *Theory*, yet fail in the Practice. See MACHINE.

THEORIES *of the Planets*, &c. are Hypotheses, according to which the Astronomers explain the Reasons of the Phænomena or Appearances thereof. See HYPOTHESIS.

THERAPEUTES, or THERAPEUTÆ, a *Greek* Term, signifying a Servant wholly employ'd in the Service of God.

The *Greeks* gave the Appellation *Therapeutes* to such as apply'd themselves to a contemplative Life, whether it were from the great Concern they had for their Souls, or from the particular Mode and Manner of their Religion; the Word θεραπεύειν, whence *Therapeutes*, signifying the Care a Physician takes of his Patient, and the Service any one renders another.

Philo, in his first Book of the contemplative Life, relates, that there were a People spread throughout most of the known World, but particularly throughout *Ægypt*, and about *Alexandria*, who renounc'd their Friends, their Effects, &c. and who, after discharging themselves of all Temporal Concerns, retir'd into solitary Places, where they had each their separate Place, call'd a *Semnee*, or Monastery. See MONASTERY.

He adds, that they there resign'd themselves wholly to the Exercises of Prayer and Contemplation, were continually as in the Presence of God, pray'd Mornings and Evenings, eat nothing till after Sun-set, and many of them not above once in three, or even six Days; nor then any thing but a Piece of Bread season'd with Salt, or, at best, with Hyssop.

They carry'd nothing with them into their Semnee but the Books of *Moses*, the Prophets, the Psalms, and other like Writings, wherein they sought for Mystical and Allegorical Meanings, from a Persuasion that the Scriptures were only Shadows or Figures, the hidden Meanings whereof were to be unfolded.

They had also some Books left them by the Founders of their Sect: They met together every seventh Day in a large Semnee, to confer together, and partake of the Mysteries.

There are two Points relating to these *Therapeutes*, exceedingly controverted among the Criticks, *viz.* 1°. Whether they were *Jews* or Christians; and 2°. If they were the latter, whether they were Monks or Laymen.

As to the first, *Scaliger de Emend. Temp.* maintains, they were *Essene-Jews*; but *Valesius* on *Eusebius* rejects this Opinion of *Scaliger*, 1°. Because *Philo* never calls them *Essenes*. 2°. Because there were no Essenes but in the Holy Land; whereas the *Therapeutæ* were spread thro' *Greece*, and all the barbarous Nations. 3°. Because *Josephus*, who gives a very ample Account of the Essenes, does not say one Word of the *Therapeutæ*, or the *Therapeutic Life*. See ESSENE.

And yet *Valesius* takes them to be *Jews*; and *Photius* is of his Opinion: The chief Reasons *Valesius* gives are what *Philo* says, That they read nothing but the Law and the Prophets. 2°. That they had some Books of their Founders; And how can this quadrate with the Christians, who were then in their first Rise? 3°. That they only pray'd twice a Day, whereas the Christians then pray'd much oftner. 4°. That the Christians had no Hymns or Psalms till after the Time of *Antoninus*. Lastly, That the Christians could not be spread over the World.

And yet *Eusebius*, lib. II. Hist. Eccl. c. 17. S. *Jerom*, *Sozomen*, *Nicephorus*, *Baronius*, *Petavius*, M. *Godeau*, *Montfaucon*, &c. maintain them to have been Christians; urging, that nothing can be more conformable to the Practices of the Church, than the Account given of them by *Philo*; that those Books of their Founders are the Gospels, and other Writings of the Apostles; and that there are Indications even of Bishops and other Ministers among them.

M. *Bohier*, President of the Parliament of *Dijon*, refutes this Opinion; supposing it inconsistent in *Philo*, a *Jew*, to write a Book expressly in Praise of the Christians.

Yet several Authors, as *Cassian*, F. *Helyot*, &c. maintain, that the *Therapeutes* were not only Christians, but that they were also Religious: And, in effect, M. *Bohier* allows, that if they were Christians, they must be confess'd to have been Monks. As to his Argument, that *Philo* would never have wrote a Panegyric on the Christians, 'tis answer'd, that they were People of his own Nation, *Jews*, as he himself expresses; and that he only look'd on them as a Sect of *Jews*, who, by their extraordinary Virtue, did Honour to his Nation.

But tho' the Christianity of the *Therapeutes* appears probable enough; yet their Monachism is not made out at all.

THERAPEUTICE, THERAPEUTICKS, that Part of Medicine which is employ'd in seeking out Remedies against Diseases, and in prescribing and applying them to effect a Cure. See MEDICINE.

Therapeutice teaches the Use of Diet, Pharmacy, Chirurgery, and the *Methodus Medendi*. See DIET, MEDICINES, PRESCRIPTION, &c.

The Word is form'd from the *Greek*, θεραπεύειν, to attend, to cure, &c.

Therapeutice is also apply'd, figuratively, to the Mind, and to Discourses made to correct the Errors and Defects thereof.

Such is the *Therapeutice* of *Theodoret*; being a Treatise against the Errors or unwholsome Opinions of the *Greeks*, *i. e.* the Heathens.

THERAPHIM, a *Hebrew* Term, which has given great Torture to the Criticks.

We meet with it 13 or 14 times in Scripture; where 'tis commonly interpreted *Idols*; but the Rabbins are not contented to have it simply signify Idols, it must be Idols, or Images for the Knowledge of Futurity, *i. e. Oracles*.

R. *David de Pomis* observes further, that they were call'd *Theraphim*, from רפה, *Raphah*, to leave, because they quitted every thing to consult them. He adds, that the *Theraphim* were in human Shape, and that when raised upright, they spoke, at certain Hours, and under certain Constellations, by the Influence of the celestial Bodies.

This is a Rabbinical Fable, which he has learnt from *Abenezra*.

Others hold, that the *Theraphim* were brazen Instruments which pointed out the Hours and Minutes of future Events, as directed by the Stars. *De Pomis* corrects *Abenezra*, saying, that the *Theraphim* being made under a certain Constellation, the Devil made them speak under the same.

R. *Eliezer* tells us the Reason why the Rabbins will have the *Theraphim* to speak and render Oracles: 'Tis, says he, because it is written in the Prophet *Zachary*, x. 2. The *Theraphim* speak vain Things.

The same Rabbi adds, that to make the *Theraphim*, they kill'd a first-born Child, clove his Head, and season'd it with Salt and Oil; that they wrote on a Plate of Gold, the Name of some impure Spirit, laid it under the Tongue of the Dead; placed the Head against the Wall, lighted Lamps before it, pray'd to it; and it talk'd with them.

Be this as it will, *Vorstius* observes, that beside the Passage of *Zachary* just quoted, it appears likewise from *Ezekiel* xxi. 21. that the *Theraphim* were consulted as Oracles.

De Pomis shews, that the *Theraphim* which *Michal* put in *David*'s Bed, were not of this Kind, because they were not in the Figure of Men; but R. *Eliezer* is of another Sentiment.

As to the manner of making the *Theraphim*, *Vorstius* takes it to be a vain Tradition of the Rabbins; though R. *Tanichuma* and *Jonathan*, in his *Targum*, *Gen.* xxxi. 21. relate it after R. *Eliezer*. The chief Reason of his Disbelief, is, that *Laban*, who had not quite lost all Notion of the true God, as appears from *Gen.* xxxi. 53. could not be guilty of so great a Cruelty; but *Vorstius* does not consider that the Custom might not be less real, for its not having been establish'd so early as *Laban*; and that the *Hebrews* sometimes burnt their Children to *Moloch*.

F. *Kircher* directs us to seek the Origin of the *Theraphim* in *Egypt*; adding, that the Word is *Egyptian*.

Spencer, in his Diſſertation on the *Urim* and *Thummin*, maintains the Word to be *Chaldee*, and to ſignify the ſame with Seraphim; the *Chaldeans* being frequently known to change the ש into ת, that is, the *ſ* into *t*. He adds, that thoſe Images were borrowed from the *Amorites*, the *Chaldeans* or *Syrians*; and that the Serapis of the *Egyptians* is the ſame thing with the *Teraphim* of the *Chaldeans*. See *Selden. de Dits Syriis*.

THERIACA, *Treacle*, in Medicine, a Name the Ancients have given to various Compoſitions, eſteem'd good againſt Poiſons; but now generally reſtrained to what, by way of Diſtinction, we ſometimes call *Theriaca Andromachi*. See ALEXIPHARMACHIC.

This is a Compound of no leſs than 64 Drugs, prepared, pulverized and reduced, by means of Honey, into a liquid Electuary.

The Baſis, or Foundation of the Compoſition, is Vipers Fleſh. M. *Charas* has wrote a particular Hiſtory of the Animals, Plants and Minerals, which enter the Compoſition of this fam'd Remedy.

'Tis found ſoveraign againſt the Bites of venomous Beaſts, and in the Wind-cholic; and is alſo uſed in intermitting Fevers, and in Caſes requiring Perſpiratives and Diaphoreticks; alſo in continual Fevers, eſpecially ſuch as are malignant, and where the Pulſe is low and ticking; in the Small-pox and Meaſles: And, as moſt of the Ingredients thereof, are very hot, for all Diſeaſes, where the natural Heat is weak and languid.

Andromachus, *Nero*'s Phyſician, paſſes for the Inventor of the *Theriaca*; at leaſt, 'twas he gave the firſt Deſcription thereof in Elegiac Verſes; his Son did the ſame in Proſe, and *Democrates* in Iambics.

Anciently, the *Treacle* made at *Venice* had all the Vogue; and many ſtill retain the ancient Prejudice; but 'tis now prepared at *Montpellier*, at *Paris*, and even at *London*, with as much Advantage as at *Venice*.

There is another vulgar kind of *Theriaca*, call'd *Diateſſaron*, becauſe only conſiſting of four Ingredients.

Treacle Water and *Treacle Vinegar* are found good Preſervatives againſt putrid Air, whether by being only ſmelt at, or by rubbing the Wriſts, Temples, and Noſe therewith.

THERMÆ, ancient Buildings, deſtined for Bathing in. See BATH.

Among the nobleſt Monuments of ancient *Rome* are reckon'd the *Thermæ* or Baths of *Dioclefian*.

Among us, *Thermæ* is reſtrain'd to ſuch Baths as are hot.

The Word is form'd from the *Greek*, θερμὸς, hot.

Thermæ, 'tis commonly argued, owe their Heat to a Colluctation, or Effervescence of the Minerals in them. Though Dr. *Woodward* aſcribes it to the ſubterraneous Heat, or Fire which communicates with them by ſome Spiracle or Canal whereby a greater Quantity of Heat is derived thither, than to ordinary Springs. See MINERAL and WATER.

THERMOMETER, THERMOMETRUM, an Inſtrument ſhewing, or rather meaſuring, the Increaſe and Decreaſe of the Heat and Cold of the Air. See HEAT, AIR, &c.

The *Thermometer* and *Thermoſcope*, are ordinarily accounted the ſame thing; *Wolfius*, however, makes a Difference; and ſhews that what we call *Thermometers*, are, in reality, no more than *Thermoſcopes*. See THERMOSCOPE.

There are various Kinds of *Thermometers*; the Conſtructions, Defects, Theories, &c. whereof, are as follow:

Conſtruction of a THERMOMETER, *depending on the Rarefaction of the Air.*

In a Tube B C, (Tab. Pneumaticks Fig. 3.) to which is faſten'd a Glaſs Ball A B, is put a Quantity of common Water mix'd with Aqua Regia, to prevent its freezing; and the Mixture ting'd with a Solution of Vitriol to give it a Greenneſs. In filling the Tube, Care is taken that there be ſo much Air left in the Ball and the Tube, as that when at its greateſt Condenſation in the middle of Winter, it may juſt fill the Ball; and yet in its greateſt Rarefaction in Summer, may not drive all the Liquor out of the Tube. To the other Extreme of the Tube, is faſten'd another Glaſs Ball C D, open to the Air at D: On each Side the Tube is applied the Scale E F, divided into any Number of equal Parts.

Now, as the ambient Air becomes warmer, the Air in the Ball and the Top of the Tube, expanding, will drive the Liquor into the lower Ball, and conſequently its Surface will deſcend; on the contrary, as the ambient Air grows colder, that in the Ball becoming condenſed, the Liquor will aſcend. See RAREFACTION and CONDENSATION.

Conſtruction of the Mercurial THERMOMETER.

In the ſame Manner, and with the ſame Caution as before, put a little Quantity of Mercury, not exceeding the Bigneſs of a Pea, into a Tube B C (Fig. 4.) thus bent with Wreaths, that, taking up the leſs Height, it may be the more manageable and leſs liable to Harm; divide this Tube into any Number of equal Parts to ſerve for a Scale.

Here the Approaches of the Mercury towards the Ball A will ſhew the Increaſes of the Degree of Heat. The Reaſon is the ſame, as in the former.

The Defect of both the Inſtruments conſiſts in this, that they are liable to be acted on by a double Cauſe: For, not only a Decreaſe of Heat, but alſo an Increaſe of Weight of the Atmoſphere, will make the Liquor riſe in the one, and the Mercury in the other; and, on the contrary, either an Increaſe of Heat, or Decreaſe of Weight of the Atmoſphere will make it deſcend. See BAROMETER.

Conſtruction of the Florentine or common THERMOMETER.

The *Academiſts del Cimento*, conſidering the Inconveniences of the *Thermometers* juſt deſcribed; attempted another, that ſhould meaſure Heat and Cold, by the Rarefaction and Condenſation of Spirit of Wine; though that be vaſtly leſs than that of Air; and, conſequently, the Alterations in the Air like to be much leſs ſenſible.

The Structure of their *Thermometer* is this: On ſome little Pieces of Turmeric is pour'd a Quantity of rectified Spirit of Wine, which hereby receives a red Tincture; this done, the Spirit of Wine is filtrated again, and again through a brown Paper, that the coarſer Particles of the Root may be ſeparated therefrom. With the Spirit thus tinged and prepared, they fill a Glaſs Ball A B (Fig. 5.) with a Tube B C; and that all the Spirit mayn't deſcend in Winter into the Ball, 'tis convenient to put the Ball into a Lump of Snow, mix'd with Salt: Or, if the Inſtrument be to be made in Summer, into Spring Water, impregnated with Salt-petre; that the condenſed Spirit may ſhew how far it will retire in the extremeſt Cold.

If it be ſtill at too great a Diſtance from the Ball, part of it is to be taken out; and that the Tube mayn't be made longer than needs, 'tis convenient to immerge the Ball, fill'd with its Spirit, in boiling Water; and to mark the furtheſt Point to which the Spirit then riſes.

At this Point the Tube is to be hermetically ſeal'd, by the Flame of a Lamp; and at the Sides, is to be added a Scale, as in the former *Thermometer*.

Now, Spirit of Wine rarifying and condenſing very conſiderably; as the Heat of the ambient Air increaſes, the Spirit will dilate, and, conſequently, will aſcend in the Tube; and as the Heat decreaſes, the Spirit will deſcend; and the Degree or Quantity of Aſcent and Deſcent will be ſeen in the Scale. Yet as the *Ratio* of yeſterdays Heat, to to-days, is not hereby diſcovered, this Inſtrument is not ſtrictly a *Thermometer*, no more than the former.

It is to be here obſerved, 1°. That as the natural Gravity of the Liquor makes it tend downwards; ſo it reſiſts its Aſcent out of the Ball into the Tube; and that the more, as it riſes higher: For which reaſon, 'twere beſt to have the Tube B C Horizontal.

2° Since there muſt of Neceſſity be ſome Air left in the void Part of the Tube over the Liquor; that Air, by its Elaſticity, will tend downwards, and, of conſequence will reſiſt the Riſe of the Liquor, and be compreſs'd by it as it does riſe: Its Elaſticity, therefore, is thus increaſed.

3° Since 'tis found from Experience, that a leſs Degree of Heat is communicated more eaſily to the Spirit of Wine in the Ball, than a greater; the Rarefactions of the Spirit of Wine are not proportionable to their Producing Cauſes; eſpecially ſince a greater Degree of Heat finds more Liquor in the Tube than a leſs does, to which, notwithſtanding, the Heat may be more eaſily communicated, than to that ſtagnating in the Ball.

On theſe Accounts, the *Florentine Thermometer*, though that commonly in Uſe, is far from being an accurate Meaſure of Heat, &c. to which may be added what Dr. *Halley* obſerves in the *Philoſophical Tranſactions*, that he has learnt from thoſe who have kept Spirit of Wine long, that it loſes Part of its expanſive Force, in Courſe of Time.

Various Methods have been propoſed by various Authors, for finding a fix'd Point, or Degree of Heat and Cold, from which to account the other Degrees, and adjuſt the Scale; that ſo Obſervations made at the ſame or different Times, in different Places, may be compared together.

Some note the Place the Liquor is at in Winter, when Water begins to freeze; and again, that in Summer, when Butter placed near the Ball of the Microſcope, melts: The intermediate Space they divide into two equal Parts, the middle Point whereof anſwers, in their Graduation, to temperate Heat; and each Moiety they ſub-divide into ten Degrees: Adding four other equal Degrees on each of the two Extremes. But this Method ſuppoſes the ſame Degree of Heat and Cold, to anſwer to the freezing of all Water, and the melting of all Butter; as alſo, that all *Thermometers* receive the ſame Impreſſions from the ſame Degree of Heat; all which are contrary to Experience.

Others adviſe the Ball of the *Thermometer* to be put in a Quantity of Snow and Salt, and the Point the Liquor is at to be noted. Thence, the *Thermometer* is to be removed into a deep Cave or Cellar, whither no external Air reaches; ſo that the Liquor receiving the Action of a temperate Air, may ſhew the Degree of temperate Heat. Laſtly, they divide the intermediate Space into 15, or more equal Parts, which they continue beyond each Extreme: But this Method is liable to the like Inconveniences as the former.

Dr. *Halley* aſſumes That for a fix'd Degree of Heat, wherein Spirit of Wine begins to boil; but there is Reaſon to ſuſpect this, too, of being precarious: Though after him, M. *Amontons* retains the Degree of Heat, anſwering to boiling Water, for the graduating his mercurial *Thermometer*. But as the different ſpecific Gravities of Water, argue a Difference of Maſs and Texture; 'tis highly probable that Heat of all boiling Waters is not the ſame: So that the Point is yet undetermined.

THERMOSCOPE, an Inſtrument ſhewing the Changes happening in the Air, with reſpect to Heat and Cold. See AIR, WEATHER, &c.

The Word *Thermoſcope* is generally uſed indifferently, with that of *Thermometer*. There is ſome Difference, however, in the literal Import of the two Words; the firſt ſignifying an Inſtrument that ſhews, or exhibits the Changes of Heat, &c. to the Eye; form'd from θερμὴ, Heat, and σκοπέω, *video*, I ſee; and the latter an Inſtrument that meaſures thoſe Changes; from θερμὴ, Heat, and μέτρεω, to meaſure: on which Foundation the Thermometer ſhould be a more accurate *Thermoſcope*, &c.

This Difference the excellent *Wolfius* taking hold of, deſcribes all the *Thermometers*, in uſe, as *Thermoſcopes*; ſhewing that none of them properly meaſure the Changes of Heat, &c. none of them do more than indicate the ſame. Though their different Heights yeſterday and to-day, ſhew a Difference of Heat; yet ſince they don't diſcover the *Ratio* of yeſterday's Heat to to-days, they are not, ſtrictly, Thermometers. See THERMOMETER.

In the *Acta Erudit. Lipſ.* we have a Method of graduating the common Thermometers ſo, as that the unequal Diviſions thereof ſhall correſpond to equal Degrees of Heat; whereby the *Ratio* of to-day's Heat to yeſterday's, will be meaſured, and, conſequently, the *Thermoſcope* improved into a Thermometer.

The Method is that of *Car. Renaldinus*, and is deſcribed by the *Leipſic* Editors thus: Take a ſlender Tube about four Palms long, with a Ball faſten'd to the ſame; pour into it Spirit of Wine, enough juſt to fill the Ball when ſurrounded with Ice, and not a Drop over. In this State, ſeal the Orifice of the Tube Hermetically; and provide ſix Veſſels, each capable of containing a Pound of Water, and ſomewhat over; and into the firſt, pour 11 Ounces of warm Water, into the ſecond 10 Ounces, into the third 9, &c. This done, immerge the Thermometer in the firſt Veſſel, and pour into it one Ounce of hot Water; obſerving how high the Spirit riſes in the Tube, and noting the Point with Unity: then remove the Barometer into the ſecond Veſſel, into which is pour'd two Ounces of hot Water, and note the Place the Spirit riſes to, with 2. By thus proceeding till the whole Pound of Water is ſpent, the Inſtrument will be found divided into 12 Parts, denoting ſo many Terms or Degrees of Heat: So that at 2, the Heat is double that at 1, at 3 triple, &c.

But the Method, though plauſible, *Wolfius* ſhews is deceitful; and is built on falſe Suppoſitions: For it takes for granted, that we have one Degree of Heat, by adding one Ounce of hot to 11 of cold Water; two Degrees, by adding two Ounces to 10, &c. It ſuppoſes that a ſingle Degree of Heat acts on the Spirit of Wine in the Ball with a ſingle Force, a double with a double Force, &c. Laſtly, it ſuppoſes, that if the Effect be produced in the Thermometer by the Heat of the ambient Air which is here produced by the hot Water, the Air has the ſame Degree of Heat with the Water.

But none of theſe Suppoſitions is true: For, as to the Firſt; allowing the Heat of the hot Water, equally diſtributed through the Cold; one Degree of Heat will then be diſtributed through 11 Parts, two through 10, three through 9, &c. Taking, therefore, equal Bulks of the Water, *e. gr.* a twelfth Part of each, the Heat will not be double in one, triple in another, quadruple in another, &c.

The firſt Suppoſition, therefore, is erroneous; and ſo is the Second: For neither is the Heat of the hot Water equably diffuſed throughout the cold; nor does the Heat of the hot Water act uniformly on the Spirit of Wine; *i. e.* not with the ſame Force, all the time of its Action.

For the third Suppoſition; the Heat of the ambient Air acts not only on the Spirit of Wine in the Ball, but alſo on that in the Tube; and therefore this, as well as that, will be changed.

THESEA, THESÆA, in Antiquity, Feaſts celebrated by the *Athenians*, in Honour of *Theſeus*. See FEAST.

In ſpight of the important Services that *Hero* had done his Country, in delivering it from a ſhameful Tribute of ſo many Youths of either Sex, ſent yearly to be devour'd by the *Minotaur* in *Crete* (as the Fable has it) or ſent as Slaves to *Minos* King of *Crete*, as the Hiſtories have it; from which he freed them, by overcoming *Taurus*, *Minos*'s General: He was baniſh'd for ſome time; and retired to *Scyro*, under the Protection of *Lycomedes*, King of that Iſland; who ſlew him out of Jealouſy.

The Gods revenged this Treatment *Theſeus* received from the *Athenians*, by afflicting them with a Famine, which the Oracle aſſured them ſhould not ceaſe, till they had avenged his Death.

Upon this, they ſlew *Lycomedes*, brought *Theſeus*'s Bones to *Athens*, placed them in a Temple erected to him, and appointed *Theſea* to be held every Eighth Day of each Month; wherein Largeſſes were diſtributed to the People, and the Day ſpent by the Rich in Feaſting and Rejoicing.

THESIS, in the Schools, a general Propoſition, which a Perſon advances, and offers to maintain.

The Word is pure *Greek*, θέσις, *Poſition*. In the Colleges, 'tis frequent to have Placards, containing a Number of theſe *Theſes*.

There are *Theſes* in Theology, in Medicine, in Philoſophy, in Law, &c. The maintaining a *Theſis*, is a great Part of the Exerciſe a Student is to undergo for a Degree. See DEGREE.

THESIS, in Logic, &c. every Propoſition is divided into a *Theſis* and *Hypotheſis*: *Theſis* contains the Thing affirmed or denied; and the Hypotheſis the Conditions of the Affirmation or Negation: Thus, in *Euclid*, *If a Triangle, and Parallelogram have equal Baſes and Altitudes*, (is the Hypotheſis) the Firſt is half of the Second; the *Theſis*. See HYPOTHESIS.

THEURGY, THEURGIA, a Name which the Ancients gave to that Part of Magic, which we ſometimes call *white Magic*, or the white Art. See MAGIC.

The Word is form'd from the *Greek*, θεὸς, God, and ἔργον, Work, *q. d.* the Art of doing divine Things, or Things which God alone can do; or the Power of working extraordinary and ſupernatural Things by lawful Means, as by Prayer, Invocation of God, &c.

Accordingly, thoſe who have wrote of Magic in the general, divide it into three Parts; the firſt whereof is call'd *Theurgy*, as operating by divine or cœleſtial Means; the ſecond, *Natural Magic*, perform'd by the Powers of Nature; and the third, *Necromancy*, which proceeds by invoking Dæmons. See NECROMANCY, &c.

THIGH, a Part of the Body of Men, Quadrupeds, and Birds, between the Leg and the Trunk. See LEG, &c.

The ſeveral Parts of the *Thigh* have different Names: The fore and upper Part is call'd the *Groin*, or *Inguen*; the Side, the *Hanch*, or *Hip*, *Coxa*, *Coxendix*; the upper hind Part the *Buttock*, *Clunis*; the lower and hind Part the *Ham*, *Poples*, of *poſt* and *plico*, becauſe it bends backwards; and the fore Part the *Knee*, *Genu*, of the *Greek* γνυ, Angle.

The Bone of the *Thigh* is the largeſt and ſtrongeſt in the whole human Body, as being to bear the whole Burthen thereof; whence its Name *femur*, of *fero*, I bear. See FEMUR.

THINKING, *Cogitation*, a general Name for any Act or Operation of the Mind. See MIND and THOUGHT.

Chauvin, with the *Carteſians*, will have *Thinking* to conſiſt in a certain native inherent Motion or Agitation of the human Mind, whereof itſelf is conſcious. --- *Native* and *Inherent*, ſince he conceives it no other than the very Eſſence of the Mind itſelf, or, at leaſt, its principal and fundamental Property; ---An *Agitation*, ſince there is a new Modification or Change made in the Mind, which we ſcarce know to conceive without Motion; add, that the Origin and Etymology of the Word Cogitation, according to *Varro* and *Feſtus*, implies as much; *cogito* being us'd for *coagito*.

When the Mind turns its View inwards, upon itſelf, the firſt Idea that offers, ſays Mr. *Lock*, is *Thinking*; wherein it obſerves a great Variety of Modifications, and thereof frames to itſelf diſtinct Ideas: Thus the Perception annex'd to any Impreſſion on the Body made by an external Object, is call'd *Senſation*. See SENSATION.

When an Idea recurs without the Preſence of the Object, 'tis call'd *Remembrance*. See MEMORY.

When ſought after by the Mind, and brought again in View, 'tis call'd *Recollection*. See RECOLLECTION.

When held there long under attentive Conſideration, it is *Contemplation*. See CONTEMPLATION.

When Ideas float in the Mind without Regard or Reflection, 'tis call'd a *Revery*: When they are taken expreſs Notice of, and, as it were, regiſter'd in the Memory, it is *Attention*: And when the Mind fixes its View on any one Idea, and conſiders it on all Sides, it is *Study* and *Intention*. See ATTENTION, STUDY, &c.

Theſe are the moſt obvious Modes of *Thinking*; but there are ſeveral others which we know of; and, doubtleſs, the Mind is capable of infinite others, whereof we have no Notion at all. See MODE.

The

The School Philoſophers uſually divide *Thinking*, with Regard to the Objects it is employ'd about, into *Unaerſtanding*, *Intellectio*; and *Willing*, *Volitio*. See UNDERSTANDING and WILLING.

And hence, thoſe are ſaid to be two Powers or Faculties of the human Mind. See POWER.

Intellectual *Thinking* is further ſub-divided into divers Kinds: The firſt, when the Mind merely apprehends or takes Notice of a Thing, call'd *Perception*: The ſecond, when it affirms or denies a Thing, call'd *Judgment*: The third, when it gathers or infers a Thing from others given, call'd *Reaſoning*: The fourth, when the Mind diſpoſes its own Thoughts or Ideas in Order, call'd *Method*. See PERCEPTION, JUDGMENT, REASONING, and METHOD.

Volitive Knowledge, or Volition, admits of infinite different Modifications, or new Determinations. See VOLITION.

Some Authors extend the Idea of *Thinking* further; and conſider it in God, Angels, Brutes, *&c.* whence a new Diviſion of *Thinking* into *Divine*, *Angelical*, *Human*, and *Animal* or *Senſitive*.

But the two firſt we know little or nothing of. See GOD and ANGEL.

The third is that we have already been treating of. As to the laſt, *viz. Animal* or *Senſitive Thought*, it is defin'd to be an Action of the Soul attending to an external Object, effected by means of the Animal Spirits duely agitated in the Brain, to excite an Idea. See SPIRITS; ſee alſo KNOWLEDGE, &c.

The *Carteſians* maintain, that *Thinking* is eſſential to the human Soul; and, conſequently, that there is no Time when the Soul does not *think*: But this Doctrine is overturn'd by Mr. *Lock*, who ſhews, that in Sleep, without Dreaming, there is an entire Ceſſation of all the Modes of *Thinking*. See IDEA.

I think, cogito, according to *des Cartes*, is the firſt, and ſureſt of all Truths; from which alone we draw this Conſequence, *therefore I am*, or exiſt, *ſum*.

One might alſo ſay, *Cogito, ergo Deus eſt*; I think, therefore there is a God. See EXISTENCE.

Logic is defin'd the Art of *Thinking* juſtly. See LOGIC.

THIRD, *Tertius*, See NUMBER, and NUMERATION.

THIRD, in Muſic, a Concord reſulting from a Mixture of two Sounds, containing an Interval of two Degrees. See CONCORD.

'Tis call'd a *Third*, as containing *three* Terms, or Sounds between the Extremes. See INTERVAL.

The *Third*, in *Italian*, *Terza*, in *French Tierce*, in *Latin Tertia*, has no general Name in the *Greek*: 'Tis the firſt of the imperfect Concords; *i. e.* of ſuch as admit of Majority and Minority, without ceaſing to be Concords.

And hence it is, that it is diſtinguiſh'd into two Kinds.

The firſt, which the *Italians* call *Ditono*, (from the *Greek Ditonon*) or *Terza Maggiore*, and we *greater Third*, is compos'd diatonically of three Terms or Sounds, containing two Degrees or Intervals; one whereof, in the ancient Syſtem, is a greater Tone, and the other a leſſer Tone; but in the modern temperate Syſtem they are both equal, as *ut, re, mi*, or *ut, mi*. See DEGREE, TONE, SEMITONE, *&c.*

Chromatically it is compos'd of four Semitones; two whereof are greater, and the *third* leſs: It takes its Form from the Ratio ſeſqui-quarta 4 : 5.

The ſecond *Third*, which the *Italians*, like the *Greeks*, call *Trihemituono*, or *Semi-ditano*, or *Terza minore*, and we *leſſer Third*, is compos'd, like the former, of three Sounds or Terms, and two Degrees or Intervals: But theſe Degrees, diatonically, are only a greater Tone, and a Semitone; and chromatically of three Tones, two greater, and one leſs, as *re, mi, fa*, or *re, fa:* It takes its Form from the Ratio Seſqui-quinta 5 : 6.

Both theſe *Thirds* are of admirable Uſe in Melody, and make, as it were, the Foundation and Life of Harmony. See MELODY and HARMONY.

They are us'd agreeably both aſcending and deſcending; and that either in running over all the Degrees, as *ut, re, mi*, or *re, mi, fa*, or in skipping the middle Degree, as *ut, mi*, or *re, fa*.

But it is to be obſerv'd, the *greater Third* has ſomewhat gay and ſprightly in riſing, and ſomewhat heavy and melancholic in falling: The *leſſer Third*, on the contrary, has ſomewhat ſoft and tender in riſing, and ſomewhat brisk in falling.

For the Uſe of the greater or leſſer Third *in the Series of the Scale.* See SCALE.

There are two other Kinds of *Thirds* that are diſſonant and vicious; the firſt only compos'd of two greater Semitones, and, by Conſequence, of a Semitone leſs than the *leſſer Third:* This they call the *defective Third.*

The ſecond, on the contrary, has a Semitone more than the *greater Third*; and this they call *redundant Third.*

The defective *Third* is very frequent in *Italian* Songs, eſpecially thoſe compos'd for Inſtruments; but is not to be us'd without Neceſſity, and a deal of Diſcretion. The redundant *Third* is abſolutely forbidden.

THIRD-*Point*, or *Tierce-Point*, in Architecture, the Point of Section in the Vertex of an Equilateral Triangle.

Arches or Vaults of the *Third Point*, call'd by the *Italians da terzo Acuto*, are thoſe conſiſting of two Arches of a Circle, meeting in an Angle a-top. See ARCH.

THIRD *Eſtate*. See ESTATE.

THIRD *Order*, a Sort of Religious Order, that obſerves the ſame Rule, and the ſame Manner of Life, in Proportion, as ſome other two Orders inſtituted before. See ORDER.

The *third Oraers* are not originally Religious Orders, but Aſſociations of ſecular, and even marry'd Perſons, who conform, as far as their Condition will allow them, to the Deſign, Intention, and Rules of a Religious Order which aſſociates and directs them.

The *Premonſtrantes*, *Carmelites*, *Auguſtines*, and *Franciſcans* diſpute among themſelves the Honour of having firſt introduc'd *third Orders*; But the Pretenſions of theſe laſt appear to be the beſt founded.

The firſt contend that the *third Order* of *Premonſtrantes* began in the Life-time of their Founder, *S. Norbert*, who dy'd in 1134. See PREMONSTRANTES.

F. *Diego de Coria Maldonado*, a *Spaniſh Carmelite*, who has a particular Treatiſe on the *third Order* of *Carmelites*, derives them immediately, as well as the *Carmelites* themſelves, from the Prophet *Elias*; and among the great Men who have made Profeſſion of that *third Order*, reckons the Prophet *Obadiah*, who liv'd 800 Years before Chriſt; and among the Women, our Saviour's Great Grandmother, under the borrow'd Name of St. *Emerentiena*. This *Obadiah*, he ſays, was Controller-General of the Houſe of K. *Ahab*, mention'd in the 1ſt Book of *Kings*, cap. xviii. and Diſciple of the Prophet *Elijah*. After ſerving that Prince, and his Succeſſors, he retir'd to ſerve God, and enter'd the Prophetic Order of *Elijah*, but without quitting his Houſe, his Wife, or Children.

The Author adds, that he was not properly of the *third Order*, but of the *ſecond*, which conſiſted of marry'd People, and was call'd the Order of Eunuchs, under the Direction of *Elijah*. Such, according to him, is the Foundation of the *third Order* of *Carmelites*. See CARMELITE.

F. *Helyot* ſhews, that this *third Order* was not begun till the Year 1476, when *Sixtus* IV. gave Permiſſion to the Prior and Provincials of the *Carmelites*, to give the regular Habit and Rule of their Order, to People of both Sexes, marry'd or unmarry'd, living at Liberty in the World. *De Coria* reckons S. *Louis*, King of *France* in the *third Order* of the *Carmelites*.

The *third Order* of *Auguſtins*, if we credit F. *Bruno*, was inſtituted by St. *Auguſtin* himſelf: But the Arguments he produces are ſo frivolous, that F. *Helyot* obſerves, they are not worth the refuting.

The *third Order* of *Franciſcans* was inſtituted by S. *Francis* in 1221, in Favour of People of both Sexes, who being ſmitten with the Preachings of that Saint, demanded of him an eaſy Manner of living a Chriſtian Life: Upon which he gave them a Rule, the Conſtitutions whereof are not now extant as wrote by himſelf, but only as reduc'd and confirm'd by Pope *Nicholas* IV. 68 Years afterwards.

The firſt Order of this Saint are the Monks call'd *minor Friars*, comprehending the *Cordeliers*, *Capuchins*, and *Recollects*; the ſecond comprehends the Nuns of S. *Clare*; and the third ſeveral Perſons of both Sexes, who live at Liberty, and theſe are what we call the *third Order*.

Of this Order, which was only eſtabliſh'd for ſecular Perſons, ſeveral of both Sexes, to attain the greater Perfection, have ſince commenc'd *Religious*, and form'd various Congregations, under various Names, as *Religious Penitents of the third Order*, &c.

THIRD *Earing*, in Husbandry, the Tilling or Ploughing of the Ground a third Time.

THIRD *Borow*, in our ancient Law Books, denotes a Conſtable. See CONSTABLE.

THIRD-*night-awn-hynd*; by the Laws of S. *Edward* the Confeſſor, a Gueſt who had lain three Nights in an Inn, was reputed a Domeſtic, and his Hoſt was anſwerable for what Offences he ſhould commit.

For one Night he was accounted *Uncuth*, for two Nights *Gueſt*, and the third *awn-hynd*. *Prima Nocte Incognitus, ſecunda hoſpes, tertia Domeſticus cenſetur. Bracton*, lib. 3. writes it *Hogenehym*.

THIRDINGS, the third Part of the Corn or Grain growing on the Ground at the Tenant's Death, due to the Lord for a Heriot, within a certain Manor and Lands belonging to the Chapel of *Turfat*, *in Com. Heref.*

THIRST, a painful Senſation, occaſion'd by a preternatural Vellication of the Nerves of the Throat or Fauces, and producing a Deſire of Drinking. See DRINK.

Rohault accounts for *Thirſt* thus: The Stomach Liquor, which ordinarily reſolves into a thick Vapour, and aſcends from the Stomach up into the Throat, to moiſten it; being too much warm'd and agitated, either from a Want of ſome other
