AREA REPORTS: INTERNATIONAL

Prepared by staff of the

BUREAU OF MINES

UNITED STATES DEPARTMENT OF THE INTERIOR • Cecil D. Andrus, Secretary

BUREAU OF MINES

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities to protect and conserve our land and water, energy and minerals, fish and wildlife, and park and recreation areas, and for the wise use of all those resources. The Department also has a major responsibility for American Indian reservation communities and for the people who live in Island Territories under U.S. administration.

Foreword

The Federal Government, through the Minerals Yearbook and its predecessor volumes, has reported annually on mineral industry activities for 95 years. This edition discusses the performance of the worldwide mineral industry during 1976. In addition to statistical data, the volumes provide background information to assist in interpreting the year's developments. Content of the individual volumes follows:

Volume I, Metals, Minerals, and Fuels, contains chapters on virtually all metallic, nonmetallic, and mineral fuel commodities important to the domestic economy. In addition, it includes a general review chapter on the mineral industries, a chapter on mining and quarrying trends, and a statistical summary.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, and the Commonwealth of Puerto Rico. This volume also has a statistical summary, identical to that in Volume I.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. A separate chapter reviews the international mineral industry in general and its relationship to the world economy.

The Bureau of Mines continually strives to improve the value of its publications to its users. Therefore, the constructive comments and suggestions of readers of the Yearbook will be welcomed.

Director

Acknowledgments

The Bureau of Mines, in preparing this volume, utilized extensively statistical and other basic data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through a variety of official publications. The cooperation and assistance of these agencies is gratefully acknowledged. Statistical and informational material was also obtained from airgrams of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular help in preparing this volume were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The text and tables of this volume were prepared by the staff of the Branch of Foreign Data, Division of Production/Consumption Data (formerly Assistant Directorate—International Data and Analysis of the Associate Directorate—Minerals and Materals Supply/Demand Analysis). Final correlation and checking of this volume were performed by the Minerals Yearbook staff of the Division of Publication (formerly Technical Data Services).

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

ALBERT E. SCHRECK, *Editor-in-Chief*

Minerals in the World Economy

By Charles L. Kimbell [1] and George A. Morgan [2]

Following the 1975 slump in almost every aspect of its activities, the world mineral industry showed strong signs of recovery in 1976, in keeping with the general improvement in overall levels of world industrial and commercial activity, particularly among market economy countries. Indexes and other measures of mineral industry activities reflect substantial growth in 1976, which was most pronounced among the market economy countries. The centrally planned economy countries, far less severely affected by the 1975 slump, continued to show growth but at a lower rate generally, more in keeping with their 1975 progress, while market economy countries combined recovery from 1975 with new growth to achieve record highs in some aspects of their activities.

PRODUCTION

The estimated value of world crude mineral production in 1976 was $190,600 million in terms of constant 1973 dollars, about 5.1% above the revised 1975 level of $181,400 million. This increase in value, however, exceeded the actual quantitative increase in output, because most mineral commodities had higher unit values in terms of constant dollars in 1976 than in 1975.

The following tabulation gives approximate data on the value of world mineral production for selected years in the period 1950–76, in billion constant 1973 dollars. These figures undervalue the role of the mineral industry in the world economy, for they represent an approximation of the value of minerals in their crudest form—the actual production of a mine—and not the enhanced value that results from beneficiation, smelting, refining, and other downstream processing, as well as the value added in transporting much of these mineral materials from the nations where they are produced in crude form to the nations where they are ultimately consumed. If the value added through processing and through manufacturing basic materials such as cement and fertilizers were included, a

Year	Value of 53 [1] major crude mineral commodities [2]	Value of all crude mineral commodities [3]
1950	$46.2	$52.6
1953	60.3	69.3
1958	77.4	93.0
1963	85.6	104.9
1968	99.2	120.2
1973	159.2	179.8
1974	162.0	r 183.0
1975	r 160.6	r 181.4
1976	169.0	190.9

r Revised.

[1] The list of commodities included appears in table 5 of the 1974 edition of this chapter; one commodity, beryl, covered for 1950–68 is excluded from the 1973–76 figures, but the overall impact of this omission is regarded as insignificant.

[2] Data for all years except 1974–76 are as reported in the Annales des Mines, December 1975, p. 13; data for 1974–76 are extrapolated from the 1973 Annales des Mines figures on the basis of the United Nations index of extractive industry production as given in: United Nations. Monthly Bulletin of Statistics, New York. V. 31, No. 8, August 1977, p. xii.

[3] Data were extrapolated from those values given for the 53 commodities to compensate for commodities not included in the source of that data. For details on the basis of this extrapolation, see relevant text in the 1974 edition of this chapter under "Value of World Mineral Production."

[1] Supervisory physical scientist, Geographic Statistics, International Data and Analysis.
[2] Physical scientist, Division of Ferrous Metals.

1976 figure on the order of $480 billion could be regarded as a conservative estimate of the value of output of primary mineral processing plants. Moreover, it should be noted that crude and processed mineral commodities constitute the overwhelmingly dominant share of the total raw materials base for all manufacturing endeavors, as well as a significant requirement for the agricultural industries because they include fertilizers.

PRODUCTION INDEX PATTERNS

United Nations indexes (1970=100) of the value of mineral industry production of the world (excluding the centrally planned economy nations of Asia) are given in table 1, together with indexes for major sectors of the industry and for overall industrial production. All figures are provided for the world aggregate and for major geographic and economic areas.

The index of the value of output of the extractive industry as a whole registered a 5.2% increase between 1975 and 1976; adjustments made in this index yield a revised decline of 0.9% between 1974 and 1975.

The index of the value of output of the world coal industry increased 1.0% between 1975 and 1976. This was not as large an increase as that recorded for total extractive industry output. The crude petroleum and natural gas sector world index advanced 7.4% between 1975 and 1976, in sharp contrast to the 2.4% decline (revised) suffered between 1974 and 1975. The metal mining sector world index registered a 2.9% increase between 1975 and 1976, in contrast to the 4.6% decline between 1974 and 1975.

A considerable disparity continued to exist between indexes of various world regions, but in distinct contrast to the situation between 1974 and 1975 when the centrally planned economy countries showed gains and the market economy countries mainly recorded declines, the changes between 1975 and 1976 favored the market economies which, as a group, showed greater increases in indexes of metals and oil output value as well as of total extractive output value than those of the centrally planned economies. Only in the case of coal did the centrally planned economies record a higher growth rate than that of the market economies.

It is notable, however, that if a comparison is made between the indexes for 1974 and 1976, the market economies recorded only very modest growth (as a result of the 1975 slump), while the centrally planned economies showed substantial gains. Furthermore, the various groups of market economy countries detailed in table 1 showed divergent patterns of change in their indexes, differing substantially, in some cases, from the average for the group as a whole in 1976 as well as in preceding years.

As with the extractive industry indexes, there were widely varying changes in the mineral processing industry indexes covered in table 1. The base metals index for the world showed an 8.0% growth between 1975 and 1976, but this just compensated for the decline between 1974 and 1975, with the result that the 1976 index was on a par with that for 1974. In the case of chemicals and petroleum and coal products, the 1976 index was 10.6% above the 1975 level and 9.0% above the 1974 level, but the growth here was more a function of rising unit prices than of increased output volume. The worldwide index for nonmetallic mineral products, which was unchanged between 1974 and 1975, advanced 7.1% in 1976. Generally, processing industry index trends followed those of extractive industry on a geographic basis, but there were some exceptions that are evident upon detailed examination of table 1.

QUANTITATIVE WORLD MINERAL PRODUCTION

Total world production of 81 mineral commodities is given for the years 1974–76 in table 2. Regional distribution of these same commodities for 1976 is given by major geographic area in table 3 and by economic group of nations in table 4. In addition, tables 34–56 give world output of selected individual major commodities by principal producing country for 1974–76.

The most prominent aspect of the data in table 2 is the great number of commodities for which production increases were registered between 1975 and 1976; of the 81 commodities listed, 59 (almost 75%) showed gains, with only 22 registering losses. This is a reversal of the pattern be-

tween 1974 and 1975, when 58 commodities registered declines, 22 registered increases, and 1 was unchanged (revised).

Metals.—Of the 41 metallic mineral commodities listed in table 2, 31 registered production increases between 1975 and 1976 and 10 showed declines; this is in contrast to the pattern between 1974 and 1975, when 30 recorded declines and only 11 showed increases (revised). Among major metals, aluminum, copper, smelter lead, zinc, and the metallic forms of iron registered increases in 1976, while iron ore and mine lead recorded declines.

Nonmetals.—Among the 29 nonmetallic mineral commodities shown in table 2, 19 showed increases between 1975 and 1976 and 10 recorded declines, in contrast to 6 up, 22 down, and 1 unchanged between 1974 and 1975. Among major nonmetals, output of cement, gypsum, lime, and salt, all of which declined between 1974 and 1975, showed increases between 1975 and 1976. Nitrogenous fertilizers recorded increases both years, while phosphate rock and sulfur declined both years.

Mineral Fuels.—In 1976, world production of energy from all commercial sources (excludes wood, charcoal, bagasse, and animal dung, which are regarded as noncommercial sources) reached a new record high, totaling 8,951 million tons of standard coal equivalent (SCE), 5.5% above the revised 1975 level of 8,482 million tons SCE and more than 4.8% above the revised 1974 level of 8,537 million tons SCE, the previous record high. The percentage distribution of energy production, by fuel source, is given in the following tabulation for 1974–76:[3]

Source	1974	1975	1976
Coal (including lignite)	2^.3	r 31.0	30.2
Petroleum	r 49.8	r 47.7	48.7
Natural gas	r 18.5	r 18.7	18.6
Hydro, geothermal, and nuclear electricity	2.4	2.6	2.5

r Revised.

All primary energy forms registered quantitative gains in production in 1976, and petroleum recovered some of the ground lost in 1975 to coal, natural gas, and primary electricity in terms of percentage of total.

Of the 11 mineral fuel commodities reported in table 2, 9 showed increases between 1975 and 1976 while 2 registered declines. Carbon black, coal (all types), metallurgical coke, natural gas, natural gas liquids, and crude and refined oil output increased, while low-temperature coke and peat output declined.

VALUE OF WORLD MINERAL PRODUCTION

General estimations regarding total world mineral output value in 1974–76 appear in the first paragraphs of the "Production" section and in the tabulation that accompanies them; no data are provided in this chapter on the value of world mineral production on a country or commodity basis. The source for this information, the French mineral industry publication *Annales des Mines,* publishes only on a 5-year cycle in this detail, the last year covered being 1973. For information on the 1973 distribution of world mineral output value by commodity and country and details on the methods used to extrapolate this data in aggregate to the present, the reader is referred to the corresponding section of the 1974 edition of this chapter.

TRADE

GENERAL TRENDS

In 1975, the value of total world trade in mineral commodities declined to $311,136 million from a record high of $320,612 million (revised) in 1974. This is the first time in recent years that a decline has occurred and represents the end of the commodity price boom that began at the end of 1973 when world crude petroleum prices were drastically increased. The value decline of nearly 3% compares with a more than 110% increase (revised) between 1973 and 1974. The value of world mineral commodity trade as a percentage of the value

[3] Based on: United Nations. World Energy Supplies 1972–76, New York. Statistical Papers, ser. J, No. 21, 1978, p. 2.

of world trade in all commodities declined from 38.5% (revised) in 1974 to 35.7% in 1975. This was owing not only to the decline in mineral commodities traded but also to the increase in the value of other commodities traded. Prices in a given mineral commodity eventually work their way up through the various stages of upgrading and processing, with the result that end product use reflects such added value at a later date. Thus, products of the manufacturing, processing, and chemical industries, which account for the bulk of all nonmineral commodities, increased in value while mineral commodity prices leveled off or declined. The following tabulation gives data for 5 years on the value of world trade in mineral commodities:

	Value of mineral commodities traded [1] (millions)	Percent change from previous year	Percent of total value of all commodities traded
1971	r $91,191	+9.1	r 26.3
1972 r	104,328	+14.4	25.2
1973 r	152,345	+46.0	26.5
1974 r	320,612	+110.5	38.5
1975	311,136	−3.0	35.7

r Revised.
[1] Value estimated from data on mineral commodities appearing in table 5, to which has been added a factor for all mineral commodities not included in that table. The factor added is based on a comparison of complete mineral trade value returns for selected countries with data given for these same countries in the source of table 5, which includes only the selected mineral commodity groups specified in the footnotes to that table. This comparison indicates that reported mineral commodity trade as listed in table 5 represents about 81.5% of total mineral commodity trade.

The shares of both developed and developing market economy countries in world trade in major mineral commodities declined in 1975, while that of centrally planned economy countries increased to 9.6% from 6.8% in 1974.

COMMODITY GROUP TRADE PATTERNS

The value of world export trade in major mineral commodity groups and in all commodities for 1971–75 is given in table 5. The percentage distribution of the world export value among the major mineral commodity groups is given in table 6, while table 7 gives the growth in value of export trade in each of the major mineral commodity groups over the 5-year period, as well as the growth in value of all commodities traded. The world export value of two of the five major mineral commodity groups increased slightly in 1975. Crude nonmetals and mineral fuels together were up by $857 million. However, metal ores, concentrates, and scrap, iron and steel, and nonferrous metals all were down, declining a total of $8,580 million. The sharpest decline in value of world trade was experienced by the nonferrous metals group, which fell 27.7% or $6,978 million. Its share of total major mineral commodity world trade continued to decline, falling to 7.2%. Despite the 1.3% decline in value of trade in iron and steel, that group's share of total major mineral commodity world trade increased slightly to 18.1% from 17.8% (revised) in 1974. The portion of trade in metal ores, concentrates, and scrap continued to decline, falling to a record low of 5.8%. The value of all metals trade declined 9.8%, following 2 years of 43% and 54% increases. Mineral fuels, which reached a record high world trade value of $168,560 million in 1975, experienced a growth rate of only 0.3% compared with 110.5% the previous year. However, that group's share of total major mineral commodity world trade increased again to 66.5% from 64.3% in 1974. In the 5-year period beginning in 1971, the value of all commodities traded has increased 152% or $526,257 million. However, owing to the reduction in the growth rate of the mineral fuel trade value, which value accounted for 19% of all commodities traded in 1975, the growth rate of the world export trade value in all commodities also dropped considerably, falling to 4.7% from 45.1% the previous year. In comparison with the 152% increase in the value of all commodities traded in the 1971–75 period, the total value of world export trade in major mineral commodity groups increased 241%.

REGIONAL TRADE PATTERNS

The significance and direction of world trade in major mineral commodity groups,

by value, is provided in a series of three tables. Table 8 gives the aggregate of the five major mineral commodity groups in terms of exports from and exports to major areas and countries, along with comparable data on the value of all commodities traded. Table 9 shows the direction by source and destination of aggregated major mineral commodity trade, and table 10 gives a breakdown by major mineral commodity group of the aggregate listed in table 8. The following tabulation represents a synthesis of the data available on world export trade in major mineral commodities in 1975, in terms of value and percentage of the world total by major trading areas:[4]

Destination	Source				
	Market economy countries		Centrally planned economy countries	Unspecified [1]	Total
	Developed	Developing			
Value (million dollars):					
Market economy countries:					
Developed	66,878	104,719	10,777	1	182,375
Developing	16,226	27,921	1,699	—3	45,843
Centrally planned economy countries	7,102	2,501	11,581	—1	21,183
Unspecified	2,451	1,573	147	4	4,175
Total	92,657	136,714	24,204	1	253,576
Percentage of world total:					
Market economy countries:					
Developed	26.4	41.3	4.2	(2)	71.9
Developing	6.4	11.0	.7	(2)	18.1
Centrally planned economy countries	2.8	1.0	4.6	(2)	8.4
Unspecified	1.0	.6	(2)	(2)	1.6
Total	36.6	53.9	9.5	(2)	100.0

[1] Figures represent the difference between reported totals and reported detail. Explanations for negative quantities are not provided in source publication.
[2] Less than ½ unit.

Source: United Nations. Monthly Bulletin of Statistics, New York. V. 30, No. 8, August 1976, pp. xxvii–xlv; and V. 31, No. 5, May 1977, pp. xxviii–lii.

As in 1974, the value of major mineral commodity exports from developing nations exceeded that for developed nations, although it made up a lower percentage of the world total than in 1974. Of the total value of major mineral commodities traded, 53.9% was from developing market economy countries, compared with 36.6% from developed market economy countries. The value of exports from centrally planned economy countries increased to 9.5% of the world total, rising by $6,194 million over that of 1974. Significantly, in this time period, centrally planned economy trade patterns reflected the downturn in market economies. Exports from centrally planned economies to developed market economies rose by only $1,478 million, compared with those to centrally planned economies which jumped 68% from $6,905 million in 1974 to $11,581 million in 1975. Exports from developed market economies to centrally planned economies also increased in 1975, rising by $1,201 million compared with those to developed market economies, which declined by $5,392 million.

Among the areas and countries listed in table 8, the developing market economies of Africa, the Near East, and Latin America were the most heavily affected by the slump of 1975, with the value of exports from these areas declining appreciably, both on a percentage basis and in terms of actual value. Developed market economies of North America and Europe experienced more gradual changes in the value of materials imported and exported. In absolute terms, the value of major mineral commodity exports from Canada and the United States actually increased slightly, but its share of all commodities exported declined

[4] Countries are grouped according to United Nations practice: Developed market economy countries are Australia, Austria, Belgium, Canada, Denmark, Finland, France, West Germany, Greece, Iceland, Ireland, Israel, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, the Republic of South Africa, Spain, Sweden, Switzerland, the United Kingdom, the United States, and Yugoslavia; centrally planned economy countries are Albania, Bulgaria, the People's Republic of China, Czechoslovakia, East Germany, Hungary, North Korea, Mongolia, Poland, Romania, the U.S.S.R., and Vietnam; and developing market economy countries are all other countries.

from 15.9% to 15.1%. The European Economic Community (EEC), whose exports of all commodities account for about one-third of the total value of world trade, experienced declines in both exports and imports of major mineral commodities. The most severe decline was in nonferrous metals, with exports dropping by $2,062 million and imports dropping by $3,292 million, the latter reflecting recessionary trends in the housing construction and automotive industries.

Centrally planned economies of Europe experienced increases in the value of trade in each of the major mineral commodity groups except exports of nonferrous metals, which declined by $279 million. Particularly acute was the jump in value of mineral fuels imported by that region, almost double the 1974 high of $3,880 million. The mineral fuel export value increased sharply as well, most going to countries within that political-economic block. The downturn in trade of market economies, while appearing to enhance the position of centrally planned economies with regard to world trade, was highly disruptive of exports and imports of developing market economies. The total value of exports of major mineral commodities to Latin America from the world fell to $17,189 million in 1975 from a total of $19,545 million in 1974. The total value of exports of major mineral commodity groups from Australia and New Zealand was up by $611 million in 1975. The value of mineral exports from these two countries increased to nearly every area of the world; exceptions were the United States, the European Free Trade Association (EFTA), market economy Far East and South Asia other than Japan, and Australia and New Zealand themselves.

CONSUMPTION

NONFUEL MINERAL COMMODITIES

After a sharp downturn in consumption levels for most major nonfuel mineral commodities in 1975, there was a pronounced upturn in 1976. Available information on world consumption of major commodities for 1976 indicates that some commodities reached new highs in that year (topping previous peaks of 1973 and 1974) and that others, while not setting new records, recorded substantial recoveries from 1975 levels.

World consumption (selected major countries) of iron ore was up 3.2% in 1976, as indicated in table 11, and that of iron and steel scrap advanced 6.9%, as shown in table 12. These tables present 1974–76 figures for a number of nations that report consumption levels for these materials.

The upturn in consumption of nonferrous metals is reflected in the figures presented for aluminum, copper, lead, tin, and zinc in table 13; each of these metals was used in greater quantities in 1976 than in 1975. The use of aluminum and copper topped the 1974 levels, with the former reaching a new high and the latter falling only slightly short of the 1973 record high.

Among major nonmetallic minerals, sulfur showed increasing use among market economy countries in 1976, with a 3.6% increase over the revised 1975 figure to 31.5 million tons; a growth of at least that magnitude on a percentage basis almost assuredly occurred among the centrally planned economy countries. All fertilizer commodities registered growth between the 1975–76 and 1976–77 crop years (those beginning July 1). Nitrogenous fertilizer use advanced 3.5% over the revised 1975 figure to 44.5 million tons (nitrogen content basis), phosphatic fertilizer consumption was up 5.6% over the revised 1975 figure to 26.6 million tons (P_2O_5 basis), and potassic fertilizer use increased 9.9% over the revised 1975 figure to 23.3 million tons (K_2O equivalent basis).

MINERAL FUEL COMMODITIES

World consumption of energy, by energy source, is given in table 14 for the 6-year period 1971–76 in terms of SCE. Total world energy consumption advanced 5.6% between 1975 and 1976, compared with an increase of less than 0.8% between 1974 and 1975. On a per capita basis, the 1975–76 growth was 3.7%, compared with a decline of 1.0% between 1974 and 1975.

From the viewpoint of sources of energy, liquid fuels again dominated, accounting for 44.9% of the 1976 total, followed by

solid fuels (32.4%), natural and imported gas (20.0%), and hydro, nuclear, and imported electricity (2.7%). All sources showed growth between 1975 and 1976, but the growth as contributed to by both the various sources and the various regions was far from uniform throughout the world. A comparison of energy sources by region as presented in table 14 shows a wide variety of rates of growth between 1975 and 1976.

INVESTMENT

Available information on investment in selected industrial sectors of market economy countries and total U.S. mineral industry investment, together with general indications and spot reporting of individual investments in other world areas, indicate a general upturn in investment levels in 1976. Although official 1976 results were not available at this writing, it seemed evident that the decline of 10% from 1974 to 1975 in aggregated annual investment expenditures in the steel industries of selected major market economy countries (see table 15) did not extend into 1976—rather that an upturn occurred. Investment in the petroleum industries of market economy countries advanced in 1976, as shown in table 16, which details capital and exploration expenditures by geographical area. The overall increase in petroleum industry investment was nearly 14.1% between 1975 and 1976 (compared with 13.2% between 1974 and 1975). The percentage distribution of total petroleum industry investment by geographic area, was as follows, based on data from the Chase Manhattan Bank:

Area	1975	1976
United States	36.4	39.6
Other Western Hemisphere	11.8	11.8
Western Europe	18.0	15.6
Africa	3.6	4.4
Near East	4.0	8.0
Far East	8.8	6.4
Unspecified	17.4	14.2

It is noteworthy that of the total investment, a slightly smaller share was directed to exploration expenses in 1976 than in 1975 (see table 16); most of the increase was in the areas of production facilities for crude oil, natural gas, and natural gas liquids, as can be seen in table 17, which details capital investments by industry sector.

Table 18 summarizes U.S. direct foreign investment in the mineral industry in 1973–76, providing information on value, earnings, and income in the fields of mining, smelting, and refining, and petroleum, with a 1975 and 1976 breakdown by geographic area and country. The total value of U.S. direct foreign investment in mining, smelting, and refining in 1976 was 7.8% higher than in 1975, and that in petroleum was 13.4% higher. The growth patterns of geographic areas are varied as can be seen in table 18.

TRANSPORTATION

MARINE TRANSPORT

Tankers, bulk carriers, and freighters are the primary oceangoing vessels for transport of mineral commodities. The number, gross tonnage, and deadweight tonnage of these vessels, as reported by the U.S. Maritime Administration for 1972–76, are given in table 19. The data listed therein for 1975 and 1976 are not completely comparable to those supplied for previous years owing to the inclusion of refrigerated freighters in the "Freighter" category in 1975 and 1976 and in the "Other" category in 1972–74. Such vessels numbered approximately 1,000 in 1974, with a combined gross tonnage of 5,433,000 tons and a combined deadweight tonnage of 5,794,000 tons. It must be remembered that vessels in each of the categories listed may not be involved wholly or even partly in transport of mineral commodities. Tankers generally move petroleum and refinery products, but the category also includes wine, molasses, and whaling tankers. Bulk carriers move agricultural products in addition to fertilizer and crude minerals, while freighters, because of their highly evolved technical nature, move numerous and diverse materials.

The percentage of world shipping that is mineral related is indicated by an exam-

ination of traffic transiting the Panama and Suez Canals. In 1976, 55.5% of all Panama Canal traffic and 55.6% of all Suez Canal traffic was of mineral commodities. Considering that most tanker and bulk carrier traffic bypasses the canals because of capacity limitations, it is clear that an even larger percentage of total seaborne traffic is mineral related.

The total merchant fleet amounted to 23,586 vessels in 1976, with a combined gross tonnage of 358,203,000 tons and a combined deadweight tonnage of 606,499,000 tons. The number of vessels increased 3.1%, gross tonnage 7.6%, and deadweight tonnage 9.0% over the 1975 figures. The slight change in the number of vessels in the fleet compared with the larger increases in gross weight and deaweight tonnages illustrates the increase in the average size of the vessels. With a net addition of 714 vessels, 49,927,000 deadweight tons was added to the fleet, 67% of which was in tankers.

The volume of transport in the 5-year period 1972–76, in terms of loadings and unloadings of tanker and dry cargo, is given in table 20. Overall, loadings of tanker cargo increased 9.3% in 1976, while unloadings were down 2.8%. Loadings of dry cargo were up 8.1%, and unloadings increased 16.0%. In the case of tanker loadings, the 1976 upturn followed two consecutive years of decline, while in the case of dry cargo loadings, the 1976 level was a new record high, exceeding the previous high of 1974.

Tables 21 and 22 give a regional breakdown of such loadings and unloadings, by cargo type. Loadings of tanker cargo by developed market economy countries were unchanged in 1976. An examination of their unloadings indicates a 4.6% decline. Most of the decline was the result of a 12.5% decline in the Western European countries; modest gains in the United States and Japan partly offset this drop. Tanker loadings by developing countries, which include the Near East and northern Africa, increased nearly 10.5%, only partly compensating for the 12.1% decline (revised) registered between 1974 and 1975 and still well below the 1973 record level. Unloadings by developing countries followed the 1975 decline of 9.5% with a 3.7% increase in 1976. Loadings of tanker cargo advanced 7.9% for centrally planned economy countries, and unloadings were up 13.8%. Loadings of dry cargo increased to new highs for all three groups. Unloadings of dry cargo by developed market economies recovered from the slump of 1975 to reach a new high, while unloadings by developing market economies and centrally planned economies also reached new highs, continuing unabated growth. The United States recorded a 38.0% increase between 1975 and 1976.

Tankers.—In 1976, the world tanker fleet increased by only 72 vessels (or 1.4%), compared with an increase of 190 vessels between 1974 and 1975. The additional vessels, however, resulted in an 11.0% increase in deadweight tonnage. Average tanker size increased once again, reaching 62,344 deadweight tons compared with 56,904 deadweight tons (revised) in 1975. Table 23 gives the distribution of world oil tanker tonnage, by size group, for 1976, with 1966 data included for comparison. In that 10-year period, total world oil tanker deadweight tonnage increased 223%. The dramatic change in the composition of the fleet is evident from a comparison of the percentage of vessels of 125,000 deadweight tons and over for the two years. In 1966, only 1.1% was of that size group, compared with 62.8% in 1976. As in 1975, tankers in the 205,000- to 285,000-ton group accounted for the largest percentage (43.2% in both years) of tankers afloat, However, only 20.2% of new tankers under construction or on order at yearend were in this class, compared with 29.6% at yearend 1975. Of the vessels under construction or on order at yearend 1976, 38.4% were to be 285,000 tons and over. The total tonnage of vessels under construction or on order at yearend 1976 was 35.2 million tons, compared with 88.5 million tons a year earlier, a decline of 60.2%. By yearend 1976, 60.8% of the total world tanker tonnage had been added during the past 6 years. The following tabulation gives a percentage breakdown of total tonnage, in terms of year of completion, of vessels classified as tankers in 1975 and 1976:

Year of completion	1975	1976
Through yearend 1950	1.4	1.1
1951–55	2.7	1.8
1956–60	8.8	6.6
1961–65	11.3	9.4
1966–70	22.5	20.3
1971–75	53.3	48.2
1976	--	12.6

Source: British Petroleum Co. Ltd. BP Statistical Review of the World Oil Industry. Bayard Press, London, 1975 and 1976.

Liberia remained the leading country of registry of vessels classified as tankers, with an increase of 11,762,000 tons over the 1975 tonnage. The following tabulation distributes the world tanker fleet by flag of registry, in order of total national deadweight tonnage, in 1976:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	1,004	101,232
Japan	550	36,051
United Kingdom	424	32,877
Norway	337	30,743
Greece	329	16,403
France	154	15,335
Panama	227	10,895
United States	269	10,714
Italy	230	8,880
Sweden	90	7,685
Germany, West	89	6,930
U.S.S.R	487	6,740
Spain	119	6,258
Singapore	94	5,542
Denmark	70	5,285
Other	910	34,030
Total	5,383	335,600

Bulk Carriers.—In 1976, the world bulk carrier fleet increased by 298 vessels (or 7.0%), compared with an increase of 197 vessels in 1975. Deadweight tonnage was up 8.8%, compared with 7.8% in 1975. The average size of all bulk carriers increased from 35,131 deadweight tons in 1975 to 35,733 deadweight tons in 1976. The following tabulation lists the leading countries with bulk carrier fleets in 1976, in order of total deadweight tonnage:

Country	Number of vessels	Deadweight tonnage (thousand tons)
Liberia	990	40,464
Japan	572	23,185
Norway	310	17,094
Greece	546	15,013
United Kingdom	346	14,853
Italy	155	6,962
Panama	255	5,455
Sweden	88	4,673
Germany, West	77	4,012
India	88	3,782
France	60	2,735
U.S.S.R	166	2,026
Spain	64	1,979
Poland	78	1,830
Singapore	49	1,779
Brazil	37	1,578
Other	689	15,878
Total	4,570	163,298

Freighters.—The world freighter fleet (including refrigerated freighters) amounted to 12,923 vessels in 1976. Advances in technology and application of these advances in shipyard construction have led to an extremely varied class of vessels. Freighters consist of general cargo carriers, full containerships, partial containerships, roll-on/roll-off vessels, and the newest design, barge carriers. The U.S. freighter fleet alone can not be considered solely in terms of numbers of vessels, because numerous war-built vessels have been scrapped, with a resultant decline in the number of vessels over the past 10 years. The average vessel age of the U.S. fleet has declined since 1968, with newer vessels having nearly a 20% increase in average speed and a 40% increase in average deadweight tonnage. Because of the inseparability of refrigerated freighters from the class of freighters, the overall statistics are not readily comparable to previous years' data. The following tabulation lists the leading nations in registry of freighters in 1976, in order of total deadweight tonnage:

Country	Number of vessels	Deadweight tonnage (thousand tons)
U.S.S.R	1,771	10,967
Greece	984	9,289
Panama	1,126	8,079
Japan	920	7,348
United Kingdom	716	7,050
Liberia	613	6,247
United States	299	4,931
Germany, West	461	3,912
Cyprus	451	3,009
China, People's Republic of	298	2,686
Netherlands	342	2,506
Norway	294	2,399
Other	4,648	36,216
Total	12,923	104,639

OCEAN FREIGHT RATES

Following sharp downturns in freight rates for all categories between 1974 and 1975, there were several upturns in 1976. Many categories, however, continued to decline, as can be seen in table 24, which provides considerable detail for 1973–76.

PANAMA AND SUEZ CANALS

The number of transits and quantity of cargo moved through the Panama Canal decreased 10.7% and 16.3%, respectively, in fiscal year (the year ending June 30 of that stated) 1976. The quantity declined by 31,188,000 tons from the record tonnage set

in 1974 to 119,093,000 tons. Significantly, the quantity of mineral commodities moved through the canal declined 26.2%, a greater percentage decrease than that for all commodities, which indicates that the share of mineral commodities in the total tonnage dropped. The following tabulation summarizes mineral commodity movement in comparison with other Panama Canal activity for fiscal years 1974–76:

	1974	1975	1976
Number of transits:			
Commercial ocean traffic	14,033	13,609	12,157
Other traffic	1,236	1,126	1,044
Total	15,269	14,735	13,201
Cargo moved (thousand metric tons):			
Commercial ocean traffic:			
Mineral commodities	87,696	89,250	65,861
Other commodities	62,585	53,100	53,233
Subtotal	150,281	142,350	119,094
Other traffic	1,801	543	193
Total	152,082	142,893	119,287

Modifications in the type and nature of vessels transiting the Panama Canal were again evident in 1976. While transits and tonnage were down, average ship size continued to increase. The trend continued toward replacement of smaller vessels in canal trade by larger specialized vessels, primarily bulk carriers and containerships. Table 25 gives commercial ocean traffic through the Panama Canal in terms of number of transits and cargo moved, by vessel type, for fiscal years 1975 and 1976. In terms of cargo weight, dry bulk carriers accounted for 55.4% of the total moved in 1976, followed by tankers at 19.9% and general cargo ships at 13.1%. Over 56% of the total cargo moved through the canal was Pacific bound, again with dry bulk carriers and tankers making up most of the tonnage. In terms of the number of transits, dry bulk carriers led all other classes with 28.2%, followed closely by general cargo ships with 26.5%.

Table 26 gives 3 years' data on the quantity of individual mineral commodities shipped through the Panama Canal, by direction of movement. Over 61% of the tonnage moved in fiscal year 1976 was Pacific bound. Coal and coke topped all other mineral commodities in terms of tonnage moved, accounting for 25.8% of the total, followed by crude petroleum with 18.4%, refinery products with 15.4%, and iron and steel semimanufactures with 11.8%. The tonnage of crude petroleum and refinery products moved was down 8.3% from that of 1975.

In its first full year of commercial operations since its closure during the 1967 Arab-Israeli conflict, the Suez Canal in 1976 recorded 16,806 vessel transits (all classes of vessels, both in ballast and laden), carrying 117.6 million tons of cargo of all types. This traffic, and the role of mineral commodities in it, is summarized in the following tabulation:

	1975 r 1	1976
Number of transits:		
Commercial ocean traffic	5,495	16,402
Other traffic	84	404
Total	5,579	16,806
Cargo moved: Commercial ocean traffic (thousand metric tons):		
Mineral commodities	16,684	105,203
Other commodities	20,935	12,440
Total	37,619	117,643

r Revised.
1 Data are for June 5 through Dec. 31, 1975.

Table 27 provides details on the type and number of commercial ocean traffic vessels transiting the Suez Canal since its reopening, by status (in ballast or laden) and direction of movement. Table 28 details tonnages of mineral commodities moved for the same time period, by direction of movement. Crude oil accounted for 37.2% of total 1976 mineral commodity movement and petroleum refinery products for an ad-

ditional 15.1%; this was despite limitations on the size of vessels transiting the canal and the substantial increase in the average size of tankers that took place between the time of the canal's closure in 1967 and its reopening in 1975. Other mineral commodities accounting for significant shares of total mineral commodity shipments included fertilizers (all types) with 10.5%, iron ore with 6.3%, and cement with 5.9%.

PIPELINES

Limitations of space and time do not permit an overall appraisal of worldwide pipeline construction activity in this chapter. In the most general terms, however, it is clear that construction activity was intensified over 1975 levels in most world areas. Newsworthy pipelines under construction included the crude oil line linking Alaska with mainland United States and the gasline links between the Norwegian North Sea fields and West Germany, which were nearing completion at yearend. Algeria, a member of the Organization of Petroleum Exporting Countries (OPEC), recorded the completion of four lines, each over 300 miles long—two carrying natural gas from Hassi R'Mel, one to Arzew and the other to Skikda; and two carrying crude oil from Haoud el Hamra, one to Arzew and the other to Skikda. Other OPEC completions included a 460-mile refinery products line in Iran from Ahwaz to Rey and several shorter refinery products lines and one gasline, also in Iran.

PRICES

Comprehensive data on world mineral commodity prices are not available, but some idea of the general upward trend in prices in market economy countries can be obtained from tables 29 through 31, which give recent annual average prices, as well as monthly 1976 averages, for major nonferrous metals for Canada, the United States, and the United Kingdom. Figures presented for aluminum show a moderate upward trend during 1976, reflecting the rising costs of energy required for the reduction of this metal from alumina. In the case of copper, prices in all three areas advanced for the first 7 to 9 months then declined to lose most of their gains by yearend, but the annual average price for 1976 was, in each case, significantly above the 1975 annual average. Lead prices in each of the three areas advanced during 1976 to average well over the 1975 annual average, but in contrast, zinc prices were lower in the United States and United Kingdom and only slightly above that of 1975 in Canada. The tin price on both the New York and London markets fluctuated throughout 1976 but ended the year considerably ahead of the 1975 average; the annual average was also above the 1975 average. The annual average silver price declined from 1975 to 1976, although at midyear on all three markets the price well exceeded the 1975 average and approached the monthly highs set in August 1975.

United Nations data on world mineral commodity export prices are presented in the form of indexes in tables 32 and 33. Unfortunately, results for 1976 were not complete, but the general upward trend through the first three quarters of 1976 is evident in the tables.

STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR MINERAL COMMODITIES

The final 36 tables of this chapter (tables 34 through 69) extend the statistical series that was started in Volume III of the 1963 Minerals Yearbook and was subsequently updated and expanded in the 1965 and 1967–75 editions. They are primarily a supplement to other statistical data within this chapter but also serve as a summary of international production and trade data for major mineral commodities covered in greater detail on a commodity basis in Volume I of the 1976 Minerals Yearbook and on a country basis in the balance of Volume III.

The data presented here on production (tables 34 through 56) in most instances correspond directly to the data in the individual commodity world production

tables appearing in Volume I and as such may not correspond exactly to figures presented in the individual country chapters of Volume III. Such differences are usually the result of the receipt of revised data for inclusion in either a commodity chapter or a country chapter subsequent to the completion of the other chapter. In most cases, country chapters were prepared later than commodity chapters and should be regarded as more reliable.

The data presented on world trade (tables 57 through 69) may not correspond exactly to those presented elsewhere in Volume III because these summary tables are compiled, at least in part, from sources other than those used in the individual country chapters in order to obtain data on a consistent basis. The differences, however, are regarded as unimportant from the viewpoint of indicating the general pattern of trade in these commodities.

The format of table 66 (showing world solid fuel trade) has been modified to make it parallel in structure to table 69 (refined petroleum trade). The modification, which eliminates some of the detail previously provided, was necessitated by deletion of this detail in the source publication.

r Revised. NA Not available.

[1] Excludes Albania, the People's Republic of China, North Korea, Mongolia, and Vietnam.

[2] Includes Canada, the United States, all countries of Europe except those listed in footnotes 1 and 8, the Republic of South Africa, Israel, Japan, Australia, and New Zealand.

[3] European Economic Community (EEC) comprises Belgium, Denmark, France, West Germany, Ireland, Italy, Luxembourg, the Netherlands, and the United Kingdom.

[4] European Free Trade Association (EFTA) comprises Austria, Finland, Iceland, Norway, Portugal, Sweden, and Switzerland.

[5] Includes countries not indicated in footnotes 1, 2, and 8.

[6] Corresponds to the United Nations classifications "Caribbean, Central, and South America."

[7] Corresponds to the United Nations classification "Asia, excluding Israel and Japan."

[8] Includes Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

Table 2.—World production of major mineral commodities [1]

(Thousand metric tons unless otherwise specified)

Commodity	1974	1975	1976 p
METALS			
Aluminum:			
Bauxite, gross weight	r 81,477	77,797	79,682
Alumina, gross weight	r 28,558	26,093	26,814
Unalloyed ingot metal	r 13,167	12,108	12,497
Antimony, mine output, metal content ---tons	r 72,088	69,849	69,560
Arsenic, white [2 3] ---do	r 48,959	41,976	36,063
Beryl concentrate, gross weight [2 3] ---do	r 3,184	3,265	2,718
Bismuth [2] ---do	r 4,822	4,000	4,205
Cadmium, smelter ---do	r 17,288	15,373	17,106
Chromite, gross weight [3]	r 7,460	8,233	8,610
Cobalt:			
Mine output, metal content ---tons	r 30,910	29,450	26,114
Refined ---do	r 24,798	20,584	18,360
Columbium-tantalum concentrates [3 4] ---do	r 23,969	15,126	23,055
Copper:			
Mine output, metal content	r 7,297	6,958	7,455
Smelter	r 7,319	7,071	7,408
Refined	r 7,587	7,137	7,547
Gold, mine output, metal content ---thousand troy ounces	r 40,124	38,676	39,883
Iron and steel:			
Iron ore, gross weight	r 897,056	901,551	895,139
Metal:			
Pig iron	r 511,874	480,024	501,386
Ferroalloys	r 12,616	11,915	11,996
Crude steel	r 707,754	646,380	678,811
Lead:			
Mine output, metal content	r 3,416	3,405	3,358
Smelter	r 3,470	3,314	3,438
Magnesium, primary smelter [5] ---tons	r 129,608	125,577	134,761
Manganese ore, gross weight	r 22,456	24,565	24,784
Mercury, mine output, metal content ---tons	r 8,878	8,715	8,419
Molybdenum, mine output, metal content ---do	r 86,812	83,305	87,610
Nickel:			
Mine output, metal content ---do	r 770,234	788,789	804,357
Smelter ---do	r 742,082	723,814	756,760
Platinum-group metals, mine output ---thousand troy ounces	r 5,769	5,714	5,992
Selenium, smelter [3 4] ---tons	r 1,210	1,160	1,257
Silver, mine output, metal content ---thousand troy ounces	r 292,184	297,882	304,899
Tellurium, smelter [3 4] ---tons	r 212	142	[2] 91
Tin:			
Mine output, metal content [2] ---do	r 232,880	221,035	225,755
Smelter ---do	r 236,198	230,576	228,856
Titanium concentrates, gross weight: [3]			
Ilmenite [6]	r 4,039	3,672	4,012
Rutile	r 361	[2] 378	[2] 427
Tungsten, mine output, metal content ---tons	r 37,777	38,194	41,691
Uranium oxide, mine output, U_3O_8 content [3 4] ---do	r 22,333	24,198	27,303
Vanadium, mine output, metal content ---do	r 18,831	21,045	23,543
Zinc:			
Mine output, metal content	r 5,780	5,800	5,866
Smelter	r 5,609	5,074	5,427
NONMETALS			
Asbestos	r 4,158	4,146	5,055
Barite	r 4,644	4,867	4,948
Cement, hydraulic	r 703,213	702,205	736,106
Clays: [3]			
Bentonite [4]	r 4,872	4,727	5,339
Fuller's earth [4]	r 1,504	1,426	1,505
Kaolin	r 16,030	14,505	15,492
Diamond: [3]			
Gem ---thousand carats	r 11,689	10,184	10,320
Industrial ---do	r 32,833	30,924	29,406
Total ---do	44,522	41,108	39,726
Diatomite [3]	r 1,713	1,667	1,735
Feldspar [3]	r 3,011	2,623	2,585
Fluorspar	r 4,863	4,549	4,437
Graphite [2] ---tons	r 493,807	438,204	451,540
Gypsum	r 63,768	60,247	64,271
Lime [3]	r 110,501	103,416	105,806
Magnesite [2]	r 10,054	10,095	9,597
Mica [3]	234	227	214
Nitrogenous fertilizers, N content	r 40,436	42,381	43,876
Phosphate rock	r 110,013	107,381	106,936
Potash, marketable, K_2O equivalent	r 23,794	24,813	24,382
Pumice [3 4]	r 15,348	15,491	15,939
Salt	r 166,276	164,870	167,919

See footnotes at end of table.

Table 2.—World production of major mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

Commodity	1974	1975	1976 p
NONMETALS—Continued			
Sodium compounds: [3]			
Sodium carbonate	r 18,597	17,563	17,574
Sodium sulfate	r 2,188	1,940	1,980
Strontium minerals [3 4] ——tons	r 98,958	52,659	57,086
Sulfur, elemental basis:			
Elemental [7]	r 17,769	17,599	16,756
From pyrite	r 10,384	10,110	10,064
Byproduct [8]	r 23,303	23,303	24,054
Total	r 51,456	51,012	50,874
Talc, soapstone, pyrophyllite	r 5,816	4,856	5,367
Vermiculite [3 4] ——tons	r 504,856	525,125	513,521
MINERAL FUELS AND RELATED MATERIALS			
Carbon black [3 4]	r 3,541	3,146	3,506
Coal:			
Anthracite ——million tons	176	178	179
Bituminous ——do	2,126	2,244	2,292
Lignite ——do	834	857	893
Total ——do	3,136	3,279	3,364
Coke:			
Metallurgical	r 367,365	363,287	366,956
Other [9]	r 18,154	17,049	16,489
Gas, natural, marketed ——billion cubic feet	r 47,179	47,364	49,497
Natural gas liquids [3] ——million 42-gallon barrels	r 1,031	1,027	1,048
Peat	r 200,224	203,355	202,353
Petroleum:			
Crude ——million 42-gallon barrels	20,538	19,502	21,192
Refinery products ——do	20,430	19,674	21,270

p Preliminary. r Revised.

[1] Incorporates numerous revisions from world production tables and country production tables appearing in Volumes I and III, respectively, of the Minerals Yearbook and from similar tables in Mineral Trades Notes, as well as from the table corresponding to this table in previous editions of this chapter.

[2] Excludes data for the United States (withheld to avoid disclosing company proprietary data).

[3] Excludes data for the People's Republic of China (no adequate basis for estimation available).

[4] Excludes data for the U.S.S.R. (no adequate basis for estimation available).

[5] Excludes data for the United States (withheld to avoid disclosing company proprietary data), which in previous years accounted for approximately 50% of the total.

[6] Includes titaniferous slag.

[7] Comprises sulfur produced by the Frasch process plus sulfur mined in the elemental state from ores.

[8] Comprises sulfur recovered from coal gasification, metallurgical operations (except pyrite processing), natural gas, petroleum, tar sands, spent oxides, and gypsum, whether recovered in the elemental state or as a sulfur compound.

[9] Data for the People's Republic of China and the U.S.S.R. are included in "Metallurgical."

All commodities	346,271	413,837	574,093	833,290	872,528

r Revised.

[1] Data presented are for selected major mineral commodity groups of the Standard International Trade Classification—Revised (SITC–R) and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC–R categories included are as follows: All ores, concentrates, scrap—SITC Division 28; iron and steel—SITC Division 67; nonferrous metals—SITC Division 68; nonmetals (crude only)—SITC Division 27; and mineral fuels—SITC Division 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and other coal-, petroleum-, or gas-derived crude chemicals of SITC Division 52; manufactured fertilizers of SITC Division 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667.

Data include special category exports, ships' stores and bunkers, and other exports of minor importance, and exclude the intertrade of the centrally planned economy countries of Asia and trade between West Germany and East Germany.

Grand total	253,576	253,576	872,528	872,528	29.1	29.1

[1] For detailed definition of groups, see footnote 1, table 5.

[2] Regional groupings generally conform to United Nations practice; modifications and special aspects of classification scheme are as follows: (1) Latin America includes Mexico, Central America, and South America but excludes Caribbean Islands; (2) other market economy Europe includes Greece and Spain, as well as Yugoslavia (sometimes considered a centrally planned economy country); (3) centrally planned economy Europe includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.; (4) other Africa corresponds to the United Nations category "Developing Africa"; (5) Near East corresponds to the United Nations category "Developing Asia, Middle East"; (6) other market economy Far East and South Asia corresponds to the United Nations category "Developing Asia, other"; (7) centrally planned economy Far East and South Asia includes the People's Republic of China, North Korea, Mongolia, and Vietnam; and (8) the category "Not reported" is derived by subtracting all listed figures from reported totals and includes the Caribbean and Pacific Islands.

[3] Not reported in source, but derived from data therein.

[4] Partial figure; value of crude nonmetals is excluded but is presumably included under "Not reported."

[5] Percentage based on partial figure; see footnote to entry in "Exports from" value column.

[6] Not reported separately for this area; presumably included under "Not reported." Percentage can not be calculated.

[7] Partial figure; value of iron and steel is excluded but is presumably included under "Not reported."

[8] Partial figure; value of mineral fuels only. Totals for other commodity groups are presumably included under "Not reported."

[9] Partial figure; values of metal ores, concentrates, and scrap and crude nonmetals are excluded but are presumably included under "Not reported."

[10] Value of major mineral commodities from "Not reported" exceeds value of all commodities exported from that area by $203 million. Discrepancy is presumably owing to (1) revisions in totals reported in later source data for developed market economy countries which could not be distributed among those countries individually, and (2) rounding.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Unless otherwise noted, figures represent consumption of scrap in the production of pig iron, ferroalloys, crude steel, foundry products, and rerolled steel, as well as in other unspecified uses by the steel industry and by other unspecified industries. Also, unless otherwise noted, figures are from: United Nations Economic Commission for Europe. 1976 Annual Bulletin of Steel Statistics for Europe, New York. V. 4, 1977, 97 pp.

[2] Excludes scrap consumed in rerolling.

[3] Excludes scrap consumed in foundries.

[4] Excludes scrap consumed within the steel industry for purposes other than rerolling and production of pig iron, ferroalloys, crude steel, and foundry products.

[5] Excludes scrap used outside the steel industry.

[6] Organization for Economic Cooperation and Development. The Iron and Steel Industry in 1975, Paris. 1976, 61 pp.

[7] British Steel Corporation. International Steel Statistics, the United Kingdom. 1976, 43 pp.

[8] Total of listed figures only.

[9] Following United Nations practice, Yugoslavia has been included with market economy countries of Europe.

[10] Excludes scrap used in production of pig iron.

[11] Excludes scrap used in production of steel by any method other than open-hearth furnace.

[12] Data for 1974–75 are from: Latin American Iron and Steel Institute. Statistical Yearbook of Steelmaking and Iron Ore Mining in Latin America 1975, Santiago, Chile. 1976, 193 pp. Data for 1976 are U.S. Bureau of Mines estimates.

[13] Includes, Uruguay plus unspecified countries in Central America, as reported in source.

[14] British Steel Corporation. International Steel Statistics, India. 1974, 57 pp.

Table 13.—Estimated world consumption of major nonferrous metals [1]

(Thousand metric tons)

Commodity	1974 r	1975	1976 p
Aluminum [2]	14,201	12,139	14,483
Copper [3]	8,396	7,469	8,558
Lead [4]	4,132	3,646	3,968
Tin [5]	181	156	177
Zinc [6]	5,753	4,880	5,602

p Preliminary. r Revised.

[1] In general, figures are totals for major consuming countries only; sum of consumption by excluded minor consumers may be significant. Data for centrally planned economy countries included are listed as conjectural in sources.

[2] Includes secondary metal.

[3] Primary and secondary refined metal.

[4] Chiefly primary but includes some secondary.

[5] Primary only, as reported by the International Tin Council. Centrally planned economy countries are all excluded; consumption of primary and secondary tin by these countries is estimated at about 60,000 tons annually.

[6] Primary and secondary slab.

Source: American Bureau of Metal Statistics, Inc. Nonferrous Metal Data, 1975, New York. 1976, 143 pp.

1976	2,696	3,733	1,662	228	8,318	2,069

[1] In most cases, data are aggregates of country figures representing apparent inland consumption—the arithmetic result of adding production and imports and subtracting from this sum the total of exports, bunker loadings, and additions to stocks (where the latter are known). All totals in this table are reported in source except those for "Total market economy," which are the sums of reported figures for developed and developing market economy areas. In some cases, data may not add to totals shown because of rounding and/or omission from detail of minor quantities not listed separately. A large share of the entries in this table have been revised from those appearing in previous editions of this chapter owing to revisions in the new edition of the source; such revisions have not been identified by footnote.

[2] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.

[3] Areas listed are those appearing in source and have not been conformed in scope to standard terms used in the Minerals Yearbook.

[4] Includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[5] Includes the People's Republic of China, North Korea, Mongolia, and Vietnam.

[1] Maritime Administration classification. "Tankers" includes whaling tankers. Vessels shown here as "Other" include combination passenger and cargo, combination passenger and refrigerated cargo, and refrigerated freighters, except as otherwise indicated. The contribution of these vessels to mineral commodity trade is regarded as minimal. Data are as of yearend.
[2] Excludes refrigerated freighters, which are included under "Freighters."

[e] Estimate. [p] Preliminary. [r] Revised.

[1] Includes all recorded production of sulfur, regardless of its origin or the form in which it is recovered. Thus it includes elemental sulfur, whether mined by conventional methods or by the Frasch process, as well as elemental sulfur and the sulfur content of compounds such as H_2S, SO_2, and H_2SO_4 recovered as a principal product of pyrite mining, as a byproduct of the recovery of crude oil and natural gas, and as a byproduct of oil refining, coal treatment, and metals smelting and/or refining.

[2] Entirely Frasch-process sulfur.

[3] Includes Frasch-process sulfur as follows, in thousand metric tons: Poland: 1974—3,274, 1975—3,817, and 1976—4,341; and grand total: 1974—14,234, 1975—13,957; and 1976—13,368. The balance is mined elemental sulfur.

[4] Revised to none.

[1] In addition to the countries listed, the People's Republic of China may also produce natural gas liquids, but available information is inadequate to make reliable estimates of output levels. Every effort has been made to include in this table only those natural gas liquids produced by natural gas processing plants and to exclude natural gas liquids obtained from field treatment facilities, including wellhead separators, because the latter are normally blended with crude oil and thus are included in crude petroleum statistics. In some cases, however, sources do not clearly specify whether data presented represent only output of natural gas processing plants or if they include field output. Thus, some of the figures in this table may include field condensate.

[1] Data on bauxite production are on a dry equivalent basis for a number of countries, and as such may be reported on a different basis than data on bauxite trade, which almost universally are on a gross weight basis. Data on alumina production are generally for output prior to calcination, while data on alumina trade include aluminum hydroxide and thus may not be exactly comparable.

[2] As reported in the "Bauxite and alumina" chapter of Volume I of the Minerals Yearbook, but on a metric ton basis.

[3] Data are compiled from official export statistics of source countries.

bauxite and alumina in 1975 [1]

[4] Unless otherwise specified, data are compiled from official import statistics of destinations, and as such are incomplete but are believed to account for the great majority of total world movement of bauxite and alumina. Countries selected are major world aluminum producers that depend upon imports of bauxite and/or alumina for a significant share of their raw material requirements, plus a few minor countries for which data are readily available.

[5] Includes the Virgin Islands.

[6] Less than ½ unit.

[7] Figure represents exports of source country.

[8] Figure represents difference between reported total and reported detail.

e Estimate. XX Not applicable.

[1] Discrepancies between reported exports of a source country and the total reported imports of the corresponding destinations are generally owing to (1) the time lag between shipment and receipt, and (2) the fact that the latter totals are incomplete, representing only the imports of the destinations listed.

[2] Unless otherwise specified, data are compiled from official export statistics of source countries.

[3] Unless otherwise specified, data are compiled from official import statistics of destinations.

[4] Includes the following countries, with total reported imports of each in thousand metric tons: Argentina—1,520, Brazil—less than ½ unit, Mexico—34, and Venezuela—17.

[5] Official import statistics for Czechoslovakia, Poland, Romania, and the United Kingdom do not fully distribute total imports by country of origin and therefore do not clearly indicate whether shipments were received from any of the source countries where this footnote has been entered.

[6] Exports not available. Production reported in lieu of exports because all or nearly all output is exported.

[7] Compiled from official mineral statistics publication of source country rather than official trade return.

[8] Includes pyrite.

[9] Less than ½ unit.

[10] Sum of (1) reported exports of the following countries, in thousand metric tons: Austria—1, Belgium-Luxembourg—3, Bolivia—20, Denmark—13, West Germany—5, Hong Kong—165, Italy—12, the Republic of Korea—62, Mexico—14, Morocco—214, the Netherlands—96, New Zealand—2,352, Tunisia—296, and Yugoslavia—30; and (2) apparent exports (as measured by imports of trading partner countries) of the following countries, in thousand metric tons (trading partner countries in parentheses): Indonesia—282 (Japan only), North Korea—203 (Japan only), and Mozambique—172 (Japan only). In addition to the preceding countries, Switzerland reported exports of less than ½ unit.

[11] Includes the following countries, with total reported imports of each in thousand metric tons: Austria—2,578, Bulgaria—1,687, Denmark—1, Finland—1,206, East Germany—2,818, Greece—787, Norway—38, Portugal—385, Spain—6,136, Sweden—319, Switzerland—45, and Yugoslavia—598.

[12] Includes the following countries with total reported imports of each in thousand metric tons: Australia—17, the Republic of Korea—1,494, Malaysia—less than ½ unit, Singapore—24, Taiwan—143.

[13] Compiled from official export statistics of source country.

[14] Includes the following countries, with reported exports of each in thousand metric tons: Belgium-Luxembourg—97, Bolivia—20, Denmark—9, Finland—1, East Germany—20, Greece—6, Hong Kong—167, Hungary—57, Indonesia—292, Iran—4, Italy—9, Japan—87, North Korea—203, the Republic of Korea—62, Libya—58, Morocco—130, Mozambique—172, the Netherlands—356, New Zealand—2,503, Nigeria—33, Panama—116, Portugal—129, Tunisia—270, and the United Kingdom—15.

NA Not available. XX Not applicable.

[1] Because some countries do not report destinations for a portion of exports (see "Unallocated"), figures given for distribution of those countries' exports by geographical area are not exactly correct. However, such unallocated portions are sizable only in the case of the centrally planned economy countries and the Republic of South Africa.

[2] Includes all Western Hemisphere areas except Canada and the United States.

[3] Consists of Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[4] Consists of Bahrain, Cyprus, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Syria, Turkey, the United Arab Emirates, the People's Democratic Republic of Yemen, and the Yemen Arab Republic.

[1] Figures given are for fuel commodities only and exclude lubricants and other refinery products not normally used as energy sources. Apparent discrepancies between export, import, and bunker totals evidently result from quantities of material being en route at yearend, incomplete data, and differing practices from country to country in reporting bunkering materials.

[2] For details on countries included in each area, see footnotes to table 66.

[3] Totals are as reported in source and as such may differ from sums of detail owing to independent rounding.

The Mineral Industry of Albania

By Nikita Wells [1]

Albania is the world's third largest producer of chromite, after the Republic of South Africa and the U.S.S.R., accounting for 9.2% of the world's production. Other mineral commodities produced by Albania in 1976 included nickeliferous iron ore, copper ore, blister copper, crude oil, petroleum products, lignite, natural gas, natural asphalt, and cement.

Albania's mineral industry, headed by the Ministry of Heavy Industry and Mining, plays an important role in the industrial sector of the country's economy and provides some raw materials for export, of which only chromite is important by world standards. The domestic supply of raw materials is sufficient for the country's present low level of industrial development, and therefore the requirement for imports of raw materials is low. Albania is presently self-sufficient in all forms of energy and is exporting crude oil and electric energy. Nearly 75% of Albania's electric power requirements are supplied by hydroelectric powerplants.

Albania's centrally planned economy is slowly shifting toward industrial expansion. Construction continued on the steel complex at Elbasan, where Albania's first steel was produced in October 1976. This steel complex is Albania's largest investment project. Other major construction projects included the 1-million-ton-per-year Ballësh petroleum refinery, a ferrochromium plant at Burrel, a copper smelter at Laç, a urea plant at Fieri, a polyvinyl chloride plant at Vlora, and a 500-megawatt hydroelectric powerplant at Fierzë. These major industrial projects were being constructed and developed with help from the People's Republic of China.

The production schedules and targets of Albania's economy are prescribed by 5-year plans. The sixth 5-year plan (1976–80) places particular emphasis on the petroleum industry. Special attention is to be given to exploration for new deposits to increase reserves of oil and gas. Crude oil production in 1980 is to increase 11% over that of 1975, while the output of natural gas is to increase 48%. In the previous 5-year plan (1971–75), crude oil production increased 51% and natural gas 206%. Lignite production is to double during 1976–80, compared with a 48% gain during the 1971–75 plan. The nonfuel mineral industry is also to be rapidly developed during the 1976–80 period. In 1980, production of chromite, nickeliferous iron ore, copper ore (metal content), and cement are to increase 46%, 230%, 57%, and 55%, respectively, over the 1975 levels. The corresponding actual increases from 1970 to 1975 were 67%, 62%, 64%, and 190%.

In 1980, electric energy output is to be increased about 220% over that of 1975. Output of hydroelectricity is to treble when the Fierzë hydroelectric powerplant begins operation. Construction is also to be initiated on the hydroelectric powerplant at Kaman on the Drin River.

Since the recent cooling in foreign relations with its closest ally, the People's Republic of China, Albania has been improving relations with its immediate neighbors (Yugoslavia, Greece, and Italy) and has been expanding trade relations with other countries. Albania is also stressing total self-reliance in the eventuality that a complete break is made with the People's Republic of China.

---

[1] Physical scientist, International Data and Analysis.

PRODUCTION

In 1976, only limited information on Albania's mineral production was available. The production data used in this chapter are therefore based on published growth-rate data and production goals set for the current 5-year plan.[2] The latest Albanian statistical handbook was published in 1974 and contained only minimal information on mineral commodities for 1973.[3]

The growth rate of overall industrial production in the current 5-year plan is set at 41% to 44%, a more modest rate of increase than the 52% of the previous plan period.[4]

Actual annual production for 1976 exceeded the planned goals for chromite by 1.8%, nickeliferous iron ore by 0.7%, copper ore by 2.3%, blister copper by 3.4%, and crude oil by 0.8%.

In 1976, the production of chromite increased 6.5% over that of 1975 and that of nickeliferous iron ore increased 16.9%. Cement production increased 23% and lignite production 9%. Production of crude oil, however, declined 17% from that of 1975. In the chemical industry, Albania increased its production of phosphatic and nitrogenous fertilizers, as well as of calcined and caustic soda. In October 1976, Albania initiated indigenous crude steel production.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, a variety of crude construction materials (common clay, sand and gravel, and stone) is undoubtedly produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Smelter output is used as an estimate of mine output inasmuch as there is no evidence of ore and/or concentrate exports.

[3] Petroleum data were converted to barrels from metric tons using the following factors: Crude petroleum—6.672, gasoline—8.50, kerosine—7.75, distillate fuel oil–7.46, residual fuel oil–6.66, lubricants—7.00, petroleum jelly and wax—7.87, asphalt and bitumen—6.06, petroleum coke—5.50, and unspecified—7.00. The tonnage figures for "Unspecified" were derived by subtracting the reported tonnages for individual products from a reported total refinery figure, which may have excluded refinery fuel.

TRADE

In 1976, as in previous years, the major portion of Albania's exports was mineral related. Chromite was the only mineral export of importance by world standards and amounted to about 680,000 tons of both metallurgical (beneficiated) and refractory grade. All of the chromite was exported, the bulk going to the People's Republic of China, Yugoslavia, Italy, Poland, and Japan. Albanian exports of crude oil in 1975 were 450,000 tons, and those of asphaltic flux (natural bitumen) were about 1.0 million tons. Other Albanian exports were nickeliferous iron ore, blister and electrolytic copper, and copper wire.

Albania imports mainly capital goods. The main mineral-related imports are iron and steel semimanufactures, coke, phosphate rock, and potash. The People's Republic of China is Albania's principal trade partner, with an estimated $230 million or 70% of the value of all Albanian trade in was Yugoslavia, followed by Italy, Poland, 1975. The second largest trading partner West Germany, Austria, Romania, and Greece.

Albania signed a trade agreement with Poland at yearend whereby Poland will export coke, metallurgical products, and chemicals to Albania. Albania, in return, is to export chromium ore, petroleum asphalt, copper wire, and cables to Poland.[5] Albania will import engineering products, chemicals, and rolling stock from Czechoslovakia which will in turn receive nickeliferous iron ore and asphalt. A trade agreement between Romania and Albania was also signed in 1976 which stated that Romania will supply Albania with petroleum products, chemicals, and mechanical engineering goods in return for chromite, nickeliferous iron ore, and copper wire.[6]

COMMODITY REVIEW

METALS

Chromite.—In 1976, Albania produced 830,000 tons of chromite (run-of-mine), demonstrating an increase of 6.5% over the 1975 output. Albania remained the world's third largest producer of chromite with 9.2% of total production, following the Republic of South Africa and the U.S.S.R. According to the sixth 5-year plan, chromite production is to increase more than 46% over that of 1975 by 1980. Albania exported all of its chromite output in 1975.

Albania's chromite mining is concentrated in the Bulgiza area, northeast of Tirana, with deposits at Batra and Thekna; in Tropojë and Kukës in the north (Karn, Ragarn, and Kalimash); and in the south, near the shore of Lake Ohrid in the Shebenik-Pogradec area.[7] Presently, Albania has about seven chromite mines, of which the Todo Manco mine is the largest. It is equipped with a 200,000-ton-per-year ore beneficiation plant. The average grade of chromite that was exported increased from 22.8% Cr_2O_3 content in 1960 to 36.5% in 1970 and to approximately 38.0% in 1975. In 1973, the average Albanian chromium ore contained 37.5% Cr_2O_3, 13% FeO, and 22% Al_2O_3.

Construction is presumed to have continued during 1976 on the ferrochromium plant at Burrel, located in the Mat District. This plant is to supply the Elbasan metal-

[7] Pumo, E. Mineral Deposits of Albania. L'Industria Mineraria, Rome. July/August 1977, pp. 262–271.

lurgical complex and will enable Albania to reduce chromite to metal within the country for the first time. The plant is being built with help from the People's Republic of China.

Copper.—Albania's blister copper production increased 13% in 1976, reaching an estimated 10,400 tons, 3.4% over the planned figure. In 1980, blister copper production is to increase 57% over that of 1975 according to the sixth 5-year plan. About 60% of the blister copper was to have been processed into wire in 1975, while the rest was to be used as refined metal, bronze, or brass. The Mirditë District produces about 45% of Albania's blister copper, 50% of the copper ore, and all of the electrolytic copper. The copper deposits are located in the north in the Mirditë, Kukës, Pukë, and Shkodër Districts, where reserves are estimated at 50 million tons of low-grade ore.

During 1976, Albania continued construction of the smelter located at Laç in the Kruja District, north of Tirana. Albania's other two copper-smelting plants are located in the Mirditë and Kukës Districts.

Iron Ore.—Production of nickeliferous iron ore in 1976 reached an estimated 760,000 tons, showing an increase of 16.9% over that of 1975, slightly more than the planned increase of 16%. By 1980, the production of nickeliferous iron ore is to increase as much as 230% over that of 1975. Until 1975, all of the ore had been exported. After that time, part of the ore was to be used by the Elbasan steel plant which was to be operational by then, but no definite data have as yet been published on this development.

Most of Albania's nickeliferous iron ore mines are surface-mining operations. The most important mines are located near Lake Ohrid at Pishkash and Prrenjas in the Pogradec and Librazhd Districts. Three new mines were reported to be under development at Prrenjas, Guri-i-Kug, and Cervenaka and were to be commissioned shortly. A railroad was completed connecting Prrenjas to the Elbasan steel complex, and a second railroad line is under construction, linking Guri-i-Kug to Prrenjas. Albanian nickeliferous iron ore contains, on the average, 51% iron, 1% nickel, and 0.06% cobalt. Other components amount to 3.6% Cr_2O_3, 5.1% SiO_2, 5.5% Al_2O_3, and 5% to 10% H_2O.[8] In the future, Albania plans to recover the nickel and cobalt from the ore.

Iron and Steel.—Albania's largest investment project during the 1976–80 period is the construction of a steel plant at Elbasan (the Elbasan metallurgical complex) which began in 1971. The commissioning of the plant will represent the advent of an indigenous iron and steel industry in Albania. According to incomplete reports, the first steel was produced in October 1976, although the blast furnace had been operating since 1975. The capacity of the steel plant is to reach 800,000 tons per year by 1980 and is to include ingots, bars, wire, sheet, and other products. It is being built with the assistance of the People's Republic of China, which is also providing the bulk of the equipment. Some machinery, however, has been purchased from West Germany.[9]

NONMETALS

Little information on production, trade, and development of Albanian nonmetallic minerals was published in 1976. Production of cement and mineral fertilizers showed marked improvement in 1976. Other nonmetals produced in 1976 included soda ash, caustic soda, asbestos, kaolin, gypsum, lime, limestone, salt, silica, sulfur, sulfuric acid, and volcanic glass.

Cement.—Cement production in 1976 reached 800,000 tons, an increase of 23% over that of 1975. By 1980 cement production is to increase 55% over that of 1975. Albania's two cement plants are located at Fusë-Krujë and Elbasan.

Fertilizer Materials.—In 1976, production of nitrogenous fertilizers increased 10% over that of 1975, reaching an estimated 230,000 tons.

The 36,000-ton-per-year (nitrogen content) urea plant at Fieri was completed during 1976.[10] This plant is to double Albania's nitrogenous fertilizer production upon full operation. The Fieri plant is Albania's only nitrogenous fertilizer plant and already has facilities to manufacture ammonia and ammonium nitrate.

In 1976, Albania imported 62,000 tons of phosphate rock from Morocco and 10,000

[8] Pages 267–268 of work cited in footnote 7.
[9] Világgazdaság, Budapest. Aug. 18, 1976, p. 2.
[10] Nitrogen, London, No. 103, September/October 1976, p. 13.

tons from Algeria. During the same year, imports of potash totaled 5,000 tons.

MINERAL FUELS

Albania was self-sufficient in all forms of energy in 1976 and continued to export surplus crude oil and electric energy. Nearly 75% of Albania's electric power requirements were supplied by hydroelectric powerplants.

Production of primary energy in Albania in 1976 was slightly lower (8.4%) than in the previous year, reaching 4.14 million tons of standard coal equivalent (SCE). Primary energy exports totaled 1.36 million tons SCE, mostly in the form of petroleum, and imports totaled 20,000 tons SCE, all in the form of coal and coke. Albania's primary energy consumption in 1976 showed a 12% decline, reaching 2.8 million tons SCE. Petroleum accounted for 52.9% of total Albanian energy consumption in 1976, coal and coke 25.0%, natural gas 16.8%, and hydroelectricity 5.3%. Total primary energy balances for Albania in 1975 and 1976 are shown in table 4.

Coal.—Albania has no bituminous coal. Indigenous lignite contributed approximately 16% to total primary energy production in 1976. Lignite production, at an estimated 975,000 tons, was 9% greater than in 1975 and is planned to be double the 1975 level by 1980. Most of the new production is to come from expanded mines.

In 1975, production started at the new mine at Valias, near Tirana, where a coal beneficiation plant was being built with help from the People's Republic of China. The capacity of the Memaliaj mine was expanded, and output in 1976 was to have increased 20,000 tons. Two additional mines have recently gone into operation at Mushqeta and Mëzez. By 1980, Albania plans to beneficiate 60% of the lignite produced.

Albanian lignites and subbituminous coals have a calorific value of about 4,900 kilocalories per kilogram (8,800 Btu per pound). The largest deposits are located near Korcë, at Memaliaj; near Tepelenë; and in a triangular area bounded by Tirana, Elbasan, and Lushnjë.

Petroleum.—Albania's crude oil production in 1976 declined sharply (17%) totaling 1,900,000 tons.[11] The present 5-year plan provides for a relatively small increase of 11% in crude oil production for the 1976–80 period.

Albania's second most significant investment after the Elbasan steel complex is the oil refinery under construction at Ballësh near Valona. Supposedly, completion of the 1-million-ton-annual-capacity refinery was scheduled for late 1975. With the new refinery in full operation, Albania's petroleum products exports should increase while crude oil exports decrease. Greece and Romania are the principal markets for exported Albanian crude petroleum.

Albania's crude oil reserves are concentrated in the areas west of Stalin within a

Exports	1.36	--	1.31	--	.05
Apparent consumption	2.80	.70	1.48	.47	.15

[1] Data obtained from various Albanian sources and estimates.

[2] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are: Lignite, 0.7; crude oil, 1.47; natural gas, 1.33 (per thousand cubic meters); and hydroelectric power, 0.125 (per thousand kilowatt-hours); these factors were obtained from: United Nations. World Energy Supplies. Statistical Papers, ser. J, No. 18, 1975.

triangle formed by Vlorë, Berate, and Durres. The crude oil produced has an average specific gravity of 0.98; according to past reports, it yielded 13% gasoline, 8% kerosine, 18% gas oil, 40% asphalt, and 18% residuals, and contained 3% sulfur.

Albania's crude oil exports were sent abroad from the seaport of Vlorë, which is connected to the oilfields and refineries by a pipeline system. Total refining capacity, estimated at 2 million tons per year (excluding the new refinery at Ballësh, last reported to be under construction), was distributed as follows: Fieri, 1.0 million tons; Stalin, 0.5 million tons; and Cerrik, 9.5 million tons.

Natural Gas.—Albania's natural gas production for 1976 was estimated at 350 million cubic meters. By 1980, natural gas production is to increase 48% over that of 1975.

The increase in Albanian natural gas production in 1975 and 1976 was ascribed to recent gas finds at Diviakë and Budulinë in the Lushnjë District.

Total gas resource estimates have not been published by official sources but are thought to be about 8 trillion cubic feet.

The Mineral Industry of Algeria

By David E. Morse [1]

The petroleum and natural gas industry, the most important sector of the country's economy, dominated the mineral industry of Algeria in 1976. Algeria's production of metallic minerals remained modest by world standards. Although Algeria produced iron, copper, mercury, lead and zinc ores and concentrates, and other metals, only iron and mercury were significant. Algeria was one of Africa's largest producers of barite, cement, and gypsum, and a minor producer of phosphate rock. Exploration, production, processing, and marketing of mineral commodities was carried out by the autonomous State-owned Société Nationale de Recherches et d'Exploitations Minières (SONAREM). Natural gas and petroleum activities were dominated by the State-owned Société National pour la Recherche, la Production, le Transport, la Transformation et la Commercialisation des Hydrocarbures (SONATRACH).

Algeria continued its strong economic growth in 1976, and the gross domestic product (GDP) increased 23.5% to $15,300 million[2] after an increase of nearly 8% in 1975. Petroleum and natural gas contributed over 30% to the GDP, and provided nearly 60% of the revenue for the Government's 1976 balanced budget. The 1976 inflation rate was put at 12% by the Finance Minister.

The Government continued its deep and ambitious commitment to industrialization under the second development plan (1974–77). SONATRACH was investing in new petroleum refineries, liquefied natural gas (LNG) plants, gas and oil pipelines, and oil production wells to increase exports of hydrocarbons. Significant investments in petrochemical, methanol, plastic, resin, and chlorine plants were underway or planned by SONATRACH. Large investments had been made or planned for plants producing fertilizer materials using natural gas feedstocks and domestic phosphate rock. In the manufacturing sector the second development plan called for heavy investments in the steel, nonferrous metals, and construction materials industries. The Government also invested large sums for education and training to combat the shortage of skilled and semiskilled manpower.

After several years of construction, a new port at Ghazaouet in northwest Algeria was readied for operation. The port could handle 1 million tons per year of bulk cargo and would serve the regions along the Moroccan border from Tlemcen to Becar.

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Algerian dinars (DA) to U.S. dollars at the rate of DA4.1638=US$1.00.

PRODUCTION

There were no significant changes in Algeria's production of metals in 1976. Lead and zinc, mercury, and copper remained stagnant while iron ore output continued to decline. Crude oil production increased 9.5% compared with 1975 output and averaged 1.07 million barrels per day. Crude oil condensate production exceeded 18 million barrels, and liquefied petroleum gas output increased 12%. The gross production of natural gas remained fairly stable, although usage increased because of improvements to processing facilities.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, secondary aluminum, secondary lead, and copper may be produced in small quantities, and additional crude construction materials (crude clays and stone) presumably are produced for local consumption, but output is unreported and available information is inadequate to make reliable estimates of output levels.

[2] Includes plasters as follows in tons: 1974—48,408; 1975—49,441; 1976—[e] 50,000.

TRADE

In 1976, Algeria exported large quantities of petroleum and natural gas, mainly to Europe and the United States. The United States imported 149.2 million barrels of crude oil from Algeria, an increase of 64.4 million barrels compared with the 1975 level. The value of exported crude oil in 1976 was about $4,120 million, and petroleum exports represented 86% of Algeria's total exports during the year. Of the crude oil exported during the year, 50% went to Europe, 40% to North America, and 10% to Asia and other areas. LNG exports were about 4,950 million cubic meters (8.5 million barrels) with over 90% going to Europe and less than 5% to the United States. LNG exports were valued at approximately $80 million.

COMMODITY REVIEW

METALS

Aluminum.—Algeria and the Soviet Union signed a contract in April for the construction of an electrolytic aluminum smelter at M'sala in the Sétif District of north-central Algeria. The Soviet Union would construct the 140,000-ton-per-year smelter with payment from Algeria in the form of metallic aluminum. Included in the project was a 600-megawatt thermal powerplant to furnish the electricity requirements of the smelter. The powerplant was to run on domestic natural gas, and the raw material for the aluminum plant was to come from Jamaica and Guinea. Under the terms of the contract the port of Béjaïa would be developed, and M'sala would be connected to the national rail network.

Iron Ore.—SONAREM planned the mine development and rail link to the remote Gara Djebilet iron deposits in southwest Algeria. The Gara Djebilet deposits were estimated to contain over 1,000 million tons of hematitic ore averaging 58% iron. The Ouenza open pit mine near Annaba continued to be Algeria's largest producer of iron ore. Expansion was underway at Ouenza in 1976 to increase its output to 5 million tons per year.

Iron and Steel.—Algeria's industrial expansion under the second development plan included large expenditures for the steel industry. Expansion at the El Hadjar steel complex near Annaba was to include a third blast furnace with a 2,000-cubic-meter volume rated at 1.3 million tons per year, new hot-rolling machinery to increase capacity to 1.3 million tons per year, cold-rolling machinery to increase capacity to 700,000 tons per year, and a new bank of coke ovens. When the expansion is completed, Algeria will be a net importer of iron ore instead of an exporter.

Lead and Zinc.—The El Abed mine in western Algeria remained the country's largest producer of lead and zinc ore and concentrates in 1976. The expansion and development work begun in 1973 at El Abed was nearly completed during the year. The mine's output of zinc concentrate was processed at the nearby 40,000-ton-per-year electrolytic zinc plant in Ghazaouet. Development was underway to expand the output of the Kherzet Youssef mine south of Sétif. Beginning in 1978, about 20,000 tons per year of zinc concentrate is to be shipped from Kherzet Youssef to the zinc plant at Ghazaouet.

Mercury.—Algeria and five other countries (Italy, Spain, Yugoslavia, Turkey, and Peru) belong to the International Association of Mercury Producers. The organization was formed in 1975 in response to depressed world mercury prices. The mercury plant at Annaba, which came onstream in late 1974, operated nearly at capacity during 1976. Production figures for 1974 and 1975 increased to 14,000 and 28,000 flasks, respectively. The total Algerian output for 1976 was 31,000 flasks. Over 95% of the mercury produced in Algeria in 1976 was exported.

Uranium.—Development of the uranium deposits in the Hoggar Plateau of southern Algeria was planned to begin in 1980. SONAREM signed a contract with a French consortium to study the various technical solutions that could be used to exploit the deposits and determine the best method to be used. Exploratory drilling indicated that 12,000 tons of uranium and 30,000 tons of tungsten are contained in the Hoggar deposits.

NONMETALS

Cement.—Société Nationale des Matériaux de Construction (SNMC) operated cement plants at Point Pescade, Meftah, Zahna, and El Hadjar with an installed capacity of about 2.5 million tons per year during 1976. SNMC signed a contract with an unnamed Japanese firm to construct a second 1-million-ton-per-year cement plant at El Asnam, near Algiers. The first 1-million-ton cement plant at El Asnam was under construction in 1976. Other contracts in effect during 1976 called for construction of 1-million-ton-per-year cement plants at Ain el Kebira near Sétif, at Zahana near Oran, at Beni Saf near Oran, and at Hamma Bouziene near Constantine, as well as a joint Algerian-Tunisian plant at Djebel Boulahneche in western Tunisia. A 500,000-ton-per-year plant at Saida near Mascara was under construction and was due onstream in mid-1977. The total addition to Algeria's cement capacity was to be 7.5 million tons per year, and all plants were to be in operation by 1980.

Fertilizer Materials.—*Nitrogen.*—SONATRACH planned to use Hassi R'Mel natural gas as feedstock for new 330,000-ton-per-year ammonia plants at Arzew and Annaba. At Arzew, the expansion to bring the ammonium nitrate plant to 330,000 tons per year was due onstream in late 1977, the 240,000-ton-per-year expansion to the nitric acid plant was underway, and a 330,000-ton-per-year urea plant was planned. A 165,000-ton-per-year ammonium nitrate plant and a 195,000-ton-per-year nitric acid plant were due onstream at Annaba in 1978. A 528,000-ton-per-year sulfuric acid plant was planned for the Annaba area and was to be onstream by 1980.

Phosphorus.—SONAREM planned to increase phosphate rock output to 6 million tons per year of crude ore by 1980 from the Djebel Onk and Djebel Koiuf mines near Bir-El-Ater, close to the Tunisian border. A processing plant to increase refined phosphate output by 900,000 tons per year at

Djebel Onk was under construction and was to be onstream in 1979. A phosphoric acid plant (165,000 tons per year P_2O_5) and expansion of the mixed fertilizer plant to increase output of monoammonium phosphate and diammonium phosphate were planned for Annaba.

MINERAL FUELS

Natural Gas.—Algeria's proven reserves of natural gas were estimated to be 3.55 trillion cubic meters in 1976. SONATRACH controlled production, liquefaction, and exportation of natural gas, and Société Nationale Algérienne de l'Electricité et du Gaz (SONELAGAZ) controlled distribution to domestic consumers. In 1976, natural gas production for domestic consumption, reinjection, and exporting LNG was 10.5 billion cubic meters. Estimated gross production was about 21 billion cubic meters. The Camel LNG plant at Arzew operated above capacity, and the three operational lines at the Skikda LNG plant had an output of over 3.2 billion cubic meters in 1976. Construction of line 4 at Skikda continued to encounter technical difficulties, and the expected completion date was moved back from late 1976 to mid-1977. Construction on lines 5 and 6 at Skikda began during the year with completion due in 1979. When the Skikda plant is completed, total output should be 8.4 billion cubic meters per year. In January, Bechtel International Inc. of the United States was awarded a cost-plus contract to complete the large liquefaction plant (LNG–1) at Bettioua near Arzew. SONATRACH had dismissed the original contractor, Chemical Construction Corp. of the United States, late in 1975 because of construction delays. LNG–1 was to begin operations in the fall of 1977. When completed, total capacity of LNG–1 was to be 10.5 billion cubic meters per year. SONATRACH awarded a contract to Pullman Kellog of the United States for a 10.5-billion-cubic-meter-per-year LNG plant (LNG–2) to be built at Bettioua. Besides methane, LNG–2 was to produce 300,000 tons per year of butane and 350,000 tons per year of propane and have provisions for helium production. The $800 million plant was to have six liquefaction lines and to be operational in mid-1979. In July, SONATRACH signed a contract with Foster Wheeler Corp. of the United States for the construction of a huge LNG plant at Arzew. The $1,000 million plant (LNG–3) was to process 15.75 billion cubic meters per year in nine lines and to produce LNG, 500,000 tons per year of propane, and 450,000 tons per year of butane. LNG–3 was to go onstream in 1980.

A Japanese consortium of Japan Gasoline Co., Ltd., and C. Itoh & Co., Ltd., won a $480 million contract to construct two natural-gas-processing plants at the Hassi R'Mel Field from SONATRACH in April 1976. Each plant was to process 20 billion cubic meters per year and to produce 1.7 million tons of liquefied petroleum gas and 8 million tons per year of condensate. The dry gas was to be reinjected, and the output was to be conveyed by pipeline to Arzew. The plants were to be onstream by late 1979. A $237.5 million contract was signed by Algeria and a subsidiary of Ente Nazionale Idrocarburi (ENI) of Italy to construct two natural-gas-reinjection stations at the Hassi R'Mel Field. The plants, scheduled to go on-line in early 1980, would each pump 20 billion cubic meters per year back into the formations.

SONATRACH was actively engaged in negotiating LNG sales contracts with foreign utility companies in 1976. A long-term contract was signed with Distrigas Corp. of the United States for 1.2 billion cubic meters of LNG per year over a 20-year period with deliveries beginning in 1978. Gaz de France signed a 20-year contract to purchase an additional 3.5 billion cubic meters of LNG per year in June with deliveries beginning in 1980. Saar Ferngaz of West Germany negotiated a 1.5-billion-cubic-meter-per-year, 20-year contract with SONATRACH and would start receiving LNG in 1980. ENI of Italy signed a contract with SONATRACH to purchase 8.5 billion cubic meters of LNG per year. The 25-year contract called for LNG deliveries to begin in 1982.

Société d'Etudes du Gazoduc de la Mediterranee Occidentale (SEGAMO), a joint Algerian, French, and Spanish research organization, signed a contract with a French firm to plan a 160-kilometer pipeline from Algeria to Europe. The pipeline would run from the West Algerian port of Oran to Almería in southeastern Spain. The pipeline was expected to carry 40,000 million cubic meters of gas per year for distribution by the Spanish gas company Empresa Nacional del Gas (ENAGAS) and Gaz de

France. Negotiations on the planned natural gas pipeline from Algeria to Sicily through Tunisia remained at a stalemate, and ENI withdrew from the project late in the year.

Petroleum.—Crude oil reserves in Algeria were estimated to be over 10,000 million barrels in 1976. Reserves in the Hassi Messaoud Field, which produced about 50% of Algeria's 1976 output, were about 7,300 million barrels. Crude oil production for the year was 50.099 million tons, or about 1.7% of total world crude output. Of Algeria's over 850 producing wells, nearly one-fourth required artificial lifting in 1976. Over 170 wells were drilled in Algeria during the year, compared with 103 in 1975, by about 80 drilling rigs. No accurate account was available as to the types of wells drilled, but the majority were drilled for production wells, water-injection wells, and natural-gas-reinjection wells.

Petrobás Internacional S.A. (Braspetro) planned to drill two delineation wells between Biskra and Djebel Onk, where its 1975 discovery flowed 35° API crude oil at a rate of 3,465 barrels per day.

Algeria's oil refineries at Arzew, Algiers, and Hassi Messaoud operated at about 86% of capacity in 1976 and had an output of approximately 4.9 million tons. Algeria was making progress on expanding oil refinery capacity with new facilities at Skikda (300,000 barrels per day), Béjaïa (150,000 barrels per day), Hassi Messaoud (13,200 barrels per day), and at In Amenas (3,600 barrels per day). All four were to come onstream by 1980 and quintuple Algeria's oil-refining capacity.

The Mineral Industry of Angola

By Janice L. W. Jolly [1]

Production of goods that formed the mainstay of Angola's prewar exports, including diamond and iron, was still far below the 1973 target that the ruling Movimento Popular para a Libertação de Angola (MPLA) had set as a goal to be again reached. The conflict that accompanied liberation had taken a heavy economic toll, slashing diamond production by 80%, discontinuing iron ore production altogether, and leaving agriculture in such disarray that Angola had to import over half of its food. No reliable figures for the gross domestic product (GDP) are available, but it was estimated at no more than 50% of preindependence levels of $1.8 billion[2] (1973 estimate).[3] Despite the presence of many Cuban, East European, and U.S.S.R. advisors, the economy was almost totally dependent for hard currency revenue on the operations of the Cabinda Gulf Oil Co. Not even in the offshore Cabinda Gulf operations had the 1973 target level of around 160,000 barrels per day been reached. Even so, Angola's oil was yielding an indispensable $400 million per year. State revenues from oil, however, were rapidly being absorbed in infrastructural reconstruction costs, demurrage charges paid at the Luanda port, and the continuing food imports.[4] The MPLA set 1980 as the target date for initial stages of reconstruction.

In early 1976, Angola claimed itself firmly united with Cuba and the U.S.S.R. in a common Marxist ideology. However, the MPLA declared that it was not prepared to do away entirely with the private sector of the economy at the outset. With this short term guarantee against wholesale nationalization, some Angolans who had fled to Portugal were reportedly returning.[5] The Government published a new law regulating State intervention in Angola's economy. The law was in the context of a "resistance economy which must rely fundamentally on national and anti-imperialist forces," as the preamble stated. Under the terms of the law, the State will control what are termed strategic industries while the private sector "must be encouraged and supported by the State as long as it respects the general economic and labor policies defined by MPLA." Nationalization of both Angolan and foreign firms can be ordered by the Revolutionary Council either partially or totally, and the law establishes a list of criteria for such nationalizations, including monopolistic practices, incidence on Angola's foreign exchange, type of production, and whether a firm's continuation under private ownership is considered in the national interest.[6] Angolan officials acknowledged that great sums of financial aid and investment would be needed to develop such major foreign exchange earners as oil, diamond, and iron ore.

The largest task of reconstruction was expected to be that of rebuilding the transportation system. It was reported that 144 bridges were destroyed and that Yugoslav engineers were helping to rebuild them. There was also a shortage of trucks; only 6,000 remained out of the original

24,000 available for distributing merchandise. Before independence, there were 407 civil construction companies, but by 1976, there were only 53 on record and only 7 or 8 that were actually working. The construction materials industry was also practically paralyzed. There was only one ceramic factory functioning in Luanda and that very badly.[7]

In December 1976, Angola was admitted to the United Nations as the 146th member, giving the State international recognition. Even before this, however, aid for reconstruction was pouring in. The Arab League gave $1 million to Angola in February; an additional $1.2 million came from West Germany to finance geological exploration; Brazil loaned $50 million in financial credit; and by the end of October 1976, $2.6 million in aid had been obtained from Denmark, England, Switzerland, Norway, Sweden, Saudi Arabia, the United Nations, and the World Food Program. Donations of food amounted to $7 million. At the end of 1976, East German and Bulgarian technicians were reportedly arriving in Angola to construct two naval bases.[8] Algeria was serving as a major Angolan oil advisor, and Cuba and Angola had signed a series of cooperation agreements covering wide-ranging assistance.

There were no moves to take over Cabinda Gulf or the privately-owned Benguela Railway, although it was reported that the Government was subsidizing railroad employees' salaries (estimated at $1.2 million per month) to keep the railroad going. The Government reportedly resisted demands to hand over control of all nationalized firms to the people who work in them, and it insisted that Government representatives be appointed to the management committees. So far, only the businesses abandoned by departing Portuguese were expropriated; banking was nationalized to facilitate credit for national reconstruction. A cement factory and a metallurgical company of the Champalimaud Group were both nationalized.[9] Portuguese residences that were vacant for more than 45 days were also seized. Of the 6,000 Portuguese estates abandoned, only 1,500 were taken over as part of the massive nationalization program.

National reorganization commissions were formed in mid-1976 including the National Petroleum Industry Reorganization Commission and the National Mining Industry and Geological Activity Reorganization Commission. They were to create organizational conditions for efficient industry management and assist the Secretary of State for Industry and Power in selecting members for responsible positions in the newly organized industries, with particular emphasis on nationalized companies.[10]

In September 1976, the Angolan Government requested that all work be suspended by the South Africans on the Calueque Dam on the Cunene River. The Republic of South Africa had officially withdrawn its troops in March from the power installations located near the South-West African border. The Ruacaná power project was still scheduled to come on-stream in mid-1978, but no more than 80% of the optional output was to be realized unless Angola allowed the Calueque regulating dam to be finished.

PRODUCTION AND TRADE

In 1976, 36.7 million barrels of oil were produced, valued at an estimated $442 million. This represented an overall production decrease of about 37% from that estimated for 1975. The decrease was principally the result of Gulf's shut-in for the first few months of 1976. The Cia. de Petróleos de Angola (PETRANGOL) had nearly tripled crude petroleum production to 44,000 barrels per day by yearend as the Zaire Province increased its output. The PETRANGOL refinery experienced difficulties in operation because of a lack of trained personnel.[11] The refinery produced 5.2 million barrels of refined prod-

ucts despite operating difficulties caused by local disturbances and a lack of specialized personnel. Exports of refined petroleum products were 2,331,000 barrels. The bulk of the exported oil, both crude and refined, went to the United States, Portugal, and Canada.

There was no iron ore production in 1976. West Germany reportedly imported 57,000 tons of iron ore from Angola in 1976, starting with 17,000 tons in February, and continuing periodically until November. There were no exports to the United States and Japan, as in the previous year.

The Zaire-Angola accord was signed in March 1976 pledging a guarantee of each country's territorial integrity. It was hoped the Benguela Railway would rapidly open allowing freer trade once again with both Zambia and Zaire. The railroad remained closed throughout 1976, however, because of effective guerrilla disruption by the União Nacional para a Independência Total de Angola (UNITA), a rival political party. Approximately 800 Zambian freight cars and 70,000 tons of freight including copper and zinc from Zambia and Zaire had been detained since late 1975 at Lobito. At yearend, the Angolan Government was giving assurances that the impounded freight would soon be moved. About 15,000 tons of Zambian copper was believed stranded en route,[12] waiting for two of the main rail bridges to be repaired. In June 1976, the Lobito authorities permitted 2,000 tons of Zambian copper to be loaded on ships destined for West Germany.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, a variety of crude construction materials, such as clays, sand, gravel, and broken stone presumably was produced for local consumption, but information is inadequate to make reliable estimates of output levels.

[2] Less than ½ unit.

United Kingdom exports to Angola decreased 48%, and its imports from Angola decreased 18%.[13] Brazil was becoming a major trading partner. Angola was rated as Brazil's third most important trading partner after Algeria and Nigeria.

Angolan imports were reported as totaling about $19 million by September 30, 1976. Of this amount, 64% were imported by the State sector and 36% were acquired by the private sector.[14]

COMMODITY REVIEW

METALS

Iron and Steel.—Operation of the Cassinga iron mine ceased in August 1975 as a result of the war. Since then the mine has been effectively closed because of guerrilla activity, loss of experienced mining personnel, sabotage at the mine by departing miners, and a general lack of development funds. The Angolan Government was reportedly seeking new foreign interests to participate in reopening the mine. Between February and November 1976, 57,000 tons of iron ore was exported to West Germany, probably from accumulated stocks. By September 1976, the major commercial port of Moçâmedes was once again in operation after a period of paralysis. The ore port at Saco do Giraul, near the city of Moçâmedes, was not destroyed; all of its loading and unloading facilities were intact. The railroad running from Moçâmedes to Menongue was again operational.

Italian interest in Angola was being shown by the Societá Finanziaria Siderurgica S.p.A. (Finsider) (interested in buying iron ore) and by its subsidiary Italimpianti S.p.A. (interested in a contract for modernization of the steel mill near Luanda). The steelworks was reported to be operating at about 10% of the design capacity.[15]

NONMETALS

Diamond.—In early 1976, Companhia de Diamantes de Angola (DIAMANG) began negotiations with the Angolan Government for control and operation of the diamond mining concessions in northeastern Angola. At yearend, settlement was reported to be imminent, with the State expected to nationalize about 61% of the company in 1977. The company was jointly owned by the Portuguese Government and private shareholders in Portugal, the United Kingdom, the Republic of South Africa, Belgium, and the United States. Angola had an 11.6% share of the company and before the civil war had received half of the profits. During and after the conflict, however, smuggling and personnel problems reached alarming proportions. The strict discipline and hard work required to restore productivity and efficiency were nonexistent. The 1976 diamond production by DIAMANG fell to 339,000 carats,[16] compared with about 2.1 million carats produced in 1973. The sale of diamond from Angola was handled entirely by the Central Selling Organization (CSO) of De Beers Consolidated Mines Ltd. The U.S.S.R. was reportedly trying to take De Beers' place.

MINERAL FUELS

Petroleum and Natural Gas.—Crude oil production fell 37% in 1976 to 102,000 barrels per day. The Cabinda Fields were shut-in from December 22, 1975, to April 29, 1976, while Gulf held the petroleum taxes and royalties in a special account. In March this account, which totaled $102 million including interest, was released to the new Government and Gulf began negotiations to resume oil production. The royalty and tax agreement was reported to be the same as before MPLA took over, although long term negotiations were to continue. In early 1975, the Angolan Government raised oil royalties from 12.5% to 16.7% and the profits tax from 50% to 65.75%. The Angolan Government had also acquired 55% participation in the capital of Gulf. During the year, the anti-MPLA, Liberation Front of the Enclave of Cabinda periodically threatened Gulf's

facilities in the Front's attempts for independence, but this was effectively prevented by Cuban assistance.

Production estimates for the first 6 months of 1976 were down to 33,610 barrels per day[17] for the Cabinda enclave, compared with 141,200 barrels per day for the equivalent 1975 period. By yearend, however, a production rate of about 130,000 barrels per day was being reached. Gulf's total production for 1976 was estimated at 28.5 million barrels from five major fields (Malongo, N.; Malongo, S.; Malongo, W.; Field 95–03; and Field 121–02).

For the year ending June 30, 1976, PETRANGOL reported that production of crude oil had reached a total of 8,296,319 barrels (23,045 barrels per day).[18] Natural gas sales were reported at 9.1 million cubic meters for this period, representing a reduction from the equivalent 1975 period. Distribution of the production was as follows: PETRANGOL, 380 barrels per day of crude oil; PETRANGOL/Soc. Portuguesa Exploraçao de Petróleos Angol SARL (ANGOL) partnership, 5,646 barrels per day of crude oil and 9.1 million cubic meters of gas; and PETRANGOL/ANGOL/Texaco Petróleos de Angola partnership, 17,020 barrels per day of crude oil. While PETRANGOL's crude oil production was at the rate of 13,880 barrels per day for the first 6 months of 1976,[19] this had increased to over 40,000 barrels per day by yearend. There were 851 workers in PETRANGOL on December 31, 1975, when the sudden departure of 115 of the 187 technicians nearly shut down the refinery. The company was forced into an immediate effort to train new persons for these specialized jobs. The first of these trainees were on the job by May 1976.

In June 1975, PETRANGOL acquired landholdings comprising 757 square kilometers in the Congo Basin and 1,447 square kilometers in the Cuanza Basin. Under the terms of partnership contracts and the Government prospecting decree, PETRANGOL retained two-thirds of the Congo areas and half of the Cuanza areas. The study of these areas was to continue until December 1977 under the terms of the contract extension.

Exploration in 1976 was minimal. Texaco had a rig working offshore and shot a short offshore survey. Both American Oil Co. (Amoco) and Sun Oil Co. were inactive. Petrofina S.A. was the only operator to drill, accounting for 33,206 feet. The lack of exploratory drilling in the past 2 years had allowed serious inroads to be made in Angola's reserves. Proved oil reserves were estimated to have dropped about 37 million barrels to 1.321 billion barrels, while gas reserves were depleted by about 300 billion cubic feet to 1.483 trillion cubic feet.[20] The Italian national petroleum company Ente Nazionale Idrocarburi (ENI) was reportedly planning to engage in exploratory drilling in the Cabinda enclave.[21]

In May 1976, a national oil company, Société Nationale des Combustibles de l'Angola (SONANGOL), was set up for undertaking all fuel production and distribution.[22] There were two refineries, one at Luanda with a 21,700-barrel-per-day capacity and the other at Cabinda handling 2,800 barrels per day.

The Mineral Industry of Argentina

By Orlando Martino [1]

The Argentine economy, one of the most industrialized in Latin America, made a modest recovery from the recession that began in 1974. The gross domestic product (GDP) of $37.5 billion [2] grew 1.9%, compared with the annual average growth of more than 5% during 1971–74. The rate of inflation remained high at 344% for the year.

The mineral industry of Argentina, not including mineral fuels (petroleum, natural gas, and coal), represented less than 0.5% of the GDP. In 1976, Argentina did not contribute significant quantities of mineral commodities to world supplies and continued to rely heavily on imports to meet domestic demand for iron ore, copper, coal, alumina, and manganese ore. Nevertheless, mining remained an area of high potential in Argentina.

Despite the depressed situation of the manufacturing and construction industries, there were notable increases in the output of certain metallic and nonmetallic minerals. The inauguration of the new aluminum smelter at Puerto Madryn made it possible for Argentina to sharply reduce imports of aluminum ingot from the high level of 1974. The Dirección General de Fabricaciones Militares (DGFM), the army's industrial complex which holds the largest mining interests in Argentina, reported progress on two large projects: The Sierra Grande iron ore and pellet complex scheduled for completion in August 1978 and the open pit copper project in Catamarca Province. Yacimientos Carboníferos Fiscales (YCF), the Government-owned coal company, suffered from a severe drop in domestic demand for coal, and delayed its expansion plans. The uranium mining project at Sierra Pintada of the Comisión Nacional de Energía Atómica (CNEA) remained in the feasibility study stage. Yacimientos Petrolíferos Fiscales (YPF) and Gas del Estado were active in exploration and expansion of production of petroleum and natural gas.

In the private sector, Compania Minera Aguilar S.A. (CMA), a nearly wholly owned subsidiary of St. Joe Minerals Corp., continued preliminary work on its Pachón copper deposit. Engineering design and financial arrangements were being held up pending approval of the Government's new mining promotion law.

Government Policies and Programs.—The military junta which assumed control of the Government in March 1976 initiated an economic stabilization program to reduce inflation and the balance-of-payments deficit, restore the climate for foreign investment, and establish the basis for a lasting economic recovery. At yearend, it was not clear how this program would affect funding for development projects in the mineral sector.

Another year went by without final Government action on the new mining promotion law, despite high hopes for its approval. Although the Government released large tracts of land from its strategic reserves for private exploration and exploitation and the National Development Bank and the Secretariat of Mining stepped up their support for small- and medium-size mining ventures, it appeared unlikely that there would be any significant activity in the sector until the mining promotion law is published. Approval of the proposed law,

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Argentine pesos (M$N) to U.S. dollars at the 1976 average rate of M$N150=US$1.00. At yearend the rate was M$N275=US$1.00.

reportedly in the final stages of review by the Government, was expected by mid-1978. Considering the beneficial impact that pending investments would have on economic recovery, the Government appeared interested in stimulating foreign investment as a complement to domestic investment.

The Minister of Economy was preparing a new law to regulate risk contracts covering oil exploration in onshore and offshore areas and development of the heavy petroleum resources at Llancanelo. Approval of the new law was expected by mid-1977.

In April, the Government outlined its energy plan under which the role played by natural gas, hydroelectrical power, and nuclear energy is to increase and the role of coal and petroleum is to decrease. In 1976, Argentina's electrical installed capacity rose 8% to 7,876 megawatts. Work proceeded on the $1.3 billion Salto Grande hydroelectric project on Río Uruguay, a combined national effort of Argentina and Uruguay. The 1,890 megawatts of installed capacity are expected to be available in 1980. In 1976, an agreement was signed between Argentina and Paraguay to construct the Yaciretá-Apipé dam on Rio Paraná The $4.5 billion project will provide 4,050 megawatts of energy and is scheduled for completion in 1985.

Argentina signed an agreement with the United Nations Development Program (UNDP) for a $1 million project to explore for metallic minerals in three areas of Chubut Province.

PRODUCTION

The mineral industry of Argentina was geared to the needs of the domestic market, with almost no export orientation. However, the low level of production of strategic commodities such as ores of copper and iron made it necessary to rely heavily on external sources. Argentina produced barely 10% of its demand for iron, and imported all of the alumina for its growing aluminum industry. The country's self-sufficiency in crude petroleum declined to 86%.

The value of mineral output increased substantially, especially that of nonmetallic minerals. Metallic minerals represented only 14% of the total excluding mineral fuels, up from 9% in 1975. There were notable increases in the output of lead and zinc ores. Output of aluminum metal rose sharply as Argentina continued to expand capacity while exploiting its hydroelectric resources. In the mineral fuels sector, the recent declining trend in production of crude petroleum was reversed, although it remained short of the peak output of 1972. Output of coal recovered from the depressed level of 1975. Expansion of production of natural gas, one of Argentina's primary energy sources, continued. Argentina remained the second largest producer of crude petroleum and natural gas in South America.

During 1976, a total of 28,500 persons were employed in the mining sector, primarily in production of limestone (15%), coal (14%), iron and manganese ore (9%), and lead (7%). Oil production employed 20,700.[3]

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, cadmium, lime, perlite, and urea are also produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels. Titanium-bearing iron sands are also produced, with an annual production of approximately 100 tons of contained metal, but recovery of titanium oxides is not attempted and the material is used for nonmetallurgical purposes.

[2] Hot-rolled semimanufactures only; excludes castings and cold-rolled semimanufactures produced from imported hot-rolled semimanufactures.

[3] Data are for years ending June 30 of that stated.

TRADE

The deficit in the balance of trade in 1974 and 1975 was eliminated in 1976 with a trade surplus of $845 million. In April, the new Government initiated a stabilization policy, counting upon a favorable trade balance as the first step toward recovery. Total exports in 1976 with an f.o.b. value of $3.89 billion were 30% over those of 1975 and were predominantly agricultural. Exports of minerals and mineral fuels of about $27 million represented a very small part of total exports. Following, in thousand dollars, are significant mineral exports with an f.o.b. value exceeding $100,000:

Petroleum products	$17,840
Borates	4,039
Salt	936
Granite	865
Bentonite	823
Gypsum	357
Fluorspar	305
Marble	168

Total imports in 1976 were valued (c.i.f.) at $3.05 billion, a 23% decrease from those of 1975. Argentina's imports of minerals and mineral fuels represented one-third of the total value of imports and played a more significant role than exports of the same. Imports of mining machinery, which had decreased in 1975, increased in 1976 as import restrictions were partially lifted. Imports of natural gas from Bolivia and Chile increased 21% in volume. The sharp reduction in imports of aluminum reflected Argentina's progress in building up domestic productive capacity at Puerto Madryn. The main imports from the United States in 1976 were coal ($55.8 million) and iron and steel scrap ($30.2 million). Brazil was the main source of crude petroleum.

Table 2.—Argentina: Imports of selected mineral commodities, by value

(Thousand dollars)

Commodity	1975	1976
Iron and steel products	807,195	393,813
Crude petroleum	222,810	289,050

COMMODITY REVIEW

METALS

Aluminum.—Although Argentina's first smelter, operated since 1974 by Aluminio Argentino S.A.I.C. (ALUAR), had a rated annual capacity of 140,000 tons, it was operating at a level of only 50,000 tons. Aluminum output was limited by the restricted power available from the Futaleufú hydroelectric station, originally scheduled for completion in July 1975 and subsequently for May 1978. Aluminum production was projected at 85,000 tons in 1978, 132,000 tons in 1979, and at full capacity of 140,000 tons in 1980. Reportedly, ALUAR's capacity will be more than doubled in the 1981–86 period. Most of ALUAR's feedstock was purchased under contract from Alcoa of Australia Ltd. in the form of calcined alumina. Domestic supply was augmented by a secondary recovery plant. The demand for aluminum continued at a low level, owing in part to the rise in international prices and the general recession in the industrial sector.

Table 5.—Argentina: Aluminum statistics

(Metric tons)

Year	Primary production	Secondary production	Imports of ingot		Apparent consumption [1]
			From United States	Total	
1970	--	5,500	26,164	50,701	56,596

Copper.—Argentina continued to be heavily dependent on imports to meet its demand for primary copper. CMA completed a capital cost feasibility study on the Pachón mine-mill-smelter complex in San Juan Province. The porphyry copper deposit discovered by CMA in the 1960's was estimated by St. Joe to contain 790 million tons of ore grading 0.59% copper and 0.016% molybdenum. Construction of an improved access road to the Pachón site was underway. The company expected to initiate negotiations with the Argentine Government in early 1977 concerning development and financing of the $940 million copper project. Detailed engineering design would begin in 1978, and output in 1980 would be at the rate of 100,000 tons per year of refined copper.

Yacimientos Mineros de Agua de Dionisio (YMAD), the State mining company located at Belén, Catamarca Province, was conducting its own prefeasibility study of the $600 million Alumbrera copper project to produce 50,000 tons of refined copper per year. YMAD expected to call for proposals for a full feasibility study in late 1977. Estimated reserves of sulfide ores were revised upward to 330 million tons grading 0.5% copper, with small amounts of gold and molybdenum which give an equivalent grade of 0.85% copper. YMAD continued exploration of the nearby El Durazno copper deposit.

Iron Ore.—Construction of the Sierra Grande mine, concentrator, and iron ore and pellet complex in Río Negro Province was nearing completion. Although the deposit was discovered in 1945, implementation of the project by Hierro Patagónica Sociedad Anónima Minera (HIPASAM) did not begin until 1970. The underground mine with a capacity of 3.5 million tons of crude ore per year was expected to begin operations in November 1977. The 2.0-million-ton-per-year pellet plant, connected to the mine by a slurry pipeline, was under construction at the port of San Matías and was scheduled for startup in mid-1978. Resrves of magnetitic iron ore averaging 55% iron at Sierra Grande were estimated at 500 million tons with 150 million tons currently recoverable.

Argentina continued to rely heavily (about 90%) on imports of iron ore to meet domestic demand. In 1976, imports of iron ore, mainly from Brazil, Chile, and Bolivia, amounted to 1.74 million tons, a 15% increase over 1975 imports, which were valued at $60.7 million. Output from the Sierra Grande mine will improve the country's iron ore situation but will not close the gap between domestic production and the requirements of the national iron and steel plan. Local supplies of iron ore came from Zapla Steel Co.'s mines, primarily in Río Negro Province (80%) and also in the Provinces of Jujuy and Salta (at Unchime).

Iron and Steel.—Production of crude steel recovered from the depressed level of 1975 to a record high of 2.4 million tons. Domestic steel demand, however, was slack. The State enterprises maintained a normal rate of activity by building up inventories. Most raw materials for Argentina's steel industry, such as iron ore, coke, and ferroalloys, were imported. Metallurgical coke, imported mostly from the United States, was mixed with Río Turbio coal. The limited domestic output of ferroalloys was mostly ferromanganese.

The newest and largest blast furnace of Sociedad Mixta Siderurgia Argentina (SOMISA) went out of service in August and was not expected to resume operation until early 1977. During 1976, SOMISA completed its expansion program to 2 million tons. Certain civil works were initiated and equipment purchased under the plan to expand production further to 4 million tons.

Propulsora Siderúrgica S.A., the second largest steel producer, took steps to optimize its operations and expand its capacity for production of cold-rolled laminates to 130,000 tons per year. For the longer term, expansion to 1 million tons of cold-rolled steel sheet was foreseen.

In 1976, Dálmine Siderca S.A.I.C. started up Argentina's first direct-reduction plant using the Midrex process at Campana, Buenos Aires Province, on Río Paraná. Initial output of sponge iron was 320,000 tons. Expansion of the Dálmine Siderca steelworks to 365,000 tons per year was expected to be completed by mid-1977. In a second stage, expansion to 530,000 tons per year was contemplated.

Acindar Industria Argentina de Aceros S.A., the leading steel company in the private sector, initiated construction on a major integrated steelplant approved by the Government in 1975. The first of two

stages to be completed by 1978 involved installation of a 462,000-ton-per-year Midrex direct-reduction plant. The second stage of the $180 million program would increase direct-reduction capacity to 600,000 tons per year and provide a third electric furnace. The plant site is at Villa Constitución, Santa Fe Province, 247 kilometers northwest of Buenos Aires.

Lead.—Mine production of lead increased in 1976, but was insufficient to meet domestic demand. Lead was mined from vein deposits in the Provinces of Jujuy, Río Negro, San Juan, and Chubut, with 90% of the output from Jujuy. CMA, a leading lead and zinc producer from the Aguilar mine in Jujuy Province, reported output of 46,600 tons of lead concentrate in 1976, a 13% increase over the revised 41,400 tons of concentrate in 1975.

Manganese.—Manganese demand has been closely linked to the development of Argentina's steel industry. Although imports of manganese ore and concentrate have been declining, they remained important in meeting the country's supply deficit. This deficit will be partially covered by output from the Farallón Negro mines and industrial plant in Catamarca Province, under development by YMAD. Mine development was expected to be completed in mid-1977 with an output of 25,000 tons of ore, and the Farallón Negro plant was scheduled to be operational in early 1978 for production of sinterized manganese concentrate with a minimum content of 40% manganese. Gold and silver will be recovered as byproducts. Estimated ore reserves at Farallón Negro with an average grade of 16% manganese would provide for a mine life of 23 years.

Silver.—Silver was produced primarily as a byproduct of lead and zinc mine operations. CMA reported that lead concentrate produced in 1976 from the Aguilar mine contained 1.75 million troy ounces of silver, a slight decline from the 1975 silver content. The Farallón Negro mine and plant were expected to produce 95,000 troy ounces of silver and 19,600 troy ounces of gold.

Tin.—Argentina's demand for tin was partially met by domestic mine production. Known tin deposits are located in the Provinces of Catamarca, La Rioja, and Jujuy, but practically all of the output in 1976 was from the La Puna area of Jujuy.

Zinc.—Mine output rebounded from the depressed level of 1975, increasing 9% in terms of zinc content. Zinc was being mined primarily in areas of lead production, with 98% coming from Jujuy Province. CMA reported output for 1976 of 89,300 tons of zinc concentrate, an 8% increase over the revised 1975 output of 82,380 tons. Imports of zinc concentrate dropped sharply, in line with increased domestic output.

NONMETALS

Cement.—The portland cement industry comprised seven companies operating 17 plants with a total installed capacity of 8.7 million tons per year. The industry has grown in spurts since 1967 (when annual capacity was 5.0 million tons) but at a rate generally sufficient to meet demand. The largest company operating in 1976 was Loma Negra Compania Industrial Argentina S.A., whose five plants have a total capacity of 4.3 million tons per year. Planned new plants and renovation of existing ones were expected to increase capacity by 2.8 million tons per year at a cost of $300 million.

Clays.—*Bentonite.*—Argentina was the second largest producer of bentonite in Latin America, producing about 35% of the region's total. The level of output made it possible to export almost 15% of the total. Exports were chiefly to Brazil and Chile.

MINERAL FUELS

The energy plan for Argentina as prepared by the Secretary of Energy is summarized as follows, in terms of the percentage composition of the energy demand by source:

Energy source	National energy resource potential (percent)	Energy demand (percent)		
		1975	1980	1985
Petroleum	16	62.5	56.0	51.5
Natural gas	7	22.9	26.3	27.3
Coal and charcoal	13	8.5	7.9	7.7
Hydroelectrical energy	53	4.4	8.4	10.5
Nuclear energy	11	1.7	1.4	3.0

The energy plan was based on a GDP growth rate of 5.5% and an energy demand growth rate of 4.6%. A main objec-

tive of the plan was to reduce the relative importance of nonrenewable energy resources. By 1985, Argentina expects to become self-sufficient in petroleum and almost self-sufficient in natural gas. The relative importance of hydroelectrical power and nuclear energy was to increase. It was predicted that by the year 2000 Argentina will have 15,000 megawatts of installed nuclear capacity. Argentina's 4.4% dependency on hydroelectric sources contrasts sharply to Brazil's 23.8% share.

Coal.—Production of coal continued to fall short of the goals set in 1972 by the Government coal-mining agency YCF to produce 3 million tons by 1975 and 8 million tons by 1980. Argentina's coal production goals were revised to more modest levels in the energy plan as follows:

	Coal supply and demand projections (thousand metric tons)		
	1975	1980	1985
Demand	2,070	2,900	4,400
Production	500	1,500	2,500
Imports	1,570	1,400	1,900

Output of coal in 1976, primarily from YCF's Río Turbio operations, recovered from the depressed level of 1975, increasing 23%. Consumption at the mines was 48,413 tons. Coal imports, mostly metallurgical-grade bituminous coal, were almost all for SOMISA and came chiefly from the United States and Poland. Total imports of 833,122 tons, a 19% decrease from 1975 imports, made up more than one-half of total coal consumption. Imports of anthracite totaled 1,680 tons and of coke, 1,200 tons. The average c.i.f. values of imported bituminous coal, anthracite, and coke were $82, $193, and $258 per ton, respectively. During most of 1976, shipments of domestic coal from Puerto Gallegos were hampered by a lack of ships to transport coal to the distant steel companies north of Buenos Aires. Toward yearend, the situation became worse, and the Coal Board apparently had found no solution to the transport bottleneck. It appeared that private enterprise would participate in the long-distance transport of coal.

Argentina's measured coal reserves, detailed in table 6, were 285 million tons, located primarily in the Río Turbio coalfield. At the current rate of production, reserves are adequate for hundreds of years.

Table 6.—Argentina: Coal reserves

Source: Energy Plan for Argentina, 1976.

Natural Gas.—Argentina continued to expand its production of natural gas. The need to substitute gas for petroleum and compensate for declining petroleum production has provided impetus for the increased output of natural gas. According to the energy plan, the share of natural gas will be expanded from 23% of total energy demand in 1975 to 27% in 1985.

Toward the end of 1976, gas demand was further increased with the inauguration of the first direct-reduction plant of the Dálmine Siderca steel company, to be joined in 1978 by a similar plant being built by Acindar. Completion of the Futaleufú hydroelectric plant, however, will save the gas supply to the ALUAR aluminum plant and help alleviate the acute gas supply shortage.

Strong demand in 1976 necessitated increasing imports of natural gas from Chile by way of the trans-Andean pipeline, but most imports came from Bolivia by way of the Campo Durán-Buenos Aires pipeline. Bolivia has been an important source of gas imports since the Santa Cruz-Yacuiba pipeline was completed to the Argentine border in April 1972. Gas imports from Bolivia in 1976 were valued at $54.6 million. In January, a new gas price of $0.82 per thousand cubic feet was negotiated with the Bolivian Government, compared with the price of $0.35 prevalent before the renegotiation of late 1974. Under the new sales agreement, gas imports from Bolivia would increase 50% beginning in 1979.

Argentina continued to expand and integrate its gas transport system. In late 1976, Gas del Estado, a Government entity, initiated work on the $210 million Austral gas pipeline to utilize the rich gas reserves of the Tierra del Fuego fields, estimated at 1.06 trillion cubic feet. Completion of the 205-kilometer pipeline, to run from San Sebastián to Cerro Redondo where it will connect with the main southern trunkline, was scheduled for 1977 but has been delayed until 1978–79. The Inter-American Development Bank is participating in the project with an $87 million loan to Gas del Estado.

According to Government sources, total proven gas reserves at yearend were estimated at 6.7 trillion cubic feet, mostly in the region of Patagonia.

Table 7.—Argentina: Production and imports of natural gas

Petroleum.—Production of crude oil increased slightly in 1976, reversing the declining trend of 1973–75. By yearend, the production rate had increased 12% to 426,000 barrels per day. This increase represented an improvement in the operating efficiency of YPF since there was no output from new investments during the year. Primary recovery accounted for 90% of the total, and 10% was obtained by secondary recovery. The Government was planning to increase secondary recovery output to 40% of total production. YPF accounted for 108 million barrels or 74.5% of the country's output.

With the decline in self-sufficiency to 86%, Argentina spent $298 million in 1976 to import 22.1 million barrels of crude oil, a 41% increase over the volume of 1975. Argentina planned to reduce imports to 10 million barrels by 1980 and to become self-sufficient in crude oil by 1985. Brazil provided 43% of Argentina's crude oil imports, Gabon 25%, and Bolivia 11%.

During 1976, a total of 503 wells were drilled, compared with 547 wells in 1975

and 606 wells in 1974. Of the total, 324 wells were capable of producing oil in commercial quantities and 42 wells were suitable for gas production. Proved reserves of oil, mostly in the regions of Comahue and Patagonia, were estimated at 2.5 billion barrels. Of all the South American countries, Argentina was considered to possess the largest potential for new oil discoveries, especially in the Provinces of Salta, Jujuy, and Tucumán, where numerous large anticlines remained undrilled. Considerable potential also exists offshore. It has been estimated that the oil potential of the Argentine Continental Shelf may be four times larger than that of the U.S. Atlantic Continental Shelf.[4] The Government of Argentina was negotiating with Geophysical Service, Inc., a U.S. company, to undertake seismic studies of Argentina's Continental Shelf during the period of October 1977 to September 1978.

The semisubmersible platform *General Mosconi,* purchased by YPF from Compagnie Française d'Entreprises Telligues, arrived in Argentina during 1976 and was expected to begin offshore drilling operations in early 1977.

YPF was evaluating proposals for primary and secondary recovery operations at the following oilfields: Centenario and Neuquén del Medio (Neuquén Province); Veinticinco de Mayo (La Pampa Province); Medanito and Medianera (Río Negro Province); Cañadón Seco, Meseta Espinosa, Piedra Clavada, and El Cordón (Santa Cruz Province); and Refugio Tupungato (Mendoza Province).

YPF was preparing an international tender for the recovery of heavy petroleum from a field located near Llancanelo Lake, 40 kilometers southeast of Malargüe, Mendoza Province. Reserves of this heavy oil in the Neuquén Basin have been estimated at 943 million barrels. The feasibility of recovering the Llancanelo reserves depends on the use of appropriate technology.

According to Argentina's energy plan, $9.5 billion of the $20 billion to be spent in the next decade would be for petroleum development. Government projections indicated that Argentina's annual petroleum consumption would reach 198 million barrels in 1980 and 233 million barrels in 1985.

Table 8.—Argentina: Production, trade, and self-sufficiency of crude petroleum

(Million 42-gallon barrels)

Year	Production	Imports	Exports [1]	Apparent demand	Self-sufficiency (percent)

Uranium and Nuclear Energy.—The uranium mining project of Sierra Pintada, located 20 kilometers south of San Rafael in Mendoza Province, was stalled for several months over a dispute between CNEA and the contractor for the feasibility study of the open pit mining project and design of the plant to produce yellowcake. It appeared that the contract would be abrogated. Once a new contract is signed, it would be 3 or 4 years before initial production. The project was expected to produce 720 tons of yellowcake per year. The Sierra Pintada deposit, discovered in 1968, has reserves of 12,000 tons of U_3O_8 and is Argentina's largest deposit. Although

[4] Grossling, B. F. Latin America's Petroleum Prospects in the Energy Crisis. 1975.

Argentina has uranium reserves in several areas, the most important are in Mendoza Province. There were 20 areas throughout the country that had uranium mines, and 50 deposits had important reserves.

CNEA controlled all production of atomic energy as well as the mining of uranium ore. This Government agency was considering the possibility of subcontracting with foreign companies for uranium exploration.

CNEA continued construction of the second 600-megawatt Candú atomic power center in Río Tercero, Córdoba Province. The project, delayed 1 year, was expected to be completed by 1981. Three other atomic centers for Argentina were under study, but at yearend only two proposed centers were active: Bahía Blanca and Atucha No. 2, next to Atucha No. 1 (the 319-megawatt center located 95 kilometers northwest of Buenos Aires and initiated in 1973). The capacity of Atucha No. 2 would be 685 megawatts, and work was to begin in 1979.

Argentina was in the process of developing and integrating its operations, from the mining of uranium to the production of nuclear pellets, under a plan to complete the entire cycle by 1979. A decision was made to set up a 30-ton pilotplant for the production of heavy water at Arroyito, Neuquén Province.

The Mineral Industry of Australia

By Charlie Wyche [1]

Recovery from the worldwide economic recession of recent years was gradual, and some Australian mineral producers experienced difficulties in maintaining production levels and profitability. World demand for many minerals and metals continued to be weak, and the Australian industry faced more competitive markets with the added burden of a high rate of inflation and incidence of labor problems. However, improvement began toward year-end 1976, and production records were set for bauxite, alumina, black coal, manganese, and nickel.

The value of mine production of all minerals in Australia increased to $4.1 billion,[2] 21% higher than the $3.4 billion reported for 1975. The $4.3 billion value added by domestic smelting and other processing of mineral commodities credited the mineral industry with products valued at $8.4 billion. This figure represents 9.5% of the $88.2 billion adjusted gross national product (GNP).

In its first full year in office, the Federal Government (elected in December 1975) made a number of decisions of direct or indirect interest to the mining industry. These included relaxation of restrictions on the amount of equity that foreign mining companies could hold, provision for an investment allowance, and phasing out the export coal levy. Petroleum exploration expenditures became immediately deductible against income from any source instead of petroleum income only. All production of crude oil from new discoveries would be free from the $2-per-barrel production excise. Mineral export control procedures were greatly simplified. Instead of ship-by-ship approvals, exporters were able to secure approval of all shipments under a contract over an extended period, usually 1 year. Devaluation of the Australian dollar in November was advantageous to exporters and helped some major mining companies to record substantial profits during the second half of the year. A less welcome decision was removal of the total tax exemption on profits from gold mining. The withdrawal of export licenses for rutile and zircon recovered from sand mining operations on Fraser Island, Queensland, was also unfavorable. These deposits were worked on leases granted by the Queensland government, but by denying access to markets the Federal Government exercised a form of veto over the mining operations. This form of control was always available, but the Fraser Island case was believed to be the first time in which it was used retrospectively to close a mining concern.

The Government still placed emphasis on the objective of achieving 50% Australian ownership and control of mining ventures. It was expected that this would be achieved prior to mineral production. The Government announced, however, that a lack of Australian investors would not prevent mineral development.

There were strong indications of a revival in domestic mineral exploration and development. Local and overseas companies demonstrated confidence in the future of mining in Australia by their commitment to large capital expenditures on exploration and development projects. Coal, iron ore, aluminum, nickel, uranium, and some base metal projects were either

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Australian dollars ($A) to U.S. dollars at the rate of $A1.00=US$1.17.

being developed or under investigation. In 1976, it was estimated that total capital required for all active and deferred projects was in excess of $14.4 billion.

PRODUCTION

Production of most major commodities increased quantitatively, with the exception of iron ore, copper, lead, and zinc. However, the corresponding value increases were, almost without exception, substantially greater because of renegotiation of contract prices and higher prices on domestic and world markets. The major contributors to the increase in mine value were black coal, iron ore, mineral sands, zinc, nickel, liquefied petroleum gases (LPG), and some nonmetals.

Production of phosphate rock from newly developed deposits continued to increase; output of mineral sands increased with commencement of new production; and mine production of tin was up after a steady decline for several years. Exceptions to the upward trend were iron ore production, which declined for the first time in recent years, reflecting world market conditions, and mine production of lead and zinc, because of a rundown of stocks and the closure of a mine. The number of gold mines continued to decrease, and gold output declined.

Western Australia remained the largest mineral-producing State, accounting for 37% of the total national mineral output value in 1976. The value of minerals produced was $1.5 billion, an 83% increase over the previous year's total. Principal reasons for the value rise were increased production of alumina, nickel, ilmenite, and rutile, and the higher price paid by Japanese steel mills for iron ore. Iron ore production decreased 1.5 million tons to 85.5 million tons, but the value increased from $750 million to $841 million. The value of nickel concentrate increased $45 million to $222.8 million, and the values of rutile and ilmenite increased $11.5 million and $2.1 million, respectively. The increase by these minerals more than offset the decline in value of alumina, gold, and zircon.

Queensland was the second largest mineral-producing State, with a mineral value of $1.1 billion. This figure represents an increase of $375 million over that of 1975, and is 27% of total national output. This was due mainly to increased coal production and increased prices for the major metals. The total value of coal was $629.1 million, with 25.8 million tons mined. The second highest earner was copper, with a total value of $180 million for 159,000 tons mined. Other major minerals mined in Queensland were zinc ($68.1 million), bauxite ($62.7 million), and lead ($49.2 million).

New South Wales, with its large base metal and coal industries, ranked third, accounting for 17% of total national value. Victoria, with substantial brown coal output, was fourth with 14%. Tasmania, South Australia, and the Northern Territory with a wide variety of minerals such as copper, tin, bauxite, and zinc contributed the remaining share.

Table 1.—Australia: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 p

e Estimate. p Preliminary. r Revised. NA Not available.

1 Revised to none.

2 Exports (production not officially reported).

3 Data for plants owned by Broken Hill Pty. Co. Ltd. (BHP) are for years ending November 30 of that stated.

4 Figures represent recovery from nickel concentrate exported to Japan from Kambalda.

5 The output of Peko-Wallsend Ltd. reported in the previous edition of this chapter as Australian output has been deleted because it represented the content of intermediate products of metallurgical operations which are treated elsewhere to recover elemental selenium. Australia has one metallurgical facility that can recover selenium (the Port Kembla refinery of the Electrolytic Refining and Smelting Co. of Australia Ltd.) but output, if any, at this facility is not reported and no basis is available for estimation.

6 Excludes producion from Western Australia.

7 Data are for years ending June 30 of that stated.

8 Excludes production from Victoria.

9 Excludes production from Northern Territory, Australian Capital Territory, and Queensland.

10 Excludes production from Northern Territory, Australian Capital Territory, and Western Australia.

11 Sulfur content of materials obtained as a byproduct of nonferrous metallurgical operations and oil refining.

12 Residual fuel oil equivalent.

TRADE

Increased exports of most major minerals and higher prices caused export income from minerals and mineral products to reach a record high. The value of exports of primary products was $4 billion, an increase of 29%. Exports of most of the more important mineral commodities increased in 1976, except for refined aluminum exports, whose value was down slightly; exports of alumina and coal were at record high levels. The value of coal exports, among the largest earners of foreign exchange, increased 47% to $1.1 billion, that of iron ore and pellets 11% to $828 million, and that of alumina 53% to $527 million. Significant gains in exports were also reported for nickel concentrate (from $176 million to $278 million), lead (from $130 million to $161 million), and zinc (from $118 million to $160 million).

The value of mineral imports increased 14% to $723 million. Crude oil accounted for approximately 78% of this. Phosphate rock, asbestos, and diamond (gem), with values of $53 million, $22 million, and $20 million, respectively, were the other principal import categories.

Table 2.—Australia: Exports and reexports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1973–74	1974–75	Principal destinations, 1974–75

Unwrought and semimanufactures:			
Magnesium and beryllium and their alloys	59	345	Indonesia 144; New Zealand 87.
Base metals including alloys, all forms value, thousands	r $272	$1,069	Nauru $604; United Kingdom $228.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc do	r $150	$172	Japan $84; Singapore $39; New Zealand $17.
Dust and powder of precious and semiprecious stones do	$50	$107	United States $34; Philippines $23; Italy $14.
Grinding and polishing wheels and stones do	r $507	$864	New Zealand $380; Philippines $128; Malaysia $107.
Asbestos, crude and fiber	29,372	15,940	Japan 10,357; New Zealand 1,411; Malaysia 1,331.
Barite and witherite	1,079	2,690	New Zealand 2,459.
Cement, hydraulic	112,779	146,614	Singapore 130,431.
Clays and clay products (including all refractory brick):			
Crude clays including fire clay and sillimanite	6,043	7,464	United Kingdom 5,316; Japan 1,355.
Products:			
Refractory:			
Bricks	3,193	7,458	New Zealand 4,956; Malaysia 647.
Other value, thousands	r $679	$931	New Caledonia $199; New Zealand $183; Singapore $149.
Nonrefractory do	r $319	$273	Papua New Guinea $76; New Zealand $70.
Diamond:			
Gem, not set or strung carats	7,178	6,095	Hong Kong 1,382; Belgium-Luxembourg 1,324; Israel 878.
Industrial do	160,695	216,267	Ireland 147,817; United States 35,200; Philippines 25,127.
Fertilizer materials:			
Crude, nitrogenous	69	18,016	Republic of Korea 6,602; Malaysia 5,358.
Manufactured:			
Nitrogenous	r 37,869	7,291	Philippines 5,948; New Zealand 780.
Phosphatic (excluding basic slag)	70	918	Papua New Guinea 340; Malaysia 252; New Caledonia 250.
Potassic	15	34	Malaysia 30; New Zealand 4.
Other, including mixed	1,453	20,319	Indonesia 20,255; Papua New Guinea 36.

See footnotes at end of table.

Table 2.—Australia: Exports and reexports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1973–74	1974–75	Principal destinations, 1974–75
NONMETALS—Continued			
Fertilizer materials—Continued			
Ammonia ---value, thousands--	r $6,197	$15,803	United States $13,904.
Gem stones, except diamond:			
Opal ---do---	r $21,788	$19,072	Hong Kong $10,009; United States $2,982.
Sapphire ---do---	r $4,250	$3,261	Thailand $1,078; New Zealand $417; Hong Kong $410.
Other ---do---	r $1,620	$1,679	Hong Kong $410; New Zealand $381; United States $283.
Gypsum	390,028	264,891	New Zealand 163,692; Singapore 29,327.
Lime (quicklime, slaked lime, hydraulic lime)	5,123	2,267	Papua New Guinea 2,068.
Magnesite	975	644	All to United States.
Mica, worked, and articles -value, thousands--	$65	$62	New Zealand $59.
Pigments, mineral:			
Micaceous iron oxide	51	26	New Zealand 8; Hong Kong 7; Malaysia 5.
Iron oxides, other	67	116	Canada 59; New Zealand 41; Papua New Guinea 11.
Pyrite, unroasted, gross weight	109	15	Papua New Guinea 10; New Zealand 5.
Salt and brine ---thousand tons--	4,063	3,898	Japan 3,322; Taiwan 368.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	785	8,364	New Zealand 5,645; Poland 1,500.
Caustic potash	62	104	New Zealand 102.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	2,347	379	Japan 359.
Worked ---value, thousands--	$46	$40	United States $21; Nauru $6; Fiji $4.
Sand and gravel, limestone, flux, other calcareous stone	554,536	513,856	Japan 460,142; United States 38,354.
Sulfur, sulfuric acid	14,088	6,101	Japan 5,879.
Talc, steatite, soapstone, pyrophyllite	47,601	43,801	Japan 24,049; Netherlands 17,991.
Other nonmetals:			
Crude:			
Quartz, mica, feldspar, fluorspar, cryolite	1,539	248	New Zealand 148; West Germany 89.
Refractory materials, except clay and magnesite	48	173	Indonesia 95; New Zealand 57.
Other ---value, thousands--	r $116	$85	United States $30; New Zealand $15; Papua New Guinea $14.
Oxides and hydroxides of magnesium, strontium, barium	666	306	Philippines 212; Mauritania 65.
Building materials of asphalt, asbestos, and fiber cement ---value, thousands--	r $3,286	$9,887	New Zealand $2,572; Papua New Guinea $1,578; Canada $1,297.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	22,941	21,180	New Zealand 7,179; Indonesia 5,338; Malaysia 3,862.
Coal, bituminous and lignite, and peat (including briquets):			
Bituminous coal and briquets thousand tons--	27,853	32,657	Japan 24,324.
Lignite, peat, and briquets thereof	2	40	Malaysia 25; Papua New Guinea 3.
Coke and semicoke ---thousand tons--	141	421	Japan 192; Netherlands 131; Belgium-Luxembourg 48.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels--	1,918	1,474	Japan 901; New Zealand 573.
Refinery products:			
Gasoline ---do---	3,231	2,463	New Zealand 2,086; Fiji 269.
Jet fuel ---do---	1,928	2,533	New Zealand 1,571; Fiji 484; Singapore 271.
Kerosine ---do---	480	635	New Zealand 608; Papua New Guinea 8.
Distillate fuel oil ---do---	4,653	2,805	New Zealand 1,732; Singapore 512; Fiji 456.

See footnotes at end of table.

Commodity	1973–74	1974–75	Principal sources, 1974–75
METALS—Continued			
Gold:			
Ore and concentrate	16	45	All from Fiji.
Crude bullion, gold content troy ounces	89,830	84,795	Fiji 60,645; Papua New Guinea 24,107.
Refined bullion do	660	1,252	Hong Kong 932; New Zealand 320.
Iron and steel:			
Ore and concentrate, including roasted pyrite	13,964	18,378	Canada 11,844; Philippines 6,501.
Metal:			
Scrap	114	492	Papua New Guinea 271; United States 171.
Sponge iron, powder, shot	7,265	8,702	Sweden 3,670; Japan 1,894.
Spiegeleisen	30	24	All from West Germany.
Ferroalloys:			
Powder:			
Ferromanganese	374	325	Japan 249; West Germany 37; Belgium-Luxembourg 36.
Other	1,186	463	United Kingdom 272; Japan 146.
Shot:			
Ferrochromium	14,646	9,390	Republic of South Africa 3,247; India 1,806.
Ferromanganese	12,196	7,239	Republic of South Africa 6,514.
Ferromolyodenum	253	540	Austria 245; United States 185.
Ferrosilicon	14,286	21,578	Republic of South Africa 9,415; Japan 3,306.
Ferronickel	1,450	1,563	New Caledonia 1,562.
Other	3,324	--	
Steel, primary forms	212,494	136,440	Japan 133,807.
Semimanufactures:			
Bars, rods, angles, shapes, sections	60,462	91,236	Japan 57,928.
Universals, plates, sheets	371,196	288,701	Japan 217,652; United States 32,332.
Hoop and strip	r 49,447	40,767	Japan 23,438; United Kingdom 5,215.
Rails and accessories	15,925	19,230	Japan 18,726.
Wire	45,483	63,967	Italy 34,744; Japan 20,450.
Tubes, pipes, fittings [3]	r 239,335	90,335	Japan 63,478.
Castings and forgings, rough value, thousands	r $220	$204	United States $109; West Germany $43.
Lead:			
Oxides	33	91	United Kingdom 65; Republic of South Africa 20.
Metal including alloys:			
Scrap	326	160	New Zealand 85; Fiji 36.
Unwrought and semimanufactures	98	119	New Zealand 65; United Kingdom 28.
Magnesium metal including alloys, all forms	2,544	2,749	U.S.S.R. 1,202; Norway 1,019.
Manganese:			
Ore and concentrate:			
Battery grade	299	2,581	All from United States.
Metallurgical grade	1,606	171	Do.
Oxides	1,087	1,396	United States 805; Japan 560.
Metal including alloys, all forms	950	1,197	Republic of South Africa 1,105.
Mercury 76-pound flasks	2,974	1,456	People's Republic of China 831; Spain 287.
Molybdenum:			
Ore and concentrate	469	642	Canada 296; Chile 163; United States 149.
Metal including alloys, all forms:			
Wire	8	6	Mainly from United States.
Other value, thousands	r $87	$84	United States $52; United Kingdom $18.
Nickel:			
Matte, speiss, similar materials	177,362	--	
Metal including alloys:			
Scrap	5	16	United States 11; New Zealand 4.
Unwrought	2,496	2,191	Canada 2,134.
Semimanufactures	1,344	2,023	United States 1,201; United Kingdom 385.

Commodity	1973–74	1974–75	Principal sources, 1974–75
METALS—Continued			
Platinum-group metals and silver:			
Ores and concentrates	23	8	All from Fiji.
Waste and sweepings—value, thousands	r $385	$1,132	New Zealand $851; Hong Kong $187.
Metals including alloys:			
Platinum-group ——— troy ounces	1,392,796	20,885	United States 8,442; United Kingdom 7,242.
Silver containing 75% or more silver, silver content ———do	99,047	38,053	Fiji 21,601; Hong Kong 10,353.
Silicon metal	2,496	2,602	Norway 751; France 583; Switzerland 380.
Tin:			
Oxides	9	5	United Kingdom 3; West Germany 2.
Metal including alloys:			
Scrap	4	(4)	All from Australia (reimported).
Unwrought	67	27	Mainly from Malaysia.
Semimanufactures	1,134	42	United States 24; West Germany 10.
Tungsten:			
Ore and concentrate	(4)	--	
Metal including alloys, all forms	14	12	United States 6; West Germany 2.
Zinc:			
Ore and concentrate	21,935	6,468	Canada 5,576; New Zealand 692.
Oxides	1,574	1,141	United States 563; Canada 288; United Kingdom 197.
Metal including alloys, all forms	119	69	United States 34; New Zealand 16.
Other:			
Ores and concentrates:			
Of niobium, tantalum, titanium, vanadium, zirconium	60	11	NA.
Of base metals, n.e.s	12,048	4,726	United States 3,766; Republic of South Africa 917.
Ash and residue containing nonferrous metals	12,829	7,683	Chile 6,700; New Zealand 601.
Oxides, hydroxides, peroxides of metals, n.e.s	r 1,236	1,854	United States 1,106; Japan 135.
Metals including alloys, all forms:			
Metalloids	2,820	2,668	Canada 1,106; United States 720.
Alkali, alkaline earth, rare-earth metals	70	87	West Germany 39; United States 25.
Base metals including alloys, all forms, n.e.s	429	407	United States 240; Republic of South Africa 54.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	1,396	935	United States 514; New Zealand 130; Greece 107.
Grinding and polishing wheels and stones	1,301	1,319	United Kingdom 295; West Germany 189; Japan 175.
Asbestos:			
Chrysotile	40,165	30,800	Canada 27,671.
Amosite	10,070	11,546	Republic of South Africa 8,507; Canada 3,007.
Other	6,816	8,658	Canada 7,314; West Germany 888.
Barite and witherite, natural and ground	9,532	1,400	All from People's Republic of China.
Boron materials:			
Crude natural borates	1,075	913	Japan 663; United Kingdom 123; Turkey 100.
Oxide and acid	3,090	3,397	United States 3,210.
Cement, hydraulic	48,811	36,839	Japan 19,588; United Kingdom 5,988.
Chalk	9,589	10,074	United Kingdom 5,902; France 4,121.

Commodity	1973–74	1974–75	Principal sources, 1974–75
NONMETALS—Continued			
Clays and clay products (including all refractory brick):			
Crude clays, n.e.s.:			
Bentonite	69,054	50,215	United States 45,079.
Fire clay and ball clay	r 4,370	4,770	United States 3,293; United Kingdom 1,265.
Andalusite, mullite, chamotte, dinas earths	14,513	2,010	United States 1,383; India 554.
Kyanite and sillimanite	737	--	
White clays	33,592	--	
Other	20,375	31,526	United States 30,131.
Products:			
Refractory (including nonclay bricks)	15,684	34,597	United Kingdom 12,232; Japan 8,615; Austria 6,131.
Nonrefractory ----value, thousands--	r $31,986	$24,205	Italy $6,040; United Kingdom $2,442; West Germany $1,880.
Cryolite and chiolite	506	193	Denmark 175.
Diamond:			
Gem, not set or strung ----------carats--	198,213	89,501	Israel 43,756; Belgium-Luxembourg 20,973.
Industrial, including dust --------do----	1,089,969	923,761	Republic of South Africa 289,070; United States 233,355.
Diatomite and other infusorial earth	8,159	9,895	United States 8,546.
Feldspar, leucite, nepheline	13,653	6,166	Canada 2,799; People's Republic of China 2,450.
Fertilizer materials:			
Crude:			
Nitrogenous	3,920	3,135	Chile 3,008.
Phosphatic ----------thousand tons--	3,109	2,647	Nauru 1,278; Christmas Island 1,002.
Manufactured:			
Nitrogenous	6,535	12,288	Japan 6,313; France 2,740; West Germany 2,200.
Phosphatic	1,816	332	Japan 321.
Potassic	182,881	211,109	United States 138,232; Canada 71,432.
Other, including mixed	5,201	4,767	West Germany 3,179; United States 654.
Ammonia ----------value, thousands--	r $394	$1,889	United States $1,886.
Fluorspar	30,332	30,627	Republic of South Africa 15,369; Thailand 7,722.
Graphite, natural	2,180	1,269	Sri Lanka 555; Republic of Korea 336; People's Republic of China 189.
Gypsum and plasters	918	904	United Kingdom 559; United States 226.
Iodine	54	47	Japan 34; United States 12.
Lime ----------value, thousands--	r $31	$37	United Kingdom $21; United States $8.
Magnesite, crude, calcined, fused	742	174	United States 58; People's Republic of China 50.
Mica:			
Crude, including splittings and waste ---	1,188	888	India 391; Republic of South Africa 263.
Worked, including agglomerated splittings value, thousands--	r $327	$410	West Germany $96; United States $95.
Pigments, mineral:			
Natural, crude	1,004	792	Austria 368; United Kingdom 172.
Iron oxides, processed	11,940	9,448	West Germany 6,778; Spain 790; United Kingdom 561.
Precious and semiprecious stones, except diamond:			
Natural ----------value, thousands--	r $6,256	$6,011	Thailand $1,461; India $754; West Germany $598.
Manufactured ---------- do----	r $421	$468	Austria $124; Switzerland $100; Hong Kong $56.
Salt	5,441	44,434	United Kingdom 42,192.
Sodium and potassium compounds, n.e.s.:			
Caustic soda ----------value, thousands--	r $22,664	$52,301	NA.
Caustic potash, sodic and potassic peroxides	r 2,171	2,777	Japan 1,188; West Germany 600.

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

Commodity	1973–74	1974–75	Principal sources, 1974–75
NONMETALS—Continued			
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	3,455	3,835	Mainly from Italy.
Slate	464	741	Republic of South Africa 560; Italy 99.
Other	1,267	1,610	Republic of South Africa 632; Finland 595.
Worked—value, thousands	r $1,228	$1,329	Italy $825; United Kingdom $117.
Dolomite	450	416	West Germany 222; United States 178.
Gravel and crushed rock	419	411	New Zealand 104; France 95; Belgium-Luxembourg 92.
Limestone (except dimension)	1,370,343	1,591,609	All from Japan.
Quartz and quartzite	846	1,121	Sweden 799; West Germany 163; United States 113.
Sand, excluding metal bearing	827	1,182	Sweden 500; Republic of South Africa 212; New Zealand 184.
Sulfur:			
Elemental:			
Other than colloidal	608,092	580,183	Mainly from Canada.
Colloidal	115	54	United States 26; West Germany 14; France 13.
Sulfur dioxide	351	369	United States 148; Japan 139.
Sulfuric acid, oleum	5	620	Mainly from Japan.
Talc, steatite, soapstone, pyrophyllite	1,700	1,062	People's Republic of China 601; United States 312.
Vermiculite	3,215	3,639	Republic of South Africa 2,781; People's Republic of China 749.
Other nonmetals:			
Crude	1,439	936	Italy 341; United States 254; West Germany 132.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture	9	91	Mainly from New Zealand.
Slag and ash, n.e.s	--	17	Mainly from United States.
Oxides and hydroxides:			
Magnesium	13,592	21,376	Japan 20,684; United States 498.
Strontium and barium	2,848	5,040	Japan 4,816; United States 179.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s—value, thousands	r $247	$9,887	New Zealand $2,677; Canada $1,350.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	1,089	925	United States 430; Trinidad and Tobago 428.

COMMODITY REVIEW

METALS

Aluminum.—Despite the slow pace of the general economic recovery, 1976 was a year of improvement for Australia's aluminum industry. Domestic production of bauxite, alumina, and aluminum increased significantly from the depressed level of 1975. The higher bauxite production resulted from increased output at the three main producing areas—Weipa, Queensland; Gove, Northern Territory; and the Darling Range, Western Australia. The greatest increase was in the Darling Range area, where a new mine began operating at Huntly, about 6 kilometers northeast of the Del Park mine. The combined output from these two mines supplied the increased bauxite requirement for the Pinjarra alumina refinery in Western Australia.

Alumina production increased 21% over that of 1975. The principal factor contributing to the higher total was the commissioning of increased capacity at the Pinjarra refinery. The total capacity of Alcoa of Australia Ltd.'s Pinjarra and Kwinana refineries was increased to 3.4 million tons annually. Output from Gladstone (Queensland) and Gove increased steadily throughout 1976, and by yearend both refineries were operating at installed capacity.

The increase in production of primary aluminum resulted from reactivation of idle capacity at the smelters of Comalco Industries Pty. Ltd. at Bell Bay, northern Tasmania, and of Alcan Australia Ltd. at Kurri Kurri, New South Wales. At yearend, the three domestic producers of primary aluminum (Alcan, Alcoa, and Comalco) were operating at full capacity.

At Weipa, on Cape York Peninsula, Comalco reported a record high bauxite production for 1976. Comalco, which is owned 45% by Conzinc Riotinto of Australia Ltd., 45% by Kaiser Aluminum & Chemical Corporation, and 10% by the Australian public, produced 9.6 million tons of bauxite. Shipments, however, were slightly lower than in the previous year at 9 million tons. The decline was owing mainly to the deferment of some shipments to Europe and to an industrial dispute at the Gladstone refinery. The company announced plans to develop a $280 million aluminum smelter at Gladstone. If the project proceeds as planned, Comalco could spend a total of $350 million over the next 4 years on the first stage of the smelter and expansion of its mining operations at Weipa.

The $9.8 million expansion program undertaken by Comalco at its Bell Bay aluminum operations was expected to be completed by July 1977. The project, which involves the construction of a fourth potline (reduction furnace), would raise the plant's total installed capacity 18,900 tons to 114,500 tons. The work underway

also included expanding the billet chill casting, homogenizing, and sawing facilities. The annual capacity of the $85 million complex, 48 kilometers north of Launceston, had been increased to 95,600 tons in five successive expansion programs since 1961. The Bell Bay complex uses alumina from Gladstone to produce primary metal, which goes to a number of fabricating and foundry outlets throughout Australia. Production of primary metal during 1976 increased 16% to 160,500 tons.

The Gove bauxite and alumina project in Arnhem Land operated continuously throughout 1976. The annual design capacity of about 1 million tons of alumina and 2 million tons of bauxite was attained.

Alcoa, a fully integrated producer of bauxite, alumina, primary aluminum, and fabricated products, operated mines at Jarrahdale, Del Park, and Huntly, all in the Darling Range. Bauxite, mined at Jarrahdale, supplied a refinery at Kwinana, south of Perth, and the refinery at Pinjarra used bauxite mined at Del Park and Huntly. The company's smelter at Point Henry, Victoria, gradually increased output to the rated capacity of 90,000 tons per year.

Exports of alumina reached a record 5.8 million tons, valued at about $527 million, compared with 4.5 million tons valued at $344 million in 1975. The average unit value of alumina exports continued to increase during the year, and at yearend it was $98.93 per ton f.o.b. Aluminum exports dropped 19% from those of 1975. However, the higher price obtained in 1976 resulted in a total value of $45 million, only slightly less than the 1975 value of $46 million.

Copper.—Economic conditions in the copper market remained depressed throughout the year, and production declined in all sectors of the industry. Mine production by Mount Isa Mines Ltd. (MIM) in Queensland, which supplies about 70% of Australia's output, decreased 2% from that of 1975. Output by Cobar Mines Pty. Ltd., located in New South Wales, was reduced 40%, and the approaching end of the economic life of Mount Morgan Ltd. in Queensland was made public. In midyear, the Kanmantoo mine in South Australia was placed on care-and-maintenance, and it was announced that operations of Mount Lyell Mining & Railway Co. Ltd. at Mount Lyell were to be drastically reduced and 400 employees laid off, leaving only the Prince Lyell ore body in production.

Owing to the lack of demand, production at several of the smelters and refineries was also scaled down. The MIM refinery at Townsville, Queensland, operated about 9% below plant capacity of 160,000 tons per year. At Electrolytic Refining and Smelting's refinery at Port Kembla, New South Wales, processing of Cobar concentrates and some concentrates from Mount Lyell declined about 30%. The smelter at Tennant Creek was closed and the mining emphasis there was switched to gold, with the byproduct copper being treated at Mount Morgan.

At Mount Isa, copper production was maintained at a level consistent with the depressed market. The quantity of ore treated decreased 12.8% (4.3 million tons) from that of 1975. About 94% of the total ore mined came from the 1100 ore body. Over 27.8 million tons of ore has been recovered from this ore body since mining began in 1967. At the copper smelter, construction work proceeded throughout the year on the electrostatic precipitator for the fluo-solids roaster. A fume hood, which completely encloses the unit, was installed on one of the converters. The output of refined products from the Townsville copper refinery dropped about 9%, in line with the output of blister copper from MIM. Design work and equipment procurement for a continuous-casting and rod-rolling installation proceeded. The plant design incorporated the new process for metal rolling previously developed at the refinery.

At MIM's Hilton mine, development work was scaled down in response to difficult economic conditions. However, ore processing investigations proceeded. The metallurgical characteristics were quite different from those associated with Mount Isa ores, particularly with respect to the silver minerals, which were unusally refractory. Primary ore reserves on June 30, 1976, were reported as 135 million tons with an average grade of 3.2% copper. Reserves of secondary ore were 150 million tons containing 3.8% copper.

Mount Lyell Mining & Railway milled 2.2 million tons of ore and produced

21,299 tons of copper concentrates at its Queenstown, Tasmania, plant. Ore mined was 85,609 tons less than in the previous year owing to a reduction in quantity from the two principal sources, Prince Lyell and Cape Horn. The share of ore produced from underground sources amounted to 91.5% of total production. Underground operations were at the pillar recovery stage, and this was the primary reason for lower tonnage and grade of ore. Also, production from Cape Horn was severely curtailed early in the year owing to a major pillar collapse.

Peko-Wallsend's copper mining operations at Tennant Creek, Northern Territory, remained closed throughout 1976. However, 3,658 tons of copper concentrate was produced as a byproduct of mining gold-bismuth ore at the Warrego mine. Even with the upward trend in copper prices, operations were not expected to resume until about mid-1978 because of major changes to the copper smelter and plans to build a bismuth plant. Through its own research, Peko-Wallsend designed a differential flotation process that separates bismuth into a separate concentrate.

Cobar treated 594,430 tons of ore, from which 33,502 tons of copper concentrate containing 25.5% copper was recovered. Improved metallurgical operations achieved a higher-grade copper concentrate, which continued to be sold to Electrolytic Refining and Smelting. Mine development totaled 1,627 meters (2,483 meters in 1975) including 1,229 meters for development of open stopes. Development was limited to the opening up of ore bodies already accessible from existing development. A total of 3,286 meters of exploratory diamond drilling was completed (4,807 meters in 1975). Drilling was almost entirely directed toward determination of ore boundaries for open stoping above the 630-meter level.

Kanmantoo Mines Ltd. in Kanmantoo, South Australia, managed by Broken Hill South Ltd. (BH South), was closed in early 1976. Increased operating expenditures and the low price of copper which persisted for most of the year were the major factors contributing to the closure. The crushing, grinding, and flotation plant operated for 11 months on ore stockpiled in previous years. During that time, 104,278 tons of ore was treated to produce 3,122 tons of a 25.57% copper concentrate.

Table 4.—Australia: Major copper production, by company

Gold.—Output was about 6% below that of 1975. Closure of a number of the larger mines was offset somewhat by increased production from the Central Norseman Gold Corporation N.L. mine in Western Australia, the Warrego mine in the Northern Territory, and the Blue Spec mine at Nullagine, Western Australia, which started production in mid-1976. The Warrego mine was the only producing mine of the Peko-Wallsend group after the closure of two mines (Peko and Juno) and the cessation of production from the Gecko mine. Increased gold output at the Central Norseman mine and at Warrego was owing principally to the higher grade of ore mined.

The devaluation of the Australian dollar at the end of 1976 effectively increased the Australian producers' price of gold, which could help the few surviving mines. The Liberal Government did not restore the special concessions to the gold industry removed by the previous Labor Government, and the investment allowance was of little direct benefit to the older mines.

Despite the general gloom over the gold mining industry, two new mines were under development in Western Australia. They were the Blue Spec mine, operated by Australian Anglo American Ltd., and the Telfer mines in the Paterson Range, a joint venture of Newmont Pty. Ltd. (70%) and BHP (30%). The Blue Spec mine commenced operations in March. The Telfer mine, in remote north-central Western Australia, experienced considerable delays as a result of industrial disputes, but the mine and mill were expected to be commissioned in early 1977. Newmont is expected to mine 4.2 million tons of ore averaging 0.28 troy ounce of gold per ton by open pit methods over the next 10 years. A mill with a capacity of 1,350 tons per day would recover the gold by standard gravity methods and the cyanide process. Because of the remote location of Telfer, living facilities for about 100 families have been constructed at the site.

Virtually all of the gold from the Northern Territory was produced by Peko-Wallsend in the Tennant Creek area. Output was increased as a result of expanded production from the Warrego mine. The main shaft was extended to 746 meters, which was the depth initially planned. Mine development continued to define the Warrego gold and copper ore body. Development openings totaling 1,930 meters were completed. Reserves were 830,000 tons of ore averaging 1 troy ounce of gold per ton.

The Central Norseman mine, 50.5% owned and wholly managed by Western Mining Corporation Ltd. (WMC), produced 32,000 troy ounces of gold during the year. The Central Norseman mine was an underground operation with 12 working levels. The gold occurred in quartz veins in Archaean basic igneous rocks. Ore reserves were estimated at 400,000 tons averaging 0.53 troy ounce of gold per ton.

The principal gold producers and quantities recovered during 1976 were as follows:

Company	Production (troy ounces)
Central Norseman Gold Corporation N.L	32,000
Golden Plateau N.L	12,450
Kalgoorlie Lake View Pty. Ltd	103,550
Mount Lyell Mining & Railway Co. Ltd	13,188
North Kalgurli Mines Ltd	1,400
Peko-Wallsend Ltd	199,000

Iron and Steel.—Australia's iron and steel industries declined on all fronts in 1976, reflecting reduced demand, effects of industrial disputes, and adverse weather in the Pilbara region of Western Australia. Ore production declined 4.5%, and iron and steel output decreased 1%. Although domestic demand for steel remained fairly static, production was maintained early in the year through export sales. Export orders declined sharply during the latter part of the year, and output was reduced, as industrial disruptions by seagoing and waterfront unions resulted in the loss of 1,000 ship-days. This caused serious interruptions in shipments of iron ore to world markets.

Five major companies operating in the Pilbara region produced nearly 90% of Australia's total iron ore. They were Hamersley Iron Pty. Ltd. (Mount Tom Price and Paraburdoo), Mount Newman Iron Ore Pty. Ltd. (Whaleback Hill), Cliffs Western Australian Mining Co. Pty. Ltd. (Robe River), Goldsworthy Mining

Ltd. (Mount Goldsworthy, Shay Gap, and Sunrise Hill), and Dampier Mining Co. Ltd. (Koolan Island and Yampi Sound). Outside the Pilbara region, iron ore at Koolyanobbing was mined by Dampier for use in the Kwinana blast furnace. In South Australia, BHP produced ore from the Middleback Ranges for the steel plants at Whyalla and in New South Wales, and for pelletizing at Whyalla for export. About 2.2 million tons of ore was mined at the Savage River operation in Tasmania by a consortium of Australian, U.S., and Japanese companies. The ore was slurried and pumped to a pelletizing plant at Port Latta and shipped to Japan.

The iron ore industry was almost entirely export oriented, and Australia remained the world's largest iron ore exporter. In the world market in 1976, iron ore was the fourth highest commodity in terms of export receipts. Receipts of $774 million amounted to 19% of Australia's total value of commodity exports, second only to coal. This ranking was achieved in recent years and was due primarily to demand generated by the Japanese steel industry. Exports of some 62 million tons of ore to Japan accounted for approximately 87% of Australia's total iron ore exports for the year.

Iron ore sales to Japan were by long term contracts with very few spot sales. Several prices applicable to long term contracts of Australian producers were due for renegotiation in 1977, and talks were in progress during 1976. Market prices in Japan tended to lag behind those in other markets, particularly the European market, because of Japan's strong bargaining position against Australian oversupply.

Ore prices varied between contracting companies, as prices were negotiated by the individual exporter. Hamersley Holdings Ltd. and Mount Newman reached an agreement with Japan in April for price increments over a 2-year period. Hamersley's number one contract was for 5 million tons of ore annually. Lump ore remained at $13.86 per ton f.o.b. until October 1977 and would then increase to $18.43. Fines remained at $10.87 per ton until October 1977 and would then increase to $14.76. The Mount Newman contract covered 5.5 million tons annually. Lump ore began in October 1976 at $13.93 per ton and would increase to $18.81 in October 1977. Fines were to increase from $11.20 per ton to $14.00 per ton during the same period.

Production of iron ore by Hamersley was 30.7 million tons, compared with 36.1 million tons in 1975. This decline resulted from industrial disputes and the introduction of a planned program of reconstruction of major ore handling equipment to eliminate structural and operating inefficiencies. Hamersley announced a project to increase its annual capacity 6 million tons to 46 million tons of salable ore by the treatment, including concentration, of 13.5 million tons of Mount Tom Price low-grade ore. Previously, most of this ore was discarded as waste. The total cost of the beneficiation plant would be approximately $375 million. The new investment would enable Hamersley to defer until 1980 its commitment to submit proposals for a direct-reduction plant using its HImet process. The deferment of the direct-reduction plant was consistent with expected availability of gas from the Northwest Shelf of Western Australia, on which the viability of the HImet process would depend.

Output by the Mount Newman consortium, a joint venture operated by Mount Newman Mining Co. Pty. Ltd., was 18% lower than that of 1975. The decline was attributed to an unprecedented number of prolonged strikes that affected Mount Newman's operations. Despite the strikes and worldwide recession in demand for steel, expansion of Mount Newman's production capacity to 40 million tons per year was completed. Consideration was being given to a further expansion of 5 million tons, which would involve construction of a heavy media beneficiation plant to upgrade ores presently being stockpiled.

Industrial disputes also adversely affected production by Goldsworthy, resulting in a 12% reduction during the year. Iron ore was produced at Mount Goldsworthy, Shay Gap, and Sunrise Hill. Ore from Shay Gap and Sunrise Hill was railed 182 kilometers by way of Mount Goldsworthy to Port Hedland. The rail distance from Port Hedland to Mount Goldsworthy is 113 kilometers. Ore shipments in 1976 averaged 63.4% iron.

The principal Australian iron ore producers and their output in 1976 were as follows, in thousand tons:

Company	Location	Products	Output
Broken Hill Pty. Co. Ltd	South Australia	Lump and pellets	5,302
Do	Western Australia	Lump	2,774
Goldsworthy Mining Ltd	do	do	7,091
Mount Newman Mining Co. Pty. Ltd	do	do	27,200
Hamersley Iron Pty. Ltd	do	Lump and pellets	30,682
Savage River Mines	Tasmania	Pellets	2,193

Australian reserves of iron ore were estimated at 35 billion tons, comprising 25.8 billion tons of hematite with 54% or more iron content and 9.2 billion tons of limonite with 50% or more iron content. A large proportion of Australia's reserves occur in the Pilbara region of Western Australia, which accounted for 90% of Australia's production of iron ore in 1976. New mines in the area, however, are unlikely unless iron ore prices rise substantially, as none of the three planned projects is economically viable at present prices. Japanese steelmills announced that they would not take part in any new Western Australian iron ore projects for at least 2 years.

BHP was Australia's sole producer of steel, output of which was slightly less than that of 1975. The steel division encompassed the operations of the integrated iron- and steelmaking plants at Newcastle, Whyalla, and Port Kembla and the iron-producing and steel-rolling activities at Kwinana. Steelmaking capacity was about 9 million tons per year. BHP announced plans to increase this capacity to about 15 million tons per year in 10 to 15 years, depending on domestic requirements. At many BHP facilities, expansion plans were completed or in various stages of progress. At Port Kembla, completed work included additional bloom mill soaking pits, stage 1 of the ingot mold foundry conversion, and additional diesel locomotives and rolling stock. Work was in progress on several other major projects, including the continuous slab casting and vacuum degassing plant, relining the blast furnace, and additional hot metal ladles. Modifications and additions were also being made to the flat products division and the ingot mold foundry. Projects completed at Whyalla included the deepening of the harbor and access channel, additional soaking pits at the bloom mill, and the mill tracking computer system. Major work still in progress included the construction of a battery of coke ovens and the extension of the tonnage oxygen plant.

Lead and Zinc.—Mine production of lead decreased 2%. Increased output at Mount Isa failed to offset a decline in production at Broken Hill, New South Wales, where lower output was recorded from most mines and where Minerals Mining and Metallurgy Ltd. (MMM) ceased underground operations in August because of unfavorable economic conditions. Mine production of zinc, however, decreased 7%. Over 60% of the total production of lead and zinc came from three mines and one treatment operation at Broken Hill and Mount Isa. Most of the remaining output was from the west coast mines in Tasmania and the Cobar mine in New South Wales.

MIM remained Australia's largest single producer of lead and zinc. During 1976, 2.4 million tons of lead-zinc ore was mined at average grades of 7.0% and 6.7%, respectively. Ores were extracted by cut-and-fill and open stoping with subsequent pillar recovery methods. Some 14 separate narrow ore bodies were being mined by cut-and-fill stoping, with a productivity of 30 tons per shift.

Mine output by Australian Mining and Smelting Co. Ltd.'s (AM&S) two subsidiaries, Zinc Corporation Ltd. and New Broken Hill Consolidated Ltd. (NBHC), was at the same level (1.87 million tons) as in the previous year. This level was maintained despite problems encountered at NBHC with large fragmentation after primary blasting in some longhole stopes and a series of curtailments in a critical auxiliary ore pass. Emphasis continued to be placed on development for longhole stoping in both mines where practicable. Investigation of sandfill consolidation and of pillar mining methods commenced with the aim of improving the productivity of future extraction of pillars of ore remaining between primary stopes. The Zinc Corporation concentrator commenced production on a trial basis of two product grades of zinc concentrate with a view to optimizing conditions and achieving a greater recovery of zinc metal. Considerable difficulties were experienced with

some items of equipment in re-treating old mine residues in the new plant. However, it was expected that the planned rate of concentrate production would be achieved in early 1977.

An improvement in zinc metal markets enabled the Sulphide Corporation Pty. Ltd. smelter at Cockle Creek, New South Wales, to operate at 70% capacity during the year. A more diverse range of raw material was processed through the smelter. Fuel oil injection through the tuyeres of the I.S. Furnace as a partial substitute for the more expensive coke resulted in a substantial saving in fuel costs. Development of briquetting technology for recycled process materials continued successfully, with the pilotplant operating on a semi-commercial basis.

The Broken Hill Associated Smelters Pty. Ltd. (BHAS) smelter at Port Pirie, South Australia, increased refined lead and zinc output 13% and 12%, respectively. Oxygen enrichment was used to increase the smelting capacity of the blast furnace. Research on reflux refining of lead in collaboration with the Commonwealth Scientific Industrial Research Organization (CSIRO) was continuing. The company is committed to a pilot development process for several years.

EZ Co., a subsidiary of EZ Industries Ltd., increased production at its Rosebery, Farrell, and Hercules mines near Rosebery, Tasmania. Combined output totaled 517,683 tons. The Rosebery mine, by far the largest, was also the site of the concentrating mill for ore from all the locations. Rosebery and Hercules are zinc-lead-copper deposits in association with gold, silver, and pyrite. The Farrell mine is a silver-lead-zinc vein deposit. The average grade of production in the mines was 10% lead and 10 troy ounces per ton silver. The products of the concentrating mill were zinc, lead, copper, and pyrite concentrates, which were railed to the port of Burnie. There were 11 line-haul locomotives and 69 bulk wagons of 44-ton capacity on the railway. Traffic on the line exceeded 500,000 tons per year.

MIM began operating a pilotplant at McArthur River, Northern Territory, as part of its feasibility study for what could become a zinc-lead project. The plant, which comprises a mine and a 50-ton-per-day pilot concentrator, would be operated initially for 1 year, after which progress would be reviewed. MIM has conducted work at McArthur River for several years, but development was hindered by metallurgical problems involved in concentrating the fine-grained McArthur River ore.

A consortium consisting of Conzinc Riotinto of Australia and St. Joe Minerals Corp. and Phelps Dodge Corporation of the United States was undertaking an $80 million development of a deposit in New South Wales known as Woodlawn. The mine is expected to be producing by 1978 at an ore production rate of 3,000 tons per day. The concentrate produced would be taken by each of the participants in proportion to their equity. Each company has a one-third interest in the project. Diamond drilling revealed ore reserves of 10 million tons, averaging 9% zinc, 3.5% lead, 1.8% copper, and 1.8 troy ounces per ton silver.

Table 5.—Australia: Lead-zinc production, by major company
(Metric tons)

Mine	1974		1975		1976	
	Lead	Zinc	Lead	Zinc	Lead	Zinc
North Broken Hill Ltd	58,383	46,922	57,192	39,308	62,840	44,425
Zinc Corporation Ltd	74,850	62,800	78,950	88,700	78,210	55,800
New Broken Hill Consolidated Ltd	71,150	114,200	83,120	116,300	71,790	136,200
Mount Isa Mines Ltd	124,381	103,061	131,689	115,209	132,910	99,750
Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery)	26,311	76,777	18,162	60,801	29,000	67,600

Manganese.—Production of manganese ore increased substantially over that of 1975. More than 90% of the country's output was supplied by the Groote Eylandt Mining Co. Pty. Ltd. (GEMCO), a subsidiary of BHP, where production declined slightly. The $20 million expansion program to increase capacity to 2 million tons was completed during 1976.

GEMCO exported 1.96 million tons of manganese ore from its operations in the Northern Territory. The largest tonnage (860,000 tons) went to Japan. About 570,000 tons was shipped to Europe, 220,000 tons to the United States, and 45,000 tons to the Republic of Korea. The remaining 265,000 tons was domestically consumed and processed by the Bell Bay plant operated by Tasmanian Electro Metallurgical Co. Pty. Ltd. (TEMCO), a subsidiary of BHP. The plant produced about 60,000 tons of ferromanganese and 10,000 tons of silicomanganese. Operations were expanded during the year with the commissioning of a 39,000-kilovolt-ampere ferrosilicon furnace with a capacity of 25,000 tons per year and a manganese ore sinter plant of 220,000 tons per year. The latter would treat manganese ore fines that were not readily salable unprocessed. A new 24,000-kilovolt-ampere manganese alloy furnace was under construction and should be completed in early 1977. When the expansion is completed, the plant would require about 250,000 tons of manganese ore annually, doubling the present output.

A new contract between BHP and the Japanese ferroalloy industry was reached in June. The new agreement increased the price of metallurgical-grade manganese ore 8.6% to $51.40 per ton. Longreach Metals N.L. also agreed to sell ferromanganese ore to Japan in 1977. The contract with Nippon Steel Corporation was for 5 million tons per year over a 5-year period. The ore would be produced at the company's Woodie Woodie Creek and Ripon Hills deposits in the Pilbara region. Bulk loading and storage facilities were being constructed at Port Hedland, Western Australia.

Australian reserves were estimated at 891 million tons, the main part of which were on Groote Eylandt. The remainder were located principally in the east Pilbara and Peak Hill regions of Western Australia and at Pernatty Lagoon in South Australia. Known deposits in Queensland and other deposits in the Northern Territory were subeconomic.

On the exploration front, large manganese deposits along the outcrop of the Marra Mamba iron formation in the Pilbara were being evaluated. These secondary enrichment deposits were low in silica and consisted of about equal proportions of high-grade ore (40% manganese) and lower-grade ores suitable for beneficiation.

Nickel.—Australia remained the world's fourth largest nickel producer. Production increased about 10% in 1976, largely the result of rising output from recently commissioned mines and improvement in market conditions. Western Australian sulfide mines accounted for about 64% of the total Australian mine production. The remaining 36% was produced at the Greenvale lateritic nickel mine in Queensland.

The Kambalda mine in Western Australia was the largest single nickel producer, accounting for nearly 50% of Australia's total output. Other Western Australian mines were Windarra, Scotia, Nepean, Redross, and Spargoville, all within 300 kilometers of Kalgoorlie. In addition to operating the Kambalda and Scotia mines and managing the Windarra mine, in which it has 50% interest, WMC owned the smelter at Kalgoorlie and the refinery at Kwinana. WMC purchased ore from the Nepean mine and concentrates from Spargoville for toll treatment. Output by WMC was about 61,000 tons in 1976. Ore treated at the Kalgoorlie smelter reached 2.0 million tons containing 2.9% nickel.

Redross and Spargoville were operated throughout the year, but both incurred losses. Neither plant ran at full capacity owing to technical difficulties commonly associated with building up production of small mines and the lack of skilled miners. Production was maintained at Nepean, and full operations were resumed at Scotia after a year of restricted work following a cave-in. Operations were suspended at Carr Boyd, and the mine was put on a care-and-maintenance basis (after less than 2 years' production) because it was unprofitable.

The other major producer of nickel was the Greenvale project in Queensland,

owned equally by Metals Exploration Ltd. and Freeport of Australia Inc. The Greenvale project was the first of its kind in the Southern Hemisphere and the second largest in the world. After some serious financial and technical problems, the Greenvale operation officially began in January 1976. The major problems on the technical side were excessive wear on the crushing equipment (owing to hard silica in the lateritic ore), failure of the ore coolers, and insufficient capacity in the reduction furnace. The project was much more costly to establish than the sulfide counterpart, mainly because a treatment process had to be developed. Financial restructuring was necessary to insure the survival of the project, and the Queensland government was instrumental in saving the operation by guaranteeing capital and interest repayments on loans made to Greenvale and organizing the deferment of repayments until March 1977. Most of the plant operated at design capacity, but problems remained in the ore coolers and carbonate calciner.

Of several potentially viable development projects, the only one in progress was at Agnew, Western Australia. In mid-1975, the partners, Western Selcast (Pty.) Ltd. (60%) and M.I.M. Holdings Ltd. (40%), deferred further work until the economic climate improved. In early 1976, work was again continued but in a modified form. The original plan to produce 25,000 to 30,000 tons of nickel matte per year was deferred, and development commenced on a plant to produce 10,000 tons of nickel in concentrate annually. Expenditures were expected to be in excess of $100 million, and production could commence in 1978. The concentrate would be smelted in Kalgoorlie, and the partnership would contribute $20 million to the cost of a new smelter there. The ore body contains about 40 million tons averaging 2% nickel.

Exploration activity was fairly low key, as work continued mainly on existing prospects. However, Endeavour Oil Company N.L. announced that diamond drilling had indicated significant additions to the known ore reserves at its Digger Rocks prospect at Forrestania, Western Australia. Endeavour indicated that the sum of possible and probable ore reserves at Digger Rocks together with those of another prospect in the area were sufficient to bring the Forrestania reserves to 8.8 million tons of 1.9% nickel ore. Nickel exploration also continued in the Kimberleys of Western Australia in an area 250 kilometers southwest of Kununurra. In this area Australian Anglo American, Australian Aquitaine Petroleum Pty. Ltd., BHP, and Kennecott Copper Corporation were all active.

Silver.—Most silver produced was a byproduct from lead-zinc mines, with gold and gold-copper mines making a significant contribution. Total silver production was up about 7% from the 1975 total. About 87% of the output came from Mount Isa in Queensland and Broken Hill in New South Wales. Silver was also produced as a byproduct of copper mining at Tennant Creek, Mount Morgan, Cobar, Kanmantoo, and Mount Lyell.

MIM was Australia's largest producer of silver. Some 2.5 million tons of lead-zinc ore averaging 5.5 troy ounces of silver per ton was treated to produce approximately 9,450,000 troy ounces of silver. Some 82% of the silver was recovered from lead concentrate, slightly higher than in 1975. Some silver was also recovered from copper concentrate. All Mount Isa lead concentrate was smelted to bullion at the mine site, and silver was recovered from the bullion at MIM's primary lead refinery in the United Kingdom. Zinc concentrate was generally exported, but some shipments were made to the Risdon refinery in Tasmania. Silver was reported in tankhouse slimes at MIM's electrolytic copper refinery at Townsville. The slimes were treated by Electrolytic Refining and Smelting at Port Kembla for recovery of the silver and other contained metals.

The Broken Hill area was the second greatest source of silver. Output in recent years, however, continued to decline as an increasing proportion of ore was mined from the southern end of the field (zinc-rich lodes), where the ore's silver content was lower. Most silver produced at Broken Hill was contained in lead concentrates, which were processed at BHAS's smelting and refining plant at Port Pirie, South Australia.

The Perth mint produced silver from gold bullion received from Western Australian mines. Silver was also recovered by EZ Co. as a byproduct of zinc refining at Risdon, Tasmania. In 1976, the company

processed 588,730 tons of ore averaging 6 troy ounces of silver per ton and produced 2.8 million troy ounces of silver.

About 81% of all silver exported was contained in lead bullion, lead, zinc, and copper concentrates, blister copper, and various slags, mattes, and residues. The remainder was exported as refined silver and mint bullion.

Principal producers of silver and output in thousand troy ounces during 1975 and 1976 were as follows:

Company	1975	1976
Electrolytic Zinc Co. of Australasia Ltd	2,468	2,780
Mount Isa Mines Ltd	11,008	9,450
New Broken Hill Consolidated Ltd	1,559	1,739
North Broken Hill Ltd	2,925	2,738
Zinc Corporation Ltd	1,753	1,621

Tin.—Reversing the trend of the past several years, tin production was about 8% greater than that of 1975, despite export quotas imposed by the International Tin Council (ITC) during the first half of 1976, when production by some companies declined 60%. This had a corresponding effect on financial results, which were already affected by a decline in domestic tin consumption. Conditions changed in the second half of 1976, and Australian producers made every effort to take advantage of the market which turned in favor of sellers. After lifting the quota restrictions, the ITC exhausted its stockpile in trying to maintain the price of tin below the buffer stock ceiling. With no buffer stock, the ITC effectively lost control of prices, and at yearend the London Metal Exchange (LME) cash price reached the equivalent of $8,700 per ton compared with $4,700 per ton 12 months earlier.

Renison Ltd. remained Australia's principal tin producer and has the distinction of being the world's largest tin producer from a hard-rock underground mining operation. Ore treated during the year totaled 494,340 tons, 13% above the previous year's total. Tin metal in concentrates increased from 3,889 tons to 4,010 tons. Concentrator throughput increased 42,000 tons (9%) over that of the previous year, but the head grade was marginally lower at 1.24% tin compared with 1.25% tin in 1975. Overall recovery of tin metal dropped from 68.8% to 65.3%. Renison's proven and probable ore reserves increased 839,000 tons, but the average grade dropped slightly from 1.34% tin to 1.24% tin. Proven ore reserves totaled 6.24 million tons and probable reserves, 3.65 million tons.

The name of Cleveland Tin N.L., another major tin producer, was changed to Abminco N.L. after the company acquired a number of mining properties in Australia. Other acquisitions of Abminco N.L. included Ardlethan Tin N.L., Aberfoyle Tin N.L., Aberfoyle Management Pty. Ltd., Cominco Australian Pty. Ltd., Cominco Exploration Pty. Ltd., and a one-third interest in Mineral Sales Pty. Ltd. The Cleveland deposit is located 100 kilometers southwest of Burnie, Tasmania. Mine development was underground by trackless methods, and the milling and refining facilities consisted of gravity and flotation circuits on site. Approximately 363,000 tons of ore, with head grades of 0.73% tin and 0.27% copper, was treated to produce 1,519 tons of tin in concentrate. The concentrate was shipped to Associated Tin Smelters Pty. Ltd. in Sydney and to smelters in Penang, Malaysia.

Minops Pty. Ltd. commenced production in early 1976 from the old Razorback tin mine in the Zeehan area. Mining operations would initially be open pit, and output, about 60,000 tons annually. Minops represents a joint venture between Amalgamated Petroleum N.L. and Apollo International Minerals N.L.

Renison entered a joint venture with Minefields Exploration Ltd. of Melbourne to explore a tin prospect at Mount Moss, north of Townsville, Queensland.

Titanium and Zirconium.—Overall domestic production of mineral sand concentrates increased only slightly from the 1975 total owing to a weak market and lower prices throughout the year. This, combined with an increase in exports, brought production and shipments of some mineral sands into better balance. In particular, the high level of ilmenite stocks accumulated in 1975 was substantially reduced during 1976, although stocks of zircon concentrates continued to accumulate. Production of ilmenite concentrates was maintained at the 1975 level of about 1 million tons. Output of zircon and rutile concentrates from new operations at En-

eabba, Western Australia, raised the 1976 production of these minerals 8% and 7%, respectively, over that of 1975.

On November 10, the Federal Government announced that it would exercise its export control powers to stop sand mining on most of Fraser Island, located off the Queensland coast. The mining ban became effective December 31, 1976. The Government decided to accept the recommendations of the Fraser Island Environmental Inquiry, which called for the cessation of mineral sands mining. The greatest impact of the Government's decision fell on Queensland Titanium Mines Pty. Ltd. and Dillingham-Morphyores Inc. Pty. Ltd., the only mining ventures on the Island. Approximately 350 people were directly or indirectly involved in beach sands mining operations on the Island. The Island contained about 9% of the recoverable rutile reserves in Australia and about 15% of those located on the east coast. Zircon reserves were equal to about 5% of the recoverable reserves in the whole of Australia, and about 17% of those available from the east coast.

In June 1976, Western Titanium Ltd. began commissioning its $20 million mineral sands project at Eneabba. Annual production capacity of the plant was rated at 30,000 tons of rutile, 60,000 tons of zircon, and 150,000 tons of ilmenite.

At Jurien Bay, WMC's mineral sands plant was commissioned early in the year, and by yearend some 9,000 tons of rutile and 1,800 tons of zircon had been produced. Progress was made in overcoming technical problems. Plant modifications were necessary to achieve design capacity, particularly in the zircon plant where semiprocessed material was stockpiled. The modifications were to be completed during the latter part of the year. The assets of the company, previously named WMC Mineral Sands Ltd., were incorporated in WMC, and the operation is now a wholly-owned subsidiary under the name WMC Mineral Sands Operation.

Allied Eneabba Pty. Ltd. completed work on its wet separation plant at Eneabba and the dry separation plant at Geraldton. The company's annual capacity was increased to 250,000 tons of ilmenite, 120,000 tons of zircon, and 50,000 tons of rutile. The concentrates were shipped by road from Eneabba to Geraldton. In early 1976, bulk shipments of ilmenite, zircon, and rutile concentrates were made.

At Naracoopa on the east coast of King Island, Tasmania, Kikuka Mines Pty. Ltd. produced 5,800 tons of rutile concentrate and 8,300 tons of zircon concentrate. Plant modifications continued, and a mill to produce zircon was commissioned in February.

Jennings Mining Ltd. achieved production capacity of 40,000 tons of rutile, 30,000 tons of zircon, and 165,000 tons of ilmenite; shipments were maintained throughout the year. Further capital works included two 60-meter-diameter thickeners and a powerhouse at Eneabba and storage facilities at Geraldton.

Research was carried out on the application of plasma arc technology to titanium processing and zirconium dioxide production. The technology was developed by Ionare Smelters Ltd. It was also announced that zircon-based refractory bricks were to be used for ladle linings in a major Australian steel plant. This resulted from a program introduced several years ago by Associated Minerals Consolidated Ltd. in conjunction with CSIRO.

Proven and probable reserves of heavy minerals in Western Australia totaled about 70 million tons and in Queensland and New South Wales, over 20 million tons. The grade of heavy minerals ranged from 1% near Newcastle, New South Wales, to 80% at Eneabba. All producing companies conducted exploration to maintain reserves. However, because of increasing pressure from conservationists, the emphasis on exploration was shifting to the west coast.

NONMETALS

Phosphate Rock.—Queensland Phosphate Ltd. (QPL), a wholly-owned subsidiary of BH South, produced phosphate rock on an interim basis while the transport, treatment, and support facilities were under construction. When completed, QPL's capacity would be 1 million tons per year. The interim treatment plant produced 167,712 tons of phosphate rock in 1976.

Work was being completed at a rapid pace. The 68-kilometer rail extension from the Great Northern Railway to the mine was completed, and rail transport from the mine to the port at Townsville commenced. At Townsville, the railcar

dumper was commissioned, allowing ore transportation in the new rail wagons. Additional installations under construction included a conveyor system, storage building, and dryer. Also, the first stage of the township being built to house personnel was completed.

Long term contracts, both domestic and export, were held for 800,000 tons per year, and letters of intent were held for the remaining 200,000 tons. Estimated expenditure, including working capital, was expected to reach $75 million by the time the 1-million-ton-per-year project was fully operational. Australia is well placed geographically to supply growing Asian demand, providing labor costs and industrial unrest are kept at reasonable levels to remain competitive.

Australia's reserves were contained in 10 deposits in Queensland and the Northern Territory. About two-thirds of the reserves were in the Phosphate Hill deposit, 60 kilometers south of Duchess, Queensland. All 10 deposits were discovered by BH South. The larger BH South deposits contained an estimated 2.1 billion tons of phosphate rock at an average grade of 17.1% P_2O_5.

Australia imported 1.5 million tons of phosphate rock in 1976, valued at $53 million. This figure represents a decline of 43% from the 1975 tonnage total. Sources of imports were Nauru, a Pacific island, and Christmas Island in the Indian Ocean.

Salt.—Both production and export of salt decreased slightly in 1976. Five major companies, Texada Mines Ltd., Dampier Salt Ltd., Leslie Salt Co., Lefroy Salt Pty. Ltd., and Shark Bay Salt Pty. Ltd. (all based in Western Australia) produced about 85% of the total domestic output. Producers in South Australia, Victoria, and Queensland accounted for the remainder. All production was by solar evaporation using either seawater or natural brines associated with inland lakes. In the Pilbara region of Western Australia, the future of the salt industry appeared brighter if recommendations were accepted by the Federal and State governments that the industry form an integral part of the petrochemical complex.

In Western Australia, production of 3.7 million tons, valued at $26.4 million, was slightly lower than that of 1975. Texada reported salt production totaling 1.2 million tons, and shipments were made from the company's port of Cape Cuvier near its production facilities on Lake McLeod. Approximately 1,800 hectares of evaporation pans was constructed on the southern section of the lake of which about 1,000 hectares was used for sodium chloride production and the balance for langbeinite ($K_2Mg_2(SO_4)_3$) production. During the year, BHP, through its subsidiary Dampier Mining, acquired 76% interest in Texada under an agreement with C. Itoh & Co., Ltd., the Japanese trading house. C. Itoh would retain a 24% interest in Texada and would continue to act as selling agent.

Dampier Salt reported production of 1.4 million tons from Mistaken Island, slightly less than the 1975 figure. Production came from 30 crystallizer ponds covering an area of 738 hectares. The company reported that work was on schedule to expand capacity to 2.4 million tons annually. Leslie Salt reported that 1976 production from Port Hedland increased slightly. The company produced about 1.5 million tons from 16 crystallizer ponds covering an area of 512 hectares. Leslie Salt reported that new markets were established in the Philippines and the Republic of South Africa, and negotiations to establish markets in Japan, the Republic of Korea, New Zealand, and Taiwan continued. Production capacity was around 2 million tons annually.

Lefroy Salt reported production of 110,000 tons of salt from operations on Lake Lefroy, compared with 152,000 tons in 1975. Construction of additional facilities to raise the total washing capacity to 500,000 tons annually was nearing completion. Shark Bay Salt, which produced a record high 265,000 tons, reported that an expansion program continued during the year.

South Australia ranked second to Western Australia in salt production. The principal producer was Imperial Chemical Industries of Australia and New Zealand Ltd. (ICIANZ) at Dry Creek, followed by BHP and Waratoh Gypsum Co. at Whyalla. Together, they accounted for 70% of that State's production of 588,000 tons in 1976. The Ocean Salt Co. at Price and the Australian Salt Co. at Bumbunga Lake were the other main suppliers.

Production in Queensland was 114,600 tons, 21% less than the previous year's

output, the decline mainly attributable to adverse weather conditions. Companies contributing to the output were Central Queensland Salt Industries Ltd. and Imperial Chemical Industries Australia Ltd. Both companies operated at Bajool, about 30 kilometers south of Rockhampton.

Sulfur.—There were no known deposits of native sulfur in Australia, but pyrite was mined for its sulfur content at several locations. Approximately 30% of domestic requirements were obtained from indigenous raw materials, and 70% came from imported brimstone. Elemental sulfur was obtained from petroleum by Petroleum Refineries (Australia) Pty. Ltd. at Altona, Victoria, and Halletts Cove, South Australia; Shell Refining (Australia) Pty. Ltd. at Clyde, New South Wales, and Geelong, Victoria; Australian Oil Refining Pty. Ltd. at Kernell, New South Wales; and Amoco (Aust.) Pty. Ltd. at Bulwer Island, Queensland. Total production of sulfur from petroleum in 1976 was about 10,000 tons.

Pyrites for sulfuric acid manufacture were produced only as a byproduct of base metal mining in Tasmania by EZ Co. and Mount Lyell Mining & Railway. The largest deposit occurred at Mount Lyell where it was associated with copper, gold, and silver mineralization. The pyrite was recovered and shipped to Victoria for acid manufacture in the company's superphosphate works. Mount Lyell Mining & Railway produced 108,442 tons of pyrite concentrate.

The zinc-lead sulfides of the Read-Rosebery district in Tasmania were also utilized for their sulfur content by the EZ Co. at Risdon, where the roaster gases were used in sulfuric acid manufacture.

Some exploration was done on pyritic black slate occurrences near Port Sorell and at Dial Range, both located in Tasmania. Tin deposits at Mount Bischoff and Renison Bell were associated with enormous deposits of pyrite and pyrrhotite and were being investigated.

MINERAL FUELS

Coal.—*Bituminous.*—Production of black coal increased to 74.9 million tons, 12% over that of 1975. New South Wales remained the largest coal-producing State, accounting for 60% of the 1976 output. The main growth in recent years, however, has been in Queensland, which produced 34% of the national output. The growth in Queensland resulted from the development of large-scale and comparatively low-cost open pit mines, which accounted for approximately 85% of Queensland's production. In New South Wales, underground mines continued to be the main source of supply, accounting for 79% of production.

The abolition of the export coal levy was accepted in principle in the 1976 Federal budget, and legislation was passed to phase out the charge over a 3-year period. As of August 1976, the levy on coking coal was decreased 25% to $4.50 per ton, while the levy on inferior grades of coal was reduced from $2.00 to $1.50 per ton. The levy on noncoking grades of coal was removed entirely.

Coal produced in New South Wales was bituminous and nearly all was mined in the Sydney Basin. More than two-thirds was high-volatile soft coking coal and steaming coal, most of which was mined in the Newcastle and Singleton areas. Small quantities were mined in the southern Maitland area and in the Western District around Lithgow. The low- and medium-volatile coal (premium hard-coking coals) was mined on the south coast and in the Burragorang Valley. Some high-volatile coal was mined on the north of the Sydney Basin at Gunnedah. Mining operations further north at Ashford and Nymboida were of low tonnage.

New mine development continued during the year, but completion of the coal loader at Newcastle and approval of a loader at Botany Bay were delayed. Major new development was underway at Warkworth, near Singleton, where recoverable reserves were estimated at 550 million tons. A 21-year lease on 4,192 hectares was granted to a consortium of H. C. Sleigh Ltd. (45%), Costain Australia Ltd. (30%), Mitsubishi Development Pty. Ltd. (15%), and the Australian Resources Development Bank (10%). Capital expenditure was estimated at $100 million, and production capacity was expected to be around 4 million tons annually. The Clutha Development group, which controls 13 operating mines and 1 under development, sold one-half of its assets to BHP for $162 million. This would provide capital necessary to increase Clutha's total

production from 5.8 million tons to 7 million tons annually.

In Queensland, both bituminous and subbituminous coal were mined. Utah Development Co. (UDC), owned 89.2% by Utah International Inc. of the United States and 10.8% by Utah Mining Australia Ltd. (UMAL), was Queensland's principal coal producer. Most of the output came from the Bowen Basin in central Queensland, which extends from Collinsville south to Cracow. About half of the State's coal was obtained from three open pit mines (Goonyella, Peak Downs, and Saraji), which had a combined annual capacity of 13.5 million tons. Coal was also mined in the Clarence-Moreton Basin, the Callide Basin, at Blair Athol, and near Maryborough.

The Queensland government announced that work on the three large development projects at Nebo, Norwich Park, and Hail Creek in the Bowen Basin would start during 1977. Evaluation of these projects had been underway for some years, but delay arose when the Federal Government required at least 50% Australian equity in the producing companies. Rearrangement of the capital structure of the companies satisfied this requirement. Capital needed to make the projects fully operational would depend largely on new rail and port facility requirements. Cost was estimated at over $1 billion in 1977 prices. The mines could take 5 years to commission and, when fully developed, would produce 14 million tons annually. Two adjoining deposits, at Gregory and German Creek in the Bowen Basin, were also being studied. BHP controlled the Gregory venture and was negotiating sales contracts to enable the open pit project to enter production at a rate of about 3 million tons per year. Other coal deposits in the Basin at Taroom, Theodore, Millmerran, and Newland were being evaluated by Australian and overseas interests. A project under consideration was the supply of coal for liquefaction, a process which the Queensland government was actively promoting. Coal from the Millmerran and Taroom areas was said to be suitable for that purpose.

Small quantities of coal were produced from open pit and underground mines at Collie, Western Australia, and from the open pit mine at Leigh Creek, South Australia. Bituminous coal was mined for use by local industry at Fingal in Tasmania. No bituminous coal was produced in the Northern Territory or Victoria.

Black coal reserves were estimated at 229 billion tons of which 35 billion tons was indicated and 194 billion tons inferred. Indicated reserves were located in New South Wales (16.2 billion tons), Queensland (15.8 billion tons), Western Australia (1.9 billion tons), South Australia (730 million tons), and Tasmania (143 million tons). Substantial deposits of coal have also been delineated in areas not being mined, notably in the Surat Basin (Queensland), at Lake Phillipson in the Arckaringa Basin (South Australia), and in the Coorabin-Oaklands Basin (New South Wales). The Joint Coal Board reported output, by State, as follows, in thousand tons:

State	1974	1975	1976
New South Wales	38,703	40,152	44,940
Queensland	21,085	22,760	25,802
Western Australia	1,446	2,114	2,143
South Australia	1,671	1,751	1,819
Tasmania	127	162	175
Total[1]	63,033	67,019	74,881

[1] Data may not add to totals shown because of independent rounding.

Domestic consumption of black coal in recent years was as follows, in thousand tons:

	1973	1974	1975
Electricity	14,787	16,253	16,454
Iron and steel	8,981	9,606	8,854
Cement	862	1,031	992
Metallurgical coke	393	478	398
Railroads and town gas	139	137	123
Other (including bunkers)	2,521	2,685	2,633
Total	27,683	30,190	29.454

Lignite.—Victoria produced all of Australia's lignite during 1976. The major deposits were in the Latrobe Valley, 200 kilometers southeast of Melbourne. Deposits were also located at Anglesea, Bacchus Marsh, and Gelliondale. The State Electricity Commission (SEC) produced 29.7 million tons, more than 95% of the State's total output, at Yallowin and Morwell. Coal was won by large dredges with an excavating capacity of 2,000 tons

per hour. The Yallowin open pit produced at a rate of 13 million tons per year. Traditionally, production from Yallowin was used to produce a high-grade solid fuel in the form of briquets for domestic and industrial use. However, briquets were used as a basis for the production of high-grade char, gas, liquid fuel products, and other chemical industry feedstocks.

The Victorian Parliamentary Public Works Committee continued to review the proposed Loy Yang development program. The proposals were for the progressive development of an open pit to serve a 4,000-megawatt power station. The first stage, comprising a 2,000-megawatt station, was planned to come into service between 1983 and 1988 and the second stage between 1989 and 1992.

Brown coal reserves were estimated at 122 billion tons (67 billion tons indicated and 55 billion tons inferred). Victoria has 66.7 billion tons of indicated reserves (12.2 billion tons salable), and the rest was in the Saint Vincent Basin of South Australia.

Petroleum and Natural Gas.—Production of both crude oil and natural gas continued the upward trend of the past decade. Crude oil production averaged 417,867 barrels per day, an increase of 1.8% over the 1975 figure. The Victorian offshore fields (Bass Strait) provided 91.8% of the total, with production of 140 million barrels, averaging 374,549 barrels per day. The remainder was supplied by Western Australia's Barrow Island Field and the Moonie, Queensland, Fields. In Western Australia production dropped from 13 million barrels to 12.5 million barrels (34,246 barrels per day), while the Queensland production dropped from 525,000 barrels to 490,000 barrels (1,342 barrels per day).

Construction for the Mackerel and Tuna Fields continued throughout the year. The Mackerel platform was completed and placed on location offshore in April. Construction of the Tuna platform was well advanced. The laying of offshore pipelines and the construction of production modules for both structures were almost complete. Mackerel was programed to be onstream in late 1977 and Tuna by 1980.

Input of crude oil and other feedstock to Australian refineries during 1976 totaled 211 million barrels. Indigenous crude oil comprised 75% of the total input with the balance imported mainly from the Middle East. Excluding exports, refinery output provided about 81% of the Australian consumption requirements for petroleum products.

Petroleum imports of 86 million barrels represented a decline of 3.8% from those of 1975. Imports of crude oil and other refinery feedstock amounted to 61 million barrels, while imports of refined products totaled 25.2 million barrels. Fuel oil was the principal product imported at 13.4 million barrels. The total cost of petroleum imports was estimated at $563 million. Exports of refinery products increased 4.8% to 26.1 million barrels. LPG at 12.3 million barrels was the main product exported. Shipments to Japan totaled 15.3 million barrels (about 60% of all refinery product exports), including 11.8 million barrels of LPG.

Consumption of petroleum products during 1976 totaled 207.4 million barrels, a decrease of 22% from that of the previous year. Gasoline consumption decreased 15% to 83.4 million barrels. Other major products consumed were fuel oil (38.7 million barrels, down 19.4%), industrial diesel fuel (11.8 million barrels, up 14.9%), and aviation turbine fuel (11.6 million barrels, up 1.2%).

On the exploration and development scene, the most significant event was the discovery of oil offshore Western Australia's Dampier subbasin. The oil flow rate from this well was the largest to date in that basin, and this discovery revived hope for other major oil discoveries in the area. Other notable wells included the Sunrise No. 1 and Spar No. 1 gas condensate discoveries in the Bonaparte Basin and the Barrow-Dampier subbasin. West Australian Petroleum Pty. Ltd. continued its investigation of deep high-pressure gas in the Middle Jurassic range on Barrow Island. Development drilling continued in the Cooper and Surat Basins.

The Australian Government was considering a proposal by an international consortium to develop large natural gas deposits off the northwestern Australian coast. If approved as expected, this would be the largest resource development ever undertaken in Australia. The gas deposits were discovered in 1972, but their development was delayed pending Government discussions concerning whether to export

or reserve for domestic needs. Plans for the $3.4 billion project called for construction of at least two offshore platforms, a 120-kilometer seabed pipeline to shore, and processing and liquid natural gas plants. A number of specialized tankers to carry the liquefied gas overseas would also be built.

Total resources of hydrocarbon liquids (crude oil, condensate, and LPG), both commercial and noncommercial, amounted to 4.4 billion barrels. Natural gas reserves totaled 31 trillion cubic feet. In terms of crude oil fields presently producing or about to produce, the country had consumed 41% of its reserves at the end of 1976. The position in regard to natural gas was much better; in terms of presently producing fields, the depletion factor was 6.6%. If all gas reserves, including the major reserves on the Northwest Shelf, are taken into account, Australia had consumed only 3% at the end of 1976.

Uranium.—Mary Kathleen Uranium Ltd. (MKU), which had been kept on care-and-maintenance since operations ceased in 1963, commenced production in early 1976. Problems encountered by MKU in reopening the mine were greater than expected, and the objective of reaching rated capacity by yearend 1976 was not achieved. By yearend, 423 tons of U_3O_8 was produced, significantly less than the original estimate of 791 tons. Adverse factors included inability to mine the previously planned ore grade, the need to redesign the pit, which increased the quantity and rate of waste rock removal from the mine, the breakdown of old machinery in the treatment plant, the need to modify new sections in the treatment plant, and adverse weather in November and December.

Because of the production problems, the company was unable to deliver contracted tonnages within the time specified. Some purchasers were asked to extend contract delivery by approximately 3 years. The factors that affected production also caused significant increases in costs, some of which were expected to continue throughout 1977. The Commonwealth Government and Conzinc Riotinto agreed to provide short term financing facilities for up to $6 million to the company.

Plans for further development of Australia's identified uranium resources were held in abeyance pending the final outcome of the Ranger Uranium Environmental Inquiry (Fox Commission). The first part of the report, which dealt with the general implications of the mining and export of uranium in Australia, was released in October 1976. It approved development of a domestic uranium industry but recommended stringent Government controls, particularly over the marketing of uranium. It also recommended the postponement of any decisions on the Northern Territory deposits until the release of the Commission's second report, which will deal solely with the environmental impact of mining in the Northern Territory. Two basic findings of the first inquiry were that, if properly regulated and controlled, the hazards of uranium mining and milling were not sufficient to justify a decision not to mine and sell Australian uranium. The Commission also recommended that ample time be given for public consideration of the report, including Parliamentary debate, before any decisions on the mining and export of uranium were made.

The second part of the report is expected to be released in May 1977, and approval for mining, milling, and export of uranium was anticipated.

Australia's reasonably assured uranium resources recoverable at less than $15 per pound U_3O_8, as of June 30, 1976, totaled 227,000 tons of U_3O_8, according to the Australian Atomic Energy Commission (AAEC). In the cost range of $15 to $30 per pound U_3O_8, there were 10,000 tons of reasonably assured resources and 5,000 tons of estimated resources.

The Mineral Industry of Austria

By William F. Keyes [1]

Austria made a substantial recovery in 1976 from the 1975 recession and seemed to avoid the pause that some other countries experienced late in the year. The country's close economic ties with West Germany and the linking of the schilling with the mark led to stability and a growth (5.2%) in the gross national product (GNP), surpassed in Europe only by West Germany itself. Nevertheless, the trend in output of the minerals extractive and processing industries was mixed. Iron and steel production was back up to the level of 1974 and salt and refined copper production rose, but production of domestic fuels, mine copper, and magnesite declined.

Minerals produced in Austria were in general of importance only to the domestic economy, except for magnesite, of which Austria was the largest producer among market economy countries. The need to import raw materials increased slightly by the closing at yearend of the country's only copper mine. Other developments during the year were the planning for a large new salt refinery and a decline in reserves of petroleum and natural gas.

PRODUCTION

The value of minerals extracted in Austria in 1976 was AS10.7 billion (about $600 million[2]), or slightly above that of 1975. Of this amount, about 47% represented the value of petroleum and natural gas, 32% was nonmetallic minerals including magnesite products, 10% was metallic ores, 8% was coal, and 3% was salt. There were 98 mines in operation, of which 56 were surface, including 53 quarries for nonmetallic minerals. The total ore extracted was 15.4 million tons, and 15,045 workers were employed in the extractive industries. The structure of the Austrian minerals industry is outlined in the following tabulation:

[1] Supervisory physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from the Austrian schilling (AS) to U.S. dollars at the rate of AS17.95=US$1.00.

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Aluminum	Vereinigte Metallwerke Ranshofen-Berndorf AG, plant at Braunau-am-Inn, Government	87
Do	Salzburger Aluminum GmbH, plant at Lend, Salzburg	13
	Alusuisse	
Antimony	Bleibergerbergwerksunion AG, mine at Schlaining, Burgenland, Government	100
Coal	Graz-Köflacher Eisenbahn und Berbaugesellschaft, mines in Styria, Government	70
Copper	Kupferbergbau Mitterberg GmbH, mine at Mühlbach am Hochkönig, Government	100
Copper, refined	Montanwerke Brixlegg GmbH, smelter and refinery at Brixlegg, Tirol, Government	100
Iron, steel	VÖEST Alpine Montan AG (VAM) mine at Erzberg and plants at Linz and Donawitz, Government	100
Lead, zinc	Bleibergerbergkwerksunion AG, mine at Bleiberg-Kreuth, Carinthia, Government	100
Cement	Perlmooser Zementwerke AG, plants in Vienna area	50
Graphite	Graphitbergbau Kaisersberg Franz Mayr-Melnhof und Co., mine at St. Stefan/Leoben	100
Magnesite	Österr.-Amerik. Magnesit AG, mines at Radenthein and Hochfilzen, General Refractories, United States	50
Do	Veitscher Magnesitwerke AG, mine at Breitenau/Mixnitz, Magnesia AG, Switzerland	50
Petroleum	Österreichische Mineralölverwaltung AG, oil- and gasfields in Vienna Basin, Government	80
Petroleum products	Österreichische Mineralölverwaltung AG, refinery at Schwechat, Government	100
Tungsten	Wolfram Bergbau und Hüttenbetrieb GmbH, mine at Mittersill, VAM, Metallgesellschaft AG	100

e Estimate. p Preliminary. NA Not available.

[1] Excludes clay sand.

[2] Less than ½ unit.

[3] Excludes stone used by the cement and iron and steel industries.

[4] Includes blast furnace and coke oven gas. Manufactured gas is reported in source as gas having a caloric value of 4,200 calories per cubic meter. (1 cubic meter equals 35.3145 cubic feet).

TRADE

The mineral trade of Austria was largely with its neighbors, notably West Germany, Italy, and Yugoslavia. Unprocessed minerals imported for domestic processing included alumina from West Germany, chromite from South Africa, iron ore from Brazil, lead concentrate from a nearby producer in Italy, phosphate rock from the United States and the Soviet Union, and potash from East Germany and West Germany. Exports of Austrian products were chiefly magnesite and some steel and graphite. Tables 2 and 3 detail the mineral trade for the latest years available.

1 Included with unwrought for 1974.
2 Includes scrap.
3 Includes spiegeleisen, powder, sponge, and shot.

COMMODITY REVIEW

METALS

Aluminum.—Production of aluminum declined for the second year in a row, as the export market fell away. Imports continued unchanged, as Ranshofen-Berndorf AG imported from its new subsidiary in Hamburg, West Germany.

Capacities of the two producers also remained unchanged: Salzburger Aluminium GmbH at Lend, 12,000 tons per year; and Vereinigte Metallwerke Ranshofen-Berndorf AG at Ranshofen, 80,000 tons per year.

Antimony.—The small antimony mine at Schlaining, Burgenland, after finishing equipping the new Vinzenz shaft, continued normal operation, but the grade of ore mined dropped from 3.17% antimony in 1975 to 3.04% in 1976. The mine, operated by Bleibergerbergwerksunion AG, also maintained its moderate reserves of ore by adequate exploration.

Copper.—Austria's only copper mine, at Mühlbach am Hochkönig, Salzburg Province, was closed late in 1976 after 40 years of modern operation; production by Kupferbergbau Mitterberg GmbH had become uneconomic at the current price of copper. Recently the mine had been producing only about 100,000 tons annually of ore averaging 1.3% copper, but production had reached a maximum of almost 200,000 tons in 1973. Operation of the copper smelter-refinery at Brixlegg, Tirol, was not affected, since the mine provided only about 4% of the copper refined there.

Iron Ore.—There were three iron ore mines in Austria; all are owned by the Government's VÖEST Alpine Montan AG (VAM), and production chiefly supplies the steelworks at Donawitz. Production at all three mines declined slightly (about 1%) in 1976, and only about one-third of Austria's consumption of iron ore was supplied by domestic mines.

The largest mine, Erzberg, which furnished 89% of the total production, and the small Radmer mine are both located northwest of Leoben. The third mine,

Hüttenberg, is located in Carinthia, north of Klagenfurt, and was expected to close around 1980; other deposits in the area, such as Waitschach, are considered uneconomic, and concern was expressed over effects on local employment of the expected closing.

Iron and Steel.—In 1976, steel production increased over the low output of 1975, as business conditions generally improved. In the period 1976–80 iron and steel producers planned to spend AS20 billion (about US$1.2 billion) to complete investment projects expanding metallurgical processing and finished steel capacity. According to the Chairman of the Board of Directors of VAM Austria should not attempt to expand its industry in order to hold its share of world production, because the country lacks resources to produce steel at low cost; two-thirds of its ore and all its coking coal are imported. Instead the country should concentrate on finished steel products, especially high-grade special steel, expand the use of the LD (basic oxygen) process, and establish stable relationships with new producers such as Brazil, Mexico, and Venezuela to obtain basic steel products.

VAM continued as the dominant steel producer in Austria, with major plants at Linz and Donawitz. The company had originally taken a small participation in the Saldanha Bay steel mill project in the Republic of South Africa, expecting to receive some 400,000 tons annually for 20 years. However, South Africa postponed the project; Austrian industry representatives ascribed the postponement to unfavorable economic and political developments.

Lead and Zinc.—The Bleiberg-Kreuth mine of Bleibergerbergwerksunion AG, located near the Italian border, increased production at the cost of some decline in ore grade, from 1.61% lead in 1975 to 1.33% in 1976 and from 6.06% to 5.63% zinc in the same period; most of the increased ore output came from the Bleiberg section. Exploration continued in the Erlach area west of the mine, and prospecting and sampling covered a wide area in the Alps near the mine and along the Yugoslav border.

Tungsten.—Mining of scheelite ore at the Mittersill mine of Wolfram GmbH (subsidiary of VAM, Metallgesellschaft, and Teledyne of the United States) increased greatly in 1976, the first full year of operation. As in 1975, a large part of the production (1,800 tons of WO_3) went into building up stocks; WO_3 content of the concentrate was less than 700 tons. Output was apparently due to reach 1,000 to 1,200 tons of tungsten, not WO_3 as earlier reported.

The processing and refining plant for the concentrate at Bergla, south of Graz and near the Yugoslav border, came into production at yearend 1976 or early in 1977. Plant capacity was reportedly about 1,350 tons per year of tungsten contained in blue oxide, tungsten powder, and tungsten carbide powder.

NONMETALS

Graphite.—About 60% of Austrian graphite production came from the Kaisersberg mine at St. Stefan ob Leoben and the Trieben mine at Hohenstauern, both operated by Graphitbergbau Kaisersberg Franz Mayr-Melnof und Co. The remainder represented graphite recovered from old tailings at two locations in Lower Austria and one in Styria.

Magnesite.—Poor export demand caused a drop of over 25% in the total production of the six magnesite mines; all mines registered declines in production. The mines were operated by the Veitscher Magnesitwerke AG (Breitenau and Hohenstauern mines), the Steirische Magnesit Industrie AG, a subsidiary of Veitscher (Oberdorf mine), and the Österreichisch-Amerikanische Magnesit AG (Hochfilzen, Radenthein, and Tux mines). Radenthein changed mining methods during the year, from top slicing to block caving.

Salt.—The Austrian state salt monopoly, Österreichische Salinen, planned to build, by 1980, a new salt-evaporating plant at Steinkogel near Ebensee. Production would be at the rate of 400,000 tons of salt per year. The additional brine was to come from expansion of the mines and boreholes at Altaussee, Hallstatt, and Bad Ischl; another mining area was at Dürrnberg, near Hallein; all areas were in Upper Austria, Salzburg, and Styria Provinces. The brine product, of which one-third has been obtained from boreholes in recent years, was pumped to plants at Ebensee, Bad Aussee, and Hallein.

MINERAL FUELS

Energy.—Over one-third of Austria's supply of energy came from domestic sources in 1975. These were fairly well distributed among hydroelectric energy, natural gas, and petroleum, with minor additional amounts of coal and appreciable fuelwood. Imports of energy were in the form of petroleum from the Middle East and the U.S.S.R. and natural gas from the U.S.S.R. The energy balances for 1974 and 1975 are presented in table 4.

Coal and Coke.—Interest continued on the part of VAM in purchasing a U.S. coal mine to assure itself of a steady source of metallurgical coal. In 1975–76, about 90% of all Austrian imports of solid fuels came from Eastern Europe, and the company was interested in diversifying its sources of supply.

Domestic production of coal and employment in the coal mining industry continued the declining trend of the last two decades. Of the four coal mining areas, only one, the Trimmelkam brown coal mine of Salzach Kohlenbergbau GmbH, in Upper Austria near the West Germany border, was able to increase production. Exploration was conducted also for further coal seams north of the mine in the area between St. Radegrund and Mattighofen. Production dropped at the Fohnsdorf glanzkohle mine in Upper Styria; it also dropped at Voitsberg-Köflach in western Styria, the largest brown coal mining area; and in the second-ranking brown coal area, Wolfsegg-Trauenthal. The only mine in the former western Styria brown coal district, Pölfing-Bergla, was closed at the end of 1975. One glanzkohle district (Fohnsdorf mine) and three brown coal districts (Voitsberg-Köflach, Wolfsegg-Trauenthal, and Salzach, or Trimmelkam) remained in operation.

Petroleum and Natural Gas.—There were eight minor discoveries of hydrocarbons in the Vienna Basin during the year, of which two were of oil. Intense exploration continued, including stratigraphic wells and seismic surveys, to clarify the structure of the Tertiary Basin to a depth of 2,000 meters. In the Molasse Basin to the west, a less important producing area, three small discoveries were made in structural-stratigraphic traps. All exploration activity was by the Austrian State oil company Österreichische Mineralölverwaltung AG (OMV) and the Shell-Mobil subsidiary, Rohöl-Aufsuchungs AG (RAG).

Consumption of petroleum and natural gas increased sharply in 1976, as a result of a dry summer and lessened hydroelectric production, but domestic production of both hydrocarbons declined by about 1%. Production of petroleum peaked in 1955 at about 3.7 million tons, well above domestic consumption at that time, but had declined almost 50% to 1.9 million tons

Table 4.—Austria: Supply and apparent consumption of fuels and power for 1974 and 1975

(Million tons of standard coal equivalent [1])

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Fuelwood	Hydroelectric power
1974:						
Production	11.7	1.8	3.3	2.9	0.9	2.8
Imports	20.6	4.5	12.5	3.1	.1	.4
Exports	.9	r --	.1	--	--	.8
Apparent consumption	[2] 31.4	6.3	15.7	6.0	1.0	2.4
1975:						
Production	11.8	1.7	3.0	3.3	.9	[3] 2.9
Imports	19.4	3.9	12.6	2.5	--	.4
Exports	1.0	--	.2	--	--	.8
Apparent consumption	[2] 30.2	5.6	15.4	5.8	.9	2.5

r Revised.
[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2] Includes refinery and other losses and nonfuel uses.
[3] Calculated at 1,000 kilowatt hours = 0.123 SCE, which understates the utility of hydroelectric power.

Sources: 1974: Adapted from World Energy Supplies, 1950–1974, United Nations Statistical Paper, ser. J, No. 19; 1975: Energy Statistics, Organization for Economic Cooperation and Development, Paris, 1976, 241 pp.

by 1976; almost all was produced by OMV and RAG, with the Canadian company Richard K. van Sickle contributing a negligible amount. Oil reserves fell to 23.2 million tons at yearend 1976, a decline of 9% from 1975 reserves; natural gas reserves were estimated at 14.9 billion cubic meters as of the same date, a decrease of 5% from the 1975 reserves.

Austria's only petroleum refinery in 1976 —at Schwechat, near Vienna, owned by OMV—was being expanded by 40,000 barrels to a capacity of 320,000 barrels per stream-day. However, throughput during 1976 averaged only about 180,000 barrels per day. Most of the crude was imported through a 260-mile branch of the Transalpine pipeline from Trieste, Italy. A twin 100-mile products line ran from the refinery west to a terminal near Linz.

Uranium.—Investigation continued of the uranium occurrences in the Mitterberg copper mine; the mine, however, was inactivated at yearend. A drilling and sampling program for uranium was to be carried out in the Ruperti section at a cost of AS14 million ($800,000).

Development continued at the Pongau mine of Pryssok und Co. near Forstau (Schladming), and surface drilling was planned near Tweng, Weisspriach, and Faningberg to the south.

The Mineral Industry of Belgium and Luxembourg

By William F. Keyes [1]

After the recession of 1975, the Belgian economy revived during the first half of 1976, only to decline again in the second half. The metalworking industry benefited from the initial strong demand in industries such as automobiles and construction, but orders declined as the year progressed. Private investment continued low in 1976, partly discouraged by low-capacity utilization, which was below 70% in metals production. Belgian industry has, in recent years, fallen behind in investment in new technology, and the Belgian Government was impelled to propose various new fiscal incentives during the year.

Belgium was an important processor of nonferrous metals and a significant producer of crude steel in 1976. Coal production was moderate, but production declines of recent decades may have been halted. The country is also an important petroleum refiner, producing products largely for its own consumption.

During 1976, the Belgian steel industry was consolidated, copper and lead-zinc treatment facilities were expanded, and a major expansion of petroleum-refining capacity was completed. The Luxembourg steel industry suffered during the economic slowdown and struggled to maintain employment at existing levels.

BELGIUM

PRODUCTION

The extractive production index declined again in 1976 to 67.5 compared with 70 in 1975. Only the coal production index declined, however; the production index of the lower valued nonmetallic minerals increased slightly. Processing industries also registered small gains; the steel production index rose from 88.2 to 95.9 and the nonferrous metals index, from 105.4 to 129.5 (1970=100). Major producers of minerals in Belgium in 1976 are listed in the following tabulation:

[1] Supervisory physical scientist, International Data and Analysis.

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Cement	S.A. Ciments d'Obourg, plant at Obourg	33
Do	S.A. Cimenteries C.B.R. Cementbedrijven N.V., plant at Lixhe, Société Générale de Belgique (SGB)	31
Coal	N.V. Kempense Steenkolenmijnen, mines in Limburg Province	65
Copper, refined	Métallurgie Hoboken-Overpelt N.V. S.A., smelter at Antwerp-Hoboken, electrolytic refinery at Olen, SGB	90
Iron and steel	S.A. Cockerill-Ougrée Providence et Espérance-Longdoz, plants near Liège, SGB	40
Do	Sté. Métallurgique Hainaut-Sambre S.A., plants near Charleroi-Marcinelle, Frère group	20
Do	S.A. Forges de Thy-Marcinelle et Monceau, plant at Charleroi-Marcinelle, Frère group	10
Do	Maritieme Staalnijverheid N. V., also called Sidérurgie Maritime S.A. (SIDMAR), plant at Ghent-Zelzate	15
	Aciéries Réunies de Burbach-Eich-Dudelange S.A. (ARBED), Luxembourg	--
Lead	Métallurgie Hoboken-Overpelt N.V. S.A., smelter at Antwerp-Hoboken, SGB	80
Petroleum products	Société Industrielle Belge des Pétroles S.A., refinery at Antwerp, British Petroleum, United Kingdom	36
Do	S.A. Texaco Belgium N.V., refinery at Ghent	19
Do	S.A. Chevron Oil Belgium, refinery at Feluy	15
Zinc	Métallurgie Hoboken-Overpelt N.V. S.A., electrolytic refinery at Overpelt, SGB	30
Do	Société des Mines et Fonderies de Zinc de la Vieille-Montagne, S.A., electrolytic refinery at Balen, SGB	50

Table 1.—Belgium: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity [1]	1974	1975	1976 [p]
METALS			
Aluminum metal, secondary only	5,900	2,700	2,600
Cadmium	1,044	972	1,200
Copper:			
Blister [e]	16,000	11,000	6,000
Refined including alloys	388,308	357,024	481,788
Iron and steel:			
Iron ore and concentrate thousand tons	123	93	63
Pig iron do	13,021	9,082	9,877

Residual fuel oil ---do---	71,429	67,393	68,558
Lubricants ---do---	707	595	707
Other ---do---	23,400	21,682	25,634
Refinery fuel and losses ---do---	8,703	8,356	8,195
Total ---do---	221,022	214,268	213,065

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed individually, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are listed under other nonferrous metals.

[2] Known to include gold and silver and may include platinum-group metals.

[3] Derived by subtracting aluminum data from a reported total for unspecified base metals.

[4] Slate only.

TRADE

A slight deficit in the overall balance of payments, technically the first since 1968, marked the year; the balance of trade continued to be unfavorable with another deficit over $2 billion.[2] While the annual fluctuations were not greatly significant, a longer term weakening of the trade balance was feared as a result of two changes in the minerals position of Belgium: (1) Higher prices for oil imports, and (2) expectations of continued reduced demand and reduced prices for Belgian (and Luxembourg) steel on international markets.

Belgium was an importer and processor of mineral raw materials, and an exporter of refined and fabricated mineral products. About 74% of exports and 67% of imports were to and from the Common Market countries in 1976; 3.5% of exports went to the United States and 6% of imports came from the United States. Mineral imports were valued at about $6 billion, or 23% of all imports; of this, about 60% was fuels, largely petroleum from the Middle East and natural gas from the Netherlands. Base metal ores were imported in large quantities from Zaire, Canada, and Peru. Iron ore was imported mainly from Sweden and France.

[2] Where necessary, values have been converted from Belgian francs (BF) to U.S. dollars at the rate of BF38.60=US$1.00.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS			
Aluminum:			
Bauxite and concentrate	175	75	NA.
Oxide and hydroxide	306	437	West Germany 388.
Ash and residue containing aluminum	2,524	4,870	France 3,727; West Germany 1,058.

Mica:			
Crude including splittings and waste	70	108	NA.
Worked including agglomerated splittings	1,360	1,419	United States 489; United Kingdom 212; West Germany 170.
Pigments, mineral, including processed iron oxides	4,369	4,669	France 1,183; Italy 876.
Precious and semiprecious stones:			
Natural (except diamond):			
Unworked ----------kilograms--	6,026	665	Switzerland 420; India 199.
Worked:			
Gem ----------do----	1,754	2,020	West Germany 183.
Industrial ----------do----	(1)	(1)	NA.
Manufactured [2]	155	201	West Germany 41.
Pyrite (gross weight)	548	312	NA.
Salt and brine	123,690	103,992	France 90,784.
Sodium and potassium compounds thousand tons--	447	214	NA.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous ------thousand tons--	1,059	871	Netherlands 820.
Slate ----------do----	3	4	Netherlands 2; West Germany 1.
Other ----------do----	59	37	Netherlands 3.
Worked:			
Slate ----------do----	1	1	Mainly to France and West Germany.
Paving and flagstone -----do----	9	13	Netherlands 11; West Germany 2.
Other ----------do----	11	9	France 2; Netherlands 2; West Germany 2.
Dolomite, chiefly refractory grade -do----	1,835	1,618	Netherlands 710; West Germany 633.
Gravel and crushed rock ----------do----	8,988	9,495	Netherlands 4,797; France 3,906.
Limestone (except dimension) ----do----	600	665	Netherlands 420; France 232.

See footnotes at end of table.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
NONMETALS—Continued			
Stone, sand and gravel—Continued			
Quartz and quartzite ----thousand tons--	15	15	West Germany 12.
Sand excluding metal bearing ----do----	3,989	3,161	France 857; Netherlands 663; Italy 373; West Germany 331.
Sulfur:			
Elemental, all forms ----------	18,759	17,473	France 8,863; West Germany 3,210.
Sulfur dioxide ----------	203	21	NA.
Sulfuric acid ----------	286,903	106,320	France 71,601; Turkey 12,463.
Talc, steatite, soapstone, pyrophyllite --------	21,813	15,656	West Germany 4,248; United Kingdom 2,562; Sweden 2,219; France 1,791.
Other nonmetals, n.e.s.:			
Crude:			
Meerschaum, amber, jet ----------	231	336	NA.
Lithium minerals ----------	6,263	3,685	Netherlands 3,641.
Vermiculite, perlite, chlorite --------	233	117	NA.
Other ----------thousand tons--	761	328	Netherlands 302.
Slag, dross, and similar waste, not metal bearing ----------do----	2,847	2,903	Netherlands 1,237; France 858; West Germany 720.
Oxides and hydroxides of magnesium, strontium, barium ----------	666	1,805	NA.
Halogens ----------	19	NA	
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural ----------	9,204	5,860	NA.
Carbon black and gas carbon:			
Carbon black ----------	20,165	11,841	West Germany 10,750.
Gas carbon ----------	150	31	NA.
Coal and briquets:			
Anthracite and bituminous coal thousand tons--	527	542	West Germany 275; France 208.
Briquets of anthracite and bituminous coal ----------do----	61	20	France 13.
Lignite and lignite briquets ----------	32	3	NA.
Coke and semicoke ----------thousand tons--	409	360	France 112; Netherlands 72; West Germany 56.
Gas, natural ----------million cubic feet--	26,177	42,416	Netherlands 42,395.
Hydrogen, argon, other rare gases ----------	15,550	13,258	France 6,671; West Germany 2,889; Netherlands 1,509.
Peat including briquets and litter ----------	4,883	859	NA.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels--	411	571	Norway 413.
Refinery products: [3]			
Gasoline ----------do----	5,324	25,336	United Kingdom 6,105; West Germany 4,664; Netherlands 3,978; Sweden 2,973.
Kerosine ----------do----	2,213	5,715	Denmark 1,160; United Kingdom 881; West Germany 853.
Distillate fuel oil ----------do----	21,348	20,711	West Germany 8,511; bunkers 3,151; Sweden 2,746; Denmark 2,352.
Residual fuel oil ----------do----	31,961	31,377	Bunkers 13,216; United Kingdom 3,098; Denmark 3,069.
Lubricants ----------do----	2,633	2,039	Netherlands 648; West Germany 201.
Other:			
Liquefied petroleum gas --do----	1,653	1,707	United States 590; Portugal 243.
White spirit ----------do----	1,371	1,269	Netherlands 614; West Germany 332.
Mineral jelly and wax ----do----	20	13	Netherlands 2; Spain 1; West Germany 1.
Nonlubricating oils, n.e.s -do----	32	7,079	Netherlands 3,331; West Germany 1,660; bunkers 1,030.
Bitumen and other residues do----	2,894	1,800	Netherlands 930; West Germany 302; Norway 223.
Bituminous mixtures, n.e.s-do----	66	75	Netherlands 42; France 20.
Pitch, pitch coke, petroleum coke ----------do----	283	31	Netherlands 31.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons--	230	211	Netherlands 70; United States 48; France 38.

NA Not available.
[1] Less than ½ unit.
[2] May include diamond.
[3] Includes bunkers.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS			
Aluminum:			
Bauxite and concentrate	23,814	16,380	Guyana 6,814; West Germany 4,251; Denmark 2,638.
Oxide and hydroxide	17,442	12,689	West Germany 9,918.
Ash and residue containing aluminum	1,219	758	NA.
Metal including alloys:			
Scrap	18,138	14,778	Netherlands 6,088; France 2,938; United States 1,647.
Unwrought	253,205	188,176	Netherlands 68,568; Norway 28,926; France 25,446; West Germany 23,670.
Semimanufactures	70,110	52,140	West Germany 25,070; Netherlands 12,388; France 7,541.
Antimony:			
Ore and concentrate	9,221	8,707	Bolivia 5,953; Canada 1,288.
Metal including alloys, all forms	72	222	Netherlands 80; France 65; West Germany 47.
Arsenic:			
Natural sulfides	24	53	NA.
Trioxides, pentoxides, acids	311	121	United States 9.
Beryllium metal including alloys, all forms kilograms	200	300	NA.
Bismuth metal including alloys, all forms	717	NA	
Cadmium metal including alloys, all forms	1,477	978	Japan 362; U.S.S.R. 106.
Chromium:			
Chromite	4,051	3,714	Netherlands 2,266; Mozambique 559.
Oxide and hydroxide	693	555	West Germany 316; U.S.S.R. 150.
Metal including alloys, all forms	200	232	United Kingdom 147; West Germany 36.
Cobalt oxides and hydroxides ----kilograms	11,900	20,600	West Germany 19,200.
Copper:			
Ore and concentrate	32,406	46,651	Zaire 7,867; Peru 5,439; Chile 5,200; Morocco 4,681.
Matte	201,189	214,471	Zaire 139,887; Republic of South Africa 25,525.
Copper sulfate	652	1,084	U.S.S.R. 585; France 342.
Ash and residue containing copper	54,878	38,970	France 13,168; United States 8,874; Chile 6,485.
Metal including alloys:			
Scrap	NA	58,545	France 21,531; United States 11,547; Netherlands 9,182.
Unwrought	292,323	190,656	Zaire 94,707.
Semimanufactures	25,466	25,768	West Germany 13,333; France 5,081; Netherlands 3,039.
Germanium metal including alloys, all forms	17	NA	
Gold:			
Waste and sweepings --value, thousands	$1,446	$610	United States $372; Netherlands $188.
Metal, unworked and partly worked thousand troy ounces	3,499	2,623	Switzerland 1,587; United States 173.
Iron and steel:			
Ore and concentrate, except roasted pyrite ----thousand tons	33,430	25,520	France 10,802; Sweden 4,919.
Roasted pyrite ----do----	497	214	West Germany 121; France 73.
Metal:			
Scrap ----do----	870	706	France 284; Netherlands 175; West Germany 79.
Pig iron including cast iron --do----	233	161	France 67; West Germany 65.
Sponge iron, powder, shot ----do----	9	6	France 3; West Germany 1; Sweden 1.
Spiegeleisen ----do----	(1)	(1)	NA.
Ferroalloys ----do----	215	153	France 52; Norway 39.
Steel, primary forms ----do----	970	810	West Germany 275; Netherlands 240; France 148.
Semimanufactures:			
Bars, rods, angles, shapes, sections ----do----	724	734	France 266; West Germany 180; Netherlands 91.
Universals, plates, sheets --do----	654	520	Netherlands 142; Japan 132; West Germany 104.
Hoop and strip ----do----	116	100	France 50; West Germany 20.
Rails and accessories ----do----	33	11	France 6; West Germany 3.
Wire ----do----	60	40	West Germany 22; Netherlands 6; France 5.
Tubes, pipes, fittings ----do----	182	192	Netherlands 52; France 44; West Germany 44.

See footnotes at end of table.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS—Continued			
Iron and steel—Continued			
Metal—Continued			
Semimanufactures—Continued			
Castings and forgings, rough thousand tons	16	22	France 8; West Germany 6; Netherlands 3.
Lead:			
Ore and concentrate	88,030	90,268	Bolivia 15,322; Canada 12,079; Australia 10,481.
Ash and residue containing lead	45,663	63,015	United States 13,908; France 13,550; United Kingdom 8,728.
Oxides	2,246	843	West Germany 496; France 288.
Metal including alloys:			
Scrap	11,497	12,439	Netherlands 4,154; West Germany 4,138; United States 1,557.
Unwrought	24,786	13,857	France 5,363; United Kingdom 3,503; West Germany 2,152; Netherlands 1,882.
Semimanufactures	2,943	2,074	West Germany 916; Netherlands 768.
Magnesium metal including alloys:			
Scrap	270	153	West Germany 25.
Unwrought	1,465	1,207	Italy 317; Norway 262; France 234; Netherlands 216.
Semimanufactures	150	183	France 57; West Germany 48; United States 31.
Manganese:			
Ore and concentrate	400,246	313,264	Republic of South Africa 153,238; Zaire 72,077.
Oxides	2,220	1,275	Japan 534; France 527.
Metal	1,226	615	Republic of South Africa 226; Japan 189.
Mercury 76-pound flasks	5,773	8,963	Italy 5,192; Spain 1,102; Yugoslavia 1,102.
Molybdenum:			
Ore and concentrate	12,545	13,175	Canada 5,289; United States 3,436; Chile 1,852; United Kingdom 1,556.
Metal including alloys, all forms	70	77	Netherlands 45; United States 11.
Nickel:			
Matte, speiss, similar materials	271	87	United Kingdom 31; Netherlands 21; Republic of South Africa 16; Canada 13.
Metal including alloys:			
Scrap	1,423	1,060	United States 206; France 178; Singapore 157; Netherlands 109.
Unwrought	3,988	3,495	United Kingdom 788; Cuba 490; Canada 460; Republic of South Africa 379.
Semimanufactures	3,427	3,316	West Germany 1,527; France 1,224; United Kingdom 389.
Platinum-group metals including alloys, all forms troy ounces	108,881	292,539	United States 206,472; United Kingdom 32,472.
Selenium, elemental kilograms	19,100	42,300	NA.
Silver metal including alloys thousand troy ounces	23,517	18,711	Netherlands 5,208; United States 3,987.
Thorium ore and concentrate kilograms	NA	NA	
Tin:			
Ore and concentrate	5,281	7,210	Zaire 4,804; Rwanda 1,669.
Oxides	30	40	West Germany 22; Netherlands 16.
Metal including alloys:			
Scrap	83	113	France 53; West Germany 43; Netherlands 15.
Unwrought	2,914	1,756	Zaire 671; Malaysia 506.
Semimanufactures	256	300	Netherlands 120; West Germany 99.
Titanium:			
Ore and concentrate	120,527	31,350	Canada 30,757.
Oxides	11,618	10,522	West Germany 4,675; Netherlands 3,155; France 1,433.
Metal including alloys, all forms	1,739	1,598	United States 1,379.

See footnotes at end of table.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS—Continued			
Tungsten:			
Ore and concentrate	458	375	Zaire 120; Australia 97.
Metal including alloys, all forms	266	157	Netherlands 117.
Uranium:			
Ore and concentrate ——kilograms	52,200	NA	
Metal including alloys, all forms thousand tons	6,336	NA	
Zinc:			
Ore and concentrate	644,850	610,984	Canada 391,809.
Oxide and peroxide	9,273	7,548	France 2,891; Netherlands 1,615; United Kingdom 1,188.
Ash and residue containing zinc	90,404	71,610	Peru 29,937; West Germany 16,807.
Metal including alloys:			
Scrap	12,066	14,330	United States 7,663; Netherlands 1,579; France 1,551.
Blue powder	1,681	784	West Germany 356; Netherlands 170.
Unwrought	69,592	23,885	United States 7,225; Zaire 3,000; Australia 2,701; Canada 2,614.
Semimanufactures	10,903	9,167	France 8,132.
Other:			
Ore and concentrate:			
Of niobium, tantalum, vanadium, zirconium	2,282	1,002	United Kingdom 310; Republic of South Africa 175; West Germany 174.
Of precious metals	252	241	Colombia 224.
Of base metals, n.e.s	8,075	475	Italy 27; Bolivia 20.
Ash and residue containing nonferrous metals, n.e.s	45,059	33,993	Republic of South Africa 4,242.
Waste and sweepings of precious metals value, thousands	$41,859	$17,209	United States $10,676; Netherlands $2,164; France $2,151.
Oxides, hydroxides and peroxides of metals, n.e.s	3,247	1,936	West Germany 1,077; Republic of South Africa 201.
Metals including alloys, all forms:			
Metalloids:			
Tellurium and arsenic	66	69	Sweden 50.
Other	851	440	West Germany 177; France 137.
Alkali, alkaline-earth and rare-earth metals	112	49	Netherlands 3; West Germany 3.
Pyrophoric alloys	6	3	NA.
Base metals including alloys, all forms, n.e.s	18,245	75	United States 44; France 10.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	144,841	90,247	West Germany 89,781.
Dust and powder of precious and semi-precious stones, natural and manufactured, including diamond kilograms	27,246	1,974	Ireland 906; United States 600.
Grinding and polishing wheels and stones	2,874	2,533	West Germany 724; France 457; Austria 416.
Asbestos	82,662	60,549	Canada 27,456; U.S.S.R. 14,357; Republic of South Africa 10,615.
Barite and witherite	7,210	7,829	France 6,020.
Boron materials:			
Crude natural borates	71,557	49,838	Netherlands 35,301; West Germany 5,715.
Oxide and acid	2,241	1,495	France 1,075; West Germany 200.
Bromine ——kilograms	79,100	46,100	NA.
Cement	150,318	76,328	Netherlands 41,150; France 12,700.
Chalk	114,577	116,468	France 88,569.
Clays and clay products:			
Crude clays, n.e.s.:			
Bentonite	17,296	22,654	West Germany 9,815; Netherlands 6,264.
Kaolin	301,766	237,206	United Kingdom 86,359; West Germany 73,563; Netherlands 49,566.
Other	273,867	198,853	West Germany 107,871; France 37,170; Netherlands 22,430.

Table 3.—Belgium-Luxembourg: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
NONMETALS—Continued			
Clays and clay products—Continued			
Products:			
Refractory (including nonclay bricks)	169,604	108,054	West Germany 54,021; Austria 16,214.
Nonrefractory ----value, thousands--	$80,326	$75,742	West Germany $22,128; Italy $18,532; Netherlands $16,691.
Cryolite and chiolite	339	112	NA.
Diamond (except powder):			
Gem:			
Unworked ----------thousand carats--	10,425	12,535	United Kingdom 9,969.
Worked ----------do----	1,276	1,279	U.S.S.R. 296; India 204; Israel 185.
Industrial:			
Unworked ----------do----	8,545	7,772	Ireland 2,390; United States 1,721; United Kingdom 1,295.
Worked ----------do----	28	7	Switzerland 2; United Kingdom 2.
Diatomite and other infusorial earth	8,402	7,402	France 3,288; Denmark 1,676; United States 1,292.
Feldspar, leucite, nepheline, nepheline syenite	78,559	61,532	Norway 39,999; France 16,369.
Fertilizer materials:			
Crude:			
Nitrogenous	19,199	12,464	Chile 11,529.
Phosphatic ----------thousand tons--	2,407	1,771	Morocco 1,231.
Potassic	(2)	1,286,227	France 669,740; West Germany 616,341.
Manufactured:			
Nitrogenous, N_2 content	72,490	10,213,191	West Germany 3,564,495; France 2,369,386; Netherlands 1,706,906.
Phosphatic, P_2O_5 content	16,534	1,320,278	United States 289,176; Netherlands 273,204; Algeria 227,860.
Potassic	(2)	53,255,196	West Germany 20,384,133; France 18,399,050; U.S.S.R. 7,872,008.
Other including mixed	163,954	122,643	France 47,995; West Germany 33,125; Netherlands 19,691.
Ammonia	2,244	1,499	West Germany 800; Netherlands 540.
Fluorspar	15,433	10,101	France 4,072; West Germany 2,534; East Germany 1,915.
Graphite, natural	1,454	1,915	Malagasy Republic 1,011; West Germany 295; France 195.
Gypsum and plaster	537,189	470,371	France 445,228.
Lime	210,102	107,573	France 94,877.
Magnesite	29,716	25,940	Greece 13,130.
Mica:			
Crude including splittings and waste	3,171	7,034	India 4,673; Malagasy Republic 1,486.
Worked including agglomerated splittings	94	38	Switzerland 9; France 5; West Germany 4; United Kingdom 3.
Pigments, mineral, including processed iron oxides	11,237	6,104	West Germany 4,810.
Precious and semiprecious stones, except diamond:			
Natural:			
Unworked ----------kilograms--	5,550	9,543	Brazil 5,512; West Germany 2,827.
Worked:			
Gem ----------do----	3,262	1,449	West Germany 854; India 107.
Industrial ----------do----	256	42	NA.
Manufactured ----------do----	25,794	3,816	United States 3,597.
Pyrite (gross weight)	257,916	207,810	Spain 134,223; Portugal 67,387.
Salt and brine ----------thousand tons--	1,144	796	Netherlands 404; West Germany 346.
Sodium and potassium, n.e.s	40,244	44,605	West Germany 21,847; Netherlands 14,843.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	143,128	155,295	France 68,709; Portugal 19,560; West Germany 15,504.
Worked	59,257	67,655	Italy 21,628; France 14,292; Portugal 7,339.
Dolomite, chiefly refractory grade	68,724	74,991	West Germany 33,969; France 30,448; Netherlands 10,114.
Gravel and crushed rock ----thousand tons--	5,936	5,249	Netherlands 2,774; West Germany 801; France 756.
Limestone (except dimension)	208,571	281,893	United Kingdom 174,872.
Quartz and quartzite	112,231	115,822	West Germany 79,937; France 16,924.

See footnotes at end of table.

[2] Crude and manufactured potassic fertilizers not reported separately and total of these commodities not reported in terms of gross weight but rather in terms of K_2O equivalent. Total for 1974 was 654,076 tons. Principal sources in 1974 were: West Germany 260,364; France 184,679; U.S.S.R. 137,624.

COMMODITY REVIEW

Metals.—*Copper.*—Recent expansion of the Olen electrolytic refinery to a nominal capacity of 330,000 tons per year took effect in 1976. Total domestic production of refined copper including secondary metal and alloys reached about 480,000 tons, an increase of more than 100,000 tons compared with that of 1975.

Métallurgie Hoboken-Overpelt S.A. continued its 5-year investment program despite unfavorable market conditions and rising labor costs. The company's second new wire-rod (Contirod) plant began production at Olen, raising total company capacity from 100,000 tons to 250,000 tons per year of continuous 5/16-inch rods for production of wire.

Hoboken-Overpelt controlled about half of Belgium's copper-smelting capacity of 90,000 tons in 1976, and almost 90% of refining capacity of 395,000 tons of primary copper. The remainder of Belgium's smelting and refining capacities was controlled by Métallo-Chimique S.A.

Iron and Steel.[3]—Sizable losses, growing lack of competitiveness, and continued inactivity in steel markets led to structural changes in the Belgian steel industry. In July, several corporations in the Charleroi area consolidated many functions, while remaining independent in name and management. Sté. Métallurgique Hainaut-Sambre S.A. (HS), S.A. Forges de Thy-Marcinelle et Monceau (TMM), and Laminoirs du Ruau (LR) came under the control of a newly established holding company, Financière de Ruau, which was jointly controlled by the Frère-Bourgeois group, Banque Bruxelles-Lambert, and Banque de Paris et des Pays Bas. Albert Frère was appointed chief executive of all three manufacturing firms. Production of the three firms was around 4.8 million tons in 1976, consisting chiefly of rolled basic products to be used in the construction industry or other metalworking.

This reorganization followed the formation of the Cockerill group (S.A. Cockerill-Ougrée-Providence et Espérance-Longdoz) in the early 1970's by a number of steelmakers in the Liège area. Cockerill's peak production, primarily sheets, was 6.6 million tons in 1974; since that time, production has declined owing to reduced demand. The third center of Belgian steel production was at Zelzate, the port for Ghent, where Sidérurgie Maritime S.A. (SIDMAR), a subsidiary of Aciéries Réunies de Burbach-Eich-Dudelange S.A. (ARBED) of Luxembourg, reached a peak production of 2.25 million tons of large, wide, flat products in 1974.

In December, Cockerill, HS, TMM, and LR agreed formally to coordinate and collaborate on measures to restore their competitiveness while retaining their present legal structures. These firms, controlling about 60% of the industry, agreed to exchange information, jointly conduct studies, and coordinate policies and planning. The agreement was open to other firms, notably the two large producers outside the Charleroi area, Usines Gustave Boël at La Louvière and Forges de Clabecq at Clabecq, each of which produced a million or more tons per year of steel.

The steel industry in Wallonia, the French-speaking half of Belgium, that included Liège and Charleroi, employed over 50,000 persons in 1976, and thus could not be allowed to collapse. Its problems, however, were severe, including an unbalanced product mix; a small domestic market (80% of production was exported in 1975); an inconvenient location, resulting from former dependence on the coal mines of the Campine and the nearby iron ore deposits of Lorraine (France), both now approaching exhaustion; high labor costs, with wages and benefits being the highest in the world as a result of Government policy and recent prosperity of the steel industry; and growing labor unrest. These problems, if not solved by cooperation within Belgium and with other European producers, would require Government intervention to protect jobs and the economy.

Lead and Zinc.—Despite low zinc demand and continued low prices, which forced Société des Mines et Fonderies de Zinc de la Vieille-Montagne S.A. to operate well below capacity, the company continued with its $90 million investment plan. About $25 million was allocated in 1976, mostly to equip the company's mine in Sweden and plants at Viviez and Calais in France. However, at Balen, Belgium, a flotation plant was added to treat electrolytic residues.

---

[3] This section is largely based upon reports from the U.S. Embassy, Brussels, Belgium, especially State Department telegram 641, Jan. 21, 1977.

Vieille-Montagne, with a production capacity at Balen of about 168,000 tons per year, continued to be the largest Belgian zinc producer. Other producers of electrolytic zinc were Hoboken-Overpelt, with a 100,000-ton-per-year capacity at Overpelt, and Société de Prayon at Prayon near Liège, with a 60,000-ton-per-year capacity.

In July, Vieille-Montagne permanently closed its lead smelter at Balen, which was too small to operate economically; annual production had been less than 30,000 tons in recent years. Smelter lead continued to be produced chiefly by Hoboken-Overpelt at Hoboken, near Antwerp.

Nonmetals.—*Cement.*—Cimenteries C.B.R. S.A., possibly the largest Belgian cement producer, completed its new plant at Lixhe, Liège Province, in early 1976, at a total investment cost of about $70 million. The plant, with an annual capacity of 1 million tons of clinker, was supplied from the limestone quarry through a 2.2-kilometer-long tunnel, constructed to protect the environment. The new facility was shared with the company's Dutch affiliate, Eerste Nederlandse Cement Industrie N.V. of Maastricht.

Stone.—*Quarzite.*—The Administration des Mines of Belgium reported[4] that high-silica sandstones or quartzites are produced principally in the area of Villerot and Hautrage, west of Mons. In addition, millstone is mined at St. Denis, Obourg, and Ghlin, all close to Mons; normal methods of cutting, blasting, grinding, and washing are followed.

Mineral Fuels.—Consumption of fuels declined in 1975, the latest year for which complete information is available, as a result of the lower industrial activity caused by the economic recession. Petroleum was imported from the Middle East and natural gas, from the Netherlands. The only significant domestic source of energy was the declining coal mining industry, which was to continue at approximately present levels through Government support. An approximate energy balance is given in table 4.

Coal.—Although coal consumption increased in 1976, Belgian production declined to just over 7 million tons, continuing a long-term trend. Production declined 25% in the southern basins after two shafts were closed. In the Campine Basin, however, where the major remaining Belgian reserves are located production remained unchanged. Imported coal continued to displace Belgian coal, especially in the steel industry; in 1976, imports from the United States increased significantly owing to favorable prices for coking coal.

The Government, determined to keep Belgium's coal mining industry alive, was prepared to provide necessary subsidies to protect employment and the domestic supply of energy. With Government aid, production should not decline in the future below 7 million tons per year. In addition, the Government made plans to investigate underground coal gasification in 1977 at a site near Thulin, near Mons, where con-

[1] 1 ton of standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2] Includes bunkers.
[3] Includes refinery and other losses.

Source: Organization for Economic Cooperation and Development. Energy Statistics, 1973–1975. Paris.

tinued conventional mining was uneconomic. The Sartis pit was closed in this area in 1976, and Cockerill closed the Colard pit near Liège at the same time; there were then seven small mines (producing a total of about 1 million tons per year) in the Charleroi-Namur-Liège Basins, and five large mines (producing a total of 6 million tons) in the Campine (Kempen) Basin.

Petroleum.—Esso Belgium completed a modernization and expansion program, raising capacity at its refinery in Antwerp 150,000 barrels per day (7.5 million tons per year) to a reported 240,000 barrels per day (12 million tons per year), an increase of more than 160%. The expansion, carried out in the face of a large surplus of oil refinery capacity, was based on a decision made prior to the petroleum price rise of 1973.

Total Belgian refining capacity was about 1.1 million barrels per day after the Esso expansion. Eight refineries were in operation. Five were in the Antwerp area including Esso (240,000 barrels per day), Anglo-Belge des Pétroles, S.A. (4,900), Albatross S.A. (120,000), Société Industrielle Belge des Pétroles (340,000), and Raffinerie Belge des Pétroles (95,000). One refinery was at Feluy (Chevron Oil Belgium N.V., 140,000) and two were at Ghent (S.A. Texaco Belgium N.V., 180,000, and Shell, 9,000).

A refined products pipeline, with a projected capacity of 8 million tons per year, was to be built by Pipeline Antwerpen Limburg Luik N.V. from Antwerp to DSM's chemical complex at Geleen, the Netherlands. The pipeline was to be owned by the Belgian Government (51%) and DSM.

LUXEMBOURG

The year was dominated by the severe crisis in the steel industry that had begun in 1974. Production of crude steel declined about 1% in Luxembourg compared with that of 1975, although other European steel-producing nations were able to register small gains. Luxembourg production continued almost 30% below the 1974 level. The effect was particularly severe on the Luxembourg economy because the value of steel production represented almost half of the value of the country's industrial production, about 40% of total exports, and 25% of the gross national product (GNP). The two operating companies that comprise Luxembourg's steel industry suffered high financial losses; ARBED, by far the larger, lost almost $40 million, after losing $80 million in 1975.

ARBED produced about 4.0 million tons of steel in 1976, or 87% of the national total of almost 4.6 million tons; the remainder was produced by Minière et Métallurgique de Rodange-Athus, a Belgian-Luxembourg company straddling the border in the southwest. ARBED continued operating during the year at about 60% of capacity. Shutdowns, transfers of personnel to public-works-type projects, and reduction of the number of shifts worked were effected to avoid layoffs. The problems were aggravated by the large increase in personnel costs in recent years owing to lower productivity, wage increases, and higher social costs. It was feared that the disabilities of the steel industry were structural, and that they stemmed from changes in the world steel market, such as increased competition from Japanese and national steel companies in non-European markets. A further cut in steel industry jobs of at least 2,500 by 1980 was also feared.

ARBED used 9.7 million tons of iron ore in 1976, compared with 10.3 million tons in 1975. About 84% of the total in 1976 came from ARBED's Lorraine minette (low-grade Jurassic ironstone) mines, located in France on the Luxembourg border; the remaining 16% came from the Luxembourg minette mines, chiefly Differdange. Almost none of the high-cost, high-grade foreign ores were needed, because of the general production decline.

Luxembourg's slate quarries continued to suffer from high costs and competition from alternate roofing materials. Production of about 6,000 square meters of slab was only half that produced in 1973. The quarries were located in the community of Perle, west central Luxembourg, near the Belgian border.

The Mineral Industry of Bolivia

By Orlando Martino [1]

Bolivia's economic performance in 1976 was marked by recovery from the recession that began in late 1975 and continued through the first half of 1976. The increase in Bolivia's gross domestic product (GDP), as indicated in the following tabulation in million dollars,[2] represented the fifth consecutive year of growth.[3] Inflation,

	1975	1976	Percent change
GDP at current prices	2,154	2,628	+22
GDP at constant 1970 prices	801	859	+7

at 12%, was unchanged from the rate of 1975.

The Bolivian mining industry participated in the economic recovery and accounted for about 11% of the GDP. The value of mineral exports increased 20% in 1976 to $379 million. Exports of minerals and mineral fuels (crude oil and natural gas) represented 89% of total exports, indictating the important role of minerals as an earner of foreign exchange for Bolivia.

Three State-owned organizations dominated the mineral industry. The Corporación Minera de Bolivia (COMIBOL), as operator of 90 mines grouped under 12 mining companies, was the leading producer and exporter of tin, zinc, lead, silver, bismuth, and cadmium. COMIBOL contributed 61% of all mineral exports. Yacimientos Petrolíferos Fiscales Bolivianos (YPFB), the Bolivian national oil company, was the principal producer and exporter of oil and natural gas. Empresa Nacional de Fundiciones (ENAF) was concerned with metallurgical programs in line with the Government's policy of maximizing processing of concentrates in Bolivia.

Besides the State-owned organizations, in the private sector there were medium-size miners (34 in early 1976 compared with 19 in 1972) and small miners grouped under Cámara Nacional de Minería (Small Miners Association). In 1976, the World Bank granted a $10 million loan to the Banco Industrial S.A. for medium miners and industrial projects and a $12 million loan to be channeled in part through Banco Minero de Bolivia (BAMIN), the State mining bank, for increasing the productivity of the small mining sector.

Mining cooperatives were officially recognized during 1976 as a distinct group in the mining sector. The cooperatives were primarily involved in tin and gold operations. The price situation forced copper and sulfur cooperatives in Potosí to operate on a small scale.

About 79,000 persons were employed in the mining sector, representing 3.6% of total employment. COMIBOL maintained its dominant position, accounting for 32% of mining employment, followed by small mines (29%), mining cooperatives (29%), and medium mines (10%). YPFB employed 4,700 persons in its oil and gas operations.

Government Policies and Programs.—The year 1976 marked the beginning of Bolivia's 5-year national development plan for the period ending in 1980. As part of this plan, the Government aims at diversification of mining and considerable expansion of smelting and refining capacity.

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Bolivian pesos ($b) to U.S. dollars at the rate of 20$b = US$1.00.

[3] U.S. Department of Commerce. Foreign Economic Trends, Bolivia. No. 77-128, September 1977.

Planned public sector mining and refining investment for the 5-year period amounting to $450 million was distributed as follows: ENAF 54%, COMIBOL 25%, and Servicio Geológico de Bolivia (GEOBOL) 7%. The Ministry of Mines and Metallurgy was preparing a mining development law covering taxation, expanded exploration, and methods to attract new investment in mining. The proposed legislation was based partly on the 1975 taxation study by the Harvard Institute for International Development. The Government was especially interested in attracting foreign investment in the development of its lead, zinc, silver, and tungsten resources. By yearend, neither the proposed mining law nor the $1.2 million mineral exploration fund had been approved. The proposed fund was based on a feasibility study by the U.S. Geological Survey.

Following the miners strike in June, Bolivia's military forces occupied the mining areas, arresting and exiling the leaders of the Federation of Mine Workers.

By yearend, Bolivia had not ratified the fifth International Tin Agreement. Bolivia advocated a systematic and periodic review of buffer stock floor and ceiling tin prices. Priority matters of the International Tin Council (ITC) for Bolivia concerned changes in the voting system and compulsory contributions by consumers to the ITC buffer stock.

GEOBOL operated as the counterpart Government agency for exploration programs with technical assistance from foreign and international agencies. The Cordillera Exploration Project, financed by the United Nations Development Program (UNDP), COMIBOL, and GEOBOL, was completed in 1976 and final reports were under preparation. The Institute of Geological Sciences of London began an exploration project with GEOBOL in mid-1976 covering the Brazilian pre-Cambrian shield in eastern Bolivia. Phase I of the Geo-Mineralogic Apolo Project financed by West Germany and executed by GEOBOL with the technical assistance of the Bundesanstalt für Geowissenschaften und Rohstoffe (BGR) was partially completed. Phase I involved geochemical reconnaissance of an area north of La Paz. Phase II will focus on an evaluation of the gold deposits of the middle Tuichi River.

The Government issued Supreme Decree 12879 which provided a new schedule of export taxes (regalias) for minerals exported from Bolivia after January 1, 1976. The new schedule covers tin, antimony, copper, lead, zinc, and tungsten, and specifies tax rates that are lower than those of the previous schedule.

PRODUCTION

The production of antimony, tin, and tungsten showed important increases and provided the basis for the recovery of mineral production during 1976 relative to the depressed level of 1975. The sharp increase in manganese output reflects initial exploitation of the Mutún deposit. Natural gas output increased 12%. Copper and gold output dropped, and the declining trend for sulfur continued. Production problems caused a decline in cement output. Table 1 shows the role of COMIBOL in mineral production.

Table 1.—Bolivia: COMIBOL's total mineral output

(Metric tons of fine content unless otherwise specified)

Commodity	1974	1975	1976

[e] Estimate. [p] Preliminary. NA Not available.

[1] In addition to the commodities listed, salt and a variety of construction materials such as clays, stone (crushed, broken, and dimension), and sand and gravel are produced, but information is inadequate to permit formulation of reliable estimates of output levels.

[2] Unless otherwise specified, data for 1974 and 1975 represent the sum of production by COMIBOL and exports by medium and small mines; and data for 1976 are actual output by COMIBOL and medium and small mines.

[3] Actual production not reported; data presented are total national exports and are regarded as being virtually equal to total production.

[4] Contained in zinc concentrates produced by COMIBOL; not recovered in elemental form in Bolivia.

[5] COMIBOL output plus sales by placer mines. (Medium and small mines cannot legally export gold.)

[6] Sum of COMIBOL production; COMIBOL purchases from lessees in COMIBOL-owned mines and from other producers; sales of medium and small mines to ENAF smelter; and exports of medium and small mines.

[7] Sales by cement plants.

[8] Actual production not reported; data presented are total national exports, however, total national production is believed to be considerably larger, with that portion of output not exported being consumed in local markets. Available information is inadequate to estimate reliably the level of domestic consumption.

TRADE

Bolivia was a major world exporter of tin, tungsten, antimony, and bismuth, and an exporter of lesser importance of zinc, silver, lead, petroleum, and natural gas. Bolivian mineral and mineral fuel exports in 1976 regained the high level attained in 1974.

Bolivia's mineral trade, shown in table 3, showed a decreasing dependence on tin and the increasing importance of petroleum and natural gas for export earnings. Tin exports were 37% of the total in 1976 compared with 50% in 1970; petroleum and natural gas exports increased its share of total export earnings from 6% to 27% during the same period. The increase in the value of tin exports resulted from increases in both volume and price of tin. The inauguration of the Vinto antimony smelter accounted for the increase in the value of antimony exports.

Argentina continued as the chief market for Bolivian exports of petroleum and natural gas. The United States and Ecuador were the next most important importers of crude oil from Bolivia. Brazil, Chile, and Peru were no longer purchasing the higher-priced Bolivian oil.

In September an economic delegation from Argentina visited Bolivia and agreed to negotiate the purchase of an additional 4 million cubic feet of natural gas per day. Argentina promised to consider studying the purchase of Bolivian iron ore once the Mutún feasibility study is completed.

The second meeting of the Brazil-Bolivia Committee on Economic and Technical Cooperation (COBBET), originally scheduled for April 1976, was repeatedly postponed during the year. The first meeting of COBBET in Santa Cruz in December 1975 outlined several major projects for joint development. The chief projects were the $350 million gas pipeline from Santa Cruz, Bolivia, to Corumbá, Mato Grosso, Brazil, and the construction of an industrial complex in southeast Bolivia that would utilize the gas and iron ore resources.

Government measures restrained the growth of imports to 5% in 1976, resulting in a small trade surplus.

COMMODITY REVIEW

METALS

ENAF, in partnership with COMIBOL, was planning several smelting and refining plants to reduce the amount of minerals exported as concentrates. The projects located around Potosí are listed in table 7 and would comprise Bolivia's third metallurgical complex. The status of the feasibility studies on the lead-silver and zinc plants is covered under each commodity.

Antimony.—The sharp increase in the output of metallic antimony resulted from ENAF's Vinto smelter near Oruro that went into production in early 1976. Equipment was provided by SKODAEXPORT of Czechoslovakia. ENAF produced 1,430 tons of antimony and 793 tons of antimony trioxide, representing 32% and 39%, respectively, of full capacity. Two privately owned smelters, Fundestaño and Bernal, produced about 300 tons of antimony.

In 1976, there was a 33% increase in the export of antimony concentrate to 15,662 tons, most of which was supplied by medium-size miners. Exports of metallic antimony rose sharply to 1,744 tons. Total antimony reserves in Bolivia were estimated at 145,000 tons of fine content, of which measured reserves were 97,000 tons.[4]

[4] Armando Ergueta Arama. La Riqueza Minera en Bolivia (La Paz). 1976, p. 94.

NA Not available.
[1] Project will be executed in cooperation with COMIBOL.
[2] ENAF's first plant with a current capacity of 4,270 tons is located at Vinto (Oruro).

Bismuth.—With the inauguration in March 1976 of COMIBOL's refinery, Bolivia may become one of the leading world producers of refined bismuth. The refinery, located in southern Bolivia at Telamayo, had a capacity of 600 tons per year and was built by the Belgian firm Sidech PBR at a cost of $500,000. Bolivia was among the few countries that produced bismuth as a primary product from sulfide ore, although bismuth was also produced as a byproduct of copper, lead, and zinc mining operations.

Bismuth production and exports suffered in 1976 because of the large drop in European pharmaceutical consumption. Exports fell 45% to 320 tons in 1976.

Copper.—The mine output of copper has been declining sharply in recent years, and there was no prospect of any significant new production. Copper exports in 1976 decreased 22% to 4,680 tons because of the closing of the Chararilla mine of Nitto Bolivia Mining Co. Ltd., the second largest copper mine in Bolivia, which produced 44% of total exports of copper in 1975.

The Dowa Mining Co., Ltd., of Japan was preparing a feasibility study for a copper smelter which ENAF was planning to install in the Department of La Paz. The plant was scheduled to start production at the beginning of 1981 at the rate of 10,000 tons per year of fine copper.

Gold.—Gold production fell 46% in 1976. Although gold production by the cooperatives on the Tipuani River increased 16%, that of South American Placers Inc. (SAPI) and COMIBOL decreased. The cooperatives accounted for 61% of Bolivia's total production. There were again no exports of gold in 1976, as in 1975.

In May, SAPI and the Corporación de las Fuerzas Armadas para el Desarrollo Nacional (Armed Forces Development Corp.) (COFADENA) formed a joint venture to explore the COFADENA concessions on the Mapiri and Kaka Rivers. A drilling program was started and the evaluation work was expected to be completed by October 1977.

Throughout 1976, the Ministry of Mines and Metallurgy had under consideration a proposal to open the fiscal reserves to private exploration. This was thought to be a significant step for the future of gold production in Bolivia.

Iron Ore.—Bolivia did not export any iron ore in 1976 from the Mutún deposit. Supreme Decree 13059 signed in April placed iron and manganese exports under the control of the Empresa Siderúrgica Boliviana S.A. (SIDERSA).

SIDERSA and Atkins Planning of the United Kingdom continued monitoring and evaluating the feasibility study of the Mutún project by Arthur G. McKee and Co. of Cleveland, Ohio. At yearend the study was 80% complete and expected to be concluded by July 1977.

Iron ore reserves at Mutún were calculated at 600 million tons within the 2-square-kilometer area chosen as the mine site out of an estimated 48 billion tons for the 55-square-kilometer ore body. Iron ore grade increases to an average of 65% in secondary deposits and drops to an average of 50% in most of the mountain. The magnetite–hematite ratio, originally thought to be high, was found to be 1 to 5.

Iron and Steel.—After long discussions with the central Government and the regional Development Corp. of Cochabamba and Santa Cruz, SIDERSA arrived at a master plan to produce 200,000 tons per year of low carbon steel using charcoal blast furnaces and iron ore from the rich secondary deposits of Mutún. It was also planned to produce 600,000 tons per year of sponge iron by a direct reduction system using natural gas from Santa Cruz and iron ore from the primary ore deposit of Mutún. Final production targets for iron and steel output were to be defined by the McKee study.

Lead.—The production of lead concentrate rebounded from the depressed level of 1975. Lead occurs in Bolivia mainly in silver and zinc ores, but it also occurs in ores of antimony and bismuth. Deposits are located chiefly in southern Bolivia in the Department of Potosí and secondarily in the Department of La Paz. COMIBOL was the main producer with 77% of total annual production primarily from the Tatasi and Telamayo mines. Important medium miners were the companies of Alameda, Casado Hermanos, Tanera, and Tuntoco. With new mining projects scheduled to start up in late 1977, lead production in 1978 was expected to reach 28,000 tons. Lead exports

Table 8.—Bolivia: Lead exports
(Metric tons)

Year	COMIBOL	Medium mines	Small mines	Total	Value (c.i.f.) (millions)
1973	13,178	3,858	3,116	20,152	$8.3
1974	13,968	1,911	3,473	19,352	11.5
1975	14,228	2,129	1,308	17,665	7.7
1976	12,668	2,739	3,173	18,580	8.4

in recent years showed a slight declining trend.

By the end of 1976, Klockner Industries Anlagen of West Germany and Sidech PBR of Belgium had completed the feasibility study of the lead-silver smelter-refinery planned by ENAF and COMIBOL. Bolivia was expected to refine 90% of its lead-silver concentrate by 1980.

Measured and indicated lead reserves in Bolivia were estimated as follows: [5]

Sector	Measured reserves	Indicated reserves
COMIBOL	85,000	78,200
Medium mines	35,500	15,200
Small mines	4,100	15,800
Total	124,600	109,200

Manganese.—SIDERSA was developing the San Pedrito manganese bed in the Mutún ore body to produce 30,000 tons during 1977, of which 20,000 tons was already sold to Metallgesellschaft of West Germany. The balance of the Mutún ore was expected to be marketed in Brazil or Argentina. No reserve figures were available.

Silver.—Silver has been mined in Bolivia for over 500 years. Production has ranged between 4.5 million and 8.0 million troy ounces in the twentieth century. Silver ranks after tin, zinc, and tungsten in value.

Silver production was derived mainly as a byproduct of COMIBOL's tin, lead, and zinc mining. COMIBOL's most important producer was Empresa Minera Quechisla from its Animas, Tatasi, and San Vicente mines. Exports of silver of 5.63 million troy ounces in 1976 declined 14% from those of 1975.

COMIBOL and private mining companies were planning to expand silver production. The startup in late 1976 of New Jersey Zinc Co.'s Huari-Huari zinc mine would add between 300,000 and 500,000 troy ounces to Bolivia's total annual silver output. The startup of the S. J. Groves Cascabel lead-silver mine in 1978 would add an additional 500,000 troy ounces per year. Empresa Minera Unificada S.A. (EMUSA) was planning to open a silver mine in Toldos, Sud Lípez, in 1978.

Tin.—From 1894, when tin was first exported, to 1976, exports totaled 2.12 million tons. Bolivian tin production in 1976 recovered from the slump of 1975, when the industry was constrained by export quotas imposed by the ITC and lower world prices. The price of tin began rebounding in February 1976, and by December was at $4.00 per pound. ITC export quotas were lifted in June. Tin exports from Bolivia increased to 30,355 tons, 15% over those of 1975. Much of the increase was from stocks created by 1975 production. Production, exports, and sales to ENAF of tin concentrate in tons were as follows:

Sector	Production	Exports	Sales to ENAF
COMIBOL	20,626	15,092	6,011
Medium mines	7,188	2,762	4,097
Small mines	NA	2,632	--
Total	NA	20,487	10,108

NA Not available.

COMIBOL's tin production decreased 2%. ENAF's production of electrolytic tin and alloys totaled 9,185 tons in 1976.

COMIBOL's tin mining costs in 1976 showed a sharp increase of 27% over those of 1975 mainly as a result of wage increases, increases in financing costs, and higher prices on imported machinery, equipment and spare parts. Royalties, based on market prices and volume of exports, also increased 31%. A summary of COMIBOL's tin mining and marketing costs is given in table 9.

The average rate of recovery of tin from ore by COMIBOL and the medium mines was about 50%. To help improve recovery,

[5] Page 95 of work cited in footnote 4.

Table 9.—COMIBOL's tin mining and marketing costs
(Dollars per pound)

Year	Mining costs	Export taxes	Royalties	Handling, transport, insurance, smelting	Total cost on market [1]	Average London Metal Exchange price
1971	1.10	0.14	--	0.31	1.54	1.59
1972	1.03	.18	0.08	.35	1.64	1.71
1973	1.05	.37	.23	.48	2.13	2.18
1974	1.60	.24	.81	.59	3.24	3.71
1975	1.59	.21	.55	.67	3.02	3.11
1976 [2]	2.02	.28	.72	.78	3.80	3.40

[1] Data may not add to totals shown because of independent rounding.
[2] 1976 costs are provisional.

COMIBOL was expected to begin concentrating tin by volatilization in a U.S.S.R.-built plant in April 1976. COMIBOL was also planning to install preconcentration and flotation plants at its Colquiri, Caracoles, and Huanuni mines.

The Playa Verde alluvial tin deposit near Huanuni was to be jointly exploited by COMIBOL and London Tin in a $10 million dredging project.

Bolivia continued to increase the amount of tin smelted in the country. ENAF started building a tin smelter at Vinto for low-grade materials. The smelter is scheduled to start operation in 1979. Fundestaño, the largest private smelter, was also increasing its capacity so that by 1980 Bolivia would be able to refine nearly all the projected 1980 production of tin concentrate.

Tungsten.—In terms of export value, tungsten ranked third in importance as a nonfuel mineral export after tin and zinc. In 1976, the sharp increase in production of tungsten, primarily from wolframite, ranked Bolivia as the third largest producer on a worldwide basis after the People's Republic of China and the U.S.S.R. Bolivian reserves of metallic tungsten were estimated at 40,000 tons, about 2% of the world total.

In response to record price levels, exports by the three mining groups increased as follows:

Sector	Percent of total production in 1976	Exports (metric tons) 1975	1976	Percent change
Medium mines	48	1,202	1,575	+31
COMIBOL	37	1,021	1,160	+14
Small mines	15	328	543	+66
Total	100	2,551	3,278	+28

As prices improved during the year, many small miners went into tungsten operations.

Bolivia was active in the United Nations Conference on Trade and Development (UNCTAD) Committee on Tungsten and was working with other producer countries in trying to form an international organization of tungsten producers and consumers to stabilize prices. A Bolivian was president of the Primary Tungsten Association, an association of tungsten-producing companies.

Uranium.—Although Bolivia has been explored for uranium since 1950, only recently have systematic exploration and advanced techniques been used. The only known deposit of minable size is owned by the Comisión Boliviana de Energía Nuclear (COBOEN), established in 1960. The deposit is located at Cotaje, south of Lake Poopó, with reserves of about 500 tons of U_3O_8. The Cotaje deposit was being planned as the source of ore for the pilot plant to be completed in May 1977 by the Argentines. Initial production of yellowcake was scheduled for July 1977.

Only one foreign company had an exploration contract with COBOEN. In June 1976, the Italian oil company AGIP began drilling around Corocoro west of La Paz under a contract signed in July 1974 covering four areas in separate regions of Bolivia. Negotiations were in process between COBOEN and a French company to explore large tracts in the pre-Cambrian shield area in eastern Bolivia.

Zinc.—A large increase in output of up to 80,000 tons was projected for 1977. The increased production was to come from: (1) the startup in late 1976 of the Huari-Huari mine north of Potosí operated by

New Jersey Zinc, (2) improved recovery from marmatite flotation at the Colquiri mine of COMIBOL, and (3) the completion of the Enrique shaft at COMIBOL's Matilde mine. COMIBOL's share of zinc output was expected to decrease from 67% in 1975 to 61% in 1977.

Klockner Industries Anlagen of West Germany was completing a feasibility study on a smelter planned by ENAF using a new process (developed by ENAF and Klockner) to recover zinc from slag that may run as high as 20% zinc content from the complex marmatitic ores mined in Bolivia.

NONMETALS

Asbestos.—A prospecting project financed by the United Nations Industrial Development Organization (UNIDO) and UNDP for the evaluation of the asbestos and magnesite deposits of Chaparé-Cochabamba was concluded in 1976, and final reports were under preparation. The objective of the project was to increase reserves for the asbestos beneficiation plant built by the United Nations outside of Cochabamba.

Barite.—The Baroid Div. of NL Industries, Inc., in a joint venture with Mosamar of Bolivia, was constructing a barite and bentonite beneficiation plant in Oruro. The plant was scheduled for completion in early 1977. Barite is found near Oruro, and bentonite is found near Río Mulatos further south on the Bolivian Altiplano. Barite production was to be 10,000 tons per year, and bentonite production was to be 8,000 tons per year.

Lithium.—During 1976, a French-Bolivian team confirmed the presence of large high-grade deposits of lithium and potassium in the Salar de Uyuni and other smaller salt lakes to the south of Uyuni. The lithium is contained primarily in brines, salt crusts, and interbedded clays.

MINERAL FUELS

Natural Gas.—Production of natural gas by YPFB rebounded from the depressed level of 1975, as shown in table 10. There were 247 producing wells in 13 gasfields in 1976.

YPFB exports of natural gas to Argentina in 1976 were at the level of the previous year, but revenues increased 29% to $54.6 million. In January 1976, a new gas price of $0.82 per thousand cubic feet was negotiated with the Argentine Government, compared with the price of $0.35 prevalent before the renegotiation of late 1974. During 1976, Bolivia negotiated a new sales agreement with Argentina to increase gas exports by 50% beginning in 1979. If the 640-kilometer gasline to Brazil, under negotiation, is completed by 1980, gas exports would reach 470 million cubic feet per day and produce revenues of $214 million per year at the projected price of $1.25 per thousand cubic feet of gas.

The Río Grande, La Peña, and Los Monos gasfields had the greatest increase in production, and the Camiri gasfield had the greatest decrease.

Table 10.—Bolivia: Distribution of natural gas production

(Million cubic feet)

	1975	1976	Percent of total, 1976	Percent change
Injected	60,615	71,442	46	+18
To Argentina pipeline	55,099	55,489	36	+1
Vented and flared	16,590	20,744	13	+25
Local consumption	4,992	6,277	4	+26
Total[1]	137,297	153,952	100	+12

[1] Data may not add to totals shown because of independent rounding.

Natural gas resrves at yearend were estimated to range between 4.7 and 5.0 trillion cubic feet. The largest gas reserves were located north and northwest of Santa Cruz. The Tita Field, discovered by Occidental Boliviana Inc. in 1976, was estimated to have 180 billion cubic feet of gas reserves. The Yapacani, Palometas, and Palacios Fields were being held in reserve for the planned gasline to Brazil. At 1976 rates of consumption, natural gas reserves, which are more substantial than oil reserves, would last for 62 years.

Petroleum.—Data on Bolivia's production, consumption, and trade of petroleum are given in tables 11 and 12. Bolivia received a premium price for its light sulfur-free oil. The average price per barrel was $13.95 in 1976 compared with $13.45 in 1975. Argentina, by way of the pipeline from Santa Cruz to Yacuiba, was the major market.

There were four oil discoveries in 1976: A large field by Occidental (at Tita) and three smaller fields by YPFB (at Cambeiti, Espejos, and Montecristo). The new fields were expected to come onstream in 1978. Projected output from the four fields for 1978, 1979, and 1980 were, respectively, 4.9 million, 10.6 million, and 14.6 million barrels. Thus, by 1980 Bolivia's national plan projected a petroleum output of 180,000 barrels per day compared with current production of 40,000 barrels per day.

Domestic consumption of petroleum was 20,000 barrels per day. The price of gasoline in Bolivia, despite the substantial increase in late 1975, was one of the lowest in South America. Local fuel oil consumption was expected to rise sharply in the next 3 years to meet the needs of COMIBOL's tin volatilization plant in 1978 and additional tin and other smelters scheduled for 1977. Some plants may have to switch to natural gas supplies eventually, but to date no specific conversion plans were underway.

Exploration was at a relatively high level in 1976. Drilling increased 238% over that of 1975, and four discoveries were made, as previously detailed. Only one operations contract, with AMOCO, wes signed during 1976 bringing the total number of signed contracts to 17 since the General Hydrocarbons Law of March 1972. At yearend, only 3 of the 17 exploration groups were active: Occidental, Phillips Petroleum Co., and Tesoro Bolivia Petroleum Co. To maintain the pace of exploration, YPFB was considering opening up areas previously reserved to the Government, except where it has its own specific drilling plans.

Bolivia's proven petroleum reserves at yearend totaled 176 million barrels, a 21% increase over those of 1975.

Field	Reserves (million barrels)	
	Proven	Estimated, under evaluation
Established fields	152	--
Cambeiti	15	--
Espejos	9	--
Montecristo	--	90
Tita	--	60–100
Total	176	XX

XX Not applicable.

YPFB operated five refineries ranging in capacity from 600 barrels to 13,000 barrels per day with a total capacity of 40,300 barrels per day. A 5,000-barrel-per-day topping plant was inaugurated at the Santa Cruz refinery in 1976. Construction continued by McKee on expanding the refineries of Cochabamba and Santa Cruz to 25,000 and 15,000 barrels per day, respectively. By late 1978, Bolivia's total refinery capacity would be 75,000 barrels per day, which would exceed current oil output.

The Mineral Industry of Brazil

By Orlando Martino [1]

Brazil's gross domestic product (GDP) grew 9.2% in real terms in 1976 to $131 billion,[2] while per capita income increased to $1,190. This impressive growth was accompanied by inflation of 46.3%, the highest rate in 12 years.

The Brazilian mineral industry represented only a small part of the country's economy because of the predominant roles played by agriculture and manufacturing. Although the mineral sector accounted for less than 2% of Brazil's GDP, it was responsible for 17% of the country's total exports. Production of minerals and mineral fuels in 1976 was valued at $2.3 billion, a 6.8% increase over that of 1975, compared with the average 13.1% increase of the post-World War II period. The percentage distribution of the total value of mineral production, by mineral group, follows:

	Percent of total value		Percent change of value
	1975	1976	
Metals	38.1	38.0	+6
Diamond and gem stones	1.6	1.1	--
Nonmetals, n.e.s	19.9	26.3	+40
Mineral fuels	40.4	34.6	−10

The nonmetals group, made up of some 40 commodities, had the highest rate of growth in value. Of the total value of mineral output of $2.3 billion, 10 commodities accounted for 86.3%, as follows: Petroleum 30.5%, iron ore 28.5%, limestone 7.5%, crushed rock 4.6%, manganese 3.6%, clays 3.1%, coal 2.8%, marine salt 2.8%, tin 1.5%, and pyrochlore 1.4%.

Government Policies and Programs.—In its effort to reduce the high rate of inflation, the Government in November announced a cutback of $2.8 billion in the public investment budget. By the end of 1976 it was not clear what impact this would have on the production goals for the mining industry as outlined in the Second National Development Plan (1975–79).

Decree No. 574 of May 1976 issued by the Ministry of Mines and Energy established the National Energy Balance to be prepared annually. To reduce Brazil's great dependency on imports of crude oil, the Government projected a reduction in the role played by petroleum as a primary energy source and an increase in the use of Brazil's coal, hydroelectric power, and nuclear fuels. Taking advantage of a practice well-established in the past, the Government was planning a substantial increase in the production of alcohol from sugarcane and manioc to obtain a 20% mixture with gasoline nationwide by the mid-1980's. During 1976, the Government initiated sales of an alcohol-gasoline mixture with 10% to 15% alcohol in Rio de Janeiro, the States of Pernambuco and Alagoas, and the interior of São Paulo State.

As a result of increased exploration by private and Government-owned mining companies, the Departmento Nacional da Produção Mineral (DNPM) of the Ministry of Mines and Energy reported in its "Anuario Mineral Brasileiro—1977," covering 1976, substantial increases in the

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Brazilian new cruzeiros (NCr$) to U.S. dollars at the average rate of NCr$10.67 = US$1.00. During 1976, Brazil continued its policy of minidevaluations. As of December 31, 1976, the rate was NCr$12.35 = US$1.00.

measured reserves of beryllium, zirconium, tungsten, quartz, titanium, mica, coal, tin, asbestos, lithium, and chromium.

In December 1976, several relatively minor changes were made in Brazil's 1967 Mining Code, the most important of which was to require payment of the fee charged for exploration claims at the time of filing, instead of when exploration licenses are approved as was previously the case.

The legislation establishing the Companhia de Pesquisas de Recursos Minerais (CPRM) (Mineral Resources Research Company) in 1969 prohibited it from undertaking mining operations. It was restricted to calling for bids for development of the properties it discovered. A December 1976 change in that legislation, however, allows CPRM to negotiate directly with private companies on its discoveries without having to call for bids and also permits it to participate in mining activities.

PRODUCTION

Production of iron ore stagnated in 1976 following a decade of strong growth. Output of crude manganese ore was only slightly above that of the recent peak year of 1971. The upward trend in output of crude steel continued with a further increase of 10.4%, while production of ferroalloys, especially ferrocolumbium, reached record highs. Brazilian production of nonferrous metals in 1976 increased for aluminum (14%), copper (12%), lead (12%), and zinc (35%), and fell for nickel (6%) and tin (4%). Production of copper was based entirely on secondary (scrap) sources.

Output of portland cement increased 10% to 19.1 million tons, continuing the strong upward trend of the decade. Production of natural phosphates (P_2O_5 content) increased 136%, manufactured phosphates 58%, and nitrogenous fertilizers 14%. A decrease in production was notable in mica and lithium minerals.

Employment in the mining sector in 1976, including the coal industry but excluding the petroleum industry, totaled 61,100, a 10% increase over that of 1975. The iron ore and coal industries employed 11,500 (19%) and 9,900 (16%) workers, respectively.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, molybdenite and bismuth are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Exports.

[3] Includes nickel contained in ferronickel.

[4] Smelter and/or refined metal.

[5] Includes baddeleyite-caldasite.

[6] Less than ½ unit.

[7] Apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional unreported quantities of common quartz.

[8] Produced from a portion of the crude quartzite listed; quantity of crude quartzite processed was 76,003 tons in 1974, 78,178 tons in 1975, and 61,542 tons in 1976.

TRADE

The performance of Brazil in the international economy during 1976 was marked by an overall balance-of-payments surplus and a significant reduction in the trade deficit. The trade deficit was $2.2 billion, down from the $3.5 billion deficit of 1975. This was made possible by a less than 1% increase in imports and a 17% increase in exports to $10.13 billion.

Exports from Brazil's mineral sector including ores, concentrates, common metals, semimanufactures, crude petroleum, and petroleum products totaled $1.72 billion or 17% of total exports. Exports of iron ore valued at $995 million represented 58% of mineral exports, followed by crude petroleum and derivatives, $331 million; steel and ferroalloys, $248 million; manganese, $66 million; gem stones and diamond, $22 million; tin, $15 million; and columbium-tantalum, $13 million. Iron ore exports rose in importance to third place after coffee and soy products. In recent years, Brazil has displaced Sweden as the principal supplier of iron ore to West Europe and has displaced India as the second largest supplier to Japan.

Following are Brazilian exports of particular significance to the United States:

Commodity	Percent of U.S. imports from Brazil in 1976	Brazil's rank as supplier
Quartz crystal	98	1
Lithium	82	1
Columbium	68	1
Beryllium	48	1
Manganese ore	40	1
Mica, sheet	17	2
Iron ore	12	3

Out of a total of $12.28 billion of imports by Brazil in 1976, minerals and mineral fuels accounted for $5.63 billion or 46%. Imports of crude petroleum and derivatives alone represented $4.21 billion or 34%. Steel and ferroalloys were the next most important imports valued at $568 million, followed by fertilizer materials, $268 million; coal, $222 million; copper, $219 million; aluminum, $110 million; tin, $49 million; zinc, $42 million; sulfur, $42 million; and silver, $20 million. The value of crude oil imports increased 20% and petroleum derivatives 61%.

The tonnage of steel and ferroalloy imports decreased 61% from that of 1975. However, Brazil continued to be heavily dependent on imports to meet the demands of its expanding economy. Brazil's dependence on foreign resources for domestic consumption was: Aluminum 34%, asbestos 29%, copper 80%, lead 11%, sulfur 96%, zinc 49%, phosphatic fertilizers 87%, nitrogenous fertilizers 80%, potassic fertilizers 100%, coal 57%, and petroleum 82%. Silver imports increased sharply over those of 1975.

In February 1976, Petróleo Brasileiro S/A (PETROBRAS) established a new subsidiary, PETROBRAS Comercio Internacional S/A (INTERBRAS), to act as an international trading company to capitalize on the market experience and bargaining power of PETROBRAS.

Chromium, chromite	13,378	190	9,128	All to Argentina.
Columbium and tantalum ore and concentrate:				
Columbite[3]	41	29	NA	All to United States.
Tantalite	105	96	NA	United States 57; Netherlands 28.
Pyrochlore	4,344	2,895	NA	United Kingdom 820; United States 760.
Copper metal including alloys, all forms	1,242	806	547	Belgium-Luxembourg 347; Uruguay 196.
Gold metal, unworked or partly worked, all forms—troy ounces	450	418	NA	West Germany 322.
Iron and steel:				
Ore and concentrate, including roasted pyrite—thousand tons	59,439	72,522	67,138	Japan 26,963; West Germany 12,294.
Metal:				
Pig iron	252,256	510,524	NA	Argentina 136,874; Venezuela 114,619.
Sponge iron, powder, shot	276	59	NA	Mainly to Argentina.
Ferroalloys:				
Ferrochrome	26,764	34,469	47,460	United States 20,500; Canada 8,890.
Ferrocolumbium	7,467	4,135	9,155	NA.
Ferromanganese	5,245	10,080	11,028	United States 6,025; Colombia 1,660; Peru 1,010.
Ferromolybdenum	143	36	2	Spain 30; Argentina 6.
Ferronickel	2,929	3,838	1,736	All to Japan.
Ferrosilicon	5,724	4,337	13,298	United States 1,420; Romania 1,000.
Other	r 3,621	4,110	4,091	United States 2,324; West Germany 1,645.
Total	51,893	61,005	86,770	
Steel, primary forms	r 79,683	27,692	NA	Italy 12,309; Uruguay 7,805; Chile 7,577.
Semimanufactures:				
Bars, rods, angles, shapes, sections	r 108,257	65,075	NA	United States 20,706; Nigeria 19,112.
Universals, plates, sheets	r 33,201	37,376	NA	Argentina 23,738; Uruguay 9,709.
Hoop and strip	207	800	NA	Uruguay 320; Bolivia 169.
Wire	r 3,780	1,978	NA	Colombia 639; Venezuela 400.
Tubes, pipes, fittings	r 7,996	7,541	NA	Venezuela 3,017; Bolivia 916; United States 878.
Castings and forgings, rough	937	1,004	NA	Bolivia 411; United States 387; Paraguay 121.
Lead metal including alloys, all forms	(4)	2	3	Mainly to United States.
Manganese:				
Ore and concentrate—thousand tons	1,493	1,555	1,072	United States 634; Norway 351.
Oxides	272	1,179	1,071	Argentina 664; Greece 152; Colombia 125.
Mercury—76-pound flasks	(4)	(4)	--	All to Bolivia.
Molybdenum metal including alloys, all forms—kilograms	--	23	NA	Netherlands 19; Uruguay 4.
Nickel metal including alloys, all forms	1	11	4	Mainly to Argentina.

See footnotes at end of table.

Table 2.—Brazil: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 [1]	Principal destinations, 1975
METALS—Continued				
Platinum-group and silver metals, including alloys:				
Platinum-group ----------troy ounces--	305,592	219,750	NA	Mainly to Spain.
Silver ----------do----	1,150,416	218,368	NA	France 128,603; Spain 81,052.
Rare-earth metals:				
Ores and concentrates, except monazite-	949	849	--	United States 249; Japan 220; Austria 200.
Oxides ----------	10	3	NA	United States 2; United Kingdom 1.
Metals including alloys:				
Cerium ----------	r 169	212	NA	Belgium-Luxembourg 99; United Kingdom 61.
Other ----------	--	--	NA	
Total ----------	r 169	212	NA	
Tin:				
Ore and concentrate ----------	20	--	NA	
Metal including alloys, all forms ------	2,669	3,494	3,801	United States 1,233.
Titanium:				
Ore and concentrate ----------	r 70	63	4	Mainly to Venezuela.
Oxides ----------kilograms--	--	20	NA	All to Ecuador.
Metal including alloys, all forms-do----	--	--	NA	
Tungsten:				
Ore and concentrate ----------	r 1,382	1,411	1,044	Sweden 895; France 180; Netherlands 160.
Metal including alloys, all forms ------	(4)	25	8	Mainly to Sweden.
Zinc:				
Ore and concentrate ----------	8,525	8,510	7,042	All to France.
Oxide ----------	10	13	NA	Mainly to Bolivia.
Metal including alloys, all forms ------	r 14	92	60	Mainly to Chile.
Other:				
Ores and concentrates ----------	4,860	--	NA	
Ash and residue containing nonferrous metals ----------	25	222	NA	Netherlands 170; United States 52.
Oxides, hydroxides, peroxides of metals, n.e.s ----------	95	70	NA	France 41; Argentina 13; Chile 10.
Metals including alloys, all forms:				
Pyrophoric alloys ----------	104	12	NA	Mainly to Canada.
Waste and sweepings of precious metals ----------	2	6	NA	Mainly to Spain.
NONMETALS				
Abrasives, natural, n.e.s.:				
Emery ----------	4	1	NA	Mainly to Argentina.
Grinding and polishing wheels and stones ----------	188	340	NA	Chile 131; Colombia 63.
Other ----------	1	(4)	NA	Mainly to Mauritania.
Asbestos ----------	--	1	--	All to Chile.
Barite and witherite ----------	46	--	--	
Boron materials, oxide ----------	7	--	--	
Cement ----------	120,312	46,738	51,683	Guyana 33,800; Bolivia 7,354.
Clays and clay products (including all refractory brick):				
Crude clays, n.e.s.:				
Bentonite ----------	203	1,160	600	Mainly to Bolivia.
Kaolin ----------	3,224	2,845	815	Uruguay 1,845; Chile 1,000.
Other ----------	r 1,220	1,416	475	Mainly to Uruguay.
Products:				
Refractory (including nonclay bricks) ----------	6,867	8,772	NA	Argentina 4,967; Poland 2,448.
Nonrefractory ----------	21,099	30,472	NA	Paraguay 21,150.
Diamond:				
Gem, not set or strung --------carats--	9,630	3,875	NA	United States 1,355; Netherlands 785; Japan 265.
Industrial ----------do----	2,455	10,570	NA	Argentina 9,070; United Kingdom 1,500.

See footnotes at end of table.

Table 2.—Brazil: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 [1]	Principal destinations, 1975
NONMETALS—Continued				
Fertilizer materials:				
Manufactured:				
Nitrogenous	--	2,000	30	Mainly to Uruguay.
Phosphatic	2,666	100	--	All to Paraguay.
Potassic	--	--	290	
Other, including mixed	1,672	8,140	NA	Mainly to Uruguay.
Ammonia	1	121	148	Uruguay 109; Paraguay 12.
Fluorspar	31,360	11,075	202	Japan 5,500; United States 5,250.
Graphite, natural	([4])	66	195	Argentina 50; Spain 10.
Lime	r 22	38	38	Bolivia 29; Paraguay 9.
Magnesite	42,594	40,237	27,919	Argentina 8,820; Venezuela 8,120; Chile 5,260.
Mica:				
Crude, including splittings and waste:				
Lepidolite	200	4,146	1,173	NA.
Other	2,613	1,100	2,799	United States 763; West Germany 180.
Worked, including agglomerated splittings	([4])	([4])	NA	Mainly to Peru.
Pigments, mineral:				
Natural, crude	200	--	NA	
Iron oxides, processed	12	38	NA	Paraguay 27; Uruguay 10.
Precious and semiprecious stones, except diamond, crude and worked:				
Agate ---kilograms	1,519,666	2,465,994	1,929,158	Japan 926,509; United States 802,244.
Amethyst ---do	315,856	249,015	182,324	United States 69,383; West Germany 65,725.
Aquamarine ---do	1,528	1,438	559	Japan 769; West Germany 504.
Cat's-eye ---do	2	1	([5])	Mainly to Japan and United States.
Citrine ---do	24,267	24,049	24,250	West Germany 7,622; Japan 5,722.
Emerald ---do	1,963	2,293	2,991	United States 784; India 685.
Garnet ---do	1,584	307	211	Mainly to Japan.
Opal ---do	222	77	513	Australia 47; Hong Kong 16.
Sapphire ---do	1	--	([4])	
Topaz ---do	1,860	2,714	4,743	West Germany 1,133; France 456.
Tourmaline ---do	1,863	422	2,838	West Germany 181; Japan 82.
Turquoise ---do	51	101	([4])	Mainly to United States.
Other ---do	r 389,992	436,944	742,433	West Germany 185,493; Japan 69,277.
Quartz crystal:				
Electronic and optical grade	r 7,658	1,672	1,965	West Germany 421; East Germany 280.
Other	r 147	177	73	West Germany 64; Italy 54; France 34.
Salt	18	32,421	1	Mainly to Uruguay.
Sodium and potassium compounds, n.e.s	10,773	7,777	NA	Mainly to Argentina.
Stone, sand and gravel:				
Dimension stone:				
Crude and partly worked	49,027	25,635	NA	Italy 11,944; Japan 6,680; Spain 2,447.
Worked	2,859	8,355	NA	Italy 4,263.
Dolomite, chiefly refractory grade	1,495	558	875	All to Argentina.
Quartz and quartzite	41	192	17	Belgium-Luxembourg 100; Netherlands 89.
Sand, excluding metal bearing	101	1,934	2,763	Mainly to Paraguay.
Sulfur:				
Sulfur dioxide ---kilograms	68	--	NA	
Sulfuric acid, oleum	4	90	289	Do.
Talc, steatite, soapstone, pyrophyllite	489	209	247	Argentina 100; Colombia 60.
Vermiculite	--	1	--	All to Chile.

See footnotes at end of table.

Table 2.—Brazil: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 [1]	Principal destinations, 1975
NONMETALS—Continued				
Other:				
Crude	53	90	NA	All to France.
Slag, dross, and similar waste, not metal bearing:				
From iron and steel manufacture	28	15	NA	All to Argentina.
Slag and ash, n.e.s	--	--	NA	
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	3	(4)	NA	Mainly to Mexico.
MINERAL FUELS AND RELATED MATERIALS				
Carbon black	--	6	NA	Mainly to Bolivia.
Coke and semicoke of coal, lignite, peat	5	--	NA	
Hydrogen and rare gases ——kilograms	2,296	1,891	NA	Uruguay 1.
Petroleum:				
Crude and partly refined thousand 42-gallon barrels	12,102	8,079	3,209	Bahamas 6,557; Uruguay 1,156.
Refinery products:				
Gasoline:				
Aviation ——do	--	563	NA	Argentina 337; Colombia 196.
Motor ——do	175	956	NA	United States 365; Bermuda 200.
Jet fuel ——do	159	123	NA	Mainly to Peru.
Kerosine ——do	r 283	281	NA	Trinidad and Tobago 214; Pakistan 67.
Distillate fuel oil ——do	816	2,975	NA	Argentina 1,945; United States 321.
Residual fuel oil ——do	1,701	2,156	NA	United States 1,491; Uruguay 315.
Lubricants (including grease) do	(4)	(4)	NA	Mainly to Paraguay.
Other:				
Liquefied petroleum gas do	169	804	NA	Argentina 497; Uruguay 195.
Mineral jelly and wax do	(4)	3	NA	Mainly to Peru.
Bitumen ——do	9	71	NA	Bolivia 35; Mauritania 30.
Bituminous mixtures ——do	4	1	NA	Mainly to Bolivia.
Pitch ——do	12	15	NA	All to Argentina.
Petroleum coke ——do	--	5	NA	Bolivia 3; Paraguay 2.
Not specified ——do	65	32	NA	Venezuela 22; Italy 10.
Total ——do	r 3,393	7,980	NA	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	--	116	NA	Argentina 79; Uruguay 20; Paraguay 16.

r Revised. NA Not available.
[1] DNPM. Anuario Mineral Brasileiro—1977. 282 pp.
[2] Includes alumina gel.
[3] Includes some tantalum.
[4] Less than ½ unit.
[5] Quantity not available. Value was $599,000.

Table 3.—Brazil: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 [1]	Principal sources, 1975
METALS				
Aluminum:				
Bauxite and concentrate	15,120	12,988	14,017	Guyana 8,342; United States 3,745; Japan 900.
Oxide (alumina) and hydroxide	1,930	10,674	3,335	Jamaica 10,000; West Germany 431.
Metal including alloys:				
Scrap	5,593	4,182	4,033	United States 2,777; West Germany 493.
Unwrought	81,388	64,848	57,783	Canada 12,398; France 10,180; Norway 8,258.
Semimanufactures	r 16,626	12,022	NA	United States 5,955; France 1,644.
Antimony:				
Ore and concentrate	1,738	1,597	1,721	Bolivia 668; Thailand 531; Chile 204.
Metal including alloys, all forms	209	47	129	West Germany 19; Belgium-Luxembourg 15.
Arsenic:				
Trioxide, pentoxide, acids	851	749	1,353	France 337; West Germany 190; Mexico 149.
Metal including alloys, all forms	[2] 44	17	38	Sweden 11; Japan 3.
Beryllium metal including alloys, all forms—kilograms	([3])	([3])	NA	All from United States.
Bismuth metal including alloys, all forms	26	21	NA	Mexico 13; Netherlands 5.
Cadmium metal including alloys, all forms	176	74	NA	Mexico 58; Peru 8; West Germany 7.
Chromium:				
Chromite	30,686	9,300	12,232	Philippines 5,000; Republic of South Africa 4,084.
Oxide and hydroxide	394	113	438	West Germany 40; Poland 30; United States 23.
Metal including alloys, all forms	39	18	35	Japan 10; United States 6.
Cobalt:				
Oxide and hydroxide	82	50	93	Belgium-Luxembourg 37; United Kingdom 10.
Metal including alloys, all forms	198	148	289	Belgium-Luxembourg 100; United States 39.
Columbium and tantalum: Tantalum metal including alloys—kilograms	46	52	NA	Mainly from United States.
Copper:				
Copper sulfate	9,693	2,212	3,718	Chile 1,356; Mexico 335; United Kingdom 269.
Metal including alloys:				
Scrap	4,573	215	266	United States 188; Panama 19.
Unwrought	131,903	127,946	150,552	Chile 42,066; United States 28,508; Zaire 17,650.
Semimanufactures	3,048	2,350	2,001	United States 714; West Germany 480.
Gold metal, unworked or partly worked—troy ounces	47,133	111,788	126,995	United States 58,643; United Kingdom 27,682.
Iron and steel:				
Ore and concentrate	52	17	7	Republic of South Africa 9; United States 7.
Metal:				
Scrap	37,306	17,587	2	United States 11,196; Surinam 3,452; Canada 2,747.
Sponge iron, powder, shot	7,987	4,207	NA	United States 3,089; West Germany 821.
Ferroalloys	14,875	24,226	2,439	United States 12,409; Surinam 3,452; Canada 2,771.
Steel, primary forms	r 641,252	860,011	NA	Japan 344,831; Italy 198,954.

See footnotes at end of table.

Ingots, high carbon and alloy steel	1,553	783	NA	Canada 505; Japan 205.
Lead:				
Oxides	1,292	678	1,793	Mexico 605; United States 39; West Germany 30.
Metal including alloys, all forms	r 27,288	16,708	9,199	Mexico 11,660; Canada 2,985; Peru 1,048.
Magnesium metal including alloys, all forms	12,003	10,630	10,356	Norway 5,600; United States 508.
Manganese:				
Ore and concentrate	12,205	17,682	19,871	Gabon 14,012; Mexico 1,471.
Oxides	1,542	101	108	France 85; United States 10.
Metal	332	338	510	Republic of South Africa 192; Japan 82.
Mercury 76-pound flasks	r 4,910	5,308	5,729	Mainly from Mexico.
Molybdenum:				
Ore and concentrate	1,401	1,063	1,413	United States 642; Chile 272; Canada 149.
Metal including alloys, all forms	38	20	33	United States 10; West Germany 3; Netherlands 3.
Nickel:				
Matte, speiss, similar materials	--	(3)	--	All from West Germany.
Metal including alloys:				
Scrap	10	--	--	
Unwrought	3,209	1,500	NA	United States 746; Finland 165; West Germany 136.
Semimanufactures	1,782	923	1,068	Sweden 412; United States 132.
Platinum-group metals including alloys, all forms:				
Platinum troy ounces	6,366	6,687	3,408	West Germany 3,537; United States 1,222.
Other, including platinum alloys thousand troy ounces	34	32	NA	West Germany 21; Netherlands 5.
Rare-earth metals	2 2	--	--	
Selenium, elemental	2 14	13	NA	United States 4; West Germany 2.
Silicon metal	2 4,158	2,291	NA	Norway 917; United States 315; France 274.
Silver metal including alloys thousand troy ounces	3,764	2,480	3,687	West Germany 965; United States 792.

See footnotes at end of table.

Table 3.—Brazil: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 [1]	Principal sources, 1975
METALS—Continued				
Sodium metal	30	37	NA	Mainly from West Germany.
Tellurium, elemental ——kilograms	[2] 627	11	NA	Do.
Tin:				
Ore and concentrate	6,015	3,137	1,493	Bolivia 2,502; Belgium-Luxembourg 243.
Oxides	160	122	141	West Germany 67; United Kingdom 46.
Metal including alloys, all forms	10	34	10	Panama 20; United States 8.
Titanium:				
Ore and concentrate:				
Ilmenite	35,880	15,233	41,250	Mainly from Australia.
Rutile	3,213	3,216	4,620	Netherlands 1,579; Australia 1,046.
Oxides	3,299	1,300	4,368	West Germany 634; France 320.
Metal including alloys, all forms	41	56	156	Italy 24; United States 24.
Tungsten metal including alloys, all forms	33	21	25	Portugal 6; United States 6.
Uranium and thorium oxides, including rare-earth oxides	162	133	NA	Mainly from United States.
Vanadium:				
Oxides	560	330	NA	Republic of South Africa 279; West Germany 28.
Metal including alloys, all forms	26	8	NA	Mainly from United States.
Zinc:				
Ore and concentrate	24,237	24,836	--	Canada 20,032; United States 4,804.
Oxides	192	98	121	West Germany 67; United States 30.
Metal including alloys:				
Unwrought	63,468	50,332	54,173	Peru 14,636; Mexico 13,647; United States 5,636.
Semimanufactures	267	312	20	Norway 74; United States 63.
Zirconium and hafnium:				
Ore and concentrate	7,891	6,903	10,864	Australia 4,865; United States 1,892.
Metal including alloys, all forms	1	[3]	--	Mainly from West Germany.
Other:				
Ash and residue containing nonferrous metals	2,022	2,241	NA	United States 1,895; Nigeria 150.
Oxides, hydroxides, peroxides of metals, n.e.s	1,793	1,631	NA	West Germany 638; United States 554.
Waste and sweepings of precious metals ——kilograms	26	22	NA	West Germany 12; Italy 9.
Metals including alloys, all forms:				
Alkali and alkaline-earth metals, n.e.s ——do	7	1	NA	Mainly from France.
Pyrophoric alloys	6	6	NA	Do.
Base metals including alloys, all forms, n.e.s	[r] 3	2	NA	West Germany 1; United States 1.
NONMETALS				
Abrasives, natural, n.e.s.:				
Pumice, emery, natural corundum, etc	1,157	999	626	United States 482; Italy 454.
Dust and powder of precious and semiprecious stones ——kilograms	196	207	3	United States 82; Ireland 59; West Germany 32.
Grinding and polishing wheels and stones	801	888	NA	West Germany 280; United States 244.

See footnotes at end of table.

COMMODITY REVIEW

METALS

During 1976, the Conselho Nacional de Não-Ferrosos e Siderúrgia (CONSIDER) approved seven projects in the nonferrous industry, four of which involve expansion of currently operating plants as shown in table 4. Total investment required was estimated at over $1 billion. The Brazilian "content index" relating to local procurement for these projects was set at 72%. The primary capacity and demand projected to 1980 by CONSIDER for the nonferrous metals group are given in table 5.

Table 4.—Brazil: Nonferrous projects approved by CONSIDER in 1976

Company	Location	Capacity (thousand metric tons per year)		Scheduled startup date	Estimated cost (millions)
		Current	New or expanded		
Aluminum:

Aluminum.—The Mineração Rio do Norte S/A, a consortium led by Cia. Vale do Rio Doce (CVRD), continued construction of the port facility and other infrastructure for the Trombetas project just north of the Amazon River. Initial shipments of bauxite were scheduled for 1979 and an output level of 3.3 million tons per year was expected by 1982. During the year, Rio Tinto-Zinc Corp. Ltd. dropped out of the Trombetas project.

A Japanese-Brazilian agreement was reached in 1976 to proceed with the aluminum smelter project of Albras, a joint venture of CVRD and the Light Metal Smelter Association of Japan. The scaled-down 320,000-ton-per-year smelter and associated alumina facility were estimated to cost $940 million and $400 million, respectively. Initial alumina production was scheduled for the early 1980's, with a significant part of the output destined for export to Japan.

During the year, an estimated 100-million-ton bauxite deposit containing 40% alumina was discovered near the Carajás iron ore reserve in Pará State. CVRD geologists announced the discovery of a 200-million-ton bauxite deposit in Paragominas, Pará.

The Companhia Brasileira de Alumínio (CBA) announced plans to double its current 40,000-ton-per-year aluminum capacity to 80,000 tons per year by 1978 at a cost of $120 million. Further expansion to 120,000 tons per year was projected by 1982. The Aluminum Co. of Canada Ltd.'s (Alcan) Pindamonhangaba smelter near São Paulo was being expanded from a capacity of 25,000 tons to 50,000 tons per year by 1981.

The 15% increase in the production of primary aluminum in 1976 reflected the increased capacity of Alcominas from 30,000 tons to 60,000 tons per year.

Beryllium.—DNPM reported a 450% increase in measured reserves of beryl, primarily in the municipalities of Salinópolis and San Jose da Safira in the State of Minas Gerais.

Chromium.—Mine production of chromite increased 26% to a record level of 887,000 tons of crude ore, compared with an output of 24,000 tons a decade ago. Beneficiated output, however, declined 14%. In 1976 Brazil exported 47,460 tons of ferrochromium (valued at $20 million f.o.b.), an increase of 38% in tonnage. Brazil's major chromite producer, Companhia de Ferro-Ligas da Bahia S/A (FERBASA), produced 60,000 tons of high-carbon ferrochrome and 6,000 tons of the low-carbon alloy in 1976.

A joint venture of FERBASA and Japanese interests, Companhia de Mineração Serra da Jacobina (SERJANA), was set up to increase production of concentrate an additional 150,000 tons per year over a 10-year period.

During 1976, measured reserves of chromite increased 26% to 6.6 million tons located mostly at Campo Formoso in the State of Bahia. DNPM reported the total of measured, indicated, and inferred chromite ore reserves at 23 million tons. Prospecting activities were centered in Bahia. A West German firm, Kloeckner Und Co., set up a joint venture with FERBASA, called Ferklock, to explore and exploit FERBASA's chrome deposits in Bahia.

Columbium.—Pyrochlore ore production increased 30%, but was below the record high of 1973. Exports of ferrocolumbium in 1976 increased sharply 121% to 9,155 tons. Valued at $47.4 million, they represented 61% of all ferroalloys exported by Brazil in 1976. The United Kingdom and France were the major markets.

The major producer of pyrochlore concentrate and ferrocolumbium, Companhia Brasileira de Metalurgia e Mineração (CBMM), was planning expansion from 36,000 tons to 48,000 tons per year of pyrochlore concentrate and from 12,000 tons to 24,000 tons per year of ferrocolumbium by 1980. Mineração Catalão de Gerais S/A, an affiliated company of Brasimet Comercio e Industria S/A (BRASIMET), located in Minas Gerais State, started operations in 1976 and expected to be at full capacity of 4,000 tons per year of concentrate by 1977.

Copper.—Mine production of copper ore declined sharply, continuing the strong downward trend since the peak year of 1971 when 504,000 tons of copper ore and 5,100 tons of primary copper were produced. Brazil continued to be heavily dependent on imports of primary copper.

Caraíba Metais S/A, a subsidiary of Insumos Basicos S/A-Financiamento e Participações (FIBASE), was negotiating a loan from the Inter-American Development Bank for partial financing of the Caraíba

complex in northeastern Bahia. Besides the copper smelter that was under construction, the project included investments in open pit and underground mine facilities scheduled to produce 100,000 tons per year of concentrates by the early 1980's. The smelter located at Camaçari, Bahia, would also be supplied from the existing Camaquã mine in Rio Grande do Sul and the Pedra Verde mine in Ceará.

Exploration for copper was intense in 1976. CPRM as well as private companies focused significant efforts on the States of Bahia, Ceará, and Rio Grande do Sul. New discoveries, especially in the Curaçá Valley (400 kilometers northeast of Salvador, Bahia) and Rio Grande do Sul, elevated Brazil's total reserves of copper ore to 134 million tons with an average grade of 1.23%.

Iron Ore.—In 1976 Brazil was the world's third largest producer and the second largest exporter of iron ore. Brazil accounted for 10% of world output of iron ore. Although production of run-of-mine ore decreased slightly in 1976, output of beneficiated ore increased 4%. The impressive growth over the past decade in the production and export of iron ore by Brazil is shown in table 6. In 1976 Japan with 29% was the major market for Brazilian iron ore exports, followed by West Germany (18%) and the United States (11%). Internal consumption reached 12.7 million tons, a 16% increase over the 1975 figure.

Brazil's production of ore pellets from the two plants operated by CVRD at Tubarão achieved a record high of 4.6 million tons, a 7% increase over the 4.3 million tons produced in 1975.

There were 139 large and small iron ore producers, of which 29 had production exceeding 100,000 tons in 1976. The "Iron Quadrangle" in the State of Minas Gerais with 75% of the measured reserves continued as the only significant area of production. Table 7 shows nine major producers, which together accounted for 96% of Brazil's production.

Table 6.—Brazil: Production and exports of iron ore

Year	Production [1] (thousand metric tons)	Exports			
		Quantity (thousand metric tons)	Percent change from previous year	Value (thousands)	Average export price (per metric ton)
1967	r 21,723	14,279	+11	$102,783	$ 7.20
1968	r 24,532	15,050	+5	104,450	6.94
1969	r 27,571	21,478	+43	147,400	6.86
1970	r 36,381	27,943	+30	209,600	7.50
1971	37,486	31,020	+11	237,000	7.64
1972	46,471	30,512	−2	231,708	7.59
1973	r 55,019	44,963	+47	362,811	8.07
1974	76,071	59,439	+32	571,159	9.61
1975	89,894	72,522	+22	920,891	12.70
1976	[2] 94,087	67,138	−7	995,473	14.83

r Revised.
[1] Data for years prior to 1972 cover crude or run-of-mine ore; those for 1972 and subsequent years cover beneficiated ore plus ores of direct-shipping grade.
[2] Output of beneficiated ore was 92,610,645 tons.

Table 7.—Brazil: Major producers and exporters of iron ore
(Million metric tons)

Company	Mine production		Exports	
	1975	1976	1975	1976
CVRD	52.2	49.9	47.3	[1] 47.3

Other	14.1	10.9	25.2	1.8
Total	89.9	94.1	72.5	67.1

NA Not available.
[1] Total exports by CVRD of 54 million tons include 6.7 million tons exported for the account of other producers.
[2] Includes 3.5 million tons shipped by CVRD which is not added into total.
[3] Includes output of Cia. de Mineração Serra da Moeda.
[4] ACESITA produces for its own use as steelmaker.

CVRD maintained its position as the world's largest producer and exporter of iron ore. By yearend CVRD held firm long term contracts for the delivery of iron ore totaling 727 million tons.[3] CVRD acquired a controlling interest in Minas d'El Rey Don Pedro S/A, thus increasing the company's reserves in Minas Gerais. Together with Kawasaki Steel Corporation, CVRD established Minas da Serra Geral S/A to exploit an iron ore deposit at Capanema, Minas Gerais. The $150 million mine project is designed to produce 11 million tons beginning in late 1981.

The Itavale project, a joint effort of CVRD and ACESITA to mine 7 million tons per year from the Periquito mine in the Iron Quadrangle, entered into operations during the year. The measured ore reserves at the Periquito mine included 170 million tons of hematite averaging 67% iron and 200 million tons of itabirite averaging 50% iron. Indicated and inferred reserves of hematite and itabirite amounted to 700 million tons. At Caué, CVRD's largest mine, ore reserves totaled 1,116 million tons including 385 million tons of hematite grading over 64% iron and 731 million tons of itabirite grading 45% to 50% iron. The large Serra dos Carajás project in Pará State, a joint venture with the United States Steel Corporation, remained undefined at yearend.

At yearend, CVRD was preparing the inauguration of the Cia. Italo-Brasileira de Pelotização (ITABRASCO) pellet plant at the Tubarão complex designed primarily for exports to European markets. This joint venture with the Italian Società Finanziaria Siderurgica S.p.A. (Finsider) group was expected to produce 3 million tons of pellets in 1977.

Additional CVRD pelletization plants at Tubarão included that of Cia. Nipo-Brasileira de Pelotização (NIBRASCO), with Japanese interests, for 6 million tons per year and that of Cia. Hispano-Brasileira de Pelotização (HISPANOBRAS), with a Spanish group, for 3 million tons per year. Construction of civil works of the HISPANOBRAS plant, scheduled to begin operations in mid-1978, began in August 1976.

In 1978, CVRD was expected to reach a production of 60 million tons of iron ore including 6 million tons of pellets. By 1981 CVRD's annual capacity was expected to exceed 100 million tons including 25 million tons of pellets.

New capacity and expansion of current capacity actively underway during the year are summarized in table 8.

[3] CVRD Annual Report 1976, p. 2.

Table 8.—Brazil: Iron ore projects underway in 1976

Company	Mine	Capacity (million metric tons per year)		Startup date	Cost (millions)
		Current	New or expanded		
CVRD	Conceição, Dois Córregos.	14.0	24.7	1978	[1] $220

FERTECO	Fábrica [2]	3.5	5.0	1977	130
SAMARCO Mineração S/A.	Germano [3]	--	7.0	1977	564

NA Not available.
[1] Covers only the ore-processing complex at Conceição.
[2] An additional 2.5-million-ton-per-year pellet plant was to come onstream in 1977 at Fábrica.
[3] A 5-million-ton-per-year pellet plant was under construction at Pôrto Ubu, Espírito Santo.

Iron and Steel.—The production of crude steel increased 10.4%, continuing the strong uninterrupted upward trend of the past decade. This rise compares favorably with the 5% growth in world steel output. Imports of steel products decreased significantly to less than half those of 1975. Steel exports valued at $91 million went chiefly to Nigeria (30%) and the United States (23%). Brazil's demand for steel projected for 1980 ranges from 17 million to 19 million tons and for 1985, from 32 million to 38 million tons.

Brazil's steel industry in 1976 experienced many uncertainties. Financing was deemed inadequate to support the country's ambitious steel expansion programs, especially those of the Government-owned producers, whose budgets were under restraint to control inflation. Construction work in the transportation program Ferrovia do Aço (Railway of Steel), designed to double Brazil's iron and steel rail-carrying capacity, was seriously retarded during the year. In addition, Government and private steel manufacturers felt that domestic steel prices were low considering the high and increasing costs of imported raw materials.

Table 9 provides a summary of the most important projects with new or expanded steel production facilities. By yearend, stage II of the master plan for expansion of the major Government-owned producers CSN, Usinas Siderúrgicas de Minas Gerais (USIMINAS), and Companhia Siderúrgica Paulista (COSIPA) was nearing completion. Of special note within stage II were the commissioning of the blast furnaces of CSN and COSIPA and the continuous-casting plant of USIMINAS. Steel output by USIMINAS in 1976 of 2.3 million tons was 33% above the 1975 output. COSIPA encountered major difficulties with its stage II expansion. COSIPA's significant drop in production was owing in part to a major accident and fire. As for stage III of the master plan, procurement of equipment underway in 1976 was expected to be completed in 1977.

The Itaqui steel project, a joint Brazil-Japan steel plant to be located at the port of Itaqui in Maranhão State, was shelved early in 1976 at Japanese request, owing to unfavorable world market conditions.

CONSIDER completed the main studies which make up Brazil's steel master plan. On the basis of these studies, CONSIDER approved resolutions to support steel-making based on scrap and wood charcoal, aimed at decreasing Brazilian dependence on foreign reductants.

Table 9.—Brazil: Active steel projects, 1976

Company or project	Production (metric tons)	New or expanded capacity (million metric tons)	Startup date	Observations
CSN	1,366,200	4.5	NA	Stage II was under construction for 2.5 million tons.
USIMINAS	2,345,300	3.5	1979	A new plate mill is to be ready in 1977.
COSIPA	788,700	3.5	delayed	Stage II output of 2.3 million tons is planned for 1977.
Cia. Siderúrgica da Guanabara (COSIGUA).	341,300	.5	NA	The Purofer direct-reduction plant is scheduled for 1977.
Tubarão steel project (Siderúrgica Brasileira S/A (SIDERBRAS), CVRD, Finsider, Kawasaki).	--	3.0	1982 (stage I)	In 1976, SIDERBRAS signed agreements with Finsider and Kawasaki for this joint venture.

NA Not available.

Lead.—The 12% increase in primary and secondary metallic lead output was a result of more efficient use of installed smelter capacities and improved technology. Output of primary lead increased 16%. Mine production of lead ore continued its downward trend after the peak output of 1972 when 374,200 tons of lead ore was produced. Imports of lead concentrate, primary lead, and lead products also continued a downward trend. Imports of lead concentrate in 1976 were mostly from Canada (54%) and the United States (46%). Refined lead imports were from Mexico (50%) and Peru (34%). Prospecting efforts for lead in 1976 were centered in northern Brazil.

Manganese.—Despite an increase in mine production of manganese ore to a new high of 2,881,000 tons for the recent decade, the output of beneficiated ore decreased 21%. Tonnage of ore exports declined 31% while the f.o.b. export value declined 18% to $66 million. Apparent domestic consumption was 400,000 tons.

Industria e Comercio de Minerios S/A (ICOMI) continued as the major producer and exporter of manganese ore from the Amapá Territory. ICOMI is jointly owned by Cia. Auxiliar de Empresas de Mineração (CAEMI) (51%) and Bethlehem Steel Corporation (49%). The ore and pellets are shipped out of the port of Santana on the northern bank of the Amazon River delta a few miles west of the small town of Macapá, Amapá Territory. The pellet plant has enabled the utilization of previously unsold fines and low-grade ores. ICOMI's pellet capacity was 212,000 tons per year. ICOMI shipped 1,047,000 tons of ore in 1976 including 149,300 tons of pellets, compared with 1,254,055 tons including 100,500 tons of pellets in 1975. The 1976 shipments went to the United States and 15 other countries. Domestic sales in 1976 were about 120,000 tons.

In 1976, the Urucum deposits near Corumbá, Mato Grosso State, were a small but growing source of manganese ore as indicated in the following tabulation, in thousand metric tons:

State or Territory	Production		Measured ore reserves	Average grade (percent)
	1975	1976		
Amapá	1,671	1,218	25,270	38
Minas Gerais	335	334	7,550	32
Bahia	101	67	2,410	32
Mato Grosso	1	46	14,700	45
Goiás	47	30	560	45
Espírito Santo	1	1	NA	NA
Total[1]	2,156	1,696	50,500	39

NA Not available.
[1] Data may not add to totals shown because of independent rounding.

Urucum Mineração S/A, formed in April by a Brazilian group, produced 36,000 tons of ore grading 46% manganese from its mines in Urucum. The new company was organized by CVRD, the State-owned Cia. Matogrossense de Mineração (METAMAT), and the privately-owned Cia. Vale do Paraupeba (Alcindo Vieira group), each with one-third interest. The ore was previously mined by SOBRAMIL, a subsidiary of the Brazilian-owned Chamma group, in association with Companhia Meridional de Mineração (MERIDIONAL) of United States Steel interests, but there has been no mining since 1972. Before the deposits can be fully developed, problems of transportation and high alkali and phosphorus content must be overcome. Output was expected to be for both domestic consumption and export, with mining to start before yearend.

MERIDIONAL produced 220,000 tons of 39% manganese ore at its Morro da Mina mine at Lafaiete, Minas Gerais. The output from Minas Gerais was primarily for the domestic steel industry. Five companies in Brazil produced 98,738 tons of low- and high-carbon ferromanganese in 1976.

Cia. Paulista de Ferro-Ligas, a ferroalloy producer headquartered in São Paulo, was readying a new plant at Corumbá for production of ferromanganese from Urucum ore by mid-1977. The plant will use two 4-megavolt-ampere furnaces in a two-step process expected to solve the high-phosphorus, high-alkali problem, while producing 24,000 tons per year of high-carbon ferromanganese and silicomanganese. Approximately one-half of the production will be for export. Company plans also include two similar furnaces to begin producing ferromanganese and silicomanganese at Macapá, Amapá, by yearend 1977. The annual capacity of this plant would also be 24,000 tons.

In June, Construtora Alcindo Vieira CONVAP S/A (CONVAP), a Brazilian contracting company, together with METAMAT formed a new company, Cia. Matogrossense de Ferro-Ligas (FERMAT), with plans to install five 20-megavolt-ampere furnaces by 1982 in a new plant at Três Lagoas, near the Jupiá hydroelectric plant northwest of São Paulo at the eastern boundary of the State of Mato Grosso. Plans called for the first two furnaces to begin production of high-carbon ferromanganese and silicomanganese from Urucum ore in 1981, half for domestic consumption and half for export. Research was conducted in 1976 on the best metallurgy to use on the iron-rich, high-alkali Urucum ore.

Nickel.—In 1976 there was a large increase in the mine output of lateritic nickel ore. The average grade mined was 1.25% nickel. The 6% decrease in the nickel content of ferronickel produced resulted from the closing of Cia. de Niquel do Brasil and the decrease in the grade of ore mined by the major producer in Minas Gerais, Morro do Niquel S/A-Mineração, Industria e Comercio, a subsidiary of BRASIMET. Brazil produced no primary refined nickel. Construction was underway on a project of Companhia Niquel Tocantins (CNT) of the Votorantim group in Niquelândia, Goiás, where estimated reserves of 340,000 tons of contained nickel in 20 million tons of ore will be used to produce 5,000 tons per year of electrolytic nickel by 1978.

Baminco Mineração e Siderúrgia S/A, a subsidiary of International Nickel Co. of Canada Ltd. (INCO), announced the discovery of promising nickel ore reserves in the São Félix do Xingu region of Pará State. CVRD prepared its mining plan with respect to its nickel discovery in São João do Piauí, Piauí State, Brazil's second-richest known nickel area after Goiás.

Tin.—DNPM reported a 45% increase in measured tin ore (cassiterite) reserves to 79,000 tons averaging 65% tin. The increases were primarily in the Pôrto Velho area of Rondônia.

Output of beneficiated tin ore increased 18% in 1976 to a record high level. In line with this increase, Brazil imported a reduced amount of tin concentrate, primarily from Bolivia, to feed the country's smelters. During the year, 33 companies in Brazil's National Tin Association severed relations with the Patiño-controlled Companhia Estanífera do Brasil (CESBRA) group to form a new tin association.

Titanium.—DNPM reported a 100% increase in measured reserves of titanium ore, which at the end of 1976 were as follows: Anatase, 57 million tons; ilmenite, 3.5 million tons; and rutile, 91,000 tons. Production of ilmenite concentrate increased sharply 218% but did not exceed

the peak output of 1970 when 20,644 tons of beneficiated ore was produced.

Tungsten.—Mineração Tungstenio do Brasil (MTB), a subsidiary of Union Carbide Corp., continued to develop new ore deposits near Currais Novos in Rio Grande do Norte. MTB expected to begin production in 1977 of up to 7,000 tons of ore per month to yield 500 tons of scheelite concentrate per year. Government sources indicated that the MTB output combined with increased production from the tungsten mines of BRASIMET, owned by private Brazilian interests and the Hochschild Group, would enable Brazil to increase its production 25% per year during the 1977–80 period.

During 1976, Government geologists working in northeastern Brazil located a minimum of 44,000 tons of economically recoverable tungsten metal in deposits ranging from 0.3% to 2.6% in grade. For 1976, DNPM reported a major increase in the measured reserves of tungsten to 4,708 tons of contained metal compared with 1,181 tons reported in 1975.

Zinc.—Brazil continued the strong upward trend in its production of primary zinc. The 37% increase in 1976 to 43,154 tons contrasts sharply to the 1,800 tons produced in 1967. Nonetheless, Brazil produced less than one-half of the apparent domestic consumption of 95,000 tons. The increase in output was attributed to Cia. Mineira de Metais (CMM), which was increasing installed capacity from 25,000 tons to 50,000 tons per year. In 1976, CMM began to produce special high grade zinc totaling 3,400 tons with a rated capacity of 10,000 tons expected to be ready in 1977.

Zirconium.—Production of zirconium concentrate continued to be less than the peak output of 1971 of 4,240 tons (revised). DNPM reported a 430% increase in measured reserves of zirconium ore to 815,000 tons in the new area of Mataraca, Paraíba State, and São João da Barra in Rio de Janeiro State.

NONMETALS

As a result of stepped-up activity in exploration by CPRM and mining companies, DNPM reported substantial increases in the measured reserves of several nonmetallic ores: Barite (2,300%), coal (90%), diamond (37%), feldspar (28%), graphite (108%), lithium (33%), mica (95%), quartz (214%), slate (6,700%), and vermiculite (198%). The extent of a large deposit of carnallite for potassic fertilizers in Brazil's Northeast region was announced in 1976.

Fertilizer Materials.—Brazil continued to depend heavily on imports to meet its demand for fertilizer materials. In 1976, 4.04 million tons (a 38% increase) of phosphatic, nitrogenous, and potassic fertilizer materials was imported at a cost of $268 million. Brazil's output of these materials amounted to 1.49 million tons. Output of natural phosphates (P_2O_5 content) increased 136%, manufactured phosphates 58%, and nitrogenous fertilizers 14%. During 1976, internal fertilizer prices were below world prices and in December a 40% price subsidy was removed, causing a 53% increase in average prices. DNPM specified for the first time the reserves of potassic fertilizer ore in the State of Sergipe in the localities of Capela-Siriri, Japaratuba-Pirambú, and Pirambú-Carmópolis. Measured reserves of carnallite were stated at 2.0 billion tons averaging about 10% potash, indicated reserves at 3.5 billion tons, and inferred reserves at 1.4 billion tons.[4] Late in 1976, the Brazilian Government indicated its plans to create another subsidiary of PETROBRAS, Petrobras Mineração S/A, to exploit the potash deposits in Sergipe.

As shown in table 10, several projects were under construction or being planned to exploit Brazil's abundant phosphate resources. Brazil's measured ore reserves were estimated at 1.1 billion tons. Brazil was expected to meet its requirements for phosphate rock entirely from domestic sources by the mid-1980's.

Petrobras Fertilizantes S/A (Fertibras), established by PETROBRAS in March, finalized plans to produce nitrogenous fertilizers in a plant to be located in Rio Grande do Sul. Output of ammonia and urea were projected at 1,200 tons and 800 tons per day, respectively, by 1980. Production of nitrogenous fertilizer products in Brazil was chiefly under the control of subsidiaries of PETROBRAS.

Quartz Crystal.—Brazil, which has 95% of the world's known reserves of natural

Total		1,127	3,900	

NA Not available.
[1] Owned 40% by Serrana S/A de Mineração, 40% by the Itaú group, and 20% by FIBASE.
[2] CVRD's fertilizer complex will produce per year: 330,000 tons of monoammonium phosphate, 340,000 tons of triple superphosphate, and 560,000 tons of phosphoric acid.
[3] Equity composition established in 1976: Cia. Agricola de Minas Gerais S/A (CAMIG) 20%, Fertibras 20%, FIBASE 20%, and private capital 40%.

quartz crystal, produced an estimated 1 ton of electronic-grade quartz crystal, 1,964 tons of lower-grade crystal-lasca (lump quartz, the feedstock for cultured quartz growth), and 73 tons of other grades. The total crystal export quota for 1976 was 3,000 tons. The 1,964 tons of exports of crude crystal and lasca in 1976 went primarily to the U.S.S.R. (51%), Japan (11%), and East Germany (10%).

XTAL do Brasil initiated experimental production of electronic-grade cultured quartz to compete directly in the world market and projected full-scale operation by early 1977.

MINERAL FUELS

In May, the Government established a requirement to prepare a National Energy Balance, an analysis of Brazil's energy sector, to be undertaken annually. The following percentage distribution of Brazil's sources of overall energy consumption for selected years shows Brazil's intention to decrease its dependence on petroleum in favor of other domestic energy alternatives:

Year	Petroleum, natural gas, alcohol[1]	Water power	Bagasse, firewood, charcoal	Coal	Uranium
1966	33.6	16.5	46.1	3.8	--
1970	38.5	18.9	38.7	3.9	--
1976	43.8	23.8	28.9	3.5	--
1980	43.4	27.6	23.3	4.8	0.9
1986	[2] 40.8	31.8	16.0	7.4	4.0

[1] Includes shale oil in 1986.
[2] The alcohol portion is 1.7%.

Source: Ministry of Mines and Energy. National Energy Balance—1977, Federative Republic of Brazil. Pp. 16–17.

Alcohol Energy.—The Federal Government was planning a significant expansion of alcohol production from sugarcane and manioc. In use as a fuel supplement since 1933, alcohol-gasoline mixtures represented about 3% of the gasoline sold in 1976. Brazil's goal was to produce enough alcohol so that all gasoline consumed in the early 1980's would consist of 20% alcohol and 80% petroleum. It was estimated that this mixture of alcohol and gasoline ultimately would cut Brazil's oil imports 10%. Re-

search programs designed to test the feasibility of all-alcohol automobile engines were underway. The 20–80 mixture would require Brazil to more than quadruple its alcohol production. This goal would also require a diversion of 2% of Brazil's 110 million acres of farmland to the production of sugarcane and manioc for industrial alcohol.

Coal.—Prospecting for coal was active during the year. As part of an intensive program, "Projeto Carvão," DNPM discovered 80 million tons of coking-grade coal at Gravataí and 300 million tons at Faxinal, both in Rio Grande do Sul. In Araranguá-Tôrres, Santa Catarina State, 59 million tons was discovered. The Ministry of Mines and Energy reported that at yearend Brazil's coal reserves increased to 20.1 billion tons, a 34% increase over 1975 reserves. Official estimates of metallurgical coal reserves totaling 3.6 billion tons were distributed as follows: Rio Grande do Sul, 2.8 billion tons; Santa Catarina, 760 million tons; and Paraná, 43 million tons.

Production of run-of-mine coal increased 10% in 1976 to 7 million tons, while the output of marketable coal increased 16% to 3.3 million tons. Washed metallurgical coal output from Santa Catarina, the major production area for this coal type, totaled 865,000 tons. Four projects under study at Metropolitana, Araranguá, Criciúma, and Prospera could increase the State's metallurgical coal output 600,000 tons per year. As shown in table 11, the balance of 2.4 million tons produced in 1976 was mostly steam coal. Two coal gasification projects were being planned in the States of Santa Catarina and Rio Grande do Sul. Steam coal was being stockpiled because a market did not exist to absorb the increased production.

Table 11.—Brazil: Coal production, by type

(Thousand metric tons)

Type of coal	State	1972	1973	1974	1975	1976
Metallurgical	Santa Catarina	809	785	1,071	804	865
Coke	do	20	28	46	45	72
Steam	do	612	636	970	878	1,232

Total steam		1,688	1,464	2,075	1,829	2,240
Reducing	Rio Grande do Sul	--	50	64	84	76
Grand total [1]		2,517	2,327	3,256	2,762	3,253

[1] Totals may differ from data given elsewhere in this chapter because of difference in source.

Source: Ministry of Mines and Energy. Relatorio de Atividades—1976, Federative Republic of Brazil. P. 79.

During the year, CONSIDER passed a resolution requiring Brazil's major State-owned steelmills to increase the use of domestic coking coal from 20% to 30% in their mix. The domestic coal in the mix in 1976 was actually 21.7%, compared with 25.7% in 1975. The shortfall was caused by the inability of the coal mining companies in Santa Catarina to meet production targets. Consumption of imported metallurgical coal by the steel industry reached 2,997,000 tons, a 35% increase over that of 1975, at a cost of $180 million. Consumption of charcoal by the steel industry was 3,287,000 tons. During 1976, SIDERBRAS, the Government steel holding company, was given the responsibility of coordinating and supervising all imports of coking coal. It was estimated that coking coal imports could reach 7 million tons by 1980 and 15 million tons by 1985. The projected demand for domestic metallurgical coal in 1985 is 4.6 million tons.

Brazil signed agreements with Colombia and Poland to diversify its sources of imported coal. The agreement signed with Colombia at midyear provided for a joint venture to locate and develop Colombian coal and for the shipment of up to 20 million tons to Brazil.

An agreement was concluded with Poland covering an exchange of 11.9 million tons of Brazilian iron ore for 14.8 million tons of Polish coal. The agreement also provided for Polish technical assistance in improving the quality of Brazilian coal. In

1976, Brazil imported 1,151,000 tons of coal from Poland.

Natural Gas.—The production of natural gas by PETROBRAS, the sole producer, reached a record high but was only slightly above that of 1975. Reserves of natural gas as of yearend 1976 increased 31% to 1.2 trillion cubic feet. The reserve increases were located in several fields on the Continental Shelf of the oil producing region of Brazil's northeast.

Nuclear Energy.—Brazil's rate of industrial growth indicates that by the year 2000 the country will need 150,000 megawatts in electric power installations, mostly in the South-Central region. Because potential hydroelectric power sources are distant from centers of consumption, a supplement on the order of 70,000 megawatts from nuclear power will be needed by the year 2000. Brazil's nuclear development began in the 1950's when technical personnel were trained; by 1965 three experimental reactors had been installed.

During 1976, the Government continued to move forward with plans to construct Brazil's first uranium concentration plant, to be located adjacent to uranium deposits at Poços de Caldas in Minas Gerais. The plant, scheduled for completion by 1979, is designed to produce 500 tons of yellowcake annually, initially utilizing only the Poços de Caldas ore. A Brazilian firm, Natron Consultoria e Projetos S/A, will supervise the $70 million project, with technology and nuclear engineering supplied by the French firm Société du Cycle de l'Uranium Péchiney Ugine Kuhlmann (PUK).

Yellowcake from the Poços de Caldas plant will be used in the country's first nuclear power facility, Angra I, a 625-megawatt pressurized water (PUR) plant under construction at Angra dos Reis near Rio de Janeiro, also scheduled for completion by 1979. The enriched uranium reactor of Angra I was being built by Furnas Centrais Electricas, a subsidiary of Centrais Electricas Brasileiras S/A (ELECTROBRAS), under contract with the Westinghouse Electric Corporation. According to Empresas Nucleares Brasileiras S/A (NUCLEBRAS), output from the Poços de Caldas concentrating facility will be sufficient to provide supplies for at least the first three power reactors to be installed in Brazil (first recharge for Angra I and initial charges for Angra II and Angra III) and perhaps supply all of the country's uranium demands until 1990. By 1985, Brazil hopes to have four nuclear powerplants completed, with a total installed power capacity of 4,200 megawatts.

As in previous years, there was no production, consumption, or export of uranium (U_3O_8) from Brazil in 1976. In its annual review of quotas for the export of nuclear-related elements, Brazil's Comissão Nacional de Energia Nuclear (CNEN) established the limits for 1976 exports of beryllium, pyrochlore, and lithium.

Prospecting efforts for new uranium deposits were monopolized by the Federal Government through its nuclear exploration and production arm, NUCLEBRAS. Private entities were permitted, however, to set up partnerships with NUCLEBRAS, provided the latter retains at least 51% control. NUCLEBRAS formed a joint prospecting and production organization, Nuclebras Auxiliar de Mineração S/A (NUCLAM), which in association with the West German firm Urangesellschaft mbH & Co. was carrying out a low-key exploratory effort for new sources of U_3O_8 with a guarantee to West Germany of a uranium supply. At yearend, Brazil's reserves of U_3O_8 were estimated to be 26,380 tons, more than double the official estimates announced in 1975. Brazil has significant world reserves of thorium, which is important for breeder reactors.

Deposit	Reserves (metric tons of U_3O_8)		
	Measured and indicated	Inferred	Total
Poços de Caldas, Minas Gerais	11,200	2,730	13,930
Figueira, Paraná	4,700	90	4,790
Amorinópolis, Goiás	1,000	2,000	3,000
Campos Belos, Goiás	--	560	560
Iron Quadrangle, Minas Gerais	--	4,100	4,100
Total	16,900	9,480	26,380

Source: Ministry of Mines and Energy. Relatorio de Atividades—1976, Federative Republic of Brazil. P. 36.

Oil Shale.—Although PETROBRAS had initially planned to begin production of oil from shale at a plant to be located in Irati (Paraná) by 1982, the company was expected to announce its intention in early 1977 to restudy the project which, based on data available at the end of 1976, was considered to be nonviable. As a result of improvements and modifications to be made to its prototype plant at São Mateus do Sul (already operating), PETROBRAS hoped to amass a more reliable data base by which to determine whether petroleum would be economically recoverable from the region's oil shale deposits.

Petroleum.—The declining trend in the production of crude petroleum since the peak year of 1974 continued in 1976. Output decreased 3% from that of 1975. The production level has remained relatively flat over the past decade. The production rate of 172,000 barrels per day required Brazil to import 82% of its crude oil needs.

Table 12.—Brazil: Crude oil production by PETROBRAS

(Thousand 42-gallon barrels)

Area	1974		1975		1976	
	Production	Percent	Production	Percent	Production	Percent
Bahia	46,898	72.4	39,973	63.7	39,489	64.7
Sergipe	9,523	14.7	10,039	16.0	10,165	16.7
Espírito Santo	1,396	2.2	1,692	2.7	1,534	2.5

Source: PETROBRAS Annual Report 1974, 1975, and 1976.

The cost of importing crude oil increased 24% to $3.8 billion, representing a major item in Brazil's balance of payments. The average price paid for crude oil during 1976 was $11.50 per barrel compared with an average price of $1.50 paid during the 1960's. The quantity of crude oil imports increased 16%, and came primarily from Iraq, Saudi Arabia, Kuwait, Iran, and Libya. Total apparent consumption of petroleum products in 1976 increased 8.8%, compared with a 5.6% increase in 1975. Consumption of automobile gasoline increased only 0.3% as a result of price increases and distribution restrictions.

Through its State-owned oil monopoly PETROBRAS, the Brazilian Government continued in 1976 to emphasize exploration and development of the offshore Campos Basin, located 240 kilometers northeast of Rio de Janeiro. At least 13 oil-bearing structures have been identified in the region, which has been officially estimated to contain as much as 800 million barrels of oil. Since 1970, when the area was first explored, a total of 37 wells have been drilled in the Campos Basin. There were no changes in the estimate of the production potential of the Basin of 200,000 barrels per day by the early 1980's. A total expenditure of $3.7 billion would be required to bring the field into full production.

By the end of 1976, nine oilfields had been discovered in the Campos Basin: Garoupa, Namorado, Badejo, Pargo, Bagre, and four new unnamed fields. The temporary undersea production system for the Garoupa Field was planned for startup in early 1977 with an eventual capacity of 45,000 to 50,000 barrels per day. Namorado, the largest Campos field discovered with potential reserves of 400 million barrels, was expected to be developed after Garoupa.

PETROBRAS increased its oil exploration budget to $395 million in 1976 resulting in the discovery of several notable oilfields on the Continental Shelf off Amapá Territory, Rio Grande do Norte, and the highly promising Enchova Field in the Campos Basin. Nationwide, PETROBRAS drilled 111 exploratory wells, of which 48 were on land and 63 offshore, a 35% increase over 1975 drilling. At year-end 1976, proved oil reserves increased 12% to 877 million barrels, including 22

million barrels of natural gas liquids, primarily as a result of development of the Garoupa, Namorado, and Enchova oilfields.

On February 16, 1976, PETROBRAS issued an announcement to foreign oil companies concerning prequalification procedures for exploration and development operations under a service contract (with risk clause) program authorized by the Government in October 1975. In the announcement 10 blocks were specified, totaling 34,000 square kilometers. Out of 40 foreign oil firms prequalified by PETROBRAS, only 11 firms paid the $400,000 fee for the geological data package covering the initial areas open for bids. By the limit date of June 15, six proposals were presented.

By yearend, risk contracts had been signed with BP Petroleum Development Brazil Ltd. and a consortium headed by Shell Exploration Services. Negotiations were completed with the joint venture of Elf Aquitaine Brésil and Agip S.p.A., but the contract had not been signed. Negotiations were still in progress with Exxon Corp. and Texaco Inc.

The Mineral Industry of Bulgaria

By Tatiana Karpinsky [1]

Bulgaria is a small country but has well-developed industries including energy, ferrous and nonferrous metallurgy, machine-building, metalworking, chemical, and petrochemical. In 1976, industrial enterprises built with Soviet financial aid and technical assistance accounted for about 96% of the ferrous and 85% of the nonferrous metals output, nearly 80% of the oil refining and petrochemical products, approximately two-thirds of the electrical power, and a predominant part of the chemical products.

In 1976, industrial production and national income increased 8.2% and 7%, respectively, well below the initially planned rates of 9.2% and 9%.[2] Ferrous and nonferrous metallurgy provided some 6% of Bulgaria's industrial production.

Capital investment increased from 4.6 billion leva (L) in 1975 to L5.5 billion in 1976.[3] About 54% of this was used for renovation and development of existing industrial facilities.

Machine-building and metallurgy continued to be the most significant sectors of Bulgaria's economy. Output of the machine-building industry increased 13% (planned, 14.4%), ferrous metallurgy 13.1%, the chemical industry 5.1% (planned, 13.4%), and construction materials 8.1% (planned, 13.1%).[4] Labor productivity, expected to rise more than 8%, increased only 7%. These figures indicate that most of the 1976 targets were not met.

Bulgaria's chief industrial problems were labor shortages, unused production capacity in certain sectors, and poor management. The following percentage increases, however, were reported for 1976: Pig iron 3.3%, crude steel 8.6%, rolled steel 10.4%, and electrical energy 9.9%. Coal production fell 8.5%.

The total number of industrial workers and employees in State enterprises was 1,171,000 in 1975. The number of workers and employees in State mineral and energy enterprises, by branch, is given in the following tabulation:

Branch	Workers and employees (thousands)
Engineering and metalworking industry	321.0
Fuel industry	51.6
Ferrous metallurgy (including ore mining)	31.0
Production of electricity and steam heat and power	[1] 19.5

[1] Statisticheski Godishnik na Narodna Republika B'lgariya 1976 (Statistical Yearbook of the People's Republic of Bulgaria 1976). Sofia. 1976, p. 155.

Bulgaria is poor in fuel-energy resources. About 97% of Bulgarian coal consists of lower rank lignite and brown coal. The country's domestic reserves of petroleum and natural gas are nearly depleted. Reserves of ores for ferrous metallurgy are insufficient in terms of requirements. Newly developed reserves of nonferrous metal ores show a declining trend in metal content.

Bulgaria continued to participate in many multilateral investment projects for the production of natural gas, petroleum, asbestos, iron ore, ammonium phosphate, and other products on Soviet territory. In

[3] The official exchange rate from Bulgarian leva (L) to U.S. dollars and Soviet rubles in 1976 was L0.96=US$1.00=0.75 ruble.
[4] Rabotnichesko Delo (Labor Review), Sofia. Feb. 3, 1977, p. 1.

exchange, Bulgaria is to receive annually 40,000 additional tons of asbestos, 2.8 billion cubic meters of gas, 850,000 tons of iron ore and concentrate, and other raw materials.

The U.S.S.R. accounted for about 55% of Bulgaria's total trade in 1976. Bulgaria, in turn, ranked third in the U.S.S.R.'s total trade with 8%, preceded only by East Germany and Poland. In 1977, Bulgarian-Soviet trade is to increase 11% to 4,800 million rubles.[5]

Plans have been developed for a railway ferry between the seaports of Ilyichevsk (U.S.S.R.) and Varna (Bulgaria).

Government Policies and Programs.—Bulgaria's economy is centrally planned and controlled by the Government. The 1977 annual plan foresees an increase of 8.2% in the national income, 9.2% in gross industrial output, and 8% in labor productivity.[6] Major growth is planned in the machine-building, chemical, and metallurgy industries. Engineering output is to increase 16.7% and chemical production 15.9%.

The 1977 annual plan calls for the generation of 30.7 billion kilowatt-hours of electrical energy and foresees an increase of 20% in coal production. Total coal production is to reach 30.7 million tons, including 23 million tons of lignite, 7.1 million tons of brown coal, 430,000 tons of bituminous coal, and 130,000 tons of anthracite.[7]

Plans for the steel industry include the output of 1.7 million tons of pig iron (up 9%), 2.7 million tons of steel (up 9.8%), and 2.9 million tons of rolled products (up 5.2%).

Capital investment is to total L5.7 billion in 1977, a 3.6% increase over that of 1976. Investment in production of coal is to reach L108 million. Bulgaria is planning to accelerate development of the Troyanovo 3, Bobov Dol, Merichleri 3, and Ing. St. Seimenliysky (Black Sea) coal mines and to renovate the Marshal Tolbukhin mine at Pernik. The planned increase in coal production is to result in the following output levels: Maritsa-East, 2.5 million tons; Bobov Dol, 400,000 tons; and other Maritsa mines, 200,000 tons.[8]

Construction projects of national importance to be continued into 1977 include extension of the Kozloduy atomic powerplant, completion of the third power station (840 megawatts) at the Maritsa-East power complex, and completion of the Belmeken-Sestrimo hydroelectrical power complex in the Rila and Rhodope Mountains. Projects for 1977 also include reconstruction of the Kremikovtsi and Lenin metallurgical combines, expansion of the Burgas petroleum refinery, expansion of a copper-producing combine at Pirdop, development of the Elatsite copper concentration combine, and other projects.

The final targets of the seventh 5-year plan (1976–80) were approved by the Eleventh National Party Congress. During the 1976–80 period, the Bulgarian Government is to continue to accelerate industrialization. Industrial production is to increase about 170%, mainly as a result of increased labor productivity. In 1980, Bulgaria is to produce 4.1 million tons of steel, 3.7 million tons of rolled ferrous metals, and 38 million tons of coal. Production of electrical power is to reach 38 billion kilowatt-hours. About 3,000 megawatts of new capacity is to be brought into operation.

Prospecting for ores, petroleum, natural gas, nonmetal deposits, and quarry material is to continue at a steady pace.

PRODUCTION

Total coal production in Bulgaria decreased from 27.8 million tons in 1975 to 25.5 million tons in 1976. Brown coal production decreased from 7.3 million tons in 1975 to 6.7 million tons in 1976. Reportedly, the decline in coal production resulted from the renovation of a number of mines and labor shortages.

In 1976, production of iron ore at 2.3 million tons remained far below expanding national requirements. An additional 1.6 million tons was imported during the year. Production of pig iron amounted to 1.6 million tons, compared with 1.5 million tons in 1975.

Crude steel production in 1976 reached

2.5 million tons, compared with 2.3 million tons in 1975. In order to expand the steel industry in 1976, Bulgaria continued to modernize the Kremikovtsi and Lenin steel plants. Plans are to build a third major steelworks in the near future. The expansion program in the steel industry is expected to be completed in 1982.

In 1976, refined copper production increased about 1.9% over that of 1975 and reached 53,000 tons. The Medet open pit mine accounted for 80% of total mine output. Development of the new open pit copper mine Elatsite, with a planned capacity of 10 million tons of ore per year, started in 1976. During 1976, new copper reserves were proved in Bulgaria's copper deposits.

Smelter production of lead and zinc in 1976 was approximately the same as in 1975, at about 112,000 tons and 92,000 tons, respectively. The main lead-zinc producer was Gorubso Mining Enterprise which accounted for 70% of total Bulgarian production. Intensive prospecting for lead-zinc ores continued in 1976; as a result, proved reserves increased 40%.

Bulgaria also mined small quantities of tungsten, molybdenum, and manganese.

Production of crude oil continued to decline as output reached 117,000 tons, 4.1% below the 1975 level. An additional 11.9 million tons of crude oil was imported from the U.S.S.R. Natural gas production was also slightly below the 1975 level. Bulgaria imported 2.2 billion cubic meters of natural gas from the U.S.S.R.

Production of electrical energy was 27.7 billion kilowatt-hours, up from 25.2 billion kilowatt-hours in 1975. About 18% of the total output came from the Kozloduy atomic powerplant.

Table 1.—Bulgaria: Production of mineral commodities

(Thousand metric tons unless otherwise specified)

Commodity [1]	1974	1975	1976 [p]
METALS			
Cadmium, smelter output [e] ---------- tons	200	220	220
Copper:			
Mine output, metal content ---------- do	50,000	55,000	57,000
Blister, including secondary ---------- do	48,000	60,000	60,000
Refined, electrolytic, including secondary [e] ---------- do	47,000	52,000	53,000
Iron and steel:			
Iron ore and concentrate ----------	2,685	2,337	2,317
Pig iron, including blast furnace ferroalloys ----------	1,528	1,560	1,632
Crude steel ----------	2,188	2,265	2,460
Semimanufactures ----------	2,242	2,495	2,756

Bituminous ----------	190	212	196
Lignite and brown ----------	23,998	27,515	25,184
Total ----------	24,305	27,845	25,479
Coke ----------	1,308	1,364	1,408
Natural gas, marketed ---------- million cubic feet	6,344	3,905	3,637
Petroleum:			
Crude:			
As reported ----------	144	122	117
Converted ---------- thousand 42-gallon barrels	1,051	891	854
Refinery products:			
Gasoline ---------- do	13,175	14,195	NA
Kerosine ---------- do	1,240	1,279	
Distillate fuel oil ---------- do	21,634	22,007	
Residual fuel oil ---------- do	32,301	33,167	
Lubricants ---------- do	490	560	
Asphalt, including natural ---------- do	1,666	2,120	
Total ---------- do	70,506	73,328	NA

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, bismuth, chromite, gold, silver, barite, fluorspar, magnesite, palladium, platinum, tellurium, and uranium are also produced but information is inadequate to make reliable estimates of output levels.

TRADE

In 1976, Bulgaria's foreign trade turnover (value of imports plus exports) amounted to L10,636 million, an increase of L859 million or 8.8% over that of 1975. Total exports were valued at L5,200 million, an increase of L659 million or 14.5%, and the value of imports rose to L5,436 million, an increase of L200 million or 3.8%. The balance-of-trade deficit decreased from L695 million in 1975 to L236 million in 1976. In 1976, Bulgaria's foreign trade turnover with Council for Mutual Economic Assistance (CMEA) countries[9] was approximately 80% of its total turnover, trade with developed market economy countries about 13%, and trade with developing market economy countries about 7%. Bulgaria's largest trading partner in 1976 was the U.S.S.R., with 54.4%. Its second largest trading partner among CMEA countries was East Germany, followed by Czechoslovakia, Poland, Romania, and Hungary.[10] Imports from the U.S.S.R. comprised primarily machinery and equipment and raw materials.

In 1976, Bulgaria imported about 6.2 million tons of hard coal and 357,000 tons of coke. Almost all of the 11.9 million tons of crude oil imports came from the U.S.S.R.; imports of natural gas totaled 2,200 million cubic meters.

With the further development and modernization of Bulgarian ferrous metallurgy, imports of iron ore and concentrate reached 1.64 million tons and those of pig iron, 340,000 tons.

Bulgarian exports consisted chiefly of machinery and equipment. Other important export items were chemicals, ferrous metallurgy products, and some nonferrous metals and alloys.

According to a signed trade agreement, the value of Bulgarian-Soviet trade during the seventh 5-year plan (1976–80) is to total 24.5 billion rubles, a 76% increase over the 13.9 billion rubles of the preceding 5-year period (1971–75).

Soviet deliveries are of utmost importance to the Bulgarian economy. In 1977, the U.S.S.R. is to continue to supply most of Bulgaria's raw material, machinery, and equipment requirements. Deliveries are to include 11 million tons of oil, 6.2 million tons of coal, 3 billion cubic meters of natural gas, and 4 billion kilowatt-hours of electricity. Other supplies will include 850,000 tons of iron ore (metal content), 500,000 tons of rolled steel, and 360,000 tons of pig iron.[11]

[9] Includes the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

COMMODITY REVIEW

METALS

Aluminum.—In 1976, construction of the Shumen aluminum processing complex continued. The complex is to produce 48,000 tons of rolled aluminum products per year starting in 1978, but the 1976 annual plan for construction of the plant was not fulfilled. Imports of aluminum ingot from the U.S.S.R. were estimated at 25,000 tons.

Copper.—Copper ore production was estimated at 12.3 million tons and electrolytic copper at 53,000 tons. The copper consumed in Bulgaria is supplied entirely by indigenous production. In 1976, about 80% of the country's copper ore was supplied by the 8-million-ton-per-year-capacity Medet mine; the remainder came from the Chelopech (underground), Burgas, Panagyurishte, and other mines.

Medet copper ore is surface mined and contains about 0.36% copper, 0.008% molybdenum, and 0.81% sulfur. The main minerals are chalcopyrite, pyrite, and molybdenite. The Medet open pit mine uses a fully automated, computerized truck-haulage control system. The Chelopech mine (near Sofia) is Bulgaria's largest underground copper mine and has a capacity of 500,000 tons of ore per year. The ore at Chelopech contains 0.5% to 1.5% copper. One of the major Bulgarian projects in the copper industry during 1976 was the development of a new open pit copper mine at Elatsite, about 50 miles northeast of Sofia.[12] The Elatsite mine has a design capacity of 10 million tons per year (0.45% copper content). Ore reserves at Elatsite are estimated at 250 million tons.

Mineral exploration activity increased near Burgas on the Black Sea coast. Detailed investigations were made at Rosen, Meden Rid, Cherveno Zname, V'erly Briay, and other mining fields of Burgaski Medni Mini (Burgas Copper Mines).

During the seventh 5-year plan, a geological survey of the Burgas mines is to continue, with planned investments of L5.0 million for drilling, L5.0 million for a mining survey, and L1.8 million for geophysical investigations. It is expected that new reserves of copper ore will be discovered in seven mining areas, the most promising of which is the Rosen area.[13]

During 1976–80, large planned investments are to develop the mining industry, including copper mining. The G. Damyanov ore-dressing plant at Pirdop is to be modernized and two other ore-dressing plants are to be built by the end of the 5-year plan.

Iron and Steel.—Production of iron ore in Bulgaria totaled 2,317,000 tons in 1976, a decrease of 0.9% from the 1975 level and 13.7% from the 1974 level. Total imports of iron ore and concentrate amounted to 1.64 million tons. The U.S.S.R. has for many years been the chief source of iron ore for Bulgaria. Total consumption of iron ore was 3.96 million tons, a decrease of 8.1% from that of 1975. Bulgaria's principal iron ore deposits are located at Kremikovtsi, north of Sofia. The ore is basically limonite (70%), siderite (18%), and hematite (12%). Iron ore reserves at Kremikovtsi are estimated at about 250 million tons; they are surface mined. The deposits have a high content of other components: About 18% barite, 12% manganese, and 0.8% lead.[14] In 1976, new technology was introduced at the mine, resulting in a higher degree of mechanization in the mining and loading of ore.

The iron ore mined at Kremikovtsi is delivered to the Kremikovtsi metallurgical complex which also receives iron ore imported from the U.S.S.R. Total production of pig iron (excluding ferroalloys) in Bulgaria was 1.56 million tons in 1976, an increase of 3.3% over that of 1975. Imports of pig iron reached 0.34 million tons, approximately the same as in 1975.

Bulgaria produced 2.46 million tons of crude steel, an 8.6% increase over that of 1975. Bulgaria's share in world crude steel production was 0.37%. It is anticipated that output will reach 2.7 million tons in 1977 and 4.1 million tons in 1980. Oxygen-blown steel accounted for about 57.7% of Bulgaria's steel output, the open-hearth process for about 20.9%, and the electric-furnace process for 21.7%.

Production of rolled steel was 2.8 million tons; about 1 million tons of ingot

[12] Rabotnichesko Delo (Labor Review), Sofia. Dec. 22, 1976, pp. 1–2.
[13] Rudodobiv (Ore Mining), Sofia. No. 5, 1977, pp. 3–5.
[14] Bulgarian Foreign Trade, Sofia. No. 1, 1977, p. 14.

steel was imported from the U.S.S.R. to supply rolling mills. Rolled steel imports totaled 618,173 tons and exports, 43,340 tons. Expansion of the Kremikovtsi integrated iron and steel complex continued in 1976.

Lead and Zinc.—Estimated production of metal content of lead was 110,000 tons and of zinc, 85,500 tons. Bulgaria has an exportable surplus of lead and zinc metals. Bulgaria exported 4,500 tons of zinc to the United Kingdom, 2,600 tons to Italy, 2,580 tons to France, and 5,000 tons to Czechoslovakia. About 8,000 tons of lead was also exported.

Bulgaria has numerous lead-zinc deposits. Although complex lead-zinc ore bodies are scattered over various regions of the country, the more significant ones are located at Madan, Kardjali, Smolian, Rudozem, Ustrem, Martinovo, Osogova, Chiprovtsi, and Vratsa. All Bulgarian lead-zinc ore bodies are mined by underground methods. The main deposits are veined and the others are stratified masses or bedded deposits.

Bulgaria has several lead-zinc mining enterprises; Gorubso Mining Enterprise maintained its lead in production, accounting for about 70% of the national output. The ores at the Gorubso mines average approximately 2.7% lead and 2.4% zinc. Bulgaria has been consistently expanding the productive capacities of existing mines and ore-processing facilities.

In 1976, deep drilling proved the existence of new lead-zinc ore deposits. The best results thus far were achieved in the Gorubso lead-zinc ore fields. A new field was also discovered in the Haskovo region where several million tons of ore was identified.

During the 1971–75 period, L77.9 million was allocated for geological investigations of lead-zinc deposits. Investments are to increase 11% to L86.5 million during the 1976–80 period.[15]

Large investments are to be made in the mining and metallurgical industry during the current 5-year plan. Renovation of many lead-zinc mines and plants is planned. The development plan foresees the introduction of advanced technology and automation in mines and smelters. New, highly productive beneficiation equipment is to be put into operation in all new plants.[16]

NONMETALS

Cement.—Cement production in 1976 was 4.4 million tons, unchanged from that of 1975. Reportedly, the Cement and Lime Production State Economic Trust did not fulfill its annual goals. The national production goal for cement in 1980 was set at 8.5 million tons. The 1976–80 plan provides for development of machines and equipment necessary for the cement, ceramics, and construction materials enterprises.

Construction of two additional production lines with a total annual capacity of 2 million tons at the Devnya cement works continued during the year. By 1980, the sixth technological line at the Wilhelm Pieck cement works at Beli Izvor, near Vratsa, is to have an annual production of 550,000 tons.

Fertilizer Materials.—Bulgaria is expanding its production of mineral fertilizers. After the Devnya complex near Varna was commissioned in 1974, the national productive capacity of compound fertilizer facilities increased 70%.[17]

In the first 6 months of 1976, according to Bulgarian reports, production of fertilizers increased 9% over that of the same period in 1975. A total of 658,000 tons of chemical fertilizers (elemental content) was supplied to the agricultural sector in 1976.

Bulgaria is self-sufficient in nitrogenous fertilizers. In 1976, the country exported about 200,000 tons of nitrogenous fertilizers (nitrogen content). The main purchasers of the nitrogenous fertilizers and urea were India, Egypt, the People's Republic of China, Iran, and Indonesia. Some Bulgarian fertilizers went to Western Europe. Estimated imports of phosphatic and potassic fertilizers were about 38,000 tons (P_2O_5 content) and 50,000 tons (K_2O content), respectively.

During 1977–80, development of fertilizer plants is to continue at Devnya, Stara Zagora, and Dimitrovgrad. A new line producing 1,360 tons of ammonia per day will be built at Dimitrovgrad. Two sulfuric acid lines at Devnya are to be modernized

[15] Rudodobiv (Ore Mining), Sofia. No. 6, 1976, pp. 2–3.
[16] Rudodobiv (Ore Mining), Sofia. No. 7, 1976, p. 21.
[17] Economical Cooperation of the CMEA Member Countries, Moscow. No. 5, 1976, p. 91.

to use elemental sulfur. The chemical works at Stara Zagora and Dimitrovgrad are to be adapted to use natural gas feedstock. A new nitrogenous fertilizer plant is to be built at Varna, with a capacity of 1,800 tons of urea per day. Bulgaria is to produce about 716,000 tons of nitrogenous and 450,000 tons of phosphatic fertilizers per year by the end of 1980.

The fertilizer application goal for 1980 is 250 kilograms of nutrient per hectare of arable land. Reportedly, Bulgaria is interested in a joint undertaking with Angola for the production of chemical fertilizers.

MINERAL FUELS

Production of total primary energy derived from fossil fuels and hydroelectric and nuclear generation in Bulgaria decreased from 15.2 million tons of standard coal equivalent in 1975 to 14.7 million tons in 1976. The share of coal (lignite, brown, and bituminous) and coke in total primary energy production was 91.1%, crude oil 1.4%, natural gas 0.7%, hydroelectrical energy 2.7%, and nuclear energy 4.1%.

Total consumption of primary energy increased from 40.8 million tons of standard coal equivalent in 1975 to 41.9 million tons in 1976. Coal provided about 47.5% of the total, oil 42.0%, natural gas 7.1%, hydroelectrical energy 1%, nuclear energy 1.4%, and imported energy 1%.

The total installed capacity of electrical powerplants in Bulgaria was 7,063 megawatts, up from 6,912 megawatts in 1975. Energy production reached 27.7 billion kilowatt-hours, a 9.9% increase over that of 1975; the share of nuclear energy in total electrical energy output was 18% and that of hydroelectrical energy, 12%.

During 1976, 0.5 billion kilowatt-hours of electrical energy was exported and 4.0 billion kilowatt-hours was imported. Bulgaria's first nuclear powerplant, located near Kozloduy on the Danube, was commissioned in September 1974. The powerplant employs two of the Voronezh-type 440-megawatt reactors. The installed capacity of the Kozloduy powerplant is expected to reach 1,760 megawatts in 1980.[18]

Bulgaria's largest hydroelectric complex, the Belmeken-Sestrimo cascade, with three power stations and a total capacity of 755 megawatts, was scheduled to be completed in 1977. The Dospat-Vŭcha cascade in southern Bulgaria, with a projected capacity of 550 megawatts, was also under construction in 1976. Energoproekt of Sofia and Bucharest Power Engineering Institute are jointly preparing plans for the Nikopol-Turnu Magurele hydroelectrical power complex.

The plan for 1976–80 calls for construction of an 840-megawatt thermal powerplant, Maritsa-East 3, and a 630-megawatt unit at the Varna thermal plant, and further development of thermal plants at Plovdiv, Ruse, Abram Stoyanov, and Sofia.

[18] Energetica (Energy), Sofia. July 1977, pp. 4–7.

Table 4.—Bulgaria: Total primary energy balance for 1975 and 1976

(Million tons of standard coal equivalent [1])

	Total primary energy	Coal (lignite and bituminous) and coke	Crude oil and petroleum products	Natural gas	Hydroelectrical energy	Nuclear energy	Turnover of electrical energy
1975:							
Production	15.2	14.1	0.2	0.3	0.3	0.3	--
Imports	25.6	6.6	17.0	1.6	--	--	0.4
Exports	--	--	--	--	--	--	--
Apparent consumption	40.8	20.7	17.2	1.9	.3	.3	.4
1976:							
Production	14.7	13.4	.2	.1	.4	.6	--
Imports	27.3	6.5	17.4	2.9	--	--	.5
Exports	.1	--	--	--	--	--	.1
Apparent consumption	41.9	19.9	17.6	3.0	.4	.6	.4

[1] 1 ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are as follows: Hard coal, 1.0; lignite and brown coal, 0.5; crude oil, 1.47; natural gas, 1.33 (per thousand cubic meters); and hydroelectrical and nuclear energy, 0.125 (per thousand kilowatt-hours).

Source: Statisticheski Godishnik na Narodna Republika B'lgariya 1976 and 1977 (Statistical Yearbook of the People's Republic of Bulgaria 1976 and 1977), Sofia. 1976 and 1977.

Coal.—Bulgaria produced a total of 25.5 million tons of coal (including 295,000 tons of bituminous coal and anthracite), a decrease of 8.5% from that of 1975. Coal production in 1977 is expected to reach 30.7 million tons, including 23.0 million tons of lignite, 7.1 million tons of brown coal, 430,000 tons of bituminous coal, and 130,000 tons of anthracite.[19] Coal production in 1980 is expected to reach 38 million tons, and in 1990, about 50 million tons.[20]

Coal imports amounted to 6.2 million tons, including 3.5 million tons of anthracite. About 5.8 million tons came from the U.S.S.R. and 0.4 million tons from Poland. During the 10 years from 1966 to 1975, imports of bituminous coal increased 280%.

Production of coke reached 1.4 million tons in 1976. Imports amounted to 357,000 tons, mainly from the U.S.S.R.

Consumption of coal in the various internal market sectors in Bulgaria in 1975 was as follows, in thousand tons:

	Bituminous coal and anthracite	Brown coal and lignite
Coke-oven plants	2,366	--
Powerplants	2,366	18,176
Iron and steel industry	1,191	1,304
Transportation	268	96
Other	1,844	4,412

Almost all of Bulgaria's coal deposits are located in the southern and western part of the country. At present, Bulgaria has about 5 billion tons of lignite available for development. An additional 1 billion tons of reserves may be proved as exploration proceeds at the more promising deposits now classified as probable.[21]

The largest reserves of lignite are found at the Maritsa-East lignite basin, located near the town of Zagora. This basin has over 2.9 billion tons of reserves, of which 2.1 billion tons in seven mine fields is suitable for surface mining.[22] The Maritsa-East Basin's surface-mined output accounted for about 60% of total coal production. Lignite reserves totaling about 180 million tons are located at the Maritsa-West coal fields, and about 560 million tons, near Sofia.

Brown coal reserves are concentrated mainly in the western and southwestern part of the country in the Bobov Dol, Pernik, and Pirin Basins, and are estimated at about 350 million tons.

A few score million tons constitute the brown coal reserves of the Burgas Basin, situated near Burgas. Hard coking coal reserves are found in the Balkan coal field, situated in the eastern part of the Balkan mountain range. Reserves in the Balkan coal basin are estimated at 30 million tons of hard coal.

Reserves in the recently discovered Dobrudzha Basin, in the northeastern part of Bulgaria, are estimated at over 1.5 billion tons of hard coal. The economic advantage of developing this basin has already been proven.

Development continued in 1976 of new mines brought into operation in 1975, including the Troyanovo 3 lignite open pit (3 million tons per year) and the Bobov Dol (500,000 tons per year) and Merichleri 3 (300,000 tons per year) mines, both underground brown coal mines. Soviet assistance and machinery and equipment imported from the U.S.S.R. and East Germany are being used in the development of these mines.

The seventh 5-year plan foresees development of the Maritsa-East complex, which is to produce 22 million tons of coal annually by 1980, as well as modernization of the Troyanovo 1 mine and development of the Troyanovo 2 mine. The Bobov Dol brown coal mine is to reach design capacity of 1.5 million tons per year in 1980.

Natural Gas.—Production of natural gas rose from 73.2 million cubic meters in 1965 to 473.6 million cubic meters in 1970 and then gradually declined to 110.6 million cubic meters in 1975. In 1976, estimated production of natural gas was 103 million cubic meters. Estimated imports of natural gas from the U.S.S.R. totaled 2.2 billion cubic meters.

Most of Bulgaria's gas production comes from the Chiren gas reserves in the northwestern part of Bulgaria, with some from the region of Varna, near the Black Sea. New sources of natural gas have been found along the coast at the Golden Sands resort; the towns of Balchik, Kavarna, and

[22] Ninth World Mining Congress, West Germany. III-23, May 1976, p. 2.

Michurin; Cape Kaliakra; and near the mouth of the Kamchiya River. Prospecting for oil and gas will continue in 1977–80.

Gas was first delivered to Bulgaria from the U.S.S.R. across Romania by a new pipeline in August 1974. In Bulgarian territory, the gas pipeline runs through Devnya to Pleven Vratsa and Sofia.

Work continued on construction of the southern branch of the Soviet-Bulgarian pipeline. This segment will be 267 kilometers long and is to supply the chemical plants in southern Bulgaria in 1980. Bulgaria is also to receive 2.8 billion cubic meters of gas per year from the Orenburg pipeline starting in the fourth quarter of 1978. Bulgaria, together with the U.S.S.R., is building a 516-kilometer section of this pipeline crossing the Carpathians. The Orenburg gas pipeline has a total length of 2,750 kilometers and a projected capacity of 24 billion cubic meters per year.

Petroleum.—Crude petroleum production in Bulgaria increased from 200,000 tons in 1960 to 334,000 tons in 1970 and decreased to about 122,000 tons in 1975.[23] In 1976, indigenous production of crude oil was 117,000 tons, a decline of 4.1% from that of 1975. Bulgaria imported 11.9 million tons of crude petroleum and petroleum products from the U.S.S.R. Some additional crude oil was imported from Iraq, Iran, Libya, Algeria, Nigeria, and Egypt. Total imports of crude petroleum increased from 12,000 tons in 1960 to 11,553,000 tons in 1975. Imports of petroleum products increased more than 300% from 800,000 tons in 1960 to 2,600,000 tons in 1975.

Bulgaria had three operating refineries in 1976 with a total capacity of 15 million tons per year. Construction of plants for processing petroleum and manufacturing petroleum products continued at Burgas.[24]

During 1976–80, about 40% of the capital investment allocated for the chemical industry is to be spent on expansion of existing plants and construction of new petroleum processing capacity.

In 1976, a major effort was underway to find crude oil reserves in the northern and northwestern part of the country. Deep drilling started on newly discovered prospective formations and is to continue during 1977. Development of the oilfield at Dolna-Lukovitsa, discovered in 1975, continued in 1976.

The Mineral Industry of Burma

By Gordon L. Kinney [1]

Burma's economic situation showed a modest but encouraging upswing in fiscal 1976.[2] The gross domestic product (GDP) in 1976 was estimated at $3.7 billion[3] in current dollars. At constant 1969 prices the GDP rose an estimated 5.6% to $1.8 billion.[4] This was a considerable improvement over Burma's 10-year average growth rate of less than 3%, which had barely exceeded the population growth, leaving per capita GDP growth negligible during the decade. Per capita income at current prices rose an estimated 15% during 1976 to about $118, over twice the 1975 gain of 7%. The balance of payments showed a $28 million deficit in 1975, and estimates for 1976 indicated a slight increase in the deficit to around $30 million.

Inflation was still the main economic problem as the amount of currency in circulation continued to increase and bottlenecks in production, transportation, and distribution kept the supply of goods low. Speculators, hoarders, smugglers, and black marketeers added to inflation. In recent years, the inflation rate has been well over 20%. The consumer price index in Rangoon (1972=100) was at 222 in 1975, an increase of nearly 35% over that of the previous year. In 1976, however, consumer prices were held to a 20% increase, closing the year at about 266. Similarly, the wholesale agricultural price index climbed 20% in 1976.

The major bright spot in the economic picture was the vital agricultural sector, which had an increase in output of about 7% over that of 1975, the largest increase in the past 15 years. Production of all major crops except jute rose for the 1975–76 crop season, mainly because of excellent climatic conditions during the year. These favorable conditions continued throughout the 1976–77 crop season, and Burma was expected to have a record harvest for the second consecutive year. Rice production in 1976 could be over 9 million tons and again contribute the major portion of Burma's export income.

Burma's mineral production was mixed during the year, with some products making modest gains. These included antimony, copper, mixed tin-tungsten concentrates, gypsum, limestone, and crude petroleum. A number of the minerals most important to the economy, however, showed declines in production. Foremost among these were the products from the famed Bawdwin mine—lead, zinc, and silver. Silver was particularly disappointing, with production falling 73% to 211,000 troy ounces.[5]

Substantially increased crude oil production was a great help in keeping fuel import bills from contributing to the already high rate of inflation. The Government had not imported crude oil since 1974, thereby saving millions of dollars in foreign exchange but causing a decline in production in many industries because of recurring petroleum shortages. The shortages were caused not so much by lack of crude oil production capacity as by a continuing difficulty in transporting and distributing the petroleum products on a timely basis.

---

[5] U.S. Embassy, Rangoon, Burma. Industrial Outlook Report: Minerals. State Department Airgram A–44, June 17, 1977, pp. 1–7.

The value of output of the mineral sector was not available for 1976. However, the order of magnitude at constant prices should be approximately the same as in the previous year. A decrease in the value of metallic minerals produced was balanced by the increase in value of petroleum and natural gas production. The significance of the mineral sector has gradually declined in recent years, contributing only a little over 1% of the GDP in 1976. The reported output value of the mineral sector for 1975 was $49 million at current prices, a slight decrease from $51 million in 1974.[6]

About 67,000 people or 0.6% of the 12-million-person labor force in Burma were employed in the mining sector during 1975. They produced about 1.5% of the net output of goods and services during the period.

In an effort to develop and promote the mining industry, the Government of Burma and the United Nations Development Program (UNDP) allocated $480,000 and $640,000, respectively, to strengthen the technical capability of the Planning and Research Department of the Myanma Mineral Development Corp. (MMDC). MMDC is responsible for exploiting Burma's mineral resources and developing new mining enterprises.

The immediate objectives of the project will be to establish and equip research and development facilities for mineral beneficiation and metallurgy, to train engineers and technicians in production-oriented research and the planning of mineral development projects, and to prepare a feasibility study for the establishment of a 20,000-ton-per-year metallurgical works based on the Monywa copper prospect.

The electric power industry continued to expand in 1976. Total installed capacity was provisionally reported at 452,000 kilowatts, a 15% increase over that of 1975. Total power generated during 1976 was about 850 million kilowatt-hours, about 5% over that of 1975. A major new use of natural gas in Burma was for the generation of electric power at gas turbine powerplants. The installed capacity of turbines fueled with natural gas nearly doubled in 1976 to over 103,000 kilowatts. These plants now account for over 23% of Burma's total capacity, one of the highest proportions of natural gas-fueled turbines to total capacity in the world.

PRODUCTION

Burma's overall production of metallic ores and coal decreased in 1976. Petroleum and natural gas had significant increases. Again in 1976 the value of oil production was estimated at more than twice that of other mineral output. Total tin-tungsten production was apparently up about 3%. Neither the grade of the concentrates nor the value of the production was available from official sources in 1976, making comparisons and conclusions difficult and liable to change. Production of lead, zinc, and silver, mainly from the Bawdwin mine, dropped. Antimony continued a 5-year climb to a record high production for Burma. Industrial minerals had a mixed year: Cement, limestone, bentonite, industrial white clay, and gypsum all had healthy increases, while barite, talc, and fire clay showed moderate decreases for the year.

Total onshore petroleum production in 1976 increased more than 20% over the 1975 figure. The increase came from the Mann oilfield; other producing fields declined in output. There was no offshore petroleum or natural gas production in 1976.

Natural gas production jumped an impressive 42% to meet increased demand from fertilizer and cement plants and gas turbine powerplants.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, Burma also produces pottery clay, common sand and gravel, other varieties of crude construction stone, and other varieties of gem stones, but available information is inadequate to make reliable estimates of output levels.

[2] Data are for fiscal years beginning April 1 of that stated.

[3] Includes fire clay powder.

[4] Based on reported figures for fiscal years beginning April 1 of that stated.

TRADE

Mineral products ranked third in value of exports after agriculture and forestry products in 1976. The estimated value of Burma's exports was over $235 million and import values were estimated at $296 million, giving a balance-of-trade deficit of about $60 million. Exports of base metals and ores and silver were provisionally reported at $6 million or about 2.6% of total exports. Imports of base metals and base metal manufactures were valued at over $20 million. This was 30% less than in 1975, reversing the steady increase of the last 2 years. Coal and coke imports dropped to an insignificant level from 1975's record high value of $12 million.

COMMODITY REVIEW

METALS

Antimony.—Production of antimony ore increased for the fifth consecutive year. The 1,122 tons of ore mined in 1976 was nearly double the 1971 figure. The UNDP was conducting an exploratory drilling program at Lebin in an effort to evaluate the ore body. The site has long been worked by individual miners.

Copper.—Detailed drilling of the Monywa copper prospect (22°07′ N, 95°08′ E), about 80 kilometers west of Mandalay, continued during the year. The drilling, undertaken with assistance from the UNDP and a Japanese firm, is expected to be completed by mid-1978. Preliminary estimates of the size and grade of the deposit have ranged from 60 million to 200 million tons of ore and from 0.7% to 1.0% copper in the form of easily milled chalcocite. Pyrite occurs with the copper mineralization in sufficient quantity to produce sulfuric acid as a byproduct. The Japanese proposed construction of an 8,000-ton-per-day mine and a mill producing 20,000 tons of concentrate per year, but this was apparently not satisfactory to the Government of Burma. The Government wanted to obtain copper smelting facilities as well as the concentration plant. West Germany continued the interest shown in 1975 to invest in the project and could be chosen to finance and build the mill and smelter.

Exploration of a copper prospect at Shangalon (23°42′ N, 95°31′ E), 190 kilometers north of Mandalay, was abandoned because of disappointing results from the exploratory drilling.

Lead, Zinc, Silver.—Production of most of Burma's lead, zinc, and silver continued to come from the Bawdwin mine over 200 kilometers northeast of Mandalay. Production of lead and zinc concentrates dropped about 66% and 46%, respectively. Refined lead and byproduct silver production also fell. The higher-grade ores were becoming less plentiful and harder to recover. Much of the mining equipment was of pre-World War II vintage and no longer operated efficiently. Topping the equipment problems at the mine were the unstable security conditions in the northern Shan State area. West Germany was reluctant to invest in a large-scale modernization of the mine in 1975, and the security conditions apparently had not improved significantly in 1976. A small amount of equipment updating was planned for 1976, but no results were evident by yearend, as seen by the poor production figures.

Some of West Germany's loan commitment for 1975 was reportedly scheduled for use in construction of a small zinc smelter at Ela (19°37′ N, 96°13′ E). The smelter, which would be Burma's first, would presumably refine zinc from the Bawdwin mine's slag and tailings piles. The tailings have been accumulating since the startup of modern mining activity in 1905.

Tin and Tungsten.—Modernization of the Myanma Tin and Tungsten Corporation's Heinda mine was nearly completed and the mine should begin operating in 1977. The project was financed by West Germany with Krupp Industries as the major contractor. The new capacity was planned at 1,000 tons per year of tin concentrate.

The World Bank's International Development Association (IDA) was reportedly ready to approve a $16 million loan to cover the foreign exchange costs of developing tin-tungsten production at the Heinze Basin, 280 kilometers southeast of Rangoon. The project was to include construction of a dredge and associated support facilities for the Basin. In addition, facilities at the nearby Kanbauk mine were to be improved, a new tin and tungsten concentrating plant built at Tavoy (14°05′ N, 98°12′ E), 80 kilometers south of the Heinze Basin, and the gravel mines at Tavoy rehabilitated. Completion of the project could increase mineral export earnings by $6 million annually. Current production from the area is mostly by small-scale private miners who sell their production to the State.

Overall production of tin concentrate, tungsten concentrate, and mixed tin-tungsten concentrate was nearly 2,100 tons, an increase of about 3% over the 1975 figure.

NONMETALS

The country's three cement kilns labored during the year to keep up with increased domestic demand. Production took a sizable jump to 255,000 tons in 1976, a 43% increase over the 178,000 tons (revised) in 1975. The three kilns were all located at Thayetmyo (19°19′ N, 95°11′ E) on the Irrawaddy River about 310 kilometers north of Rangoon.

Gypsum production increased 15% in support of the increased cement output.

Ceramic Industries Corp. was negotiating with Asahi Glass Co., Ltd., of Japan for a sheet glass plant at yearend. The plant would be located at Bassein (16°47′ N, 94°44′ E) and could make Burma self-sufficient in sheet glass by 1979. Glass sand would be obtained locally.

MINERAL FUELS

Coal.—Despite an increased demand for coal from industry and the Burma Railway system, production decreased 15% to under 21,000 tons in 1976. The major mines located at Kalewa and Nama were unable to supply the demand. A reported 177,000 tons of coal was imported during 1976.

Petroleum and Natural Gas.—Development of oilfields continued during the year with a total of 26 onshore development wells completed. Most of the 18 wells drilled at the Mann oilfield proved to be good producers. Four wells at the Letpando oilfield proved unproductive, further dimming hopes of significant production from the field. Four wells were drilled at Myanaung and Shwepyitha with only one at Shwepyitha showing good natural gas production.

Despite the efforts at further development, production at the Chauk, Prome, and Myanaung Fields continued to decline. The introduction of gas-lift and water-drive secondary recovery systems at the

Yenangyaung Field arrested that Field's production decline.[7]

Exploration drilling was apparently down slightly from 1975 levels; however, areas of the Irrawaddy Delta and the upper Chindwin River drainage basin were explored by Myanma Oil Corporation's geological survey and seismic teams. By the end of June 1976, six exploration wells had been drilled throughout the country. Only one of these was encouraging, a hole drilled at Yenanma south of the Mann oilfield.

Of the 19 offshore wells contracted, 17 unsuccessful wells had been drilled off the western and southern coasts of Burma by yearend. Because of the poor results, no further offshore wildcat drilling was planned. The four international firms operating in the offshore area had ceased drilling by autumn 1976. Esso Co. drilled four wells to complete its eight-well contract, Total CFP Birmanie drilled two wells to complete its requirement of three wells, and Arakan Oil Development Corp. drilled one well to complete its required five wells. Martaban-Cities Service, Ind., drilled one well in 1976 but did not drill the final two holes required to fulfill its contract obligations. No oil was discovered in commercial quantity in any of the areas drilled. Total struck a potentially commercial natural gas deposit off the Arakan coast, but its offshore location will make exploitation presently impractical.

It was expected that during 1977 the Government would offer international tender announcements for both relinquished areas and some choice new offshore drilling blocks.

Chronic transport problems continued to disrupt the flow of crude oil and refined products during the first half of 1976. However, after midyear the water transport fleet was rejuvenated by the addition of 10 imported push tugs, 10 imported self-propelled barges, and 20 domestically built oil barges. New rail tank cars and highway tanker trucks were also to be added to the system as funds become available.

To further upgrade the transport system, several additions to the pipeline network were begun or completed during the year. The most important was the start of construction of the 218-kilometer crude oil pipeline (25.4 centimeters in diameter) from the Mann oilfield to Prome. By midyear, the first 88 kilometers had been completed. The project was continuing at yearend and was to be completed by mid-1977. A 51-kilometer pipeline from the Yenangyaung oilfield to the Chauk refinery was completed in October. A 112-kilometer pipeline was completed in April between the Letpando oilfield and the Chauk refinery. The line was idle, however, as there was no production from the Letpando oilfield.

A Chase Manhattan banking consortium agreed to lend Burma $39 million toward construction of a 280-kilometer pipeline and the purchase of five drilling rigs. The pipeline will connect the oil facilities at Prome with the refinery at Syriam south of Rangoon. Construction of the pipeline would eliminate the slow and costly river barge traffic presently used to deliver most of the crude oil to the Syriam refinery.

The Japanese Government agreed to loan Burma nearly $100 million toward equipment and services for the construction of a 25,000-barrel-per-day refinery. Total cost of the refinery will be $132 million. It will replace the present 6,800-barrel-per-day Chauk refinery, which is to be scrapped. The new refinery will process the increased crude oil production from the Mann oilfield.

A production record of 8.2 million barrels was set for crude oil in 1976, representing a 22% increase over the 1975 figure of 6.7 million barrels. The production target for 1977 was set at 10.95 million barrels. Burma's crude oil production was small by world standards but ranked fifth in the Far East area.

Both of Burma's refineries, Syriam and Chauk, continued to process all of the country's crude output, but final 1976 product output breakdowns were not available.

Petroleum product supplies from the refineries, however, did not satisfy the increasing domestic demand, particularly during the first half of 1976. Shortages of diesel oil and furnace fuel caused many industries to close temporarily or operate well below normal capacity. The situation was improving toward yearend; the transport improvements noted earlier provided

[7] U.S. Embassy, Rangoon, Burma. Petroleum Outlook Report: Burma. State Department Airgram A-22, Apr. 12, 1977, pp. 1-12.

a smoother flow of crude oil to the refineries and of petroleum products to consumers.

Marketed natural gas production reached 7.8 billion cubic feet (221 million cubic meters) in 1976, a 42% increase over the 1975 figure. Gas production at Ayadaw and Chauk was stepped up to meet the increased requirements of the Kyunchaung (Ayadaw) and Sale (Chauk) fertilizer plants. The Shwepyitha gasfield near Myanaung was brought into production during the year to supply the new units at the Myanaung gas turbine powerplant and the Kyangin cement mill.

The Mineral Industry of Canada[1]

By Charlie Wyche [2]

In 1976, the Canadian mining industry gave some indications of recovery from the recession that began in 1974 and resulted in weakened demand and decreased prices of mineral products during 1975. During the first quarter, both production and demand were up substantially for most mineral commodities. However, economic growth was curtailed during the second and third quarters, and by yearend, the rate of economic growth had slowed considerably.

Overall domestic and foreign demand for Canadian minerals increased during 1976, but market conditions fluctuated widely among commodities. Although markets improved for iron ore, molybdenum, asbestos, and flat-rolled steel products, they remained weak for many nonferrous metals, structural steel products, and construction materials. In some cases, market conditions were too weak to support price levels sufficient to provide reasonable returns on invested capital. Price increases announced by nickel, copper, and zinc producers had to be reduced when actual demand fell far short of projected demand.

Strikes and lockouts, resulting from labor disputes, affected the production of aluminum, lead, zinc, and nickel during the year. Strikes occurred not only because labor was seeking higher wages from companies, but also to protest wage rollbacks ordered by the Anti-Inflation Board.

Despite these adverse economic and labor conditions, a new production record was set in 1976 for the Canadian mineral

[1] The Canadian Minerals Yearbook for 1976 and the Canadian Mineral Survey for 1976, both prepared by the Mineral Development Sector, Department of Energy, Mines and Resources, Ottawa, are sources of more detailed information on the mineral industry of Canada. The 1977 and succeeding Canada chapters of the Minerals Yearbook, Volume III, will be abbreviated. The Bureau of Mines has arranged to have the Canadian Minerals Yearbook placed in libraries, one in each of the 50 States and Puerto Rico, as follows: University of Alabama, University; E. E. Rasmuson Library, University of Alaska, Fairbanks; University of Arizona, Tucson; University of Arkansas, Fayetteville; California State Library, Sacramento; A. Lakes Library, Colorado School of Mines, Golden; Wilbur Cross Library, University of Connecticut, Storrs; H. M. Morris Library, University of Delaware, Newark; Strozier Library, Florida State University, Tallahassee; P. [2] Physical scientist, International Data and Analysis.

industry. According to preliminary data provided by Statistics Canada, mineral production reached a total value of $15.4 billion,[3] an increase of 14.8% over that of 1975. With respect to the national economy, value of minerals produced in Canada during 1976 represented 8.6% of the estimated $178 billion gross national product (GNP).

On the world scene, Canada ranked first in production of nickel and zinc; second in asbestos, potash, uranium, and molybdenum; third in gypsum, silver, gold, and platinum; fourth in copper and lead; fifth in aluminum metal; and sixth in iron ore. Some 62 minerals were produced from more than 300 underground and open pit mines. Canada's resource position included a wide variety of minerals; exceptions are bauxite, tin, chromium, manganese, and phosphate ores.

Exploration activity remained strong, particularly for the mineral fuels. The search for uranium proceeded in all provinces and territories. Provincial and Federal Crown corporations participated in exploration ventures, as did foreign governments. Electric power utilities, both foreign and domestic, were also financially backing uranium exploration programs. Oil and gas exploration work resulted in several discoveries in the Arctic Islands. On Newfoundland Island, in the Beaufort Sea, and offshore from Labrador, the search for oil and gas continued. A number of exploration projects were also underway for copper, lead, zinc, nickel, and the precious metals.

Regarding mineral fuel production, coal regained importance, mainly because of recent international and domestic energy events. The Organization of Petroleum Exporting Countries (OPEC) oil embargo of the early 1970's and subsequent price increases, coupled with the deteriorating petroleum and natural gas situation in Canada, all contributed to the renewed interest in coal. Several new mines, particularly in Alberta and British Columbia, were under development or planned. The Federal Government estimated that it would spend about $2.5 million on coal research and development programs during 1976. The largest portion of funds would be allocated to programs for coal gasification and liquefaction. Ontario Hydro finalized a contract with Thunder Bay Terminals Ltd. to transship some 3.2 million tons of coal annually by 1981.

Exploration for oil and gas was at an alltime high, particularly in Alberta, where drilling footage exceeded the previous record established in 1973. Pipeline construction reached a record 1,448 kilometers in 1976, chiefly as a result of a large upsurge in gasfield development. The largest project was the completion of 362 kilometers of pipeline for the Alberta Energy Co. in the British Block of southeastern Alberta. A consortium headed by Foothills Pipelines Ltd. filed an application with the National Energy Board (NEB) for permission to construct 824 kilometers of 1,067-millimeter-diameter gas pipeline in the Yukon Territory.

The question of oil and natural gas prices occupied a major position in industry developments in 1976. No general agreement on new price schedules could be reached at the first Ministers' Conference held in May, but after consultation with the producing provinces and under the authority of the Petroleum Administration Act, new prices were set.

Tax and investment policies of Federal and provincial governments continued to cause uneasiness among potential investors. There were pending legislation and changes in mineral policy and taxation during 1976 that could affect exploration and development expenditures. The most restrictive was pending legislation limiting foreign participation in the uranium industry. If a foreign group should discover a uranium deposit, it would be permitted to keep a maximum 30% equity and required to sell the remainder to Canadians. A Canadian group making a discovery was also limited to 30% equity participation, but no one foreign interest could own more than 10%.

The Ontario Legislative Assembly proposed a long-range requirement that new mining ventures in Canada be at least 75% Canadian owned. The Government would be empowered to take up to 50% equity in new ventures either by purchase or by waiver of royalties. The taxation policies of British Columbia and Manitoba, plus the program of the Province of Saskatchewan to acquire additional potash mines in

[3] Where necessary, values have been converted from Canadian dollars (Can$) to U.S. dollars at the rate of Can$1.014 = US$1.00, the average exchange rate for 1976.

the Province, added to the uncertainty. The Saskatchewan government also announced changes to the Mineral Resources Act that included new petroleum and natural gas regulations and a new royalty tax on uranium. The basic policy objectives were to provide greater Canadian control and participation, to increase the mineral processing potential, and to sell the more advanced mineral and metal forms.

PRODUCTION

Mineral production in Canada was reported from all 10 provinces and the 2 territories, with over 81% of the total value coming from Alberta, Ontario, British Columbia, and Quebec. Alberta, with over 45%, had been the leading province in mineral output value since 1971. This was due primarily to its production of crude petroleum, natural gas, and natural gas byproducts, whereas most of Ontario's value was derived from nickel, copper, zinc, iron ore, and gold. Copper and coal were the principal commodities produced in British Columbia, and asbestos, iron ore, copper, and zinc led in the value of Quebec's mineral output. Of the $15.4 billion in total value of minerals produced in 1976, contributions of the 10 provinces and 2 territories were as follows: Alberta, 45.4%; Ontario, 16.9%; Quebec, 9.9%; British Columbia, 9.2%; Saskatchewan, 5.9%; Newfoundland, 4.9%; Manitoba, 3.1%; New Brunswick, 1.7%; Northwest Territories, 1.4%; and the Yukon Territory, Nova Scotia, and Prince Edward Island, each less than 1%.

Table 1.—Canada: Production of mineral commodities

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Antimony content of antimonial lead alloys, flue dust, and dore slag.

[2] Refined metal and bullion plus recoverable bismuth content of exported concentrate.

[3] Refined metal from domestic ores plus cadmium content of exported ores and concentrates.

[4] Actual output not reported; figure represents cobalt content of all products including cobalt in nickel sinter shipped to the United Kingdom by International Nickel Co. for further processing and cobalt in nickel copper matte shipped to Norway by Falconbridge Nickel Mines.

[5] Total cobalt content of all products produced less the amount of cobalt metal reported as produced in Norway. Thus, this figure includes cobalt content of cobalt oxide produced in Canada for sale as such as well as cobalt metal and/or chemicals.

[6] Blister copper plus recoverable copper in exported matte and concentrate.

[7] Includes shipments of ingots from primary plants for rolling elsewhere.

[8] Refined nickel plus nickel content of oxide produced plus recoverable nickel in exported matte.

[9] Refinery output from all sources, including imports and secondary sources.

[10] Cement shipped and/or used by producers.

[11] Includes value of bentonite products from common clay, stoneware clay, fire clay, and other types of clay.

[12] Crushed, building, ornamental, paving, and similar uses.

TRADE

A substantial gain in mineral exports contributed to the overall expansion in Canadian economic activity. The mining industry exported 60% of its output and accounted for about one-third of Canada's total exports. In the first 9 months of 1976, the total value of crude and fabricated nonfuel minerals exported from Canada amounted to $52 billion, an increase of 19.3% over that of the corresponding period of 1975. This was a major contribution to the country's balance of trade. In the same 9-month period, Canadian exports exceeded imports by $637 million, in contrast to the same period of 1975 when imports exceeded exports by $678 million. The value of nickel exports, among the largest earners of foreign exchange, increased 13% to $1.1 billion; that of copper, 12% to $900 million; and that of zinc, 16% to $580 million. Significant gains in export value were also recorded by iron ore (from $685.7 million to $750 million), coal (from $477.9 million to $710 million), and aluminum (from $450 million to $660 million). Precious metals exports remained around the 1975 figure of $240 million, but the values of asbestos and molybdenum exports were sharply higher.

Cement, portland—thousand tons	1,148	997	Do.
Clays and clay products (including all refractory brick):			
Crude clays, including refractory clay—do	r 1,095	553	Do.
Products:			
Refractory (including nonclay bricks)—value, thousands	r $13,588	$15,183	Do.
Nonrefractory—do	r $2,247	$1,655	Do.

See footnotes at end of table.

Table 3.—Canada: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974 [1]	1975	Principal destinations, 1975
NONMETALS—Continued			
Diamond:			
Gem ---------- carats	27,398	26,810	Belgium-Luxembourg 7,775; Netherlands 6,450; United States 5,427.
Industrial (including dust) ---------- do	711,679	450,054	United States 234,910; Belgium-Luxembourg 82,428.
Fertilizer materials:			
Nitrogenous ---------- thousand tons	r 620	502	Mainly to United States.
Potassic ---------- do	9,044	7,242	Do.
Mixed ---------- do	r 724	532	Do.
Ammonia ---------- do	96	116	Do.
Gypsum, crude ---------- do	5,212	3,692	Do.
Lime ----------	r 386,653	235,779	Do.
Nepheline syenite ----------	454,699	356,086	Do.
Pigments, mineral, including processed iron oxides ----------	r 14,843	9,824	United States 8,000; Poland 1,086.
Precious and semiprecious stones, except diamond ---------- value, thousands	r $1,743	$2,382	United States $397; Hong Kong $349; West Germany $336.
Salt and brines ---------- do	r $7,021	$5,111	Mainly to United States.
Sand and gravel ---------- thousand tons	r 358	138	Do.
Sodium sulfate ----------	r 236,971	178,109	Do.
Stone:			
Limestone, crude, crushed, refuse thousand tons	1,219	1,218	Do.
Quartzite ---------- do	144	40	All to United States.
Rough building and crude, n.e.s -- do	r 482	303	Mainly to United States.
Sulfur:			
Crude and refined ---------- do	r 4,252	3,284	United States 975; Italy 339.
Sulfuric acid and oleum ---------- do	249	225	Mainly to United States.
Talc, steatite, soapstone, pyrophyllite [3] -----	r 9,354	6,065	All to United States.
Other nonmetals, crude --- value, thousands	r $44,826	$44,913	United States $13,747; West Germany $8,400; France $5,433.
MINERAL FUELS AND RELATED MATERIALS			
Coal, bituminous ---------- thousand tons	r 10,833	11,695	Mainly to Japan.
Coke from coal ----------	r 261,167	99,998	United States 68,968; Netherlands 15,639; Spain 15,391.
Fuel briquets, coal and coke ----------	37,858	2,220	Mainly to United States.
Gas, natural ---------- million cubic feet	960,713	949,465	All to United States.
Peat ----------	275,270	263,372	Mainly to United States.
Petroleum:			
Crude ------ thousand 42-gallon barrels	r 333,921	262,455	Do.
Refinery products:			
Gasoline ---------- do	1,672	4,876	United States 3,708; Mexico 780.
Distillate fuel oil ---------- do	r 5,189	6,597	Netherlands 2,954; United States 2,094.
Residual fuel oil ---------- do	r 32,274	21,111	Mainly to United States.
Lubricants ---------- do	r 43	16	United States 8.
Other:			
Liquefied petroleum gas -- do	r 32,286	36,919	Mainly to United States.
Asphalt ---------- do	r 637	331	Do.
Petroleum coke and pitch coke do	r 153	980	United States 668; United Kingdom 159.
Total ---------- do	r 72,254	70,830	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals -------- do	r 444	284	Mainly to United States.

r Revised.

[1] Many figures for 1974 are revised from those appearing in the previous edition of this chapter owing to the inclusion of reexports.

[2] May include relatively minor quantities of certain shapes not normally included among semimanufactures.

[3] Partial figures; data given are U.S. imports for consumption only.

[4] Includes some scrap.

[5] Largely, if not all, used in the production of heavy aggregate.

[6] Excludes scrap and sweepings valued in thousands at r $22,283 in 1974 and $26,410 in 1975.

r Revised.
1 May include relatively minor quantities of certain shapes not normally included among semimanufactures.

COMMODITY REVIEW

METALS

Aluminum.—The economic recovery during 1976 that induced other world aluminum producers to increase output was not reflected in Canada's aluminum industry. Both alumina and aluminum metal output, obtained from ore imported primarily from Guinea, Guyana, Sierra Leone, and Surinam, were significantly below the 1975 totals. Largely because of strikes, total smelter production by the Aluminum Co. of Canada Ltd. (Alcan) declined to 543,000 tons in 1976 from 838,000 tons in 1975, according to the company's annual report. Strikes, which started in June, stopped production at three of Alcan's Quebec smelters for almost 6 months. Production was resumed in November, but full output was not expected to be reached before yearend. Canadian Reynolds Metals Co. Ltd., which operated a smelter at Baie Comeau, Quebec, produced 157,800 tons, up from the 148,800 tons produced in 1975. Reynolds imported most of its alumina from the United States.

Because of more favorable economic conditions worldwide in 1976, expansion programs by Alcan and Reynolds were resumed. Expansions in ingot capacity of 25,000 tons each were nearing completion

at Arvida, Quebec, and Kitimat, British Columbia. Alcan planned a 30-year expansion program estimated to cost about $1 billion. In the first phase of the expansion, plans called for construction of a new 190,000-ton-per-year smelter at Port Alfred, Quebec. The plant would be built in three 63,000-ton modules, each estimated to cost $150 million. Following completion of the smelter, plans called for 100,000 tons of additional annual capacity through modernization of existing smelters in Quebec, which now have a total annual installed capacity of 735,000 tons. Eventually, capacity would also be increased at the Kitimat smelter in British Columbia. No definite timetable was announced for initial construction of these projects because of uncertainty over sources of financing. However, part of the new capacity was expected to come onstream by about 1980. Expansion of 135,000 tons per year by Reynolds at its Baie Comeau smelter in Quebec was on schedule.

Reynolds completed a 145,000-square-foot addition to its Cap-de-la-Madeleine, Quebec, rolling mill to house additional melting, casting, and other manufacturing equipment. Alcan was in the final stages of installing a second cold-rolling mill and a continuous heat-treating line at its Kingston, Ontario, works. The $22 million installation would increase Alcan's coiled sheet capacity to 190,000 tons per year.

Copper.—Mine output from 70 Canadian mining operations increased 2% over that of 1975. Smelter production was also above the previous year's level, but refinery output declined. Mine output was higher in all major provinces except Manitoba. British Columbia remained the leading copper-producing province with 37% of the total, followed by Ontario with 35%, Quebec with 16%, Manitoba with 8%, and the remaining provinces with 4%. The increased mine output was attributed to a partial recovery of copper consumption in Japan and to redirecting part of the flow of copper concentrate production to North American smelters.

In British Columbia, Brenda Mines Ltd. set new company production records in 1976. Operating a porphyry copper-molybdenum mine containing ore averaging 0.188% copper and 0.052% molybdenum, Brenda Mines increased copper-in-concentrates production 5% over that of 1975. The improvement in operating performance was due to full computer control of all grinding and flotation units in the concentrator.

Placer Development Ltd. (33% owned by Noranda Mines Ltd) operated the Craigmont mine in Merritt, British Columbia, and the Gibraltar mine in McLeese Lake, British Columbia, during the year. The Gibraltar mine, affected by a 5-month strike, milled 5 million tons of ore grading 0.43% copper. Its production of copper in concentrate was reduced 40% to 17,000 tons. Reserves decreased to 308 million tons with an average grade of 0.35% copper. At

Table 5.—Canada: Aluminum production facilities in 1976

Company	Plant location	Products	Rated annual capacity (thousand metric tons)
Aluminum Co. of Canada Ltd.	Arvida, Quebec	Sized bauxite, calcined alumina, primary aluminum and alloy ingots, super-purity aluminum.	[1] 1,664

Canadian Reynolds Metals Co. Ltd.	Baie Comeau, Quebec	Primary aluminum and alloy ingots, extrusion billets, rolling blocks, wire bars.	158

[1] 1,258,000 tons alumina and 406,000 tons aluminum.

Source: Department of Energy, Mines and Resources, Ottawa.

Craigmont, 2.2 million tons of ore grading 1.42% copper was milled. The 95,000 tons of concentrates produced contained 29,000 tons of copper, an increase of 7% over that of 1975. Ore reserves of 7 million tons with 1.83% copper were sufficient to maintain operations at the 1976 level for 3 to 4 years.

Copper production by Lornex Mining Corp. Ltd. was 37% higher than that of 1975. Changes in a Lornex sales agreement to Japanese copper concentrate buyers were the principal factors in the company's increased output. The modified sales agreement provided for deliveries of fixed amounts of copper concentrates in the years 1976–79 rather than the full production of the mine. Lornex also agreed to a temporary upward adjustment in refining charges for its Japanese buyers.

Afton Mines Ltd., controlled 54% by Teck Corp. Ltd., continued work on its mine-smelter complex. The $800 million operation was expected to have a capacity of 25,000 tons of copper per year when completed in 1977. This would be the first copper smelter to employ the New Top Brown Rotary Converter process developed by the International Nickel Co. of Canada Ltd. (INCO) and Dravo Corp. The complex syenite porphyry deposit contains 34 million tons of open pit ore grading 1% copper. As an incentive to encourage the construction of copper smelters in the Province, the British Columbian government would provide Afton with payment of $0.02 per pound of copper produced from the smelter during its first 4 years of operation. The Province also had an option to purchase, at cost, a 5% joint venture interest in the smelter unit, exercisable for a period of 1 year after completion of the project.

Bethlehem Copper Corp. Ltd. milled 7.5 million tons of ore grading 0.47% copper from open pit mines in the Highland Valley and produced concentrates containing 25,000 tons of copper compared with 27,300 tons in 1975. Reserves at the operating Huestis, Iona, and Jersey mines totaled 56 million tons of 0.46% copper. Utah International Inc. shipped approximately 45,350 tons of copper from its copper mine on the northern end of Vancouver Island in British Columbia. The mill treated 15 million tons of ore in 1976.

In Ontario, Union Minière Explorations and Mining Corp. Ltd. (UMEX) began operations at its new Thierry copper deposit in the Pickle Crow area of Ontario in August. Concentrates were shipped to Noranda, Quebec, for smelting, and refining was done at Noranda Mines' Montreal refinery. The complete cost of the project was $104 million. Ore reserves were estimated to be 15 million tons, with an average grade of 1.63% copper. This was considered adequate for at least 12 years of operation at the planned production rate of 1.3 million tons of ore per year. Production for the first year was to be from two small open pit mines, followed by production from an underground mine.

Production of copper by Falconbridge Nickel Mines Ltd. in the Sudbury area of Ontario was 60,445 tons, 2% above the 59,300-ton total for 1975. Concentrates from the copper-nickel operations were processed at the company's smelter in Sudbury and from the other copper-zinc operations at the Noranda Mines smelter at Noranda, Ontario. The Falconbridge smelter modernization program, which was temporarily suspended in 1975, was resumed in late 1976. The project was estimated to cost $97 million.

At the Kidd Creek mine of Texasgulf Canada Ltd. in the Timmins District, production continued at both open pit and underground mines. Production was about 63% from open pit operations and 37% from underground operations. The mine yielded 212,920 tons of 25% copper concentrate and 430,194 tons of copper-silver-zinc concentrate during 1976. At yearend 1976, measured and indicated reserves were estimated at 83 million tons averaging 2.7% copper. An additional 6 million tons was classified as inferred reserves. Texasgulf Canada proceeded with a $100 million project to increase the mine production rate from 3.3 million tons to 4.5 million tons per year by adding a fourth 3,500-ton-per-day circuit to the concentrator and by construction of a 1,600-meter shaft to develop the lower portion of the ore body.

INCO mined 19.8 million tons of ore with an average grade of 0.97% copper from mines in Ontario, compared with 21.2 million tons of ore with an average grade of 0.92% copper in 1975. Deliveries

of copper metal from the Copper Cliff refinery increased 6% to 177,200 tons in 1976, but were about 5,000 tons below the record 1974 figure. At yearend, INCO had proven ore reserves in Canada of 412 million tons, containing 1.06% copper.

In northwestern Ontario, Mattagami Lake Mines Ltd. reported that development work on its Lyon Lake mine was on schedule. A three-compartment shaft was sunk during the year. Commercial production of 1,000 tons of ore per day was scheduled for 1978. Reserves at the Lyon Lake deposit were increased to 4 million tons of ore grading 1.2% copper. The Geco mine of Noranda Mines in Manitouwadge, Ontario, produced 2 million tons of ore averaging 1.8% copper.

In Quebec, Campbell Chibougamau Mines Ltd. resumed operations in July 1976. These mines were closed in May 1975 because of low copper prices and failure to reach agreement on the terms of a new labor contract. Because of depressed copper prices, the Sullivan Mining Group Ltd. also announced its intention to close its operations at Cupra and D'Estrie in the eastern townships of Quebec.

Noranda treated 45 million tons of ore containing 210,100 tons of copper from 19 copper and zinc-copper mines in Quebec, British Columbia, Ontario, and New Brunswick. The company's two copper smelters, at Noranda, Quebec, and Gaspé Copper Mines Ltd. in Murdochville, Quebec, treated 870,000 tons of concentrates from Noranda operations and 825,000 tons of custom material from other Canadian copper mines and from overseas. The 1.7 million tons of total concentrates yielded 301,200 tons of copper in anodes, a decrease of 9% from that of 1975. Canadian Copper Refiners Ltd. (CCR) in Montreal East, Quebec, operated by Noranda, is one of the word's largest copper refineries with a rated annual capacity of 432,000 tons. In 1976, refinery production decreased 7% to 395,000 tons of copper. CCR processed the output of Noranda smelters, the Flin Flon smelter of Hudson Bay Mining & Smelting Co. Ltd., and also imported and secondary sources.

In Manitoba, Hudson Bay Mining & Smelting operated eight mines and one smelter in the Flin Flon Lake area. Approximately 1.4 million tons of ore with an average grade of 2.4% copper was processed to produce 195,000 tons of a 16% concentrate containing 32,000 tons of copper, a decrease of 2% from that of 1975. The copper smelter produced 64,360 tons of anode copper from feed supplied 48% by Hudson Bay mines and 52% by purchased concentrates. Development work continued on the new Centennial and Westarm mines. A 500-meter shaft was completed at the Westarm mine during 1976, and some surface facilities were installed. The main shaft at Centennial was sunk to a depth of 420 meters and lateral development was started on most levels. The Schist Lake and White Lake mines were closed in 1976 owing to exhaustion of economic ore reserves. At yearend, Hudson Bay had reserves of 16 million tons grading 2.8% copper.

Sherritt Gordon Mines Ltd. operated the Fox, Lynn Lake, and Ruttan mines and produced a combined output of 37,919 tons of copper in concentrate compared with 43,400 tons in 1975. Production declined at all three mines. At Ruttan the tonnage of ore mined and milled in 1976 was 95% of the planned rate of production but only 80% of the 1975 tonnage. Low availability of pit equipment and the increasing hauling distance continued to limit production. Operations at the Fox mine were reduced to a 5-day week in March 1976, to preserve resources. Tonnage of ore milled declined 17% from that of 1975, and the average copper grade was lower, resulting from temporary production problems in the higher grade stopes. The Lynn Lake mine was closed in June 1976. The use of a mining contractor provided evidence that the mine was no longer economical. The net operating loss and shutdown cost in 1976 totaled $3.3 million.

Sherritt Gordon successfully completed a pilot plant test of a new hydrometallurgical copper recovery process at the Fort Saskatchewan metallurgical complex. The process was a joint venture between Sherritt Gordon and Cominco Ltd. with 50% funding by the Federal Government. This environmentally clean process was applicable to a wide range of copper sulfate concentrates and produced high-purity copper by electrowinning, and sulfur as a by-product in elemental form. Secondary values also associated with copper concen-

trate, such as gold, silver, zinc, and molybdenum, were also recovered.

Gold.—Reversing the downward trend of the past decade, Canada's gold production increased about 2% in 1976, although value of output was lower. The sharp drop in the price of gold reduced the dollar value of Canadian output by 25%. The price was $132 per troy ounce in January 1976, receded to $110 in August, and averaged $123 for the year. This decline caused some serious financial problems, especially for marginal gold mines. In order to operate at a profit or at reduced losses, the marginal mines were forced to reduce labor forces, curtail development, and mine higher grade ores. Mine operators also approached the Government for financial assistance to enable the mines to operate until the price of gold improved.

The Emergency Gold Mining Assistance Act (EGMA) expired on June 30, 1976. The Act, which came into force in 1948, provided financial assistance to marginal gold mines to counteract the effect of increasing costs of production and the fixed price of gold. By enabling gold mines to extend their productive lives, the subsidy helped communities dependent on gold mining to adjust gradually to diminishing economic support. The amount paid to gold mine operators during the life of EGMA totaled $303,104,402 for 61,813,545 troy ounces of gold produced and sold in accordance with the requirements of EGMA.

At yearend, there were 22 operating gold mines, accounting for about 73% of total gold production. Two new mines opened in 1976, and several of the smaller base metal mines that produce gold as a byproduct closed.

Although its output was approximately 3% below the 1975 level, Ontario remained the largest gold-producing province, accounting for 44% of the total output. Campbell Red Lake Mines Ltd., the largest gold producer in Canada, operated continuously throughout the year. Located in the district of Balmertown, Ontario, the mill treated over 800 tons of ore per day. Routine development work continued to disclose sufficient ore to maintain ore reserves. Increased costs of labor and supplies and a sharp reduction in the price of gold forced Bulora Corp. Ltd. to close its Red Lake District gold mine, formerly the property of Madsen Red Lake Gold Mines Ltd. Hollinger Mines Ltd. sold its Ross properties at Holtyre and Timmins to Pamour Porcupine Mines Ltd. The ore from the Ross mine was trucked to Timmins for treatment. Pamour operated four mines in the Timmins area. Increasing costs of labor, supplies, and services and the low gold price placed the mines in serious financial difficulties. To offset these adverse factors, the company was forced to reduce its labor force and to phase out lower grade and higher cost ore blocks. Rengold Mines Ltd. brought its 270-ton-per-day gold property, the formerly producing Renabie gold mine near Missanabie, into production in January but was forced to close the mine in June because of finan-

cial problems and the drop in the gold price.

Virtually all gold produced in Alberta, Manitoba, Saskatchewan, and British Columbia was recovered as a byproduct of base metal mining. Northair Mines Ltd. began production at its 270-ton-per-day concentrator located near Brandywine Falls, about 110 kilometers north of Vancouver, British Columbia, in March 1976. This is a vein-type deposit, and reserves were estimated at 410,000 tons averaging 13 grams of gold per ton of ore, 9 grams of silver per ton, and 5.4% combined lead and zinc. Dusty Mac Mines Ltd. exhausted its reserves and closed in May. Small quantities of placer gold were recovered from deposits in the north-central part of the Province and in the Atlin District.

In the Yukon Territory, the older placer districts attracted considerable attention. Claymore Resources Ltd. carried out an extensive program testing ground in the recently discovered placer deposits in the Ladue River District on the Alaska-Yukon boundary, about 48 kilometers north of the Alaska Highway. Other properties in the area were also receiving attention.

Iron Ore.—Canada's iron ore industry performed well in 1976 owing to increased capacity, new demand, and additional mining operations. Ore shipments were 22% higher than those of 1975. The increase in production was due mainly to improvements in the operations of Wabush Mines and the Iron Ore Company of Canada (IOC), and new production from the Mount Wright operation in Quebec, owned by Quebec Cartier Mining Co. (QCM). Canada's iron ore industry was primarily export oriented, with 79% of production entering international markets in 1976. Exports were expected to increase further in 1978 when the Mount Wright operation reaches full production capacity of 18 million to 20 million tons per year. Imports decreased from 4.8 million tons in 1975 to an estimated 3.1 million tons in 1976. The decrease was attributed to greater output from Wabush Mines in which the

Steel Co. of Canada Ltd. (Stelco) and Dominion Foundries and Steel Ltd. (Dofasco) had interests. Imports, however, were expected to increase substantially in later years, and could exceed 7 million tons per year by 1980, probably from Cleveland-Cliffs Iron Co.'s Tilden mine in Michigan and the Eveleth Taconite Co. and Hibbing Taconite Co. in Minnesota.

There were 15 iron ore producers in Canada during 1976, but IOC and QCM accounted for approximately 69% of the total output for the year. IOC produced about 21 million tons alone, representing 37% of Canada's output. IOC completed a major 3-year expansion program, increasing combined annual production capacity at Schefferville and Labrador City, Labrador, and Sept-Iles, Quebec, to about 31 million tons. At Labrador City, the existing pellet plant was reconstructed and an 11-million-ton-per-year concentrator expansion was initiated to increase concentrate production to about 21 million tons annually. At Sept-Iles, a 6-million-ton-per-year pellet plant was installed to upgrade ore from Schefferville.

At QCM, development work on two major projects, Fire Lake and Mount Wright, both in Quebec, was near completion. The Mount Wright project included development of a new mine, a new beneficiation complex, and the new town of Fermont, Quebec. The operation will have a capacity of over 18 million tons of concentrate per year by mid-1977. QCM completed the restructuring of its Fire Lake project. Sidbec-Dosco Ltd., the Quebec Provincial steel company, purchased the Fire Lake iron ore mine and the Lac Jeannine beneficiation facilities and began building a pellet plant. The project included the development of the Fire Lake mine, the purchase and redesign of the Lac Jeannine concentrator at Gagnon, Quebec, and the construction of a 6-million-ton-per-year pellet plant at Port Cartier, Quebec. Of two beneficiating and pelletizing lines, each with 3 million tons of capacity, one line was designed to produce a standard blast furnace pellet grading about 65.5% iron, and the other was designed to produce a special high-grade pellet grading 68% iron for use as feed material in Sidbec's direct reduction plant at Contrecoeur, Quebec.

Campbell Chibougamau requested the Marcona Corp. to prepare a preliminary market study for the production of pellets. Campbell Chibougamau delineated some 300 million tons of magnetite ore and expected to produce 4 million tons of pellets annually for use in direct reduction plants. The pellets would contain 66% iron, 2.5% silica, and 1% titanium. Hilton Mines Ltd. was expected to cease operation at its iron ore mine near Shawville, Quebec, in mid-1977 when its ore reserves are depleted.

In Ontario, the direct reduction plant of Stelco at the Griffith mine operated from January to mid-March when the plant closed because of operating problems. While in production, the plant operated at 75% capacity and produced 300,000 tons of sponge iron. It was expected to reopen in 1977 and operate at about 50% capacity. The plant had a rated capacity of 400,000 tons of sponge iron per year.

The direct reduction plant of Sudbury Metals at Falconbridge, Ontario, owned by Allis-Chalmers Corp. and National Steel Corp. of Canada Ltd., opened in May. Annual capacity was 275,000 tons of sponge iron. The plant uses INCO oxide pellets as feed material and oil and gas as a reductant and could eventually use solid reductants.

Iron and Steel.—Canada began recovering from the economic recession of 1975, but the steel industry experienced an unfavorable year in the face of low demand for steel products. Crude steel production was slightly above the 1975 level. Domestic consumption of 9.6 million tons was 4% below the 1975 level, but producer shipments increased from 9.5 million tons in 1975 to 9.8 million tons in 1976, owing to increased exports to the United States. The steel industry was relatively free of labor strikes, although strikes did occur at several plants. Steel prices increased about 4% to 10% in 1976, reflecting cost increases for labor, energy, raw materials, and transportation.

Despite the drop in consumption, the steel industry initiated major expansion programs. The most significant was by Stelco, Canada's largest steel company, with its commitment to a new steel complex at Nanticoke, Ontario. Initial steel production capacity, scheduled for completion in 1980, will be 1.2 million tons

Table 8.—Canada: Iron ore mining and processing facilities in 1976 [1]

Province	Operating company	Location	Products	Mill capacity (thousand metric tons)	Remarks
Newfoundland and Labrador.	Iron Ore Company of Canada.	Carol Lake, Labrador City.	Concentrate, pellets	127 (ore per day)	Open pit mine; annual capacity of 10 million tons concentrate, 9 million tons pellets.

per year at a cost of about $1.2 billion. It will include coke ovens, a blast furnace, two basic oxygen furnaces, and a double-strand continuous-casting machine for steel slabs. Eventually, capacity at the Nanticoke steel plant is expected to be 5.4 million tons when expansion is completed in 1990.

Algoma Steel Corp. Ltd. was nearing completion of a major investment program that would increase steel production capacity from 2.7 million tons to 3.9 million tons per year making it Canada's second largest steelmaker. In the final phase of the expansion program, a two-strand continuous-casting machine for the production of slabs up to 305 millimeters thick and from 1,016 to 2,159 millimeters wide was installed. An output of 680,000 tons of slabs annually was scheduled to commence in mid-1977. After resolving some technical problems, Algoma's new 4,500-ton-per-day blast furnace and a 1,400-ton-per-day coke oven battery, commissioned in 1975, operated at a high rate of efficiency.

Dofasco was also in the midst of expanding its steel production and processing facilities. In mid-1976, Dofasco commissioned a five-strand, 1,829-millimeter tandem cold-rolling mill which would increase the company's cold-rolling capacity to about 2 million tons per year. In addition, a new basic oxygen furnace shop was under construction that would raise Dofasco's annual steelmaking capacity from the present level of 3.1 million tons to 3.9 million tons by late 1977.

In Quebec, Sidbec-Dosco nearly completed installation of two 136-ton electric furnaces and two continuous-casting machines, one for billets and one for slabs. Completion, scheduled for early 1977, will increase the company's annual steel producing capacity from 635,000 tons to 1.5 million tons. Sidbec-Dosco took a 50.1% equity in the Sidbec-Normines project at Fire Lake, Quebec, during the year. The 6-million-ton-per-year iron ore pellet project was expected to begin operation in late 1977.

In addition to the major steel companies, several of the smaller regional steel producers also initiated expansion programs. Atlas Steel Ltd. of Rio Algom Ltd., Canada's largest producer of stainless and specialty steel, neared completion of installation of two 54-ton and one 23-ton electric arc furnaces at Welland, Ontario. These furnaces were expected to be fully operational in early 1977. Also at Welland, a new Sendzimir cold-rolling mill was commissioned in late 1976 at the Tracy, Quebec, plant. The Dominion Bridge Co. Ltd. at Selkirk, Manitoba, commissioned a new merchant-bar rolling mill. Western Canada Steel Ltd. also commissioned a 73-ton, 5.5-meter-diameter electric arc furnace to replace the existing 27-ton electric arc furnace. This would nearly double Western Canada's annual steel-producing capacity from 99,800 tons to 181,400 tons.

Lead and Zinc.—Because of work stoppages at several mines, production of both lead and zinc declined in 1976. Mine output of lead dropped 30% to its lowest level in 12 years as strikes at several major producers cut production significantly in New Brunswick and the Yukon Territory. Zinc mine production declined 3%, because of an extended strike at Cyprus Anvil Mining Corp. Ltd. and reduced output at Noranda. Metal production, however, was unaffected by the strikes, and as market conditions strengthened, lead and zinc refineries increased output.

All zinc mine production in Canada was in conjunction with lead, copper, and/or silver. By ore classification, about 40% came from zinc ores, 13% from copper ores, and the balance from mixed ores. Production from lead ores was insignificant. Likewise, approximately 30% of the mine copper, 100% of the mine lead, and 80% of the mine silver were jointly produced with zinc.

Canada strengthened its position as the world's leading zinc producer when three new mines, Nanisivik Mines Ltd., Lemoine Mines Ltd., and Northair Mines Ltd., began operation in 1976. These new operations more than offset the closure of one mine by Hudson Bay Mining & Smelting during the year.

Nanisivik commenced production at its lead-zinc-silver deposit at the northwestern end of Baffin Island, Northwest Territories. Mill capacity was 1,360 tons per day, and ore reserves were estimated to be 6.7 million tons, averaging 14.6% zinc, 1.4% lead, and 1.6 troy ounces of silver per ton. The company was expected to produce approximately 118,000 tons of zinc concentrate annually, which would contain about 60% zinc, 0.32% cadmium, and 280 grams of silver per ton. It would also produce

9,000 tons of lead concentrate containing about 65% to 70% lead and 1 to 2 troy ounces of silver per ton. Construction costs of the mine complex were estimated to be about $64 million. Completion of the townsite, airport, and road construction was scheduled for 1977. Nanisivik is owned by Mineral Resources International Ltd. (59.5%), Metallgesellschaft AG of West Germany (29.25%), and Billiton B.V. of the Netherlands (11.25%).

Lemoine, a wholly-owned subsidiary of Patino Mining Corp., completed underground development as well as a 275-ton-per-day milling plant and ancillary facilities at its Chibougamau, Quebec, deposit. Mill tuneup commenced in late 1975, and the mill went into production in early 1976. Ore reserves were estimated at 567,000 tons, grading 10.8% zinc, 4.5% copper, 3.9 grams of gold per ton, and 75 grams of silver per ton.

Northair commenced operation at its lead-zinc-gold deposit near Brandywine Falls, British Columbia, in March. The company produced some 500 tons of zinc in concentrate, which was shipped to Cominco at Trail, British Columbia, for refining. Ore reserves were estimated at 410,000 tons, grading 3.09% zinc, 2.28% lead, 9.02 grams of silver per ton, and 13.06 grams of gold per ton.

Three mine expansion programs were in progress during 1976. Heath Steele Mines Ltd. expanded the mill capacity of its zinc-lead-copper property at Little River, New Brunswick, from 2,800 tons to 3,600 tons per day. Zinc-in-concentrate production was expected to increase 16,000 tons to 46,000 tons in 1977. Brunswick Mining & Smelting Corp. Ltd. was sinking a second 1,372-meter shaft at the No. 12 zinc-lead-copper mine and expected to commence hoisting ore in 1977 when ore from the No. 6 open pit mine is exhausted. The expanded ore processing capacity from 9,100 tons to 10,000 tons per day combined with higher grade ore in the No. 12 mine was expected to increase zinc-in-concentrate capacity about 35% from approximately 190,000 tons to 256,000 tons, which would be phased in during 1979–80. Cost of the expansion program was estimated to be $53 million.

The Kidd Creek zinc-copper mine at Hoyle, Ontario, wholly owned by Texasgulf Canada, was the site of a $100 million expansion program designed to increase mine production and processing of ore to 4.5 million tons per year in 1978–79 by the addition of a 1,600-meter No. 2 shaft and a fourth circuit to the concentrator. Because the copper content of underground ore increases with depth and zinc content decreases with depth, zinc-in-concentrate production was not expected to increase as a result of this expansion. However, some zinc-rich ore was found at greater depth.

Most of the major lead-producing provinces reported a drop in lead production. In New Brunswick, output at Brunswick Mining & Smelting was down about 35% from the 1975 level. Mining operations were stopped for 4 months when the 1,200 workers at the No. 6 and No. 12 mines were on strike.

Mine output of lead from Ontario and Quebec was down slightly in 1976. This output was mainly a byproduct of copper and zinc, and the continuing softness of the market for these two metals resulted in a simultaneous lowering of the lead output. The expansion program of Texasgulf Canada at the Kidd Creek mine in Ontario was designed to increase lead output, probably less than 10,000 tons per year.

Output of lead in western Canada was up from 1975 levels. Production activity was normal at most operations. The lead-zinc-gold property of Northair, near Brandywine Falls in British Columbia, commenced production in March. Production of lead concentrate was estimated at 1,000 tons of contained lead. Mill capacity was 275 tons per day; this may be increased to about 300 tons per day in 1977. The lead concentrate was exported to the United States. Production at Cominco's Sullivan and H.B. mines was also above 1975 levels.

In northern Canada, strikes at mines in the Yukon severely restricted output, while technical problems affected output at Pine Point Mines Ltd. in the Northwest Territories. In the Yukon, Cyprus Anvil lost 169 production days as a result of strikes by mine, office, and technical workers. The last strike, which began on July 30, ended November 23 when workers agreed to a new 3-year labor contract that would expire September 30, 1978.

Of the four producers of lead in the Atlantic provinces, none showed a significant increase in output. The new No. 5

shaft at Heath Steele, was completed to a depth of 991 meters and production in 1977 will be at a rate of 3,600 tons per day, up from the previous level of 2,800 tons per day. Output of lead in 1977 was expected to increase about 30% as a result of the expansion.

Nickel.—Output increased slightly over that of 1975, with output in both 1975 and 1976 about 9% below that of 1974. The slow upturn in economic activity in industrialized countries, labor disputes, and large stock inventories adversely affected nickel output during the year. Canadian producers operated considerably below capacity, and three producers ceased operations. Falconbridge maintained the 30% cutback in production instituted in late 1975 and INCO also operated well below its capacity.

In June 1976, Sherritt Gordon closed its Farley mine at Lynn Lake, Manitoba, because of heavy operating losses. Ore reserves were limited at the time of closure. The mill and surface plant were mothballed to permit reactivation if a new ore discovery was made in the area. Kanichee Mining Inc. stopped production at its copper-nickel mining operation at Temagami, Ontario, after termination of its smelter contract. Dumbarton Mines Ltd. closed its mining operations in the Bird River area of eastern Manitoba in May because of unfavorable economic conditions.

INCO, the world's largest nickel producer, operated 15 mines, 6 concentrators, 3 smelters, and 3 refineries in Ontario and Manitoba during 1976. Production of nickel by INCO increased to 230,800 tons from 209,000 tons in 1975. Its deliveries of nickel increased to 204,900 tons, 17% above that of 1975. INCO began construction of a new $29 million plant near Sudbury, Ontario, to manufacture metal strip for coinage. The plant, scheduled for completion in mid-1977, would manufacture the coinage strip from both elemental and prealloyed metal powders. It would also have facilities for rerolling intermediate products from INCO's rolling mill at Hereford, England, and Huntington, W. Va.

Falconbridge operated nine mines, four concentrators, and one smelter in Ontario and Manitoba. Although production of the company was sharply curtailed, two major capital expenditure programs that were suspended in 1975 were reactivated in July. Sinking of the Fraser shaft on the north rim of the Sudbury Basin, which was 84% complete when work halted, was resumed. Construction was also resumed on the $97 million smelter environmental and efficiency improvement program.

In August, UMEX began operating the 3,600-ton-per-day concentrator at its Thierry deposit near Pickle Crow, Ontario. During the first year of production, the concentrator was fed from two small open pit deposits. The ore would be mined underground in succeeding years.

Two exploration projects could become nickel producers. In the Key Lake area of northern Saskatchewan, the joint venture of Uranerz Exploration and Mining Ltd., Inexco Mining Co., and Saskatchewan Mining Development Corp. was outlining two uranium-nickel deposits. These deposits have a high nickel content that would be recoverable.

Platinum-Group Metals.—Domestic production of platinum-group metals was at the highest level recorded in the last 5 years. These metals were recovered as a byproduct of the nickel-copper ores mined in the Sudbury and Shebandowan Districts of Ontario and the Thompson, Wabowden, and Bird River areas of Manitoba. The 7.7% rise in output resulted mainly from a production increase by INCO, Canada's largest producer, whose deliveries were 84% higher than in 1975. Falconbridge, with an output of 130,000 troy ounces, ranked second in production. Some smaller producers were the Langmuir mine near Timmins, Ontario, Kanichee Mining in Ontario, and Dumbarton Mines in the Bird River area of Manitoba. These producers shipped copper-nickel concentrates to INCO and Falconbridge for treatment.

In August, UMEX began recovering platinum from its Thierry deposit near Pickle Crow, Ontario. A copper concentrate containing platinum-group metals would be processed by Noranda. After extensive diamond drilling, Texasgulf Canada dropped its option on the Lac des Isles property, 80 kilometers north of Thunder Bay, Ontario.

Silver.—Production was valued at approximately $175 million, representing a decrease of about $2 million from the 1975 output. Tonnage of production, how-

ever, increased by 1.2 million troy ounces. This increase was mainly attributable to several base metal mines that produced more byproduct silver, particularly Texasgulf Canada in Ontario and Western Mines Ltd. in British Columbia. Higher output was also reported by Echo Bay Mines Ltd. and Terra Mining and Exploration Ltd. at their silver-copper properties near Port Radium in the Northwest Territories and in the Cobalt area of Ontario.

Ontario remained the leading silver-producing province, with an output of 15.6 million troy ounces in 1976. Ore and concentrate production from mines in the Cobalt area was significantly higher than in 1975. Greater output by the two main producers, Agnico-Eagle Mines Ltd. and Teck Corp.'s Silverfields Div., accounted for most of the increase. The new hydrometallurgical plant of Canadian Smelting and Refining Ltd., the operating company for the joint venture of Péchiney Ugine Kuhlmann of Paris, France, and St. Joseph Explorations Ltd., began commercial production in early 1976. The plant was especially designed to treat arsenic-rich ores and concentrates produced by the Cobalt area mines. The plant was expected to produce up to 6 million troy ounces of silver annually.

In late 1976, operations began at the new 540-ton-per-day concentrator of Canadaka Mines Ltd. in the Cobalt area. The concentrator, which replaced one destroyed by fire in May 1975, was the largest ever built in the Cobalt-Gowganda area.

At the Kidd Creek property of Texasgulf Canada, near Timmins, Ontario, the $100 million expansion program continued on schedule. Included in the program was a transition from open pit to underground mining, with mine production being increased from 3.3 million tons to 4.5 million tons of ore per year.

Mattagami Lake Mines continued development work at its Lyon Lake silver-base metals property about 8 kilometers east of the Mattabi mine in the Sturgeon Lake area of northwestern Ontario. Ore production at a rate of 1,000 tons per day was expected to begin in 1978.

In Manitoba and Saskatchewan, silver continued to come mainly from several base metals mines operated by Hudson Bay Mining & Smelting near Flin Flon and Snow Lake, Manitoba. Significant quantities of silver were also obtained from the Fox and Ruttan copper-zinc mines operated by Sherritt Gordon at Lynn Lake and Ruttan.

In British Columbia, base metal ores were the main sources of silver. Cominco, the largest silver producer in the Province, derived its output from the lead-zinc-silver ores of its Sullivan mine and from purchased ores and concentrates. Byproduct silver output from the Sullivan mine increased 9% over that of 1975. Byproduct silver output from some of the British Columbia porphyry copper mines was lower because of curtailed operations. Northair began operation of its 270-ton-per-day concentrator at the Brandywine Falls silver-gold-base metal property about 110 kilometers north of Vancouver. This is a multivein deposit, containing gold as the major metal.

A feasibility study was completed about mid-1976 on Equity Mining Corp.'s Sam Goosly silver-gold-copper property 60 kilometers south of Smithers. The company plans to bring the property into production in 1978 at a rate of 3,000 to 4,500 tons of ore per day. Reserves of ore minable by open pit methods were estimated at 39.5 million tons grading 2.8 troy ounces of silver per ton.

Silver output in the Yukon Territory declined 50% in 1976 because of labor strikes at all three producers. United Keno Hill Mines Ltd. at Elsa, Canada's fourth largest mine producer of silver, was idle for 2 months. Three suspensions in operations reduced byproduct silver output at the silver-lead-zinc mine of Cyprus Anvil at Faro more than 50%. Byproduct silver output also declined at the copper-silver property of Whitehorse Copper Mines Ltd. near Whitehorse, as a result of a 2-month strike.

In the Northwest Territories, silver output was significantly higher because of greater output by the two main producers, Echo Bay Mines and Terra Mining and Exploration. Both companies operated their silver-copper properties near Port Radium free of labor strikes during 1976.

Other Metals.—Consolidated Durham Mines & Resources Ltd. continued to increase production of antimony concentrate at its Lake George property near

Fredericton, New Brunswick. The mill output was 400 to 450 tons per day with a total production of 89,000 tons in 1976. The concentrate, which averaged about 65% antimony, was shipped mainly to Europe. Output of bismuth and cadmium, obtained as a byproduct of base metal mining, increased in 1976. Production of cobalt increased slightly; however, the value of production and the value of exports increased substantially because of price increases. Two companies, INCO and Falconbridge, produced cobalt as a byproduct of domestically produced nickel-copper ores while a third, Sherritt Gordon, recovered cobalt from imported nickel ores.

Demand for columbium remained strong, but Niobec Inc. was Canada's only producer at yearend. St. Lawrence Columbium & Metals Corp. (SLC) had serious problems and halted all activities in February, following a strike by its miners. Financial problems, in addition to those caused by the strike, forced the company to file for bankruptcy in July. The labor conflict was resolved in the latter part of 1976, but the problem of financial reorganization was still pending at yearend. SLC operated during January only and produced 136 tons of Cb_2O_5.

Demand was high for molybdenum, and shipments of oxide, sulfides, and ferromolybdenum were 15% above those of 1975. Molybdenum was recovered as a primary product at two Canadian mines, as a coproduct with copper at one mine, and as a byproduct of copper at four mines. Canex Placer Ltd.'s Endako Div., British Columbia, accounted for about 50% of Canada's production. Brenda Mines as a coproduct producer supplied about 30% of Canada's output of molybdenum, and as a byproduct producer accounted for 20% of the output.

Demand for Canadian ferrosilicon was weak in 1976. However, another large manufacturer of silicon metal and ferrosilicon began operations in Becancour, Quebec. This company, Sueddeutsche Kalkstickstoffwerke AG of West Germany, began production in July. Built at a cost of $50 million, the plant had an annual production capacity of 27,000 tons of ferrosilicon and 23,000 tons of silicon.

Demand for tantalum remained at the low level of 1975. Output by Tantalum Mining Corp. of Canada Ltd. (Tanco), Canada's only producer, amounted to about 135 tons, a drop of 25% from that of 1975. Tanco's mine and mill were located at Bernic Lake in Manitoba. At the end of 1975, the company had reserves for only another 5 to 7 years of mining. As a result, Tanco began an extensive exploration program in 1976 to develop new reserves. By June, 3 additional years of reserves had been identified.

Quebec Iron and Titanium Corp. (QIT) was the only producer of ilmenite in Canada. The deposit was located in the Havre St. Pierre District of Quebec, and the ilmenite ore was processed in the Sorel area of Quebec. QIT produced 814,059 tons of titanium slag, an increase of almost 9% above its 1975 output.

Production of tungsten trioxide totaled 2,000 tons, up 40% from that of 1975. Canada Tungsten Mining Corp. Ltd., with its mine and mill in the Flat River Valley of the Northwest Territories, remained Canada's only producer of tungsten. The increased output was attributed to improved market conditions and better operating results. The mill rate, mill-head grade, and tungsten recovery rate were all above the 1975 levels. Brunswick Tin Mines Ltd. continued pilot plant tests on its tungsten-molybdenum-bismuth deposit at Mount Pleasant, New Brunswick. Amax Exploration, Inc., worked on a tungsten deposit at Mac Tung, Northwest Territories. While both deposits seem to have economic potential, no production decisions were made during the year. Cordilleran Engineering Ltd. announced that it had found an area of extensive tungsten mineralization on the British Columbia-Yukon Territory border.

NONMETALS

Asbestos.—Shipments rebounded in 1976 after the problematical year of 1975 and almost reached the 1974 shipment rate. Available capacity was inadequate for the strong demand during the year. Strong prevailing prices and anticipated high future demand spurred exploration for new asbestos prospects and evaluation of known deposits particularly in Quebec and Ontario.

The production rate was cut back at United Asbestos Inc.'s mine, 27 kilometers

southwest of Matachewan, Ontario, while equipment was installed to meet environmental requirements. The company expected to be at full operational capacity of 90,000 tons of fiber per year in early 1977.

Canadian Johns-Manville Co. Ltd.'s Asbestos Fibre Div. planned to spend $77 million during 1976–81 in expansion at the Jeffrey mine, Asbestos, Quebec, the largest asbestos mine in Canada. Expenditures in 1976 totaling $12.5 million were for purchase of property in the mine area, repairs, and new facilities.

Asbestos Corp. Ltd. decided not to rebuild the King-Beaver mill at Thetford Mines, Quebec. The mill was destroyed by fire in late 1974. King-Beaver ore will be processed at the Normandie mill, Black Lake, Quebec, probably beginning in 1977, when Black Lake ore is expected to be mined out. In the meantime, ore from the King-Beaver underground operations was treated at Asbestos Corp.'s British Canadian mills at Black Lake.

Brinco Ltd. of Montreal, Quebec, and ASARCO Inc. of New York began preliminary discussions for development of a large asbestos deposit owned by Abitibi Asbestos Mining Co. Ltd., located 84 kilometers north of Amos, Quebec. Brinco held a 55% interest in Abitibi. An estimated $300 million investment would be necessary for a 220,000-ton-per-year operation. Ore reserves were 100 million tons containing 3.5% recoverable asbestos fiber.

Late in the year, the newly elected Provincial government in Quebec indicated an intention to acquire control over the asbestos industry in the Province.

Cement.—Cement shipments declined again in 1976. Contracts for sales in the improving U.S. construction industry provided an important market for Canadian cement. According to Statistics Canada, shipments were valued at $339.2 million in 1976 and $320.2 million in 1975.

Expansions and modernizations were underway. There were also shutdowns and terminations of clinker production. Companies abandoned old, less efficient, and costly-to-operate equipment and planned conversions to the dry process and energy conservation.[4]

The energy intensive cement industry, which consumed about 4% of the industrial total, planned a 12% energy savings by 1980.

Theoretical annual capacity was 15.1 million tons at yearend. This capacity was distributed as follows, by province: Ontario, 43.7%; Quebec, 27.1%; the Western provinces, 24.4%; and the Atlantic provinces, 4.8%.

Fertilizer Materials.— *Phosphate.*—International Minerals & Chemical Corp. (Canada) Ltd. (IMC) completed a first-stage exploration program on a deposit, discovered in 1975 near Kapuskasing, Ontario, 640 kilometers northwest of Toronto. Reserves were estimated at 56.7 million tons at 20% P_2O_5.

Erco Industries Ltd. was rebuilding the No. 2 furnace at the elemental phosphorus plant at Long Harbour, Newfoundland. Upon completion, annual capacity will be 72,500 tons.

Potash.—Production and sales were up, compared with those of 1975, although prices were soft during the year. Sales were nearly 14% higher overall and nearly 29% higher to U.S. markets. The 10 operating mines worked at slightly over 50% of capacity through August and at or near full capacity the remainder of the year. IMC, the leading producer, announced plans for expansion from 3.5 million tons to about 4 million tons KCl per year at its two mines near Esterhazy in eastern Saskatchewan.

The Saskatchewan Provincial government continued negotiations with several of the potash producers for effective control of the potash industry in the Province through purchase of all Provincial potash mining assets. In August, the first transfer of ownership, that of the mine owned by Duval Corp. of Canada, was announced. Potash Corp. of Saskatchewan (PCS), the Provincial Crown company, announced purchase of the mine and related assets of Duval Corp. for $128.5 million, with transfer of property and management by October. PCS renamed the mine as the Cory mine after its location near Saskatoon, announced plans for a 25% expansion, and assured job security and no production or supply disruptions. By yearend, PCS was negotiating with four other com-

panies (Hudson Bay Mining & Smelting, Alwinsal Potash of Canada Ltd., Allan Potash Mines Operators Ltd. (APM), and Central Canada Potash Co. Ltd.). Acquisition of these properties would give PCS control of nearly 50% of the potash production in the Province at an estimated cost in excess of $500 million.

In January, the Saskatchewan legislature voted final approval of the Potash Development Act, empowering the Province to acquire ownership, through purchase or expropriation, of part or all of the potash industry. The Potash Corp. of Saskatchewan Development bill was also passed, creating PCS as a Crown corporation with headquarters in Saskatoon. Bills were also introduced with amendments redefining the prorationing system, the PCS Development bill, and expropriations relating to the Federal Income Tax Act and mine valuations.

In June, the U.S. Department of Justice announced a Federal grand jury indictment, with charges against U.S. potash producers with operations in Canada for violations of the Sherman Anti-Trust Act by fixing prices and production rates during 1969–74 beyond regulations of the Provincial prorationing program.

In January, the government of New Brunswick concluded an agreement with IMC for exploration and development work for potash and salt in a 200-square-kilometer area near Salt Springs, Kings County. A high-grade sylvite and halite bed reportedly lies at a depth of 600 meters. IMC was to spend $1 million in the first exploration stage, and if the deposit proved economic, development and mining would follow within specified times.

IMC was also drilling out a potash discovery near Kapuskasing, 640 kilometers northwest of Toronto, in Cargill Township, Ontario.

Potash Co. of America, also granted an exploration contract for potash in New Brunswick, was working near Sussex.

Fluorspar.— Production of concentrates, containing about 70% CaF_2, at Alcan's Newfoundland Fluorspar Div. near St. Lawrence, Newfoundland, was down 50% from normal output because of a strike lasting for several months at Alcan's aluminum smelting facilities at Arvida, Quebec, where the concentrates are shipped for use in the manufacture of aluminum fluoride.

Shaft sinking and other mine development continued north of St. Lawrence, where new reserves have been discovered. Mining will be at a depth of 460 meters. An initial production rate of 450 tons per day was scheduled for 1977.

Sulfur.—Sulfur production was down 3% from that of 1975 and was 10% below that of the record year of 1973. The decline reflected stagnation in development of new sour natural gas reserves and reduced output of natural gas. During the year, 42 sour natural gas plants in Alberta, 2 in British Columbia, and 1 in Saskatchewan operated with a combined annual capacity of 9.2 million tons.

Sulfur was also obtained from crude oil, the Athabasca bituminous sands, smelter gases (in the form of sulfuric acid), and pyrite concentrates (for sulfuric acid). However, sulfur from sour natural gas was the most important source in Canada, particularly in Alberta, where it occurred as hydrogen sulfide in varying quantities in many reservoirs.

Sulfur produced from smelter gases (as contained sulfur in sulfuric acid) totaled 781,000 tons, an increase of 12% over that of 1975. Smelter gases will continue to increase in importance as a source of sulfuric acid in Canada, as current output is expected to double by 1985. Pyrite shipments were virtually stopped as acid producers formerly using pyrite either closed down or converted to elemental sulfur.

Canada was the world's largest exporter of sulfur, accounting for over 30% of total sulfur trade. In 1976, Canada's elemental sulfur exports rose about 8% over 1975 exports to 3.4 million tons, but were still below the record 1974 sales. Shipments to the United States returned to the 1974 levels. Shipments to Asian markets, for many years a significant outlet for Canadian sulfur, rose 25% in 1976, also returning to 1974 levels.

African markets were becoming a major destination for Canadian sulfur, increasing from less than 10,000 tons in 1972 to over 400,000 tons in 1976. The Republic of South Africa received about 75% of this tonnage. Similarly, South America has grown rapidly as an outlet for Canadian sulfur, exceeding 400,000 tons in 1976, more than three times the 1975 level. Brazil accounted for about 65% of these purchases.

Sulfur prices have been volatile over the years, varying between an annual average price of $37 per ton f.o.b. Alberta in 1968 to $5 per ton in 1973. The boom in 1974 raised the price to $25 and depressed markets during 1975 and 1976 resulted in a fall to below $20.

MINERAL FUELS

Coal and Coke.—Because of some major coal miners strikes during the year, Canada's coal production remained virtually unchanged from that of 1975. While bituminous coal production declined about 1.3 million tons, output of both subbituminous coal and lignite increased. Also because of the strikes and soft markets for spot coal sales, exports were down 252,000 tons. Of the total coal consumed in Canada, about 16.8 million tons was used to generate electricity in thermal power stations, and about 7.4 million tons of coking coal was carbonized to make 5.3 millon tons of coke.

Three new coal mines were in various stages of development, and several companies were expanding operations during 1976. In Nova Scotia, production from Cape Breton Development Corp.'s (Devco) new Prince mine was increased and it was expected to reach capacity in 1977. In Saskatchewan, the Saskatchewan Power Corp. (SPC) began production from its Souris Valley surface mine near Estevan. In Alberta, Luscar Sterco Ltd. decided to proceed with its surface mine southeast of Hinton, after receiving Alberta government approval. Production was expected by mid-1978. Several companies were expanding established mines during 1976, mainly for subbituminous coal in Alberta and lignite in Saskatchewan to fuel electric power stations. Exploration and evaluation work on several prospects in Alberta was discontinued following release of Alberta's new coal zoning conditions.

Many of the coal-producing provinces either announced new coal policies or were actively reviewing their existing policies during 1976. In June, the government of Alberta announced a new coal development policy. This policy stated that the use of Alberta's coal resources was designed to give maximum benefit to the people of Alberta. Development of coal for use in Alberta power stations was given priority with strong emphasis on proper regard for the environment. The new coal policy also included a royalty system of a flat $0.10 per short ton of coal produced. The royalty became effective July 1, 1976, and was based on a percentage of the selling price of coal after factors were calculated for cost, revenue, and investment. The minimum royalty applicable would be 5%.

Ontario Hydro finalized a contract with Thunder Bay Terminals to transport 3.2 million tons of coal annually from western Canada to central Canada by 1981.

In British Columbia, coal production by Kaiser Resources Ltd. near Sparwood in the Crowsnest Pass area was halted for 30 days by a coal miners strike. Production in 1976 declined 15% to approximately 5.5 million tons of clean coal. Also affected by the strike were the expansion of the Elkview preparation plant and development of Panel 6 of the underground hydraulic mine. On April 1, 1976, Kaiser and its Japanese customers negotiated a basic price of $50.91 per ton f.o.b. Vancouver for coking coal. With the application of escalation factors the price increased to $53.30. This price established the pattern for most of the other Canadian coking coal producers with long term Japanese contracts.

Four companies in Alberta produced coking coal. Output for 1976 totaled about 14 million tons of coal in the two main categories of subbituminous and bituminous material. At Grand Cache, McIntyre Mines Ltd. produced approximately 1.9 million tons of coal from one underground and two surface mines. McIntyre shipped 1.5 million tons of coal to Japan under terms of a 3-year contract that expires in 1978. During 1976, McIntyre also shipped small volumes of coal to Hamilton, Alberta, for both Stelco and Dofasco and to Sydney, Nova Scotia, for Sydney Steel Corp. Cardinal River Coals Ltd. produced nearly 1.7 million tons of coking coal at its Luscar surface mine, near Hinton, during 1976. Cardinal River planned to expand the mining operation by about 500,000 tons per year. The principal consumers of Alberta's coal were Calgary Power Ltd. (CPL) and Alberta Power Ltd. (APL). CPL, which produced about 65% of the electrical power in the Province of Alberta, operated two large coal-fired thermal stations. The remainder of the electrical power came from two large coal-fired steam turbine installations.

In Saskatchewan, only lignite was produced from five surface mines in the southeastern Estevan-Bienfait region. Production in 1976 totaled 4.7 million tons, up about 1.2 million tons from that of 1975. Most of the production was sold to SPC for use in its power stations. The other important lignite market was in Manitoba where shipments were made to the Manitoba Hydro-Electric Board for power station use.

Coal in New Brunswick was mined in the Minto-Chipman area by New Brunswick Coal and Railway Co. Production amounted to approximately 320,000 tons, down about 90,000 tons from that of 1975; about 275,000 tons was sold to the New Brunswick Electric Power Commission's coal-fired power station at Grand Lake. A new coal-fired unit being built at Dalhousie by New Brunswick Electric was scheduled for operation in mid-1979. This unit was expected to burn approximately 275,000 tons of coal annually, which should improve coal market conditions in the Province.

Production increased 20% to 1.9 million tons in Nova Scotia during 1976. Devco produced about 97% of the total from its three expanded underground mines. Devco's newest mine, the Prince mine at Point Aconi, produced 215,000 tons of coal. An annual rate of 725,000 tons was expected by 1977 if markets warrant it. At Lingan, a major change was made in the belt haulage system to improve the efficiency of coal movement out of the mine. Three longwalls were operated in 1976 as production increased to 1.1 million tons.

Natural Gas.—Production decreased marginally in 1976. The wellhead value of marketable gas production was $2.5 billion compared with $1.5 billion in 1975.

Table 12.—Canada: Principal coal mines in 1976 [1]

Province	Company	Mine and location	Estimated production (thousand metric tons)	Remarks
Nova Scotia	Cape Breton Development Corp.	Lingan mine, Lingan	1,233	Underground; coal for power generation.
Saskatchewan	Manitoba and Saskatchewan Coal Co. Ltd.	Boundary Dam mine, Estevan	1,510	Open pit; lignite for power generation.
Do	Utility Coals Ltd	Utility mine, Estevan	1,247	Do.
Alberta	Manalta Coal Ltd	Whitewood mine, Wabamun	2,059	Open pit; coal for power generation.
Do	----do	Highvale mine, Sundance	2,589	Do.
Do	Coleman Collieries Ltd	Tent Mountain mine, Coleman.	1,274	Open pit; coking coal for export to Japan.
Do	Cardinal River Coals Ltd	Cardinal River mine, Luscar	2,253	Do.
Do	McIntyre Mines Ltd	Smoky River mines, Grand Cache.	2,073	Open pit and underground; coking coal for export to Japan.
British Columbia	Kaiser Resources Ltd	Harmer Ridge, Sparwood	5,987	Open pit and underground; leading producer in country; coking coal for export to Japan.
Do	Fording Coal Co. Ltd	Fording mine, Fording Valley	2,401	Open pit ranks second as producer; coking coal for export to Japan.

Increases in prices late in 1975 and again in 1976 were responsible for the increase in gas value. Sales of gas to customers in Canada were 1.3 trillion cubic feet, slightly below the 1975 level. Commercial consumption increased, but both residential and industrial consumption declined. The value of natural gas sold domestically amounted to $1.4 billion, an increase of $97 million over that of 1975.

Export sales of natural gas to the United States increased slightly to 957,000 million cubic feet. This marked the third consecutive year that export volumes were below the authorized level of about 970 million cubic feet. The decline undoubtedly resulted from the Federal Government's decision to cut back on natural gas exports because of predicted shortages in Canada for 1976. These shortages did not develop, and there were no further plans to substantially reduce natural gas exports to the United States.

There were major natural gas discoveries in the foothills of Alberta, particularly in the Burnt Timber, Wilson Creek, and Limestone Mountain regions. In addition, a Devonian reef gas discovery was made in the Pinto region of western Alberta, about 32 kilometers west of the Berland River Field. Early indications were that these were substantial discoveries although their true significance would only be known after a more complete evaluation. In northwestern Alberta, a significant new shallow gas trend was continuing to develop near the scene of the Keg River oil discoveries of the 1960's. Several discoveries were made there in the Bluesky Formation of Cretaceous age in 1974, and since then several successful followup wells were drilled expanding the known limits of the productive area.

In the Arctic Islands, Panarctic Oil Ltd. made two significant gas discoveries in April. The first was a major northwestward extension to the Hecla gasfield off the Sabine Peninsula, Melville Island. The well was drilled 24 kilometers offshore in 30 meters of water from an artificially thickened ice pad. The Hecla Field was now over 40 kilometers long and was estimated to contain upward of 5 trillion cubic feet of natural gas. The second gas discovery was at a well drilled 6 kilometers offshore from Ellef Ringnes Island in 61 meters of water about midway between Panarctic's King Christian Island gasfield and the gasfield at Kristoffer Bay on Ellef Ringnes Island. The well was drilled on a separate structure from those of the two previous discoveries.

Work was resumed on two potential gas discoveries made in 1975 on the Labrador Shelf. One of these, Eastern Snorri, located about 1,100 kilometers north of St. John's, Newfoundland, yielded significant flows of gas and condensate and was considered to be a potential commercial discovery. The other well, Karlsefni H–B, also penetrated a gas- and condensate-bearing reservoir, but it was not considered to be commercial at the present time.

On the Grand Banks and Scotian Shelf, exploration was declining as results had been costly and disappointing. The only discoveries made in this region were in the vicinity of Sable Island, but currently all of these were considered to be noncommercial.

On August 31, a consortium headed by Foothills Pipelines filed an application with the NEB for permission to construct 824 kilometers of 1,067-millimeter-diameter gas pipeline in the Yukon Territory as its contribution to the proposed Alcan project to transport Alaskan natural gas to U.S. markets. The system would follow the trans-Alaska crude oil pipeline currently under construction to Fairbanks, Alaska, and then parallel the Alaska Highway to the Alberta border, where it would connect with the Alberta Gas Trunk Lines Co. and Westcoast Transmission Co. Ltd. systems. The NEB decided to incorporate the Alcan proposal in the hearing currently

underway on the northern pipeline proposals of Canadian Arctic Gas Study Ltd. (CAGSL) and Foothills. The NEB decided that having a consolidated hearing for the three projects, rather than having a separate hearing on the Alcan project, would result in a faster decision as to which pipeline proposal would eventually be approved.

Canadian natural gas prices, which were set at $1.25 per thousand cubic feet at Toronto city gate, were increased to $1.40 in July and to $1.50 on January 1, 1977. In September 1976, the export price was increased from $1.60 to $1.80 per thousand cubic feet, and again at yearend it increased to $1.94. The increase follows the Federal Government policy of receiving full market value for this commodity. Canadian producers would receive a wellhead price for gas of $1.22 per thousand cubic feet on January 1, 1977, up from $0.99 in effect during 1976.

The Energy Resources Conservation Board reported marketable natural gas reserves at 53.7 trillion cubic feet on December 31, 1975, and at 55.5 trillion cubic feet on December 31, 1976. Most of the reserves were located in Alberta, where the 1976 total was estimated at 53,302 billion cubic feet. This represents an increase of 4% over that of 1975.

Petroleum.—Production of crude oil (including synthetic crude and natural gas liquids) continued the downward trend which began in 1974. In 1976, output was down 6% from that of 1975. Conventional crude oil production declined 6% and that of natural gas liquids dropped 7%. Production of synthetic crude oil, however, was up 9% over that of 1975. The overall decrease in production of crude petroleum resulted from lower export quotas to the United States. The increase in domestic requirements coincident with the opening of the interprovincial pipeline extension from Sarnia to Montreal failed to offset the limitations on exports.

In May, the Federal Government announced the terms of a territorial Petroleum and Natural Gas Act. The Act would provide for a new regulatory system to govern the manner in which oil and gas rights were made available for development in Canada's territories and offshore regions. The new legislation was designed to promote early assessment of Canada's frontier oil and gas resources through incentives to explore.

The Act also had elements to stimulate exploration which include fiscal and landholding incentives, together with complementary provisions for greater Government control over the rate and level of exploration, development, and production activities. In addition, the legislation would permit Canadian firms to benefit more fully from the development of Canadian resources.

Encouraged by rising crude oil prices and drilling incentives by provincial governments, the number of wells completed in 1976 increased 20%. There were 5,100 wells and 4,938 kilometers drilled, the highest in both categories since 1965. Alberta was the main area of drilling activity, accounting for 90% of wells completed and 85% of total kilometers drilled. These represent increases of over 25% for wells drilled and 34% for kilometers drilled over those of 1975. In British Columbia, both kilometers drilled and number of wells drilled increased substantially, but drilling activity in Saskatchewan and Arctic areas declined. Drilling activity remained about the same in the eastcoast offshore area. There were no significant oil discoveries.

Interest remained high in the development of vast resources of heavy oil in the Cold Lake area of eastern Alberta. Imperial Oil Ltd., one of the pioneers in Cold Lake oil sands development, has spent about $40 million since 1964 experimenting with potential extraction methods. During 1976, the company operated a 56-well steam-injection project. Production totaled approximately 10,000 cubic feet per day which was shipped to Imperial's new Strathcona refinery in Edmonton as feedstock for asphalt. Depending on technical success in the pilot stage, Imperial eventually intends to expand this project to an ultimate production of 567,850 cubic feet per day.

Great Canadian Oil Sands Ltd. (GCOS) remained Canada's only commercial synthetic crude oil producer. Operations from the bituminous sands at Athabasca, Alberta, resulted in crude production of 17.5 million barrels compared with 15.5 million barrels in 1975. The higher level of production was influenced by increased crude oil prices instituted by the Government on

July 1. Improved economics, largely as a result of increasing crude oil prices and possible incentives of reduced royalty and tax payments, were expected to speed up tar sands development in the next decade. Canada planned to reduce dependence on imported oil in the 1980's, and both Federal and provincial governments considered that work on the Athabasca tar sands must be expedited.

Output by GCOS would have been greater except for mechanical difficulties and the occurrence of pockets of lean sand during first quarter mining. There were also problems with the power and steam facilities and the sulfur plant during the last quarter. Overall, however, operations saw less mechanical downtime than in previous years. This was particularly true in overburden removal where the time that equipment was available increased substantially over that of 1975 and resulted in record removal of material. This improvement eliminated the need to hire outside contractors to supplement company efforts. More stable operations also characterized the extraction plant, and levels of bitumen production were well above average.

Fabrication of the third large bucket wheel by GCOS was completed in late 1976 and, following testing, operation commenced in December. Although it is approximately the same size as the company's two original mining machines, it has a greater capacity. Its primary function would be overburden removal, but it also had the flexibility to mine oil sand.

The Petrofina Canada Ltd. consortium announced that the planned 121,250-barrel-per-day Athabasca tar sands extraction plant would be shelved indefinitely. Petrofina gave rising costs and lack of Government incentives as reasons for its actions. Shell Canada Resources Ltd. and Home Oil Co. Ltd., both of which had intentions of constructing Athabasca tar sands plants, also postponed their plans pending further economic studies. On the other hand, Syncrude Canada Ltd.'s $2 billion tar sands plant, located 48 kilometers north of Fort McMurray, Alberta, was more than 60% complete at yearend. Mining and extraction would be applied to those sands that lie within 60 meters of the surface. Major research and technological areas that were concentrated upon in developing the project included mining, extraction, froth treatment, diluent recovery, and upgrading of the bitumen. The 124,375-barrel-per-day plant was scheduled to begin operating in mid-1978.

Alberta established the Alberta Oil Sands Technology and Research Authority (AOSTRA) to advance tar sands technology. This was undertaken to study processes of recovering the oil from sand deposits to a depth of 600 meters. Amoco Canada Petroleum Co. Ltd. signed a contract for a $46 million joint venture with AOSTRA to study the recovery of bitumen from the Athabasca tar sands. Under the agreement, Amoco Canada and AOSTRA would contribute $23 million each by 1980 for development of a pilot project which would involve 25 wells. Production was expected to reach a level of over 1,000 barrels per day of bitumen.

Refinery capacity was increased substantially, mainly because of the completion of Irving Oil Company Ltd.'s refinery expansion from 140,000 barrels to 234,000 barrels per day. By 1978, refinery capacity was expected to be about 2.5 million barrels per day with the completion of Texaco Canada Ltd.'s 94,375-barrel-per-day refinery at Nanticoke and Petrosar Ltd.'s large facility at Sarnia, Ontario. In spite of the closure of Newfoundland Refining Co. Ltd. 99,400-barrel-per-day refinery in Newfoundland, Canada was expected to have a surplus of refinery capacity for several years. This was attributed to a sharp decline in exports of petroleum products during the last 2 years.

Uranium.—Production was substantially above that of 1975. This rise was attributed to an increase in the number of producers. Shipments, including some from inventory, totaled 5,100 tons U_3O_8, slightly less than that of 1975. Of the total production, over 80% came from Denison Mines Ltd. and Rio Algom Ltd. at Elliot Lake, Ontario. The remainder came from Eldorado Nuclear Ltd. near Uranium City, Saskatchewan; Gulf Minerals Canada Ltd. at Rabbit Lake, Saskatchewan; and Madawaska Mines Ltd., which began production near Bancroft, Ontario. Increased exploration activity was evident in most provinces and territories, but northern Saskatchewan emerged as the prime exploration area. A shortage of skilled miners continued to plague the industry despite training and new housing for the workers.

Denison Mines, Canada's largest uranium company, produced 1,411 tons of U_3O_8 during 1976, 7% above the 1975 level of 1,320 tons. Deliveries were made from production and from stockpile. Tonnage milled increased 14% to 1.5 million tons in 1976. On several occasions the mill achieved the planned 7,100-ton-per-day ore capacity, but it averaged 6,000 tons, well ahead of the average 3,800 tons per day of 1975. Introduction of larger equipment, construction conveyorways, and manpower training programs were among steps taken to increase mine capacity.

Rio Algom was well into its expansion program to gradually increase production and to reactivate the Panel mine, located near its Quirke property. A comprehensive environmental, engineering, and operating study of the Panel mine was scheduled for completion by mid-1977. At that time, the optimum milling rate as well as a definitive estimate of the capital cost will be determined. New housing will be constructed, in addition to the extensive housing program already underway in connection with the Quirke expansion.

In mid-1976, the joint Gulf Minerals Canada Ltd./Uranerz Canada Ltd. open pit operation at Rabbit Lake, Saskatchewan, reached full capacity. The mine and mill were operated on a 7-day week, two 12-hour shifts basis. At yearend, the open pit was about 30 meters deep and will ultimately reach a depth of over 120 meters. The plant was designed to process about 1,800 tons of ore per day and production was expected to total about 1,730 tons U_3O_8 annually.

Also in Saskatchewan, Amok Ltd. continued development work on its Cluff Lake deposits. Final feasibility studies were completed in early 1976 and mill design was underway. A two-phase operation was envisaged, at a total cost of some $133 million, for an annual output of 1,540 tons U_3O_8 by 1979.

Madawaska Mines completed rehabilitation of the former Faraday mine and mill located near Bancroft, Ontario, in August. Late in the year, the mill had reached a capacity of 680 to 725 tons of ore per day. Full capacity of 1,360 tons per day was expected in early 1977.

Uranium exploration activity in Canada remained high, involving not only mining companies but Federal, provincial, and foreign governments as well. Electric power utilities, both foreign and domestic, were also financially backing uranium exploration programs. Work was conducted in all provinces and territories with the possible exception of Prince Edward Island. In Saskatchewan, the joint venture partners Inexco Mining Co., Uranerz Exploration and Mining Ltd., and Saskatchewan Mining Development Corp. discovered a deposit in the Key Lake area, near their Gardner ore body that was discovered in 1975. The partners discovered the Deilmann ore body in June. This deposit is approximately 320 meters long and 70 meters wide, with uranium ore varying from 6 to 35 meters in thickness. In the same area, Colt Resources Ltd. discovered a 200- by 30-meter area containing uranium ores on its Highrock Lake property. Tyee Lake Resources Ltd. made a discovery in the Hydraulic Lake area about 23 kilometers southwest of Kelowna, British Columbia. Drilling by Tyee Lake showed U_3O_8 values ranging from 150 to 2,000 grams per ton for thicknesses from 1 to 30 meters.

The comparison of 1975 and 1976 estimates of recoverable resources by the Uranium Resource Appraisal Group was as follows, in thousand tons U_3O_8:

Price per pound U_3O_8	Measured		Indicated		Inferred		Total	
	1975	1976	1975	1976	1975	1976	1975	1976
Up to $20	74	94	97	104	205	280	376	478
$20–$40	13	5	20	13	101	82	134	100
Total	87	99	117	117	306	362	510	578

The comparison shows a 14% increase in measured reserves over the quantity reported in 1975. Indicated reserves remained the same, while inferred reserves increased 18%. The increase was attributed in part to more extensive study of deposits in established mines and in part to new discoveries.

In December, Canada strengthened requirements applying to the export of nuclear reactors and uranium. Under the new policy, shipments would be made only to those countries which ratify the Non-Proliferation Treaty. The Saskatchewan government instituted a new two-part uranium royalty system, effective August 1. First, there would be a basic royalty of 3% of the gross value of sales. Second, there would be a graduated royalty, with the marginal rate of tax being determined on the basis of the rate of return on capital invested in the project.

As of June, total contractual export commitments by domestic producers were about 84,000 tons U_3O_8. Although several small Canadian uranium sales were mentioned, only one new contract was approved by the Atomic Energy Control Board (AECB). That contract was between Agnew Lake Mines Ltd. and a Republic of Korean utility for the delivery of 230 tons U_3O_8. Other sales by Agnew Lake to the United States and Swedish utilities were awaiting AECB approval at yearend. Domestic utilities contracted for 30,000 tons of U_3O_8 through 1990 to provide fuel for 11,900 megawatts-electric of nuclear generating capacity.

The Mineral Industry of Chile

By George J. Coakley [1]

Chile ranked 2d in world copper and iodine production in 1976, 3d in molybdenum and rhenium, 5th in vanadium, 9th in silver, and 13th in iron ore. Although production was declining, Chile also remained one of the world's major sources of natural nitrates. Rebounding from a period of extreme inflation and the domestic and world recession of 1975, the gross domestic product, in constant 1976 dollars, increased 4% to $8.7 billion.[2] With exports of $2.1 billion, approximately 70% of which were mineral exports, Chile showed a favorable balance of trade for the year. Aided by increased copper production and higher iron ore and molybdenum prices, the value of mineral exports increased 38% to $1.4 billion.

Resulting from a policy of full production to maximize foreign exchange revenues, copper, molybdenum, and silver output all reached record highs in 1976. Weak export demand kept iron ore production down. Nitrates, petroleum, and coal production continued to decline. Increased demand for crude petroleum added $300 million to import costs in 1976.

In an effort to encourage increased participation of foreign investment in developing Chile's wealth of natural resources, the Government withdrew from the Andean Pact and its restrictive trade agreements and issued more laws modifying foreign investment regulations, restructuring the copper industry, and specifying new procedures for foreign participation in copper, petroleum, and uranium developments.

Most major investments in 1976 were concentrated on modernizing and maintaining productive capacity in the copper and iron industries and on constructing a major iron ore pelletizing plant in the Huasco Valley. A priority effort to increase Chile's energy independence met with initial success as the first major offshore drilling platform working in the Strait of Magellan hit petroleum or natural gas in four of the first five holes drilled.

Government Policies and Programs.—The Chilean Government experienced continued delays in finalizing several new foreign investment contracts under negotiation to exploit the undeveloped Andacolla, El Abra, Quebrada Blanca, and Los Pelambres copper deposits. On October 30, 1976, in an effort to improve the foreign investment climate, Chile withdrew from the Andean Pact and from the obligations of the Pact's Decision No. 24 restricting foreign investment, the repatriation of capital, and import tariff levels within the Andean region. On March 18, the Foreign Investment Statute was modified under Decree Law No. 1748 to extend the commitment to complete agreed-upon investments in mining from 8 years to 12 years, to limit total income tax levels to 49.5%, and to lighten tariffs on imported machinery and equipment. Also, discrimination between foreign and domestic companies would not be allowed.

Under Decree Law No. 1350, effective April 1, 1976, the five major copper-mining companies were dissolved and a new State-owned enterprise, Corporación Nacional del Cobre de Chile (Codelco-Chile), was created. Codelco-Chile will operate as a single company, with four operating divisions in Chuquicamata, Salvador, Andina, and El Teniente. The Chuquicamata Divi-

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Chilean pesos to U.S. dollars at the rate of 17.42 pesos=US$1.00.

sion encompasses both the Chuquicamata and Exótica mines.

Capitalized at $1.3 billion and with an annual production rate of nearly 850,000 tons of copper, Codelco-Chile is now the world's largest copper-mining company. Decree Law No. 1350 also established the new Comisión Chilena del Cobre under the Ministry of Mines to serve as a supervisory organization to direct copper development, marketing, and trade and to represent Chilean copper policy at international meetings. The Comisión will advise the Committee on Foreign Investment of new copper investments and will supervise the performance of foreign contractors. Through the restructured Centro de Investigación Minera y Metalúrgica (CIMM) the Comisión was also given the responsibility for promoting geological studies and mining and metallurgical research and development and for training technical and administrative personnel for the copper industry.

A new Chilean Nuclear Energy Commission was established by Decree Law No. 1557 of September 16, 1976.[3] The Commission will be an exclusive dependency of the President and will coordinate with the Government through the Ministry of Mining. The law designates the Commission as the sole agency responsible for the exploration, exploitation, and processing of natural atomic materials; "commercializing" all atomic materials extracted; and stockpiling all materials of nuclear interest. The Commission will negotiate operations contracts with private Chilean or foreign firms to conduct most of its activities. The new law specifies contractors' responsibilities, incentives, and obligations and includes terms for possible future State expropriation of private contractor operations.

The ninth annual Ministerial Conference of the Conseil Intergouvernmental des Pays Exportateurs de Cuivre (CIPEC) (Intergovernmental Council of Copper Exporting Countries) was hosted by Chile in Santiago in December 1976, during which the Chilean Minister of Mines was appointed Chairman of CIPEC for 1977. With Chile playing an important policymaking role at the conference, CIPEC expressed its continued concern over the gravity of the world economic and monetary climate as it affected current world copper market prices and the future of recent copper developments. The Ministers voted to continue support of the United Nations Conference on Trade and Development (UNCTAD) copper producer-consumer dialogue seeking a solution to these problems. An extraordinary session was to be called in early 1977 to discuss possible interim measures for stabilizing copper prices while awaiting agreement on other long-term solutions. In other policy action, CIPEC announced that it would increase support of existing national copper development centers, including granting of interim financial assistance to help the centers defend markets and develop new copper uses.

PRODUCTION

Buoyed by the termination of the CIPEC 15% copper production cutback agreement in July and by both increased copper prices and demand, Chilean production of copper and its major byproducts, molybdenum and silver, reached record highs in 1976, each increasing approximately 20%. Smelter and refinery output of copper each increased 18%. Combined iron and steel output increased 2%. With the exception of an 11% increase in marketed natural gas and an 83% rise in vanadium, production of all other significant minerals and fuels decreased in 1976. Total output of crude fertilizer materials decreased 14% despite an 82% increase in potassium nitrate production. Iron ore and petroleum production each decreased 6%, iodine 27%, and coal 14%.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, lime and pyrites are also produced, but available information is inadequate to make reliable estimates of output levels.

[2] Data given are the nonduplicative copper contents of ore, concentrate, precipitate, metal, and other copper-bearing products measured at the lowest stage of processing, as reported in available sources.

[3] Data given are total blister and equivalent copper output, including blister subsequently refined in Chile and copper produced by electrowinning.

[4] Data given are total refined copper output, distributed into 2 classes according to method of refining.

[5] Excludes castings.

[6] Includes natural sodium sulfate and anhydrous sodium sulfate, coproducts of the nitrate industry.

TRADE

Chile showed a favorable trade balance for the third consecutive year, with a 1976 surplus of over $400 million. The surplus reflects the success of a Government policy to reduce nonessential imports and to expand nonmineral exports such as timber. Copper accounted for $1.25 billion or 60% of the $2.1 billion value of all exports. In the past, copper has provided 75% to 80% of all export earnings. The reduced relative earning power of copper is attributed, in part, to the drop in the average international price of copper from $0.93 per pound in 1974 to $0.64 per pound in 1976. At a production level of 1 million tons of copper, this price difference represents an annual loss of nearly $600 million.

The other major mineral export earners in 1976 were iron ore, $88.6 million; nitrates and iodine, $41.3 million; and molybdenum, $33.1 million.

Chile's economic recovery during the year, which led to increased petroleum demand along with the decline of domestic petroleum production, continued to cause a drain on foreign exchange revenues. The $324 million value of petroleum imports represented 19% of all imported goods, and coal and coke imports accounted for an additional $11 million. Petroleum imports totaling 23.9 million barrels were purchased from Iran (34%), Venezuela (25%), Ecuador (21%), Gabon (15%), and Iraq (5%).

West Germany and Brazil were the biggest consumers of Chilean copper exports, receiving 19% and 15%, respectively, of the 982,000 tons of copper shipped. The United States and Japan followed with 10% each, and the United Kingdom was next with 9%. Over one-half of all copper exports went to Western Europe.

Approximately one-third of the nitrate output was used domestically as fertilizer, and 300,000 tons of sodium nitrate, valued at $20.6 million, and 80,400 tons of potassium nitrate, valued at $9.6 million, were exported.

COMMODITY REVIEW

METALS

Copper.—In attaining its highest mine production on record, Chile increased its production 21% to 1,005,200 tons of copper. As shown in table 3, production was up at all mines except the Andina and Empresa Nacional de Minería (ENAMI) mines. Mine production exceeded reported capacity at Chuquicamata, suggesting that Codelco-Chile was mining a higher-than-average grade of ore during the year. The average grade of proven ore reserves at Chuquicamata is 1.38% copper.

Minera Sagasca, S.A., controlled 59% by Continental Copper & Steel Industries Inc., operated at 50% of capacity for the year and produced 11,400 tons of cement copper. The company, despite a $4 million partial writedown of investment, continued a $3.6 million improvement project to increase recovery efficiency and to increase production to 80% of capacity by mid-1977.

Production of blister copper at Chile's six smelters increased 18% to 856,300 tons. Electrolytic and fire-refined copper output also increased 18% to 632,000 tons. Codelco-Chile invested over $110 million during the year to replace equipment and improve operating efficiency. Major improvements included enlargement of the Chuquicamata smelter to a capacity of 4,000 tons of feed per day, installation of the new Sapos reservoir and the Coya-to-Colon water supply

system, and installation of a new tailings pond at El Teniente. Engineering plans were completed to update mine and mill systems at El Teniente to handle the harder, lower grade ore as mining moves into the deeper primary copper sulfide portion of the ore body.

At El Salvador, work began on the modernization of all old production facilities from mine through refinery, scheduled to be completed between 1977 and 1981. At Andina, work continued on a project to increase mine and mill capacity to 15,400 tons of ore per day.

Iron Ore.—Production of iron ore decreased 6% from the record high 11-million-ton output of 1975. Production was decreased to reduce the buildup of port stockpile and to bring production more in line with 1976 export shipments of 9,669,000 tons.

El Romeral, operating at full capacity, produced 4.1 million tons of ore in 1976, the highest output in its 21-year history. Its current reserves are estimated at 65 million tons of magnetic ore. El Algarrobo's open pit production decreased 15% to 2.4 million tons in 1976. The high phosphorus content of the ore and the irregular ore grade distribution continued to present mining and recovery problems. El Algarrobo's reserves are estimated at 70 million tons of primarily hematitic ore. Total output of the Santa Fe mine was down 16% in 1976 to 3.4 million tons. Santa Fe's reserves are estimated at 27 million tons, distributed among a group of smaller ore bodies divided into four districts (Incahuasi, Vallenar, Copiapó, and Caldera).

Shipments of iron ore by Cía. de Acero del Pacífico, S.A. (CAP), shown in table 4, decreased for each of the three mining divisions. Shipments to Japan were 470,939 tons less than those of 1975 but still represented 78% of the 9.7 million tons of ore exported. Shipments to the United States decreased 55%, and deliveries to the Hauchipato steel complex for domestic consumption were up 10% in 1976.

With $183 million of the expected total cost of $250 million spent by yearend, the Huasco Valley project was well on its way to meeting a late 1977 startup date. The project is composed of three major elements: The El Algarrobo concentration plant, the Huasco pellet plant, and the Guacolda Port pellet storage and shiploading facilities. The concentration plant is scheduled for completion in July 1977 at an annual capacity of 4.2 million tons of preconcentrate. The pellet plant, located 50 kilometers southwest of El Algarrobo, will have an initial capacity of 3,850,000 tons per year, with plans to double this capacity in the future. At this plant, 60% iron preconcentrates will be mixed with lime hydrate and bentonite and kiln-fired to produce ½-inch-diameter pellets containing 66% iron with maximum impurity levels of 0.05% phosphorus, 0.039% sulfur, and

3.5% silica. At Guacolda Port, construction is underway on two storage areas capable of holding 135,000 tons each of preconcentrates or pellets. The port will be able to handle ships of up to 150,000 deadweight tons. It is hoped that the additional pelletizing capabilities will help in the development of over 500 million tons of previously nonexportable ore in the Huasco Valley area. These future reserves are distributed among the El Algarrobo, Boqueron Chanor, Los Colorados, Domeyko II, Cristales, and other ore bodies.

Table 4.—Chile: Iron ore shipments by CAP[1] in 1976

(Thousand metric tons)

Division and product	Quantity
El Romeral:	
Blast furnace ore to West Germany	108
Blast furnace ore to Japan	1,163
Blast furnace ore to Argentina	112
Blast furnace ore to Huachipato steelmill	709
Fines to Japan	1,391
Fines to West Germany	108
Total	3,591
Santa Fe:	
Run-of-mine ore to Japan	2,198
Run-of-mine ore to Belgium	306
Run-of-mine ore to United States	429
Fines to Belgium	309

Source: Skillings' Mining Review. V. 66, No. 8, Feb. 19, 1977, p. 33. (Original data in long tons, converted at a rate of 1 long ton=1.01605 metric tons.)

Iron and Steel.—Increased domestic demand failed to offset weak international export markets, and CAP continued to operate at reduced capacity, with iron and steel output for 1976 at about the same level as in 1975. In 1976, CAP produced 403,000 tons of pig iron, 448,000 tons of steel ingots, 342,000 tons of semifinished steel products, and 307,000 tons of finished products. Despite its current operating losses and the capital requirements of the Huasco Valley project, CAP continued to spend approximately $18 million per year to expand, maintain, and modernize its Hauchipato steel complex. The relining and hearth expansion of one of the complex's two blast furnaces was completed in August. In July, after 25 years of continuous operation, most of the company's 70 coking ovens were shut down to undergo a $7 million, yearlong renovation, during which CAP is importing coke from Japan. The year also saw the startup of a new water purification plant, a burnt lime plant, and fuel-saving Linz-Donawitz or basic oxygen process converters. The converters raised the Huachipato plant's capacity from 650,000 tons to 1 million tons per year at a cost of $65 million. Space was also allowed for a third converter to eventually increase capacity to 2 million tons per year.

Molybdenum.—Chile maintained its position as the world's third largest molybdenum producer, following the United States and Canada. Production increased to 10,899 tons, a 20% increase over that of 1975.

As part of a major expansion plan to produce 15,000 tons of molybdenum per year in Chile by 1980, Codelco-Chile brought in the first full year of production at its new 10,900-ton-per-year molybdenum recovery plant at Chuquicamata, and in October began production at the new 500-ton-per-year molybdenite recovery plant at Andina. Chile possesses 28% of the world's reserves of molybdenum, including approximately 2.5 million tons each of proven and indicated reserves. The major portion of the molybdenum reserves are found in association with the world's two largest copper mines, El Teniente and Chuquicamata.

Precious Metals.—Production of gold remained constant in 1976 at 129,143 troy ounces (46% from gold ores, 1% from silver ores, and 53% as a byproduct of copper production).

Domestic silver production increased 16% to a record high of 7.3 million troy ounces. Copper byproduct production accounted for 93.6% of silver output, silver and gold ores 4.9%, and lead and zinc byproduct production 1.6%.

NONMETALS

Iodine.—The State-owned Sociedad Quimeca y Minera de Chile (Soquimich), one of the world's three largest producers of iodine, continued a decreasing production trend from a high of 2,822 tons in 1970 to 1,424 tons in 1976.

Lithium.—Chile possesses approximately 1,270,000 tons of lithium, representing 64% of known world reserves. The lithium is found in the potassium-rich brines of the Salar de Atacama, 280 miles from Antofagasta in northern Chile. Foote Mineral Co. of the United States had been exploring the deposits for the past 2 years and at yearend was negotiating their potential development with the Chilean Government. Lithium is used in the production of primary aluminum, ceramics and glass, greases, fluxes, and air-conditioning equipment.

Nitrates.—In 1976, sodium nitrate production decreased 25% to 491,415 tons, while enriched potassium nitrate output increased 82% to 127,565 tons. The nitrate industry was facing a number of problems resulting in annual losses of $20 million. The downward trend of Soquimich's sodium nitrate and iodine production is attributed to the continued use of antiquated, labor-intensive extraction and processing systems. Chile has opted to keep the three older northern plants at Pedro de Valdivia, Maria Elena, and Victoria in operation to maintain the local employment levels at 9,000 persons, realizing that a new modern plant would match present total output but would employ only 300 to 400 persons.

MINERAL FUELS

Coal.—The State-owned coal company Empresa Nacional del Carbon (ENACAR) produced 1,272,000 tons of coal in 1976, with 44% coming from the Lota mine, 29% from the Schwager mine, and 27% from Minas Arauco. The 14% decrease in production was attributed by ENACAR partly to reduced worker productivity and partly to a methane fire that forced the closure of the District 5 South section of Schwager in September. Domestic coal sales increased 21% to 1,113,000 tons, with over 50% going for electricity and steel production. Chile exports small quantities of coal, primarily to Bolivia which imports about 1,000 tons per year. Coal imports dropped 17% to 134,580 tons. CAP imported virtually all of this coal for its specialty steels production.

ENACAR continued to encourage the substitution of coal for petroleum, estimating that annual demand for domestic coal could be increased by 462,000 tons. Since 1975, two copper refineries have converted their source of fuel from petroleum to coal. The copper industry is the largest end user of coal for electric power generation. ENACAR is also assisting other industries in preparing conversion plans.

ENACAR plans to expand annual production to 2.7 million tons by 1982; however, the lack of adequate financing may delay these plans. Chile estimates its current coal reserves at 5.5 billion tons, 90% of which are located in Magallanes Province in the far south of Chile, which accounts for less than 1% of current production. Proven reserves in the main producing fields of the Concepción-Arauco area total only 54 million tons. The Magallanes coal is high-ash, low-sulfur subbituminous coal. It is unsuitable for coking but may be used for electric power generation.

Petroleum and Natural Gas.—Crude oil production continued to decline, decreasing more than 6% to 8.4 million barrels. In response to improved economic growth, crude oil imports increased from 19.8 million barrels in 1975 to 23.9 million barrels in 1976 at a cost of $324.2 million, a 34% cost increase.

As part of Government policy to increase Chile's energy independence by intensifying the search for new petroleum resources, Empresa Nacional del Petróleo (ENAP) encountered increasing success in its oil exploration program in 1976. ENAP leased a large offshore drilling platform, the *Nugget*, from the U.S. firm Diamond M Drilling Co. to begin exploratory drilling in the Strait of Magellan. Between September and December 1976, four of the five *Nugget* holes in the Strait struck oil or gas, significantly increasing known reserves. At yearend, ENAP estimated proven reserves to be 51.3 million barrels of crude petroleum and 384.4 million petroleum-equivalent barrels (2.1 trillion cubic feet) of natural gas. Its probable reserves were estimated at 175.3 million barrels of crude petroleum and 409.1 million petroleum-equivalent barrels

(2.2 trillion cubic feet) of natural gas.[4 5] The majority of the reserves are located in Magallanes Province.

Of the 8.4 million barrels of crude petroleum produced, 56% was from mainland wells and 44% was from the island of Tierra del Fuego. Of the 248.3 billion cubic feet of natural gas produced, 43% was reinjected.

Geophysical and geological exploration continued in both the south-central zone and Magallanes Province; however, all of the 64 holes and 148,000 meters of total length drilled onshore in 1976 were located in Magallanes Province. The following tabulation gives the number of well completions:

Type of well	Petroleum	Natural gas	Dry	Total
1975:				
Exploration	--	2	20	22
Extension	--	1	5	6
Development	12	3	22	37
Total	12	6	47	65
1976:				
Exploration	4	1	17	22
Extension	1	--	8	9
Development	16	4	13	33
Total	21	5	38	64

Cumulative records of the drilling history in Magallanes Province to the end of 1976 show that of 1,700 holes drilled, 37% have located oil, 15% have located gas, and 48% have been dry.

Gasoline plants at Manantiales and Cullen on Tierra del Fuego and Posesión-Cabo Negro on the mainland processed 156.4 billion cubic feet of natural gas, stabilized 3.4 million barrels of crude petroleum, and refined 355,000 barrels of petroleum. During 1976, the refineries at Concón and Concepción processed a combined total of 32.4 million barrels of crude petroleum, 9% less than in 1975. The crude oil processed was supplied 23% from domestic sources and 77% from imports. The refineries operated at about 70% of capacity owing to extended maintenance downtime in the third and fourth quarters.

At Lirquen, work continued on new terminal facilities to receive tankers of up to 100,000 deadweight tons and on storage facilities for 664,000 barrels for the refinery at Concepción. A new plant was completed near Cabo Negro to build permanent drilling platforms for operations in the Strait of Magellan.

Chile was negotiating a major petroleum agreement with Atlantic Richfield Co. (Arco). Arco was interested in exploration and possible production of petroleum in a Pacific offshore area in southern Chile, near Chiloe Island between Chacao Canal and the Gulf of Penas. The total project cost is estimated at as much as $1 billion. The agreement was being negotiated as an operations contract under the terms of the 1975 Decree Law No. 1089 which reserves the ownership of hydrocarbon resources for the Government.

Difficulties in obtaining the necessary capital and in arranging long term gas sales contracts have forced ENAP to delay construction of the $320 million gas liquefaction plant at Cabo Negro.

Petroleum production, by field, for 1975 and 1976 was as follows, in thousand barrels:

Field	1975	1976
Daniel	1,485	1,136
Daniel Este	1,261	1,065
Calafate	1,153	1,044
Cullen	699	733
Posesión	717	685
Cañadón	601	569
Tres Lagos	625	566
Other	r 2,405	2,574
Total	r 8,946	8,372

[5] Conversion factors used were 1 cubic meter=6.28981 42-gallon barrels of crude oil and 1 42-gallon barrel of crude oil=5,430 cubic feet of natural gas at 1,031 Btu per cubic foot.

The Mineral Indutry of the People's Republic of China

By K. P. Wang [1]

The economy of the People's Republic of China gave a lackluster performance in 1976. China's gross national product (GNP) was estimated at $280 billion to $290 billion.[2] Mineral production (excluding fuels) was significant in the overall scene, contributing approximately 10% of the 1976 GNP. Most analysts estimate that the GNP rose only 3%, about one-half of the 1975 increase. Industrial output increased a maximum of 5%, following 1975's estimated growth of 10%. Production of food grains registered an increase of 1% to 2% at most, barely keeping pace with population growth.

The fifth 5-year plan, originally scheduled to start in January 1976, was moved back at least 1 year, but Premier Chou En-Lai's announced goals of "achieving relative modernization of industry and agriculture by 1980 and making China a powerful modern socialist country by the end of the century" apparently still stood despite the Premier's death on January 8. Major programs to mechanize farming and raise industrial production 15% annually were initiated at yearend. The plan was to build up an independent nationwide industrial and economic system during 1976–85. Oil consumption continued to increase as more supplies became available—a significant development in China's economic progress.

Political uncertainties slowed down production somewhat and decreased equipment purchases considerably in 1976. In absolute terms, output of basic industrial products continued to increase although growth rates went down in this year of tense circumstances. Total trade volume may not have changed too much from 1975's $14 billion, but imports of equipment and industrial products clearly declined. Petroleum, an important foreign exchange earner, showed a decline in exports to market economy countries, despite a significant gain in overall output. The Minister of Foreign Trade, Li Chiang, told Peking visitors near yearend that China would resume large-scale foreign trade, particularly purchases of entire plants, in 1978.[3]

There was a series of major earthquakes in 1976. The first occurred in western Yunnan Province near the Burmese border around July 5. Like its predecessor 17 months earlier in southern Liaoning Province (Manchuria region)—China's first serious earthquake in the 20th century—the Yunnan upheaval was predicted by seismologists, and damage to human life and industry was minimal. The Tangshan earthquake on July 27–28 was 8.2 on the Richter scale and killed perhaps 650,000 people, injuring a like number. Upheaving in the heartland of northern China's industrial area within the confines of the country's largest coal combine and near the Takang oilfield, this earthquake was expected but the date had not been predicted. There was another severe earthquake west of Ch'engtu in the southwest around August 15, which was accurately predicted and therefore caused minimal loss of life.

[2] Where necessary, values have been converted from Chinese Ren-Min-Bi (RMB) to U.S. dollars at the nominal exchange rate of RMB1.9=US$1.00.

[3] New York Times. Oct. 28, 1976, p. 10.

Around November 15, the Tangshan tremors moved closer to Peking and Tientsin, with two quakes of more than 7 on the Richter scale at the epicenters and 4 at Peking. The Chinese had expected these and have not talked much about their aftermath.

The year 1976 was one of slower economic growth, marked by slight gains in most mineral industries and setbacks in a few. The overall transportation system was in difficulty because of the slowdown brought about by political activities and the aftermath of the earthquakes. The petroleum industry continued to make notable gains, with the main field Taching showing signs of production maturity and a new field reported near Chinchou. The oil refining and petrochemicals industries did well, but construction of pipeline and distribution facilities lagged. Production and use of natural gas made significant gains, and Szechwan gas had been piped halfway to Shanghai. The coal industry suffered the earthquake catastrophe in northern China but did well in all other areas, particularly in the south. The steel industry had considerable difficulty, caused mainly by the curtailment of Kailan's coking coal output and political problems at the Wuhan steelworks. The cement and fertilizer industries continued to expand, and one-half of the ammonia plants being constructed by Kellogg Co. were completed.

The Chinese Academy of Sciences announced on January 4, 1977, that three geological maps of considerable significance were about to be published.[4] The 1:4,000,000-scale tectonic map shows in detail China's three systems of geological structures, with information on their genesis, development, and interrelationships. The 1:4,000,000-scale geological map of China shows the accomplishments of China's geological work since the founding of the People's Republic. Comprehensive geological surveys had been completed throughout most of the country, and this map was to be the first of its kind announced to the outside world. The 1:5,000,000-scale geological map of Asia is to be an extension of the geological map of China and includes tectonic information. The Chinese lauded the publication of these maps for breaking the monopoly of the United States and the U.S.S.R. in compiling world geological maps, and as a credit to China and the Third World at large.

Electric power output rose 6% to 8% in 1976. Between 1973 and 1975, eight powerplants costing over $200 million were imported from the West, indicating the emphasis in this area. China's capacity at just over 40 million kilowatts at yearend was still only one-tenth of the U.S. total. About 80% of Chinese electric power was thermal, mostly coal-fired, and the rest was hydroelectric. However, many new facilities based upon oil and gas were being built. Hydropower was also being pushed, particularly medium and small plants, with over 60,000 of these scattered throughout southern and southwestern China. Large thermal and hydropower plants were being built in strategic locations. The largest hydroelectric generator was 300,000 kilowatts, compared with 200,000 kilowatts for thermal units. The whole area of electric equipment manufacture and capability in power distribution was moving ahead rapidly, as evidenced by the fact that high-pressure transmission facilities of 500,000 volts were being trial-manufactured in Shenyang.[5] China had been buying large quantities of nonferrous metals abroad for its electric power industry. Abundant supplies of coal, oil and gas, and hydropower in widespread areas give Chinese policy planners important alternatives in developing energy resources. China was the world's fourth largest producer and consumer of energy, with coal accounting for about three-fourths of the total.

During 1976, China exploded four nuclear devices, all at Lop Nor, Sinkiang Uighur Autonomous Region, bringing the country's total to 21. The second blast was an H-bomb in the atmosphere, the third test was underground, and the fourth test was a 4-megaton hydrogen device in the atmosphere. China successfully launched its sixth and seventh satellites into orbit around the earth on August 30 and December 7, respectively. The latter was China's second satellite to be returned to earth without malfunction, the first being the fourth satellite launched on November 26, 1975.

---

[4] New China News Agency (Peking). Jan. 4, 1977, p. 4.
[5] Takungpao (Peking). July 3, 1976, p. 1.

The Chinese have become very interested in nuclear power generation because of rapidly growing needs for electricity in industry. As early as October 1972, a Chinese industrial survey team composed mainly of power and nuclear specialists visited Japan to investigate Japanese know-how and seek possible technical ties. They also exchanged visits with the Canadians on the subject of electric power in 1973 and expressed an interest in nuclear power. Apparently, China does not intend to generate electricity from nuclear energy on a large scale until the 1980's.

PRODUCTION

China retained its position as the world's fifth largest mineral producer in 1976. The country's prominence as a leading world producer of anthracite, bituminous coal, antimony, salt, tin, and tungsten have been known for some time. In recent years, China has also achieved ranking among the top five producers of steel, cement, fluorspar, graphite, magnesite, nitrogenous fertilizer, phosphate rock, high-grade talc, and natural gas. Also of great importance was the fact that China has become one of the world's top 10 producers of petroleum, rare-earth elements, and rare and high-purity metals. China is not only one of the world's richest mineral areas but has also made significant headway in producing the necessary quantities of minerals and fuels for its expanding industrial economy.[6]

Despite the Kailan-Tangshan catastrophe and the fact that other large coal combines around the country came to the rescue at the expense of their own operations, the Chinese coal industry still registered a small gain in output. China's coal output, ranking a strong third after that of the United States and the U.S.S.R., was scheduled to be expanded sharply. Crude oil production reportedly rose 13% over that of 1975, and the annual output rate probably reached 100 million tons (or 2 million barrels per day) by midyear. Marketed output of natural gas reportedly increased 14% over that of 1975, and there is evidence that the Chinese were trying hard to fully utilize the additional production.

The steel industry had a poor year, with output declining 7% from the 1975 level. However, the situation looked much improved at yearend, and it appeared to be a matter of a few years before annual production would exceed 30 million tons. The cement industry continued to gain ground swiftly, spearheaded by the buildup of small- to medium-size local plants in southern China. Many felt that China's cement output had already surpassed that of any Western European country.

The well-known export metals such as tungsten, antimony, and tin appeared in lesser quantities in world markets than in 1975, but this did not mean that production was any less. China greatly improved its manufacturing position in both nitrogenous and phosphatic fertilizers, spurred in part by the growth in oil and gas use and the fact that the large new chemical fertilizer plants had not yet reached full production. The Chinese salt industry, which mainly utilized seawater, gained on the United States, the only larger salt producer than China. China remained prominent in production of nonmetals such as asbestos, barite, fluorspar, magnesite, pyrite, and talc.

Refinery products ——do	422,000	509,000	575,000

[p] Preliminary. [r] Revised.

[1] In addition to the commodities listed for which quantitative estimates of output have been made, the People's Republic of China is known or believed to have produced the following commodities for which no estimates, even of order of magnitude, have been prepared, owing to a paucity of general information upon which to base an estimate: Arsenic, chromite, nickel, titanium minerals, uranium, boron materials, various clays (including kaolin), lime, mica, various industrial and dimension stones, sand and gravel, and carbon black. Other unlisted commodities may also be produced.

[2] Diasporic bauxite; includes an estimated 160,000 tons annually of production for refractory applications.

[3] Iron content assumed to be 50%.

[4] Data are for years ending June 30 of that stated as reported in the British Sulphur Corp. Ltd. Statistical Supplement (London), No. 14, November-December 1976, pp. 18–19.

[5] Sulfur content of pyrite is reported under "Sulfur".

TRADE

China's total trade value remained at about $14 billion. Exports were up marginally from $6.9 billion (revised) in 1975, and imports were down somewhat from $7.2 billion (revised) in 1975. Purchases of complete industrial plants and nonferrous metals were considerably lower than in 1975, but steel imports increased slightly. Oil exports were a little lower, as were fertilizer imports. Reduced quantities of China's main export minerals were sold in the world market. Thus, overall mineral trade appeared to have been lower in 1976, compensated for, however, by more business in other areas.

Japan continued to be China's leading trading partner, but trade declined from $3.79 billion in 1975 to $3.03 billion in 1976. Imports from Japan fell 27.8% to $1.66 billion and exports to Japan fell 8.7% to $1.37 billion. Lower receipts of Japanese chemical fertilizers and machinery caused the decline in imports, whereas lower shipments to Japan of Chinese high-wax crude oil was the principal reason for the reduced exports. Crude oil exports to Japan declined from 8.1 million tons in 1975 to 6.8 million tons in 1976, whereas imports of Japanese steel increased from 2.9 million tons in 1975 to nearly 4 million tons in 1976. The Chinese were quite concerned over this double loss in foreign exchange and started to negotiate a long-term deal to increase sales to Japan of oil and coking coal to an estimated 10 million tons of oil and 5 million tons of coal per year within 5 years.

Trade between the United States and China remained small, although the potential is excellent. U.S. exports to China were $135 million in 1976, with aluminum worth $25 million, and U.S. imports from China were $200 million.

Table 2.—People's Republic of China: Apparent exports of selected mineral commodities [1]

COMMODITY REVIEW

METALS

Aluminum.—China apparently had not yet built a second large aluminum facility to complement the 20-year-old, 100,000-ton-per-year Fushun plant in southern Manchuria. The Fushun plant had 640 450-kilogram-per-day horizontal stud Soderberg cells in four potlines. Without connections with the international aluminum companies, the Chinese have not been able to increase production substantially. There were signs, however, that some firms may be interested in doing something in China, including Aluminum Co. of America (Alcoa). An aluminum plant with at least 100 cells had been mentioned for Sanmen Gorge, the site of a scaled-down hydroelectric irrigation project on the Honan-Shansi border. The Japanese said that there was another plant of 20,000- to 30,000-ton size at Lanchow, Kansu. In Yiliang County of Yunnan Province, about 80 kilometers southeast of K'unming, there was reportedly a new aluminum plant with two production lines. Other small plants may have been erected at Ch'angsha (Hunan), Wuhan (Hupeh), Taiyüan (Shansi), Tsingtao (Shantung), Hofei (Anhwei), Sian (Shensi), Changlin (Kirin), and several other places as well. Thus, total aluminum capacity appears to be more than 250,000 tons per year. The country's 1976 aluminum production was conservatively estimated at 200,000 tons, but it may have been considerably higher and prospects for somewhat expanded output within several years were good. The Nant'ing plant in Changtien, Shantung Province, remained the only known large alumina plant in China, and it had four big rotary kilns. A small alumina plant had recently been completed in Wench'ang County, Hainan Island, and there were undoubtedly many other similar plants around the country.

China's known aluminum resources were extensive but not of a particularly good grade. Total resources may be on the order of 1 billion tons, but known workable reserves were probably closer to 100 million tons. Most of the raw materials used consisted of high-silica diasporic bauxite from Shantung, aluminous shale from Liaoning, and alunite that had to be processed by the soda-lime sinter, calcium aluminate, and other non-Bayer processes. Promising bauxite resources, however, were said to occur in Kweiyang, Kweichow Province; around Pench'i, Liaoning Province; Hopeh Province; K'unming, Yunnan Province; and even in Honan, Chekiang, and Fukien Provinces and Kwangsi Chuang Autonomous Region. A limited number of good-grade bauxite deposits undoubtedly have been worked, although bauxite in general has

not been investigated enough for accurate appraisals. The Fushun plant uses about 500,000 tons of local aluminous shale annually for its aluminum raw material.

Demand for aluminum and copper has been increasing steadily in China as a result of expansion of power generation and transmission facilities. A further sharp rise in aluminum consumption was expected in view of the overall industrial activity to be created by higher levels of oil and gas production and consumption. Chinese imports of aluminum, which were low in 1974, shot up suddenly in 1975 under low-price conditions, then dropped to a new low in 1976 as prices rose. Swiss Aluminium Co. (Alusuisse), Péchiney Ugine Kuhlmann of France, Kaiser Aluminum & Chemical Corp. and Howmet Corp. of the United States, Mosal Aluminium A/S of Norway, and Aluminum Co. of Canada Ltd. (Alcan) all concluded large contracts with China during 1975, along with half a dozen other international firms for lesser tonnages. Actual shipments to China in 1975 included 62,510 tons from the United States, about 24,000 tons from the United Kingdom, 33,000 tons from Canada, 38,430 tons from Japan, 48,120 tons from France, and 50,160 tons from Norway. U.S. exports to China of unwrought aluminum in 1976 were 37,350 tons. Trade circles believe that China could buy up to 100,000 tons of aluminum in 1977. China seemed to be shopping around for good deals, vacillating between traditional and new suppliers.

Antimony.—China has traditionally produced antimony in various forms mainly for export, having excellent knowledge of this metal. In recent years, annual output of antimony has been in excess of 10,000 tons and was perhaps 12,000 tons in 1976, worth $35 million to $40 million. During World War I, China was by far the world's largest producer. However, the market for antimony for use in small arms and shrapnel shells vanished with the end of the war, although demand for use in batteries, bearings, type metal, solder, and standard munitions remained strong and consumption in flame proofing, pigments, and ceramics became stronger. The Republic of South Africa with its gold-antimony ores and Bolivia with its complex metals rivaled China in 1976 as leading antimony producers. The three countries met in La Paz late in 1975, and a Bolivian antimony delegation visited China in 1976 to discuss cooperation and exchange of information.

The bulk of Chinese antimony traditionally comes from the southwestern part of Hunan Province, led by the Hsik'uangshan mine, which alone may have more than 1 million tons of antimony reserves. Kwangtung Province ranked a distant second in potential reserves and output. Resources were so large and of sufficiently good grade that China could produce as much antimony as the world and Chinese markets could absorb. However, with only moderate prices ($1.50 per pound in mid-1976) and the small tonnages involved, the antimony business was not too attractive.

Measured by receipts of importing countries, Chinese exports of antimony have been declining since 1973. Japan's Hibino Metals Corp. was a major importer of 50% to 60% antimony concentrates at one time, but Japan as a whole took only 819 tons in 1976. The United States imported 1,170 tons of antimony oxide and 200 tons of metal in 1976, valued at about $4 million. China's own consumption of antimony may have been about 5,000 tons annually, although demand should have been rising. The Chinese undoubtedly had considerable antimony stockpiles.

Copper.—China's refined copper output was perhaps on the order of 150,000 tons in 1975 and 1976. Most of the raw material was domestic ore. However, local scrap was of some importance, and foreign concentrates were also imported. The country still did not have one really big copper facility, and there was no evidence that any operating copper mine had more than 15,000 to 20,000 tons per year of capacity. The Hungtoushanching mine near Fushan, Liaoning, may have been producing about 3,000 tons of 1.2% copper (plus 1% zinc) ore per day. The Huatung copper mine at Ch'ingyüan, Liaoning, recently installed a new flotation unit to greatly increase beneficiation capacity. The T'unghua mine in Kirin Province was expanded and diversified to yield possibly 4,000 tons per year of mine copper. The T'ungkuanshan copper mine in Anhwei Province may have been producing 300,000 tons per year of 2% copper ore. Fushan and Yashan were newly developed copper mines in Shantung Province. There was no news on the relatively large

Tungch'uan mine in Yunnan Province, but the "No. 3 metal mine" in Yunnan (very possibly Tungch'uan) had an aerial tramway installed in the early 1970's.

Porphyry copper was identified somewhere in the Ch'ilien Mountains of Kansu Province and the Chungt'iao Mountains of Shansi Province, and Chekiang Province may have a 1% copper ore body 3 kilometers long. Apparently, none of these so-called large deposits has been developed, probably because of the great concentration of capital, technology, and effort needed. An open pit copper mine mentioned for Tayeh, Hupeh Province, called Tunglüshan is of archeological as well as commercial interest, because old underground workings and tools found have been identified as being of the "Chunchiu-Chankuo" period more than 2,000 years ago. The original ore body was about 2 kilometers long and 1 kilometer wide, with 400,000 tons of smelting slags lying around native copper-malachite-chrysocolla minerals. Considerable excavation for relics has been done.

Because of electric power and machinery requirements, China's copper consumption has risen steadily and probably exceeded 300,000 tons during 1975 and 1976. Most of the shortage has been met by imports of refined copper, although foreign concentrates have recently come into the picture. Except for those at Shenyang and Shanghai, little was known about Chinese nonferrous smelters. The Shenyang smelter produced several tens of thousands of tons of copper per year, along with refined lead and zinc. That at Shanghai primarily used imported blister copper and local scrap as copper raw materials, and its capacities in copper and lead were both a little larger than those of the Shenyang smelter. Apparently, relatively new nonferrous smelters have been built at Lanchow in Kansu Province and Urumchi in Sinkiang Uighur Autonomous Region. Copper refineries of undetermined size have also been mentioned for Taiyüan, Wuhan, and K'unming; Anhwei Province; and Hainan Island. Chinese discussions with Japanese firms such as Sumitomo Metal Mining Co., Ltd., Furukawa Mining Co., Ltd., and Mitsubishi Metal Corp. about flash and continuous smelters have not led to anything specific.

China handed over the 1,100-mile, $250 million Tanzam Railway to the Presidents of Tanzania and Zambia on July 15, 1976, with the Presidents of Zaire and Botswana attending the ceremonies as well. This could very well mean that China will be getting more copper from Africa in the future. A long-term contract with Zambia called for the purchase of 50,000 tons of copper annually, and large quantities might eventually be purchased from Zaire also. Chile may have sold China over 30,000 tons of copper in 1976; actual exports of copper by Chile to China were 55,500 tons in 1973 and 40,800 tons in 1974. The Chileans were talking about renegotiating a large 3- to 5-year Chinese loan contract to be repaid by Chilean copper, nitrates, and iodine. An understanding with Peru was still in effect for approximately 40,000 tons of copper annually, plus 10,000 tons each of lead and zinc, in exchange for help in developing the Tintaya copper deposit in Peru.

There was no known followup on receiving copper concentrates from Bougainville after an initial trial shipment of 10,000 tons of concentrates to China in late 1975. Philex Mining Corp. and Atlas Consolidated Mining and Development Corp. of the Philippines balked in late 1976 at supplying China with the 5,000 tons remaining on a 20,000-ton import order for copper cencentrates because of the considerable rise in copper prices since the initial agreement. Subsequently, however, the Philippines was said to have sold China 40,000 tons of copper concentrates valued at $12 million, which pushed total Philippine copper sales to China to $36 million.[7]

Iron and Steel.—It was an unimpressive year for the iron and steel industry. Performance was uneven, and basic construction lagged. Overall steel output declined to possibly the 26-million- to 28-million-ton range; some estimates were much lower. Production was adversely affected either directly or indirectly by the Tangshan earthquakes and by political unrest, particularly at Wuhan. Kailan's coking coal was in short supply because of the earthquake disruptions. Nevertheless, most major plants held their own in 1976, with basic oxygen furnaces making a significant contribution. The Wuhan plant may have been somewhat behind schedule in installing its foreign equipment. The country was saving

[7] China Trade Report. V. 15, May 1977, pp. 3–4.

tin for a new tinplate mill to be completed at Wuhan. Medium and small steel plants, which produced one-fourth to one-third of the country's steel, encountered setbacks in northern China because of the earthquakes but did well in southern China. There were signs at yearend that Chinese steel output would more than recover in 1977.

Problems in steel production and metal shortages in general caused difficulties for all heavy industry. Inadequate supplies meant lower inputs for vehicles, mechanical equipment, farm machinery, and other important products. Shortages of steel were becoming increasingly acute, because of the agricultural mechanization program and the sharply expanding use of petroleum which had to be distributed to the markets. Southern China may have been slightly better off, since many small plants and industries recently established south of the Yangtze River drew on local supplies of raw materials.

China has been importing 4 million to 5 million tons of iron and steel products annually to complement domestic output. The country was extremely short of finished steel, particularly seamless steel pipes. Japan has been China's leading steel supplier by far, sending nearly 3 million tons of products to China in 1974 and 1975 and 4 million tons in 1976. The newly contracted tonnages from Japan were 650,000 tons in the first half and 1,590,000 tons in the second half of 1976. The Chinese were not as willing to buy steel as the Japanese were to sell, partly because of the difficulty of paying for it by selling oil. However, this situation was expected to be temporary, since Japan is the most logical supplier of steel to China and buyer of petroleum from China. At yearend, talks were being arranged to stabilize steel imports from Japan, increase oil exports, and develop new coal production for the Japanese market.

In a special magazine section of the Takungpao dated November 1976, an article entitled "New Developments in Iron and Steel Smelting Technology" showed a pictorial model of a steel plant with three-unit 120-ton basic oxygen furnaces capable of turning out 2.5 million tons of steel annually. This clearly illustrated what the Chinese steel planners were thinking about. The Chinese-designed 120-ton-per-heat furnace was being promoted, and sizable basic oxygen furnaces reportedly have already been installed at the Anshan, Penhsi (Pench'i), Shanghai, and Paotou steelworks. The whole smelting process was described in the article, pointing out the great advantages of basic oxygen furnaces over open-hearth operations: Lower unit investments, shorter construction time, higher production, and better quality control. It was further stated that Chinese technologists were working on recovery of fuels from smoke and dust, reuse of iron oxide dust as iron raw material, use of slag for cement manufacture, and better utilization of waste heat. China may already have a 150-ton basic oxygen furnace and was studying even larger furnaces.

The Anshan plant continued to overshadow all other Chinese steel plants, and it was used as a model at yearend to exhort other steelworks to better performance in the year ahead. Anshan had 11 blast furnaces (the last was a 2,000-cubic-meter one), 25 open-hearth furnaces (200- to 500-ton capacity), 2 large basic oxygen furnaces, various mines and sintering and beneficiation plants, and blooming, plate, hot strip, rail, and pipe mills. Anshan's steel ingot capacity may have been just over 7 million tons, and output in 1976 probably was about this level; record production was claimed for the first half of 1976. Anshan's mines produced concentrates of more than 60% iron grade, and the recently installed sintering plant is sizable. One production unit with a 4-cubic-meter shovel (at the Kungch'angling mine) produced at a level of 10,000 tons per day of run-of-mine ore during late 1976. Anshan iron ore is much like Mesabi ore in the United States, but Anshan did not have pelletizing plants. In 1976, the Japanese sold a Kowa Seiko sulfide iron ore pelletizing plant to China; however, this probably was not for Anshan since the ore there is known for silicates rather than sulfides.

Wuhan's three byproduct coke plants, large sintering plant, four 1,400- to 2,000-cubic-meter blast furnaces, eight mostly 500-ton open-hearth furnaces, hot-rolling mill, plate mill, and rail mill have been producing steel ingot at an annual rate of more than 2.5 million tons. Wuhan had at least four iron mines, including the Tayeh open pit and the Ch'engchao and Tahung-

shan underground mines. Meanwhile, $550 million worth of West German and Japanese fabrication equipment was being installed: A new 3-million-ton hot strip mill (including a 70,000-ton silicon Sendzimir steel mill and a tinplate line), a 1-million-ton cold strip mill, and a continuous-casting mill. Some said that installation of these foreign mills would be delayed as much as 18 months after late 1977 (the original date), yet it had been reported that the Chinese have been saving tin for the tinplate line. Since the new fabrication equipment seemed to be superimposed on already adequate facilities, it would not be surprising if Wuhan may in the near future be building additional blast furnaces or large basic oxygen furnaces. Wuhan's October 1976 steel output was said to be 39.4% higher than the September 1976 output,[8] possibly indicating its problems during the early part of 1976.

The Peking steelworks, also known as the "capital" or Shihchingshan steelworks, had stabilized at about 1.5 million tons of steel ingot and 2 million tons of pig iron annually and was a showcase for foreign visitors. Actual production in 1975 and 1976 was said to be somewhat lower. The Peking steelworks had two 400- to 500-cubic-meter and two 1,000- to 1,200-cubic-meter plant furnaces. It also had three 30-ton basic oxygen furnaces, several fair-sized open-hearth furnaces, a coke plant, a sintering plant, a blooming mill, a billet mill, and a bar mill. The Chiennan and Lungyen mines supplied the Peking steelworks with over 60% grade concentrates. This steelworks was very diversified, having about 100 operational units, including facilities for making ferroalloys, refractories, cast iron pipes, and nonferrous metals. The earthquake may have affected this steelworks somewhat.

The Taiyüan steelworks in Shansi Province was made famous by the installation of a pair of 55-ton Austrian basic oxygen furnaces in the early 1970's. There were probably three plants, one to house the basic oxygen furnaces, a second for open-hearth furnaces, and a third for electric furnaces. The Taiyüan steelworks had five blast furnaces, including one of 963 cubic meters and another of 291 cubic meters; at least one blast furnace had been greatly enlarged. With the recent completion of a large open pit mine called Okou, the Taiyüan steelworks became totally integrated and self-sufficient in iron ore. A large sintering plant was built in 1970. There were a blooming mill, a cold-rolling mill, and a sheet mill. Steel capacity was more than 1 million tons. This steelworks had been exceeding targets in the previous 5 years. The Taiyüan steelworks was reported to have a good research institute.

Shanghai had perhaps eight steel plants; only one-half of these were ingot producers. The No. 1 steelworks appeared to be the largest, followed by the No. 3 steelworks. Shanghai as a whole had a steel capacity of at least 3 million tons and possibly as much as 5 million tons. The No. 1 steelworks had three 30- to 35-ton and one 120-ton basic oxygen furnaces and two 70-ton open-hearth furnaces. The medium-size Maanshan steelworks in nearby Anhwei Province reportedly raised output steadily during 1976. The medium-size Tangshan steelworks suffered serious damage during the earthquakes but apparently resumed production fairly quickly. The Paotou steelworks started to produce sizable tonnages of pipe for use in oil distribution. A new 150,000-ton-per-year steelmaking unit of the medium-size Lanchow steelworks was brought into production in fall of 1976.

Tin.—The Chinese tin industry probably did not undergo much change during 1971–76, but assessments of its performance have varied. Overall tin reserves (1.5 million to 2 million tons) were still acknowledged as large. Kuch'iu, with its widespread ore bodies occupying 500 square kilometers in Yunnan Province, and "Fuhochung," embracing Fuch'uan, Hohsien, and Chungshan in Kwangsi Chuang Autonomous Region, were still considered China's principal tin-producing areas. A new placer district called Chiumou was mentioned for Kwangsi Chuang Autonomous Region, and byproduct tin of Kiangsi Province has long been of some significance. A recent book[9] lists all of the Chinese tin deposits known to the author during the early 1960's. Although some feel that national production may have dipped below the 20,000-ton-per-year

[8] Jen-Min Jih-Pao (Peking). Nov. 4, 1976, p. 1.

[9] Ikonikov, A. V. Mineral Resources of China. Geological Society of America, Boulder, Colo., 1975, 500 pp.

level, the view cannot be substantiated. In fact, Japanese experts believe that Chinese tin production could be substantially greater.

The Kuch'iu nonferrous complex in Yunnan has been the mainstay of the Chinese tin industry for decades. New reserves of mainly lode tin have been steadily found to compensate for what is mined out. Tin ore at 2% to 4% is high grade, but base metal impurities present beneficiation and metallurgical problems. Much construction and expansion took place in Kuch'iu in the late 1950's, and another push occurred around 1970 when the Kohsien mine was basically mechanized and expanded several-fold. Previously, some of Kuch'iu's refined tin was not very high grade; however, the quality of this tin has been greatly improved through the apparent addition of electrolytic refining facilities in recent years. There was an earthquake in Yunnan Province in spring of 1976. China's second-ranked tin center, Fuhochung, has clean placer tin. The tin there is of 99.9% quality or better, the potential seemed good, and deposits were easily workable by methods employed by Chinese tin miners in Southeast Asia.

Chinese tin, long an important export product and significant in the international tin market, once again entered world trade in sizable tonnages. Accountable imports of Chinese tin by consuming countries indicated that totals approximated 10,000 tons in 1974, then increased substantially in 1975 before dropping to 7,000 to 8,000 tons in 1976. With no tin duty, U.S. imports of Chinese tin rose to 3,336 tons in 1974 and about 6,350 tons in 1975 before settling back at 1,700 tons. The tin industry was at first alarmed by the sharp increases in Chinese tin exports but later realized that China had no intention of sustaining these levels despite having refrained from joining the International Tin Council. Both the Bolivians and the Malaysians had visited China, although they were unable to shed much light on tin developments. Chinese tin consumption may have risen to 8,000 to 9,000 tons annually, and a new 100,000-ton-per-year tinplate line being completed at the Wuhan steelworks should boost tin use further. Thus, unless production is stepped up, China may have less tin to sell even though prices have skyrocketed to nearly $5 per pound. China undoubtedly stockpiled considerable tin (very likely at least 50,000 tons).

Tungsten.—China's extensive tungsten resources were being mined at an estimated annual rate of 15,000 to 20,000 tons of concentrates. Domestic consumption has steadily risen because of the expanded use of drillbits and machine tools, and annual requirements apparently already surpassed 7,000 tons per year. There may be need for stockpiles to be built up also. Exports of concentrates declined to possibly the 8,000- to 9,000-ton level in 1976 despite very high tungsten prices. It seems that the Chinese must invest and explore more in order to avert a decline in tungsten output. An entire line of tungsten products was produced by the Chinese, including synthetic scheelite, paratungstate, powder, wire, and tungsten carbide. Although regularly attending the Geneva meetings of the United Nations Conference on Trade and Development (UNCTAD) and the Primary Tungsten Association, China continued to keep silent on its tungsten situation. However, the Chinese did imply that exports in 1977 may be down as much as 50% and that they would go along with price-stabilizing efforts of other major tungsten producers.

Most Chinese ore is high-grade wolframite from Kiangsi Province, but scheelite from Hunan Province and wolframite from Kwangtung Province has also become important. There were probably a dozen mines in 1976 capable of producing 500 to 2,000 tons per year of concentrates, as well as many other smaller mines in the "tungsten belt" along the Nan Ling Range. The best-known mines in Kiangsi were Hsihuashan, Tachishan, Kueimeishan, and P'ankushan. Chinese tungsten ores could contain important amounts of tin and some molybdenum and bismuth as well. In fact, Kiangsi tungsten mines were the primary source of China's bismuth. Considerable geophysical exploration has been done in recent years on the known deposits of Kiangsi, and the many "hidden" ore bodies discovered helped to rejuvenate the tungsten industry.

A typical large Kiangsi mine in the Tayu area has hundreds of veinlets in a mineralized zone of several square kilometers. Possibly two sets of very steep veinlets averaging 0.3 meter in thickness (the thickest part may be 3 meters) extend 0.25 to 1 kilometer in length and 100 to 250 meters in depth. Ore grade is uneven but

may average 1.2% WO_3 and over 0.5% tin. A single large mine can have over 100,000 tons of contained WO_3 as reserves. Mining was well engineered and at least semimechanized, with daily ore production often 2,000 tons and more. There was in most cases a fairly good mill capable of at least 90% recovery of valuable constituents.

Hsihuashan has been modernized into a fairly efficient mine, and its mill apparently has been streamlined. The P'ankushan mine had a good record of meeting production targets. A large but deep ore zone was discovered at Tachishan a few years ago which brought new life back to this old mine. Hunan mines are best known for scheelite, and one of these may be Yangchiat'an. Two better known wolframite mines in Kwangtung Province are Yang-chiang and Yaoling. Most Chinese tungsten ores entering the world market were medium-high grade. The small tonnages of scheelite recently sold contained moderate amounts of impurities, and one wonders when synthetic scheelite plants will be built for marketing advantages.

Other.—Chinese deposits of rare-earth elements are large by world standards and widely distributed. In less than 20 years, China emerged as a very important producer, consumer, and exporter of materials such as lutetium, praseodymium, neodymium, dysprosium, erbium, ytterbium, gadolinium, holmium, and yttrium. Reports from the recent Canton Fairs said that China had been offering not only the rare-earth elements but also ferroalloy metals, such as beryllium, beryllium-copper alloys, tungsten powder, ferro-tungsten, electrolytic manganese, molybdenum, barium, columbium, columbium oxide, ferrophosphorus, zirconium, and titanium. China also sold concentrates such as xenotime, columbite, zircon, lithium mica, spodumene, single silicon crystal, and natural and synthetic quartz crystals, and many kinds of high-purity metals (99.99% to 99.9999%) such as tellurium, arsenic, cadmium, gallium, copper, lead, zinc, tin, bismuth, antimony, nickel, phosphorus, sulfur, boron, and lithium. The National Rare Earth Conference convened in Paotou, and the Rare Earths Institute was established at Lanchow during 1975. These developments indicated that China has achieved considerable sophistication in providing quality materials needed by modern industry.

Kwangtung Province's "rare metals" industry was recently described as having been developed after the Cultural Revolution.[10] Beneficiation and extraction technology related to some 40 types of rare metals reportedly has been mastered. During the fourth 5-year plan (1971–75), output value increased threefold each year to meet the needs of the metallurgical, nuclear, chemical, electric, electronic, semiconductor, and "special area" industries. Apparently, rare metal raw materials have been found in many parts of the Province, both in hilly inland and flat seashore regions. Developments at the Pant'an tin mine are significant; discovered in 1958 for tin, this mine reportedly recovered about 11 types of byproducts which together constitute two-thirds of the mine's output value. Germanium used for defense purposes is a new byproduct recovered, and technology has progressed to a point that germanium recovery reached 75%. Kwangtung Province was more than self-sufficient in rare metals.

NONMETALS

Asbestos.—Chinese production of asbestos remained at the approximate level of 150,000 tons per year. Shihmien, Szechwan, with about a dozen fairly up-to-date projects producing long-fiber chrysotile asbestos, continued to be the country's leading producer by far. A second major asbestos deposit was located at P'enghsien, Szechwan, near Shihmien. Laiyüan County of Hopeh Province may be the most productive of the lesser sources, and its product is fairly good-grade chrysotile asbestos. Chinhsien in Liaoning Province reported a 23% rise in output during the first half of 1976 over the same period 1 year ago. There is no news concerning the newly found deposit in Yüankiang County, Yunnan Province.

Barite.—Chinese output of barite probably approached 300,000 tons in 1976, 5.5% of the world total. The steady gain in production was a reflection of the growing domestic market in oil and gas drilling. China seemed to have extensive and widespread deposits of barite and a good surplus of 90% to 97% grade barite available for export. China's exports have greatly declined since 1974.

[10] Takungpao (Peking). Aug. 17, 1976, p. 3.

Cement.—The cement industry continued to expand, with estimated production exceeding the 35-million-ton level in 1976. The French were helping to build a large cement plant at an unknown location. China had at least 30 large cement plants each capable of producing more than 200,000 tons per year, with 4 rated at more than 1 million tons. One of these large plants, a 700,000-ton facility at Tangshan, was said to have been a casualty of the severe earthquake in late July. There were more than 30 other plants with capacities in excess of 100,000 tons annually. China had more than 3,000 small cement plants; one common size range was 3,000 to 7,000 tons, and a second was 10,000 to 50,000 tons. These plants accounted for more than one-half of the national output of cement. The Chinese claimed that the small plant sector fulfilled the 1976 target 33 days ahead of schedule and produced about 7% more cement than in 1975. Apparently, Shantung led the provinces in small cement plant production, with output in 1975 reported at 2.44 million tons[11] and output in 1976 at least 20% higher. Kwangtung Province with 190 small cement plants produced 12% more in 1976 than in 1975, and these small plants accounted for 70% of the Province's cement output.

Diamond.—China's need for industrial diamond has steadily increased, particularly for drilling purposes. Until 1971, most of the diamond was imported. It was around that time that the Changte diamond mine in western Hunan was brought into production. In late 1973, synthetic diamond manufacture began, and by 1976 there may have been a dozen synthetic diamond plants operating in China, producing small industrial diamonds. It was said that synthetic diamond drillbits were used to drill China's deepest oil and gas drillhole (6,011 meters in depth) somewhere in Szechwan Province. In mid-1976, an important diamond deposit was found in Liaoning Province.[12] The drilling and exploration program of China suffered from inadequate supplies of large enough diamonds.

Fertilizer Materials.—*Nitrogen.*—China had an estimated production of between 3 million and 4 million tons of contained nitrogen in 1976, significant by world standards. Considering the growth of the oil and gas industry, the program to build many more small nitrogenous fertilizer plants, and the 13 new large foreign plants (including 8 Kellogg plants in the Provinces of Heilungkiang, Liaoning, Hopeh, Yunnan, Kweichow, Hupeh, Hunan, and Szechwan) in various stages of construction, the country's fertilizer production should reach 7 million to 8 million tons of nitrogen by 1980. The Kellogg plants in Liaoning, Hopeh, Heilungkiang, and Szechwan were to be completed by the end of 1977.

China was still greatly dependent upon imports of nitrogenous fertilizers, mainly from Japan. Sino-Japanese trade in fertilizers was very important in world transactions. In 1975, Japan exported 1,169,000 tons of urea (46% nitrogen), 307,000 tons of ammonium sulfate (21% nitrogen), and 499,000 tons of ammonium chloride (over 25% nitrogen) to China, down considerably from that of the peak year of 1973. The agreement for the first half of 1977 was for Japan to ship 500,000 tons of urea and 200,000 tons of ammonium sulfate to China. The Chinese negotiated additional contracts to purchase over 300,000 tons of urea from Eastern European countries in 1976, plus significant amounts of ammonium sulfate from Western European countries.

In addition to about a dozen large nitrogenous fertilizer plants that have been in operation for some time and a similar number of large plants being built, China had more than 1,200 small- and medium-size nitrogenous fertilizer plants scattered around the country. In 1975, small plants provided 58% of China's total synthetic ammonia output. Production from small plants underwent a further sharp increase in 1976. A typical small plant produces 3,000 to 5,000 tons per year of aqueous ammonia or ammonium bicarbonate. Medium-size plants may produce 50,000 to 100,000 tons per year.

Shantung has become the leading nitrogenous fertilizer producing province in China. In 1976, there were about 120 small plants and one large plant. In early 1977, the Shengli general petrochemical complex associated with the oilfield of the same name was placed in full-scale operation; it had two chemical fertilizer plants in addition to oil refineries and plants producing

[11] New China News Agency (Peking). Nov. 16, 1976, p. 4.
[12] Takungpao (Peking). July 25, 1976, p. 1.

synthetic rubber and petrochemicals. The Taching oilfield also had a recently completed large chemical fertilizer plant based upon natural gas, capable of producing 1 million tons of various fertilizers annually.[13] Szechwan Province had nearly 100 small nitrogenous fertilizer plants plus a number of large plants (including a plant rated at 1 million tons of fertilizers), all based upon natural gas. Kwangtung Province also had a growing number of fertilizer plants, particularly small ones.

Phosphate.—China's phosphate rock production capacity may have risen to about 4 million tons per year in 1976. A few years earlier, imports were as high as 2 million tons, mainly from Morocco and the Lao Cai apatite deposit in northern Vietnam. When Morocco tripled its price, Chinese imports dwindled to small tonnages. Morocco subsequently cut its prices, perhaps making it again attractive as a source of high-grade ore.

The bulk of the phosphate rock was converted to chemical phosphates, although some was directly applied in ground form. China must have had about 1,500 small phosphate plants (430 in Shantung Province), which together produced three-fourths of the country's chemical phosphate, totaling possibly 10 million tons per year. Relatively large superphosphate plants that have been mentioned in the press include Nanking, Ch'angsha in Hunan, Hunghochou in Yunnan, Shanghai, Taiyüan in Shansi, Canton and Chanchiang in Kwangtung, and Tunghsiang in Kiangsi.

China's phosphate rock resources are widespread throughout the eastern and southern areas of the country. Most deposits are sedimentary rather than igneous in origin. Reserves are large, but the quality is uneven and often poor. The best known deposits are located in the Provinces of Yunnan, Kweichow, Hunan, and Hupeh. In Yunnan, there were open pit and underground mines in the K'unming and K'unyang areas and probably apatite deposits near the Vietnamese border. The Kaiyang region of Kweichow, with more than one large mine, has been worked for a decade. Liuyang, Shihmen, and Huach'iao are known locations of phosphate mining in Hunan, where output has risen tenfold since 1965. The Chinghsiang mine in Hupeh had an annual capacity of 600,000 tons per year of phosphate rock. A 20-million-ton phosphate deposit reportedly was discovered in the Ch'aoyangli area of Kiangsi Province.

Phosphates are found in many localities in Foshan, Kwangtung Province. A large deposit of high-grade ore was recently reported in the Hsuai-yi-ling area on the shores of the Tatu River in Szechwan Province. A large phosphate rock deposit was found at Fanshan, Chülu County, Hopeh Province.[14] This deposit was said to be the largest of its kind found in northern China, and its development would mean that phosphate rock from the distant Hunan and Kweichow Provinces would no longer have to be shipped in. Shantung Province had many small phosphate operations also.

Fluorspar.—China has long been a prominent world producer and exporter of fluorspar, and output in 1976 probably exceeded 350,000 tons. A large surplus has been traditionally exported, mainly to Japan which took 179,485 tons in 1974 and 107,611 tons in 1975. The U.S.S.R. took 84,840 tons in 1974 and 55,407 tons in 1975. However, Japan's overall steelmaking and aluminum requirements for fluorspar have been declining. On the other hand, China's domestic consumption was approaching the 100,000-ton-per-year level for fluorspar. The United States reported receipt of a trial shipment of about 6,300 tons of Chinese "high-grade lump" fluorspar in July 1976. Most Chinese fluorspar is metallurgical grade, but a significant share of output was acid grade. The leading producing districts had been Wuyi in Chekiang, Kaip'ing in Liaoning, and Lunghua in the Jehol region. The Taolin mine in Hunan produced over 80,000 tons of acid-grade fluorspar in 1976, along with lead and zinc. Taolin's 3,000 tons per day of ore milled analyzes 10% to 15% fluorspar and 3% combined lead-zinc. A similar but smaller mine operated at Hengtung, also in Hunan. It had about 1,000 workers and two mills totaling less than 500 tons per day of ore. Hengtung's fluorspar output was about 20,000 tons per year, and combined lead-zinc output was 3,000 tons per year.

[13] Takungpao (Peking). Dec. 20, 1976, p. 2.
[14] New China News Agency (Peking). Jan. 21, 1977, p. 4.

Salt.—There were no claims for salt production in 1976, probably because of the earthquakes and other difficulties during the year. Several large saltfields are around the Gulf of Pohai, near the earthquake areas. However, there was no particular reason why these saltfields should have been greatly affected. Apparently, the southern saltfields did well; Kwangtung Province's output was said to have increased 40% and Hainan's output 25% over that of 1975. Record high production was also reported for Szechwan Province and Sinkiang Uighur and Ningsia Hui Autonomous Regions. It was estimated that Chinese salt production in 1976 was at least 30 million tons.

Soda and Borates.—A comprehensive survey carried out by Chinese scientific workers on the Tsinghai-Tibet Plateau established the fact that Tibet has about 1,000 lakes covering nearly 30,000 square kilometers or one-third of the country's total lake area. Most lakes are brackish, many are deep, and a good number are dry. The lakes reportedly contain rich mineral and aquatic resources. Abundant deposits of salt, soda, sodium sulfate, and borax are found in many of the lakes in northern Tibet.[15] The survey team under the Chinese Academy of Sciences further verified that one small salt lake contains 5 million tons of salt and 50 million tons of sodium sulfate.

Talc.—China's leading talc-producing area was centered around Tashihch'iao and Taling in Liaoning Province where the mineral is associated with magnesite and soapstone. Chinese magnesite is very extensive in this area and is already exploited in large tonnages. The talc is best known for its high quality in world markets. Local demand for this important filler and auxiliary material was steadily increasing, but large tonnages were still available for export. In fact, the Chinese advertise "talc lumps" from many areas, including Haich'eng, Hsiuyen, and Yingk'ou; Liaoning, Shantung, and Kwangtung Provinces; and Kwangsi Chuang Autonomous Region, and "talc powder" of 200 or 325 mesh. Japan, the main customer, imported 134,624 tons of Chinese talc in 1974, 97,052 tons in 1975, and 151,276 tons in 1976, in addition to soapstone and magnesia clinker.

MINERAL FUELS

Coal.—Coal output showed possibly only a 2% to 3% gain over the 1975 production and was no doubt held back by the major earthquakes in northern China. Kailan's demise was more than made up for by increased output in most other centers and at the small coal mines south of the Yangtze River, where production reportedly gained 10.7%. China's coal output in 1976 was in the 450-million- to 490-million-ton range, corresponding to at least 400 million tons of good U.S. coal. Many coal mine conferences were organized during the year. The most important one was the National Conference held in mid-November in Peking calling upon the 3 million coal workers to "work particularly hard during the last 40 days in order to fulfill the (1976) target."[16] At that conference, red flags were awarded to the 10 best coal-mining teams. A 1,500-meter coal drill was successfully manufactured. A coal cutter capable of adjusting to different thicknesses of coal seams was built in Kirin Province.

It has become abundantly clear that the nine provinces in the Chiangnan region south of the Yangtze River possess considerable coal. During the last decade, Chiangnan's proven reserves and actual production have more than tripled, and its self-sufficiency rate reportedly has increased from 50% to 70%.[17] Two-thirds of the counties and cities in Chiangnan possess coal resources. "Several tens" of deposits have proven reserves exceeding 100 million tons each, such as the anthracite of Hsiangshui, Hunan; Huangshih, Hupeh; Hoshan, Kwangsi Chuang; and Shaowu, Fukien; the "fat coal" of Wusi, Kiangsu; the gas coal of Changkuang, Chekiang; the coking coal of Fengch'eng, Kiangsi, and Huaipei, Anhwei; the brown coal of Hainan Island, Kwangtung; etc. Even in coal-poor Chekiang Province, minable coal reserves have been found in about 27 counties. Kwangtung Province's coal output rose from just over 100,000 tons per year to approximately 4 million tons.

Kailan provided the big news for 1976, with the earthquakes striking Tangshan

[15] New China News Agency (Peking). Apr. 28, 1977, p. 5.
[16] Takungpao (Peking). Nov. 20, 1976, p. 1.
[17] Takungpao (Peking). Dec. 11, 1976, p. 1.

and Fengnan in late July. Tangshan, one of seven coal mines of Kailan combine (or bureau), was literally mangled, with its shafts twisted and many workers caught underground. The cement plant was put out of commission, but the steelworks was brought back into production fairly quickly. Although Tangshan had the most damage, the other six mines were hit also. Overall earthquake casualties apparently were between 1 million and 1.5 million people, of which roughly one-half died. All of the large coal combines sent rescue teams to help, along with supplies and equipment. Some Kailan mines resumed production quickly, and in a little over 2 months, six of the seven mines were producing coal again. The Lüchiat'un mine had returned to nearly 8,000 tons of output per day by mid-December. The Chaokochuang mine hoped to raise production to 2.3 million tons in 1977, its pre-earthquake rate. Kailan as a whole produced over 20 million tons of marketable coal (not raw coal) in 1975, and the estimate for 1976 was approximately 15 million tons.

Yearend news on the performance of Chinese coal combines and individual provinces was not as abundant as it was a year earlier. This may reflect lesser gains in output. However, the catastrophe of the Tangshan earthquakes and the abundance of other significant events probably also had a bearing on the reduced news coverage. Many large coal mines around the country dispatched their best people along with valuable equipment to Kailan, which no doubt hurt their own output somewhat. Another National Coal Conference was convened in January 1977 to stimulate coal production. No effort is made here to give detailed data on individual mines and facilities, which can be found in a book by this author.[18]

Shansi coal mines did well in 1976. This Province, virtually underlain by coal, produced about one-sixth of China's total and has plans to expand output severalfold. The Tatung bituminous coal combine, with 13 pairs of major mine shafts, reportedly produced 20 million tons of coal (corresponding to at least 15 million tons of marketable coal) in 1976, which was about twice that produced by the Yangchüan anthracite combine, with 12 pairs of mine shafts. Tatung was said to have achieved its target 37 days ahead of schedule and surpassed the 1975 output rate by about 13%; Yangchüan's record was 43 days and 11%, respectively. Tatung apparently has been increasing output by 2 million tons annually in recent years.

Fushun and Fuhsin, the two best known coal combines in Liaoning Province, had the largest open pit operations in all of China, which is better known for its underground coal mines. Fushun, with two pits and three deep mines, apparently met output targets in 1975 and 1976, although actual production may have declined to possibly 12 million tons of clean coal. This combine had electric shovels and heavy media plants. Fushun, starting with coal and oil shale and branching into oil refining, chemicals, and nonferrous metals, has become one of China's major industrial bases. Fuhsin was on the upswing in coal production because of the discovery of extensive new reserves during the early 1970's. Production quotas were generally met, and 1976 output of clean coal by this combine probably was about 17 million to 19 million tons. Fuhsin has the Haichow and Hsinch'iu open pits and an underground operation at P'ingan.

Shuangyashan was the smallest of three important bituminous coal combines in Heilungkiang Province, the others being Hokang and Chihsi, which each produce 10 million to 12 million tons annually. Shuangyashan reportedly attained its 1976 target on November 12 and established a record high annual production in the process. Chihsi fulfilled the year's target on November 25, and Hokang recently installed a pair of new shafts at the Suli mine rated at 1.4 million tons per year. Shantung was singled out as a province that performed well, fulfilling the 1976 target 38 days ahead of schedule with output increasing 4.5 million tons over that of 1975. With coal production in the 30-million- to 35-million-ton-per-year range, Shantung was also well known for oil and fertilizers.

The two large coal combines in Anhwei Province were mentioned in the news. Huainan (the older and larger one) and Huaipei together produced up to 20 mil-

[18] Wang, K. P. Mineral Resources and Basic Indusries in the People's Republic of China. West View Press, Boulder, Colo., May 1977, 225 pp.

lion tons of marketable coal in 1976. Huainan's old Tatung mine has been rejuvenated, achieving its target more than 3 months ahead of schedule. With 10 modern shaft mines and a large coal beneficiation plant, Huaipei established a record high output in meeting its 1976 goal by late November. A new large coalfield called Linhsi reportedly was discovered in Anhwei Province.[19] Located in the Shuhsien region, Linhsi coal reserves are said to be more than three times those of the Huaipei combine according to preliminary estimates, coal quality is excellent, and coal types cover a wide range.

P'ingtingshan, a relatively new coking coal base in Honan Province with 13 collieries and 70,000 workers, had already achieved a production level of 10 million tons per year of run-of-mine coal by 1975. However, 1976 seems to have been a difficult year, with political difficulties apparently slowing down operations. Output in early September dropped to below 15,000 tons per day, although operations returned to normal by yearend. Two new coal centers in outlying areas were brought to light in May. Holanshan in Ningsia Hui Autonomous Region, located at the "gateway to the northwest," was probably producing more than 5 million tons of clean hard coal annually from mostly underground mines. Paoting, located in the mountains of southern Szechwan Province, has also been built up to a 5-million-ton-per-year coal base; its coal is medium-volatile coking coal.

Petroleum and Natural Gas.—Oil production was estimated at about 90 million tons (or 1.8 million barrels per day) in 1976, although some feel the figure may have been as low as 85 million tons. It was officially announced that the gain over 1975 was 13%.[20] By mid-1976, the national output rate had reached 100 million tons per year. However, growth was subsequently slowed down by adverse factors such as the Tangshan earthquakes (which definitely affected the Takang oilfield), export and distribution difficulties, construction of port and refinery facilities, and major political happenings. Taching, the main field, exhibited a growth rate much lower than the national average, exemplifying the behavior of a mature field. On the positive side, startup of a third large oilfield near the Gulf of Pohai, comparable in magnitude to the Takang oilfield, was announced near yearend, with the location given as between Yingk'ou and Chinchou in Liaoning Province.[21]

China ranked 10th among world oil producers in 1976; however, output corresponded to only about 15% to 25% of the tonnage produced by the world's four leading producers. There is no evidence that China can ever become one of the top four oil producers, but doubling of output within a decade to 200 million tons was well within reach. The new Yingk'ou-Chinchou oilfield added to the potential, and other onshore fields were being developed. New reservoirs and production zones were reported for most of China's leading oilfields. The Chinese felt very hopeful about offshore possibilities, particularly on the northern and southern coasts. In recent years, they dispatched equipment and exploration teams to countries such as Norway, West Germany, Venezuela, Singapore, and the United Kingdom where offshore oil and gas production was due to rise sharply. The Chinese apparently were wavering between a policy of rapid and intense development of oil and gas, so as to expand exports for earning more foreign exchange, and a conservative policy of a balanced program of oil, gas, coal, and electric power. In any case, the Chinese showed no indication of accepting production-sharing contracts, not to speak of joint ventures, although they clearly knew the importance of foreign technology and equipment.

China did not export as much oil in 1976 as might have been expected—perhaps 10 million tons, slightly lower than in 1975. Exports to Japan declined from 8.1 million tons in 1975 to 6.8 million tons in 1976, mainly because of Japanese reluctance to take more of China's waxy crude and concern over Chinese political sensitivity toward exports. Shipments to North Korea may have increased because of the new pipeline installed, whereas shipments to Romania may have been about the same and shipments to Southeast Asia a little lower. Most people assessing Chinese oil exports felt that the tonnage by the early

[19] Takungpao (Peking). Mar. 28, 1977, p. 1.
[20] New China News Agency (Peking). Jan. 5, 1977, p. 1.
[21] Takungpao (Peking). Dec. 21, 1976, p. 3.

1980's may be close to 20 million tons but is not likely to be much higher. The program of installing pipelines and building oil-handling ports and coastal tankers made significant headway in 1976, as did efforts to construct additional refineries and petrochemical facilities. With larger production and little change in exports, it follows that consumption was increasing, and this means more industrial facilities, diesel plants and trains, oil-fired cement plants, vehicles, petrochemicals, fertilizers, and farm mechanization. Without many private cars, 70 million to 80 million tons of petroleum annually means a great deal to the economy of China.

The Taching oilfields near Harbin probably produced about 35 million tons of oil in 1976. The official report was that output in 1976 was 8.7% over the 1975 output, which in turn was 13.4% more than the 1974 output. In evaluating its potential and production, two very important points stand out. One is that Taching had a new field called Ta-king, some distance from the existing center, that was opened in late 1973. The second is that the drilling and water-injection system of the old field was recently changed from "line drive" to "9-spot," which meant better recovery but lower output. Western newspapers had been reporting that production of Taching may have peaked. This was probably true in the sense that annual output may not greatly exceed 40 million tons in the future, although it should be remembered that the Sungliao Plain where Taching is located is a sizable area. However, production at Taching very likely will last for decades, although it shows signs of maturing. Interest in Taching's oil was universal, and, of late, some was shipped by pipeline to North Korea. The refinery at Taching produces only 5 million to 6 million tons annually. A recently completed large fertilizer plant was rated at about 1 million tons of fertilizers and 300,000 tons of synthetic ammonia yearly.[22]

The Shengli oilfield near the mouth of the Yellow River, with oil reserves on a par with Taching, produced more than 15 million tons (perhaps 17 million to 18 million tons) of crude oil in 1976. Output in 1975 was said to be 33% more than in 1974. However, the official statement for 1976 only mentions that State quotas for crude oil and all other major products were overfulfilled, and "new discoveries have been made in prospecting."[23] Two fertilizer plants, a catalyst plant, and a synthetic rubber plant were in operation, and there was a plan to change the course of the Yellow River. Shengli had a 2.5-million-ton refinery and a 3.5-million-ton refinery, which were connected by pipelines across the Shantung Peninsula to the new Huangtao port near Tsingtao.

The Takang oilfield, near the Gulf of Pohai 60 kilometers southeast of Tientsin, had not yet been totally built up, although annual output may have already reached 12 million tons. Takang's crude oil output gained 60% in 1973, nearly 25% in 1974, and 16% in 1975. Its actual 1976 production was reported as close to the State quota. The Tangshan earthquakes hit Takang mildly. Chinese reports said that extraction never stopped; although production declined in the first 2 days, operations returned to normal on the 3d day. Only a relatively small refinery was in existence in early 1975, but a large petrochemical complex of the scale of the one at Chinshan near Shanghai was under construction in 1976. The hope was to also produce liquefied natural gas for export to Japan. Oil and gas were piped to Tientsin where a large refinery and petrochemical complex were being expanded. Additionally, a pipeline had been built from Tientsin to Hsinkang, probably with a view toward exports.

A new oil and gas field was found in mid-1976. The Yingk'ou-Chinchou field is slightly inland from the Gulf of Pohai, covering 62 kilometers in length and possibly extending into the Gulf. Development began in 1974, and the first well, which was reportedly heavy in sulfur smell, was spudded on June 25, 1976. Yingk'ou-Chinchou has been proclaimed as northern China's fourth big oilfield, the others being Taching, Shengli, and Takang. As far back as 10 to 12 years ago, it was felt that promising oil resources might be found in this area.

The Karamai oilfields located in the western Dzungarian Basin in Sinkiang Uighur Autonomous Region, 147 kilometers by

[22] Takungpao (Peking). Dec. 28, 1976, p. 1.
[23] New China News Agency (Peking). Jan. 2, 1977, p. 1.

pipeline to the Tushantzu refinery, had expanded production twofold in a decade. In 1975 alone, output was raised 65% over that of 1974. All major production goals for 1976 were said to have been met, and these were higher than the 1975 levels. Karamai's oilfields have been streamlined and a new field built, equipped with measuring and transfer stations, necessary derricks, and 50 kilometers of new pipelines. Annual crude oil output may have risen to the 6-million- to 7-million-ton range.

China's natural gas has become a very significant resource on a par with oil, and production should rise sharply in the years ahead. Marketed output of natural gas reportedly increased 14% over that of 1975. Firm figures were not available, but production of 100 billion cubic meters annually should be achieved before 1980. Natural gas is associated with various oilfields, particularly Takang and Taching. Szechwan Province has long been known for natural gas itself, and supply quadrupled in the last decade. Gas was used at two-thirds of Szechwan's steel plants, over 80% of the salt facilities, over 70% of the fertilizer plants, and many cement plants as well. Reportedly, a pipeline to bring Szechwan gas to Shanghai had already reached Ch'angsha. The Chinese were hoping to sell liquefied natural gas from Takang to Japan. There was a rumor that China was thinking of building a large liquefied natural gas plant near Canton.

China had two of the three shale-oil-producing operations in the world, the other being the Estonian facilities in the U.S.S.R. The older operations at Fushun, Liaoning Province, have been deemphasized because of the natural crude oil discoveries. However, the newer operations at Maoming (Mowming), Kwangtung Province, have been often mentioned in the press. Maoming had six shale-oil-retorting plants,[24] together producing at least 1.5 million tons of shale oil annually. It had a regular crude oil refinery as well, and a 140-kilometer-long, 1-meter-diameter pipeline from Chanchiang was completed to Maoming near yearend to facilitate processing of crude oil brought in from elsewhere.

The steady increase in oil and gas production in China necessitated the building of pipelines and ports. Szechwan Province had a network of natural gas pipelines, and an important gasline was recently built in Yunnan Province. The first long and large oil pipeline was completed near the beginning of 1974, extending 1,152 kilometers between the Taching oilfield and the port of Ch'inhuangtao; this was subsequently extended to Peking. Another line was later built from Taching to T'iehling and Talien (or Dairen), with a branch line to North Korea. Lesser lines had been constructed from the Takang and Shengli oilfields to nearby markets and ports. Talien had a new oil port, capable of accommodating up to 100,000-ton vessels. All other ports could only handle up to 50,000-ton ships. A concerted program was underway to build up shipping ports and unloading facilities.

Oil-refining and petrochemical capacities were being rapidly expanded to accommodate the new oil and gas coming onstream. Many refineries were being enlarged or newly built, bringing China's total capacity to at least 70 million tons by early 1977. Three prominent refining and petrochemical complexes being built were at Whampoa near Canton, Takang, and Chinshan near Shanghai. All three are probably of a magnitude of 5 million tons per year. Other large refineries were located at Fushun, Taching, Lanchow, Shanghai (an old one), Peking, Shengli, Talien, Chinhsi, Nanking, Anshan, Maoming, Yumen, Tientsin, and Karamai-Tushantzu. Capacity of the Nanking refinery was reportedly doubled from the original 3 million tons per year. At the Peking refinery, five new petrochemical units were placed in operation during 1976. The 1.5-million- to 2.0-million-ton Tushantzu refinery in Sinkiang Uighur Autonomous Region was being substantially expanded, and the Maoming refinery was being enlarged also.

[24] China Reconstructs (Peking). August 1976, pp. 18–19.

The Mineral Industry of Colombia

By Lotfollah Nahai [1]

For Colombia 1976 was a year of sharp economic growth. The gross national product at current prices increased 25% from the 1975 level to $15,218 million (estimated); the corresponding figures at constant prices (1970) were 4.6% and $9,655 million (estimated). Real industrial production increased by an estimated 11% during 1976. The same was not the case with the mineral industry, which had no significant gains in production. Colombia's mineral potential, largely petroleum, coal, nickel and, perhaps, copper and uranium, remained substantially unexploited. However, development prospects have improved, and the Government is giving attention to petroleum, coal, and nickel development, in that order.

Of importance to the investment climate was the adoption of the liberalized Andean code on investment, raising the allowable remittance on profits to leave Colombia from 14% to 20% and higher if necessary.

Government action in the minerals area concerned the price of petroleum and a national policy for coal. Prices for new petroleum, which were controlled well below world levels, were raised in May 1976 to world prices c.i.f. Cartagena. A nationwide policy for coal was adopted, and contracts were made to develop coal reserves in association with Exxon Corp. and Spanish and Brazilian entities.

The mineral industry reportedly accounts for 2.5% of the gross domestic product and employs 73,000 people. Coal mining with 15,000 is the largest single employer in the mining sector.[2]

Results of prospecting in collaboration with the United Nations Development Program and the Institute of Geological and Mineral Investigation (Ingeominas) were not announced during the year. This 3-year program will concentrate on detailed examination of copper, lead, and zinc prospects in Western Cordillera.

PRODUCTION

There was little change in the level of output of most minerals other than petroleum, which showed a decline. The production of precious metals was mixed, with silver increasing and gold and platinum declining.

[1] In addition to the commodities listed, coal briquets are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[2] Revised to none.

TRADE

Colombia had a favorable overall trade balance of $125 million in 1976 but a negative balance for petroleum, minerals, and metals. For petroleum alone the trade deficit totaled $33 million. Crude imports ($84.1 million) accounted for 68% of total petroleum imports ($122.6 million).

COMMODITY REVIEW

METALS

Chromite.—During 1970–72, production averaged 200 tons per year but increased to 12,000 tons in 1973. Since 1974, production has averaged 700 tons to 800 tons per month. Cromitas Ltda. is the only producing company. The deposits are located in Antiqua near Medellin-Reilo-Envigado and San Benito. Total reserves are estimated at 1.5 million tons. The ore is refractory grade with 36% Cr_2O_3.

Copper.—The copper deposits in the Choco Los Patanos and Murindo were turned over to Empresa Colombiana de Minas (ECOMINAS) for promotion. The area's geology indicates porphyry copper deposits, but exploration has been minimal. ECOMINAS plans to issue guidelines during 1977 calling for proposals to explore the area. The guidelines will probably call for an arrangement similar to the Exxon-Empresa Carbones de Colombia (CARBOCOL) association contract. Other attractive copper deposits discovered by Amoco Colombia Oil Co. near the Panamanian border may be opened this year for drilling and feasibility studies.

Gold, Platinum, and Silver.—Gold production declined 3% from 308,709 troy ounces in 1975 to 297,861 troy ounces in 1976. Until 1976, gold production had been increasing steadily at an annual rate of 13% since world prices rose sharply in the early seventies. Most of the production increase had been from small miners. To spur the levels of gold production, the Government recently established an 8% export subsidy and raised the internal price of gold. Platinum, a byproduct of gold dredging, also declined (24%). Gold production is expected to increase in 1977 by about 10%.

It was reported that the British-owned Frontino Gold Mine Co. was in the process of liquidation because of labor problems and shrinking reserves.[3]

Increased silver production in 1976 resulted from the finding of higher grade ores. Over 70% of total production was from small miners.

[3] American Metal Market. V. 82, No. 242, Dec. 15, 1976, p. 8.

Iron and Steel.—According to the United Nations Industrial Development Organization (UNIDO), annual steel consumption averaged 0.7 million tons in 1970–74, 50% of which was met through local production. Apparent consumption for 1974 and 1975 were 798,000 and 637,000 tons, respectively. According to the same source, the steel works at Paz del Rio will be expanded to produce 1 million tons of steel ingot in 1980, and a new plant is also planned. Information on the implementation of the expansion of the Paz del Rio plant is not available.

Nickel.—The Cerro Matoso nickel mining project, with The Hanna Mining Co., Standard Oil of California, and the Government as partners, was held up by financing problems. The $300 million project is to produce about 23,000 tons of ferronickel per year when completed. The Instituto de Fomento Industrial (IFI) has sought a $75 million World Bank loan, but the Bank requested long-term marketing contracts before it would provide financing. Such contracts were not secured in 1976, and the project probably has to seek alternative financing. Final ownership and management of the project may ultimately depend upon the financial package on which it is based.

Uranium.—The Institute of Nuclear Affairs (IAN) has found, with the collaboration of several European entities, uraniferous occurrences, most of them located in the Central and Eastern Cordilleras. IAN has contracted to conduct detailed uranium exploration in Sapatoca, Santander. Westinghouse also entered discussions with IAN to initiate exploration. It is Colombia's desire to develop the uranium as rapidly as possible, but the exploration is in the very earliest stages, and development is many years in the future.

NONMETALS

Asbestos.—Minera Las Brisas S.A. reported that engineering plans for the asbestos mill were being completed. The deposit near Campamento in Antioquia Department reportedly has 8.4 million tons of ore reserves capable of producing 390,000 tons of fiber. Fiber production at 20,000 tons per year is scheduled to begin in 1979.[4]

Phosphate.—No developments were reported on the phosphate deposit explored by Ingeominas with assistance from the United States Agency for International Development.

MINERAL FUELS

Colombia has announced a 10-year plan to attain self-sufficiency in petroleum by 1985. The plan requires the expenditure of $3,000 million for exploration and production, and $800 million for the expansion of refinery capacity and the pipeline network.[5] A new production contract system will allow foreign operators 40% of commercial output from their discoveries.

The use of coal and natural gas is also to be stimulated, especially in the northern part of the country, in order to attain self-sufficiency in mineral fuels.

Coal.—Colombia has the largest coal resources in South America. Yet the development of coal resources has been slow and hampered by the widespread distribution of the deposits together with the mountainous topography, which has resulted in the isolation of the various coalfields as well as the consuming industrialized areas. With few exceptions, past production has been solely to satisfy these internal and isolated markets. Developments in 1976 point to larger scale coal production; the increase in petroleum prices and Colombia's declining petroleum production have made coal a viable alternate energy source.

Using the association contract of Empresa Colombiana de Petróleos (ECOPETROL) as a model for mineral development, a contract was awarded to Exxon for exploration and development of the so-called area B (38,000 hectares) of the Guajira coalfield. This coalfield is located on the coast of the Department of Guajira and has low-sulfur steam coal. Exxon has drilled a number of exploration holes with reportedly good results and is well into the feasibility studies for the port and railroad needed for exploitation of the seams. The amount of the initial investment has been estimated at $350 million, which is to include infrastructure costs—a 125-kilometer railroad to the port of exit and development of harbor facilities.

Area A of the Guajira coalfield, which has been investigated by Peabody Coal Co.,

[4] Asbestos. September 1976, p. 44.
[5] Petroleum Economist. V. 43, September 1976, p. 357.

will revert to CARBOCOL,[6] which was formed in 1976. CARBOCOL will develop the coal on a small scale to produce 1,000 tons per day from surface operations. In the meantime, plans for larger scale production will be prepared to coincide with availability of infrastructures.

The Exxon contract with CARBOCOL has a number of innovations and will serve as a model for future large-scale foreign investments in the mineral industry. International Petroleum Colombia, Ltd. (INTERCOL), Exxon's Colombian coal subsidiary, will undertake all exploration and feasibility, cost, and risk studies over a 3-year period (which can be extended by 1 year). If at the end of the period the project is considered viable, CARBOCOL will pick up half the costs and become half owner. INTERCOL and CARBOCOL will then have 3 years to develop the project. During this period, CARBOCOL may proceed to develop the infrastructure designed by INTERCOL. However, if INTERCOL and CARBOCOL determine that the area is commercially viable, the infrastructure will revert to 50% ownership by INTERCOL and will be operated by it. INTERCOL will pay a royalty of 15% on its half of the coal and can market it as it pleases. In addition to profits and remittance taxes, INTERCOL will pay an increasing share of any profits over 35% of the indexed investment. It will pay on a scale ranging from 2% on the amounts up to $25 million over the basic 35% profit and reaching 90% on amounts up to $250 million or more. The contract has a lifespan of 30 years including the exploration and development period. INTERCOL will operate the mine and transportation facilities and will report to an executive board composed of INTERCOL and CARBOCOL.

In an agreement signed February 7, 1977, Spain committed to carry out coal and uranium exploration in Colombia. After a period of initial exploration, the Spanish can make a proposal for an association contract for detailed exploration and development. The exploration will be in the Sabana area where substantial coking coal (perhaps over 1 billion tons) occurs.

Natural Gas.—Continued delineation drilling of the Texaco Guajira gasfield confirmed that these fields constitute the largest in Colombia with reserves among the largest found to date in South America. Discovery of offshore gas in August by the same company could also add significantly to Colombia's reserves. Limited drilling indicates the potential for 400 million cubic feet of production per day for 20 years. The Cartagena find will be further tested and drilled over the next year. The new discoveries have not yet impacted production, which actually declined slightly from 120,394 million cubic feet in 1975 to 117,541 million cubic feet in 1976.

The gas pipeline from the Guajira Field was inaugurated in August 1976. The pipeline has a capacity of 400 million cubic feet per day from Ballena to Palomino and 200 million cubic feet per day from Palomino to Barranquilla. The two Fields Riohacha and Ballena, with a capacity of 120 million cubic feet per day, will be supplemented in 1978 by the Chucupa Field.

Progress was made during the year in promoting additional development projects based on this gas, when 13 companies submitted proposals for a 150-million-cubic-foot-per-day liquefied natural gas (LNG) facility in the Guajira. These proposals were narrowed down to five which are being studied by ECOPETROL and Texaco. The new gas discoveries could alter the magnitude of this project. Also, at least one 1,000-ton-per-day ammonia plant is planned. The present price of gas is $0.80 per thousand cubic feet.

Petroleum.—Action taken in May 1976 to link new crude oil prices to world prices c.i.f. Cartagena was an important incentive to the industry. Prior to this action, local producers were required to sell their output at unrealistically low prices. This policy resulted in a precipitous decline in exploration drilling and production development in 1975. The May 1976 measure improved the profit situation of local producers. As a result, the rate of decline of old petroleum fields slowed through workovers. There was also a significant increase in exploration (wildcat) and development wells drilled. Further increases in exploration activity in terms of rigs and seismic crews were indicated for 1977; 39 wildcats were scheduled to be drilled in 1977.

[6] The State entities IFI and Ingeominas both have shares in CARBOCOL.

Drilling activity during 1975–77 is summarized[7] in the following tabulation:

	1975	1976	1977 (projected)
Exploration wells	11	21	39
Development wells	13	23	77

In 1976 total footage of exploration and development wells was 186,462 and 201,829 feet, respectively. Eleven of the exploration wells were new-field wildcats, and two of these resulted in discoveries of unproved importance in the Putumayo Basin near the Ecuadorian border. The only other discovery was in the Middle Magdalena Valley. Three Putumayo Fields were put in production—Burdine, Nancy, and Maxine. Burdine and Maxine had an initial production of 3,000 barrels per day. The operating consortium is headed by Farmland International Energy Co.[8]

Of the 23 development wells in 1976, 20 were in the Magdalena Valley fields: 11 in Lisama, Yarigui, and Cantagallo Fields in Middle Magdalena; 7 in Dina, Upper Magdalena; and 2 in Ciuco, Upper Magdalena. Two of the development wells were in the Ballena gasfield, and the last, in Tibu, southwest Maracaibo.

Crude oil production declined about 6.7%. Production by various companies is shown in table 4. Texaco Inc. with its one-half share in Texaco-Petrólera del Rio S.A. (Texaco-Petrório) was the largest producer. All producers except Shell-Condor had lower production than in 1975. Consumption continued to increase resulting in large imports.

The Orito Field of Texaco-Petrório, with a production of 10.8 million barrels, accounted for about one-fifth of the total. The second largest producing field was La Cira of ECOPETROL (5.2 million barrels).

Colombia had a refining capacity of 176,000 barrels per day: 110,000 in ECOPETROL's Barrancabermeja refinery; 50,000 in ECOPETROL's Cartagena refinery; and 15,000 in others. As shown in table 5, domestic production of refined products was not sufficient to meet demand and the country imported about 2.8 million barrels of refined products at a cost of $38.4 million. Crude imports were valued at an additional $84.1 million for a total of $122.6 million. But the country also exported $89.2 million worth of residual fuels. Imports are projected to reach $500 million by 1980.

The Mineral Industry of Cyprus

By E. Shekarchi [1]

In 1976, the island of Cyprus remained divided into two parts by a line running east-west through Nicosia; Turkey controlled the northern sector through the Federated Turkish Cypriots (FCS), and the Government of Cyprus occupied the south. The information in this chapter is based primarily on the Government's report from the south, since no information was available on the northern sector. No major new ore bodies have been reported in Cyprus since the hostilities of 1974.

There were 11 mines in operation, producing asbestos, chromite, iron pyrite and copper and worked by 4 major companies: Hellenic Mining Co. Ltd. (HMC), Cyprus Sulphur & Copper Co. Ltd., Kampia Mines Ltd., and Cyprus Asbestos Mines Ltd. During 1976, the mining sector in Cyprus provided about 11% of the total exports from the island, and 2,300 persons were directly employed in the industry.

The Geological Survey Department (GSD) continued detailed geological mapping, geochemical surveying, and geophysical work in the southern section of the island. Most emphasis was placed on finding new water sources for irrigation of land and water supplies for refugee camps and new housing settlements. Since most of the construction materials needed in the south were located in the northern Turkish zone, supplies of sand and gravel, clay suitable for tile and brick, crushed stone, and other materials were short of demand. The engineering geology and the economic geology sections of GSD concentrated all their efforts in 1976 on finding ample reserves of construction materials to carry out the Government's rebuilding program. The engineering geology section also conducted feasibility studies for the Nicosia-Limassol highway and the initial investigations of various sites under consideration for construction of low-cost housing for refugees. In the field of mineral exploration, GSD's efforts to find new ore bodies in the most promising parts of Cyprus' pillow lava belt continued. The agreement between the Government of Cyprus and Noranda Mines Ltd. of Canada to explore the Pano Lefkara and Mandres prospects by geophysical methods continued in 1976, but no new findings were reported by yearend.

PRODUCTION

Total mineral production in 1976 was about 272,000 tons, compared with 51,000 tons in 1975; the dramatic increase reflected the cessation of hostilities on the island. On a value basis, mineral production had an even better year in 1976, because of higher prices paid on the international market for chromite, asbestos, and pigments. Table 1 shows the available figures on mineral production.

[1] Supervisory physical scientist, International Data and Analysis.

[1] In addition to the commodities listed, a variety of other crude construction materials are also produced, but information is inadequate to permit formulation of reliable estimates of output levels.

[2] Includes the nonduplicative sum of copper content of all exportable products, including copper concentrate, cupreous pyrites, cement copper, and copper precipitates.

[3] Exports.

[4] Revised to none.

TRADE

Cyprus' foreign trade showed a speedy recovery in 1976 after the serious setback it suffered because of the civil hostilities in 1974. Agricultural products continued to be one of the most important categories of goods exported, accounting for 34% of total exports, and exports of manufactured goods showed an impressive increase in 1976, to 55% of total exports. Exports of minerals declined further and represented 11% of the total, compared with 15% in 1975. While exports of iron pyrites and chromite concentrate decreased, exports of asbestos and cupreous concentrates increased significantly.

COMMODITY REVIEW

METALS

Chromite.—HMC was the sole chromite producer in the country. Production of chromite ore and concentrate was about 9,000 tons, a 67% decrease from the 1975 output. The value decrease of chromite production was less pronounced, owing to higher prices for chromite in the international market. HMC's search for new ore bodies along the ultrabasic belt of the island did not yield promising findings during the year. The bulk of the chromite exports went to the European market, but a small amount was shipped to Japan.

Copper.—Three companies produced copper during the year. HMC operated seven mines and produced 22,000 tons of copper concentrate containing about 20% copper, Cyprus Sulphur & Copper operated an opencast mine and produced about 14,000 tons of copper concentrate at an average grade of 23% copper, and Kampia continued production at its Peristeria and Pitharochoma mines and produced about 2,000 tons of ore containing 20% copper. Since the Kampia mineral dressing plant had not been completed, the company upgraded its ore at HMC's plant. However, Kampia expected to operate its new concentrator in 1977.

Zinc.—Kampia produced about 1,400 tons of zinc concentrate with an average grade of 50% zinc. The company had accumulated a large stockpile of copper-zinc ore pending the erection of a mineral-dressing plant near the Peristeria mine. However, installation of the concentrator was delayed and the company transferred the bulk of its ore to the HMC plant during 1976 for upgrading.

NONMETALS

Asbestos.—Production of asbestos increased substantially in 1976 over the 1975

output. Cyprus Asbestos Mines remained the sole operator and producer on the island. The International Investment Organization (IIO), a member of the International Bank, and Cypriot Pipe Co. signed an agreement in the latter part of 1976 whereby IIO was to finance the construction of a factory for asbestos cement products (high-pressure pipe and asbestos slabs) at Limassol. IIO was to hold 10% of the stock of the company, the Cypriot Government 20%, the Cyprus Development Bank 10%, and Cypriot Pipe Co. 25%; the remaining shares were to be offered to the public. The total cost of the first phase of the project was given as about $4 million [2] and its initial production as about 15,000 tons of various asbestos cement products.

Cement.—Total production of cement was about 1.0 million tons, a 67% increase over the 1975 output. The Cyprus Cement Co. Ltd. and Vassiliko Cement Works Ltd. remained the major producers in 1976. Most of Vassiliko's production was earmarked for export and was very effective in reducing the company's foreign exchange commitments. Syria remained the main importer of Cypriot cement as the result of the contract that was signed between Syria and Vassiliko in 1975 for importation of 4 million tons of cement.

Gypsum.—United Gypsum Ltd. remained Cyprus' main gypsum producer, with a total production of 50,000 tons of crude gypsum and about 8,000 tons of calcined gypsum. The 1976 gypsum production increased 131% over that of 1975, owing to the activity in the construction industry.

Mineral Pigments.—The depressed international market of 1975 gave way to a growing demand for Cypriot pigments in 1976. Total production of terre verte, umber, and yellow ocher was about 10,000 tons in 1976, compared with about 4,000 tons in 1975.

Pyrite.—Pyrite ore and concentrate production in the south decreased 3% in 1976. Sulfur content of Cypriot pyrite, exported primarily to the European market, was close to 50%. The exploration efforts of the GCD to locate new deposits of pyrite continued during the year.

MINERAL FUELS

Offshore oil drilling activity remained minimal since legislation dealing with offshore rights remained uncertain. The Government continued to delay any action on this legislation until the northern and southern sectors could agree on mutually suitable common legislation.

Cyprus Petroleum Refinery Ltd. at Loranca imported about 380,000 tons of crude oil, and petroleum refinery output totaled 380,000 tons, including 100,000 tons of gas oil and diesel oil, 118,000 tons of residual oil, and 76,000 tons of gasoline. The Government held several discussions during 1976 with petroleum-rich Arab countries over the possibility of constructing a second refinery on Cyprus. However, by yearend, no firm decision had been made on a new refinery.

---

[2] Where necessary, values have been converted from Cyprus pounds (£C) to U.S. dollars at the rate of £C1 = US$2.44.

The Mineral Industry of Czechoslovakia

By Tatiana Karpinsky [1]

Czechoslovakia is one of the most industrially advanced countries in Eastern Europe. The engineering and metal-processing industries account for one-third of all industrial production. In 1976, Czechoslovakia's share of world production exceeded 1.8%, with only roughly 0.4% of the world's population. For its size, the country had a high share of world output of crude steel (2.2%), bituminous coal (1.5%), and brown coal (9.7%). Czechoslovakia's share of the overall turnover of world trade amounted to 1.1% in 1976.

The national income in Czechoslovakia reached 383,593 million Czechoslovak korunas (Kcs),[2] about 4% more than that of 1975 compared with a planned increase of 5%.[3] In 1976, fuel and energy production accounted for about 6% of the total national income and output of the engineering industry, about 20%.

In 1976, industrial production increased 5.5% and labor productivity 4.9%; in 1975, however, industrial output had increased 7% over that of 1974. In 1976, the first year of the sixth 5-year plan (1976–80), the following percentage increases were reported: Crude steel, 2.6; rolled products, 3.5; cement, 2.7; bituminous coal, 0.5; brown coal and lignite, 3.7; and electrical power, 5.7. Output of nonferrous metals increased moderately.

Czechoslovakia's overall growth rate continued to be the lowest in Eastern Europe. Czechoslovakia is relatively poor in natural resources, but its processing industry is well developed and advanced.

The country has large reserves of coal, antimony, magnesite, mercury, kaolin and other clays, sand for the glass industry, limestone, and building materials, but it is deficient in oil, natural gas, and most metallic ores. To meet the requirements of industry in 1976, imports of raw materials and semifinished products accounted for about 37% of total imports from Council for Mutual Economic Assistance (CMEA) countries.[4] Special emphasis on the conservation of fuel, energy, and raw materials was directed at an overall reduction of 2% to 3% in requirements.

In 1976, Czechoslovakia continued to participate in multilateral projects of the CMEA, including construction of facilities for production of iron ore, construction of an asbestos production complex in the U.S.S.R., construction of a gas pipeline from Orenburg, eastern U.S.S.R., to the western Soviet frontier, and construction of a 750-kilovolt transmission line from Vinnitsa, U.S.S.R., to the Hungarian border. Czechoslovakia joined other CMEA countries in the construction of facilities for the production of nickel in Cuba. For participation in these joint projects, Czechoslovakia is to receive 17 million tons of iron ore, 14,000 tons of asbestos, and 2.8 billion cubic meters of natural gas per year for several years. For its participation in the construction of the 750-kilovolt transmission line, Czechoslovakia's supply of electrical power is to be increased 10%.

---

[1] Foreign mineral specialist, International Data and Analysis.

[2] The official exchange rate from Czechoslovak korunas (Kcs) to U.S. dollars in 1976 was Kcs5.775=US$1.00.

[3] Rude Pravo, Prague, Jan. 27, 1977.

[4] Includes the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

Bilateral agreements have led to Czechoslovak geological expeditions in the developing countries, in exchange for deliveries of mineral raw materials.

Like some other CMEA countries, Czechoslovakia typically reserves two-thirds of its total international trade for centrally planned economy countries. In 1976, the country had substantial overall trade deficits with market economy countries; trade with CMEA countries was almost balanced.

Government Policies and Programs.—The basic goal of the 1977 State plan, approved by the Communist Party of Czechoslovakia in April 1976, was to insure the continued development of the national economy and the national income. According to the resolution, the gross national product in 1977 is to increase 5.4% and the national income 5.2%. Industrial production is to increase 5.3%, agricultural production 8.2%, and building construction 6.2%. Fully 90% of the growth in national income is to be achieved by increased labor productivity.

The following percentage increases in production have been planned from 1976 to 1977:

Steel	2.3
Cement	6.3
Fertilizers	3.3
Coal	1.9
Electrical power	6.2

During 1977, production of brown coal is to reach an estimated 92.5 million tons and bituminous coal, 28.1 million tons.

A 6.2% increase in electrical power production is to be achieved by the installation of new generating capacity. In order to achieve the planned output of steel, the ferrous metals industry is to be expanded and modernized. In the heavy engineering sector, production is slated to increase 7.2%, with emphasis on meeting the needs of the foreign trade program. In particular, output of machinery and plant equipment is to be increased. Production of nuclear plant equipment is to be increased 24%.

The most important task in the chemical industry remained the installation of new petrochemical facilities. In the transportation industry, the volume of commodity freight shipments is expected to go up 4.5%. Most solid fuel shipments by rail will be concentrated along the main rail routes leading out of the North Bohemian brown coal basin.

PRODUCTION

In building its industrial base, Czechoslovakia continued to develop the mining industry. Total output of bituminous coal, lignite, and brown coal increased 3.4 million tons since 1975, reaching 118.5 million tons in 1976. Brown coal output accounted for 3.3 million tons of the increase, reaching 86.8 million tons in 1976. The increase in brown coal production was mainly from the North Bohemian Basin, which accounts for approximately three-fourths of the country's production.

In 1976, production of iron ore (1.9 million tons) remained far below expanding national requirements. An additional estimated 15.4 million tons was imported during the year. Production of pig iron totaled 9.5 million tons in 1976, an increase of 0.22 million tons over that of 1975. Crude steel production in 1976 reached 14.7 million tons compared with 14.3 million tons in 1975.

In 1976, total production of refined copper from domestic and imported ore was estimated at 22,052 tons. Continuous production of copper was planned to start on a trial basis at Krompachy in early 1977. According to Czechoslovak sources, annual production of many nonferrous ores is to be increased considerably in the near future, as a result of prospecting.

Crude oil production in 1976 was 0.13 million tons compared with 0.14 million tons in 1975. The rapid increase in output of petroleum products was based on crude oil imported from the U.S.S.R. (17.1 million tons in 1976).

Production of natural gas increased from 929 million cubic meters in 1975 to 937 million cubic meters in 1976. In addition, 4.6 billion cubic meters of gas was imported from the U.S.S.R. In 1976, new deposits of gas with limited reserves were discovered at Dolní Dunajovice in the South Moravian Region and other places.

In 1976, the nonmetallic minerals industry in Czechoslovakia was developing production of magnesite from the Slovak deposits and of kaolin and refractory clays from newly opened deposits. Cement pro-

duction increased 2 million tons to 9.6 million tons in 1976. New deposits of fluorspar were discovered in the Ore Mountains in 1976; Czechoslovakia was expected to be self-sufficient in fluorite by 1985.

In 1976, 62.7 billion kilowatt-hours of electrical energy was produced, an increase of 3.4 billion kilowatt-hours over that of 1975. The electrical power industry was having problems in production and failed to meet plans for the installation of new capacity. To meet the consumption level of electrical energy, additional power was taken from the joint grid of the CMEA countries. The energy situation was strained in Czechoslovakia because electrical power reserves were limited and every power cut affected the pace of overall production. In 1976, eight power stations fueled by brown coal were under construction. Construction of the first 440-megawatt unit of the V–1 nuclear powerplant at Jaslovske Bohunice, which began in 1973, continued in 1976; the unit was expected to be put into operation in 1978.

[e] Estimate. [p] Preliminary. NA Not available.

[1] In addition to the commodities listed, arsenic, gold, feldspar, graphite, uranium, and a variety of additional petroleum products are also produced, but information is inadequate to make reliable estimates of output levels.

[2] This material, although reported as manganese ore, is believed to be manganiferous iron ore with a manganese content of about 17%, and as such is not equivalent to materials reported elsewhere as manganese ore, which generally contains 25% or more manganese.

[3] Includes gas produced from coal mines; gross output of natural gas is not reported, but it is believed to exceed reported marketed output by a relatively inconsequential amount.

[4] Data presented are for those products reported in official Czechoslovak sources and in United Nations publications; no estimates have been included for other products or for refinery fuel and losses.

TRADE

In 1976, Czechoslovakia's foreign trade turnover (value of exports plus imports) amounted to Kcs108,133 million, an increase of Kcs10,766 million or 11.1% over that of 1975.[5]

In 1976, the total value of exports increased to Kcs52,137 million, an increase of Kcs5,486 million or 11.8% over the 1975 level. Total imports were valued at Kcs55,996 million, an increase of Kcs5,280 million or 10.4% over those of 1975. The balance-of-trade deficit decreased 5.1% from Kcs4,065 million in 1975 to Kcs3,859 million in 1976.

The negative balance of Czechoslovak trade with market economy countries increased to Kcs3,454 million in 1976 from Kcs2,044 million in 1975, owing to a higher deficit in trade with the most advanced Western countries. The trade bal-

[5] Statisticke Prehledy (Statistics Summary), Prague. No. 6, 1977, p. 174.

ance of Czechoslovakia with other centrally planned economy countries improved considerably in 1976, decreasing from Kcs2,021 million in 1975 to only Kcs405 million in 1976.[6]

The State plan for 1977 envisaged a 6.4% increase in foreign trade turnover. Trade with market economy countries is to increase more rapidly (12.2%) than that with other centrally planned economy countries (3%). The plan also called for a greater increase in exports (7.3%) than in imports (5.5%) in order to reduce the unfavorable trade balance. The targets in relation to market economy countries are even higher: Exports are to rise 17.8% and imports 7.5%.[7]

In 1976, the principal trading partner of Czechoslovakia was the U.S.S.R., which accounted for 32.7% of Czechoslovak exports and 32.6% of Czechoslovak imports. The second largest trading partner was East Germany, which accounted for 12.2% of exports and 11.7% of imports. Poland ranked third, with 9.1% of exports and 9% of imports, followed by West Germany, with 5.3% of exports and 5.7% of imports.[8]

In 1976, exports of machinery and equipment accounted for 49.7% of the total national export value; fuels, mineral raw materials, and metals 18.7%; chemical products 4.9%; construction materials 2.1%; and other products 24.6%. The value of machinery and equipment imports amounted to 35.9% of the total import value; fuel, mineral raw materials, and metals 28.9%; chemical products 9.3%; construction materials 1.0%; and other products 24.9%.

Czechoslovakia has trade agreements with many market economy countries. In 1976, more than 130 long-term intergovernmental agreements regulated Czechoslovakia's economic relations with these countries.

The share of trade with developing countries in Czechoslovakia's total foreign trade was about 10%.[9] Czechoslovakia's principal exports to these countries are complete capital investment projects and products of the engineering industry, while its main imports are raw materials. Among the largest and most important orders was the construction of a 3-million-ton-per-year oil refinery at Başzah in Iraq. The contract for the addition of a 3-million-ton-per-year distillation unit was concluded in February 1976.[10]

The major Czechoslovak exports in 1976 included 2.7 million tons of rolled steel, 0.2 million tons of cement, 4 million tons of kaolin, 0.4 million tons of magnesite, 3.8 million tons of bituminous coal, 1.6 million tons of brown coal, and 2.1 million tons of coke. All uranium ore mined in Czechoslovakia was exported to the U.S.S.R.

In 1976, Czechoslovakia's imports from the U.S.S.R. included 12.7 million tons of iron ore, 0.8 million tons of pig iron, 2.9 million tons of bituminous coal, 4.6 billion cubic meters of natural gas, and 16.3 million tons of crude oil. Imports of nonferrous metals were mainly from the U.S.S.R., as well as from Poland, Cuba, the People's Republic of China, Yugoslavia, Iran, and India.

r Revised.

[1] Unless otherwise specified, data are partially or wholly compiled from the 1975 edition of the United Nations World Trade Annual and the 1974 edition of the United Nations Supplement to the World Trade Annual, as well as official trade statistics of selected trading partner countries (Bulgaria, East Germany, Hungary, Poland, Romania, and the U.S.S.R.).

[2] Official Czechoslovak Trade Statistics.

[3] Official U.S.S.R., Yugoslav, and Hungarian trade statistics report exports to Czechoslovakia of 97,689 tons, 29,914 tons, and 4,255 tons, respectively, in 1975.

[4] Official U.S.S.R. and Polish trade statistics report exports to Czechoslovakia of 38,910 tons and 14,690 tons, respectively, in 1975.

[5] United Nations. Statistics of World Trade in Steel, New York. 1974 and 1975.

[6] Excludes quantities from Denmark valued at $183,000 in 1974 and $107,000 in 1975.

[7] Excludes quantity valued at $51,000.

[8] Excludes quantity from the United States valued at $182,000.

[9] Excludes quantity valued at $28,000.

[10] Imports from the U.S.S.R. probably include rock salt.

[11] Official U.S.S.R. and Polish trade statistics report exports to Czechoslovakia of 160,618 tons and 92,085 tons, respectively, in 1974 and 111,699 tons and 129,135 tons, respectively, in 1975.

[12] Excludes quantities valued at $421,000 in 1974 and $157,000 in 1975.

[13] Excludes quantities valued at $51,000 in 1974 and $145,000 in 1975.

COMMODITY REVIEW

METALS

Antimony.—In 1976, the estimated metal content of mine output of antimony was 750 tons. Production of antimony is expected to increase 200% by 1980.

Antimony was mined at Dúbrava (Central Slovak Region) and Pezinok near Bratislava (West Slovak Region). In 1976, a new concentration plant came into operation near Dúbrava. Prospecting for new deposits of antimony is to be carried out in the Lesser Tatra Mountains and other areas of Slovakia.[11]

Copper.—Czechoslovakia's copper ores are mined at an annual rate of 0.7 million tons at various locations. Czechoslovakia's largest copper deposits are located in the eastern part of the Slovak Ore Mountains (East Slovak Region) and at Zlaté Hory (Moravia). Copper mining is to be expanded at the Zlaté Hory deposits and at the other mines.

New deposits of copper have been discovered in the area of L'ubietová in the Nízké Tatry Mountains. Plans are to increase domestic copper production more than 100% by 1980 and more than 300% by the year 2000.[12]

Imports of copper metal from the U.S.S.R., Poland, and the United Kingdom supplied the main requirements of Czechoslovak industry. Soviet copper deliveries totaled 41,000 tons and Polish deliveries 13,000 tons in 1976. Imports from the United Kingdom totaled 5,000 tons in 1976. Under a long-term trade agreement, Czechoslovakia was participating in the development of copper production in Poland.

Iron and Steel.—In 1976, Czechoslovakia produced 1.9 million tons of iron ore, an increase of 7.4% over that of 1975 and 19% over that of 1970.[13]

The Czechoslovak steel industry is dependent upon imported iron ore. In 1976, imports totaled 15.4 million tons. About 12.7 million tons or 82% of the total was from the U.S.S.R. The remaining 18% came from Brazil, Sweden, India, Algeria, and Liberia.

The types of iron ore supplied by the U.S.S.R. in 1976 were lump (50.3% to 50.8% iron), sinter (54.4% to 54.8% iron), and concentrate (64.5% to 65.0% iron). Some 4.5 million tons of iron ore concentrate, in the form of pellets, came from the U.S.S.R. in 1976. Czechoslovakia plans to receive 50% of its iron ore in pelletized form from the U.S.S.R. by 1990.[14]

Czechoslovakia's iron ore deposits are located in the Slovak Ore Mountains and in the Central Slovak Region. Total reserves of iron ore were estimated at approximately 400 million tons, with an average iron content of 30% to 35%.[15]

In 1976, pig iron production in Czechoslovakia totaled 9.5 million tons, an increase of 0.22 million tons or 2.4% over that of 1975. All ferroalloys were produced at the Orava ferroalloy works.[16]

Crude steel production increased 2.6% from 14.32 million tons in 1975 to 14.69 million tons in 1976.[17] This was 2.2% of total world production of crude steel. Czechoslovakia's plans for the steel industry are to reduce the number of open hearth facilities and increase the number of oxygen converters, as shown in the following tabulation, giving crude steel production in million tons:

	Actual		Planned	
	1970	1975	1980	1985
Thomas/Bessemer	0.23	0.15	--	--
Open hearth	7.84	9.19	5.08	2.65
Electric	1.34	1.56	2.22	2.64
Oxygen	2.06	3.42	9.00	12.75
Total	11.48	14.32	16.30	18.04

[11] Rude Pravo, Prague. Aug. 17, 1977, p. 2.
[12] Horník a Energetik. July 14, 1977, p. 5.
[13] Statisticka Rocenka Ceskoslovenske Socilisticke Republiky, 1977 (Statistical Annual of the Czechoslovak Socialist Republic, 1977), Prague. 1977, p. 371.
[14] Czechoslovak Foreign Trade, Prague. No. 7, July 1977, p. 33.
[15] United Nations. Survey of World Iron Ore Resources, 1955. Pp. 126–130.
[16] Czechoslovak Foreign Trade, Prague. No. 6, June 1977, p. 35.
[17] Statisticke Prehledy (Statistics Summary), Prague. No. 4, 1977, p. 106.

The share of oxygen-blown steel increased from 18% in 1970 to 24% in 1975 and is expected to reach 55% in 1980 and 71% in 1985.

In 1976, production of rolled steel was 10.78 million tons, a 3.5% increase over that of 1975. Production of steel pipe reached 1.49 million tons. Construction of a new foundry valued at Kcs712 million, with a capacity of 17,000 tons per year, continued at the Precision Engineering Works at Gottwaldov during 1976.[18]

In 1980, the ferrous metals industry is to be expanded and modernized. Pig iron production is to reach 10.5 million tons per year. Steel output is to exceed 16 million tons and output of rolled products is to reach 11.5 million tons.[19]

One of the main targets for the steel industry in the sixth 5-year plan is to concentrate the production of pig iron and steel into fewer, bigger plants.

The construction of large-volume coke oven batteries was planned at New Klement Gottwald Metallurgical Works at Kunčice, using a licensed process bought from the U.S.S.R.[20] Construction of the batteries will result in a reduction in the number of production enterprises. A large-capacity central oxygen plant with a capacity of 70,000 cubic meters of oxygen per hour is to be built during the second half of the sixth 5-year plan period. This plant is to meet the needs of two large metallurgical plants, New Klement Gottwald Metallurgical Works at Kunčice and East Slovak Iron and Steel Works at Kosice. The new oxygen plant will substantially increase the production of pig iron in existing blast furnaces.

Lead and Zinc.—Ore production in Czechoslovakia has been about 0.6 million tons per year in recent years. In 1976, lead-zinc ores were mined at Banská Štiavnica (Slovakia) and also at deep levels of mines at Příbram (Central Bohemian Region) and Kutná Hora (eastern part of the Central Bohemian Region).

In 1976, production of lead in Czechoslovakia was 4,180 tons (metal content) and production of zinc, 9,270 tons (metal content). Production of lead and zinc is expected to increase 200% and 260%, respectively, by 1980.

Imports of lead and zinc from the U.S.S.R. and Yugoslavia supplied the basic requirements of Czechoslovak industry. In 1976, imports of lead totaled 36,000 tons, including 25,000 tons from the U.S.S.R. and 6,000 tons from Yugoslavia. Imports of zinc totaled 63,000 tons, 21,000 tons of which came from the U.S.S.R., 19,000 tons from Yugoslavia, 5,000 tons each from Bulgaria and Finland, and 2,000 tons from Poland.

The Institute of Ore Research in Prague developed the plans for construction of a new lead and zinc ore dressing mill.[21]

Tin and Tungsten.—Tin and tungsten ores were mined in the Ore Mountains at Cínovec (North Bohemian Region) and at Horní Slavkov (West Bohemian Region). The cassiterite ores have a low tin and tungsten metal content. Estimated production of tin metal in 1976 was 120 tons. According to Czechoslovak sources, there are promising deposits of tin ores in Slovakia. Tin imports were estimated at 4,000 tons in 1976.

Uranium.—Czechoslovakia has substantial uranium ore deposits. Uranium production is centered at Hamr-na-Jezere (North Bohemian Region) and Příbram (Central Bohemian Region). Underground and surface uranium mines at Hamr-na-Jezere were first developed in 1966 and have been expanding since that time. Hamr-na-Jezere is expected to become an important uranium mining center.

Data on uranium ore production are unavailable. The deposits of uranium ore at Hamr-na-Jezere are considered relatively large and are expected to last through several decades of exploitation.[22] Since World War II all uranium ore has been exported to the U.S.S.R.

Reportedly, the Czechoslovak uranium industry fulfilled the first quarter plan in 1976 and is expected to fulfill the target set for the full year.[23]

NONMETALS

Cement.—Czechoslovakia has been expanding its cement production capacity; a

[18] Czechoslovak Heavy Industry, Prague. February 1977, p. 23.
[19] Hospodarske Noviny (Economic News), Prague. No. 43, 1976, p. 3.

[21] Rude Pravo, Prague. Sept. 22, 1976, p. 4.
[22] Czechoslovak Foreign Trade, Prague. No. 1, January 1977, p. 39.
[23] Horník a Energetik. No. 26, July 1, 1976, p. 3.

total of 9.55 million tons of cement was produced in 1976, a 2.7% increase over the output of 1975. In 1976, Czechoslovakia exported 188,000 tons of cement and imported 630,000 tons, mainly from the U.S.S.R. and Romania.

Construction of the new 1.2-million-ton-annual-capacity Prachovice cement plant in the East Bohemian Region continued in 1976. Construction was scheduled to be completed in 1980. The cost of the Prachovice cement plant was reported to be almost Kcs2 billion.[24]

Construction of a new 184-meter-long rotary kiln at the Maloměřice cement works at Brno with a capacity of 1,200 tons of clinker neared completion in 1976. Trial operations were planned for the beginning of 1977.

Under a 1976 agreement between Czechoslovakia and Afghanistan, a cement plant with a projected capacity of 700 tons per day of cement is to be built in the Afgan town of Herāt. The contract was valued at $22 million and falls within the framework of agreements between the two countries on economic, scientific, and technical cooperation. This is typical of Czechoslovakia's practice of exporting large industrial projects to developing countries.[25]

Fertilizer Materials.—Czechoslovakia's chemical industry produced 562,462 tons of nitrogenous and 375,666 tons of phosphatic fertilizers (nutrient content) in 1976. Production of nitrogenous fertilizer increased 13.5% over that of 1975. Production of phosphatic fertilizer decreased 5.6%.

In 1976, consumption of pure nutrients per hectare of agricultural land reached 236 kilograms. By 1980, Czechoslovakia plans to use 268 kilograms and by 1990, about 350 kilograms (nutrient content) of fertilizer per hectare. Czechoslovakia's production of nitrogenous and phosphatic fertilizers provides approximately 70% of the country's consumption; fertilizers continued to be imported from the U.S.S.R., African countries, and East Germany.

Nitrogenous fertilizer was produced at the Lovosice-Záluží chemical complex (North Bohemian Region), at the new chemical complex at Šal'a (West Slovak Region) at a rate of 450,000 tons per year, and at the chemical complex at Strážske (East Slovak Region). The new chemical complex at Šal'a makes nitrogenous fertilizer from natural gas. The important chemical complex at Strážske is expanding its variety of products with the availability of Soviet natural gas.

Phosphatic fertilizer was produced at the chemical complexes at Lovosice (North Bohemian Region), Přerov (North Moravian Region), Kolín and Ústí (Central Bohemian Region), and Bratislava (West Slovak Region). There are plans to build six ammonium polyphosphate plants, each with a capacity of 100,000 tons per year, in the near future.

Plans were made to start construction of a 360-ton-per-day ammonia unit and a 300,000-ton-per-year urea unit, both at Ostrava (North Moravian Region) in 1981. Production of phosphatic fertilizer at the Přerov complex was expected to increase considerably after completion of the new sulfuric acid line in September 1978.[26]

Magnesite.—Production of magnesite ($MgCO_3$) was approximately 0.7 million tons in 1976. Exports of magnesite to Hungary, West Germany, Poland, East Germany, and Romania totaled approximately 0.4 million tons. Substantial deposits of magnesite are located between Lučenec and Kosice in Slovakia. Deposits of amorphous magnesite are found in the South Bohemian Region.

MINERAL FUELS

Coal, mostly brown coal and lignite, has been the major source of primary energy in Czechoslovakia. Total production of primary energy derived from fossil fuels and hydroelectrical power and nuclear power generation increased from 82.2 million tons of standard coal equivalent in 1975 to 84.5 million tons in 1976. In 1976, the share of coal (bituminous, brown, and lignite) in total primary energy production was about 97.5%, crude oil 0.2%, natural gas 1.5%, and nuclear power and hydroelectrical power 0.7%. Total consumption of primary energy in Czechoslovakia increased from 109.9 million tons of standard coal equivalent in 1975 to 113.6 million tons in 1976. In 1976, coal represented 71.8% of total consumption, crude oil 21.5%, natural gas 5.6%, hydroelec-

[26] Rude Pravo, Prague. July 1, 1977, p. 2.

Table 4.—Czechoslovakia: Total primary energy balance for 1975 and 1976

(Million tons of standard coal equivalent [1])

	Total primary energy	Coal (bituminous, brown, lignite) and coke	Crude oil and petroleum products	Natural gas	Hydro-electrical power	Nuclear power	Turnover of electrical power with other countries
1975:							
Production	82.2	80.4	0.2	1.1	0.4	0.1	--
Imports	34.7	5.5	23.3	5.1	--	--	0.8
Exports	7.0	6.8	--	--	--	--	.2
Apparent consumption	109.9	79.1	23.5	6.2	.4	.1	.6
1976:							
Production	84.5	82.4	.2	1.3	.5	.1	--
Imports	37.3	5.7	25.7	5.1	--	--	.8
Exports	8.2	6.5	1.5	--	--	--	.2
Apparent consumption	113.6	81.6	24.4	6.4	.5	.1	.6

[1] 1 ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are: Hard coal 1.0, brown coal and lignite 0.6, crude oil 1.47, natural gas (per thousand cubic meters) 1.33, and hydroelectrical and nuclear power (per thousand kilowatt-hours) 0.125.

Sources: Statistical Yearbook of Czechoslovakia, Prague. 1976.
Statisticke Prehledy (Statistics Summary), Prague. No. 6, 1977, p. 170.

trical power 0.4%, nuclear power 0.1%, and imported electrical power 0.5%.

The total primary energy balances for 1975 and 1976 are shown in table 4.

In 1976, Czechoslovakia produced 62.7 billion kilowatt-hours of electrical energy, a 5.7% increase over the 59.3 billion kilowatt-hours (revised) of 1975 instead of the planned 7.2%.[27]

The planned construction of new powerplants with total capacity of 800 megawatts remained unfinished in 1976. As was stated at the third session of the Party Central Committee in September 1976, the planned parameters had not been attained in individual blocks during powerplant construction, particularly of Tušimice II and Dětmarovice, and also of the Nováky powerplants with two 110-megawatt blocks.[28]

Nuclear Energy.—The first A–1-type heavy-water nuclear powerplant at Jaslovske Bohunice was put into operation in 1972 with a target capacity of 150 megawatts.[29]

In 1976, work continued at Jaslovske Bohunice on construction of the second nuclear powerplant (V–1) using 440-megawatt-capacity reactors (Voronezh-type) with a total capacity of 880 megawatts. The first unit (440 megawatts) of the V–1 nuclear plant is to become operational in 1978. The second unit, also with a capacity of 440 megawatts, is to be put into operation in 1979. Preparations were in progress for the construction of two additional 440-megawatt units of a V–2 nuclear plant also at Jaslovske Bohunice.

Coal.—Bituminous coal production in Czechoslovakia has stabilized in recent years at around 28 million tons. In 1976, it amounted to 28.1 million tons.[30] Production is expected to remain at about 28 million tons during the remainder of the 1976–1980 period. More than 65% of the bituminous coal produced in Czechoslovakia is metallurgical quality. In 1976, bituminous coal exports (mainly to Romania, Austria, Yugoslavia, and East Germany) totaled 3.8 million tons; bituminous coal imports, supplied by the U.S.S.R. and Poland, amounted to 5.2 million tons.

In 1976, Czechoslovakia produced a total of 86.8 million tons of brown coal (up 4%) and 3.5 million tons of lower quality lignite. Brown coal exports were 1.6 million tons, and imports were 0.5 million tons. Most of the brown coal exports went to West Germany.

Coke production was 10.9 million tons in 1976, approximately the same level as in 1974 and 1975. About 2.1 million tons

[27] Czechoslovak Foreign Trade, Prague. No. 8, August 1976, p. 14.
[28] Hospodarske Noviny (Economic News), Prague. July 1, 1977, p. 7.
[29] Czechoslovak Heavy Industry. April 1976, p. 30.
[30] Page 170 of work cited in footnote 5.

of coke was exported, mainly to East Germany, Hungary, Romania, and Austria.

There are 12 principal coal mining areas in Czechoslovakia, 5 of which produce bituminous coal, 4 brown coal, and 3 lignite.

The bituminous coal areas, located along the northern border and in the west-central section of the country, are Ostrava-Karviná, Kladno, Plzeň, Trutnov, and Rosice. In 1976, about 86.3% of the bituminous coal came from the Ostrava-Karviná Basin, 8.2% from Kladno, 1.5% each from Plzeň and Trutnov, and 2.5% from Rosice. The calorific value of bituminous coal from the Ostrava-Karviná Basin is estimated at 6,400 to 8,200 kilocalories per kilogram (11,500 to 14,800 Btu per pound) and that from Kladno, 5,300 to 6,300 kilocalories per kilogram (9,300 to 11,100 Btu per pound).[31]

The major brown coal areas are located in Bohemia (North Bohemian Region and Sokolov), with smaller basins in Slovakia (Handlová and Modrý Kameň). In 1976, about 72% of the brown coal came from the North Bohemian Basin, about 21% from the Sokolov Basin, and the remainder from the Handlová and Modrý Kameň Basins. About 86% of the brown coal produced in Czechoslovakia is from strip mines. The calorific value of the brown coal in the North Bohemian Basin is estimated at 3,000 to 4,500 kilocalories per kilogram (5,400 to 8,100 Btu per pound) and in some areas as much as 5,500 kilocalories per kilogram (9,900 Btu per pound).[32]

Lignite is found mainly in the South Moravian Region and the Central Slovak Region (Nováky), with some in the West Bohemian Region. The Nováky Basin produces 1.5 million tons of lignite per year.

Coal production in Czechoslovakia is highly mechanized. In 1976, machine mining of bituminous coal in Ostrava-Karviná accounted for about 90% of the total production of coal in that area. Continuous miners produced about 90.5%, scrapers 1.3%, and plows 8.2%. Hydraulic mining was not used. About 91% of all coal was mechanically loaded. Estimated output per worker of bituminous coal in the Ostrava-Karviná Basin was 517 tons in 1976.

Mechanization at brown coal and lignite strip mines was 100%; 34% was mined by power shovels and 66% by wheel excavators. All of the brown coal and lignite output was mechanically loaded. About 20% of the overburden was removed by power shovels, 67% by wheel excavators, and 13% by chain bucket excavators.[33] Estimated output per worker of brown coal and lignite in strip mines was 3,529 tons in 1976.

Measured, indicated, and inferred reserves of bituminous coal were estimated at 4.2 billion tons (as of December 31, 1971).[34] Reserves in the category of undiscovered-speculative resources were estimated at 5.5 billion tons, and marginal reserves were estimated at 3.4 million tons. Brown coal reserves were estimated at 6.6 billion tons measured, indicated, and inferred, 2.0 billion tons undiscovered-speculative and 4.0 billion tons marginal. Total reserves of lignite were estimated at about 2.2 billion tons, of which 0.3 billion tons were measured, indicated, and inferred.

Czechoslovakia's total consumption of bituminous and brown coal in 1975 (latest data available), by consumer group, is as follows, in percent:

Consumer	Bituminous coal	Brown coal
Electric powerplants	19.7	47.6
Steam for heating and industrial use	19.0	24.4
Coke plants	50.7	--
Coal gas plants	--	3.3
Railroads	1.7	1.0
Households	3.3	9.4
Other	5.6	14.3

Source: Statisticka Rocenka Ceskoslovenske Republiky, 1976 (Statistical Annual of the Czechoslovak Socialist Republic, 1976), Prague. 1976, p. 256.

In 1976, geological investigations continued in the Central Bohemian Region, where the Slaný mine, one of the deepest coal mines in Czechoslovakia, is to be developed. Preparatory work for mining was planned to begin in 1979. After 1990, annual production is to reach 2.5 million tons of coal. The coal seams, with a workable thickness of 5 meters at Slaný, are about 1 kilometer below the surface. In the Ostrava-Karviná Basin, development of the Sverma

[31] Czechoslovatskaya Sotsialisticheskaya Respublika, I. M. Maergoiz (Czechoslovak Socialist Republic, I. M. Maergoiz), Moscow. 1964, p. 231.

coal mine (begun in 1973) continued in 1976, with completion scheduled for 1984. The reserves of this mine are estimated to include 13 million tons of coking coal.[35] During 1977–85, many other coal fields are to be developed, among which are the Čankov (West Bohemian Region), Hodonín (South Moravian Region), and Erenstat-Trojanovice (East Bohemian Region) coal fields.

Development of the brown coal industry in the North Bohemian fields continued during 1976. The new Maxim Gorkiy strip mine at Bilny, with a design capacity of 16 million tons per year, produced 2 million tons of coal. This mine is to play an important role in the development of the entire North Bohemian brown coal basin and is to be a base for the newly constructed power station at Chvaletice. The Marshal Konev mine at Dřínov in the Most area was scheduled to be closed in June 1977 to make room for the open cast Army mine.[36]

At the Sabarovice (North Bohemian Region) lignite mine, a large new excavator of 1,000-cubic-meter-per-hour capacity was put into operation to supply the electric powerplant at Ústí.

Among the most important projects in the West Bohemian Region was preparation for the development of the Jiri-3 open cast mine at Vřesová. Plans for 1976–80 include the following new mining developments in the brown coal industry, with the indicated annual capacities in million tons: Bresno, 3.6; Mercury, 0.8; Maxim Gorkiy, 6.5; Chabrovice, 1.4; and others.

The largest river transshipment point in Europe, which was under construction at Lovosice (North Bohemian Region) in 1976, is to be capable of loading and unloading 35,600 tons of coal per day.

Natural Gas.—Production of natural gas in 1976 was 937 million cubic meters, an increase of 0.9% over that of 1975. In 1976, natural gas imports from the U.S.S.R. were 4.6 billion cubic meters.

A contract for the supply of 4.5 billion cubic meters of natural gas from the U.S.S.R. in 1977 was signed in Prague in December 1976.

Work on the 562-kilometer Czechoslovak section of the Orenburg pipeline between the Soviet towns of Aleksandrov Gay and Sokhranovka continued in 1976. Preparation work also started at two compressor stations—Kalinin in Rostov Oblast and Antipovka in Volgograd Oblast, U.S.S.R. Czechoslovak workers are to construct five compressor stations on the Czechoslovak section. Some 2.8 billion cubic meters of gas per year is to be delivered to Czechoslovakia through this pipeline after 1978.

According to the agreement signed between Czechoslovakia and Iran in November 1976, Czechoslovakia is to receive 3.6 billion cubic meters of Iranian gas by way of the U.S.S.R. over a 20-year period starting in 1981.

Since commencement in 1971 of the operation of the Czechoslovak Transit Gas Pipeline, the total amount of natural gas conveyed through the pipeline from the U.S.S.R. to Western Europe and Czechoslovakia reached 30 billion cubic meters by the end of July 1976. In the first 6 months of 1976, the pipeline carried 7 billion cubic meters of natural gas. The control center of the Transit Gas Pipeline in Prague was still under construction in 1976.

Plans are to complete construction of additional pipelines for the transit of 37 billion cubic meters of natural gas per year in 1980. At the beginning of 1977, preparations are to begin on the construction of a gas pipeline, through which gas is to be delivered across Czechoslovak territory to a Western European consortium which includes Ruhrgas A.G. of West Germany, Gaz de France, and Österreichische Mineralölverwaltung A.G. (OMV) of Austria; the pipeline is to have branches running to Switzerland and Belgium.[37]

Czechoslovakia's indigenous natural gas comes mainly from the South Moravian Region (the northern part of the Vienna oil basin). During the 1976–80 5-year plan, 10 newly discovered deposits of natural gas are to be opened. Total production from the new fields is expected to be 680 million cubic meters of gas during the plan period.[38]

Petroleum.—Crude oil production in Czechoslovakia is relatively insignificant. In 1976, output of crude oil amounted to 131,000 tons, a 7.7% decrease from that of 1975.

[38] Supplement to Horník a Energetik, Prague. No. 33, Aug. 18, 1976, and No. 34, Aug. 26, 1976, pp. 1–16.

A total of 17.1 million tons of crude oil was imported in 1976, an increase of 8.2% over that of 1975. According to Czechoslovak sources, imports of crude oil in 1980 are to reach 20 million tons, instead of the originally planned 23 million tons.[39]

Indigenous oil is produced mainly in the southeastern part of the South Moravian Region and in the West Slovak Region, where intensive prospecting work continued in 1976.[40]

Crude oil was delivered from the U.S.S.R. to Czechoslovakia through the Friendship pipeline, which has been in operation almost 15 years. This pipeline starts at Almetevsk, in the Volga-Ural region of the U.S.S.R., and runs through Poland, East Germany, Czechoslovakia, and Hungary. Czechoslovakia participated in the financing of an oil pipeline from an Adriatic seaport in Yugoslavia to Czechoslovakia. Completion of this line is planned for 1978; at that time, Czechoslovakia is to receive 5 million tons of crude oil per year from African and Middle Eastern countries (Egypt, Iraq, Iran, Algeria, and Nigeria).

In 1976, Czechoslovak refineries produced approximately 17 million tons of refined petroleum products, mainly from imported oil. The total capacity of refineries was estimated at 20 million to 21 million tons per year.

The largest refinery in Czechoslovakia, the Slovnaft at Bratislava, had a capacity of about 8.5 million tons per year, and a new plant at Kralupy nad Vltavou had a capacity of about 3 million tons per year. The Slovnaft oil refinery processed about 8 million tons of crude oil in 1976; this was to be increased to 8.5 million tons in 1980. The Kralupy nad Vltavou refinery processed about 2.5 million tons of Soviet oil in 1976 and plans were to process about 3 million tons in 1980. In 1976, a new refinery was under construction in Moravia. The initial annual capacity of this refinery is to be 3 million tons in 1978, to be expanded to 6 million tons in 1980.

The Mineral Industry of Denmark and Greenland

By Joseph B. Huvos [1]

In 1976, Denmark and Greenland had to rely almost completely on fuel and mineral imports. Denmark produced modest quantities of crude oil, iron ore, diatomaceous earth, salt, and construction materials. Greenland produced a small amount of lead-zinc ore.

The gross national product (GNP) of Denmark and Greenland, reported as a total, was about $37.6 billion[2] in 1976.[3] The mineral industry's share of the GNP was about 1%. Average employment and contribution of the principal sectors of the mineral industry to the GNP in 1975 and 1976 are shown in table 1.

In 1976, the Danish Steel Works Ltd. commissioned a steel reinforcing bar plant at Helsinge near Frederiksvaerk. New nitrogen-phosphorus-potassium (NPK) fertilizer capacity was commissioned at the Fredericia and Nörresundby plants of Superfos A/S. Oil was found at the discovery well I Ruth in the North Sea, where two new drilling platforms were installed, and Danish North Sea oil leases were renegotiated. In Greenland, a new lead-zinc deposit was discovered at Greenex A/S's Marmorilik concession near Uvkussigsat; Greenmines Ltd. made a feasibility study of an iron ore deposit near Godthaab; and the Danish Government funded the further exploration of its South Greenland uranium ore deposits.

DENMARK

PRODUCTION

In 1976, production of most mineral products increased. Production of selected mineral commodities in 1974, 1975, and 1976 is detailed in table 2. The following tabulation shows the major producers of commodities in 1976:

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Cement	A/S Ålborg Portland-Cement-Fabrikk, plants at Rördal, Ålborg, F.L. Smidth & Co.	100
Iron and steel	Det Danske Staalvalsevaerk A/S, plant at Frederiksvaerk	95
Lead and zinc	Greenex A/S, mine at Marmorilik, Greenland, Cominco Ltd., Canada	100
Moler	Skarrehage Molaervaerk A/S, plants on islands of Fur and Mors	60
Petroleum	Dansk Undergrunds Consortium, Dan oilfield, Shell (40%), A.P. Moller (30%), Standard Oil of Calif. (15%), Texaco (15%)	100
Petroleum, refined	Gulf Oil Refining A/S, refinery at Stignaes, Gulf Oil, United States	41
Do	Dansk Esso A/S, refinery at Kalundborg, Standard Oil N.J., United States	31
Do	A/S Dansk Shell, refinery at Fredericia, Shell Petroleum, United Kingdom	28
Salt	Dansk Salt Co., mine at Hvornum, Kryolitselskabet Øresund A/S and Koninklijke Zout Ketjen N.V., Netherlands	100

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Sales.

[2] Excludes shipyard production of crude castings.

[3] Includes only granite and gneiss; quantity of other dimension stone is not reported, but sales volume was $258,413 in 1974; $209,878 in 1975; and $332,341 in 1976.

[4] Partial figure; excludes quartz, quartzite and flint, for which the quantities produced are not available. However, sales values were $3,008,909 in 1974; $2,806,898 in 1975; and $377,833 in 1976.

TRADE

In 1976, there was no important change in the trade pattern of Denmark and Greenland. Imports of fossil fuels, the most important commodity group, totaled about 16% of imports; exports of mineral products remained insignificant. The European countries were Denmark's main trading partners. Trade in 1974 and 1975 is shown in tables 3 and 4.

Table 3.—Denmark: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS			
Aluminum:			
Bauxite, including calcined	5,189	18,344	Netherlands 7,835; France 5,707; West Germany 2,449.
Oxide and hydroxide[1]	75	314	People's Republic of China 256.
Metal including alloys:			
Unwrought including scrap	8,993	9,362	West Germany 3,456; Sweden 1,584; Belgium-Luxembourg 1,169.

[1] Not including synthetic corundum.
[2] Including spiegeleisen, grit, sponge, powder, and shot of iron and steel.
[3] Including wire rod.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—A new reinforcing bar plant (Danstal Armering) was commissioned at Helsinge, near Frederiksvaerk, by the Danish Steel Works Ltd. (DDS) in 1976. DDS, the country's main steel producer, had expanded in 1975 into an all-electric steelmaking operation, enabling it to increase production in 1976 to 690,000 tons of crude steel. Employment increased to 2,676.[4]

Nonmetals.—*Cement and Other Nonmetallic Mineral Products.*—A/S Alborg Portland-Cement-Fabrikk, owned by F. L. Smidth & Co., operated Denmark's four cement plants, located one each at Karlstrup near Copenhagen, Lindholm near Nörresundby, Danmark, and Rordal near Alborg. The company's fifth cement plant, located at Dania near Mariager, was used to process bauxite imported from Surinam and British Guinea into calcined bauxite at a rate of 80,000 tons per year.

Various companies produced a number of nonmetallic minerals. Dansk Salt Co. continued to produce about 320,000 tons per year of rock salt by solution mining from a salt dome at Hvornum near Hobro in north Jutland. Production of building stone, sand, and gravel was estimated at 27.5 million cubic meters, including 4.5 million tons from offshore. Production of chalk and limestone, mined mainly in north and eastern Jutland and southeast Iceland, was about 3.3 million cubic meters, and that of clay, mostly on Bornholm Island, was 1.4 million cubic meters. Production of moler, a tertiary clayey diatomaceous earth, on Fur and Mors Islands was about 183,000 cubic meters; about 8,500 cubic meters of kieselguhr was produced in eastern Jutland. About 300,000 cubic meters of granite, sandstone, and slate and 25,000 tons of kaolin were mined on Bornholm Island. About 273,000 cubic meters of peat for nonfuel use was also mined in the country.

Fertilizer Materials.—In 1976, Superfos A/S, Denmark's largest fertilizer producer, expanded and modernized its Jutland fertilizer plants at Fredericia and Nörresundby; as a result, capacity was nearly doubled for producing NPK fertilizer material. Nitric acid capacity had doubled after completion of a new plant at the same location.[5] The company was cooperating with the German Veba Chemie group in a project to build a 550,000-ton-per-year ammonia plant at Brunsbüttel in Holstein, West Germany. Superfos will receive one-half of the plant's output.

Mineral Fuels.—In 1976, Denmark produced only nominal quantities of crude oil and hydroelectric power, and remained almost completely dependent on imported fuels. Use of alternative energy sources, such as imported coal, natural gas, or the building of a nuclear powerplant remained under study.

Table 5 shows supply and apparent consumption of fuel and power in Denmark and Greenland for 1975 and 1976.

Petroleum.—Refining.—Danish refining capacity was unchanged at 11.6 million tons per year in 1976. Refining facilities include A/S Dansk Shell's Fredericia plant in southeast Jutland (3.2 million tons per year capacity), Dansk Esso A/S's Kalundborg plant in northwest Zealand (3.6 million tons per year capacity), and Gulf Oil Refining A/S's Stignaes plant in southeast Zealand (4.7 million tons per year capacity).

Exploration and Development.—A discovery well, 1 Ruth, 13 kilometers southwest of the Dan Field, tested oil at a depth of 1,600 meters. During the year, there were 11 producing wells, but the total increased to 16 at yearend. Two new drilling platforms were installed in the Dan Field, raising the total to five. The Danish Undergrunds Consortium (DUC) remained the sole concessionaire in the Danish sector of the North Sea. DUC consisted of Shell (40%), A.P. Møller (30%), Standard Oil Co. of Calif. (15%), and Texaco Denmark Inc. (15%). Reserves in the Dan Field were estimated at 43 million tons of oil and 25 billion cubic meters of gas.[6]

The Ministry of Commerce renegotiated oil leases to increase production royalties and taxes and to give the Government a greater share of participation. DUC agreed to stop flaring associated gas at Dan and to submit a plan for utilizing it. The Government estimated that municipal distribution companies will require 3 billion cubic meters of gas in 1985 and 5 billion in 1995.

GREENLAND

In 1976, Greenland produced lead and zinc ore and exported crude cryolite from existing stocks. Greenmines Ltd., an exploration subsidiary of Kryolitselskabet Øresund A/S (KØAS), carried out an extensive drilling program in niobium-bearing carbonatite at Quagssiarssuk in South Greenland. The company continued feasibility studies of the Isukasik iron ore deposit east of Godthaab. Efforts to attract participation from European steel producers remained unsuccessful.

The Danish Government, in partnership with the European Economic Community (EEC), allocated funds for a drilling program at a State-owned uranium deposit, located at Kvanefjeld near Narssaq, South Greenland. The program was expected to commence in 1977.

COMMODITY REVIEW

Metals.— *Lead and Zinc.*—In 1976, for the third consecutive year, Greenex A/S operated the Black Angel mine at Marmorilik on the west coast of Greenland. 1976 production totaled 602,000 tons of raw ore containing 5.2% lead and 14.7% zinc; development work was started in the mine's cover zone. Ore reserves at yearend were valued at 3.6 million tons containing 4.9% lead and 13.9% zinc.[7] Exploration on nearby Agpat Island was fruitless, but promising mineralization was found at Uvkussigsat. Greenex was controlled 62% by Vestrgron Mines Ltd., which in turn was controlled 62% by Cominco Ltd. of Canada.

Nonmetals.— *Cryolite.*—KØAS exported 21,850 tons of refined cryolite. The refined product was produced in Copenhagen from raw ore imported from old stocks remaining in Greenland after the closing of the depleted Ivigtut mine.

Mineral Fuels.— *Petroleum.*—In 1976, a single dry hole was drilled in the Davis Straits off the west coast of Greenland in bloc No. 34. The French state-owned oil company, Elf-Erap, was the operator for the TGA-Grepco group, which held the concession. In about 180 meters of water and in favorable weather and iceberg conditions, a depth of 3,700 meters was reached. Plans for 1977 include the drilling of several holes by companies holding licenses in the area.

The Mineral Industry of Egypt

By Candice Stevens [1]

The value of Egypt's mineral production increased to approximately 15% of the 1976 gross national product (GNP) of $14 billion[2] owing largely to augmented petroleum revenues. However, Egypt's general budgetary deficit was estimated at $2.5 billion in 1976, and foreign debts totaled $11.8 billion. Expanded public and private investment in the minerals sector and increased revenues from the Suez Canal and the Arab Oil Pipeline Co.'s Suez-Mediterranean (SUMED) pipeline were expected to aid in Egypt's general economic recovery. The 1976–80 5-year plan forecasted overall development expenditures of $20 billion, with the major share coming from foreign sources. In 1976, a total of approximately $158 million was allocated to three major mineral projects: The Helwân iron and steel complex, the Naj Hammādī aluminum plant, and development of the Abu Tartûr phosphate deposits. The budget also included an allocation of $245 million for oil industry development; an additional $422 million was to be contributed by foreign partners. A mineral resource identification program was to be conducted by the U.S. Geological Survey on behalf of Egypt's General Organization for Geological Research and Mining Projects (GOGRM).

Egypt planned a further liberalization of its foreign investment policies set forth in Investment Law No. 43. Since its enactment in 1974, the law has attracted very little foreign investment in mining aside from the petroleum industry. In addition to granting a number of investment incentives, Law No. 43 protected foreign investors from property nationalization or confiscation and established free zones exempt from exchange control regulations and general taxes. New measures under consideration at yearend would minimize restrictions on holding and using foreign exchange, alter the fixed exchange rate system, establish more flexible employment policies, extend corporate tax holidays, change policies on repatriation of profits, streamline complicated bureaucratic procedures, and make the investment law retroactive to older companies.

Large quantities of foreign aid continued to underpin the Egyptian economy and new pledges of support were received in 1976. The Gulf Organization for Development in Egypt (GODE) was established in August 1976 by Saudi Arabia, Kuwait, the United Arab Emirates, and Qatar to finance Egypt's 5-year plan and provide direct budgetary support. An initial capital outlay of $2 billion was expected to be boosted to $12 billion over a 5-year period. During 1976, GODE planned to back a $250 million loan from the Chase Manhattan Bank. It was estimated that the Gulf States have extended more than $4 billion in aid to Egypt during the past 3 years.

In September 1976, the International Bank for Reconstruction and Development (IBRD), which was estimated to have nearly $700 million in loans outstanding to Egypt, formed a consultative group to coordinate Egyptian aid programs. The group was composed of about 15 countries and agencies including the United States, Japan, Western European countries, the Arab oil countries, and the International Monetary Fund (IMF). The IMF pledged to advance a number of loans totaling $600 million over a period of 3 to 4 years.

---

[1] Economist, International Data and Analysis.

[2] Where necessary, values have been converted from Egyptian pounds (£E) to U.S. dollars at the rate of £E1 = US$2.56.

The United States extended $795 million in project aid to Egypt in 1976 and expected to increase its total aid to $1 billion in 1977.

The Egyptian Government and Westinghouse Electric Corporation (United States) signed a letter of intent in 1976 for the provision of a 600-megawatt nuclear powerplant project at a cost of $325 million. The plant was to be provided as part of a 1974 agreement between the United States and Egypt, subject to approval by Congress, for the sale of two nuclear reactors. Woodward Clyde (United States), in collaboration with the Egyptian Atomic Energy Authority, was conducting economic and technical feasibility studies for the power projects. The start of a 6-year construction program for the first station at Sidi Kreir, west of Alexandria, was scheduled for 1977.

Egypt was considering a 50-year-old plan to construct a 10,000-megawatt hydroelectric powerplant in the Qattara depression, which covers an area of 19,500 square kilometers. West Germany was assisting in studies of a scheme to excavate a 76-kilometer maritime canal between the depression and the Mediterranean Sea, flood the area with seawater, and install power-generating machinery. The feasibility study was to be completed in 1977.

Egypt expected to earn more than $350 million from Suez Canal transit fees in 1977. More than 12,000 vessels, paying $200 million in passage and carrying 117 million tons of cargo, passed through the Canal in the year since its opening in June 1975. Egypt received a pledge from a number of regional and international organizations to finance $500 million in foreign exchange costs for deepening and widening the Canal. The expansion was to enable tankers weighing up to 150,000 tons fully loaded, 200,000 tons partially loaded, and 300,000 tons in ballast to transit the Canal. Penta-Ocean Construction Co., Ltd., a Japanese construction company, began expansion of the southern end of the Canal in 1976 under a $171 million contract. At yearend, Penta-Ocean signed a $112.5 million contract to widen and deepen the middle section. The reconstruction of devastated towns along the Canal and the reestablishment of infrastructure was to proceed according to master plans prepared by the British firms Bullen & Partners (for Port Said), Clifford Culpin & Partners (for Ismailia), and Sir William Halcrow & Partners (for Suez).

The construction of a new industrial and mineral port at Dekhela was in the planning stage. The new facility, which would reduce traffic at the overburdened Alexandria port, was expected to accommodate tankers of 160,000 deadweight tons and to double an anticipated initial capacity of 20 million tons per year later. Background studies and development of the master plan were under the supervision of the French Bureau Centre d'Études pour les Équipements d'Outre-Mer in conjunction with White Young and Partners (United Kingdom). Construction was tentatively scheduled to begin in 1978, with first-phase completion in 1980.

PRODUCTION AND TRADE

Petroleum continued as Egypt's major mineral commodity in 1976. Production increased 43% from 84 million barrels in 1975 to 120.2 million barrels in 1976. The return of the Sinai oilfields by Israel in late 1975 accounted for the large increase in output. Approximately 28%, or 33 million barrels, of crude oil production was exported; most of the remainder was processed in domestic refineries. Other key mineral products were phosphate, cement, fertilizer, aluminum, and steel. Egypt also produced smaller quantities of manganese, barite, gypsum, talc, and salt. Minerals produced in Egypt are shown in table 1.

Egypt had an overall balance-of-trade deficit of $3.14 billion in 1976, compared with a $2.54 billion deficit in 1975. However, crude oil exports emerged as a major foreign exchange earner and were valued at approximately $650 million in 1976. With petroleum imports valued at $315 million, Egypt had a $335 million surplus in its oil account, compared with an oil trade deficit of $75 million in 1975. Although the U.S.S.R. remained Egypt's largest trading partner, trade between the United States and Egypt exhibited a significant upward trend. U.S. imports from Egypt increased from $32.8 million in 1975

to $130 million in 1976, owing largely to a gain in oil shipments. U.S. exports to Egypt grew in value from $225 million in 1973 to more than $800 million in 1976. In addition to petroleum, important Egyptian mineral exports were phosphate rock, aluminum, iron and steel, and cement.

COMMODITY REVIEW

METALS

Aluminum.—In 1976, the new Naj Hammādī aluminum complex, situated 200 kilometers west of the Red Sea port of Safâga and 200 kilometers north of Aswān, produced approximately 55,000 tons of aluminum. About 10,000 tons was exported to the United Kingdom, West Germany, and the Netherlands. The plant, built with Soviet technical assistance, was expected to reach a full capacity of 170,000 tons by 1980. Approximately 2 billion kilowatt-hours of electric energy was supplied annually by overhead transmission lines from the Aswān power station. Alumina was imported from Guinea and the U.S.S.R. and transferred to Naj Hammādī from Safâga.

The Arab Aluminum Co. was formed in 1976 as a joint venture between Egyptian, Kuwaiti, and U.S. investors, including Tabor Metals Inc. (United States), to construct an aluminum-fabricating plant. After 5 years of operation, the plant was expected to process 8,000 tons of ingot annually for use in the manufacture of a variety of industrial, commercial, and consumer products for domestic use and export. The plant, to be located in Ismailia, was to start production in October 1977.

Iron and Steel.—The United Nations Industrial Development Organization (UNIDO) was sponsoring a study by U.S. Engineers and Consultants, a subsidiary of United States Steel Corporation, of the continuing problems of the Helwân iron and steel complex. The program was to include the installation of a computerized maintenance system for establishing a preventive maintenance schedule. The plant, built in 1958 with Soviet technical assistance, was operating at 50% capacity and averaging 500,000 tons of finished products per year. Iron ore came primarily from the Baharîya Oasis, where reserves were estimated at 195 million tons. Among the problems encountered by the Helwân complex were operational difficulties, including equipment breakdowns and a lack of spare parts, a shortage of trained technicians, and irregularities in the supply of coking coal.

Two sponge iron plants were to be constructed, utilizing natural gas from the Abu Madi and Abū Qīr Fields. The Dekhela plant, situated south of Alexandria, was to have a capacity of 1.6 million tons per year. The $200 million project was to be a joint venture of the Egyptian General Organization for Industrialization (50%), the Japanese firm C. Itoh & Co., Ltd. (25%), the West German firm Korf-Stahl A.G. (15%), and the Brazilian firm Companhia Vale do Rio Doce (10%). A second plant, requiring an investment of $125 million, was to be built at Helwân with an 800,000-ton-per-year capacity.

NONMETALS

Cement.—Egypt's cement production capacity in 1976 was approximately 4 million tons concentrated in four plants, as follows: Torah Portland Cement Co., 1.4 million tons; Helwân Portland Cement Co., 1.4 million tons; Alexandria Portland Cement Co., 500,000 tons; and National Cement Co. at Assiut, 700,000 tons. To meet a projected local cement demand of 10 million tons, plans were made for the construction of new cement plants and the expansion of existing facilities. New plants in Torah, Alexandria, Suez, Assiut, and Naj Hammādī would add 4 million tons per year to production capacity. Expansion of the four existing plants would add another 2.5 million tons to annual capacity.

Fertilizer Materials.—Egypt's production capacity for nitrogenous and phosphatic fertilizer was estimated at 1.8 million tons per year. Projected increases in capacity were expected to make Egypt self-sufficient in fertilizer production by 1979. In 1976, Cremer and Warner (United Kingdom) was contracted to act as consultant on Egypt's fertilizer projects in conjunction with the Egyptian General Organization for Chemical Industries.

Construction continued in 1976 on the Ṭalkhā and Abū Qīr ammonia-urea projects. The Ṭalkhā plant, which will use natural gas feedstock from the Abu Madi Field, was scheduled for completion in 1978. Constructed by Foster Wheeler Italiana, the plant was to produce 1,200 tons of ammonia and 1,700 tons of urea per day. The Abū Qīr project, to be constructed by Friedrich Uhde GmbH of West Germany, was also to be completed in 1978. Using natural gas from the Abū Qīr Field as feedstock, the plant was to produce 1,200 tons per day of ammonia and urea.

Cremer and Warner was to carry out preliminary studies for the Abu Zaabal triple-superphosphate complex, which was to be partially financed by the United Kingdom. The study was to include an assessment of phosphate from the West Sabaya mine and necessary beneficiation facilities. The complex was scheduled to come onstream in 1979 with a capacity of 170,000 tons per year.

Egypt planned a joint venture with Iran for the construction of a fertilizer complex at Shuqeir on the Red Sea. Projected output of the $400 million complex was 1,200 tons per day of ammonia and phosphoric acid.

Phosphates.—Phosphate production declined from 1.4 million tons in 1968 to approximately 400,000 tons in 1976 owing to the depletion of older mines at Koseir and Safaga. The 1976–80 5-year plan predicted a great increase in production through the exploitation of deposits at Abu Tartûr, Hamrawein, and El Mahâmid. Egypt's three main areas of phosphate deposition were as follows:

1. Red Sea Coast—The Red Sea area of the Eastern Desert has constituted the nucleus of phosphate mining activity with more than 15 mines at two principal locations, Safaga and Koseir. Most of these mines were expected to be depleted by 1980. However, a new phosphate-extraction facility was to come onstream at Hamrawein and produce 600,000 tons of phosphate rock per year.

2. Nile Valley—Smaller phosphate deposits extend along both sides of the Nile Valley between Isnā and Idfū, north of Aswān. Major mines included Abu Sapona, Mahamid, Owayneya, and Naṣr in the Sabaya and Gebel Abou Had areas. El Nasr Phosphate Co. completed feasibility studies on increasing production at the Mahamid mine to 450,000 tons, including 200,000 tons for export.

3. Western Desert—The most promising deposits in the Western Desert were those located at the Abu Tartûr plateau. These deposits were to be the subject of a feasibility study by Sofre-mines of France and Alusuisse of Switzerland. Discovered in 1959, the Abu Tartûr phosphate deposits were estimated to contain reserves of 1 billion tons with an average P_2O_5 content of 25.6%. The projected mine there was expected to produce 10 million tons of ore per year to be processed into 7 million tons of phosphate concentrate. Negative aspects of the deposits included the depth of overburden (170 to 288 meters), the low grade of the deposits, and the remoteness of the location. Infrastructure requirements were estimated to cost $800 million which included a city of 30,000 inhabitants, a 520-kilometer railroad, a 250-kilometer powerline, and a new port.

Gypsum.—The Ras Matarma and Ras Mallap mines, situated in Sinai territory occupied by Israel following the 1967 Arab-Israeli war, were recovered and brought into production in 1976. Reserves were estimated at 2 million tons at Ras Mallap and 15 million tons at Ras Matarma. Gypsum production was used in local cement industries and exported to Japan and Sri Lanka.

MINERAL FUELS

Natural Gas.—Egypt's natural gas reserves were estimated at 5 trillion cubic feet and were concentrated in four major fields. The Abu Madi, Abū Qīr, and Abu al-Gharādiq Fields were in various stages of development; there were no immediate plans to utilize gas associated with oil in the El Morgan Field in the Gulf of Suez.

The Abu Madi Field, situated in the Nile Delta northwest of Port Said, was operated by Delta Petroleum Co., a joint venture of Egyptian General Petroleum Corporation (EGPC) and the Italian firm Ente Nazionale Idrocarburi (ENI). The Field started production in 1974 and was expected to ultimately produce 290 million cubic feet per day of gas, which would be distributed to local industry in the Cairo area, including the Ṭalkhā fertilizer plant, an electric power station, and the Misr spinning and weaving complex.

Reserves were estimated at 1.4 trillion cubic feet.

The Abū Qīr Field, located offshore Alexandria, was operated by Western Desert Operating Petroleum Company (WEPCO), a joint venture of EGPC and Phillips Petroleum Company. In 1976, Combustion Engineering Inc. (United States) was awarded two contracts, totaling $5.3 million, to design and construct a natural gas processing system for the Field. Production, which was to supply a planned sponge iron plant, fertilizer plant, and petrochemical complex in Alexandria, was projected at 124 million cubic feet of gas and 6,000 barrels of condensate per day. Gas reserves were estimated at 1 trillion cubic feet.

The Abu al-Gharādiq Field, situated in the Western Desert, was operated by Faiyum Petroleum Company (FAPCO), a joint venture of EGPC and Amoco Egypt Oil Co., a subsidiary of Standard Oil Co. of Indiana. The Field was to produce 160 million cubic feet of gas per day, which would feed the Helwân iron and steel complex by way of a 300-kilometer pipeline. Reserves were estimated at 2.2 trillion cubic feet.

Petroleum.— *Production.*—Egypt did not become a significant petroleum producer until 1969, and began exporting crude oil in modest amounts in 1974. Total output in 1976 averaged 329,000 barrels per day, including production from the Sinai oilfields which were recovered from Israel in late 1975. This represented an increase of 43% over the 1975 production rate of 230,000 barrels per day. Targeted output of 1 million barrels per day by 1980 was expected to yield annual revenues of $1.4 billion. In 1976, a law was drafted which would set up an Egyptian General Petroleum Authority (EGPA) to replace EGPC and be responsible for oil exploration and development and for oil products distribution.

Approximately 58% (192,000 barrels per day) of Egypt's petroleum output was produced by Gulf of Suez Petroleum Company (GUPCO), which discovered and operated three offshore fields in the Gulf of Suez. GUPCO was a joint venture of EGPC and Amoco. Egypt's largest field, El Morgan, at one time produced at a rate of 350,000 barrels per day, but in 1976, output dropped to 98,000 barrels per day from 42 wells. A $40 million water-injection program was expected to result in the eventual recovery of 1,100 million barrels of crude. The July Field, 19 kilometers northwest of El Morgan, started production in 1974 at the rate of 32,000 barrels per day. Production was expected to reach 100,000 barrels per day when the Field was fully defined. GUPCO's latest field to come onstream was Ramadan, 11 kilometers northwest of El Morgan, which increased output to 40,000 barrels per day in 1976.

GUPCO planned to start commercial production from two other recent discoveries in the Gulf of Suez. Amoco and EGPC were to form a new company, Rudeis Oil Co. (RUDOCO), for the exploitation of a strike made 9 kilometers west of the July Field in the South Gharib concession area. Tests yielded a flow of 2,660 barrels per day, and a second well was planned as part of the initial development program. Production was to begin in 1977 from a second discovery, situated 32 kilometers southeast of El Morgan, which tested at a rate of 3,700 barrels per day. Plans included the construction of six wells from a single platform and a 43-kilometer, 20-inch pipeline to the expanded onshore reception facilities at Ras Shukheir.

FAPCO operated the Abu al-Gharādiq Field in the Western Desert. Production started in 1973 at the rate of 10,500 barrels per day, but dropped to 5,000 barrels per day in 1976. The gas-condensate field was linked by pipeline to the export terminal on the Mediterranean operated by WEPCO.

Nile Valley Petroleum Co. (NIPCO), the third Amoco/EGPC company, operated the al-Razzaq Field northwest of Abu al-Gharādiq. Output averaged 14,000 barrels per year in 1976, but the Field was believed capable of producing 40,000 barrels per day when completely developed.

The two other producing fields in the Western Desert, Alamein and Yidma, were operated by WEPCO. Production at Alamein reached a peak of more than 40,000 barrels per day, but declined to approximately 9,000 barrels per day in 1976. The Yidma Field, discovered in 1971 southwest of Alamein, averaged 5,000 barrels per day in 1976. WEPCO's two other oil discoveries, Meleiha and Um-

baraka, were not yet brought onstream, but development drilling was underway at Umbaraka. In 1972, Phillips assigned 30% of its interest in WEPCO's undeveloped concessions to Hispanoil, a Spanish State firm.

Seven smaller fields in the Eastern Desert were operated by The General Petroleum Company (GPC), wholly owned by the Egyptian Government. Combined output of the Ghârib, Umm-el-Yusr, Bakr, Amir, Karim, Shukheir, and Umm-el-Ayoun Fields was approximately 30,000 barrels per day.

Two groups of oilfields on the Sinai Peninsula which were returned to Egypt in 1975 after 8 years of Israeli occupation produced a combined total of about 65,000 barrels per day in 1976. In an effort to raise production to 100,000 barrels per day, the Government allocated nearly $32 million for the maintenance and repair of oil installations, including pumping stations and loading terminals. Cie. Orientale des Pétroles d'Egypte (COPE), a joint venture of EGPC and ENI, operated the main Sinai fields—Belayim, Abu Rudeis, Sidri, Feiran, and Ekma. Three smaller fields—Ras Sudr, Asl, and Matarma—were operated by GPC, approximately 40 kilometers south of Suez.

Exploration.—Egypt's massive petroleum exploration campaign continued in 1976, with more than 30 onshore and offshore concessions granted to about 24 foreign oil companies (see table 5). The production-sharing contracts provided for the companies to finance all exploration and development costs and spend a given amount on exploration over a period of up to 12 years. In the case of a commercial discovery, a joint company with a contractual lifespan of up to 30 years would be formed with EGPC. The foreign company would recover its expenses from an initial allocation of 40% of production; remaining output would be shared in various proportions with EGPC. It was anticipated that nearly $750 million would be spent on petroleum exploration in Egypt over the next 5 years.

Six general areas were opened for exploration:

1. Gulf of Suez—The Gulf of Suez Basin covers an area of approximately 20,000 square kilometers from Suez to Hurghada. Amoco was the main producer in the Gulf and planned startup of two additional fields in 1977. Transworld Petroleum, Inc. (United States), the first company to conclude a production-sharing agreement with Egypt, completed seismic work in its tract southwest of El Morgan Field and scheduled drilling of an exploratory well for 1977. Deminex (West Germany) drilled a well 12 kilometers north of Ras Shukheir and west of El Morgan. The well tested 37° API gravity low-sulfur crude at a rate of 3,700 barrels per day from two structures at depths of 8,000 and 12,000 feet. Deminex planned further drilling to determine the commercial feasibility of the discovery. A dispute between Egypt and Israel regarding sovereignty over the eastern half of the Gulf of Suez remained unresolved at yearend.

2. Red Sea—No oil discoveries have yet been made in this 25,000-square-kilometer area extending from Hurghada to the Egyptian-Sudanese border. Exxon Corp. (United States), which renewed its exploration rights in Egypt after a 25-year hiatus, held options to drill in deep or shallow water, with its share of production dependent on water depth. Exxon was in the process of drilling its first exploratory well, which was expected to reach a depth of 9,000 feet.

3. Western Desert—Continental Oil Company (Conoco) was the latest company to acquire a concession in this area which stretches south from the Mediterranean Coast between the Libyan border and the Nile Delta and totals about 400,000 square kilometers, including the offshore. In 1976, Conoco was granted prospecting rights to about 300,000 square kilometers in the southern part of the Desert. The agreement provided for an exploration period of 12 years with an exploration commitment of $30 million and a production period of 30 years.

In other leasing action, British Petroleum Company Ltd. (BP) acquired a one-half share in the 4,000-square-kilometer area held by Petroswede Oljeprospektering AB (Sweden) in the Wadi Natrum. Petrobrás Internacional S.A. (BRASPETRO) (Brazil) was reported to have struck oil in an area near the Sakkara Pyramid.

4. Nile Delta—The Nile Delta, an area covering 36,000 square kilometers including the offshore, has yielded two gasfields but little oil. In 1976, a Conoco joint

Table 4.—Egypt: Oilfields, 1976

venture tested the Qantara No. 1 well at 2,635 barrels per day of oil and 13 million cubic feet per day of gas at a depth of 10,200 feet. The discovery, situated in the northern delta 6 kilometers west of the Suez Canal, was to be further evaluated by the members of the joint venture, International Egyptian Oil Co. (I.E.O.C.) (50%), Conoco (25%), and Marathon Petroleum Egypt, Ltd. (25%).

5. Nile Basin—Few discoveries were made in the Nile Basin, a 100,000-square-kilometer area bounded to the west by the Kharga-Wadi El Rayan uplift and to the east by the Red Sea Hills. The Santa Fe International Corp. (United States) oil and gas concession was completing its first exploratory well at a depth of 12,500 feet at yearend. Membership in the venture was changed to Santa Fe 35%, Central Energy Development Co. (Japan) 25%, Bow Valley Industries (Canada) 20%, and Cities Service Oil Company 20%.

6. North Sinai—The northern portion of the Sinai Peninsula down to the latitude of Suez and including the Mediterranean offshore area encompassed a total area of 40,000 square kilometers. In November 1976, Egypt concluded agreements with Conoco, Gulf Oil Company, and a Total/AGIP S.p.A. joint venture for exploration in this territory, which was recovered from Israel after the 1973 Arab-Israeli war. Formal conclusion of the three agreements, covering seven blocks with a total area of 8,400 square kilometers, awaited a United Nations decision regarding exploration rights in the Egyptian-Israeli buffer zone. Egypt was negotiating with other companies regarding exploration in five other blocks in North Sinai totaling 6,000 square kilometers.

Refining.—Egypt's petroleum refining capacity was estimated at 255,000 barrels per day (13 million tons per year) in 1976. Total throughput was approximately 200,000 barrels per day, compared with 150,000 barrels per day in 1975. Egypt continued to expand its refining capacity by repairing and recommissioning the two Suez refineries damaged in the 1967 war and expanding other facilities.

GUPCO operated three refineries: The Suez refinery, where capacity was restored to 37,000 barrels per day after the war; the Musturud refinery near Cairo, which was expanded to refine 67,000 barrels per day; and the Tanta refinery in the Nile Delta with a 37,000-barrel-per-day capacity. Naşr Petroleum Co. operated two refineries, one in Suez where capacity was restored to 32,000 barrels per day and one in Amreya which came onstream in 1972 with a capacity of 23,000 barrels per day, later expanded to 32,000 barrels per day. Alexandria Petroleum Co. operated a single refinery at Alexandria with a 50,000-barrel-per-day capacity. Plans for the construction of a $400 million, 250,000-barrel-per-day export refinery in the Alexandria free zone were under consideration.

In 1976, EGPC contracted Montedison S.p.A. (Italy) for the construction of a $400 million petrochemical complex in Alexandria. The proposed complex, in which EGPC would have a 75% interest, was to produce 100,000 tons of low-density polyethylene, 30,000 tons of high-density polyethylene, and 60,000 tons of polyvinyl chloride per year.

Pipelines.—Experimental testing of the $500 million SUMED oil pipeline began in mid-December 1976. The SUMED system consisted of two 320-kilometer, 42-inch pipelines with a combined capacity of 1.6 million barrels per day (80 million tons per year). The pipeline, which was to supply Mediterranean ports with Middle East crude oil, was operated by Arab Petroleum Pipeline Co., owned by Egypt (50%), Saudi Arabia (15%), Kuwait (15%), the United Arab Emirates (15%), and Qatar (5%). Construction was by an Italian consortium sponsored by Montaggi Materiali Tubolari S.p.A. (Montubi) and including SAIPEM S.p.A. and SNAM Progetti, S.p.A., subsidiaries of ENI. Bechtel Corp. (United States) acted as technical adviser. Two terminals, Ain Sukhna on the Gulf of Suez and Sidi Kreir on the Mediterranean, were being expanded to accommodate tankers of up to 250,000 deadweight tons.

The basic transit fee for SUMED was set at $1.60 per ton of oil in addition to a 25¢-per-ton charge for deballasting water. Mobil Oil Corp. signed a 10-year agreement (to begin in 1977) that provides for the throughput of 5 million tons of oil per year during the first 5 years and 10 million tons per year during the second 5 years. SUMED also had letters of intent from Exxon for 5.0 million to 7.5 million tons per year from 1977 to 1980, and Petrofina, S.A., of Belgium for 3 million to 5 million tons per year.

Table 5.—Exploration agreements finalized between EGPC and foreign companies in 1976

Location	Foreign company	Date of agreement	Acreage (square kilometers)	Bonuses (millions)		Exploration commitments	Production sharing [1] (percent)
				Signature	Production		
Gulf of Suez	Amoco	July 1974	100 (South Ghârib)	$3	$7	$2,000,000 for 2 years	80–20

[1] Percentage of production sharing between EGPC (first figure) and foreign company (second figure), after allocation of 40% of production to cover the latter's costs.

[2] Egyptian Petroleum Development Co.

A new pipeline to supply Cairo and Suez with oil from offshore fields in the Gulf of Suez was to be partially financed by the Kuwait Development Fund and operated by the State-owned Petroleum Pipelines Co. The $70 million pipeline, which was to start 30 kilometers offshore from Ras Shukheir, was to have an initial capacity of 8 million tons per year, expandable to 12 million tons per year.

The Mineral Industry of Finland

By Joseph B. Huvos [1]

A moderate-size producer of mineral commodities, Finland had no domestic energy sources besides some hydroelectric power, fuelwood, and peat. The country's most important mineral products in 1976, with approximate percentages of the world total, were as follows: Vanadium, 6.2%; cobalt metal, 4.7%; refined zinc, 2.2%; chromite, 2.0%; refined nickel, 0.9%; and mine copper, 0.5%. Other commodities of continuing national importance were iron and steel, cement, feldspar, fertilizer materials, talc, and wollastonite.

The country's gross national product (GNP) was $28.8 billion [2] in 1976.[3] Mining and quarrying contributed $111 million or 0.4% of the total; the minerals industry, including processing of minerals into products, contributed an estimated 4%. Employment was about 6,000 in mining and quarrying and an estimated 80,000 for the minerals industry as a whole, including processing.

The country's inflation rate and trade deficit decreased to 15% and $270 million, respectively, while unemployment increased to 4% in 1976.

Significant developments in Finland's mineral industry in 1976 included the commissioning of Outokumpu Oy's stainless steel plant at Tornio on the Gulf of Bothnia and of the company's ore mill at the Pyhälsami, Phyäjärvi mine; Rautaruukki Oy's steelwork expansion at Raahe on the Baltic Sea; and construction of United Paper Mill's peat-fired powerplant at Simpele on Finland's western border. Trial runs started at Rautaruukki Oy's Mustavaara vanadium mine in central Finland. Construction continued on four Government-controlled nuclear powerplants and on Outokumpu's chromium mine at Kemi near Tornio. Decisions were made to terminate nickel ore production at Outokumpu's Vuonos mine near Outokumpu and sulfur production at Kokkola on the Baltic Sea.

PRODUCTION

Volume indices of production for the principal sectors of the mineral industry and the country's industry as a whole are shown in the following tabulation:

Sector	1970=100	
	1975	1976 [p]
Mining and quarrying	97	111
Nonmetallic mineral processing	134	127
Iron and steel	133	138
Nonferrous metals	106	109
Petroleum refining	113	143
Industrial chemicals	159	139
All industry	121	124

[p] Preliminary.

TRADE

There was no significant change in the pattern of Finland's foreign trade in 1976. The principal mineral commodities exported, going mainly to Western Europe, were iron and steel, cobalt, copper, nickel, vanadium, zinc, asbestos, feldspar, and talc. Mineral commodity imports, of which fuels and power were 60%, were valued at about one-third of all imports. Finland's mineral commodity trade in 1974 and 1975 is shown in tables 2 and 3.

COMMODITY REVIEW

METALS

In 1976, Finland operated 13 metal mines, including 9 that were controlled by Outokumpu Oy, 3 by Rautaruukki Oy, and 1 by Myllykoski Oy. Products extracted from ores mined included cadmium, copper, cobalt, iron, lead, nickel, precious metals, selenium, sulfur, and vanadium. Government-controlled Outokumpu Oy's production of base metal concentrates, and metal content, in thousand tons, was as follows:

Mine	Metal content of mine output (thousand tons)					
	Copper	Cobalt	Nickel	Lead	Zinc	Pyrite
Outokumpu-Keretti	1.2	1.2	--	--	1.1	--
Outokumpu-Vuonos	9.4	--	1.0	--	2.5	--
Hammaslahti	4.7	--	--	--	--	--
Vihanti	3.7	--	1.1	--	35.6	--
Kotalahti	1.0	--	3.5	--	--	--
Virtasalmi	2.0	--	--	--	--	--
Pyhäsalmi	5.3	--	--	--	20.1	372
Hitura	--	--	1.2	--	--	--
Vammala (exploratory)	--	--	.4	--	--	--

Source: Outokumpu Oy. Annual Report, 1976, p. 22.

Chromium.—In 1976, chromite production increased significantly at Outokumpu Oy's Kemi mine near Tornio, where mining activity continued to shift increasingly to the Viianlahti-Viiaranta ore body. The mine produced chromium ore concentrate and some foundry sand. Some of the chromite concentrate produced at Kemi was processed into ferrochrome at the company's Tornio plant, but some chromite was also exported. Some of the ferrochrome produced at Tornio was processed into stainless steel at Outokumpu's stainless steel plant completed during 1976 at the same location.

Cobalt.—In 1976, cobalt concentrate from Outokumpu Oy's Outokumpu-Vuonos and Outokumpu-Keretti mines was processed at the company's Kokkola metallurgical works on the Gulf of Bothnia.

Copper, Lead, Nickel, and Zinc.—In 1976, an additional 200,000-ton-per-year ore mill was commissioned at Outokumpu Oy's Pyhäsalmi, Pyhäjärvi copper-zinc-pyrite mine, and work continued at the Kokkola smelter on the company's powerplant project designed to supply low-pressure steam for heating the town of Kokkola. It was decided to discontinue nickel production at the company's Vuonos mine in 1977 and use the concentrator for processing Oy Lohja AB's Polinjärvi talc ore, yielding some nickel concentrate byproduct to be sent to the company's Harjavalta smelter. Opencast mining was ended at Hammaslahti during the year, but mining continued underground. Investigation of the Isoaho ore body proceeded at Vihanti near Raahe, while exploratory mining at the Vammala mine in the southwest went underground. It was decided to terminate uneconomical sulfur production at Kokkola in 1977.

In 1976, Outokumpu Oy continued to operate nine complex metal sulfide ore mines, one of them exploratory. Myllykoski Oy operated the Luikonlahti mine also near Outokumpu, accounting for 10% of Finnish copper output. Smelting and refining of copper and nickel concentrates was in the hands of Outokumpu Oy, at the Harjavalta and Pori refineries in southwest Finland. Domestic and imported zinc concentrates were refined at the company's Kokkola zinc works.

Iron Ore.—In 1976, Government-controlled Rautaruukki Oy's Rautavaara mine in Finnish Lapland completed its first full year of operation, thus filling the gap created by the closing of the company's Raajärvi mine. Development of the company's Mustavaara mine resulted in trial runs and some production. In addition, the company operated the Otanmäki mine in central Finland. These three mines were the only iron mines operating in Finland during the year.

Iron and Steel.—In the framework of

"Programme 1500," a long-term expansion program for the steel industry approved in 1970, capacity of Rautaruukki Oy's Raahe steelworks, near the northern end of the Gulf of Bothnia, increased to 1.7 million tons per year after the company's No. 1 blast furnace went back into service. The furnace was taken out of service for relining when the No. 2 furnace was commissioned in 1975. In the company's converter shop, a third basic oxygen converter was installed; in the rolling mill a new plate mill was commissioned, hot rolling of steel slabs was started, and the company's continuous-casting plant was expanded. Various improvements were added to the Hämeenlinna rolling mill located near Helsinki, and work started on the Oulainen spiral welded pipe mill near Raahe.

Another important event of the iron and steel industry in 1976 was the commissioning of Outokumpu Oy's stainless steel plant at Tornio.

In 1976, about half of Finland's pig iron and steel was still produced by Rautaruukki Oy's integrated steel plant at Raahe; the rest came from plants of the Ovako Group located at Immatra on the U.S.S.R. border, and at Turku and Koverhar in the southwest.

Titanium.—Rautaruukki Oy's iron ore mine at Otanmäki in central Finland produced byproduct titanium concentrate that was sold to Kemira Oy for processing into titanium dioxide at its Pori plant on the west coast.

Vanadium.—Development of Rautaruukki Oy's Mustavaara, Suomussalmi, vanadium mine advanced to such a level that trial runs could begin in 1976. When fully developed, the mine is to produce 3,000 tons of vanadium pentoxide and 200,000 tons of iron concentrate per year. Farther south, the company's Otanmäki, Vuolijoki, mine continued production of vanadium pentoxide in 1976.

NONMETALS

Cement, feldspar, fertilizer materials, limestone, pyrite, quartz, sulfur, talc, and wollastonite were the main nonmetallic minerals produced in Finland in 1976.

Fertilizer Materials.—Executive committees of the Ministry for Trade and Industry recommended continuation of two phosphate ore research and development projects: Rautaruukki Oy's Sokli (Savukoski, Lapland) phosphate ore project, and Kemira Oy's Siilinjärvi (Kuopio Province) apatite project.

In recent years, the U.S.S.R. has reduced phosphate rock exports to Finland making the country's domestic phosphate development projects more urgent. In the meantime, the development of mines has been postponed because of softening of phosphate prices. Kemira Oy, the country's largest fertilizer and chemical company, produced phosphoric acid and ammonia (200,000 tons per year) at Oulu on the west coast, and compound fertilizers at Kokkola, also on the west coast.

Pyrite and Sulfur.—Because of rising production costs and lower market prices, Outokumpu Oy decided to terminate production of byproduct sulfur and roasted pyrite from its pyrite ore. The company remained the country's only producer of sulfuric acid, partly from its smelter waste gases.

MINERAL FUELS

Heavily dependent on imported oil, Finland produced only a moderate amount of hydropower, fuelwood, and peat, supplying about one-seventh of the country's needs. The balance was supplied by imported crude oil and petroleum products, natural gas, coal, and coke. Table 4 shows supply and apparent consumption of fuel and power in Finland in 1975 and 1976.

Nuclear and Hydroelectric Power.—Construction continued on four nuclear powerplants: Two units of 660,000 kilowatts each at Olkiluoto on the west coast and two units of 440,000 kilowatts each at Loviisa on the south coast. Teollisuuden Voima Oy, the State industrial power company, contracted for the 660,000-kilowatt plants with Atomenergi, A.B. of Stockholm and for the 440,000-kilowatt plants with the U.S.S.R. Hydroelectric power supplied about 6% of the country's energy. Less than one-third of all electric power generated was hydroelectric. Only 60% of Finland's exploitable waterpower has been utilized. Development of the remaining resources has not been considered economical.

Peat.—In 1976, the country's first peat-fired powerplant was commissioned at the United Paper Mill in Simpele on the southeast border. Finland reportedly has

Table 4.—Finland: Supply and apparent consumption of fuels and power for 1975 and 1976

(Million tons of standard coal equivalent [1])

some of the world's largest exploitable peat resources, estimated at 2.5 to 3.5 billion tons of standard coal equivalent (SCE).[4] By 1980, peat is expected to provide 5% of the country's energy needs, and is to be used mostly in smaller powerplants of local significance.

Petroleum and Natural Gas.—Government-owned Neste Oy remained the country's sole oil company. Its two refineries, having a total capacity of 15 million tons per year, were located at Porvoo on the south coast and Naantali on the southwest coast. About two-thirds of all crude oil was imported from the U.S.S.R., the rest came mostly from Saudi Arabia. All natural gas was imported from the U.S.S.R.

The Mineral Industry of France

By Roman V. Sondermayer [1]

France produced only moderate amounts of domestic crude minerals but remained a significant processor of imported mineral commodities during 1976. However, the value of extracted minerals in France was significant to certain local areas in terms of their economic well-being and the employment provided.

The most prominent minerals and metals produced in France during 1976, with production expressed as approximate percentage of the world total, were as follows: Arsenic 23%; fluorspar 15%; diatomite 12%; gypsum 9%; uranium 8%; potash 7%; bromine and magnesium each 6%; carbon black, iron ore (gross weight), lead metal, lime, and talc each 5%; alumina, cobalt metal, cement, pig iron, salt, and zinc metal each 4%; and aluminum, anthracite, bauxite, cadmium, iron ore (iron content), and steel each 3%.

Principal events in the mineral industry included: Discovery of new lead-zinc-copper deposits in Brittany, initial operation of a pilot plant for production of alumina from clay, startup of a new steel blooming plant and a new zinc roasting plant, and closure of a potash mine and plant.

PRODUCTION

A general downward trend in production reflected economic problems in the country. Table 1 shows the latest figures on French mineral production. Both private companies and the Government, through State-owned corporations, produced mineral commodities at home and abroad. The Bureau de Recherches Géologiques et Minières (BRGM) was an important instrument of the Government in securing raw materials for the domestic economy by exploration and ventures abroad. The following tabulation shows major firms in the mineral industry and percent of domestic output:

[1] Physical scientist, International Data and Analysis.

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Alumina	Aluminium Péchiney, plant at Gardanne, Péchiney Ugine Kuhlmann (PUK) 100%	100
Aluminum	Aluminium Péchiney, 10 plants, largest at Noguères, PUK	100
Bauxite	Aluminium Péchiney, mines at Var, PUK 100%	70
Cement	Ciments Lafarge, 19 plants, largest at Saint Pierre	26
Do	Société des Ciments Français, 37 plants, largest at Airvault	25
Do	Société Anonyme des Ciments Vicat, 11 plants, largest at Montalieu-Bourvesse	24
Coal, lignite	Charbonnages de France, mines in northeast and north France, Government 100%	98
Copper	Compagnie Générale d'Electrolyse du Palais, electrolytic plant at Palais, Metallurgie Hoboken-Overpelt S.A. (Belgium)	97
Ferroalloys	Aciéries de Paris et d'Outreau, plants at Outreau and La Plaine-Saint-Denis, U.S. Steel Corporation	60
Do	Société Française d'Electrometallurgie, plants at Bellegarde and Aiguebelle-Montricher, PUK	20
Iron ore	Sacilor Aciéries et Laminoirs de Lorraine (SACILOR), mines in Moselle Department, public 45% and Compagnie Lorraine Industrielle et Financière 27%	40
Lead ore	Société Minière et Métallurgique de Peñarroya, mines at Malines and Largentière, Imetal SA 58.6%	99
Lead, smelter	Peñarroya, Imperial smelter at Noyelles-Godault, Imetal SA 58.6%	100
Natural gas	Société Nationale Elf Aquitaine (SNEA), gasfields near Lacq	40
Nickel	Société le Nickel (SLN), nickel refinery at Le Havre, Imetal SA 50% and SNAP 50%	100
Petroleum, crude	SNEA, oilfield east of Paris	90
Petroleum, refined	Compagnie Française de Raffinage (CFR), 3 refineries, largest at Gonfreville	23
Do	Shell Française, 3 refineries, largest at Petit Couronne	21
Do	SNEA, 3 refineries, largest at Feyzin	12
Potash	Mines de Potasse d'Alsace, mines near Mulhouse, Government 100%	100
Steel, crude	Union Sidérurgique du Nord et de l'Est de la France (USINOR), plant at Dunkerque, Denain Nord-Est Longwy 63%	37
Do	SACILOR, iron and steel plant at Boussange, public 45% and Compagnie Lorraine Industrielle et Financière 27%	28
Tungsten	Société Minière d'Anglade, mines at Salau	90
Uranium ore	Commissariat a l'Énergie Atomique (CEA), mine at La Crouzille, Government 100%	61
Uranium, yellow cake	Société Industrielle des Minerais de l'Ouest (SIMO), 3 plants, largest at Bessines	86
Zinc ore	Peñarroya, mines at Largentière, Malines, and Saint Salvy, Imetal SA 58.6%	95
Zinc, smelter	Société des Mines et Fonderies de Zinc de la Vieille Montagne, electrolytic refinery at Viviez, Société Générale de Belgique S.A. (Belgium)	37
Do	Compagnie Royale Asturiennes des Mines (RAM), plant at Auby, RAM (Belgium)	34

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Includes smectic clay.

[2] Consists of material for the ceramic and glass industries and reportedly contains pegmatite.

[3] Data include quantity for glass industry as well as for ceramic use.

[4] Excludes bituminous material.

TRADE

During 1975, the latest year for which complete data were available, imports of minerals valued at $18.4 billion were 34% of the country's total imports. Fuels, mainly petroleum, accounted for 67% of mineral imports. The Middle East supplied crude oil and European countries were the major suppliers of metals. Exports of mineral commodities, largely to countries in Europe, were valued at $7.3 billion, 14% of total exports of France. Tables 2 and 3 show details on foreign trade of France.

Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS—Continued			
Titanium—Continued			
Metal, all forms	786	432	United Kingdom 154; Italy 100; West Germany 48.
Tungsten:			
Ore	1,067	1,398	West Germany 1,282.
Oxide	20	1	NA.
Metal, all forms	602	278	West Germany 109; United States 55.
Zinc:			
Ore	18,939	17,361	Italy 16,760.
Matte	1,005	1,100	West Germany 398; United Kingdom 318; Italy 147.
Oxide	NA	NA	
Metal including alloys:			
Scrap	1,276	2,847	Belgium-Luxembourg 1,620; Italy 665; West Germany 409.
Dust (blue powder)	5,889	2,739	Poland 1,114; Norway 416; Belgium-Luxembourg 348; Switzerland 282.
Slab and ingot	29,425	18,089	West Germany 4,522; United States 3,176.
Semimanufactures	24,549	25,693	West Germany 9,032; Belgium-Luxembourg 8,278.
Zirconium:			
Ore	3,779	798	Italy 644.
Oxide	191	126	West Germany 33; Spain 28.
Metal including nuclear grade	239	184	United States 100; Sweden 35.
Other:			
Ores and concentrates	4,067	135	NA.
Ash and residue from nonferrous metals:			
Aluminum	8,499	6,740	Italy 5,344; West Germany 827.
Copper	10,682	8,758	Belgium-Luxembourg 4,870; West Germany 2,268.
Lead	9,051	4,172	Belgium-Luxembourg 3,983.
Nickel	638	452	West Germany 256; Netherlands 96.
Zinc	12,964	9,632	Belgium-Luxembourg 5,234; West Germany 1,942; Sweden 1,783.
Other	24,050	19,629	Belgium-Luxembourg 11,118; Sweden 6,087; West Germany 1,052.
Ashes, sweepings, and other residues of platinum, silver, and other precious metals	2,019	146	United Kingdom 22; West Germany 17.
Slag and ash, n.e.s	45,240	84,643	West Germany 49,043; Belgium-Luxembourg 34,068.
Metals including alloys, all forms [5]	356	377	West Germany 146; Yugoslavia 130; Belgium-Luxembourg 56.
NONMETALS			
Abrasives, natural:			
Pumice, emery, other	2,011	341	NA.
Dust and powder of precious and semi-precious stones ----value, thousands [2]	$673	$549	Spain $274; Switzerland $150; Netherlands $90.
Grinding and polishing wheels	4,163	4,079	West Germany 541; Belgium-Luxembourg 508; Italy 500.
Asbestos, crude	317	2,050	Pakistan 637; Senegal 350.
Barite and witherite	25,217	22,552	Gabon 6,379; Italy 4,773; Belgium-Luxembourg 2,314.
Borates, natural	1,806	503	NA.
Cement ----------thousand tons	2,218	2,103	Ivory Coast 362; Algeria 339; West Germany 272.
Chalk	478,215	427,554	West Germany 182,175; Belgium-Luxembourg 85,036.
Clays and clay products (including all refractory brick):			
Crude:			
Kaolin	135,397	110,954	West Germany 57,761; Italy 22,631.
Bentonite	3,564	7,182	Algeria 1,908; West Germany 982.
Refractory	3,160	2,338	West Germany 1,880.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
NONMETALS—Continued			
Clays and clay products (including all refractory brick)—Continued			
Crude—Continued			
Other	604,757	247,584	Italy 126,120; West Germany 47,952; Belgium-Luxembourg 29,940.
Products, refractory (including nonclay brick)	482,191	478,463	West Germany 159,333; Belgium-Luxembourg 106,966.
Corundum:			
Natural including emery (included in Abrasives above)	433	396	Algeria 107.
Artificial	23,940	17,345	Italy 3,097; Belgium-Luxembourg 2,805; Austria 2,651; West Germany 2,000.
Cryolite and chiolite, natural	NA	445	NA.
Diamond:			
Industrial, excluding powder value, thousands [2]	$837	$1,222	Ireland $507; Belgium-Luxembourg $470.
Gem, unset ---do---	$18,143	$17,808	Switzerland $8,526; Netherlands $3,246; United States $2,020.
Diatomite	19,428	18,186	West Germany 8,777; Belgium-Luxembourg 2,998.
Feldspar	43,153	38,362	Belgium-Luxembourg 16,329; Spain 10,726; West Germany 6,560.
Fertilizer materials:			
Crude:			
Nitrogenous (natural sodium nitrates)	515	2	NA.
Phosphate rock	3,972	3,704	NA.
Potassic salts	24,148	11,994	Belgium-Luxembourg 10,620.
Organic	26,363	23,036	Switzerland 13,832; Belgium-Luxembourg 3,383; Spain 2,438.
Manufactured:			
Nitrogenous ---thousand tons---	559	575	Egypt 123; Belgium-Luxembourg 95; West Germany 90.
Phosphatic:			
Basic slag ---do---	286	198	Switzerland 105; Austria 45; Italy 44.
Other ---do---	124	100	Indonesia 20; Bangladesh 17; U.S.S.R. 15.
Potassic ---do---	789	742	Belgium-Luxembourg 333.
Ammonia, anhydrous ---do---	207	259	West Germany 104; Spain 35.
Flint (pebbles)	120,512	89,548	West Germany 26,037; United Kingdom 20,271; Belgium-Luxembourg 15,566.
Fluorspar	146,743	109,337	West Germany 71,676; Italy 12,059.
Graphite	1,079	589	Spain 142.
Gypsum and anhydrite, including plaster thousand tons	1,254	1,068	Belgium-Luxembourg 463; West Germany 185; Netherlands 177.
Iodine	14	61	United Kingdom 42.
Lime	398,602	236,133	Belgium-Luxembourg 105,305; West Germany 92,286.
Magnesite including calcined	664	516	NA.
Mica	2,967	2,746	United Kingdom 1,141; West Germany 513; Belgium-Luxembourg 304.
Pigments, mineral, including iron oxide	2,143	2,064	NA.
Pozzolan, santorin, etc	29,304	2,081	NA.
Precious and semiprecious stones, except diamond [6] ---value, thousands [2]	$20,768	$22,886	Switzerland $14,169.
Pyrite, gross weight	36	75	NA.
Salt	236,916	106,899	West Germany 47,311; Belgium-Luxembourg 21,193; Sweden 11,760.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	566,828	355,474	Australia 84,441; Guinea 62,368; Yugoslavia 41,269.
Caustic potash and peroxides of potassium and sodium	19,141	6,568	United Kingdom 928; Brazil 760.

See footnotes at end of table.

Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
NONMETALS—Continued			
Stone, sand and gravel: [7]			
Building stone:			
Crude and partly worked, n.e.s	113,336	103,160	Belgium-Luxembourg 59,984; West Germany 19,505.
Worked:			
Slate including crude	48,486	39,741	Netherlands 22,074; Belgium-Luxembourg 10,476.
Not specified	14,429	13,114	Belgium-Luxembourg 7,230; West Germany 3,530.
Dolomite, chiefly refractory grade	90,156	44,863	Belgium-Luxembourg 15,017; West Germany 12,265.
Gravel and crushed stone—thousand tons	12,676	11,921	West Germany 8,965; Switzerland 1,387.
Limestone (except dimension)	236,906	174,589	West Germany 88,339; Belgium-Luxembourg 83,312.
Quartz and quartzite	5,299	8,733	Belgium-Luxembourg 7,920.
Sand excluding metal bearing thousand tons	3,666	3,522	West Germany 2,004; Switzerland 666; Italy 537.
Sulfur, elemental ——do	871	539	United Kingdom 234.
Talc and steatite	76,432	63,397	West Germany 15,266; United Kingdom 11,601.
Other nonmetals, n.e.s.:			
Crude	277,353	263,020	Switzerland 240,095.
Slag, dross, and similar waste, not metal bearing, from iron and steel manufacture—thousand tons	1,161	1,021	West Germany 603; Belgium-Luxembourg 296.
Oxides and hydroxides of magnesium, strontium, barium	8,514	7,253	U.S.S.R. 3,265; West Germany 928.
Fluorine	1	23	NA.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	10,465	27,082	Belgium-Luxembourg 19,465; United Kingdom 6,645.
Carbon black	40,496	37,255	Spain 8,995; West Germany 8,357; Italy 5,841.
Coal and briquets:			
Bituminous	638,226	552,420	West Germany 329,088; Belgium-Luxembourg 115,598.
Briquets of bituminous coal	77,214	85,354	United Kingdom 61,725.
Lignite and lignite briquets	26,247	14,999	Spain 14,986.
Coke —thousand tons	1,013	719	Belgium-Luxembourg 233; West Germany 125.
Gas, natural —million cubic feet	4,485	5,372	Switzerland 2,763; Belgium-Luxembourg 2,598.
Hydrogen, helium, rare gases	798	935	Switzerland 491; Italy 156.
Peat including briquets	3,092	NA	
Petroleum refinery products:			
Gasoline —thousand 42-gallon barrels	21,046	15,785	Switzerland 4,607; West Germany 4,225; United Kingdom 2,924.
Kerosine and jet fuel ——do	5,532	7,270	Switzerland 2,573; West Germany 1,558; United Kingdom 984.
Distillate fuel oil ——do	28,438	26,841	West Germany 9,101; Switzerland 8,758.
Residual fuel oil ——do	15,271	21,345	West Germany 4,569; Italy 4,289; Sweden 2,897.
Lubricants ——do	3,267	2,771	Belgium-Luxembourg 473; United Kingdom 473; Netherlands 360.
Other:			
Liquefied petroleum gas ——do	6,622	5,881	Spain 2,900; Portugal 708.
Bitumen, petroleum coke, other residues ——do	3,005	2,479	West Germany 1,315; Switzerland 709.
Chemical derivatives of coal, petroleum, or gas	221,021	193,746	West Germany 124,479.

NA Not available.

[1] Excludes artificial corundum.

[2] Based on exchange rate of 4.8099 francs per U.S. dollar in 1974 and 4.80 francs per U.S. dollar in 1975.

[3] Includes indium and thallium.

[4] Including cast iron and shot, grit, powder, and sponge of iron and steel.

[5] Alkali, alkaline earth, and rare-earth metals except sodium and mercury.

[6] Including synthetic and reconstituted stone, but not including diamond.

[7] Not including slate, flint, or industrial limestone.

Table 3.—France: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS			
Aluminum:			
Bauxite	1,012,251	1,456,000	Guinea 655,112; Australia 557,836.
Oxide and hydroxide [1]	14,162	15,708	West Germany 7,545; Netherlands 2,689; United States 2,605.
Metal including alloys:			
Scrap	27,203	25,190	West Germany 7,926; Belgium-Luxembourg 7,061; Netherlands 2,692.
Unwrought	262,882	217,903	Netherlands 59,543; West Germany 44,083; Greece 39,408.
Semimanufactures	132,703	107,442	West Germany 42,617; Belgium-Luxembourg 29,001; Netherlands 11,149.
Antimony:			
Ore and concentrate	8,104	5,045	Thailand 1,874; Bolivia 964; Australia 661; Republic of South Africa 560.
Metal, all forms	2,110	527	Belgium-Luxembourg 226; People's Republic of China 194.
Arsenic, anhydride and acid	20	2	NA.
Beryllium metal, all forms value, thousands [2]	$711	$406	United States $331.
Bismuth	1,259	640	Bolivia 217; Japan 135; Belgium-Luxembourg 128.
Cadmium	937	694	Belgium-Luxembourg 261; Japan 159.
Chromium:			
Ore	365,300	354,109	Malagasy Republic 103,701; U.S.S.R. 96,741; Republic of South Africa 54,911; Turkey 43,587.
Oxide and hydroxide	2,706	2,397	U.S.S.R. 955; West Germany 775; United Kingdom 521.
Metal, all forms	88	65	Japan 33; United States 21.
Cobalt:			
Ore	8,625	9,158	Morocco 9,154.
Oxide and hydroxide	296	170	Belgium-Luxembourg 168.
Metal, all forms	855	681	Zaire 197; United States 144; Belgium-Luxembourg 133.
Columbium:			
Ore (including tantalum ore) [3]	1,081	1,241	Canada 915; Gabon 208.
Metal, all forms—value, thousands [2]	$116	$187	West Germany $65; United Kingdom $59.
Copper:			
Ore and concentrate	501	879	West Germany 422; United Kingdom 210; Belgium-Luxembourg 103.
Matte	2,481	872	West Germany 422; United Kingdom 210; Belgium-Luxembourg 97.
Metal including alloys:			
Scrap	17,817	14,228	Belgium-Luxembourg 2,529; United States 2,466; West Germany 1,889.
Blister and other unrefined	42,001	26,777	Zaire 8,648; Chile 7,865; Belgium-Luxembourg 7,660.
Refined	377,458	2,816	Belgium-Luxembourg 1,065; Netherlands 909; United Kingdom 295.
Semimanufactures	97,240	92,400	Belgium-Luxembourg 41,777; West Germany 24,450; Italy 11,546.
Germanium, gallium, etc. value, thousands [2]	$988	$616	Belgium-Luxembourg $403.
Gold:			
Ash and sweepings—kilograms	1,213	6,213	Laos 568.
Metal:			
For domestic use thousand troy ounces	360	313	Netherlands 169; West Germany 95; United States 36.
Temporary imports—do	4,726	3,506	Switzerland 2,575; Republic of South Africa 365.

See footnotes at end of table.

Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS—Continued			
Iron and steel:			
Ore and concentrate, except roasted pyrite ---thousand tons--	15,822	13,169	Brazil 3,491; Mauritania 2,163; Liberia 1,994; Australia 1,676; Sweden 1,646.
Roasted pyrite	131,827	107,093	Italy 70,610; West Germany 31,628.
Metal:			
Scrap	328,123	278,066	Belgium-Luxembourg 143,900; United Kingdom 64,904; West Germany 54,379.
Pig iron, spiegeleisen, other [4] thousand tons--	332	329	West Germany 272.
Ferroalloys ---do---	197	204	New Caledonia 148.
Steel, primary forms ---do---	2,027	1,250	Belgium-Luxembourg 720; West Germany 364.
Semimanufactures:			
Bars, rods, sections [5] --do---	2,332	2,035	West Germany 763; Belgium-Luxembourg 747; Italy 267.
Universals, plates, sheets do---	3,153	2,594	Belgium-Luxembourg 1,159; West Germany 767.
Hoop and strip ---do---	431	266	Belgium-Luxembourg 141; West Germany 87.
Rails and accessories --do---	75	57	Belgium-Luxembourg 30; United Kingdom 20; West Germany 6.
Wire	154	115	Belgium-Luxembourg 48; West Germany 44.
Tubes, pipes, fittings --do---	443	401	West Germany 142; Italy 106.
Castings and forgings, rough do---	31,988	30,699	West Germany 14,493; Belgium-Luxembourg 5,004; Switzerland 3,875; Italy 3,599.
Lead:			
Ore and concentrate	165,544	129,803	Ireland 34,803; United States 28,381; Greenland 25,372; Morocco 17,255.
Oxide	2,982	1,475	East Germany 528; Belgium-Luxembourg 488; West Germany 166.
Metal including alloys:			
Scrap	21,755	12,599	Netherlands 3,946; Belgium-Luxembourg 3,122; West Germany 2,655; United Kingdom 1,826.
Unwrought	43,940	57,798	Belgium-Luxembourg 23,373; West Germany 12,589; United Kingdom 8,217.
Semimanufactures	1,192	734	Belgium-Luxembourg 533.
Magnesium including alloys:			
Scrap	329	271	Italy 223.
Unwrought	2,850	2,665	Norway 1,095; U.S.S.R. 914.
Semimanufactures	139	113	West Germany 43; United States 32.
Manganese:			
Ore and concentrate --thousand tons--	1,428	1,158	Republic of South Africa 544; Gabon 532.
Oxide	4,518	4,155	Spain 1,560; West Germany 979; Belgium-Luxembourg 764.
Metal, all forms	489	932	Republic of South Africa 751; Japan 122.
Mercury ---76-pound flasks--	9,747	7,774	Italy 3,713.
Molybdenum:			
Ore and concentrate	8,836	7,138	Canada 3,932; United States 1,537; Netherlands 1,206.
Oxide	134	136	Netherlands 119; Norway 17.
Metal, all forms	174	213	West Germany 99; Austria 34; Italy 25.
Nickel:			
Matte	13,377	15,202	New Caledonia 13,420.
Oxide and hydroxide	121	212	Canada 106; Belgium-Luxembourg 103.
Metal including alloys:			
Scrap	1,544	1,546	Belgium-Luxembourg 353; Spain 251; United Kingdom 182; West Germany 177.

See footnotes at end of table.

Liquefied petroleum gas ---do---	2,339	2,777	U.S.S.R. 1,334; Venezuela 302.
Vaseline, waxes, petroleum coke, bitumen, mixtures of bitumen, etc ---do---	2,897	3,873	United States 2,727; West Germany 455.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	292,859	517,133	United States 307,330; Italy 91,683.

NA Not available.
[1] Excludes artificial corundum.
[2] Based on exchange rate of 4.8099 francs per U.S. dollar in 1974 and 4.80 francs per U.S. dollar in 1975.
[3] Includes vanadium.
[4] Includes cast iron and sponge, powder, etc., of iron and steel.
[5] Includes wire rod.
[6] Less than ½ unit.
[7] Includes oxides of germanium.
[8] Including synthetic and reconstituted stone, but not including diamond.
[9] Excludes flint and industrial limestone.

COMMODITY REVIEW

METALS

Aluminum.—French bauxite production declined in relation to the output in 1975, because certain mining operations were closed as reserves were exhausted. Four companies, Aluminium Péchiney, Société Anonyme des Bauxites et Alumines de Provence (SABP), Swiss Aluminium Ltd. (Alusuisse), and Comptoir d'Extraction et de Vente de Bauxite (CEVB), produced bauxite. Aluminium Péchiney was by far the largest producer, and its output accounted for 70% of the country's total bauxite production. Bauxite mines were located in the Departments of Var, Hérault, Bouches-du-Rhône, and Ariège. The following tabulation shows the various Departments' shares of total national output in 1976:

Department	Percent of total
Var	77.0
Hérault	14.5
Bouches-du-Rhône	8.0
Ariège	.5

Domestic production supplied about half the French requirements in 1976. Guinea and Australia were the largest foreign suppliers and accounted for 76% and 16% of French imports, respectively.

Three plants, owned and operated by PUK, produced alumina (about 1 million tons in 1976). The following tabulation shows the output and capacity of these plants:

Plant location	Percent of total production	Capacity (thousand tons per year)
Bouches-du-Rhône:		
Gardanne	60	720
La Barasse	27	350
Gard: Salindres	13	250
Total	100	1,320

During 1976, the alumina plants operated at about 90% of their installed annual capacity. The Netherlands was the largest purchaser of exported alumina (about 54% of the total), followed by Spain (about 17%).

In October 1976, PUK started operation of a pilot plant at Estaque in the Rhône Delta for the production of alumina, based on PUK's H+ process. This process uses sulfuric acid to break down the aluminum silicate found in clay and shales. The impure aluminum sulfate produced is converted to aluminum chloride by the addition of hydrochloric acid. The final product, alumina, is produced by recrystallization. PUK reported that, depending on the alumina content of the clay, 60 to 100 tons of clay is required to produce 20 tons of alumina. PUK officials expected the process to lessen the dependence of the aluminum industry on bauxite and perhaps to partially reorient alumina production toward utilization of shales and clays.

Iron and Steel.—The performance of the iron and steel industry was mixed. The production of iron ore declined, but steel production increased. A draft of the French National Economic Plan, released in 1976, projected an output of 34 million tons of steel by 1980; to increase capacity to this target figure, an investment of 16.4 million francs would be necessary. Other developments in the steel industry were as follows: A new blooming plant came onstream at facilities operated by Pompey Company; a renovated wire plant operated by USINOR started production at Longwy; and Société des Hauts Fourneaux Reunis de Saulnes et Uckange and Société des Hauts Forneaux de la Chiers/Société des Aciéries Trefileries de Neuves Maisons Châtillon started production at agglomeration plants at Uckange and Isbergues. Details on capacities of these new facilities were not available at yearend. Other large structural changes in the steel industry were postponed. In particular, the Fos plant near Marseilles, operated by Société Lorraine et Méridionale de Laminage Continu (SOLMER), was a victim of the recession; expansion plans, originally conceived for 1980–82, were indefinitely shelved.

Iron ore, with an average iron content of 30.2%, was produced from three major basins, the Est and Ouest Basins, both in northern France, and the Pyrénées Basin. The Est Basin, located in Lorraine, was the largest, accounting for about 96% of iron ore output. Because of the economic depression, activities at the mines were limited to maintain production but with no major projects for expanding output. At yearend, stocks at mines totaled 7.9

million tons of iron ore and employment was about 10,000 persons. Domestic iron ore supplied 75% of the total domestic demand. Imports of high-grade iron ore continued to increase to supply coastal steelplants and to blend with low-grade domestic ores. Principal suppliers of iron ore (more than 1.5 million tons) were Brazil, Mauritania, Liberia, Sweden, and Australia. France also exported large quantities of iron ore, principally to the nearby Luxembourg steel industry.

The French iron and steel industry was located in five geographical regions, as shown in the following tabulation, with production in thousand tons:

Region	1975		1976	
	Pig iron	Steel	Pig iron	Steel
East	9,870	10,235	10,316	10,932
North	5,541	7,072	6,145	7,932
Center	--	956	--	896
Southwest	224	160	195	138
Southeast	1,520	2,228	1,638	2,517
West	766	879	730	800

The principal steel producers, their production in million tons, and major plants were: USINOR (7.9) at Dunkerque, Longwy, Thionville, Denain, and Valenciennes; SACILOR (6.0) at Boussange near Grandrange, Usine de l'Orne-Amont (Homécourt), Rombas (Moselle), and Hagondange (Moselle); Société Lorraine de Laminage Continu (SOLLAC) (2.0) at Hayange, Knutange, Sermange, Ébange, and Florange, all in Moselle; SOLMER (1.6) at Fos-sur-Mer near Marseilles; and Creusot-Loire Entreprises S.A. (1.3) at Le Creusot, Saint Étienne, Leffrinckoucke near Dunkerque, Imphy, and Firkny (Loire).

The percentages of total steel production by various processes for selected years were as follows:

Process	1960	1970	1975	1976
Oxygen	0.6	29.0	63.4	68.3
Electric	8.6	11.0	14.2	14.2
Thomas	60.5	41.1	15.2	11.8
Martin	29.7	18.6	7.1	5.7
Other	.6	.3	.1	--

Lead.—France remained dependent on imports of lead concentrate to meet its smelter demand; in 1976 this dependence was over 80%. Canada, Greenland, Ireland, and Morocco were the principal suppliers.

Increased production by domestic mines resulted from a full year of operation at the Argentière mine without strikes. In addition, technical problems in the flotation plant at the Farges mine (Corrèze) were resolved. The following tabulation shows the output by mine in tons of lead concentrate:

	1975	1976
Argentière, Ardèche (Peñarroya)	25,750	32,600
Malines, Gard (Peñarroya)	2,700	3,000
Farges, Corrèze (Société Minère de Corrèze)	1,370	3,200

The largest producer of lead concentrate in France was Peñarroya. The Imperial smelter at Noyelles-Godault (annual capacity 130,000 tons), owned by Peñarroya, remained the only primary lead smelter in operation in the country. In addition, Peñarroya operated secondary smelters at Saint-Denis (Villefranche-sur-Saône) and Escaudoeuvres. Aggregate production from secondary plants, including lead content of antimonial lead, was 53,800 tons in 1976.

Imported lead supplied 21% of total domestic demand. The largest suppliers of lead and lead alloys were Belgium (39%) and West Germany (26%).

Nickel.—Construction by SLN continued on a plant for production of electrolytic nickel, located at Le Havre. This plant was scheduled to replace the existing one, which was unable to meet current market specifications for nickel. As in the past, French production of nickel metal was based on imported matte from the company's smelter in New Caledonia. Imports of nickel were 67% of the demand.

Tungsten.—Although France remained the principal producer of tungsten among European Economic Community (EEC) countries, imports were essential to meet the demand.

Two companies produced tungsten from two mines. Société Minière d'Anglade, with a mine at Salau (Ariège) in southwest France, was the principal producer. Preliminary reports indicated the discovery of an additional 200,000 tons of ore averaging about 2% WO_3 in this general area.

Zinc.—During 1976, principal events included discovery of complex lead-zinc ore bodies in Brittany, increased output of zinc concentrate from a new mine, and

startup of a new zinc roasting plant at Pas-de-Calais.

In Brittany at La Porte-aux-Moines (Côtes du Nord), BRGM announced discovery of an important ore body of complex sulfide ore. Preliminary results indicated reserves at 2 million tons with an average of 2.1% lead, 8.0% zinc, 0.6% copper, and 102 grams of silver per ton of ore. In addition, BRGM continued to explore, by underground working, copper-lead-zinc deposits at Bodennec (Finistère).

Although output of zinc concentrate increased 250% during 1976, imports still accounted for 86% of the demand. In 1976, most of the zinc concentrate was imported from Peru (23%), Canada (22%), Sweden (10%), Ireland (8%), and Morocco (6%). The sharp increase in zinc concentrate production resulted from the first full year of production of the Saint Salvy (Tarn) mine and its concentrator owned by Peñarroya. This mine should reach its capacity of 900 tons of ore per day by 1977. Saint Salvy ore reserves were estimated at 3 million tons with 9.5% zinc and 0.5% lead, and silver content of 80 grams per ton of ore. Output of slightly over 71,000 tons of zinc concentrate came from three mines and concentrators, as shown in the following tabulation, in tons:

	1975		1976	
	Concentrate	Zn content	Concentrate	Zn content
Saint Salvy (Tarn)	4,870	2,256	43,700	21,586
Malines (Gard)	14,523	6,814	19,210	8,690
Argentière (Ardèche)	6,903	3,561	8,460	4,424
Other	2,615	13,810	--	--

Peñarroya operated almost all the zinc mines in France during 1976.

A new 150,000-ton-per-year facility for roasting zinc concentrate and producing sulfuric acid came onstream in Pas-de-Calais. The plant was owned and operated by Société des Mines et Fonderies de Zinc de la Vieille Montagne.[2] At the electrolytic plant at Viviez (Aveyron), owned by Vieille Montagne, construction continued on a plant for treatment of residues from electrolysis. Capacity was not made public, and the startup is expected in 1977.

Zinc metal was produced in three electrolytic plants and one Imperial smelter facility. Approximately 88% of demand was met by domestic production of metal, which increased as a result of a decision of zinc producers not to hold down output when conditions on the market were difficult, as they did in 1975.

Vieille Montagne operated two electrolytic plants, one at Viviez (Aveyron) and another at Creil (Oise); RAM operated an electrolytic plant at Auby (Nord); and Peñarroya operated an Imperial smelter installation at Noyelles-Godault (Pas-de-Calais).

Countries of the EEC—Belgium, West Germany, and the Netherlands—were the largest suppliers of zinc metal and together provided for about 71% of total French zinc imports in 1976.

Other Metals.—The French metallurgical industry produced a variety of metals during 1976 from mostly imported ores. However, no major events were reported. Output of these commodities is shown in table 1.

NONMETALS

Barite.—French barite output increased during 1976 as a result of a full year of operation at the new open pit mine on the Rossignol deposit. During 1976, Talcs de Luzenac acquired majority shareholding in the Société des Mines de Garrot Chaillac and changed the name to Barytine de Chaillac. The remaining equity in the company was held by Beneki, Mines de Garrot, and BRGM.

Cement.—Approximately 82% of cement capacity was controlled by four companies. The two principal companies were Société des Ciments Français with 22 plants and Ciments Lafarge with 18 plants. France had a total installed capacity of 40.4 million tons of cement per year.

Fluorspar.—During 1976 no changes of importance were registered. Domestic output was more than adequate to meet demand, and France was a net exporter of fluorspar. However, production and consumption declined, mainly because of the economic slowdown. PUK remained among the largest producers of fluorspar; with operations at Tanneron (Var), Longeau (Haute-Loire), and Paulinet and Reyssas-Montroc (Tarn), it produced half of the total output. The other half of the French

[2] Mining Journal (London). Mining Annual Review 1977—France. June 1977, p. 516.

output was accounted for by Société Denain-Anzin Minéraux with operations at Escaro (Pyrenees-Orientales); Société Minière de Trébas in Tarn; Société Industrielle du Centre at Chaillac (Indre), and other small producers.

Potash.—Experiments for producing potash by solution mining were underway during 1976 in French potash fields. The new method was intended to produce from sectors of deposits that are not easily accessible. Leaching, according to preliminary results, should extend the life of some deposits. In addition, restructuring and concentration of production of potash continued. In 1976, the mine and plant at Bollwiller were closed, leaving three plants, Amélie, Marie-Louise, and Theodore, in operation. The Government-owned Mines de Potasse d'Alsace operated the three mines and was the sole producer of mined potash. Output at the mines declined mainly because of unfavorable market conditions. France was a net exporter of potash; the countries of the EEC were the principal purchasers and took 86% of total potash exports.

MINERAL FUELS

Coal.—Output of coal remained at the same level as in 1975, and the decline that started in 1960 appeared to be leveling off. Contrary to expectations, the recession did not cause a decline in energy consumption or coal consumption. High prices for imported liquid hydrocarbons were another factor in improved performance of the coal industry.

The French coal industry, mainly operated by the Government-owned Charbonnages de France, was concentrated in three basins: Nord-Pas-de-Calais (northern France), Lorraine (northeastern France), and Centre-Midi (central and southern France).

Production figures for various coal basins, by type of coal, are given in the following tabulation, in thousand tons:

	1974	1975	1976
Anthracite and bituminous coal:			
Nord-Pas-de-Calais	9,011	7,715	7,318
Lorraine	9,066	10,021	9,970

Grand total	r 25,668	r 25,610	25,067

r Revised.

Source: Annales des Mines. September–October 1977, sec. 11, p. 99.

In general, operating mines were deep, gassy, and wet, with thin, almost vertical, seams. However, in thick horizontal seams the degree of mechanization was high, about 98%. In some of the mechanized sectors of French coal mines, productivity was outstanding. At one mine in the Lorraine Basin, productivity reached 100 tons per manshift.[3]

Salient statistics on the coal industry are shown in table 4.

Capacity of all coal washeries in France was 15,267 tons of crude coal per hour. Approximately 62% of treated coal was produced by dense media separation.

Coke.—In Lorraine, modernization was completed on ancillary facilities with repairs of the Coppee No. 3 coking battery at Carling. At the No. 2 coking plant at Carling, the first set of furnaces came onstream after repair. Rebuilding of furnaces continued at coking plants situated in the Nord-Pas-de-Calais Basin; in the same Basin the Waziers coking plant ceased production on December 15, 1976. Production of coke and semicoke in the three Basins and at the steel coking plants, in thousand tons, was as follows:

[3] Charbonnages de France. Rapport de Gestion 1976 (Paris). 1977, p. 65.

Sources: Charbonnages de France. Rapport de Gestion 1976 (Paris). 1977, p. 74. Annales des Mines. September–October 1977, p. 177.

At yearend 1976, installed capacity at coking plants in French basins was about 17,225 tons of coke per day. During 1976, coking plants in basins operated at about 83% of installed capacity.

The outflow of coke and semicoke to various sectors of the economy, in thousand tons and percentage of total during 1974–76, was as follows:

	1974	Percent	1975	Percent	1976	Percent
Steel industry	3,629	55.3	2,638	54.3	2,873	54.5
Small industries	1,290	19.6	1,008	20.8	957	18.2
Other industries	232	3.5	157	3.2	132	2.5
Exports	964	14.7	642	13.2	880	16.7
Household consumption	451	6.9	410	8.5	429	8.1
Total	6,566	100.0	4,855	100.0	5,271	100.0

Natural Gas.—The most important events in the natural gas industry were related to construction of trunk pipelines, expansion and renovation of the distribution network, and construction of underground storages. During 1976, laying of pipe was completed between l'Horme-Saint Chamond, Saint Cézaire-Colomars, Marcq-Villeneuve-Asque, and This-Warcq; doubling of pipelines continued at trunklines in Vannes (between Noyal and Muzillac), Besançon (between Dannemarie and Besançon), Nevers (between Sauvigny and Saint-Éloi), Bourges (between Foëcy and Mehun), Tulle (between Thenon and Farges), Verdun-Tréport (between Bourseville and Mers), and in Lorraine and Alsace. In addition, work was completed on doubling of pipelines in Centre-Est and Charente and construction of the pipeline near Saint-Nazaire. Construction started on an additional 80,000 cubic meters of underground storage space for gas in the general area of Fos, a port on the Mediterranean Sea.

Domestic output provided about 32% of the apparent demand of the country. The Netherlands remained the principal supplier and accounted for 77% of total imports of natural gas.

Table 4.—France: Salient statistics of the coal industry

(Thousand metric tons unless otherwise specified)

	1974	1975	1976
Production, bituminous and lignite	r 25,668	r 25,610	25,067

r Revised.

Based on existing plans, natural gas should provide 16% of energy demand in 1985. To meet that target, France concluded a new agreement with Algeria to assure deliveries of 40 gigatherms per year until 1990. An additional 50 gigatherms per year will be delivered starting in 1980.

Petroleum.—With only a token domestic output of crude oil, France was heavily dependent on imports to meet demand in 1976. Principal sources of crude oil, domestic and foreign, are shown in the following tabulation, with percent of total refinery receipts:

	1975	1976
Europe:		
France	1.0	0.9

Other:		
U.S.S.R	1.2	1.5
Venezuela	.7	.7
Total	1.9	2.2

r Revised.

To explore and develop new sources of petroleum and modify refinery capacity, large investments are necessary. The following tabulation shows investment in the French petroleum industry for selected years, in million current French francs:

The petroleum industry had economic difficulties caused by higher prices for imported crude oil and excessive capacity for refining, storing, and transporting liquid hydrocarbons. Although some increase in utilization of refinery capacities was reported in 1976, excess refinery capacity was available, resulting from lower consumption caused by conservation and the economic recession.

Exploration.—Expenditures in current francs for petroleum exploration and production increased 14% during 1976, although at yearend permits for exploration in force covered a total area of 109,718 kilometers, a decline of about 5% from that of 1975. Two new permits were granted for an area totaling 1,848 square kilometers in the Paris Basin and five new requests were submitted for exploration permits (four in the Aquitaine Basin and one in the Paris Basin). Geophysical exploration decreased 23% during the year to a total of 24.3 crew-months. Three wells completed showed encouraging signs of oil and gas (two in the Aquitaine Basin and one in the Paris Basin). However, two offshore wells in the Iroise Gulf were dry.

Production.—French companies produced crude oil in France and abroad. Domestic output was only about 0.9% of demand. The share of production from operations in which French companies had interest around the world amounted to about 78 million tons of crude oil in 1976, about 6 million tons less than that of 1975. The drop in French-controlled output abroad resulted from termination of contracts for coproduction in Algeria and termination of the concession of Basrah Petroleum Co. Ltd. in Iraq. New activities of French companies in Indonesia and the North Sea were expected to offset these losses of production in the future.

	1960	1970	1974	1975	1976 e
Exploration and production	383	362	231	350	400
Refining	217	1,534	1,460	1,054	995
Stocks and distribution	298	1,567	1,508	1,383	1,383
Pipelines	13	176	114	83	36
Tankers	206	510	1,837	1,550	1,294
Other investments	36	194	221	270	295
Total	1,153	4,343	5,371	4,690	4,403

e Estimated by Union des Chambres Syndicates de l'Industrie du Pétrol.

Source: L'Industrie Française du Pétrole (Paris). 1976, p. 36.

The following tabulation shows domestic output by basin and production by French companies abroad of crude oil, in thousand tons:

	1975	1976
Domestic production:		
Crude oil:		
Aquitaine Basin	797	824
Paris Basin	231	234
Total	1,028	1,058
Natural gas liquids from Lacq	761	661
Total domestic production	1,789	1,719
Production abroad by French interests:		
Europe	1,583	2,209
Middle East	53,690	47,598
Africa	26,759	24,839
Oceania: Indonesia	604	1,580
North America	1,953	2,100
Total production abroad	84,589	78,326

In Aquitaine, increased output was due principally to the initiation of production from the Castera-Lou Field, increased production from the Upper Lacq reservoir and higher yield from Bonrepos-Montastruc.

Refining.—Installed petroleum refining capacity remained the same as in 1975, although the official figure (171.7 million tons) shows an increase of 2.3 million tons of capacity. The difference resulted from expressing installed capacity for 1976 in terms of only one quality of crude oil, which previously was not done. The utilization of refinery capacity was 71%, approximately 7% more than in 1975, but this favorable trend cannot be considered permanent. The 1976 summer was dry and availability of hydroelectric energy was low. Consequently there was a greater demand for thermal power from plants fueled with liquid hydrocarbons.

French refinery capacity by process, in tons per day, on January 1 for selected years follows:

	1965	1970	1975	1976
Reforming:				
Thermal	6,785	1,900	--	--
Catalytic	21,910	39,025	58,290	58,290
Cracking:				
Thermal	7,300	6,600	6,600	5,600
Catalytic	16,332	18,788	28,720	28,720
Of which hydrocracking	--	--	2,200	2,200

The capacity for desulfurization in France was 63.7 million tons at yearend.

Table 5 shows location, ownership, and capacity of petroleum refineries in France.

Transportation.—On December 31, 1976, the French tanker fleet comprised 83 tanker ships with deadweight capacity of 15.5 million tons. The average tonnage of tankers was 186,700 tons. The ports of Marseille-Lavéra-Fos and Le Havre shared about 76% of total seagoing traffic in liquid fuels. During 1976, a new port for supertankers (500,000 deadweight tons) and large bulk carriers was commissioned at Antifer, north of Le Havre.

Several crude oil pipelines were in service with a total length of about 3,700 kilometers (including main line and connecting lines). The two largest pipelines were the Sud-European pipeline (1,702 kilometers) from Fos to Mannheim, West Germany, and the Île-de-France pipeline (87 kilometers) from Le Havre to Grandpuits. About 38 million tons were moved through the Sud-European pipeline and 7.8 million tons through the Île-de-France pipeline.

For transportation of petroleum refinery products, the Le Havre-Paris and Mediterranée-Rhône pipelines, with a total length of 1,768 kilometers, were used to move about 20 million tons of products.

In addition, about 30 tankers for liquid hydrocarbons, 4 tankers for liquefied gas, 534 riverboats, 13,022 railroad tank cars, and 4,094 tank trucks were used for movement of crude and products.

Uranium.—During 1976, the French Government placed industrial and commercial activities of the CEA in a new company, Compagnie Générale des Matières Nucleaires (COGEMA), leaving scientific and regulatory activities in the CEA. COGEMA was in charge of exploration, production, and beneficiation of uranium ores, production of nuclear fuels, and marketing of nuclear technology.

To meet long-range projections, which placed uranium demand at 10,000 tons per year by the year 2000, new sources of uranium would be required. Domestic exploration was intensified and efforts were made to assure supplies from abroad,

Total		62.0	105.2	171.7

mostly from former French colonies in Africa.

In France, COGEMA explored in the areas around its producing mines in the districts of Limousin, Vendée, and Forez. In addition, the company explored in Rouergue, Lauragais-Castrais, Berry, Bourbonnais-Morvan, and Les Vosges. Other companies, Minatome and Dong Thieu, explored south and west of the Central Massif in Bretagne and Aquitaine.

Most of the foreign exploration activities were in Gabon (near Franceville) and Niger.

Uranium in France was produced by COGEMA, Société Centrale de l'Uranium et des Minerais et Metaux Radioactifs (SCUMRA), Compagnie Française des Minerais d'Uranium (CFMU), Société Industrielle et Minière de l'Uranium (SIMURA), and Société des Mines d'Uranium du Centre (SMUC), a subsidiary of CFMU, COGEMA, and Société des Asphaltes du Centre.

The following tabulation shows mine production of uranium in France, in tons:

Company	Location of mine	Ore	Uranium content
COGEMA	Limousin	342,000	741
Do	Vendée	348,000	536
Do	Forez	126,000	460
CFMU	Lozère	137,000	162
Do	Creuse	15,000	50
SIMURA	Morbihan	7,000	36
SMUC	Corrèze	7,000	27
SCUMRA	Cantal-Creuse	33,000	65
Total		1,015,000	2,077

This tabulation does not include low-grade ores (0.02%) produced by COGEMA at Limousin and Vendée and by CFMU at Lozère.

COGEMA increased output in 1976 because of startup of a new extension to facilities at La Crouzille. Minatome started production from a small deposit at Saint-Pierre in Cantal and from another in the Department of Creuse. Dong Thieu started production from its property at Mailhac, and development by COGEMA of the Lodevois property in Hérault continued. According to plans, the Lodevois operation was scheduled to come onstream in 1980 and replace production from the Forez deposit whose reserves should be exhausted by that time.

Yellowcake from domestic ores was produced at three plants operated by SIMO and at the plant at Lozère. From imported raw materials (mostly from Gabon), COGEMA's plant at Guégon also produced yellowcake. The following tabulation shows production of concentrate expressed in tons of uranium content:

	1974	1975	1976
From domestic ores and liquids	1,540	1,731	1,813
From Gabon ores	436	597	606
Total	1,976	2,328	2,419

The Mineral Industry of Gabon

By Candice Stevens [1]

The mineral sector accounted for approximately 64% of Gabon's gross national product (GNP) in 1976, when the Government implemented measures to maximize revenues from its dominant petroleum industry. Increased Government participation, higher petroleum prices, and new reinvestment provisions were to provide the basis for an ambitious development program as outlined in the third 5-year plan (1976–80). The plan set forth two programs of investment based on differing estimates of future oil production. The basic plan, which projected investments totaling $3.5 billion,[2] was founded on a decrease in petroleum production to 8.3 million tons per year by 1980; an alternative plan, which would involve investments of nearly $4 billion, assumed that production would be maintained at the annual rate of 11 million tons through 1980 by the exploitation of new petroleum discoveries. In the 1976 budget which totaled $788 million, oil revenues accounted for $452 million (of which $260 million was derived from corporation taxes, $180 million from oil royalties, and $12 million from the Government's share in oil company profits).

A primary goal of the 5-year plan was economic diversification through the development of both infrastructure and the industrial base. The Provision pour Investissements Diversifiés (PID) required that oil companies reinvest up to 10% of their profits in domestic industrial ventures. The Gabonese Government would then acquire a 51% interest in all new projects, which were essentially tax-free. In the mineral sector, projects being financed with PID funds included the Compagnie Gabonaise-ELF de Raffinage (COGER) refinery, the Société des Ciments de Gabon cement plant at N'Toum, an ammonia fertilizer plant at Port-Gentil, and the Société Nationale de Transportation Maritime (SONATRAM) tanker fleet.

Mineral research and exploration were an important focus of the 5-year plan which allocated nearly $18 million for a general geological survey and mapping program and $23 million for petroleum and mineral prospecting. The Bureau de Recherches Géologiques et Minières (BRGM) (France) was to participate in prospecting for diamond in a 60,000-square-kilometer area in southern Gabon and for copper in the Nyanga syncline area near Mayumba, which was an extension of the Congolese Niari syncline. Cie. Minière de l'Ogooué, S.A. (COMILOG) was to undertake prospecting for copper and molybdenum in the Nouna-Ivindo region, for carbonatite in the Ngutu region, northeast of Okondja, and for kyanite at Etéké.

Further development of Gabon's mineral sector depended on the completion of the Trans-Gabon Railroad, which would link the manganese mines at Moanda, the uranium mines at Mounana, and the iron ore deposits at Belinga to a deepwater port under construction at Santa Clara, 15 kilometers north of Libreville. Construction began in January 1975 from points at Owendo, N'Djolé, and Franceville. The total length of 950 kilometers comprised a 340-kilometer link from Owendo to Booué, a 360-kilometer link between Booué, Moanda, and Franceville, and a 250-kilometer section connecting Booué and Belinga. The first link from Owendo to N'Djolé was to be inaugurated in early 1978. In 1976, a 13-

[1] Economist, International Data and Analysis.
[2] Where necessary, values have been converted from Communauté Financière Africaine Francs (CFAF) to U.S. dollars at the rate of CFAF242 = US$1.00.

company European consortium for the construction of the railroad completed site clearing, roadbed preparation, and bridge construction for laying the first section of track. The Gabonese Government was to finance the Owendo-Booué line and allocated $119 million of its 1976 budget to this undertaking. An additional $110 million was received from 13 lenders on the basis of agreements signed between 1973 and 1976, with the major share donated by the French Aid and Cooperation Fund.

Power-generating capacity of Société de l'Énergie et de l'Eau de Gabon (SEEG) increased from 50 million kilowatt-hours in 1966 to over 253 million kilowatt-hours in 1976. Gabon's first hydroelectrical power station was commissioned at Kinguélé in 1973 and supplied about 130 million kilowatt-hours of power in 1976 for the Libreville region. A second hydroelectric plant with a 69-megawatt capacity was to be constructed 30 kilometers upstream from Kinguélé in conjunction with a dam-reservoir complex scheduled for completion in 1979. During the year, Charles T. Main International (United States) was contracted for a feasibility study and financial plan for the Grand Poubara dam on the Ogooué River, 20 kilometers north of Franceville. The $300 million project would include an underground generating turbine with an eventual capacity of 210 megawatts.

PRODUCTION AND TRADE

Production of Gabon's major mineral commodities—manganese, uranium, and petroleum—remained at approximately the 1975 levels pending the completion of expansions in facilities and the Trans-Gabon Railroad. Manganese production was expected to increase from the 1976 level of 2.2 million tons to 3 million tons per year by 1980. Uranium metal production, which totaled 950 tons in 1976, was projected to reach 1,000 tons in 1978. Production of petroleum was expected to remain at the 11-million-ton-per-year level if new fields supplemented a decline in output from older fields. Construction of a second cement plant was to increase Gabon's cement production capacity from 270,000 tons in 1976 to 620,000 tons in 1979. Production of refined petroleum products was to reach 17 million barrels per year when a second refinery is brought into full production in 1977.

Gabon continued to evidence a favorable balance of trade in 1976 owing to increased mineral exports, which accounted for approximately 93% of total export values in 1976. Petroleum, which provided 83% of export earnings, was sold to the United States and Caribbean countries (30%), France (25%), Africa (25%), and Latin America and the Philippines (20%). Manganese was the second largest earner (8% of total export value) and was exported to the United States and Canada (42%), France (22%), Japan (12%), and other Western European countries. France remained the sole importer of Gabon's uranium production, which accounted for 2% of export value. France retained its position as Gabon's primary trading partner in 1976, being the largest recipient of exports and providing nearly 63% of Gabon's total import value. Approximately 55% of imports was capital goods required for construction of infrastructure and other development projects. Mineral products accounted for 10% of total imports. Gabon's major imports and exports are shown in tables 2 and 3.

The trading centers of Port-Gentil and Owendo were to be supplemented by a $100 million mineral port under construction at Santa Clara. Soros Associates (United States) was contracted to design the port, which was to handle tankers of 180,000 to 250,000 deadweight tons. Manganese, uranium, and iron ore were to be transported to the port by the Trans-Gabon Railroad for direct shipment. Petroleum was exported primarily from the Cap Lopez terminal north of Port-Gentil, which could stock up to 400,000 cubic meters of petroleum and could load tankers of up to 150,000 deadweight tons. The Gamba terminal farther south, from which approximately 25% of the petroleum was exported, had a capacity of 100,000 cubic meters and facilities for tankers of up to 80,000 deadweight tons. At yearend 1975, Gabon put into service the first in a planned tanker fleet, the *N-Tchengue*, which had a capacity of 140,000 deadweight tons.

COMMODITY REVIEW

METALS

Iron.—A 15-month study was in progress in 1976 to determine the reserves and average phosphorus content of the iron ore deposits at Belinga in northeastern Gabon. During the year, the Gabonese Government announced its intention to yield part of its 56% interest in Société des Mines de Fer de Mékambo (SOMIFER) to Japanese firms. SOMIFER, a consortium of European interests and Bethlehem Steel Corp. (United States), scheduled exploitation of the deposits for 1982 in conjunction with the opening of the northeastern section of the Trans-Gabon Railroad. Total iron ore resources in Gabon were estimated at 1.2 billion tons. Reserves at Belinga were previously estimated at 566 million tons averaging 65% iron. An iron and steel industry was planned on the basis of iron ore production from the Belinga deposits reaching 12 million to 15 million tons per year. Exploration for iron ore was also being conducted in the Tchibanga region in southwestern Gabon.

Manganese.—Gabon was the fifth largest manganese producer in the world, with production totaling 2.2 million tons of metallurgical-grade ore and approximately 65,000 tons of chemical-grade ore in 1976. Reserves at Moanda, situated 50 kilometers west of Franceville, were estimated at 210 million tons of salable product grading 48% manganese dioxide. Open pit mining since 1962 has been under the direction of COMILOG, owned by United States Steel Corp. (44.1%), BRGM (19.8%), Cie. de Mokta (17.1%), the Gabonese Government (10%), and Société Auxiliare du Manganese de Franceville (9%). Ore was transported by a 76-kilometer overhead chain conveyer from Moanda to M'Binda on the Congolese border, then along a 286-kilometer stretch of the Chemin de Fer Congo-Ocean railroad for export from the port of Pointe-Noire. COMILOG continued its detailed geological study of the Okouma plateau north of Moanda and planned to invest $40 million over the next 4 years in the development of additional manganese deposits. The increased production, which was to eventually reach 4 million tons per year, would be transported by the Trans-Gabon Railroad to Santa Clara for export.

Manganese dioxide production was used by the Société Gabonaise des Piles (SOGAPIL) plant, completed in 1975. The plant, which had a production capacity of 6 million 1.5-volt batteries per year, was owned by the Gabonese Government (20%), Wonder (20%), and COMILOG (20%), with the remaining shares divided among private banks and individuals. Output, which was to be increased to 21 million

batteries of 4.5 volts, was sold for domestic use and exported to the Congo and Zaire.

A feasibility study on construction of a ferroalloys plant at Franceville was being conducted by Société Gabonaise des Ferroalliages (SOGAFERRO). Principal shareholders in SOGAFERRO were Okura Trading Co., Ltd. (25%), COMILOG (15%), the Gabonese Government (10%), Union Carbide Corp. (10%), Acièrs de Paris (10%), Elkem-Spigerverket A/S (Norway) (10%), Applications de la Chimie de l'Electricité et des Métaux S.A. (Sadacem) (Belgium) (10%), and an Italian firm (10%). Production of 85,000 tons of ferromanganese and 50,000 tons of silicomanganese was scheduled to begin in 1981. Four blast furnaces were to be powered by the 210-megawatt power station under construction at the Grand Poubara dam. The $75 million plant would produce ferromanganese and silicomanganese for export to the United States, Europe, and Japan.

Uranium.—Compagnie des Mines d'Uranium de Franceville (COMUF) planned to increase uranium metal production from 950 tons in 1976 to 1,000 tons in 1978 through underground exploitation of the Oklo mine. Shareholdings in COMUF were altered during the year to give the Gabonese Government 25%, Compagnie de Mokta 28.13%, the French Commissariat à l'Énergie Atomique (CEA) 15%, Minatome S.A. 13.12%, Compagnie Française des Minerais d'Uranium 7.5%, Cie. des Mines de Huaron 3.75%, and Compagnie de Gestion d'Investissements Internationaux (COGEI) 7.5%. COMUF mined the Mounana deposit, located 25 kilometers north of Moanda, from 1961 to 1975 and produced a total of 5,700 tons of uranium metal. Open pit mining at the Oklo deposit, discovered in 1968 about 2 kilometers south of Mounana, began in 1970. Preparations were underway for underground mining to begin at Oklo in 1978. Feasibility studies were being conducted on exploitation of the Boyindzi deposit, 400 meters north of Mounana, and the Okelobondo deposit, 500 meters south of Oklo. Total reserves at the three deposits were estimated at 20,000 tons of uranium metal.

Uranium exploration was continued by CEA, which held two prospecting licenses in 1976. A $4 million exploration program was being conducted in the Franceville concession which covered 45,000 square kilometers. CEA was negotiating with Union Carbide and Urangesellschaft mbH & Co. K.G. (West Germany) for partial financing of exploration in this area. Partners were also sought for investment in the Estuary concession covering 4,000 square kilometers in the Cocobeach region. The Gabonese Government was also discussing possible financing of uranium exploration and exploitation with the Iranian Government and the South Korean firm Ssangyong Co., Ltd.

Ore mined at Mounana and Oklo contained an average of 5% U_3O_8. The Mounana processing facility, which reached a capacity of 240,000 tons of ore in 1976, produced preconcentrates containing between 35% and 55% uranium. Final processing was done at the Gueugnon plant at Saône-et-Loire, France. A plant to produce yellowcake with a content of 70% to 75% uranium was scheduled for completion at Mounana in 1978. Capacity of the plant, which would cost $40 million, was to be 1,000 tons per year of contained metal.

The Gabonese Government concluded a new agreement with COMUF in January 1976, retroactive to January 1975. The agreement included provisions for construction of the yellowcake plant at Mounana, participation of the Gabonese Government in deciding prices and customers for uranium metal, preparation of a plan for "Gabonization" of the company and training of nationals, and sale of all output to CEA through yearend 1978. More significantly, Gabon's revenues from uranium production would be augmented by an increase in the gross profits tax from 25% to 50% and in the turnover tax from 12% to 28%.

NONMETALS

Cement.—Gabon's cement consumption increased from approximately 40,000 tons to 180,000 tons per year during 1966–76. In order to reduce its dependence on imported cement, Gabon undertook expansion of existing facilities and the construction of two new cement plants. Gabon's only clinker-grinding plant, owned by Société des Ciments d'Owendo, increased production capacity from 90,000 tons to 270,000 tons per year by the installation of an additional grinder in September 1976. Total production in 1976 was reported at 115,000 tons.

The expansion was funded by a $3.5 million loan from Caisse Centrale de Cooperation Economique (CCCE). Principal shareholders in the Owendo plant were the Gabonese Government (20%) and Ciments Lafarge S.A. (France) (71.3%).

Société des Ciments de Gabon was created in May 1976 to construct a cement plant utilizing limestone from deposits at N'Toum, where reserves were estimated at 20 million to 30 million tons. The cement plant, located 40 kilometers from Libreville, would produce 350,000 tons of clinker per year which would be processed at Owendo (250,000 tons) and at a new clinker-grinding plant to be built at Franceville (100,000 tons). Construction of the two facilities would be by Creusot-Loire Entreprise S.A. (France). Total costs, estimated at $70 million, were to be financed by a consortium of banks including the Banque de l'Union Européene and the Banque de Paris et des Pays Bas (Suisse) S.A. Shareholders in the N'Toum plant were the Gabonese Government (51%), Elf Gabon (19%), Ciments Lafarge (15%), and Société des Ciments d'Owendo (15%). Cement production for both domestic use and export was to commence in 1979.

Fertilizer Materials.—A plant to produce 60,000 tons of ammonia per year was under construction at Port-Gentil. The $27 million plant was owned by N'Ren Corp. (United States) (35%), Elf Gabon (31.85%), and the Gabonese Government (33.15%). Startup was scheduled for 1977 with the greater share of production to be exported to other African countries.

Marble.—A new marble cutting and polishing plant was completed at Tchwanga, near Doussé-Ossou, where reserves were estimated at 2 million tons. The plant was operated by Société Italo-Gabonaise des Marbres (SIGAMA), owned by the Gabonese Government (25%) and a consortium of Italian firms (75%). The $4.4 million plant was constructed by an Italian firm. Approximately 80% of the annual output of 40,000 tons per year was to be exported.

MINERAL FUELS

Natural Gas.—Gabon's natural gas reserves were estimated at 6.6 trillion cubic feet. Approximately 52 billion cubic feet of associated gas was produced during the year. Nearly 2 billion cubic feet was used to generate electricity in Port-Gentil and to power oil installations at Cap Lopez; the remainder of the output was flared.

Petroleum.—*Exploration.*—Oil exploration, which began in 1928 in Gabon, continued both onshore and offshore in 1976 under concessions granted to about 20 international companies (see table 4). Despite difficult physical conditions, the small size of deposits, and stringent Government terms, the number of companies engaged in exploration has steadily increased. The terms of the prospecting licenses required producing companies to reinvest up to 10% of their profits in domestic industrial enterprises, Government participation of 25% in case of commercial discovery, refining of 50% of crude output in local facilities, and training of local personnel. It was estimated that approximately $440 million would be spent on exploration in the period 1976–80. Prospecting licenses covered an area of 155,000 square kilometers and activity was concentrated in the coastal area and regions like the Nyembe forest near Lambaréné.

Elf Gabon was the most active company engaged in oil exploration, with shares in five offshore and three onshore concessions. In one of three offshore concessions held in conjunction with Mitsubishi Oil Co., Ltd., oil was struck in early 1976. Onshore, Elf Gabon was the operator for a group that struck an 850-barrel-per-day flow in the Olendé No. 1 well at the edge of the Ogooué area. Remaining shares in the concession were held by five U.S. firms—Ocean Drilling & Exploration Co. (ODECO), Ocean Oil and Gas Co., Murphy Oil Corp., Kewanee Industries, Inc., and Ensearch Corp.

Shell Gabon held one concession on its own, the Atlantique license, and shares in three other exploration permits. In 1976, Shell Gabon conducted an aerial photographic survey on 8,000 square kilometers in the Setté Cama region and completed a seismic survey on 450 square kilometers in the Ndogo Lagoon. Offshore, Shell Gabon concentrated its activity in the Mayumba Grand Fonds concession, held jointly by Elf Gabon, Gulf Oil Co. of Gabon, Hispanoil, and Shell Gabon.

In 1976, the Inguessi Marine concession, formerly held by Ashland Oil Inc., was acquired by British Petroleum Co. Ltd.

Table 4.—Gabon: Petroleum exploration concessions in 1976

Location	Operator/Shareholders	Expiration date	Area (square kilometers)
Port-Gentil, Nord et Sud	Elf Gabon/Mitsubishi	NA	4,774

(BP) in partnership with three West German firms. Shares were divided among BP (30%), Wintershall Aktiengesellschaft (37%), Deutsche Schactbau und Tiefbohregesellschaft (16.5%), and Preussag Aktiengesellschaft (16.5%). Exploration was to begin in early 1977.

Production.—Petroleum production in Gabon, Africa's fifth largest producer and the most recent member of the Organization of Petroleum Exporting Countries (OPEC), remained at the 1975 level of approximately 11 million tons. Gabon began producing oil in 1957 with the development of inland deposits in the vicinity of Port-Gentil, and passed the symbolic 10-million-ton-per-year mark in 1974. Total production was maintained at this level owing to a series of small discoveries brought onstream in the past 2 years, but was expected to decline as a result of the depletion of older fields. The oil basin of Gabon, approximately 645 kilometers long and 241 kilometers wide, extends along the west African coast south of the Gulf of Guinea. Although there are a few large oilfields, most of the fields are of moderate size, and approximately 80% of oil production originates from offshore deposits (see table 5). Recoverable oil reserves were estimated at 100 million tons in 1976.

Three different types of crude were produced in Gabon: Mandji oil of 30° API gravity in the area of Port-Gentil, Gamba oil of 31.7° API gravity in the area near Setté Cama, and Lucina oil of 30.9° API gravity farther south near Mayumba. In 1976, the price of Mandji crude was raised 14% from $11.55 to $13.20 per barrel, and the price of Gamba crude was raised 13% from $12.00 to $13.50 per barrel. The largest producer in Gabon was Elf Gabon, a subsidiary of Essence et Lubrificants de France-Entreprise de Recherches et d'Activités Pétrolières (Elf-Erap), with about 85% of total production. Lesser producers were Shell Gabon, a subsidiary of Royal Dutch/Shell, with 12% of production, and Gulf, with 1% of production.

Elf Gabon, owned 25% by the Gabonese Government and 75% by Elf-Erap, operated 18 fields on its own and several others in conjunction with other companies. The largest producing field was Grondin, which accounted for about one-fourth of total Gabonese production from 20 wells. The Grondin Field, situated 80 kilometers south of Port-Gentil, was being used as a test site for deepwater production technology. In the same vicinity as Grondin were the Mandaros, Barbier, and Gonelle Fields; Gonelle was the latest in a chain of discoveries made south of Cap Lopez, beginning production in 1976 at a rate of 2,000 barrels per day. The three-field, offshore Anguille complex, located immediately southwest of Port-Gentil, was undergoing a water-injection program to

boost production. The combined flow rate of the Anguille Marine, Anguille Northeast, and Anguille Southwest Fields was about 43,000 barrels per day in 1976.

Two smaller fields to the north were brought onstream in 1976 by Elf Gabon, in conjunction with Mitsubishi. The Merou Field, located 105 kilometers south of Cap Lopez, started production in July 1976 at an initial rate of 1,000 barrels per day. The Baliste Field, 80 kilometers south of Cap Lopez, started producing in September 1976 at an initial rate of 2,000 barrels per day. Elf Gabon, in conjunction with the U.S. firms ODECO and Ocean Oil and Gas, also brought the offshore Breme Field near Batanga into production in 1976.

Shell Gabon, owned 25% by the Gabonese Government and 75% by Royal Dutch/Shell, started oil production jointly with Elf Gabon at the Gamba Field in 1963 and the Ivinga Field in 1968. In 1976, secondary recovery was being used to maintain production at the two fields, situated onshore near Setté Cama. The Lucina Field, located off the southern coast near the Congolese border, was brought into production in 1974 by Shell Gabon (50%), in a venture with Gulf (30%) and Elf Gabon (20%).

Table 5.—Gabon: Oilfields, 1976

Company and location	Discovery date	Date of first production	Average rate of production (barrels per day)	Gravity (°API)
Elf Gabon:

[1] Onshore.

Refining.—The refinery operated by Société Gabonaise de Raffinage (SOGARA) at Port-Gentil produced about 7 million barrels of refined products in 1976. The refinery was supplied with crude oil from the deposits of Mandji Isle by an 18-kilometer, 8-inch-diameter pipeline. SOGARA was owned 30% by the Gabonese Government, 18.75% by Elf Gabon, 18.75% by Compagnie Française des Pétroles, and the remainder by a group of petroleum marketing companies. About 40% of its production went to Société Nationale de Distribution Pétrolière, the Gabonese national oil distribution company, and the remainder was sold to Gabon's partners in the Central African Economic and Customs Union, which included Cameroon, the Central African Empire, Chad, and the Congo.

Preliminary trial operations at Gabon's second refinery at Port-Gentil began in June 1976, and production for export was to commence at yearend. The refinery was operated by COGER, owned 30% by the Gabonese Government and 70% by Elf Gabon. Capacity of the COGER refinery was 10 million barrels per year.

The Mineral Industry of East Germany

By Nikita Wells [1]

In 1976, East Germany remained the world's leading producer of lignite and the third largest producer of potash, producing approximately 28% and 13%, respectively, of total world output. Apart from these commodities, salt, building sand, and a moderate amount of natural gas that was discovered in 1971, East Germany can be considered relatively poor in raw materials and thus dependent upon imports for most of its mineral requirements. In 1976, the U.S.S.R. supplied 97% of East Germany's iron ore, about 40% of its pig iron and rolled steel, 87% of its crude oil, and about 40% of its natural gas. The U.S.S.R. also provided 60% to 70% of East Germany's nonferrous metal demand. In return for the raw materials, East Germany is helping to build projects in the U.S.S.R. such as the Orenburg gas pipeline, the Kiyembay asbestos complex, the Ust-Ilimsk pulp and paper complex, and several oil refining complexes, and is participating in the development of some iron ore deposits.

East Germany was stepping up its investments in developing the lignite mining industry, which is to continue to be its primary source of energy. Other major investments are concentrated on the petrochemical and chemical industry, metallurgy, exploration and exploitation of indigenous energy sources, and the potash industry. A special effort was also being made in recycling to derive secondary raw materials.

East Germany's national income grew 3.7% in 1976, 1.6% below the planned growth rate of 5.3%. This resulted mainly from the severe drought in the summer of 1976 that caused a sharp drop in agricultural output. Industrial production during the year increased 14 billion marks [2] or 5.9% over that of 1975.

PRODUCTION

East Germany's iron and steel industry showed a moderate increase in production in 1976. Crude steel increased 4.0%, pig iron 2.9%, and steel semimanufactures 7.3%. East Germany's iron ore resources are almost depleted and present production is low; production of most nonferrous metal ores is on the decline.

In the nonmetals industry, production of potash increased 4.7% over that of 1975. This was owing mainly to new developments at Kalibetrieb Zielitz potash combine. Production of nitrogen fertilizers in 1976 increased 44.2% over that of 1975 owing to the full operation of three new production units of the VEB Stickstoffwerk Piesteritz plant.

In the mineral fuels area, production of indigenous fuels remained constant.

Production statistics for many of East Germany's mineral commodities are not officially reported. Therefore, much of the data presented in table 1 are estimated.

[1] Physical scientist, International Data and Analysis.

[2] Because of fluctuating exchange rates, a meaningful conversion from East German marks to U.S. dollars is impractical. The published official exchange rate as of December 1976 was 2.40 marks = US$1.00.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, magnesium, peat, and a variety of crude nonmetallic construction materials (clays and stone) are produced, but output is not reported and available general information is inadequate for reliable estimates of output levels.

[2] Source indicates that data include "roasted ore," presumably roasted pyrite.

[3] Total of reported figures only; no estimates have been made for unreported products and/or refinery fuel and losses.

TRADE

In 1976, East Germany's total foreign trade turnover increased 14% over that of 1975, reaching 84.8 billion marks. In 1975, 69.7% of the trade was with other centrally planned economy countries, 25.9% was with developed market economy countries, and 4.4% was with developing countries. About 35.6% of the trade was with the U.S.S.R. alone.

East Germany's principal trading partners for 1975, in order of importance, with their respective values of total trade turnover in billion marks, were as follows:

U.S.S.R	26.5
Czechoslovakia	6.9
Poland	6.6
West Germany	5.0
Hungary	4.0
Bulgaria	2.4
Romania	2.0
Other	21.0
Total	74.4

East Germany incurred a record high trade deficit of $2.68 billion in 1976, approximately 50% above the 1975 deficit. This resulted mainly from sharp increases in the prices of raw materials supplied by Council for Mutual Economic Assistance (CMEA) countries,[3] especially the U.S.S.R.

In 1976, as in previous years, East Germany's mineral exports consisted mainly of potash, brown coal briquets, rock salt, kaolin, iron and steel semimanufactures, and some petroleum products. Only the exports of potash and brown coal briquets were of significance.

Of the large list of mineral imports, crude oil is the most significant with 18 million tons imported in 1976. Other important imports include natural gas, bituminous coal, coke, iron ore, pig iron, rolled steel, nonferrous metals, phosphate rock, apatite concentrate, and chemical products.

[3] Includes the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

COMMODITY REVIEW

METALS

Aluminum.—In 1976, East Germany's domestic aluminum consumption was estimated at 200,000 tons per year, while the output of primary metal remained approximately 70,000 tons. Primary aluminum comes from the Bitterfeld electrochemical combine, with an estimated annual capacity of 65,000 tons, and the Lauta aluminum works, with an annual capacity of 25,000 tons. In 1975, East Germany imported 114,454 tons of aluminum from the U.S.S.R.

In 1976, alumina production reached 44,468 tons and came from East Germany's only alumina plant, located at Lauta, having a capacity of 70,000 tons per year. All of East Germany's bauxite is imported, mainly from Hungary and Yugoslavia.

Cadmium.—Estimated cadmium production in 1976 was 18 tons of metal, while estimated consumption was 450 tons. In 1975, 208 tons of cadmium was imported from the U.S.S.R. East Germany's cadmium is obtained mainly as a byproduct of the smelting of zinc and other nonferrous metals at the VEB Mansfeld Kombinat "Wilhelm Pieck," located at Eisleben, and at the "Elektro" works at Weida, Thuringia.

Copper.—Primary copper production in East Germany has virtually come to a standstill. The deposits at Mansfeld-Eisleben-Hettstedt are almost depleted and the mines were closed in 1974.

The copper mines near Sangerhausen, however, maintained their output during 1976. East Germany does not publish its copper production or import figures, but in 1976 as in the past, most of the copper was imported from the U.S.S.R.

A copper drawing and rolling mill was under construction during 1976 at the copper and silver works in Hettstedt, which is part of the VEB Mansfeld Kombinat. The mill is to be completed in 1979 and was developed jointly with the U.S.S.R. It is to help meet the increasing demand for copper wire in the electrical and cable industry.

Iron and Steel.—In 1976, East Germany produced 6.7 million tons of crude steel (up 4.0%), 2.5 million tons of pig iron (up 2.9%), and 4.6 million tons of steel semimanufactures (up 7.3%). East Germany's iron ore resources are almost depleted and production figures are no longer reported. Production of steel and pig iron is also inadequate to meet domestic demand, making East Germany dependent upon imports for a large share of its requirements for these commodities. About 97% of the iron ore and 40% of the pig iron and rolled steel are imported from the U.S.S.R. In 1977, the U.S.S.R. is to provide East Germany with 630,000 tons of pig iron and 1.1 million tons of rolled steel products.

At yearend 1976, work was being completed on the 30-ton plasma furnace at the Freital high-grade steel works. This furnace, which was developed in Novosibirsk, U.S.S.R., was a joint effort between East Germany and the U.S.S.R. It is to operate at a temperature of 15,000° C for melting high-alloy steels having an extremely low carbon content. Argon gas will be used to stabilize the electric arc and to shield the melting mixture from impurities. Short melting times will be available with this furnace since the arc can reach a maximum temperature of 30,000° C.[4]

Expansion has been progressing at the Wilhelm Florin steelworks located at Hennigsdorf, west of East Berlin. A 200,000-ton-per-year rod mill was commissioned in 1976 and a 175,000-ton-per-year arc furnace has been ordered. The iron ore sintering plant at Eisenhüttenstadt went into operation with a design capacity of 4 million tons of sinter per year. This plant was designed by the Institute of Metallurgical Plants and Factories of Bucharest and was built by Romanian engineers.

To maintain its steel production, East Germany placed emphasis on the reconstruction and completion of rolling mills and steel production plants. During the 1976–80 5-year plan, 3 billion marks are to be spent on modernizing and equipping foundries. East Germany is also placing emphasis on recovering secondary metallurgical raw materials.

[4] Berliner Zeitung (East Berlin). Jan. 15–16, 1977, p. 13.

The total number employed in the iron and steel industry in 1976 was 122,700, an increase of 3,300 over that of 1975.[5] Foundries comprise 450 enterprises and employ approximately 60,000 people.

Lead and Zinc.—Lead and zinc data are not reported by East Germany, and primary production is assumed to have declined to insignificance owing to depletion of ore reserves. Secondary lead and zinc production in 1976 was estimated at 36,000 tons and 18,000 tons, respectively. Estimated consumption was 85,000 tons for lead and 62,000 tons for zinc. In 1975, East Germany imported 47,009 tons of lead and 40,553 tons of zinc from the U.S.S.R.

East Germany's indigenous resources of lead and zinc consist of low-grade complex polymetallic ores that contain lead, zinc, silver, pyrites, and fluorspar in thin beds mined in the vicinity of Freiberg. The ores are concentrated by flotation at two plants at Freiberg.

Nickel.—Estimated nickel production in 1976 was 2,500 tons, compared with 2,400 tons in 1975. Nickel production had been rising in the past few years owing to modernization of the nickel industry which is centered at the Aue (St. Egidien) nickel plant.

Tin.—Tin production for 1976 was estimated at 1,200 tons, unchanged from that of 1975. Tin production is to increase 43% to 45% during the present 5-year plan by renovating and expanding existing mining and ore-processing capacities. The first stage of the Albert Funk smelting combine at Freiberg was put into operation during 1976. It is now processing the low-grade ores of the large tin ore deposit near Altenberg.

East Germany's tin deposits are located in the Erzgebirge along the southeastern border of the country, with mines at Altenberg, Sadisdorf, and Ehrenfriedersdorf. The ore contains 0.2% to 0.35% tin and is beneficiated by gravity concentration to approximately 40%.

NONMETALS

Barite.—Barite production in 1976 was estimated at 31,000 tons, as in the past few years, providing for domestic demand and leaving about one-third for export. Barite is processed at the Lengenfeld fluorite and barite plant in the south of the country.

Cement.—Production of cement in 1976 reached 11.3 million tons, a 6.4% increase over that of 1975. East Germany has 11 cement plants dispersed throughout the country. The largest plant is the Karsdorf cement works near Halle with an annual production of 4.3 million tons. The Deuna cement works near Erfurt is being expanded and is to reach a 2.5-million-ton-per-year capacity in the near future.

East Germany's cement production is to be increased 25% by 1980 through the better utilization and expansion of existing facilities. Geological exploration for cement raw materials is being continued in the Posewald area and is to be completed by yearend 1977.

Chalk.—Chalk production for 1976 was estimated at 50,000 tons. Europe's largest compact chalk deposits are located on East Germany's Rügen Island near Sassnitz. The deposits are being strip mined in the Wittenfelde chalk quarry on the Jasmund Peninsula, and are so vast that they will be able to supply the country's demands for many years.[6] Presently, about 400 enterprises in East Germany are obtaining chalk from Rügen Island, which is being used in making numerous products. About one-fourth of the annual chalk production is exported.

Clays.—East Germany is planning an annual increase of 5% to 6% in the production of clays during the 1976–80 period. To insure this output, the opening of new deposit sites of white burning clay is planned at Rossbach in the Halle District, of fireproof clay at Guttau in the Cottbus District, and of vitreous sand at Hohenbocka, also in the Cottbus District. High-quality kaolin is to be provided by the opening of a new kaolin works at Cominau in 1977 and by additional construction projects at the works in Salzmünde, Spergau, and Kemmlitz.[7] The kaolin deposit situated near Bautzen is the richest in East Germany.

Fertilizer Materials.—East Germany's total fertilizer production in 1976 reached 4.4 million tons of nutrients (nitrogen,

[5] United Nations. The Steel Market in 1976. ECE Report. Steel/WP.1/R.5/Add. 5, Apr. 4, 1977, pp. 1–2.
[6] IWE Tagesdienst (Bonn). Feb. 1, 1977, p. 2.
[7] Presse-Informationen (East Berlin). Dec. 14, 1976, p. 6.

P_2O_5, and K_2O content). Potassic fertilizers constituted 72% of the total, nitrogenous fertilizers 18%, and phosphatic fertilizers 10%.

Nitrogen.—Production of nitrogenous fertilizers in 1976 reached a total of 776,000 tons (nitrogen content), an increase of 44.2% over that of 1975. Production is centered around Leipzig in the south, with one important plant located at Schwedt near the Polish border. The increase in production is mainly owing to the full operation of three new units of the VEB Stickstoffwerk Piesteritz, including a 345,000-ton-per-year nitrogenous fertilizer and plastics-grade urea plant constructed by Czechoslovakia, a 450,000-ton-per-year ammonia plant designed by M. W. Kellog Co. and constructed by Toyo Engineering Corporation, and a 350,000-ton-per-year urea plant. An estimated 80% to 90% of the urea produced at these new plants is used for fertilizer purposes.[8] East German nitrogenous fertilizer imports in 1975 amounted to 111,800 tons.

Phosphate.—East Germany has virtually no phosphatic raw materials and therefore must import phosphate. In 1975, East Germany imported a total of 509,700 tons (P_2O_5 content) of raw phosphate and apatite concentrates and 32,300 tons of phosphatic fertilizers, most of which came from the U.S.S.R. East Germany's production of phosphatic fertilizers in 1976 was 423,000 tons (P_2O_5 content).

Potash.—In 1976, East Germany remained the world's third largest producer of potash, with 13% of total world output. Production reached 3.2 million tons, a 4.7% increase over that of 1975.

Exports of potash in 1975 totaled 2.25 million tons, of which 1.44 million tons went to CMEA countries and 483,000 tons went to Western Europe. In 1976, exports of potash totaled 2.43 million tons.

East Germany went through a period of improving the potash industry in the early 1970's by closing down smaller submarginal mines, commissioning new capacities, and upgrading the quality of the product. These improvements have enabled East Germany to increase production of potash despite the closing of several mines. A major event was the commissioning of the potash mine and refinery of Kalibetrieb Zielitz, about 10 kilometers north of Magdeburg. The refinery, which is to reach a capacity of 900,000 tons of K_2O per year when in full operation, has four lines of flotation cells that yield a standard-grade potassium chloride (minimum 60% K_2O) as the principal product. The commissioning of the mine more than replaced the capacity lost by the closing of the Saale group of mines.[9]

East Germany's potash industry was restructured in 1970 when the VEB Kombinat Kali was formed. The industry is now divided into four groups, each responsible for several mines. The Kalibetrieb Werra controls the mines at Unterbreizbach, Merkers, and Dorndorf in the southwestern part of the country. The Kalibetrieb Süd Harz is responsible for the operations of six mines at Rossleben, Sondershausen, Sollstedt, Bleicherode, Menteroda, and Bischofferode, all in the Harz region. The Kali und Steinsalzbetrieb Saale consisted of only one potash mine at Teutschenthal. The Kalibetrieb Zielitz operates East Germany's newest mine at Zielitz.[10]

Sulfur.—*Sulfuric Acid.*—Sulfuric acid production in 1976 was 957,000 tons. This production should increase as soon as the newly built plants at Magdeburg, Seelingstädt, and Nünchritz go into full operation.

MINERAL FUELS

In 1976, East Germany produced 247 million tons of lignite, 550,000 tons of bituminous coal, 8.0 billion cubic meters of natural gas, and 350,000 tons of crude oil. During the same year, it imported 18.0 million tons of crude oil, 4.0 billion cubic meters of natural gas, 6.1 million tons of bituminous coal, and 2.9 million tons of coke. Exports amounted to 2.3 million tons of brown coal briquets and approximately 3.0 million tons of petroleum products. In 1980, East Germany expects to maintain its lignite, natural gas, and crude oil production at approximately the 1976 levels. Indigenous bituminous coal is expected to be depleted before 1980, and imports of natural gas and crude oil are to increase considerably.

East Germany produced a total of 89.2 billion kilowatt-hours of electric energy in

[8] Nitrogen (London). No. 100, March/April 1976, p. 15.
[9] Phosphorus and Potassium (London). No. 87, January/February 1977, pp. 40–43.
[10] Page 41 of work cited in footnote 9.

1976; by 1980 this figure is to reach 104 billion to 109 billion kilowatt-hours. More than 80% of the electric power presently produced is from lignite. Domestic lignite will continue to be the primary energy source; its share in 1980 is expected to be approximately 60%. Electric energy produced by nuclear powerplants in 1976 totaled 7.5 billion kilowatt-hours or 8.4% of the total electric energy produced.

East Germany's total primary energy consumption for 1976 reached an estimated 121.7 million tons of standard coal equivalent, representing an increase of 1.8% over that of 1975. Coal provided 67.2% of the total primary energy, oil 18.7%, natural gas 13.1%, nuclear energy 0.7%, hydroelectric energy 0.2%, and imported electric energy 0.1%.

The production of primary energy derived from domestic fossil fuels, nuclear energy, and hydroelectricity generation in 1976 remained the same as in 1975 at 86.8 million tons of standard coal equivalent. This domestic production represented 71.3% of total primary energy consumption, while imports of primary energy made up 33.4%. The total primary energy balances for 1975 and 1976 are shown in table 4.

Coal.—In 1976, East Germany produced 247 million tons of lignite and 550,000 tons of bituminous coal. The lignite production represented 28% of total world output, making East Germany again the world's top producer. East Germany utilizes more than 40% of its lignite for making fuel briquets, whose production in 1976 reached 48.7 million tons.

In 1976, East Germany imported a total of 6.1 million tons of bituminous coal, of which 4.1 million tons came from the U.S.S.R., 1.3 million tons from Poland, 593,000 tons from Czechoslovakia, and 148,000 tons from West Germany. Coke imports for the same year totaled 2.9 million tons, of which 1.1 million tons came from the U.S.S.R., 751,400 tons from Czechoslovakia, 775,000 tons from Poland, and 204,000 tons from West Germany. Brown coal briquet exports amounted to 2.3 million tons in 1976, continuing the decreasing trend from 6.3 million tons in 1960 and 3.8 million tons in 1970. These exports are primarily to Hungary, Czechoslovakia, West Germany, and Austria.

Lignite is now being mined at 36 surface mines with an output of nearly 700,000 tons per day. The Cottbus region is the principal mining area and produces approximately 50% of the country's total production. This region has the largest and the most productive surface mines, which employ modern large-capacity surface mining equipment. The rest of the lignite mining is done at 20 surface mines in the coal regions of Halle and Leipzig.

Future lignite mining in East Germany will be increasingly difficult owing to unfavorable geological and hydrological con-

Table 4.—East Germany: Primary energy balance for 1975 and 1976

(Million tons of standard coal equivalent [1])

Year	Total primary energy	Coal (lignite, brown, bituminous)	Crude oil and petroleum products	Natural and associated gas	Hydroelectric power	Nuclear power	Electric power
1975:							
Production [2]	86.8	74.6	0.5	10.6	0.2	0.9	--
Imports	38.8	9.1	25.2	4.3	--	--	0.2
Exports	6.0	1.5	4.4	--	--	--	.1
Apparent consumption	119.6	82.2	21.3	14.9	.2	.9	.1
1976:							
Production [2]	86.8	74.6	.5	10.6	.2	.9	--
Imports	40.7	8.7	26.5	5.3	--	--	.2
Exports	5.8	1.5	4.2	--	--	--	.1
Apparent consumption	121.7	81.8	22.8	15.9	.2	.9	.1

[1] 1 ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are: Hard coal, 1.0; lignite and brown coal, 0.3; crude oil, 1.47; natural gas, 1.33 (per thousand cubic meters); and hydroelectric and nuclear power, 0.125 (per thousand kilowatt-hours).

[2] Derived from table 1.

Source: United Nations. World Energy Supplies, Statistical Papers. New York. Ser. J, No. 18, 1975.

ditions. A greater amount of overburden will have to be removed to obtain the same amount of lignite. Ratios of cubic meters of overburden to tons of lignite for the coming years will probably develop as follows:[11] 1960, 2.8:1; 1975, 3.9:1; 1980, 4.5:1; 1985, 4.8:1; and 1990, 5.2:1.

With these more costly mining conditions, the required increase in annual production of 250 million to 254 million tons by 1980 can only be reached by intensification of mining at existing surface mines, fuller mechanization, development of 18 new large open pits in the Halle-Leipzig area and south of Cottbus, and closing down unprofitable mines. By 1980, 76% of the overburden is to be removed by continuous systems including overburden conveyor bridges and belt conveying systems. The percentage is to reach 85% in 1985.

East Germany's total geological resources of lignite as of January 1, 1971, amounted to approximately 38 billion tons. The industrial reserves which can be economically mined and processed with present-day technology amounted to about 26 billion tons. The industrial reserves with an overburden-to-coal ratio of less than 10:1 amounted to 20 billion tons.[12]

The present industrial reserves are located in 144 coalfields. Approximately 45% of all the reserves are found in 23 fields that have resources of more than 250 million tons. Of the remaining 121 fields, 77 have reserves of less than 100 million tons. East German lignite is a lower-rank fuel, possessing a calorific value of approximately one-third that of standard bituminous coal (ranging from 1,800 to 2,700 kilocalories per kilogram or 2,300 to 4,800 Btu per pound). The moisture content ranges from 45% to 56% for the Magdeburg deposits and 52% to 62% for the Lausitz deposits, around Cottbus and Senftenberg. The ash content ranges from 6% to 13%.[13]

East Germany presently uses domestic lignite to produce 80% of its electric power. Lignite will continue to be East Germany's primary energy source; its share of energy production in 1980 is to be approximately 60%.

The surface mines at Jänschwalde and Cottbus-Nord are being developed to supply the Jänschwalde powerplant which will have a capacity of 3,000 megawatts. The Jänschwalde surface mine started producing lignite in 1976 and is to become the largest mine in the future. It will have a 60-meter overburden conveyor bridge that is to begin operating in mid-1978. The mine should then reach design capacity of nearly 20 million tons of lignite per year. The Cottbus-Nord open pit is to produce 15 million tons per year in 1981.[14]

Two other surface mines are to be developed, the Bärwalde and Schlabendorf open pits in the Lausitz region. Reconstruction of the Greifenhain surface mine is to insure a fourfold increase in production in the future. By 1980, newly opened surface mines are to replace depleted annual capacity of 78 million tons and add 35 million tons of new annual capacity.

An institute for lignite mining was established in 1976 at the mining town of Grossräschen, in the Cottbus District. The new facility was evolved from the Brown Coal Rationalization VEB, which ceased operations at yearend 1976. The new institute is to serve as the scientific center for coordination of research, development, and rationalization of lignite mining in East Germany.[15]

Natural Gas.—Natural gas production reached a stable level of approximately 8 billion cubic meters for the past 3 years. Considerable effort is to be exerted to maintain this output in the near future. Recent natural gas production continued to come mostly from the Salzwedel gasfields, located in the Magdeburg District near the West German border, that were discovered in 1971. Before the discovery of these gasfields, natural gas production was around 100 million cubic meters per year and came from a few small gasfields located near Erfurt, Cottbus, and Rostock. In 1970, annual production increased to approximately 400 million cubic meters and then climbed to 2.8 billion in 1971,

5.2 billion in 1972, 7.0 billion in 1973, and is now leveling off at about 8.0 billion. East Germany is still searching for commercial-size reserves by deep drilling in other parts of the country. Present natural gas reserves are estimated at about 100 billion cubic meters.

East Germany imported approximately 3 billion cubic meters of natural gas from the U.S.S.R. in 1975 and about 4 billion cubic meters in 1976, and plans to import 7 billion cubic meters in 1980.

With the other CMEA countries, East Germany is participating in the construction of the Orenburg gas pipeline which is to link the large deposits of natural gas in Orenburg, in the southern Ural Mountains of the U.S.S.R., to the borders of Eastern Europe. East Germany is responsible for a 550-kilometer section of this pipeline that lies in the Ukraine and runs from Kremenchug on the Dnieper River to the town of Bar. This section is to cross several rivers, 10 railroad lines, and 15 main roads. The most difficult task is laying the line across the Dnieper River which is 1,500 meters wide at the crossing point. Upon completion by 1980, this pipeline is to supply Eastern European countries with 15.5 billion cubic meters of natural gas per year. Each of the CMEA countries involved in the construction will receive deliveries of gas for a period of 12 years as payment for participation in the construction of the pipeline.

Petroleum.—Domestic crude oil production remained insignificant with approximately 350,000 tons produced in 1976. A total of 18.0 million tons of crude oil was imported during the year, representing 98% of total crude oil requirements. The U.S.S.R. provided 16.0 million tons, while 2.0 million tons came from Persian Gulf countries. By 1980, oil imports from the U.S.S.R. and Persian Gulf countries are to increase to 19.5 million tons and 3.0 million tons, respectively. The Soviet crude is delivered from Almeteevsk to East Germany through the Friendship oil pipeline. In 1976, East Germany exported an estimated 2.7 million tons of petroleum products.

East Germany's refining capacity reached 18 million tons per year in 1976 and is to increase to 22.5 million to 23 million tons by 1980. Crude petroleum is processed at Schwedt, Böhlen, Zeitz, Lützkendorf, and Leuna. The Schwedt refinery is to be expanded to process 12 million tons of Soviet oil annually by 1980, compared with 9.3 million tons in 1976. The crude oil processing capacity at Leuna is to be raised 7% during the 1976–80 5-year plan.

In spite of considerable efforts to develop domestic oil reserves, East Germany has, so far, discovered only small deposits along the seaboard. Plans have been made for offshore drilling in the Baltic Sea in cooperation with Poland and the U.S.S.R.

Nuclear Power.—In 1976, East Germany produced approximately 7.5 billion kilowatt-hours of electric energy through the use of nuclear powerplants, representing 8.4% of the total electric energy produced in 1976. By 1980, nuclear power is to provide 17.0 billion kilowatt-hours. At present, East Germany has two operating nuclear powerplants. The Rheinsberg powerplant, located approximately 100 kilometers north of East Berlin, has been in operation since 1966 and has a capacity of 70 megawatts. The Bruno Leuschner North powerplant, near Greifswald, has been operating its first 440-megawatt reactor block since 1973 and its second 440-megawatt block since mid-1975. The second stage of this powerplant is presently under construction and is comprised of three 440-megawatt blocks similar to the ones now in operation. Further expansion of the powerplant is to add three 440-megawatt blocks to make a total capacity of 3,520 megawatts. A third nuclear powerplant is in the planning stage and is to be located at Stendal, near Magdeburg. This plant is eventually to consist of eight 440-megawatt reactor blocks, similar to the Bruno Leuschner North plant.[16]

The nuclear powerplants in East Germany, as in other CMEA countries, are being built in very close cooperation with the U.S.S.R., which provides much of the equipment and technology.

The Mineral Industry of the Federal Republic of Germany

By Joseph B. Huvos [1]

In 1976, West Germany was one of the world's major processors and consumers of minerals, most of which were imported. There was, however, a plentiful supply of domestic coal, potash, and salt. The most important mineral products of the country were lignite (15% of the world total), bituminous coal (5%), potash (8%), crude steel (6%), refined copper (6%), smelter zinc (6%), aluminum ingot (6%), barite (5%), and smelter lead (3%).

In 1976, the gross national product (GNP) of the Federal Republic of Germany was $446 billion.[2 3] The contribution of the minerals industry to the total was about 10%; the contributions of the individual branches of the minerals industry in 1975 and 1976 are shown in table 1.

Although the overall economy of West Germany made a fairly good recovery in 1976, mining lost ground on a per-ton

basis, as bituminous coal output fell slightly.

There were no major new capital investments in West Germany's mineral industry. One thermal and one electrolytic zinc plant expanded their facilities. One aluminum smelter changed hands, one lead-zinc mine was closed, and a coal-fired powerplant came onstream. An extensive domestic and foreign exploration program was pursued for securing West Germany's minerals supply.

PRODUCTION

In 1976, production was still under the influence of sluggish market conditions, after the previous year's slump. Production of mineral commodities is shown in table 2, and the following tabulation shows the major producers of mineral commodities in 1976:

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Aluminum	Vereinigte Aluminium-Werke AG (VAW), plants at Norf, Stade, Lünen, Töging, and Grevenbroich, Government	47
Do	Reynolds Aluminium Hamburg GmbH, smelter at Hamburg, Reynolds International Inc. 90%, city government 10%	13
Do	Aluminium-Hütte Rheinfelden GmbH, plants at Rheinfelden, Essen, and Borbeck, Alusuisse	8
Coal	Ruhrkohle AG, mines in Ruhr Basin, VEBA AG 14%, Gelsenberg AG 13%, Salzgitter AG 11%, Sidéchar, France, 8%, and Hoesch AG 8%	76
Do	Eschweiler Bergwerks Verein, mines in Aachen area, Arbed, Luxembourg	8
Do	Saarbergwerke AG, mines in Saar Basin, Government	10
Copper, refined	Norddeutsche Affinerie, refinery at Hamburg, Degussa 40%, Metallgesellschaft AG 40%, and British Metal Corp. Ltd. 20%	80
Ferroalloys	Gesellschaft für Elektrometallurgie mbH, plants at Nürnberg and Eschweiler-Weisweiler, Metallurg Inc., United States	40
Do	Thyssen-Hütte AG, plant at Duisburg-Hamborn	30
Iron and steel	Thyssen-Hütte AG, plants at Duisburg, Bruckhausen, Beeckerwerth and Ruhrort	24
Do	Stahlwerke Peine-Salzgitter AG, mines and plant at Salzgitter, Government	12
Do	Mannesmann AG, plant at Duisburg-Huckingen	10
Do	Fried. Krupp Hüttenwerke AG, plant at Bochum	9
Lead and zinc	Preussag AG Metall, mines at Lüderich, Meggen and Rammelsberg, smelters at Nordenham and Harlingerode, Government	50
Do	Sachtleben Bergbau GmbH, mine and smelter at Lennestadt-Meggen, Metallgesellschaft	38
Do	AG des Altenbergs für Bergbau und Zinkhüttenbetrieb, mine at Lüderich, Vieille Montagne, Belgium	12
Lignite	Rheinische Braunkohlenwerke AG, Aachen-Cologne Basin mines, Rheinisch Westfälisches Elektrizitätswerk AG 100%	76
Petroleum and natural gas.	Shell-Esso-Mobil, fields north of Elbe, Elbe-Wesser, Weser-Ems, Ems Estuary, west of Ems, Upper Rhine Valley, and South Bavaria	54
Do	Gelsenberg AG, Preussag AG, and Salzgitter AG, fields north of Elbe, Elbe-Wesser, Weser-Ems, Ems Estuary, west of Ems, Upper Rhine Valley, South Bavaria	23
Petroleum, refined products.	VEBA AG, refineries at Gelsenkirchen, Salzbergen, and Lingen, Government	44
Do	Deutsche BP AG, refineries at Hamburg, Bucholdtwelmen, and Vottburg, BP	12
Do	Esso AG, refineries at Hamburg, Köln, Karlsruhe, and Ingolstadt, Esso	12
Do	Deutsche Shell AG, refineries at Hamburg, Monheim, Godorf, and Ingolstadt, Shell	10
Potash	Kali und Salz AG, mines at Salzdetfurth, Sigmundshall, and Wintershall, BASF AG 73%	89
Do	Kali-Chemie AG, mine at Friedrichshall, Solvay, Belgium	11
Rare metals	Deutsche Gold und Silberscheideanstalt, (Degussa) refinery at Hamburg	80

Quartz sand ---do---	473	402	423
Quartz sand (unground) and glass sand ---do---	7,301	5,669	6,171
Salt (marketable):			
Rock ---do---	6,982	5,379	6,375
Marine and other ---do---	4,338	3,937	4,942
Stone, sand and gravel, n.e.s.:			
Dimension stone ---thousand cubic meters--	242	210	218
Limestone, industrial ---thousand tons--	59,144	52,574	54,628
Crushed and broken ---do---	124,376	113,115	105,689
Slate [4] ---do---	11	NA	2
Basalt lava and lava sand ---do---	6,597	6,894	5,922
Calcite ---do---	22	7	4
Grinding stone ---cubic meters--	59	NA	NA
Tuff ---thousand tons--	2	3	3
Industrial sands:			
Molding sand ---do---	1,155	1,007	1,002
Other (klebsand) ---do---	197	140	143
Sand and gravel ---do---	183,946	171,476	163,359
Sulfur, elemental byproduct ---do---	429	521	608
Talc including talc schist ---do---	30	21	18
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	299,668	260,992	292,322
Coal:			
Anthracite ---thousand tons--	7,384	7,651	6,628
Bituminous ---do---	87,492	87,742	82,641
Lignite ---do---	126,044	123,377	134,535
Total ---do---	220,920	218,770	223,804
Coke:			
Metallurgical ---do---	r 34,921	34,818	31,951
Gas house ---do---	1,544	1,250	971
Total ---do---	r 36,465	36,068	32,922
Fuel briquets:			
Anthracite and bituminous ---do---	2,249	1,697	1,358
Lignite ---do---	6,326	4,984	4,391

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976 p
MINERAL FUELS AND RELATED MATERIALS—Continued			
Gas:			
Manufactured gas (excluding that from petroleum refineries):			
Blast furnace gas ---million cubic feet--	r 278,879	201,292	201,434
Coke oven gas [5] ---do----	r 287,919	288,414	263,517
Other gas ---do----	r 79,705	74,655	72,359
Total ---do----	r 646,503	564,361	537,310
Natural:			
Gross production ---do----	734,787	645,445	665,537
Marketable production ---do----	713,202	639,414	658,050
Peat:			
Agricultural use ---thousand tons--	1,871	1,950	1,904
Fuel use ---do----	187	226	238
Petroleum:			
Crude ---thousand 42-gallon barrels--	44,718	41,470	39,902
Refinery products:			
Gasoline, aviation and motor fuel ---do----	163,944	115,378	147,439
Jet fuel ---do----	12,365	11,789	10,799
Kerosine ---do----	529	257	378
Distillate fuel oil ---do----	307,810	269,543	301,929
Residual fuel oil ---do----	210,135	144,088	158,397
Lubricants ---do----	8,787	8,444	9,081
Other:			
Liquefied petroleum gas ---do----	32,511	26,498	32,680
Bitumen ---do----	27,479	24,274	23,063
Unspecified ---do----	45,772	90,132	98,534
Refinery fuel and losses ---do----	40,185	35,762	38,230
Total ---do----	849,517	726,165	820,530

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Primary nickel and nickel contained in ferronickel, Monel metal, and nickel oxide directly used by the steel industry.

[2] K_2O equivalent of potassic constituent not added to K_2O equivalent of marketable crude and chemically processed potassic fertilizers because this would result in double counting.

[3] Produced in part from imported crude graphite.

[4] Exclusive of slate recovered from mine dumps.

[5] Includes water gas and generator gas from coke ovens.

TRADE

In 1976, West Germany traded with most countries of the world (151), although the countries of the European Economic Community (EEC) were its principal trading partners. The country's 1976 trade balance was favorable, but the surplus was expected to disappear almost completely by 1977. Mineral commodities exported included petrochemicals, petroleum products, iron, steel, semifinished steel products, nonferrous metals, and semifinished products. Principal mineral imports consisted of crude oil, natural gas, petroleum products, nonferrous metals, iron and steel, iron ore, and crude minerals. West German trade in 1974 and 1975 is shown in tables 3 and 4.

Table 3.—Federal Republic of Germany: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS			
Aluminum:			
Bauxite	1,255	10,178	Republic of South Africa 4,035; Belgium-Luxembourg 3,616.
Alumina	245,379	227,639	Canada 45,497; Netherlands 32,095.
Aluminum hydroxide	123,398	111,172	Sweden 45,554; Netherlands 21,365.
Metal including alloys:			
Scrap	31,756	27,711	Netherlands 12,402; Italy 7,838; France 6,251.
Unwrought	174,309	159,658	France 42,751; Netherlands 28,114; Belgium-Luxembourg 22,578; Italy 17,753.
Semimanufactures	278,173	195,538	France 43,671; Netherlands 27,518; Belgium-Luxembourg 23,752; Norway 13,901.
Antimony:			
Ore and concentrate	55	7	NA.
Metals including alloys, all forms	196	111	Belgium-Luxembourg 45; Netherlands 40.
Arsenic hydroxide and acids	295	609	Italy 246.
Beryllium metal including alloys, all forms kilograms	(1)	8	Mainly to Czechoslovakia.
Bismuth metal including alloys, all forms	274	401	United Kingdom 84; United States 50.
Cadmium metal (including rhenium), including alloys, all forms	237	408	United States 20; Netherlands 10.
Chromium:			
Chromite	3,679	3,014	Mainly to Austria.
Oxide and hydroxide	10,558	7,147	NA.
Metal including alloys, all forms	331	106	Italy 56; Belgium-Luxembourg 36.
Cobalt:			
Oxide and hydroxide	56	NA	
Metal including alloys, all forms	286	222	Austria 45; Sweden 34; Belgium-Luxembourg 22.
Columbium and tantalum metal including alloys, all forms:			
Columbium kilograms	11,959	15,858	Mainly to Belgium-Luxembourg.
Tantalum do	59,281	29,331	Mainly to France.
Copper:			
Ore and concentrate	5,015	NA	
Matte	NA	1,182	All to Belgium-Luxembourg.
Copper sulfate	1,541	270	NA.
Metal including alloys:			
Scrap	41,790	28,493	Italy 10,194; Austria 5,221; Netherlands 3,835; Belgium-Luxembourg 3,423.
Unwrought:			
Blister	50,222	38,463	United Kingdom 20,743; Belgium-Luxembourg 16,520.
Refined	82,440	49,790	Austria 8,541; Netherlands 7,775; Switzerland 7,063; France 6,999.
Alloys	7,415	6,597	Italy 1,677; Austria 873; Netherlands 842; Sweden 755.
Master alloys	1,024	724	France 605; Belgium-Luxembourg 75.
Semimanufactures	224,827	169,519	France 23,211; Netherlands 22,726; Belgium-Luxembourg 12,412.
Gallium metal including alloys kilograms	NA	97	Switzerland 65; Netherlands 15.
Germanium metal including alloys, all forms value	$143,524	$89,981	France $43,741.
Gold:			
Ash and waste kilograms	(2)	198	NA.
Scrap and sweepings thousand troy ounces	(3)	36	All to Hungary.
Metal:			
Unwrought do	288	493	Switzerland 141; Israel 117; Singapore 55.
Semimanufactures do	7,858	178	United Kingdom 54; Italy 22.
Iron and steel:			
Ore and concentrate	5,086	4,551	NA.
Roasted pyrite	195,784	139,198	Mainly to Belgium-Luxembourg.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS—Continued			
Iron and steel—Continued			
Metal:			
Scrap ---thousand tons--	2,545	2,206	Italy 1,763; Belgium-Luxembourg 132.
Pig iron including cast iron --do----	1,361	763	France 274; Italy 169.
Sponge iron, powder and shot--do----	27	22	Italy 3; Netherlands 3; Switzerland 3; France 2.
Spiegeleisen ---do----	4	2	Italy 1; Switzerland 1.
Ferroalloys:			
Ferrochrome ---do----	41	31	Italy 7; United States 6; Belgium-Luxembourg 5; France 4.
Ferromanganese ---do----	79	41	Belgium-Luxembourg 12; France 8; Italy 4; Canada 3; Netherlands 3.
Ferronickel	147	53	All to Belgium-Luxembourg.
Ferrosilicon ---thousand tons--	24	16	Italy 2; Austria 1; France 1; Netherlands 1.
Ferrosilicochrome ---do----	1	1	Mainly to Italy.
Ferrosilicomanganese	1,213	567	Switzerland 283; Italy 100; Belgium-Luxembourg 89.
Other ---thousand tons--	17	13	Italy 2; Romania 2; Austria 1; France 1; Spain 1; Sweden 1.
Steel, primary forms ---do----	2,622	2,345	France 345; Belgium-Luxembourg 302; United Kingdom 258; Italy 222.
Semimanufactures:			
Bars, rods, angles, shapes, sections do----	6,086	3,684	France 750; Poland 243; U.S.S.R. 226.
Universals, plates, sheets--do----	7,898	5,268	U.S.S.R. 911; France 726; Netherlands 475; United States 381.
Hoop and strip ---do----	1,340	883	U.S.S.R. 137; Netherlands 110; France 94; Poland 70.
Rails and accessories ---do----	210	278	Republic of South Africa 97; Italy 45; Poland 33; Netherlands 27.
Wire ---do----	493	286	France 45; Netherlands 40; Belgium-Luxembourg 25.
Tubes, pipes, fittings ---do----	3,710	3,635	U.S.S.R. 986; Netherlands 566; France 155; United Kingdom 151; Poland 148.
Castings and forgings, rough do----	102	94	France 16; Belgium-Luxembourg 14; Netherlands 10.
Lead:			
Ore and concentrate	3,689	3,433	Belgium-Luxembourg 2,040; Austria 1,080.
Oxides	10,404	8,880	Netherlands 4,185; Sweden 1,195.
Metal including alloys:			
Scrap	16,701	17,769	Netherlands 6,762; Belgium-Luxembourg 4,133; Italy 4,054; France 2,381.
Unwrought	87,749	80,902	Italy 30,343; Netherlands 12,488; France 10,322; Czechoslovakia 8,170.
Semimanufactures	11,474	8,662	Denmark 1,322; Switzerland 1,117; Belgium-Luxembourg 927; Sweden 900.
Lithium:			
Ore and concentrate	267	186	NA.
Oxides and hydroxides	NA	517	Italy 115; France 104; Belgium-Luxembourg 70.
Metal, all forms	NA	15	Switzerland 12; France 2.
Magnesium:			
Oxides, hydroxides, peroxides	4,694	3,063	Italy 826; Austria 318.
Metal including alloys:			
Scrap	3,268	1,507	Italy 501; Netherlands 361; United Kingdom 276; Ireland 172.
Unwrought	477	336	Sweden 59; Netherlands 54; Austria 50; France 37.

See footnotes at end of table.

Mica:			
Crude including splittings and waste	912	768	Switzerland 232; Yugoslavia 106; Austria 82.
Worked including agglomerated splittings	303	204	United Kingdom 42; Austria 20.
Pigments, mineral:			
Natural, crude	7,315	3,237	Netherlands 1,884.
Iron oxide and hydroxides	152,013	89,387	France 11,227; United Kingdom 9,922; United States 8,748.
Precious and semiprecious stones, except diamond:			
Natural ---kilograms	176,613	319,972	People's Republic of China 85,808; France 50,633; Hong Kong 41,483.
Manufactured ---do	5,380	7,121	United States 2,710; Italy 1,443; Japan 943.
Pyrite (gross weight)	594	500	NA.
Salt ---thousand tons	2,207	1,589	Sweden 286; Denmark 65; Nigeria 25.
Sodium and potassium compounds, n.e.s.:			
Caustic soda ---do	518	NA	
Caustic potash, sodic and potassic peroxide ---do	162	NA	
Stone, sand and gravel:			
Dimension stone:			
Crude or partly worked:			
Calcareous	3,109	2,868	Austria 1,459; Switzerland 355.
Slate	17,968	13,338	Netherlands 6,384; Belgium-Luxembourg 4,708.
Other	267,311	459,034	Netherlands 358,667; Switzerland 81,527.
Worked:			
Building and monumental stone	17,429	15,350	Belgium-Luxembourg 3,461; Netherlands 2,990; France 2,802.
Paving and flagstone	26,592	9,052	Netherlands 2,216; Denmark 2,158; Belgium-Luxembourg 1,504; France 1,353.
Slate	825	649	Netherlands 317; Switzerland 89.
Dolomite	193,327	170,675	France 63,856; Netherlands 60,072; Belgium-Luxembourg 37,026.
Gravel and crushed rock---thousand tons	11,241	4,395	Netherlands 3,322; France 646; Belgium-Luxembourg 151; Switzerland 84; Austria 69.
Limestone ---do	155	46	Netherlands 29; Belgium-Luxembourg 14.
Quartz and quartzite:			
Quartz crystal ---kilograms	46	52	NA.
Other	63,736	59,937	Belgium-Luxembourg 15,877; Austria 13,883; France 6,135.
Sand, excluding metal bearing thousand tons	7,704	7,367	Netherlands 6,147.
Sulfates, natural, magnesium sulfate (Kieserite) ---do	468	445	Norway 68; Netherlands 60; France 45.
Sulfur:			
Elemental:			
Other than colloidal	140,526	199,018	Denmark 69,889; Netherlands 59,307; Switzerland 27,936.
Colloidal	3,756	2,516	United Kingdom 475; Republic of South Africa 312; Italy 291.
Sulfur dioxide	16,301	15,019	Sweden 6,325; Belgium-Luxembourg 3,975; Austria 2,146.
Sulfuric acid	427,349	737,921	Netherlands 124,834; Turkey 93,673; France 87,854; Belgium-Luxembourg 82,067.
Talc, steatite, soapstone	7,115	5,748	Denmark 3,021; Belgium-Luxembourg 569.
Vermiculite, chlorite, perlite	639	473	NA.

See footnotes at end of table.

Table 3.—Federal Republic of Germany: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
NONMETALS—Continued			
Other nonmetals,, n.e.s.:			
Crude:			
Meerschaum, amber, jet--kilograms--	1,700	3	NA.
Pottery, broken ----------	r 32,116	22,402	Netherlands 9,770; France 6,109; Austria 2,810.
Other ----------thousand tons--	889	1,361	Netherlands 1,220.
Slag, dross and similar waste, not metal bearing:			
From iron and steel manufacture do----	3,282	2,328	Netherlands 2,250.
Slag and ash, n.e.s ----------do----	913	1,056	Netherlands 895; France 125.
Oxides and hydroxides of strontium and barium ----------	5,804	2,441	France 952; United States 706; Belgium-Luxembourg 292.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural ----------	866	2,667	Netherlands 1,559; Austria 585.
Carbon black ----------	94,385	90,411	France 18,343; Austria 12,198; Poland 11,265.
Coal and briquets:			
Anthracite and bituminous thousand tons--	17,444	14,468	France 5,522; Belgium-Luxembourg 3,754; Italy 3,020.
Briquets of anthracite and bituminous coal do----	239	240	Belgium-Luxembourg 123; Austria 37; France 29.
Lignite and lignite briquets ------do----	680	486	France 190; Austria 151; Belgium-Luxembourg 63.
Coke and semicoke ----------do----	13,082	7,372	Sweden 546; Netherlands 421; Romania 139.
Gas, natural ----------do----	299	275	Switzerland 112; Belgium-Luxembourg 48; Denmark 32; Netherlands 30.
Helium and other rare gases ----------	23,135	NA	
Peat and briquets ----------thousand tons--	337	399	Netherland 243; Switzerland 57; France 47.
Petroleum refinery products:			
Gasoline, motor spirit thousand 42-gallon barrels--	7,747	5,729	Switzerland 2,482; Austria 2,134; Czechoslovakia 357; France 315.
Kerosine, white spirit ----------do----	9,316	8,765	Denmark 628; Switzerland 581; Norway 372; Netherlands 132.
Distillate fuel oil ----------do----	13,495	8,691	Switzerland 3,342; France 1,209; Netherlands 455; Austria 380.
Residual fuel oil ----------do----	27,140	18,565	Austria 2,644; Denmark 1,918; France 1,465; Belgium-Luxembourg 1,359; Sweden 1,052.
Lubricants ----------do----	2,958	2,814	Belgium-Luxembourg 483; United Kingdom 322; Sweden 294; Netherlands 252.
Mineral jelly and wax ----------do----	1,186	929	Italy 102; Netherlands 87; Denmark 63; Sweden 63.
Other ----------do----	19,292	13,580	France 4,137; Netherlands 2,548; United Kingdom 1,435; Spain 623; Sweden 609.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals-thousand tons--	359	187	Netherlands 54; Belgium-Luxembourg 36; France 32; United Kingdom 23.

r Revised. NA Not available.
[1] Value only reported at $58,258.
[2] Less than ½ unit.
[3] Reported in 1975 as "ashes, residue, and scrap."
[4] Platinum and silver combined in 1974.
[5] Includes zirconium ore and concentrate.

Table 4.—Federal Republic of Germany: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS			
Aluminum:			
Bauxite ---thousand tons--	434	421	Australia 276; Guinea 78.
Alumina	499,149	471,753	Italy 208,420; Australia 134,849; Surinam 106,258.
Aluminum hydroxide	1,570	2,541	United States 1,989; France 471.
Metal including alloys:			
Scrap	77,170	44,016	Netherlands 12,907; United States 10,185.
Unwrought	338,942	169,111	Norway 76,180; Netherlands 15,523; Italy 14,806.
Semimanufactures	144,955	140,305	France 37,907; Belgium-Luxembourg 36,878; Netherlands 26,983.
Antimony:			
Ore and concentrate	3,369	2,129	Turkey 602; Austria 372; Bolivia 335; Republic of South Africa 323; Chile 272.
Metal including alloys, all forms	924	841	Belgium-Luxembourg 626; People's Republic of China 124.
Arsenic hydroxide	975	957	France 481; Belgium-Luxembourg 219; Sweden 128.
Beryllium metal including alloys, all forms ---kilograms--	5,384	496	Mainly from United States.
Bismuth metal including alloys, all forms	129	259	United Kingdom 47; Japan 21; Mexico 20.
Cadmium metal including alloys, all forms	1,094	631	Belgium-Luxembourg 139; Japan 108; North Korea 75.
Chromium:			
Chromite	386,545	561,035	U.S.S.R. 168,129; Republic of South Africa 136,930; Turkey 78,917.
Oxide and hydroxide	1,309	2,273	U.S.S.R. 1,853; Netherlands 143.
Metal including alloys, all forms	551	391	Japan 206; United Kingdom 84; France 62.
Cobalt metal including alloys, all forms	1,956	14,451	Zaire 6,856; Belgium-Luxembourg 3,420; United States 1,864.
Columbium and tantalum metal including alloys, all forms:			
Columbium ---kilograms--	6,349	4,769	Mainly from United States.
Tantalum ---do---	89,107	138,994	United States 118,118; Japan 13,321.
Copper:			
Ore and concentrate	571,146	564,352	Papua New Guinea 271,042; Chile 61,387; Republic of South Africa 60,705.
Matte	743	2,051	Australia 1,086; United Kingdom 887.
Copper sulfate	7,563	6,349	France 3,541; Belgium-Luxembourg 1,310.
Metal including alloys:			
Scrap	106,534	89,294	United Kingdom 16,650; United States 15,053.
Unwrought:			
Blister	98,160	119,850	Republic of South Africa 55,678; Chile 34,422.
Refined	440,025	393,936	Chile 83,342; Zambia 75,987; Belgium-Luxembourg 36,475.
Alloys	32,693	39,086	United Kingdom 9,767; Poland 8,329.
Master alloys	1,500	1,235	United Kingdom 968.
Semimanufactures	674,602	115,190	Belgium-Luxembourg 42,012; France 33,457; Italy 12,819.
Gallium metal including alloys, all forms ---kilograms--	NA	4,700	Belgium-Luxembourg 1,200; Japan 1,200; U.S.S.R. 1,200; Netherlands 700.
Gold:			
Ash and waste ---do---	[1] 221,457	96,946	United States 60,058; Austria 15,463; Switzerland 12,008.
Scrap and sweepings ---thousand troy ounces--	(1)	1,154	Italy 286; Belgium-Luxembourg 253; United States 160.
Metal:			
Unwrought ---do---	3,123	2,122	Switzerland 1,125; Republic of South Africa 418.
Semimanufactures ---do---	166	19	United States 6; France 4; Switzerland 4.

See footnotes at end of table.

Table 4.—Federal Republic of Germany: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS—Continued			
Hafnium metal including alloys, all forms kilograms	NA	2	NA.
Iron and steel:			
Ore and concentrate thousand tons	57,720	44,322	Liberia 6,196; India 982; Spain 879; Sierra Leone 614; Peru 593.
Roasted pyrite do	792	843	Spain 587; Belgium-Luxembourg 156; Portugal 75.
Metal:			
Scrap do	1,811	1,720	Netherlands 818; United Kingdom 309; Belgium-Luxembourg 263; France 204.
Pig iron including cast iron do	189	158	Canada 42; U.S.S.R. 28; France 22; Norway 18.
Sponge iron, powder and shot do	40	38	France 13; Sweden 13; United Kingdom 7.
Spiegeleisen	351	503	Mainly from Belgium-Luxembourg.
Ferroalloys:			
Ferrochrome thousand tons	81	88	Republic of South Africa 49; Japan 11.
Ferromanganese do	167	157	Norway 57; France 47.
Ferronickel do	56	38	New Caledonia 16; Greece 15; Dominican Republic 3; Japan 3.
Ferrosilicon do	134	116	Norway 47; France 28.
Ferrosilicochrome do	22	13	Republic of South Africa 8; France 2.
Ferrosilicomanganese do	73	70	Norway 43; Czechoslovakia 8.
Other do	189	8	Belgium-Luxembourg 2; Brazil 1; United Kingdom 1.
Steel, primary forms do	2,035	1,859	Netherlands 455; Japan 187; Australia 170; Austria 144.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	2,528	2,690	France 511; Italy 397; Spain 107; Netherlands 91; United Kingdom 82.
Universals, plates, sheets do	2,974	3,185	France 594; Japan 328; Austria 291; Netherlands 189; Italy 164.
Hoop and strip do	484	456	Belgium-Luxembourg 240; France 108; Netherlands 50.
Rails and accessories do	18	20	Netherlands 8; Sweden 4; Sierra Leone 3.
Wire do	176	156	Belgium-Luxembourg 71; France 34; Netherlands 10.
Tube, pipes, fittings do	558	538	Italy 140; Netherlands 93; France 90; Belgium-Luxembourg 67.
Castings and forgings, rough do	34	25	France 5; Netherlands 5; Romania 4; Poland 3.
Lead:			
Ore and concentrate	184,036	208,978	Canada 50,788; Sweden 36,383; United States 27,259; Ireland 26,507.
Oxides	4,994	3,765	Belgium-Luxembourg 2,194; Italy 415.
Metal including alloys:			
Scrap	35,773	10,205	United Kingdom 3,742; Netherlands 1,872; Sweden 1,614.
Unwrought	128,693	122,829	United Kingdom 37,701; Australia 17,829; Sweden 10,459.
Semimanufactures	2,433	1,885	Belguim-Luxembourg 1,065; France 271; Netherlands 235.
Lithium:			
Ore and concentrate	4,243	3,521	Republic of South Africa 2,997; United States 320.
Oxides and hydroxides	NA	457	United States 253; U.S.S.R. 107; France 70.
Metal all forms	NA	26	United States 21; U.S.S.R. 3.
Magnesium:			
Oxide, hydroxide, peroxide	6,417	3,409	United States 944; France 919; Netherlands 731.

See footnotes at end of table.

Table 4.—Federal Republic of Germany: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
METALS—Continued			
Titanium—Continued			
Oxides	21,382	19,533	Belgium-Luxembourg 9,283; Netherlands 4,497; France 2,178; Italy 2,045.
Metal including alloys, all forms	3,807	3,483	U.S.S.R. 2,591; Japan 460.
Tungsten:			
Ore and concentrate	4,246	3,365	France 1,175; Australia 415; People's Republic of China 394; Portugal 357.
Oxide and hydroxide	NA	174	People's Republic of China 144; United Kingdom 19.
Metal including alloys, all forms	505	91	United States 35; France 21; Austria 13.
Uranium and thorium:			
Ore and concentrate	560	7	NA.
Uranium, thorium, rare-earth compounds	939	3	NA.
Metal including alloys, all forms kilograms	210	42,900	Mainly from France.
Vanadium:			
Oxides, hydroxides, pentoxides	NA	408	Finland 362; Republic of South Africa 28.
Metal including alloys, all forms	14	5	Mainly from Netherlands.
Zinc:			
Ore and concentrate	640,056	550,888	Canada 213,696; Sweden 70,259; Republic of South Africa 62,926.
Oxide and peroxide	5,898	4,374	France 1,762; Netherlands 908.
Metal including alloys:			
Scrap	5,177	5,414	Denmark 1,165; United Kingdom 1,040; Belgium-Luxembourg 1,010; Netherlands 928.
Dust	12,928	8,838	Belgium-Luxembourg 7,744.
Unwrought	94,870	90,535	Belgium-Luxembourg 49,503.
Semimanufactures	18,220	17,738	France 7,494; Yugoslavia 3,263; Netherlands 2,670; Belgium-Luxembourg 2,477.
Zirconium metal including alloys, all forms	321	332	United States 264; France 32.
Other:			
Ore and concentrate:			
Of columbium, tantalum, vanadium	26,537	2,097	Brazil 1,053; United States 282; Canada 278.
Of zirconium	NA	24,761	Australia 18,073; Malaysia 2,842.
Of base metals, n.e.s	3,279	4,143	Australia 3,703.
Ash and residue containing nonferrous metals	278,444	277,449	Canada 72,673; Italy 27,753.
Oxides, hydroxides, peroxides of metals, n.e.s	6,371	3,873	Belgium-Luxembourg 1,421; France 1,143; United Kingdom 585.
Metals including alloys, all forms:			
Metalloids:			
Arsenic and tellurium	81	32	U.S.S.R. 13; Japan 4.
Selenium and phosphorus	25,726	18,349	NA.
Alkali, alkaline-earth, rare-earth metals	337	269	Mainly from France.
Pyrophoric alloys, all forms	30	55	Denmark 3.
Base metals including alloys, all forms	353	840	Sweden 472; United States 134.
NONMETALS			
Abrasives:			
Natural:			
Pumice, emery, natural corundum, etc	74,259	34,939	Greece 26,311; Italy 4,268.
Dust and powder of precious and semiprecious stones kilograms	1,456	1,242	United States 652; Ireland 303; Netherlands 134.
Grinding and polishing wheels and stones	6,211	4,655	Austria 1,114; Spain 597; Netherlands 593; Italy 577.
Artificial:			
Corundum	25,842	22,634	Netherlands 7,685; Hungary 4,590; Austria 2,477; United Kingdom 2,452.
Silicon carbide	45,464	49,557	Norway 10,638.

See footnotes at end of table.

Table 4.—Federal Republic of Germany: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources, 1975
NONMETALS—Continued			
Asbestos	399,561	386,188	Canada 294,580.
Barite and witherite	165,336	91,156	U.S.S.R. 15,327.
Boron materials:			
Crude natural borates	194,426	116,951	United States 71,109; Turkey 44,989.
Oxide and acid	15,574	11,623	France 4,706; Turkey 2,975; United States 1,815.
Bromine	1,625	1,805	Israel 1,206; United Kingdom 365; France 212.
Cement—thousand tons	679	540	France 252; Belgium-Luxembourg 120; Netherlands 81.
Chalk—do	85	69	France 64.
Clays and clay products (including all refractory brick):			
Crude clays:			
Bentonite—do	107	44	United States 33; Greece 4.
Ceramic clays:			
Kaolin—do	768	555	United Kingdom 309; United States 76; France 73; Czechoslovakia 71.
Other—do	110	109	Czechoslovakia 35; France 30; Netherlands 24; United Kingdom 19.
Fire clays:			
Raw—do	660	85	Czechoslovakia 23; United States 21; France 15; Netherlands 8.
Burned, including chamotte—do	195	182	Czechoslovakia 66; United States 43; Republic of South Africa 39.
Fuller's earth—do	9	9	Spain 7; United States 2.
Kyanite, sillimanite, andalusite, mullite—do	25	24	India 6; Republic of South Africa 6; United Kingdom 3; United States 2.
Other—do	305	41	Netherlands 19; France 9; Switzerland 9.
Products:			
Refractory (including nonclay bricks)—do	288	245	Austria 69; Czechoslovakia 39; France 29.
Nonrefractory—do	1,002	1,048	France 471; Italy 247; France 103.
Cryolite and chiolite	2,668	1,955	Mainly from Denmark.
Diamond:			
Gem:			
Crude or rough cut—thousand carats	100	70	NA.
Other—do	405	11,810	Brazil 6,665; United States 1,405.

COMMODITY REVIEW

METALS

Aluminum.—Schweizerische Aluminium AG (Alusuisse) and Metallgesellschaft AG terminated their partnership in Leichtmetall-Gesellschaft mbH (LMG), Essen, leaving Alusuisse the sole owner of the company's reduction and processing plants.[4]

In 1976, West Germany's aluminum industry was running at full capacity, with stocks reduced substantially. Primary aluminum capacity of the country's plants was estimated at 748,000 tons per year; Germany was a net importer of primary and secondary aluminum and a net exporter of semifabricates. West Germany's principal supplier of aluminum metal was Norway, the main supplier of bauxite was Australia, and Surinam was the main source for alumina.[5]

German primary aluminum metal producers, with plant capacity in 1976, are shown in the following tabulation:

Company	Location	Yearend capacity (thousand tons)
Aluminium-Hütte Rheinfelden GmbH	Rheinfelden, Baden	50
Gebrüder Giulini GmbH	Ludwigshafen	45
Kaiser-Preussag Aluminium GmbH	Voerde, Duisburg	72
Leichtmetall-GmbH	Essen-Borbeck	130
Hamburger Aluminium-Werke GmbH	Hamburg	100
Vereinigte Aluminium-Werke AG	Erftwerk, Grevenbroich	36
Do	Innwerke, Töging	55
Do	Lippenwerke, Lünen	50
Do	Norf, Rheinwerke	145
Do	Elbewerk, Stade	65
Total		748

Iron Ore.—In 1976, Stahlwerke Peine-Salzgitter AG closed its 500,000-ton-per-year Bülten-Adenstedt mine, located south of Peine. The company also took over from Salzbergbau AG the Haverlahwiese and Konrad iron ore mines near Salzgitter. Eisenwerk-Gesellschaft Maximilianshütte mbH (Maxhütte) continued the development of the new Leonie mine near Sulzbach-Rosenberg, east of Nuremberg. In 1976, Germany's dwindling domestic iron ore supply was controlled by three companies operating seven mines. The mines supplied only a negligible fraction of Germany's iron ore requirements.

Iron and Steel.—Hopes for the recovery of West Germany's steel industry in 1976 faded by yearend, with a marked falloff of business during the winter. To improve the situation, steel companies were discussing large-scale mergers,[6] and there was a proposal for massive Government aid for German steel mills.[7] There were several important developments during the year. Klöckner-Werke AG took over the largest south German steel mill, Maxhütte, at Sulzbach-Rosenberg, from its present owner, the Düsseldorf-based Flick group, making it the country's third largest producer, with a 6.5-million-ton capacity. The Saar region's three mills have also been considering a closer cooperation for some time.[8]

Several investment projects started before the steel slump were completed. Maxhütte reconstructed its steelworks with new 60-ton converters. Gutehoffnungshütte Sterkrade AG commissioned a 7,000-ton-per-day blast furnace. Fried. Krupp Hüttenwerke AG commissioned at its Rheinhausen works two 300-ton basic oxygen converters and continuous-casting machines. All new metallurgical plants commissioned in West Germany were equipped with modern dust collectors. A go-ahead was given to replace existing open hearth furnaces at the Thyssen AG's Oberhausen plant with a new electric melting shop.

West Germany's major steel producers and their approximate steelmaking capac-

ities in 1976 are shown in the following tabulation:

Company	Approximate steelmaking capacity (million tons per year)
Thyssen AG	15
Hoesch AG	7
Klöckner-Werke AG	6.5
Peine-Salzgitter AG	3.5
Fried. Krupp GmbH	3.5
Mannesmann AG	2.5
Stahlwerke Röchling-Burbach GmbH	2.1
AG der Dillinger Hüttenwerke	1.8
Neunkircher Eisenwerk AG	1.3

Lead and Zinc.—In 1976, prospecting for lead-zinc-copper deposits was continued in the Eifel Mountains, mainly by the mining companies themselves but also together with the Bundesanstalt für Geowissenschaften und Rohstoffe (Federal Institute for Geosciences and Natural Resources).

During 1976, mine production of lead and zinc decreased slightly; the ores mined assayed a total of 7.5% lead and zinc. Domestic mines supplied about one-eighth of the country's lead and one-third of its zinc requirements. Three West German companies operated four lead-zinc mines and five beneficiation plants in 1976.

NONMETALS

Cement.—In 1976, production of cement increased only slightly as industrial activity remained restrained. Investment funds were used solely for the replacement of old equipment or the rationalization of plants.[9] Sixty-one West German companies continued to operate the country's 86 cement plants.

Fertilizer Materials.— *Nitrogen.*—Nitrogen production decreased further in 1976. Ammonia production capacity was about 2.61 million tons in 1976. Companies engaged in the production of ammonia, with their plants and capacity, are shown in the following tabulation:

Company	Plant	Approximate capacity (thousand tons per year)
Badische Anilin und Soda Fabrik AG (BASF)	Ludwigshafen	800,000
Erdölchemie GmbH (Bayer AG, The British Petroleum Co. Ltd.)	Cologne	300,000
Gewerkeschaft Viktor Chemische Werke	Castrop Rauxel	250,000
Hoechst AG	Frankfurt	115,000
Rheinische Braunkohlenwerke AG	Wesseling	[1] 360,000
VEBA-Chemie AG	Bottrop	145,000

Do	Gelsenkirchen-Scholven	400,000
Do	Brunsbüttel	[2] 400,000

[1] In planning stage.
[2] Startup in 1978.

Source: Petroleum Times, v. 81, No. 2060, Sept. 30, 1977, pp. 51–53.

Potash.—In 1976, West Germany's potash industry was again strongly affected by depressed activity in domestic or foreign markets. Both Kali und Salz AG and Kali-Chemie AG had to go on short working schedules.

Two companies operated West Germany's 12 potash mines. The largest among them was Kali and Salz AG, producing almost nine-tenths of the country's output and operating 10 potash mines (Bergmannssegen-Hugo, Hattorf, Neuhof-Ellers, Ronnenberg, Niedersachsen-Riedel, Salzdetfurth, Siegfried-Giesen, Sigmundshall, Hope, and Wintershall). Kali-Chemie AG, the second largest company, operated the Friedrichshall and Glückauf-Sarstedt mines. All these mines are in the Hannover area except Wintershall and Hattorf, which are east of Kassel on the East German border, and Neuhof-Ellers, located near Fulda.

Salt.—In 1976, West German rock salt sales had to be reduced to 8.5 million tons of common salt sales. Present West German salt capacity is about 13 million tons per year.[10] The country's major salt-producing areas were near Hannover (Lower Sax-

[9] Polysius AG (Neubeckum). Annual Report 1976. P. 5.
[10] Industrial Minerals. March 1977, p. 19.

ony), Borth (near Dortmund), and Heilbronn (north of Stuttgart). The largest mine, located at Borth, was owned by the Deutsche Solvay Werke GmbH (Solvay & Cie. S.A., Belgium) and had a capacity of about 4 million tons per year. Capacity at operations located in the Heilbronn salt deposit by Südwestdeutsche Salzwerke AG was about 5 million tons from four mines, and by Wacker Chemie GmbH, about 0.8 million tons. That of Kali und Salz was 2 million tons in Lower Saxony. Vacuum salt capacity of less than 1 million tons was divided mainly between Bayerische Berg-, Hütten- und Salzwerke AG (Stade), and Norddeutsche Salinen GmbH (Lüneburg). Some solution mining took place at Solvay's Borth, Heilbronn, and Epe mines. The solution from Epe, located on the Dutch border, is transported by pipeline to chemical plants near the Sambre River in Belgium.

Sulfur.—Davy Power Gas GmbH was to supply the technology for a secondary sulfur recovery plant at Ammoniawerk Brunsbüttel with a capacity of 22,000 tons per year of sulfur. Increased emphasis on environmental factors has resulted in a surge in the construction of secondary sulfur recovery plants.

Other Nonmetals.—Total fluorspar output increased at the country's approximately 13 fluorspar mines, located mainly in Baden-Württemberg and the Oberpfalz. Production covered nearly all domestic consumption requirements. Sales of barite decreased further, and more mines were closed in Rheinland-Palatinate and Bavaria, leaving only about seven producing mines in Lower Saxony, North Rhine Westphalia, and Baden-Württemberg. The largest barite producer was Sachtleben Bergbau GmbH, with mines at Dreislar and Meggen in North Rhine Westphalia and Wolfach in Baden-Württemberg.

MINERAL FUELS

Domestic coal and lignite, natural gas, and crude oil supplied 40% of West Germany's energy requirements. Imported petroleum accounted for most of the remaining portion, with some imported natural gas and nuclear fuel accounting for the rest.

The West German Government approved the basic guidelines of a revised energy program in 1976. The guidelines emphasized the importance of nuclear energy to close the energy gap but projected a total output of 30,000 megawatts (13% of the total) in 1986 instead of 45,000 to 50,000 megawatts; the importance of coal was also emphasized. The share of oil in domestic consumption would be reduced from 52% to 45%. Primary energy consumption was to increase at a rate of 3.6% per year to reach 500 million tons of standard coal equivalent in 1985. The plan also contained a number of energy conservation measures, mainly in the private sectors, such as housing.

Supply and apparent consumption of fuel and power in 1975 and 1976 are shown in table 5.

Coal.—In 1976, bituminous coal production decreased again as demand remained depressed during the slow recovery of the economy. Stocks of bituminous coal and coke grew to 21 million tons by yearend, although 10 million tons were absorbed by the Federal stockpile. Only the electric power industry increased coal consumption, from 23.3 million to 30.3 million tons, encouraged by Government subsidies.

West German lignite production increased in 1976, owing mainly to the use of new 200,000-cubic-meter-per-day bucketwheel excavators, installed by the Rheinische Braunkohlenwerke AG, the major producer, at its mines located in the Rheinland.

By yearend, employment in the bituminous coal industry had reached almost 200,000 while employment in the lignite industry just exceeded 20,000.

There were a number of important events in the coal industry of West Germany in 1976. In line with its 1974 Revised Energy Program and as part of a set of measures to relieve the depressed bituminous coal industry, the Federal Government decided to advance the creation of a national bituminous coal reserve from 1977 to 1976, and to assume the cost of interest as of January 1, 1976. It was estimated that these measures would bring approximately $700 million of extra liquidity to the coal industry by yearend 1977.[11]

Ruhrkohle AG underwent a reorganization when the company's Western, Central, and Eastern mines, operated by six subsidiaries, were consolidated under only three newly formed subsidiaries. Ruhrkohle

also reported the discovery of a coal deposit containing more than 450 million tons of coking coal 7 miles northwest of Bottrop in the western part of the Ruhr.[12]

Saarbergwerke AG opened up 150 million tons of new coal by commissioning an $80 million mine at Warndt (Saar); the company also decided to invest $1.5 billion by 1981. About one-fifth of this amount was allotted to the mines, one-third was earmarked for a 700-megawatt extension of a thermal powerplant, and the rest was to be used for financial investments; environmental aspects of all investments were strongly emphasized. One new 650-megawatt section of the company's thermal powerplant came on-line; the unit was built with Government aid as part of the national 6,000-megawatt expansion program.

Work continued on development of Rheinische Braunkohlenwerke's Hambach lignite mine, located between Aachen and Cologne, which has reserves of about 2.4 billion tons. In the 1980's, the company's mines at Ville, Frechen, and Fortuna will be depleted, and development of the new mines was necessary to maintain production (Rheinbraun produced 118 million tons in 1976). In the process, up to 10,000 village and farm inhabitants are to be moved to new homes.

In an attempt to increase domestic bituminous coal consumption, coal gasification received a new boost when Ruhrkohle AG, Ruhrgas AG, and Steag AG agreed to build a 150-ton-per-day, $50 million experimental plant at Dorsten (north of Essen) to test bituminous coal gasification using the Lurgi process; the plant was expected to be operational by 1978–79.

As a result of 2 year's negotiation between West and East Germany, minor temporary shifts in the countries' common border have been agreed upon, making it possible for the Braunschweigische Kohlen-Bergwerke to exploit an additional 15 million tons of lignite located on the East German border near Helmstedt.

In 1976, there were 46 coal mines, 25 coking plants, 6 briqueting plants, and 31 coal-fired powerplants in West Germany's bituminous coal industry. The industry was controlled mainly by seven companies: Three in the Ruhr, two in the Aachen area, and one each in Saarland and Lower Saxony. The largest industrial group was Ruhrkohle, controlling about three-quarters of the country's output.

The lignite industry was dominated by the Rheinische Braunkohlenwerke, accounting for almost four-fifths of total output, followed by Bayerische Braunkohlen-Industrie AG (6%) and Braunschweigische Kohlen-Bergwerke AG (3.5%); the remaining production came from four smaller companies.

[12] The Wall Street Journal. V. 439, No. 102, May 25, 1977, p. 10.

Petroleum and Natural Gas.—With demand rebounding vigorously in 1976, West Germany remained Western Europe's largest consumer of crude oil and petroleum products, accounting for 138 million tons, or more than one-fifth of Europe's total crude oil consumption.[13]

Shrinking domestic crude oil production supplied only an unimportant 4% of demand. However, natural gas production expanded slightly, to 65% of the domestic natural gas supply. Secondary and tertiary recovery measures were used to slow down the decrease in domestic oil production. Exploratory drilling totaled 235 kilometers in 1976. A total of 22 offshore wells were drilled in the West German sector without making any commercial discoveries. On January 1, 1977, reserves of crude oil were 70.3 million tons (about 500 million barrels), of which 44.4 million (300 million barrels) were proven reserves; the rest consisted of possible reserves. Natural gas reserves were calculated at 296 billion cubic meters, of which 208.6 billion were proven reserves.[14]

Imports of crude oil and petroleum products exceeded 140 million tons in 1976. The oil originated mainly in the Middle East, with Libya, Iran, and Saudi Arabia each supplying one-fifth of the total. Norway, the United Kingdom and Denmark figured for the first time on the list of 22 suppliers.

About 83 million tons of the crude oil was imported through five pipelines: The Wilhelmshaven-Rheine (NWO); Trieste-Ingolstadt-Karlsruhe (TAL); Marseilles-Karlsruhe, Woerth, Speyer-Saarbrücken (SEPL); Rotterdam-Rhine (RRP); and Geneva-Ingolstadt (CEL).

There were 64 caverns in salt domes at nine locations for storage of petroleum with 9.5 million tons of oil stored at yearend 1976.

Natural gas imports came mainly from the Netherlands and from the U.S.S.R. through Czechoslovakia, Austria, or Switzerland.

Petroleum refining was little changed compared with that of 1975, as excess refinery capacity and an increase in the compulsory storage of stocks burdened oil companies. Total West German refining capacity remained a nominal 153.9 million tons.[15] Twenty-two companies controlled 33 domestic oil refineries. The largest among them was Government-owned VEBA, with nearly half of the country's refining capacity.

Uranium.—In 1976, West Germany remained a small producer of uranium with five active companies: (1) Esso-Erz GmbH was prospecting in West Germany and found a potential deposit in the Upper Pfalz; (2) Gewerkschaft Brunhilde had a 150-ton-per-year U_3O_8 plant at Birkenfeld (Nahe) southeast of Trier, processing domestic and imported French ores and doing some domestic prospecting; (3) Uranerzbergbau GmbH was prospecting in Germany, Austria, and Switzerland and had operating facilities in Canada in partnership with Canadian companies; (4) Urangesellschaft mbH & Co. KG was exploring and operating worldwide to secure uranium reserves for West Germany; and (5) Saarberg-Interplan GmbH was exploring for uranium in West Germany and discovered at Müllenbach in the Murg Valley (Black Forest) reserves of 1,500 tons of ore containing 0.2% to 1.3% U_3O_8.[16]

The bulk of the uranium used in West Germany was imported as processed nuclear fuel from the United States, the U.S.S.R., and France. West Germany's nuclear construction industry was strongly export oriented and competitive on the world market. The country's present nuclear power program includes 10 operating plants with a total capacity of 3,494 megawatts, 13 plants under construction with an installed capacity of 13,330 kilowatts, 8 reactors in the planning stage with 9,219 megawatts' installed capacity, a further 6 plants totaling 7,800 megawatts under consideration, and 5 reactor sites under preliminary consideration.

The Mineral Industry of Ghana

By Janice L. W. Jolly [1]

The 1976 mineral industry of Ghana consisted of bauxite, diamond, gold, manganese ore, and salt mining and also included production of cement from imported clinker, aluminum from imported alumina, and petroleum products from imported crude oil. Gold production increased slightly over 1975, but manganese, diamond, and bauxite production were down. Most major exports declined in 1976 and prices paid for imports rose sharply, necessitating governmental action to conserve foreign exchange.

The effective date for minimum Ghanaian participation, under the Investment Policy Decree of 1975, was extended to December 31, 1976, to give more time for Ghanaians to become familiar with the implications of shareholding and to enable the Investment Policy Implementation Commission (IPIC) to work more effectively. Firms affected by the Investment Policy Decree in the meantime continued to float their shares. The State, or Ghanaian individuals, must hold from 20% to 55% in all enterprises. The share specified in each varied as determined by the National Redemption Council. A new income tax decree was also published which consolidates and codifies the Income Tax Decree of 1966 and later amendments. The company tax rate of 65% was to remain unchanged, but small Ghanaian companies whose turnover did not exceed $175,000 [2] were to pay higher rates of tax in the first 5 years of operation.[3]

The Government's ordinary budget for 1976–77 was set at $771.3 million, an increase of 15% over the preceding budget. The development budget was about $313 million. Loans for completing the Kpong dam and hydroelectric power project were secured. Construction on the $280 million project was expected to start by July 1977. Loans were derived from the European Development Fund ($9.7 million), the European Investment Bank ($10.9 million), the Saudi Arabian Fund for Development ($30 million), and the Canadian International Development Agency (CIDA) ($35 million). The Federal Republic of Germany also agreed to loan $22.8 million for the financing of development projects including electrical expansion. An agreement was reached with Acres International Ltd. of Canada to undertake the consulting engineering services and supervision of the Kpong hydroelectric project construction. Five foreign firms had submitted bids to construct the dam, including Sweden, Italy, West Germany, and France.[4]

The World Bank was to loan $18 million to the Electrical Corp. of Ghana for supply of power and extension to existing plants in the Western Ashanti and Greater Accra regions. This was to include reinforcement of the existing Tema, Accra, and Kumasi networks and extension of power to the Subin gold mines, the Bibiani metal complex, the Awaso bauxite mines, and the Aboso glass factory.[5] The International Development Association (IDA) was to loan $10 million for road improvements. The Ghanaian Government started construction of 106 kilometers of principal roads aided by Italian engineers from Siteco Fiat.

The Government has reactivated the atomic reactor project originally started

with the U.S.S.R. but abandoned after the 1966 coup. The project was considered necessary to permit the country to accelerate development. The atomic reactor, to be situated at Kwabenya, was expected to be operating in about 3 years. The Commission of Atomic Energy was also studying the utilization of solar energy. The second African meeting on energy was held in late 1976 in Accra, Ghana. The purpose was to appraise the current and future energy situation and prospects in the continent; to analyze the trends and energy resources, supplies and marketing, and the development of indigenous sources of energy at all levels; to consider cooperation among member States in the field of energy; to exchange information on the latest advances and research in energy; to consider the possibilities of training technical personnel in energy fields; and to formulate and coordinate energy policies of member States. One of the key developments was the establishment of a group to study the founding of an African energy bank to finance the necessary investments. Plans were also formulated for an information agency to disseminate energy resource data.[6]

PRODUCTION AND TRADE

In 1976, Ghana National Manganese Corp. shipped 384,752 tons of manganese ore to Belgium, Czechoslovakia, Finland, the Netherlands, Ireland, Italy, Japan, Norway, Portugal, Spain, the United Kingdom, West Germany, and Yugoslavia.[7] By comparison, 355,300 tons of ore were exported in 1975. Bauxite exports in 1975 were 320,495 tons and went mainly to British Aluminium Co., Ltd., in the United Kingdom. Exports are apparently limited by the poor condition of the railroad from the mine to the Port of Takoradi.

Among the imports that rose sharply in the first part of 1976 were petroleum and cement clinker. At the same time, major export items were declining sharply. In the first 4 months of 1976, gold exports slumped to $15 million from $27 million for the same period in 1975. Gold production was down to 301,794 ounces in the first 6 months of 1976 compared with 306,731 ounces for the same 1975 period.

Ghana Supply Commission imported 9.4 million barrels of crude oil in 1976 from the U.S.S.R. (700,000 barrels), Nigeria (6.3 million barrels), and Libya (2.4 million barrels). The Ghana Commissioner for Foreign Affairs appealed to the Organization of Petroleum Exporting Countries (OPEC) to exercise moderation in oil price increases for 1976 in view of problems that oil prices have created in Africa, adding that further increases would jeopardize the economies of developing countries.

On August 25, 1976, the Government issued a decree establishing a National Procurement Agency for bulk purchasing and for the distribution of selected consumer goods and raw materials for manufacturing. Cement clinker, scrap iron, and fertilizers were included products. The Special Unnumbered Import Licenses (SUL) were also reintroduced allowing financing of imports by private businesses using their own private sources of foreign exchange. The reintroduction of SUL's was apparently the result of pressure on the country's foreign exchange resources resulting from a deteriorating trade balance. All exports of manganese ore, bauxite, and ores or concentrates of nonferrous base metals were to be made under the supervision of the General Superintendent Co. Ltd. in Accra. This organization also was to have authority to inspect ore shipments at the cargo's seaport destinations. Ore exporters were required to give the company signed copies of ore sales contracts with overseas buyers, shipping contracts, and details of shipments.

The U.S.S.R. and Ghana signed a new 5-year trade agreement to replace the long-term trade and payment agreement made between the two countries in 1961.[8] The agreement provided for the payment in convertible currency for all goods exchanged between the two countries. Ghana's main imports from the U.S.S.R. were crude oil and iron rods, while the U.S.S.R. imported cocoa and timber from Ghana. A bilateral trade agreement was also signed with the Ivory Coast and Cameroon.

COMMODITY REVIEW

METALS

Aluminum.—The $65 million addition of a fifth potline to the Volta Aluminium Co. Ltd.'s (VALCO) smelter at Tema was reported as 50% complete at the beginning of 1976. The smelter's capacity was to be raised to 198,000 tons by late 1976.

The Government was anxious to continue development studies of the Kibi and Nyanihin bauxite deposits. The Aluminium Resources Development Co. of Tokyo withdrew from the Kibi bauxite development program because of unfavorable world market conditions. Kaiser Aluminum and Chemical Corp. of the United States was maintaining its interest in the project and continuing exploitation studies. The Ghana Commission of Aluminum Industries had allotted $434,800 for reviewing the feasibility studies.[9] New facilities would have to be built to move the bauxite to the port at Tema.

Ghana Bauxite Co. Ltd. (GBC), that operated Ghana's only bauxite mine near Awaso, was 55% owned by the Ghanaian Government and 45% by the British Aluminium Co., Ltd. The Government assumed its share of the control in 1974. There was no alumina production in Ghana. The aluminum smelter at Tema used imported alumina from the United States, Jamaica, and Australia. In 1975, bauxite reserves were estimated at 335 million tons and resources at 460 million tons.

Gold.—Gold production, cumulative to July 1976, totaled 301,794 troy ounces compared with 306,731 ounces for the same 1975 period.[10] Alluvial Dredges Ltd. was to supply the State Gold Mining Corp. (GMC) with two new dredges designed and equipped for gold recovery. The two dredges were to cost about $8 million and were the result of a second contract placed by GMC as a part of its long-term plan to revitalize the gold placer operations. Alluvial Dredges was in the final phase of completing the earlier contract for two dredges ordered in 1975.

The United Nations was undertaking a training program to last through 1977 for improving mining skills of Ghanaians of GMC. Part of the program included a fellowship training program in which Ghanaians were placed at selected mines in Zambia and the United States to learn modern, practical mining techniques on a firsthand basis.

Iron and Steel.—A second steel factory was to be constructed at Kumasi with a rolling mill of 30,000 tons per year.[11]

Manganese.—In 1974, Ghana acquired the entire holdings of the Nsuta manganese operations from the African Manganese Co., a subsidiary of Union Carbide Corp. The mine was now being operated by the Ghana National Manganese Corp. In a 1973 executive instrument, the Government had appointed Ghana National Manganese as its agent to purchase all ores mined at the Nsuta mine. Caemi International of the Netherlands was to serve as exclusive agent for manganese marketing.[12] Initial production results after the Ghana National Manganese takeover of the mine had improved by early 1975, and both recruitment and prospecting were reported as recommencing.[13] Ghana National Manganese Corp. was also undertaking construction of a concentrator to further treat low-grade minerals.[14] Some concentrated carbonate ore was reportedly shipped to Japan in 1976.

NONMETALS

Diamond.—Ghana Consolidated Diamonds Ltd. (GCDL) estimated the lower Birim River would yield another 50 million carats. The deposit was to be mined at the rate of 2 million carats per year. This new deposit was now to be exploited since the traditional Akwatia area in Akyem Abuakwa was expected to be phased out by 1980. The First International Natura Corp., a New York-based company, was negotiating with the Government for mining rights in a 63.6-square-kilometer area near the confluence of the Birim and Pra Rivers. The Government will hold a 55% share of the project. Preliminary prospecting had already been completed.

At yearend 1975, an increase in diamond prices was announced by the Diamond Marketing Corp. (DMC) according to size

[11] Page 660 of work cited in footnote 9.
[12] Mining Annual Review, London. West Africa. June 1974, p. 373.
[13] World Mining. Ghana. V. 29, No. 7, Jun. 25, 1976, p. 142.
[14] Industries et Travaux D'Outre-mer, Paris. Ghana. V. 24, No. 275, October 1976, p. 729.

and quality, but the effective overall increase was about 3%. An improvement in demand in the first quarter of 1976 was evident especially for larger diamonds with certain qualities. The DMC was grading, valuing, and processing diamonds as well as buying all those mined locally. All companies except GCDL sold directly to the DMC and received money directly from it. GCDL sold through the DMC instead of to it. Under the 1968 marketing arrangement, licensed dealers were to bid on "reserve prices" set by GCDL and the DMC. If the dealers' highest bid was below the higher of the two prices, the diamonds were sold to the DMC, which sold them overseas with assistance from Consolidated African Selection Trust Limited (CAST) in London.[15] CAST owned 45% of GCDL.

MINERAL FUELS

Petroleum.—Signal Exploration and Development Co., Amoco Ghana Exploration Co., Mobil Oil Ghana Ltd., and Zapata Exploration Co. were all prospecting for oil offshore Ghana. Shell (incorporated in Ghana as Shell Exploration and Production Co.) was operating onshore near Attebubu in the Brong-Ahafo region of the Voltaian Basin. The Commissioner of Lands and Mineral Resources announced new terms for liberalizing exploration agreements that would include duty-free importation of exploration equipment and guarantee of profit repatriation. Participation of oil companies, if necessary, might be up to 20% by the Government.

The Ghanaian Government completed negotiations for the takeover of the Ghanaian Italian Petroleum Co. Ltd. (GHAIP) refinery at Tema in 1975 and formed a new oil distributing company called Ghana Oil Co. The Ghana Supply Commission was sole oil importer and agent for the refinery. The Government of Ghana authorized the Ghana Supply Commission to construct an asphalt plant costing $8.7 million near the Tema refinery. The construction was to take place at the beginning of 1977.[16] Mobil Oil was projecting the creation of a lubricant factory to help cut down on imports.

The Mineral Industry of Greece[1]

By Roman V. Sondermayer [2]

Bauxite and various nonmetals were the main mineral commodities of Greece during 1976, and efforts continued to develop new mineral resources. The most important minerals produced were magnesite, pumice, bauxite, alumina, barite, lignite, nickel, perlite, pyrite, and aluminum. Output of other mineral commodities was of only domestic significance.

The year was mixed for the Greek mineral industry, reflecting the recession in major industrialized countries, Greece's uneven economic performance, and price fluctuations on international commodity markets.

The mineral industry was privately owned, but the Government was organizing publicly owned corporations. The Ministry of Industry regulated activities and collected statistics. In addition, the Greek Government continued to stimulate development of the mineral sector, enacted new legislation, and reorganized Government institutions involved in the mineral industry. The Government has assumed a leading role in mineral exploration. The three major Government agencies involved in the mineral industry's activities were the Institute of Geological and Mineral Research (IGME), the Public Power Corp. (PPC), and the Public Petroleum Co. (DEP). The Project Studies and Mining Corporation (GEMEE), a mining company controlled by the Hellenic Industrial Development Bank (ETVA), was reactivated to assist in development of ETVA/Government-controlled mines.

The mineral industry contributed an estimated 7% to the gross national product (GNP). However, the extractive industry's share was only 1.3%. Employment in the mineral industry was estimated at 18,000 persons.

Major events in the mineral industry in 1976 were as follows: Planning for a new 600,000-ton-per-year alumina plant; exploration for chromite and increasing the capacity of existing chromite mines and beneficiation plants; the opening of a new complex lead-zinc-pyrite ore mine at Olimpias; approval by the Government of expansion of Société Minière et Métallurgique de Larymna S.A.'s (LARCO) nickel mines and smelter; completion of two cement plants; completion of several facilities for processing magnesite; the first discovery of phosphate rock at Delvinákion; development of lignite deposits at Ptolemaïs and Megalópolis; and continuation of exploratory drilling for petroleum and natural gas in northern Greece.

PRODUCTION

Mineral-producing facilities varied greatly in regard to size, mechanization, and efficiency. As a rule, petroleum-processing facilities were modern and efficient. Metal mining and processing had some outdated operations, and productivity was low compared with that of other European countries. The following tabulation shows major companies and facilities in Greece during 1976:

[1] A principal source of information for this chapter was: U.S. Embassy, Athens, Greece. Industrial Outlook Report, Minerals—1976, drafted by D. Kirkini and R. L. Jackson. State Department Airgram A-16, Jan. 31, 1977.

Table 1.—Greece: Production of mineral commodities—Continued

(Metric tons unless otherwise specified)

Commodity [1]		1974	1975	1976 [p]
NONMETALS—Continued				
Fertilizers, manufactured, gross weight:				
Nitrogenous	thousand tons	361	283	NA
Phosphatic	do	147	187	NA
Potassic	do	30	23	NA
Fluorspar		1,000	1,000	[e] 1,000
Gypsum and anhydrite		441,759	416,557	410,000
Magnesite:				
Crude	thousand tons	1,369	1,426	1,500
Deadburned		382,500	359,963	341,485
Caustic-calcined		76,745	56,281	70,364
Perlite:				
Crude		213,017	158,074	235,677
Screened		114,195	105,580	129,298
Pozzolan (Santorin earth)		820,735	857,944	848,213
Pumice		523,896	525,952	364,978
Pyrite, gross weight		255,414	188,257	180,368
Salt, all types	thousand tons	149	[r e] 150	140
Silica (probably silica sand)		17,997	16,165	16,866
Stone, marble	cubic meters	120,000	110,000	115,000
Sulfur, content of pyrite		114,936	84,716	81,166
Talc		4,320	5,860	[e] 6,000
MINERAL FUELS AND RELATED MATERIALS				
Coal, lignite	thousand tons	14,109	17,600	22,237
Coke:				
Coke-oven	do	372	421	[e] 360
Gashouse	do	12	11	[e] 10
Fuel briquets (lignite briquets)	do	89	90	NA
Gas, manufactured:				
Gas works	million cubic feet	320	NA	NA
Blast furnace	do	7,652	NA	NA
Coke ovens	do	6,811	NA	NA
Petroleum refinery products:				
Gasoline	thousand 42-gallon barrels	7,098	7,149	8,424
Jet fuel	do	2,384	5,152	4,728
Kerosine	do	302	372	395
Distillate fuel oil	do	22,111	21,932	19,918
Residual fuel oil	do	35,178	36,150	35,112
Lubricants	do	539	427	385
Other	do	9,250	10,164	8,523
Refinery fuel and losses	do	7,264	5,062	4,248
Total	do	84,126	86,408	81,733

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, other types of crude construction materials such as clays, sand and gravel, and stone are produced, but output is not reported and available information is inadequate for formulation of reliable estimates of output levels. Cobalt is also produced, but output is included with nickel.

[2] Nickel content is reported under nickel.

[3] Black sheet, galvanized sheet, reinforcing bars, and wire only.

[4] Includes antimonial lead and hard lead.

[5] Includes powdered manganese as follows, in tons: 1974—1,122, 1975—3,908, and 1976—4,194.

[6] Nickel plus contained cobalt.

TRADE

During 1975, the latest year for which complete data are available, imports of minerals and fuels were valued at $1.5 billion, or about 33% of the country's total imports. Fuels, mostly petroleum, accounted for $1 billion. Mineral exports, mostly bauxite, ferronickel, and nonmetals, were valued at $0.7 billion, or 34% of total exports. Tables 2 and 3 give trade statistics for selected commodities.

COMMODITY REVIEW

METALS

Aluminum.—Plans for a new alumina plant and expansion of existing bauxite mines were the highlights of the aluminum industry of Greece during 1976. Although 2.7 million tons of bauxite was produced, output of alumina and aluminum for the past several years averaged only 470,000 tons and 135,000 tons, respectively. The new alumina plant should improve the situation and change Greece from a producer and exporter of bauxite to a processor of bauxite and exporter of alumina.

Greece's largest bauxite mining company, Bauxites Parnasse Mining Co., planned construction of a 600,000-ton-per-year alumina plant near Itea, on the Gulf of Corinth, with provisions to double its capacity. Chase Manhattan Bank was arranging a financial package and foreign participation for an initial investment of $200 million, with an additional $100 million for expansion. Bauxites Parnasse will control 51% of the equity of the corporation to be created to carry out the project. The Government approved a plan for expansion of mines in the Parnassós-Ghiona area from 2 million tons to 3.2 million tons. The operator, Bauxites Parnasse, plans to invest $10 million in this expansion.

Eleusis Bauxite Mines, part of Mining-Industrial & Shipping Inc., established centers for production of bauxite at Oeta Mountain in central Greece, at Atalándi in Phthiotis, and on Amorgós Island. Deposits are small, and equipment and personnel move from deposit to deposit while maintenance and supplies remain in the three centers. A smaller bauxite producer, Barlos Bauxite Hellas S.A., purchased new equipment and planned to expand its present output of 200,000 tons per year at mines in Fokis and Boeotia by an additional 50,000 tons.

Aluminium de Grèce S.A. (AG) was the operator of the only aluminum smelter in Greece, situated at Distomon, Boeotia, and a nearby 500,000-ton-per-year alumina plant. During 1976, AG was installing a pollution-control system at its facility at a cost of $10 million. Bauxite exports, about 75% of the output, were again based on export quotas allocated by the Ministry of Commerce. The 1977 quota was set at 2.3 million tons, 28% below the 1976 quota, mostly because of lower demand in market economy countries.

Chromite.—The Government of Greece, through GEMEE, assigned priority to exploration and development of chromite deposits at Vourinos Mountain near Kozáni. Expenditures for new equipment for GEMEE's Skoumitsa mine in the Vourinos area, mostly for drills and wagons, totaled $1 million in 1976. During 1976, ores from the Vourinos deposits were upgraded in an obsolescent 15,000-ton-per-year beneficiation plant, but a feasibility study on a new 60,000-ton-per-year beneficiation installation was ordered and is to be completed by 1978.

Eleusis Bauxite started reactivating the idle Dhomokós chromite mine near Lamia. Eleusis Bauxite also produced chromite concentrates at a plant situated at Eretria near Vólos and explored for chromite near Kozáni.

Iron and Steel.—A ministeelplant was completed in the Almirós area near Vólos. Plant capacity, with two electric furnaces, was 260,000 tons per year, and the operator was Metallurgiki-Chalps. Normal output was expected to be achieved in the first half of 1977.

The domestic iron and steel industry, although modest by world standards, was an important factor in the country's economy. The only integrated steel producer in the country remained Halyvourghiki S.A. with a plant near Eleusis, which accounted for about 75% of the country's steel production. Shipbuilding remained the principal use of steel.

Lead, Zinc, Pyrites.—A new 360,000-ton-per-year underground complex sulfide ore mine and a corresponding beneficiation plant started production at Olimpias, Khalkidhikí. The owner, Hellenic Chemical Products & Fertilizer Co. Ltd., invested about $14 million in the project. When full operation is attained, annual output should reach 21,000 tons of silver-bearing lead concentrate (65% lead, 1,600 grams of silver per ton), 30,000 tons of zinc concentrate (55% zinc), and 100,000 tons of pyrite concentrate (46% sulfur, 20 grams of gold per ton). The company was conducting economic studies for total utilization of these complex sulfide ores within Greece. Preliminary plans indicated con-

struction of a 550,000-ton-per-year sulfuric acid plant, a 60,000-ton-per-year lead smelter, a 50,000-ton-per-year zinc smelter, a plant for recovery of nonferrous metals from iron cinder based on Japanese Kowa-Seiko technology, and a small 15-ton-per-year copper cathode plant. An investment of about $190 million would be needed for the project. At the Laurium mines, operated by Compagnie Française des Mines du Laurium, economic conditions deteriorated during 1976, owing to low market prices and low ore grade.

Nickel.—During 1976, the Government of Greece approved LARCO's plan for a $50 million expansion of installed nickel-producing capacity near Larymna from the present 15,000 tons to 27,000 tons per year, to be completed by 1978. To meet the demand of the smelter, the Government also approved doubling the annual output of the nearby mine, which is presently 1.7 million tons of lateritic ore. LARCO planned to provide financing of $17 million from its own funds, while about $33 million would be borrowed abroad. LARCO was planning a subsequent $170 million investment to establish an additional 13,000-ton-per-year nickel plant nearby, bringing the company's annual capacity to 40,000 tons of nickel. However, implementation of this plan depended on world market conditions. During 1976, LARCO purchased equipment, mostly U.S.-made, for about $8.5 million.

Eleusis Bauxite completed construction of a pilotplant of French design for beneficiation of ores from Psakhná (central Euboea). The deposit was rated at 70 million tons of lateritic ore of about 1% nickel-cobalt content. Eleusis Bauxite was asking for approval of a $60 million to $65 million investment in a mine and a 10,000-ton-per-year nickel plant.

NONMETALS

Asbestos.—Cerro Corp., after terminating its partnership with ETVA in development of the Zidanion mines near Kozáni, sold all its rights to ETVA. The Government was searching for another foreign partner.

Barite.—A barite deposit was discovered on Mílos Island. Geologists for Silver and Baryte Ores Mining Co., one of the largest barite producers in Greece, estimated reserves at 3 million tons (30% to 50% barium sulfate content). At yearend, a feasibility study was underway to determine the economics of production to supply a 50,000-ton-per-year beneficiation plant.

Cement.—During 1976, Greece's annual cement-producing capacity reached 11.7 million tons. The increase in capacity of 2.5 million tons resulted from completion of General Cement Co. S.A.'s 1.5-million-ton-per-year plant at Vólos and Chalkis Cement Co. S.A.'s 1-million-ton-per-year cement plant at Mikro Vathy near Chalkis. The Government authorized investments totaling $300 million in six new cement plants, but no locations or capacities for the new plants were mentioned. Domestic cement consumption was up 11%, and exports rose 16% in volume.

Clays.—*Bentonite.*—Silver and Baryte Ores started construction on Mílos Island of a new bentonite plant to increase annual capacity from 260,000 tons to 350,000 tons. At a later stage, plans call for additional expansion to 500,000 tons of bentonite per year.

Fertilizer Materials.—*Phosphate Rock.*—IGME announced the discovery of a phosphate rock deposit at Delvinákion, near Ioánnina, with reserves of 10 million tons (15% P_2O_5 content). In addition, geologists for Hellenic Chemical Products & Fertilizer discovered important phosphate rock deposits on the Ionian Islands and in Epirus. However, details of the deposits were not made public.

Magnesite.—During 1976, magnesite was among the most active mineral commodities in Greece. However, export of magnesite refractories was adversely affected by the slow recovery of the steel industry in Europe.

A pilotplant for production of magnesia from seawater came onstream at Mantoudhi, Euboea. This plant was part of a large $50 million project financed by Financial Mining-Industrial & Shipping Corp. (FIMISCO) that would include a 100,000-ton-per-year plant for extracting refractory magnesia from seawater.

In early 1976, FIMISCO received Government approval for development of magnesite mines and construction of a 36,000-ton-per-year sink-float beneficiation plant of French origin on Lésvos Island, and exploratory drilling was underway at the mine site during the year. Total investment for the mine and plant was planned at $3.5 million. FIMISCO also started production

of briquetted deadburned magnesite from low-grade magnesite and tailings at a 50,000-ton-per-year plant, also at Mantoudhi. The plant includes a flotation section, two vertical kilns, and a briquetting press. Construction costs were reported at $10 million.

Another producer of magnesite, Macedonian Magnesite Ltd. (part of Mining-Industrial & Shipping Corp.) (Scalistiri Group), obtained approval for investment of $8.6 million in expansion of the Ormalia mine and construction of a magnetic dressing plant and a 50,000-ton-per-year plant for briquetting deadburned magnesite.

Grecian Magnesits Ltd. S.A., as part of a $10 million expansion plan, purchased new mining equipment for its open cast mines at Gerakini, Khalkidhikí, and completed a cyclone separation installation nearby.

A new magnesite beneficiation plant, operated by Magnomin General Mining Co., a subsidiary of General Refractories Co. (United States), started production in Khalkidhikí using a Belgian-Yugoslav method (basically sink-float) for upgrading low-grade magnesite and tailings.

At Troupi, northern Euboea, a new 87,000-ton-per-year magnesite concentrator and a 35,000-ton-per-year deadburned magnesite rotary kiln were completed. The owner, Magnesite Mining-Industrial and Commercial S.A., expected to have the plant in normal operation early in 1977.

Perlite.—Silver and Baryte Ores was planning construction of a 40,000-ton-per-year perlite treatment plant on Kos Island. At yearend, approval from the Greek Government, needed for actual beginning of construction, had not been granted.

The largest deposits of perlite in Greece are situated on Mílos and Kos Islands in the Aegean Sea. On Mílos, the largest deposits are in the area of Trachila and Chibadolimni. Total perlite reserves were estimated at 100 million tons. Silver and Baryte Ores, General Enterprise Sarides S.A., and Mykobar Mining Co. (a subsidiary of Dresser Industries, Inc., of the United States) were among the largest perlite producers.

Salt.—A salt deposit was discovered near Préveza in Epirus. IGME was continuing exploration to determine the size of the new deposit.

MINERAL FUELS

Imported petroleum remained the principal source of energy in Greece. During 1975, the latest year for which complete data are available, about 74% of Greece's apparent fuel and power consumption was met through net imports. Crude oil and refinery products accounted for approximately 97% of primary energy imports. Lignite was the principal form of energy produced in the country and provided 25% of apparent energy consumption. However, importing high-rank coals was necessary to meet demand. Table 4 shows the supply and apparent consumption of fuels and power for 1974 and 1975.

Table 4.—Greece: Supply and apparent consumption of fuels and power in 1974 and 1975

(Million tons of standard coal equivalent [1])

	Total energy	Coal and coke	Petroleum and refinery products	Fuelwood	Hydro-electrical power
1974:					
Production	4.9	4.6	--	(2)	0.3
Imports	20.5	1.0	19.5	(2)	(2)
Exports	3.6	(2)	3.6	(2)	(2)
Apparent consumption	21.8	5.6	15.9	(2)	.3
1975:					
Production	6.2	5.9	--	(2)	.3
Imports	22.6	.6	22.0	(2)	(2)
Exports	4.8	(2)	4.8	(2)	(2)
Apparent consumption	24.0	6.5	17.2	(2)	.3

[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2] Less than ½ unit.

Source: United Nations. World Energy Supplies (1950–75), Statistical Papers, ser. J. No. 20, 1977, 239 pp.

Coal.—Lignite was the only mineral fuel produced in significant commercial quantities in Greece during 1976. High prices for imported energy made domestic low-grade lignites more attractive than in the past. Consequently, development of existing deposits and exploration for new ones continued. IGME conducted exploration, mostly in northwestern Greece, with funds supplied by Government-owned PPC, the major lignite mine operator in the country.

Of a total production of 22 million tons of lignite, 15 million tons was produced from the Ptolemaïs mines, 6.4 million tons at the Megalópolis lignite field, and 0.6 million tons at Alivérion, Euboea. Most of the lignite produced was used for production of electrical power. Lignite-fired powerplants accounted for about 55% of the total electrical energy produced in the country.

During 1976, PPC started implementing plans aimed at increasing output and consumption of lignite in Greece. According to plans for the Ptolemaïs lignite deposit (which has proven reserves of 1.4 billion tons with a calorific value of 1,400 kilocalories per kilogram), expansion of mines should lead to an output of 18 million tons in 1980 and 42 million tons by 1990. The South Field area was slated to yield most of the new output. The Otto Gold firm of West Germany was engaged to complete a study on development of the South Field to supply lignite for seven 300-megawatt generating units at Kardia, beginning sometime between 1980 and 1986. PPC signed contracts for delivery of three bucket-wheel excavators by Fried. Krupp Hüttenwerke AG and Siemens AG; other contracts were let to the East German firm Maschinen-Export and the Swiss firm Brown, Boveri & Cie AG for delivery of two bucket-wheel excavators and four stackers. Deliveries under both contracts were scheduled for 1980. The management of PPC was planning to purchase locally an 11-kilometer-long conveyor belt, mainly for transportation of the overburden at the new mine.

At Megalópolis, where proven reserves are 470 million tons with an average calorific value of 960 kilocalories per kilogram, plans call for an output of 14 million tons by 1990. The Kiparission Field, which will be developed at Megalópolis, should account for the increased production.

At the Alivérion, Euboea, deposit, production will continue until 1978 from a mine based on a small lignite deposit with proven reserves of 2 million to 3 million tons with a calorific value of 2,800 kilocalories per kilogram.

Exploration was underway at numerous sites, the most significant of which were northern Ptolemaïs (proven reserves of 54 million tons), Amyneteon (proven reserves of 140 million tons), and Édhessa (proven reserves of 20 million tons).

Petroleum and Natural Gas.—During 1976, Greece was not a producer of petroleum and natural gas, and all demand was met through imports. However, exploration was underway offshore and onshore. Two wells were drilled offshore in the area of Thásos Island. Results were discouraging because producing formations apparently pinched out; consequently, estimates of reserves in the Prinos Field were lowered to 25,000 barrels per day for 15 years instead of the 50,000 barrels per day previously reported. In the fall, Oceanic Exploration Co. of Denver, Col., sold its 68.75% equity in the offshore oil exploration and development concession near Thásos Island to Denison Mines Ltd. of Canada. At yearend, a new company, North Aegean Petroleum Corp. (EPE), was organized to act as operator for the new consortium.

New legislation related to petroleum and natural gas, Law 468/761, was passed by the Greek Parliament, vesting the right of exploration and production of petroleum and natural gas in the State. The State may, however, contract exploration activities to a contractor, provided that exploration does not last longer than 4 years; in seawater deeper than 200 meters, exploration time may be extended another 2 years; when oil or gas is discovered, the lease for production should not exceed 25 years; and the State has the right to ask for a joint venture with the contractor if oil or gas is discovered.

In addition, Law 367/76, which became effective in June 1976, provided for compulsory expropriation of land required for oil and gas activities, including pipelines and storage facilities.

The crude oil capacity of petroleum refineries in Greece was 20 million tons per year, distributed as follows, in million tons:

Motor Oil (Hellas) Corinth Refineries (Vardinoyannis family)	7
Petrola Hellas S.A. refinery (shipowner John Latsis)	5
Hellenic Aspropyrgos Refinery S.A	4.8
Esso Pappas refinery	3.2
Total	20

Refinery throughput in 1976 was 11.1 million tons, or 55.5% of installed capacity. The Government canceled, by negotiated agreement, a 1970 $200 million contract with the Niarchos Group and repurchased for $12.4 million Niarchos' share in Hellenic Aspropyrgos Refinery. This takeover was designed to increase Government control over the Greek petroleum sector.

Uranium.—Exploration for uranium continued in northern Greece in an area west of the Axios River. Greek and foreign scientists working for the Atomic Energy Institute of Greece and United Nations teams were active in the Kaválla-Dráma area.

The possibility of building a nuclear powerplant was considered by authorities in Greece. However, no decision was made public at yearend.

The Mineral Industry of Hungary

By Jozef Plachy [1]

The year 1976 was the beginning of the fifth 5-year plan. Reportedly, the overall 4.1% increase in industrial production during 1976 was led by the chemical industry (up 11.1%), followed by the electric energy industry (up 7.8%). The increase in output of machinery, an important export item, dropped to 4.2% in 1976 from 4.8% in 1975.

In compliance with new economic regulations, priorities were assigned to investment projects crucial to the national economy. The pertinent accelerated investments completed in 1976 were the second and third stages of the Danube Thermal Powerplant at Százhalombatta, the second stage of the Danube Petroleum Enterprise, phase 2 of the Székesfehérvár Light Metal Works wide strip rolling mill, phase 1 of the press works of the Ózd Metallurgical Works continuous steel casting and bar/wire-rolling mill, the Hejöcsaba Cement Plant, and the Pét Nitrogen Plant.

The fifth 5-year plan allocates 870 billion forints (Ft) for investments, 40% of which is earmarked for industry. In 1976, industrial investment amounted to Ft58.4 billion, or 38.9% of total 1976 investment. The allocation of investment funds, production, and employment within the various industrial branches for 1976 is shown in the following tabulation:

Industry	Investment			Gross industrial production		Employment	
	According to fifth 5-year plan (percent)	Actual		Billion forints	Percent	As of January 1	Percent change from 1975
		Million forints	Percent				
Electric energy	19.7	8,176	14.0	24.0	3.5	38,600	+0.4
Chemical	14.7	11,563	19.8	105.7	15.4	118,600	—.2
Engineering	14.1	10,220	17.5	180.6	26.3	552,300	—.4
Mineral	13.0	5,782	9.9	30.9	4.5	122,000	—1.2
Food processing	9.9	7,475	12.8	131.2	19.1	197,900	--
Light	8.8	6,716	11.5	116.0	16.9	452,500	—1.4
Building materials	8.5	4,088	7.0	22.0	3.2	81,000	—2.4
Metallurgy	7.9	3,738	6.4	65.2	9.5	102,400	—1.0
Other	3.4	642	1.1	11.0	1.6	62,700	—.4
Total	100.0	58,400	100.0	686.6	100.0	1,728,000	—.8

Source: Statistical Pocket Book of Hungary, Budapest. 1977.

About 70 mineral commodities are produced in Hungary. The economically significant mineral reserves total more than 7 billion tons, representing approximately 15% of national resources.[2] More than half of the minerals suitable for industrial use are for construction use; 30% are solid fuel resources; 8% are various other nonmetallic minerals; approximately 4% are metal-bearing ores such as bauxite, copper ore, lead ore, zinc ore, iron ore, and manganese ore; and 2% are liquid hydrocarbons. Although the mineral fuels and metallic ores amount to only 36% of total mineral reserves, their value is almost 90% of all natural resources.[3]

[3] Work cited in footnote 2.

In 1976, 58% of total energy needs, 95% of mineral raw material needs, and almost 100% of construction industry mineral raw material needs were supplied by indigenous production.[4] Mining is basically conducted by three organizations: Magyar Szénbányászati Tröszt (Hungarian Coal Mining Trust) (MSZT), Országos Köolaj-és Gázipari Tröszt (National Petroleum and Gas Trust) (OKGT), and Országos Érc-és Ásványbányászati Vállallat (National Ore and Mineral Mining Enterprise) (OEAV).

The largest of the three enterprises is the MSZT with a total employment of 82,000 people, 87% of which are miners.[5] The OKGT manages 27 firms and employs 51,000 people.[6] The OEAV operates 22 surface mines, 10 underground mines, and 25 processing plants, and some 86% of its mined minerals are processed.[7] The OEAV is divided horizontally into seven independent organizations: The Transdanubia (Dunántúl), Hegyalja, and Mátra regions; the Recsk, Úrkút, and Rudabánya mines; and the Prospecting and Exploring Enterprise. In addition, it is organized vertically to insure better coordination of operations occurring during mining, processing, and marketing of minerals and/or semifinished products.

PRODUCTION

In the light of Hungary's increasing dependence on imports of primary materials, mining remains the most crucial branch of industry. A 12.1% increase in oil and natural gas production was generated mainly by stepped-up production at the Szeged-Algyö Fields. Petroleum output from this area increased over 20% and constituted three-fourths of total production. Natural gas production in the same region was approximately 60% of the total production in Hungary. In 1976, expansion of the Danube Thermal Powerplant was completed, resulting in a 7.6% increase in electric energy production.

Except for fossil fuel production, bauxite mining is the most significant branch of Hungary's mineral industry. With the opening of the Iza II mine, bauxite production recorded a 1% increase. The 3.6% increase in gross production by the entire metallurgy sector in 1976 proved inadequate to offset the small decline of the previous year.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, diatomite, gypsum, and other crude construction materials such as common clay are produced but available information is inadequate to make reliable estimates of output levels.

[2] Contains 30% to 33% manganese.

[3] Excludes refinery fuel and losses.

TRADE

The value of Hungarian foreign trade in 1976 reached Ft434,890 million of which Ft204,834 million represented exports and Ft230,056 million imports.[8] Because of the new exchange rate incorporated in the new economic regulations and introduced on January 1, 1976, a comparison with the previous year would be inaccurate. The commercial exchange rate is now Ft-40–41=US$1.00, and the tourist rates are Ft20.63=US$1.00 and Ft20.67=US$1.00 (selling and buying, respectively).

Hungary's major trading partners in 1976 are as follows:[9]

Country	Exports		Imports	
	Million forints	Percent	Million forints	Percent
U.S.S.R	61,783	30.2	61,192	26.6
Germany, East	18,138	8.9	20,034	8.7
Czechoslovak'a	15,235	7.4	14,561	6.3
Germany, West	16,814	8.2	22,522	9.8
Austria	8,183	4.0	12,608	5.5
Italy	9,795	4.8	10,707	4.7

The value of Hungarian trade with the United States in 1976 was Ft5,976 million ($146 million) of which 35.6% was exports and 64.4% was imports, showing an Ft1,720 million ($42 million) trade deficit.[10]

With the exception of bauxite and, to a certain extent, manganese ore, Hungary is a net importer of energy, raw materials, and semifinished products. While the trade balance in machinery, transportation equipment, and investment goods was favorable with centrally planned economy countries, it showed a small deficit with market economy countries.

During 1977, foreign trade is to increase 10.9% to Ft482,482 million, of which 48.7% is to represent exports and 51.3% imports. Planned increases are 12% and 7% for exports and imports, respectively, for centrally planned economy countries and 17% to 18% and 8%, respectively, for market economy countries.[11]

COMMODITY REVIEW

METALS

Aluminum.—The aluminum industry is one of the most important industries in Hungary. It employs over 40,000 people, and its share of the total value of national industry was almost 4%. With an export value of $90 million to market economy countries and 80 million rubles to centrally planned economy countries, it constituted nearly 5% of the total value of Hungarian exports.[12]

The Hungarian aluminum industry is under the management of Magyar Aluminiumipari Trószt (Hungarian Aluminum Trust) (MAT). The 1976 production and trade and planned goals for 1977 and 1980 are shown in the following tabulation, in tons:[13]

[12] Magyar Aluminium (Hungarian Aluminum), Budapest. V. 13, No. 9, 1977, p. 281.

NA Not available.
[1] Long-term trade agreements already signed.
[2] Included with semifinished products as "Semimanufactures" on table 2.

In 1976, Hungary exported 328,680 tons of bauxite to Czechoslovakia and 190,023 tons to East Germany.[14] In 1962, Hungary signed a long-term alumina-aluminum agreement with the U.S.S.R., followed by a similar agreement with Poland. Under this agreement, 330,000 tons of alumina was shipped to the U.S.S.R. in 1976. In exchange, Hungary received 165,000 tons of aluminum. For the 80,000 tons of alumina shipped to Poland, Hungary received 17,500 tons of aluminum.[15] In a similar fashion, Hungary shipped 18,432 tons of alumina to Romania and imported 12,304 tons of aluminum and 5,056 tons of aluminum products. With imports of 20,624 tons of aluminum products in 1976, Sweden was the largest importer of Hungarian aluminum.[16]

Bauxite reserves are estimated at 110 million tons of 50% to 60% Al_2O_3.[17] The better quality is found at depths of 150 to 300 meters or more; only low-quality bauxite is found close to the surface. Consequently, less than 15% of bauxite is surface mined. The SiO_2 content averages between 7% and 8%.[18]

Bauxite reserves are located west and north of Lake Balaton, covering an area of less than 2,000 square kilometers. The northern part, between Székesfehérvár and Tatabánya, is known as the Fejer County Bauxite Mines. It supplies around one-third of the total national production. The Bakony bauxite mining region, stretching from Tapolca to Kislöd, is divided into two independent enterprises, the Halimba mines and the Nyirád-Darvastó mines. Both enterprises contribute almost equally to the remaining two-thirds of national production.

The only underground bauxite mine put into operation in 1976 was Iza (Iza-major) II. With the participation of 16 companies and an investment of Ft800 million, the Iza II mine reached its full capacity of 425,000 tons of bauxite in 1976 instead of 1980 as originally planned.

Future plans for the Bakony region include the opening of the Deáki bauxite mine in 1980 at a cost of Ft700 million, replacing the existing Deáki I and II mines soon thereafter. Under the lignite deposits at Nagyegyháza, 10 million tons of bauxite reserves have been found.[19] Work on a lignite-bauxite mine will start in January 1977, and by 1985 it should produce 500,000 tons of bauxite, later to be increased to 750,000 tons. In Fejer County, the Bitó II bauxite mine is to be opened in 1981, reaching its full annual capacity of 400,000 tons by 1983.

Individual mines and their production in 1976 are shown in the following tabulation:

[19] Népszabadság (People's Freedom), Budapest. Dec. 24, 1976, p. 5.

Region	Independent enterprise	Production		Individual mines			Remarks
		Quantity [1] (thousand metric tons)	Average quality [2]	Name	Startup date	Capacity (thousand metric tons per year)	
Bakony	Halimba	1,000	6.8 modul, 51% Al_2O_3, 7.5% SiO_2.	Kislöd	1960's	100	Underground mines. The 20 million to 22 million tons of reserves are expected to last until 1985.
				Halimba II	1952	200	
				Halimba III	1973	600	
				Open pit mines	NA	100	Numerous small open pits.
	Nyirád-Darvastó	900	9.5 modul	Deáki I	1974	200	Both mines will cease production by the early 1980's, when replaced by a new one.
				Deáki II	1974	100	
				Iza II	1976	400	Ft800 million investment. Underground mine.
				Open pit mines	NA	200	Numerous small open pits.
Fejer County	Fejér	1,060	7.2 modul, 52.1% Al_2O_3, 7.3% SiO_2.	József III	1968	80	High-quality bauxite (9.1 modul, 53% Al_2O_3, 5.8% SiO_2).
				Iszkai II	1960's	400	Mine was renovated in 1972 and is expected to operate until 1982.
				Rákhegy II	1975	480	2 million tons of reserves at depths of 600 to 800 meters. Reserves are expected to last until 1987.
				Open pit mines	NA	100	Numerous small open pits.

NA Not available.
[1] Total quantity may differ from data given elsewhere because of independent rounding.
[2] Modul is calculated as the ratio of % Al_2O_3 to % SiO_2.

Nearly 80% of the bauxite production is processed domestically. Total alumina production by the end of the fifth 5-year plan should reach 440,000 tons. The largest and oldest alumina plant is located at Ajka, 120 kilometers southwest of Budapest, near Balaton. Future plans include an 80,000-ton capacity addition to the new alumina plant by 1980 and an increase in gallium recovery to 2.8 tons annually by 1977. The Ft350-million expansion project at the Almásfüzitö alumina plant, located on the Czechoslovak border 63 kilometers northwest of Budapest, was still under construction in 1976; according to plans, total annual capacity of the plant is to reach 320,000 tons of alumina by yearend 1977. In 1976, work began on a gallium extraction process based on Soviet technology. Gallium recovery at this plant is scheduled to begin by 1978 or 1979. The smallest of the three alumina plants in Hungary is located at Mosonmagyaróvár, 12 kilometers from the Austrian and Czechoslovak borders.

A number of alumina plants are being designed or built by the Hungarian aluminum planning organization, Aluminumipari Tervezo Vállalat (ALUTERV). Two alumina plants are being built in Yugoslavia. One, a 300,000-ton-per-year plant at Obrovac, was to start production in 1976. It was reported, however, that 85% to 90% of the work had been accomplished, at a cost of $150 million compared with a budgeted cost of $100 million.[20] A second alumina plant with a capacity of 600,000 tons per year is being built near Vlasenica in cooperation with the U.S.S.R. In addition, Hungarian experts are involved in installing equipment and training personnel for an alumina plant in India and in conducting bauxite prospecting in India, Cuba, and many African countries.

The capacity of Hungarian alumina plants in 1976 is shown in the following tabulation, in thousand tons per year:

Name and location	Capacity	Remarks
Ajkai Timföldgyár (Ajka)	385	The addition of 240,000 tons to annual capacity was completed in 1975 at a cost of Ft2.3 million. 80,000 tons of annual capacity is to be added by 1980.
Almásfüzitöi Timföldgyár (Almásfüzitö)	304	Additional capacity of 16,000 tons will be added by 1977 at a cost of Ft350 million. Gallium recovery based on Soviet technology is scheduled to start in 1978 or 1979.
Mosonmagyaróvári Timföld és mükorundgyár (MOTIM) (Mosonmagyaróvár).	72	By the end of the fifth 5-year plan, production is to increase by 27,000 tons at a cost of Ft560 million.

The energy intensity of aluminum production (15,000 kilowatt-hours per ton of aluminum) was the reason for alumina-aluminum agreements with the U.S.S.R. and Poland. As a result, the indigenous production of aluminum grew at a slower rate than other sectors of the aluminum industry.[21] However, recent discoveries of lignite in the Tatabánya region and the building of a new powerplant in Bicske will enable the aluminum industry to increase its primary aluminum production. The largest smelter is located in Inota, near Várpalota, 75 kilometers southwest of Budapest, where more than half of total Hungarian aluminum is produced.

The capacity and production of Hungarian primary aluminum plants in 1976 are shown in tons in the following tabulation:

	Annual capacity	Production
Inota	46,000	20,000 (ingots), 15,300 (wire).
Ajka	25,000	21,000 (ingots), 1,100 (castings).
Tatabánya	17,000	10,000 (ingots), 1,000 (high-purity ingots). 3,200 (wire).
Total	88,000	

The production of semifinished and finished aluminum products is concentrated at Székesfehérvár, 70 kilometers southwest of Budapest. In 1976, the Székesfehérvár Light Metal Works produced 106,000 tons of aluminum products, representing over

[20] Világgazdaság (World Economy), Budapest. 1977.

[21] Kohászat (Metallurgy), Budapest. V. 108, No. 9, 1975, pp. 415–421.

79% of the entire Hungarian production. The expansion of this plant was completed in July 1976 at a cost of Ftl billion. By the end of the fifth 5-year plan in 1980, the annual capacity of the plant is to be increased to 120,000 tons. A continuous-casting and wire-drawing mill unit is also to be added.[22]

The Köbánya Light Metal Works, located in Budapest, produced an estimated 9,000 tons of aluminum sheet, strip, foil, and pigment paste. According to an agreement signed in 1976 with Japanese Tokai Metals Co., Ltd., production of aluminum foil will be increased from 1,500 tons in 1976 to over 7,000 tons by 1982.[23] Additional capacity for production of semifinished goods is located at Ajka, Inota, and Tatabánya.

Copper.—According to Hungarian sources, production of copper concentrate declined from 7,018 tons in 1975 to 6,794 tons in 1976.[24] Hungary imported 30,248 tons of copper and 12,169 tons of copper products.

There are small copper mines located at Rudabánya (35 kilometers north of Miskolc), Gyöngyösoroszi (20 kilometers southwest of Recsk), and Mecsek (55 kilometers north of Pécs in southern Hungary).

In 1972, a new copper deposit was found in the vicinity of an old one at Recsk in northern Hungary, 145 kilometers northeast of Budapest. The discovery is said to be large, even by international standards, with much of the ore contained in a relatively small area. By 1976, 8-meter-diameter vertical shafts had been sunk to a depth of 1,200 meters. Construction of two connecting haulageways commenced at depths of 700 and 900 meters. By 1985, a 7-million- to 8-million-ton annual capacity mine and a plant to fully process the extracted ore are to be developed.

Gallium.—In 1976, Hungary produced an estimated 2.15 tons of gallium, or around 14% of the world production.[25] The gallium-extracting section of the Ajka alumina plant was developed by Hungarian experts in the early 1970's. By 1977, plans are to produce about 2.8 tons of gallium per year.

The Almásfüzitö alumina plant bought the Soviet technology for gallium production because this method is simpler and less harmful to health than the Hungarian method. By 1979, the first gallium from Almásfüzitö is to enter the internal market and the favorable foreign market.[26]

Iron Ore.—Iron ore production in 1976 was 601,846 tons, a 6.2% decline from that of 1975. About one-half of the output was concentrated iron ore with 42% iron content, and 51% was limonite with 32.6% iron content, resulting in a total of 224,046 tons metal content.[27]

Two-thirds of total national production came from an open pit mine 4 kilometers long and 350 meters deep; the remaining one-third was produced in an underground mine. Because there is little prospect of finding new deposits and present production cannot be expanded, the 4% to 5% share of Hungarian ore in the domestic consumption is expected to decline further.[28]

The only known iron ore reserves are located in Rudabánya, 153 kilometers northeast of Budapest. The known reserves consist of 3.2 million tons of limonite and 14.6 million tons of siderite, giving a total of 17.8 million tons of iron ore reserves, of which 70% is now under exploitation.

To supplement its inadequate production in 1976, Hungary imported over 4 million tons of iron ore from the U.S.S.R. and 157,000 tons from India.[29] Together with other countries in the Council of Mutual Economic Assistance (CMEA), Hungary is participating in the development of iron ore deposits in the U.S.S.R. Once this joint plan is realized, imports of iron ore from the U.S.S.R. will increase.

Iron and Steel.—In 1976, ferrous and nonferrous metallurgy contributed 9.5% to the gross production in Hungary. This was achieved by only 5.9% of the total work force, or 102,400 employees.[30] Investment in ferrous and nonferrous metallurgy in 1976 was around Ft3.7 billion, an 8.8% increase over that of 1975. Iron and steel production represents 70% of all metal-

[2] Includes sheet metal and rods.

In 1976, pig iron was produced in nine small blast furnaces. The average dry coke consumption for production of 1 ton of pig iron was 535 kilograms.[31]

Hungarian steel industry technology and most of the equipment at steel plants are outdated. Around 93% of the crude steel in 1976 was produced in open-hearth furnaces, while only 7% came from electric furnaces;[32] only 32% of the Siemen-Martin furnaces are equipped with oxygen injection.

Over 90% of the crude steel production in 1976 came from three metallurgical complexes: 1.2 million tons from the Ózd Metallurgical Works at Ózd (120 kilometers northeast of Budapest, near the Czechoslovak border); 1.2 million tons from the Danube Iron Works in Dunaújváros (60 kilometers south of Budapest on the Danube); and 0.8 million tons from the Lenin Metallurgical Works in Diósgyör (a suburb of Miskolc, 145 kilometers northeast of Budapest).[33] The remaining 10% was produced in Köbánya, Mohács, Szeged, and elsewhere.

In 1976, a new 110-ton-capacity open-hearth furnace was built and a bar/wire-rolling mill was installed at Ózd. The Ft3-billion investment for transformation of the open-hearth furnaces into a modern and more intensive technological operation with oxygen injection is to be completed in 1978. With this, the production of the furnaces can be increased 25% to 30%.

The biggest investment in the metal industry during the present 5-year plan was being made at Dunaújváros. Two 130-ton Linz-Donawitz converters, two 960-cubic-meter blast furnaces, and one 1,700-cubic-meter furnace are to be built by 1980. In addition, a coking plant based on foreign technology is to be completed by 1981, and an ore-dressing plant will be ready by 1983. The estimated initial investment of Ft5.7 billion has been revised to Ft12.9 billion.[34]

With a production of 797,000 tons of steel, the Lenin Metallurgical Works at Diósgyör is the smallest of Hungary's major steelworks. At a cost of Ft10 billion, a new 80-ton-capacity Linz-Donawitz converter, an 80-ton electrofurnace, and continuous-casting facilities are to be completed by 1983. The old open-hearth production is to be completely shut down by that time. With the present electrofurnaces, the capacity of the Lenin Works will increase to 1.1 million tons during the sixth 5-year plan.[35]

The 6.9% increase in rolled steel production was achieved by intensification of work at the existing 20 mills. The 0.5-million-ton production of high-quality steel is concentrated at Dunaújváros, while 83% (0.3 million tons) of the steel pipe is made

[35] Work cited in footnote 34.

at Csepel.[36] With the completion of continuous-casting facilities at Ózd, the share of steel casting in Hungary's steel production reached 26.5%.

Lead and Zinc.—The output of lead and zinc ore and concentrate is as follows, in tons:

	1976 [1]	Percent change from 1975
Lead-zinc ore	143,655	−2.0
Lead concentrate	1,711	−3.5
Zinc concentrate	4,324	+.1

[1] Mining Annual Review, London. 1977, pp. 555–559.

Lead-zinc production is centered at Mátra Mountain, in the northeastern part of Hungary near Gyöngyösoroszi, where a 29-ton-per-hour ore concentration plant is located.[37] Lead production met only 10% of Hungary's needs, and zinc production, only 20%. Consequently, 85% to 90% of the national requirements of both metals must be imported, mostly from the U.S.S.R. Lead and zinc reserves were found in polymetallic ores at Recsk, but the size of the deposits had not been determined.[38]

Manganese.—The 1976 manganese crude ore production in Hungary is shown in the following tabulation:

	Manganese ore [1] (metric tons)	Manganese content [2] (percent)	Percent change from 1975
Oxide	114,450	26.6	−10.3
Carbonate	50,624	18.5	−7.5

[1] Mining Annual Review, London. 1977, pp. 555–559.
[2] Bányászat (Mining), Budapest. V. 109, No. 8, 1976, pp. 186–195.

Hungary exported 13,739 tons of manganese ore, of which 8,517 tons was shipped to Czechoslovakia and 5,222 tons to West Germany; Hungary imported 15,130 tons of manganese ore, all from the U.S.S.R.[39]

Hungary has an estimated 80-million-ton reserve of manganese ore, most of it carbonate.[40] Manganese mines are located near Úrkút (underground) and Csárdahegy (open pit), 120 kilometers southwest of Budapest. Because of inadequate ore beneficiation technology, the carbonate ore is used only as an additive for iron and steel production. There are smaller known reserves of manganese ore near the towns of Eger and Demjén in northeastern Hungary, but these are not presently being mined.

In the near future, an electrolytic ferromanganese furnace is to be erected at Kislöd. Ore production is expected to grow thereby to approximately 500,000 tons per year by the end of the present 5-year plan in 1980.

NONMETALS

Cement.—Cement production in Hungary was 14.3% higher than in 1975, reaching a total of 4,298,000 tons. Consequently, imports of 762,000 tons of cement in 1976 were 22.3% less than in the previous year.[41] Some 42% of the imported cement came from the U.S.S.R., while Romania and East Germany supplied 31% and 26%, respectively. Of 224,000 tons of cement exported, more than 90% was shipped to Yugoslavia.[42]

The first two kilns of a third dry-method cement plant in Bermend came onstream in 1972. The plant, which represents a Ft-2.5-billion investment, is to reach its full capacity of 1.07 million tons in 1977.[43] In 1976, the newest cement plant, located in Hejöcsaba (near Miskolc, 150 kilometers northeast of Budapest), began production. The 1.6-million-ton-capacity plant was built at a cost of Ft4.7 billion. Limestone and clay reserves in the vicinity of Hejöcsaba are sufficient to maintain planned output for 50 years.[44] The fuel used for heating the kiln is natural gas from the U.S.S.R. The plant requires 780 kilocalories (3,095 Btu) to produce 1 kilogram of cement.[45]

A fifth cement plant which is under construction at Bélapátfalva, 115 kilometers from Budapest, is to start production in 1978, and is to reach 1.25-million-ton capacity in the same year.[46] Fuel is alternatively

oil or gas, and the product is portland and blended cement.

Clays.—*Bentonite.*—The 1976 production of bentonite declined almost 20%. From 71,148 tons of raw ore, 51,012 tons of processed bentonite was produced in 1976.[47] Hungary exported 18,537 tons of bentonite, of which 83% was shipped to East Germany.[48]

More than 70% of the production came from the open pit mine in Hercegköves, located in northern Hungary. The average 10-meter-thick seam of bentonite lies under 1.5 to 10 meters of overburden. Extraction is accomplished in two benches. A smaller open pit is located in the Rátka-Újhegy area. The entire raw bentonite output is trucked to a milling and processing plant at Mád.[49]

The oldest bentonite mine at Komlóska temporarily ceased production. New reserves found at Ond were being evaluated.[50]

Kaolin.—In 1976, Hungary produced 72,000 tons of kaolin, a 19.1% decline from that of 1975.[51] In the same year, Hungary imported 28,797 tons of washed kaolin and exported 7,235 tons of raw kaolin, three-fourths of which was destined for Czechoslovakia.

Kaolin production is concentrated in the the southern part of the Zempléni Mountains, 180 kilometers from Budapest. The Szegilong and Füzérradvány underground mines and the Bámboby and Királyhegy open pits are the largest of numerous mines in the region. Most of the kaolin reserves in this area are spotty. The main processing plant is located at Bodrogszegi; additional processing capacity and a mill are at Szegi and a mixer at Erdöbénye.[52]

Fertilizer Materials.—In 1976, Hungary produced a gross weight of 3,396,000 tons of mineral fertilizers, a 7.9% increase over that of 1975. Of this quantity, 2,402,000 tons was nitrogen fertilizer and 994,000 tons was superphosphate. Expressed in terms of plant nutrients, the total production in 1976 was 680,000 tons of mineral fertilizers, showing an 8.5% increase over that of 1975.[53]

In 1976, Hungary imported over 2.5 million tons of fertilizers of the following composition: 436,712 tons of nitrogen fertilizer (20.5% nitrogen content), 804,889 tons of phosphatic fertilizer (18% P_2O_5 content), 1,172,083 tons of potash fertilizer (40% K_2O content), and 94,309 tons of combined fertilizers. Of the total fertilizer imports, 34.2% came from the U.S.S.R., 24.9% from East Germany (all potash), and 18% from the United States (all phosphatic).[54]

Since Hungary does not have raw materials for production of potash and phosphatic fertilizers, all potash fertilizer is imported, and the small domestic production of phosphatic fertilizer is based on imported raw materials. In spite of sufficient resources of natural gas, only 62.5% of nitrogen fertilizer was produced domestically.

The largest fertilizer plant is located at Pétfürdö, near Várpalota, 80 kilometers southwest of Budapest. The Pét Fertilizer Complex was commissioned at yearend 1975, but production was hampered by faulty equipment.[55] When fully operational, the plant is to produce 268,000 tons of nitrogen active ingredient, 80,000 tons of P_2O_5, and 80,000 tons of K_2O active ingredient. Other Hungarian fertilizer plants are the Borsod Chemical Combine and the Tisza Chemical Combine, both located near Miskolc, 195 kilometers northeast of Budapest.

Perlite.—The production of perlite in 1976 was 96,180 tons, 33.6% more than in 1975.[56] Perlite is surface mined in the Zempléni Mountains, 200 kilometers northeast of Budapest. The largest mine is located near Pálháza, where extraction is carried out on four benches, each 10 to 12 meters high. Ore is processed locally and shipped to Belegrádpuszta and Zalaegerszeg for bulging.[57] Two-thirds of the final products are exported, mostly to Austria and East Germany.

Refractory Materials.—In 1976, Hungary produced 169,000 tons of chamotte products and 47,000 tons of chrome magnesite products, showing a 1.2% decline and an 11.9% increase, respectively, from the 1975 levels. Imports of refractory materials totaled 42,143 tons, consisting

[47] Work cited in footnote 28.

[57] Work cited in footnote 52.

mainly of chrome magnesite products. In 1976, 24,498 tons of refractory materials was exported.[58] Because of inadequate domestic resources of magnesite, 70% of the basic materials are imported.[59] Half of the output is used in metallurgy, 18% is used in construction, 11% is exported, and the rest is used in 75 other industrial branches.[60]

Future plans include construction of a new aluminum silicate plant at Encs, located in Borsod County, 180 kilometers northeast of Budapest. The projected capacity is to reach 170,000 tons in 1983 and the projected cost is Ft3 billion. Plans also include setting up a synthetic magnesite facility at Tiszavárkony, but as of 1976 the project had not been approved.

MINERAL FUELS

Hungary's primary energy consumption in 1976 reached an estimated 45 million tons standard coal equivalent, representing a 7.7% increase over that of 1975. Coal provided 38% of total primary energy, oil 37.6%, natural gas 22.4%, hydroelectric and imported energy 1.1%, and fuelwood 0.9%. In 1976, 58.4% of Hungary's primary energy consumption came from indigenous fossil fuels. Imports accounted for 42.7% and exports for 1.1% of the total primary energy available in 1976. The total energy balance for 1975 and 1976 is shown in table 4.

Substantial efforts to explore additional energy sources characterized 1976. Coal prospecting was concentrated around Tatabánya. Oil and gas prospecting centered around Szeged in the south. The urgency of locating new energy sources is reflected in the current 5-year plan, in which one-third of all industrial investment is related to energy. Exploration is carried out by Országos Földtani Kutató és Fúró Vállalat (National Geological Exploring and Drilling Enterprise) (OFKFV), which is capable of drilling up to 80,000 meters per year.

In its 27 producing, processing, and supply enterprises, the OKGT employs around 51,000 people. Future investments to be completed during the present 5-year plan are the Szeged oil and gas processing complex by 1977, expansion of storage capacity at the Tisza Petroleum Enterprise by 580,000 cubic meters, the gas pipeline network, building of underground gas storage, building of the Adriatic petroleum, pipeline, and an Ft1.3-billion program for environmental protection. The objective of the 5-year plan is to search for an additional 30 million to 35 million tons of hydrocarbons, for which an estimated 1,000 kilometers of drilling is foreseen.

Coal.—In 1976, total production of coal in Hungary was 25,257,000 tons, of which 11.6% was bituminous, 58.5% brown, and 29.9% lignite. Of the total production,

[58] Work cited in footnote 8.

[60] Work cited in footnote 59.

Table 4.—Hungary: Primary energy balance for 1975 and 1976

(Million tons of standard coal equivalent [1])

Year	Total primary energy	Coal (lignite, anthracite, bituminous), coke, and briquets	Crude oil and petroleum products	Natural and associated gas	Fuelwood	Hydroelectric and other power
1975:						
Production	r 24.2	14.0	r 2.9	6.9	0.4	--
Imports	r 18.2	r 2.7	r 13.5	1.1	--	0.9
Exports	r .6	.1	r .3	--	--	.2
Apparent consumption	r 41.8	r 16.6	r 16.1	8.0	.4	.7
1976: [p]						
Production	26.3	14.3	3.1	8.5	.4	--
Imports	19.2	2.9	14.2	1.6	--	.5
Exports	.5	.1	.4	--	--	--
Apparent consumption	45.0	17.1	16.9	10.1	.4	.5

[p] Preliminary. [r] Revised.
[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are: Hard coal, 1.0; lignite and brown coal, 0.5; recovered slurries, 0.515; briquets and household coke, 0.67; coke, 0.9; crude oil, 1.47; refinery products, 1.53; natural gas, 1.33 (per thousand cubic meters); manufactured gas, 0.6; and hydroelectric power, 0.125 (per thousand kilowatt-hours).

76% came from underground mines, and the remaining 24% came from open pit mines.[61] In the same year, Hungary exported 55,000 tons of brown coal, 16,345 tons of coal briquets, and 5,000 tons of industrial and household coke. Imports during the year consisted of 1,297,000 tons of bituminous and anthracite coal, 1,360,000 tons of metallurgical coke, 514,704 tons of coal briquets, and 98,000 tons of industrial and domestic coke.[62]

Hungary has an estimated 20 billion tons of explored and recorded coal reserves,[63] representing around 86% of all energy reserves. The estimated composition of coal reserves is bituminous 25%, brown 48%, and lignite 27%.[64] Coal production is divided into nine independent enterprises, supervised by the MSZT.

With an output of 6.2 million tons of lignite (involving 31 million cubic meters of overburden removal), the Thorez open pit mine at Visonta, located 80 kilometers northeast of Budapest, is the largest mine in Hungary. In 1976, over 3,500 people were employed at this mine.[65] The average heating value of the lignite ranged from 1,450 to 1,500 kilocarlories per kilogram (2,610 to 2,700 Btu per pound). Explored reserves at Visonta were estimated at 186 million tons of lignite.[66] The entire production is used locally in the Gagarin Thermal Powerplant.

The largest coal mining area is located in northern Hungary, 130 kilometers from Budapest. Recoverable reserves in the Borsod area were estimated at 360 million tons of brown coal, covering an area of 650 kilometers.[67] In 1976, the production from 15 mines in the Borsod coal mining region was around 5.2 million tons of brown coal. Over 19,000 people were employed there and of these about 47% were underground miners.[68] The quality of coal varies with the depth of the mine, which ranges from 110 to 458 meters. Some indication of the quality may be seen from the following: Calorific value 2,000 to 3,600 kilocalories per kilogram (3,600 to 6,240 Btu per pound), 12.5% to 38% ash content, 3.2% to 8.6% sulfur, and 29.5% to 34.5% moisture.[69] In the same year, mechanization of production stood at 66% of stoping and 73% of loading. Some 52% of the extraction was done by the longwall system.[70] Three of the least productive mines are to be closed in 1977. During the 5-year plan, three-fourths of the Ft1.8-billion investment in coal mining is to be spent on new machinery.[71]

During the current 5-year plan, Hungary is to spend Ft1.2 billion to explore undeveloped coal reserves. Ft7 billion is to be spent on the development of new mines at known deposits. Four new mines are to be developed in the Tatabánya-Oroszlány coal region. The Márkushegy mine, with a projected output of 6,000 tons per day, is to be developed by 1981. It will be followed by the Nagyegyháza mine (6,000 tons per day), the Mány mine (14,000 tons per day), and the Lencsehegy mine (2,000 tons per day).[72] By 1986, when all four mines are developed, the design capacity of 8 million tons per year should be reached, a level that could be maintained for at least 40 years. The opening of these mines is coordinated with the construction of a 1,930-megawatt-capacity thermal powerplant in Bicske,[73] 35 kilometers west of Budapest. Explored coal reserves in this area were estimated at 400 million tons of lignite, having a calorific value of around 4,000 kilocalories per kilogram (6,200 Btu per pound).[74]

In addition to the above, there are two other lignite deposits large enough to fuel power stations. One is in the area of Bükkábrány-Emöd near Miskolc, where the feasibility of building a 2,000-megawatt powerplant is now being investigated. The second is in the area around the town of Torony, near Szombathely, where preliminary research indicates enough lignite reserves to fuel a 1,500- to 2,000-megawatt powerplant.[75]

The joint Hungarian-Polish enterprise Haldex, recovering coal from spoil banks, has processed some 42 million tons of spoil, from which 4.8 million tons of coal, 4.2 million tons of raw material used as concrete aggregate, 3 million tons of material for the ceramic industry, and 3 million tons of rock have been recovered during 16 years of operation. By the end of 1977, the sixth Haldex plant, with a capacity of 240 tons per hour, should come into operation.

Construction of the No. 3 coking battery of Hungary's largest coking plant, located at Dunaújváros, began in 1976. The plant will be supplied with coking coal from the Mecsek region, and by 1980 it is to produce 640,000 tons of blast furnace coke per year.[76] Because of inadequate reserves of coking coal, Hungarian experts are experimenting with production of form coke, using lignite and bituminous coal of lesser quality.[77]

In 1977, the MSZT is to produce 25.1 million tons of coal.[78] The quality of coal is expected to continue to decline. Investments in 1977 will be concentrated on the development of new mines in the Tatabánya region, replacement of old mining machinery, and extension of mechanization in all coal mining.

Natural Gas.—The 1976 gas production in Hungary was 6,081 million cubic meters, 17.4% over that of 1975 and almost 5% over the planned amount.[79] A total of 1,208 million cubic meters of natural gas was imported in 1976, of which 1,000 million came from the U.S.S.R., 200 million from Romania, and 8 million from Czechoslovakia. In addition, Hungary imported nearly 24,000 tons of liquefied gas from the U.S.S.R. and East Germany. Exports amounted to 9 million cubic meters of natural gas and 44,766 tons of liquefied gas.[80] Gross reserves in place of natural gas were estimated at 100 billion cubic meters.[81]

The largest gas-producing area is located in southern Hungary around Szeged and Algyö, where reserves were estimated at 45 billion cubic meters.[82] The 1976 production reached 3,600 million cubic meters, representing 59% of the total natural gas production in Hungary.[83] The second largest gas-producing region is located at Hajduszoboszló, 180 kilometers east of Budapest, where natural gas production in 1976 amounted to 1,460 million cubic meters.[84] Additional gasfields are located at Szank, 50 kilometers northwest of Szeged, where reserves were estimated at 5.5 billion cubic meters;[85] smaller fields are located at Kardoskút, Békés, Berekfürdö, and Kiskunhalas. Exploratory drilling was carried out in Gyor-Sopron County, 100 kilometers west of Budapest, and in the valley of the Dráva River, at the Yugoslav border.[86] With the exception of Szeged and Szank, the older gasfields are rapidly being depleted. Consequently, during the fifth 5-year plan, equipment for secondary extraction is to be installed.

Consumption of town gas in 1976 was 638 million cubic meters, and is slowly declining as more cities are being connected to the natural gas network. Budapest and Szombathely will be converted to natural gas by 1980, and the remaining five cities, during the following 5-year plan.[87]

In order to narrow the difference between annual and peak consumption, a special storage facility was built in 1975 at Szeged, and two underground storage facilities are planned for the fifth 5-year plan. By 1985, the Hajduszoboszló I and Pusztaederics underground storage facilities are to be completed, with a combined capacity of 650 million cubic meters. Together with the future storage facilities in Kardoskút, Szank, and Hajduszoboszló II, the total storage capacity should reach more than 2 billion cubic meters.[88]

At the beginning of 1976, the 800-millimeter-diameter Friendship gas pipeline was completed, connecting Zsámbok and Budapest. The high-pressure pipeline network, with a total length of nearly 3,000 kilometers, is connected to the Czechoslovak network as a security measure in case of emergency. In addition to extending the

national pipeline network, the existing pipelines for town gas are being converted to carry natural gas.

The biggest processing enterprise is located at Szeged, where the largest share of natural gas is produced. In addition to the 1-million-cubic-meter-per-day older plant, there are two new primary gas-processing plants with a total capacity of 8 million cubic meters per day. The second stage of the enterprise, a plant for processing the liquids separated from the gas, should have been finished in 1976, but completion was postponed to 1977 owing to late delivery of equipment. Other gas-processing plants are located in Hajduszoboszló (4 million cubic meters per day), Kardoskút (2 million cubic meters per day), and Szank (1 million cubic meters per day).

The 1977 plans include production of 6.1 billion cubic meters of natural gas and 237,000 tons of liquefied gas, and the addition of 22,000 consumers to the natural gas distribution network.[89] Together with other CMEA countries, Hungary is participating in the construction of the Orenburg pipeline in the U.S.S.R. Hungary is responsible for a 500-kilometer section, running from Orenburg to Aleksandrova Gai, containing three compressor stations at Chust, Bogoradsani, and Gusyatin. In exchange for its participation, after completion of the pipeline in 1979, Hungary is to receive 2.8 billion cubic meters of Soviet natural gas annually.

Petroleum.—Crude oil production in 1976 reached 2,142,000 tons, a 6.8% increase over that of 1975.[90] Of the 8,785,000 tons of imported oil, 87.9% came from the U.S.S.R. and the remaining 12.1% came from Iraq and Iran. In addition, Hungary imported 864,065 tons of refinery products. Exports consisted of 277,191 tons of refinery products, 67% of which was sold to Austria.[91] Some 10,927,000 tons of crude oil was refined in 1976; the refined products included 2,165,000 tons of gasoline, 3,509,000 tons of fuel oil, and 3,360 tons of gas oil.[92]

Hungary's production of petroleum is centered around Szeged-Algyö, close to the Yugoslav-Romanian border. In 1976, three-quarters of the entire output was produced there, and by 1977 it is to increase to 87%.[93] At yearend 1976, there were 720 oil and gas wells either producing oil or pumping gas or water for secondary production.[94] About 200,000 tons of oil was produced from under the city of Szeged using inclined drilling, piped to Móraváros for storage, and piped from there to Algyö. Of the neighboring fields, only Asotthalom and Kelebia were producing on a commercial scale. Because of faulty and obsolete equipment, the Kiszombor, Móraváros, and Ferencszállás Fields, with a potential annual production of more than 500,000 tons, were still not producing.[95] This temporary shortcoming was offset by putting the Endröd, Karastarcsa, and Kiskunhalas Fields into operation.[96]

Secondary production at the Lovászi Field, located in the western portion of Hungary, began in 1976. Carbon dioxide, piped from the nearby Budafa gasfield, was injected into depleted fields. According to plans, 40 existing wells will begin this type of secondary production, which should yield 360,000 tons of crude oil by 1985.[97]

Hungarian imports of crude oil come through the Friendship I and II pipelines. The Friendship I was opened in 1962 and runs from Sahy in Czechoslovakia to Százhalombatta, with a pumping station in Gödöllö; the 400-millimeter-diameter pipeline carries around 4.5 million tons of oil per year. The Friendship II pipeline, with a 600-millimeter diameter and an annual capacity of 10 million tons of crude oil, was commissioned in 1972. The 290-kilometer pipeline runs from Ungvár, on the Hungarian-Soviet border, to Százhalombatta, with a pumping station in Fényeslitke. In addition, there is a pipeline connecting Százhalombatta with Algyö and Szöny. Three main oil product pipelines connect Százhalombatta with Leninváros, Pécs, and Székesfehérvár.

Nearly 11 million tons of crude oil was refined in Hungary in 1976. With an annual capacity of 7 million tons of crude oil, the Danube Petroleum Enterprise (Dunai Köolojipari Vállalat) in Százhalombatta is the largest supplier of fuel oils and lubri-

cants in Hungary. In 1976, there were about 30 units in operation, the latest ones being the ortho-xylol and aromatic extraction plants completed in 1976.[98] The second largest refinery is now being built in Leninváros, 170 kilometers northeast of Budapest on the Tisza River. Tiszai Köolajfinomitö (Tisza Refinery) (TIFO) is to be finished by 1978 at a cost of Ft6.5 billion.[99] Projected capacity is 3 million tons of crude oil, imported from the U.S.S.R. It will supply mazout to the neighboring powerplant and industrial-grade gasoline to the Tisza Chemical Combine for further processing.[1]

The 2-million-ton-annual-capacity refinery near Komárom is now under reconstruction. Work on the first stage, which includes the replacement of a 1-million-ton-capacity distillation unit at a cost of Ft1.1 billion, began in 1976.[2] After completion of this work in 1980, new large-capacity units are to be built. The two smallest refineries are located in Zalaegerszeg and Nyírbogdány, having annual capacities of 0.7 million tons and 0.3 million tons, respectively.

The future plans of the Hungarian oil industry include intensification of oil production in the Szeged-Algyö area, connection of smaller fields (Kiszombor and Ferencszállás) with a collection station at Algyö, and continuation of exploratory drilling, not only in the Szeged-Algyö region but in other parts of Hungary as well. Construction of the Adria pipeline, originating at the Yugoslav port of Bakar on the island of Krk, is to start in 1977. Through the 600-millimeter-diameter pipeline, 10 million tons of crude oil is to be piped annually to Hungary, half of which is to be shipped to Czechoslovakia.

Nuclear Power.—Work was proceeding on the nuclear powerplant at Paks on the Danube River, 120 kilometers south of Budapest. The first of the four 440-megawatt Novovoronezh-type light-water reactors is scheduled to begin operation in 1979. The second block is to start up in 1981, the third in 1983, and the fourth in 1984, reaching a planned capacity of 1,760 megawatts. By 1990, total capacity of this powerplant is to reach 4,000 megawatts with the help of 1,000-megawatt Leningrad-type units. The design and construction of this powerplant was being carried out under a Soviet-Hungarian cooperation agreement. About 30% of the equipment is to be provided by Hungary while the rest is to come from the U.S.S.R.[3]

The Mineral Industry of Iceland

By Joseph B. Huvos [1]

In 1976, Iceland had only a small mineral production. Hydroelectrical and geothermal energy were abundant, and there were plans to expand their use. Imported alumina was reduced to aluminum, and there was minor production of nonmetallic minerals, including diatomite (about 1.3% of the world total), cement, fertilizer materials, sand and gravel, and stone. In 1976, the gross national product (GNP) was about $1.3 billion;[2 3] the aluminum industry contributed about 2.6% of this value and nonmetallic minerals, about 1.7%.

Several important events occurred in the mineral industry during 1976. Construction of the Sigalda hydroelectric project was completed. Construction continued on Icelandic Alloys' ferroalloy project and on the Government's Krafla geothermal generating station in northern Iceland. Pilot development on a perlite project and planning of the Blanda and Hrauneyjafoss hydroelectric projects continued. An earthquake damaged Johns-Manville Corp.'s diatomite mine. Discussions continued on expanding Icelandic Aluminium Co. Ltd.'s reduction plant.

PRODUCTION

There was gradual improvement in Iceland's economy in 1976, in which aluminum and other mineral products shared. Production of mineral commodities is detailed in table 1, and the following tabulation shows the major producers of mineral commodities:

[1] Physical scientist, International Data and Analysis.

TRADE

There was no significant change in the pattern of Iceland's foreign trade in 1976. Mineral commodity exports were mainly aluminum (16.8% of total exports),[4] scrap, and diatomite. Mineral imports were mainly petroleum products, alumina, cryolite, and salt. Iceland's mineral commodity trade in 1974 and 1975 is shown in table 2.

COMMODITY REVIEW

METALS

Aluminum.—The Swiss aluminum company Alusuisse discussed with the Icelandic Government expansion of its 35,000-ton-per-year Straumsvik, Hafnarfjordur, reduction plant, which was operated by its subsidiary, Icelandic Aluminium. Electrical power for the project was to be allocated from the Sigalda hydroelectric station, located about 160 kilometers east of Reykjavík and operated by Iceland's National Power Company.

The aluminum market improved significantly in 1976; 65,300 tons of primary metal was produced, leaving only 6,000 tons of unsold stock.

Ferroalloys.—After Union Carbide Co. dropped participation in a ferrosilicon project with the Icelandic Government, the Government started new negotiations with Elkem-Spigerverket A/S of Norway, involving financing of the project through the Nordic Investment Bank. During 1976, the plant site was under preparation on the northern shore of Hvalfjördhur; construction was to start in 1977 and be completed by 1979.

NONMETALS

Diatomite.—In 1976, an earthquake and a lava eruption damaged the Johns-Manville-operated diatomite mine near Krafla, north of Lake Mývatn. The company is a minority partner (48%) with the Icelandic Government in the mine and processing plant. The plant is supplied with process steam and electrical power from the nearby Námafjall geothermal field.

Perlite.—In 1976, the Industrial Development Institute of Iceland operated a pilot project for mining a perlite deposit at Prestahnúkur Mountain, about 100 kilometers inland from Reykjavík; the deposit contained about 48 million tons of raw ore. Ore beneficiation and expanding tests were performed at the State Cement Works at Akranes near Reykjavík.[5]

MINERAL FUELS

Energy.—In 1976, hydroelectrical and geothermal power supplied almost one-half of Iceland's energy needs. The rest was supplied by imported petroleum products from Western Europe and the U.S.S.R. There were no petroleum refineries in the country, and only inferior-quality coal and peat were known to exist. Iceland's supply and apparent consumption of fuel and power in 1975 and 1976 are shown in table 3.

[5] Industrial Minerals. May 1977, pp. 25–26.

Table 3.—Iceland: Supply and apparent consumption of fuel and power in 1975 and 1976

Geothermal Energy Magazine. V. 3, No. 11, November 1975, p. 11.

Geothermal.—Work continued in 1976 on construction of the 55-megawatt geothermal power station at Krafla north of Lake Mývatn; damage during construction by a lava flow and an earthquake delayed indefinitely the commissioning of the plant.

Owing to its location on the mid-Atlantic Ridge, Iceland has a very high geothermal potential, estimated at 3,200 megawatts.[6] At present, about 315 megawatts (thermal) is utilized, including about 254 for space heating, 40 in agriculture, 18 in industry, and 3 for generating electrical power at Námafjall.

Hydroelectrical.—In 1976, installed hydroelectrical generating capacity was approximately 550 megawatts-electric, or 10% of the country's potential. Major facilities were the 210-megawatt-electric complex at Búrfell, about 130 kilometers east of Reykjavík, which was completed in 1970, and the recently completed 150-megawatt-electric Sigalda complex, about 30 kilometers farther inland. Construction was to begin in 1977 on a 210-megawatt-electric plant, 5 kilometers downstream from Sigalda at Hrauneyjafoss. Under consideration was construction of a 150-megawatt-electric powerplant on the Blanda River in the north.

The Mineral Industry of India

By Gordon L. Kinney [1] and Francis E. Shafer [2]

The Indian economy recorded little change during fiscal year 1976.[3] Overall growth of the gross national product (GNP) was 1.6% in constant 1970 prices. In current prices, India's GNP was $90.7 billion.[4 5] The small increase in the GNP at constant prices, coupled with a population growth of over 2.0%, led to a virtual stagnation in the per capita GNP ($91.84 in 1976 versus $92.40 in 1975). India's population at the end of calendar year (CY) 1976 was estimated at 616 million and was increasing by about 12 million persons each year, the equivalent of adding annually the population of Venezuela or Malaysia. India's agricultural sector continued to be a key factor in the overall economy, accounting for 44% of the GNP. The second consecutive good summer monsoon had a favorable impact on food grain yields. The 1976 harvest exceeded 111 million tons, second only to 1975's record 121 million tons (revised). Prospects looked good for 1977, and another favorable monsoon could push food grain production near or above the 1975 record.

The industrial production index for 1976 showed a record high 10.4% increase, owing primarily to greater capacity utilization of existing plants, especially in the public sector, and to a generally quiet labor situation. The number of productive man-days lost because of labor disputes declined significantly during 1976 but may increase again during 1977 because continued inflation and a gradual decline in purchasing power was causing renewed restiveness among the labor unions at yearend.

Low investment in the private sector continued to be a problem for Indian industry despite Government attempts to stimulate it. Another problem facing the industrial sector was the chronic shortage of electric power. The shortages have adversely affected overall industrial output, especially in the aluminum, iron and steel, and cement industries. The agricultural sector was not seriously affected because it was given priority and was therefore not subjected to power cuts or periods of load-shedding. It is estimated that in 1977 the difference between demand and available supply will be about 7 billion kilowatt-hours. The power shortage has persisted in spite of an 8% increase in India's installed capacity to 23,700 megawatts in 1976 (well below the target of 25,700 megawatts). Power generation increased over 11% to 89 billion kilowatt-hours.

An ambitious power development program is being conducted by the Government of India. It calls for an increase in installed capacity to 45,000 megawatts by 1983. This target growth will be expensive and difficult to achieve, with over half of the increased capacity to be fired by thermal powerplants using noncoking Indian coal. The World Bank, the Organization of Petroleum Exporting Countries (OPEC) Special Fund, and several foreign countries are to assist in the new power projects.

PRODUCTION

Total mineral production value was estimated at over $1.4 billion in 1976 or about 1.5% of the GNP. Bituminous coal was the leading mineral with nearly 60% of the total value, followed by petroleum and natural gas with around 20%, metallic minerals with 12%, and nonmetals with about 8%. Iron ore accounted for about one-half of the metals value, and limestone and phosphate rock together accounted for nearly three-fourths of the nonmetals value.

Production of the more important minerals except chromite and mica increased. Mica production dropped about 28%, and chromite production declined 20% from the CY1975 record high. Despite the drop in chromite production, the minehead value increased to about $22 million from $18 million in 1975 because of large world price increases.

India was one of the world's major bituminous coal producers. The CY1976 production of 101 million tons ranked about fifth in the world. Of major interest was India's unusual speed in bringing its first offshore oilfield into production. The first oil strike at the field was made in February 1974 and commercial oil flowed from it in May 1976. By yearend 1976, the field was producing at a rate of 16,000 barrels per day.

Of India's 30 states and territories, Assam, Bihār, Gujarāt, Madhya Pradesh, and West Bengal States together accounted for nearly 80% of the total mineral production value. Bihār alone contributed over 30%, mainly coal, iron ore, copper, and bauxite. Most of Gujarāt's and Assam's value was derived from their crude oil and natural gas output.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, bromine, other clays (bentonite, fuller's earth, and common clay), other gem stones (aquamarine, ruby, and spinel), and uranium are also produced, but production is not reported and available information is inadequate for formulation of reliable estimates of output levels. In 1975, production of 6,514 metric tons of uranium ore containing about 3 metric tons of U_3O_8 was reported from two mines, but this output was only a portion of total national production.

[2] Data are for calendar years; data for fiscal years beginning Apr. 1 of years stated are as follows, in thousand metric tons: 1974—7,736. 1975—8,340, and 1976—10,022.

[3] Data are for calendar years; data for fiscal years beginning Apr. 1 of years stated are as follows, in thousand metric tons: 1974—7,186, 1975—7,910, and 1976—9,731.

[4] Data are for fiscal years beginning Apr. 1 of years stated.

[5] Data are from: Fertilizer Association of India. Fertilizer Statistics, 1977–78 (New Delhi). 1978, pp. I/37–I/39 and I/178–I/179.

[6] Includes ammonium sulfate, ammonium sulfate-nitrate, urea, calcium ammonium nitrate, and ammonium chloride.

[7] Includes single superphosphate, pelophos, and triple superphosphate.

[8] Includes all reported varieties of nitrogenous-phosphatic and nitrogenous-phosphatic-potassic (NP and NPK) mixed fertilizers.

[9] Includes reinjected gas.

TRADE

India's world trade continued to grow at a steady rate. Total foreign trade of about $12 billion amounted to about 13% of India's GNP in 1976.

There was a dramatic reversal in India's balance-of-trade situation in CY1976. Imports dropped in value about 4% while the value of exports increased a substantial 28%. According to preliminary data, trade was nearly in balance in 1976, compared with the $1,438 million (revised) deficit in 1975. Exports and imports are expected to be about in balance in 1977.

The total value of India's exports in 1976 was $5.9 billion, of which about $1.3 billion or 22% was accounted for by the mineral industry. Nonmetal exports were valued at about $640 million and metal exports at about $630 million. Japan was by far India's largest mineral purchaser with 43% of the total. The five leading mineral exports in value were iron ore and concentrate ($280 million), cut diamonds ($220 million), chromite ($30 million), mica ($27 million), and manganese ($18 million).

The total value of imports in 1976 was $5.97 billion, down slightly from the 1975 figure of $6.2 billion (revised). Mineral imports were valued at $1.6 billion, with petroleum again the dominant item. Imports from Iran, Saudi Arabia, Iraq, and Abu Dhabi accounted for over 80% of the total import value. Although metal imports have dropped in the last few years, nonmetal imports other than petroleum, particularly uncut diamonds, have increased. India is mining and processing domestically a higher proportion of its mineral requirements than it has in the past. In terms of value, only petroleum imports have continued a steady increase, because of rising international prices and increased demand.

Table 2.—India: Exports and reexports of mineral commodities

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—The Indian aluminum industry had a mixed year in 1976. Aluminum production started strong but was again hampered by severe electric power shortages toward yearend. In contrast, reserves of bauxite, the principal ore of aluminum, took a major upturn.

Bauxite production for the calendar year increased about 14% to 1,448,000 tons valued at over $4 million at the mine. Average pithead prices rose from $2.70 to $2.84 per ton. Alumina production increased significantly to 442,000 tons, of which Bharat Aluminium Co. Ltd. (BALCO) exported 40,000 tons which earned $4.5 million in foreign exchange.

Total production of aluminum metal in CY1976 was 211,835 tons, which would have been higher except for the electric power supply problems. Installed capacity increased to 299,000 tons per year with the completion of the second potline at BALCO's Korba aluminum smelter. It was not commissioned, however, because of the power shortage. At yearend, indications were that the 55 megawatts of power needed to operate the line would be available in mid-1977, and the outlook for the third and fourth potlines under construction was that power would be available by

March 1978 and December 1978, respectively, at the earliest.[6]

The huge bauxite deposits discovered in the Eastern Ghats Range near Visākhāpatnam were under detailed investigation during 1976 by the Geological Survey of India (GSI) and the Government-owned Minerals Exploration Corp. (MEC). The bauxite exists over an area of potentially 25,000 square kilometers. The deposits parallel the coast starting north of the Godāvari gorge upstream of Rājahmundry, extending northeast through Andhra Pradesh into Orissa, over a length of 300 kilometers and a width of 40 to 100 kilometers.[7]

MEC was conducting detailed exploration on proving specific deposit conditions, tonnages, and assays. One of the features of the deposits was that the ore, which varies in thickness from 6 to 51 meters, is near the surface and often has virtually no overburden. So far, the grade of the deposits has ranged from 42% to 55% Al_2O_3 (with much of it exceeding 48%), a favorable 2% to 4% SiO_2 and 1% to 4% TiO_2, and 19% to 22% iron content. A breakdown of bauxite reserve figures by class was not available at yearend, and different sources gave various figures. However, the totals for Orissa ran as high as 1.3 billion tons with a cutoff grade of 40% Al_2O_3 and less than 5% SiO_2. The reserves of adjacent Andhra Pradesh State were put at around 750 million tons.

Considering the new finds, total bauxite reserves for the country could increase from 1.4 billion tons to about 2.4 billion tons, putting India about fourth in world reserves.

As a result of these highly favorable findings and the good potential for establishing nearby hydroelectric or thermal powerplants, BALCO was considering various schemes for development of the deposits. It plans to set up export-oriented alumina-aluminum complexes, together with associated power and caustic soda production facilities.

Plans called for a minimum of two 600,000-ton-per-year alumina plants. The Indian Government was anxious to use these resources to the greatest benefit of the country by processing the ores and making alumina or aluminum metal, rather than exporting the relatively low-value bauxite. The furthest advanced plan was that for a complex to mine and process the Orissa ores. There would be a 600,000- to 800,000-ton-per-year alumina plant, a 150,000- to 200,000-ton-per-year smelter, a captive 500-megawatt powerplant, and a 200- to 400-ton-per-day caustic soda plant with downstream utilization of the chlorine discharge. The output of the smelter and the surplus alumina would be exported, earning considerable foreign exchange. Several foreign companies were reportedly interested in participating in the plans. Financing and details of the $1 billion project were still to be decided.

Plans for a second project, to be located at Golukonda in Andhra Pradesh, were still in the early stages. Basically, a 600,000-ton-per-year alumina plant would be built, with the entire output exported until a second smelter could be completed.

India's aluminum metal exports for April through September 1976 reached a new high of $20 million, exceeding the previous record for the entire year of 1975. Principal items exported were ingot and electric-conductor-grade wire, bar, and rod. Among the principal buyers were Bangladesh, Sri Lanka, Hong Kong, Libya, Indonesia, Kuwait, and Iraq. As demand rises in India, especially for conductor-grade aluminum, there will be less available for the export market. The Government began a ban on ingot exports but not on fabricated items. Any additional problems with the electric power supply would almost certainly cause domestic shortages and a complete ban on aluminum exports.

Chromite.—Production of chromite declined to about 402,000 tons in CY1976, about 20% below the CY1975 record high. The minehead value, however, was nearly $22 million, ranking chromite sixth in mineral value in India for the year. About 97% of India's chromite production came from Orissa State, with most of that originating at nine mines, three State-owned and six privately owned. Except for the Byapur underground mines, chromite mining was open pit and labor intensive, employing about 6,000 workers.

Although the Government officially banned the export of high-grade ore to conserve the limited supply, the State-

[6] Government of India. Ministry of Steel and Mines, Department of Mines (New Delhi). Report 1976–77, pp. 49–51.
[7] Work cited in footnote 6.

owned Orissa Mining Corp. was permitted to export some chromite of all grades on an ad hoc basis in 1976. There appeared to be some flexibility in the export ceiling depending on the local supply and demand situation. Chromite exports totaled 278,000 tons valued at $30 million in CY1976, compared with 350,000 tons valued at $21 million in CY1975. The 43% value increase, despite the 21% tonnage decline, reflected the large world price increases in 1976. Japan continued as the principal recipient of Indian chromite, accounting for about 86% of the exports in 1976. The United States, Switzerland, the Republic of Korea, and Taiwan received the remainder.

Indian chromite reserves (27% to 52% Cr_2O_3 content) were revised upward from 13.8 million tons in 1973 to over 17 million tons in 1976. Orissa State possessed about 73% of the total reserves, which were composed of 4.2 million tons proved, 2.36 million tons indicated, and 10.7 million tons inferred. An intensive exploration and drilling program was conducted during the year by GSI to further delineate India's chromite deposits. The 17-million-ton reserve figure was computed with a 40-meter-depth limit, generally considered the limit for economical recovery in the Indian deposits. However, with pithead prices jumping from $19 per ton in 1975 to $48 per ton in 1976, the depth at which economical retrieval would be possible will increase. Sample borings detected chromite at 108 meters, a depth which could be exploited if the deposit was rich enough. A further large increase in reserves was expected when the drilling program is concluded.

Two other noteworthy developments occurred during the year. The State-owned Mysore Minerals Ltd. announced plans to build a 6,000-ton-per-year charge chrome plant at Byapur in the Hassan District of Karnataka. Charge chrome is a high-carbon ferrochromium containing 3% to 6% silicon. The plant would be built with Japanese collaboration and would be the first of its kind in India. Secondly, the Government began studying the economic viability of a 50,000-ton-per-year high-carbon ferrochromium plant in Orissa. The plant would utilize chromite fines from the Sukinda deposit and probably would be a joint venture between the Federal and State Governments.

Copper.—India has always been poor in known copper deposits, but persistent exploration efforts were beginning to reveal a number of modest-size occurrences that have the potential for economical exploitation.

In an effort to minimize dependence on imports, Hindustan Copper Ltd. (HCL) was organized in 1967 with the responsibility of developing the various copper deposits found in different parts of the country. Subsequently, Indian Copper Corp. Ltd. in Bihār was taken over by the Government and entrusted to HCL in 1972. Since then copper has been a fully nationalized industry.[8]

HCL's current responsibilities include the copper complex at Ghātsīla and the Rakha copper project, both in Bihār; the Khetri copper complex and the small copper mines at Dariba and Chandmari in Rājasthān; and the Agnigundala lead-copper project in Andhra Pradesh. In addition, HCL was planning the development of the Malanjkhand copper deposit in the Bālāghāt District of Madhya Pradesh.

Copper deposits have been reported in 11 of the states, but most of India's known reserves are in Bihār, Rājasthān, and Madhya Pradesh. Total reserves (proved, indicated, and inferred) in these three States are reported as 322 million tons or 91% of the national total. Grades ranged from 0.4% to 2.5% copper content with some deposits not economically exploitable under present or near future conditions.

GSI reported two recent copper finds in Karnataka that are apparently high-grade vein deposits; one is at Aladahalli near Tiptūr, and the other is in Hassan District. As these are the first known occurrences of base metals in the "peninsular gneiss formation," the possibility exists that further exploration in this formation may uncover additional deposits.

Several interesting copper discoveries were reported in Rājasthān during 1976. They were located at Padarkipal in Dūngarpur District, Basantgarh and Derhi in Sirohi District, and Khankhera in Bharatpur District. Details of the reserves were not yet known, and exploratory drilling was still in progress at yearend.

The Kesapura deposit in the Mayurbhanj District of Orissa was discovered by GSI.

[8] Pages 52–56 of work cited in footnote 6.

About 1.7 million tons of chalcopyrite ore at a 0.7% copper cutoff grade has been proved. The average grade was 1.59% copper. The deposit was turned over to MEC for detailed delineation of the ore body.

A copper, lead, and zinc deposit at Ambaji in the Banaskāntha District of Gujarāt was being examined by a technical team from a British firm. The firm will prepare a feasibility report on reserves and suitability of the ore for beneficiation. MEC did the original exploration and reported over 8 million tons of ore with a total metal content of over 12% lead, zinc, and copper.

The $102 million development project at the Malanjkhand copper deposit in Bālāghāt District, Madhya Pradesh, was finally approved in February 1977. The long-awaited project was delayed in October 1976 pending clarification of the reserve and ore-grade figures. The mine will be a mechanized, hard-rock, open pit operation capable of producing 1 million tons of ore per year when commissioned, with output gradually increasing to 2 million tons by 1984. The concentrator will have the same capacity and will supply the Khetri smelter. It was reported that Soviet technical assistance would be provided for the design and development of the mine. Design and preparatory work was expected to take about 16 months.[9]

Improvements were underway or authorized at several of the mines supplying India's two copper smelters, Ghātsīla in Bihār and Khetri in Rājasthān, which have a combined annual capacity of 57,000 tons.

The Mosaboni mine was to be expanded from 2,200 tons to 3,200 tons per month at a cost of nearly $7 million. A system for increasing ore production at the Surda mine from 400 tons to 1,300 tons per day was sanctioned in July 1976 at a cost of about $3.4 million. The new capacity will come from increased mechanization of the underground workings and a change from timbered breast stoping to more efficient and faster mining methods.

The phase two expansion of the Rakha mine was in the final planning stages. The mine output would be increased from 1,000 tons to 6,000 tons per day at a cost of $5.6 million. Phase one construction at Rakha was completed in October 1975 at a cost of $11.6 million. The Mosaboni, Surda, and Rakha mines all supply copper concentrate to the Ghātsīla smelter.

Production at the Khetri and Kolihan underground mines increased to over 3,500 tons per day from an average of 2,500 tons per day in 1975.

At the underground Dariba mine, ore production was over 40,000 tons during 1976, exceeding the design capacity of the mine by 10,000 tons.

The Chandmari mine near Khetri Nagar in Rājasthān began operation in December 1975, 4 months ahead of schedule, at a rate of 100 tons of ore per day. By July 1976, a production rate of 500 tons per day was attained. Chandmari was India's first open pit, hard-rock copper mine. A $3 million plan to expand its production to 1,000 tons per day was sanctioned in July 1976.[10]

The Khetri, Kolihan, and Chandmari mines all supply ore for concentration to the Khetri copper complex. Production of blister copper at Khetri during 1976 fell to 7,800 tons from the 9,200 tons produced in 1975.[11] This decline was caused by a variety of technical and operational problems at the smelter, particularly with the flash furnace that produces the copper matte. Operations at the byproducts complex, however, ran smoothly during the year, with sulfuric acid production more than doubling to over 37,000 tons. Production of single superphosphate fertilizer began in October 1976, and a phosphoric acid plant was under construction at yearend. The Khetri complex will ultimately produce over 19,000 tons of triple superphosphate per year.

Total ore production for 1976 increased 31% to about 2.36 million tons. Output of blister copper at the two smelters increased slightly to nearly 25,000 tons. Production should improve markedly in the next few years if the problems at Khetri can be solved and when the increased ore production from the mine expansions begins to be available. The production target for 1977 was set at 36,000 tons of blister copper.

Indian demand for copper was estimated at 50,000 tons in 1976, with imports, including semimanufactures and alloys, reportedly at more than 40,000 tons. Although

[11] Work cited in footnote 8.

the Government was striving for self-sufficiency in copper, demand was increasing along with the improved supply. Thus, India will find it difficult and expensive to attain this objective in the near future.

Iron Ore.—Iron ore continued to be one of the main minerals produced in India, exceeded in value only by coal and petroleum and natural gas during 1976. There are three categories of iron ore mines in India: Captive mines, owned and operated by the large integrated steel plants; public-sector mines, run by State mining corporations and the National Mineral Development Corp. (NMDC), a subsidiary of the Steel Authority of India, Ltd. (SAIL); and the smaller, privately owned mines, excavated by both mechanized and manual methods. Of the 392 mines reportedly operating at the beginning of 1976, 18 were in the captive category and accounted for about one-third of total production. There were apparently 351 private-sector mines, most located in or near Goa. They were generally small but together provided an additional one-third of the production, nearly all of which was direct-shipping ore for the export market.

Massive hematite deposits were the only important source of iron ore in India during the year. However, other common types of iron mineralization are known in India, with banded magnetite-quartzite and goethite both occurring in considerable tonnages. India's measured reserves of hematite were put at over 4 billion tons, with total reserves of all classes estimated to exceed 10 billion tons. India ranked fifth in the world in recoverable reserves. One-half of the total reserves were located in Bihār and Orissa States and were estimated to grade over 55% iron, of which over 1.8 billion tons was expected to grade over 62% iron.

Magnetite reserves were much smaller and mostly of lower iron content. Measured reserves were put at 1.2 billion tons and the total of all classes at 2.75 billion tons. The magnetite deposits are well suited to beneficiation by grinding, magnetic separation, and agglomeration. There was no commercial exploitation during the year, but the extensive Kudremukh deposit in Karnataka State was under development.

Production was about 4% higher than in 1975, increasing to an estimated 43 million tons valued at roughly $93 million at the mine. This ranked India eighth in world production of iron ore with 5% of total world output. Most production was from open pit operations. Value of the ore at the mine was reported to average $2.11 per ton for the public-sector mines and $1.33 per ton for the private-sector mines.[12]

NMDC was the largest producer in India. It operated the two major mechanized mines in the country—one at Kiriburu and the other at the Bailādila No. 14 deposit—and had three more under development (Donimalai, Bailādila No. 5, and Meghahataburu).

About 53% of the iron ore output was exported in 1976, earning about $280 million or nearly 5% of India's total exports. Japan was the main market, receiving over three-fourths of the ore. Most of the remaining exports went to Romania, Czechoslovakia, the Republic of Korea, the Netherlands, and Turkey.

In previous years, outdated bulk-handling facilities at India's ore-exporting ports caused slow and inefficient loading of bulk ore carriers. To remedy this situation, several of India's ports have been undergoing major modernization of bulk-loading facilities to increase export capability. Marmagao was building new mechanized 8,000-ton-per-hour loading equipment and will be able to berth ships of 60,000 deadweight tons; plans call for an eventual capability to handle 100,000-deadweight-ton ships. Madras can now berth 100,000-deadweight-ton ships and can load over 7 million tons per year. Paradeep is able to handle 2 million tons per year and 55,000-deadweight-ton ships. The $110 million Visākhāpatnam outer harbor development was commissioned in December 1976. The project provided berthing for bulk carriers of 100,000 deadweight tons. The ore-handling facilities have a loading capacity of 8,000 tons per hour with a potential of 16,000 tons per hour.

Supplying these four improved loading facilities could put a strain on the transportation network feeding the ore to the ports, and diligent scheduling and maintenance will be required to prevent bottlenecks or tieups from occurring.

[12] U.S. Embassy, New Delhi, India. State Department Airgram A-70, Apr. 19, 1977, p. 11.

One of the key export-oriented projects during the year was development of the 1-billion-ton Kudremukh magnetite deposit being financed by a $630 million loan from Iran. The project calls for mining low-grade ore (34% to 36% iron), beneficiating it by magnetic separation to 64% to 66% iron, and transporting the concentrate through a 70-kilometer slurry pipeline (the first in India) to the port of Mangalore. There the slurry is to be dried, caked, and shipped to Iran for pellet feedstock. The foreign exchange component of the cost is estimated at $150 million to $170 million for equipment and supplies. The main imported equipment is to include autogenous grinding mills, large shovels, 120- to 150-ton-capacity dump trucks, rotary blasthole drills, crushers, magnetic-separation equipment, concentrators, and slurry pipe and pumps. Construction of the foundation for the concentrator plant began in November 1976; the project was apparently proceeding on schedule with the first shipment of pellet feed due in September 1980.[13]

A new public-sector company, Kudremukh Iron Ore Co. Ltd., was formed in April 1976; Canadian Met-Chem Consultants Ltd. of Montreal, a subsidiary of United States Steel Corporation, was appointed the major contractor for the project. Met-Chem is to design and supervise construction of mine, concentrator, and transport facilities. It will also operate the project for the first 3 years following its completion.

India's fifth 5-year plan (1974–79) provides $123 million for development of iron ore resources by the Government-owned NMDC; it was recognized that cost escalations could push the expenditures to nearly three times the planned amount. Major projects included continued development and expansion of:

(1) The Bailādila No. 5 and No. 14 mines and possibly a 2-million-ton-per-year pelletization plant. Development at the No. 5 mine, originally due for startup in 1974, has cost over $40 million. Serious construction problems at a crucial 2.2-kilometer tunnel at Bailādila No. 5 were overcome during 1976 and construction was resumed. The No. 5 mine will probably begin operating in early summer 1977.

(2) The 4-million-ton-per-year Donimalai mines and a possible pelletization plant near Madras. This plant is to utilize 2.8 million tons per year of fines generated in the production of over 1.2 million tons per year of lump ore. The mine was scheduled for startup by the end of CY1976.[14]

(3) The Kiriburu mine to a capacity of over 1 million tons per year of lump ore and 2.7 million tons per year of fines.

(4) The Meghahataburu mines.

(5) A 1.8-million-ton-per-year pellet plant in Goa by a West German firm.

NMDC also plans to undertake detailed ore drilling and exploratory tunneling at the Chiria deposits in Bihār State and a feasibility study of the banded magnetite-quartzite deposits of the Bababudan Hills of Chikmagalūr District near Kudremukh. Development costs on the latter site were estimated at $500 million.

MEC completed a 2-year exploration of the Manoharpur area in the Bonai ore belt on the Bihār-Orissa border. The deposit reportedly contains the largest ore body in India with reserves of nearly 2 billion tons of 62%-grade iron ore. Unusually high silica and alumina content, however, complicates exploitation of the deposit.

Iron and Steel.—Endowed with abundant iron ore and coal reserves and sizable deposits of manganese, chromite, and limestone, India has developed the steel industry into an important segment of its economy. At the end of the fiscal year, six of the seven integrated steel plants were publicly owned and represented an investment of around $3.25 billion or about 26% of the total investment in the public sector.

Accelerating its steady growth of the past 3 years, the industry had another good year, exceeding its production targets for 1976 and establishing record highs in production, capacity utilization, and exports.

In 1976, total production of pig iron exceeded 10 million tons for the first time, accounting for nearly 1.9% of total world production. India's production of salable steel from the major steel plants rose to 7 million tons, well above the target of 6.6 million tons and more than 21% above the previous year's output. Of particular interest was the encouraging increase in plant capacity utilization at the large integrated mills, which averaged about 66%

[13] Page 90 of work cited in footnote 6.
[14] Work cited in footnote 13.

just 3 years ago but increased to about 92% by 1976.

While the major steel plants were having their best year, the so-called ministeelplants fared rather poorly. Small electric arc furnace plants, with about 4 million tons of total annual capacity, were built during 1973–75 to produce mild steel products. Their establishment represented an effort to relieve the domestic steel shortages that developed at the beginning of the decade; the plants were to use steel scrap previously exported. It was only because of a financial concession and several other incentives granted to them earlier by the Government, and the improvement of the electric power supply, that the minimills were able to slightly increase production to about 1 million tons in 1976.

The policy that had encouraged growth of the ministeelmills in the past was disowned and reversed following the change in the Government administration in March 1977. The new Government appeared unwilling to extend its support or official assistance indiscriminately to the approximately 100 operating mills, many of which were uneconomical, inefficient, and poorly managed. The Government instead was expected to develop a position to give aid selectively to some of the viable mills. The Government was more concerned with the potential loss of employment than with the loss of steel production resulting from mill closures.

Despite increased domestic sales of iron and steel products from 4.7 million tons in 1975 to 5.6 million tons in 1976, the major steel plants continued to hold large inventories of unsold stock, collectively estimated at 1.6 million tons at the end of the fiscal year. To relieve some of the pressure on the producers, the Government was reportedly considering the establishment of a 1-million-ton steel buffer stockpile.

The official targets for the seven major Indian steel producers in 1977 were a 10% increase in production of steel ingot to 9.5 million tons and a rise in salable steel production to 7.5 million tons.

Steel production figures for India occasionally differ from source to source. In table 4, the Government's Iron and Steel Controller production figures were used for consistency.

In 1976, India emerged for the first time as a net exporter of steel as total exports exceeded total imports in both quantity and value. Indian exports for the entire year amounted to 1.4 million tons of steel and 1.0 million tons of pig iron, together valued at about $370 million, the highest value ever recorded for the country. This was nearly triple the quantity and value of exports in 1975. India sold steel to a diverse group of 28 countries in 1976, 14

Table 4.—India: Production of pig iron and steel
(Thousand metric tons)

Year [1]	Pig iron [2]	Steel ingot	Salable steel [3]	Finished steel
1973:				
Total	7,193	6,615	5,460	4,889
Six major mills [4]	NA	5,830	4,350	3,612
1974:				
Total	7,736	7,186	5,678	5,161
Six major mills [4]	NA	6,286	4,800	3,972
1975:				
Total	8,340	7,910	6,179	5,745
Seven major mills [5]	NA	7,390	5,779	4,309
1976: [p]				
Total	10,022	9,731	7,701	6,902
Seven major mills [5]	NA	8,566	7,000	5,490

[p] Preliminary. NA Not available.
[1] Data are for fiscal years beginning Apr. 1 of years stated.
[2] Pig iron figures were not broken down, but nearly all would have come from the major mills.
[3] Salable steel includes not only finished steel but also semifinished primary billets and tin bars, which primary producers sell to secondary producers.
[4] Includes the Bhilai, Visvesvaraya, Durgāpur, and Rourkela steel mills and Indian Iron and Steel Co. in the public sector, and Tata Iron and Steel Co. in the private sector.
[5] Includes those given in footnote 4 plus Bokāro Steel Co. in the public sector, which came into production in 1975.

Source: U.S. Embassy, New Delhi, India. State Department Airgram A–13, Aug. 9, 1977, pp. 1–50.

more than last year and 24 more than in 1973. The principal buyers were Egypt, Dubai, Kuwait, Iran, Japan, the People's Democratic Republic of Yemen, and the U.S.S.R.

Most of the material exported was in the form of relatively low-value pig iron, rods, bars, and billets. In 1977, India is likely to make serious efforts to export more of the higher priced items such as plates, sheets, strips, wire, and galvanized products. These will be available in excess of domestic demand and from new facilities at Bokāro and Rourkela.

India continued to import selected varieties of steel products. Total imports of steel (including scrap) in April through December 1976 fell, however, to about 330,000 tons valued at over $190 million from about 445,000 tons valued at $260 million during the same period in 1975. Two-thirds of the imports came from Japan, West Germany, and the United Kingdom.

India will continue to strive for a steady increase in its steelmaking capacity in order to supply its growing domestic demand and to raise its share in world exports of steel. But the official high priority on the rapid development of the steel industry to a target production of 75 million tons per year by the year 2000 was being revised downward by the new Janata Party Government. The new Government announced that priority will be given to agriculture and rural development, and that preference will be shifted to employment-oriented small and cottage industries from the capital-intensive industries such as steel.

The continuing official programs for the expansion of domestic capacity will not be immediately affected, however, as funding was already committed for some new projects. Plans called for the expansion of the Bokāro Steel Co. plant from 1.7 million tons to 4.0 million tons per year by March 1980 and of the Bhilai plant from 2.5 million tons to 4.0 million tons per year by December 1981, and modernization of the old Indian Iron and Steel Co. plant at Burnpur as well as doubling of capacity to 2.0 million tons per year.

The Government approved the construction of the Salem steel plant in Tamil Nadu, to be done in two phases. The first phase, estimated to cost $150 million with a capacity of 32,000 tons per year of cold-rolled stainless steel sheet, was planned for completion by June 1981. The second phase, estimated to cost an additional $490 million, envisioned the installation of hot-rolling facilities and the expansion of the plant to 220,000 tons per year. The plant would produce stainless steel sheets, strips, and other specialty steels formerly imported.[15]

The continually increasing cost estimates and the shortage of investment funds had discouraged the Government from making firm commitments for construction of the proposed 3-million-ton-per-year steel plants at Visākhāpatnam and Vijayanagar. The new Government will probably look even more critically at these two projects.

India was planning to establish a 30,000-ton-per-year sponge iron pilot plant at Kottagudem in Andhra Pradesh and a commercial-size 200,000-ton-per-year plant in Bihār. At yearend 1976, the Ministry of Steel and Mines was evaluating two different processes for the plants. A decision on the process to be used and the arrangements for funding the projects were expected to be completed by mid-1977.

Lead and Zinc.—Hindustan Zinc Limited (HZL), the Government-owned lead and zinc company, had a particularly noteworthy year with the commissioning of three new or expanded smelters. In January 1977, a major $30 million expansion program was completed at the Debari zinc smelter near Udaipur in Rājasthān. Zinc capacity was increased from 18,000 tons to 45,000 tons per year. The major features of the expansion were installation of a new roaster by a West German firm and construction of a byproduct phosphoric acid plant.[16]

Construction of a new 30,000-ton-per-year zinc smelter, based on 60,000 tons per year of imported zinc concentrate, was completed in February 1977 at Visākhāpatnam in Andhra Pradesh. The plant will also produce about 200 tons per day of byproduct sulfuric acid. Cost of the project was reported at $51 million, about double the originally planned outlay. The new smelter may have economic problems in its first year of operations. When the plant was approved in 1970, there was no import duty on zinc concentrate, in contrast to a stiff

[15] Work cited in footnote 13.
[16] Work cited in footnote 13.

duty of 45% ad valorem in 1976. The originally planned cost of water has skyrocketed, and the availability of electric power, originally thought to be good, was critically low at yearend.

A 10,000-ton-per-year lead smelter was under construction at Visākhāpatnam and is to be commissioned in 1977.

The HZL lead smelter at Tundoo in Bihār was modernized and the principal sections completed during 1976. Capacity was increased from 5,400 tons to 8,000 tons per year. It was the only lead smelter in India.

Total zinc capacity at yearend was 95,000 tons per year, inasmuch as the capacity of the privately owned Cominco-Binani Zinc Ltd. smelter at Alwaye in Kerala was unchanged at 20,000 tons per year.

In order to meet some of the additional needs of the Debari smelter, a new 2,000-ton-per-day mine was being developed at Balaria in the Zawar area near Udaipur. Supporting ore beneficiation facilities were also being built. The existing Balaria mine produced 800 tons per day of lead-zinc ore. It was unclear whether the new mine was to replace the old one or be in addition to the old production. Cost of the project was over $23 million.

Development by HZL of the Rajpura-Dariba deposits, also near Udaipur, was continuing. The 550-meter-deep shaft was under construction. The mine and associated concentrator will handle 3,000 tons of ore per day. Output will help feed the expanded Debari zinc smelter. The $50 million project was scheduled for completion in 1981.

A feasibility report on development of the lead deposits at Sargipalli in Orissa showed that the project was not viable in the proposed form. HZL was carrying out additional exploration work and is to try to develop a new plan.

A lead concentrator reportedly began production during 1976 at Bandalamottu in Guntur District. A part of the development of the Agnigundala lead-copper deposit in Andhra Pradesh, the plant had a capacity of 120 tons of ore per day, and plans call for doubling this capacity. The concentrate assayed about 65% lead content. Metal content of the ore was 6%, but only about 10 years of reserves were proved.

Total production of ore by HZL for CY1976 was 835,000 tons. About 45,000 tons of zinc concentrate was produced with a value of $9.2 million. Zinc metal production was up marginally, from 25,700 tons in CY1975 to 26,800 tons in CY1976. Lead metal output reached 5,435 tons in CY1976, a 14% increase over that of CY1975. Zinc imports were 49,107 tons and those for lead were 46,379 tons.

Manganese.—Manganese is one of India's most important minerals and has been a significant source of foreign exchange for many years. In an effort to conserve resources, the Government banned export of all high-grade ore and put export ceilings on the medium- and low-grade material. There was a small decline in the tonnage of ore exported in CY1976, and the value of exports declined from $19 million in 1975 to $18 million in 1976. Export quotas will probably be set at about 900,000 tons of medium- and low-grade ore in 1977 to take advantage of the increased demand for exports and higher prices.

Manganese ore production in CY1976 rose about 12% to nearly 1.8 million tons. The main producer, Manganese Ore India Ltd. (MOIL), a Government-run company in Nagpur, operated eight mines which generally account for 20% to 25% of India's total production. The Government planned to buy out the privately owned 49% of the joint-sector company. MOIL would thus become a totally Government-owned operation. Most of MOIL's output was high-grade ore and was sold to ferromanganese plants.

Over 60% of India's manganese production comes from open pit mines in Orissa and Karnataka. At the beginning of 1976, there were 332 mines in India, of which 182 mines actually reported production.

Manganese reserves were officially put at 108 million tons, including the 7.7 million tons proved in 1976. However, GSI, in conjunction with MEC, continued to explore for new deposits, reportedly with considerable success.

Work on a new 1,000-ton-per-year battery-grade electrolytic manganese dioxide plant at Trivandrum in Kerala State continued toward a mid-1977 startup date. The plant is unusual because it will utilize waste sulfate and acid solutions from a nearby titanium plant in place of the ex-

pensive commercial acid. Plans were being completed for a 45,000-ton-per-year ferromanganese and silicomanganese plant at Tumsar in the Bhandāra District of Maharashtra.

NONMETALS

India's nonmetallic mineral production was valued at $122 million in CY1976 (nearly the same as in CY1975), or 8% of the country's total mineral output value. Two minerals, limestone and phosphate rock, accounted for nearly three-fourths of the total value in the nonmetals sector.

Barite.—Barite reserves were estimated at over 8 million tons, among the largest in the world. They were located mostly in Andhra Pradesh. In view of the increasing world demand for barite, GSI intensified its search for new deposits. It had reportedly located the world's largest deposit, at least 15 million tons, at Mangampeta in the Cuddapah District of Andhra Pradesh. Detailed drilling of the deposit was continuing, and the reserves will probably be much higher than the reported amount. The State-owned Andhra Pradesh Mining Corp. planned to mine the deposit and build a plant at Cuddapah to process the ore both for export and for domestic consumption. India's major consumer was the Oil and Natural Gas Commission (ONGC).

Barite production increased steadily during the last 4 years, reaching about 235,000 tons in 1976, making India eighth in world output. This represented a 32% increase in value over that of 1975 and roughly a fivefold increase since 1972.

Exports were over 151,000 tons valued at $8.8 million in CY1976. The export target for 1977 was placed at 300,000 tons with a projected value of $14 million.

Cement and Limestone.—Limestone accounted for about 45% of the total value of nonmetallic mineral production in 1976. Production increased nearly 11% to more than 29 million tons. The cement and steel industries used about 90% of the output. Limestone production was expected to continue a steady increase in light of expected steel and cement industry capacity increases. Reserves, estimated at 50 billion tons, are adequate to meet long-term needs. About 28 billion tons of the reserves were considered to be of cement grade, most of which were in the Gulbarga District of Karnataka and the Kurnool and Cuddapah Districts of Andhra Pradesh.

Portland cement capacity remained essentially unchanged at about 21 million tons per year at 54 plants, 9 in the public sector and 45 privately owned. Output increased to 18.6 million tons and capacity utilization increased from 77% to 88%. The Government-owned cement plants were reportedly going to begin production of a special oil well cement. The sulfate-resistant cement was formerly imported.

Orders have been placed for equipment for a new two-kiln plant with cyclone preheaters and grate coolers at Maihar in Madhya Pradesh. Capacity of the two kilns is to total 2,400 tons per day. The Nimbahera plant in Rājastān was being expanded with the addition of a 1,200-ton-per-day kiln, cyclone preheater, planetary cooler, and grinding mills.

Diamond.—India's production of diamond remained stable at about 20,000 carats. Production was entirely from the Government-owned Panna diamond mines in Madhya Pradesh. Value of the domestic output at the mine was estimated at $1.1 million.

Exploration by GSI in Andhra Pradesh revealed diamond-bearing kimberlitic works at Vajrakarūr, Raman Katla, Baganpalli, and Anantapur. Further assessment work was in progress.

Despite the small indigenous production, India's exports of diamond constituted 34% of the value of nonmetallic minerals exported. The trade was dependent on the import of uncut diamond which was cut and polished by local artisans and then reexported as finished stones and jewelry. The Indian diamond-cutting and polishing industry, which employed about 5,000 persons 15 years ago, had about 150,000 skilled and unskilled workers at yearend. Exports in CY1976 reportedly totaled $220 million, a sixfold increase over those of 1971. The value of uncut diamond imports reportedly rose from $79 million in CY1975 to $159 million in CY1976. The major supplier was the Diamond Trading Company of London, with small amounts coming from the Ivory Coast, Zaire, and Belgium.

Fertilizer Materials.—Total plant nutrient consumption (nitrogen, phosphorus, and potassium) in 1976 reportedly increased about 18% to 3.4 million tons. Ni-

trogen consumption rose 14% (to nearly 2.5 million tons of contained nitrogen), phosphate 36%, and potash 14%. The current growth in consumption was stimulated by the Government's drive for increased agricultural output (especially of high-yield cereal crops), expanded use of irrigation, and increased use of multiple cropping. Consumption in recent years had been less than the agricultural conditions warranted because of high prices and tight credit restrictions on farmers' borrowing. The trend appeared to have been reversed in 1976, with prices being lowered and consumption and domestic production likely to increase markedly in the coming years. Considerable capacity expansion was underway or in the advanced planning stage. This expansion reflected the Government's growing reluctance to depend on imports for India's critical fertilizer requirements.[17]

The plants under construction or in the final planning stages would expand annual ammonia capacity in India by nearly 2.8 million tons nitrogen, urea capacity by 2.2 million tons nitrogen, and complex fertilizer capacity by 0.5 million tons nitrogen. The nitrogen expansion would represent a near doubling of capacity between 1975 and 1980 if all plants are completed on schedule. Two new projects rescheduled for a 1978 startup date are to use coal as the raw material and source of energy. They are the 244,000-ton-per-year ammonia/228,000-ton-per-year urea plants at Talcher and Ramagundam. Technical problems reported at yearend could cause further delay in the startup of these plants. Future plants, however, will almost certainly be based on natural gas which is to be available from the offshore Bombay High and Bassein Fields.[18]

Phosphate rock production in CY1976 reached a record high of 644,119 tons, representing a 50% increase over production in CY1975. Projected minehead value was estimated at $20 million. Production was confined to the States of Rājasthān, Uttar Pradesh, and Madhya Pradesh. India's most important mine was located at Jhamar Kotra (24°28′ N, 73°52′ E), near Udaipur. Proved reserves at the Jhamar Kotra mine were placed at over 43 million tons of ore with over 18% P_2O_5, more than half of the proved reserves in India. Exploration was continuing to determine the full extent of the deposit. Production reached 500,000 tons and was targeted for 700,000 tons in 1977. Only direct-shipping, 33% to 35% P_2O_5 ore was being mined at Jhamar Kotra for use in manufacturing chemical fertilizers. Two foreign firms were reportedly testing the low-grade ore with the intention of setting up a processing plant. The plant would handle 1.5 million to 2.0 million tons of ore annually and turn out 750,000 to 1,000,000 tons of concentrate. There was only one beneficiation plant operating in India in 1976. It was located at Maton near Udaipur and produced about 28,000 tons of 34% P_2O_5 concentrate from 110,000 tons of ore. Work is now proceeding on doubling the present 300-ton-per-day capacity of the plant. The concentrate was used as feedstock for the single superphosphate plant located nearby at Debari where a 29,000-ton-per-year phosphoric acid plant was scheduled to open in 1978.

Phosphate rock imports amounted to 471,528 tons in CY1976. The United States, Morocco, Jordan, and Senegal were the only suppliers.

As of October 1976, installed capacity for production of phosphatic fertilizer stood at 927,000 tons per year. Existing plants operated at about one-half of their rated capacity of 478,000 tons of P_2O_5 content during 1976, up from 320,000 tons in 1975.

Mica.—Mica is one of India's traditional mineral exports. However, both production and exports declined in CY1976—production, 28% to about 32,147 tons and exports, 36% to just over 22,000 tons. There were 214 mines reporting production in December 1976, 65 fewer than in August 1975. Production was mainly from Bihār, Andhra Pradesh, and Rājasthān. The Indian Bureau of Mines recently located two new minable mica pegmatites in the Nellore District of Andhra Pradesh.

Although the tonnage of mica exports declined in 1976, the value rose about $6 million as a result of world price increases. Crude mica exports were valued at $19 million and fabricated mica exports at $8 million. According to trade sources, the U.S.S.R. and Eastern European countries were the major importers of Indian mica. Export prospects looked promising for 1977

[17] Page 48 of work cited in footnote 6.
[18] Ministry of Petroleum, Chemicals, and Fertilizers (New Delhi). Report 1976–77, pp. 1–48.

because of recent interest shown by Japan and the Republic of Korea in Indian mica.

The Government was trying to increase the amount of fabricated mica exported in view of the much higher unit value and market potential. East Germany was preparing a feasibility study on setting up a fabricated mica plant in India, estimated to cost $7 million. Negotiations were also underway with Norwegian and U.S. firms for equipment and technology to manufacture different grades of mica powder.

Because of the small reserve and the erratic nature of mica-bearing pegmatites, there has never been a systematic approach to the mining of India's mica, so it remains basically a cottage industry.

MINERAL FUELS

Coal.—Coal remained the principal source of Indian energy, despite growing competition from oil. Coal met approximately 70% of the total commercial energy needs of the country. Petroleum contributed 20% and hydroelectric and nuclear energy supplied the remainder.

Coal India Limited (CIL), the Government-owned holding company for the coal industry, employed over 600,000 persons, roughly 80% of the total mineral industry labor force. The company had made a large capital investment in maintenance, modernization, and mine safety and had been operating at a loss since its founding in November 1975. Wages, which comprised nearly two-thirds of the cost of production, had more than tripled in 2 years, contributing to the lack of profits. The Government-controlled selling price of the coal in some of CIL's subsidiaries was bringing considerably less than the pithead production cost. The Government, however, was hesitant to allow major price increases because of the strong effect this would have on the wide range of industries dependent on coal.

Bituminous.—According to the Ministry of Energy, bituminous coal reserves were estimated at 20.7 billion tons proved, 32.0 billion tons indicated, and 30.8 billion tons inferred, for a total of 83.5 billion tons. Coking coal accounts for about 23% of this total. Over two-thirds of the reserves were located in the three adjacent eastern States of Bihār, West Bengal, and Orissa. The imbalance of distribution causes transport problems for southern and western Indian consumers who must absorb freight charges for coal deliveries from mines often more than 1,000 kilometers away.

GSI recently discovered large reserves of bituminous coal suitable for power generation in the Rājmahāl hills of Bihār. Reportedly, 440 million tons has so far been estimated in the Hura coalfield, of which about 150 million tons will be suitable for power stations. Also, in the nearby Chuparbhita coalfield, 982 million tons of similar-quality bituminous coal has been estimated to a depth of 500 meters. These deposits would feed the proposed huge Farakka thermal power station.

The Government's major focus continued to be on metallurgical-grade coal confined primarily to the Jharia, Raniganj, and Western Bokāro coalfields. Coking coal deposits of 152 million tons were reported in the Bhowra block and 33 million tons in the Mohuda block of the Jharia coalfield. Based on these discoveries, coking coal reserve estimates were revised upward to just over 20 billion tons at yearend 1976.

Coal exploration continued to be very active during the year. Exploration drilling amounted to about 146,000 meters in 1976. The 1977 target called for nearly 200,000 meters. About 165 drills were deployed by the coal companies and an additional 60 drills were engaged by GSI.

India's bituminous coal production, again a record high in CY1976, was up more than 5% to 101 million tons, with coking coal representing about 29% of the total. The value of the output was placed at $826 million. In 1976, open pit mines accounted for about 25% of the total output, but that was expected to increase to 33% by 1983. The change will result from the increased efficiency and productivity of newly mechanized open pit mines. The steady growth of India's bituminous coal production is shown below, in million tons and million dollars:

Year	Quantity	Value
1972	74.8	305
1973	77.9	314
1974	84.1	473
1975	95.9	606
1976	101.0	826

As a result of slowdown in industrial demand, pithead stocks reached a record high of 14.5 million tons at yearend. The output for 1977 was expected to remain at

about the 1976 level. Because of the large stocks and lowered demand, the target for 1978 was revised downward to a 108-million- to 110-million-ton level from the earlier projection of 124 million tons.

Coal mining in India remains a highly labor-intensive industry, with output per man-shift being one of the lowest in the world. Plans were under consideration for the application of technology to improve the recovery and beneficiation of coal. One of the basic complaints of end users continued to be the lack of quality control. This, combined with a rising ash content, has caused consumers to express strong concerns about the calorific value of the coal being supplied and its adverse effect on equipment and industrial production, particularly that of steel. India's steel plants were receiving coal with an ash content of up to 22%, compared with foreign steel plants which operate on 5% to 9% ash. To improve quality control, plans called for increasing the number of washeries for coking coal from 14 to 26 by 1985. This would increase the existing washery capacity by 18 million tons to roughly 44 million tons per year. Present washeries were operating at about 80% capacity. There were currently plans for the construction of four new washeries totaling 10 million tons per year capacity. They were to be located at Sudamdih and Monidih (2 million tons each) and at Ramgarh and Kedla-Pundi (3 million tons each).

Bituminous coal consumption in 1976 was 99.2 million tons, up about 4% over that of 1975. Public-sector industries such as railroads, steel plants, and thermal powerplants continued to be the main consumers, accounting for over 60% of the total demand. The changing consumption pattern in recent years is shown in the following tabulation, in million tons:

	1973	1974	1975	1976	1978 [1]
Thermal powerplants	17.0	[r] 19.6	[r] 24.0	25.0	[r] 31.6
Steel plants	13.7	[r] 15.4	[r] 19.0	20.0	[r] 24.5
Railroads	13.9	14.4	[r] 14.4	14.0	13.5
Cement plants	3.6	4.4	[r] 4.5	4.9	5.1
Brick kilns	2.3	2.5	[r] 3.0	3.5	4.5
Soft coke	3.9	3.7	3.7	3.8	3.8
Other	23.4	27.5	26.8	28.0	27.0
Total	77.8	87.5	95.4	99.2	110.0

[r] Revised.
[1] Projected.

Bituminous coal consumption in 1977 was expected to be up marginally to about 101 million tons, reflecting the slowdown in industrial growth. By 1983, demand could be as high as 155 million tons. However, that consumption level would be dependent on the success of the power sector in carrying out its projected major expansion program. Bituminous coal consumption by the railroads was expected to remain stable or perhaps decline a little as more lines are electrified and more efficient diesel locomotives are used.

Despite expectations of exceeding 1.0 million tons in 1976, exports during the year reached only 622,000 tons, up only marginally from those of 1975. The major importers of Indian bituminous coal were Bangladesh (268,000 tons), Burma (106,000 tons), and Taiwan (78,000 tons). Belgium imported the first shipment of Indian coal to a European country in June 1976. Belgium, the Netherlands, France, and Denmark received a combined total of 134,000 tons during the year. Poor coal-handling facilities at Haldia and Paradeep as well as draught limitations at Haldia continued to impose the major constraints on exports. Improvements in these facilities were progressing slowly, so exports in 1977 are not likely to exceed 1 million tons, compared with the original target of 2 million tons. There was talk about importing low-ash coal from Australia to blend with domestic bituminous coal. The Ministry of Steel reportedly favored the move to improve the operating efficiency of its steel plants. The much higher cost of imported coal and the lack of bulk coal-unloading facilities will be major factors in the pending Government decision on the matter.

CIL was working on 71 projects at an estimated cost of $814 million. The projects, in various stages of implementation, were designed to increase the country's production capacity by 67 million tons in the next 6 to 8 years. The major projects included development of 42 underground

and 24 open pit coal mines, primarily through consolidation and modernization; expanding the washery capacity for coking coal; and establishment of gasification, coke oven, and low-temperature carbonization plants. Proposals for beneficiation of non-coking coal were also being considered.

In light of the 20% to 30% ash content of most Indian bituminous coal, a recent development could, if commercially and technically successful, be extremely helpful for the Indian coal industry. India's Central Fuel Research Institute reportedly developed a new oil agglomeration technique that would reduce the mineral content of coal from 25% to 4%. Recovery of combustible carbon was 90%, compared with 50% by prevailing methods. A 2-ton-per-hour pilot plant was being constructed at the Jharia coalfields to test the new process.

The U.S.S.R. was aiding in the design of what is to be India's largest bituminous coal mine. The Jayant mine in the Singrauli area of Madhya Pradesh will exploit reserves at the coalfield estimated at over 7.5 billion tons. Design work was expected to be completed in March 1978. The use of large, high-capacity draglines, dump trucks, and drills will permit a capacity of 10 million tons per year when fully developed. The output of the mine will support the 2,000-megawatt Mirzāpur District super thermal powerplant a few kilometers across the border in Uttar Pradesh. Long-term plans called for the further development of the Singrauli field by designing additional open pit mines, leading to an eventual production of 45 million tons per year at the turn of the century.

In addition to the 2-million-ton-per-year coal-washing plants planned or under construction at Sudamdih and Monidih, CIL was planning to begin a major mechanization program at the Monidih No. 1 mine near Dhanbad in Bihār. The new system would greatly increase the productivity of the mine.

The overall planned increases in production are certainly attainable with the coal reserves already indicated. However, investment capital for the Government-run coal industry may be difficult to acquire in the amounts needed during the next few years. In addition, the Indian economy may not be able to absorb the large production increases in the planned time frame. Therefore, the planned 67-million-ton-per-year capacity increase may more realistically be reached in a decade or more.

Lignite.—India's lignite reserves were estimated at 2.1 billion tons, 1.9 billion of which were located at Neyveli in the southern Indian State of Tamil Nadu. Most of the remaining 200 million tons was located in Gujarāt State in western India. The Government-owned Neyveli Lignite Corp. (NLC) mines the lignite mainly for use in a 600-megawatt thermal powerplant, a chemical fertilizer plant, and a briquetting plant.

Lignite production totaled 3.9 million tons in CY1976, up 38% over that of the previous year. NLC claimed that the production increase was owing to improved labor relations and to an increase in the production incentive bonus. Plans called for stepping up the production capacity to 6.5 million tons per year by 1980. Orders for necessary equipment were reportedly placed with domestic and foreign suppliers, and over $100 million was approved for the new equipment.

The lignite stockpile was at 684,000 tons at yearend, more than doubling the 1975 stocks. The more favorable stock level would allow a higher assured power output for electric-power-deficient Tamil Nadu State.

Petroleum and Natural Gas.—The main focus of the ONGC's activities continued to be offshore exploration and development, primarily at the Bombay High Field. This was the first offshore petroleum discovery in India, and commercial production from this field began in May 1976 from two wells on platform A at an initial rate of 4,300 barrels per day. By yearend, production had reached 16,000 barrels per day. Plans called for bringing platform D into production by mid-1977, bringing total production to about 35,000 barrels per day from the two platforms.

Oil was discovered on the Bassein North structure and natural gas on the Bassein South structure, both located southeast of the Bombay High Field. Additional exploration included drilling wells on four nearby potential oil structures.

Production wells were to be drilled by the jackup rig *Shenandoah* for platforms C and E during 1977 and for platform B in

early 1978. Completion of this drilling would conclude phase two development. Production at that time should be at the planned 80,000-barrel-per-day level, equivalent to 4 million tons per year.

Phase three is to commence by October 1977 with the laying of a 220-kilometer-long, 76-centimeter-diameter (30-inch) subsea crude oil pipeline and a parallel 66-centimeter-diameter (26-inch) subsea gas pipeline to onshore terminal facilities at Uran near Bombay. The oil pipeline is to bring crude oil production to 120,000 barrels per day by May 1979. Onshore, the oil line will connect to two refineries and the gas line will connect to a fertilizer plant at Trombay. Phase three also includes construction of platform F with gas-treatment and oil-pumping facilities, five more platforms at the Bombay High Field, and one or two well platforms, a process platform, and a flare jacket for the Bassein North Field, also to be served by the pipelines.

Phases four and five provide for raising the crude oil production rate to 200,000 barrels per day and producing 3 million to 4 million cubic meters per day of associated gas by 1981.

The cost of development at the Bombay High Field will be about $183 million upon completion of phase two and is expected to exceed $1 billion with the completion of phase five work. The 200,000 barrels per day of additional petroleum production would replace about $1 billion per year of imported oil at current prices.

ONGC may take up seismic work as a prelude to exploratory drilling in the Kutch Basin (relinquished by Reading & Bates Offshore Drilling Co. (United States) after drilling one dry well), and in the Bay of Bengal (abandoned by Natomas/Carlsberg (United States) following the drilling of two dry wells). At yearend 1976, the Government was still receptive to exploration offers from foreign companies on these or other open blocks on a production-sharing or contract drilling basis.

Asamera Oil Corp. Ltd. (Canada), in which ONGC has a 35% share, completed seismic work in the Gulf of Mannar off the Tamil Nadu coast, and began analyzing the data in November 1976. The results were favorable, and a drilling rig was chartered and the first well was to be spudded in March 1977.

ONGC's 1976 onshore activities were largely confined to exploration in Gujarāt and Assam in order to establish additional reserves in proven areas. Plans for 1977 called for stepping up exploration in the eastern region to double the crude oil output from 1.2 million tons in 1976 to 2.5 million tons in 1978.

ONGC operated in three overseas areas during 1976—Iran, Iraq, and Tanzania. In Iran, an ONGC subsidiary has a one-sixth interest in the operation of the Rostam oilfield. During 1976, its share was 3.4 million barrels. In Iraq, ONGC's activities were confined to contract seismic work during the year. In late 1975, ONGC had completed drilling one contract well in the Abu Keme area. It struck a flow of oil which in India or the United States would have been developed but was considered uneconomical in Iraq, so the well was abandoned. ONGC drilled a contract well on Songo Songo Island for the Tanzanian Government in 1976. The well struck gas, then blew out destroying the rig and the well. Another rig was brought in and drilled a second well, reportedly finding a gasfield with a massive 30-billion-cubic-meter reserve.

Oil India Limited (OIL), a joint-sector company owned 50% by the Government of India and 50% by Burmah Oil Co. Ltd. of the United Kingdom, continued to operate two small concessions in northeastern India. The company produced a little over 3 million tons of oil during 1976. It drilled 12 wells in 1976 and planned to drill 14 wells in 1977. Negotiations were taking place for the Government's acquisition of Burmah Oil's share of the company. When this is completed, OIL plans to expand exploration to the eastcoast offshore areas as well.

India's crude oil production was up slightly in CY1976 to 8.66 million tons. ONGC's increase was from the Bombay High Field's new production; OIL's output from the Assam oilfields remained steady. The private-sector Assam Oil Co., Ltd., contributed only 63,000 tons as production continued to decline. India's crude oil production target for 1977 was set at 11.25 million tons, and a 14.23-million-ton output was planned for 1978 although this may be somewhat optimistic. Assuming that the Bombay High development is completed on schedule with production of 10 million

tons per year in 1981 and that the North Bassein Field will add another 2 million tons per year, total Indian production should reach around 22 million tons in 1981. Unfortunately for the Indian energy situation, it is estimated that the demand for oil will have risen to about 32 million to 34 million tons by that time. Since the shortfall will have to be made up by imports, the goal of self-sufficiency by the mid-1980's appears unrealistic.

Usable natural gas production in 1976 was reported at 1.97 billion cubic meters, up about 4% over that of the previous year. Much of the gross production was flared and will continue to be flared until adequate pipelines and gas-based industries are developed. With the planned completion of the Bombay High gas pipeline in 1978, the volume of gas produced will increase substantially, peaking at 3 million to 4 million cubic meters per day in 1981. Substantial amounts of gas are also expected from the South Bassein structure when this field comes onstream in several years. Utilization of this gas was under study by a number of industries including fertilizer, petrochemical, and electric power in the States of Maharashtra and Gujarāt.

Despite the continual growth of the domestic petroleum industry, India still required large imports of both crude oil and refined products because demand rose almost as fast as the exploration program discovered new supplies. Iran, Saudi Arabia, and Iraq were the major crude oil suppliers, and the U.S.S.R. and Kuwait furnished most of the refined products. The cost of petroleum imports reached a new record high of $1.56 billion during CY1976—$1.30 billion for 14.0 million tons of crude oil and $259 million for 2.3 million tons of refined products.[19]

Crude oil imports were projected to increase slightly in 1977 to about 14.5 million tons. Most contracts were on a government-to-government basis. The U.S.S.R., the traditional products supplier, agreed to furnish 1 million tons of crude oil in 1977 and 1.5 million tons per year for the following 3 years.

India exports a few surplus products to neighboring countries, dropping in value from $14 million in 1975 to $9 million in 1976. Exports were not likely to increase in the coming years because of the rising domestic demand.

As demand for petroleum products increases, Indian planners continue to make every effort possible to decrease India's dependence on foreign oil, particularly on expensive petroleum products. According to the fifth 5-year plan, the country's refinery capacity is to be increased to 37.8 million tons per year by 1980. This is to be accomplished by the expansion of two existing refineries and the construction of two new ones. India's annual refinery capacity for 1976 and that projected for 1980 and crude oil throughput in CY1974–76 were as follows, in million tons:

Source: Oil Statistics. V. XV, No. 1, January–March 1977, p. 12.

Construction on the large Mathura refinery, 130 kilometers south of New Delhi, continued during the year with both U.S. and Soviet technical assistance. Completion was scheduled for 1980. Completion of the 1-million-ton-per-year Bongaigaon refinery in Assam fell behind schedule, mainly becreased 6% to 23.6 million tons in CY1976. original plans. The delays caused the original $148 million cost to balloon to $239 million, and further increases could be expected. Originally planned for operation in 1977, startup is now expected to be well into 1978 if there are no new delays.

Consumption of petroleum products increased 6% to 23.6 million tons in CY1976. Significant increases were recorded for naphtha and light diesel oil because of rising demand by fertilizer plants and the general pickup in industrial demand. Consumption of furnace oil was stable because of the earlier switch to use of coal by many powerplants. Efforts were underway to convert more industries from furnace oil to coal as their main fuel. Demand for 1977 was estimated at 25.0 million tons (a 6% increase). Assuming that consumption continues to increase at the present rate, demand should be over 32 million tons in 1981.

In addition to the phase three Bombay High offshore pipelines, there was one major onshore pipeline under construction in 1976, the 1,222-kilometer Salaya-Koyali-Mathura pipeline. It is designed to transport imported crude oil from the Salaya offshore terminal in the Bay of Cambay to the Koyali and Mathura refineries. The originally projected cost of the pipeline was $214 million, but costs were expected to escalate well above that figure. Installation of the offshore single-buoy mooring point at Salaya was underway, and the 120-kilometer section between Viramgrām and Koyali was completed. Construction of the pipeline from Salaya to Viramgrām had also started. Operation of the pipeline to the Koyali refinery should begin by January 1978 and to the Mathura refinery by June 1979. A pipeline was proposed from Mathura to Ambāla in order to distribute petroleum products to Haryana and Punjab. Construction was to begin in 1980.

The Mineral Industry of Indonesia

By K. P. Wang [1]

A new air of relaxation and self-confidence was evident among Indonesia's economic planners at the end of the fiscal year from April 1976 to March 1977.[2] The crisis of the State oil company P.T. Pertamina and its foreign borrowings had been overcome, and the country was ready to return to normalcy and resume growth in line with the targets of Repelita II (the second 5-year plan, covering 1974–79).

Petroleum production was up, and there were signs of increased interest in exploration. The oil contract renegotiations were essentially concluded, and Indonesia went out of its way to take a pragmatic view of the needs and feelings of foreign investors. Foreign exchange reserves soared to $2.4 billion[3] at the end of July 1977, a $1 billion increase over those of the year before. Net petroleum earnings of $3.7 billion in fiscal year 1976–77 accounted for 59% of the country's net foreign exchange earnings, and tax revenues from petroleum activities of $4 billion accounted for 59% of total budget receipts. Nonoil exports of $3.5 billion in fiscal year 1976–77 were one-third higher than those of the year before.

Indonesia's gross national product (GNP), in constant 1973 prices, increased from approximately $18.4 billion in 1975 ($29.2 billion in current prices) to about $19.8 billion in 1976. However, the inflation rate remained high, with the cost of living increasing about 14% in 1976. Oil output value increased from about $7 billion in 1975 to $8 billion in 1976 at current prices. The country's potentially very important natural gas industry was still in the development stage, with most of the gas being flared. However, various large liquefied natural gas (LNG) and nitrogenous fertilizer facilities were being built. In 1976, the value of mineral and metal production except oil totaled less than $500 million, headed by tin, cement, copper, fertilizers, nickel, and bauxite. Fuels and minerals together contributed about 25% of the GNP, indicating the raw material nature of Indonesia's economy. Petroleum dominated exports, accounting for more than 70% of all 1976 exports. Agriculture contributed approximately one-third of the GNP, but only about one-fourth of all exports.

At yearend 1976, the Minister of Mines, Mohammed Sadli, stated, "Despite its vulnerability and shortcomings, the Indonesian mining sector has very good prospects. They depend upon several factors: The development of national politics, the international economic situation, and technological developments. These factors together place the mining sector in a special position."

The Indonesian Government made considerable progress in managing the Pertamina debt in 1976. Local currency obligations were substantially reduced and 12 tanker contracts were resolved, with additional settlements a distinct possibility. Pertamina continued to streamline operations in an effort to concentrate more exclusively on oil-related activities. Several changes in the Pertamina board of directors were announced.

The formation of the Technical Committee of Energy Power-Resources on November 11, 1976, marked the first step

[1] Supervisory physical scientist, International Data and Analysis.

[2] Far East Economic Review (Hong Kong). Indonesia: Back to the Real Priorities. Sept. 9, 1977, pp. 49–56.

[3] Where necessary, values have been converted from Indonesian rupiahs (Rp) to U.S. dollars at the rate of Rp415 = US$1.00.

toward a comprehensive energy policy that will respond to the new realities of coming decades. The new plan is expected to lay stress on the twin goals of continued expansion of oil reserves for export and the rapid development of nonoil energy resources, particularly coal, to meet the anticipated growth in domestic energy consumption.

The oil and gas industry made notable gains, with many new lesser producers coming into full production to complement P.T. Caltex Pacific Indonesia, the dominant producer. Two significant LNG projects, together costing close to $2 billion, were well into the first phase which should be completed in 1977; one is Mobil Oil Indonesia Inc.'s Arun Field in North Sumatra and the other is Roy M. Huffington, Inc.'s (Huffco) Badak Field in East Kalimantan. Based on natural gas, Indonesia's fertilizer industry was expected to more than double capacity between 1976 and 1978. Petrochemicals got off the ground floor, and construction of new refining facilities to meet future domestic demand was being planned.

The tin industry showed a small decline in mine production, despite good tin prices, as it geared for expanded output, with two large dredges ordered for delivery in the near future. Smelter tin production rose sharply, as a result of more normal utilization of the new reverberatory furnaces. Initial work on the very important Asahan aluminum and power project got underway. The first large nickel plant, located at Soroako on Sulawesi and owned mainly by P.T. International Nickel Indonesia (P.T. INCO) was brought into first-stage operation. The first parts of the P.T. Krakatau Steel integrated steelworks were being readied for production at yearend 1976. Freeport Indonesia Inc.'s Erstberg copper mine in Irian Jaya (formerly New Guinea) had a good year, although the matter of whether or not to go underground was not settled. The cement industry moved ahead on its program to raise annual capacity to about 6 million tons before 1980, more than triple the 1976 output.

The Indonesian Government issued new regulations in early 1977 that provide a basis for negotiating "third-generation" mining contracts. No mining contracts had been signed with foreign companies in more than 4 years, and there was need to revitalize mining activity. Rio Tinto-Zinc Corp. Ltd. was expected to sign the first third-generation contract with the Indonesian Government. The agreement would entitle P.T. Rio Tinto Indonesia to exploration and mining rights for base metals in a 6,500-square-mile area in Central Sulawesi for 30 years. At least 51% of the company's shares is to be tendered to the Government within 10 years after mineral production begins. An undisclosed percentage of foreign exchange earnings from mining exports may be retained in a special account to be used for jointly agreed purposes. A 10% export tax on unprocessed minerals would be assessed. Equipment may be imported free of duty and transfer/sales taxes for a period of 10 years. An additional 5% of all capital costs would be deductible annually for the first 4 years. Corporate income tax would be 35% per year for 10 years and 45% per year thereafter. Royalties and land fees would have to be paid. There would be a windfall clause, according to which a 60% tax is charged when average profits exceed 15% of invested capital for a period of 3 years. This contract was expected to be the model for other mining contracts. Subsequently, at least two similar contracts were being negotiated, one involving Taiwan interests and another, Hong Kong interests.

Production-sharing agreements have been employed, initially in oil and later in coal. Pertamina's financial crisis triggered a move to revise oil contracts, and new terms were issued in July and August 1976. Prior to July 1976, firms operated on the basis of a 40% in-kind cost recovery allowance and a 65–35 split in net operating income. The new terms revised both concepts. In the recovery of costs, companies were divided into two categories based upon the amounts of reserves; cost writeoffs became more complicated and were thereby reduced. The profit-sharing split became 85–15. Including the inroads on costs, the effective split came closer to 89–11. The new terms substantially altered cash flows and forced contractors to review ongoing and future exploration and/or development programs.

The revised contract terms provided $640 million in additional Government revenues, but raised doubts about Indo-

nesia's oil investment climate. When exploration activities subsequently slowed, it became evident that the terms must be modified. Pertamina issued an announcement on February 11, 1977, concerning granting of exploration incentives. Oil to Pertamina would be priced at market level for 5 years. A 20% credit of the capital investment cost directly related to development of new fields would be deductible from gross output in the first year of production, and additional taxes would be reduced. The United States Internal Revenue Service (IRS) issued a ruling on May 7, 1976, which affected Indonesian production-sharing contracts. The ruling stated that the share of production retained by Pertamina is judged to be a royalty in its entirety and is therefore not eligible for a foreign tax credit in the United States. The Indonesian Government was trying to find a solution to this important taxation issue to remove a major impediment to further exploration and development spending by U.S. oil companies.

On July 14, 1976, the IRS issued a second announcement, noting that payments to a foreign government by U.S. taxpayers owning minerals in place (oil producers in this instance) would be treated as creditable income tax if all of the following characteristics were present: Income tax is calculated independently of royalty and other foreign taxes; income tax payable under foreign law is based upon income receipts realized in a manner consistent with U.S. income tax principles; taxpayers' income tax liability cannot be discharged from property owned by the foreign government; foreign income tax liability, if any, is computed on the basis of all operations within the foreign country; the taxpayer, in computing the income subject to foreign income tax, is allowed to deduct, without limitation, the significant expenses incurred by him; and reasonable limitations of the recovery of capital expenditures are acceptable.

PRODUCTION

Indonesia's mineral production showed sharp increases in cement, ammonia, petroleum, natural gas, and refined tin; small increases in copper and nickel; and slight reductions in bauxite, iron sands, coal, mine tin, and precious metals. Radical expansion of cement capacity was gaining momentum and other construction materials, such as granite, did well also. Oil sales rebounded and established a record high, with large exports of low-sulfur crude to the United States. Despite a very impressive gain in natural gas output (about 25% furnished by Pertamina), more than half was still flared. Development of the petrochemical and fertilizer industries made significant headway. Production of nickel matte and ferronickel began; ore was formerly the only nickel material produced and exported. Mine copper output increased 10% in tonnage, but low prices held the value below the 1975 level. Indonesia's tin, oil, and gas are of considerable world consequence, and nickel and fertilizers are potentially so.

Table 1.—Indonesia: Production of mineral commodities

(Metric tons unless otherwise specified)

e Estimate. p Preliminary. r Revised.

[1] Includes gold and silver content of copper ore and output by Government-controlled operations. Gold output by operators of so-called "People's" mines is unavailable, but may be as much as 30,000 troy ounces per year.

[2] Includes a small amount of cobalt which is not recovered separately.

[3] Data represent quantities of limestone used for cement production. Excludes considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.

[4] Sulfur produced by other than Frasch process.

TRADE

Indonesia's strong balance-of-payments position improved further in 1976 as a result of increased oil exports and realistic handling of Pertamina's financial problems. Total exports increased from $7,103 million in 1975 to $8,547 million in 1976; total imports rose less sharply, from $4,770 million in 1975 to $5,673 million in 1976.

As expected, the largest share of Indonesia's trade has been with Asia. In 1976, 54.8% of all exports went to Asian countries and 53.0% of the imports came from Asian countries. Imports from Japan alone were $1,485 million in 1976, and exports to Japan were $3,564 million. The United States was Indonesia's second most important trading partner, with imports valued at $988 million and exports at $2,452 million. Imports from Europe totaled $1,340 million in 1976, whereas exports totaled a mere $704 million.

Equipment and machinery represented about 40% of all imports in 1976. However, base metals aggregated 14%; mineral products, 9%; and chemical products, 8%.

Minerals, particularly oil, continued to be of overriding importance in total exports. Oil represented 70% of all 1976 exports in value, and other minerals accounted for an additional 3.4%. Gross receipts from Indonesia's mineral exports are as follows, in million dollars:

	1974	1975	1976
Petroleum	5,211	5,311	6,004
Tin	173	154	165
Copper concentrate	125	74	80
Nickel ore	14	21	29
Bauxite	7	6	13
Other minerals	3	4	5
Nonminerals	1,892	1,533	2,251

Mineral exports and imports are shown in tables 2 and 3, respectively.

Table 2.—Indonesia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS			
Aluminum:			
Bauxite and concentrate	1,260,971	973,370	All to Japan.
Metal including alloys, all forms	--	90	Pakistan 62; Singapore 21.
Copper:			
Concentrate, gross weight	239,946	199,581	Japan 149,386; West Germany 50,195.
Scrap	1,967	--	
Iron and steel metal:			
Scrap	18,179	1,580	All to Singapore.
Pig iron, including cast iron	--	1,813	All to Hong Kong.
Semimanufactures	--	1,265	All to Singapore.
Lead ore and concentrate	--	150	All to Malaysia.
Manganese ore and concentrate	388,762	310,841	Japan 307,641.
Nickel ore and concentrate	928,368	639,020	All to Japan.
Silver metal including alloys-troy ounces	184,545	72,725	United Kingdom 32,151; West Germany 24,113.
Tin:			
Ore (including slag and ash)	11,752	10,056	Malaysia 9,542; Japan 514.
Metal including alloys, all forms:			
Scrap	1,054	2,965	Japan 1,237; Netherlands 762.
Unwrought	15,412	5,772	Japan 2,260; United States 1,343; Netherlands 1,016.
Semimanufactures	--	5,517	Netherlands 1,826; Japan 1,768; United States 1,523.
Zinc metal:			
Scrap	--	134	Japan 84; Singapore 50.
Unwrought and semimanufactures	--	945	Japan 743.
NONMETALS			
Barite	--	35,011	Malaysia 10,025; Burma 2,498.
Clays, kaolin	--	1,710	Japan 1,630; People's Republic of China 80.
Fertilizer materials:			
Manufactured, nitrogenous	--	921	Malaysia 543; Singapore 359.
Ammonia	--	352	Singapore 249; Thailand 103.
Stone, sand and gravel:			
Crude and partly worked, granite	--	82,409	United States 82,406.
Gravel and crushed rock	--	9	All to Singapore.
Other:			
Bromine, iodine, fluorine	--	9	Japan 5; Australia 4.
Slag, dross, similar waste from iron and steel manufacture	--	169	All to Singapore.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	--	2,783	United States 1,561; Japan 479; France 380.
Petroleum:			
Crude—thousand 42-gallon barrels	405,134	397,261	Japan 189,980; United States 127,749; Trinidad and Tobago 36,696.
Refinery products:			
Gasoline, motor ——do——	258	825	Japan 472; Singapore 169.
Kerosine, white spirit ——do——	69	18,368	Japan 10,881; United States 3,863.
Distillate fuel oil ——do——	578	--	
Residual fuel oil ——do——	38,413	6,928	Japan 4,830; Netherlands 672.
Lubricants ——do——	--	6	Singapore 4.
Other:			
Paraffin wax ——do——	587	2,432	Japan 1,628; United States 534.
Nonlubricating oils ——do——	--	55,458	Singapore 55,456.
Total ——do——	39,905	84,017	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	--	8	All to Singapore.

COMMODITY REVIEW

METALS

Aluminum and Bauxite.—P.T. Aneka Tambang's bauxite mines on Bintan Island near Singapore produced at a rate slightly lower than in 1975. The same mines producing 1.2 million to 1.3 million tons annually a few years ago turned out less than 1 million tons per annum in 1975 and 1976. All the bauxite has been destined for Japan, which of late has cut back on purchases from Indonesia. Aneka Tambang continued to move ahead on a $400 million alumina project on Bintan to produce 600,000 tons of alumina annually. The U.S.S.R. had offered a $300 million loan, only to withdraw the offer subsequently. Kaiser Engineers Inc. was then employed to study the project, on the basis of a 27-million-ton reserve of high-silica trihydrate bauxite at the mine site and a little more in surrounding areas. Indonesia is geologically most promising for finding additional bauxite. The hope is to sell 450,000 tons of alumina annually to the Asahan aluminum complex and provide 150,000 tons for export, possibly to the Middle East, by the early 1980's.

The Asahan aluminum project has become a symbol of Indonesian-Japanese economic cooperation,[4] and is the most important project in Indonesia's second 5-year plan. The Japanese view it not only as a great technical challenge but as a source of low-cost aluminum, produced with power costing only about 1.3 yen per mil. (US$1 equals 297 yen in 1976 and 279 yen in July 1977.) Virtually all of the large Japanese aluminum producers have banded together into a consortium to work on the 250-billion-yen project. Construction costs, including infrastructure and research expenses, were estimated at 80.3 billion yen for electric power development, 149.1 billion yen for aluminum smelting facilities, and 20.6 billion yen for long term working funds.

Half of the potential power of Asahan River in North Sumatra will be developed (a maximum of 243,000 kilowatts at Sigura-gura and 271,000 kilowatts at Tangga). The aluminum plant will use 410,000 kilowatts, leaving surplus electricity for general distribution. The powerplant site is near Toba Lake, a sightseeing resort 260 kilometers from the port of Belawan. The aluminum plant will be at Kualatandjung, 120 kilometers from the powerplant and 45 kilometers east of Tebingtinggi. Initial capacity of 75,000

[4] Japan Chemical Week (Tokyo). July 1, 1976, pp. 4–5.

tons per year in 1981 is expected to be expanded to 225,000 tons per year by 1984. More than 800,000 tons of cargo will be shipped in and out of the plants, which explains the need for improving port facilities. The Bintan alumina complex and the Asahan aluminum and power complex are expected to become the foundation of Indonesia's emerging power, chemical, and heavy industries.

Chromite.—Indonesian and Japanese interests have recently joined hands to investigate chromite in Sulawesi. Kanematsu-Gosho Ltd., Kawasho Corporation, and Chugai Mining Co., Ltd., formed a company called Japan Sulawesi Chrome Development Ltd. for this purpose. The project calls for an initial outlay of $1 million (to be borne by the Japanese) in the next 2 years for exploring an area 35 miles south of the port of Parepare. The Indonesian firm, P.T. Perto, has the mining rights to an 80,000-square-mile site. Preliminary surveys indicate a 200,000-ton chrome deposit grading 38% Cr_2O_3. If subsequent drilling confirms its viability, a joint venture will be established, with Japanese firms funding 40% and Perto 60%. Initial output could be 20,000 to 40,000 tons of chrome product annually.[5]

Copper.—Indonesia's only primary copper producer, Gunung Bijih (or Erstberg), located in Irian Jaya and owned by Freeport Indonesia, Inc. (8.5% Indonesian Government), had a slightly better-than-average year, producing 223,300 tons of 30% copper concentrate. Exports increased 9% in tonnage, reaching nearly 67,000 tons of contained copper in 1976, of which two-thirds was shipped to Japan and one-third to West Germany. This open pit mine in the mountains, with concentrates slurried down to the port of Amampare, may be worked underground in the future if copper prices hold up. Initial underground surveys show promise, and a 2-kilometer tunnel was being driven to facilitate collection of samples. This phase of exploration should be completed by yearend 1978. A final decision as to whether or not to go ahead with underground mining probably will not be made until later, although Fluor Corp. (United States) has been engaged to explore the Pegunungan Jaya Wijaya Mountains, the underground site.

Significant interest in exploring for copper continued in several areas of the archipelago. P.T. Tropic Endeavour, under a work contract, was exploring in the Gorontalo area of northern Sulawesi. South Sulawesi Mining Corp. had a work contract to explore in its area. Aneka Tambang, drilling a large base metals deposit in West Java, had investigations underway in Sulawesi, Lampung, and West Kalimantan. A local firm, C.V. Disco, holding five work contracts, was exploring for base metals with assistance from Taiwan Metal Mining Corp. P.T. Wall had contracted for preliminary geological and geochemical work in East Nusatenggara.

Gold and Silver.—Aneka Tambang's mine in Cikotok, southern Banten, West Java, continued to be the only important primary gold producer in Indonesia. However, its output in 1976 was only about 11,000 troy ounces of gold and 100,000 troy ounces of silver. Unrecorded production from small mines in Kalimantan and Sumatra may be several times the recorded levels. Byproduct precious metals from the copper concentrates of Erstberg, also unrecorded, may total 70,000 troy ounces of gold and 800,000 troy ounces of silver.

Iron and Steel.—Indonesia's 1976 steel developments concern P.T. Krakatau Steel, with facilities at Cilegon in West Java. Krakatau has a long, checkered history, having been started with U.S.S.R. aid in 1962. Idle for 7 years beginning in 1965, the project was resumed once more in 1972 under the aegis of Pertamina and managed by Manderstan Associated Consultants of Geneva, Switzerland. The project was taken out of the Pertamina ambit in 1975, when Krakatau was reorganized, and Kaiser Engineers and Armco Steel Corp. were brought in to help. Foreign exchange commitments were reduced from $2.1 billion to $1.1 billion when the project was basically redesigned. In 1976, West Germany signed a contract to supply a credit of 1.2 billion Deutsche marks to support the project. At yearend 1976, two small parts of the project were being readied for operation —a 150,000-ton-per-year reinforcing rod mill and a 100,000-ton-per-year steel angle mill. Already, $150 million had been spent for these mills and a port for Krakatau.

[5] World Mining (San Francisco). July 1977, p. 78.

The mills will be part of an integrated steel complex, aimed at producing 2.2 million tons of steel products per year by 1985, the last year of phase 4. The hope is to complete phase 1 in 1979, when 1 million tons of sponge iron will be produced by the HyL direct-reduction process using Australian iron ore and natural gas from Central Java. Half of the sponge iron will be sold and the other half processed into billets and then wire, bars, and shapes. Indonesian demand for steel increased from about 400,000 tons in 1967 to 1,500,000 tons in 1976, and prospects for 1985 are that requirements will reach 3 million tons. Thus, justification for this steel project seems obvious, unless Indonesia continues to import large quantities of steel products and to flare its surplus gas.

The Indonesians hope eventually to develop some local iron ore; in 1976, the country continued to rely on high-grade imports from Australia. Locally, small quantities of iron sands (about 353,000 tons in 1975 and 292,000 tons in 1976) have been produced by Aneka Tambang east of Cilacap (Tjilatjap), along the south coast of Java. All of the sands, analyzing 55% to 57% iron and 9.5% to 11% titania, have been exported to Japan. In early 1977, consideration was given to the exchange of Indonesian oil for Brazilian high-grade iron ore to meet part of Krakatau's future iron ore needs.

Nickel.—Until Indonesia develops a strong steel industry, its nickel supply will continue to be totally export oriented. Such prospects are not in sight for at least a decade. Until yearend 1976, all of the nickel extracted was exported as ore by Aneka Tambang, which operates a nickel mine at Pomalaa in southeast Sulawesi. In 1976, the Pomalaa mine produced nearly 830,000 tons of 2.4% nickel ore for export to Japan; Japan received 811,684 tons during the year, and would like to cut imports by at least 10% in the coming year. Aneka Tambang's new 20,000-ton-per-year ferronickel smelter (4,500 tons of contained nickel) commissioned in October 1976 was designed to use the lower-grade ore at Pomalaa, with the final product also destined for export. Indonesia has extensive and widespread resources of high-moisture (generally more than 25%) nickeliferrous laterites in Sulawesi and elsewhere.

P.T. INCO, owned 75% by the International Nickel Co. of Canada Ltd. (with provision to sell 20% of this to Indonesians after start of production) and 25% by Japanese firms, started phase 1 production at its Soroako project on Sulawesi in September 1976. Seven local deposits were being developed to supply 2.2% nickel ore for the smelter. Phase 1 capacity is 37 million pounds of contained nickel in 75%-grade nickel matte (sulfur comes from Canada), to be increased in phase 2 at yearend 1978 to 107 million pounds with the addition of two similar process lines. Ore is mined selectively and upgraded by vibrating grizzlies to reject large barren rock. It is then dried, screened, and blended before feeding into a 100-meter (328-foot) reduction kiln where sulfur is injected at the discharge end. The reduced product is made into a 25% nickel matte in an electric furnace and then upgraded in a top-blown rotary convertor to a 75% nickel matte final product. A 165,000-kilowatt hydropower plant on the Larona River was being built to meet the needs of phase 2, when a total of 4,000 workers will be employed. Actually, there may be 8,000 workers, mostly construction workers, on the site as of early 1977, so that Soroako has become quite a community in a formerly sparsely inhabited land. The total capital cost has been steadily revised upward, with the latest figure at $850 million, comprising one-third equity and two-thirds loans. Sales will be mainly to Japan, with some eventually aimed at the People's Republic of China market.

P.T. Pacific Nikkel Indonesia's project on Gag Island near the "bird's head" of Irian Jaya continued to have good hope of realization. If its plans are eventually implemented, Indonesia would become the third leading nickel producer among market economy countries, after Canada and New Caledonia, by the 1980's. Pacific Nikkel had already spent $40 million on this project, which may cost $1 billion to implement. United States Steel Corp. and the Dutch steelmaker, Hoogovens IJmuiden B.V., are the mainstays of the consortium, with the Indonesian Government agreeing to take 20% equity for World Bank financing purposes. However, New-

mont Mining Corp. and Sherritt Gordon Mines Ltd. withdrew from the venture, and Amoco Minerals Co. (a subsidiary of Standard Oil Co. of Indiana) subsequently agreed to equity participation. Another new partner was being sought, so as to qualify Pacific Nikkel for a $50 million World Bank loan by yearend 1977. The original consortium had a 30-year work contract dating from 1969. Early studies indicated 260 million tons of 1.5% nickel ore, but the reserve could be much greater. Projected annual output for the early 1980's is approximately 110 million pounds of nickel powder or briquets, and 2 million pounds of nickel and 1 million pounds of cobalt contained in mixed sulfide concentrates.

The project of the Indonesian Nickel Development Co. (INDECO) on Gebe Island near Halmahera apparently will be shelved indefinitely by an eight-member Japanese consortium. The original plan was to build a 20,000-ton-per-year ferronickel plant locally. INDECO had already spent nearly $10 million, but decided to reconsider when cost estimates doubled to $400 million to $500 million.

Tin.—Indonesia retained its position as the world's fourth ranking tin producer, and its producer votes in the International Tin Council (ITC) constituted 15.7% of the total in early 1977. The country's tin output was still far below past peak levels, and pressure was building to expand production and increase export quotas. Meanwhile, some of the newer companies, such as P.T. Koba Tin, were being restrained by existing tin quotas. Higher world tin prices near yearend did not stimulate Indonisia's tin production, because the Government is by far the principal producer (there being few small private operations) and costs spiraled in the face of sharp inflation. The country's tin exports in 1976, which reflect production value, were valued at about $165 million.

The State-owned tin company P.N. Timah was reorganized into a limited company in 1976, with the name changed to Perusahaan Terbatas Tambang Timah (P.T. Timah). The new company was granted wider powers and greater freedom, and Abdul Rachman Ramly was appointed president-director, replacing Major General Tajib. In 1975, P.N. Timah produced 24,391 tons of mine tin, 96.3% of the national total (70.4% from Bangka, 21.4% from Belitung, 7.4% from Singkep, and 0.8% from Bangkinang). The company's total production dropped slightly in 1976, because of operational difficulties related to inflation, but the pattern of output remained the same, with Bangka producing 16,066 tons, Belitung 4,716 tons, Singkep 1,270 tons, and Bangkinang 152 tons. P.T. Timah has 12 fixed dredges (9- to 18-cubic-foot) and 8 small dismantlable dredges on Bangka, 14 fixed dredges (5- to 14-cubic-foot) and 2 small dismantlable dredges on Belitung, and 4 fixed dredges on Singkep. P.T. Timah's reserves may be on the order of 500,000 tons of recoverable tin. A new 24-cubic-foot bucket dredge with an annual throughput of nearly 7 million cubic yards and a 150-foot digging depth, known as Bangka II, was being built for P.T. Timah by the United Kingdom firm F. W. Payne for service by 1979. Indonesia needs large strong dredges, since many operations are near shore or offshore.

N.V. Billiton Exploratie Maatschappij Indonesia, a subsidiary of the Royal Dutch/Shell Group, was having built at the Jurong shipyard in Singapore a $25 million dredge which was designed by Mining and Transport Engineering B.V. (MTE) of Amsterdam, the Netherlands. This deep (150-foot) yearround dredge, equipped with 30-cubic-foot buckets and capable of processing over 8 million cubic yards of gravel annually, will start working the Pulau Tujuh concession (between Bangka and Singkep Islands) by 1978 and expects to extract 2,500 tons of tin-in-concentrate per year. In addition to Pulau Tujuh, Billiton has another 40-year concession dating from 1968. Billiton offered 25% of the shares to P.T. Timah.

P.T. Broken Hill Pty. Indonesia, a subsidiary of Broken Hill Pty. Co. Ltd. (Australia), has been investigating since 1973 an old flooded underground lode mine (closed since 1942) on Belitung, called Kelapa Kampit. Reportedly, Broken Hill had spent as much as $10 million in trying to rehabilitate this mine, and was ready to give up on it in late 1976. However, a feasibility study on commercial operations was still being prepared. P.T Koba Tin, a joint venture between Australian interests and P.T. Timah (with 25% of the shares), continued gravel-

pump operations at its Nibung property, although temporarily shutting down its Lubuk-Besar property, both on Bangka Island. Koba Tin produced nearly 900 tons of mine tin in 1975, and had ordered two small bucket dredges.

The 31% increase in Indonesia's tin metal production to 23,322 tons in 1976 reflects the completion of the Peltim smelter at Mentok on Bangka Island. Mackay Consultants helped to install three new 6,000-ton reverberatory furnaces to complement three West German rotary furnaces that were producing at less than half of design capacity. The plant was capable of producing about 27,000 tons of tin annually as of yearend 1976. Thought was given to the replacement of the rotaries with a fourth conventional reverberatory furnace. P.T. Timah owns and operates the tin smelter, which smelts all of the country's mine tin.

Uranium.—Indonesia's national atomic energy agency has the authority to arrange for foreign participation under special agreements, although the law reserves all rights for the Government. French teams exploring West Kalimantan reportedly made some promising discoveries, prompting optimism to the effect that uranium mining might commence as early as 1980, despite difficult working terrain. The most promising location is Kalan, in the Nangapinoh district of Sintang Regency. Analysis of a 10-kilogram sample of the West Kalimantan ore showed an average of 0.3% uranium (may be U_3O_8) content. The French were hopeful that they would be selected to undertake mining for the ores they discovered. Prospects for finding commercial uranium deposits in southcentral Sumatra by the West Germans and in Kalimantan by the Indonesians also appeared good. Construction of a nuclear testing reactor at Serpong, West Java, was in progress.

NONMETALS

Cement.—Indonesia was on schedule in its program to expand cement production from less than 1 million tons per year in 1974 to about 6 million tons per year before 1980. Output in 1976 reached 1.8 million tons, an increase of 0.7 million tons over that of 1975. Demand increased sharply also, with many construction projects getting underway. Shortages were met by imports.

P.T. Semen Cibinong (Cibinong Cement Co.), 51% owned by Kaiser Cement & Gypsum Corp. (to be reduced to 44%), moved ahead on a $48 million expansion program to raise capacity of its newly built 500,000-ton plant in West Java to 1.1 million tons by mid-1977. Fuller Company (United States) was supplying necessary equipment, including a 15- by 220-foot rotary kiln, a 15- by 115-foot rotary dryer, a 12- by 33-foot raw mill, and a 12- by 33-foot finish mill. Allis-Chalmers Corporation, Fuller, and Polysius AG (West Germany) received equipment orders from Morrison-Knudsen Co., Inc., of San Francisco, Calif., for the P.T. Semen Gresik plant in East Java to triple capacity to 1.5 million tons by 1978. F. L. Smidth & Co. was awarded a contract from P.T. Semen Padang for construction of a 2,000-ton-per-day dry-process plant next to its existing Indarung wet-process facility in West Sumatra. Mitsui & Co. Ltd. started to build a 600,000-ton plant at Cilacap in Central Java. Various other cement projects were also underway.

Fertilizer Materials.—Indonesia's fertilizer supply picture, based mainly upon fixed nitrogen from the use of the abundant resources of natural gas, was undergoing significant change in 1976, as part of an overall program to greatly increase production and make the country more than self-sufficient in a few years. With its large population and emphasis on agriculture, particularly food crops, Indonesia has been a significant consumer of fertilizers for some time already, needing 300,000 to 400,000 tons of nitrogen annually. Imports of nitrogen reached a peak of 580,000 tons in fiscal year 1975–76, but were banned in the following year because of oversupply. Stocks at the beginning of 1976 were 644,000 tons,[6] but fell to 437,000 tons a year later. Production was about 250,000 tons in 1976 and should reach 600,000 tons by 1978. In 1976, Indonesia had 525,000 tons per year of urea capacity, was building to accommodate an additional 1,710,000 tons, and had firm plans to construct for another

[6] Nitrogen (London). Heralding a New Era in Indonesia. The British Sulphur Corp. Ltd. No. 106, March/April 1977, pp. 31–33.

1,140,000 tons. Ammonium sulfate capacity will be raised from 150,000 tons to 260,000 tons per year. A major restructuring has taken place in the Indonesian fertilizer industry, with responsibility passing from Pertamina to the Directorate General for Chemical Industries.

An ammonia-urea complex near Palembang in South Sumatra, known as Pusri III and rated at 272,000 tons per year of nitrogen as ammonia and 262,000 tons per year of nitrogen as urea (or 560,000 tons per year of urea), was completed by Kellogg Overseas Corp. at a cost of nearly $200 million near yearend 1976. The total urea capacity at this site, combined with that of Pusri I and Pusri II, was raised to 483,000 tons per year of nitrogen. Kellogg and Toyo Engineering Corporation will bring Pusri IV, which is identical to Pusri III, into production by 1979. Kellogg was also constructing a $250 million complex rated at 1,000 tons per day of ammonia and 1,725 tons per day of urea at Cikampek in West Java, with the help of a $200 million Iranian loan, for completion by yearend 1978 and to be operated by P.T. Kujang.

An Association of Southeast Asian Nations (ASEAN) regional fertilizer complex capable of producing 570,000 tons per year of urea, designed by the West German firm August Thyssen-Hütte AG, to be located at Aceh in North Sumatra, was past the drawing board stage. Construction of a compound fertilizer plant at Gresik for Petrokimia, rated at 80,000 tons per year of diammonium phosphate, 152,000 tons per year of P_2O_5 triple superphosphate, and 50,000 tons per year of nitrogen-phosphorus-potassium (NPK), was well underway and scheduled for completion by early 1979. Indonesia's only ammonium sulfate plant, with 31,000 tons per year of nitrogen capacity, is also located at Gresik. The scheme to construct a floating fertilizer plant off the coast of East Kalimantan was abandoned by the Indonesian Government for an onshore location and two specifically built ships will be scrapped or sold.

Clays.—*Kaolin.*—Kaolin occurs in various localities of Indonesia, either as a weathered product of feldspar in granitic rocks or formed as a result of hydrothermal activity. Output was 29,323 tons in 1976 compared with 30,528 tons in 1975. Belitung Island with 15 properties is the largest producer, followed by Bangka with 5 properties and North Sulawesi with 1 property.

P.T. Timah became interested in kaolin and other clays on Bangka and Belitung Islands, as part of a program to diversify. Most of the clays found so far are only intermediate in quality.

Stone.—*Marble.*—Mesozoic- to Tertiary-age marble of various grades occurs in a number of localities. The oldest enterprise is P.T. Industri Marmer Indonesia Tulungagung, which owns quarries in the Trenggalek and Tulungagung areas of East Java. The firm's output was 19,828 cubic meters of finished products in 1975 and 25,944 cubic meters in 1976. Another company has recently started to develop pre-Tertiary marble in the Banjarnegara area of Central Java.

Other Nonmetals.—Iodine has been produced in East Java since before World War II. The important current producer is P.T. Kimia Farma, whose plant at Mojokerto provided 33.0 tons of iodine in 1975 and 27.3 tons in 1976. Indonesian iodine was used in the pharmaceutical industry.

Sulfur deposits with 240,000 tons of reserves were recently discovered in the Sorikmerapi and Pahae districts of North Sumatra. The mountainous areas of Sibayak and Sinabung are also thought to possess workable sulfur deposits.

MINERAL FUELS

Coal.—Indonesia's new energy policy was expected to lay stress on the twin goals of continued expansion of oil reserves for export and the rapid development of nonoil energy resources, particularly coal, to meet the anticipated growth in domestic energy consumption. First, existing mines were scheduled to be expanded by P.N. Batubara, the State coal company. The Bukit Asam open pit mine, near Palembang in South Sumatra, produced only 120,000 to 130,000 tons in 1976, but will be expanded first to 800,000 tons per year and eventually to 2 million tons per year. Large-scale expansion at Bukit Asam must await approval of a $100 million World Bank loan; its planned markets would include the Baturaja cement plant, other industries in Palembang, the Muntok tin smelter, powerplants in Lampung Prov-

ince, and Cilincing on coastal Java. Another smaller mine is Ombilin (underground operation) near Padang in West Sumatra. These subbituminous coal mines can only provide coal for general use, and part of Ombilin's future output will go to Padang's Indarung cement plant.

Of far greater interest is the several-billion-ton deposit in Lampung Province of southern Sumatra, newly discovered by Shell Internationale Chemie Mijnbouw B.V. (the Netherlands). Shell completed a reconnaissance drilling program in mid-1976, and was planning to relinquish most of the contracted area granted for exploration. A production-sharing contract was signed with Batubara, with Shell committing over $1 billion. Future output would be related to export demand (mainly by Japan), and up to 25 million tons may eventually be produced annually, together with removal of several times that much in overburden. New railroads will have to be built, and port facilities need to be radically expanded.

Petroleum and Natural Gas.—Indonesia's oil production, which ranked 12th in the world in 1976, was up 15.4% from the 1,313,000 barrels per day (dividing by 7.348 will give the approximate equivalent in tons) in 1975. The bulk of this was exported as crude oil, which explains why Indonesia's refinery capacity is not particularly large. In 1976, Indonesia produced 550,319,000 barrels of crude oil, exported 449,226,000 barrels, and refined 113,698,000 barrels, of which it exported 36,255,000 barrels of refined oil products. Oil exports netted $6.0 billion in 1976, compared with $5.3 billion in 1975 and $5.2 billion in 1974. In 1976, 43% of Indonesia's crude oil exports went to Japan and 41% went to the United States. The radical price increase which occurred in 1973 had not been succeeded by any significant change by yearend 1976. (There was a price rise of nearly 6% on January 1, 1977.)

Near yearend 1976, P.T. Caltex Pacific Indonesia's share of national output was about 48%, down from 63% in 1975. Caltex's output did not show much change, whereas lesser companies made significant advances. Caltex produces low-sulfur Minas light crude, famed the world over. Caltex, with facilities mainly near the coast in Central Sumatra, produced 307 million barrels in 1976. Ranked next was Atlantic Richfield Indonesia Inc. (Arco) with 44 million barrels, followed by Independent Indonesian American Petroleum Co. (IIAPCO) with 34 million, Pertamina with 31 million, Total Indonesie with 29 million, Union Oil Company of Indonesia and Petromer Trend Corporation with 28 million each, Japex Indonesia Ltd. with 19 million, and P.T. Stanvac Indonesia with 13 million. During 1976, U.S. companies produced about 85% of Indonesia's oil.

An integrated oil company involved in exploration, production, marketing, and refining operations, Pertamina's influence goes far beyond the usual lines of oil enterprise, since this State-owned company is also the Indonesian Government's representative in all oil ventures, programs, and regulatory efforts. In addition, Pertamina was involved in projects related to airplanes, ships, hotels, office buildings, steel, and fertilizers. During 1976, the Government made considerable progress in managing Pertamina's debt, which initially ran up to more than $10 billion. Local currency obligations were substantially reduced and 12 tanker contracts were resolved. Pertamina continued to streamline operations in an effort to concentrate more exclusively on oil-related activities, and several changes in the board of directors were announced.

During 1976, the Government virtually scrapped its longstanding production-sharing contract system. Original contracts provided for a recovery of investments by operators from the first 40% of output. About 20% of production was turned over to refineries operated by Pertamina at just above cost. The remainder was split 65–35 (sometime less evenly), with additional excess profit tax imposed upon operator sales. The IRS ruled that Pertamina's share of oil was to be treated like a royalty, of which only half was deductible, rather than as a tax payment, which is fully deductible. This prompted the Indonesian Government to revise contract terms to make production-sharing oil value fully deductible as tax payments. New contracts were drawn up which in effect give the Government 88% to 89% of the take from foreign operators' production; companies were placed in 7-year and 14-year cost-recovery groups. The new contract system was an attempt to net more

income for Indonesia, but instead had the effect of slowing down exploration, which hit bottom at yearend 1976. In early 1977, the Indonesian Government was attempting to develop a formula of economic incentives to revitalize exploration drilling and attract new operators to the Indonesia arena. Pertamina was considering asking foreign oil firms to explore and develop certain Pertamina fields on a joint-venture basis.

Foreign contractors, along with Pertamina, completed 142 new exploratory wells, of which 43 succeeded in discovering new sources of oil and gas. Total exploratory footage drilled in 1976 was 748,000 feet, down 31% from the previous year. Development drilling footage was reported at 1,550,000 feet, also an appreciable drop. In 1976, companies spent $1.1 billion on the search for oil and gas, and the outlook for 1977 and early 1978 calls for this depressed level of activity to continue.[7] The country's oil reserves were estimated at about 10.5 billion barrels, and gas reserves at 24 trillion cubic feet. Field depletion in Indonesia, however, is generally more rapid than in some other areas, and to maintain growth more reserves will need to be tapped.

Caltex operates the giant Minas Field at 350,000 barrels per day and discovered some small fields near Minas recently. Stanvac, a longtime operator in Indonesia, reported no significant developments. Arco's four producing structures off the northwestern coast of Java, known as Ardjuna Fields, increased production to more than 100,000 barrels per day. A newcomer to East Kalimantan, Huffco increased output to 13,000 barrels per day from Badak and other fields. Badak has a potential capacity of 50,000 barrels per day of oil, and was trying to supply 550 million cubic feet per day of gas for an LNG plant. Petromer Trend had boosted production to 90,000 barrels per day from fields in the Vogelkop region of Irian Jaya. Of Petromer Trend's fields, Walio had the best potential. Mobil Oil Indonesia Inc., which discovered the huge Arun gasfield near the Sumatran coastal town of Lho Seumawe in 1971, was in the process of drilling 50 development wells, and expects to eventually produce 100,000 barrels per day from the Arun Field. A 1-billion-cubic-foot-per-day LNG plant was being jointly built by Mobil and Pertamina at Arun, for 1977 completion.

At yearend 1976, Indonesia's oil refining capacity stood at 528,000 barrels per day. Three refineries were in the 100,000- to 110,000-barrel-per-day range: Plaju in South Sumatra, Cilacap in Central Java, and Dumai in Central Sumatra. Three other refineries were in the 50,000- to 80,000-barrel-per-day range: Sungei Gerong in South Sumatra, Balikpapan in Kalimantan, and Sungaipakning in Central Sumatra.

The Mineral Industry of Iran

By Janice L. W. Jolly [1]

The mineral industry of Iran contributed approximately 42% to the 1976 gross national product (GNP) [2] of $54.6 billion[3] at current prices. Petroleum accounted for most of the mineral derived income, but other minerals, while contributing a comparatively lesser amount, nonetheless figured as important in the nation's economic progress. Coal, natural gas, and iron ore production figured significantly in the nation's efforts to develop a steel industry. Cement production could not keep pace with demands of domestic expansion. Iran was also producing nearly 2% of the world's production of lead and zinc and was important as a chromite producer in a world becoming increasingly more conscious of the uniqueness of chromite as a resource. Iranian turquoise and Persian red iron oxides used for pigments are world renowned.

Iran's fifth development plan (1973–78) called for a development investment of $70 billion, of which two-thirds was to come from the public sector. Total Government expenditures of $123 billion in real terms for the duration of the plan were to increase the GNP to $67 billion in 1978, or $1,860 per capita. Over $1.3 billion was to be spent on mining during the plan period. Government income from increasing petroleum exports was expected to finance the development. Industrial exports other than oil were expected to grow at 30% annually. Iran was entering into many joint projects with foreign firms and countries, involving billions of dollars in investments. These included new oil refineries and petrochemical plants, to effect a change from a producer of chiefly raw materials to one of finished products; steel and machine building industries; natural gas development; pipelines; liquefaction projects; and nuclear power projects. Mineral exploration and development was expanding. Recently, however, the strains of rapid growth had caused rising inflation (16% to 18% above that of 1975) and higher demand for skilled manpower. The economic slowdown that occurred throughout the world in 1975 and the resulting dropoff in Iran's oil revenues caused some realistic reappraisal of the speed with which some of the planned projects would be accomplished.

PRODUCTION AND TRADE

The estimated mineral production value for 1976 (based on average world prices) was $422 million excluding petroleum products, clays, and gem stones. Mineral production included cement ($206 million), zinc ($70 million), chromite ($28 million), coal ($27 million), lead ($21 million), iron ore ($20 million), gypsum ($15 million), barite ($3 million), and copper ($2 million). Crude petroleum production for 1976 was valued at approximately $22 billion.

The volume of crude petroleum produced for the year ending December 1976 increased 11% over that of 1975 to an average of 5.9 million barrels per day, but was still below the record production of 1974. Petroleum exports, including refinery

[1] Physical scientist, International Data and Analysis.

[2] All data for Iran calendar year beginning March 21 of year indicated and ending March 20 of following year.

[3] Where necessary, values have been converted from Iranian rials (Rls) to U.S. dollars at the rate of Rls70.62 = US$1.00.

products, for 1976 were valued at $22.8 billion compared with $18.5 billion for the year ending December 1975. Crude petroleum exports accounted for 96% of the total petroleum value exported in 1976. Petroleum exports formed 98% of the total value for all products exported. Record levels of production and exports were reached during the last quarter of 1976 as a result of stockpiling, and during November and December, Iran was producing at its full capacity of 6.7 million barrels per day. Iran had produced a total of 2,168 million barrels of crude oil in 1976.[4]

The Organization of Petroleum Exporting Countries (OPEC) held the price of crude oil at the same level through 1976 as agreed upon in Vienna, Austria, in September 1975. At that meeting, a 10% increase in crude prices was instituted. At the meeting in Bali in May 1976, OPEC failed to agree on a price increase, but at the December 1976 meeting held in Qatar, a 10.34% increase in crude oil prices (effective January 1, 1977) was agreed upon by 11 members. Saudi Arabia and the United Arab Emirates raised their prices 5% and a two-tier price system resulted. The posted price for Iranian crude oil was $12.50 per barrel for 34° API gravity crude and $12.36 per barrel for 31° API gravity crude through most of 1976. In February 1976, however, Iran was obliged to impose a reduction in price (to $11.40) for its heavy crude.[5] Another 5- to 7-cent-per-barrel cut was made in June. One-third or more of Iran's crude oil production was the heavy viscous variety. Demand for heavy crude was particularly slow during the recent worldwide economic slump when factories reduced operations. As a consequence, Iran's petroleum exports were depressed for some months. In an effort to step up its exports, Iran was seeking barter trade deals for oil. In anticipation of a fall in exports for the first quarter 1977, National Iranian Oil Co. (NIOC) was attempting to convince customers to continue to purchase at the high rates. There was a large gap between Arabian Light crude at $12.085 per barrel and Iranian Light crude at $12.81.

Over the past 3 years, Iran's leading suppliers have been the United States, West Germany, Japan, the United Kingdom, and France, in that order.[6] The slight drop in U.S. exports to Iran in 1976 was due in part to the overall contraction of the Iranian market. Similar drops in exports were experienced by Japan and the United Kingdom. On the other hand, West Germany and France reported increased sales to Iran in 1976 compared with those of 1975. Fried. Krupp GmbH, the German steel and engineering corporation in which Iran had acquired a 25.11% share[7] (Iran already owned 25.04% in Krupps steelmaking subsidiary), in 1976 was reported as considering a barter agreement whereby Iran would receive a $135 million copper refinery for 4.5 million tons of crude oil. Iran was also involved in discussions for financing a $3 billion steel complex to be built by Italsider S.p.A., the Italian State corporation, through an oil barter arrangement.[8]

COMMODITY REVIEW

METALS

Aluminum.—The U.S.S.R. reportedly signed an agreement to undertake feasibility studies on recovering alumina from Iran's extensive alunite deposits and possibly constructing an alumina plant using alunite. Iran's alunite deposits were estimated at 1 billion tons, according to the Iranian firm Barite Iran. The Soviet company Tsvetmetpromexport was considering plans for an alumina plant able to produce 500,000 tons annually with provisions to expand later to 1 million tons per year.[9] An investment of $600 million was expected. In addition to alumina, the plant would also be able to produce sulfuric acid and potassium.

Plans for expansion of the Arak aluminum plant had been approved by Iran's Industrial Development and Renovation Organization (IDRO). The first phase of the plant expansion was to be operational by March 1979; capacity was to be gradually increased until March 1981 when it was to reach 125,000 tons aluminum per year. The Arak plant capacity was 45,000 tons per year in 1976. The IDRO was also planning an aluminum beam plant and other industries using aluminum with the expected increased production.

Chromite.—Iran produced approximately 2% of the world's chromite with 210,116 tons of 46% to 48% Cr_2O_3 for the year March 21, 1975, to March 20, 1976. This represented nearly a 20% increase over the 1974 production. Chromite deposits are known to occur in seven areas in Iran, but only four of these, occurring in two belts of serpentinized ultrabasic rocks in northeastern and southern Iran, have been considered economic. The Iranian deposits have been described as a link between the Turkish and Balkan deposits and those of the Logar Valley in Afghanistan and Hindubagh in West Pakistan.[10] The chromite ore bodies formed as typical irregular lenses, pipes, beds, and masses, which pinch and swell, sometimes disappearing at depth and making prediction of reserves difficult.

In the northeast Forumad-Sabzawar District, the Gaft mine was the only operating mine in 1976, but two other small mines (Mirmamoud and Sarur mines) and many small occurrences (Sudkhar, Najmabad, Ziarat, Robatsfid, and Sirsar) were known.[11] The Iran Metals and Mining Co. operated the Gaft mine. Chromite in Iran was first discovered in the Forumad District in 1940. The chromite reserves of

[9] World Mining. Iran. V. 30, No. 1, January 1977, p. 57.

[11] Taghizadeh, N., and M.A. Mallakpour. Mineral Distribution Map of Iran. Geological Survey of Iran, Teheran, Iran, 1976.

this district were at one time estimated to be 1 million tons possible and 50,000 tons proved.[12]

In southern Iran, the Khajehiamali mine, located northwest of Neyriz, was a small operating mine in 1976. Somewhat further south and east, in the Esfandaqeh District, the Government-owned Abdasht and Bahborj mines were being operated by the Esfandaqeh Mining Co. of Iran. These mines are located about 60 miles southwest of Sabzavaran. The privately owned (Iran Chromite Co.) Shekhali mine is another small but nonoperating mine in the same area. Chromite deposits known in this area include the Solo, Shah Baqal, Chahdust, and Khash occurrences. Reserves of the Esfandaqeh concession were estimated at 200,000 tons proved, and 1 million tons possible.[13]

The largest producing district is the Fariab District located near Minah. Two large mines were being operated in 1976, the Amir and the Shahriar Shahin, by the Faryab Co. (Shahriar Industrial Group). The Shahriar Shahin mine was estimated to contain two-thirds of the ore in the area of active mines. Some 31 occurrences have been located both in this district and further to the east where several are located just south of the Jaz Murian Depression. The possible resources of this concession have been estimated as high as 50 million tons. More recently, total Iranian chromite reserves at producing mines examined in the year ending March 20, 1976, were estimated at 1,355,000 tons of 40% to 48% Cr_2O_3 proved and 1,850,000 tons probable.[14]

Copper.—Copper ore production at mines inspected by the Ministry of Mines and Industry in the year ending March 20, 1976, was 34,100 tons averaging 4.34% copper. Total mine output was nearly 4,000 tons copper metal. Thirteen operating mines with copper as a major product were indicated on the 1976 mineral distribution map of Iran by the Geological Survey.[15] Two copper mines, the Sunjun and Anjert, were located in a district northeast of Tabrīz and just south of the U.S.S.R. border. The Chizeh copper mine south of Rasht and the Baychebagh copper mine (lead, zinc, copper, molybdenum, bismuth) west of Mianeh have also had small production but were not shown as operating in 1976. The Dorvan (Sanj) mine, which has minor molybdenum minerals, was located just north of Teheran near Karaj. Producing mines east of Teheran included the following: The Chahmesi (minor lead and zinc) located west of Semnān; the Damanjala, Choghonder Sur North, and Choghonder South located west of Sabzevar; and the Taknar (zinc, copper with minor lead, gold and silver) and Dahanehsiah mines located south of Sabzevar. South of Teheran, the operating mine of Veshnoveh was located south of Qom. Also of interest west of Teheran was the Razan (Mazra'eh) copper, lead, and zinc mine which has had small production. In southern Iran, producing mines were located west of Yazd (Mazra'eh-e'Khut) and south of Birjand, where the Qal'eh Zari mine started production in 1975. The Qal'eh Zari was being mined by Minak Co., a Japanese (Toho Zinc Co., Ltd.) and Iranian joint venture. Deposits totaling about 60 million tons of copper and zinc (lead) ore at Chehelkareh near Zahedan were also being explored by Minak. Deposits under development included the Lachar (Meiduk) copper (gold, silver, molybdenum), Chahmesi (Meiduk) copper (zinc, lead), and Chahar Gonabad copper (silver, gold) deposits, all located in the vicinity of Kermān.

Development of Sarcheshmeh was running about 6 months behind schedule, but the initial metallurgical program, which involved only the construction of a smelter, was nearing completion.[16] Startup was expected in late 1977. The mine was controlled by the National Iranian Copper Industries Co. (NICIC) (changed from Sar Cheshmeh Copper Mining Co.), but operational management was under contract to The Anaconda Company of the United States. The Ralph M. Parsons Co. was undertaking design and construction of the processing plant and metallurgical complex. The West German corporation Fried. Krupp and the Mechim Co. of Belgium were expected to start soon on a 135,000-ton-per-year copper refinery.

Gold.—The Muteh gold mine located north of Iṣfahān and just west of Kashan

[16] Mining Magazine (London). Iranian Copper Mine Progress. V. 136, No. 4, April 1977, pp. 242–243.

was being developed for production by the Iranian Mining and Metal Smelting Co. (IMMSC). Mine operations were suspended in 1972. Reserves were estimated to be sufficient for a 10-year operation at the rate of 770 tons per year.[17]

Iron Ore.—Reserves at the Gol-e-Gowar iron ore deposit were estimated at 400 million tons with 60% iron and a comparatively low phosphate and sulfur content. Construction of the necessary infrastructure for the mine was in the planning stage. The nearest railroad at Zarand was several hundred kilometers north. Commercial exploitation of the deposit was expected to be at least 5 years away.

Total proved reserves of magnetite ore at Choghart were given as 170 million tons.[18] Total resources of iron ore in Iran were estimated to be about 1.2 billion tons.

Iron and Steel.—Of the seven steel projects planned, only three were expected to be producing by 1983.[19] These included the expansion of the Soviet-built Aryamehr steelworks, which is expected to have a total capacity of 1.9 million tons per year by 1983; a new steelmaking complex near Ahwaz, which is expected to have about 2.5 million tons capacity per year; and another steel complex outside Iṣfahān, planned for a capacity of 1 million tons per year. Lagging oil revenues were causing delays in project completions, and many development projects were being reconsidered. The construction of the steel-manufacturing complex near Bandar Abbas was being postponed.

A $40 million contract for three continuous casting machines for use at the Ahwaz steelworks was concluded between the National Iranian Steel Industries Corp. (NISIC) and Nippon Kokan K.K. (NKK) of Japan in 1976.[20] NKK was also to provide technical consultant services for equipment operation and personnel training. Upon completion in 1978, the Ahwaz steelworks was to have 1.5 million tons capacity of crude steel using natural gas and the Thyssen "Purofer" direct reduction process. Two other Japanese companies and Concast A.G. of Switzerland were also involved in the contract.

The direct reduction steel plant of the Shahryar Group at Ahwaz had a rated 400,000-ton yearly capacity with four electric furnaces and a rolling mill. Production was from scrap metal, and the rolling mill produced various structural steels and pipes. The NISIC was doing final studies and a survey on projects for gas-fired smelter complexes in Kangan and Bushire with 3 million tons per year capacity. A total of 10 direct reduction steel mills were planned.[21]

Lead and Zinc.—In 1976, there were 37 operating lead-zinc mines in Iran, 20 of which could be classified as medium to large in size.[22] In northwestern Iran, nine mines were operating: The Senjedeh, Shah Ali Baglu, and the large Angouran mine, west of Rasht; the Barikab and the larger Zehabad mine, west of Qazvin; and the Kalardasht, Pasqal'eh, and the larger mines Duna and Lak, near Teheran. In northeastern Iran, operating mines included those east of Semnān (Reshm and Zereshkuh) and south of Sabzevar (the medium-sized zinc-copper Taknar mine). In central Iran, seven mines were operating near Arak (Babqolleh, Khugan, Ashtian, and the larger Hoseinabad, Lakan, Ahangaran, and Ravandje mines). Also listed as operating were the medium-sized mines Anjireh, Tiran, Vijin, and Shahkuh near Iṣfahān; the Darrehzanjir and Mehrjerd mines near Yazd; and the Siah kuh and Feizabad mines near Ardekan. In east-central Iran, near Anarak, were the Gowd, Nakhaluk, Garmab, Seh changi and Naiband operating mines; and near Bafg were the Ahmadadbad, Kushk, Mehdiabad, Tajkun and Tars mines. There was only one mine operating in southern Iran south of Kermān. This was the Qanat Marvan mine of medium size.

Iran produced nearly 2% of the world's lead with about 35,000 tons of lead metal in 1976. The Ravandje mine, operated by the Société Générale des Minerais (SOGEMIRAN) was the largest lead producer with approximately 10% of the total production. The Ravandje mine also produced barite and zinc. The Angouran zinc-lead mine was the second largest lead producer, operated by the Chekate Shami Calcimen

Co., but owned by the Société Industrielle et Minière de l'Iran (SIMIRAN). It is primarily a zinc mine. The Nakhaluk lead mine, operated by the Government Iran Mining and Metallurgical Co. (IMMC), produced about 4% of the total lead production. Zinc production was estimated at 72,000 tons metal content in 1976 and was nearly 1% of the world zinc production. The Angouran (18%), Kushk (12%), and Shahkuh (7%) mines were the leading zinc producers. The Kushk mine was operated by the Bafg Mining Co. but was owned by SIMIRAN. The Shahkuh mine was operated by the Bama Mining Co. Estimated reserves at producing mines inspected in the year ending March 20, 1976, were given as 17.2 million tons proved reserves with an average lead content of 6.5% and zinc content of 8.6% and another 26.2 million tons probable reserves.[23] The Sormak Mining Co. operated several small lead (and manganese) mines, including the Ahangaran lead mine, in the Arak area.

Uranium.—Prospecting for uranium was continuing with U.S. and U.S.S.R. assistance. Contracts worth about $300 million for aerial radiometric surveys were made in 1976 with Frankla-Seismis of West Germany, a French company, and Austires of Australia. Areas near Anarak, Yazd, and the Elburz mountains continued to be of interest. From initial surveys in the 1960's joint Iranian-French exploration teams had considered the most promising areas to be the Elburz highland area and the Shemshak and Meygoun mountains.[24] Discoveries near Anarak and near Khawaja-Mared in Khorāsān Province were also of continuing interest. Uranium occurs as a minor element in the copper-nickel deposit at Talmesi north of Anarak.

Two big nuclear reactors were under construction in Iran, with completion expected in 1980. Iran was described as having the fourth largest nuclear development program in the world.[25] Iran has signed and ratified the Nuclear Non-Proliferation Treaty and accepted control by the International Atomic Energy Agency over nuclear installation and material within its sovereignty.

NONMETALS

Barite and Bentonite.—Magcobar Iran, a subsidiary of Dresser Magcobar Corp. of the United States and a joint venture with SIMIRAN, produced barite and bentonite for use in the petroleum industry. Established in 1962, the mines produced 230,000 tons of barite and about 50,000 tons of bentonite in 1976. Barite occurrences in Iran are mostly lode types in Oligocene-Miocene volcanic flows and tuffs.[26] Barite reserves were estimated at 1 million tons proved and 2.9 million tons probable.

Cement.—The volume of cement production reached 6.2 million tons in 1976, and 2 million tons were imported to satisfy domestic consumption. The Ministry of Industry and Mines announced that the production of cement would attain 9 million tons per year by the spring of 1978 and was to reach 19 million tons per year by 1980. An effort was being made to provide for domestic needs by constructing new plants and expanding existing ones. The Gorgan, Māzandarān, Kermānshāh, Behbehan, and Arya (Iṣfahān) cement plants were under construction with part of the Behbehan cement plant ready for use in 1977 and the rest ready for operation in 1978–79. The capacities of the cement factories at Sufian, Abyek, and Teheran were going to be doubled. In all there were plans under study to expand eight factories and to construct seven other plants in Zahedan, Yazd, Kashan, Sanandaj, Hamadan, Bandar Abbas, and Resz'ieh. Expansion of the Sufian cement plant would be completed in 1979 when capacity would be about 5,500 tons per day. Shares in the new factories were to be offered to the public. Fifty-one percent of the new factory shares were to be sold to the public; 12% of the share dividends were to be guaranteed initially for 3 years and thereafter, there would be a 15% guaranteed interest for 7 years.

Gem Stones.—*Turquoise.*—The turquoise mines near Nishapur were believed to be among the most ancient in the world; there were reports of turquoise from this area during the Achaemenid Empire (553–330 B.C.). In the 1940's, mining methods were somewhat modernized adding com-

pressors and cutting machines, raising the output of the principal mine to 1,000 kilograms of ore per month. There were two small turquoise mines in operation in 1976, which the Government had taken over in 1975. The value of production was estimated to total about $1.3 million. Approximately 70 tons of material was produced. The United States was a principal market for the stone.

Iron Oxide.—IMMC mines red iron oxide for pigment use and export from a deposit on Hormuz Island. Specular hematite iron ore and red ocher occur associated with many of the salt domes in the Persian Gulf region where rocks of the Cambrian Hormuz Series have been thrust up through Cretaceous and Tertiary formations. The ocher deposits located at the south end of Hormuz Island were formed by a process of enrichment during sedimentation in the conglomerates at the base of the Pliocene, and are a reconcentration of original material derived from ancient residual marine concentrations. Production in the year ending in March 20, 1976, was 5,783 tons. Proved reserves were estimated at 66,000 tons with another 165,000 tons probable.[27]

To combat the excessive soluble salt content and high mining costs, IMMC began a new project for upgrading the value of the mineral in 1974. A team of foreign specialists was engaged to implement the project. The new processing plant was to have a capacity of 5,000 tons annually. In the past, normally about 150 men were employed with daily production being about 150 tons. No work was done between July and September because of excessive heat.

Phosphate.—NIOC and the National Petrochemical Co. of Iran (NPCI) were surveying the large phosphate deposits reported as occurring in the foothills of the Elburz mountains near Shemshak, about 40 miles northeast of Teheran.[28] Prospecting of the folded Paleozoic sequence of the Elburz mountains began in 1964[29] when the black phosphate-rich Devonian horizon was originally located 30 miles north of Teheran. Here, the horizon in the Geirud Formation of Devonian age was up to 7.6 meters thick with phosphoritic sandstone containing over 20% P_2O_5 and a fairly consistent association of underlying and overlying beds of phosphatic shale and sandstone with lower (8% to 18%) P_2O_5 content. Prospecting was then extended beyond this region north and east of Teheran. The phosphate rock extends throughout the region and is dark gray with black phosphate pellets. The rock is essentially quartz and apatite with minor clay and some pyrite. The main phosphorite layer in the Elburz mountains was as much as 2 meters thick with values from 20% to 31% P_2O_5. In the area of the original discovery, 24 million tons of high (22.3%) P_2O_5 and 68 million tons of lower (11.4%) P_2O_5 were estimated. At Shemshak, the beds extend for 150 kilometers and are steeply dipping and extensively faulted.[30] Tentative reserves were given as 12 million tons of 22.5% P_2O_5 and 34 million tons of 11.4% P_2O_5.

Another deposit was also recently reported at Zagros. A marine phosphorite deposit at Zagros was initially reported in 1964 by the Iran Geological Survey as occurring in Eocene strata that extended over 500 kilometers along the eastern Zagros range. The phosphate horizon was part of the Pabdeh Formation, a marl and shale sequence on top of the Cretaceous disconformity. The phosphorite horizon was 10 to 40 meters thick in which rich phosphate layers (up to 28.3% P_2O_5) were up to 1 meter thick. The lenticular form of the deposits suggested that these would be uneconomic.

Potassium and Sodium Compounds.—In order to exploit the potassium contained in the brines of various lakes in Iran the brines of Urmiah Lake were investigated as early as 1959. Samples were also examined from Lakes Urmiah (also called Rezaiieh), Neyriz, and Maharlou and from brine springs located in Habib Abad. It was decided to exploit Urmiah Lake. The area of Urmiah Lake comprised 6,000 square kilometers. Its deepest point was 16 meters and it was estimated to contain 60 million tons of K_2O, promising to yield 50,000 tons to 100,000 tons K_2SO_4 yearly in addition to a large amount of sodium

chloride. Approximately 25,000 tons of sodium and potassium sulfates are produced yearly in Iran.

Iran's first soda ash plant was commissioned at Shiraz in 1973.[31] The plant was designed to produce 50,000 tons per year of soda ash (sodium carbonate) and 10,000 tons per year of sodium bicarbonate. The plant was designed and constructed with Romanian aid.

Salt.—Iran produced 650,000 to 700,000 tons per year of rock salt derived principally from salt domes located on the Hormuz and Quishm Islands, and from various lake brines. The Hormuz and Quishm Mining Corp., a company owned by IMMC, employed workers on Hormuz Island for mining salt, in addition to red oxide pigment. The salt is mostly used for domestic purposes, but up to 2,500 tons have also been exported yearly to Oman, Bahrain, and Egypt.

Silica Sand.—The main raw material for glassmaking and foundry sands in Iran is quartzite from mines located around Kazvin, Teheran, and Malayer. Kaolin may also be produced as a coproduct from these mines. The Foundry Sand Co., located at Firouzkooh, was a small specialized Government-owned mining operation. The mine here had a production capacity of 35 tons per hour of foundry sand. The mine's output was primarily used by State-owned metalworking complexes Machine Sazi Tabriz and Machine Sazi Arak, both of which are shareholders in the mine. Reserves of refractory sand were estimated at 520,000 tons and silica and quartz at 3.5 million tons in 1975.[32]

Sulfur.—The most workable deposits of sulfur occur in three main regions: (1) At the northern edge of the central desert (Dashte Kavir), (2) in the Persian Gulf area, and (3) inland, 400 to 500 kilometers from the Persian Gulf coast near Shiraz. The northern deposits occur as elemental sulfur disseminated in gypsiferous chalk and soft limestone of Miocene age. The sulfur mineralizations in the Persian Gulf are all related to the numerous salt domes of the area, in various forms as breccia cementing material at the contact of the salt domes and the younger Fars Formation. Some are formed around fumeroles and active sulfur springs. Native amorphous sulfur occurs in the soft friable Fars Formation of calcareous muds and marls near Shiraz. Approximately 20,000 tons of sulfur per year were produced from sulfur deposits. Another 400,000 tons was produced from other sources as a byproduct, principally by recovery operations at the Shahpur and Kharg chemical plants.

MINERAL FUELS

Coal.—Coal has been mined for many years in Iran for local uses, but in 1972, coal and coke production was significantly expanded to supply the new Iṣfahān steel mill, which began production in 1973. In 1975, the State-owned National Mining and Smelter Co., IMMC, and NISIC were all operating coal mines. Coal production was expected to reach 8 million tons per year by 1980. NISIC was the largest single producer of coal with collieries in Kermān, Elburz, Sanghroud, and Shahroud. IMMC was operating mines or was exploring for coal in areas east of Mashhad, north of Kermān, and north and northeast of Teheran. Coal washing facilities were operated near Zarand near Kermān and at Shahroud. Development of the Elburz, Shahroud, and Kermān coal deposits were a key objective in the fifth development plan.

Of the more than 30 coal deposits in Iran, which were estimated[33] to contain a possible 1.8 trillion tons (of which only a part are exploitable), the Kermān Province deposit has been the most thoroughly studied and has proved a good source of coking coal. Divided into five coal zones (classified as A, B, C, D, and E zones) of Lower to Middle Jurassic age, the Kermān deposits under development or producing were collectively estimated at greater than 380 million tons. The producing area of Shahroud in Semnān Province was estimated to have 150 million to 160 million tons. Major producing mines in Semnān Province included the Damghan mines and the Kalavi, Tarz, and Dehmolia deposits at Shahroud. Producers also included the Sanghroud mine in Gīlān Province and the IMMC Golbanu and Chesmegol mines east of Machhad in Khorāsān. In January 1975,

[31] Industrial Minerals (London). Iran. No. 70, July 1973, p. 39.

[33] Glazov, I. National Iranian Steel Co., V/O "Technoexport" U.S.S.R., Brief Information About the Kermān Coal Deposit. Unpublished report, February 1968, 7 pp.

discovery of large coal deposits estimated to consist of about 200 million tons were announced in the northeast, between Gonbad-Kabus and Shah Pasand (Mazandaran) and Bojnurd (Khorāsān).

Producing areas in the Kermān Province included Pabdana (68 million tons estimated reserves) and Badamu (20 million tons estimated reserves). Four new deposits were also under development in Kermān: The Darbidkun (50 million to 200 million tons reserves), Khamrud (40 million tons reserves), Sarapardeh (36 million tons reserves), and Assadabad (15 million tons reserves). The best coking coal occurs in the D (Dogger) zone of Middle Jurassic age in the Kermān deposits. Carbonizing properties of five coal samples were determined [34] from three zones within the Kermān deposit. Two samples ranked as medium-volatile bituminous coal and three as high-volatile bituminous coal. The ash content of all five samples was high, ranging from 9.6% to 26.2%. The sulfur content ranged from 1.0% to 4.1%, of which 76% was pyrite. The phosphorus content ranged from 0.007% to 0.031%. Compared with U.S. coals, the coke, tar, and light oil yields were lower and the gas yields (percentage basis) higher for the Iranian coal. The heating values of the gases from Iranian coals were lower than those of U.S. coals of similar rank. The coals of the Lower Jurassic (Lias) A, B, and C zones in the Kermān area were more highly metamorphosed and thus generally unsuitable for coking.[35] The Kermān deposits have complex geologic structure.

The Lower Jurassic (Lias) beds of the Elburz mountains also contain a variable quantity of coal seams intercalated with a thick series of shales and sandstones.[36] The Lias coal horizon in this area has been easy to mine where the beds outcrop along escarpments formed along the edges of synclinal basins. Within the basins themselves, however, commercial recovery of the large quantity of coal that is presumed to occur buried would be doubtful because of the deep mines that would be required.

In 1975, the coke plant at Iṣfahān used 770,000 tons of coal per year and produced 44,000 tons of metallurgical coke, 30,000 tons of coal tar, 4,700 tons of sulfuric acid, 4,500 tons of benzol, and 5,600 tons of aluminum sulfate.[37]

Natural Gas.—The natural gas share of local energy consumption in Iran was expected to reach 35% by 1987 from the 18% to 24% expected at the end of the fifth development plan in 1978. Iran was already conscious of the role it was to assume in the future as a principal gas provider to western Europe as evident in a paper presented by the National Iranian Gas Co. (NIGC) to the 13th World Gas Conference in 1976.[38] Iran's proved natural gas reserves were given as over 11,000 billion cubic meters by NIGC. NIOC had also confirmed in June 1976 the discovery of large natural gasfields near Bushehr, about 500 miles south of Teheran in the Persian Gulf. The field was being developed by a consortium of Iranian, Japanese, U.S. and Norwegian companies but was discovered several years ago by a joint Shell/Iranian venture. Shell pulled out and the consortium took over the company.[39] Several gasfields also have been discovered in cooperation with the European Group of Oil Co. (EGOCO) in the Kangan area. Companies in the EGOCO venture with NIOC include Entreprise de Recherches et d'Activités Pétrolières (ERAP), French, 32%; AGIP S.p.A., Italian, 28%; Hispanoil, Spanish, 20%; Petrofina Française, French, 15%; and Öesterreichische Mineralöelverwaltung AG (ÖEMV), Austrian, 5%.

Assuming completion of current projects, Iran was expected to have an export capacity of about 67 million cubic meters of gas per year by the mid-1980's. Iran had the second largest proved gas reserves in the world after the U.S.S.R. By yearend 1976, Czechoslovakia had signed an agreement joining West Germany, France, Austria, and the U.S.S.R. for Iranian natural gas to be delivered by the second Iranian gas trunkline (IGAT-II). IGAT-II pipeline was to be completed for scheduled deliveries to begin in 1981. Approximately 17 billion cubic meters per year were to

be delivered to these countries with a 3-year buildup. Local needs of about 10 billion cubic meters per year of gas were also to be transmitted by IGAT-II with an 8-year scheduled buildup. The cost of the IGAT-II pipeline project was estimated at $2.5 billion. Snam Progetti S.p.A. (Italy) and Sofregaz, a subsidiary of Gaz de France (France), were awarded the contract for detailed design and engineering for the 1,420-kilometer pipeline that was to extend from Shiraz and Iṣfahān in southern Iran to Astara on the Soviet frontier. NIGC was studying tenders for contracts for material procurement and handling, supervision and inspection, project management and construction.[40]

NIOC was planning construction of seven new plants (in addition to the six already in operation) which were to process a total of 4.7 billion cubic feet of natural gas per day. When completed these plants and additional facilities were to allow meeting the needs of the Iranian gas trunkline (IGAT) and the Iran, Japan Petrochemical Co. (IJPC) and NIOC natural gas liquids (NGL) refinery at Bandar Mah Shahr. In 1976, these needs were being met by the following plants: NGL 100, 200, and 300 at Agha Jari; NGL 400 and 500 at Marun; and NGL 600 at Ahwaz. Engineering design studies were nearly complete on the plants that were to be situated at Ahwaz (NGL 700 and 800) which were expected to be commissioned in the first half 1979. Plants NGL 900 and NGL 1000 in the Pazanan Field will process gas for injection into Gachsaran and Marun Fields. Site preparation was nearly complete for both plants. NGL 900 was to be commissioned in early 1978 and NGL 1000 was to be commissioned in early 1979. Both were to have a processing capacity of 1.5 billion cubic feet of gas and 45,000 barrels of liquids per day. Preliminary design work was being done for NGL plants 1200 (at Gachsaran), 1300 (at Bibi Hakimeh) and 1500 (at Karanj).[41]

An Italian consortium signed a contract with NIGC for the construction of a gas plant, which was expected to employ 1,000 workers including 30 Italians at Sarakhs. The Pars liquefied natural gas (LNG) project was reportedly canceled. Feasibility studies had shown that liquefaction facilities would have cost considerably more than earlier anticipated without corresponding increases in the value of gas in western markets. A Spanish company bought two-thirds of the 15% share held by International Systems and Controls in the Kangan Liquefied Gas Co. (Kalingas) LNG export project, in which Peoples Gas, Light & Coke Company of Chicago was taking over two-thirds of Chicago Bridge and Iran's 7.5% share inthe same venture.[42]

The Oil Service Co. of Iran (OSCO) was engaged in the implementation of a major gas-injection program in the Khūzestān area. Initial stages of this project were underway in the Asmari reservoir at Haft Kel. Gas for the project, some 400 million cubic feet per day, was to come from six wells in the Naft Safid Field through a new 24-inch line. Drilling of four injection wells at Haft Kel and construction of pipelines and gas-treating facilities was underway. Later the 24-inch line was to be extended to Paris Field where another injection project using Naft Safid gas was to begin in 1978. The Haft Kel project was regarded as a pilot scheme for similar injection programs in larger fields such as Gachsaran, Karanj, and Marun. It was estimated that the complete Khūzestān injection project would need 13 billion cubic feet per day of gas. Cost of the overall gas injection program was put at $2.5 billion.[43]

Petroleum.—*Exploration.*—Iran, through NIOC, has contractual agreements with a number of international companies. Agreements made under the 1974 contractual formula require payment of a cash bonus and spending of an agreed sum for exploration over a 5-year period. In event of commercial discovery, NIOC was to take over production and development operations. NIOC was to sell about 50% of the production to the exploration company at a discount of about 5% off market price, depending upon the agreement. An amount was allotted for exploration and development compensation, but no compensation was paid if no commercial property was discovered.

A 3-year agreement for joint research into oil exploration, production, and im-

proved recovery techniques was signed between NIOC and Shell Oil Iran.[44] Elf Iran has made two discoveries, one with Sofiran (a company involving the French State oil company, ERAP). Elf's offshore Sirri Field was expected to produce 150,000 barrels per day during 1977. Deminex, Total Iran, Ultramar Iran Oil Co., AGIP Iran, Hormog Petroleum Co. (Hopeco), Phillips Petroleum Company Iran, and Bushehr Petroleum Co. (Bushco) have all been operating under contract with NIOC. Exploration activity was highlighted by the following: Bushco was drilling offshore near Bushire; Hopeco was exploring offshore near Bandar Abbas, and Phillips, in the west district near Bandar Abbas; AGIP Iran was drilling onshore in the Lar area; Sofiran-EGOCO was continuing to drill in the Aghar-Khaura Districts; and Ultramar was exploring for oil near Bandar Lengeh and Deminex Iran in the Sabzpooshan Field near Shiraz.[45]

OSCO had 41 rigs in the field during 1976 drilling 125 wells including 14 exploration wells. The deepest hole drilled in southern Iran was the Agha-Jari No. 140 well which was 18,342 feet.

Production.—Crude petroleum production by the Société Irano Italienne de Pétroles (SIRIP), an AGIP Mineraria (50%) joint venture with NIOC, was about 16.6 million barrels in 1976. SIRIP held three producing petroleum concession blocks on the continental shelf of the Persian Gulf and three commercial blocks in a mainland area on the eastern slopes of central Zagros Mountains that were under development with production expected to begin in 1978. SIRIP was also undertaking major expansion of processing facilities.

Iran Pan American Oil Co. (IPAC) (Amoco Iran Oil Co. 50%, NIOC 50%) operated four oilfields in the Persian Gulf and produced 108 million barrels of crude in 1976. Darius Field produced at a rate of 100,000 barrels per day; Cyrus Field averaged 45,000 barrels per day; Fereidoon Field development was to eventually bring peak output to 150,000 barrels per day; and the Ardeshir Field was expected to reach full capacity at 200,000 barrels per day in 1978.

The Lavan Petroleum Co. (LAPCO) (Atlantic Richfield Co. 12½%, Murphy Oil Corp. 12½%, Sun Oil Co. 12½%, and Union Oil Co. 12½%) and NIOC joint venture held two commercial fields. In 1976, the LAPCO Sassan Field produced 55.7 million barrels. The Bahram Field was scheduled to start production in 1977 at about 45,000 barrels per day.

The Iranian Marine International Co. (IMINOCO), a 50–50 venture with NIOC that includes Phillips Petroleum (16⅔%), AGIP (16⅔%), and the Oil and Natural Gas Commission of India (16⅔%), produced 17.3 million barrels from the Rostam and Rakhsh Fields. Both fields need stimulation and a water injection project under way for Rakhsh Field was expected to boost capacity from about 35,000 barrels per day to 90,000 barrels per day. A third field, Alpha, was being evaluated.

Consortium members which now purchase most of Iran's oil are formally linked in a joint, London-based corporation, Iran Oil Participants Ltd., and they take Iranian oil in proportion to their equity in the group. The Royal Dutch/Shell Group accounts for 14%; Compagnie Française des Pétroles accounts for 6%; five major American oil producers—Exxon Corp., Standard Oil Co. of California, Mobil Oil Corp., Texaco, Inc., and Gulf Oil Corp.—account for 7% each; and British Petroleum Co. (BP) accounts for most of the rest. Various services are provided by the consortium in Iran under contract between NIOC and the consortium-owned concern, OSCO, which carries out production and exploration and other technical services in the southern areas where the consortium buys petroleum. Negotiations for a revision of the 1973 agreement under which the consortium buys most of Iran's oil was in progress. Approximately 5.4 million barrels per day came from the former Consortium Khūzestān Fields in 1976. The NIOC Naft-e-Shah produced a total of 6.7 million barrels for 1976.

NIOC completed a $60 million project to expand the loading capacity of the Azarpad steel jetty near Kharg Island in the Persian Gulf in early 1976. With the project completion, the loading capacity of the oil terminal has been doubled. Tankers of 500,000 and 300,000 tons each can be served at a time. It is possible to deliver 46,000 tons of crude oil per hour through

[44] Work cited in footnote 40.
[45] Oil and Gas Journal. NIOC Shapes Iran's Exploration, Production. V. 74, No. 33, Aug. 16, 1976, p. 93.

the pipes laid between the Kharg Island tank farm and the jetty.

Refineries.—Iran was predicting a need for a 100,000-barrel-per-day refinery every 2 years over the next 10 years to meet its expanding petroleum demand. By 1980, about $3 billion was expected to be invested in new refining facilities. Current refining capacity was about 736,000 barrels per day and was expected to reach about 981,000 barrels per day in 1977.

Work was progressing on the new refinery at Tabrīz where construction was started on June 12, 1975. It will have a capacity of 80,000 barrels per day or 4 million tons annually and is scheduled to start up in April 1977. It will have 14 interconnecting refining units. When completed, the northeastern province of Azarbaijan will almost cease to depend on products currently being supplied from Teheran refineries. The Tabrīz refinery will produce liquefied petroleum gas (LPG), gasoline, kerosine, gas oil, fuel oil, and asphalt. Before construction, a 380-mile pipeline was built from Teheran to Tabrīz. This line will be used to carry crude for the refinery with an ultimate throughput of 87,000 barrels per day.

Preliminary engineering and economic feasibility studies for the Iṣfahān refinery were completed by NIOC engineers, and a ground-breaking ceremony took place in December 1976.[46] The refinery was to have a capacity of 200,000 barrels per day, and was to be constructed by the Fluor Thyssen Joint Venture Co. It will consist of two independent plants, each with 100,000-barrel-per-day capacity. The first plant was scheduled for operation in early 1978 with the second following later in the year.

A new refinery to be situated close to the Ahwaz Fields with a 350,000-barrel-per-day capacity was in the preliminary design stage. Scheduled for startup by 1979, it was to produce both petroleum products and feedstock for adjacent petrochemical plants. Doubling the Shiraz refinery by 1978 was also under study. Now rated at 40,000 barrels per day, it was designed for maximum production of middle distillate. Debottlenecking of the Teheran refineries was also to be undertaken to raise capacity from 200,000 barrels per day to 225,000 barrels per day. At Lavan Island, a multipurpose topping plant was completed in 1976. The capacity of the Abadan Refinery was being boosted from 460,000 barrels per day to 600,000 barrels per day. A new 24-inch pipeline was to be laid from Ahwaz to Abadan to supply additional crude. The construction was expected to be complete by early 1977.

Iran was to enter into several joint petroleum refinery agreements during 1976. An agreement was concluded between Iran and Japan in November 1976 for building a new oil refinery in southern Iran. It was to be completed by 1983 and was initiated to meet growing Japanese petroleum product demands. In a joint venture arrangement with Senegal, the Iran-Senegal Petroleum Co. was also established to build and operate a 60,000-barrel-per-day refinery on a 50–50 partnership. A ground-breaking ceremony took place in November 1976 near Ounsan city in South Korea for the joint Iranian-Korean oil refinery. The 50–50 equity shares were to be owned by NIOC and Sang-Ung Oil Co. of South Korea.

Petrochemicals.—Five petrochemical development centers have been developed in the last 10 years at Abadan, Bandar Shahpur, Ahwaz, Kharg Island, and Shiraz. All are controlled by the National Petrochemical Co. of Iran (NPCI), a subsidiary of NIOC. The five areas produce over 800,000 tons per year of ammonia products, phosphatic and compound fertilizers, soda ash, and nitric acid. They also produce about 600,000 tons per year of sulfur, 60,000 tons per year of polyvinyl chloride, 12,000 tons per year of detergent alkylate, 16,000 tons per year of carbon black, and 30,000 tons per year of sodium tripolyphosphate. Plant expansions and construction in progress were to double the production capacity so that by mid-1979 or early 1980, $3 billion worth of new facilities would have been commissioned. Iran was expected to invest $1 billion annually in petrochemical development over the next 5 years.

A 50,000-ton-per-year mixed fertilizer unit and a 30,000-ton-per-year sodium tripolyphosphate unit were commissioned at the Iran Fertilizer Co. complex near Shiraz (wholly owned by NPCI), and a major expansion program was to add capacity for 1,200 tons per day of ammonia, 1,500 tons per day of urea, 750 tons per day

[46] Iran Oil Journal (Teheran). Construction of Iṣfahān Refinery. No. 191, Autumn 1976 and Winter 1977, pp. 2–3, 14.

of 30% ammonium nitrate, and 600 tons per day of nitric acid. The expansion would be complete in first half 1977. Further expansion to bring the polyvinyl chloride production to 120,000 tons per year at Abadan Petrochemical Co., Ltd.'s plant was under study. Expansion of Shahpur Chemical Co., Ltd.'s complex would add a capacity of 330,000 tons per year of ammonia, 465,000 tons per year of urea, 198,000 tons per year of monammonium phosphate, and 627,000 tons per year of sulfuric acid. It was planned to double the output of the Kharg Chemical Co., Ltd., a 50–50 venture between NPCI and Amoco. It currently recovers some 230,000 tons per year of sulfur and 300,000 tons per year of LPG from gas in offshore fields in the Gulf and from Kharg Island onshore production.

A second phase expansion at the Iran-Nippon Petrochemical Co., Ltd. (NPCI 50%, and Nissho Iwai Company Ltd. and Mitsubishi Chemical Industries Limited, 25% each) plant was to be for production of 2-ethylhexano as raw material for dioctyl phthalate. The first phase of the project was to come onstream in late 1976 or early 1977 and involved production of 23,800 tons per year of phthalic anhydride and 40,000 tons of dioctyl phthalate.

The largest project was the $1.8 billion petrochemical plant that was to start construction at Bandar Shahpur under a 50–50 joint venture agreement between NPCI and the Iran Chemical Development Co. (owned by five Japanese firms headed by Mitsui & Co. Ltd.). Completion was scheduled for early 1980 of the major olefin aromatic complex with three core units—olefins, aromatic and chlor-alkali—feeding 10 satellite processes.

The Mineral Industry of Iraq

By David E. Morse [1]

The mineral industry of Iraq continued to be dominated by the petroleum sector during 1976. Revenue from crude oil was the keystone of the country's economy. Oil revenue was used to balance the budget, to stabilize the currency, to maintain a positive trade balance, and to provide the funding for industrial and agricultural development projects.

Iraq was one of the major producers and exporters of oil in the Middle East, and was an active member of the Organization of Arab Petroleum Exporting Countries (OAPEC) and the Organization of Petroleum Exporting Countries (OPEC). OPEC price increases for petroleum have raised Iraq's gross national product (GNP) from $5.3 billion [2] in 1973 to an estimated $16 billion in 1976. Output from the oil sector, entirely Government owned, constituted about 60% of the GNP during the year.

In September, the Government issued Law No. 101 of 1976 organizing the Ministry of Oil, defining the Ministry's divisions and powers, and providing the general rules pertaining to the Ministry. Implementation of the new law began in mid-October when the Oil Minister reorganized the oil industry. Subordinate to the Ministry were the foreign relations and investment office, the collection planning department, the project studies department, and Iraq Petroleum Co. Ltd. Iraq Petroleum included four boards: The State Board for Marketing and Transporting Oil and Oil Products, the State Board for Prospecting and Drilling Oil and Gas Wells, the State Board for Extracting Oil and Gas in the Northern Region (to replace the Iraqi Company for Oil Operations), and the State Board for Extracting Oil and Gas in the Southern Region (to replace Iraq National Oil Company). Iraq Petroleum also had four components specializing in prospecting for oil and gas, drilling for oil and gas, marketing oil and oil products, and operating Iraqi oil tankers.

The new 5-year development plan (1976–80) was delayed, and the Government began reviewing the plan in April, placing a "hold" on most major development projects. Prior to review, the development plan was to commit $33.8 billion to economic development, with emphasis on the industrial and agricultural sectors. Revision was to be announced in early 1977, with a shift in priority to housing, education, transportation, and communications at the expense of industrial projects.

Iraq embarked on several civil engineering projects to increase and improve port facilities near the Persian Gulf, to control flooding of the Tigris and Euphrates Rivers, and to provide water for irrigation projects.

The Government awarded a $400 million contract to the Japanese Mitsubishi group for construction of a thermal powerplant near Al Qurnah, about 20 kilometers north of Basrah. The plant, to provide power to the Basrah area, is to have four 200-megawatt generators and be onstream in 1980. Hidrokradina of Yugoslavia received a $186 million contract to build a flood-control dam and hydroelectric complex on the Diyālá River east of Baghdad. The project is to be completed in 1981 and have two 40-megawatt hydroelectric stations. The Government planned to build a hydroelectric dam on the Tigris near

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Iraqi dinars (ID) to U.S. dollars at the rate of ID1=US$3.3778.

Mosul in the north with an eventual output of 600 megawatts.

In February 1976, Iraq and Saudi Arabia signed a final agreement for the demarcation of their border in the neutral zone. An interim agreement had been signed in 1975, and Pacific Aero Survey Co., Ltd., of Japan was hired to survey the border and provide detailed maps.

PRODUCTION

During 1976, crude oil production increased 1.7% to 112 million tons from 110.1 million tons in 1975. Total crude oil output for the year averaged slightly over 2.1 million barrels per day, but there were large monthly variations. January's output was about 1.9 million barrels per day. The yearly low of 1.44 million barrels per day in April was followed by a recovery to 2.4 million barrels per day in August and a record high monthly output of slightly over 3 million barrels per day in December. The variations in output had several causes. The loss of markets after Iraq nationalized Basrah Petroleum Co. Ltd. in December 1975 and the suspension of Mediterranean oil deliveries from the Kirkuk pipeline to Syria and Lebanon produced the early slump. Transport of Kirkuk oil through the newly completed (1975) strategic oil pipeline to Persian Gulf ports, expanded production capacity, and reestablishment of markets were responsible for the recovery and record output.

During the year, cement output remained stable at about 2.4 million tons, and sulfur production increased from 640,000 tons in 1975 to 675,000 tons in 1976. A small amount of phosphate rock was mined from the Akashat deposits near the Syrian border for chemical and physical testing.

Table 1.—Iraq: Production of mineral commodities

Commodity [1]		1974	1975	1976 [p]
Cement, hydraulic	thousand metric tons	[r e] 2,300	2,385	[e] 2,400
Gas, natural:				
Gross production	million cubic feet	329,237	368,648	468,553
Marketed [2]	do	41,989	58,410	74,408
Gypsum	thousand metric tons	[e] 150	156	[e] 160
Natural gas liquids:				
Natural gasoline	thousand 42-gallon barrels	[e] 925	955	[e] 960
Propane and butane [3]	do	[e] 2,200	2,249	[e] 2,300
Petroleum:				
Crude	do	[r] 719,269	825,521	881,621
Refinery products:				
Gasoline	do	4,412	4,501	5,549
Jet fuel	do	1,175	1,199	1,341
Kerosine	do	4,118	4,200	3,490
Distillate fuel oil	do	7,973	8,030	8,432
Residual fuel oil	do	5,278	5,383	8,568
Lubricants	do	353	360	372
Other	do	9,256	9,441	7,360
Refinery fuel and losses	do	2,017	2,057	2,130
Total	do	34,582	35,171	37,242
Salt [e]	thousand metric tons	60	60	70
Sulfur, elemental:

Byproduct [e]	do	[r] 50	[r] 40	65

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, lime and a variety of crude construction materials (clays, stone, and sand and gravel) are produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Includes reinjected, if any.

[3] Includes small quantities of propane and butane from refineries.

TRADE

During 1976, crude oil exports accounted for the bulk of Iraq's mineral exports. Petroleum exports were valued at $8,600 million, a 4% increase over that of 1975, representing about 97% of the total value of Iraqi exports. Petroleum exports decreased about 3.6% in quantity during the year, but Iraq received a price increase of nearly 7% per barrel. Sulfur was also an important mineral export, with large quantities shipped to India, the People's Republic of China, Tunisia, and Egypt. In January 1976, Iraq and Czechoslovakia signed a new trade exchange pact to provide Iraq with Czechoslovak products and to increase Iraqi exports of sulfur and other commodities.

The latest data available on trade is that for 1974, reported in the 1975 edition of this chapter.

COMMODITY REVIEW

METALS

Aluminum.—The 30,000-ton-per-year aluminum plant at An Nāṣirīyah, on the Al Furat River about 170 kilometers northwest of Basrah, was under construction in 1976. The plant is to process imported alumina and be in full operation in 1977.

Iron and Steel.—Creusot-Loire was constructing a $120 million iron and steel complex on Khor al Zubair near Umm Qaṣr south of Basrah. The plant is to have a 1.2-million-ton-per-year sponge iron output and auxiliary iron and steel facilities to produce steel beams, rods, pipes, and sheets.

NONMETALS

Cement.—During 1976, Iraq's installed cement plant capacity was about 3 million tons per year. Production was about 2.4 million tons during the year. Expansion of existing plants and construction of new plants continued, with total capacity to reach 7.2 million tons per year by 1978 and 9 million tons per year by 1980. The status of the 500,000-ton-per-year expansion of the Al-Samawa cement plant by a Soviet firm was not known, but completion had been expected in 1976. Construction was underway on a 2-million-ton-per-year plant at Al Kūfah, a 500,000-ton-per-year plant at Ḥammām al 'Alīl, and a 500,000-ton-per-year plant at El Mathna.

The Government and an unnamed foreign firm signed an $18 million contract for construction of a plant to produce concrete railroad ties. The plant was to be built at Baghdad and produce 500,000 reinforced concrete ties per year.

Fertilizer Materials.—*Nitrogen.*—The first stage of expansion of the Basrah chemical complex in southeastern Iraq was tested in September and came online in December, adding 200,000 tons per year of ammonia and 325,000 tons per year of urea to the existing capacity of 84,000 tons and 52,000 tons per year, respectively. The second stage of expansion was underway and was to add 500,000 tons per year of ammonia and 825,000 tons per year of urea when completed in late 1979. An 800,000-ton-per-year urea plant was under construction at Az Zubayr, about 15 kilometers south of Basrah. The plants were to use associated natural gas from the southern Rumaila oilfield as feedstock.

Phosphorus.—Iraq has taken the first steps in establishing a domestic phosphate industry. A $635 million contract was signed with Syndicate Belge d'Entreprises a l'Etranger (Sybetra) of Belgium in association with Union Minière S.A. of France to establish a phosphate mine at Akashat in western Iraq near the Syrian border and a phosphate beneficiation facility and fertilizer complex at Al Qā'im on the Euphrates River, 12 kilometers from the Syrian border. The Akashat mine is to produce 3.4 million tons per year of phosphate rock averaging 21% P_2O_5. Crude ore is to be shipped to Al Qā'im where water from the Euphrates is available for the beneficiation plant and fertilizer complex. The Industrial Equipment Div. of F.L. Smidth & Co. A/S of Denmark is to build the $50 million beneficiation plant. The components of the projected plant are 12 railroad discharge silos with two extraction feeders each; a circular 80,000-ton homogenization silo; a screening and

crushing plant with four vibrating screens and two crushers for crushing to 16 millimeters; a circular 28,000-ton silo for 16-millimeter crushed ore; two rotary kilns, 130 meters long, provided with planetary coolers and dedusting scrubbers; a slaking plant for dry slaking of calcined phosphate; two parallel washing lines, each containing a 1,600-kilowatt grinding mill and a centrifugal dewatering section; a thickener for wastes; and transport and storage facilities for the beneficiated product. The fertilizer complex is to have a 4,500-ton-per-day Parsons-process sulfuric acid plant that will use domestic sulfur. The sulfuric acid will be used to process Akashat phosphate rock to produce 400,000 tons per year of phosphoric acid (P_2O_5) for the production of granular triple superphosphate (600,000 tons per year), monoammonium phosphate (250,000 tons per year), and a variety of complex fertilizers (272,000 tons per year). Total fertilizer output is to be 1.1 million tons per year, and the project is to be operational in early 1980. In March 1976, the Government established General Phosphate Co. to manage the new Iraqi phosphate industry.

Stone.—*Marble.*—Iraq and an Italian firm were to develop facilities for production of block marble at Sulaymānīyah, southeast of Kirkuk, and Niawa, south of Mosul. The details of the projects were not publicized.

Sulfur.—The larger share of Iraq's 1976 sulfur production came from Misraq State Sulfur Co.'s operation, south of Mosul in north-central Iraq. Production came from a cavernous, bedded deposit, estimated to contain over 200 million tons of sulfur. Extraction was accomplished using a Polish modification of the Frasch process, and output for 1976 was about 610,000 tons. Sulfur was also produced at the natural gas processing plant at Kirkuk. Reliable figures on the 1976 output from Kirkuk were not available but were estimated at about 65,000 tons.

MINERAL FUELS

Natural Gas.—At the beginning of 1976, Iraq's proven reserves of natural gas were estimated at 27 trillion cubic feet. Iraq initiated studies to make greater use of the associated natural gas from crude oil production that has been mostly flared. Procon (Great Britain) Limited and two U.S. companies began a study on production and utilization of natural gas from central and northern fields. Natural gas from the Rumaila Field in the south was to be used as feedstock for fertilizer plants and as a source of energy for electric powerplants.

Petroleum.—The Government reported crude oil reserves in Iraq at 75 billion barrels, although industry sources estimated reserves at 34.3 billion barrels. Iraq's petroleum industry was actively engaged in exploration and development projects and in construction of pipelines and export facilities. An estimated 27 rigs were drilling for oil in Iraq during 1976, about one-third owned by the Government and the remainder by foreign companies.

New production wells at the Kirkuk oilfield complex, which included the Bāi Hassan and Jamba Fields in northeastern Iraq, expanded the capacity of the complex from 1.2 million barrels to 1.4 million barrels per day at a cost of $85 million. An additional $100 million was to be spent to increase the output of the Bāi Hassan and Jamba Fields from 70,000 barrels to 300,000 barrels per day. Initial production of 50,000 barrels per day from the Buzurgun and Abu Ghīrab Fields in southeastern Iraq, near the border of Iran, began late in the year. Further development to bring their output to 200,000 barrels per day included production from the new field at Fauqi in the same area. The fields were connected to Iraq's Persian Gulf export terminals by a 170-kilometer, 68-centimeter pipeline that was completed during 1976.

Petrobrás Internacional S/A (BRASPETRO), the foreign exploration arm of Brazil's Petróleo Brasileiro S/A (PETROBRAS), had an oil find at the 1 Manjoon wildcat well in its 3,050-square-mile service contract area in southern Iraq between Basrah and Buzurgun. The discovery flowed at 4,000 barrels per day, and the oil pool was estimated to contain 1 billion to 2 billion barrels of oil. Several other new oilfield discoveries had been indicated but detailed information was not available by yearend.

The 545-kilometer, 20-centimeter Baghdad-to-Basrah petroleum product pipeline was nearly completed during 1976 and was to be in full operation in early 1977.

Refinery production could be transferred in either direction depending on demand. Capacity of the line is to be 1.5 million tons per year. The 1,005-kilometer, 102-centimeter Kirkuk-to-Dörtyol (Turkey) crude oil pipeline was nearing completion during the year. The line is to be in service in 1977, with an initial throughput of 500,000 barrels per day, rising in intervals to 700,000 barrels per day by 1984. Turkey is to offtake 200,000 barrels per day from the line, and the remainder is to be shipped by tanker to European markets. Construction of a 122-centimeter crude oil pipeline from northern Rumaila to the Persian Gulf export terminals continued in 1976. Construction of a 35-kilometer, 122-centimeter natural gas pipeline from the southern Rumaila Field to Khor al Zubair commenced during the year. Nippon Kokan K.K. of Japan was the contractor for the natural gasline, and the $90 million contract included construction of dehydration and liquid separation facilities. The natural gasline is to transport about 2.4 million cubic meters of gas per day when completed in 1977.

The 655-kilometer north-south strategic oil pipeline from Al Ḥadīthah to Rumaila was used to export Kirkuk crude oil in January 1976. The reversible flow capability of the pipeline allowed Iraq the flexibility of delivering crude oil from the major producing centers, Kirkuk in the north and Rumaila in the south, to either Mediterranean or Persian Gulf export terminals.

Early in 1976, Iraq shut down the 1.4-million-barrel-per-day oil pipeline from Al Ḥadīthah to Syria and shifted Kirkuk exports to the deepwater port of Khor al-Maya in the Persian Gulf. Iraq and Syria failed to agree on transit fees to be paid by Iraq to Syria and on the cost of Iraqi crude oil that was blended with Syrian oil for use at Syrian refineries. After the shift, the cost of Kirkuk oil at Persian Gulf terminals was reported to be 5% lower than it had been at the Mediterranean ports of Banias, Syria, and Tripoli, Lebanon.

Iraq's oil-refining capacity was rated at 183,500 barrels per day, with the 71,000-barrel-per-day plant at Basrah and the 70,000-barrel-per-day plant at Daura near Baghdad making up most of the total. In February, Technoexport of Czechoslovakia received a contract to double the size of the Basrah refinery, but the terms of the contract and the expected completion date were not announced. A consortium of Thyssen Rheinstahl Technic of Düsseldorf, West Germany, and Lummus Company, a subsidiary of Combustion Engineering, Inc., of New York, received a $1.1 billion contract in February to construct a petrochemical complex near Basrah. The turnkey project, to be onstream in 1982, was to produce 60,000 tons per year of polyvinyl chloride, 45,000 tons per year of caustic soda, 60,000 tons per year of low-density polyethylene, 30,000 tons per year of high-density polyethylene, and 130,000 tons per year of ethylene.

The Mineral Industry of Ireland

By William F. Keyes [1]

In 1976, the Irish economy recovered from the recession experienced in 1975; by yearend, industrial output was slightly above that of the prerecession peak of March 1974. The index of industrial production increased from 280 in 1975 to 308 in 1976, but increases were unevenly distributed among the various sectors of the economy. In the mineral production sector, mine output of lead, zinc, copper, and peat, and refinery throughput of petroleum all declined, but there was a promise of significant growth in the mineral industry in the future.

During the year, exploration activity was intense, especially in the Navan, County Meath area, where two zinc mines were scheduled to start production, and in the Robertstown, County Kildare area. A decision was made by the Government to construct a zinc smelter, a manganese dioxide plant and a barite mine were started up, and a major offshore natural gasfield was being readied for production.

On March 1, 1976, stricter terms for prospecting licenses were introduced by the Ministry for Industry and Commerce. Fees, work commitments, and limitations on permissible expenditures and license renewals were instituted to prevent holding of claims for an excessive length of time. Other new legislation concerning ownership and exploitation of mineral deposits was under study by the Ministry, which resulted in a record-high level of exploration activity. Companies involved in exploration included Amax Explorations, Inc., Dresser Minerals International Inc., Preussag AG, New Jersey Zinc Company, Société Nationale des Pétrole d'Aquitaine, Canadian Superior Explorations Ltd., Péchiney Ugine Kuhlmann, Noranda Mines Ltd., Athlone Prospecting and Development Corp. Ltd. (United States Steel), Northgate, and Messina (Transvaal) Development Company Limited. Eleven new licenses for petroleum exploration offshore were awarded to 36 companies.

PRODUCTION

Ireland produced about 1% each of the world's lead and zinc in 1976. Copper production declined owing to the closing of one mine. Cement was domestically important, and barite production was modest, but expected to increase. For electricity generation, Ireland depended heavily on peat, which supplied over 25% of the country's energy.

The principal producers of minerals and metals in Ireland in 1976 are listed in the following tabulation:

[1] Supervisory physical scientist, International Data and Analysis.

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Barite	Magcobar Ltd., mine at Silvermines, Magnet Cove Barium Corp., United States	100
Cement	Cement Ltd., plants in Counties Heath and Limerick	100
Copper	Avoca Mine Ltd., mine at Arklow, Avoca Mine, Canada	90
Lead-zinc	Tara Mines Ltd., mine at Navan, Tara Exploration and Development Co., Ltd., Canada	(start 1977)
Do	Mogul of Ireland Ltd., mine at Silvermines, Kerr-Addison, Canada	60
Do	Irish Base Metals, mine at Tynagh, Northgate, Canada	40
Natural gas	Marathon Petroleum Ireland Ltd., offshore County Cork, Marathon Oil Company, United States	(start 1978)
Peat	Bord na Mona, various sites, Irish Government Peat Board	75
Petroleum products	Irish Refining Co. Ltd., refinery at Whitegate, near Cork, Irish Government	100

Table 1.—Ireland: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity [1]	1974	1975	1976 [p]
METALS			
Copper, mine output, metal content	12,701	9,856	4,064

Distillate fuel oil—do	[r] 3,228	4,476	3,812
Residual fuel oil—do	[r] 11,501	7,678	5,714
Other:			
Liquefied petroleum gas—do	[r] 456	470	278
Naphtha—do	[r] 366	312	162
Refinery fuel and losses—do	801	836	616
Total—do	[r] 21,762	18,872	14,270

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, substantial quantities of stone, sand, and gravel are produced by local authorities for such purposes as road maintenance, but statistics on output are not reported and available general information is inadequate to make reliable estimates of output levels.

[2] Excludes output by local authorities.

[3] Figures given as reported in source; includes granite, marble, silica rock, sand, calcspar, fire clay, and shale and clays for cement production, but excludes output of these materials by local authorities.

[4] Includes production by farmers and by Bord Na Mona.

[5] Includes milled peat used in the production of peat briquets, listed previously in this table.

TRADE

Because Ireland's small mineral industry is not diversified, most of the country's mineral products are imported. Petroleum products and iron and steel come from the United Kingdom, the nearest source, whereas crude petroleum has in the past come from the Middle East; this picture may change, however, when North Sea oil reaches export markets. Irish lead, zinc, and copper concentrates are presently smelted on the continent; this will change when the first Irish zinc smelter is to be built in the next few years.

COMMODITY REVIEW

METALS

Aluminum.—Construction of an 800,000-ton-per-year alumina plant was postponed by Alcan (Ireland) Ltd. The plant, which was to be located on Aughinish Island, County Limerick, in the Shannon estuary, had been under study for several years and was a joint venture of Alcan, Årdall og Sunndal Verk of Norway, and Gränges AB of Sweden. Postponement was attributed to the economic recession. Ireland has no indigenous bauxite production.

Copper.—In 1976, copper production continued to decline, totaling about 4,000 tons compared with 9,800 tons in 1975 and 13,000 tons in 1974. The decrease was caused largely by the closing of the Gortdrum mine in 1975. Most of the 1976 production came from the Avoca mine, south of Dublin, a marginal producer operated by Avoca Mines (Ireland) Ltd.; a small amount of copper was produced by the Tynagh lead-zinc mine of Irish Base Metals.

Lead-Zinc.—Three mining companies were active in the Navan area of County Meath, northwest of Dublin. At midyear, Sabina Industries of Canada reported that diamond drilling had indicated 1.3 million tons of ore grading 7.6% combined lead and zinc at its Rennicks and Bennett property. Later, a second ore body of somewhat lower grade was identified by Sabina and drilling continued. Exploration was being

conducted by Messina (Transvaal) Development Company Limited of the Republic of South Africa, which would take 47.5% of the property after an initial expenditure of about $500,000[2] on exploration and after making a feasibility study.

Bula Ltd., second of the mining companies in the Navan area, reported that exploration conducted on its behalf by Canadian Bechtel Corp. had resulted in the discovery of an estimated 13.5 million tons of ore averaging about 9.2% combined lead and zinc at Nevinstown, 1.5 miles northwest of Navan. Earlier reports estimated the deposit to be 22 million tons. A planning application was lodged with the Meath County Council to mine the deposit at a rate of 1.1 million tons of ore per year, producing 70,000 tons per year of combined metals. Approximately 40% of the ore body was to be extracted by open pit methods. Mining and milling were to be conventional, and capital cost was estimated at almost $50 million. Construction was to start in early 1977 and first production was expected in late 1978. Bula was controlled by Irish interests, with unspecified foreign backing. A 25% equity was granted to the Irish Government gratis, and an additional 24% was to be purchased by the Government for a sum to be arbitrated.

The largest mine in the Navan area, controlled by Tara Exploration and Development Co. Ltd., a Canadian firm, and operated by Tara Mines Ltd., continued to be developed on schedule; initial production was expected early in 1977. Final financial arrangements for the project were made as follows: About Can$100 million was to be provided by a consortium of Irish and Canadian banks; an additional Can$30 million was to come from the Export Development Corp. of Canada; and the remaining Can$150 million, plus a Can$15 million contingency fund, was to be equity capital. The four main groups participating in Tara Exploration reportedly were Cominco Ltd. (17.4%), Noranda (19.9%), and Northgate Exploration (10%), all of Canada, and Charter Consolidated Ltd. (10.8%) of the United Kingdom.

The Irish Industrial Development Authority (IDA) invited 40 firms to discuss proposals for a zinc smelter that would process concentrates from the Tara and Bula mines and produce 100,000 to 150,000 tons of zinc per year. In early 1977, the IDA selected the New Jersey Zinc Co. to make a 6-month feasibility study; the company was expected to be the operator and major shareholder. If construction begins in late 1978 as expected, the project could be completed by 1982.

During 1976, lead and zinc were produced in Ireland by the Tynagh mine of Irish Base Metals, County Galway, and by the Silvermines Ltd., mine in Tipperary, controlled by Mogul of Ireland Ltd.

Manganese.—A plant to produce electrolytic manganese dioxide was opened at midyear by Mitsui Denman (Ireland) Ltd. on a 28-acre site on Little Island, east of the city of Cork. The plant had a production capacity of 12,000 tons per year and represented an investment of about $25 million.

NONMETALS

Barite.—The Benbulbin mine in County Sligo was reopened by Sligo Bay Barites Co. Ltd., a subsidiary of Halliburton Company (Imco Inc.) of Dallas, Tex., with a planned production of 50,000 tons per year. In addition Milchem Minerals Ltd. increased production from tailings of the Tynagh mine. The bulk of production, however, continued to come from the Magcobar (Ireland) Ltd. mine at Silvermines, Tipperary.

Fertilizer Materials.—A $17 million loan was made by the European Investment Bank, an agency of the European Economic Commission, to Nitrigin Eireann Teoranta, owned by the Irish Government, for the construction of an ammonia-and-urea complex at Marino Point on Great Island in the harbor of Cork. Total fixed investment was estimated at about $110 million, and natural gas from the Kinsale Head Field will be used to fuel the complex.

MINERAL FUELS

Energy.—Production of indigenous energy was confined to peat, which decreased seasonally in 1976, plus a minor amount of semibituminous coal and hydroelectric power. Almost all remaining energy came from imported petroleum, processed in the one refinery, at Whitegate, Cork

[2] Where necessary, values have been converted from the Irish pound (£) to U.S. dollars at the rate of 1£=US$1.72.

Table 4.—Ireland: Supply and apparent consumption of fuels and power for 1974 and 1975

(Million tons of standard coal equivalent [1])

	Total energy	Coal, coke and peat	Petroleum and refinery products	Hydro-electric power
1974:				
Production	2.1	2.0	--	0.1
Imports	9.4	.9	8.5	XX
Exports	1.1	.1	1.0	XX
Apparent consumption	10.4	2.8	[2] 7.5	.1
1975:				
Production	3.5	3.4	--	.1
Imports	8.9	.7	8.2	XX
Exports	.8	.1	.7	XX
Apparent consumption	11.6	4.0	[2] 7.5	.1

XX Not applicable.
[1] 1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories.

Source: 1974: United Nations. World Energy Supplies, 1950–74. Statistical Papers, Ser. J, No. 19, 1976. 1975: Organization for Economic Cooperation and Development. Energy Statistics, 1973–1975.

harbor, and from imported petroleum products. The Kinsale Head gasfield, offshore from the south coast, was expected to make a contribution starting in April 1979. A gross energy balance is given in table 4, based on consumption of all energy materials, whether used for that purpose or not.

Natural Gas.—Progress continued on bringing the Kinsale Head gasfield of Marathon Ireland into production, with a target date of April 1979 for first deliveries. Six offshore wells were drilled elsewhere in the Celtic Sea, south of Ireland, during 1976 but all were negative; dry wells drilled there totaled 29 by yearend. Some 11 concessions totaling 3,000 square miles were awarded to 36 companies in the Atlantic, west of Ireland, during the year; these brought the area under contract offshore to about 20,000 square miles, mostly in the Celtic Sea.

Petroleum.—Offshore petroleum licensing terms, revised in 1975, included the following provisions: The state may participate on an equity basis up to 50%; royalties range from 8% at a production rate of less than 40,000 barrels per day to 16% for 350,000 barrels per day; licenses are valid for 6 years (9 years for depths of more than 600 feet), renegotiable 5 years after initial production; the minimum exploration program requires drilling one well per block during the first 3 years; licenseholder may be required to train a reasonable number of people; rate of development must be approved by the Minister of Industry and Commerce; all production must be landed in Ireland; activities must be conducted from an Irish base; and exploration expenditures are chargeable against profits in the year they are incurred.

Uranium.—A subsidiary of Péchiney Ugine Kuhlmann commenced exploration in the granitic area of southwest Ireland. The European Economic Commission in 1976 established funds to finance exploration for uranium in the European Economic Community countries. About £314,000 ($540,000) was earmarked for exploration in Ireland.

The Mineral Industry of Israel

By David E. Morse [1]

Exploitation of Israel's modest natural resources in 1976 involved the processing of Dead Sea brine to produce potash, bromine, magnesium oxide, and industrial and table salts and the mining of phosphate rock, glass sand, clay minerals, copper ore, building stone, sand, and gravel. The output of the mineral industry furnished the base for Israel's ceramic and nonmetallic chemical industries. During 1976, mineral production declined because of the low world demand for fertilizer materials and the closing of the Timna copper mine on March 31. Geophysical exploration for oil increased significantly above the 1975 level and exploration drilling intensity was unchanged, but no important oil discoveries were reported in Israel during 1976.

Israel's economic growth continued to be sluggish in 1976. The real gross national product (GNP) increased 1.4% to $12 billion[2] after an increase of 0.4% in 1975. An encouraging aspect of the economy was the nearly $800 million drop in the balance of trade deficit. Government subsidy cuts and higher rates for Government services increased consumer costs during 1976. The unemployment rate rose from 3.1% in 1975 to 3.5% in 1976, although industrial employment increased by 6,000 to 298,000.

Starting in June 1975, the Government instituted a system of creeping devaluations of the Israeli pound (I£) with monthly devaluations of up to 2%. The pound was devaluated from I£7.10=US$1.00 to I£7.97=US$1.00 during the first half of 1976. The Government decided that, beginning July 19, 1976, the Israeli pound would be pegged to a basket of five currencies instead of to the U.S. dollar only. The five currencies and their initial basket rates were as follows: U.S. dollar 35%, pound sterling 23%, Deutsche mark 20%, French franc 14%, and Netherlands guilder 8%.

Israel had one of the most modern road systems in the Middle East, but had neglected its rail transport system. Expansion of the railroads was underway in 1976, with the line from Oron to the new phosphate mine at Hor Hahar nearly finished. Planned construction of a rail link from Oran to Eilat on the Gulf of Aqaba with a branch line to Sedom on the Dead Sea would require about $50 million for its expected 1983 completion.

Ninety-eight percent of Israel's known fresh water resources were being exploited in 1976, and desalinization of seawater was required to obtain fresh water for industrial and agricultural growth. Israel began intensive desalinization research in 1964 and had success with vapor-compression units, multiple-effect plants, and multiple-effect flash distilling plants. The 1-million-gallon-per-day plant that began operation at Eilat in 1974 was the largest built in Israel through 1976. Five similar multiple-effect flash distilling units were under construction in Israel in 1976. In 1975, an agreement was signed between Israel and the United States for the construction of a 10-million-gallon-per-day desalinization plant at Ashdod. Included in the project was a dual-purpose thermal powerplant to supply the electricity as well as the energy needed in the desalinization process. Israel would supply $35 million and the United States would assist with a $20 million loan for the project. A 100-million-gallon-per-day plant, to be powered by a dual-purpose nuclear reactor, was to be in operation by 1988.

[2] Where necessary, values have been converted from Israeli pounds (I£) to U.S. dollars at the rate of I£8.05=US$1.00.

PRODUCTION

Although Israel's 1976 industrial output increased 4%, the contribution from mining and quarrying decreased more than 25% to 1.7% of the total industrial output. The sales of potash fell 35% and crude phosphate rock output fell nearly 30%. Copper operations were terminated at the end of March. Cement, dimension and crushed stone, gypsum, iron and steel, sand, gravel, and petroleum refinery production levels were on a par with 1975 output. Bromine, flint clay, and magnesium oxide outputs increased in tonnage over those of 1975.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, Israel reportedly has the capacity to produce 71 metric tons of U_3O_8 per year, but official data are not reported and available information is inadequate to make reliable estimates of output levels.

[2] Israeli control relinquished in November 1975.

TRADE

Polished diamond exports, the country's biggest single foreign exchange earner, were valued at $711.8 million. The 1976 sales were the diamond industry's largest to date and increased almost 30% over those of 1975. Total carat sales increased 22% from 2.7 million in 1975 to 3.3 million in 1976. The diamond industry employed 20,000 workers and planned to add 4,000 more because sales were expected to increase to $1 billion per year by 1980. Major importers of polished gem diamonds from Israel in 1976 were, in order of importance, the United States, Hong Kong, the Netherlands, Japan, Belgium, Switzerland, and the Federal Republic of Germany.

Mining and quarrying accounted for 3.0% of total industrial exports in 1976, a 40% decrease from the 5.2% in 1975. The decrease was attributed to declines in exports of phosphates and potash because of the decreased world demand for fertilizers and to the closing of the Timna copper complex. The import value of fuels increased 7.7% over the 1975 value because of greater dependence on foreign crude oil. About 50% of Israel's crude petroleum requirements had previously been supplied by the Abu Rodeis Field in the southwest Sinai. This Field was relinquished at the end of November 1975.

[e] Estimate. [r] Revised. NA Not available.

[1] Data provided for 1974 and 1975 may be incomplete. The figures presented, unless otherwise specified, are the sum of listed detail for all countries for which a quantity figure is provided in official Israeli trade returns; additional quantities may have been exported to other countries for which only a value figure is provided. In some cases, where it is clear that a significant portion was exported for which no quantity figure was provided, the value figure has been provided in a footnote.

[2] Totals exclude quantities valued at $933,000 in 1974 and $1,452,000 in 1975.

[3] Totals exclude quantities valued at $231,000 in 1974 and $140,000 in 1975.

[4] Totals exclude quantities valued at $346,000 in 1974 and $461,000 in 1975.

[5] Totals exclude quantities valued at $16,000 in 1974 and $130,000 in 1975.

[6] Totals exclude quantities valued at $1,800,000 in 1974 and $13,639,000 in 1975.

[7] Totals exclude quantities valued at $949,000 in 1974 and $5,000 in 1975.

[8] Elemental bromine is included with chlorine, fluorine and iodine, and is reported in this grouping under "Other nonmetals" in this table.

[9] Totals exclude quantities valued at $1,000 in 1974 and $790,000 in 1975.

[10] Totals exclude quantities valued at $419,000 in 1974 and $322,000 in 1975.

[11] Total excludes quantity valued at $542,000.

[12] Totals exclude quantities valued at $28,000 in 1974 and $837,000 in 1975.

[13] Quantity not available but valued at $2,880,000 in 1974.

COMMODITY REVIEW

METALS

Copper.—The Timna mining complex, located about 20 kilometers north of Eilat in southern Israel, was closed at the end of March 1976 because the operation was not economically viable at the then-current price of copper. Since Timna opened in 1959, about 150,000 tons of copper cement (80% copper content) was exported for a return of $140 million. About 14 million tons of copper ore had been extracted, and remaining reserves are estimated at 14 million tons containing 1.1% to 1.3% copper. A staff of 50 was retained for maintenance of the mine and equipment. The Government planned to reopen the mine when the price of copper makes the operation economically favorable.

Magnesium.—Dead Sea Periclase Ltd. manufactured periclase (high-purity magnesium oxide (MgO)) from Dead Sea Works Ltd.'s (DSW) residual brines. The brines, after potash and bromine extraction, were pumped by pipeline to the MgO plant on the Rotem Plain above the Dead Sea. Improvements to the kilns during 1976 increased the MgO output 25% to about 25,000 tons. Magnesium oxide is primarily used in the manufacture of high-temperature refractory bricks. Nearly 54,000 tons of hydrochloric acid was produced as a byproduct and shipped to the adjacent phosphoric acid plant operated by Arad Chemical Industries Ltd.

NONMETALS

Bromine.—Dead Sea Bromine Ltd., a subsidiary of DSW, used the residual brines from potash extraction at the adjacent DSW plant to produce liquid bromine. The brines contained 10 to 12 grams of bromine per liter compared with the natural concentration of 4.6 grams per liter in the Dead Sea. Bromine gas was liberated by heating the brines in a chlorine atmosphere. The bromine gas was condensed, collected, and shipped by truck in lead-lined 14-ton tanks. Dead Sea Bromine's 1976 output was about 21,000 tons of bromine and 4,700 tons of ethylene dibromide. Expansion at the facility was underway in 1976 to raise the capacity from 22,000 to 55,000 tons per year by yearend 1978 and included the construction of a 33,000-ton-per-year electrolysis plant for chlorine production. A portion of the 1976 bromine production was shipped to a sister company, Bromine Compounds Ltd. at Be'er Sheva, for the manufacture of ethylbromide, sodium bromide, potassium bromide, and ammonium bromide for industrial uses. Bromine Compounds planned to begin production in a new plant south of Be'er Sheva by 1978. The new plant was designed to process 20,000 tons of raw bromine per year.

Cement.—Most of Israel's demand for cement in 1976 was met by Nesher Cement Ltd., the country's only producer. Output from Nesher's plants at Haifa, Ramale, and Bet Shemesh was over 2 million tons, an 8% decrease from that of 1975.

Clays and Sand.—Israel's requirements for industrial sand and clays were supplied by Negev Ceramics Ltd. Nearly-pure quartz sand and various clays for the glass and ceramic industries were mined from the Great Crater near Yeruham. Flint clays for refractories were mined and processed in the Ramon Crater. Both mining areas are located in the northern Negev Desert.

Fertilizer Materials.—*Phosphorus.*—Israel's phosphate reserves in the Negev were estimated to exceed 300 million tons in over 20 deposits. Negev Phosphates Ltd. (NPL) operated the Oran and Little Crater mines at reduced output during the year. NPL began development work at the new phosphate mine, Hor Hahar, in the Zin Valley and started construction on the beneficiation plant. Mining operations were to begin in 1978 and reach full production of 1 million tons per year by 1980. When the Hor Hahar mine reaches full output, Israel's crude phosphate capacity will be about 3 million tons per year.

Arad Chemical Industries Ltd., a subsidiary of Negev Phosphate, operated a phosphoric acid plant on the Rotem Plain and a phosphate mine nearby at Mishor Rotem in 1976. Arad processed phosphate rock with hydrochloric acid to produce phosphoric acid. Hydrochloric acid was manufactured at the plant by processing residual brines pumped from the DSW plant at Sedom in fluidized-bed reactors. Technical difficulties in the reactors had not been overcome and they were secured late in the year. The company continued to produce phosphoric acid by using the

hydrochloric acid output of the adjacent MgO plant.

Potassium.—Israel's source of potassium is the natural 1% concentration of potassium chloride (KCl) in the water of the Dead Sea. DSW concentrated the KCl by solar evaporation of the water in an extensive system of diked ponds. The hydrated double salt carnalite ($KCl \cdot MgCl_2 \cdot 6H_2O$) formed on the bottom of the ponds, and a slurry of brine and carnalite was harvested by dredgers and pumped to the extraction plant. The KCl concentration of the slurry was about 22%. KCl was recovered using a reverse brine flow process to remove magnesium chloride ($MgCl_2$) and a hot-leach process to separate KCl from sodium chloride. In 1976, DSW also produced potassium sulfate, potassium nitrate, table salt, magnesium chloride, and various brines. DSW's sales during 1976 fell about 35% because of low world fertilizer demand. Extension of the pond system was underway in 1976 to increase the annual production capacity to 1.5 million tons of KCl. DSW also planned to increase output of table salt from 20,000 to 50,000 tons per year.

In 1976, Haifa Chemicals Ltd. produced fertilizer-grade and technical-grade potassium nitrate at its plants in Haifa. Fertilizer grade (NPK–13–0–46) was used for applying chlorine-free potash, and technical grade (99.9% pure) was used by the ceramic, explosives, and printing industries. Haifa Chemicals commissioned its second 110,000-ton-per-year plant late in the year. The original 110,000-ton-per-year plant had been extensively damaged by fire in June; repairs were expected to be completed by mid-1977. Over 90% of Haifa's 1976 potassium nitrate output, manufactured from domestic raw materials, was exported.

MINERAL FUELS

Energy.—In 1976, Israel's 12 thermal powerplants had a generating capacity of nearly 1,800 megawatts and were located along the Mediterranean coastal plain. During the year, Israel invested over $5 million in research and development of domestic nonpetroleum energy sources. Areas under investigation included exploitation of Israel's oil shale and peat resources, increased use of solar energy, and exploitation of the hydroelectric potential from the Mediterranean Sea to the Dead Sea. Nearly $500,000 was to be spent to determine if there was economic justification for constructing a tunnel to carry water from the Mediterranean Sea to ponding areas near the Dead Sea for the production of electricity. Probable incorporation in this project would be the use of the water to cool a dual-purpose nuclear powerplant and desalinization plant.

Coal.—The Government authorized the construction of a coal-fired powerplant at Hadera near the central Mediterranean coast. The powerplant would have four 300-megawatt units and would require over 3 million tons of imported coal per year for operation. To reduce coal importation, surveys were initiated on domestic coal deposits and on the abandoned coal mine at Jebel Mghara in northwest Sinai. It was estimated that reserves at the mine were over 35 million tons of coal. The Government had not made a decision concerning mining operations at Jebel Mghara in 1976.

Petroleum.—After relinquishing control of the Sinai oilfield in November 1975, Israel became highly dependent on outside sources for crude oil. Oil production from Israel's only oilfield, the 20-year-old Helez Field, was under 700 barrels per day and supplied less than 1% of the total crude oil demand. An intensive exploration effort was planned to determine the extent of Israel's oil resources and to reduce dependence on imports. Extensive geophysical exploration was planned for areas along the Mediterranean coastal plain and shelf, the southern end of the Dead Sea, and the northern Negev. Exploratory drilling was to include 10 to 15 wells per year onshore and 4 or more per year offshore.

At the beginning of 1976, the Paz Oil Co. Ltd. held permits for 375 square miles along Israel's west coast and 50 square miles southwest of the Dead Sea. Oil Exploration Ltd. held permits for a 135-square-mile area near the west Negev and a 95-square-mile area in the Dead Sea. By mid-1976, approximately 25 leases had been awarded to local and foreign companies in areas that included most of Israel's Mediterranean continental shelf.

The general level of geophysical exploration increased during the year, although the number of exploratory wells drilled was comparable with that of 1975. No important oil discoveries were made during

the year; however, the Ashdod–2 well, drilled near the Mediterraean coast, had a show of oil. Ashdod–3 was drilled nearby in an eflort to find an oil reservoir, but without positive results. A fourth well was planned for the same general area. Exploratory wells were also drilled in the Dead Sea, at Caesarea, and near Aṭ Ṭūr in the southwest Sinai. The Government leased a drill ship for offshore exploration drilling near yearend. Drilling operations were to be conducted on the Mediterranean shelf by the United Kingdom contractor under the direction of the Israeli National Oil Co.

Israel's petroleum refining capacity in 1976 was 10 million tons per year (6.5 million at Haifa and 3.5 million at Ashdod). An additional 3.5-million-ton-per-year unit under construction at Haifa was scheduled to be completed in early 1978. The 1976 refinery input was about 7.3 million tons, which was approximately the same as the 1975 input.

The Mineral Industry of Italy

By Roman V. Sondermayer [1]

Despite lingering economic problems, 1976 was a year of recovery for the Italian mineral industry. According to published indicators, the index of mining activity showed an increase of about 4% when compared with 1975. However, this increase in mining output was not followed by a corresponding increase in industrial activity, and a substantial increase in stocks was registered in the second half of the year.

Italy remained an important processor of mostly imported raw minerals and crude oil and a producer of metals, petroleum products, and nonmetals. Pumice, feldspar, cement, gypsum, pyrite, fluorspar, barite, asbestos, and zinc were among the major minerals mined in the country. Steel, lead, zinc, and aluminum metals were produced, but primary copper was not mined or refined, and all copper requirements were met through imports.

The mineral industry generated about 1.1% of the gross national product (GNP) and employed 220,000 persons.

Marginal mining operations, mostly Government owned, continued operations during 1976, since closure of such mines, often the only source of employment in the area, would create social problems. The Government-owned concern, Ente Autonomo di Gestione per le Aziende Minerarie Metallurgiche (EGAM), operator of those mines, was in serious financial difficulties during the year. A new law imposing strict control of liquid waste disposal was passed during 1976. This law and other environmental requirements, together with higher labor costs, have affected the profitability of mining operations.

In 1976, major events in the mineral industry were as follows: Small lead and zinc deposits were discovered in Sardinia and northeast Italy, production of mercury stopped in July, development of the Campiano pyrite mine continued, a new company for salt production was organized in Sicily, and several modest gasfields and oilfields were discovered offshore and onshore.

PRODUCTION

During 1976, output of mineral and related commodities showed mixed results, as shown in table 1. The mineral industry was owned by both Government and private concerns; the structure of the industry, with approximate share of the country's totals, is shown in the following tabulation:

[1] Physical scientist, International Data and Analysis.

Commodity	Major companies, principal facilities, and ownership	Percent of domestic output
Aluminum	Aluminio Sarda S.p.A., smelter at Porto Vesme, Government 94%	40
Do	Alummetal S.p.A., smelters at Bolzano, Fusina, and Mori, Government 90%	38
Asbestos	Amantifera di Balangero S.p.A., mine at San Vittore	90

Lubricants ---do---	4,524	3,694	4,795
Other:			
Refinery gas ---do---	4,761	3,193	3,227
Liquefied petroleum gas ---do---	25,898	25,071	27,061
Naphtha ---do---	72,203	48,159	55,612
Paraffin ---do---	50	47	165
Bitumen ---do---	11,035	10,696	10,288
Unspecified ---do---	2,224	1,532	1,412
Partly refined oil ---do---	31,615	27,655	31,232
Refinery fuel and losses ---do---	48,820	43,628	47,145
Total ---do---	936,076	779,832	833,031

e Estimate. p Preliminary. r Revised. NA Not available.
[1] Includes secondary blister used chiefly for production of copper sulfate and other chemical uses.
[2] Excludes pelletized iron oxide derived from pyrite.

TRADE

Imports of minerals and fuels were valued at $16 billion or approximately 40% of the country's total imports in 1975, the latest year for which complete data were available. Imports of fuels accounted for 64% of the mineral imports. The Netherlands and the U.S.S.R. provided most of the natural gas. Saudi Arabia, Iran, and Libya were major sources of crude oil. Mineral and fuel exports, chiefly refined petroleum and other processed minerals, were valued at about $5 billion or 17% of total exports. Tables 2 and 3 show foreign trade of Italy for selected minerals and fuels.

Table 2.—Italy: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal destinations, 1975
METALS			
Aluminum:			
Bauxite	5,256	5,912	Yugoslavia 2,561.
Oxide and hydroxide	252,645	364,195	Netherlands 223,236; U.S.S.R. 49,903.
Ash and residue containing aluminum	3,275	3,783	France 2,096; West Germany 1,468.

COMMODITY REVIEW

METALS

Aluminum.—Domestic output of aluminum was dependent on imported bauxite, but metal production was also below demand, and imports of aluminum were essential for the Italian manufacturing industry. Aluminum output came from plants at Porto Vesme, operated by Societá dell Aluminio in Sardegna (Alsar); at Bolzano, Fusina, and Mori, operated by Alummetal; Fusina and Porto Marghera, operated by Societá Aluminio Veneto per Azioni S.p.A. (SAVA); and Borgo-Franco d'Ivrea, operated by Alcan Italiano S.p.A. The aggregated capacity of the aluminum smelters was 340,000 tons. About two-thirds of the total aluminum supply was used by the automobile manufacturing, construction, and appliance industries.

Antimony.—During 1976, no major events were reported in the antimony industry of Italy. Antimony ore was mined at the Tafone mine near Grosseto. Domestic and imported stibnite ores were processed to regulus at the Azienda Minerali Metallici Italiane S.p.A. (AMMI) smelter near Manciano.

Iron and Steel.—Depressed economic conditions kept operations of the iron and steel industry at modest levels and without new developments that would significantly affect future performance of the industry. During 1976, Italy remained dependent on imports of iron ore, scrap, and some pig iron to meet the demand of its steel industry, which was among the largest in Europe. On Elba, domestic iron ore, averaging about 44% Fe, was produced at opencast and underground mines operated by Italsider S.p.A., but output was not significant, amounting to only about 3% of annual consumption. In addition, ferrogenous sand was dredged from waters 10 to 15 meters deep in the northern part of the island.

Italsider remained the principal producer of iron and steel. The company is headquartered in Genoa and has plants in Taranto, Bagnoli, Cornigliano, Campi-Corso, Novi Ligure, Trieste, Maghera, San Giovani Valdarno, Lovere, and Savona. Dalmine of Milan and Fiat S.p.A. of Turin were other leading producers. Salient statistics for iron and steel are shown in table 4.

Lead and Zinc.—Domestic mine and smelter output of lead and zinc was below domestic demand, nevertheless, output and consumption of lead and zinc metals continued high in spite of the economic slowdown.

At the Massua mine, operated by AMMI Sarda, exploration led to delineation of a new ore body with proven reserves of 10 million tons of ore with an average content of 4% zinc and 1% lead. The bismuth, cadmium, and silver content of the ores was not announced. In addition, expansion of the flotation plant to a capacity of 1,000 tons per day was completed. At mines operated by Societá Piombo Zincifera Sarda, studies were conducted to resolve the problem of tailings disposal into the sea, and work was underway to concentrate production in the Carolina shaft.

At AMMI's Raibli mine, located north of Udine and near the Yugoslav border, a new ore body with 500,000 tons of proven reserves was discovered and delineated; average aggregated metal content was 9.5% lead and zinc oxide.

At the Salafossa mine, located in northeastern Italy near the Austrian border and operated by Societá Mineraria e Metallurgica di Pertusola, exploratory activities led to discovery of a new ore body with reserves of about 300,000 tons. Grade of ore was not made public.

Largest producers of lead and zinc metals were AMMI Sarda with a smelter at Porto Vesme, and Pertusola with smelters at La Spezia and Crotone.

In the Porto Vesme lead and zinc smelter, construction of a briqueting plant for concentrates of oxide ores for the Waelz kiln, and of a new sulfuric acid plant was completed.

At the Crotone zinc electrolytic plant, work was underway to increase annual capacity from 90,000 tons to 130,000 tons. Completion was scheduled for 1978–81. Capacity of AMMI's lead refinery at San Gavino will be 43,000 tons of refined lead in 1978, when present expansion work is expected to be completed.

Other Metals.—Italy produced a variety of metals. Cadmium and silver were produced as byproducts of lead and zinc production in Sardinia and the northeastern part of Italy.

Source: Associaziono Nazionale Industrie Siderurgiche (ASSIDER).

The mercury mines, operated by Societá Mercurifera Monte Amiata S.p.A., were closed in July. Low prices for mercury on world markets made mercury mine operations uneconomic.

Pyrite was produced at mines operated by Solmine and situated in Maremma Toscana. The largest mine, Niccoleta, maintained its output level. Development of the Campiano pyrite mine continued during 1976. Three vertical shafts were sunk to a total depth of 900 meters, and an inclined shaft 1,100 meters long was excavated.

NONMETALS

Asbestos.—Societá Amiantifera di Balangero S.p.A., with its San Vittore open pit mine and related facilities located near Turin, remained the principal producer of asbestos in Italy. New equipment for bagging "dust-free" short-fiber filters went onstream at San Vittore. New filters installed at the plant have also lowered air pollution in the area. At the opencast mine, new equipment was installed to enable the mining methods to cope with greater depth and larger quantities of overburden.

Cement.—About 120 cement plants were well distributed over the country and had an installed capacity of 72 million tons. The most important producer of cement was Italcementi S.p.A. with its largest plants at Bergamo, Brescia, and Colleferro. Italcementi accounted for 37% of the country's cement output.

Fluorspar.—Although output was lower when compared with that of 1975, exports were higher because of the sale of fluorspar from stocks. Near the Torgola mine, operated by Societá Fluormina, a new crushing plant went onstream. The plant, with a capacity of 350 tons per day, consists of a primary jaw crusher, a screening installation, and a cone crusher.

Potash.—Industria Sali Potassici e Affini (ISPEA) operated mines at San Cataldo and Palo, which are located in the western part of Caltanissetta Province in Sicily, and from the Racalmuto mine in Agrigento Province. The main processing plant (capacity 240,000 tons of potash salts per year) was situated at Campofranco, about 18 kilometers to the west. The raw material from the mines was treated by a crystallization process patented by Montecatini engineers. Average K_2O content of ore ranged between 10% and 12%.

Salt.—During 1976, the Sicilian Mining Board and Montedison organized a new company, Societá Salitaliana, to coordinate operations of various sources of salt in Sicily. The Montedison 900,000-ton-per-year plant at Cero Marina and all mines operated by the Sicilian Mining Board were incorporated in the new company. Total capacity of the mines involved was about 1.7 million tons.

Stone.—*Marble and Ornamental Stone.*—The output of marble and other ornamental stone was an important segment of the mining industry of the country. The most important of the large producing areas were as follows: Marble at Botticino (Lombardy), Aurisina and Repen (Eastern Venetia), and Trapani (Perlato de Sicilia); granite, at Lago Maggiore (Piedmont) and Sardinia; and travertine, at Tivoli and Rapolano. There were many single locations producing ornamental stone throughout Italy, of which the most important were as follows: Green marble at Val d'Aosta and Val di Susa, rose- and gold-colored marble near Lago Maggiore, black marble at Lago Iseo, red marble at Asiagio, and travertine at Ascoli Piceno. About 3,000 quarries, employing 45,000 to 50,000 persons, were in operation at yearend 1976.

Talc and Graphite.—The Talco Graphite Valchisome Co. produced talc at mines in Piedmont and conducted exploration and preparatory work for opening an opencast mine in Sardinia.

MINERAL FUELS

Petroleum, mostly imported, was the principal source of energy in Italy, supplying 73% of the country's apparent consumption. Domestic energy output (approximately 70% natural gas, 21% hydroelectric power, and the rest petroleum, coal, and fuelwood) accounted for about 15% of the nation's energy apparent consumption. Crude oil imposed a heavy burden on the economy and on the foreign trade balance. Use of nuclear power was being examined as a substitute for oil-fired powerplants.

Coal.—Lignite was produced in two mines, Santa Barbara and Pietrafitta, both near Perugia, operated by Ente Nazionale Electrico (ENEL). All lignite output (2 million tons) was used for fueling ENEL's thermal powerplants. During 1976, the

Table 5.—Italy: Supply and apparent consumption of fuel and power for 1974 and 1975

(Million tons of standard coal equivalent [1])

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Fuelwood	Hydroelectric and nuclear power	Nuclear power alone
1974:

XX Not applicable.
[1] 1 ton of standard coal equivalent (SCE) = 7,000,000 kilocalories.
[2] Less than 0.01 million tons of SCE.

Source: World Energy Supplies, 1971–75, Statistical Papers, ser. J, No. 20, United Nations, New York, 1977, p. 231.

heavy rains at the Santa Barbara mine affected production. At Pietrafitta, production has been affected by complicated tectonics and increased depth of lignite seams. Exploratory drilling was underway in marginal areas of the principal basin.

The Carbosulcis Co. was organized to reactivate coal mines in the Sulcis coal basin in Sardinia. Coal in the Sulcis Basin is low in thermal quality and high in sulfur and ash content, but renewed production was needed to decrease Italy's dependence on imported fuels. Imports of coking coal and coke were particularly necessary for operation of metallurgical installations in the country; the United States provided 30% of the 12 million tons of coal imported in 1975.

Petroleum and Natural Gas.—Exploration continued and additional liquid and gaseous hydrocarbons were discovered onshore and offshore. However, future production from the new discoveries will only slightly improve the share of domestic output in the total supply of the country. During 1976, domestic natural gas and petroleum contributed 10% and 0.9%, respectively, to the total energy supply of the country, and imports of crude oil and natural gas heavily taxed the foreign trade balance. During 1976, 36 refineries were in operation with a total installed capacity of over 200 million tons; however, they operated at only 55% of capacity.

In the Po Valley, AGIP Mineraria started production of gas at Malossa, near Bergamo, from a new pay zone 6,200 meters deep. Two other wells encountered difficulties due to high pressure, temperatures, and depth. The new producing zone was discovered by complex geophysical exploration in an old gasfield.

In Prglia, Elf–SNPA–BP announced discovery of a new oilfield offshore in the Adriatic, north of Andria. Reports indicated recoverable reserves of 80 million tons.

Explorazioni Mediterraneo S.A. announced discovery of a new gas pay zone at a depth of 2,670 meters in a well near Castel Volturmo in Casserta Province. The Luna gasfield, located in the general area of Crotone in the Ionian Sea, started production. The field was discovered in 1971, and gas reserves were reported at 18 billion cubic meters.

Uranium and Nuclear Power.—During 1976, Government-owned Azienda General Italiani Petroli S.p.A. (AGIP) started preparations for production of uranium from a deposit near Novazza (Bergamo); recoverable reserves were estimated at 1,500 U_3O_8. In addition, construction started on a yellow cake plant near the mine. Production was scheduled for 1979. For development of the Novazza project, the European Investment Bank granted a loan to AGIP of 9 billion lire (approximately $10 million), repayable in 12 years, with interest at 9.5%.

The Mineral Industry of Japan

By E. Chin [1]

Following the world oil crisis in the autumn of 1973, Japan's economy suffered from inflation, increased unemployment, and excess industrial capacity as a result of decreased demand for its goods and merchandise in domestic and foreign markets. The gross national product (GNP) declined 1.3% in 1974 in real terms, compared with an annual average growth rate of about 8.1% during 1960–73. In 1975, the economy began its upswing and the GNP posted a 2.1% growth in real terms. By 1976, the GNP registered a real growth of 6.3% to $329 billion [2] in 1970 prices. In addition, Japan had a surplus of nearly $3,700 million in its current balance of payments, second only to West Germany among industrial nations.[3]

The Japanese economy had experienced severe inflation in 1974 with consumer prices up 21.8% and wholesale prices up 23.4%; with the fourfold increase in oil prices, there ensued sharp price boosts for manufactured goods, especially for energy-intensive products. In 1975, as a result of restrictive fiscal and monetary policy, the wholesale price increase was a modest 2.1%. In 1976, price increases crept upward but slackened to a rate of 0.1% to 0.3% per month; the overall price level for 1976 averaged 6% higher than in 1975.

The labor market in 1976 showed little improvement over the high unemployment rate of 1975. As the total labor force increased from 53.2 million in 1975 to 53.8 million in 1976, the unemployment rate increased from 1.9% to 2%. While the unemployment rate was considerably lower than that of the United States and European countries, it was contradictory to Japan's tradition of lifetime employment in which employees are seldom dismissed and are retained by firms even during recession periods.

Although the economy was rebounding from a protracted recession, about 25% of the country's industrial production capacity was left idle throughout the year, owing generally to high inventory, curtailment in consumer spending, and decreased export shipments. Industrial activity was reportedly strong in the first half of 1976 and sluggish in the second half. Moreover, production levels varied from industry to industry. The iron and steel, petroleum refining, pulp and paper, electronics (computers), and industrial chemicals sectors managed to sustain production rates approaching the pre-1973 levels. Manufacturers of consumer goods, particularly automobiles and electronic products, benefited from a surge in export demand. Other industries enjoying brisk demand included food processing, rubber, pharmaceuticals, and producers of photographic equipment and supplies. On the other hand, shipbuilding and metalworking, chemical-processing, textile, and bicycle equipment industries generally remained depressed. Other poorly performing sectors included nonferrous metals, nonelectrical machinery, communications equipment, synthetic fibers, and plastics.[4]

The consumption of oil accounted for about 75% of Japan's total use of primary energy, compared with a world average of 45%. Annual domestic production of

crude oil was equivalent to only 1 day's supply; therefore, the country's requirement for oil was met by purchases from abroad, of which 80% was from the Middle Eastern countries. In 1974 and 1975, the financial stability of oil refineries was weakened by the freezing of oil products prices by the Government, below-cost sales, foreign exchange losses, and an increase in fixed costs for the industry. However, by the end of the third quarter of 1976, oil refiners were posting increased sales and higher pretax profits. The improved performance of the industry was attributed to the establishment of standard prices initiated by the Government in December 1975, gains in foreign exchange resulting from a higher yen (Y) to dollar ratio, and a change in the mix of refinery output, such as increased production of gasoline, a more profitable item.

In 1976, 38 Japanese companies had oil exploration and development operations overseas; 8 of the developers were producing oil and supplied about 8% of the country's total crude imports. Two developers were reportedly close to producing oil, while the remaining 28 operators were expected to begin exploration or test drilling.

At the beginning of the year, Japan's iron and steel industry was buoyed up by sales of sheet to domestic automobile manufacturers and by foreign shipments in general. Because of the bright export market, crude steel output advanced steadily from 25.1 million tons in the first quarter to 28.0 million tons in the third quarter of 1976. Late in the year, however, the industry encountered a slowdown in domestic demand and criticism from abroad urged curtailing exports to the United States and European countries. After regaining momentum, the producers were thus facing operation curtailments again in 1977.

Japan's nonferrous metal industry was troubled by excess inventory, higher cost of production, and fluctuating prices, resulting in production curtailments averaging 20% to 30% throughout the year. For example, 15,000 kilowatt-hours of power was required to produce 1 ton of aluminum ingot. Domestic electricity rates had doubled since the oil crisis, and at Y10 the cost of power per kilowatt-hour was 500% to 1000% higher than the cost of hydropower in the United States and Canada. Owing to the higher cost for power, the Japanese aluminum industry was at a decided disadvantage in international competitiveness.

Production and shipments by lead producers were close to the pre-1973 level as a result of sales in the automotive sector. Because of large inventories, however, producers of copper and zinc operated at about 75% of capacity throughout 1976, and the weak market for sulfuric acid, a byproduct of the copper and zinc industry, was an additional damper to domestic producers. International prices for zinc were relatively stable in 1976. Copper prices fluctuated, and the highest quotation for copper, occurring in midyear, was still below the break-even point for Japanese producers, which was estimated to be around Y600,000 per ton.

The position of the other major mineral sectors, coal and cement, remained depressed in 1976. Total coal output in 1976 was estimated at 18.5 million tons, compared with the current output target of 20 million tons per year and a peak production of 55 million tons in 1961. Japan annually uses about 70 million tons of coking coal for steelmaking and about 10 million tons of steam coal for power generation. Because of the oil embargo of 1973 and the rising prices of crude oil, the Government favored a review of the coal industry and looked to the resurgence of coal as an energy source. Under a proposed coal policy developed in 1976, the Government was to assist collieries in obtaining higher prices for delivery from the user industries inasmuch as domestic coal prices have been semiofficially fixed since 1963 on the basis of recommendations by the Coal Mining Council to the Government. Also, through collaboration between Federal and local governments and the user industries (iron and steel, power, and others), new mines were to be developed to replace superannuated ones.

The construction industry was adversely affected in 1976 by a sharp decline in orders, particularly in private plant equipment investments, and by keen competition, which decreased profits on construction contracts. As a result, the cement industry operated at about 60% of capacity in 1976. In addition, producers were restrained from increasing prices for cement by opposition from the construc-

tion sector. Domestic shipments of cement totaled about 64.5 million tons and exports were 5.9 million tons. Japan's total production capacity remained unchanged from that of 1975 at about 110 million tons.

The Organization for Economic Cooperation and Development (OECD) ranked Japan fourth among the world's plant-exporting nations in 1974 after the United States, West Germany, and the United Kingdom. Because of a rapid growth in plant exports in 1975–76, the OECD rated Japan as the world's third largest exporter, replacing the United Kingdom. To date, the largest export item had been chemical plants, notably to centrally planned economies and to the Middle East. In 1976, total contracts for plant exports were estimated at $9 billion.[5]

At the end of 1976, Japan's cumulative direct foreign investment totaled $17.8 billion. By area, Asia accounted for 27.6% of the total foreign investment, followed by North America, 24.2%; Latin and South America, 17.5%; Europe, 15.3%; Middle East, 6.4%; Oceania, 5.4%; and Africa, 3.6%. By type of industry, manufacturing accounted for 32% of total foreign investment; mining, 26.9%; commerce, 13.7%; and other, 27.4%. Foreign investments for the manufacturing sector included $1.1 billion for chemicals, $1.1 billion for textiles, $0.9 billion for iron and steel and nonferrous metals, $0.6 billion for electrical machinery, $0.6 for lumber pulp, and $1.5 billion for miscellaneous manufactures.

PRODUCTION

Japan was much more important as a consumer of raw materials and as a producer of intermediate and finished products than as an ore producer. In terms of mine output, Japan had minor significance only in the production of clays, dolomite, limestone, and other construction raw materials. Domestic mine output of iron ore, copper, gold and silver, manganese, tin, lead, zinc, salt, and magnesia was supplemented by large imports of these commodities to meet Japan's requirements in the production of value-added goods. Moreover, the aluminum industry was wholly dependent on the imports of bauxite and alumina for metal production.

To meet the country's energy needs, virtually all forms of mineral fuels were imported to sustain Japan's industries. For instance, domestic production of crude oil was only 674,260 kiloliters, compared with imports of 254.2 million kiloliters. Production of liquid petroleum gases (propane, butane, and other) totaled 25,297 tons in 1976; imports of liquefied petroleum gases were 66,774 tons, imports of propane and butane gas were 6,343,257 tons, and imports of liquefied methane gas were 5,791,852 tons. Imports of over 1 million tons of anthracite coal dwarfed domestic production of 38,000 tons in 1976. Bituminous coal production was close to 18.4 million tons and was supplemented by 50.9 million tons imported mainly from the United States, Australia, and Canada.

In terms of mineral and metal processing, however, Japan's industries were very prominent, and output of refined metals and mineral products was large by world standards.[6] Japan ranked within the world's first three producing countries in output of iron and steel, aluminum, copper, and zinc metals, cement, fertilizers, and refined oil. It was also the leading producer, or a major producer, of lesser metals and minerals such as bismuth, cadmium, indium, selenium, silicon, tellurium, titanium, lime, seawater magnesia, talc, and pyrophyllite. In addition, Japan's outputs of coke, lead, industrial gases (argon, nitrogen, and oxygen), and halogens (bromine and iodine) were within the first 10 in world production.

The level of production in mining and manufacturing varied from commodity to commodity. For instance, the total output of the petroleum-refining industry was about 70% of capacity throughout 1976. Coal production dropped from 55 million tons in 1961 to 18.5 million tons in 1976. Output of the iron and steel industry was about 92% of the peak level of production in the period just prior to the 1973 oil crisis. The industry was slowly recovering from the protracted recession, with increased sales to domestic and foreign auto-

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Includes (but not limited to) ferromolybdenum, ferrotungsten, ferrovanadium and silicochromium.

[2] Includes aplite as follows in thousand tons: 1974—490; 1975—324; 1976—358.

[3] Nitrogen content of fertilizer for year ended June 30 of that stated.

[4] Revised to none.

[5] Includes byproduct sulfur from sulfide ores and the petroleum industry. Native sulfur is no longer produced.

[6] Includes a small amount of natural coke.

[7] Includes output from gas mines and coal mines.

mobile makers. Lead producers also were supported by the favorable trend in sales of the automotive industry. On the other hand, the aluminum, copper, and zinc industries had large inventories at the end of 1975; coupled with decreased demand, the nonferrous metal sector curtailed production throughout 1976. Production in 1976 by the aluminum industry was about 60% of installed capacity, while that of copper and zinc was between 70% and 80%.

TRADE

Japan's foreign trade in 1976 totaled $132,042 million, compared with $113,608 million in 1975. Total exports increased 21% to $67,210 million in 1976, and imports increased 12% to $64,832 million. The value of imports during the first 5 months of 1976 exceeded that of exports. However, the volume of export shipments increased briskly during the remainder of the year, resulting in a favorable trade balance of $2,378 million for the year. Owing to the oil crisis of 1973 and the ensuing world recession, Japan had had a trade deficit each year during 1973–75.

The United States continued to be the largest market for Japanese products, receiving about 23% of total exports, or $15,690 million. The largest export categories to the United States were transport vehicles, valued at $4,396 million; followed by electrical machinery and equipment, $3,202 million; iron and steel products, $2,558 million; and mechanical machinery and appliances, $1,203 million. Completing the 10 largest export markets for Japan in 1976 were the Republic of Korea, $2,825 million; Liberia, $2,802 million; Australia, $2,306 million; Taiwan, $2,279 million; the U.S.S.R., $2,252 million; West Germany, $2,239 million; Saudi Arabia, $1,888 million; Hong Kong, $1,841 million; and Iran, $1,706 million.

Mineral fuels continued to be the most important import item for Japan, accounting for nearly 44% of the value of total imports in 1976.[7] The value of the imported crude oil alone during the year was $20,131 million, and the oil came principally from Saudi Arabia, $6,306 million; Iran, $4,193 million; and Tunisia, $2,631 million. Imports of steam coal totaled 1.1 million tons, valued at $48.2 million. Major suppliers were Vietnam, the People's Republic of China, Canada, the Republic of South Africa, the Democratic People's Republic of Korea, and the U.S.S.R., in that order.

Imports of metal ores in 1976 included 4.3 million tons of bauxite, 2.6 million tons of copper ore and concentrate, 133.7 million tons of iron ore and concentrate, 0.16 million tons of lead ore and concentrate, 3.5 million tons of nickel ore, and 0.99 million tons of zinc ore. The principal nonmetallic ores and products imported during the year were asbestos, clays, fertilizers, fluorspar, magnesite, stone, sand, and gravel.

By value, the principal sources of Japanese imports during 1976 follow, in million dollars: The United States, 11,818; Saudi Arabia, 7,832; Australia, 5,362; Iran, 4,452; Indonesia, 4,093; Canada, 2,718; the United Arab Emirates, 2,471; Kuwait, 2,017; the Republic of Korea, 1,915; and Taiwan, 1,371.

By industrial classification, Japan was a net importer of animal and vegetable products, oil, foodstuffs, wood and paper products, hides, skins, leather products, footwear and apparel, mineral commodities, gem stones, and precious metals. However, because of the advanced technology and industrial strength of its manufacturing sector, Japan was a net exporter of value-added products such as wrought and unwrought metals, mechanical and electrical machinery, transport vehicles, optical, photographic, and cinematographic equipment, chemicals, plastics, and textiles.

Table 2.—Japan: Exports of mineral commodities [1]

(Thousand metric tons unless otherwise specified)

Commodity	1974	1975	1976	Principal destinations, 1975
METALS				
Aluminum:				
Bauxite and concentrate ---------tons--	146	860	1,066	Republic of Korea 800.
Oxide (alumina) and hydroxide ---------	79	57	123	Republic of Korea 34; Taiwan 7.
Fused alumina ---------tons--	6,054	r 5,290	8,820	Republic of Korea 2,342; Taiwan 1,926.
Metal including alloys, all forms --------	69	136	137	People's Republic of China 39; Republic of Korea 16.
Arsenic trioxide, pentoxide, and acids--tons--	20	6	5	Philippines 3; Indonesia 2.
Beryllium metal including alloys, all forms kilograms--	(2)	91	188	Taiwan 66; Poland 15.
Bismuth metal including alloys, all forms tons--	507	r 362	306	Netherlands 195; United Kingdom 90; United States 71.
Cadmium metal including alloys, all forms do----	1,606	1,471	1,841	Netherlands 764; East Germany 365.
Chromium:				
Chromite ---------do----	244	364	2,089	Republic of Korea 210; Thailand 100.
Oxide and hydroxide ---------do----	r 1,306	749	1,102	Republic of Korea 332; Taiwan 198.
Cobalt oxide and hydroxide ---------do----	12	12	11	Republic of Korea 3; North Korea 2; Taiwan 2.
Columbium and tantalum: Tantalum metal including alloys, all forms -----kilograms--	25,298	8,971	14,934	United States 7,104; West Germany 1,724.
Copper:				
Ore and concentrate ---------tons--	2,299	4,799	--	All to Republic of Korea.
Copper sulfate ---------do----	379	1,523	331	People's Republic of China 760; Peru 350.
Metal including alloys, all forms --------	344	117	163	Hong Kong 17; Taiwan 15; United States 15.
Iron and steel:				
Ore and concentrate ---------tons--	--	--	5	
Scrap ---------do----	301,163	274,759	202,659	Republic of Korea 144,865; United States 47,811.
Pig iron, including cast iron ------do----	72,070	406,846	3 146,331	United States 140,180; Cuba 54,887; Romania 50,127.
Sponge iron, powder, shot --------do----	9,079	7,995	9,739	Republic of South Africa 1,196; Taiwan 1,138.
Spiegeleisen ----------	(4)	--	--	
Ferroalloys:				
Ferromanganese ----------	54	r 131	122	United States 86; West Germany 12.
Other ----------	123	129	89	United States 66; Netherlands 15.
Steel, primary forms ----------	7,595	6,360	5,669	Spain 746; United States 735; People's Republic of China 540.
Semimanufactures:				
Bars, rods, angles, shapes, sections --	r 6,800	r 6,218	9,389	United States 1,121; People's Republic of China 598.
Universals, plates, sheets:				
Universals, plates, sheets, uncoated ----------	9,640	r 8,212	10,976	United States 1,332; People's Republic of China 1,107.
Tinned plates and sheets --------	1,049	865	785	United States 257; U.S.S.R. 81; People's Republic of China 80.
Other coated plates and sheets --	1,562	1,465	2,443	United States 509; Iran 92.
Hoop and strip ----------	734	r 563	967	People's Republic of China 75; Iran 59.
Rails and accessories ----------	114	240	156	Brazil 103; United States 47; Australia 23.

NONMETALS—Continued				
Kyanite and related materials ---------tons--	20,768	8,592	10,165	Taiwan 5,527; Thailand 1,025; Brazil 1,000.
Lime ----------do----	31,484	31,364	34,312	Malaysia 4,619; Indonesia 4,500.
Magnesite ----------do----	1,134	324	405	Taiwan 302.
Mica ----------do----	257	r 209	349	Republic of Korea 71; Hong Kong 56.
Pigments, mineral, iron oxides, processed do----	12,342	5,746	12,141	Taiwan 2,117; United States 1,238; U.S.S.R. 1,040.
Precious and semiprecious stones, except diamond:				
Natural ----------kilograms--	65,046	84,207	240,899	Republic of Korea 41,141; Taiwan 23,805.
Manufactured ----------do----	22,583	21,521	32,184	Republic of Korea 10,021; West Germany 3,647.
Salt and brines ----------tons--	1,120	1,858	1,059	Republic of Korea 1,255.
Sodium and potassium compounds, n.e.s.:				
Caustic soda ----------	331	365	211	Australia 271.
Caustic potash, sodic and potassic peroxides ----------	4	5	5	United States 3.
Stone, sand and gravel:				
Dimension stone ----------tons--	1,529	330	1,095	Iran 108; North Vietnam 27.
Dolomite, chiefly refractory grade--do----	6,025	7,284	6,909	Philippines 6,896.
Gravel and crushed rock ----------do----	1,199	1,348	9,712	Taiwan 633; Republic of Korea 150; Philippines 123.
Limestone (except dimension) ----------	1,469	1,439	1,488	Australia 1,431.
Quartz and quartzite ----------tons--	1,165	219	133	Philippines 124; Taiwan 67.
Sand, excluding metal bearing ----do----	1,575	1,134	1,899	Taiwan 450; Malaysia 294; Republic of Korea 147.
Sulfur:				
Elemental:				
Other than colloidal ----------do----	62,986	117,267	335,660	Republic of Korea 100,938.
Colloidal ----------do----	114	831	457	Republic of Korea 703; North Vietnam 100.
Sulfur dioxide ----------do----	181	108	55	Australia 88; Taiwan 8.
Sulfuric acid ----------do----	289	r 60	117	Philippines 35; Republic of South Africa 24.
Talc and steatite ----------do----	746	454	1,499	Philippines 94; Taiwan 70; Iran 64.
Other nonmetals, n.e.s.:				
Crude ----------	7	7	10	Taiwan 2; United Arab Emirates 2.
Slag, dross, and similar waste, not metal bearing ----------	39	37	2	Republic of Korea 33.
Oxides, hydroxides, and peroxides of magnesium, strontium and barium (including magnesia clinker) ----------	82	168	125	Netherlands 24; Republic of South Africa 18.
Fluorine and bromine -------kilograms--	8,090	300	[10] 5,517	All to Republic of Korea.
MINERAL FUELS AND RELATED MATERIALS				
Asphalt and bitumen, natural ---------tons--	11	--	--	
Carbon black and gas carbon:				
Carbon black ----------	14	21	23	Taiwan 4; Thailand 4; Republic of Korea 3.
Gas carbon ----------tons--	3	--	--	
Coal, all grades, including briquets ----------	132	26	51	Republic of Korea 22.
Coke and semicoke ----------	656	733	540	Peru 256; Venezuela 149; Republic of Korea 117.
Gas, manufactured only ----------tons--	([11])	2	16	Indonesia 1; Republic of Korea 1.
Hydrogen and rare gases (helium, neon, krypton, xenon) ----------do----	442	r 426	449	Republic of Korea 98; Saudi Arabia 82; Iran 28.

See footnotes at end of table.

(Thousand metric tons unless otherwise specified)

Commodity	1974	1975	1976	Principal destinations, 1975
MINERAL FUELS AND RELATED MATERIALS —Continued				
Petroleum:				
Crude and partly refined thousand 42-gallon barrels	16	4	([8])	All to Republic of Korea.
Refinery products, nonbunker:				
Gasoline ---do---	26	r 12	--	Do.
Kerosine and jet fuel ---do---	1,062	66	11	Netherlands 60.
Distillate fuel oil ---do---	495	47	129	Mexico 38.
Residual fuel oil ---do---	12,574	8,415	3	Republic of Korea 2,461; Taiwan 1,703; Sweden 1,415.
Lubricants ---do---	4,496	r 1,826	1,259	Taiwan 572; Republic of Korea 500.
Other:				
Liquefied petroleum gas ---do---	85	92	54	Hong Kong 81.
Naphtha ---do---	1,162	677	([8])	Mainly to Belgium-Luxembourg.
Mineral jelly and wax ---do---	315	237	199	Peru 72; Republic of Korea 45.
Bitumen ---do---	245	136	184	Republic of Korea 58; Nauru 17.
Unspecified ---do---	248	r 87	134	Republic of Korea 48; Taiwan 24.
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	51	r 49	95	Republic of Korea 31.

r Revised.
[1] Excludes exports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.
[2] Value only reported at $3,894.
[3] Includes spiegeleisen, if any.
[4] Value only reported at $3,922.
[5] Value only reported at $41,460.
[6] Value only reported at $24,141.
[7] Excludes mosaic tile valued as follows: 1974—$88,109; 1975—$43,332; 1976—$71,601.
[8] Less than ½ unit.
[9] Includes exports of the following amounts of urea containing more than 45% nitrogen: 1974—2,249,275 tons; 1975—2,205,265 tons; 1976—746,453 tons.
[10] Iodine is inseparable from fluorine and bromine.
[11] Value only reported at $2,393.

Table 3.—Japan: Imports of mineral commodities [1]

(Thousand metric tons unless otherwise specified)

Commodity	1974	1975	1976	Principal sources, 1975
METALS				
Aluminum:				
Bauxite and concentrate	5,311	4,600	4,277	Australia 2,940; Indonesia 985; Malaysia 590.
Oxide and hydroxide	r 14	561	9	Australia 546.

r Revised.

[1] Excludes imports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.

[2] Less than ½ unit.

[3] Includes zinc sulfate.

[4] Includes ferruginous manganese and manganese dioxide.

[5] Excludes quantity valued at $747.

[6] Includes lithium hydroxide, beryllium oxide, mercury oxide, antimony trioxide, cupreous oxides, hydroxides and peroxides, n.e.s., and silicon dioxides.

[7] Includes phosphorus, boron, and arsenic.

[8] Includes lithium, sodium, alkali metals, n.e.s., and alkaline-earth metals.

COMMODITY REVIEW

METALS

Aluminum.—Total imports of bauxite by Japan were 4.3 million tons in 1976, compared with 4.6 million tons in 1975. Australia continued to be the principal supplier of bauxite for Japan's aluminum industry. In 1976, shipments of bauxite from Australia totaled about 2.7 million tons. About 1 million tons of bauxite was imported from Indonesia, and about 510,000 tons was supplied by Malaysia. The remainder of the bauxite shipments and imports of alumina was from Guyana, China, Trinidad, Surinam, the United States, Greece, and India, in that order.

Imports of unwrought aluminum metal in 1976 totaled 340,435 tons and were principally from New Zealand, Bahrain, Australia, and the United States; imports of unwrought aluminum alloy were 89,700 tons of which about 60% was supplied by the U.S.S.R. Receipts of aluminum waste and scrap during the year totaled 69,304 tons, of which 46,896 tons was from the United States.

Production of alumina by four companies in fiscal 1976 was 1.4 million tons, down 10% from the output in 1975. Alumina production by company was as follows, in tons: Nippon Light Metal Company, Ltd., 520,410; Showa Light Metal Co., 356,074; Sumitomo Aluminium Refining Co., 401,118; and Mitsui Aluminum Co., Ltd., 219,193. The largest decline in output was 22.5% by Showa, followed by Nippon, 9.7%. Production by Sumitomo and Mitsui was up 11.7% and 28.8%, respectively.

Production of primary aluminum metal by 14 smelters of 5 companies was 970,107 tions in fiscal 1976, down 1.8% from that of fiscal 1975. Because of high inventories, the industry operated collectively at about 60% of capacity during the year. Shipments in 1976 totaled 1.2 million tons, up 36.7% from that of 1975. Nippon and Showa were the only companies reporting decreased production from that of 1975. Yearend capacity and production of primary metal in fiscal 1976 by company and plant were as follows, in tons:

Company and plant location	Capacity	Production
Mitsubishi Light Metal:		
Naoetsu	162,000	128,759
Sakaide	195,600	103,840
Mitsui Aluminum: Miike	165,600	102,280
Nippon Light Metal:		
Kambara	95,040	60,809
Niigata	144,960	80,961
Tomakomai	129,960	92,509
Showa Light Metal:		
Chiba	165,720	97,566
Kitakata	28,320	24,852
Omachi	41,340	23,280
Sumitomo Aluminium:		
Kikumoto	79,200	56,787
Nagoya	54,000	42,408
Sakata (Sumikei Aluminium Industry)	14,033	887
Toyama	182,400	126,348
Toyo (Sumitomo Toyo Aluminium Co.)	98,400	28,821
Total	1,556,573	970,107

Production of superpurity aluminum metal was 4,313 tons in 1976, up 59% from the output in 1975. Production was by the Kambara smelter of Nippon (929 tons) and the Kikumoto smelter of Sumitomo (3,384 tons).

By form, the major consumption of aluminum was of rolled products, sashes, castings, wires, and plates. In 1976, Japan's total demand for aluminum manufactures was estimated at 2.1 million tons, up 20% from that of the prior year. By trade classification, consumption was as follows, in thousand tons: Civil engineering and construction applications, 688; transport vehicles, 379; utensils and metal products, 253; communications, 145; electric power and transmission, 84; industrial machinery, 70; miscellaneous uses, 313; and export shipments, 139.

The aluminum industry was a large user of electric power. Because of high costs for production directly related to higher energy costs, producers were able to attain two price increases in 1976, of Y46,000 and Y45,000 per ton, whereby the price per ton of metal climbed from Y280,000 in 1975 to Y371,000 in 1976. Japanese aluminum was not price competitive in international trade, and the producers were faced with lower-priced imports. The industry was hoping that the Government would grant relief measures for power costs. The Ministry of International Trade and Industry (MITI) encouraged the aluminum producers to vertically integrate their operations. By so doing, the profits from production of semimanufacturing operations (rolling, casting, and forging) could be used to cover deficits accrued in smelting.

In 1976, the aluminum divisions of three general chemical companies were reorganized as new companies in an attempt to establish them in a more stable financial position. In April, the aluminum division of Mitsubishi Chemical Industries Limited became Mitsubishi Light Metal Industries, Ltd., an independent company but with support from the Mitsubishi group of enterprises. In July, Sumitomo Aluminium Refining Co., Japan's largest aluminum producer, was capitalized at Y4 billion. In addition to its output capability of 314,000 tons of aluminum metal, 5,000 tons of highpurity metal, and 740,000 tons of alumina, Sumitomo had the sales rights of 100,000 tons of aluminum produced by Sumitomo Toyo Aluminium Co. at Shikoku and 40,000 tons of aluminum produced through its connection with New Zealand Aluminium Smelters Ltd. Effective on October 1, Showa Light Metal Co. was capitalized at Y10 billion (50% by Showa Denko K.K., 35% by the Fuyo Group composed of Fuji Bank, Ltd., and Marubeni Corp., and 15% by consumer interests).

Japan's only new smelter, Sumikei Aluminium Industry, a totally-owned subsidiary of Sumitomo, started operating late in the year. The Y45 billion smelter had an annual output capacity of 45,000 tons of metal. Original plans called for expanding the smelter's capacity to 90,000 tons in 1978, which may be deferred owing to the financial plight of the aluminum industry.

In 1975, the five primary aluminum producers, a group of Japanese trading companies, and the Indonesian Government concluded an agreement for a joint venture involving a hydroelectric power dam and an aluminum smelter at Asahan in North Sumatra. The $870 million project, scheduled for completion in mid-1980, was still in the construction survey stage in 1976.

Nippon Amazon Aluminum Co. (Nalco) and Rio Doce Geologia e Mineração SA, the Brazilian State development and mining firm, agreed to construct an alumina-aluminum facility in Belém at the mouth of the Amazon River. Nalco, composed of 32 Japanese private companies (including the 5 primary aluminum producers), is an investment company for the Albras and Alnorte projects of Rio Doce. Under the Albras project, a $960 million aluminum complex will be constructed with an annual production capacity of 320,000 tons of metal. The Alnorte project involves an outlay of $330 million for constructing an 800,000-ton-per-year alumina plant that will provide the feed for the aluminum smelter.

Copper.—Total mine output of copper ore in 1976 was 82,000 tons (metal content). Production was mainly from Kamaishi, Iwate; Hanaoka, Akita; Kosaka, Akita; Yaguki, Fukushima; and Shimokawa, Hokkaido. During the year, imports of copper ores and concentrates totaled 2.6 million tons and were principally from the Philippines (814,000 tons), Canada (742,000 tons), Papua New Guinea (292,000 tons), Chile (201,000 tons), Australia (154,000 tons), and Indonesia (139,000 tons).

Production of copper blister in 1976 was 1.0 million tons by 11 smelters of 9 companies. Output of refined electrolytic copper totaled 864,000 tons. Japan's copper smelting and refining capacity at yearend 1976 follows, in tons:

Company and plant location	Capacity	
	Smelting	Electrolytic refining
Nippon Mining Co., Ltd.:		
Hitachi	84,000	192,000
Saganoseki	240,000	168,000
Mitsubishi Metal Corporation: Nao-Shima	168,000	168,200
Sumitomo Metal Mining Co., Ltd.:		
Toyo	156,000	48,000
Niihama	--	132,000
Shisaka-Jima [1]	12,000	--
Mitsui Mining & Smelting Co., Ltd.:		
Hibi	68,400	84,000
Takehara	--	84,000
The Dowa Mining Co., Ltd.:		
Kosaka	63,360	45,000
Okayama	--	12,000
Furukawa Mining Co., Ltd.: Ashio	42,000	--
Furukawa Electric Co., Ltd.: Nikko	--	48,000
Rasa Industries, Ltd.: Miyako	31,200	--
Toho Zinc Co., Ltd.: Onahama [2]	--	15,600
Onahama Smelting and Refining Co., Ltd.: Onahama	234,000	234,000
Hibi Kyodo Smelting Co., Ltd.: Tamano	132,000	102,000
Total	1,230,960	1,332,800

[1] Operation discontinued in December 1976.
[2] Operation to be discontinued in March 1977.

Japan's copper industry continued to be plagued with financial difficulties resulting from fluctuating copper prices and increased energy and labor costs. The selling price for electrolytic copper by domestic producers in 1976 was up about 17%. Actual average selling prices by the major producers in 1976 were as follows, in thousand yen per ton (1975 prices in parentheses): Nippon Mining, 443 (381); Mitsubishi Metal, 439 (374); The Dowa Mining, 448 (383); Furukawa, 441 (375); and Toho Zinc, 438 (377). The selling price for copper in 1975 and 1976, however, was well below the average price of Y492,000 per ton in 1974. Toward yearend, the demand for sulfuric acid began to increase as a result of increased domestic and foreign demand for fertilizer. Large stocks of sulfuric acid, a byproduct of smelting, were accumulated in 1975 and copper production was decreased to avoid increasing acid inventory. The consumption of copper in 1976 was estimated at 1.11 million tons and was expected to increase 3% in 1977. Copper for wire and cable constituted 70% of total Japanese consumption, followed by brass and rolled products, 28%, and other uses, 2%.

The Agency of Natural Resources and Energy of MITI estimated that the total copper resources of Japan were 78.9 million tons. Confirmed copper resources totaled 25.2 million tons, grading 1.79% copper; estimated resources were 28.9 million tons, grading 1.68% copper, and prospect resources were 24.8 million tons, grading 1.34% copper.

The Metal Mining Agency of Japan and a consortium of five Japanese copper companies signed a joint venture with Mount Isa Mines Ltd. for a 5-year exploration and feasibility study of the Frieda River area in Papua New Guinea. Copper reserves in the Frieda River area were estimated to be around 400 million tons of 0.47% copper.

The Michiquillay Mining Co., composed of seven Japanese mining companies, submitted a feasibility study on the Michiquillay copper mine to the Government of Peru. The mine, owned previously by ASARCO Incorporated, was nationalized by the Peruvian Government. Surveys of the Michiquillay deposit had confirmed 412 million tons of 0.75% copper ore that could be mined by opencut methods. Plans to develop the copper deposit included an ore-dressing facility with a capacity of 40,000 tons of crude ore per day and a 210-kilometer pipeline for transport of ore slurry from the mine to a port on the Pacific. The cost to develop the mine was estimated at $590 million, excluding the cost of infrastructure which will be borne by the Peruvian Government.

Société de Development Industriel et Minrier du Zaire (SODIMIZA), a joint venture of the Government of Zaire and Japanese concerns, continued the develop-

ment of the copper deposit at Kinsenda. Reserves were estimated at 35 million tons of 5.5% copper. Production was not expected to begin until late 1977.

Iron and Steel.—Japan's steel production of 107.4 million tons in 1976 was 5% higher than in 1975 but well below the peak production of 119.3 million tons in 1973. As the world's third largest steel producer, Japan followed the U.S.S.R. and the United States whose crude steel production was 144.8 million tons and 116.1 million tons, respectively. Japan, however, continued to be the world's foremost exporter of steel with about 36 million tons in 1976, an increase of 25% over shipments in 1975.

Five Japanese steel companies were among the world's top 15 producers in 1976, headed by Nippon Steel Corporation with an output of 34.0 million tons. The other top producers follow, with output in 1976 in million tons: United States Steel Corp., 25.7; British Steel Corp., 19.1; Bethlehem Steel Corp., 17.1; Nippon Kokan K.K., 14.7; Societa Finanziaria Siderurgica (FINSIDER), 13.4; Sumitomo Metal Industries, Ltd., 13.3; Kawasaki Steel Corporation, 13.3; August Thyssen-Hütte A.G., 12.8; National Steel Corp., 9.8; Republic Steel Corp., 8.7; Union Sidérurgique du Nord et de l'Est de la France S.A. (USINOR), 7.9; Kobe Steel, Ltd., 7.8; Broken Hill Pty. Co. Ltd., 7.8; and Inland Steel Co., 7.2.

Japan's industry operated the largest blast furnaces in the world. On September 9, Sumitomo Metal Industries began operation of blast furnace No. 3 at Kashima; with an internal capacity of 5,050 cubic meters, it superseded blast furnace No. 9 (5,026 cubic meters) of the Krivoy Rog Steel Works, U.S.S.R., as the world's largest furnace. Sumitomo began construction of the No. 3 blast furnace in October 1974. Total cost of construction was Y46 billion, which included Y4.6 billion for pollution controls. The furnace had an output capacity of 11,000 tons per day of pig iron.

On October 5, 1976, however, Nippon Steel started operation of its No. 2 blast furnace at the Ōita Works with an internal working volume of 5,070 cubic meters, surpassing Sumitomo's capacity. Construction on this blast furnace, which had an output capacity of 12,000 tons per day of pig iron, began in October 1973. The total cost of this installation was Y300 billion, which also included three units of 340-ton converters, two units of continuous steel casting mills, two units of coking furnaces, a sintering furnace, a heavy plate mill, and an unloader of 2,500-ton-per-hour capacity. With the expanded facilities, the Ōita Works boosted its production capacity for crude steel from 3.6 million tons to 8 million tons per year.

On November 12, 1976, Nippon Kokan K.K. began operation of its No. 1 blast furnace at the Ogishima Works. This blast furnace had an internal capacity of 4,052 cubic meters and a production capacity of 8,000 tons per day of pig iron. Construction on this facility began in December 1974. In addition to the blast furnace, the principal equipment installed included two units of 250-ton converters, a steel mill, a continuous-casting mill, a blooming mill, and a plate mill with an annual output capacity of 1.6 million tons of heavy plate (5.3 meters wide by 25 meters long). Total cost of construction was Y600 billion, which included Y100 billion for land reclamation for the site of the steelworks.

Because Japan relies on foreign sources for the principal raw materials of iron ore and coking coal, the industry strives to lower production costs by using large plants and equipment and advanced operational technology. At yearend 1976, the number of blast furnaces in Japan totaled 72. Thirty-seven had an inner volume of more than 2,000 cubic meters. As of yearend, Japan's 10 largest blast furnaces were as follows:

Company and blast furnace	Inner working volume (cubic meters)	Startup date
Nippon Steel, Oita Works No. 2	5,070	October 1976.
Sumitomo, Kashima Works No. 3	5,050	September 1976.
Nippon Steel, Kimitsu Works No. 4	4,930	October 1975.
Nippon Kokan, Fukuyama Works No. 5	4,617	November 1973.
Kawasaki Steel, Mizushima Works No. 4	4,323	April 1973.
Nippon Kokan, Fukuyama Works No. 4	4,197	April 1971.
Nippon Steel, Oita Works No. 1	4,158	April 1972.
Sumitomo, Kashima Works No. 2	4,080	March 1973.
Nippon Steel, Kimitsu Works No. 3	4,063	September 1971.
Nippon Kokan, Ogishima Works No. 1	4,052	November 1976.

Mine output of iron sands, pyrite sinter, and iron ore constituted about 1% of the total industry requirement. During the year, 133,727,000 tons of iron ore was imported, primarily from Australia (56.1 million tons), Brazil (24.4 million tons), and India (17.2 million tons). Japan's largest iron ore suppliers continued to be Hamersley Iron Pty. Ltd., Mt. Newman Mining Co. Pty. Ltd., Mt. Goldsworthy Mining Associates, Robe River Ltd., and Broken Hill Pty. Co. Ltd. of Australia; Companhía Vale do Río Doce S.A. (CVRD) and Mineração Brasileiras Reunidas S.A. of Brazil; and the Mineral and Metal Trading Corporation of India.

In addition, the industry imported 1.5 million tons of ferruginous manganese ore, 1.8 million tons of manganese ore, 56.5 million tons of coking coal, 0.6 million tons of pig iron, and 1.8 million tons of iron and steel scrap.

About 117.2 million tons of iron sinter and pellet was consumed for ironmaking. In 1976, consumption by the iron and steel producers included 86.7 million tons of pig iron, 38.2 million tons of iron and steel scrap, 44.3 million tons of coke, 63.2 million tons of coking coal, 9.1 kiloliters of heavy fuel oil, 6.2 billion cubic meters of oxygen, 65.2 million kilowatt-hours of electricity, 1.7 million tons of manganese ore, and 18.0 million tons of limestone.

During the year, crude steel production totaled 107.4 million tons. A breakdown of steel production by type of furnace follows, in million tons: Basic oxygen, 86.9; electric, 20.0; and open hearth, 0.5. About 98% of the total output was consumed for rolled products; the remainder was used for forgings and castings. Production of hot-rolled ordinary steel totaled 83.2 million tons, that of hot-rolled special steels was 9.9 million tons, and that of electric furnace ferroalloys was 2.0 million tons.

Steel exports in 1976 were estimated at 36 million tons, valued at $10.9 billion. Compared with 1975 exports, the volume increased 25% and the value increased 4.1%. The average export price per ton in 1976 was $294, compared with $348 in 1975 and $343 in 1974. Exports of ordinary steel products were 32.5 million tons, while shipments of special steel products were 1.7 million tons.

By major destination, 10.9 million tons was shipped to Southeast Asia, the largest market for Japan's steel industry. Exports to China increased 24% to 3.5 million tons in 1976. Shipments to Taiwan and the Republic of Korea were 1.3 million tons and 1.6 million tons, respectively. Demand for steel products in the Middle East was strong, and exports to this area increased 13.9% to 5.2 million tons. Exports to Europe were 8.2 million tons, including 3.0 million tons shipped to the U.S.S.R. Japanese steel exports to the United States totaled 7.4 million tons during the year.

At the request of the European Economic Community (EEC) in 1975, six major steel producers formed a Steel Export Cartel to voluntarily limit shipments to the member countries of EEC in 1976 to 1.22 million tons. Shipments to EEC in 1976 were about 1 million tons; however, sales to EEC neighboring countries sharply increased. The European Coal and Steel Community charged that the inflow of Japanese steel was a damper on the sales of local steel industries in the area. To alleviate the criticism, the Japan Iron & Steel Federation agreed to continue controlling exports in 1977. Later, U.S. steel producers charged that imports of Japanese steel were forcing the U.S. industry to decrease operations and lay off workers. Negotiation continued on establishing reference prices whereby the U.S. industry

would be given a measure of protection from foreign steel.

The financial stability of Japan's small steelmakers, weakened by the prolonged recession, faced further obstacles such as fluctuations in availability of steel scrap, strong competition from major steel companies, weakened position in regard to bargaining power in pricing, and swelling inventories. To overcome these difficulties, Daido Steel Co., Ltd., absorbed Japan Special Steel Co. and Tokushu Seiko Co., Ltd., on September 1, 1976. In addition, Osaka Iron & Steel Co., Ltd., and Ohtani Heavy Industry Co. were expected to merge in June 1977 and begin operations as Godo Steel. The mergers were expected to alleviate some of the difficulties that face the small producers.

Japan's industries are well known for seeking out stable supplies of raw materials throughout the world. Hitherto, raw materials were obtained either as direct purchases or, more recently, through an investment and import policy. A trend, particularly noteworthy in 1976, was an attempt by Japanese industry to directly participate in management and operation of overseas mines. Nippon Steel and Sumitomo Metal Industries approached the owners of the Robe River iron mine in western Australia about obtaining partial management equity. Reportedly, there were similar moves to obtain ownership equity in coking coal mines overseas.

Brazil's State-run CVRD and a consortium of five Japanese companies headed by Kawasaki Steel were expected to form a joint venture for the development and mining of iron ore deposits at Capanema, Minas Gerais State, Brazil. The deposits at Capanema, 300 kilometers north of Rio de Janeiro, were estimated at 233 million tons of hematite and itabirite.

Lead and Zinc.—Japan's lead and zinc industries were interwined, and producers of lead were producers of zinc as well as copper. Domestic mine production supplied about 25% of the total industry smelter output of lead and zinc. The major mines were at Kamioka, Iwate Prefecture; Hanaoka, Akita; Hosokura, Miyagi; Kosaka, Akita; Nakatsu, Fukui; and Toyoha, Hokkaido.

The estimated metal content of domestic lead ore mined in 1976 was 52,000 tons. Imports of lead ore and concentrate totaled 154,601 tons and were principally from Canada, Peru, and the United States, in that order. The remaining 25,955 tons was from Australia, the Philippines, and the Republic of Korea. Receipts of unwrought lead metal were 35,029 tons; shipments from Mexico, North Korea, Peru, and Canada accounted for 96% of the total.

Production of primary lead in 1976 totaled 219,000 tons, compared with 53,800 tons of secondary metal. Total industry shipments of lead in 1976 were 201,631 tons valued at Y32.6 billion, compared with 206,923 tons valued at Y25.3 billion in 1975. The unit value per ton of sales increased Y39,118. The Tokyo price quotation for lead in 1976 began at Y116 per kilogram, increased to Y166 in July, and ended the year at Y157.

Producers of lead by smelter, type of operation, and capacity (as of September 1976) follow, in tons:

Company and plant	Annual capacity	
	Electrolytic	Dry smelting
The Dowa Mining Co., Ltd.: Kosaka	12,000	--
Mitsubishi Cominco: Nao-Shima	--	36,000
Mitsubishi Metal Corporation: Hosokura	19,200	--
Mitsui Mining & Smelting Co., Ltd.:		
Kamioka	30,000	--
Takehara	42,000	--
Nippon Mining Co., Ltd.: Saganoseki	36,000	--
Rasa Industries, Ltd.: Miyako	1,400	--
Sumiko ISP Co., Ltd. (Sumitomo Metal Mining): Harima	26,400	--
Toho Zinc Co., Ltd.: Chigirishima	72,000	--
Total	239,000	36,000

Throughout the year, production of lead (primary and secondary) was close to industry output capacity. Sales of lead were buoyed up by the manufacture of storage batteries and demand for lead by producers of inorganic chemicals. Aside from export shipments, Japan's consumption pattern for lead was as follows: Batteries,

46%; inorganic chemicals, 19%; cable sheathing, 11%; lead pipe and sheet, 8%; and other, 16%.

The estimated metal content of zinc ore mined in 1976 was 260,000 tons. Imports of zinc ore and concentrate during the year totaled 986,053 tons and were mainly from Peru (324,827 tons), Canada (260,647 tons), and Australia (256,085 tons). The remainder was supplied by eight countries. Imports of unalloyed, unwrought metal totaled 27,904 tons, virtually all supplied by North Korea (27,276 tons).

Japan was the world's largest producer of zinc metal. Output in 1976 totaled 742,069 tons of primary metal and was distributed as follows: Electrolytic, 452,560 tons; high purity, 127,728 tons; and distilled, 161,781 tons. Production of secondary metal was 33,976 tons. Total industry output during the year was about 72% of the industry's production capacity. Consumption was estimated at 701,000 tons in 1976: Galvanizing accounted for 386,400 tons; diecasting, 116,900 tons; brass, 99,600 tons; rolled products, 34,700 tons; and other, 63,400 tons. In addition to decreased demand, the industry was plagued with large inventories. Opening and closing stocks for 1976 were 253,500 tons and 251,900 tons, respectively, which were approximately equivalent to a 4-month supply at the current consumption rate.

The price for zinc metal likewise remained depressed throughout the year. The highest price quotation in the Tokyo market was Y243 per kilogram, reached on August 2. The lowest quotation, on December 1, was Y233 per kilogram, equivalent to about $0.3936 per pound.

The prolonged recession that the zinc industry faced in 1974–76 was expected to continue into 1977. Demand for zinc was expected to rise only 4% to 727,000 tons in 1977. Industry stocks were expected to remain at the current levels, and curtailment of output was expected to be 25% to 30%. Moreover, exports of primary metal were expected to be near 60,000 tons in 1977, compared with 80,000 tons in 1976.

Producers of zinc metal by smelter, type of operation, and capacity (as of September 30, 1976) follow, in tons:

Company and plant	Annual capacity	
	Electrolytic refining	Distilling
Akita Zinc Co., Ltd.: Iijima	156,000	--
Hachinohe Smelting Co., Ltd.: Hachinohe	--	84,000
Mitsubishi Metal Corporation:		
Akita	105,600	--
Hosokura	21,600	--
Mitsui Mining & Smelting Co., Ltd.:		
Hiki-Shima	84,000	--
Kamioka	72,000	5,300
Miike	21,600	116,400
Nippon Mining Co., Ltd.: Mikkaichi	--	120,000
Nisso Smelting: Aizu	31,200	--
Ohte Metal (subsidiary of Mitsubishi Metal): Onahama	1,320	--
Sumiko ISP Co., Ltd.: Harima	--	66,000
Toho Zinc Co., Ltd.: Annaka	139,200	--
Total	632,520	391,700

In midyear, MITI formally approved the establishment of the nonprofit Metallic Mineral Stockpiling Association, founded by about 25 metal refiners and manufacturers of copper, lead, and zinc. The Association purchased 13,000 tons of electrolytic copper cathodes and 12,000 tons of electrolytic and distilled zinc. Because of the recovery of the lead market, the Association was expected to use $5 million originally earmarked for lead to purchase additional zinc.

Magnesium.—Production of magnesium metal in 1976 by Furukawa Magnesium Co., Ltd., and Ube Industries, Ltd., totaled 11,190 tons, up 28% from the 1975 output. Total industry production capacity was 12,500 tons (Furukawa, 7,000 tons and Ube, 5,500 tons). Both producers used the Pidgeon process, utilizing domestic dolomite for metal production. Recovery of secondary metal during the year was 7,396 tons. Exports during the year totaled only 1,128 tons, of which the Netherlands, Australia, and the Republic of Korea collectively accounted for 80%. Unit value of exports was $0.92 per pound, equivalent to U.S. quoted prices. Imports of magnesium

were 5,109 tons (unit value about $0.85 per pound) and were all from the world's three largest producing countries, the United States, Norway, and the U.S.S.R.

Total consumption of magnesium metal was estimated at 22,000 tons. In 1976, nearly 8,000 tons of magnesium metal was used as a reductant to produce titanium and zirconium metal. The magnesium chloride generated was reduced back to metal and hence was a nondissipative use. About 10,600 tons of magnesium was used for structural purposes such as castings, aluminum alloys, and mill products. A small portion of magnesium consumed was for dissipative uses in production of nodular iron, powder, and anodes. Unspecified uses in 1976 took about 1,800 tons.

Showa Denko produced small quantities of magnesium metal from its pilot plant at Chichibu, Saitama. Showa Denko had developed a patented vacuum smelting process; the test furnace had an annual capacity of 200 tons of metal.

Manganese.—In 1976, mine production of manganese ore was 141,742 tons, containing about 38,700 tons of manganese. Most of Japan's requirements for manganese, however, were met by imports. Receipts of manganese ore in 1976 were about 3.4 million tons; 44% of the total came from Australia, 25% from the Republic of South Africa, 11% from Gabon, and the remainder from Mexico, Brazil, Malaysia, and a number of other countries. Approximately 97% of the manganese was used in the iron and steel industry. The remainder was consumed in battery manufacture, chemicals, and miscellaneous uses.

Production of electrolytic manganese during the year totaled 6,752 tons, compared with 8,265 tons in 1975. The total output was by two companies, Tekkosha Co., Ltd., and Chuo Denki Kogyo K.K., with a combined annual capacity of 14,000 tons. Production of manganese oxide totaled 33,000 tons and was by Mitsui Mining & Smelting and Daiichi Carbon. Production of ferromanganese and silicomanganese by the iron and steel industry was 632,160 tons and 373,196 tons, respectively.

In 1976, Mitsui Denman (Ireland) Ltd., a joint venture of Mitsui Mining & Smelting (85%), Mitsui & Co., Ltd. (10%), and the Irish Development Authority (5%), began operation of an electrolytic manganese dioxide plant at Little Island in Cork. The plant, which had a 1,000-ton-per-month output capacity of manganese dioxide, used local limestone and sulfuric acid and manganese ore imported from Ghana. As an inducement, the Irish Government granted Mitsui Denman a tax exemption on export profits for a 15-year period. It was believed that the plant would be operating at 90% of capacity by late 1977.

Tekkosha Hellas, a joint venture of Tekkosha Co., Ltd., and Mitsubishi Corporation, began operating an electrolytic manganese dioxide plant in August in the Tessaloniki industrial zone at Tessaloniki, Greece. The plant, with a designed output of about 1,000 tons per month, experienced equipment difficulties, and production was suspended to correct faulty equipment.

Molybdenum.—Domestic mine production of molybdenum ore remained nominal, about 225 tons in 1976. Imports of molybdenum ore during the year totaled 127 tons and were from the United States, West Germany, the Republic of Korea, and Chile, in that order. Receipts of molybdenum concentrates were 17,789 tons principally from the United States (9,187 tons) and Canada (7,168 tons).

The bulk of molybdenum consumption was for the production of ferromolybdenum. During the year, the iron and steel industry produced 4,501 tons of ferromolybdenum. Production of high-purity molybdenum metal totaled 336 tons. Output of fabricated metal products in 1976 included 34 tons of wire, 42 tons of rod, 14 tons of sheet, and 76 tons of other products.

Nickel.—For lack of indigenous resources, Japan imported all of its nickel needs. During 1976, Japan imported 3,450,189 tons of 1.8% to 2.5% nickel ore (2,634,881 tons from New Caledonia, 811,684 tons from Indonesia, and the remainder from the Philippines and the Netherlands) and 45,133 tons of matte and speiss (27,847 tons from Australia, 13,213 tons from Canada, and the remainder from New Caledonia). Receipts of unalloyed nickel metal totaled 11,986 tons and were mainly from the Republic of South Africa (3,013 tons), the U.S.S.R. (2,950 tons), Australia (2,147 tons),

Canada (1,283 tons), the Philippines (1,081 tons), and Norway (1,073 tons). Imports of unalloyed waste and scrap were 60 tons, 60% from the United States. Imports of nickel alloys totaled 277 tons, which included 138 tons from the United States, 99 tons from Egypt, 25 tons from the Republic of South Africa, and 10 tons from the United Kingdom. Receipts of alloy waste and scrap were 4,737 tons and were mainly from the United States, Taiwan, and the United Kingdom. Japan also imported 1,327 tons of semifabricated nickel and alloy products.

Nickel metal production during fiscal 1976 was 24,132 tons and was by Sumitomo Metal Mining (16,665 tons) and Shimura Kako Co., Ltd. (7,467 tons). Consumption of nickel metal in 1976 totaled 27,674 tons and was as follows, by end use: Specialty steels, 8,284 tons; other ferrous alloys, 2,035 tons; nonferrous alloys, 4,895 tons; plating, 7,664 tons; magnets, 98 tons; and miscellaneous, 4,698 tons.

In terms of contained nickel, the quantity of ferronickel consumed was more important than nickel metal consumption. Production of ferronickel in 1976 was 198,000 tons, down 1% from that of 1975. Pacific Metals Co., Ltd., Nippon Yakin Kogyo Co., Ltd., Nippon Mining, Sumitomo Metal Mining, and Shimura Kako were the five companies (with six plants) that produced ferronickel. As in the past, about 97% of the sales of ferronickel was consumed in the production of specialty steels. Most of the remainder was exported.

Shimura Kako reached an agreement with its labor union to transfer its nickel division from Tokyo to Date, Hokkaido. Construction of the nickel refinery at Date was expected to begin in late 1977; the facility was to be constructed adjacent to the company's existing ferronickel plant. The nickel refinery will have an annual production capacity of 10,000 tons of electrolytic nickel and 1,000 tons (nickel content basis) of nickel sulfate. The new plant, which will utilize International Nickel Co. of Canada Ltd.'s (Inco) newly developed electrowinning process, will replace the 7,200-ton-per-year nickel refinery in Tokyo. Total cost of construction was expected to be over Y10 billion.

Indonesia Nickel Development Co. (Indeco), composed of Sumitomo Metal Mining, Nippon Mining, Pacific Metals, Nippon Yakin Kogyo, Mitsui & Co., Mitsubishi Corporation, Sumitomo Shoji Kaisha, Ltd., and Nippon Steel, was expected not to proceed with the nickel development project in Indonesia. The original plans called for the development of the Gebe Island ore deposits and the construction of a 20,000-ton-per-year ferronickel plant near the mine site at a total cost of Y60 billion to Y70 billion. The cost was later revised to Y130 billion, and Indeco indicated that the company may consider developing the mine only for export of ore.

Titanium.—Production of titanium sponge in 1976 by Osaka Titanium Co., Ltd., and Toho Titanium Co., Ltd., totaled 6,346 tons. The companies had a combined rated output capacity of 950 tons per month, indicating that total production during the year was only at 56% of capacity. Titanium metal was used primarily for its corrosion-resistant properties. While consumption of titanium was on the upturn during 1972–74, demand slackened in 1975 and 1976 owing to delayed orders for desalination, petrochemical, and caustic soda plant equipment as a result of the prolonged recession.

Total demand for titanium in 1976, measured in terms of shipments, follows: Domestic consumption, 4,800 tons and exports, 1,680 tons. In comparison, domestic shipments in 1975 were 3,700 tons and exports totaled 3,274 tons. Producers' inventories at the end of 1976 were estimated at 2,000 tons, down slightly from 2,100 tons held at the end of 1975. At the current level of demand, producer stocks were approximately equivalent to a 4-month supply.

Producers negotiated for a 10% price increase for shipments beginning in October. Thirty thousand kilowatt-hours was consumed to produce 1 ton of titanium metal. Moreover, it was estimated that power costs account for 21% of the total cost of production. As electric power charges had been raised 30% and the industry was operating at about 55% of capacity, the producers needed a price increase because of the higher cost of operation per ton of metal produced.

Osaka Titanium was awarded the MITI prize for energy conservation for its

research on integrated reduction and vacuum separation furnace techniques in titanium production. The company built a single-charge 5-ton test furnace and operated the furnace successfully with a 3-ton charge (Japanese reduction furnaces are between 1.5 and 2 tons). The techniques for operating the furnace fully charged were expected to be fully developed by the end of 1977. Test results indicated that the larger charge furnace could result in a 20% reduction (as much as 9,000 to 10,000 kilowatt-hours per charge) in energy consumption for titanium metal production.

In 1976, shipments of titanium ore and concentrate to Japan totaled 496,750 tons. Major suppliers were Australia (203,232 tons), Malaysia (123,825 tons), India (64,006 tons), Sri Lanka (54,568 tons), and Canada (51,063 tons). Only a small portion of the imports was used for metal production. Japan, on the other hand, was a prominent world producer of titanium dioxide (titania), using imported ilmenite as a raw material (some rutile and anatase was also imported). The demand for pigments, the primary market for titanium, was hard-pressed by sluggish domestic and foreign demand, and production of titania was sharply curtailed in 1975. Demand began to recover in 1976, and 346,401 tons of ilmenite was consumed to produce 156,049 tons of titania, compared with 277,573 tons of ilmenite consumed in 1975 for 127,287 tons of titania. Producer-held stocks remained high, at about 1 month's production level. There were six titania producers capable of producing 180,000 tons of titanium dioxide per year. Stocks at yearend 1976 were 15,358 tons, compared with 16,221 tons at yearend 1975. Because of high inventories, two producers, Ishihara Sangyo Kaisha, Ltd., and Sakai Chemical Industry Co., Ltd., were expected to suspend production temporarily in 1977.

Tungsten.—Domestic production of tungsten concentrate in 1976 totaled 1,026 tons and was by Kaneuchi Mining (Kaneuchi and Fujigawa), Nittetsu Mining Co., Ltd. (Yaguki), Awamura Mining (Ōtani), Tanaka Mining (Kuga), Chitose Mining (Takatori), Mitsubishi Metal (Ikuno), and Chugai Mining Co., Ltd. (Tsumo). The largest production was by Kaneuchi Mining (426 tons), followed by Nittetsu Mining (348 tons) and Awamura Mining (221 tons). Imports of tungsten ore totaled 2,605 tons. The largest suppliers were the Republic of Korea (855 tons), Thailand (540 tons), Peru (378 tons), and Australia (313 tons). The remainder of tungsten shipments came from Canada, the United States, China, Portugal, Zaire, Mexico, Bolivia, and Spain, in that order.

Consumption of tungsten was estimated at 3,000 tons. Production of ferrotungsten during the year totaled 447 tons and of tungsten powder, 1,596 tons. Output of fabricated products included fine wire, 66 tons; rod, 89 tons; contacts, 46 tons; copper alloys, 33 tons; silver alloys, 26 tons; thoriated tungsten, 14 tons; and miscellaneous, 67 tons.

Other Metals.—Japan produced only a small quantity of antimony ore. Imports of ore and concentrate totaled 12,703 tons in 1976, of which 66% was supplied by Bolivia. The remainder of the receipts was from 11 countries. Imports of antimony metal totaled 1,055 tons, of which 811 tons was supplied by China, 146 tons by Bolivia, and the remainder by Thailand, the United States, the United Kingdom, Spain, and Yugoslavia, in that order. Output of metal in fiscal 1976 totaled 2,201 tons, of which 1,537 tons was produced by Hibino Metal Industries, 379 tons by Nippon Mining, and 285 tons by Mikuni Refining. Production of antimony oxide in 1976 was 5,901 tons and was by Nippon Mining Sumitomo Metal Mining, Hibino, Mikuni Refining, and Japan Mining, in that order.

Domestic consumption of antimony metal in 1976 was estimated at 2,023 tons distributed as follows, in tons: Batteries, 1,311; hardening alloy for lead, 173; Babbitt metal, 152; type metal, 75; lead pipes and sheets, 28; plating, 12; and other uses, 272. Domestic consumption of metal declined from 3,125 tons in 1973, 2,691 tons in 1974, and 2,117 tons in 1975. Domestic consumption of antimony oxide in 1976 was 4,819 tons, compared with 2,765 tons in 1975 and 3,644 tons in 1974. By far the largest use for the oxide was as a flame retardant, which consumed 3,095 tons in 1976. Other uses included 88 tons for enamel, 50 tons for tartar emetic, and 871 tons for miscellaneous uses.

Production of bismuth metal, a byproduct of lead refining, was 681 tons in 1976.

Domestic consumption of bismuth was estimated at 342 tons, of which the largest use was as a metallurgical additive (120 tons). Ninety-five tons was consumed for condensers, 63 tons for low-fusing alloys, 20 tons for pharmaceuticals, 19 tons for catalysts, and 25 tons for other uses. Exports during the year totaled 306 tons, of which 126 tons was shipped each to the United States and the Netherlands. Contrary to the Japanese consumption pattern, it was estimated that 40% of the world demand for bismuth was for pharmaceutical products manufactured primarily by France.

Japan and the U.S.S.R. were the world's leading producers of cadmium, a byproduct of zinc smelting. Production in 1976 of 2,900 tons was 9% greater than in 1975. The uses for cadmium were in batteries, in pigments, and as a stabilizer for polyvinyl chloride.

Production of cobalt metal, a byproduct of copper and nickel refining, totaled 515 tons in 1976 compared with 48 tons in 1975. Most of Japan's requirements for cobalt were met by imports. During the year, receipts of unwrought cobalt metal totaled 3,148 tons, mainly from Zaire (2,400 tons). Imports of cobalt powder and flake were 686 tons, primarily from Zaire (257 tons) and Belgium (230 tons).

The estimated consumption of cobalt in 1976 was 2,996 tons, compared with 1,979 tons in 1975. Nearly 52% of the total use of cobalt in 1976 was for the production of magnets for small speakers used in radios and television sets. The remainder of cobalt consumption was distributed as follows, in tons: Heat-resistant alloys, 390; high-speed steels, 201; other alloy steels, 238; ultrahard alloys, 122; catalysts, 107; and other uses, 389.

Japan was a major producer of indium, and 1976 output was estimated at 7.7 tons, including recovery from recycled indium products. Toho Zinc was the largest producer with an annual production rate of 3.8 tons. Nippon Mining had an average monthly output of 250 kilograms, with a peak capacity of 280 kilograms. The Dowa Mining began recovering indium in June 1976 from slag generated from gallium processing. The Dowa Mining was capable of producing 50 kilograms per month. Tanaka Electronics Industries, an associated company of Mitsui Mining & Smelting, had a monthly capacity of 50 kilograms of indium. Indium was used in electronics components and solders and other alloys.

Japan was the world's largest producer of selenium. Production in 1976 was 460 tons. Selenium as well as tellurium was recovered as a byproduct in the processing of slimes generated from electrolytic copper refining. The major uses for selenium were in electronics and photocopier components, glass manufacture, chemicals, and pigments. A growing use for selenium was as an addition agent to stainless steel to improve machinability. Selenium addition, in a proportion of 0.15% to 0.16%, improves resistance to corrosion and increases ductility of certain steels.

During 1976, Japan produced 1.11 million troy ounces of gold and 36.5 million troy ounces of silver. Output of gold, derived mainly from the smelting of imported nonferrous ores, was about 7% higher than in 1975. Recovery of silver was at a slightly higher level than in 1973–74 and was about 33% from domestic ores. Domestic production of platinum and palladium was nominal, less than 1,000 kilograms, and Japan had to import these metals in one form or another.

Japan also produced other metals, usually of high purity and generally in quantities prominent by world standards. Output for some of these metals during 1976, mostly from imported materials, follows, in tons: Chromium, 2,417; germanium, 16; germanium oxide, 22; cerium, 301; lanthanum oxide, 80; silicon, 283; tantalum, 42; and uranium, 3.

NONMETALS

Cement.—Japan ranked with the United States and the U.S.S.R. as the foremost producers of cement in the world. Total industry capacity to produce cement was 110 million tons per year. However, total output of cement during the year was only 59% of rated capacity. Production of cement was by 61 plants of 22 companies. By density, Kyūshū District had the highest number of plants, totaling 19; followed by Kantō-Shinetsu, 14; Kinki, 8; Chūgoku, 7; Tohoku, 5; Tokai-Hokuriku, 3; Hokkaido and Shikoku, 2 each; and Okinawa, 1.

Total sales of cement in 1976 (domestic and export shipments) were 64,519,965 tons, up 2.1% over sales in 1975. Domestic

sales of cement by consuming sector in 1976 were estimated as follows: Building construction, 32.7%; civil engineering, 25.4%; concrete products, 15.5%; roads and bridges, 7.3%; harbor construction, 3.0%; railways, 2.8%; electric power, 1.5%; and miscellaneous, 11.8%. Exports of cement during the year totaled almost 5.9 million tons. The major export destinations were Kuwait (1.2 million tons), Singapore (1.1 million tons), the United Arab Emirates and Saudi Arabia (0.7 million tons each), Indonesia (0.6 million tons), Tanzania (0.5 million tons), and Hong Kong (0.3 million tons).

Since 1974, Japan's construction industry had been in a depression which particularly hurt cement producers. Construction orders received by the nation's 43 leading companies in 1976 totaled around Y5.5 billion, down 1.5% from that of a year ago. The 3-year slump in the industry reflected the sharp decline in private plant equipment investments that had played a central role in the construction sector.

Late in 1975, cement manufacturers formed a production cartel to provide temporary relief to the industry in light of slackened demand. In 1976, 20 producers were member companies of The Cement Association of Japan. By banding together, the manufacturers of cement could attempt to lessen competition, make adjustments in production levels, and negotiate higher prices for cement because of increased production costs owing primarily to higher energy costs.

Fertilizer Materials.—Japan's chemical fertilizer industry was one of the largest in the world. In terms of nitrogen fertilizers, Japan ranked fourth in world production after the United States, the U.S.S.R., and China, in that order. The industry's output of calcium and phosphatic fertilizers was large, while that of potassic fertilizers was relatively insignificant.

Japan's production of fertilizer materials during 1976 follows, in thousand tons: Ammonia (100%), 2,621; ammonium sulfate, 2,104; urea, 1,572; ammonium chloride, 703; calcium carbide, 552; calcium superphosphate, 535; calcium cyanamide, 157; and fused magnesium phosphate, 461. Total output of compound fertilizers in 1976 was 3,973,884 tons. There was a decline of about 15.1% in chemical fertilizer production, although the output of compound fertilizers increased 13.7%.

Japan's fertilizer industry has been traditionally export oriented, exporting between 70% and 80% of production. During the year, exports of ammonium sulfate nitrate were 48,861 tons; mixed fertilizers containing nitrogen, phosphorus, and potassium, 23,639 tons; and calcined phosphate, 11,200 tons. By destination, significant quantities of fertilizers were shipped to China, Brazil, India, Taiwan, and the United States.

Japan's industry had been adversely affected by low plant operation rates, international competitiveness, narrowing export markets, and increased costs. Since 1975, there was a marked deterioration in profits, especially for nitrogen fertilizers. Although foreign market prices for ammonium sulfate and urea were increasing, Japanese export prices were still insufficient to cover the added cost of energy and other raw materials. However, the producers agreed with the Federation of Agricultural Cooperative Associations to raise the prices only slightly for urea, lime-nitrogen, and fused phosphorus owing to the increased expenditures for petroleum and electric power. Significantly, the price of naptha, the most widely used feedstock, rose nearly fivefold after the 1973 oil crisis. To worsen the situation, Japanese exports of fertilizers had sharply decreased since 1975.

To remedy the bleak picture, the industry began to reshape its structure, exploit new markets, revamp its distribution system, and retire surplus or outmoded production equipment. The Government was urged to use fertilizers for forests. Also, the Federation advised the industry that surplus ammonia be used more heavily for nonfertilizer applications. In 1976, Mitsubishi Chemical, Nippon Kasei Chemical Co., Ltd., and Sumitomo Chemical Co., Ltd., reduced the capacity of their ammonia plants. Mitsui Toatsu Chemicals, Inc., a leading fertilizer manufacturer, was also expected to reduce its capacity for ammonia and urea.

Magnesium Compounds.—Japan's capacity to produce magnesium oxide from seawater was estimated at 750,000 tons per year. The largest producer was Ube Chemical Industries Co., Ltd., with about 58% of the total output capacity, followed by Shin-Nihon Chemical Industries Co., Hokuriku Seien Kogyo K.K., and Nihon

Kasui Kako Co., in that order. Imports of magnesium carbonate and magnesia clinker during the year were 2,448 tons and 104,549 tons, respectively. By far the largest use for magnesia was in the production of basic refractory heat-insulating bricks for lining metallurgical furnaces, of which the largest consumption was by the iron and steel industry. Exports of basic refractory bricks totaled 35,095 tons in 1976. The remainder of the magnesia consumption, about 10%, was in agricultural and chemical processing applications.

Salt.—Japan's salt production, all from evaporites, was 1,021,000 tons in 1976, compared with imports of 6,341,502 tons. The largest shipments were from Australia, 3,243,837 tons, and Mexico, 2,597,247 tons. The remainder was from China. In 1975 both Australia and Mexico renegotiated price increases for salt exports to Japan. The producers claimed that higher prices were needed to make a reasonable profit. The average unit value of imports in 1976 from Australia was about $15.70 per ton, compared with $12.40 per ton from Mexico.

Aside from human consumption, salt is need in Japan mainly by the chlor-alkali industry. Consumption of industrial salt in 1976 was estimated at about 6 million tons. During the year, Japan produced 2.9 million tons of caustic soda, 1.1 million tons of soda ash, 0.7 million tons of liquid chlorine, 0.7 million tons of 35% grade hydrochloric acid, and 0.2 million tons of 8% bleaching solution.

Throughout 1976, the chlor-alkali industry operated at about 60% of capacity. The industry was faced with depressed demand for caustic soda in 1976 as well as with the Government decree for the industry to switch production technology from mercury cells to a nonmercury technique by March 1978. The financial requirement to change technology was expected to be between Y600 billion and Y800 billion. In addition to declining profits and the prospect of large capital outlay to change technology, the industry faced technical problems. Most producers chose the asbestos diaphragm technique, which resulted in relatively poor product control and increased production costs. However, the producers continued to carry out further research and development efforts.

Asahi Chemical Industry Co., Ltd., adopted an ion exchange membrane technique in a 40,000-ton-per-year plant. Asahi's technique was also incorporated in a 60,000-ton-per-year facility of Denki Kagaku Kogyo K.K., which was completed and started up in 1976. Tokuyama Soda Co., Ltd., was trying out other techniques.

Over industry opposition, the Government approved in May 1976 the application of Dow Chemical Company to allow chlor-alkali production by Dow Chemical Japan, Ltd. Dow's plans called for the construction of a 720,000-ton-per-year caustic soda facility in Japan, which would comprise 16% of the country's total caustic soda capacity.

Sulfur.—The sulfur content of pyrite and pyrrhotite ore processed in 1976 totaled 470,691 tons, compared with 926,180 tons of elemental sulfur recovered from petroleum-refining operations. Domestic consumption of sulfur was estimated at 620,000 tons in 1976. Exports of sulfur during the year were 335,660 tons; the principal destinations were the Republic of Korea (232,117 tons), Taiwan (64,482 tons), and the United States (25,239 tons).

Total industrial production of sulfuric acid was up about 2% to 6,103,427 tons in 1976, compared with total consumption of 6,122,565 tons during the year. Production and yearend capacity of sulfuric acid in 1976 follows, in tons:

Contact process	Production	Capacity
Fertilizer	1,466,226	2,421,775
Smelter	3,348,731	5,422,310
Other	1,288,470	2,417,034
Total	6,103,427	10,261,119

The Sulfuric Acid Association of Japan credited the depressed production and consumption of acid to decreased demand by the fertilizer and synthetic fiber sectors, two of the major consumers of sulfuric acid. Consumption by the fertilizer industry in 1976 totaled 1,883,840 tons, down 6.8% from the 1975 level; that of the textile industry was 888,757 tons, down 1%. The consumption of sulfuric acid by other significant user industries in 1976 follows, in tons: Inorganic chemicals, 1,385,889; mining and smelting, 137,115;

pulp and paper, 128,276; iron and steel, 127,226; organic chemicals, 95,394; and exports, 154,424. The remainder was consumed in a number of applications. The major recipients for the exported sulfuric acid were the Philippines, Turkey, Spain, and Peru, in that order.

MINERAL FUELS

According to the Agency of Natural Resources and Energy of MITI, Japan's total energy supply in 1976 was 3,767,410 billion kilocalories, compared with 3,666,410 billion kilocalories in 1975. Energy supply by source follows, in billion kilocalories: Hydropower, 204,380; nuclear, 90,020; domestic coal, 122,700; imported coal, 462,190; domestic petroleum, 6,320; imported petroleum, 2,534,780; imported petroleum products, 167,400; imported liquefied petroleum gas, 75,890; natural gas, 26,670; and imported liquefied natural gas, 77,060.

Of the total energy supply, imported energy accounted for 88%, with the balance supplied by domestic energy sources, primarily hydropower and coal. Japan's reliance on oil accounted for 71.9% of the total supply in 1976. Following oil, in order of contribution to the energy supply, were coal, 15.5%; hydropower, 5.4%; petroleum and natural gas, 4.8%; and nuclear, 2.4%.

Coal.—Japan's coal mining industry reached its peak in 1961 when output exceeded 55 million tons with about 660 collieries in operation. Subsequently, readily available and low-priced oil rivaled coal as Japan's primary fuel source. After losing ground to oil, the coal industry began closing mines and reducing employment year after year. By 1976, domestic production of coal by 8 companies with 30 collieries and about 20,000 workers was 18.5 million tons, down 3% from the 1975 output. Production during the year was by Mitsui Mining & Smelting; Hokkaido Colliery & Steamship Co., Ltd.; Taiheiyo Coal Mining Co., Ltd.; Mitsubishi Coal Mining Co., Ltd.; Sumitomo Coal Mining Co., Ltd.; Matsushima Coal Mining Co., Ltd.; Joban Coal Mining Co., Ltd.; and Kaijima Coal Mining Co., Ltd.

In 1975, coal output dropped owing principally to gas explosions, flooding, and cave-ins at the Horonai Colliery in Hokkaido, one of the big steam coal mines. Horonai had a yearly output capacity of 1.5 tons of coal, and full production was not expected to be achieved until 1977 when the mine was restored. In addition, Kaijima, one of the small producers, went bankrupt during the year and was preparing to restructure its financial position.

Consumption of coal in steelmaking was much more important than for energy production. In 1976, Japan used 63.2 million tons of coking coal for steelmaking and about 10 million tons of steam coal for power generation. Most of the metallurgical-grade coal imported in 1976 was from Australia (25.0 million tons), the United States (14.9 million tons), Canada (10.3 million tons), and the U.S.S.R. (1.9 million tons). Most of the steam coal was supplied by domestic collieries and supplemented by imports primarily from the United States, Australia, Vietnam, the U.S.S.R., and China.

While the quantity of imports increased about 5% from that of 1975, the value of imports increased about 3%. Japan's coal import bill was $3.6 billion in 1976, compared with $3.5 billion in 1975, $2.9 billion in 1974, and $1.4 billion in 1973.

In 1976, MITI presented a coal policy that sought to assist the sagging coal industry. Included in the recommendations were proposals for the iron and steel industry to deemphasize outright purchases of coal in favor of foreign development and import projects to ensure a stable supply of coal from abroad. The Government was opposed to nationalizing the domestic industry as well as to consolidating the industry into a single corporation. The Government was also to provide assistance by helping the coal producers raise prices for domestic shipments to the power, steel, and other consuming industries. On the recommendation of the Coal Mining Council, Japan's coal prices had been fixed semiofficially since 1963. In 1976, the price of steam coal averaged Y13,130 per ton (up 15% from 1975), while the price of coking coal was fixed in accordance with long term delivery contracts of imported coal. Lastly, the coal industry was urged to develop new mines in collaboration with the Government, regional authorities, and the principal consuming industries.

To decrease dependence on foreign oil supplies, the coal industry was conducting research on coal gasification and liquefac-

tion. For example, Mitsui Mining Co., Ltd., in cooperation with Gulf Oil Corp. was studying coal liquefaction techniques. In addition, a group of Mitsui enterprises began the construction late in 1976 of a pilot plant using an undisclosed technique for the solvent refining of coal. The plant was expected to be completed by the end of 1977 with the capacity to produce 3 tons of low-sulfur-content fuel that was to be used by Nippon Steel and other steelmakers on a trial basis.

Japan Petroleum Development Corporation was expected to lend assistance to 11 Japanese oil, chemical, steel, trading, and banking enterprises for participating in Exxon Corp.'s coal liquefaction project. Exxon was to begin construction of a test plant in Texas in July 1977, capable of producing 600 barrels of synthetic oil per day from 250 tons of coal. The total cost of the project (research, construction, and operation) was estimated at $300 million.

Petroleum and Natural Gas.—Japan's production of crude oil remained minor, amounting to 4.2 million barrels in 1976, compared with imports of 1,599 million barrels valued at about $20.1 billion. Total industry refinery input during the year was 1,680 million barrels, equivalent to 4,603,862 barrels per day. The refinery input of Japan's 10 largest companies follows, in million barrels: Idemitsu Kosan Co., Ltd., 210; Nippon Petroleum Refining Co., Ltd., 160; Toa Nenryo Kogyo K.K., 118; Mitsubishi Sekiyu, 93; Maruzen Sekiyu, 81; Showa Yokkaichi Sekiyu Co., Ltd., 75; Nippon Mining, 68; Koa Sekiyu, 66; Showa Sekiyu, 59; and General Sekiyu Seisei K.K., 55.

As of December 31, 1976, Japan had 49 refineries owned by 31 companies, with a total atmospheric crude distillation capacity of 5,940,360 barrels per stream-day. Corresponding downstream capacities follow, in thousand barrels per day: Vacuum distillation, 1,858; catalytic cracking, 329; catalytic reforming, 605; middle distillates hydrodesulfurization, 1,251; fuel oil desulfurization, 1,351; hydrocracking, 13; lube oil solvent extraction, 72; lube oil solvent deasphalting, 49; lube oil solvent dewaxing, 62; sulfur recovery, 7,754 tons per day; and liquefied petroleum gas recovery, 24,439 tons per day. There were 36 vacuum distillation units, 41 catalytic reforming units, and 19 catalytic cracking units. The refinery input of Japan's 10 largest companies represented 64% of the total industry capacity.

Petroleum refinery output follows, in million barrels: Residual fuel oil, 674; distillate fuel oil, 231; gasoline, 188; kerosine, 152; jet fuel, 22; and lubricants, 14. Other refinery output included 4.4 million tons of asphalt. Japan's capacity by company and plant follows:

Company and refinery	Capacity (barrels per day)	
	December 1975	December 1976
Asia-Kyoseki: Sakaide	150,000	150,000
Asia Sekiyu:		
Hakodate	25,000	25,000
Yokohama	100,000	100,000
Daikyo Sekiyu: Yokkaichi	215,000	215,000
Fuji Kosan K.K.: Kainan	77,600	77,600
Fuji Sekiyu: Sodegaura	210,000	210,000
General Sekiyu Seisei K.K.:		
Kawasaki	55,000	55,000
Sakai	120,000	120,000
Idemitsu Kosan Co., Ltd.:		
Aichi	130,000	130,000
Chiba	310,000	310,000
Hyogo	110,000	110,000
Tokuyama	140,000	140,000
Hokkaido (Tomakomai)	70,000	70,000

During the year, 25 wells were completed, comprising 19 exploratory wells and 6 development wells.[8] Japan Petroleum Exploration Co., Ltd., (Japex) conducted onshore drilling in Hokkaido and Niigata, and Teikoku Oil Co., Ltd., drilled on Akita and Niigata. Gulf Oil and Idemitsu completed drilling offshore Okinawa, and Japex Hokkai completed drilling offshore Hokkaido. In addition to the 19 exploratory wells, which were plugged and abandoned, drilling continued at yearend on 7 wells (1 on Okinawa, 5 on Niigata, and 1 offshore Hokkaido). Teikoku Oil suspended drilling at 2,050 meters of the Matsunoyama well in Niigata. Three successful gas wells were reported in 1976: The Yurihara SK–1 and Yurihara SK–2D wells of Japex in Hokkaido and the Kami Tajima 1 well of Teikoku Oil in Niigata.

[8] American Association of Petroleum Geologists Bulletin. Petroleum Development in Far East. V. 61, No. 10, October 1977, pp. 1832–1879.

In September 1976, the development of the Ago-Oki oilfield by Japex Offshore Co., Ltd., was completed and production from the Field was begun. Ago-Oki, discovered in early 1972 by Idemitsu Exploration, Japex, and Amoco International Oil Company, is offshore the city of Niigata in the Sea of Japan. Ultimately the Field will produce 3,000 barrels per day of oil and up to 50 million cubic feet per day of gas. Aside from the Ago-Oki Field, crude oil production was from the Niigata, Yumagata, and Akita Fields in Honshu and the Shiratsukari Field in Hokkaido.

In 1976, eight Japanese oil developers participating in foreign development were producing oil in operations overseas: Arabian Oil Co., Ltd., Zaire Petroleum Co., Ltd., United Petroleum Development Co., Abu Dhabi Oil Co., Ltd., JPDC, C. Itoh Energy Development Co., Ltd., Japex Indonesia Co., Ltd., and Japan Low Sulfur Oil Co., Ltd. Mitsubishi Petroleum Development and Japan Iraq Petroleum Development were preparing to start crude oil production. Eleven companies were due to launch exploration or test drilling in overseas operations. Significantly, the Government-owned JPDC was providing financial aid to 25 of the 40 companies involved with foreign oil development.

In April 1976, Idemitsu was awarded the tender to develop crude oil in the Gulf of Alaska. In partnership with Amoco and Occidental Petroleum, Idemitsu will begin exploratory drilling in 1977. Andes Petroleum Co., Ltd., and Papua New Guinea Petroleum Company withdrew from exploration in Peru and Papua New Guinea, respectively, after conducting unsuccessful test drillings. Kaiyo Oil Co., Toyo Oil Development Co., and Japan Development & Construction Co., Ltd., along with French and other foreign companies that held offshore concessions in Vietnam, were awaiting official approval from the Hanoi Government concerning resumption of operations in Vietnamese waters.

The Mineral Industry of Kenya

By Janice L. W. Jolly [1]

Kenya's mineral industry, excluding refined petroleum products, contributed more than $80 million[2] to the 1976 gross domestic product (GDP) of about $3 billion at current prices. The GDP increased 1% over that of 1975 in constant 1972 prices. Disintegration of the East African Community (EAC) (Kenya, Tanzania, and Uganda) was on the horizon in 1976, prompted by financial disputes, endless bureaucratic muddles, ideological clashes, and other troubles among members. Despite this and a slow economic start at the beginning of 1976, Kenya was expected to realize one of the best economic years in its history in 1977. At yearend 1976, foreign reserves had increased to $273 million. In 1976, coffee was becoming one of Kenya's most valuable export items. Kenya also enjoyed good receipts during the year from exported refined petroleum products and cement. Petroleum and allied products accounted for 25% of Kenya's $945.1 million import bill. A 12.5% devaluation of the Kenyan shilling in October 1975, plus a sizable increase in taxes on luxury goods, helped reduce imports in 1976.

Active U.S. commercial involvement in Kenya was evidenced by the Overseas Private Investment Corp.'s (OPIC) efforts through loans, investment insurance, and OPIC's own equity participation. The Eximbank also offered financing for development projects. Teams from both Eximbank and OPIC visited Kenya in 1976 and gave a favorable report on the business climate. Kenya's State-owned Industrial and Commercial Development Corp. (ICDC) was actively looking for foreign investment partners. The World Bank and its affiliate, the International Development Association (IDA), were to give Kenya loans and credits totaling $45 million. Kenya also received $3.6 million from the African Development Bank and $2.3 million from the European Investment Bank to finance industrial development.[3] The United Kingdom and West Germany had negotiated development loan schemes with the Kenyan Government for a wide range of projects.

In an effort to promote West German investment in the country, Kenya and West Germany signed an agreement for relief of double taxation. The agreement will apply to taxes on income and capital imposed on behalf of each of the contracting States, their political subdivisions, or local authorities, regardless of the manner in which the taxes are levied. It will apply to all classes of income including capital gains, royalties, pensions, and annuities. An accord for bilateral cooperation was signed by Kenya and the Republic of Korea.

Kenya and Sudan have contracted the Norwegian Agency for International Development (Norad) to make a feasibility study for the new road to be built between Lodwar in northwestern Kenya and Juba in Sudan, a distance of about 500 kilometers. The road project was expected to cost about $1.2 million, and will help in the development of the isolated and semi-desert area of northern Kenya. Juba is the capital of Sudan's southernmost province and is one of Africa's most inaccessible areas, having no outside rail or paved road

[1] Physical scientist, International Data and Analysis.

[2] Where necessary, values have been converted from Kenyan shillings (K Sh) to U.S. dollars at the rate of K Sh8.26 = US$1.00.

[3] Africa Report, Kenya. January–February 1977, p. 35.

links. The road will provide an alternative to the present route from Sudan which transits Uganda to Kenya, as well as facilitating exports of cement, fuels, and chemicals (chiefly soda ash) to Sudan.

The Tana River Development Co. Ltd. signed a $44 million contract for the main civil works of the Gitaru hydroelectric project which, when completed in 1978, will have cost an estimated $363 million. Gitaru will generate 144 megawatts, almost 75% of the country's energy requirements of 200 megawatts. Contractors for the project were Skanska Cementgjuteriet AB of Sweden and Stirling Astaldi Ltd. of the United Kingdom. The project was being jointly financed by the World Bank, the Commonwealth Development Corp., the Kenyan Government, and the East African Power and Lighting Co. (EAPLC), under the overall supervision of Tana River.

Exploration continued on the geothermal energy potential of the Olkaria zone in the Rift Valley Province. With financial aid from the United Nations, French and Swiss companies were contracted to conduct studies for the EAPLC.

The fourth session of the United Nations Conference on Trade and Development (UNCTAD) was held in Nairobi on May 3–28, 1976. The program dealt with, among other things, commodities, manufactures, and semimanufactures; multilateral trade negotiations; money and finance for resource development; transfer of technology; and economic cooperation between developing countries and their trade relations.

Mineral exploration activity continued to increase in 1976. Field and laboratory capabilities of the Kenyan Mines and Geological Department were strengthened through the provision of technical experts and exploration equipment by the Canadian International Development Agency (CIDA). Field reconnaissance was being carried out in two major geological provinces—the Archaean volcanic sequences of Rift Valley Province and the Permian-Triassic sediments of the Coast Province. The Archaean volcanics were thought to be good hosts for massive base metal deposits. CIDA was to carry out airborne geophysical surveys in selected areas beginning in 1977. Zinc sulfide and uranium mineralization was being sought in the Coast Province, and an airborne magnetic-radiometric survey was to be carried out over selected Karroo sandstone areas. The survey was expected to be eventually extended west, using magnetometer only, toward the basement rocks being mapped by the Mines and Geological Department/Austromineral Project. Renewed interest was also being shown in the mineral potential of a large carbonatite-syenite complex intruding into the Permian-Triassic sediments near the coast. The complex was being examined to determine its niobium, phosphate, and base metal potential.

PRODUCTION AND TRADE

Mineral production in 1976 consisted of petroleum products produced from imported crude oil; limestone, limestone products, clinker, and cement (valued at $64 million); soda ash and salt (valued at $10.4 million); fluorspar (valued at $4.9 million); and many less significant mineral products produced mostly for local use, including calcite, diatomite, carbon dioxide gas, feldspar, gold, guano, magnetite, magnesite, lead ore, gem stones, vermiculite, and clays.

Cement production of 982,800 tons was up 10% from 1975 production, and advance orders signaled a promising year for 1977. The world market for soda ash was affected by continued slackened demand, but Kenya's soda ash production was up about 26% from that of 1975. The 1976 production rate for soda ash was only 58% of potential output.

Net imports of petroleum and petroleum products totaled $82 million in 1976. Exports of refined petroleum products, Kenya's second most important foreign-exchange earner after coffee, increased in value but declined in volume. Crude oil throughput at the refinery was reported as 19.1 million barrels, a 9% decrease from that of 1975. Crude oil supplies came from Iran and Saudi Arabia.

Total exports, excluding EAC trade, increased 29% to $668.4 million in 1976; these went mainly to West Germany, the

United Kingdom, the United States, the Netherlands, Zambia, and Japan. Trade with West Germany, the United States, and the Netherlands increased more than 100% in 1976.[4] Exports to Tanzania increased 13.3% and to Uganda, 4%. The value of total intracommunity trade in the EAC increased 12% in 1976 to $159.7 million.

The United States was becoming one of Kenya's most important economic partners. Trade with the United States increased about 25% owing to a doubling of exports. U.S. exports to Kenya were expected to increase 12% in 1977. In 1976, high coffee prices narrowed the trade deficit with the United States to $13 million from $40 million in 1975.

COMMODITY REVIEW

METALS

Chromite.—The Japanese consortium investigating the chromite and garnierite deposits of Telot in the West Pokot District of the Rift Valley Province was withdrawing from exploration. The Kenya Geological Survey had estimated about 60,000 tons of chromite at Telot based on projected connection of drillholes. The Japanese did additional drilling and concluded that the deposit consisted of several small pods rather than a large continuous one as formerly projected. Based on their exploration, the Japanese put the reserve estimate nearer to 8,000 tons. However, Kenyan authorities suspected that the Japanese had only investigated the central portion of a much larger known occurrence of these podiform bodies. There is another area of chromite occurring on the eastern range of the Great Rift Valley, which had not been investigated sufficiently to estimate reserves. For a summary of known chromite deposits in Kenya, the reader is referred to the recent Kenyan Ministry of Natural Resources report on the minerals of Kenya.[5]

Copper.—A small mine at Baragoi on the lower slopes of the Elgeyo Escarpment northeast of Eldoret produced mixed sulfide and carbonate ore from veins and lenses in pre-Cambrian metamorphics. The ore was roasted and leached to produce a metal precipitate, which was melted and cast into ingots at the mine site. Production of copper from Macalders Mine in South Nyanza District stopped in 1966 when the ore was exhausted, except for a small amount done by circulating water from the flooded mine over iron scrap to recover copper leached from the abandoned slopes.[6]

Lead and Silver.—The lead and silver operation at Kinangoni closed down. Operated by Kenya Mining Industries, which is a partnership of the ICDC of Kenya and Geomin of Romania, the mine started operations in 1973 and had mined out 2 million tons of ore. Reserves had been estimated at 5 million tons when mining began. The silver content was recovered at the smelter and ranged from 5% to 6% (750 grams per ton of lead concentrate). Metallurgical, water, and management problems brought about the closure. Underground mining was difficult because the area was very faulted and weathered.

Magnetite.—Magnetite was mined in southeastern Kenya near Ikutha for use in cement manufacture at Mombasa.[7]

NONMETALS

Barite.—In the Kilifi District of the Coast Province, the Vitengeni barite-lead mine continued with small-scale produc-

[5] Du Bois, C. G. B., and J. Walsh. Minerals of Kenya. Kenya Geol. Survey Bull. 11 (Kenya). Ministry of Natural Resources. 1970, p. 11.

tion of high-grade barite, most of which was consumed locally. Lead concentrate was being stockpiled. Plans were made to exploit additional barite from the nearby Nyali deposit.[8] The Vitengeni deposit consisted of a system of almost vertical veins up to 30 feet wide over a distance of several miles. The barite was of good white color and assayed 98% to 99.32% $BaSO_4$. Possible reserves were estimated at about 100,000 tons. About 420 tons was produced yearly.

Cement.—Production of cement increased 10% over that of 1975. The East African Portland Cement Co. Ltd. and the Bamburi Portland Cement Co. Ltd. merged under the name of Kenya Cement.[9] Production continued at the Bamburi plant near Mombasa in the Coast Province and the Athi River plant near Nairobi in the Eastern Province. Recent expansion of the Bamburi plant raised capacity from 800,000 tons to 1,250,000 tons per year. The company was also expanding the capacity of the Athi River plant from 250,000 tons to 400,000 tons per year, to be mostly used for local needs. Gypsum for this plant was available 10 miles from Athi River. At yearend, the local price of cement was about $3.25 per 50-kilogram bag. Sudan was a major importer of Kenyan cement.

Diatomite.—Diatomite was produced from several deposits in Kenya. Large deposits occurred in lakebeds of Pleistocene age at several localities in and near the Great Rift Valley. The more important deposits were situated at Kariandus and Elmenteita, both near Gilgil; Gicheru in the Kedong Valley; Eburru; and several localities around Lake Naivasha. Deposits were also located in the vicinity of Lake Magadi at Legamunge and Koora. The Kariandus deposit, which was being actively exploited, contained several bands of diatomite having a wide range in purity. The best had a powder density of 7 to 8 pounds per cubic foot and came from a horizon with a low-grade cover ranging from 45 to 120 feet thick. Partial chemical analysis of the higher-quality diatomite had shown a silica content of 78.2% to 85.2%. The Gicheru deposit was also mined periodically. Reserves of various qualities were large.[10] Tables 4 and 5 show a summary of diatomite deposit characteristics.

Fertilizer Materials.—The U.S.-financed company, Ken-Ren Chemicals and Fertilizers, of Nairobi, was expecting to complete a monoammonium-diammonium phosphate fertilizer plant in Kenya by the second half of 1978. The stamicarbon

process plant was to cost about $19.6 million and have a 130,000-ton-per-year capacity. Coppee-Rust S.A.-N.V. of Brussels was the contractor for the plant.

Fluorspar.—The Fluorspar Co. of Kenya Ltd. continued to mine fluorite at its Kerio Valley mine, producing a record high of 75,027 tons valued at $4.9 million in 1976. The new mill was completed in 1975, when the company began production. The company spent a total of $18 million on mine development, including construction of a complete township for 2,800 people, 350 of which were employees. One year and $2 million were spent in constructing a 24-kilometer, all-weather dirt road between the mine and the Government-built tarmacadam road to Eldoret.

Both acid- and metallurgical-grade fluorspar were produced from ore grading 45% to 60% fluorite. The metallurgical grade contained an average of 78% CaF_2 with a maximum of 17% silica. The company had set a target for 1977 of 10,000 tons per month of acid grade and 1,000 tons per month of metallurgical grade.

The acid-grade fluorite had a high phosphorus content making it undesirable for some markets. Research and a microprobe analysis indicated that some of the phosphorus was in the mineral lattice and not easily extractable. The P_2O_5 content ranged between 0.2% and 0.6% in the ore and could not be reduced below 0.1%. Japan canceled its expected contract for 50,000 tons per year because of the high phosphorus content. Production from new low-phosphorus fluorite vein deposits was expected during 1977. The Fluorspar Co. discovered that most of the vein deposits, whether in the older limestones or the overlying Miocene basalts, did not contain high phosphorus in the fluorite lattice, whereas the massive replacement bodies found in the limestone did. The replacement bodies, which were about 120 meters wide, formed the greater part of the minable reserves, estimated at 11 million tons of proven and 10 million tons of probable. One vein deposit in basalt was reported to be 8 meters wide containing about 500,000 tons of minable fluorite. Three vein deposits were being investigated for their production potential.

Transportation costs were about $18 per ton for the 864 kilometers by rail to Mombasa; production costs were about $22 per ton. The company paid a royalty of $0.24 per ton of concentrate, although this payment was not due until capital costs had been fully paid. Fuel costs had increased in the past few years. Exploration costs, however, remained low—about $0.06 per ton of ore. All prospecting was done by trenching. There was little soil or overburden covering the deposits. Fluorite vein deposits were known to occur along the rift zone extending to the Sudanese border.

Graphite.—A graphite deposit of 5 million tons was reported from the Austrian-supported exploration efforts in the Taita-

Taveta region. The small graphite mine located in the Machakos District, 40 miles from Kiboise, was recently closed down, but the deposit was still considered promising by Kenyan authorities.

Kaolin and Kyanite.—An Austrian-supported exploration team reported deposits of exploitable size in the Taita-Taveta region, including 10 million tons of kaolin and 5 million tons of kyanite. The Austrians were to spend $1.4 million on the prospecting effort.[11] Deposits of gem stones were also known in the area. The Kenyan Mines and Geological Department was to receive technical assistance for mineral exploration from the Canadian Government. A development agreement was expected to be signed in March 1977, providing $1.06 million to support exploration over the coastal mineral and gem stone belt, and over selected parts of Nyanza and Western Provinces. Under terms of the agreement, Kenya was to employ a private Canadian firm, Terrasurveys, to carry out airborne magnetic and radiometric surveys.

Magnesite.—Less than 10 tons per year of magnesite has been mined in Kenya since 1974 owing to suspension of the Kinyiki Hill mine operations. New management was expected to renew production. A steel rolling mill company was to mine the magnesite for use in making brick for its mill.

Soda Ash.—The Government was negotiating for capital participation in the Magadi Soda Co. Ltd., but no agreement was reached. Soda ash production was up to 115,214 tons in 1976 in spite of slackened demand. The company had a potential for producing more than 200,000 tons per year. The plant had two kilns, together capable of processing 800 tons of soda ash per day. Reserves in Lake Magadi were calculated to a depth of 10 feet to be 100 million tons. According to company officials, however, the trona appeared to form as quickly as it was mined. The company drilled the lake to a depth greater than 400 feet and found that the soda fluoride and clay contents increased with depth; the best material was in the top 10 to 25 feet. The company had two dredges, one capable of dredging to a depth of 25 feet.

Salt.—Magadi Soda produced two types of salt in large crystals for grinding and refining elsewhere. Red iron oxide was added to the variety made for animal use and iodine (30 to 40 parts per million, as required by the Government) was added to that intended for human consumption. Salt was produced from the liquor associated with the soda deposits in Lake Magadi. The liquor was pumped to evaporating paddocks where it was separated from the sodium carbonate by evaporating techniques, scraped up, washed, and then bagged in 80-kilogram bags. In 1976, Magadi Soda produced 50,000 tons of salt valued at $40 per ton. Salt production, conducted only during the dry season, was usually equal to about 25% of soda ash production.

The Italian firm Saltech International was building a salt refinery in Mombasa.[12] By 1977, the plant was expected to produce salt from Malindi at an initial rate of 50,000 tons per year, to be increased later to 80,000 tons per year.

Stone.—Basement-system limestone was exploited for the manufacture of portland cement at Kabinga, south of Sultan Hamud. Marble was quarried for ornamental stone and lime products near Turoka, Kajiado District. Calcite veins cut carbonatite bodies at Mrima Hill, Coast Region; Homa Hill, South Nyanza District; and Ruri. At the first two localities, the mineral formed white or colorless bladed crystals up to 1 foot in length, which formed radiating clusters. The Ruri calcite tended to be massive in habit. A firm in the Kajiado area produced calcite for Ceramic Industries of East Africa Ltd. for the manufacture of eating utensils.

Vermiculite.—A Japanese company was mining vermiculite from a small deposit located near Samburu near Mt. Kenya. Production of about 100 tons per month started in 1972. The 1976 production of vermiculite was reported as 3,587 tons valued at $755,615.

MINERAL FUELS

Coal.—Coal exploration and drilling continued in the Permian-Triassic Karroo sediments of the Coast Province. No coal

[11] Industries et Travaux d'Outre-mer (Paris). Afrique de l'Est (East Africa). V. 25, No. 281, April 1977, p. 252.

[12] Industries et Travaux d'Outre-mer (Paris). Afrique de l'Est (East Africa). V. 24, No. 275, October 1976, p. 725.

deposits of economic value have been found in Kenya, although there has been intermittent interest in searching those Karroo sediments with a favorable geologic environment.

Petroleum.—Kenya began construction of an oil pipeline that would link the port of Mombasa with Nairobi. Expected to be ready by yearend 1977, the 450-kilometer long, 14-inch diameter pipeline was to be capable of carrying 1 million tons of oil products per year. The pipe will deliver oil, paraffin, and gasoline from East African Oil Refineries, Ltd., at Mombasa to a terminal in the industrial area of Nairobi, where four 4,500-horsepower pump stations are to be built. Three United Kingdom firms and the Japanese firm Nissho-Iwai Co., Ltd., were awarded contracts for pipeline construction. Pencol Engineering Consultants of the United Kingdom was to design and supervise the construction of the pipeline. Ingersoll-Rand Co. Ltd. and Metrotect, also of the United Kingdom, won contracts of $445,000 and $890,000, respectively, for the pipeline's construction. Financing was being arranged through the IDA and Eximbank. The total cost was expected to be $96 million.[13]

Petroleum exploration was relatively low in 1976. Drilling took place in two areas. Chevron Oil Co. and Esso Standard Kenya Ltd. acquired a permit for a 25,000-square-mile concession in 1976, located onshore near the Somali border. Two dry holes were drilled and the concession was released in early 1977. The wells, Anza 1 and Bahati 1, went to 12,015 feet and 11,220 feet, respectively. Texas Pacific Oil Co., Inc., operator for a consortium involving also Whitestone Kenya Petroleum Co. and Louisiana Land & Exploration Kenya Ltd., began drilling about 6 miles southeast of Garissa in late 1975. The hole, Hagarso 1, proved dry at 10,000 feet. On the basis of these drilling efforts, both Chevron and the Texas Pacific consortium suspended virtually all field activity. Chevron abandoned its prospecting license and moved equipment to Sudan for exploration in 1976. In September 1976, Texas Pacific renewed its license until January 1978, but only on a portion of its original southern concession.

Adobe International (including Burmah Oil Kenya Ltd.) renewed its license on two small parts of its previous area in northeastern Kenya. Ocean Exploration Co. Ltd.'s license on an onshore and offshore area in southern Kenya was revoked by the Government in 1976 owing to insufficient activity. Kenya Sun Oil ceased its survey activities in late 1976, and it was anticipated that this license would also be abandoned. Wainoco Kenya and Anschutz Kenya were continuing studies in their offshore area. BP-Shell Petroleum Development Company of Kenya Limited and Total Petroleum Ltd. were negotiating for drilling rights in an offshore area. Phillips Petroleum Co. was authorized to run a seismic survey and was to work in conjunction with the Total group. With the exception of the marine license areas, petroleum exploration in Kenya was expected to cease completely during 1977, as no new bids had been received.[14]

The Mineral Industry of North Korea

By E. Chin [1]

The year 1976 marked the end of the fourth economic development plan (1971–76) initiated by the Government to promote industrialization and modernization and advance overall technology in the country. The Government advanced the completion date of the plan by 1 year to 1975; purportedly, the target levels set for most production sectors were attained. The objectives for 1976, the last year of the current plan, were to sustain the output capacity achieved thus far and prepare the fifth economic development plan for further advances in the economy. The quantitative output goals set for 1980 under the new plan call for doubling coal, fertilizer, and cement production and tripling steel production. Targets of the third and fourth plans and proposed goals for 1980 of the fifth plan were as follows, in million tons, unless otherwise specified:

Sector	1970	1975–76	1980
Iron ore	7.2	NA	NA
Pig iron	2.3	3.5–3.8	NA
Steel:			
Crude	2.2	3.8–4.0	12
Rolled	1.7	2.8–3.0	NA
Nonferrous metals	.16	.45	1
Cement	4.0–4.5	7.5–8.0	20
Fertilizers, chemical	1.5	2.8–3.0	5
Magnesium clinker	NA	1.6	NA
Coal	27.5	50–53	100
Electricity ---billion kilowatt-hours--	16.5	28–30	50

NA Not available.

To sustain a high industrial growth rate, priority was given to fostering technological advances in the mineral extractive industry and in the power and transportation sectors. Significantly, technology had to be imported in the form of hardware. Large deficits were incurred after 1970 owing to imports of complete plants, machinery and transportation equipment, and other manufactures. By yearend 1976, North Korea's external debt was estimated at $1.8 billion, distributed as follows, in millions: Centrally planned economy countries, $800; Western European countries, $710; and Japan, $290. Of this accumulated trade deficit, about $300 million was overdue at yearend, indicating that North Korea had been unable to meet payments on purchase contracts and that its foreign exchange reserves were low. During the year, the Government began to negotiate a repayment formula for its financial obligations.

[1] Physical scientist, International Data and Analysis.

PRODUCTION

North Korea produces a variety of mineral commodities, with anthracite, graphite, magnesite, and tungsten considered to be significant by world production standards. Copper, gold, iron ore, lead, nickel, zinc, apatite, barite, pyrite, talc, and other minerals also were produced. Although North Korea has large reserves of anthracite, petroleum and natural gas have not been discovered. Official mineral production data are not available. However, it was conjectured that output of minerals and metals did not meet the national targets inasmuch as the President's New Year's address stated that industrial production capacity far exceeded industrial production.

[p] Preliminary. [r] Revised.

[1] In addition to the items listed, a number of other mineral commodities apparently are produced, but information is inadequate to make reliable estimates of output levels. These include (but are not limited to) antimony, germanium, indium, lithium minerals (lepidolite), manganese ore, mica (phlogopite), molybdenite, monazite, nickel, and/or miscellaneous clays, glass sand, building sand, stone, and gravel.

[2] Includes granulated iron.

TRADE

North Korea's total trade in 1976 was estimated at around $1.5 billion, of which approximately 60% was for imports and the remainder for exports. All foreign trade and transactions are conducted by the Government, although the State has never published for dissemination its foreign trade data. North Korea's chief exports are manufactured goods, with some raw materials and foods. The leading mineral and metal exports include iron ore, pig iron, steel semimanufactures, lead and zinc metal, tungsten concentrate, cement, magnesite, and talc. The country imports machinery and transportation equipment, mineral fuels, foodstuffs, and selected raw materials such as coal, coke, and chromium and manganese ore. North Korea's main trading partners were the People's Republic of China, the U.S.S.R., and Japan.

Table 2.—North Korea: Apparent exports of selected mineral commodities [1]
